Finally, the DEIR's conclusions fail to acknowledge the uncertainties inherent in the Cap-and-Trade program. The DEIR provides no explanation for why compliance with the Cap-and-Trade program by petroleum producers in the County will reduce the Project's capped emissions to a level of insignificance. Instead, it relies for its conclusion on a separate six-page guidance document prepared by the San Joaquin Valley Air Pollution Control District. But that document itself contains little reasoning or analysis, and does not constitute substantial evidence that emissions from sources subject to MMR (which will make up 90 percent of the Project's emissions) are not significant. The DEIR therefore does not adequately support its conclusion that impacts will be mitigated to insignificant levels. It must be revised to include all "capped" emissions as part of its evaluation of the Project's significant environmental impacts.

c. The DEIR's Analysis of Operational Emissions From Sources Not Subject to the Mandatory Reporting Regulations Is Not Supported By Substantial Evidence.

The DEIR's analysis of the operational impacts from facilities not subject to MRR is also flawed. Conclusions regarding environmental impacts under CEQA must be supported by substantial evidence. "Substantial evidence" is evidence "reasonable in nature, credible, and of solid value, evidence that a reasonable mind might accept as adequate to support a conclusion." *American Canyon Community United for Responsible Growth v. City of American Canyon* (2006) 145 Cal.App.4th 1062, 1070. The DEIR's cursory treatment of sources not subject to MMR does not come close to meeting this standard. The document merely states that "GHG emissions from the operations of the Project include . . . an allowance (10%) for emissions from small facilities not subject to MRR. . . ." DEIR at 4.7-33. It then relies on this apparently arbitrary number to calculate the total operational emissions from the Project. *See* DEIR at 4.7-34 (Table 4.7-8). The sole rationale for the DEIR's use of the 10 percent "allowance" is the conclusory statement that "GHG emissions from non-permitted sources and activities are calculated based on emissions within the state." DEIR at 4.7-33. But this is not supporting evidence at all.[9]

[9] As support for its estimation of operational emissions, the County cites an unpublished technical report and an email exchange. DEIR 4.7-34 (Table 4.7-8 citing Vector 2015a and 205b [*sic*].) Neither of these documents appears to have been made available for public review, and they are not included among the DEIR's appendices. *See* DEIR at vol. II, p. ix.

0044-231
Continued

The DEIR contains no further discussion of why this so-called allowance is accurate or is representative of the total emissions from non-MRR facilities at the Project site. In particular, there is no evidence that the number of non-MRR facilities statewide is in any way representative of the number in Kern County. Thus, the DEIR's purported analysis leaves the following questions unanswered, at the least: (1) What is the current ratio of MRR facilities to non-MRR facilities in the County? (2) Will the ratio of MRR facilities to non-MRR facilities remain the same over the lifetime of the Project? (3) Will the ratio of MRR facility emissions to non-MRR facility emissions remain the same over the lifetime of the Project? (4) How many non-MRR facilities does the County anticipate will voluntarily opt in to Cap-and-Trade?

It strains credibility to believe that the County does not have, or could not reasonably collect, information on the number of oil and gas producing facilities within its borders that are not subject to MRR, and that it could not calculate the GHG emissions from these facilities. The number of non-permitted facilities is especially important, given the fact that the DEIR claims it can dismiss all other emissions from permitted facilities as mitigated because they will participate in Cap-and-Trade. Until the County provides actual analysis of the GHG emissions from non-MRR facilities, and supports that analysis with substantial evidence in the record, the DEIR will remain legally deficient.

2. The DEIR Does Not Properly Evaluate the Project's Consistency With State Emissions Reduction Goals.

The DEIR/S fails to analyze adequately the Project's consistency with the state's plans and policies for reducing GHG emissions. It provides little discussion or meaningful analysis of whether the Project is consistent with these policies or will help the State meet the reduction targets that they prescribe. Instead, the DEIR attempts to downplay key state policies, including EO S-3-05 and B-30-15. DEIR at 4.7-44 ("The County does not believe that the 2050 target or the 2035 interim target are appropriate significance criteria for this Project. . . . The County does not believe that the general directives in the EOs to reduce statewide GHG emissions from 1990 levels by 40% in 2030 and 80% in 2050 are legal mandates or required to be included as a significance threshold under CEQA."). But the DEIR's reasons for ignoring state policy miss the point. Even if the County chooses not to use the reduction targets contained in the Executive Orders as significance thresholds under CEQA, it must still evaluate the Project's consistency with them.

0044-232

Under CEQA, the DEIR simply cannot ignore the question of whether the Project's emissions trajectory is consistent with the trajectory set forth in EO S-3-05, EO B-30-15, the AB 32 Scoping Plan, and the First Update to the Scoping Plan. California climate policy, as reflected in EO S-3-05, calls for reducing GHG emissions to 80 percent below 1990 levels by 2050 so as to avoid catastrophic climate impacts. This Executive Order embodies the reductions that climate scientists have concluded are needed to provide a 50-50 chance of limiting global average temperature rise to 2°C above pre-industrial levels. The AB 32 Scoping Plan incorporates this goal, establishing a "trajectory" for reaching it over time. California Air Resources Board, Climate Change Scoping Plan: A Framework for Change (2008) at 15, attached as Exhibit GHG 2.

0044-233

In May 2014, CARB approved an Update to the Scoping Plan that examines California's progress toward meeting the "near-term" 2020 GHG emission reduction goals defined in the initial Scoping Plan. California Air Resources Board, First Update to the Climate Change Scoping Plan: Building on the Framework (2014), attached as Exhibit GHG 3. It also evaluates how to align the State's "longer-term" GHG reduction strategies with other State policy priorities for water, waste, natural resources, clean energy, transportation, and land use. Subsequently, on April 29, 2015, Governor Brown signed Executive Order B-30-15, which sets an interim target in order to help state agencies achieve California's long-term reductions goals. This interim target calls for reductions in GHG emissions to 40 percent below 1990 levels by the year 2030. EO B-30-15. This newest executive order confirms that GHG emissions reductions are a top state priority and that interim targets are crucial for achieving the 2050 reductions goal of 80 percent below 1990 levels.

0044-234

Critically, meeting the statewide 2050 goals requires continuing and steady annual *reductions* in both total and per capita GHG emissions. Exhibit GHG 2 at ES-1. By contrast, the DEIR reports that the Project will nearly double direct emissions from Project sources over the next two decades. DEIR 4.7-35 (Table 4.7-9). Because state policy aims to steeply reduce GHG emissions over that same time period, it is imperative that the DEIR inform the public and decision-makers that the Project directly conflicts with the state's reduction goals. Of course, as mentioned above, that analysis should include the Project's anticipated emissions out to 2050. As the California Supreme Court has held, an agency "abuses its discretion if it exercises it in a manner that causes an EIR's analysis to be misleading or without informational value." *Neighbors for Smart Rail v. Exposition Metro Line Const. Authority* (2013) 57 Cal.4th 439, 445, 457.

0044-235

The County cannot avoid this critical analysis simply by finding that the Project would have a significant and unavoidable impact with respect to applicable plans,

0044-235
Continued

policies or regulations adopted for the purpose of reducing the emissions of GHG. DEIR 4.7-42. Assessing the full extent and severity of the Project's climate impacts is especially important in this instance, where the Project proposes no specific and credible mitigation to remedy this inconsistency. *See id*. (proposing only to rely on MM 4.7-3—compliance with current and expected future regulations governing the recovery or reuse of methane gas); *see Santiago County Water Dist.,* 118 Cal.App.3d at 831(lead agency must inform public not just *whether* an impact is significant, but *how* significant the impact will be).

As one Court of Appeal reasoned, omitting an analysis of a project's inconsistency with EO S-3-05 demonstrates a lack of a reasonable, good faith effort at full disclosure and is not supported by substantial evidence. *Cleveland National Forest Foundation v. San Diego Association of Governments* (2014) 231 Cal.App.4th 1056, as modified on denial of reh'g (Dec. 16, 2014) *review granted and opinion superseded sub nom. Cleveland Nat. Forest Foundation v. San Diego Assn. of Governments* (Cal. 2015) 184 Cal.Rptr.3d 725. Attached as Exhibit GHG 4. Although the opinion was depublished when the California Supreme Court granted review, the Court of Appeal's reasoning on this issue is instructive.

3. The DEIR Must Identify Significance Thresholds That Do Not Obscure the Project's Impacts.

As a general rule under CEQA, a project's impacts must be compared against the baseline conditions on the project site at the time of the analysis. *Neighbors for Smart Rail,* 57 Cal.4th at 455. The DEIR here does not consider the full impacts of GHG emissions as measured against this baseline, even though it admits they will approximately double. The existing GHG emissions from Project sources are 16.95 $MMTCO_2e/yr$, but will increase to 32.40 $MMTCO_2e/yr$ by 2035, the final Project year. DEIR at 4.7-35. Consequently, it is clear that permitting a massive number of new oil and gas extraction facilities will significantly increase GHG emissions. Yet rather than evaluate the Project's significance by comparing the proposed Project to the existing environmental setting, the County chooses its thresholds of significance in a way that allows it to completely ignore this fundamental CEQA tool. DEIR at 4.7-31 to -32 (establishing thresholds of significance based only on CEQA Guidelines Appendix G, and the Cap-and-Trade program).

The CEQA Guidelines explain that a lead agency should evaluate GHG emissions by: (1) comparing project emissions to the "existing environmental setting"; (2) comparing project emissions to an established threshold of significance; and (3)

0044-235
Continued

assessing project compliance with existing regulations or requirements adopted to implement a statewide, regional, or local plan to combat GHG pollution. CEQA Guidelines § 15064.4. The County's methodology, however, eliminates the first factor. While lead agencies are granted some discretion in selecting thresholds of significance, they are not permitted to choose thresholds that foreclose consideration of other evidence tending to show the environmental effect may be significant. *Protect The Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 ("[T]hreshold[s] of significance cannot be applied in a way that [] foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant."). The Project unquestionably increases the County's oil and gas production related GHG emissions by over 90 percent. The County cannot craft its thresholds of significance in a way that glosses over this massive increase.

Compounding the problem, the County also refuses to adopt a "no net increase" threshold—that is, determining that the Project would have a significant impact if emissions from the Project would result in a net increase in emissions from the Project's existing levels. While the DEIR states that "the County has determined to conservatively mitigate project direct GHG emissions to net zero" (DEIR at 4.7-38; *see also id.* at 4.7-39 (mitigation will "assure that [*sic*] no net increase in greenhouse gas emissions from the Project."), this claim cannot be squared with the nearly 90 percent increase in emissions from the Project over the next 20 years. DEIR at 4.7-44 (DEIR declaring "it is anticipated that Project GHG emissions from the oil and gas industry in Kern County will result in additional GHG emissions as set forth in Table 4.7-9"). If the County is truly committed to ensuring no net increase in CO_2 emissions from the Project, it must establish that as a threshold, and measure the Project's impacts against it.

4. The DEIR's Proposed Measures Are Inadequate to Mitigate the Project's Greenhouse Gas Emissions to Less Than Significant Levels.

Unfortunately, the GHG mitigation identified in the DEIR fails to meet CEQA's standards for effective, enforceable mitigation. The proposed measures are vague and ineffective, and the document provides no assurance that they will be enforced, let alone substantial evidence for their efficacy. To the extent that some proposed measures defer mitigation to the future, without any standards, they are also legally deficient.

0044-235
Continued

For example, Mitigation Measure MM 4.7-1 simply requires permitted stationary sources to comply with the Cap-and-Trade regulation and implement the San Joaquin Valley Air Pollution Control District's "Best Performance Standards" ("BPS")[10] for certain types of operations. DEIR at 4.7-39. But these BPS only apply to certain types of facilities. Other operations, such as wells not using thermal enhancement techniques, appear not to be subject to the BPS. And, if they are not subject to Cap-and-Trade, this mitigation measure will not apply to them at all. What's more, the SJVUPCD has expressly provided that its BPS are not mitigation measures.[11]

Mitigation Measures MM 4.7-2 and 4.7-3 are essentially toothless. Measure MM 4.7-2 simply restates the existing requirement that applicants comply with Cap-and-Trade regulations and "other applicable greenhouse gas emission control and reduction regulations" without identifying what those other regulations are or how they might apply to reduce emissions to less-than-significant levels. The measure goes on to require "[c]ompliance with the expected California Air Resources Board methane regulation." DEIR 4.7-39. This is an obvious and impermissible deferral of mitigation. This measure does not satisfy CEQA's requirement that feasible mitigation be identified to mitigate or reduce the impacts of the project under consideration.

Reliance on a future regulation, the specifics of which are unknown, is not permissible mitigation under CEQA. Merely requiring compliance with agency regulations does not conclusively indicate that a proposed project would not have a

[10] These BPS, which are not even attached as an appendix to the document, should be included in the DEIR. *See California Oak Found. v. City of Santa Clarita* (2005) 133 Cal.App.4th 1219, 1239 (relevant information may not be "buried in an appendix"). The public should not have to locate and search through another agency's documents in order to determine what mitigation measures a lead agency is actually proposing for a project.

[11] "Use of BPS is a method of determining significance of project specific GHG emission impacts using established specifications. BPS is not a required mitigation of project related impacts. Use of BPS would streamline the significance determination process by pre-quantifying the emission reductions that would be achieved by a specific GHG emission reduction measure and pre-approving the use of such a measure to reduce project-related GHG emissions." Best Performance Standard Class: Components at Light Crude Oil and Natural Gas Production, Natural Gas Processing Facilities, Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants Light Category: Components Subject or not to District Rules 4409 & 4455 Requirements (July 1, 2010). Attached as Exhibit GHG 5.

0044-235
Continued

significant and adverse impact. In *Kings County Farm Bureau,* 221 Cal.App.3d at 716, for example, the court found that the fact that the EPA and the local air pollution control district had issued the necessary air emission permits for the construction of a coal fired cogeneration plant did not nullify the CEQA requirement that the lead agency analyze the significant air quality impacts of the entire project. This principle holds doubly true where the regulation being relied upon has not yet been finalized or promulgated. Here, there is no guarantee that the new methane regulations will ever be adopted, especially since they are outside the control of the County.

Mitigation Measure MM 4.7-4 also falls short of the minimum requirements CEQA imposes for project mitigation. Under CEQA, proposed mitigation measures must be "fully enforceable" through permit conditions, agreements, or other legally binding instruments. Pub. Res. Code § 21081.6(b); CEQA Guidelines § 15126.4(a)(2). Similarly, any proposed mitigation must provide assurance that such implementation will in fact occur. *Anderson First Coalition v. City of Anderson*, 130 Cal.App.4th 1173, 1186-87 (2005). While MM 4.7-4 purports to require permit applicants to secure carbon offsets for emissions that do not fall within the Cap-and-Trade program, it provides no system to ensure that this measure is properly implemented. For example, it does not describe: (1) how officials will quantify the emissions to be offset for each permit applicant; (2) the process by which the offsets will be purchased (for instance, whether the applicant must provide proof of their purchase as part of the complete permit application); or (3) any enforcement mechanism to ensure that this requirement is actually followed. This measure should be revised to ensure that permits will not be issued and project construction may not begin until the applicant has demonstrated compliance with the mitigation measure.

Equally troubling, Measure MM 4.7-4 allows permittees to purchase offsets from third parties through an "Emission Reduction Agreement." Thus, there is no control or oversight over the offsets allowed to be purchased. In order to be effective, the allowable offsets must be restricted to those purchased from the California Air Pollution Control Officers Association Greenhouse Gas Reduction Exchange register.

The DEIR promises that Measure MM 4.7-4 will "assure that no net increase in greenhouse gas emissions [will result] from the Project." DEIR at 4.7-39. As it stands, however, this measure is aspirational, and contains no enforcement or implementation provisions that would render it adequate under CEQA. As described above, the correct way to ensure that this goal is actually accomplished is to establish "no net increase" in GHG emissions as the threshold of significance, develop an enforceable mitigation requirement (most likely as part of the Project, with the offset requirement as a

0044-235
Continued

component of the new ordinance), and then explain with substantial evidence in the record how the offset requirement and any other mitigation measures will ensure that the Project meets the "no net increase" threshold. If this approach proves difficult, it simply illustrates the challenges associated with trying to issue a project EIR for all oil and gas permitting in the County for the next 20 years.

Finally, the DEIR proposes no serious mitigation for the Project's significant and unavoidable impacts associated with applicable plans, policies or regulations adopted for the purpose of reducing GHG emissions. The document acknowledges that "[mitigation measures] MM 4.7-1 through MM 4.7-3 and the RTP mitigation measures . . . do not provide a mechanism that guarantees GHG emission reductions on a cumulative basis" and on that grounds determines that impacts will be significant and unavoidable. DEIR at 4.7-41 to -42. It proposes no additional mitigation measures, however, stating without elaboration that it will implement mitigation Measure MM 4.7-3 (discussed above). DEIR at 4.7-42. Furthermore, if the DEIR discloses the Project's inconsistency with the EO S-3-10 and B-30-15's goals for emissions reduction—as it must—it should also consider mitigation that would allow the project to avoid or minimize that inconsistency.

5. The DEIR Should Have Considered Feasible, Enforceable Mitigation Measures Beyond Mere Compliance with Other Agencies' Regulations.

By relying primarily on compliance with uncertain regulations by other agencies, the DEIR omits an array of obvious mitigation measures that could actually reduce the Project's GHG emissions. The California Air Resources Board maintains a clearinghouse of mitigation measures and control technologies to reduce non-CO_2 GHG emissions from petroleum production operations. *See* http://www.arb.ca.gov/cc/non-co2-clearinghouse/non-co2-clearinghouse.htm. The DEIR should consider whether any, if not most, of these measures are appropriate for the Project.

Also, the DEIR notably does not even attempt to mitigate the Project's construction-related GHG impacts, focusing only on mitigation for operational impacts. DEIR at 4.7-39. But many construction-related mitigation measures for GHGs exist, and the DEIR must consider them. For example, the California Air Pollution Control Officers Association, CEQA and Climate Change (2008), attached as Exhibit GHG 6, details numerous mitigation measures in its Appendices B and C, and the County must consider all feasible, applicable measures therein, including the following representative sampling of feasible measures:

0044-235
Continued

- Requiring that off-road diesel-powered vehicles used for construction be new low-emission vehicles, or use retrofit emission control devices, such as diesel oxidation catalysts and diesel particulate filters verified by the California Air Resources Board.

- Utilizing the combination of construction materials with the lowest carbon footprint.

Given that this is a project- and not a program-level EIR, the document cannot simply defer the implementation of concrete measures to a later date. Any purported difficulty in proposing concrete, enforceable mitigation measures and control technologies at this time simply illustrates the inadvisability of attempting to conduct a project-level EIR for a permitting regime of this size and scope.

H. The DEIR's Analysis of Growth-Inducing Impacts Is Inadequate.

0044-236

CEQA requires that an EIR include a "detailed statement" setting forth the growth-inducing impacts of a proposed project. Pub. Res. Code § 21100(b)(5); *City of Antioch v. City Council of Pittsburg* (1986) 187 Cal.App.3d 1325, 1337. A proposed project is either directly or indirectly growth-inducing if it: (1) fosters economic or population growth or requires additional housing; (2) removes obstacles to growth; (3) taxes community services or facilities to such an extent that new services or facilities would be necessary; or (4) encourages or facilitates other activities that cause significant environmental effects. CEQA Guidelines § 15126.2(d). The CEQA Guidelines expressly recognize that growth-inducing impacts can occur through extension of infrastructure. CEQA Guidelines App. G, § XIII(a). While the growth-inducing impacts of a project are not necessarily adverse, the secondary impacts (such as loss of open space/habitat/agricultural lands and impacts to air quality and transportation) may be significant and adverse. In such cases, the secondary impacts of growth-inducement must be disclosed as significant secondary or indirect impacts of the project.

The DEIR's treatment of growth-inducing impacts is entirely perfunctory and relies on conclusory statements unsupported by evidence. Its ultimate determination that "any link between the Project and growth in Kern County would be speculative," DEIR at 5-8, is unwarranted and does not excuse the County from conducting a legally sufficient analysis of these impacts. *See Save our Peninsula Committee,* 87 Cal.App.4th at 131 (EIR inadequate where it failed to analyze the growth-inducing effects of proposed offset mitigation).

1. The DEIR's Analysis of Growth-Inducing Impacts Is Too Cursory to Adequately Inform the Public or Decision-makers.

0044-237

The DEIR's analysis of growth-inducing impacts is wholly inadequate and falls far short of the "detailed statement" required by law. Pub. Res. Code § 21100(b)(5). The section is approximately one page and contains five scant paragraphs. Of these, only three paragraphs provide any Project-specific analysis. In fact, the County spends nearly as much space defending its abbreviated approach (including a long-winded review of the facts of an entirely unrelated case) as it does providing actual, Project-specific analysis. This is no substitute for the analysis that CEQA requires.

One factor courts consider in determining the requisite level of detail for an EIR's growth-inducing impacts is the likelihood that future effects will themselves require analysis under CEQA. *Napa Citizens for Honest Government,* 91 Cal.App.4th at 369. Here, the County will not conduct any supplemental or subsequent environmental review under CEQA section 21166 and CEQA Guidelines section 15162 because future oil and gas permit approvals will be ministerial and therefore exempt from CEQA. It is all the more important, then, that the DEIR consider the Project's growth-inducing impacts at this time and make a good faith effort to disclose them before the Project is approved. The document's failure to do so in any detail violates CEQA's basic purpose of fully informing decision-makers and the public of the Project's potential significant environmental effects. CEQA Guidelines § 15002(a).

2. The DEIR Provides No Credible Evidence to Support Its Conclusions Regarding Oil and Gas and Production Levels and Prices.

0044-238

The DEIR attempts to downplay future oil and gas production levels in the County (and thus the associated indirect effects on population, employment, and housing) by distinguishing the region's geology from other states that have undergone "fracking booms." It states that "[i]n the absence of any dramatic technical advances, substantial increases in oil and gas production in the County—and substantial increases in the population and housing activity associated with oil and gas production—are not anticipated to increase appreciably above the baseline 2012 level." DEIR at 4.13-9. But it offers little support for this determination.

Instead, the DEIR points to the Energy Information Administration's ("EIA") 2014 downward revision of the amount of recoverable oil and gas in the

0044-238
Continued

Monterey Shale formation. *Id.* This broad estimate, which covers territory well outside of Kern County, is not necessarily a sound basis for estimating future production levels in the County. Moreover, the evidence contradicts, rather than supports, the DEIR's conclusion. The EIA revision did not downwardly revise its estimate of the actual amount of oil and gas that is contained in the formation. In fact, the revision did not even affect predictions of near-term (2010 to 2040) production—that is, during the Project's lifetime—which is expected to rise. *See* U.S. Energy Information Administration, Assumptions to the Annual Energy Outlook 2014, *Oil and Gas Supply Module* (June 11, 2015), at 116 (estimate for economically recoverable oil from Monterey shale play between 2010 and 2040 rose from 14,000 barrels/day to 57,000 barrels/day), attached as Annex 1 to Exhibit PD 1; *see also* E. McAllister, Reuters, *UPDATE 2-U.S. EIA cuts recoverable Monterey shale oil estimate by 96 pct*, May 21 2014, attached as Exhibit GI 1.

What's more, the EIA's downward revision was based on new estimates of how much oil and gas could be extracted from the formation *given currently available technologies*. *Id*. It is reasonably foreseeable that new technologies will emerge during the twenty-year life of the Project, just as they have over the past twenty years, that will allow for removal of previously unrecoverable deposits. The DEIR must take this potential into consideration if it is to convey a realistic picture of oil and gas production that will occur as a result of the Project. Exhibit PD 1.

The DEIR also cites for support the "dramatic drop in the global price of oil in 2014" DEIR 4.13-9. While it is true that oil and natural gas markets are highly volatile, as evidenced by the recent drop in oil prices, these markets experience corresponding upturns as well, and oil and gas prices can be expected to increase considerably during the life of the Project. *See* Kira Brecht, U.S. News, *Oil Stocks May Have Hit Bottom: Here's What to Expect Next*, July 21, 2015, attached as Exhibit GI 2. The DEIR ignores this fact. Instead, it selects a low-point on the market to use as a "baseline" for its conclusion that economic activity, and therefore growth, will not significantly increase as a result of the Project. DEIR at 4.13-9. But this low point is not the appropriate basis for measuring oil prices in the future or the growth that will result when oil prices rise again, as they inevitably will. *See Communities for a Better Env't,* 48 Cal.4th at 327-28 ("[A] temporary lull or spike in operations that happens to occur at the time environmental review for a new project begins should not depress or elevate the baseline. . . .").

0044-238
Continued

The DEIR's approach of downplaying production estimates appears even less tenable given the document's statement of Project Applicant Objectives, which call for growth of the County's oil and gas industry:

- Provide for economically feasible and environmentally responsible *growth* of the Kern County oil and gas industry.

