RE: **Response to Comments for Draft Environmental Impact Report** – Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting

Ladies and Gentlemen:

Enclosed is a document entitled Volume 3 - Chapter 7 - Response to Comments, for the above-referenced project. Section 15088 of the California Environmental Quality Act Guidelines requires the Lead Agency to evaluate comments on environmental issues received from persons who reviewed the Draft Environmental Impact Report (EIR) and prepare a written response addressing each comment. This document is Chapter 7 of the Final EIR.

A public hearing has been scheduled with the Kern County Planning Commission to consider this request on October 5, 2015 at 5:00 p.m. or soon thereafter, at the chambers of the Board of Supervisors, first floor, Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, California.

Thank you for your participation in the environmental process for this project. If you have any questions regarding this letter please contact Christopher B. Mynk, AICP, Supervising Planner at (661) 862-8607 or email at: MynkC@co.kern.ca.us.

Sincerely,

Christopher B. Mynk, AICP
Supervising Planner

Responses to Comments

7.1 Introduction

7.1.1 Purpose

As defined by Section 15050 of the California Environmental Quality Act (CEQA) Guidelines, the Kern County Planning and Community Development Department is serving as "Lead Agency" for preparation of the Environmental Impact Report (EIR) for the proposed Draft EIR (DEIR) for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting ("Project" or "proposed Project"). The Final EIR (FEIR) presents the environmental information and analyses that have been prepared for the Project, including comments received addressing the adequacy of the DEIR, and responses to those comments. In addition to the responses to comments, clarifications, corrections, or revisions have been made to the DEIR. The FEIR, which includes the responses to comments, the DEIR, and the Mitigation Monitoring Program, will be used by the Planning Commission and Board of Supervisors in the decision-making process for the Project.

7.1.2 Environmental Review Process

Kern County prepared and circulated an Initial Study (IS)/Notice of Preparation (NOP) to the State Clearinghouse (SCH# 2013081079), public agencies, special districts, responsible and trustee agencies, and other interested parties for review and comment on August 30, 2013. In conjunction with this public notice, four scoping meetings and community workshops were held by Kern County at the locations and dates identified in Table 7-1. The purpose of these workshops/meetings was to introduce the Project and to solicit input from agencies, organizations, and other interested parties regarding the proposed Project, alternatives, mitigation measures, and environmental impacts to be analyzed in the EIR. Comments received during the review period were used in the preparation of the DEIR.

Table 7-1: Scoping Meetings and Community Workshops

Location	Date	Time
Lost Hills Recreation Building, Lost Hills Park Highway 46, Lost Hills, CA	Sept. 16, 2013	6:30 p.m.
Taft Veterans Hall, Room 1 218 Taylor Street, Taft, CA	Sept. 18, 2013	6:30 p.m.
Kern County Board Chambers, 1st Floor Board Chambers 1115 Truxtun Avenue, Bakersfield, CA	Sept. 23, 2013	6:30 p.m.

Table 7-1: Scoping Meetings and Community Workshops

Location	Date	Time
Shafter Veterans Building, Room 2 309 California Avenue, Shafter, CA	Sept. 25, 2013	6:30 p.m.

The DEIR prepared incorporated public and agency responses to the IS/NOP and scoping process. The DEIR was circulated for review and comment to appropriate agencies and additional individuals and interest groups who have requested to be notified of EIR projects. Per Section 15105 (Public Review Period for a DEIR or a Proposed Negative Declaration or Mitigated Negative Declaration) of the State CEQA Guidelines, Kern County provided a 60-day public review period, which included an extension to the comment period. The extension was noticed on July 29, 2015 to agencies and all parties on the Kern County distribution list for EIR projects.

Three public workshops were held to receive comments on the DEIR at the following locations:

- Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, CA on July 27, 2015
- Shafter Veterans Building, 309 California Avenue, Shafter, CA on August 10, 2015
- Taft Veterans Hall, 218 Taylor Street, Taft, CA on August 17, 2015

Comments received and PowerPoints used during the three public workshops are included in Appendix B-1.

Some commenters requested an extension of time to submit comment letters on the Draft EIR, either at these workshops or in separate correspondence to the County. The County extended the review period, from August 24 to September 11, 2015. The letters and correspondence are included in Appendix B-1.

Some commenters offered their opinions about the benefits and costs of continuing, curtailing, and/or ending oil and gas extraction activities in Kern County. Some commenters noted charitable and other contributions made by the oil industry, jobs and tax revenues created by the oil industry, and financial returns from many small mineral rights holders. Others commented on the rights and interests of surface owners on split estates. More commenters stated that oil and agricultural uses were compatible than those who raised concerns about agricultural impacts from the oil industry. Several commenters also noted the ongoing importance of hydrocarbon fuels to the local and national economy, and the benefits of producing oil locally rather than relying on oil imports.

Other workshop commenters offered questions, suggestions or criticisms regarding the Amended Ordinance. For example, some commenters endorsed a new local permit process, and others raised concerns about compliance costs. Some wanted clarifications or expansion of public or surface owner notice procedures, and measures to address existing and abandoned equipment. As described

in Section 7.1-3 below, these workshop comments as well as written comments were considered and informed the changes made to the Revised Draft Ordinance.

Some workshop commenters offered questions, suggestions or criticisms regarding the impacts and mitigation measures included in the Draft EIR. For example, some wanted assurances that mitigation dollars would be used on local improvements, others were concerned about the adequacy of air and agricultural impacts and mitigation measures, and roads. These workshop comments, along with written comments, were considered and informed the changes made the Project Mitigation Measures included in Section 7.1.4, and overlapped with concerns raised in written comments for which detailed responses have been provided in Section 7.2.

7.1.3 Revised Project Description

Several commenters requested changes to the Amended Ordinance. Some requested changes related to administrative processing requirements (e.g., contents of applications, staff review time), others requested changes to notice and meeting requirements (e.g., adding additional notice requirements to surface owners of split estates), and several requested changes to substantive requirements (e.g., setback requirements) and clarifications or changes to implementation and enforcement procedures. Some commenters requested the elimination of the proposed ministerial permit process for or some types of oil and gas activities, and advocated instead for a "conditional use permit" discretionary permit process that, in the view of these commenters', would automatically trigger the need for additional review under the California Environmental Quality Act (CEQA) as well as create third party administrative and judicial appeal rights to challenge each such permit.

Most of these requested changes do not relate to the identification or mitigation of environmental impacts, and instead raise policy issues about the content and implementation of the County's zoning authority.

The County has revised the Amended Ordinance included in the Draft EIR (Revised Amended Ordinance) based on these comments and further internal policy discussions. The physical activities that are regulated by the Revised Amended Ordinance have not changed, and thus the ordinance implementation activities that are considered in the EIR have not changed. Clarifications and other modifications in the Revised Amended Ordinance do not authorize any new activity that was not allowed under the Amended Ordinance, and impose new restrictions on some activities (e.g., the number of well permits that can be issued annually under this EIR is now subject to a cap). The Revised Amended Ordinance does not itself create, or allow through activities regulated under this ordinance to create, any new or worse significant impact than those considered in the Draft EIR.

The Revised Amended Ordinance, with changes marked from the ordinance version included in the Draft EIR, is included in its entirety beginning on the following page. It should be noted that consistent with County practice and zoning laws, County staff, the Planning Commission, and the Board of Supervisors, will all review – and may make further changes to – this Revised Amended Ordinance. Approval of amended Ordinances is a legislative decision of the Board of Supervisors. Subsequent modifications to the Revised Amended Ordinance will continue to be evaluated to assure ongoing CEQA compliance.

REVISED AMENDED DRAFT (09/25/2015)

~~**APPENDIX A**~~

19.98.010 PURPOSE AND APPLICATION

The purpose of this chapter is to promote the economic and streamlined recovery of oil, gas, and other hydrocarbon substances in a manner compatible with surrounding land uses and protection of the public health and safety by establishing reasonable limitations, safeguards, and controls on exploration, drilling, and production of hydrocarbon resources. The procedures and standards contained in this chapter shall apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out within the unincorporated San Joaquin Valley portion of Kern County (See Figure 19.98.015). This effective date of this version of Chapter 19.98 is MONTH, DAY, YEAR.

19.98.020 DEFINITIONS OF OIL AND GAS PRODUCTION ACTIVITIES

Oil and Gas exploration and operations contain many highly technical activities. For the purposes of this Chapter 19.98, definitions of activities are located throughout the Chapter, were applicable~~in Appendix A~~. Unless otherwise indicated in this Chapter, the definitions in Chapter 19.04 remain applicable.

19.98.030 OIL AND GAS PRODUCTION BOUNDARY AREA AND TIER AREAS

Oil and Gas production in Kern County occurs within the portion of Kern County depicted in Figure 19.98.015. This~~The~~ Oil and Gas ~~Production~~Activities Boundary Area is divided into five (5) Tier Areas and depicted in Figure 19.98.015. Changes to the Oil and Gas Production Boundary Area and Tier boundaries of Figure 19.98.015 shall be through the procedures in Chapter 19.112.

The Tier Areas were designated based on the following land use planning considerations~~are generally, described as follows~~:

A. Tier 1 Area is defined as all areas in which oil and gas activity is the primary land use. The existing well and activity densities preclude almost all other uses except for passive uses such as grazing.

B. Tier 2 Area is defined as all areas~~land~~ that ~~is~~ are classified ~~with the~~ Exclusive Agriculture (A) or Limited Agriculture (A-1) Districts, have ~~and has~~ agriculture as the primary surface land use, and are not ~~already~~ included in Tier 1.

C. Tier 3 Area is defined as other areas not within ~~the~~a Tier 1 Area that are located ~~and~~ in one of the following zone districts:

- Natural Resource (NR)
- Recreation Forestry (RF)
- Light Industrial (M-1)
- Medium Industrial (M-2)
- Heavy Industrial (M-3)
- Floodplain Primary (FPP)
- Drilling Island (DI)
- Zone Districts that have the Petroleum Extraction (PE) Combining District

D. Tier 4 Area is defined as areas not within Tier 1, 2, or 3, that include~~containing~~ at least one of the following zone districts:

- Estate (E)
- Low–Density Residential (R-1)
- Medium-Density Residential (R-2)
- High-Density Residential (R-3)
- Commercial Office (CO)
- Neighborhood Commercial (C-1)
- General Commercial (C-2)
- Highway Commercial (CH)
- Open Space (OS)
- Platted Lands (PL)
- Mobilehome Park (MP)

Authorized oil and gas activities in Tier 4 are subject to approval of a conditional use permit in accordance with 19.104 of this Title. ~~The Open Space (OS) District are those areas where oil or gas exploration and production activities are prohibited, but ancillary facilities are an~~

~~allowable use.~~

E. Tier 5 are areas including all current and future Specific Plan boundaries either adopted with a Special Planning (SP) District or which include specific provisions for oil and gas operations. Oil or gas exploration and production activities would be allowed with a conditional use permit or as permitted by the regulations contained within the adopted Specific Plan in Tier 5 areas.

F. All other areas not defined as Tier 1-5 Areas within the Oil and Gas Production Area are considered Non-Jurisdictional because they are not within the jurisdiction of Kern County.~~, including are considered Non-Jurisdictional~~ including . ~~These areas include~~ lands ~~under the administration of~~Lands owned by the United States, State of California or land within an incorporated city are exempt, unless under the authority of a written agreement with the Board of Supervisors. The regulations set forth in this chapter pertain only to accessory structures, facilities or uses that are physically connected to, provide access or services to, or otherwise support, oil and gas activities in these Non-Jurisdictional Areas.~~do not pertain to these areas.~~

19.98.040 OIL AND GAS ACTIVITIES BY MINISTERIAL PERMIT

A. No well for use as an injection well and no well for the exploration for or development or production of oil or gas or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in any Tier 1, 2, ~~3~~ and ~~5~~3 Areas until an application for Oil and Gas Conformity Review or Minor Activity Review has been submitted to and approved by the Planning Director as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the procedures set out in Sections 19.98.070 through 19.98.120 of this chapter. No such well may be drilled, or related accessory equipment, structure, or facility installed, in a Tier 5 Area unless the Specific Plan procedures for authorizing such activities have been completed, or if no such procedures are included in a Specific Plan unless the Oil and Gas Conformity Review or Minor Activity Review has been submitted and approved consistent with the procedures applicable to Tier 1, 2 and 3 areas.

B. Disposal of nonhazardous oilfield fluid waste and production water is considered an accessory facility only if the facility complies with the following:

1. The nonhazardous oilfield fluid waste or production water is produced and disposed of within the same designated oilfield; or

2. The nonhazardous oilfield fluid waste or production water disposed of outside the designated oilfield of origin is produced by and disposed of solely and only by the same individual, corporation, or entity or by reciprocal agreement among oil and gas operators in Kern County.

C. The provisions of this Section apply to the first three thousand six hundred and forty seven (3,647) new well permits issued each calendar year, within the Oil and Gas Production Boundary Area. Any new well permits beyond three thousand six hundred and forty seven (3,647) applied for in a calendar year would be subject to a conditional use permit.

19.98.050 OIL AND GAS ACTIVITIES BY CONDITIONAL USE PERMIT

A. In Tier 4, n~~N~~o well for use as an injection well and no well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, ~~or~~ facility or use may be installed in any zoning district described in this title in which such uses are permitted as conditional uses, or on land owned by the State of California subject to provisions of 19.98.030, until an application for a conditional use permit, which includes the information specified in Section 19.98.080, has been submitted to and approved by the Planning Commission as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive any condition set out in Section 19.98.060 of this chapter if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact and compliance with the California Environmental Quality Act.

B. No well for use as an injection well and no well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility, outside the boundaries as defined in Figure 19.98.015, may be installed in any zoning district described in this title in which such uses are permitted, or on land owned by the State of California subject to provisions of 19.98.030, until an application for a conditional use permit, which includes the information specified in Section 19.98.080, has been submitted to and approved by the Planning Commission as consistent with the standards set out in Section 19.98.060 of this chapter and in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive any condition set out in Section 19.98.060 of this chapter if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact and compliance with the California Environmental Quality Act.

C. Should any activity requiring approval of an Oil and Gas Conformity Review or Minor Activity Review pursuant to Sections 19.98.070 through 19.98.120 of this chapter, not be able to comply with the Implementation Standards and Conditions set forth in Section 19.98.060, an application for a conditional use permit, which includes the information specified in Section 19.98.080, shall be submitted to and approved by the Planning Commission in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180 and Chapter 19.98 of this title. In approving a conditional use permit, the Planning Commission may waive/modify any condition set out in Section 19.98.060 of this chapter if it determines that such waiver or modification will not result in material detriment to the public welfare or the property of other persons located in the vicinity, based on findings of fact and compliance with the California Environmental Quality Act.

D. If a ~~producing~~ well ~~or service well~~ is not completed upon land subject to a conditional use permit issued pursuant to this chapter and Chapter 19.104 of this title within twelve (12) months from the date of issuance of the permit, or within any approved ~~extended~~

period thereof, the conditional use permit shall expire and the premises shall be restored as nearly as practicable to their original condition. No permit shall expire while the permittee is continuously conducting drilling, redrilling, completing or abandoning activities, or related operations, in a well on the lands covered by such permit, which activities were commenced while said permit was otherwise in effect. Continuous activities are those suspended for not more than ~~thirty~~ninty (~~30~~90) consecutive days. If, at the expiration of the twelve- (12-) month period, the permittee has not completed his drilling program on the lands covered by such permit, the decision making authority, upon a written request of the permittee, may extend the permit for the additional time requested by permittee for the completion of such drilling ~~program~~, in accordance with the standards and procedures set out in Sections 19.102.130 through 19.102.180.

E. The following accessory uses shall require a Conditional Use Permit:
1. Cogeneration facility
2. Landfills

19.98.060 IMPLEMENTATION STANDARDS AND CONDITIONS

Pursuant to this chapter, all activities for the exploration for or development or production of oil, gas, and other hydrocarbon substances and related accessory buildings, structures, facilities ~~and~~, and activities shall comply with the following standards, unless otherwise provided in this chapter:

A. No oil or gas well shall be drilled within:

1. One hundred (100) feet of any public Major or Secondary highway or building not necessary to the operation of the well;
2. ~~One hundred and ninety~~Two hundred and ten (~~190~~210) feet of any ~~dwelling unit (single or multifamily)~~sensitive receptor (single or multi-family dwelling unit, place of public assembly, institution, school or hospital); or
3. ~~Three hundred (300) feet of any building used as a place of public assembly, institution, or school; or~~
3. One hundred (100) feet of any building utilized for commercial purposes, not used for oil and gas operations.

B. All drilling and production activities shall conform to all applicable fire and safety regulations. Firefighting apparatus and supplies required by the Kern County Fire Department shall be maintained on the site at all times during drilling and production operations.

C. All required federal, State, and County rules and regulations shall be complied with at all times, including, but not limited to, the rules and regulations of the following agencies:

1. California Division of Oil, ~~and~~ Gas and Geothermal Resources ~~(DOGGR)~~
2. Kern County Fire Department
3. Kern County Public Health Department
4. Regional Water Quality Control Board
5. San Joaquin Valley Air Pollution Control District
6. Kern County Public Works Department
7. California Department of Fish and Wildlife
8. United States Bureau of Land Management
9. United States Fish and Wildlife Service

10. United States Environmental Protection Agency

D. The applicant shall demonstrate compliance with all applicable Mitigation Measures as listed in the approved Mitigation Monitoring and Reporting Program (MMRP) for the Revisions to the Zoning Ordinance (C) - 2015.

19.98.070 OIL AND GAS CONFORMITY REVIEW AND APPROVAL ── REQUIRED

In Tiers 1, 2, 3 and 5, ~~E~~except as provided in this section, no permitted use shall be established, no permitted development shall occur, and no building permit or grading permit shall be issued for any permitted use or development subject to this chapter until an Oil and Gas Conformity Review or Minor Activities Review has been submitted to and approved by the Planning Director in accordance with the procedures set out in Sections 19.102.040 through 19.102.060 of this title.

Oil and Gas Conformity Review and Minor Activities Review

Activity	Conformity Review	Minor Activity Review	No Permit Required
Drilling & Completion			
Production Well (including cyclic steam production well) A well drilled to produce oil and or natural gas	✓		
Reworked Well	✓		
Injection Well A U.S. Environmental Protection Agency class 2 injection well into which fluids are injected rather than produced with the primary objective typically is to maintain reservoir pressure, conduct EOR operations or dispose of produced water or gas, including: steamflood, waterflood or gas injection	✓		
~~Temperature~~ Observation Well A well for the purpose of observing parameters such as temperature, fluid levels and pressure changes	✓		
SB4-Regulated Activities An activity regulated under California Senate Bill 4 (SB4) designed to enhance oil and or gas production or recovery. SB4 activities do not include activities such as steam flooding, water flooding, cyclic steaming, routine well cleanout, well maintenance or removal of formation damage due to drilling, chemical treatments that do not meet the requirements in 584, bottom hole pressure surveys, or routine activity Sidetracking, Deepening, activities that do not affect the integrity of the well of the formation	✓		
Drilling Pit or Sump A drilling pit or sump that requires a permit from the Central Valley Water Quality	✓		

Activity	Conformity Review	Minor Activity Review	No Permit Required
Control Board			

Sidetrack Change in well type, perforate new or existing perforations in casing, run or remove or cement liners, place or drill out any plug (cement, sand, mechanical): essentially, any operation that permanently alters the casing of a well	✓		
Deepening To deepen or permanently alter the casing in a well. Altering includes actions that require a DOGGR permit	✓		
Exploration and Development			
Geophysical Survey or Drilling by Scientific Means Tests conducted to determine the extent of and presence of oil and natural gas reserves and whether the resources for development	✓ *	✓	
Well Pad Preparation Construction activity consisting of clearing and grading of a new surface disturbance to accommodate the well and drilling activity or ancillary facilities that may be required for oil and gas drilling and operations	✓ *	✓	
Access Road Construction New surface disturbance that occur during the construction of a new road or expansion that includes new surface disturbance	✓ *	✓	
Electric Distribution Line Applies to new surface disturbance that occur during the construction of an electrical distribution line or expansion that includes new surface disturbance	✓ *	✓	
Pipeline Applies to new surface disturbance that occur during the construction of a pipeline or expansion that includes new surface disturbance	✓ *	✓	
Production Operations			
~~Steamflood~~	~~✓~~		
~~Waterflood~~	~~✓~~		
~~Gas Injection~~	~~✓~~		
~~Chemical EOR~~	~~✓~~		

Well ~~Workover~~ Operations and Maintenance Not Requiring a DOGGR permit			✓
Geophysical Monitoring			✓
Oil/Gas Treatment	✓ *	✓	
Produced Water Treatment	✓ *	✓	
Well Maintenance	✓ *	✓	
Well Testing			✓
Pipelines	✓ *	✓	
~~Pipelines (Oil, Produced Water, Waste Gas)~~	~~✓~~	~~✓~~	
Electric Lines	✓ *	✓	
Wastewater Treatment and Injection Disposal	✓ *	✓	
Wastewater Treatment and Surface Disposal	✓ *	✓	
Waste Treatment and Disposal	✓ *	✓	
Access Road	✓ *	✓	
Vegetation			✓
Reactivation of Idle Wells	✓ *	✓	
Support Facilities			
Administrative Building or Support Facility Building	✓ *	✓	
Steam Generator Boilers that generate steam for oil and gas field production purposes	✓ *	✓	
Flare A gas combustion device used primarily for burning off raw, waste, or unusable flammable gas that cannot be effectively commercialized	✓ *	✓	
Electric Lines Overhead or buried electrical distribution lines used for oil and gas field operations	✓ *	✓	
Electric Substations Electric substations used for oil and gas field operations	✓ *	✓	
~~Export~~ Pipelines Pipelines that part of an oil and gas field operation	✓ *	✓	
Tanks Tanks used for oil field operations	✓ *	✓	
Oil/Water Treatment Oil/ water treatment equipment used in oil and gas operations	✓ *	✓	
Produced Water Treatment Equipment used to treat produced water in an oil and gas operation	✓ *	✓	
~~Production Sump~~	~~✓~~ *	~~✓~~	
Produced Water Percolation Pond/Sump Produced water percolation and or evaporation ponds permitted by the Central Valley Regional Water Quality Control Board and used during oil and gas field operations	✓ *	✓	

Emergency Pit, Sump or Secondary Containment	✓ *	✓	
Fencing Fencing used to protect and prevent unauthorized individuals from coming into contact with oil and gas equipment and to prevent trespassing			✓
Well Abandonment A DOGGR process to plug and abandon a well used for oil and or gas activities including production, observation, and injection.			✓
Revegetation The processes taken to establish vegetation at an oil and gas operation			✓
Short Term Employee Housing Short Term Employee Housing Temporary housing for individuals involved in oil and gas operations that require onsite 24 hour 7 day a week oversight	✓ *	✓	
Pre-Ordinance Activities that Cause New Ground Disturbance and/or Subject to the Emission Reduction Agreement	✓ *	✓	
Note: * - Ongoing operations of existing wells, facilities and equipment, including minor modifications such as new interconnections between such facilities, does not trigger conformity review or minor activity review. When these accessory uses, equipment and facilities are proposed as part of the same project as an activity that requires an Oil and Gas Conformity Review, then these accessory activities are required to be included in the Oil and Gas Conformity Review. In all other circumstances, where new ground disturbance occurs, these accessory activities are subject to Minor Activity Review. ~~All activities denoted with a check mark in multiple columns, above, are subject to Oil and Gas Conformity Review only when in conjunction with another activity subject to only Oil and Gas Conformity Review; otherwise are only subject to Minor Activity Review. These activities shall be considered incidental to the Oil and Gas conformity Review for fee purposes.~~			

19.98.080 OIL AND GAS CONFORMITY REVIEW — APPLICATION CONTENTS (TIER 1)

Applications for an Oil and Gas Conformity Review within Tier 1 Areas, pursuant to Section 19.98.040 of this chapter shall include the following:

A. Name, telephone number and address of the applicant.

B. Name(s), telephone number(s) and address(es) of the surface property owner(s), mineral owner(s), oil and gas operator (if different than the applicant).

C. Assessor's parcel number(s) of all parcels located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities. Latitude/Longitude coordinates for all existing and proposed wells.

D. Description of the project area, including total site acreage, accessory equipment, structures, and/or facilities.

E. A site plan drawn to scale, sufficient in size to show all necessary details, no larger than 11x17, with multiple sheets (if necessary), which includes the following information:

1. Project boundary lines and dimensions, including lease lines and property lines.

2. Location and coordinates of all proposed well holes and related accessory equipment. Location of all roadways, pipelines, tanks, treatment or other structures and facilities to be installed. Distance from proposed well holes to section/midsection lines, located within ½ mile.

3. Location of all existing dwellings and structures, located within fifteen hundred and fifty (1,550) feet for all wells proposed to be drilled less than ten thousand (10,000) feet in depth or located within three thousand two hundred and seventy (3~~000~~,270) feet, for all wells proposed to be drilled greater than ten thousand (10,000) feet in depth, of the proposed well holes~~,~~. ~~I~~Identification of the use of each structure, and distances between well holes and existing buildings shall be noted. Location of existing property lines and distance from well site to property line.

4. Location of all new flare gas production lines, lines for production, electrical lines, and location of tank farms to be used.

5. North arrow, date the site plan was prepared, and scale.
6. Location of all accessory/ancillary facilities (including trucking parking, onsite storage, etc.) to be installed with the proposed wells.
7. California Division of Oil, Gas and Geothermal Resources permit application number, if available.
8. Identify the proposed source of water (domestic or production), if applicable.
9. Show location of all proposed underground pipelines.
10. Location of any existing Oil and Gas Conformity Review boundaries within and/or contiguous to the proposed boundary, including total site acreage and identification of Tier Area.
11. Written documentation in sufficient detail to allow the County to determine that all conditions required in Section 19.98.060 will be complied with, including all applicable mitigation measures as listed in the approved Mitigation Monitoring and Reporting Program for the Revisions to the Zoning Ordinance (C) – 2015.
12. Evidence that notice was provided to Land/Surface Owners as required by Section 19.98.080 G.

G. Notification Requirements

1. A physical letter of notification of application that requires a signature for delivery shall be sent by the applicant to all Land/Surface Owners of the property for which the Conformity Review is being requested, if the Land/Surface Owners are different from the mineral owners. The notice shall include all information required by State law. The letter of notification package shall include a copy of proposed site plan, including an official County handout explaining the conformity review process. The package shall be sent 30 days before submittal of the application. The application

shall include evidence that the letter was sent and the signatures received. Any application for which the Land/Surface Owner letter is returned for failure to obtain a signature, the Applicant shall provide evidence that the Land/Surface Owner of the property cannot be located through normal means such as tax records. A dated letter of authorization, with specific Assessor Parcel Numbers and the period of time applicable, from the Land/Surface Owner addressed to the County of Kern may be submitted asking that the notification be waived as allowed by State law. In site locations where mineral rights are owned by the United States Government and the surface is privately owned, the application package shall include confirmation that the proposed site plan has been submitted to the United States Bureau of Land Management.

2. A second letter shall be sent, by the applicant, when the application is submitted to the County. A dated letter of authorization, with specific Assessor Parcel Numbers and the period of time applicable, from the Land/Surface Owner, addressed to the County of Kern, may be submitted asking that the notification of application submitted be waived.

3. Access of the surface for purposes of conducting pre-application activities, such as surveys, shall be subject to any existing agreement between the Mineral Owner and the Land/Surface Owner, and State regulations. Such access is not subject to the notification requirements set forth in this title.

19.98.080~~5~~ OIL AND GAS CONFORMITY REVIEW AND CONDITIONAL USE PERMIT — APPLICATION CONTENTS (TIERS 2-5)

Applications for an Oil and Gas Conformity Review within Tiers ~~1~~ 2, 3, or Tier 5 Areas, pursuant to Section 19.98.040 of this chapter, or for a conditional use permit, for oil and gas activities within a Tier 4 Area, pursuant to Section 19.98.050 of this chapter, shall include the following:

A. Name, telephone number and address of the applicant.

B. Name(s), telephone number(s) and address(es) of the surface property owner(s), mineral owner(s), oil and gas operator (if different than the applicant).

C. Assessor's parcel number(s) of all parcels located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities. Latitude/Longitude coordinates for all existing and proposed wells.

D. Preliminary Title Report, not over ninety (90) days old. A Guarantee of Title may be submitted for parcels with a Preliminary Title Report on file, over (90) days old.

E. Legal description of the project area, including total site acreage, located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities in aliquot format, unless a more precise legal description is determined to be needed by the Planning Director.

F. A site plan drawn to scale, sufficient in size to show all necessary details, no larger than 11x17, with multiple sheets (if necessary), which includes the following information: ~~All~~

~~information required in Tier 2, 3, 4 and 5. Tier 1 information to be determined based on density of pre-ordinance oilfield development, as determined by the Director.~~

1. Topography and proposed grading of the site plan.

2. Project boundary lines and dimensions, including lease lines and property lines.

3. Location and coordinates of all proposed well holes and related accessory equipment. Location of all roadways (access roads), any proposed landscaping, pipelines, tanks, treatment or other structures and facilities to be installed, and any existing or abandoned wells if such are known to exist.

4. Location of all existing dwellings and structures, located within fifteen hundred and fifty (1,550) feet for all wells proposed to be drilled less than ten thousand (10,000) feet in depth or located within three thousand two hundred and seventy (3~~000~~,270) feet in depth, for all wells proposed to be drilled greater than ten thousand (10,000) feet, of the proposed well holes~~,~~. ~~I~~Identification of the use of each structure, and distances between well holes and existing buildings shall be noted. Location of existing property lines and distance from well site to property line.

5. Location of all new flare gas production lines, lines for production, electrical lines, and location of tank farms to be used.

6. North arrow, date the site plan was prepared, and scale.
7. Location of all recorded easements onsite, roads, section/midsection lines, located within ½ mile of the proposed wells.
8. Location of all accessory/ancillary facilities (including trucking parking, onsite storage, etc.) to be installed with the proposed wells. Location of planned ground disturbance on irrigated or prime agricultural land.
9. Description of ~~parcel~~project boundary in relation to Tier areas as ~~indicated~~defined in Figure 19.98.015.
10. ~~DOGGR~~ California Division of Oil, Gas and Geothermal Resources permit application number, if available.
11. Identify the location of the 100-year floodplain, if applicable.
12. Identify the proposed source of water (domestic or production), if applicable.
13. Show location of all new proposed underground pipelines. ~~Identify if pipelines connect to a Gas Distribution System.~~
14. Location of any existing Oil and Gas Conformity Review boundaries within and/or contiguous to the proposed boundary.
15. Written documentation in sufficient detail to allow the County to determine that all conditions required in Section 19.98.060 will be complied with, including all applicable mitigation measures as listed in the approved Mitigation Monitoring and Reporting Program for the Revisions to the Zoning Ordinance (C) – 2015.
16. Evidence that notice was provided to Land/Surface Owners as required by Section 19.98.085 H.

G. Signature Block and Statement (Land/Surface Owner, Mineral Owner and Operator.
The following statement shall be included to the first page of the site plan. ~~In Tier 1 Areas it shall be signed by both the Mineral Owner and the Operator.~~ ~~In Tier 2, 3, 4 and~~

~~5 Areas it~~ The statement shall be signed by all parties, irrespective of ownership relationship. Multiple lines may be added for multiple ownership signatures. A dated letter of authorization, with specific Assessor Parcel Numbers, from the Land/Surface Owner addressed to the County of Kern may be submitted asking that the signature on the site plan be waived.

REQUIRED STATEMENT

The undersigned Land/Surface Owner is the owner of APN#_____. The undersigned is the Mineral Owner and/or Operator or Lessee of the Mineral Owner. The Land/Surface Owner and the Mineral Owner and/or the Operator or Lessee have come to an agreement regarding the use of the surface of the property in connection with the Kern County permit that is being issued with this site plan.

H. Notification Requirements - Tier ~~1,~~ 2, 3, 4 and 5 Areas.

1. A physical letter of notification of application that requires a signature for delivery shall be sent by the applicant to all Land/Surface Owners of the property for which the Conformity Review is being requested, if the Land/Surface Owners are different from the mineral owners. The notice shall include all information ~~providing the notice~~ required by State law. The letter of notification package shall include a copy of proposed site plan, ~~and~~ including an official County handout explaining the conformity review process. The package shall be sent 30 days before submittal of the application. The application shall include evidence that the letter was sent and the signatures received. Any application for which the Land/Surface Owner letter is returned for failure to obtain a signature, the Applicant shall provide evidence that the Land/Surface Owner of the property cannot be located through normal means such as tax records. A dated letter of authorization, with specific Assessor Parcel Numbers and the period of time applicable, from the Land/Surface Owner addressed to the County of Kern may be submitted asking that the notification be waived as allowed by State law. In site locations where mineral rights are owned by the United States Government and the surface is privately owned, the application package shall include confirmation that the proposed site plan has been submitted to the United States Bureau of Land Management.

2. Access of the surface for purposes of conducting pre-application activities, such as surveys, shall be subject to any existing agreement between the Mineral Owner and the Land/Surface Owner, and State regulations. Such access is not subject to the notification requirements set forth in this title.

~~1. Within a Tier 1 Area only, a second letter shall be sent, by the applicant, when the~~

~~application is submitted to the County. A dated letter of authorization, with specific Assessor Parcel Numbers, from the Land/Surface Owner, addressed to the County of Kern, may be submitted asking that the notification of application submitted be waived.~~

19.98.090 OIL AND GAS CONFORMITY REVIEW – WITH ~~REQUIRED~~APPLICABLE SURFACE OWNER SIGNATURE

A. An applicant for a ministerial Oil and Gas Conformity Review permit pursuant to this chapter shall submit an application to the Planning Director in the format and number of copies specified by the Planning Director. The application shall contain all the information specified for the application by the applicable section of this chapter. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title. For Tier 2, 3 and 5 Areas, a copy of the application shall be provided to the Land/Surface owner per the requirements of 19.98.085.~~F~~H above. The application must contain the signature block and statement pursuant to Section 19.98.08~~05~~.~~F~~G, or shall contain a letter from the Land/Surface Owner waiving the need for said signature on the specified parcel of the proposed application. The waiver letter must be dated and provide specific language as to the length of time the letter is valid if to be used for future Oil and Gas Conformity Reviews.

B. The Planning Director shall ~~make reasonable efforts to~~ inform the applicant in writing within seven (7) business days of receipt that the application is complete and shall issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application and therefore the application is deemed incomplete.

C. Within three (3) business days of reviewing the second submittal, if required, to correct any deficiencies, the Planning Director shall ~~make reasonable efforts to~~ issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application and therefore the application is deemed incomplete.

D. Within seven (7) business days of reviewing the third submittal to correct any deficiencies, the Planning Director shall ~~make reasonable efforts to~~ issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of chapter. If the application remains incomplete ~~additional information is needed~~, a mandatory in person meeting with the applicant, and any consultant processing the application on behalf of the applicant, will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived, and shall be held at the Kern County Planning and Community Development Department.

E. Failure of the Planning Director to meet any deadline for application review or permit issuance as provided in this section shall not cause a permit to be deemed approved.

F. Any reviews beyond three (3), as provided above, shall require additional fees to be paid, as set forth pursuant to Section 19.06.040 of this Title, and shall be ~~conducted~~completed within thirty (30) days after the application is deemed complete.

~~F~~G.Prior to conducting any drilling activity the applicant (or operator, if acting on behalf of an applicant) must have received and have on file both the approved Permit to Conduct Well Operations from ~~DOGGR~~ California Division of Oil, Gas and Geothermal Resources and an approved Oil and Gas Conformity Review unless the activity involves facility placement not subject to ~~DOGGR~~ California Division of Oil, Gas and Geothermal Resources permit approval.

~~G~~H. Upon issuance of this permit~~.~~:

1. ~~t~~The County shall send a notification to the applicant, applicable responsible agencies, and the land/surface owner (if different from the mineral owner) stating a permit has been issued by the County~~, to facilitate the responsible agencies compliance with and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.~~ The approval letter shall include a stamped site plan, list of applicable conditions and mitigation measures, and a determination that the permit approval falls within the scope of the Environmental Impact Report prepared for the Revisions to the Zoning Ordinance (C) – 2015, and that other state, regional, and local agencies are responsible agencies under the California Environmental Quality Act.

2. The applicant shall notify the Land/Surface owner of the proposed dates for access of the property to commence operations and/or to comply with mitigation measures. Such notification may take the form of multiple letters. A dated letter of authorization, with specific Assessor Parcel Numbers and the period of time applicable, from the Land/Surface Owner, addressed to the County of Kern, may be submitted asking that the notification of access be waived or has already been satisfied with a single notification letter.

I. If the development for which a permit has been approved pursuant to this article has not commenced within one (1) year of the granting of the permit, or if the permit has been unused, abandoned, discontinued, or has ceased for a period of one (1) year, the permit shall become null and void and of no effect, unless an extension has been granted by the Planning Director upon written request for an extension before the expiration of the one- (1-) year period. A copy of any expiration or extension shall be provided to the Land/Surface Owner.

19.98.100 OIL AND GAS CONFORMITY REVIEW - WITHOUT REQUIRED SURFACE OWNER SIGNATURE

The provisions contained in this section apply only to applications submitted within Tier 2, 3 and 5 Areas, which do not contain the surface owner signature as required by Section 19.98.070, above:

A. An applicant for a ministerial Oil and Gas Conformity Review permit pursuant to this chapter, which does not include the Land/Surface Owner signature required pursuant to Section 19.98.085 F, shall submit an application to the Planning Director in the format and number of copies specified by the Planning Director. The application shall contain all the information specified for the application by the applicable provisions of this chapter. A copy of the application shall be provided to the Land/Surface Owner per the requirements of Section 19.98.080.F above. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title.

B. The Planning Director shall ~~make reasonable efforts to~~ inform the applicant in writing on the~~within~~ thirtieth (30) calendar day~~s~~ of receipt that the application is complete or that additional information is needed to complete the application and therefore the application is deemed incomplete. ~~No sooner than thirty (30) calendar days from issuance of the Kern County Oil and Gas Conformity Review and any other necessary state or federal permits, the applicant may begin construction of the facility.~~ The Planning ~~and Community Development Department~~Director shall notify the Surface/Land Owner ~~that the permit has been issued~~of their option for an in-person meeting with the Department to discuss the conformity review process and answer questions regarding the site plan, to be scheduled within the thirty (30) day period stated above.

C. ~~Additional~~Second Thirty (30) Day Review Period ~~Within~~.

1. If the application is deemed complete during the thirty (30) day period in Section 19.98.100 B, a mandatory second thirty (30) calendar day review will commence immediately following the end of the first review period.

2. If the application is found to be incomplete during the review period in Section 19.98.100 B, a subsequent thirty (30) day review period will commence at the time of submittal by the Applicant of the additional documentation~~thirty (30) calendar days will be of reviewing the second submittal, if required, to correct any deficiencies.~~.;

3. The Planning Director shall notify the Surface/Land Owner of their option for an additional in-person meeting with the Department to answer questions including review of any revisions to the site plan, to be scheduled within the thirty (30) day period stated above.

4. The Planning Director shall request to schedule a mandatory in-person meeting with the Applicant to review the current site plan and discuss the conformity review process.

5. On the first business day following the 30 day review period, the Planning Director shall ~~make reasonable efforts to~~ issue the permit if he/she determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application and therefore the application is deemed incomplete.

D. ~~Within~~All subsequent reviews, due to incomplete application submittals, shall require a mandatory thirty (30) calendar day~~s of reviewing the third submittal, if required,~~ review period. ~~to correct any deficiencies, t~~The Planning Director shall ~~make reasonable efforts to~~ issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application and therefore the application is deemed incomplete. If application remains incomplete, ~~additional information is needed,~~ a mandatory in-person meeting with the applicant, and any consultant processing the application will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived.

E. Any reviews beyond three (3), as provided above, shall require additional fees to be paid, as set forth pursuant to Section 19.06.040 of this Title, and shall be completed within thirty (30)

days after the application is deemed complete.

F. At any time during the review periods in Sections 19.98.100.A ~~or B~~ D the applicant submits proof of the required surface owner signature on the site plan, the application will be deemed acceptable to be processed under the provisions set forth in Section 19.98.090.

G. Failure of the Planning Director to meet any deadline for application review or permit issuance as provided in this section shall not cause a permit to be deemed approved.

~~F~~H. No sooner than thirty (30) calendar days from issuance of the Kern County Oil and Gas Conformity Review and any other necessary state or federal permits, the applicant may begin construction of the facility. This period shall be used to coordinate deposits and inspections pursuant to 19.98.140 (Inspection Compliance). Prior to conducting any drilling activity the operator must have received and have on file both the approved Permit to Conduct Well Operations, from ~~DOGGR~~ California Division of Oil, Gas and Geothermal Resources and an approved Oil and Gas Conformity Review unless the activity involves facility placement not subject to ~~DOGGR~~ California Division of Oil, Gas and Geothermal Resources permit approval.

~~G~~I. Upon issuance of this permit~~,~~;

1. ~~t~~The County shall send a notification to the Applicant, applicable responsible agencies, and the Land/Surface Owner stating a permit has been issued by the County. ~~to facilitate the responsible agencies complance with and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.~~ The approval letter shall include a stamped site plan, list of applicable conditions and mitigation measures, and a determination that the permit approval falls within the scope of the Environmental Impact Report prepared for the Revisions to the Zoning Ordinance (C) – 2015, and that other state, regional, and local agencies are responsible agencies under the California Environmental Quality Act.

2. The Applicant shall notify the Land/Surface owner of the proposed dates for access of the property to commence operations and/or to comply with mitigation measures. Such notification may take the form of multiple letters.

J. If the development for which a permit has been approved pursuant to this article has not commenced within one (1) year of the granting of the permit, or if the permit has been unused, abandoned, discontinued, or has ceased for a period of one (1) year, the permit shall become null and void and of no effect, unless an extension has been granted by the decision-making authority upon written request for an extension before the expiration of the one- (1-) year period. A copy of any expiration or extension shall be provided to the Land/Surface Owner.

19.98.110 MINOR ACTIVITY REVIEW — APPLICATION CONTENTS

An application for Minor Activity Review ministerial permit for Tier 1-3 and 5 Areas, pursuant to Section 19.98.040 of this chapter, shall include the following:

A. Name, telephone number and address of the applicant.

B. Name(s), telephone number(s) and address(es) of the property owner(s), mineral owner(s), oil and gas operator (if different than the applicant).

C. Assessor's parcel number(s) of all parcels located within the boundaries of the proposed operation, including accessory equipment, structures, and/or facilities. Latitude/Longitude coordinates for all wells.

D. Preliminary Title Report, not over ninety (90) days old. A Guarantee of Title may be submitted for parcels with a Preliminary Title Report on file, over (90) days old. For all Tier 2-5 Applications only.

E. Description of proposed oil and gas activity ~~and documentation of compliance with applicable Mitigation Measures (see incorporated Mitigation Monitoring and Reporting Program).~~ And written documentation in sufficient detail to allow the County to determine that all conditions required in Section 19.98.060 will be complied with, including all applicable mitigation measures as listed in the approved Mitigation Monitoring and Reporting Program for the Revisions to the Zoning Ordinance (C) – 2015.

F. Sufficient number of photographs to identify the extent of existing ground disturbance.

G. For Tier 2, 3 and 5 Areas only, documentation of a letter submitted to the Land/Surface Owner(s), if different from the Mineral Owner, informing the Land/Surface owner of the Minor Activity Review application and providing a complete copy of the application, shall be mailed and received a minimum of thirty (30) days prior to application being submitted to the County for review.

19.98.120 MINOR ACTIVITY REVIEW

A. An applicant for a Minor Activity Review ministerial permit for Tiers 1-3, and 5, pursuant to this chapter shall submit an application to the Planning Director in the format and number of copies specified ~~by the Planning Director~~. The application shall contain all the information specified for the application by the applicable section of this chapter. The application shall be accompanied by the fee established by the Board of Supervisors pursuant to Section 19.06.040 of this Title. For Tier 2, 3 and 5 Areas, a copy of the application shall be provided to the Land/Surface Owner per the requirements of Section 19.98.080.F above.

B. The Planning Director shall ~~make reasonable efforts~~ to inform the applicant in writing within seven (7) business days of receipt that the application is complete and shall issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application and therefore the application is deemed incomplete.

C. Within three (3) business days of reviewing the second submittal, if required, to correct any deficiencies, the Planning Director shall ~~make reasonable efforts to~~ issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of this chapter or inform the applicant that additional information is needed to complete the application and therefore the application is deemed incomplete.

D. Within seven (7) business days of reviewing the third submittal, if required, to correct any deficiencies, the Planning Director shall make reasonable efforts to issue the permit if he/she determines that the proposed use meets the development standards and conditions specified in the applicable provisions of Title. If additional information is needed, a mandatory in-person meeting with the applicant, and any consultant processing the application will be required to resolve the issues preventing issuance of the permit. The in-person meeting cannot be waived.

E. Failure of the Planning Director to meet any deadline for application review or permit issuance as provided in this section shall not cause a permit to be deemed approved.

F. Any reviews beyond three (3), as provided above, shall require additional fees to be paid, as set forth pursuant to Section 19.06.040 of this Title, and shall be completed within thirty (30) days after the applicant is deemed complete.

~~F~~G. Prior to conducting any activity the operator must have received and have on file both approved applicable ~~DOGGR~~California Division of Oil, Gas and Geothermal Resources permit(s), if necessary, and an approved Minor Activity Review pursuant to the chapter.

~~G~~H. Upon issuance of this permit, the County shall send a notification to the applicable responsible agencies stating a permit has been issued by the County and that the agency has certain requirements under the California Environmental Quality Act as a responsible agency.

I. If the development for which a permit has been approved pursuant to this article has not commenced within one (1) year of the granting of the permit, or if the permit has been unused, abandoned, discontinued, or has ceased for a period of one (1) year, the permit shall become null and void and of no effect, unless an extension has been granted by the decision-making authority upon written request for an extension before the expiration of the one- (1-) year period. A copy of any expiration or extension shall be provided to the Land/Surface Owner.

19.98.130 SELF-CERTIFICATION

Upon issuance of Oil and Gas Conformity Review or Minor Activity, as specified in Sections 19.98.090 and 19.98.120 of this chapter, and any other necessary state or Federal permits, the applicant may begin construction of the facility. The provisions of this section do not apply to issuance of an Oil and Gas Conformity Review pursuant to 19.98.100 (Oil And Gas Conformity Review - Without Required Surface Owner Signature) of this chapter. The applicant must self-certify compliance with Chapter 19.98 during the construction and operation process. Once the project applicant has completed the construction of the oil and gas facilities, as indicated on the approved site plan, the project applicant will provide a self-certified statement, in writing, to the County, in a format specified by the Director.

During construction and continued operations of the activities specified by the approved site plan, the applicant will be responsible for complying with the issued Oil and Gas Conformity Review, and all applicable implementation standards as outlined in this chapter. Should a violation of a permit issued under this chapter occur on-site, a Certification and Finalization process for the Oil and Gas Conformity Review will be conducted by the County Oil and Gas Inspector, and self-certification for the permit will no longer be permitted for the applicant for the next issued permit, as a probationary period. Once the applicant has demonstrated compliance on the following permit, any subsequent permit may be self-certified.

19.98.140 INSPECTION COMPLIANCE

Upon receipt of an issued permit pursuant to Section 19.98.100 (Oil And Gas Conformity Review - Without Required Surface Owner Signature), the applicant must contact the Planning and Community Development Department and the Public Works Department to pay perusant to Section 19.06.040 of this title and provide a signed Cost Recovery Agreement, and schedule an inspector to be present during all activities related to the Oil and Gas Conformity Review. The County inspector or third-party building inspector and expert(s) retained by the County shall confirm compliance with all requirements of this Title and Mitigation Measures, and other federal and State laws. All compliance verification costs shall be During construction and continued operations of the activities specified by the approved site plan, a building inspector will be present on the site to monitor and enforce the applicant's compliance with ~~will be responsible for complying with~~ the issued Oil and Gas Conformity Review, and all applicable standards and conditions as outlined in the permit.

19.98.145 IDLE WELLS

A. An operator shall file a notification with the County, and with the Surface/Land Owner (if different from the Mineral Owner) of any Idle or Long Term Idle Well, within 30 days of changing the well status.

B. For purposes of this section, a "Idle Well" is defined as a well that has not produced oil or natural gas, or has not been used for injection for six consecutive months of continuous operation during the last five or more years. A "Long-Term Idle Well" means any well that has not produced oil or natural gas, or has not been used for injection for six consecutive months of continuous operations during the last 10 or more years. An "active observation well" means a well being used for the sole purpose of gathering reservoir data, such as pressure or temperature in a reservoir being currently produced or injected by the operator, and the data is gathered at least once every three years. An Idle well or Long-Term Idle Well does not include an active observation well.

C. Any member of the public may file a notice with the County asking for confirmation of the status that a well is either a Idle or Long Term Idle Well, and the County shall forward this notice to the California Division of Oil, Gas and Geothermal Resources to seek information about the status of this well and the owner/permittee for the well. The County shall cooperate with the California Division of Oil, Gas and Geothermal Resources in its enforcement of regulations applicable to these wells.

D. The County shall check whether an applicant for an Oil and Gas Conformity Review permit or Conditional Use Permit is the subject of an idle well complaint, and if so shall coordinate with the California Division of Oil, Gas and Geothermal Resources to assure that the applicant is in compliance with applicable idle well regulations. An applicant not in compliance with idle well regulations, as determined by official correspondence from the California Division of Oil, Gas and Geothermal Resources, shall not be eligible to receive additional Oil and Gas Conformity Review permits or conditional use permits under this Chapter until such time as the Division of Oil, Gas and Geothermal Resources has advised the County that the applicant is in compliance.

19.98.150 PLUGGED AND ABANDONED

Any permit issued pursuant to this chapter must plug and abandon all permitted wells per the following procedures:

A. The applicant shall plug and abandon all facilities in accordance with applicable laws and regulations as administered by the ~~DOGGR~~ California Division of Oil, Gas and Geothermal Resources.

B. Within thirty (30) days from completion of the plugged and abandoned procedures for any well constructed after the amendment of this Chapter 19.98, the applicant shall submit to the Planning and Community Development Department a letter stating which facilities have been abandoned, including the unique well identification number for each well. Compliance of this requirement shall include written confirmation from California Division of Oil, Gas and Geothermal Resources.

19.98.160 PERMIT REVOCATION AND MODIFICATION

Any permit issued pursuant to this chapter may be revoked or modified pursuant to Section 19.102.020 of this Title.

OTHER SECTIONS OF THE ZONING ORDINANCE NEEDED REVISIONS (Revisions in Underline and ~~Strikethrough~~)

C H A P T E R 19.48

DRILLING ISLAND (DI) DISTRICT

19.48.080 HEIGHT LIMITS

Height limits in the DI District are as follows:

A. None on derricks and other equipment used during the exploration and drilling phase of development.

B. Pumping units shall not exceed ~~thirty-five (35)~~ eighty (80) feet in height.

19.48.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

A. All drilling and other hydrocarbon development activity in the DI District shall be carried out in accordance with the standards and procedures set out in Section 19.98.~~050~~060 of this title. All activities subject to an Oil and Gas Conformity Review or Minor Activity Review shall comply with the provisions of Section 19.98.060 of the title.

B. Development in the DI District shall comply with the interpretations and provisions of Chapter 19.08 of this title.

CHAPTER 19.81

OUTDOOR LIGHTING

"DARK SKIES ORDINANCE"

19.81.050 EXEMPTIONS

The following are permanently exempt from the provisions of this chapter:

1. Outdoor lighting specifically approved in conjunction with a discretionary permit.

2. Federal and State Facilities: Outdoor light fixtures on, in, or in connection with facilities and land owned or operated by the government of the United States of America or the State of California; however, these agencies are encouraged to comply with the provisions of this ordinance.

3. Airports and Other Lighting Required by the Federal Aviation Administration: Outdoor lighting for public and private airports and any other uses that are regulated by the Federal Aviation Administration.

4. Correctional Institutions: Outdoor lighting for federal, State, and County-owned or operated correctional institutions; however, voluntary compliance with the intent and provisions of this chapter is encouraged.

5. Emergency Light: Temporary emergency lighting needed by the sheriff's department, police department, fire department, public utility, rescue operation or in conjunction with any other emergency service.

6. Temporary Construction: All temporary lighting used for the construction or repair of roadways, utilities, and other public infrastructure.

7. Internally Illuminated Signs: All internally illuminated signs, including those used for on-site and off-site advertising purposes. Such signs are regulated by the provisions of Chapter 19.84 (Signs) of the Kern County Zoning Ordinance.

8. Neon, Argon, or Krypton: All fixtures illuminated solely by neon, argon, or krypton.

9. United States Flag and State of California Flag: Lighting used to illuminate a properly displayed United States Flag and/or the State of California Flag.

10. Lighting Required by Building Codes or other Regulations: Communication towers, exit signs, lighting for stairs/ramps, lighting for points of ingress/egress to buildings, and all other illumination required by air navigation safety provisions, building codes, OSHA standards, and other permitting requirements from State or federal agencies.

11. Fossil Fuel Light: All outdoor light fixtures producing light directly by the combustion of fossil fuels (such as kerosene lanterns, gas lamps, etc.)

12. Street Lighting: Lighting equipment within a public or private right-of-way or easement for the principal purpose of illuminating streets, roadways, and/or other areas open to transport by vehicle or pedestrian traffic.

13. Seasonal Displays: Displays using multiple low wattage bulbs or lasers, provided that they do not constitute a fire hazard, create a nuisance, and are maintained in a safe condition. Such displays shall not be illuminated for more than forty-five (45) days per calendar year.

14. Water Features: Lighting in swimming pools and other water features governed by Article 680 of the National Electrical Code.

~~15. Oil and Gas Exploration and Production: Outdoor lighting in association with oil and gas exploration and production operations and related facilities shall be exempt from this chapter and are regulated by the provisions of Chapter 19.98 of the Kern County Zoning Ordinance.~~

~~16.~~ 15. Temporary Event Lighting: Temporary lighting for special events that does not conform to this chapter shall be reviewed as part of an application for a Temporary Event Permit (TEP), pursuant to Chapter 19.08.340 of the Kern County Zoning Ordinance. Any temporary lighting exemption approved via the

TEP process shall be utilized for a period of time that exceeds a combined total of twelve (12) combined days on any one (1) parcel during a calendar year. Exemptions are renewable for a period of not more than twelve (12) additional combined days. Requests for renewal of a temporary exemption shall be processed in the same manner as the original request. No outdoor light fixtures shall be exempted from this chapter for more than twenty-four (24) days combined during a calendar year.

~~17.~~ 16. Steeples: Lighting used to illumination the tall ornamental tower that forms the superstructure of a church, temple, office building, etc., shall be exempt from this chapter.

~~18.~~ 17. Temporary Agricultural Activities: Lighting used to illuminate temporary agricultural activities such as harvesting on property zoned A (Exclusive Agriculture) or A-1 (Limited Agriculture) and lasting no more than twelve (12) consecutive days and no more than twenty four (24) combined days on any one parcel during a calendar year.

C H A P T E R 19.50

FLOODPLAIN PRIMARY (FPP) DISTRICT

19.50.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

A. All development within the FPP District is subject to the requirements of the Flood Damage Prevention Ordinance, Chapter 17.48 of this code.

B. Development in the FPP District shall comply with the interpretations and provisions of Chapter 19.08 of this title.

C. Oil or gas exploration and production shall comply with Section 19.98.~~050~~060 and the following standards:

1. The following uses are permitted within the FPP District if they will not obstruct flows, will not cause peripheral flooding of other properties, will not cause any increase in flood levels during the occurrence of the base flood discharge, will be resistant to floatation and immune to extensive damage by flooding, and will not endanger life or property:

   (a) All oil or gas wells, including pumps and all other associated equipment.

   (b) Feasible remedial work, improvements, and flood-proofing of facilities.

2. No oil or gas well shall be drilled on the slope or within ten (10) feet of the top or toe of the bank of a river or stream located within the FPP District. The required setback on the top of bank shall be measured from an imaginary plane on a slope two (2) horizontal to one (1) vertical projected upward from the toe of the existing bank.

3. All oil or gas wells in the FPP District, including pumps and all other associated equipment, shall be designed such that they are resistant to damage by flooding.

4. All pipelines in the FPP District shall be flood-proofed by burial to sufficient depth to prevent rupture during flood conditions or by suspension at least two (2) feet above the surface of the base flood. Supports for elevated pipelines shall also carry a catwalk to facilitate removal of debris caught by supports during floods.

5. The location of all buried pipelines shall be recorded on appropriate maps by the company that owns said pipelines, and the maps shall be made available to any public agency that shall request a copy.

6. All drilling, redrilling, and producing, including remedial work, well pulling, work-overs, and deepening, shall conform to all applicable fire, safety, spacing, and environmental State law and regulations.

7. Proven technological improvements generally accepted and used in drilling and production methods shall be adopted as they may from time to time become available, if capable of reducing factors of nuisance and annoyance.

8. Prior to the commencement of any drilling, a copy of a Spill Prevention Control and Countermeasure Plan, as required by the United States Environmental Protection Agency, shall be filed with the Kern County ~~Engineering and Survey Services~~ Public Works Department.

9. All pumps expected to be inaccessible during times of flood shall be equipped with an accessible remote switch to shut off the pumps during emergencies.

10. The derrick, all boilers, and all other drilling equipment used pursuant to this chapter to drill any well hole or to repair, clean out, deepen, or redrill any completed or drilling well shall be removed within ninety (90) days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derrick, boilers, and drilling equipment are to be used within a reasonable time limit, determined by the Kern County ~~Engineering and Survey Services~~ Public Works Department, for the drilling of another well or wells on the premises.

11. After any well has been placed in production, no earthen sumps shall be used for the storage of petroleum or gas.

12. Within ninety (90) days after any well has been placed in production or after its abandonment, earthen sumps used in drilling or production or both shall be emptied by vacuum truck or other approved means, then filled, and the drilling site restored as nearly as practicable to a uniform grade, unless such sumps are to be used within a reasonable time limit, as determined by the Kern County ~~Engineering and Survey Services~~ Public Works Department.

13. Any derrick used for servicing operations shall be of the portable type; provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable-type derrick will not properly service such well, the Kern County ~~Engineering and Survey Services~~ Public Works Department may approve the use of a standard type of derrick.

14. Directional and warning signs, and those required for identification of the well, shall be constructed, erected, placed, or maintained on the premises, except those required by law to be displayed in connection with the drilling or maintenance of the well.

15. If a producing or service well is not secured twelve (12) months from the date of commencement of drilling operations or any extended period granted by the Kern County ~~Engineering and Survey Services~~ Public Works Department, the premises shall be restored to the original condition as nearly as practicable to do so. If at the expiration of the twelve- (12-) month period, the drilling program has not been completed, the Kern County ~~Engineering and Survey Services~~ Public Works Department may, upon a written request, grant an additional period of time as requested for the completion of such drilling program.

C H A P T E R 19.66

PETROLEUM EXTRACTION (PE) COMBINING DISTRICT

19.66.020 PERMITTED USES

The following uses and all others determined to be similar to these uses pursuant to Sections 19.08.030 through 19.08.080 of this title are permitted in a PE District:

A. Wells for the exploration for and development and production of oil or gas or other hydrocarbon substances if the well or wells are located more than ~~three~~two hundred and ten (~~300~~210) feet away from any existing dwelling or existing building utilized for commercial purposes, excluding those premises utilized solely for storage of equipment, material, household goods, or similar material.

B. Deepening or redrilling, within the existing well bore, of any well used for the production or development of oil or gas or other hydrocarbon substances, or the replacement of any production facility which did not require a conditional use permit on the date drilling began or the date the facility was installed.

C. Drilling of a replacement well when the original well did not require a conditional use permit, and where the original well has been abandoned in accordance with California Division of Oil and Gas regulations and drilling of a replacement well commences within one (1) year of the conclusion of abandonment procedures, and the replacement well is located within twenty (20) feet of the original well or is farther from any existing dwelling or commercial building than the original well.

D. Uses permitted by the base district with which the PE District is combined.

19.66.030 USES PERMITTED BY A CONDITIONAL USE PERMIT

The following uses and all others determined to be similar to these uses pursuant to Sections 19.08.030 through 19.08.080 of this title are permitted in a PE District subject to securing a conditional use permit in accordance with the procedures set out in Chapter 19.104 of this title:

A. Wells for the exploration for and development and production of oil or gas or other hydrocarbon substances if the well or wells are located within ~~three~~two hundred and ten (~~300~~210) feet of any existing dwelling or existing building utilized for commercial purposes, excluding those premises utilized solely for storage of equipment, material, household goods, or similar material.

B. Conditional uses permitted by the base district with which the PE District is combined.

19.66.080 HEIGHT LIMITS

Height limit requirements in a PE District are as follows:

A. No height limit on derricks and other equipment used during the exploration and drilling phase of development.

B. Pumping units shall not exceed ~~thirty-five (35)~~ eighty (80) feet in height.

C. All other uses permitted by the base district shall conform to the height limits of the base district with which the PE District is combined.

19.66.130 SPECIAL REVIEW PROCEDURES AND DEVELOPMENT STANDARDS

All drilling and hydrocarbon development activities in a PE District shall be carried out in accordance with the standards and procedures set out in Section 19.98.~~050~~060 of this title. All activities subject to an Oil and Gas Conformity Review or Minor Activity Review shall comply with the provisions of Section 19.98.060 of the title.

C H A P T E R 19.102

PERMIT PROCEDURES
ARTICLE II. MINISTERIAL PERMITS ISSUED BY THE PLANNING DIRECTOR

19.102.040 GENERAL REQUIREMENTS — PERMIT TYPES

The ministerial permits specified in this title for review pursuant to this article shall be issued by the Planning Director upon submission of an application containing the information specified in applicable sections of this title and a determination by the Planning Director that the proposed use

or development meets the development standards and conditions specified in the applicable section or sections of this title. These permits include:

A. CRV recycling center permit (Section 19.08.480)

B. Temporary animal permit plot plan review (Sections 19.14.130 and 19.60.130 through 19.60.160)

C. Extensions for temporary mobilehomes and recreational vehicles (Sections 19.16.130 and 19.18.160)

D. Mobilehome park plot plan review (Sections 19.26.130 through 19.26.190)

E. Minor plan modifications (Section 19.52.130 through 19.52.180, 19.56.130 through 19.52.180, 19.56.130 through 19.56.200, 19.58.130 through 19.58.180, and 19.100.050

F. Commercial wind farm plot plan review (Section 19.64.130 through 19.64.150)

G. Geologic hazard plot plan review (Section 19.68.130 through 19.68.150)

H. Special development standards plot plan review (Sections 19.80.040 through 19.80.070)

I. Off-street parking plot plan review not in conjunction with a ministerial permit (Sections 19.82.100 through 19.82.130)

J. Landscaping plot plan review not in conjunction with a ministerial permit (Sections 19.86.070 through 19.86.100)

K. Density bonus permit (Sections 19.92.030 through 19.92.060)

L. Home occupation permit (Sections 19.94.050 through 19.94.080)

M. Production water injection wells for the purpose of disposing of production wastewater produced in the same oilfield in which the injection well is located (Section 19.98.030)

N. ~~Oil and gas plot plan review (Section 19.98.030)~~ Oil and Gas Conformity Review and Minor Activity Review (Section 19.98.070 through 19.98.120)

O. Large family day-care permit - no hearing (Sections 19.96.030 through 19.96.060)

P. Temporary batch plant (thirty (30) days or less) plot plan review (Section 19.08.290)

Q. Secondary residential unit plot plan review (Section 19.90.040 through 19.90.060)

R. Truck parking as accessory to residential use permit (Section 19.08.252)

C H A P T E R 19.108

NONCONFORMING USES, STRUCTURES, AND LOTS

19.108.040 NONCONFORMING USES OF LAND

A. A nonconforming use of land shall not be expanded, extended, or intensified in any way with respect to scope, duration, or frequency of the use, except as follows:

The Planning Commission may authorize the expansion or intensification of legal, nonconforming uses if, after consideration at a public hearing noticed pursuant to Section 19.102.150, both of the following findings can be made:

1. The proposed expansion will not create any significant adverse impacts to surrounding properties.

2. The only other remedy to bring the use into conformance would require an amendment to the applicable General Plan.

Public hearing notification shall consist of mailing notices to property owners having property within three hundred (300) feet from the exterior boundaries of the subject property. Published notice in a local newspaper shall not be required, unless the Planning Director determines that such additional notice is warranted. In consideration of a request to expand or intensify a legal, nonconforming use, the terms and conditions for any approval shall be as specified in Section 19.104.050.

B. A nonconforming use of land shall not be changed to or replaced by any other use except a use that complies with the regulations of the zoning district in which the subject property lies.

C. Any nonconforming use of land that has been discontinued or abandoned for a period of one (1) year or more shall not be reestablished. In instances where the assessed value of improvements on the property exceeds fifty thousand dollars ($50,000), as determined by the County Assessor, the nonconforming use shall not be reestablished if the use has been discontinued or abandoned for a period of two (2) years or more.

D. The exploration for or development or production of oil, gas, or other hydrocarbon substances ~~shall not be considered nonconforming uses of land~~ lawfully constructed prior to MONTH, DAY, YEAR shall be considered nonconforming uses of land. Any subsequent ~~alteration or expansion of these facilities is~~ maintenance, production, operations, well stimulation treatments, alterations or expansion, and other activities involving existing wells, including ancillary facilities, are allowed subject to Chapter 19.98 of this Title.

E. A legal nonconforming dwelling in any zone district may be replaced with the approval of the Planning Director, provided that all applicable requirements of this title, other than density or conditional use permit requirements, can be satisfied.

F. Any use of land continuously in existence for a period of twenty (20) years or more may qualify as a legal, nonconforming use pursuant to Section 19.108.080, irrespective of when zoning requirements became effective for that property, provided that the Planning Director determines that the use is not significantly incompatible with surrounding land uses and that there is no significant threat to the public health, safety, and welfare in allowing the use to continue.

19.108.060 NONCONFORMING SETBACKS

Any use permitted under the provisions of this title that currently exists with nonconforming setbacks may:

1. ~~b~~Be replaced in the same location if damaged or destroyed by fire, earthquake, explosion, or act of God regardless of the cost of such reconstruction; or
2. Be maintained in accordance with the provisions of this Title provided there is no greater degree of nonconformity with regard to setback.

MOBILEHOME PARK (MP) DISTRICT

19.26.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT

The following uses are permitted in the MP District with a conditional use permit:

A. RECREATION, ENTERTAINMENT, AND TOURIST FACILITIES

— Recreational vehicle park, except as permitted by Subsection 19.26.020.B

B. MISCELLANEOUS USES

— Drainage sump
— Water system, large

— Water treatment plant

C. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— Oil or gas exploration and production pursuant to Chapter 19.98 of this title

C H A P T E R 19.12

EXCLUSIVE AGRICULTURE (A) DISTRICT

19.12.020 PERMITTED USES

E. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— ~~Cogeneration facility or steam generators, primarily intended for steam production used for production of oil or gas, excluding coal fired~~

— Electrical power generating plant in conjunction with a biogas recovery system associated with a confined animal facility, subject to the criteria specified in Section 19.12.130.G

— Explosives storage, temporary

— Mineral exploration

— Oil or gas exploration and production pursuant to Chapter 19.98 of this title

— Solar energy electrical generators which are accessory to a permitted or conditionally permitted use and where the power generated does not exceed the total on-site power demand

— Small wind energy system, pursuant to Section 19.08.415, except when all criteria specified below for wind-driven electrical generators will be satisfied , in which case a small wind energy system permit pursuant to Section 19.08.415 shall not be required

— Wind-driven electrical generators when accessory to a permitted or conditionally permitted use where:

1. The system employed is designed to supplement other electricity sources, or as an accessory use to existing buildings or facilities, wherein the power generated is used primarily for on-site consumption.

2. The wind generators are located a minimum distance of one times (1x) the overall machine height from any property line.

3. The parcel on which the wind generators will be erected does not abut a residential zoning district.

4. The wind generator(s) will be located a minimum of one and one-half (1 1/2) times the overall height to any off-site dwelling.
5. The proposed height of the wind turbines does not exceed the maximum heights specified in Figure 19.08.160.

19.12.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT

G. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— Backfilling of surface mines with inert, nonorganic fill material, limited to construction and demolition wastes, where a Solid Waste Facility Permit is not required

— ~~Coal-fired~~ ~~c~~Cogeneration facility or steam generators, primarily intended for production of oil or gas

— Concrete or asphalt batch plant

— Dam, small hydro

— Dam, large hydro

— Electrical power generating plant

— Explosives storage, permanent

— Mining and mineral extraction pursuant to Chapter 19.100 of this title

— Rock, gravel, sand, concrete, aggregate, or soils crushing, processing, or distribution

— Solar energy electrical generators when not accessory to a permitted or conditionally permitted use

— Wind-driven electrical generators when accessory to a permitted or conditionally permitted use which do not comply with the installation standards specified in Section 19.12.020.E.

C H A P T E R 19.14

LIMITED AGRICULTURE (A-1) DISTRICT

19.14.020 PERMITTED USES

E. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— ~~Cogeneration facility or steam generators, primarily intended for steam production, used for production of oil and gas, excluding coal fired~~

— Mineral exploration

— Oil or gas exploration and production pursuant to Chapter 19.98 of this title, including the temporary installation of commercial coaches as accessory to this activity, not to exceed a two- (2-) year period

— Solar energy electrical generator which are accessory to a permitted or conditionally permitted use and where the power generated does not exceed the total on-site power demand

— Small wind energy system, pursuant to Section 19.08.415

19.14.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT

G. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— ~~Coal-fired~~ ~~c~~Cogeneration facility or steam generators, primarily intended for production of oil or gas

— Concrete or asphalt batch plant, temporary

— Electrical power generating plant, excluding nuclear or coal powered

— Mining and mineral extraction pursuant to Chapter 19.100 of this title

— Solar energy electrical generators when not accessory to a permitted or conditionally permitted use

— Wind-driven electrical generators, commercial

— Mineral exploration

— Oil or gas exploration and production pursuant to Chapter 19.98 of this title

— Solar energy electrical generators which are accessory to a permitted or conditionally permitted use and where the power generated does not exceed the total on-site power demand

— Small wind energy system, pursuant to Section 19.08.415

19.38.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT

G. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— ~~Coal-fired c~~Cogeneration facility or steam generators

— Mining and mineral extraction pursuant to Chapter 19.100 of this title

— Ore reduction

— Potash manufacture

— Rock, gravel, sand, concrete, aggregate, or soils crushing, processing, or distribution

— Solar energy electrical generators when not accessory to a permitted or conditionally permitted use

— Wind generators, commercial

C H A P T E R 19.40

HEAVY INDUSTRIAL (M-3) DISTRICT

19.40.020 PERMITTED USES

H. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— Cogeneration facility or steam generators, not primarily intended for production oil or gas, excluding coal fired

— Electrical distribution stations

— Electrical power generating plants, excluding nuclear and coal

— Mineral exploration

— Oil or gas exploration and production pursuant to Chapter 19.98 of this title

— Rock, gravel, sand, concrete, aggregate, or soils crushing, processing, or distribution

— Solar energy electrical generators which are accessory to a permitted or conditionally permitted use and where the power generated does not exceed the total on-site power demand

— Small wind energy system, pursuant to Section 19.08.415

— Wind-driven electrical generators when accessory to a permitted or conditionally permitted use where:

1. The annual amount of power generated does not exceed the total on-site annual power demand.

2. The wind generators are located a minimum distance of one (1) times the overall machine height from any property line.

3. The parcel on which the wind generators will be erected does not abut a residential zoning district.

4. The wind generator(s) will be located a minimum of one (1) times the overall height to any off-site dwelling.

5. The proposed height of the wind turbines does not exceed the maximum heights specified in Figure 19.08.160.

19.40.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT

G. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— ~~Coal-fired c~~Cogeneration facility or steam generators

— Electrical power generating plant, nuclear or coal powered

— Mining and mineral extraction pursuant to Chapter 19.100 of this title

— Solar energy electrical generators when not accessory to a permitted or conditionally permitted use

— Wind-driven electrical generators, commercial

— Wind-driven electrical generators when accessory to a permitted or conditionally permitted use which do not comply with the installation standards specified in Section 19.12.020.E.

C H A P T E R 19.46

NATURAL RESOURCE (NR) DISTRICT

19.46.020 PERMITTED USES

E. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— Accessory structures and equipment storage for natural resource extraction or processing uses

— ~~Cogeneration facility or steam generators, primarily intended for steam production for another permitted use, excluding coal fired~~

— Explosives storage, temporary, subject to approval by the Kern County Fire Department

— Mineral exploration

— Oil or gas exploration and production pursuant to Chapter 19.98 of this title

— Solar energy electrical generators which are accessory to a permitted or conditionally permitted use and where the power generated does not exceed the total on-site power demand

— Small wind energy system, pursuant to Section 19.08.415

19.46.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT

G. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— ~~Coal-fired~~ eCogeneration facility or steam generators

— Concrete or asphalt batch plant

— Electric power generating plant

— Explosives storage

— Mining and mineral extraction pursuant to Chapter 19.100 of this title

— Rock, gravel, sand, concrete, aggregate, or soils crushing, processing, or distribution

— Solar energy electrical generators when not accessory to a permitted or conditionally permitted use

— Wind-driven electrical generators, commercial or domestic

C H A P T E R 19.44

OPEN SPACE (OS) DISTRICT

19.44.030 USES PERMITTED WITH A CONDITIONAL USE PERMIT

The following uses and all others determined to be similar to these uses pursuant to Sections 19.08.030 through 19.08.080 of this title are all permitted in the OS District subject to securing a conditional use permit in accordance with the standards and procedures set out in Chapter 19.104 of this title:

A. RECREATION, ENTERTAINMENT, AND TOURIST FACILITIES

— Park

— Roads or trails for motor driven vehicles, excluding race courses

B. INSTITUTIONAL USES

— Public service uses

C. TRANSPORTATION FACILITIES

— Auto parking lot

D. RESOURCE EXTRACTION AND ENERGY DEVELOPMENT USES

— Oil or gas exploration and production pursuant to Chapter 19.98 of this title

~~D~~E. MISCELLANEOUS USES

— Restrooms and shelters

— Scientific study sites for the systematic exploration and classification of archaeological, anthropological, or historic artifacts or remains

7.1.4 Revised Summary of Impacts, Mitigation Measures & Significance Conclusions

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Aesthetics				
Impact 4.1-1 Have a Substantial Adverse Effect on a Scenic Vista	Less than significant	No mitigation measures are proposed.	Less than significant	All Tiers
Impact 4.1-2 Substantially Damage Scenic Resources, Including, but Not limited to, Trees, Rock Outcroppings, and Historic Buildings within a State Scenic Highway	Less than significant	No mitigation measures are proposed.	Less than significant	All Tiers
Impact 4.1-3 Substantially Degrade the Existing Visual Character or Quality of the Site and its Surroundings	Potentially Significant	**MM 4.1-1** The Applicant shall use existing roads ~~whenever possible. If use of~~to access oil production areas, or shall construct new roads (or extend existing roads~~ is not feasible, construction of new roads should be routed~~) to minimize the amount of disturbance without impeding existing surface use. **MM 4.1-2** All derricks, boilers, and other drilling equipment used to drill, repair, clean out, deepen or redrill any well with oil, gas, or other hydrocarbon shall be removed from the drill site within 90 days after completion of production tests or after abandonment of any well. Earthen sumps used in drilling shall be filled within 90 days after any well has been placed in production (unless such sumps are to be used within six months for the drilling of another well), and any sump used in productions shall be filled after its abandonment and restored to a uniform grade within ninety days. **MM 4.1-3** Sumps and ponds shall be permitted only to the extent authorized by the Central Valley Regional Water Quality Control Board (via waiver, Waste Discharge Requirements, or other form of authorized written documentation) and shall comply with all applicable legal requirements and mitigation measures for sumps serving as storage, percolation or evaporation ponds for produced water. **MM 4.1-4** ~~Oil~~Except where located within agricultural land, new oil or gas tanks located within 200 feet of any sensitive receptor shall be partially screened from public view by shrubs, trees or solid screen fencing. Similarly, new pump sites (including multiple well pump sites) within 500 feet of any dwelling must be surrounded by a fence, at least 6 feet in height, constructed of dark-colored chain-link with wood or metal slates, dark green or brown fabric material, or other more visually restrictive fencing material. The height of all new pumping units shall not exceed 80 feet, and shall be painted in accordance with the Kern County Zoning Ordinance. **MM 4.1-5** Project signage is limited to directional, warning, safety, security and identification signs in connection with oil, gas, or other hydrocarbon drilling and development operations in accordance with Chapter 19.84.135 of the Kern County Zoning Ordinance. For any signage necessary for wayfinding, safety, or security, the Applicant shall use the minimum necessary to adequately communicate the required information.	Significant and unavoidable	All Tiers
Impact 4.1-4 Create a New Source of Substantial Light or Glare that Would Adversely Affect Day or Nighttime Views in the Area	Potentially significant	**MM 4.1-6** Permanent nighttime lighting that will be installed for ~~facilities~~new facility operations will only be lighting required for safety or security. During operations when the lighting is in use, lighting for safety and security will be shielded and oriented downward, bare bulbs will be fully screened from view from sensitive viewing receptors such as residences, and on-demand lighting and/or timers will be used to minimize visual impacts of lighting. In doing so, the Applicant shall comply with the standards in the amended Chapter 19.81 – Outdoor Lighting "Dark Sky Ordinance."	Significant and unavoidable	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.1-5 Contribute to Cumulative Aesthetic Impacts	Cumulatively considerable	Implement MM 4.1.1 through 4.1.6, as described above. No additional feasible mitigation measures exist to avoid or reduce significant adverse cumulative impacts to aesthetics to a less than significant level.	Significant unavoidable	All Tiers
Agricultural Resources				
Impact 4.2-1 Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to Non-Agricultural Use	Potentially significant	**MM 4.2-1** For ~~future~~new oil and gas exploration and extraction activities that are: 1) on land designated Prime, Farmland of Statewide Importance or Unique Farmland; and 2) that have been actively farmed 5 years or more out of the last 10 years, agricultural land mitigation is required at a ratio of 1:1. The 1:1 ratio is applied to actual ground disturbance area for oil and gas activities (inclusive of temporary construction and permanent operational impact areas), but excludes non-farmed existing areas such as roads, and tank and maintenance areas, and lands for which agricultural mitigation has previously been provided at a 1:1 ratio. Prior to ground disturbing activity, the Applicant shall submit to the County written evidence of completion of one or more of the following measures to achieve this 1:1 mitigation ratio: a. Funding and/or purchasing agricultural conservation easements or similar instrument acceptable to the County (to be managed and maintained by an appropriate entity). b. Purchasing of credits for conservation of agricultural lands from an established agricultural farmland mitigation bank or an equivalent agricultural farmland preservation program managed by the County. c. Restoring agricultural lands to productive use through the removal of legacy oil and gas production equipment, including well abandonment and removal of surface equipment. Participating in any agricultural land mitigation program adopted by Kern County that provides equal or more effective mitigation than the measures listed above. Mitigation lands shall meet the definition of Prime Farmland, Farmland of Statewide Importance, and/or Unique Farmland, and be of similar or higher agricultural quality as the lands, as established by the California Department of Conservation. Completion of the selected measure or, with the Kern County Planning and Community Development Director's approval, a combination of measures, are to occur on qualifying land in Kern County. If qualifying lands cannot be found in Kern County, upon written application to the County, the mitigation lands may be located within the San Joaquin Valley (San Joaquin, Stanislaus, Merced, Fresno, Madera, Kings, Tulare, or Kern County) or outside the San Joaquin Valley with written evidence that the same or equivalent crops can be produced on the mitigation land. Mitigation consisting of removal of legacy equipment within active agricultural fields shall not require recordation of an agricultural conservation easement or conservation easement. Available mitigation funding shall be prioritized for acquisition of large blocks of agricultural land for preservation, and removal of legacy equipment, to minimize and mitigate fragmentation and edge impacts.	Less than significant	All Tiers
Impact 4.2-2 Conflict with Existing Zoning For Agricultural Use or a Williamson Act Contract	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.2-3 Conflict with Existing Zoning for, or Cause Rezoning of, Forest Land or Timberland	No impact	No mitigation measures are required.	No impact	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.2-4 Result in the Loss of Forest Land or Conversion of Forest Land to Non-Forest Use	No impact	No mitigation measures are required.	No impact	All Tiers
Impact 4.2-5 Involve Other Changes in the Existing Environment Which, Because of Their Location or Nature, Could Result in Conversion of Farmland to Non-agricultural Use or Conversion of Forest Land to Non-Forest Use	Potentially significant	**MM 4.2-2** To protect crops and structures adjacent to oil and gas activities on active agricultural lands, each Applicant/operator shall comply with the following mitigation measures set forth in other chapters of this Environmental Impact Report: a. Surface water runoff and drainage on the well pads shall be mitigated as described in mitigation measures for Hydrology and Water Quality. b. A Spill Prevention Countermeasure and Contingency Plan or Division of Oil Gas and Geothermal Resources Assembly Bill 1960 spill plan, as applicable, shall be prepared for the site and oil and chemical spills treated in accordance with the Division of Oil Gas and Geothermal Resources Senate Bill 4 Regulations for the site to protect adjacent farmland, as described in Mitigation Measure for Hazards. c. Speed limits for oil and gas trucks shall be posted on unpaved roads to reduce dust generation; in the absence of signage, speed limits shall be limited to 25 miles per hour (or an alternate, more stringent dust suppression standard as adopted by the San Joaquin Valley Air Pollution Control District), and Applicants shall attest that employees have been trained in the appropriate speed limits. d. Unpaved roads shall be watered or otherwise treated for dust suppression and control as described in Mitigation Measure for Air Quality, unless speeds are restricted to 15 mph. e. Vehicle tracking control shall be installed where unpaved roads intersect with public paved roads, to prevent tracking of mud, dust, and weed seeds off site, unless speeds are restricted to 15 mph. This shall consist of a 50-foot length of a 3 inch-thick layer of gravel one inch or larger in diameter (or an alternate, more stringent dust suppression technique as approved by the San Joaquin Valley Air Pollution Control District). f. Stormwater control shall be required at construction sites during well drilling, reworking, and/or decommissioning as described in mitigation measures for Hydrology. g. Hazardous materials shall be stored within secondary containment as described in mitigation measures for Hazards. h. Overhead electrical or communication lines shall be shown on the Site Plan, and shall be aligned to the greatest extent feasible with existing access roads and the minimum distance between the access road and the well installation or other oil and gas facility, parallel to tree or row crops, described further in mitigation measures for Public Utilities. If the use of existing roads is not feasible, lines shall be routed to minimize surface disturbance and minimize the impacts to surface activity i. Underground pipelines serving the Project shall be shown on the Site Plan with locations marked and recorded with USAA, and periodically inspected and maintained as described in mitigation measures for Hazards.	Less than significant	All Tiers
Impact 4.2-6 Result in the Cancellation of an Open Space Contract Made Pursuant to the California Land Conservation Act of 1965 or Farmland Security Zone Contract for Any Parcel of 100 or More Acres	No impact	No mitigation measures are required.	No impact	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.2-7 Cumulative Impacts to Agricultural or Forest Resources	Potentially significant	Implement mitigation measure MM 4.2-1 and MM 4.2-2.	Significant and unavoidable	All Tiers
Air Quality				
Impact 4.3-1 Conflict With or Obstruct Implementation of the Applicable Air Quality Plan	Potentially significant	**MM 4.3-1** Consistent with the requirements of the San Joaquin Valley Air Pollution Control District Regulation II-Permits, the Applicant shall obtain an Authority to Construct permit and a Permit to Operate for any facility or equipment requiring a permit from the San Joaquin Valley Air Pollution Control District, such as stationary sources required to obtain permits pursuant to District Rule 2010. All emissions increases from permitted equipment shall comply with District Rule 2201. **MM 4.3-2** The Applicant shall develop and implement a Fugitive Dust Control Plan in compliance with San Joaquin Valley Air Pollution Control District fugitive dust suppression regulations to further reduce emissions, during construction, of particulate matter that is 10 microns or less and 2.5 microns or less in diameter. The Fugitive Dust Control Plan shall include: a. Name(s), address(es), and phone number(s) of person(s) responsible for the preparation, submission, and implementation of the plan. b. Description and location of operation(s). c. Listing of all fugitive dust emissions sources included in the operation. d. The following dust control measures shall be implemented: 1. All on-site unpaved roads shall be effectively stabilized using water or chemical soil stabilizers that can be determined to be as efficient as or more efficient for fugitive dust control than California Air Resources Board approved soil stabilizers, and that shall not increase any other environmental impacts including loss of vegetation. 2. All material excavated or graded will be sufficiently watered to prevent excessive dust. Watering will occur as needed with complete coverage of disturbed areas. The excavated soil piles will be watered as needed to limit dust emissions to less than 20% opacity or covered with temporary coverings. 3. Construction activities that occur on unpaved surfaces will be discontinued during windy conditions when winds exceed 25 miles per hour and those activities cause visible dust plumes. Construction activities may continue if dust suppression measures are used to minimize visible dust plumes. 4. Track-out debris onto public paved roads shall not extend 50 feet or more from an active operation and track-out shall be removed or isolated such as behind a locked gate at the conclusion of each workday, except on agricultural fields where speeds are limited to 15 mph. 5. All hauling materials should be moist while being loaded into dump trucks. 6. All haul trucks hauling soil, sand, and other loose materials on public roads shall be covered (e.g., with tarps or other enclosures that would reduce fugitive dust emissions). 7. Soil loads should be kept below 6 inches or the freeboard of the truck. 8. Drop heights should be minimized when loaders dump soil into trucks. 9. Gate seals should be tight on dump trucks.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		10. Traffic speeds on unpaved roads shall be limited to 25 miles per hour. 11. All grading activities shall be suspended when visible dust emissions exceed 20%. 12. Other fugitive dust control measures as necessary to comply with San Joaquin Valley Air Pollution Control District Rules and Regulations. 13. Disturbed areas should be minimized. 14. Disturbed areas should be re-vegetated as soon as possible after disturbance if area is no longer needed for oil and gas activities. **MM 4.3-3** All off-road construction diesel engines not registered under California Air Resources Board's Statewide Portable Equipment Registration Program, which have a rating of 50 horsepower or more, shall meet, at a minimum, the Tier 3 California Emission Standards for Off-road Compression-Ignition Engines as specified in California Code of Regulations, Title 13, section 2423(b)(1) unless that such engine is not available for a particular item of equipment. In the event a Tier 3 engine is not available for any off-road engine larger than 100 horsepower, that engine shall be equipped with retrofit controls that would provide nitrogen oxides and particulate matter emissions that are equivalent to Tier 3 engine. a. All equipment shall be turned off when not in use. Engine idling of all equipment shall be limited to five minutes, except under exemptions specified in California Code of Regulations Title 13 Section 2449(d)(2)(A). b. All equipment engines shall be maintained in good operating condition and in proper tune per manufacturers' specifications. **MM 4.3-4** To further reduce emissions of oxides of nitrogen from on-road heavy-duty diesel haul vehicles: a. 2007 engines or pre-2007 engines shall comply with California Air Resources Board retrofit requirements set forth in California Code of Regulations Title 13 Section 2025. b. All on-road construction vehicles, except those meeting the 2007/California Air Resources Board-certified Level 3 diesel emissions controls, shall meet all applicable California on-road emission standards and shall be licensed in the State of California. This does not apply to worker personal vehicles. c. All on-road construction vehicles shall be properly tuned and maintained in accordance with the manufacturers' specifications.		
Impact 4.3-2 Violate Any Air Quality Standard as Adopted in (c)i or (c)ii, or Established by United States Environmental Protection Agency or Air District or Contribute Substantially to an Existing or Projected Air Quality Violation	Potentially significant	Implement MM 4.3-1 through MM 4.3-4, as described above.	Less than significant	All Tiers
Impact 4.3-3 Expose Sensitive Receptors to Substantial Pollutant Concentrations	Potentially significant	**MM 4.3-5** <u>Construction:</u> The Site Plan Application shall include a Site Vicinity Figure showing the location of any sensitive receptor(s) within 3,000 feet of the construction site (potential impact area) for the proposed new well or other ancillary facility or equipment (excluding pipelines). a. If there are no sensitive receptors within this potential impact area, then no construction mitigation measures shall be required.	Less than significant	All Tiers

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		other risk assessment to the San Joaquin Valley Air Pollution Control District, which may include implementation of implement one or more of the following risk minimization measures, or other such measures that are demonstrated by the Applicant to the San Joaquin Valley Air Pollution Control District, to achieve a level of risk less than the threshold risk level, and shall provide confirmation from the San Joaquin Valley Air Pollution Control District that the activity that is the subject of the application will not exceed the risk threshold: 1. Placement of engines in the potential impact area away from the sensitive receptors. 2. Utilize directional drilling to locate rig away further from the sensitive receptor(s). 3. Use of late-model engines, low-emission diesel products, alternative cleaner fuels (e.g., natural gas or liquefied petroleum gas), engine retrofit technology, add-on devices such as diesel particulate filters or oxidation catalyst, and/or other options as such become available to reduce emissions from off-road and other equipment. 4. Utilize electricity line power if available. 5. Shutdown all equipment when not in use, and otherwise minimize engine idling by limiting idling to 15 minutes. 6. Use of automatic rigs. 7. Assist and pay to relocate residents to ~~an area hotel~~temporary lodging during well construction, drilling, and completion activities, if such residents voluntarily agree to such relocation. **MM 4.3-6** Applicants shall include in their Worker Environmental Awareness Program information on how to recognize the symptoms of Valley Fever and to promptly report suspected symptoms of work-related Valley Fever to a supervisor. Workers exposed to fugitive dust shall be provided with the option of using a filter fitted over their nose and mouth, secured by a strap, including training for appropriate mask practices as part of the Worker Environmental Awareness Training Program.		
Impact 4.3-4 Create Objectionable Odors Affecting a Substantial Number of People	Potentially significant	**MM 4.3-7** Applicant shall submit an Odor Complaint Management Plan to the County prior to receiving its first Site Plan conformity review approval. The Plan shall include a designated contact for odor complaints, creation of a log for odor complaints, and protocol for handling odor complaints. The Odor log and report files shall be available for public review upon request.	Significant and unavoidable	All Tiers
Impact 4.3-5 Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant for which the project Region is Nonattainment under an Applicable Federal or State Ambient Air Quality Standard (Including Releasing Emissions which Exceed Quantitative Thresholds for Ozone Precursors)	Potentially significant	Implement MM 4.3-1 through MM 4.3-4, as described above. **MM 4.3-8** For ~~Project facilities or equipment that are~~criteria emissions, not required to be offset ~~emissions~~ under a District rule as described in MM 4.3-1, and for Project vehicle and other mobile source emissions, the County will enter into an emission reduction agreement with the San Joaquin Valley Air Pollution Control District, pursuant to which the Applicant shall pay fees to fully offset Project emissions of oxides of nitrogen, reactive organic gases, and particulate matter of 10 microns or less in diameter (including as applicable mitigating for reactive organic gases by additive reductions of particulate matter of 10 microns or less in diameter) (collectively, "designated criteria emissions") to avoid any net increase in these pollutants. The air quality mitigation fee shall be paid to the County as part of the Site Plan review and approval process, and shall be used to reduce designated criteria emissions to fully offset Project emissions that are not otherwise required to be fully offset by District permit rules and regulations. As an alternative to paying the fee, an Applicant may reduce emissions for one or more designated criteria emissions through actual reductions in air emissions from other Applicant sources, as submitted to the County and validated by the District. This Project offset requirement alternative shall be enforced by the County and verified by San Joaquin Valley Air Pollution Control District, and must be approved in advance by the San Joaquin Valley Air Pollution Control District. If a voluntary emission reduction agreement is not executed	Significant and unavoidable	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		by the County and San Joaquin Valley Air Pollution Control District, then each Applicant must mitigate for the full amount of designated criteria pollutants as verified by the San Joaquin Valley Air Pollution Control District, with evidence of such District-verified offsets presented as part of the Site Plan Conformity Review application documentation. Examples of feasible air emission reduction activities that may be funded by air quality fees paid by Applicant or proposed and implemented by the Applicant under the emission reduction agreement include, but are not limited to, the following: a. Replacing or retrofitting diesel-powered stationary equipment such as motors on generators, pumps and wells with electric or other lower-emission engines that are not subject to Title V reductions. b. Replacing or retrofitting diesel-powered school, transit, municipal and other community mobile sources such as buses, car fleets, and maintenance equipment, with electric or other lower-emission engines. c. Reducing emissions from public infrastructure sources such as water and wastewater treatment and conveyance facilities, and reducing water-related emissions through water conservation and reclamation. d. Funding lower-emission equipment and processes for local businesses, schools, non-profit and religious institutions, hospitals, city and county facilities.		
Biological Resources				
Impact 4.4-1 Have a Substantial Adverse Effect, either Directly or through Habitat Modifications, on any Species Identified as a Candidate, Sensitive, or Special Status Species in Local or Regional Plans, Policies, or Regulations or by the California Department of Fish and Wildlife or the United States Fish and Wildlife Service	Potentially significant	~~**MM 4.4-1** With the exception of focused surveys that are seasonally restricted, special status wildlife surveys must be completed by a qualified biologist within a 30-day period prior to commencement of new ground-disturbance construction activities. The purpose of the pre-disturbance~~ **MM 4.4-1** A qualified biologist shall conduct a biological reconnaissance survey in potential special-status species habitat to advise the project proponent of potential project impacts, potential surveying needs, and advise on the need for focused special status surveys. Early consultation with United States Fish and Wildlife Service and California Department of Fish and Wildlife would confirm the biologist's advice and/or inform project proponents of additional recommendations. Based on the information gathered from the biological reconnaissance survey and any informal consultation with United States Fish and Wildlife Service and California Department of Fish and Wildlife, focused/protocol surveys shall be conducted by a qualified or permitted biologist (whichever is applicable) well in advance of ground disturbing activities to determine the presence/absence of sensitive species protected by state and federal Endangered Species Acts and potential project impacts to those species. The survey shall be conducted in accordance with the most current standard protocol of United States Fish and Wildlife Service and California Department of Fish and Wildlife. The purpose of focused/protocol surveys is to confirm the presence or absence of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the California Endangered Species Act, rare or endangered in the California Native Plant Protection Act, or designated as fully-protected in the California Fish and Game Code (collectively, "Protected Species"), and to confirm the presence or absence of any other species considered "sensitive" under California Environmental Quality Act ("Sensitive Species"), and to identify and implement feasible avoidance and minimization measures for such species. The surveys shall be conducted in accordance with all currently-applicable presence and absence survey and/or species protocols established by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife ("Species Protocols"). In the absence of any approved protocols, the survey shall extend for a minimum of 250 feet from all areas where any ground disturbance activities would occur, provided that permission to access has been obtained. As an alternative to individual pre-disturbance surveys for each application, and after consultation with and concurrence by the California Department of Fish and Wildlife and the United States Fish and Wildlife Service, multiple parcels or areas of oil and gas production lands (including lands which may have multiple surface or mineral ownership) may be consolidated for the purpose of more efficiently managing pre-disturbance surveys and determinations regarding the absence of protected species in areas of proposed new ground disturbance	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier

activities. A biological monitor shall be present during ground-disturbing activities in project locations that have special-status species habitat or are adjacent to potential special-status species habitat. Within 30 days before any ground disturbing activities in special-status species habitat, a qualified biologist shall conduct a pre-disturbance survey to record existing conditions of the site, determine if conditions have changed since the reconnaissance or focused/protocol surveys were conducted, and to determine where sensitive species avoidance buffers will be established.

MM 4.4-2 No incidental take of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the California Endangered Species Act, rare or endangered in the California Native Plant Protection Act, or designated as fully-protected in the California Fish and Game Code (Protected Species) may occur unless the incidental take is authorized by applicable state and federal wildlife agencies in the form of a permit or other written authorization, an approved state or federal conservation plan, or in accordance with an approved regional plan such as the Draft Valley Floor Habitat Conservation Plan and/or Natural Community Conservation Plan.

MM 4.4-3 ~~Exclusion barriers or~~ Protective buffers ~~may~~ shall be used, where effective and feasible in the opinion and guidance of the qualified biologist, to avoid any unauthorized incidental take of Protected Species, and to minimize any incidental take of Sensitive Species, by separating the planned disturbance area from any locations where ~~pre-disturbance~~ biological reconnaissance surveys ~~or~~ previously conducted focused/protocol surveys, or pre-disturbance surveys have detected the presence of Protected Species or Sensitive Species. Protective buffers shall be delineated using brightly colored stakes and/or flagging or similar materials and remain until construction activities are complete, at which time of completion the buffers must be removed. ~~All buffers must extend for a minimum of 50 feet from the nearest point of disturbance unless a smaller avoidance buffer has been established by either the United States Fish and Wildlife Service or the California Department of Fish and Wildlife as the minimum to avoid unauthorized take of protected species~~If special-status plant or animal species are found adjacent to the project during biological surveys, protective buffers shall be established around active dens and/or burrows of special-status animal species, or populations of special-status plant species to avoid unauthorized take of protected species as listed in the table below~~, and the barriers must prevent the potential migration of wildlife into the construction area and unlawful incidental take of any Protected Species during ground disturbance activities~~. The ~~minimum~~ protective buffer distance shall be increased if required to avoid unauthorized incidental take of any Protected Species as determined by a qualified biologist. ~~Exclusion barriers,~~ Protective buffer distances~~,~~ and other avoidance measures that may be implemented to avoid impacts to Protected Species or Sensitive Species must be consistent with the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife, and shall be implemented and overseen by ~~the~~ a qualified biologist.

Table: Disturbance Buffers for Sensitive Resources

Sensitive Resource	Buffer Zone from Disturbance (feet)
Potential San Joaquin kit fox den	50
Known San Joaquin kit fox den	100

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier

Natal San Joaquin kit fox den	Contact California Department of Fish & Wildlife, United States Fish & Wildlife Service
Atypical San Joaquin kit fox den	50
Rodent burrows	50
Listed bird species active nests	0.5 mile
Burrowing owl burrow (breeding and non-breeding season)	Pursuant to California Department of Fish & Wildlife guidelines (see Table 4.4-85)
San Joaquin coachwhip, silvery legless lizard, coast horned lizard	30
American badger:	
Non-maternity dens	50
Maternity dens	200
Special-status plants	50

MM 4.4-4 Occupied burrowing owl burrows shall not be disturbed during the species nesting season (February 1 through August 31). The following distances shall be maintained between all disturbance areas and burrowing owl nesting sites (Table 4.4-84).

Table 4.4-84: Setback Distances for Burrowing Owl Nesting Sites by Level of Proposed Project Impacts

Location		
Nesting sites	Nesting sites	Nesting sites
Time of Year		
April 1–Aug 15	Aug 16–Oct 15	Oct 16–Mar 31
Project Impact Level		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier

Low		
656 feet (200 meters)	656 feet (200 meters)	164 feet (50 meters)
Medium		
1,640 feet (500 meters)	656 feet (200 meters)	328 feet (100 meters)
High		
1,640 feet (500 meters)	1,640 feet (500 meters)	1,640 feet (500 meters)

Burrowing owls present in proposed disturbance areas or within 500 feet or as specified under an approved Habitat Conservation Plan (as identified during pre-disturbance surveys) outside of the breeding season (between September 1 and January 31) may be moved away from the disturbance area using passive relocation techniques approved by the California Department of Fish and Wildlife. Passive relocation techniques in the California Department of Fish and Wildlife *Staff Report on Burrowing Owl Mitigation Guidelines* (California Department of Fish and Game 2012) include installing one-way doors in burrow entrances for 48 hours, to ensure the owl(s) have left the burrow, daily monitoring during the passive relocation period, and collapsing existing burrows to prevent reoccupation. A minimum of one or more weeks will be required to relocate the owl(s) and allow for acclimatization to alternate off-site burrows. Prior to burrow exclusion or eviction, a burrowing owl management plan shall be prepared and approved by the California Department of Fish and Wildlife. Destruction of burrows shall occur only pursuant to a management plan for the species approved by the California Department of Fish and Wildlife; burrow excavation shall be conducted by hand whenever possible.

As an alternative to passive relocation, occupied burrows identified off-site within 500 feet of construction activities may be buffered with hay bales, fencing (e.g. sheltering in place), or as directed by the qualified biologist and the California Department of Fish and Wildlife, to avoid disturbance of burrows.

MM 4.4-5 The pre-disturbance surveys shall determine whether active bat maternity roosts are located in or within 250 feet of any disturbance area. All active bat maternity roosts shall be avoided during breeding periods, including postponing disturbance activities if required, and to the maximum extent feasible at other times. If an active bat maternity roost location cannot feasibly be avoided by disturbance, the United States Fish and Wildlife Service and California Department of Fish and Wildlife must be contacted to identify appropriate impact minimization measures prior to initiating any disturbance that would affect the roost.

MM 4.4-6 Any potential San Joaquin kit fox dens (as defined in United States Fish and Wildlife Service 2011) detected during ~~pre-disturbance~~reconnaissance or focused/protocol surveys shall be reevaluated for species activity no more than ~~14~~30 days prior to the commencement of ground disturbance. Potential kit fox dens shall be marked and a 50-foot avoidance buffer shall be delineated using brightly colored stakes and flagging or similar materials to prevent inadvertent damage to the potential den. If a potential den cannot feasibly be avoided, the den may be hand excavated in accordance with the United States Fish and Wildlife Service *Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox Prior to or During Ground Disturbance* (United States Fish and Wildlife Service 2011). If species activity is detected, the location shall be identified as a "known" kit fox den in accordance with the U.S. Fish and Wildlife Service species guidelines (United States Fish and Wildlife Service 2011). A minimum 100-foot buffer from any disturbance area shall be maintained for known dens and a minimum 500-foot buffer from any disturbance area shall be maintained for natal dens. No excavation of a known or natal den shall occur without prior authorization from the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. For activities occurring on land covered under an approved ~~Habitat Conservation~~

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		~~Plan~~federal and/or State incidental take authorization, the requirements set forth in those documents shall be implemented. Other standard measures to protect San Joaquin kit fox, including capping pipes, covering trenches, adding exit ramps to excavated areas, shall be implemented in accordance with MM 4.4-~~19~~15. **MM 4.4-7** Occupied American badger dens detected during pre-disturbance surveys shall be flagged and ground-disturbing activities avoided within 50 feet of the den. Maternity dens shall be avoided and a minimum 200-foot buffer from disturbance shall be maintained during pup-rearing season (February 15 through July 1). Maternity dens must be avoided to the maximum extent feasible. If a maternity den cannot feasibly be avoided, the California Department of Fish and Wildlife must be contacted to identify appropriate impact minimization measures prior to initiating any disturbance that would affect the den, including potential passive relocation by excavation before or after the rearing season. **MM 4.4-8** Pre-disturbance surveys for all sites located above 2,000 feet in elevation, or within 200 feet down gradient from the 2,000-foot elevation contour line, shall specifically survey for any golden eagle nests located within 2 miles of the site. If golden eagle nests are detected by the surveys, the qualified biologist shall conduct a nest-specific viewshed analysis. No disturbance may occur within 0.25 mile, or within 0.5 mile of the viewshed of an active golden eagle nest~~.~~ unless otherwise authorized by State and federal wildlife agencies. The United States Fish and Wildlife Service and California Department of Fish and Wildlife must be notified prior to the commencement of any disturbance activities within 1 mile of an active golden eagle nest to avoid golden eagle take. **MM 4.4-9** All sites located above 2,000 feet in elevation, or within 200 feet down gradient from the 2,000-foot elevation contour line, shall implement the following measures to avoid and minimize potential adverse impacts to the California condor: a. The site shall, at all times, be maintained to avoid any trash, debris, food sources and microtrash, such as bottle caps, that could be ingested by or attract California condor. Trash shall be disposed in animal-proof containers as required in BIO 4.4-19. b. The Worker Environmental Awareness Program described in BIO MM 4.4-18 shall include information about microtrash and potential effects to California condor, and shall prohibit the disposal of trash (and microtrash) on the site of oil and gas activities. c. If a condor is observed in a proposed construction site, all disturbance activities must immediately cease within 500 feet of the condor until the animal has moved from the site. If condor occurrence persists, the United States Fish and Wildlife Service and the California Department of Fish and Wildlife must be contacted to identify appropriate avoidance measures prior to initiating or resuming any disturbance activity. d. All condor observations shall be reported within 24 hours to the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. e. All tanks, liquid storage facilities, and any open area containing water or other liquid materials, including drilling sumps, must be covered or otherwise shielded in a manner that prevents condor intrusion and potential entrapment. f. No overhead transmission lines greater than 85kV may be used at the site without the prior approval of the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. **MM 4.4-10** Pre-disturbance surveys for active bird nests must be conducted no more than 10 days prior to the commencement of disturbance. Surveys shall follow United States Fish and Wildlife and California Department of Fish and Wildlife guidance and/or protocols, as applicable. If no active nests or nesting birds are identified, then Project construction activities may proceed and no further mitigation measures for nesting birds are required. If active nest(s) are identified, the active nest(s) should be continuously surveyed for the first 24 hours after detection, to establish a behavioral baseline prior to any construction-related activities. Once construction commences, all nests shall be continuously monitored to detect any behavioral changes as a result of the Project (i.e., nest avoidance or abandonment). If behavioral changes are observed, the work causing that change should cease and the California Department of Fish and Wildlife and the United States Fish and Wildlife should be consulted for additional avoidance and minimization measures. If continuous monitoring of identified nests by a qualified wildlife biologist is not feasible, a minimum no-disturbance buffer of 250 feet will be established around active nests and a 500-		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		foot no-disturbance buffer around the nests of raptors until the breeding season has ended, or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival, and any adult birds are no longer occupying the nest. Variance from these no-disturbance buffers may be implemented a qualified biologist concludes that work within the buffer area would not cause nest avoidance or abandonment (e.g., when the disturbance area would be concealed from a nest site by topography). The California Department of Fish and Wildlife and the United States Fish and Wildlife must be notified in advance of implementing of a variance in the no-disturbance buffer. MM 4.4-11 The following measures will be implemented to avoid take of blunt-nosed leopard lizard and to ensure protection of these animals during Project activities: a. Project activities will avoid all potential burrows that may be occupied by blunt-nosed leopard lizards. Suitable burrows within and adjacent to potential habitat for the species should be avoided by a minimum distance of 50-feet in all areas where ground-disturbing Project activities will occur. b. No more than one year prior to ground disturbing activities, focused surveys following current California Department of Fish and Wildlife and United States Fish and Wildlife protocols for detection of this species or other methods approved by both agencies shall be conducted in all potential blunt-nosed leopard lizard habitat within the work site and a 250-foot buffer area. If no individual blunt-nosed leopard lizards are observed during focused surveys, and surveys are current (e.g., completed in the same calendar year), then Project activities may proceed. c. If blunt-nosed leopard lizards are detected during focused surveys, a blunt-nosed leopard lizard avoidance plan shall be prepared for the Project that will result in avoidance of incidental take of this species unless take is separately authorized under a Natural Communities Conservation Plan and appropriate federal authorization is obtained. At a minimum, the blunt-nosed leopard lizard avoidance plan shall be provided to the California Department of Fish and Wildlife and the County, and shall contain the following elements: 1. A Worker Environmental Awareness Program shall be implemented for all construction personnel before construction begins (see MM 4.4-18). 2. During periods that are optimal for blunt-nosed leopard lizard activity (early spring through late fall), a qualified biologist will be present during all ground disturbing activities. The qualified biologist will check the Project site(s) and access route(s) daily during the blunt-nosed leopard lizard active season to determine presence or absence of lizards in or near the work areas. Monitoring by a qualified biologist is not required during periods of inactivity (the winter season). 3. All open trenches or excavations shall be covered at the end of each workday or protected with the use of exclusion fencing to prevent wildlife entrapment. If an excavation is too large to cover, escape ramps shall be installed at an incline ratio of no greater than 2:1. All trenches and pipes shall be inspected for the presence of wildlife each day prior to the commencement of work. If blunt-nosed leopard lizards are observed at the work site during construction, construction shall cease within a 250-foot radius and the United States Fish and Wildlife Service and the California Department of Fish and Wildlife shall be consulted to determine what additional measures would be necessary to prevent take of this species. 4. Offsite locations where blunt-nosed leopard lizards have been observed or are likely to occur shall be clearly marked to prevent workers from driving off the road and to prevent inadvertent destruction of burrows. Barriers, such as exclusionary fencing may be installed. All construction equipment and construction personnel vehicles will be checked prior to moving to ensure no blunt-nosed leopard lizard are under equipment/vehicles.		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		5. A speed limit of 10 miles per hour shall be posted and observed within 0.25 miles of any reported blunt-nosed leopard lizard observation. 6. Construction activities shall avoid burrows that may be used by blunt-nosed leopard lizards. Any location of proposed construction activity with potential to collapse or block burrows (i.e., stockpile storage, parking areas, staging areas, trenches) will be identified prior to construction in the blunt-nosed leopard lizard avoidance plan and approved by the qualified biologist. The qualified biologist may allow certain activities in burrow areas if the combination of soil hardness and activity impact is not expected to collapse burrows and no blunt-nosed leopard lizards have been found during pre-Project surveys in the impact area. 7. All individual blunt-nosed leopard lizards observed above-ground will be avoided. Any individual blunt-nosed leopard lizard that may enter the Project site(s) would be allowed to leave unobstructed, and on its own accord. If a blunt-nosed leopard lizard is detected during biological monitoring or observed at any other point, the California Department of Fish and Wildlife and the United States Fish and Wildlife Service shall be notified to determine what additional measures would be necessary to prevent take of the species. **MM 4.4-12** The Applicant shall comply with the following: a. Plant surveys for Protected Species and Sensitive Species must be completed by a qualified biologist during the appropriate blooming periods for species identification and detection. Plant surveys shall be conducted in accordance with all applicable protocols established by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife for particular plant species ("Plant Survey Protocol"), and shall extend 50 feet from areas where any new disturbance would occur unless a greater survey distance is specified in the Plant Survey Protocol. All detected plant populations of Protected Species and Sensitive Species shall be identified in the field during the surveys with temporary flags or other appropriate materials to avoid and minimize impacts to the plant populations from any disturbance activities. b. No incidental take or relocation of any plant listed under the ~~California~~federal Endangered Species Act, the California Endangered Species Act, or the California Native Plant Protection Act may occur unless the incidental take is authorized by the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife in a permit or other authorization, or in an approved Habitat Conservation Plan or Natural Communities Conservation Plan. If ~~pre-construction~~focused plan surveys detect the presence of ~~any California Endangered Species Act Plant~~any listed plant, the plant populations shall be buffered from disturbance activities by implementing applicable impact avoidance protocols established by the United States Fish and Wildlife Service and/or the California Department of Fish and Wildlife unless incidental take authority is obtained. Projects covered under incidental take authority shall conduct activities in accordance with the take authorization. The California Department of Fish and Wildlife may be contacted to determine the appropriate buffer required to prevent incidental take of a ~~California Endangered Species Act Plant~~listed plant if avoidance protocols have not been established for the species. The qualified biologist shall confirm that all applicable ~~California Endangered Species Act Plant~~listed plant buffers have been implemented prior to the commencement of any disturbance activity. c. If any non-listed sensitive plant species are identified that may be impacted by new ground disturbing activities, populations must be avoided by a 50-foot buffer. ~~**MM 4.4-13** No incidental take or relocation of any plant listed under the California Endangered Species Act may occur unless the incidental take is authorized by the California Department of Fish and Wildlife in a permit or other authorization, or in an approved Natural Communities Conservation Plan. If pre-construction surveys detect the presence of any California Endangered Species Act Plant, the plant populations shall be buffered from disturbance activities by implementing applicable impact avoidance protocols established by the California Department of Fish and Wildlife, unless incidental take authority is obtained. Projects covered under incidental take authority shall minimize disturbance in accordance with the take authorization. The California Department of Fish and Wildlife shall be contacted to~~			

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		~~determine the appropriate buffer required to prevent incidental take of a California Endangered Species Act Plant if avoidance protocols have not been established for the species. The qualified biologist shall confirm that all applicable California Endangered Species Act Plant buffers have been implemented prior to the commencement of any disturbance activity. If any non listed sensitive plant species are identified that may be impacted by new ground disturbing activities, populations must be avoided by a 50-foot buffer.~~ **MM 4.4-14** A Worker Environmental Awareness Program shall be developed and implemented for all personnel that could access the site prior to commencing any disturbance activities. The program shall consist of an on-site or center presentation that will describe the locations and types of sensitive plant, wildlife, and sensitive natural communities (collectively, "Biological Resources") on and near the site, an overview of the laws and regulations governing the protection of Biological Resources, the reasons for protecting the Biological Resources, the specific protection and avoidance measures that are applicable to the site, and the identity of designated points of contact should questions or issues arise, including the qualified biologist. The program shall provide training to recognize, avoid and report to applicable qualified biologists any Biological Resources on the site. a. The Worker Environmental Awareness Program shall emphasize the need to avoid contact with onsite wildlife, and avoid entry into areas where Biological Resources have been identified based on pre-disturbance field surveys and to implement the buffer avoidance or other protection measures established by the United States Fish and Wildlife Service shall be identified California Department of Fish and Wildlife or required by the Biological Resource mitigation measures. The training shall emphasize the importance of not feeding or domesticating wildlife and the need to avoid any trash, microtrash, or potential food disposal onsite except in animal-proof containers emptied daily to avoid attracting, or causing adverse impacts to special status wildlife. b. All onsite personnel must sign a statement verifying that they have completed the Worker Environmental Awareness Program, and that they understand and agree to implement the biological requirements for the worksite. If signed employee statements are not available, documentation may be provided by Worker Environmental Awareness Program training records, which shall be kept by the Applicant for a minimum of 5 years. Each Applicant shall maintain a list of all persons who have completed the training program, and shall provide the list to the County or to state and federal wildlife agency representatives upon request. **MM 4.4-15** The following additional measures shall be implemented to avoid and minimize potential significant adverse impacts to Protected and Sensitive Species: a. All vehicles shall observe a 20-mile-per-hour speed limit in all areas of disturbance and on unpaved roads unless otherwise posted. Off-road traffic outside of designated access routes is prohibited. Speed limit signs shall be posted in visible locations at the point of site entry and at regular intervals on all unpaved access roads. b. All disturbance activities, except emergency situations or drilling that may require continuous operations, shall only occur during daylight hours. Night time disturbance activity for drilling purposes shall use directed lighting, shielding methods, or reduced lumen intensity to avoid unnecessary visual disturbance to wildlife and to comply with applicable lighting mitigation measures. c. All food-related trash items and all forms of microtrash, such as wrappers, cans, bottles, bottle tops, and food scraps shall be disposed of in closed, animal proof containers and removed daily from the site. d. Excavations, spoils piles, access roadways, and parking and staging areas shall subject to dust control as set forth in the dust control mitigation measures. e. The use of herbicides for vegetation control shall be restricted to those approved by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. No rodenticides shall be used on any site unless approved by the United States Fish and Wildlife Service, and the California Department of Fish and Wildlife, and shall observe label and other restrictions mandated by the United States Environmental Protection Agency, California Department of Food and Agriculture, and state and federal laws and regulations. For split estates, no herbicides for vegetation control may occur in Tier 2 areas without surface owner approval.		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		f. No plants or wildlife shall be collected, taken, or removed from the site or any adjacent locations except as necessary for Project-related vegetation removal or wildlife relocation by a qualified biologist and subject to all applicable permits and authorizations. g. All open trenches or excavations shall be covered at the end of each workday to prevent wildlife entrapment. If an excavation is too large to cover, escape ramps shall be installed at an incline ratio of no greater than 2:1 ~~to~~. All trenches and pipes shall be inspected for the presence of wildlife each day prior to the commencement of work. h. To enable San Joaquin kit foxes and other wildlife to pass through the Project site, any perimeter fencing shall include a 4- to 8-inch opening between the fence mesh and the ground or the fence shall be raised 4 inches above the ground except blunt-nosed leopard lizard exclusion fencing. The bottom of the fence fabric shall be knuckled (wrapped back to form a smooth edge) to protect wildlife. i. <u>All vertical tubes used in Project construction and chain link fencing poles, shall be temporarily or permanently capped to avoid the entrapment and death of special-status wildlife and birds. All pipes 1.5 inches or greater in diameter stored overnight on a project location must have end caps or other physical barriers that prevent wildlife from entering the pipe.</u> j. All dead or injured special status wildlife shall be left in place and reported to the United States Fish and Wildlife Service and the California Department of Fish and Wildlife within 48 hours of discovery for rescue or salvage. Discovery of state or federal listed species that are injured or dead shall also be <u>managed consistent with regulatory requirements including being</u> reported immediately via telephone and within 24 hours in writing, and with a copy to Kern County Planning and Community Development. k. All drilling installations and operations will comply at all times with the applicable federal, State, county, and local law ordinances and regulations. l. All activity shall use previously disturbed areas to the maximum extent feasible to minimize the amount of new disturbance. m. Vehicle, equipment, and material storage must be limited to previously disturbed areas. No construction or operational materials may be placed or stored outside of the planned disturbance area or stockpiled for future disposal. All concrete and asphalt debris should be removed from the site for recycling or proper disposal. n. No vehicles or construction equipment shall be parked within a wetland or waterbody/dry wash. o. Tracked vehicles and other construction equipment must be washed or maintained to be weed-free prior to entering and working within areas of new disturbance. p. All washing of trucks, paint, equipment, or similar activities should occur in areas where runoff is fully contained for collection and offsite disposal. Wash water may not be discharged from the site and shall be located at least 100 feet from any water body, or sensitive Biological Resources. q. Locate all extra work areas (such as staging areas and additional spoil storage areas) at least 50 feet away from wetland boundaries or waterbody, except where the adjacent upland consists of cultivated or rotated cropland or other disturbed land. r. All areas that must be avoided as result of the pre-disturbance surveys, and areas where new disturbance will occur, shall be clearly delineated by fencing or staking and flagging and/or rope or cord. s. No firearms shall be allowed on any site. t. No pets shall be allowed on any site. u. No smoking may occur except in designated areas. v. If ground disturbance is intended to be temporary <u>and does not occur on cultivated and crop lands</u>, perform topsoil segregation during construction activities to preserve the seed bank for restoration efforts. Store the segregated topsoil separate from the subsoil and		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		restore segregated topsoil to its original location. **MM 4.4-16** Ground disturbance shall be mitigated at a 1.0 to 1.0 ratio (one-acre of new disturbance shall require one-acre of mitigation) except in Tier 1 areas that contain existing disturbance of 70% or greater which shall be mitigated at a 1.0 to 0.5 ratio (one-acre of new disturbance shall require one-half acre of mitigation~~).~~), for the land included in the Site Plan. This compensatory mitigation requirement does not apply to construction on ground for which compensatory mitigation has already been provided, or on ground that has been previously disturbed (e.g., cleared of vegetation for other oil and gas extraction uses, existing unpaved roads, and existing unvegetated well pads). Ground disturbance activities that are authorized by permits or other written authorizations approved by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife, which include avoidance and compensatory mitigation acreage requirements, may be used to satisfy this County compensatory mitigation ratio. Compensatory mitigation shall be required for the actual acreage of ground disturbance documented during the site plan review and completion process. New disturbance mitigation may be satisfied by one or a combination of the following measures: a. The recordation of a conservation easement or similar permanent, long-term conservation management agreement in a form acceptable to the County for land within the Project Area on land that has mitigation value. The easement lands may be owned by an Applicant or a third party under contract with an Applicant. Larger land areas may be placed under a conservation easement or similar agreement, and an Applicant may "draw down" the conserved land as needed to satisfy the acreage mitigation requirements for multiple site plan review conformity permits or other authorizations from the County for oil and gas activities. b. Acquisition of land preservation credits from a mitigation bank located within the Project Area which is owned by the County, on other lands approved by the County, or on lands approved for mitigation or conservation purposes by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife. c. Removal of legacy oil and gas equipment, inclusive of compliance with applicable legal requirements (e.g., well plugging and abandonment requirements under state or federal regulations), restoration of the surface grade to be consistent with surrounding lands, complete a reseeding effort using native species, and notification of the site owner (if not the Applicant) of the completion of the removal and grading restoration work. d. Enhancement or restoration of existing habitat on lands already subject to a conservation easement or similar agreement, or which become subject to a conservation easement or similar agreement subsequent to the certification of this Environmental Impact Report, provided that such activities are covered in a permit or authorization, conservation plan, Habitat Conservation Plan, or Natural Community Conservation Plan, approved by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife. e. Payment of a biological resources mitigation fee for the acquisition and management of mitigation lands, legacy equipment removal, and/or land enhancement already subject to conservation easements or a similar agreements under the terms of any biological resource mitigation program that is adopted by Kern County and approved by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife. The County shall coordinate with the United States Fish and Wildlife Service or the California Department of Fish and Wildlife to identify priority conservation areas and potential conservation partners and funding sources to increase the efficiency and effectiveness of mitigation fee expenditures.		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.4-2 Have a Substantial Adverse Effect on Any Riparian Habitat or Other Sensitive Natural Community Identified in Local or Regional Plans, Policies, Regulations, or by the California Department of Fish and Wildlife or the United States Fish and Wildlife Service	Potentially significant	Implement MM 4.4-1 through 4.4.18, described above, and dust control, spill and hazardous material avoidance and containment, and surface and subsurface water quality and hydrology mitigation measures. **MM 4.4-17** Pre-disturbance surveys shall be conducted by a qualified biologist during the appropriate periods for detecting Sensitive Natural Communities that could occur within the Project Area. The surveys shall be completed consistent with applicable protocols approved by the United States Fish and Wildlife Service and/or the California Department of Fish and Game, including the Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (California Department of Fish and Wildlife 2009). The qualified person shall map and identify all sensitive natural communities, including riparian communities that occur in or within 100 feet of any new disturbance area. The site plan for the proposed activity shall identify waters, wetlands and other riparian habitats that occur in and within 100 feet of the disturbance area. **MM 4.4-18** No land disturbance activity in any Sensitive Natural Community that requires a state or federal permit, including state or federally regulated wetlands and waters, shall occur unless the activity is specifically authorized by the issuance of permits or approvals as required by state and federal law. This provision is not intended to restrict survey activities or restrict permit approvals for such disturbance activities However, no new wells, tanks, sumps or ponds shall be constructed within 50 feet of federal or state waters or wetlands.	Less than significant	All Tiers
Impact 4.4-3 Have a Substantial Adverse Effect on Federally Protected Wetlands as Defined by Section 404 of the Clean Water Act (Including, but Not Limited to, Marsh, Vernal Pool, Coastal, etc.) through Direct Removal, Filling, Hydrological Interruption, or Other Means	Potentially significant	Implementation of the Biological Resources mitigation measures would ensure that oil and gas activities would not disturb state or federally regulated wetlands and waters unless the activity is specifically authorized by the issuance of permits or approvals as required by state and federal laws and that activities in the vicinity of wetlands and water bodies would not adversely disturb them. Other mitigation measures identified in this Environmental Impact Report would further reduce potential state or federally jurisdictional wetland and waters, including dust control, spill and hazardous material avoidance and containment, surface and subsurface water quality and hydrology, mitigation measures.	Less than significant	All Tiers
Impact 4.4-4 Interfere Substantially with the Movement of any Native Resident or Migratory Fish or Wildlife Species, or with Established Native Resident or Migratory Wildlife Corridors, or Impede the Use of Native Wildlife Nursery Sites	Potentially significant	Implementation of the Biological Resources mitigation measures would reduce wildlife movement impacts. Other mitigation measures identified in this Environmental Impact Report to further reduce wildlife movement impacts, include dust control, nighttime lighting, noise controls, spill and hazardous material avoidance and containment,, and surface and subsurface water quality and hydrology (including but not limited to Kern River and Poso Creek channels), measures.	Less than significant	All Tiers
Impact 4.4-5 Conflict with Any Local Policies or Ordinances Protecting Biological Resources, Such as a Tree Preservation Policy or Ordinance	Potentially significant	**MM 4.4-19** In the event that new disturbance would occur at a site within an oak woodland area as defined in Section 1.10.10 of the Kern County General Plan Land Use, Open Space and Conservation Element (10% or greater oak tree cover), the Applicant shall comply with the minimum 30% canopy retention standard in Section 1.10.10 KK (a). Impacts to oak trees in other locations, and in locations that meet the criteria for an oak woodland area, shall be avoided to the maximum extent practicable, including modification of the disturbance area, if feasible, to avoid existing oak trees within a site.	Less than significant	All Tiers
Impact 4.4-6 Conflict with the Provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or Other Approved Local, Regional, or State Habitat Conservation Plan	Potentially significant	**MM 4.4-20** Applicants shall fund through the Site Conformity Review administrative fee, preparation by Kern County of, an annual report describing the Project's ground disturbance acreage, and the acreage of compensatory mitigation lands, in each sub-area.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.4-7 Cumulative Impact to Biological Resources	Potentially significant	Implement MM 4.4-1 through MM 4.4-20, as described above.	Significant and unavoidable	All Tiers
Cultural Resources				
Impact 4.5-1 Cause a Substantial Adverse Change in the Significance of a Historical Resource as Defined in Section 15064.5	Potentially significant	**MM 4.5-1** Prior to initiating ground disturbance activities for an activity for which a conformity review is required, the Applicant shall: a. ~~Have~~Provide an archival records search completed by a qualified archaeologist. This shall include an examination of the California Historical Resources Information Files at the Southern San Joaquin Valley Information Center, California State University, Bakersfield, and a search of the Native American Heritage Commission Sacred Lands Files, Sacramento. The Applicant may rely on a previously performed records search for subsequent ground disturbing activities. b. If an application location has been previously surveyed and no cultural resources have been recorded on it, no further cultural resources studies shall be required. c. Implement either: 1. If ~~an applicationa~~ site plan ~~is within a section~~ includes land that has experienced 100% of previous ground-surface disturbance, ~~as indicated by~~or is within a section with 300 or more existing oil wells or other agricultural, industrial or urban uses, and the records searches indicate that the parcel has been previously surveyed and no cultural or Native American resources are known on it, no further cultural resources studies shall be required. All other application locations shall be subject to intensive (100%) pedestrian ground-surface survey (Phase I survey/Class III inventory) by qualified archaeologists. The Applicant may rely on a previously performed ground surface survey for subsequent ground disturbing activities; or 2. If an application location has not been previously surveyed based on the records search information, an intensive (100%) pedestrian ground-surface survey (Phase I survey/Class III inventory) by qualified archaeologists shall be required. d. All prehistoric/Native American archaeological sites, whether identified during the records searches or during the intensive survey, shall be demarcated by a qualified archaeologist, fenced by the Applicant, and preserved in place. e. Historical (Euro-American) archaeological sites that are potentially eligible for listing in the National Register of Historic Places shall be evaluated by a qualified archaeologist and must meet the requirements of the National Historic Preservation Act of 1966 in order to qualify. Qualifying sites, structures and equipment that are identified during the records search or field survey shall be fenced and preserved in open-space, removed and curated, or treated using appropriate data recovery procedures. f. Historical (Euro-American) archaeological site types relating to oil and gas activities that have been determined Not Significant/Unique shall require no archaeological study or treatment. g. All oil and gas industry employees conducting work in the area identified on the Conformity Site Plan shall complete Worker Environmental Awareness Program training including training dedicated to cultural resources protection.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.5-2 Cause a Substantial Adverse Change in the Significance of an Archaeological Resource as Defined in Section 15064.5	Potentially significant	Implement MM 4.5-1, as described above.	Less than significant	All Tiers
Impact 4.5-3 Directly or Indirectly Destroy a Unique Paleontological Resource or Site or Unique Geologic Feature	Potentially significant	**MM 4.5-2** As part of any Worker Environmental Awareness Program training, all construction personnel shall be trained regarding the recognition of possible buried paleontological resources and protection of paleontological resources during construction, prior to the initiation of construction or ground-disturbing activities. Training shall inform construction personnel of the procedures to be followed upon the discovery of paleontological materials. All personnel shall be instructed that unauthorized collection or disturbance of fossils is unlawful. **MM 4.5-3** All ~~well~~ permits for new wells that use Enhanced Oil Recovery or Well Stimulation methods shall pay a mitigation fee of $50 per well shall be paid to the Buena Vista Museum to fund the continued education and curation of paleontological resources and provide educational support regarding the paleontological history of the region.	Less than significant	All Tiers
Impact 4.5-4 Disturb any Human Remains, Including Those Interred Outside of Formal Cemeteries	Potentially significant	**MM 4.5-4** In the event archaeological materials are encountered during the course of ground disturbance or construction, the Project operator/contractor shall cease any ground disturbing activities within 50 feet of the find. The qualified archaeologist shall evaluate the significance of the resources and recommend appropriate treatment measures. Per California Environmental Quality Act Guidelines Section 15126.4(b)(3), Project redesign and preservation in place shall be the preferred means to avoid impacts to significant historical resources. Consistent with California Environmental Quality Act Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures in consultation with the County, which may include data recovery or other appropriate measures. The Planning and Community Development Department shall consult with appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature. If after consultation it is deemed appropriate, archaeological materials recovered during any investigation shall be curated at an accredited curation facility. The qualified archaeologist shall prepare a report documenting evaluation and/or additional treatment of the resource. A copy of the report shall be provided to the Kern County Planning and Community Development Department and to the Southern San Joaquin Valley Information Center. In the event archaeological materials are encountered, in Tier 2 the surface owner shall be notified immediately. **MM 4.5-5** If human remains are uncovered during Project construction, the Applicant shall immediately halt all work, contact the Kern County Coroner to evaluate the remains, and follow the procedures and protocols set forth in Section 15064.4 (e)(1) of the California Environmental Quality Act Guidelines. The Kern County Planning and Community Development Department shall be notified concurrently. If the County Coroner determines that the remains are Native American, the Project proponent shall contact the Native American Heritage Commission, in accordance with Health and Safety Code Section 7050.5, subdivision (c), and Public Resources Code 5097.98 (as amended by Assembly Bill 2641). The Native American Heritage Commission shall designate a Most Likely Descendant for the remains per Public Resources Code 5097.98. Per Public Resources Code 5097.98, the applicant, in coordination with the landowner, shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the ~~landowner has discussed~~discussion and ~~conferred~~conference with the ~~most likely descendant regarding their recommendations~~Most Likely Descendant has occurred, if applicable, taking into account the possibility of multiple human remains. If the remains are determined to be neither of forensic value to the Coroner, nor of Native American origin, provisions of the California Health and Safety Code (7100 et. seq.) directing identification of the next-of-kin will apply. In the event human remains are uncovered, in Tier 2 the surface owner shall be notified immediately.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.5-5 Cumulative Impacts to Historical, Archaeological, or Paleontological Resources and Human Remains	Potentially significant	Implement MM 4.5-1 through MM 4.5-5, as described above.	Significant and unavoidable	
Geology and Soils				
Impact 4.6-1 Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving the Rupture of a Known Earthquake Fault	Potentially significant	**MM 4.6-1** Prior to beginning a ground disturbance activity, the Applicant shall comply with the following regulations (as applicable) and confirm compliance in its Site Plan Conformity Review application documentation: h. Alquist-Priolo Earthquake Fault Zoning Act. i. California Building Code. j. Division of Oil Gas and Geothermal Resources regulations, as identified in the California Code of Regulations, Title 14, Division 2, Chapter 4, including regulations implementing Senate Bill 4 as applicable. If hydraulic fracturing is conducted for any well associated with the Site Plan Conformity Review, the Applicant shall comply with requirements to monitor the California Integrated Seismic Network for indication of an earthquake of magnitude 2.7 or greater for the period of 10 days following the end of hydraulic fracturing. The earthquake search radius shall be consistent with Division of Oil Gas and Geothermal Resources Senate Bill 4 regulations. The data will be submitted to Division of Oil Gas and Geothermal Resources for an evaluation of the risks and actions consistent with the Division of Oil Gas and Geothermal Resources Senate Bill 4 regulations. <u>In approving a well stimulation treatment permit that would authorize, within an urban area (i.e., an area with a population over 50,000, as defined by the U.S. Census Bureau), the emplacement of well stimulation fluids into an oil or gas formation that has not been previously been subject to well stimulation activity, and/or into an oil or gas formation for which Division of Oil Gas and Geothermal Resources does not yet possess adequate information about formation fracture geometries, Division of Oil Gas and Geothermal Resources shall impose a permit condition requiring that the applicant conduct ground monitoring to characterize as-built fracture geometries prior to, during, and post-hydraulic fracturing. Monitoring shall also be conducted during fracturing treatments by use of applicable microseismic fracture mapping, tilt measurements, tracers, or proppant tagging. Copies of ground monitoring records shall be provided to the County and Division of Oil Gas and Geothermal Resources for review and approval within 30 days of well stimulation treatment.</u> k. Additionally, the Applicant shall: 1. Avoid placement of structures intended for human occupancy on or within 50 feet of any active faults designated and mapped pursuant to the Alquist-Priolo Earthquake Fault Zoning Act where the fault breaks the surface. 2. Have a professional geologist prepare a fault rupture hazard evaluation according to guidelines in California Geological Survey Special Publication 42, 2007 for new developments with structures that are intended for human occupancy. 3. All Class II injection wells shall be authorized, and shall comply with all applicable legal requirements, Underground Injection Control Program Approval permit conditions, and be operated according to the California Code of Regulations Title 14 requirements, as described in the mitigation measures for Hydrology and Water Quality. 4. Ensure that active fault trace placement restrictions are in place for all permanent tanks and storage reservoirs used to store, treat, or transport hazardous materials or materials that are considered pollutants to surface water and groundwater, located in an Earthquake Fault Zone. Ensure that all <u>newly installed</u> pipelines ~~designated for the transportation~~<u>subject to 49 Code</u> of ~~hazardous materials~~<u>Federal Regulations</u>	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		(CFR) Parts 192 and 195, are engineered and constructed in compliance with the requirements of the pipeline safety regulations, ~~49 Code of Federal Regulations Parts 192 and 195.f)~~as set forth by the Pipeline Hazardous Materials Safety Administration (PHMSA). All other newly installed pipelines that transport gas or hazardous liquids are designed to be constructed, tested operated and maintained in accordance with good oilfield practice and applicable standards set forth and approved by the State Oil and Gas Supervisor. Ensure that all new pipelines designated for or water used for fire suppression are engineered and constructed in compliance with the requirements of California Building Code Chapter 9, Fire Protection Systems, and the California Fire Code to address potential fault rupture displacements. **MM 4.6-2** All structures designed for human occupancy shall be designed to withstand substantial ground shaking in accordance with applicable California Building Code seismic design standards and Kern County Building Code.		
Impact 4.6-2 Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Strong Seismic Ground Shaking	Potentially significant	Implement MM 4.6-1 and MM 4.6-2, as described above.	Less than significant	All Tiers
Impact 4.6-3 Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Seismic-Related Ground Failure, Including Liquefaction	Potentially significant	Implement MM 4.6-1 and MM 4.6-2, as described above.	Less than significant	All Tiers
Impact 4.6-4 Expose People or Structures to Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Landslides	Potentially significant	**MM 4.6-3** Operators shall avoid siting ~~structures~~wells or accessory equipment and facilities on slopes greater than 30% unless the Applicant determines that mineral recovery is infeasible from a different location, and site-specific Professional Engineering certification is submitted concluding that the new equipment will not cause landslides.	Less than significant	All Tiers
Impact 4.6-5 Result in Substantial Soil Erosion or the Loss of Topsoil	Potentially significant	Implement stormwater mitigation measures, as described in Section 4.9, Hydrology and Water Quality.	Less than significant	All Tiers
Impact 4.6-6 Be Located on a Geological Unit or Soil That is Unstable, or That Would Become Unstable as a Result of the Project, and Potentially Result in On- or Off-site Landslide, Lateral Spreading, Subsidence, Liquefaction, or Collapse	Potentially significant	Implement MM 4.6-3and MM 4.6-4, as described above, and the following: **MM 4.6-4** The Applicant shall confirm compliance with, and shall implement, a Division of Oil Gas and Geothermal Resources approved re-pressuring plan as required by Division 3, Chapter 1, Article 5.5 of the Public Resources Code, commencing with Section 3315. In developed areas where subsidence is confirmed or suspected, subsidence monitoring shall be required using Synthetic Aperture Radar studies and/or other methods as approved by the Division of Oil Gas and Geothermal Resources to quantify and evaluate the potential effect on the area.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.6-7 Be Located on Expansive Soil, as Defined in Table 18-1-B of the Uniform Building Code (1994), Creating Substantial Risks to Life or Property	Potentially significant	**MM 4.6-5** The Applicant shall avoid building infrastructure on expansive soils unless the Applicant determines that mineral recovery is infeasible from a different location, and site-specific Professional Engineering certification is submitted concluding that the new equipment will not cause substantial risks to life or property.	Less than significant	All Tiers
Impact 4.6-8 Have Soils Incapable of Adequately Supporting the Use of Septic Tanks or Alternative Wastewater Disposal Systems Where Sewers Are Not Available for the Disposal of Wastewater	Less than significant	Implement MM 4.6-1, as described above.	Less than significant	All Tiers
Impact 4.6-9 Cumulative Impacts to Geologic and Soil Resources	Potentially significant	Implement MM 4.6-1 through MM 4.6-5, as described above.	Less than significant	All Tiers
Green House Gas Emissions				
Impact 4.7-1 Generate Greenhouse Gas Emissions, Either Directly Or Indirectly, that may have a Significant Impact on the Environment	Potentially significant	**MM 4.7-1** An Applicant with permitted stationary sources shall comply with the Cap-and-Trade regulation (e.g., by reducing greenhouse gas emissions within their facilities or by surrendering greenhouse gas allowances, offset credits, or other compliance instruments to offset the greenhouse gas increases), and implement Best Performance Standards applicable to greenhouse gas reduction for Components at Light Crude Oil and Natural Gas Production, Natural Gas Processing Facilities, Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants (San Joaquin Valley Air Pollution Control District 2010), Thermally Enhanced Oil Recovery Wells (San Joaquin Valley Air Pollution Control District 2010a), Steam Generators (San Joaquin Valley Air Pollution Control District 2010b), and Front-line Organic Liquid Storage Tanks (San Joaquin Valley Air Pollution Control District 2011). **MM 4.7-2** Each Applicant shall comply with applicable Cap and Trade regulations, and other applicable greenhouse gas emission control and reduction regulations as these may be adopted or amended over time, to reduce, avoid, mitigate and/or sequester greenhouse gas emissions from Project-related air emissions. **MM 4.7-3** Each Applicant shall implement methods to recover for reuse or destroy methane existing in associated gas and casinghead gas, as follows: a. Recover all associated gas produced from the reservoir via new wells, regardless of the well type, except for gas produced from wildcat and delineation wells or as a result of start-up, shutdown and maintenance activities (whether planned or unplanned), system failures, and emergencies in accordance with San Joaquin Valley Air Pollution Control District regulations (Rule 4401 and 4409), as this may be amended over time. b. Compliance with the expected California Air Resources Board methane regulation. **MM 4.7-4** Each Applicant shall offset all greenhouse gas emissions not covered by the Cap-and-Trade program or other mandatory greenhouse gas emission reduction measures through Applicant reductions of greenhouse gas emissions as verified by ~~the San Joaquin Valley Air Pollution Control District~~Kern County, through acquisition of offset credits from the California Air Pollution Control Officers Association Exchange Register or other third party greenhouse gas reductions ~~as~~, with consultation as to the validity of methodology for calculating reductions verified by the San Joaquin Valley Air Pollution Control District and accepted by Kern County, or through inclusion in an Emission	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		Reduction Agreement, to offset Project-related greenhouse gas emissions that are not included in the Cap and Trade program to assure that no net increase in greenhouse gas emissions from the Project.		
Impact 4.7-2 Conflict with any Applicable Plan, Policy, or Regulation Adopted for the Purpose of Reducing the Emissions of Greenhouse Gases	Potentially significant	Implement MM 4.7-3, as described above.	Significant and unavoidable	All Tiers
Impact 4.7-3 Cumulative Greenhouse Gas Emissions Impacts	Potentially significant	Implement MM 4.7-4, as described above.	Significant and unavoidable	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Hazards and Hazardous Materials				
Impact 4.8-1 Create a Significant Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials	Potentially significant	**MM 4.8-1** The Applicant shall provide a comprehensive Worker Environmental Awareness Program to the County with its first Site Plan Conformity Review permit application in each calendar year. The program shall include all training requirements identified in Applicant Best Management Practices and mitigation measures, and include training for all field personnel (including Applicant employees, agents and contractors). The Worker Environmental Awareness Program shall include protocols and training for responding to and handling of hazardous materials and hazardous waste management, and emergency preparedness, release reporting, and response requirements. In Tier 2, the Worker Environmental Awareness Program shall be provided to the surface owner at the time of the application pathway process so the surface owner may educate employees as well. **MM 4.8-2** The Applicant shall arrange for transportation, storage and disposal of all hazardous materials in compliance with the Hazardous Materials Transportation Act. Drivers transporting hazardous materials or wastes should follow the measures recommended by the Federal Motor Carrier Safety Administration for avoiding roll-over accidents. To avoid roll-over accidents involving cargo tank trucks: a. Avoid sudden movements that may lead to roll-overs. b. Control your load in turns and on straight roadways. c. Identify high risk areas on roads. d. Remain alert and attentive behind the wheel. e. Control speed and maintain proper “speed cushions.” **MM 4.8-3** The Applicant shall implement the following practices: a. Construction activities shall be conducted to allow for easy clean-up of spills. Construction crews shall have sufficient tools, supplies, and absorbent and barrier materials to contain and recover spilled materials. b. Fuels and lubricants shall be stored only at designated staging areas. Fuel and lubricant tanks shall have appropriate secondary spill containment (e.g., curbs). Compliance with laws and regulations is required, including compliance with hazardous materials and hazardous waste storage laws, as applicable. c. Storage of fuel and lubricants in the staging area shall be at least 100 feet away from the edge of water bodies. Refueling and lubrication of equipment shall be restricted to upland areas at least 100 feet away from stream channels and wetlands. d. Any fuel truck shall carry an oil spill response kit and spill response equipment at all times. e. ~~Applicants shall be required to perform all routine equipment maintenance at the well pad,~~ or other suitable locations (i.e., maintenance yards), and promptly collect and lawfully dispose of wastes ~~at an authorized recycling, treatment or disposal facility~~in compliance with existing regulatory requirements. f. Berms and/or dikes (secondary containment) shall be constructed around the permanent above-ground bulk tanks and the foundations shall be installed with a passive leak detection system, so that potential spill materials shall be contained and collected in specified areas isolated from any water bodies. Tanks shall not be placed in areas subject to periodic flooding or washout. Compliance with laws and regulations is required, including compliance with hazardous materials and hazardous waste storage laws as applicable, including for secondary containment, such as Division of Oil Gas and Geothermal Resource regulation (Title 14, C,C.R. § 1773.1), which requires secondary containment in "an engineered impoundment such as a catch basin, which can include natural topographic features, that is designed to capture fluid released from a production facility."	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		g. A sufficient supply of sorbent and barrier materials shall be maintained on construction sites~~,~~ consistent with the type and ~~sorbent~~level of construction activities. Sorbent and barrier materials shall also be utilized to contain runoff from contaminated areas where appropriate. 1. ~~Shovels and drums shall be stored at each well pad or~~ be readily available. If small quantities of soil become contaminated, hand tools such as shovels or other appropriate tools, shall be used to collect the soil and the material shall be stored in ~~55 gallon~~storage drums. Large quantities of contaminated soil may be bio-remediated on-site or at a designated remediation facility, subject to government approval, or collected utilizing heavy equipment, and stored in drums or other suitable containers prior to disposal. Should contamination occur adjacent to staging areas as a result of runoff, shovels and/or heavy equipment shall be utilized to collect the contaminated material. Contaminated soil shall be disposed of in accordance with state and federal regulations. 2. Above-ground tanks, valves and other equipment shall be visually inspected monthly and when the tank is refilled. Inspection records shall be maintained. Applicants shall periodically check tanks for leaks or spills. 3. Drain valves on ~~temporary~~all tanks shall be locked to prevent accidental or unauthorized discharges from the tank. 4. Equipment maintenance shall be conducted in staging areas or other suitable locations (i.e., maintenance shops or yards) to the extent practical. 5. The Applicant shall maintain equipment in operating condition to reduce the likelihood of fuel or oil line breaks and leakage. Any vehicles with chronic or continuous leaks shall be removed from the ~~construction~~ site and repaired before being returned to operation. 6. Applicants are encouraged, but not required, to use an alternate to silica sand as a proppant, after Division of Oil Gas and Geothermal Resources has determined that such an alternative does not introduce new hazards.		
		MM 4.8-4 The Applicant shall implement the following measures to prevent, repair, and remediate accidental leaks and spills from oil and gas operations. a. The Applicant shall identify gas, oil and produced water pipelines to be used for each new or reworked well site in its Site ~~Review~~ Plan, and shall show the location of any sensitive receptor located within ~~200~~300 feet of any such pipeline. For any pipeline located within ~~200~~300 feet of a sensitive receptor, the Applicant shall present evidence that each such pipeline has been integrity tested using pressure testing or other accepted test methods by a qualified professional within a two-year period prior to submittal of the Site ~~Review~~ Plan, and shall provide a copy of the test result to the County. For all waste gas lines less than or equal to 4 inches in diameter, a Pipeline Management Plan shall be developed and implemented in accordance with Division of Oil Gas and Geothermal Resources regulations Title 14, Division 2, Chapter 4, Section 1774.2. The Pipeline Management Plan shall include: 1. A listing of information on each pipeline including, but not limited to: i. Pipeline type. ii. Grade. iii. Installation date of pipeline. iv. Design and operational pressure. v. Any leak, repair, inspection and testing history. 2. A description of the testing method and schedule for all pipelines. b. The Applicant shall notify the Kern County Environmental Health Division, Certified Union Program Agency (CUPA), surface		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		landowner, and sensitive receptors located within 300 feet, of ~~reportable quantities of fuel, gas, petroleum or~~any hazardous materials ~~leaks~~/waste release to the County ~~within 48 hours of~~immediately upon discovery, and to other applicable agencies as required by other laws. The Applicant shall immediately contain the leak (e.g., by isolating or shutting down the leaking equipment), clean up contaminated media (e.g., soils), and repair the leak prior to recommencing operations. The Applicant shall report the status and progress of the leak repair and remediation work to the County and the CUPA on monthly intervals or predetermined intervals until the repair has been completed~~, and any contaminated~~. Contaminated media ~~has been remediated.~~ shall be analyzed according to 22 C.C.R. §§ 66261.21-66261.24 for determination of appropriate hazardous waste disposal. Hazardous Waste Determination procedures are provided in 22 C.C.R. § 66262.11. c. As part of the Site Plan, the Applicant shall identify the location and right of way for all pipelines to be used for the transport of oil, gas, and produced water, including pipelines that intersect the main transport line, based on existing data and using commercially available technology, and, based on the results of this analysis, shall identify any sensitive receptors within 300 feet of the pipeline for purposes of complying with Mitigation Measure 4.8-4. Mechanical integrity testing of all such pipeline lengths within 300 feet of a sensitive receptor shall be required pursuant to Mitigation Measure 4.8.4-1. d. If a release, identified pursuant to subsection (b), cannot be repaired or remediated within 48 hours, and has potential impact to sensitive receptors, the Applicant shall incur costs to sample and analyze the potentially affected area, which may include soil, groundwater, outdoor or indoor air of sensitive receptors within 300 feet of the leak. Applicant shall pay all temporary relocation costs (e.g., housing, food, and transportation) for any exposed sensitive receptor until such time as the leak has been repaired and post-indoor air testing has been completed, as confirmed by identified agency having oversight of the remediation. **MM 4.8-5** If, during grading or excavation work, the Applicant observes visual or olfactory evidence of contamination or if soil contamination is otherwise suspected, work near the excavation site shall be terminated, the work area cordoned off and appropriate health and safety procedures implemented for the location by the contractor's Health and Safety Officer. Samples shall be collected by a trained and qualified individual. Analytical data from suspected contaminated material shall be reviewed by the contractor's Health and Safety Officer. If the sample testing determines that contamination is not present, work may proceed at the site; however, if contamination is detected above regulatory limits, the Kern County Public Health Services Department shall be notified. All actions related to encountering unanticipated hazardous materials at the site shall be documented and submitted to the Kern County Public Health Services Department. MM 4.8-6 The Applicant shall implement ~~the most up-to-date best management practices as part of their normal operations. Specifically, operators and/or their contractors shall implement~~ measures to prevent the release or accidental spillage of solid waste, garbage, construction debris, sanitary waste, industrial waste, naturally occurring radioactive materials, oil and other petroleum products, and other wastes into water bodies or water sources~~. The best management~~, including all applicable practices included in the most up-to-date versions of the following documents shall be followed: *Exemption of Oil and Gas Exploration and Production Wastes From Federal Hazardous Waste Regulations (EPA 2002)*. Equivalent industry standards such as Environmental Protection for Onshore Oil and Gas Productions and Leases (American Petroleum Institute 2009) and related standards may also be utilized, provided that a professional engineer, certified industrial hygienist or certified safety professional certifies to the County that such alternative standards are as or more protective of human health and the environment, as compared to the standards in the referenced Environmental Protection Agency manual. The determination of when and the extent to which a measure is "practical" is to be made by the Applicant; however, all of the below activities must comply with all applicable legal requirements, including federal and state laws and regulations, County ordinances, and the mitigation measures included in this Final EIR. a. Classify the various oil and gas exploration and production wastes for proper disposal as described in United States Environmental Protection Agency 2002~~.~~, and in accordance with applicable California laws and regulations.. b. Size reserve pits properly to avoid overflows.		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		c. Use closed loop mud systems when practical, particularly with oil-based muds. d. Review safety data sheets of materials used, and select less toxic alternatives when possible. e. Minimize waste generation, such as by designing systems with the smallest volumes possible (e.g., drilling mud systems). f. Reduce the amount of excess fluids entering reserve and production pits. g. Keep non-exempt wastes out of reserve or production pits. h. Design the drilling pad to contain stormwater and rigwash. i. Recycle and reuse oil-based muds and high density brines, when practical~~.~~, and when such recycling and reuse complies with hazardous waste laws and recycling laws j. Perform routine equipment inspections and maintenance to prevent leaks or emissions. k. Reclaim oily debris and tank bottoms when practical, and when such reclamation complies with hazardous waste laws and recycling laws. l. Minimize the volume of materials stored at facilities. m. Construct adequate berms around materials and waste storage areas to contain spills. n. Perform routine inspections of materials and waste storage areas to locate damaged or leaking containers. o. Train personnel to use sensible waste management practices.		
		MM 4.8-7 Conduct exploration and development activities as described in *Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development The Gold Book* (Bureau of Land Management 2007~~).~~) or equivalent industry standard such as Environmental Protection for Onshore Oil and Gas Production Operations and Leases (American Petroleum Institute 2009) and related standards. The following specific measures should be undertaken at a minimum: a. ~~Sufficiently~~Sufficient impervious secondary containment, such as containment dikes, containment walls, and drip pans, should be constructed and maintained around all qualifying petroleum facilities, including tank batteries and separation and treating areas consistent with the Environmental Protection Agency's Spill Prevention, Control, and Countermeasures regulation (40 Code of Federal Regulations 112). The containment structure must have sufficient volume to contain, at a minimum, the content of the largest storage tank containing liquid hydrocarbons within the facility/battery and sufficient freeboard to contain precipitation, unless more stringent protective requirements are deemed necessary by the authorized officer. Drip pans should be routinely checked and cleaned of petroleum or chemical discharges and designed to prevent access by wildlife and livestock. b. ~~Chemical~~Chemical containers should not be stored on bare ground, exposed to the sun and moisture. Containers and labels are subject to degradation and punctured drums could leak contents on the ground. Chemicals~~s~~ containers should be maintained in good condition and placed within secondary containment in case of a spill or high velocity puncture. c. Containment dikes are not to be constructed with topsoil or coarse, insufficiently impervious spoil material. Containment is strongly suggested for produced water tanks. Chemicals should be placed within secondary containment and stored so that the containers are not in contact with soil or standing water and product and hazard labels are not exposed to weathering. d. Maintain a clean well location. Remove trash, junk, and other materials not in current use e. In approving a well stimulation treatment permit, the applicant shall include in the spill contingency plan required by Section 1722.9 of Title 14 of the California Code of Regulations a protocol for measuring and reporting earthquake and earth consequences that occur during the well stimulation process, for however many well stimulation treatments are proposed to occur simultaneously at any given		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		time. The Spill Contingency Plan shall include requirements for adequate personnel and equipment that may be necessary to conduct post-earthquake inspection and repair plans to evaluate any damage that has occurred. The Spill Contingency Plan shall include spill prevention, control and countermeasure plans to address the hazardous substances associated with well stimulation activities. The post-earthquake inspection procedures shall ensure the integrity of the mechanical systems and well integrity of wells used for stimulation or wastewater injection and idle wells that might have become conduits for escaping fluids or gases. The plan shall include procedures describing the necessary steps to be taken after service is disrupted in order to make the facilities secure, operational and safe as soon as possible. **MM 4.8-8** Applicants shall use the appropriate American Petroleum Institute Standards, or other recognized sources imposing the same or equivalent standards, for their facility, such as the following: a. Use cements and well materials in well completions as described in Specifications for Cements and Materials for Well Cementing (American Petroleum Institute 2011). b. Prior to start-up of all new facilities, verify and prove the construction, installation, integration, testing, and preparation of systems have been completed as designed following the practices described in Facilities Systems Completion Planning and Execution (American Petroleum Institute 2013a). c. When the use of centralizers and stop-collars are required during well completion activities, follow the installation and testing requirements described in Recommended Practice for Centralizer Placement and Stop-collar Testing (American Petroleum Institute 2010a). d. Limit the environmental footprint of oil and gas exploration and production and reduce the incidence of releases of hazardous substances following the practices described in Environmental Protection for Onshore Oil and Gas Production Operations and Leases (American Petroleum Institute 2009). e. Minimize improper disposal by following the practices described in American Petroleum Institute Order No. G00004, Guidelines for Commercial Exploration and Production Waste Management Facilities (American Petroleum Institute 2001) or other recognized methods. These guidelines discuss the relevant regulations and permitting requirements; siting, construction, and technical consideration for various waste disposal options; as well as mitigation options. f. Minimize the environmental footprint of exploration and production activities following the practices described in Land Drilling Practices for Protection of the Environment (American Petroleum Institute 2010b) or other recognized sources. g. ~~Prior~~When pressure testing is required by State or federal law, prior to pressurizing or re-pressurizing petroleum product pipelines, ensure the integrity of pipelines following the practices described in Recommended Practice for the Pressure Testing of Steel Pipelines for the Transportation of Gas, Petroleum Gas, Hazardous Liquids, Highly Volatile Liquids, or Carbon Dioxide (American Petroleum Institute 2013b) or other recognized sources. h. To minimize releases of hazardous substances during oilfield construction, pit and sump operations shall be conducted in accordance with State Water Resources Control Board General Orders or appropriate Regional Water Quality Control Board waste discharge requirements or general orders. **MM 4.8-9** For all operations subject to the Oil and Gas Conformity Review, the Applicant shall comply with the pipeline management plan, including inspection and maintenance requirements, as administered by the Division of Oil Gas and Geothermal Resources pursuant to 14 California Code of Regulations 1774. **MM 4.8-16** The applicant shall not use any well stimulation fluid unless the applicant presents one of the following:		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		1. Safety Data Sheet that accurately describes the physical and chemical properties of the well stimulation fluid; or 2. Safety Data Sheets that accurately describe the physical and chemical properties of all chemical compounds in the well stimulation fluid; or 3. Toxicological report prepared by a qualified laboratory and/or the fluid vendor confirming the environmental profile of the well stimulation fluid is known; or 4. Results of an aquatic bioassay by a qualified laboratory confirming the environmental profile of the well stimulation fluid is known. For purposes of this mitigation measure, the term "environmental profile" means the physical and chemical properties of a compound that determine its risk to human health and the environment. This mitigation measure shall be superseded by any list of approved well stimulation treatment fluids, chemicals or additives published by the State of California or by any applicable State of California regulation pertaining to chemical use in well stimulation treatment.		
Impact 4.8-2 Create a Significant Hazard to the Public or the Environment through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment	Potentially significant	Implement MM 4.8-1 through MM 4.8-9, as described above, and **MM 4.8-10** The Applicant shall incorporate annual maintenance checks for leaks and corrosion that cause releases into current operations, maintenance, and inspection schedules as provided by the Division of Oil Gas and Geothermal Resources pursuant to 14 California Code of Regulations Sections 1774.1 and 1774.2, the Applicant shall visually inspect all above-ground pipelines for leaks and corrosion at least once per year, comply with the pipeline testing requirements included therein, shall maintain records of such inspections and testing; and shall make inspection and testing records available to the County for review upon request. **MM 4.8-11** As part of the Hazardous Materials Business Plan and the spill prevention, control, And countermeasures Plan, the Applicant shall require annual worker training requirements to: increase awareness of the most common types of failures and methods to avoid mistakes, shall maintain records of employee training, and shall make such records available to the County for review upon request. **MM 4.8-12** An Applicant who plans to perform cyclic steam injection activities above reservoir fracture ~~levels~~pressures shall conduct such activities in accordance with the requirements set forth in the Division of Oil Gas and Geothermal Resources site-specific Project Approval Letter for the injection project. The following requirements from a Project Approval Letter for an injection project are examples of the types of conditions that would be triggered if a surface expression were to occur, though such conditions may be modified by the Division of Oil Gas and Geothermal Resources to reflect site-specific conditions and changing regulatory requirements. a. Cease cyclic steaming operations in accordance with the site-specific Project Approval Letter. Streaming can resume following the Division of Oil Gas and Geothermal Resources specifications outlined in the Project Approval Letter. b. All new or reactivated surface expressions that discharge oil in a reportable quantity shall be reported as an oil spill to the California Emergency Management Agency at (800) 852-7550. c. Any measures to address surface expressions from the well and associated Project shall be reviewed by the Division of Oil Gas and Geothermal Resources prior to initiating. d. Immediately control any water, steam, or oil flowing from a surface expression and contained. All discharged material shall be removed and disposed of in a manner approved by all state and local agencies. e. Cordon off and clearly mark all surface expressions to prevent inadvertent access. f. Conduct air sampling of any emissions associated to a recent surface expression in accordance to the local air board requirements to ensure a health hazard condition does not exist. g. Report immediately to the Division of Oil Gas and Geothermal Resources all surface expressions within 300 feet of the Project site. If the surface expression continues to flow after five days, all wells within a 300-foot radius shall cease steaming until the surface expression ceases to flow. If the surface expression continues to flow, the damage will be evaluated at the Supervisor's discretion, as	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		assigned by Section 3106 of the Public Resources Code and existing laws and regulations. **MM 4.8-13** The Applicant shall comply with the Division of Oil Gas and Geothermal Resources requirements for assuring safe drilling and drill casing practices, well design, construction and well management requirements, blowout requirements, and all other provisions of 14 California Code of Regulations 1744 and other applicable Division of Oil Gas and Geothermal Resources regulations. The Applicant shall also reduce the incidence of well control loss by following the practices described in Recommended Practice for Well Control Operations (American Petroleum Institute 2012). **MM 4.8-14** The Applicant shall report contamination caused by oil and gas activities, including previously unknown injection wells, of a reportable quantity of hazardous substances, as specified in the Code of Federal Regulations Title 40 and/or the California Code of Regulations Titles 22 and 23, which is discovered during Project construction activities and operations. Notification must be made to Kern County Environmental Health Division and the appropriate implementing regulatory agency that has responsibility or oversight of the specific contamination conditions. The Applicant shall remediate such contamination outside Tier 1 areas as required by the Kern County Environmental Health Division and the appropriate implementing regulatory agency.		
Impact 4.8-3 Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within One-Quarter Mile of an Existing or Proposed School	Potentially significant	Implement toxic air contaminant setback mitigation measures, as described in Section 4.3, Air Quality, and **MM 4.8-15** The Applicant who intends to use acutely hazardous chemicals, including chemicals at or above the specified threshold quantities or a process which involves a Category 1 flammable gas or a flammable liquid with a flashpoint below 100 degrees Fahrenheit (37.8 degrees Celsius) on site in one location, in a quantity of 10,000 pounds (4535.9 kilograms) or more according to 8 California Code of Regulations Section 5189, Appendix A, within 0.25 mile from a school must: a. Evaluate whether other alternative chemicals that are less hazardous could be used. b. Ensure that the smallest quantity of necessary acutely hazardous materials are stored on site. c. Notify the occupants of the buildings when and where acutely hazardous materials would be used. d. Notify Kern County Fire Department about the details of the use of acutely hazardous materials (e.g., when, where, how much). e. Ensure that all employees who would contact the acutely hazardous materials are trained on the handling, transport, storage, and disposal of the materials. f. Ensure that all employees who would contact the acutely hazardous materials are trained and are provided the proper personal protective equipment. g. Ensure that all employees who would contact the acutely hazardous materials are trained and have exercised on the Spill Prevention, Control, and Countermeasures P Plan that addresses these chemicals.	Less than significant	All Tiers
Impact 4.8-4 Create a Hazard to the Public or the Environment as a Result of Being a Site that is Included on a List of Hazardous Materials Sites Compiled Pursuant to Government Code Section 65962.5	Potentially significant	Implement MM 4.8-14, as described above, and MM 4.8-17 and MM 4.8-18, as described under Impact 4.8-5.	Less than significant	All Tiers
Impact 4.8-5	Potentially significant	**MM 4.8-17** The Applicant shall determine whether any proposed construction or alteration meets requirements for notification of the Federal Aviation Administration. If a proposed construction or alteration is found to require notification, the Applicant shall notify the Federal Aviation	Less than	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
For a Project Located within the Adopted Airport Land Use Compatibility Plan, Result in a Safety Hazard for People Residing or Working in the Area		Administration and request that the Federal Aviation Administration issue a Determination of No Hazard to Air Navigation. If the Federal Aviation Administration determines that the construction or alteration would result in a potential hazard to air navigation, the Applicant would be required to work with the Federal Aviation Administration to resolve any adverse effects or airport operations. The Applicant shall notify the Federal Aviation Administration and the nearest Airport, by completing and submitting Federal Aviation Administration Form 7460-1 if oil and gas related exploration, production, or associated development activities are planned that meet one or more of the following criteria: a. Any construction or alteration exceeding 200 feet above ground level. b. Any construction or alteration within 20,000 feet of all public use airports except Poso-kern Airport which exceeds a 100:1 surface from any point on the runway. c. Any construction or alteration within 10,000 feet of the Poso-Kern Airport which exceeds a 50:1 surface from any point on the runway. d. Any construction or alteration within 5,000 feet of a public use heliport which exceeds a 25:1 surface. e. When requested by the Federal Aviation Administration. f. Any construction or alteration located on a public use airport or heliport regardless of height or location. **MM 4.8-18** The Applicant shall determine the distance from the proposed operation to the nearest boundary of the Joint Service Restricted R-2508 Complex, using a map of this Complex provided by the County. The Applicant shall notify the Joint Service Restricted R2508 Complex representative identified by the County if oil and gas related exploration, production, or associated development activities are planned that meet one or more of the following criteria: a. Any structure within 75 miles of the R-2508 Complex that is greater than 50 feet tall. b. Any project within 50 miles of the R-2508 Complex that emit radio and communication frequencies. c. Any project that would create environmental impacts such as visibility or elevated obstructions within 25 miles of the R-2508 Complex. **MM 4.8-19** All oil and gas related development activities shall review the Kern County Airport Land Use Compatibility Plan for compliance with all applicable policies.	significant	
Impact 4.8-6 Result in Safety Hazard for People Residing or Working in Project Area within Vicinity of a Private Airstrip	Less than significant	None required.	Less than significant	All Tiers
Impact 4.8-7 Impair Implementation of, or Physically Interfere with, an Adopted Emergency Response Plan or Emergency Evacuation Plan	Less than significant	None required.	Less than significant	All Tiers
Impact 4.8-8 Expose People or Structures to a Significant Risk of Loss, Injury, or Death Involving Wildland	Less than significant	**MM 4.8-20** The Applicant is required to implement the following measures: a. Comply with Kern County Fire Codes.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Fires, Including Where Wildlands are Adjacent to Urbanized Areas or Where Residences are Intermixed with Wildlands		b. Maintain firefighting apparatus and supplies required by the Kern County Fire Department. c. Maintain of a list of all relevant fire-fighting authorities for each work site. d. Have available equipment to extinguish incipient fires and or construction of a fire break, such as: chemical fire extinguishers, shovels, axes, chain saws, etc. e. Carry water or fire extinguishers and shovels in non-passenger vehicles in the field. f. Have and maintain an adequate supply of fire extinguishers for welding, grinding, and brushing crews. g. ~~Protect~~Use available resources to protect individual safety and to contain any fire that occurs and notify local emergency response personnel. h. Remove any flammable wastes generated during oil and gas activities regularly. i. Store all flammable materials used in oil and gas activities away from ignition sources and in approved containers. j. Allow smoking only in designated smoking areas. k. Prohibit smoking where flammable products are present and when the fire hazard is high. Train personnel regarding potential fire hazards and their prevention. l. All internal combustion engines, stationary and mobile, shall be equipped with spark arresters. Spark arresters shall be in good working order. m. Light trucks and cars with factory-installed (type) mufflers shall be used only on roads where the roadway is cleared of vegetation. Said vehicle types shall maintain their factory-installed (type) muffler in good condition. n. Fire rules shall be posted on the Project bulletin board at the contractor's field office and areas visible to employees. o. Equipment parking areas and small stationary engine sites shall be cleared of all extraneous flammable materials. p. Personnel shall be trained in the practices of the Fire Safety Plan relevant to their duties. Construction and maintenance personnel shall be trained and equipped to extinguish small fires in order to prevent them from growing into more serious threats. **MM 4.8-21** The Applicant should restrict the use of chainsaws, chippers, vegetation masticators, grinders, tractors, torches, and explosives at its locations, and ensure the sites where this equipment is used are equipped with portable or fixed fire extinguishers and/or a water tank, with hoses, fire rakes, and other tools to extinguish and or control incipient stage fires. The Worker Environmental Awareness Program shall include fire prevention and response training for workers using these tools.		
Impact 4.8-9 Generate Vectors or Have a Component that Includes Agricultural Waste Exceeding Adopted Qualitative Thresholds	Less than significant	Implement dust control and Valley Fever education and mask measures as described in Section 4.3, Air Quality, and **MM 4.8-22** Applicants shall ensure that trash is stored in closed containers and removed from the site at regular intervals. Open containers shall be inverted and construction ditches shall not be allowed to accumulate water. Construction and maintenance operations shall not generate standing water. Naturally occurring depressions, drainages, or pools at the site shall not be drained or filled without consulting with the appropriate resource agency (Kern County, United States Army Corps of Engineers, United States Fish and Wildlife Service, California Department of Fish and Wildlife) as applicable, and obtaining the appropriate permits.	Less than significant	All Tiers
Impacts 4.8-10 Contribute to Cumulative Hazards and Hazardous	Potentially significant	Implement MM 4.8-1 through MM 4.8-22, as described above, and dust control and toxic air contaminant setback mitigation measure, as described in Section 4.3, Air Quality, risk reduction measures, as described in Section 4.6, Geology and Soils, and mitigation measures to maintain water quality, as described in	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Materials Impacts		Section 4.9, Hydrology and Water Quality.		
Hydrology and Water Quality				
Impact 4.9-1 Violate any Water Quality Standards or Waste Discharge Requirements	Potentially significant	**MM 4.9-1** The Applicant shall comply with all applicable federal, state, regional and local agency water quality protection laws and regulations, and commonly utilized industry standards, including (where applicable) obtaining coverage under the stormwater construction general permit and industrial general permit issued by the State Water Resources Control Board and complying with industry stormwater management standards for construction and operational activities. The applicant shall obtain all required permits from Division of Oil Gas and Geothermal Resources, and such permits shall include measures that will safeguard protected groundwater with appropriate casing, seal and related down-hole technical specifications. **MM 4.9-2** A. Oil and Gas activities in Tier I shall comply with the following. 1. In areas subject to National Pollutant Discharge Elimination System stormwater permitting requirements, project applicants shall file a Notice of Intent to the State Water Resources Control Board to comply with the statewide General Permit for Discharges of Stormwater Associated with Construction Activities (Construction General Permit State Water Resources Quality Control Board Order No 2009-009-DWO) prior to undertaking all ground-disturbing activities greater than one acre and shall prepare and implement a Stormwater Pollution Prevention Plan for construction activities on the Project site in accordance with the Construction General Permit. For facilities requiring coverage under the Construction General Permit, the site specific Stormwater Pollution Prevention Plan shall include measures to achieve the following objectives: (1) all pollutants and their sources, including sources of sediment associated with construction activity are controlled; (2) all non-stormwater discharges are identified and either eliminated, controlled and treated, (3) site Best Management Practices are effective and result in the reduction or elimination of pollutants in stormwater discharges and authorized non-stormwater discharges from construction activity and (4) stabilization Best Management Practices to reduce or eliminate pollutants after construction are completed. The Stormwater Pollution Prevention Plan shall be prepared by a qualified preparer and shall include the minimum Best Management Practices required for the identified risk level. The Stormwater Pollution Prevention Plan shall include a construction site monitoring program that identified requirements for dry weather visual observations of pollutants at all discharge locations and , as appropriate, depending on the project risk level, sampling of site effluent and receiving waters. A qualified Stormwater Pollution Prevention Plan practitioner shall be responsible for implementing and all monitoring for the Best Management Practices as well as all inspection, maintenance and repair activities at the project site. If applicable, each project shall also implement and fully comply with the Industrial Storm Water Permit (Order No 97-03-DWO) and Kern County Municipal Stormwater Permit (Order No 5-01-120). All plans under these requirements shall be submitted to Kern County Public Works for review and approval. Any operator of a facility that meets the following requirements is not required to be covered by the Construction General Permit (State Water Regional Control Board Memorandum dated 5-18-2010): a. discharges of stormwater runoff from oil and gas exploration, production, processing or treatment operations or transmission facilities, including field activities or operations that may be considered construction activity; 1. are not contaminated by contact with, or do not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products;	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		2. are only contaminated by or only come into contact with sediment; and 3. pursuant to 40.C.F.R. § 122.26(c)(1) (iii) that do not contribute to a violation of a water quality standard. Any change to this State Water Regional Control Board determination will require full compliance with National Pollutant Discharge Elimination System requirements. **2.** Any operator not subject to National Pollutant Discharge Elimination System stormwater permitting requirements shall implement Best Management Practices during construction and operation. All selected practices shall be shown on a drainage implementation plan and self-certified as complete and feasible by a licensed professional qualified in drainage and flood control issues. The plan shall be submitted to the Kern County Planning and Community Development department. The following Best Management Practices shall be implemented and shown on the drainage implementation plan : a. Utilizing established facilities design, construction or similar standards as appropriate (e.g.American Society for the Testing and Materials (ASTM) American Petroleum Institute (API) b. Implementation good housekeeping and maintenance practices: i. Preventing trash, waste materials and equipment from construction storm water. ii. Maintaining wellheads, compressors, tanks and pipelines in good condition without leaks or spills. iii. Designing and maintaining graded pads to not actively erode and discharge sediment iv. Maintaining vehicles in good working order v. Providing secondary containment for all –above –ground storage tanks and maintaining such containment features in good operating condition c. Implementing spill prevention and response measures i. Utilizing preventative operating practices such as tank level monitoring, safe chemical handling and conducting regular inspections. ii. Developing and maintaining a spill response plan iii. Conducting spill response training for employees and have a process to ensure contractors have the necessary training		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		iv. Maintaining spill response equipment on site. d. Implementing material storage and management practices: i. Preventing unauthorized access ii. Utilizing "run-on" and "run-off" control berms and swales iii. Stabilizing exposed slopes through vegetation and other appropriate methods (e.g., hay bales or rolls). B. Oil and gas activities in Tier 1 shall comply with all applicable state and federal stormwater management laws. For any oil and gas activity outside Tier I that is not subject to state or federal stormwater management laws, regulations or general permits, the Applicant shall prepare a drainage plan that is designed to minimize runoff and minimize the potential for impeding or redirecting 100-year flood flows. The drainage plan shall be prepared in accordance with the Kern County Grading Code, the Green Code and approved by the Kern County Engineering, Surveying and Permit Services Department, Floodplain Management Section. The plan shall specify best management practices to prevent all construction pollutants from contacting stormwater, with the intent of keeping sedimentation or any other pollutants from moving offsite and into receiving waters. The requirements of the Plan shall be incorporated into design specifications. Recommended best management practices for the construction phase must be shown on a drainage plan, and shall include the following: a. Erosion Control - 1. Scheduling of construction activities to avoid rain events. 2. Limiting vegetation removal to the ~~maximum extent practicable~~minimum required. b. Sediment Control - 1. Secure stockpiling of soil. 2. Installation of a stabilized construction entrance/exit and stabilization of disturbed areas. c. Non-stormwater Control - 1. Proper fueling and maintenance of equipment and vehicles. 2. Proper concrete handling techniques. d. Waste and Material Management - 1. Properly managing construction materials, designating construction staging areas in or around the Project site.		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		2. Stockpiling and disposing of demolition debris, concrete, and soil properly. 3. ~~Aggressive control~~Prompt removal and proper disposal of litter. 4. Proper disposal of demolition debris, concrete and soil. 5. Proper protections for fueling and maintenance of equipment and vehicles. 6. Provide and maintain adequate secondary containment to minmize or eliminate pollutants from moving offsite and into receiving waters. e. Post-Construction Stabilization - 1. Ensuring the stabilization of all disturbed soils per revegetation or application of a soil binder. C. If construction activities will alter federal jurisdictional waters, project applicants shall comply with the federal Clean Water Act Section 404 and Section 401 permitting and certification requirements. If construction activities will alter state waters, project applicants shall comply with California Department of Fish and Wildlife Streambed Alteration requirements. **MM 4.9-3** All drilling operations must either use a closed loop system to avoid discharges of drilling muds and fluids, or obtain coverage under the State Water Resources Control Board low threat discharge General Order (Waste Discharge Requirements General Order 2003-0003-DEW), obtain individual Waste Discharge Requirements issued by the Central Valley Regional Water Quality Control Board for the unit, or obtain coverage under a general order issued by the Central Valley Regional Water Quality Control Board applicable to drilling ponds. Any surface ponds or sumps must be cleared of fluids and muds in accordance with the State Water Resources Control Board general order, applicable Water Discharge Requirements and Division of Oil Gas and Geothermal Resources regulations. Compliance with the State Water Resources Control Board or Central Valley Regional Water Quality Control Board low-threat discharge orders or Water Discharge Requirements, if closed-loop systems are not used, and applicable laws, regulations and standards will reduce potential surface water quality impacts from contact with drilling muds or fluids during drilling and construction to less than significant levels. ~~**MW**~~After consultation with and approval by the Regional Water Board with jurisdiction over injection and groundwater, applicant shall provide for a tracer or some other reasonable method to allow well stimulation fluids to be distinguished from other fluids or chemicals for well stimulation permits. This could consist of an added tracer using an inert constituent that could be used to identify the presence of well stimulation fluids. Alternatively, it could be an intrinsic tracer, or some naturally occurring component that makes the well stimulation fluids chemically unique. Potential geochemical changes in the subsurface during injection or migration shall be considered. Use of a tracer shall be required to be disclosed to the public under Section 1788 of the SB 4 regulations. The regulations specifically require that the applicant require the composition and disposition of all well stimulation treatment fluids other than water, including "any radiological components or tracers injected into the well as part of the well stimulation treatment, a description of the recovery method, if any, for those components or tracers, the recovery rate, and specific disposal information for the recovered components or tracers a radiological component or tracer injected" (Section 1788 (15)). For any well stimulation treatment activity, the applicant shall not conduct well stimulation treatment activity until the State Water Resources Control Board, in consultation with the Central Valley Regional Water Quality Control Board, has approved either a		

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		groundwater monitoring plan or exclusion from groundwater monitoring for a given well, consistent with the State Water Resources Control Board Model Criteria for Groundwater Monitoring in Areas of Oil and Gas Well Stimulation. **MM 4.9-4** For any activity for which Chapter 19.98 applies, the Applicant shall not conduct any Class II injection activity regulated by the Underground Injection Control program, including enhanced oil recovery activities that discharge into any underground source of current or future beneficial use groundwater, including drinking water, unless the aquifer has been exempted by the United States Environmental Protection Agency or injection has otherwise been authorized by the U.S. Environmental Protection Agency or by the Division of Oil Gas and Geothermal Resources ~~under delegated authority under the Safe Drinking~~, in consultation and agreement by the State Water ~~Act~~Resources Control Board, consistent with Public Resources Code 3131. **~~MW~~MM 4.9-5** For any activity for which Chapter 19.98 applies, the Applicant shall not discharge produced water into any surface disposal facility unless the facility has received the Waste Discharge Requirements from the Central Valley Regional Water Quality Control Board, or the need for Water Discharge Requirements has been waived by the Central Valley Regional Water Quality Control Board. As required by the SB 4 regulations, well stimulation treatment fluids and produced fluids from wells that have been stimulated cannot be stored, discharged, or disposed into surface ponds or pits. **MM 4.9-6** For any oil and gas activity within a ~~mapped 100-year floodplain~~Special Flood Hazard Area, the Applicant shall ensure that all constructed facilities are ~~protected from the maximum potential elevation of flooding during a 100-year flood by elevating structures~~elevated or ~~by implementing containment berms or other protective measures~~floodproofed in compliance with the requirements and standards found in the Kern County Floodplain Management ~~Code~~Ordinance and Chapters 19.50 and 19.70 of the Kern County Zoning Code.		
Impact 4.9-2 Substantially Deplete Groundwater Supplies or Interfere Substantially with Groundwater Recharge such that There Would be a Net Deficit In Aquifer Volume or a Lowering of the Local Groundwater Table Level (e.g., the Production Rate of Pre-Existing Nearby Wells Would Drop to a Level That Would Not Support Existing Land Uses or Planned Uses for Which Permits Have Been Granted)	Potentially significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Significant and unavoidable	All Tiers
Impact 4.9-3 Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, in a Manner That Would Result in Substantial Erosion or Siltation On-site or Off-site	Less than significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.9-4 Substantially Alter the Existing Drainage Pattern	Less than significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
of the Site or Area, Including Through the Alteration of the Course of a Stream or River, or Substantially Increase the Rate or Amount of Surface Runoff in a Manner That Would Result in Flooding On-site or Off-site				
Impact 4.9-5 Create or Contribute Runoff Water That Would Exceed the Capacity of Existing or Planned Stormwater Drainage Systems or Provide Substantial Additional Sources of Polluted Runoff	Less than significant	Implement MM 4.9-1 through MM 4.9-6, as described above.	Less than significant	All Tiers
Impact 4.9-6 Otherwise Substantially Degrade Water Quality	Less than significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.9-7 Place Housing within a 100-year Flood Hazard Area as Mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or Other Flood Hazard Delineation Map	No impact	No mitigation measures are required since the Project does not include housing development.	No impact	All Tiers
Impact 4.9-8 Place Within a 100-Year Flood Hazard Area Structures That Would Impede or Redirect Flood Flows	Potentially significant	Implement MM 4.9-1 through MM 4.9-6, as described above.	Less than significant	All Tiers
Impact 4.9-9 Expose People or Structures to a Significant Risk of Loss, Injury, or Death Involving Flooding, Including Flooding as a Result of the Failure of a Levee or Dam	Potentially significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.9-10 Contribute to Inundation by Seiche, Tsunami, or Mudflow	No impact	No mitigation measures are required.	No impact	All Tiers
Impact 4.9-11 Contribute to Cumulative Hydrology and Water Quality Impacts	Potentially significant	Implement MM 4.9-1 through MM 4.9-6, as described above, and the groundwater mitigation measures described in Section 4.17, Utilities and Service Systems. The County lacks jurisdiction and control over land conversions, and actions or approvals by other agencies that may cause cumulatively significant impacts to hydrology or water quality in the region; accordingly this impact remains significant and unavoidable.	Significant and unavoidable	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Land Use and Planning				
Impact 4.10-1 Physically Divide an Established Community	Less than significant	Implement specified mitigation measures, including those that are applicable from Section 4.1, Aesthetics and Visual Resources, Section 4.3, Air Quality, Section 4.4 Biological Resources, Section 4.12, Noise, Section 4.15, Recreation, and Section 4.17, Utilities and Service Systems.	Less than significant	All Tiers
Impact 4.10-2 Conflict with Any Applicable Land Use Plan, Policy, or Regulation of an Agency with Jurisdiction Over the Project	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.10-3 Conflict with Any Applicable Habitat Conservation Plan or Natural Community Conservation Plan	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.10-4 Contribute to Cumulative Land Use Impacts	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Minerals				
Impact 4.11-1 Result in the Loss of Availability of a Known Mineral Resource that Would be of Value to the Region and the Residents of the State	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.11-2 Result in the Loss of Availability of a Locally Important Mineral Resource Recovery Site Delineated on a Local General Plan, Specific Plan, or Other Land Use Plan	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.11-3 Contribute to Cumulative Mineral Resources Impacts	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Noise				
Impact 4.12-1 Exposure of Persons to, or Generate, Noise	Potentially significant	**MM 4.12-1** Construction: The Site Plan Application shall include a Site Vicinity Figure showing the location of any sensitive receptor(s) within ~~3,000 feet~~the distances	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

<table>
<tr><th>Impact</th><th>Level of Significance before Mitigation</th><th>Mitigation Measure(s)</th><th>Level of Significance after Mitigation</th><th>Applicable Tier</th></tr>
<tr><td>Levels in Excess of Standards Established in the Local General Plan or Noise Ordinance or Applicable Standards of Other Agencies</td><td></td><td>
listed in the construction noise setbacks table, as shown below, of the construction site (potential impact area) for the proposed new well or other ancillary facility or equipment (excluding pipelines). This Figure need not be prepared for Tier 1 areas unless a sensitive receptor is located within 3,~~000~~270 feet of a construction site inside the Tier 1 area.
a. If there are no sensitive noise receptors within this potential impact area, then no construction mitigation measures shall be required.
b. If there are sensitive human noise receptors within the potential impact area, then additional information must be provided showing the type of equipment being used and the noise contours with levels not exceeding 65 ~~dBA~~dB DNL at the nearest exterior wall of the sensitive receptor or more than 1 ~~dBA~~dB DNL higher than the ambient noise levels, if in excess of 65~~ dBA~~dB DNL. If noise levels are shown to exceed 65 ~~dBA~~dB DNL or more than 1 ~~dBA~~dB DNL higher than the ambient noise levels in excess of 65 ~~dBA~~dB DNL, then one or more of the following mitigation measures shall be taken:
1. Placement of a temporary sound attenuation wall(s) shall be placed at the optimal distance to the sensitive receptor, as determined by an acoustical expert.
2. Construction of a temporary berm shall be placed at the optimal distance to the sensitive receptor, as determined by an acoustical expert.
3. Modification of equipment to reduce noise impacts.
4. Implementation of a quiet mode drilling plan or other sound reduction technology or practices as documented in a report submitted to the County.
5. Arranging for the voluntary, temporary relocation of the occupants of the sensitive receptor during the construction period.
6. Use the following setback distances for the activities specified:
Construction Noise Setbacks
<table>

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
		New oil and gas wells shall be a minimum ~~190~~210 feet from the closest sensitive receptor. Geophysical testing methods using vibroseis vehicles to generate sound waves shall be a minimum 150 feet from the closest occupied building, water well, sewer system, and septic tank. Geophysical testing methods using shotholes that employ explosives shall be a minimum 300 feet from the closest occupied building, water well, sewer system, and septic tank, and shall be in full compliance with all laws governing explosives.		
Impact 4.12-2 Exposure of Persons to, or Generate, Excessive Groundborne Vibration or Groundborne Noise Levels	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.12-3 A Substantial Permanent Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project	Potentially significant	Implement MM 4.12-2, as described above.	Less than significant	All Tiers
Impact 4.12-4 A Substantial Temporary or Periodic Increase in Ambient Noise Levels in the project Vicinity Above Levels Existing Without the Project	Potentially significant	Implement MM 4.12-1, as described above.	Less than significant	All Tiers
Impact 4.12-5 For a Project Located Within the Kern County Airport Land Use Compatibility Plan, Would the Project Expose People Residing or Working in the Project Area to Excessive Noise Levels	Potentially significant	Implement MM 4.12-1 and MM 4.12-2, as described above.	Less than significant	All Tiers
Impact 4.12-6 For a Project Located Within the Vicinity of a Private Airstrip, Would the Project Expose People Residing or Working in the Project Area to Excessive Noise Levels	Potentially significant	Implement MM 4.12-1 and MM 4.12-2, as described above.	Less than significant	All Tiers
Impact 4.12-7 Cumulative Impact on Noise Receptors	Potentially significant	Implement MM 4.12-1 and MM 4.12-2, as described above.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Population and Housing				
Impact 4.13-1 Induce Substantial Population Growth in an Area, Either Directly or Indirectly	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.13-2 Displace Substantial Numbers of Existing Housing, Necessitating the Construction of Replacement Housing Elsewhere	No Impact	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.13-3 Displace Substantial Numbers of People, Necessitating the Construction of Replacement Housing Elsewhere	No impact	No mitigation measures are required.	Less than significant	All Tiers
Impact 4.13-4 Cumulative Impact on Population and Housing	Less than significant	No mitigation measures are required.	Less than significant	All Tiers
Public Services				
Impact 4.14-1 Result in Substantial Adverse Physical Impacts Associated with the Provision of New or Physically Altered Governmental Facilities, Need for New or Physically Altered Governmental Facilities, the Construction of which could Cause Significant Environmental Impacts, in Order to Maintain Acceptable Service Ratios, Response Times, or Other Performance Objectives for Any of the Public Services, which Include: Fire Protection, Police Protection, Schools, Parks, and Other Public Facilities	Potentially significant	**MM 4.14-1** Applicant shall contribute to funding the acquisition of a Combination Walk-in/Non-Walk-in Industrial Firefighting vehicle capable of responding with a minimum of five firefighters with the tools and equipment necessary for industrial firefighting and rescue. Each Applicant shall pay $150 per well on each Oil and Gas Conformity Review permit until the total cost of the vehicle purchase is reached, not to exceed $850,000, to be paid through mitigation fees on Oil and Gas Conformity Review permits. Subsequent Applicants shall not be subject to this mitigation measure. **MM 4.14-2** Applicant shall provide funding in the amount of $425 per Oil and Gas Conformity Review permit issued for the Sheriff's Rural Crime Unit. Funding shall be used for one Sergeant, two Senior Deputies (investigators), three Deputies, One Support Technician (clerical), and helicopter usage, based on the amount of funding provided by this permit mitigation fee. The Sheriff's department shall annually report on the expenditure of funds for the Rural Crimes Unit, including incident reports and response times. If other sources of funding for the Rural Crimes Unit are secured, then the mitigation fee amount shall be adjusted to pay only the gap between actual costs and funding provided from other sources.	Less than significant	All Tiers
Impact 4.14-2 Contribute to Cumulative Public Service Impacts	Potentially significant	Implement MM 4.14-1 and MM 4.14-2, as described above.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Recreation				
Impact 4.15-1 Increase the Use of Existing Neighborhood and Regional Parks or Other Recreational Facilities Such That Substantial Physical Deterioration Would Occur or Be Accelerated	Less than significant	No mitigation measures required.	Less than significant	All Tiers
Impact 4.15-2 Include Recreational Facilities or Require Construction or Expansion of Recreational Facilities That Might Have an Adverse Physical Effect on the Environment	Less than significant	No mitigation measures required.	Less than significant	All Tiers
Impact 4.15-3 Cumulative Impact on Recreational Facilities	Less than significant	No mitigation measures required.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Transportation and Traffic				
Impact 4.16-1 Conflict with an Applicable Plan, Ordinance, or Policy Establishing Measures of Effectiveness for the Performance of the Circulation System, Including, but Not Limited to, Intersections, Streets, Highways and Freeways, Pedestrian and Bicycle Paths, and Mass Transit	Potentially significant	**MM 4.16-1** The Applicant shall pay a road maintenance mitigation fee of $1,500 per permit for new wells to pay for roadway maintenance and related improvements to address wear and tear on roads caused by oil and gas industry traffic. The Roads department shall annually report on the expenditure of funds from the Oil and Gas Roadway Maintenance Fee. Expenditures from the fund shall be as determined by the Roads Commissioner, using as a reference the list of roadways identified in the Environmental Impact Report as being used for traffic by the oil and gas industry. If Kern County secures funding from a sales tax dedicated to transportation funding, then the amount of the traffic mitigation fee shall be re-evaluated at the time the County becomes a self-help county. **MM 4.16-2** Applicants who are using an arterial or collector, or Caltrans route, for access to a construction site, shall consult with the Kern County Public Works Department – Roads Division to determine if a Construction Traffic Control Plan is required based on the timing and volume of larger vehicle rigs and the volume of traffic to address public safety and congestion management. If a Plan is required, the Applicant shall prepare and submit a Construction Traffic Control Plan to the Kern County Roads Department and to the California Department of Transportation (District 9 office) for approval. The Construction Traffic Control Plan must be prepared in accordance with both the California Department of Transportation Manual on Uniform Traffic Control Devices and Work Area Traffic Control Handbook and shall include, but not be limited to, the following issues: a. Timing of deliveries of heavy equipment and building materials. b. Placing temporary signing, lighting, and traffic control devices as necessary to indicate the presence of heavy vehicles and construction traffic. c. Determining the need for construction work hours and arrival/departure times outside peak traffic periods. d. Ensuring access for emergency vehicles to the Project site. e. Any temporary closure of travel lanes or disruptions to street segments and intersections during well development. f. Maintaining access to adjacent property.	Less than significant after mitigation	All Tiers
Impact 4.16-2 Conflict with an Applicable Congestion Management Program, Including, but Not Limited to Level of Service Standards And Travel Demand Measures, or Other Standards Established by the County Congestion Management Agency for Designated Roads or Highways -Metropolitan Bakersfield General Plan Level of Service "C" -Kern County General Plan Level of Service "D" -Caltrans Endeavors to Maintain a Target Level of Service at the Transition between Level of Service "C" and Level of Service "D"	Less than significant	Implement MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.16-3 Result in a Change in Air Traffic Patterns, including Either an Increase in Traffic Levels or a Change in Location that Results in Substantial Safety Risks	Potentially significant	Implement airport-related mitigation measures, as described in Section 4.8, Hazards and Hazardous Materials.	Less than significant after mitigation	All Tiers
Impact 4.16-4 Substantially Increase Hazards due to a Design Feature (e.g., Sharp Curves or Dangerous Intersections) or Incompatible Uses	Potentially significant	Implement MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers
Impact 4.16-5 Result in Inadequate Emergency Access	Potentially significant	Implement MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers
Impact 4.16-6 Conflict with Adopted Policies, Plans, or Programs regarding Public Transit, Bicycle, or Pedestrian Facilities, or Otherwise Decrease the Performance or Safety of Such Facilities	Potentially significant	Implement MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers
4.16-7 Cumulative Impacts on Transportation and Traffic	Potentially significant	Implementation of MM 4.16-1 and MM 4.16-2, as described above.	Less than significant after mitigation	All Tiers
Utilities and Service Systems				
Impact 4.17-1 Exceed Wastewater Treatment Requirements of the Applicable Regional Water Quality Control Board	Less than significant	Implement stormwater mitigation measures, as described in Section 4.9, Hydrology and Water Quality.	Less than significant	All Tiers
Impact 4.17-2 Require or Result in the Construction of New Water or Wastewater Treatment Facilities or Expansion of Existing Facilities, the Construction of which could cause Significant Environmental Effects	Potentially significant	**MM 4.17-1** Prior to the issuance of building permits for an operations and maintenance building, the method of sewage disposal shall be as required and approved by the Kern County Public Health Services Department. Compliance with this requirement will necessitate that the Project proponent obtain the necessary approvals for the design of the septic system from the Kern County Engineering, Surveying and Permit Services Department. The septic system disposal field shall be located a minimum of 100 feet from a classified stream or 25 feet from a non-classified stream and shall not be located where it would impact State wetlands or special-status plant species.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.17-3 Require or Result in the Construction of New Stormwater Drainage Facilities or Expansion of Existing Facilities, the Construction of which could cause Significant Environmental Effects	Less than significant	Implement stormwater mitigation measures, as described in Section 4.9, Hydrology and Water Quality.	Less than significant	All Tiers
Impact 4.17-4 Not Have Sufficient Water Supplies Available to Serve the Project from Existing Entitlements and Resources, or New or Expanded Entitlements Would Be Needed	Potentially significant	**MM 4.17-2** Applicant shall increase the re-use of produced water, and reduce its use of municipal and industrial-quality ground or surface water use to the extent feasible. By the end of 2016, the Applicants shall work with the County to review water use data submitted to Division of Oil Gas and Geothermal Resources under Senate Bill 1281 and identify the five biggest oil industry users of municipal and industrial water by volume. The five biggest oil industry users of municipal and industrial water shall work together to develop and implement a plan identifying new measures to reduce municipal and industrial water use by 2020. The plan shall address the following activities, as appropriate: steam generation; drilling and completions (including hydraulic fracturing); dust control; compaction activities related to construction; and landscaping. Through the KernFLOWS initiative or other efforts (e.g., Groundwater Sustainability Agency), the five biggest oil industry users of municipal-and-industrial water shall also work with local agricultural producers and water districts to identify new opportunities to increase the use of produced water for agricultural irrigation and other activities, as appropriate. Any produced water treated and used for agricultural irrigation or other activities shall be tested and monitored to assure compliance with applicable standards for such agricultural irrigation or other uses. **MM 4.17-3** In the County's required participation for the formulation of a Groundwater Sustainability Agency, the Applicant shall work with the County to integrate into the Groundwater Sustainability Plan for the Tulare Lake-Kern Basin, best practices from the oil and gas industry to encourage the re-use of produced water from oil and gas activities, and (with appropriate treatment) to produce new water supplies for other uses such as agricultural irrigation and groundwater recharge. The produced water re-use goal is 30,000 acre-feet per year, which would offset more than the current use of imported water and groundwater from non-oil bearing zones by the oil and gas industry. **MM 4.17-4** The Applicant shall work with the County on the Groundwater Sustainability Plan to increase Applicant use of reclaimed water and reduce the Applicant's use of municipal-and-industrial quality imported surface water or groundwater. The Applicant will provide copies of water use reports produced under AB 1281 to the Groundwater Management Agency, which will then integrate this information into the Groundwater Sustainability Plan required under the Sustainable Groundwater Management Act.	Significant and unavoidable	All Tiers
Impact 4.17-5 Result in a Determination by the Wastewater Treatment Provider that Serves or May Serve the Project that it has Adequate Capacity to Serve the Project's Projected Demand in Addition to the Provider's Existing Commitments	Less than significant	Implement MM 4.17-1, as described above.	Less than significant	All Tiers
Impact 4.17-6 Be Served by a Landfill with Insufficient Permitted Capacity to Accommodate the Project's Solid Waste Disposal Needs	Potentially significant	Implement MM 4.17-2 and MM 4.17-3, as described above, and the following: **MM 4.17-5** During construction activities for Project facilities, the Applicant shall not store construction waste onsite for longer than the duration of the construction activity, or transport any waste to any unpermitted facilities. The Applicant shall also reduce construction waste transported to landfills by recycling solid waste construction materials, such as taking materials to recycling and reuse locations listed in the brochure on recycling construction and demolition materials available on the Kern County Waste Management Department website.	Less than significant	All Tiers

Table 7-2: Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation

Impact	Level of Significance before Mitigation	Mitigation Measure(s)	Level of Significance after Mitigation	Applicable Tier
Impact 4.17-7 Fail to Comply with Federal, State, and Local Solid Waste Statutes and Regulations	Potentially significant	Implement MM 4.17-5, as described above.	Less than significant	All Tiers
Impact 4.17-8 Cumulative Impacts on Utilities and Service Systems	Potentially significant	Implement MM 4.17-1 through MM 4.17-5, as described above.	Significant and unavoidable	All Tiers

7.2 Responses to Comments

7.2.1 Global Responses

1: Ministerial Permit Process

Several commenters questioned the proposed ministerial permit process. The County is authorized to amend its zoning ordinance to provide for the ministerial approval of future oil and gas activities in the County, even though such future projects will not be subject to individual CEQA review. "Land use regulations are a manifestation of local police powers conferred by the California Constitution." (Barclay, et al., *Curtin's Cal. Land Use and Planning Law* (34th ed. 2014) p. 2.; see Cal. Const., art. XI, § 7 ["A county or city may make and enforce within its limits all local, police, sanitary, and other ordinances and regulations not in conflict with general laws."].) The police power grants cities and counties the authority to adopt ordinances to "control and organize development within their boundaries as a means of serving the general welfare." (*Wal-Mart Stores, Inc. v. City of Turlock* (2006) 138 Cal.App.4th 273, 303.) Commenters may prefer a different approach that would require discretionary review for all future activities, but the County is within its constitutionally-granted land use authority to structure the Revised Amended Zoning Ordinance to allow ministerial approvals of certain activities, and such an approach does not run afoul of CEQA.