  . . .

- *Increase oil and gas exploration and production in Kern County* as a means of reducing California's dependence upon foreign sources of energy.

DEIR at 1-6 (emphases added). The DEIR cannot credibly claim that the Project will not meet these Project Applicant Objectives in order to ignore growth-inducing impacts. Especially as the DEIR declines to consider alternatives to the Project on the basis that they will not meet these same Objectives, the County's approach is indefensible. *See* DEIR at 1-21, 6-13 (rejecting an alternative calling for fewer wells as infeasible in part because "it would not achieve the basic Project objectives of the Applicant (i.e., to provide for growth of the Kern County oil and gas industry. . .)").

By relying only on unsupported conclusions about oil and gas production and prices, the DEIR underestimated the growth-related impacts from the Project, in violation of CEQA. *See Ocean Advocates v. U.S. Army Corps of Engineers* (9th Cir. 2005) 402 F.3d 846, 855, 867, 870 (in National Environmental Policy Act case, court found that the agency's environmental review failed to properly analyze the growth-inducing impacts of permitting an oil refinery pier extension).[12]

3. The DEIR Ignores Growth-Inducing Impacts from Building Additional Infrastructure.

0044-239

The DEIR's analysis of growth-inducing impacts relies upon a Project Description that suffers from several fundamental flaws, as described in section II, above. For example, the DEIR does not describe all reasonably expected future drilling,

[12] The National Environmental Policy Act ("NEPA") is CEQA's federal equivalent. California courts have long "[r]ecogniz[ed] that the California act was modeled on the federal statute . . . [and] consistently treated judicial and administrative interpretation of the latter enactment as persuasive authority in interpreting CEQA." *Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 201.

0044-239
Continued

all related infrastructure, or the number of exploratory or injection wells that will occur as a result of the Project. These omissions, in turn, cause it to gloss over the potential growth-inducing impacts from new roads, electricity lines, and other oil and gas infrastructure.

For example, while the DEIR admits that the Project will involve the construction of new "temporary and permanent access roads," DEIR at 5-7, it does not provide the public with a clear and full understanding of the projected road construction. The document states simply, "[s]ome roads may be removed and restored after initial construction; some may be reduced in size; and others may be maintained at their constriction size for the life of the associated oil and gas operation." *Id.* at 5-7 to -8. This passage leaves many questions unanswered, including, for instance, how many miles of roadway will be constructed; how the "temporary" roads will be removed, restored, or reduced in size; and which areas of the County the most new roads are likely to be located in. Instead, the DEIR recites that the roads "would provide for access into oil and gas construction and operation areas and would not provide access into other areas thereby promoting growth-inducing development. No other development would be anticipated as a result of these roads, and oil and gas development would tend to preclude other development from happening." DEIR at 5-8. But many of the oil and gas wells projected to be drilled in Kern County will be located on so-called "split estates," where the surface owner retains the surface rights to development of the land. The roads built as part of the Project could lead to increased development in new areas of the County by increasing accessibility to these locations and reducing the barriers to surface development. *See* CEQA Guidelines § 15126.2(d). In the absence of supporting evidence, the County cannot jump immediately to the conclusion that rural road-building will not promote growth in the County.

The DEIR also acknowledges that the Project will involve expanding or creating new infrastructure to transmit electricity. DEIR at 3-40 ("[e]xtending existing high-voltage electric transmission lines (i.e., lines above 50 kV) to provide a permanent supply of electricity to a new well pad or facility may be required.") But it does not analyze where these extensions will occur, claiming that power line construction "is not within the scope of this EIR." *Id.* Without at least a basic explanation of how the Project will affect the power grid in the County, the DEIR cannot possibly conclude, as it does, that the Project will not create any new growth as a result of its contribution to energy supply. DEIR at 5-8. Like roads, increased utility coverage and grid capacity can reduce barriers to development. The DEIR may not sidestep this result by claiming, flatly, and

0044-239
Continued

with no evidentiary support or analysis, that "it is anticipated growth that drives energy-production projects and development, not vice-versa." *Id.*

Finally, the DEIR's paltry analysis of growth-inducing impacts makes no mention of the pipelines, pumps, power stations, and other related infrastructure necessary to transport crude oil from wells to refineries. The document must include a discussion of whether, and how, this additional infrastructure may affect growth in the County and the associated impacts.

0044-240

4. The DEIR Provides No Evidence to Support Its Conclusion That the Project Will Not Result in Employment-Related Growth.

The DEIR notes that the County's civilian labor force grew by 38% between 2000 and 2010. DEIR at 4.13-4. The energy and natural resources industry and the transportation, logistics, and advanced manufacturing industry increased jobs by 16% during that same period. *Id.* And, citing the California Employment Development Department, the DEIR acknowledges that from 2002 to 2012, employment in the oil and gas sector in Kern County almost doubled, from 6,900 to 12,300. DEIR at 4.13-5.

Despite this considerable growth in the industry over the past 12 to 15 years, the DEIR astonishingly declares, without evidence, that no employment-related growth would occur as a result of the Project. The document claims that any new jobs created will be taken by County residents: "Given the history of oil and gas development within Kern County . . . any nominal increase in the oil and gas workforce in the future would likely be comprised of local Kern County residents. As such, the nominal population growth would not stress certain existing public services . . . ." DEIR at 4.14-19. The DEIR provides no evidence for this factual assertion. Instead, it speculates about the nature of the existing workforce: "The pool of experienced oil and gas workers residing in Kern County is sufficient to provide the industry workforce over the lifetime of the Project, and any nominal increase in the oil and gas workforce in the future would likely continue to be comprised of local Kern County residents . . . ." DEIR at 4.13-11.

The DEIR's conclusion is suspect on its face. The DEIR states that the existing "pool" of resident oil and gas workers will supply the workforce over the lifetime of the Project, but the Project's lifetime is twenty years, extending to 2035. The existing pool of experienced workers will diminish over the next two decades as workers age and retire, and new workers will be required to replace them. But the DEIR does not explain whether existing workers will be replaced by Kern County residents or by new

0044-240
Continued

residents with experience. In the latter case, the Project would result in considerable new growth and associated impacts; these are not analyzed in the DEIR.

The DEIR additionally claims that " unemployment in Kern County is approximately 10.4%; therefore, there would be an available labor pool to fill the anticipated nominal growth in employment." DEIR at 4.13-11. But by this logic, all projects located in areas with non-negligible unemployment rate—that is to say, nearly all projects—could be found to have little or no impact on population since employment opportunities created by the project would "absorb" the pool of unemployed residents. This argument is both economically unsound and unsupported by evidence. The DEIR cannot avoid analyzing and disclosing the potential employment-related growth impacts of a project that spans an entire industry simply by pointing to the County's prevailing unemployment rate.

Finally, the DEIR glosses over the fact that increasing economic development is one of the Project's stated objectives. DEIR at 1-5 (Project objective is "Encourage ongoing economic development by the oil and gas industry that creates quality, high paying jobs and promotes capital investment in Kern County. . ."). Indeed, relying on a 2011 economic study that it commissioned, Project Proponent Western States Petroleum Association claims the following:

> [F]or every job created [in California] by an oil company or other business directly associated with petroleum, another 2.5 indirect jobs are created in the economy. This multiplier effect is especially pronounced in the refining and oil production areas. This multiplier effect is especially pronounced in the refining and oil production areas. For every direct refinery job in California, another nine jobs are created. For every job in California's oil and gas production fields, another 5.4 jobs are created.

Western States Petroleum Association, weblog, *Petroleum Industry Creates Jobs for Californians,* accessed Aug. 31, 2015, attached as Exhibit GI 3. The DEIR therefore cannot credibly claim, without providing substantial evidence, that there will be no employment-related growth as a result of the Project. The County's faulty analysis falls short of CEQA's requirements. *See City of Davis v. Coleman* (9th Cir. 1975) 521 F.2d at 674-75 (in CEQA and NEPA case, court rejected agency's argument that growth would occur with or without a new highway interchange project and that the project would simply accommodate this growth).

0044-241

I. The DEIR's Mitigation for the Project's Air Quality Impacts Is Inadequate.

The Project is located within the southern portion of the San Joaquin Valley Air Basin. DEIR at 4.3-1. The Basin has severe air pollution problems, especially with respect to ozone emissions. The American Lung Association ranks Kern County as the *fifth worst county in America* for ozone pollution, and consistently gives the County an "F" grade—the worst—for air quality.[13] Similarly, it rates Bakersfield as the third worst city in the Country for ozone pollution.[14] The direct and indirect air pollutant emissions from oil- and gas-related activities is a major contributor to this poor air quality.

The oil and gas industry is the Country's largest industrial source of emissions of volatile organic compounds (VOCs), a group of chemicals that contribute to the formation of ground-level ozone. U.S. EPA, "Oil and Natural Gas Pollution Standards" attached as Exhibit AQ 5. Exposure to ozone is linked to a wide range of health effects, including aggravated asthma, increased emergency room visits and hospital admissions, and premature death. *Id.* The oil and natural gas industry also is a significant source of air toxics such as benzene, ethylbenzene, and n-hexane, which are known or suspected of causing cancer and other serious health effects. *Id.* Studies suggest that air emissions from the oil and gas industry are linked to poor health outcomes[15] and reduced agricultural yields.[16] Thus, air pollution, especially from ozone emissions, is arguably the biggest impact from oil and gas, especially in the San Joaquin Valley.

0044-241
Continued

Given the existing air pollution in the Project study area, and the Project's potential to significantly contribute to that pollution, one would expect the DEIR to provide a comprehensive program to mitigate these impacts. Yet the DEIR is grossly inadequate in that respect, failing to identify all feasible mitigation to reduce the Project's impacts to air quality to less than significant levels. Instead, in violation of CEQA, the DEIR proposes a narrow range of ineffectual mitigation measures that will not adequately mitigate the Project's air quality impacts.

For example, the DEIR's primary air quality mitigation is MM 4.3-1, which simply requires permit applicants to obtain necessary permits from the San Joaquin Valley Air Pollution Control District. DEIR at 4.3-68. This "mitigation," which adds nothing to the existing regulatory scheme, cannot satisfy CEQA. As the courts explain, merely requiring compliance with existing agency regulations does not conclusively indicate that a proposed project would not have a significant and adverse impact. *See Kings County Farm Bureau,* 221 Cal.App.3d at 716. Compounding the problem, the DEIR elsewhere states that the San Joaquin Valley Air Pollution Control District will itself rely on the certified EIR to satisfy CEQA's environmental review requirements when it is issuing individual permits to oil and gas applicants in the future. DEIR at 1-2. The County cannot use this circular process to avoid fully mitigating air emissions that will result from the Project.

The DEIR's other air quality mitigation measures are generally vague, unenforceable, and/or defer mitigation until an uncertain future date. *See* MM 4.3-2 (applicants must develop future "Fugitive Dust Plan"); MM 4.3-3 (off-road construction vehicles must meet California emissions standards and be properly maintained); MM 4.3-4 (on-road construction vehicles must meet California emissions standards and be properly maintained); MM 4.3-5 (applicants should use (unenforceable) setbacks, or, in the alternative, use suggested "'risk minimization measures' or other such measures that are demonstrated by the Applicant to achieve a level of risk less than the threshold level"); MM 4.3-6 (applicants must distribute information on Valley Fever and offer workers masks); MM 4.3-7 (applicants must submit an undefined "Odor Management Plan"); MM 4.3-8 (for certain emissions, applicants must pay an air quality mitigation fee or fund retrofits). These paltry measures do not meet CEQA's requirements for detailed, specific, and enforceable mitigation. In particular, the DEIR may not delegate to the applicant the responsibility to enforce mitigation. *See California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 194.

At the same time, the DEIR fails to include additional concrete measures that *could* effectively reduce the Project's air quality impacts. For example, the DEIR

0044-241
Continued

considered Alternative 5, a Low-Emission Enhanced Oil Recovery ("EOR") Alternative. DEIR at 6-25. This alternative would require oil and gas permit applicants to implement low-emission EOR technology as a condition of permit approval for new and replacement steam generators, and to replace certain inefficient existing steam generators. *Id.* The DEIR admits that this alternative "would have reduced air quality and greenhouse gas impacts, as compared to the Project." *Id.* Thus, this is a proven, feasible mitigation measure that could reduce the Project's significant impacts on air quality. However, the County inexplicably avoided including this requirement as mitigation for the Project. The County must revise the DEIR to include all feasible mitigation measures, including the emissions-reduction strategies set forth as the Low-Emission Enhanced Oil Recovery Alternative. Pub. Res. Code § 21002.1(b); CEQA Guidelines § 15126.4.

Despite the patent deficiency of the DEIR's proposed mitigation, the document concludes that after mitigation there will be *no significant air quality impacts* from the Project, except that the Project would generate a significant and unavoidable level of odors. DEIR at 1-14. This conclusion is wholly unwarranted. The DEIR must be revised to consider additional mitigation for the Project's air quality impacts, including appropriate measures proposed by experts and the public up to the close of the final public hearing on the DEIR.

IV. The DEIR's Analysis of Alternatives Is Inadequate.

0044-242

The DEIR's analysis of alternatives falls short. Under CEQA, a proper analysis of alternatives is essential to comply with the Act's mandate that significant environmental impacts be avoided or substantially lessened where feasible. Pub. Res. Code § 21002; CEQA Guidelines §§ 15002(a)(3), 15021(a)(2), 15126(d); *Citizens for Quality Growth v. City of Mount Shasta* (1988) 198 Cal.App.3d 433, 443-45. Indeed, the analysis of alternatives lies at the "core of an EIR." *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564. As stated in *Laurel Heights Improvement Association*, "[w]ithout meaningful analysis of alternatives in the DEIR, neither the courts nor the public can fulfill their proper roles in the CEQA process . . . . [Courts will not] countenance a result that would require blind trust by the public, especially in light of CEQA's fundamental goal that the public be fully informed as to the consequences of action by their public officials." 47 Cal.3d at 404.

Properly developing, evaluating, and comparing project alternatives are thus key to the environmental review process. However, the DEIR suffers from an inadequate analysis of the Project alternatives as discussed below.

0044-243

A. The DEIR Does Not Provide an Adequate Comparative Analysis of the Impacts of Each Alternative.

The DEIR/S does not contain adequate analysis comparing the alternatives' respective environmental impacts. Under CEQA, the alternatives analysis "must contain sufficient detail to help ensure the integrity of the process of decision-making by precluding stubborn problems or serious criticism from being swept under the rug." *Kings County Farm Bureau,* 221 Cal.App.3d at 733 (citing cases). An EIR that does not produce adequate information regarding alternatives cannot achieve the EIR's dual purposes of enabling the reviewing agency to make an informed decision and ensuring that the decision-maker's reasoning is accessible to the public. *Id.* Readers must be able to "evaluate [alternatives'] comparative merits." *Id.* A thorough comparison of the Project alternatives' impacts is therefore crucial to a successful environmental document. Unfortunately, the DEIR fails to provide this information. It evaluates each alternative only against the proposed Project. Then, instead of supplying an actual qualitative or quantitative comparison of the impacts of each alternative, the document merely summarizes, in abbreviated, tabular form, the significance of each alternative's impacts. *See* DEIR at 6-29 to -30 (Table 6-1).

The DEIR's truncated approach is no substitute for the in-depth comparison of each alternative's impacts that the law and common sense require. Table 6-1 should provide detailed descriptions of the alternatives' impacts, and a means for readers to quickly and easily weigh them. For example, each cell in a row could contain a numeric ranking on a scale of 1 to 5 of the extent of that impact.

The document's current approach also prevents the public from understanding the effect on the environment of each alternative *as a whole* in comparison to each other alternative. Before it discusses the alternatives in any detail, the DEIR merely "summarizes" the Project's impacts for each category of impacts considered. *See* DEIR at 6-2 to -9. This adds nothing to the discussion and does not give readers a clear understanding of the impacts that each alternative will have, respectively, in each category, as compared against one another. In addition to Table 6-1, the DEIR should provide detailed narrative analysis and a comprehensive discussion comparing the extent of the alternatives' impacts to one another, not just to the proposed Project. This discussion should be organized by impact category.

0044-244

B. The County May Not Use Alternatives as a Justification for Failing to Consider Feasible Mitigation for the Project's Significant Impacts.

Under CEQA, the ultimate purpose of alternatives and mitigation is the same: to avoid or substantially lessen a project's significant environmental impacts. Pub. Res. Code § 21002; CEQA Guidelines §§ 15126.4(a)(1), 15126.6(a). Whether this purpose is achieved by selecting an alternative to the proposed project, or by incorporating mitigation measures, or both, is unimportant in light of the alternative's or mitigation measure's ability actually to avoid or reduce environmental impacts. The County turns this logic on its head by crafting project alternatives in order to preclude consideration of key mitigation measures. The DEIR builds mitigation measures into proposed alternatives which are then rejected from consideration in the EIR, or, if they are considered, will likely be rejected in favor of the Project. Then, it reasons that if the measure has been included as part of an alternative, it need not be considered as mitigation for the proposed Project. But the mere fact that an environmentally-protective condition is included as a component of an alternative is no reason for excluding it from consideration as a potential mitigation measure for the proposed project. The DEIR cannot reject feasible mitigation measures for the Project on the sole ground that they are part of Project alternatives.

For example, during the public scoping period the public suggested several mitigation measures pertaining to air quality. DEIR at 4.3-121 to -22. One of these measures proposed requiring oil and gas projects to generate their own clean electricity during production using photovoltaic solar, direct line power, or both, to eliminate all need for operational power diesel generation onsite. DEIR at 4.3-122. The DEIR responds to—and apparently dismisses as infeasible—this suggested measure by stating that "[i]ncreasing use of renewable energy is considered in an Alternative to this EIR." *Id*. The DEIR does not identify which alternative it is referring to. However, it elsewhere states that it eliminated renewable energy alternatives, including solar, from full consideration. DEIR at 6-14 to -17.[17] Thus, the County appears to reason that

[17] The only alternative actually considered that resembles the suggested "clean energy" mitigation measure is the "Low-Emission EOR Technology Alternative," which the DEIR admits would result in reduced air quality and GHG impacts compared to the Project. DEIR at 6-25; *see also id.* at 6-29. But this alternative would only require that all new and replacement steam generators for thermal EOR activities would be required to implement low-emission steam generation technology, such as the ClearSign Duplex

0044-244
Continued

including measures in an alternative—even one that it rejects from full consideration in the EIR—categorically forecloses considering those measures, or any variation or subset thereof, as mitigation for the proposed Project.

This reasoning is predicated on a false dichotomy. CEQA requires that reasonable, feasible mitigation be considered where a project may have significant impacts. Pub. Res. Code §§ 21002, 21002.1(a). The fact that requiring the use of clean electricity during production was included as part of a rejected project alternative does not mean that no such mitigation measures may be proposed for the Project. For instance, the DEIR could easily include mitigation measures for the Project requiring that emitters use clean electricity for a specific percentage of their operational energy needs. These opportunities for mitigation are lost, however, when the entire category of clean electricity generation is taken off the table.

Similarly, the DEIR's "Recycled Water Alternative" would require sources to treat and recycle produced water and put it to an alternative use, such as agriculture. DEIR at 6-26. But in considering mitigation for the Project's impacts to hydrology and water quality, not a single mitigation measure addresses treatment and reuse of produced water, presumably because this is already addressed in the Recycled Water Alternative. *See* DEIR at 4.9-146 to -147 (setting forth mitigation measures MM 4.9-1 through 4.9-6). As it does with clean energy, the DEIR thus appears to take the position that if the measures form the basis of an alternative they must be excluded entirely from consideration as mitigation for the proposed Project. This all-or-nothing approach is untenable. The DEIR may not use measures' inclusion as alternatives as the basis for rejecting them outright as mitigation for the proposed Project.

C. The DEIR's Conclusion That the CUP Alternative Is Environmentally Inferior to the Project Is Unsupported By Substantial Evidence.

0044-245

The DEIR improperly concludes that Alternative 2 (the "CUP Alternative"), is environmentally inferior to the Project. Under that alternative, future oil and gas drilling projects in the County would require a discretionary conditional use permit approval. DEIR at 6-20. The CUP Alternative would amend Zoning Ordinance Chapter 19.98 to establish updated development standards and conditions to address environmental impacts of pre-drilling exploration, well drilling and the operation of wells

---

Tile combustion technology or the equivalent. DEIR at 6-25. The measure says nothing about clean energy, including photovoltaic solar or direct line power.

0044-245
Continued

and other oil and gas production-related equipment and facilities, including exploration, production, completion, stimulation, reworking, injection, monitoring, and plugging and abandonment. *Id.* The DEIR acknowledges that this alternative would allow for the County to consider the potential environmental effects for each permit on a case-by-case basis. *Id.* That is, under this alternative mitigation would be site-specific and tailored to ensure that it addressed the individual impacts from each permit. Yet the DEIR manages to find that the CUP Alternative is inferior to the Project, declaring that "[i]n practice, the Project's ministerial approval procedure would be more protective of the environment overall than would Alternative 2." *Id.*

This conclusion is not credible or supported by substantial evidence. The County bases it on the assumption that the CUP would not include the "comprehensive avoidance and mitigation program specifically designed to reduce the effects of the County's entire oil and gas industry" that the Project offers. *Id.* But there is no reason that this should or need be the case. As explained in the DEIR, the CUP Alternative would amend Zoning Ordinance Chapter 19.98 to establish updated development standards and conditions to address the environmental impacts of oil and gas development. These updated development standards and conditions can and should include feasible industry-wide mitigation measures, including most of those proposed in the DEIR for the Project. In other words, the CUP Alternative offers the opportunity for site-specific impact mitigation of individual *in addition to* industry-wide mitigation, not *instead of* it.

The County additionally argues that the CUP alternative is inferior because it would not address "regional conservation priorities." DEIR at 6-20. But it nowhere explains what these so-called regional conservation priorities are or why site-specific mitigation will not address them. Moreover, as explained above, there are no grounds for asserting that the CUP Alternative cannot not include industry-wide mitigation. Thus, the County has no basis for determining that the CUP Alternative is environmentally inferior to the Project.

V. A Revised DEIR Must Be Recirculated for Public Review and Comment.

0044-246

Because of the inadequacies discussed above, the DEIR cannot form the basis of a final EIR. CEQA requires lead agencies to prepare and recirculate a supplemental draft "[w]hen significant new information is added to an environmental impact report" after public review and comment on the earlier draft EIR. Pub. Res. Code § 21092.1. The opportunity for meaningful public review of significant new information is essential "to test, assess, and evaluate the data and make an informed judgment as to

0044-246
Continued

the validity of the conclusions to be drawn therefrom." *Sutter Sensible Planning, Inc. v. Sutter County Board of Supervisors* (1981) 122 Cal.App.3d 813, 822; *see also City of San Jose v. Great Oaks Water Co.* (1987) 192 Cal.App.3d 1005, 1017. An agency cannot simply release a draft report "that hedges on important environmental issues while deferring a more detailed analysis to the final [EIR] that is insulated from public review." *Mountain Lion Coalition v. California Fish and Game Comm'n* (1989) 214 Cal.App.3d 1043, 1052.

0044-247

In order to cure the egregious flaws in the DEIR identified in this letter, the County must obtain substantial new information to adequately assess the proposed Project's environmental impacts, and to identify effective mitigation and alternatives capable of alleviating the Project's significant impacts. This new information will clearly necessitate recirculation. CEQA requires that the public be given a meaningful opportunity to review and comment upon this significant new information in the form of a recirculated draft EIR.

Very truly yours,

0044-1

The comment is a general introduction. No response is necessary and it is noted for the record.

0044-2

The comment is a general introduction. No response is necessary and it is noted for the record.

0044-3

The Revised Amended Ordinance would establish a ministerial permit system. Please see GR-1 regarding the ministerial permitting process. Commenter is legally incorrect in describing a ministerial permit proces as an "as of right" process. Only activities that comply with the scores of substantive and procedural standards imposed by the Ordinance and EIR may be issued a ministerial permit under the Site Conformity Review or Minor Conformity Review process. This comment that the Revised Amended Zoning Ordinance provides no further environmental review is inaccurate. The revised Ordinance includes exclusions (e.g., cogeneration plants, landfills, etc.), oil and gas operations requiring Conditional Use Permits, oil and gas cogeneration plants and landfills, and produced water treatment facilities used for third party use (e.g., agricultural irrigation). The Revised Amended Ordinance has been further revised to include a cap of 3,649 well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR. Any well permit applications over this cap may be processed only during the following year, or with additional CEQA review as described in the Revised Amended Ordinance. This provision will ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0044-4

The commenters' opinion is noted for the record. The opinion is an unsubstantiated conclusion for which a substantive response is not required by CEQA. Also noted for the record is the fact that the commenter is a longstanding opponent of hydraulic fracturing, among other oil and gas extraction activities, and proponent of municipal regulations that ban oil and gas extraction. See, e.g., http://earthjustice.org/features/using-municipal-zoning-to-limit-or-ban-fracking-in-california-communities and [pdf - provided under separate cover]

0044-5

0044-10

Commenter's opinion is noted for the record.

0044-11

Please see GR 1 and GR 2 regarding the level of detail required in a project EIR.

0044-12

Please see GR-1 regarding the ministerial permit process and GR 2 regarding the approach to County-wide analysis of the Project. As explained in the Project Description and impact analyses, this EIR analyzes the categories of impacts noted by the commenter based on projected levels of oil and gas activity. See also GR-8 for further explanation of the well projections. In addition, the EIR discourages new ground disturbance activities, and anticipates that most oil and gas activities will continue to occur in "Tier 1" areas where oil and gas development is the dominant surface land use.

The surface owner of a "split estate" has property rights to the surface that are subordinate, under applicable constitutional and statutory law, to the rights of the subsurface owner to access and extract oil and gas. As provided by California Civil Code section 3522, one who grants something to another person is presumed to grant whatever is essential to its use. California courts have long held that that the right of entry to the surface is incident to the grant of mineral rights and exists even without an express grant. *Callahan v. Martin* (1935) 3 Cal. 2d 110, 125–26; *Dabney-Johnston Oil Corp. v. Walden* (1935) 4 Cal. 2d 637, 649. If the Revised Amended Ordinance were to infringe on such rights, the County would be subject to claims by the mineral owners for the "taking" of property rights. Land use regulations can constitute improper takings under both the federal and California constitutions if they go too far and impact constitutional rights to property. *See e.g., Lockaway Storage v. Alameda*, 216 Cal. App. 4th 161, 184 (2013). Please see GR 4 regarding surface owner rights.

The EIR and Amended Ordinance impose more than 100 new restrictions and procedural mandates to protect the environment, and to improve the collaboration required between surface and mineral owners within the constraints of the California constitution and statute. Please refer to GR-4 re surface owner rights. Surface spacing of wells is regulated by DOGGR to assure protection of, and maximize extraction from, oil fields. Impacts and mitigation for agricultural parcels, occupied habitat, and groundwater aquifers are discussed in chapters 4.2, 4.4 and 4.9. Impacts to scenic vistas are discussed in chapter 4.1, which concludes that oil and gas extraction and production equipment is visually incompatible with open space and rural agricultural vistas, and hence this impact is considered significant and unavoidable.

0044-13

Commenter's opinion is noted for the record.

0044-14

The commenter's opinion is noted for the record.

0044-15

See GR 1.

0044-15 cont'd

See GR 1.

0044-16

If by "no other opportunity" commenter is referring to a new CEQA document for those activities that do not require a new discretionary permit from the County, commenter is incorrect in that responsible agencies are also subject to CEQA in making their discretionary decisions and if there are significant new or worse impacts than evaluated in this EIR then under Cal Pub Res Code 21166 further CEQA review would be required. Additionally, further CEQA review would be required for oil and gas related activities that require a discretionary approval by the County, or that fall outside the scope of the Amended Ordinance and this EIR.

0044-17

The comment includes a partial quotation from Kostka and Zischke, "Practice Under the Environmental Quality Act", Second Edition, Section 19.22, stating that no further environmental review is required after a project receives all necessary discretionary approvals. As the treatise goes on to state: "Changes to a project that are sufficiently major to require a further discretionary approval, however, will trigger an evaluation of the need for further environmental review." Oil and gas production is subject to other discretionary permit approval requirements from state agencies such as DOGGR, the San Joaquin Valley Air Pollution Control District, the Regional Water Quality Control Board and the California Department

of Fish and Wildlife. In addition, the Revised Amended Ordinance has been further revised to include a cap of 3,649 new well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR, ensuring that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0044-18

CMT 1: The commenter's opinion is incorrect as a matter of law: If future technologies cause new or significantly worse adverse impacts than those impacts forecast by this EIR, then further CEQA review would be required under 21166.

CMT 2: It is not clear to which "resources" the commenter is referring. The Draft EIR for the first requires, for example, that oil and gas activities fully offset air emissions to achieve a "no net increase" standard for non-attainment criteria pollutants to protect air quality. Conservative estimates are provided for new ground disturbance activities, and compensatory mitigation is required in both previously undisturbed areas and agricultural lands for biological resource impacts (even for unoccupied habitat).

CMT 3: This EIR forecasts impacts for the full range of impact categories required to assessed under CEQA, with implementation tracked through the MMRP. As set forth in the Revised Amended Ordinance, no more than 3,649 new well permits can be issued in per year, for example. Please see GR-1 and GR-2, discussing the ministerial permitting process and regarding the approach to County-wide analysis of the Project.

0044-19

See GR 1 and 2.

0044-20

The commenter's opinion is noted for the record.

0044-21

The commenter's "reservation of rights" is noted for the record.

0044-21 cont'd

Commenter's legal citations are noted for the record and included in the FInal EIR.

0044-22

Please see GR 16 regarding CEQA requirements for specificity, enforceability and performance standard in mitigation measures.

0044-23

Commenter's opinion is noted for the record. Please refer to GR 30.

0044-24

Please see GR 16 and also GR 19 regarding CEQA requirements for a mitigation monitoring and reporting program.

0044-25

Please see GR 16 regarding CEQA requirements for mitigation measures.

0044-25 cont'd

Please see GR 16 regarding CEQA requirements for mitigation measures.

0044-26

See GR 30.

0044-27

The commenter's opinion is noted. Please see GR 16, which discusses the approach to mitigation measures. The mitigation measures in this EIR are not improperly deferred and meet the requirements for clarity and specificity under CEQA. The commenter's opinion that the level of detail required in the EIR is "high" is noted. As discussed in GR 1, CEQA applies to the adoption of ordinances and regulations that remain in effect until amended or repealed. Adoption of such ordinances and regulations authorizes certain conduct as lawful without further discretionary agency review. The commenter provides no legal support for the contention that the indefinite term of ordinances and regulations requires an unusually "high" level of detail in the EIR or mitigation measures. In fact, CEQA provides that implementation of the ordinance or regulation itself is a lawful means of assuring ongoing enforcement of requirements to avoid or lessen significant effects on the environment. "A requirement that a project comply with specific laws or regulations may also serve as adequate mitigation of environmental impacts in an appropriate situation." Kostka and Zischke, "Practice Under the Environmental Quality Act", Second Edition, Section 14.15; see *Oakland Heritage Alliance v. Oakland* (2011) 195 Cal. App. 4th 884, 906 ("a condition requiring compliance with regulations is a common and reasonable mitigation measure, and may be proper where it is reasonable to expect compliance"). Moreover, as explained above, the County will have additional opportunities through the Revised Amended Ordinance to engage in additional review if and when required by CEQA (Pub. Res. Code 21166).

0044-28

Commenter's legal references are noted and included in the Final EIR. Commenter is correct that extensive detail is not necessary in EIR Project Descriptions.

0044-29

Commenter's legal citations are noted and included in the FInal EIR.

0044-29 cont'd

Commenter's legal citations are noted and included in the FInal EIR.

0044-30

Commenter's opinion is noted.

0044-31

The EIR project description incorporates the Revised Amended Ordinance. See EIR, Chapter 3, Project Description, Attachment A, Zoning Ordinance Amendments.

0044-32

The comment is incorrect in stating that the ministerial permit process does not ensure compliance with the mitigation measures. The Revised Amended Ordinance requires the applicant to "demonstrate compliance with all applicable Mitigation Measures as listed in the approved Mitigation Monitoring and Reporting Program (MMRP)." Revised Amended Ordinance, Section 19.98.60.D. The applicant must self-certify its compliance, but if violation of a permit occurs, compliance must be demonstrated to, and certified by, the County Oil and Gas Inspector and self-certification is no longer permitted. Revised Amended Ordinance, Section 19.98.130.

0044-33

Commenter's opinion that the ordinance and mitigation measures will not be complied with is noted. As discussed in GR 19, the County enforces the requirements of its ordinance as well as compliance with mitigation measures. Projects that require a Conditional Use Permit under the Revised Amended Ordinance are required to complete a further CEQA review process, as required under CEQA, including identifying, analyzing, and mitigating to the greatest extent feasible any site-specific impacts that would be caused by the activity for which a CUP

application has been filed. This CUP process does not constitute any "waiver" of an ordinance condition or mitigation requirement.

0044-34

Please see response to 0044-33.

0044-35

As explained in Section 7.1.3, the County received multiple comments on the Amended Ordinance, and after consideration of these sometimes conflicting comments has developed a Revised Amended Ordinance that includes various modifications to administrative procedural issues such as notice requirements, application content requirements, permit processing schedules and procedures, and clarifications of various terms. The physical activities that are regulated by the ordinance, and evaluated in the Draft EIR, have not changed. The Revised Amended Ordinance is included in full in Section 7.1.3.

0044-36

See comment 35.

0044-37

Commenter's legal references are noted and included in Final EIR.

0044-37 cont'd

Commenter's legal references are noted and included in Final EIR.

0044-38

Please see GR-8 explaining the well projections utilized for purposes of impact analysis in the EIR. Lead agencies "are encouraged to make reasonable forecasts in the preparation of the EIR." *San Francisco Ecology Center v. City and County of San Francisco* (1975) 48 Cal.App.3rd 584, 595. As discussed in the EIR, p. 2-22, and in GR 6 and GR 8, data from 1985 through 2012 show wide fluctuations in the number of new well completions per year in response to the price of oil, available technology, available reserves, and changing regulatory requirements. Annual new well completions during this period ranged from a low of 730 in 1992, to a high of 3,005 in 1985. The most recent peak was 2,619 new well completions in 2012. Thus, the assumption that an average of 2,697 new producing wells per year, and 3,649 total new well per year could be drilled over the next 25 years in the Project Area is conservative and does not impermissibly truncate the total number of new wells or the time period in which they would be drilled. In addition, as discussed in the EIR, p. 3-23, the geographic extent of the Project Area represents the portion of the County in which oil and gas development has historically occurred and is reasonably foreseeable to occur in the coming decades. In the unlikely event that oil and gas production activities are proposed outside the Project Area, a Conditional Use Permit and supplemental environmental review under CEQA would be required.

0044-39

The commenter's opinion that the project description is incomplete is noted for the record. Please see GR-8 explaining the well projections utilized for purposes of impact analysis in the EIR. The comment is incorrect in stating that the projections do not include new exploratory or injection wells. The annual forecasts used for purposes of impact analysis are shown in the EIR, Table 3-5, p. 3-32. The table separately lists water disposal, water flood, steam flood, air injection and gas disposal wells, which are included in the total. In addition, the category of "new producing wells" includes exploratory wells. All oil and gas activities are included in the analysis of aesthetic impacts (which are significant and unavoidable); and construction and maintenance of all wells, including injection and exploration wells, are included in the traffic, air quality and GHG analyses. All ground disturbing activities including temporary impacts from exploratory wells and permanent impacts from all producing and injection wells are included in the ground disturbance factors for determining compensatory mitigation, as explained in the the EIR, Appendix F, Land Use Disturbance Report.

0044-40

Please refer to GR 6 (baseline) and GR 8 (well projections). The number of new producing wells per year is only a portion of the total number of

new wells used as the basis for impact analysis. The total number of projected estimated new wells included in the EIR, Table 3-5, is 3,649, which is higher than the 2,697 new producing wells per year. As explained in those Global Responses, data from 1985 through 2012 show wide fluctuations in the number of new well completions per year in response to the price of oil, available technology, available reserves, and changing regulatory requirements. Annual new well completions during this period ranged from a low of 730 in 1992, to a high of 3,005 in 1985. The most recent peak was 2,619 new well completions in 2012. Thus, the assumption that 3,649 total new well per year could be drilled does not represent an average of past data, as suggested by the comment. In addition, the Revised Amended Ordinance has been further revised to include a cap of 3,649 new well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR. Any well permit applications over this cap may be processed only during the following year, or with additional CEQA review as described in the Revised Amended Ordinance. As a result, only the total number of new wells whose impacts were evaluated in the EIR can be drilled in any given year.

0044-41

The EIR, pages 3-15 – 3-16 and 3-32 – 3-34, and the data sets analyzed to develop the projections used as the basis for impact analysis, considered the history of oil and gas production. Please also see GR 6 and GR 8. The commenter's expert opinion states that market conditions in some circumstances may warrant more drilling than forecast. However, the County's experts disagree based on historical and forecast data. Moreover, the cap on annual well permits reflects a conservative analysis that both exceeds the actual well permits issued annually and, for the first time, establishes a cap on annual new well permits issued in the future.

0044-42

The comment that 5,000 wells may be drilled annually is not supported by the County's experts. Moreover, with the inclusion of a cap on annual well permits, drilling 5,000 wells annually would not be lawful under the Revised Amended Ordinance.

0044-43

Please see responses 41 and 42.

0044-44

Commenter's legal references are noted and included in the Final EIR.

0044-45

Please see responses 40, 41 and 42. As described above, the Draft EIR includes an estimated future level of wells based on an expert assessment as described in GR 8. The Revised Amended Ordinance caps the number of well permits that can be issued annually at 3,649 based on forecasts supported by substantial evidence. Thus, the assumption of 3,649 total new wells per year for purposes of impact analysis does represent the Project's maximum number of wells, rather than the "estimated average" annual production faulted by the court in the case cited by the commenter.

0044-46

Please see GR 6, GR 8 and responses 40, 41 and 42. The EIR does not underestimate the total number of future wells. As explained in GR 8, trends in drilling rates were taken into account in developing the well forecasts. The assumption that 3,649 total new well per year could be drilled exceeds the maximum annual number of wells based on past data. While the commenter's expert opinion states that more drilling may occur, the County's experts disagree based on historical and forecast data.

0044-47

As the comment correctly notes, "new technologies" will be necessary to access the Monterey Shale formation. Please see GR 18 regarding geological and technological constraints on extensive development of the Monterey Shale. As the EIR explains, page 5-13, estimates of the amount of recoverable oil in the Monterey Shale formation vary and remain in flux, making it difficult to assess whether and to what extent recovery of those resources would occur. The commenter's expert, Mr. Hughes, bases his opinion in Exhibit PD1, in part, on the assumption that substantial development will occur in the Monterey Shale. However, as explained in detail in GR 18, in another report Mr. Hughes has criticized estimates of Monterey Shale reserves based on comparison to shale oil production in the Bakken and the Eagle Ford Plays of North Dakota/Montana and southern Texas, respectively, because these two plays are geologically very different from the Monterey Shale.

As discussed in the EIR, page 4.13-9, and in GR 18, due to geological and technological constraints, substantial increases in oil and gas production in Kern County, including production from the Monterey Shale, are not expected in the absence of dramatic technical advances. The EIR's conclusions as to the uncertainty about potential future development in the Monterey Shale are supported by the California Council on Science and Technology (CCST) study, *Independent Assessment of Scientific Technical Information on Advance Well Stimulation Technologies in California* , which concluded that "large-scale production from Monterey source rock is unlikely without some as-yet unforeseen technological advance." http://ccst.us/publications/2015/vol-III-chapter-3.pdf, p. 1. CCST further explained that "complexities" in the Monterey Shale formation "result in uncertainty that is not easily reduced" and "make the performance of such long-reach horizontal wells difficult or impossible to predict." CCST also noted that, "at present the quantity, quality, and distribution of potentially recoverable source-rock resources are poorly constrained and it is extremely difficult to set policy or plan for mitigation against possible environmental impacts when we are uncertain if, where, and with what technology source rock would be developed." *Id.* at p. 135–136. CCST's assessment noted that the deep Monterey exploration wells drilled to date (2009 to 2013) have not been particularly successful, causing the U.S. Energy Information Administration to significantly reduce its estimate of potentially recoverable oil reserves for the Monterey play in California from 15 billion barrels to 0.6 billion barrel with a high degree of uncertainty of its future economic feasibility. *Id.*

In the face of such uncertainty, it is not required to include analysis of potential Monterey Shale development in the EIR. *Saltonstall v. Sacramento* (2015) 234 Cal. App. 4th 549, 583 ("CEQA does not demand what is not realistically possible, given the limitation of time, energy and funds. ‘Crystal ball’ inquiry is not required."). CEQA does not require speculation in making those projections. CEQA Guidelines § 15144 ("Drafting an EIR or preparing a negative declaration necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can."). The fact that commenters disagree about the the forecasts in the DEIR does not render them unreasonable. CEQA Guidelines § 15151.

The Revised Amended Ordinance caps the number of new well permits that can be issued annually at 3,649 based on forecasts supported by substantial evidence. This provision will ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0044-47 cont'd

0044-47 cont'd

0044-48

The comment states that the EIR impermissibly shortens the duration of the Revised Amended Ordinance. EIRs do not have expiration dates; see GR 3 regarding the "shelf life" of this EIR. In *Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, the court upheld the City of Napa's reliance on the EIR for its 1998 General Plan to serve as its CEQA review document for its 2009 Housing Element Update Project. The Court held that the age of an EIR is not relevant; supplemental CEQA review is required only where the conditions of Public Resources Code Section 21166 are met, which they were not in that case. *Id*. at 204-205. In this case, as stated in the EIR, p. 3-30, if the annual Project activity level or total projected activity level is exceeded, the County must consider whether the exceedance triggers further review in accordance with the requirements of CEQA (Pub. Res. Code 21166. If the criteria for subsequent or supplemental CEQA review are met, further review would be required for continued reliance on the Conformity Review Process. Thus, the Project has effective temporal limits and the Draft EIR analyzes the "whole of the action" within those limits. CEQA Guidelines § 15378.

0044-49

The comment cites *Christward Ministry v. Superior Court* (1986) 184 Cal.App.3d 180, 190–92, where the court held that the lead agency county could not rely on a previously prepared EIR for a general plan amendment because the general plan amendment changed the circumstances analyzed in the prior EIR (Pub. Res. Code 21166). Consistent with that case, this EIR acknowledges the potential for subsequent environmental review if the criteria under Public Resources Code Section 21166 are met. EIR, pp. 2-23, 3-30. The commenter's citation of *City of Carmel-by-the-Sea v. Board of Supervisors of Monterey County* (1986) 183 Cal.App.3d 229 is inapposite to this Project. In that case, the court rejected a negative declaration for a zoning amendment in anticipation of a major development project, because the development project's

environmental impacts were foreseeable at the time the zoning amendment but CEQA review was deferred to a later EIR. By contrast, this EIR itself evaluates the impacts of the Revised Amended Ordinance, together with the implementation of future oil and gas activities expected to be undertaken pursuant to the Revised Amended Zoning Ordinance. See GR 3 regarding the shelf life of the EIR.

0044-50

The commenter conflates the EIR's description of project impacts with the annual cap on well permits that may be issued under the Amended Ordinance. The Amended Ordinance has been further clarified to include this annual cap, and thereby addresses commenters' concerns.

0044-51

The Revised Amended Ordinance has been further revised to include a cap of 3,649 new well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR. Any well permit applications over this cap may be processed only during the following year, or with an Conditional Use Permit and additional CEQA review as described in the Revised Amended Ordinance. This provision will ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0044-52

The commenter is mistaken. Further CEQA review is required for oil and gas activities that require Conditional Use Permits, as described above in [cross-reference]. Through the MMRP process, the County and members of the public will also have the opportunity to assess the extent to which Project impacts remain within the scope of impacts that were assessed and mitigated under this EIR. At such time as the MMRP identifies a trend that may lead to significant impacts that are new or worse than forecast in the EIR, then the County's ongoing implementation of the Ordinance would need to be assessed. Further, the many responsible agencies that issue discretionary permits for Project-related activities remain subject to Section 21166 and may require additional environmental review for future new or significantly worse impacts than identified in the EIR.

0044-53

The comment is correct that the Revised Amended Ordinance would establish a ministerial permit system. Please see GR-1 regarding the ministerial permitting process. However, as discussed above, the Revised Amended Ordinance caps the number of new well permits that can be issued annually at 3,649 based on forecasts supported by substantial evidence. This provision will ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0044-54

The commenter's summary of the EIR is noted.

0044-55

The commenter's opinion is noted.

0044-56

The DEIR has reached a different conclusion about the ongoing concentration, consistent with historic trends, of oil and gas production activities on Tier 1 lands. Drilling on Tier 2 lands is also subject to more extension permit processing requirements, and the County's expanded suite of measures for split estates creates new costs and burdens for oil producers and new benefits for surface owners. While there have been limited examples of litigation between surface owners and subsurface mineral rights owners, it is possible that intensification of activities in new areas could increase such conflicts and that may further discourage surface production activities on Tier 2 lands.

The EIR assumes that the geographic distribution of future oil and gas production in the Project Area will be similar to historic patterns, rather than an unprecedented expansion of development into Tier 2 agriculture lands and into the Monterey Shale as the commenter suggests.

Regarding the Monterey Shale, please see GR 18 and response 47. Regarding continued concentration of oil and gas development in Tier 1 areas, this assumption is supported by substantial evidence, including the CCST study, Independent Assessment of Scientific Technical Information on Advance Well Stimulation Technologies in California. The CCST's assessment indicated that future oil development will be primarily achieved through extending the life of existing oil fields via a variety of conventional methods. CCST's assessment further indicated that future expanded production will likely be in and near the existing oil fields. *Id.,* page 210. Under the Revised Amended Ordinance, those areas are classified as Tier 1.

The category of Tier 2 lands did not exist prior to the Revised Amended Ordinance and nothing would have prevented oil fields from expanding into the predominantly agricultural areas that will now be classified as Tier 2 lands. The reason that no major oil fields are located in Tier 2 is that there is insufficient recoverable oil to drive major expansion into these areas. Exploration for oil and gas in Kern County has been going on for over 100 years. If there were enough oil reserves concentrated somewhere within Tier 2 lands that were economically viable to develop into new oil fields, those areas of Tier 2 would already have undergone Tier 1 levels of development. Accordingly, future oil and gas production activities of the Project are considered in the DIER to impact less than 1% of Tier 2 agricultural lands from year 2015 through 2040. EIR Section 4.2.4, Project Impacts. Based on CCST's assessment of future patterns of oil expansion in Kern County, it is highly likely that future oil development will continue to occur within or near DOGGR's existing field Administrative Boundaries. It is also reasonable to assume, based on the CCST's assessment, that there is a low probability of significant undiscovered oil fields existing beneath Tier 2 agricultural lands that would lead to unprecedented expansion of future oil wells into Tier 2 agriculture lands. Accordingly, substantial evidence supports the EIR project description in that the anticipated percentage of 95% of future oil and gas production would occur within DOGGR's Administrative Boundary areas.

0044-57

Regarding the unlikelihood of substantial increased production on Tier 2 lands, see response 56. The Draft EIR relies on the best available scientific information and avoids speculation, consistent with CEQA's mandates. Please see GR 21. Commenter's argument that the EIR must speculate on future technological breakthroughs that would result in some future unknown new level of well activity in the Monterey Shale formation is unreasonable and improper under CEQA. EIR Appendix U, Kern County Drilling and Hydraulic Fracturing Comparison Memo, describes the differences in hydraulic fracturing techniques in oil and gas fields in other parts of the County in relation to the Monterey Shale. As discussed in Appendix U and in GR 18, geological and technological barriers to accessing the Monterey Shale remain formidable. Moreover, the Amended Ordinance caps the number of well permits that can be issued annually. Even if a technology breakthrough permitted accessing the Monterey Shale and created greater demand for new wells, the cap would apply.

0044-57 cont'd

0044-58

The experts advising the County, as noted above, believe that the historic pattern of well distribution reflects the actual location of recoverable oil reserves, and that it is reasonable to assume that the vast majority of future wells will continue to be located above existing oil reserves.

0044-59

As described above, the best available scientific information is that formidable technological barriers preclude large-scale increases in extraction from the Monterey Shale. Unknown new technologies that may be developed, coupled with global pricing variability and other regulatory uncertainties, do not provide the necessary evidence that major increases in WST activities are reasonably foreseeable. WST activities are now tracked at the state level, and are also part of the MMRP process, and will provide advance warning of any change in this circumstance that could potentially trigger the need for a supplemental EIR process under 21166. Please see GR 18 and responses 47 and 57.

0044-60

The location of oil reserves in Kern County have been thoroughly explored for more than a century. No "new fields" are anticipated to be discovered given this level of historic exploration and production. The commenter's Exhibit PD-1 assumes greatly expanded production in the Monterey Shale. Regarding the Monterey Shale, please see GR 18 and responses 47 and 57. As explained in GR 18, while accessing the Monterey Shale would require advances in well stimulation technology, the differences in geology between the Monterey Shale and shale deposits elsewhere in the U.S. mean that the technologies used elsewhere would not be applicable and new technologies would be necessary. The commenter's argument that the EIR must speculate on future technological breakthroughs that would result in some future unknown new level of well activity in the Monterey Shale is unreasonable and improper under CEQA.