The Project considered in this EIR is similar to the project upheld by the *Court of Appeal in San Diego Citizenry Group vs. County of San Diego* (2013) 219 Cal.App.4th 1 (*San Diego*). In that case, the County of San Diego wanted to encourage the growth of the local wine industry by adopting zoning amendments to streamline the winery approval process. Under the proposed regulations, boutique wineries would be allowed to be developed in San Diego County "by-right," without the need to obtain any discretionary approvals or to conduct any CEQA review. As part of its zoning amendment process, San Diego County certified an environmental impact report that analyzed environmental impacts of unregulated "by-right" winery development. The *San Diego* EIR determined that, by approving an unlimited number of future wineries as a matter of right, the proposed zoning amendment would cause 22 different significant and unavoidable environmental impacts in seven different resource categories.

Upon review, the Court of Appeal acknowledged that the San Diego County's zoning ordinance amendment would "allow the by-right operation of certain wineries" and "that by-right uses are not subject to discretionary zoning approvals and are thus not subject to environmental review, unless some other discretionary approval is required." Nevertheless, the Court of Appeal upheld the *San Diego* EIR after finding that it properly disclosed that the county's streamlined zoning process would cause significant environmental effects that might be otherwise avoided if each winery project was instead subject to a discretionary approval process that included individual CEQA review. According to the Court of Appeal, the *San Diego* EIR "served its purpose as a disclosure document, by informing the public of the potential environmental impacts of approving the project. … CEQA does not mandate that every environmental impact be mitigated. Rather, so long as it has

made an informed decision in adopting a statement of overriding considerations, an agency need not require mitigation."

As in *San Diego*, here the County is proposing a zoning amendment that would encourage industry growth through a streamlined regulatory process with the application of environmental protections that, in many cases, will authorize new development without additional environmental review. Kern County currently contains approximately 75 active oil and gas fields, and approximately 2,500 wells are drilled in the County every year. It is not practical for individual environmental review to be conducted on every single well or groups of wells. The County lacks the resources to process potentially thousands of oil and gas Negative Declarations or EIRs each year. The economic consequences for operators would be severe, delaying drilling for many months during the preparation of costly individualized CEQA documents. Moreover, such individualized review would be highly repetitive, as the thousands of Negative Declarations and EIRs would re-analyze the same impacts and prescribe the same mitigation for each new well or group of wells throughout the County.

Accordingly, an important purpose of the Revised Amended Zoning Ordinance is to eliminate time-consuming and costly reviews of individual well and field development activities, by establishing a ministerial site plan review process which incorporates mitigation identified in this EIR. As such, future County actions processing individual site plans will not trigger further CEQA review by the County. In addition, this process will avoid the need for responsible agencies to prepare additional CEQA documents for individual well or field development proposals when they are considering the discretionary decisions within their respective jurisdictions. Only if the criteria for supplemental CEQA review under CEQA Section 21166 are met would additional review be necessary. (CEQA Guidelines, §§ 15096(e)(3), 15162.) Such streamlined permitting is a permissible objective reflecting land use policy decisions within the authority of a county board of supervisors. (*San Diego*, *supra*, 219 Cal.App.4th 1).

While this streamlining may avoid individualized-CEQA review for many projects, it is not analogous to a "shortcut" around environmental review. To the contrary, the Amended Zoning Ordinance significantly increases the County's oversight over oil and gas extra that are currently allowed "by right," without any ministerial or discretionary review, under the County's Zoning Code. The Amended Zoning Ordinance includes over 100 new procedural and substantive requirements applicable to Project activities, all of which have been subject to disclosure and review in the EIR.

CEQA is satisfied so long as this EIR properly informs the public of the Project's potential environmental effects on the basis of substantial evidence. CEQA review is only required when a public agency proposes to undertake a discretionary "project," which CEQA defines to mean "the *whole of an action*, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect change in the environment." (CEQA Guideline § 15378(a)(1)(emphasis added).) Here, the discretionary action that requires CEQA review is the County's proposed adoption of the Amended Zoning Ordinance. CEQA thus requires this EIR to analyze the environmental effects of the "whole of the action," which includes the future oil and gas activities that might be authorized under the Amended Zoning Ordinance. The degree of specificity

in this EIR thus corresponds to the degree of specificity in the proposed Project and serves as a "project-level" EIR not only with respect to the County's proposed adoption of the Amended Zoning Ordinance, but also with respect to future oil and gas activities that may be authorized by the County in accordance with the Amended Zoning Ordinance, just as in the *San Diego* case.

To ensure that this EIR presents a conservative analysis of likely impacts that might occur if the Project is approved, this EIR makes a number of conservative assumptions in order to present a "worst case" impact scenario and to design feasible measures to mitigate such "worst case" impacts. The conservative assumptions carried forward in this EIR include but are not limited to the following:

- All new well activities in the County are assumed to occur on Project Area lands that are under the County's jurisdictional control and non-jurisdictional areas are addressed as part of the cumulative impact analysis;
- The EIR analysis assumes that ongoing environmental effects that are part of the baseline environmental conditions are instead new impacts caused by the Project that require mitigation;
- Project-related land disturbance is conservatively estimated based on existing land use disturbance associated with oil and gas activities, then further increased by 1.2 to 3 acres per well site (depending on Subarea) to provide a conservative assessment of potential impacts;
- Project-related land disturbance assumptions are also based on the conservative assumption that new well construction and operations will not utilize existing access roads and other oil and gas infrastructure to their full potential, especially in the more heavily developed Tier 1 areas, and will thus require additional disturbances;
- Future replacement or expansion of existing oil and gas facilities are conservatively assumed to result in new land disturbances, even though not all facility replacement and expansion activities will cause new land disturbances;
- The EIR conservatively assumes that, under Project conditions, 264 more well stimulation treatments will annually occur than actually occurred under baseline conditions, even though the number of future stimulation treatments is expected to be similar to baseline conditions;
- For the purpose of analyzing and mitigating agricultural impacts, the EIR conservatively assumes that all land disturbed by oil and gas activities within the Tier 2 area will be to unique and important farmlands, even though not all land within Tier 2 falls into those categories;
- For purposes of analyzing and mitigating air quality impacts, the EIR conservatively assumes that the number of wells to be built in the Project Area will exceed the number of wells projected to be authorized under the Project;
- For the purposes of analyzing and mitigating impacts to wetland features, the EIR conservatively assumes that the Project's wetland disturbance area includes waters that

are not regulated as wetlands, such as artificial ponds and drains used for agricultural, oil and gas operations, mining, and other industrial activities;

- Potential impacts to modeled special status species were conservatively characterized in terms of annual impacts to all identified habitat categories for each species analyzed within the Project Area, which includes urbanized, agricultural, or high-density oil and gas production areas where predicted habitat values have been reduced or eliminated;
- Potential impacts to non-modeled special status species were conservatively analyzed to assume that impacts will occur even in areas where there is an extremely low likelihood of species impact;
- The EIR conservatively assumes that all Project Area land located above 2,000 feet in elevation is high quality golden eagle and condor habitat, and that disturbance in these areas could result in significant impacts to the species without mitigation;
- The EIR conservatively mitigates the Project's direct greenhouse gas emissions to net zero levels, an emission level below applicable thresholds of significance;
- To provide a conservative assessment of Project-related impacts to water supplies, the EIR assumes that all oil and gas municipal and industrial (M&I) water use will be provided by groundwater, not surface water supplies, and will be of sufficient quality to potentially be utilized for agricultural, urban or other M&I activities;
- To provide a conservative estimate of Project-related impacts to water supplies, the EIR further assumes that State Water Project surface supplies that are sometimes available in wet years will never be available during the life of the Project;
- To provide a conservative estimate of Project-related impacts to water supplies, the EIR further assumes that future Central Valley Project (CVP) water supply delivery levels in the Project Area will only be sourced from Class 1 (firm) contract supplies under future conditions, even though other CVP water supplies may be available in wet years;
- To provide a conservative estimate of Project-related impacts to water supplies, the EIR further assumes that recycled water projects currently being considered by Project Area water suppliers will not produce recycled water to serve the Project, even though such supplies may in fact become available in the future;
- The EIR's assessment of potential flooding impacts conservatively assumes that a catastrophic failure of dam facilities would occur, if at all, under full capacity conditions, even though full capacity typically occurs only in wet years;
- The EIR conservatively assumes that all Project-related well construction will disturb land throughout the life of the well, even though the permanent footprint of most wells will be less than what is projected by the EIR; and
- The EIR's assessment of Project noise impacts conservatively assumes that Project Area topography is flat, that there are no structures that will shield Project-related sounds sources, and that noise impacts will be generated by the largest operating drill rigs in

operation in the United States even though such rigs are not commonly utilized in the Project Area.

Since the EIR's analysis of Project impacts is often based on conservative assumptions, the EIR's predicted level of Project-related impacts is more severe than will likely occur under Project conditions. Nevertheless, future oil and gas activities will be required to mitigate for such "worst case" impacts scenarios, even if they won't individually cause every impact identified in the EIR. While the mitigation imposed is roughly proportional to the impacts anticipated under a "worst case" scenario, the Amended Zoning Ordinance is expected to result in fewer impacts under actual Project conditions than assumed by the EIR.

As discussed in DEIR Chapter 3, Project Description, the Amended Zoning Ordinance would establish updated development, implementation standards and conditions to address environmental impacts of pre-drilling exploration, well drilling, and the operation of wells and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring, and plugging and abandonment (the "Implementation Standards and Conditions"). In addition to establishing minimum setback requirements, and requiring compliance with all applicable federal, state and county rules and regulations, the Amended Zoning Ordinance's Implementation Standards and Conditions would also require compliance with all applicable mitigation measures and additional regulatory requirements set forth in this EIR.

In addition, the Amended Zoning Ordinance would establish "Oil and Gas Conformity Review" and "Minor Activity Review" ministerial permit procedures to govern the County's approval of future well drilling and operations and to ensure compliance with the Implementation Standards and Conditions. The Oil and Gas Conformity Review and Minor Activity Review processes will ensure comprehensive review of all drilling activities and other minor oil and gas activities while requiring consistent, comprehensive mitigation based on defined Tiers of surrounding land uses, as specified in the Amended Zoning Ordinance. An oil and gas permit applicant that can clearly demonstrate that its project complies with the Implementation Standards and Conditions will be eligible for streamlined ministerial approval that would not require additional CEQA review. Such projects would, however, be required to implement every applicable mitigation measure described in this EIR, whether or not the applicant's project would actually cause every impact such mitigation measures are designed to address. Moreover, under the Oil and Gas Conformity Review and Minor Activity Review process, the County will have no discretion to waive any mitigation requirements for any particular oil and gas projects. All mitigation requirements will be mandatory for every project.

Since individual oil and gas projects seeking ministerial approval would be required to comply with every applicable mitigation requirement established by this EIR, in exchange for streamlined approval, most projects will be required to mitigate for some impacts that they don't actually cause. In contrast, oil and gas projects subject to a discretionary approval process can only be required to mitigate for environmental impacts when there is evidence such impacts are likely to occur. In this sense, the Amended Zoning Ordinance's ministerial approval process is environmentally superior to

the typical discretionary approval process because its comprehensive mitigation program applies even when on-the-ground impacts may not occur.

Finally, it should be noted that not all future oil and gas projects will be eligible for streamlined permitting under the Amended Zoning Ordinance. For example, projects proposed in residential and commercial zoning districts (i.e., the Project proposed within Tier 4) will be required to obtain a conditional use permit, which is a discretionary approval subject to additional CEQA compliance obligations. Similarly, projects that cannot demonstrate compliance with the Implementation Standards and Conditions will not be allowed to proceed unless they first obtain a conditional use permit following an additional round of CEQA compliance.

A question has been raised as to whether the streamlined permitting process is truly ministerial. CEQA Guidelines § 15369 define "ministerial" to mean "a governmental decision involving little or no personal judgment by the official as to the wisdom or manner of carrying out the project. The public official merely applies the law to the facts as presented but uses no special discretion or judgment in reaching a decision. A ministerial decision involves only the use of fixed standards or objective measurements, and the public official cannot use personal, subjective judgment in deciding whether or how the project should be carried out." As described by the courts, a ministerial permit is one which can be "legally compelled without substantial modification or change." *Friends of Westwood, Inc. v. City of Los Angeles* (1987) 191 Cal. App. 3d 259, 269. By contrast, a "discretionary project" is defined as a project which requires the exercise of judgment or deliberation . . . as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statues, ordinances, or regulations." CEQA Guidelines § 15357. While not determinative, a municipality's classification of a certain approval process as ministerial is entitled to great weight. *Friends of Davis v. City of Davis* (2000) 83 Cal. App. 4th 1004, 1015.

The process outlined in the EIR creates a ministerial permitting program in which mitigation measures and mandatory performance standards apply to all oil and gas developments within the scope of the Project. The County reviews permit activities only to determine conformity with applicable mitigation measures and standards; it does not engage in an exercise of judgment or deliberation. Since the Project's Conformity Review process involves only the use of fixed standards and objective measurements, it has been determined by the County that such Conformity Review permits are ministerial in nature. This determination is entitled to great weight. *Id.*

It has been suggested that the permitting system is not properly characterized as ministerial. It has been argued by some commenters that isolated phrases in the mitigation measures have created a discretionary approval process. Multiple cases have been cited on this point, but the facts of these cases are distinguishable:

***Natural Resources Defense Council v. Arcata National Corporation* (1976) 59 Cal. App. 3d 959, 970.**

Arcata National has been cited for the proposition that a discretionary element, specifically assessing whether a logging plan had "adequate" drainage and utilized the general contours of

the land "to the full extent practicable," rendered approval discretionary. This is a mischaracterization of the case. While the court did list non-quantitative standards in determining the nature of the permit, the court found it "even more important[]" that the agency official was granted authority "'to state reasonable conditions' which in his 'professional judgment' are necessary to bring a conforming plan into compliance with the rules.'" *Id*. at 272. The mitigation measures proposed by the EIR are substantially more specific than those at issue in *Arcata National*. Further, the mitigation measures do not require nor do they authorize officials to formulate their own conditions in an exercise of professional judgment. As such, the principles in *Arcata National* are not in play here.

***Friends of Westwood, Inc. v. City of Los Angeles* (1987) 191 Cal. App. 3d 259, 270.**

Friends of Westwood has been cited as holding that the power to determine what building components are "adequate" renders approval discretionary. However, this is a mischaracterization. It was not that the municipality had the power to determine "adequacy" which rendered the permit discretionary. As in *Arcata National*, the permitting process in question expressly allowed for the exercise of an agency official's discretion. *Id*. at 274. Further, the granting of the permit in *Friends of Westwood* also involved "several departures from standards the city council had enacted," including an exercise of discretion to exempt the project from consistency with the general plan, allowing the development to intrude into a low-density specific plan area. No such departures have been authorized by the mitigation measures or by the County. Further, those mitigation measures allowing multiple pathways require that the chosen pathway meet or exceed objective standards. This is distinct from the standard in *Friends of Westwood* allowing variation when the modification "conforms to the 'spirit and purpose' of the ordinance." *Id*. In contrast to the permitting regime in *Friends of Westwood*, the Project does not authorize or require the exercise of personal judgment in its conformity review.

The scope of CEQA extends to hybrid projects of a mixed ministerial-discretionary character and that doubts whether the project is ministerial or discretionary should be resolved in favor of the latter characterization. *Miller v. City of Hermosa Beach* (1993) 13 Cal. App. 4th 1118, 1139. However, the permitting process created under the Project is not of this mixed character. When an activity falls within the scope of the project, there is no exercise of personal judgment or deliberation; the agency merely determines conformity with the applicable standards.

2: Project vs. Program EIR

Several commenters assert that environmental review for an ordinance must be conducted on a program level rather than a project level. Other comments assert that this EIR lacks sufficient detail to be considered a project-level review.

This EIR contains a comprehensive analysis of the impacts of the proposed Project, including adoption of the Amended Zoning Ordinance as well as oil and gas development expected to be undertaken pursuant to the amended ordinance in coming years. Section 2.6.3 of the DEIR explains how the Project Objectives influenced the analytical approach to this EIR. Specifically, the County desires to strengthen environmental protections while maintaining a largely ministerial site plan

approval process in the future. By conducting a project-level review of the Amended Zoning Ordinance and future development pursuant to the ordinance at this time, the EIR informs the policy decisions reflected in the Ordinance, and allows the County to identify performance standards and mitigation measures that most effectively and efficiently address both the large scale and localized effects of oil and gas development. The impact analysis has been performed on a landscape or regional scale, and the EIR also contains extensive analysis and mitigation measures at the micro scale. As such, the EIR meets CEQA's requirements for a project-level review both for the Amended Zoning Ordinance and the development undertaken in the future under the Ordinance. The EIR undertakes a detailed analysis of site-specific impacts and mitigation measures by using the Kern County Data Basin, a publicly accessible science-based mapping and analysis platform that supports learning, research, and sustainable environmental stewardship, and provides map-based data in support of county planning efforts.

A lead agency may, but is not required to, use a program-level CEQA review to consider related actions in the early stage of the particular program's planning process.[1] Ultimately, however, the degree of specificity required in an EIR corresponds to the degree of specificity in the project being described in the EIR.[2] Accordingly, the question is not whether a program EIR should have been prepared for this Project, but whether the EIR addressed the environmental impacts of this Project to a "degree of specificity" consistent with the underlying activity being approved through the EIR.[3] Here, the environmental impacts covered in each resource section are analyzed at several different levels, from regional impacts and policy issues to highly localized effects and tailored mitigation. Each level of analysis informs the development of the mitigation measures, which are ultimately imposed at the well or parcel level using the Data Basin GIS tool.

Beginning on a regional or landscape level, the EIR analyzes the entire Project Area using geographic boundaries, concentrated oil and gas exploration and production areas, and historic and current land uses and zoning. Geographic boundaries divide the three project subareas into Eastern, Western and Central Subareas. Areas which have historically had concentrated oil and gas production activities (and which include the California Department of Conservation Division of Oil, Gas, and Geothermal Resources' (DOGGR's) "Administrative Boundary" areas) are Core Areas.[4] The EIR also analyzes and characterizes the Project Area by categorizing lands into Tiers based on existing and zoned land uses.[5] The EIR then analyzes potential impacts of the Project, analyzing differences within and between the Subareas and Tiers.

By applying these categories to the analysis, the EIR is able to home in on Project impacts that are unique to, for example, a subdivision in the Eastern Subarea. For example, within the Biological Resources section of the DEIR, Table 4.4-1 shows how many acres of vegetation cover exist in each

[1] 14 Cal. Code Regs. §15168(b)(1)-(4).
[2] 14 Cal. Code Regs. §15146.
[3] *Citizens for a Sustainable Treasure Island v. City and County of San Francisco*, 227 Cal. App. 4th 1036, 1052 (2014) (citing CEQA Guidelines, § 15146 and § 15168, subd. (c)(5)).
[4] Core Areas are described in detail in Section 3.4.3 of the EIR, beginning at page 3-23.
[5] Tier Areas are described in detail in Section 3.4.4 of the EIR, beginning at page 3-24.

Subarea—and for each Tier within that Subarea. The table presents a clear picture of the type of vegetation that could be impacted in any given Tier within any of the three Subareas. It shows, for example, that while Fresh Emergent Wetlands are present within Tier 2 lands of all the Subareas, they also exist in Tier 4 lands of the Central Subarea. Later tables similarly show the estimated disturbance acreage within Subarea and Tier.[6] Impacts to species were then analyzed based on the disturbance acreage and either a modeling approach or, where available, species-specific occurrence information.[7] Using this analysis, the EIR identifies mitigation measures for the potential impacts identified. The mitigation measures identified in the EIR will be populated in the Data Basin and linked to Subarea, Tier, and Core or Non-Core area as applicable. The Conformity Review process outlined in the ordinance, combined with the Data Basin GIS website, is the implementing mechanism for the applicable measures.[8]

Section 19.98.070 of the Amended Zoning Ordinance sets forth a lengthy checklist of activities that will trigger a Conformity Review or Minor Activity Review. The Amended Zoning Ordinance also sets forth the required contents of an application for Conformity. Information requested may differ depending on the Tier in which the proposed activities take place. The applicant must provide the assessor parcel number(s) (APNs) related to the activities. The Data Basin mapping tool will provide for a streamlined review of oil activities on a well or parcel-specific basis. By entering the APNs into the Data Basin, the mitigation measures and site specific characteristics of each parcel can be displayed for ease of review and public information. The ordinance further specifies that the applicant must demonstrate compliance with applicable mitigation measures.[9]

This approach is consistent with many other ordinances and permitting processes. For example, in 2008 the Los Angeles County Board of Supervisors adopted the Baldwin Hills Community Standards District (CSD) to regulate oil and gas production activities in the unincorporated portion of the Inglewood Oil Field.[10] The CSD establishes a detailed checklist of performance standards that operations are required to meet, and provides for the County Planning Director to issue ministerial approvals for projects that comply with those standards and with other requirements of the County's Planning Code.[11] Los Angeles provided CEQA coverage for this approach by preparing a detailed EIR that studied the impacts of all oil and gas development that would occur pursuant to the ordinance, and proposed mitigation measures that Los Angeles County incorporated into the requirements of the ordinance.[12]

Similarly, in 2014, Los Angeles County approved the East Los Angeles Third Street Plan, one of several plans for transit-oriented development in the Los Angeles metropolitan area. The plan, and the ordinance that implements it, provide detailed development standards and allow for the county to

[6] See, e.g., Table 4.4-71.

[12] Baldwin Hills CSD Final Environmental Impact Report, at 4-1, 6-1.

issue ministerial approval of certain projects after determining that the projects conformed to the plan.[13] Again, the EIR for the ordinance "covered" adoption of the ordinance by studying the impacts of all developments predicted to occur under the ordinance, and proposing mitigation measures to be adopted into the ordinance itself.[14]

The county's approach to this project EIR was recently validated in *Citizens for a Sustainable Treasure Island v. City and County of San Francisco*, 227 Cal. App. 4th 1036, 1052 (2014). There, the court held that San Francisco's preparation of a project-level EIR—instead of a program EIR—for a 20-year redevelopment project did not make the EIR inadequate even though future development was envisioned as part of the project description. Opponents of the project argued that the proposed project was an "overarching, conceptual plan or program" and that the project-level details could not become known until they were revealed in later project proposals.[15] The court reiterated that it is the substance of the EIR—not its label—which informs the decision makers of the level of specificity.[16]

The *Treasure Island* court also acknowledged that the "'degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR. [¶] … An EIR on a construction project will necessarily be more detailed in the specific effects of the project than will be an EIR on the adoption of a local general plan … .'"[17] Ultimately, the question before any court is whether the EIR has presented the decision makers with sufficient analysis to adequately consider the potential environmental consequences of the project.

The redevelopment project at issue in *Treasure Island* proposed to combine a special use district with zoning districts associated with detailed and binding development standards within each district. Opponents of the project argued that because the final layout of particular buildings was left for future agency review, the information about the project was not sufficiently finite or accurate to allow for a project-level review. Using the opponent's future building construction example, the court stated that the special use districts, combined with the voluminous detailed development standards, provided sufficiently concrete information about where future buildings would be located, along with separation, bulk and mass. In fact, the court stated, the EIR "made an extensive effort to provide meaningful information about the project, while providing for flexibility needed to respond to changing conditions and unforeseen events that could possibly impact the Project's final design."[18]

[16] *Id.* at 1048.
[17] *Id.* at 1051, citing 14 Cal. Code Regs. § 15146.
[18] *Id.* at 1053.

Like the *Treasure Island* project, this EIR provides an accurate and stable project description critical for conducting an analysis, even while maintaining flexibility necessary to account for the precise locations and nature of the future oil and gas production and development activities. The EIR describes in detail the types of equipment that will be used, the types of activities that will be conducted, and the associated potential impacts, and quantifies the potential impacts within both Subareas and Tiers. And like the *Treasure Island* EIR, this EIR provides a comprehensive analysis of the potential environmental consequences of the Amended Zoning Ordinance and future oil and gas development pursuant to that ordinance, and incorporates mitigation measures via the development standards incorporated in the ordinance which are, in turn, made a part of the mandatory Oil and Gas Conformity Review process. The EIR need not pinpoint the precise location of the future activities it has considered to provide a meaningful analysis of the impacts; the EIR "cannot be faulted for not providing detail that, due to the nature of the Project, simply does not now exist."[19] Viewed as an informational document, the EIR's Project Description provided sufficient information about the Project to allow the public and reviewing agencies to evaluate and review its environmental impacts, and also provided the required major characteristics of the Project.

Finally, like the *Treasure Island* project, the use of this EIR as a project-level EIR does not attempt to prospectively evade the possibility of future CEQA review. The EIR acknowledges the duty to perform supplemental CEQA review under Public Resources Code under section 21166 if a proposed action falls outside the project scope, or other changes necessitating subsequent CEQA review are met.[20]

This approach is also validated by the Court of Appeal's 2013 decision in *San Diego Citizenry Group v. County of San Diego*,[21] as discussed in more detail in Global Response #1 (Ministerial Review). In that case, the County of San Diego amended its zoning code to allow small boutique wineries to operate with no discretionary approvals or additional CEQA review. The Court of Appeal upheld the EIR for this zoning code amendment against multiple challenges, since the EIR fully disclosed, and proposed mitigation for, the full impact of all wineries that were predicted to be developed as a result of the ordinance.

During the public review period for this EIR, the Court of Appeal upheld a project-level EIR in *Backcountry Against Dumps v. San Diego County Board of Supervisors* (2015) 2015 WL 5451508 ("*BAD*") for a zoning update project that is substantially similar to the Project considered in this EIR. The *BAD* EIR was prepared for a county zoning ordinance amendment to establish administrative procedures to govern the approval of wind energy turbine projects. Similar to the Amended Zoning Ordinance in this case, the *BAD* zoning amended provided that small wind

City and County of San Francisco*, 227 Cal. App. 4th 1036, 1051 (2014) (explaining that if even a *program* EIR is sufficiently comprehensive in its analysis, a lead agency need not conduct further environmental review for future activities sufficiently analyzed in the EIR; the sufficiency of the EIR is based on its content, not its label).
[21] 219 Cal.App.4th 1 ("*San Diego*")

turbines (i.e., turbines with a rated capacity of not more than 50 kilowatts) and meteorological testing facilities were subject only to ministerial approval without additional CEQA review following a required conformity review process conducted by County staff to verify compliance with new development standards adopted by the *BAD* zoning amendment.[22] Similar this Project's Amended Zoning Ordinance at issue, the *BAD* zoning amendment also provided some structures (i.e., very large wind turbines) would not be eligible for ministerial approval and would instead require a discretionary conditional use permit subject to further CEQA review. On appeal, the Court upheld the *BAD* EIR after determining that it adequately disclosed and mitigated the project's environmental impacts without regard to the fact that the *BAD* zoning amendment would authorize significant energy development on a ministerial basis.

The above examples of similar regulatory programs demonstrate that there is nothing novel about the Project's proposed regulatory framework. Local agencies commonly include provisions in their respective zoning regulations that authorize a variety of land uses subject only to ministerial approval, including oil and gas well permits. The County's current zoning regulations allow Project activities to occur in many zoning districts within the County without ministerial or discretionary review, based on prior determinations regarding the general land use compatibility of continued oil and gas extraction activities and the sufficiency of third party expert agency regulations to protect human health and safety, and the environment. The County directed that the current ordinances be updated to substantially expand the County's oversight and enforcement role, which now includes over 100 new procedural and substantive requirements applicable to Project activities. The Board of Supervisors directed that this ordinance update process be procedurally structured to avoid imposing excessive administrative burdens, while assuring effective implementation and enforceability. Nevertheless, though the regulatory structure proposed by Project is substantially similar to analogous zoning ordinances enacted throughout the state following certification of a single project-level EIR, some comments state that a first tier program EIR is required for the Project as a matter of law. According to such comments, project-level EIRs are reserved only for specific individual well construction proposals and program EIRs are required for the adoption of policies, plans, programs, or ordinances that contemplate a "series of related actions." According to these comments, no matter how detailed the analysis in this EIR, CEQA prohibits the County form certifying a project-level EIR for a zoning amendment that would authorize ministerial well permits without additional CEQA review. As explained below, such comments are misguided.

No court has ever held, as a matter of law, that CEQA required a program EIR and prohibited a project-level EIR. The CEQA statute itself refers only to "environmental impact reports" or EIRs, making no distinction between project EIRs and program EIRs.[23] The CEQA Guidelines identify various types of EIRs, including project EIRs, master EIRs, general plan EIRs, subsequent EIRs, staged EIRs, supplemental EIRs, focused EIRs, and program EIRs.[24] However, the CEQA guidelines explain that these are but "examples of variations in EIRs" and that these variations "are not

[22] *BAD* at 1.
[23] Pub. Res. Code §§ 21003, 21061, 21000.
[24] CEQA Guidelines §§ 15161, 15162, 15163, 15166, 15167, 15168, 15175, 15175.5, 15179.5.

exclusive."[25] According to the CEQA Guidelines, the lead agency "may use other variations" if desired to "meet the needs of other circumstances."[26] Irrespective of the type of EIR that the lead agency prepares, the Guidelines state that *all* EIRs must "meet the content requirements discussed in Article 9 beginning with section 15120."[27] These include, among other things, the requirements to provide a project description, describe the environmental setting, analyze and mitigate significant impacts, consider alternatives, and discuss cumulative impacts.[28] Thus, CEQA provides a variety options the lead agency "may use" at its discretion, provided the content of each document variation meets CEQA's content requirements. As discussed above, the CEQA Guidelines explain that a program EIR "*may* be prepared" for "a series of actions that can be characterized as one large project[,]" but the Guidelines don't *require* a program EIR in such cases.[29] As the Court of Appeal held in *Treasure Island*, "the fact that this EIR is labeled a 'project' rather than a 'program' EIR matters little for purposes of its sufficiency as an informational document."[30]

CEQA Guidelines § 15166 governs the preparation of an EIR in conjunction with the adoption of a local general plan, the quintessential example of a local "policy, plan, program, or ordinance" that contemplates a "series of related actions." Section 15166 is a prime example of CEQA's focus on substance over form because it explains that the general plan *can itself serve as an EIR*, so long as it satisfies CEQA's mandatory content requirements. Notably absent from section 15166 is any mention of program EIRs. Thus, even were the project is as broad as a general plan, the lead agency has discretion to decide what sort of EIR to prepare, provided it meets CEQA's mandatory content requirements.

To claim that the County can legally adopt the Project *only* if it first prepares a program EIR is to focus on semantics, rather than content. However, "[i]t is the substance, rather than the form, of [the] document which determines its nature and validity."[31] "The degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR."[32] Therefore, "the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible."[33] Accordingly, the relevant question is not whether it is appropriate for the County to prepare a project-level EIR in this matter, but whether this EIR addresses the Project's environmental impacts to a "degree of specificity" consistent with the nature of the Project.[34] CEQA thus directs the County to focus on substance over form in order to ensure that this EIR provides "decision makers with sufficient analysis to intelligently consider the environmental consequences

of [the] project."[35] "Designating an EIR as a program EIR … does not by itself decrease the level of analysis otherwise required in the EIR. All EIR's must cover the same general content. The level of specificity of an EIR is determined by the nature of the project and the 'rule of reason,' rather than any semantic label accorded the EIR."[36]

Some comments equate project-level review with detailed site-specific development proposals, but they are not the same thing. CEQA has never mandated that an EIR evaluate site-specific, detailed, construction plans because such a requirement would limit CEQA's effectiveness by freezing proposed projects before environmental review has commenced. However, CEQA Guidelines § 15004(b) makes it clear that "EIRs … should be prepared as early as feasible in the planning process to enable environmental considerations to influence the project program and design[.]" Indeed, conceptual or illustrative plans suffice for project-level review, provided they provide sufficient information to enable the lead agency to evaluate the project's impacts.[37] As held in *Dry Creek Citizens Coalition v. County of Tulare*:

> [CEQA Guidelines § 15124(c)] requires a "general description" of the project's technical characteristics. "General" means involving only the main features of something rather than details or particulars. The "general description" requirement for the technical attributes of a project is consistent with other CEQA mandates to make the EIR a user-friendly document. For example, Guidelines section 15140 states the EIR's must be written in plain language so that decisionmakers and the public can rapidly understand them. The general description requirement also fosters the principle that EIR's should be prepared early enough in the planning stages of a project to enable environmental concerns to influence the project's design. A general description of a project element can be provided earlier in the process than a detailed engineering plan and is more amendable to modification to reflect environmental concerns.

Indeed, by describing numerous Project modifications implemented specifically to address environmental concerns raised during the Draft EIR's public review process, this document appropriately serves the very CEQA principles identified by the *Dry Creek Citizens* court.

Rio Vista Farm Bureau Center v. County of Solano (1992) 5 Cal. App. 4th 351, 372–73 has been raised as opposing authority. It has been suggested that *Rio Vista Farm Bureau* compels a tiered approach to environmental review when evaluating a more general project—such as the adoption or amendment of a zoning ordinance or a plan. However, *Rio Vista Farm Bureau* and the project are inapposite. In *Rio Vista Farm Bureau*, the agency approved an EIR and broad plan without conducting any site-specific project-level analysis. The court found the EIR was not required to conduct such an analysis because the EIR functioned as a "general planning device." *Id.* at 373. The scope of the plan in question was limited to "recitation of policies, requirements, and siting criteria"

[35] *In re Bay-Delta etc.* (2008) 43 Cal.4th 1143, 1175.
[36] *Friends of Mammoth v. Town of Mammoth Lakes Redevelopment Agency* (2000) 82 Cal.App.4th 511, 533.
[37] *Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 28 ("*Dry Creek Citizens*").

and future site-specific activities were made contingent on further CEQA review. *Id.* The *Rio Vista Farm Bureau* EIR was a program EIR that was not intended to provide project-level CEQA coverage and was adequate as such. *Rio Vista Farm Bureau* is therefore inapposite. As discussed above, the EIR provides project-level analysis. The EIR has not deferred environmental analysis to a later date, but has conducted a thorough review of all environmental impacts and developed a suite of mitigation measures that are tailored to each specific oil and gas activity and its location within the Project area.

Cases discussing the necessity of tiering when drafting a program EIR were raised by several commenters. These cases are not relevant to the Project. This EIR is a project-level EIR. A second environmental evaluation is only necessary when the first-tier analysis is limited to broadly analyzing the implementation of a general set of actions. *In re Bay-Delta Programmatic Envtl. Impact Report Coordinated Proceeding* (2008) 43 Cal. 4th 1143, 1169–1170; *Fiends of Mammoth v. Town of Mammoth Lakes Redevelopment Agency* (2000) 82 Cal. App. 4th 511, 528. The EIR is not so limited. As discussed above, the EIR engages in both regional and project-level analysis to create mitigation measures tailored to the specific conditions of an oil and gas activity and its site. This is distinct from cases like *In re Bay Delta* (in which the program-level EIR deferred analysis of certain environmental impacts to later review, necessitating future independent determinations of environmental impacts), *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal. App. 4th 1156 (in which the series of interrelated tasks at issue were subsequent plans, the effects of which were not addressed in the program EIR), or *Rio Vista Farm Bureau*. This EIR has not deferred its analysis for later review; it is not a program-level EIR. As such an iterative process is not necessary.

It has also been suggested by several commenters that the Project Description is inadequate for a project-level EIR. It is a correct statement of law that "[a]n accurate project description is necessary for an intelligent evaluation of the potential environmental effects of a proposed activity." *San Joaquin Raptor/Wildlife Rescue Ctr. v. Cnty. of Stanislaus* (1994) 27 Cal. App. 4th 713, 730. It has been suggested that there are certain, minor discrepancies in the Project Description and that, as a result of these discrepancies, the EIR fails to comport with CEQA's requirements for a project-level EIR. These alleged discrepancies in, for example, the duration of the Project are inconsequential. "CEQA requires an EIR to reflect a good faith effort at full disclosure; it does not mandate perfection." *Dry Creek Citizens Coal. v. Cnty. of Tulare* (1999) 70 Cal. App. 4th 20, 28. It has been suggested that the alleged discrepancies in the EIR rise to the level of discrepancies found in *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal. App. 4th 70, 89. In that case, however, the EIR failed because the fundamental purpose of the project was unclear; the EIR claimed that the project was designed to allow more flexibility in crude supplies, including "increasingly heavier" crude, while the project description denied that the project would enable processing of heavier crude. No commenter has identified even an alleged discrepancy rising to this level of conflict. The alleged discrepancies do not make the Project Description incomplete, vague, or obscure. The EIR functions as an informational document allowing the public and the County to "ascertain the project's environmentally significant effects, assess ways of mitigating them, and consider project alternatives." *Sierra Club v. Cty. Of Orange* (2008) 163 Cal. App. 4th 523, 533.

Finally, some comments state that the Project and this EIR are intended to evade future CEQA review of oil and gas activities, but this argument is belied by the record. This EIR clearly acknowledges the County's obligation to perform supplemental environmental review under Public Resources Code section 21166 if the annual Project activity level or total activity level assumed by this EIR is exceeded.[38] If the criteria for subsequent or supplemental CEQA are met, further review environmental would be required for the County's continued reliance on Project's conformity review process.[39]

3: EIR Shelf Life

Commenters propose that the Amended Zoning Ordinance and this EIR should have a defined "shelf life" and expire after a specific term. In its EIR on Oil and Gas Well Stimulation Treatments in California prepared pursuant to Senate Bill (SB) 4, for example, DOGGR noted that a County representative predicted that "the County's EIR should remain sufficient and reasonably up-to-date for a period of approximately 10 years." (p. C.2-43).

There is no scheduled expiration date for a County zoning ordinance. The development standards and conditions specified in the Amended Ordinance will continue to apply unless and until the Zoning Ordinance is amended again. Moreover, there is no set time frame beyond which an EIR expires or must be supplemented. This EIR is expected to remain sufficient and up-to-date for a period of approximately 20 years, and could remain so beyond that time frame, depending on whether annual oil and gas activity levels turn out to be less than expected and there is no other trigger for further CEQA review. The County has also included in the Revised Amended Ordinance an annual cap on the number of well permits that may be issued through the ministerial approval process to 3,647 since that is the maximum number of ministerial permit approvals that are reasonably foreseeable and included within the scope of this EIR.

The Project Description in this EIR assumes that 3,647 new wells will be drilled per year, which is a conservative (high) number of new oil and gas well activity. In practice, it is likely that annual activity levels will be lower, especially if oil prices remain low for a substantial period of time. However, the analysis of environmental impacts is based on the conservative assumption that this level of activity will continue each year for the next 20 years. Similarly, the mitigation measures identified in this EIR are designed to mitigate impacts based on this projected level of activity. The County can rely on this EIR and further environmental review would not be needed, as long as the annual projected activity level is not exceeded (no more than 3,647 wells are drilled in a single calendar year), the total projected activity level does not exceed 72,940, and none of the environmental impact projections are exceeded such that continued implementation of the Amended Ordinance would cause a significant new impact not identified in the EIR, or worsen a significant impact already identified in the EIR.

[38] Draft EIR at 3-30.
[39] *Id*.

At the point that either the annual activity level or total activity level is exceeded, or there is evidence of a significant new or significantly worse impact, the County will consider whether the circumstances require further environmental review in accordance with CEQA (Pub. Res. Code) Section 21166 and CEQA Guidelines Section 15162. CEQA Guidelines Section 15162 provides that no subsequent or supplemental EIR is required for a project unless one or more of the following events occurs:

(1) Substantial changes are proposed in the project which will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

(2) Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

(3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete, shows any of the following:

(A) The project will have one or more significant effects not discussed in the previous EIR;

(B) Significant effects previously examined will be substantially more severe than shown in the previous EIR;

(C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

(D) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

The County will make the decision as to whether further CEQA review is required and its determination is entitled to deference. *A Local & Regional Monitor v. City of Los Angeles* (1993) 12 Cal.App.4th 1773, 1799-1800. In making that determination, the County is specifically authorized to limit its consideration to effects not considered in connection with the previous EIR. *Temecula Band of Luiseño Mission Indians v. Rancho Cal. Water Dist.* (1996) 43 Cal.App.4th 425, 437. Similarly, a Responsible Agency will use this EIR unless it determines that subsequent CEQA review is permissible under the same standard described above. Guidelines, § 15096(e). See Global Response 6: Use of this EIR by the Lead Agency and Responsible Agency.

If and when the County determines that any of the criteria in CEQA Guidelines Section 15162 is met, further CEQA review would be required (e.g., an Addendum, supplemental EIR, etc.) in order

to continue to issue permits under the Amended Ordinance. However, until one or more of those criteria is met, the County may continue to implement the Amended Ordinance (e.g., by approving additional wells under the Conformity Review process) without further CEQA review. For example, if 2,697 wells have already been permitted in one year, but the County determines that drilling a 2,698th well will not result in new or worse significant impacts than were already considered in this EIR, supplemental environmental review would not be required, and the County could approve the 2,698th well through the Conformity Review process. If, on the other hand, the County determines that the 2,698th well would cause a new or worse significant impact than already considered in this EIR, then further CEQA review would be required before approving the well.

4: Surface Owners and Agriculture

Several commenters raised questions about how the Project relates to the property rights and protections of surface owners on split estates. In certain Project Area (as defined in the DEIR) locations, surface and subsurface mineral rights, including the ownership of oil and gas deposits, have been split or severed by deed, government patents or by similar property conveyances. These lands are commonly referred to as "split estates." The different situations include:

1. Surface owner and mineral owner are different and both have rights to the surface;
2. Surface owner and mineral owner are different but the surface owner controls down to 500 feet or other depth and then the mineral ownership begins; and
3. The surface owner owns the private surface and the minerals are owned by the Federal Government or State Government. All federal mineral ownership, regardless of location is managed by the US Department of Interior, Bureau of Land Management (BLM). This zoning ordinance does not apply to the permitting of the BLM.

The Amended Ordinance include significantly enhanced permit review timelines and requirements that create new incentives for mineral estate owners to negotiate with surface owners prior to initiating construction activities for oil and gas extraction activities on split estate parcels. The zoning ordinance requirements center on the requirement for the surface owner to sign the site plan submitted for the Oil and Gas Conformity review by the County in order to expedite permit processing, and provide an alternate permit procedure for applications for which surface owner signatures have not been included in the Site Plan. The Revised Amended Ordinance (Section 7.1.3) and revised Mitigation Measures (Section 7.1.4) included in this Final EIR further clarify and expand on the notice and documentation rights of surface owners, and on mitigation measures applicable to agricultural areas.

Responses to the many related comments on these surface owner agricultural issues are provided below, and in responses to comment letters.

In contrast with most oil and gas-producing states, California has not adopted legal principles or legislative measures that have amended or lessened the common law rights of mineral estate owners to enter into and use surface land as reasonably required to extract oil, gas and other minerals. In addition, oil and gas exploration and production in the Project Area is not subject to permitting or review in most agricultural zoned locations under the existing Zoning Ordinance. As a result, under

current law, Project Area surface right owners that may have concerns about mineral rights development have relatively limited opportunities and short timeframes to affect mineral estate, including oil and gas operations and activities on split estate parcels. The proposed revisions to the Zoning Ordinance implement new mineral estate owner disclosure to the surface owners and County oversight requirements that provide surface estate owners with additional timeframes to understand the actual site development plans so they can engage directly with mineral owners and seek modifications to the operational plans. These modifications and discussions can include changes to the site plan to minimize surface disruption and any other issues of concern, to a much greater extent than under existing state and local law.

Split estates occur in the Project Area and throughout California and the United States. A substantial majority of the land in Colorado, Wyoming and other Rocky Mountain states, for example, consists of split estates created by federal land grants. Over 140,000 acres of land within or adjacent to the Project Area consists of split estates resulting from federal mineral reservations, and the subsurface rights to oil, gas and similar mineral assets for these parcels are managed by the U.S. Bureau of Land Management (BLM). Private transactions can also sever a parcel's mineral and surface ownership. The locations of privately-generated split estate properties in the Project Area cannot be precisely identified from available data sources, but most locations where agricultural, ranching and other surface owners have expressed concerns about split estate oil and gas estate operations are located in the Eastern and Central Subareas. The ownership and control of surface and mineral rights has not been severed, and is subject to common ownership and management, within a significant portion of the Project Area.

Split estates are relatively unique to the United States and can give rise to situations in which the surface and subsurface mineral rights holders may be completely unknown to each other. Split estate surface owners may conduct activities, such as farming, for several years without contact with subsurface rights holders. As mineral market conditions or extraction technologies change, however, mineral rights holders may seek to explore and produce oil, gas or other subsurface minerals in new locations and where surface activities, such as farming, ranching or other industrial developments , have become established. The unanticipated legal entry on to and use of surface land by mineral estate owners can disrupt existing surface activities, such as crops and orchards, and has generated legal conflict throughout the United States.

American common law considers a mineral estate to be "dominant" over a surface estate because without surface access sufficient to locate and remove subsurface deposits, a mineral ownership would have no value. As a result, most states, including California, provide a mineral estate owner with surface rights that are often likened to an implied easement to use surface land in any way "reasonably necessary" for mineral exploration, drilling, production, or recovery. Under these principles, a mineral estate holder may reasonably access and use surface land without the surface estate holder's consent. The common law of split estates often does not specifically require that surface owners be compensated for reasonable mineral estate-related surface disruption, although mineral rights holders typically compensate surface owners for damage to crops or existing structures. Surface owners also have the right to sue mineral owners for damages for negligent or unreasonable surface land use.

Conflict between surface and mineral rights holders in split estate parcels, especially in the western United States, has generated judicial and legislative efforts to attenuate the common law dominance of the mineral estate and to provide surface estate owners with more capacity to negotiate access and land use agreements that reduce potential surface farming or other disruption. Many state courts, including in Texas and Colorado, have modified the common law of split estates to include an "accommodation doctrine." In general, states that recognize the accommodation doctrine allow surface owners to bring a lawsuit to show that a mineral estate owner can reasonably use a less disruptive, alternative method for extracting oil, gas or other minerals. Should a surface owner prevail in court, the mineral estate owner is required to implement the less disruptive method identified by the surface owner to reduce impacts to the surface estate.

Many states, including Alaska, Colorado, Montana, New Mexico, North Dakota, South Dakota, Utah, and Wyoming have also enacted "surface damage" or "surface use" statutes that partially attenuate the common law dominance of the mineral estate. While statutory requirements vary from state to state, most of these laws require: (1) notice to surface owners prior to commencing drilling or other major operations; (2) good faith negotiations with the surface owner if the surface owner desires to modify a mineral operation plan; and (3) methods for valuing, compensating or bonding to protect surface owners from damages to surface assets. Similar requirements have been implemented by the BLM for federal mineral estates, including evidence of good faith negotiation with a surface owner prior to the issuance of drilling or other mineral-related permits, and bonding if an agreement with the surface owner cannot be completed.

The practical effect of the accommodation doctrine (as defined above), state surface damage or surface use statutes in other States, and the BLM mineral estate management policies, is to create incentives for the mineral estate holder to notify and reasonably accommodate the concerns of surface estate holders prior to the commencement of oil, gas or other mineral operations. None of the state statutes or BLM mineral policies specifically require that surface owners consent to a mineral estate plan of operations as a condition of permit issuance (Schwan 2015; Jones 2013; Watson 2008).

California remains one of the few significant oil and gas producing states that has not, through court actions, recognized the accommodation doctrine and that has not enacted surface damage or surface use statutes specifically for split estates. As discussed in the DEIR, the current County Zoning Ordinance allows for oil and gas exploration and production as an "of right" land use in most of the County that is zoned for agricultural uses, including virtually all locations where agriculture and ranching occurs on split estate parcels in the Project Area. Consequently, the common law dominance of mineral estates (e.g., oil and gas rights holders) over surface estate holders (e.g., agricultural and ranching operators) has been much less lessened or amended by legal or legislative action in California, including the Project Area, than in almost all other major oil and gas producing states.

California law provides relatively limited rights to surface owners. The state legislature most recently addressed split estates involving oil and gas operations in 2012 (effective 2013) and amended Section 848 of the California Civil Code to require that a mineral estate owners provide a surface owner with: (1) at least 5 days advance notice prior to commencing "non-surface-disrupting

activities such as surveying, water and mineral testing, and removal of debris and equipment not involving use of an articulated vehicle on the real property;" and (2) at least 30 days prior notice before conducting "surface-disrupting activities, including drilling new wells, constructing structures, bringing articulated vehicles or excavation equipment on the site, or reclamation of the real property after the surface has been disturbed." The 30-day notice must identify (A) the extent and location of the prospecting, mining, or extraction operation; and (B) the approximate time or times of entry and exit upon the real property. Unlike many other states, and the BLM mineral lease policies, these provisions do not specifically require that the mineral estate owner discuss or attempt to negotiate an intended plan of operations with an agricultural surface owner to minimize crop or other surface impacts. As amended, Section 848 only allows a surface owner to file a lawsuit "to enjoin the prospecting, mining, or extracting operation" until a mineral rights owner has complied with the applicable notice requirements. Based on common law lawsuits in other states, such as Texas, surface owners should also be able to sue for damages if the mineral estate owner's surface use is unreasonable or negligent (Norwood 2007). There are few if any reported cases in California involving surface owner claims that mineral estate owners unreasonably used surface land to access and remove oil, gas or other minerals.

Except in rare circumstances, almost no mineral-related activities on split estate lands in the Project Area would be subject to review and approval by the County under the existing the Zoning Code. Certain oil and gas operations are subject to general Zoning Code requirements, such as setbacks from schools, but the existing Ordinance does not generally impose specific mineral operation planning and impact avoidance, minimization and mitigation requirements in the Project Area, including split estate lands. Once the Section 848 notice requirements have been completed, (specifically the 30 day notice before conducting surface disturbance activities) and applicable state permits, primarily a permit from the Division of Oil, Gas and Geothermal Resources have been obtained, a mineral estate owner may generally commence surface activities consistent with common law and that are reasonably required to access and remove oil, gas or other minerals. As noted in the July 27 Workshop Briefing Staff Planning Department Staff Report , certain agricultural and ranching surface owners have asserted that, under existing state and local law, mineral estate owners have failed to contact them to discuss reasonable mineral operation accommodations after providing the required 30 day notice and obtaining state Department of Oil, Gas and Geothermal Resource (DOGGR) permits. These surface owners have been concerned that oil and gas operations on split estate lands have resulted in the creation of new access roads, productive crop removal, conflicts over the placement of pipelines, tank farms and electrical connections and disputes about monetary compensation that can only be addressed after the fact by means of frequently costly and time-consuming litigation.

The proposed Zoning Ordinance amendments provide surface owners with significantly enhanced protection from potential oil and gas activity impacts, and opportunities to provide input into and negotiate the terms of mineral estate operations that could affect surface uses All oil and gas activity in the Project Area subject to the proposed Zoning Ordinance amendments will be required to comply with much more substantial County development standards and mitigation requirements, including 88 new mitigation requirements (several of which incorporate multiple additional measures). These new mitigation measures are required to reduce impacts related to the proposed

Zoning Ordinance amendments under the California Environmental Quality Act (CEQA). They are not applicable to oil and gas activity under the existing Zoning Code as there is currently no County permit necessary for these areas.

Proposed mitigation measures that directly benefit and protect surface owners include the following:

Mitigation Measure (MM) MM 4.1-1, which requires that oil and gas applicants use existing roads whenever possible and route new roads in a manner that minimizes surface disturbance.

MM 4.1-2, which requires that all derricks, boilers, and other drilling equipment used to drill, repair, clean out, deepen or redrill any well with oil, gas, or other hydrocarbon, and sump facilities, be removed from a drill site within 90 days after completion of production tests or after abandonment of any well.

MM 4.1-3, which requires that all surface sumps and ponds be permitted only to the extent authorized by the Central Valley Regional Water Quality Control Board (via waiver, Waste Discharge Requirements, or other form of authorized written documentation) and must comply with all applicable legal requirements and mitigation measures for sumps serving as storage, percolation or evaporation ponds for produced water.

MM 4.1-4, which requires screening of oil or gas tanks located within 200 feet of any sensitive receptor, fencing within 500 feet of any dwelling, and limits oil and gas equipment to 80 feet in height.

MM 4.2-1, which requires 1:1 mitigation by means of land or easement conservation expenditures for oil and gas exploration and extraction activities that are: 1) on land designated Prime, Farmland of Statewide Importance or Unique Farmland; and 2) that have been actively farmed 5 years or more out of the last 10 years and provides significant economic incentives to minimize agricultural land disturbance.

MM 4.2-2 which required numerous measures that protects crops and structures adjacent to oil and gas activities on active agricultural lands, including: (a) surface water runoff and drainage well pads mitigation; (b) implementation of a Spill Prevention Countermeasure and Contingency Plan or Division of Oil Gas and Geothermal Resources (DOGGR) Assembly Bill 1960 spill plan and treatment of chemical spills treated in accordance with the DOGGR well stimulation treatment regulations; (c) speed limits to reduce dust generation or an alternate, more stringent dust suppression standard as adopted by the San Joaquin Valley Air Pollution Control District; (d) watering unpaved roads for dust suppression and control; (e) vehicle mud, dust, and weed seed tracking control where unpaved roads intersect with paved roads; (f) stormwater controls during well drilling, reworking, and/or decommissioning; (h) secondary containment for hazardous materials; (h) alignment of overhead electrical or communication lines on each applicant's site plan to the greatest extent feasible with existing access roads and the minimum distance between the access road and the well installation or other oil and gas facility and parallel to tree or row crops or, if not feasible, alignment to minimize surface disturbance and impacts to surface activity; and (i)

location of underground pipelines serving an oil and gas facility on each applicant's site plan, the recordation of these locations with the USAA, and periodic pipeline inspection and maintenance.

MM 4.3-2, which requires numerous measures to reduce construction emissions of particulate matter, including: (a) implementing a Fugitive Dust Control Plan in compliance with San Joaquin Valley Air Pollution Control District fugitive dust suppression regulations; (b) discontinuing operations if winds exceed 25 miles per hour; (c) limiting debris track out on paved roads to 50 feet; (d) moistening hauling materials when loaded into dump trucks; (e) covering all haul trucks with soil, sand, and other loose materials on public roads; (f) limiting soil loads below 6 inches or the freeboard of the truck, minimizing soil dump drop heights, tight gate seals on dump trucks; (g) a 25 mph traffic speed limit; (h) grading suspension when visible dust emissions exceed 20%; (i) other fugitive dust control measures as necessary to comply with San Joaquin Valley Air Pollution Control District Rules and Regulations, minimizing disturbed areas, and (j) revegetating disturbed areas as soon as possible after disturbance if an area is no longer needed for oil and gas activities.

MM 4.3-5, which requires the identification of and setbacks from, or alternative impact minimization and avoidance measures for, any sensitive receptors (e.g., farmworkers, farm residences, and other occupied agricultural facilities or locations), for air quality purposes on each applicant's site plan within 3,000 feet of a construction site for a proposed new well or other ancillary facility or equipment (excluding pipelines).

MM 4.3-7, which requires that each applicant prepare and implement an Odor Complaint Management Plan to the County, including a designated contact for odor complaints, creation of a log for odor complaints, and protocol for handling odor complaints.

MM 4.4-15, which requires numerous measures to avoid and minimize impacts to protected and sensitive species that will also protect agricultural operations, including: (a) a 20-mile-per-hour speed limit in all areas of disturbance and on unpaved roads unless otherwise posted and the prohibition of off-road traffic outside of designated access routes is prohibited; (b) disposal of all food-related trash items and all forms of microtrash, such as wrappers, cans, bottles, bottle tops, and food scraps in closed containers removed daily from the site; (c) dust control measures for all excavations, spoils piles, access roadways, and parking and staging areas; (d) herbicides and rodenticide use restricted to those approved by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife, and no herbicide use for vegetation control on split estate land in Tier 2 areas without surface owner approval; (e) drilling installations and operations must comply at all times with the applicable federal, State, County, and local law ordinances and regulations; (f) the use of previously disturbed areas for new oil and gas activities to the maximum extent feasible to minimize the amount of new disturbance; (g) vehicle, equipment, and material storage limited to previously disturbed areas, no construction or operational material placement or storage outside of the planned disturbance area or stockpiled for future disposal, and the removal of all concrete and asphalt debris should from the site for recycling or proper disposal; (h) washing or maintaining tracked vehicles and other construction equipment to be weed-free prior to entering and working within areas of new disturbance; (i) full containment, collection and offsite disposal of all truck washing, paint, equipment, or similar activities; and (j) prohibitions on pets, firearms and smoking except in designated areas on a site.

MM 4.6-1, which requires substantial earthquake risk analysis and structural mitigation, including for pipelines that carry oil, gas, produced water, or other oil and gas related materials, to avoid and minimize damage due to seismic activity that could affect Project Area agriculture.

MM 4.6-3, which requires that structures on slopes greater than 30% be avoided unless an applicant determines that mineral recovery is infeasible from a different location, and site-specific professional engineering certification is submitted concluding that the new equipment will not cause landslides that could affect adjacent and downstream activities, including agriculture.

MM 4.6-4, which requires a repressuring plan to avoid and minimize potential oil and gas related surface subsidence.

MM 4.6-5, which requires avoiding the placement of infrastructure on expansive soils unless an applicant determines that mineral recovery is infeasible from a different location, and site-specific professional engineering certification is submitted concluding that the new equipment will not cause substantial risks to life or property, including agriculture.

MM 4.8-1, which requires a comprehensive Worker Environmental Awareness Program that includes hazardous materials and hazardous waste management, and emergency preparedness, release reporting, and response requirements.

MM 4.8-2, which requires transportation, storage and disposal of all hazardous materials in compliance with the Hazardous Materials Transportation Act and measures to avoid roll-over accidents involving cargo tank trucks.

MM 4.8-3, which requires numerous spill prevention and cleanup measures, including: (a) construction activities allowing for easy cleanup of spills and construction crews that have sufficient tools, supplies, and absorbent and barrier materials to contain and recover spilled materials, fuels and lubricants shall be stored only at designated staging areas; (b) fuel and lubricant tanks with appropriate secondary spill containment, (c) fuel trucks with oil spill response kits and equipment at all times; (d) regular routine equipment maintenance at the well pad, and prompt collection and lawfully disposal of wastes at an authorized recycling, treatment or disposal facility; (e) berms and/or dikes (secondary containment) for permanent above-ground bulk tanks, foundations with a passive leak detection system, and no tank placement in areas subject to periodic flooding or washout; and (f) a sufficient supply of sorbent and barrier materials on construction sites and contain runoff from contaminated areas, including shovels, drums for collection and disposal of contaminated soils, above ground tank inspection, drain locks, inspections conducted as much as possible in staging areas; and maintaining or repairing equipment and vehicles to reduce the likelihood of fuel or oil line breaks and leakage.

MM 4.8-4, which requires several measures to prevent, repair, and remediate accidental leaks and spills from oil and gas operations, including (a) the identification and evidence of integrity testing for all gas, oil and produced water pipelines located within 200 feet of any sensitive receptor; (b) a pipeline management plan for all waste gas lines less than or equal to 4 inches in diameter, developed and implemented in accordance with DOGGR regulations Title 14, Division 2, Chapter 4,

Section 1774.2. The Pipeline Management Plan shall include; (c) pipeline design , testing methods, maintenance, recordkeeping requirements; (d) County notification of reportable quantities of fuel, gas, petroleum or hazardous materials leaks within 48 hours of discovery, and to other applicable agencies as required by other laws, with immediate containment, clean up , and repair.

MM 4.8-5, which requires that if an oil and gas applicant observes visual or olfactory evidence of contamination, or if soil contamination is otherwise suspected, work near the excavation site must be terminated, the work area must cordoned off and appropriate health and safety procedures implemented for the location.

MM 4.8-6, which requires that all oil and gas applicants implement the most up-to-date best management practices to prevent the release or accidental spillage of solid waste, garbage, construction debris, sanitary waste, industrial waste, naturally occurring radioactive materials, oil and other petroleum products, and other wastes into water bodies or water sources.

MM 4.8-7, which requires that exploration and development activities be conducted in accordance with the Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development The Gold Book (Bureau of Land Management 2007), including sufficiently impervious secondary containment,, not storing chemical containers on bare ground or exposed to the sun and moisture; maintenance and secondary containment of chemicals containers; proper construction of containment dikes, containment to the extent feasible for all produced water tanks, and the removal of trash, junk, and other materials not in current use.

MM 4.8-8, which requires compliance with well and related facility construction standards for well completions, testing, and limiting a facility's environmental footprint and the incidence of releases of hazardous substances in accordance with the practices described in applicable American Petroleum Institute publications, State Water Resources Control Board General Orders or appropriate Regional Water Quality Control Board waste discharge requirements or general orders.

MM 4.8-9, which requires that all operations subject to the proposed Oil and Gas Conformity Review process comply with the pipeline management plan, including inspection and maintenance requirements, as administered by DOGGR pursuant to 14 California Code of Regulations 1774.

MM 4.8-10, which requires annual maintenance checks for leaks and corrosion and inspection schedules as required by California law.

MM 4.8-11, which requires annual worker training consistent with the facility's Hazardous Materials Business Plan and Spill Prevention, Control and Countermeasures Plan.

MM 4.8-12, which requires that cyclic steam injection activities above reservoir fracture levels comply with the terms and conditions of an applicable DOGGR site-specific Project Approval Letters for an injection project and appropriate monitoring and response if any surface expressions are observed.

MM 4.8-13, which requires compliance with all DOGGR safe drilling and drill casing practices, well design, construction and well management requirements, blowout requirements, all other provisions

of 14 California Code of Regulations 1744 and other applicable regulations, and the practices described in Recommended Practice for Well Control Operations (American Petroleum Institute 2012).

MM 4.8-14, which requires reporting and notification of reportable contamination caused by oil and gas activities.

MM 4.8-15, which requires numerous measures pertaining to the use of acutely hazardous chemicals, including (a) evaluating whether other alternative chemicals that are less hazardous could be used; (b) ensuring that the smallest quantity of necessary acutely hazardous materials are stored on site; (c) notifying building occupants and the Kern County Fire Department when and where acutely hazardous materials would be used; and (e) ensuring that all applicable employees are trained to handle, transport store, dispose of, and are trained in the spill prevention, control and countermeasures for acutely hazardous materials.

MM 4.8-20, which requires the implementation of numerous onsite equipment and training measures to prevent fires from oil and gas activities.

MM 4.8-21, which requires minimization of onsite use of chainsaws, chippers, vegetation masticators, grinders, tractors, torches, and explosives and the implementation numerous onsite equipment and training measures to prevent fires from and safely use such equipment.

MM 4.8-22, which requires that trash be stored in closed containers and removed from the site at regular intervals.

MM 4.9-1, which requires that oil and gas applicants comply with all applicable federal, state, regional and local agency water quality protection laws and regulations, and commonly utilized industry standards, including (where applicable) stormwater and well stimulation treatment permit coverage.

MM 4.9-2, which requires that a drainage plan and related measures be prepared in accordance with the Kern County Grading Code, the Green Code and approved by the Kern County Engineering, Surveying and Permit Services Department, Floodplain Management Section where oil and gas sites subject to the proposed Zoning Code do not have stormwater permit coverage.

MM 4.9-3, which requires that all drilling operations either use a closed loop system to avoid discharges of drilling muds and fluids, or obtain coverage under the State Water Resources Control Board low threat discharge General Order, individual Waste Discharge Requirements issued by the Central Valley Regional Water Quality Control Board for the unit, or obtain coverage under a general order issued by the Central Valley Regional Water Quality Control Board applicable to drilling ponds.

MW 4.9-4, which requires that any activity subject to proposed Zoning Code Chapter 19.98 not conduct any injection activity regulated by the Underground Injection Control program, including enhanced oil recovery activities that discharge into any underground source of drinking water unless the aquifer has been exempted by the United States Environmental Protection Agency or injection

has otherwise been authorized by the U.S. Environmental Protection Agency or by DOGGR under delegated authority under the Safe Drinking Water Act.

MW 4.9-5, which requires that any activity subject to proposed Zoning Code Chapter 19.98 not discharge produced water into any surface disposal facility unless the facility has received Waste Discharge Requirements or a waiver from the Central Valley Regional Water Quality Control Board.

MM 4.9-6, which requires that all oil and gas constructed facilities within a mapped 100-year floodplain be protected from the maximum potential elevation of flooding during a 100-year flood by elevating structures or by implementing containment berms or other protective measures in compliance with the standards in the Kern County Floodplain Management Code and Chapters 19.50 and 19.70 of the Kern County Zoning Code.

MM 4.12-1, which requires noise mitigation measures for any sensitive receptors within 3,000 feet of an oil and gas construction site.

MM 4.12-2, which requires that all oil and gas wells be located at least 190 feet from the closest sensitive receptor.

MM 4.14-1, which requires that oil and gas applicants defray the costs of purchasing additional County fire fighting equipment that would also provide service to agricultural and other portions of the Project Area.

MM 4.14-2, which requires that oil and gas applicants defray the costs of increasing the capacity of the County Sheriff's Rural Crime Unit, including one new Sergeant, two new Senior Deputies (investigators), three new Deputies, One new Support Technician (clerical), and new helicopter usage, which would also provide service to agricultural areas (e.g., responding to agricultural copper, other metal and equipment thefts).

MM 4.16-1, which requires that oil and gas applicants pay a road maintenance mitigation fee of $1,500 per permit for new wells to pay for roadway maintenance and related improvements to address wear and tear on roads caused by oil and gas industry traffic, including in agricultural areas.

MM 4.16-2, which requires a traffic control plan for oil and gas operations that use arterial, collector, or Caltrans routes for access to a construction site to maintain normal and emergency access to adjacent property, including agricultural areas.

MM 4.17-1, which requires approved septic systems in appropriate locations for oil and gas operations and maintenance buildings.

MM 4.17-2, which requires that oil and gas applicants increase the re-use of produced water and reduce the use of municipal and industrial-quality ground or surface water to the extent feasible in accordance with a plan submitted to the County to conserve higher quality water supplies for agricultural and other uses.

MM 4.17-3, which requires that oil and gas applicants work with the County during the County's participation in the creation of a Groundwater Sustainability Agency and to integrate into the Groundwater Sustainability Plan for the Tulare Lake-Kern Basin, best practices from the oil and gas industry to encourage the re-use of produced water from oil and gas activities, and (with appropriate treatment) to produce new water supplies for other uses such as agricultural irrigation and groundwater recharge.

MM 4.17-4, which requires that oil and gas applicants work with the County on the Groundwater Sustainability Plan to increase the use of reclaimed water and reduce the use of municipal-and-industrial quality imported surface water or groundwater.

MM 4.17-5, which requires that oil and gas applicants not store construction waste onsite for longer than the duration of a construction activity, not transport any waste to any unpermitted facilities, and reduce construction waste transported to landfills by recycling solid waste construction materials.

Other DEIR mitigation measures, including air emissions control measures identified in Section 4.3 (Air Quality) and greenhouse gas emissions reduction measures in Section 4.7 (Greenhouse Gases) would also benefit Project Area agriculture by improving regional air quality and implementing measures consistent with state and federal climate change policies.

The proposed Zoning Ordinance amendments include a two-track system of oil and gas project review and permitting that requires, for a shortened timeframe for permitting, the mineral estate owners to secure surface owner signatures on the site plan required for the application. This application can only be submitted after the 30 day notification period required by State Law and now included as a requirement of the County as well.

The requirement for a site plan signature is not a requirement for a surface access agreement. A surface access agreement is a voluntary agreement between mineral and surface estate owners that identifies mutually acceptable locations, methods for conducting oil and gas exploration and monetary compensation on split estate land. The method and terms of obtaining the signature on the site plan is between the negotiating parties and enforceable through the courts. It will not be presented to the County on the application and the County will not be an responsibly for enforcement of any terms of that agreement, but only the necessary information and details required for the Oil and Gas Conformity Review site plan.

The proposed Zoning Ordinance amendments would expedite processing of oil and gas applications for a split estate parcels that have the signature of the surface owner on the site plan. Under these circumstances, the County would issue permits to an oil and gas applicant in most cases within 7 days after the statutory 30-day notice period required by Civil Code Section 848 (or a shorter period, if waived by the surface owner). Subsequent compliance with permit terms and conditions, including all applicable mitigation and monitoring requirements, would be conducted under a self-certification program by the project applicant. Consequently, oil and gas mineral estate owners that contact, discuss, and reach agreement with surface estate owners regarding oil and gas operations prior to submitting an application to the County will be subject to substantially expedited, streamlined and less costly permit review, approval, and compliance requirements.

In contrast, applications for oil and gas activities on split estate parcels that do not have the signature on the site plan of the surface owner will be subject to a minimum processing time of 120 days, including the pre-application notification process under Section 848 (30 days), a mandatory first County site plan review (30 days), a mandatory County second site plan review process (30 days), and a minimum County permit approval waiting period of 30 days. If additional site plan reviews are required, each would extend for at least a mandatory 30-day period. Applicants that are issued permits for split estate lands without the signature on the site plan will also be required to pay for: (1) a County building inspector to be present at all times during construction activities to ensure full and complete compliance with the approved site plan; and (2) a County or third party expert retained by the County to confirm compliance with all Zoning Ordinance, mitigation, and federal and state laws. Applicants will not be allowed to self-certify construction, mitigation and state and federal law compliance if the surface owner has not signed the site plan.

The longer, mandatory processing period, and additional independent inspection and compliance monitoring requirements, are intended to provide mineral estate owners with significant incentives to contact the surface owner and engage in meaningful discussions and attempt to obtain the signature on the site plan. During the County review process, applicants will be required to provide evidence that the proposed site plan has been provided to the surface owner within the initial 30-day notice period. In addition, the County will invite the surface owner to meet with County staff to understand the permitting process, including the mitigation measures that will be applicable to oil and gas operators on the site, during the first mandatory 30-day site plan review process. While the County staff will not negotiate site plan terms or conditions with or on behalf of either the applicant or the surface owner, the surface owner will be able to provide staff with any concerns and comments regarding the site plan. The second mandatory 30–day review will then provide feedback to the surface owner on any site plan modifications provided by the applicant in the second submittal. If at any time during the process, the signature is obtained the process immediately goes to the streamlined 7 day review, self certification process.

As a result, applicants will have incentives to consider the concerns of and negotiate with surface owners to reduce permit issuance delays, and avoid the cost and coordination issues associated with onsite County construction period and compliance inspections. Surface owners will, at a minimum, be provided with a detailed site plan for the proposed oil and gas activity, an opportunity to meet with and discuss the site plan with County staff, and with additional time to negotiate and discuss with the mineral estate holder or to seek other legal remedies, including the possibility of an injunction.

In sum, the proposed Zoning Ordinance amendments will significantly enhance the negotiating position of a split estate surface owner relative to the mineral estate owner compared with existing state and local law. As discussed above, California has not recognized or adopted legal principles or legislative measures that have amended or lessened the legal dominance of the mineral estate under the common law of split estate land in other jurisdictions. Recent state law amendments applicable to oil and gas activities on split estates require only 30 days notice before the commencement of ground disturbance activities, and allow for injunctive relief only until the mineral owner provides the required notice. Most oil and gas operations that may occur on split estate agricultural or

ranching lands in the project area are currently not subject to County permit, review or mitigation requirements and must comply with only a limited number of Zoning Ordinance and related County building and operational standards. The proposed Zoning Ordinance amendments: (1) create, for the first time, a County permit and review process for most oil and gas activities in the project area including on split estate agricultural or ranching lands; (2) impose significantly enhanced mitigation, monitoring and operational standards on any County- permitted oil and gas activity; (3) expedite permitting for applications that have the signature of the surface owners on the site plan for split estate parcels; (4) require much more extensive oil and gas site plan disclosures to split estate surface owners when applications do not include the required signature ; and (5) require significant additional permit processing time, and construction inspection and compliance verification requirements, with associated costs, that provide incentives for applicants and enhanced opportunities for surface owners to discuss and negotiate issues and concerns when oil and gas operations occur on split estate lands. The effect of the Zoning Ordinance amendments is to largely implement most of the measures that have been adopted in other states, and by the BLM for federal mineral parcels, that modify the common law dominance of mineral estates and provide surface estate owners with additional capacity to be educated on the oil operations proposed for their property, incentivize discussions and minimize the disruption of and damage to the mutually available surface space.

Additional information about split estates can be found in: (1) David L. Schwan (Schwan 2015) *Preemption Update: Local Attempts to Preempt State Regulation of Hydraulic Fracturing*, American Bar Association, January 2015; (2) Kendor Jones et al., (Jones 2103) *Split Estates and Surface Access Issues,* Landman's Legal Handbook, Chapter 9, Rocky Mt. Numerous commenters address the procedure through which oil and gas development may be commenced on a "split estate"; that is, a parcel of real property where the surface rights and the mineral rights are owned by different legal entities. Some commenters suggested that the County should refuse to permit any and oil and gas activities on a split estate without the surface owner's express consent. The County lacks authority to impose such a condition.

Mineral rights are distinct from "surface rights," i.e., the ownership of and right to use the surface of the land for residential, agricultural, recreational, commercial, or other purposes. A mineral right is also an interest in real property and may be sold, transferred, leased, or retained separately from the surface rights, in which case the mineral rights are said to be "severed", creating a split estate. In addition to the activities that occur in the subsurface, petroleum exploration and extraction involves the use of the surface for the establishment of well drilling and associated activities. Although the land overlying the oil and gas reservoir (the minerals) may have other surface uses (e.g., commercial businesses or residences), the oil or gas operator has a legal right to access the minerals and is entitled to extract them from the surface. The rights to use the land surface for these activities are

governed by applicable laws, regulations and court orders, as well as leases and other agreements that oil and gas operators have established with individual surface landowners.

California has long held that the right of entry onto the surface is incident to the grant of mineral rights and exists even without an express grant. Callahan v. Martin (1935) 3 Cal. 2d 110, 125–26; Dabney-Johnston Oil Corp. v. Walden (1935) 4 Cal. 2d 637, 649. As provided by California Civil Code section 3522, one who grants something to another person is presumed to grant whatever is essential to its use. By severing and selling a mineral interest or granting a mineral lease, surface owners have implicitly granted a right of entry onto the surface land. The County does not have authority to deny this pre-existing right, already held by the mineral owner, by conditioning a permit on express permission of the surface owner. Moreover, if the surface owner refused to give permission, the County would be subject to the potential cost of compensating the mineral rights owner for the "taking" of mineral property rights effected by the County's unlawful condition. Land use regulations can constitute improper takings under both the federal and California constitutions if they go "too far." See e.g., Lockaway Storage v. Alameda, 216 Cal. App. 4th 161, 184 (2013). Important factors in this regard are: the economic impact of the regulation; the extent to which the regulation interferes with distinct investment-backed expectations; and the character of the governmental action. Penn Cent. Transp. Co. v. N.Y. (1978) 438 U.S. 104, 124. The County does not have the resources to compensate mineral rights holders for the lost value of their investments.

More recently, the state legislature struck a balance between the concerns of surface owners and the rights of mineral rights holders. AB 1966, passed in 2012, amended the notice requirements in Civil Code Section 848. As amended, the statute requires a mineral owner/operator wishing to enter the property for exploration of minerals to provide a minimum of 30-days' advance notice to the surface owner. The notification must state the location and time in which the activity is planned to occur. Once notice has been provided, under California law, the mineral owner/operator may proceed to obtain a DOGGR permit and any other required federal, state or local permit(s) and, without consultation with the surface owner, may enter the property, remove obstructions and commence drilling. During this time, the surface owner may go to court to seek an injunction against the mineral owner/operator to stop all activities and to determine the relative rights and obligations of the surface owner and mineral rights owner. As both surface and mineral owners have a property right, the surface owner cannot lawfully bar or prevent the mineral owner/operator from accessing the minerals, unless the surface owner buys out the mineral rights. In passing this amendment to Civil Code Section 848, the legislature struck a balance between the concerns of surface owners and the long-standing right of mineral owners to enter on to the surface land.

The legislature further addressed surface owner concerns specifically related to well stimulation treatment in Senate Bill 4. Once an application has been deemed complete by DOGGR, a well operator must hire an independent entity or person to provide notification to every tenant and owner of neighboring property within a specified distance from the wellhead and horizontal projection of the applicable well at least 30 days before beginning a well stimulation treatment. Pub. Res. Code 3160(d)(6).

Conditioning the grant of a County permit on the surface owner's express consent would be unlawful and would disturb the balance of interests established by the legislature in AB 1966 and SB 4.

5: Use of EIR by Responsible Agencies

Some commenters questioned how this EIR would be used by other agencies with permitting jurisdiction, called "responsible agencies" under CEQA, over oil and gas production activities in Kern County. The following Global Response explains the difference between a "lead agency" and a "responsible agency" and discusses how this EIR will be used by responsible agencies when considering approvals for oil and gas activities in the County.

Under CEQA, the "lead agency" is "the public agency which has the principal responsibility for carrying out or approving a project which may have a significant effect upon the environment." (Pub. Res. Code § 21067). With respect to the EIR, the County is the "lead agency" because it has principal responsibility for "approving" the Project – *i.e.*, the Amended Zoning Ordinance – and "carrying out" the Project by issuing future permit approvals for oil and gas activities that implement the Amended Zoning Ordinance.

As explained in Draft EIR Chapter 2, Introduction, future oil and gas projects or actions authorized by the lead agency – *i.e.*, the County - in accordance with the Amended Zoning Ordinance may require subsequent discretionary approvals or permits from other public agencies. Under CEQA, such other public agencies are referred to as "responsible agencies."

A "responsible agency" is a public agency that proposes to carry out or approve a project for which a lead agency is preparing or has prepared an EIR or negative declaration. (CEQA Guideline § 15381.) For the purposes of CEQA, the term "responsible agency" includes all public agencies other than the lead agency that have discretionary approval power over a project. (*Id*.)

This EIR was prepared as a "project-level" CEQA document that is intended to be used by responsible agencies to comply with CEQA in conjunction with the issuance of subsequent approvals for future oil and gas projects in the County. The various state and local agencies that may serve as responsible agencies with respect to the Project, and thus may rely on this EIR for purposes of CEQA compliance, include, but are not limited to, the following: California Air Resources Board; California Department of Conservation Division of Oil, Gas & Geothermal Resources; California Department of Fish and Wildlife; California Department of Public Health; California Department of Toxic Substances Control; California Energy Commission; California Highway Patrol; California Public Utilities Commission; California Native American Heritage Commission; California Office of Historic Preservation; California State Lands Commission; Governor's Office of Planning and Research; Regional Water Quality Control Board, Central Valley District; State Water Resources Control Board; San Joaquin Air Pollution Control District; and the Kern County Council of Governments.

For purposes of CEQA, each permit issued for a new oil and gas well analyzed in this EIR constitutes just one component of a single overall "project," irrespective of whether such permit was

issued by the lead agency or a responsible agency. CEQA defines the term "project" to mean "the *whole of an action*, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect change in the environment." (CEQA Guideline § 15378(a)(1)(emphasis added).) CEQA expressly states that "[the] term 'project' refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies" and that "[t]he term 'project' does not mean each separate governmental approval." (CEQA Guideline § 15378(c).) Finally, CEQA is clear that, in order to "implement the lead agency principle[,]" where "the Lead Agency could describe the project as either the adoption of a [zoning amendment] or as a development proposal which will be subject to several governmental approvals[,]" then "the lead agency shall describe the project as the development proposal for purposes of environmental analysis." (CEQA Guideline § 15378(d).) Thus, for purposes of CEQA, the County is the "lead agency" not only with respect to its adoption of the Amended Zoning Ordinance, but also with respect to the full extent of the oil and gas well development that would be implemented pursuant to the Amended Zoning Ordinance. This is true despite that fact that such development "will be subject to several governmental approvals," some of which will be granted by various responsible agencies.

Will the County lose its lead agency status when it issues ministerial oil and gas well permits under the Amended Zoning Ordinance, followed by a discretionary approval issued by a Responsible Agency?

CEQA applies only to the discretionary actions of a public agency that may have a physical effect on the environment; it does not apply ministerial actions. (Pub. Res. Code § 21080(a), (b)(1).) An action is discretionary if the public agency is required to exercise judgement in deciding whether to approve or disapprove the particular activity, whereas an action is ministerial when the public agency need only determine whether there has been conformity with objective standards in applicable ordinances or other laws. (CEQA Guideline § 15357.)

Under the Amended Zoning Ordinance, most, though not all, oil and gas well permit approvals granted by the County will qualify as ministerial actions that are not individually subject to CEQA. However, the County does not lose its lead agency status simply because its implementation of the overall discretionary project – *i.e.*, its adoption of the Amended Zoning Ordinance – will be followed by ministerial approvals by the County and discretionary approvals by one or more responsible agencies. As discussed above, for purposes of CEQA, the term 'project' refers to the "whole of the action" and "does not mean each separate governmental approval." Indeed, CEQA mandates that the lead agency play an integral role in the implementation of the overall project well beyond the date on which the lead agency issues the project's last discretionary approval.

To reduce a project's significant environmental effects, the lead agency is required to adopt a mitigation monitoring and reporting program (MMRP) to ensure that its adopted mitigation measures will be complied with "during project implementation" and will not merely be adopted and later disregarded. (Pub. Res. Code § 21081.6(a)(1); CEQA Guideline §§ 15091(d), 15097(a); *Environmental Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1081.) Pursuant to CEQA Guideline § 15097(a), "until mitigation measures have been completed the lead agency remains responsible for ensuring that implementation of the mitigation measures occurs in

accordance with the [MMRP.]" Thus, by its plain terms, CEQA is structured to ensure that the County will maintain its status as the "lead agency," and will thus "remain responsible" for mitigation enforcement, well beyond its initial discretionary approval of the Amended Zoning Ordinance. Nothing in CEQA permits the County to avoid or surrender its lead agency obligations with respect to future oil or gas well development simply because the County permit authorizing such development is ministerial in nature.

A responsible agency has two primary roles in the CEQA environmental review process.

First, before completing an EIR, the lead agency is required to consult with and receive comments from every responsible agency that has jurisdiction over some aspect of the project. With respect to this EIR, for example, the County submitted a Notice of Preparation to each applicable responsible agency and received comments and recommendations from the responsible agencies regarding the scope of environmental analysis set forth herein. Upon publication of the Draft EIR, the County again consulted with responsible agencies, who provided comments on the Draft EIR that were considered by the County and responded to in the Final EIR. Indeed, the Final EIR incorporates many Draft EIR revisions to address comments made by various responsible agencies in this matter, as described in Final EIR Chapter [XXX], as well as performance standards and mitigation measures relating to potentially significant impacts identified by responsible agencies.

The second role that CEQA assigns to responsible agencies concerns their environmental review obligations when in considering subsequent discretionary approvals for a project for which the lead agency has prepared an EIR or negative declaration. Before reaching a decision on a discretionary approval for oil and gas projects in the County, the responsible agency's decision-making body must consider the environmental effects the environmental effects of the project in accordance with CEQA. Per CEQA Guideline 15096(a), a responsible agency complies with CEQA by considering the EIR or negative declaration prepared by the lead agency and by reaching its own conclusions on whether an how to approve the project involved. However, the responsible agency's consideration of a project for purposes of CEQA extends only to matters which fall within the jurisdictional control of the responsible agency. (*See RiverWatch v. Olivenhain Municipal Water Dist.* (2009) 170 Cal.App.4th 1186, 1202.)

By way of illustration, in this case, an applicant for a gas well permit to be issued by the County pursuant to the Amended Zoning Ordinance may also need a subsequent permit approval from the California Department of Conservation Division of Oil, Gas and Geothermal Resources (DOGGR), the State agency with primary jurisdiction over the surface and subsurface operation of oil and gas wells. Thus, in this example, DOGGR would comply with CEQA by considering this EIR's analysis of impacts related to those project features within DOGGR's jurisdiction and by reaching its own conclusions on whether and how to approve well project's initially authorized by Kern County pursuant to the Amended Zoning Ordinance.

As part of its consideration of the environmental effects related to the issuance of discretionary approvals for oil and gas projects in the County, the responsible agency must determine whether any alternatives or mitigation measures within its control are feasible and would substantially lessen or avoid a significant effect of the project on the basis of the lead agency's CEQA document, such as

this EIR. (CEQA Guideline § 15096(g)(1).) If the responsible agency finds that any alternatives or feasible mitigation measures within its jurisdictional control would substantially lessen or avoid a significant project effect, it may not approve the project, but must first adopt the feasible mitigation measures or the alternative. (CEQA Guideline § 15096(g)(2).)

To document its compliance with CEQA, a responsible agency must adopt findings for its approval of the project and, if necessary, a statement of overriding considerations that explains why the project was approved despite its significant environmental effects. (CEQA Guideline § 15096(h).). Finally, the responsible agency must certify that it reviewed and considered the information in the lead agency's EIR. (CEQA Guideline § 15050(b).) Once the above described tasks are complete, the responsible agency will typically file a notice of determination with the County or the State, as appropriate, which begins a thirty day period within which the responsible agency's CEQA compliance may be legally challenged. (CEQA Guideline § 15096(i).)

An EIR approved by a lead agency is conclusively presumed to comply with the requirements of CEQA for use by a responsible agency unless the EIR is legally challenged within the applicable statutory challenge period. (Pub. Res. Code § 21167.2.) Once the EIR is final, however, a lead or responsible agency may not require a subsequent or supplemental EIR unless it first finds, on the basis of substantial evidence, that either (i) substantial changes are proposed in the project that will require major revisions of the EIR, (ii) substantial changes have occurred in the circumstances under which the project is being undertaken that will require major revisions in the EIR, or (iii) new information of substantial importance to the project that was not known and could not have been known at the time the EIR was certified as complete becomes available. (Public Resources Code § 21166.) If the responsible agency can adequately substantiate any of these three findings, it may then, and only then, require additional CEQA review.

The degree of specificity in this EIR corresponds to the degree of specificity in the proposed Project and serves as a "project-level" EIR for CEQA purposes. A project-level EIR provides responsible agencies with the level of completed CEQA process required by such agencies to inform and reach final decisions regarding subsequent discretionary approvals and other actions regarding oil and gas activities proposed within the County. Based on the comprehensive project-level analysis, mitigation measures, and performance standards included in the EIR and the Amended Zoning Ordinance, it is anticipated that in the vast majority of future oil and gas production activities, implementation of the Amended Zoning Ordinance will not result in the need for responsible agencies with discretionary review and approval processes to prepare additional CEQA documents for individual well or field development proposals. Thus, the County expects that responsible agencies will generally rely only on this EIR to comply with CEQA when considering subsequent approvals for the oil and gas well projects analyzed in this EIR.

6: Baseline: 2012

A few comments questioned the existing environmental setting or baseline used in the DEIR. Generally, they assert that the number of wells drilled in 2012 is not a reasonable reflection of current oil and gas development activity. As explained below, the wells per year assumed in the baseline represents a conservative figure and was not calculated as an average of multiple prior years

(which could underrepresent the amount of activity under existing conditions in light of past fluctuations), or based on well completion data from 2013 or 2014, after the price of oil began to soften and fall. Commenters also question the use of 2012 numbers for plugging and abandonments and well stimulation.

The EIR's approach to environmental setting and baseline is described in the DEIR in Section 2.6.2 at pages 2-21 to 2-23. The DEIR explains that the current level of oil and gas development activity is one component of the existing conditions. The DEIR further explains that at the time environmental review commenced, 2012 was the most recent year for which complete data were available. The NOP was released in August 2013. In California, it typically takes one to two years for DOGGR to receive and review the relevant well data and release it for general distribution. Thus, at the time technical analyses were initiated to support the DEIR, 2012 data was the most recent complete data set available. This data set also was considered a reasonable choice for describing the existing conditions because it reflected the cumulative effect of technological and regulatory factors that influence activity levels.

The description of the current level of well activity was first developed by the Applicant's technical consultant, WZI Inc. (WZI), for County review. WZI began by reviewing the DOGGR database for years 1983 through 2012. The Annual Reports of the State Oil and Gas Supervisor for calendar years 2009 and earlier summarized well activity a number of different ways, including by DOGGR district, but not by county. By examining other DOGGR databases and reports, WZI determined that Kern County production generally accounts for 92% of the production from District 4, and adjusted the District 4 annual well activity numbers accordingly. For calendar years 2010 and 2011, no Annual Report of the State Oil and Gas Supervisor was produced, and annual reports since that time have been abbreviated reports labeled "preliminary." The preliminary reports contain aggregate, statewide activity data, and do not show the data by DOGGR district or by type of well. To fill in the gaps and determine the portion of statewide well activity that was attributable to Kern County, WZI reviewed the complete well database for the missing years. In addition, WZI calculated the statewide well activity occurring in Kern County for years 1995 to 2009, and applied that percentage to the statewide well activity for years 2010 through 2012 to calculate Kern County well activity for those years. DOGGR receives and compiles notices for many different well-related events. WZI sorted the data and compiled annual totals for new producing wells, as well as other types of wells. WZI clarified information in the DOGGR database through discussions with the oil and gas companies reporting well activity for DOGGR District 4. For the more recent years, WZI also cross-checked the totals for producing wells by interviewing the largest well logging company active in the state and comparing against their records.

As discussed at page 2-22 of the DEIR, data from 1985 through 2012 show wide fluctuations in the number of new well completions per year in response to the price of oil, available technology, available reserves, and changing regulatory requirements. Peak years for drilling activity during this period included 3,005 wells in 1985 and 2,896 wells in 2007. The most recent peak was 2,619 new well completions in 2012. The lowest activity year during this period was 1992 with only 730 new well completions.

A lead agency has the discretion to decide how the existing physical conditions can be most realistically measured, provided the agency's decision is supported by substantial evidence. Where an industry is subject to wide market fluctuations and trends, a lead agency must have latitude in selecting an appropriate baseline because "[e]nvironmental conditions may vary from year to year and in some cases it is necessary to consider conditions over a range of time periods."[40] Some comments claim that the lead agency was required to use an average of well completion activity in a number of prior years, and that by using a relatively high activity rate from 2012, the DEIR overstates baseline and underestimates the impacts of the Project. Neither CEQA nor reported cases require using a past average for the baseline. Rather, the California Supreme Court stated: "In some circumstances, peak impacts or recurring periods of resource scarcity may be as important environmentally as average conditions." In light of the past fluctuations in oil and gas development activity, using an average of activity levels over a range of prior years would tend to obscure peak activity that can contribute to impacts, and would underrepresent the amount of activity occurring at the time environmental review commenced.

The environmental setting/baseline information in the DEIR represents a reasonable choice based on available information. The DEIR reviewed prior years' data going back to 1985, and explained the rationale for using 2012 data in the description of existing environmental conditions. The 2012 data is not the highest activity level in the data set—the peak years were 1985 and, more recently, 2007. Neither is the 2012 data the lowest annual activity level. Rather, it is within the range of recent activity, and it is intended to reflect the cumulative effect of technological developments and regulatory changes, together with the current mature condition of most of the oilfields.

More importantly, the selection of 2012 as the year to represent existing environmental conditions does not skew the results of the Project impact analysis performed in the DEIR because this EIR does not subtract out the existing activity from the future impacts analysis to determine the net impacts caused by the Project. CEQA Guidelines Section 15125 requires an EIR to include a description of the physical environmental conditions in the vicinity of the project as they exist at the time of publication of the notice of preparation or commencement of the environmental review. Ordinarily, this environmental setting will constitute the baseline by which a Lead Agency determines whether an impact is significant. Where the project undergoing review involves the continuation of a prior program or activity, this means that the environmental baseline ordinarily includes continuation of the existing program or activity, even if that means that the baseline conditions and the conditions under the proposed future project are essentially the same.[41]

---

[40] *Communities for a Better Environment v. South Coast Air Quality Management District* (2010) 48 Cal.4th 310, 327-28, citing *Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 125.

[41] *Center for Biological Diversity v. Department of Fish and Wildlife,* (2015) 234 Cal.App.4th 214, 248 ("the proposed project being evaluated is the continuation of the existing [fish] stocking enterprise", and "the baseline for a continuing project is the current environmental condition including the project, even if the project has not undergone prior environmental review").

For this Project, application of the conventional baseline approach would mean that the impacts associated with continuation of oil and gas development as it has been conducted in the past would all be considered part of the baseline, and the impacts of the Project—with its more stringent site development standards—would be considered environmentally beneficial. However, as discussed at page 3-30 of the DEIR, the County decided to take a much more environmentally conservative approach in this EIR. The future environmental impacts associated with new oil and gas activities subject to approval by the County utilizing the new conformity review process are considered impacts of the Project, even though they represent a continuation of existing activities. Accordingly, the selection of 2012 or any other prior year(s) to represent current well development activity in the existing environmental setting does not affect the EIR's analysis of significant impacts.

Finally, as stated in the DEIR, the current level of oil and gas activity is only one component of the environmental setting. Other relevant information in the DEIR regarding existing environmental setting includes the following:

- Section 3.2.5, Regulatory Setting - Kern County Zoning Ordinance, p. 3-8, describing the existing zoning ordinance as it relates to oil and gas development.
- Section 3.3, History, Existing Operations and Background, pp. 3-15 to 3-16, describing oil development in Kern County, and specifically Table 3-2 showing annual well counts and production of oil, gas, and produced water.
- Section 3.3.1, pp. 3-17 to 3-20, describing the existing oilfields for which DOGGR has established Administrative Boundaries.
- Section 3.4.3, Core Areas, p. 3-24, to the extent that the Core Areas reflect the locations of most intensive current oil and gas development, and fields within established DOGGR Administrative Boundaries that have historically been the location of 95% of oil and gas production within the County.
- Section 3.4.4, pp. 3-24 to 3-26, Tiers, to the extent that the tiers (especially Tiers 1 and 2) reflect a blend of the existing physical and regulatory settings based on existing land use and existing zoning.
- Chapter 4, and the detailed descriptions of Existing Setting and Regulatory Setting at beginning of each sub-chapter.

Each subchapter within Chapter 4 commences with detailed information regarding the setting relevant to that topic. Relevant information and time frame varies from topic to topic because each environmental medium has different sensitivities, and there is different information available for each. For example, the relevant setting can include historical information and trends over centuries (e.g., seismic events), decades (e.g., drought cycles and long-term planning for water supply) or shorter (e.g., air quality, where more recent data reflects the benefits of aggressive rule development by the air district, and the continuing struggle as new population is added to the County). The setting information provided in each topical chapter thus creates the context for evaluating the ongoing and future oil and gas activities included in the Project.

7: Baseline: Legacy Conditions

Some commenters generally state that the project definition should have addressed pre-existing legacy conditions. They state that the Project should include all legacy equipment and activities, including unneeded oil and gas equipment and long-term idle wells. They claim this failure to include all legacy equipment and activities as part of the Project has resulted in a DEIR that underestimates the true impacts of oil and gas activities in the County. Commenters request an analysis of the impacts, including loss of Farmland and Grazing Land and fragmentation impacts, resulting from the failure to abandon thousands of existing idle wells in the County and to restore agricultural lands to productive use by promptly removing equipment. See also Haz-3.

The purpose of the Amended Ordinance is to adopt a permit program applicable to future oil and gas production activity, consistent with other zoning ordinances. In response to comments regarding concerns with legacy operations and existing conditions, the Revised Amended Ordinance now includes a new procedure by which members of the public can contact the County to report a well that they believe may be idle or abandoned, that requires the County to report this information to DOGGR (which regulates idled and abandoned wells, as well as new and existing wells, under state law), and to deny approvals for new well permits for operators whom DOGGR has determined are in violation of idled well permit regulations. (See section 7.1.3) The mitigation measures included in this EIR have also been clarified, and in some cases expanded, to address surface owners concerns, and to further encourage operator removal of legacy equipment to satisfy agricultural land mitigation requirements. (See section 7.1.4)

The remainder of this response addresses questions raised by commenters about legacy conditions in relation to the CEQA process and this Project and EIR.

CEQA defines "project" as an activity which may cause a direct or reasonably foreseeable indirect physical change in the environment, and is either an activity directly undertaken by a public agency, or an activity undertaken by a person that is financially supported or approved by a public agency (e.g., through the issuance of a lease, permit license or other entitlement).[42] Here, the Project has two components: the amendment to Title 19 and related sections of the Kern County Zoning Ordinance to include updated procedures, development and implementation standards relating to future oil and gas exploration; and the implementation of future oil and gas development activities expected to be undertaken pursuant to the amended ordinances.

The ordinance amendment undergoing CEQA review was initiated by a letter from the Applicant to the Board of Supervisors dated January 18, 2013, requesting "an amendment to update details of oilfield operations, production and exploration…. It is Applicants' intention that any amendments to the zoning ordinance would be prospective in nature, and would not have any application to current projects or operations." Adoption and amendment of County Ordinances are legislative actions of the Board of Supervisors, and the scope of issues addressed by the legislative action reflects policy

[42] Pub. Res. Code § 21065.

choices within the discretion Board. Following consideration of the Applicant's request at a public hearing on January 22, 2013, the Board directed staff to initiate the process to amend the Zoning Ordinance to establish a new, ministerial permit process for certain oilfield activities. The Board did not direct the Planning and Community Development Department to initiate amendments addressing legacy equipment and activities that were being conducted lawfully under existing County codes.

CEQA defines "project" to include "the whole of an action" that has the potential for resulting in a physical change in the environment.[43] However, this does not mean that the "project" includes equipment or activities that already are in the environmental setting or baseline. In preparing an EIR, the lead agency must distinguish the setting (things that already exist) from the project (the future action with the potential to change the environment). Environmental analysis is required only for the project and its impacts, not for things in the existing setting or baseline. Thus, analysis of legacy equipment and activities is not required or necessary under CEQA, and the DEIR need not be revised to show the location of idle and long-term idle wells on Farmland and Grazing Land within the Project Area.

Where the project undergoing review involves the continuation of a prior program or activity, the environmental baseline ordinarily includes continuation of the existing program or activity, even if that means that the baseline conditions and the conditions under the proposed future project are essentially the same.[44] Even when a new permit or permit extension is required to continue an activity, existing equipment and activities are ordinarily considered part of the baseline for environmental review.[45]

The purpose of an EIR is to inform the decision-maker and the public about the potential consequences of the action the decision-maker is about to approve. Feasible mitigation or alternatives must be explored to address the impacts flowing from that approval. CEQA is forward-looking.[46] CEQA is not remedial, and an agency is not required to define the project in a way to address past environmental harm, or to adopt mitigation or alternatives to remedy those effects.[47] Thus, commenters' request that the County establish a program to properly abandon deserted or long-time idle wells before approving new oil and gas wells is not required under CEQA or Pub. Res. Code § 3206.5.

---

[43] CEQA Guidelines § 15378.

[44] *Center for Biological Diversity v. Department of Fish and Wildlife,* (2015) 234 Cal.App.4th 214, 248 ("the proposed project being evaluated is the continuation of the existing [fish] stocking enterprise", and "the baseline for a continuing project is the current environmental condition including the project, even if the project has not undergone prior environmental review").

[45] *Citizens for East Shore Parks v. State Lands Commission (2011)* 202 Cal.App.4th 549, 560-561.

[46] *Bloom v. McGurk* (1994) 26 Cal.App.4th 1307, 1315 (no legislative or regulatory directive to apply CEQA to permit renewals, and "such a result would contravene the regulatory language and prospective character of the statute").

[47] See, e.g., *In re Bay-Delta Programmatic Environmental Impact Report* (2008) 43 Cal.4th 1143, 1167-68 (EIR need not include an alternative that would address existing environmental problems).

For this Project, application of the conventional baseline approach would mean that the impacts associated with continuation of oil and gas development as it has been conducted in the past would all be considered part of the baseline, and the impacts of the Project – with its more stringent site development standards – would be considered environmentally beneficial. Even so, Kern County decided to take a more environmentally conservative approach to defining the Project for this DEIR. A general description of the DEIR's approach to environmental setting and baseline is described in the DEIR in Section 2.6.2 at pages 2-21 to 2-23, and in Section 3.5 at pages 3-30 to 3-32. See also Global Response GR-6 describing in general CEQA's approach to baseline, and the more environmentally conservative approach taken in the Draft EIR. For any new well or facility subject to approval by the County utilizing the new conformity review process, the equipment and other associated activities are treated by this DEIR as new impacts, even if they would ordinarily be considered a continuation of activities currently occurring within the County (e.g., the same drill rig moving to a succession of sites).

In addition, a number of mitigation measures are designed to require or create incentives to reduce the impacts from continuing legacy oil and gas facilities and activities. In some cases, these measures are triggered by attaching a proposed new well or facility to existing legacy equipment. In other cases, the measure creates an incentive for an oil and gas developer to rehabilitate already disturbed or degraded lands. Some of these measures are summarized below.

- MM 4.2-1: To mitigate impacts related to conversion of farmland to non-agricultural use, this measure provides the applicant several options, including: "Restore agricultural lands to productive use through the removal of legacy oil and gas production equipment, including well abandonment and removal of surface equipment."
- MM 4.2-2: This measure includes several components to protect crops and agricultural structures from oil and gas development on active agricultural lands. Subparts c., d. and e. regulate speed on unpaved roads, require dust suppression on unpaved roads, and require measures to reduce tracking from unpaved roads to paved roads, respectively. To the extent that an existing unpaved road will be utilized for a well or other facility subject to site plan review under the Amended Ordinance, compliance with these measures may reduce fugitive dust and seed from existing use of the road. Subpart i. of MM 4.2-2 requires that underground pipelines serving a well or other facility subject to site plan review under the Amended Ordinance be shown on the site plan and periodically inspected and maintained in accordance with the mitigation measures for Hazards. To the extent that an existing underground pipeline will be utilized for a well or other facility subject to site plan review, compliance with this measures may reduce potential impacts associated with existing use of the pipeline. These benefits have not been quantified in the DEIR, enhancing the environmentally conservative approach of this EIR.
- MM 4.3-2 requires development of a Fugitive Dust Control Plan. Items 1, 4 and 10 in Subpart d. of MM 4.3-2 regulate speed, require dust suppression, and require measures to reduce track-out of debris into public roads. To the extent that an existing unpaved road will be utilized for a well or other facility subject to site plan review under the Amended Ordinance, compliance with these measures may reduce fugitive dust from existing use of the

road during the period of construction of the new well or facility. These benefits have not been quantified in the DEIR, enhancing the environmentally conservative approach of this EIR.

- MM 4.4-16 requires mitigation of biological impacts of ground disturbance, usually at a ratio of 1:1. Mitigation may be accomplished via a conservation easement or other means, including removal of legacy oil and gas equipment and restoration of the site (subpart c.) or enhancement or restoration of existing habitat (subpart d.).
- MM 4.8-4 a. requires an applicant to mitigate the hazards associated with transportation of hazardous materials. This measure requires the applicant to identify on the proposed site plan the gas, oil and produced water pipelines to be used for each new or reworked well site, and to show sensitive receptors within 200 feet of any such pipeline. The measure further requires integrity testing or other leak detection, reporting and repair for specified pipelines, including preparation of a Pipeline Management Plan. (See also MM 4.8-9 and MM 4.8-10.) To the extent that an existing pipeline will be utilized for a well or other facility subject to site plan review under the Amended Ordinance, compliance with these measures may reduce the risk of and impacts from an unauthorized release of hazardous materials from existing use of the pipeline. These benefits have not been quantified in the DEIR, enhancing the environmentally conservative approach of this EIR.

Based on the foregoing, the commenter is incorrect that the DEIR merely acknowledges the significance of the above-described impacts to Farmland and Grazing Land. Instead, the DEIR creates a credit through removal of idle wells. See also GR Haz-3. The DEIR provides decisionmakers with sufficient information to enable them to make a decision which takes account of the Project's environmental consequences.[48]

Finally, it is important to note that no one raised this issue in comments on the NOP. CEQA sets forth a comprehensive, step-wise process for development of an EIR. The statute emphasizes the importance of lead agency consultation with responsible agencies very early in conceptualizing project review.[49] CEQA Guidelines Section 15082 – entitled "Notice of Preparation and *Determination of Scope of EIR*" – requires the lead agency to provide responsible agencies a NOP to initiate the formal process of preparing the EIR. The NOP must include a description of the project so that the responsible agencies can comment on the scope of the project and environmental review. Sections 15082 and 15083 also encourage early consultation or "scoping" meetings with agencies and the public regarding the "range of actions … and significant effects to be analyzed in depth" in the EIR. The primary purpose of outreach at this stage is to obtain clarity regarding project definition, the needs of the responsible agencies who will review the project, and the issues of concern to the public. The project scope affects every chapter of the EIR, and so it is vital to orderly

[48] Authority cited by commenters which provides this general rule does not affect this conclusion. *Galante Vineyards v. Monterey Peninsula Water Mgmt. Dist.* (1997) 60 Cal.App.4th 1109, 1123 (quoting CEQA Guidelines § 15151).

[49] See, e.g., CEQA Guidelines § 15060.5 encouraging lead agency consultation with responsible agencies even at the pre-application stage.

review under CEQA that questions of project scope be brought forward at the NOP stage, before a considerable effort is expended in drafting the EIR.

The NOP for this Project was released on August 30, 2013. See Appendix A to the DEIR. Responsible and trustee agencies and the public were invited to provide comments in writing through September 30, 2015 or in person at one of four public meetings held in the community on September 16, 18, 23 and 25, 2013. The scoping meetings were well attended. A total of 57 individuals signed the sign-in sheets, and additional people attended who did not sign in. 57 individuals spoke at the scoping meetings. Written comments were received from government agencies, environmental organizations, community and business organizations, and individuals. No oral or written comments on the NOP raised this issue at a time when it could have been effectively and efficiently addressed in the DEIR.

8: Future Well Projections

Commenters assert that the County should not have relied on projections of future well development, that the projections are faulty, or that they are not supported by substantial evidence. Commenters challenge the DEIR's potential future oil and gas development scenario, which they state impermissibly underestimates the total number of new wells and fails to describe the Project's maximum development potential. One commenter challenges projected future oil and gas activity because it is based on current practice with the assumption that future development will follow the same trends. Another commenter requests clarification of the basis for the DEIR's estimate of average annual new production wells. This group of comments is addressed together here because the responses to all of these comments depend on a common explanation of the reasons for using projections, and the basis for the well projections used in the DEIR.

CEQA's primary purpose is to inform the public agency decision-makers and the public about the significant environmental consequences of an action, identify ways to minimize the effects, and explore feasible alternatives.[50] An EIR may present certain information in a qualitative manner,[51] but it must contain a sufficient degree of analysis to allow the decision-makers to intelligently take account of environmental consequences.[52]

CEQA anticipates that drafting an EIR necessarily involves a degree of forecasting. Indeed, lead agencies "are encouraged to make reasonable forecasts in the preparation of the EIR."[53] But CEQA also acknowledges that forecasting will not yield perfect predictions about the future. In developing forecasts, CEQA Guidelines Section 15144 instructs: "While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can."

[50] CEQA Guidelines § 15121(a).
[51] See, e.g., CEQA Guidelines § 15064.7 allowing thresholds of significance to be qualitative or quantitative; and CEQA Guidelines § 15142 requiring an interdisciplinary approach that includes consideration of qualitative and quantitative factors.
[52] CEQA Guidelines § 15151.
[53] *San Francisco Ecology Center v. City and County of San Francisco* (1975) 48 Cal.App.3d 584, 595.

In preparing the DEIR for this particular Project, the County was able to develop reasonable projections based on available data, and the projections allow a more thorough analysis for consideration by the decision-maker, the Board of Supervisors. Without projections, the EIR could broadly describe characteristics of future oil and gas development; but without quantification, the EIR would be unable to meaningfully assess impacts for many environmental topics, reach conclusions regarding the significance of the impacts, or support those conclusions with substantial evidence. In this case, the best information available allows the County to make reasonable forecasts regarding future activity, and to better inform the Board of Supervisors and the public of the potential consequences of the Project.

The County followed four primary steps in developing the potential future oil and gas development scenario. First, the County solicited information from the Project Applicant, including the trade associations and their affected oil and gas operator members. Second, the information was validated by comparing it to historical trends and available third party data, including data maintained by other agencies. Third, experienced County staff conferred with the County's expert consultant team regarding the reasonableness of the projections. Fourth, at several points in the process the number was adjusted upward slightly to provide a margin for future growth, and to reduce the chance of the EIR underestimating future activity levels and related impacts. The steps are described in more detail below.

Development of the forecast began with a survey of the Project Applicant and their member companies (oil and gas operators) regarding their future business forecasts. Commenters challenge the DEIR's reliance on purportedly unverified information submitted by the oil industry. However, these comments ignore the additional steps undertaken by the County as discussed below.[54] It is not unusual for a lead agency to rely on the business plans of the project proponent as the starting point in the CEQA analysis. (For private projects, for example, the applicant defines the scope of the proposed project for which it is seeking approval.). Here, the Project consists of the proposed Amended Zoning Ordinance together with the future oil and gas development activities that will be carried out pursuant to the ordinance. As the entities that will need to provide the capital, people, expertise and technical knowledge to plan, drill and operate the wells and ancillary facilities, the oil companies are in a unique position to estimate future activity. They also possess proprietary information not routinely shared with one another or the public agencies regarding their future plans. To provide the best possible estimate without inappropriately divulging competitive information in violation of antitrust laws, the oil and gas associations comprising the Project Applicant retained an independent third party to survey member companies regarding their future business plans.[55] The third party consolidated the responses of individual companies so that it would not be possible to determine the projections of any single company.

[54] As discussed in this response, the County sufficiently exercised its independent judgment over the environmental analysis and fully complied with authority cited by commenters. *Foundation for San Francisco's Architectural Heritage v. City and County of San Francisco* (1980) 106 Cal.App.3d 893, 908; accord, *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 369.

[55] Documents submitted by the oil industry contain proprietary and other protected information and may not be disclosed for public inspection as requested by one commenter.

Survey responses were more complete from larger companies, and companies with large holdings in Kern County. To account for the wells and ancillary facilities of small companies, the preliminary projection compiled from the survey responses was both scaled from larger company data, and rounded up to avoid underestimates. In addition, as explained in the DEIR, many oilfields in the County are mature fields experiencing a decline in oil production.[56] Accordingly, in the future, it will likely require more wells to sustain comparable levels of oil production, and so it is anticipated that there will be an increase in the number of new well completions per year. The preliminary projection developed from survey results was further adjusted upward to provide for this as well as other factors that could increase production such as oil supply interruptions or decreased production levels from other parts of the world.

he preliminary projection was then compared to the historical trends for the number of oil and gas wells that were completed in the database maintained by the state agency responsible for issuing permits for all oil and gas wells in California, DOGGR. (Well completions are a subset of the number of well permits issued, as not all permits are used and not all wells successful completion. See also, GR-6, Baseline, for a discussion of historical new well completions.) As discussed at page 2-22 of the DEIR and in GR-6, data from 1985 through 2012 show wide fluctuations in the number of new well completions per year in response to the price of oil, available technology, available reserves, and changing regulatory requirements. Annual new well completions during this period ranged from a low of 730 in 1992, to a high of 3,005 in 1985. The most recent peak was 2,619 new well completions in 2012. The Project Applicant's technical consultant, WZI, used the historical data to develop an historical trend line extending into the future to estimate potential future well drilling activity. This historical trend analysis produced an estimate of future drilling activity less than the preliminary projection based on the Project Applicant survey, thus confirming that the projected well development assumptions used in the DEIR would not underestimate future well drilling activity or resulting environmental impacts.

The County then reviewed the technical information provided by the Project Applicant. With more than 100 years of experience with oil and gas development, Kern County staff has substantial knowledge regarding oilfield trends. County staff was assisted in its review by its technical consultant, Ecology and Environment, Inc. (E & E). (E & E is a recognized global leader in environmental management and has extensive experience with oil and gas production.)[57] Based on its own experience and the expertise of its consultant, County staff judged the projections of the Project Applicant to be reasonable and supported by substantial evidence.

[56] See DEIR at p. 2-22 (many of the oildfields in the County are mature fields that are experiencing declining oil production). See also SB4 Final EIR p. 6-3, Figure 6-1 (California Oil Production and Number of Producing Wells, 1980 Through May 2013 (DOGGR 2015) (showing declining oil production, with peak production in 1985).

[57] E & E is an internationally recognized leader in environmental planning and has completed thousands of projects worldwide, with particular expertise in the oil and gas market. See generally http://www.ene.com/About (E & E employs "nearly 1,000 respected experts in 85 engineering and scientific disciplines."); http://www.ene.com/Markets (Oil and Natural Gas).

The final forecast used in the DEIR is 2,697 new producing wells per year. This projection for future well development activity fell within the range of activity from 1985 through 2012. Table 3-5 of the DEIR also shows projections for other types of wells, including water disposal wells, injection wells, observation wells, etc.[58] The DEIR's projected total number of wells drilled per year is 3,649 (including new production wells, all categories; water disposal; water flood injectors; idle wells, non-cyclic; observation wells; steam flood injectors; air injection; and gas disposal). DEIR p. 3-32.

One commenter questioned the DEIR's use of 2,697 new wells as an estimate in some places, but 4,083 and 3,647 in other places. However, the DEIR clearly distinguishes between and explains these figures, with support in the record. As explained in Section 3.5, over the next 25 years, for analytic purposes, the DEIR assumes that an average of 2,697 new producing wells (oil and gas, dry gas, dry hold and liquid petroleum gas wells) could be drilled in the Project Area as part of the potential future oil and gas development scenario included in the proposed Project.[59] The level of well drilling in any given year may be higher or lower than this average, consistent with the variations in well drilling activities that have historically occurred due to market and other conditions. Commenters assert the DEIR impermissibly relies on this "average" annual number of producing wells, rather than the "maximum" that could occur in any given year. One commenter points to expert statements that the number of new wells drilled will greatly exceed—and could even double this average during periods of high-oil prices, which are expected to occur regularly in the future. Commenters state the DEIR must be revised to reflect these spikes and evaluate the maximum number of new wells that could be drilled in any given year. However, the DEIR does include this analysis and makes clear that the maximum number of new wells that may be authorized in any given year is 3,647. DEIR p. 4.3-98; p. 4.3-79 (the DEIR does not authorize the County to permit more than 3,647 new well permits in a single year). Regardless of oil pricing fluctuations, only the number of wells studied in the DEIR can be drilled in any given year – with no carry-over from prior years or borrowing from future years. The County may not issue more than 3,647 well permits (including the estimated 2,697 producing wells) per year. This annual permit limit will be enforced. The DEIR clearly states the maximum number of well permits that will be issued in any given year and, accordingly, fully identifies the nature and scope of the Project in compliance with CEQA and *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645.

Moreover, the DEIR examines the history of oil production on pages 2-22 to 2-23, including pricing and production variability.[60] Notwithstanding the commenter's expert opinion that market conditions in some circumstances may warrant more drilling than forecast, the County's experts disagree based

[58] Research and analysis based on DOGGR's databases showed that these other types of support wells (referred to in many DOGGR reports as "service wells") are usually drilled per year in consistent ratios with new producing wells; therefore, the forecasts for these service well categories was developed by applying the historical ratios to the projected number of new producing wells.

[59] Future oil and gas exploration and production activities that would be authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance would result in 2,697 new production wells being drilled annually, while 2,231 wells would be plugged and abandoned. DEIR p. 1-19.

[60] DEIR pages 2-22 - 2-23, 4.5-9 to 4.5-15, 4.13-9, Sections 3.3, 4.13, and 5.6. The dramatic drop in the global price of oil in 2014, for example, resulted in production curtailments and well construction activity levels in 2014 that were well under 2012 levels. DEIR p. 4.13-9.

on historical and forecast data, and the cap on annual well permits reflects a conservative analysis that both exceeds the actual well permits issued annually and for the first time establishes a cap on annual well permits issued in the future.[61] Commenter's assertion that 5,000 wells may be drilled annually is not supported by the County's experts, nor would it be lawful under the Amended Ordinance.

In sum, the DEIR includes an estimated future level of wells based on an expert assessment. The Amended Ordinance caps the number of wells that can be issued annually to 3,647 wells (including 2,697 producing wells). The Amended Ordinance thus includes the "maximum" number of well permits that can be issued annually, and the DEIR analyzes this maximum rather than the "estimated average" annual production faulted by the court in *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, cited by commenter.

For purposes of emissions modeling, the DEIR conservatively assumed a higher well count than 3,647 (with a maximum annual well count of 4,083), but nonetheless acknowledged that the Project Description includes a yearly total of wells not to exceed 3,647. DEIR p. 4.3-101. The number of wells, for the emissions analysis, projected to be built every year exceeds the number of wells that would be authorized under the Project and therefore the estimates are considered conservative. DEIR pp. 4.3-71, 4.3-79 – 4.3-80, 4.3-97, 4.3-101, 4.7-30. Final total emissions from the Project are calculated by scaling down the emissions calculated using the assumed number of new wells to the emissions corresponding to the authorized number of new wells per year, that is 3,647 wells each year. DEIR p. 4.3-741, Table 4.3-32D.

The commenter also stated it is unclear whether the reactivation of idle wells is included in the tally. The DEIR makes clear that idle wells/non-cyclic wells are included in the total annual well forecast (3,649), which includes the category of new producing wells (2,697). DEIR p. 3-32.

One commenter states impacts are understated because the analysis includes only the drilling of 2,697 producing wells in a single year, but fails to account for drilling of injection wells. Similarly, a commenter states the DEIR's future oil and gas development scenario, upon which its impacts analysis is based, only estimates the number of "new producing wells." However, as detailed above, the DEIR provides projections for all wells (including new production wells, all categories; water disposal; water flood injectors; idle wells, non-cyclic; observation wells; steam flood injectors; air injection; and gas disposal). DEIR p. 3-32. As discussed in this response and in Global Response GR-6, projected well numbers represent conservative estimates. Moreover, the DEIR analyzes impacts of the project maximum yearly total of all wells, 3,647, not just producing wells. One commenter asserts the DEIR attempts to downplay future oil and gas production levels in the County (and thus the associated indirect effects on population, employment, and housing) by distinguishing

[61] Disagreement among experts does not make an EIR inadequate. CEQA Guidelines, § 15151; *Save Round Valley Alliance v. County of Inyo* (2007) 157 Cal.App.4th 1437; *Association of Irritated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383, 1397 ("When the evidence on an issue conflicts, the decisionmaker is 'permitted to give more weight to some of the evidence and to favor the opinions and estimates of some of the experts over the others.' [Citation.]").

the region's geology from other states that have undergone "fracking booms." The commenter questions the DEIR's discussion of the amount of recoverable oil and gas in the Monterey Shale Formation and challenges estimates which cover territory outside Kern County. The County is not aware of any independent third party or academic source that issues publicly available forecasts of oil and gas development in Kern County, and none are cited in the comments. Kern County includes the Monterey Shale, but that geologic feature extends beyond Kern County, and there are no peer reviewed estimates of future oil and gas development in the Kern County portion of the Monterey Shale.[62] Further, there has been uncertainty in public sources regarding the future development potential of the Monterey Shale, including a high estimate from the U.S. Energy Information Administration (EIA) in 2012 of 13.7 billion barrels of technically recoverable oil, and a restated estimate from that same agency in 2014 that reduced the prior estimate by nearly 96% to approximately 600 million barrels of recoverable oil.[63] The California Council on Science and Technology recently opined that there is little evidence to support either estimate.[64] The County determined that the forecasting process described above for this EIR resulted in a more sound projection of future well activity specific to Kern County than the EIA estimate or other estimates for the Monterey Shale generally.

Finally, the projection in the DEIR follows a similar path as that used in the well stimulation EIR recently certified by DOGGR under SB4 (DOGGR 2015). [65] The two agencies developed similar forecasts. As with Kern County's forecast for this EIR, DOGGR's forecast for the SB4 EIR started with a survey of affected oil and gas companies.[66] DOGGR then compared the survey results to its historical database, and applied its expertise and independent judgement to confirm the reasonableness of the forecast.[67] A buffer was included in the forecast for future growth. The SB4

---

[62] As explained in the DEIR, while hydraulic fracturing and other well stimulation techniques have resulted in very substantial increases in oil and gas production activities in other states, the Monterey Shale geologic formation in Kern County is fundamentally different and estimates of both the quantity and rate of petroleum production from the Monterey Shale using existing technologies have been substantially reduced (See, e.g., http://www.postcarbon.org/publications/drilling-california/). DEIR p. 4.13-9; see also DEIR pp. 4.6-28 – 4.6-29 (informational discussion of 2014 independent study commissioned by the Bureau of Land Management (CCST 2014), which concludes acid fracturing is not expected to lead to major increases in oil and gas development in California). The CCST study also concluded that technologies might be developed to extract oil and gas from new locations, e.g., the Monterey Formation. *Id*. However, analysis of potential new technologies that could emerge during the life of the Project in this context would be speculative. See Global Response GR-18.

June 2014, 16 p.

[64] An Independent Scientific Assessment of Well Stimulation in California, January 2015, Vol. 1, p. iv (the EIA estimates are "highly uncertain"; "[t]here is little evidence to support either estimate.") , p. 247-249.

[65] The process for development of the forecast for the SB4 EIR is described at DOGGR 2015 Vol. I, p. C.2-59 and C.6-7; and Vol. II, p. 7-22.

[66] DOGGR 2015 Vol. I, p. C.2-59 ("Since probable future projects (i.e., future well stimulation treatments) will be proposed by members of WSPA, DOGGR and its consultants properly relied to a considerable degree on the business plans of these entities to determine what is reasonably foreseeable.")

[67] DOGGR 2015 Vol. I, p. C.2-59 ("DOGGR's experienced staff and the preparers of the EIR did the following: reviewed the information provided by the oil and gas industry; checked that information against DOGGR's own

EIR used a forecast of up to 3,300 new wells (including production, cyclic producer, injection, and other miscellaneous wells, e.g., observation, water supply, etc.) annually for DOGGR District 4.[68] The outcome of the DOGGR forecasting exercise is the same order of magnitude as the Kern County projection.

Although the estimates reached by both agencies are similar, there are a number of reasons why the DOGGR estimate may not be precisely the same as the Kern County estimate. First, the DOGGR estimate is for DOGGR District 4, not just for Kern County. Second, the business surveys may have presented somewhat different questions, eliciting different responses from the oil and gas operators. Third, it is important to compare projections for similar types of wells. DOGGR's forecast of 3,300 new wells annually for DOGGR District 4 included new production, cyclic producer, injection, observation, water supply and other miscellaneous wells.[69] Rather than comparing DOGGR's SB4 forecast to the 2,697 new producing wells annually projected in the DEIR, the SB4 projection should be compared to the projection of "Total New Wells (Annually)" in DEIR Table 3-5, p. 3-32 (3,649 total), which includes water disposal, water flood injectors, and a number of other categories of wells. Finally, DOGGR and the County may have applied different buffers or adjustments for potential future growth in well drilling activity, both falling within a reasonable range based on their respective experiences and independent judgement.

In sum, the well projections used in the DEIR were based on the best information available to the County at the time preparation of the EIR commenced, including the business forecasts of the companies who would carry out the oil and gas development. The forecasts were validated by the County and its consultant, and adjusted upward so that the EIR would analyze a reasonably high maximum impact case. The projection represents a good faith, reasonable effort to forecast the future using the best information available to Kern County. As stated at page 3-30 of the DEIR, it is likely that the actual development will be less than the forecast. In such case, the environmental impacts of the Project will be less than estimated in the DEIR.

9: DOGGR: SB 4 EIR

Some commenters raised questions about the relationship between the EIR approved by DOGGR pursuant to Senate Bill 4 (SB 4) following issuance of the Kern County Draft EIR, and the EIR issued by the County for the Amended Ordinance.

The SB 4 EIR was required to examine oil production activities using well stimulation techniques (WST) to inform DOGGR's regulation and permitting of WST. The SB 4 EIR was a statewide EIR that considered WST in a wide range of physical environmental conditions, ranging from ocean drilling, to drilling in highly populated urban areas in Los Angeles County, to drilling in rural areas such as Kern and San Benito counties.

---

historic files and data, assessed the information relying their professional knowledge of trends in the industry, and reached their own conclusions based on all available input and their own knowledge and professional judgment.")

[68] DOGGR 2015 Vol. II, p. 7-23.

[69] DOGGR 2015 Vol. II, p. 7-23.

The Kern EIR has a much narrower geographic focus (the Project Area within Kern County), but addresses a broader scope of oil and gas production activities in that it is not limited to WST activities.

The SB 4 Draft EIR was available for review by the preparers of the Kern EIR, and is cited within and helped inform preparation of the Kern DEIR. Similarly, the Final SB 4 EIR helped inform the contents of the Kern Final EIR. Please see responses to Letter 2 (DOGGR) and other responses for a more detailed response to specific comments raised about the SB 4 EIR.

10: DOGGR: Regulations

Commenters assert that the DEIR regulatory setting, environmental baseline and impact analysis should not incorporate or rely on compliance with DOGGR's final regulations governing well stimulation treatment pursuant to SB 4 (Pub. Res. Code § 3160 et seq.), which were not in effect until July 1, 2015. In addition, some commenters claim that DOGGR's regulations are insufficient and/or will be insufficiently enforced to protect against environmental impacts of well stimulation, and that the County should impose more stringent requirements.

SB 4 directed DOGGR to adopt regulations on hydraulic fracturing and other forms of well stimulation treatment. The regulations cover all facets of subsurface operations, including well maintenance and testing, operational requirements and well stimulation fluids and wastes, as shown in the table below. On December 30, 2014 the Office of Administrative Law approved DOGGR's final regulations and filed them with the Secretary of State. Although the regulations did not go into effect until July 1, 2015 as provided by SB 4 (Pub. Res. Code § 3161(a)), the regulations were final and available for incorporation in the analysis as the DEIR was prepared, and were effective months before certification of the Final EIR.

14 Cal. Code Regs. Section	Summary of DOGGR Final Well Stimulation Treatment (WST) Regulations
1751	Provides for a single DOGGR approval for multiple WST permit applications
1761, 1781	Definitions
1777.4	Requires submission of well maintenance and cleanout history to DOGGR after WST activities
1782	Outlines general WST wells requirements, including for well casing
1783, 1783.1	Specifies information that must be submitted with a WST permit application
1783.2, 1783.3	Imposes obligation on WST operators to identify and notify neighboring surface property owners, including as to rights to request water testing
1783.4	Requires groundwater sampling, testing and monitoring as part of WST activities
1784	Ensures WST wells are designed to meet hydrologic and geologic isolation standards
1784.1	Mandates pressure testing for WST activities
1784.2	Requires cement evaluations for WST activities
1785, 1785.1, 1787	Imposes monitoring obligations during and after WST, including for seismic activity
1786	Outlines requirements for storage and handling of WST fluids and wastes
1788	Mandates certain public disclosures
1789	Specifies reporting obligations following WST activities

In connection with its environmental review of well stimulation treatment operations throughout the state, DOGGR announced in July of 2015 its intent to, "very shortly after July 1, 2015 … initiate rulemaking with respect to" certain proposed mitigation measures from the Final SB 4 DEIR. The details of these forthcoming well stimulation treatment regulations were also available for incorporation in the analysis as the DEIR and Final EIR were prepared. They include:

SB 4 Final EIR Reference	Summary of DOGGR Forthcoming Regulation
MM GW-1a	Requires the use of alternative water sources, to the extent feasible
MM SWR-1b	Establishes setbacks from perennial water bodies and intermittent or ephemeral water bodies in certain circumstances
MM GEO-1	Requires avoidance of active faults in certain circumstances
MM GEO-1b	Requires that the Spill Contingency Plan already required for each oil and gas well by 14 CCR 1722.9 include as additional contents well control and well shut-in procedures that adequately address the consequences of the rupture of a known fault, seismically induced ground shaking, and/or ground failure that could occur during the well stimulation process
MM GEO-1e	Requires that the Spill Contingency Plan referenced above also include elements of an earthquake response plan
MM HAZ-1a	Requires that the Spill Contingency Plan referenced above be sufficient to prevent any leaks, spills, or other discharges of well stimulation fluids, flowback fluids, produced water, hazardous chemicals, contaminated surface water runoff, oil, or other potentially dangerous materials that might occur before, during, and after the well stimulation process from reaching the soil at all site pads
MM GW-4b	Requires, for a new well drilled for a stimulation treatment, that the well contain an annular 500-foot cement seal extending across the base of protected water and that the integrity of the seal will prevent unintended migration of fluids

In addition to the existing and impending SB 4 regulations, well operations are subject to DOGGR's existing regulations for all oil and gas wells, which set the standards for well construction, operation and abandonment. See 14 Cal. Code Regs., Div. 2, Ch. 4.

The DEIR properly relies on DOGGR's SB 4 regulations. The amended oil and gas zoning ordinance operates in the context of other federal, state and local law, including SB 4 and its implementing regulations. To the extent compliance with the SB 4 and its regulations will avoid or lessen a potentially significant environmental impact, CEQA allows such reliance on existing laws and regulations. *Oakland Heritage Alliance v. Oakland* (2011) 195 Cal. App. 4th 884, 906 ("a condition requiring compliance with regulations is a common and reasonable mitigation measure, and may be proper where it is reasonable to expect compliance"); *Ctr. for Biological Diversity v. Dep't of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 243 ("Complying with government regulations as a mitigation measure is not an improper deferral").

It is reasonable for the DEIR to assume that operators will comply with SB 4 and its implementing regulations. *Towards Responsibility in Planning v. San Jose* (1988) 200 Cal. App. 3d 671, 680 ("City is not obliged to speculate about effects which might result from violations of its own ordinances or water quality standards set by other agencies"); *Rominger v. Colusa* (2014) 229 Cal. App. 4th 690, 728 (arguments against significance analysis rejected where challengers offered "no evidence to suggest that it would be unreasonable to expect" compliance with statewide regulations). The DEIR may also assume that DOGGR will carry out its duty to enforce its regulations. Cal. Evid. Code § 664 ("It is presumed that official duty has been regularly performed").

As explained in Section 2.6.4 of the DEIR, Kern County cannot lawfully impose in its zoning ordinance requirements specifically for well stimulation activities below ground that are more stringent than those imposed by DOGGR. DOGGR is the state agency with exclusive authority to regulate the subsurface operations of oil and gas activities. Under CEQA, lead agencies may enforce only "feasible" mitigation measures. "Feasibility" is defined in CEQA Guidelines § 15364 to include "legal feasibility" (*i.e.*, mitigation must be lawfully enforceable by the lead agency). The County lacks the legal authority to regulate subsurface oil and gas activities because such regulation is preempted by state law.

Local legislation that conflicts with state law is preempted and void. *Conejo Wellness Ctr., Inc. v. Agoura Hills* (2013) 214 Cal. App. 4th 1534, 1552 ("Local legislation enters an area or field that is 'fully occupied' by state law when the Legislature has either expressly manifested its intent to fully occupy the area or has impliedly has done so"). *Id.* "Implied preemption occurs when: (1) general law so completely covers the subject as to clearly indicate the matter is exclusively one of state concern; (2) general law partially covers the subject in terms clearly indicating a paramount state concern that will not tolerate further local action; or (3) general law partially covers the subject and the adverse effect of a local ordinance on transient citizens of the state outweighs the possible municipal benefit." *Big Creek Lumber Co. v. Santa Cruz* (2006) 38 Cal. 4th 1139, 1157–1158.

Even before the passage of SB 4, the California Attorney General concluded that the state had fully occupied the field with respect to subsurface oil and gas operations:

> State laws on drilling and production activities of oil, gas and geothermal resources wells for the purpose of conserving and protecting those resources take precedence over local regulations, particularly where the state law approves of or specifies plans of operation, methods, materials, procedures, or equipment to be used by the well operator or where activities are to be carried out under direction of the State Supervisor.

59 Ops. Cal. Atty. Gen. 461, Opinion No. 76-32 (Aug. 24, 1976). The Attorney General further reasoned that "the State has so fully occupied [the underground phases of oil and gas activities] that there is no room left for local regulation" *Id.* at 477–478.

The degree of detail in which the state has specified requirements has only increased with the adoption of SB 4 and its implementing regulations. The highly specific technical prescriptions for well stimulation treatment leave no room for additional, inconsistent or duplicative downhole

regulation imposed by local zoning ordinances, reinforcing the conclusion of preemption reached by the Attorney General.

11: Regulatory Developments: General

Some commenters have suggested that certification of the Environmental Impact Report (EIR) should be delayed to account for pending regulatory developments. Although a number of regulatory developments related to oil and gas exploration activities were recognized throughout the Draft EIR, a summary of pending regulatory developments considered by the County in its review of the Project has been summarized below.

U.S. EPA's Proposed Regulation of Methane Emissions from Oil and Gas Production

On January 14, 2015, President Obama's Administration announced a new goal to cut methane emissions from the oil and gas sector by 40-45 percent from 2012 levels by 2025. To achieve this goal, the Administration outlined a cross-agency effort that considers the role of the federal Environmental Protection Agency, the Department of the Interior, and industry. Administration actions include:

- Proposing and setting commonsense standards for methane and ozone-forming emissions from new and modified sources.
- Developing new guidelines to reduce volatile organic compounds in ozone non-attainment areas.
- Enhancing leak detection and emissions reporting.
- Leading by example on public lands.
- Reducing methane emissions while improving pipeline safety.
- Driving technology to reduce natural gas losses and improve emissions quantification.
- Modernizing natural gas transmission and distribution infrastructure.
- Releasing a quadrennial energy review.

The proposal is designed to help the United States a goal unveiled by Obama in China last year to reduce greenhouse gas emissions 26-28 percent below 2005 levels by 2025.

In furtherance of these goals, the U.S. EPA is expected to propose new source performance standards for all new and modified sources in the oil and gas industry. EPA is also expected to propose control technique guidelines that will provide a methane co-benefit by reducing VOC emissions in ozone non-attainment areas. In addition, the Bureau of Land Management is expected to release rules that would reduce methane and VOC emissions from flaring and venting from oil and gas operations on federal leases. The new BLM rules would impact new and existing sources.

CARB Methane Rule

CARB is expected to adopt a new rule aimed at reducing methane emissions from the oil and gas sector in October 2015. The draft rule includes requirements for controls on storage tanks, liquid unloading, pneumatic devices, completion operations and compressors, and requires leak detection and repair programs, as well as equipment associated with hydraulic fracturing operations.

DOGGR's Proposed Aquifer Exemption Compliance Schedule

In April 2015, DOGGR released a notice of proposed emergency rulemaking action to adopt emergency regulations necessary to protect public health, safety and the environment, and to bring California's Class II Underground Injection Control program into compliance with the federal Safe Drinking Water Act. The regulations were adopted on a temporary basis by emergency rulemaking, and DOGGR initiated formal rulemaking in May 2015 to adopt permanent regulations that, when final, will replace the emergency regulations.

The rule serves to address U.S. EPA concerns that fluids from Class II wells may be being injected into aquifers that have not been formally designated as exempt by U.S. EPA. An "exempt aquifer" is defined by U.S. EPA as an aquifer that meets one or more of the criteria specified in Underground Injection Control (UIC) Program regulations, which means that it is not an "underground source of drinking water. Exempt aquifers are those for which "protection under the Safe Drinking Water Act has been waived because the aquifer is not a source of drinking water or a source of water for public water supply systems. If an aquifer has not been formally exempted by EPA, it cannot be used in connection with oil and gas operations, whether for waste disposal or enhanced oil recovery.

DOGGR's emergency regulations, and the proposed permanent regulations, phase out injection into non-exempt aquifers by 2017. In addition, DOGGR has begun collecting data from oil and gas operators in order to support requests for aquifer exemptions for certain aquifers, thus allowing Class II injection to continue into aquifers once they have received an exempt status. The 45-Day comment period for DOGGR's permanent Aquifer Exemption Compliance Schedule Regulations ended on July 13, 2015.

Although the County cannot be certain that pending legislative and regulatory developments will be adopted, it will continue to monitor the legal landscape to assure that future oil and gas exploration, development, and production activities in unincorporated Kern County comply with any newly adopted mandates. Notably, the DEIR recognized that developing legislation and regulations could affect future exploration activities within unincorporated Kern County. In fact, several of the Proposed Project's objectives considered the evolving regulatory landscape:

- Update the County's Zoning Ordinance to include additional procedures and compliance standards that address changes in laws and regulations by other agencies, and technological advancements within the oil and gas industry, for the purpose of reducing or eliminating potential significant adverse environmental

impacts, to the extent feasible, of future oil and gas activities, and thereby ensure that current County ordinances reflect the County's interest in protecting the health, safety, and general welfare of residents and visitors.

- Continue Kern County's ongoing commitment to consult and cooperate with federal, state, regional, and local agencies by periodically reviewing adopted regulations to ensure the long-term viability of Kern County's resources.
- Continue to improve and streamline current energy regulations and increase County monitoring and involvement in state and federal energy legislation.

Similar directives are included in the County's General Plan Goals and Policies, which were reviewed for consistency. The DEIR determined that the Proposed Project would be consistent with General Plan Section 1.9, Goal 6, Policy 25, Implementation Measure J: "The County shall continue to monitor new legislation as it relates to energy production and periodically review the General Plan and Zoning Ordinance for any required updates." (DEIR, p. 4.10-104.) In addition, the EIR determined that the Proposed Project would be consistent with General Plan Section 5.3.1, Policy 8, Implementation Measure C: "The County shall monitor its regulations pertaining to petroleum exploration, production, and update such regulations as necessary." (DEIR, p. 4.10-131.) Each of these implementation measures requires the County to keep abreast of regulatory developments to assure that any adopted mandates are properly implemented.

In sum, the County recognized that there will continue to be legal developments related to oil and gas exploration activities. Given the evolving legal landscape, the County will continue its monitoring efforts to assure that any newly adopted legislation or regulation is considered during future oil and gas exploration entitlement efforts. However, as legislative and regulatory developments remain ongoing, and new developments are likely to arise in the future, it is not feasible to wait for all such efforts to be completed before finalizing the EIR. Further action at this time would be speculative and potentially counterproductive as the County does not want to create conflicts with new laws and regulations that may come out of the ongoing regulatory dialogue concerning the oil and gas sector.

12: CCST: General

Several commenters raised questions about the relationship between this EIR and studies issued by the California Center on Science and Technology. (Volume 1 of the CCST study was issued earlier this year, and Volumes 2 and 3 were issued after publication of the DEIR.) This response addresses the CCST study issues generally, and other global responses as well as responses to individual comments address more specific CCST study issues as noted.

As discussed in the DEIR, in 2014, California enacted new laws pertaining to well stimulation treatments in the state (commonly referred to as the "Senate Bill 4" or "SB 4" legislation). The laws required DOGGR to adopt new interim and final well stimulation treatment regulations and also commissioned the California Council on Science and Technology (CCST) to conduct an independent scientific assessment of well stimulation treatments, including hydraulic fracturing, in California. The purpose of the CCST analysis was to synthesize and assess the available scientific

information associated with well stimulation treatments in California. The CCST review surveyed hydraulic fracturing, matrix acidizing, and acid fracturing as they are applied both onshore and offshore for oil and gas production in the state. The study work scope was organized in three major areas, which were documented in three separate report volumes delivered to the California Natural Resources Agency.

Volume I was released on January 14, 2015 and provides a factual basis for the analysis including a description of well stimulation treatments (WST), how they are conducted in general and practiced in California, and where they have been and are being used for oil and gas production in the state.

Volume II was released on July 9, 2015 and discusses how well stimulation could affect water, atmosphere, seismic activity, wildlife and vegetation, and human health, reviews available data, and identifies knowledge gaps and alternative practices that could avoid or mitigate possible impacts.

Volume III was released on July 9, 2015 and presents four case studies that assess environmental issues and qualitative risks for specific geographic regions: Offshore, Monterey Formation, Los Angeles Basin, and the San Joaquin Basin.

The report findings were organized into seven "principles" and CCST "conclusions" and "recommendations" applicable to each of the principles. CEQA did not and does not impose any requirement on the County to await the finalization of the CCST review prior to completing its DEIR analysis. (See *Chaparral Greens v. City of Chula Vista* (1996) 50 Cal.App.4th 1134, 1145 [CEQA contains no requirement that an agency rely on proposed or draft regional studies in evaluating a project]; see also *City of Maywood v. Los Angeles Unified School District* (2012) 208 Cal.App.4th 362, 411-412). Even so, as discussed below, the DEIR is consistent with the applicable principles, conclusions and recommendations developed by the CCST in the three-volume report on well stimulation in California.

CCST Principle 1. Maintain, expand and analyze data on the practice of hydraulic fracturing and acid stimulation in California.

CCST Conclusion 1.1. Most well stimulations in California are hydraulic fracturing and most hydraulic fracturing occurs in the San Joaquin Valley. About 95% of reported hydraulic fracturing operations in California occur in the San Joaquin Basin, nearly all in four oil fields in Kern County. Over the last decade, about 20% of oil and gas production in California came from wells treated with hydraulic fracturing. Hydraulic fracturing accounts for about 90% of all well stimulations in California; matrix acidizing accounts for only 10%; and acid fracturing operations nearly none. Operators in California commonly use acid for well maintenance, but acid stimulation will not likely lead to major increases in oil and gas production due to the state's geology.

CCST Conclusion 1.2. The California experience with hydraulic fracturing differs from that in other states. Present-day hydraulic fracturing practice and geologic conditions in California differ from those in other states, and as such, recent experiences with hydraulic fracturing in other states do not necessarily apply to current hydraulic fracturing in California.

CCST Conclusion 1.3. Hydraulic fracturing in California does not use a lot of fresh water compared to other states and other human uses. Operators in California use about 800 acre-feet per year.

CCST Recommendation 1.1. Identify opportunities for water conservation and reuse in the oil and gas industry.

Note: CCST Conclusions 1.4 and 1.5 and Recommendation 1.2 pertain to offshore activities and are not applicable to the Project Area.

The DEIR is consistent with CCST Principle 1, Conclusions 1.1-1.3, and Recommendation 1.1. As discussed in the DEIR, Kern County requires compliance with monitoring and data collection/reporting requirements of other agencies, requires submittal of written information about oil and gas activities (e.g., depth of well, produced water disposal practice, destination of produced oil and gas, biological and cultural resource survey results, stormwater management practices) in the required application documentation for activities subject to the proposed Conformity Review process. The application status information will be made available via the Acela program and DataBasin layers that are accessible online.

These measures are consistent with the CCST Principle 1 goal to maintain, expand and analyze data on the practice of hydraulic fracturing and acid stimulation in California.

The DEIR includes an appendix describing how hydraulic fracturing practices in other states differ from California. This analysis is consistent with the findings summarized in CCST Conclusions 1.1-1.3.

The DEIR requires the five largest oil and gas producers in the Project Area to cooperate in developing additional produced water treatment and re-use supplies, and to cooperate with the pending implementation of a Groundwater Sustainability Plan (GSP) for Project Area basins. The DEIR also encourages additional produced water reuse and recycled water use for oil and gas production activities. These measures are consistent with the CCST Recommendation 1.1 to identify opportunities for water conservation and reuse in the oil and gas industry.

CCST Principle 2: Prepare for potential future changes in hydraulic fracturing and acid stimulation practice in California.

CCST Conclusion 2.1. Future use of hydraulic fracturing in California will likely resemble current use.

CCST Recommendation 2.1. Assess the oil resource potential of the Monterey Formation. The state should request a comprehensive, science-based and peer-reviewed assessment of source-rock ("shale") oil resources in California and the technologies that might be used to produce them. The state could request such an assessment from the U.S. Geological Survey, for example.

CCST Recommendation 2.2. Keep track of exploration in the Monterey Formation.

As discussed above, the proposed County Conformity Review process will include application information that will be publicly available online and that will support efforts to track where oil and gas activity in the Project Area, including exploration related to the Monterey Formation, may occur in the future. The analysis and assessments included in CCST Principle 2, however, are beyond the scope of a local agency such as Kern County. As noted CCST Recommendation 2.1, Monterey Formation assessments should be addressed by applicable state and federal agencies with the appropriate expertise.

CCST Principle 3. Account for and manage both direct and indirect impacts of hydraulic fracturing and acid stimulation.

CCST Conclusion 3.1. Direct impacts of hydraulic fracturing appear small but have not been investigated

CCST Conclusion 3.2. Operators have unrestricted use of many hazardous and uncharacterized chemicals in hydraulic fracturing.

CCST Conclusion 3.3. The majority of impacts associated with hydraulic fracturing are caused by the indirect impacts of oil and gas production enabled by the hydraulic fracturing. Impacts caused by additional oil and gas development enabled by well stimulation (i.e. indirect impacts) account for the majority of environmental impacts associated with hydraulic fracturing. A corollary of this conclusion is that all oil and gas development causes similar impacts whether the oil is produced with well stimulation or not. As hydraulic fracturing enables only 20-25% of production in California, only about 20-25% of any given indirect impact is likely attributable to hydraulically fractured reservoirs.

CCST Conclusion 3.4. Oil and gas development causes habitat loss and fragmentation. Any oil and gas development, including that enabled by hydraulic fracturing, can cause habitat loss and fragmentation. The location of hydraulic-fracturing-enabled development coincides with ecologically sensitive areas in the Kern and Ventura Counties.

CCST Recommendation 3.1. Assess adequacy of regulations to control direct impacts of hydraulic fracturing and acid stimulations.

CCST Recommendation 3.2. Limit the use of hazardous and poorly understood chemicals. Operators should report the unique Chemical Abstracts Service Registry Number (CASRN) identification for all chemicals used in hydraulic fracturing and acid stimulation, and the use of chemicals with unknown environmental profiles should be disallowed. The overall number of different chemicals should be reduced, and the use of more hazardous chemicals and chemicals with poor environmental profiles should be reduced, avoided, or disallowed.

CCST Recommendation 3.3. Evaluate impacts of production for all oil and gas development, rather than just the portion of production enabled by well stimulation. Concern about hydraulic fracturing might cause focus on impacts associated with production from fractured wells, but concern about these indirect impacts should lead to study of all types of oil and gas production, not just production

enabled by hydraulic fracturing. Agencies with jurisdiction should evaluate impacts of concern for all oil and gas development, rather than just the portion of development enabled by well stimulation.

CCST Recommendation 3.4. Minimize habitat loss and fragmentation in oil and gas producing regions. Enact regional plans to conserve essential habitat and dispersal corridors for native species in Kern and Ventura Counties. The plans should identify top-priority habitat and restrict development in these regions. The plan should also define and require those practices, such as clustering multiple wells on a pad and using centralized networks of roads and pipes, which will minimize future surface disturbances. A program to set aside compensatory habitat in reserve areas when oil and gas development causes habitat loss and fragmentation should be developed and implemented

The DEIR is generally consistent with CCST Principle 3, Conclusions 3.1-3.4, and Recommendations 3.1-3.4. Kern County does not have the jurisdiction to directly implement Recommendation 3.1, which pertains to the assessment of the adequacy of applicable WST regulations that are adopted by state and federal agencies. The DEIR requires compliance with all laws and regulations, including WST-related regulations implemented and permit conditions that may be required by DOGGR and the Central Valley Regional Water Quality Control Board (CVRWQCB) as these may evolve and expand over time. The County will also request that responsible agencies provide copies of any oil and gas notices of violation or similar enforcement orders to the County and will coordinate with any agency issuing such orders to ensure that no new County permit will be issued for non-complying facilities. The County may exercise its enforcement discretion to seek revocation of approved permits in the event of serious non-compliance.

Similarly, the use or restriction of WST chemicals discussed in CCST Recommendation 3.2 is a state and federal regulatory issue. The DEIR requires compliance with existing and future regulations pertaining to WST and other activities subject to the proposed County permit review process, including any such laws or regulations that may restrict or limit the use of certain WST chemicals. In addition, the FEIR includes a new mitigation measure (see MM 4.8-16) which requires the submittal of certain information (safety data sheets, toxicity information, etc.) before a WST fluid may be used. Therefore, the DEIR also addresses CCST's concern that chemicals used are not fully known or understood.

The DEIR mitigation measures that would be implemented in conjunction with the proposed permit review process are consistent with CCST Recommendation 3.3, which pertains to the evaluation of impacts from all oil and gas development, rather than just the portion of production enabled by well stimulation. The permit application requirements and the DEIR mitigation measures encompass most oil and gas activities in the project area and are not limited to well stimulation.

The DEIR includes mitigation measures that avoid and minimize potential habitat fragmentation in the Project Area by requiring the use of existing roads where available to minimize new surface disturbance, and compensatory mitigation for biological resource impacts. These measures generate significant incentives for oil and gas applicants to avoid unnecessary new ground disturbance activities and are consistent with CCST Recommendation 3.4.

CCST Principle 4. Manage water produced from hydraulically fractured or acid stimulated wells appropriately.

CCST Conclusion 4.1. Produced water disposed of in percolation pits could contain hydraulic fracturing chemicals.

CCST Conclusion 4.2. The chemistry of produced water from hydraulically fractured or acid stimulated wells has not been measured.

CCST Conclusion 4.3. Required testing and treatment of produced water destined for reuse may not detect or remove chemicals associated with hydraulic fracturing and acid stimulation.

CCST Conclusion 4.4. Injection wells currently under review for inappropriate disposal into protected aquifers may have received water that contains chemicals from hydraulic fracturing.

CCST Conclusion 4.5. Disposal of produced water by underground injection has caused earthquakes elsewhere. Fluid injected in the process of hydraulic fracturing will not likely cause earthquakes of concern. In contrast, disposal of produced water by underground injection could cause felt or damaging earthquakes. To date, there have been no reported cases of induced seismicity associated with produced water injection in California. However, it can be very difficult to distinguish California's frequent natural earthquakes from those possibly caused by water injection into the subsurface.

CCST Conclusion 4.6. Changing the method of produced water disposal will incur tradeoffs in potential impacts. Based on publicly available data, operators dispose of much of the produced water from stimulated wells in percolation pits (evaporation-percolation ponds), about a quarter by underground injection (in Class II wells), and less than one percent to surface bodies of water. Changing the method of produced water disposal could decrease some potential impacts while increasing others.

CCST Recommendation 4.1. Ensure safe disposal of produced water in percolation pits with appropriate testing and treatment or phase out this practice.

CCST Recommendation 4.2. Evaluate and report produced water chemistry from hydraulically fractured or acid stimulated wells.

CCST Recommendation 4.3. Protect irrigation water from contamination by hydraulic fracturing chemicals and stimulation reaction products.

CCST Recommendation 4.4. In the ongoing investigation of inappropriate disposal of wastewater into protected aquifers, recognize that hydraulic fracturing chemicals may have been present in the wastewater.

CCST Recommendation 4.5. Determine if there is a relationship between wastewater injection and earthquakes in California. Conduct a comprehensive multi-year study to determine if there is a relationship between oil and gas-related fluid injection and any of California's numerous

earthquakes. In parallel, develop and apply protocols for monitoring, analyzing, and managing produced water injection operations to mitigate the risk of induced seismicity. Investigate whether future changes in disposal volumes or injection depth could affect potential for induced seismicity.

CCST Recommendation 4.6. Evaluate tradeoffs in wastewater disposal practices. As California moves to change disposal practices, for example by phasing out percolation pits or stopping injection into protected aquifers, agencies with jurisdiction should assess the consequences of modifying or increasing disposal via other methods.

The DEIR is consistent with CCST Recommendation 4.1 and requires that applicants produce written evidence from the CVRWQCB and/or DOGGR of lawful produced water disposal as a required element of the application process. As discussed above, the evaluation of technical and scientific issues associated with WST in general, such as the evaluation of WST water chemistry in CCST Recommendation 4.2, is most appropriately conducted by state or federal agencies with appropriate expertise. The DEIR requires that all applicants comply with all applicable laws and regulations, including reporting that include WST chemistry information.

The DEIR summarizes available information about contamination sources (primarily from percolation ponds, with none from hydraulic fracturing) including water quality exceedances associated with the reuse of produced water for irrigation. As discussed in Global Response Water-01, in 2014 the CVRWQCB implemented a work plan that included informational orders issued to 77 well operators that require data on the water quality of produced water disposed in surface ponds. This data could help identify whether WST chemicals remain resident in oil-bearing formations that could generate produced water used for irrigation. As discussed in Global Response GR Water-8, the CVRWQCB has also convened a panel to consider food safety issues that may be associated with the use of produced water for irrigation. The DEIR requires compliance with all DOGGR and CVRWQCB requirements, including waste discharge requirements (WDRs) applicable to agricultural use of produced water, and any future requirements that may be adopted to address food safety or other irrigation and water quality issues. As a result, the DEIR is consistent with CCST Recommendation 4.3.

Consistent with CCST Recommendation 4.4, the DEIR summarizes available information about the ongoing review of the Underground Injection Control (UIC) program in California by DOGGR, the CVRWQCB, and the EPA. The current (as of August 2015) status of these efforts is also discussed in Global Response Water-02. DEIR mitigation measure 4.9 prohibits any applicant under the proposed review process from conducting any injection activity regulated by the UIC program, including enhanced oil recovery activities that discharge into any underground source of drinking water unless the aquifer has been exempted by the EPA or the injection has otherwise been authorized by the EPA or by DOGGR under the Division's delegated Safe Drinking Water Act authority.

Consistent with CCST Recommendation 4.5, the DEIR addresses seismic risks from oil and gas activities, including produced water disposal. As discussed above, the DEIR requires compliance with all applicable laws and regulations, including future requirements that may be adopted in response to the CCST-recommended study of seismic risks by DOGGR or other applicable agency.

Consistent with CCST Recommendation 4.6, the DEIR requires that applicants produce written evidence from the CVRWQCB and/or DOGGR that all forms of produced water disposal will occur in a lawfully permitted manner and facility as an element of the application process. The regulatory requirements associated with the permitting of disposal methods and facilities requires measures that protect water quality and avoid and minimize other impacts that could be associated with different forms of produced water disposal.

CCST Principle 5. Add protections to avoid groundwater contamination by hydraulic fracturing.

CCST Conclusion 5.1. Shallow fracturing raises concerns about potential groundwater contamination. In California, about three quarters of all hydraulic fracturing operations take place in shallow wells less than 2,000 feet (600 meters) deep. In a few places, protected aquifers exist above such shallow fracturing operations, and this presents an inherent risk that hydraulic fractures could accidentally connect to the drinking water aquifers and contaminate them or provide a pathway for water to enter the oil reservoir. Groundwater monitoring alone may not necessarily detect groundwater contamination from hydraulic fractures. Shallow hydraulic fracturing conducted near protected groundwater resources warrants special requirements and plans for design control, monitoring, reporting, and corrective action.

CCST Conclusion 5.2. Leakage of hydraulic fracturing chemicals could occur through existing wells. California operators use hydraulic fracturing mainly in reservoirs that have been in production for a long time. Consequently, these reservoirs have a high density of existing wells that could form leakage paths away from the fracture zone to protected groundwater or the ground surface. The pending SB 4 regulations going into effect July 2015 do address concerns about existing wells in the vicinity of well stimulation operations; however, it remains to demonstrate the effectiveness of these regulations in protecting groundwater.

CCST Recommendation 5.1. Protect groundwater from shallow hydraulic fracturing operations. Agencies with jurisdiction should act promptly to locate and catalog the quality of groundwater throughout the oil-producing regions. Operators proposing to use hydraulic fracturing operation near protected groundwater resources should be required to provide adequate assurance that the expected fractures will not extend into these aquifers and cause contamination. If the operator cannot demonstrate the safety of the operation with reasonable assurance, agencies with jurisdiction should either deny the permit, or develop protocols for increased monitoring, operational control, reporting, and preparedness.

CCST Recommendation 5.2. Evaluate the effectiveness of hydraulic fracturing regulations designed to protect groundwater from leakage along existing wells. Within a few years of the new regulations going into effect, DOGGR should conduct or commission an assessment of the regulatory requirements for existing wells near stimulation operations and their effectiveness in protecting groundwater with less than 10,000 TDS from well leakage.

The DEIR summarizes available information about potential contamination sources related to oil and gas water use. To date, confirmed water quality impacts in the Project Area have been associated

with the use of percolation ponds and, in one instance, with subsurface injection. Global Response Water-01 summarizes additional information about surface pond use, and Global Response Water-02 summarizes the status of the state and federal review of the California UIC program regulating subsurface injection activities. The DEIR requires compliance with all existing and future laws and regulations applicable to groundwater protection and is consistent with CCST Recommendation 5.1. CCST Recommendation 5.2 pertains to the evaluation of state WST regulations by DOGGR that protect against leakage along existing wells. The DEIR requires compliance with all existing and future laws and regulations applicable to groundwater protection and is consistent with CCST Recommendation 5.1 and would also require compliance with any new regulatory measures DOGGR may implement to address WST leakage along existing wells.

CCST Principle 6. Understand and control emissions and their impact on environmental and human health.

CCST Conclusion 6.1. Oil and gas production from hydraulically fractured reservoirs emits less greenhouse gas per barrel of oil than other forms of oil production in California. Burning fossil fuel to run vehicles, make electricity, and provide heat accounts for the vast majority of California's greenhouse gas emissions. In comparison, publicly available California state emission inventories indicate that oil and gas production operations emit about 4% of California total greenhouse gas emissions. Oil and gas production from hydraulically fractured reservoirs emits less greenhouse gas per barrel of oil than production using steam injection. Oil produced in California using hydraulic fracturing also emits less greenhouse gas per barrel than the average barrel imported to California. If the oil and gas derived from stimulated reservoirs were no longer available, and demand for oil remained constant, the replacement fuel could have larger greenhouse gas emissions.

CCST Conclusion 6.2. Air pollutant and toxic air emissions from hydraulic fracturing are mostly a small part of total emissions, but pollutants can be concentrated near production wells. According to publicly available California state emission inventories, oil and gas production in the San Joaquin Valley air district likely accounts for significant emissions of sulfur oxides (SO_x), volatile organic compounds (VOC), and some air toxics, notably hydrogen sulfide (H_2S). In other oil and gas production regions, production as a whole accounts for a small proportion of total emissions. Hydraulic fracturing facilitates about 20% of California production, and so emissions associated with this production also represent about 20% of all emissions from the oil and gas production in California. Even where the proportion of air pollutant and toxic emissions caused directly or indirectly by well simulation is small, atmospheric concentrations of pollutants near production sites can be much larger than basin or regional averages, and could potentially cause health impacts.

CCST Conclusion 6.3. Emissions concentrated near all oil and gas production could present health hazards to nearby communities in California. Many of the constituents used in and emitted by oil and gas development can damage health, and place disproportionate risks on sensitive populations, including children, pregnant women, the elderly, and those with pre-existing respiratory and cardiovascular conditions. Health risks near oil and gas wells may be independent of whether wells in production have undergone hydraulic fracturing or not. Consequently, a full understanding of health risks caused by proximity to production wells will require studying all types of productions wells, not just those that have undergone hydraulic fracturing. Oil and gas development poses more

elevated health risks when conducted in areas of high population density, such as the Los Angeles Basin, because it results in larger population exposures to toxic air contaminants.

CCST Conclusion 6.4. Hydraulic fracturing and acid stimulation operations add some occupational hazards to an already hazardous industry.

CCST Recommendation 6.1. Assess and compare greenhouse gas signatures of different types of oil and gas production in California. Conduct rigorous market-informed life-cycle analyses of emissions impacts of different oil and gas production to better understand GHG impacts of well stimulation.