0044-61

The extent to which future production in Kern County will "increase" is speculative given technology barriers to Monterey Shale recovery, and the need for more wells to maintain even existing production volumes given the age and depleting volumes of existing oil and gas reserves. Please see GR 8, GR 18 and responses 47, 57 and 60. The EIR's projections concerning future oil and gas development in the County, and the extraction techniques that will be used for such activities, is supported by substantial evidence, based on past and projected future industry practice. The EIR relies on the best available scientific information and avoids speculation, consistent with CEQA's mandates; please see GR 21.

0044-61 cont'd

0044-62

Commenter confuses the level of infrastructure improvements forecast to be needed by the project, with a description of permitting responsibilities by other responsible agencies. Additional infrastructure is anticipated to be required for Project implementation, as described in the Project Description and in Appendix W describing the ground disturbance factors. New infrastructure, or "accessory" facilities and equipment, includes a broad range of Project activities such as electric and communication service and distribution lines, access roads, storage tanks and separators, steam plants, pipelines, etc. However, large-scale infrastructure such as new or expanded cogeneration facilities, landfills, and transmission lines, are not anticiapted to be needed, require separate Conditional Use Permits if proposed (if within the jurisdiction of the County) or other agencies (if within the jurisdiction of other agencies such as the CPUC, and will require further CEQA review at that time. This is not impermissible piecemealing since these are not reasonably foreseeable future uses. Legal team add cites etc.

Cases hold that review of such support facilities "is not required in an EIR for the project the facility is to serve if: (1) obtaining more detailed useful information is not meaningfully possible at the time when the EIR for the project is prepared, and (2) it is not necessary to have such additional information at an earlier stage in determining whether or not to proceed with the project." *National Parks and Conservation Association v. County of Riverside* (1996) 42 Cal.App.4th 1505, 1518; see also *Kaufman & Broad-South Bay, Inc. v. Morgan Hill Unified School District* (1992) 9 Cal.App.4th 464 (CEQA review premature when no plan has been formulated about future development). The Project makes no commitment to construction of energy infrastructure and there are "adequate environmental safeguards" in place in the form of review of additional infrastructure by other agencies such the CPUC if the expansions do occur. *National Parks* at p. 1520.

0044-63

Commenter's legal citations are noted for the record and included in the Final EIR. Extension of high-voltage electric transmission lines is not an "integral part[] of the same project" (*Tuolomne County Citizens for Responsible Growth, Inc. v. City of Sonora* (2007) 155 Cal.App.4th 1214, 1229) or a "crucial element" without which the proposed project "cannot go forward" (*San Joaquin Raptor/Wildlife Reserve Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 732).

0044-64

The Draft EIR serves as an informational disclosure document, and as such properly describes extent to which certain no new or expanded large-scale infrastructure is needed for Project implementation, along with the lead agency jurisdiction of such infrastructure.

0044-65

No new electrical transmission lines are necessary, or anticipated to be constructed, to meet demands created by Project activities.

0044-66

The EIR appropriately describes constraints that reduce the likelihood that new cogeneration facilties would be constructed as part of the evidentiary basis for concluding that no such new facilities are reasonably foreseeable. The EIR thus appropriately excludes construction of unnecessary cogeneration facilities, while acknowledging that existing cogeneration facilities continue to operate in support of Project activities and are thus appropriately included in emission estimates and other impact assessment categories.

The commenter cites caselaw to demonstrate that cogeneration plants are polluting; however, the case is not relevant to this EIR. As explained in the EIR, construction of new cogeneration plants is not reasonably foreseeable, and in the unlikely event that one is proposed it will undergo separate CEQA review.

0044-66 cont'd

0044-67

The EIR explains the basis for the future well projections, and the speculative nature of unknown future technology, as described above.

0044-68

The information about Stockton is noted, but is also irrelevant. Kern County is the host of more megawatts of renewable energy (solar and wind) facilities than any other county in California, also has major gas plant electric generators, and already has ample cogeneration capacity from existing plants. It is not reasonably foreseeable that new cogeneration plants will be constructed in Kern County.

0044-69

The EIR explains the basis for excluding new cogeneration facilities from the EIR and requiring a discretionary permit, which automatically triggers the need for further CEQA review. Any future cogeneration facilities are speculative as Kern County has not approved a cogeneration facility in over 10 years and the current energy market makes cogeneration facilities less attractive. EIR, page 3-44. This satisfies CEQA's requirements. While the commenter cites *Bozung v. Local Agency Formation Commission* (1975) 13 Cal.3d 263 (*Bozung*), deferring consideration of remote or speculative cogeneration facilities is not unlawful "piecemealing" under *Bozung*. In that case, the court held that an annexation proposal was part of an overall development plan by which a property owner intended to urbanize its agricultural property. As such, the future development should have been considered with the annexation proposal. (*Id.* at pp. 283-284.) The test for piecemealing was further developed in *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376, 396, which held that "an EIR must include an analysis of the environmental effects of future expansion or other action if: (1) it is a reasonably foreseeable consequence of the initial project; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects."

As applied here, it is not reasonably foreseeable that the Project will result in the construction of new cogeneration facilities. Based on past permitting and the current energy market, it is not reasonable to anticipate the development of any cogeneration facilities in the foreseeable future. The comment provides no evidence of proposed projects or any regulatory changes that would drive the construction of new cogeneration facilities for oil and gas production.

Not only is it uncertain whether any new cogeneration facilities would be proposed, but any estimate regarding the number or technology for future cogeneration facilities would be entirely speculative. While the comment points to a recent natural gas-fired combined heat and power facility that was approved in Stockton in 2015, that project was to provide power to a wet corn milling plant and not to support oil and gas activities. The cited example does not make construction of future cogeneration facilities in Kern County for oil and gas activities "reasonably foreseeable" or demonstrate that the County is actually contemplating a larger project that includes cogeneration facilities by approving the Project. See *Christward Ministry v. County of San Diego* (1993) 13 Cal.App.4th 31, 45.

0044-70

The comment is incorrect in suggesting that a cogeneration facility is a type of steam generator. A steam generator produces only steam, while a cogeneration facility produces both electricity and steam. See San Joaquin Valley Air Pollution Control District Rule 4406, defining "Steam Generator" as a "fossil-fuel-fired combustion device which has a rated heat input capacity greater than fifteen million BTUs per hour and which evaporates water to dry steam, or to a mixture of water vapor and steam that has an absolute pressure of more than thirty pounds per square inch." In the same rule, a "Cogeneration Facility" is a facility which employs technology defined in Sections 25134 of the Public Resources Code, and from which the electricity generated is no less than ten (10) percent and no greater than 90 percent of the useful energy output of the facility." Pub. Res. Code section 25134 in turn defines "Cogeneration" as "the sequential use of energy for the production of electrical and useful thermal energy. The sequence can be thermal use followed by power production or the reverse, subject to the following standards: (a) At least 5 percent of the cogeneration project's total annual energy output shall be in the form of useful thermal energy. (b) Where useful thermal energy follows power production, the useful annual power output plus one-half the useful annual thermal energy output equals not less than 42.5 percent of any natural gas and oil energy input.

0044-71

The comment states that the EIR must be revised to describe the Project's maximum build-out, which includes the maximum density of oil and gas operations that could occur on different types of land uses, and the total number of new wells that could be developed over time. These comments are addressed by information provided in the EIR, and further clarification is provided here.

The EIR describes the maximum build-out and total number of new wells that can be developed over time. The DEIR's projected total number of wells drilled per year is 3,649 (including new production wells, all categories; water disposal; water flood injectors; idle wells, non-cyclic; observation wells; steam flood injectors; air injection; and gas disposal). DEIR p. 3-32. The Revised Amended Ordinance includes a cap of 3,649 well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR. Thus, the maximum build-out for purposes of the ministerial permit approval process is the 3,649 wells annually over the 25 year life of the project. Please see GR-8 explaining the well projections utilized for purposes of impact analysis in the EIR.

The EIR also discloses information on the distribution of those new wells. The EIR divides the Project Area into Tiers, and into sub-regions, for the purposes of forecasting future Project activities and assessing impacts and mitigation measures. As described in the EIR, 90% of future activities are forecast to occur in Tier 1 areas, where oil and gas is the dominant surface use. DEIR p. 4.4-199; 4.9-130; 4.9-135. The remaining 10% of future oil and gas activities are expected to be distributed as shown on Tables 3-6 through 3-8, which shows distribution among Tiers within each of the three subareas. These tables provide a breakdown of potential drilling activities for years 2015 through 2040 for the Western, Central and Eastern Subareas, and for the Tiers. Based on this forecast, of the maximum annual 3,649 new wells forecasted, an average of 248 new wells could be drilled annually on Tier 2 lands. This amounts to less than 1% of the forecasted annual new wells. The level of well drilling in any given year may be higher or lower than this average, consistent with the variations in well drilling activities that have historically occurred due to market and other conditions. However, the total number of new wells drilled annually would not exceed 3,649 under the Revised Amended Ordinance.

Commenter's concerns about land use adjacent to certain receptors is evaluated extensively in several sections of the EIR. See, e.g., DEIR Section 4.3 (Air Quality); 4.8 (Hazards and Hazardous Materials); and 4.12 (Noise). A range of mitigation measures has been prescribed to protect sensitive receptors from nearby oil and gas activities. For example, MM 4.3-5, MM 4.8-4, and MM 4.12-1 require a permit applicant to identify sensitive receptors in the vicinity of the permit applicant's project and take protective measures as specified. To the extent the comment is concerned with sensitive biological resources, MM 4.4-1 through 4.4.18 impose requirements for activities that could impact sensitive natural communities. See also the Appendices to this EIR, which include additional clarifying information on air quality, noise, and vibration. Please refer to Section 7.1.4 for the Revised Summary of Impacts, Mitigation Measures and Significance Conclusions.

Additionally, Tier 1 does not include schools, daycare centers, hospitals, cemeteries, or similar types of sensitive receptors. DEIR p. 4.4-3. The Kern County and Metropolitan Bakersfield General Plans contain policies designed to guide land use decisions to ensure that sensitive land uses are adequately considered. See DEIR p. 4.10-14 through 4.10-173. The Project is consistent with these policies. DEIR Table 4.10-7.

0044-72

As described above, the number of wells issued under the Amended Ordinance is capped at 3,647 annually. This represents "full buildout" as that term is used by commenter, notwithstanding the fact that the term is more often applied to construction projects than ongoing implementation of a land use ordinance.

0044-72 cont'd

0044-73

Further clarifications to the Amended Ordinance have been made that address this comment, including clarification of the total annual cap of 3,647 well permits.

0044-74

See prior responses beginning with 35. The Revised Amended Ordinance now includes a cap on the number of new wells that may be issued under the ministerial permit provisions considered in this EIR. As discussed in GR 8, the annual well projections are very conservative. As discussed in GR 3, this EIR will have a "shelf life" or effective period that corresponds to the environmental impacts evaluated and mitigated in this EIR. Zoning ordinances remain in effect, but at such time as activities are proposed that fall outside the scope of the EIR – whether that occurs in year 5, 15 or 25 – must be evaluated under CEQA. Similarly, although it is not reasonably foreseeable that after more than 100 years of exploration and production in Kern County "new" oil reserves will be discovered outside the Project Area, the Revised Amended Ordinance also now makes clear that any such activities are outside the scope of this EIR and would require discretionary permitting including additional CEQA review. Commenter's example of using zoning authority to impose cap on the construction of housing units is noted, but while local government's zoning authority is an appropriate tool to regulate land use development such as housing units, as discussed in GR Alts 1 and 2, the County cannot impose absolute locational or infrastructure caps that would limit or preclude a mineral owner from extracting oil without incurring liability for compensating that owner. The Revised Amended Ordinance clarifies that any such activities that are outside the scope of this EIR would require a discretionary permit and trigger the need for additional CEQA review.

0044-75

Commenter's legal references are noted and included in teh Final EIR.

0044-78

Commenter's legal references are noted and included in the Final EIR.

0044-79

Commenter's reliance on the facts presented in the DEIR is noted.

0044-80

Commenter's reliance on the facts presented in the DEIR is noted. A letter from Holly King, cited by the commenter, was not received by the close of the public comment period.

0044-80 cont'd

0044-81

Commenter's opinion is noted.

0044-82

Please see GR AG-2 regarding rangeland.

0044-83

Comments 85 to 86 state that the EIR does not effectively analyze indirect farmland conversion because the EIR provides inaccurate calculations used to determine the number of future wells likely to occur in Tier 2 lands. The commenter's opinion is noted for the record and will be forward to the Planning Commission and Board of Supervisors for their consideration. Please see response to comments 43-85 to 43-86 below.

0044-84

The comments state taht Tier 2 lands make up 87% of land in the Project Area, and that new production is "most likely to occur on Tier 2 lands." The commenter has not submitted evidence to suggest that new oil and gas activities are more likely to occur on Tier 2 lands than in other Tiers, and that conclusion is not supported by information in the EIR. Please refer to response to comment 44-54 regarding the concentration and likely location of future oil and gas activities in the Tier 1 and Tier 2.

0044-84 cont'd

0044-85

Comments 85 to 86 state that the EIR's estimate of farmland conversion is also inaccurate because the EIR used an average acreage of land disturbance that occurs per producible well, rather than analysis of maximum buildout. The EIR does analyze maximum buildout, and does not use improper averaging that might underrepresent potential disturbed area. Further clarification is provided here about the methodology by which the EIR conducts the analysis and portrays the information in Appendix F. Also, under the Revised Amended Ordinance, actual mitigation will be imposed on a site-specific basis, based on the site plan submitted by the permit applicant in the Conformity Review process.

The comment cites to Appendix F of the EIR in its statement that the EIR analyzed only an average acreage of land disturbance, rather than considering full build out. Appendix F describes the derivation of a land disturbance factor – that is, a mathematical multiplier for purposes of estimating total land disturbance from Project activities within the scope of the EIR . In order to estimate the amount of land use disturbance which will occur when oil and gas production and development activities are undertaken pursuant to the Revised Amended Ordinance, it is

necessary to derive a multiplier – the disturbance factor – which can then be multiplied by the maximum number of annual wells to arrive at land use disturbance figures for full buildout.

To determine the land disturbance figure, the County conducted an independent analysis of the actual, on the ground disturbance in the ten largest oil producing fields in the County fields using aerial photography. The aerial photographs were digitized for the ArcGIS platform, and then used to identify physical disturbance related to oil production in each field, including roads, well pads, pipelines, storage and parking areas, and other uses. The identification of these features is done by digitizing the shapes, or "polygons," of the area to be calculated. Determining the individual areas from each digitized polygon allowed for an acreage calculation for individual polygon areas to reach a total disturbance area for a given field, as discussed further below.

To present the total disturbance acreage estimates to a per-well land disturbance factor, the next step was to divide the total by the number of wells in the field. This was accomplished by dividing total land disturbance by the number of producible wells in the field, rather than dividing by the number of wells identified as active in the DOGGR data base. Using the smaller number of producible wells as the denominator resulted in greater per-well land disturbance factors, adding environmental conservatism to the analysis of impacts to agricultural, biological and other resources in the Draft EIR. See Draft EIR, Appendix F, page 8.

Then, after dividing total land disturbance by the number of producible wells in the field, the initial result was rounded upward to derive the final disturbance factors. This rounding upward also ensures that the land use disturbance analysis uses conservative figures. The final adjusted (rounded up) disturbance factors are shown on Table 11 of Appendix F. The Western Subarea used an adjusted factor of 2.0 acres of disturbance per well; the Central subarea used a disturbance factor of 3.0 acres of disturbance per well, and the Eastern Subarea used a disturbance factor of 1.20 acres per well.

The comment cites to the Western subarea's factor of 2.0 acres per well and states that "of 10 fields surveyed, 5 had disturbed more than 2.0 acres per well…" The comment refers to Attachment A to Appendix F, and is correct that some fields list individual disturbance areas that are greater than the factor for that field. However, that does not indicate that improper averages were used; rather, those individual disturbance areas are a function of the use of polygons in the ArcGIS platform which are necessary to calculate total area. This part of the methodology warrants further clarification here.

Disturbance for each field is shown on Attachment A to Appendix F. It is important to understand that even though Attachment A includes lists of discrete disturbance figures, these numbers are derived from need to represent the specific disturbed features on the digitized aerial photographs in numeric form for purposes of adding up a total disturbance number. For example, depending on the technical intricacies of calculating land area using ArcGIS polygons, a portion of an access road shown on the map might be calculated as a fraction of an acre, while an adjoining portion of that same road could be an acre. Or, a building's footprint could be represented as a separate number from an adjoining parking area, depending on how the how one draws the polygon to calculate the area. In other words, the list of discrete disturbance areas for each field represents the GIS polygons used to calculate land area from a digitized GIS photograph. The fact that some polygons were larger than others was taken into account, but was not the sole driver, for the calculation of the land use disturbance factor.

Upon adding up the individual polygon areas to get total disturbed area, that area was divided by the number of producible wells in the field and rounded up, as described above. Therefore, there is no averaging conducted here that would tend to underrepresent disturbed area. An example of the type of averaging that might underrepresent disturbance areas would be if the EIR had collected a range of well pad sizes, and then used the average well pad size rather than the largest well pad size to evaluate potential land disturbance. That methodology was not employed here.

Conversely, a methodology which uses a disturbance factor derived from only the largest features, or polygons, from each well field would grossly distort the analysis so as to render it virtually meaningless. The total land disturbance figures in Appendix F represent land disturbed due to a variety of oil field uses: access roads, producible and injection well pads, water and oil storage, conveyance pipelines, processing tanks and other facilities, administrative buildings, and maintenance, truck and other equipment staging, storage and parking areas. There is necessarily a range in the area of land disturbed for each of these various uses identified in the aerial photographs, and using only the largest features as a factor would not make sense. For example, a small access spur disturbs less ground than an administrative building and, depending on the way the polygon is drawn, each of these features would likely be listed as discrete land uses disturbances in Attachment A of Appendix F. Using only the surface disturbance for the administrative building - or the largest feature in a given field – would ignore the range of uses in an oil field and would grossly distort the analysis which, in turn, would undermine the informational value of the EIR.

The commenter cites to *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal. App. 4th 645, 655 in stating that CEQA requires an analysis of maximum buildout, not a "hoped for average." The legal authority has been noted and reviewed, and the EIR is consistent with this principles in that case. With respect to the discussion of "averages" raised by the comment, *County of Merced* illustrates the rationale behind analyzing potential impacts based on the maximum anticipated production, which this EIR has done. In *County of Merced,* the EIR for a mine expansion analyzed only potential impacts from the average forecast mine production, rather than the maximum production level anticipated by the project description. That EIR concluded that since the forecast for average annual production did not exceed historical averages, the project would not result in an increase in production. The court invalidated the approval of that EIR, citing the misleading nature of the project description and analyses. Here, however, this EIR forecasts the maximum annual number of future ministerial wells permits issued pursuant to the Project, and conducts the environmental analysis based on the assumption that the maximum number of wells is reached. The analysis is consistent with that required by CEQA and in line with the principle of analyzing the maximum proposed build-out espoused in *County of Merced.*

The commenter also refers back to earlier comments made regarding analysis of the whole of the project under CEQA; please accordingly refer back to responses to comments 44-37 through 44-70.

0044-86

Comments 85 to 86 state that the EIR's estimate of farmland conversion is also inaccurate because the EIR used an average acreage of land disturbance that occurs per producible well, rather than analysis of maximum buildout. The EIR does analyze maximum buildout, and does not use improper averaging that might underrepresent potential disturbed area. Further clarification is provided here about the methodology by which the EIR conducts the analysis and portrays the information in Appendix F. Also, under the Revised Amended Ordinance, actual mitigation will be imposed on a site-specific basis, based on the site plan submitted by the permit applicant in the Conformity Review process.

The comment cites to Appendix F of the EIR in its statement that the EIR analyzed only an average acreage of land disturbance, rather than considering full build out. Appendix F describes the derivation of a land disturbance factor – that is, a mathematical multiplier for purposes of estimating total land disturbance from Project activities within the scope of the EIR . In order to estimate the amount of land use disturbance which will occur when oil and gas production and development activities are undertaken pursuant to the Revised Amended Ordinance, it is necessary to derive a multiplier – the disturbance factor – which can then be multiplied by the maximum number of annual wells to arrive at land use disturbance figures for full buildout.

To determine the land disturbance figure, the County conducted an independent analysis of the actual, on the ground disturbance in the ten largest oil producing fields in the County fields using aerial photography. The aerial photographs were digitized for the ArcGIS platform, and then used to identify physical disturbance related to oil production in each field, including roads, well pads, pipelines, storage and parking areas, and other uses. The identification of these features is done by digitizing the shapes, or "polygons," of the area to be calculated. Determining the individual areas from each digitized polygon allowed for an acreage calculation for individual polygon areas to reach a total disturbance area for a given field, as discussed further below.

To present the total disturbance acreage estimates to a per-well land disturbance factor, the next step was to divide the total by the number of wells in the field. This was accomplished by dividing total land disturbance by the number of producible wells in the field, rather than dividing by the number of wells identified as active in the DOGGR data base. Using the smaller number of producible wells as the denominator resulted in greater per-well land disturbance factors, adding environmental conservatism to the analysis of impacts to agricultural, biological and other resources in the Draft EIR. See Draft EIR, Appendix F, page 8.

Then, after dividing total land disturbance by the number of producible wells in the field, the initial result was rounded upward to derive the final disturbance factors. This rounding upward also ensures that the land use disturbance analysis uses conservative figures. The final adjusted (rounded up) disturbance factors are shown on Table 11 of Appendix F. The Western Subarea used an adjusted factor of 2.0 acres of disturbance per well; the Central subarea used a disturbance factor of 3.0 acres of disturbance per well, and the Eastern Subarea used a disturbance factor of 1.20 acres per well.

The comment cites to the Western subarea's factor of 2.0 acres per well and states that "of 10 fields surveyed, 5 had disturbed more than 2.0 acres per well…" The comment refers to Attachment A to Appendix F, and is correct that some fields list individual disturbance areas that are greater than the factor for that field. However, that does not indicate that improper averages were used; rather, those individual disturbance areas are a function of the use of polygons in the ArcGIS platform which are necessary to calculate total area. This part of the methodology warrants further clarification here.

Disturbance for each field is shown on Attachment A to Appendix F. It is important to understand that even though Attachment A includes lists of discrete disturbance figures, these numbers are derived from need to represent the specific disturbed features on the digitized aerial photographs in numeric form for purposes of adding up a total disturbance number. For example, depending on the technical intricacies of calculating land area using ArcGIS polygons, a portion of an access road shown on the map might be calculated as a fraction of an acre, while an adjoining portion of that same road could be an acre. Or, a building's footprint could be represented as a separate number from an adjoining parking area, depending on how the how one draws the polygon to calculate the area. In other words, the list of discrete disturbance areas for each field represents the GIS polygons used to calculate land area from a digitized GIS photograph. The fact that some polygons were larger than others was taken into account, but was not the sole driver, for the calculation of the land use disturbance factor.

Upon adding up the individual polygon areas to get total disturbed area, that area was divided by the number of producible wells in the field and rounded up, as described above. Therefore, there is no averaging conducted here that would tend to underrepresent disturbed area. An example of the type of averaging that might underrepresent disturbance areas would be if the EIR had collected a range of well pad sizes, and then used the average well pad size rather than the largest well pad size to evaluate potential land disturbance. That methodology was not employed here.

Conversely, a methodology which uses a disturbance factor derived from only the largest features, or polygons, from each well field would grossly distort the analysis so as to render it virtually meaningless. The total land disturbance figures in Appendix F represent land disturbed due to a variety of oil field uses: access roads, producible and injection well pads, water and oil storage, conveyance pipelines, processing tanks and

other facilities, administrative buildings, and maintenance, truck and other equipment staging, storage and parking areas. There is necessarily a range in the area of land disturbed for each of these various uses identified in the aerial photographs, and using only the largest features as a factor would not make sense. For example, a small access spur disturbs less ground than an administrative building and, depending on the way the polygon is drawn, each of these features would likely be listed as discrete land uses disturbances in Attachment A of Appendix F. Using only the surface disturbance for the administrative building - or the largest feature in a given field – would ignore the range of uses in an oil field and would grossly distort the analysis which, in turn, would undermine the informational value of the EIR.

The commenter cites to *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal. App. 4th 645, 655 in stating that CEQA requires an analysis of maximum buildout, not a "hoped for average." The legal authority has been noted and reviewed, and the EIR is consistent with this principles in that case. With respect to the discussion of "averages" raised by the comment, *County of Merced* illustrates the rationale behind analyzing potential impacts based on the maximum anticipated production, which this EIR has done. In *County of Merced,* the EIR for a mine expansion analyzed only potential impacts from the average forecast mine production, rather than the maximum production level anticipated by the project description. That EIR concluded that since the forecast for average annual production did not exceed historical averages, the project would not result in an increase in production. The court invalidated the approval of that EIR, citing the misleading nature of the project description and analyses. Here, however, this EIR forecasts the maximum annual number of future ministerial wells permits issued pursuant to the Project, and conducts the environmental analysis based on the assumption that the maximum number of wells is reached. The analysis is consistent with that required by CEQA and in line with the principle of analyzing the maximum proposed build-out espoused in *County of Merced.*

The commenter also refers back to earlier comments made regarding analysis of the whole of the project under CEQA; please accordingly refer back to responses to comments 44-37 through 44-70.