CCST Recommendation 6.2. Control toxic air emissions from oil and gas production wells and measure their concentrations near productions wells. Apply reduced-air-emission completion technologies to production wells, including stimulated wells, to limit direct emissions of air pollutants, as planned. Reassess opportunities for emission controls in general oil and gas operations to limit emissions. Improve specificity of inventories to allow better understanding of oil and gas emissions sources. Conduct studies to improve our understanding of toxics concentrations near stimulated and un-stimulated wells.

CCST Recommendation 6.3. Assess public health near oil and gas production. Conduct studies in California to assess public health as a function of proximity to all oil and gas development, not just stimulated wells, and develop policies such as science-based surface setbacks, to limit exposures.

CCST Recommendation 6.4. Assess occupational health hazards from proppant use and emission of volatile organic compounds. Conduct California-based studies focused on silica and volatile organic compounds exposures to workers engaged in hydraulic-fracturing-enabled oil and gas development processes based on the National Institute for Occupational Safety and Health occupational health findings and protocols.

The DEIR requires compliance with the California cap and trade program, which is designed to substantially reduce state greenhouse gas (GHG) emissions. The DEIR also requires that applicants implement GHG mitigation measures that will result in no net increase in GHG emissions for sources smaller than those regulated under the cap and trade program (i.e., those that emit less than 25 tons of GHG per year), and requires compliance with all other GHG regulations, including planned new methane controls for wells. These measures are consistent with CCST Recommendation 6.1.

Consistent with CCST Recommendations 6.2 and 6.3, the DEIR includes a Health Risk Assessment for construction and operation of different well configurations including hydraulically fractured wells at depths of 10,000 feet, and prescribed health-based setback requirements to assure no adverse health risks to sensitive receptors from toxic air contaminants. The DEIR also requires that applicants implement mitigation measures to ensure no net increase in Project Area non-attainment criteria air pollutants, including NO_x, PM_{10} and ROGs, which also contribute to adverse health impacts in the air basin. These measures may include emission reductions completed by the applicant (and verified by the San Joaquin Valley Air Pollution Control District (SJVAPCD) or via

emission reductions achieved by the County through an Emission Reduction Agreement with the SJVAPCD.

The DEIR does not specifically address occupational health and safety risks from proppant use. However, consistent with CCST Recommendation 6.4, occupational health risks related to volatile organic compounds, as well as reactive organic compounds, are addressed in the Health Risk Assessment included in the DEIR. See also, responses to letter 2 (DOGGR), comments 43 and 133.

CCST Principle 7. Take an informed path forward.

CCST Conclusion 7.1. Data reporting gaps and quality issues exist.

CCST Conclusion 7.2. Future research would fill knowledge gaps.

CCST Conclusion 7.3. Ongoing scientific advice could inform policy. As the state of California digests this assessment and as more data become available, continued interpretation of both the impacts of well stimulation and the potential meaning of scientific data and analysis would inform the policy framework for this complex topic.

CCST Recommendation 7.1. Improve and modernize public record keeping for oil and gas production.

CCST Recommendation 7.2. Conduct integrated research to close knowledge gaps. Conduct integrated research studies in California to answer key questions about the environmental, health, and seismic impacts of oil and gas production enabled by well stimulation. Integrated research studies should include regional hydrologic characterization and field studies related to surface and groundwater protection, induced seismicity, ecological conditions, as well as air and health effects.

CCST Recommendation 7.3. Establish an advisory committee on oil and gas. The state of California should establish a standing scientific advisory committee to support decisions on the regulation of oil and gas development.

Consistent with CCST Recommendation 7.1, the County will be using online systems, including the DataBasin and Acela program, and implementing a mitigation and monitoring reporting plan, that will significantly improve existing recordkeeping for oil and gas production activities in the Project Area. The information generated by these enhanced recordkeeping and informational requirements can be used to inform future regulatory activities and studies.

As discussed above, the WST-related integrated research programs described in CCST Recommendation 7.2 are most appropriately conducted by state and federal agencies with applicable expertise.

In summary, the mitigation, monitoring and application process that would be implemented by the County in conjunction with the proposed project is generally consistent with the CCST report principles, conclusions and recommendations. Certain of the CCST recommendations specifically refer to, or are appropriate for, implementation by state and federal agencies with applicable

technical expertise. The County process will help generate additional information that would support these efforts, and will also require applicant compliance with all laws and regulations that may be implemented as a result of large scale WST research projects and studies.

13: CCST - Well Stimulation

Numerous commenters express opposition to the use of well stimulation treatments (WST), arguing that the proposed mitigation measures are insufficient to protect against the risks associated with WST. Most of the cited impacts are common to all oil and gas production, rather than specifically related to WST. However, some of the cited risks have been attributed to WST, such as the potential for groundwater contamination at the surface or through hydraulic fractures. Surface contamination risks from WST fluids were recently addressed in a new DOGGR regulation that forbids surface disposal of WST fluids, as discussed further in GR Water 1. With respect to contamination risks from hydraulic fracturing, in its recently released report, the California Council on Science and Technology (CCST) concluded that the direct impacts of well stimulation appear to be small, although they bear further investigation. As explained by CCST, good management and mitigation measures can address these relatively small direct impacts.

Well stimulation can be conducted as part of the well completions process or as part of a well work-over process. Decisions on whether a well stimulation operation is required are generally dictated by the geologic characteristics of the reservoir. Stimulation is performed on a well to increase or restore production from new or under-producing existing wells. Public Resources Code Section 3157 of Division 3, Chapter 1, as amended, defines oil and gas well stimulation as "any treatment of a well designed to enhance oil and gas production or recovery by increasing the permeability of the formation. Well stimulation treatments include, but are not limited to, hydraulic fracturing treatments and acid well stimulation treatments. Well stimulation treatments do not include steam flooding, water flooding, or cyclic steaming."

CCST proposed 24 recommendations in its report. Of those applicable to Kern County, many are already included in this EIR or are required by existing regulations. In the lifecycle of a well, WST plays a small role, lasting only a few days at most while production over the life of the well may last years. As such, the risks associated with WST are relatively limited and manageable with proper mitigation measures.

Many commenters suggested that well stimulation is inadvisable due to associated risks, such as the use of fresh water for oil and gas development, the potential contamination of high quality groundwater, and induced seismicity. For the reasons described below, the County disagrees with these assertions.

Water Usage

Commenters have expressed concern that well stimulation requires a large amount of fresh water, the use of which is inadvisable in current drought conditions. Well stimulation in fact requires relatively little water—operators in California use about 800 acre-feet of water per year for hydraulic fracturing. This amount does not represent a large amount of freshwater compared

to other human use, representing less than 0.2% of all human water use. The majority of water use in oil and gas development occurs in enhanced oil recovery; well stimulation's contribution is relatively minimal.

Groundwater Contamination

Many commenters have voiced concerns regarding groundwater contamination. Only one of the identified pathways of groundwater contamination stems directly from well stimulation and its potential effects are overstated in the CCST report. The CCST report discussed a number of potential issues including use of evaporation-percolation ponds and underground injection for produced water disposal, reuse of produced water potentially containing hazardous concentrations of stimulation constituents, and the release of well stimulation constituents via induced fractures, faults, and wells present potential risks for groundwater contamination. Of these, well stimulation contributes only one potential pathway: the migration of stimulation fluids via faults, fractures, and wells.

Based on an analysis of the San Joaquin Basin's geology, CCST suggested that migration via faults, fractures, and wells poses a potential risk for groundwater contamination. However, this risk is overstated in the CCST report. As explained in the DEIR, recent studies have indicated that well failure rates in the Project Area have been significantly reduced over time by improved well construction technologies. Failure rates due to well operations in California Oil and Gas District 4 from 1991 to 2005 ranged from one per 10,000 to one per 60,000 well years, representing an 80% decline from 1991 to 2005. Further, new regulations regarding well stimulation require physical well inspections before commencing the stimulation process. Once stimulation has begun, well pressure must be closely monitored during the treatment operation and terminated immediately if pressure or performance thresholds are exceeded. In light of the declining rate of failures and stringent new regulations, the risk from well leakage is significantly reduced.

Please also see GR Water-1, which addresses potential impacts from the use of sumps, pits and ponds in connection with oil and gas activities, and RTC 2-56, which is an explanation of the EIR's evaluation of potential impacts of the Project related to the disposal of produced water and other Class II wastes.

Induced Seismicity

Commenters raised concerns regarding the potential for well stimulation treatments to induce seismicity. CCST conducted a literature review to assess the risk posed by well stimulation and its effect on net fluid balance, noting that the "lack of reported felt seismicity for hydraulic fracturing in California is consistent with the relatively shallow injection depths and small [fluid] volumes currently employed in California operations." Seismic events have been associated with WST in other parts of the United States, where high volume fracturing uses much greater quantities of water at greater depths. However, as the CCST report documents, seismic events in other states are not relevant predictors of risk of such events in California, where different geologic conditions and WST practices apply. In the SB 4 Final EIR, DOGGR

similarly concluded that "well stimulation treatments and oil and gas extraction themselves do not pose a high risk for inducing felt seismic events." SB 4 EIR at C.2-94–C.2-95.

In addition, DOGGR's SB 4 implementing regulations address potential seismic-related impacts. Section 1785.1 of DOGGR's permanent regulations require monitoring and evaluation of seismic activity in the vicinity of any proposed hydraulic fracturing operation, including an evaluation of any indication of a causal connection between the hydraulic fracturing and an earthquake. Section 1785.1 does not allow any further hydraulic fracturing within a specified radius until DOGGR has completed such evaluation and is satisfied that hydraulic fracturing within that radius does not create a heightened risk of seismic activity. If a seismic event is determined to be a result of WST operation, the WST regulations require that an evaluation be conducted to determine whether surrounding wells have zonal isolation. Post-earthquake evaluation is also required under the WST regulations — if a seismic event is WST related, the WST regulations require a post seismic event evaluation of the mechanical integrity of wells within the 5x radius to determine if any wells have been compromised and prohibit future wells in this area from WST activities until after an evaluation has been completed. Remediation of wells to ensure zonal isolation may also be required by DOGGR.

In addition to the above requirements, the FEIR includes a new mitigation measure which requires seismic monitoring. The potential for induced-seismicity impacts from WST is therefore expected to be less than significant after mitigation. Reducing the potential for induced seismic events to less than significant also reduces the level of potential post-earthquake harm to insignificance.

14: DOGGR Well Count Reconciliation

Commenters have stated that the Draft EIR's projection of future oil and gas activity in the County is inaccurate because the 2014 report of California Oil and Gas Production Statistics by DOGGR states that DOGGR issued 10,122 permits for oil and gas operators statewide in calendar year 2014, and most of the state's oil and gas activity occurs in Kern County. By comparison, the analysis in the Draft EIR includes a Project Description that includes 3,649 total wells per year, of which 2,697 would be producing wells.

As explained in the Draft EIR and further described in Global Responses to Comments 6 and 8, the County used a variety of data resources and reports available from DOGGR, as well as applicants' projections of potential future well activity, to derive the 3,649 and 2,697 well counts included in the Project Description. As explained in those responses, for calendar years up through 2009, the State Oil and Gas Supervisor published Annual Reports that summarized well activity a number of different ways, including by DOGGR district, type of well (e.g., exploration wells were called "prospect" wells, etc.) For calendar years 2010 and 2011, no Annual Report of the State Oil and Gas Supervisor was produced. For calendar years 2012 through 2014, the State Oil and Gas Supervisor issued shorter-form reports that were identified as "preliminary". These preliminary reports contain aggregate, statewide well activity data, but do not show data by DOGGR district (e.g., as explained in the DEIR, District 4 is primarily Kern County but also extends outside the County's boundaries), or by County. The preliminary reports also do not break out the type of

drilling activity (i.e., prospect, oil and gas, or service wells), although the notices required to be sent to DOGGR did include more detailed information.

The 2012 through 2014 DOGGR preliminary reports show that DOGGR receives more notices of planned well activities, but fewer actual well activities are actually completed. Table 7-3 below shows the annual number of notices filed compared to the number of wells drilled in the same year and the following year for the years summarized in the 2012 through 2014 preliminary reports. The number of wells drilled has ranged between approximately 20% and 35% of the number of notices filed in the same or the prior year.[70]

Table 7-3: Statewide Wells Drilled Compared to Notices Filed

Year	Notices Filed[a]	Wells Drilled	Wells Drilled / Notices Prior Year	Wells Drilled / Notices Same Year
2008	9,547 [b]	3,410 [b]	---	36%
2009	6,457 [b]	1,920 [b]	20%	30%
2010	8,845 [b]	2,103 [b]	33%	24%
2011	10,629 [b]	2,294 [b]	26%	21%
2012	9,410 [b]	3,081 [b]	28%	33%
2013	10,479 [c]	2,723 [c]	29%	26%
2014	10,122 [d]	2,087 [d]	20%	21%

[a] Drilling + Rework + Abandonment.
[b] 2012 Preliminary Report, p. 2.
[c] 2013 Preliminary Report, p. 2.
[d] 2014 Preliminary Report, p. 2.

It also should be noted that for all years presented in the Preliminary Reports, the total number of wells drilled statewide was less than the number of wells projected for future oil and gas development activity in Kern County in the Draft EIR. This confirms that the Draft EIR includes a conservative (greater) level of future actual well activity for purposes of completing a comprehensive environmental analysis and requiring appropriate mitigation measures, and also responds to the commenter's request for an explanation of the difference between DOGGR Notices Filed, actual permits completed, and forecast well activities in Kern County.

15: CCST: Hydraulic Stimulation Enabling/Production Inducing

Citing conclusions reached by the California Council on Science and Technology (CCST) in its statewide review of well stimulation treatment (WST), some commenters allege that WST has

[70] Notices of intent to drill ordinarily are cancelled if drilling operations have not commenced within one year after receipt of the notice. See Pub. Res. Code Section 3203; 14 C.C.R. Section 1722.

indirect, growth-inducing effects because it enables production from some wells and fields which may have been uneconomical if WST were not used. Commenters assert that any activities which would not occur but-for WST could have "growth –inducing" effects within the meaning of CEQA Guidelines § 15126.2(d) that were not properly accounted for in this EIR.

As CCST's review demonstrates, WST facilitates approximately 20% of California oil and gas production; that is, approximately 20% of production might become uneconomical if WST were unavailable. See CCST Report, Executive Summary, p. 42. CCST attributed indirect environmental impacts to such WST-enabled production, concluding:

> Hydraulic fracturing or acid stimulation can also incur indirect impacts, i.e., those not directly attributable to the activity itself. Some reservoirs require hydraulic fracturing for economic production. All activities associated with oil and gas production enabled by hydraulic fracturing or acid stimulation can bring about indirect impacts. Indirect impacts of hydraulic-fracturing-enabled oil and gas development usually occur in all oil and gas development, whether or not the wells are stimulated.

CCST Report, Executive Summary, p. 5.

> However, this EIR, which analyzes all oil and gas activities within the Project Area, including WST, already addresses the potential for increased production ("growth-inducing") from WST. As explained in section 5.5 of the DEIR, the growth-inducing analysis examined the number of new production wells that would be drilled as a result of the Zoning Ordinance amendment, including the number of wells which would undergo WST. The projected number of new wells captures all new wells, including those that would not be drilled if WST were unavailable. DEIR at 5-7. The EIR projections ongoing well stimulation activities in the Project Area, and these are included in the assessment of Project impacts. As relevant or requested, the EIR has also included refined projections based on projected levels of well stimulation activities. For example, GR Water-1 addresses the impact that WST fluid surface disposal regulations will have on changes to produced water disposal practices in the Project Area. Based on those assumptions, the DEIR found that the Project would not have significant growth-inducing impacts within Kern County.

Similarly, on a statewide basis, DOGGR's SB 4 EIR regarding WST concluded:

- Growth or changes in the local and state population projections would not occur as a result of the physical activities or employment associated with WST at existing or future oil and gas wells within the State;
- No change in population or employment trends would occur as a result of implementing WST activities; and
- No direct or indirect growth-inducing impacts that exceed current population growth projections and trends would occur as a result of implementing WST activities.

SB 4 EIR, p. 15-2.

Commenters have not pointed to substantial evidence, including evidence of supposed new or forthcoming technological changes, indicating that this EIR's assumptions about growth resulting from the Project are incorrect, or that the conclusions reached do not follow from those assumptions.

16: Mitigation Measures

Several comments requested that mitigation measures include more specific requirements and suggested, and that not doing so would amount to deferred mitigation. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments, as well as to add specificity and remove discretion so that the measures, as implemented, will be consistent with the ministerial conformity review process adopted by the Revised Amended Ordinance. The revised mitigation measures are set forth in section 7.1.4 of this Final EIR.

With these revisions, the mitigation measures considered in the EIR are legally adequate. An EIR must propose mitigation measures that will minimize the project's significant impacts by reducing or avoiding them. (Pub. Resources Code, §§ 21002, 21100.) "Any action, whether it be part of the project or imposed as a condition of approval, that is designed to avoid, minimize, rectify, or reduce or eliminate a significant environmental impact or to compensate for the impact qualifies as a mitigation measure. (CEQA Guidelines, §§ 15126.4, subd. (a)(1), 15370.) "[A]n EIR need not analyze ""every *imaginable* alternative or mitigation measure; its concern is with *feasible* means of reducing environmental effects."" [Citation.]" (*Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1055-1056.) The agency must ensure that these measures are "fully enforceable" through permit conditions, agreements, or other legally binding instruments. (Pub. Resources Code, §§ 21002, 21081.6(b); CEQA Guidelines, §§ 15002(a)(3), 15126.4(a)(2); *City of Marina v. Bd. of Trustees of the Cal. State Univ.* (2006) 39 Cal.4th 341, 359, 368-69.) Where substantial evidence supports the approving agency's conclusion that mitigation measures will be effective, courts will uphold such measures against attacks based on their alleged inadequacy (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d, 376, 407.)

Mitigation measures must provide enough detail and specificity to assure that they will be properly enforced. (See *San Franciscans for Reasonable Growth v. City & County of San Francisco* (1984) 151 Cal.App.3d 61, 79 [rejecting the City's mitigation measure to expand Muni capacity by paying an unspecified fee at an unspecified time, with an unspecified funding mechanism].) A mitigation plan is sufficient if it identifies methods that will be used to mitigate the impact and sets out standards that the agency commits to meet. (*North Coast Rivers Alliance v. Marin Municipal Water District* (2013) 216 Cal.App.4th 614, 629-630 (*Marin*); see also CEQA Guidelines, § 15126.4, subd. (a)(1)(B) [mitigation measures "may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way"].)

Regarding deferred mitigation, the courts have developed legal principles regarding the extent to which an agency, in concluding that a significant impact will be mitigated to a less than significant level, can rely on a mitigation measure that defers some amount of environmental problem-solving until after project approval. Such deferral is permissible where the adopted mitigation measure both:

- Commits the agency to a realistic performance standard or criterion that will ensure the mitigation of the significant effect; and
- Disallows the occurrence of physical changes to the environment unless the performance standard is or will be satisfied.

(See CEQA Guidelines, § 15126.4, subd. (a)(1)(B) ["measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way"]; *Endangered Habitats League v. County of Orange* (2005) 131 Cal. App. 4th 777, 793-794 [deferral is permissible where the agency commits itself to mitigation and either (1) adopts a performance standard and makes further approvals contingent on finding a way to meet the standard or (2) lists alternative means of mitigating the impact which must be considered, analyzed, and possibly adopted in the future]*; Riverwatch v. County of San Diego* (1999) 76 Cal. App. 4th 1428, 1147-1448 ["the fact the entire extent and precise detail of the mitigation that may be required is not known does not undermine the Final EIR's conclusion that the impact can in fact be successfully mitigated;" such analysis was appropriately deferred where there was "nothing in the record which suggests that the impact cannot be mitigated in the manner described in the Final EIR."].)

For example, in *Rio Vista Farm Bureau Center v. County of Solano* (1992) 5 Cal. App. 4th. 371, 375-376, the Court of Appeal upheld mitigation measures adopted as policies within a hazardous waste management plan. The respondent intended to adopt more specific mitigation measures when individual projects were proposed in the future. The petitioners argued that the mitigation measures were "vague, inconclusive, and even inconsistent." The court disagreed, explaining that the EIR's discussion of mitigation measures was adequate "given the broad, nebulous scope of the project under evaluation." (*Id*. at p. 376) Additionally, the Court found that there was no flaw in the potential inconsistency between different mitigation measures, given that the plan did not embody any site-specific commitments and that the nature of any possible future projects remained speculative. (*Id*. at p. 376-377)

The mitigation measures included in the EIR comply with these requirements.

17: EIR Review Time/Comment Period

A few commenters suggested the 65 calendar day public comment period (20 days beyond the 45-day minimum for EIR comments) was insufficient given the complexity and volume of the EIR and appendices. The Draft EIR was made publicly available, and the public review and comment period commenced, on July 8, 2015, and closed on September 11, 2015, for a total of 65 calendar days.

CEQA Section 21091(a) requires a minimum 45-day public review period for any draft EIR submitted to the State Clearinghouse. Any extension beyond the minimum 45 days is subject to lead agency discretion. The CEQA Guidelines reiterate the 45-day minimum requirement:

> The public review period for a draft EIR shall not be less than 30 days nor should it be longer than 60 days except in unusual circumstances. When a draft EIR is submitted to the State Clearinghouse for review by state agencies, the public review period shall not be less

than 45 days, unless a shorter period, not less than 30 days, is approved by the State Clearinghouse.

CEQA Guidelines § 15105(a); *see also* CEQA Guidelines § 15087(e) ("In order to provide sufficient time for public review, the review period for a draft EIR shall be as provided in Section 15105"); *Gilroy Citizens for Responsible Planning v. City of Gilroy* (2006) 140 Cal. App. 4th 911, 921 n.6 ("When the EIR is submitted to the State Clearinghouse...the review period is 45 days.") The public and agency review and comment period for a Draft EIR should not be longer than 60 days except under "unusual circumstances." No unusual circumstances exist concerning the Draft EIR and the comment period was extended to 65 days. Nothing more is required.

The County acknowledges that the Draft EIR contained thousands of pages, including appendices. However, this is not uncommon or unusual for an EIR. In addition, the CEQA Guidelines make clear that the public comment period length is at the discretion of the lead agency, and only establish the minimum period.

Nothing in CEQA requires anything more than the 45-day minimum comment period. The 65 days provided by the County fully complied with all requirements under CEQA and the CEQA Guidelines.

18: Monterey Shale Recovery in Project Area

In 2011, the Energy Information Administration (EIA)[71] estimated that the Monterey shale contained 15.42 billion barrels of technically recoverable oil. This estimate was based on the areal extent of the play of (1,752 square miles), the assumption that 28,032 wells could be drilled throughout the play, an average recovery rate of horizontal wells at 500 barrels of oil equivalent per day, 250 to 800 barrels of oil equivalents per day for vertical wells; an average ultimate recovery from each well at 550,000 barrels of oil; and the use of completion technologies that have been successfully used in other tight oil plays (i.e. hydraulic fracturing).

A study by David Hughes of oil production data from the Monterey Formation, including geological properties, indicates that the EIA estimate is overstated due to the comparison of the Monterey play to the tight oil production in the Bakken and the Eagle Ford Plays of North Dakota/Montana and southern Texas, respectively. However, geologically, these two plays are very different from the Monterey. The Bakken and Eagle Ford plays are less than a few hundred feet thick and are generally flat-lying, compared to the Monterey, which is much thicker (up to 2,000 feet) and much more lithologically and structurally complex. Also, the Bakken and Eagle Ford plays cover roughly 20,000 to 8,000 square miles, respectively, where the Monterey play encompasses less than 2,000 square miles (Hughes, 2013). In addition, due to its deposition in a rapidly subsiding and tectonically

[71] U.S. Energy Information Administration, *Review of Emerging Resources: U.S. Shale Gas and Shale Oil Plays*, July 2011, http://www.eia.gov/analysis/studies/usshalegas/.

active deep marine basin environment, the Monterey shale's lithologic and structural complexity make extrapolation between control points much less predictable compared to these other plays. Moreover, due to its geologic complexity, the target production zones within the Monterey are typically very small in comparison to other more uniform and widespread oil shale deposits currently under development and production (e.g., Bakken, and Eagle Ford shales). Jointly, these factors present technical challenges which make development of the Monterey shale a much more high-risk endeavor compared to these other two plays.

For example, within Kern County, where the Monterey shale is typically present at significantly greater depths than most other oil plays, industry experience has demonstrated that Monterey wells may cost five to ten times the cost of wells completed in other, shallower, oil shale deposits in the same area. Beyond its geologic complexity, the condition of extreme depths and pressures under which the Monterey exists in this area requires use of only the largest drilling rigs available. Operating these large rigs requires the most advanced technologies, including both well control and emission control, and must be operated by only the most experienced drilling crews available. Such requirements present significant additional technological, as well as financial, challenges to production from the Monterey shale.

The average initial productivity of wells in the Monterey shale is only 25-50 percent of that assumed by the EIA estimate, even with fracking and acidization recovery techniques (Hughes, 2013). As discussed, a significant limiting factor of production for the Monterey shale fields is that the formation is restricted to relatively small, and structurally isolated geographic areas, not widespread, contiguous regions of source rock amenable to high tight oil production from dense drilling as assumed by the EIA report. Due to the complex lithology and geologic structure, and limitations in recovery technologies, of the total estimated 500 billion barrels of oil in place, the estimated recovery from the Monterey is only about 2.5 billion barrels (NETL, 2013) , or only approximately 0.5 percent of that estimated by the EIA.

Typically shale energy resources can be extracted economically only by using hydraulic fracturing techniques. Water flooding technology isn't an option in shale plays because the tight oil formations are too dense to permit those water flows. Carbon dioxide can be used to pressure-up an oil well, however, there are limited supplies of that gas to pump underground. Steam injection can boost recovery but is unlikely to be economic due to the large amounts of water required, the energy needed to heat the water, and the related difficulty of obtaining regulatory approval of the additional air emission sources posed by the needed boilers. For the Monterey shale to experience greatly increased development, recovery technologies will have to improve, and 3D seismic analysis and modeling of the formation will have to be conducted (AAPG, 2012). Technical challenges to production inherent in the Monterey shale may be overcome by improved 3D modeling of the formation in order to better define specific target production zones. Such modeling would provide the detailed lithostratigraphic and structural information needed to better focus hydraulic fracturing efforts, which in-turn would lessen the extent of hydraulic fracturing needed to reach and produce oil from these targeted zones.

Currently, studies of the Monterey shale are being conducted in an effort to improve recovery because recovery of this resource has been difficult due to complex, highly faulted, and structurally

disturbed stratigraphic framework. Typical flowrates from the largely vertical and non-fracked wellbores that specifically target the Monterey shale have been much less than expected. Companies like Schlumberger are using proprietary software to evaluate the reservoir potential and to provide an enhanced technical basis to support drilling and infrastructure. Their model uses a basin-scale 3D earth model that characterizes heterogeneity of the reservoirs to provide guidance on placement of wells, completion methods, and drilling techniques in order to maximize recovery (Redden, 2012). In addition, Professor Richard Behl, California State University, Long Beach, heads the Monterey and Related Sedimentary Rocks (MARS) Project, focused on investigating stratigraphic, geochemical, diagenetic, and structural aspects of the Monterey Formation. These studies are being conducted in hopes of developing a model of lithologic composition that can be predictive of mechanical stratigraphy and fracturability in different parts of the formation. Results of such advanced 3D modeling techniques, and studies such as the MARS Project, may eventually provide the additional detailed subsurface information which will allow more focused and targeted future development of the Monterey shale using horizontal or directional drilling techniques, as opposed to the typically vertical well bores that are currently used. It should be noted that such a shift in drilling technology for the Monterey shale would allow multiple wells to be drilled from a single pad, resulting in greatly reduced surface disturbance through lessened infrastructure requirements.

In sum, the evidence demonstrates that access to potential reserves of the Monterey shale is limited by geological conditions and technological constraints. The current methodological limitations and the EIA's downward revision of Monterey reserves indicate that unlocking the full potential of the Monterey shale is unlikely in the reasonably foreseeable future, even with improved recovery technology and better understanding of the formation.

19: Enforcement of Mitigation Measures and Ordinance

Several commenters questioned how the County would enforce the Amended Ordinance and the EIR mitigation measures. As discussed in Draft EIR Chapter 3, Project Description, the Project's proposed Amended Zoning Ordinance would establish permit procedures as well as Implementation Standards and Conditions that oil and gas permit applicants will be required to satisfy as a condition of permit approval, including mandatory compliance with the mitigation measures identified in this EIR. The County has broad authority to enforce its zoning regulations. The source of this broad authority is the police power conferred on the County by Article XI, Section 7 of the California Constitution, which expressly provides that the County may "make and enforce within its limits all local police, sanitary and other ordinances and regulations not in conflict with the general laws." The County implements its enforcement powers through revocation actions, administrative penalties, nuisance abatement actions, criminal sanctions and injunctive relief authorized by the County Code. In addition, the County may enforce mitigation requirements pursuant to CEQA. Each of these enforcement mechanisms are discussed below.

Zoning Ordinance – Revocation Actions

The Zoning Ordinance (Title 19 of the Kern County Ordinance Code) provides for general and specific provisions for enforcement and penalties. The General Provisions Chapter 19.02 of the Zoning Ordinance, Section 19.02.070 Violation-Penalty, provides that any person, firm or corporation using any building, structure or parcel of land in violation of any provision of this title is guilty of a misdemeanor and may be prosecuted to the fullest extent of the law under Chapter 19.114 of this title. Unauthorized activities would be subject to the provisions in Chapter 19.114 Enforcement and Penalties, which provides for the process and authority for inspection, complaints, noticing requirements, administrative penalties, injunctive relief, abatement proceedings and the collection of costs for the abatement proceedings.

Oil and Gas Conformity Reviews, Minor Activities issued, and approved Conditional Use Permits for covered oil and gas activities would be subject to Section 19.102.020 Permit Revocation and Modification, which provides that the permit may be revoked or modified by the official or decision-making body that originally approved the permit by the same procedure under which the permit was issued for any of the following causes: (A) that any term or condition of the permit, conditional use permit, variance, or zone modification has not been complied with; (B) that the property or portion thereof subject to the permit, conditional use permit, variance or zone modification is used or maintained in violation of any statute, ordinance, law or regulation; (C) that the use for which the permit, conditional use permit, variance or zone modification was granted has been so exercised as to be detrimental to the public health, safety or as to constitute a nuisance; or (D) that changes in technology or in the type or amount of development in the vicinity of the use or other good cause warrants modifications of the conditions of operation or imposition of additional conditions of operation to assure that the use remains compatible with existing and potential uses of other property within the general area in which the use is located.

Under these provisions, an Oil and Gas Conformity Review or Minor Activity Review could be revoked or amended, with appropriate due process notice, by the Planning Director. The action would include timeframes for the implementation of corrective measures for discontinuing the activity and any remediation, restoration or abandonment required by conditions, or by State and/or Federal law.

As provided in Chapter 19.102.060 – Permit Denial – Appeal, if an Oil and Gas Conformity Review or Minor Activity Review is revoked or amended by the Planning Director, the applicant may then file an appeal, with the established fee, within seven (7) calendar days of the action and the matter will be heard before the Planning Commission within 30 days. No public hearing notice shall be required (Section 19.102.060 B.) No appeal rights are provided for the public to file the appeal The Planning Commission may reverse or affirm the action of the Planning Director and that action is considered a ministerial action. The determination by the Planning Commission can only be based on compliance with the conditions, and standards in the zoning ordinance. Conditions include all required mitigation measures under the California Environmental Quality Act.

The decision of the Planning Commission may be appealed ,with appropriate fees, by either the applicant or a member of the public for a hearing before the Board of Supervisors within fourteen (14) calendar days from and including the date of the decision (Section 19.102.160 D and 19.102.170.) A noticed public hearing, including appropriate notices to the applicant for a

revocation action, is required and the Board can take action on the same ministerial findings of facts regarding compliance with conditions and standards in the ordinance title and timeframes for implementation of a revocation or corrective actions. The action by the Board of Supervisors is final.

The revocation of a Conditional Use Permit would require a noticed public hearing, with notice to the applicant, before the Planning Commission with appeal by either the applicant or member of the public to the Board of Supervisors. If the original Conditional Use Permit was approved through an appeal process by the Board of Superiors, then the revocation hearing would be conducted only at the Board of Supervisors as they are the decision making body that approved the permit (19.102.020). The action by the Board of Supervisors is final.

Administrative Penalties

Pursuant to County Code section 8.54.040, any person that violates any provision of the County zoning regulations may be issued an administrative citation for each day such violation is allowed to continue. Since the Amended Zoning Ordinance would require permit applicants to comply with each Implementation Standard and Condition, any failure to maintain compliance would constitute a continuing administrative violation subject to penalty for each day the violation is allowed to continue. Administrative penalties for a violation of the County zoning regulations are assessed as a fine not to exceed $250 for the first violation, $500 for the second violation, and $1,000 for each additional violation thereafter within one year from the date of the first violation. Any County public official may also petition the Board of Supervisors to increase the fine amount, which the Board may approve in its discretion. Failure to pay an administrative penalty is subject to a civil action initiated by the County to collect the unpaid fines with interest, as well as to seek reimbursement of the County's costs to enforce, investigate, establish and collect such fines.

Nuisance Abatement

Pursuant to County Code section 19.114.090, any building or structure set up, erected, constructed, altered, enlarged, converted, moved or maintained in a manner contrary to the County's zoning regulations, or any use of land, building or premises conducted, operated or maintained in violation of the County's zoning regulations, constitutes a public nuisance subject to abatement in accordance with County Code chapter 8.44, Public Nuisances. Since the Amended Zoning Ordinance would require permit applicants to comply with each Implementation Standard and Condition, any failure to maintain compliance with any standard or condition that regulates the construction, operation or maintenance of permitted oil and gas facilities would constitute a public nuisance. Upon a reasonable determination that a public nuisance exists, the County must notify the responsible party of the offending use or condition constituting a nuisance and order that it be corrected or abated within a reasonable time, as determined by the County. If, however, the County determines that the offending use or condition presents an *immediate* threat or danger to the public health, safety or welfare, the County may order summary abatement of the nuisance and require the responsible party to take immediate action to eliminate the hazardous use or condition. Otherwise, the permit holder may request a public hearing to present evidence to the Board of Supervisors that demonstrates why the use or condition does not constitute a nuisance. If a hearing is not requested, or if a hearing is

conducted an the nuisance determination is upheld, the County may abate the nuisance without further notice and commence a civil action against the responsible party to seek reimbursement of the County's costs of abating the nuisance. Moreover, any materials obtained from the nuisance abatement may be sold at a noticed public auction.

Injunctive Relief

Pursuant to County Code section 19.114.080, the County may seek injunctive relief in superior court to prohibit any violation of the County's zoning regulations, including the Amended Zoning Ordinance (and its Implementation Standards and Conditions). Injunctive relief may be sought at any time, including prior to the issuance of, or compliance with, a notice of violation if the County determines that an anticipated violation of the County zoning regulations might injure the public health or safety.

Enforcement Under CEQA

In addition to the zoning enforcement mechanisms set forth in the County Code, as described above, CEQA provides the County with a mechanism to remedy a permit holder's failure to implement mitigation measures required by permit. If the County approves the Project, it will be required to adopted a Mitigation Monitoring and Reporting Program (MMRP) pursuant to Public Resources Code § 21081.6 in order to ensure implementation the mitigation measures identified in this EIR. CEQA also requires the County to ensure that the Project mitigation measures are made fully enforceable as conditions of future oil and gas development activities in the County. If approved, the Amended Zoning Ordinance would establish Implementation Standards and Conditions that require permit applicant's to comply with the mitigation measures identified in the EIR. Permit applicants that fail to implement a mitigation measure will be subject to "work stop" orders and/or permit revocation. Moreover, once a mitigation measure has been adopted, it cannot be cancelled or modified unless the County first reviews the ongoing need for the measure, stating the reasons for modifying or deleting the measure, and supporting its decision with substantial evidence demonstrating that the measure is unnecessary or otherwise infeasible. (*See Katzeff v. Department of Forestry and Fire Protection* (2010) 181 Cal.App.4th 601, 604; *Mani Bros. Real Estate Group v. City of Los Angeles* (2007) 153 Cal.App.4th 1385, 1388; *Napa Citizens for Honest Gov't. v. Board of Supervisors* (2001) 91 Cal.App.4th 342, 359.) In addition, additional CEQA review may be required per Public Resources Code section 21155 if an adopted mitigation measure is modified in manner that would increase the severity of an existing significant impact, or allow a new significant impact to occur.

Criminal Sanctions

Pursuant to County Code section 19.114.060, any person who causes or permits a violation of any County zoning regulation commits a misdemeanor that, upon conviction, is punishable by a maximum fine of $1,000 or by imprisonment for up to six months, or both. In addition, each day the violation continues constitutes a separate offense. Accordingly, per the County Code, the County may stack cumulative punishments for each day a zoning violation is continued, a practice upheld by the courts in *People v. Djekich* (1991) 229 Cal.App.3d 1214, 1224. Since the Amended Zoning

Ordinance would require permit applicants to comply with each Implementation Standard and Condition, any failure to maintain compliance would constitute a continuing misdemeanor violation subject to criminal prosecution for each day such violation is allowed to continue.

Through the mechanisms described above, the County has several tools that it can use to enforce implementation of each mitigation measure identified in this EIR.

20: Recirculation

Several comments state that the EIR should be recirculated. Some of these comments are based on general assertions that the EIR is inadequate, and others are linked to analysis in specific resource areas. Recirculation is not required here. The EIR presents an exhaustive review of the potential environmental impacts of the project, including activities to be undertaken pursuant to the proposed ordinance. Additionally, there has been no new information added to this EIR that would trigger the need to recirculate for further public comment.

CEQA requires recirculation of an EIR only when "new significant information is added to the EIR" after the EIR is circulated for public review but before the EIR is certified. CEQA Guidelines § 15088.5 (a); see also CEQA § 21092.1. "Significant new information" can include the following disclosures : (1) a new significant environmental impact that would result from the project or from a new proposed mitigation measure; (2) a substantial increase in the severity of an environmental impact unless mitigation measures are adopted that reduce the impact to a level of insignificance; (3) a feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the project's environmental impacts, but the project's proponents decline to adopt it; or (4) when a draft EIR is so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. CEQA Guidelines § 15088.5(a).

However, "new information" added to the EIR is not "significant unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement." CEQA Guidelines § 15088.5 (a); *Laurel Heights Improvement Assn. of San Francisco, Inc. v. Regents of the Univ. of Cal.* (1993) 6 Cal.4th 1112, 1129; *Center for Biological Diversity v. Cal. Dept. of Forestry and Fire Protection* (2014) 232 Cal.App.4th 931, 949. When the Legislature drafted the requirements for recirculating an EIR, the Legislature intended to balance the goal of promoting meaningful public participation with the goal of protecting against endless rounds of revisions and recirculation. *Laurel Heights Improvement Assn. of San Francisco, Inc. v. Regents of the Univ. of Cal.* (1993) 6 Cal.4th 1112, 1132. "Recirculation was intended to be an exception, rather than the general rule." *Id.*

Recirculation is <u>not</u> required when new information is added that "merely clarifies or amplifies or makes insignificant modifications in an adequate EIR." CEQA Guidelines § 15088.5(b). In response to comments received on the DEIR, this EIR includes additional information to clarify information or make minor modifications to the EIR. For example, a comment suggested that the EIR should be recirculated to provide adequate information specifically concerning hydrology. GR Water-01

through GR Water-08, as well as Appendix E-1, Final Water Supply Assessment, provide information responsive to this comment. However, this information does not rise to the level of "significant information" that would warrant recirculation.

The EIR includes additional new appendices which contain updated or clarifying information on air quality, water supply, water quality, noise and vibration. Other information is included in Section 7.2.1 with the global responses. The EIR also includes new and revised mitigation measures, and a revised summary of impacts and significance conclusions (see Sec. 7.1.4). While these additions to the EIR provide valuable information by which to evaluate the environmental impacts of the Project, and include clarification and insignificant modifications to the EIR, they do not trigger recirculation under the standard articulated in the Guidelines or in *Laurel Heights.*

This determination is consistent with a line of cases in which courts have considered whether certain types of new information warrant recirculation and determined they did not. *Silverado Modjeska Recreation & Park Dist. v County of Orange* (2011) 197 Cal.App. 4th 282 (holding that an EIR need not be recirculated because of new information about the proximity of sensitive toad larvae to the project site when the earlier analysis had assumed that the toad was present near the project); *Clover Valley Found. V. City of Rocklin* (2011) 197 Cal.App. 4th 200 (finding that specific information added to the final EIR about cultural resources sites added narrative detail about the resources' characteristics but did not add new substantive information affecting the EIR's findings relating to significant impacts); *Marin Mun. Water Dist. v KG Land Cal. Corp.* (1991) 235 Cal.App.3d 1652 (EIR on district's moratorium on water hookups did not need to be recirculated because of new information that it would be extended by additional 5 years); *Sierra Club v Gilroy City Council* (1990) 222 Cal.App. 3d 30 (preparation of supplemental EIR was unnecessary in light of incorporation of study and mitigation measures concerning newly discovered species on project site in final EIR, which was circulated for 2 weeks for public and agency review), disapproved on other grounds by *Western States Petroleum Ass'n v Superior Court* (1995) 9 Cal.4th 559.

Like the examples cited above, the information added to the EIR does not reveal any potentially new significant impacts which had not been previously analyzed. Similarly, information in the EIR demonstrates that the new and revised mitigation measures are feasible and will adequately mitigate impacts discussed in the EIR (see section 7.1.4 and discussion related to the revised mitigation measures in the respective GRs). Recirculation is not required here.

21: Use of Best Available Information

Several commenters have questioned whether the County should certify an EIR while ongoing scientific studies of oil and gas extraction activities, especially WST, are underway. Other have claimed that a different expert judgement about an issue considered in the EIR renders the EIR legally inadequate. The CEQA Guidelines expressly address these issues:

> An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of

> what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.

CEQA Guidelines § 15151. *See also Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 234. Courts recognize, for example, that perfection would be an impossible standard for lead agencies to satisfy under CEQA, especially for major projects. *Kings County Farm Bureau v. Hanford* (1990) 221 Cal. App. 3d 692, 727 ("It is doubtful that any agency, however objective, however sincere, however well-staffed, and however well-financed, could come up with a perfect environmental impact statement in connection with any major project.").

In addition, CEQA does not require lead agencies to "conduct every test or perform all research, study, and experimentation recommended or demanded by commenters." CEQA Guidelines § 15204(a). Rather, a lead agency must "use its best efforts to find out and disclose all that it reasonably can" about potential environmental impacts. CEQA Guidelines § 15144; *see also Planning & Conservation League v. Castaic Lake Water Agency* (2009) 180 Cal. App. 4th 210, 253 ("When, as here, an EIR must address controversial matters that resist reliable forecasting, CEQA requires only that the agency use its best efforts to find out and disclose all that it reasonably can, and that the EIR display adequacy, completeness, and a good faith effort at full disclosure."). The primary standard in this regard is reasonableness — "CEQA does not demand what is not realistically possible, given the limitation of time, energy and funds." *Saltonstall v. Sacramento* (2015) 234 Cal. App. 4th 549, 583. If, for example, certain data or projections are not readily available, the EIR is not necessarily defective due to a failure to include such data or speculate about it. *Id.* ("'Crystal ball' inquiry is not required.").

Although it may be the case that reasonable experts disagree as to the analysis presented in the DEIR, the relevant question is whether the DEIR adequately supports the County's findings:

> Disagreements among experts do not make an EIR inadequate. Technical perfection is not required; we look not for an exhaustive analysis but for adequacy, completeness, and a good faith effort at full disclosure … The issue is not whether the studies are irrefutable or whether they could have been better. The relevant issue is only whether the studies are sufficiently credible to be considered as part of the total evidence that supports the findings.

Eureka Citizens for Responsible Government v. Eureka (2007) 147 Cal. App. 4th 357, 371–372; *see also Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 28 ("The court must uphold an EIR if there is any substantial evidence in the record to support the agency's decision that the EIR is adequate and complies with CEQA").

This EIR satisfies that above standards, as it represents a good faith effort at full disclosure of the potential environmental impacts of the Project, and contains sufficient information to support the analysis and conclusions.

22: Compliance with Regulations as CEQA Mitigation

Some commenters questioned whether compliance with regulatory requirements can be a CEQA mitigation measure. Mitigating a project's contribution to cumulative impacts can be achieved through reliance on some prior plan or program, and/or the EIR prepared for a prior plan or program, that already addresses cumulative impacts in a specified area. The CEQA Guidelines contain several variants on this approach:

> CEQA Guidelines § 15064(h)(3): "A lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program (including, but not limited to, water quality control plan, air quality attainment or maintenance plan, integrated waste management plan, habitat conservation plan, natural community conservation plan, plans or regulations for the reduction of greenhouse gas emissions) that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located. Such plans or programs must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency. When relying on a plan, regulation or program, the lead agency should explain how implementing the particular requirements in the plan, regulation or program ensure that the project's incremental contribution to the cumulative effect is not cumulatively considerable."
>
> CEQA Guidelines § 15130(d): "Previously approved land use documents, including, but not limited to, general plans, specific plans, regional transportation plans, plans for the reduction of greenhouse gas emissions, and local coastal plans may be used in cumulative impact analysis. A pertinent discussion of cumulative impacts contained in one or more previously certified EIRs may be incorporated by reference pursuant to the provisions for tiering and program EIRs. No further cumulative impact analysis is required when a project is consistent with a general, specific, master or comparable programmatic plan where the Lead Agency determines that the regional or areawide cumulative impacts of the proposed project have already been adequate addressed, as defined in section 15152(f), in a certified EIR for that plan."[72]
>
> CEQA Guidelines § 15130(e): "If a cumulative impact was adequately addressed in a prior EIR for a community plan, zoning action, or general plan, and the project is consistent with that plan or action, then the EIR for such a project should not further analyze that cumulative impact, as provided in Section 15183(j)."

[72] "Adequately addressed" means that the cumulative impacts have been mitigated or avoided as the result of the prior first-tier EIR, or have been "examined at a sufficient level of detail in the prior [EIR] to enable those effects to be mitigated or avoided by site specific revisions, the imposition of conditions, or by other means in connection with the approval of the later project." CEQA Guidelines § 15152(f)(3).

> CEQA Guidelines § 15152(f)(1): When a project-specific EIR or negative declaration is "tiered" from a prior EIR for a general plan, policy or program, and the "lead agency determines that a cumulative effect has been adequately addressed in the prior EIR, that effect is not treated as significant for purposes of the later EIR or negative declaration, and need not be discussed in detail."
>
> CEQA Guidelines §15183(j): "When a project is consistent with the development density established by existing zoning, community plan or general plan policies for which an EIR was previously certified, "[i]f a significant offsite or cumulative impact was adequately discussed in the prior EIR, then this section may be used as a basis for excluding further analysis of that offsite or cumulative impact."

The broad range of plans, policies, programs and documents cited in these provisions – especially the list in CEQA Guidelines § 15064(h)(3) (water quality control plan, air quality attainment or maintenance plan, integrated waste management plan, habitat conservation plan, natural community conservation plan, plans or regulations for the reduction of greenhouse gas emissions) – embraces many of the types of cumulative impacts addressed in EIRs.

Consistent with these CEQA Guidelines, courts have upheld reliance on existing general plans, water, air quality or traffic plans and their prior EIRs that analyzed future projects and determined that the cumulative impacts of projects complying with the plan will be less than significant. *See, e.g.*, *Preserve Wild Santee v. City of Santee*, 210 Cal. App. 4th 260, 276–79 (2012); *CBE*, 103 Cal. App. 4th at 114–15. Previously adopted plans, policies, programs, land use documents and their respective EIRs may be incorporated by reference and relied on in the proposed project EIR, so long as they are sufficiently comprehensive to provide the cumulative impact analysis for the proposed project. *Las Virgenes Homeowners Federation v. County of Los Angeles* (1986) 177 Cal. App. 3d 300.

Lead agencies may also rely on other regulatory problems that can provide comparable assurance that each project will address its contribution to a cumulative impact. To the extent that compliance with other regulatory programs will avoid or reduce significant environmental impacts, CEQA authorizes reliance on those regulatory programs. *Oakland Heritage Alliance v. Oakland* (2011) 195 Cal. App. 4th 884, 906 ("a condition requiring compliance with regulations is a common and reasonable mitigation measure, and may be proper where it is reasonable to expect compliance"); *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 243 ("Complying with government regulations as a mitigation measure is not an improper deferral"). The lead agency may presume that other agencies charged with enforcing environmental regulations will do so. *Towards Responsibility in Planning v. San Jose* (1988) 200 Cal. App. 3d 671, 680 ("City is not obliged to speculate about effects which might result from violations of its own ordinances or water quality standards set by other agencies"); *Rominger v. Colusa* (2014) 229 Cal. App. 4th 690, 728 (challengers offered "no evidence to suggest that it would be unreasonable to expect" compliance with statewide regulations); Cal. Evidence Code § 664 ("It is presumed that official duty has been regularly performed").

Ag-1: Agricultural Impacts and Farmland Mitigation Program

Several commenters suggested that the mitigation program for impacts to prime farmland, farmland of statewide importance, or unique farmland ("Farmland") was inadequate.

The mitigation measures will ensure that any active Farmland that is converted by future oil and gas exploration and extraction activities authorized by the Project over its 25-year life span are mitigated at a ratio of 1:1. (DEIR at pp. 4.2-18, 4.2-19.) The DEIR's analysis shows that this mitigation program will reduce the impacts on Farmland to a level that is less than significant. (DEIR at p. 4.2-19.)

Specifically, under the mitigation program required in the DEIR, prior to conducting any ground disturbing activity, the Applicant must submit to the County written evidence of completion of one or more of the following measures to achieve a 1:1 mitigation ratio:

a. Funding and/or purchasing agricultural conservation easements or similar instrument acceptable to the County (to be managed and maintained by an appropriate entity).

b. Purchasing of credits for conservation of agricultural lands from an established agricultural farmland mitigation bank or an equivalent agricultural farmland preservation program managed by the County.

c. Restoring agricultural lands to productive use through the removal of legacy oil and gas production equipment, including well abandonment and removal of surface equipment.

d. Participating in any agricultural land mitigation program adopted by Kern County that provides equal or more effective mitigation than the measures listed above.

Mitigation lands shall meet the definition of Prime Farmland, Farmland of Statewide Importance, and/or Unique Farmland, as defined by the California Department of Conservation, and be of similar or higher agricultural quality as the disturbed lands. Completion of the selected measure or, with the Kern County Planning and Community Development Director's approval, a combination of measures, are to occur on qualifying land in Kern County. If qualifying lands cannot be found in Kern County, upon written application to the County, the mitigation lands may be located within the San Joaquin Valley (San Joaquin, Stanislaus, Merced, Fresno, Madera, Kings, Tulare, or Kern County) or outside the San Joaquin Valley with written evidence that the same or equivalent crops can be produced on the mitigation land. (DEIR at p. 4.2-19.)

Mitigation is only required for the conversion of "active" Farmland, which is defined as land that has been actively farmed 5 years or more out of the last 10 years. (DEIR at p. 4.2-19.) This distinction is consistent with the FMMP's Important Farmland Categories. (California Department of Conservation 2015.) Specifically, lands considered Prime, Farmlands of Statewide Importance, or Unique Farmlands must have been used for irrigated agricultural production at some time during the four years prior to the land's classification.

It is also important to note that this distinction between active and inactive farmland is justified because the environmental impact concerns the conversion of actively-cultivated agricultural land to land that is temporarily used for oil and gas exploration. Unlike the conversion of land for residential or commercial development, the land that is converted for this purpose is not lost forever; the land can be farmed again in the future. Because it is a temporary loss in agricultural production, the mitigation efforts focus on replacing the active agricultural land lost with land that can grow the same or equivalent crops. (DEIR at p. 4.2-19). This comports with the requirement that mitigation measures bear a "rough proportionality" to the Project's actual adverse impacts. (See CEQA Guidelines, § 15126(a)(4)(A), (B) [citing *Nollan v. California Coastal Com'n* (1987) 483 U.S. 825, 837; *Dolan v. City of Tigard* (1994) 512 U.S. 374, 391;*Ehrlich v. City of Culver City* (1996) 12 Cal.4th 854, 866-877)].)

While comments have questioned the DEIR's methods of quantifying the amount of converted farmland during the next 25 years as a result of the Project, this is simply an estimation of potential Farmland that could be converted and does not limit the actual amount of farmland that will be mitigated over the life of the project. In other words, mitigation is not limited to a maximum acreage based on the overall estimate of land that may be converted; instead, specific mitigation acreage for each activity will be based on a 1:1 ratio and determined at the time future oil and gas exploration and extraction activities occur. The mitigation of active Farmland impacts at a ratio of 1:1 will reduce the impact below a level of significance.

Courts have supported application of a 1:1 mitigation ratio for farmland conversion. (See *Building Industry Assn. v. County of Stanislaus* (2010) 190 Cal.App.4th 582, 591-593 [upholding the county's Farmland Mitigation Program (FMP), which required projects converting agricultural land to non-agricultural use to "replace" agricultural land at a 1:1 ratio with agricultural land of equal quality located in the county]; *Citizens for Open Government v. City of Lodi (2012)* 205 Cal.App.4th 296, 324 [finding that conservation easements on 40 acres of farmland "would minimize and substantially lessen" the impact of the conversion of 40 acres of prime farmland]; see also *Masonite Corp. v. County of Mendocino* (2013) 218 Cal.App.4th 230, 236-238 [finding offsite mitigation to be feasible and noting that the Department of Conservation advocated for a 1:1 mitigation ratio and called this a "common and appropriate means of mitigating the loss of prime farmland"].)

The fact that Kern County has yet to adopt an agricultural land mitigation program is inconsequential because "the success or failure of mitigation efforts" do not depend on this program. (*Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 281.) A County-adopted mitigation program is one of several available mitigation options. Moreover, the mitigation will occur over the 25-year life span of the Project, a significant amount of time in which the County could adopt such a program. This same reasoning applies to the current lack of a mitigation bank in Kern County. (See *Endangered Habitats League v. County of Orange* (2005) 131 Cal. App. 4th 777, 793–794 [deferral is permissible where the agency commits itself to mitigation and lists alternative means of mitigating the impact which must be considered, analyzed, and possibly adopted in the future].) Finally, specific information about who will hold and manage future conservation easements used as mitigation for the Project is not legally required in the DEIR. (See *Riverwatch v. County of San Diego* (1999) 76 Cal. App. 4th 1428, 1147-1448 (*Riverwatch*) ["the fact the entire

extent and precise detail of the mitigation that may be required is not known does not undermine the Final EIR's conclusion that the impact can in fact be successfully mitigated.") In *Riverwatch*, it was appropriate to defer such analysis because there was "nothing in the record which suggests that the impact cannot be mitigated in the manner described in the Final EIR." (*Ibid.*) Here, there is no indication that mitigation at a ratio of 1:1 cannot occur by one of the four methods laid out in the EIR. To the contrary, substantial evidence supports the County's selection of the alternative mitigation methods, each of which could achieve the same mitigation goal of preserving agricultural land at a 1:1 ratio.

Ag-2: Rangeland

Some commenters suggest that the DEIR impermissibly failed to analyze the impacts of the Project on rangelands. The DEIR included discussion of agricultural impacts, inclusive of grazing and rangelands:

> The evaluation of possible impacts to agricultural resources included the review of the Kern County General Land Use Plan and zoning information, the MBGP, and the most current DOC, Division of Land Resource Protection, Important Farmland data, and Kern County's Williamson Act data. Agricultural land conversion associated with oil and gas exploration and production operational activities related to the Project were predicted based on the anticipated land disturbance associated with anticipated oil and gas development described in Appendix F, and compared to the significance thresholds. The methodology used to evaluate potential agricultural conversion is described in detail in Appendix H.

DEIR, p. 4.2-15.

The DEIR indicated that there are approximately 1,869,954 total acres of FMMP lands within the project area, of which 982,166 acres are grazing/rangeland. DEIR, p. 4.2-4; See also DEIR App. H - Farmland Conversion Study, pp. 3, 10 (Kern County has approximately 2,317 square miles of rangeland). To analyze impacts of oil and gas operations on agriculture, agricultural land types were grouped into categories of crop types that would be similarly impacted. DEIR App. H–Farmland Conversion Study, p. 10. The "uncultivated" crop type category included dairy farms, grazing range, and other agricultural production that is not dependent on cultivated land. Projected over the next 25 years, the Farmland Conversion Study relied on by the DEIR found that approximately 832 acres of uncultivated lands would be converted by the Project by 2040. DEIR App. H–Farmland Conversion Study, p. 21.

The DEIR also noted the cumulative impacts to rangeland. DEIR, p. 4.2-25. Specifically, the Agricultural and Forest Resources Analysis relied on the Kern County General Plan, which forecasted "a net loss of 55,000 acres of grazing lands in Kern County based on land use conversions consistent with existing land use plans, which would further reduce Kern County's agricultural lands." Ibid.

CEQA requires that an EIR serve as an informational document. Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 391 ("[t]he legislature has made clear

that an EIR is 'an informational document' and that '[t]he purpose of an environmental impact report is to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment'"). The DEIR has provided sufficient information about potential impacts to rangeland from the Project.

CEQA does not require a lead agency to specifically include rangeland in its agricultural resources analysis or to mitigate for impacts to rangeland. In 1993, the Legislature tasked the Resources Agency with creating an appendix to the CEQA Guidelines that would propose methods to analyze significant effects on the environment from conversion of "agricultural land." Pub. Resources Code, § 21095. Pursuant to Public Resources Section § 21095, the Resources Agency produced a set of questions on agricultural resources in Appendix G that agencies must consider when approving a project. Under Appendix G, when considering the environmental effects of a project, an agency should evaluate whether the project would:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

d) Result in the loss of forest land or conversion of forest land to non-forest use?

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

The definition of "Farmland" in subdivision (a) comports with CEQA's definition of "Agricultural land," which is limited to land that is defined by the U.S. Department of Agriculture land inventory and monitoring criteria as prime farmland, farmland of statewide importance, or unique farmland. See Pub. Resources Code, § 21060.1.

The Department of Conservation has adapted the definitions from the U.S. Department of Agriculture as follows:

- **Prime Farmland (P):** Irrigated land with the best combination of physical and chemical features able to sustain long term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been irrigated for production of irrigated crops at some time during the four years prior to the mapping date.

- **Farmland of Statewide Importance (S):** Irrigated land similar to Prime Farmland that has a good combination of physical and chemical characteristics for the production of agricultural crops. This land has minor shortcomings, such as greater slopes or less ability to store soil moisture than Prime Farmland. Land must have been irrigated for production of irrigated crops at some time during the four years prior to the mapping date.

- **Unique Farmland (U):** Lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Land must have been cropped at some time during the four years prior to the mapping date.

Grazing land, a synonym for rangeland, is defined separately by the Department of Conservation as follows:

- **Grazing Land (G):** Land on which the existing vegetation is suited to the grazing of livestock. This category is used only in California and was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities.

Thus, CEQA does not contain a mandate to consider whether a project will result in the conversion of rangeland. The lead agency must only consider the possible conversion of the statutorily defined "agricultural land." The DEIR has evaluated this impact. DEIR at pp. 4.2-16–4.2-19.

Some comments have cited *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503 (*Save Panoche Valley*), for the proposition that agencies are required to assess impacts to rangelands as part of the agricultural impact analysis. The case does not stand for this proposition. Rather, in *Save Panoche Valley* the court affirmed the adequacy of a mitigation measure included in the FEIR to reduce the impacts of canceling Williamson Act contracts covering 6,953 acres of land. Since many of these Williamson Act contracts protected rangeland, the mitigation measure in the EIR required the applicant "to create agricultural conservation easements that would either cover 4,563 acres of rangeland or 285 acres of high quality cropland." *Id.* at 528. The project applicant was also required to restore the land to its original state in 30 years. According to the court, "[t]hese mitigation measures adequately address the potential impacts on agricultural resources, including the impact on grazing land, and adequately satisfy the requirements set forth under the CEQA Guidelines." *Id.* at p. 529. *Save Panoche Valley* does not hold that such analysis or mitigation is mandated by CEQA anytime there are potential impacts to rangeland; rather the case held that the analysis and mitigation that was included in the FEIR to address Williamson Act contract cancelations was supported by substantial evidence.[73]

[73] The court also considered a separate mitigation measure that was proposed by the applicant: allowing sheep to graze on the land to offset any conversion impacts to grazing land. The court determined that this mitigation

Some comments have also cited *Twaine Harte Homeowners Assc. v. County of Tuolomne* (1982) 138 Cal.App.3d 664 (*Twaine Harte)*. This case considered the adequacy of an EIR prepared for a General Plan Amendment that included, among other things, a land use designation for "Rangeland" that allowed for low-density residential development. The court found that the General Plan designation was appropriate and the EIR adequately analyzed this issue. Accordingly, neither *Save Panoche Valley* nor *Twaine Harte* stands for the proposition that an agency must mitigate for impacts to rangelands.

Occasionally, impacts on grazing are relevant given the nature of the project and federal agency partner's participation. On Kern County and BLM's Alta East West Project, for example, grazing impacts were considered due to BLM's California Desert Conservation Area (CDCA) Plan. See Alta East Wind Project DEIR/EIS, § 4.7. However, the DEIR/EIS noted that "[t]he County's CEQA Implementation Document and Environmental Checklist does not provide specific significance criteria for livestock grazing; therefore, no significance determination has been made with respect to this resource." (*Id*. at p. 4.7-1) Similarly, impacts to grazing were analyzed in the DEIR for the Eastern Kern County Property Acquisition, which proposed to create an off-roading vehicle area on land included in the CDCA. See Eastern Kern County Property Acquisition DEIR, § 4.2.1. Here, however, the Project does not involve a federal agency partner and this type of analysis is not required.

Further, the mitigation measures required in the DEIR to protect biological resources will provide de facto protection for rangeland. Specifically, buffers placed around San Joaquin kit fox dens pursuant to MM 4.4-6 will also serve to protect rangeland since kit fox dens usually occur in rangeland areas. These protections will be occurring in the Western Subarea. See DEIR at p. 4.4-195 (describing San Joaquin kit fox habitat). Additionally, protection of the Eastern Subarea will occur due to buffer zones created by MM4.4-7 around American badger dens. See DEIR at p. 4.4-195 (describing American badger habitat). Of the 982,166 acres of grazing land contained in the Project Area, 585,011 acres are in the Western Subarea and 338,500 acres are in the Eastern Subarea. Only 58,655 are contained in the Central Subarea. See DEIR at p. 4.2-4.

The DEIR properly disclosed the project's potential impacts to agricultural resources, inclusive of grazing and rangelands. CEQA does not require more.

Air-1: Air Permitting, Indirect Sources, and Emission Estimates

Several comments state that oil and gas production operations are a large source of organic compound emissions in the County, suggest that the project's air quality impacts are insufficiently

measure was adequate, even if the project resulted in the land being unusable for cattle grazing. *Id.* at 529. The EIR specifically noted that this mitigation measure was proposed by the applicant, it was not required mitigation, and that any conversion of grazing land should not be analyzed since grazing land is not "Farmland" as defined by the FMMP. See Panoche Valley Solar Farm Project FEIR at p. C.3-17.

mitigated, that reliance on existing air quality regulations is inadequate mitigation, and that mitigation is improperly deferred. The comments further state that the DEIR does not provide adequate mitigation for emissions from new stationary sources and indirect sources of emissions that occur as a result of activities undertaken pursuant to the Project.

As explained in detail below, full mitigation of air quality impacts is achieved by mitigation measures imposed by the DEIR, as well as by compliance with a wide range of regulatory requirements.[74] The DEIR considers potential impacts from all new activities and equipment undertaken in accordance with the Project and adequately mitigates the potential impacts from all Project sources.[75]

Comments also state that certain of the individual air quality mitigation measures, such as compliance with applicable air quality regulations, are inadequate to fully mitigate Project emissions. The mitigation measures were designed to work together as a package to fully mitigate Project emissions, with each measure achieving a portion of the needed emissions mitigation. The quantities of offsetting emission reductions needed are the same as the emission increases described in the DEIR, so a separate calculation is not necessary.

Mitigation Measure 4.3-1 requires applicants to obtain an Authority to Construct (ATC) and Permit to Operate (PTO) for any facility or equipment requiring such a permit from the SJVAPCD. DEIR at 4.3-68. Thus, new stationary sources will be required to obtain permits from the SJVAPCD, and in so doing must comply with all of the applicable SJVAPCD requirements. As stated in the DEIR, this includes District Rule 2201 which requires that all emissions increases greater than 2 pounds per day from permitted equipment be offset at a ratio greater than 1:1. *See* DEIR at 4.3-68, 85, 92. Thus, operational emissions from permitted stationary sources will be offset or mitigated to below the SJVAPCD threshold of significance.

Indirect sources of emissions from the Project are fully accounted for in the air quality analysis. The analysis included all construction, truck, passenger, and other on- and off- road vehicle trips that would be generated by the project including, but not limited to, routine business travel, facility

[74] See GR 22 for more detailed responses regarding compliance with regulations as CEQA mitigation. The SJVAPCD's air quality nonattainment status for ozone and particulate matter, despite the adoption of numerous EPA, CARB and SJVAPCD emission control regulations, is a different issue than mitigating Project emissions to net zero, in part, through compliance with regulatory standards. Since the Project will consist of new oil and gas production activities that require conformity review before a new well is drilled, it is possible to require full mitigation of anticipated emission increases. The same is not true for all of the ongoing pollutant-emitting activities in the San Joaquin Valley

[75] The DEIR takes account of potential emission increases associated with activities of the Project's permitted sources and with non-permitted sources/activities, including oil and gas production facilities (permitted stationary sources), permit-exempt sources, and mobile sources. See, e.g., Tables 4.3-27 – 4.3-31; Table 4.3-42. Table 4.3-27 presents the annual total estimated emissions from both construction and operational activities (permitted, non-permitted, and permit exempt equipment) for the Project. While the DEIR recognizes that the San Joaquin Valley is in non-attainment for certain criteria pollutants, the significance threshold and non-attainment status are not the same measure. As described on pages 4.3-99 – 4.3-102 and 4.3-122, all emissions will be mitigated to net zero after application of emissions reductions and the Oil and Gas Emission Reduction Agreement (OG-ERA).

inspections, delivery of construction materials, and worker commutes. Although SJVAPCD Rule 9510 (Indirect Source Review) does not apply to the Project because oil and gas activities are exempt from that rule, all indirect sources of emissions were fully accounted for in the air quality analysis and will be mitigated to a level of insignificance. Mitigation Measure 4.3-3 sets engine standards and limits idling of off-road construction equipment, mitigating emissions from construction equipment. Similarly, Mitigation Measure 4.3-4 sets retrofit and other requirements for on-road heavy-duty diesel haul vehicles. In addition, emissions from indirect sources after application of MM 4.3-3 and 4.3-4 are included in calculating the total Project emissions and are thus required to be offset via the Oil and Gas Emission Reduction Agreement (OG-ERA) to be created in accordance with Mitigation Measure 4.3-8 (see discussion of the OG-ERA below). These mitigation measures, and the OG-VERA mentioned below combine to adequately mitigate for emissions impacts due to emissions from indirect (mobile) sources.

The OG-ERA in Mitigation Measure 4.3-8 requires applicants to pay an air emission mitigation fee, or alternatively to undertake direct emissions reductions to fully offset new emission increases not already required to be offset under SJVAPCD rules, including emissions from permitted equipment that is not subject to the emission offset requirement. The offset requirement for the OG-ERA is based on the total estimated emissions from the Project as calculated in the DEIR. This calculation includes emissions from construction and operation of new permitted facilities, construction and operation of permit-exempt equipment and small production settings, and construction activities related to wells including drilling, stimulation, rework, and abandonment. DEIR pp. 4.3-74 – 92. As stated above, the calculation also includes all mobile source emissions related to these Project activities.

The total estimated Project emissions from both construction and operational activities are provided in Table 4.3-27 and are used to calculate the total estimated per well emissions for preliminary consideration in the OG-ERA in Table 4.3-32. The requirement for each operator to pay for emission reductions through the OG-ERA or to undertake direct emissions reductions will generate emissions reductions at a level equal to expected Project actual emissions. In this way, compliance with the OG-ERA will result in a net zero emissions increase due to Project implementation as all incremental increases due to Project implementation will be mitigated either by offsets required under SJVAPCD Rule 2201 (or other SJVAPCD rules) or by emissions reductions under the OG-ERA.

The SJVAPCD had no objections to the proposed OG-ERA, and "are pleased to work with Kern County to carry the concept through to successful completion". SJVAPCD Comment Letter, September 11, 2015 (Comment 0001). District Rule 2201 requires offsets for permitted stationary sources to be real, excess, permanent, and enforceable. In addition, the SJVAPCD will assure that mitigation reductions used for increases from unpermitted equipment and activities are likewise real, excess, permanent, and enforceable, although these offsetting reductions are not subject to federal Clean Air Act offset requirements. Contrary to commenters' assertions, the DEIR need not state the precise amount of emissions reductions because it commits to mitigating all Project emissions, no matter the amount. Refer to GR-21 (speculation not required by CEQA); GR-16 (mitigation measures); and GR Air-2. As the DEIR explains, emission reductions funded by the OG-ERA

mitigation fees will offset the impacts from the new oil and gas activities resulting in a "net zero increase" to contributions of designated criteria air emissions in the entire air basin. DEIR at 4.3-102 – 103 (discussing quantification and validation that reductions can be achieved); 4.3-122 (Air Quality Mitigation Measures require no net increase in NOx, ROGs and PM10 emissions, which can be met by using solar PV or other available technologies, and thereby reducing what would be otherwise required as a fee under the OG-ERA). Additional mitigation is not necessary.

Although not all of the reductions achieved by the OG-ERA will occur exactly contemporaneously with Project emissions increases, the OG-ERA does not constitute deferred mitigation. Mitigation Measure 4.3-8 will ensure collection of mitigation fees to fund emission reductions at the actual pace of well development in the County. There may be a slight lag time between collection of the air emissions mitigation fee (i.e., prior to site plan approval) and the accomplishment of the emissions reductions funded by the fee, due to the time required to solicit and vet proposals for emission reduction projects, award the funds, and complete construction or implementation, on a county-wide annual basis. However, the emission reductions from implementing the OG-ERA are expected to match the emissions from drilling new wells on an annual basis.

Please see Global Response Air-2 for more information regarding the structure, feasibility, and legal basis for the OG-ERA, and GR Air-4, Air-5, and Air-6 regarding the Project Health Risk Assessments and air toxic emissions.

Air-2: Emission Reduction Agreement As Mitigation

A number of commenters questioned whether Mitigation Measure 4.3-8 provides sufficient mitigation for air quality impacts. MM 4.3-8 requires applicants to pay an air emission mitigation fee, or alternatively to undertake direct emissions reductions, to fully offset new emissions increases. Commenters variously stated that the mitigation is not enforceable, that it will not produce emission reductions necessary to offset Project impacts, or that it is impermissible deferred mitigation. In fact, MM 4.3-8 ensures that Project emissions of designated non-attainment pollutants are fully offset. The Oil and Gas Emission Reduction Agreement (OG-ERA) is an enforceable mitigation measure that will effectively "zero out" new project emissions of NOx, PM10 and ROGs by generating equivalent emissions reductions through equipment replacements and other measures funded by the mitigation fees. The OG-ERA is expected to be in place by the time the Board of Supervisors considers the proposed Project, otherwise each applicant will be required to enter into individual VERA agreements to provide mitigation needed for criteria air pollutant emissions.

The DEIR finds that the project will generate cumulatively significant emissions of oxides of nitrogen (NOx), reactive organic gases (ROGs), and particulate matter of 10 microns or less in diameter (PM10); therefore, feasible mitigation is required for Project approval. Mitigation Measures 4.3-1 through 4.3-4 will reduce emissions of these criteria pollutants. In addition, Rule 2201 of the SJVAPCD will require emissions increases attributed to certain sources (primarily, stationary sources) to be offset in conjunction with obtaining authority to construct permits. But the DEIR concludes that the Project's contribution to cumulative impacts will remain considerable even after compliance with these measures.

Mitigation Measure 4.3-8 will require applicants to fully offset the remaining emissions of these pollutants. The measure requires applicants to pay an air quality mitigation fee to the County that will be used to reduce NOx, ROG and PM10 emissions from other equipment and activities in the region. Alternatively, in lieu of paying the fee, an applicant may reduce emissions directly from other applicant sources by the amount necessary to fully offset the increases in designated pollutants. Air emission mitigation fees collected by the County will be managed jointly by the County and SJVAPCD pursuant to an emission reduction agreement between the two agencies.

MM 4.3-8 is enforceable. Fees required by the measure must be paid as a part of the site conformity review process. Similarly, an applicant proposing to make direct emission reductions in lieu of paying the fee will need to satisfy the County, based on validation of the emission reductions by the SJVAPCD, that the emission increases have been fully offset. If the applicant fails to either pay the fee or provide the necessary validation of emissions reductions, the proposed site plan will be disapproved.

MM 4.3-8 will generate real, quantifiable emissions reductions. SJVAPCD has significant experience administering air emission fees to achieve emissions reductions. The SJVAPCD has been administering fees from its indirect source rule since 2006. In addition, since 2008, SJVAPCD has entered into Voluntary Emission Reduction Agreements or Development Mitigation Contracts (collectively referred to here as VERAs) with a number of project proponents to provide CEQA mitigation for the air impacts from a variety of industrial, residential, and other projects. VERAs benefit air quality by achieving emission reductions in excess of Air District rules. Funds paid to the SJVAPCD through VERAs have been used in the Air District's existing Emission Reduction Incentive Program to fund emission reduction projects, achieving emission reductions on behalf of the projects. Since 2006, the SJVAPCD has issued grants totaling nearly $500 million resulting in more than 98,000 tons of lifetime emissions reductions.

For the proposed Project, the monies paid pursuant to the Oil and Gas Emission Reduction Agreement (OG-ERA) would be placed into a fund established by the Board of Supervisors, with an additional administrative fee collected by the SJVAPCD. Expenditure of the mitigation funds shall be for certified air quality reduction projects managed by the SJVAPCD in consultation with Kern County. DEIR at 4.3-100, as modified in response to SJVAPCD Comment 0001-5. The SJVAPCD will make the final determination of air quality reductions achieved; and selection of specific projects shall be determined by the SJVAPCD in consultation with Kern County. *Id*. The mitigation measure lists examples of the types of emission reduction strategies that would be considered for funding, although it is expected that other strategies may be more cost effective over time as new emission control technologies are developed. Based on the SJVAPCD's history of administering the Indirect Source Rule fees and VERAs, it is reasonable to expect that the funds administered through the OG-ERA would achieve effective emissions reductions to offset Project emissions increases.

Fee-based programs are acceptable mitigation measures, and can be the most effective means of addressing cumulative impacts. CEQA Guidelines § 15130 (a)(3) expressly recognizes a project's contribution to a cumulative impact may be found less than cumulatively considerable where the project is required to fund its fair share of a mitigation measure through contributing to a regional mitigation fund. Similarly, courts have found fee-based mitigation programs for cumulative impacts

based on fair-share infrastructure contributions by individual projects adequate mitigation under CEQA. See, e.g., *City of Marina v. Board of Trustees of California State University* (2006) 39 Cal. 4th 341, 364 and *Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 1188. Courts have held that an agency's imposition of fair-share contributions to a mitigation fund are adequate if they "are part of a reasonable plan of actual mitigation that the relevant agency commits itself to implementing." *Id* 1187. Courts have also held that when a mitigation program is established, there is a presumption that the agency will comply with its own ordinances, and will spend fees it collects on the purposes for which they have been collected. *Save Our Peninsula Comm. v Monterey County Bd. Of Supervisors* (2001) 87 Cal.App.4th 99, 141, 104.

The Air District's authority to enter into VERAs (and by extension the OG-ERA) is well established. The Legislature has granted air pollution control districts the authority to adopt and implement regulations to reduce or mitigate emissions from indirect and area wide sources of air pollution, and to adopt a schedule of fees to be assessed on indirect sources of emissions. Health & Safety Code §§ 40716(a); 42311(g) and 40604. The SJVAPCD adopted Rules 9510 (indirect source review) and 3180 (fees for indirect source review) pursuant to these authorities. These rules and their adoption are discussed extensively in the DEIR at 4.3-48 to 4.3-49 and 4-99 to 4-100, and in Appendix L (San Joaquin Valley Air Pollution Control District Documents). The SJVAPCD has been implementing VERAs since 2008 and, as described in its annual report on the indirect source review program, has methodically implemented, analyzed and reported on the tangible results of the program, including the mitigation funds. DEIR, Appendix L.

The County's imposition of fees pursuant to VERAs has been found to be a valid regulatory fee and not subject to certain statutory limits and requirements that apply to other types of fees imposed as conditions of a development project, (*California Building Industry Assn. v. San Joaquin Valley Air Pollution Control Dist*. (2009) 178 Cal.App.4th 120, 130). The same analysis would apply to the OG-ERA imposed here. A regulatory fee is one charged for the associated costs of regulatory activities and does not exceed the reasonable cost of carrying out the purposes and provisions of the regulation. *California Assn. of Prof. Scientists v. Department of Fish & Game* (2000) 79 Cal.App.4th 935, 945. Regulatory fees are not subject to the limitations imposed by the Mitigation Fee Act, which requires, *inter alia*, a public agency to determine a reasonable relationship between the fee and the project, and limits the fee to the estimated reasonable cost of providing the required service or facility. Govt. Code § 6600 *et seq.* While there must be a reasonable relationship between the fee charged and the burden posed by the project, the agency is allowed to employ a flexible assessment of proportionality in setting the fees assessed pursuant to a regulatory program. *California Building Industry Assn. v. San Joaquin Valley Air Pollution Control Dist*. (2009) 178 Cal.App.4th 120, 132; see also *California Assn. of Prof. Scientists v. Department of Fish & Game* (2000) 79 Cal.App.4th 935, 948–949.

For the Project, the mitigation fee will be adjusted for depth of well and equipment configuration. It is expected to range from $8,000 to $18,603 per well, plus an administrative cost to the District. This is based in part on the historical range of cost effectiveness for funds collected through the Indirect Source Rule and VERA programs, which has ranged from $1,728 per ton of reductions as reported in the 5-year evaluation conducted in 2010, to $6,974 per ton as reported in the

SJVAPCD's 2014 Annual Report on the Indirect Source Review Program. In addition to the cost effectiveness reported by the SJVAPCD for fees collected through the Indirect Source Rule and VERAs, in setting the fee, the County has also considered the types of equipment and other emission reduction strategies available within the San Joaquin Air Basin, and the types of emission reduction strategies that can be funded through the monies expected under the new OG-ERA. The estimated amount to be generated every year in mitigation fees to fund emission reduction projects ranges from $14.4 million to $33.49 million (based on an estimate of 1,800 permits year). The total fees collected by the OG-ERA over 21 years (using the estimate of 1,800 permits per year) will range from $302.4 million to $703.3million. DEIR at 4.3-102. A fund of this magnitude offers economies of scale not previously available to the Air District. As such, it is expected that the fund will be able to advance larger projects requiring substantially more capital than was available in the past.

These funds would be used pursuant to specific requirements set forth in the agreement and set out by the County and the SJVAPCD. They would achieve reductions by targeting emissions sources that are currently legal and compliant with SJVAPCD rules, but whose emissions could be reduced via a funded project. For example, the existing SJVAPCD program funds the replacement of old, high-emitting diesel school buses with newer, lower emission school buses, but only buses serving public schools are eligible for the program. The County has the flexibility, with this OG-ERA, to allow for funding of replacement school buses for charter schools, private schools, and church schools.

The OG-ERA will mitigate impacts within the San Joaquin Valley Air Basin. This is appropriate in light of the regional nature of NOx, which contributes to regional ozone formation. In addition, as a party to the agreement, the County will have the ability, in consultation with the SJVAPCD, to set priorities for distribution of the funds. For example, the County may choose to allocate a set percentage for cities within the County.

The OG-ERA is not impermissible deferred mitigation. Mitigation Measure 4.3-8 will ensure collection of mitigation fees to fund emission reductions at the actual pace of well development in the County in coming years. There will be a lag time between collection of the air emissions mitigation fee (i.e., prior to site plan approval) and the accomplishment of the emissions reductions funded by the fee, due to the time required to solicit and vet proposals for emission reduction projects, award the funds, and complete construction or implementation. In some instances, such as where a well requires responsible agency permits subsequent to undergoing the conformity review, the well permit may be obtained and fees paid well before the well is drilled. Thus, emissions reductions may be achieved prior to commencement of drilling. However, for wells that are drilled immediately upon approval of the conformity review, the lag time will result in commencement of emitting activities for well development in advance of the offsetting emission reductions. For this reason (and because – as described at page 4.3-49 of the DEIR – the program will not ensure 100% offset of ROGs), the EIR identified the Project's contribution to cumulative air quality as cumulatively significant.

Lag time is expected to diminish in time with continuous program administration. However, even if there is some lag time for any particular well, the emissions from drilling a single well are relatively small as compared to emissions in the San Joaquin Valley Air Basin; on a county-wide annual basis,

the emission reductions from implementing the OG-ERA are expected to match the emissions from drilling new wells.

Additionally, any perceived lag in emissions mitigation from implementing OG-ERA projects should be considered in light of the conservative approach taken by the EIR with respect to emissions from drilling and operating future wells. The EIR uses 2012 oil and gas drilling and operations activity levels as the baseline for measuring impacts. Although the total number of active wells is expected in increase over time from the 2012 baseline activities, the EIR (and the OG-ERA), CEQA would have allowed the County to subtract the baseline activity levels from the total number of projected wells in order to determine the incremental increase attributed to the project. However, the EIR does not merely consider that increment; instead, it treats every future well drilled and operated as a new well for which emissions will be mitigated via the OG-ERA. In other words, emissions from well drilling and operations which would otherwise have been subtracted as baseline activities will be considered new impacts resulting from the project, and will be mitigated accordingly. This goes further than CEQA requires, and is a particularly conservative approach considering that oil well drilling and operation in the County is ongoing and has occurred for many years.

The County considered other approaches to avoid the lag time. For example, the County considered requiring full funding in advance for the number of wells projected to be drilled in the coming 25 years of Project implementation. However, this approach has several serious disadvantages.

First, it would result in severe inequities. The County cannot predict which companies will drill wells in the coming years, or even roughly approximate the proportion of wells that will be drilled by different companies ten or twenty years from now. If the mitigation measure required full funding in advance, there is a substantial risk that the cost of mitigation would not be borne by the companies responsible for the future emissions.

Second, while the emissions estimates in the EIR are based on regulatory programs in existence in 2015, the decades-long history of air quality regulation in California teaches that there will likely be continued, steady decline in emissions from equipment and activities associated with oil and gas development, including engines on drilling rigs, motor vehicle engines, etc. Therefore, fully funding the mitigation in advance would likely result in mitigation exceeding actual Project emissions, potentially by a wide margin. This would be contrary to decisions of the United States Supreme Court requiring that there be an essential nexus between a project and the mitigation or other exactions imposed by the government, and that mitigation be roughly proportional to the impact of the proposed development. See *Nolan v. California Coastal Commission*, 483 U.S. 825 (1987), and *Dolan v. City of Tigard*, 512 U.S. 374 (1994). These principles are incorporated into CEQA Guidelines Section 15126.4 (a)(4).

Finally, the County has a legitimate interest in ensuring that emissions from future oil and gas development pursuant to the Amended Zoning Ordinance are as low as feasible. If the mitigation measure required full funding in advance, companies would have no incentive in the future to continue advancing air emissions control technologies.

Following issuance of the DEIR, the Applicant submitted additional documentation to the County for consideration as part of the Final EIR. The submittal pertaining to the OG-ERA is addressed below, and the Applicant's technical report is included as an Attachment to the Final EIR.

Attachment 1: Air Emission Technical Proposal on Emission Calculation and Mitigation Measure Options

On August 14 and 24, 2015, the Applicant submitted a two-part technical report requesting certain changes to emissions calculations, and asking for emission reduction credits for certain emission reduction measures. The County's technical consultants completed an independent assessment of these requests, and the County also consulted with SJVAPCD regarding each of these requests. A summary of each request, and the staff decision as to the disposition of each request, is provided below:

1. The Applicants discovered two mathematical errors in the extensive air emission models that they reported caused emissions estimates to be overstated in the DEIR. These errors were confirmed by the County's experts and SJVAPCD staff, and resulted in an overstatement of emissions generated in the construction of new facilities, in the construction of permit-exempt equipment and small production settings, and from the operation of stationary permitted sources.

The errors consisted of: i) in the DEIR, permitted stationary equipment and permitted stationary source emissions are increased by 10% in order to account for the emissions from small oil and gas operators not subject to Title V permit requirements. The 10% factor was incorrectly applied in certain spreadsheets, leading to an overestimate of the forecast of additional equipment needed for the 2035 project build-out; and ii) The number of active wells per year is calculated as the number of new wells drilled, plus the number of wells reworked and placed in service, minus the number of abandoned wells. The number of abandoned wells in the Eastern Subarea was incorrectly applied in the DEIR.

The following tables summarize the difference between the emission estimates for these sources that were included in the DEIR, and the accurate emission values that are now included in this Final EIR to supersede the values in the DEIR.

Original Table:

Table-4.3-11b: Forecast of Additional Equipment Needed for 2035 Project Build-Out

	Kern County Baseline			Count

The County has determined that these emission estimation corrections are minor, did not result in any underestimate of air emissions in the DEIR, and do not warrant any modifications to the per well emission estimates and mitigation requirements for 2.48 tons per well included in the DEIR.

2. The Applicants provided additional field data showing actual operations of well construction equipment, and requested that this actual data be used in lieu of a more conservative default value for estimating the duration and "load" of construction equipment. In particular, the 'load factor' used in the OFFROAD model to calculate emissions from the 'Oil Drilling' category of equipment was reduced from the original value of 0.5025 to the new proposed value of 0.4. The Applicant report concludes that with the proper load factor, construction emissions are lower than the estimates included in the DEIR. Use of this actual, as opposed to modeled, load factor was determined to be reasonable and appropriate by the County's experts and SJVAPCD staff. Table 4.3-15 summarizes the difference between the emission estimates using the load factors included in the DEIR, and the accurate emission values that are now included in this Final EIR to supersede the values in the DEIR:

The County has determined that these emission estimation corrections are minor, did not result in any underestimate of air emissions in the Draft EIR, and do not warrant any modifications to the per well emission estimates and mitigation requirements included in the Draft EIR.

As a consequence of the changes introduced by correction 1 and correction 2 above, the following tables in the DEIR will be revised accordingly:

Original Table:

Table 4.3-27: Total Estimated Emissions from the Project in Tons per Year

Year	NO_X	ROG	CO	SO_2	PM_{10}	$PM_{2.5}$

Average		**1.58**	**0.72**	**0.18**	**2.48**		**9044**

The County has determined that these emission estimation corrections are minor, did not result in any underestimate of air emissions in the DEIR, and do not warrant any modifications to the mitigation requirements included in the DEIR.

3. Applicants requested that a portion of the emission reduction offsets that are required for stationary sources under District permit rules also be counted as emission reductions under the OG-

ERA included in MM 4.3-5. Specifically, Applicants requested that since stationary source permit requirements require greater than 1:1 offsets (including 1:1.5 – or 50% more emission reductions than required to fully offset new emissions), that emissions reductions greater than 1:1 be credited under the OG-ERA.

The SJVAPCD administers the stationary source permit program as well as other programs designed to assure that the region meets applicable ambient air quality standards. The SJVAPCD has advised the County that the offset ratios required under the stationary source permit program are critical to the region's attainment of air quality standards, and that the "no net increase" OG-ERA requirement must be met through additional emission reductions not required for stationary source permits. The County agrees with the SJVAPCD, and has declined this Applicant request.

4. Applicants requested that the OG-ERA recognize that operation of well construction equipment as an ongoing annual operation, and that the emission reduction fee paid under the OG-ERA should count toward multiple years of operation for the same fleet of construction vehicles. The SJVAPCD has advised the County that the emission reduction fee included in the EIR was for a single ton of emission reduction, and not a ton of reduction for each of multiple years. The SJVAPCD further advised that its methodology for operational emissions, which allowed for multiple-year emission reductions under some circumstances, could be considered as part of the OG-ERA development and implementation process. The County agrees with the SJVAPCD and declines to accept the specific alternate OG-ERA multi-year emission credit calculation methodology proposed by Applicant, but agrees that an appropriate multi-year emission credit methodology can and should be included in the OG-ERA to enforce and assure compliance with MM 4.3-5.

5. Applicant requested recognition of three emission reduction mitigation measure options that could be used to comply with the emission reductions required under MM 4.3-5, including: (1) voluntary early replacement of engines with low emission engine technology (Tier 4f engines), (2) increasing carpooling and vanpooling for oil and gas employees above levels required by applicable regulations, and (3) paving roads. The first two measures would reduce NOx as well as other pollutants such as particulate matter (PM), while the third measure will achieve direct PM reductions. The SJVAPCD agrees that all of the measures are appropriate for inclusion in the OG-ERA provided that there are also appropriate enforcement mechanisms to assure implementation and actual emission reductions. The SJVAPCD's top priority for "no net increase" emission agreements remains NOx reductions, but PM reduction measures also have value and can be included in the OG-ERA with appropriate conditions (which may include a limitation on reliance on this measure to assure the ongoing prioritization of PM reduction measures). The County agrees with the SJVAPCD's assessment, including inclusion of these three measures in the OG-ERA with appropriate enforcement and prioritization conditions.

6. Finally, Applicant identified but did not include quantified emission estimates for other potential emission reduction measures for potential future investigation and possible inclusion in the OG-ERA. The SJVAPCD has concluded that all available and effective emission reduction technologies and practices should be considered for potential inclusion in the OG-ERA. The County agrees with the SJVAPCD, and agrees that these measures should be considered as part of the OG-ERA process. The report is included in Volume IV of Chapter 7.

Air-3: Sufficiency of Health Risk Assessment (July 2015)

Appendix M - the Health Risk Assessment (HRA) has been updated to incorporate comments received from the San Joaquin Valley Air Pollution Control District (SJVAPCD) on the DEIR prepared for the proposed Amendment to Title 19 – Kern County Zoning Ordinance – Chapter 19.98 for Oil and Gas Local Permitting. See the new single well HRA now included as Appendix M-1. This new analysis is discussed in detail in Global Response Air-6. This Global Response focuses on comments concerning the adequacy of the original HRA, Appendix M to the DEIR.

An HRA is Not Required for Each Well

Various commenters said that the risk analysis in the EIR is inadequate to support issuance of individual well permits, that a separate Health Risk Assessment (HRA) is required for each well, that the HRA should have evaluated more exposure pathways as in the CCST Report, and that bioaccumulation and endocrine disruption should have been considered. These statements are incorrect.

Health Risk Assessments (HRAs) are used to estimate whether current or future chemical or air emission exposures will pose health risks to a broad population, such as a city or community. In the DEIR, an HRA was prepared to assess the potential impacts from emissions of toxic air contaminants for well construction, drilling, completion, and use of oil and gas processing equipment that could occur in the County under the Project. The HRA assessed the potential health risks of drilling wells at three different locations in Kern County, in order to capture various terrains, wind speed, wind direction, and other dispersion characteristics within the County. In this way, the HRA in the DEIR is a "model" HRA which accurately evaluates the worst case potential health risk for oil and gas operations at any location in the County. Although this HRA is not specific to each different well drilling site or oil and gas processing site that could be approved under the Project, the processes that will occur at these sites and the emissions of air toxics resulting from those processes are quite similar. As a result, the HRA analysis is representative of the potential health risks from the Project.

The HRA was performed following the Office of Environmental Health Hazard Assessment (OEHHA), Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA, March 2015).

The latest version of the Guidance Manual updates the previous version (OEHHA, 2003), and reflects advances in the field of risk assessment along with new more conservative consideration given to infants and children and their associated inhalation rates. The new guidelines are significantly more stringent (health conservative) than the 2003 predecessor. Results using the March 2015 OEHHA Guidelines result in calculated risk of more than 300% or 600% (3-6 times) higher than previous calculations using the previous guidelines. The Guidelines do not require analysis of bioaccumulation and endocrine disreuption.

As recommended by the 2015 OEHHA guidelines, the California Air Resources Board (CARB) Hotspots Analysis and Reporting Program, Version 2 (HARP2) was used to perform a refined health risk assessment for potential future drilling and operational emissions. HARP2 includes three

modules: a dispersion model, an exposure/dose module and a risk module. The dispersion model incorporates the United States Environmental Protection Agency (USEPA's) AERMOD model and the risk model includes the latest changes made by the State of California to the Risk Assessment inputs. The HARP2 risk model (as of March 2015) has a 30-year residential exposure built into the program. Traditionally, it was assumed that someone lived in the same house for 70 years. For more information about the HARP2 Model please reference Global Response Air-7.

The HRA completed for this DEIR and FEIR was based on very conservative assumptions; one of which was to assume that all receptor locations are sensitive receptors. For the purposes of this analysis, each receptor site was assumed to be occupied by a pregnant woman and her young children.

The HRA process consists of four steps:

1. Emissions Estimation
2. Exposure Assessment
3. Dose-Response Assessment
4. Risk Characterization

Emissions Estimation

Emissions estimation involves identifying and estimating the amount and type of toxic emissions likely to occur from Project activities. To accomplish this, the HRA identified emissions of potential toxic substances from each source related to the Project for both construction and operational activities. For construction, the HRA assessed seven phases of drilling: land preparation, drilling survey, well drilling, well completion, well flowline, pump unit, and electrical. Using a conservative approach, the HRA assumed that all seven phases of construction would occur simultaneously, even though these activities generally occur sequentially. Emissions from well drilling were estimated for wells of 2,000, 5,000, and 10,000 feet because wells of different depths require drill rigs with different horsepower ratings and deeper wells require more days of drilling, both factors which influence emissions. For example, a 10,000 foot well requires 3 drill rigs of 1,040 HP each drilling for 23 days, while a 2,000 foot well requires 3 drill rigs of 440 HP each drilling for 4 days.

Emissions from operational activities were evaluated separately based on emissions sources used for oil processing and natural gas combustion. The oil processing scenario assumed that emission sources would consist of: two 1,000 Bbl above-ground tanks; one 3,000 Bbl above-ground tank; one 10 MMBtu/hour flare; one truck loading rack; fugitive emissions from valves, flanges, and one underground sump; and thermally enhanced oil recovery (TEOR) equipment. The natural gas combustion scenario assumed that emission sources would consist of: one new 100 MMBtu/hour flare; one 8 MMBtu/hour process Heater; one 10 MMBtu/hour boiler; one 85 MMBtu/hour steam generator; and one 33 MW cogeneration plant.

The analysis also assumes that all emissions (construction and operational) occur on a shared fence line between a drill site and a neighboring landowner (rather than in the middle of a well pad or spread out throughout a well pad), further adding to the conservative nature of the assessment.

Exposure Assessment

Exposure assessment determines the amount, duration, and pattern of human exposure to the chemical or air emission. When emissions are released from a source, various factors such as terrain, wind speed, and wind direction affect how the emissions move and the concentration of those emissions in different areas. This subsequently affects the concentration that an individual in a particular location is exposed to. Thus, this step takes the emissions estimates from step 1 and uses modeling to predict how individuals will be exposed to emissions from the Project and at what concentrations. The HRA looked at three different locations in Kern County in order to capture the differences in various parts of the County that affect how emissions disperse as they leave a source.

Dose-Response Assessment

The dose-response assessment describes the quantitative relationship between an individual's exposure to a substance (the dose, here Project emissions) and the incidence of an adverse health impact (the response). This step estimates how much of the chemical/air emission it would take to cause varying degrees of health effects that could lead to illnesses (e.g., what are the health effects at different levels of exposure?). This analysis also attempts to identify levels of exposure to toxic emissions at which no or very low levels of adverse health effects occur.

Risk Quantification

The goal of risk characterization is to assess the risk of cancer and other illnesses in the general population due to toxic emissions from the Project. The HRA in the DEIR achieves this goal by identifying how far away from the shared property boundary (oil company and private residence) that a sensitive receptor must be located in order for the calculated cancer risk to that receptor to fall under the SJVAPCD cancer risk threshold of 10 in 1 million. These buffer distances are in Table 4.3-34 in the DEIR, replicated below.

Table 4.3-34: Potential health risk from well construction, drilling and completion emissions

Well Depth (feet)	Year	Maximum distance from well site and project boundary to 10 in one million calculated risk
Western Subarea		
10,000	2015	367 feet
10,000	2020	232 feet
10,000	2029	82 feet
5000	2015	116 feet

Table 4.3-34: Potential health risk from well construction, drilling and completion emissions

Well Depth (feet)	Year	Maximum distance from well site and project boundary to 10 in one million calculated risk
5000	2029	NA
2000	2015	NA
2000	2029/2035	NA
Central Subarea		
10,000	2015	367 feet
10,000	2020	232 feet
10,000	2029	82 feet
5000	2015	116 feet
5000	2029	NA
2000	2015	NA
2000	2029/2035	NA
Eastern Subarea		
10,000	2015	296 feet
10,000	2019	183 feet
10,000	2029	NA
5000	2015	NA
5000	2029	NA
2000	2015	NA
2000	2029/2035	NA

Table 4.3-34 shows the minimum setback/buffer distance from the well site to the sensitive receptor for wells drilled to the specified depth in each subarea for the specified year. Thus, Table 4.3-34 shows that, in 2015, a sensitive receptor in the Western or Central Subareas would need to be 367 feet away from a shared property line where a 10,000 foot well is being drilled in order for the cancer risk to individuals on that property to be below 10 in 1 million. If the sensitive receptor is beyond 367 feet from the shared property line, the risk to individuals on the property falls below the threshold. The necessary buffer distances decrease over time (as further emission controls set in) and for shallower wells (as those produce fewer emissions over fewer days, as explained above).

The 10 in 1 million cancer risk threshold means that, out of one million people exposed to the emissions from the Project continuously over 70 years (an assumed lifetime), only 10 people would contract cancer. Although emissions from drilling are more substantial than emissions from operations, they are also of much shorter duration, 23 days at the most for a 10,000 foot well. Thus, it is unlikely that any individual would be exposed to Project emissions for the duration assumed in the cancer risk analysis (24 hours per day for 70 years). In addition, even though operational emissions would be constant, they occur at much lower levels than drilling emissions.

The DEIR requires in MM 4.3-5 that operators meet the minimum setback distances in Table 4.3-34 in order to ensure that no sensitive receptors are exposed to cancer risk above the threshold. These setback requirements adequately protect sensitive receptors from Project emissions by ensuring that they are far enough away from Project emissions to fall below the SJVAPCD cancer risk threshold. The conservative nature of the HRA analysis and the implementation of MM 4.3-5 will assure that no sensitive receptors will be exposed to hazardous air pollutant emissions that would result in a health risk exceeding the threshold risk levels set by the SJVAPCD.

The HRA Considers All Sources of Potential Toxic Risk

Several commenters claim that the HRA only partially addresses the potential health impacts of oil and gas production. In fact, the HRA considered multiple potential exposure pathways including inhalation, skin contact, mother's milk. In the new HRA, crops were also included per SJVAPCD direction. Appendix M, p. 9; Appendix M-1, p. 3. The list of equipment used in the original HRA (Appendix M to the DEIR) and the new single-well HRA (Appendix M-1) is too long to repeat here, but is included as Appendix 2 to new Appendix M-1. The "Scope of Work" provided to Environmental Compliance Solutions with regard to the HRA is not germane to the EIR, as all necessary assumptions, calculations and background information are described in the HRA Appendices (M and M-1). With regard to the emissions assumptions, CEQA does not require the use of "worst case" or "high end" emissions estimates and similar data. Due to the conservative nature of the analysis (considering all emissions from new wells to be emission increases) and the conservative nature of the factors built into the OEHHA Guidelines and the HARP model, the HRAs in this EIR provide a reasonable estimate of the health risk to sensitive receptors from project activities.

A commenter stated that the HRA analysis failed to consider emissions from all types of well construction and operational activities. The HRAs did evaluate emissions from all project activities related to well construction and operation. Individual items of permitted stationary equipment that is not sited at each well, such as processing equipment, was not included in the analysis because it is not sited at each well and must undergo equipment-specific risk analysis during the SJVAPCD permitting process.

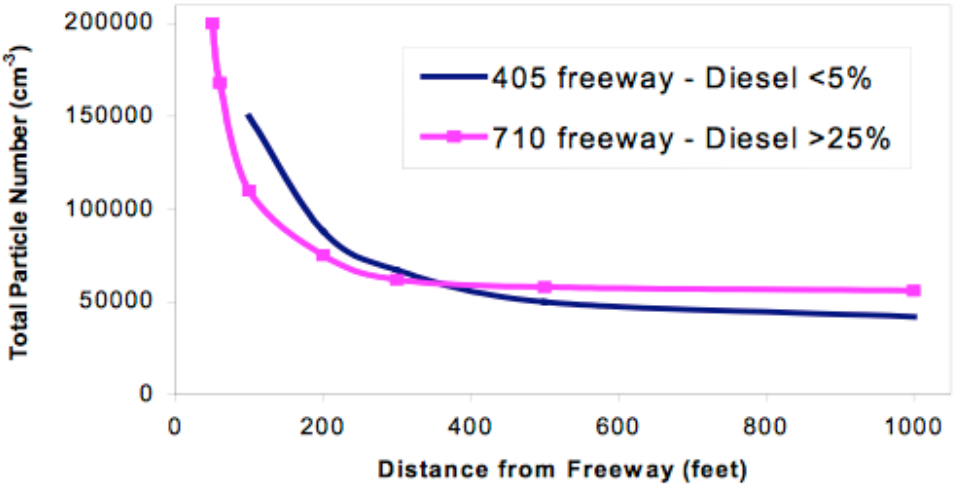
Rebuttal to CCST Risk Assertions/Setback not far enough

Numerous commenters asserted that risk from or that the setback distances in the DEIR are not far enough. Some commenters stated that the setback distances are also inconsistent with CARB recommended minimum setback distances between sources of diesel PM and sensitive populations (500 feet minimum). The commenter did not identify its source for "CARB Recommended Minimum Setback Distances." A 2005 CARB document titled "Air Quality And Land Use Handbook: A Community Health Perspective" includes suggested setback distances of 500 feet or 1000 feet for new sensitive receptors to be located near existing industrial and transportation facilities such as freeways, distribution centers, railyards and refineries. With the recommendations, CARB stated: "These recommendations are advisory. Land use agencies have to balance other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues." Since the CARB recommendations were made for the siting of sensitive

receptors near large, relatively continuous sources of diesel particulate emissions, they are not germane to the question of appropriate setback distances for diesel emissions from well construction that will typically last for 66 days or less.

As shown in the figure below[76], DPM concentrations drop off quickly with distance from high-volume freeways. This helps to explain why the risk from the Project drops below threshold levels within a moderately short distance from the well pad. As shown in the table, once a sensitive receptor is any appreciable distance from the source (approximately 300 feet), total concentration of DPM, and thus risk, drop off significantly and remain mostly steady even at further distances.

Figure 1-1
Decrease In Concentration of Freeway Diesel PM Emissions With Distance



Locations Modeled

Commenters said that the HRA should consider potential risk at more than three sites in the County. Given the number of wells drilled in Kern County each year, requiring preparation of an HRA for each well would be impractical for the operators, the County, and the SJVAPCD. The County determined that an HRA evaluating the possible health risk at a representative location in each of the three subareas would provide an adequate estimate of the potential risk countywide.

In its comments on the DEIR (Comment Letter 0001), the SJVAPCD did not take issue with this approach. However, the SJVAPCD did suggest moving two of the three locations somewhat, and asked for modeling at a fourth location intended to have higher impacts due to the terrain. See Appendix M-1, pages 2, 3.

[76] This figure is from page 9 of ARB's "Air Quality And Land Use Handbook: A Community Health Perspective", April 2005. http://www.arb.ca.gov/ch/handbook.pdf

Comments concerning the OEHHA Guidance and the HARP Model are addressed in GR Air-7.

Air-4: Air Quality Methodology and Emissions Estimates

Numerous commenters have asked for substantiation for various assumptions in the Air Quality analysis in the DEIR. They claim that because the assumptions and the calculation methods are unsupported, the estimated emissions from Project activities must necessarily be higher and more significant than those addressed in the DEIR. These comments are assertions without substantiation. No commenter provides any evidence that actual emissions from the Project are higher than projected in the DEIR.

In addition, this response explains various assumptions that underlie the analysis in the air quality chapter and provides substantial evidence for both factual assumptions and calculation methodologies used in the analysis. Because all of the assumptions are supported by substantial evidence, the estimated emissions in the DEIR are adequate under CEQA.

- Well Depth in Future Years. Commenters claim that the assumption that depth distribution of wells will remain stable from 2012 to 2035 has no justification. Despite the commenters assertions that as more accessible (i.e., shallower) oil and gas resources are exhausted wells will have to be drilled deeper, this is not the case. Analysis of the data contained in the DOGGR Technical Report "California Oil and Gas Wells Volume-I, Central California" at the "Field-Area-Pool" level, shows that for 576 oil and gas pools with reported depth, the average pool depth is approximately 4,900 feet. More than 90% of the oil and gas pools have a depth of 10,000 feet or less. Within Kern County, the average depth of active oil and gas wells is about 2,220 feet with a standard deviation of 1,973 feet. Statistically, 99.7% of a population is expected to be within 3 standard deviations of the average value. Therefore, it may be predicted with a high degree of certainty that 99.7% of the oil and gas wells drilled in Kern County will have a maximum depth of about 8,100 feet (at 3 standard deviations). It is reasonable to conclude that the emissions resulting from the drilling of a 10,000 foot well are conservative and representative of the maximum emissions that might result from the drilling of an oil and gas well in Kern County. Given that most oil and gas pools are located at a depth less than 10,000 feet and almost all the wells within Kern County also have a depth less than 10,000 feet it is reasonable to conclude that most future wells will also have a depth of 10,000 feet or less.
- Number of Idle Wells. Commenters also claim that the assumption that the number of idle wells will remain stable over time is not appropriate. In Kern County idle wells are regulated by the California Division of Oil, Gas and Geothermal Resources (DOGGR). Beginning in1976, DOGGR initiated a well abandonment and well adoption program to reduce the number of orphaned and idle wells. The DOGGR program has resulted in the abandonment of approximately 1,300 wells at a cost of about $23 million. DOGGR has also

initiated a well adoption program which is designed to further reduce the number of idle wells. Given that the total number of idle wells has remained relatively constant, even though the total number of wells has increased, we believe the existing regulations and the DOGGR programs have proven effective in limiting the population of idle wells

Over the years the price of crude oil has varied significantly. When crude oil prices are high, idle wells may be placed into service. Conversely, when the crude oil prices decline, wells may be idled or abandoned. Despite, these changes, historic trends show that idle well counts remain relatively constant. Historic idle well counts obtained from the idle well lists maintained by DOGGR (summarized below), show that between 1999 and 2014, the change in the average number of idle wells was about 44 wells.

Kern County Idle Wells			
DOGGR Report Year	**Total Idle Wells Reported**	**Change in Wells/Year**	**Percent Change**
1999	12,867	0	0.00
2000	12,581	-286	-2.27
2001	12,726	145	1.14
2002	12,057	-669	-5.55
2003	11,253	-804	-7.14
2004	11,767	514	4.37
2005	11,542	-225	-1.95
2006	11,518	-24	-0.21
2007	11,065	-453	-4.09
2008	11,057	-8	-0.07
2009	10,963	-94	-0.86
2011	11,294	331	2.93
2012	11,826	532	4.50
2013	11,864	38	0.32
2014	12,214	350	2.87
Average	11,773	-44	-0.40

The spreadsheets are available at the DOGGR FTP site
ftp://ftp.consrv.ca.gov/pub/oil/Idle_Well_Inventory/

Based on the DOGGR data spanning approximately 15 years, it is reasonable to conclude that the future change in idle well counts will follow a similar pattern.

In addition, one commenter mentioned a spreadsheet showing the number of idling wells to be constant over time. Although the total number of idle wells is relatively constant over time, the particular wells that are idle change. The air quality calculations assume that 2% of

the idle wells are reworked each year and are included in the well "rework" counts. Another 2% are abandoned each year and are included in the well abandonment counts. In other words the constant value includes a 4% allowance each year which is accounted for as an increase in well "rework counts" and an increase in well "abandonment counts".

- Depth of Wells. The air quality analysis considers a well of 10,000 as a representative well in Kern County. As commentators rightly assert, some wells in Kern County are shallower than 10,000 feet while some, particularly in the Central subarea, are deeper than 10,000 feet. A well of 10,000 feet was chosen for the analysis to represent the vast majority of wells in the Project area and accurately represents Project emissions (overestimating emissions for some wells but underestimating for others and thus balancing out throughout the Project area). According to DOGGR data, only 3% of wells drilled in Kern County in 2012 exceeded this depth. It is reasonable to conclude that the emissions resulting from the drilling of a 10,000 foot well are conservative and representative of the maximum emissions that might result from the drilling of an oil and gas well in Kern County.
- NOx Emissions. Some commenters state that NOx emissions are underestimated in the DEIR based on an exhibit entitled "On the Underestimation of NOx from Oil Well Drilling in Kern County, CA" by Dr, Ron Sahu. Dr. Sahu's article pertains to a selected sample of projects and not specifically to the air quality analysis conducted in the DEIR. He states that because the article shows that there are inaccuracies in NOx reporting, the air quality analysis in the DEIR must suffer the same fate. However, there are numerous issues with Dr. Sahu's report that make it ill suited to compare to the air quality analysis in the DEIR.

First, the report cited examples of the different levels of activities and emission rates used for the sample of projects but did not provide evidence that these different inputs used in the emissions inventory for NOx are incorrect. The title "On the Underestimation of NOx from Oil Well Drilling in Kern County, CA" implies that there was an underestimation of emissions. The document failed to prove that there was an underestimation of emissions.

For example, the report states: "It is also worth comparing the NOx emission factors against the relevant CA emission standards. For example, for the largest engines, size 750 hp (560 kW) and greater, the NOx standard for engines manufactured after 2006-2010 is 3.5 grams/kW-hr or 2.61 grams/hp-hr.3 Yet, the vast majority of the NOx emission factors used for these sized engines is significantly lower at around 1.5 grams/hp-hr. Why that is so or what makes these engines able to meet the lower (and unenforceable) assumed emission factor is not explained by DOGGR." First, the emission rate of 3.5 grams/kW-hr is for carbon monoxide and not for NOx. Second, Dr. Sahu assumes that the emission rate of 1.5 gram/hp-hr was for the year 2006-2010. The California Air Resources Offroad Model provides emission rates for 750 hp engines of 1.36 gram/hp-hr for the year 2013. As such, an emission rate of 1.5 gram/hp-hr is plausible if the equipment selected had a model 2013 engine year or newer.

In addition, the article contains a very small sample size from which to draw conclusions. Dr. Sahu's concludes that there is a significant underestimation of NOx emissions associated with oil and gas well drilling activities in Kern County. This conclusion is based on a review of 5 projects and summary information for four additional projects. As such, a total of 9 projects submitted to DOGGR were reviewed. As stated on page 2 of Dr. Sahu's document, "For example, in just 2013 and 2014 respectively, 2586 and 2207 permits were issued for well drilling by the State of California, Department of Conservation, Division of Oil, Gas and Geothermal Resources (hereafter "DOGGR") field office in District 4, with jurisdiction over Kern County." A total of 4,793 permits were issued in District 4 for 2013-2014. A sampling size of 9 of the 4,793 permits that were issued indicates that Dr. Sahu's study covered 0.2% of the permits that were issued. This small sampling of projects should not be used to implicate the 99.8% of the other projects are inaccurate even if Dr. Sahu's claims on these few permits are valid.

Dr. Sahu is also concerned about how construction equipment emission rates used in the environmental analyses can be verified with the actual equipment used in the field. The DEIR imposes MM 4.3-4, which requires the use of offroad engines that meet Tier 3 emission standards. The use of Tier 3 emission standards is readily verifiable through inspection of the engine year during the implementation of the Mitigation Monitoring Plan as well as an online search through the CARB's Diesel Off-road On-line Reporting System (DOORS).

- VOC Emissions Factors. The fraction of VOC contained in the hydrocarbon vapors released from components differs because overall gravity of the crude oil differs in the each subarea. For example, about 40% of the oil produced in the Western subarea is light oil; around 96% of the oil produced in the central subarea is light oil; and only about 3% of the oil produced in the Eastern subarea is light oil. The fraction of light oil and heavy oil production within a given subarea was used to calculate weighted average VOC emission factors, from the component counts in light oil and heavy oil service respectively.

The component counts for wells recommended in the Gulfwide Offshore Activities Data System (GOADS 2014) were used in the calculations for three reasons. First, the counts are typical of the component counts seen on well-heads used by the petroleum industry in Kern County. Secondly, the information was published by the Department of Interior and the report is readily available to the public. Finally, the report also includes estimates of the weight fraction of VOC contained in the fugitive emissions from light oil and heavy oil.

With respect to the leak fractions used in the calculation, the leak fractions correspond to the allowable leak fractions specified in SJVAPCD Rule 4409.

- Activity Assumptions for Drilling. The information listed in the spreadsheet summarizes actual data compiled during the drilling of 10 wells having an average depth of 10,000 feet. The information serves as a starting point for evaluating similar types of activities (i.e. line items in the spread sheet). The

duration of some drilling activities (or tasks) vary with well depth. Others do not. Depending on the nature of the task, each line item (i.e. task) listed in the spreadsheet was adjusted as needed on a case-by-case basis. For example, use of a portable crane for "rig-up" and "rig-down" was assumed to require two days to complete regardless of well depth. On the other hand, the number of days required for the operation of rig engines and mud-pumps depends on well depth. These days were adjusted accordingly. For example, the drilling of a well having a depth of 1,000 feet requires about 3 days; while the drilling of a well having a depth of 15,000 feet requires about 66 days.

With respect to the hours of operation used in the calculations, the use of a 22 hour per day operating schedule is very conservative (90% run time). It may overestimate emissions, since rig equipment could be idle for more than 2 hours per day, to complete required maintenance or due to equipment breakdown. Rig sizes used in the calculations also vary with depth. The size of the rig was determined by grouping the 2012 US Drilling Rig fleet into rated depth categories corresponding to 5K, 10K, 15K, 20K and 25K feet. Within each depth category the horsepower rating of the rig engines and the mud-pumps were averaged to obtain a representative configuration for a rig rated to drill to the given depth. The horsepower and equipment configuration for that depth rating was then used in the calculation of the emissions resulting from the drilling of a well to the given depth.

- Use of Ten Wells Drilled in 2010-2011. The analysis is not based solely on information obtained from the drilling of 10 wells. The data collected from the 10 wells was used to compile a list of equipment and activities for calculating emissions from offroad and onroad equipment. The data was combined with actual geographic information (well site locations) to calculate emissions from well construction and related operational activities. Detailed information on the equipment and operating parameters were compiled during each phase of the well construction activities. The information was subject to a peer review by other industry members, and members of the drilling industry and it was concluded that the list of equipment and operating parameters was broad enough to capture equipment and activities required for well construction in Kern County. Historic production records and trends were evaluated for more than 50,000 wells and the analysis includes consideration of the existing and forecast emissions from most of the oil and gas production equipment permitted by the SJVAPCD in Kern County.
- Well Projections, Well Count Numbers for Various Well Activities, Information on Well Drilling, Rework, and Abandonment. Please see GR 8 for future well projections. Well abandonment counts were estimated to be about 2% of the number of active wells per year. The number is based on industry expectations. Hydraulic stimulation counts were derived from historic data obtained from Frac-Focus. Future counts were estimated from historic trends. Commenters have not supplied any data to suggest that these assumptions are inaccurate. The Frac-Focus database contains the most comprehensive information available on the

hydraulic stimulation of wells located in Kern County. Given the fact that information on the hydraulic stimulation of wells is proprietary, the data contained in the Frac-Focus database proved to be the best information available for determining the number of hydraulically stimulated wells in Kern County. In addition, data derived from a voluntary source such as Frac-Focus is not necessarily inaccurate merely because it is provided on a voluntary basis. "There is no merit to [the assertion that] information in the record . . . should be discounted or ignored because it was provided by real party in interest." *SPRAWDELF v. San Francisco Bay Conservation and Development Comm'n* (2014) 226 Cal. App. 4th 905, 921 (the agency could reject applicant-provided evidence it found not credible or accept information as accurate and relevant); *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal. App. 4th 656, 684 (agency may rely on study provided by applicant). An agency may accept applicant-provided information "as accurate and relevant." *Id.*; *see also* Pub. Res. Code § 21160.

Other data was provided by the DOGGR District-4 Office and includes detailed information on each well included within a given category. At the time that the preliminary data was provided, the data was the most comprehensive information available and the only information available at a level of detail (well level data) needed to evaluate baseline drilling, rework and abandonment activities. DOGGR has yet to release its final 2012 Annual Report. There are only minor differences between drilling counts obtained from the well-level information provided by DOGGR, and the total (OG+UIC) drilling counts contained in the weekly summaries (which include all oil and gas production wells in addition to wells used pursuant to the underground injection control program).

- Use of Equipment List for Well Maintenance for Well Abandonment. Even though well maintenance and well abandonment are conducted for different purposes, the equipment and activities are similar. With respect to maintenance, small rigs are used for hoisting rods and down-hole pumps out of the wells so that they can be replaced as part of routine maintenance conducted on the well. Similarly, small rigs are used to hoist rods and electric submersible pumps from wells so that the wells can be filled with "mud" and cement per DOGGR requirements for abandonment. In both cases activities are conducted using the same types of rigs and only require a few days to complete.

- Number of Days to Complete Work Based on Well Depth. The equation used for estimating well depth was derived using a curve fitted equation generated by Golden Software "Grapher, Version 10". The data used in the analysis was obtained from a compilation of DOGGR well records, provided by "IHS", a company that specializes in providing data to a variety of industries including the petroleum industry. The data used in the analysis was obtained directly from the detailed well records maintained by the DOGGR in their well record database. The number of days required to drill a well to a given depth was determined by subtracting the "rig spud date" from the "rig release" date. The analysis includes

the evaluation of the wells drilled between the years 2000 through 2012. Outlying data was rejected as recommended in ASTM Standard E 178-02 "Standard Practice for Dealing With Outlying Observations". The number of wells drilled to a given depth were grouped into 1,000 foot intervals between 1,000 feet to 24,000 feet. The data was then input to the "Grapher 10" program and curve fitted to generate the equation used for estimating well depth. The preliminary data on well drilling, rework and abandonment is freely available to the public and may be obtained from the DOGGR District-4 office upon request.

- Lower Emission Factors in 2035. The air quality analysis utilizes lower emission factors in 2035 because assumes that new regulatory controls will come into effect**.**
- Fugitive VOC Emissions. Emissions of volatile organic compounds (VOC) from the operation of oil and gas production wells were accounted for as follows. The VOC emissions from the operation of downstream equipment associated with production from oil and gas wells is accounted for on the SJVAPCD permits authorizing the use of the equipment. These emissions are included in the emissions that were calculated for permitted equipment. The fugitive VOC emissions from the well-head components (valves, flanges, connectors, etc.) were calculated for all wells (active and idle wells). The emissions were calculated from typical well head component counts using EPA and SJVAPCD approved calculation procedures. Fugitive VOC emissions for each year were calculated from the running total well count of all active and all idle wells for the given year.
- Toxic Emissions will be Zero After Mitigation. One commenter claims that the analysis assumes that all air toxics emissions will be zero after mitigation. This commenter refers to a draft table which is not part of the air quality analysis in the DEIR. In addition, the analysis in the DEIR shows that toxic emissions from Project activities will be less than significant (0) with mitigation. MM 4.3-5 will result in less than significant impacts due to toxic emissions. Please also see GR Air-3 and GR Air-6 for a discussion of the HRAs prepared for the Project.

Several of these assumptions are discussed in the DEIR itself while others merely form the basis for the analysis in the DEIR. CEQA does not require the entirety of the analysis to be presented in the DEIR itself. The information supporting the analysis in the DEIR was available for viewing by request to the County and as evidenced by the fact that numerous commenters made comments on various draft charts and spreadsheets used in the air quality analysis for the DEIR, this information was made available to commenters for their review. If the air quality chapter in the DEIR were to contain every assumption, justification, and calculation methodology necessary to estimate project emissions it would be convoluted, excessively long, and too complex to be understood by the common reader. This would be in clear violation of CEQA's mandate that EIRs be written so that "decisionmakers and the public can rapidly understand the documents." CEQA Guidelines § 15140; *see also* Pub. Res. Code § 21003(b) (EIRs should be organized and written in a manner that will make them "meaningful and useful to decision-makers and to the public."); *San Joaquin Raptor*

Rescue Ctr. v. County of Merced (2007) 149 Cal. App. 4th 645, 659 (an EIR should be written in a way that readers are not forced "to sift through obscure minutiae or appendices" to find important components of the analysis).

Because all of the assumptions in the air quality analysis are supported with substantial evidence, the analysis accurately estimates Project emissions and is adequate under CEQA.

Air-5: Cumulative Analysis: Health Risk Assessment

Multiple commenters suggested that the Health Risk Assessment in Appendix M of the DEIR was not adequate because it did not address the cumulative risk from drilling and operating multiple wells in close proximity to a sensitive receptor. For the reasons outlined below, the HR in the DEIR in Appendix M and the revised HRA in Appendix M-1 together are sufficient to show that impacts to sensitive receptors will be mitigated to less than significant with implementation of MM 4.3-5.

As explained in GR Air-3 and GR Air-7, the HRA conducted for the DEIR provides a conservative analysis. For example, the HRA included the following conservative assumptions:

- All receptor locations, including the closest receptor, were assumed to be sensitive receptors;
- All phases of construction were assumed to occur simultaneously;
- All equipment was assumed to operate simultaneously;
- All emissions were assumed to occur on a shared fence line with the nearest receptor; and
- Certain co-located equipment was assumed to be present for each wellhead.

The HRA conducted for the DEIR also uses the HARP2 model which, as explained in GR Air-7, results in significantly more conservative estimates of risk.

Even with these conservative assumptions and models, the HRA for the DEIR found that in no case did the proposed Project exceed, or even approach, the 20 in one million risk threshold established by San Joaquin Valley Air Pollution Control District. In addition, the lower 10 in one million threshold utilized in the original HRA was only exceeded by drilling a 10,000 foot well in the Western Subarea in the early years of the Project. Thus, MM 4.3-5 was implemented to require a setback of 367 feet from sensitive receptors. This mitigation measure and the conservative nature of the HRA analysis will assure that no sensitive receptors will be exposed to hazardous air pollutant emissions that would result in a health risk exceeding applicable thresholds.

As explained in GR Air-6, a revised HRA was conducted for the FEIR in response to comments from the SJVAPCD. The results of the revised HRA with SJVAPCD's suggested assumptions, including making the analysis more conservative by assuming that wells are drilled to 15,000 feet rather than 10,000 feet, resulted in a very low risk level requiring no setback. The revised HRA analysis in the FEIR confirms the conservative nature of the HRA performed for the DEIR. Despite the results of the revised HRA, the EIR will maintain the setbacks established in MM 4.3-5.

As explained in both HRAs, the major risk driver from the Project is diesel particulate matter from well drilling activities which accounts for nearly 99% of the toxic risk from the Project. Operational activities add negligibly to the risk outcome and thus, a sensitive receptor near several operational wells would not be subject to hardly any incremental risk. Instead, it would require a receptor to be near multiple wells all being drilled at the same time to appreciably increase risk in a way to approach the risk threshold.

The conservative nature of both HRAs, the implementation of MM 4.3-5, and the risk profile for the Project being driven by DPM from well drilling activities suggest that the DEIR adequately protects a sensitive receptor in close proximity to multiple wells.

Air-6: Revised Health Risk Assessment: SJVAPCD Methodology

Several commenters stated that the HRA was deficient. In particular the SJVACPD requested that the HRA be remodeled to ensure that it is consistent with their regulatory risk policy which was recently updated. After discussions with the SJVAPCD, new single well HRA modeling was conducted based on the District's suggested methodology. The changes in the methodology are summarized below.

1) Diesel Exhaust. The SJVAPCD asked that diesel exhaust be modeled as particulate matter of 10 microns or less (PM10) rather than PM2.5, which was previously modeled in the HRA in Appendix M of the DEIR. The SJVAPCD understands and confirmed that this overstates emissions and risk as PM10 includes road dust and other fugitive dust which is not considered to be toxic by the State of California.

2) Receptor Grid. The receptor grid spacing has been adjusted per the District's request. The prior HRA had used grid spacing at every 25m facing out up to 250m away from the source of emissions. The HRA in Appendix M-1 includes further distances up to 2,000m in a grid system as follows: 25m spacing on facility boundary, 25m spacing from facility boundary to 100m, 50m spacing from 100 – 250m, 100m spacing from 250 – 500m, 250m spacing from 500 – 1,000m, and 500m spacing from 1,000 – 2,000m.

3) Terrain Characteristics. The HRA in the DEIR used three scenarios for terrain characteristics: (1) Midway Sunset Oilfield, (2) Kern River Oilfield, and (3) North Shafter Oilfield. As requested by the SJVAPCD, the HRA in Appendix M-1 includes one additional modeling location in the Western Subarea which is known as "Derby Acres." An additional HRA is included in Revised Appendix M-1 which includes an analysis of Derby Acres. This location has very complex terrain. The selected location is at the bottom of a "bowl type" formation which allows for minimal air dispersion and thus likely represents a worst-case risk scenario. The SJVAPCD also moved one of the previously modeled locations to a site about one mile away and moved another location about eight miles away. The location of the Central Subarea location in Shafter did not change.

4) Meteorological Data. The prior HRA modeling used meteorological data only from the Bakersfield meteorological station (station ID 23155) rather than multiple meteorological

data sites. This is because the Bakersfield station data is the only dataset set up to work exactly with the HARP model. In addition to the Bakersfield data that was previously used, for the HRA in Appendix M-1 additional meteorological data was used from the Arvin, Fellows and Missouri Triangle stations.

5) Dispersion Modeling Inputs (AERMOD).

    a. The prior HRA modeled drilling rigs as volume sources. The HRA in Appendix M-1 modeled drilling rigs as point sources at the SJVAPCD's request.

    b. Flare emission factor updates were also provided by the APCD and used in these calculations.

6) HARP 2 Inputs.

    c. SJVAPCD utilizes a 70-year residential exposure assumption in HRAs prepared in the District as compared to the State of California's HARP2 computer risk program which assumes a 30-year residential exposure. The HRA in Appendix M-1 assumes that residents stay in the same home for 70 years while the prior HRA used the 30-year assumption.

    d. SJVAPCD requested that the possibility of home-grown food exposure be included in the analysis. Although this is not part of the State of California guidelines, it was included as a potential route of exposure to chemicals in the HRA in Appendix M-1.

7) The prior HRA conservatively assumed that all emissions (construction and operational) occurred on a shared fence line between a drill site and a neighboring landowner (rather than in the middle of a well pad or spread out throughout a well pad) as is more likely. The District requested that the drilling rig emission sources not be contained on such a small area of land and that they also be separated from the drilling mud sump location. This was resolved in the HRA in Appendix M-1 by measuring to the highest concentration of risk from either source so their location relative to each other is not a risk determinant.

8) CEQA Threshold. Finally, SJVAPCD requested that the analysis results be compared to the SJAPCD CEQA Significance for Toxic Air Contaminants of 20 in one million (20 x 10-6) rather than the 10 in one million threshold utilized in the DEIR. The HRA in Appendix M-1 also includes comparisons to the 10 in one million threshold for informational purposes.

The aforementioned changes have been made and are included in the HRA in Appendix M-1 to the DEIR.

The basis for the analysis did not change from the HRA that is in Appendix M of the DEIR (please see GR Air-3 for more information on that analysis). For example, both HRAs evaluated potential calculated cancer risk as well as other potential illnesses due to both short-term (acute) and long-term exposure (chronic health risk) from toxic emissions associated with well construction, drilling, and completion as well as oil and gas processing equipment.

None of the equipment assumptions for well drilling or operational activities changed. Typical well construction phasing and equipment lists were provided as part of our scope of work; along with emission calculations from all well drilling equipment. The list of equipment used for both HRAs is available in GR Air-3. All well construction emissions were assumed to occur simultaneously for worst case, conservative assumptions. Both the HRA completed for the DEIR in Appendix M and the revised HRA in Appendix M-1 were based on very conservative assumptions; **one of which was to assume that all receptor locations are sensitive receptors.** Sensitive Receptors are defined as "[p]eople that have an increased sensitivity to air pollution or environmental contaminants are considered to be sensitive receptors. Sensitive receptor locations include schools, parks and playgrounds, day care centers, nursing homes, hospitals, and residential dwelling unit(s). The location of the nearest sensitive receptors to a project site is needed to assess toxic impacts on public health." SJVAPCD "Guidance for Assessing and Mitigating Air Quality Impacts", April 2012, p. 9. In addition, both HRAs assume that a pregnant woman and her small children reside at the nearest residential location.

Both HRAs followed the OEHHA Guidelines as amended in March 2015. The latest version of the Guidance Manual updates the previous version (OEHHA, 2003), and reflects advances in the field of risk assessment along with new more conservative consideration given to infants and children and their associated inhalation rates. The new guidelines are significantly more stringent than the 2003 predecessor and this is the document that was used for the DEIR. Results using the March 2015 OEHHA Guidelines result in calculated risk of more than 300% to 600% (3-6 times) higher than calculations using the previous guidelines.

As recommended by the 2015 OEHHA guidelines, the California Air Resources Board (CARB) Hotspots Analysis and Reporting Program, Version 2 (HARP2) was used to perform a refined health risk assessment for potential future drilling and operational emissions. HARP2 includes three modules: a dispersion model, an exposure/dose module and a risk module. The dispersion model incorporates the United States Environmental Protection Agency (USEPA's) AERMOD model and the risk model includes the latest changes made by the State of California to the Risk Assessment inputs. For more information about the HARP2 Model please reference Global Response Air-7.

The State of California's HARP2 risk model (as of March 2015) has a 30-year residential exposure built into the program. Traditionally, it was assumed that someone lived in the same house for 70 years. SJVAPCD has decided to continue to require the assumption that one lives in the same home for 70 years (per the old model). This change, along with the other state changes mentioned above, have the potential to result in calculated risk significantly higher than those calculated using the model prior to March 2015. In response to this change, the SJVAPCD also changed their risk threshold from 10 in one million to 20 in one million on June 30, 2015. *See* SJVAPCD APR – 1906, "Framework for Performing Health Risk Assessments", dated June 30, 2015.[77] The staff report for the update to SJVAPCD's threshold states that it is revising the District's HRA threshold to 20 in one million due to the changes in OEHHA's March 2015 guidance document. SJVAPCD Draft

[77] Available at: http://www.valleyair.org/policies_per/Policies/apr-1906.pdf.

Staff Report, "Proposed Update to District's Risk Management Policy to Address OEHHA's Revised Risk Assessment Guidance Document", dated September 23, 2014.[78] For more information on the risk threshold in the EIR, please reference Response 0049-9.

The HRA analysis in Appendix M-1 was completed for wells with depths of 10,000 and 15,000 feet. The prior HRA modeled wells at 10,000 feet and less. Based on the current wells in Kern County it is reasonable to assume that less than 5% of wells in the County are deeper than 15,000 feet and even this assumption is likely conservative. Wells were not modeled below 10,000 due to lack of impacts, as discussed below.

As shown in Table 7-4 below, results for the HRA contained in Appendix M-1 indicate that none of the modeled scenarios resulted in risk greater than 20 in one million. The only scenario which resulted in a risk greater than 10 in one million was drilling a 15,000 foot well in the hilly Western - Derby Acres location (a location where a well would be unlikely to be drilled). Risk decreases to below 10 in one million at 182 feet from the well drilling equipment at this location. This set back distance is below the 210 foot noise set back requirement contained in the DEIR in MM 4.12-2 and below the 367 foot setback in the DEIR in MM 4.3-5.

Table 7-4: Potential Health Risk from Well Construction, Drilling, and Completion Emissions

Well Depth (feet)	Year	Maximum distance from well site and project boundary to 10 in one million calculated risk	Maximum distance from well site and project boundary to 20 in one million calculated risk
Western Subarea – Derby Acres			
15,000	2017	182 feet	NA
10,000	2015	NA	NA
Western Subarea – Midway Sunset			
15,000	2017	NA	NA
10,000	2015	NA	NA
Central Subarea			
15,000	2017	NA	NA
10,000	2015	NA	NA
Eastern Subarea			
15,000	2017	NA	NA
10,000	2015	NA	NA

As shown in Table 7-5 below, the Subareas had risk levels ranging from 2-4 in one million for a 10,000 foot well scenario.

[78] Available at: http://www.valleyair.org/Workshops/postings/2014/10-09-14_OEHHA/Draft-Staff-Report-9-23-14.pdf.

Table 7-5: Potential Health Risk Levels from Well Construction, Drilling, and Completion Emissions

Well Depth (feet)	Year	Risk Level by Subarea			
		Western Subarea – Derby Acres	Western Subarea – Midway Sunset	Central Subarea	Eastern Subarea
10,000	2015	4.6	2.8	2.1	1.6
15,000	2017	13.1	7.6	2.8	4.4

The County and its experts have reviewed both this Revised HRA (available in Appendix M-1) and the Cumulative HRA (available in Appendix M-2 and discussed further in GR Air-5), and concluded that no changes to the setback distances included in MM 4.3-5 are necessary as these are greater than warranted based on the analyses and conclusions included in these revised HRAs. The greater setback distances included in MM 4-3-5 provide an extra margin of safety to protect the public health of nearby homes, schools, and other sensitive receptors under both single-well and multiple-well exposure scenarios.

Air-7: HARP Model

As explained in more detail below, the assumptions used for the Health Risk Assessments (HRAs) completed for this EIR were based on conservative assumptions and are consistent with the state and SJVAPCD required model. Appendices M and M-1 contain the HRA for the DEIR and the HRA that were completed in response to comments. Please also see global responses GR-Air-3 and GR-Air-6 for a further explanation of the HRA process for both the DEIR and FEIR.

HRA Overview

The overall goal of an HRA is to establish potential risk criteria for residences, workers and other sensitive receptors. Sensitive receptors are people that have an increased sensitivity to air pollution. Sensitive Receptors are defined as "[p]eople that have an increased sensitivity to air pollution or environmental contaminants are considered to be sensitive receptors. Sensitive receptor locations include schools, parks and playgrounds, day care centers, nursing homes, hospitals, and residential dwelling unit(s). The location of the nearest sensitive receptors to a project site is needed to assess toxic impacts on public health." SJVAPCD "Guidance for Assessing and Mitigating Air Quality Impacts", April 2012, p. 9. In addition, both HRAs assume that a pregnant woman and her small children reside at the nearest residential location.

In general, as described in the DEIR under Impact 4.3-3 (beginning on page 4.3-103) an HRA is conducted by taking the following approach: identifying the hazardous constituents of concern and developing an emissions inventory; performing air dispersion modeling to identify how the identified emissions may potentially be transported through the atmosphere; developing benchmarks for the cancer and non-cancer dose response to these constituents; and developing a probability-

based risk factor based on the abovementioned steps. An HRA considers all of the following to establish a conservative, probability-based finding:

- Cancer potency factor
- Age sensitivity factor
- Daily breathing rate
- Frequency of time at home
- Length of exposure

HARP 2 Overview

California's Office of Environmental Health Hazard Assessment (OEHHA) is tasked with determining the relative toxicity of numerous chemicals and compounds. In conjunction with the California Air Resources Board (ARB), OEHHA also develops guidelines for how an HRA must be conducted. California facilities have been required to assess potential health risks from toxic air contaminant emissions since 1987. OEHHA released the first HRA guidelines in 2003.

California also produces the software that is required to be used to complete HRAs. The software consists of two tools: an air dispersion modeling tool known as AERMOD, and a Risk Assessment Calculator known as the Hot Spots Assessment Reporting Program (HARP).

AERMOD predicts where specific emission concentrations will be deposited based on specific meteorological and terrain conditions in the project area. AERMOD replaces the previous air dispersion modeling tool, which was known as ISCST.

The HARP model has been required since 2003. HARP assigns risk values to the concentrations of each toxic air pollutant based on how toxic OEHHA has deemed each chemical to be at varying levels of exposure. HARP was updated (and renamed HARP2) in March 2015 to reflect OEHHA's most recent changes to toxic risk assumptions.

HARP2 is equipped with three modules: the Emissions Inventory Module (EIM), the Air Dispersion Modeling and Risk Tool (ADMRT), and the Risk Assessment Standalone Tool (RAST). HARP2 allows the results to be plotted on a map so that distances to receptors and risk isopleths can be created.

HARP2 reflects advances in the field of risk assessment. HARP2 also includes new and more conservative considerations for infants and children, including their associated inhalation rates. For example, under HARP2 children under the age of 2 are assumed to breathe considerably more air than was previously assumed. HARP2 also has a 30-year residential exposure built into the program. Traditionally, it was assumed that someone lived in the same house for 70 years. These and similar changes in HARP2 mean that HRAs conducted subsequent to March 2015 are significantly more conservative with regard to estimates of risk probability rates, and in fact almost tripled such rates from the previous HARP version. On average, a risk number is about 300% higher under HARP2. In other words, a 3 in one million risk in 2014 under HARP would become an

almost 10 in one million risk in 2015 under HARP2. Also see the discussion in GR Air-6 regarding modeling changes requested by the SJVAPCD for the updated HRAs included in the FEIR.

Significance Thresholds for this Project

Local air districts, in conjunction with OEHHA, establish thresholds of significance for toxic air contaminant risk levels. The risk level established by the San Joaquin Valley Air Pollution Control District (SJVAPCD) is 20 in one million. Projects in excess of this threshold are considered to pose a significant adverse environmental impact under CEQA. The DEIR utilized a threshold of 10 in one million in the HRA in Appendix M. This resulted in the setbacks required by MM 4.3-5. The revised HRA completed in response to comments (found in Appendix M-1) utilized the 20 in one million threshold established by the District but also compare their results to the 10 in one million threshold for informational purposes.

The HRA conducted for the DEIR followed the OEHHA guidelines as amended in March 2015 and utilized the newly released HARP2 program. As explained above, HARP2 already results in significantly higher theoretical risk estimates than those resulting from use of the previous HARP guidelines. In addition, one of the key assumptions in the HRAs completed for this EIR was that any potential emissions receptor location is a sensitive receptor. Individuals who may be more sensitive to toxic exposure (such as pregnant women or young children) were assumed to be the individuals who would be present in the closest residential and/or school location to the emissions source. Furthermore, the HRA also assumed that all equipment would be operating simultaneously (which is not realistic, but utilized to create the most conservative analysis possible). Even with these conservative assumptions and the use of HARP2, in no case does the proposed Project exceed, or even approach, the 20 in one million threshold established by SJVAPCD.

Air-8: Well Stimulation Emissions

Some commenters suggested that the Health Risk Assessments (HRAs) completed for this EIR should include a discussion of well stimulation treatment activities (WST), including considering the health risks posed by chemicals used for WST.

WST primarily involves adding chemicals to water and injecting them into the subsurface area. Adding chemicals to water used as part of a down-well process generally does not cause air emissions. Instead, the chemicals are underground in the wells in which they are injected. To the extent WST does cause emissions, the vast majority result from large diesel-fired drill rigs or workover rigs (the latter are used for well re-work activities on existing wells). As explained in Appendices M and M-1 emissions from large diesel-fired drill rigs were accounted for in the HRAs. Thus, the HRAs completed for the Project considered all relevant sources of health risks for the Project. Any health risks from emissions other than diesel particulate matter are insubstantial and as the HRA is conservative and over-estimates potential risks, it adequately represents the risks from Project implementation. Please also see GR Air-3 and Air-6 for more information about the conservative nature of the HRA analysis.

Air-9: CCST: Air Emissions

Commenters noted the recent CCST study on well stimulation treatment activities in California and questioned whether the emissions analysis and Health Risk Assessments (HRAs) for the EIR are consistent with CCST's findings and recommendations.

For instance, commenters stated that CCST found that most of the hydraulic fracturing in the San Joaquin Basin occurs at depths of less than 1,000 feet. The commenters therefore questioned whether wells within the Project Area would be at a depth (<2,000 ft.) that would trigger the setbacks established in the EIR. The HRAs assumed that most wells would be drilled at a depth of well over 2,000 feet (each well was assumed to be 15,000 feet deep and to include an associated drilling mud sump) to ensure that the impacts and HRA analysis were conservative. Deeper wells pose higher risks because they require more days of equipment operation to reach the stated depths and therefore have higher emissions. The fact that most wells within the San Joaquin Basin may actually be drilled at depths that are less than 2,000 feet further demonstrates that the EIR's analysis is conservative because the analysis assumes greater emissions than will actually occur.. Also, as noted in the DEIR, 97% of all wells drilled in Kern County are less than 10,000 feet deep, confirming that use of a 15,000 foot depth in the HRA is conservative.. DEIR, pp. 4.3-104, 105. For more information about the setbacks used in the HRAs and throughout this EIR, please see GR Air-10.

Commenters also pointed to CCST's finding that residents near active oil and gas wells may have a higher risk of being exposed to harmful chemicals, and as a result could have a higher risk of developing health problems. Commenters note that CCST found that significant exposures could occur as far as two miles from an active well. In the analysis performed for this Project, emissions were assumed to occur from the drilling of 42 oil wells at distances of ½ mile, one mile, and two miles away from a sensitive receptor. The analysis assumed that the closest sensitive receptor would be a school (and therefore also assumes some of the most sensitive individuals, small children, are present). In addition to the conservative depth assumptions noted above, the analysis in this EIR assumed that well re-work utilizing a workover rig would be required annually for each well. In practice, re-work is performed less frequently. Even with these conservative assumptions, the HRA conducted for the DEIR (Appendix M) results in calculated potential cancer risks of less than 5 in one million. This is significantly below the SJVAPCD CEQA risk threshold standard of 20 in one million (please also see GR Air-7, regarding the HARP2 model used for the HRAs, and GR Air-6, discussing the HRA methodology changes from the DEIR made at the request of the SJVAPCD). Therefore, the Project-specific analysis for this EIR demonstrates that risk levels are acceptable for nearby residents.

The analysis used in the original HRA followed all requirements of the most recent OEHHA Risk Assessment Guidelines and SJVAPCD risk assessment guidelines, and used CARB's HARP model as directed by the state. The new risk assessment in the FEIR (Appendix M-1) also followed these directives, with additional refinements requested by the SJVAPCD. (See GR Air-6 for more discussion of the revised HRA.) If these guidelines and models are updated to incorporate any new toxicity or exposure information that was used in the CCST study, any future HRAs will use that methodology.

Diesel particulate matter is responsible for most of the health risk from well construction and operation. It is noted that airborne concentrations of diesel particulate matter (and hence potential risk from exposure) decrease significantly within a very short distance from the source. This finding (which is consistent among many scientific studies) is the basis for certain conclusions in the California Air Resources Board's April 2005 publication – *Air Quality and Land Use Handbook: A Community Health Perspective*.[79] This document serves as the basis for CARB's recommendations on siting sensitive receptors within certain distances from diesel sources such as freeways. The report states that "California freeway studies show about a 70% drop off in particulate pollution levels at 500 feet [away from the source]."[80] The report also states that "measured concentrations of vehicle-related air pollutants, including ultra-fine particles, decreases dramatically within approximately 300 feet of [major] freeways."[81] Most of the emissions at a well site are due to the operation of heavy drilling and processing equipment. Therefore, the associated risks from exposure to those emissions, including diesel particulate matter, would be expected to drop-off significantly within 300 feet of a well, and be substantially lower for residences located as far as two miles away from the well site. For more information about sufficiency of the HRAs, please also see GR Air-3.

Air-10: HRA Setbacks and Other Setbacks in EIR

It has been noted that several mitigation measures in the DEIR require setbacks from sensitive receptors. A question has arisen as to how these differing setback measures interact. A setback is a requirement that provides a minimum buffer distance between a regulated activity and a sensitive receptor. Sensitive Receptors are defined as "[p]eople that have an increased sensitivity to air pollution or environmental contaminants are considered to be sensitive receptors. Sensitive receptor locations include schools, parks and playgrounds, day care centers, nursing homes, hospitals, and residential dwelling unit(s). The location of the nearest sensitive receptors to a project site is needed to assess toxic impacts on public health." SJVAPCD Guidance for Assessing and Mitigating Air Quality Impacts, April 2012, p. 9.

These uses are generally considered to be more sensitive to air pollution or noise impacts than others due to the types of population groups or activities. Acknowledging that oil and gas activities due to Project implementation may have an adverse impact on such receptors, the DEIR provides for setback requirements from sensitive receptors for both air quality and noise impacts. For both air quality and noise, the impacts are greater during construction activities so setbacks during construction are greater than during operations.

Construction Activity Setbacks Protective of Health Risks and Noise Impacts

Mitigation Measure 4.3-5 on page 4.3-110 – 112 of the DEIR requires that the Site Plan for a proposed activity include a Site Vicinity Figure showing the location of any sensitive receptor(s)

[79] http://www.arb.ca.gov/ch/handbook.pdf.
[80] *Id.* at p. 6.
[81] *Id.* at p. 9.

located within 3,000 feet of the construction site. When there are no such receptors, no mitigation is required.

However, if sensitive receptors are present with 3,000 feet of the site, the HRA setback requirements for construction activities are triggered as follows:

Well Depth (Feet)	**Minimum Setback distance from Well Site to Adjacent Property Line of an Existing Sensitive Receptor (Feet) During Construction**
Western Subarea	
10,000	367
5,000	116
2,000	NA
Central Subarea	
10,000	367
5,000	116
2,000	NA
Eastern Subarea	
10,000	296
5,000	NA
2,000	NA

If the Applicant can demonstrate to the San Joaquin Valley Air Pollution Control District that alternative measures achieve a level of risk less than the threshold level of risk, the setbacks may not be required. Such measures include: preparation of a risk assessment showing that a lesser setback is required under District protocols; placing engines away from sensitive receptors; utilizing directional drilling to locate the rig farther from sensitive receptors; using late-model low-emission diesel products, alternative cleaner fuels, retrofit technology, add-on devices, and other emission reducing equipment; utilizing electricity line power when available; limiting idling to 15 minutes; using automatic rigs; and assisting and paying to relocate residents to an area hotel during well construction, drilling, and completion activities.

Mitigation Measure 4.12-1 establishes a similar regime to address the exposure of sensitive receptors to noise in excess of established standards during construction. As in Mitigation Measure 4.3-5, the Site Plan Application must include a Site Vicinity Figure showing the location of any sensitive receptors within 3,000 feet of the construction site. If no sensitive receptors are present, then no mitigation is required. However, if sensitive human noise receptors occur in the potential impact area identified in the Site Vicinity Figure, then the Applicant is required to provide information showing the type of equipment being used and the noise contours with levels not exceeding 65 dBA at the nearest exterior wall of the sensitive receptor or more than 1 dBA higher than the ambient noise levels if such levels are in excess of 65 dBA. If the resulting noise levels cannot meet these standards, then further mitigation is required including placement of a temporary sound attenuation wall; construction of a temporary berm; implementation of a quiet mode drilling plan or other sound

reduction technology or practices documented in a report to the County; arranging the voluntary, temporary relocation of the sensitive receptor during the construction period; and the use of the following setback distances:

Construction Noise Setbacks

Activity	Setback Distance (feet)
Drilling (Well Advancement)	1550
Drilling (Pull Out Of Well/Borehole)	820
Large-Scale Exploratory Drilling[1]	3270
Well Workover	930
Hydraulic Fracturing	1090

The most stringent of these setbacks apply. For example, if the construction HRA setback is 296 feet but the applicable noise setback is 3270 feet, then the required setback is 3290 feet.

Operational Activity Setback Requirements

The Draft EIR explains that there is no offsite health risk from operational emissions, hence there is no setback requirement for operational air emissions.

The Draft EIR also explains that operational noise impacts do require a setback to protect sensitive receptors from significant adverse noise impacts. The current County ordinance provides for a setback distance of 100 feet, but the noise analysis in the Draft EIR shows that a 190 foot setback is appropriate. In response to comments, the Noise analysis was recalculaed and a revised Noise Appendix was prepared as discussed in GR Noise 1. The setback distance required to protect sensitive receptors from operational noise impacts increased from 190 feet to 210 feet. Mitigation Measure 4.12-2 has been revised to require that new oil and gas well shall be a minimum of 210 feet from the closest sensitive receptor.

Conclusion

Setback distances represent the distances necessary to achieve full mitigation. When multiple setback distances apply, the Applicant is required to comply with the most rigorous. For example, during construction, if the Applicant is required to locate the well site 367 feet away from the nearest sensitive receptor under Mitigation Measure 4.3-5 and is required to locate the well 190 feet away from the nearest sensitive receptor under Mitigation Measure 4.12-2, the Applicant will be required to comply with the larger setback requirement. Complying with the larger setback requirement ensures that mitigation is achieved for both impacts.

Air-11: Emissions from Sumps, Ponds, and Pits

Some commenters questioned the DEIR's analysis with regard to potential impacts, including air emissions and health risks, from the use of sumps, pits and ponds. As explained in more detail below, the DEIR relied on the best and most relevant data for the analysis of this particular issue.

What are Sumps, Pits & Ponds?

As an initial matter, it is helpful to explain the terms "sump" "pit" and "pond" as used in this EIR. The terms were often used interchangeably and incorrectly by commenters, and they are not currently specifically defined in applicable regulations. However, for purpose of this EIR, the terms "sump" and "pit" are one in the same, and refer to an excavated depression in the ground which collects crude oil, produced water, or solids, such as drilling muds or cuttings, in oil producing fields. The terms "drilling sump" and "drilling pit" are utilized interchangeably in this EIR to refer to the collection of drilling fluids and cuttings (collectively known as "drilling muds"), which are produced during drilling operations. The term "operation sumps" is used to refer to sumps that are utilized to store fluids and solids, which are produced during the life of the operational well as well as potential workover activities. (DEIR at 3-47).

By contrast, the terms "evaporation and percolation ponds," or "perc ponds" refers to a type of storage for produced water, where it is allowed to percolate into the soil and / or evaporate into the air. A percolation pond is used to dispose of water associated with hydrocarbon production by percolation into the soil. A natural or artificial evaporation pond is a pond with a large surface area that is designed to efficiently evaporate water by exposure to sunlight. (DEIR at 3-47)

The primary difference between sumps and pits on the one hand and ponds on the other is that sumps and pits are co-located with wellhead sites. Ponds, on the other hand, are typically centralized facilities which collect fluids from multiple operators at a location that is not related to the location of drilling operations. *See also* Comment on DEIR No. 83-25 ("CVRWQCB staff uses the term 'pond' for an unlined impoundment for disposal of produced water via evaporation and percolation … CVRWQCB staff uses the words 'drilling mud pits' for an unlined impoundment used by the industry to contain drilling fluid and cuttings while drilling a well.")

The Analysis of Sumps, Pits & Ponds in the Health Risk Assessment

Some commenters stated that because the Health Risk Assessment took into consideration the use of sumps and pits in its analysis (commenters refer only to sumps but, as noted above, this EIR uses the terms sumps and pits interchangeably), it should have also taken into consideration the use of ponds. As explained above, ponds are not necessarily co-located with wellheads or drilling sites. As a result, they are not relevant to the HRA analysis, which is primarily used to determine the appropriate setback for activities considered part of the Project. The Health Risk Assessment (Appendix M) included potential fugitive toxic emissions from both a drilling mud sump during drilling operations and a 30' x 30' ground level sump that was assumed to exist as part of on-going oil and gas processing operations. Emissions from such a sump were very conservatively assumed to have a continuous volatile organic compound (VOC) release rate of 0.01 pounds per hour. Those VOCs were further assumed to contain potentially toxic components typically found in crude oil. The compounds modeled from the sump were: ethylbenzene, benzene, xylene, tolune, cyclohexane, and nhexane. This hydrocarbon sump would be expected to have significantly higher emissions than a produced water disposal ponds. Pond facilities are not considered to be within the scope of the Project, and would be subject to separate permitting (and perhaps HRA analysis) if and when any new pond facilities are proposed in the Project Area. (*See* DEIR at Attachment A to Chapter 3, which notes that drilling pits and sumps will be subject to conformity review, but does not reference ponds).

The Analysis and Need to Forecast with Regard to the Number of Sumps, Pits and Ponds

Some commenters argued that the DEIR improperly did not include an estimate as to how many pits and sumps would be required to meet the wastewater disposal demand of the wells within the Project, or an analysis of impacts related to that number. The analysis in the DEIR with regard to impacts from sumps was, contrary to commenters' assertions, actually overestimated. For example, as explained above the HRA assumed that there would be one co-located sump for every well drilled (and accounted for assumptions about leaks from such sumps), and established the setbacks accordingly. In practice, multiple well-heads will usually share a sump or pit, meaning the HRA was actually conservative in terms of the presumed number of sumps going forward. This is compounded by the fact that in recent years the use of drilling sumps has been reduced in the Project Area because well field operators increasingly utilize closed-loop drilling systems that avoid mud or fluid discharges to land during the well drilling process. Furthermore, at least with respect to produced water from well stimulation treatment operations, DOGGR's final SB 4 regulations prohibit disposal or storage of produced water in sumps or pits. 14 Cal. Code Regs. § 1786. Therefore, the overall number of such sumps and pits is expected to decrease in the future.

The Analysis of Sumps, Pits & Ponds for Purposes of Potential Air Quality Impacts

Some commenters noted that sumps, pits and ponds were not accounted for in the analysis of certain impacts, including air quality. It is correct that sumps, pits and ponds were not included directly. However, air emissions are either accounted for indirectly, or are negligible.

Emissions from sumps and pits co-located with well sites are captured in the 10% allowance included in the emissions estimate for permit exempt equipment. *See, e.g.* DEIR at 4.3-85, -88. Percolation ponds are not included in the 10% allowance, but air emissions from the produced water in such ponds is negligible (because there are not many light end constituents that are volatile), and would be expected to be less than pits, as noted above. In addition, percolation pond facilities are not within the scope of the Project. (*See* DEIR at Attachment A to Chapter 3.)

For additional information about the permitting and potential water quality impacts from sumps, pits and ponds, please refer to Global Response Water-1.

Air-12: Lifecycle

Several comments state that the EIR should have considered the "life cycle" of Project activities or the petroleum products that will be produced as a result of the oil and gas operations resulting from the Project. For example, commenters state that the EIR should analyze upstream operations (such as the generation of electricity required to carry out Project activities) or downstream processes and actions (such as the ultimate combustion of oil and gas resources produced as part of Project activities). As explained in more detail below, the EIR does not consider such "life cycle" issues because they are not properly considered impacts of the Project, and CEQA does not require "life cycle" analysis.

The EIR properly analyzes the potential environmental impacts from the Project, including future oil and gas activities carried out in accordance with the Amended Zoning Ordinance. This includes considering impacts from all phases of construction and operation of an oil and gas well, such as pre-drilling and site preparation, drilling and well completion, testing and production, well stimulation treatments, and well plugging and abandonment. The EIR also analyzes the effects of construction and operation of ancillary equipment and activities required to support oil and gas development and production, such as roads connecting the drill sites, pipelines gathering oil from the wells, etc. These ancillary activities are directly tied to the oil and gas development, and the development cannot occur without them, and so they are part of the Project.

The comments urge the County to undertake an environmental analysis of highly speculative effects of a long chain of independent transactions by many parties outside of Kern County and even outside of California. CEQA only requires a good faith effort to reasonably disclose impacts resulting from the project and in the vicinity of the project, and cautions against attempting to assess speculative or uncertain impacts. *See* CEQA Guidelines § 15145.

CEQA does not require a "cradle to grave" analysis of purported impacts that are so remote from the project that they cannot reasonably be linked to the approval at issue. The California Supreme Court has expressly rejected the argument that CEQA requires a detailed analysis of "life cycle" impacts that, no matter how attenuated from an actual project, could be associated with the project in some way. In *Save the Plastic Bag Coalition v. City of Manhattan Beach* (2011) 52 Cal. 4th 155, 173-174

(*Manhattan Beach*) the California Supreme Court clarified that CEQA does not require an exhaustive analysis of all conceivable impacts a project may have in areas outside its geographic boundaries.[82] Rather, broad environmental impacts without direct impact on the local agency's geographical area may be evaluated at "a reasonably high level of generality." Less detail would be required where those effects are more indirect than effects felt within the project area, or where it would be difficult to predict them with any accuracy.

The Court cautioned against reliance on "life cycle" studies associated with a particular product, such as plastic or paper bags. Stressing that courts must apply "common sense" when determining how far afield a lead agency must look to review a project's supposed impacts, the Supreme Court held:

> "When . . . increased use of the product is an indirect and uncertain consequence, and especially when the scale of the project is such that the increase is plainly insignificant, the product 'life cycle' must be kept in proper perspective and not allowed to swamp the evaluation of actual impacts attributable to the project at hand."[83]

Where impacts are indirectly related to the project under review, are uncertain and are difficult to predict, the lead agency is not required to guess at the significance of such impacts, particularly where those impacts would occur far from the site of the project itself.[84] The court concluded that the environmental effects discernible from the life cycles of plastic and paper bags would not be significantly impacted by a plastic bag ban in the City of Manhattan Beach.

Similarly, when the California Resources Agency amended the CEQA Guidelines in 2009, the agency deleted previous guideline references to "life cycle" analyses of energy-related emissions in assessing a project's energy impacts pursuant to Appendix F. Section II.C.1 of Appendix F was amended to state that environmental impacts "may include …[t]he project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project~~'s life cycle~~ including construction, operation, maintenance and/or removal."[85] In its *Final Statement of Reasons* explaining the rationale behind the 2009 amendments, the California Resources Agency noted that no existing regulatory definition of life cycle exists, and that such an analysis would not be

[85] *Adopted and Transmitted Text of SB97 CEQA Guideline Amendments,* Section II.C.1 (available at: http://resources.ca.gov/ceqa/docs/Adopted_and_Transmitted_Text_of_SB97_CEQA_Guidelines_Amendments.pdf, last accessed September 19, 2015).

consistent with CEQA if it would require an analysis of emissions impacts beyond those that could be considered indirect effects of a project. The Resources Agency also explained that in many industries, products may be manufactured for many different uses as a result of general market demand, regardless of whether one particular project proceeds.[86] These concepts apply equally to "upstream" life cycle activities—such as the manufacturing of the metal to build the drilling rig—as to "downstream" life cycle activities, such as refining or end use consumption of the extracted hydrocarbons.

Here, if the Amended Zoning Ordinance were not adopted, oil and gas production would continue under the existing ordinance. The Amended Zoning Ordinance simply creates a process for review and adds protections for public health, safety and the environment for an activity that has occurred for 100 years and will continue for the foreseeable future. Therefore, the Project does not in any way cause oil and gas development, let alone downstream "life cycle" activities such as refining and consumption.

Even if oil and gas production were curtailed in Kern County, the attendant downstream activities and consumption of refined petroleum products would still occur here and elsewhere, regardless of whether extraction took place in Kern County or somewhere else. This is because downstream activities and end-use consumption in Kern County are not a function of local oil and gas production. Rather, those activities are part of the larger regional, national and even international framework of energy production and consumption. Kern County's and California's energy demands will not decrease simply because less oil and gas is produced locally, nor will they increase if local production increases.

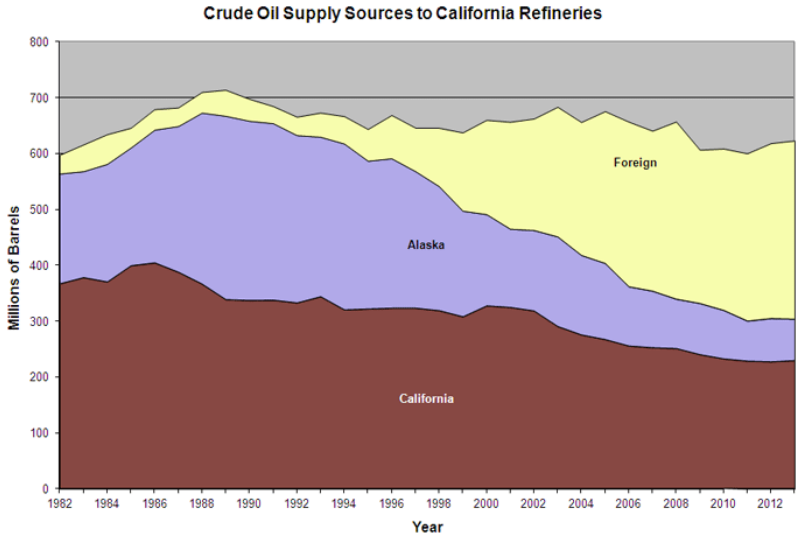
Section 5.6 of the DEIR discusses the potential energy impacts of the proposed Project as required by Appendix F of the CEQA Guidelines. As that section describes, California is the U.S. state that imports the greatest amount of energy from other states and countries. Consumption of overall energy in California outweighs in-state production by about three-to-one.[87] As shown on Table 5-2 of the DEIR, 90% of California's natural gas demands, and about 64% of refinery crude, come from out-of-state. Even while consumption generally continues to decline, California continues to import the majority of its crude oil. If less oil and gas is produced in Kern County, Californians will simply import more oil and gas.

Information from the California Energy Commission (CEC) and the U.S. Energy Information Administration (EIA) demonstrate that California's oil production has generally declined over the

[86] Cal. Natural Resources Agency, *Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97* (Dec. 2009) at pp. 71-72. On August 11, 2015, the Resources Agency released new proposed amendments to the CEQA Guidelines. The proposed changes, while not yet final, underscore that "lifecycle" analysis is not a required part of CEQA review. Proposed revisions to CEQA Guidelines section 15126.2, subdivision (b), are designed to "place reasonable limits on the analysis [and signal] that a full 'lifecycle' analysis that would account for energy used in building materials and consumer products will generally not be required." Cal. Natural Resources Agency, *Proposed Updates to the CEQA Guidelines – Preliminary Discussion Draft,* (Aug. 2015) at pp. 77-78.

[87] DEIR at p. 5-9.

past 30 years.[88] The data also shows that less than half of the crude oil refined in California is produced in California.[89] The remainder is supplied from other parts of the U.S. and Canada, and by tanker from Alaska and foreign countries. In 2013, the most recent year for which data are available, 51 percent of the crude oil used in California came from foreign sources, and 12 percent of the crude oil came from Alaska. Clearly, the demand for crude oil and consumption of petroleum products in California is not a function of California production; if California crude oil is not produced, crude and refined products will be supplied by another source outside the state. Conversely, if California produces more crude oil, California refineries may simply displace some out-of-state oil in favor of California-produced oil. While the proportions of California oil and non-California oil refined in the state may shift, California will still be dependent on out-of-state oil supplies to meet its energy needs, even as it reduces its energy consumption. This out-of-state oil is likely to be refined in California,[90] and will certainly be consumed in California.



Source: Energy Almanac, "Oil Supply Sources to California Refineries," California Energy Commission, 2014. Available at energyalmanac.ca.gov/petroleum/statistics/crude_oil_receipts.html, last accessed January 23, 2015.

In-state production reduces the amount of crude oil that the state must import from Alaska, South America, the Middle East, and other oil producing regions, and reduces the transportation energy use, health and safety hazards, and potential environmental consequences associated with crude oil

[88] Source: http://www.eia.gov/dnav/pet/hist/LeafHandler.ashx?n=PET&s=MCRFPCA1&f=M
[89] Source: Energy Almanac. Crude Oil Supply Sources to California Refineries. [online]: http://energyalmanac.ca.gov/petroleum/statistics/crude_oil_receipts.html. Accessed January 23, 2015.
[90] See, e.g., the Alon Bakersfield Refinery Crude Flex Project (SCH# 2013091062), which entails modifications to a Kern County refinery to increase the refinery's flexibility for receiving and processing a variety of crude oils - including crude coming by train from out of state - and to expand the existing crude terminal operations.

production in less regulated locations outside of the state. However, refining and consumption of petroleum and petroleum products within Kern County and California will occur regardless of whether the hydrocarbons were extracted pursuant to the Amended Zoning Ordinance. Because petroleum refining and use of diesel and gasoline will take place even without this Project, environmental impacts, including emissions, from these activities cannot be considered indirect effects of the Project.

Any potential impacts from the production, transport and usage of oil and gas on a statewide and nationwide scale will not be affected by, much less caused by, the proposed Project, and CEQA does not require that the County speculate about those impacts. CEQA should not to be interpreted "in a manner which imposes procedural or substantive requirements beyond those explicitly stated in [the statute] or in the [CEQA] guidelines."[91] The California Supreme Court has likewise cautioned that CEQA "must not be subverted into an instrument for the oppression and delay of social, economic, or recreational development or advancement."[92]

Moreover, the analysis requested by the commenters would require the County to examine the impacts of downstream activities and end use consumption that may take place outside of the Project Area and even outside of California. Analysis of these remote activities is plainly beyond the scope of CEQA. The Legislature intended CEQA to require analysis of a project's environmental impacts within the State of California. For instance, Public Resources Code section 21000 states:

> The Legislature finds and declares as follows: (a) The maintenance of a quality environment *for the people of this state* now and in the future is a matter of statewide concern. . . . (c) There is a need to understand the relationship between the maintenance of high-quality ecological systems and the general welfare of *the people of the state*, including their enjoyment of *the natural resources of the state*. . . . [and] (g) It is the intent of the Legislature that all agencies of the state government which regulate activities or private individuals, corporations, and public agencies which are found to affect the quality of the environment, shall regulate such activities so that major consideration is given to preventing environmental damage, while providing a decent home and satisfying living environment *for every Californian*. (Emphasis added.)

Nothing in CEQA requires the far-reaching analysis urged by commenters here. Instead, CEQA specifically requires that analysis be focused on impacts within a relatively localized project area. CEQA Guidelines section 15125, which addresses the environmental setting, states: "An EIR must include a description of the physical environmental conditions in the vicinity of the project . . . from both a local and regional perspective." Here, the EIR considers local impacts on a well-by-well basis, as described in Global Response GR-2, and also considers the Project's oil and gas activities regionally. The Project will occur exclusively within Kern County. Likewise, direct and indirect

[91] Pub. Resources Code § 21083.1.
[92] *Laurel Heights Improvement Association v. Regents of University of California*, 6 Cal.4th 1112, 1132 (1993) and *Citizens of Goleta Valley v. Board of Supervisors*, 52 Cal.3d 553, 576 (1990).

project impacts will occur within Kern County, with a few discrete exceptions (*e.g.*, regional air quality impacts within the San Joaquin Valley Air Basin that have been fully evaluated in the EIR). Accordingly, the scope of CEQA review does not extend beyond the borders of California (over which the Legislature of this State has no jurisdiction), or to activities that are not directly or indirectly caused by a project, as is the case here. Any analysis of such impacts would be speculative and beyond the reasonable, good faith disclosure standard established by CEQA.[93]

Additionally, comments that urge a cradle to grave life cycle analysis disregard the many environmental analyses that have been conducted for independent projects and activities relating to oil and gas transportation, refining, wholesale and retail distribution of petroleum products, and end use of fuels in all manner of transportation, power supply, heating, and more. In fact, these activities and uses often are subjected to extensive environmental review, which would affect the scope of CEQA review, if any were required.[94]

Similarly, beyond environmental review of individual projects, local, regional and state programs addressing transportation, land use planning, and energy consumption have typically undergone environmental review as well. The wide variety of programs that may account for end-use of petroleum products include regional transportation plans, such as those adopted under SB 375; the transportation elements of city and county general plans; and various sustainable communities initiatives and programs.

We recognize that one Attorney General Opinion from 1975 opined that "CEQA applies to the whole of the project including those parts occurring beyond the boundaries of the state." (58 Ops. Cal. Atty. Gen. 614 (September 26, 1975).) The facts and circumstances under which the 1975 Opinion was issued make it inapplicable to the analysis of this Project. The 1975 Opinion dealt with a proposal by several California and Utah cities to build a coal-burning electricity generating plant in the State of Utah. Fuel and water for construction and operation of the plant would be obtained entirely from sources outside of California and transmission facilities -- all of which were part of the project -- were to be constructed in Utah, Nevada and California. Thus, the scope of the project was very broad, spanning across several states. It consisted of California municipalities constructing major power generating facilities and transmission lines outside California in order to serve California demand. The Attorney General was concerned that if California municipalities could escape CEQA review in such circumstances, it would encourage the export of California's pollution-generating activities to neighboring states.

Here, by contrast, the Project Area is entirely within the state of California, and the County has prepared this EIR. The Project does not include ancillary developments in other areas within the State of California or neighboring states. Oil and gas activities in Kern County that occur pursuant to

[93] CEQA Guidelines §§ 15064(d)(3), 15088(c), 15144, 15145, 15151, 15204(a); *Save Tara v. City of West Hollywood*, 45 Cal.4th 116, 133 (2008); *Save Round Valley Alliance v. County of Inyo*, 157 Cal.App.4th 1437, 1450-1454 (2007).

[94] See CEQA Guidelines § 15162 for independent projects inside California, and § 15277 for independent projects outside California.

the Amended Zoning Ordinance may displace some imported crude oil; however, that possibility does not expand the scope of the Project or the Project Area to other states. Therefore, contrary to the commenters' assertions, out-of-state environmental impacts, including GHG emissions, are not directly attributable to the Project.

In sum, the impacts of downstream activities, such as the ultimate end use of the refined products, are independent of the oil and gas production activities undertaken pursuant to the Amended Zoning Ordinance. Conducting a far-reaching analysis of those impacts is not required under CEQA.

Bio-1: Mitigation Measures, Mitigation Criteria and Ratios

Several comments state that the mitigation measures are insufficient to reduce Impacts Bio 4.4-1 through 4.4-6 to less than significant. These comments assert variously that the mitigation has been improperly deferred because it is uncertain specifically which or how much conservation lands will be provided. Some comments assert that the mitigation measures lack necessary performance standards. Other comments assert that the mitigation ratios for conservation lands are inadequate because they require one acre of mitigation for each acre of land disturbed in most areas, and only 0.5 acre of mitigation for each acre of land disturbance in Tier 1 areas that have already experienced 70% or greater land disturbance.

When reviewing the adequacy of mitigation, the evidence in the record must be considered as a whole.[95] The question is not whether each individual measure meets some standard of perfection, but whether the set of mitigation measures as a whole is sufficient to support the lead agency's conclusion that feasible mitigation has been incorporated to reduce impacts to less than significant. When considered as a whole, the mitigation measures for biological resources comprise a comprehensive approach that emphasizes avoidance of impacts and mitigation of the remaining impacts through conservation of species and habitats in a manner that has the greatest likelihood of success.

The suite of mitigation measures starts with pre-disturbance surveys. Pre-disturbance surveys are required by Mitigation Measures 4.4-1 (special status wildlife), 4.4-5 (bats), 4.4-8 (golden eagle nests), 4.4-10 (active birds' nests), 4.4-11 (blunt-nosed leopard lizard), 4.4-12 (protected and sensitive plant species), and 4.4-17 (sensitive natural communities, including waters and wetlands). The mitigation measures specify that surveys must be completed by qualified biologists in accordance with approved protocols. Surveys must be conducted at times that will provide relevant information regarding the presence of sensitive species at the site. Usually, this will be shortly before commencement of ground disturbance so as to facilitate avoidance. In light of the Draft EIR's extensive analysis of potential impacts to biological resources, pre-disturbance surveys

[95] *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376, 408.

performed pursuant to site plan review are not likely to reveal any unanticipated impacts; rather, they will likely just reveal whether the impacts discussed in the EIR might occur at that location.[96]

Where pre-disturbance surveys reveal the presence of sensitive species or habitats, the mitigation measures stress avoidance. In addition to general directives to avoid sensitive species, the mitigation measures establish species-specific buffer distances (see e.g., Mitigation Measures 4.4-4, 4.4-5, 4.4-6, 4.4-7, 4.4-8, 4.4-9, and 4.4-10), exclusion fencing (Mitigation Measure 4.4-3), and other species-specific exclusion or avoidance strategies. In some limited cases, and only with strict oversight, sensitive wildlife can be discouraged or removed from the site, e.g., through closure of unoccupied burrows. See Mitigation Measures 4.4-4, 4.4-5, 4.4-6, and 4.4-7.

The avoidance and minimization requirements in the mitigation measures are modelled after measures typically required by the USFWS or CDFW to reduce potential effects to ESA and CESA-listed species, as found in management plans or recovery plans adopted by those agencies, or in take authorizations previously approved by them. With their incorporation as conditions of the Project, these measures would be applied to all oil and gas activities under the purview of the County, including entities that do not typically undertake Section 7 or Section 10 consultation for ESA-listed species or Section 2081 for CESA-listed species. This extension and standardization of these measures will, in some cases, provide more protection for special status species than would occur under the No Action alternative.

Where complete avoidance is not possible, Mitigation Measures 4.4-2, 4.4-11 and 4.4-12 prohibit take without authorization from the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service. Similarly, if wetlands and riparian areas cannot be completely avoided, Mitigation Measure 4.4-18 prohibits disturbance without authorization by appropriate federal or state agencies. These regulatory programs provide meaningful additional oversight and protections for biological resources. The mitigation measures in the Draft EIR reflect the measures needed to reduce impacts to less than significant under CEQA. The California Department of Fish and Wildlife may determine that additional requirements must be met to comply with the CESA or the other permitting programs that agency administers. The same is true of the U.S. Fish and Wildlife Service when administering the ESA, or the Army Corps of Engineers administering Section 404 of the Clean Water Act. In this way, the survey, avoidance and compensation measures in the Draft EIR may be augmented by measures imposed by these other agencies. A requirement to comply with such regulatory programs can properly be included as part of the mitigation measures, and is not considered improper deferral of mitigation.[97]

To address habitat loss, Mitigation Measure 4.4-16 requires compensation "at a 1.0 to 1.0 ratio (one acre of new disturbance shall require one acre of mitigation)" in most cases. Some comments criticize this compensation ratio as too low, and they point to examples of other project approvals in

[96] See *Center for Biological Diversity v. Department of Fish and Wildlife* (2015) 234 Call.App.4th 214,

[97] *Rialto Citizens for Responsible Growth v. City of Rialto* (2012) 208 Call.App.4th 899, 945=946; *Center for Biological Diversity v. California Department of Fish and Wildlife* (2015) 234 Call.App.4th 214, 243.

which higher compensation ratios have been required. For this Project, however, the County has determined that a ratio of 1.0 to 1.0 will adequately mitigate the impact to less than significant. As noted above, the suite of mitigation measures emphasize avoidance, and compensation lands are required only where impacts cannot be completely avoided. Just as important, it is expected that much of the mitigation lands provided under Mitigation Measure 4.4-16 will be part of large scale conservation plans, such as the Lokern HCP or Elk Hills HCP, or will utilize a mitigation bank or other similar entity that is protecting habitat of regional importance for special status species. The regional HCPs and mitigation banks are usually centered on lands that have been identified in recovery goals established for special status species (i.e. recovery goals established in the Recovery Plan for Upland Species of the San Joaquin Valley, USFWS, 1998). As discussed in the Draft EIR at pp. 4.4-9, 4.4-131 to -132, and 168, the Recovery Plan seeks to protect land in large blocks to minimize edge effects, increase the likelihood that ecosystem functions will remain intact, and facilitate management. The Plan also seeks to connect blocks of conservation lands, allowing organisms greater movement between blocks. This further enhances the value of the conservation lands because habitat connectivity and wildlife movement corridors are important to biodiversity conservation, maintaining the gene pool, and reducing extinction risk. Thus, large blocks of conservation land provided at a 1:0 to 1.0 ratio can effectively mitigate habitat loss, whereas small, isolated parcels of mitigation lands may be less effective mitigation, requiring greater compensation ratios.

The comments correctly point out that in some cases Mitigation Measure 4.4-16 will require only one-half acre of compensation lands for each acre of land disturbance. They allege that the mitigation is inadequate as a result. However, a 0.5 to 1.0 compensation ratio is appropriate where the quality of the land being disturbed is already substantially degraded. The reduced compensation ratio of 0.5 to1.0 will apply only in Tier 1 areas where existing disturbance is already 70% or greater. As discussed in the Draft EIR at page 4.4-135, research suggests that "elements of the wildlife community remain relatively intact up to 70% disturbance in oilfield development, with some special status species persisting provided that at least 30% of the natural landscape is left intact". For this reason, Mitigation Measure 4.4-16 conservatively requires a full acre of compensation land for each acre disturbed, even if the land to be affected is already disturbed up to 69%. But if the land has already been disturbed 70% or more, its habitat value is already substantially compromised, and a requirement to compensate for this loss with a full acre of high quality habitat would be contrary to the requirement that CEQA mitigation be roughly proportional to the impacts addressed by the mitigation.[98] In these cases, in Tier 1 areas, a lower compensation ratio of 0.5 to 1.0 is appropriate. Mitigation need not be 1:1 to be adequate, as long as the remaining unmitigated impact is no longer significant.[99]

---

[98] See *Nollan v. California Coastal Commission* (1987) 483 U.S. 825 (a requirement to dedicate an easement as a condition of approving development permit would be "out and out extortion" without an essential nexus between the dedication required and the burden imposed by the proposed development), and *Dolan v. City of Tigard* (1994) 512 U.S. 374 (an adjudicative exaction requiring dedication of private property must also be "'roughly proportional' … both in nature and extent to the impact of the proposed development").

[99] *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1233.

The measures in the Draft EIR do not improperly defer mitigation. "Essentially, the rule prohibiting deferred mitigation prohibits loose or open-ended or performance criteria. Deferred mitigation measures must ensure that the applicant will be required to find some way to reduce impacts to less than significant levels. If the measures are loose or open-ended, such that they afford the applicant a means of avoiding mitigation during project implementation, it would be unreasonable to conclude that implementing the measures will reduce impacts to less than significant levels."[100]

The Draft EIR provides for sequential application of definite measures with specific, enforceable standards. At each step, concrete actions are required. If the action in a mitigation measure is sufficient to avoid significant impacts, then it is not necessary to continue to the next step. If, however, it is not feasible to avoid potentially significant impacts to species or loss of habitat, then compensation for land disturbance will address the remaining impacts and ensure they will not be significant. This sequential approach has been found acceptable under CEQA.[101]

Some comments assert that to be adequate CEQA mitigation, a specific number of acres of mitigation lands must be put under conservation easement or other protection at the commencement of Project implementation. It is not known now how many acres of land ultimately will be protected under Mitigation Measure 4.4-16, but that does not make the mitigation measure deficient. CEQA does not require certainty that a specific number of acres of habitat will be protected. Rather, CEQA requires substantial evidence supporting the conclusion that the mitigation as a whole will reduce the impacts to less than significance. Mitigation Measure 4.4-16 contributes to the overall showing of substantial evidence by ensuring that the actual number of acres protected will compensate for the actual number of acres of habitat disturbed. The Draft EIR discloses that the actual number of future wells drilled and other facilities installed will likely be less than projected. Similarly, the actual amount of land disturbance likely will be less than estimated. But regardless how precisely the actual impacts match the projections, Mitigation Measure 4.4-16 assures that compensation lands will be provided based on the actual disturbance. See Draft EIR p. 4.4-175, and p. 4.4-214. Thus, even if Mitigation Measure 4.4-16 is considered to have some aspects of deferred mitigation, it is nonetheless sufficient under CEQA because it articulates a specific performance criterion (i.e., the compensation ratio), and the Amended Ordinance requires a demonstration of compliance with the performance standard in conjunction with the site review process.

Revisions and clarifications have also been made to Biological Resources mitigation measures in this Final EIR, in response to comments filed by the California Department of Fish and Wildlife and other parties. These revised mitigation measures clarify, and in some cases include more stringent provisions than, those included in the Draft EIR. Please refer to Section 7.1.4 for the list of revised Biological Resource mitigation measures.

Bio-2: Valley Floor HCP, LoKern and Elk Hills HCP

Some commenters requested further information regarding the relationship between this Environmental Impact Report (EIR) and future actions anticipated to be taken by CDFW for oil and gas activities in Kern County. As explained in the Draft EIR, future discretionary approvals associated with the Proposed Project include California Department of Fish and Wildlife (CDFW, Department) incidental take permits (ITPs). (Draft EIR, p. 1-2.) For this reason, the Draft EIR identifies CDFW as a responsible agency for the purposes of the California Environmental Quality Act (CEQA) (Draft EIR, p. 3-3.) As a responsible agency, the County has and will continue to consult with, and provide all relevant notices to, CDFW. (See, e.g., Pub. Resources Code, §§ 21080.3, subd. (a), 21080.4, subd. (a), 21153, subd. (a).)

The Draft EIR explains that it "provides project-level CEQA coverage for CDFW permits and approvals, including ITPs and habitat conservation plans (HCPs) and natural community plans, for oil and gas activities in Kern County." (Draft EIR, p. 3-3.). The Project area of the Draft EIR includes the central and western portions of Kern County, as displayed in Figure 1.

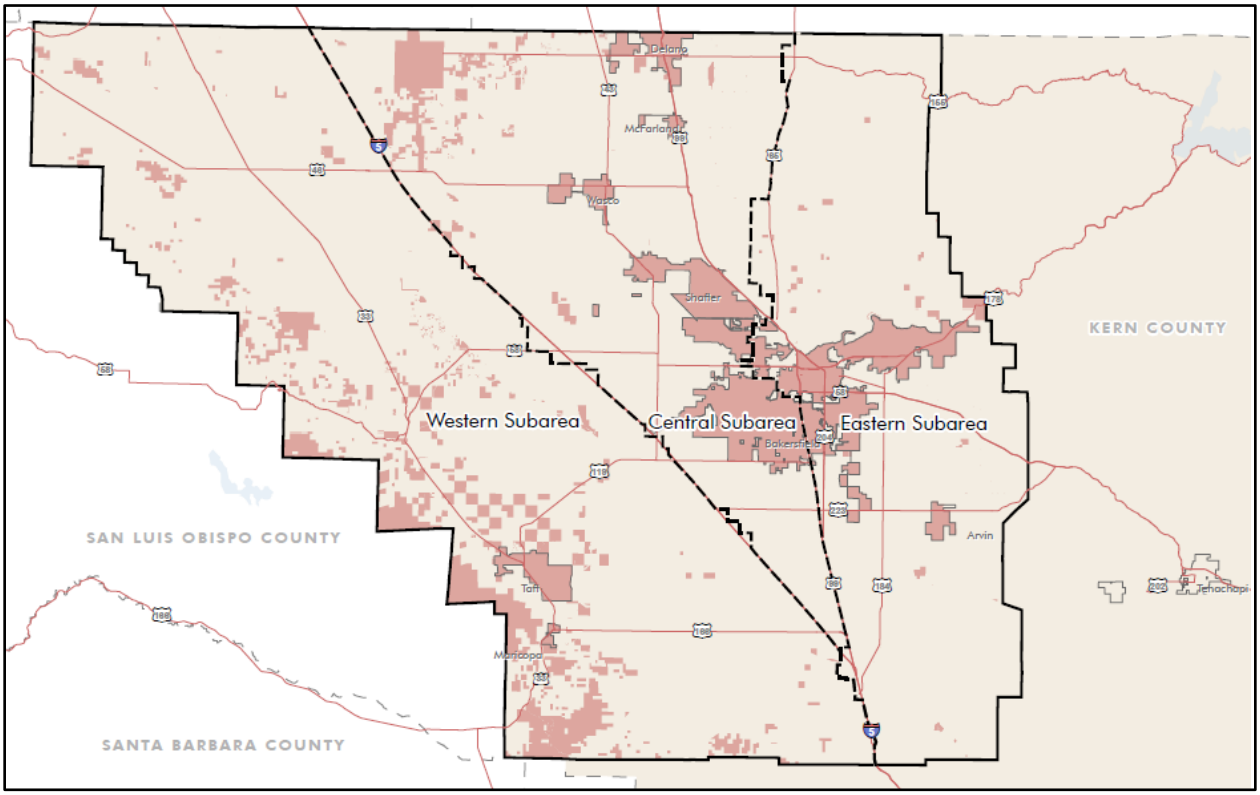

Figure 1. Kern County Oil and Gas EIR Project Area

The Draft EIR's coverage extends to permits and plan approval applications currently pending before CDFW, including, for example, CDFW approvals for the draft Lokern and Elk Hills HCPs. (*Ibid*). The Draft EIR may also be used by CDFW for future decisions relating to oil and gas development in the Project Area, including for example ITP or Lake and Streambed Alteration Agreements, subject to CDFW's determination as to whether supplemental or subsequent

environmental review is necessary. The Draft EIR also identifies mitigation for impacts to species covered in the draft Lokern and Elk Hills HCPs, though the intention is that the conservation measures identified in the draft Lokern and Elk Hills HCPs will substitute for the mitigation measures in the draft EIR once the two HCPS are approved. The draft Lokern and Elk Hills HCPs are described in Section 4.4, Biological Resources, in the Draft EIR.

In addition, the County has prepared the Draft Valley Floor HCP to obtain Section 10(a)(1)(B) and Section 2081(b) ITPs for the incidental take of certain federally listed species, certain state listed species, and certain other species of concern related to oil and gas, water district, urban development, and public infrastructure activities. The Valley Floor HCP also includes land uses unrelated to oil and gas activities analyzed in the Draft EIR, and therefore is subject to a separate and independent environmental review process.

These three draft HCPs (Valley Floor, Lokern, and Elk Hills) are described further below. While the current provisions of these three HCPs are described in the present tense, all three may be subject to change before final approval and implementation.

Covered Lands

Each of the three draft HCPs would establishes a separate Permit Area within which certain activities would be covered (i.e., Permitted Activities) as established within each individual HCP. In locations where the Permit Area of the draft HCPs overlap, project applicants would only utilize one of the HCP programs, as needed, for special-status species permitting compliance. For example, Chevron would utilize the Lokern HCP to cover permitted activities within the Lokern HCP Permit Area, but may utilize the Valley Floor HCP to cover permitted activities outside of the Lokern HCP Permit Area.

The Valley Floor HCP Program Area encompasses approximately 3,100 square miles, and generally includes most of the San Joaquin Valley Floor in Kern County up to an elevation of 2,000 feet above mean sea level (amsl). On the west side, the Valley Floor HCP area extends to the San Luis Obispo County line; and therefore some portions of the Valley Floor HCP area are at elevations greater than 2,000 feet amsl. The Valley Floor HCP conservation strategy does not provide incidental take coverage for the Kern Water Bank HCP Permit Area, Coles Levee Ecosystem Preserve, or CRC's Elk Hills HCP Permit Area, all of which are located inside the Valley Floor HCP Permit Area. However, as currently proposed the Valley Floor HCP conservation strategy would provide overlapping incidental take coverage for the Lokern HCP Permit Area. The lands covered by the Valley Floor HCP are collectively referenced here as the Valley Floor Permit Area as shown on Figure 2 below.

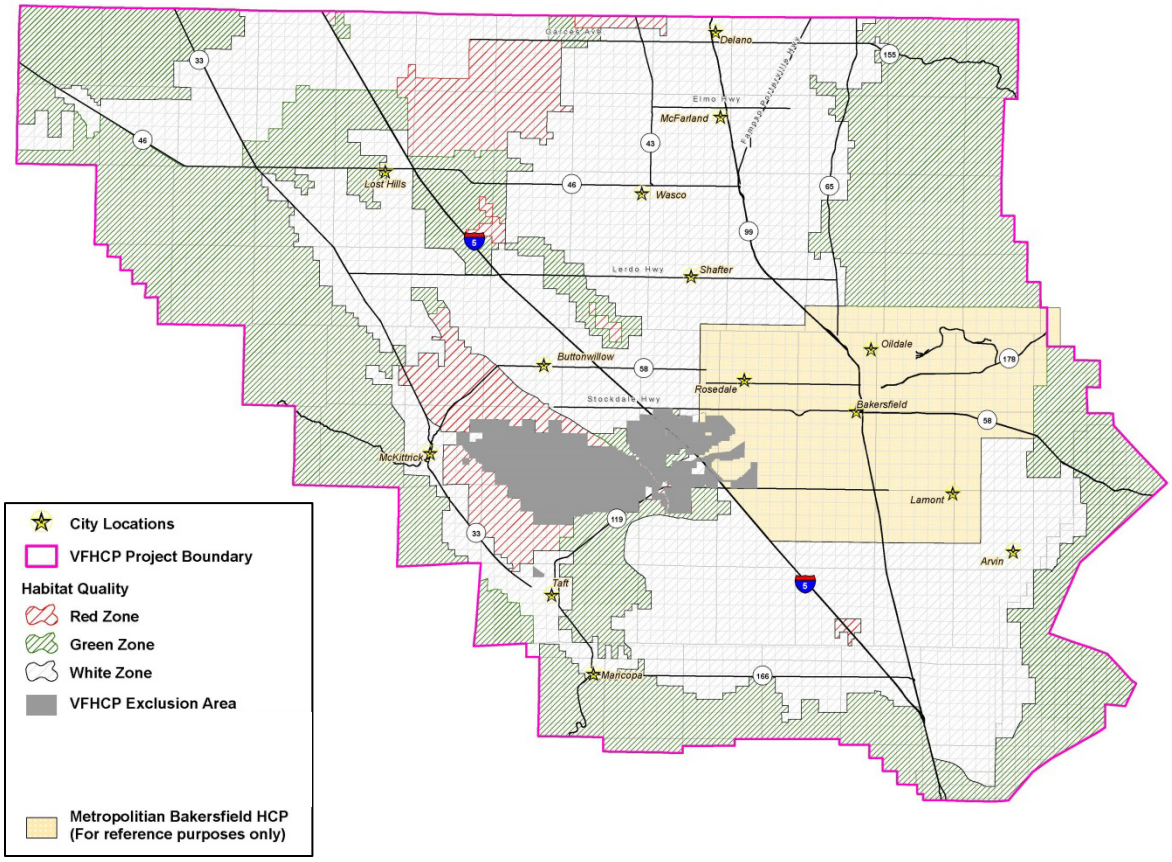

Figure 2. Valley Floor HCP Permit Area

The Lokern HCP addresses activities within the following lands in Kern County, California: (1) the Chevron Lokern Lands (i.e., lands owned by Chevron in the Lokern area in western Kern County); (2) the Lokern Contiguous Area, which is in the Lokern area contiguous to the Chevron Lokern Lands; and (3) the Four Fields, which are oil and gas properties throughout Kern County in which Chevron has now or may have in the future the necessary interests (e.g., fee ownership, lease, mineral interest, right-of-way, etc.) to engage in the activities addressed in the Lokern HCP. These lands, which are a subset of the Valley Floor Permit Area, are collectively referenced here as the Chevron Permit Area as shown on Figure 3 below.

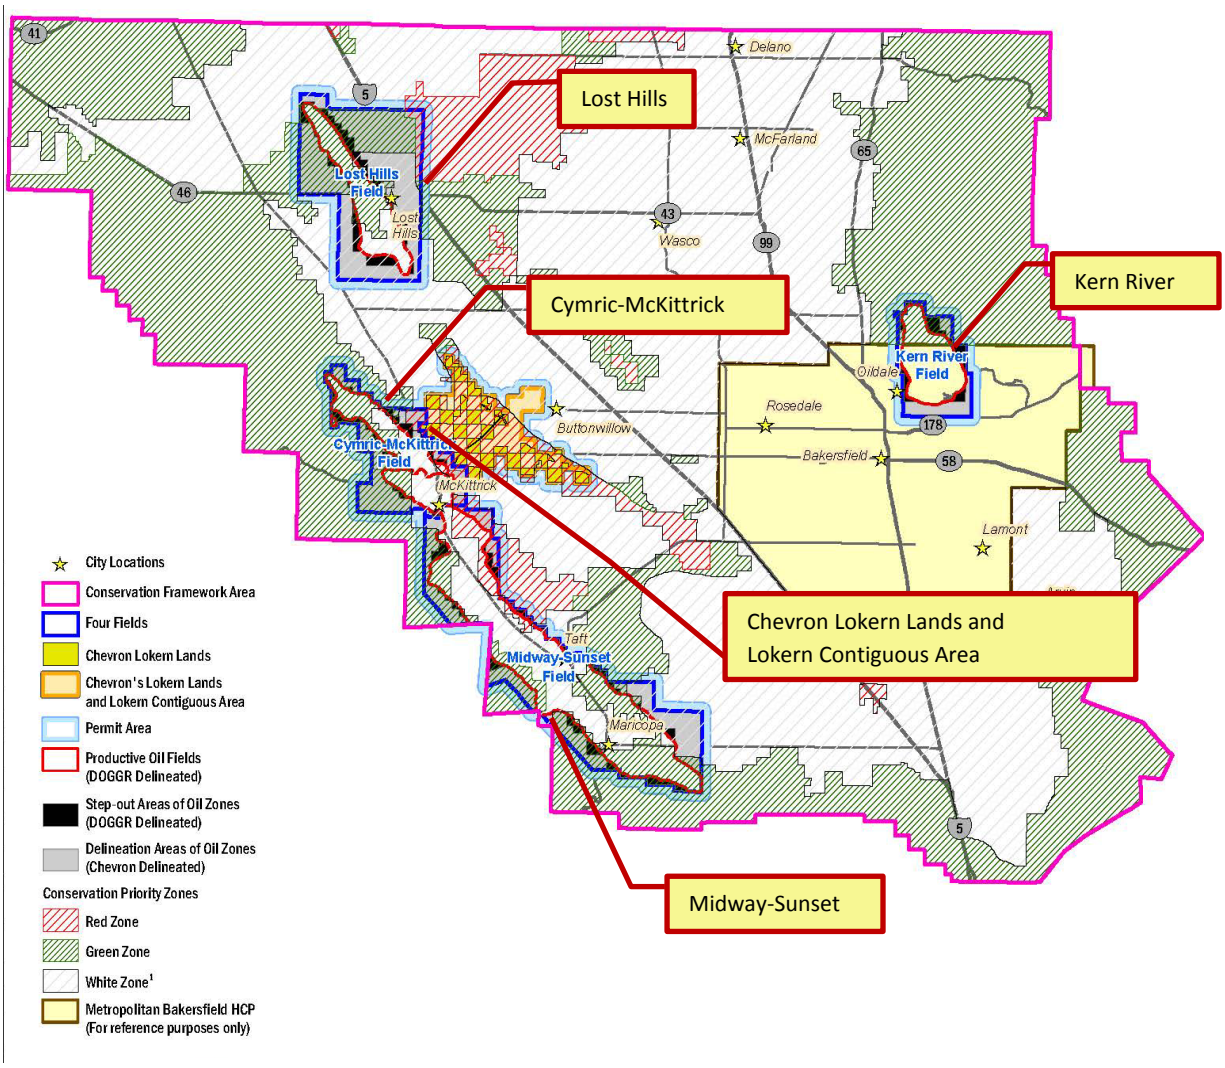

Figure 3. Chevron Permit Area of the Lokern HCP

The Elk Hills HCP covers continued operation at the Elk Hills Oil Field (EHOF) beyond the terms of the 1995 Biological Opinion and associated state Memorandum of Understanding (MOU) approved by CDFW under the California Endangered Species Act (CESA). As required by the 1995 Biological Opinion, CRC established a 7,075 acre Conservation Area (now totaling 7,878 acres) and executed a management agreement with the USFWS and CDFW. The Elk Hills HCP encompasses the entire EHOF (approximately 47,884 acres), lands located within a contiguous 2-mile wide buffer area to accommodate existing and limited new facility rights-of-way, and existing and future conservation lands located within a Target Acquisition Area inside the 2-mile buffer and a second Target Acquisition Area located outside the 2-mile buffer (Figure 4).

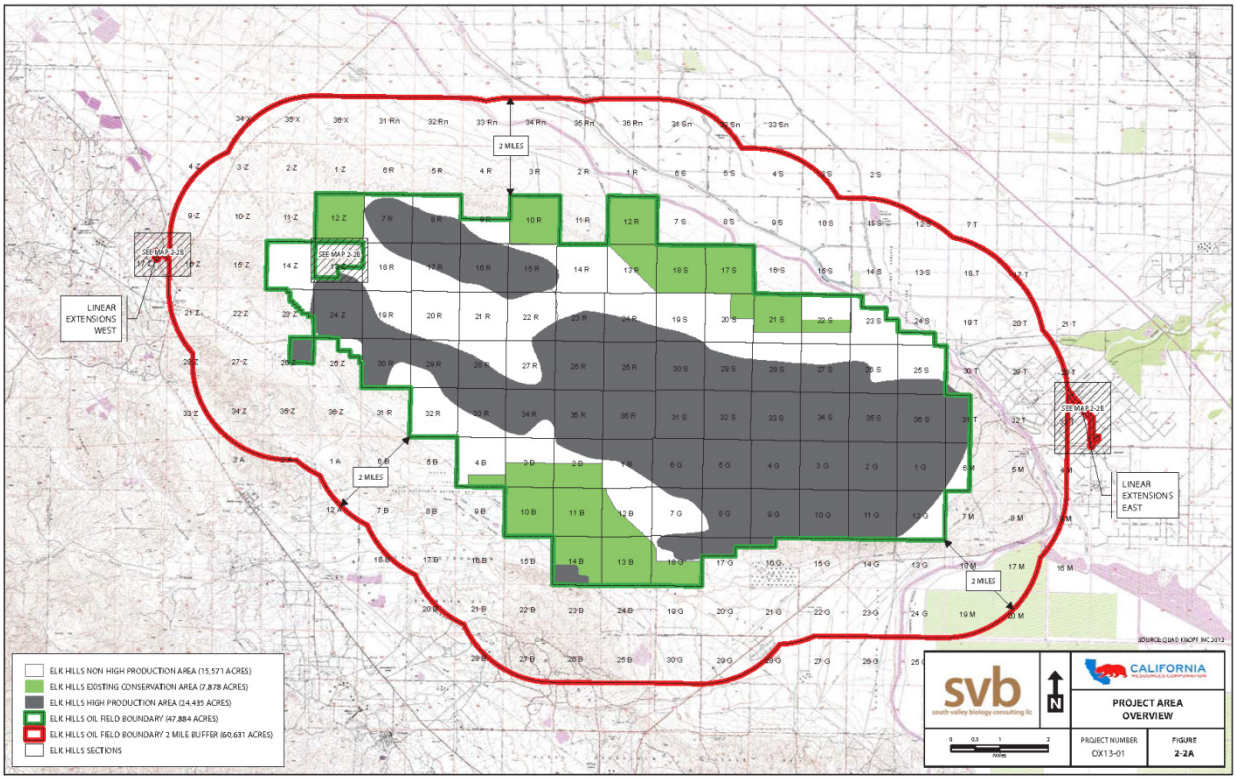

Figure 4. Elk Hills Permit Area

In summary, the Valley Floor, Lokern, and Elk Hills HCPs are included within the Draft EIR project area. The focus of each HCP is the preservation of special-status species that are unique to each geography, but support the overall goal of habitat conservation throughout Kern County. All three HCPs address oil and gas activities in Kern County, with the Valley Floor HCP addressing other activities such as water districts, urban development, and public infrastructure activities.

Covered Species

Each of the three draft HCPs provide incidental take coverage (Section 10(a)(1)(B) and Section 2081(b) ITPs) for a specific set of special-status species found in their respective Permit Area. Many of the efforts for special-status species recovery occurring in the southern San Joaquin Valley, including the three HCPs discussed here, have a basis in the conservation strategies presented in the Recovery Plan for Upland Species of the San Joaquin Valley, California published by the U.S. Fish and Wildlife Service (USFWS) in 1998 (the SJV Recovery Plan). The SJV Recovery Plan includes conservation goals for both federally listed species and other species of regional concern, many of which have a special status designation provided by the USFWS and CDFW. The SJV Recovery Plan area includes the land in which the permit areas of all three HCPs are located and its surroundings and covers 34 species of plants and animals that occur in the southern San Joaquin Valley. The SJV Recovery Plan presents both an ecosystem approach to recovery and a community-level strategy for recovery (USFWS 1998). There are several HCP-covered species that are not included in the SJV recovery plan, which focuses on upland species that are endemic to the San Joaquin Valley.

About half of the species addressed in the SJV Recovery Plan are covered species of the Valley Floor HCP. The Valley Floor HCP is consistent with the conservation goals of the SJV Recovery Plan and it contributes key element(s) in achieving several goals of the SJV Recovery Plan. The Valley Floor HCP addresses the conservation needs of the Federally and state listed wildlife and plant species found in the Kern County Valley Floor area (Table 7-6).

The Lokern HCP also covers many of the species addressed in the SJV Recovery Plan. However, since the Permit Area of the Lokern HCP is a small subset of the Valley Floor HCP Permit Area, the list of species that are covered is more limited. Additionally, the reduced list of species that are covered is based on the habitat suitability of land available for conservation and the ability to compensate for those species though the provisions of the Lokern HCP.

The covered species for the Elk Hills HCP is based on the 1995 Biological Opinion, as a result, a limited number of federally listed species are covered by the Elk Hills HCP. The overall monitoring program as described in the Elk Hills HCP is based on the monitoring programs developed under the prior permits and agreements, but with some minor changes to reflect improved species monitoring, adjustments to the biological goals and objectives, and changes to the species that are covered for protection. Similar to the Lokern HCP, the smaller list of species that are covered is related to the habitat suitability of land available for conservation and the ability to compensate for those species. Elk Hills Oil Field intends to update its ITP application to seek coverage for species identified subsequent to the 1995 Biological Opinion. Table 7-6 reflects the coverage requested in the pending application.

Table 7-6: Summary of Covered Species

Scientific/Common Name	Status			Hcp Covered Species

Covered Activities and Permit Terms

Each of the three HCPs provides permitting coverage for a specified set of activities over the respective permit term of each draft HCP. The County is working to update the current draft of the Valley Floor HCP, and is also considering augmenting the HCP with the elements required for a state Natural Communities Conservation Plan (NCCP). Unlike the other two HCPs discussed here (Lokern and Elk Hills), the Valley Floor HCP (or HCP/NCCP) is intended to cover multiple land uses rather than only oil and gas activities. While summary information about the current draft of the Valley Floor HCP is provided here for informational purposes (and to clarify its relationship to the Lokern and Elk Hills HCPs), it is anticipated that the current draft Valley Floor HCP will be modified. The Valley Floor HCP Permit Term is proposed to be 30 years.

The current draft of the Valley Floor HCP accommodates future land use development activities (i.e., oil/gas, water storage/conveyance, urban development, and public infrastructure), and minimizes uncertainty, risks, delays, and unexpected costs in Kern County that could be associated with project-by-project permitting. It also establishes a permitting approach that provides incentives to conduct Permitted Activities within areas of lesser conservation value and that promotes conservation of areas of higher conservation values. The Valley Floor HCP also provides for the implementation key element(s) (i.e., habitat protection) of the SJV Recovery Plan (USFWS 1998).

The draft Lokern HCP includes coverage for oil and gas exploration and production activities as well as land conservation activities within a 50-year time horizon. The draft Lokern HCP explains that Chevron's business purpose in developing a landscape level HCP is to provide operational flexibility and to avoid uncertainty, risks, delays, and unexpected costs as a result of activities associated with project-by-project permitting. The draft Lokern HCP includes conservation and preservation in perpetuity of Chevron's Lokern Lands to compensate for impacts resulting from oil and gas exploration and production activities in the Four Fields.

Like the draft Lokern HCP, the Elk Hills HCP includes operations, facilities, and activities associated with oil and gas exploration and production and land conservation. The Elk Hills HCP evaluates activities within a 50-year time horizon. The Elk Hills HCP addresses limited new infrastructure within the 2-mile buffer to accommodate oil field operations should such a need arise in future years.

Permitting Process

HCPs are federal documents approved by the USFWS and not the CDFW, although CDFW can contribute and advise on the technical aspects of HCPs. It is common practice for CDFW to use the HCP process to issue a 2080.1 Consistency Determination that effectively adopts the HCP as a state permit. For activities covered under each of the three HCPs, it is anticipated the measures included in each HCP will enable USFWS to make the findings necessary, under 10(a)(2)(B) of the U.S. Endangered Species Act (FESA) and the implementing regulations at 50 C.F.R. section 17.22, to issue an ITP pursuant to section 10(a)(1)(B) of FESA for incidental take of the HCP's covered species. This may also enable USFWS to issue a biological opinion pursuant to Section 7(b)(4) of FESA and its implementing regulations at 50 C.F.R. section 402.14, finding that activities allowed

by the Section 10(a)(1)(B) Permit are not likely to jeopardize Covered Species' continued existence nor result in the adverse modification or destruction of designated critical habitat. It is anticipated that the HCPs will also be used to authorize an ITP for covered activities under Section 2081(b) of the California Fish and Game Code and its implementing regulations, California Code of Regulations, title 14, section 783.

Although the Valley Floor HCP covers much of the same area analyzed by the Kern County Oil and Gas EIR, this HCP covers more than oil and gas activities and is part of a joint federal/state action. An Environmental Impact Statement (EIS) prepared pursuant to the National Environmental Policy Act (NEPA) process will be required as part of the USFWS process, and a separate EIR prepared pursuant to the CEQA process will be required by the County to evaluate the impacts. This separate EIS/EIR process would be used by responsible agencies such as CDFW to approve permits for activities other than the oil and gas activities covered in this EIR, and for permits for oil and gas activities that are available only under the Natural Community Conservation Act of 2003 (i.e., relating to fully protected species). The Kern County Oil and Gas EIR will help inform the content of the EIS/EIR for the Valley Floor HCP, but it is not dependent on the Valley Floor HCP, potential NCCP, or the HCP/NCCP EIS/EIR.

The draft Lokern HCP is a federal agency action, and since CEQA does not apply to federal agencies the Kern County Oil and Gas EIR will serve as an informational resource for the USFWS. The USFWS will be required to prepare its own environmental study as required by NEPA. Federal approval of the Lokern HCP is not dependent on approval of the Kern County Oil and Gas EIR. CDFW permit approvals relating to the HCP, like approvals for other oil and gas activity permits falling within the scope of the Kern County Oil and Gas EIR that do not rely on the HCP, are addressed in the Kern County Oil and Gas EIR, and CDFW is a responsible agency that will use the Kern County Oil and Gas EIR as provided for under CEQA and CESA.

As proposed, the Elk Hills HCP would supersede the 1995 Biological Opinion for continued operation of the Covered Lands. However, until such time when additional federal approval is deemed necessary, the Elk Hills Oil Field will be operated in compliance with the 1995 Biological Opinion. Likewise, once approved, the Section 2081 ITP sought by CRC would supersede the existing CESA MOU. Once approved, CDFW permit approvals relating to the HCP would be addressed through the Kern County Oil and Gas EIR in a manner similar to the draft Lokern HCP as described above.

If any of the three HCP are delayed in their approval, neither one is dependent on the other. Furthermore, an applicant can always request a Section 7 consultation from the USFWS to enable project-by-project permitting for federally listed special-status species. Similarly, CDFW can approve ITPs on a project-by-project basis if the HCPs are not adopted. Both USFWS and CDFW have processed, and are anticipated to continue to process, incidental take applications for oil and gas activities within Kern County whether or not the Valley Floor HCP/NCCP or Lokern or Elk Hills HCPs are timely approved.

Use of Kern EIR

The County's decision to prepare the Draft EIR to cover future CDFW permitting actions for oil and gas activities in Kern County is consistent with CEQA's prohibition against piecemealed environmental review. Specifically, for the purpose of CEQA the term "project" is defined broadly to include "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment …." (CEQA Guidelines, § 15378, subd. (a); see also Public Resources Code, § 21002.1, subd. (d) ["The lead agency shall be responsible for considering the effects, both individual and collective, of all activities involved in a project."].) As a result of this definition, "[c]ourts have considered separate activities as one CEQA project and required them to be reviewed together where, for example, the second activity is a reasonably foreseeable consequence of the first activity [citation]." (*Sierra Club v. West Side Irrigation Dist.* (2005) 128 Cal.App.4th 690, 698.)

The Kern County Oil and Gas EIR is an informational document for use by the USFWS, but each HCP is undergoing a separate NEPA review as required. CDFW is a responsible agency under CEQA for the Draft EIR, and will use the Draft EIR pursuant to CEQA for all CESA actions that fall within the scope of the Draft EIR per CEQA requirements.

The Kern County Oil and Gas EIR shares similar goals with the Lokern and Elk Hills HCPs. These goals include providing a more uniform approach to addressing biological resource impacts and associated mitigation and supporting the conservation of biological resources that are important conservation priorities that are associated with oil and gas activities. Consistent with these goals, both HCPs would contribute to the permanent conservation of lands in central and western Kern County that support covered species and provide important linkages to other existing and proposed conservation lands in the project vicinity for the overall benefit of species conservation and recovery. Therefore, the Lokern and Elk Hills HCPs would help protect and restore vital wildlife linkages and promote connectivity for wildlife movement.

The implementation of the Lokern and Elk Hills HCPs, and preservation of important species habitats, when combined with the conservation efforts of other unrelated projects addressed by the County's Oil and Gas EIR, will result in preservation of habitat for the benefit of federal and state listed species and species of concern. These habitat lands will be managed in larger, contiguous blocks rather than smaller project-specific mitigation efforts. As illustrated on Figure 5 below, the draft Lokern and Elk Hills HCPs will help to establish a continuous habitat corridor between the Lokern Lands and the Elk Hills, which is one of the recovery goals of the USFWS SJV Recovery Plan and other plans enacted for the preservation of threatened and endangered species in central and western Kern County.

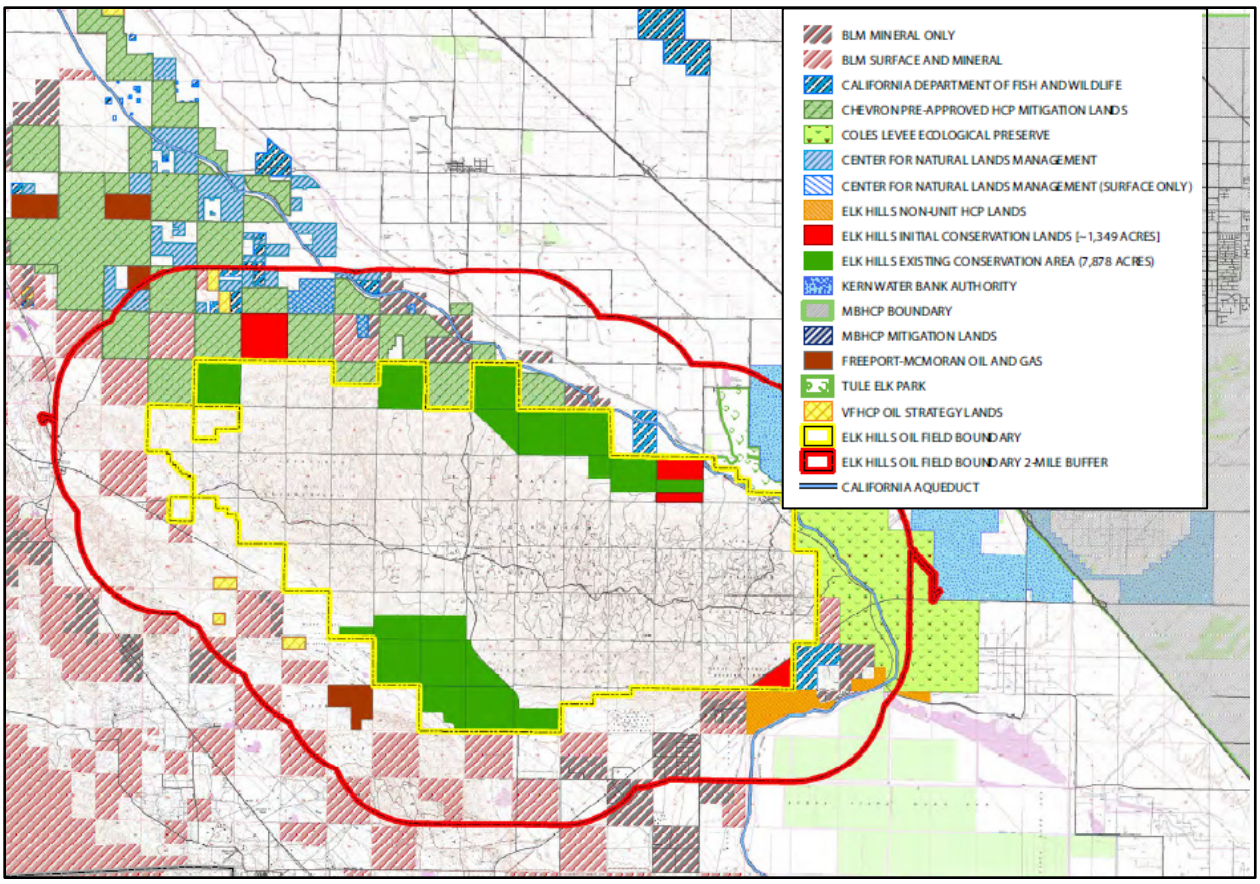

Figure 5. Conservation Lands in the vicinity of the Elk Hills and Chevron's Lokern Lands

Geo-1: CCST: Produced Water and Earthquake Risk

The California Council for Science and Technology (CCST), in its report, *An Independent Scientific Assessment of Well Stimulation in California, Potential Environmental Impacts of Hydraulic Fracturing and Acid Stimulations* (2015),[102] considered the risk that disposal of produced water by underground injection could cause earthquakes. Citing that finding, some commenters suggested that potential induced seismicity impacts from injection operations had not been sufficiently analyzed in this EIR.

The DEIR did analyze the findings of CCST's previous report, *Advanced Well Stimulation Technologies in California* (2014).[103] In that report, CCST concluded:

[102] https://ccst.us/publications/2015/2015SB4-v2.pdf.
[103] http://ccst.us/publications/2014/2014wst.pdf.

- Differences between California and other U.S. regions suggest that the likelihood of induced seismicity due to wastewater injection in California is low compared to other regions in the U.S;
- The zones at which the rocks are rigid enough to accumulate enough stress to cause significant earthquakes are relatively deep in California, and significantly deeper than the oil and gas development and wastewater disposal zones;
- Oil and gas production in California occurs in sedimentary basins, which are less susceptible to induced seismicity from wastewater injection; and
- Operation of injection wells has had little effect on seismicity rates in Southern California, including Kern County.

DDEIR at 4.6-15–17.

CCST's July 2015 report reached similar conclusions, finding that:

> Typical wastewater volumes injected per well in California are generally less than those associated with well stimulation operations in other parts of the country where induced seismicity has occurred. For example, typical wastewater volumes injected in Kern County to date have been about one fourth of those resulting from well stimulation in the Barnett shale and injected in the Dallas-Fort Worth area in Texas, where induced seismicity has been reported from ongoing observational studies. This might suggest that at the present time the potential for induced seismicity related to wastewater disposal in California may be relatively low compared with some other regions in the U.S.

CCST 2015 at 271.

CCST also noted that, to date, there have been no reported cases of induced seismicity associated with produced water injection in California. CCST 2015 at 30. CCST recommended further study of the correlation, if any, between injection and earthquakes. *Id.* Commenters claim that CCST found evidence of a link between injection well activity and certain earthquakes in California, but that overstates CCST's conclusions. In fact, CCST identified a couple historical cases where there was seismic activity following pressure changes in certain injection wells; but in some cases CCST also found "no immediate correlation" was evident. *Id.* at 295. CCST's ultimate recommendation was for more detailed analysis. *Id.* In connection with this EIR, the County reviewed such a study (BSK 2015), the results of which are discussed in the DEIR. The BSK study similarly concluded that seismic hazard related to current wastewater injection practices in California is low. DEIR at 4.6-53. It is therefore not critical to the analysis in this EIR whether seismic events have caused structural damage in other parts of the country, as induced seismic events are unlikely to occur as a result of the Project.

Commenters incorrectly state that CCST found that the potential for induced seismicity from injection activities in California is just as high as in other locations. CCST notes the relative depths of earthquakes and injection activity, but ultimately concludes that "While the above argument suggests that induced seismicity could potentially be caused by wastewater disposal in California,

analysis of the relationship of seismicity to injection operations in the state is necessary to find out if that is indeed the case." *Id.* at 281.

Two studies released in June 2015 provide further confirmation of the conclusions in the DEIR. The first study focused on large-scale assessment of differences in injection operations and the possibly of induced seismicity in California and Oklahoma. T. Gobel, A comparison of seismicity rates and fluid-injection operations in Oklahoma and California: Implications for crustal stresses. Leading Edge (June 2015) at 640-648. The study found that:

- Injection rates increased in Oklahoma between 1998 and 2013, and the rate of earthquakes increased significantly after 2009. Injection rates increased in California between 2001 and 2009, and in Kern County injection has continuously increased since 1995. However, in California there was no association between injection and earthquake rates comparable to that in Oklahoma. In fact, the rate of earthquakes in California actually decreased (though not significantly) over approximately the same period in which injection increased.
- Pressures and peak rates at which injection occurs are similar in California and Oklahoma. No systematic differences were identified that could be responsible for observed differences in seismic activity.
- The focal depths of seismic events in California are significantly deeper than injection depths. Much of the seismic activity is distributed in the upper 15 km (9.3 miles) with a mean of 10 km (6.2 miles). From 1980 through 2001, events with magnitudes between M4 and M5 and above M5 occurred at depths of about 1 to 27 km (0.6 and 16.7 miles) with many of the shallow earthquakes being aftershocks of the Northridge earthquake. By contrast, the mean depth of injection in California is shallower, at approximately 1.5 km (0.9 mile).

The study concludes that the specific geologic setting, in particular hydraulic connectivity and the stress state on nearby faults, is the primary determinant of injection-induced seismicity. The absence of noticeable seismic response in California despite the largely similar injection operations in the two states indicates a fundamental difference geological stresses between the regions.

The second study was conducted in the Los Angeles Basin to assess the influence of oil industry operations on seismicity. E. Hauksson, T. Gobel, J. Ampuero and E. Cochran, *A century of oil-field operations and earthquakes in the greater Los Angeles Basin, southern California*. Leading Edge (June 2015) at 650-656. The authors reported the following:

- Based on record since 1935, no significant differences were found in seismicity characteristics inside and outside oil fields in the Los Angeles Basin, including earthquake rates and depths, and the ratio between earthquake magnitude and frequency (referred to as the "b value").
- Analysis of Southern California Seismic Network data and DOGGR records of production and injection did not reveal significant changes in seismicity rate associated with temporal changes in production or injection.

- Production and injection rates are fairly steady over months to years, and were not associated with sudden changes in stresses that could trigger earthquakes.
- Oil and gas reservoirs are sealed by impermeable sedimentary layers and fault zones that enclose the reservoirs. Fluid movements in and out of the reservoirs are unlikely to affect the adjacent, mostly impermeable faults.
- More than 98% of earthquakes in the Los Angeles Basin occur at depths of greater than 5 kilometers below the surface. There is no significant difference in the depth distribution between earthquakes outside or inside of the oil fields. These results suggest that the earthquakes are tectonic in origin, not the result of oil field activities.
- No evidence of induced earthquakes was found, and the management of balanced production and injection of fluids appears to reduce the risk of induced-earthquake activity in the oil fields

Finally, in responding to comments on the SB 4 EIR regarding this subject, DOGGR concluded:

- The injection factor that appears to have the most direct consequence in regard to induced seismicity is net fluid balance (*e.g.*, the total balance of fluid introduced into or removed from the subsurface). In California, existing regulations require that injection wells affect only the zone targeted for injection and that injection pressures remain at or below the pressure of the target zone. This practice maintains stability of the target zone and the likelihood of a resulting seismic event is therefore low; and
- DOGGR's forthcoming revised rules and regulations for the underground injection control (UIC) program may further address the potential for deep well injection that could potentially cause seismic events.

SB 4 Final EIR at C.2-94–95.

Despite the above conclusions, commenters assert that the mitigation measures in the EIR must prohibit injection or drilling near fault lines in order to adequately mitigate the risks of induced seismicity. To the contrary, existing regulations such as the control of over-pressuring according to CCR Title 14, Division 2, Chapter 4, Subchapter 1, Article 3 requirements, sufficiently protect against induced seismic events.

Therefore, potential induced-seismicity impacts from wastewater injection are expected to be less than significant after mitigation. To further address concerns about earthquake risk, a new mitigation measure has been added (MM 4.8-7(e)) to require additional earthquake monitoring and reporting to help inform the need for, and substance of, any further regulation of this issue. Further information about the topics addressed in the CCST report in relation to the DEIR is provided in GR-20.

GHG-1: GHG Methodology and Emission Estimates

Several comments state that the DEIR did not adequately identify all of the potential greenhouse gas (GHG) emissions from the project and their potential impacts.

The GHG analysis in the EIR quantifies direct GHG emissions from permitted and non-permitted facilities, as well as combustion, venting, and fugitive sources associated with construction, well production and stimulation, and well abandonment. The analysis also includes emissions from vehicles used during well construction and operation. The analysis compares GHG baseline emissions for 2012 with emissions in 2035 under full project build out. The emissions estimate for 2035 includes all GHG emissions from construction and operation of the project, including fugitive emissions and methane leakage, and thus accurately portrays the GHG emissions attributable to the Project.

Emissions from the following GHGs were quantified as carbon dioxide equivalent (CO2E) in the GHG analysis: Carbon Dioxide (CO_2), Methane (CH_4), Nitrous oxide (N_2O), Chlorofluorocarbons (CFCs), Sulfur hexafluoride (SF_6), Hydrofluorocarbons (HFCs), and Perfluorocarbons (PFCs). The following GHGs were not counted in the analysis: black carbon and Nitrogen trifluoride (NF_3). Nitrogen trifluoride is not emitted by the oil and gas industry but is used for production of computer memory products, flat panel displays, and thin-film solar cells and thus it was not included in the GHG analysis. Black carbon emissions are a result of incomplete combustion and occur in the oil and gas industry from flaring. "Black carbon and methane emissions from oil and gas activities – overcoming emission reduction barriers", Carbon Limits, p. 8, online at: http://www.carbonlimits.no/PDF/CH4BCBarrierReportCarbonlimits.pdf, accessed September 2, 2015. However, physical measurements of black carbon from flares are difficult to conduct and there are currently little to no measurements on the magnitude of black carbon emissions from gas flares. *Id.* pp. 8, 26. In addition, Health & Safety Code § 38505(g) does not include black carbon in its definition of GHGs for AB 32. *See* H&S Code § 38505(g) (including in the definition of GHGs: Carbon dioxide, methane, nitrous oxide, Hydrofluorocarbons, Perfluorocarbons, Sulfur hexafluoride, and nitrogen trifluoride). Finally, SJVAPCD enforces several regulations related to flaring that apply to Project activities. For these reasons, black carbon was not calculated in the GHG analysis.

Significance Thresholds and Analysis

CEQA Guidelines § 15064.4(b) gives a lead agency discretion to choose the appropriate threshold of significance to apply to a project. A lead agency is not required to adopt a "no net increase" significance threshold. Thus, the analysis in the EIR appropriately relies on SJVAPCD guidance for determining GHG impacts. The SJVAPCD guidance utilizes a tiered approach to assess impacts of GHG emissions. The tiers are (1) demonstrating compliance with an approved GHG emissions reduction program such as CARB's cap-and-trade program, (2) demonstrating project implementation of Best Performance Standards (BPS) to reduce GHG emissions, and (3) demonstrating achievement of a 29% reduction in GHG emissions from Business As Usual (BAU). *See* "Guidance for Valley Land-use Agencies in Addressing GHG Emission Impacts for New Projects under CEQA" and "District Policy: Addressing GHG Emission Impacts for Stationary Source Projects Under CEQA When Serving as the Lead Agency". None of these methods of determining the significance of GHG emissions have been rejected by a court with jurisdiction in Kern County, while reliance on the BAU-based significance threshold has been specifically upheld as a proper exercise of agency discretion by two California appellate courts.

In *Citizens for Responsible Equitable Environmental Development v. City of Chula Vista* (2011) 197 Cal. App. 4th 327, 336-37 (*CREED*), reliance on the BAU significance threshold was upheld as a proper exercise of agency discretion. In evaluating a remodel and expansion of an operating retail store that would demolish a 1970s-era building and build a modern, energy-efficient building, the City of Chula Vista used AB 32's reduction goals to determine whether the project would reduce "business as usual" emissions – emissions assuming no reduction from measures required by AB 32 – by the percentage required to be consistent with AB 32's statewide emission goals. *CREED* had argued various other thresholds were more stringent and therefore should have been the relevant threshold. The court, citing to CEQA Guidelines § 15064.4, upheld the City's decision to use an AB 32 percentage reduction based on the "business as usual" methodology and found that *CREED*'s arguments regarding potential alternative thresholds were unavailing.

Three subsequent cases concurred with the approach in *CREED*. *Friends of Oroville v. City of Oroville* (2013) 219 Cal.App.4th 832, 841-42; *Friends of Northern San Jacinto Valley v. County of Riverside*, Riverside County Sup. Ct., Case No. RIC10007572 (2012); and *Center for Biological Diversity v. City of Fullerton*, Orange County Sup. Ct., Case No. 30-2011-00499466-CU-WM-CXC (2012).) Though the courts in *Friends of Oroville* and *Friends of Northern San Jacinto* criticized the lead agency's *analysis* of the BAU-based significance threshold, neither court disapproved of the BAU approach. Instead, both courts stated that the lead agencies should have followed the same analysis utilized in *CREED*. In particular, in *Friends of Northern San Jacinto*, the trial court rejected the comparison to a "hypothetical" worst-case BAU scenario that was highly unrealistic (disregarding local zoning restrictions, assuming the project site was stripped of vegetation and fully developed even in steeply sloping areas) – but distinguished that unrealistic hypothetical BAU scenario from the reasonable BAU analysis in *CREED*.

More recently, in *Friends of Oroville*, an EIR for a Wal-Mart replacement project used the BAU scenario for GHG as the threshold of significance, an approach favorably reviewed in *CREED*. Although the court found that the City of Oroville operated from an appropriate legal foundation with regard to its adopted threshold, the court found that the *analysis* was faulty. Specifically, the lead agency focused on the relative percentage of project emissions against the statewide numbers for 2004, determining that the project would contribute a mere .003% of California's 2004 emissions. Such a calculation, as noted by the court, would always pale when compared to the "world's eighth largest economy." The appellate court stated that the correct analysis, as reflected in *CREED*, would have involved an evaluation of the project as compared to a business-as-usual reference point. According to the court, *CREED* "exemplifies the model, showing us a proper way to apply the AB 32 threshold-of-significance standard." *Id.* at 841.

One trial court found that the BAU methodology improperly relied on a hypothetical baseline. *Center for Biological Diversity v. Dept. of Fish and Wildlife*, Los Angeles Sup. Ct., Case No. BS131347 (2012) (*Newhall Ranch*). In Newhall Ranch, the trial court found the BAU methodology improper, but the court of appeal reversed. *Center for Biological Diversity v. Dept. of Fish and Wildlife* (2014) 224 Cal. App. 4th 1105. Relying on cases that rejected use of purely hypothetical conditions (such as planned or permitted facility capacity, never actually achieved) as the baseline, the trial court interpreted the BAU scenario as a form of impermissible "hypothetical baseline." On

the contrary, the court of appeal concluded, the trial court erred in equating the BAU-based *significance threshold* with an improper hypothetical *baseline*: "We agree with the [lead agency] that the trial court's ruling, as do some aspects of plaintiffs' analysis, conflated the baseline with the significance determination." Slip Opin. at 99-100 (this portion of the decision was not published). The case is currently pending appeal before the California Supreme Court.

In addition, in *Cleveland National Forest Foundation v. San Diego Assoc. of Gov. et al.* (2014) 231 Cal.App.4th 236 (*SANDAG*) the Superior Court of San Diego County found that the EIR for SANDAG's SB 375 mandated transportation plan violated CEQA because it failed to: (1) analyze the inconsistency between the plan's GHG emissions impacts after 2020 and the state's policy goals presented in Executive Order S-3-05; and (2) adequately address mitigation measures for the plan's GHG emission impacts. On appeal, the court held that the EIR violated CEQA for omitting a discussion of the plan's consistency with the state climate policy of continual GHG emissions reductions, presented in Executive Order S-3-05. The opinion also included some broad language that could be interpreted to call into question the BAU approach:

> Although [§ 15064.4] specifies three means of determining whether a project's greenhouse gas emissions impacts are significant, the "among others" qualifying language indicates these means are not exclusive. Moreover, "the fact that a particular environmental effect meets a particular threshold cannot be used as an automatic determinant that the effect is or is not significant . . . a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant." (*Protect The Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 (Amador).) Consequently, the use of the Guideline's thresholds does not necessarily equate to compliance with CEQA, particularly where, as here, the failure to consider the transportation plan's consistency with the state climate policy of ongoing emissions reductions reflected in the Executive Order frustrates the state climate policy and renders the EIR fundamentally misleading. *SANDAG* at p. 18 (emphasis added).

Thus, the BAU methodology, as well as the extent to which CEQA's GHG analytical and mitigation obligations can be satisfied through compliance with other GHG laws such as SB 375 and AB 32, are matters currently under consideration by the California Supreme Court in both the *SANDAG* and *Newhall Ranch* cases.

The analysis in the EIR finds that Project GHG emissions would either be covered by CARB's cap-and-trade program, or are exempt from cap-and-trade and mitigated to a no net increase standard by GHG mitigation offsets. MM 4.7-1, 4.7-2, and 4.7-4. GHG emissions are also required to be reduced through compliance with applicable regulations, such as CARB's proposed new methane standard. MM 4.7-3; CARB Proposed "GHG Emission Standards for Crude Oil and Natural Gas Facilities" online at: http://www.arb.ca.gov/cc/oil-gas/meetings/Draft_Regulatory_Language_4-22-15.pdf.

The EIR thus finds that the Project would result in an overall increase in GHG emissions and that these GHG emissions would be potentially significant, but that impacts would be reduced to less than significant with mitigation. Mitigation Measures 4.7-1 through 4.7-4 will ensure that all

regulated sources are covered by and comply with CARB's cap-and-trade program and implement BPS, and that GHG emissions not covered by CARB's cap-and-trade program or other mandatory GHG emission reduction measures are offset. In addition, each applicant must implement methods to recover for reuse or destroy methane. Irrespective of the significance threshold, these mitigation measures collectively will assure that GHG emissions from the Project are mitigated to a level of net-zero increase.

Although the Project is anticipated to be consistent with the adopted California Climate Change Scoping Plan, CARB's GHG cap-and-trade program, and other applicable adopted standards and regulations, Impact 4.7-2 is found to be significant and unavoidable. In addition, impacts from cumulative GHG emissions are found to be significant and unavoidable due to Kern County's inability to assure that cumulative GHG emissions are controlled in a manner sufficient to address global climate change, even though Project emission are fully mitigated.

Methane

Commenters state that the EIR should have used a different Global Warming Potential (GWP) for methane, claiming that the values used mask the short term effects of methane emissions. The comment is correct that the EIR did not use the IPCC's most recently updated GWP for methane. The EIR used GWPs from the values included in the EPA's most recently amended Mandatory Greenhouse Gas Reporting Regulation (40 C.F.R. Part 98, Subpart A, Table A-1), which has not yet adopted the IPPC's most recent GWP values. Table A-1 of this regulation provides the methane GWP of 25, based on a 100-year time horizon. The California Air Resources Board's GHG Mandatory Reporting Regulation and Cap-and-Trade regulations both use the federal GWP values by reference. *See* 17 Cal. Code Regs. § 95102(a)(67). Since the major state GHG regulatory programs rely on the federal greenhouse gas reporting regulation for specifying the GWP of various greenhouse gases, the DEIR appropriately used the same GWP values for its analysis.

Duration of Project, Scope of Analysis, and Impacts

Commenters suggest that the EIR should have included an analysis of consistency with various Executive Orders issued by California Governors, analysis of GHG emissions after 2035, and "aggregate" or total GHG emissions from the Project. These analyses are not required by CEQA.

Under the Article V, Section 1 of the California Constitution, the "supreme executive power of this State is vested in the Governor" and the Governor must "see that the law is faithfully executed". However, the Governor does not have the power to make law. As an executive officer of the state, the Governor is "forbidden to exercise any legislative power or function except as the constitution expressly provide[s]…" *St. John's Well Child and Family Center v. Schwarzenegger* (2010) 50 Cal. 4th 960, 985. The Governor may use executive orders to direct subordinate officers in the enforcement of a particular law, but cannot invade the province of the Legislature. 63 Ops. Cal. AG 583 (1980). Specifically, "the Governor is not empowered, by executive order or otherwise, to amend the effect of, or to qualify the operation of existing legislation." Id. In addition, nothing in the California Constitution or state law grants the Governor authority to issue an executive order that would impose obligations on third parties.

Since the Governor's executive power does not extend to making law or imposing obligations on third parties, it follows that Executive Orders, while aspirational, do not and cannot establish formal state policy for entities other than state agencies that report to the Governor. This conclusion is supported by the Legislature's action on climate change legislation in the recently-ended first year of the 2015-2016 legislative session. In particular, SB 32, which would set various future GHG reduction goals into statute, was not enacted but will be further considered in 2016. The debate on SB 32 showed that the Legislature has not yet determined what, if any, are the appropriate greenhouse gas emissions reduction goals beyond 2020. Accordingly, the Governor's post-2020 GHG emissions reduction goals are not formal state policy or law and need not be considered in the EIR's analysis. Nevertheless, the DEIR included an informational assessment of the Project's consistency with Executive Orders S-3-05 and B-30-15 on pages 4.7-43 and 4.7-44. This assessment concluded that "the proposed Project as mitigated is consistent with the goals of both EOs".

The EIR accurately identifies anticipated project emissions. Emissions from construction (well drilling) and operation are provided for anticipated annual emissions (Table 4.7-8) and for build out emissions in 2035. Emissions from facilities subject to Cap-and-Trade are identified in Table 4.7-6. As stated above, the EIR need not consider Governor's Executive Orders as binding policies, so there is no requirement to assess emissions out to 2050 as a commenter suggested. Also, unlike the situation in *Vineyard Area Citizens for Responsible Growth*, 40 Cal.4th 412, 431, the DEIR does identify and evaluate GHG emissions out to project build-out in 2035.

A commenter said that the 10% GHG emissions allowance, to account for emissions from facilities that are not subject to ARB's GHG Mandatory Reporting Regulation (MRR), is unsubstantiated. The 10% GHG allowance is the same as the 10% allowance added to the air quality emissions calculations to assure that emissions from smaller facilities were included in the analysis. As described on DEIR page 4.3-75, the larger operators (Title V sources) account for about 90% of the active crude oil wells in Kern County, so after emissions from these facilities were determined an additional 10% was added to the emissions total to account for emissions from the smaller sources that do not have Title V permits. Annual criteria pollutant emissions are not reported for smaller (non-Title V) sources, so direct emissions information is not available. Similarly, GHG emissions are not reported by facilities that are not subject to MRR. To account for those emissions, it was reasonable to assume a similar ratio for MRR and non-MRR sources. All GHG emissions from non-MRR sources will be mitigated by compliance with mitigation measures other than compliance with Cap-and-Trade.

Contrary to commenters' statements, nothing in CEQA requires that the EIR identify total GHG emissions summed over the lifetime of the Project. Annual emission rates as provided in Tables 4.7-6, 4.7-8 and 4.7-9 are much more informative, because they allow for comparison to statewide and county-wide annual emissions rates (Tables 4.7-2 through 4.7-5). The federal and state GHG mandatory reporting programs, California Cap-and-Trade, and the analyses in ARB's original and updated Scoping Plans under AB 32 all address GHG emissions on an annual basis. The approach used in the EIR is consistent with the approach used in these regulatory programs.

It is also noted that it is not possible to determine the particular impact on global climate change that may result from the emissions that come from a particular project, or even from all GHG emissions in California, and the commenter did not identify any such methodology. The CEQA Guidelines and the SJVAPCD policies also do not require such an analysis.

A commenter states that the DEIR did not properly compare Project GHG emissions to baseline GHG emissions. Table 4.7-9 identifies Project baseline emissions (2012) and Project build-out emissions (2035). As discussed in Global Responses 2 and 6, the analysis is conservative because all emissions from new wells drilled after Project approval are considered to be new emissions without consideration of emission decreases from well retirement.

Mitigation

Commenters state that the EIR analysis "treats MRR permitted emissions as though they will not occur" and that the Cap-and-Trade program will expire in 2020 and therefore cannot be relied on as mitigation after 2020. With regard to reliance on Cap-and-Trade as mitigation, the statewide emission cap for sources and activities included in Cap-and-Trade (including most oil and gas production activities as described in the DEIR) is fixed by regulation through 2020. 17 Cal. Code Regs. §95800 *et seq*. Any GHG emission increases from sources in the program are subject to the limit, and facility operators must either purchase GHG emissions allowances or emission offsets in quantities equal to reported annual emissions. Under the program as a whole, the statewide GHG emission rate for sources in the program cannot exceeded the levels specified in the regulation, which ARB imposed as necessary to achieve the AB 32 statewide GHG emission limit for 2020. The SJVAPCD CEQA guidance and policy documents referenced above specifically authorize reliance on Cap-and-Trade as a mitigation measure, and explain the District's reasons for adopting these policies. Considering emissions covered by Cap-and-Trade to be mitigated in no way ignores those emissions or the CEQA Guidelines. Thus, reliance on the Cap-and-Trade program is an appropriate mitigation measure for sources and activities included in the program. Also see GR 22 regarding compliance with regulations as mitigation.

Commenters state that the Cap-and-Trade program expires in 2020 and therefore can't mitigate project emissions after that time. This statement is inaccurate. The California Cap-and-Trade program and other federal and state GHG emission control programs will almost certainly continue beyond 2020. AB 32 specifically states that the statewide greenhouse gas emission limit "shall remain in effect unless otherwise amended or repealed" and that the statewide GHG emission limit should "be used to maintain and continue reductions in emissions of greenhouse gases beyond 2020." Health and Safety Code § 38551(a), (b). The Cap-and-Trade regulation does not expire, it just currently includes compliance periods and statewide emission caps only through 2020. Since cap-and-trade is the signature element of ARB's AB 32 regulations, like other emissions regulations it is expected to remain in in effect indefinitely, with ARB adding requirements for later years as needed.

Reliance on Best Performance Standards (BPS) and future GHG emission standards are said to not be enforceable mitigation. BPS are used to reduce GHG emissions from various sources and activities, and in that way do mitigate GHG emissions. The EIR analysis does not rely solely on

future GHG regulations to mitigate project emissions. Rather, since it is known that ARB and other agencies will be adopting GHG emission standards that will apply to Project emissions, the EIR correctly recognizes that emissions will be reduced (mitigated) when such regulations become effective. Lower emission levels will require smaller quantities of offsetting emission reductions, but in all cases emissions remaining after application of MM 4.7-1, 4.7-2 and 4.7-3 must be offset in accordance with MM 4.7-4. At the time of filing an application for conformity review, applicants must specify their expected GHG emissions and identify how those emissions will be mitigated. Emission-reducing measures may include the measures listed by ARB at http://www.arb.ca.gov/cc/non-co2-clearinghouse/non-co2-clearinghouse.htm, but those measures are not required, All reductions will be verified by the County.

Various comments identify a single mitigation measure and state that the measure will be unenforceable or otherwise ineffective in providing mitigation. The mitigation measures were not intended to individually provide full mitigation for Project GHG emissions. The measures were designed as a package, such that mitigating Project GHG emissions to a level of net zero is achieved by all four of the GHG mitigation measures working in concert. Since Project GHG emissions are mitigated to a net zero increase, additional mitigation for the significant and unavoidable impacts associated with plans, policies or regulations for reducing GHG emissions is not necessary or feasible.

A comment references the California Air Pollution Control Officers Association (CAPCOA) "CEQA and Climate Change" (2008) document as a source for mitigation measures for construction related GHG impacts. This document lists the following mitigation measures:

MM C-1: Certified Diesel Construction Equipment

MM C-2: Alternative Fuel Construction Equipment

MM C-3: Local Building Materials

MM C-4: Recycle Demolished Construction Material

MM C-1: Certified Diesel Construction Equipment is a mitigation measure for some criteria pollutants and diesel particulates (DPM), but the measure indicates that it has an adverse impact on GHG, as it "Increases CO2 emissions when trapped CO and carbon particles are oxidized." As such, there are reductions to some pollutants from certified diesel construction equipment but apparently there are also increases in GHG emissions. Other DEIR mitigation measures such as MM 4.3-3, which requires that off-road engines meet the Tier 3 emission standards, would substantially reduce emissions of criteria pollutants (without increasing GHG emissions).

The CAPCOA document includes MM C-2: Alternative Fuel Construction Equipment, but states that this measure is also adverse with respect to some criteria pollutants. The measure suggests "Use alternative fuel types for construction equipment. At the tailpipe biodiesel emits 10% more CO2 than petroleum diesel. Overall lifecycle emissions of CO2 from 100% biodiesel are 78% lower than those of petroleum diesel." However, the use of biodiesel may also result in a 10% increase in NOx

which would contribute to the nonattainment status for the State and federal ozone standard[104]. As such, MM 4.3-3 in the DEIR was recommended to reduce emissions of nitrogen oxides and particulate matter.

The CAPCOA document also lists MM C-3: Local Building Materials. The use of local building materials is frequently practiced by the construction industry to minimize the costs and time associated with transporting building materials.

Lastly, the CAPCOA document lists MM C-4: Recycle Demolished Construction Material. Section 4.17 Utilities and Service Systems of the DEIR discusses how the Kern County Waste Management Department (WMD) operates seven landfills, five transfer stations and three bin sites throughout the county. The WMD also operates two special waste facilities and provides information on recycling and waste to minimize waste generation. This DEIR section also discusses The California Solid Waste Reuse and Recycling Access Act of 1991 which requires expanded or new development projects to incorporate storage areas for recycling bins into the project design. Reuse and recycling of construction debris would reduce operating expenses and save valuable landfill space. To comply with this Act, the DEIR included the following mitigation measure:

MM 4.17-5 During construction activities for Project facilities, the Applicant shall not store construction waste onsite for longer than the duration of the construction activity, or transport any waste to any unpermitted facilities. The Applicant shall also reduce construction waste transported to landfills by recycling solid waste construction materials, such as taking materials to recycling and reuse locations listed in the brochure on recycling construction and demolition materials available on the Kern County Waste Management Department website.

For these reasons, the analysis in the EIR captures and addresses all GHG emissions from the Project and ensures that impacts from GHG emissions will be mitigated to a net-zero increase. The analysis is adequate under CEQA.

Haz-1: Pipeline Integrity

Commenters have suggested that the EIR does not adequately analyze and mitigate the risks from potential leaks from pipelines used during oil and gas activities that would be authorized by the Project, citing as an example the 2014 waste gas pipeline leak in the City of Arvin, CA. (The Arvin waste gas pipeline leak is discussed in the Chapter 4.8 – Hazards and Hazardous Materials, pp. 4.8-19-20).

As described in the Project Description, oil and gas activities that would be authorized by the Project could include construction and use of new, and use of existing, pipelines, including pipelines for transport of crude oil and natural gas, flowlines and injection lines, gathering lines and headers. (DEIR p. 3-45). These pipelines would transport crude oil, produced water, natural gas, waste gas,

[104] EPA. A Comprehensive Analysis of Biodiesel Impacts on Exhaust Emissions. EPA420-P-02-001. October 2002.

and other hazardous and nonhazardous substances. As described in Chapter 4.8 – Hazards and Hazardous Materials, myriad federal and state regulations address pipeline safety, including: the Transportation of Hazardous Liquids by Pipeline regulations (49 CFR 195) (DEIR p. 4.8-33); the Pipeline Safety Improvement Act of 2002 (DEIR pp. 4.8-35-36); the Hazardous Liquid Pipeline Safety Act of 1979 (DEIR 4.8-36-37); the Oil Pipeline Environmental Responsibility Act (DEIR p. 4.8-56); and California Public Utilities Commission General Order 112-E and Proposed Amended General Order 112-F (DEIR p. 4.8-57).

In addition to the above regulations, the AB 1960 implementing regulations, which became effective in January 2011, impose requirements on pipelines transporting crude oil not already regulated under federal law. The AB 1960 regulations are codified at 14 CC §§ 1722-1777.3. (DEIR pp. 4.8-72 – 74). Pursuant to Section 1774 – Pipeline Construction and Maintenance, "[n]ewly installed pipelines shall be designed and constructed, and all pipelines shall be tested, operated, and maintained in accordance with good oil field practices and applicable standards …." The regulations further require that operators visually inspect all aboveground pipelines for leaks and corrosion at least once a year, and that any pipeline found to have a release of a reportable quantity be pressure tested to verify integrity prior to return to service. Further, mechanical integrity testing is required to be performed every two years on all active environmentally sensitive pipelines that are gathering lines, and all urban pipelines over 4 inches in diameter, subject to an exemption for pipelines less than 10 years old. The AB 1960 regulations further require operators to prepare and implement a pipeline management plan for all pipelines that have not been abandoned to the specified standards. 14 CCR 1776(f). The plan is required to be updated within 90 days of whenever pipelines are acquired, installed, or altered, or otherwise at the request of DOGGR.

The DEIR identified Mitigation Measure (MM) 4.8-4 to require, among other things, mechanical integrity testing requirements on pipelines within 200 feet of a sensitive receptor. MM 4.8-4 also applies to gas, oil and produced water pipelines, which goes beyond the proposed requirements in AB 1420, which would apply to gas pipelines only. Based on comments received, MM 4.8-4 is modified as follows to apply to pipelines within 300 feet of a sensitive receptor rather than 200 feet as identified in the DEIR:

MM 4.8-4 The Applicant shall implement the following measures to prevent, repair, and remediate accidental leaks and spills from oil and gas operations.

a. The Applicant shall identify gas, oil and produced water pipelines to be used for each new or reworked well site in its Site Plan, and shall show the location of any sensitive receptor located within ~~200~~ **300** feet of any such pipeline. For any pipeline located within ~~200~~ **300** feet of a sensitive receptor, the Applicant shall present evidence that each such pipeline has been integrity tested using pressure testing or other accepted test methods by a qualified professional within a two-year period prior to submittal of the Site Plan, and shall provide a copy of the test result to the County. For all waste gas lines less than or equal to 4 inches in diameter, a Pipeline Management Plan shall be developed and implemented in accordance with Division of Oil Gas and Geothermal Resources regulations Title 14, Division 2, Chapter 4, Section 1774.2. The Pipeline Management Plan shall include:

1. A listing of information on each pipeline including, but not limited to:
   i. Pipeline type.
   ii. Grade.
   iii. Installation date of pipeline.
   iv. Design and operational pressure.
   v. Any leak, repair, inspection and testing history.

2. A description of the testing method and schedule for all pipelines.

b. The Applicant shall notify the Kern County Environmental Health Division, surface landowner, and sensitive receptors located within 300 feet, of reportable quantities of fuel, gas, petroleum or hazardous materials leaks to the County within 48 hours of discovery, and to other applicable agencies as required by other laws. The Applicant shall immediately contain the leak (e.g., by isolating or shutting down the leaking equipment), clean up contaminated media (e.g., soils), and repair the leak prior to recommencing operations. The Applicant shall report the status and progress of the leak repair and remediation work to the County on monthly intervals until the repair has been completed, and any contaminated media has been remediated.
c. As part of the Site Plan, The Applicant shall identify the location and right of way for all pipelines to be used for the transport of oil, gas, and produced water, including pipelines that intersect the main transport line, based on existing data and using commercially available technology, and, based on the results of this analysis, shall identify any sensitive receptors within 300 feet of the pipeline for purposes of complying with Mitigation Measure 4.8-4. Mechanical integrity testing of all such pipeline lengths within 300 feet of a sensitive receptor shall be required pursuant to Mitigation Measure 4-8-4.
d. If a release, identified pursuant to subsection (b), cannot be repaired or remediated within 48 hours, and has potential impact to sensitive receptors, the Applicant shall incur costs to sample and analyze the potentially affected area, which may include soil, groundwater, outdoor or indoor air of sensitive receptors within 300 feet of the leak. Applicant shall pay all temporary relocation costs (e.g., housing, food, and transportation) for any exposed sensitive receptor until such time as the leak has been repaired and post-indoor air testing has been completed, as confirmed by identified agency having oversight of the remediation

Based on existing federal and state regulations, including AB 1960, as well MM 4.8-4 and other proposed mitigation measures, the DEIR concludes that impacts associated with the routine transport, use or disposal of hazardous materials via pipeline would be less than significant. (DEIR,

pp. 4.8-71 – 4.8-89. If the Project is approved, use of pipelines for oil and gas activities in Kern would be the most rigorously regulated in the State.

Nevertheless, commenters have suggested that, as with the waste gas pipeline leak in Arvin, CA, where records of the pipeline records purportedly showed the pipeline in a different location, so-called "legacy" pipelines must be identified and located to ensure that such pipelines do not run under or near sensitive receptors. The County recognizes that, over the course of one hundred-plus years of oil and gas operations in the County, thousands of miles of pipelines have been laid, and that over time, use of many of those pipelines may have been discontinued and records relating to their precise location lost. The existence of such legacy pipelines is not a function of the Project, however, and, pursuant to CEQA, is part of the environmental baseline. As explained by the California Supreme Court in *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310 (*CBE*), "the baseline for CEQA analysis must be the 'existing physical conditions in the affected area' . . . , that is, the 'real conditions on the ground'." (*Id*. at p. 321, quoting *Environmental Planning & Information Council v. County of El Dorado* (1982) 131 Cal. App. 3d 350, 354, and *Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 121.) This is the case even where "actual development or activity had, by the time CEQA analysis was begun, already exceeded that allowed under the existing regulations." (*CBE, supra*, 48 Cal.4th at p. 321; see also *Riverwatch v. County of San Diego* (1999) 76 Cal.App.4th 1428, 1452-1453[baseline for a proposed quarry development was the actual condition of the land, even though some existing environmental degradation had resulted from prior illegal mining and clearing activities]; *Fat v. County of Sacramento* (2002) 97 Cal.App.4th 1270, 1278-1280 [baseline for airport expansion was existing airport operations, even though the airport had been operating and had expanded without a required permit for several years]; *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 370-371 [baseline for proposed school playground use was the existing playground facility, even though prior construction of the facility may have violated the city's code].) "This is so even if the current condition includes unauthorized and even environmentally harmful conditions that never received, and, as a result of being incorporated into the baseline, may never receive environmental review." (*Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal.App.4th 214, 249, citing *Citizens for East Shore Parks v. State Lands Com.* (2011) 202 Cal.App.4th 549, 561 [explaining that the CEQA definition of the environmental baseline means some existing environmental conditions may "never receive environmental review"]; see also *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1233 [stating that "any illegal activities affecting the baseline environmental condition are best addressed by enforcement agencies"].) Thus, the County lacks the authority pursuant to CEQA to require mitigation to address the existence of legacy pipelines.

However, for existing pipelines that will be used by the Project, the County does believe further action can be taken to map the location of these pipelines so that, as necessary, the requirements MM 4.8-4 can be applied if such pipelines are within 300 feet of a sensitive receptor. Subsection (c) of MM 4.8-4 was added to address this issue, as noted above.

The potential impact from the routine transport, use or disposal of hazardous materials via pipeline would continue to be less than significant with mitigation.

Haz-2: Idle Wells

Some commenters have expressed concern regarding potential impacts of existing idle wells located within the County. An idle well is a well that has not been officially plugged and abandoned, on which the operator has ceased all activity, including but not limited to drilling, production or injection. (DEIR at p. 11-29.) The County recognizes that, over the course of one hundred-plus years of oil and gas operations in the County, numerous wells have been allowed to idle. The existence of such idle wells is not a function of the Project, however, and, pursuant to CEQA, is part of the environmental baseline.

As explained by the California Supreme Court in *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310 (*CBE*), "the baseline for CEQA analysis must be the 'existing physical conditions in the affected area' . . . , that is, the 'real conditions on the ground'." (*Id*. at p. 321, quoting *Environmental Planning & Information Council v. County of El Dorado* (1982) 131 Cal. App. 3d 350, 354, and *Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 121.) This is the case even where "actual development or activity had, by the time CEQA analysis was begun, already exceeded that allowed under the existing regulations." (*CBE, supra*, 48 Cal.4th at p. 321; see also *Riverwatch v. County of San Diego* (1999) 76 Cal.App.4th 1428, 1452-1453[baseline for a proposed quarry development was the actual condition of the land, even though some existing environmental degradation had resulted from prior illegal mining and clearing activities]; *Fat v. County of Sacramento* (2002) 97 Cal.App.4th 1270, 1278-1280 [baseline for airport expansion was existing airport operations, even though the airport had been operating and had expanded without a required permit for several years]; *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 370-371 [baseline for proposed school playground use was the existing playground facility, even though prior construction of the facility may have violated the city's code].) "This is so even if the current condition includes unauthorized and even environmentally harmful conditions that never received, and, as a result of being incorporated into the baseline, may never receive environmental review." (*Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal.App.4th 214, 249, citing *Citizens for East Shore Parks v. State Lands Com.* (2011) 202 Cal.App.4th 549, 561 [explaining that the CEQA definition of the environmental baseline means some existing environmental conditions may "never receive environmental review"]; see also *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1233 [stating that "any illegal activities affecting the baseline environmental condition are best addressed by enforcement agencies"].) Therefore, existing idle wells within the Project Area are properly considered part of the environmental baseline for the purpose of this EIR. (See, e.g., Draft EIR, p. 4.3-73.)

However, the Draft EIR describes and analyzes potential impacts associated with future well abandonments authorized under the proposed Amendment to Chapter 19.98 (Oil & Gas Production). Specifically, the Draft EIR analyzes potential impacts associated with the anticipated abandonment of 2,231 wells per year in the Project Area. (Draft EIR, pp. 1-19, 4.9-134.) Similarly, the Draft EIR acknowledges the potential for idle wells to be reactivated. Reactivation of an idle

well may range from simple activities, such as replacement of a well pump, to well deepening, sidetracking, or re-working. (Draft EIR, p. 3-53.) As discussed in the Project Description, the Draft EIR addresses potential environmental impacts associated with reactivation of idle wells that may occur under the proposed project. Where necessary, the Draft EIR requires mitigation measures to address potentially significant project-specific and cumulative impacts associated with future reactivation as well as abandonment of wells within the Project Area. (See Generally Draft EIR, Chapter 4.) Therefore, the Draft EIR properly incorporates existing idle and abandoned wells into the baseline conditions; in addition, the Draft EIR evaluates and mitigates potential impacts to the extent future well activities are anticipated to create new idle or abandoned wells or otherwise impact existing idle or abandoned wells within the Project Area through, for example, reactivation of an idle well.

In response to comments, the County has added a new idle well process to the Revised Amended Ordinance to help facilitate public involvement, DOGGR enforcement, and applicant accountabity, for compliance with DOGGR's idle well regulations. (Section 7.1.3)

Noise-1: Noise and Vibration

"A threshold of significance is an identifiable, quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." (CEQA Guidelines, § 15064.7 subd. (a))

Like many lead agencies, Kern County has exercised its discretion to formulate significance thresholds by using language from Appendix G of the CEQA Guidelines. Consistent with the CEQA Guidelines, Kern County has adopted the following thresholds of significance (among others) to analyze noise impacts from project construction and operation: (1) whether a project would expose persons to, or generate noise levels in excess of standards in the local general plan or noise ordinance or applicable standards of other agencies; (2) whether a project would create a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project; and (3) whether a project would create a permanent increase in ambient noise levels in the project vicinity above levels existing without the project. (DEIR, p. 4.2-18.)

The first threshold applies to both project construction and project operation, and addresses whether the proposed project would result in "exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies standard." This threshold clearly specifies that noise impacts should be analyzed against the standards established in the local general plan. The Kern County General Plan, as well as the general plans for each of the incorporated cities within the project area, applies an exterior noise

level standard of 65 dB DNL[105] for noise-sensitive receptors. (DEIR, pp. 4.2-8, 4.2-18; Noise Assessment (September 2015), p. 14.) Therefore, a project would normally be considered to have a significant impact if it would result in exposure of persons to exterior noise levels in excess of 65 dB DNL/CNEL.

The second threshold applies to project construction, and addresses whether the proposed project would create a "substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project." The third threshold applies to project operation, and addresses whether the proposed project would create a "substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project." While these two thresholds qualitatively assess temporary or permanent increases over ambient noise without the project, the lead agency – Kern County – maintains discretion to determine the quantitative threshold applicable to each project. For this project, the County applied a quantitative threshold of 65 dB DNL/CNEL, which represents the exterior noise levels the County has deemed to be acceptable for noise sensitive areas. (DEIR, pp. 8-9; General Plan, pp. 145-150.) Where a project would exceed 65 dB DNL/CNEL, noise mitigation measures would be required. (General Plan, p. 148.)

In addition, the County noise ordinance exempts from restriction all daytime construction noise that occurs between 6:00 AM and 9:00 PM on weekdays, and between 8:00 AM and 9:00 PM on weekends. For nighttime construction noise occurring between 9:00 PM and 6:00 AM on weekdays and between 9:00 PM and 8:00 AM on weekdays, the Kern County noise ordinance provides that construction noise cannot be audible within 150 feet of the construction site and 1,000 feet of an occupied residential building. (DEIR, p. 4.12-20.) These exemptions are typical of city and county noise ordinances and reflect the recognition that construction-related noise is temporary in character, is inherently noisy, is generally acceptable when limited to daylight hours, and is part of what residents expect as part of a typical urban noise environment.

A number of commenters challenged the County's selected noise thresholds. As an initial matter, where an agency's significance thresholds are challenged by a project opponent, the standard of review for a court reviewing the selected threshold is the "substantial evidence" standard, meaning the court must give deference to the lead agency's decision to select particular significance thresholds, including the threshold for construction noise. (See National Parks and Conservation Association v. County of Riverside (1999) 71 Cal.App.4th 1341, 1358 [applying the substantial evidence test to review of an agency's decision to select particular thresholds for an EIR]; Mount Shasta Bioregional Ecology Center v. County of Siskiyou (2012) 210 Cal.App.4th 184, 204-207 [upholding analysis of increased noise generated by project based on significance thresholds adapted from other agencies]; Eureka Citizens for Responsible Government v. City of Eureka (2007) 147

[105] DNL is the day/night average sound level, which is the average equivalent sound level during a 24-hour day, obtained after addition of ten decibels to sound levels in the night after 10:00 pm and before 7:00 am. The DNL represents the existing ambient conditions, as measured over a 24 hour period.

Cal.App.4th 357, 371-374 [deferring to city's determination that noise analysis was performed in a manner consistent with general plan policy]; Sierra Club v. Tahoe Regional Planning Agency (E. D. Cal. 2013) 916 F.Supp.2d 1098, 1146-1151 [upholding agencies' application of significance threshold for construction noise].) As discussed in the DEIR and in these responses to comments, the County's noise thresholds are supported by substantial evidence. As such, they are to be accorded great deference.

Those commenters challenging the thresholds generally attack the quantitative 65 dB DNL threshold long used by the County in its CEQA documents, which is based on the Noise Element in the County's General Plan, to measure whether the project would create substantial temporary or permanent unacceptable increases in ambient noise levels in the project vicinity above levels existing without the project. Rather than rely on the County's adopted General Plan noise standard of 65 dB DNL, which was developed to protect County residents from excessive noise, commenters suggest the County should have applied an alternative quantitative threshold that analyzes whether a project would create a 5 dB increase over the existing ambient noise level. CEQA does not require the County to adopt such threshold. To the contrary, CEQA vests the lead agency with substantial discretion in determining the appropriate threshold of significance to evaluate the severity of a particular impact. (See CEQA Guidelines, § 15064, subd. (b); Save Cuyama Valley v. County of Santa Barbara (2013) 213 Cal.App.4th 1059, 1068 [explaining agency discretion to fashion significance thresholds].) As explained in the CEQA Guidelines, "[t]he determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting. For example, an activity which may not be significant in an urban area may be significant in a rural area." (CEQA Guidelines, § 15064, subd. (b).)

Importantly, case law clearly provides that a lead agency does not run afoul of CEQA by rejecting different thresholds proposed by a project opponent. (See Citizens for Responsible Equitable Environmental Development v. City of Chula Vista (2011) 197 Cal.App.4th 327, 335-336 ("CREED") [rejecting petitioners' argument that the City erred by not applying a different significance threshold]; California Oak Foundation v. Regents of University of California (2010) 188 Cal. App. 4th 227, 282 [rejecting petitioner's argument that a lead agency used the incorrect significance threshold in evaluating the biological significance of tree impacts]; National Parks & Conservation Assn. v. County of Riverside (1999) 71 Cal. App. 4th 1341, 1356-1357 [upholding a biological significance threshold used by Riverside County as supported by substantial evidence].) Moreover, CEQA does not require an agency to set thresholds that would essentially establish a "one molecule rule" by which a project's noise impacts would be deemed significant if the project's noise levels exceeds the background ambient levels by five decibels. (Communities for a Better Environment v. California Resources Agency (2002) 103 Cal.App.4th 98, 120.)

To the extent commenters suggest it is inappropriate for the County to rely on regulatory noise standards, such as the County's General Plan, to analyze noise impacts, commenters are incorrect. Ordinances, plans, policies, and regulations adopted by a lead agency, or adapted from those of another agency with expertise over the resource at issue, can and often do serve as the basis for

setting thresholds of significance. (See North Coast Rivers Alliance v. Marin Mun. Water Dist. (2013) 216 Cal.App.4th 614, 651 [upholding analysis of greenhouse gas emission based on consistency with county's emissions reduction goals]; National Parks & Conserv. Assn. v. County of Riverside (1999) 71 Cal.App.4th 1341, 1353 [upholding EIR's use of county noise standards for assessing significance of project's noise impacts]; Mira Mar Mobile Community v. City of Oceanside (2004) 119 Cal.App.4th 477, 492-493 [upholding thresholds of significance for aesthetic impacts derived from city's local coastal program policies; Sierra Club v. Tahoe Regional Planning Agency (E. D. Cal. 2013) 916 F.Supp.2d 1098, 1146-1151 [upholding significance threshold that limited hours during which construction could occur, but did not otherwise impose limit on construction noise because county's approach was consistent with noise ordinance.)

CEQA case law also endorses a lead agency's use of existing environmental standards or regulations as thresholds of significance. (See Tracy First v. City of Tracy (2009) Cal.App.4th 912 [upholding determination that energy impact of project was less than significant because the project achieved energy efficiencies greater than those required by California Energy Efficiency Standards]; Cadiz Land Co. v. Rail Cycle (2000) 83 Cal.App.4th 47 [upholding finding that incremental impacts of criteria pollutants on sensitive crops would be less than significant based on National Ambient Air Quality Standards promulgated to protect public health and welfare from adverse effects of a pollutant]; Protect The Historic Amador Waterways v. Amador Water Agency (2004) 116 Cal.App.4th 1099, 1107 ["thresholds can be drawn from existing environmental standards, such as other statutes or regulations"]; Rialto Citizens for Responsible Growth v. City of Rialto (2012) 208 Cal.App.4th 899 [upholding use of thresholds of significance recommended by SCAQMD to assess air quality impacts]; Oakland Heritage Alliance v. City of Oakland (2011) 195 Cal.App.4th 884, 896 [agency has discretion to rely on adopted standards to serve as significance thresholds for a particular project].)

In sum, the EIR properly relied on its General Plan and noise ordinance to establish thresholds of significance for noise impacts.

One commenter attached an Acoustical Review of the DEIR, prepared by Charles M. Salter Associates, Inc. (Salter Report). The Salter Report alleges that the County's noise analysis ignores increases to ambient noise levels, does not adequately mitigate noise and vibration impacts, and fails to analyze interior noise, nighttime noise and single event noise. The County reviewed the Salter Report and determined that it does not constitute substantial evidence of noise impacts not already addressed in the DEIR. Commenter's citations to its own expert to discredit the County's environmental and noise experts constitutes nothing more than a classic "battle of the experts." Under established CEQA precedent, lead agencies may accept the determinations and conclusions reached by the expert or experts that prepared the EIR, even though other conclusions also might be reached by other experts. (See Center for Biological Diversity v. Dept. of Fish & Wildlife (2014) 224 Cal.App.4th 1105, 1179-1180; Eureka Citizens v. City of Eureka (2007) 147 Cal.App.4th 357, 371-72; Greenebaum v. City of Los Angeles (1984) 153 Cal.App.3d 391, 412 [it is not an "abuse of discretion" for a public agency "to give more weight to one set of 'experts' than to another"].) Here, the County properly relied upon the standards articulated in its General Plan and Noise Ordinance, and upon the analysis and conclusions of its noise expert and EIR consultant.

Some commenters attempt to frame the EIR's use of regulatory thresholds as a "baseline" issue. The E's selection of the appropriate significance thresholds by which to measure a project's impacts is not akin to the DEIR's description of the existing environmental conditions, or the "baseline." As such, the law governing a lead agency's selection of thresholds differs vastly from the case law governing a lead agency's description of the environmental baseline. The "baseline" cases cited by commenters (Communities for Better Environment v. South Coast Air Quality Management Dist. (2010) 48 Cal.4th 310; Environmental Planning & Information Council v. County of El Dorado (1982) 131 Cal.App.3d 350) are clearly inapplicable to the County's selection of the noise thresholds for the proposed project. In Communities for Better Environment, the EIR for a refinery project relied upon the permitted emissions capacity as the "baseline" rather than the refinery's actual emissions. The Supreme Court held that the maximum amount of emissions allowed under the refinery's existing permit was not part of the baseline against which future environmental impacts should be assessed. The Court did not address an agency's reliance on its General Plan standards as significance thresholds. Similarly, in Environmental Planning & Information Council v. County of El Dorado (1982) 131 Cal.App.3d 350, 355 the Court of Appeal analyzed whether the a project to update the county's general plan should set the baseline by the existing general plan or on the "actual environment upon which the proposal will operate." The Court did not consider whether the county could rely on its regulations to establish thresholds of significance.

In any event, here the County's EIR did quantify and disclose the on-site existing average ambient noise emissions. As explained in the DEIR, ambient noise monitoring was conducted between January 7, 2015 and January 21, 2015, at 18 locations within the Project Area. Noise monitoring sites were selected to represent typical acoustic settings within the Project Area where oil and gas exploration and production activities either already occur or could occur in the future, and included six locations in the Western Subarea, six locations in the Central Subarea, and six locations in the Eastern Subarea. (DEIR, p. 4.12-4; Noise Assessment, p. 8.) As shown in Table 4.12-3 of the DEIR, the average DNL for the project area, or the average ambient baseline condition, is 54.7 dB DNL. (DEIR, p. 4.12-5; see also, Noise Assessment (September 2015), Table V, p.9.)

In addition, existing traffic noise levels along US 5 and along state highways in the project area were calculated to provide a representative sampling of the range of existing traffic-related noise levels along major roadways within the project area. (Noise Assessment (September 2015), p. 10.) A total of 270 roadway segments were analyzed for existing traffic noise exposure. Traffic noise levels were calculated using the FHWA Highway Traffic Noise Production Model. Table VI in the Noise Assessment prepared for the project summarizes existing annual average (or baseline) traffic noise exposure. In addition, existing noise levels generated by the three railroad operations in the project area (the Union Pacific Railroad, Burlington Northern Santa Fe Railway and San Joaquin Valley Railroad) were calculated by Brown-Buntin Associates and are reported in Table VII of the Noise Assessment. (Noise Assessment (September 2015), Table VII, p. 11.) The Noise Assessment also addressed existing aircraft noise levels and reasonably foreseeable noise from the high speed train proposed by the California High Speed Rail Authority. (Noise Assessment (September 2015), p. 12.)

After disclosing the existing ambient noise in the Project Area, the DEIR disclosed the construction and operational noise that is expected to be generated by the project. Although noise impacts may vary for each location of future oil and gas construction and operational activities, the DEIR analyzed the potential project activities (both construction and operations) that may occur at any given time. (DEIR, p. 4.12-18.) As explained in the DEIR and further articulated in the Noise Assessment prepared for the project, project-related construction noise levels could exceed 60 dB CNEL at distances of 800 to 3,000 feet. (DEIR, p. 4.2-19.) Table 4.12-11 in the DEIR provides estimated project construction noise levels caused by well pad preparation, Table 4.12-12 sets forth estimated project construction noise levels for well drilling, and Table 4.12-13 presents estimated project construction noise levels for hydraulic fracturing (DEIR, pp. 4.2-26 to 4.2-17.) The Noise Assessment further articulates the anticipated noise generated by typical project construction equipment at distances of 50 to 100 feet from a receptor. (Noise Assessment (September 2015), p. 20.)

For project operations, the DEIR analyzed noise exposure that would be caused by gas and production wells and related accessory activities. Here, the DEIR disclosed that well production (electric power) could exceed 60 dB CNEL at a distance of 70 feet and well production (diesel power) could exceed 60 dB CNEL at a distance of 190 feet. (DEIR, p. 4.12-20.) The Noise Assessment further disclosed the project-related noise exposure caused by each project-related noise source. Table XI in the Noise Assessment provides distances to the 60 dB DNL and 65 dB DNL contours for individual project related noise sources such as drilling, hydraulic fracturing and well production. (Noise Assessment (September 2015), p. 17.)

While the DEIR discloses that the increased noise from the project would constitute a change to existing on-site conditions, this increase alone is not sufficient to support a significance determination because the County has determined that exterior noise levels at or below 65 DNL are not harmful. The DEIR therefore inquires whether the project's noise generation is significant when measured against the County's noise threshold as codified in its General Plan. (DEIR, pp 18-20, 25-28.) Neither CEQA nor any of the CEQA "baseline" cases cited by commenters prohibits the use of these EIR inquiries. To the contrary, the CEQA Guidelines expressly allow a lead agency to use its discretion to select the appropriate factors for determining the significance of impacts. (See CEQA Guidelines § 15064(b) ["The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved . . ."].) Guidelines section 15125(e) also authorizes comparison of a project to an adopted plan, provided the analysis examines "the existing physical conditions . . . as well as the potential future conditions discussed in the plan."

Moreover, commenters do not show how the use of the EIR's inquiries precluded, or could preclude, public participation or informed decision-making. The EIR' s noise analysis is supported by substantial evidence; does not understate the Project' s actual noise impacts; and examines and discloses existing ambient noise conditions and the significance of the Project's emissions based on the methodology derived from the County's General Plan. It is only when an EIR "fails to include relevant information and precludes informed decision-making and public participation" that a

prejudicial abuse of discretion arises. (Save Our Peninsula Committee v. Monterey County Bd. of Supervisors (2001) 87 Cal.App.4th 99, 128.) That did not occur here.

The DEIR Was Not Required to Analyze Single Event Noise

Some commenters assert the DEIR is inadequate for failing to analyze sleep disturbance caused by single event noise. Single event noise is measured by the Sound Exposure Level (SEL), a noise metric commonly used to describe intermittent or isolated noise events such as an aircraft overflight or train pass-by, and should not be applied when describing long-term exposure over a 24-hour period of time. There are no noise standards that utilize the SEL metric. Kern County establishes noise level criteria in terms of the DNL metric. The DNL is a the time-weighted energy average noise level for a 24-hour day, with a 10 dB penalty added to noise levels occurring during the nighttime hours (10:00 p.m.-7:00 a.m.). The 10 dB penalty applied during the nighttime hours accounts for increased sensitivity to noise exposure occurring during nighttime hours, and therefore does address the potential for sleep disturbance.

Interior Noise Levels Would Be Less Than Significant

Some commenters allege the DEIR improperly omits analysis of noise impacts on interior noise levels of sensitive receptors. This is incorrect. Although the DEIR did not explicitly describe potential impacts to interior noise levels, it can be assumed that compliance with the exterior noise level standards established in the DEIR will also demonstrate compliance with the interior noise threshold of 45 dB DNL. Although construction methods and materials vary based upon location and period of construction, typical construction complying with building code standards can be expected to provide an outdoor-to-indoor noise level reduction (NLR) of a at least 20 dB. The DEIR establishes an exterior noise level criterion of 65 dB DNL. Demonstration of project compliance with the exterior noise level criterion would ensure project compliance with the interior noise level criterion of 45 dB DNL. It can reasonably be assumed that residential uses will be capable of providing a minimum outdoor-to-indoor NLR of 20 dB, provided door and windows remain closed for acoustical purposes. Contrary to some commenters' opinions, quantification of outdoor-to-indoor noise level reductions and subsequent interior noise levels is commonly determined with doors and windows closed.

Nighttime Noise Levels Would Be Less Than Significant

Some commenters assert the DEIR is inadequate for failing to analyze nighttime noise impacts. Here, commenters assert the DEIR should take into account receptors' higher sensitivity to noise during nighttime hours. As noted above, however, Kern County establishes noise level criteria in terms of the DNL metric. The DNL is a the time-weighted energy average noise level for a 24-hour day, with a 10 dB penalty added to noise levels occurring during the nighttime hours (10:00 p.m.-7:00 a.m.). The 10 dB penalty applied during the nighttime hour accounts for increased sensitivity to noise exposure occurring during nighttime hours, and therefore does address the potential for sleep disturbance. The DEIR concludes that noise impacts are less than significant with mitigation.

The Noise Mitigation Measures Adequately Reduce Noise Impacts to Less Than Significant

The DEIR requires the project applicant to implement mitigation measure 4.12-1 and mitigation measure 4.3-3 to reduce construction and operational noise impacts to less than significant. Measure 4.12-1 includes a number of measures, such as temporary sound attenuation walls, modification of equipment, construction of a temporary berm, and minimum setback distances for various construction activities (e.g., 800 foot setback for well pad preparation.) Measure 4.12-2 requires a minimum 190 foot setback between new oil and gas wells and the closest sensitive receptor. In addition, Table XI of the Noise Assessment describes minimum setback distances required to ensure that noise impacts remain less than significant. (Noise Assessment (September 2015), p.17.)

A few comments suggested that these mitigation measures are inadequate to reduce noise impacts to less than significant levels. The minimum setbacks provided in Table XI of the Noise Assessment accurately describe the minimum setback distances required to ensure that noise levels do not exceed 65 dB DNL at sensitive receptors, for each specified equipment type. The setbacks described in Table XI were calculated and modeled using the loudest Leq levels for each type of equipment. Leq noise level measurements were obtained from 4 individual directions from each equipment type to document the loudest direction from the noise source. Additionally, the reference measurements were obtained while each equipment type was operating at maximum capacity during the loudest activity. For example, over any given period of time, noise levels fluctuate during drilling activities such as well advancement and well pull out activities. Noise levels increase as the drill rig is actively advancing (loudest activity) and decrease while the well string is being pulled from the bore hole and new sections of pipe are added. Over any given hour or 24-hour period, there are regular periods of time where the diesel engine may be turned off entirely for maintenance or other required services. The setback distances provided in Table XI assume continuous, peak noise levels over a 24-hour period, and therefore should be considered a worst-case assessment of project-related noise levels (setback distances). Therefore, utilizing these minimum setbacks will ensure compliance with the County's applicable 65 dB DNL noise threshold and the impacts will be less than significant.

A Revised Noise Study has been submitted to and accepted by the County. FEIR, App. F-1. The Revised Noise Study provides additional information concerning appropriate setbacks and, for each construction activity, the setback distance has increased slightly, resulting in still greater protection for the environment. Mitigation Measure 4.12-1 has been revised to incorporate these new setback requirements.

TR-1: Traffic Analysis and Mitigation Program

The County received several comments concerning the EIR's analysis of transportation and traffic impacts. This global response is intended to address those comments in a single response. Comments not addressed by this Master Response are addressed in the individual responses to comments.

Introduction

The DEIR's analysis of the Project's transportation and traffic impacts is set forth in DEIR, *Section 4.16, Transportation and Traffic*. This section describes the affected environment and regulatory setting for transportation and traffic. It also describes the impacts on transportation and traffic that would result from the implementation of the Amendment to Chapter 19.98 (Oil and Gas Production) of the Project, including impacts from future oil and gas development pursuant to the Amended Zoning Ordinance, and mitigation measures that would reduce these impacts, if necessary.

This section of the EIR is based on the technical study, Traffic Impact Study and Roadway Assessment Kern County Oil and Gas Well Activity (Traffic Study), dated March 2015, which was prepared by Ruettgers and Schuler and included as Appendix W to the EIR. The Traffic Study provides an analysis of existing and 2035 traffic conditions. Potential traffic impacts to intersections and roadways were determined for both development/construction and operation of the Project using the most recently published roadway volumes and project-related vehicle trip calculations. Discussion and evaluation of the transportation facilities, including pavement conditions, are based on site surveys with applicable thresholds and impacts identified. Additional impacts to the airport system are also discussed.

As explained in *Section 4.16, Transportation and Traffic*, with mitigation, the Project would not conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, and would not conflict with an applicable congestion management program. With mitigation, the Project would not result in a change in air traffic patterns that results in substantial safety risks, nor would it substantially increase transportation-related hazards due to a design feature or incompatible use. The Project, as mitigated, would have a less than significant impact with respect to its potential to result in inadequate emergency access, and would not conflict with adopted policies, plans, or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities. Finally with mitigation, the Project would not make a cumulatively considerable contribution to cumulative transportation or cumulative traffic impacts. (See also DEIR, at p. 6-9.)

The County's Reliance on its Transportation Experts

As an initial matter, under established CEQA precedent, lead agencies such as the County, may accept the determinations and conclusions reached by the expert or experts that prepared the EIR, even though other conclusions also might be reached by other experts. (See *Center for Biological Diversity v. Dept. of Fish & Wildlife* (2014) 224 Cal.App.4th 1105, 1179-1180; *Eureka Citizens v. City of Eureka* (2007) 147 Cal.App.4th 357, 371-72; *Greenebaum v. City of Los Angeles* (1984) 153 Cal.App.3d 391, 412 [it is not an "abuse of discretion" for a public agency "to give more weight to one set of 'experts' than to another"].) Here, the County's determinations are supported by substantial evidence; it has properly relied on the standards articulated in its CEQA Implementation Document, its Environmental Checklist, and upon the analysis and conclusions of its transportation and traffic expert and EIR consultant in arriving to its less than significant impact conclusions for Impacts 4.16-1 through 4.16-7.

A detailed discussion of concerns raised by commenters is presented below.

Pavement Conditions

A commenter raised concerns regarding the DEIR's impact analysis of pavement conditions, suggesting that that the analysis of traffic impacts and road wear and tear appear to exclude vehicle trips associated with workers driving to and from the project site. A commenter also raised concerns regarding the determination of appropriate mitigation for pavement impacts, arguing that there was no justification as to how mitigation fees were reached.

The EIR did consider the potential impacts of oil and gas traffic on pavement condition. (See DEIR, at pp. 4.16-25 – 4.16-28, 4.16-50 – 4.16-78; Traffic Report, at pp. 69-76.) As noted in the traffic study:

> Heavy truck traffic is the primary factor affecting pavement condition. Pavements are designed using a Traffic Index (TI) which is a measure of the cumulative number of heavy trucks expected to load a pavement over its service life. As per Caltrans methodology, TI's are estimated by converting mixed truck loads to 8,000-pound Equivalent Single-Axle Loads (ESAL's).

(Traffic Study, at p. 69.) To accurately reflect pavement impacts over the duration of the project, the analysis methodology, the analysis included freeways, highways, arterials and collectors. Specifically, on the same page the Traffic Study states:

> A TI for a 20-year design life (standard for new roadway construction) was assigned to each study roadway. Caltrans truck count data for the year 2012 were used to develop TI estimates for state routes per Caltrans methodology. When available, design TI's obtained from record drawings were used for county roadways. For each of the remaining county roadways, TI's were estimates based on a review of KernCOG traffic count data and roadway classification.

Using the inputs above, the County was able to run the pavement condition analysis:

> The pavement condition analysis consisted of assessing the need and timing for maintenance and rehabilitation improvements per roadway segment per study year based on estimates of remaining pavement service life. Both remaining life and improvement needs were estimated based on a pavement life cycle curve developed for this study. The curve . . . closely approximates a "typical" pavement life cycle curve and correlates PASER ratings to pavement condition.

One comment states that the pavement condition analysis resulted in inadequate maintenance mitigation fee determinations and cites both: (a) oil and gas truck loads; and (b) mitigation fees from other states. Neither point of criticism is considered applicable to this Project. The comment refers to reported occurrences of oil and gas trucks exceeding legal load limits in Pennsylvania as a reason why the County should consider increased oil and gas axle loadings in the pavement condition analysis. The existence of illegal loads in Pennsylvania does not substantiate the existence of illegal

oil and gas loads in the County. The EIR assumes that special loads are permitted by the County, and are dealt with independently from the normal oil and gas permit process.

A direct comparison of the pavement condition mitigation fee calculated as a part of this study to similar fees imposed in other states suggests a uniformity in oil and gas traffic characteristics and roadway maintenance and rehabilitation practices that is neither presented nor supported. There are a number of variables that go into determining pavement condition and the variables cited in the states referenced by the commenter are unknown. For example, the initial condition of the roads may have been highly deficient to begin with for truck loading and the volume of trucks used in oil activity. Additionally, many other regions of the country do not have Kern County's pipeline infrastructure for both oil products and water. Another variable is weather – Kern County does not have extreme winter weather that destroys road pavement, as do some of the regions to which the comments refer.

Significantly, Kern County is different from most other regions cited by the comments in that the County's road system has been built to service the oil & gas industry over the past 100 years. (Traffic Study, p. 3.) Accordingly, traffic related to oil and gas production is not a new impact on an existing road system. Further, as described in the Traffic Study, and included as MM 4.16-1, the County is developing and implementing a pavement condition mitigation program to ensure Project-related activities contribute their fair share for the preservation, upkeep, and restoration of county roads and appurtenant facilities. (DEIR, at p. 1-65, 4.16-77.)

Level of Service

One comment suggests that the DEIR did not analyze the "existing plus project" traffic scenario. The "existing plus project" traffic scenario was considered in the DEIR as the "Year 2015" Scenario. (DEIR, at pp. 4.16-45 – 4.16-49; Traffic Study, at pp. 18-68.)

One comment states that the DEIR's analysis of traffic impacts is inadequate. Specifically, the commenter disagrees with the DEIR's conclusions that several signal-controlled intersections will have an improved LOS after the addition of Project traffic under 2035 conditions.

Level of Service is used to provide generalized categories of operational performance, which can be clearly understood by decision-makers and the general public. This rating system is used by the County to provide criteria and thresholds for significant impacts. The evaluation of delay numbers is a technical consideration for engineers during the report development process and for reviewing agencies through the use of appendix.

Despite what the commenter suggests, this is not a case where adding project traffic to an intersection results in an improved level of service. As provided on page 19 of the Traffic Study:

> Future traffic volumes, evaluated in this study, were developed for both, typical traffic volume growth and for oil and gas industry specific growth. These future traffic volume scenarios are referred to as "2035 % Growth Only" and "2035 NOG + O&G Projection" respectively.

(Traffic Study, at p. 19.) "2035 % Growth Only" is defined as existing traffic volumes projected to 2035 using typical growth rates appropriate for the study area. (*Ibid.*) "2035 NOG + O&G Projection" is derived from the addition of: (1) Existing traffic that is not oil and gas related projected to 2035 using appropriate growth rates for the area; and (2) Oil and gas related traffic projected to 2035 using an oil and gas industry specific growth rate. (*Ibid.*)

Both "2035 % Growth Only" and "2035 NOG + O&G Projection" scenarios include project traffic and were calculated for the purposes of comparing various growth rate potentials. These are both "Future + Project" scenarios and cannot be compared in the same way as would be done in a simple traffic study where the basic scenarios like "Future" and "Future + Project" are compared.

Assumptions

One comment states that the DEIR's traffic analysis is flawed because it bases its trip generation estimates on "suspect assumptions." The comment also questions the DEIR's reliance on traffic forecast assumptions.

The assumptions used to develop oil and gas trip generation estimates, traffic volume projections and average vehicle occupancy rates are considered within the industry to be both conservative and reasonable.

Regarding trip generation, as stated in the Transportation Study on page, traffic engineers and planners typically use trip generation rates, equations and data contained in the ITE *Trip Generation Manual* to estimate traffic volumes generated by conventional land use (e.g., commercial, residential, recreational, etc.). However, the ITE manual does not contain similar information for traffic generated by oil and gas activities. Therefore, for the purposes of this study, a multi-tiered approach was used to estimate daily volumes of oil and gas traffic using three data sources: well field vehicle counts, oil and gas employment figures and AADT (Annual Average Daily Traffic) volumes. The results of each of this three tiered approach were in general agreement, lending support for the assumptions and values used within each estimate.

For traffic volume projections, the annual growth rate for oil and gas traffic was developed based on projections of new wells drilled and total producible wells for the years 2015 through 2035. (WZI, WSPA.) Annual growth rates ranged from 0.71 percent to 0.81 percent. The study used the average annual growth rate of 0.76 percent because.

Methodology

One comment states that the DEIR employs analytical methods that are unsuitable for a project of this type and scale. Specifically, the comment states that the DEIR inappropriately analyzes roadway segment LOS impacts using a volume/capacity ("V/C") ratio. The comment also disagrees with the DEIR's use of "Project % Share," which identifies the proportion of the total improvement cost attributed to the Project.

The analysis methodology of the DEIR and corresponding Traffic Study is based on County adopted standards, which utilized a daily traffic volume evaluation and General Plan goals.

Further, in response to comments, the following EIR text changes are being made to ensure consistency with Appendix W:

DEIR, p. 4.16-57:

The "Project % Share" for Olive Ave: South St - Wood St. is changed from "245.68%" to "100.00%."

DEIR, p. 4.16-64:

The "Project % Share" for Stockdale Hwy: I5 SB Ramps - I5 NB Ramps is changed from "207.26%" to "100.00%."

The Project-share figures assign a 1.00 percent share to more than half of the roadway segments within the street network that had nominal traffic volume assignments within the project distribution. Notwithstanding an assignment of "no measureable traffic," as a conservative approach, the 1.00 percent value acknowledges potential use, resulting in a mitigation value and fees for roadway maintenance/improvement.

Mitigation of Transportation and Traffic Impacts

One comment disagrees with the DEIR's underlying conclusions and indicates that because impacts were not appropriately found "significant" the DEIR failed to properly "mitigate." The comment is based on the statement that, "under the County's criteria, no matter how much congestion exists or how much intersection and traffic operations are impacted, they will still be defined as LOS F as there is no lower LOS category."

The comment disagrees with the County's established threshold. "A threshold of significance is an identifiable, quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." (CEQA Guidelines, § 15064.7 subd. (a).) Like many lead agencies, Kern County has exercised its discretion to formulate significance thresholds by using language from Appendix G of the CEQA Guidelines. Consistent with the CEQA Guidelines, Kern County has adopted the following thresholds of significance (among others) to analyze transportation and traffic impacts: Conflict with an applicable congestion management program, including, but not limited to LOS standards and travel demand measures, or other standards established by the County congestion management agency for designated roads or highways as follows: (1) Metropolitan Bakersfield General Plan LOS C, (2) Kern County General Plan LOS D, and (3) Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D. (DEIR, at p. 4.16-44.)

Where an agency's significance thresholds are challenged by a project opponent, the standard of review for a court reviewing the selected threshold is the "substantial evidence" standard, meaning the court must give deference to the lead agency's decision to select particular significance thresholds. (See National Parks and Conservation Association v. County of Riverside (1999) 71 Cal.App.4th 1341, 1358 [applying the substantial evidence test to review of an agency's decision to

select particular thresholds for an EIR]; Mount Shasta Bioregional Ecology Center v. County of Siskiyou (2012) 210 Cal.App.4th 184, 204-207 [upholding analysis based on significance thresholds adapted from other agencies]; Eureka Citizens for Responsible Government v. City of Eureka (2007) 147 Cal.App.4th 357, 371-374 [deferring to city's determination that analysis was performed in a manner consistent with general plan policy]; Sierra Club v. Tahoe Regional Planning Agency (E. D. Cal. 2013) 916 F.Supp.2d 1098, 1146-1151 [upholding agencies' application of significance threshold].) As discussed in the DEIR and in these responses to comments, the County's transportation and traffic thresholds are supported by substantial evidence. As such, they are to be accorded great deference.

The comment disagrees with the County's criteria because, according to the comment, no matter how much traffic operations are impacted, they will still be defined as LOS F, as there is no lower LOS category. Rather than rely on the County's adopted standard, the comment suggests the County should have applied an alternative quantitative threshold that analyzes LOS in excess of "F." CEQA does not require the County to adopt such threshold. To the contrary, CEQA vests the lead agency with substantial discretion in determining the appropriate threshold of significance to evaluate the severity of a particular impact. (See CEQA Guidelines, § 15064, subd. (b); Save Cuyama Valley v. County of Santa Barbara (2013) 213 Cal.App.4th 1059, 1068 [explaining agency discretion to fashion significance thresholds].) As explained in the CEQA Guidelines, "[t]he determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting. For example, an activity which may not be significant in an urban area may be significant in a rural area." (CEQA Guidelines, § 15064, subd. (b).)

Importantly, case law clearly provides that a lead agency does not run afoul of CEQA by rejecting different thresholds proposed by a project opponent. (See Citizens for Responsible Equitable Environmental Development v. City of Chula Vista (2011) 197 Cal.App.4th 327, 335-336 ("CREED") [rejecting petitioners' argument that the City erred by not applying a different significance threshold]; California Oak Foundation v. Regents of University of California (2010) 188 Cal. App. 4th 227, 282 [rejecting petitioner's argument that a lead agency used the incorrect significance threshold in evaluating the biological significance of tree impacts]; National Parks & Conservation Assn. v. County of Riverside (1999) 71 Cal. App. 4th 1341, 1356-1357 [upholding a biological significance threshold used by Riverside County as supported by substantial evidence].)

CEQA case law also endorses a lead agency's use of existing environmental standards or regulations as thresholds of significance. (See Tracy First v. City of Tracy (2009) Cal.App.4th 912 [upholding determination that energy impact of project was less than significant because the project achieved energy efficiencies greater than those required by California Energy Efficiency Standards]; Cadiz Land Co. v. Rail Cycle (2000) 83 Cal.App.4th 47 [upholding finding that incremental impacts of criteria pollutants on sensitive crops would be less than significant based on National Ambient Air Quality Standards promulgated to protect public health and welfare from adverse effects of a pollutant]; Protect The Historic Amador Waterways v. Amador Water Agency (2004) 116 Cal.App.4th 1099, 1107 ["thresholds can be drawn from existing environmental standards, such as

other statutes or regulations"]; Rialto Citizens for Responsible Growth v. City of Rialto (2012) 208 Cal.App.4th 899 [upholding use of thresholds of significance recommended by SCAQMD to assess air quality impacts]; Oakland Heritage Alliance v. City of Oakland (2011) 195 Cal.App.4th 884, 896 [agency has discretion to rely on adopted standards to serve as significance thresholds for a particular project].) The County properly relied on its General Plan, the City of Bakersfield General Plan, and Caltrans standards to establish thresholds of significance for transportation and traffic impacts.

One comment states that even where the DEIR does disclose significant intersection and roadway LOS impacts, it fails to provide adequate mitigation. The comment states that the DEIR should have included the recommended improvements in the Traffic Study.

"[A]n EIR need not analyze '"'every imaginable alternative or mitigation measure; its concern is with feasible means of reducing environmental effects.'"' [Citation.]" (Santa Clarita Organization for Planning the Environment v. City of Santa Clarita (2011) 197 Cal.App.4th 1042, 1055-1056.) "'Feasible' means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors. (Pub. Resources Code, § 21061.1.) Mitigation measures that cannot be legally imposed or enforced need not be proposed or analyzed. (San Diego Citizenry Group v. County of San Diego (2013) 219 Cal.App.4th 1, 16; citing Tracy First v. City of Tracy (2009) 177 Cal.App.4th 912, 938; Pub. Resources Code, § 21086, subd. (b).) The EIR complies with these requirements – the County has incorporated a thorough mitigation framework to ensure that transportation and traffic impacts are minimized, and the DEIR concluded that these measures would reduce the impact to less than significant. (DEIR, p. 4.4-125.)

Water-01: Disposal into Unlined Ponds and Sumps

Several commenters requested further information about disposal into a "sump," "pit" or "pond" as used in this EIR. (Please also see Global Response GR-Air 11 for a description of these terms and an explanation of how they were accounted for with regard to particular impacts.) For purposes of this EIR, the terms "sump" and "pit" are one in the same, and refer to an excavated depression in the ground which collects crude oil, produced water, or solids, such as drilling muds or cuttings, in oil producing fields. The terms "drilling sump" and "drilling pit" are utilized interchangeably in this EIR to refer to the collection of drilling fluids and cuttings (collectively known as "drilling muds"), which are produced during drilling operations. The term "operation sumps" is used to refer to sumps that are utilized to store fluids and solids, which are produced during the life of the operational well as well as potential workover activities. (DEIR at 3-47). By contrast, the terms "evaporation and percolation ponds," or "perc ponds" refers to a type of storage for produced water, where it is allowed to percolate into the soil and / or evaporate into the air. A percolation pond is used to dispose of water associated with hydrocarbon production by percolation into the soil. A natural or artificial evaporation pond is a pond with a large surface area that is designed to efficiently evaporate water by exposure to sunlight. (DEIR at 3-47)

The primary difference between sumps and pits on the one hand and ponds on the other is that sumps and pits are co-located with wellhead sites. Ponds, on the other hand, are typically

centralized facilities which collect fluids from multiple operators at a location that is not related to the location of drilling operations. *See also* Comment on DEIR No. 83-25 ("CVRWQCB staff uses the term 'pond' for an unlined impoundment for disposal of produced water via evaporation and percolation … CVRWQCB staff uses the words 'drilling mud pits' for an unlined impoundment used by the industry to contain drilling fluid and cuttings while drilling a well.")

As discussed in the DEIR Section 4.9, a portion of the produced water generated in the Project Area has been disposed in unlined ponds. The disposal of produced water to unlined ponds has been conducted on reliance on an exemption contained in state regulations applicable to "discharges of [nonhazardous] wastewater to land, including but not limited to evaporation ponds, percolation ponds, or subsurface leachfields" (23 CCR §2511(b)) where the discharge was in compliance with an adopted water quality control plan, including the Tulare Lake Basin Plan adopted by the Central Valley Regional Water Quality Control Board (CVRWQCB).

As discussed in the DEIR, the CVRWQCB has determined that groundwater quality has been impaired as the result of constituent migration from unlined ponds in Project Area locations and has issued remediation orders to certain of these facilities. A farmer in the Western Subarea was awarded damages for agricultural water quality impacts attributed to the use of up-gradient produced water disposal ponds. More recently, as summarized in the California Council on Science and Technology (CCST) assessment of well stimulation treatments in California released on July 9, 2015, there is concern that produced water disposed of in percolation ponds could contain hydraulic fracturing chemicals (CCST Study, p. 41). These chemicals could remain resident in oil-bearing formation water after treatments are conducted, be extracted with produced water during subsequent hydrocarbon production activity, and disposed into surface ponds. Recently enacted California regulations prohibit the direct surface disposal of produced water into sumps and pits from a well following a well stimulation treatment (14 CCR § 1786; *see also* CCST Study, p. 43). As discussed in the DEIR, the CVRWQCB has determined that well stimulation treatment flowback water was improperly discharged into surface drilling sumps. In July 2015, an operator in the Project Area was subject to administrative civil liability for discharges of treatment fluids to drilling sumps (Administrative Civil Liability Order R5-2015-0096, http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/kern/r5-2015-0096.pdf, accessed September 2015). To date, as noted in the CCST Study, there has been no documented contamination of groundwater from well stimulation treatment chemicals as a result of disposal in percolation ponds, and the extent to which treatment chemicals remain in oil-bearing formations after treatment or may be disposed into surface ponds with other produced water volumes has not been characterized.

Existing oilfield sumps are subject to DOGGR regulations including, but not limited to, 14 CCR §§ 1760, 1770, 1775, and 1776. These regulations include requirements for sump location, construction, and closure. Project Area oilfield sumps and surface ponds are also regulated by the CVRWQCB under state and, where applicable, federal water quality laws and regulations. As discussed in the DEIR, in November 2014 the CVRWQCB adopted a work plan to address oilfield production water disposal within the jurisdiction of the Central Valley Water Board (http://www.swrcb.ca.gov/rwqcb5/water_issues/oil_fields/information/disposal_ponds/index.shtml, accessed September 2015). The work plan is scheduled to be completed by December 2016 and focuses on clarifying the

locations and regulatory status of oilfield ponds used in California, including the Project Area (*e.g.*, whether they are permitted or unpermitted and whether they are operating in compliance with state regulations) and to address potential water quality issues associated with their past or ongoing use. Unpermitted facilities will be required to obtain waste discharge requirements (WDRs) from the CVRWQCB under state law and to comply with other applicable requirements designed to protect groundwater quality. Permitted facilities that are determined to be out of compliance will be required to meet applicable compliance requirements or to close.

The 2014 Work Plan includes the following tasks:

- Systematic inventory of all produced water ponds within the Central Valley to identify the location and status of land discharges.
- Continuing field inspections of produced water ponds at permitted facilities to assess compliance with WDRs and instituting inspections of ponds at unpermitted facilities prior to the Regional Board issuing requests for information or enforcement orders.
- Permitting all facilities — including currently permitted facilities that need updated WDRs and unregulated facilities that require a permit to operate — via three new General Orders (GOs): GO 1 – facilities with discharges that meet the basin plan maximum salinity, chloride, and boron limits; GO 2 – facilities that have discharges exceeding the salinity limits but will not substantially affect water quality or cause a violation of water quality objectives; and GO 3 – facilities that overlie areas with naturally occurring poor quality groundwater that do not have probable beneficial uses and are not specifically identified in the basin plans. Facilities that are found to be suitable to remain in operation, but that do not meet the criteria in one of the GOs, will be considered for coverage under individual WDRs.
- Facilities that have produced water ponds that are suspected to have adversely affected water quality will be issued Cleanup and Abatement Orders (CAOs) with a schedule for tasks, including: collecting information on the ponds; groundwater quality assessment; assessment of potential or actual impacts to groundwater; submittal of a Report of Waste Discharge or Notice of Intent to operate under a GO; and, if needed, an estimate of when termination of discharge would occur. Each CAO will be in effect until the facility either obtains WDRs or until no further regulatory coverage is needed (i.e., discharge ceases and any needed remedial activity is completed).
- Possible enforcement actions for existing facilities that cannot comply with conditions of their WDRs or for unregulated facilities that do not comply with Regional Board directives.

Three status reports have been issued by the CVRWQCB since the Work Plan was adopted. The most recent status report, "Status Report #3," is dated April 4, 2015 (http://www.swrcb.ca.gov/rwqcb5/water_issues/oil_fields/information/disposal_ponds/index.shtml, accessed September 2015). The April status report states that the CVRWQCB has identified 578 active ponds and 355 inactive ponds within the Regional Board's jurisdiction, including the Project Area. Of the 578 active ponds, 370 are covered by WDRs and 208 are not currently regulated. Notices of Violation (NOVs) were sent to facilities with active ponds not covered by WDRs and with no record of a Report of Waste Discharge as required by state law. The April status report also

indicated that the Regional Board was working on drafting enforcement orders for those facilities that are not covered by WDRs and where existing WDRs need to be updated. The April status report indicates that the Regional Board will issue approximately 180 enforcement orders pertaining to disposal ponds.

The April status report states that in March 2015, the CVRWQCB issued orders under State Water Code Section 13267 to 77 oil producers covering active ponds at 169 facilities requiring the submission of a comprehensive characterization of wastewater discharged to the ponds. These orders require submittal of analytical data for produced water waste constituents, including general minerals (major cations and anions), total dissolved solids, metals, radionuclides, organic compounds (such as polynuclear aromatic hydrocarbons, benzene, toluene, ethylbenzene, and xylenes), and others (such as boron, lithium, and strontium). These orders were issued to answer questions about specifically what is in the wastewater. The orders also include a list of known ponds and require operators to inform the CVRWQCB if any additional discharges are occurring. The responses to the orders were due on 15 June 2015. The CVRWQCB has been publicly releasing responses, including analytical data for produced water waste constituents (available at http://www.swrcb.ca.gov/rwqcb5/water_issues/oil_fields/information/disposal_ponds/index.shtml, last accessed September 28, 2015).

The CVRWQCB work plan states that the Board may utilize Cease and Desist Orders (CDOs), CAOs, information orders under Section 13267 of the Water Code, or assess Administrative Civil Liabilities (ACLs) to address compliance issues that are determined to exist at surface pond disposal facilities. Two surface pond operators have been subject to compliance orders in the Project Area since June 2015. In June 2015, the CVRWQCB issued a CAO to E&B Natural Resources Management addressing the operation of three disposal ponds for which WDRs had not been issued (Order R5-2015-0066, http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/kern/r5-2015-0066_cao.pdf, accessed September 2015). In July 2015, the CVRWQCB adopted an order directing the Valley Water Management Company to conduct additional investigations and implement remediation measures, if necessary, for ponds at the Fee 34 Facility and ponds and a surface spray system at the Race Track Hill Facility in the Project Area (Order R5-2015-0093, http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/kern/r5-2015-0093.pdf, accessed September 2015). In general, these orders include periodic monitoring, hydrogeologic characterization of the area around the ponds, an evaluation of the nature and extent of any impacts to groundwater, a survey of water supply wells within a mile of the ponds, sampling of domestic wells, and set specific deadlines for compliance.

As discussed above, the CVRWQCB has significantly enhanced oversight of surface pond disposal activities in the Project Area and is implementing a work plan that is designed to ensure that all such facilities are compliant with all applicable water quality and other legal requirements by December 2016. DEIR mitigation measure (MM) 4.9-1 requires that applicants subject to the proposed Conditional Permit Review process must comply with all applicable laws and regulations at all times. DEIR MM 4.9-5 prohibits any applicant for activities subject to the proposed amended Zoning Code Chapter 19.98 to discharge produced water into any surface disposal facility unless the

facility has received WDRs or an express waiver of such requirements from the CVRWQCB. These measures ensure that no oil or gas activity subject to the Conditional Permit Review process may discharge into a surface disposal pond or other facility unless the facility has not been permitted by the CVRWQCB or is not otherwise in compliance with all applicable laws and regulations, including surface and groundwater water quality protection requirements.

Section 1786 of the California Public Resources Code was revised and became effective July 1, 2015 in response to California's new well stimulation treatment legislation (commonly referred to as "Senate Bill 4" ("SB 4")). Section 1786 requires that all oilfield operations must comply with several "requirements for the storage and handling of well stimulation treatment fluid, additives, and produced water from a well that has had a well stimulation treatment." The regulations state that fluids "shall be stored in containers and shall not be stored in sumps or pits," which has been interpreted by DOGGR and the CVRWQCB to mean that any fluids recovered from a stimulation treatment, and all produced water subsequently generated from a well subject to a stimulation treatment, cannot be disposed to land. In addition, the new regulations require that operators, during "the course of conducting well stimulation activities, including but not limited to well stimulation treatment fluid, additives, produced water from a well, solids separated from well stimulation treatment fluid, remediation wastes, or any other wastes generated from the processing, treatment or management of these wastes…" determine if the waste is a hazardous waste as defined by State law. Any such hazardous wastes may not be disposed by using Class II injection wells and disposal must instead be "in compliance with all hazardous waste management requirements of the Department of Toxic Substances Control." In general, identified hazardous wastes would be physically transported to appropriate hazardous waste disposal facilities.

As revised, Section 1786 prohibits the surface disposal of well stimulation treatment (WST) fluids, WST flowback recovered from a well during and immediately after a WST process, and produced water subsequently generated during production from a well that was subject to a WST. These fluids must be disposed by Class II well injection if they are nonhazardous, or disposed in an appropriate hazardous waste management facility the materials qualify as hazardous wastes under state law. As a result, Section 1786 limits the use of WST fluids, flowback and produced water from WST wells. Table 7-7 summarizes the allowable uses of produced water and other fluids from WST and non-WST wells relative to the produced water use categories considered in the DEIR, including three future 2035 scenarios (see Table 4.9-27 and discussed below).

Table 7-7: Summary of Allowed Uses, WST and Non-WST Well Fluids and Produced Water

	Fluids and Produced Water From WST Wells (Section 1786)	Fluids and Produced Water From non-WST wells
Coil tubing, dust control, surface facility construction (non-Class II Injections)	**NO**	YES
Agricultural reuse	**NO**	YES
Produced Water Land Disposal	**NO**	YES
EOR water and steam injections, pressure maintenance and well pulling (Class II Injections)	YES	YES
Injection Well Disposal	YES	YES

Note: Uses not allowed for WST-well derived fluids and produced water assume no additional treatment. Recent studies indicate that advanced treatment trains, including reverse osmosis, would likely be sufficient to remove WST-related constituents for uses such as irrigation. See California Council on Science and Technology, *Potential Environmental Impacts of Hydraulic Fracturing and Acid Stimulations,* Volume II, pp. 115-116 (July 2015). It is possible that Section 1786 may allow for surface uses of WST-well water provided sufficient monitoring and treatment is implemented to detect and remove constituents of concern prior to reuse.

The extent to which the produced water reuse and disposal scenarios considered in the DEIR (see Table 4.9-27) might change in response to the revised Section 1786 requirements depends on the relative amount of Project Area produced water that would be generated from wells subject to WST treatment. As discussed in DEIR Table 4.9-5, the California Council on Science and Technology (CCST) study of well stimulation technology in response to the state SB 4 legislation included an analysis of 1,986 well stimulation treatments in Kern County from 2012-2014. The average water use per WST in the Project Area was 0.38 acre-feet. As discussed in DEIR Table 3-5, 2,697 new production wells would be drilled each year in the Project Area, and 1,200 wells would be subject to a WST procedure. Based on the CCST consumption data for WST operations in Kern County, about 456 acre-feet per year of water and other fluids would be used to complete 1,200 well stimulation treatments annually in the Project Area. The volume of fluid directly related to WST in the Project Area amounts to 0.14% of the total produced water supply projected for 2035 (321,894 acre-feet) and would have no significant impact on produced water use under future any future scenario considered in the DEIR.

As discussed above, DOGGR and the CVRWQCB interpret Section 1786 to preclude surface use of produced water generated in the normal course of oilfield operations from a well that was subject to a WST procedure. The amount of total Project Area produced water that current is, and that may in the future be derived from stimulated wells and subject to the Section 1786 restrictions does not appear to be quantified in any existing study or analysis. In general, produced water would be generated within the Project Area from a combination of legacy wells that predate revised Section 1786 and non-stimulated well which would not be subject to the new surface use limitations, and

WST wells that are subject to Section 1786. The relative number of each type of these well depends on such factors as the rate of new drilling, the retirement of legacy wells, and the need for WST procedures. These factors can vary over time and in response to market conditions.

The following methodology was used to provide a conservative assessment of the potential impacts of newly enacted Section 1786 on the future water use scenarios in the DEIR:

1. Based on the CCST analysis of WST and non-WST well performance, the volume of produced water generated from oil production in WST and non-WST wells is assumed to be the same in each instance. The CCST compared the volume of produced water in 1,414 WST and 3,247 non-WST wells over a six-month period in Kern County and concluded that "The data do not show substantive differences between the volumes of produced water generated in the first six months from stimulated wells and non-stimulated wells." California Council on Science and Technology, *Potential Environmental Impacts of Hydraulic Fracturing and Acid Stimulations,* Volume II, pp. 94-95 (July 2015).

2. The ratio of produced water from WST wells to total Project Area produced water was assumed to be equal to the ratio of the annual number of projected WST activities (1,200 treatments) to the annual number of new production wells (2,697 wells). As a result, this approach assumes that 44% (1,200/2,697) of all produced water in the Project Area would be subject to the Section 1786 surface use limitations. This methodology is highly conservative because a significant portion of Project Area produced water would likely be generated by wells that predated Section 1786, and the ratio of total produced water that could potentially be limited by Section 1786 is likely to be significantly lower than 44% of the Project Area total.

3. As shown in Table 4.9-27, about 321,894 acre-feet of produced water is projected to be generated in the Project Area by 2035. Using the conservative assumptions described above, about 143,223 acre-feet (44%) is assumed to be produced from WST wells subject to the new Section 1786 limitations, and about 178,671 acre-feet (56%) is assumed to be produced from non-WST wells. The potential impacts of this assumed distribution of produced water under Section 1786 for the three future scenarios discussed in the DEIR are summarized below.

Scenario 1: Pro-Rata Increase. Scenario 1 assumes that the uses of produced water in 2012 increase pro-rata by 2035, including injection, land disposal, and enhanced oil recovery, except for agricultural reuse, which is assumed to remain constant at 38,658 acre-feet per year. As shown in Table 7-8, the Project Area would have enough non-WST produced water to allocate to surface uses as anticipated in Scenario 1, including (non-Class II injection) surface maintenance and repairs, agricultural use, and land disposal with a remainder of 97,531 acre-feet.

Table 7-8: Scenario 1 (Pro-Rata Increase) and WST, Non-WST Supply Availability

Non WST Supply	**178,671**
Coil tubing, dust control, surface facility construction	-197
Agricultural reuse	-38,658
Produced Water Land Disposal	-42,285

Table 7-8: Scenario 1 (Pro-Rata Increase) and WST, Non-WST Supply Availability

Unused non-WST Supply	**97,531**
WST Supply	**143,223**
EOR water and steam injections, pressure maintenance and well pulling (Class II Injections)	-121,215
Injection Well Disposal	-119,539
Supply Excess or Deficit	**0**

The Project Area WST-derived produced water supply would be about 143,223 acre-feet, and this water could be used for subsurface activities, including Class II enhanced oil recovery (EOR) and disposal. The combined amount of the remaining non-WST and the WST derived produced water would be sufficient to meet the projected Class II injection activity in Scenario 1. It is possible that, in certain subareas, such as in the west where majority of WST activity would occur, the volume of non-WST produced water would not be sufficient to allow for the projected amount of surface disposal. In such an instance, it is injection disposal rates would increase to dispose of water that could not be applied to the surface due to the Section 1786 limitations.

Scenario 2: 50% reduction from 2012 surface disposal volume. Scenario 2 includes most of the assumptions in Scenario 1, except that surface disposal is assumed to fall by 50% in response to regulatory concerns, or from 30,931 acre-feet in 2012 to 15,466 acre-feet in 2035. As shown in Table 7-9, Scenario 2 reduces the surface disposal volumes that would be affected by Section 1786. Consequently, the Project Area would have sufficient non-WST supplies for the surface uses anticipated in Scenario 2 with a residual non-WST supply of 124,350 acre-feet.

Table 7-9: Scenario 2 (50% Surface Disposal Reduction) and WST, Non-WST Supply Availability

Non WST Supply	**178,671**
Coil tubing, dust control, surface facility construction	-197
Agricultural reuse	-38,658
Produced Water Land Disposal	-15,466
Unused non-WST Supply	**124,350**
WST Supply	**143,223**
EOR water and steam injections, pressure maintenance and well pulling (Class II Injections)	-121,215
Injection Well Disposal	-146,358
Supply Excess or Deficit	**0**

The combined amount of the remaining non-WST and all the WST derived produced water (143,223 acre-feet) would be sufficient to meet the projected Class II injection activity in Scenario 2.

Scenario 3: 90% reduction from 2012 surface disposal volume and increased agricultural reuse. Scenario 3 assumes that land disposal is reduced by 90% in response to regulatory concerns, or from 30,931 acre-feet in 2012 to 3,093 acre-feet, and that agricultural reuse of produced water will increase from 38,658 to 50,419 acre-feet to fully offset oil and gas demand (11,761 acre-feet) for

higher quality water in 2035. As shown in Table 7-10, Scenario 3 reduces the surface disposal and also increases the agricultural use volumes that could be affected by Section 1786. In this scenario, the Project Area would have sufficient non-WST supplies (178,671 acre-feet) to allocate to these uses and also retain a residual non-WST supply of 124,962 acre-feet.

Table 7-10: Scenario 2 (50% Surface Disposal Reduction) and WST, Non-WST Supply Availability

Non WST Supply	**178,671**
Coil tubing, dust control, surface facility construction	-197
Agricultural reuse	-50,419
Produced Water Land Disposal	-3,093
Unused non-WST Supply	**124,962**
WST Supply	**143,223**
EOR water and steam injections, pressure maintenance and well pulling (Class II Injections)	-121,215
Injection Well Disposal	-146,970
Supply Excess or Deficit	**0**

The combined amount of the remaining non-WST supply, and all the WST-derived produced water (143,223 acre-feet) that could be used for Class II injection activity in Scenario 3.

In conclusion, although it is possible that the use of water from WST-derived sources may be constrained by Section 1786 in certain subareas, especially in the west where most WST activity will occur, in the aggregate, and based on the projected number of new production and WST wells over time, the Project Area appears to have sufficient WST and non-WST produced water supplies to fulfill the three future scenarios discussed in the DEIR. Section 1786 shortfalls that could occur would likely affect surface disposal in the western subarea. Additional injection would occur to dispose of WST-derived water that could not be applied to the surface under Section 1786. There appears to be sufficient non-WST produced water available to maintain the level of agricultural reuse assumed in scenarios 1 and 2, and to increase the level of reuse by 11,761 acre-feet per year in Scenario 3.

Finally, it is possible that some of the produced water and other fluids associated with WST wells will be characterized and disposed of as a form of hazardous waste. The volume of this potential waste stream cannot be estimated at this time due to the lack of historical data. The analysis summarized above, however, indicates that a very significant amount of Project Area WST-related material must be treated as hazardous waste to significantly affect the three scenarios considered in the DEIR.

Water-02: Exempt Aquifers and Underground Injection Program

Several commenters questioned the DEIR's analysis of certain wells which have been injecting into non-exempt aquifers or aquifers historically treated as exempt. Commenters also questioned whether the EIR may properly rely on compliance with DOGGR's Underground Injection Control program requirements, which they allege are inadequate.

The UIC Program

As discussed in the DEIR, oil and gas wastewater, produced water, and enhanced oil recovery operations that inject water and other constituents into subsurface formations are regulated under the Underground Injection Control (UIC) program administered by the U.S. Environmental Protection Agency (USEPA) in conjunction with the federal Safe Drinking Water Act. In 1982, DOGGR was granted primacy by the USEPA to administer the UIC program for underground injections associated with oil and gas exploration and production. In general, subsurface injections regulated by the UIC program are not permitted in any aquifer that meets the federal criteria for an underground source of drinking water (USDW), which typically includes groundwater with a total dissolved solid (TDS) concentration of less than 10,000 milligrams per liter (mg/l). Certain locations that contain groundwater that otherwise meet the USDW criteria may be exempted from the UIC injection prohibition, including aquifers located in formations that are actively used or that can commercially be developed for oil and gas production. The Safe Drinking Water Act and related regulations include a process for identifying, evaluating, and granting or denying exemptions for aquifers that meet the USDW criteria. Any such exemption must be approved by the USEPA.

As explained in the DEIR, in 2011, the USEPA commissioned an independent audit of the California UIC program which identified several potential problems, including the potential lack of exemption documentation for 11 aquifers that had historically been treated as exempt in California. In response, DOGGR, the State Water Resources Control Board (SWRCB), and the USEPA developed a work plan for systematically reviewing and correcting UIC program problems. In March of 2015 the USEPA issued a final schedule for DOGGR's and the SWRCB's work plan. As explained in the DEIR, the UIC work plan requires DOGGR and the SWRCB to submit updates to USEPA by certain deadlines. On April 20, 2015 DOGGR adopted emergency regulations codifying the compliance dates in that work plan. On July 13, 2015, DOGGR initiated the process of adopting permanent regulations that codify those compliance dates. The existing UIC program and the emergency and permanent regulations were available for incorporation in the analysis as the DEIR was prepared.

14 Cal. Code Regs. Section	Summary UIC Program Regulations
1722	General requirements for all onshore wells
1722.1 1722.1.1 1722.8 1722.8.1	Operator bond and identification requirements

14 Cal. Code Regs. Section	Summary UIC Program Regulations
1722.2 – 1722.4	Casing standards
1722.5	Blowout prevention standards
1722.6	Fluid control requirements
1722.7	Authorization to require directional surveys
1722.9	Spill Contingency Plan requirements
1723 – 1723.8	Standards relating to plugging and abandonment
1723.9	Idle well testing
1724 1724.1	Recordkeeping requirements
1724.3 1724.4	Standards for well safety devices, including testing and inspection
1724.6 1724.10	Permitting requirements for Class II UIC projects
1724.7	General data submittal requirements
1724.8	Data submittal requirements for cyclic steam injection projects
1724.9	Data submittal requirements for gas storage projects

14 Cal. Code Regs. Section	Summary of DOGGR Emergency UIC Program Review Regulations
1760.1	Definitions
1779.1(a)(1)	Mandates that injection into non-exempt, non-hydrocarbon-producing aquifers containing less than 3,000 mg/l TDS cease by October 15, 2015, unless EPA approves an aquifer exemption.
1779.1(a)(2)	Requires injection into non-exempt, non-hydrocarbon-producing aquifers containing between 3,000 and 10,000 mg/l TDS to cease by February 15, 2017, unless EPA approves an aquifer exemption.
1779.1(a)(3)	Specifies that injection into non-exempt but hydrocarbon-producing aquifers must cease by February 15, 2017, unless EPA approves an aquifer exemption.
1779.1(b)	States that injection into certain identified aquifers must cease by December 31, 2016 unless EPA approves aquifer exemptions.
1779.1(c)	Indicates that UIC project approvals are discretionary.
1779.1(d)	Outlines civil penalties.

11 Aquifers Historically Treated as Exempt

As explained in the DEIR, the UIC work plan requires DOGGR and the State Water Board to submit updates to EPA by certain deadlines. Consistent with the work plan, on July 15, 2015 DOGGR and the SWRCB sent a letter to the USEPA that included a "Preliminary Assessment of 11 Aquifers Historically Treated As Exempt" (July 15, 2015 letter). The letter included the following information for each of the 11 aquifers: (1) the number and location of injection (disposal) wells; (2) the TDS concentration representative of each aquifer; (3) the TDS of the injected fluids for each aquifer; (4) the historical depth of injection; and (5) the volume injected since 1983. Two of the 11 aquifers, the Pico formation in the South Tapo Canyon field (Ventura County) and an undifferentiated formation in the Bunker field (Sacramento County) are not located in the Project Area, and are apparently no longer used for injection. Consequently, the potential exemption or non-exemption of these two aquifers would have no effect on oil and gas exploration or production in the Project Area.

Nine of the 11 aquifers historically been treated as exempt are located in the Project Area. The field and geological formation in which each aquifer occurs, the number of active injection disposal wells, and the total and annual average injection in each aquifer, are summarized in Table 7-11. Based on the references to "number of disposal wells permitted in the zone" that are included in Attachment 1 of the July 15, 2015 for each aquifer, the following discussion assumes that the wells and reported well volumes refer to disposal rather than enhanced oil recovery or other forms of subsurface injection that are also regulated under the UIC program.

Table 7-11: Project Area Aquifers Historically Treated as Exempt and Under Review by DOGGR, the SWRCB and the USEPA

Field	Formation	Permitted Disposal Wells	Barrels injected since 1983	Average Annual Injection, 1983-2015 (22 years) Acre feet/year	Year of last injection
Round Mountain	Walker	30	1,529,910,014	8,987	2015
Kern River	Santa Margarita	32	799,041,272	4,694	2015

Source: DOGGR, SWRCB July 15, 2015 letter to the EPA

As shown in Table 7-11, three fields and formations account for 74 of 98 injection wells and over 88% of the total injection volume from permitted disposal wells in the nine Project Area aquifers historically treated as exempt. These include the Walker formation in the Round Mountain oil field, the Santa Margarita formation in the Kern River oil field, and the Chanac formation in the Kern River oil field. On average, about 17,023 acre feet per year was injected into aquifers historically treated as exempt located in the three fields. As discussed in the DEIR, in 2012 about 84,571 acre-feet of produced water and other permitted materials were disposed by injection in the Project Area. The average annual volume of injection by the 74 permitted disposal wells in the Walker formation in the Round Mountain oil field, the Santa Margarita formation in the Kern River oil field, and the Chanac formation in the Kern River oil field is about 20% of the total amount of Project Area injection disposal during 2012.

The potential exemption or non-exemption of the Walker formation in the Round Mountain oil field, the Santa Margarita formation in the Kern River oil field, and the Chanac formation in the Kern River oil field could affect oil and gas operations in the Round Mountain and Kern River oil fields, two of the largest producing fields in the Project Area. As discussed in the DEIR (see Appendix F), the Kern River field ranked as the second largest oil producing field in the Project Area, and the Round Mountain field was one of the top 10 producing oil fields in the Project Area during 2012. As shown in Appendix F, in 2012 about 283,802,002 barrels (36,700 acre-feet) of produced water was generated in the Kern River field, and 131,738,812 barrels (17,000 acre feet) of produced water was generated in the Round Mountain field. The average annual disposal volume in the two aquifers historically treated as exempt in the Kern River field is about 20% of the total amount of produced water generated in that field during 2012. The average annual disposal volume in the Walker formation historically treated as exempt in the Round Mountain field is more than 50% of the total amount of produced water generated in that field during 2012.

If disposal into one or more of the three largest Project Area aquifers historically treated as exempt is not permitted in the future, oil operators in the Kern River and Round Mountain fields that currently inject into these aquifers would be required to use alternative disposal methods. Potential disposal alternatives could include: (a) installing new, permitted disposal wells in aquifers and formations that do not meet the USDW criteria or that are clearly exempt; (b) conveying the affected disposal fluids to other existing and permitted injection facilities that discharge into aquifers and formations that do not meet the USDW criteria or that are clearly exempt; (c) conveying disposal fluids to other permitted noon-injection disposal facilities, such as surface ponds; (d) treating certain of the disposal fluids as required for oil field operational reuse (e.g., enhanced oil recovery steam or water injection) or for agricultural or other permitted reuse; and/or (e) reducing oil production activities that generate produced water and other fluid wastes to reduce the volume of disposal fluids and not exceed available disposal capacity by alternative methods.

The July 15, 2015 letter indicates that “most or all [of the Project Area aquifers] may not meet the criteria for an aquifer exemption.” The letter further indicates that if oil operators “cannot provide information that supports a determination that an aquifer meets the criteria for exemption, the Division will deem its evaluation complete for that aquifer” and “will issue [a] public notice proposing a determination that the aquifer fails to meet the criteria for exemption.” According to the

letter, DOGGR "believes it is likely that it will be receiving such information for at least one of the 11 aquifers." This aquifer was not identified in the letter. Based on the volume of disposal in each of the nine Project Area aquifers historically treated as exempt, operators would likely have greater incentives to seek aquifer exemptions for the Walker formation in the Round Mountain oil field, or for the Santa Margarita or Chanac formations in the Kern River oil field. If aquifer exemptions were sought but not approved for these locations, and alternative permitted disposal or reuse options cannot feasibly be identified or developed, oil production (and associated produced water generation) could be reduced below the levels assumed in the DEIR for the Kern River and/or Round Mountain oil fields. The extent to which any such reduction might occur, or disposal fluids currently injected into the three aquifers might be disposed of or reused in a different manner, cannot be predicted with reasonable certainty at this time.

The other six Project Area aquifers historically treated as exempt (Round Mountain field, Olcese formation; Kern Front field, Santa Margarita formation; Mount Poso field, Walker formation; Kern Bluff field, Kern River formation; Blackwell's Corner field, Tumey formation; Wild Goose field, Undifferentiated formation) either have no permitted disposal wells operating in the applicable aquifers (the Kern Bluff, Blackwell's Corner and Wild Goose fields) or have historically injected relatively minor amounts of disposal fluids. No injections have occurred since 1993 in the Kern Bluff, Blackwell's Corner, and Wild Goose fields, and the July 15, 2015 letter indicated that the Wild Goose aquifer may not meet USDW criteria. Consequently, the potential exemption or non-exemption of these three aquifers will likely have no significant effect on oil and gas exploration or production in the Project Area.

Chevron U.S.A. Inc. operates approximately 98% of the Kern River Field. Chevron is the process of exiting the two aquifers historically treated as exempt in the Kern River Field, Santa Margarita and Chanac. The new target formation for disposal is the Olcese formation, a zone with greater than 10,000 mg/l TDS which does not require an exemption because it is not a USDW. Chevron received UIC project approval for the Olcese formation in March 2015. As of September 2015, two wells have already been converted to the Olcese formation and Chevron has received permits for five other wells to be converted. Chevron has represented it is on target to exit the two aquifers historically treated as exempt by December 31, 2016, as required by DOGGR regulations. 14 CCR 1779.1.

The total average annual disposal volume in the three aquifers historically treated as exempt in the Round Mountain (Olcese formation), Kern Front, and Mount Poso fields is about 2,212 acre-feet per year, or 2.6% of the total volume disposed by injection in the Project Area during 2012. As noted above, the July 15, 2015 letter indicates that DOGGR and SWRCB do not expect that oil field operators will provide additional information to support aquifer exemption applications for most of the aquifers historically treated as exempt apart from potentially one Project Area aquifer. Due to the limited volume of disposal that has historically occurred, operators may have less incentive to pursue aquifer exemptions for any of these three aquifers. If aquifer exemptions were sought but not approved for any of these locations, and alternative permitted disposal or reuse options could not feasibly be identified or developed by the affected operators, oil production (and associated produced water generation) could be reduced below the levels assumed in the DEIR for the Kern Front, Mount Poso and/or Round Mountain oil fields. Based on the relatively small ratio of total

Project Area disposal (about 2.6%) that, on average, occurs in the Kern Front, Mount Poso and/or Round Mountain (Olcese formation) aquifers historically treated as exempt, the extent to which any such reduction might occur, or disposal fluids currently injected into the three aquifers might be disposed of or reused in a different manner, would likely be substantially lower than could be associated with larger Project Area aquifers.

As shown in Table 7-11, the average annual disposal volumes into the Round Mountain, Olcese formation is about 11% of the average annual volume disposed into the Walker formation, and 5.5% of the total volume of produced water generated in the field during 2012. If both the Round Mountain field Olcese and Walker formation aquifers are not exempted, operators in the Round Mountain field would be required to identify or develop alternative disposal methods for a greater volume of fluid than if either aquifer remains available for injection.

EOR Activities in Non-Exempt Aquifers

On July 31, 2015, DOGGR reported to EPA that it had reviewed 5,625 UIC wells throughout the state that permitted to inject into aquifers not designated as "exempt" under the UIC program. 5,475 of the wells are associated with thermal Enhanced Oil Recovery (EOR) operations (steam flood and cyclic steam wells). Because water must be pretreated to a higher quality before EOR injection, and small quantities of water are involved, DOGGR considered any threat to aquifers to be "greatly reduced." Of the remaining 150 non-thermal wells, 126 are no longer classified as injection wells and are not injecting fluids, 19 are water flood wells, one is a pressure maintenance well and only four are waste disposal wells. Of those four waste disposal wells, 2 are located in Kern County. DOGGR is conducting further investigation of the remaining wells to determine if they pose a potential risk to groundwater with a current beneficial use. Letter from Steve Bohlen, DOGGR, and Jonathan Bishop, State Water Resources Control Board, to Michael Montgomery, USEPA Region IX (July 31, 2015). Accordingly, the magnitude of the risk to usable groundwater aquifers appears very limited based on information currently available.

EIR Baseline and Reliance on UIC Program Regulations

As discussed in the DEIR, all oil and gas activity subject to the new County permit process under proposed Zoning Ordinance amendments must certify that all waste disposal, including by subsurface injection to surface ponds, or by reuse, will only occur in facilities and by means that are fully permitted by and meet all applicable state and federal laws and permit requirements. It is reasonable for the County to assume that operators will comply with the UIC program and any updates thereto for purposes of this EIR. Towards Responsibility in Planning v. San Jose (1988) 200 Cal. App. 3d 671, 680 ("City is not obliged to speculate about effects which might result from violations of its own ordinances or water quality standards set by other agencies"); Rominger v. Colusa (2014) 229 Cal. App. 4th 690, 728 (arguments against significance analysis rejected where challengers offered "no evidence to suggest that it would be unreasonable to expect" compliance with statewide regulations). The County is also entitled to presume that DOGGR and the SWRQB will carry out their duty to update and enforce the UIC program consistent with USEPA requirements. Cal. Evid. Code § 664 ("It is presumed that official duty has been regularly performed").

The information released by DOGGR and the State Water Board thus far in connection with the review of the UIC program indicates that, even as the state agencies are engaged in correcting the deficiencies in UIC program enforcement identified by EPA, there has been little or no resulting environmental harm. This conclusion is supported by a recent court decisions as well. In May 2015 two environmental groups filed a lawsuit challenging emergency regulations adopted by DOGGR in connection with the work plan described above. The environmental groups sought a preliminary injunction against their enforcement. On July 16, 2015, the Alameda County Superior Court denied the preliminary injunction. Among other things, the court found:

- The plaintiffs failed to present evidence that the emergency regulations posed a risk of imminent harm to protected (non-exempt) aquifers;
- DOGGR and the State Water Board have not discovered evidence that any active drinking water wells have been impacted; and
- The threat of contamination alleged by the plaintiffs is theoretical and speculative.

Even to the extent there is any associated harm from past activities in aquifers historically treated as exempt or EOR activities in non-exempt aquifers, it is part of the environmental baseline for purposes of CEQA review. Mount Shasta Bioregional Ecology Ctr. v. Siskiyou (2012) 210 Cal. App. 4th 184, 200 ("CEQA analysis must be the existing physical conditions in the affected area, that is, the real conditions on the ground, rather than the level of development or activity that could or should have been present according to a plan or regulation"); Ctr. for Biological Diversity v. Dep't of Fish & Wildlife (2015) 234 Cal. App. 4th 214, 250 ("How present conditions come to exist may interest enforcement agencies, but that is irrelevant to CEQA baseline determinations — even if it means preexisting development will escape environmental review under CEQA").

Water-03: Sustainable Groundwater Management Act

Several commenters raised questions about water supply, and the management of groundwater resources, in the Project Area. As discussed in the DEIR, California enacted a Sustainable Groundwater Management Act (SGMA) in 2014 that requires the implementation of a Groundwater Sustainability Plan (GSP), or a coordinated set of GSPs, by January 31, 2020 for virtually all groundwater basins in the Project Area (as defined in the DEIR). The GSP will managed by one or more new Groundwater Sustainability Agencies (GSAs) that must be established for the Project Area by June 30 2017. Groundwater basins within the Project Area are ranked as high- and medium-priority by the state and therefore are subject to the earliest GSA establishment and GSP enactment deadlines under the SGMA. California statewide groundwater elevation monitoring maps identify virtually all of the valley floor groundwater basins in the Project Area as "high priority" basins, and the Tulare Lake and Kern County basins are identified as being in a critical condition of overdraft. Prior to enactment of the SGMA, several local governments and water districts (including Kern County) established the Kern Groundwater Authority as a Joint Powers Authority to provide a framework for the active, comprehensive management of the groundwater basin underlying the valley portion of Kern County, to preserve and maintain local control of groundwater resources and provide long term surety for all basin users.

The SGMA defines groundwater as "water beneath the surface of the earth within the zone below the water table in which the soil is completely saturated with water, but does not include water that flows in known and definite channels." A groundwater extraction facility is defined as "a device or method for extracting groundwater from within a basin" (Water Code §10721(g-h)). The purpose of a GSP is to achieve "sustainable groundwater management" within 20 years, which is defined as "the management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results" (Water Code Section 10721(u)). The SGMA defines six basin management "undesirable results":

- Chronic lowering of groundwater levels (not including overdraft during a drought, if a basin is otherwise managed);
- Significant and unreasonable reductions in groundwater storage;
- Significant and unreasonable seawater intrusion;
- Significant and unreasonable degradation of water quality;
- Significant and unreasonable land subsidence; and
- Surface water depletions that have significant and unreasonable adverse impacts on beneficial uses (Water Code Section 10721(w)).

According to the California Department of Water Resources (DWR), the DWR is required to enact emergency regulations for evaluating and implementing GSPs by June 1, 2016. The DWR is conducting public workshops that address ten topics associated with the development and implementation of GSPs, including:

Topic 1 - Pre-SGMA Conditions and Undesirable Results

Topic 2 - Measureable Objectives and Interim Milestones

Topic 3 - Land Use and County Involvement

Topic 4 - Alternative GSP Submittals

Topic 5 - Boundaries – Overlapping and Unmonitored Areas

Topic 6 - Intra-Basin Coordination Agreements

Topic 7 - Water Budgets and Coordination

Topic 8 - State Agency Coordination

Topic 9 - Data Collection, Management, and Reporting

Topic 10 - Adaptive Management and Focus Areas

The topical discussions are tentatively scheduled to be completed by September 2015. Draft GSP regulations are currently anticipated by the DWR to be available and will be discussed at three public meetings to be held in early 2016 in accordance with the SGMA. As of mid-August 2015, the DWR had released discussion papers and other documentation related to the first six of the ten GSP regulation topics (http://www.water.ca.gov/groundwater/sgm/gsp.cfm, accessed August 18, 2015).

As discussed in DEIR Section 4.9, water from hydrocarbon-bearing formations is brought to the surface and separated from recoverable oil and gas deposits throughout the state, including the Project Area. This water is commonly called "produced water." About 91% of the total water used for oil and gas exploration and production in the Project Area during 2012 (88,812 acre-feet of 97,590 acre-feet), including well development, enhanced oil recovery (EOR) steam and water flooding, well maintenance, and other oil and gas activities, was obtained from treated and reused produced water (DEIR Table 4.9-27). About 38,372 [TBD K-J] acre-feet of treated produced water was supplied to farmers in the Eastern Subarea for irrigation in 2012, including 37,102 acre-feet supplied to the Cawelo Water District (Cawelo Water District, Agricultural Water Management Plan, February 2014, Table 30), 70 acre-feet on approximately 80 acres of the Concordia Ranch, and 1,200 acre-feet supplied to the Jasmine Mutual Water Company for use on about 400 acres (Per. Communication, Central Valley Regional Water Quality Control Board staff, August 2015). Oil and gas reuse of produced water, and treated produced water used for irrigation, accounted for about 54% [TBD K-J] of the total volume of produced water extracted in the Project Area in 2012 (127,184 [TBD K-J] acre-feet of 234,959 acre-feet). As shown in DEIR Table 4.9-27, treated produced water is projected to meet over 91% of all oil and gas water demand in the Project Area under future conditions.

Produced water has not typically been considered a source of municipal and industrial (M&I) or irrigation-quality groundwater in California. Water derived from hydrocarbon-bearing formations is often highly saline and may contain constituents that preclude most M&I or agricultural reuse without treatment. In many cases the necessary treatment may be similar in scope to the processes required to desalinate marine water. These processes usually require significant energy use which generates greenhouse gas and other emissions. Constituents removed from the treated water, including salts, may require additional infrastructure, such as pumps and pipelines, transportation and handling for safe disposal. In contrast with higher quality groundwater that is available and used for M&I and agricultural purposes, most of the volume of produced water in the Project Area is extracted and reused or disposed only by oil and gas operators. As noted by the California Commission on Science and Technology (CCST) in a 2015 report to the state legislature on well stimulation treatments, produced water that is subsequently re-injected back into the formation largely comprises "a closed loop system," and operators "using solely produced water for injection are not generally competing with other water users" (CCST 2015, Vol. II, Chapter 2 page 59). In 2012, about 38% (88,812 acre-feet of 234,959 acre-feet) of the total volume of produced water in the Project Area was reinjected into source formations in the "closed loop" manner described in the CCST report.

Produced water that is not reused by oil and gas operators or treated and supplied for irrigation is subject to disposal in Class II injection wells regulated by the state Division of Oil, Gas and

Geothermal Resources (DOGGR) under the federal Underground Injection Control (UIC) program or by other means, including to surface ponds and land. As discussed in DEIR Section 4.9, disposal by Class II injection wells has increased in the Project Area over time due to regulatory and safety concerns. As noted by the U.S. Environmental Protection Agency (U.S. EPA), by injecting produced water "deep underground, Class II wells prevent surface contamination of soil and water," and all oil and gas producing states require the injection of produced water "into the originating formation or into formations that are similar to those from which it was extracted" (http://water.epa.gov/type/groundwater/uic/class2/index.cfm, accessed August 2015). In some cases, the U.S. EPA may allow for Class II well discharges into formations that meet the criteria for a potential underground source of drinking water (USDW) under federal law. According to the U.S. EPA, the UIC program prevents contamination of water supplies by setting minimum requirements for state UIC programs, including in California, that "prevent contamination by keeping injected fluids within the intended injection zone, or in the case of injection directly or indirectly into a USDW, the fluids must not endanger or have the potential to endanger a current or future public water supply" (http://water.epa.gov/lawsregs/guidance/sdwa/upload/programregplaceunder.pdf, accessed August 2015). As discussed in DEIR Section 4.9, and in Global Response __, DOGGR, the State Water Resources Control Board (SWRCB) and the U.S. EPA are implementing a work plan to correct certain regulatory deficiencies in the state UIC program. In 2012, about 36% (84,517 acre-feet of 234,959 acre-feet) of the total volume of produced water in the Project Area was disposed by injection in Class II wells. As of August 2015, DOGGR and the SWRCB had not confirmed that any aquifer used for M&I or agricultural purposes had been contaminated by current or prior Class II injection well operations in the Project Area.

As discussed in DEIR Section 4.9 and 4.17, in addition to treated produced water, oil and gas operators also use higher-quality M&I or agricultural irrigation-quality groundwater for exploration and production activities (collectively, "M&I water"). Oil and gas demand for M&I water in the Project Area is projected to increase from 8,778 acre-feet in 2012 to 11,761 acre-feet in 2035. As discussed in DEIR Section 4.17, all oil and gas demand for M&I water is conservatively assumed in the DEIR analysis to be obtained from groundwater. The volume of M&I groundwater used for oil and gas activities was less than 1% of total Project Area groundwater extraction in 2012, and is projected to remain lower than 1% of total annual M&I groundwater extraction in the future during normal, dry, and multiple dry years (DEIR, Table 4.17-34).

The SGMA groundwater sustainability planning requirements have never been previously implemented in California. As of August 2015, no GSP (as defined in the SGMA) has ever been adopted by any state or local agency, and the DWR has not published draft regulations for GSP preparation and implementation. Consequently, the extent to which oil and gas-related activities, including the "closed loop" extraction and reinjection of produced water into source formations or disposal in similar formations in accordance with the UIC program, will be incorporated into a Project Area GSP is uncertain. Any GSP adopted in the Project Area must ensure that groundwater use will not cause any of the six "undesirable results" listed in the SGMA. The proposed revisions to the Zoning Ordinance include significantly enhanced requirements that are consistent with these objectives.

Water Code Sections 10721(w)(1)-(2) require that a GSP must not cause the "chronic lowering of groundwater levels" or "significant and unreasonable reductions in groundwater storage." As discussed in DEIR Section 4.17, M&I and agricultural water demand in the Project Area, including oil and gas use of M&I-quality groundwater, has resulted in a significant lowering of groundwater levels and reduced groundwater storage, particularly during the current drought. Additional groundwater has been extracted by Project Area and other California users in recent years to make up for the absence of imported and other surface water supplies. The proposed Zoning Code amendments require Oil and Gas Conformity Review applicants to reuse and/or supply additional amounts of produced water, and to use other supplies in lieu of M&I-quality groundwater, to the extent feasible. Oil and Gas Conformity Review applicants are also required to cooperate with the County to integrate into the GSP for the Tulare Lake-Kern Basin best practices to encourage reuse of produced water and the development of new supplies of treated produced water.

DEIR mitigation MM 4.17-2 requires that oil and gas operators increase the reuse of produced water, and reduce use of municipal and industrial-quality ground or surface water use to the extent feasible. By the end of 2016, the five biggest oil industry users of M&I water by volume shall be identified by using water supply data submitted to DOGGR, and the five largest M&I users shall work together to develop and implement a plan identifying new measures to reduce municipal and industrial water use by 2020. The plan shall address the following activities, as appropriate: steam generation; drilling and completions (including hydraulic fracturing); dust control; compaction activities related to construction; and landscaping. MM 4.17-2 also requires that the five biggest oil and gas users of M&I water in the Project Area work with local agricultural producers and water districts through available programs, including GSPs adopted under the SGMA, to identify new opportunities to increase the use of produced water for agricultural irrigation and other activities, as appropriate. Finally, MM 4.17-2 requires that any produced water treated and used for agricultural irrigation or other activities shall be tested and monitored to assure compliance with applicable standards for agricultural irrigation or other uses.

MM 4.17-3 requires that any oil and gas applicant subject to the proposed Oil and Gas Conformity Review process must cooperatively work with the County to integrate into the GSP for the Tulare Lake-Kern Basin, best practices from the oil and gas industry to encourage the reuse of produced water from oil and gas activities, and (with appropriate treatment) to produce new water supplies for other uses, such as agricultural irrigation and groundwater recharge. The produced water reuse goal is 30,000 acre-feet per year, which would offset more than the current and projected future use of imported water and groundwater from non-oil bearing zones by the oil and gas industry.

MM 4.17-4 requires that any Oil and Gas Conformity Review applicant shall work with the County on the GSP for the Project Area to increase the use of reclaimed water and reduce the use of M&I quality imported surface water or groundwater.

Pursuant to MM 4.17-2 through 4.17-4, Oil and Gas Conformity Review applicants will be required to: (a) use additional produced water for oil and gas activities to offset their demand for M&I quality groundwater to the extent feasible; (b) treat additional produced water for irrigation or other activities in lieu of groundwater to the extent feasible; (c) increase oil and gas use of recycled water to offset demand for higher quality ground and surface water; and (d) cooperate with the County in

the development of a GSP to incorporate measures that encourage the reuse of produced water, with appropriate treatment. These objectives are consistent with the SGMA goals of managing groundwater basins to avoid the chronic lowering of groundwater levels and significant and unreasonable reductions in groundwater storage.

Water Code section 10721(w)(3) requires that a GSP avoid "significant and unreasonable seawater intrusion." The Project Area is located about 90 miles east and inland from the Pacific Ocean. Project Area groundwater basins are not subject to a significant risk of seawater intrusion.

Water Code section 10721(w)(4) requires that a GSP avoid "significant and unreasonable degraded water quality, including the migration of contaminant plumes that impair water supplies." Potential oil and gas production and exploration activities that could affect water quality are discussed in detail in Section 4.9, including: (a) stormwater and site runoff discharges; (b) discharges to oil drilling sumps during well construction; (c) produced water and other discharges to surface ponds; (d) surface spills and other discharges of oil and gas related-materials or fluids to land, including agricultural reuse of produced water; (e) surface or unintended subsurface discharges of well stimulation treatment fluids; (f) unintended subsurface discharges during well construction, maintenance, reworking, production, or other roil and gas exploration or production activities; and (g) unintended subsurface discharges from Class II injection wells. The proposed Zoning Code amendments require Oil and Gas Conformity Review applicants to comply with several measures that address potential risks of groundwater quality degradation, including the following:

MM 4.1-1, which requires that oil and gas applicants use existing roads whenever possible and route new roads in a manner that minimizes surface disturbance that avoid or reduce groundwater impacts that could be related to the mobilization of constituents that might degrade groundwater quality.

MM 4.1-2, which requires that all derricks, boilers, and other drilling equipment used to drill, repair, clean out, deepen or redrill any well with oil, gas, or other hydrocarbon, and sump facilities, be removed from a drill site within 90 days after completion of production tests or after abandonment of any well.

MM 4.1-3, which requires that all surface sumps and ponds be permitted only to the extent authorized by the Central Valley Regional Water Quality Control Board (via waiver, Waste Discharge Requirements, or other form of authorized written documentation) and must comply with all applicable legal requirements and mitigation measures for sumps serving as storage, percolation or evaporation ponds for produced water.

MM 4.2-2 which requires several measures to protect agricultural lands that also avoid and minimize potential groundwater quality impacts, including: (a) surface water runoff and drainage well pad mitigation; (b) implementation of a Spill Prevention Countermeasure and Contingency Plan or Division of Oil Gas and Geothermal Resources (DOGGR) Assembly Bill 1960 spill plan and treatment of chemical spills treated in accordance with the DOGGR well stimulation treatment regulations; (c) speed limits to reduce dust generation or an alternate, more stringent dust suppression standard as adopted by the San Joaquin Valley Air Pollution Control District; (d) watering unpaved roads for dust suppression and control; (e) vehicle mud, dust, and weed seed

tracking control where unpaved roads intersect with paved roads; (f) stormwater controls during well drilling, reworking, and/or decommissioning; and (h) secondary containment for hazardous materials.

MM 4.3-2, which requires numerous measures to reduce construction emissions of particulate matter that also avoid and minimize potential groundwater quality impacts.

MM 4.4-15, which requires numerous measures to avoid and minimize impacts to protected and sensitive species that also avoid and minimize potential groundwater quality impacts, including: (a) a 20-mile-per-hour speed limit in all areas of disturbance and on unpaved roads unless otherwise posted and the prohibition of off-road traffic outside of designated access routes is prohibited, which reduces surface disturbance and dust generation; (b) disposal of all food-related trash items and all forms of microtrash, such as wrappers, cans, bottles, bottle tops, and food scraps in closed containers removed daily from the site; (c) dust control measures for all excavations, spoils piles, access roadways, and parking and staging areas; (d) herbicides and rodenticide use restricted to those approved by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife, and no herbicide use for vegetation control on split estate land in Tier 2 areas without surface owner approval; (e) drilling installations and operations must comply at all times with the applicable federal, State, county, and local law ordinances and regulations; (f) vehicle, equipment, and material storage limited to previously disturbed areas, no construction or operational material placement or storage outside of the planned disturbance area or stockpiled for future disposal, and the removal of all concrete and asphalt debris should from the site for recycling or proper disposal; and (g) full containment, collection and offsite disposal of all truck washing, paint, equipment, or similar activities.

MM 4.6-1, which requires substantial earthquake risk analysis and structural mitigation, including for pipelines that carry oil, gas, produced water, or other oil and gas related materials, to avoid and minimize damage due to seismic activity that could affect groundwater quality.

MM 4.6-3, which requires that structures on slopes greater than 30% be avoided unless an applicant determines that mineral recovery is infeasible from a different location, and site-specific professional engineering certification is submitted concluding that the new equipment will not cause landslides that could affect adjacent and downstream groundwater quality.

MM 4.8-1, which requires a comprehensive Worker Environmental Awareness Program that includes hazardous materials and hazardous waste management, and emergency preparedness, release reporting, and response requirements.

MM 4.8-2, which requires transportation, storage and disposal of all hazardous materials in compliance with the Hazardous Materials Transportation Act and measures to avoid roll-over accidents involving cargo tank trucks.

MM 4.8-3, which requires numerous spill prevention and cleanup measures, including: (a) construction activities allowing for easy cleanup of spills and construction crews that have sufficient tools, supplies, and absorbent and barrier materials to contain and recover spilled materials, fuels

and lubricants shall be stored only at designated staging areas; (b) fuel and lubricant tanks with appropriate secondary spill containment, (c) fuel trucks with oil spill response kits and equipment at all times; (d) regular routine equipment maintenance at the well pad, and prompt collection and lawfully disposal of wastes at an authorized recycling, treatment or disposal facility; (e) berms and/or dikes (secondary containment) for permanent above-ground bulk tanks, foundations with a passive leak detection system, and no tank placement in areas subject to periodic flooding or washout; and (f) a sufficient supply of sorbent and barrier materials on construction sites and contain runoff from contaminated areas, including shovels, drums for collection and disposal of contaminated soils, above ground tank inspection, drain locks, inspections conducted as much as possible in staging areas; and maintaining or repairing equipment and vehicles to reduce the likelihood of fuel or oil line breaks and leakage.

MM 4.8-4, which requires several measures to prevent, repair, and remediate accidental leaks and spills from oil and gas operations, including (a) the identification and evidence of integrity testing for all gas, oil and produced water pipelines located within 200 feet of any sensitive receptor; (b) a pipeline management plan for all waste gas lines less than or equal to 4 inches in diameter, developed and implemented in accordance with DOGGR regulations Title 14, Division 2, Chapter 4, Section 1774.2. The Pipeline Management Plan shall include; (c) pipeline design , testing methods, maintenance, recordkeeping requirements; (d) County notification of reportable quantities of fuel, gas, petroleum or hazardous materials leaks within 48 hours of discovery, and to other applicable agencies as required by other laws, with immediate containment, clean up , and repair.

MM 4.8-5, which requires that if an oil and gas applicant observes visual or olfactory evidence of contamination, or if soil contamination is otherwise suspected, work near the excavation site must be terminated, the work area must cordoned off and appropriate health and safety procedures implemented for the location.

MM 4.8-6, which requires that all oil and gas applicants implement the most up-to-date best management practices to prevent the release or accidental spillage of solid waste, garbage, construction debris, sanitary waste, industrial waste, naturally occurring radioactive materials, oil and other petroleum products, and other wastes into water bodies or water sources.

MM 4.8-7, which requires that exploration and development activities be conducted in accordance with the Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development The Gold Book (Bureau of Land Management 2007), including sufficiently impervious secondary containment,, not storing chemical containers on bare ground or exposed to the sun and moisture; maintenance and secondary containment of chemicals containers; proper construction of containment dikes, containment to the extent feasible for all produced water tanks, and the removal of trash, junk, and other materials not in current use.

MM 4.8-8, which requires compliance with well and related facility construction standards for well completions, testing, and limiting a facility's environmental footprint and the incidence of releases of hazardous substances in accordance with the practices described in applicable American Petroleum Institute publications, State Water Resources Control Board General Orders or appropriate Regional Water Quality Control Board waste discharge requirements or general orders.

MM 4.8-9, which requires that all operations subject to the proposed Oil and Gas Conformity Review process comply with the pipeline management plan, including inspection and maintenance requirements, as administered by DOGGR pursuant to 14 California Code of Regulations 1774.

MM 4.8-10, which requires annual maintenance checks for leaks and corrosion and inspection schedules as required by California law.

MM 4.8-11, which requires annual worker training consistent with the facility's Hazardous Materials Business Plan and Spill Prevention, Control and Countermeasures Plan.

MM 4.8-12, which requires that cyclic steam injection activities above reservoir fracture levels comply with the terms and conditions of an applicable DOGGR site-specific Project Approval Letters for an injection project and appropriate monitoring and response if any surface expressions are observed.

MM 4.8-13, which requires compliance with all DOGGR safe drilling and drill casing practices, well design, construction and well management requirements, blowout requirements, all other provisions of 14 California Code of Regulations 1744 and other applicable regulations, and the practices described in Recommended Practice for Well Control Operations (American Petroleum Institute 2012).

MM 4.8-14, which requires reporting and notification of reportable contamination caused by oil and gas activities.

MM 4.8-15, which requires numerous measures pertaining to the use of acutely hazardous chemicals, including (a) evaluating whether other alternative chemicals that are less hazardous could be used; (b) ensuring that the smallest quantity of necessary acutely hazardous materials are stored on site; (c) notifying building occupants and the Kern County Fire Department when and where acutely hazardous materials would be used; and (e) ensuring that all applicable employees are trained to handle, transport store, dispose of, and are trained in the spill prevention, control and countermeasures for acutely hazardous materials.

MM 4.9-1, which requires that Oil and Gas Conformity Review applicants comply with all applicable federal, state, regional and local agency water quality protection laws and regulations, and commonly utilized industry standards, including (where applicable) stormwater and well stimulation treatment permit coverage.

MM 4.9-2, which requires that a drainage plan and related measures be prepared in accordance with the Kern County Grading Code, the Green Code and approved by the Kern County Engineering, Surveying and Permit Services Department, Floodplain Management Section where oil and gas sites subject to the proposed Zoning Code do not have stormwater permit coverage.

MM 4.9-3, which requires that all drilling operations either use a closed loop system to avoid discharges of drilling muds and fluids, or obtain coverage under the State Water Resources Control Board low threat discharge General Order, individual Waste Discharge Requirements issued by the Central Valley Regional Water Quality Control Board for the unit, or obtain coverage under a

general order issued by the Central Valley Regional Water Quality Control Board applicable to drilling ponds.

MW 4.9-4, which requires that any activity subject to proposed Zoning Code Chapter 19.98 not conduct any injection activity regulated by the Underground Injection Control program, including enhanced oil recovery activities that discharge into any underground source of drinking water unless the aquifer has been exempted by the United States Environmental Protection Agency or injection has otherwise been authorized by the U.S. Environmental Protection Agency or by DOGGR under delegated authority under the Safe Drinking Water Act.

MW 4.9-5, which requires that any activity subject to proposed Zoning Code Chapter 19.98 not discharge produced water into any surface disposal facility unless the facility has received Waste Discharge Requirements or a waiver from the Central Valley Regional Water Quality Control Board.

MM 4.9-6, which requires that all oil and gas constructed facilities within a mapped 100-year floodplain be protected from the maximum potential elevation of flooding during a 100-year flood by elevating structures or by implementing containment berms or other protective measures in compliance with the standards in the Kern County Floodplain Management Code and Chapters 19.50 and 19.70 of the Kern County Zoning Code.

MM 4.17-1, which requires approved septic systems in appropriate locations for oil and gas operations and maintenance buildings.

MM 4.17-3, which is discussed above, and that requires Oil and Gas Conformity Review applicants to work with the County during the County's participation in the creation of a Groundwater Sustainability Agency and to integrate into the GSP for the Tulare Lake-Kern Basin, best practices from the oil and gas industry to encourage the re-use of produced water from oil and gas activities, and (with appropriate treatment) to produce new water supplies for other uses such as agricultural irrigation and groundwater recharge.

MM 4.17-5, which requires that Oil and Gas Conformity Review applicants not store construction waste onsite for longer than the duration of a construction activity, not transport any waste to any unpermitted facilities, and reduce construction waste transported to landfills by recycling solid waste construction materials.

Other DEIR mitigation measures, including air emissions control measures identified in Section 4.3 (Air Quality), and MM 4.17-2 and 4.17-5, would also avoid and minimize Project Area groundwater quality degradation risks by improving regional air quality and reducing the constituent deposition on land that might be mobilized by stormwater or other means and percolate into groundwater, and by reducing oil and gas production and exploration demand for higher-quality groundwater supplies.

The proposed Zoning Ordinance amendments would result in the implementation of significantly enhanced groundwater water quality protection requirements applicable to all Oil and Gas Conformity Review applicants in the Project Area. These requirements are consistent with the

SGMA goals of managing groundwater basins to avoid significant and unreasonable degraded water quality, including the migration of contaminant plumes that impair water supplies.

Water Code section 10721(w)(5) defines as an "undesirable result" significant and unreasonable "land subsidence that substantially interferes with surface land uses." As discussed in DEIR Section 4.6, land subsidence in the Project area has primarily been caused by higher-quality groundwater withdrawal for M&I and agricultural purposes. Project Area land subsidence rates were generally high until the early 1950s, when surface water began being transported into the area through the construction of canals and aqueducts. The importation of surface water resulted in decreased groundwater usage, water level recovery, and ultimately reduced rate of compaction. However, drought conditions in the mid-1970s, late 1980s and early 1990s caused increased pumping, water level declines and renewed compaction due to the lack of surface water supplies and increased reliance on groundwater. During the current drought, surface supplies curtailment has led to more significant groundwater use in the Project Area. As a result, significant land subsidence has occurred throughout the San Joaquin Valley, including in portions of the Project Area.

Land subsidence of less than one foot from oilfield withdrawals is known to occur in a few isolated areas in southwest Kern County. Generally, the extent and rate of oil and gas extraction subsidence is significantly less than subsidence caused by groundwater use because hydrocarbon extraction typically occurs at much deeper locations beneath the ground surface and a significant amount of the extracted produced water is reinjected to or near source formations. DOGGR monitors subsidence in oil and gas fields and regulates oil and gas withdrawal and re-pressurizing of each oilfield. If oilfield subsidence is observed, well operators are required to stabilize the ground by injecting additional produced water or reducing the volume of produced water being pumped during field operations.