0044-87

The comment states that the DEIR's survey of the ten largest oil producing fields for purposes of determining land disturbance acreage did not take into account economies of scale that the comment states occur in high-producing fields. The comment is noted. Various methods of determining land use disturbance were considered, and the methodology described in Appendix F was selected. The method surveys those oil producing fields which account for 97 to 99 percent of the total oil production and total produced water in the Project Area, which forms a reasonable basis by which to select the fields. Appendix F, p 4.

Additionally, the EIR contains measures to encourage the use of existing infrastructure where possible. See DEIR at pp. 4.9-152–4.9-153; MM 4.1-1 (The Applicant shall use existing roads whenever possible. If use of existing roads is not feasible, construction of new roads should be routed to minimize the amount of disturbance without impeding existing surface use.); MM 4.2-2(h) (requiring that overhead electrical and communication lines "shall be aligned to the greatest extent feasible with existing access roads" and that the lines be run "the minimum distance between the access road and the well installation and other oil and gas facility" and "parallel to tree or row crops" and the "[i[the use of existing roads is not feasible, lines should be routed to minimize surface disturbance and minimize the impacts to surface area.").

No evidence has been submitted to show that surveying the ten largest oil fields to determine the land use disturbance factor results in significant adverse impacts. Nor has the County received additional suggestions for an alternative method of surveying that would be preferable to the method selected by the County and its experts.

0044-88

The comments state that the EIR only considered farmed acreage that was physically replaced by certain oil and gas infrastructure, but did not consider actual acreage taken out of production due to interference with agricultural operations. Please see responses to comments 44-89 and 44-114, which discuss mitigation measures which address the commenter's concern. Additionally, to the extent the Project results in conversion of farmland, MM 4.2-1 requires 1:1 replacement of such Farmland, regardless of who holds title to such Farmland. Please see GR Ag-1 and GR-4.

0044-89

A letter from Holly King, cited by the commenter, was not received by the close of the public comment period.

0044-90

The County does not regulated private property transactions, which may occur for many reasons and are in any event wholly outside the County's jurisdiction and control. The comment states that the EIR fails to take into account potential of conversion of Farmland from voluntary sale by property owners. The comment cites the "H. King Letter" as evidence that such transactions have occurred in the past. As of September 19, 2015, the County has received no such letter. In any event, to the extent the Project results in conversion of Farmland, MM 4.2-1 requires 1:1 replacement of such Farmland, regardless of who holds title to such Farmland. Please see GR Ag-1.

0044-91

Tier 2 was defined to include farmed lands, and comprises the vast majority of the lands within the Project Area. There are no significant farmed agricultural areas outside of Tier 2.

0044-92

The environmental impacts associated with loss of farmlands is properly assessed at the Project Area and sub-area scale for Tier 2 lands, since agricultural lands are a regional and statewide resource.

0044-93

0044-97

The comment states that purchasing farmland in other parts of the state will do nothing to mitigate for loss of farmland in Kern County. Even if mitigation lands were located outside Kern County, this would be consistent with the Department of Conservation's views that agricultural conservation is a regional and statewide issue. (*See Masonite Corp. v. County of Mendocino* (2013) 218 Cal.App.4th 230, 237 [quoting the Department of Conservation as stating that "[t]he conversion of agricultural land should be deemed an impact of at least regional significance. Hence, the search for replacement lands should be conducted regionally or statewide, and not limited strictly to land within the project's surrounding area"].)

More importantly, the majority of Farmland conservation mitigation will occur in Kern County. MM 4.2-1 prioritizes conservation of farmland in Kern County, both through the acquisition and conservation component of the measure, as well as by promoting restoration of already disturbed agricultural land in the County through the removal of legacy oil and gas production equipment, including well abandonment and removal of surface equipment. It is only if qualifying lands from willing property owners cannot be found in Kern County that mitigation lands may be located within the San Joaquin Valley or outside the San Joaquin Valley. See MM 4.2-1. Under the worst-case projection of Farmland conversion due to the project, less than 1% of the total acreage of Farmland in the County will be converted. Over 820,000 acres of Farmland will remain in Kern County to provide mitigation. DEIR at p. 4.2-18.

To the extent the comment seeks to have the EIR analyze the economic effects of loss of farmland in the County, such an analysis in beyond the scope of this EIR. *See* 14 Cal. Code Reg. § 15131(a); *see also Gray v. County of Madera* (2008) 167 Cal. App. 4th 1099, 1120, 85 Cal. Rptr. 3d 50 (EIR need not evaluate economic impacts on neighboring property owners from effects of groundwater declines on their private wells); *San Franciscans for Reasonable Growth v. City and County of San Francisco* (1989) 209 Cal. App. 3d 1502, 1516, 258 Cal. Rptr. 267 (impacts on availability of child care facilities are not environmental impacts that need to be considered in EIR). Please see GR Ag-1.

0044-98

Agriculture and oil and gas activities have coexisted in Kern County for over a century. (DEIR at P. 2-24.) There is no indication that the Project, which provides more restrictions on oil and gas activities and mitigation measures to conserve agricultural resources, will cause a mass acceleration of Farmland conversion. Based on the analysis conducted in the DEIR, under the worst-case projection of Farmland conversion due to the Project, less than 1% (approximately 8,289 acres) of the 828,973 total acres of Farmland in Tier 2 of the total acreage of Farmland in Tier 2, which contains all of the Prime Farmland, Unique Farmland, and Farmland of Statewide Significance that is currently being used for agricultural uses in the Project Area (DEIR at p. 4.2-16), will be converted, and over 820,000 acres of Farmland will remain in Kern County. (DEIR at p. 4.2-18.)

Further, as described in response 99, response 114, and GR AG-1, MM 4.2 4.2-1 requires a 1:1 mitigation ratio for conversion of farmland and prioritizes conservation of farmland in Kern County, both through the acquisition and conservation component of the measure, as well as by promoting restoration of already disturbed agricultural land in the County through the removal of legacy oil and gas production equipment, including well abandonment and removal of surface equipment. Further, MM 4.2-1 has been revised to prioritize "acquisition of large blocks of agricultural land for preservation, and removal of legacy equipment, to minimize and mitigate fragmentation and edge impacts.

0044-103

Commenter indicates that the Farmland mitigation programs must be developed and established in the DEIR and not deferred to a later date.

The commenter cites to two cases for the proposition that a mitigation program must be fully developed during the EIR process—*California Native Plants Society v. County of El Dorado* (2009) 170 Cal.App.4th 1026 (CNPS) and the unpublished *South County Citizens for Responsible Growth v. City of Elk Grove* (Cal. Ct. App., Feb. 5, 2004), 20004 WL 219789 (*Elk Grove*).

In *CNPS*, the Court of Appeal considered the adequacy of a "rare plant fee" in El Dorado's County Code that allowed mitigation either through participation in a rare plant off-site mitigation program or through paying a fee for the direct or indirect impacts caused by development on the rare plants and rare plant habitat. The Court held that "[f]or an in-lieu fee system to satisfy the duty to mitigate, either that system must be evaluated by CEQA (two-tier approval for later, more specific, projects) or the in-lieu fees or other mitigation must be evaluated on a project-specific basis." (*CNPS*, *supra*, 170 Cal.App.4th at p. 1055.) The Court held that the fee program for rare plants was required to go through an environmental review and that it was not enough for the County to declare that the fee would fully mitigate the effects of development on rare plants.

Similarly, in *Elk Grove* the Court held that the mitigation fees that were going to be used to reduce the impact of farmland conversion should have been discussed in the EIR but stated that "[t]his would not be necessary if the City had an established program for the assessment and use of conservation fees." (*Elk Grove*, *supra*, 20004 WL 219789 at *8.) Since an established program was not in place, the Court requested that the EIR discuss when fees should be paid, how the fees should be spent, and which properties should have priority. (*Ibid.*)

Those standards are met here. The mitigation program for farmland conversion is being evaluated by CEQA through the EIR process.

MM 4.2-1 clearly states that Farmland will be mitigated at a 1:1 ratio and sets out four methods that can be used to achieve this standard. (See *North Coast Rivers Alliance v. Marin Municipal Water District* (2013) 216 Cal.App.4th 614, 629-630 [holding that a mitigation plan is sufficient if it identifies methods that will be used to mitigate the impact and sets out standards that the agency commits to meet]; see also CEQA Guidelines, § 15126.4, subd. (a)(1)(B) [mitigation measures "may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way"].)

MM 4.2-1 also states that mitigation must occur prior to a Project applicant submitting an application and that the land used for mitigation must "be of similar or higher agricultural quality as the lands" converted and priority is given to land in Kern County. This provides the necessary specificity to allow for public response through the CEQA process.

For more information, please see the Global Response on Mitigation Specificity and the Global Response on Agricultural Mitigation. Please see GR Ag-1 and GR 16.

0044-104

The comment cites *Citizens for Open Government v. City of Lodi* (2012) 205 Cal.App.4th 296 (*Lodi*) for the proposition that "conversion of 40 acres of farmland was a significant impact even after conservation easement mitigation measures." In *Lodi*, the draft EIR determined that the conversion of 40 acres of prime farmland to urban use could not be mitigated absent an outright prohibition on development. (*Id.* at p. 320.) This was due to the fact that the urban development changed the character of the land such that it was permanently removed from the stock of agricultural land. (*Id.* at p. 323). Because more agricultural land could not be created (only other existing agricultural lands preserved), the EIR found that the lost farmland was not fully mitigated by a 1:1 conservation ratio and adopted a statement of overriding consideration. (*Id.* at p. 322). The Court of Appeal held that substantial evidence supported the City's determination that there was no feasible mitigation measure for permanently converted agricultural lands. However, the Court determined that a ratio higher than 1:1 was not justified in that circumstance and that the City's proposed 1:1 mitigation ratio "would minimize and substantially lessen the significant effects of the proposed project." (*Id.* at pp. 323-324.) The Court's first determination regarding permanently converted agricultural lands is not relevant here, as agricultural lands affected by the Project could be used again in the future for agricultural purposes. Further, that finding is in conflict with the later Court of Appeal decision of *Masonite Corp. v. County of Mendocino* (2013) 218 Cal.App.4th 230, in which the Court concluded that "[b]y thus preserving substitute resources, [1:1 ratio conservation easements] compensate for the loss of farmland within the Guidelines’ definition of mitigation." (*Id.* at p.

238.)

Each of these suggested revisions to mitigation measures is addressed in responses to commenter's Exhibits (including Ex Ag 13, LU-4 and LU-5), included in Response 262, 274, and 275 below. Additional surface owner provisions have been added to the Revised Amended Ordinance, and to EIR Mitigation Measures, to address many of the subjects raised by commenter. Commenter's request that surface owner permission or agreement be imposed as a pre-condition for allowing mineral owners to access land, comply with mitigation measures and regulatory mandates, or extract oil or gas, are all noted, but cannot be imposed by the County as these provisions would effectively create a surface owner "veto" of mineral owner property rights given existing laws that provide mineral owners with the dominant property right on split estates. See also, GR 4.

0044-112

The potential effect of water shortages is addressed in the EIR, pp. 4.17-49 – 60, which covers utilities and service systems. The DEIR acknowledges that the shortage of water in Kern County is a significant problem, to which the Project's water demand will contribute. Mitigation measures 4.17-2 and 4.17-3 are provided to reduce the Project's impacts on the water supply. However, given competing water demands, the complexity of laws affecting water rights, the preexisting allocation of water supplies, and the many water districts that have legal jurisdiction over one or more sources of water in the Project Area, the scope of the County's jurisdiction is limited and the implementation and effectiveness of mitigation measures is considered uncertain. The EIR therefore concludes that the mitigation measures cannot reduce the impacts below a level of significance. Section 15126.2(b) of the CEQA Guidelines requires that the EIR describe any significant impacts, including those that can be mitigated but not reduced to less-than-significant levels. In order to approve the Project with this and other significant and unavoidable impacts, the County would be required to find that the project benefits outweigh these impacts.

0044-113

The EIR includes 22 detailed mitigation measures to reduce the frequency and/or consequences of hazardous materials spills. See MM 4.8-1 to 4.8-22. The EIR does not assume that mitigation will cause the risk of spills and contamination to "disappear", but analyzes the each impact and concludes that these mitigation measures are sufficient to reduce impacts to less than significant. The mitigation measures contain detailed prescriptive requirements which go beyond "best management practices." MM 4.8-6, which in the Draft EIR referred to best management practices, has been revised in the Final EIR to require compliance with specified standards. This analysis is comprehensively covers spills on all lands including agricultural lands. Commenter references its Exhibit Ag-9 regarding "irrigation water contamination"; please see GR Water-8.

0044-114

The comment refers to EIR page 4.22-2 which states that: "Use of heavy equipment, including trucks, and tanks used during oil and gas production activities would result in soil compaction *beneath roads* leading to well pad areas" (emphasis added). Soil compaction from heavy equipment used for oil and gas production would be confined to limited areas (access roads and well pads) and soil productivity would not be significantly affected. (By comparison, the use of farm equipment would have greater impact agricultural fields because soil compaction would occur throughout the field.) Similarly, any increased runoff related to soil compaction would be limited to oil and gas production areas because of the limited footprint that the heavy equipment would travel. Runoff from oil and gas production areas would be addressed by mitigation measures 4.9-1 and 4.9-2. A separate mitigation measure is not necessary.

0044-115

The commenter notes that use of heavy equipment *on cropland* would result in soil compaction. However, Project impacts related to soil compaction would be limited to areas disturbed for oil and gas activities, i.e., well pads and access roads. Moreover, any increased runoff related to soil compaction is managed through mitigation measures designed to control run-off.

The commenter's Exhibit 12 is a study of soil compaction caused by heavy farm equipment (high axle loads 10 tons and heavier). Although equipment used for oil and gas production is heavier than farm equipment, the impacts resulting from soil compaction during oil and gas production would be far less, because the frequency of trips and footprint that the heavy equipment would travel would be less than that required for farming activities. Heavy equipment for oil and gas production would be limited to roads and well pads and would be limited to well installation and/or recovery events (usually one trip in and one trip out). By contrast, farming activities (row crop production) requires heavy equipment that traverses throughout the entire area designated for agriculture (100% of a field per commenter's Exhibit 12) and the equipment will traverse the entire area prior to, during, and throughout the growing season and/or seasons (four passes as cited in the study).

The commenter's Exhibit 12 is a fact sheet advising landowners in Pennsylvania on soil compaction as an issue for negotiation of oil and gas lease provisions for restoration of the landowner's property after operations end. The fact sheet states: "Depending on the location and accessibility of the affected site," leaving the limited areas subject to soil compaction to revert to wildlife habitat is "often the most economical and logical use of these sites." This is an economic issue which is not an environmental impact under CEQA. "Economic and social changes resulting from a project shall not be treated as significant effects on the environment." CEQA Guidelines § 15064(e); *see also* Guidelines §§ 15131(a), 15382.

0044-116

The comment states that idle wells in the County can lead to fragmentation of farmland and grazing land, and cites to "H. King Letter" as evidence for this assertion. As of September 11 , 2015, no comment letter has been received from "H. King." Further, the existence of idle wells are part of the environmental baseline and are not an impacts of the Project. The vast majority of idle wells are located in Tier I areas, rather than in other tiers, as depicted in the attached Figures 1-4.

0044-117

See comment 116.

0044-118

See comment 116.

0044-119

The comment states that MM 4.2-2 is too vague to mitigate indirect Farmland conversions. MM 4.2-2 provides that each Applicant "shall comply" with 9 specific measures that control the physical and environmental footprint of oil and gas activities. These measures are specific and enforceable, and substantial evidence supports the determination that MM 4.2-2 will mitigate indirect impacts to less than significant. Please see GR 16.

0044-124

Commenter's objections to the sufficiency of MM 4.2-2 are noted. Revisions have been made to this MM that partially address these issues; however, as discussed in comment 261 in response to Ex AG 11 and 12, further mitigation to address soil compaction is not warranted based on evidence provided by commenter that use of heavy farm equipment has caused soil compaction in Pennsylvania. Responses to comments regarding water mitigation, farmland fragmentation, and idle wells, which commenter notes here but addresses in detail in other parts of its comment letter, are responded to in the context of the cross-referenced comments. The issue of idle wells, and the quotation from the County staff report, are also noted, and this issue is addressed in Responses 116-118 above. Commenter's concerns about the effects of mitigation measures on farmland are also noted, and as explained in Responses 262, 274, and 275 (responses to Exh Ag 13, LU 4 and LU-5), when under County jurisdiction and control some measures have been modified to reduce impacts to agricultural lands (e.g., planting of screening vegetation on agricultural lands) and other measures are required to comply with applicable regulations (e.g., federal Clean Water Act stormwater management requirements) or mitigate significant adverse impacts (e.g., pre-construction cultural resource surveys to assure avoidance of significant cultural resources). Following further consideration of these comments, and the modifications included in the Revised Amended Ordinance and EIR mitigation measures to address surface owner and agricultural impact issues, the County's longstanding practice of requiring compensatory mitigation for loss of agricultural lands based on ground disturbance impacts has been determined to continue to be the appropriate mitigation metric for this EIR.

0044-125

Please see GR 4.

0044-126

Please see GR 4.

0044-127

The comment states that the cumulative impacts analysis for Agriculture and Forest Resources is inadequate. As noted in section 3.7 of the DEIR, the cumulative analysis in the DEIR "uses the plan/projection approach, and includes both the KCGP and the regional growth plan and projections included in the Kern COG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) approved in 2014." DEIR p. 3-80. This approach to cumulative analysis is authorized by Cal. Pub. Res. Code s. 21100(e), 14 CCR 15130(b)(1)(B), as well as CEQA case law. *See Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260; *Schaeffer Land Trust v. San Jose City Council* (1989) 215 Cal.App.3d 612.

Commenter asserts that the DEIR's cumulative agricultural impacts analysis is insufficient. Specifically, commenter requests that the County clarify whether the average annual farmland conversion rate has been increasing, whether the RTP/SCS conversion figure is calculated annually or over a period of time, and where the conversions forecasted under Kern County's General Plan would occur.

The Kern County General Plan provides a lawful basis for cumulative impacts, as does the Kern COG RTC/SCS. Pursuant to CEQA Guidelines § 15130(b)(1)(B), a lead agency "may base the cumulative impact analysis on a summary of projections of future development and impacts contained in an adopted general planning or related planning document, or in a prior environmental document that has been certified." The only requirements are that "[t]hese documents must be available to the public and actually describe or evaluate the regional or areawide conditions contributing to the cumulative impact." (*Ibid.*) The County General Plan and the RTP/SCS meet these requirements.

In response to commenter's questions about whether the rate of conversion is increasing and how the RTP/SCS conversion figure is calculated, the RTP/SCS states that the conversion of 24 square miles from agricultural use will occur "[f]or the 2014-2040 planning period (26 years)" (2014 RTP at p. 4-35). This duration is noted and included in the Final EIR prepared for the RTP/SCS. During this period, as stated in the DEIR, the RTP/SCS forecasts that the conversion of agricultural land will be 1/10th the conversion of the previous 22 years. (DEIR at p. 4.2-25). Thus, according to the RTP/SCS, the rate will be decreasing over the next 26 years due largely to local government efforts to balance urban expansion with the conservation of economically viable farmland.

Identification of the specific location of the potentially converted agricultural parcels was not necessary in order to prepare the cumulative impacts analysis for the Project, since the geographic scope of the Project is all of Kern County and not any particular agricultural area within the County. (See DEIR at p. 4-2-24.) The CEQA Guidelines allow a lead agency to define the geographic scope when conducting a cumulative impacts analysis, as long as a reasonable explanation for the geographic limitation is given. (CEQA Guidelines, § 15130(b)(3).) Here, the County chose analysis chose the whole of Kern County because agricultural land statistics and characteristics are typicallycollected at the County level. (DEIR at p. 4.2-24.) This is a reasonable explanation for this geographic limitation. Additional information regarding the mapping techniques used by the County to predict the loss of 80,847 acres of prime and important farmland and 55,000 acres of grazing land can be found in the Recirculated Draft Program EIR for the Kern County General Plan Update, January 2004, at pages 4-7-37 to 4-7-38. Since 2004, the Kern County General Plan Progress Reports (2005 to 2015) required to be filed by April 1 to the State Office of Planning and Research has shown the statistics of conversion in contrast to the projection in the 2004 General Plan EIR. The 2015 report shows that the cumulative conversion of agricultural land from 1998 to 2014 is 19,973 acres countywide. Compared to the projection of the loss of 80,847 acres, the current total of 19,973 in 2014 can been seen to show that conversion has declined not accelerated since the General Plan DEIR. Text revisions have been made to this EIR to reflect the duration of the analysis in both the RTP/SCS and the KCGP, as well as to reflect that the predicted loss of prime and important farmland in the KCGP is 80,847 acres, not 80,854 acres as identified in the DEIR.

0044-128

Please see response 111.

0044-129

The comment states that the cumulative impacts analysis for Agriculture and Forest Resources fails to include the "Tier 5 specific plans." Commenter fails to indicate which specific plans it believes should have been considered, and the comment's cross-reference to Section III.D.4 of its letter is inapposite. All relevant Specific Plans are discussed on DEIR pages 4.10-64 – 73. These Specific Plans are appropriately considered as part of the Project-level analysis, rather than as part of the cumulative analysis, because the Revised Amended Zoning Ordinance regulates all future oil and gas activity in the County, including in Tier 5. DEIR, pp. 3-24 – 3-26. As noted on page 3-26, Tier 5 are areas

including current and future Specific Plan boundaries either adopted with a Special Plan Zone District or which include specific provisions for oil and gas operations. Oil or gas exploration and production activities would be allowed with a CUP or as permitted by the regulations contained within the adopted Specific Plan(s) in Tier 5 areas." Any wells that will be developed in the Tier 5 will be part of the well cap imposed by the Revised Amended Ordinance (DEIR, p. 3-26; *see also* Global Response 13), though such wells would be subject to additional environmental review consistent with the requirement to obtain a conditional use permit.

The comment also states that the DEIR fails to take into account "the potential for future wind and solar development" in the cumulative analysis of impacts to agricultural resources. As discussed in response 130, this EIR appropriately uses a plan/projection approach to cumulative analysis, including specifically the KCGP. DEIR p. 3-80. This approach to cumulative analysis is authorized by Cal. Pub. Res. Code s. 21100(e), 14 CCR 15130(b)(1)(B), as well as CEQA case law. *See Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260; *Schaeffer Land Trust v. San Jose City Council* (1989) 215 Cal.App.3d 612. Future solar and wind development in the County are specifically included in the KCGP Energy Element (pp. 203-204 (wind) and pp. 209-210 (solar)), and the KCGP Land Use, Conservation and Open Space Element contains a specific goal "encourage alternative sources of energy, such as solar and wind energy, while protecting the environment" (p. 53). The assumed future development of renewable energy resources such as solar and wind were also considered in the KCGP Program EIR. KCGP PEIR, Ch. 4.7. Further the siting of commercial wind in the project boundary area is limited by the availability of wind velocities that are stable enough for commercial production and the Kern County Figure 19.08.160 and provisions that limit the height of structures for impacts to military operations. Commerical wind development requires the use of the WE (Wind Energy) Combining District. There is no WE zoing currently in the project boundary area and a discretionary zone change would be required for commercial wind development which would be subject to CEQA. Siting of new utlility scale solar projects would require the processing of a discretionary Conditional Use Permit and would be subject to CEQA. This DEIR while providing cumulative information on impacts has no inclusion of details or analysis for a project specific zone change for the WE combining District or a Conditional Use Permit for a utlility scale solar project. Thus, potential future development of wind and solar resources in the County, and the potential for such development to convert farmland, is included in the KCGP's predicted loss of up to 80,847 acres of prime and important farmland, and is therefore included in the cumulative analysis of this EIR.

0044-130

The reactivation of idle wells in Tier 2 is a component of the Project, has been included in the calculation of Project air emissions, and the effects of reactivation of idle wells are considered as part of the Project-level environmental review and therefore need not be considered as part of the cumulative analysis."

0044-137

The commenter's opinion is noted.

0044-138

As explained in the Draft EIR (*see e.g.,* p. 4.10-85) the proposed Project differs significantly from linear projects such as proposed highways. The proposed Project therefore does not have the same potential to create a physical barrier in the middle of an existing community in the CEQA sense. CEQA Guidelines § 15131(b); *Gentry v. Murrieta* (1995) 36 Cal. App. 4th 1359, 1419 ("A project will normally have a significant effect on the environment if it will disrupt or divide the physical arrangement of an established community. This guideline was intended to apply to projects, such as highway construction, that would constitute physical barriers dividing a community."). Oil and gas activities have historically taken place in the Project Area and existing communities have been constructed throughout the Project Area, including near existing well sites. To the extent Project activities and existing communities do or will overlap, the County's policies and zoning setbacks protect residential or other existing uses, and oil and gas drilling operations.

0044-139

The comment states that a project's conflict with an applicable land use plan is a significant impact under CEQA, and that this EIR is incorrect in finding that there are no significant land use conflicts. The commenter's opinion is noted. For reasons explained and in the responses to comments immediately following, the Project is consistent with the applicable General Plans.

The legal authorities cited by the commenter are noted. *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777 ("*Endangered Habitats League*") and *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903 ("*Pocket Protectors*"). In *Endangered Habitats League*, the Court found a project was inconsistent with the applicable general plan because the project would cause traffic impacts using a specific method of analysis beyond the threshold specified in the general plan's policy for a specific street. *Endangered Habitats League*, *supra*, 131 Cal.App.4th at pp. 783-785. There, the traffic conflict would have resulted in the type of actual environmental impact that the general plan policy was designed to avoid. Unlike the project in *Endangered Habitats League*, the Revised Amended Ordinance here does not directly conflict with an applicable goal or policy in the applicable land use plans. DEIR pp. 4.10-91 through 4.10-173.

The comment cites another case but does not discuss its applicability. In *Pocket Protectors*, the court held the City of Sacramento had to prepare an EIR after it approved a mitigated negative declaration for a residential project. *Pocket Protectors v. City of Sacramento*, *supra*, 124 Cal.App.4th at p. 908. The court held in part that the administrative record supported a fair argument that the proposed project could conflict with the applicable land use policies, which constituted grounds for requiring an EIR. *Id.* at p. 930. The court noted that the mitigated negative declaration was devoid of reasoning and evidence to support Sacramento's conclusion that the proposed project was consistent with the applicable land use policies. Here, unlike the analysis in *Pocket Protectors*, a full environmental impact report has been prepared. This EIR has fully analyzed and explained the Revised Amended Ordinance's consistency with the applicable land use policies. Please also see the responses to comments immediately following.

0044-140

There is no conflict with the applicable General Plans, and therefore no violation of the Planning and Zoning Law if the Project is approved. A lead agency has discretion to balance potentially competing goals and policies within a general plan, and that has been done here in making the determination that the Project is consistent with the Kern County General Plan and Metropolitan Bakersfield General Plan.

The relevant standard to determine consistency with an applicable land use plan is whether the project is "in agreement or harmony with the terms of the applicable plan." *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 678; see also *Friends of Lagoon Valley v. City of Vacaville* (2007) 154 Cal.App.4th 807, 817; *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993) 23 Cal.App.4th 704, 718. A proposed project need not be in "rigid conformity with every detail" of an applicable land use plan. *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 678. To be consistent with the applicable land use plan, the proposed project must only be "compatible with the objectives, policies, general land uses, and programs specified in the applicable plan." *Id*. "Because policies in a general plan reflect a range of competing interests, the governmental agency must be allowed to weigh and balance the plan's policies when applying them, and it has broad discretion to construe its policies in light of the plan's purposes. [Citations.]" *Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal. App. 4th 342, 386.

Here, this EIR's Land Use and Planning Chapter provides detailed analysis showing how the Revised Amended Ordinance is consistent with over 400 of the applicable goals, polices, and implementation measures in the Kern County General Plan and Metropolitan Bakersfield General Plan. DEIR pp. 4.10-91 through 4.10-173. In determining the Project's consistency with these policies, this EIR has analyzed the policies in light of a range of potentially competing interests. As clearly described in this EIR, both General Plans have a number of policies, goals, and implementation measures which support continued and expanding oil and gas activities, including – but not limited to - the following:

Kern County General Plan:

Chapter 1. Land Use, Conservation, and Open Space Element; Section 1.9 - Resource: Goal 1. To contain new development within an area large enough to meet generous protections of foreseeable need, but in locations that will not impair the economic strength derived from the

petroleum, agriculture, rangeland, or mineral resources or diminish the other amenities that exist in the County. Goal 2. Protect areas of important mineral, petroleum, and agricultural resource potential for future use. Goal 4. Encourage safe and orderly energy development within the County, including research and demonstration projects, and to become actively involved in the decision and actions of other agencies as they affect energy development in Kern County. Implementation Measure K. Protect oilfields and mineral extraction areas through the use of appropriate implementing Zone Districts: A (Exclusive Agriculture), DI (Drilling Island), NR (Natural Resource), or PE (Petroleum Extraction).

Chapter 5. Energy Element; Section 5.2 - Importance of Energy to Kern County: General Goal: To assert Kern County's position as California's leading energy producer, to encourage safe and orderly energy development within the County, including research and demonstration projects, and to become actively involved in the decisions and actions of other agencies as they affect energy development in Kern County. Policy 3. The County shall continue to streamline energy permitting regulations.

Chapter 5. Energy Element, Section 5.3. Petroleum Resources and Development; subsection 5.3.1. Urban/Residential Development in Petroleum Resource Areas: Goal. To protect oil resource areas from unnecessary urban/suburban encroachment, and in instances of urban/suburban development in oil resource areas, to provide for the development of petroleum resources in a manner compatible with the surrounding environment to minimize adverse impacts and protect health and safety. Policy 3. The County shall continue to provide the opportunity for establishing drilling islands prior to final maps subdivision approval of any proposal in a petroleum resource area or a waiver of surface entry rights by the applicable mineral rights holder. Policy 6. In areas where petroleum production occurs close to urban development, oil companies shall be encouraged to site equipment so as to avoid unnecessary disturbance to urban uses. Policy 7. The County should work in cooperation with incorporated cities of Kern County to establish compatible standards for oil development within urban areas. Implementation Measure A. The Drilling Island District of the Kern County Zoning Ordinance shall establish and maintain development standards to permit petroleum exploration and development on single lots and in small areas. Implementation Measure B. The Petroleum Extraction Combining District of the Kern County Zoning Ordinance shall establish and maintain specific standards for ensuring compatibility with urban and petroleum development for the Estate (E), Commercial Office (CO), Neighborhood Commercial (C-1), General Commercial (C-2), and Highway Commercial (CH) zoning designations. Oil and gas production shall be subject to provisions set forth in Chapter 19.98 of the Kern County Zoning Ordinance. Implementation Measure C. The County shall monitor its regulations pertaining to petroleum exploration, production, and update such regulations as necessary.

Chapter 5. Energy Element, Section 5.3. Petroleum Resources and Development; subsection 5.3.4. Petroleum Technology and Advancement: Goal. To encourage the continuing advancement of energy technology and to respond to the needs it creates on the work force. Policy 2. The County should encourage the energy resource industry to invest and research the practical advancement of technology, and allow for periodic updates or training sessions for industry workers. Implementation Measure A. The County should promote a continuing dialogue with petroleum industry representatives to monitor trends in technology and anticipate needed changes to development standards. Implementation Measure B. The County shall review and revise, as necessary, the Zoning Ordinance to make provisions for experimental technologies.

Chapter 5. Energy Element, Section 5.3. Petroleum Resources and Development; subsection 5.3.7. Processing and Transportation of Petroleum Products: Goal. To ensure the siting of refining facilities and pipelines in locations to provide maximum health, safety, and environmental protection; and to encourage the necessary processing and transportation facilities for Kern County's petroleum production. Policy 1. New refineries shall be sited in accordance with provisions of the Kern County Zoning Ordinance. Policy 2. The County shall review proposed pipelines and their alignments for their conformity with the Land Use, Open Space, and Conservation Element of this General Plan. Policy 3. The County shall encourage the development of new pipelines with alignments that provide for environmental and the public's health and safety protection. Implementation Measure A. The County shall review and revise, as necessary, the Zoning Ordinance to provide for suitable sites for refinery construction and expansion.

Metropolitan Bakersfield General Plan:

Chapter II, Land Use Element: Policy 31. Allow for a variety of industrial uses, including land-extensive mineral extraction and processing, heavy manufacturing, light manufacturing, warehousing and distribution, transportation-related, and research and development uses (I-1). Policy 32. Protect existing industrial designations from incompatible land use intrusions (I-1, I-6, I-8).

Chapter V, Conservation Element; Section B. Mineral Resources: Goal 1. Protect areas of significant resource potential for future use. Goal 2. Document areas of current mineral and energy resource extraction, as a basis for land use and conservation policies and programs. Policy 4. Land use decisions shall recognize the importance of identified mineral resources and need for conservation of resources identified by the State Mining and Geology Board (I-2). Policy 7. Promote development of compatible uses adjacent to mineral extraction areas (I-2). Implementation Measure 3. Periodically review and update local Zoning Ordinances that have been amended to accommodate mineral extraction uses outside of mineral resource zones.

Kern River Plan Element, Chapter III. Issues, Goals, and Basic Plan Policies: 3.4. Floodplain Management Policy 9. Oil and mineral exploration and production shall be allowed within the secondary floodway, provided that adverse effects on riparian vegetation and wildlife habitat are minimized. Appurtenant facilities, such as tank farms and steam generators, shall be located outside any floodway; except that they may be allowed within the 8.4/2.5 (Mineral and Petroleum/Secondary 3.6. Mineral and Petroleum Goal. To provide for the continued production of petroleum resources and to ensure that future exploration activities can take place, while ensuring that other open space values in the River area are reasonably protected. Utilize sand and gravel resources of the River in such a way as to ensure that floodway, groundwater recharge, and wildlife habitat values are protected.

Kern River Plan Element, Chapter V. Implementation Policies, F. Mineral and Petroleum Extraction: Implementation Policy 2. Mineral and petroleum extraction shall be encouraged on those lands designated "Mineral and Petroleum" on the Kern River Plan Map. Such use may also occur in other areas designated for recreation, resource, or industrial uses as long as the primary designated use is not significantly impaired and as long as such use is consistent with other provisions of this plan and in compliance with existing local, state, and federal regulations.

See additional policies related to providing for continued oil and gas development in both General Plans. DEIR pp. 4.10-14 through 4.10-70. These goals, policies and implementation measures demonstrate the interests that Kern County and the City of Bakersfield have in promoting

the continued development of oil and gas within their respective jurisdictions, as well as surrounding cities and communities and these interests must factor into the balancing conducted by the County.

The Project is not incompatible with those aspects of the two General Plans which promote interests other than oil and gas development. A finding that a particular project is consistent with the general plan requires only that the proposed project be "*compatible* with the objectives, policies, general land uses, and programs specified in" the applicable plan. (Emphasis added.) Govt. Code §66473.5.

General plans serve as "charter[s] for future development" and embody a local agency's "fundamental policy decisions." *Federation of Hillside and Canyon Assns. v. City of Los Angeles* (2004) 126 Cal.App.4th 1180, 1194. Policies in a general plan "typically reflect a range of competing interests." *Id*. Local agencies have "broad discretion to weigh and balance [those] competing interests in formulating development policies." *Id.*at 1196; *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 678. Local agencies further have broad discretion to construe a general plan's policies "in light of the plan's purposes." *Save Our Peninsula Com. v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 142.) "General plans ordinarily do not state specific mandates or prohibitions," but instead "state policies and set forth goals." *Friends of Lagoon Valley v. City of Vacaville* (2007) 154 Cal.App.4th 807, 817; *Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 378. Accordingly, the Kern County General Plan explains that the General Plan is a "policy document" that is "designed to give long-range guidance to those County officials making decisions affecting the growth and resources of the unincorporated Kern County jurisdiction, excluding the metropolitan Bakersfield planning area." Kern County General Plan, Introduction, p. vi. The Metropolitan Bakersfield General Plan likewise states that the "general plan is a policy document designed to give long range guidance to those making decisions affecting the future of the Metropolitan Bakersfield planning area." Metropolitan Bakersfield General Plan, Introduction, p. I-1.

Considering the County's need to balance competing interests, the Revised Amended Ordinance is consistent with Kern County's General Plan and the Metropolitan Bakersfield General Plan. A proposed project is consistent with a land use plan if that proposed project is "in agreement or harmony with the terms of the applicable plan." *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 678; *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993) 23 Cal.App.4th 704, 718. A proposed project need not be in "rigid conformity with every detail" of an applicable land use plan. *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 678. To be consistent with the applicable land use plan, the proposed project must only be "compatible with the objectives, policies, general land uses, and programs specified in the applicable plan." *Id.* A proposed project must also not obstruct the attainment of any policies in the general plan. *Friends of Lagoon Valley v. City of Vacaville* (2007) 154 Cal.App.4th 807, 817.

The Project's compatibility is described in great detail in Table 4.10-7, and implementation of the Revised Amended Ordinance would not result in incompatible land uses. As explained in this EIR, for more than a century, there has been co-location of oil and gas operations with agricultural operations in Kern County, including use of the land via split estates between surface owners and mineral owners. Further there are legal recourses and constitutional protections for both parties to resolve any disputes in the courts. DEIR p. 3-15 to 17. As described further in Global Response 4, detailing the benefits to surface owners and agricultural interests in the Revised Amended Ordinance, co-located agricultural and oil and gas operations will continue to productively coexst. Please also refer to responses to commenter's comments immediately preceding and following this comment (comments -139 to -167).

The commenter cites to *Families Unafraid to Uphold Rural El Dorado County v. El Dorado County* (1998) 62 Cal.App.4th 1332 ("*Families"*) to support its statement that a project may be inconsistent with a general plan if it conflicts with a fundamental and clear policy in that plan. In that case, the court found the proposed project clearly conflicted with a fundamental policy in the applicable land use element that required development to be contiguous with specified land uses as specified in the general plan; there was no room for discretion or ambiguity within that particular policy. *Families*, *supra*, 62 Cal.App.4th at pp. 1341-42. Here, however, the applicable goals and policies land use plans have been analyzed, and the EIR has concluded the Revised Amended Ordinance is consistent with those goals and policies. See pp. 4.10-91 through 4.10-173 in DEIR. The comment also cites to *Napa Citizens for Honest Gov. v. Napa County* (2001) 91 Cal.App.4th 342,378 to assert that a proposed project cannot frustrate a general plan's policies and objectives. As this EIR's detailed analysis shows, the Revised Amended Ordinance will not frustrate the applicable policies or objectives in existing land use policies, and, in fact, furthers the policies described above. DEIR pp. 4.10-91 through 4.10-173.

In sum, as explained in Chapter 4.10 – Land Use and Planning, the County has weighed the competing interests in the applicable General Plans. The Revised Amended Ordinance is in "agreement" and "harmony" with the Kern County and Metropolitan Bakersfield General Plan and is compatible with the general policies and goals set forth in those plans.

0044-140 cont'd

0044-141

This comment states that oil and gas development would occur on lands governed by the Kern County General Plan and the Metropolitan Bakersfield General Plan, and states that the project conflicts with three objectives in the plan concerning conflict with existing land uses, adequacy of water supplies, and clustering of industrial developments. The comment is incorrect . The Kern County and Metropolitan Bakersfield General Plan both contain policies which support oil and gas activities, and the Planning and Zoning Law allows the County to harmonize policies through a balancing of interests.

The commenter also states that the DEIR recognizes the potential for a land use conflict. It should be noted that the EIR also states that the revisions to the ordinance would reduce the potential land use conflicts to less than significant. DEIR p. 4.10-87.

Please see response to comment 0044-140 regarding consistency with the Kern County and Metropolitan Bakersfield General Plans. See also GR 4 (regarding benefits to surface owners and agricultural interests from the Revised Amended Ordinance), and responses to commenter's comments 44-139 to 44-167.

0044-142

This comment cites five goals and policies from the Kern County and Metropolitan Bakersfield General Plans which the comment states "prohibit the County from approving projects that would result in incompatible land uses." Both General Plans have been thoroughly considered in this EIR, and the EIR concludes that approving the Project would not result in incompatible land uses.

This comment also states that the DEIR recognizes the potential for a land use conflict. This comment is correct; however, it should be noted that the EIR also states that the Revised Amended Ordinance would reduce the potential land use conflicts to less than significant. DEIR p. 4.10-87.

The five policies cited in the comment do not prohibit approval of this Project. The Project's consistency with these five policies and goals cited are individually analyzed and directly addressed in Table 4.10-7. (Please note that the comment includes a typographical error when it cites "Chapter 1.9 (Industrial);" it is understood that the commenter meant "Chapter 1.8 (Industrial)" here.) The relevant analyses from Table 4.10-7 is excerpted here for clarity:

Kern County General Plan

Chapter 1.8 (Industrial)

Goal 3. Ensure compatibility with land use designations such as residential, commercial, or other land uses that may be affected by such activities.

CONSISTENT. The proposed Project would not alter currently established land use designations such as residential, commercial, or other land uses. The new development standards are intended to provide greater environmental protection with respect to oil and gas development in the Project Area. Additionally, oil and gas development in residential and commercial areas (Tier 4) would still require the acquisition of a CUP prior to drilling new wells. Therefore, the proposed Project would be consistent with Goal 3.

Chapter 1.9 (Resource)

Goal 3

Goal 3. Ensure the development of resource areas minimize effects on neighboring resource lands.

CONSISTENT. The purpose of the EIR is to analyze the impacts of future oil and gas development on all land within the County's jurisdiction within the Project Area as well as analyzing impacts on neighboring resource lands. Mitigation designed to reduce and avoid impacts on lands associated with resource area development would also have the indirect effect of reducing impacts on neighboring areas. Therefore, the proposed Project would be consistent with Resource Goal 3.

Policy 7. Areas designated for agricultural use, which include Class I and II and other enhanced agricultural soils with surface delivery water systems, should be protected from incompatible residential, commercial, and industrial subdivision and development activities.

CONSISTENT. Lands designated as Tier 2 are zoned either A or A-1 and may contain Important Farmland with Class I and II soils. As discussed in Section 4.2, Agricultural and Forestry Resources, the Kern County Zoning Ordinance identifies oil and gas drilling and production activities as a compatible use on A and A-1 lands. Therefore, the proposed Project would be consistent with Policy 7.

Metropolitan Bakersfield General Plan

Goal 3. Accommodate new development which is compatible with and complements existing land uses.

CONSISTENT. The proposed Project's new development standards would reduce adverse impacts associated with oil and gas production. 90% of new development would occur in Tier 1 areas, by definition, are areas in which oil and gas development is the primary land use. New development standards described throughout this EIR would ensure that oil and gas development in all Tiers is compatible with existing land uses. Therefore, the proposed Project would be consistent with Goal 3.

Policy 10. Implement, as appropriate, the California Environmental Quality Act to minimize land use conflicts and reduce environmental impacts of all proposed resource extraction operations (I-2).

CONSISTENT. Proposed development standards are intended to minimize land use conflicts and reduce environmental impacts of future oil and gas explorationand production activities. MM 4.10-1 would implement a new Oil and Gas Conformity Review Process, which includes a system of surface owner sign off and notification in order to reduce land use conflicts. Therefore, the proposed Project would be consistent with Policy 10.

Both the Kern County General Plan and the Metropolitan Bakersfield General Plan have in their land use designations, policies and the County's implementing Zoning Ordinance acknowledge that agriculture, grazing and oil and gas production are compatible uses with one another. The Kern County General Plan Land Use, Open Space and Conservation Element, Section 1.9 Resource, identifies petroleum exploration and extraction and farming and grazing activities as being compatible land uses in all of the Resource Land Use Designations(Map Code 8.1(Intensive Agriculture), Map Code 8.2 (Resource Reserve), Map Code 8.3 (Extensive Agriculture), Map Code 8.4 (Mineral and Petroleum) and Map Code 8.5(Resource Management). Oil and gas production activities occur throughout many of these designations. In addition, Resource Policy No. 15 specifies that "Agricultural and other resource uses will be considered a consistent use in areas designated for Mineral and Petroleum Resource uses on the General Plan

The project is compatible with the cited policies and goals from the Kern County and Metropolitan Bakersfield General Plans. None of these policies would prohibit the Project or result in impermissible land use conflicts. Please see response to comments 43-141 and 43-142 for a discussion regarding the standards for determining whether a project is consistent with applicable general plans. Please also see also GR 4 (regarding benefits to surface owners and agricultural interests from the Revised Amended Ordinance), and responses to commenter's comments 44-139 to 44-167.

0044-142 cont'd

0044-143

The comment states that mineral rights are often severed from surface ownership, and that this allows oil and gas operators to use farmlands to develop mineral rights. This comment is correct. The EIR discusses split estates at page 3-15 to 3-17, and explains that the rights of the mineral owner to use of the surface of the real property are dominant to the rights of the owner of the surface estate, which gives the mineral owner the right to reasonable access to develop its mineral right. This section further explains that the rights of a mineral owner to use the surface estate can only be restricted by an express grant of such rights from the mineral owner to the surface owner, and that mineral rights are real property rights primarily established under the common law of California and generally governed by the California Civil Code, Division 2, Part 2.

The comment also states co-locating oil and gas and agricultural operations can create significant land use impacts, and that the Project will result in oil and gas encroachments into agricultural land. As explained in this EIR, for more than a century, there has been co-location of oil and gas operations with agricultural operations in Kern County, including use of the land via split estates between surface owners and mineral owners. DEIR p. 3-15 to 17. In the historic and ongoing co-location of these uses, there has been little evidence of problems and conflicts.

In evaluating the Project, a range of competing interests, goals and policies were balanced. Please see response to comments 44-141 and 44-142 for a more detailed discussion of the balancing required to determine consistency with a project's general plan and responses to comments 44-146 through 44-167 which address additional comments regarding potential conflicts of these land uses. Also, please refer to Global Response 4, which details the benefits to surface owners and agricultural interests in the Revised Amended Ordinance None of the policies commenters cite would prohibit the Project or result in impermissible land use conflicts.

0044-144

The comment states that the DEIR is silent on conflicts between agricultural and oil and gas land uses, and lists examples taken from the staff report for the DEIR. The comment also cites to the "H. King Letter" as evidence that such transactions have occurred in the past. As of September 19, 2015, the County has received no such letter. However, this EIR is not silent on the topic of potential conflicts between agricultural and oil and gas use. The EIR discloses and analyzes several potential areas of conflict.

For example, the EIR discusses potential conflicts with Williamson Act contracts, and concludes that because the Kern County Agricultural Preserve Standard Uniform Rules includes oil and gas drilling and production as a compatible use within Agricultural Preserves established under the Williamson Act, there is no significant impact with respect to Williamson Act contracts. DEIR p. 4.2-20.

Potential conflicts between oil and gas development and agricultural operations in the area of water use was also considered. For example, this EIR considered the potential for water quality impacts to agricultural or drinking water wells downgradient of a produced water pond. DEIR p. 4.9-69. Potential impacts to drinking or agricultural groundwater quality as a result of injection activity in the Project Area was also considered. DEIR p. 4.9-72 and 4.9-74. Please refer also to GR Water-3, which discusses the Project's consistency with the Groundwater Sustainability Management Act, which is also relevant to water use by both oil and gas and agricultural operations.

The EIR also considers the potentially significant impact of farmland conversion. DEIR p. 4.2-16 to 4.2-18. Several of the examples cited in the comment would trigger the farmland mitigation measures considered in the EIR. For example, the creating of new access roads "which take out crops" could trigger an obligation to mitigate that disturbed land at a 1:1 ratio. The mitigation measure ensure that any active farmland that is converted by future oil and gas exploration and extraction activities authorized by the Project over its 25-year life span are mitigated at a ratio of 1:1. DEIR at pp. 4.2-18, 4.2-19. The DEIR's analysis shows that this mitigation program will reduce the impacts on Farmland to a level that is less than significant. DEIR at p. 4.2-19. Please refer to GR 4 for a more complete discussion of this mitigation measure. Please also see Section 7.1.4, the Revised Summary of Impacts, Mitigation Measures and Significance Conclusions for revisions to mitigation measures that concern impacts to agricultural lands.

0044-145

The comment states that agricultural land values have decreased because of oil and gas operations. Land value is not a CEQA issue, and the commenter has submitted no evidence of any decline in value caused by the proximity of oil and gas operations to agricultural lands that is strictly tied to the oil and gas development and not to other limiting factors such as drought, site specific water availability, invasive insects, international commodity prices, and other market factors.