As discussed above, the proposed Zoning Code amendments and MM 4.17-2 through 4.17-4 require Oil and Gas Conformity Review applicants to reuse and/or supply additional amounts of produced water, and to use other supplies in lieu of M&I-quality groundwater, to the extent feasible. Oil and Gas Conformity Review applicants will also be required to implement MM 4.6-4, which requires shall compliance with, and implementation of, a DOGGR approved repressuring plan as required by Division 3, Chapter 1, Article 5.5 of the Public Resources Code, commencing with Section 3315. MM 4.6-4 further requires that, in developed areas where subsidence is confirmed or suspected, subsidence monitoring shall be required using Synthetic Aperture Radar studies and/or other methods as approved by DOGGR to quantify and evaluate the potential effect on the area. These requirements would reduce oil and gas demand for higher-quality groundwater extraction that has been associated with subsidence in the Project Area, generate new water supplies that could be used in lieu of higher-quality groundwater, and will require oilfield subsidence monitoring and the implementation of appropriate responses to arrest any detected subsidence by repressuring the affect fields if necessary. As a result, the proposed Zoning Code amendments are consistent with the SGMA goals of avoiding significant and unreasonable land subsidence that substantially interferes with surface land uses.

Water Code section 10721(w)(6) defines as an "undesirable result" depletions of "interconnected surface water that have significant and unreasonable adverse impacts on beneficial uses of the surface water." As discussed above, the proposed Zoning Code amendments include significantly

enhancement requirements for avoiding and reducing potential impacts to Project Area surface water beneficial uses. MM 4.17-2 through MM 4.17-4 require additional reuse of produced water to the extent feasible and recycled water to reduce oil and gas demand for M&I quality imported surface water or groundwater. Surface water quality, including potential impacts from stormwater runoff, accidental spills or discharges, surface disposal of produced water or other oil and gas-related materials, including well stimulation treatment chemicals and construction muds and wastes, and constituent deposition from land disturbance, dust or air contaminants, will be subject to several additional requirements in conjunction with the Oil and Gas Conformity Review process, including the following:

MM 4.1-1, which requires that oil and gas applicants use existing roads whenever possible and route new roads in a manner that minimizes surface disturbance that avoid or reduce groundwater impacts that could be related to the mobilization of constituents that might degrade surface water quality and beneficial uses.

MM 4.1-2, which requires that all derricks, boilers, and other drilling equipment used to drill, repair, clean out, deepen or redrill any well with oil, gas, or other hydrocarbon, and sump facilities, be removed from a drill site within 90 days after completion of production tests or after abandonment of any well.

MM 4.1-3, which requires that all surface sumps and ponds be permitted only to the extent authorized by the Central Valley Regional Water Quality Control Board (via waiver, Waste Discharge Requirements, or other form of authorized written documentation) and must comply with all applicable legal requirements and mitigation measures for sumps serving as storage, percolation or evaporation ponds for produced water.

MM 4.2-2 which requires several measures to protect agricultural lands that also avoid and minimize potential surface water quality and beneficial use impacts, including: (a) surface water runoff and drainage well pad mitigation; (b) implementation of a Spill Prevention Countermeasure and Contingency Plan or Division of Oil Gas and Geothermal Resources (DOGGR) Assembly Bill 1960 spill plan and treatment of chemical spills treated in accordance with the DOGGR well stimulation treatment regulations; (c) speed limits to reduce dust generation or an alternate, more stringent dust suppression standard as adopted by the San Joaquin Valley Air Pollution Control District; (d) watering unpaved roads for dust suppression and control; (e) vehicle mud, dust, and weed seed tracking control where unpaved roads intersect with paved roads; (f) stormwater controls during well drilling, reworking, and/or decommissioning; and (h) secondary containment for hazardous materials.

MM 4.3-2, which requires numerous measures to reduce construction emissions of particulate matter that also avoid and minimize potential surface water quality and beneficial use impacts.

MM 4.4-15, which requires numerous measures to avoid and minimize impacts to protected and sensitive species that also avoid and minimize potential surface water quality and beneficial use impacts, including: (a) a 20-mile-per-hour speed limit in all areas of disturbance and on unpaved roads unless otherwise posted and the prohibition of off-road traffic outside of designated access

routes is prohibited, which reduces surface disturbance and dust generation; (b) disposal of all food-related trash items and all forms of microtrash, such as wrappers, cans, bottles, bottle tops, and food scraps in closed containers removed daily from the site; (c) dust control measures for all excavations, spoils piles, access roadways, and parking and staging areas; (d) herbicides and rodenticide use restricted to those approved by the United States Fish and Wildlife Service and the California Department of Fish and Wildlife, and no herbicide use for vegetation control on split estate land in Tier 2 areas without surface owner approval; (e) drilling installations and operations must comply at all times with the applicable federal, State, county, and local law ordinances and regulations; (f) vehicle, equipment, and material storage limited to previously disturbed areas, no construction or operational material placement or storage outside of the planned disturbance area or stockpiled for future disposal, and the removal of all concrete and asphalt debris should from the site for recycling or proper disposal; and (g) full containment, collection and offsite disposal of all truck washing, paint, equipment, or similar activities.

MM 4.6-1, which requires substantial earthquake risk analysis and structural mitigation, including for pipelines that carry oil, gas, produced water, or other oil and gas related materials, to avoid and minimize damage due to seismic activity that could affect surface water quality and beneficial uses.

MM 4.6-3, which requires that structures on slopes greater than 30% be avoided unless an applicant determines that mineral recovery is infeasible from a different location, and site-specific professional engineering certification is submitted concluding that the new equipment will not cause landslides that could affect adjacent and downstream surface water quality and beneficial uses.

MM 4.8-1, which requires a comprehensive Worker Environmental Awareness Program that includes hazardous materials and hazardous waste management, and emergency preparedness, release reporting, and response requirements.

MM 4.8-2, which requires transportation, storage and disposal of all hazardous materials in compliance with the Hazardous Materials Transportation Act and measures to avoid roll-over accidents involving cargo tank trucks.

MM 4.8-3, which requires numerous spill prevention and cleanup measures, including: (a) construction activities allowing for easy cleanup of spills and construction crews that have sufficient tools, supplies, and absorbent and barrier materials to contain and recover spilled materials, fuels and lubricants shall be stored only at designated staging areas; (b) fuel and lubricant tanks with appropriate secondary spill containment, (c) fuel trucks with oil spill response kits and equipment at all times; (d) regular routine equipment maintenance at the well pad, and prompt collection and lawfully disposal of wastes at an authorized recycling, treatment or disposal facility; (e) berms and/or dikes (secondary containment) for permanent above-ground bulk tanks, foundations with a passive leak detection system, and no tank placement in areas subject to periodic flooding or washout; and (f) a sufficient supply of sorbent and barrier materials on construction sites and contain runoff from contaminated areas, including shovels, drums for collection and disposal of contaminated soils, above ground tank inspection, drain locks, inspections conducted as much as possible in staging areas; and maintaining or repairing equipment and vehicles to reduce the likelihood of fuel or oil line breaks and leakage.

MM 4.8-4, which requires several measures to prevent, repair, and remediate accidental leaks and spills from oil and gas operations, including (a) the identification and evidence of integrity testing for all gas, oil and produced water pipelines located within 200 feet of any sensitive receptor; (b) a pipeline management plan for all waste gas lines less than or equal to 4 inches in diameter, developed and implemented in accordance with DOGGR regulations Title 14, Division 2, Chapter 4, Section 1774.2. The Pipeline Management Plan shall include; (c) pipeline design , testing methods, maintenance, recordkeeping requirements; (d) County notification of reportable quantities of fuel, gas, petroleum or hazardous materials leaks within 48 hours of discovery, and to other applicable agencies as required by other laws, with immediate containment, clean up , and repair.

MM 4.8-5, which requires that if an oil and gas applicant observes visual or olfactory evidence of contamination, or if soil contamination is otherwise suspected, work near the excavation site must be terminated, the work area must cordoned off and appropriate health and safety procedures implemented for the location.

MM 4.8-6, which requires that all oil and gas applicants implement the most up-to-date best management practices to prevent the release or accidental spillage of solid waste, garbage, construction debris, sanitary waste, industrial waste, naturally occurring radioactive materials, oil and other petroleum products, and other wastes into water bodies or water sources.

MM 4.8-7, which requires that exploration and development activities be conducted in accordance with the Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development The Gold Book (Bureau of Land Management 2007), including sufficiently impervious secondary containment,, not storing chemical containers on bare ground or exposed to the sun and moisture; maintenance and secondary containment of chemicals containers; proper construction of containment dikes, containment to the extent feasible for all produced water tanks, and the removal of trash, junk, and other materials not in current use.

MM 4.8-8, which requires compliance with well and related facility construction standards for well completions, testing, and limiting a facility's environmental footprint and the incidence of releases of hazardous substances in accordance with the practices described in applicable American Petroleum Institute publications, State Water Resources Control Board General Orders or appropriate Regional Water Quality Control Board waste discharge requirements or general orders.

MM 4.8-9, which requires that all operations subject to the proposed Oil and Gas Conformity Review process comply with the pipeline management plan, including inspection and maintenance requirements, as administered by DOGGR pursuant to 14 California Code of Regulations 1774.

MM 4.8-10, which requires annual maintenance checks for leaks and corrosion and inspection schedules as required by California law.

MM 4.8-11, which requires annual worker training consistent with the facility's Hazardous Materials Business Plan and Spill Prevention, Control and Countermeasures Plan.

MM 4.8-13, which requires compliance with all DOGGR safe drilling and drill casing practices, well design, construction and well management requirements, blowout requirements, all other provisions of 14 California Code of Regulations 1744 and other applicable regulations, and the practices described in Recommended Practice for Well Control Operations (American Petroleum Institute 2012) to protect groundwater and surface water beneficial uses.

MM 4.8-14, which requires reporting and notification of reportable contamination caused by oil and gas activities.

MM 4.8-15, which requires numerous measures pertaining to the use of acutely hazardous chemicals, including (a) evaluating whether other alternative chemicals that are less hazardous could be used; (b) ensuring that the smallest quantity of necessary acutely hazardous materials are stored on site; (c) notifying building occupants and the Kern County Fire Department when and where acutely hazardous materials would be used; and (e) ensuring that all applicable employees are trained to handle, transport store, dispose of, and are trained in the spill prevention, control and countermeasures for acutely hazardous materials.

MM 4.9-1, which requires that Oil and Gas Conformity Review applicants comply with all applicable federal, state, regional and local agency water quality protection laws and regulations, and commonly utilized industry standards, including (where applicable) stormwater and well stimulation treatment permit coverage.

MM 4.9-2, which requires that a drainage plan and related measures be prepared in accordance with the Kern County Grading Code, the Green Code and approved by the Kern County Engineering, Surveying and Permit Services Department, Floodplain Management Section where oil and gas sites subject to the proposed Zoning Code do not have stormwater permit coverage.

MM 4.9-3, which requires that all drilling operations either use a closed loop system to avoid discharges of drilling muds and fluids, or obtain coverage under the State Water Resources Control Board low threat discharge General Order, individual Waste Discharge Requirements issued by the Central Valley Regional Water Quality Control Board for the unit, or obtain coverage under a general order issued by the Central Valley Regional Water Quality Control Board applicable to drilling ponds.

MW 4.9-5, which requires that any activity subject to proposed Zoning Code Chapter 19.98 not discharge produced water into any surface disposal facility unless the facility has received Waste Discharge Requirements or a waiver from the Central Valley Regional Water Quality Control Board.

MM 4.9-6, which requires that all oil and gas constructed facilities within a mapped 100-year floodplain be protected from the maximum potential elevation of flooding during a 100-year flood by elevating structures or by implementing containment berms or other protective measures in compliance with the standards in the Kern County Floodplain Management Code and Chapters 19.50 and 19.70 of the Kern County Zoning Code.

MM 4.17-1, which requires approved septic systems in appropriate locations for oil and gas operations and maintenance buildings to reduce potential water quality impacts, including to surface waters and beneficial uses.

MM 4.17-5, which requires that Oil and Gas Conformity Review applicants not store construction waste onsite for longer than the duration of a construction activity, not transport any waste to any unpermitted facilities, and reduce construction waste transported to landfills by recycling solid waste construction materials.

In summary, the proposed Zoning Ordinance amendments will significantly enhance groundwater level, storage and quality, surface water beneficial use, and land subsidence protection requirements in the Project Area. In addition Oil and Gas Conformity Review applicants will be required to cooperate with the County in the development of a project Area GSP that incorporates best practices for oil and gas exploration and production, including increased produced water reuse with appropriate treatment, and increased oil and gas use of recycled water in lieu of higher-quality ground or surface waters. Implementation of the proposed Zoning Code amendments would support the achievement of and be consistent with all applicable SGMA sustainable groundwater management objectives for the Project Area.

Water-04: Feasibility of Potable Water Use Ban

Some commenters requested that oil and gas producers be banned from use of any potable water for production activity. The County recognizes the importance of addressing impacts on water supply under current drought conditions in California. The EIR incorporates feasible mitigation measures to increase use of produced water. See Mitigation Measures 4.17-2, 4.17-3 and 4.17-4. However, CEQA requires an EIR to identify only mitigation measures that are feasible.[106] Mitigation is feasible if it is capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.[107] Similarly, the County may reject any alternative that is not actually feasible.[108]

An alternative or mitigation measure requiring use of produced water for all oil and gas operations, or banning the use of potable municipal and industrial (M&I) water or groundwater for oil and gas operations, would not be feasible. Using produced water would, in many cases, significantly increase costs, and could result in increased chemical use, longer and more intensive surface activities, and the need for additional permitting processes to avoid adverse secondary environmental impacts.

---

Produced water is currently used for some oilfield activities, such as discharge for dust suppression, but increasing that use beyond existing levels would require additional permitting and approvals to avoid impacts to biological, water and other resources. While the oil and gas industry in Kern County has been working with the Regional Water Quality Control Boards to increase use of produced water for dust suppression and other oilfield activities, there are regulatory hurdles to increasing use of produced water and it is uncertain whether and to what extent additional use of produced water will be permitted by the Boards. As such, a requirement to substitute produced water for all uses would not be legally feasible.

While oil and gas operators may be able to utilize additional produced water for some oilfield activities – as contemplated by Mitigation Measures 4.17-2, 4.17-3 and 4.17 – not all oilfield activities are able to use produced water. For some oilfield activities, such as drilling and abandonment work, the use of fresh water is required to properly formulate the cement mixtures that are needed to safely drill and abandon wells. Using produced water for these activities would jeopardize operators' ability to comply with well specifications provided for in DOGGR regulations.

Certain enhanced oil recovery (EOR) operations, such as steam generation, can require higher-quality water supplies than are typically obtained from treated produced water in order to avoid equipment corrosion or damage and potential chemical interactions. Use of produced water in these operations can also lead to increased need for equipment maintenance due to, for example, silica buildup or tube failures in boilers. Even when produced water can be used in EOR operations, water losses in the oil production cycle—due to losses on the surface, in the geological zones, or otherwise—typically necessitate the use of some fresh or brackish "make up" water from a surface or subsurface source. Depending on the nature of the operation, "make up" water often represents between 10 and 25 percent of the water used.

Additionally, the lack of infrastructure linking sources of produced water to the locations where water may be used, particularly in cases of new exploration, can result in increased truck trips and other more significant impacts associated with transporting produced water to operation sites. For example, pilot EOR projects typically cannot use recycled water due to the early stage of project development, which results in a lack of available recycled water. Furthermore, the treatment of water for reuse requires specialized equipment, consumes energy, and generates waste. In many cases, operators have also contracted with local water purveyors to utilize some supply of purchased water over a long-term contract; cancellation of such contracts would also create negative financial impacts for the region.

Some commenters urge a mitigation measure or alternative requiring the use of produced water specifically for well stimulation treatments. However, such requirements would significantly increase chemical use as well as costs. Chemicals used in fracture treatments impart viscosity for proppant transport and fracture geometry creation and improve post-treatment production results by minimizing polymer plugging and other phenomena detrimental to production. Using produced water instead of fresh water as a base fluid for fracture treatments would increase the chemical volumes needed to fulfill these functions. Produced water use for fracture treatments could require as much as a five-fold increase in buffering agents, and additional chelating agents, clay and scale inhibitors, and surfactants to prevent emulsions and reduce surface tension may also be needed to

minimize production complications that would be caused by the use of produced water. While produced water could be pre-treated to require fewer chemicals during the fracture treatment itself, such pre-treatment conditioning would also involve more chemicals, equipment, or both, to obtain water sufficient for use in the fracture treatment. Because of these complications, a typical fracturing operation would become significantly more expensive, and often uneconomic.

In addition, for some types of well stimulation, such as matrix acid stimulation, it is technologically infeasible to utilize produced water. Typically, matrix acid stimulation employs hydrofluoric acid (HF acid), which can only be mixed with fresh water. If HF acid comes into contact with formation brine, insoluble precipitants form, limiting the effectiveness of the acid stimulation system by plugging pore throats in the reservoir pore network. Such plugging can completely counteract the effects of the stimulation treatment. The reduction in the effectiveness of the treatment would require more frequent treatments, larger treatments, or both, which would lead to a significant increase in use of chemicals, emissions and heavy vehicle traffic hauling hazardous chemicals.

In sum, while operators are working to increase their use of produced water for oil and gas operations in Kern County, issues ranging from harms caused by chemical interactions to the lack of availability of produced water at certain sites renders complete elimination of freshwater use economically, socially, environmentally, and technologically infeasible.

Water-05: Water Supply and Demand Data Update

Commenters have indicated that that the 2012 water supply and demand estimates for oil and gas exploration and production activities in DEIR Section 4.9, DEIR Section 4.17, Impact 4.17-4, and in the Water Supply Assessment (WSA) for the project region underestimate the amount of surface pond disposal in the Western Subarea and the volume of produced water used for agriculture in the Eastern Subarea, and overestimate the amount surface pond disposal in the Eastern Subarea. Commenters have also requested clarification that the regional groundwater use and supply and demand average, and dry and multiple dry year estimates in the DEIR and WSA, do not identify or are intended to represent an assumed groundwater safe or sustainable yield for the analysis region.

In response to these comments, the County requested that Kennedy-Jenks, the engineering firm that prepared the WSA, review the estimates for the Western and Eastern subareas, clarify that the analysis does not assume a safe or sustainable yield for the analysis region, and revise the WSA as applicable. The revised, final WSA was prepared by Kennedy-Jenks and delivered to the County on September 18, 2015. The final WSA is attached as Appendix T-1. In addition, conforming changes to the table of Project Area produced water generation use or disposal were made to Table 5.1 of the Water Quality Assessment (WQA) prepared by Kennedy Jenks. The revised, final version of the WQA is attached as Appendix S-1.

The revisions in the Final WSA and WQA reflect minor corrections or additional information, including a larger amount of produced water land disposal in the Western Subarea, a larger amount of agricultural reuse of produced water in the Eastern Subarea, and a correspondingly smaller amount of land disposal in the eastern subarea. In addition, because the increased use of treated produced water for irrigation reduces agricultural demand for other water supplies by the same

amount, the ratio of oil and gas demand for higher quality (e.g., municipal and industrial or "M&I" water) to agricultural demand increases in the revised analysis by a small extent. No other changes were made to the WSA or WQA, and one of the revisions significantly affect the DEIR analysis or conclusions.

The following sections summarize in more detail the WSA revisions that have been made in response to comments, discuss the extent to which the revisions affect the DEIR analysis of potential impacts related to water supply and use, and demonstrate that the revisions do not significantly affect the DEIR impact analysis and significance conclusions.

A. Western Subarea Surface Disposal Volumes

As shown in Appendix T-1, Table 28, during the WSA review process a calculation error was identified for the amount of the produced water land disposal (primarily surface ponds) in the Western Subarea during 2012. The produced water land disposal for the Western Subarea has been revised to 19,545 acre-feet, an increase of 6,995 acre-feet from the amounts shown in DEIR Table 4.9-2. Table 7-12 summarizes the revisions to the Western Subarea water supply and use estimates for 2012 that reflect this revision.

Table 7-12: Western Subarea 2012 Oil and Gas Exploration and Production DEIR and Revised WSA Water Supply and Demand (acre feet)

Produced Water Land Disposal	12,950	19,545	6,595
Subtotal: Oil and Gas Produced Water Waste Disposal	53,432	60,027	6,595
TOTAL	139,699	139,699	-

Sources: DEIR Table 4.9-1, GR Appendix 1 Table 25

Note: Includes a water balance closure factor for the net difference between estimated water inputs and outputs of 2,490 in DEIR Table 4.9-1 and -4,104 in Appendix t-1 Table 28. All values subject to rounding and may vary slightly from Appendix T-1 Table 28.

As shown in Table 7-12, the WSA revisions increase the total volume of produced water land disposal, and the total amount of waste disposal (including by injection well) in the Western Subarea by 6,595 acre-feet. The water balance closure factor, which accounts for the net difference between the estimated water supplied and water used in the subarea using various methodologies, changes from 2,409 acre-feet to -4,104 acre-feet in the final WSA due to the revised calculations. All other 2012 water supply and use amounts for the Western Subarea in DEIR Table 4.9-2 are unaffected by the final WSA revisions in Appendix T-1

B. Eastern Subarea Produced Water Irrigation Reuse and Surface Disposal Volumes

As shown in Appendix T-1, Table 28, in response to comments, available information about the reuse of treated produced water for agricultural irrigation and the amount of produced water surface land disposal in the Eastern Subarea was reviewed for 2012. The review determined that the volume of produced water supplied to agricultural users in 2012, including the Cawelo Water District, the Jasmine Mutual Water Company and Concordia Ranch, was 38,658 acre-feet, an increase of 5,887 acre-feet from the amount in DEIR Table 4.9-4. The review also determined that the amount of produced water land disposal in the Eastern Subarea was lower by -5,887 acre-feet from the amount in DEIR Table 4.9-4. Table 7-13 summarizes the revisions to the Eastern Subarea water supply and use estimates for 2012 that reflect these revisions.

Table 7-13: Eastern Subarea 2012 Oil and Gas Exploration and Production DEIR and Revised WSA Water Supply and Demand (acre feet)

	DEIR Table 4.9-4	Final WSA (Appendix T-1)	Change from DEIR Table 4.9-4

Injection Well Disposal	41,919	41,919	-
Produced Water Land Disposal	17,084	11,197	-5,887
Subtotal: Oil and Gas Produced Water Waste Disposal	59,003	53,116	-5,887
TOTAL	101,091	101,091	-

Sources: DEIR Table 4.9-4, GR Appendix 1 Table 28.

Notes: Includes a water balance closure factor for the net difference between estimated water inputs and outputs of -3,613 in Table 4.9-4 and Appendix T-1, Table 28. All values subject to rounding and may vary slightly from Appendix T-1, Table 28.

As shown in Table 7-13, the volume of produced water used for agricultural reuse, and the total volume of produced water reuse, increased by 5,887 acre-feet in the Eastern Subarea in 2012. The volume of produced water land disposal, and total volume of produced water disposal correspondingly decreased by -5,887 acre-feet in the Eastern Subarea due to the increased use of produced water for irrigation. All other 2012 water supply and use amounts for the Eastern Subarea in DEIR Table 4.9-4 are unaffected by the revisions in the final WSA.

C. Project Area 2012 Oil and Gas Exploration and Production Water Supply and Demand

Table 7-14 summarizes the revisions to the Project Area oil and gas exploration and production water supply and use estimates for 2012 in DEIR Table 4.9-1 that reflect the Western and Eastern subarea revisions in the final WSA (Appendix T-1). No changes were made to the DEIR information for the Central Subarea.

Sources: DEIR Table 4.9-1, GR Appendix 1 Table 28.

Notes: Includes a water balance closure factor for the net difference between estimated water inputs and outputs of -1,418 in DEIR Table 4.9-1 and -8,012 in Appendix T-1. All values subject to rounding and may vary slightly from Appendix T-1, Table 28.

As shown in Table 7-14, the volume of produced water used for agricultural reuse, and the total amount of produced water reuse in the Project Area during 2012 in the final WSA increased by 5,887 acre-feet from the level in DEIR Table 4.9-1. This increase reflects the larger volume of produced water reuse in the Eastern Subarea as shown in Table 7-13. The volume of produced water land disposal, and total volume of produced water disposal in the Project Area increased by 708 acre-feet from the level in DEIR Table 4.9-1. This increase reflects the net difference between the larger volume of produced water land disposal in the Western Subarea shown in Table 7-12 (+6,595 acre-feet) and the lower volume of produced water land disposal in the Eastern Subarea shown in Table 7-13 (-5,887 acre-feet). The water balance closure factor, which accounts for the net difference between the estimated water supplied and water used in the subarea using various methodologies, changes from -1,418 acre-feet to -8,012 acre-feet in the final WSA due to the revised calculations. All other 2012 water supply and use amounts for the Project Area in DEIR Table 4.9-1 are unaffected by the WSA revisions.

D. WSA Revisions and Water Supply and Demand Projections

Table 7-15 incorporates the revised Project Area agricultural water reuse and land disposal volumes summarized above in the DEIR projections of future water supply and demand , including the three future scenarios in DEIR Table 4.9-27. As discussed in the DEIR, Table 4.9-27 analyzes three future (2035) oil and gas water supply and use scenarios based on the projected annual increase in oil and gas exploration and production activity described in the DEIR. These scenarios include: (a) Scenario 1, which assumes a pro-rata increase in oil and gas water supply and demand from 2012 levels; (b) Scenario 2, which assumes a 50% reduction in surface disposal from 2012 levels in response to regulatory concerns about such disposal methods; and (c) Scenario 3, which assumes that

agricultural reuse of produced water is increased from 2012 levels by the amount of the projected oil and gas demand for higher-quality municipal and industrial (M&I) water demand in 2035 (11,761 acre-feet) and that produced water surface disposal would decline by 90% from 2012 levels. The DEIR scenarios assume that agricultural reuse of produced water will remain constant at an assumed 2012 level of 32,771 acre-feet year, a volume of use that is consistent with the average amount of produced water used for irrigation by the Cawelo Water District over the period 2009-2012 (see Appendix T-1, Table 28 and accompanying notes).

Table 7-15 incorporates all of the final WSA revisions (see Appendix T-1) described above, including the revised estimate of 38,658 acre-feet of agricultural produced water reuse and the revised produced water land disposal revisions in the Western and Eastern subareas for 2012, with the three scenarios analyzed in DEIR Table 4.9-27. Table 7-15 shows the net difference between the 2012 and the 2035 scenario projections in DEIR Table 4.9-27 and Table 7-15, which utilizes the revisions from the final WSA.

Sources: GR Appendix 1, Table 28, DEIR Table 4.9-27, and Table 7-15 above; the 2012 summary includes a water balance closure factor of -4,104 as discussed in Table 7-12 above.

As shown in Table 7-15 and Table 7-16, the WSA revisions increase the amount of produced water reused for agriculture in 2012 from 32,771 acre-feet to 38,658 acre-feet, a net change of 5,887 acre-feet. Consistent with the methodology discussed in the DEIR and used to derive DEIR Table 4.9-27, the 2012 amount of produced water used for agriculture is assumed to be the same under future conditions, except in Scenario 3. The Scenario 3 projection assumes that agricultural reuse will increase from the 2012 level by 11,761 acre-feet in 2035 to fully offset the projected oil and gas demand for M&I quality water in that year. As shown in Table 7-16, the net difference between the amount of treated produced water used in 2012 and projected to be used for agriculture in the three 2035 scenarios in DEIR Table 4.9-27 and Table 7-15 is 5,887 acre-feet.

As shown in Table 7-15, the WSA revisions increase the amount of produced water land disposal in 2012 from 30,223 acre-feet to 30,931 acre-feet, a net change of 708 acre-feet. The slight increase in the net amount of produced water land disposal, and the increased use of treated produced water for agriculture in 2012 and in the three future scenarios, also generates minor changes to the amount of produced water land and injection well disposal in each scenario as follows:

Scenario 1 assumes that 2035 land and surface injection volumes will increase pro-rata from 2012 levels based on the applicants' estimated water demand increase by 2035 (see DEIR Section 4.9, "Methodology and Assumptions"). The final WSA 2012 land disposal volume increase from 30,233 acre-feet to 30,933 acre-feet results in a projected land disposal volume for Scenario 1 that is 479 acre-feet above the volume projected in the DEIR (42,285 acre-feet compared with 41,806 acre-feet in Table 4.9-27). As shown in Table 7-15, the volume of injection well disposal in Scenario 1 declines from 125,905 acre-feet in DEIR Table 4.9-27 to 119,539 acre-feet (-6,366 acre-feet). The reduced level of injection well disposal reflects the net increase of 5,887 acre-feet used for agriculture and 479 acre-feet of additional surface disposal in Scenario 1 attributable to the final WSA revision.

Scenario 2 is based on Scenario 1, and also assumes that produced water land disposal will be 50% below 2012 levels (see DEIR Section 4.9, "Methodology and Assumptions"). The final WSA revision of the 2012 land disposal volume from 30,233 acre-feet to 30,933 acre-feet results in a projected 2035 land disposal volume for Scenario 2 that is 354 acre-feet above the volume projected in the DEIR (15,466 acre-feet compared with 15,112 acre-feet in Table 4.9-27). As shown in Table 7-15, the volume of injection well disposal in Scenario 2 declines from 152,600 acre-feet in DEIR Table 4.9-27 to 146,358 acre-feet (-6,241 acre-feet). The reduced level of injection well disposal reflects the net increase of 5,887 acre-feet used for agriculture and 354 acre-feet of additional surface disposal in Scenario 2 attributable to the final WSA revisions.

Scenario 3 is based on Scenario 1 and assumes that produced water land disposal will be 90% below 2012 levels and that produced water agricultural reuse will increase by 11,761 acre-feet to offset projected oil and gas M&I water demand in 2035 (see DEIR Section 4.9, "Methodology and Assumptions"). The final WSA revision of the 2012 land disposal volume from 30,233 acre-feet to 30,933 acre-feet results in a projected land disposal volume for Scenario 3 that is 71 acre-feet above the volume projected in the DEIR (3,093 acre-feet compared with 3,022 acre-feet in Table 4.9-27).

As shown in Table 7-15, the volume of injection well disposal in Scenario 3 declines from 152,600 acre-feet in DEIR Table 4.9-27 to 146,970 acre-feet (-5,958 acre-feet). The reduced level of injection well disposal reflects the net increase of 5,887 acre-feet used for agriculture and 71 acre-feet of additional surface disposal in Scenario 3 attributable to the final WSA revisions.

E. Other WSA and WQA Changes

The final WSA (Appendix T-1) and final WQA (Appendix S-1) include certain additional adjustments to reflect the revised agricultural water reuse and land disposal volumes discussed above. The amount of produced water deliveries identified for the eastern subarea, and the Project Area as a whole, are increased by 5,887 acre-feet for the years 2015-2035 in Table 19 to be consistent with the additional use of treated produced water that was identified in the final WSA. Similarly, to reflect the additional use of 5,887 acre-feet of treated produced water for irrigation in the eastern subarea, the amount of water identified in Table 39 for "Agricultural Demand Raw and M&I Water" was reduced by 5,887 acre-feet, and the amount of water identified in the row "Agricultural Demand Produced Water" was increased by 5,887 acre-feet. Since the total agricultural water demand remains the same in the analysis, these changes do not affect the total supplies and demands in the project area for normal, dry and multiple dry years in the final WSA and in the DEIR. Table 5.1 in the WQA (Appendix S-1), which summarizes Project Area produced water generation and use, was revised to conform with the final WSA and water volumes were converted to acre-feet for ease of reference.

F. Clarification of Groundwater Use Estimates in Revised WSA and Basin Safe Yield

In response to comments, the revised WSA clarifies that the amount of groundwater use assumed in the regional supply and demand projections through 2035 does not, and was not intended to, represent the safe or sustainable yield for the Project Area.

As discussed in DEIR Section 4.9 and Section 4.17, and in Global Response Water-3, California recently enacted a Sustainable Groundwater Management Act (SGMA) that requires the implementation of a Groundwater Sustainability Plan (GSP), or a coordinated set of GSPs, by January 31, 2020 for virtually all groundwater basins in the Project Area. The GSP will be managed by one or more new Groundwater Sustainability Agencies (GSAs) that must be established for the Project Area by June 30, 2017. The purpose of a GSP is to achieve "sustainable groundwater management" within 20 years, which is defined as "the management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results" (Water Code Section 10721(u)). The SGMA defines six basin management "undesirable results":

- Chronic lowering of groundwater levels (not including overdraft during a drought, if a basin is otherwise managed);
- Significant and unreasonable reductions in groundwater storage;
- Significant and unreasonable seawater intrusion;
- Significant and unreasonable degradation of water quality;

- Significant and unreasonable land subsidence; and
- Surface water depletions that have significant and unreasonable adverse impacts on beneficial uses (Water Code Section 10721(w)).

Groundwater basins within the Project Area are ranked as high- and medium-priority by the state and therefore are subject to the earliest GSA establishment and GSP enactment deadlines under the SGMA. California statewide groundwater elevation monitoring maps identify virtually all of the valley floor groundwater basins in the Project Area as "high priority" basins, and the Tulare Lake and Kern County basins are identified as being in a critical condition of overdraft. Prior to the enactment of the SGMA, several local governments and water districts (including Kern County) established the Kern Groundwater Authority as a Joint Powers Authority to provide a framework for the active, comprehensive management of the groundwater basin underlying the valley portion of Kern County, to preserve and maintain local control of groundwater resources and provide long term surety for all basin users.

As discussed in more detail in the revised WSA (Appendix T-1) the projected groundwater extraction rate used in the WSA assessment is not intended to represent the safe yield for the Project Area. Rather, it uses an historical mean extraction value for analysis purposes as the best available information prior to the implementation of the GSP for the basin. The historical mean extraction value used in the analysis does not represent the safe or sustainable yield for the Project Area. This assessment does not consider or identify a safe or sustainable yield for the Project Area. The GSP will identify the sustainable or safe yield that will avoid unsustainable extraction rates that could yield "undesirable results" (see Appendix T-1, Section 4.3.4.1 "Groundwater Extractions," Section 4.3.4.3, "Groundwater Supply Available in Project Area and Sub-Areas," and Section 7, "Comparison of Supplies and Demands" including the tables projecting supplies and demands through 2035 for normal/average, single dry and multiple dry years).

F. Summary and Evaluation of DEIR Impact Analysis and Findings

The final WSA revisions to Western and Eastern subarea produced water land disposal and Eastern Subarea produced water irrigation reuse result in an additional 5,887 acre-feet of treated produced water used for agriculture and an additional 708 acre-feet of produced water land disposal relative to the amounts assumed in the DEIR for the Project Area in 2012. The final WSA revisions also result in minor changes to the three water supply and demand scenarios considered in the DEIR through 2035, including: (a) treated produced water used for agriculture increases by a net amount of 5,887 acre-feet per year in all three scenarios; (b) produced water land disposal increases by a net amount of from 71 to 459 acre-feet depending on the scenario; and (c) produced water injection well disposal decreases by a net amount of -6,366 to -5,958 acre-feet depending on the scenario. None of these changes affect the total volume of Project Area produced water or the amount of oil and gas M&I water demand, and neither do they materially change any other oil and gas water use volumes in the Project Area during 2012-2035.

As shown in the final WSA (Appendix T-1), the increased amount of produced water reused for irrigation in 2012 and under future conditions slightly reduces the total regional demand for higher-quality water supplies, such as M&I or agricultural quality ground surface water assumed in the

DEIR. As discussed in the DEIR, Project Area water supplies have been significantly affected by continuing and severe drought conditions. The additional amount of treated produced water available for irrigation in the final WSA generates a small positive net water supply benefit, and slightly reduces the potential impacts associated with demands for higher quality ground or surface water, than the level assumed in the DEIR.

As discussed in GR-20-CCST concerns have been raised that treated produced water reused for agriculture could contain certain constituents, including well stimulation treatment chemicals, that are not currently subject to testing and monitoring requirements. Produced water reuse for agriculture is subject to regulation by the Central Valley Regional Water Quality Control Board (CVRWQCB). The CVRWQCB has convened a panel to consider food safety issues that may be associated with the use of produced water for irrigation. The DEIR requires compliance with laws and regulations, including CVRWQCB laws, regulations, waste discharge requirements or other permit terms and conditions that are and may become applicable to produced water reuse for irrigation in the future. As discussed in the DEIR, agricultural demand accounts for 2,667,687 acre-feet per year in the Project Area. An increase of 5,887 acre-feet from the 32,771 acre-foot level of produced water reuse for irrigation assumed in the DEIR represents just 1.4% (versus 1.23% at 32,771 acre-feet) of total annual Project area irrigation. The revised volume of produced water reuse for irrigation does not significantly affect the DEIR impact analysis and conclusions.

As shown in Table 7-15 and Table 7-16, the WSA revisions result in a reduction of the amount of produced water subject to injection well disposal under each of the future scenarios considered in the DEIR. The DEIR, GR Water-02, GR Water-06 [seismic analysis for produced water/CCST issue] discuss potential groundwater quality, seismic, hazard, and other potential impacts related to produced water well disposal. The DEIR requires that all project-related injection activity must comply with all applicable laws and regulations including all laws and regulations that protect underground sources of drinking water and groundwater quality. The volume of and potential impacts associated with produced water disposal injection attributable to the WSA revisions are either the same (2012) or lower (all three future scenarios) than analyzed in the DEIR. Consequently, the WSA revisions reduce the potential impacts associated with produced water well disposal and do not significantly affect the DEIR impact analysis and conclusions.

As shown in Table 7-15 and Table 7-16, the WSA revisions result in a slight increase in the amount of produced water land disposal in 2012 (+708 acre-feet) and in the future scenarios considered in the DEIR (+479 acre-feet in Scenario 1, +354 acre feet in Scenario 2, and +71 acre-feet in Scenario 3). The DEIR and GR Water-01 discuss potential ground and surface water quality and other impacts associated with produced water land disposal, including the ongoing surface disposal pond characterization and regulatory program implemented by the CVRWQCB in 2014. The DEIR requires that all project-related produced water land disposal must comply with all applicable laws and regulations, including all current or future laws and regulations that pertain to surface discharges in the Project Area. The volume of produced water land disposal attributable to the WSA revisions results in disposal volumes that are only 2.3% above the amounts assumed in the DEIR for 2012 and Scenarios 2 and 3, and 1.1% above the level for Scenario 1. These increases do not materially and significantly affect the DEIR impact analysis and conclusions.

The final WSA and final WQA do not change the Project Area water supply and demand analyses for normal, single dry, and multiple dry years. As discussed in the DIER, the Project Area has a significant supply deficit during dry years, and the project, even with mitigation intended to fully offset, if feasible, oil and gas use of higher quality water supplies by 2035, will contribute to significant and unavoidable impacts to regional water supplies. As a result, the final WSA and final WQA do not materially affect the DEIR analysis of water supply impacts, avoidance, minimization and mitigation measures.

At the request of DOGGR and the CVRWQCB, and additional analysis of produced water use was performed to account revised Public Resources Code Section 1786, which the agencies have indicated prohibits the surface disposal of any fluids from a well stimulation treatment, including produced water obtained after a well has been stimulated. The results of the analysis are included in the GR Water-05 and show that, in general, sufficient produced water from both stimulated and non-stimulated wells should be available in the Project Area for allocations consistent with the three 2035 scenarios considered in the DEIR.

Water-06: Response to Issue Raised in CCST Recommendations

Some commenters requested information and concerns about potential adverse impacts to shallow groundwater from WST activities. The California Council on Science and Technology's (CCST) July 2015 report on found that a significant amount of WST in California takes place in shallow wells that could be located close to drinking water aquifers. CCST suggested that WST operators should therefore be required to "provide adequate assurance that the expected fractures will not extend into [drinking water] aquifers and cause contamination." CCST also recommended that agencies and WST operators "develop protocols for increased monitoring, operational control, reporting, and preparedness." CCST 2015 at 34–38. Some commenters have questioned whether CCST's recommendations have been sufficiently addressed with respect to WST operators in Kern County.

As CCST explained, it found no documented instances of WST directly causing groundwater contamination in California. CCST 2015 at 34. Similarly, in the SB 4 EIR DOGGR acknowledged that, to date, no definitive studies have documented a subsurface release of contaminants affecting groundwater quality from WST in California. SB 4 Final EIR at 10.14-83. The U.S. Environmental Protection Agency (USEPA) has also issued a draft study which identified "mechanisms by which hydraulic fracturing activities have the potential to impact drinking water resources", but concluded that: "We did not find evidence that these mechanisms have led to widespread, systemic impacts on drinking water resources in the United States."

USEPA (June 2015), *Assessment of Potential Impacts of Hydraulic Fracturing for Oil and Gas on Drinking Water Resources*, p. ES-6; at http://alternativeenergy.procon.org/sourcefiles/epa-assessment-impacts-hydraulic-fracturing-june-2015.PDF.

In Kern County the majority of oil fields are present along the margins of the valley. Oil fields are typically defined by impermeable boundaries of lithified rock or faults (or both) that serve to contain fluids within the limits of the structure, and coupled with internal pumping programs that promote inward flow, serve to minimize any impact from migration of fluids outside of the boundary of the field into the adjacent alluvial aquifer. WST operations would likewise be managed within the field and be subject to the same impermeable boundary and inward pumping programs that would restrict movement of fluids outside the field boundary.

There have been no documented incidents of subsurface releases of WST fluid impacting groundwater. Hydraulic fracturing for shale gas production in other regions of the United States and Canada has been associated with some incidents of groundwater contamination; however those cases involved stray methane gas leaking into the groundwater, not WST fluid. Moreover, there is no evidence that fractures propagating from the zone of stimulation provided conduits for the methane gas. Rather, the few documented stray methane gas events were likely caused by poor well integrity allowing methane gas to migrate up the outer annulus of the wellbore and into shallow groundwater. The limited number of such incidents compared to extensive shale gas development led EPA to conclude that there was no evidence that hydraulic fracturing activities have caused widespread, systemic impacts to drinking water resources, as noted above.

Once released into shallow groundwater, methane tends to be rapidly consumed by microorganisms and attenuated. In addition, stray gas events appear to be spatially correlated with the presence of geologic hazards such as overlying pressured gas pockets, rather than the use of hydraulic fracturing. Similar geologic hazards are not present in the oil fields in California, which are depressurized and rely on artificial lift (mechanical pumping) for extraction.

CCST's recommendation for "protocols for increased monitoring, operational control, reporting, and preparedness" is addressed by regulations promulgated by DOGGR and the State Water Resources Control Board (State Water Board), as required by SB 4, to protect groundwater resources from potential contamination related to WST.

For example, through its *Model Criteria for Groundwater Monitoring in Areas of Oil and Gas Well Stimulation*,[109] the State Water Board has instituted increased monitoring and reporting requirements. The State Water Board explained that its model criteria "outline the methods to be used for assessment, sampling, analytical testing, and reporting of water quality associated with [WST]." Model Criteria, p. 4. In addition to aquifers that are a potential source of drinking water, the State Water Board's model criteria also "consider the protection of water designated for any beneficial use" and therefore will protect a broader category of water than was considered by CCST. Model Criteria, p. 3. To obtain a WST permit WST operators will be required to have a groundwater monitoring plan that meets the State Water Board's criteria. 14 CCR § 1783.1(a)(27).

[109] http://www.waterboards.ca.gov/water_issues/programs/groundwater/sb4/docs/model_criteria_final_070715.pdf.

Other aspects of DOGGR's SB 4 regulations contain new measures for operational control and preparedness. For instance:

- 14 CCR § 1782 (General WST Requirements) requires operators to ensure that: well casing is sufficiently cemented; geologic and hydrologic isolation of the oil and gas formation is maintained; zones are isolated and sealed; WST fluids are only directed into the zones of interest; wellbore mechanical integrity is tested and maintained; WST fluids will not cause damage to well casing, tubing, cement or cause degradation to the well's mechanical integrity; any well breach occurring during WST is reported; and WST is conducted in compliance with applicable requirements of the Regional Water Quality Control Board (Regional Water Board) and other agencies. Section 1782 further requires that operators follow the intent of all well construction requirements, use good engineering practices and employ best industry standards. WST must be terminated if the conditions in section 1782 are not met.
- 14 CCR §§ 1783.2, 1783.3 (Notification, Water Testing) obligate WST operators to sample and test drinking and irrigation wells at the request of neighboring property owners.
- 14 CCR § 1784 (WST Area Analysis and Design) states that operators must: ensure the geologic and hydrologic isolation of the oil and gas formation; provide detailed well construction information for nearby wellbores; conduct a geologic evaluation to identify potential migration pathways for WST fluids; and design the WST so that treatment fluids and hydrocarbons do not migrate outside of the hydrocarbon formation.
- 14 CCR §§ 1784.1, 1784.2 (Pressure Testing, Cement Evaluation Prior to WST) mandate that, prior to commencing WST, operators pressure test cemented casing strings, tubing strings, pumps, and all equipment downstream of pumps. The operators are also required to conduct a cement evaluation on the well to undergo WST.
- 14 CCR § 1785 (Monitoring During WST) states that operators must monitor the pressure of the well annulus, tubing, and casing while WST is ongoing. If a breach is discovered, the operator must immediately shut-in the well, isolate the perforated interval, and notify DOGGR and the Regional Water Board.
- 14 CCR § Section 1787 (Monitoring After WST) requires operators to monitor each producing well that has undergone WST to identify potential problems that could endanger any underground source of protected water or hydrocarbon zone. If well failure is detected, the operator must notify DOGGR and the Regional Water Board and prevent contamination of underground sources of protected water, hydrocarbon zones, and surface waters in the area of the well.

Because DOGGR's final WST regulations (effective July 1, 2015), the State Water Board's final groundwater monitoring criteria (adopted July 7, 2015) and CCST's report (published July 9, 2015) were all being developed at the same time, CCST could not rely on these regulations and groundwater monitoring criteria when it was finalizing its analysis and recommendations. However, these new DOGGR WST regulations, and the new State Water Board monitoring criteria, specifically address the concerns raised by CCST. As EIR explains, all WST operators in Kern

County are required to comply with the SB 4 regulations and the State Water Board's groundwater monitoring criteria. *See also* MM 4.9-1 (applicants must comply with all applicable water quality protection laws and regulations). Additional information about the CCST report in relation to the Draft EIR is provided in GR-9.

Water-07: SB 1281 Industry Water Use Reports

"How do the new industry water use reports submitted to and published by the Division of Oil, Gas and Geothermal Resources under the new reporting provisions of SB 1281 compare to the information in the draft EIR?"

As discussed in DEIR Section 4.9, Senate Bill 1281 (SB 1281), effective January 2015, amended Sections 3226.3 and 3227 of the Public Resources Code to require that: (1) DOGGR provide the SWRCB with an annual "inventory of all unlined oil and gas field sumps"; and (2) well operators provide DOGGR with quarterly information regarding the source and disposition of water produced by or used in oil and gas production in addition to existing obligations to report gas and oil production and produced water information on a monthly basis. The first quarterly reports pursuant to SB 1281 were due from well operators by June 1, 2015.

In August 2015, DOGGR released a report entitled the "SB 1281 Water Report Summary" and four spreadsheets covering information submitted by oil well operators for the first quarter of 2015 (ftp://ftp.consrv.ca.gov/pub/oil/SB1281/2015%20Q1/SB1281_First_Quarter_2015_Summary_Report.pdf, accessed August 2015). The four spreadsheets include the submitted data on "Quarterly Water Production," "Quarterly Water Injection," and "Quarterly Other Water Allocation" as well as a "Quarterly Well Allocation List" (ftp://ftp.consrv.ca.gov/pub/oil/SB1281/2015%20Q1/Database%20Files/, accessed August 2015). The report indicates several operators were unable to submit the required reports by June 1, and that other submissions were returned by DOGGR to correct data format errors. According to DOGGR, the new SB 1281 requirements increase the information that operators must provide for each well from 2-4 to 121 data elements, and include as many as "144 new possible data elements" covering oil field water use. As a result, DOGGR has estimated that the August report includes information for approximately 59% of the produced water and 41% of the injected water in the state during the first quarter of 2015. DOGGR did not validate the accuracy of the operator reported data.

Due to the data and coverage issues identified in the DOGGR report, it is not possible to precisely compare the annual water use estimates for the Project Area with the partial statewide water use data for the first quarter of 2015 summarized in the DOGGR report. Certain of the reporting categories in the report also appear to overlap with some of the Project Area water uses discussed in the DEIR. The DEIR, for example, differentiates between the Project Area injection that reuses produced water for oil and gas production, such as enhanced oil recovery (EOR) steam or water injection, and injection for disposal purposes in Class II wells. The SB 1281 reporting format appears to group all water "injected into the subsurface of the same oil field and operator, from which it was produced" in a single "subsurface injection" category and does separately identify injection for production purposes and waste disposal. The DOGGR report includes a second produced water disposal category that is referenced as "sale/transfer oil field produced" water and that is defined in the SB

1281 report format as water "sold or transferred to another operator or oil field." As discussed in the DEIR, most produced water is usually either reused by operators for EOR and other production purposes or disposed in surface or subsurface facilities. The uses of the water volumes listed as having been sold or transferred to another operator or oil field in the SB 1281 report are not identified, but it appears likely that portions of this water are also injected for production purposes or subject to disposal.

Notwithstanding these considerations, the data summarized in the August report is broadly consistent with the relative proportion of produced water, water disposal and fresh (municipal and industrial) water use estimates for the Project Area. The following discussion utilizes the information summarized in Table 3, "Disposition methods of produced water, including water suitable for domestic or irrigation use" of the SB 1281 report. As discussed above, DOGGR has estimated that the produced water information for the first quarter of 2015 under the new SB 1281 reporting requirements covers the largest percentage (59%) of statewide activity for which information was available during this period.

A total of 65,279 acre-feet of produced water in the state was reported during the first quarter of 2015. Of that amount, 40,206 acre-feet, or 61% was subject to "subsurface injection" in the DOGGR data. The report also states that about 16,702 acre-feet, or 25.4% of the produced water was disposed by "sale/transfer for oil field use." As discussed above, a proportion of this water may also have been injected for production purposes or disposal. Assuming that half (8,351 acre-feet, or 12.7% of the total produced water in the category) of the "sale/transfer for oil field use" volume was reinjected, about 61% to 73.7% of the reported produced water volume could have been injected during this period. The DEIR estimates that 239,949 of produced water was generated in the Project Area during 2012. Of that amount, 173,383 acre-feet (88,688 acre feet for EOR and other production-related reuse, and 84,571 acre-feet of disposal in Class II injection wells), or 74% of the total amount of produced water, was reinjected in 2012. Consequently, subject to the data and nomenclature limitations discussed above, the ratios of the volume of produced water generated to the volume of produced water injection in the SB 1281 report and in the DEIR analysis are reasonably consistent.

A total of 691 acre-feet, or 1%, of produced water in the state was disposed into unlined surface sumps or ponds during the first quarter of 2015. As discussed in the DEIR and in Global Response 01 [Water Revisions] , about 30,931 acre-feet, or 13% of the produced water in the Project Area was disposed into surface ponds in 2012. The differences between the ratios of sump or pond disposal and produced water volumes in the SB 1281 report and the DEIR likely reflect several factors. The SB 1281 data provides a partial summary of statewide activities, and it is possible that the not yet available operator reports covering about 41% of the state will include a larger amount of surface water disposal. Surface pond use may be more prevalent in the Project Area than in other portions of the state that are included in the SB 1281 report. As discussed in the DEIR, in response to regulatory concerns, operators have been reducing the use of surface disposal ponds and increasingly using Class II injection wells. It is possible that the 2015 first quarter data in the SB 1281 report reflects the increased use of Class II injection wells since 2012. Finally, certain of the SB 1281 reporting

format categories, such as disposal by "Other (commercial disposal, industrial, etc.,)" and the "sale/transfer for oil field use," may include water that is eventually disposed to surface ponds.

A total of 6,469 acre-feet, or 10% of the produced water generated statewide in 2012 was subject to "sale/transfer for domestic use." The SB 1281 reporting category is defined as water "used for agriculture, irrigation, water replenishment, water banking, livestock, etc." As discussed in in the DEIR and in Global Response 07, about 38,658 acre-feet, or 16% of the produced water in the Project Area. Was reused for agriculture in 2012. Subject to the data and nomenclature limitations discussed above, and the fact that significant amounts of agricultural activity are conducted in the Eastern Subarea, where relatively high-quality produced water is available, the ratio produced water reused for agriculture in the SB 1281 report and in the DEIR analysis are reasonably consistent.

A total of 1,583 acre-feet, or 3.9% of the 40,206 acre-feet listed as subject to "subsurface injection" in the SB 1281 report was also identified as water "suitable for domestic or irrigation." As discussed in in the DEIR, about 7,279 acre-feet of higher-quality water that could be used for municipal and industrial (M&I) purposes was used in the Project Area for supplemental EOR steam production and injection purposes in 2012. The total amount of Project Area injection including the use of M&I quality water was 182,161 acre-feet. M&I water accounted for about 4.2% of this total. Subject to the data and nomenclature limitations discussed above, the ratios of higher-quality water used for injection in the SB 1281 report and in the DEIR are reasonably consistent.

Water-08: Produced Water Irrigation

A number of commenters have raised concerns regarding the use of treated oil field produced water to irrigate Central Valley crops. This Global Response is intended to address these concerns in a single response. Comments not addressed by this Global Response are addressed in individual responses to comments.

Use of Produced Water for Agricultural Irrigation in Kern County

As described in Chapter 4.9 – Hydrology and Water Quality (pp. 4.9-139-140) and Chapter 4.17 – Utilities and Service Systems (DEIR pp. 4.17-12-13, 20), approximately 234,959 acre feet (AF) of produced water was generated in the Project Area during the 2012 baseline period. Approximately 14% of this total (32,771 AF) was treated and supplied to the Cawelo Water District (CWD) for agricultural irrigation. Subsequent data provided to the Central Valley Regional Water Quality Control Board (CVRWQCB) indicated that the total amount of treated produced water provided to CWD was 32,491 AF, or slightly less than the more conservative estimate in the Draft EIR.

The treated produced water was supplied by Chevron and the Valley Water Management Company, totaling approximately 700,000 barrels of treated produced water per day. The produced water supplied to the CWD from oil field operations is treated before being supplied to CWD. CWD then blends this water with fresh water from other sources in CWD's "Reservoir B". The blended water is then sent through CWD's canal system, where additional fresh water is added and farmers are then able to draw water for irrigation.

The treated produced water entering and exiting "Reservoir B" is regulated by Waste Discharge Requirements (WDRs) established by the Central Valley Regional Water Quality Control Board (CVRWQCB), and those requirements are based on the Tulare Lake Basin Plan.

Further, since the 1980s, California Resources Corporation (CRC) has been transferring produced water to CWD via the Valley Water Management Company. In recent years, the total produced water transfers have been in the range of approximately 5,300-5,500 AFY. Additionally, CRC has entered into an agreement to transfer produced water to North Kern Water Storage District ranging from approximately 11,700 AFY up to approximately 21,200 AFY. These water transfers have undergone their own respective reviews and are not covered by this EIR.

Quantities of produced water used for agricultural irrigation are also addressed in the WSA (Appendix T), with minor corrections noted in revised Appendix T and in GR Water 5. New regulatory restrictions on surface disposal of produced water containing well stimulation treatment (WST) fluids are addressed in GR 1; these new regulations apply to the disposal of WST fluids in surface impoundments such as ponds and sumps, but would also be considered in evaluating treatment and irrigation uses of produced water containing WST fluids.

Los Angeles Times Coverage

As noted in the DEIR (p. 4.9-57), a Los Angeles Times article published May 3, 2015 focused on what it called "concern over the adequacy of safety measures in place to prevent contamination from toxic oil production chemicals" based on sample results reportedly obtained by a third party. (Cart, *Central Valley's growing concern: Crops raised with oil field water* (May 2, 2015) Los Angeles Times <http://www.latimes.com/local/california/la-me-drought-oil-water-20150503-story.html> [as of Aug. 26, 2015].) The validity of the sample results cited in the article has been contested. A subsequent article, published June 20, 2015, explained that subsequent testing of the treated produced water supplied to the CWD, which was submitted to the CVRWQCB, demonstrated that the tested samples contained traces of petroleum hydrocarbons, "but at concentrations considered safe for drinking and well below the maximum level" established by the CVRWQCB WDRs. (http://www.latimes.com/local/california/la-me-oil-water-tests-20150620-story.html). On July 1, 2015, the Los Angeles Times reported that the testing also confirmed "no traces of methylene chloride" in the water. (http://www.latimes.com/local/california/la-me-0702-chevron-water-20150702-story.html). According to this article, "all test results to date show that water supplied by Chevron [to CWD] is in compliance with the company's permit from the water board." The various data submitted to the CVRWQCB are available at:

SB 4 Independent Scientific Assessment of Well Stimulation Treatments

Pursuant to SB 4, the California Natural Resources Agency commissioned the California Council on Science and Technology (CCST) to conduct an independent scientific assessment of well stimulation treatments, including hydraulic fracturing, in California. The purpose of the report was to synthesize and assess the available scientific information associated with well stimulation treatments in California. The review surveyed hydraulic fracturing, matrix acidizing, and acid fracturing as applied onshore and offshore for oil and gas production in the state. The study work scope was organized in three major areas: (1) Overview of Well Stimulation in California; (2) Impacts on water, air quality, greenhouse gases (GHGs), induced seismicity, ecology, traffic, noise; and (3) Case studies to assess environmental issues and qualitative hazards.

The CCST study identified the Kern River Oil Field as a location where hydraulic fracturing of wells has occurred. The study found that "produced water from oil fields that have been hydraulically fractured may contain hazardous chemicals and chemical by-products" and that the Kern River Oil Field is "the only … oil field where both hydraulic fracturing occurs and farmers use produced water for irrigation." (CCST Study, p. 45). Further the CCST study concluded that "required testing and treatment of produced water destined for reuse may not detect or remove chemicals associated with hydraulic fracturing and acid stimulations" and recommended that steps be taken to "[p]rotect irrigation water from contamination by hydraulic fracturing chemicals and stimulation reaction products."

Chevron has contested the CCST study's finding that Chevron is hydraulically fracturing wells in the Kern River Oil Field and the attendant implication that produced water from the Kern River Oil Field being sold to the CWD for agricultural irrigation may contain hydraulic fracturing fluids or related chemicals. [Chevron 2015]. Chevron claims that (1) it does not use hydraulic fracturing in the Kern River Oil Field; (2) the CCST misidentified Chevron wells as having been hydraulically fractured in 2012 and 2014; and (3) the CCST extrapolated that error based on the percentage of well files reviewed to incorrectly conclude that approximately two hydraulic fracturing operations occur per year.

On August 25, 2015, the Senate Natural Resources and Water and Assembly Natural Resources Committees convened for a joint informational hearing on *Hydraulic Fracturing and Well Stimulation Treatments in California – What the Science Says*. During the informational hearing, the CCST presented its findings and the Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR), and State Water Resources Control Board (SWRCB) were given the opportunity to respond to the issues raised by the CCST. Video of the hearing is available at: http://calchannel.granicus.com/MediaPlayer.php?view_id=7&clip_id=3148.

DOGGR Supervisor Steve Bohlen testified that existing regulations in place have given DOGGR a high degree of confidence in their monitoring of current well stimulation activities and understanding of the limited geographical scope where well stimulation occurs. He further testified that DOGGR has made staffing changes to assure that "clean water regulations are followed."

SWRCB Director Jonathan Bishop testified concerning the Board's developments relating to regulation of oil and gas activities, as well as on the recommendations from CCST. Given limited water supplies in the State due to the current drought, Director Bishop testified that the SWRCB is looking at treatment of produced water so that all water in the state can be used to the greatest extent. Director Bishop indicated that it is important to recognize that oil and gas production also extracts water which the state can put to use after treatment rather than injecting it. Regarding concerns over the use of treated water, Director Bishop indicated that testing and monitoring are already in place for water that is to be used or reused at the surface. Water used for beneficial uses has to have a permit from the regional boards, which places limits on constituents in the water and requires monitoring. SWRCB is evaluating whether it needs to provide more regulatory action.

Central Valley Regional Water Quality Control Board Technical Advisory Committee

The CVRWQCB has formed a technical advisory committee of food safety experts to examine the issue and analyze the recent test results on treated produced water provided to CWD. The group contains experts from the California Department of Public Health and the State Department of Food and Agriculture, and is advising CVRWQCB officials about food safety and any additional testing or requirements that may be needed. CVRWQCB officials have indicated that they are "working our way through the process", and that "[t]his is a priority issue for them." (Cart, *Central Valley's growing concern: Crops raised with oil field water* (May 2, 2015) Los Angeles Times <http://www.latimes.com/local/california/la-me-drought-oil-water-20150503-story.html> [as of Aug. 26, 2015].)

Mitigation Measure 4.8-16

To further address uncertainties regarding well stimulation fluid content and transport, as discussed in the CCST report, this EIR has added MM 4.8-16, requiring toxicity testing as included in Section 7.1.4.

Conclusion

Current data concerning the treated produced water reused by CWD for agricultural irrigation demonstrates that the standards for such water established pursuant CVRWQCB-issued WDRs have been met. The CVRWQB, which has regulatory oversight concerning this matter, will continue to review and monitor these results and require additional testing as necessary. The CVRWQCB has also assembled a technical advisory committee of food quality experts to review the issue. Because the DEIR assumes that the same level of produced water will be available for reuse for agricultural irrigation throughout the Project term and that existing regulatory standards will continue to be followed, the Project does not result in a significant change to baseline conditions warranting additional mitigation.

Further, there is currently significant conflicting information about whether Chevron is undertaking hydraulic fracturing in the Kern River Oil Field that could result in fluid or chemicals from that activity being present in treated produced water used for agricultural irrigation. As described above, there is an ongoing regulatory dialogue concerning the need to promote increased reuse of treated produced water given the current drought, whether additional testing and monitoring of produced water is necessary, and what, if any, additional requirements or other steps are necessary. While this regulatory discussion continues, this EIR implements new MM 4.8-16, which further addresses this issue and supports the County's conclusion that potential impacts from reuse of produced water for agricultural irrigation is less than significant.

Alt-1: Alternatives Eliminated from Consideration

Several comments were submitted concerning the EIR's elimination of certain Project alternatives from detailed consideration in Draft EIR Chapter 6, *Alternatives*. This Global Response is intended to address these related concerns in a single response. Comments on these alternatives screened from detailed consideration that are not addressed in this Global Response are addressed the individual responses to comments.

Basis for Elimination of Drilling Ban on All Land Alternative

As explained on Draft EIR page 6-12, the Drilling Ban on All Lands Alternative would prohibit all oil and gas activities throughout the Project Area. The Draft EIR concludes that this alternative is legally infeasible due to existing legal restrictions on the County's authority to prohibit access to subsurface mineral interests without liability. Several comments challenge this conclusion on the basis of caselaw upholding drilling bans in other jurisdictions. As explained below, the commenters misconstrue the EIR. The Draft EIR does not conclude that the County lacks authority to enact a drilling ban throughout the Project Area, as commenters claim. Rather, the Draft EIR concludes that enactment of a drilling ban would imprudently subject the County to unreasonable legal liability.

CEQA does not require the Draft EIR to consider alternatives that are infeasible. 14 Cal. Code Regs. §§ 15126.6(a); 15126.6(f)(1). The term "feasible" is defined to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." 14 Cal. Code Regs. § 15364

(emphasis added). On this basis, the County may appropriately determine that an alternative is legally infeasible if it would conflict with applicable regulatory limitations. *See City of Maywood v. Los Angeles Unified School Dist.* (2012) 208 Cal.App.4th 362, 417. The County may also appropriately determine that an alternative is infeasible upon a showing that such alternative is not economically viable. 14 Cal. Code Regs. § 15126.6(f)(1); *see also Uphold Out Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 600; *San Franciscans Upholding The Downtown Plan v. City & County of San Francisco* (2002) 102 Cal.App.4th 656, 693. Here, the County's enactment of an outright ban on oil and gas activities throughout the Project Area is infeasible because it would conflict with applicable regulatory limitations and would imprudently expose the County to significant and unreasonable legal liability, as explained below.

There is no question that the County has broad police power authority to regulate land use. As some comments correctly point out, the California constitution authorizes cities and counties to "make and enforce all ordinances and regulations in respect to municipal affairs." On the basis of this authority, the California Supreme Court has upheld local zoning regulations that limit or ban oil and gas land uses. *See, e.g., Beverly Oil Co. v. City of Los Angeles* (1953) 40 Cal.2d 552, 558 ("*Beverly Oil*") (zoning restrictions on oil drilling "is not of itself an unreasonable means of accomplishing a legitimate objective within the police power of the city."); *Hermosa Beach Stop Oil Coalition v. City of Hermosa Beach* (2001) 86 Cal.App. 4th 534, 555 ("*Hermosa Beach*") ("Enactment of a city ordinance prohibiting exploration for and production of oil, unless arbitrary, is a valid exercise of the municipal power.") These cases, however, merely recognize a local agency's authority to ban oil drilling pursuant to the police power. Indeed, the Draft EIR, at page 6-23, expressly affirms the County's "broad discretion to regulate oil and gas activities within its jurisdiction" and California oil and gas law expressly reserves for cities and counties the right to "enact and enforce laws and regulations regulating the conduct and location of oil production activities." Cal. Pub. Res. Code § 3690.

The police power is not unlimited, however. Pursuant to the Fifth Amendment to the U.S. Constitution (applicable to the states through the Fourteenth Amendment), and Article I, Section 19 of the California Constitution, zoning regulations may not be so oppressive that they effect a taking of private property without just compensation. *See Kavanau v. Santa Monica Rent Control Bd.* (1997) 16 Cal.4th 761, 859. This principle of law was first established in the seminal case *Pennsylvania Coal Co. v. Mahon*, wherein the U.S. Supreme Court held that a land use regulation that "goes too far" may effect a taking of that property, even though title to such property remains in private hands. *See* (1922) 260 U.S. 393, 415. Notably, in *Pennsylvania Coal*, the Court determined that a land use regulation prohibiting extraction of privately owned subsurface minerals did indeed "go too far" and effected an unconstitutional taking without just compensation. *Id.*

Since *Pennsylvania Coal*, both the United States Supreme Court and the California Supreme Court have established that a regulation that deprives "all economically beneficial or productive use" of private property effects a *per se* taking of such property. *See Kavanau* at 774 (*citing Lucas v. South Carolina Coastal Council* (1992) 505 U.S. 1003, 1015). Indeed, a regulation that stops short of destroying all economically beneficial use of private property may nevertheless effect a taking depending on the economic impact of the regulation, the extent to which the regulation interferes

with distinct investment-backed expectations, and the character of the governmental action. *See Kavanau* at 775-776 (citing *Penn Cent. Transp. Co. v. N.Y.* (1978) 438 U.S. 104, 124). In either case, "the property owner may bring an inverse condemnation action, and if it prevails, the regulatory agency must either withdraw the regulation or pay just compensation. Even if the agency withdraws the regulation, the property owner may have the right to just compensation for the temporary taking while the regulation was in effect." *Id.* at 773

As recognized by the California Supreme Court, the owner of a mineral interest "has a property right in oil and gas beneath the surface" that includes "the exclusive right to drill[.] … This is a right which is as much entitled to protection as the property itself, and an undue restriction of the use thereof is as much a taking for constitutional purposes as appropriating or destroying it." *Bernstein v. Bush* (1947) 29 Cal.2d 773, 778 (internal citations omitted.) Thus, California courts have held that land use regulations that provide "no adequate means of protection or substitute for their right to extract oil" effects a compensable taking of private property. *See, e.g., Braly v. Board of Fire Com'rs. of City of Los Angeles* (1958) 157 Cal.App.2d 608, 616; *Bernstein v. Bush* (1947) 29 Cal.2d 773, 780. Similarly, federal law recognizes that owners of oil and gas interests "have the right to reduce to possession the oil and gas beneath the surface, and that they could not be absolutely deprived of that right without a taking of private property." *Ohio Oil Co. v. Indiana* (1900) 177 U.S. 190, 209. In this case, the Drilling Ban on All Lands Alternative, if adopted, would deprive the affected mineral owners the right to extract oil and gas beneath the surface, effectively denying them "all economically beneficial or productive use" of their private property. Thus, under *Kavanau* and *Lucas*, adoption of this alternative would expose the County to potentially substantial legal liability.

As explained in the Draft EIR, Section 4.11, *Mineral Resources*, Kern County leads the state in oil and natural gas production. Kern County produced 77% of California's in-state oil in 2012 and about 64% of the state's total natural gas. Kern County's Elk Hills oilfield is the state's top natural gas producer. Two other fields, South Belridge and Lost Hills, rank in the state's top five for gas production. The state's top five oil producing fields—Midway-Sunset, South Belridge, Kern River, Cymric, and Elk Hills—are located within the Project Area. Three of these fields—Midway-Sunset, South Belridge, and Kern River—are ranked in the top 10 producing oilfields in the nation. Specifically, Kern County produced 141.69 million barrels of oil and 143.16 million cubic feet of natural gas in 2012. The historic production of oil and natural gas in Kern County, from 2002 to 2012, is provided in Draft EIR Chapter 3, Project Description (Table 3-3). As of 2014, of the 100 administrative wellfields located within Kern County, 76 are active fields that continue to produce oil and natural gas.

Kern County is a leading oil-producing county in the nation, yielding approximately 145 million bbl of oil and 132 billion CF of gas annually, according to 2014 DOGGR data. These amounts represent 71% of California's oil production and 10% of the total U.S. oil production. Kern County produces 66% of the state's total gas production (KCEDF, 2015). The oil and gas industry has the highest gross domestic product and tax contribution level in the County. The industry generates significant regional economic activity. Extraction, production, refining, and petroleum product manufacturing result in highly tradable products that are consumed domestically and are also exported. These efforts produce high revenues, create high wage jobs, and contribute significant tax revenue to all

levels of government. The impact of the oil and gas industry is very far-reaching. The approximately $3.8 billion paid in 2013 to local oil and gas employees creates a significant "ripple effect" phenomenon in the local economy. Direct activity includes the materials purchased and the employees hired by the industry itself. Indirect effects are those which stem from the employment and business revenues motivated by the purchases made by the industry and any of its suppliers. Increased output generates new money in the community, resulting in increased spending on new homes, durable goods such as cars and appliances, plus additional spending on restaurants and entertainment options.

In 2009, oil reserves in Kern County were estimated at 1,395,171 mbbl, as shown in Table 7-17, below (DOGGR, 2009). Production information available from DOGGR between 2010 and 2014 shows that approximately 720 mbbl were extracted from oilfields in Kern County, for a total reserve of approximately 1,394,450 mbbl of oil, as shown in Table 7-18, below (DOGGR, 2010, 2011, 2012, 2013, 2014). At the current price of $50 per barrel of oil, the Kern County reserves estimated value is $62 billion, and at an average yearly (July 2014 – July 2015) price of $75.60 per barrel of oil the estimated value is $105 billion.

Total Kern County taxable property value for the fiscal year beginning July 1, 2015 is $89.2 billion, representing an $8.5 billion decrease or a 9% decline from the prior fiscal year. A decline in overall Kern County assessed property values was anticipated due to the recent plunge in oil and gas prices and underscores the role of oil and gas as an economic asset in Kern County. The mineral roll represented approximately one third of assessed values for the 2014-2015 tax year but is down to less than one quarter of the county's total assessment for the new fiscal year, 2015-2016 (Kern County Assessor Recorder, http://www.recorder.co.kern.ca.us/). Based on one quarter of the County's total assessment, approximate mineral roll represents a value of $22.3 billion in Kern County.

Kern County's oil and gas industry also significantly impacts the community through its philanthropic activity and contributions to local education efforts. More than $5.5 million was donated to more than 130 local non-profits and educational programs in 2014. Kern County's two community colleges, California State University - Bakersfield, and K-12 funding are the most frequent beneficiaries of the financial support. Social service non-profits (*e.g.*, the Homeless Center / Alliance Against Family Violence) and health-related organizations (*e.g.*, the American Heart Association) also rank among the top recipients (KCEDF, 2015). These economic benefits would be lost or severely curtailed if oil and gas drilling activities were banned throughout all or a significant portion of the Project Area, as contemplated by the Drilling Ban on All Lands Alternative.

As demonstrated by the above data, a complete ban of oil and gas activities within the Project Area would cause enormous economic impacts throughout the County and the state and would adversely impact the investment-backed expectations of Project Area mineral owners, including both individuals and companies. Even a moratorium on drilling would raise similar concerns regarding the County's ability compensate for lost value for the duration of the moratorium using General Fund proceeds derived in large part from taxes on oil and gas production. Mineral and petroleum resources are a fundamental element of Kern County's employment base and overall economy. As new recovery technologies come into use, petroleum extraction should continue its economic importance. Even as California ramps up state laws to promote renewable energy resources and alternative transportation fuels, experts continue to recognize that oil and gas production will continue to be critical, and domestic oil and gas production remains a vital national interest. In sum, a ban on oil and gas activity in Kern County is not feasible within the meaning of CEQA.

The Drilling Ban on All Lands Alternative was also eliminated from consideration because would not meet most of the Project objectives, as described on Draft EIR pages 6-9 through 6-10. Please also see Global Response 1, Ministerial Permit Process, and Global Response 2, Project v. Program EIR.

Basis for Elimination of the Drilling Ban on Agriculturally Productive Land Alternative

As explained on Draft EIR page 6-11, the Drilling Ban on Agriculturally Productive Land Alternative is identical to the Project, except that it would prohibit all oil and gas activities on land zoned either Exclusive Agricultural (A) or Limited Agricultural (A-2) if such land is being used for

agricultural production at the time of drilling permit application. These zoning districts comprise approximately 90% of the Project Area.

As explained in the Draft EIR, if this alternative were adopted, the owners of mineral rights underlying agricultural lands subject to the drilling ban would be forced to access such minerals, if at all, from adjacent lands that are not subject to the ban. This would entail the use of directional and horizontal drilling techniques, which may not be technologically or economically feasible, depending on geologic conditions. As explained in Draft EIR, Appendix U, Kern County Drilling and Hydraulic Fracturing Comparison Memo, faulting and folding in Kern County has created more complex geology with less lateral continuity that in most other oil and gas plays. In the Project Area, most reservoirs are contained within highly complex geologic settings that vary greatly (AECOM, 2015).

Reservoir geometry is often modified by complex structural environments where faulting creates isolated "rooms" within the geometry of the containing structure. This can be likened to a pane of glass that has been broken into various sized pieces and trying to place the well on the smallest piece on the bottom of a stack of ten layers. Additionally, while reservoir geometry is complicated by structural overprinting, the reservoir characteristic, notably porosity and correspondingly permeability, is controlled by subtle differences in the lithology of the rock matrix. This added complexity serves to greatly complicate the design of a well drilling and completion program, and requires flexibility in well design and drilling technique to provide safe, environmentally sound, and efficient oil production.

Drilling only horizontal wells in order to access the geologic structures beneath agricultural lands substantially limits the feasibility of the drilling program and securing the optimal completion geometry. Moreover, this limitation could lead to more horizontal wells being drilled, which in fact would add environmental impacts potentially to the point of being greater than if the drilling was allowed vertically on the agricultural land in the first place. Such increased impacts could include increased traffic and related air emissions, increased potential for injury, and increased or intensified habitat disruption posed by densely clustered well drilling pads that may be necessary to conduct only horizontal drilling operations surrounding agricultural lands. While horizontal drilling may be suitable in some conditions, it is overly restrictive and possibly more environmentally damaging to require that all wells be completed via horizontal drilling in proximity to agricultural lands.

In addition, where feasible, the directional and horizontal drilling assumed by this alternative is reasonably expected to require longer drilling periods to reach the mineral source than would be necessary to complete a vertical well. Longer drilling periods mean increased levels of construction-related emissions. It is therefore reasonable to assume that directional and horizontal well development activities under this alternative would cause greater emissions than would occur if the wells were drilled vertically under Project conditions. Thus, while this alternative would have the environmental benefit of impacting fewer acres of agriculturally productive land, it would may exacerbate overall emissions of criteria pollutants for which the air basin is in nonattainment. Moreover, is some cases, this alternative might cause land disturbance impacts to relatively undisturbed land cover types as compared to adjacent agriculturally productive land, in which case

this alternative could result in additional impacts to biological and cultural resources that would not occur were the well operator able to access overlying agricultural land for drilling purposes.

As discussed above, this alternative has the potential of reducing one significant Project impact (i.e., cumulative agricultural impacts), while exacerbating other significant Project impacts (e.g., cumulative air quality impacts, cumulative biological impacts, cumulative cultural impacts). Thus, on balance, this alternative would not offer significant environmental advantages, as compared to the Project, and is property eliminated from consideration in the EIR.

Given the unconventional geology of the Project Area, it is also reasonable to assume that, in some instances, the owners of mineral interests underlying agriculturally productive lands will not be able to feasibly exercise their mineral rights as a result of the drilling ban assumed by this alternative. In such cases, this alternative would arguably destroy all economically beneficial or productive use of such mineral interests, thus exposing the County to economic harm and unreasonable legal liability for the same reasons detailed in the above discussion of the Drilling Ban on All Lands Alternative. Accordingly, the Drilling Ban on Agriculturally Productive Land Alternative was eliminated for consideration on the additional basis that it is legally and economically infeasible.

Basis for Elimination of the Fewer Wells Within the Project Footprint Alternative

As explained on page 6-13 of the Draft EIR, the Fewer Wells Within the Project Footprint Alternative (the "Fewer Wells Alternative") would amend Chapter 19.98 of the Kern County Zoning Ordinance to cap the number of oil and gas drilling permits issued by the County at 1,500 per calendar year, an amount significantly less than the 2,697 new producing wells (3,647 total wells) the EIR evaluates as being be drilled in the Project Area on an annual basis over the next 20 years. As some comment's point out, though this alternative would cap the annual number of available permits at 1,500, it would allow for some level of industry grown each year, albeit less growth than would occur under Project conditions. This alternative was rejected for analysis, however, on the basis that it is legally infeasible due to legal restrictions on the County's authority to prohibit access to subsurface mineral interests without liability.

Under the Fewer Wells Alternative, up to 1,197 proposed wells may not qualify for drilling permits in any given calendar year. As explained above, California courts have held that land use regulations that provide "no adequate means of protection or substitute for their right to extract oil" effects a compensable taking of private property. *See, e.g., Braly v. Board of Fire Com'rs. of City of Los Angeles* (1958) 157 Cal.App.2d 608, 616; *Bernstein v. Bush* (1947) 29 Cal.2d 773, 780. Under the Fewer Wells alternative, once the annual permit cap has been reached in any calendar year, subsequent well permit applicants will have "no adequate means" to exercise their mineral rights and extract oil or gas for the remainder of that year. Though such applicants may qualify for a permit under the following year's cap, per *Kavanau*, property owners temporarily denied all economic beneficial use of their property by regulation "may have the right to just compensation for the temporary taking[,]" as explained above. *Kavanau*, 16 Cal.4th at 773. Therefore, adoption of the Fewer Wells Within the Project Footprint Alternative could expose the County to hundreds of lawsuits in any given year and potentially substantial just compensation claims. For this reason, this

alternative is appropriately eliminated from consideration on the basis that it is legally and economically infeasible.

Basis for Elimination of the Renewable Energy Alternatives

Draft EIR pages 6-14 through 6-16, sets forth two renewable energy alternatives, the Wind Energy Alternative and the Solar Energy Alternative. A number of comments state that the County improperly excluded these alternatives from consideration and that the County should require use of renewable energy for oil and gas activities potentially authorized by the Project.

As discussed in the Draft EIR and summarized below, both the Wind Energy Alternative and the Solar Energy Alternative were rejected for analysis on the basis that they would not offer significant environmental advantages over the Project, even if they would reduce overall Project emissions by reducing each well site's reliance on polluting fossil fuel combustion to power well operations. (DEIR, p. 6-15 – 6-16.)

Oil & Gas Field Operations Energy Requirements

Oil field operations are generally automated facilities that run 24 hours per day, 7 days per week. These operations have a steady daily energy demand comprised of cyclic demand periods interspersed in any given hour, and will have additional periodic pumping demands that arise when tank volumes cycle (such as stock tanks) and the tank contents are forwarded. Given the continuous operations, equipment will start and stop, as well as load and unload, according a well's particular pumping schedule. Motors in a field or facility are typically cyclic-load duty alternating current (AC) motors, controlled by pump-off timers while tanks may controlled by interlinked level control "on-off" relays. (Frick,et al, 1962, p9-35).

Site control and instrument power supplies must be capable of allowing control systems to continuously operate all critical electrical components to ensure that spill prevention interlocks will operate without failure. Electrical systems must be robust, easily maintained, and able to withstand high amperage events, full-load trips, frequency instability, overvoltage and undervoltage conditions, as well as general loss of power events. The power supply and the well's electrical and control systems must be compatible with the area's hazard designation, including any inverters, battery banks, and charge controllers. (Frick,et al, 1962, p9-35).

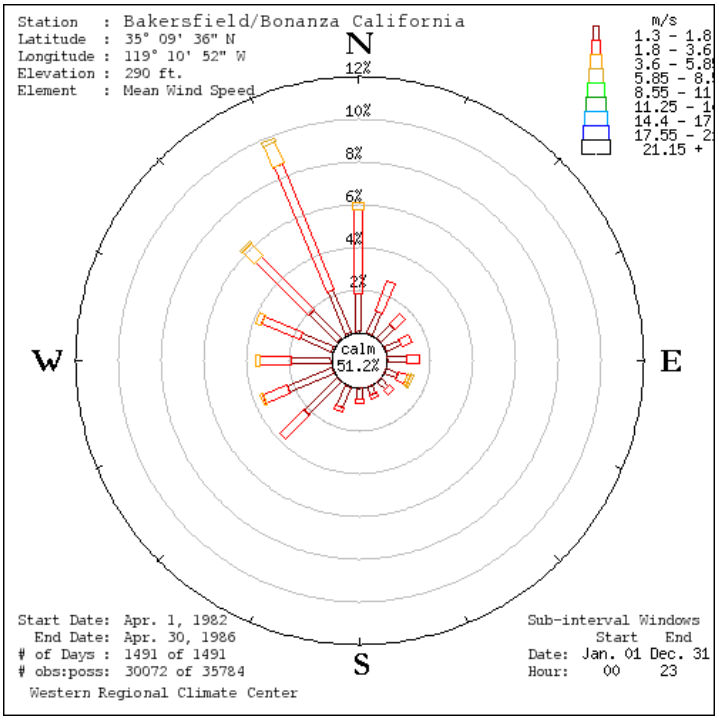
A new well, once installed and operating, must have starting and cyclic load following capability, with peak demand ranging from 200% to 275% of the well motors average energy consumption (actual average energy demand). (Frick,et al, 1962, p9-35). This cyclic loading and unloading is normally managed through the shared generation resources of the interconnected electricity grid, to which the vast majority of well fields are connected, which works to maintain the necessary system voltage and frequency stability. Therefore, according to electrical codes and CPUC guidelines and tariffs, any electrical interconnect to the grid must be designed to follow the cyclic loads of the new

oil well as if the generation is provided by the serving utility using the pre-existing generating fleet's capability, regardless of origin of the energy.[110] (NEC, 2014; CPUC GO95; PG&E Rule 16)

The Kern County-wide actual average per-well energy consumption is 236 kW-h/well-day or approximately 0.01MW on a demand basis. (Brandt, 2015) Thus, for the 2,697 new wells per year that could be developed pursuant to the Project, approximately 26.5 MW (baseload capacity) of energy would be required per year. The pumping unit cyclic peak demand is 2.75 times the average demand, or roughly 0.0275 MW. (Frick,1962)

Wind Energy

Wind energy, or electricity generated from wind-powered turbines, is a proven and available technology. However, power generated by wind turbines is, like solar power, highly variable. Both wind power and solar power are "non-firm" forms of renewable energy and thus are interruptible and not available on a continuous schedule. According to the California Energy Commission (CEC) wind resource potential for the area in the County is low (below 10.1 miles per hour) with the exception of Tehachapi, southeast of Bakersfield. (CEC, 2015.) Wind Turbine starting wind speeds are typically 3 to 4 meters per second or roughly 6 to 10 miles per hour. The Wind Rose for Bakersfield shows the lack of wind available in the Valley floor that exceeds the starting speed for wind turbines.



[110] National Electrical Code, Articles 90 through 830 (governing electrical design); California Public Utilities Commission (CPUC) General Order 95 (addressing utility side interconnections).

Given the limited opportunities for wind energy in the County, wind energy is less desirable in much of the County than solar for repowering purposes.

Further, even if the Project area had greater wind resource potential, development of adequate wind facilities to provide the necessary power for the oil and gas activities under the Project would result in significantly greater environmental impacts than the Project. As noted above, oil and gas field operations are 24/7 and have a steady daily demand for electricity. This relatively constant demand around-the-clock does not match well to wind which is driven by the diurnal cycle in the mountain regions surrounding the Central Valley (particularly Project study area). The oil fields in the study area are not in locations that are well suited to wind power generation therefore the generation cannot be installed at a new well site on a per new well basis. To be remotely feasible either on a cost-effectiveness basis or technical basis, wind generation energy must be transmitted by conventional grid systems from the wind generating region to the oil-field loads using traditional electrical infrastructure.

As noted, approximately 26.5 MW (baseload capacity) of electricity would be required to offset electricity needs for 2,697 new wells per year requires. Per CEC data, current wind turbines have an actual annual capacity of 25% of the rated capacity (based on actual energy produced). Thus, approximately 106 MW of wind energy capacity would need to be constructed to provide the necessary capacity to offset the energy demand of the oil and gas activities potentially authorized by the Project.[111] Assuming all wells that could be developed pursuant to the Project are developed and operated over the Project life, it would be necessary to construct a range of approximately 1,060 MW to 2,120 MW of wind turbine facilities, or up to one-third again of the 5,896 MW of installed wind turbine capacity in the entire state.

According to the American Wind Energy Association, as a general rule of thumb, it requires 60 acres of land to produce 1 megawatt (MW) of power capacity for land-based wind farms. Annually, in order to offset energy demand for activities potentially authorized by the Project, wind turbines would need to be constructed on 6,360 acres of land having the proper wind potential, or 127,200 acres of land for the life of the Project. These facilities would also require construction of new substations as well as transmission facilities in order to interconnect to the grid. Additional ground disturbance would be required for each wind turbine site, thus exacerbating environmental effects associated with well development under Project conditions. The related aesthetic impacts would be significant and unavoidable with conventional wind turbine technology. Communities in which large, utility scale wind developments have been constructed have also raised concerns about subsonic noise and avian mortality issues. (CEC, 2007.) Further, assuming such wind developments would be considered part of the Renewables Portfolio Standard, including a future RPS standard of 50%, the utility grid owner/operator would have to plan, develop, install, operate and rate-base the

[111] http://energyalmanac.ca.gov/electricity/electric_generation_capacity.html

necessary capital to provide the infrastructure to transmit the energy and maintain the system reliability.

Given the scope of the necessary development and the potential significant adverse impacts associated with wind development, further analysis of a wind energy alternative was screened out on the basis that it is infeasible.

Solar Energy

Solar photovoltaic (PV) electric generation is commercially available in the Project Area. The Solar Energy Alternative assumes that each new well site permitted in the Project Area would be developed in the same manner as would occur under the Project conditions, but also that each new well site would be developed with solar PV panels and related facilities in an amount sufficient to provide the electric capacity needed to power well operations at such site. (DEIR, p. 6-15.)

The relatively constant demand for energy necessary for oil and gas field operations, as described above, does not match well to solar as is the case with residential cooling, both of which are driven by solar cycles (particularly in the Kern County EIR Project study area). Generally, to provide continuous uninterrupted power for 24-hours per day consistent with accepted demand, a solar PV facility would have to have an ideal capacity four-to-five times larger than normal demand, depending on weather.

In a situation where sufficient solar PV capacity was constructed and interconnected to the electricity grid for reliability purposes, the solar PV system design capacity could be limited to only deliver the actual average energy 236 kW-h per well-day requirement. The ideal Kern County winter season solar output for fixed panels is 41% of the summer output; thus, as a minimum, the array must have roughly twice the number of panels to deliver equal service during the winter months.[112] CEC data indicates that, on average, all California solar PV facilities (including large scale tracking arrays) deliver at 21 % of their rated capacity.[113] Therefore, to ensure the complete offset of electrical energy use, the actual solar facility would need to be sized 4.5 times larger than the base load capacity of 0.0275 MW, resulting in a design capacity of .044 MW per hour. Based on industry standards of 6 to 8 acres of land per 1 MW of solar PV-generated, (NREL, 2013) powering the activities potentially authorized by the Project using solar PV technology would require 0.6 to 1 acres of arrays per new well, assuming a tie-in to the electricity grid.

Thus, in order to offset the total power demand for planned construction and operation of 2,697 wells per year, approximately 119 MW of solar PV capacity would have to be constructed annually on approximately 714 to 952 acres of land. For the life of the Project, assuming full build out of wells authorized by the Project, 2,373 MW of solar PV capacity would need to be constructed on approximately 14,238 to 18,984 acres of land. This scenario would also need sufficient electrical

[112] CEC EPBB Calculator, Azimuth =180 degrees, Tilt =18 degrees. Local Data indicates that the actual winter performance is 10% to 25%.
[113] http://energyalmanac.ca.gov/electricity/electric_generation_capacity.html

grid infrastructure to ensure grid reliability to comply with California Public Utility Commission and Federal Energy Regulatory Commission mandatory reliability criteria.

A "stand-alone" solar option that did not interconnect to the State's electricity grid would result in still greater impacts. The design sizing of a stand-alone solar array would require the ability to generate the peak demand of 649 kW-h/day (.27 MW) (year round including winter) and store 16 hours worth of the non-daytime energy as 432 kW-h (16/24*649 kW-h) stored during the peak generation period and available for any peak demand at night. Using the same assumptions described above concerning winter season solar output and rated capacity, a stand-alone solar array capacity would need to be sized using the peak of design of .28 MW (to ensure delivery of .028 MW in the winter), or 1.7 to 2.8 acres per new well. This would result in development of an additional 4,530 acres of land per year (.28 MW per well x 2,697 wells = 755 MW of solar array capacity x 6 acres per MW). This scenario would also need sufficient electrical grid infrastructure would be needed to ensure grid reliability to comply with California Public Utility Commission and Federal Energy Regulatory Commission mandatory reliability criteria.

Given the scope of the necessary development and the potential significant adverse impacts associated with solar development, further analysis of a solar energy alternative was screened out on the basis that it is infeasible.

Basis for Elimination of the Zero Net Gain Alternative

As explained on page 6-16 of the Draft EIR, the Zero Net Gain Alternative is identical to the Project, except that it would amend Chapter 19.98 of the Kern County Zoning Ordinance to also provide that no new oil or gas well drilling permits will be issued by the County, except to the extent that an equal number of existing oil and gas wells have first stopped production and have been abandoned in accordance with state law. The Draft EIR eliminated this alternative on the basis that it would not achieve most of the Applicant's project objectives.

Some comments reasonably concluded that, though this alternative would not increase oil and gas exploration and production in the County at the same rate as the Project, it would nevertheless provide for industry growth over time and would not substantially conflict with the basic objective to establish a primarily ministerial administrative process governing the issuance of County well permits. Other comments reasonably conclude that this alternative would also reduce the marginal harm resulting from the addition of thousands of new wells per year under Project conditions. Nevertheless, it also reasonable to conclude that this alternative would not increase employment opportunities and economic prosperity to the County's residents, business, and local government to the same extent as would the Project. Moreover, while this alternative might reduce some marginal impacts associated with new well development on an annual basis, many of the Project's environmental impacts would still occur under this alternative, though at a slower rate over a longer period of time.

Additionally, the Zero Net Gain Alternative is legally infeasible. Like the Fewer Wells Within the Project Footprint Alternative, the Zero Net Gain Alternative would impose a regulatory cap on the volume of oil and gas production in the Project Area by limiting the number of new well permits on

the basis of the number of new well abandonments. Under this regulatory scheme, some applicants may not qualify for drilling permits at any given time. As explained above, California courts have held that land use regulations that provide "no adequate means of protection or substitute for their right to extract oil" effects a compensable taking of private property. *See, e.g., Braly v. Board of Fire Com'rs. of City of Los Angeles* (1958) 157 Cal.App.2d 608, 616; *Bernstein v. Bush* (1947) 29 Cal.2d 773, 780. Under the Zero Net Gain Alternative, applicants denied well permits on the basis that issuance would violate the zero net gain standard will have "no adequate means" to exercise their mineral rights and extract oil or gas until a sufficient number of existing wells have been legally abandoned. As discussed above, property owners temporarily denied all economic beneficial use of their property by regulation "may have the right to just compensation for the temporary taking[,]" as explained above. *Kavanau,* 16 Cal.4th at 773. Therefore, adoption of the Zero Net Gain Alternative could expose the County to hundreds of lawsuits in any given year and potentially substantial just compensation claims. For this reason, the Zero Net Gain is appropriately eliminated from consideration in this EIR on the basis that it is legally and economically infeasible.

Alt-2: Alternatives Evaluated in Detail in the EIR

Several commenters questioned the Draft EIR's evaluation of one or more of the alternatives considered in detail. (Comments regarding alternatives that were screened from detailed analysis are addressed in GR Alt 1.) This response generally addresses comments on these Alternatives that were raised by multiple commenters; comments raised by a single commenter are addressed either in this response or in responses to specific comment letters.

Global Response to Certain Comments Regarding Alternative 1 - No Project Alternative

As required by CEQA Guideline § 15126.6(e), the EIR evaluates Alternative 1, the No Project Alternative, as set forth on pages 6-17 through 6-19 of the Draft EIR. The EIR determines that Alternative 1 is environmentally inferior to the Project. As explained in the EIR, the proposed Project would substantially amend sections of the Kern County Zoning Ordinance to update and extend to *all* Project Area oil and gas exploration and production facilities development standards and conditions designed to avoid or minimize environmental impacts associated with pre-drilling exploration, well drilling, and the operation of well and other oil and gas production-related equipment and facilities. The Project's proposed development standards and conditions include several new requirements that are more protective of the environment and human health and safety than those required by current County regulations, and they would avoid or minimize the impacts of oil and gas exploration and production related to land use, agricultural resources, biological resources, soils and geological resources, water resources, flooding, fire safety, odor management, noise, air quality, cultural resources, lighting, spill prevention and remediation measures, among other categories, as compared to "no project" conditions. The Project would also establish a new "Oil and Gas Conformity Review" procedure for County approval of future well drilling and operations to ensure compliance with the updated development standards and conditions, and to provide for ongoing tracking and compliance monitoring. If Alternative 1 were adopted, none of the Project's proposed development standards or conditions would be implemented in the County on a consistent basis for all new oil and gas wells in the future. Therefore, Alternative 1 would not achieve the environmental benefits offered by the Project.

Some comments assert that the EIR's description of the Alternative 1 is incomplete or inaccurate because it does not conclude that, under "no project" conditions, future oil and gas wells in the County will require a drilling permit issued by DOGGR and would thus be subject to individual environmental review conducted by DOGGR. The comments speculate that each well permitted by DOGGR would be subject to the mitigation measures set forth in DOGGR's 2015 statewide Well Stimulation Treatment EIR (SB 4 EIR). On this basis, some comments claim that the No Project Alternative would be environmentally superior to the Project.

Draft EIR page 6-17 clearly explains that future oil and gas wells constructed in the Project Area under "no project" conditions would be subject to the regulatory authority of both DOGGR and the County. Moreover, as explained in GR 9, the mitigation measures described in this EIR are consistent with, or more protective than, the mitigation measures described in the DOGGR EIR. Thus, there is no evidence that oil and gas wells constructed under "no project" conditions would be environmentally superior to wells constructed under Project conditions simply because they would presumably be subject to DOGGR's mitigation measures, rather than the mitigation measures described in this EIR. Indeed, the DOGGR EIR only mitigates for impacts related to well stimulation treatments, such as hydraulic fracturing, while this EIR mitigates for a far broader range of oil and gas activities. Moreover, DOGGR has never prepared an EIR for an individual well permit and, in fact, typically approves individual permits with either no CEQA review or on the basis of a negative declaration that imposes no mitigation requirements (other than mandating compliance with existing DOGGR regulations, which apply in any case). Similarly, there is no substantial evidence that DOGGR would, in the future, conduct a more thorough CEQA review for individual permits than it has in the past. Finally, there is no substantial evidence that future oil and gas activities in the Project Area would have reduced environmental impacts, as compared to Project conditions, simply by subjecting each oil and gas well to an individual CEQA review process, whether conducted by DOGGR or the County. Accordingly, there is no substantial evidence demonstrating that Alternative 1 is environmentally superior to the Project.

As further explained on Draft EIR page 6-19, Alternative 1 would not achieve the Project's basic objective. Under "no project" conditions, Project activities occur in many zoning districts within the Project Area without any ministerial or discretionary review, based on prior determinations regarding the general land use compatibility of continued oil and gas extraction activities and the sufficiency of third-party expert agency regulations to protect human health and safety, and the environment. The County directed that the current ordinances be updated to substantially expand the County's oversight and enforcement role, which under Project conditions would include over 100 new procedural and substantive requirements applicable to Project activities. The Board of Supervisors directed that this ordinance update process be procedurally structured to avoid imposing excessive administrative burdens, while assuring effective implementation and enforceability. This is the basic Project objective to be met. It goes without saying that this basic objective cannot be achieved if the Project is not approved and future well permits continue to be processed in accordance with existing zoning regulations.

Global Response to Certain Comments Regarding Alternative 2 - CUP Alternative

Alternative 2, the CUP Alternative is evaluated on Draft EIR pages 6-19 through 6-21. Under Alternative 2, all new oil and gas activities would be permitted in the Project Area only upon County's issuance of a conditional use permit. Under Alternative 2, development standards would be updated, but would only imposed if substantial evidence demonstrates they are required to reduce project impact below applicable significance thresholds. As explained in the Draft EIR, in many respects, the CUP Alternative would be environmentally inferior to the Project. There are two primary reasons for this conclusion: (i) the EIR uses highly conservative impact assumptions in order to present a "worst case" impact scenario based on best available evidence, and (ii) to reduce the "worst case" impacts to the extent feasible, the EIR establishes mandatory mitigation requirements that will be imposed on every individual well project without regard to whether any single we project would actually cause the impact for which mitigation is required hereunder.

As further discussed in Global Response 1, to ensure that this EIR presents a conservative analysis of the likely impacts of new wells constructed under Project conditions, this EIR makes a number of highly conservative assumptions in order to present a "worst case" impact scenario and to design feasible measures to mitigate such "worst case" impacts. The conservative assumptions carried forwarded in this EIR include but are not limited to the following:

- All new well activities in the County are assumed to occur on Project Area lands that are under the County's jurisdictional control and non-jurisdictional areas are addressed as part of the cumulative impact analysis;
- The EIR analysis assumes that ongoing environmental effects that are part of the baseline environmental conditions are instead new impacts caused by the Project that require mitigation;
- Project-related land disturbance is conservatively estimated based on existing land use disturbance associated with oil and gas activities, then further increased by 1.2 to 3 acres per well site (depending on Subarea) to provide a conservative assessment of potential impacts;
- Project-related land disturbance assumptions are also based on the conservative assumption that new well construction and operations will not utilize existing access roads and other oil and gas infrastructure to their full potential, especially in the more heavily developed Tier 1 areas, and will thus require additional disturbances;
- Future replacement or expansion of existing oil and gas facilities are conservatively assumed to result in new land disturbances, even though not all facility replacement and expansion activities will cause new land disturbances;
- The EIR conservatively assumes that, under Project conditions, 264 more well stimulation treatments will annually occur than actually occurred under baseline conditions, even though the number of future stimulation treatments is expected to be similar to baseline conditions;
- For the purpose of analyzing and mitigating agricultural impacts, the EIR conservatively assumes that all land disturbed by oil and gas activities within the Tier 2 area will be to unique and important farmlands, even though not all land within Tier 2 falls into those categories;

- For purposes of analyzing and mitigating air quality impacts, the EIR conservatively assumes that the number of wells to be built every in the Project Area will exceed the number of wells projected to be authorized under the Project;
- For the purposes of analyzing and mitigating impacts to wetland features, the EIR conservatively assumes that the Project's wetland disturbance area includes waters that are not regulated as wetlands, such as artificial ponds and drains used for agricultural, oil and gas operations, mining, and other industrial activities;
- Potential impacts to modeled special status species were conservatively characterized in terms of annual impacts to all identified habitat categories for each species analyzed within the Project Area, which includes urbanized, agricultural, or high-density oil and gas production areas where predicted habitat values have been reduced or eliminated;
- Potential impacts to non-modeled special status species were conservatively analyzed to assume that impacts will occur even in areas where there is an extremely low likelihood of species impact;
- The EIR conservatively assumes that all Project Area land located above 2,000 feet in elevation is high quality golden eagle and condor habitat, and that disturbance in these areas could result in significant impacts to the species without mitigation;
- To provide a conservative assessment of Project-related impacts to water supplies, the EIR assumes that all oil and gas M&I water use will be provided by groundwater, not surface water supplies, and will be of sufficient quality to potentially be utilized for agricultural, urban or other M&I activities;
- To provide a conservative estimate of Project-related impacts to water supplies, the EIR further assumes that State Water Project surface supplies that are sometimes available in wet years will never be available during the life of the Project;
- To provide a conservative estimate of Project-related impacts to water supplies, the EIR further assumes that future Central Valley Project (CVP) water supply delivery levels in the Project Area will only be sourced from Class 1 (firm) contract supplies under future conditions, even though other CVP water supplies may be available in wet years;
- To provide a conservative estimate of Project-related impacts to water supplies, the EIR further assumes that recycled water projects currently being considered by Project Area water suppliers will not produce recycled water to serve the Project, even though such supplies may in fact become available in the future;
- The EIR's assessment of potential flooding impacts conservatively assumes that a catastrophic failure of dam facilities would occur, if at all, under full capacity conditions, even though full capacity typically occurs only in wet years;
- The EIR conservatively assumes that all Project-related well construction will disturb land throughout the life of the well, even though the permanent footprint of most wells will be less than what is projected by the EIR; and

- The EIR's assessment of Project noise impacts conservatively assumes that that Project Area topography is flat, that there are no structures that will shield Project-related sounds sources, and that noise impacts will be generated by the largest operating drill rigs in operation in the United States even through such rigs are not commonly utilized in the Project Area.

Since the EIR's analysis of Project impacts is often based on conservative assumptions, the EIR's predicted level of Project-related impacts is more severe than will likely occur under Project conditions. Nevertheless, under Project conditions, future oil and gas activities will be required to mitigate for such "worst case" impacts scenarios, even if they won't individually cause every impact identified in the EIR.

To adequately reduce or avoid the conservative "worst case" impact scenario assumed by this EIR, future well facilities will be required to implement mitigation at levels above those that would be required if individual wells were permitted on a case-by-case basis subject to individual environmental review. Examples include, but are not limited to:

- MM 4.3-5: In order provide an extra margin of safety to protect the public health of nearby homes, schools, and other sensitive receptors under both single-well and multiple-well exposure scenarios, this mitigation measure imposes extremely conservative setback requirements. If individual wells were instead subject to discretionary approval, as contemplated by the CUP Alternative, potential impacts to sensitive receptors from emissions related to oil and gas activities would never warrant setback requirements as protective as those required by MM 4.3-5.
- MM 4.3-8: Pursuant to this mitigation measure, all permit applicants will be required to pay fees to fully offset emissions of oxides of nitrogen, reactive organic gases, and particulate matter of 10 microns or less in diameter (including as applicable mitigating for reactive organic gases by additive reductions of particulate matter of 10 microns or less in diameter) increase in these pollutants for facilities or equipment that are not otherwise required to offset emissions under a Joaquin Valley Air Pollution Control District rules, and for other vehicle and other mobile source emissions. If individual wells were instead subject to discretionary approval, as contemplated by the CUP Alternative, full offset of these emissions would not be required by law.
- MM 4.7-4: Pursuant to this mitigation measure, all permit applicants are required to fully offset all greenhouse gas emissions not otherwise covered by the state's cap-and-trade program or other mandatory greenhouse gas emission reduction measures by, for example, acquiring sufficient offset credits from the California Air Pollution Control Officers Association Exchange Register or other third party greenhouse gas reductions as verified by the San Joaquin Valley Air Pollution Control District. If individual wells were instead subject to discretionary approval, as contemplated by the CUP Alternative, full offset of these emissions would not be required by law.

As the above examples demonstrate, the mitigation program to be established by the Project will provide mitigation at levels in excess of that which would occur if new wells were subject to discretionary approval following individual environmental review. In this sense, the Project is

environmentally superior to Alternative 2 and will better serve regional conservation priorities, such as those described in SJVAPCD's Climate Change Action Plan and air quality attainment plans. Though some comments challenge this conclusion, none provide substantial evidence to support such claims.

The County currently contains approximately 75 active oil and gas fields, and over 2,500 wells are drilled in the County every year. It is not practical to subject every well permit to an individual discretionary approval process, or for environmental reviews to be conducted on every single well or groups of wells. The County lacks the resources to process thousands of oil and gas Negative Declarations and/or EIRs each year. The economic consequences for operators would be severe, delaying drilling for many months during the preparation of costly individualized CEQA documents. Moreover, such individualized review would be highly repetitive, as the thousands of Negative Declarations and EIRs would re-analyze the same impacts and prescribe the same mitigation for each new well or group of wells throughout the County. Accordingly, the basic objective of the Project and this EIR is to eliminate time-consuming and costly discretionary reviews of individual well and field development activities by establishing a ministerial site plan review process which incorporates mitigation identified in this EIR. As such, future County actions processing individual site plans will not trigger further CEQA review by the County. In addition, in the vast majority of cases, this process will avoid the need for responsible agencies to prepare additional CEQA documents for individual well or field development proposals when they are considering the discretionary decisions within their respective jurisdictions. Only if the criteria for supplemental CEQA review under CEQA Section 21166 are met would additional review be necessary. (14 Cal. Code Regs. §§ 15096(e)(3), 15162.) Such streamlined permitting is a permissible objective reflecting land use policy decisions within the authority of a county board of supervisors. *San Diego Citizenry Group v. County of San Diego*, 219 Cal.App.4th 1 (2013). This basic Project objective cannot be achieved by Alternative 2, the CUP Alternative. Nevertheless, for informational purposes, this alternative was fully evaluated in the EIR in response to prior expressions of public interest.

Global Response to Certain Comments Regarding Alternative 3 – Reduced Ground Disturbance Alternative

The Reduced Ground Disturbance Alternative was fully evaluated in the Draft EIR and, if adopted, would prohibit all new well drilling activities outside existing DOGGR-designated "Administrative Boundary" areas, and would require subsurface oil and gas to be extracted from surface equipment located within such Administrative Boundary Areas.

If this alternative were adopted, the owners of mineral rights underlying outside of Administrative Boundary areas could only access their mineral interests, if at all, from adjacent lands that are located within an Administrative Boundary area through the use of directional and horizontal drilling techniques, which may not be technologically or economically feasible, depending on geologic conditions and location (AECOM, 2015). Where feasible, the directional and horizontal drilling assumed by this alternative is reasonably expected to require longer drilling periods to reach the mineral source than would be necessary to complete a vertical well. Longer drilling periods mean increased levels of construction-related emissions. It is therefore reasonable to assume that directional and horizontal well development activities under this alternative would cause greater

emissions than would occur if the wells were drilled vertically under Project conditions. Thus, while this alternative would have the environmental benefit of impacting fewer acres of land, it would also exacerbate overall emissions of criteria pollutants for which the air basin is in nonattainment.

Given the size and unconventional geology of the Project Area, it is also reasonable to assume that, in some instances, the owners of mineral interests underlying lands outside of Administrative Boundary areas will not be able to feasibly exercise their mineral rights as a result of the drilling restrictions assumed by this alternative. In such cases, this alternative would arguably destroy all economically beneficial or productive use of such mineral interests, thus exposing the County to economic harm and unreasonable legal liability for the same reasons detailed in Global Response Alt-1's discussion of the Drilling Ban on All Lands Alternative. Accordingly, the Alternative 3 is legally infeasible.

Global Response to Certain Comments Regarding Alternative 4 - No Hydraulic Fracturing Alternative

The No Hydraulic Fracturing Alternative was fully evaluated in the Draft EIR at pages 6-23 through 6-24 and, if adopted, would amend the Chapter 19.98 of the Kern County Zoning Ordinance to prohibit hydraulic fracturing in the Project Area. However, the Draft EIR explains that "a local government's legal authority to regulate every step in the hydraulic fracturing process is the subject of legal disputes currently pending in certain California courts," but nevertheless evaluates the alternative under the assumption that "the County has sufficient legal authority" to ban hydraulic fracturing in the Project Area. Some commenters have requested further information about the scope of the County's authority to prohibit hydraulic fracturing or other well stimulation treatment (WST) techniques in the Project Area. As explained below, applicable law suggests that Kern County may not impose a ban on WST activities.

Local legislation that conflicts with state law is preempted and void. *Conejo Wellness Ctr., Inc. v. Agoura Hills* (2013) 214 Cal. App. 4th 1534, 1552. A conflict can occur if the local ordinance duplicates state law, contradicts state law or enters an area or field fully occupied by state law. *Id.* "Local legislation enters an area or field that is 'fully occupied' by state law when the Legislature has either expressly manifested its intent to fully occupy the area or has impliedly has done so." *Id.* "Implied preemption occurs when: (1) general law so completely covers the subject as to clearly indicate the matter is exclusively one of state concern; (2) general law partially covers the subject in terms clearly indicating a paramount state concern that will not tolerate further local action; or (3) general law partially covers the subject and the adverse effect of a local ordinance on transient citizens of the state outweighs the possible municipal benefit." *Big Creek Lumber Co. v. Santa Cruz* (2006) 38 Cal. 4th 1139, 1157–1158.

The California Attorney General has concluded that, through enactment of the comprehensive California oil and gas laws set forth in Division 3 of the Public Resources Code, commencing with section 3000, and its implementing regulations, the State had completely covered the field with respect to "down-hole or subsurface" oil and gas operations:

> In our view, the conservation and protection of the state's finite energy resources, by means of regulatory policy reviewed herein, transcends local boundaries and interests. Oil, gas and geothermal resources are flung far and wide around the state; to leave the simultaneous regulation of their development to various local entities would subject development of the state's fuel resources to [a] "checkerboard of regulations[.]" ... Such local regulation could obviously interfere with and frustrate the state's conservation and protection regulatory scheme reviewed above. This "checkerboard" problem seems highlighted by the fact that this state's deposits of energy resources do often extend under the boundaries of several local entities as, for example, in the Los Angeles basin. In our view, the drilling and production of energy resources represents an endeavor of commercial activity that commands uniform regulation. … The statutory and administrative regulatory scheme outlined above reveal to us a comprehensive purpose and scope broad enough to exclude local regulation in each instance where the [State Oil & Gas] Supervisor or his regulatory program approves or specifies plans of operation, methods, materials, procedures or equipment to be used by the operator or where activities are to be carried out under the direction of the Supervisor as part of the Supervisor's regulation for purposes of conservation or protection of resources.

59 Ops. Cal. Atty. Gen. 461, Opinion No. 76-32 (Aug. 24, 1976) at 477-478. On this basis, the Attorney General concluded that the state oil and gas laws "appear to occupy fully the underground phases of oil and gas activities" and that, "in all probability there will in our view be a [preemptive] conflict with state regulation when a local entity, attempting to regulate for a local purpose, directly or indirectly attempts to exercise control over subsurface activities."

With the recent enactment of SB 4 and DOGGR's permanent WST regulations, the level of complexity, detail, and comprehensive quality of the State oil and gas laws has only increased since the Attorney General first concluded that local down-hole regulation of oil and gas activities is preempted by state law. The complexity and specificity of SB 4 and its implementing regulations are described in detail on Draft EIR pages 4.9-108 through 4.9-109. This new mandatory regulatory program only reinforces the Attorney General's determination that the State's statutory and administrative regulatory scheme governing subsurface oil and gas activities presents "a comprehensive purpose and scope broad enough to exclude local regulation[.]" Accordingly, County regulations limiting subsurface WST operations would be preempted. Kern County retains its police power, and may enact laws in furtherance of public health, safety and the general welfare, including ordinances regulating oil and gas activities at the surface. However, the County is likely prohibited from enacting laws that ban or control WST operations in areas where oil and gas operations are allowed to take place. In addition, to the extent the No Hydraulic Fracturing Alternative would, if adopted, deny affected mineral rights holders all economically beneficial or productive use of such mineral rights, then such alternative would be infeasible for the same reasons described above for the Drilling Ban on Agriculturally Productive Land Alternative and the Drilling Ban on All Lands Alternative. For these reasons, it is reasonable for the County to determine that the No Hydraulic Fracturing Alternative is infeasible for purposes of CEQA, even though such alternative is fully evaluated in the Draft EIR.

Finally, approval of the No Hydraulic Fracturing alternative would likely cause an increase in greenhouse gas emissions, without a reduction in other adverse impacts. As explained by the California Council on Science & Technology (CCST) in its recent study, *An Independent Scientific Assessment of Well Stimulation in California*, "[t]he majority of impacts associated with hydraulic fracturing are caused by the indirect impacts of oil and gas production enabled by the hydraulic fracturing." According to the CCST, "all oil and gas development causes similar impacts whether the oil is produced with well stimulation or not." The exception to this general rule, however, concerns greenhouse gas emissions.

According to CCST:

> Fields with lighter oil result in low emissions per barrel of crude produced, while fields with heavier oil have higher emissions because of the need for steam injection during production as well as more intensive refining needed to produce useful fuels such as gasoline. Well stimulation generally applies to reservoirs with lighter oil and consequently smaller greenhouse gas burdens per unit of oil. Oil and gas from San Joaquin Basin reservoirs using hydraulic fracturing have a relatively smaller carbon footprint than oil and gas from reservoirs such as those in the Kern River field that use steam flooding. If well stimulation were disallowed and consumption of oil and gas in California did not decline, more oil and gas would be required from non-stimulated California fields …, possibly with higher emissions per barrel. Consequently, overall greenhouse gas emission due to production could increase if well stimulation were stopped in California.

Thus, if well stimulation were disallowed, as contemplated by the No Hydraulic Fracturing Alternative, more oil and gas would be required from non-stimulated California fields. This would likely result in an overall increase in greenhouse gas emissions, without an overall increase in other adverse environmental impacts. Accordingly, the No Hydraulic Fracturing Alternative would be environmentally inferior to the Project. It is well settled that an EIR need not consider alternatives that do not offer significant environmental advantages in comparison to the Project. 14 Cal. Code Regs. § 15126.6(b).

Global Response to Certain Comments Regarding Alternative 5 – Low-Emission Enhanced Oil Recovery (EOR) Technology Alternative

Some commenters suggested that Alternative 5, the Low-Emission Enhanced Oil Recovery (EOR) Alternative, should be adopted instead of the Project because it is the environmentally superior alternative. Further review suggests that Alternative 5 is infeasible within the meaning of CEQA Guidelines § 15364. A lead agency may choose not to adopt the environmentally superior alternative if it is infeasible. CEQA Guidelines § 15126.6.

Under Alternative 5 all new and replacement steam generators for thermal EOR activities would be required to install low-emission steam generation technology. However, low-emission steam generation technologies are still in the demonstration and prototype phase. ClearSign Duplex (CSD) technology, which is referenced as a possible technology in Alternative 5, involves ceramic tile and burner modification. One operator (Aera) is conducting pilot testing of CSD. At least one other

operator (Chevron) is considering pilot testing low-emission steam generation technologies. All technologies currently under consideration require additional testing and validation in actual operating conditions and environments before they can be considered field-proven.

Long-term effectiveness and commercial viability of either technology still remain to be determined, and no company has deployed either technology to date. Furthermore, because the technologies are still in development, the cost of installing the equipment is high compared to the resulting emissions decreases. As such, the technology is not yet readily available on a commercial scale for implementation in oil and gas production in Kern County. The commenters have not provided any evidence suggesting that low-emission steam generation technology is economically or technologically feasible at this time. For these reasons, a finding of infeasibility is appropriate (CEQA Guidelines § 15126.6(f)(1)).

The technological infeasibility of Alternative 5 is further demonstrated by the current Best Available Control Technology (BACT) Guideline for oilfield steam generators in the San Joaquin Valley Air Pollution Control District (SJVAPCD). The federal Clean Air Act requires implementation of BACT, defined as as an emission limitation that the relevant permitting entity "determines is achievable." 42 USC § 7479. Similarly, the SJVAPCD defines BACT as the most stringent emission limitation or control technique (1) achieved in practice; (2) contained in any State Implementation Plan, if presently achievable; (3) contained in an applicable New Source Performance Standard; (4) "Any other emission limitation or control technique, including process and equipment changes of basic or control equipment, found … to be cost effective and technologically feasible …" Rule 2201, Section 3.10. The SJVAPCD BACT guideline was last updated in March of 2014 and currently requires 6 ppm NOx at 3% O_2 for steam generators that operate at 85 MMBtu/hr; and 7 ppm NOx at 3% O_2 for steam generators that operate at less than 85 MMBtu/hr.[114] By comparison, the low-emission steam generation technology contemplated by Alternative 5 would be expected to achieve rates comparable to or lower than 5 ppm NOx at 3% O_2 for steam generators operating at 55 MMBtu/hr. The fact that the rates in the current SJVAPCD BACT guideline are higher than what is contemplated by Alternative 5 further supports the conclusion that the technology required by Alternative 5 has not yet been achieved in practice, has not been shown to be presently achievable and is not technologically feasible. Alternative 5 was therefore properly rejected as an alternative. Moreover, at such time as the SJVAPCD determines that low-emission steam generation technology has become feasible, it would be expected to update its BACT guidelines accordingly.

Global Response to Certain Comments Regarding Alternative 6 – Recycled Water Alternative

As explained in Draft EIR pages 6-26 through 6-28, Alternative 6, the Recycled Water Alternative, would require well permit applicants to treat an amount of produced water that is currently being disposed of via underground injection will which is equivalent to the mount of M&I water used in the applicant's operations. Under Alternative 6, such produced water would be required to be

[114] http://www.valleyair.org/busind/pto/bact/bactLoader.htm.

treated, recycled and put to an alternate use such as agricultural irrigation. Further analysis of Alternative 6 in response, in part, to comments on the Draft EIR suggests that this alternative would not be feasible. The reuse of treated produced water would, in many cases, significantly increase costs, and could result in increased chemical use, longer and more intensive surface activities, and the need for additional permitting processes to avoid adverse secondary environmental impacts. Moreover, in comments on the Draft EIR, DOGGR has expressed concerned that the reuse of produced water, as contemplated by this alternative, may contribute to land subsidence in the Project Area, as explained below.

Produced water is currently used for some oilfield activities, such as discharge for dust suppression, but increasing that use beyond existing levels would require additional permitting and approvals to avoid impacts to biological, water and other resources. While the oil and gas industry in Kern County has been working with the Regional Water Quality Control Boards to increase the treatment and use of produced water for dust suppression and other oilfield activities, there are regulatory hurdles to increasing use of produced water and it is uncertain whether and to what extent additional use of produced water will be permitted by the Boards. As such, a requirement to substitute produced water, as contemplated by Alternative 6, may be legally infeasible.

While oil and gas operators may be able to utilize additional produced water for some oilfield activities – as contemplated by Mitigation Measures 4.17-2, 4.17-3 and 4.17 – not all oilfield activities are able to use produced water. For some oilfield activities, such as drilling and abandonment work, the use of fresh water is required to properly formulate the cement mixtures that are needed to safely drill and abandon wells. Using produced water for these activities would jeopardize operators' ability to comply with well specifications provided for in DOGGR regulations.

Certain enhanced oil recovery (EOR) operations, such as steam generation, can require higher-quality water supplies than are typically obtained from treated produced water in order to avoid equipment corrosion or damage and potential chemical interactions. Use of produced water in these operations can also lead to increased need for equipment maintenance due to, for example, silica buildup or tube failures in boilers. Even when produced water can be used in EOR operations, water losses in the oil production cycle—due to losses on the surface, in the geological zones, or otherwise—typically necessitate the use of some fresh or brackish "make up" water from a surface or subsurface source. Depending on the nature of the operation, "make up" water often represents between 10 and 25 percent of the water used.

Additionally, the lack of infrastructure linking sources of produced water to the locations where water may be used, particularly in cases of new exploration, can result in increased truck trips and other more significant impacts associated with transporting produced water to operation sites. For example, pilot EOR projects typically cannot use recycled water due to the early stage of project development, which results in a lack of available recycled water. Furthermore, the treatment of water for reuse requires specialized equipment, consumes energy, and generates waste. In many cases, operators have also contracted with local water purveyors to utilize some supply of purchased water over a long-term contract; cancellation of such contracts would also create negative financial impacts for the region.

In addition, the use of produced water specifically for well stimulation treatments would significantly increase chemical use as well as costs. Chemicals used in fracture treatments impart viscosity for proppant transport and fracture geometry creation and improve post-treatment production results by minimizing polymer plugging and other phenomena detrimental to production. Using produced water instead of fresh water as a base fluid for fracture treatments would increase the chemical volumes needed to fulfill these functions. Produced water use for fracture treatments could require as much as a five-fold increase in buffering agents, and additional chelating agents, clay and scale inhibitors, and surfactants to prevent emulsions and reduce surface tension may also be needed to minimize production complications that would be caused by the use of produced water. While produced water could be pre-treated to require fewer chemicals during the fracture treatment itself, such pre-treatment conditioning would also involve more chemicals, equipment, or both, to obtain water sufficient for use in the fracture treatment. Because of these complications, a typical fracturing operation would become significantly more expensive, and often uneconomic.

In addition, for some types of well stimulation, such as matrix acid stimulation, it is technologically infeasible to utilize produced water. Typically, matrix acid stimulation employs hydrofluoric acid (HF acid), which can only be mixed with fresh water. If HF acid comes into contact with formation brine, insoluble precipitants form, limiting the effectiveness of the acid stimulation system by plugging pore throats in the reservoir pore network. Such plugging can completely counteract the effects of the stimulation treatment. The reduction in the effectiveness of the treatment would require more frequent treatments, larger treatments, or both, which would lead to a significant increase in use of chemicals, emissions and heavy vehicle traffic hauling hazardous chemicals.

Finally, in its comment letter on the Draft EIR, DOGGR expresses its concern that the treatment and reuse of produced water for agricultural or other uses may adversely affect the balance between production and injection that needs to be maintained to prevent subsidence in the Project Area. DOGGR is mandated to prevent subsidence. It is concerned that, if produced fluids are redirected to other beneficial uses, there may not be fluid available to put to use in subsidence abatement. The County concurs with DOGGR's view that alternative uses of produced water should not be at the expense of other considerations that equally important, such as subsidence management.

In sum, while operators are working to increase their use of produced water for oil and gas operations in Kern County, issues ranging from harms caused by chemical interactions to the lack of availability of produced water at certain sites, as well as subsidence management, suggests that Alternative 6 is infeasible.

Project: Draft Environmental Impact Report for "Revisions to the Kern County Zoning Ordinance – 2015, Focused on Oil and Gas Local Permitting"

SJVAPCD CEQA Reference No: 20150630

Dear Ms. Oviatt:

0001-1

The San Joaquin Valley Unified Air Pollution Control District (SJVAPCD) has reviewed the Draft Environmental Impact Report (Draft EIR) for "Revisions to the Kern County Zoning Ordinance – 2015, Focused on Oil and Gas Local Permitting." The Draft EIR prepared by Kern County evaluates the impacts from revisions to the Kern County Zoning Ordinance to implement a new permit process for oil and gas activities. The revisions include new site development standards, review processes for all oil and gas exploration, extraction, operations, and production activities in unincorporated Kern County, California (Project).

0001-2

The SJVAPCD commends Kern County on this innovative and groundbreaking approach to addressing environmental impacts from growth in the oil and gas production industry in Kern County. We recognize the ambitious nature of the effort, and are pleased to work with Kern County to carry the concept through to successful completion. In that spirit, we offer the following comments to assist in the effort to appropriately analyze and address a necessarily complex assessment of air quality impacts.

1) Emissions Not Addressed Through Permits

0001-3

The Draft EIR should be clarified that only operational emissions exceeding the SJVAPCD's offset thresholds from equipment subject to District Rule 2201 will be required to be offset through SJVAPCD air permits.

SJVAPCD rules do not require offsets for construction emissions, including emissions associated with well construction and new facility construction. District Rule 2201 (New and Modified Stationary Source Review Rule) requires offsets only for operational emissions from permitted stationary sources exceeding the offset thresholds.

Printed on recycled paper.

0001-4

Furthermore, SJVAPCD rules do not require offsets for construction and operational emissions from equipment subject to portable equipment registrations or permit-exempt equipment registrations. Therefore, the Draft EIR (page 4.3-82) should be clarified as follows:

> *In summary, emissions from the new facility and well construction at a Project level would result in emissions levels that would exceed SJVAPCD Construction Emissions Threshold. Only the ~~new facility~~ ~~construction~~ operational emissions from equipment subject to SJVAPCD Rule 2201 (New Source Review) that exceeds the SJVPACD's offset thresholds would be required to be ~~off-set~~ offset because it would be a condition of the SJVAPCD air permit. Although ~~offset all~~ permitted stationary source operational ~~construction~~ emissions that are above ~~baseline~~ SJVAPCD's thresholds of significance would be offset through SJVAPCD Rule 2201 (New Source Review), other equipment and activities are exempt. Specifically, SJVAPCD rules do not require offsets for construction and operational emissions from equipment subject to portable equipment registrations or permit-exempt equipment registrations. In addition, new facility construction and well construction emissions have no offset requirements. Since these emissions exceed the SJVAPCD Construction Emissions Threshold and would not be offset, they would result in a cumulatively considerable net increase of criteria pollutants for which the Project region is nonattainment and therefore the construction impacts would be significant.*

2) Clarify OG-ERA Mitigation

0001-5

The Draft EIR should be revised to clarify that all criteria pollutant emissions not offset by SJVAPCD rules and regulations will be fully mitigated to a level of no net increase under the OG-ERA. The SJVAPCD looks forward to continuing to work with Kern County to clearly identify emissions and emission sources that are subject to this mitigation process, prior to the finalization of the EIR.

Mitigation Measure 4.3-8 in the Draft EIR should be revised as follows:

> *For criteria emissions ~~Project facilities or equipment that are~~ not required to be offset ~~emissions~~ under a District rule as described in MM 4.3-1, and for Project vehicle and other mobile source emissions, the County will enter into an emission reduction agreement with the San Joaquin Valley Air Pollution Control District, pursuant to which the Applicant shall pay fees to fully offset Project emissions of oxides of nitrogen, reactive organic gases, and particulate matter of 10 microns or less in diameter (including as applicable mitigating for reactive organic gases by additive reductions of particulate matter of 10 microns or less in diameter) (collectively,*

0001-5 Continued

"designated criteria emissions") to avoid any net increase in these pollutants.

The air quality mitigation fee shall be paid to the County as part of the Site Plan review and approval process, and shall be used to reduce designated criteria emissions to fully offset Project emissions that are not otherwise required to be fully offset by District permit rules and regulations.

3) Alternative Mitigation to OG-ERA

SJVAPCD recommends that Mitigation Measure 4.3-8 alternative mitigation be implemented through a SJVAPCD-approved process.

0001-6

Mitigation Measure 4.3-8 includes an alternative mitigation option under the OG-ERA. Over the years, the SJVAPCD has built a reputation for excellence in the implementation of its incentive emissions reduction programs, as highlighted in multiple audits by state agencies that lauded the SJVAPCD's incentive programs for their efficiency and effectiveness. The SJVAPCD also has a long and successful history of working collaboratively with local land use agencies (including Kern County) in verifying emission estimates, and collaborating on effective emission reduction mitigation measures. Therefore, the SJVAPCD recommends that this alternative mitigation option be done through a SJVAPCD-approved process. The SJVAPCD recommends the language in Mitigation Measure 4.3-8 be revised as follows:

As an alternative to paying the fee, an Applicant may reduce emissions for one or more designated criteria emissions through actual reductions in air emissions from other Applicant sources, as submitted to the County and subsequently validated by the District. This Project offset requirement alternative shall be enforced by the County and verified by the San Joaquin Valley Air Pollution Control District, and must be approved in advance by the San Joaquin Valley Air Pollution Control District.

4) OG-ERA Implementation

The Draft EIR should be revised throughout to reflect the SJVAPCD's primacy in choosing reduction projects, in consultation with Kern County, and the mechanism for updating the cost of the reductions.

0001-7

The SJVAPCD recommends two mitigation options under the OG-ERA: 1) allowing an applicant to pay a calculated fee to the SJVAPCD to fund emission reduction projects through its Incentive Program, or 2) allowing an applicant to propose their own emission reduction projects through a SJVAPCD approved process in lieu of paying a calculated mitigation fee.

0001-8

The SJVAPCD has developed Incentive Programs around several core principles, including cost-effectiveness, integrity, effective program administration, excellent customer service, and efficient use of resources, fiscal transparency and public accountability. When the SJVAPCD spends mitigation funds through its Incentive Program, the goal is to achieve emission reductions closest to the proposed project while also maintaining cost effectiveness. The implementation of these principles has resulted in a consistently low cost for emissions reductions achieved – a fact that Kern County is relying upon when establishing a cost of $6974 (actually, the EIR should be updated throughout to reflect the SJVAPCD 's annual ISR report for 2014 - $6987 is the correct number) per ton of reductions achieved.

0001-9

To achieve the reductions necessary to mitigate the air quality impacts of future growth in the oil and gas sector in Kern County, the SJVAPCD must be able to choose the most cost effective emissions reduction projects available that will positively impact the location of the increased emissions.

0001-10

Therefore, the SJVAPCD recommends the Draft EIR (page 4.3-100) be revised to reflect implementation of the OG-ERA as follows:

> *The mandated emission reductions will be achieved by a menu of options that range from paying a calculated mitigation fee for use in doing emission reduction projects through a grant-type program, to applicant's proposing and achieving their own emission reduction projects through a SJVAPCD-approved process in lieu ~~changing equipment on existing operations or proposing projects for implementation instead~~ of paying the fee. The first pathway, the mitigation fee, will involve paying a calculated mitigation fee to the County on each permit for implementation of the OG-ERA. The mitigation fee shall be placed in a fund, established by the Board of Supervisors, with an additional administrative fee collected for the SJVAPCD. Expenditure of the mitigation funds shall be for certified air quality reduction projects managed ~~jointly~~ by ~~Kern County and~~ the SJVAPCD, in close consultation with Kern County. Final determination of air quality reductions achieved shall be under the determination of the SJVAPCD~~; however,~~ Furthermore, selection of specific projects shall be determined by the SJVAPCD in consultation with Kern County~~Kern County in consultation with District~~. Projects of equal cost-effectiveness to off-set criteria pollutants under the OG-ERA would be given priority for within Kern County valley locations ~~and be implemented on a yearly basis. Multi-year phased projects could also be funded.~~ The fee will be based and tiered to address different configurations of equipment that could be used, as well as other variables such as the depth of the well at standard depths of 3,000, 5,000, and 10,000 feet. The fee shall be adjusted as of January 1 of each year, and shall be tied to the prior year's average cost effectiveness, as published in the SJVAPCD's "Annual Report on the District's Indirect*

0001-10 Continued

Source Review Program" (i.e., the cost of $6974 per ton used in this EIR shall be updated annually, accordingly).

5) Greenhouse Gas Emissions

0001-11

The SJVAPCD would like the EIR to clarify how the SJVAPCD determines significance of greenhouse gas emissions impacts.

Mitigation Measure 4.7-1 requires applicants with permitted stationary sources to comply with the Cap-and-Trade regulation and implement applicable best performance standards (BPS) for oil and gas production activities. The SJVAPCD considers any source subject to cap and trade (http://www.valleyair.org/policies_per/Policies/APR-2025.pdf) to be less than significant for GHG impacts, without requiring the implementation of additional emission reduction measure such as BPS.

6) Greenhouse Gas Emission Reduction Agreement

0001-12

The SJVAPCD recommends Mitigation Measure 4.7-4 be revised to clarify requirements for fully mitigating greenhouse gas emission impacts.

Mitigation Measure 4.7-4 provides mitigation options for fully mitigating greenhouse gas emission impacts and requires the SJVAPCD to verify. The SJVAPCD does not have statutory authority for regulating greenhouse gas emission impacts but can provide any necessary guidance Kern may need. As such, SJVAPCD verification is not necessary.

0001-13

Furthermore, the SJVAPCD appreciates the County providing the option of fully mitigating greenhouse gas emission impacts under an emission reduction agreement. However, the SJVAPCD does not yet have an established incentive program for generating greenhouse gas emission reductions to provide the option to enter into an emission reduction agreement. The SJVAPCD is currently exploring options for such a GHG mitigation program, and the EIR should allow its use in the future.

0001-14

Therefore, the SJVAPCD recommends Mitigation Measure 4.7-4 be revised as follows:

> *Each Applicant shall offset all greenhouse gas emissions not covered by the Cap-and-Trade program or other mandatory greenhouse gas emission reduction measures through Applicant reductions of greenhouse gas emissions as verified by ~~the San Joaquin Valley Air Pollution Control District~~ Kern County, acquisition of offset credits from the California Air Pollution Control Officers Association Exchange Register or other third party*

0001-14 Continued

greenhouse gas reductions as verified by ~~the San Joaquin Valley Air Pollution Control District~~ Kern County, or through inclusion in an Emission Reduction Agreement, to offset Project-related greenhouse gas emission that are not included in the Cap-and-Trade program to assure that no net increase in greenhouse gas emissions from the Project.

0001-15

7) Health Risk Assessment

Kern County has informed the SJVAPCD that the final EIR will contain a Health Risk Assessment (HRA) to identify the risks to potential sensitive receptors, and which will follow SJVAPCD guidance and policies.

0001-16

The SJVAPCD provides the following comments accordingly:

Diesel Exhaust

The Slope factor developed by the Office of Environmental Health Hazard Assessment (OEHHA) for diesel exhaust is based on the aerometric diameter of 10 microns (PM10). Therefore, using an aerometric diameter of 2.5 microns (PM2.5) to consider diesel particulate matter (DPM) would assure that calculated emissions and the potential impact to nearby residence(s) are accurate.

0001-17

Receptor Gridding

Based on the information provided, the receptor gridding used in the model was limited to only 250 meters away. The SJVAPCD requires that a receptor grid be used sufficient to ensure that the maximum impact is found. As found in the SJVAPCD's guidance, the following grid system should be used in the revised Health Risk Assessment:

- 25 m spacing on the facility boundary
- 25 m spacing from facility boundary to 100 m
- 50 m spacing from 100 to 250 m
- 100 m spacing from 250 to 500 m
- 250 m spacing from 500 to 1,000 m
- 500 m spacing from 1,000 to 2,000 m

0001-18

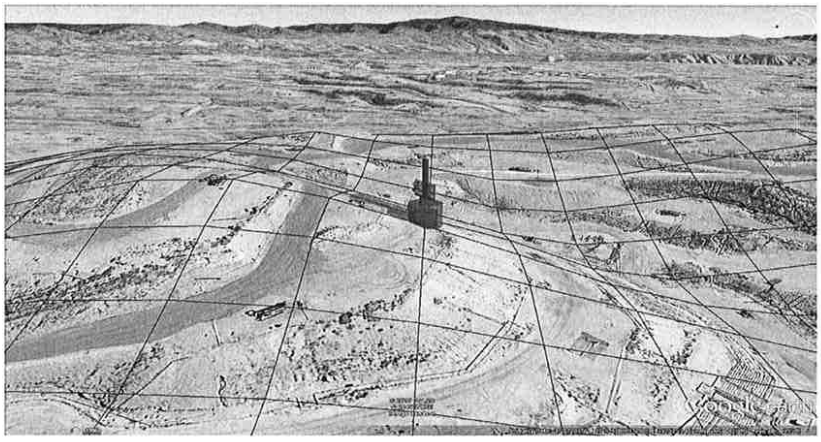
Terrain Characteristics

The terrain characteristics used in the three modeling scenarios were within the following areas: 1) Midway Sunset Oilfield, 2) Kern River Oilfield, and 3) North Shafter Oilfield. While the two of the three areas selected are located within the major oilfield and the third is located in a new oilfield, there is no assurance that the sites chosen have terrain that would result in a higher risk in the specified oilfield. For example, two of the locations selected are basically flat within the receptor gridding used. Only one scenario provided any elevation, and in that case, placing all the units near the top of the hill

0001-18
Continued

may not be the best scenario to determine the maximum impact in elevated terrain (see Figure 1 below).

Figure 1: Eastern Location – Kern River



Meteorological Data

0001-19

In reviewing the model inputs used to derive the results for the study, it was noted that not only a single meteorological dataset was used. The SJVAPCD provides AERMOD ready meteorological datasets for several areas in Kern County including those areas where the proposed scenarios were conducted. The table below presents the meteorological datasets available that should have been considered when conducting the modeling scenarios.

Table 1 – Kern County Meteorological Datasets

District	Location	Station ID	Elevation (m)	No. of Years
SJVAPCD	Arvin	MM5	267	5
SJVAPCD	Bakersfield	23155	149	5
SJVAPCD	Fellows	MM5	472	5
SJVAPCD	Missouri Triangle	MM5	268	5
SJVAPCD	Wasco	MM5	77	5

0001-20

Dispersion Model Inputs (AERMOD)

A review of the dispersion model inputs indicated that the input parameters for two types of point sources are outside the range of acceptable parameters. Below is a table identifying the model input used compared to those used by the SJVAPCD when conducting modeling runs for similar sources. Specifically, the modeled exit velocities are significantly outside the normal range, which can drastically affect modeled results.

Table 2 – Project Model Inputs Compared to SJVAPCD

		Height [m]	Diameter [m]	Exit_Temp [K]	Exit_Vel [m/s]
440 hp Diesel ICE	DRL03	4.572	0.1524	672.04	10
	SJVAPCD	2.85	0.18	761.9	71.23
1,000 hp NG ICE	ICE01	6.096	0.6096	727.59	9.144
	SJVAPCD	6.78	0.35	745.19	63.9

0001-21

Additionally, other sources were identified in the model inputs that were not described in the model write-up from Environmental Compliance Solutions Inc. (model name DRL01 and DRL02). The SJVAPCD is uncertain why these sources are included in the modeling runs especially since DRL01 was modeled as an "area" source 20 feet by 65.62 feet and DRL02 was modeled as a "volume" source 30 feet off the ground. Please provide an additional explanation of these sources in the revised Health Risk Assessment.

0001-22

HARP 2 Inputs

Risk Scenario (70- versus 30- year exposure): Based on a review of the HARP2 output files provided, the runs were conducted June 8, 2015. It's uncertain why a 30-year exposure duration was selected for this analysis. The SJVAPCD has been working with the regulated community and lead agencies in establishing a new threshold of significance for CEQA HRAs with a 70-year exposure duration. The SJVAPCD finalized its policy for implementation of the new OEHHA guidance on May 28, 2015 (District APR-1906). The SJVAPCD recommends that a 70-year risk assessment be conducted to ensure that estimates of risk conducted for permitting actions and those done for CEQA actions are comparable. That does not mean that within a scenario, adjustments cannot be made. For example, when looking at the drilling operation within the production lifecycle of the Project a short term HRA of one year (third trimester to one-year old) could have been evaluated and added to the HRA for the other time period(s) to get the total impact. The HARP2 program allows for this type of scenario.

The SJVAPCD's minimum required toxicological pathways must also be used when conducting HARP2 runs. Specifically, the SJVAPCD enables the inhalation, soil ingestion, dermal absorption, mother's milk, and homegrown crops toxicological pathways for residential and other sensitive receptors. The HARP2 runs must activate the homegrown crop toxicological pathway. 0001-23

SJVAPCD's *CEQA Significance Threshold for Assessing Health Impacts* 0001-24

As noted above, the SJVAPCD's guidance also establishes a cancer risk significance threshold for CEQA of 20-in-a-million. The significance threshold of 10-in-a-million is no longer used by the SJVAPCD to determine if a project under CEQA is considered significant.

The SJVAPCD strongly recommends that the 20-in-a-million risk threshold be used in conjunction with the 70-year exposure period, consistent with SJVAPCD-adopted policy.

General Comments 0001-25

Co-locating all sources in reference to a single location may not result in the maximum concentration especially when different source types and a limited number of receptors are used – dispersion characteristics can be drastically different amongst differing source types. This is true when comparing impacts from point and area source types where point sources tend to have their maximum impacts further away while area and volume source tend to be closer to the emissions release. Therefore, different distance/separations between source types could produce higher risk estimates, such as co-locating area sources at an appropriate point, and co-locating point sources at an appropriate point.

The HRA seeks to establish minimum go-no-go offset distances such that a site would not be permitted if the nearest sensitive receptor is closer to the site than the offset distance. The SJVAPCD suggests that such offset distances be used as a guideline, or screening level. Individual projects that locate further than the offset distance from receptors may proceed, but individual projects that locate closer than the offset distance should be required to perform a site-specific HRA using SJVAPCD approved procedures, and receive SJVAPCD approval of the site specific HRA. 0001-26

Such site-specific HRAs that demonstrate no significant impact from air toxics should be allowed to proceed with permitting processes as if they were outside of the offset distance. The EIR should be updated with an appropriate mitigation measure that allows this more refined process to determine health risk of a proposed project. 0001-27

0001-28

The SJVAPCD appreciates the opportunity to comment on the Draft EIR for this innovative and groundbreaking effort to address environmental issues associated with growth in the oil and gas industry in the San Joaquin Valley. If you have any questions or require further information, please call Mark Montelongo at (559) 230-5905.

Sincerely,

Arnaud Marjollet
Director of Permit Services

0001-15

The comment is a general introduction and it is noted for the record. The FEIR contains a revised HRA completed in accordance with the District's guidance and policies. Please see GR-6 for a discussion of this HRA. The revised HRA can be found in Appendix M-1 of the FEIR.

0001-16

Please see GR Air-6 regarding the revised Health Risk Assessment completed according to the District's comments. The revised Health Risk Assessment is included for informational purposes as Appendix M-1. Please also see GR Air-7 for an explanation of the HARP model.

0001-17

Please see GR Air-6 regarding the revised Health Risk Assessment completed according to the District's comments. The revised Health Risk Assessment is included for informational purposes as Appendix M-1. Please also see GR Air-7 for an explanation of the HARP model.

0001-18

Please see GR Air-6 regarding the revised Health Risk Assessment completed according to the District's comments. The revised Health Risk Assessment is included for informational purposes as Appendix M-1. Please also see GR Air-7 for an explanation of the HARP model.

0001-18 cont'd

0001-19

Please see GR Air-6 regarding the revised Health Risk Assessment completed according to the District's comments. The revised Health Risk Assessment is included for informational purposes as Appendix M-1. Please also see GR Air-7 for an explanation of the HARP model.

0001-20

Please see GR Air-6 regarding the revised Health Risk Assessment completed according to the District's comments. The revised Health Risk Assessment is included for informational purposes as Appendix M-1. Please also see GR Air-7 for an explanation of the HARP model.

0001-21

Please see GR Air-6 regarding the revised Health Risk Assessment completed according to the District's comments. The revised Health Risk Assessment is included for informational purposes as Appendix M-1. Please also see GR Air-7 for an explanation of the HARP model.

0001-22

Please see GR Air-6 regarding the revised Health Risk Assessment completed according to the District's comments. The revised Health Risk Assessment is included for informational purposes as Appendix M-1. Please also see GR Air-7 for an explanation of the HARP model.

0001-23

Please see GR Air-6 regarding the revised Health Risk Assessment completed according to the District's comments. The revised Health Risk Assessment is included for informational purposes as Appendix M-1. Please also see GR Air-7 for an explanation of the HARP model.

0001-24

Please see GR Air-6 regarding the revised Health Risk Assessment performed according to these comments. The revised Health Risk Assessment is included as Appendix M-1, and it uses the requested 20 in a million risk threshold for informational purposes. However, the FEIR continues to use the 10 in on million risk threshold for purposes of maintaining the setback established in MM 4.3-5 (367 feet for a 10,000 foot well in 2015) as this provides a conservative analysis.

0001-25

In response to the District's comments, the various sources of emissions were spread out throughout a well pad in the revised HRA in Appendix M-1. Please see GR Air-6 for more information on the revised HRA prepared in response to the District's requests.

0001-26

MM 4.3-5(c) has been modified in the final FEIR as follows:

"c. If the above setbacks cannot be met, and for existing wells, the Applicant shall provide a site-specific or other risk assessment to the SJVAPCD, which may include implementation of one or more of the following risk minimization measures, or such measures that are demonstrated by the Applicant to the SJVAPCD, to achieve a level of risk less than the threshold risk level, and shall provide confirmation from the SJVAPCD that the activity that is the subject of the application will not exceed the risk threshold:"

0001-27

MM 4.3-5(c) has been modified in the final FEIR as follows:

"c. If the above setbacks cannot be met, and for existing wells, the Applicant shall provide a site-specific or other risk assessment to the SJVAPCD, which may include implementation of one or more of the following risk minimization measures, or such measures that are demonstrated by the Applicant to the SJVAPCD, to achieve a level of risk less than the threshold risk level, and shall provide confirmation from the SJVAPCD that the activity that is the subject of the application will not exceed the risk threshold:"

0001-28

The comment is a general conclusion. No response is necessary and it is noted for the record.

Re: Comments on the Draft EIR re Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting (SCH No. 2013081079)

Dear Mr. Mynk:

This letter and associated attachments provide comments from the California Department of Conservation (DOC), through its Division of Oil, Gas, and Geothermal Resources (DOGGR), on the proposed Revisions to the Kern County Zoning Ordinance – 2015 C ("Project") and the County's associated Draft Environmental Impact Report (DEIR). 0002-1

DOGGR submits this letter to request additional information, to seek clarification, to provide substantive comments on the adequacy of the DEIR, to provide information relevant to DOGGR's function as a responsible agency, and to offer recommendations based on the recently completed, statutorily mandated Independent Scientific Study on the subject of well stimulation. Of particular note, this letter serves to inform Kern County that the DEIR, in its current form, does not include all of the information that DOGGR would ideally like to have when it acts in the future on various oil and gas permits as a responsible agency consistent with the California Environmental Quality Act (CEQA) (Public Resources Code, § 21000 et seq.), and the CEQA Guidelines (Cal. Code Regs., tit.14, § 15000 et seq.). Through this letter, DOGGR intends to identify for the County areas in which additional information will be necessary or desirable for the Final EIR to meet all of DOGGR's needs. 0002-2

As you know, pursuant to Senate Bill 4 (SB 4) (Stats. 2013, ch. 313, § 2) and follow-up legislation (Stats. 2014, ch. 35, § 130), the DOC was required by statute, through DOGGR, to prepare an EIR "to provide the public with detailed information regarding any potential environmental impacts of well stimulation in the state." (Pub. Resources Code, § 3161, subd. (b)(3).) DOGGR evaluated the impacts of existing and potential future oil and gas well stimulation treatments occurring within California in an EIR entitled "Analysis of Oil and Gas Well Stimulation Treatments in California" (State Clearinghouse Number 2013112046) ("SB 4 EIR"). The Draft EIR was made available on January 14, 2015. The public review period for the Draft EIR ended on March 16, 2015, and the Final EIR was certified on July 1, 2015, as required by SB 4. 0002-3

As explained in the SB 4 EIR and in Oil and Gas Supervisor Dr. Steven Bohlen's "Certification Statement," DOGGR has an obligation to make local lead agencies processing oil and gas projects 0002-4

that will likely involve well stimulation aware of all of the generic mitigation measures in the SB 4 EIR. (See Exhibit 1 [SB 4 EIR's mitigation measures, as set forth in DOGGR's "Mitigation Policy Manual for Well Stimulation Treatment Permits"[1]].) As further explained in those documents, DOGGR is willing to work with such local agencies, where necessary, to try to formulate mutually acceptable mitigation measures for specific well stimulation treatment permits. The generic measures developed by DOGGR to date are intended to set standards that DOGGR believes should be satisfied, where relevant and necessary, for all such permits. By making local lead agencies such as Kern County aware of these generic measures, DOGGR intends to ensure that the mitigation measures for well stimulation treatment permits achieve protections consistent with DOGGR's mandate to supervise oil and gas well operations "so as to prevent, as far as possible, damage to life, health, property, and natural resources." (See Pub. Resources Code Section 3106, subd. (a).) The mitigation measures set forth in the SB 4 Final EIR create good standards against which local lead agencies and DOGGR can measure the capability of proposed mitigations to satisfy that mandate for specific projects.

0002-4
Continued

Although this interagency communication reflects DOGGR's own notions about how best to ensure environmentally acceptable outcomes, this kind of input from a responsible agency to a lead agency is expressly contemplated by CEQA. Public Resources Code section 21081.6, subdivision (c), provides, in pertinent part, as follows:

> Prior to the close of the public review period for a draft environmental impact report or mitigated negative declaration, a responsible agency … shall either submit to the lead agency complete and detailed performance objectives for mitigation measures which would address the significant effects on the environment identified by the responsible agency…, or refer the lead agency to appropriate, readily available guidelines or reference documents. Any mitigation measures submitted to a lead agency by a responsible agency… shall be limited to measures which mitigate impacts to resources which are subject to the statutory authority of, and definitions applicable to, that agency. Compliance or noncompliance by a responsible agency… with that requirement shall not limit the authority of the responsible agency…, or the authority of the lead agency, to approve, condition, or deny projects as provided by [CEQA] or any other provision of law.

0002-5

Another purpose of this letter is to offer suggestions to the County beyond those already found in DOGGR's SB 4 Final EIR. Because the final two volumes of the Independent Scientific Study conducted pursuant to SB 4 by the California Council on Science and Technology (CCST) were not available prior to the certification of the SB 4 Final EIR, DOGGR committed in Steven Bohlen's Certification Statement to reviewing the final Independent Scientific Study ("CCST Study") and considering whether any of its conclusions justified formulating additional generic mitigation measures for well stimulation treatment permits or additional permanent regulations addressing well stimulation. DOGGR recognizes that Volumes II and III of the CCST Study were not available to the County during its preparation of the DEIR. Since DOGGR has now had time to review these final two volumes, DOGGR is sharing with the County some of the CCST Study conclusions and recommendations that are relevant to the County's proposed project and are of particular importance to DOGGR.

0002-6

[1] / Exhibit 1 is the July 2015 version of the Mitigation Policy Manual, which may be revised as needed in the future.

0002-7

DOGGR also notes that there is an ongoing effort by an interagency working group to fully consider the findings and recommendations of the CCST Study. Established on July 22, 2015, by Governor Jerry Brown, the interagency working group consists of policy and technical staff from nine state agencies and departments:

- California Natural Resources Agency
- California Environmental Protection Agency
- Department of Fish and Wildlife
- Department of Public Health
- Office of Environmental Health Hazard Assessment
- Department of Toxic Substances Control
- California Air Resources Board
- Department of Conservation
- California Department of Industrial Relations.

Before the end of 2015, the interagency working group is scheduled to provide the public with a plan for the full implementation of certain recommendations in the CCST Study, as well as a map of the process for further analyzing and considering other recommendations in the Study. The plan will provide a timeline that identifies the agencies charged with implementation of a certain recommendation and the method (e.g. rulemaking) for implementation. To avoid duplicative efforts or conflicting approaches, DOGGR's comments do not endorse a particular plan of action for addressing the concerns raised in the CCST Study. DOGGR's comments simply bring to the County's attention the existence of additional data that can be addressed in the County's Final EIR. Based on the foregoing, DOGGR's comments, discussed in detail below and in the attached technical comments, generally fall into two categories: (1) comments on, and requests for additional information or clarification with respect to, the DEIR; and (2) comments relating to the reconciliation of the mitigation measures in County's DEIR with mitigation measures in DOGGR's SB 4 Final EIR.

I. COMMENTS ON THE COUNTY'S DRAFT EIR

0002-8

In this section, DOGGR raises various issues with regard to the County's DEIR, including requests for additional information or clarification. Some of these comments refer to the CCST Study as a source of additional data for the County to consider. These comments are not intended to imply that the County's DEIR is legally inadequate for not including the conclusions and recommendations of the CCST Study, as DOGGR recognizes that Volumes II and III of the CCST Study were not available to the County during its preparation of the DEIR. Rather, these comments simply bring to the County's attention the existence of additional data that can be addressed in the County's Final EIR. Please also see Exhibit 2 for technical comments from DOC and DOGGR staff.

A. Projections of project-related water use

0002-9

The County's DEIR developed three scenarios or "projections of project-related water use in 2035" that "focus on potential variation in the amount of surface pond disposal, injection well disposal, and reuse of produced water that could occur under future conditions." (DEIR, pp. 4.9-125 to 4.9-126.) In Scenario 1 (Pro-Rata Increase), "produced water land disposal" is projected to increase from 30,233 acre-feet per year (AFY) in 2012 to 41,806 AFY by 2035. (DEIR, p. 4.9-126.) In

contrast, Scenario 2 shows 15,112 AFY in 2035, and Scenario 3 shows 3,022 AFY in 2035. (DEIR, p. 4.9-126.)

0002-9 Continued

It is important for the County's analysis of project-related water use and wastewater disposal to consider the balance that needs to be achieved between various important uses of water, such as groundwater recharge, irrigation, and subsidence abatement. As explained below, DOGGR is seeking additional information and clarification about the DEIR's three scenarios.

0002-10

First, the DEIR's three scenarios do not appear to address the amount of produced fluids from well stimulation treatment (WST) wells that would be shifted from disposal into evaporation and percolation ponds to injection wells. As explained in the SB 4 EIR, new permanent regulations prohibit the storage or disposal of well stimulation fluids, additives, and produced water from a well that has had a well stimulation treatment in sumps, ponds, or pits. (SB 4 Final EIR, Vol. II, p. 10.14-84 [citing 14 CCR § 1786 (a)(4)].) Under regulation Section 1786, produced fluid from a well that has had a well stimulation treatment can never be stored, disposed, or managed in sumps, ponds, or pits. The produced fluid volumes in the DEIR's three scenarios do not consider the WST fluid prohibition in new permanent regulations, which will affect the volumes of fluids that will need to be managed through other means, mainly (we anticipate) through injection wells. This volume will not be available for groundwater recharge by percolation pits. If managed by irrigation use, the cleanup of WST chemical contaminants will create an impact, since treated waste will be generated and necessitate disposal. The generated waste could be hazardous. Given the intent to use produced fluids for beneficial uses, such as, groundwater recharge, irrigation, and subsidence abatement, how does the County propose to address the risk of WST chemical dispersal through these alternative uses?

0002-11

0002-12

0002-13

Second, the DEIR's discussion of water use and wastewater disposal needs to better address the issue of subsidence. In one place, the DEIR explained:

0002-14

> Land subsidence is the gradual, local settling or sinking of the earth's surface with little or no horizontal motion. Subsidence is normally the result of gas, oil or water extraction, hydrocompaction, or peat oxidation, not the result of landslide or ground failure. The southern part of the planning area has been undergoing gradual land subsidence, with up to 4 feet of subsidence over a 40-year period.

(DEIR, p. 4.6-45.)[2] In another place, the DEIR states that groundwater extraction resulted in more than 8 feet of subsidence in the north-central portion of the Kern County Subbasin, and 9 feet in the south-central area between 1926 and 1970. (DEIR, p. 4.9-9.) As explained elsewhere in the DEIR:

0002-15

> Land subsidence of less than 1 foot from oilfield withdrawals is known to occur in a few isolated areas in southwest Kern County. Generally, the extent and rate of oil and gas extraction subsidence is significantly less than subsidence caused by groundwater use. . . . DOGGR monitors subsidence in oil and gas fields and regulates oil and gas withdrawal and re-pressurizing of each oilfield. If oilfield subsidence is observed, well operators are required to stabilize the ground by injecting additional produced water or reducing the volume of produced water being pumped during field operations.

---

[2] / Please see Exhibit 2 for comments about the accuracy of this quote

(DEIR, p. 4.6-19 to -20.)[3] To address this potential impact, the DEIR includes MM 4.6-4, which requires the applicant comply with a DOGGR approved re-pressuring plan as required by "Division 3, Chapter 1, Article 5.5 of the Public Resources Code, commencing with Section 3315." (DEIR, p. 4.6-58.) Please explain how the DEIR's three scenarios of water use and wastewater disposal takes into account MM 4.6-4 and the potential impact of subsidence. The FEIR should discuss whether increased use of produced water for irrigation outside the Project area affects the balance that needs to be maintained to prevent more subsidence in the Project area. DOGGR is mandated to prevent subsidence. The means by which subsidence is abated is either by balancing production and injection, or by requiring injection and re-pressurization. If produced fluids are redirected to other "beneficial uses," there may not be fluid available to put to use in subsidence abatement. Alternative uses of produced fluids should not be at the expense of other considerations that are just as important.

0002-16
0002-17
0002-18

Third, please clarify how the DEIR's projections for how much water will be used by well stimulation treatments is taken into account in the three scenarios. Although the DEIR and Appendix T provide figures for past water use in the Project Area and estimates for future water use, it is unclear what percentage of those figures are attributable to use for well stimulation treatments. (DEIR, pp. 4.9-20, 4.9-125; Appendix T, pp. 70-71, 74.) Please see the SB 4 EIR's discussion of "Estimated Water Use for Unconventional Well Stimulation Treatments in the Monterey Formation," which explained that exploratory Monterey Formation treatments could take significantly more water (up to 20 AF per treatment) than the typical well stimulation treatments that might only use about 0.38 AF per treatment in Kern County. (SB 4 Final EIR, Vol. II, pp. 10.14-79 to -80; County's DEIR, p. 4.9-20.)

0002-19
0002-20

Finally, please explain which of the three scenarios has been chosen as the most likely outcome. Please explain how the proposed mitigation measures are adequate to address impacts under all three scenarios. Please explain how the DEIR's mitigation will address impacts even though there is a wide variation in how much produced water land disposal is projected under the three scenarios. The DEIR should evaluate the usage of produced water and ensure that one usage does not negatively affect other equally important needs.

0002-21

B. Health Risk Assessments and impacts on sensitive receptors

0002-22

Toxic air contaminants are air pollutants that, even when present in relatively low concentrations, "may lead to serious illness or increased mortality," such as "birth defects, neurological damage, cancer, and death." (SB 4 Final EIR, Vol. II, p. 10.3-5; see also CCST Study, Summary Report, p. 60, fn. 15.) The SB 4 EIR recognized that "[p]roject-level or site-specific health risk assessment may be necessary to determine whether concentrations of [Toxic Air Contaminants] would occur at excessive levels downwind of new oil and gas fields or sites experiencing extensive well stimulation treatment." (SB 4 Final EIR, Vol. II, p. 10.3-38.) According to the SB 4 EIR, the "greatest need for site-specific health risk assessment would [be] for activities occurring near particularly sensitive land uses (for example within 1,500 feet [of uses]) such as residences, worksites, schools, daycare centers, playgrounds, or medical facilities." (SB 4 Final EIR, Vol. II, p. 10.3-38.) This is because "[m]any of the constituents used in and emitted by oil and gas development can damage health, and place disproportionate risks on sensitive populations, including children, pregnant women, the elderly, and those with pre-existing respiratory and cardiovascular conditions." (CCST Study, Summary Report, p. 62.)

---

[3] / Please see Exhibit 2 for comments about the accuracy of this quote.

The SB 4 EIR was a programmatic EIR focused, among other things, on air quality impacts from well stimulation treatments. As a result, the SB 4 EIR included a flexible mitigation measure (MM AQ-3a) that would require an applicant for a well stimulation permit to "Comply with Local Air District Protocols Relating to the Preparation of Prepare a Health Risk Assessment and Implement Emission Controls." (SB 4 Final EIR, Vol. II, p. 10.3-38 to -40.) But the CCST Study noted that it is oil and gas "production in general aside from well stimulation that may cause an impact," and that "a full understanding of health risks caused by proximity to production wells will require studying all types of production wells, not just those that have undergone hydraulic fracturing." (CCST Study, Summary Report, p. 62; see also CCST Study, Vol. II, p. 325.) According to the CCST Study, oil and gas production in the San Joaquin Valley accounts for "about 30% of sulfur oxides and 8% of anthropogenic volatile organic compound (VOC) emissions." (CCST Study, Summary Report, p. 60.) In particular, oil and gas facilities are responsible for over 70% of total hydrogen sulfide emissions in the San Joaquin Valley. (*Ibid.*)

0002-23

The County's DEIR includes a Health Risk Assessment (HRA) to evaluate "potential calculated cancer risk and acute and chronic health risk from toxic emissions associated with well construction, drilling, and completion as well as oil and gas processing equipment." (DEIR, Appendix M: Health Risk Assessment Proposed Drill and Oil and Gas Operations, p. 2.) As explained in more detail below, DOGGR is seeking more information and clarification about the HRA from the County:

1. It appears the impact of constructing, drilling, and operation of one well at a time was assessed. There may be times, however, when multiple wells will be constructed, drilled, and operating concurrently. The HRA should take into consideration these cumulative impacts. As the CCST Study explained, "the threshold of emissions for any single well to have an acceptable impact is smaller than the threshold for a well among a grouping of wells." (CCST Study, Vol. III, p. 328.) For example, the threshold in the Shafter area "for a well among the group would be about one hundredth of the threshold for a single well, based on a proximity of 1.6 km." (*Ibid.*)

0002-24

0002-25

2. The DEIR states that the HRA was conducted by the County Application Technical Committee. (DEIR, p. 4.3-103.) Appendix M states that the HRA was prepared by Environmental Compliance Solutions, Inc. in Santa Monica. Was the HRA done in consultation with the local San Joaquin Air Pollution Control District? Please include this information in the Final EIR.

0002-26

3. Were emissions from well stimulation activities included in the HRA? If the answer is yes, please explain in the Final EIR how emissions from well stimulation activities were quantified and included in the analysis of the HRA. If not, please revise the assessment as it appears in the Final EIR to include emissions from these activities. Additionally, the County's rules should provide that, if an oil or gas project is larger than what was assessed in the HRA is proposed, a site-specific HRA should be conducted to identify any additional potential health impacts.

0002-27

0002-28

4. The HRA refers to an "Appendix B" that includes the "exact equipment list for each of the seven phases [of well drilling] and their associated emissions." (DEIR, Appendix M, p. 5.) Unfortunately, Appendices B, C, and D to the HRA were not made publicly available with the HRA. The HRA also references a "Scope of Work" that includes the "equipment list and

0002-29

parameters" used to calculate operational equipment emissions. (DEIR, Appendix M, p. 6.) This Scope of Work was also not made publicly available with the HRA. Please include these missing items in the Final EIR for consideration by the public and sister agencies. 0002-30

5. Finally, the CCST Study includes Table 5.6-1, which shows the proximity of children, seniors, and people from minority groups to all active wells and hydraulically fractured wells in the San Joaquin Basin. (CCST Study, Vol. III, p. 327.) The County's DEIR and HRA does not include similar data specific to Kern County. Please provide such information in the Final EIR. 0002-31

Relying upon the HRA, the County's DEIR includes MM 4.3-5, which states in relevant part: 0002-32

> The Site Plan Application shall include a Site Vicinity Figure showing the location of any sensitive receptor(s) within 3,000 feet of the construction site (potential impact area) for the proposed new well or other ancillary facility or equipment (excluding pipelines).
> a. If there are no sensitive receptors within this potential impact area, then no construction mitigation measures shall be required.
> b. If there are sensitive receptors within the potential impact area, then additional information must be provided showing the setback from the closest edge of the well pad to the property line of the nearest sensitive receptor. The minimum distances shall be as follows:

Well Depth (Feet)	Minimum Setback Distance from Well Site to Adjacent Property Line of an Existing Sensitive Receptor (Feet)
Western Subarea	
10,000	367
5,000	116
2,000	NA
Central Subarea	
10,000	367
5,000	116
2,000	NA
Eastern Subarea	
10,000	296
5,000	NA
2,000	NA

(DEIR, pp. 4.3-110 to -112.) Are there other mitigation measures that impose relevant setbacks? Please explain in the Final EIR how the setbacks in MM 4.12-2 (mitigating noise impacts) interacts with the setbacks in MM 4.3-5. 0002-33

Both MM 4.3-5 and MM 4.12-2 apply only to new oil and gas wells and not to existing wells. Please explain if there are any relevant setbacks for redrilled or reworked wells or for well stimulation treatments that are proposed for existing wells. 0002-34

In addition, the CCST Study reports that the risk to public health due to air pollution from production wells only declines to background levels at distances more than one to two km (0.6 to 1.2 mi) from the well. (CCST Study, Vol. III, p. 324.) Please explain in the Final EIR how the County's final approach will be consistent with, or at least take into account, the information and studies referenced in the CCST Study related to this issue. 0002-35

Lastly, DOGGR requested the Office of Environmental Health Hazard Assessment (OEHHA) within the California Environmental Protection Agency to review the HRA. SB 4 mandated OEHHA to work with science team on the CCST Study; among many issues, OEHHA was very much involved with the conclusions and recommendations related to assessing public health as a function of proximity to oil and gas development. OEHHA's memo to the DOGGR is attached as Exhibit 3. OEHHA's comments included the following: 0002-36

1. The risk assessment did not include sufficient discussion of the toxic air emissions inventory that it used as input to the air dispersion analysis, and therefore it is unclear whether the emission estimates generated for the study are accurate and representative of potential emissions from the proposed project. In order to be health-protective, it would be preferential to develop and use reasonable, high-end emission estimates to compensate for uncertainty and variability in the data underlying the emissions estimates. 0002-37

2. Although Section 4.3 of the DEIR evaluated impacts due to criteria air pollutants, and Appendix M did the same for Toxic Air Contaminants (TACs), one gap in the analysis remains related to the localized non-cancer air impact of $PM_{2.5}$ and PM_{10} emissions from new oil and gas activities. This gap occurs because criteria air pollution, unlike TAC pollution, is normally analyzed and controlled (or offset) at a regional geographic scale. However, smaller sources of criteria air pollutants may, in certain cases, produce significant localized air impacts to fence line receptors. This possibility exists especially for $PM_{2.5}$ in Kern County since the San Joaquin Valley is out of attainment with the $PM_{2.5}$ standards. According to Table 4.3-9 of the DEIR, an increase of > 1.2 $\mu g/m^3$ in the 24-hour ambient air concentration of $PM_{2.5}$ would represent a significant air impact. 0002-38

   While the Appendix M risk assessment looked at long-term exposures and impacts (cancer risk to a maximally exposed individual) due to diesel particulate emissions, there is a remaining question as to whether 24-hour concentrations of $PM_{2.5}$ would be acceptable with respect to non-cancer health risks. Addressing this gap in the analysis could result in a revision of the proposed setbacks. Also note that this type of regulatory gap may exist for other criteria air pollutants although it likely is most significant for PM pollution due to the elevated PM levels in the San Joaquin Valley. 0002-39

3. Another analysis gap relates to potential localized air impacts from accidental spills. Spills of various oil and gas production-related fluids have been occurring on a regular basis in Kern County, as indicated in the following table (extracted from Table 4.8-6 of the DEIR). The DEIR also describes 57 crude oil spills ranging from 5 to 53,550 gallons that were 0002-40

reported for PHMSA[4]-regulated pipelines between 2002 and 2009.

The DEIR concluded that in spite of current regulations, accidental spills still represent a significant potential impact of the proposed project. Thus, it seems reasonable to question whether an acute air hazard could be created by vapor emissions from such accidental spills of hazardous fluids. This analysis was not carried out in the DEIR or the Appendix M risk assessment. 0002-41

Spills in Kern County Oilfields between January 2009 and June 2014 Not Associated with PHMSA-Regulated Pipelines 0002-42

	Number of Spills	Range of the Spill Volume (Gallons)	Average Spill Volume (Gallons)
Oil	403	0.126 - 27,300	1,126
Produced Water	263	2.1 - 126,000	6,888
Acid	9	33.2 - 7,333	2,633
Diesel	2	1,323 - 2,688	2,003

4. Some chemicals specific to well stimulation processes were not covered in the risk assessment. For example, proppant materials frequently contain crystalline silica, and elevated air concentrations of silica have been measured during fracking operations in studies conducted in other states. If this is also the case in California, then fence line receptors could be exposed to silica particulate and this should be evaluated. Another example specific to well stimulation is the operational or accidental release of highly hazardous materials such as hydrogen fluoride (or its chemical precursors) and hydrogen chloride. 0002-43 0002-44

5. The risk assessment assumed that well construction, drilling, and completion would last 23 days on average, whereas the DEIR noted that these activities could last longer than 60 days (see pg. 3-41 of the DEIR). Using a more conservative well-development period of 60 days or more might indicate the need for increased setback values. 0002-45

6. Mitigating measures (MMs) are proposed for potential air impacts to sensitive receptors. However, MM 4.3-5 also states that, "If there are no sensitive receptors within this potential impact area, then no construction mitigation measures shall be required." We could not find a complete definition of "sensitive receptor" in the DEIR. However, the OEHHA risk methodology used in the Appendix M risk assessment is designed to protect the general public (including sensitive individuals), as well as offsite workers. We recommend that the DEIR clarify the use of the term "sensitive receptor" to include the general public and offsite 0002-46

[4] PHMSA: Pipeline and Hazardous Materials Safety Administration.

workers, some of whom may be sensitive to the adverse effects of air pollution. 0002-47

7. The air dispersion modeling used meteorological data from a single site in Bakersfield to model air impacts over the entire 3700 square mile project area of Kern County. We did not look closely at the air dispersion model but wonder if this meteorological data is representative of dispersion conditions throughout the region of interest. For example, Bakersfield is a relatively urbanized area and may experience more air turbulence and pollutant mixing effects than rural areas. It may be appropriate to use multiple meteorological datasets to better characterize the high-end air pollution levels, particularly in rural areas. 0002-48

8. Section 3, page 3-47 defines "sumps" and "evaporation and percolation ponds" as separate installations. Appendix A to the risk assessment provides a list of devices analyzed and their estimated air emissions. Sumps are included in this list but we did not find emissions estimates for evaporation and percolation ponds. These potential air pollution sources should be included in the risk assessment. 0002-49

Please address these issues in the Final EIR and in any subsequent or updated version of the HRA. 0002-50

C. Underground Injection Control (UIC)

In general, DOGGR recommends that the DEIR augment the discussion and analysis of activities and associated impacts related to the Underground Injection Control (UIC) program. The subject areas referred to below are recommended to be considered for additional analysis or augmentation in the DEIR. 0002-51

With an expanded description of physical activities associated with UIC operations in the County (including the number of wells drilled for injection and associated production), the impacts resulting from those activities can be more fully disclosed and analyzed in the EIR. Also, a discussion of DOGGR's current and future regulations would be appropriate in order to provide information regarding how such regulations work to avoid or mitigate impacts resulting from UIC activities. In particular, a more thorough discussion and analysis of how the requirements of sections 1724.7 and 1724.10 of Title 14 of the California Code of Regulations, and related regulatory practices, act to prevent, mitigate or monitor certain potential impacts would be helpful to interested members of the public and to decision-makers. Last, the County should consider the regulatory goals identified by DOGGR in connection with its process to promulgate new regulations for its UIC program. Information about these goals can be found at: 0002-52 0002-53 0002-54

ftp://ftp.consrv.ca.gov/pub/oil/UIC%20Files/UIC%20Regulations/Phase%201%20%20Workshop%20Notice%20and%20Discussion%20Paper.pdf

With the above stated, DOGGR draws the County's specific attention to the following areas: 0002-55

Depth of Injection

DOGGR encourages the County to make a clear distinction between the different types of injection activities according to depth, and to analyze the impacts accordingly. For example, disposal wells should be analyzed separately from enhanced recovery operations, which should be analyzed differently than certain cyclic steam operations.

0002-55 Continued

Confinement of Injected Fluids

DOGGR encourages the County to augment the DEIR to analyze vertical confinement and lateral confinement of fluids for projects injecting into exempted groundwater zones with Total Dissolved Salts levels that are less than 10,000 mg/l. This issue has been raised, in conjunction with DOGGR, by both the U.S. Environmental Protection Agency and the State Water Resources Control Board (SWRCB). Modeling and/or monitoring may need to be required to ensure both vertical and lateral confinement in certain situations. This issue was also raised in the CCST Study. The groundwater monitoring criteria developed by the SWRCB regarding well stimulation activities may only apply to areas subject to well stimulation activity and not necessarily to those areas with UIC activity but not well stimulation activity.

0002-56

Shallow Thermal Diatomite

Shallow thermal diatomite (STD) is a significant hydrocarbon-bearing resource for the State, roughly making up 20% of the State's production. Although this is a significant resource, STD extraction operations have had, and continue to have, significant impacts to the environment. These impacts include: potential air emissions from surface expressions; oil-bearing formation water coming to the surface through surface expressions and seeps; high and low energy well and non-well blowouts (eruptions); subsidence and associated casing damage; and ground stability issues causing health and safety concerns to field personnel. DOGGR encourages the County to augment its current analysis or include additional analysis of the issues associated with shallow thermal diatomite extraction activities, including consideration of controls to limit injection pressures and/or injection volumes in order to minimize the risk of potential breakout to the surface of injected fluids and/or hydrocarbons. In working with DOGGR, some oil operators have voluntarily implemented reduced injection volumes and pressures in their steaming cycles and engage in continuous monitoring of well and line pressures.

0002-57

0002-58

Waste Gas Disposal

There are over 120 waste gas disposal wells in Kern County injecting a gas mixture with over 75% CO2 and H2S into currently producing hydrocarbon zones and other underground formations. H2S and CO2 are normal emissions in the oilfield. In some fields, there may be larger emissions because of the nature of the hydrocarbons being produced in that field. Many of these wells are injecting hazardous and corrosive fluids into the sub-surface of oil fields after piping this material over several miles through the surface of the field. DOGGR encourages the County to augment its current analysis or include additional analysis of the issues associated with waste gas transport and disposal activities. The County, either independently or in consultation with the Department of Industrial Relations or other agencies, could consider certain measures such as permanent fencing, warning signage and controlled entry in and around gas disposal wells, permanent H2S detectors in the well areas and compressor areas handling the waste gas streams, and adequate identification of conveyance pipelines.

0002-59

CO2 Injection in Enhance Oil Recovery (EOR)

0002-60

To DOGGR's knowledge, there are currently no carbon dioxide injection activities for EOR operations in Kern County. CO2 injection is used in certain oil reservoirs to promote the flow of oil into production. There is a possibility that this type of injection activity may occur in the future when large volumes of CO2 become available and economical. CO2 in large volumes and concentrations is a toxic gas that, when mixed with water to form carbonic acid, may impact well casing and pipeline integrity, or result in other impacts. This extraction method and associated activities and impacts should be considered by the County's EIR.

Subsidence

0002-61

DOGGR encourages the County to include additional information and analysis regarding subsidence in the oilfield potentially resulting from UIC activities to the discussion appearing in the DEIR at page 4.6-19. The County should consider expanding the analysis of past surface impacts that may occur in subsidence areas such as to roads, infrastructure, and natural habitats. Below surface, oil wells are also affected by subsidence. Ground movement may damage well casings and cement. Periodic testing of wells may be needed in certain areas to monitor well/casing integrity. The County might also consider requiring operators to be proactive in implementing remedial measures in subsidence-prone areas to ensure containment of injection fluids in the zone of injection. The DEIR's analysis of this issue could include additional information regarding abandonment or plugging of wells when signs of casing damage are observed, reinjection of produced water, and monitoring of production and injection volumes to monitor reservoir pressure balance.

0002-62

0002-63

Induced Seismicity

0002-64

DOGGR encourages the County to expand the discussion in the DEIR regarding UIC activities (waste water disposal, EOR, stimulation of injection wells or producing wells utilized in an UIC project) and the possible interplay, if any, with induced seismicity.

D. Surface disposal of wastewater (percolation or evaporation ponds and sumps[5])

0002-65

One of the "conclusions and recommendations" in the CCST Study's San Joaquin Basin Case Study chapter states: "Analysis of available data suggests the concentrations of hydraulic fracturing fluid constituents in produced water from fields with substantial hydraulic fracturing are sufficiently high that it should not be disposed of by percolation, because of the risk of groundwater

[5] / According to the CVRWQCB, they use the word "ponds" for unlined impoundments for disposal of produced water by both evaporation and percolation. They use "sumps" for unlined impoundments to contain drilling fluid and cuttings while drilling a well. In this letter, "ponds" and "pits" are used synonymously. And references to "percolation ponds" can also be seen as references to evaporation ponds.

contamination this creates." (CCST Study, Vol. III, p. 338.) As explained in more detail below, DOGGR is seeking more information and clarification on this topic from the County.

0002-65 Continued

According to the County's DEIR, produced water is managed in several different ways, including disposal in percolation pond facilities. (DEIR, p. 4.8-82.) For example, 30,233 acre-feet (AF) of produced water "was disposed in the Project Area-produced water ponds in 2012." (DEIR, p. 4.9-69.) Almost all of these ponds are unlined, earthen ponds that range from two to five acres in size and "can be as shallow as five feet deep." (DEIR, pp. 3-64, 4.9-69.) In March 2015, the Central Valley Regional Water Quality Control Board (CVRWQCB) identified 370 active and permitted ponds, 208 active ponds that were not issued any permits, and 355 inactive ponds. (DEIR, p. 4.9-69.) Elsewhere, the DEIR explains that there are 933 produced water ponds in the CVRWQCB, and only approximately 500 of these ponds have been issued Waste Discharge Requirements (WDRs). (DEIR, p. 4.9-102.)

0002-66

The County's DEIR states that the CVRWQCB "has indicated that it will issue enforcement orders to oil and gas disposal pond facilities as necessary to bring them into compliance with applicable laws and regulations." (DEIR, p. 4.9-103.) The DEIR also states that the CVRWQCB will not complete its "review program" until November 2016. (DEIR, p. 4.9-103.) Please update this discussion in the Final EIR with any additional relevant information about when these enforcement orders will be issued and what these orders would impose as requirements.

0002-67

In one place, the DEIR states that produced water is not considered a hazardous waste (p. 4.8-82). But in another place the DEIR explains that "produced water could be classified either as 'nonhazardous solid waste' [27 CCR § 20220(a)] or 'designated waste' [27 CCR § 20210; Water Code, § 13173]" depending on "the characteristics of the formation from which the water is produced." (DEIR, p. 2.9-103.) The California Water Code defines "designated waste" as either

> (a) Hazardous waste that has been granted a variance from hazardous waste management requirements pursuant to Section 25143 of the Health and Safety Code.
>
> (b) Nonhazardous waste that consists of, or contains, pollutants that, under ambient environmental conditions at a waste management unit, could be released in concentrations exceeding applicable water quality objectives or that could reasonably be expected to affect beneficial uses of the waters of the state as contained in the appropriate state water quality control plan.