Reduction in agricultural land values is not an impact on the environment under CEQA. "Economic and social changes resulting from a project shall not be treated as significant effects on the environment." CEQA Guidelines § 15064(e); *see also* Guidelines §§ 15131(a), 15382; *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1020-21 (holding an EIR for a mining project did not have to consider the project's economic impacts on neighboring landowners due to the potentially significant impact on water levels in their private wells because there was "no evidence that any significant physical changes on the environment will result from loss in the property value of [those] neighboring lands"). Economic considerations are not relevant to the CEQA analysis unless there is evidence to show those considerations will have "a significant effect on the physical environment." *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 120 Cal.App.4th 396, 446; CEQA Guidelines §§ 15064(e), 15131(a).) The commenter has submitted not submitted such evidence. Evidence of economic impacts that "do not contribute to or are not caused by physical changes in the environment is not substantial evidence that the project may have a significant effect on the environment."(CEQA Guidelines § 15064(f)(6); *Friends of Davis v. City of Davis* (2000) 83 Cal.App.4th 1004, 1019. The focus of the environmental review under CEQA "shall be on the physical changes" that result from a project. CEQA Guidelines § 15131(a).

Agricultural uses and oil and gas uses have a long history of co-existing on split estates in the County. This commenter presents no evidence that any economic considerations from the adjacent or co-location of agricultural and oil and gas uses will have any effect on the physical environment. Therefore, analysis of the Revised Amended Ordinance on neighboring property values is not required under CEQA or the CEQA guidelines.

0044-146

This comment is noted. Please refer to GR 4 and GR Ag-1.

0044-147

The comment is noted. Please refer to GR 4 (Surface Owners and Agriculture).

0044-148

The comment is noted. The Revised Amended Ordinance surface owner sign off provisions, and its alternative review process if the surface owner sign off cannot be obtained, reflect a balancing of the respective interests between the mineral estate owner and the surface owner. Please refer to GR 4 (Surface Owners and Agriculture). Please also refer to RTC 44-272.

0044-149

The comment is noted. Please refer to GR 4. Please also see changes made in the Revised Amended Ordinance that relate to the surface owner signoff process.

0044-150

The comment is noted. Please refer to GR 4. Please also see changes made in the Revised Amended Ordinance that relate to the surface owner signoff process.

0044-151

The comment is noted. Please refer to GR 4. Please also see changes made in the Revised Amended Ordinance that relate to the surface owner signoff process. With respect to resolution of other land use conflicts described earlier, please see responses to comments 44-139 to 44-145. In response to this comment's statement that there are no measures that require clustering, please see response to comment 44-159.

0044-152

Please see GR 4. Please also see the Revised Amended Ordinance. The requirements of the site plan contents provide sufficient information to inform the surface owner of the nature and extent of the potential impacts to the surface use.

0044-153

Please see GR 4. Please also see the Revised Amended Ordinance. The requirements of the site plan contents provide sufficient information to inform the surface owner of the nature and extent of the potential impacts to the surface use.

0044-154

Please refer to responses to comments 44-139 through 44-145 regarding the Project's consistency with the Kern County and Metropolitan Bakersfield General Plans, and the standards by which that consistency is determined. With respect to consistency with Williamson Act contracts specifically, please see response to comment 44-147. The express statements in the Kern County Agricultural Preserve Standard Uniform Rules that oil and gas activities are considered compatible with Williamson Act demonstrates that the Project would have less than significant impacts to Williamson Act contract farmlands. With respect to potential general land use conflict between oil and gas activities and agricultural surface use, the mitigation measures proposed in this EIR reduce the impacts of the potential conflicts to less than significant. Please see the Section 7.1.4. (Revised Summary of Impacts, Mitigation Measures and Significance Conclusions). Please also see GR Ag-1 regarding agricultural impacts and mitigation.

0044-155

Please refer to GR 4, GR Ag-1, responses to comments 44-139 to 44-167, the Revised Amended Ordinance, and Section 7.1.4 of this EIR.

0044-156

Commenter's text references an exhibit listing mitigation measures that commenter recommends as additional feasible mitigation for agricultural impacts. Responses to these comments are included in Response 262, Ex Ag 13.

0044-159

The comment states that the Project conflicts with KCGP and Metropolitan Bakersfield General Plan policies concerning the clustering of industrial uses. The policies are specifically discussed in the General Plan in relation to Industrial general plan designations and Industrial zone distircts. The amended zoning ordinance applies to activities that are not limited to these industrial zones and primarily are in resource conservation zones and therefore, the policies do not specifically apply. Each General Plan's policies are discussed in Chapter 4.10 – Land Use and Planning. DEIR, pp. 4.10-14 – 4.10-64. While section 1.8 of the Land Use, Open Space and Conservation Element does include Policy 5, which promotes clustering of industrial uses (DEIR, p. 4.10-18), the Energy Element of the KCGP include numerous and more specific policies concerning promotion and implementation of oil and gas activities in the County that do not require clustering (DEIR, pp. 4.10-37-42). The County is entitled to balance its General Plan policies when determining whether the Project is consistent with the General Plan. *San Franciscans Upholding the Downtown Plan* (2002) 102 Cal.App.4th 656, 668; *Mitchell v. County of Orange* (1985) 165 Cal.App.3d 1185, 1191-1192. Here, the Revised Amended Ordinance reflects an appropriate balance of interests between economic development and environmental protection, as reflected in the KCGP policies concerning the petroleum industry. DEIR, pp. 4.10-37 – 42.

0044-159 cont'd

0044-160

Please see response 142 to this letter. A lead agency has discretion to balance potentially competing goals and policies within a general plan,

and that has been done here in making the determination that the Project is consistent with the Kern County and Metropolitan Bakersfield General Plans. This EIR's Land Use and Planning Chapter provides detailed analysis showing how the Revised Amended Ordinance is consistent with over 400 of the applicable goals, polices, and implementation measures in the Kern County General Plan and Metropolitan Bakersfield General Plan. DEIR pp. 4.10-91 through 4.10-173. In determining the Project's consistency with these policies, this EIR has analyzed the policies in light of a range of potentially competing interests, including the General Plan policies related to water supply cited in the comments.

0044-160 cont'd

0044-161

Please see response 142 to this letter. A lead agency has discretion to balance potentially competing goals and policies within a general plan, and that has been done here in making the determination that the Project is consistent with the Kern County and Metropolitan Bakersfield General Plans. This EIR's Land Use and Planning Chapter provides detailed analysis showing how the Revised Amended Ordinance is consistent with over 400 of the applicable goals, polices, and implementation measures in the Kern County General Plan and Metropolitan Bakersfield General Plan. DEIR pp. 4.10-91 through 4.10-173. In determining the Project's consistency with these policies, this EIR has analyzed the policies in light of a range of potentially competing interests, including the General Plan policies related to water supply cited in the comments.

0044-162

The comment's quotations from the EIR are accurate.

0044-163

Please see response 160-161 to this letter. As described in the EIR, p. 4.17-58, oil and gas activities utilize a very small fraction of groundwater resources. (Please note that the Final Water Supply Analysis has been revised to reflect minor corrections or additional information as described in GR Water-05. None of the revisions significantly affects the EIR analysis or conclusions.) Maintaining oil and gas production is consistent with policies favoring oil and gas development in the General Plan, which are cited above in response 141 to this letter. The County has discretion to balance competing General Plan policies, including those favoring oil and gas development and the water supply policies cited by the commenter.

0044-164

Regarding General Plan consistency, please see responses 141 and 160-161 to this letter. Water shortages already exist in Kern County and will not "result" from the Project as suggested by the commenter. As described in the EIR, oil and gas activities utilize a very small fraction of groundwater resources. However, consistent with the requirements of CEQA, the EIR recognizes that the Project does contribute additional demand. The Project's share of M&I water use would compete with other M&I demands for supplies that are not expected to be readily available in the Project Area. Therefore, the EIR finds that the impacts to M&I water supplies in the Project Area would be significant at a Project level, and oil and gas water demand would also contribute to significant cumulative impacts to groundwater and regional water resources in the Project Area. Implementation of MM 4.17-2 to MM 4.17-4 could reduce water supply impacts, but the allocation of water supplies and water demands, the complex laws affecting water rights, the many water districts that have legal jurisdiction over one or more sources of water in the Project Area, the varied technical feasibility of treating produced water, and the produced water reuse opportunities all present complex variables that fall outside the scope of the County's jurisdiction or control under CEQA. Accordingly, the EIR concluded that Project impacts to water supplies would be significant and unavoidable. EIR,pp. 4.17-57 – 59.

0044-165

Please see responses 141 and 160-165 to this letter.

0044-166

The comment states that the DEIR fails to analyze the Project's inconsistency with habitat conservation plans and the Sustainable Communities Plan.

Habitat conservation plans (HCPs) and Natural Community Conservation Plans (NCCPs) are disclosed and discussed in the DEIR Chapter 4.4 – Biological Resources. The following plans are discussed: Draft Valley Floor HCP; Chevron North American Exploration and Production LoKern HCP (LoKern HCP); California Resources Elk Hills HCP (Elk Hills HCP); Freeport McMoRan Oil & Gas HCP; CRC Non-Unit HCP; Aera

Coles Levee Ecosystem Preserve HCP; Chevron Pipeline HCP; California Aqueducts – San Joaquin Field Unit HCP; Kern County Water Facilities HCP; Kern Water Bank HCP/NCCP; PG&E San Joaquin Valley Operations and Maintenance Program HCP; Tehachapi Uplands Multiple Species HCP; and Metropolitan Bakersfield HCP. DEIR, pp. 4.4-154-168. The DEIR states: "HCPs are approved by the USFWS in conjunction with providing incidental take permit coverage for listed species and to also foster the conservation of other covered species. NCCPs are approved by the CDFW and are intended to function in a manner similar to the federal a HCP for state listed and other covered species. The CDFW may also issue incidental take permits for state covered species that are based on and coordinated with an approved federal HCP under section 2081(b) of the CESA." DEIR, p. 4.4-154. Mitigation Measure 4.4-2 ensures that no incidental take of species may occur in a manner inconsistent with an approved HCP or NCCP. For further discussion of the LoKern HCP and Elk Hills HCP, see Global Response Bio-2.

As disclosed in the DEIR, the "Kern County Council of Governments (COG) adopted the SCS for Kern County as part of its Regional Transportation Plan (RTP) in 2014. The RTP and SCS incorporate forecasted development patterns, modeling and measures designed to integrate land use and transportation planning to reduce local and regional GHG emissions. Oil and gas resources, as well as other land uses, are components of the SCS." DEIR, p. 4.10-14. The SCS recognizes Kern County's leading role as a provider of energy and natural resources to the State:

"Energy and Natural Resources production is the cornerstone and foundation of Kern County. Historically oil production has driven energy development. Kern County is the top oil-producing county in California. This county alone produces 76% of California's total oil. If Kern County were a state, it would be the third largest oil-producing state in the U.S., behind Alaska and Texas. Kern County has four giant oil fields (greater than 1 billion barrels of cumulative production) and as a whole produces 445,000 barrels per day. In terms of future production, Kern County is leading the state in development and production of renewable energy. Over 7,000 megawatts of renewable energy in the form of wind, solar, geothermal, biogas, and gasification production have been permitted countywide. The county's dependence on energy and natural resource production as part of our economic structure is reflective in the fact that all 10 of the county's top tax payers are either oil-producing and/or processing companies, renewable energy producers or mining operations. For the year 2013–2014, these companies made up an overall assessed value of over 31% of all general taxes owed and paid to the county." SCS, p. 4-18.

The SCS also promotes the need to increase regional and local energy independence through a variety of means:

"The Kern region will continue to increase its regional and local energy independence. With more transit and active transportation options and by living closer to where they work, community members will have alternatives to driving their cars. Additionally, this SCS seeks to promote conservation of our natural resources and open spaces, providing opportunities to invest in renewable energy production and distribution. Increased energy independence means less dependence on foreign oil, decreased payments to foreign countries, reduced trade imbalances and an improved economy." SCS p. 4-4

The Revised Amended Ordinance is consistent with the SCS's recognition of Kern County as a leader in energy and natural resource production, as well as the goal of increasing energy independence by reducing dependence on foreign oil, as it will allow the continued production of oil and gas in the County, while also imposing new procedural and environmental requirements that are more protective of the general health, safety, and welfare of the community. To the extent the SCS promotes alternative means of transportation to reduce consumption of oil and gas, the Revised Amended Ordinance is not in conflict with those policies because the consumption of oil and gas products by end users is a function of market demand, and the production of oil and gas under the Revised Amended Ordinance will necessarily react to that demand. The Revised Amended Ordinance has been further revised to include a cap of 3,649 well permit ministerial approvals annually, however, consistent with the projected number of annual wells evaluated in this EIR, so the production of oil and gas in the County would be consistent with the total number of authorized wells.

0044-167 cont'd

0044-168

Please see the responses below. The commenter's opinion regarding the adequacy of the EIR's analysis of groundwater resources is noted. The EIR acknowledges the importance of agriculture in the County, see EIR, pages 4.2-1 – 4.2-6. The EIR included a comprehensive evaluation of available water supplies, including the significant current overdraft of groundwater, as explained in the Water Supply Assessment (Appendix T) and as further updated in GR Water 5. The amount of water used in WST operations is a very small fraction of the amount of water used in the Project Area. MM 4.17-2 requires Applicants to increase the re-use of produced water, following treatment as needed, to more than offset Project use of higher quality groundwater and surface water. The EIR also recognizes that current drought conditions have severely

restricted the availability of imported and local surface supplies throughout California, including the Project Area, and groundwater is being used more heavily to meet Project Area demand, including for oil and gas activities. The WSA evaluates average, single dry year, and multiple dry year conditions. EIR, pp. 4.17-50. (Please note that the WSA has been revised to reflect minor corrections or additional information as described in GR Water-05. None of the revisions significantly affects the EIR analysis or conclusions.)

0044-169

0044-171 cont'd

0044-172

The comment states that the EIR improperly considered groundwater in the Project Area as a single "undifferentiated mass." The EIR describes the hydrogeological features and water-bearing formations within the County, pp. 4.9-3 – 4.9-8, with basins as well as surface features depicted in Figure 4.9-9; see also p. 4.9-11 depicting individual aquifers exempted under the Underground Injection Control (UIC) program. The EIR also includes detailed quantitative data on groundwater quality in the Western, Central and Eastern Subarea, with analytical results from both shallow and deep wells. Tables 4.9-17 and 4.9-18. The WSA (Appendix T1) prepared for purposes of the EIR considered a variety of data sources and specific groundwater formations. WSA, pp. 14-15, 17-21. Data on groundwater supplies were obtained by reviewing detailed publicly available reports and water management plans prepared by the local water agencies and water districts within the Project Area. These local agencies are the best sources of information on available groundwater resources and management, and are required to update their management plans every five years. Based on supply and demand estimates developed from the detailed water management plans and reports, the WSA concluded that there is no surplus water in the Project Area and that the Kern County Subbasin is in an existing overdraft condition. This information was incorporated into the analysis of available groundwater supplies for purposes of the EIR. CEQA analysis requires reasonable disclosure based on best available information, but does not require "perfect" information; please see GR 21. In addition, it should be noted that many groundwater aquifers within the Kern County Subbasin are interconnected laterally and, to a lesser extent, vertically, and water distribution systems in the Project Area are also interconnected. Hence the use of groundwater is not as precisely location-specific as the commenter suggests.

It should also be noted that, as part of implementation of the Sustainable Groundwater Management Act (SGMA), local groundwater management authorities are being established to further define groundwater resources; establish sustainable groundwater use rates; and allocate groundwater among users. See GR Water-3 regarding the SGMA. The SGMA will play a significant role in future supply estimates. The County is required to participate in the Kern groundwater sustainability effort underway, and the basin has now been designated by the Department of Water Resources as being in critical overdraft. SGMA will require that agricultural, municipal, and industrial activities account for

current and future uses of water and create sustainable plans for managing the resource. While the EIR finds that oil and gas activity uses very little groundwater compared to other uses, significant impacts to groundwater supply are identified and mitigation measures are proposed. MM 4.17-2 and 4.17-3 require the Applicant to work with the County to increase the re-use of produced water from oil and gas activities. These measures are intended to help reduce the industry's dependence on groundwater, which will contribute to alleviating stress on this limited resource in the future.

0044-173

The EIR does not assume that all groundwater is suitable for all purposes. The EIR clearly acknowledges that aquifer water quality is variable and extensively discusses the UIC program, in which aquifer unsuitable as sources of drinking water due to high salinity, hydrocarbons or other criteria (as specified in USEPA regulations) may be utilized for disposal by injection of oilfield produced water. EIR, pp. 4.9-72-75, 104-108. However, for purposes of the water supply analysis, the EIR does conservatively assume that the oil and gas industry's demand for Municipal and Industrial (M&I) quality water will be met by using M&I-quality groundwater. EIR, p. 4.17-22. As the commenter notes, some oil and gas production activities require high quality M&I water. Operators obtain M&I water from a variety of sources, including groundwater wells, deliveries from Project Area water purveyors, spot market purchases, or in truck-mounted tanks that are filled at industrial locations served by M&I supplies. However, the amount of water supplied by these sources varies considerably from year to year, and the current drought has severely restricted the availability of imported and local surface supplies. Accordingly, for conservative analysis purposes, the WSA and EIR assumed that all oil and gas demand will be met by M&I quality water, in order to be sure not to underestimate the industry's M&I water demand.

0044-174

As the commenter notes, the DEIR discusses the status of the ongoing investigation of DOGGR's UIC program. See, e.g., EIR pp. 4.9-72, 4.9-96–98, and 4.9-107–4.9-108. Please see also GR Water-02 regarding the UIC program. As of July 31, 2015, DOGGR reported to EPA that it had reviewed 5,625 UIC wells throughout the state that were permitted to inject into aquifers not designated as "exempt" under the UIC program. 5,475 of the wells are associated with thermal Enhanced Oil Recovery (EOR) operations (steam flood and cyclic steam wells). Because water must be pretreated to a higher quality before EOR injection, and small quantities of water are involved, DOGGR considered any threat to aquifers to be "greatly reduced." Of the remaining 150 non-thermal wells, 126 are no longer classified as injection wells and are not injecting fluids, 19 are water flood wells, one is a pressure maintenance well and only four are waste disposal wells. DOGGR is conducting further investigation of the remaining wells to determine if they pose a potential risk to groundwater with a current beneficial use. Letter from Steve Bohlen, DOGGR, and Jonathan Bishop, State Water Resources Control Board, to Michael Montgomery, USEPA Region IX (July 31, 2015). However, the magnitude of risk to aquifers utilized for water supply appears very limited based on information currently available.

0044-174 cont'd

0044-175

The EIR describes the Central Valley Regional Water Quality Control Board (CVRWQCB) enforcement efforts to address surface disposal-related groundwater contamination. EIR, p. 4.9-101–4.9-108. As discussed in GR Water-01, on July 30, 2015, subsequent to the release of the Draft EIR, the CVRWQCB adopted an order directing the Valley Water Management Company to conduct additional investigations and implement remediation measures, if necessary, for the surface spray system at the Race Track Hill Facility in the Project Area (Order R5-2015- 0093, http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/kern/r5-2015-0093.pdf, accessed September 19, 2015). It should be noted that this water management facility would not be eligible for Site Plan Conformity Review under the Revised Amended Ordinance and would require a Conditional Use Permit.

0044-176

Please see responses 172 and 173 above. The EIR is not required to conduct the site-by-site groundwater quality evaluation requested by the commenter.

0044-176 cont'd

0044-177

The EIR acknowledges that California is experiencing a severe drought and has implemented unprecedented water use reduction measures to address historically low snowpack and rainfall levels. As stated in the EIR, the drought has had substantial impacts in Kern County, which relies on imported surface water and groundwater to meet urban and agricultural demand. Due to drought-related reductions in surface water availability, regional aquifers have been depleted by extractions in lieu of surface water use to a substantial extent. Should groundwater extractions be further limited by the SGMA planning process, supply shortfalls could be greater than anticipated. EIR, p. 4.9-149. The WSA, Appendix T, also considers historic and current drought conditions; see WST pp. 97-102.

0044-178

The EIR acknowledges that the drought has had substantial impacts in Kern County, which relies on imported surface water and groundwater to meet urban and agricultural demand. EIR, p. 4.9-149. The EIR cites the Department of Water Resources’ "Public Update for Drought Response" report referenced by the commenter. EIR, p. 4.7-9 and 4.17-53.

0044-178 cont'd

0044-179

Please see above responses regarding water supply impacts and please see GR 20 regarding recirculation.

0044-180

0044-180 cont'd

0044-181

The commenter's opinion is noted.

0044-182

Please see responses 172 and 173 to this letter, above. This EIR is not required to conduct the site-by-site groundwater quality evaluation requested by the commenter. An EIR does not require "perfect" information; please see GR 21. This EIR includes a comprehensive evaluation of available water supplies, including the significant current overdraft of groundwater, as explained in the WSA, and as further updated in GR Water 5. The amount of water used in WST operations is a very small fraction of the amount of water used in the Project Area. MM 4.17-2 requires Applicants to increase the re-use of produced water, following treatment as needed, to more than offset Project use of higher quality groundwater and surface water. This analysis is sufficient for CEQA purposes.

0044-183

Please see response to 0044-182.

0044-183 cont'd

0044-184

Please see GR Water 03 regarding the SGMA. This statute creates a new process for addressing regional groundwater supplies throughout the state. The County is required to participate in the Kern groundwater sustainability effort underway, and the basin has now been designated by

the Department of Water Resources as being in critical overdraft. SGMA will require that agricultural, municipal, and industrial activities account for current and future uses of water and create sustainable plans for managing the resource. Under these circumstances, it would be speculative to predict how groundwater extraction by any sector will affect long-term aquifer viability, how competition for groundwater will impact current users, which users will bear the brunt of future groundwater deficiencies, or whether and how much crop production may be affected. While the EIR finds that oil and gas activity uses very little groundwater compared to other uses, significant impacts to groundwater supply are identified and mitigation measures are proposed. MM 4.17-2 and 4.17-3 require the Applicant to work with the County in the SGMA process to increase the re-use of produced water from oil and gas activities.

Regarding land subsidence, please see response 2-14 through 2-21**.**

0044-185

The commenter states that the EIR identifies groundwater as the Project's sole potential source of M&I water. This is not correct. As explained in the EIR, p. 4.17-22, operators obtain M&I water from a variety of sources, including groundwater wells, deliveries from Project Area water purveyors, spot market purchases, or in truck-mounted tanks that are filled at industrial locations served by M&I supplies. However, the amount of water supplied by these sources varies considerably from year to year, and the current drought has severely restricted the availability of imported and local surface supplies. Accordingly, for purposes of analysis, the EIR adopted the over-conservative assumption that all oil and gas demand will be met by M&I quality water, in order to be sure not to underestimate the industry's M&I water demand.

0044-186

Please see response to 0044-186.

0044-187

The commenter's legal citations are noted and included in the record. The commenter's opinion regarding the adequacy of mitigation is noted. Please see GR 16 regarding adequacy of mitigation measures.

0044-188

The Draft EIR included a comprehensive evaluation of available water supplies, including the significant current overdraft of groundwater, as explained in the WSA, and as further updated in GR Water 5. The amount of water used in WST operations is a very small fraction of the amount of water used in the Project Area. MM 4.17-2 requires Applicants to increase the re-use of produced water, following treatment as needed, to more than offset Project use of higher quality groundwater and surface water.

Further, as noted in the Water Quality discussions in the EIR, in the Water Quality Appendix, and in various comment letters including the letter from the Water Board (Letter 3), produced water varies dramatically in quality and treatability. For these and related reasons, the Draft EIR does not prescribe any particular location, treatment technology, or beneficial use of treated produced water. However, as described in GR Water 5, there is more produced water used for agriculture than was reported in the Draft EIR, and several produced water treatment proposals remain under consideration by local water districts. Local water districts act as the lead agency for such projects, and are not subject to County zoning regulations; any such treatment facility would trigger the need for further CEQA review by the lead agency and be required to address environmental impacts and mitigation measures to address issues such as subsidence, monitoring and compliance parameters, and related issues.

0044-189

As discussed in response 2-85 through 92, the produced water reuse mitigation measure included in the Draft EIR has been clarified to explain the County's ongoing role in overseeing implementation of this mitigation measure. The feasibility of implementing this mitigation measure is supported by substantial evidence in the record, including information about additional produced water reuse and about additional produced water treatment proposals under consideration by local water districts. Applicant's use of higher quality water is minimal relative to other users, and increased treatment and reuse of produced water is already occurring, and the MMRP will include monitoring for Applicant compliance with this mitigation measure.

0044-193 cont'd

0044-194

As the commenter notes (comment 173), oil and gas production requires a certain amount of high quality, clean water, designated M&I water, for certain activities including well drilling and maintenance, well stimulation and supplemental steam generation. Please see GR Water-4 regarding for further details regarding the infeasibility of replacing all use of M&I water for oil and gas activities with produced water.

0044-195

Please see response to 0044-194.

0044-196

As the commenter notes (comment 173), well stimulation is among the activities for which M&I water may be needed. Please see GR Water-4 regarding for further details regarding the infeasibility of replacing all use of M&I water for well stimulation with produced water.