0002-68

(Water Code, § 13173.) Please identify in the Final EIR any regulations or enforceable orders that require produced water to be tested so that "designated waste" can be separated from nonhazardous waste. (See DEIR, p. 3-59 [describing how pipeline gathering systems collect and transport produced water, with "[e]xcess produced water" disposed of in percolation ponds].)

0002-69

According to the CCST Study, "treatment of water produced in most fields is typically handled in central facilities, leading to the assumption that all the produced water from the stimulated pools is commingled with produced water from the entire field." (CCST Study, Vol. III, p. 290.) In fact, "records from 2011 to mid-2014 show that percolation pits received produced water from hydraulically fractured wells" in the following fields in Kern County: Elk Hills, South Belridge, North Belridge, Lost Hills, and Buena Vista. (CCST Study, Summary Report, p. 42; CCST Study, Vol. III, p. 17.) As noted above, regulation Section 1786 prohibits produced fluid from a well that has had a

0002-70

well stimulation treatment from being stored, disposed, or managed in sumps or pits. But, according to the CCST Study, unless sampling of sumps or pits is required, well stimulation fluids may still end up in sumps or percolation pits because "most stimulation-fluid returns are commingled and co-managed with water from the oil reservoir as produced water." (CCST Study, Vol. III, p. 290.) Moreover, a "higher fraction of the hydraulic fracturing fluid constituent mass returns in water produced after the hydraulic fracturing operation" in California than in other parts of the country. (CCST Study, Vol. III, p. 292 ["Fracturing fluids in California typically have the highest viscosity of fracturing fluid formulations available . . . . Consequently, it is likely there is less interaction between hydraulic fracturing fluid and reservoir rock in California than elsewhere in the country on average."].) In addition, the County's DEIR acknowledges that "stimulation fluids have been impermissibly discharged to drilling ponds, and certain recently posted flowback fluid testing results apparently indicate high levels of benzene and other chemicals returning to the wellhead after treatment." (DEIR, pp. 4.9-145, 4.9-93 ["benzene has been detected in produced water drawn from hydrocarbon bearing formations"].) Benzene is of particular concern, as it is a known human carcinogen and has a relatively high solubility. (SB 4 Final EIR, Vol. II, p. 10.13-12.) "Calculations show that, if benzene is poured into water, about 1.2 mL (or about one-fifth of a teaspoon) of pure benzene can contaminate one acre-foot of water (325,851 U.S. gallons) to the California MCL of 1.0 ppb." (SB 4 Final EIR, Vol. II, p. 10.13-12.) To address potential hydrology and water quality impacts (Impact 4.9-1: Violate Any Water Quality Standards or Waste Discharge Requirements), the County's DEIR sets forth six mitigation measures, including MM 4.9-3 and MM 4.9-5. (DEIR, p. 4.9-147.) In essence, these two mitigation measures simply require the applicant and oil field operator to comply with regulations issued by DOGGR, the State Water Resources Control Board (SWRCB), and the CVRWQCB. Please discuss in the Final EIR the specific regulations that are relevant and explain how these and other mitigation measures can adequately mitigate potential impacts to less than significant levels, at least until such time as new requirements from SWRCB and CVRWQCB are developed and in place.

0002-70
Continued

0002-71

Because the SB 4 EIR did not have the benefit of the findings and conclusions of the CCST Study, the SB 4 EIR did analyze potential contamination from existing percolation pits. As explained above, DOGGR is committed to reviewing the CCST Study and charting a path forward on its recommendations by way of the charge of the interagency working group. The CCST Study identifies serious concerns related to the use of percolation pits, including the potential for well stimulation treatment fluid to contaminate groundwater. DOGGR raises the above concerns in an effort to request additional information and clarification from the County. DOGGR also welcomes specific mitigation measures from the County that would ultimately be implemented by DOGGR or other appropriate state agencies.

0002-72

E. Reuse of produced water for agricultural irrigation

0002-73

Another conclusion of the CCST Study's San Joaquin Basin Case Study is that "hydraulic fracturing should not be allowed in fields that supply produced water for use in the environment, such as irrigation" or, alternatively, that "use of produced water for irrigation from fields with hydraulic fracturing should be prohibited." (CCST Study, Vol. III, p. 338.) The CCST Study explains that the "ban should continue until or unless testing the produced water specifically for hydraulic fracturing chemicals and breakdown products shows non-hazardous concentrations, or required water treatment reduces concentrations to non-hazardous levels." (CCST Study, Summary Report, p. 46; CCST Study, Vol. III, p. 20.) As explained in more detail below, DOGGR is seeking more information and clarification on this topic from the County.

0002-74

According to the County's DEIR, the Cawelo Water District in the Eastern Subarea has been reusing produced water for agricultural irrigation and is the only water district currently permitted to do so. (DEIR, pp. 4.9-139, 4.17-58.) In 2012, approximately 32,771 AF of produced water was "treated by oil and gas operators . . . to remove certain constituents, including oil and grease and dissolved solids" and then "conveyed through a system of canals and pipelines to Cawelo Water District reservoirs," where it is "blended to further reduce constituent concentrations, and discharged for irrigation." (DEIR, p. 4.9-139.)

As noted above, the County's DEIR evaluated three scenarios to "focus on potential variation in the amount of surface pond disposal, injection well disposal, and reuse of produced water that could occur under future conditions." (DEIR, pp. 4.9-125 to 4.9-126.) Under Scenarios 1 and 2, 32,771 AFY of produced water would continue to be reused for agricultural irrigation by 2035. (DEIR, p. 4.9-126.) But under Scenario 3 (Full M&I Water Use Offset and 90% Surface Disposal Reduction), the amount of produced water reused for agricultural irrigation would increase to 44,532 AFY. (DEIR, p. 4.9-126.)

0002-75

The DEIR acknowledges that the produced water reused for irrigation purposes, "in certain instances, has exceeded the allowable limits for arsenic and oil and grease." The DEIR explains that the CVRWQCB issues permits for the reuse of produced water for agricultural irrigation and that these permits "require water quality monitoring, and corrective action, including percolation into water banking facilities to filter arsenic from the banked water." (DEIR, p. 4.9-139.) DOGGR is interested in hearing from the County how it believes the CVRWQCB or other appropriate state or local agency should mitigate this potential impact.

0002-76
0002-77

DOGGR is also interested in hearing from the County as to whether the reuse of produced water for agricultural irrigation should be restricted to oil fields without ongoing or a past history of well stimulation activity. According to the CCST Study, two established oil fields where hydraulic fracturing has occurred have been permitted to reuse produced water for agricultural irrigation: the Mount Poso and the Kern River fields. (CCST Study, Summary Report, p. 45; CCST Study, Vol. III, p. 299.) The CCST Study also reported that its authors were unable to "find policies or procedures that would necessarily exclude produced water from hydraulically fractured wells from use in irrigation." (CCST Study, Summary Report, p. 45; CCST Study, Vol. III, p. 19.) The SB 4 EIR did not have the benefit of the CCST Study's conclusions and findings, and the discussion of irrigation with produced water was not developed in detail in the SB 4 EIR. (See, e.g., SB 4 Final EIR, Vol. II, p. 10.22-19.)

0002-78

The DEIR states that the Kern-Tulare Water District (KTWD) in the Western Subarea has initiated the CEQA review process for the potential use of up to 8,000 AFY of produced water. (DEIR, pp. 4.17-58, 4.9-140.) The Kern-Tulare Water District's Oil Field Water Reuse project's CEQA notice of preparation (NOP) describes the project as follows:

> The project is the construction and operation of an oil field produced water conveyance system. The District is currently partnering with local oil producers to acquire up to 8,000 acre-feet (AF) per year of produced water for delivery to crops in the District. The produced water would first be treated to remove residual hydrocarbons before it leaves the oil fields. The treated water would then be transported from the oil fields through 12- and 15-inch underground pipelines to two proposed reservoirs with ~1,200 AF of total storage capacity. From the two new reservoirs, water would be transported in 18-and 24-inch pipeline to the District's

> existing Big 4 Reservoir, from which it will be distributed to irrigated agriculture within the District. As part of the Project, three new agricultural turnouts would be constructed to facilitate conveyance of the water.

(February 9, 2015, KTWD's NOP, SCH # 2015021024, available at http://www.ceqanet.ca.gov/DocDescription.asp?DocPK=688636 [last visited August 3, 2015].)

0002-78 Continued

The "treatment" referenced in KTWD's project description is similar to the basic three-step process for treatment as described in the County's DEIR. (See DEIR, pp. 3-55 to 3-56.) It is unclear if KTWD's EIR will ultimately impose additional testing and treatment requirements as mitigation measures.

0002-79

The DEIR also acknowledges that "the reuse of additional produced water, particularly supplies with lower quality than available in the Eastern Subarea, could require more intensive, technically demanding, and more costly forms of treatment" and that those "treatment requirements could have other environmental effects related to increased energy use and air quality and greenhouse gas (GHG) emissions, or post-treatment waste stream disposal." (DEIR, p. 4.17-58.)

Please explain in the Final EIR whether the County does or does not intend for its EIR to cover the potential future reuse of produced water for irrigation. Has the County been informed that Cawelo Water District has in the past or would in the future complete an EIR for its continued reuse of produced water for agricultural irrigation? If the County intends for other EIRs completed by water districts to provide more complete CEQA analysis of impacts from this activity, then please explain in the Final EIR how the County's project-level EIR accounts for the impacts of wastewater disposal under its project where all three scenarios assume some level of reuse for irrigation purposes as a means of wastewater disposal.

0002-80

0002-81

The CCST Study concluded that "there has been and is currently no regulatory control on produced water from hydraulically fractured wells being used for irrigation and groundwater recharge." (CCST Study, p. 300.) The CCST Study also concluded that:

0002-82

> [T]he current practice of treatment and dilution of produced water utilized for irrigation may not be sufficient to reduce concentrations of all stimulation constituents to levels that are less than acutely toxic, or even to levels less than what can cause chronic effects for aquatic species on a continuous basis. In addition, the human exposure pathway involving consumption of food irrigated with produced water containing hydraulic fracturing fluid constituents is not considered. (CCST Study, Vol. III, p. 301.)

Please provide in the Final EIR any additional information that would support or contradict the CCST Study's conclusions. For example, does the County have reason to believe that the reuse of produced water for irrigation purposes would be limited to non-food crops? Who would be responsible for imposing this limitation?

0002-83

The DEIR's MM 4.17-2 advocates for increased reuse of produced water for agricultural irrigation. MM 4.17-2 asserts that "produced water treated and used for agricultural irrigation or other activities shall be tested and monitored to assure compliance with applicable standards for such agricultural irrigation or other uses." (DEIR, p. 4.17-59.) Please provide in the Final EIR information regarding who will test and monitor the water, and what the applicable standards will be.

0002-84

F. Groundwater quantity impacts

0002-85

The SB 4 EIR concluded that Impact GW-1 ("Cause or contribute to overdraft conditions") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.14-96.) As the SB 4 EIR explained, "[a]ll of the oil and gas fields within Kern County, and therefore all of the reported hydraulic fracturing jobs between June 2012 and June 2013, are located within the Kern County [groundwater] subbasin, which has a [CASGEM] ranking of 5." (*Id.* at p. 10.14-121.) This means that "any increase in groundwater use for well stimulation [in the Kern County subbasin] would have a significant impact unless effective mitigation measures are developed, such as those that limit the amount and location of fresh groundwater use." (*Id.* at p. 10.14-82.) To mitigate Impact GW-1, the SB 4 EIR recommended several measures, including MM GW-1b, which requires the applicant to "fund an independent review that evaluates the potential for any proposed use of groundwater to cause or substantially contribute to an 'Undesirable result'" (as defined in the Sustainable Groundwater Management Act), so that DOGGR can "ensure that the use of such groundwater will not cause or substantially contribute to" an undesirable result. (*Id.* at p. 10.14-99.)

0002-86

In contrast, the County's DEIR concluded that Impact 4.9-2 ("Substantially Deplete Groundwater Supplies . . . such that there would be a Net Deficit in Aquifer Volume or a Lowering of the Local Groundwater Table Level . . .") would be significant and unavoidable even with the mitigation measures proposed in the DEIR. (DEIR, p. 4.7-38.) Please explain if and why the County concluded that avoidance of "undesirable results" was infeasible and whether the County believes that its own approach is substantially consistent with DOGGR's approach in MM GW-1b.

0002-87

The County's DEIR includes several mitigation measures that address groundwater impacts and water supplies: MM 4.9-1 through MM 4.9-6 and MM 4.17-2 through MM 4.17-4. (DEIR, p. 4.9-146 to -147, 4.9-155, 4.17-59 to -60.) In particular, MM 4.17-2 provides as follows:

> Applicant shall increase the re-use of produced water, and reduce its use of municipal and industrial-quality ground or surface water use to the extent feasible. By the end of 2016, the Applicants shall review water use data submitted to Division of Oil Gas and Geothermal Resources under Senate Bill 1281 and identify the five biggest oil industry users of municipal and industrial water by volume. The five biggest oil industry users of municipal and industrial water shall work together to develop and implement a plan identifying new measures to reduce municipal and industrial water use by 2020. The plan shall address the following activities, as appropriate: steam generation; drilling and completions (including hydraulic fracturing); dust control; compaction activities related to construction; and landscaping. Through the KernFLOWS initiative or other efforts (e.g., Groundwater Sustainability Agency), the five biggest oil industry users of municipal-and-industrial water shall also work with local agricultural producers and water districts to identify new opportunities to increase the use of produced water for agricultural irrigation and other activities, as appropriate. Any produced water treated and used for agricultural irrigation or other activities shall be tested and monitored to assure compliance with applicable standards for such agricultural irrigation or other uses.

DOGGR understands that the point of this measure is to require the County's oil and gas industry to create enough "new water" for agricultural irrigation and other uses to fully offset the industry's historic and otherwise anticipated use of municipal and industrial-quality ground and surface water. Thus, although oil and gas wells using high quality groundwater will contribute to ongoing overdraft conditions, new facilities for the treatment of produced water will create even more "new water" for agricultural irrigation and other uses. If this understanding is correct, then DOGGR suggests that the County add the following language at the end of MM-4.17-2, so that it includes an enforceable CEQA performance measure:

0002-87 Continued

0002-88

> Through all of these efforts, sufficient amounts of produced water shall be made suitable and available for agricultural uses or other non-oil and gas uses within the County to fully offset all increases from oil and gas activities in the County over baseline (2015) conditions in the use of groundwater otherwise potentially suitable for use as drinking water or for agricultural irrigation.

0002-89

The CCST Study explains that the "largest demand for low-salinity water in hydraulic-fracturing-enabled production is not for making fracturing fluids, but rather for EOR [enhanced oil recovery]." (CCST Study, Vol. III, p. 285.) If more low-salinity produced water could be used to satisfy the water demand in other fields, then the need for supply of potential high-quality water would be reduced. (*Id.* at p. 285.) The CCST Study uses the Elk Hills field as an illustrative example. In the Elk Hills field in 2013, approximately 1.1 million m^3 of low-salinity water was disposed of by injection in 2013 at the same time that approximately 2.3 million m^3 was supplied from outside sources for EOR in hydraulic-fracture-enabled pools. (*Id.* at p. 286.) The CCST Study states that "it should be possible to treat the low-salinity water disposed of in Elk Hills so that it can instead be used for EOR." (*Id.* at p. 286.) Additionally, "if it is not practical to improve the water sufficiently with treatment," then the low-salinity water disposed by injection in surrounding fields "may be of sufficient quality for this use." (*Id.* at 287.) Finally, the CCST Study notes that there "may be additional low-salinity water resource opportunities [e.g., water disposed of in unlined pits] in the San Joaquin Basin oil fields, because the quality of the water produced in each field is not coded in DOGGR's data, only the quality of the water disposed of by injection." (*Id.* at p. 287.)

0002-90

One of the seven SB 4 EIR mitigation measures that DOGGR intends to convert into formal regulations is MM GW-1a, which is concerned with identifying alternative sources of water (including produced water) for well stimulation treatments. MM GW-1a requires the applicant for a well stimulation permit to "conduct a feasibility study to determine if recycled water or alternative water sources (including produced water, flowback water, or saline groundwater) may effectively be used for well stimulation." (SB 4 Final EIR, Vol. II, p. 10.14-96.) The DEIR states that "[t]he extent to which oilfield operators can feasibly increase produced water reuse and decrease M&I demand is uncertain." (DEIR, pp. 4.9-128; see also DEIR, p. 4.9-20 [approximately 9% of the statewide well stimulation treatment water supply during January to September 2014 was obtained by reusing produced water].) Does the County have reason to believe that reuse of produced water for WST and/or EOR is infeasible in Kern County? Please provide in the Final EIR an explanation and any relevant supporting evidence.

0002-91

0002-92

G. Limiting chemicals used in well stimulation treatments to an "approved" list of chemicals with known toxicity profiles

0002-93

Both the SB 4 EIR and the CCST Study identified significant gaps in information about the toxicity, biodegradability, and concentration of a majority of the chemicals used in hydraulic fracturing. (SB

4 Final EIR, Vol. II, pp. 10.13-8 to -12; CCST Study, Summary Report, pp. 34-37; CCST Study, Vol. III, p. 336 [data gaps include the "concentration of well stimulation chemicals, their degradation products, and natural constituents mobilized by stimulation in produced water streams from central treatment plants"].) As the CCST Study reported, the "toxicity and biodegradability of more than half the chemicals used in hydraulic fracturing [in California] remains uninvestigated, unmeasured, and unknown." (CCST, Summary Report, p. 34.) Because of this uncertainty, the CCST Study recommended that the chemicals used in hydraulic fracturing be limited "to those on an approved list that would consist only of those chemicals with known and acceptable environmental hazard profiles." (CCST Study, Summary Report, p. 36.)

0002-93
Continued

The County's DEIR admits that "[u]nauthorized releases [of hydraulic fracturing fluids] have occurred and would likely continue to occur during well stimulation activities." (DEIR, p. 4.8-78.) The SB 4 EIR explained that:

> If a well stimulation fluid release were to occur, it would be difficult to anticipate the fate of the released chemicals in the environment because many individual chemical compounds within well stimulation fluids lack sufficient mobility and toxicity data. California drinking water maximum contaminant levels (MCLs) do not exist for many of the chemicals known to be used in hydraulic fracturing. Available data indicate that many hydraulic fracturing chemical compounds are either highly soluble or miscible in water and/or have densities greater than water. Certain constituent mixtures are considered either proprietary or are described only as chemical classes, hindering a more complete understanding of potential transport/fate of some fluid constituents. In addition, some chemicals may be transformed (degraded) by hydrolysis and, in some cases, degradation (daughter) products are not known. Daughter products may be more hazardous than the parent chemicals.

(SB 4 Final EIR, Vol. II, p. 10.13-27.)

0002-94

The SB 4 EIR included several mitigation measures to address potential impacts from the release of well stimulation fluids into the environment. (See SB 4 Final EIR, Vol., II, chapters 10.13 [Hazards and Hazardous Materials], 10.14 [Groundwater Resources], 10.15 [Surface Water Resources], 10.21 [Risk of Upset/Public and Worker Safety].) One of the mitigation measures in the SB 4 EIR requires applicants for well stimulation treatment permits to "implement a strategy of reducing the inventory of the hazardous materials with the aim to reduce the total mass of potential accidental releases, and thus, also the consequences and effects for workers and public in the surroundings." (SB 4 Final EIR, Vol. II, p. 10.21-60 [MM RSK-2a: Reduce the Inventory/Volumes Handled with the Hazardous Chemicals].) This mitigation measure, prepared without the benefit of the final CCST volumes, does not go as far as the CCST Study recommends.

0002-95

0002-96

Since the County's Final EIR will be prepared subsequent to the release of the final CCST Study, whereas the SB 4 EIR was not, DOGGR brings this issue to the County's attention and asks for additional information in the Final EIR about the County's analysis and conclusions on this issue.

0002-97

II. RECONCILIATION OF THE MITIGATION MEASURES IN THE COUNTY'S DEIR WITH THOSE IN THE SB 4 EIR

0002-98

DOGGR chose early in the SB 4 process to use the SB 4 EIR in a manner that should provide practical real-world benefits. DOGGR's main goals were to provide programmatic analysis that would be useful in processing future applications for well stimulation treatment permits and to develop mitigation measures that, with possible modifications for specific projects, could be imposed on such permits as necessary, appropriate, and feasible under the various circumstances facing individual permit applicants.

As required by SB 4, the "project" analyzed in the SB 4 EIR is well stimulation in the State of California and all physical acts that are associated with hydraulic fracturing, acid fracturing, and acid matrix stimulation as they apply to both existing and future oil and gas wells within the State. (Pub. Resources Code, §§ 3157, 3161.) Because the final regulations required by SB 4 were to become effective on July 1, 2015, the EIR's analysis assumed that well stimulation treatments would be performed in a manner consistent with those regulations. (Pub. Resources Code, § 3161, subd. (a).) In those instances where the regulations were found to not minimize potentially significant environmental effects, the SB 4 EIR recommended mitigation measures to lessen these impacts to the extent feasible.

0002-99

As responsible agency for permitting oil and gas well drilling and operations, DOGGR wants to work with Kern County to ensure adequate mitigation for all impacts that can be seen as direct or reasonably foreseeable indirect effects of well stimulation treatment. As explained in more detail below, where the County's proposed mitigation measures are not as comprehensive or robust as DOGGR believes is necessary, DOGGR may use its regulatory power outside of CEQA to impose conditions of approval on well stimulation treatment permits to ensure that they are adequately protective, as determined by DOGGR. Such regulatory authority derives both from SB 4 itself, which requires DOGGR to "evaluate the quantifiable risk of the well stimulation treatment" under consideration, and from DOGGR's more general legal mandate to supervise oil and gas well operations "so as to prevent, as far as possible, damage to life, health, property, and natural resources[.]" (Pub. Resources Code, §§ 3160, subd. (d)(3)(C), 3106, subd. (a).) The imposition of additional conditions of approval can be done without challenging the adequacy of the County's EIR, and without preparing a formal supplemental EIR or other CEQA document beyond what the County has prepared.

0002-100

0002-101

This reservation of authority should not be understood, however, to mean that DOGGR does not accept any of the mitigation measures as formulated by the County. Rather, DOGGR appreciates that the County has discretionary authority over aspects of larger oil or gas projects that will involve well stimulation treatments. As noted earlier, the mitigation measures in the SB 4 EIR establish some standards for future mitigation that DOGGR could impose as permit conditions. The comments below seek to make the County aware of these standards in formulating mitigation measures for the County's Project. As indicated below, DOGGR has identified some instances in which the County's measures are not as rigorous as DOGGR's generic measures, but has identified other instances in which the County's measures do appear to be "substantially consistent" with the measures in the SB 4 Final EIR.

0002-102

First, there are several mitigation measures in the SB 4 EIR for which DOGGR can identify substantially consistent measures in the County's DEIR:

- MM AQ-2c (Reduce Emissions from Dust-Causing Activities
- MM BIOT-1c (Replace or Offset Loss of Sensitive Habitat)
- MM GHG-2a (Require Applicant Enter into Mitigation Programs or Agreements for GHG Emissions Not Covered by or Exempt from ARB's Cap and Trade Program)
- MM GW-6a (Require Wastewater Disposal Wells to Inject Only Into Exempted Aquifers or Protect Groundwater)
- MM AES-1b (Minimize Lighting Visibility Offsite)
- MM AGF-1c (Compensate for Loss of Important Farmland)
- MM NOI-1a (Control Noise Levels Near Sensitive Land Uses)
- MM PUB-1a (Assess Public Service Ratios and Ensure Adequate Compensation)
- MM TR-2a (Repair Roadway Damage)

0002-102 Continued

DOGGR does not have any further comments on these mitigation measures.

0002-103

Second, for the remaining mitigation measures in the County's DEIR, DOGGR notes that the County appears to have taken a somewhat different approach to mitigating impacts than the approach found in the SB 4 EIR. This does not mean that DOGGR has found the remaining mitigation measures to *all* be inconsistent with SB 4 EIR. Rather, DOGGR is simply taking this opportunity to bring the SB 4 EIR mitigation measures to the County's attention; DOGGR has attached Exhibit 1 (July 2015 Mitigation Policy Manual) to serve this purpose.

0002-104

Seven of the SB 4 EIR mitigation measures will be converted into formal regulations: MMs GW-1a (Use Alternative Water Sources to the Extent Feasible), GW-4b (Install a Well Seal across Protected Groundwater for New Wells Subject to Well Stimulation Treatments), SWR-1b (Surface Water Protection), GEO-1a (Avoid Active Faults if Necessary), GEO-1b (Implement an Appropriate Setback if Necessary), GEO-1e (Include an Earthquake Response Plan within the Spill Contingency Plan), and HAZ-1a (Ensure that Spill Contingency Plan Provides Adequate Protection Against Leaks or Discharges of Dangerous Fluids and Other Potentially Dangerous Materials). Some, but not all, of these measures are discussed below.

Finally, in the sections below, DOGGR is providing more detailed comments about a few SB 4 EIR mitigation measures that DOGGR found to be missing from and overlooked by the County's DEIR. These mitigation measures are especially important because they relate to public safety and/or the protection of natural resources.

0002-105

A. Mitigation Measure GEO-1d (Conduct Ground Monitoring)

The SB 4 EIR concluded that Impact GEO-1 ("Expose people or structures to potential substantial adverse effects as a result of rupture of a known fault, seismically induced groundshaking, and/or ground failure") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.11-37.) As the SB 4 EIR explained:

0002-106

> Because there is the potential for well stimulation activities to occur in a seismically active area, they could be impacted by moderate to occasionally strong ground shaking from faults, as well as background shaking from other seismic active nearby areas. Strong seismic activity could impact the operations of the well stimulation and exceed standard design stresses that could result in damage or collapse of stimulation infrastructure, exposing people to injury or death. . . . Active and

> abandoned recovery and disposal wells could also be impacted by seismic activity, such as degradation in the seals or plugs of abandoned wells that could potentially allow migration of materials to overlying zones sensitive to such materials (e.g., usable groundwater zones or confined spaces that accumulate gases). Impacts to infrastructure may also result in damage to infrastructure carrying hazardous materials and the spilling of materials such as fuels and lubricants, hydraulic fracturing or drilling fluids.

0002-106 Continued

(*Ibid.*) One of the mitigation measures recommended by the SB 4 EIR to mitigate Impact GEO-1 is MM GEO-1d, which requires the applicant to "conduct ground monitoring to characterize as-built [formation] fracture geometries prior to, during, and post-hydraulic fracturing" if the well stimulation would occur in an urban area. (*Id.* at p. 10.11-42.)

0002-107

The CCST Study concluded that the abundant faults in the San Joaquin Basin present potential paths for leakage out of hydraulically fractured pools. (CCST Study, Vol. III, pp. 315-318.) The CCST Study estimated that there is a "3.6% probability of a hydraulic fracture encountering an unknown fault with sufficient extent to encounter a USDW" in the western San Joaquin Basin (North and South Belridge, and Lost and Elk Hills). (*Id.* at pp. 316-317.) Given that over 1,500 wells are hydraulically fractured each year in the western San Joaquin Basin (representing 90% of all hydraulic fracturing in the San Joaquin Basin), "it is possible that tens of hydraulic fractures encounter such a fault each year." (*Id.* at p. 317.) The CCST Study notes that more research is needed "to better understand fault permeabilities and how they might be affected by high fluid pressure if intersected by a hydraulic fracture." (*Id.* at p. 318.) Therefore, the CCST Study recommended that "site characterization efforts [be] designed to ensure a reasonable chance of detecting existing faults of a given size before a hydraulic fracturing operation is conducted." (*Id.* at p. 318.) MM GEO-1d in the SB 4 EIR, if revised to apply even outside of urban areas, would serve this purpose well because it would require the characterization of formation fracture geometries prior to hydraulic fracturing.

0002-108

The County's DEIR concluded that Impacts 4.6-1 ("Expose People or Structures to Substantial Adverse Effects . . . Involving the Rupture of a Known Earthquake Fault"), 4.6-2 (". . . Involving Strong Seismic Ground Shaking"), and 4.6-3 (". . . Involving Seismic-Related Ground Failure, Including Liquefaction") were potentially significant and required mitigation. (DEIR, p. 4.6-52 to 4.6-56.) The County's MM 4.6-1 and MM 4.6-2 do not include requirements that are substantively similar to those in SB 4 EIR's MM GEO-1d.

B. Mitigation Measure GEO-1e (Include an Earthquake Response Plan within the Spill Response Plan)

As noted above, the SB 4 EIR concluded that Impact GEO-1 was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.11-37.) One of the mitigation measures recommended by the SB 4 EIR to mitigate Impact GEO-1 is MM GEO-1e, which requires the applicant to demonstrate to DOGGR's satisfaction that the spill contingency plan "adequately addresses the consequences of an earthquake occurring during the well stimulation process, for however many well stimulation treatments are proposed to occur simultaneously at any given time." (*Id.* at pp. 10.11-42 to -43.)

0002-109

The CCST Study concluded that the process of hydraulic fracturing is not likely to cause earthquakes of concern. (CCST Study, Summary Report, p. 48.) But the CCST Study also noted that "it can be very difficult to distinguish California's frequent natural earthquakes from those

0002-110

possibly caused by [waste] water injection into the subsurface." (*Id.* at p. 48.) Because California has frequent naturally occurring earthquakes, seismologists "have a hard time determining if any of these earthquakes were actually induced" by disposal of wastewater and produced water into deep injection wells. (*Id.* at p. 48). Figure S.3-7 shows the location of over 1,000 water disposal wells that are located with 1.5 mile of a mapped active fault, and more than 150 wells within 650 feet of a mapped active fault. (*Id.* at p. 49 [showing six central and southern California basins, with the San Joaquin Basin being the largest].) According to the CCST Study, the "state could likely manage and mitigate potential induced seismicity, by adopting protocols to modify an injection operation when and if seismic activity is detected." (*Id.* at p. 50.)

0002-110
Continued

MM GEO-1e in the SB 4 EIR is designed to address both naturally occurring earthquakes and any seismic events that may be potentially induced by wastewater injection. The County's MM 4.6-1 and MM 4.6-2 do not include requirements that are substantively similar to those in SB 4 EIR's MM GEO-1e.

C. Mitigation Measure GW-4a (Demonstrate that Wells within the ADSA Have Effective Cement Well Seals and Monitor Wells during Well Stimulation Treatments)

0002-111

The SB 4 EIR concluded that Impact GW-4 ("Migration of well stimulation fluids or formation fluids including gas to protected groundwater through non-existent or ineffective annular well seals") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.14-105.) To mitigate this impact, the SB 4 EIR included MM GW-4a, which:

> require[s] the operator to specifically monitor certain DOGGR-selected wells within the ADSA during a well stimulation treatment to demonstrate that the wells are not serving as a conduit for upward migration of formation fluids or gas, either through the annular space, well bore, or the well casing, into the protected groundwater zone. DOGGR shall select which wells within the ADSA are required for monitoring, but at a minimum, these wells will include: (1) wells that have been stimulated previously, (2) idle wells, and (3) other accessible wells if deemed necessary by DOGGR.

(*Id.* at p. 10.14-105.) These requirements go beyond existing regulations. The SB 4 EIR concluded that Mitigation Measures HAZ-1a, GW-4a, GW-4b, GW-4c, GW-5a, GW-6a, and GW-7a, along with the requirements of the proposed permanent SB 4 regulations reduce the impacts to groundwater quality to less than significant levels. (*Id.* at p. 10.14-105.)

0002-112

The CCST Study concluded that leakage of well stimulation fluids could occur via an existing "offset" well "that is intersected by a hydraulic fracture generated from a neighboring well." (CCST Study, Vol. III, p. 313.) The CCST Study concluded that there is a frequency of "about one intersection [with an offset well] per 50 hydraulically fractured wells." (*Id.* at p. 313.) Fluids from induced fractures could leak via the offset well if the well is "transmissive, or becomes transmissive as a result of the hydraulic fracture intersection." (*Id.* at p. 313.) Because hydraulic fracturing operations in San Joaquin Basin are "largely located in reservoirs with high well density that have been in production for a long time," there may be "many older offset wells in the vicinity of hydraulic fracturing operations, and these wells may not always be designed for, or have the integrity to withstand, the high pressures used in hydraulic fracturing." (*Id.* at p. 313.)

The County's DEIR concluded that Impacts 4.9-1 ("Violate any Water Quality Standards or Waste Discharge Requirements") and 4.9-6 ("Otherwise Substantially Degrade Water Quality") were potentially significant and required mitigation. (DEIR, p. 4.9-145, 4.9-160.) The County's MMs 4.9-1 to 4.9-6 do not include requirements that are substantively similar to those in SB 4 EIR's MM GW-4a. 0002-113

D. Mitigation Measure GW-4b (Install a Well Seal Across Protected Groundwater for New Wells Subject to Well Stimulation Treatments) 0002-114

As noted above, the SB 4 EIR concluded that Impact GW-4 was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.14-105.) One of the mitigation measures recommended by the SB 4 EIR to mitigate this impact is MM GW-4b, which requires an

> applicant [to] demonstrate to DOGGR's satisfaction that a well used for well stimulation treatments contains an annular 500-foot cement seal extending across the base of protected groundwater and that the integrity of the seal will prevent unintended migration of fluid. This applies to all new wells that will be subjected to well stimulation. For new shallow wells drilled in areas where protected groundwater is present, this requirement is amended to require cementing the entire casing string from the bottom of the well to the surface.

(*Id.* at p. 10.14-106.)

As the CCST Study explained, "DOGGR's groundwater protection program has been oriented to fresh groundwater, defined as having TDS of 3,000 mg/L or less." (CCST Study, Vol. III, p. 314.) Thus, in the past, "wells in California have not been constructed to be protective of groundwater that is of USDW [underground sources of drinking water] quality but above the 3,000 mg/L TDS limit." (*Id.* at p. 314.) This means that "surface casings have been set and cemented below the 3,000 mg/L TDS limit rather than below the 10,000 mg/L TDS limit, which may create a leakage hazard." (*Id.* at p. 314.) To address this potential impact, the CCST Study recommends that future wells "be constructed with casings extending through USDW," which may "require the addition of an intermediate casing, depending upon the depth separation between the base of groundwater with less than 3,000 mg/L and groundwater with less than 10,000 mg/L TDS." (*Id.* at p. 314.) 0002-115

The SB 4 EIR confirms the information summarized in the CCST Study. Existing regulations include well construction requirements (see 14 CCR §§ 1722.2 - 1722.6) that require cement placement in surface casing from the base of the casing to the surface and preferably through the freshwater zone (3,000 mg/L TDS). (SB 4 Final EIR, Vol. II, p. 10.14-107.) DOGGR regulations also require the use of a second string of casing if the surface casing does not extend through the base of freshwater (3,000 mg/L TDS). But, under existing regulations, the depth of subsequent casing strings might not extend through the zone of protected groundwater. MM GW-4b requires a seal across the base of protected groundwater (<10,000 mg/L TDS) for all new wells subject to well stimulation treatment. The County's MM MMs 4.9-1 to 4.9-6 do not include requirements that are substantively similar to those in SB 4 EIR's MM GW-4b. 0002-116

E. Mitigation Measure GW-4c (Install Methane Sensors on Wells Subject to Well Stimulation Treatments)

0002-117

As noted above, the SB 4 EIR concluded that Impact GW-4 was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.14-105.) One of the mitigation measures recommended by the SB 4 EIR to mitigate this impact is MM GW-4c, which requires

> that the applicant install a methane sensor to monitor potential leaks or venting of methane gas. In order to provide additional monitoring for potential migration up ineffective well seals, wells shall be equipped with a devices approved by DOGGR to allow for continuous monitoring at the wellhead for methane migration up the well annular space. As part of the permit application, the applicant shall propose a monitoring program for DOGGR approval that provides details on sensor manufacturer, installation, calibration, settings/units, and measurements. Gas detectors shall be operated (1) before the test to determine variability in baseline readings, (2) for the complete duration of the test, and (3) for a specified time period after the test has been completed, as specified by DOGGR.

(*Id.* at p. 10.14-108.)

0002-118

As the SB 4 EIR explains, "[n]umerous studies in shale gas regions have demonstrated upward gas migration within or around the well into shallow aquifers due to uncemented annular space, poor cement bonding, and/or ineffective cementing practices." (SB 4 Final EIR, Vol. II, p. 10.14-86.) Potential causes of leakage in the annular space include: "a lack of cement, poor bonding with the borehole, channels within the cement, fracturing or cavitation within the seal, or deterioration of the seal over time." (*Id.* at p. 10.14-86.) When methane migrates into an aquifer, it "can change the redox conditions which can cause microbial methane oxidation and consumption of oxygen," and can also "degrade water quality and cause geochemical reactions, such as the dissolution of trace metals (e.g., arsenic and iron), and radioactive elements into aquifers." (*Id.* at p. 10.14-87.) In other words, "the introduction of methane into an aquifer can lead to an increase in dissolved arsenic and iron concentrations in groundwater."

The County's MM MMs 4.9-1 to 4.9-6, and MM 4.7-3 do not include requirements that are substantively similar to those in SB 4 EIR's MM GW-4c.

F. Mitigation Measure GW-5a (Conduct Surface Geophysical Surveys or Apply Other Field Methods to Locate Improperly Abandoned Wells and Mitigate)

0002-119

The SB 4 EIR concluded that Impact GW-5 ("Migration of well stimulation fluids or formation fluids including gas into protected groundwater through damaged or improperly abandoned wells") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.14-109.) As the SB 4 EIR explained:

> Poorly abandoned wells within the ADSA could provide a conduit for upward migration of well stimulation fluids (including gas) to potentially reach protected groundwater. The proposed permanent SB 4 regulations require an operator to identify any existing wells/wellbores within twice the area of the ADSA and design the test such that geologic and hydrologic isolation of the formation can be demonstrated. However, there may be wells that are undocumented, and whose

0002-120

> condition and/or location is unknown. A field program needs to be conducted to locate older and abandoned wells within the ADSA to ensure that poorly abandoned wells do not provide a conduit for migration of well stimulation fluids.

0002-121

(*Id.* at p. 10.14-109.) To mitigate this potential impact, the SB 4 EIR included MM GW-5a, which requires that an "applicant demonstrate to DOGGR's satisfaction that a record review has been conducted and, if warranted, require a surface geophysical survey or use other suitable field methods to locate any improperly abandoned wells within the ADSA of the well to be stimulated." (*Id.* at p. 10.14-109.) Under MM GW-5a, if conduit wells are located, the applicant must mitigate the potential pathway in a manner approved by DOGGR, and that mitigation could include modifying the design of the well stimulation treatment or moving the location of a proposed treatment to another well. (*Id.* at p. 10.14-109.)

0002-122

The County's DEIR concluded that Impacts 4.9-1 ("Violate any Water Quality Standards or Waste Discharge Requirements") and 4.9-6 ("Otherwise Substantially Degrade Water Quality") were potentially significant and required mitigation. (DEIR, p. 4.9-145, 4.9-160.) The County's MMs 4.9-1 to 4.9-6 do not include requirements that are substantively similar to those in SB 4 EIR's MM GW-5a.

0002-123

G. Mitigation Measure GW-7a (Add a Tracer to Well Stimulation Treatment Fluids or Develop a Reasonable Method to Distinguish Well Stimulation Treatment Fluids in the Environment)

The SB 4 EIR concluded that Impact GW-7 ("Inability to identify specific impacts to groundwater quality from well stimulation activity") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.14-111.) As the SB 4 EIR explained, it "will be difficult for any groundwater monitoring program to differentiate impacts from well stimulation treatments from those resulting from other activities." (*Id.* at p. 10.14-111.) To mitigate this impact, the SB 4 EIR included MM GW-7a, which requires that

> the applicant provide for a tracer or some other reasonable method to allow well stimulation fluids to be distinguished from other fluids or chemicals. This could consist of an added tracer using an inert constituent that could be used to identify the presence of well stimulation fluids. Alternatively, it could be an intrinsic tracer, or some naturally occurring component that makes the well stimulation fluids chemically unique

0002-124

(*Id.* at p. 10.14-112.) The requirements in MM GW-7a are not duplicative of requirements in the Draft Model Criteria for Groundwater Monitoring in Areas of Oil and Gas Well Stimulation, as developed by the State Water Resources Control Board (April 29, 2015). The Draft Model Criteria anticipates that tracers may be used and requires that such tracers be analyzed in groundwater samples. Requirements of MM GW-7a are consistent with the Draft Model Criteria and are complementary to the groundwater monitoring requirements.

The County's DEIR did not specifically analyze an impact that is similar to Impact GW-7 in the SB 4 EIR. The County's mitigation measures do not include requirements that are substantively similar to those in SB 4 EIR's MM GW-7a.

0002-125

H. Mitigation Measure HAZ-1b (Require the Operator to Conduct an Annual Inventory of its Well Stimulation Equipment and Report of the Aged Infrastructure and its Likelihood of Failure Leading to Spills or Leaks to DOGGR)

The SB 4 EIR concluded that Impact HAZ-1 ("Release hazardous materials into the environment from a spill or leak") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.13-31.) As the SB 4 EIR explained, when an oil and gas field has been active for more than 50 years, "some of the infrastructure within the field, such as tanks and pipelines, may be old" and "be subject to increased metal fatigue and/or corrosion." (*Id.* at pp. 11.13-12 [discussing Wilmington Oil and Gas Field], 11.13-14 [same conclusion for Inglewood Oil and Gas Field], 11.13-18 [same for Sespe Oil and Gas Field].) Aged infrastructure are at a higher risk for "spills, leaks or ruptures of hazardous materials." (*Id.* at pp. 11.13-12, 11.13-14, 11.13-18.) Additionally, lack of proper seals, inadequate seal or poor cement bonds with bore walls, channels within cement, deterioration of annular seals over time, or fracturing or cavitation of enclosing walls can cause leakage through the annular space between the casing and formation.

As the County's DEIR noted, oil drilling has a long history in Kern County. The first commercially developed oilfield in Kern County (the McKittrick Field) was developed in 1898. And the Kern River Field was established in 1899. (DEIR, p. 3-15.) Similar to the Wilmington, Inglewood, and Sespe Oil and Gas Fields analyzed in the SB 4 EIR, Kern County has oil fields that have been active for more than 50 years. Therefore, MM HAZ-1b in the SB 4 EIR is relevant and applicable to Kern County. (See DEIR, p. 3-17 [County has over 100 active or abandoned oil fields].)

0002-127

The CCST Study concluded that chronic leaks caused by defects or deficiencies in well seals "may not ever be observed, or, if observed, do not necessarily trigger immediate mitigation action in practice." (CCST Study, Vol. III, p. 308.) While locating monitoring wells "closer to stimulated wells would increase the likelihood of detection," the probability of detecting a leak "would still depend on a monitoring well being in a zone into which a leak occurs, along a flow line from where leaking fluid entered the zone, and in sufficiently close proximity to where the leak entered the zone to allow its detection within a reasonable time of when the leak occurred." (*Id.* at p. 311.) The CCST Study also notes that California-specific considerations such as seismic activity and "land subsidence related to groundwater extraction and oil production" could result in a higher chronic well leakage frequency. (*Id.* at p. 312.)

The County's DEIR concluded that Impacts 4.8-1 ("Create a Significant Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials") and 4.8-2 ("Create a Significant Hazard to the Public or the Environment through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment") were potentially significant and required mitigation. (DEIR, pp. 4.8-83, 4.8-92.) The County's MM 4.8-1 through MM 4.8-14 do not include requirements that are substantively similar to those in SB 4 EIR's MM HAZ-1b.

I. Mitigation Measure SWR-1b (Surface Water Protection)

0002-128

The SB 4 EIR concluded that Impact SWR-1 ("Violate water quality standards or waste discharge requirements, provide substantial additional sources of polluted runoff, or otherwise substantially degrade or diminish surface water quality") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.15-39.) As the SB 4 EIR explained, water quality could be adversely affected through:

0002-128
Continued

- Introduction of diesel fuel, gasoline, lubrication oil, hydraulic fluids, anti-freeze, transmission fluid, lubricating grease, trash and other items during construction of new wells.
- Spills during on-site refueling and equipment maintenance activities, leaks from defective or poorly maintained equipment, spills of chemicals used in the drilling process, blowouts, or improper disposal and containment of drilling mud during drilling of new wells.
- Spills of hydraulic fracturing fluid additives, acids, inhibitors, surfactants, diesel fuel, gasoline, lubrication oil, hydraulic fluids, anti-freeze, transmission fluid, lubricating grease, and trash during the hydraulic fracturing process.
- Spills of flowback fluids and overflush from hydraulic fracturing and acid treatments.
- Disposal of treated flowback fluids and overflush from hydraulic fracturing and acid treatments directly into surface waters.

(*Id.* at p. 10.15-34.) To mitigate this potential impact, the SB 4 EIR included MM SWR-1b, which requires the applicant to "submit to DOGGR maps, photographs, and other information, prepared by a qualified hydrologist acceptable to DOGGR, that describe or show any perennial, intermittent or ephemeral streams or other water bodies within 300 feet of the proposed well stimulation treatment and of any surface disturbance associated with the proposed stimulation treatment." (*Id.* at p. 10.15-41.) The required information includes: (a) water body name, if applicable; (b) characteristics (stream, pond, lake, wetland); (c) whether the water body is perennial, intermittent or ephemeral; (d) normal summer and winter flow rate, if available, or estimated; (e) habitat characteristics; (f) distance and ground slope between the well pad and water body; (g) contributing watershed area; and (h) expected drainage patterns at the location of the proposed well stimulation treatment. (*Id.* at p. 10.15-41.) "In cases where surface water is expected to be present at the time of well stimulation, a 100-foot setback is required unless such a setback cannot feasibly be achieved or is unnecessary to avoid significant effects on potentially affected water bodies." (*Id.* at p. 10.15-39.)

0002-129

0002-130

The County's DEIR did not analyze surface water impacts separately from groundwater impacts. As noted above, the County's DEIR concluded that Impacts 4.9-1 ("Violate any Water Quality Standards or Waste Discharge Requirements") and 4.9-6 ("Otherwise Substantially Degrade Water Quality") were potentially significant and required mitigation. (DEIR, p. 4.9-145, 4.9-160.) The County's MMs 4.9-1 to 4.9-6 do not include requirements that are substantively similar to those in SB 4 EIR's MM SWR-1b.

J. Mitigation Measure RSK-2a (Reduce the Inventory/ Volumes Handled with the Hazardous Chemicals)

0002-131

The SB 4 EIR concluded that Impact RSK-2 ("Create a hazard to the public, workers or environment through a reasonably foresee-able accidental release of hazardous materials due to a hose leak or connection leak while pumping well stimulation treatment fluids") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.21-59.) As the SB 4 EIR explained:

> Processing and handling hazardous materials, including hazardous wastes, could lead to accidental releases impacting public and/or worker health and safety. The state of the art for bonded flexible pipes study conducted by the Petroleum Safety

0002-131
Continued

> Authority (PSA) of Norway in 2009, states that the oil and gas industry has worked extensively with mitigating actions; however, incidents are still reported. The majority of the incidents are caused by hose misuse or improper maintenance. Some of the examples below describe the main causes of hose failure, based on the state of the art study conducted for PSA:
>
> - Hoses have burst due to pressure surge (pressure hammering) several times higher than the hose design pressure
> - Hoses have failed due to cover damage resulting in corrosion and fatigue of armoring
> - Hoses have been used after handling defects such as crushing or excessive tension
> - Hoses have been exposed to chemicals which they have not been designed for
> - Leakage of hose joints

(*Id.* at pp. 10.21-58 to -59.) To mitigate this impact, the SB 4 EIR included MM RSK-2a, which requires "the applicant to implement a strategy of reducing the inventory of the hazardous materials with the aim to reduce the total mass of potential accidental releases, and thus, also the consequences and effects for workers and public in the surroundings." (*Id.* at p. 10.21-60.)

0002-132

The County's DEIR did not analyze "risk" separately from hazards and hazardous materials impacts. The County's DEIR concluded that Impacts 4.8-1 ("Create a Significant Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials") and 4.8-2 ("Create a Significant Hazard to the Public or the Environment through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment") were potentially significant and required mitigation. (DEIR, pp. 4.8-83, 4.8-92.) The County's MM 4.8-1 through MM 4.8-14 do not include requirements that are substantively similar to those in SB 4 EIR's MM RSK-2a.

K. Mitigation Measure RSK-7a (Use Alternative Proppant (e.g., Sintered Bauxite, Ceramics, Resins) or Use Alternative Proppant Delivery System

0002-133

The SB 4 EIR concluded that Impact RSK-7 ("Expose workers and public to hazardous levels of airborne silica during the use of proppant") was potentially significant. (SB 4 Final EIR, Vol. II, p. 10.21-70.) As the SB 4 EIR explained:

> Silica sand is often used as a proppant in most of the hydraulic fracturing operations. The National Institute for Occupational Safety and Health (NIOSH) identifies exposure to airborne silica as a potential health hazard to workers conducting hydraulic fracturing operations. Breathing silica could produce silicosis, which potentially leads to lung disease causing inflammation and reducing the lungs ability to take oxygen.

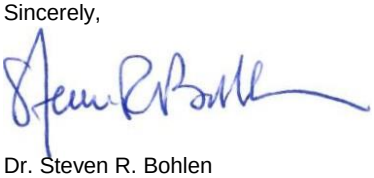
(*Id.* at p. 10.21-70.) To mitigate this impact, the SB 4 EIR included MM RSK-7a, which suggests the use of an alternate to silica sand as a proppant and encourages the selection of appropriate materials that lack any harmful properties. (*Id.* at p. 10.21-71.) Additionally, MM RSK-7a requires "the use of an alternative proppant delivery system that is a closed system and results in less dust and truck traffic than traditional methods." (*Id.* at p. 10.21-71.)

The County's DEIR did not analyze "risk" separately from hazards and hazardous materials impacts. The County's DEIR concluded that Impacts 4.8-1 ("Create a Significant Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials") and 4.8-2 ("Create a Significant Hazard to the Public or the Environment through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment") were potentially significant and required mitigation. (DEIR, pp. 4.8-83, 4.8-92.) The County's MM 4.8-1 through MM 4.8-14 do not include requirements that are substantively similar to those in SB 4 EIR's MM RSK-7a. The County should include specific standards to address health concerns related to exposure and inhalation hazards from silica dust during well stimulation treatment operations where proppant is used. 0002-134

CONCLUSION 0002-135

DOGGR appreciates the opportunity to provide these comments and looks forward to the County's responses. DOGGR will be happy to continue working with County staff to obtain additional information on subjects important to DOGGR as a responsible agency.

Sincerely,



Dr. Steven R. Bohlen
State Oil and Gas Supervisor
Division of Oil, Gas and Geothermal Resources

Exhibit 3: OEHHA's comments on Kern County's Health Risk Assessment

Kern County DEIR Page/Section/MM	Comment	
General Comments		
	1. The Hydrologic description identifies the Corcoran Clay as the boundary between shallow and deep aquifers in the west and central area, and the mechanism of groundwater recharge from the Sierra and the Kern River. The document would benefit from more detail on how the geologic and hydrologic environments interact and contribute to or influence the impacts from oil and gas development regionally.	0002-136
	2. Projected future oil and gas activity is based only on current practice with the assumption that future development will follow the same trends. Projected oil and gas activity uses 2012 numbers for new drills, plugging and abandonments, and well stimulation. Projected produced fluid management uses 2012 figures although there has been a significant change resulting from Well Stimulation Treatment regulations. For example, the EIR does not take into consideration the prohibition of produced fluid from WST wells into surface impoundments: sumps, and pits.	0002-137
	3. Since produced fluid from WST wells is prohibited from going to surface sumps and pits, all of the sections in the Kern EIR that reference alternative use of produced fluid for injection and irrigation purposes and management by surface percolation ponds will need to be adjusted. The amounts and percent increases also need to take into consideration this change in fluid management. These sections in the Kern EIR can be found in comments on Section 4.9 below.	0002-138
Chapter 2 Introduction		
Pg. 2-26	Compliance with regulations is a requirement whether or not the proposed action would be implemented and should not be described as mitigation that is unique to the project. Additionally, significant impacts can and sometimes do occur despite regulations.	0002-139
Chapter 3 Project Description		
Pg. 3-2	"*This EIR provides project-level CEQA coverage on which DOGGR can rely, as a Responsible Agency, for permitting of oil and gas activities, including well stimulation treatment, in the Project Area within Kern County*." DOGGR does not believe that the draft EIR contains sufficient detail to qualify as providing for project-level coverage for all of the oil and gas approvals that DOGGR might be called upon to make. DOGGR is hopeful, however, that, in responding to DOGGR's requests for additional information for inclusion in the Final EIR, the County will be able to supply sufficient information to make the document sufficient for DOGGR's use as a responsible agency.	0002-140

Kern County DEIR Page/Section/MM	Comment	
Pg. 3-28	Mitigation Self-Certification: Please provide a more detailed description of the Self-Certification process. The section would benefit from a detailed discussion of the method by which operator compliance would be ensured. Will self-certification data be available to the public to view?	0002-141
Pg. 3-30, 3-32	Section 3.5 mentions that no more than 2,697 producing wells would be drilled in a single year under this CEQA review. However, the impacts of oil and gas activity is not just the drilling of production wells but also should include the drilling of injection wells. According to our published Weekly Summary Reports the Division has received the following: Drill Year / Drill Notices Received / Permits Issued 2010 / 2758 / N/A 2011 / 3427 / 3143 2012 / 3083 / 3164 2013 / 3997 / 3411 2014 / 3678 / 2790 If these numbers continue, the EIR evaluation may not adequately address impacts caused by the amount of drilling activity in the County.	0002-142
Pg. 3-52	Decommissioning and Abandonment paragraph 4 item 1: Sentence 3 states that DOGGR regulates sumps. Although the Division does have some minor regulations, as cited in the document, to deal with some aspects of sumps, sumps are permitted by the Regional Water Quality Control Board.	0002-143
Pg. 3-53	Reactivation of Idle Wells: The Division would like the definition of an idle well to be based on its regulations: Section 3008(d) defines “Idle well” as any well that has not produced oil or natural gas or has not been used for injection for six consecutive months of continuous operation during the last five or more years. An idle well does not include an active observation well.	0002-144
Attachment A: Zoning Ordinance Amendment, pg. 13	Chapter 19.98.130 Self-Certification: Please include a description of this process as part of the proposed project in Section 3.4.1.	0002-145

Kern County DEIR Page/Section/MM	Comment	
Attachment A: Zoning Ordinance Amendment, pg. 7	Chapter 19.98.070 Conformity Review and Approval: The associated table depicting oil and gas activities and the types of review required states that where activities are checked in multiple columns, they would be subject to Oil and Gas Conformity Review only if proposed in conjunction with another activity subject to only Oil and Gas Conformity Review. Otherwise they are subject to Minor Activity Review. Is there a mechanism to ensure that applicants seek approval for the whole of an action?	0002-146
Attachment A: Zoning Ordinance Amendment, pg. 5	Chapter 19.98.070 Conformity Review and Approval: Well pad preparation has the greatest potential amongst oil and gas activities for potential impact. Please clarify on reasons that it is considered under Minor Activity Review.	0002-147
Agriculture		
MM 4.2-1	This measure would be enhanced by adding that agricultural easements or mitigation lands be held in perpetuity as required by Gov. Code § 65965 et seq., and that any non-governmental easement holding entities be certified by the Land Trust Accreditation Commission to ensure accountability and permanence of land conservation.	0002-148
Air Quality		
Pg. 4.3-103 to -104	Appendix M does not seem to include impacts from WST activities. Please explain.	0002-149
MM 4.3-2 (pg. 4.3-68 to -69)	Please see the discussion in the SB 4 EIR of Impact RSK-7 (Expose workers and public to hazardous levels of airborne silica during the use of proppant). In particular, the County should include specific standards to address health concerns related to exposure and inhalation hazards from silica dust during well stimulation treatment operations where proppant is used. Mitigation measures should be added to either require the use of alternative effective proppants, or require enclosed proppant containers and bins.	0002-150
Biology		
General	What process does the County plan to use to confirm permits or approvals (such as wetlands permits and/or streambed alternation agreements) from other state or federal agencies have been issued?	0002-151
Pg. 4.4-82	The southwest willow flycatcher is listed under Category 3 in the document. Since it is endangered under federal and state ESAs and has potential to occur in the Project Area, should it be under Category 2?	0002-152
MM 4.4-3 (pg. 4.4-204 to -205)	In mitigation measures that address situations where protected species are identified during pre-disturbance surveys and avoidance buffers are	0002-153

Kern County DEIR Page/Section/MM	Comment	
MM 4.4-10 (pg. 4.4-208) MM 4.4-11 (pg. 4.4-208 to -210) MM 4.4-12 (pg. 4.4-210 to -211)	established, the inclusion of qualified biological monitors on site during disturbance activities might be considered to enhance the measure.	0002-153 Continued
MM 4.4-10 (pg. 4.4-208)	This measure currently sets no disturbance buffers (generally and for raptor nests) where continuous monitoring by a biologist is not available. One possible way to enhance the measure would be to include a combination of buffers along with monitoring by a qualified biologist.	0002-154
MM 4.4-11 (pg. 4.4-208 to -210)	This measure directs applicants to conduct blunt nose leopard lizard surveys, when appropriate. Would such BNLL surveys be conducted in coordination with CDFW on location and timing? How would the surveys be enforced?	0002-155
MM 4.4-15 (pg. 4.4-212 to -214)	Aside from requiring washing of tracked and tired vehicles and equipment before moving to a new disturbance, identifying specific types of invasive plant species that are most problematic in the Project Area and considering measures that limit their spread from construction activities to either habitat or agricultural lands would enhance effectiveness.	0002-156
MM 4.4-17 and MM 4.4-18 (pg. 4.4-219)	Kern County might consider minimum buffers from jurisdictional waters.	0002-157
Impact 4.4-1 (pg. 4.4-173) Impact 4.4-4 (pg. 4.4-222)	Habitat for Special Status Species and Native Resident Wildlife Corridors: The California Council on Science and Technology's Independent Scientific Assessment on Well Stimulation Volumes II and III (CCST Study) presented valuable information on habitat fragmentation and corridors in the Project Area, specifically the Western Subarea. Consideration of the information in these volumes would benefit impact analysis on special status species habitat in the Project Area. Since important contiguous areas of quality habitat exist on Tier 1/Tier 2 lands within the Western Subarea, the information from the CCST Study offers insight not available in existing literature. This information could inform the County's habitat conservation efforts that surround the dense oilfields in the Western Subarea for the next 25 years.	0002-158

Kern County DEIR Page/Section/MM	Comment	
Pg. 4.4-229	Biology Cumulative Impacts: Cumulative biological impacts would benefit from adding the County's knowledge of trends in other industries in the County.	0002-159
Pg. 4.4-229	Cumulative Impact: In the cumulative impact discussion, the County might consider using the same projected approach as is used for the project impacts. Adding information from the County General Plan, trends in growth and industrial development within the Project Area would be informative for this discussion.	0002-160
Figure 4.4-12	This figure shows locations of HCPs and Division wells. In the legend under **DOGGR Well Location**, the last category is listed as 'Unknown Well Type.' While such a category does exist in the Division's database, the category signifies older wells that often have pre-1977 records that may not have been properly converted to digital formats. The Division recommends that Kern County work with DOGGR's District 4 staff to determine the appropriate well status.	0002-161
Cultural and Paleontology		
General comments	Impacts to paleontology would be greatest from land disturbance activities (well sites/drilling islands/access roads construction) where formations with high paleontological resource potential are shallow. But in some cases such formations are in the same formation that have oil and gas deposits. Would EOR activities affect these resources?	0002-162
MM 4.5-2 (pg. 4.5-55 to -56)	Please expand on the 'procedures to be followed upon the discovery of paleontological materials.' This mitigation measure would benefit from including a professional paleontologist to assess discovered materials to determine whether important information can be collected from them and if they should be curated at a museum.	0002-163
Pg. 4.5-56	Shallow land disturbance activities to prepare well sites/drilling islands/oil and gas developments could also result in potential impact on paleontological resources in rocks that are shallow in depth. Consider requiring the presence of a qualified paleontologist at earth moving activities to monitor for finds in such situations.	0002-164
MM 4.5-4 (pg. 4.5-56 to -57)	Unexpected archaeological materials found during construction. This measure is more appropriate under Impact 4.5-1 than under Impact 4.5-4. Such unexpected archaeological finds can be historic in nature as well as prehistoric/Native American.	0002-165

Kern County DEIR Page/Section/MM	Comment
Geology and Soils	
Pg. 4.6-19 to -20	The DEIR states: Land subsidence of less than 1 foot from oilfield withdrawals is known to occur in a few isolated areas in southwest Kern County. Generally, the extent and rate of oil and gas extraction subsidence is significantly less than subsidence caused by groundwater use because hydrocarbon extraction typically occurs at much deeper locations beneath the ground surface. Please *delete* the last phrase: "~~because hydrocarbon extraction typically occurs at much deeper locations beneath the ground surface~~." The depth of the extraction is not the relevant factor. Subsidence occurs at any depth where the extraction of fluids from a reservoir results in the decrease of pore pressure or where extraction of fluids exceeds recharge. Subsidence also occurs as a result of production practices specific to the characteristics of the reservoir rock, i.e., diatomite production. Subsidence commonly occurs in South Belridge where oil extraction in the diatomite causes the collapse of the reservoir due to the nature of the diatomite formation and occurs at quite shallow depths (<1000 ft.). Subsidence is subsidence regardless of whether the cause is from shallow or deeper production. The Division is mandated to prevent subsidence. The means by which subsidence is abated is either by balancing production and injection, or by requiring injection and re-pressurization. If produced fluids are redirected to other "beneficial uses," there may not be fluid available to put to use in subsidence abatement. Alternative uses of produced fluids should not be at the expense of other just as important issues.
Pg. 4.6-40	The EIR identified landslides as a potential impact and noted that local ordinances address this impact. Please elaborate on the types of industry accepted practices. If construction is within an oilfield administrative boundary, would Kern County's construction requirements apply?
Pg. 4.6-45	The DEIR states: "Subsidence is normally the result of gas, oil or water extraction, hydrocompaction, or peat oxidation, not the result of landslide or ground failure." DOGGR recommends adding in a phrase: "Subsidence is normally the result of gas, oil or water extraction *(by various industries, including oil and gas, and agriculture, among others)*, hydrocompaction, or peat oxidation, not the result of landslide or ground failure."

0002-168

Kern County DEIR Page/Section/MM	Comment
MM 4.6-1 (pg. 4.6-53 to -54)	MM 4.6-1, subsection (d)(3), states: All Class II injection wells shall be authorized and shall comply with all applicable legal requirements, UIC program approval permit conditions, and be operated according to CCR title 14 as described for the mitigation measures for Hydrology and Water Quality. • MM 4.6-1 does not clearly specify the adverse impacts resulting from earthquakes. The EIR does not explain how compliance with Division WST and UIC requirements would address adverse impacts. • If a seismic event is determined to be a result of WST operations (or UIC) then WST regulations require that an evaluation be conducted to determine whether surrounding wells have zonal isolation. However, if the seismic event is not WST related, this evaluation would not be required. DOGGR could, under different powers of the supervisor, request operators to conduct a well review. Neither the UIC nor the WST program have a requirement to evaluate MIT of wells post-earthquake. Post-earthquake evaluation is only required under the WST regulations not the UIC regulations. Therefore, this mitigation measure does not fully cover the potential impacts. • The DEIR implies that earthquakes could be induced by WST and UIC activities. It is unclear then how compliance with DOGGR regulations would mitigate inducing earthquakes. • The DEIR does not specify whether there are potential impacts to groundwater if and when a seismic event would cause lack of integrity in oil and gas wells. If the seismic event is WST related, then the WST program requirements would address well integrity measures. WST regulations require a post seismic event evaluation of the mechanical integrity of wells within the 5x radius to determine if any wells have been compromised and prohibits future wells in this area from WST activities until after an evaluation has been completed. The resulting analysis would require the Division to act to remediate any wells to ensure zonal isolation. Permit condition would be added to the WST permit to address this; however, there would not be the benefit of public review and discussion.
Hazards and Hazardous Materials	
General comments	We suggest adding additional details to explain how the mitigation measures in the section would be enforced. Before a well stimulation treatment, DOGGR regulations require pressure testing for all surface equipment, tubing and casing that will come in contact with the WST pressures, to be pressure tested for a required period to ensure equipment integrity. Pressure test of casing must be recorded using a chart recorder. This requirement is not mentioned in the Kern EIR.

0002-169

0002-170

Kern County DEIR Page/Section/MM	Comment	
Pg. 4.8-15	The flowback section depicts "flowback" fluids as flow reversal. In Kern County, and specifically South Belridge field where 85-90% of the WSTs are performed, after WST the fluids do not flow back to the surface. Operators must add motive forces to the well, such as a pump, to recover fluids after WST.	0002-171
Pg. 4.8-91	Blowouts and Steam-Related Events paragraphs 1 and 2: These two paragraphs imply that surface expressions are related to the blowout prevention equipment. The cause of steam-related events or surface expressions, however, normally has very little if anything related to the blowout equipment. Many surface expressions are caused by a breakdown of the formation or from damaged casing allowing fluids to migrate vertically and laterally to the surface.	0002-172
MM 4.8-14 (pg. 4.8-93 to -94)	This measure addresses contamination caused by oil and gas activity outside of a Tier 1 area. Please clarify how contamination by oil and gas activity would be mitigated within Tier 1.	0002-173
MM 4.8-15 (pg. 4.8-95 to -96)	This mitigation measure may not adequately address extremely hazardous waste such as H2S associated with waste gas disposal wells.	0002-174
Pg. 4.8-99	Impact 4.8-7: This impact refers to evacuation plans or lack thereof. It appears the County does not have evacuation plans associated with any of the gas plants, pipelines, or wells used for waste gas disposal. Some of these wells inject gas with concentrations of over 50,000 ppm H2s and are extremely lethal. We recommend a study considering the nearest sensitive receptors to these facilities to determine if an evacuation plan or emergency response plan is appropriate to reduce impacts should a significant leak occur.	0002-175
Pg. 4.8-103	Impact 4.8-10: The document relies on existing regulations to address releases of hazardous material, but the Division does not have regulations that address this topic. Therefore, we suggest the County augment the discussion on risk of H2S release in this document.	0002-176
Hydrology and Water Quality Comments		
Pg. 4.9-14	Oil and Gas Production and Water Resources, Overview: This portion of the document states that 26% of produced water is discharged into percolation or evaporation ponds. It is debatable how much authority for	0002-177

Kern County DEIR Page/Section/MM	Comment	
	these ponds fall to the Division, but again the document appears to rely on existing regulations to minimize impacts. The Division only has regulations to restrict flowback fluid from entering these ponds.	0002-177 Continued
Pg. 4.9-22	Well Stimulation section, discussion of NORM: The document mentions that DOGGR did a study in 1996 on NORM, found some elevated radiation reading in District 4, and suggested that further evaluation may be required. Consider adding a requirement for evaluations of this type as a mitigation measure.	0002-178
Pg. 4.9-22	Surface Water and Groundwater Quality first paragraph: This discussion appears to confuse freshwater definitions with water subject to beneficial use. The discussion cites public drinking water supply standards such as maximum contaminant levels (MCL), but then the discussion switches to agriculture irrigation, which can easily be confused. Separately, comments from DOGGR workshops on aquifer exemptions indicate that farmers use water with TDS greater than 4,000 mg/l on crops, yet the EIR suggests that this practice is not very common. According to the State Water Board, many residents in Kern County are using and drinking water above the MCL.	0002-179
Pg. 4.9-30	Surface Water Quality Data: This section is very general and continually uses phases like: "…data suggests…", "…most like due to…", and "…results likely suggest…" These are very general and would suggest that the analysis at issue is not site specific.	0002-180
Pg. 4.9-105	Discharge to Injection Wells: The document refers to the Area of Review and an approved mathematical model such as the "This equation". It should read the "Theis equation".	0002-181
Pg. 4.9-108	Discharge to Injection Wells: The last paragraph under this section describes Field Rules. The document states that field rules are to be considered when in fact if a Field Rule exists, then those rules *must* be followed. The Field Rule replaces the existing regulations based upon known geologic conditions.	0002-182

Kern County DEIR Page/Section/MM	Comment	
Pg. 4.9-113	Kern County General Plan: It is not clear how these local policies and measures listed would be reviewed, enforced, or monitored to protect water quality. Please clarify how these measures would be managed under conformity or minor ministerial permit review.	0002-183
Pg. 4.9-117	Implementation Measure D states that: "*Discretionary actions will be required to address and mitigate impacts form inundation, land subsidence, landslides, high groundwater areas, liquefaction and seismic events through the CEQA process*." It is not clear how these impacts would be addressed for ministerial projects. Please clarify.	0002-184
Pg. 4.9-130	"*… BMPs may still be utilized to prevent or minimize pollutants from becoming entrained in stormwater*." What specific BMPs would be required and how would they be enforced?	0002-185
Pg. 4.9-132	The first sentence of second full paragraph is inaccurate. The Division does not require the use of freshwater drilling muds. It may be industry "preferred" practice but is not required. The use of oil-based drilling mud may be preferred in order to prevent the swelling of clays during drilling through certain formations. Oil-based drilling muds must be disposed of differently than water-based drilling muds. The Division does not have specific drilling mud requirements, only that drilling must be under controlled conditions at all times. Well control is assured through appropriate mud weight control during drilling. Oil-based drilling muds would be in contact with groundwater during the drilling phase but would only infiltrate a few inches into the formation as any deeper could result in wellbore fluid loss and loss of well control. The potential exists for groundwater to come in contact with oil-based muds and the Kern EIR should include this in their description. Potentially this would not rise to the significant impact level; however, the EIR should accurately reflect this drilling practice.	0002-186
Pg. 4.9-133	"*The API and other sources of applicable industry engineering standards publish and regularly update oil and gas industry standards and criteria for construction period fluid mixing, storage, handling, and conveyance equipment.*" In order to ensure standards would adequately prevent impacts, specific standards should be described in the Final EIR and adopted as mitigation.	0002-187

Kern County DEIR Page/Section/MM	Comment	
Pg. 4.9-135	Spills and Leaks from Oilfield Operations: This discussion needs to take into consideration WST chemicals found in produced fluids from WST wells.	0002-188
Pg. 4.9-137	Surface or Subsurface Discharges Related to Produced Water Reuse and Disposal: This discussion needs to consider that all produced fluids from WST wells cannot be managed in surface ponds or pits as of July 1, 2015. The scenarios should take this change in state regulations into consideration.	0002-189
Pg. 4.9-137	Produced Water Reuse for EOR Activities: This discussion needs to consider that produced fluid for injection may increase since a large quantity of produced fluid from WST wells will be redirected from surface ponds and pits to injection wells, either EOR or disposal.	0002-190
Pg. 4.9-140	The first sentence would need to change since the amount of produced fluid that is not reused but going into surface ponds is no longer allowed. The suggested fluid amounts available for irrigation use needs to be adjusted.	0002-191
MM 4.9-2 (pg. 4.9-146)	It is not clear if the BMPs described in MM 4.9-2 are required or recommended. Please clarify.	0002-192
MM 4.9-3 (pg. 4.9-147)	Although this MM is relevant to all oil and gas activities, it needs to include a statement that reflects current WST regulations and the prohibition of managing produced fluids from WST wells in evaporation pits or any surface impoundment in perpetuity. This prohibition is found in CCR section 1786. Produced fluids from wells that have been WST cannot be stored in sumps or pits. Produced fluids from WST wells will need to be managed by other alternatives, preferably through injection wells. It should be noted that drilling sumps that are used during the drilling of the well (and then left on site to complete the completion operations such as WST) must not be used during WST operations as DOGGR WST regulations prohibit the storage of WST fluids in sumps and pits. This prohibition needs to be considered in this section.	0002-193
MM 4.9-5 (pg. 4.9-147)	MM 4.9-5 needs to be changed to reflect that WST fluids and produced fluids from wells that have been stimulated cannot store, discharge, or disposed into surface ponds or pits.	0002-194

Kern County DEIR Page/Section/MM	Comment	
Pg. 4.9-148 to -155	Impact 4.9-2 ("Substantially Deplete Groundwater Supplies or Interfere Substantially with Groundwater Recharge …"): The potential use of WST fluids, produced or recovered, should be removed from this section as it cannot be used for groundwater recharge (unless it is treated). Therefore the reference in the first sentence to WST should be deleted and the figures in the charge recalculated to delete WST fluids from the equation.	0002-195
Pg. 4.9-155	Summary: "*Potential impacts to groundwater supply and recharge from produced water generation, injection and WST would be less than significant with the implementation of MM 4.9-1 through 6.* " This finding needs to be reevaluated with the omission of the quantity of WST fluid as potential recharge. Since 73% of produced fluid from WST wells from North and South Belridge, Lost Hills and Elk Hills (2011-2014 from Division Production data) was discharged into evaporation ponds, this amount could significantly reduce the benefit to groundwater recharge proposed in the Kern EIR.	0002-196
Utilities		
MM 4.17-2 (pg. 4.17-59)	In regards to increasing the reuse of produced water: • Would the top 5 O&G users of M&I water likely make up the majority of M&I water use compared to the rest of the O&G users combined? • How much of a reduction in M&I water use by the top 5 O&G users (to be identified in 2016) would make this MM effective? • The California Council on Science and Technology's Independent Scientific Assessment on Well Stimulation Volume II, chapter 2, presented information on potential impacts of reusing produced water. Consideration of the information in this study would benefit impact analysis.	0002-197

SUBJECT: HEALTH RISK ASSESSMENT ASPECTS OF THE DRAFT ENVIRONMENTAL IMPACT REPORT FOR REVISIONS TO THE KERN COUNTY ZONING ORDINANCE - 2015, OIL AND GAS LOCAL PERMITTING

This memorandum provides several comments on portions of the subject Draft Environmental Impact Report (DEIR) that evaluate the air pollution generated by project-related oil and gas operations and the pollution's potential health impacts. It is based on a brief reading of Appendix M and chapters 3.4 (project description), 4.3 (air quality impacts), and 4.8 (hazardous materials impacts) of the draft. Appendix M contains the health risk assessment for air toxics emissions. The DEIR evaluated cancer and non-cancer risks using the Office of Environmental Health Hazard Assessment's (OEHHA) Air Toxics Hotspots guidelines and California Air Resources Board Hotspots Analysis and Reporting Program, Version 2 (HARP). The risk estimates developed in Appendix M were then used to define acceptable setback distances for sensitive receptors located near oil and gas operations.

0002-198

0002-199

Given the limited time available for this review, we did not look closely at either the air dispersion modeling or the HARP-based risk calculations. A preliminary issue that we had with the risk assessment report was that it provided an insufficient narrative of less than 10 pages (not counting tables) and was missing key information on the exposure and risk modeling methods and assumptions. We nonetheless were able to identify several potential technical issues, all of which could have an impact upon defining appropriate setback distances to protect sensitive receptors. These are as follows:

1. The risk assessment did not include sufficient discussion of the toxic air emissions inventory that it used as input to the air dispersion analysis, and therefore it is unclear whether the emission estimates generated for the study are accurate and representative of potential emissions from the proposed project. In order to be health-protective, it would be preferential to develop and use reasonable, high-end emission estimates to compensate for uncertainty and variability in the data underlying the emissions estimates.

2. Although Section 4.3 of the DEIR evaluated impacts due to criteria air pollutants, and Appendix M did the same for Toxic Air Contaminants (TACs), one gap in the analysis remains related to the localized non-cancer air impact of $PM_{2.5}$ and PM_{10} emissions from new oil and gas activities. This gap occurs because criteria air pollution, unlike TAC pollution, is normally analyzed and controlled (or offset) at a regional geographic scale. However, smaller sources of criteria air pollutants may, in certain cases, produce significant localized air impacts to fence-line receptors. This possibility exists especially for $PM_{2.5}$ in Kern County since the San Joaquin Valley is out of attainment with the $PM_{2.5}$ standards. According to Table 4.3-9 of the DEIR, an increase of > 1.2 $\mu g/m^3$ in the 24-hour ambient air concentration of $PM_{2.5}$ would represent a significant air impact.

   While the Appendix M risk assessment looked at long-term exposures and impacts (cancer risk to a maximally exposed individual) due to diesel particulate emissions, there is a remaining question as to whether 24-hour concentrations of $PM_{2.5}$ would be acceptable with respect to non-cancer health risks. Addressing this gap in the analysis could result in a revision of the proposed setbacks. Also note that this type of regulatory gap may exist for other criteria air pollutants, although it likely is most significant for PM pollution due to the elevated PM levels in the San Joaquin Valley.

3. Another analysis gap relates to potential localized air impacts from accidental spills. Spills of various oil and gas production-related fluids have been occurring on a regular basis in Kern County, as indicated in the table on the next page (extracted from Table 4.8-6 of the DEIR). The DEIR also describes 57 crude oil

0002-200

spills ranging from 5 to 53,550 gallons that were reported for PHMSA[1]-regulated pipelines between 2002 and 2009.

The DEIR concluded that in spite of current regulations, accidental spills still represent a significant potential impact of the proposed project. Thus, it seems reasonable to question whether an acute air hazard could be created by vapor emissions from such accidental spills of hazardous fluids. This analysis was not carried out in the DEIR or the Appendix M risk assessment.

Spills in Kern County Oilfields between January 2009 and June 2014 Not Associated with PHMSA-Regulated Pipelines

	Number of Spills	Range of the Spill Volume (Gallons)	Average Spill Volume (Gallons)
Oil	403	0.126 - 27,300	1,126
Produced Water	263	2.1 - 126,000	6,888
Acid	9	33.2 - 7,333	2,633
Diesel	2	1,323 - 2,688	2,003

4. Some chemicals specific to well stimulation processes were not covered in the risk assessment. For example, proppant materials frequently contain crystalline silica, and elevated air concentrations of silica have been measured during fracking operations in studies conducted in other states. If this is also the case in California, then fence-line receptors could be exposed to silica particulate and this should be evaluated. Another example specific to well stimulation is the operational or accidental release of highly hazardous materials such as hydrogen fluoride (or its chemical precursors) and hydrogen chloride.

5. The risk assessment assumed that well construction, drilling, and completion would last 23 days on average, whereas the DEIR noted that these activities could last longer than 60 days (see pg. 3-41 of the DEIR). Using a more conservative well-development period of 60 days or more might indicate the need for increased setback values.

[1] PHMSA: Pipeline and Hazardous Materials Safety Administration.

0002-201

6. Mitigating measures (MMs) are proposed for potential air impacts to sensitive receptors. However, MM 4.3-5 also states that, "If there are no sensitive receptors within this potential impact area, then no construction mitigation measures shall be required." We could not find a complete definition of "sensitive receptor" in the DEIR. However, the OEHHA risk methodology used in the Appendix M risk assessment is designed to protect the general public (including sensitive individuals), as well as offsite workers. We recommend that the DEIR clarify the use of the term "sensitive receptor" to include the general public and offsite workers, some of whom may be sensitive to the adverse effects of air pollution.

7. The air dispersion modeling used meteorological data from a single site in Bakersfield to model air impacts over the entire 3700 square mile project area of Kern County. We did not look closely at the air dispersion model but wonder if this meteorological data is representative of dispersion conditions throughout the region of interest. For example, Bakersfield is a relatively urbanized area and may experience more air turbulence and pollutant mixing effects than rural areas. It may be appropriate to use multiple meteorological datasets to better characterize the high-end air pollution levels, particularly in rural areas.

8. Section 3, page 3-47 defines "sumps" and "evaporation and percolation ponds" as separate installations. Appendix A to the risk assessment provides a list of devices analyzed and their estimated air emissions. Sumps are included in this list but we did not find emissions estimates for evaporation and percolation ponds. These potential air pollution sources should be included in the risk assessment.

As initially noted, these comments are based on a brief reading of limited sections of the DEIR, including the Appendix M risk assessment. With further review of the air dispersion and risk modeling documentation, it is likely that we would have additional comments and recommendations.

0002-10

These comments are noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration.

0002-11

The comment is correct that, as of July 1, 2015 (the effective date of the SB 4 permanent regulations), produced fluids from wells subjected to well stimulation treatment (WST) may not be disposed of in evaporation and percolation ponds. 14 Cal. Code Regs. § 1786. Given these legal constraints on disposal of produced water from stimulated wells, the County does not anticipate that such produced water will be used for irrigation. Please see GR Water-1, for the calculations requested by the commenter. As shown in GR Water-1, in the aggregate, and based on the projected number of new production and WST wells over time, the Project Area appears to have sufficient WST and non-WST produced water supplies to fulfill the three future scenarios discussed in the DEIR. Shortfalls related to the new regulations that could occur would likely affect surface disposal in the Western Subarea. Additional injection would occur to dispose of WST-well derived produced water that could not

be applied to the surface under Section 1786. There appears to be sufficient produced water derived from non-stimulated wells available to maintain the level of agricultural reuse assumed in scenarios 1 and 2, and to increase the level of reuse by 11,761 acre-feet per year in Scenario 3.

0002-12

See comment above.

0002-13

All operators are required to comply with all applicable legal requirements, including the prohibition on disposal of fluids from stimulated wells in percolation ponds, and requirements to identify and appropriately manage and dispose of hazardous as well as non0hazardous wastes. It is possible that some of the produced water and other fluids associated with WST wells will be characterized and disposed of as a form of hazardous waste. The volume of this potential waste stream cannot be estimated at this time due to the lack of historical data. The analysis summarized above, however, indicates that the three scenarios considered in the DEIR would be affected only if a very significant amount of Project Area WST-related material proved to be hazardous waste. This prospect is speculative. Produced water has been tested in the past and generally has been found not to exhibit hazardous waste characteristics. The presence of benzene in produced water does not render it hazardous under California law because wastes which are excluded from regulation as hazardous wastes under RCRA are not subject to the TCLP (the federal Toxicity Characteristic Leaching Procedure).

In any case, as noted above, the balance between uses must be considered, including groundwater recharge, irrigation and subsidence abatement needs as identified by the commenter, in the context of current regulatory requirements and restrictions. Further, as noted in the Water Quality discussions in the EIR, in the Water Quality Appendix, and in various comment letters including the letter from the Water Board (Letter 3), produced water varies dramatically in quality and treatability. For these and related reasons, the EIR does not prescribe any particular location, treatment technology, or beneficial use of treated produced water. However, as described in GR Water 5, there is more produced water used for agriculture than was reported in the Draft EIR, and several produced water treatment proposals remain under consideration by local water districts. Local water districts act as the lead agency for such projects, and are not subject to County zoning regulations; any such treatment facility would trigger the need for further CEQA review by the lead agency and be required to address environmental impacts and mitigation measures to address issues such as subsidence, monitoring and compliance parameters, and related issues. This EIR does not authorize any produced water treatment or re-use facilities, although it does set a target of re-use of 30,000 acre feet per year of produced water. As shown in GR Water-1, there are adequate quantities of produced water available from non-stimulated wells to achieve this reuse target.

0002-14

The comment describes the content of the EIR and is noted.

0002-15

The comment describes the content of the EIR and is noted.

0002-16

The DEIR states that subsidence is a known occurrence in the Project Area resulting from groundwater and to a lesser extent oil and gas extraction (including produced water). Historically, between 1926 and 1970 localized areas of subsidence have occurred within the Project Area due to groundwater extraction. Agriculture is one of the largest users of ground water and is primarily responsible for permanent surface subsidence, particularly in the Central Valley; for example, the Tulare Lake region experienced subsidence of 26 feet from groundwater extraction. EIR 4.6-18. However, as discussed in the EIR, subsidence from oilfield withdrawals is limited. Subsidence on the order of less than 1 foot from oilfield withdrawals has been identified in a few isolated areas in southwest Kern County (EIR 4.6-19 – 4-20), which is substantially less that subsidence attributed to groundwater extraction. Monitoring and balancing fluids and pressures in the reservoirs has reduced the levels of subsidence in the basin. As stated in the EIR and noted in the comment, DOGGR monitors subsidence in oil and gas fields and regulates oil and gas withdrawal and re-pressurizing of each oilfield. If subsidence is observed, well operators are required to stabilize the ground by injecting additional produced water or reducing the volume of produced water being pumped during field operations. This practice returns produced water back into the oil-bearing formation to maintain reservoir pressure and mitigate subsidence. Recycling produced water for enhanced oil recovery and well stimulation treatment also mitigates subsidence. The EIR includes MM 4.6-4, which requires the applicant to comply with a DOGGR -approved re-pressuring plan

Because subsidence is monitored by DOGGR, and operators must comply with these measures to manage subsidence, water for injection to manage subsidence will take precedence over other water uses so as to meet DOGGR's mandate. Reuse of produced water for other beneficial uses will be subject to the need to ensure availability of sufficient fluid for use in subsidence abatement. MM 4.17-2 to MM 4.17-4 will encourage the additional reuse of produced water, but prioritizing the use of produced water for management of subsidence imposes a limit on the reuse of

produced water. For this reason, among others, the extent to which oilfield operators can feasibly increase produced water reuse and decrease M&I demand is uncertain. Accordingly, while the EIR includes MM 4.17-2 to MM 4.17-4 to reduce the Project's impact on water supply to the extent feasible, the impacts is considered significant and unavoidable.

0002-17

See response to comment 16, above

0002-18

See response to comment 16, above.

0002-19

Please see GR Water-1. Based on the CCST consumption data for WST operations in Kern County, about 456 acre-feet per year of water and other fluids would be used to complete 1,200 well stimulation treatments annually in the Project Area. The volume of fluid directly related to WST in the Project Area amounts to 0.14% of the total produced water supply projected for 2035 (321,894 acre-feet) and would have no significant effect on produced water use under any of the three future scenarios considered in the EIR.

0002-20

Please see GR Water-01 and GR 18 regarding geological and technological constraints on extensive development of the Monterey Shale.

0002-21

None of the three future scenarios identified in the EIR is considered the "most likely outcome." As explained in the EIR, p. 4.17-59, The feasibility of achieving the results in Scenario 3, and the extent to

which additional produced water could be reused to offset oil and gas M&I water use in the Project Area, depends on several factors, including produced water quality, treatment costs and requirements, the availability of conveyance capacity to route produced water to and from treatment facilities, the availability of institutional mechanisms for managing produced water treatment and distribution – and the need to ensure availability of sufficient fluid for use in subsidence abatement. As such, the EIR did not identify feasible mitigation measures available to reduce water supply impacts to a less than significant level. Implementation of MM 4.17-2 to MM 4.17-4 could reduce such impacts, but Project impacts to water supplies would remain significant and unavoidable. Along with the need to ensure subsidence abatement, the allocation of water supplies and water demands, the complex laws affecting water rights, the many water districts that have legal jurisdiction over one or more sources of water in the Project Area, the varied technical feasibility of treating produced water, and the produced water reuse opportunities all present complex variables that fall outside the scope of the County's jurisdiction or control under CEQA. The County concludes that other agencies can and should cooperate in water management planning and implementation actions under the Sustainable Groundwater Management Act and other applicable laws to improve the quantity and reliability of water supplies in the Project Area.

0002-22

The comment provides background on toxic air contaminants. The comment is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration. Please also see GR Air-11 for a discussion of the CCST study in relation to air quality.

0002-23

The comment provides background information and is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration. As described in GR Air-6, a revised HRA was also completed for the Project.

0002-24

The HRA in the DEIR considers the impact of drilling and operation of one well at a time. Please see GR Air-3 and GR Air-7 regsrding the adequacy of the HRA in the DEIR. Please also see GR Air-5.

0002-25

See response to comment 24.

0002-26

Air District consultation was ongoing throughout preparation of the Draft EIR; however, the District also requested modifications to the HRA as prepared for the DEIR as described in greater detail in GR Air-6.

0002-27

Emissions from WST were not included in the HRAs prepared for the Project. Please see GR Air-8 for an explanation of why emissions from WST activities do not need to be quantified and are negligible for HRA purposes.

0002-28

It is unclear what the commenter means by a project being larger than what was assessed in the HRA, but the HRAs for the Project considered wells drilled to 10,000 and 15,000 feet respectively. The risk driver for toxic emissions is well depth, with risks generally increasing at deeper levels. Please see GR Air-3, 5, and 6 for an explanation of why the HRAs for the Project as adequate.

0002-29

Appendix B, C, and D to the HRA were inadvertently left out of the DEIR. However, those documents, in addition to all references and more detailed technical documents, were available for review upon request to the County. Some of these documents were transmitted to interested parties during the comment period. For example, model runs from the HRA were transmitted to the SJVAPCD for their review during the comment period. These appendices, and all supporting materials for the HRA, are included in the Final EIR in Appendix M. Appendix B contains a list of all equipment which was assumed to be needed for the following phases of drilling: land preparation, drilling survey, well drilling, well completions, flowlines, pump unit, and electrical. The equipment lists are identical in the HRA for the DEIR in Appendix M and the revised HRAs in Appendix M-1 and M-2.

0002-30

Appendix B to the HRA in Appendix M was inadvertently omitted from the Draft EIR, but has been included in a reprint of the Appendix M HRA. An equipment list was contained within the DEIR, and additional supporting material was provided at the request of the commenter during the public review process. The Scope of Work for the HRA was not included in the DEIR because it was not relevant to the HRA analysis.

0002-31

The requested information was not included because it is irrelevant to the Health Risk Analysis. The modeling in the HRA analysis evaluates receptor locations, which include residences, schools, hospitals, day care facilities, senior living facilities and the like. The HRA model is set up to assume that the person(s) exposed are those with higher susceptibility to toxic air pollutants, but the model (which is consistent with the most recent OEHHA and CARB guidance) does not require any information about what groups those individuals may be in. In any event, the information in the referenced table demonstrates that the Project will not have a disparate impact on communities of color.

0002-32

This comment recites MM 4.3-5. No response is needed.

0002-33

Please see GR Air-10 for and explanation of how the setbacks in MM 4.12-2 and MM 4.3-5 interact.

0002-34

There are no setbacks for redrilled or reworked wells or for well stimulation treatments that are proposed for existing wells. Potential rework emissions are negligible as compared to drilling emissions and thus any health risk would be substantially lower than the risks necessary to

trigger a setback (10 in one million). Rework emissions are included in the cumulative HRA in Appendix M-2. Please reference GR Air-5 for a discussion of that HRA, and refer to clarifying language in MM 4-3-5.

0002-35

Please see GR Air-11 for a discussion of the CCST study in relation to air emissions. Please also see GR Air-3 and GR Air-6 for a discussion of the HRAs which show that even in the worst case scenario, emissions from the Project are below a 10 in one million risk level at only 367 feet from the boundary of a well pad in 2015 and will decline over time as future regulatory controls come in effect.

0002-36

Comment is background and is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration

0002-37

Appendix A in the HRA in Appendix M of the DEIR includes the list of toxic compounds by equipment type that was included in the HRA analysis. The equipment list and their associated potentially toxic emissions are identical in both the original HRA and the revised HRAs in Appendix M-1 and M-2 (please see GR Air-5 and Air-6 for a discussion of these HRAs).

For drilling equipment, CARB's OFFROAD Model (2011) was used to generate all criteria pollutant emissions and diesel particulate matter emissions.

0002-38

Original Appendix M and Appendix M-1 and M-2 each calculated and modeled both potential carcinogenic effects from diesel exhaust as well as other potential chronic (non-cancer) effects such as other potential health impacts. OEHHA provides the reference exposure levels (ie. how toxic each substance is) for both potential carcinogenic and chronic illness that must be used as part of the risk computer model.

The final chronic results for drilling diesel exhaust are:

Derby Acres = 0.0018

Kern River = 0.00244

Midway Sunset = 0.00396

Shafter = 0.00637

The regulatory standard of significance for chronic illness is 1.0. Thus, an increase of potential diesel emissions of between a 200 times and 500 times increase would still results in potential calculated impacts below the regulatory standard.

0002-39

See response to comment 38, above.

0002-40

The DEIR concluded that spills occur occasionally in Kern County. The commenter states that the DEIR concluded that in spite of current regulations, accidental spills still represent a significant potential impact of the proposed project. The commenter suggests that this means that there is an analysis gap in regards to potential localized air impacts from accidental spills. Table 4.8-6 of the DEIR shows spills in Kern County Oilfields between January 2009 and June 2014. The DEIR shows 57 crude spills ranging from 5 to 53,550 gallons between 2002 and 2009.

Despite the fact that spills occasionally occur in Kern County, the air quality analysis is not required to analyze potential localized air impacts from accidental spills. First, accidental spills by nature are accidental and thus not part of regular on-going drilling or operational equipment scenarios. Thus, they were not modeled in the HRA. In addition, accidental spills of oil produced in Kern County are not generally an air quality problem. Even 53,000 gallons of crude would only cause negligible emissions because the crude from the Project Area is "heavy," meaning it contains fractions of petroleum that have fewer volatile organics. In addition, the potential for spills is addressed in the DEIR in Section 4.2 Agricultural and Forest Resources, 4.4 Biological Resources, 4.5 Cultural and Paleontological Resources, 4.6 Geology and Soils, 4.8 Hazards and Hazardous Materials, 4.9 Hydrology and Water Quality, and 4.10 Land Use and Planning.

0002-41

0002-42

See response to comment 40, above.

0002-43

Silica-containing sand is used as a "proppant," i.e., to hold open the fractures created by the hydraulic fracturing process with sufficient pore space to allow oil and gas to flow. Silica proppant is processed so that it is close as possible to spherical and contains a small range of particle sizes. Sizes of proppant depend on specific needs but are generally in the range of about 0.4 to 0.8 millimeters average diameter. Smaller particles may become airborne during transportation and handling, and workers can be exposed if they inhale the particles.

Crystalline silica is a natural component of silica sand. Worker-related health concerns are related to the tiniest crystalline silica particles, less than 10 micrometers in aerodynamic diameter, which if inhaled are small enough to enter the gas-exchange regions of the lungs. At sufficient concentrations and exposure durations, respirable crystalline silica inhalation can lead to silicosis (inflammation of tissue around trapped silica particles) and lung disorders. Respirable crystalline silica particles are listed by the California Office of Environmental Health Hazard Assessment as a chemical known to the state to cause cancer.

The United States Occupational Health and Safety Administration and National Institute of Occupational Safety have issued a "Hazard Alert: Worker Exposure to Silica during Hydraulic Fracturing." The Hazard Alert states that a "combination of engineering controls, work practice, protective equipment, and product substitution where feasible, along with worker training, is needed to protect workers who are exposed to silica during hydraulic fracturing operations." The National Institute of Occupational Safety identified seven primary points of silica dust exposure during hydraulic fracturing operations:

Dust ejected from access ports on top of sand movers during refilling operations while the machines are running Dust ejected through open side fill ports on sand movers during refilling operations Dust generated by on-site vehicle traffic Dust released from the transfer belt under the sand movers Dust created as sand drops into, or is agitated in, the blender hopper and on transfer belts Dust released from operations of transfer belts between the sand mover and the blender; and Dust released from the top of the end of the sand transfer belt on sand movers If air samples show levels above the U.S. Occupational Health and Safety Administration's calculated Permissible Exposure Limit (PEL) for crystalline silica, approximately 0.1 milligrams per cubic meter (mg/m^3), employers are required to take actions to reduce worker exposures. In addition, the Occupational Health and Safety Administration and National Institute of Occupational Safety recommend that employers take the following actions to further reduce worker exposures below the National Institute of Occupational Safety Recommended Exposure Limit (REL) of 0.05 mg/m^3:

Work practice and procedural changes: Cap unused fill ports on sand movers to help reduce the dust released, especially during filling. Reduce the drop height between the sand transfer belt and T-belts and blender hoppers. Limit the distance that sand falls through the air to help reduce dust. Limit the number of workers, and the time workers must spend in areas where dust and silica levels may be elevated, and consider ways to perform dusty operations remotely. Apply fresh water to roads and around the well site to reduce the dust. Practices that involve equipment changes: Enclose points where dust is released. Install thick plastic stilling or staging curtains around the bottom sides of the sand movers to limit dusts released from belt operation. Enclosures can also be added along and at the ends of the sand transfer belt. Where possible, use enclosed cabs or booths. Consider configuring operator cabs and booths with High Efficiency Particulate Arrestance (HEPA) filtration and climate controls. Use local exhaust ventilation to collect silica-containing dusts and prevent dust escape. Install dust collection systems onto machines or equipment that can release dust. Replace transfer belts with screw augers on sand movers in new designs or retrofits. Moving sand through an auger system rather than a belt will help contain the sand and reduce dust release. The Occupational Health and Safety Administration's Hazard Communication standard requires that employers provide workers with training and information about hazardous chemicals used in the workplace, including crystalline silica.

In addition, the National STEPS Network (Service, Transmission, Exploration and Production Safety), which promotes safety, health and environmental improvement in the oil and gas industry, organized the "Respirable Silica Focus Group" which issued a list of "Quick Fix Suggestions" (September 2, 2013) to mitigate respirable silica exposure in hydraulic fracturing. The practices include:

Exposure reduction work practices and procedures, such as capping unused fill ports, minimizing sand fall distances during transfer operations, and using enclosed cabs/booths Respiratory protection requirements Decontamination/hygiene requirements Exposure monitoring Informing management about silica hazards and company actions to reduce exposure Worker silica awareness training Signage identifying the seven points of silica dust exposure identified by NIOSH (listed above) Identifying the proppant used and reviewing material safety data sheets in pre-job safety meetings Signage identifying potential silica exposure in or near exposure zones. Limiting non-essential workers in potential exposure zones Ensuring that workers required to wear respirators are provided appropriate equipment and properly trained Requiring workers to wash hands and face before eating, drinking, smoking and leaving location. Instructing workers on cleaning silica from clothing or change clothes at the end of the shift, and on handling silica-contaminated clothing Cleaning enclosed worker congregation areas if the area becomes contaminated with silica dust Engineering and work practice controls provide consistent levels of protection to a large number of workers, allowing for predictable performance levels. Engineering controls that reduce the risk of worker exposure also have the effect of reducing off-site emissions of silica dust that could expose off-site receptors.

To further reduce any risk, Mitigation Measure 4.3-2 in the Draft Environmental Impact Report requires implementation of a fugitive dust control plan, in compliance with San Joaquin Valley Air Pollution Control District regulations for fugitive dust suppression. Dust control measures required to be implemented include stabilizing of on-site unpaved using water or chemical soil stabilizers, and covering of haul trucks (including those hauling sand) with tarps or other enclosures to reduce fugitive dust emissions. Compliance with these requirements will serve to ensure that health risks to workers and offsite receptors are minimized.

Finally, as discussed in response to comments 133 & 134 below, at the suggestion of the Division of Oil Gas and Geothermal Resources, the Final EIR will include an revised version of Mitigation Measure 4.8-3 with a new subsection f encouraging the use of alternates to silica sand as a proppant where the Division of Oil Gas and Geothermal Resources has determined that the alternate proppant does not pose any health hazard.

0002-44

The operational or accidental release of hazardous materials such as hydrogen fluoride (or its chemical precursors) and hydrogen chloride are a potential on-site worker safety issue, but not an air quality emissions issue.

0002-45

The commenter notes that the HRA assumed that well construction, drilling, and completion would last 23 days on average, whereas the DEIR noted that these activities could last longer than 60 days. DEIR at 3-41. Twenty-three days is the approximate time to drill a 10,000 foot well, which was determined to represent the maximum time it would take to drill 90-95% of the wells in Kern County. Thus, a 10,000 foot well was chosen as a representative well for purposes of the HRA in the DEIR. Please see GR Air-However, a few wells in Kern County are deeper than 10,000 feet and thus could take more time to drill, as referenced in the DEIR at 3-41.

For this reason, the revised HRA in Appendix M-1includes an additional well depth scenario for emission associated with drilling a 15,000 foot well; which can take approximately 66 days. Maximum potential health risks are significantly below the 20 in one million SJVAPCD risk threshold and also below a 10 in one million threshold with the exception of the Western Subarea – Derby Acres which was specifically selected by the SJVAPCD as a modeling site due to its complex terrain. Please see Appendix M-1 and GR Air-6 for a further discussion of this HRA.

0002-46

Sensitive receptor as used in the HRA is any location where people who have an increased sensitivity to air pollution are located. Sensitive Receptors are defined as "[p]eople that have an increased sensitivity to air pollution or environmental contaminants…locations include schools, parks and playgrounds, day care centers, nursing homes, hospitals, and residential dwelling unit(s). The location of the nearest sensitive receptors to a project site is needed to assess toxic impacts on public health." SJVAPCD "Guidance for Assessing and Mitigating Air Quality Impacts", April 2012, p. 9. All HRAs completed for the Project conservatively assume that all receptor locations are sensitive receptors. In addition, the HRAs assume that a pregnant woman and her small children reside at the nearest residential location. Please also see GR Air-3, GR Air-5, and GR Air-6 for further discussions of the HRAs.

0002-47

See response to comment 46, above.

0002-48

Please see GR Air-6.

0002-49

Please see GR Air-11.

0002-50

The issues raised by the commenter have been addressed in the FEIR and these responses to comments.

0002-51

Please see Technical Appendix to GR 10 on DOGGR Regulations and GR Water-2 regarding the UIC program, for a discussion of DOGGR's current UIC regulations. The comment does not explain what "future" regulations are referenced. If this refers to DOGGR's permanent regulations codifying the UIC compliance schedule currently provided in emergency regulations, those are discussed in GR 10. DOGGR's "Discussion Paper for Workshops on the Development of Updates to DOGGR's Underground Injection Control Regulations" sets forth a series of questions to be addressed by future regulations but does not include proposed future regulations or outline their possible content.

0002-52

0002-54

See response to comment 51 above.

0002-55

Regarding the different types of injection wells: About 95% of Class II injection wells in California are used for enhanced oil recovery (EOR) and about 3% are used for disposal of wastewater associated with oil production[1]. The average injection depth is about 2,000 ft. deep[2]. In Kern County, the average thermal EOR injection well is about 1,000 feet deep, with the shallowest injections (200-400 feet deep) occurring in the Lost Hills oil field.[3] Thermal recovery includes cyclic steam injection which is best suited for highly saturated and porous formations located less than 3,000 feet, with a thickness greater than 30 feet[4].

The CCST study, Volume II, page 282, states that DOGGR database depth information is given for only 13% (329) of water disposal wells active in California since 1981. Reported depths range from 197 feet to 14,500 feet. Depths greater than 5,905 feet have been recorded for 21 currently active water disposal wells. The depth range for the ten highest-volume injection wells for which depth information is available is 2,400–2,750 feet. Available data suggest that typical wastewater injection depths in California are about 4,921–9,842 feet. In the Rose Field in Kern County, produced water is injected at depths of about 2,500 to 6,000 feet into the Etchegoin and San Joaquin Formations[5].

As described by the CCST study (Volume I, pg. 87), in California, hydraulic fracturing in vertical wells is conducted at relatively shallow depths (less than 2,000 feet deep), with shorter treatment intervals than the horizontal wells common elsewhere. In about half the operations, the top of the fracturing interval is less than 1,000 feet deep. According to DOGGR well stimulation notices and the Central Valley Regional Water Quality Control Board data, operators used acid fracturing in California in fewer than 1% of reported well stimulations through May 2014. A few notices have indicated planned acid stimulations in the Elk Hills field at vertical depths ranging from 6,888 to 10,575 feet[6].

EOR, WST and injection wells activities occur at various depths depending on the source rock, geologic structure of the oilfield, and target zone. The DEIR provided a thorough analysis of water quality by considering available information on a number of studies conducted by the US Environmental Protection Agency, US Geological Survey, California State Water Resources Control Board and DOGGR to evaluate the potential of adverse impacts to water quality in in the Project area. These analyses comprehensively addressed potential impacts, focusing on the "receptors" (e.g., drinking water wells) that could be impacted from potential contaminant sources regardless of their depth, and including oil field operations in the Project Area. While the DEIR looked at the entire data set without segregation consideration of the relative injection well intervals as noted above, the review indicated that there are no data or confirmed evidence of drinking or agricultural well water contamination from current or historical oil and gas waste disposal by injection in the Project Area. An alternative analysis segregating the water quality by depth would not return a different conclusion.

0002-55 cont'd

0002-56

Draft EIR Chapter 4.9, Hydrology and Water Quality, fully evaluates the potential impacts of the Project related to the disposal of produced water and other permitted Class II wastes into subsurface formations that geologically isolated from, and that will contain and prevent potential future migration of the disposed materials to any USDW or other protected groundwater. The EIR explains that disposal injection volumes tend to, but may not necessarily occur, in the same general geographic locations where produced water and other injection wastes are generated. The EIR further explains that injection well disposal formations can include the same or closely proximate zones from which produced water and other wastes were extracted, or in geologically distinct formations and that, in either case, the injection zone must be stable and prevent the migration of disposed materials to protected waters.

With respect to potential Project impacts, the EIR fully discloses that injection well disposal could result in a discharge to groundwater in the event of a casing or well failure that allows injected materials to move from breach locations into other water-bearing formations. As the volume of waste disposal accumulates over time in specific zones, the discharge formation and portions of the well structure could become pressurized and subject to stresses that could increase the risk of well failure and groundwater impacts could increase. The EIR explains that oil and gas waste disposal by well injection is regulated by DOGGR as a Class II injection under the federal UIC program, which requires that all injections, including waste disposal, be permitted by DOGGR and that all wells used for disposal be regularly inspected and tested for structural integrity. To mitigate the risk of groundwater contamination from injection well failure, the EIR requires all injection wells to be constructed and operated in accordance with applicable state and federal laws and regulations.

In addition to potential impacts to groundwater caused by injection well failure, if injection wells are left idle without being properly plugged and abandoned, there is some potential for previously injected produced water and other Class II waste to migrate up the well bore and contaminate shallow groundwater aquifers above the injection zone. To address this risk, the Revised Amended Ordinance includes a new provision for the County to receive reports of idle wells that any person believes is actually abandoned or otherwise not in compliance with applicable idle well regulations, for the County to forward those reports to DOGGR for further action, and for the County to refrain from issuing new well permits to operators whom DOGGR has determined are in violation of applicable regulations requiring idle and abandoned wells until such violations are corrected. Moreover, mitigation measure MM 4.9-3 has been supplemented to prohibit well stimulation treatment activities under the State Water Resources Control Board, in consultation with the Central Valley Regional Water Quality Control Board, has approved either a groundwater monitoring plan or exclusion from groundwater monitoring for a given well, consistent with the State Water Resources Control Board Model Criteria for Groundwater Monitoring in Areas of Oil and Gas Well Stimulation.

0002-57

The comment's summary of "shallow thermal diatomite" is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration.

0002-58

The DEIR refers to, and includes an analysis of, "cyclic steam injected at or above the fracture pressure." This term is used to describe a process conducted in reservoirs characterized by low permeability to create and improve connectivity in the reservoir, lower the viscosity of oil and produce the reservoir fluids from the same wellbore. Draft EIR at 3-61. Although not referred to as "shallow thermal diatomite extraction operations," such processes are synonymous with what is being referred to by commenter. DOGGR has previously defended its decision to allow such activity: "Permitting cyclic steam in diatomite is consistent with the Division's statutory mandate to supervise oil and gas operations so as to allow operators to use methods and practices known to be suitable for recovery of oil and gas." DOGGR Letter to Sen. Pavley re: UIC Regulations and Injection Pressures (Mar. 23, 2015) at 2.

The impacts of such activities have been adequately mitigated in the EIR, including as to potential air emissions, blowouts, subsidence and ground stability. For example:

Cyclic steam production wells, including where cyclic steam is injected at or above the fracture pressure, are generally included as part of the Project and will be subject to full conformity review under the revised zoning amendment; (Draft EIR at Attachment A to Chapter 3.6); Cyclic steaming operations at or above the fracture gradient must comply with DOGGR's blowout prevention guidance (Draft EIR at 4.8-91–92); and MM 4.8-12 mandates that applicants who plan to perform cyclic steam injection activities at or above reservoir fracture levels comply with DOGGR requirements regarding protections against potential impacts from hazardous materials releases. As noted in DOGGR's comments, some oil operators have voluntarily implemented reduced injection volumes and pressures in their steaming cycles, and engage in continuous monitoring of well and line pressures. See also DOGGR Letter to Sen. Pavley re: UIC Regulations and Injection Pressures (Mar. 23, 2015) at 2 ("[DOGGR] has been working closely with operators conducting cyclic steam in diatomite on a project-by-project basis to ensure to that production occurs in the safest possible manner."). Such industry practices further ensure that any potential impacts will be insignificant after

mitigation. DOGGR has also found that because "most of the cyclic steam wells inject steam for a limited duration and volume into ‘zones laden with hydrocarbons’ the wells are ‘very unlikely’ to pose a threat to water supply wells. Draft EIR at 4.9-73.

In addition, DOGGR is in the process of developing regulations that will apply to various types of thermal steam production operations. This EIR is intended to cover all activities that will fall within the scope of the new DOGGR regulations once they have been adopted. (Draft EIR at 3-62). Such regulations will further ensure that potential impacts associated with cyclic steam injected at or above the fracture pressure will remain insignificant. See also DOGGR Letter to Sen. Pavley re: UIC Regulations and Injection Pressures (Mar. 23, 2015) at 2 ("We intend to enlarge and rewrite many of our UIC regulations to help assure that the conduct of cyclic steaming operations will be protective of surface integrity, public safety and the environment. We are committed to undertaking this effort soon").

In light of these existing and forthcoming DOGGR regulations, the County disagrees with commenter's suggestion that the County consider controls to limit injection pressures and/or injection volumes. As DOGGR is aware, the local regulation of the downhole aspects of oil and gas activities is preempted. SB 4 Final EIR at C.2-44 ("DOGGR has exclusive legal jurisdiction over, and thus ‘occupies the field’ regarding, ‘subsurface regulation.’ This means that that no other State or local agencies can impose regulations or mitigation on top of those imposed by DOGGR in that context.").

0002-59

As described in Global Response Haz-1, this EIR's mitigation program goes beyond existing regulatory requirements for mapping and mechanical integrity testing of pipeline, including waste gas pipelines. Specifically, in addition to implementing the regulatory requirements of AB 1960 and AB 1420, MM 4.8-4 has been modified to require the following:

As part of the Site Review Plan, the Applicant shall identify the location and right of way for all pipelines to be used for the transport of oil, gas, and produced water, including pipelines that intersect the main transport line, based on existing data and using commercially available technology, and, based on the results of this analysis, shall identify any sensitive receptors within 300 feet of the pipeline for purposes of complying with MM 4.8-4. Mechanical integrity testing of all such pipeline lengths within 300 feet of a sensitive receptor shall be required pursuant to MM 4.8.4-1.

With implementation of revised MM 4.8-4, the comment's stated concern regarding adequate identification of waste gas pipelines that will be utilized by the Project has been addressed.

In early 2014 DOGGR started issuing UIC permits for new sour (waste) gas disposal wells. Those permits generally contain the following conditions concerning H2S, which have become industry standard practice:

A Work Safety Plan that addresses H2S safety training, safe working procedures, signals alerting personnel to potential H2S exposure, and the use of personal H2S monitors. Due to the hazardous nature of the injectate gas, adequate safety precautions pursuant to local, state and federal agency requirements shall be taken to protect personnel operating in the hydrogen sulfide gas (H2S gas) project area. Such precautions shall include, but are not necessarily limited to: A. A permanent H2S monitoring system shall be installed at all project gas compressors. The monitoring system shall consist of four equally-spaced H2S detectors around each gas compressor station and shall be connected to a visual and audible warning system, set to activate if the monitors detect H2S gas concentrations above a safe working level. A windsock or windvane islocated at each compressor station.

B. The waste gas pipeline shall be clearly and adequately marked every 40 feet (unless buried) as containing H2S gas. It shall be tested in compliance with current Division pipeline testing requirements.

C. The following safety equipment shall be installed at each gas disposal well:

1. Permanently installed pipe or chainfencing around each well, offset a minimum of 5 feet, to protect the well head, and control entry.

2. The operator shall install permanent warning signs on all four sides of each well that clearly identifies the well as dangerous and containing hazardous gas. Additional signs must be posted with emergency contact information and that operator approval is necessaryprior to gas disposalwell site entry.

3. A permanently installed H2S monitoring system consisting of four equally¬ spaced H2S detectors connected to a visual and audible warning system, set to activate if the monitors detectH2S concentrations above a safe level.

4. A windsock or windvane is located at each well.

With implementation of these standard permit conditions, risks from new waste gas disposal wells that could be authorized by the Project will be adequately managed. No further mitigation is required.

0002-60

Commenter's observation about the absence of carbon dioxide injection activities for EOR operations in Kern County is noted for the record.

0002-61

The DEIR acknowledges land subsidence from oil and gas production, mainly in a few areas southwest Kern County. In general, it has been an industry practice to inject produced water from oil fields back into the oil-bearing formation to enhance oil recovery, maintain reservoir pressure and mitigate subsidence. This includes recycling produced water for well stimulation, which also mitigates subsidence. The DEIR also notes that

DOGGR monitors subsidence in oil fields and if subsidence is observed the operators are required to stabilize the ground either by inject additional produced water or reducing the volume of produced water extracted.

In major fields, subsidence is currently being monitored by DOGGR and the operators.

The comment provides accurate quotations from the EIR.

0002-67

Please see GR Water-1, updating available information regarding the Regional Water Board's enforcement orders.

0002-68

Under California hazardous waste regulations, it is the generator's responsibility to determine whether waste that it generates is hazardous. 22 CCR §66260.200(c). Assuming the waste is not otherwise excluded or exempted, and is not listed as a hazardous waste, the regulations provide for two primary means by which generators may make hazardous waste determinations: generator knowledge, and analytical testing. 22 CCR §66262.11(c). Please refer also to responses to Comment Letter 6 (DTSC).

To make a hazardous waste determination based on generator knowledge, the generator must obtain enough information to facilitate making a proper characterization of the waste. The information available may be of variable forms, including Material Safety Data Sheets for materials used in the process, process flow diagrams, information regarding the physical state and volume of wastes generated by the process, waste characterizations performed by industry associations for similar processes, chemical engineering designs or plans for the process showing inputs, chemical reactions expected, and products, literature from the supplier of materials or equipment used in the process, published data, documented studies on similar processes, and any previous waste analyses, if available. Ideally, the information available would enable the generator to calculate a materials balance of inputs and outputs of the process. Generator knowledge as a basis for hazardous waste classification comes with a greater risk of inaccurate characterization than analytical testing. The generator remains liable for its waste characterization, whether it employs generator knowledge or analytical testing. But if a generator determines that adequate information is available and the generator has confidence in its characterization of the waste based on the information, there is no legal requirement to conduct analytical testing to characterize the waste. If, however, the generator does not have sufficient information to serve as a reasonable basis upon which to characterize using process knowledge, the generator must perform analytical testing to accurately characterize the waste. Generators are expected to maintain documentation for at least three years demonstrating the information and/or data upon which its waste characterizations were made.

Produced water has been tested in the past and generally has been found not to exhibit hazardous waste characteristics. The presence of benzene in produced water does not render it hazardous under California law. See 40 CFR 261.4(b)(5).

0002-69

Please see previous response. Should the interagency working group result in additional requirements adopted by the State or Regional Water Board, or any other agency, those requirements would further reduce the potential for significant impacts.

0002-70

Please GR 12 regarding the CCST study and GR Water-1 regarding surface disposal in percolation ponds. As the commenter notes, new SB-4 regulations effective July 1, 2015 require sampling and testing of produced water after WST operations. All wastewater must be disposed of in accordance with hazardous waste regulations as required by 22 Cal. Code Regs. Division 4.5 and enforced by the Department of Toxic Substances Control. The discharge of produced water from wells that have been hydraulically fractured into percolation ponds is no longer permitted, 14 Cal. Code Regs. §1786. To the extent that the CCST study identified a potential impact resulting from disposal of produced water from wells subjected to WST in percolation ponds, which was previously permitted but is now prohibited, new impacts would not be expected to occur. The County is entitled to rely on enforceable regulations of other agencies as substantial evidence that an otherwise significant impact will be reduced to less than significant; please see GR 22.

0002-70 cont'd

0002-71

Please see previous response. Should the interagency working group result in additional requirements adopted by the State or Regional Water Board, or any other agency, those requirements would further reduce the potential for significant impacts.

0002-72

Please see previous responses and GR regarding the CCST study. As the commenter notes, it did not have the benefit of the CCST study when it prepared its SB 4 EIR. Similarly, the County did not have the benefit of the CCST study when preparing its Draft EIR. However, as discussed in the responses above, to the extent that the CCST study identified a potential impact resulting from disposal of produced water from wells subjected to WST in percolation ponds, which was previously permitted but is now prohibited, new impacts would not be expected to occur. It is not necessary for the County to propose new mitigation measures regarding this issue.

0002-78 cont'd

0002-79

The comment is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration.

0002-80

This EIR is not meant to provide CEQA coverage for any future use of produced water for agriculture irrigation currently being contemplated by the Kern-Tulare Water District. The County is currently unaware of any plans by Cawelo Water District (CWD) to undertake CEQA review for its continued reuse of produced water for agriculture irrigation. As explained in GR Water-8, this EIR discloses the baseline use of produced water by CWD of approximately

32,771 AF, though that number was in fact 32,491 AF, or slightly less than the more conservative estimate in the Draft EIR. As explained by the California Supreme Court in *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310 (CBE), "the baseline for CEQA analysis must be the ‘existing physical conditions in the affected area’ . . . , that is, the ‘real conditions on the ground’." (*Id.* at p. 321, quoting *Environmental Planning & Information Council v. County of El Dorado* (1982) 131 Cal. App. 3d 350, 354, and *Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 121.) Thus, this EIR properly takes into account existing use of treated produced water for agricultural irrigation regardless of whether CWD has conducted past environmental review of this use.

This EIR assumes that the amount of produced water provided to and resused by CWD for agricultural irrigation will remain the same going forward. DEIR pp. 4.17-12-13, 20. The provision of produced water to CWD is part of the existing conditions and subject to an existing agreement and permit between Chevron and CWD. Any increase in the amount of produced water provided to CWD would be subject to the terms of the existing agreement and permit, or an amendment thereto. CWD, as lead agency for any such amendment, would be required to make its own determination concerning CEQA compliance. It would be inappropriate for the County to interfere with CWD's existing contractual relationships and permit requirements or it's authority as a CEQA lead agency. Further, as explained in GR Water-8, there is substantial evidence in the record that all treated produced water supplied to CWD complies with the regulatory and permit standards required by CWD; thus, any impact associated with such provision is less than significant. As also explained in GR Water-8, this EIR adds MM 4.8-23 concerning use of well stimulation treatment (WST) fluids, which will help address concerns about the potential existence of WST fluids in produced water.

0002-81

See response to comment 80, above.

0002-82

Please see GR Water-8.

0002-83

Please see GR Water-8.

0002-84

Testing and monitoring of treated produced water used for agricultural irrigation is best done pursuant to agreement between the provider and water district to which such water is being provided, consistent with regulatory and permit standards promulgated by the districts, the regional water quality control board, or the state water resources board. The requirement that testing and monitoring be undertaken will be tracked as part of the MMRP for this EIR. Please see GR 19.

0002-85

Commenter's notes regarding the content of the SB 4 EIR are noted. The Draft EIR included a comprehensive evaluation of available water supplies, including the significant current overdraft of groundwater, as explained in the Water Supply Assessment (Appendix T in the Draft EIR), and as further updated in GR Water 5. The amount of water used in WST operations is a very small fraction of the amount of water used in the

Project Area. MM 4.17-2 requires Applicants to increase the re-use of produced water, following treatment as needed, to more than offset Project use of higher quality groundwater and surface water. As commenter notes, replacing produced water back into appropriate geologic strata and aquifers is important to avoiding adverse subsidence impacts. Further, as noted in the Water Quality discussions in the EIR, in the Water Quality Appendix, and in various comment letters including the letter from the Water Board (Letter 3), produced water varies dramatically in quality and treatability. For these and related reasons, the Draft EIR does not prescribe any particular location, treatment technology, or beneficial use of treated produced water. However, as described in GR Water 5, there is more produced water used for agriculture than was reported in the Draft EIR, and several produced water treatment proposals remain under consideration by local water districts. Local water districts act as the lead agency for such projects, and are not subject to County zoning regulations; any such treatment facility would trigger the need for further CEQA review by the lead agency and be required to address environmental impacts and mitigation measures to address issues such as subsidence, monitoring and compliance parameters, and related issues.

See response to comment 90, above.

0002-96

See response to comment 90, above.

0002-97

The comment states the commenter's conclusion that MM RSK-2a "does not go as far as the CCST Study recommends" and asks for "additional information in the Final EIR about the County's analysis and conclusions on this issue." To further address uncertainties regarding well stimulation fluid content and transport, as discussed in the CCST report and raised by this and other commenters, this EIR has added MM 4.8-16, requiring toxicity testing, as included in Section 7.1.4.

0002-98

The commenter's goals for the SB 4 EIR are noted, the "project" analyzed in the SB 4 EIR is noted, commenter's regulatory authority and role (including commenter's authority to impose additional conditions of approval in DOGGR permits without challenging the adequacy of the EIR, and without preparing a supplemental EIR or other CEQA document beyond what the County has prepared), and commenter's role as a responsible agency for permitting oil and gas well drilling and operations, are noted for the record, are consistent with the County's understanding, and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

The commenter's explanation that its reservation of its permitting authority is not intended to mean that DOGGR rejects any of the County's EIR mitigation measures, and that DOGGR could impose permit conditions that include measures from the SB 4 EIR, are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

Commenter's conclusion that some of the mitigation measures included in the EIR are more rigorous than the SB 4 EIR measures, but has also identified some instances in which the County's mitigation measures do not appear to be "substantially consistent" with the SB 4 measures, are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-99

Please see response to comment 98.

0002-100

Please see response to comment 98.

0002-101

Commenter's list of nine mitigation measures for which DOGGR has identified substantially consistent mitigation measures about which commenter has no further comments is noted for the record, and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

Please see response to 0002-101.

0002-102 cont'd

0002-103

Please see response to 0002-101.

0002-104

The commenter's conclusion that the other mitigation measures in the EIR reflect a somewhat different approach than the measures that were included in the SB 4 EIR, and commenter's submittal of its July 15 Mitigation Policy Manual for the SB 4 EIR Mitigation Measures, are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

Commenter's decision that seven of its SB 4 mitigation measures will be converted into formal regulations is noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-105

This is an introductory comment describing eleven mitigation measures from the SB 4 EIR that commenter states were missing from and overlooked by the County's EIR, which commenter notes are important for public safety and/or the protection of natural resources. This introductory comment is noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-106

Commenter's recommendation that an additional seismic risk measure be added for urban areas has been accepted and included in the Final EIR as revisions to MM 4.6-1(b), as set forth in Section 7.1.4 of the Final EIR. Commenter's recommendations regarding this measure, and its relationship to certain CCST recommendations, are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration. The CCST report volumes released after issuance of the Draft EIR are generally addressed in GR 12, and the CCST report regarding earthquake risks from WST produced water management activities is addressed in GR Geo 1.

0002-106 cont'd

0002-107

Please see response to 0002-106.

0002-108

Please see response to 0002-106.

0002-109

Commenter's recommendation that an Earthquake Response Plan be included in the Spill Response Plan required by applicable regulations, and that certain additional measures be included in the Plan, is noted. MM 4.8-7(e) has been added to the Final EIR to address this concern, and is included in Section 7.1.4 of this Final EIR. Commenters’ further points about the CCST report content on earthquake risks and related information are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-110

Please see response to 0002-109.

0002-110 cont'd

0002-111

Commenter's request that the County adopt a mitigation measure that is substantially similar to GW-4a in the SB 4 EIR, which requires adequate "down-hole" cement seals, casings, and other technical specifications. These technical specifications fall within DOGGR's jurisdiction and expertise, and the County anticipates that DOGGR will adopt appropriate standards and permit conditions as part of its permitting authority. The Draft EIR does describe improvements in well casing standards and other well construction practices, which third party experts such as Stanford University have concluded have been effective in improving the integrity of well casings in recent years. MM 4.8-10(b) has been revised to require applicants to obtain, and comply with, DOGGR permits to assure that WST activities occur in wells with adequate casings, seals, and other technical specifications. Commenter's further points about the importance of these technical specifications, and adverse consequences from well failures, are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-112

Please see response to 0002-111.

0002-113

Please see response to 0002-111.

0002-114

Commenter's request that the County adopt a mitigation measure that is substantially similar to GW-4b in the SB 4 EIR, which requires installation of a well seal across protected groundwater for new WST wells, likewise applies to "down-hole" technical specifications that fall within DOGGR's regulatory jurisdiction and expertise. The County anticipates will adopt and enforce appropriate well construction standards to protect groundwater. The revised MM 4.9-1, described in the prior comment, has been added in response to this comment. Commenter's further points about the importance of well seals to protect groundwater resources are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-115

Please see response to 0002-114.

0002-116

Please see response to 0002-114.

0002-117

Commenter's request that the EIR include a mitigation measure requiring a methane sensor has been reviewed and determined to fall within the jurisdiction and expertise of other agencies, but is not required to mitigate a significant adverse impact identified in the EIR. The EIR does include a methane mitigation measure (MM 4.7-2) which is designed to reduce methane emissions, and require compliance with methane regulations.

0002-118

Please see response to 0002-117.

0002-119

Commenter's suggestion to require geophysical surveys and other field methods to locate improperly abandoned wells is considered a remedial measure to address legacy practices. The Project under consideration is an amended zoning regulation to address future activities, and the EIR evaluates the impacts of the Project. Adoption of a program to address legacy conditions is outside the scope of the Project, and thus this suggested mitigation measure has not been included. In response to this and other comments regarding legacy activities, the Revised Amended Ordinance includes a new reporting and accountability process for idle wells, and MM 4.2-1 provides agricultural mitigation credit for removal of legacy activities on active agricultural lands.

0002-120

Please see response to 0002-119.

0002-121

Please see response to 0002-119.

0002-122

Please see response to 0002-119.

0002-123

Commenter's request that the County add a mitigation measure requiring use of a tracer for WST wells has been included in revised MM 4.9-3, which also requires RWQCB approval of the appropriate type of tracer for this subsurface water quality monitoring activity, as set forth in Section 7.1.4. Commenter's other points regarding the importance of this measure are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-124

Please see response to 0002-123.

0002-125

Commenter's request for mitigation measure requiring an annual inventory of WST equipment and infrastructure, and a report including likelihood of spill or leaks, falls within DOGGR's regulatory jurisdiction and expertise. While such studies have value in informing future regulations, they do not have direct mitigation value in avoiding or reducing significant adverse Project impacts, and thus this has not been added as a mitigation measure to this EIR. Commenter's other points regarding the CCST study's concerns regarding this study are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-127

Please see response to 0002-125.

0002-127

0002-128

Commenter notes that WST activities may adversely affect water quality, and recommended the addition of a surface water quality mitigation measure. MM 4.4-18 has been modified to include a mandatory 50-foot setback from waters and wetlands for wells, tanks, ponds and sumps.

The Final EIR also continues to include MM 4.8-3(c), which requires a 100-foot setback for fuel and lubricant storage, and refueling and equipment lubrication. Commenter's other points about the need to protect waters and wetlands are noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0002-128 cont'd

0002-129

Please see response to 0002-128.

0002-130

Please see response to 0002-128.

0002-131

Commenter recommends including a mitigation measure to encourage operators to reduce their mass inventory of hazardous materials, and thus reduce the likelihood and potential harms created from accidental spills and releases. Section 4.8 of the Draft EIR includes 22 mitigation measures to avoid and mitigate potential hazard impacts, including spill prevention and response measures. These have been tailored for project-level implementation as part of a ministerial permit approval program to avoid and reduce hazard-related risks, and addition of the suggested mass inventory reduction encouragement measure is not warranted.

0002-131 cont'd

0002-132

Please see response to 0002-131.

0002-133

The Draft EIR has not identified a significant adverse impact from proppant use that warrants a mitigation measure revision to limit proppant use, nor did the Draft EIR evaluated the use of unknown alternative proppants or delivery systems which could pose similar or more serious worker safety issues as silica proppant. However, in response to this DOGGR comment the Final EIR includes a revised mitigation measure by adding a new subsection (f) to Mitigation Measure 4.8-3, encouraging use of an alternate to silica sand as a proppant only after the Division of Oil Gas and Geothermal Resources has determined that such an alternative does not introduce new hazards.

0002-134

See response to comment 133, above.

0002-135

Commenter's concluding statement is noted for the record.

0002-136

Within the Central area moving from east to west, the aquifer ranges from unconfined to semi-confined to confined conditions. This is because the Corcoran Clay, a low permeability layer that separates the shallow, unconfined aquifer from the deep, confined aquifer, pinches out to the west as it nears the surface. Where the Corcoran Clay pinches out, it becomes ineffective as a hydraulic barrier between the shallow and deep aquifers and the aquifers become hydraulically connected under semi confined and unconfined conditions.

The area where this occurs is called the forebay and is located generally between the Sierra Nevada bedrock and highway 99. At the city of Delano, the area expands to also include the area east of highway 99 around the cities of Shafter and Wasco. The forebay is where the deep, confined aquifer receives recharge (SWSD 2012).

Recharge of groundwater occurs through infiltration of surface water. Surface water includes precipitation, water from lakes and streams, as well as application, storage, and infiltration of imported water, including a number of groundwater recharge facilities in the area (SWSD 2012). Recharge to the deep, confined aquifer occurs principally as subsurface inflow from the forebay. It is possible that potential impacts in the unconfined aquifer from wells located in the forebay area could flow down with the groundwater that is recharging the deep, confined aquifer.

However, due to the large volume of recharge, and the small potential volume of impacted groundwater, it is not likely that measureable concentrations from potential impacts would be detected in the deep, confined aquifer. This is primarily due to dilution and diffusion.

Source: Semitropic Water Storage District (SWSD), 2012. Draft Groundwater Management Plan, Kern County, California

0002-137

Please see GR 8 regarding the basis for well projections. Regarding the prohibition of produced fluids from WST wells into surface impoundments, please see responses above and GR Water-1.

0002-138

Regarding the prohibition of produced fluids from WST wells into surface impoundments, please see responses above and GR Water-1.

0002-139

Please see GR 22 regarding compliance with regulations as CEQA mitigation.

0002-140

The comment states that it does not believe the DEIR contains sufficient detail to provide meaningful coverage for all oil and gas approvals that DOGGR may be called upon to make as a responsible agency.

An important purpose of the Revised Amended Ordinance is to establish a ministerial site plan review process that incorporates mitigation identified in this EIR. While this streamlined process may avoid individualized-CEQA review for many projects, it should not be considered a "shortcut" around environmental review. Rather, the Revised Amended Ordinance increases the County's oversight of oil and gas extraction that are allowed "by right" and properly sets forth a ministerial permitting process. DEIR, pp. 2-23 to 2-24; see also, *Sierra Club v. Napa County Board of Supervisors* (2012) 205 Cal.App.4th 162; *San Diego Citizenry Group vs. County of San Diego* (2013) 219 Cal.App.4th 1.

The EIR has determined that project-level environmental review of this ministerial program was appropriate for a number of reasons:

First, by examining both the broad implications of the ordinance changes and the detailed site-specific impacts, this approach facilitates identification of the most effective development standards and mitigation requirements to be incorporated into the site plan review process. Second, a project-level EIR allows the Board of Supervisors and the public to be informed by a comprehensive analysis of impacts at the time the Board considers whether and how to modify existing County ordinances. Finally, a project-level EIR provides responsible agencies with the level of completed CEQA process required to inform and reach final decisions regarding subsequent discretionary approvals and other actions regarding these County oil and gas activities. If the criteria for supplemental CEQA review are triggered for a particular activity regulated by the revised County ordinances, additional CEQA review would be necessary (14 CCR §§ 15096(e)(3), 15162). DEIR, p. 2-24. Thus, the EIR recognizes a backstop where one or more criteria for additional CEQA review is triggered. DOGGR has not specified the details it believes are lacking from the Draft EIR, and the County need not address speculative effects of a project. CEQA Guidelines, §§ 15144 ["[w]hile foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can"], 15145 ["If after thorough investigation, however, the agency finds that a particular impact is too speculative for evaluation, it may terminate further discussion of the impact"].

For a more detailed discussion regarding the County's ability to utilize a Program vs. Project-Level EIR, please see GR-2. For a more detailed discussion of the proposed use of this EIR by responsible agencies, please see GR 5.

0002-141

The self-certification process was described in the Amended Ordinance included in the Draft EIR. Based on this and other comments, a Revised Amended Ordinance has been completed that includes further information on this and other topics. The Revised Amended Ordinance is included in Section 7.1.3 of this Final EIR.

0002-142

The comment notes that the CEQA review should consider impacts from injection wells, as well as from the 2,697 producing wells. As shown in Table 3-5, the EIR considers impacts from a variety of new well types anticipated to occur under the Project. The EIR considers potential impacts of up to 3,649 new wells drilled, of which 2,697 are estimated to be producing wells. The Revised Amended Ordinance incorporates this 3,649 new well figure as an annual cap on new well ministerial permits issued.

The comment also cites to DOGGR's Weekly Summary reports, which show drill notices received and permits issued and notes that based on the numbers presented, the EIR may not adequately address impacts from drilling in the Project Area.

The comment's list of "Permits Issued" shows annual numbers which are less than the cap of 3,649 well permit ministerial approvals provided for in the Revised Amended Ordinance. Please refer to GR-14, which explains the numbers used in the EIR in relation to data provided by DOGGR and notes in part that based on a review of the data, the number of annual wells drilled is significantly less than the number of notices filed in the same or the prior year. Please also see GR-8 explaining the conservative well count projection used in this EIR.

0002-143

The comment is noted. The Regional Water Quality Control Board's role in regulating sumps and ponds is described in Chapter 4.9 of the EIR, as well as GR Water-1.

0002-144

The comment is noted and included in the Final EIR. The DEIR does use this regulatory definition when referring to "idle wells." DEIR, p. 4.3-85.

0002-145

Please see GR 19.

0002-146

Please see GR 19.

0002-147

The Revised Amended Ordinance included in Section 7.1.3 includes several modifications that make clear new ground disturbance activities such as constructing wells (which includes well pad preparation) does trigger the need for a County permit review process.

0002-148

Commenter indicates that MM 4.2-1 would be enhanced by adding that agricultural easements or mitigation lands be held in perpetuity as required by Government Code § 65965 et seq., and that any non-governmental easement holding entities be certified by the Land Trust Accreditation Commission.

Conservation easements that are created to satisfy a mitigation requirement must be perpetual in duration. (See Govt. Code, § 65966.) As such, the County's Ordinance does not need to specifically state a perpetuity requirement. In regard to the entities holding the easement, the County will apply its discretion in selecting qualified entities to hold easements within the parameters established by the Civil Code and Government Code. Please see GR Ag-1 (Adequacy of Mitigation Program for Farmland Impacts), which addresses the County's ability to defer deciding specific information about the conservation easement mitigation option.

0002-149

Emissions from WST were not included in the HRAs prepared for the Project. Please see GR Air-8 for an explanation of why emissions from WST activities do not need to be quantified.

0002-150

The commenter asks that the County include specific standards to address health concerns related to exposure and inhalation hazards from silica dust during well stimulation treatment operations where proppant is used. Please see Response to Comments 43 fand 133 for a discussion of silica proppant.

0002-151

Please see section 7.1.4 and revised MM 4.4-1, as well as GR 19.

0002-152

The comment asks whether the southwest willow flycatcher should be listed under Category 2 rather than Category 3 in the EIR. As explained in Table 4.4-36, the Southwestern willow flycatcher nests in riparian vegetation, willows, and coast live oak. Due to the lack of dense riparian tree and shrub communities associated with rivers, lakes, and swamps in the San Joaquin Valley Floor portion of Kern County, Southwestern willow flycatcher was not included in the Category 3 species for detailed analysis.

0002-153

Please see section 7.1.4 and revised MM 4.4-1, as well as GR 19.

0002-153 cont'd

0002-154

The comment is noted for the record and included in the Final EIR. Please see GR 19 and section 7.1.4.

0002-155

Please see section 7.1.4 and GR 19.

0002-156

The commenter questions the adequacy of the DEIR's mitigation to limit the spread of invasive species. The commenter indicates that, aside from requiring washing of tracked and tired vehicles and equipment before moving to a new disturbance, the DEIR should identify specific types of invasive plant species that are most problematic in the Project area and consider measures that limit their spread from construction activities to either habitat or agricultural lands as a means of increasing the DEIR's effectiveness.

Given the broad geographic scope of the Project, the DEIR defines "Nonnative Invasive Species" as:

[P]lant species that are introduced into an area in which they did not evolve, and in which they usually have few or no natural enemies to limit their reproduction and spread. These species can cause environmental harm by significantly changing ecosystem composition, structure, or processes, and can cause economic harm or harm to human health.

DEIR, at p. 11-33. As described in the DEIR, new land disturbance outside of actively disturbed areas could indirectly affect special status plants and wildlife by introducing invasive species that could disturb occupied or suitable special status species habitats. DEIR, at p. 4.4-173.

Recognizing the potential impacts caused by the introduction of invasive species to suitable special status species habitats, the DEIR identifies appropriate mitigation. As the comment observes, MM 4.4-15, subdivision (o) requires that "[t]racked vehicles and other construction equipment must be washed or maintained to be weed-free prior to entering and working within areas of new disturbance." DEIR, at p. 4.4-214. However, this is not the only mitigation measure designed to limit the spread of invasive plant species. MM 4.2-2, subdivision (e) indicates that vehicle tracking control will be installed to prevent the tracking of mud, dust, and weed seeds offsite. DEIR, at p. 4.2-23. MM 4.4-12, subdivision (a) requires plant surveys to be completed. In the event that protected plants or plant populations are identified during field surveys, they will be demarcated with temporary flags or appropriate materials to avoid and minimize impacts to such plants from disturbance activities. DEIR, at p. 4.4-210. Additionally, MM 4.4-14 identifies a "Worker Environmental Awareness Program" designed to provide worker training to recognize, avoid, and reduce impacts to onsite Biological Resources. DEIR, pp. 4.4-211 – 4.4.-212.

This mitigation scheme is consistent with CEQA's mandates. Specifically, "an EIR need not analyze ‘"‘every imaginable alternative or mitigation measure; its concern is with feasible means of reducing environmental effects.’"’ [Citation.]" *Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1055-1056. "‘Feasible’ means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors. Pub. Resources Code, § 21061.1. Mitigation measures that cannot be legally imposed or enforced need not be proposed or analyzed. *San Diego Citizenry Group v. County of San Diego* (2013) 219 Cal.App.4th 1, 16; citing *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 912, 938; Pub. Resources Code, § 21086, subd. (b).

The EIR complies with these requirements – the County has incorporated a thorough mitigation framework to ensure that the spread of invasive species is limited, and the DEIR concluded that these measures would reduce the impact to less than significant. DEIR, p. 4.4-125.

0002-157

The comment is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration

0002-158

The comment is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration. The County intends to utilize the habitat prioritization approach identified by CCST to inform the County's acquisition of wildlands with compensatory mitigation fees. The adequacy of the proposed mitigation program for impacts to Biological Resources is discussed further in GR Bio-1. The overlap between the analysis and conservation measures in this EIR and those in the Draft Valley Floor Habitat Conservation Plan (HCP); Chevron North American Exploration and Production Lokern HCP; California Resources Elk Hills HCP, and the use of this EIR for future approvals related to the Lokern and Elk Hills HCPs, is discussed in GR Bio-2.

0002-159

The comment is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration.

0002-160

The comment suggests that, in the discussion of cumulative impacts on biological resources (Section 4.4.5), the County might consider using the same projected approach that is used for project impacts, and that it would be informative to add information from the County General Plan, trends in growth and industrial development.

The EIR's cumulative discussion analysis in the Biological Resources chapter included future growth in the County, and was informed by regional growth forecasts such as the Kern General Plan and the Kern Council of Governments (COG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). DEIR p. 4.4-229 and p. 10-1. Specifically, the EIR notes that the existing urbanized development areas are currently interspersed with less developed or undeveloped lands which either are, or could be, planned for eventual urbanized development under adopted general plans. DEIR p. 4.4-229. The EIR also reports that future land uses and development could affect biological resources, and that new projects or urbanization consistent with the applicable general plans would be undertaken as independent actions with associated impacts, avoidance and minimization requirements, and mitigation, if required, under applicable federal, state, regional and local agency law. DEIR p. 4.4-230.

0002-161

The comment is noted and included in the Final EIR. DOGGR Division 4 staff was consulted and assisted with preparation of the EIR.

0002-162

Paleontological resources could be impacted by activities in oil and gas formations as described in Section 4.5.4 (under Impact 4.5-3) and identified in Table 4.5-2, including EOR operations.

0002-163

This comment is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration. Upon further consideration the County has determined that the mitigation measure includes appropriate specificity.

0002-164

This comment is noted, and it is accurate that paleontological resources may be found in shallower strata. Staffing all well sites with a qualified paleontologist during all earth moving activities is not determined to be required to implement this mitigation measure.

0002-165

The comment is noted and included in the Final EIR. The referenced MM applies to archeological resources.

0002-166

The comment is noted and the suggested text deletion has been made in the Final EIR.

0002-167

The comment requests information on industry practices to address landslide risk. Such practices include avoidance, slope modification, drainage control, and debris movement control. Avoidance consists of identifying the landslide or unstable slope area and taking steps to avoid placing structures or other infrastructure within the unstable area. Slope modification is used to correct the underlying causes of the unstable slope. Commonly used practices are removing material from the head, or top, of the landslide and putting additional material at the toe, or bottom, of the landslide. This reduces the driving forces that contribute to the movement of landslides. Additional methods used are retaining structures and internal slope reinforcement. Water adds weight and reduces friction within a landslide so engineering drainage controls to prevent the introduction of water into a landslide and interior drains to remove water from within a landslide are used to reduce the risk. To control the movement of landslide debris downslope of the landslide, mechanical barriers or diversionary structures can be used to direct landslide debris into predetermined areas. See Dai, F.C., Lee, C.F., Ngai, Y.Y., Landslide risk assessment and management: an overview (2002), in Engineering Geology Vol. 64, pages 65–87

0002-168

The comment is noted and included in the final EIR.

0002-169

All local ordinances apply as applicable. In addition, the mitigaion measures in this EIR have been clarified to address this issue. Please Global Response Geo-1.

0002-170

MM 4.8-13 requires compliance with all applicable DOGGR regulations and requirements, including those regarding well stimulation treatment. Please see GR 19 regarding mitigation measure enforcement.

0002-171

The comment is noted and included in the Final EIR.

0002-172

The comment is noted and included in the Final EIR. The Draft EIR was not intended to be read as a limitation on the potential cause of surface expressions.

0002-173

The EIR has numerous mitigation requirements concerning reporting and clean-up of contamination in all parts of the Project Area, not just Tier 2. MM 4.8-1 requires a Worker Training Awareness Program to implement all mitigation measures; MM 4.8-2 requires that the transportation, storage and disposal of hazardous materials be done in accordance with the Hazardous Materials Transportation Act; MM 4.8-3 requires implementation of eight (8) related to storage and cleaning up of hazardous materials; MM 4.8-4 has been modified by this Final EIR to include new reporting and relocation requirements for pipeline leaks (see FEIR section 7.1.4); MM 4.8-5 requires reporting, testing, and, where necessary, clean up of contamination discovered during grading or excavation work; MM 4.8-6 requires implementation of 15 measures to prevent the release or accidental spillage of wastes, including oil and other petroleum products consistent with American Petroleum Institute (API) or other accepted environmental standards; and MM 4.8-7 requires that all exploration and development activities be conducted consistent with API or other environmental standards, including secondary containment standards and implementation of spill contingency plans consistent with DOGGR regulations. The remaining mitigation measures identified in DEIR Ch. 4.8 also contribute to the containment and clean-up of hazardous materials. Thus, while the comment correctly notes that certain obligations in MM 4.8-14 apply outside of the Tier 1 area, other mitigation measures ensure appropriate reporting, containment and clean-up in all Tiers.

0002-174

The comment is noted. Please see RTC 2-59.

0002-175

Impact 4.9-7 concerns whether implementation of the Project will interfere with any County-adopted emergency response or evacuation plans, and the analysis properly concludes that the Project does not interfere with the County's emergency evacuation plan in the event of a failure of the Lake Isabelle Dam. CEQA does not require analysis of whether the Project is consistent with facility-specific emergency response or evacuation plans.

Federal, state and local regulations do require industry to maintain and regularly update safety plans, including evacuation procedures, for various hazards associated with oilfield operations.

0002-176

See response to comment 59.

0002-177

As the commenter has noted, its regulations preclude disposal of produced water from stimulated wells in percolation ponds. Regarding produced water from wells that have not been stimulated, please see response 68-69 above. Produced water has been tested in the past and generally has been found not to exhibit hazardous waste characteristics.

0002-177 cont'd

As the commenter has noted, its regulations preclude disposal of produced water from stimulated wells in percolation ponds. Regarding produced water from wells that have not been stimulated, please see response 68-69 above. Produced water has been tested in the past and generally has been found not to exhibit hazardous waste characteristics.

0002-178

Neither this EIR, the CCST Study, nor the SB 4 EIR identified NORM-related groundwater impairment as a potential impact of well stimulation treatment or other oil and gas activities authorized by the Project. Mitigation measures must bear a "rough proportionality" to the Project's actual adverse impacts. (See CEQA Guidelines, § 15126(a)(4)(A), (B) [citing *Nollan v. California Coastal Com’n* (1987) 483 U.S. 825, 837; *Dolan v. City of Tigard* (1994) 512 U.S. 374, 391; *Ehrlich v. City of Culver City* (1996) 12 Cal.4th 854, 866-877)].) Since the analysis in the EIR does not support a conclusion that the activities authorized by the Project will result in NORM-related groundwater impairment, there is no legal basis for imposing the suggested mitigation measure.

0002-179

The comment is noted and included in the Final EIR. This section of the Draft EIR addresses all of the referenced topics (beneficial uses, public drinking water standards, and agricultural irrigation). Agricultural uses of groundwater with higher ranges of TDS is not generally desirable for most types of crops, and the Draft EIR's generalization is accurate. Finally, water quality in Kern County does vary and residents in Kern County do use drinking water above MCLs.

0002-180

Surface water quality varies by season, and also varies over time (e.g., quality over extended drought periods is different than quality over extended rainy period). Water quality also varies between the different basins included in the Project Area, and helped inform the division of the Project Area into three sub-areas. The EIR provides an appropriate level of detail (including quantitative data), which informs the generalized text conclusions referenced by the commenter.

0002-181

The comment is noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration.

0002-182

The comment is noted and included in the Final EIR. The Field Rules refine and inform the application of regulations within a field.

0002-183

Please see GR 1 and GR 19.

0002-184

Please see GR 1 and GR 19.

0002-185

The Best Management Practices (BMPs) set forth in DEIR section 3.5.5 are Applicant-proposed measures that reflect current practice and, in many instances are already required by applicable law and regulations. As stated on DEIR p. 3-72, the EIR does not assume that any of these BMPs will be implemented for purposes of analyzing or mitigating the potential significance of an environmental impacts of the Project.

In order to mitigate the risk of pollutants becoming entrained in stormwater, MM 4.9-1 (requiring compliance with all applicable federal, state, regional and local agency water quality protection laws and regulations) and MM 4.9-2 (requiring preparation of a detailed drainage plan for activities not subject to state or federal stormwater management laws). Implementation of these measures, as well as MMs 4.9-3 – 4.9-6, will ensure that impacts to stormwater are less than significant.

0002-186

The Best Management Practices (BMPs) set forth in DEIR section 3.5.5 are Applicant-proposed measures that reflect current practice and, in many instances are already required by applicable law and regulations. As stated on DEIR p. 3-72, the EIR does not assume that any of these BMPs will be implemented for purposes of analyzing or mitigating the potential significance of an environmental impacts of the Project.

In order to mitigate the risk of pollutants becoming entrained in stormwater, MM 4.9-1 (requiring compliance with all applicable federal, state, regional and local agency water quality protection laws and regulations) and MM 4.9-2 (requiring preparation of a detailed drainage plan for activities not subject to state or federal stormwater management laws). Implementation of these measures, as well as MMs 4.9-3 – 4.9-6, will ensure that impacts to stormwater are less than significant.

0002-187

The comment suggests that specific industry standards should be described in the final EIR and adopted as mitigation for "construction period fluid mixing, storage, handling, and conveyance equipment." MM 4.8-7 provides that exploration and development activities authorized by the Project be conducted "as described in *Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development: The Gold Book* (Bureau of Land Management 2007) or an equivalent industry standard such as *Environmental Protection for Onshore Oil and Gas Production Operations and Leases* (American Petroleum Institute 2009). This measure then sets forth minimum standards to be implemented as guided by these documents. MM 4.8-8 sets forth eight requirements, with references to specific industry standards, addressing topics such as well materials (subparagraph (a)), use of centralizers and stop-collars, and pressurizing or re-pressurizing petroleum product pipelines. By referencing these standards, the EIR ensures minimum safe operating requirements for oil and gas activities. Because industry standards are regularly updated, however, the EIR does not attempt to memorialize the precise language of the standard, thus allowing for more protective requirements to be applied as such standards are promulgated and rolled out to the industry.

0002-188

As the comment notes, spills of produced fluids from stimulated wells may contain WST chemicals from flowback. Table 4.9-23 in the EIR, page 4.9-76, presents a Summary of Chemicals Used in California Well Stimulation. While some of these chemicals are toxic, they are not qualitatively different from many chemicals found on oilfield sites. Many of them occur naturally in the target formation and even in common household items. The majority of well stimulation fluids by volume are comprised of water and proppants (sand). Base fluids (water, saline solutions, or brine) can account for over 85% of the mass of well stimulation fluids; see CCST study, Volume II, page 98. Flowback of WST chemicals in produced water is further vastly diluted in the produced water itself. Accordingly, spills of produced fluids from stimulated wells would not be expected to differ qualitatively or quantitatively from the general oilfield spills and leaks analyzed in the EIR. All of the analysis and conclusions in the EIR on the topic of spills and leaks from oilfield operations remain accurate. Please see also response 40, 41, and 42, above.

0002-189

Please see RTCs 2-65 – 2-84.

0002-190

Please see RTCs 2-65 – 2-84.

0002-191

Please see RTCs 2-65 – 2-84.

0002-192

MM 4.9-2 has been substantially modified and now requires, among other things, mandatory implementation of numerous Best Management Practices pursuant to subparagraph (3). Please see FEIR section 7.1.4 for the revised mitigation measures.

0002-193

The comment is noted and included in the Final EIR. Please see RTCs 65-72.

0002-194

As discussed in GR Water 1, the Final EIR incorporates the new regulatory prohibition on surface disposal of WST fluids.

0002-195

Please see GR Water-1 for the calculations requested by the commenter.

0002-196

Unlike the prohibition on percolation pond disposal of produced water from stimulated wells in the SB 4 implementing regulations, there is no unconditional regulatory prohibition use of produced water from stimulated wells for groundwater recharge. As the commenter notes, produced water may be treated for use in groundwater recharge. As the commenter elsewhere notes (see comments and responses 16-18), groundwater recharge with produced water may be an important means of controlling subsidence. This EIR does not authorize any produced water treatment or re-use facilities. Local water districts act as the lead agency for such projects, and are not subject to County zoning regulations; any such treatment facility would trigger the need for further CEQA review by the lead agency and be required to address environmental impacts and mitigation measures

0002-197

March 23, 2015

The Honorable Fran Pavley
Chair, Senate Committee on Natural Resources and Water
State Capitol, Room 5046
Sacramento, CA 95814

Re: UIC Regulations and Injection Pressures

Dear Senator Pavley,

Thank you for your letter of March 11, 2015, concerning fracture pressure specifications in our underground injection regulations. As you correctly observed in your background document[1] for the March 10 hearing, injection above fracture pressure has occurred and continues to occur in particular fields and injection zones.

This topic arose in your oversight hearing during the discussion of a particular kind of injection for production, namely, cyclic steaming. The question posed by Senator Allen at the time was whether cyclic steaming is legal. The legal basis for permitting these operations is described below.

The cyclic steaming technique involves injecting steam into a hydrocarbon-bearing zone at a temperature and pressure sufficient to free oil enough that it can return to the same well through which steam was injected initially and be pumped to the surface. This occurs most frequently in diatomite formations.

Diatomite is made up of the accumulated fossilized skeletons of prehistoric single-celled animals. It is both brittle and highly absorbent. (Its absorptive qualities make it suitable for use as cat litter and a grease absorber, and in places, it is mined for that purpose.) Diatomite is extremely brittle and even very low pressure will cause it to fracture. Very significant quantities of crude oil in this State are found in the same strata as the diatomite, absorbed into the pore spaces in the fossil matrix. In fact, oil from diatomite zones is the major portion of the total cyclic steaming picture, which is estimated to account for nearly 20% of California's total oil production.

[1] Oversight Hearing of The Senate and Natural Resources and Water and Environmental Quality Committees, *Ensuring Groundwater Protection: Is the Underground Injection Control Program Working?* March 10, 2015, p. 12

Most important to this discussion, the oil in such deposits cannot be easily freed from its diatomite matrix without cyclic steaming, using steam of sufficient heat to break down the brittle diatomite matrix, freeing the oil.

Permitting cyclic steam in diatomite is consistent with the Division's statutory mandate to supervise oil and gas operations so as to allow operators to use methods and practices known to be suitable for recovery of oil and gas. (Pub. Resources Code, § 3106, subd. (b)). This part of the statute authorizes the Supervisor, among other things, to:

> *supervise the drilling, operation, maintenance, and abandonment of wells so as to permit the owners or operators of the wells to utilize all methods and practices known to the oil industry for the purpose of increasing the ultimate recovery of underground hydrocarbons and which, in the opinion of the supervisor, are suitable for this purpose in each proposed case.*

This provision further provides that it is state policy to allow operators, with appropriate safeguards, to engage in

> *the injection of air, gas, water, or other fluids into the productive strata, the application of pressure heat or other means for the reduction of viscosity of the hydrocarbons, the supplying of additional motive force, or the creating of enlarged or new channels for the underground movement of hydrocarbons into production wells, when these methods or processes employed have been approved by the supervisor.*

The regulation you cite in your letter explicitly addresses other forms of long-term injection, such as water flood and water disposal, techniques involving the "sustained liquid injection" expressly referred to in the section you cite. (Tit. 14, Cal. Code Regs. §1724.10, subd. (i).) This is not surprising, as water was a commonly used secondary recovery method at the time these regulations were written. The regulation was likely meant to prevent operators from "watering-out" nearby operators' oil deposits. But the regulation does not directly address the regulatory concerns particular to cyclic steam generally, or cyclic steam in diatomite specifically.

Nevertheless, it is obviously important to Californians and to me that the Division's regulations impose reasonable protective limits upon all types of injection operations. We intend to enlarge and rewrite many of our UIC regulations to help assure that the conduct of cyclic steaming operations will be protective of surface integrity, public safety and the environment. We are committed to undertaking this effort soon: as you may know, we have agreed to deliver to US EPA a plan for comprehensive UIC program improvements, including rule-making actions, by July 15, 2015 to address the more significant shortcomings of our UIC program. In the meantime, the Division has been working closely with operators conducting cyclic steam in diatomite on a project-by-project basis to ensure to that production occurs in the safest possible manner.

As I indicated to Senator Allen during the hearing, I would be happy to meet with you and members of the Committee to discuss further with you the subject of cyclic steaming more generally.

Sincerely,

Dr. Steven Bohlen
State Oil and Gas Supervisor

RE: California regulation relevant to maximum allowable surface injection pressure for Underground Injection Control project wells

Dear Supervisor Bohlen,

At yesterday's joint legislative oversight hearing on the Division's implementation of its Underground Injection Control (UIC) program, you stated that you were unfamiliar with your Division's regulation regarding the maximum allowable surface injection pressure. The relevant excerpt from Title 14 of the California Code of Regulations, section 1724.10 "Filing, Notification, Operating and Testing Requirements for Underground Injection Projects" is as follows (emphasis added):

> (i) To determine the maximum allowable surface injection pressure, a step-rate test shall be conducted prior to sustained liquid injection. Test pressure shall be from hydrostatic to the pressure required to fracture the injection zone or the proposed injection pressure, whichever occurs first. **Maximum allowable surface injection pressure shall be less than the fracture pressure.** The appropriate district office shall be notified prior to conducting the test so that it may be witnessed by a Division inspector. The district deputy may waive or modify the requirement for a step-rate test if he or she determines that surface injection pressure for a particular well will be maintained considerably below the estimated pressure required to fracture the zone of injection.

Please confirm that all class II UIC injection wells in California comply with 14 CCR § 1724.10 (i).

I look forward to your response. Thank you for your time and consideration.

Sincerely,

Fran Pavley

RE: Comments on the Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 (C), focused on Oil and Gas Local Permitting (SCH # 2013091062)

Dear Ms. Oviatt

This letter provides staff comments from the Central Valley Regional Water Quality Control Board (Central Valley Regional Water Board or CVRWQCB) and State Water Resources Control Board (State Water Board or SWRCB), collectively referred to as the Water Boards, on the proposed Revisions to the Kern County Zoning Ordinance – 2015 C ("Project") and Associate Draft Environmental Impact Report (DEIR). 0003-1

I. COMMENTS ON THE KERN COUNTY DEIR

A. General Comments

This section contains general comments from the Water Boards regarding various aspects of the Kern County DEIR. 0003-2

1. The Water Boards recommend that the mitigation measures set forth in the "Analysis of Oil and Gas Well Stimulation Treatments in California" (State Clearinghouse Number 2013112046) SB 4 EIR, completed by the Department of Oil and Gas and Geothermal Resources (DOGGR), be taken into consideration in the Final EIR. 0003-3

2. The Water Boards are aware that this DEIR was prepared prior to the availability of the final volumes of the California Council on Science and Technology (CCST) Study but would like Kern County to consider whether any of 0003-4

0003-4 Continued

the conclusions and recommendations of the study may apply to the Kern County proposed project.

0003-5

3. The document should incorporate current well stimulation treatment (WST) regulations (California Code of Regulations [CCR], Title 14, Division 2, Chapter 4, Subchapter 2, Article 4, section 1786) that preclude WST fluid, additives, and produced water from a well that has had a WST from being stored (including disposed) in a produced water pond, sump or pit. The fluids must be stored in containers, sampled, and chemically analyzed to determine if the waste is a hazardous waste as defined by CCR, Title 22, Division 4.5, Chapter 11, Article 1, Section 662661.3.

0003-6

Given that WST fluids can no longer be stored in a produced water pond, sump, or pit, it is likely that volume of waste directed to injection wells will increase. This is likely to reduce the amount of produced water that is available for agricultural use. Therefore, the DEIR should be revised to reflect current WST regulations and to evaluate the effect of these regulations with respect to potential impacts to surface and groundwater quality.

0003-7

Additionally, if the chemical analysis of WST fluid determines that it is a hazardous waste, the waste cannot be injected into a Class II injection well. The waste must be transported to a permitted Class I well for injection. This may increase the surface transportation of hazardous wastes within Kern County.

0003-8

4. The Kern-Tulare Water District is located near the California Highway 65 and the intersection State Route 155 within the Eastern Subarea. Throughout the DEIR text, the Kern-Tulare Water District is mistakenly noted as being in the Western Subarea.

0003-9

5. In 1998, the CVRWQCB prepared Waste Discharge Requirements (WDRs) Order R5-1998-205, including a Monitoring and Reporting Program (MRP) for an operator in the Jasmin Field. The WDRs/MRP provides regulatory oversight for the operator to re-use good quality produced water, (not exceeding Basin Plan limitations) for local agriculture applications. The re-use is by blending the produced water with other surface and/or groundwater for distribution by the Jasmin Ranchos Mutual Water District. A global search of the DEIR did not locate any reference to the re-use of produced water from the operator in the Jasmin Field.

0003-10

6. Within Section 4.9 and in Appendix T, the reported amount of treated produced water reused for agriculture and produced water discharged to permitted ponds should be updated to include information that is more recent.

0003-11

7. Throughout the DEIR, the acronym RWQCB and CVRWQCB are used interchangeably in several sections of the report when discussing the Project

0003-11 Continued

area. For consistency, it is suggested that the appropriate term discussing the applicable RWQCB agency related to the Project area would be to use CVRWQCB.

0003-12

8. An additional mitigation measure should be considered that requires WST applicant to have the State Water Board, in consultation with the CVRWQCB, approve either a groundwater monitoring plan or exclusion from groundwater monitoring, consistent with the Model Criteria for Groundwater Monitoring in Areas of Oil and Gas Well Stimulation (State Water Board Resolution No. 2015-0047).

0003-13

9. As of July 1, 2015, flowback fluid and produced water from well stimulation operations may not be discharged to ponds, sumps, or other non-contained surface storage/disposal facilities as per DOGGR regulation.

B. Executive Summary

0003-14

1. Table 1-3, Impact 4.9-1 Violate any Water Quality Standards or Waste Discharge Requirements

Suggested Revision: Change to read, “Violate any Water Quality Standards, Water Quality Monitoring Requirements, or Waste Discharge Requirements.”

0003-15

2. Table 1-3 Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation (MW 4.9-2, first sentence) (see also MM 4.9-4 on 4.9-143).

Suggested Revision: shall not conduct any Class II injection activity regulated by the Underground Injection Control program, including enhanced oil recovery activities that discharge into any underground source of current of future beneficial use groundwater, including drinking water, unless the aquifer has been exempted by the United States Environmental Protection Agency or injection has otherwise been authorized by the U.S. Environmental Protection Agency or by the Davison of Oil, Gas and Geothermal Resources, in consultation and agreement by the State Water Resources Control Board, consistent with Public Resources Code 3131.

3. Add a mitigation Measure in Table 1-3, Impact 4.9-1 to cover:

0003-16

Suggested Revision: For any WST activity, the applicant shall not conduct WST until the State Water Resources Control Board, in consultation with the CVRWQCB, has approved either a groundwater monitoring plan or exclusion from groundwater monitoring for a given well, consistent with the SWRCB Model Criteria for Groundwater Monitoring in Areas of Oil and Gas Well Stimulation.

0003-17

4. Table 1-3 Summary of Impacts, Mitigation Measures, and Level of Impacts after Mitigation (MM 4.9-2, last sentence) (see also MM 4.9-2 on 4.9-

0003-17
Continued

146-147).

Original: "Recommended best management practices for the construction phase shall include the following:" (Items a. through e); Item d. "Waste and Material Management."

Suggested Revision: Add to Item d: sub-item 6. "Provide and maintain adequate secondary containment to minimize or eliminate pollutants from moving offsite and into receiving waters."

C. Chapter 4 – Environmental Setting, Impacts, and Mitigation Measures

0003-18

1. Page 4.6-35, 4th paragraph

Original: Each well operator must obtain a permit from DOGGR in advance of a well stimulation treatment and must submit an application that includes the identification and location of the well; the time period during which the well stimulation treatment is planned to occur; a water management plan; a list of the anticipated identity and concentration of the chemical constituents of the well stimulation treatment fluids the operator plans to use; modeling of the well stimulation treatment and identification of plugged and abandoned wells and geologic faults within the modeled treatment area; indication that the operator is developing a groundwater monitoring plan meeting the criteria of the applicable Regional Water Quality Control Board (Regional Board) (operations cannot begin unless a plan has been approved); an estimate of treatment-generated waste materials that are not addressed in the water management plan; identification and contact information of the operator; the depth of the base of fresh water; and the results of specified evaluation and modeling.

Suggested Revision: Each well operator must obtain a permit from DOGGR in advance of WST and must submit an application that includes the identification and location of the well; the time period during which WST is planned to occur; a water management plan; a list of the anticipated identity and concentration of the chemical constituents of the WST fluids the operator plans to use; modeling of the WST and identification of plugged and abandoned wells and geologic faults within the modeled treatment area; indication that the operator is developing a groundwater monitoring plan, or a request for exclusion from groundwater monitoring, meeting the Model Criteria for Groundwater Monitoring in Areas of Oil and Gas Well Stimulation (well stimulation operations cannot begin unless a groundwater monitoring plan, or request for exclusion from groundwater monitoring, has been approved by the State Water Resources Control Board); an estimate of treatment-generated waste materials that are not addressed in the water management plan; identification and contact information of the operator; the depth of the base of fresh water; and the results of specified evaluation and modeling.

0003-19

2. Page 4.6-35, 5th paragraph

Original: Once an application has been deemed complete by DOGGR, a well operator must hire an independent entity or person to provide notification to every tenant and owner of neighboring property within a specified distance from the wellhead and horizontal projection of the applicable well at least 30 days before beginning a WST. Notified property owners may request baseline and follow-up water quality testing at the operator's expense, and prior notice of any such testing must be provided to the applicable Regional Board to allow for the opportunity to observe the water sampling process. Well operators must also pressure test a well and meet certain integrity requirements before beginning a well stimulation treatment. An operator may conduct the stimulation activity identified in an approved application and notice within one year from DOGGR approval.

Suggested Revision: Once an application has been deemed complete by DOGGR, a well operator must hire an independent entity or person to provide notification to every tenant and owner of neighboring property within 1,500 feet from the wellhead and 500 feet from the horizontal projection of the applicable well at least 30 days before beginning a WST. Notified property owners may request baseline and follow-up water quality testing at the operator's expense, and 72 hour prior notice of any such testing must be provided to the State Water Resources Control Board and CVRWQCB to allow the opportunity to observe the water sampling process. Well operators must also pressure test a well and meet certain integrity requirements before beginning a well stimulation treatment. An operator may conduct the stimulation activity identified in an approved application and notice within one year from DOGGR approval.

3. Page 4.8-6, Table 4.8-2

0003-20

Comment: The text mentions hydrofluoric acid. Therefore, hydrofluoric acid should to be added to the table as an acutely hazardous material.

4. Page 4.8-6 (last sentence) and 4.8-7 (1st sentence)

0003-21

Original: Flowback fluids, including produced water and oil, are sent to production facilities for treatment, after which some flowback waters are disposed of in injection wells or through evaporation and percolation ponds.

Suggested Revision: Flowback fluid from a well that has undergone stimulation treatment is sent to a production facility where it is commingled with produced water that is typically sent to Class II injection wells. Some operators transport frack flowback fluid to a commercial Class II injection disposal well in the South Belridge Field that is permitted by the DOGGR. Frack flowback fluid discharge to ponds is prohibited as of July 1, 2015 as per DOGGR regulation.

0003-22

5. Page 4.8-14 (3rd paragraph)

Original: The CVRWQCB permits the operations of drilling mud pits pursuant to statewide general orders, while operations sumps are permitted through site specific Waste Discharge Requirements (WDR).

Comment: An operator can only discharge drilling mud and cuttings to a sump while drilling a well after the operator has obtained coverage under the State Water Board General Order 2003-0003-DWQ. The CVRWQCB has not adopted any site specific individual WDRs for discharges to drilling mud pits used during well work over activities.

0003-23

6. Page 4.8-15 (4th paragraph)

Original: As discussed elsewhere in this document, (flowback) fluid disposal could be facilitated through waste injection wells or percolation ponds.

Comment: Flowback fluid from wells that have undergone stimulation treatment cannot be directly discharged to ponds as of July 1, 2015 as per DOGGR regulation.

0003-24

7. Page 4.8-23 (1st paragraph)

Original: As of March 2015, 23 injection wells in the Project area were ordered to cease operations while the review was ongoing due to proximity to drinking or agricultural water supplies. Based on statements published by the agencies, no contamination or adverse impacts to groundwater was observed from the operation of the 23 wells, and no contamination of water used for drinking or agricultural purposes related to underground injection by the oil and gas industry has been detected in testing of water supply wells by the SWRCB. DOGGR and the SWRCB completed initial review of the 176 higher priority injection wells in May 2015 and SWRCB is awaiting additional test data before making a determination as to whether to seek shut-in of additional wells before the October 15, 2015, compliance date specified in the emergency regulations (DOGGR 2015).

Comments:

- Not all 23 injection wells received orders from DOGGR to cease injection since some operators voluntarily relinquished their permits.
- Please provide the reference for the statement that “no contamination or adverse impacts to groundwater was observed from the operation of the 23 wells”.
- CVRWQCB staff conducted water supply well testing, not State Water Board.
- SWRCB is awaiting not only additional test data (formation and injectate sampling), but also the results of water supply well survey data.

Suggested revision: As of March 2015, 23 injection wells in the Project Area were either ordered shut in or received operator permit relinquishments, while the

0003-24 Continued

review was ongoing due to proximity to water supply wells. No chemical contaminants related to underground injection has been detected in the water supply wells tested thus far by the CVRWQCB. DOGGR and the SWRCB completed initial review of the 176 priority injection wells in May 2015 and SWRCB is awaiting additional information before making a determination as to whether to seek shut-in of additional wells before the October 15, 2015, compliance date specified in the emergency regulations (DOGGR 2015).

0003-25

8. Page 4.8-48 (Last paragraph)

Original: Waste management units, permitted by the CVRWQCB for the E & P industry, include evaporation ponds, percolation ponds, and sumps.

Comment: CVRWQCB staff uses the term 'pond' for an unlined impoundment used for disposal of produced water via evaporation and percolation. The industry has no disposal ponds constructed to prevent percolation and thus only use evaporation for the disposal of produced water. CVRWQCB staff uses the words 'drilling mud pits' for an unlined impoundment used by the industry to contain drilling fluid and cuttings while drilling a well.

Suggested Revision: Waste management units permitted by the CVRWQCB include: (1) unlined ponds used for the disposal of produced water by evaporation and percolation (produced water ponds); and, (2) unlined drilling mud pits used for the containment of drilling mud and cuttings while drilling a well.

0003-26

9. Page 4.8-48 (Last paragraph) and 4.8-49 (1st paragraph)

Original: As discussed in Section 4.9, Hydrology and Water Quality, drilling muds and boring wastes associated with oil and gas development currently are regulated under State Water Board General Order 2003-0003-DWQ which addresses low-threat discharges to land.

Suggested Revision: As discussed in Section 4.9, Hydrology and Water Quality, the discharge of drilling mud, water and soil cuttings to drilling mud pits are low-threat discharges regulated under State Water Resources Control Board General Order 2003-0003-DWQ.

0003-27

10. Page 4.8-49 (First paragraph)

Original: The CVRWQCB staff has indicated it intends to prepare General WDRs for drilling sumps, but has not yet proposed tentative or final WDRs. If adopted, such WDRs – rather than the State Water Board General Order – would regulate the evaporation ponds, percolation ponds, and/or sumps covered by the WDRs.

Suggested Revision: CVRWQCB Staff have previously indicated that a general order may be prepared that regulates the discharge of drilling mud and cuttings to drilling mud pits when drilling wells. If adopted, the CVRWQCB General Order for low threat discharges to drilling mud pits would replace coverage under the State Water Resources Control Board General Order.

0003-28

11. Page 4.8-53 (First paragraph)

Original: State and federal authorities regulate the subsurface injection of waste. The Porter-Cologne Act regulates subsurface injection discharges that could affect the quality of "waters of the state" and requires dischargers to file a Report of Waste Discharge with the local Regional Board and comply with issued WDRs (WZI 2014a).

Comment: Dischargers of produced water to Class II injection wells are not required to file a Report of Waste Discharge with the CVRWQCB. Prior to the start of injection, an operator must obtain from the DOGGR a Project Approval Letter (PAL) that conditionally authorizes subsurface injection. A PAL should not be issued by the DOGGR if the project proposes to inject into any underground sources of drinking water or have the potential to affect current or future beneficial use groundwater. State Water Board and/or CVRWQCB staff review technical information submitted by the operator to the DOGGR and provide comments to the DOGGR about the proposed injection project.

0003-29

12. Page 4.8-82, 4th paragraph

Original: Flowback fluid from WST operations is typically managed through the oilfield's oil and gas and produced water handling system, which would pipe the flowback fluid directly into these systems. Once it is commingled with other fluids, separated, and treated, the spent acid, sediment, and, in some cases, the produced water are disposed of using the common disposal practice of that field. Any oil that is collected as part of the flowback is sent through the production facility. As discussed in Section 4.9, Hydrology and Water Quality, fluid disposal also could occur through waste injection wells or percolation ponds.

Suggested Revision: Flowback fluid from WST operations has historically been managed through the oilfield oil and gas and produced water handling system, which would pipe the flowback fluid directly into these systems. Once it was commingled with other fluids, separated, and treated, the spent acid, sediment, and, in some cases, the produced water were disposed of using the common disposal practice of that field. DOGGR's Final SB 4 WST Regulations (July 2015) now require that flowback fluid and produced water from a well that has undergone WST be stored in compliance with secondary containment requirements as outlined in Section 1786 of those regulations.

0003-30

13. Page 4.9-12 (last paragraph, after 2nd sentence)

Original: Produced water is also used for well maintenance activities, including use of coil tubing spooled into a wellbore, dust control, and surface facility construction.

Comment: The re-use of produced water for any purpose (well maintenance, dust control, or surface facility construction) would constitute an unauthorized discharge

0003-30 Continued

of waste to land. The operator would be required to submit a Report of Waste Discharge and obtain Waste Discharge Requirements (WDRs) adopted by the CVRWQCB.

14. Page 4.9-49 (2nd paragraph, lines 2 and 3)

0003-31

Original: The Kern-Tulare Water District has proposed to use 8,000 AF per year of treated produced wastewater in the Western Subarea.

Suggested Revision: The Kern-Tulare Water District has proposed to use up to 8,000 AF per year of treated produced water in the Eastern Subarea.

15. Page 4.9-49 (2nd paragraph)

0003-32

Comment: The last sentence of this paragraph is somewhat incorrect and confusing in that it is not clear if the comment is referring only to the re-use of produced water in the Kern-Tulare Water District or for the entire Project area. As noted under the comment section on page 1 of this response, produced water is re-used in the Jasmin Field and by Cawelo Water District under WDRs issued by the CVRWQCB.

16. Page 4.9-50 (Bottom paragraph)

0003-33

Comment: Consider adding the sub-heading: Storm Water Discharge and NPDES Permitting at the beginning of the bottom paragraph that begins the discussion about storm water and applicable permitting options.

17. Page 4.9-57 (3rd paragraph, line 6)

0003-34

Original: Boron was detected in the Central Subarea, but not in the Western and Eastern...

Comment: This statement is misleading because Table 4.9-17 states that no samples were analyzed for boron in the Western and Eastern Subareas and only 9 samples were analyzed for boron in the Central Subarea. Consider deleting the original sentence, as there is not enough boron data in the Table to make a meaningful statement about boron in shallow groundwater.

18. Page 4.9-57 (3rd paragraph, line 7)

0003-35

Original: Arsenic levels were higher in the Eastern Subarea, a result consistent with the elevated arsenic levels detected in blended produced water supplied to

0003-35 Continued

the Cawelo Water District discussed above. (This statement is referring to arsenic levels reported in Table 4.9-17)

0003-36

Comment #1: The average arsenic concentration reported in Table 4.9-17 is 173 µg/L for 31 samples from 10 wells in the Eastern Subarea. This is considerably higher than the 10 µg/L for 19 samples and the 19 µg/L for 62 samples in the Western and Central Subareas, respectively. Conversely, the median arsenic concentration level for the Eastern Subarea is 5.9 µg/L and for the Western and Central Subareas, median arsenic levels are 7.8 and 5.0 µg/L, respectively. The average arsenic concentration appears to be skewed compared to the median arsenic level (5.9 µg/L) for the Eastern Subarea. This skewing could be caused by errors in the data or by potential reporting errors for arsenic in Table 4.9-17. If the reported arsenic sample results for the Eastern Subarea are accurate, then the much higher average concentration compared to the median concentration indicates that two or three of the 10 wells sampled have very high arsenic concentration levels (near the maximum reported arsenic concentration of 494 µg/L) compared to the other wells sampled.

Consideration should be given to revising the original sentence that concludes that arsenic levels are higher in the Eastern Subarea given that the median arsenic concentrations for the Eastern Subarea are lower than for the Western Subarea.

0003-37

Comment #2: In support if comparing the mean versus average arsenic concentrations, a technical report, dated June 15, 2015, submitted to the CVRWQCB by Chevron, states that produced water conveyed to Cawelo Water District from the Kern River Field had an arsenic concentration level of 11 µg/L in April 2015. This concentration level is closer to the median concentration level of 5.9 µg/L than the average concentration level of 173 µg/L reported in Table 4.9-17 for the Eastern Subarea.

19. Page 4.9-57 (3rd paragraph, last sentence)

0003-38

Original: Expanded monitoring of blended produced water and other irrigation water is also being required more generally…

Comment: Oil field produced waters conveyed to local water districts for blending and then used to irrigate crops are regulated by various WDRs, adopted by the CVRWQCB (98-205, R5-2006-0049, R5-2011-0077, R5-2012-0058, and R5-2012-0059). The monitoring of produced water required by these WDRs has not been expanded to include additional chemical constituents. However, earlier this year, the CVRWQCB Assistant Executive Officer requested operators with produced water used to irrigate crops to analyze their produced water for an expanded list of chemical constituents as identified in the Model Criteria for Groundwater Monitoring in Areas of Oil and Gas Well Stimulation. Consider deleting the entire original sentence because “expanded monitoring of blended produced water” is not required by the WDRs at this time. Replacing the deleted sentence with an explanation based on this comment may not be appropriate in this paragraph because this paragraph only discusses shallow well sampling data in Table 4.9-17.

0003-38 Continued

Consider adding the information provided in this comment to other sections of this DEIR that discusses the use of produced water to irrigate crops.

0003-39

20. Page 4.9-69 (2rd paragraph, lines 7 and 8)

Original: The applicable CVRWQCB closure orders require monitoring and reporting programs to evaluate the extent of the groundwater impacts and to document that the affected groundwater constituent levels have returned to ambient conditions.

Suggested Revision: Each CVRWQCB post closure order, described above, includes a monitoring and reporting program to monitor the extent of the impacts in groundwater and the natural attenuation of the impacts over time.

0003-40

21. Page 4.9-69 (3rd paragraph)

Original: Small unlined surface impoundments have been, and continue to be, used in the Project Area to capture drilling muds and drilling fluids during well construction when closed-loop systems that avoid discharges to land are not utilized. Unless specifically permitted to accept additional discharges, the drilling mud pits may not be used to discharge other types of oilfield wastes, including well completion or well stimulation fluids and materials, or produced water. In 2013, a video of a well drilling operation north of the city of Shafter in the Central Subarea showing the discharge of non-drilling fluids to a drilling sump was posted online. In response, the CVRWQCB investigated the drilling operation, and the operator agreed to an administrative civil liability payment for 12 days of unpermitted discharges (Administrative Civil Liability Order R5-2013-0587).

Suggested Revision: Prior to December 4, 2013, unlined sumps were used throughout the Project area to contain drilling muds and drilling cuttings discharged when drilling a well. After December 4, 2013, these drilling mud pits have only been used in the Eastern and Western Subareas because coverage under the State Water Resources Control Board General Order 2003-0003-DWQ has not been obtained by any operator to use drilling mud pits in the Central Subarea. Drilling mud pits cannot be used for the discharge of other oilfield wastes such as, but not limited to, well completion fluids, WST fluids, or produced water. A video posted on-line in October 2012 of a well drilling operation to the east of the City of Shafter, in the Central Subarea, shows the discharge of WST fluids to a drilling sump. After an investigation by CVRWQCB staff determined that WST fluids were in the drilling sump for 12 days, the operator agreed to pay the maximum administrative civil liability amount for the unpermitted discharge to the sump (Administrative Civil Liability Order R5-2013-0587).

22. Page 4.9-70 (1st paragraph)

0003-41

0003-41 Continued

Original: In November 2013, the CVRWQCB also issued an investigative order to 78 oil and gas production and exploration operators requiring the submission of well drilling and well workover (repair and improvement) information during the period January 2012 to November 2013. In 2014, the CVRWQCB reported that all of the companies had responded and provided drilling information for 6,381 new wells and 8,291 workovers of existing wells (CVRWQCB 2014).

Suggested Revision: on November 15, 2013, the CVRWQCB issued 78 investigative orders (Section 13267 Orders) to operators that required submission of well drilling and workover (repair and improvement) information during the period from January 1, 2012 to November 15, 2013. In 2014, CVRWQCB staff reported that all operators responded with the required information for 6,381 new wells and 8,291 workovers of existing wells (CVRWQCB 2014).

23. Page 4.9-70 (3rd paragraph)

0003-42

Comment: Consider adding the sub-heading Underground Injection Control at the beginning of the 3rd paragraph. Prior paragraphs back to page 4.9-63 discuss water quality as it relates to discharges to land. This paragraph begins a discussion about water quality and subsurface injection that ends on page 4.9-75.

24. Page 4.9-75 (3rd paragraph)

0003-43

Comment: Consider adding the sub-heading Well Stimulation at the beginning of the 3rd paragraph. Prior paragraphs discuss underground injection control. This paragraph begins a lengthy discussion that ends on page 4.9-93.

25. Page 4.9-99 (2nd paragraph)

0003-44

Original: The State Board has adopted a general NPDES permit for construction activities that disturb more than one acre of land (NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities), Construction General Permit, Order No. 2012-0006-DWQ, NPDES No. CAS000002). The general permit applies to discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities. To comply with the general permit, a Notice of Intent (NOI) must be filed with the RWQCB…

Suggested Revision: The State Water Resources Control Board has adopted a general NPDES permit for construction activities that disturb one acre or more of land (NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities), Construction General Permit, Order No. 2009-0009-DWQ, NPDES No. CAS000002 as amended by 2010-0014-DWQ and 2012-0006-DWQ. The general permit applies to discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities. To comply with the

0003-44 Continued

general permit, a Notice of Intent (NOI) must be filed with the State Water Resources Control Board…

0003-45

26. Page 4.9-102 (2nd paragraph)

Original: On November 15, 2013, the CVRWQCB issued an order pursuant to California Water Code (CWC) §13267 requiring a large number of operators of oil and gas wells to provide information about discharges of drilling muds into sumps from January 1, 2012, to present. CWC §13267 authorizes the regional water board to require any person who has discharged waste to submit technical or monitoring program reports to assist the staff in its assessment of potential water quality impacts resulting from the discharge. The order identified for reporting those companies that had produced more than 1,000 barrels of oil or 10 million cubic feet of natural gas in a month or those companies, that may have drilled exploratory wells. These operators were required to describe the procedures used to close unlined drilling mud pits at new wells and to close smaller temporary operational sumps next to existing wells. If waste was solidified during closure of a sump, then the company was required to describe that solidification process in the report. The CVRWQCB staff reported on its progress to the Board on June 5-6, 2014, and again on February 5-6, 2015. According to the project applicant, both reports were informational and no written report has yet been issued. The CVRWQCB staff has indicated to the project applicants that it intends to prepare general WDRs for drilling mud pits, but has not yet proposed tentative WDRs. If adopted, the general WDRs would supersede the need for coverage under the State Water Board General Order.

Suggested Revision: On November 15, 2013, the CVRWQCB issued 78 orders pursuant to California Water Code (CWC) §13267, that required operators to provide information about discharges of drilling muds into sumps from January 1, 2012 to November 2013. The orders were sent to those operators that had produced more than 1,000 barrels of oil or 10 million cubic feet of natural gas per month or to those operators that drilled exploratory wells. The operators were required to describe the procedures used to close drilling mud pits and smaller temporary operational sumps. If waste was solidified during closure of a sump, then a company was required to describe that solidification process in their response. Staff has informed operators that the CVRWQCB may prepare a general order for the discharge of drilling mud and cuttings to drilling mud pits. If prepared and adopted, the CVRWQCB General Order would replace coverage under the State Water Resources Control Board General Order.

27. Page 4.9-102 (3rd paragraph)

0003-46

Original: Produced water has been historically disposed of in unlined ponds (surface impoundments), in reliance on an exemption contained in the State Water Board regulations applicable to “discharges of [nonhazardous] wastewater to land, including but not limited to evaporation ponds, percolation ponds, or subsurface leach fields” where the discharge was in compliance with an adopted water quality control plan,

0003-46
Continued

including the Tulare Lake Basin Plan (23 CCR §2511(b)). According to the RWQCB website, there are an estimated 933 produced water ponds in the Central Valley region, many of which are located in the Project area. Over 500 of these ponds have been issued WDRs.

Comment: Based on recently completed inspections of ponds by CVRWQCB staff, there are estimated 1,069 active and inactive produced water ponds in the Central Valley region with approximately 643 of these regulated under WDRs.

28. Page 4.9-126, Table 4.9-27

Comment: Table 4.9-27, Section for Treated Produced Water Demand and the three Scenarios presented on pages 4.9-127-128 should be revised to reflect the reduction in volume of produced water due to new WST regulations and the effect of this reduction regarding the potential uses of this water.

29. Page 4.9-128 (1st paragraph, last sentence)

0003-47

Original: Although the Kern-Tulare Water District has proposed to use 8,000 AF per year of treated produced water in the Western Subarea, no agreements to reuse produced water for agriculture other than with the Cawelo Water District have been approved and implemented in the Project area.

Comment: "In 1998, the CVRWQCB prepared WDRs R5-1998-205, including a Monitoring and Reporting Program (MRP) for an operator in the Jasmin Field. The WDRs/MRP provides regulatory oversight for the operator to re-use good quality produced water, not exceeding Basin Plan limitations for re-use by local agriculture applications by blending with other surface and/or groundwater for distribution by the Jasmin Ranchos Mutual Water District in the Eastern Subarea." Also, see the similar comments below for Page 4.17-58 (2nd paragraph).

30. Page 4.9-128 (2nd paragraph, lines 6 and 7)

0003-48

Original: …for other oilfield activities, such as discharge for dust suppression, would require additional permitting and approvals to avoid impacts to biological, water and other resources.

Suggested Revision: …for other oilfield activities, such as discharge for dust suppression, would require additional permitting and approvals to avoid impacts to biological, surface water, groundwater and other resources.

0003-49

31. Page 4.9-133 (2nd paragraph, following line 1)

Suggested Revision: Oil field related spills reported to DOGGR by operators are also reported to the Office of Emergency Services (OES) within 24 hours. CVRWQCB, including other agencies is immediately notified by OES via e-mail describing location, contact names and phone numbers, nature and volume of the spilled materials, and other related details. Depending on the spill/leak conditions, CVRWQCB staff may conduct an inspection to document conditions observed and evaluate the likelihood of the spill affecting surface and/or groundwater. A written inspection report is completed with photographs and possibly including soil/water sample results.

32. Page 4.9-137 through 143 - Discussion of produced Water

Comment: The discussion of Produced Water, its volume, and potential uses should be revised to reflect new WST regulations (see General Comment 1).

0003-51

33. Page 4.9-144 (Bottom paragraph, line 5) and Page 4.9-152 (1st paragraph, line 8)

Original: …owners may request baseline and follow-up water quality testing at the operator's expense, and prior notice of any such testing must be provided to the…

Suggested Revision: …owners may request baseline and follow-up water quality testing of their domestic and/or agricultural well(s) at the operator's expense, and prior notice of any such testing must be provided to the …

0003-52

34. Page 4.9-146 (MM4.9-2)

Original: The plan shall specify best management practices to prevent all construction pollutants from contacting stormwater, with the intent of keeping sedimentation or any other pollutants from moving offsite and into receiving waters. The requirements of the Plan shall be incorporated into design specifications. Recommended best management practices for the construction phase shall include the following…

Comment: The use of "Best Management Practices" needs to be required.

0003-53

35. Page 4.9-147 (MM4.9-5)

Suggestion: The discussion of produced water disposal into a surface disposal facility should include the prohibition of any WST production water.

0003-54

36. Page 4.9-154 (2nd paragraph, line 12)

Original: …and utilize higher quality produced water to minimize treatment requirements…

Suggested Revision: …and utilize higher quality produced water, primarily within the Eastern Subarea where better quality produced water is available, to minimize treatment requirements…

0003-55

37. Page 4.9-164 (Impact 4.9-11) Contribute to Cumulative Hydrology and Water Quality Impacts – Mitigation Measures and Level of Significance After Mitigation (page 4.9-165)

The DEIR should to be revised to include a discussion of Produced Water, its volume, and potential uses to reflect new WST regulations (see General Comment 1). The discussion of WST water needs to include a determination of whether or not the waste is hazardous and if hazardous how disposal will be handled. Best management practices for construction pollutants must be required not recommended. If these changes are made to the document, then implementation of Mitigation Measures MM 4.9-1 through MM 4.9-6 may reduce potential impacts to water quality. However, impact is likely to remain to be Significant and unavoidable with mitigation.

0003-56

38. Page 4.17-57 (3rd paragraph, line 9)

Original: …in lieu of M&I supplies by oil and gas operators, would effectively increase the supply of higher quality…

Suggested Revision: …in lieu of M&I supplies by oil and gas operators, primarily located in the Eastern Subarea, would effectively increase the supply of higher quality…

0003-57

39. Page 4.17-58 (2nd paragraph)

Comment: The last three sentences of this paragraph (and elsewhere in the text where referenced) should be modified to incorporate the following: “In 1998, the CVRWQCB prepared WDRs R5-1998-205 (WDRs), including a Monitoring and Reporting Program (MRP) for an operator in the Jasmin Field. The WDRs/MRP provides regulatory oversight for the operator to re-use good quality produced water, not exceeding Basin Plan limitations. The produced water is re-used for local agriculture applications by blending with other surface and/or groundwater for distribution by the Jasmin Ranchos Mutual Water District.

0003-58

40. Figure 4.9-11 – Approved Groundwater Beneficial Use Aquifer Exemptions (Map)

Comment: The title should be "Locations of Exempted Aquifers". Remove reference to beneficial use, and consider adding footnote to indicate that not all aquifers in these areas are exempt since it is depth dependent.

D. Appendices

0003-59

1. Appendix S, Page ES-2 (4th paragraph)

Original: (3) the East sub-area, which encompasses the western foothill of the Sierra up to an elevation of 1,000 feet.

Suggested Revision: …up to an elevation of 2,000 feet.

0003-60

2. Appendix S, Page 5 (Last paragraph)

Original: Figure 1-1 shows that north of Bakersfield, the East Subarea consists of the area west of Interstate 5.

Suggested Revision: Figure 1-1 shows that the West Sub-area consists of the area west of Interstate 5.

Suggested Revision: …includes the West Sierra Foothills, up to an elevation of approximately **2,000** feet msl…

0003-63

5. Appendix S, Table 4-7

Comment: Revise Table 4-7 - Ten Section Field is located the Central Subarea.

0003-64

6. Appendix S, Page 59 last paragraph) and Page 60 (first sentence)

Original: The Board considered potential impacts to water quality based on numerous factors and determined that Waiver Category No. 2 should be renewed only for fresh water supply well wastes; stating that discharge of drilling muds/boring wastes from oil and gas operations will be considered in a separate action. Consequently, drilling wastes associated with oil and gas exploration must be removed from open sumps upon completion of the drilling activities and managed according to existing handling and disposal regulations.

Suggested Revision: CVRWQCB staff considered potential impacts to water quality and determined that Waiver Category No. 2 should be renewed by the CVRWQCB only for the discharge of drilling wastes from fresh water supply wells. On December 5, 2013, the CVRWQCB adopted Resolution R5-2013-0145 without including the discharge of drilling wastes associated with oil and gas well drilling. Consequently, as of December 5, 2013, oil and gas drilling wastes cannot be discharged to drilling sumps without first obtaining conditional coverage under SWRCB General Order 2003-0003-DWQ.

0003-65

7. Appendix T, Table 28 and Figures 16 (page 65) through 20 (page 69)

Comment: The produced water volumes for the three sub-areas in Table 28 do not match the same produced water volumes in the produced water pie charts (Figures 16 through 20).

0003-66

The Water Boards appreciate the opportunity to provide Kern County with feedback on the DEIR. If you have any questions or require further assistance, please contact Ms. Christine York at (916) 341-5493.

The Division of Oil, Gas and Geothermal Resources (DOGGR) filed a separate comment letter on the DEIR and recommended reconciliation of various mitigation measures from the SB 4 EIR with those proposed by the County. Responses to those recommendations can be found in RTCs 3-98 – 3-134. Further, the Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments, as well as to add specificity and remove discretion so that the measures, as implements, will be consistent with the ministerial conformity review process adopted by the Revised Amended Ordinance. The revised mitigation measures are set forth in section 7.1.4 of this Final EIR.

The intent of MM 4.9-2 is to require the use of Best Management Practices, as indicated by the revisions to MM 4.9-2 shown in FEIR Section 7.1.4. These revisions include the elimination of discretion and provide that the BMPs "shall include" the specified components.

0003-53

Please see FEIR section 7.1.4 for revised mitigation text.

0003-54

The comment is noted and accepted in the Final EIR.

0003-55

The DEIR has been revised to reflect the requested recalculation. Please see GR Water-0_ . Regarding the determination of whether or not waste water is hazardous, please see RTC 2-68-69 and RTC 2-70-71. Regarding implementation of Best Management Practices for construction stormwater, please see RTC 353. The DEIR identifies Impact 4.9-1 as less than significant with implementation of MM 4.9-1 – 4.9-6. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments, as well as to add specificity and remove discretion so that the measures, as implements, will be consistent with the ministerial conformity review process adopted by the Revised Amended Ordinance. The revised mitigation measures are set forth in section 7.1.4 of this Final EIR. The County believes that Impact 4.9-1 continues to be less than significant mitigation based on the revisions in section 7.1.4.

Bakersfield, California 93301-2323

Subject: Draft Environmental Impact Report: Revisions to the Kern County Zoning Ordinance – 2015 C, Focused on Oil and Gas Local Permitting SCH No. 2013081079

Dear Mr. Mynk:

The California Department of Fish and Wildlife (Department) has reviewed the Draft Environmental Impact Report (DEIR) prepared for the Revisions to the Kern County Zoning Ordinance- 2015 C, Focused on Oil and Gas Local Permitting (Project), submitted by the Kern County Planning and Community Development Department (County). The proposed Project consists of revisions to various Chapters of Title 19 Kern County Zoning Ordinance to implement a new permit process for oil and gas activities. The revisions include new site development standards and review processes for all oil and gas exploration, extraction, operations, and production activities in unincorporated Kern County by: 0004-1

(a) Removing the "Unrestricted Drilling" Section in Chapter 19.98 and update "Drilling by Ministerial Permit" and "Drilling by Conditional Use Permit" Sections; 0004-2

(b) Establishing a new "Tier Area" map to address different land uses and zone districts where oil and gas activities occur and are proposed to occur in the future; 0004-3

(c) Establishing and Oil and Gas Conformity Review and Minor Activity Review, as part of the "Drilling by Ministerial Permit" Section in Chapter 19.98, to ensure compliance with all applicable Development and Implementation Standards and Conditions; 0004-4

(d) Establishing a new Development and Implementation Standards and Conditions Section in Chapter 19.98; 0004-5

(e) Establishing new requirements for site plan sign-off by owners of the surface and minerals for split estate ownership; 0004-6

(f) Establishing a new fee structure to ensure that all mitigation is complied with and that the County will be sufficiently staffed to review all new applications; 0004-7

(g) Revising additional Chapters of the Zoning Ordinance to ensure consistency with the new requirements of the Environmental Impact Report. These Chapters include: 19.08- Interpretations and General Standards, 19.48- Drilling Island (DI) District, 19.50- Floodplain Primary District, 19.66- Petroleum Extraction (PE) Combining District, 19.81 Outdoor Lighting (Dark Skies Ordinance), 19.88- Hillside Development, 19.102- Permit Procedures, and 19.108- Nonconforming Uses, Structures, and Lots. 0004-8

The Project Boundary (Local Permitting Boundary Area) encompasses 3,100 square miles and generally includes the San Joaquin Valley Floor portion of Kern County up to an elevation 2,000 feet. The boundary includes: the San Luis Obispo County line on the west side; the Kings and Tulare County lines on the north side, the 2,000-foot elevation contours, squared off to the nearest section line, on the east and south sides. 0004-9

The DEIR, once certified, will be used to satisfy the California Environmental Quality Act (CEQA) requirements for multiple State and local agency discretionary approvals on evaluated oil and gas activities in Kern County, which will include the Department's discretion on the issuance of Incidental Take Permits (ITPs) pursuant to Fish and Game Code Section 2081 and Lake or Streambed Alteration (LSA) Agreements pursuant to Fish and Game Code sections 1600 *et seq*. 0004-10

On September 26, 2013, the Department commented on the Notice of Preparation for the Project and offered recommendations to avoid, minimize, and mitigate potential impacts to biological resources. We are now providing document specific comments and recommendations for the DEIR. 0004-11

Department Comments 0004-12

The Department is providing specific recommendations to the text of the DEIR. The intent is to ensure that there are no obstacles for the Department to use the Environmental Impact Report (EIR) for CEQA compliance when issuing an ITP or LSAA for oil and gas projects in Kern County and to also provide technical assistance to the biological resources information in the document. Our recommended actions are in **bold**; additions are in ***bold italics***; and deleted language is in ~~strikethrough~~.

Executive Summary Chapter 1

0004-13

Section 1.2, Project Summary, Page 1-2, # 5: The Department recommends the following **addition**- "California Department of Fish and Wildlife incidental take permits ***and Lake or Streambed Alteration Agreements***."

Project Description Chapter 3

0004-14

Section 3.5.3 Construction Activities in Detail- Vegetation Control, Page 3-64: The first sentence of this section states, "Vegetation along roadsides and critical facilities such as tank settings and compressor stations is controlled as needed through the use of mowing, grading, weed-whacking, and spot treatments of herbicides approved by USFWS and CDFW." The Department is unclear if we're being asked to approve herbicides or the vegetation removal itself. Please make note, the Department does not have authority to approve herbicides outside of a LSA Agreement for a specific project, so we are recommending the following **edits**- "Vegetation along roadsides and critical facilities such as tank settings and compressor stations is controlled as needed through the use of mowing, grading, weed-whacking, and spot treatments of herbicides***. If vegetation removal would occur in potential habitat for special-status species, approval*** ~~approved~~ by USFWS and CDFW ***may be required***."

0004-15

Section 3.5.5 Best Management Practices- Biological Resources, Page 3-73 through 74: The first applicant proposed Best Management Practice (BMP) states, "Within 14 days before any ground disturbance activities on previously undisturbed property, a qualified biologist shall conduct a focused survey to determine the presence/absence of sensitive species protected by state and federal Endangered Species Acts and potential impacts to sensitive species onsite. The survey shall be conducted in accordance with the standard protocol of USFWS and CDFW."

0004-16

The Department recommends that focused surveys for special-status species be conducted well in advance of ground-disturbing activities to accommodate seasonal restrictions and potential permitting needs. The Department recommends that a reconnaissance biological survey be conducted as early as possible during project planning so that qualified wildlife biologist(s) have the opportunity to determine whether focused/protocol surveys are warranted, and by so doing would give project proponents plenty of time to incorporate them into their project schedule. In the event that a State-listed species is detected during a reconnaissance survey effort or during a focused/protocol survey, the project proponents need plenty of time to accommodate necessary ITP issuance to prevent project delays.

0004-17

In relation to the first applicant proposed BMP, DEIR mitigation measure (MM) 4.4-1 of Biological Resources, currently states, "With the exception of focused surveys that are seasonally restricted, special status wildlife surveys must be completed by a qualified biologist within a 30-day period prior to commencement of new ground-disturbance construction activities." The Department is recommending that the BMPs be consistent with the DEIR MMs to reflect a 30-day window for pre-disturbance surveys, and split BMP one (1) into three new BMPs to clarify when biological reconnaissance surveys, focused/protocol special-status species surveys, and pre-disturbance surveys are warranted. This would require an adjustment of the numbering of the BMPs.

0004-18

For the applicant proposed BMPs, the Department recommends the following **addition**- 1. ***A qualified biologist shall conduct a biological reconnaissance survey in potential special-status species habitat to advise the project proponent of potential project impacts, potential permitting needs, and advise on the need for focused special status species surveys. Early consultation with USFWS and CDFW would confirm the biologist's advice and/or inform project proponents of additional recommendations.***

0004-19

The Department recommends the following **edits and additions**- ~~1~~***2***. ~~Within 14 days before any ground disturbance activities on previously undisturbed property, a qualified biologist shall conduct a~~ ***Based on the information gathered from the biological reconnaissance survey and informal consultation with USFWS and CDFW,*** focused/***protocol*** survey***s shall be conducted by a qualified or permitted biologist (whichever is applicable) well in advance of ground disturbing activities*** to determine the presence/absence of sensitive species protected by state and federal Endangered Species Acts and potential ***project*** impacts to ~~sensitive~~ ***those*** species ~~onsite~~. The survey shall be conducted in accordance with the ***most current*** standard protocol of USFWS and CDFW.

0004-20

The Department also recommends the following **edits** to applicant proposed BMP # 3- If take of covered endangered or threatened species has the potential to occur, the appropriate USFWS and CDFW Endangered Species Act ***permits be acquired and*** compliance provisions shall be followed.

0004-21

The Department recommends the following **edits and additions** after applicant proposed BMP # 3- ***4.*** Within ~~14~~ ***30*** days before any ground-disturb~~ance~~***eing*** activities ~~on previously undisturbed property~~ ***in special-status species habitat,*** a qualified biologist shall conduct a ~~focused~~ ***pre-disturbance*** survey to ~~determine~~ ***record*** ~~the presence/absence~~ ***existing conditions*** of ***the site, determine if conditions have changed since the reconnaissance or focused/protocol surveys were conducted, and to determine where*** sensitive species ~~protected by state and federal Endangered~~

~~Species Acts and potential impacts to sensitive species onsite~~ ***avoidance buffers will be established***. ~~The survey shall be conducted in accordance with the standard protocol of USFWS and CDFW.~~ 0004-21 Continued

The Department recommends that a new BMP be **added** before the current applicant proposed BMP #4 to include the requirement of a biological monitor during ground-disturbing activities in project locations that have potential special-status species habitat or is adjacent to potential special-status species habitat. 0004-22

The Department recommends the following **edit** to applicant proposed BMP # 6- All pipe***s*** ~~3~~***1.5***-inch***es*** or greater in diameter stored overnight on a ***project*** location must have end caps that prevent wildlife from entering the pipe. 0004-23

The Department recommends the following **edits** to applicant proposed BMP #8- An educational briefing shall be conducted for all Project personnel on ~~previously undisturbed property~~ ***project sites that have potential special-status species habitat or is adjacent to potential special-status species habitat*** prior to the start of the covered Project/activity. 0004-24

The Department recommends the following **edits** to applicant proposed BMP #9- The Applicant/Operator shall consult with the CDFW as necessary to determine if a Section ~~1600~~ ***1602 Lake or*** Streambed Alteration Agreement will be required for Project implementation. 0004-25

Section 3.5.5 Best Management Practices- Water Resources, Page 3-75: BMP #1 for Water Resources states, "Avoid streams, wetlands, and drainages, where possible. Locate access roads to minimize stream crossings and to minimize impacts where crossings cannot be avoided. Obtains CDFW Streambed Alteration Agreement prior to any work in a state jurisdictional waterway." Please make note and **update** the DEIR to reflect the actual name of the permit discussed above as ***Lake or Streambed Alteration Agreement***. Also, a Lake or Streambed Alteration Agreement is one of three possible outcomes following notification to the Department that could result in authorizing a project's activities. Following notification to the Department, a project may not legally occur until after the Department does one of the following: 1) executes a Lake or Streambed Alteration Agreement; 2) determines that an agreement is not necessary and informs the applicant in writing; or 3) fails to issue an agreement within mandated time lines. 0004-26

Biological Resources Chapter 4, Section 4.4

Section 4.4.2 Environmental Setting- Land Cover Types, Urban and Developed Lands, Page 4.4-11: Sentence three of this paragraph states, "Developed lands do not provide substantial wildlife habitat, but a few occurrences of protected or sensitive species, such as the San Joaquin kit fox, have been documented, primarily in unpaved and fallow parcels interspersed in developed areas (USFWS 1998; Bjurlin et al. 2005)." Currently the San Joaquin kit fox population is quite robust in urban settings such as Bakersfield, Oildale, Maricopa, McKittrick, and Taft and utilizes developed areas such as schools, parking lots, green space, road right-of-ways, sumps, etc. The Department recommends **updating** this section to include the current status of the San Joaquin kit fox population and their urban setting use. 0004-27

Section 4.4.2 Environmental Setting- Wildlife Refuges and Protected Habitat Areas, Page 4.4-11: This section lists the 'permanently preserved conservation lands' located in the Project Area. The Department recommends including a definition of permanently protected conservation lands or lands preserved in perpetuity. Also, some of the private lands listed in this section which are owned by project proponents for compensatory mitigation do not yet have recorded conservation easements (parcels with recorded conservation easements are what the Department recognizes as permanently protected lands) or preserves owned and managed by non-governmental organizations (NGOs) that do not have conservation easements recorded. There are also lands identified for future protection that are not yet protected. We recommend including a different category for lands that are not preserved in perpetuity and a different category for government owned lands. In addition, not all lands that have an element of conservation protection are included in this section and in some instances the information is not correct or not complete. See below for Department comments, and recommended edits and additions. 0004-28

- Bullet #1- "The Coles Levee Ecosystem Preserve HCP conserved 6,059 acres under ~~an existing~~ ***previous*** oil and gas HCP to the east of the Elk Hills Oil Field (EHOF) and south of the Kern Water Bank in the Western Subarea***. CDFW holds a conservation easement that has been recorded upon the Coles Levee Ecosystem Preserve***;" Please make note, the Department holds the conservation easement on the Coles Levee Ecosystem Preserve, although oil and gas extraction are allowable uses (not precluded activities). 0004-29

- Bullet #2- "The Kern Water Bank HCP, which will permanently preserve ***up to*** ~~10,349~~ ***3,267*** acres ***through conservation easements*** for habitat purposes in the Central and Western Subareas***. Currently the Kern Water Bank has recorded 1,321 acres of habitat to conservation easements***;" 0004-30

- Bullet #3- "~~The Freeport-McMoRan Oil and Gas HCP conserved 1,519 acres under an oil and gas HCP in the Western Subarea~~;" The Department recommends **removing** this bullet from the list as none of these lands have recorded conservation easements yet. Further, this HCP has been partially split to California Resources Corporation and the current compensatory mitigation acreage obligation is contingent on what has been impacted by project activities. 0004-31

- Bullet #4- "The EHOF conservation area, which consists of 8,028 gross acres and 7,878 net acres of undisturbed habitat, of which a minimum of 7,075 acres undisturbed acres must be preserved under a Section 7 permit and agreements with state and federal agencies in conjunction with the sale of former Naval Petroleum Reserve properties in the Western Subarea. ***In addition, a conservation easement, held by CDFW, has been recorded on over 6,314 of these acres. A conservation easement of the remaining acreage is pending***;" 0004-32

- Bullet #5- "~~The LINN Energy Enos conservation lands, 400 acres of conservation lands held in the Poso Creek oilfield within the Eastern Subarea~~;" The Department recommends **removing** this bullet from the list as we are not aware of these lands being permanently preserved conservation lands nor having a conservation easement recorded on them. 0004-33

- Bullet #6- "~~The LINN Energy Lokern-Buena Vista Valley conservation lands are 2,895 acres of conservation lands held in the Western Subarea~~;" The Department recommends **removing** this bullet from the list as we are not aware of these lands being permanently preserved conservation lands nor having a conservation easement recorded on them. 0004-34

- Bullet #7- "The Lokern-Buena Vista ~~BLM~~ Areas of Critical Environmental Concern***, owned and managed by BLM,*** located to the north of the Elk Hills and east of the Cymric-McKittrick oilfields in the Western Subarea;" The Department recommends **moving** this bullet to a different category, as these lands are not permanently protected and can be impacted by oil and gas extraction. In addition, to follow the format of the other land information provided, the Department recommends including the acreage of the Areas of Critical Environmental Concern (ACEC). It's the Departments understanding that BLM has ACECs in other areas within Kern County; we recommend that BLM be consulted on acres and location descriptions. 0004-35

- Bullet #8- "The Kern National Wildlife Refuge, 11,249 acres ***owned and managed by the USFWS*** located 18 miles west of the city of Delano in the Central Subarea;" 0004-36

- Bullet #9- "The ~~Hart Park~~ ***Bakersfield Cactus*** Ecological Reserve, ~~500~~ ***consists of 780*** acres***, owned and*** managed by the CDFW***,*** in ~~three separate parcels~~ ***five disjunct areas*** located north ***and east*** of Bakersfield in the Eastern Subarea;" 0004-37

- Bullet # 11- "The Lokern ***Natural Area is a large undeveloped area consisting of approximately 50,600 acres of land with differing property owners. Property owners and managers that hold the largest tracts of land include*** ~~Ecological Reserve, 4,000 acres in the Semitropic Ridge area and the 295 acres Sand Ridge Wildflower preserve east of Bakersfield managed by~~ the Center for Natural Land***s*** Management ~~in the Central and Eastern Subareas~~***, Chevron, Bureau of Land Management, and CDFW. CDFW owns and manages 3,965 acres in the Lokern Natural Area known as the Lokern Ecological Reserve***;" 0004-38

- Bullet # 12- "The Semitropic Ecological Reserve~~, 4,800~~ ***consists of approximately 14,900*** acres ***which is owned and managed by CDFW in the Central Subarea. Adjacent to the Semitropic Ecological Reserve are neighboring*** ~~adjacent to~~ ***parcels collectively totaling approximately*** 3,100 acres of land ***in the Semitropic Ridge area owned and*** managed by the Center for Natural Lands Management ~~and the Kern National Wildlife Refuge in the Central Subarea~~;" Please make note, currently there are no recorded conservation easements on these properties. 0004-39

- Bullet # 14- "A portion of the 97,000 acre Windwolves ~~(Wildlands Conservancy)~~ Preserve ***owned and managed by the Wildlands Conservancy is*** located along the southwest border of the Project Area***. Also, the northern most area of the preserve which is in the Central Valley supports valley floor species***;" Please make note, currently there are no recorded conservation easements on this preserve. 0004-40

- **Add-** ***A portion of the Allensworth Ecological Reserve (South Unit), 1,110 acres (in Kern County) owned and managed by CDFW is located along the northern border of the Central Subarea.*** 0004-41

- **Add-** ***The Sand Ridge Wildflower preserve, 295 acres owned and managed by the Center for Natural Lands Management east of Bakersfield in the Eastern Subarea.*** 0004-42

- **Add-** ***Other preserved undesignated lands owned and managed by CDFW throughout the Project Area.*** 0004-43

Section 4.4.2 Environmental Setting- Methods, Category 1 Species Analysis Approach, Page 4.4-32 through 33: The DEIR includes three different modeling approaches that use various environmental parameters to produce mapping and acreage estimates depicting habitat suitability for 9 plant and 28 wildlife species within the Project Area. The Department recognizes that these are data models used for large scale environmental planning. However, Department staff have identified multiple areas where mapping in Figures 4.4-1 through 4.4-37 of Appendix N may have different habitat quality than what the models display. The Department recommends that the DEIR be extremely clear that these maps are not to be used for determining individual project impacts on the 37 special-status species used for the models, and that individual projects need to be ground-truthed by a qualified biologist familiar with the species potentially impacted by project activities. 0004-44

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area, Page 4.4-47: In the bottom row of the table, Tracy's eriastrum (*Eriastrum tracyi*) is listed as CR for the State although CR is not defined in the status abbreviations list at the end of the table. The Department recommends that this listing abbreviation in the table be **changed** to SR (State Rare) and to **add** SR in the status abbreviations list at the end of the table. In addition, for the column for "Potential to Occur in Project Area", this species location is listed in the wrong subarea. The Department recommends that this box be **changed** to read, "Yes, in Tier 2 of the ~~Western~~ ***Eastern*** Subarea." 0004-45

Section 4.4.2 Environmental Setting- Plant and Wildlife Species Summary, Special Status Plant Species, Page 4.4-36 through 37: The Department recommends the following **edits** to this section, "Special-status plant species are defined herein as those that are listed as ***candidate,*** threatened and/or endangered by the USFWS***;*** ~~***or***~~ ***candidate, rare, threatened and/or endangered by the*** CDFW; designated as ~~SSC or locally significant by CDFW~~ ***sensitive by BLM***; ~~fully protected under state law;~~ or species that meet the definition of ~~rare or~~ endangered***, rare, or threatened*** under CEQA Sections 15380(b) and (d). The status and known distributions of special-status plant species in the Project Area were evaluated based on a review of available literature, and from federal and state databases, including the CNDDB. Data collected from previous conservation-related studies and projects within the Project Area were 0004-46

also reviewed. No critical habitat has been designated by the USFWS for any plant species in the Project Area. Data sources included:" 0004-46 Continued

- Bullet # 4- Plant species listed as rare, threatened, or endangered under California Endangered Species Act (CESA) ***and the Native Plant Protection Act (NPPA)*** (~~Wildlife, CCR Title 14, Section 670.5, 1971 as amended; Plants,~~ CCR Title 14, Section 670.2, 1978 as amended). 0004-47

- ***Add- Plant species considered sensitive by BLM.*** 0004-48

Section 4.4.2 Environmental Setting- Special Status Wildlife, Page 4.4-71: The Department recommends the following **edits** to the second paragraph of this section, bullet number four : 0004-49

- Wildlife species listed as rare, ***candidate,*** threatened, or endangered under CESA (Wildlife, CCR Title 14, Section 670.5, 1971 as amended~~; Plants, CCR Title 14, Section 670.2, 1978 as amended~~).

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area, Page 4.4-73: In the fifth row down in the table, golden eagle (*Aquila chrysaetos*) is listed as CFP, although SFP (California Department of Fish and Wildlife Designated (State) Fully Protected) is defined in the status abbreviations list at the end of the table. The Department recommends that this listing abbreviation in the table be **changed** to ***SFP*** to reflect the status abbreviations list at the end of the table. 0004-50

Section 4.4.2 Environmental Setting- Special Status Wildlife, Blunt-Nosed Leopard Lizard (*Gambelia sila*), Page 4.4-86: The Department recommends the following **edits** to the first sentence of the second paragraph of this section: "The current distribution of the blunt-nosed leopard lizard is restricted to scattered sites in the southern San Joaquin Valley, Carrizo Plain, Elkhorn Plain, and southeastern Cuyama Valley, roughly corresponding to the western half of Kern County, the eastern boundary of San Luis Obispo ***County,*** ~~and~~ ***the western portion of*** Kings ~~Counties~~ ***County***, the western boundary of Fresno County, and extreme southwestern Tulare County." 0004-51

Section 4.4.2 Environmental Setting- Special Status Wildlife, Least Bell's Vireo (*Vireo bellii pusilus*), Page 4.4-95: The Department recommends the following **edits** to the first sentence of the first paragraph of this section: "The least Bell's vireo is a ~~federally~~ ***federal and state*** listed endangered species." 0004-52

Section 4.4.2 Environmental Setting- Special Status Wildlife, Swainson's Hawk (*Buteo swainsoni*), Page 4.4-102: Paragraph three of this section states, "URS SBM habitat 0004-53

modeling data are available for this species and has strong predictive power. The primary environmental conditions for determining nesting habitat suitability were primarily elevation, followed by water availability, soil type, annual precipitation, and winter low temperature. The results indicate that high quality suitable habitat does not occur within the portions of the Project Area below about 2,000 feet included in the URS analysis. Table 4.4-52 summarizes modeled Swainson's hawk high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-25 in Appendix N." The Department recommends **including** a definition of 'high quality suitable habitat' for Swainson's hawk. The Department also recommends that the County recognize that there are nesting Swainson's hawk in areas of active agriculture in the Project Area, although the minimal number of suitable nest trees are the main limiting factor for the species low population numbers in the southern end of the Central Valley.

0004-53
Continued

Section 4.4.2 Environmental Setting- Special Status Wildlife, Tipton Kangaroo Rat (*Dipodomys nitratoides nitratoides*), Page 4.4-114 through 115: Paragraph two of this section states, "The historical geographic range of the Tipton kangaroo rat was over 1.7 million acres of arid-land communities occupying the valley floor of the Tulare Basin. Currently, the Tipton kangaroo rat inhabits small, scattered, isolated fragments of remnant habitat. In the southern San Joaquin Valley, this includes the Kern and Pixley National Wildlife Refuges, and other scattered areas within Kern, Tulare, and Kings Counties (USFWS 2010c)." The reference to the USFWS 2010c document is not actually in the EIRs References Cited section, an **addition** to the References Cited section is warranted. The Department believes that the intended referenced document is the most recent USFWS 5-year review Summary and Evaluation of the Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), dated February 16, 2010. If this is not the document referenced, the Department recommends that this document also be cited.

0004-54

Section 4.4.3 Regulatory Setting- State, California State Fish and Game Code §1600-1616, Page 4.4-140: This section currently states, "Sections 1600 to 1616 of the CFGC states that it is unlawful to "substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake" without first notifying CDFW of that activity. If CDFW determines and informs the project proponent that the activity will not substantially adversely affect any existing fish or wildlife resources, the activity may be undertaken without further permitting. If CDFW determines that the proposed activity may substantially and adversely affect an existing fish or wildlife resource, a Lake or Streambed Alteration Agreement must be completed and approved by the CDFW, including reasonable measures necessary to protect the affected resources may be required prior to initiating the proposed activity (CFGC 1602)."

0004-55

The Department recommends that this section be **updated** to clarify the process of compliance with California State Fish and Game Code §1600-1616. Following notification to the Department, a project may not legally occur until after the Department does one of the following: 1) executes a Lake or Streambed Alteration Agreement; 2) determines that an agreement is not necessary and informs the applicant in writing; or 3) fails to issue an agreement within mandated time lines.

0004-55
Continued

Section 4.4.3 Regulatory Setting- State, California Native Plant Protection Act of 1977; California Fish and Game Code §1900 et seq., Page 4.4-141: The Department recommends the following **additions**, "The Native Plant Protection Act ***(NPPA)*** of 1977 (CFGC 1900 et seq.) authorizes CDFW to designate rare and endangered native plants and provides specific protection measures for state listed species. ***The Fish and Game Commission has adopted regulations governing the taking, possession, propagation, transportation, exportation, importation, or sale of any endangered or rare native plants (CCR Title 14, Section 786.9, 2014). CDFW may issue permits and plans that authorize rare plant impacts using the same procedures and under the same conditions as take authorizations issued pursuant to Title 14 CCR Section 783 et seq. relating to incidental take permits and Fish and Game Code Section 2800 et seq. relating to natural community conservation plans, as if rare plants were listed as endangered, threatened, or candidate species."***

0004-56

Section 4.4.3 Regulatory Setting- State, Natural Community Planning Act (Fish and Game Code 2800 et seq.), Page 4.4-143: There is an abbreviation (MCPC) that is not defined in two sentences of this section, and the Department believes that they are meant to actually be NCCP. If this is the case **edits** are warranted in sentences three and four of the paragraph to change MCPC to NCCP. If not, 'MCPC' needs to be defined.

0004-57

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State **HCP** in the Planning Area, Page 4.4-154: This heading needs to be **edited** as the State does not issue Habitat Conservation Plans (HCPs). The Department believes that either 'ITPs' or 'NCCPs' need to replace 'HCP'. In addition, the Department believes that there is a typo in the first sentence of the second paragraph where a deletion is in order, "The following sections summarize proposed and approved ~~and~~ HCPs for oil and gas activity, including oil and gas exploration, other HCPs within the Project Area, and approved regional plans or permits that address conservation and incidental take for oil and gas activities within the Project Area."

0004-58

In addition, this section does not include all HCPs and companion State ITPs that have been issued. The Department is not clear if this is necessary for this document. If it is, we can provide this information to the County. 0004-59

Table 4.4-66: Draft Valley Floor Habitat Conservation Plan Covered Plant Species List, Page 4.4-155: The federal listing for Hoover's eriastrum (*Eriastrum hooveri*) in this table is FT*, although * is not defined in the key at the end of the table. The Department recommends either **updating** the key to define the meaning of the *, or update the table to reflect the current listing of the species which is federally delisted and update the key to reflect the chosen abbreviation for that status. 0004-60

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Chevron North American Exploration and Production Lokern Habitat Conservation Plan, Page 4.4-158: The seventh and eighth paragraphs of this section, the following **edits** are in order: "The HCP would allow Chevron to generate conservation credits by using conversation easements to permanently preserve and ~~providing~~ ***provide*** funding for the management of Chevron Lokern Lands over the permit term. Chevron would permanently protect 1,500 acres of the Chevron Lokern Lands at the time that the HCP becomes effective. The credits created by preservation within the Chevron Lokern Lands would be used to mitigate for covered activity impacts in Chevron Lokern Lands, Lokern Contiguous Area, and the four oil fields included in the HCP. Chevron also proposes to allow for the use of conservation credits by Chevron or by sale to third parties to mitigate for impacts within ~~an~~ 2,261,715 acre (3,534 square mile) credit area that includes the San Joaquin Valley floor up to 2,000-foot elevation within Kern County ***once the conservation lands are federally and state approved as a mitigation bank pursuant to CFGC Section 1798 et seq.*** The state and federal incidental take permits that would be issued to Chevron by the USFWS and CDFW would not provide coverage for third party or Chevron activities outside of the Chevron Lokern Lands, Lokern Contiguous Area, and the four oil fields included in the HCP, and the use of credits generated by preservation within the Chevron Lokern Lands would be subject to separate approval/permitting processes as necessary. 0004-61

The activities for which take coverage would be provided under the proposed HCP and state 2081(~~a~~***b***) permits include existing and potential future oil and gas drilling and ***maintenance and*** operation~~al~~ activities ***for existing facilities*** described in Chapter 3, Project Description (Section 3.5, Potential Future Oil and Gas Development Scenario) together with the mitigation measures identified in Section 4.4.4, Impacts and Mitigation Measures." 0004-62

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, California Resources Corporation Elk Hills Habitat Conservation Plan (EHHCP), Requested ITP, Page 4.4-159: The first two sentences of this paragraph, the following **edits** are in order: "CRC is applying for an ITP from CDFW, Pursuant to Section 2081(b) of the ~~Fish and~~ CFGC. The Section 2081 application, which ~~includes an associated~~ ***would be a companion permit to the federal EH***HCP ~~that supports the proposed conservation and management program for the proposed EHOF~~, was deemed complete by CDFW on March 3, 2014. 0004-63

In addition, we are recommending that the discussion of the federal Endangered Species Act consultation status (currently on page 4.4-164) with the United States Fish and Wildlife Service (USFWS) be included in the 'Background' information of the EHHCP section. 0004-64

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, California Resources Corporation Elk Hills Habitat Conservation Plan (EHHCP), Proposed Covered Activities, Page 4.4-164: The last paragraph of this section would be best placed in the 'Background' section as discussed above. Also, the Department is unclear what the meaning of the second sentence is, as it currently it states, "There is no impending expiration date in the take authorization approved by the Service under FESA, or any other federal approval." In the sentence following this one, it discusses that NEPA still needs to be completed on the EHHCP, so we are unclear how there can be an impending expiration date for federal incidental take coverage when take has not been authorized by the USFWS. In addition, we recommend that the document be consistent in how it refers to the USFWS as this section calls them the 'Service', **edit** the second sentence of this section to clarify its meaning, and include more information on the federal Endangered Species Act consultation status. 0004-65

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Freeport-McMoRan Oil & Gas HCP, Page 4.4-164: The first paragraph of this section, the following **edits** are in order: "The Freeport-McMoRan Oil & Gas (formerly Nuevo-Torch then Plains Exploration and Production Company) HCP was adopted in 1999 and ***a companion state ITP was issued in 2000. The HCP and companion ITP*** addresses ongoing oilfield exploration***,*** ~~and~~ production ***and maintenance*** activities on oilfield properties located in western Kern County. The HCP encompasses 21,900 acres, including an initial 839.9 acres of conservation area lands in the Lokern area that will be set aside incrementally to compensate for habitat 0004-66

disturbances from oilfield activities. The federal incidental take statement authorized up to 1,700 acres of incidental take on the plan area lands. When Plains Exploration and Production Company acquired the properties from Nuevo-Torch in 2005, an additional 4,905 acres of land ~~and~~ were added to the HCP (an additional 414 acres of conservation area lands). In 2009, 300 acres of the incidental take acreage and 15 acres of the conservation land acreage were transferred to CRC (formerly Occidental) of Elk Hills, Inc., and Freeport-McMoRan (then Plains Exploration and Production Company) retained 1,400 acres of take acreage. ***In 2013 CDFW issued an ITP amendment addressing these changes.*** Covered species include…"

0004-66

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, CRC (formerly Occidental of Elk Hill, Inc) Non-Unit HCP, Page 4.4-165: **Edits** to this paragraph are in order: "The CRC Non-Unit HCP is a ***USFWS approved*** conservation plan that covers 7,050 acres (Live Oak Associates 2013). The HCP was originally prepared for Nuevo-Torch in February 1999. ***Federal*** ~~Incidental~~ ***incidental*** take authorization and responsibilities under the HCP were transferred to Plains Exploration and Production Company (PXP) on May 9, 2005. PXP subsequently transferred 300 acres of authorized ***federal*** incidental take and 15 acres of conservation lands to CRC on August 3, 2009. PXP retained take authorization and responsibilities on the remaining 1,400 acres of the original 1,700 acres authorized for incidental take, and these interests were subsequently conveyed to Freeport-McMoRan. In December 2009 USFWS approved the inclusion of 3,504 acres of new properties located in the vicinity of McKittrick Valley and the EHOF into the CRC Non-Unit HCP; 1,134 acres of the 3,504 acres were designated for use as mitigation land. No increase in the initially authorized 1,700 acres of take was included in the 2009 approval."

0004-67

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Kern Water Bank HCP/Natural Community Conservation Plan, Page 4.4-166 through 167: **Edits** to this paragraph are in order: "The Kern Water Bank HCP/Natural Community Conservation Plan (HCP/NCCP) is managed by the Kern Water Bank Authority and covers 19,900 acres. The plan was approved in 1997 and covers water conservation by developing water recharge and recovery facilities, the conservation and restoration of upland, intermittent wetland/rangeland, ~~and~~ other sensitive habitat, and the ***incidental take of*** San Joaquin kit fox (*Vulpes macrotis mutica*), Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), ~~giant kangaroo rat (*Dipodomys ingens*)~~, ***and blunt-nosed leopard lizard (Gambelia sila)*** ~~San Joaquin antelope squirrel (*Ammospermophilus nelsoni*), and Bakersfield cactus (*Opuntia basilaris var*~~). The plan also includes a conservation bank that allows for conservation credit sales to third parties under certain conditions and subject to USFWS and CDFW

0004-68

approval. In 1997, ~~5,592~~ ***3,267*** acres of the plan area were ~~permanently~~ ***set aside to be permanently*** preserved in the HCP area ***in conjunction with conservation credit sales***~~, and 3,267 acres were included in the conservation bank~~. ***Currently, conservation easements have been recorded on 1,321 acres of Kern Water Bank's Conservation Bank***" Since there are so many species covered by the Kern Water Bank HCP and NCCP, the Department recommends discussing species for which the USFWS is authorizing incidental take.

0004-68
Continued

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Pacific Gas and Electric (PG&E) San Joaquin Valley Operations and Maintenance Program HCP, Page 4.4-167: **Edits** to this paragraph are in order: "The PG&E San Joaquin Valley region HCP was approved ***by the USFWS*** ~~in early 2008~~ and ***CDFW issued a companion state ITP in early 2008. The HCP and companion*** covers routine operations and maintenance and minor new construction activities related to PG&E's electrical system ***and natural gas facilities*** in the San Joaquin Valley for 30 years. The HCP covers 23 wildlife and 42 plant species, including the San Joaquin kit fox, California red-Legged frog, vernal pool fairy shrimp, and Western burrowing owl. ***The companion state ITP initially covered 8 wildlife species and 18 plant species, until CDFW issued and amendment to include California tiger salamander (Ambystoma californiense) in 2012.*** PG&E facilities ~~that are~~ covered by the HCP occur throughout the Project Area, generally within existing ROWs owned by the company."

0004-69

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Metropolitan Bakersfield HCP, Page 4.4-167: The Department recommends that this section clarify the current status of the Metropolitan Bakersfield HCP (MBHCP) including when it expired and a discussion of the MBHCP extension issued by the USFWS and its expiration date. Also, the eighth sentence of this paragraph, **edits** are in order as it currently states, "The County and City have updated the HCP to support the extension of the plan or a new set of take permits." The Department is unclear what this meaning of this sentence is in relation to the current status of the MBHCP. The Department recommends the following **edits** and **additions** for this sentence, "The County and City have ~~updated the~~ ***requested a time extension for the MB***HCP ***from the USFWS*** to ***provide federal incidental take coverage for an additional five years from the date of initial expiration, while*** ~~support the extension of the plan or~~ a new ***HCP is prepared for the planning area*** ~~set of take permits~~."

0004-70

The Department also recommends that the ninth sentence have one word **added** for clarification, "A new ***state*** Incidental Take Permit was issued by CDFW …" This would provide the reader a clear distinction between the federal and state incidental take coverage for Metropolitan Bakersfield. 0004-71

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-1, Methodology, Page 4.4-173 through 204: The Department recommends the addition of a discussion in the EIR disclosing a description of impacts (direct and indirect) on species listed pursuant to CESA (e.g., state-listed species) and on lake and streambed resources to facilitate the Department's use of the DEIR as a CEQA Responsible Agency in issuance of ITPs and/or LSAAs for oil and gas projects in Kern County. The Department recommends that Section 4.4-1 be **updated** to include a comprehensive discussion on all potential Project impacts to special-status species and lake and streambed resources. A discussion needs to be **added** including, but not limited to, specifics as to what extent the activities and related impacts would result in the taking of state-listed species and disclose how those activities would potentially impact or take (Fish and Game Code Section 86) state-listed species. For lake and streambed resources, please include a discussion of what types of activities and related impacts are being analyzed by this DEIR, which could include for example, water diversion, fill activities, rerouting of streams, and/or removal of vegetation associated with streams. 0004-72

The Department recommends using the following example italicized language as a guide (but not limited to) to disclose potential Project impacts to state-listed species: 0004-73

> *Where project activities and their resulting impacts are expected to result in the incidental take of individuals of listed species, activities that would likely result in take include ground and vegetation clearing; grubbing; grading; leveling, excavating; scraping; land contouring; trenching; stockpiling; backfilling; compacting; paving; drilling; construction of roads, underground utilities, wastewater collection systems; materials and equipment transport and laydown; and development activities; vibroseis and shot-hole deployment; new access roads, pipeline and utility corridors; excavation of sumps; installment of sleepers or T-supports to accommodate pipelines; installation of overhead electrical lines; direct contact with moving parts of wells; clean-up of accidental spills or blowouts of oil, produced water, or other hazardous materials commonly used in oil fields; transport of drill rigs, and production materials and other project-related traffic; operations and maintenance activities; site restoration; and other activities described in the Project description section of the EIR.*
>
> *Incidental take of listed species in the form of mortality ("kill") may occur as a result of Project activities such as den or burrow collapse (in the case of fossorial*

species) resulting in crushing or suffocation of underground individuals due to site preparation and excavation; entrapment and burial within trenches and/or open pipelines; crushing by equipment in the Project Area; entanglement in, or crushing by, moving well parts; or by ingestion of, or entrapment in, spilled oil, produced water, or other hazardous materials. Incidental take, including mortality of listed species due to vehicle strikes may also occur in connection with increased project related traffic during construction and operations and maintenance activities. Incidental take of individuals of listed species may occur in the form of pursue, catch, capture, or attempt to do so of listed species via entrapment in holes or trenches, uncovering listed species through the excavation of dens and burrow systems, by corralling listed species into a confined area when exclusion fencing is constructed around work disturbance areas, and when individuals of listed species are relocated out of harm's way as maybe required by a project specific take authorization permit. Potential impacts to listed plant species include destruction of individuals from mowing, grading, or other construction activities; dust creation from project activities could settle on plant material and affect processes such as respiration, photosynthesis, pollination, and seed set; erosion and sedimentation; and increased competition from noxious weeds.

0004-73
Continued

The Department recommends using the following italicized example language as a guide (but not limited to) to disclose potential Project impacts to lake and streambed resources:

0004-74

The Project activities have the potential to result in adverse effects to fish and wildlife resources through the following project impacts: Sedimentation and erosion resulting from excavating material from the river bed channel, creating new slopes, removing vegetation, and influencing the path and thalweg of flow within the river bed; burying or crushing animals using the sediments of the river bed, including reptiles, small mammals, and ground nesting birds, and also by crushing plants or animal species that are unable to escape the path of moving equipment; sedimentation could result in material being carried by subsequent flows and carried downstream, relocated, and re-deposited in areas used by species; animal mortality from collisions with vehicles or heavy equipment or from excavation of trenches and roads; crushing of burrows or dens during vegetation removal, grubbing, clearing, grading, leveling, and compaction of well sites, entombment of animals during grading, trenching, and road construction; fugitive dust impacts to animals and plants; noise disturbance; nest abandonment; and increased predation. Potential impacts to plant species include destruction of individuals from mowing, grading, or other construction activities; dust creation from project activities could settle on plant material and

affect processes such as respiration, photosynthesis, pollination, and seed set; erosion and sedimentation; and increased competition from noxious weeds. Indirect impacts to downstream areas could include increased erosion and/or sedimentation as a result of vegetation removal, bank alteration, channel de-stabilization, and introduction of fill material. This could affect wildlife habitat functions and values, including forage production and burrowing substrate.

0004-74
Continued

In addition, the Department recommends an edit to the last sentence of the third paragraph of this section: "Oil and gas activities could also indirectly affect special status plants and wildlife by generating dust, emissions, noise, light, and unintentional spills or discharges; introducing invasive species; or increasing the risk of unauthorized vehicular use or other human activity that disturb occupied or suitable ~~species~~ ***special-***status species habitats."

0004-75

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-1, Mitigation Measures, Page 4.4-204 through 215: The Department has recommended edits to the Biological Resources MMs, see below:

0004-76

MM 4.4-1: As discussed in the Department comments above for BMPs, it is recommended that the BMPs in Chapter 3 are consistent with the MMs. The Department recommends the following **deletions** and **edits** to MM 4.4-1: "~~With the exception of focused surveys that are seasonally restricted,~~ ***A qualified biologist shall conduct a biological reconnaissance survey in potential special-status species habitat to advise the project proponent of potential project impacts, potential permitting needs, and advise on the need for focused special status species surveys. Early consultation with USFWS and CDFW would confirm the biologist's advice and/or inform project proponents of additional recommendations. Based on the information gathered from the biological reconnaissance survey and informal consultation with USFWS and CDFW, focused/protocol surveys shall be conducted by a qualified or permitted biologist (whichever is applicable) well in advance of ground disturbing activities to determine the presence/absence of sensitive species protected by state and federal Endangered Species Acts and potential project impacts to those species. The survey shall be conducted in accordance with the most current standard protocol of USFWS and CDFW*** ~~special status wildlife surveys must be completed by a qualified biologist within a 30-day period prior to commencement of new ground-disturbance construction activities~~. The purpose of the ~~pre-disturbance surveys~~ ***focused/protocol surveys*** is to confirm the presence or absence of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the

California Endangered Species Act, ***rare or endangered in the California Native Plant Protection Act,*** or designated as fully-protected in the California Fish and Game Code (Collectively, "Protected Species), and to confirm the presence or absence of any other species considered "sensitive" under California Environmental Quality Act ("Sensitive Species), and to identify and implement feasible avoidance and minimization measures for such species. The surveys…" 0004-76 Continued

The Department also recommends that the County create a criterion for determining qualified biologists. The Department is available to help the County with this task. 0004-77

MM 4.4-2: The Department recommends the following **addition** to MM 4.4-2: "No incidental take of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the California Endangered Species Act, ***rare or endangered in the California Native Plant Protection Act,*** or designated as fully-protected in the California Fish and Game Code (Protected Species) may occur unless the incidental take is authorized by applicable state and federal wildlife agencies in the form of a permit or other written authorization, an approved state or federal conservation plan, or in accordance with an approved regional plan such as the Draft Valley Floor Habitat Conservation Plan and/or Natural Community Conservation Plan." 0004-78

The Department recommends that clarification on how this MM will be verified during the County's administrative process as verification that a project proposal is following the County's requirements. 0004-79

Add a new MM: ***Within 30 days before any ground disturbing activities in special-status species habitat, a qualified biologist shall conduct a pre-disturbance survey to record existing conditions of the site, determine if conditions have changed since the reconnaissance or focused/protocol surveys were conducted, and to determine where sensitive species avoidance buffers will be established.*** 0004-80

MM 4.4-3: The Department recommends the following **edits** to MM 4.4-3: ~~Exclusion barriers or~~ ***Protective*** buffers ~~may~~ ***shall*** be used, where effective and feasible in the opinion ***and guidance*** of ~~the~~ ***a*** qualified biologist, to avoid any unauthorized incidental take of Projected Species, and to minimize any incidental take of Sensitive Species, by separating the planned disturbance area from any locations where ~~pre-disturbance~~ ***biological reconnaissance*** surveys***,*** ~~or~~ previously conducted focused/***protocol*** surveys***, or pre-disturbance surveys*** have detected the presence of Projected Species or Sensitive Species. ***Protective buffers shall be delineated using brightly colored stakes and/or*** 0004-81

flagging or similar materials and remain until construction activities are complete, at which time of completion the buffers shall be removed. ~~All buffers must extend for a minimum of 50 feet from the nearest point of disturbance unless a smaller avoidance buffer has been established by either the United States Fish and Wildlife Service or the California Department of Fish and Wildlife as the minimum~~ ***If special-status plant or animal species are found adjacent to the a project during biological surveys, protective buffers shall be established around active dens and/or burrows of special-status animal species, or populations of special-status plant species*** to avoid unauthorized take of protected species ***as listed in the table below***~~, and the barriers must prevent the potential migration of wildlife into the construction area and unlawful incidental take of any Protected Species during ground disturbance activities~~. The ~~minimum~~ ***protective*** buffer distance shall be increased if required to avoid unauthorized incidental take of any Protected Species as determined by a qualified biologist. ~~Exclusion barriers,~~ ***Protective*** buffer distances~~,~~ and other avoidance measures that may be implemented to avoid impacts to Protected Species or Sensitive Species must be consistent with the ~~United States Fish and Wildlife Service~~ ***USFWS*** and/or the ~~California Department of Fish and Wildlife~~ ***CDFW***, and shall be implemented and overseen by ~~the~~ ***a*** qualified biologist.

0004-81
Continued

Table
Disturbance Buffers for Sensitive Resources

Sensitive Resource	*Buffer Zone from Disturbance (feet)*
Potential San Joaquin kit fox den	*50*
Known San Joaquin kit fox den	*100*
Natal San Joaquin kit fox den	*Contact CDFW, USFWS*
Atypical San Joaquin kit fox den	*50*
Rodent burrows	*50*
Listed bird species active nests	*0.5 mile*
Burrowing owl burrow (breeding and non-breeding seasons)	*Pursuant to CDFW guidelines (see Table 4.4-85)*
San Joaquin coachwhip, silvery legless lizard, coast horned lizard	*30*
American badger: *Non-maternity dens* *Maternity dens*	 *50* *200*
Special-status plants	*50*

Add a new MM to include the requirement of a biological monitor during ground-disturbing activities in project locations that have potential special-status species habitat or is adjacent to potential special-status species habitat.

0004-82

MM 4.4-6: The Department recommends the following **edits** to MM 4.4-6: Any potential San Joaquin kit fox dens (as defined in ~~United States Fish and Wildlife Service~~ ***USFWS*** 2011) detected during ~~pre-disturbance~~ ***reconnaissance or focused/protocol*** *surveys* shall be reevaluated for species activity no more than ~~14~~ ***30*** days prior to the commencement of ground disturbance. Potential kit fox dens shall be marked and a 50-foot avoidance buffer shall be delineated using ***brightly colored*** stakes and flagging or similar materials to prevent inadvertent damage to the potential den. If a potential den cannot feasibly be avoided, the den may be hand excavated in accordance with the United States Fish and Wildlife Service Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox Prior to or During Ground Disturbance (~~United States Fish and Wildlife Service~~ ***USFWS*** 2011). If species activity is detected, the location shall be identified as a "known" kit fox den in accordance with the ~~U.S. Fish and Wildlife Service~~ ***USFWS*** species guidelines (~~United States Fish and Wildlife Service~~ ***USFWS*** 2011). A minimum 100-foot buffer from any disturbance area shall be maintained for known dens and a minimum 500-foot buffer from any disturbance area shall be maintained for natal dens. No excavation of a known or natal den shall occur without prior authorization from the ~~United States Fish and Wildlife Service~~ ***USFWS*** and the ~~California Department of Fish and Wildlife~~ ***CDFW***. For activities occurring on land covered under an approved ~~Habitat Conservation Plan~~ ***federal and/or State incidental take authorization***, the requirements set forth in those documents shall be implemented. Other standard measures to protect San Joaquin kit fox, including capping pipes, covering trenches, adding exit ramps to excavated areas, shall be implemented in accordance with MM 4.4-~~19~~***15***. 0004-83

MM 4.4-10(c): The Department recommends that a discussion be **included** in this section disclosing whom the blunt-nosed leopard lizard avoidance plan would be submitted to and if regulatory agencies would review the plan. 0004-84

MM 4.4-12(b): The Department recommends the following **edits** to MM 4.4-12(b): No incidental take or relocation of any plant listed under the ***federal Endangered Species Act, the*** California Endangered Species Act***, or the California Native Plant Protection Act*** may occur unless the incidental take is authorized by the ***USFWS and/or the*** California Department of Fish and Wildlife in a permit or other authorization, or in an approved ***Habitat Conservation Plan or*** Natural Communities Conservation Plan. If ~~pre-construction~~ ***focused plant*** surveys detect the presence of any ~~California Endangered Species Act Plant~~ listed plant, the plant populations shall be buffered from disturbance activities by implementing applicable impact avoidance protocols established by the ***USFWS and/or*** California Department of Fish and Wildlife ***unless incidental take*** 0004-85

authority is obtained. Projects covered under incidental take authority shall conduct activities in accordance with the take authorization. The California Department of Fish and Wildlife may be contacted to determine the appropriate buffer required to prevent incidental take of a ~~California Endangered Species Act Plant~~ ***listed plant*** if avoidance protocols have not been established for the species. The qualified biologist shall confirm that all applicable ***listed plant*** buffers have been implemented prior to the commencement of any disturbance activity. 0004-85 Continued

The Department recommends that clarification on how this MM will be verified during the County's administrative process that a project proposal is following the County's requirements. 0004-86

MM 4.4-13: The Department recommends that this MM be **deleted** as it is a repeat of MM 4.4-12(b). 0004-87

MM 4.4-15 (a-v): The Department recommends that the following MM be added to this section: ***All pipes 1.5 inches or greater in diameter stored overnight on a project location must have end caps that prevent wildlife from entering the pipe.*** 0004-88

MM 4.4-16: The Department recommends that the County create a clear way to identify and track temporary disturbance (<2 year disturbance). Also, how is the County determining or going to determine what areas are already disturbed? The Department is currently unclear how this will be calculated and has concerns; for example, if a well pad is planned in an open area within an oilfield, the open area may have no previous disturbance and thus should not be considered disturbed. Also, in contrast, if an entire oil field is considered in the calculation, there may be more than 70% disturbance as there would be existing disturbance which may not be counted as additional disturbance. We are recommending that the County include in the EIR clarification on how the existing disturbance calculations will be determined. The Department also recommends that the County include a criteria for selecting compensatory mitigation lands, such as "of equal or greater value" for the species. 0004-89

c. "Removal of legacy oil and gas equipment, inclusive of compliance with applicable legal requirements (e.g., well plugging and abandonment requirements under state or federal regulations), restoration of the surface grade to be consistent with surrounding lands, complete a reseeding effort using native species, ~~and~~ notification of the site owner (if not the Applicant) of 0004-90

the completion of the removal and grading restoration work***, and record a conservation easement on the land to protect it in perpetuity***."

0004-90 Continued

d. "Enhancement or restoration of existing habitat on lands already subject to a conservation easement or similar agreement, or which become subject to a conservation easement or similar agreement subsequent to the certification of this Environmental Impact Report, provided that such activities are covered in a permit or authorization, conservation plan, Habitat Conservation Plan, or Natural Community Conservation Plan, approved by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife." The Department recommends that the County clarify how the value of the restoration work will be assessed. The Department recommends that the County establish specific parameters and biological value/improvement goals if this option is to be included in the EIR.

0004-91

Add the header ***e.*** to the last measure of this section:

0004-92

"e. Payment of a biological resources..." In addition to this heading edit, the Department recommends that this program (and associated fees) be in place and approved by the appropriate regulatory agencies before project proponents are allowed to use this as a mitigation option.

Also, the Department is concerned that currently as proposed, there is no discussion as to where the compensatory mitigation land would or could be located. The Department highly recommends that this mitigation measure be **updated** to include a plan for land acquisition target areas to provide wildlife movement and habitat connectivity corridors.

0004-93

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-1, Level of Significance After Mitigation, Page 4.4-215: This section states, "Impacts would be less than significant." The Department recommends that the County discuss why the proposed mitigation measures would offset Project impacts to species identified as a candidate, sensitive, or special-status species to less than significant. A description in this section would explain the reason for the County's determination. Currently, because there is no justification why this determination was made.

0004-94

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-2, Page 4.4-216: The Department recommends the following **edits** in the fifth sentence of paragraph one of this section, "As discussed in Section 4.4.2***1***, Environmental Setting, the sensitive natural communities identified within the Project Area include wetlands, water and other riparian habitat that are subject to state or federal permit requirements

0004-95

prior to physical disturbance***, including but not limited to Section 1600 of the CFGC and the Clean Water Act 401 and 404***."

0004-95 Continued

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-2, MM 4.4-17, Page 4.4-219: The Department recommends the following **edits** to the fourth sentence of MM 4.4-17: "The site plan for the proposed activity shall identify waters, wetlands***, resources subject to section 1600 of the CFGC,*** and other riparian habitats that occur in and within 100 feet of the disturbance area."

0004-96

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-2, Level of Significance After Mitigation, Page 4.4-219: This section also states, "Impacts would be less than significant." The Department recommends that the County also discuss in this section why the proposed mitigation measures (including the mitigation measures in the Biological Resources section 4.4-1) would offset Project impacts to riparian habitat or other sensitive natural community to less than significant, for the same reasons described above (in comments on Page 4.4-215).

0004-97

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-3, Level of Significance After Mitigation, Page 4.4-221: This section also states, "Impacts would be less than significant." The Department recommends that the County also discuss in this section why the proposed mitigation measures in the Biological Resources section 4.4-1 would offset Project impacts to riparian habitat or other sensitive natural community to less than significant, for the same reasons described above (in comments on Page 4.4-215).

0004-98

Section 4.4.4 Impacts and Mitigation Measures, Impact 4.4-4, Page 4.4-222: This section states,

0004-99

> "As discussed in Section 4.4.2, Environmental Setting, and shown in Figure 4.4-11, the generalized patterns of wildlife movement in and through the Project Area have been characterized in certain studies. The length and width of these corridors have not been precisely determined and most correspond with major geographic features that are likely to facilitate species movement, including the Kern River and Poso Creek channels, and along the base of the mountain ranges that border the Project Area to the east, south and west.
>
> Oil and gas exploration and production activities are more porous and maintain wildlife movement to a greater extent than urban development, and, depending on species requirements, agricultural uses that modify surface vegetation, soils and irrigation. A recent study conducted in

> 2008-2010 for the BLM found that species assemblages in saltbush scrub habitat remain relatively intact in oilfield locations with up to 70% disturbance in Kern County (Fiehler, C.A. and B. Cypher, 2011). This result indicates that even moderately developed oilfields as documented in the 2011 survey would retain the capacity for wildlife movement. However, oilfield development with more than 70% disturbance could reduce species movement, and potential impacts to wildlife movement in higher density locations would be significantly impacted by project activities without mitigation."

0004-99 Continued

The Department does not believe that this section is sufficient. We are concerned that without a landscape scale conservation plan addressing oilfield development with more than 70% disturbance wildlife movement in high density locations would be significantly impacted by Project activities, even with the proposed mitigation measures in the Biological Resources section 4.4-1. In addition, 'relatively intact' species assemblages in saltbush scrub habitat (as referenced above by (Fiehler and Cypher, 2011) in oilfield locations with up to 70% disturbance in Kern County, does not mean that there is no impact to species movement by the maintenance, expansion, or establishment of new oilfields. The Department is recommending that this section fully describe and disclose all potential Project impacts to the movement of native resident or migratory wildlife species, established native resident or migratory wildlife corridors, and the use of wildlife nursery sites.

0004-100

In addition, the DEIR should identify a conservation strategy that identifies areas to target for conservation (e.g., areas on which the habitat mitigation fees would be expended). We recommend including the western Kern County corridors/conservation targets identified in the California Council on Science and Technology (CCST) document entitled "*An Independent Scientific Assessment of Well Stimulation in California*", July 2015 as a starting point.

0004-101

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-4, Level of Significance After Mitigation, Page 4.4-222: This section also states, "Impacts would be less than significant with mitigation." The Department recommends that the County also discuss in this section why the proposed mitigation measures in impact section 4.4-1 would offset Project impacts to riparian habitat or other sensitive natural community to less than significant, for the same reasons described above (in comments on Page 4.4-215).

0004-102

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-5, Level of Significance After Mitigation, Page 4.4-223: This section also states, "Impacts would be less than significant with mitigation." The Department recommends that the County also

0004-103

discuss in this section why the proposed mitigation measure 4.4-19 would offset Project impacts to biological resources such as a tree preservation policy or ordinance to less than significant, for the same reasons described above (in comments on Page 4.4-215). 0004-103 Continued

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-6, Page 4.4-223: **Move** the "California Aqueduct - San Joaquin Field Division HCP" from HCPs that have been adopted list to HCPs that are proposed list. 0004-104

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-6, Page 4.4-224: **Edits** to the seventh paragraph of this section are in order: "The Project Area also includes ~~five~~ ***four*** HCPs that do not cover oil and gas production activities: ~~the California Aqueduct - San Joaquin Field Division HCP,~~ the Kern County Waste Facilities HCP, the Pacific Gas and Electric Company San Joaquin Valley Operations and Maintenance Program HCP, the TUMSHCP, and the Metropolitan Bakersfield HCP. The original term of the Metropolitan Bakersfield HCP has expired, and a renewal process is underway. The Project is likewise not inconsistent with these ~~five~~ ***four*** HCPs that do not include oil and gas production as "Covered Activities."" A new paragraph will need to be **included** to disclose that the California Aqueduct - San Joaquin Field Division HCP is proposed and does not cover oil and gas production activities. 0004-105

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-6, Level of Significance After Mitigation, Page 4.4-229: This section also states, "Impacts would be less than significant with mitigation." The Department recommends that the County also discuss in this section why the proposed mitigation measure in section 4.4-6 would offset Project impacts regarding conflicts with the provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other Approved Local, Regional, or State Habitat Conservation Plan to less than significant, for the same reasons described above (in comments on Page 4.4-215). 0004-106

Section 4.4.5 Cumulative Setting, Impacts and Mitigation Measures, Impact 4.4-7, Cumulative Impacts to Biological Resources, Page 4.4-230: The Department recommends the following edits in the second sentence of paragraph four of this section, "Future land uses and development could affect biological resources in each of these jurisdictions and would be undertaken as independent actions with associated impacts, avoidance and minimization requirements, and ***compensatory*** mitigation, if required, under applicable federal, state, regional and local agency law." 0004-107

Hazards and Hazardous Materials Chapter 4, Section 4.8

Section 4.8.3 Regulatory Setting, State, Hazardous Materials and Hazardous Waste, Lempert-Keene-Seastrand Oil Spill Prevention and Response Act of 1990, Page 4.8-49: 0004-108

The DEIR discusses the Lempert-Keene-Seastrand Oil Spill Prevention and Response Act of 1990 in this section and mentions that the Act was amended in 2014 by Senate Bill 861 to expand application of its provisions to all waters of the state, and not solely coastal and marine waters. Additionally, throughout the entire document are many references to Spill Prevention Countermeasure and Contingency Plans; Spill Prevention, Control and Countermeasure Plans; Spill Contingency Plans; and Division of Oil Gas and Geothermal Resources Assembly Bill 1960 spill plans. Senate Bill 861 which created the Statewide Oil Spill Prevention and Response Program authorized the Administrator of the Department of Fish and Wildlife's Office of Spill Prevention and Response (OSPR) to develop emergency regulations to begin program implementation. As of September 4, 2015, the emergency regulations addressing Inland Production Facility Contingency Plans, Certificates of Financial Responsibility, and Drills and Exercises have been approved by the Office of Administrative Law. These emergency regulations now require certain inland production facilities to submit an Oil Spill Contingency Plan to OSPR and to demonstrate the financial ability to pay for costs and damages caused by a spill, and to begin a drills and exercises program. The Department recommends that the EIR **reference** and **add** these new requirements. The OSPR emergency regulations and associated guidance documents are available at the following website:
https://www.wildlife.ca.gov/OSPR/Preparedness/Inland-Facilities-Contingency-Plan

The Department's suggested text edit is added to the Final EIR.

0004-14

The Department's suggested text edit is added to the Final EIR.

0004-15

These comments, as well as comments 4-18 through 4-26, make specific recommendations regarding the applicant-proposed Best Management Practices (BMPs).

The Best Management Practices (BMPs) set forth in DEIR section 3.55 are Applicant-proposed measures that reflect current practice and, in many instances are already required by applicable law and regulations. As stated on DEIR p. 3-72, the EIR does not assume that any of these BMPs will be implemented for purposes of analyzing or mitigating the potential significance of an environmental impacts of the Project. Applicant-suggested BMPs are provided for informational purposes sine these were proposed as part of the Project, but the EIR includes specific mitigation measures that must be implemented, and these mitigation measures supersede any inconsistent or less stringent BMP.

These comments recommend that the first Applicant-proposed BMP should be changed to reflect the mitigation measures are noted. The BMPs were included as part of the Project Description as applicant proposals, but this biological survey BMP is superseded by the detailed survey mitigation measures included in Chapter 4.4, Biological Resources. Because the EIR does not assume BMPs will be implemented for purposes of analyzing or mitigating the potential significance of an environmental impacts of the Project, it is not necessary to change the Applicant-proposed BMPs in order to mitigate potential adverse impacts. As the comment notes, MM 4.4-1 provides for an adequate 30-day window for pre-disturbance surveys for special status species (excepting seasonally restricted focused surveys).

The Department's recommendation that early reconnaissance-level surveys be completed in order to provide for adequate time for Applicants to obtain any required Incidental Take Permit (ITP) approvals is noted for the record.

0004-16

These comments, as well as comments 4-18 through 4-26, make specific recommendations regarding the applicant-proposed Best Management Practices (BMPs).

The Best Management Practices (BMPs) set forth in DEIR section 3.55 are Applicant-proposed measures that reflect current practice and, in many instances are already required by applicable law and regulations. As stated on DEIR p. 3-72, the EIR does not assume that any of these BMPs will be implemented for purposes of analyzing or mitigating the potential significance of an environmental impacts of the Project. Applicant-suggested BMPs are provided for informational purposes sine these were proposed as part of the Project, but the EIR includes specific mitigation measures that must be implemented, and these mitigation measures supersede any inconsistent or less stringent BMP.

These comments recommend that the first Applicant-proposed BMP should be changed to reflect the mitigation measures are noted. The BMPs were included as part of the Project Description as applicant proposals, but this biological survey BMP is superseded by the detailed survey mitigation measures included in Chapter 4.4, Biological Resources. Because the EIR does not assume BMPs will be implemented for purposes of analyzing or mitigating the potential significance of an environmental impacts of the Project, it is not necessary to change the Applicant-proposed BMPs in order to mitigate potential adverse impacts. As the comment notes, MM 4.4-1 provides for an adequate 30-day window for pre-disturbance surveys for special status species (excepting seasonally restricted focused surveys).

0004-17

These comments, as well as comments 4-18 through 4-26, make specific recommendations regarding the applicant-proposed Best Management Practices (BMPs).

The Best Management Practices (BMPs) set forth in DEIR section 3.55 are Applicant-proposed measures that reflect current practice and, in many instances are already required by applicable law and regulations. As stated on DEIR p. 3-72, the EIR does not assume that any of these BMPs will be implemented for purposes of analyzing or mitigating the potential significance of an environmental impacts of the Project. Applicant-suggested BMPs are provided for informational purposes sine these were proposed as part of the Project, but the EIR includes specific mitigation measures that must be implemented, and these mitigation measures supersede any inconsistent or less stringent BMP.

These comments recommend that the first Applicant-proposed BMP should be changed to reflect the mitigation measures are noted. The BMPs were included as part of the Project Description as applicant proposals, but this biological survey BMP is superseded by the detailed survey mitigation measures included in Chapter 4.4, Biological Resources. Because the EIR does not assume BMPs will be implemented for purposes of analyzing or mitigating the potential significance of an environmental impacts of the Project, it is not necessary to change the Applicant-proposed BMPs in order to mitigate potential adverse impacts. As the comment notes, MM 4.4-1 provides for an adequate 30-day window for pre-disturbance surveys for special status species (excepting seasonally restricted focused surveys).

The Department's recommendation that early reconnaissance-level surveys be completed in order to provide for adequate time for Applicants to obtain any required Incidental Take Permit (ITP) approvals is noted for the record.

0004-18

The Department's suggested revision to the Applicant BMP's is noted for the record and included in the Final EIR. Mandatory survey and avoidance mitigation measures are included in Chapter 4.4, Biological Resources.

0004-19

The Department's recommended modifications to the Applicant BMPs are noted for the record and included in the Final EIR. The Department's distinction between biologists who are "qualified" to perform survey and monitoring activities that do not involve the capture or take of protected species, and biologists who are "permitted" by being specifically authorized by the Department to complete protocol-level surveys and/or engage in management activities that result in temporary capture or other forms of "take" is also noted, and included in the Final EIR.

0004-20

The Department's suggested edit, clarifying that required permits must be obtained, is noted and added to the Final EIR.

0004-21

The Department's recommended modifications to the Applicant BMPs are noted for the record, and included in the Final EIR. Mandatory survey and avoidance mitigation measures are included in Chapter 4.4, Biological Resources.

0004-21 cont'd

0004-22

The Department's suggested revision to this Applicant BMP is included in the Final EIR.

0004-23

The Department's suggested revision to this Applicant BMP is included in the Final EIR.

0004-24

The Department's suggested revision to this Applicant BMP is included in the Final EIR. A Worker Awareness Educational Program (WEAP) for sensitive biological resources is included as Mitigation Measure 4.4-14.

0004-25

The Department's suggested revision to this Applicant BMP is included in the Final EIR.

0004-26

The Department's suggested revision to this Applicant BMP is included in the Final EIR.

0004-27

The comment observes that the San Joaquin kit fox population is quite robust in urban settings in the Project Area, and recommends updating the section of the EIR to include the current status of the kit fox and their use of urban settings. The Final EIR is revised to include updated information on the San Joaquin kit fox as follows.

Habitats used by the San Joaquin kit fox are typically grassland and saltbush scrub in areas of flat or rolling topography (Cypher et al. 2013). However, this taxon is quite tolerant of human-caused impacts and will, to a varying extent, utilize urban areas, oil fields and cultivated agricultural lands (Fiehler and Cypher 2011). For example, the San Joaquin kit fox is known to use oil fields, even those with intensive impacts, for all life-history activities such as foraging, cover, reproduction, and traveling (CEC, 1996). A study conducted in the former Naval Petroleum Reserves in California (NPRC) found that conversion of 30 percent of the native habitat to oil/gas field development did not impact movements and home ranges of San Joaquin kit foxes in the area (Zoellick et al. 2002). San Joaquin kit foxes within the NPRC have smaller home ranges when compared to the size of home ranges in other portions of the geographic range of the species, indicating that NPRC lands provide some of the highest quality habitat remaining for kit foxes in the San Joaquin Valley (Zoellick et al., 2002). It is notable that remaining suitable habitat for San Joaquin kit fox is currently concentrated on the west side of the southern San Joaquin Valley Floor from the Lokern Natural Area to Maricopa (Cypher 2013), which overlaps with areas where oil and gas activities have been focused for over a century.

The comment notes recent studies by Cypher et al (2013) that emphasize the need to protect high suitability habitat for San Joaquin kit fox. The cited study by Cypher emphasizes that the historic losses of habitat are largely due to agricultural conversion and urban development. As described above, the largest blocks of remaining suitable habitat are located in the area of the southern San Joaquin Valley that is also associated with more than 100 years of intensive oil and gas development. The blocks of contiguous habitat in Kern County include lands that are proposed for conservation in regional plans such as the Lokern HCP and the Elk Hills HCP that will be important for the long-term survival and recovery of the species by protecting core populations identified in the SJV Recovery Plan (USFWS, 1998). Mitigation Measure 4.4-16 in the DEIR will provide a mechanism for the dedication and conservation of wildlife habitats, including lands in the Lokern area, the Elk Hills area, and other lands along the west side of the southern San Joaquin Valley that are considered highly suitable for San Joaquin kit fox (Cypher et al 2013).

San Joaquin kit foxes in the southern San Joaquin Valley occur in and adjacent to several urban areas including the cities of Taft (Zoellick et al. 2002), Tulare, Visalia, and Porterville (USFWS 1998), and Bakersfield, where kit foxes have been observed throughout the city (Frost 2005). Additionally, urban kit foxes have been found to den close to human activities and structures, including water sumps (catchment basins) and landscaped areas in and adjacent to urban development in Bakersfield (Frost 2005). Frost (2005) concluded that urban habitat can support viable kit fox populations when sufficient food and den sites are available, mortality is minimal, and reproduction occurs at reasonable rates (Frost 2005). As noted by Cypher et al. (2013), several hundred kit foxes may inhabit the City of Bakersfield in Kern County despite the general absence of natural habitat. This urban population of kit fox is persistent and stable (Cypher and Frost 1999, Cypher 2010).

In 2005, a study was undertaken to investigate the effects of roads on urban kit fox populations. The study found that arterial roads accounted for 72.9% of kit fox strikes and approximately 90% of road kill were retrieved from roads with posted speed limits of greater than 45 mph (Bjurlin et al. 2005). These data contrast with all other studies on San Joaquin kit fox outside of urban areas in which vehicle strike rarely exceeded 10% of mortalities and was not considered a significant influence on fox demographics or population ecology (Bjurlin et al. 2005). Based on this information, Mitigation Measure 4.4-11, which places a speed limit of between 25 and 10 mph on dirt access roads, should be reasonably sufficient to prevent vehicle strikes of San Joaquin kit fox.

As described in GR Bio-1, the avoidance and minimization requirements in the mitigation measures are modelled after measures typically required by the USFWS or CDFW to reduce potential effects to ESA and CESA-listed species With their incorporation as conditions of the Project, these measures would be applied to all oil and gas activities under the purview of the County, including entities that do not typically undertake Section 7 or Section 10 consultation for ESA-listed species or Section 2081 for CESA-listed species. Where complete avoidance is not possible, Mitigation Measures 4.4-2, 4.4-11 and 4.4-12 prohibit take of listed species such as San Joaquin kit fox without authorization from the USFWS or CDFW.

0004-44

The comment states that the large-scale mapping shown on Figures 4.4-1 through 4.4-37 of Appendix N of the EIR may have different habitat than what the other modeling methods show, and that suggests that the EIR clarify that these maps should not be used for determining impacts on the 37 special status species used for the models. The Final EIR acknowledges that they maps are not to be used for determining impacts on the 37 special-status species used for the models, and acknowledges that these maps will not be used for purposes of obtaining ITPs or other approvals from CDFW related.

Section 4.4-33 of the EIR includes the following description of habitat suitability modeling: "Habitat suitability modeling has been used to estimate potential species distribution and impacts in larger landscapes. The model results identify potentially suitable habitat for each modeled species and not actual species distribution in the Project Area." DEIR p. 4.4-33. Mitigation measure 4.4-1 requires that pre-construction surveys for special status wildlife species be performed by a qualified biologist within a 30-day period prior to the commencement of any new ground-disturbing activities. All biological mitigation measures are required to be performed at each new construction area. The habitat models that were used in this EIR include three different modeling approaches using various environmental parameters to produce maps and acreage

estimates depicting habitat suitability for each species within the Project Area. The model results did not predict the presence or absence of a species within the Project Area or the suitability of the habitat to support an individual species. Please also refer to RTC 44-91 for additional discussion of the modeling techniques used.

0004-45

The Department's suggested text edits to clarify text and correct a typographical error are noted and included in the record.

0004-46

The comment clarifies and expands the definition of special-status species. The Department's suggested text edits are noted and included in the record.

0004-46 cont'd

0004-47

The Department's suggested text edits that the referenced bullet clarifying the reference to the Native Plant Protection Act are noted and included for the record.

0004-48

0004-49

The Department's text edit is included in the Final EIR.

0004-50

The Department's text edit is included in the Final EIR.

0004-51

The Department's text edit is included in the Final EIR.

0004-52

The Department's text edit is included in the Final EIR.

0004-53

The Department recommends including a definition of "high quality suitable habitat" for Swainson's hawk.

In California's Central Valley, high quality suitable habitat for Swainson's hawk consists of riparian forests or remnant riparian trees of appropriate distribution and size adjacent to irrigated crop lands, such as alfalfa, and fallow fields that are used to forage. For the purposes of the modeling analysis for this species, environmental conditions used for determining high quality habitat suitability were primarily elevation, followed by water availability, soil type, annual precipitation, and winter low temperature. The modeling did not indicate that high quality habitat occurs within portions of the Project Area below 2000 feet. Swainson's hawks are known to nest in the Project Area.

0004-53 cont'd

0004-54

The comment states that the full reference authority for the discussion of the Tipton Kangaroo Rat on pages 4.4-114 through 115 does not appear to be in the DEIR. The comment suggests that the intended reference might be: U.S. Fish and Wildlife Service 2010 Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*) 5-Year Review: Summary and Evaluation, and that if it is not, that reference should be included in the DEIR references. That reference is the correct reference, and it does appear in the DEIR in the bibliography section at page 10-15.

0004-55

The Department's suggested clarification text regarding the three circumstances under which a project may legally occur pursuant to these statutory provisions is added to the Final EIR as an update to the regulatory setting section.

0004-55 cont'd

0004-56

The Department's suggested text edits are included in the Final EIR.

0004-57

The Department is correct that the reference was intended to be an "NCCP" not "MCPC".

0004-58

The Department's text edits are added to the Final EIR.

0004-59

The comment states that the list of HCPs and companion ITPs provided on p. 4.4-154 does not include all HCPs and companion ITPs that have been issued. The comment is noted for the record. The list provided was not intended to be an exhaustive list; rather it is intended to be illustrative of the regulatory requirements in effect for some oil and gas operators in the Project Area. It is not intended to be comprehensive, and will continue to evolve over time as existing take authorizations expire or are amended, and new take authorizations are approved. Applicants may not cause the incidental take of a protected species without an HCP and/or state take permit, as applicable.

0004-60

The Department's suggestions to update the table will be added to the Final EIR, and the Table 4.4-66 key for "FT*" is "Federally Threatened Delisted."

0004-61

The Department's text edits are added to the Final EIR.

0004-62

The Department's text edits are added to the Final EIR.

0004-63

The Department recommends some minor changes to the text discussing the requested ITP. CRC is applying for an ITP from CDFW pursuant to Section 2081 (b) of the CFGC. The Section 2081 application which would be a companion permit to the federal EHHCP, was deemed complete by CDFW on March 3, 2014. The revised text is suggested by the Department is added to the Final EIR. Please also see GR Bio-2 discussing the status of the CRC EHHCP.

0004-64

The Department recommends adding the discussion of the Federal Endangered Species Act consultation status with the USFWS (currently on page 4.4-164) to the Background information of the EHHCP section. The Department's text edit is added to the Final EIR.

0004-65

The Department reiterates its prior comment to move the last paragraph of this section to the Background section on Page 4.4-159. This comment is noted and included for the record.

The comment further recommends clarifying the FESA consultation status. With respect to the FESA, CRC is currently operating the EHOF consistent with a 1995 Biological Opinion (1995 BO) and associated Incidental Take Statement (ITS) which provides federal incidental take coverage of listed species. The Department is correct that there is no expiration date for this still-pending permit application for take authorization by the USFWS. However, in anticipation of a need for future additional federal take authorization, CRC has prepared a draft HCP for the EHOF pursuant to Section 10 of FESA. At this time CRC is using the draft EHHCP in support of its request for a Section 2081 ITP from the CDFW. When it is determined, in consultation with the USFWS that additional federal approval is necessary, CRC will prepare an Environmental Impact Statement (EIS) to comply with the requirements of NEPA (42 U.S.C. 4321; 40 CFR 1500.1) with the USFWS as lead agency.

The Department also recommends that the document be consistent in how it refers to the USFWS as this section is using the term "Service." The Final EIR is hereby revised to define the terms "Service" and "USFWS" as used in Section 4.4.3 to mean the US Fish and Wildlife Service.

0004-66

The Department's text edits are added to the Final EIR.

0004-69

The Department's text edits are added to the Final EIR.

0004-70

The comment recommends clarification of the current status of the MBHCP and recommends text edits. Comments are noted and accepted for the Final EIR.

The comment also recommends text edits; the Department's suggested text edits are added to the Final EIR.

0004-71

The Department's suggested text edit is added to the Final EIR.

0004-72

The comment recommends including a discussion of direct and indirect impacts on special-status species and on lake and streambed resources. Further information is provided here which addresses potential impacts to special-status species and streambed resources that may result from a wide range of oil and gas project activities.

Impacts to state-listed species could result in a proximate cause of take. Impacts could result from increased levels of human disturbance, destruction or excavation of burrows and dens, entrapment in open pipes and construction-related trenches, and other factors. Activities may avoid direct impacts to individuals, but these individuals may be forced into unfamiliar territory that could in turn increase the likelihood of predation, exposure (to the elements), stress through disorientation, and lack of shelter.

During construction activities, inadvertent entombment or crushing in collapsed burrows and dens and through entrapment in construction related holes or trenches could result in direct impacts, including mortality and/or injury. State-listed species may also be subject to vehicular strikes, direct contact with heavy equipment while in use, pouring of materials, contact with moving parts of wells or other heavy equipment, wildfire inadvertently ignited during welding or other operations, contact with oil spills, sumps, and inundation of animals during release of hydrostatic pipeline test water and drilling and completion fluids, including hydraulic fracturing flowback fluids.

With respect to lake and streambed resources, because many of the impacts to streambeds would occur in dry intermittent streambeds which are the more commonly occurring type of this resource in the Project Area, these areas typically have the same species composition as areas outside of the streambeds. Because of this aspect, it is recognized that impacts to dry intermittent streambed resources will generally be the same as to upland area resources surrounding such streambeds. Further, work along and within streambeds will, if possible, be scheduled to occur during naturally dry conditions when there is no surface flow.

A typical activity may include removal of vegetation, such as ruderal grasses and weeds. The activity could result in animal mortality from collisions with vehicles or heavy equipment or from sediment and vegetation excavation; crushing of burrows or dens, or entombment of animals during sediment and vegetation removal; fugitive dust impacts to animals and plants; noise disturbance; nest abandonment; and increased predation.

Most of the state-listed species that occur in the Project Area are assumed to generally occur throughout the area, with the exception of a few species that are highly restricted in occurrence such as the Bakersfield cactus as discussed in the Environmental Setting. Therefore it is assumed that state-listed species would also be subject to the same general impacts in dry intermittent streambeds as the adjacent upland areas surrounding the streambeds. Impacts to bona fide riparian areas adjacent to rivers and lakes would tend to be more intense such as vegetation removal to safely accommodate the activity.

However, the level of oil and gas activities adjacent to flowing streams, rivers and lakes would be restricted and would only represent a fraction of the level of typical oil and gas activities that occur throughout the Project Area due to the sensitive nature of these resources. Because of this greater sensitivity such resources are protected with overlapping layers of regulations and consultation/permitting requirements as described in Section 4.4-1. Please also refer to GR Bio-1.

Such regulations and permitting agency oversight would subject any proposed activity to careful review and any permit(s) issued for the project will normally include a requirement to implement protective measures and conditions to ensure that adverse impacts are avoided, minimized and mitigated as much as possible. For a discussion of lake and streambed resources comprised of sensitive natural communities, and federally protected wetlands, see the discussions in Impacts 4.4-2 and 4.4-3 where the amounts of potential impacts to these resources are evaluated. Additionally, see the discussion in Mitigation Measures MM 4.4-17 and 4.4-18 on page 4.4-219 for further detail.

0004-75

The Department's suggested text edit is included in the Final EIR.

0004-76

The Department recommends edits to MM 4.4-1. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments, as well as to add specificity and remove discretion so that the measures, as implemented, will be consistent with the ministerial conformity review process adopted by the Revised Amended Ordinance. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-76 cont'd

0004-77

The Department recommends that the County create a criterion for determining qualified biologists. The County will work with appropriate stakeholders, including the Department, to develop an appropriate definition of a qualified biologist as part of the Mitigation Monitoring and Reporting implementation process.

0004-78

The Department recommends edits to MM 4.4-2, and recommends clarifying how compliance with this mitigation measure will be verified. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-79

The Department recommends edits to MM 4.4-2, and recommends clarifying how compliance with this mitigation measure will be verified. The

Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-80

The Department recommends a new mitigation measure regarding requirements for pre-disturbance surveys. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-81

The Department recommends edits to MM 4.4-3. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-81 cont'd

0004-82

The Department recommends a new mitigation measure to include a requirement for presence of a biological monitor during certain ground-disturbing activities. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-83

The Department recommends edits to MM 4.4-6. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-84

The Department recommends edits to MM 4.4-10(c). The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-85

The Department recommends edits to MM 4.4-12(b), and recommends clarifying how compliance with this mitigation measure will be verified. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-85 cont'd

0004-86

The Department recommends edits to MM 4.4-12(b), and recommends clarifying how compliance with this mitigation measure will be verified. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-87

The Department recommends deletion of MM 4.4-13 as it is a repeat of 4.4-12(b). The Department is correct and the mitigation measure has been deleted. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-88

The Department recommends an addition to MM 4.4-15(a-v) regarding end caps on pipes. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-89

The Department recommends changes to MM 4.4-16. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR. Please see GR-19 regarding the Mitigation Monitoring and Reporting Program. The County will consult with various stakeholders, including the Department, to implement the MMRP in such a way as to allow the County to identify and track temporary disturbances.

0004-90

The Department recommends changes to MM 4.4-16. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR. Please see GR-19 regarding the Mitigation Monitoring and Reporting Program. The County will consult with various stakeholders, including the Department, to implement the MMRP in such a way as to allow the County to identify and track temporary disturbances.

0004-90 cont'd

0004-91

The Department recommends changes to MM 4.4-16. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR. Please see GR-19 regarding the Mitigation Monitoring and Reporting Program. The County will consult with various stakeholders, including the Department, to implement the MMRP in such a way as to allow the County to identify and track temporary disturbances.

0004-92

The Department recommends a text change to a header; this edit is included in the Final EIR. The comment also recommends that the program referenced in MM 4.4-16(e) be in place and approved by the appropriate regulatory agencies before project proponents may use it as a mitigation option.

0004-93

The Department recommends MM 4.4-16 be updated. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-94

The Department recommends discussion of why the proposed mitigation measures would offset Project impacts to species identified as candidate, sensitive, or special-status species to less than significant.

The avoidance and minimization requirements in the mitigation measures are modelled after measures typically required by the USFWS or CDFW to reduce potential effects to ESA and CESA-listed species, as found in management plans or recovery plans adopted by those agencies, or in take authorizations previously approved by them. With their incorporation as conditions of the Project, these measures would be applied to all oil and gas activities under the purview of the County, including entities that do not typically undertake Section 7 or Section 10 consultation for ESA-listed species or Section 2081 for CESA-listed species. This extension and standardization of these measures will, in some cases, provide more protection for special status species than would occur under the No Action alternative.

Where complete avoidance is not possible, Mitigation Measures 4.4-2, 4.4-11 and 4.4-12 prohibit take without authorization from the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service. Similarly, if wetlands and riparian areas cannot be completely avoided, Mitigation Measure 4.4-18 prohibits disturbance without authorization by appropriate federal or state agencies. These regulatory programs provide meaningful additional oversight and protections for biological resources. The mitigation measures in the Draft EIR reflect the measures needed to reduce impacts to less than significant under CEQA. The California Department of Fish and Wildlife may determine that additional requirements must be met to comply with the CESA or the other permitting programs that agency administers. The same is true of the U.S. Fish

and Wildlife Service when administering the ESA, or the Army Corps of Engineers administering Section 404 of the Clean Water Act. In this way, the survey, avoidance and compensation measures in the Draft EIR may be augmented by measures imposed by these other agencies.

As described in the DEIR a majority of new wells, approximately 95%, would be located in the Eastern and Western Subareas, which include the Project Area locations that have been subject to oil and gas exploration and production activities for several decades. The Applicant will be required to conduct pre-construction surveys for federal and state listed species, and sensitive species. If the pre-construction surveys identify listed species within the project disturbance area the Applicant will be required to consult with USFWS and CDFW. Through the consultation process the agencies may require the Applicant obtain a Take permit for impacts to listed species. Results from the surveys must be submitted to the USFWS, CDFW and Kern County Planning and Community Development Department, and must contain avoidance and minimization measures if sensitive species were documented within the survey area.

Specifically with respect to special status species, pre-disturbance surveys are required by Mitigation Measures 4.4-1 (special status wildlife) and much of the mitigation lands provided under Mitigation Measure 4.4-16 will be part of large scale conservation plans, such as the Lokern HCP or Elk Hills HCP, or will utilize a mitigation bank or other similar entity that is protecting habitat of regional importance for special status species. The regional HCPs and mitigation banks are usually centered on lands that have been identified in recovery goals established for special status species (i.e. recovery goals established in the Recovery Plan for Upland Species of the San Joaquin Valley, USFWS, 1998).

Please refer to GR Bio-1 for further discussion on the adequacy of mitigation measures for biological resources, including special-status species. Please also refer to GR Bio-2 for further discussion of some of the Project Area HCPs, which discuss the protections in place for special-status species.

0004-95

The Department's text edit is added to the Final EIR.

0004-95 cont'd

0004-96

The Department's text edit is added to the Final EIR.

0004-97

The comments request discussion on mitigation of impacts 4.4-2 and 4.4-3. The project mitigation measures require the applicant to obtain permits from CDFW (Stream Alteration Permit) and the USCOE for impacts to wetlands and waterbodies. The permits will require restoration for impacts to wetlands and waterbody. Impacts to sensitive natural commumity will be mitigated through implementation of MM 4.4-15 and MM 4.4-16. Please also refer to GR Bio-1 and GR Bio-2, which both address Project impacts in riparian habitats and sensitive natural communities. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-98

The comments request discussion on mitigation of impacts 4.4-2 and 4.4-3. The project mitigation measures require the applicant to obtain permits from CDFW (Stream Alteration Permit) and the USCOE for impacts to wetlands and waterbodies. The permits will require restoration for impacts to wetlands and waterbody. Impacts to sensitive natural commumity will be mitigated through implementation of MM 4.4-15 and MM 4.4-16. Please also refer to GR Bio-1 and GR Bio-2, which both address Project impacts in riparian habitats and sensitive natural communities. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments. The revised mitigation measures are set forth in Section 7.1.4 of this Final EIR.

0004-99

These comments restate some of the EIR's discussion on wildlife movement through disturbed areas, and notes the Department's concern that mitigation measures may not be sufficient to protect against impacts to wildlife movement through areas with disturbance greater than 70%. The comments note the potential for impacts to species in saltbrush scrub habitat, and recommends that the EIR fully describe and disclose potential

impacts to wildlife movement. The comments also recommend a conservation strategy that identifies target conservations areas.

Oil/gas field development in Kern County does not displace wildlife or interfere substantially with wildlife movement in the same manner as other development activities such as agricultural or urban development. Existing regional conservation documents such as the SJV Recovery Plan acknowledge that oil/gas production retains more habitat value for special-status species of the southern San Joaquin Valley compared to agricultural lands (USFWS, 1998). Initial oil/gas field development in natural lands affects small patches of land (e.g., well locations) and results in some linear disturbance (e.g., access roads and pipelines), but the ability of wildlife to utilize adjacent habitat and traverse active oil and gas field areas is less impeded than it is for more intensive development types such as agriculture and urban lands. This conclusion is demonstrated by the documented use of oil and gas field production areas by species such as the San Joaquin kit fox (Fiehler and Cypher, 2011).

The effects of habitat disturbance and fragmentation as a result of oil/gas development have been an ongoing subject of study in the San Joaquin Valley. The Ecosystem Analysis of Oil Fields in Western Kern County, California study conducted for BLM in 2008-2010 found that native species (including some special-status species) persist in areas of oil/gas field development up to a "medium level of disturbance" (ranging from 15 percent to 70 percent of the area disturbed). The study found that species such as Le Conte's Thrasher, San Joaquin antelope squirrel, and short-nosed kangaroo rat were present on all but the most disturbed study plots, and at high levels of oil/gas field development (Fiehler and Cypher, 2011). The vast majority of oil field areas of moderate to high disturbance occur within the DOGGR delineated productive zones, which are variously subject to current or proposed conservation planning by BLM or Habitat Conservation Plans, which seek to minimize the effects of habitat disturbance and fragmentation.

The effects of oil and gas field development disturbance in other habitat types, such as hardwood forests or sagebrush scrub, are not an accurate predictor of the effects on special status wildlife species in Kern County. The majority of the upland special-status species that occur within the southern San Joaquin Valley lands require dry, open grassland or habitats with scattered shrubs (USFWS, 2010b; USFWS, 2010c; USFWS, 1998). Dense herbaceous vegetation in uplands of the southern San Joaquin Valley (largely due to the growth of non-native grasses) may decrease habitat suitability for many of these species (Germano et al., 2012). The creation of small barren areas (unpaved access roads and well pads) can create open areas that are used by species such as blunt-nosed leopard lizard and giant kangaroo rats, especially in areas of previously dense non-native vegetation. In addition, roads and pipeline rights-of-way are utilized by San Joaquin kit fox for movement and foraging. The avoidance and minimization measures included in the DEIR would provide additional protection for special status species that utilize active oil/gas fields.

The persistence of special-status species in Kern County oil/gas fields is attributed to their "permeability" for movement and dispersal. Medium levels of disturbance and below provide for habitat connectivity for movement and dispersal as documented by Fiehler and Cypher (2011). For example, San Joaquin kit foxes are relatively common in the oil/gas fields of western Kern County, and appear to be tolerant of oil/gas field development (Cypher et al 2013). A study conducted in the former Naval Petroleum Reserves in California (NPRC) found that conversion of 30 percent of the native habitat to oil/gas field development did not impact movements and home ranges of San Joaquin kit foxes in the area. San Joaquin kit foxes within the NPRC have smaller home ranges when compared to the size of home ranges in other portions of the geographic range of the species, indicating that NPRC lands provide some of the highest quality habitat remaining for kit foxes in the San Joaquin Valley (Zoellick et al., 2002). Unlike highways, agricultural fields, and urban areas, which may present an insurmountable barrier to many species, the development associated with oil/gas fields (i.e. dirt access roads, utility ROW, and well pads) is generally porous to most wildlife.

The mitigation lands that will be provided under Mitigation Measure 4.4-16 will include the dedication of regionally important wildlife habitats identified in large scale, regional conservation plans, such as the Lokern HCP or Elk Hills HCP, or acquisition of credits from agency-approved mitigation banks or other similar entity that are protecting habitat of regional importance for special status species. The regional HCPs and mitigation banks include lands that have been identified in recovery goals established for special status species (i.e., recovery goals established in the SJV Recovery Plan) and seek to protect land in large blocks to minimize edge effects, increase the likelihood that ecosystem functions will remain intact, and facilitate management. Such planning also seeks to connect blocks of conservation lands, allowing greater movement of wildlife between blocks. For example, future conservation lands identified in the Lokern HCP and the Elk Hills HCP would expand existing contiguous areas of intact habitat along the western side of the southern San Joaquin Valley that will further enhance the value of existing conservation lands by providing habitat connectivity and wildlife movement corridors.

The comment's suggestion of conservation targets is appreciated. Through the CCST report, the numerous habitat conservation plans, and other regional natural resource documents, the identification of desired or favorable conservation areas are known to most applicants. As some applicants may have conservation opportunities within their own properties, purchasing mitigation credits, or other considerations for locating compensatory mitigation, an identified conservation strategy directing where mitigation should occur was not included in the Draft EIR. Please see GR Bio-2 for further information on Project Area HCPs.

Please also refer to responses to comments 44-95 through 44-97 which discuss similar issues. Please also see GR Bio-1, which further discusses the suite of mitigation measures prescribed here, along with explanation of measures in place to protect habitat connectivity and wildlife movement corridors. Existing regional conservation documents such as the SJV Recovery Plan acknowledge that oil/gas production retains more habitat value for special-status species of the southern San Joaquin Valley compared to agricultural lands (USFWS, 1998). Initial oil/gas field development in natural lands affects small patches of land (e.g., well locations) and results in some linear disturbance (e.g., access roads and pipelines), but the ability of wildlife to utilize adjacent habitat and traverse active oil and gas field areas is less impeded than it is for more intensive development types such as agriculture and urban lands. This conclusion is demonstrated by the documented use of oil and gas field production areas by species such as the San Joaquin kit fox (Fiehler and Cypher, 2011).

The effects of habitat disturbance and fragmentation as a result of oil/gas development have been an ongoing subject of study in the San Joaquin Valley. The Ecosystem Analysis of Oil Fields in Western Kern County, California study conducted for BLM in 2008-2010 found that native species (including some special-status species) persist in areas of oil/gas field development up to a "medium level of disturbance" (ranging from 15 percent to 70 percent of the area disturbed). The study found that species such as Le Conte's Thrasher, San Joaquin antelope squirrel, and short-nosed kangaroo rat were present on all but the most disturbed study plots, and at high levels of oil/gas field development (Fiehler and Cypher, 2011). The vast majority of oil field areas of moderate to high disturbance occur within the DOGGR delineated productive zones, which are variously subject to current or proposed conservation planning by BLM or Habitat Conservation Plans, which seek to minimize the effects of habitat disturbance and fragmentation.

The effects of oil and gas field development disturbance in other habitat types, such as hardwood forests or sagebrush scrub, are not an accurate predictor of the effects on special status wildlife species in Kern County. The majority of the upland special-status species that occur within the southern San Joaquin Valley lands require dry, open grassland or habitats with scattered shrubs (USFWS, 2010b; USFWS, 2010c; USFWS, 1998). Dense herbaceous vegetation in uplands of the southern San Joaquin Valley (largely due to the growth of non-native grasses) may decrease habitat suitability for many of these species (Germano et al., 2012). The creation of small barren areas (unpaved access roads and well pads) can create open areas that are used by species such as blunt-nosed leopard lizard and giant kangaroo rats, especially in areas of previously dense non-native vegetation. In addition, roads and pipeline rights-of-way are utilized by San Joaquin kit fox for movement and foraging. The avoidance and minimization measures included in the DEIR would provide additional protection for special status species that utilize active oil/gas fields.

The persistence of special-status species in Kern County oil/gas fields is attributed to their "permeability" for movement and dispersal. Medium levels of disturbance and below provide for habitat connectivity for movement and dispersal as documented by Fiehler and Cypher (2011). For example, San Joaquin kit foxes are relatively common in the oil/gas fields of western Kern County, and appear to be tolerant of oil/gas field development (Cypher et al 2013). A study conducted in the former Naval Petroleum Reserves in California (NPRC) found that conversion of 30 percent of the native habitat to oil/gas field development did not impact movements and home ranges of San Joaquin kit foxes in the area. San Joaquin kit foxes within the NPRC have smaller home ranges when compared to the size of home ranges in other portions of the geographic range of the species, indicating that NPRC lands provide some of the highest quality habitat remaining for kit foxes in the San Joaquin Valley (Zoellick et al., 2002). Unlike highways, agricultural fields, and urban areas, which may present an insurmountable barrier to many species, the development associated with oil/gas fields (i.e. dirt access roads, utility ROW, and well pads) is generally porous to most wildlife.

The mitigation lands that will be provided under Mitigation Measure 4.4-16 will include the dedication of regionally important wildlife habitats identified in large scale, regional conservation plans, such as the Lokern HCP or Elk Hills HCP, or acquisition of credits from agency-approved mitigation banks or other similar entity that are protecting habitat of regional importance for special status species. The regional HCPs and mitigation banks include lands that have been identified in recovery goals established for special status species (i.e., recovery goals established in the SJV Recovery Plan) and seek to protect land in large blocks to minimize edge effects, increase the likelihood that ecosystem functions will remain intact, and facilitate management. Such planning also seeks to connect blocks of conservation lands, allowing greater movement of wildlife between blocks. For example, future conservation lands identified in the Lokern HCP and the Elk Hills HCP would expand existing contiguous areas of intact habitat along the western side of the southern San Joaquin Valley that will further enhance the value of existing conservation lands by providing habitat connectivity and wildlife movement corridors.

The comment's suggestion of conservation targets is appreciated. Through the CCST report, the numerous habitat conservation plans, and other regional natural resource documents, the identification of desired or favorable conservation areas are known to most applicants. As some applicants may have conservation opportunities within their own properties, purchasing mitigation credits, or other considerations for locating compensatory mitigation, an identified conservation strategy directing where mitigation should occur was not included in the Draft EIR. Please see GR Bio-2 for further information on Project Area HCPs.

Please also refer to responses to comments 44-95 through 44-97 which discuss similar issues. Please also see GR Bio-1, which further discusses the suite of mitigation measures prescribed here, along with explanation of measures in place to protect habitat connectivity and wildlife movement corridors. References relied on this response are cited below.

0004-103

The Department recommends a discussion of why MM 4.4-19 would offset Project impacts to biological resources to less than significant.

Please refer to GR Bio-1 for a discussion on how mitigation measures prescribed in the Project will adequately reduce impacts to less than significant. Please also see GR Bio-2 for a discussion of the measures that are also in place to protect biological resources through the Valley Floor, Lokern and Elk Hills HCPs within the Project Area.

0004-103 cont'd

0004-104

The comments are noted and accepted for the Final EIR.

0004-105

The comments are noted and accepted for the Final EIR.

0004-106

The Department recommends a discussion of why MM 4.4-6 would offset project impacts regarding conflicts with the provisions of an Adopted HCP, NCCP, or other Approved, Local, Regional or State Habitat Conservation Plan to a level of less than significance.

As discussed in the DEIR the Revised Amended Ordinance amendment would not conflict with any adopted HCP in or adjacent to the Project Area. The Revised Amended Ordinance amendment would also be consistent with the proposed Chevron LHCP and California Resources Corporation EHHCP. The Project is also consistent with the overall framework of the LHCP, and imposes new mitigation measures, as well as substantive and procedural requirements, on most oil and gas production Covered Activities, including those within and outside of the three categories of lands included in the Chevron North American Exploration and Production LHCP. CEQA requires responsible agencies to use the EIR prepared by the lead agency for projects, or portions of projects, that are wholly or partially within the jurisdiction of a responsible agency. This EIR provides project-level coverage under CEQA for the specified Covered Activities described in the LHCP. The Project imposes new mitigation requirements, as well as procedural and substantive compliance requirements, on oil and gas activities that can currently be done "by right;" however, these new regulatory requirements are consistent with, and would not impede or otherwise interfere with, the draft HCP or ITP. The United States Fish and Wildlife Service, as the lead federal agency for the HCP, and the California Department of Fish and Wildlife as a responsible permitting agency for the Section 2081 permit for the Covered Activities described in the HCP and ITP, retain the jurisdiction to approve or disapprove the pending application, and to impose conditions of approval and other compliance requirements that fall within their respective jurisdictions.

0004-107

The Department's text edits are added to the Final EIR.

0004-108

The Department recommends that the EIR reference and add the new requirements associated with OSPR emergency regulations. The comment is noted and accepted in the EIR.

DEPARTMENT OF TOXIC SUBSTANCES CONTROL COMMENTS ON DRAFT ENVIRONMENTAL IMPACT REPORT ON REVISIONS TO THE KERN COUNTY ZONING ORDINANCE – 2015 (C) FOCUSED ON OIL AND GAS LOCAL PERMITTING

Dear Mr. Mynk:

This letter transmits the Department of Toxic Substances Control (DTSC) comments on the "Draft Environmental Impact Report on Revisions to the Kern County Zoning Ordinance – 2015 (c) Focused on Oil and Gas Local Permitting," herein referred to as "the draft EIR." 0005-1

Below the following comments are indexed by the draft EIR page number, except for a general comment on the last page. 0005-2

Page 1-2 (Section entitled "Project Summary") 0005-3

- **FIRST PARAGRAPH, LAST SENTENCE –**
  Please change the phrase "will be used" to "may be used." If DTSC were to approve or oversee a cleanup of a non-petroleum spill or release at an oil and gas development site within the Project Area, DTSC would use its independent judgement to determine the appropriate CEQA document. This may or may not involve reliance upon the Kern County EIR.

Page 2-23 (Section entitled "Project Level EIR") 0005-4

- **FIRST PARAGRAPH, FIRST SENTENCE –**
  Delete the term "ministerial" since ministerial projects proposed to be carried out or approved by public agencies are not subject to CEQA. (Pub. Resources Code § 21080(b)(1).)

Page 2-28 (Subsection entitled "State Agencies") 0005-5

- **FOURTH AND FIFTH BULLETS –**
  Remove the abbreviation "DTSC" that follows California Department of Public Health, and use the "DTSC" abbreviation following California Department of Toxic Substances Control. Correction of this typographical error is important so that the abbreviation "DTSC" is used in its appropriate context in the draft EIR.

Printed on Recycled Paper

0005-6

Page 4.8-1 (Subsection entitled "Hazardous Materials and Waste")

- **FIRST PARAGRAPH –**
The paragraph inaccurately describes "hazardous substance" - "Hazardous substance" is defined in statute (Health & Saf. Code § 25316, Ch. 6.8, Hazardous Substance Account) and not defined in the title 22 regulations. Also, contrary to the second sentence in the paragraph, the definition of hazardous substance does not specifically invoke the term "hazardous materials" within its definition. For accuracy, DTSC suggests the second sentence be written as follows:

"Section 25316 of the Health and Safety Code defines 'hazardous substance' to mean:

(a) Any substance designated pursuant to Section 1321 (b)(2)(A) of Title 33 of the United States Code.

(b) Any element, compound, mixture, solution, or substance designated pursuant to Section 102 of the federal act (42 U.S.C. Sec. 9602).

(c) Any hazardous waste having the characteristics identified under or listed pursuant to Section 6921 of Title 42 of the United States Code, but not including any waste the regulation of which under the Solid Waste Disposal Act (42 U.S.C. Sec. 6901 et seq.) has been suspended by act of Congress.

(d) Any toxic pollutant listed under Section 1317 (a) of Title 33 of the United States Code.

(e) Any hazardous air pollutant listed under Section 7412 of Title 42 of the United States Code.

(f) Any imminently hazardous chemical substance or mixture with respect to which the Administrator of the United States Environmental Protection Agency has taken action pursuant to Section 2606 of Title 15 of the United States Code.

(g) Any hazardous waste or extremely hazardous waste as defined by Sections 25117 and 25115, respectively, unless expressly excluded."

0005-7

Definition of "hazardous material" – neither the definition quoted nor its citation is correct. Regarding the citation, while California Code of Regulations, title 22, section 66260.10 incorporates the statutory definition by reference, the true source of the "hazardous material" definition is Health and Safety Code, section 25501. That definition was amended by the Legislature effective January 1, 2015, and now reads as follows:

"(n)(1) 'Hazardous material' means a material listed in paragraph (2) that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to

0005-7
Continued

the environment if released into the workplace or the environment, or a material specified in an ordinance adopted pursuant to paragraph (3).

(2) Hazardous materials include all of the following:

(A) A substance or product for which the manufacturer or producer is required to prepare a material safety data sheet pursuant to the Hazardous Substances Information and Training Act (Chapter 2.5 (commencing with Section 6360) of Part 1 of Division 5 of the Labor Code) or pursuant to any applicable federal law or regulation.

(B) A substance listed as a radioactive material in Appendix B of Part 30 (commencing with Section 30.1) of Title 10 of the Code of Federal Regulations, as maintained and updated by the Nuclear Regulatory Commission.

(C) A substance listed pursuant to Title 49 of the Code of Federal Regulations.

(D) A substance listed in Section 339 of Title 8 of the California Code of Regulations.

(E) A material listed as a hazardous waste, as defined by Sections 25115, 25117, and 25316.

(3) The governing body of a unified program agency may adopt an ordinance that provides that, within the jurisdiction of the unified program agency, a material not listed in paragraph (2) is a hazardous material for purposes of this article if a handler has a reasonable basis for believing that the material would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment, and requests the governing body of the unified program agency to adopt that ordinance, or if the governing body of the unified program agency has a reasonable basis for believing that the material would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment. The handler or the unified program agency shall notify the secretary no later than 30 days after the date an ordinance is adopted pursuant to this paragraph."

- **SECOND PARAGRAPH –**
  That definition of "hazardous waste" is incomplete and the following underlined text should be added to the definition (per Cal. Code Regs., tit. 22, § 66261.3), "In regulatory terms, a hazardous waste is a waste that <u>is either listed as a hazardous waste in federal or state regulations or</u> exhibits one of the four characteristics of a hazardous waste: ignitability, corrosivity, reactivity, or toxicity."

0005-8

Page 4.8-3 (Subsections entitled "Trucks" and "Pipelines")

- **THIRD AND FOURTH PARAGRAPHS –**
  DTSC recommends the following changes, (indicated in strikeout/underline):

  "A typical tanker truck is able to transport 9,000 gallons of crude oil. The transportation of crude oil via tanker truck is regulated by ~~the California~~

0005-9

~~Department of Transportation (Caltrans)~~ CHP and U.S. Department of Transportation (USDOT) motor carrier regulations. 0005-9 Continued

Pipelines
Crude oil is transported from the Project Area to refineries via pipeline. Refineries are located throughout the state including within the Project Area. Figure 4.8-1 illustrates the locations that transport crude oil and refineries where it could be processed. Inland California crude oils are typically first piped to local refineries in Bakersfield and Santa Maria due to their proximity. The balance of the inland crude oils is piped to Northern and Southern California refineries (Sheridan 2006). Transmission of hazardous materials via pipeline in the state is regulated by the California State Fire Marshal, Pipeline Safety Division and by USDOT." 0005-10

Page 4.8-13 (Subsection entitled "Hazardous Waste Generated During Oil and Gas Activities, Transport, and Disposal") 0005-11

- **FIRST PARAGRAPH, FOURTH SENTENCE –**
  The wording of following statement is unclear and misleading

  "California regulations exempt oilfield waste from being designated a California Non-RCRA hazardous waste based on toxicity characteristics. However, California did not adopt the federal exemption and does not offer a blanket exemption from state hazardous waste requirements."

  A more clear description would be as follows:

  "California did not adopt the federal exemption for wastes generated by oil and gas production. As discussed in the Regulatory Setting section, wastes exempted under RCRA are not exempt under California law if they either are listed as a hazardous waste in federal or state regulations or exhibit a hazardous characteristic such as ignitability, corrosivity, reactivity, or the California toxicity characteristic. However, wastes exempted under RCRA that are hazardous only due to the federal characteristic of toxicity as set forth in section 66261.24(a)(1), title 22, of the California Code of Regulations are also exempt in California."

Page 4.8-14 (Subsection entitled "Nonhazardous Oil and Gas Waste – Storage, Transport, Disposal") 0005-12

- **FIRST PARAGRAPH** *(under subheading "Produced Water")* **–**
  Reads as follows:

  "Drilling for oil and gas in California yields a mixture of oil, gas, and water from the formation; the water is separated from the oil and gas and stored in tanks and pits. This water is called 'produced water' and is usually very brackish and unsuitable for human use. The water is commingled naturally in the same zone with the oil and natural gas. Produced water is brought up from the formation during oil or gas production and is not considered a hazardous waste. Because it was commingled with hydrocarbons in the formation, the water typically

0005-12
Continued

contains chemicals associated with the formations, such as salts, oils and greases, inorganic and organic chemicals, and naturally occurring radioactive material, that exceed state and federal standards for drinking water."

0005-13

For that paragraph, DTSC suggests adding additional detail regarding produced water. While the paragraph mentions that produced water is unsuitable as drinking water, produced water may in some cases be unsuitable for agricultural use, and could be considered hazardous waste based on the toxicity characteristic. To express these additional details, DTSC recommends the following language for the paragraph:

"Drilling for oil and gas yields a mixture of oil, gas, and water from the target formation. In California, the water fraction, termed 'produced water,' comprises roughly 90% of the mixture, and is separated from the oil and gas and stored in tanks and pits. The produced water typically contains a high degree of salinity and low levels of oils, greases and other organic and inorganic chemicals, which can include low levels of naturally occurring radioactive materials (NORMs), and in some cases low levels of arsenic. The salinity and other pollutants render produced water unsuitable as drinking water and in some cases unsuitable for other uses such as agricultural. Past testing of produced water from conventional drilling operations has found the water not to be hazardous waste. The past testing, however, did not test produced water from WST operations, and did not test for toxicity by fish bioassay. Testing for exceedances of fish bioassay testing is one of the methods set forth at section 66261.24(a), title 22, California Code of Regulations for determining whether a waste is hazardous for the toxicity characteristic. More testing is needed to definitively establish that produced water from WST operations is not hazardous waste."

Page 4.8-37 (Subheading entitled "Resource Conservation and Recovery Act")

0005-14

- **FIRST PARAGRAPH, FIRST SENTENCE –**
  This sentence incorrectly references the federal Toxic Substances Control Act ("TSCA") in association with RCRA. Contrary to that sentence, TSCA did not establish the federal program administered by EPA for the regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. That program was established solely by RCRA.

Page 4.8-44 (Subsection entitled "Hazardous Materials and Hazardous Waste")

0005-15

- **FIRST PARAGRAPH, SECOND SENTENCE –**
  The definition of "waste" is incomplete. Pursuant to Health and Safety Code section 25124, a material becomes a waste not only when it is disposed of or burned, but also when it is recycled (certain exclusions notwithstanding), mislabeled or badly packaged, or determined inherently waste-like in regulations. The designation of materials intended for recycling as wastes is an important regulatory point that the regulated community and the public needs to be aware of.

DTSC proposes a revision to the second sentence of the first paragraph as follows: 0005-15 Continued

"According to Health and Safety Code section 25124, materials become waste when the material is disposed of, burned or incinerated, or accumulated, stored or treated before or in lieu of being disposed of, burned or incinerated, or when the material is recyclable but not managed as provided in Health and Safety Code sections 25143.2 and 25143.9."

Page 4.8-53 (Subsection entitled "Discharges to Injection Wells") 0005-16

- **SECOND PARAGRAPH –**
  DTSC proposes that Kern County add text to the end of the second paragraph to inform the public of DTSC's regulation of certain injection wells. The language should read:

  "DTSC regulates injection of hazardous wastes into underground injection wells pursuant to the Toxic Injection Well Control Act of 1985 (Health & Saf. Code, § 25159.10 et seq.). This Act exempts Class II injection wells regulated by DOGGR and which are in compliance with DOGGR's regulations and counterpart federal regulations."

Page 4.8-81 (Subsection entitled "Hazardous Waste") 0005-17

- **FIRST PARAGRAPH, FIRST SENTENCE –**
  This sentence refers to "an estimated 267 pounds of 'classified waste' would be generated per well". Because it is within a subsection entitled "Hazardous Waste," DTSC believes that the phrase "classified waste" refers to various types of wastes that are classified as hazardous wastes. To avoid potential confusion, however, DTSC suggests that the phrase "hazardous waste" be used instead of "classified waste."

Page 4.8-81 (Subsection entitled "Other Wastes") 0005-18

- **FIRST PARAGRAPH, FIRST SENTENCE –**
  This sentence cites "An estimated 1,610 pounds of Non-RCRA drilling wastes … would be generated per well". For the benefit of readers unfamiliar with the term "Non-RCRA," DTSC suggests that the language should include the statement that such wastes may be regulated as hazardous waste under California law and include a reference back to section 4.8.2 of the draft EIR

Page 4.8-82 (Subsection entitled "Other Wastes") 0005-19

- **SECOND AND THIRD PARAGRAPHS –**
  These paragraphs discuss "produced water" and "flowback fluid." The second paragraph asserts that produced water is not considered a hazardous waste. While it is believed that produced water is not hazardous waste generally, more testing is needed to establish this for all cases. Testing is also needed for WST flowback, which is more likely to be hazardous waste than produced water. For these reasons, DTSC is in the planning stages of a new waste study of flowback fluid and produced

water at WST operations. If produced water is not a hazardous waste and flowback fluid is a hazardous waste, the act of deliberately mixing the flowback with non-hazardous produced water (e.g. for dilution purposes) would constitute "treatment" of hazardous waste pursuant to Health and Safety Code section 25123.5. Treatment of hazardous waste requires authorization from DTSC unless the resultant mixture is managed as hazardous waste. Disposal of the mixture by any means not authorized for the disposal of hazardous waste constitutes illegal disposal of hazardous waste, a violation of Health and Safety Code section 25187. Similarly, mixing well maintenance fluids with produced water that is not a hazardous waste would be treatment of hazardous waste if those maintenance fluids are hazardous waste, which may often be the case.

0005-19 Continued

Page 4.8-83 (Subsection entitled "Mitigation Measures")

- **GENERAL COMMENT –**
  The label or number of the mitigation measure does not correspond to the same label or number of the impact that is being addressed by the mitigation measure. Accordingly, it is difficult to tell which potential impact the proposed mitigation measure is supposed to address. This lack of clarity makes it particularly difficult to assess whether the mitigation measure will be effective.

0005-20

Page 4.8-84 (Subsection entitled "Mitigation Measures")

- **MM 4.8-3 –**
  b. This mitigation measure is limited to the storage of "fuels and lubricants," yet the potential impact identified in the draft EIR appears to more broadly apply to the release of hazardous materials. DTSC suggests that this mitigation measure apply to the storage of all hazardous materials, not just fuel and lubricants.

0005-21

  f. This mitigation measure does not provide specifications for the required berms and dikes (for secondary containment). It would be helpful to reference an existing regulatory standard for secondary containment, such as that provided at California Code of Regulations, title 22, section 66264.193.

0005-22

Page 4.8-86 (Subsection entitled "Mitigation Measures")

- **MM 4.8-6 –**
  a. This mitigation measure states, "Classify the various oil and gas exploration and production wastes for proper disposal as described in United States Environmental Protection Agency 2002." Wastes should be classified and disposed in accordance with California laws and regulations as well.

  i. For this mitigation measure add clarifying language to the end of "Recycle and reuse oil-based muds and high density brines, when practical" to remind the operator to check to determine whether such recycling is authorized under California hazardous waste laws before undertaking that activity..

k. For this mitigation measure add clarifying language to the end of "Reclaim oily debris and tank bottoms when practical" to remind the operator to check to determine whether such reclamation is authorized under California hazardous waste laws before undertaking that activity. 0005-23

Page 4.8-94 (Subsection entitled "Impact 4.8-3: Emit Hazardous Emissions or Handle Hazardous of Acutely Hazardous Materials, Substances, or Waste within One-Quarter Mile of an Existing or Proposed School): 0005-24

- **SECOND PARAGRAPH, SECOND BULLET –**
  The citation at the end of "Extremely Hazardous Waste" should be section 66260.10 of title 22 of the California Code of Regulations.

Proposed Zoning Changes 0005-25

- **GENERAL COMMENT –**
  The following comment is merely an advisory and does not request changes to the draft EIR.

  The proposed changes to Kern's zoning ordinance may allow oil and gas well operations in or near residential zones. Such an operation would be of DTSC's concern if, for example, it prompted a hazardous waste transporter servicing the operation to set up a hazardous waste transfer facility in or near residential zones. State law prohibits the operation of a transfer facility within residential zones or within 500 feet of a residence in the absence of a hazardous waste storage permit (Health & Saf. Code, §§ 25123.3(b)(3) and 25201). The proposed change to Kern County's zoning ordinance would not necessarily induce a transporter to violate the transfer facility law. Nevertheless, if the zoning change is adopted, DTSC may undertake regulatory outreach to hazardous waste transporters to clarify the requirements regarding transfer facilities.

We thank you for the opportunity to comment on this draft EIR. If you so desire, we welcome discussion of any of our above comments. To schedule any such discussion, please feel free to contact me at (916) 327-1186 or via Rick.Brausch@dtsc.ca.gov, or contact Ms. Pauline Batarseh, Chief, of the Policy Implementation and Support Branch at (916) 322-2817 or Pauline.Batarseh@dtsc.ca.gov. 0005-26

Sincerely,

Rick Brausch, Chief
Policy and Program Support Division

0005-1

Thank you for your comments on the Draft EIR. This introductory comment is noted.

0005-2

This introductory comment is noted.

0005-3

Please see GR 6 regarding use of this EIR by responsible agencies. The EIR scope includes cleanup of minor operational spills and releases of petroleum as well as non-petroleum products (insert page reference) but does not cover remediation of non-petroleum legacy releases or major remedial projects. The EIR may be used as an informational document by DTSC for such projects, but DTSC will determine the appropriate form of CEQA documentation required for these remediation activities that do not fall within the scope of this EIR.

0005-4

The Project under consideration in this EIR includes approval and implementation of of zoning ordinance amendments, and the amendments provide different procedures for County review and approval of oil and gas activities. The Site Conformity Review process, for example, includes a ministerial permit process. Implementation of this ministerial permit process falls within the scope of this EIR. For additional information about the scope of this EIR in relation to this ministerial permit approval process, please refer to GR 1.

0005-5

The comment is accurate that "DTSC" refers to the Department of Toxic Substances Control, and "DPH" is the appropriate acronym for referring to the Department of Public Health. This typographical error is noted and hereby corrected.

0005-6

This statutory definition of "hazardous substance" is added as requested by the Department to this Final EIR. The term "hazardous materials" is not specifically included in the regulatory definition of "hazardous substances," but for purposes of CEQA both hazardous substances and hazardous materials are considered in this EIR.

0005-7

The Department's addition of a statutory definition of "hazardous material" is added to the Final EIR.

0005-7 cont'd

The Department's addition of a statutory definition of "hazardous material" is added to the Final EIR.

0005-8

The Draft EIR included descriptive information derived from this and other cited regulations, but used verbatim regulatory quotations selectively in order to improve the readability of the EIR. In this case, hazardous waste that is "listed" also generally exhibits one or more of the four toxic characteristics, and the nuanced distinctions between between "listed" and "characteristic" waste goes beyond the level of regulatory detail required to describe the Project or to disclose, assess, and mitigate Project impacts.

0005-9

The regulatory reference should be to the California Highway Patrol, and this change is made to the Final EIR.

0005-9 cont'd

0005-10

The text suggested by the Department is hereby included in the Final EIR.

0005-11

The Department's suggested language is accurate (and also makes relevant the distinction between listed and characteristic hazardous waste categories as described above). The Department's suggested additional text clarifications are hereby added to the Final EIR.

0005-12

This introductory comment is noted.

0005-12 cont'd

0005-13

The Department's suggested additional descriptive text about produced water is noted; however, the quality of produced water varies within the Project Area. Produced water must be managed in compliance with applicable laws and regulations, including hazardous waste laws and regulations that obligate generators of waste to properly manage hazardous waste and to know (with testing, as appropriate) whether a waste is hazardous.

Under California hazardous waste regulations, it is the generator's responsibility to determine whether waste that it generates is hazardous. 22 CCR §66260.200(c). Assuming the waste is not otherwise excluded or exempted, and is not listed as a hazardous waste, the regulations provide for two primary means by which generators may make hazardous waste determinations: generator knowledge, and analytical testing. 22 CCR §66262.11(c).

To make a hazardous waste determination based on generator knowledge, the generator must obtain enough information to facilitate making a proper characterization of the waste. The information available may be of variable forms, including Material Safety Data Sheets for materials used in the process, process flow diagrams, information regarding the physical state and volume of wastes generated by the process, waste characterizations performed by industry associations for similar processes, chemical engineering designs or plans for the process showing inputs, chemical reactions expected, and products, literature from the supplier of materials or equipment used in the process, published data, documented studies on similar processes, and any previous waste analyses, if available. Ideally, the information available would enable the generator to calculate a materials balance of inputs and outputs of the process. Generator knowledge as a basis for hazardous waste classification comes with a greater risk of inaccurate characterization than analytical testing. The generator remains liable for its waste characterization, whether it employs generator knowledge or analytical testing. But if a generator determines that adequate information is available and the generator has confidence in its characterization of the waste based on the information, there is no legal requirement to conduct analytical testing to characterize the waste. If, however, the generator does not have sufficient information to serve as a reasonable basis upon which to characterize using process knowledge, the generator must perform analytical testing to accurately characterize the waste. Generators are expected to maintain documentation for at least three years demonstrating the information and/or data upon which its waste characterizations were made.

The Department's comment regarding these regulatory compliance obligations are included in the Final EIR.

0005-14

The quoted sentence was not intended to suggest that TSCA created RCRA. TSCA and RCRA are both federal statutory programs enacted by Congress, and are the subject of separate regulations promulgated by EPA.

0005-15

As with other Department comments on the regulatory setting, the Draft EIR includes descriptive text but is not intended to be a verbatim reprint of regulatory requirements, or include regulatory details that are not required to consider Project impacts and mitigation measures. The additional text suggested by the Department is included in the Final EIR.

0005-15 cont'd

As with other Department comments on the regulatory setting, the Draft EIR includes descriptive text but is not intended to be a verbatim reprint

of regulatory requirements, or include regulatory details that are not required to consider Project impacts and mitigation measures. The additional text suggested by the Department is included in the Final EIR.

0005-16

The requested additional text is hereby added to the Final EIR.

0005-17

The term "classified waste" includes wastes regulated as "hazardous" as well as other wastes (i.e., waste including only petroleum products) that are regulated but not classified as "hazardous." The requested text modification could be construed as inaccurately encompassing non-hazardous regulated wastes as hazardous wastes and is accordingly not included in the Final EIR.

0005-18

The Department's text edits are included in this Final EIR.

0005-19

The Department's clarifications regarding regulatory requirements applicable to hazardous waste, including information about the Department's upcoming study of flowback fluids at WST operations. Applicants are required to comply with all applicable laws and regulations, including but not limited to future hazardous waste laws and regulations, is noted and included in the Final EIR.

0005-19 cont'd

0005-20

A sequential numbering system is used for all required mitigation measures, which simplifies ongoing ongoing monitoring for compliance with mitigation measures. Sequential numbering of impacts is also required for tracking purposes. The Department's concern with this numbering system is acknowledged.

0005-21

Fuels and lubricants are the most common hazardous materials maintained at well sites and other field locations, and other types of hazardous materials (e.g., paints, cleaning fluids, and landscaping maintenance fluids) are generally brought to and from the site by maintenance workers. Hazardous waste is not generally stored at well sites and other field locations, and thus compliance with the hazardous waste storage secondary containment regulations applicable to hazardous waste transfer, treatment, storage and disposal facilities included in 22 CCR 66264.193 is not required. Compliance with laws and regulations is required, including compliance with hazardous materials and hazardous waste storage laws as applicable, including for secondary containment. The most relevant of these requirements is in DOGGR regulations (CCR 1773.1), which requires secondary containment in "an engineered impoundment such as a catch basin, which can include natural topographic features, that is designed to captured fluid relesaed from a production facility." This additional reference to applicable DOGGR secondary containment regulations is added to the Final EIR.

0005-22

The Draft EIR makes clear that Applicants are responsible for complying with all laws and regulations. The Department's requested clarification that compliance with hazardous waste laws, and recycling laws, in determining the extent to which reuse of oil-based muds and high-density brines is practical, is included in the Final EIR.

0005-23

As noted above, compliance with applicable laws and regulations is required for all Project activities. The Department's reminder that this compliance obligation extends to the management of debris and tank bottoms is added to this Final EIR.

0005-24

The requested citation is hereby added to the Final EIR.

0005-25

The Department's concern is noted. A hazardous waste transfer facility would either be prohibited outright, or require a Conditional Use Permit, in a zoning district that allows residential uses. The Department's outreach to hazardous waste transporters is welcomed.

0005-26

Commenter's concluding remarks regarding hazardous waste transfer facility permits is noted.

Memorandum

Date: July 7, 2015

To: All Reviewing Agencies

From: Scott Morgan, Director

Re: SCH # **2013091062**

Revisions to the Kern County Zoning Ordinance – 2015 C. Focused on Oil and Gas Local Permitting

---

Pursuant to the attachments, the State Clearinghouse distributed the above-referenced **Draft EIR** on **July 7, 2015** to your agency for review and comment. It has come to our attention that the document was issued an ***incorrect*** State Clearinghouse Number. For all future correspondence regarding this project, please use the original State Clearinghouse Number **SCH# 2013081079**.

We apologize for any inconvenience this may have caused and ask that you also note the end review period has been corrected to close on **August 24, 2015**.

All other project information remains the same.

RE: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting

Dear Ms. Asiata,

A mail courier erroneously delivered a Draft EIR, titled: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting, to your office this morning (July 7, 2015) with the incorrect SCH#. The incorrect number was SCH# 2013091062. The correct number is SCH# 2013081079. After speaking with you today, we determined that your office had already distributed the materials to the appropriate agencies.

At this time, I would like to request your office provide those agencies with a memo stating the document they received today should have a corrected title page, inside cover and NOC form. I have attached these pages for your reference. If you could kindly provide these with the memo to the agencies, it would be greatly appreciated.

I would also like to request that you change the comment period to match the NOC, from July 8, 2015 to August 24, 2015. If you cannot change the start date, please change the ending date to August 24th.

If you have any questions regarding this matter, please contact me directly at (661) 862-8607 or by email at MynkC@co.kern.ca.us.

Sincerely,

Christopher B. Mynk, AICP
Supervising Planner

SUBJECT: DRAFT ENVIRONMENTAL IMPACT REPORT

This is to advise that the Kern County Planning and Community Development Department has prepared an Environmental Impact Report (EIR) for the project identified below. As mandated by State law, the minimum public review period for this document is 45 days. The document and documents referenced in the Draft EIR are available for review at the Planning and Community Development Department, 2700 "M" Street, Suite 100, Bakersfield, CA 93301 or on the Departmental website (**http://pcd.kerndsa.com/planning/oil-gas-zoning-amendment**).

The Kern County Planning and Community Development Department will host a joint public briefing workshop with the Kern County Board of Supervisors and the Kern County Planning Commission to receive comments on the document on: **July 27, 2015** at 9:00 a.m., at the Chambers of the Board of Supervisors, First Floor, Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, California.

Comments can be also be submitted at one of our additional public workshops that will be held at **6:00 p.m.** at the following locations and dates:

Shafter Veterans Building, Room 2, 309 California Avenue, Shafter CA	**August 10, 2015**
Taft Veterans Hall, Room 1, 218 Taylor Street, Taft, CA	**August 17, 2015**

A public hearing has been scheduled with the Kern County Planning Commission to receive comments on the document on: **October 5, 2015** at 5:00 p.m or soon thereafter, Chambers of the Board of Supervisors, First Floor, Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, California.

The comment period for this document closes on **August 24, 2015**. Testimony at future public hearings may be limited to those issues raised during the public review period either orally or submitted in writing by 5:00 p.m. the day the comment period closes.

Project Title: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting.

Project Location: The Project Boundary (Local Permitting Boundary Area) encompasses 3,110 square miles and generally includes the San Joaquin Valley Floor portion of Kern County up to an elevation of 2,000 feet. The boundary includes: west side-the San Luis Obispo County line, north side- the Kings and Tulare county lines, east and south sides-the 2,000-foot elevation contours, squared off to the nearest section line.

Project Description: The proposed Project consists of revisions to various Chapters of Title 19 Kern County Zoning Ordinance to implement a new permit process for oil and gas activities. The revisions include new site development standards and review processes for all oil and gas exploration, extraction, operations, and production activities in unincorporated Kern County by:

(a) Removing the "Unrestricted Drilling" Section in Chapter 19.98 and updated "Drilling by Ministerial Permit" and "Drilling by Conditional Use Permit" Sections;

(b) Establishing a new "Tier Area" maps to address different land uses and zone districts where oil and gas activities occur and are proposed to occur in the future;

(c) Establishing an Oil and Gas Conformity Review and Minor Activity Review, as part of the "Drilling by Ministerial Permit" Section in Chapter 19.98, to ensure compliance with all applicable Development and Implementation Standards and Conditions;

(d) Establishing new Development and Implementation Standards and Conditions Section in Chapter 19.98;

(e) Establishing new requirements for site plan sign-off by owners of the surface and minerals for split estate ownership;

(f) Revising additional Chapters of the Zoning Ordinance to ensure consistency with the new requirements of this EIR. These Chapters include: 19.08 – Interpretations and General Standards, 19.48 – Drilling Island (DI) District, 19.50 – Floodplain Primary District, 19.66 – Petroleum Extraction (PE) Combining District, 19.81 - Outdoor Lighting (Dark Skies Ordinance), 19.88 – Hillside Development, 19.102 – Permit Procedures, and 19.108 – Nonconforming Uses, Structures, and Lots.

Subject: Revisions to the Kern County Zoning Ordinance - 2015 C. Focused on Oil and Gas Local Permitting
SCH#: 2013081079

Dear Christopher B. Mynk:

0006-2

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on September 11, 2015, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title Revisions to the Kern County Zoning Ordinance - 2015 C. Focused on Oil and Gas Local Permitting
Lead Agency Kern County

Type EIR Draft EIR

Description Note: Extended Review per lead

The proposed project consists of an amendment to Title 19 Kern County Zoning Ordinance focused on Chapter 19.98 (Oil and Gas Production) include updated development standards and conditions for oil and gas exploration, extraction, operations, and production activities in unincorporated Kern County.

To whom it may concern:

The Bakersfield Area of the California Highway Patrol received a "Notice of Completion" of the environmental document for the Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance, State Clearinghouse ~~#2013091062.~~ The proposal concerns zoning and permitting procedures for oil and gas drilling throughout Kern County.

After review, we have determined there will be no impact on operations in the Bakersfield Area and there will be no long term adverse impact on departmental operations.

Sincerely,

Lt. Exc

P. MEDEIROS, Captain
Commander
Bakersfield Area

Subject: ENVIRONMENTAL DOCUMENT REVIEW AND RESPONSE
SCH# 2013091062

Special Projects Section (SPS) recently received a "Notice of Completion" environmental document from the State Clearinghouse outlining the information contained in the attached profile.

After a preliminary review, we believe this project will not have a significant impact on statewide departmental operations. However, because of your geographical proximity to the site, you are in a better position to provide a more accurate assessment of any traffic-related matters that may affect your local Area operations. Information and procedures outlined in Highway Patrol Manual 41.1, Transportation Planning Manual, Chapter 6, Environmental Impact Documents, should serve as a guideline when reviewing transportation-related documents.

If you determine departmental input is advisable, please provide your written comments referencing the above SCH number to the State Clearinghouse, 1400 Tenth Street, Room 121, Sacramento, CA 95814. Your comments must be received no later than August 20, 2015. Please forward a copy of your written comments to SPS. If you determine there is "no impact," please notify SPS by electronic mail (e-mail) to the analyst listed below, or by memorandum.

If you have any questions, please call Associate Governmental Program Analyst Leah Mora at (916) 843-3365, or e-mail at lemora@chp.ca.gov.

Subject: Draft Environmental Impact Report: Revisions to the Kern County Zoning Ordinance – 2015 C, Focused on Oil and Gas Local Permitting SCH No. 2013081079

Dear Mr. Mynk:

The California Department of Fish and Wildlife (Department) has reviewed the Draft Environmental Impact Report (DEIR) prepared for the Revisions to the Kern County Zoning Ordinance- 2015 C, Focused on Oil and Gas Local Permitting (Project), submitted by the Kern County Planning and Community Development Department (County). The proposed Project consists of revisions to various Chapters of Title 19 Kern County Zoning Ordinance to implement a new permit process for oil and gas activities. The revisions include new site development standards and review processes for all oil and gas exploration, extraction, operations, and production activities in unincorporated Kern County by:

(a) Removing the "Unrestricted Drilling" Section in Chapter 19.98 and update "Drilling by Ministerial Permit" and "Drilling by Conditional Use Permit" Sections;

(b) Establishing a new "Tier Area" map to address different land uses and zone districts where oil and gas activities occur and are proposed to occur in the future;

(c) Establishing and Oil and Gas Conformity Review and Minor Activity Review, as part of the "Drilling by Ministerial Permit" Section in Chapter 19.98, to ensure compliance with all applicable Development and Implementation Standards and Conditions;

(d) Establishing a new Development and Implementation Standards and Conditions Section in Chapter 19.98;

(e) Establishing new requirements for site plan sign-off by owners of the surface and minerals for split estate ownership;

(f) Establishing a new fee structure to ensure that all mitigation is complied with and that the County will be sufficiently staffed to review all new applications;

(g) Revising additional Chapters of the Zoning Ordinance to ensure consistency with the new requirements of the Environmental Impact Report. These Chapters include: 19.08- Interpretations and General Standards, 19.48- Drilling Island (DI) District, 19.50- Floodplain Primary District, 19.66- Petroleum Extraction (PE) Combining District, 19.81 Outdoor Lighting (Dark Skies Ordinance), 19.88- Hillside Development, 19.102- Permit Procedures, and 19.108- Nonconforming Uses, Structures, and Lots.

The Project Boundary (Local Permitting Boundary Area) encompasses 3,100 square miles and generally includes the San Joaquin Valley Floor portion of Kern County up to an elevation 2,000 feet. The boundary includes: the San Luis Obispo County line on the west side; the Kings and Tulare County lines on the north side, the 2,000-foot elevation contours, squared off to the nearest section line, on the east and south sides.

The DEIR, once certified, will be used to satisfy the California Environmental Quality Act (CEQA) requirements for multiple State and local agency discretionary approvals on evaluated oil and gas activities in Kern County, which will include the Department's discretion on the issuance of Incidental Take Permits (ITPs) pursuant to Fish and Game Code Section 2081 and Lake or Streambed Alteration (LSA) Agreements pursuant to Fish and Game Code sections 1600 *et seq*.

On September 26, 2013, the Department commented on the Notice of Preparation for the Project and offered recommendations to avoid, minimize, and mitigate potential impacts to biological resources. We are now providing document specific comments and recommendations for the DEIR.

Department Comments

The Department is providing specific recommendations to the text of the DEIR. The intent is to ensure that there are no obstacles for the Department to use the Environmental Impact Report (EIR) for CEQA compliance when issuing an ITP or LSAA for oil and gas projects in Kern County and to also provide technical assistance to the biological resources information in the document. Our recommended actions are in **bold**; additions are in ***bold italics***; and deleted language is in ~~strikethrough~~.

Executive Summary Chapter 1

Section 1.2, Project Summary, Page 1-2, # 5: The Department recommends the following **addition**- "California Department of Fish and Wildlife incidental take permits ***and Lake or Streambed Alteration Agreements***."

Project Description Chapter 3

Section 3.5.3 Construction Activities in Detail- Vegetation Control, Page 3-64: The first sentence of this section states, "Vegetation along roadsides and critical facilities such as tank settings and compressor stations is controlled as needed through the use of mowing, grading, weed-whacking, and spot treatments of herbicides approved by USFWS and CDFW." The Department is unclear if we're being asked to approve herbicides or the vegetation removal itself. Please make note, the Department does not have authority to approve herbicides outside of a LSA Agreement for a specific project, so we are recommending the following **edits**- "Vegetation along roadsides and critical facilities such as tank settings and compressor stations is controlled as needed through the use of mowing, grading, weed-whacking, and spot treatments of herbicides. ***If vegetation removal would occur in potential habitat for special-status species, approval*** ~~approved~~ by USFWS and CDFW ***may be required***."

Section 3.5.5 Best Management Practices- Biological Resources, Page 3-73 through 74: The first applicant proposed Best Management Practice (BMP) states, "Within 14 days before any ground disturbance activities on previously undisturbed property, a qualified biologist shall conduct a focused survey to determine the presence/absence of sensitive species protected by state and federal Endangered Species Acts and potential impacts to sensitive species onsite. The survey shall be conducted in accordance with the standard protocol of USFWS and CDFW."

The Department recommends that focused surveys for special-status species be conducted well in advance of ground-disturbing activities to accommodate seasonal restrictions and potential permitting needs. The Department recommends that a reconnaissance biological survey be conducted as early as possible during project planning so that qualified wildlife biologist(s) have the opportunity to determine whether focused/protocol surveys are warranted, and by so doing would give project proponents plenty of time to incorporate them into their project schedule. In the event that a State-listed species is detected during a reconnaissance survey effort or during a focused/protocol survey, the project proponents need plenty of time to accommodate necessary ITP issuance to prevent project delays.

In relation to the first applicant proposed BMP, DEIR mitigation measure (MM) 4.4-1 of Biological Resources, currently states, "With the exception of focused surveys that are seasonally restricted, special status wildlife surveys must be completed by a qualified biologist within a 30-day period prior to commencement of new ground-disturbance construction activities." The Department is recommending that the BMPs be consistent with the DEIR MMs to reflect a 30-day window for pre-disturbance surveys, and split BMP one (1) into three new BMPs to clarify when biological reconnaissance surveys, focused/protocol special-status species surveys, and pre-disturbance surveys are warranted. This would require an adjustment of the numbering of the BMPs.

For the applicant proposed BMPs, the Department recommends the following **addition**- 1. ***A qualified biologist shall conduct a biological reconnaissance survey in potential special-status species habitat to advise the project proponent of potential project impacts, potential permitting needs, and advise on the need for focused special status species surveys. Early consultation with USFWS and CDFW would confirm the biologist's advice and/or inform project proponents of additional recommendations.***

The Department recommends the following **edits and additions**- ~~1~~2. ~~Within 14 days before any ground disturbance activities on previously undisturbed property, a qualified biologist shall conduct a~~ ***Based on the information gathered from the biological reconnaissance survey and informal consultation with USFWS and CDFW,*** focused/***protocol*** survey***s shall be conducted by a qualified or permitted biologist (whichever is applicable) well in advance of ground disturbing activities*** to determine the presence/absence of sensitive species protected by state and federal Endangered Species Acts and potential ***project*** impacts to ~~sensitive~~ ***those*** species ~~onsite~~. The survey shall be conducted in accordance with the ***most current*** standard protocol of USFWS and CDFW.

The Department also recommends the following **edits** to applicant proposed BMP # 3- If take of covered endangered or threatened species has the potential to occur, the appropriate USFWS and CDFW Endangered Species Act ***permits be acquired and*** compliance provisions shall be followed.

The Department recommends the following **edits and additions** after applicant proposed BMP # 3- ***4.*** Within ~~14~~ ***30*** days before any ground-disturb~~ance~~***eing*** activities ~~on previously undisturbed property~~ ***in special-status species habitat,*** a qualified biologist shall conduct a ~~focused~~ ***pre-disturbance*** survey to ~~determine~~ ***record*** ~~the presence/absence~~ ***existing conditions*** of ***the site, determine if conditions have changed since the reconnaissance or focused/protocol surveys were conducted, and to determine where*** sensitive species ~~protected by state and federal Endangered~~

~~Species Acts and potential impacts to sensitive species onsite~~ ***avoidance buffers will be established***. ~~The survey shall be conducted in accordance with the standard protocol of USFWS and CDFW.~~

The Department recommends that a new BMP be **added** before the current applicant proposed BMP #4 to include the requirement of a biological monitor during ground-disturbing activities in project locations that have potential special-status species habitat or is adjacent to potential special-status species habitat.

The Department recommends the following **edit** to applicant proposed BMP # 6- All pipe***s*** ~~3~~***1.5***-inch***es*** or greater in diameter stored overnight on a ***project*** location must have end caps that prevent wildlife from entering the pipe.

The Department recommends the following **edits** to applicant proposed BMP #8- An educational briefing shall be conducted for all Project personnel on ~~previously undisturbed property~~ ***project sites that have potential special-status species habitat or is adjacent to potential special-status species habitat*** prior to the start of the covered Project/activity.

The Department recommends the following **edits** to applicant proposed BMP #9- The Applicant/Operator shall consult with the CDFW as necessary to determine if a Section ~~1600~~ ***1602 Lake or*** Streambed Alteration Agreement will be required for Project implementation.

Section 3.5.5 Best Management Practices- Water Resources, Page 3-75: BMP #1 for Water Resources states, "Avoid streams, wetlands, and drainages, where possible. Locate access roads to minimize stream crossings and to minimize impacts where crossings cannot be avoided. Obtains CDFW Streambed Alteration Agreement prior to any work in a state jurisdictional waterway." Please make note and **update** the DEIR to reflect the actual name of the permit discussed above as ***Lake or Streambed Alteration Agreement***. Also, a Lake or Streambed Alteration Agreement is one of three possible outcomes following notification to the Department that could result in authorizing a project's activities. Following notification to the Department, a project may not legally occur until after the Department does one of the following: 1) executes a Lake or Streambed Alteration Agreement; 2) determines that an agreement is not necessary and informs the applicant in writing; or 3) fails to issue an agreement within mandated time lines.

Biological Resources Chapter 4, Section 4.4

Section 4.4.2 Environmental Setting- Land Cover Types, Urban and Developed Lands, Page 4.4-11: Sentence three of this paragraph states, "Developed lands do not provide substantial wildlife habitat, but a few occurrences of protected or sensitive species, such as the San Joaquin kit fox, have been documented, primarily in unpaved and fallow parcels interspersed in developed areas (USFWS 1998; Bjurlin et al. 2005)." Currently the San Joaquin kit fox population is quite robust in urban settings such as Bakersfield, Oildale, Maricopa, McKittrick, and Taft and utilizes developed areas such as schools, parking lots, green space, road right-of-ways, sumps, etc. The Department recommends **updating** this section to include the current status of the San Joaquin kit fox population and their urban setting use.

Section 4.4.2 Environmental Setting- Wildlife Refuges and Protected Habitat Areas, Page 4.4-11: This section lists the 'permanently preserved conservation lands' located in the Project Area. The Department recommends including a definition of permanently protected conservation lands or lands preserved in perpetuity. Also, some of the private lands listed in this section which are owned by project proponents for compensatory mitigation do not yet have recorded conservation easements (parcels with recorded conservation easements are what the Department recognizes as permanently protected lands) or preserves owned and managed by non-governmental organizations (NGOs) that do not have conservation easements recorded. There are also lands identified for future protection that are not yet protected. We recommend including a different category for lands that are not preserved in perpetuity and a different category for government owned lands. In addition, not all lands that have an element of conservation protection are included in this section and in some instances the information is not correct or not complete. See below for Department comments, and recommended edits and additions.

- Bullet #1- "The Coles Levee Ecosystem Preserve HCP conserved 6,059 acres under ~~an existing~~ ***previous*** oil and gas HCP to the east of the Elk Hills Oil Field (EHOF) and south of the Kern Water Bank in the Western Subarea***. CDFW holds a conservation easement that has been recorded upon the Coles Levee Ecosystem Preserve***;" Please make note, the Department holds the conservation easement on the Coles Levee Ecosystem Preserve, although oil and gas extraction are allowable uses (not precluded activities).

- Bullet #2- "The Kern Water Bank HCP, which will permanently preserve ***up to*** ~~10,349~~ ***3,267*** acres ***through conservation easements*** for habitat purposes in the Central and Western Subareas***. Currently the Kern Water Bank has recorded 1,321 acres of habitat to conservation easements***;"

- Bullet #3- ~~"The Freeport-McMoRan Oil and Gas HCP conserved 1,519 acres under an oil and gas HCP in the Western Subarea~~;" The Department recommends **removing** this bullet from the list as none of these lands have recorded conservation easements yet. Further, this HCP has been partially split to California Resources Corporation and the current compensatory mitigation acreage obligation is contingent on what has been impacted by project activities.

- Bullet #4- "The EHOF conservation area, which consists of 8,028 gross acres and 7,878 net acres of undisturbed habitat, of which a minimum of 7,075 acres undisturbed acres must be preserved under a Section 7 permit and agreements with state and federal agencies in conjunction with the sale of former Naval Petroleum Reserve properties in the Western Subarea. ***In addition, a conservation easement, held by CDFW, has been recorded on over 6,314 of these acres. A conservation easement of the remaining acreage is pending***;"

- Bullet #5- ~~"The LINN Energy Enos conservation lands, 400 acres of conservation lands held in the Poso Creek oilfield within the Eastern Subarea~~;" The Department recommends **removing** this bullet from the list as we are not aware of these lands being permanently preserved conservation lands nor having a conservation easement recorded on them.

- Bullet #6- ~~"The LINN Energy Lokern-Buena Vista Valley conservation lands are 2,895 acres of conservation lands held in the Western Subarea~~;" The Department recommends **removing** this bullet from the list as we are not aware of these lands being permanently preserved conservation lands nor having a conservation easement recorded on them.

- Bullet #7- "The Lokern-Buena Vista ~~BLM~~ Areas of Critical Environmental Concern***, owned and managed by BLM,*** located to the north of the Elk Hills and east of the Cymric-McKittrick oilfields in the Western Subarea;" The Department recommends **moving** this bullet to a different category, as these lands are not permanently protected and can be impacted by oil and gas extraction. In addition, to follow the format of the other land information provided, the Department recommends including the acreage of the Areas of Critical Environmental Concern (ACEC). It's the Departments understanding that BLM has ACECs in other areas within Kern County; we recommend that BLM be consulted on acres and location descriptions.

- Bullet #8- "The Kern National Wildlife Refuge, 11,249 acres ***owned and managed by the USFWS*** located 18 miles west of the city of Delano in the Central Subarea;"

- Bullet #9- "The ~~Hart Park~~ ***Bakersfield Cactus*** Ecological Reserve, ~~500~~ ***consists of 780*** acres***, owned and*** managed by the CDFW***,*** in ~~three separate parcels~~ ***five disjunct areas*** located north ***and east*** of Bakersfield in the Eastern Subarea;"

- Bullet # 11- "The Lokern ***Natural Area is a large undeveloped area consisting of approximately 50,600 acres of land with differing property owners. Property owners and managers that hold the largest tracts of land include*** ~~Ecological Reserve, 4,000 acres in the Semitropic Ridge area and the 295 acres Sand Ridge Wildflower preserve east of Bakersfield managed by~~ the Center for Natural Land~~s~~ Management ~~in the Central and Eastern Subareas~~***, Chevron, Bureau of Land Management, and CDFW. CDFW owns and manages 3,965 acres in the Lokern Natural Area known as the Lokern Ecological Reserve***;"

- Bullet # 12- "The Semitropic Ecological Reserve~~, 4,800~~ ***consists of approximately 14,900*** acres ***which is owned and managed by CDFW in the Central Subarea. Adjacent to the Semitropic Ecological Reserve are neighboring*** ~~adjacent to~~ ***parcels collectively totaling approximately*** 3,100 acres of land ***in the Semitropic Ridge area owned and*** managed by the Center for Natural Lands Management ~~and the Kern National Wildlife Refuge in the Central Subarea~~;" Please make note, currently there are no recorded conservation easements on these properties.

- Bullet # 14- "A portion of the 97,000 acre Windwolves ~~(Wildlands Conservancy)~~ Preserve ***owned and managed by the Wildlands Conservancy is*** located along the southwest border of the Project Area. ***Also, the northern most area of the preserve which is in the Central Valley supports valley floor species***;" Please make note, currently there are no recorded conservation easements on this preserve.

- **Add-** ***A portion of the Allensworth Ecological Reserve (South Unit), 1,110 acres (in Kern County) owned and managed by CDFW is located along the northern border of the Central Subarea.***

- **Add-** ***The Sand Ridge Wildflower preserve, 295 acres owned and managed by the Center for Natural Lands Management east of Bakersfield in the Eastern Subarea.***

- **Add-** ***Other preserved undesignated lands owned and managed by CDFW throughout the Project Area.***

Section 4.4.2 Environmental Setting- Methods, Category 1 Species Analysis Approach, Page 4.4-32 through 33: The DEIR includes three different modeling approaches that use various environmental parameters to produce mapping and acreage estimates depicting habitat suitability for 9 plant and 28 wildlife species within the Project Area. The Department recognizes that these are data models used for large scale environmental planning. However, Department staff have identified multiple areas where mapping in Figures 4.4-1 through 4.4-37 of Appendix N may have different habitat quality than what the models display. The Department recommends that the DEIR be extremely clear that these maps are not to be used for determining individual project impacts on the 37 special-status species used for the models, and that individual projects need to be ground-truthed by a qualified biologist familiar with the species potentially impacted by project activities.

Table 4.4-26: Special Status Plant Species with Potential to Occur in the Project Area, Page 4.4-47: In the bottom row of the table, Tracy's eriastrum (*Eriastrum tracyi*) is listed as CR for the State although CR is not defined in the status abbreviations list at the end of the table. The Department recommends that this listing abbreviation in the table be **changed** to SR (State Rare) and to **add** SR in the status abbreviations list at the end of the table. In addition, for the column for "Potential to Occur in Project Area", this species location is listed in the wrong subarea. The Department recommends that this box be **changed** to read, "Yes, in Tier 2 of the ~~Western~~ ***Eastern*** Subarea."

Section 4.4.2 Environmental Setting- Plant and Wildlife Species Summary, Special Status Plant Species, Page 4.4-36 through 37: The Department recommends the following **edits** to this section, "Special-status plant species are defined herein as those that are listed as ***candidate,*** threatened and/or endangered by the USFWS***;*** ~~***or***~~ ***candidate, rare, threatened and/or endangered by the*** CDFW; designated as ~~SSC or locally significant by CDFW~~ ***sensitive by BLM***; ~~fully protected under state law;~~ or species that meet the definition of ~~rare or~~ endangered***, rare, or threatened*** under CEQA Sections 15380(b) and (d). The status and known distributions of special-status plant species in the Project Area were evaluated based on a review of available literature, and from federal and state databases, including the CNDDB. Data collected from previous conservation-related studies and projects within the Project Area were

also reviewed. No critical habitat has been designated by the USFWS for any plant species in the Project Area. Data sources included:"

- Bullet # 4- Plant species listed as rare, threatened, or endangered under California Endangered Species Act (CESA) ***and the Native Plant Protection Act (NPPA)*** (~~Wildlife, CCR Title 14, Section 670.5, 1971 as amended; Plants,~~ CCR Title 14, Section 670.2, 1978 as amended).

- ***Add- Plant species considered sensitive by BLM.***

Section 4.4.2 Environmental Setting- Special Status Wildlife, Page 4.4-71: The Department recommends the following **edits** to the second paragraph of this section, bullet number four :

- Wildlife species listed as rare, ***candidate,*** threatened, or endangered under CESA (Wildlife, CCR Title 14, Section 670.5, 1971 as amended~~; Plants, CCR Title 14, Section 670.2, 1978 as amended~~).

Table 4.4-36: Special-Status Wildlife Species with Potential to Occur in the Project Area, Page 4.4-73: In the fifth row down in the table, golden eagle (*Aquila chrysaetos*) is listed as CFP, although SFP (California Department of Fish and Wildlife Designated (State) Fully Protected) is defined in the status abbreviations list at the end of the table. The Department recommends that this listing abbreviation in the table be **changed** to ***SFP*** to reflect the status abbreviations list at the end of the table.

Section 4.4.2 Environmental Setting- Special Status Wildlife, Blunt-Nosed Leopard Lizard (*Gambelia sila*), Page 4.4-86: The Department recommends the following **edits** to the first sentence of the second paragraph of this section: "The current distribution of the blunt-nosed leopard lizard is restricted to scattered sites in the southern San Joaquin Valley, Carrizo Plain, Elkhorn Plain, and southeastern Cuyama Valley, roughly corresponding to the western half of Kern County, the eastern boundary of San Luis Obispo ***County,*** ~~and~~ ***the western portion of*** Kings ~~Counties~~ ***County***, the western boundary of Fresno County, and extreme southwestern Tulare County."

Section 4.4.2 Environmental Setting- Special Status Wildlife, Least Bell's Vireo (*Vireo bellii pusilus*), Page 4.4-95: The Department recommends the following **edits** to the first sentence of the first paragraph of this section: "The least Bell's vireo is a ~~federally~~ ***federal and state*** listed endangered species."

Section 4.4.2 Environmental Setting- Special Status Wildlife, Swainson's Hawk (*Buteo swainsoni*), Page 4.4-102: Paragraph three of this section states, "URS SBM habitat

modeling data are available for this species and has strong predictive power. The primary environmental conditions for determining nesting habitat suitability were primarily elevation, followed by water availability, soil type, annual precipitation, and winter low temperature. The results indicate that high quality suitable habitat does not occur within the portions of the Project Area below about 2,000 feet included in the URS analysis. Table 4.4-52 summarizes modeled Swainson's hawk high quality and poor to moderate quality habitat acreage by tier and subarea. The locations of modeled suitable habitat for this species in the Project Area are shown on Figure 4.4-25 in Appendix N." The Department recommends **including** a definition of 'high quality suitable habitat' for Swainson's hawk. The Department also recommends that the County recognize that there are nesting Swainson's hawk in areas of active agriculture in the Project Area, although the minimal number of suitable nest trees are the main limiting factor for the species low population numbers in the southern end of the Central Valley.

Section 4.4.2 Environmental Setting- Special Status Wildlife, Tipton Kangaroo Rat (*Dipodomys nitratoides nitratoides*), Page 4.4-114 through 115: Paragraph two of this section states, "The historical geographic range of the Tipton kangaroo rat was over 1.7 million acres of arid-land communities occupying the valley floor of the Tulare Basin. Currently, the Tipton kangaroo rat inhabits small, scattered, isolated fragments of remnant habitat. In the southern San Joaquin Valley, this includes the Kern and Pixley National Wildlife Refuges, and other scattered areas within Kern, Tulare, and Kings Counties (USFWS 2010c)." The reference to the USFWS 2010c document is not actually in the EIRs References Cited section, an **addition** to the References Cited section is warranted. The Department believes that the intended referenced document is the most recent USFWS 5-year review Summary and Evaluation of the Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), dated February 16, 2010. If this is not the document referenced, the Department recommends that this document also be cited.

Section 4.4.3 Regulatory Setting- State, California State Fish and Game Code §1600-1616, Page 4.4-140: This section currently states, "Sections 1600 to 1616 of the CFGC states that it is unlawful to "substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake" without first notifying CDFW of that activity. If CDFW determines and informs the project proponent that the activity will not substantially adversely affect any existing fish or wildlife resources, the activity may be undertaken without further permitting. If CDFW determines that the proposed activity may substantially and adversely affect an existing fish or wildlife resource, a Lake or Streambed Alteration Agreement must be completed and approved by the CDFW, including reasonable measures necessary to protect the affected resources may be required prior to initiating the proposed activity (CFGC 1602)."

The Department recommends that this section be **updated** to clarify the process of compliance with California State Fish and Game Code §1600-1616. Following notification to the Department, a project may not legally occur until after the Department does one of the following: 1) executes a Lake or Streambed Alteration Agreement; 2) determines that an agreement is not necessary and informs the applicant in writing; or 3) fails to issue an agreement within mandated time lines.

Section 4.4.3 Regulatory Setting- State, California Native Plant Protection Act of 1977; California Fish and Game Code §1900 et seq., Page 4.4-141: The Department recommends the following **additions**, "The Native Plant Protection Act ***(NPPA)*** of 1977 (CFGC 1900 et seq.) authorizes CDFW to designate rare and endangered native plants and provides specific protection measures for state listed species. ***The Fish and Game Commission has adopted regulations governing the taking, possession, propagation, transportation, exportation, importation, or sale of any endangered or rare native plants (CCR Title 14, Section 786.9, 2014). CDFW may issue permits and plans that authorize rare plant impacts using the same procedures and under the same conditions as take authorizations issued pursuant to Title 14 CCR Section 783 et seq. relating to incidental take permits and Fish and Game Code Section 2800 et seq. relating to natural community conservation plans, as if rare plants were listed as endangered, threatened, or candidate species."***

Section 4.4.3 Regulatory Setting- State, Natural Community Planning Act (Fish and Game Code 2800 et seq.), Page 4.4-143: There is an abbreviation (MCPC) that is not defined in two sentences of this section, and the Department believes that they are meant to actually be NCCP. If this is the case **edits** are warranted in sentences three and four of the paragraph to change MCPC to NCCP. If not, 'MCPC' needs to be defined.

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State **HCP** in the Planning Area, Page 4.4-154: This heading needs to be **edited** as the State does not issue Habitat Conservation Plans (HCPs). The Department believes that either 'ITPs' or 'NCCPs' need to replace 'HCP'. In addition, the Department believes that there is a typo in the first sentence of the second paragraph where a deletion is in order, "The following sections summarize proposed and approved ~~and~~ HCPs for oil and gas activity, including oil and gas exploration, other HCPs within the Project Area, and approved regional plans or permits that address conservation and incidental take for oil and gas activities within the Project Area."

In addition, this section does not include all HCPs and companion State ITPs that have been issued. The Department is not clear if this is necessary for this document. If it is, we can provide this information to the County.

Table 4.4-66: Draft Valley Floor Habitat Conservation Plan Covered Plant Species List, Page 4.4-155: The federal listing for Hoover's eriastrum (*Eriastrum hooveri*) in this table is FT*, although * is not defined in the key at the end of the table. The Department recommends either **updating** the key to define the meaning of the *, or update the table to reflect the current listing of the species which is federally delisted and update the key to reflect the chosen abbreviation for that status.

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Chevron North American Exploration and Production Lokern Habitat Conservation Plan, Page 4.4-158: The seventh and eighth paragraphs of this section, the following **edits** are in order: "The HCP would allow Chevron to generate conservation credits by using conversation easements to permanently preserve and ~~providing~~ ***provide*** funding for the management of Chevron Lokern Lands over the permit term. Chevron would permanently protect 1,500 acres of the Chevron Lokern Lands at the time that the HCP becomes effective. The credits created by preservation within the Chevron Lokern Lands would be used to mitigate for covered activity impacts in Chevron Lokern Lands, Lokern Contiguous Area, and the four oil fields included in the HCP. Chevron also proposes to allow for the use of conservation credits by Chevron or by sale to third parties to mitigate for impacts within ~~an~~ 2,261,715 acre (3,534 square mile) credit area that includes the San Joaquin Valley floor up to 2,000-foot elevation within Kern County ***once the conservation lands are federally and state approved as a mitigation bank pursuant to CFGC Section 1798 et seq.*** The state and federal incidental take permits that would be issued to Chevron by the USFWS and CDFW would not provide coverage for third party or Chevron activities outside of the Chevron Lokern Lands, Lokern Contiguous Area, and the four oil fields included in the HCP, and the use of credits generated by preservation within the Chevron Lokern Lands would be subject to separate approval/permitting processes as necessary.

The activities for which take coverage would be provided under the proposed HCP and state 2081(~~a~~***b***) permits include existing and potential future oil and gas drilling and ***maintenance and*** operational activities ***for existing facilities*** described in Chapter 3, Project Description (Section 3.5, Potential Future Oil and Gas Development Scenario) together with the mitigation measures identified in Section 4.4.4, Impacts and Mitigation Measures."

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, California Resources Corporation Elk Hills Habitat Conservation Plan (EHHCP), Requested ITP, Page 4.4-159: The first two sentences of this paragraph, the following **edits** are in order: "CRC is applying for an ITP from CDFW, Pursuant to Section 2081(b) of the ~~Fish and~~ CFGC. The Section 2081 application, which ~~includes an associated~~ ***would be a companion permit to the federal EH***HCP ~~that supports the proposed conservation and management program for the proposed EHOF~~, was deemed complete by CDFW on March 3, 2014.

In addition, we are recommending that the discussion of the federal Endangered Species Act consultation status (currently on page 4.4-164) with the United States Fish and Wildlife Service (USFWS) be included in the 'Background' information of the EHHCP section.

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, California Resources Corporation Elk Hills Habitat Conservation Plan (EHHCP), Proposed Covered Activities, Page 4.4-164: The last paragraph of this section would be best placed in the 'Background' section as discussed above. Also, the Department is unclear what the meaning of the second sentence is, as it currently it states, "There is no impending expiration date in the take authorization approved by the Service under FESA, or any other federal approval." In the sentence following this one, it discusses that NEPA still needs to be completed on the EHHCP, so we are unclear how there can be an impending expiration date for federal incidental take coverage when take has not been authorized by the USFWS. In addition, we recommend that the document be consistent in how it refers to the USFWS as this section calls them the 'Service', **edit** the second sentence of this section to clarify its meaning, and include more information on the federal Endangered Species Act consultation status.

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Freeport-McMoRan Oil & Gas HCP, Page 4.4-164: The first paragraph of this section, the following **edits** are in order: "The Freeport-McMoRan Oil & Gas (formerly Nuevo-Torch then Plains Exploration and Production Company) HCP was adopted in 1999 and ***a companion state ITP was issued in 2000. The HCP and companion ITP*** addresses ongoing oilfield exploration, ~~and~~ production ***and maintenance*** activities on oilfield properties located in western Kern County. The HCP encompasses 21,900 acres, including an initial 839.9 acres of conservation area lands in the Lokern area that will be set aside incrementally to compensate for habitat

disturbances from oilfield activities. The federal incidental take statement authorized up to 1,700 acres of incidental take on the plan area lands. When Plains Exploration and Production Company acquired the properties from Nuevo-Torch in 2005, an additional 4,905 acres of land ~~and~~ were added to the HCP (an additional 414 acres of conservation area lands). In 2009, 300 acres of the incidental take acreage and 15 acres of the conservation land acreage were transferred to CRC (formerly Occidental) of Elk Hills, Inc., and Freeport-McMoRan (then Plains Exploration and Production Company) retained 1,400 acres of take acreage. ***In 2013 CDFW issued an ITP amendment addressing these changes.*** Covered species include…"

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, CRC (formerly Occidental of Elk Hill, Inc) Non-Unit HCP, Page 4.4-165: **Edits** to this paragraph are in order: "The CRC Non-Unit HCP is a ***USFWS approved*** conservation plan that covers 7,050 acres (Live Oak Associates 2013). The HCP was originally prepared for Nuevo-Torch in February 1999. ***Federal*** ~~Incidental~~ ***incidental*** take authorization and responsibilities under the HCP were transferred to Plains Exploration and Production Company (PXP) on May 9, 2005. PXP subsequently transferred 300 acres of authorized ***federal*** incidental take and 15 acres of conservation lands to CRC on August 3, 2009. PXP retained take authorization and responsibilities on the remaining 1,400 acres of the original 1,700 acres authorized for incidental take, and these interests were subsequently conveyed to Freeport-McMoRan. In December 2009 USFWS approved the inclusion of 3,504 acres of new properties located in the vicinity of McKittrick Valley and the EHOF into the CRC Non-Unit HCP; 1,134 acres of the 3,504 acres were designated for use as mitigation land. No increase in the initially authorized 1,700 acres of take was included in the 2009 approval."

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Kern Water Bank HCP/Natural Community Conservation Plan, Page 4.4-166 through 167: **Edits** to this paragraph are in order: "The Kern Water Bank HCP/Natural Community Conservation Plan (HCP/NCCP) is managed by the Kern Water Bank Authority and covers 19,900 acres. The plan was approved in 1997 and covers water conservation by developing water recharge and recovery facilities, the conservation and restoration of upland, intermittent wetland/rangeland, ~~and~~ other sensitive habitat, and the ***incidental take of*** San Joaquin kit fox (*Vulpes macrotis mutica*), Tipton kangaroo rat (*Dipodomys nitratoides nitratoides*), ~~giant kangaroo rat (*Dipodomys ingens*)~~, ***and blunt-nosed leopard lizard (Gambelia sila)*** ~~San Joaquin antelope squirrel (*Ammospermophilus nelsoni*), and Bakersfield cactus (*Opuntia basilaris var*)~~. The plan also includes a conservation bank that allows for conservation credit sales to third parties under certain conditions and subject to USFWS and CDFW

approval. In 1997, ~~5,592~~ ***3,267*** acres of the plan area were ~~permanently~~ ***set aside to be permanently*** preserved in the HCP area ***in conjunction with conservation credit sales***~~, and 3,267 acres were included in the conservation bank~~. ***Currently, conservation easements have been recorded on 1,321 acres of Kern Water Bank's Conservation Bank***" Since there are so many species covered by the Kern Water Bank HCP and NCCP, the Department recommends discussing species for which the USFWS is authorizing incidental take.

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Pacific Gas and Electric (PG&E) San Joaquin Valley Operations and Maintenance Program HCP, Page 4.4-167: **Edits** to this paragraph are in order: "The PG&E San Joaquin Valley region HCP was approved ***by the USFWS*** ~~in early 2008~~ and ***CDFW issued a companion state ITP in early 2008. The HCP and companion*** covers routine operations and maintenance and minor new construction activities related to PG&E's electrical system ***and natural gas facilities*** in the San Joaquin Valley for 30 years. The HCP covers 23 wildlife and 42 plant species, including the San Joaquin kit fox, California red-Legged frog, vernal pool fairy shrimp, and Western burrowing owl. ***The companion state ITP initially covered 8 wildlife species and 18 plant species, until CDFW issued and amendment to include California tiger salamander (Ambystoma californiense) in 2012.*** PG&E facilities ~~that are~~ covered by the HCP occur throughout the Project Area, generally within existing ROWs owned by the company."

Section 4.4.3 Regulatory Setting- Regional and Local, Habitat Conservation Plans, Natural Community Conservation Plans or other Approved Local, Regional, or State HCP in the Planning Area, Metropolitan Bakersfield HCP, Page 4.4-167: The Department recommends that this section clarify the current status of the Metropolitan Bakersfield HCP (MBHCP) including when it expired and a discussion of the MBHCP extension issued by the USFWS and its expiration date. Also, the eighth sentence of this paragraph, **edits** are in order as it currently states, "The County and City have updated the HCP to support the extension of the plan or a new set of take permits." The Department is unclear what this meaning of this sentence is in relation to the current status of the MBHCP. The Department recommends the following **edits** and **additions** for this sentence, "The County and City have ~~updated the~~ ***requested a time extension for the MB***HCP ***from the USFWS*** to ***provide federal incidental take coverage for an additional five years from the date of initial expiration, while*** ~~support the extension of the plan or~~ a new ***HCP is prepared for the planning area*** ~~set of take permits~~."

The Department also recommends that the ninth sentence have one word **added** for clarification, "A new ***state*** Incidental Take Permit was issued by CDFW ..." This would provide the reader a clear distinction between the federal and state incidental take coverage for Metropolitan Bakersfield.

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-1, Methodology, Page 4.4-173 through 204: The Department recommends the addition of a discussion in the EIR disclosing a description of impacts (direct and indirect) on species listed pursuant to CESA (e.g., state-listed species) and on lake and streambed resources to facilitate the Department's use of the DEIR as a CEQA Responsible Agency in issuance of ITPs and/or LSAAs for oil and gas projects in Kern County. The Department recommends that Section 4.4-1 be **updated** to include a comprehensive discussion on all potential Project impacts to special-status species and lake and streambed resources. A discussion needs to be **added** including, but not limited to, specifics as to what extent the activities and related impacts would result in the taking of state-listed species and disclose how those activities would potentially impact or take (Fish and Game Code Section 86) state-listed species. For lake and streambed resources, please include a discussion of what types of activities and related impacts are being analyzed by this DEIR, which could include for example, water diversion, fill activities, rerouting of streams, and/or removal of vegetation associated with streams.

The Department recommends using the following example italicized language as a guide (but not limited to) to disclose potential Project impacts to state-listed species:

> *Where project activities and their resulting impacts are expected to result in the incidental take of individuals of listed species, activities that would likely result in take include ground and vegetation clearing; grubbing; grading; leveling, excavating; scraping; land contouring; trenching; stockpiling; backfilling; compacting; paving; drilling; construction of roads, underground utilities, wastewater collection systems; materials and equipment transport and laydown; and development activities; vibroseis and shot-hole deployment; new access roads, pipeline and utility corridors; excavation of sumps; installment of sleepers or T-supports to accommodate pipelines; installation of overhead electrical lines; direct contact with moving parts of wells; clean-up of accidental spills or blowouts of oil, produced water, or other hazardous materials commonly used in oil fields; transport of drill rigs, and production materials and other project-related traffic; operations and maintenance activities; site restoration; and other activities described in the Project description section of the EIR.*
>
> *Incidental take of listed species in the form of mortality ("kill") may occur as a result of Project activities such as den or burrow collapse (in the case of fossorial*

species) resulting in crushing or suffocation of underground individuals due to site preparation and excavation; entrapment and burial within trenches and/or open pipelines; crushing by equipment in the Project Area; entanglement in, or crushing by, moving well parts; or by ingestion of, or entrapment in, spilled oil, produced water, or other hazardous materials. Incidental take, including mortality of listed species due to vehicle strikes may also occur in connection with increased project related traffic during construction and operations and maintenance activities. Incidental take of individuals of listed species may occur in the form of pursue, catch, capture, or attempt to do so of listed species via entrapment in holes or trenches, uncovering listed species through the excavation of dens and burrow systems, by corralling listed species into a confined area when exclusion fencing is constructed around work disturbance areas, and when individuals of listed species are relocated out of harm's way as maybe required by a project specific take authorization permit. Potential impacts to listed plant species include destruction of individuals from mowing, grading, or other construction activities; dust creation from project activities could settle on plant material and affect processes such as respiration, photosynthesis, pollination, and seed set; erosion and sedimentation; and increased competition from noxious weeds.

The Department recommends using the following italicized example language as a guide (but not limited to) to disclose potential Project impacts to lake and streambed resources:

The Project activities have the potential to result in adverse effects to fish and wildlife resources through the following project impacts: Sedimentation and erosion resulting from excavating material from the river bed channel, creating new slopes, removing vegetation, and influencing the path and thalweg of flow within the river bed; burying or crushing animals using the sediments of the river bed, including reptiles, small mammals, and ground nesting birds, and also by crushing plants or animal species that are unable to escape the path of moving equipment; sedimentation could result in material being carried by subsequent flows and carried downstream, relocated, and re-deposited in areas used by species; animal mortality from collisions with vehicles or heavy equipment or from excavation of trenches and roads; crushing of burrows or dens during vegetation removal, grubbing, clearing, grading, leveling, and compaction of well sites, entombment of animals during grading, trenching, and road construction; fugitive dust impacts to animals and plants; noise disturbance; nest abandonment; and increased predation. Potential impacts to plant species include destruction of individuals from mowing, grading, or other construction activities; dust creation from project activities could settle on plant material and

affect processes such as respiration, photosynthesis, pollination, and seed set; erosion and sedimentation; and increased competition from noxious weeds. Indirect impacts to downstream areas could include increased erosion and/or sedimentation as a result of vegetation removal, bank alteration, channel de-stabilization, and introduction of fill material. This could affect wildlife habitat functions and values, including forage production and burrowing substrate.

In addition, the Department recommends an edit to the last sentence of the third paragraph of this section: "Oil and gas activities could also indirectly affect special status plants and wildlife by generating dust, emissions, noise, light, and unintentional spills or discharges; introducing invasive species; or increasing the risk of unauthorized vehicular use or other human activity that disturb occupied or suitable ~~species~~ ***special-***status species habitats."

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-1, Mitigation Measures, Page 4.4-204 through 215: The Department has recommended edits to the Biological Resources MMs, see below:

MM 4.4-1: As discussed in the Department comments above for BMPs, it is recommended that the BMPs in Chapter 3 are consistent with the MMs. The Department recommends the following **deletions** and **edits** to MM 4.4-1: "~~With the exception of focused surveys that are seasonally restricted,~~ ***A qualified biologist shall conduct a biological reconnaissance survey in potential special-status species habitat to advise the project proponent of potential project impacts, potential permitting needs, and advise on the need for focused special status species surveys. Early consultation with USFWS and CDFW would confirm the biologist's advice and/or inform project proponents of additional recommendations. Based on the information gathered from the biological reconnaissance survey and informal consultation with USFWS and CDFW, focused/protocol surveys shall be conducted by a qualified or permitted biologist (whichever is applicable) well in advance of ground disturbing activities to determine the presence/absence of sensitive species protected by state and federal Endangered Species Acts and potential project impacts to those species. The survey shall be conducted in accordance with the most current standard protocol of USFWS and CDFW*** ~~special status wildlife surveys must be completed by a qualified biologist within a 30-day period prior to commencement of new ground-disturbance construction activities~~. The purpose of the ~~pre-disturbance surveys~~ ***focused/protocol surveys*** is to confirm the presence or absence of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the

California Endangered Species Act, ***rare or endangered in the California Native Plant Protection Act,*** or designated as fully-protected in the California Fish and Game Code (Collectively, "Protected Species), and to confirm the presence or absence of any other species considered "sensitive" under California Environmental Quality Act ("Sensitive Species), and to identify and implement feasible avoidance and minimization measures for such species. The surveys..."

The Department also recommends that the County create a criterion for determining qualified biologists. The Department is available to help the County with this task.

MM 4.4-2: The Department recommends the following **addition** to MM 4.4-2: "No incidental take of any species listed as threatened or endangered under the federal Endangered Species Act, threatened or endangered under the California Endangered Species Act, ***rare or endangered in the California Native Plant Protection Act,*** or designated as fully-protected in the California Fish and Game Code (Protected Species) may occur unless the incidental take is authorized by applicable state and federal wildlife agencies in the form of a permit or other written authorization, an approved state or federal conservation plan, or in accordance with an approved regional plan such as the Draft Valley Floor Habitat Conservation Plan and/or Natural Community Conservation Plan."

The Department recommends that clarification on how this MM will be verified during the County's administrative process as verification that a project proposal is following the County's requirements.

Add a new MM: ***Within 30 days before any ground disturbing activities in special-status species habitat, a qualified biologist shall conduct a pre-disturbance survey to record existing conditions of the site, determine if conditions have changed since the reconnaissance or focused/protocol surveys were conducted, and to determine where sensitive species avoidance buffers will be established.***

MM 4.4-3: The Department recommends the following **edits** to MM 4.4-3: ~~Exclusion barriers or~~ ***Protective*** buffers ~~may~~ ***shall*** be used, where effective and feasible in the opinion ***and guidance*** of ~~the~~ ***a*** qualified biologist, to avoid any unauthorized incidental take of Projected Species, and to minimize any incidental take of Sensitive Species, by separating the planned disturbance area from any locations where ~~pre-disturbance~~ ***biological reconnaissance*** surveys, ~~or~~ previously conducted focused/***protocol*** surveys, ***or pre-disturbance surveys*** have detected the presence of Projected Species or Sensitive Species. ***Protective buffers shall be delineated using brightly colored stakes and/or***

flagging or similar materials and remain until construction activities are complete, at which time of completion the buffers shall be removed. ~~All buffers must extend for a minimum of 50 feet from the nearest point of disturbance unless a smaller avoidance buffer has been established by either the United States Fish and Wildlife Service or the California Department of Fish and Wildlife as the minimum~~ ***If special-status plant or animal species are found adjacent to the a project during biological surveys, protective buffers shall be established around active dens and/or burrows of special-status animal species, or populations of special-status plant species*** to avoid unauthorized take of protected species ***as listed in the table below***~~, and the barriers must prevent the potential migration of wildlife into the construction area and unlawful incidental take of any Protected Species during ground disturbance activities~~. The ~~minimum~~ ***protective*** buffer distance shall be increased if required to avoid unauthorized incidental take of any Protected Species as determined by a qualified biologist. ~~Exclusion barriers,~~ ***Protective*** buffer distances~~,~~ and other avoidance measures that may be implemented to avoid impacts to Protected Species or Sensitive Species must be consistent with the ~~United States Fish and Wildlife Service~~ ***USFWS*** and/or the ~~California Department of Fish and Wildlife~~ ***CDFW***, and shall be implemented and overseen by ~~the~~ ***a*** qualified biologist.

Table
Disturbance Buffers for Sensitive Resources

Sensitive Resource	*Buffer Zone from Disturbance (feet)*
Potential San Joaquin kit fox den	*50*
Known San Joaquin kit fox den	*100*
Natal San Joaquin kit fox den	*Contact CDFW, USFWS*
Atypical San Joaquin kit fox den	*50*
Rodent burrows	*50*
Listed bird species active nests	*0.5 mile*
Burrowing owl burrow (breeding and non-breeding seasons)	*Pursuant to CDFW guidelines (see Table 4.4-85)*
San Joaquin coachwhip, silvery legless lizard, coast horned lizard	*30*
American badger: *Non-maternity dens* *Maternity dens*	 *50* *200*
Special-status plants	*50*

Add a new MM to include the requirement of a biological monitor during ground-disturbing activities in project locations that have potential special-status species habitat or is adjacent to potential special-status species habitat.

MM 4.4-6: The Department recommends the following **edits** to MM 4.4-6: Any potential San Joaquin kit fox dens (as defined in ~~United States Fish and Wildlife Service~~ ***USFWS*** 2011) detected during ~~pre-disturbance~~ ***reconnaissance or focused/protocol*** *surveys* shall be reevaluated for species activity no more than ~~14~~ ***30*** days prior to the commencement of ground disturbance. Potential kit fox dens shall be marked and a 50-foot avoidance buffer shall be delineated using ***brightly colored*** stakes and flagging or similar materials to prevent inadvertent damage to the potential den. If a potential den cannot feasibly be avoided, the den may be hand excavated in accordance with the United States Fish and Wildlife Service Standardized Recommendations for Protection of the Endangered San Joaquin Kit Fox Prior to or During Ground Disturbance (~~United States Fish and Wildlife Service~~ ***USFWS*** 2011). If species activity is detected, the location shall be identified as a "known" kit fox den in accordance with the ~~U.S. Fish and Wildlife Service~~ ***USFWS*** species guidelines (~~United States Fish and Wildlife Service~~ ***USFWS*** 2011). A minimum 100-foot buffer from any disturbance area shall be maintained for known dens and a minimum 500-foot buffer from any disturbance area shall be maintained for natal dens. No excavation of a known or natal den shall occur without prior authorization from the ~~United States Fish and Wildlife Service~~ ***USFWS*** and the ~~California Department of Fish and Wildlife~~ ***CDFW***. For activities occurring on land covered under an approved ~~Habitat Conservation Plan~~ ***federal and/or State incidental take authorization***, the requirements set forth in those documents shall be implemented. Other standard measures to protect San Joaquin kit fox, including capping pipes, covering trenches, adding exit ramps to excavated areas, shall be implemented in accordance with MM 4.4-~~19~~***15***.

MM 4.4-10(c): The Department recommends that a discussion be **included** in this section disclosing whom the blunt-nosed leopard lizard avoidance plan would be submitted to and if regulatory agencies would review the plan.

MM 4.4-12(b): The Department recommends the following **edits** to MM 4.4-12(b): No incidental take or relocation of any plant listed under the ***federal Endangered Species Act, the*** California Endangered Species Act***, or the California Native Plant Protection Act*** may occur unless the incidental take is authorized by the ***USFWS and/or the*** California Department of Fish and Wildlife in a permit or other authorization, or in an approved ***Habitat Conservation Plan or*** Natural Communities Conservation Plan. If ~~pre-construction~~ ***focused plant*** surveys detect the presence of any ~~California Endangered Species Act Plant~~ listed plant, the plant populations shall be buffered from disturbance activities by implementing applicable impact avoidance protocols established by the ***USFWS and/or*** California Department of Fish and Wildlife ***unless incidental take***

authority is obtained. Projects covered under incidental take authority shall conduct activities in accordance with the take authorization. The California Department of Fish and Wildlife may be contacted to determine the appropriate buffer required to prevent incidental take of a ~~California Endangered Species Act Plant~~ ***listed plant*** if avoidance protocols have not been established for the species. The qualified biologist shall confirm that all applicable ***listed plant*** buffers have been implemented prior to the commencement of any disturbance activity.

The Department recommends that clarification on how this MM will be verified during the County's administrative process that a project proposal is following the County's requirements.

MM 4.4-13: The Department recommends that this MM be **deleted** as it is a repeat of MM 4.4-12(b).

MM 4.4-15 (a-v): The Department recommends that the following MM be added to this section: ***All pipes 1.5 inches or greater in diameter stored overnight on a project location must have end caps that prevent wildlife from entering the pipe.***

MM 4.4-16: The Department recommends that the County create a clear way to identify and track temporary disturbance (<2 year disturbance). Also, how is the County determining or going to determine what areas are already disturbed? The Department is currently unclear how this will be calculated and has concerns; for example, if a well pad is planned in an open area within an oilfield, the open area may have no previous disturbance and thus should not be considered disturbed. Also, in contrast, if an entire oil field is considered in the calculation, there may be more than 70% disturbance as there would be existing disturbance which may not be counted as additional disturbance. We are recommending that the County include in the EIR clarification on how the existing disturbance calculations will be determined. The Department also recommends that the County include a criteria for selecting compensatory mitigation lands, such as "of equal or greater value" for the species.

c. "Removal of legacy oil and gas equipment, inclusive of compliance with applicable legal requirements (e.g., well plugging and abandonment requirements under state or federal regulations), restoration of the surface grade to be consistent with surrounding lands, complete a reseeding effort using native species, ~~and~~ notification of the site owner (if not the Applicant) of

the completion of the removal and grading restoration work***, and record a conservation easement on the land to protect it in perpetuity***."

d. "Enhancement or restoration of existing habitat on lands already subject to a conservation easement or similar agreement, or which become subject to a conservation easement or similar agreement subsequent to the certification of this Environmental Impact Report, provided that such activities are covered in a permit or authorization, conservation plan, Habitat Conservation Plan, or Natural Community Conservation Plan, approved by the United States Fish and Wildlife Service or the California Department of Fish and Wildlife." The Department recommends that the County clarify how the value of the restoration work will be assessed. The Department recommends that the County establish specific parameters and biological value/improvement goals if this option is to be included in the EIR.

Add the header **e.** to the last measure of this section:

"e. Payment of a biological resources..." In addition to this heading edit, the Department recommends that this program (and associated fees) be in place and approved by the appropriate regulatory agencies before project proponents are allowed to use this as a mitigation option.

Also, the Department is concerned that currently as proposed, there is no discussion as to where the compensatory mitigation land would or could be located. The Department highly recommends that this mitigation measure be **updated** to include a plan for land acquisition target areas to provide wildlife movement and habitat connectivity corridors.

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-1, Level of Significance After Mitigation, Page 4.4-215: This section states, "Impacts would be less than significant." The Department recommends that the County discuss why the proposed mitigation measures would offset Project impacts to species identified as a candidate, sensitive, or special-status species to less than significant. A description in this section would explain the reason for the County's determination. Currently, because there is no justification why this determination was made.

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-2, Page 4.4-216: The Department recommends the following **edits** in the fifth sentence of paragraph one of this section, "As discussed in Section 4.4.~~2~~***1***, Environmental Setting, the sensitive natural communities identified within the Project Area include wetlands, water and other riparian habitat that are subject to state or federal permit requirements

prior to physical disturbance, ***including but not limited to Section 1600 of the CFGC and the Clean Water Act 401 and 404***."

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-2, MM 4.4-17, Page 4.4-219: The Department recommends the following **edits** to the fourth sentence of MM 4.4-17: "The site plan for the proposed activity shall identify waters, wetlands, ***resources subject to section 1600 of the CFGC,*** and other riparian habitats that occur in and within 100 feet of the disturbance area."

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-2, Level of Significance After Mitigation, Page 4.4-219: This section also states, "Impacts would be less than significant." The Department recommends that the County also discuss in this section why the proposed mitigation measures (including the mitigation measures in the Biological Resources section 4.4-1) would offset Project impacts to riparian habitat or other sensitive natural community to less than significant, for the same reasons described above (in comments on Page 4.4-215).

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-3, Level of Significance After Mitigation, Page 4.4-221: This section also states, "Impacts would be less than significant." The Department recommends that the County also discuss in this section why the proposed mitigation measures in the Biological Resources section 4.4-1 would offset Project impacts to riparian habitat or other sensitive natural community to less than significant, for the same reasons described above (in comments on Page 4.4-215).

Section 4.4.4 Impacts and Mitigation Measures, Impact 4.4-4, Page 4.4-222: This section states,

> "As discussed in Section 4.4.2, Environmental Setting, and shown in Figure 4.4-11, the generalized patterns of wildlife movement in and through the Project Area have been characterized in certain studies. The length and width of these corridors have not been precisely determined and most correspond with major geographic features that are likely to facilitate species movement, including the Kern River and Poso Creek channels, and along the base of the mountain ranges that border the Project Area to the east, south and west.
>
> Oil and gas exploration and production activities are more porous and maintain wildlife movement to a greater extent than urban development, and, depending on species requirements, agricultural uses that modify surface vegetation, soils and irrigation. A recent study conducted in

> 2008-2010 for the BLM found that species assemblages in saltbush scrub habitat remain relatively intact in oilfield locations with up to 70% disturbance in Kern County (Fiehler, C.A. and B. Cypher, 2011). This result indicates that even moderately developed oilfields as documented in the 2011 survey would retain the capacity for wildlife movement. However, oilfield development with more than 70% disturbance could reduce species movement, and potential impacts to wildlife movement in higher density locations would be significantly impacted by project activities without mitigation."

The Department does not believe that this section is sufficient. We are concerned that without a landscape scale conservation plan addressing oilfield development with more than 70% disturbance wildlife movement in high density locations would be significantly impacted by Project activities, even with the proposed mitigation measures in the Biological Resources section 4.4-1. In addition, 'relatively intact' species assemblages in saltbush scrub habitat (as referenced above by (Fiehler and Cypher, 2011) in oilfield locations with up to 70% disturbance in Kern County, does not mean that there is no impact to species movement by the maintenance, expansion, or establishment of new oilfields. The Department is recommending that this section fully describe and disclose all potential Project impacts to the movement of native resident or migratory wildlife species, established native resident or migratory wildlife corridors, and the use of wildlife nursery sites.

In addition, the DEIR should identify a conservation strategy that identifies areas to target for conservation (e.g., areas on which the habitat mitigation fees would be expended). We recommend including the western Kern County corridors/conservation targets identified in the California Council on Science and Technology (CCST) document entitled *"An Independent Scientific Assessment of Well Stimulation in California"*, July 2015 as a starting point.

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-4, Level of Significance After Mitigation, Page 4.4-222: This section also states, "Impacts would be less than significant with mitigation." The Department recommends that the County also discuss in this section why the proposed mitigation measures in impact section 4.4-1 would offset Project impacts to riparian habitat or other sensitive natural community to less than significant, for the same reasons described above (in comments on Page 4.4-215).

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-5, Level of Significance After Mitigation, Page 4.4-223: This section also states, "Impacts would be less than significant with mitigation." The Department recommends that the County also

discuss in this section why the proposed mitigation measure 4.4-19 would offset Project impacts to biological resources such as a tree preservation policy or ordinance to less than significant, for the same reasons described above (in comments on Page 4.4-215).

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-6, Page 4.4-223: **Move** the "California Aqueduct - San Joaquin Field Division HCP" from HCPs that have been adopted list to HCPs that are proposed list.

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-6, Page 4.4-224: **Edits** to the seventh paragraph of this section are in order: "The Project Area also includes ~~five~~ ***four*** HCPs that do not cover oil and gas production activities: ~~the California Aqueduct - San Joaquin Field Division HCP,~~ the Kern County Waste Facilities HCP, the Pacific Gas and Electric Company San Joaquin Valley Operations and Maintenance Program HCP, the TUMSHCP, and the Metropolitan Bakersfield HCP. The original term of the Metropolitan Bakersfield HCP has expired, and a renewal process is underway. The Project is likewise not inconsistent with these ~~five~~ ***four*** HCPs that do not include oil and gas production as "Covered Activities."" A new paragraph will need to be **included** to disclose that the California Aqueduct - San Joaquin Field Division HCP is proposed and does not cover oil and gas production activities.

Section 4.4.4 Impacts and Mitigation Measures, Project Impacts, Impact 4.4-6, Level of Significance After Mitigation, Page 4.4-229: This section also states, "Impacts would be less than significant with mitigation." The Department recommends that the County also discuss in this section why the proposed mitigation measure in section 4.4-6 would offset Project impacts regarding conflicts with the provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other Approved Local, Regional, or State Habitat Conservation Plan to less than significant, for the same reasons described above (in comments on Page 4.4-215).

Section 4.4.5 Cumulative Setting, Impacts and Mitigation Measures, Impact 4.4-7, Cumulative Impacts to Biological Resources, Page 4.4-230: The Department recommends the following edits in the second sentence of paragraph four of this section, "Future land uses and development could affect biological resources in each of these jurisdictions and would be undertaken as independent actions with associated impacts, avoidance and minimization requirements, and ***compensatory*** mitigation, if required, under applicable federal, state, regional and local agency law."

Hazards and Hazardous Materials Chapter 4, Section 4.8

Section 4.8.3 Regulatory Setting, State, Hazardous Materials and Hazardous Waste, Lempert-Keene-Seastrand Oil Spill Prevention and Response Act of 1990, Page 4.8-49:

The DEIR discusses the Lempert-Keene-Seastrand Oil Spill Prevention and Response Act of 1990 in this section and mentions that the Act was amended in 2014 by Senate Bill 861 to expand application of its provisions to all waters of the state, and not solely coastal and marine waters. Additionally, throughout the entire document are many references to Spill Prevention Countermeasure and Contingency Plans; Spill Prevention, Control and Countermeasure Plans; Spill Contingency Plans; and Division of Oil Gas and Geothermal Resources Assembly Bill 1960 spill plans. Senate Bill 861 which created the Statewide Oil Spill Prevention and Response Program authorized the Administrator of the Department of Fish and Wildlife's Office of Spill Prevention and Response (OSPR) to develop emergency regulations to begin program implementation. As of September 4, 2015, the emergency regulations addressing Inland Production Facility Contingency Plans, Certificates of Financial Responsibility, and Drills and Exercises have been approved by the Office of Administrative Law. These emergency regulations now require certain inland production facilities to submit an Oil Spill Contingency Plan to OSPR and to demonstrate the financial ability to pay for costs and damages caused by a spill, and to begin a drills and exercises program. The Department recommends that the EIR **reference** and **add** these new requirements. The OSPR emergency regulations and associated guidance documents are available at the following website:
https://www.wildlife.ca.gov/OSPR/Preparedness/Inland-Facilities-Contingency-Plan

If you have any questions on these comments, please contact Reagen O'Leary, Environmental Scientist, at the address provided on this letterhead, by telephone at (559) 243-4014, extension 244, or by electronic mail at Reagen.OLeary@wildlife.ca.gov.

0008-2

Special Projects Section (SPS) recently received a "Notice of Completion" environmental document from the State Clearinghouse outlining the information contained in the attached profile.

After a preliminary review, we believe this project will not have a significant impact on statewide departmental operations. However, because of your geographical proximity to the site, you are in a better position to provide a more accurate assessment of any traffic-related matters that may affect your local Area operations. Information and procedures outlined in Highway Patrol Manual 41.1, Transportation Planning Manual, Chapter 6, Environmental Impact Documents, should serve as a guideline when reviewing transportation-related documents.

If you determine departmental input is advisable, please provide your written comments referencing the above SCH number to the State Clearinghouse, 1400 Tenth Street, Room 121, Sacramento, CA 95814. Your comments must be received no later than August 20, 2015. Please forward a copy of your written comments to SPS. If you determine there is "no impact," please notify SPS by electronic mail (e-mail) to the analyst listed below, or by memorandum.

If you have any questions, please call Associate Governmental Program Analyst Leah Mora at (916) 843-3365, or e-mail at lemora@chp.ca.gov.

0008-1

Thank you for your comment and participation in the public review of the Project and the environmental document. The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. This comment is noted and will be considered by County decision makers.

0008-2

This comment does not state a specific concern related to the adequacy of the EIR and therefore does not require a detailed response. The County has not issued a “Notice of Completion” of this EIR, but the County did issue a Notice of Availability when the DEIR was circulated for public review on July 8, 2015. The Department’s conclusion that the Project will not have a significant impact on statewide departmental operations is noted with appreciation, as is the Department’s acknowledgement that the County is in the best position to gauge the extent to which the Project may impact local traffic patterns. The EIR’s methodology for evaluating Project traffic impacts is described in DEIR section 4.16.4. The Department’s offer of assistance is noted with appreciation.

2700 "M" Street, Suite 100
Bakersfield, CA 93301

Re: Draft Environmental Impact Report for the Revisions to the Kern County Zoning Ordinance – 2015 (C)

Dear Ms. Oviatt:

The Kern County Water Agency (Agency) would like to thank you for the opportunity to comment on the draft Environmental Impact Report (DEIR) for the Revisions to the Kern County Zoning Ordinance – 2015 (C) (Project) focused on oil and gas local permitting. 0009-1

The Agency was created by the California State Legislature in 1961 to contract with the California Department of Water Resources for State Water Project (SWP) water. The Agency has contracts with water districts throughout Kern County to deliver SWP water. The Agency also manages and/or is a participant in multiple groundwater banking projects, including the Kern Water Bank (KWB), Pioneer Property and Berrenda Mesa banking projects. Therefore, the Agency is uniquely qualified to provide comments on the Project. 0009-2

Comment 1: The Agency does not maintain water quality data for the Central Valley Project (CVP). 0009-3

The DEIR indicates the Agency maintains water quality data for the CVP (p. 4.9-31). While the Agency regularly tests the water quality of the Friant-Kern Canal for operational purposes, the data is not retained beyond its immediate use. Therefore, this reference should be removed from the DEIR.

Comment 2: The DEIR incorrectly refers to the Agency as the "Kern County Water Authority" in several instances. 0009-4

Several times throughout the DEIR, the Agency is incorrectly referred to as the "Kern County Water Authority." Therefore, all instances should be corrected to read the "Kern County Water Agency."

General Manager

0009-1

Commenter's statutory authority, and its role in numerous water management projects, are noted as is the commenter's unique expertise to comment on the Project.

0009-2

Commenter's statutory authority, and its role in numerous water management projects, are noted as is the commenter's unique expertise to comment on the Project.

0009-3

Commenter's information that the Kern County Water Agency does not maintain water quality data for the Central Valley Project is noted. Water quality data that were collected from the KCWA was used in the EIR, but it is understood that KCWA does not maintain these data.

0009-4

Commenter is correct that the Draft EIR incorrectly called KCWA an "authority" rather than an "agency." The correct "agency" term is included in this Final EIR.

Subject: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting - Request for Extension of Time Period for Public Review and Comment

Dear Ms. Oviatt and Mr. Mynk,

The North Kern Water Storage District (North Kern or District) appreciates the opportunity to review and comment on the subject Draft EIR. The EIR is of keen interest to the District since operation of the District's project to supply water to 60,000 acres of highly productive farmland routinely intersects with local oil operations. 0010-1

Unfortunately, given the District's current singular focus on meeting landowner's water supply needs through the historic drought on the Kern River (the District relies on the Kern River for more than 90% of its surface water supplies), the District does not have resources available to review the voluminous documents comprising the Draft EIR (the Draft EIR itself (approximately 1,800 pages) and the Technical Appendices (approximately 5,800 pages)) within the allotted 45 day review period. Consequently, the District hereby requests that the County extend the current 45 day comment period for the Draft EIR (which is the minimum time period for public review) to at least 60 days and preferably 90 days. This additional review time is essential to allow the District to provide meaningful comments on the Draft EIR and will also assist the County in meeting its obligations for public disclosure and review under CEQA. 0010-2

Very truly yours,

Richard Diamond
General Manager

Subject: Comments on Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting

Dear Ms. Oviatt and Mr. Mynk,

The North Kern Water Storage District (North Kern or District) appreciates the opportunity to review and comment on the subject Draft EIR. The EIR is of keen interest to the District since operation of the District's project to supply water to 60,000 acres of highly productive farmland routinely intersects with local oil operations. The District's comments focus on the maintenance/ protection of existing water supplies. 0011-1

The District operates a "conjunctive use" project located generally west of Highway 99 and east of the cities of Shafter and Wasco (in what is termed the "Central Area" in the DEIR). The District's project maximizes the use of available surface water supplies (primarily from the Kern River) for direct irrigation and groundwater recharge in wetter years, with previously recharged supplies pumped from the groundwater basin (by both the District and District landowners) to meet irrigation demands in the District when surface supplies are insufficient in drier years (the District also "banks" water for third parties on a limited basis). 0011-2

Oil operations in the District are focused in the western and northwestern portions of the District (North Shafter and Rose fields). Particularly in these areas, but in District areas more remote from direct oil operations as well, the proposed permitting process must ensure the protection of District and District landowner facilities necessary to operate the conjunctive use project and, critically, the quality of surface water and groundwater conveyed in these facilities. North Kern also believes it is critical that the permitting process fully respect and accommodate overlying land uses of District landowners so that oil development and production operations minimize disruption to overlying uses. 0011-3

Thank you for the opportunity to provide comments on the DEIR. If you have any questions do not hesitate to contact me at the District. 0011-4

Very truly yours,

Richard Diamond
General Manager

0011-1

Thank you for your comment and participation in the public review of the Project and the environmental document. The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. This comment is noted and will be considered by County decision makers.

0011-2

The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. This comment is noted and will be considered by County decision makers.

0011-3

DEIR Section 4.9, Hydrology and Water Quality analyze potential project impacts to hydrology and water quality for both surface and groundwater resources. As explained in that DEIR section, all Project impacts will be mitigated to less than significant, with the exception cumulative impacts related to groundwater elevations and aquifer volumes (as opposed to cumulative water quality impacts). As explained in the DEIR, mitigation measures will reduce this impact to the extent feasible, though not to less than significant. Please see Global Response 4, Surface Owners and Agriculture. Please also see revisions reflected in section 7.1.4 of this document to certain mitigation measures described in the DEIR.

0011-4

Thank you for your comments and participation in this public review of this environmental document. Such comments are noted and will be considered by County decision makers.

12 Kern County Superintendent of Schools

Kern County
Superintendent of Schools

Office of Christine Lizardi Frazier ...advocates for children

July 30, 2015

Kern County Planning Department
1115 Truxtun Avenue
Bakersfield, CA 93301

To Whom It May Concern:

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a major employer in Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county. 0012-1

The energy industry is vital to Kern County in terms of jobs, economic support and charitable contributions. Our office has benefitted from multiple partnerships with the energy industry, including but not limited to, Ready to Start, Science 4 Kern, Kern County College Night and so much more. The industry's support of education has been very important in ensuring that students have access to local jobs that keep these bright minds in Kern County where they can help our communities grow and thrive. 0012-2

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report. 0012-3

Sincerely,

Christine Lizardi Frazier
Superintendent

Bakersfield, CA 93301

Re: City Support - Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting

Dear Mr. Mynk,

This letter is in response to the Notice of Availability (NOA) issued by Kern County on July 8, 2015 for public review of the Draft Environmental Impact Report for "Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting." As indicated in that document, public comments are due to the County by September 11, 2015. 0013-1

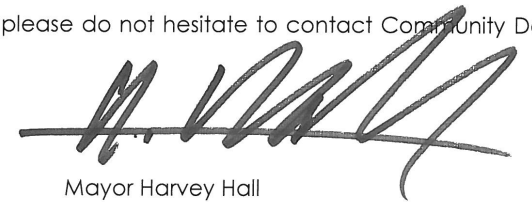
On August 18, 2014, the Bakersfield City Council's Legislative and Litigation Committee received an update from representatives of the Western States Petroleum Association (WSPA) and Kern Citizens for Energy regarding the status of operations and challenges facing the industry both statewide and locally. Kern Citizens for Energy requested that the City take a formal position in support of the industry and of Kern County's project-level environmental review of oil and gas production within the unincorporated areas of the County to allow for the future growth of the industry in a safe and responsible manner. On September 22, 2014, the committee unanimously recommended that a resolution in support of this project be brought forward to the Council. 0013-2

On October 22, 2015, the Bakersfield City Council adopted the attached Resolution affirming support for the Local Oil and Gas Industry. As noted in the resolution, the City Council of the City of Bakersfield understands the importance of this economic engine and supports governmental policies that promote and stimulate the safe and responsible growth of the oil and gas industry in our City, County, State and Country. 0013-3

Therefore, this letter and Resolution 179-14 confirm that the City of Bakersfield: (1) Acknowledges and appreciates the significant economic impacts a thriving oil and gas industry has on the economy of Bakersfield; (2) Supports the timely conclusion of Kern County' s project-level environmental review of oil and gas production within the unincorporated areas of Kern County to allow for the future growth of the oil and gas industry in Kern County in a safe and responsible manner; and (3) Supports the efforts of "Kern Citizens for Energy." 0013-4

If you have any further questions, please do not hesitate to contact Community Development Staff at 661-326-3700.

Very truly yours,



Mayor Harvey Hall

CC: Alan Tandy, City Manager
Douglas McIsaac, Community Development Director
Jacquelyn R. Kitchen, Planning Director

Attachment: Resolution 179-14

RESOLUTION NO. 179-14

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF BAKERSFIELD AFFIRMING SUPPORT FOR THE LOCAL OIL AND GAS INDUSTRY.

WHEREAS, the oil and gas industry is a key component of the economy of the City of Bakersfield, the County of Kern and the State of California; and

WHEREAS, activities related to oil and gas production in Kern County provide for a significant number of local jobs, property and sales tax revenues, and serve as an economic driver for our local economy; and

WHEREAS, the City Council of the City of Bakersfield understands the importance of this economic engine and supports governmental policies that promote and stimulate the safe and responsible growth of the oil and gas industry in our City, County, State and Country; and

WHEREAS, the County of Kern, with support from local industries, including the oil and gas industry, is currently conducting a project-level environmental review of oil and gas production within the unincorporated areas of Kern County; and

WHEREAS, the purpose for this environmental review is to provide for a clear, safe and understandable plan for oil and gas production activities to operate within and to minimize any conflicts between the activities of mineral rights holders and those of surface rights holders; and

WHEREAS, the City is aware that oil and gas production within the unincorporated areas of Kern County and their associated environmental review does not impinge upon or supersede the City's authority over such activities within its jurisdictional boundaries; and

WHEREAS, "Kern Citizens for Energy" is a coalition of small business owners, nonprofits, chambers of commerce, taxpayer advocates, and others that support a robust oil and gas industry in Kern County; and

WHEREAS, "Kern Citizens for Energy" is committed to supporting the thousands of men and women who work in the local oil and gas sector within Kern County and advocating continued oil and gas production in Kern County; and

CITY OF BAKERSFIELD ORIGINAL

WHEREAS, in accordance with the statements above, it is the intent of the Bakersfield City Council to formally support Kern County's ongoing environmental review of oil and gas production within the unincorporated areas of Kern County and the efforts of "Kern Citizens for Energy."

NOW, THEREFORE, BE IT RESOLVED by the City Council of the City of Bakersfield as follows:

1. The above recitals are true and correct.

2. The City of Bakersfield hereby:

   - Acknowledges and appreciates the significant economic impacts a thriving oil and gas industry has on the economy of Bakersfield;

   - Supports the timely conclusion of Kern County's project-level environmental review of oil and gas production within the unincorporated areas of Kern County to allow for the future growth of the oil and gas industry in Kern County in a safe and responsible manner; and

   - Supports the efforts of "Kern Citizens for Energy."

14 Kern County Public Works Department

Office Memorandum

KERN COUNTY

0014

To: Planning Department
Attn: Chris Mynk

July 16, 2015

From: Public Works Dept.
Floodplain Management Section
Aaron Leicht

Subject: Draft EIR – Revisions to the K.C. Zoning Ordinance; Oil and Gas Local Permitting

This Section has reviewed the above referenced document and recommends that Mitigation Measure 4.9-6 be amended to read; 0014-1

> For any oil and gas activity within a Special Flood Hazard Area, the applicant shall ensure that all constructed facilities are elevated or floodproofed in compliance with the requirements and standards found in the Kern County Floodplain Management Ordinance and Chapters 19.50 and 19.70 of the Kern County Zoning Ordinance. 0014-2

For clarity, it is recommended that the term Special Flood Hazard Area be added to Chapter 11.2 of the DEIR using the definition found in the Kern County Floodplain Management Ordinance Section 17.48.060. 0014-3

Additionally, the recent creation of the Kern County Public Works Department now makes references to the Engineering, Surveying and Permit Services Department obsolete. It is recommended that the DEIR be reviewed and references to ESPS (except for references made in a historic context) be updated to K.C. Public Works Department. 0014-4

0014-1

The requested modification to MM 4.9-6 has been added to the Final EIR.

0014-2

The requested modification to MM 4.9-6 has been added to the Final EIR.

0014-3

The definition of the Special Flood Hazard Area is added to the Final EIR as requested by commenter.

0014-4

The request that Draft EIR references to the Kern County Engineering, Surveying and Permiting Services Department be updated to refer to the Kern County Public Works Departmernt. This change is accepted and added to this Final EIR.

15 Kern County Public Works Department

COUNTY OF KERN
PUBLIC WORKS DEPARTMENT

Office Memorandum

To: Lorelei Oviatt, Director
Attn: Christopher Mynk, AICP, Supervising Planner

September 11, 2015

From: Warren D. Maxwell, Development Review Engineer
Building & Development Division

Subject: 7-5.3 Draft Environmental Impact Report for the Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting.

This Department has reviewed the Traffic Impact Study (TIS) and the Draft Environmental Impact Report (DEIR) for the subject project and has the following comments:

Traffic Impact Study:

1. This Department concurs with its findings as outlined in the following table: 0015-1

Category	Total Cost	O&G % Share	O&G Cost
Intersection Improvements	$11,200,000.00	29%	$3,200,000.00
Roadway Widening	$124,700,000.00	10%	$12,900,000.00
Pavement Maintenance[1]	$1,128,000,000.00	6%	$63,600,000.00
Safety & Geometrics	-	-	$2,000,000.00
Total	$1,263,900,000.00		$81,700,000.00

1. It is anticipated that the County will establish a Road Surface Impact Mitigation Fee Program.

2. Page 45, Table 3: Signalized Intersection Level of Service, AM & PM Peak Hour; Intersection #355 Real Rd & SR 58 does not show a 2015 AM Peak Hour LOS, please clarify. 0015-2

3. Page 93, Conclusion; Third paragraph; it is unclear if there were 101 studied intersections as totaled from Tables 2 and 3 or 105, please clarify. 0015-3

4. Page 93, Conclusion; Third paragraph; it is unclear if the 34 intersections currently operating below the adopted LOS will be reduced to 15 or that there will be 15 additional intersections that will operate below the adopted LOS by 2035, please clarify. 0015-4

5. Submit a stamped and signed TIS from Ruettgers & Schuler. 0015-5

Draft Environmental Impact Report:

1. Page 4.16-4; Existing Traffic Conditions; See TIS Comment #3 above. 0015-6

2. Page 4.16-5; Existing Traffic Conditions; please verify the amount of intersections calculated to operate at unacceptable LOS during AM and/or PM Peak hours, 19 appears to be incorrect. 0015-7

3. Page 4.16-9; Existing Traffic Conditions; please verify the amount of roadway segments evaluated since the quantities of 463 and 30 segments that operate at unacceptable LOS under existing conditions do not match those stated earlier in the DEIR. 0015-8

4. Page 4.16-26; Existing Pavement Conditions; please verify the centerline miles of county roads and state routes are correct, as they do not match those shown in the TIS. 0015-9

5. Page 4.16-42; Revise Engineering, Surveying, and Permit Services Department to reflect Public Works Department, Building and Development Division. 0015-10

6. Page 4. 16-46; Project Impacts; Year 2015 intersection Operations; please verify the number of intersections evaluated is 19. 0015-11

7. Page 4.16-46; Table 4.16-12: Intersection Impacts and Mitigation 2015. Intersection #112 is not shown in the TIS but it is listed in the DEIR. Please explain. 0015-12

8. Page 4.16-47; Table 4.16-12: Intersection Impacts and Mitigation 2015. Intersection #243 project percent fair share is missing. Please revise. 0015-13

9. Page 4.16-52; Table 4.16-16: Roadway Maintenance and Rehabilitation Summary, Years 2015-2035. The quantities in the DEIR do not match Table 10 in the TIS. Please clarify. 0015-14

10. Page 4.16-52 and 4.16-53; Pavement Conditions; See DEIR Comment #4 above. 0015-15

11. Page 4.16-77; Table 4.16-17: Pavement Impacts and Mitigation; Please provide the footnote for the Key. Please revise. 0015-16

12. Mitigation measures page 4.16-77: MM 4.16-1; Please revise the reference to the Roads Department to reflect Kern County Public Works Department. Also, MM 4.16-2; Please remove the "Roads Division" reference from Kern County Public Works Department and replace the subsequent Roads Department reference with Kern County Public Works Department. 0015-17

13. Page 4.16-80; Impact 4.16-4; Last paragraph states "…with the implementation of MM 4.16-1," should it also contain MM 4.16-2? Please clarify. 0015-18

14. Page 4.16-82; Project Impacts; Year 2035 Intersection Operations; please verify number of intersections that will operate below acceptable LOS as the stated value appears to be incorrect. 0015-19

15. Page 4.16-83; Table 4.16-18; Intersection #112 does not correlate with Table 11 of the TIS. Please verify. 0015-20

RE: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting

Dear Mr. Mynk:

The Kern Groundwater Authority (Authority) appreciates the opportunity to review the Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting (DEIR). Appendix T of the DEIR includes a water supply assessment report for the Project Area. Appendix T, Table 16, summarizes the groundwater pumping data used to develop a mean total of 1,319,000 acre-feet (af) of annual groundwater supply within the Project Area, and this quantity is used in subsequent tables as a constant supply in five year increments through 2035. 0016-1

Comment: Include a footnote on Appendix T tables that the groundwater supply numbers in the report are not an estimation of safe basin yield, which will be determined in the future under the Sustainable Groundwater Management Act. 0016-2

The Appendix T tables referencing a groundwater supply of 1,319,000 af, or some portion thereof, should include a footnote stating the pumping data used to develop the mean were collected prior to the enactment of the Sustainable Groundwater Management Act and the annual amount of future groundwater pumping will depend on the safe basin yield as determined for the Kern Groundwater Subbasin. 0016-3

Sincerely,

Joe MacIlvaine
President

0016-1

Commenter's summary of the Draft EIR, Water Supply Assessment (Appendix T) is noted. Appendix T has been revised to included updated information in response to comments (e.g., corrections of produced water quantities that are used for irrigation), as explained in GR-Water-05.

0016-2

Commenter's request that that groundwater supply numbers in the Water Supply Assessment do not constitute a safe basin yield, and that the safe basin yield will be determined in the future under the Sustainable Groundwater Management Act, is accurate and included in the Final EIR.

0016-3

Commenter accurately notes that the historical data presented in Appendix T were collected before enactment of the Sustainable Groundwater Management Act (SGMA). Some of the data presented in the revised Water Supply Assessment (Appendix T-1) were collected after enactment of SGMA, but none of the supplied data are intended to be understood as presenting an assessment of the sustainable basin yield under SGMA.

Re Oil & Gas DEIR

Dear Mr. Mynk,

I was compelled to write this without a complete reading of the document because I was shocked by my initial scan. My concerns relate to the oil activities as it relates to neighboring residences. I have lived surrounded by an oilfield for 23 years and can say from first hand experience they are ugly, noxious, smelly, noisy and at times unsafe and operate with impunity in Kern County. I have seen crude oil spills, gas venting, waste water pipe breaks, screaming jack pumps, pumps heads falling off, gas flares venting with flames over 20' tall, flares falling and igniting vegetation. All safety and operational reporting appears to be self reporting without oversight. There is no county dept for citizens to call upon in an emergency. The fire dept did nothing when the flare fell. No agency would help with the ear splitting compressor and pump noises. DOGGR claimed they could only help with tumbleweeds. When men in hazmat suits worked for three days cleaning up a spill, the oil company would only say that it was non reportable and nothing else. There is no emergency contact number for residents to call in an emergency. All oil and gas production data that is publicly available is self reported and in many cases nonsensical. 0017-1

These are my personal observations from actual occurrences. I do believe that oil production can occur in a responsible fashion in harmony with residences. It is possible but most often does not happen because the county will not defend residences and acknowledge and address their concerns. 0017-2

The aesthetics portion of the DEIR is woefully inadequate. As an example, under mitigation the report lists limiting pump heights to 80'. It is currently 35'. How is more than doubling the height of a pump allowed 190' from a house a mitigation? No structure as noisy, unsightly, smelly and dangerous should be allowed within 1000' from a residential property line. If it is 80' high, double that to 2000'. With horizontal drilling there is no reason to allow these any closer to homes! 0017-3

Fencing should be acoustical concrete panels. All stations used by vacuum trucks should have an acoustical enclosure. The same should apply to compressors and internal combustion trash pumps. Mufflers are inadequate to mitigate the low range noise. They cause your house to vibrate! There are many new acoustical products for industrial use and they should be required for the sake of county residences. 0017-4

The aesthetics are important and profoundly affect our quality of life. Require that the oil industry operate as good neighbors and not just as a soundbite and a PR push but in actuality!! 0017-5

We do not have to be the arm pit of CA unless we allow it. The oil industry is not going away if our public officials actually stand up for the citizens. 0017-6

Sincerely,

Janet Stockton

KERN COUNTY PLANNING
RECEIVED
2015 JUL 17 PM 4:14

0017-1

Thank you for your comment and participation in the public review of the Project and the environmental document. This comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. This comment's expression of concern regarding commenter's experience with existing oil and gas activities in the vicinity her home are noted and will be considered by County decision makers.

0017-2

Thank you for your comment and participation in the public review of the Project and the environmental document. This comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. This comment's expression of concern regarding commenter's observations of existing oil and gas activities in the vicinity her home are noted and will be considered by County decision makers.

0017-3

Please see Responses 200 through 211 to comment Letter 43, which discuss mitigation measures that address commenter's concerns. The comments proposed 2000 foot setback has been considered but rejected. However, Revised Amended Ordinance, section 19.98.060, has been modified to increase the required well setback from residences. Per such revision, no oil or gas well shall be drilled within 210 feet of any sensitive receptor, including residences, rather than 190 feet. Revised mitigation measures have been included in EIR section 7.1.4.

0017-4

Please see Responses 212 through 220 to comment Letter 43, which discuss mitigation measures that address commenter's concern. The comments proposed noise mitigation measures have been considered but rejected as they are not necessary to reduce Project noise impacts to less than significant, as discussed in DEIR section 4.12. Revised mitigation measures addressing noise impacts have been included in EIR section 7.1.4.

0017-5

This comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response.

0017-6

Thank you for your comment and participation in the public review of the Project and the environmental document. This comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. Your concerns about the Project will be considered.

Date: 7/16/15 5:49 PM
Subject: Draft EIR for Revisions to the Kern County Zoning Ordinance – 2015 C, Oil and Gas Local

Dear AICP Supervising Planner Mynk,

0019-1

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Gilbert Garcia

Dear AICP Supervising Planner Mynk,

Thank you for the opportunity to write in support of our County's oil and gas industry. This industry is critical our state and local economy. It provides thousands of well-paying jobs and a large tax revenue. I understand the desire for an enhanced permitting process and rules, but those changes should not be so burdensome as to restrict the production of oil and gas production in Kern county.

0020-1

Subject: 67 Years in the oil business & the Draft Environmental Report

Dear AICP Supervising Planner Mynk,

In my tenure in the oil business I have not seen permanent damage to the ecology--I have not seen any frac damage to acquifers. I have seen strong support to out community in both contributions and economics via taxes. What I am seeing now is tremendous opposition to our operations by bureaucratic red tape and trumpted-up environmental issues. I strongly urge approval and implementation of the proposed environmental report.

Subject: CITIZEN'S HUMBLE OPINION on the Draft EIR for the Kern County Zoning Ordinance – 2015

Dear AICP Supervising Planner Mynk,

I am writing in support of our Kern's oil and gas industry that has been faithfully following all environmental laws and regulations from multiple Federal, State, and County regulatory agencies over several decades. 0022-1

WE NOW LIVE IN AN AGE OF FRIVOLOUS CEQA lawsuits, Sanctuary Cities, and Executive Orders that intentionally encourages militant, uncompromising, vocal, and politically-supported extremist groups to not follow Federal, State and County laws, while at the same time, THEY TRY TO SHUTDOWN a law abiding industry such as oil and gas production? THE ACTIVIST'S HYPOCRACY WREAKS OF LOS ANGELES FECAL MATTER SLUDGE. 0022-2

You will know when these Los Angeles, San Francisco, and Washington DC activists come to the podium. They will make outlandish claims of environmental damage, or future catastrophes, based on biased sources such as pseudo-scientists' "studies" (e.g. Josh Fox of Gas Land infamy), quote activist-journalists from liberal newspapers (e.g. The Los Angeles Times), or refer to problems in another state (e.g. Pennsylvania) that has different geology and groundwater than California as they try and mislead you into thinking that 115 years of Kern County oil production has, or suddenly will, poison our water, air, soil, animals, climate, and target certain communities for death. DO NOT BELIEVE THEIR LIES. 0022-3

SEEK THE TRUTH!! I STRONGLY URGE TO APPROVE AND IMPLEMENT THE REPORT. 0022-4

Sincerely,

Kenneth Bork (CITIZEN OF KERN)
10403 Camino Media
Bakersfield, CA 93311

0022-1

Thank you for your comment and participation in the public review of the project and environmental document. The comment letter submitted indicates support of the oil and gas industry. The comment does not state a specific concern related to the adequacy of the Draft EIR or otherwise comment on the contents of the Draft EIR. Therefore, a detailed response is not required. This comment has been noted for the record and has been provided to the Kern County Planning Commission and the Kern County Board of Supervisors for consideration.

Subject: Draft EIR for Revisions to the Kern County Zoning Ordinance – 2015 C, Oil and Gas Local Permitting

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county. 0023-1

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report. 0023-2

I live here and raise my family here in the County and I ask you to please discount the voices of those who seek to destroy the oil and gas industry without considering the benefits and foundational role hydrocarbons play in our civilization and economy. Oil and gas are more than just energy. Hydrocarbons are a key part of materials in cars, homes, clothing, medicine, agriculture, and, well, everything. Heck, many of the materials that go into manufacturing so called "green energy" are derived from hydrocarbons and are mined using energy intensive means (requiring hydrocarbons...). Our civilization runs on the energy and the advanced materials from the chemical feedstocks provided by oil. To reject oil and gas production is to reject our civilization and condemn our children to a future of poverty and technological regression. I want to leave my children a better, more prosperous, and cleaner world. That requires energy and that means we need oil and gas. 0023-3

Regards,

Nathaniel Jones

Sincerely,

Nathaniel Jones

Dear Kern EDC Investors and Partners,

Next week marks the beginning of public workshops designed to gather input on the recently-released Oil and Gas Draft Environmental Impact Report for Kern County. 0024-1

The attached letter from Kern EDC's President/CEO Richard Chapman appeared in today's edition of The Bakersfield Californian explains why this effort is important to Kern County's future economy. 0024-2

Thank you,

Tamara Baker | Investor Relations Specialist
Kern Economic Development Corporation

An oil permitting structure for healthy community and strong economy

The oil and gas industry has been a powerful force in Kern County's economy for more than 100 years. Today, the local industry has reached a watershed moment as it struggles to safely, effectively, and yes, profitably, continue its efforts in Kern County while meeting the stringent requirements of the California Environmental Quality Act, known as CEQA.

Two years ago, our oil and gas industry collectively requested that the Kern County Planning and Community Development Department consider amending the oil and gas production portion of the local zoning ordinance which would, on one hand, require intensified environmental measures by industry, but on the other hand would streamline the permitting process. That began a two-year collaborative process between Kern County planning staff, consultants and oil and gas companies.

The result is the recently released Draft Environmental Impact Report (DEIR) which details potential impacts of the proposed zoning

change, and mitigation measures that would reduce and/or avoid significant impacts.

Each of us in Kern County should care about the results of this effort. The oil and gas industry accounts for 25 percent to 35 percent of our county's GDP (approximately $40 billion in value), and it creates up to 50,000 jobs (representing $4 billion per year in family income). Without those wages paid to local residents, our county would lose $4 billion in income, plus $1.2 billion in state and local tax revenues that pay for our roads, health care, public safety and schools (representing one-third of all the public services in Kern County).

More than $12 million (contributed by the oil and gas industry), plus two years of effort, have been spent on this project. The county and industry alike should be applauded for their commitment to a collaborative and transparent process. The document is now available for public review and comment.

The final result has the potential to create a positive and lasting impact on our economy while continuing to protect our environment. Local residents should take the time to become informed and to let their voices be heard. Groups from outside the area (some with stated agendas to end petroleum production as we know it) will most definitely be vocal about the project.

A variety of forums are available for public comment, after which a final EIR will be prepared. The process will also include public hearings before the Kern County Planning Commission and, ultimately, before Kern supervisors.

The Draft EIR is available for review at Planning and Community Development at 2700 M Street, and electronically at pcd.kerndsa.com.

Richard Chapman is President/CEO of Kern Economic Development Corporation and a member of the Leadership Committee for Kern

Citizens for Energy.

Chris Mynk - Public Records Act Request

From: "Holly King" <holly@triplecrown.bz>
To: "Chris Mynk" <mynkc@co.kern.ca.us>
Date: 7/28/15 4:33 PM
Subject: Public Records Act Request
CC: "'Lorelei H. Oviatt'" <LORELEIO@co.kern.ca.us>

Chris:

0025-1

Pursuant to the California Public Records Act, I am requesting the following public records to allow us to effectively review the Draft Environmental Impact Report ("DEIR") for Revisions to the Kern County Zoning Ordinance 2-15-(C) focused on Oil and Gas Local Permitting:

- The air quality section of the DEIR cites a technical report prepared by Vector Environmental, Inc. (Vector 2015a). DEIR, p. 4.3-71. This report is apparently the basis of numerous emission tables in the air quality section, Tables 4.3-12 to 4.3-32. These tables appear with no supporting calculations. Air Quality Appendix I presents a summary of emissions by source. None of these tables or supporting text contain the calculations and assumptions used to estimate these emissions. Further, all of the emission tables are in a pdf format that do not show underlying calculations. Please provide the Vector 2015a report and all Excel spreadsheets used to generate the emission estimates in DEIR Tables 4.3-12 to 4.3-32 and in Appendix I in their native electronic format and unprotected (i.e., showing formulas).

- For the Health Risk Assessment in Appendix M, the key inputs to the analysis are contained in Appendix B to Appendix M, "Equipment and Emissions for Well Depths." The Health Risk Assessment outputs are contained in Appendix C, Modeling Files, and Appendix D, HARP Output, which are appendices to Appendix M. Please provide Appendices B, C, and D to Appendix M.

- The DEIR Project Description includes a potential future oil and gas development scenario that assumes 2,697 new producing well per year for 20 years and a total of 67,425 new wells over the next 25 years. DEIR p. 3-30. It also breaks down these projections in Tables 3-5 through 3-8. DEIR p. 3-32 to 3-34. Please provide all records used to calculate these development scenario numbers, records showing the calculations themselves and the source of inputs and assumptions used in the calculations. This request includes the source identified in footnote 1 of the Tables, "CATC (with County team modifications)." DEIR p. 3-32 to 3-34.

Given the short public review period for the DEIR, please respond to this request as soon as possible. The Public Records Act requires a prompt response, which in these circumstances should be sooner than the maximum allowable 10 days. If any of the requested records are currently in electronic format, I request electronic transmission of these records. Electronic records may be placed on an FTP site, e-mailed or mailed on a CD.

Thank you for your attention to this request. Please contact me if you have any questions.

Thanks,
Holly

RE: Public Records Act Request Regarding Kern County Revisions to the Zoning Ordinance 2015 C

Dear Ms. King:

On behalf of Kern County, the Kern County Planning and Community Development Department is in receipt of your July 28, 2015 Public Records Act Request for the proposed Oil and Gas EIR. In response to your request, Staff notes that all materials, subject to California Public Records Request Act, related to the aforementioned project are available for review. These files can be picked up in electronic format by contacting Christopher Mynk directly at (661) 862-8607 or by email MynkC@co.kern.ca.us to schedule an appointment. The appointment will be scheduled during normal business hours (Monday through Friday, from 8:00 am to 5:00 pm) at the Kern County Planning and Community Development Department located at 2700 M Street, Suite 100, Bakersfield, California 93301.

This completes the Kern County Planning and Community Development Department's response to your Public Records Act Request. Please contact me directly if you have any questions or concerns as they relate to this letter.

Sincerely,

Christopher B. Mynk, AICP, Supervising Planner
Planning & Community Development Dept.

2.5.4 Induced Seismicity from UIC Activity and Potential SB-4 Activities 34
2.5.5 Potential Groundwater Contamination from UIC Activities 35
2.6 References 37

2 Exploration and Production related Water Use and Disposal in Kern County

Water is used by the oil and gas exploration and production industry for many different activities such as: site preparation, drilling, completion, enhancement of oil recovery, remediation and abandonment/restoration. Water from oil and gas exploration and production activities is also disposed of and reused as irrigation water in Kern County. This chapter discusses the sources of the water, the water uses and the final disposition of the water and provides Factors for utilization in the Kern County Oil and Gas EIR. The technical analyses employed in the derivation of the Factors are commonly used to analyze industrial water processes.

For the purposes of the discussion the following definitions will be utilized:

- **Waters of the State**-Means "any surface water or groundwater, including saline waters, within the boundaries of the state" (Water Code section 13050(e));
- **Groundwater**-Any water underneath the surface of the ground;
- **Underground Source of Drinking Water (USDW)**- Any groundwater less than 10,000 parts per million total dissolved solids and has not been exempted[1] by USEPA;
- **Produced Water**-Any groundwater produced in association with the production of oil and gas;
- **Treated Produced Water for Oil Field Use**-Produced water that is treated to a quality that is suitable for uses in the production of oil and gas;
- **Treated Produced Water for Agricultural Use**-Produced water that is treated to a quality that is suitable for farming uses;
- **Municipal and Industrial Water(M&I)**-Water that is sold or allocated through purveyors, agricultural users or extracted groundwater for use in oil and gas services but may be usable for other non-oil and gas uses;
- **Class II Injectate**-Wastewaters and certain allowed fluids associated with oil and gas production that are injected into non-USDW formations under the Underground Injection Control (UIC) that USEPA has delegated to the DOGGR;
- **Potential SB-4 Activity-** Those activities which include activities that may be in the future or are now governed by SB-4 as defined by regulatory proposals on June 15, 2014 and include fracturing, acidizing with acid concentrations greater than 7%, acid fracturing, and Matrix stimulation acidizing. Acid jobs for maintenance purposes, removal of precipates, mud etc. are not included as a Potential SB-4 Activity.
- **Sumps**- Permanent operational impoundments that percolate waste water into the ground generally associated with tank batteries.
- **Drilling Reserve Pits**- Temporary impoundments that store drilling mud during the drilling and reworks.
- **Flowback Water**- Flowback water is the fluid returned to the surface after the well activity has been completed but before the well is placed in, or returned to, service.

[1] Exempted aquifers are aquifers that are less than 10,000 ppm total dissolved solids that have been exempted as underground sources of drinking water for the purpose of Class II injection activities.

The source of water may be either water that is purchased from a purveyor or produced and separated from the oil and gas as it is produced. Water that is connate (returning with any produced oil) is considered produced water. The largest use of water is injection for stimulation and recovery, particularly steam injection. Produced water is largely reused for various oil and gas activities and after softening is often reinjected as steam where steam injection takes place. Produced water otherwise not used in oil and gas application is either: reinjected in Class II wells (injection wells associated with exploration and production disposal activities), treated and used as irrigation water, or evaporated and percolated in ponds.

2.1 Water Use and Disposition Activities Conducted by the Oil and Gas Companies during Operation of the Oil and Gas Fields

The operational water use and disposition Factors during the production of oil and gas in Kern County was analyzed utilizing a "Material Balance" approach. A Material Balance is an application of conservation of mass to the analysis of physical systems. By accounting for material entering and leaving a system, the mass flows (in this case water) can be identified which might have been unknown, or difficult to measure without this technique. This technique revolves around the fact that water cannot disappear or be created spontaneously. The Material Balance requires that the volume of water produced and purchased must equal the volume of water injected for any purpose or it must be disposed to land or reused as agricultural irrigation.

Water balance or use is independent of Tier or jurisdiction. Accordingly, all of the active oil and gas producing fields within the Study Area are included regardless of Tier or land use jurisdiction[2]. Additionally, to simplify the Factor derivation for the reader, the derivation is shown from data source to resultant Factor in the water unit of barrels (bbls), the commonly utilized oil and gas production unit, and then converted to acre-feet, for comparison with agricultural water use.

2.1.1 Selection of Analysis Year

For the purpose of this analysis, the year 2012 was selected as representative based on a review of the DOGGR data from 1993 to 2012. In order to select a representative year, the DOGGR reported injection data for the DOGGR District 4[3] and Kern County fields were segregated by well type, (i.e. steam flood, cyclic steam, water disposal, water flood) plotted and analyzed. Trends were established for each activity as shown on Figure 2.1-1.

[2] The definitions and boundaries for Tier and Land Use Jurisdiction are delineated in "Introduction".
[3] The Kern County Study Area comprises approximately 92% of the oil and gas activities in District 4.

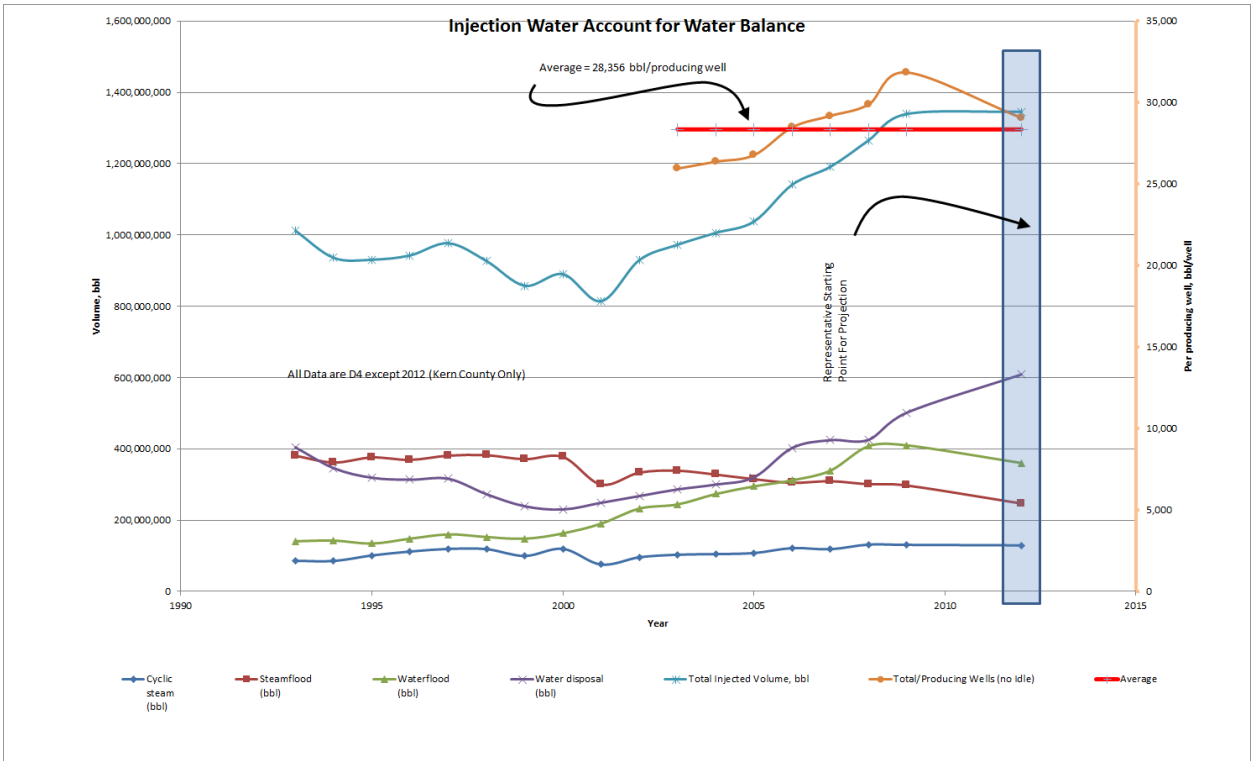

Figure 2.1-1
(WZI, CH 2 Injection Inventory Projection.xlsx)

The trend analysis demonstrates that over the time period 1993-2012 that the water disposal and water flooding has continued to increase, and that the other injection activities, have stayed constant or decreased. Therefore the most recent year of DOGGR certified data, 2012, is most reflective of current operations from which a factor can be derived.

2.1.2 Water Balance: Inputs/Use

Water use and disposal in the oil and gas operations in Kern County are tied together by process including those associated with service company type activities such as drilling, reworks, pulling unit activities.[4] Water that is produced along with oil and gas may be disposed of or used in some other use based on the need and regulatory constraints.

Certain waters used in oil and gas activity may be sourced as M&I water, or alternatively water from the oil and gas operations themselves may be reused. However, once water is affected by contact with production processes, the water is considered to be produced for purposes of this material balance-based analysis.

The accounting for water use on a net water balance basis is determined by the non-produced water use activities. The ultimate fate of used water (from both M&I and oil and gas produced water) is dependent on the manner in which the injected water is used in a given project or study area. Water used for steam injection requires higher quality of water than water injected as liquid. Water injected as steam must be treated to meet steam boiler criteria, whereas, water injected as liquid may have much higher Total Dissolved Solids, (a lower quality water) but must be compatible with the formation to avoid precipitation

[4] (NAICS/SIC, n.d.), see Introduction, for a more complete discussion of activities by SIC Code.

and well plugging (thus requiring earlier or more frequent maintenance). Water rejected as a by-product of the water treatment equipment required to create the boiler quality water (managed as produced water due to its quality), is included in the Water Disposal (WD) reported values.

The produced water from oil and gas is a major input value into the Material Balance calculation. **Table 2.1-1** shows the oil and gas related fluid and gas production by Sub-Region. The Produced Water will be utilized in the calculation.

Table 2.1-1

Table 2.1-1: 2012 Oil, Gas, and Water Production From Sub-Regions[5]

	Oil-bbl	Gas-scf	Produced Water-bbl
Western Sub-Region	99,826,696	139,817,610,000	1,024,110,341
Eastern Sub-Region	39,293,849	791,350,000	799,819,336
Central Sub-Region	2,372,806	1,893,283,000	22,285,099
Kern County Total	141,493,351	142,502,243,000	1,846,214,776

(DOGGR, Annual Report PR13, 2013 for year ending 2012) (WZI, CH 2 2012 Land Use Field Production by Sub Region.xlsx, 2014)

2.1.3 Water Balance: Injection and Volume Allocation to Sources

The second major input into the Material Balance equation is the volume of water injected by the oil and gas operations. The reported data shows that 1,345,773,438 bbls. of water were injected as Class II Injectate in all three Kern County Sub-Regions in 2012.

[5] Data from DOGGR reported data, (DOGGR, Annual Report PR13, 2013 for year ending 2012)

Table 2.1-2

Table 2.1-2 : DOGGR reported Injection Activity by Sub Region[6],[7]

(DOGGR, WZI Request) (WZI, CH 2 DOGGR WZI Data Request.xlsx - Injection)

The Class II Injection activities are delineated by type of injection in order to account for water source activities in the material balance calculations. As previously mentioned, water use, reuse, and disposal are tied in the overall water balance. Due to reporting changes between the years 2011 and 2012, gas injection and pressure maintenance water are reported in 2012 and not in 2011. The 2011 reported injection volumes are shown in Table 2.1-2, above, for comparison. The table shows that the injection volumes for 2012 are higher than 2011and are therefore more conservative for use in factor derivation.

To properly allocate M&I water and treated produced water to derive the Factors required grouping the Steam uses: Cyclic (SC) and Steam Flood (SF) together as a group using a combination of treated produced water and M&I water in the injection process, and grouping the liquid water uses: Pressure Maintenance (PM), Water Disposal (WD) and Water Flood (WF) for allocation as only treated produced water use.[9] In the Eastern Sub-Region 100% of the water used in the water flood and steam EOR processes is treated produced water.[10] In the Western Sub-Region 80% of the water used in the steam EOR processes is treated produced water that is sufficiently softened to allow use in 70% to 80% quality steam.[11] In the Western Sub-Region the Pressure Maintenance and Water Flood water is sourced from treated produced water. The remaining Western Sub-Region water used for services such as cooling tower makeup, contract services, etc. and is sourced from M&I through the use of contracts local wells owned by the operators (M&I). Unlike the Western and Eastern Sub-Regions all of the water that is

[6] DOGGR District 4 supplied data from data base. (DOGGR, Department of Oil and Gas and Geothermal Resources Data sets and Personnel)
[7] **Note**: The Central Sub Region has certain data that are not consistent. Specifically: Rosedale Ranch appears to have a bad meter (ultimately repaired in 2012);Shafter North and Rose send their water to the Western Sub-Region for disposal; (Industry) and several fields (such as but not limited to Bellevue, Greely and Canfield Ranch) are sending water to Fruitvale which is in the Eastern Sub Region (this is an activity that is allowed and consistent with regulations).The incorporation of adjustments: Rosedale Ranch injection is placed into balance with produced water metering (no net physical change), [1,371,447] (WZI, CH 2 Central Region Water Issues); North Shafter and Rose are trucked to the Western Sub-Region for disposal to land or other; [1,676,217] (Industry); and Injection water from Fruitvale (Eastern Sub Region) is accounted for by assigning mass of produced water to the Central Sub-Region [1,878,671] (WZI, CH 2 Central Region Water Issues, p. Central and Eastern Sort).

2.1.3.1 Calculations:

In order to calculate the volumes of water injected in acre feet the following calculation technique using the factors from **Table 2.1-3** by Sub-Region should be utilized. Some factors are zero due to no historic utilization of the water types within certain uses and certain Sub-Regions.

Calculating Steam Injection using Purchased M&I Water (INJ 1):

$$INJ\ 1_n(bbl) = INJ\ 1 \times\ new\ wells_n$$

Calculating Steam Injection using Treated Produced Water (INJ 2):

$$INJ\ 2_n(bbl) = INJ\ 2 \times new\ wells_n$$

Calculating Pressure Maintenance Injection using Purchased M&I Water (INJ 3):

$$INJ\ 3_n(bbl) = INJ\ 3 \times\ new\ wells_n$$

Calculating Pressure Maintenance Injection using Treated Produced Water (INJ 4):

$$INJ\ 4_n(bbl) = INJ\ 4 \times new\ wells_n$$

Calculating Water Disposal of Purchased M&I Water (INJ 5):

$$INJ\ 5_n(bbl) = INJ\ 5 \times\ new\ wells_n$$

Calculating Water Disposal of Treated Produced Water (INJ 6):

$$INJ\ 6_n(bbl) = INJ\ 6 \times new\ wells_n$$

Calculating Waterflood Injection using Purchased M&I Water (INJ 7):

$$INJ\ 7_n(bbl) = INJ\ 7 \times\ new\ wells_n$$

Calculating Waterflood Injection using Treated Produced Water (INJ 8):

$$INJ\ 8_n(bbl) = INJ\ 8 \times new\ wells_n$$

Where,

new wells = the new produce-able wells associated with a given target region for a target year

n= year

2.1.4 Water Balance: End Use/Disposal

In the Material Balance calculation, water regardless of source that is not injected as part of the operations with the subject fields is defined as disposal to land or other. This water may be reused as agricultural water depending on the quality. **Table 2.1-5** shows the Sub-Regional net results of the Material Balance Calculation.

Table 2.1-5

Table 2.1-5: Water Balance Net Export to Other Applications (by Sub-Region)

[26] Rose and N. Shafter to Western Sub-Region.
[27] This volume is the sum of the transfers to Monument Junction and the additional water sent to Eastern Sub-Region from Central Sub-Region fields.
[28] Water from Central Sub-Region

2.1.4.1 Calculations

In order to calculate the volumes of water disposed to land or other in acre feet the following calculation technique using the factors from **Table 2.1-4** by Sub-Region should be utilized:

Calculating Produced Water to Land or Other that is fated to Land/Surface application (PWL):

$$PWL_n(bbl) = PWL \times new\ wells_n$$

Where,

new wells = the new produce-able wells associated with a given target region for a target year

PWL = Sub-Regional or County Wide Factor for Produced Water applied to Land, (Factor is provided in bbl and ac-feet)

n= year

The "Produced Water to Land or Other" represents the waters used as follows: dust control, land application/irrigation, evaporation and percolation in impoundments (sumps). Uniquely, in the case of the Eastern Sub-Region, Cawelo Water District is a major recipient of treated produced water for reuse as irrigation.

The locations of the sumps are shown below in **Figure No. 2.2-1, Sump Location Map**. (DOGGR S.) (location, p. qrysump)

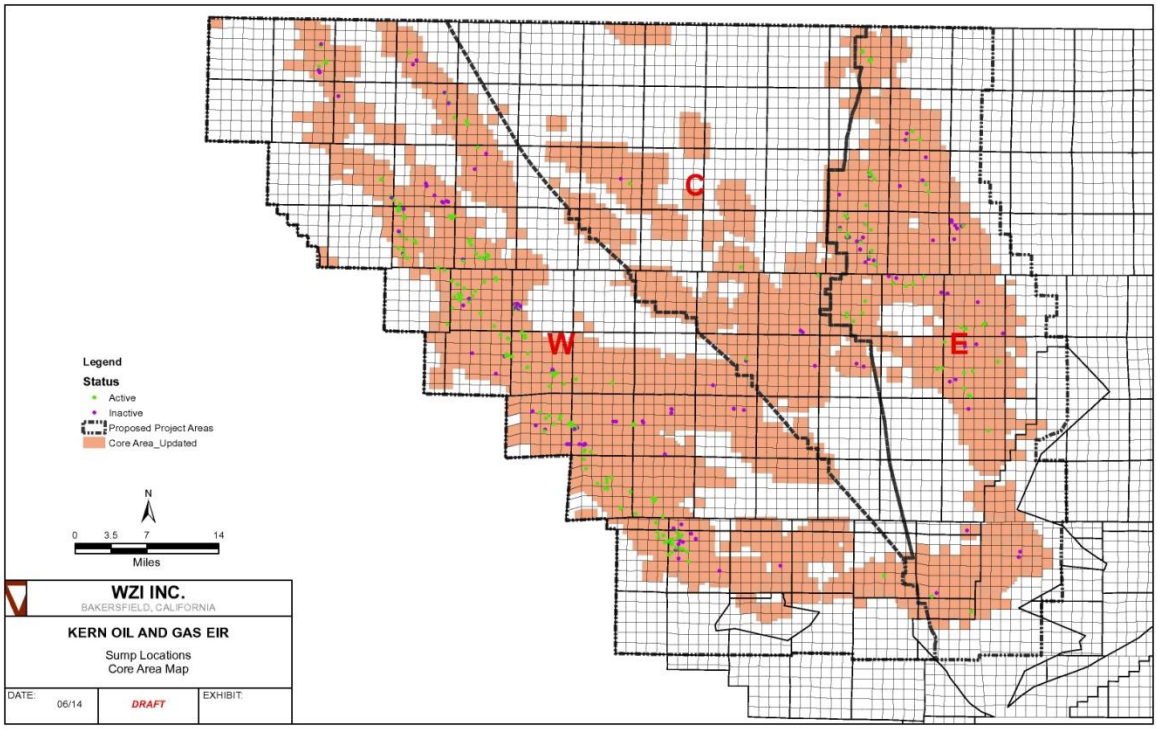

Figure 2.2-1
(WZI GIS Analysis)

When water is applied to land or is impounded for recharge the water's fate includes evaporation.[29] This evaporation from land application or other is conservatively not included on the Factors. Impoundment WDRs indicate that the pan evaporation can be as high as 108 inches (9 acre-feet per acre) as reported in Lost Hills.[30]

2.1.4.2 Western Sub-Region: Valley Water Management

In the Western Sub-Region certain non-oil associated water is pumped by non-oil and gas related wells. In order to maintain proper management some water is taken from local but not oil producing water zones and incorporated in the local fields' steam and water flood programs.[31] These water volumes are reported to DOGGR as produced water. The fate of waters from produced water to land or other activities is largely internally managed through steam enhancement, water flood and disposal via injection. Waste water (water that cannot be used) is managed on-site or sent to Valley Water Management for management, evaporation, and percolation.

2.1.4.3 Central Sub-Region:

Unique to the Central and Eastern Sub-Regions is the shared service of the Fruitvale oil field. Certain producers from Central fields situated in the Central Sub-Region have historically sent produced water to operators in Fruitvale for injection. This cross boundary transfer of about 1 million barrels from the Central to the Eastern Sub-Region is accounted for in the water balance (to establish the excess water fated to disposal to land), but the actual injection factors themselves are derived from the DOGGR reported injection. In addition, the produced water from North Shafter and Rose oil fields which is not injected is sent to the Western Sub-Region by truck.[32] Table 2.1-6 indicates the Central Sub-Region water balance adjustments.

[29] Estimates allow that half of the water volume delivered to unlined impoundments will be lost to percolation/recharge.

2.1.4.4 Eastern Sub-Region: Treated Produced Water Reuse

One of the water balance considerations for the Eastern Sub-Region is the transfer of treated produced water from certain Eastern Sub-Region oil fields such as Kern River oil field to Cawelo Water District for use as farm irrigation and recharge under Waste Discharge Requirements issued by Central Valley Regional Water Control Board.[40]

Certain non-oil associated water is also pumped by wells within the fields in order to maintain proper oil reservoir management. This water is accounted for by DOGGR as produced water.[41] Additionally, some water is extracted by wells at local steam generation operations for processes related services requiring less salinity. These waters are accounted for in the Water Balance for waters not injected (applied to land).

The Kern River oil field specific water balance is presented below in Table 2.1-7.

[33] Sends water to Fruitvale Oil Field (which is adjacent) but located in the Eastern Sub Region by boundary line designation.
[34] Sends water to Fruitvale Oil Field (which is adjacent) but located in The Eastern Sub Region by boundary line designation.
[35] Sends water to Fruitvale Oil Field (which is adjacent) but located in The Eastern Sub Region by boundary line designation.
[36] Sends water to Fruitvale Oil Field (which is adjacent) but located in The Eastern Sub Region by boundary line designation.
[37] (Industry) Communication with D. Dudics, Water from Rose is sent to the Western Sub-Region for processing.
[38] (WZI, CH 2 Central Region Water Issues) Rosedale Ranch data showed an extraordinarily high water cut and year-to-year meter variation indicated that the field had a faulty meter, therefore, the Injection was trued-up to the Produced Water.
[39] (Industry) Communication with D. Dudics, Water from North Shafter Field is sent to the Western Sub-Region for processing.

(WZI, CH 2 DOGGR WZI Data Request.xlsx - Injection) Kern River Analysis

Given the large size of the Kern River oil field, the Kern River oil field to Cawelo transfer itself accounts for a large portion (up to 208 million barrels) of the 397 million barrels for the entire Eastern Sub-Region that is land applied.[49] The amount of water otherwise used can be sent to Cawelo or applied to land for dust control and onsite evaporation and percolation as allowed by WDRs issued by CVRWQCB. The remaining non-injected otherwise managed waters for the entire Eastern Sub-Region are managed by the other remaining Eastern Sub-Region oil fields using methods that are similar to practices in oil fields in the Western Sub-Region where produced water is disposed to land or other is often managed on-site or sent offsite to Valley Water Management for disposition.

2.2 Well Servicing Specific Activity Factors.

Certain well servicing activities require the use of water. When a well is drilled, the site preparation may require the application of water for dust suppression, water for use in drilling muds, cements, completion activities and new facilities construction. Well reworks and maintenance also require the use of water as does well abandonment and site restoration. The following factors address the source and disposal of these subject waters. The conversion from barrels (bbls) to ac-ft is either done in the factor table or the conversion is given in the calculation section due to ease of calculation in whole numbers.

[42] DOGGR PR13
[43] (Industry, p. J. Lilien)
[44] (Industry, p. J. Lilien)
[45] "Interdicted" water is water that is produced at Kern River as part of the Maximum Efficient Rate processes although it contains little or no oil.
[46] (WZI, CH 2 DOGGR WZI Data Request.xlsx - Injection) Acronyms "SC", "SF" and "WD" are database identifiers by DOGGR.
[47] Ibid
[48] Ibid
[49] The WDR allow up to 280 million bbls of water per year.

2.2.1 Mud Service/Oil Field Drilling

This activity takes place as part of the normal drilling of new wells or to "kill" an existing well as part of reworking wells or in certain well abandonments. The mud process involves mixing mud (additives to water or other fluids, pumping and circulating the mud and treating the mud at the surface to remove cuttings during recirculation. Review of historic DOGGR data indicates that there are on average approximately 2,154 wells drilled each year.[50] In 2012 the Factor datum year, the number of wells drilled in the Study Area was 2,520; in addition there were approximately 1,335 reworks. (WZI, CH 2 Wells Logged in Kern County.xlsx) The majority of mud volumes are attributed to the 2,520 new wells where mud is used to facilitate the drilling process by lubricating the tools, removing cuttings and to control formation pressure in wells to prevent uncontrolled releases to the surface. Of the wells that are reworked, approximately 1/3 require mud service; the remainder of the reworks utilize treated produced water. The mud chemistry generally precludes the use of produced water due to the difficulty in logging[51]; therefore it is conservatively estimated that 100% of the water used on an average Kern County "mud job" is M&I water. Water used in the mud (427 bbl) is held in the mud slurry and is displaced to the surface by circulation or by the cement job at the end of the drilling program. This return volume is estimated to be the entire mud job volume of water used plus two bore volumes (240 bbl) of displacing M&I water with 2% KCl or other suitable completion fluid. Industry survey data indicates 667 bbl of M&I water is used per average Kern County mud service.[52] The volume of mud and therefore water used is directly correlated with the depth of the well being drilled or reworked.

[50] (WZI, CH 2 Historic Activity Data, 1995 to 2012.xlsx)

[51] "Logging" is a term of art in the oil and gas industry and describes the surveys that are conducted down in the well bore as it is drilled to delineate the geologic formations and conditions of those formations at the time of drilling.

[52] Average well depth in Kern County is 2200 feet infers a total cased wellbore volume of 110 bbls thus indicating the general use of 6 well bore volumes of water in a given mud related well job.

$$WDM\ 3_n(bbl) = WDM\ 3 \times (\ wells\ drilled_n +\ \ wells\ reworked_n)$$

n = Year

Conversion: 7758 bbl= 1 ac-ft

2.2.2 Cementing

This activity takes place as part of the normal drilling of new wells, and may be a part of reworking wells.[67] The majority of "cementing jobs" is attributed to new wells and is performed to bond casing to the native formations or to plug the hole to selected formations. For the average (shallow well) there are two cement jobs per well, the first is to set the conductor, the second is to set the long string. The cementing process involves mixing cement, pumping the cement and displacing the mud or water in the selected void spaces in a controlled manner completely bonding the casing. Review of historic DOGGR data in the Study Area indicates that since 2010 there have been approximately 2,154 wells drilled each year and since the new reporting requirements as of 2010 there have been approximately 1,335 reportable reworks each year.[68] The cement chemistry precludes the use of produced water due to the difficulty in controlling cement performance when undesirable connate salts or oils are mixed with the cement; therefore it is estimated conservatively that 100% of the water used on an average Kern County "cement job" is M&I water. Water used in the cementing job is held in the cement matrix and additional water may actually be drawn from the surrounding geologic formations to complete the cement setup; however; water is displaced to the surface by the cement job (either as water or as part of the mud), this return volume (for the long string cement job) is estimated to be the entire bore volume (120 bbl). Industry survey data indicates 320 bbl of M&I water is used per average Kern County well based on two cement jobs per well.[69]

[67] Industry Survey Halliburton, Baker Hughes, Cementing Handbook

[68] (WZI, CH 2 Historic Activity Data, 1995 to 2012.xlsx) DOGGR, 2009 Annual Report and DOGGR, 2013 Annual Report were combined and later year data were adjusted to reflect reporting requirements and data gaps in Kern County Specific data.

[69] (WZI, CH 2 SIC 1389 Water Use 4 Jul.xlsx, p. Summary) The per Cement job value is 160 bbl/cement job average per data from Halliburton. WZI assess each well with two cement jobs.

M&I water is purchased from non-exploration and production sources. Therefore, the 320 bbl per well should be accounted for in the estimation of incremental impacts associated with a new well drilled in Kern County.

Conversion: 7758 bbl= 1 ac-ft

2.2.3 Potential SB-4 Activities

This activity takes place as part of the normal drilling of a certain population of new wells and as part of reworking certain limited wells. The majority of potential SB-4 Activities is attributed to new wells and is performed to allow better production/injection from or into selected oil and gas formations. Normally, there a multiple stages (up to six) per well. Review of historic DOGGR data the Study Area indicates that since 2010 there have been approximately 2,154 wells drilled each year and since the new reporting requirements as of 2010 there have been approximately 1,335 reportable reworks each year.[81]

Based on industry survey data for the last five years[82] and correlation with FracFocus and DOGGR data the average number of new wells and reworked wells completed with potential SB-4 Activities, (fracturing, acid fracturing and acid stimulation) are 936 wells per year.[83] Therefore, on this basis the entire Kern County population of wells requiring potential SB-4 completion techniques is estimated to be 27% of the new wells drilled and or reworked wells. (WZI, CH 2 Hydraulic Stimulation Industry Report_D4_and Frac Focus.xlsx, p. Industry Potential SB4 Data)

[81] (WZI, CH 2 Historic Activity Data, 1995 to 2012.xlsx) DOGGR, 2009 Annual Report and DOGGR, 2013 Annual Report were combined and later year data were adjusted to reflect reporting requirements and data gaps in Kern County Specific data.
[82] 2008-2013
[83] Industry Survey data Aera and Oxy and Vintage, FracFocus, DOGGR data base for 2011, 2012, Hydraulic Well Stimulation Handbook

The fluid and proppant chemistry may in certain instances preclude the use of high salinity produced water due to the difficult in controlling performance when undesirable connate salts are mixed with specialty chemicals used in state-of-the-art completions. Therefore it is estimated on a conservative basis that 100% of the water used on an average Kern County potential SB-4 completion is M&I water. The 2882 bbl of water used in the completion accounts for all stages and is held in the solution/slurry of chemicals and proppant materials and is displaced to the surface by the return to production. The return water volume is estimated to be the entire volume (2882 bbl). (WZI, CH 2 Hydraulic Stimulation Industry Report_D4_and Frac Focus.xlsx, p. Frac Focus)

Most Potential SB-4 Activities are in the Western Sub-Region distantly followed by the Central Sub-Region. In the Western Sub-Region M&I water is generally taken from non-oil sources. Large producers in the Western Sub-Region have contracts with Water Agencies that provide water. When practical the producers will treat less saline produced water to meet certain needs. However, the quality of water required to facilitate potential SB-4 activities may dictate M&I water be used, therefore the water is conservatively assumed to be sourced from M&I waters. Therefore, the 2,882 bbl per potential SB-4 activity should be accounted for in the estimation of incremental impacts associated with a new well in Kern County.[84]

The volume of the potential SB-4 Activity water use is related to the depth of the well that is being completed or recompleted. The average volume of water utilized in the Study Area as reported by FracFocus and Industry Survey is approximately 1.17 bbls per foot for potential SB-4 Activities. (WZI, CH 2 Hydraulic Stimulation Industry Report_D4_and Frac Focus.xlsx, p. Frac Focus).

Table 2.2-3 delineates by Sub-Region the factors for Potential SB-4 Activities on a per-producing well drilled basis.

[84] Permitted volumes may be higher to allow for margins. FracFocus data showed higher per well volumes (3,026 bbl) or roughly 30% margin for permits v. actual.

Table 2.2-3

Table 2.2-3 Potential SB-4 Related Fluids			
	Western	Central	Eastern
Factor: (WSB4A) Percentage of Jobs by Sub-Region[85]	96.16%	3.72%	0.12%

Factor: (WSB4D) SB 4 (M&I) Fluids per New Producer Drilled, bbl/well[91] (B/A)	1,903	16,125	0
Factor: (WSB4D) SB 4 (M&I) Fluids per New Producer Drilled, ac-ft/well[92]	0.245	2.08	0

(WZI, CH 2 Hydraulic Stimulation Industry Report_D4_and Frac Focus.xlsx, p. Table for CH 2 SB4)

This water is treated, reused, and/or disposed as discussed previously under operations.[93] Flow-back water is incorporated in the produced fluids from the well and processed through the tank battery which receives the well's production. This water is in the accounting of the factors as produced water and should not be double counted.

2.2.3.1 Calculations

In order to calculate the Water Demand for potential SB-4 Activities such as use and return water to dispose of due to these completion activities associated with drilling a new well or reworking a well for any year, the Factor is multiplied by the number of wells estimated to be drilled or reworked in the target area (i.e., Sub-Region).

Calculating new wells for a target Sub-Region for a target year (WSB4C):

$$WSB\ 4C_n = WSB4A_{SR} \times\ new\ wells_n$$

[85] (WZI, CH 2 Hydraulic Stimulation Industry Report_D4_and Frac Focus.xlsx) From FracFocus. Assigned FracFocus data to Sub Regions using field designation.

[86] Ibid, From FracFocus. Average well depth by Sub-Region.

[87] Ibid, From FracFocus. Calculated Volume per foot based on average depth by Sub Region. Eastern Sub Region Value is set to Western to compensate due to lack of activity.

[88] (WZI, CH 1 2012 KC Wells Active O&G.xlsx) From D4 Data

[89] (WZI, CH 3 2012 Wells Logged in Kern County.xlsx) Data were sorted for Kern County, 2012 and well type to establish the number of producers drilled and logged and completed as opposed to wells of all types drilled and completed or abandoned. This value is approximately 3% higher than the D4 completion data due to varying precision in date of record and reporting cycle time.

[90] (WZI, CH 2 Hydraulic Stimulation Industry Report_D4_and Frac Focus.xlsx) From Frac Focus volumes and average 5 year industry data. The value is the result of 5 year industry SB 4 activity multiplied times the SB 4 per well stimulation volume.

Calculating SB-4 Associated Water that is Injected (WSB 4D):

$$WSB\ 4D_n(bbl) = WSB4D \times\ new\ wells_n$$

Where,

new wells$_n$ = the total new produce-able wells Drilled in Kern County for a target year

WSB4A = Sub-Regional produce-able well allocation

WSB4B = Sub-Regional per foot water use per well subject to SB 4

WSB4C = Sub-Regional produce-able wells allocated according to historic pattern

WSB4D = Sub-Regional produce-able well allocation

n= Year

Conversion: 7758 bbl = 1 ac-ft

2.2.4 Acidizing Wells/Well Maintenance

This activity takes place as part of the normal maintenance of injection wells and as part of a development program for new and reworked wells. The majority of "acid jobs" are attributed to injection well service to mitigate the effect of plugging due to precipitation of injected water at downhole conditions. These acid jobs are generally small in volume and utilize acids having a concentration of 7% or less. Review of DOGGR data indicates that there are 10,292 injection wells[94] in operation, allowing 10% for non-injection wells stimulation not tied directly to a specific Potential SB-4 project and assuming an "acid job" is performed every three years on each injection well, it is estimated that roughly 8481 "acid jobs" [95]are performed each year or roughly 15% of the producing well population. (WZI, CH 1 2012 KC Wells Active O&G.xlsx, p. Summary for Table) The acid treatment chemistry uses M&I water (when available); therefore it is estimated that 100% of the water used on an average Kern County acid job is that water. Except in the case where a producing well is cleaned up after drilling or rework situation, water used in the acid job is displaced into the receiving zone that the acid program targets; therefore there are no water returns. Industry survey data indicates an average of 815 bbls. of M&I water is used per Kern County acid job.[96] Produced water that is associated with the return to production of production wells (as opposed to injection wells) is ultimately reused, or disposed as discussed in the Section 2.1 operational Factors.

[94] [2012 KC Active O&G]WD,WF,SF,AI,GD
[95] (WZI, CH 1 2012 KC Wells Active O&G.xlsx, p. Summary for Table) (Industry, p. Halliburton and Baker Hughes Personal Comm.)
[96] Industry Survey Halliburton, Baker Hughes, Acidizing Handbook

The M&I water is purchased from sources and is not associated with the production or otherwise injected sources. This is due to the fact that the volume and concentration of acid for these types of maintenance jobs is less than if treated produced water were used for the same operation. The weighted impact for 8140 acid jobs based on an incremental production well is 128 bbls per year per new producable well drilled on a Kern County-wide basis.

In this particular situation the volume needs to be spread over the total number of producing wells as it is a maintenance situation.

Table 2.2-4

Table 2.2-4 Non-SB-4 Maintenance Acid-treatment Related Fluids			
	Western	Central	Eastern
Percentage of Jobs by Sub-Region[97]	67%	1%	32%
Producer Well Population, 2012[98]	36,058	497	17,388
Total non SB 4 Volume Used (M&I)[99]	4,626,526	63,769	2,231,017
Factor: (WAcid) non-SB 4 (M&I) Fluids per New Producer Drilled, bbl[100]	128	128	128

(WZI, CH 2 SIC 1389 Water Use 4 Jul.xlsx, p. Summary)

2.2.4.1 Calculations

In order to calculate the Water Demand for Non-SB-4 acid treatments such as use and return water to dispose of due to these maintenance activities associated with drilling a new well or reworking a well for any year, the Factor is multiplied by the number of wells estimated to be drilled in the target area (i.e., Sub-Region).

Calculating Acidizing Associated Water that is Injected (WAcid):

$$WAcid_n(bbl) = WAcid \times new\ wells_n$$

Where,

new wells$_n$ = the new produce-able wells associated with a given target region for a target year

WAcid = Sub-Regional or County Wide Factor for Acid job related water

n= year

Conversion: 7758 bbl= 1 ac-ft

[97] (WZI, CH 1 2012 KC Wells Active O&G.xlsx) Allocation of Producer Well Population
[98] Ibid
[99] (WZI, CH 2 SIC 1389 Water Use 4 Jul.xlsx) 8482 acid jobs were estimated using 10% of the Produce-able Well Population and 33% of the Injection Well Population per year (WZI, CH 1 2012 KC Wells Active O&G.xlsx) multiplied by the 816 barrels of fluid per job from Industry Survey
[100]

2.2.5 Coiled Tubing Operations and other similar well servicing operations

This activity takes place as part of the completion. Coiled tubing operations can also be associated with normal operation and maintenance of wells and as part of reworking wells or abandoning wells. Review of industry data indicates that there are approximately 720 wells utilizing coiled tubing each year.[101] Roughly 1% of the producing well population is worked with coiled tubing. The source water for coiled tubing operations is based on the job approximately one-half of the water is assumed[102] to be treated produced water and one-half is M&I water. (WZI, CH 2 SIC 1389 Water Use 4 Jul.xlsx, p. SIC 1389) The 442 bbl of water used is displaced to the surface by circulation and the return to production. The return water volume is estimated to be the entire volume (442 bbl).

M&I water is taken from non-oil sources. Therefore, the 221 bbl of M&I water per coiled tubing job should be accounted for in the estimation of incremental impacts associated with a new well in Kern County. The entire 442 bbl per coiled tubing job should be considered as returned produced water.

[101] (WZI, CH 2 SIC 1389 Water Use 4 Jul.xlsx, p. SIC 1389) (Industry)-Halliburton

[102] Coiled tubing units and other similar types of equipment are used to clean sand and production debris out of a well. When no mud or foam is required and no logging will be conducted, then produced water is used as it controls the pressure in the well bore to an adequate degree. The assumption of 50% M&I water is considered a conservative and high assumption.

Table 2.2-5

Table 2.2-5 Coiled Tubing and Similar Services Related Fluids				
	Western	Central	Eastern	Kern County

WCT5 = Coiled Tubing operation water returned

n= year

Conversion: 7758 bbl= 1 ac-ft

2.2.6 Well Pulling Activities

This activity takes place as part of the annual maintenance cycle for various well duties. Well Pulling operations are associated with normal and customary operation and maintenance of wells. Review of industry data indicates that there are approximately 54,000 produce-able wells requiring well pulling service each year.[113] The source water for well pulling operations is based on the average well bore volume, (121 bbl). (WZI, CH 2 SIC 1389 Water Use 4 Jul.xlsx, p. SIC 1389) The 121 bbls of treated produced water used is displaced to the surface by circulation and the well is returned to production or injection. The return water volume is estimated to be the entire volume (121 bbls).

2.2.7 Plugging and Abandonment

This activity takes place when a well is determined to have no future use, or is found to interfere with an enhanced recovery program. The abandonment process involves circulating debris from the well bore (usually with treated produced water) and plugging with cement and heavy bentonitic muds. Once the well is plugged, the casing is cut and blanked off with a steel plate below the surface, and the site is restored. M&I water is used for mud, cement and site restoration dust control. Review of historic DOGGR data indicates approximately 1751wells are abandoned each year. [121] The distribution of abandonment to new production well drilled is:

- Western Sub-Region: 1.0214
- Central Sub-Region: 1.193
- Eastern Sub-Region: 0.415

The majority of abandonment water-use volumes is attributed to the cleaning, mud mixing and cement mixing process. The water that is circulated to clean the wellbore is generally treated produced water. The displaced well bore volume of this circulated water is treated produced water and is disposed of in a manner consistent with treated produced water treatment and disposal. The surface restoration water does not go into the well and is used for restoration, or compaction and dust control and is M&I water. In 2012 the entire Kern County population of wells abandoned in 2012 is estimated to be 1,751 wells out of a statewide permitted well abandonment population of 2,195 (i.e., roughly 3% of the 53,943 produce-able well population is plugged and abandoned each year).[122] It is conservatively estimated that 100% of the water used on an average Kern County abandonment is M&I water. Based on industry survey approximately 897 bbl of water are used in each abandonment in Kern County on an annual average basis.

[121] DOGGR, 2012 Annual Report

[122] The 2013 annual report did not include the typical county-wide data. DOGGR reported for 2102 that there were 2,811 statewide completions to production and that 2,195 abandonments were permitted. The conversion from statewide to D4 using 1995 to 2009 ratios indicates D4 abandonments are 1,533 wells on average and 1,903 for 2012, in Kern County this translates to 1751 wells abandoned in 2012.

Table 2.2-7

Table 2.2-7 Abandonment Related Fluids				
	Western	Central	Eastern	Kern County
Producer Well Population, 2012[123]	36,058	497	17,388	53,943
Percentage of Jobs by Sub-Region[124]	67%	1%	32%	n/a
Kern County-Wide Abandonment Fluids, bbl[125] (A)	n/a	n/a	n/a	897
Average recorded well depth, ft[126] (B)	2,278	7,511	2,175	2,293
Abandonment water per well, ft[127] (C= A/B)	n/a	n/a	n/a	0.391
Total Number of Abandonments count[128] (D)	1,170	16	564	1,751
Total Abandonment related water, bbl[129] (E=BXCXD)	1,042,976	47,407	480,264	1,570,647
Factor: (WP&A) Abandonment Water per Abandonment, bbl/abandonment[130]	891	2,939	851	n/a

(WZI, CH 2 SIC 1389 Water Use 4 Jul.xlsx)

Therefore, the 897 bbl per abandonment should be accounted for in the estimation of incremental impacts associated with a new well in Kern County.

2.2.7.1 Calculations

In order to calculate the Water Demand for Plugging and Abandonment such as use and return water to dispose of due to these activities associated with abandonment of a well in any Tier I, II, III, IV or other Area for any year, the Factor is multiplied by the number of wells estimated to be plugged in the target area (i.e., Sub-Region).

[123] (WZI, CH 1 2012 KC Wells Active O&G.xlsx)
[124] (WZI, CH 1 2012 KC Wells Active O&G.xlsx) Well population is proportional to produce-able wells.

Calculating Plugging and Abandonment Water (WP&A):

$$WP\&A_n(bbl) = WP\&A \times wells_n$$

Where,

$wells_n$ = the number of wells associated with a given target region for a target year to be abandoned

WP&A= Sub-Regional or County Wide Factor for plugging and abandonment related water

n= year

Conversion: 7758 bbl= 1 ac-ft

2.3 Water used for Dust Control

Water is used to prevent dust forming from barren soil at well sites and on roads part of the operational process. The per well operational surface disturbance is based on the footprint including access roads as well as gathering lines and tanks settings in the more historic oil fields having a large representative population of wells (based on aerial photo review of the Western and Eastern Sub-Region Oil fields and new development footprints in the Central Sub-Region). On a per well basis, the dust control during a drilling or rework activity is estimated to be 240 bbl or one-half inch of water per acre minus the equipment coverage.[131]

2.4 Water Used for New Well Related Surface Facility Construction

Water for Surface facilities was based on adding a new facility for every 10 new wells. This facility consisted of 2-Tanks and 1-heater treater, as well as Balance of Plant equipment and piping. The water used for the construction is estimated to be primarily related to the cement and included wash water before and after the pour.[132] 20% was added for margin. The water was estimated to be 17 bbls. per new well based on a 10 well facility.

2.5 Underground Injection Control Program (UIC)

A Class II well is a well that is used for the injection of produced water and other fluids associated with oil and gas production either as a means of disposal of produced fluids, as an enhanced recovery fluid, or for purposes of hydrocarbon storage. The Class II UIC program dictates well construction standards and mechanical integrity monitoring, as well as the types and composition of fluids that can be injected. Within the Study Area DOGGR has been delegated from the USEPA primacy over the Underground Injection Control (UIC) program. Under that delegation certain aquifers within the Study Area were exempted from being an Underground Source

[131] WZI Inc. has professionals that are certified by the San Joaquin Valley Air Pollution Control District for writing and reviewing Dust Control Plans. Based on the volume of traffic on a daily basis, ½ inch per acre was determined to be sufficient to meet the requirements.
[132] The cement volumes were estimated based on the average size of tanks and equipment and 20% was added to account for wash water.

of Drinking Water for Class II injection purposes. This section will describe the Injection-related Factors by Sub-Region and Tier. The Injection-related factors include number and type of UIC wells and injection, factors for subsidence, factors for seismicity due to over pressuring, and factors for Underground Source of Drinking Water contamination. While the Material Balance analysis includes all of the UIC activities, this section specifically identifies the UIC Activities and factors for its discrete analysis.

2.5.1 Aquifer Exemptions under the UIC program

The primacy delegation for the UIC program for the Study Area was reviewed. Certain underground formations which produced oil and gas at the time of delegation and other formations into which injection had taken place historically were exempted from being an Underground Source of Drinking Water even though the natural total dissolved solids in the connate water was less than 10,000 parts per million. **Appendix 2-I, Aquifer Exemption List [by WZI]**[133] contains the aquifer exemption listing from the delegation from USEPA as well as a listing of the formations by field and connate water total dissolved solids that were exempted for Class II activities.[134,135] **Figure 2.5-1, Aquifer Exemption Areas by Sub-Region**, shows the areas in which the aquifer exemptions were granted in each Sub-Region.

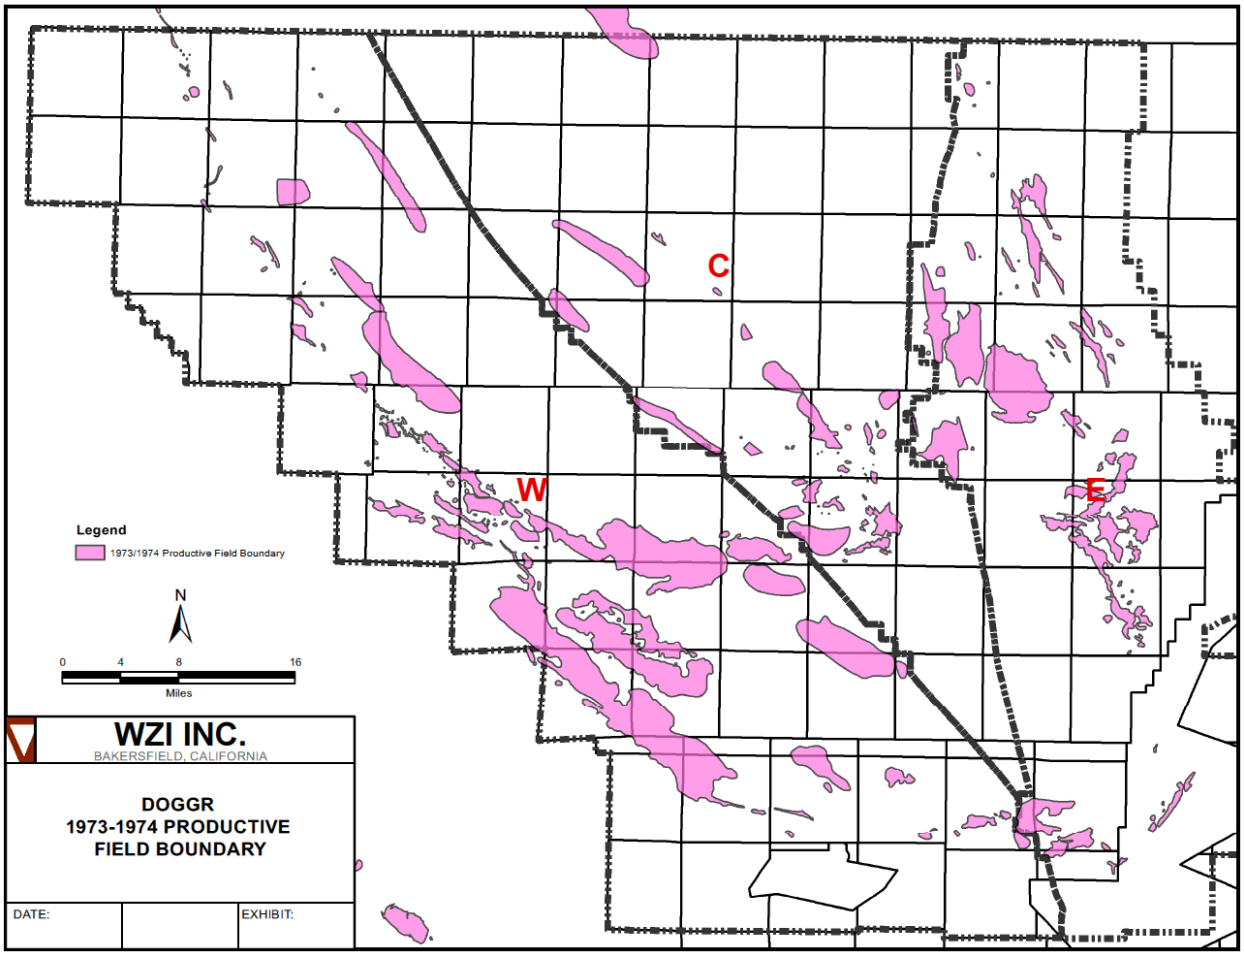

Figure 2.5-1
(WZI GIS Analysis)

[133] (State of California Resources Agency, 1981)
[134] (State of California Resources Agency, 1981) UIC Delegation and associated correspondence
[135] (WZI GIS Analysis), (Gas, 1973) DOGGR Productive Field Boundaries

A larger version of each aquifer exemption area by field is included in **Appendix 2-II, Aquifer Exemption GIS Analysis.**[136]

2.5.2 UIC Well Activities and Potential SB-4 Activites

Utilizing the DOGGR data base and GIS Well Finder and FracFocus, WZI identified the UIC well types and activities as well as Potential SB-4 Activities. The well types group into the following general categories:

- Wells used for enhanced oil recovery programs- Water Flood including chemically enhanced, Cyclic Steam, Steam Flood, Air Injection, Gas Injection of all kinds;
- Oil field Waste Water Disposal;
- Pressure Maintenance; and
- Potential SB-4 Activities.

Table 2.5-1 below delineates these activities by Sub-Region.

Table 2.5-1

Table 2.5-1: 2012 Kern County Well Data

	Well Count			
	Western	Central	Eastern	Total
Cyclic Wells [137]	19574	0	13386	32960
Water Disposal[138]	591	73	282	946
Water Flood[139]	3073	7	78	3158
Steam Flood[140]	4636	0	1451	6087
Air Injection[141]	2	0	3	5
Gas Disposal[142]	86	0	10	96
Total Wells: Less Potential SB 4[143]	8388	80	1824	10292
Potential SB 4[144]	900	35	1	936

(WZI, CH 1 2012 KC Wells Active O&G.xlsx, p. Summary for Table (2))

It is estimated that these types of activities will continue into the future at the same ratio as the well projection. The volume of treated produced water used for water flooding of all kinds and waste water disposal will increase as the volume of these types of wells increase. **Table 2.1-3** (in the previous Section 2.1) provides a Factor to estimate the volumes of Class II Injectate utilized in each Sub-Region on a per-producing well basis. (WZI, CH 2 DOGGR WZI Data Request.xlsx - Injection, p. Summary for Chap 2)

[136] (State of California Resources Agency, 1981)
[137] (WZI, CH 1 2012 KC Wells Active O&G.xlsx, p. Sumary for table) These wells are the wells that are duplicated in the active list as injectors and as producers (with identical API number)
[138] Ibid. Sorted for DOGGR designation "WD"
[139] Ibid. Sorted for DOGGR designation "WF"
[140] Ibid. Sorted for DOGGR designation "SF"
[141] Ibid. Sorted for DOGGR designation "AI"
[142] Ibid. Sorted for DOGGR designation "GD"
[143] Ibid, WZI Calculation- Sum of wells in injection service
[144] (WZI, CH 2 Hydraulic Stimulation Industry Report_D4_and Frac Focus.xlsx) Estimated average from 2008 -2012.

The Potential SB-4 Activities were discussed in Section 2.3.3 above. The potential for ground water aquifer contamination from these types of activities are most commonly attributed to accidental surface spillage.[145] Surface spills and their factors including those attributed to Potential SB-4 activities are treated in Chapter 6 Waste. The other Factors are discussed along with the UIC activities.

2.5.3 Subsidence

Subsidence occurs when the fluid withdrawal from the underground formations exceed the fluid inflow into that formation. Within the Study Area in each Sub-Region current MER[146] practices are shown by Material Balance to meet this standard definition. The volume of fluids produced both oil and water, as well as gas all exceed the volume of fluids re-injected. However, subsidence does not always occur due to the strength of the pore structure and in some cases the high influx of connate water from the water bearing formations in communication with the petroleum bearing strata.

Subsidence has occurred in South Belridge and Lost Hills in the Western Sub-Region due to fluid withdrawal from the Diatomite.[147] Prior to 1980, subsidence in Lost Hills was tenths of inches per year due to production. The rate in 1990 was estimated to be approximately 1 ft/yr. The subsidence that has occurred is in the Tier I area. Water flooding into the Diatomite has significantly slowed the subsidence. The following table illustrates the subsidence in a lease in the South Belridge oil field and the slowing of the rate due to UIC injection[148].

Table 2.5-2

Table 2.5-2:Historic Subsidence Rates in Study Area

Year	Rate	Activity
1984	No data	Commence Diatomite Production
1985	7.5 ft/yr (estimate)	
1987	1.87 ft/yr	Commence Water Injection
1988	0.92 ft/yr	
1989	0.65 ft/yr	

Subsidence measured in the 1990s utilizing spaceborne interferometric synthetic aperture radar (InSAR) in Lost Hills and South Belridge oil fields by various have indicated that the average subsidence rate is 1.0 ft/yr with ongoing water injection.[149,150,151,152]

The rate of subsidence in the northern portion of the Western Sub-Region is expected to continue due to the production of the Diatomite. No other subsidence is expected in any other Sub-Region due to the presence of strong water drives due to natural processes.[153]

[145] (WZI, CH 2 Hydraulic Stimulation Industry Report_D4_and Frac Focus.xlsx), Data from USEPA Frac study.
[146] (Code), MER is the Maximum Efficient Rate as defined by the State of California as the means by which production is managed to ensure no waste of resources.
[147] No other oil field subsidence in the Study Area has been documented. There is subsidence in the Arvin Lamont area due to groundwater withdrawals.
[148] (Bowersox & R.A., 1990, pp. 225-230).
[149] (Fielding, Blom, & Goldstein, 1998), pp. 3215-3218
[150] (Patzek, Silin, & Fielding, 2001)
[151] (Xu H. , 2002)
[152] (Van der Kooij, 1997)
[153] DOGGR Data showing high water cuts historically, Reference also the DOGGR yellow books on each field

Based on the data, the **Factor for Oil and Gas Subsidence is: 1.0ft/yr** in the South Belridge/Lost Hills area. And the **Factor is zero** for all other areas.

2.5.4 Induced Seismicity from UIC Activity and Potential SB-4 Activities

Seismic activity has been induced by injection of waters under specific circumstances.[154] Particularly it has been linked to injection volumes increasing the pressure along or near fault surfaces to such a degree as to induce earth movement.[155] US EPA has stated that the impacts from UIC injection including Potential SB-4 Activities is related to the localized geology and hydrology.[156] Unlike the areas where seismicity has been induced, the Study Area has long been managed in a pressure depleting reservoir management scenario. The 2012 Material Balance calculations demonstrate that in the Study Area that there is more volume of oil, gas, and water being extracted than is being injected. The general year-to-year mass balance is consistent with this observation, in District 4 the average Mass Balance shows approximately 1.5 billion barrels of fluids are extracted over what is injected. (WZI, CH 2 WZI Produced_Volumes.xlsx, p. Production and Injection Mass Balance)

While some M&I water is being introduced into the system, more treated produced fluids are leaving the system, thereby reducing the pressures in the system through disposal to land or other.

The DOGGR monitors injection projects for increasing formation pressures and for interference with production. Currently, there have been no reports of induced seismicity or pressures such that induced seismicity would take place in the Study Area.[157,158] WZI Inc. reviewed the historic seismic occurrence maps in the Study Area and found no correlation with earthquake occurrence and oil field injection activity. **Figure 2.5-2, GIS Maps with Seismic Events 2008 to 2014** shows the locations of the various seismic events in the Study Are that were recorded with magnitudes over 2.3 on the Richter Scale.[159]

[154] (Warner & Lehr, 1981, pp. 40-42)
[155] Ibid. Both documented seismicity systems were disposal only systems with injection volumes without production where fluid compressibility, rock compressibility were the only disposal capacity available.
[156] (Rutqvist & al, 2013)
[157] (DOGGR, Department of Oil and Gas and Geothermal Resources Data sets and Personnel) Communication Mike Toland, 2014
[158] Monitoring Water Injection Projects, Bill Gerard
[159] (Rutqvist & al, 2013) This study noted that quakes with magnitude 2.3 or greater could be induced by fracturing in some geologic formations.

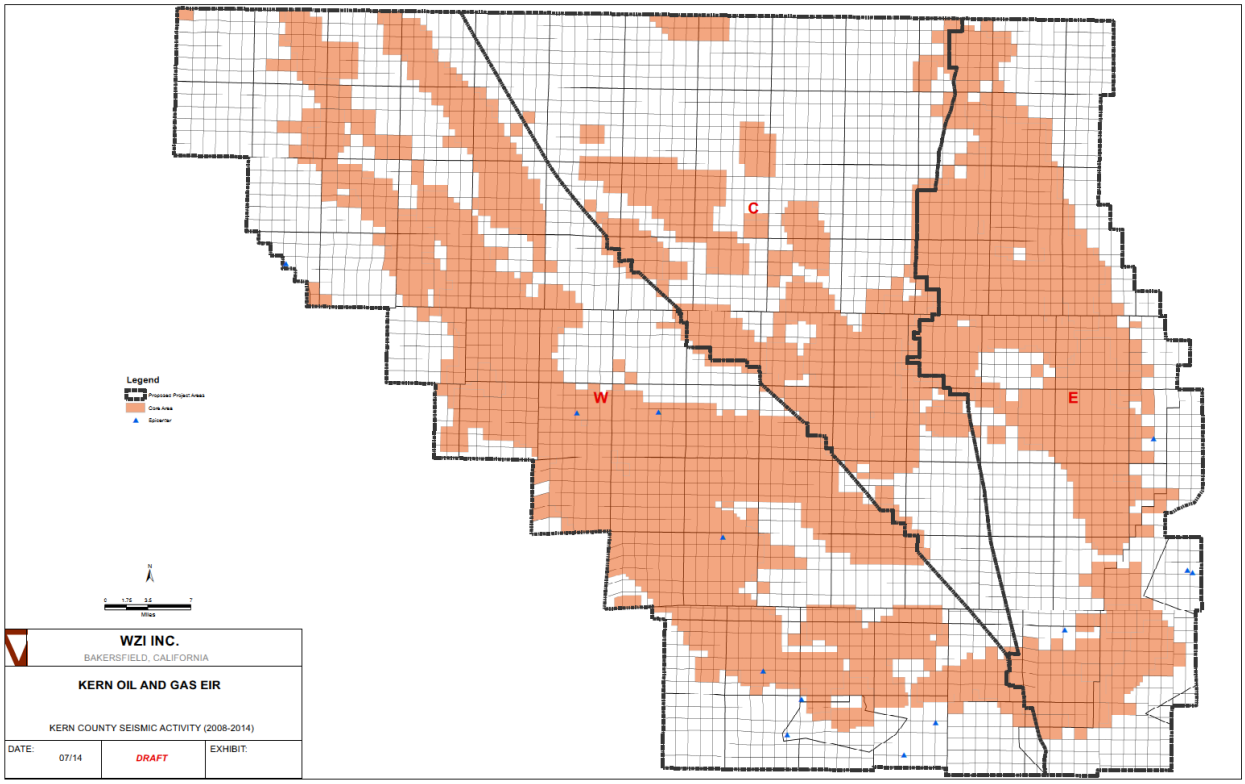

Figure 2.5-2
(CalTech, 2008 to 2014)

The Potential SB-4 Activities were included in the review as they took place within the time period of the review (2008-20014). The Western Sub-Region had the majority of the Potential SB-4 activities. There was no correlation of seismicity within the five years period of Potential SB-4 activities.

No Factor for Induced Seismicity is considered necessary based on the record.

2.5.5 Potential Groundwater Contamination from UIC Activities

The UIC application for primacy prepared by DOGGR delineated all of the cases in District 4 where a potential for contamination of the ground water was discovered due to injection. Between the years of 1940 to 1980, sixteen injection wells in District 4 failed in such a way as to potentially cause groundwater contamination.[160] The population of injection wells during that time in District 4 was over 16,000. (State of California Resources Agency, 1981, p. Appendix A Table 3) Between the years of 2000 and 2009, no failures of injection wells such that ground water was contaminated occurred in District 4.[161] The Mean-Time-Between-Failure prior to the UIC program (1981) was calculated to be 2.5 years whereas the current Mean-Time-Between-Failure for one well for the past 30 years is 15 years, i.e., one well will fail each fifteen years, reflecting state-of-the-art of integrity testing.

Based on the UIC Reporting Form 75-20, there have been two failures in the 30 years since 1984 which contributed potential introduction of treated produced water to a USDW in District 4 which includes the

[160] (State of California Resources Agency, 1981, pp. Appendix A-3 and A-4), Primacy Application by DOGGR submitted to EPA,
[161] 2010 UIC Review

Study Area. (DOGGR, Department of Oil and Gas and Geothermal Resources Data sets and Personnel, pp. DOGGR Forms 75-20) One of the two well failures was in Fruitvale oil field and one was in Round Mountain. The Fruitvale well failure did not contribute a significant volume of treated produced water due to limited injection during the failure.[162] The Round Mountain injection well failure according to DOGGR did not require any remediation due to the distance from any ground water wells.[163] Currently, there are 43,151 injection wells operating in the Study Area, including cyclic wells operating the in the study area. Since injection wells are monitored for mechanical integrity under the UIC program and monthly reporting is required by the operator, the Factor for maximum volume of discharge of treated produced water into a USDW is conservatively estimated to be one month of injection every fifteen years.

Table 2.5-3

Table 2.5-3: UIC Failure Potential Analysis				
	Western	Central	Eastern	County Wide
Injection,[164] bbl/yr	925,352,477	18,046,327	402,597,981	1,345,996,785
Injector Well Population,[165] count	27,874	80	15,197	43,151
Annual Per well Injectate, bbl/well[166]	33,198	225,579	26,492	31,193
Daily Per Well Injectate, bbl/well[167]	91	618	73	85
Failure Duration, days[168]	30	30	30	30
Factor: **(UIC FV1)**15-Year Failure Volume, bbl/15 years[169]	2,729	18,541	2,177	2,564

(WZI, CH 2 Field Injection Mass Balance.xlsx, p. Injection Failure Analysis)

Calculating the Volume of Class II water lost to formation or communicated to the surface in contact with a USDW (UIC FV1). This failure event has been shown to occur in the Kern County Study Area population of injection wells once every fifteen years. This volume is only realized at the time of the failure and lasts until it is found during routine operational visits.

$$UIC\ FV1_n(bbl) = UIC\ FV1 \times y\ events$$

$$y\ events = truncation(n\ years/15)$$

Where,

y events = the number of events in the analysis period (i.e., if the study period is 30 years then the number of events is 2)

n= study period in years

File: General Correspondence
Revisions to County Zoning Ordinance

FILE COPY

Holly King
13501 Arbolado Court
Bakersfield, CA 93314

RE: Public Records Act Request – Revisions to the County Zoning Ordinance – 2015 C – Proposed text amendments to Chapter 19.98 (Oil and Gas Production) and additional affected chapters.

Dear Ms. King:

The Kern County Planning and Community Development Department is in receipt of your August 26, 2015 Public Records Act Request. Specifically, you requested within your email any resolutions adopting or amending Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance.

In response to this request, County Staff notes that Chapter 19.98 was initially adopted in 1957. Attached to this letter is a CD containing separate pdf files of documents related to the initial adoption of the Oil & Gas Zoning Ordinance Chapter and all subsequent amendments. The attached CD contains the following pdfs:

- Zoning Ordinance Amendment to Oil & Gas Production – This pdf is a compilation of amendments to particular Sections of the Oil and Gas Chapter (19.98) with references to the Ordinances adopted by the Kern County Board of Supervisors (See attached) and the time frame that particular adopted Zoning Ordinance was in effect. (For example: 1994 – Current or July 1993 – May 1994. This document has been highlighted by County Staff to enable its use as a cross reference tool.
- A current copy of the Kern County Zoning Ordinance last updated (05/15) - Oil and Gas Chapter 19.98 – Oil and Gas Production
- A copy of the 1957 edition of the Oil and Gas Chapter, referred to as Article 26 – Oil and Gas Production, Sections 7240 – 7244, (See Ord. No. G-299 (06/18/1957)
- A copy of the 1986 edition of the Oil and Gas Chapter, referred to as Article 7260 – Oil and Gas Production, Referencing Ordinance G-4147 (02/10/1986), Section 7260.01 – 7260.07
- Ordinance No. G-299, 1957
- Ordinance No. G-4157, 1986
- Ordinance No. G-5346, 1990
- Ordinance No. G-5885, 1992
- Ordinance No. G-6077, 1994
- Ordinance No. G-6551, 1998
- Ordinance No. G-8035, 2012 (This ordinance is being provided as reference only as it cited (highlighted) in the Zoning Ordinance Amendment pdf. However, it does not reference amendments to the Oil and Gas Chapter 19.98 but references changes to the organizational structure of the Kern County Development Services Agency.

This completes the Kern County Planning and Community Development Department's response to your Public Records Act Request. Please contact me directly if you have any questions or concerns as they relate to this letter.

Sincerely,

Craig M. Murphy, Division Chief
Planning & Community Development Dept.

Article 24. H Zone

Section 7220. H Airport Approach Height Zone. Land classified in an H zone shall also be classified in another zone and the additional regualtions set forth in this Article shall apply in the H airport approach height zone unless otherwise provided in this Chapter. 7220

Section 7221. Airport Zoning Commission. The Planning Commission is hereby appointed as the Airport Zoning Commission of the County of Kern with all the powers and duties specified by the Airport Approaches Zoning Law of the State of California, Chapter 1741, Statutes of 1953, now included in Sections 50481 to 50485.14, inclusive, of the Government Code, or any amendment thereto. 7221

Section 7222. Procedure. No building or structures, including all super-structures and appurtenances, shall be erected, moved, altered or reconstructed, nor shall any plant or tree be allowed to grow in such a manner, so that the height thereof will constitute a hazard to the safe landing or take-off of aircraft using the airport in the district subject to these regulations. The height limit thus imposed shall be determined in each case by the Planning Commission and shall be governed by and not more restrictive than those imposed by Civil Aeronautics Administration Technical Standard Order N18, "Criteria for Determining Obstructions to Air Navigation," dated April 26, 1950, as amended. A copy of said Technical Standard Order N18, with amendments, shall be on file in the office of the Planning Commission. In no event shall the provisions of this Section prevent the erection or maintenance of a building, structure or tree, no part of which exceeds thirty-five (35) feet in height. Permits issued for buildings and structures in areas subject to Airport Approach zones shall specify the height limitations of such buildings or structures as set forth in this Section. 7222

The proceedings for classifying any land in the H Airport Approach Height Zone shall comply with the provisions of said Airport Approaches Zoning Law.

Article 25. B Zone.

Section 7230. B Buffer Zone. Land classified in a B Zone may also be classified in another zone, except in the C and M zones, and the regulations set forth in this Article shall apply in the B buffer zone unless otherwise provided in this Chapter. 7230

Section 7231. Uses Permitted. 7231

A. Any use permitted in the other respective zone in which the land is classified and with which the B zone is combined, provided, however, as follows:

1. No outdoor advertising sign or outdoor advertising structure shall be placed and/or maintained in any B zone, provided, however, that there may be displayed on the premises occupied by any permitted business use which is located in any B zone outdoor advertising structures for the advertising only of such business; and the total area for all outdoor advertising signs and outdoor advertising structures in the aggregate displayed by or for any one place of business shall not exceed the equivalent of one (1) square foot for each one (1) foot of frontage actually occupied by such business, including the widths of driveways directly appurtenant thereto.
2. No junk, salvage or auto wrecking yard shall be established in any B zone unless the same is completely enclosed within a building or within a fence approved by the Planning Commission.

B. The following additional uses, if not permitted in the other zone, may be permitted in a B zone upon the granting of a conditional use permit:

1. Automobile parking areas
2. Automobile service stations
3. Directional or informational signs of a public or quasi-public nature
4. Drug stores
5. Garages, public, including repairing and servicing
6. Grocery, fruit and vegetable stores
7. Hotels, apartment houses and multiple residences
8. Motels, auto courts and tourist courts
9. Meat markets or delicatessen stores
10. Professional offices
11. Restaurants, tea rooms and cafes

Section 7232. Building Height, Front Side and Rear Yards, Area Requirements and Distance Between Buildings On The Same Lot. None, except that on parcels or lots of less than ten thousand (10,000) square feet in area, said regulations shall be the same as required in the R-3 zone; and provided that all buildings, except temporary stands, shall be located not nearer than ninety (90) feet from the centerline of any public street or highway. 7232

Article 25.1, Sections 7235 – 7237 – See next page.

Article 26. Oil and Gas Production.

Section 7240. Oil and Gas Production. It hereby is declared to be the purpose and object of Article 26 of the Land Use Zoning Ordinance of the County of Kern to establish reasonable limitations, safeguards and controls with respect to the future drilling for, development and production of oil, gas and other hydrocarbon substances within the unincorporated territory of the County of Kern. 7240

Such limitations, safeguards and controls are deemed necessary in the public interest to insure practices which will permit the economic recovery of the maximum amount of oil, gas and other hydrocarbon substances but which will also take into consideration the surface uses of land as such uses are indicated by the value and character of the existing improvements in or near localities where oil and gas operations are conducted, the desirability of the area for residential or other uses, and other factors relating to the public health, comfort, safety and general welfare.

It is recognized that in regulating the surface uses of land for the development of such natural resources it is in the public interest that such regulations be of a character designed to impose the minimum burdens consistent with the maximum enjoyment of each use.

Section 7241. Oil Drilling Permitted In Specific Zones. Notwithstanding the provisions of any other part of this Chapter, oil wells or well holes for the exploration for, development and production of oil, gas and other hydrocarbon substances may be drilled, operated and maintained, together with the installation and use of such equipment, structures and facilities as are necessary or convenient for such purposes, including but not limited to the initial separation of oil, gas and water, and for the storage, handling, recycling and transportation of such oil, gas and water to and from the premises in the unincorporated territory of the County of Kern, and the owner or operator thereof shall not be required to obtain any permit or variance as a condition precedent therefor, except as in this Article hereinafter provided. However, variance may be granted to the provisions of this Article 26, according to the provisions of Article 29 of this Chapter. 7241

Section 7242. Unrestricted Drilling. In the U Unclassified Zone, M-3 General Manufacturing Zone, A-2 General Agricultural Zone and A-1 Light Agricultural Zone the following conditions shall apply. 7242

No review or permit shall be required for the drilling of any well hole for the exploration for, development and production of oil, gas and other hydrocarbon substances, or the installation of equipment, structures and facilities incidental thereto provided that all drilling installations and operations shall conform to State law and to fire and safety ordinances or regulations of the County of Kern in force and effect and applicable, provided, further, that drilling shall not be commenced within one hundred (100) feet of any residence then in existence without the written consent of the owner thereof.

Section 7243. Drilling By Conditional Use Permit. In the R-1 One Family Dwelling Zone, R-2 Two Family Dwelling Zone, R-3 Limited Multiple Family Dwelling Zone, R-4 Multiple Family Dwelling Zone, R-S Suburban Residential Zone, E-1 Estate Zone, E-2 Estate Zone, E-3 Estate Zone, C-O Professional Office Zone, C-1 Limited Commercial Zone and C-2 Commercial Zone the following conditions shall apply: 7243

No person, firm or corporation shall conduct the drilling of any well, hole or holes for the exploration for, development and production of oil, gas and other hydrocarbon substances, or install any equipment, structures and facilities incidental thereto, on or upon lands within the zones above specified in Section 7243 without first having applied for and obtained, by payment of the fee hereinafter provided, a conditional use permit from the Planning Commission so to do. No plant for the refining of petroleum products from such operation shall be permitted hereunder. The procedure for filing of applications, investigation, notices, public hearings, findings and appeal shall be the same as herein provided for variances, in Sections 7274, 7276, 7277, 7278 and 7279 of this Chapter, except that the Planning Commission may waive public hearing if all the owners of surface rights within three hundred (300) feet of the proposed site consent in writing. Such permit shall provide that all drilling and producing operations shall conform to conditions No. 1 to No. 10, inclusive, as hereinafter set forth, and one or more of conditions No. 11 to No. 15, inclusive, if applicable and determined as hereinafter set forth, except that upon request of the applicant, at or subsequent to the time the permit is issued, the Planning Commission, by specific action in each instance, may waive any one or more of such conditions if it finds that such waiver will not result in material detriment to the public welfare or to the property of other persons located in the vicinity thereof.

1. That no oil or gas well shall be drilled within one hundred (100) feet on any public highway or within one hundred and fifty (150) feet of any residence constructed prior to the commencement of such drilling, without the written consent of the owner thereof.
2. That all drilling and producing shall conform to all applicable fire and safety regulations.
3. That no signs, other than directional and warning signs and those required for identification of the well shall be constructed, erected, maintained or placed on the premises or any part thereof except those required by law or ordinance to be displayed in connection with the drilling or maintenance of the well.
4. That suitable and adequate sanitary toilet and washing facilities, approved by the Kern County Health Department, shall be installed and maintained in a clean and sanitary condition at all times.
5. That proven technological improvements generally accepted and used in drilling and production methods shall be adopted as they may become from time to time available if capable of reducing factors of nuisance

and annoyance.

6. That the derrick, all boilers and all other drilling equipment used pursuant to this section to drill any well hole or to repair, clean out, deepen or redrill any completed or drilling well, shall be removed within ninety (90) days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derrick, boilers and drilling equipment are to be used, within a reasonable time limit determined by the Planning Commission, for the drilling of another well or wells on the premises.
7. That after any well has been placed on production no earthen sumps shall be used for the storage of petroleum.
8. That within ninety (90) days after any well has been placed on production or after its abandonment earthen sumps used in drilling or production or both, unless such sumps are to be used, within a reasonable time limit determined by the Planning Commission, for the drilling of another well or wells, shall be filled and the drilling site restored as nearly as practicable to a uniform grade.
9. That any derrick used for servicing operations shall be of the portable type, provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable type derrick will not properly service such well, the Planning Commission may approve the use of a standard type of derrick.
10. That prior to the drilling, redrilling or deepening of any well, the permittee shall file with the Board of Supervisors a satisfactory corporate surety bond in favor of the County of Kern in the sum of Five Hundred Dollars ($500) per well or Twenty-five Hundred Dollars ($2,500) for five or more wells, executed by such permittee as principal and by an authorized surety company as surety, conditioned that the principal named in the bond shall faithfully comply with all the provisions of this section in drilling, redrilling or deepening any well or wells covered by the bond, and shall secure the County of Kern against all losses, charges and expenses incurred by it to obtain such compliance by the principal named in the bond.

The following additional conditions No. 11 to No. 15. inclusive, may be added by the Planning Commission if deemed necessary or desirable to protect the public health, safety, comfort, convenience and general welfare.

11. That all oil or gas produced shall be carried away by pipelines or, if produced into and shipped from tanks located on the premises, such tanks shall be surrounded by shrubs or trees, planted and maintained so as to develop attractive landscaping and, insofar as practicable, screen such tanks from public view.
12. That, except in case of emergency, no materials, equipment, tools or pipe used for either drilling or production operations shall be delivered to or removed from the drilling site, except between the hours of 8:00 A.M. and 8:00 P.M. of any day.
13. That adequate fire fighting apparatus and supplies, approved by the County Fire Department, shall be maintained on the drilling site at all times during drilling and production operations.
14. That pumping wells shall be operated by electric motors or muffled internal combustion engines, and the height of all pumping units shall be not more than twenty (20) feet. All permanent equipment shall be painted and kept in neat condition. All producing operations shall be as free from noise as possible with modern oil operations.
15. That the drilling site shall be fenced or landscaped as prescribed by the Planning Commission.

If a producing well is not secured upon land subject to said permit within twelve (12) months from the date of issuance of said permit, or within any extended period thereof, the permit shall expire and the premises shall be restored to their original condition as nearly as practicable so to do. No permit shall expire, however, while the permittee is continuously conducting drilling, redrilling, completing or abandoning operations, or related operations, in a well on the lands covered by such permit, which operations were commenced while said permit was otherwise in effect. For the purposes hereof, continuous operations are operations suspended not more than thirty (30) consecutinve days. If at the expiration of said twelve (12) months period the permittee has not completed his drilling program on the lands covered by such permit, the Planning Commission may, upon a written request of permittee, extend the permit for the additional time requested by permittee for the completion of such drilling program.

Section 7244. Drilling By Counter Permit. In the M-1 Limited Manufacturing Zone, M-2 Light Manufacturing Zone and the R-F Recreational-Forestry Zone the following conditions shall apply. 7244

No person, firm or corporation shall drill any well hole for the exploration for, development and production of oil, gas and other hydrocarbon substances or install any equipment, structures and facilities incidental thereto without first having applied and obtained, by payment of the fee hereinafter provided, an oil well counter permit from an authorized employee of the Planning Commission. Said permit shall provide that all drilling and producing operations shall conform to conditions No. 1 to No. 10, inclusive, as specified in Section 7243 except that upon request of the applicant, at or subsequent to the time the permit is issued, the Planning Commission, by specific action in each instance, may waive any

one or more of such conditions if it finds that such waiver will not result in material detriment to the public welfare or to the property of other persons located in the vicinity thereof. No plant for the refining of petroleum products from such operation shall be permitted hereunder.

Section 7245. Filing Fee For Oil Well Drilling. No fee shall be collected for unrestricted drilling under the provisions of Section 7242. 7245

The County shall charge and collect the following fees for the purpose of defraying the expenditures incidental to the proceedings described in this Article 26.

A. A fee of Thirty-five Dollars ($35.00) shall be collected for each Conditional Use Permit granted under the provisions of Section 7243. An additional fee of Thirty-five Dollars ($35.00) shall be paid by the permittee for each well (after the first well) drilled upon lands covered by a Conditional Use Permit.

B. A fee of Five Dollars ($5.00) shall be collected for each Counter Permit issued under the provisions of Section 7244. An additional fee of Five Dollars ($5.00) shall be paid by the permittee for each additional well (after the first well) drilled upon lands covered by a Counter Permit.

Article 27. General Provisions.

Section 7250. General Provisions. The regulations specified in this Chapter shall be subject to the following interpretations and exceptions. 7250

Section 7251. Less Restrictive Uses Prohibited. The express enumeration and authorization in this Chapter of a particular class of building, structure, premises or use in a designated zone shall be deemed a prohibition of such building, structure, premises or use in all zones of more restrictive classification, except as otherwise specified. 7251

Section 7252. Additional Permitted Uses. Uses other than those specifically mentioned in this Chapter as uses permitted in each of the zones may be permitted therein, provided such uses are similar to those mentioned and are in the opinion of the Board of Supervisors as evidenced by a resolution in writing, after a report and recommendation by the Planning Commission, not more obnoxious or detrimental to the welfare of the community than the permitted uses specifically mentioned in the respective zones. 7252

Section 7253. Additional Excluded Uses. Uses other than those specifically mentioned in this Chapter as uses excluded from any zone may be excluded therefrom provided such uses are in the opinion of the Board of Supervisors, as evidenced by a resolution in writing, after a report and recommendation by the Planning Commission, not less obnoxious or detrimental to the welfare of the community than the excluded uses specifically mentioned in any zone. 7253

Section 7254. Non-Conforming Buildings and Uses. The following regulations shall apply to all non-conforming buildings and structures or parts thereof and uses existing at the effective date of this Chapter, provided, however, that that these regulations shall not apply in the U-Zone. 7254

A. Any such non-conforming building or structure may be continued and maintained provided there is no physical change other than necessary maintenance and repair in such building or structure except as permitted in other sections of this Chapter.

B. Any such non-conforming use may be maintained and continued provided there is no increase or enlargement of the area, space or volume occupied or devoted to such non-conforming use, except as otherwise provided in this Chapter.

C. Any part of a building, structure or land occupied by such a non-conforming use which is changed to or replaced by a use conforming to the provisions of this Chapter shall not thereafter be used or occupied by a non-conforming use.

D. Any part of a building, structure or land occupied by such a non-conforming use, which use is abandoned, shall not again be used or occupied for a non-conforming use. Any part of a building, structure or land occupied by such a non-conforming use, which use shall have ceased for a period of one (1) year or more, shall not again be used or occupied for a non-conforming use.

E. If no structural alterations are made, a non-conforming use of a building may be changed to another non-conforming use of a more restrictive classification.

F. Every non-conforming use of land (where no main building is involved)existing at the time this Chapter becomes effective shall be discontinued within three (3) years from the effective date of this Chapter, except that this provision shall not apply to public utility structures of companies under the jurisdiction of the Public Utilities Commission of the State of California.

Ordinance G-4157
2/10/1986

ARTICLE 7260

OIL AND GAS PRODUCTION

SECTIONS:

7260.01 PURPOSE AND APPLICATION
7260.02 UNRESTRICTED DRILLING
7260.03 DRILLING BY MINISTERIAL PERMIT
7260.04 DRILLING BY CONDITIONAL USE PERMIT
7260.05 DEVELOPMENT STANDARDS AND CONDITIONS
7260.06 APPLICATION CONTENTS
7260.07 PERMIT REVOCATION AND MODIFICATION

SECTION 7260.01 PURPOSE AND APPLICATION

The purpose of this article is to promote the economic recovery of oil, gas, and other hydrocarbon substances in a manner compatible with surrounding land uses and protection of the public health and safety by establishing reasonable limitations, safeguards, and controls on exploration, drilling, and production of hydrocarbon resources. The procedures and standards contained in this article shall apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out in unincorporated Kern County.

SECTION 7260.02 UNRESTRICTED DRILLING

No review or permit shall be required for the drilling of any steam injection well, steam drive well, service well, or any well intended for the exploration for or development or production of oil, gas, and other hydrocarbon substances, or for any related accessory equipment, structure, or facility in the Exclusive Agriculture (A), Limited Agriculture (A-1), Medium Industrial (M-2), Heavy Industrial (M-3), or Natural Resource (NR) Districts, provided that:

A. All drilling installations and operations comply with the requirements of State law and with applicable fire and safety ordinances and regulations of the County of Kern.

B. Drilling shall not be commenced within one hundred (100) feet of any existing residence without the written consent of the owner thereof.

C. Signs shall be limited to directional, warning signs, and identification signs in connection with oil, gas, or other hydrocarbon drilling and development operations.

D. Disposal of nonhazardous oil field liquid waste and production water is considered an accessory facility only if the facility complies with the following:

1. The nonhazardous oil field liquid waste or production water is produced and disposed of within the same designated oil field, or

2. The nonhazardous oil field liquid waste or production water disposed of outside the designated oil field of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

SECTION 7260.03 DRILLING BY MINISTERIAL PERMIT

No well for use as an injection well and no well for the exploration for or development or production of oil or gas or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in the Light Industrial (M-1) or Recreation Forestry (RF) Districts until an application for plot plan review has been submitted to and approved by the Director of Planning and Development Services as consistent with the standards set out in Section 7260.05 and in accordance with the procedures set out in Section 7284.02 of this chapter. In approving an application for plot plan review, the Director of Planning and Development Services may waive any standards set out in Section 7260.05 if he/she determines that such waiver will not result in material detriment to the public welfare or to the property of other persons located in the vicinity.

Disposal of nonhazardous oil field liquid waste and production water is considered an accessory facility only if the facility complies with the following:

A. The nonhazardous oil field liquid waste or production water is produced and disposed of within the same designated oil field, or

B. The nonhazardous oil field liquid waste or production water disposed of outside the designated oil field of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

SECTION 7260.04 DRILLING BY CONDITIONAL USE PERMIT

No well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in any zoning district described in this chapter in which such uses are permitted as conditional uses until an application for a conditional use permit has been submitted to and approved by the Board of Zoning Adjustment as consistent with the standards set out in Section 7260.05 and in accordance with the standards and procedures set out in Section 7284.04 and Article 7286 of this chapter. In approving a conditional use permit, the Board of Zoning Adjustment may waive any condition set out in Section 7260.05 if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity.

Disposal of nonhazardous oil field liquid waste and production water is considered an accessory facility only if the facility complies with the following:

A. The nonhazardous oil field liquid waste or production water is produced and disposed of within the same designated oil field, or

B. The nonhazardous oil field liquid waste or production water disposed of outside the designated oil field of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

If a producing well or service well is not completed upon land subject to a conditional use permit issued pursuant to this article and Article 7286 within twelve (12) months from the date of issuance of the permit, or within any extended period thereof, the conditional use permit shall expire and the premises shall be restored as nearly as practicable to their original condition. No permit shall expire while the permittee is continuously conducting drilling, redrilling, completing or abandoning operations, or related operations, in a well on the lands covered by such permit, which operations were commenced while said permit was otherwise in effect. Continuous operations are operations suspended not more than thirty (30) consecutive days. If, at the expiration of the twelve (12) months period, the permittee has not completed his drilling program on the lands covered by such permit, the Board of Zoning Adjustment may, upon a written request of the permittee, extend the permit for the additional time requested by permittee for the completion of such drilling program.

SECTION 7260.05 DEVELOPMENT STANDARDS AND CONDITIONS

All wells drilled, pursuant to Sections 7105.02, 7260.03, and 7260.04, for the exploration for or development or production of oil, gas, and other hydrocarbon substances and related facilities and activities shall comply with the following standards, unless otherwise provided in this article:

A. No oil or gas well shall be drilled within one hundred (100) feet of any public highway or building not necessary to the operation of the well, or within one hundred and fifty (150) feet of any dwelling, or within three hundred (300) feet of any building used as a place of public assembly, institution, or school, or within fifty (50) feet of any building utilized for commercial purposes constructed prior to the commencement of such drilling, without the written consent of the owner of such structure.

B. All drilling and production activities shall conform to all applicable fire and safety regulations, and fire fighting apparatus and supplies required by the Kern County Fire Department shall be maintained on the site at all times during drilling and production operations.

C. No signs, other than directional and warning signs and those required for identification of the well, shall be constructed, erected, maintained, or placed on the premises or any part thereof, except those

required by law or ordinance to be displayed in connection with the drilling or maintenance of the well.

D. Sanitary toilet and washing facilities, if required by the Kern County Health Department or other governmental agencies, shall be installed and maintained in a clean and sanitary condition during drilling operations, and at such other times as specified by these agencies.

E. Proven technological improvements generally accepted and used in drilling and production methods shall be employed as they may become available if they are capable of reducing nuisances or annoyances.

F. All derricks, boilers, and other drilling equipment employed pursuant to this section, to drill any well hole or to repair, clean out, deepen, or redrill any completed or drilling well, shall be removed within ninety (90) days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derricks, boilers, and drilling equipment are to be used within a reasonable time, as determined by the Director of Planning and Development Services, for the drilling of another well or wells on the premises.

G. Within ninety (90) days after any well has been placed in production, or after its abandonment, earthen sumps used in drilling or production or both (unless such sumps are to be used within a reasonable time as determined by the Director of Planning and Development Services for the drilling of another well or wells) shall be filled and the drilling site restored as nearly as practicable to a uniform grade. Temporary earthen sumps may be used for cleanout or remedial work on an existing well or other production facility. However, these sumps shall be filled and the site restored as nearly as practicable to uniform grade within ninety (90) days after the cleanout or other remedial work is completed. Such restoration work shall comply with all applicable regulations of the California Division of Oil and Gas.

H. Any derrick used for servicing operations shall be of the portable type, provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable type derrick will not properly service such well, the Director of Planning and Development Services may approve the use of a standard type of derrick.

I. Whenever oil or gas is produced into and shipped from tanks located on the premises, such tanks, whenever located within five hundred (500) feet of any dwelling or commercial building, shall be surrounded by shrubs or trees, planted and maintained so as to develop attractive landscaping or shall be fenced in such a manner as to, insofar as practicable, screen such tanks from public view. Such fencing shall comply with the requirements of the California Division of Oil and Gas.

J. Whenever a well is located within five hundred (500) feet from an existing dwelling unit, except in case of an emergency, no materials, equipment, tools, or pipe used for either drilling or production operations shall be delivered to or removed from the drilling site, except between the hours of 8:00 a.m. and 8:00 p.m., unless otherwise required by the California Division of Oil and Gas.

K. Pumping wells shall be operated by electric motors or muffled internal combustion engines.

L. The height of all pumping units shall not exceed thirty-five (35) feet and shall be painted and kept in neat condition.

M. All vehicle parking and maneuvering areas shall be treated and maintained with oiled sand or a similar dust binding material.

N. After production begins and a pump is installed on the wellhead, a fence at least six (6) feet in height shall be installed around the pump site or drilling island for public safety. This fence shall be constructed of chain link with wood or metal slats or other screening fence as may be approved by the Director of Planning and Development Services. This fencing and screening requirement shall apply only to those pump sites located within five hundred (500) feet of any dwelling. Such fencing shall comply with the requirements of the California Division of Oil and Gas.

O. All required federal, State, and County rules and regulations shall be complied with at all times, including, but not limited to, the rules and regulations of the following agencies:

1. California Division of Oil and Gas
2. Kern County Fire Department
3. Kern County Health Department
4. Regional Water Quality Control Board
5. Air Pollution Control District
6. Kern County Public Works Department

SECTION 7260.06 APPLICATION CONTENTS

An application for plot plan review pursuant to Section 7260.03 and an application for a conditional use permit pursuant to Section 7260.04 shall include the following:

1. Name and address of the applicant
2. Name(s) and address(es) of the property owner(s)

3. Assessor's parcel number(s)

4. Legal description of the property

5. A plot plan or site development plan (in the case of a conditional use permit) drawn at the scale specified by the Director of Planning and Development Services, which includes the following information:

   a. Topography and proposed grading

   b. Location of all proposed well holes and related accessory equipment, structures, and facilities to be installed and any abondoned wells if such are known to exist

   c. Location of all existing dwellings and buildings used for other purposes, located within three hundred (300) feet of the proposed well holes, identification of the use of each structure, and distances between well holes and existing buildings

   d. North arrow

6. Narrative description of the proposed development, including:

   a. Acreage or square footage of the property

   b. Nature of hydrocarbon development activity

   c. Description of equipment to be used

   d. Distance to all existing buildings

   e. Phasing or development schedule

SECTION 7260.07 PERMIT REVOCATION AND MODIFICATION

Any permit issued pursuant to this article may be revoked or modified pursuant to Section 7284.06 of this chapter.

Therefore IT IS RECOMMENDED that your Board 1) receive and file this report 2) provide direction and 3) continue to January 22, 2013.

Sincerely,

LORELEI H OVIATT, AICP, Director
Kern County Planning and Community Development Department

Article 24. H Zone

Section 7220. H Airport Approach Height Zone. Land classified in an H zone shall also be classified in another zone and the additional regualtions set forth in this Article shall apply in the H airport approach height zone unless otherwise provided in this Chapter. 7220

Section 7221. Airport Zoning Commission. The Planning Commission is hereby appointed as the Airport Zoning Commission of the County of Kern with all the powers and duties specified by the Airport Approaches Zoning Law of the State of California, Chapter 1741, Statutes of 1953, now included in Sections 50481 to 50485.14, inclusive, of the Government Code, or any amendment thereto. 7221

Section 7222. Procedure. No building or structures, including all super-structures and appurtenances, shall be erected, moved, altered or reconstructed, nor shall any plant or tree be allowed to grow in such a manner, so that the height thereof will constitute a hazard to the safe landing or take-off of aircraft using the airport in the district subject to these regulations. The height limit thus imposed shall be determined in each case by the Planning Commission and shall be governed by and not more restrictive than those imposed by Civil Aeronautics Administration Technical Standard Order N18, "Criteria for Determining Obstructions to Air Navigation," dated April 26, 1950, as amended. A copy of said Technical Standard Order N18, with amendments, shall be on file in the office of the Planning Commission. In no event shall the provisions of this Section prevent the erection or maintenance of a building, structure or tree, no part of which exceeds thirty-five (35) feet in height. Permits issued for buildings and structures in areas subject to Airport Approach zones shall specify the height limitations of such buildings or structures as set forth in this Section. 7222

The proceedings for classifying any land in the H Airport Approach Height Zone shall comply with the provisions of said Airport Approaches Zoning Law.

Article 25. B Zone.

Section 7230. B Buffer Zone. Land classified in a B Zone may also be classified in another zone, except in the C and M zones, and the regulations set forth in this Article shall apply in the B buffer zone unless otherwise provided in this Chapter. 7230

Section 7231. Uses Permitted. 7231

A. Any use permitted in the other respective zone in which the land is classified and with which the B zone is combined, provided, however, as follows:

1. No outdoor advertising sign or outdoor advertising structure shall be placed and/or maintained in any B zone, provided, however, that there may be displayed on the premises occupied by any permitted business use which is located in any B zone outdoor advertising structures for the advertising only of such business; and the total area for all outdoor advertising signs and outdoor advertising structures in the aggregate displayed by or for any one place of business shall not exceed the equivalent of one (1) square foot for each one (1) foot of frontage actually occupied by such business, including the widths of driveways directly appurtenant thereto.
2. No junk, salvage or auto wrecking yard shall be established in any B zone unless the same is completely enclosed within a building or within a fence approved by the Planning Commission.

B. The following additional uses, if not permitted in the other zone, may be permitted in a B zone upon the granting of a conditional use permit:

1. Automobile parking areas
2. Automobile service stations
3. Directional or informational signs of a public or quasi-public nature
4. Drug stores
5. Garages, public, including repairing and servicing
6. Grocery, fruit and vegetable stores
7. Hotels, apartment houses and multiple residences
8. Motels, auto courts and tourist courts
9. Meat markets or delicatessen stores
10. Professional offices
11. Restaurants, tea rooms and cafes

Section 7232. Building Height, Front Side and Rear Yards, Area Requirements and Distance Between Buildings On The Same Lot, None, except that on parcels or lots of less than ten thousand (10,000) square feet in area, said regulations shall be the same as required in the R-3 zone; and provided that all buildings, except temporary stands, shall be located not nearer than ninety (90) feet from the centerline of any public street or highway. 7232

Article 25.1, Sections 7235 – 7237 – See next page.

Article 26. Oil and Gas Production.

Section 7240. Oil and Gas Production. It hereby is declared to be the purpose and object of Article 26 of the Land Use Zoning Ordinance of the County of Kern to establish reasonable limitations, safeguards and controls with respect to the future drilling for, development and production of oil, gas and other hydrocarbon substances within the unincorporated territory of the County of Kern. 7240

Such limitations, safeguards and controls are deemed necessary in the public interest to insure practices which will permit the economic recovery of the maximum amount of oil, gas and other hydrocarbon substances but which will also take into consideration the surface uses of land as such uses are indicated by the value and character of the existing improvements in or near localities where oil and gas operations are conducted, the desirability of the area for residential or other uses, and other factors relating to the public health, comfort, safety and general welfare.

It is recognized that in regulating the surface uses of land for the development of such natural resources it is in the public interest that such regulations be of a character designed to impose the minimum burdens consistent with the maximum enjoyment of each use.

Section 7241. Oil Drilling Permitted In Specific Zones. Notwithstanding the provisions of any other part of this Chapter, oil wells or well holes for the exploration for, development and production of oil, gas and other hydrocarbon substances may be drilled, operated and maintained, together with the installation and use of such equipment, structures and facilities as are necessary or convenient for such purposes, including but not limited to the initial separation of oil, gas and water, and for the storage, handling, recycling and transportation of such oil, gas and water to and from the premises in the unincorporated territory of the County of Kern, and the owner or operator thereof shall not be required to obtain any permit or variance as a condition precedent therefor, except as in this Article hereinafter provided. However, variance may be granted to the provisions of this Article 26, according to the provisions of Article 29 of this Chapter. 7241

Section 7242. Unrestricted Drilling. In the U Unclassified Zone, M-3 General Manufacturing Zone, A-2 General Agricultural Zone and A-1 Light Agricultural Zone the following conditions shall apply. 7242

No review or permit shall be required for the drilling of any well hole for the exploration for, development and production of oil, gas and other hydrocarbon substances, or the installation of equipment, structures and facilities incidental thereto provided that all drilling installations and operations shall conform to State law and to fire and safety ordinances or regulations of the County of Kern in force and effect and applicable, provided, further, that drilling shall not be commenced within one hundred (100) feet of any residence then in existence without the written consent of the owner thereof.

Section 7243. Drilling By Conditional Use Permit. In the R-1 One Family Dwelling Zone, R-2 Two Family Dwelling Zone, R-3 Limited Multiple Family Dwelling Zone, R-4 Multiple Family Dwelling Zone, R-S Suburban Residential Zone, E-1 Estate Zone, E-2 Estate Zone, E-3 Estate Zone, C-O Professional Office Zone, C-1 Limited Commercial Zone and C-2 Commercial Zone the following conditions shall apply: 7243

No person, firm or corporation shall conduct the drilling of any well, hole or holes for the exploration for, development and production of oil, gas and other hydrocarbon substances, or install any equipment, structures and facilities incidental thereto, on or upon lands within the zones above specified in Section 7243 without first having applied for and obtained, by payment of the fee hereinafter provided, a conditional use permit from the Planning Commission so to do. No plant for the refining of petroleum products from such operation shall be permitted hereunder. The procedure for filing of applications, investigation, notices, public hearings, findings and appeal shall be the same as herein provided for variances, in Sections 7274, 7276, 7277, 7278 and 7279 of this Chapter, except that the Planning Commission may waive public hearing if all the owners of surface rights within three hundred (300) feet of the proposed site consent in writing. Such permit shall provide that all drilling and producing operations shall conform to conditions No. 1 to No. 10, inclusive, as hereinafter set forth, and one or more of conditions No. 11 to No. 15, inclusive, if applicable and determined as hereinafter set forth, except that upon request of the applicant, at or subsequent to the time the permit is issued, the Planning Commission, by specific action in each instance, may waive any one or more of such conditions if it finds that such waiver will not result in material detriment to the public welfare or to the property of other persons located in the vicinity thereof.

1. That no oil or gas well shall be drilled within one hundred (100) feet on any public highway or within one hundred and fifty (150) feet of any residence constructed prior to the commencement of such drilling, without the written consent of the owner thereof.
2. That all drilling and producing shall conform to all applicable fire and safety regulations.
3. That no signs, other than directional and warning signs and those required for identification of the well shall be constructed, erected, maintained or placed on the premises or any part thereof except those required by law or ordinance to be displayed in connection with the drilling or maintenance of the well.
4. That suitable and adequate sanitary toilet and washing facilities, approved by the Kern County Health Department, shall be installed and maintained in a clean and sanitary condition at all times.
5. That proven technological improvements generally accepted and used in drilling and production methods shall be adopted as they may become from time to time available if capable of reducing factors of nuisance

and annoyance.

6. That the derrick, all boilers and all other drilling equipment used pursuant to this section to drill any well hole or to repair, clean out, deepen or redrill any completed or drilling well, shall be removed within ninety (90) days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derrick, boilers and drilling equipment are to be used, within a reasonable time limit determined by the Planning Commission, for the drilling of another well or wells on the premises.
7. That after any well has been placed on production no earthen sumps shall be used for the storage of petroleum.
8. That within ninety (90) days after any well has been placed on production or after its abandonment earthen sumps used in drilling or production or both, unless such sumps are to be used, within a reasonable time limit determined by the Planning Commission, for the drilling of another well or wells, shall be filled and the drilling site restored as nearly as practicable to a uniform grade.
9. That any derrick used for servicing operations shall be of the portable type, provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable type derrick will not properly service such well, the Planning Commission may approve the use of a standard type of derrick.
10. That prior to the drilling, redrilling or deepening of any well, the permittee shall file with the Board of Supervisors a satisfactory corporate surety bond in favor of the County of Kern in the sum of Five Hundred Dollars ($500) per well or Twenty-five Hundred Dollars ($2,500) for five or more wells, executed by such permittee as principal and by an authorized surety company as surety, conditioned that the principal named in the bond shall faithfully comply with all the provisions of this section in drilling, redrilling or deepening any well or wells covered by the bond, and shall secure the County of Kern against all losses, charges and expenses incurred by it to obtain such compliance by the principal named in the bond.

The following additional conditions No. 11 to No. 15. inclusive, may be added by the Planning Commission if deemed necessary or desirable to protect the public health, safety, comfort, convenience and general welfare.

11. That all oil or gas produced shall be carried away by pipelines or, if produced into and shipped from tanks located on the premises, such tanks shall be surrounded by shrubs or trees, planted and maintained so as to develop attractive landscaping and, insofar as practicable, screen such tanks from public view.
12. That, except in case of emergency, no materials, equipment, tools or pipe used for either drilling or production operations shall be delivered to or removed from the drilling site, except between the hours of 8:00 A.M. and 8:00 P.M. of any day.
13. That adequate fire fighting apparatus and supplies, approved by the County Fire Department, shall be maintained on the drilling site at all times during drilling and production operations.
14. That pumping wells shall be operated by electric motors or muffled internal combustion engines, and the height of all pumping units shall be not more than twenty (20) feet. All permanent equipment shall be painted and kept in neat condition. All producing operations shall be as free from noise as possible with modern oil operations.
15. That the drilling site shall be fenced or landscaped as prescribed by the Planning Commission.

If a producing well is not secured upon land subject to said permit within twelve (12) months from the date of issuance of said permit, or within any extended period thereof, the permit shall expire and the premises shall be restored to their original condition as nearly as practicable so to do. No permit shall expire, however, while the permittee is continuously conducting drilling, redrilling, completing or abandoning operations, or related operations, in a well on the lands covered by such permit, which operations were commenced while said permit was otherwise in effect. For the purposes hereof, continuous operations are operations suspended not more than thirty (30) consecutinve days. If at the expiration of said twelve (12) months period the permittee has not completed his drilling program on the lands covered by such permit, the Planning Commission may, upon a written request of permittee, extend the permit for the additional time requested by permittee for the completion of such drilling program.

Section 7244. Drilling By Counter Permit. In the M-1 Limited Manufacturing Zone, M-2 Light Manufacturing Zone and the R-F Recreational-Forestry Zone the following conditions shall apply. 7244

No person, firm or corporation shall drill any well hole for the exploration for, development and production of oil, gas and other hydrocarbon substances or install any equipment, structures and facilities incidental thereto without first having applied and obtained, by payment of the fee hereinafter provided, an oil well counter permit from an authorized employee of the Planning Commission. Said permit shall provide that all drilling and producing operations shall conform to conditions No. 1 to No. 10, inclusive, as specified in Section 7243 except that upon request of the applicant, at or subsequent to the time the permit is issued, the Planning Commission, by specific action in each instance, may waive any

one or more of such conditions if it finds that such waiver will not result in material detriment to the public welfare or to the property of other persons located in the vicinity thereof. No plant for the refining of petroleum products from such operation shall be permitted hereunder.

Section 7245. Filing Fee For Oil Well Drilling. No fee shall be collected for unrestricted drilling under the provisions of Section 7242. 7245

The County shall charge and collect the following fees for the purpose of defraying the expenditures incidental to the proceedings described in this Article 26.

A. A fee of Thirty-five Dollars ($35.00) shall be collected for each Conditional Use Permit granted under the provisions of Section 7243. An additional fee of Thirty-five Dollars ($35.00) shall be paid by the permittee for each well (after the first well) drilled upon lands covered by a Conditional Use Permit.

B. A fee of Five Dollars ($5.00) shall be collected for each Counter Permit issued under the provisions of Section 7244. An additional fee of Five Dollars ($5.00) shall be paid by the permittee for each additional well (after the first well) drilled upon lands covered by a Counter Permit.

Article 27. General Provisions.

Section 7250. General Provisions. The regulations specified in this Chapter shall be subject to the following interpretations and exceptions. 7250

Section 7251. Less Restrictive Uses Prohibited. The express enumeration and authorization in this Chapter of a particular class of building, structure, premises or use in a designated zone shall be deemed a prohibition of such building, structure, premises or use in all zones of more restrictive classification, except as otherwise specified. 7251

Section 7252. Additional Permitted Uses. Uses other than those specifically mentioned in this Chapter as uses permitted in each of the zones may be permitted therein, provided such uses are similar to those mentioned and are in the opinion of the Board of Supervisors as evidenced by a resolution in writing, after a report and recommendation by the Planning Commission, not more obnoxious or detrimental to the welfare of the community than the permitted uses specifically mentioned in the respective zones. 7252

Section 7253. Additional Excluded Uses. Uses other than those specifically mentioned in this Chapter as uses excluded from any zone may be excluded therefrom provided such uses are in the opinion of the Board of Supervisors, as evidenced by a resolution in writing, after a report and recommendation by the Planning Commission, not less obnoxious or detrimental to the welfare of the community than the excluded uses specifically mentioned in any zone. 7253

Section 7254. Non-Conforming Buildings and Uses. The following regulations shall apply to all non-conforming buildings and structures or parts thereof and uses existing at the effective date of this Chapter, provided, however, that that these regulations shall not apply in the U-Zone. 7254

A. Any such non-conforming building or structure may be continued and maintained provided there is no physical change other than necessary maintenance and repair in such building or structure except as permitted in other sections of this Chapter.

B. Any such non-conforming use may be maintained and continued provided there is no increase or enlargement of the area, space or volume occupied or devoted to such non-conforming use, except as otherwise provided in this Chapter.

C. Any part of a building, structure or land occupied by such a non-conforming use which is changed to or replaced by a use conforming to the provisions of this Chapter shall not thereafter be used or occupied by a non-conforming use.

D. Any part of a building, structure or land occupied by such a non-conforming use, which use is abandoned, shall not again be used or occupied for a non-conforming use. Any part of a building, structure or land occupied by such a non-conforming use, which use shall have ceased for a period of one (1) year or more, shall not again be used or occupied for a non-conforming use.

E. If no structural alterations are made, a non-conforming use of a building may be changed to another non-conforming use of a more restrictive classification.

F. Every non-conforming use of land (where no main building is involved)existing at the time this Chapter becomes effective shall be discontinued within three (3) years from the effective date of this Chapter, except that this provision shall not apply to public utility structures of companies under the jurisdiction of the Public Utilities Commission of the State of California.

Ordinance G-4157
2/10/1986

ARTICLE 7260

OIL AND GAS PRODUCTION

SECTIONS:

7260.01 PURPOSE AND APPLICATION
7260.02 UNRESTRICTED DRILLING
7260.03 DRILLING BY MINISTERIAL PERMIT
7260.04 DRILLING BY CONDITIONAL USE PERMIT
7260.05 DEVELOPMENT STANDARDS AND CONDITIONS
7260.06 APPLICATION CONTENTS
7260.07 PERMIT REVOCATION AND MODIFICATION

SECTION 7260.01 PURPOSE AND APPLICATION

The purpose of this article is to promote the economic recovery of oil, gas, and other hydrocarbon substances in a manner compatible with surrounding land uses and protection of the public health and safety by establishing reasonable limitations, safeguards, and controls on exploration, drilling, and production of hydrocarbon resources. The procedures and standards contained in this article shall apply to all exploration drilling and production activities related to oil, gas, and other hydrocarbon substances carried out in unincorporated Kern County.

SECTION 7260.02 UNRESTRICTED DRILLING

No review or permit shall be required for the drilling of any steam injection well, steam drive well, service well, or any well intended for the exploration for or development or production of oil, gas, and other hydrocarbon substances, or for any related accessory equipment, structure, or facility in the Exclusive Agriculture (A), Limited Agriculture (A-1), Medium Industrial (M-2), Heavy Industrial (M-3), or Natural Resource (NR) Districts, provided that:

A. All drilling installations and operations comply with the requirements of State law and with applicable fire and safety ordinances and regulations of the County of Kern.

B. Drilling shall not be commenced within one hundred (100) feet of any existing residence without the written consent of the owner thereof.

C. Signs shall be limited to directional, warning signs, and identification signs in connection with oil, gas, or other hydrocarbon drilling and development operations.

D. Disposal of nonhazardous oil field liquid waste and production water is considered an accessory facility only if the facility complies with the following:

1. The nonhazardous oil field liquid waste or production water is produced and disposed of within the same designated oil field, or

2. The nonhazardous oil field liquid waste or production water disposed of outside the designated oil field of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

SECTION 7260.03 DRILLING BY MINISTERIAL PERMIT

No well for use as an injection well and no well for the exploration for or development or production of oil or gas or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in the Light Industrial (M-1) or Recreation Forestry (RF) Districts until an application for plot plan review has been submitted to and approved by the Director of Planning and Development Services as consistent with the standards set out in Section 7260.05 and in accordance with the procedures set out in Section 7284.02 of this chapter. In approving an application for plot plan review, the Director of Planning and Development Services may waive any standards set out in Section 7260.05 if he/she determines that such waiver will not result in material detriment to the public welfare or to the property of other persons located in the vicinity.

Disposal of nonhazardous oil field liquid waste and production water is considered an accessory facility only if the facility complies with the following:

A. The nonhazardous oil field liquid waste or production water is produced and disposed of within the same designated oil field, or

B. The nonhazardous oil field liquid waste or production water disposed of outside the designated oil field of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

SECTION 7260.04 DRILLING BY CONDITIONAL USE PERMIT

No well for the exploration for or development or production of oil, gas, or other hydrocarbon substances may be drilled, and no related accessory equipment, structure, or facility may be installed in any zoning district described in this chapter in which such uses are permitted as conditional uses until an application for a conditional use permit has been submitted to and approved by the Board of Zoning Adjustment as consistent with the standards set out in Section 7260.05 and in accordance with the standards and procedures set out in Section 7284.04 and Article 7286 of this chapter. In approving a conditional use permit, the Board of Zoning Adjustment may waive any condition set out in Section 7260.05 if it determines that such waiver will not result in material detriment to the public welfare or the property of other persons located in the vicinity.

Disposal of nonhazardous oil field liquid waste and production water is considered an accessory facility only if the facility complies with the following:

A. The nonhazardous oil field liquid waste or production water is produced and disposed of within the same designated oil field, or

B. The nonhazardous oil field liquid waste or production water disposed of outside the designated oil field of origin is produced by and disposed of solely and only by the same individual, corporation, or entity.

If a producing well or service well is not completed upon land subject to a conditional use permit issued pursuant to this article and Article 7286 within twelve (12) months from the date of issuance of the permit, or within any extended period thereof, the conditional use permit shall expire and the premises shall be restored as nearly as practicable to their original condition. No permit shall expire while the permittee is continuously conducting drilling, redrilling, completing or abandoning operations, or related operations, in a well on the lands covered by such permit, which operations were commenced while said permit was otherwise in effect. Continuous operations are operations suspended not more than thirty (30) consecutive days. If, at the expiration of the twelve (12) months period, the permittee has not completed his drilling program on the lands covered by such permit, the Board of Zoning Adjustment may, upon a written request of the permittee, extend the permit for the additional time requested by permittee for the completion of such drilling program.

SECTION 7260.05 DEVELOPMENT STANDARDS AND CONDITIONS

All wells drilled, pursuant to Sections 7105.02, 7260.03, and 7260.04, for the exploration for or development or production of oil, gas, and other hydrocarbon substances and related facilities and activities shall comply with the following standards, unless otherwise provided in this article:

A. No oil or gas well shall be drilled within one hundred (100) feet of any public highway or building not necessary to the operation of the well, or within one hundred and fifty (150) feet of any dwelling, or within three hundred (300) feet of any building used as a place of public assembly, institution, or school, or within fifty (50) feet of any building utilized for commercial purposes constructed prior to the commencement of such drilling, without the written consent of the owner of such structure.

B. All drilling and production activities shall conform to all applicable fire and safety regulations, and fire fighting apparatus and supplies required by the Kern County Fire Department shall be maintained on the site at all times during drilling and production operations.

C. No signs, other than directional and warning signs and those required for identification of the well, shall be constructed, erected, maintained, or placed on the premises or any part thereof, except those

required by law or ordinance to be displayed in connection with the drilling or maintenance of the well.

D. Sanitary toilet and washing facilities, if required by the Kern County Health Department or other governmental agencies, shall be installed and maintained in a clean and sanitary condition during drilling operations, and at such other times as specified by these agencies.

E. Proven technological improvements generally accepted and used in drilling and production methods shall be employed as they may become available if they are capable of reducing nuisances or annoyances.

F. All derricks, boilers, and other drilling equipment employed pursuant to this section, to drill any well hole or to repair, clean out, deepen, or redrill any completed or drilling well, shall be removed within ninety (90) days after completion of production tests following completion of such drilling, or after abandonment of any well, unless such derricks, boilers, and drilling equipment are to be used within a reasonable time, as determined by the Director of Planning and Development Services, for the drilling of another well or wells on the premises.

G. Within ninety (90) days after any well has been placed in production, or after its abandonment, earthen sumps used in drilling or production or both (unless such sumps are to be used within a reasonable time as determined by the Director of Planning and Development Services for the drilling of another well or wells) shall be filled and the drilling site restored as nearly as practicable to a uniform grade. Temporary earthen sumps may be used for cleanout or remedial work on an existing well or other production facility. However, these sumps shall be filled and the site restored as nearly as practicable to uniform grade within ninety (90) days after the cleanout or other remedial work is completed. Such restoration work shall comply with all applicable regulations of the California Division of Oil and Gas.

H. Any derrick used for servicing operations shall be of the portable type, provided, however, that upon presentation of proof that the well is of such depth or has such other characteristics, or for other cause, that a portable type derrick will not properly service such well, the Director of Planning and Development Services may approve the use of a standard type of derrick.

I. Whenever oil or gas is produced into and shipped from tanks located on the premises, such tanks, whenever located within five hundred (500) feet of any dwelling or commercial building, shall be surrounded by shrubs or trees, planted and maintained so as to develop attractive landscaping or shall be fenced in such a manner as to, insofar as practicable, screen such tanks from public view. Such fencing shall comply with the requirements of the California Division of Oil and Gas.

J. Whenever a well is located within five hundred (500) feet from an existing dwelling unit, except in case of an emergency, no materials, equipment, tools, or pipe used for either drilling or production operations shall be delivered to or removed from the drilling site, except between the hours of 8:00 a.m. and 8:00 p.m., unless otherwise required by the California Division of Oil and Gas.

K. Pumping wells shall be operated by electric motors or muffled internal combustion engines.

L. The height of all pumping units shall not exceed thirty-five (35) feet and shall be painted and kept in neat condition.

M. All vehicle parking and maneuvering areas shall be treated and maintained with oiled sand or a similar dust binding material.

N. After production begins and a pump is installed on the wellhead, a fence at least six (6) feet in height shall be installed around the pump site or drilling island for public safety. This fence shall be constructed of chain link with wood or metal slats or other screening fence as may be approved by the Director of Planning and Development Services. This fencing and screening requirement shall apply only to those pump sites located within five hundred (500) feet of any dwelling. Such fencing shall comply with the requirements of the California Division of Oil and Gas.

O. All required federal, State, and County rules and regulations shall be complied with at all times, including, but not limited to, the rules and regulations of the following agencies:

1. California Division of Oil and Gas
2. Kern County Fire Department
3. Kern County Health Department
4. Regional Water Quality Control Board
5. Air Pollution Control District
6. Kern County Public Works Department

SECTION 7260.06 APPLICATION CONTENTS

An application for plot plan review pursuant to Section 7260.03 and an application for a conditional use permit pursuant to Section 7260.04 shall include the following:

1. Name and address of the applicant
2. Name(s) and address(es) of the property owner(s)

3. Assessor's parcel number(s)

4. Legal description of the property

5. A plot plan or site development plan (in the case of a conditional use permit) drawn at the scale specified by the Director of Planning and Development Services, which includes the following information:

   a. Topography and proposed grading

   b. Location of all proposed well holes and related accessory equipment, structures, and facilities to be installed and any abondoned wells if such are known to exist

   c. Location of all existing dwellings and buildings used for other purposes, located within three hundred (300) feet of the proposed well holes, identification of the use of each structure, and distances between well holes and existing buildings

   d. North arrow

6. Narrative description of the proposed development, including:

   a. Acreage or square footage of the property

   b. Nature of hydrocarbon development activity

   c. Description of equipment to be used

   d. Distance to all existing buildings

   e. Phasing or development schedule

SECTION 7260.07 PERMIT REVOCATION AND MODIFICATION

Any permit issued pursuant to this article may be revoked or modified pursuant to Section 7284.06 of this chapter.