0044-196 cont'd

0044-197

The commenter's statute and case citations are noted for the record and included in the final EIR. *Pocket Protectors v. City of Sacramento* (2004) 124 Cal. App. 4th 903 and *Ocean View Estates Homeowners Ass’n Inc. v. Montecito Water Dist.* (2004) 116 Cal. App. 4th 396 do not address the adequacy of an EIR analysis of significant impacts. These cases concern Negative Declarations and consider whether the record contained any substantial evidence raising a "fair argument" of significant impact that would require an EIR. Such cases are irrelevant to the task of reviewing the conclusions in an EIR. *North Coast Rivers Alliance v. Marin Muni. Water Dist. Bd.* (2013) 216 Cal. App. 4th 614, 625; *see also Bowman v. City of Berkeley* (2004) 122 Cal. Ap. 4th 572, 589.

0044-198

The commenter's opinion is noted. As the comment correctly states, the EIR acknowledges significant and unavoidable impacts to visual resources.

0044-199

Oil and gas operations are distributed throughout the Project Area, with particular intensity in Tier 1, and at lesser intensity but still with a strong presence in Tier 2. Continuing this pattern of historic land development will cause visual changes within the immediate vicinity of the new equipment. However, these changes are generally consistent with existing visual patterns.

Not every visual change is a significant visual impact for CEQA purposes. *North Coast Rivers Alliance v. Marin Mun. Water Dist.* (2013) 216 Cal. App. 4th 614, 62-25 ("aesthetic issues, such as public and private views, are properly studied in an EIR to assess the impacts of a project. However, a lead agency has the discretion to determine whether to classify an impact described in an EIR as ‘significant,’ depending on the nature of the area affected"). See also *Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal. App. 4th 200, 243 (upholding EIRs determination that aesthetic impacts of a residential development would be less than significant, despite high degree of change, based on the topography and residential character of the area). Under Kern County's environmental checklist, a significant impact occurs if a project would:

Have a substantial adverse effect on a scenic vista; Substantially damage scenic resources, including but not limited to, trees, rock, outcroppings, and historic buildings within a state scenic highway; Substantially degrade the existing visual character or quality of the site and its surroundings; or Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. [The commenter does not discuss this topic.] The EIR evaluated all of these impacts. First, the EIR found that there were no designated scenic vistas or State Scenic highways within the Project Area. EIR, pp. 4.1-28. Next, the EIR provided an extensive discussion of the potential to degrade existing visual character, as discussed in the next response.

0044-199 cont'd

0044-200

The comment criticizes the EIR's analysis of visual impacts as cursory or generic. In determining whether the Project would substantially degrade the existing visual character of sites, the EIR considered the impacts on a landscape or regional scale and also provided extensive analysis and included mitigation measures at the micro scale. EIR, pp. 4.1-19 - 4-41. Ten key observation points ("KOPs") were identified as representative views within the Project Area where oil and gas development would occur. The The KOPs were selected to represent typical views of the Project components and views from sensitive locations. As stated in the EIR, the County identified Western, Central and Eastern Subareas, and Tiers within each subarea, based on existing development characteristics, which include visual characteristics. Views representative of all Subareas and Tiers were included for consideration, as were views from sensitive areas (Panorama Park, Wind Wolves Preserve) and . The photosimulations for each KOP illustrate potential oil and gas development that could occur during construction and operation. The KOPs were assessed across of variety of factors at various points of oil and gas development. The KOPs include county and local parks, open spaces, highways, and residences. Viewer sensitivity and view vividness, intactness and unity were included in the assessment. Based on this analysis, the County's expert consultants determined that the KOPs provide representative views based on common topography, geography and existing visual features and reached conclusions regarding the significance of visual impacts, including the finding that some visual impacts would be significant and unavoidable even after mitigation. EIR, pages 4.1-41, 4.1-50. 4.1-51. Such visual simulations provide substantial evidence supporting the conclusions in an EIR. *North Coast Rivers Alliance v. Marin Muni. Water Dist. Bd.* (2013) 216 Cal. App. 4th 614, 627. The conclusions are tied to the analytical methodology employed by the County and paint a representative picture of impacts throughout the Project Area that "reflect[s] a good faith effort at full disclosure." *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App.3d 692, 712. So long as the simulations

0044-201

Commenter's opinion regarding the importance of the environmental setting is noted for the record. The citation to *Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal. App. 4th 99, 119, refers to an argument raised by a party without the court determining its validity. The citation to CEQA Guidelines § 15125(a) is inaccurate. The relevant provision is § 15125(c) which states that special emphasis "should" be placed on environmental resources that are rare or unique, not "must."

0044-202

The commenter's reference to parks and other locations within the Project Area is noted. See EIR p. 4.15-5 – 4.15-8, listing parks and preserves in the Project Area, including those mentioned by the commenter.

0044-203

In addition to the environmental setting discussion on EIR pages 4.1-3–5, the existing visual character from each of the KOP viewpoints is discussed in detail in the EIR, pp. 4.1-19 – 41

0044-204

The commenter's quotation from the Kern River Plan is noted. The Kern River Plan is an element of the Kern County General Plan which has been incorporated by reference in the EIR, p. 2.29-30. It should also be noted that the Kern River Plan contains policies supportive of oil and gas development:

Kern River Plan Element, Chapter III. Issues, Goals, and Basic Plan Policies: 3.4. Floodplain Management Policy 9. Oil and mineral exploration and production shall be allowed within the secondary floodway, provided that adverse effects on riparian vegetation and wildlife habitat are minimized. Appurtenant facilities, such as tank farms and steam generators, shall be located outside any floodway; except that they may be allowed within the 8.4/2.5 (Mineral and Petroleum/Secondary 3.6. Mineral and Petroleum Goal. To provide for the continued production of petroleum resources and to ensure that future exploration activities can take place, while ensuring that other open space values in the River area are reasonably protected. Utilize sand and gravel resources of the River in such a way as to ensure that floodway, groundwater recharge, and wildlife habitat values are protected.

Kern River Plan Element, Chapter V. Implementation Policies, F. Mineral and Petroleum Extraction: Implementation Policy 2. Mineral and petroleum extraction shall be encouraged on those lands designated "Mineral and Petroleum" on the Kern River Plan Map. Such use may also occur in other areas designated for recreation, resource, or industrial uses as long as the primary designated use is not significantly impaired and as long as such use is consistent with other provisions of this plan and in compliance with existing local, state, and federal regulations. Oil and Gas development was evaluated during the creation of the Kern River Plan and all mitigation measures are consistent with the plan design.

0044-205

The Kern River is included in the visual impact analysis for the Eastern Subarea, EIR p. 4.1-30. The immediate foreground of KOP 1 includes the Kern River. As the following comment notes, three of the ten KOPs are views from parks. The EIR was not required to evaluate viewpoints from every park and recreation venue in the Project Area. See GR 21 regarding the use of best available information for purposes of CEQA review. The EIR found that there were no designated scenic vistas or State Scenic highways within the Project Area. EIR, p. 4.1-28.

0044-205 cont'd

0044-206

As the comment notes, three of the ten KOPs are views from parks. KOP 4 represents views "for motorists travelling westbound on Highway 223 and descending into the San Joaquin Valley through the transitional foothills of the southern Sierra Nevada." EIR, p. 4.1-23. KOP-6 describes views from the Wind Wolves Preserve. For KOP 9, the "view is representative of views for motorists and others traveling west in the transitional foothills of the rugged Temblor Range." EIR, p. 4.1-26.

The commenter is correct that the Project will result in several significant visual impacts, but these impacts have been evaluated by the EIR; see pp. 4.1-27–51. To be adequate, the EIR must "reflect a good faith effort at full disclosure; [CEQA] does not mandate perfection, nor does it require an analysis to be exhaustive." *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App.3d 692, 712. See also GR 21 regarding the use of best available information for purposes of CEQA review. There is no requirement—and the commenter has cited to no authority—that an EIR must evaluate the impacts on views from every public park or trail. The commenter's citations to, 1607 and *Ocean View Estates Homeowners Ass’n Inc. v. Montecito Water Dist.* (2004) 116 Cal. App. 4th 396, 401 are unavailing. These cases do not reach the adequacy of an EIR's analysis of significant impacts. Such decisions are irrelevant to the task of reviewing the conclusions in an EIR. *North Coast Rivers Alliance v. Marin Muni. Water Dist. Bd.* (2013) 216 Cal. App. 4th 614, 625; *see also Bowman v. City of Berkeley* (2004) 122 Cal. Ap. 4th 572, 589.

The commenter cites *Quail Botanical Gardens Foundation v. City of Encinitas* (1994) 29 Cal. App. 4th 1597 and *Ocean View Estates Homeowners Ass’n Inc. v. Montecito Water Dist.* (2004) 116 Cal. App. 4th 396. These cases concern Negative Declarations and consider whether the record contained any substantial evidence raising a "fair argument" of significant impact that would require an EIR. Such decisions are irrelevant to the task of reviewing the conclusions in an EIR. *North Coast Rivers Alliance v. Marin Muni. Water Dist. Bd.* (2013) 216 Cal. App. 4th 614, 625; *see also Bowman v. City of Berkeley* (2004) 122 Cal. Ap. 4th 572, 589.

The commenter's Exhibit AES-1 is a close-up photograph of existing wells on Highway 46. AES 1 is cited to suggest that the photosimulations in the DEIR are misleading. Several of the KOPs were taken from roads and highways similar to Highway 46 and represent the views of such locations in perspective. The mitigation measures included in the DEIR will help minimize the significant, but unavoidable, impacts on aesthetic resources. EIR , p. 4.1-40–41; 4.1-50.

0044-206 cont'd

0044-206 cont'd

0044-207

The commenter objects to the aesthetic impacts of the Project, which would result in "the addition of oil and gas facility construction activities and the ongoing operation of production facilities to the rural characteristics of open space lands in the Project Area." The comment does not acknowledge the existing visual character of the Project Area, which has nearly ten thousand wells already in existence on Tier 2 agricultural

lands (See Figure XX). The co-existence of agricultural operations with oil and gas production, which comprise the top two economic sectors in Kern County, has characterized the visual character of the Project Area for nearly a century. Commenter's specific requests for changes to aesthetic mitigation measures, referenced in this comment, are set forth in greater detail in Appendix AG-14 of commenter's letter, for which further responses are provided in [INSERT CROSS REFERENCE TO APPROPRIATE CORES NUMBER FOR THIS APPENDIX]. Commenter's opinion that compliance with law is not appropriate as CEQA mitigation is inconsistent with applicable legal authorities, as described in GR 16. One of the aesthetic mitigation measures in the Draft EIR, MM 4.1-4, was revised to not require planting of visual screening vegetation from sensitive receptors to avoid vegetation planting that would be incompatible with crop cultivation. Aesthetic impacts, and the effectiveness of aesthetic mitigation measures, can be highly subjective. Because there is no objective metric for concluding that changes to the existing environment have no significant aesthetic impact, this impact was considered significant and unavoidable.

0044-207 cont'd

0044-207 cont'd

0044-208

The comment criticizes the EIR's cumulative analysis of visual impacts. However, "it is reasonable to infer the [lead agency] addressed both individual *and* cumulative visual impacts" of the Project when it found that Project development would "unavoidably affect visual resources." *Sequoyah Hills Homeowners Ass’n v. City of Oakland* (1993) 23 Cal. App. 4th 704, 716. The commenter also states that the EIR failed to identify feasible mitigation for the Project's cumulative visual impacts. The EIR identified Mitigation Measures 4.1-1 through 4.1-6 as feasible mitigation measures, though it also determined that no additional feasible mitigation measures exist to reduce the significant cumulative visual impacts to less than significant. DEIR at 4.1-51.

The EIR complied with the plan or projection method of compliance identified in CEQA Guidelines § 15130(b)(1)(B) by relying on both the Kern County General Plan the regional growth plan and projections included in the Kern COG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) approved in 2014. EIR at 3-80. The commenter states that the lack of a summary of projections or description or evaluation of the documents invalidates the EIR. These documents were incorporated by reference and are publicly available. DEIR at 2.29–30.

An EIR is required to provide a reasonable analysis of the cumulative impacts. CEQA Guidelines § 15130(b). The discussion need not provide as much detail as is provided for the effects attributable to the project alone and is guided by standards of practicality and reasonableness. *Id.* In this EIR, the direct impacts of the Project are already significant and unavoidable. The EIR combines these effects with the projected continued growth in unincorporated Kern County and the cities within Kern County to determine that visible changes to the landscape will occur even with implementation of the mitigation measures and other goals, policies, implementation policies, and mitigation measures for these other General Plans, regional plans. EIR at 4.1-51. In so doing, it was determined that these visual changes constitute adverse aesthetic impacts. *Id.*

The commenter's legal citations are noted for the record and included in the final EIR. The commenter cites *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App.3d 692, 712 for the proposition that the DEIR is inadequate because it fails to provide information on similar developments contributing to cumulative effects. In *Kings County Farm Bureau*, the lead agency determined that the project would have no significant adverse effect on the environment, but the court found insufficient information in the records to support the determination. . The commenter also cites *San Bernardino Valley Audubon Society v. Metropolitan Water District of Southern California* (1999) 71 Cal. App. 4th 382, 399. In that case, the EIR merely stated that the cumulative effects could occur, but would be mitigated. The court found that this analysis was insufficient to support a finding of no impact. In contrast to those cases, this EIR finds, based on substantial evidence in the visual analysis of representative KOPs, that the Project will result in a significant impact on aesthetic resources.

0044-215

This is an introductory comment generally stating that the DEIR's analysis of vibration impacts is flawed because it establishes a threshold of significance for vibration but then ignores that threshold. Further clarifications on the tables presented in this EIR has been provided below. Additionally, Mitigation Measure 4.12-2 is modified to include setback distances for geophysical testing methods including Vibroseis and shothole techniques. Please refer to response to comment 44-216 below, and new Appendix V-2 to the FEIR regarding Geophysical Surveys and Vibration), also discussed in more detail below.

0044-216

The comment states that activities associated with geophysical surveys will results in vibration levels which will exceed state guidelines for vibration annoyance and damage potential criteria. The comment also states that the DEIR does nothing to protect residents and other receptors from the vibration impacts. Both of these comments are incorrect. Additional clarification on this topic is provided here, and further review of this issue has resulted in modifications to MM 3-12-2 to include manadatory setback distances to uses that are susceptible to adverse vibration risks for designated types of geophysical survey operations.

As explained in this EIR, vibration is measured at peak particle velocity (ppv, inches per second). The ppv value represents the degree to which vibration is perceptible to a receptor; the higher the value, the more perceptible the vibration. The ppv value is a function of the relationship between the source of the vibration and the distance of the source from the receptor.

In support of its statement that the project's activities will exceed thresholds for annoyance and structure damage, the commenter makes a comparison of Tables 4.12-10 with 4.12-5 and 4.12-6. Table 4.10-5 lists ppv values for different levels of perceptible vibration – that is, whether a person can feel a vibration - from both transient sources and continuous/frequent intermittent sources. Using this threshold, a value of .9 ppv represents a vibration that rises to the level of "annoyance" if felt by a person. Table 4.10-6 lists ppv thresholds that are protective of structures. Since ppv is a function of distance and the source of the vibration, these ppv values could be generated by any number of sources at whatever distance is required to reach the stated values.

The commenter compares those two thresholds (one for human perceptibility and the other for structure protection) with Table 4.12-10, which shows typical vibration levels during construction. This latter table provides the ppv for various types of equipment and activities at a specified distances of 100 feet and 300 feet. To clarify, Table 4.12-10 provides examples, i.e., it is an illustrative dataset: if a receptor is located 100 feet or 300 feet from the specified vibration source, they are likely to feel vibrations at the ppv shown in the table.

In order to clarify an understanding of Table 4.12-10, it must be stated that the Table does not present ppv thresholds and minimum "stand-off distances." The stand-off distance is the buffer distance between the source generating the vibration and the receptor which is protective of the receptor or structure. Table 4.12-10 shows that a specific shot-hole blast at 100 feet could cause damage to structures (and annoyance to people). Accordingly, the DEIR states: "To avoid exceeding these values, operators generally set charges at least 300 feet from water wells and engineered structures unassociated with oil and gas development. For the shothole method, Table 4.12-10 shows the vibration levels for various charge sizes at the minimum 300 feet stand-off distance." DEIR p. 4.12-24. The ppv of 0.40 for the specified shothole at a 300 feet stand-off distance is less than the ppv threshold for both "annoyance" (for human perceptibility) and structures.

As stated in the DEIR, "[f]or the shothole method, survey practices and existing regulatory guidance ensure that there would be no exceedance of the significance threshold when detonating charges." DEIR p. 4.12-24. For a detailed explanation of oil industry practices within Kern County, please also see and new Appendix V-2 to this EIR.

Appendix V-2 is a letter dated September 19, 2015, from Cynthia Black, Chief Geophysicist for California Resources Corporation, regarding Geophysical Surveys and Vibration, with attachments. This letter provides information on geophysical surveying technologies used by the oil industry in general, and California Resources Corporation's activities in Kern County in particular. The letter further provides technical detail on how vibration impacts are measured, describes the regulatory and industry standards and practices, and suggests specific standards to be included in the DEIR.

Appendix V-2 notes that industry practices either follow, or are more conservative than, the U.S. Bureau of Mines (USBM) and the Office of Surface Mining and Reclamation (OSMR) guidelines. The Black letter recommends a stand-off distance of 300 feet from the closest occupied building, water well, sewer system, and septic tank for shothole geophysical surveying activities, and 150 feet from the closest occupied building, water well, sewer system, and septic tank for Vibroseis geophysical surveying activities.

The comment states that some types of damage could occur as a result of shothole blasting even at 300 feet, again citing a comparison of the tables described above. Table 4.10-6, which comes from Caltrans references, states that there could be potential damage to "fragile" structures at a ppv of .2 or "extremely fragile, historic buildings, [and] ancient monuments" at .12 ppv. These buildings are unlikely to be present in the vicinity of geophysical surveying activities within the project area. Additionally, Attachment 2 to Appendix V-2 is a report by Matheson Mining Consultants entitled *Utilizing Peak Particle Velocities to Develop Seismic Offset Distances*, published in the Denver Geological Society's monthly publication, the Record, in 2014. The report summarizes the USBM and OSMR standards and states that "Documented cases of structural damage have never been observed in any structure (historic, exceptionally fragile, residential, or commercial) at particle velocities less than or equal to those recommended in the USBM and OSMRE standards." Based on this information, applying a stand-off distance of 300 feet from the closest occupied building, water well, sewer system, and septic tank for shothole geophysical surveying activities, and 150 feet from the closest occupied building, water well, sewer system, and septic tank for Vibroseis geophysical surveying activities will ensure necessary protection to those receptors.

Accordingly, Mitigation Measure 4.12-2 is modified to include setback distances for geophysical testing methods including vibroseis and shothole techniques.The revised mitigation measure follows:

Operations. New oil and gas wells shall be a minimum 210 feet from the closest sensitive receptor. Geophysical testing methods using truck-mounted machines, such as the Vibroseis technique, shall be a minimum 150 feet from the closest occupied building, water well, sewer system, and septic tank. Geophysical testing methods using underground detonation (also called shothole) techniques shall be a minimum 300 feet from the closest occupied building, water well, sewer system, and septic tank.

0044-226

The comment does not cite authority for the statement that "A valid safety analysis must develop and compare accident rates, measured in collisions per million-vehicle-miles, per key roadway segments." An unsubstantiated opinion is not substantial evidence. (See CEQA Guidelines, § 15384, subd. (a).) The Traffic Impact Study looked at roadway accident history data and concluded that there were "no specific findings indicating increased accident rates on study area roadways related to oil and gas activity." (Traffic Impact Study, DEIR Appendix W, at pp. 76-77.)

The comment also misquotes the Traffic Study, which actually found that there were no "specific items identified for improvement or mitigation related to recent accident history or existing roadway geometrics." (Traffic Impact Study, DEIR Appendix W, at p. 93.) The report merely recommends that the DEIR include funding as a mitigation measure to cover any issues that may occur in the future. (*Ibid.*) MM 4.16-1 includes a fee of $1,500 per permit for new wells to cover roadway impacts. (See DEIR at p. 4.16-77.)

The Traffic Impact Study considered the fact that as much as ten percent of Project-generated traffic would consist of heavy trucks. (Traffic Impact Study, DEIR Appendix W, at p. 79.) This figure was determined based on existing roadway segments that are used by oil and gas traffic. (*Ibid.*) These are the same roadways where there has not been a history of serious safety impacts. This information was included and analyzed in the Transportation and Traffic section. (See DEIR at pp. 4.16-79–4.16-80.) Since there was a potential for significant impacts in the future, MM 4.16-2 would require that the Applicants create a Construction Traffic Control Plan if there is a large volume of heavy trucks that may cause conflict with auto traffic. With this mitigation measure, the impacts will be less than significant. (DEIR at p. 4.16-80.)

The Traffic Impact Study and the DEIR also included information on the two mainlines for the Union Pacific Railroad and BNSF Railway. (Traffic Impact Study, DEIR Appendix W, at p. 79; DEIR 4.16-24.) While the at-grade railroad crossings were not studied specifically, the roads in this

Project Area (which contain railroad crossings) were analyzed and the Traffic Impact Study determined that there were no increased accident rates from oil and gas activity. (Traffic Impact Study, DEIR Appendix W, at pp. 76-77.)

With mitigation, the Project would not result in a change in air traffic patterns that results in substantial safety risks, nor would it substantially increase transportation related hazards due to a design feature or incompatible use. The impacts are less than significant.

0044-230

The comment suggests that the DEIR's reliance on MM 4.16-2, to reduce emergency access impacts, does not address emergency access impacts for the duration of the Project. As recognized by the DEIR, Countywide access is generally adequate. Although a number of corridors would operate at a level of LOS E or below, these roadways would operate below an acceptable LOS regardless of Project. (DEIR, at p. 4.16-78.) To minimize impacts to traffic generated by construction, the DEIR established MM 4.16-2, which would require a Construction Traffic Control Plan. Emergency access for the duration of the Project is further addressed in DEIR *Section 4.8, Hazards and Hazardous Materials*. As described by the DEIR, Oil and gas-related development is unlikely to result in a significant impact to emergency response within the Project area. (DEIR, at p. 4.8-9.) "While oil and gas development-related equipment may be present along emergency . . . routes, setback distances from public roadways, residences, and other structures in the vicinity of oil and gas-related development would ensure that oil and gas activities" would not interfere with emergency response. (*Ibid.*) For the cumulative scenario, the DEIR further provides that "given the overall rural nature of the Project Area, and the fact that Kern Council of Governments Regional Transportation Plan took in account traffic volumes from anticipated projects, the potential for a considerable contribution to a cumulative impact to emergency response is unlikely to occur, and would therefore be less than significant." (DEIR, at p. 4.8-104.) In any event, all future development under the Project would be subject to the California Occupational Safety and Health Administration (Cal/OSHA) standards developed in accordance with CCR, Title 8, Sections 1270, Fire Prevention, and 6773, Fire Protection and Fire Equipment. (DEIR, at p. 4.14-11.)

The commenter's legal citations are noted and included in the Final EIR.

0044-237

The commenter's opinion is noted. Please see GR 1 regarding the ministerial permitting process. The Revised Amended Ordinance caps the number of well permits that can be issued annually at 3,649 based on forecasts supported by substantial evidence. This provision will ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0044-238

The conclusion that substantial increases are not expected without dramatic technological advances, and accordingly substantial increases in population and housing activity are not expected, is supported by substantial evidence. Please see GR 18, which addresses the EIA estimates of recoverable reserves in the Monterey Shale cited by the commenter, and GR 15, regarding hydraulic fracturing technology and growth inducing impacts. Please also see GR regarding the baseline 6, which explains that the EIR did not select a market low point for use as the baseline.

0044-238 cont'd

0044-238 cont'd

0044-239

Please see responses above regarding comments that EIR understates the level of future oil and gas activity. The commenter mischaracterizes the nature of oil and gas access roads. As the EIR states, on page 3-39: "If an existing road cannot be used to access a new well location, a new road would be extended from adjacent existing roads. Access roads are typically 16 to 20 feet in width and vary in length, depending upon the distance from an existing roadway. . . . Although some access roads may be paved, it is assumed that almost all (95%) of new access roads would be unpaved dirt roads." Moreover, while an access road may be extended from an adjacent existing public or private road, the access roads themselves are private. Thus, these are not highway extensions or public roadways that may encourage or allow subsequent major residential or commercial development. The prospect that an oil and gas operator might allow an adjacent landowner to construct a house utilizing a private oil and gas access road for residential access is purely speculative. Moreover, the prospect of a few additional houses scattered in remote rural areas is not the type of development-scale growth considered significant in CEQA and NEPA cases on growth-inducing impacts. *City of Carmel-by-the-Sea v. Department of Transportation* (9th Cir. 1997) 123 F.3d 1142, 1165 (growth-inducement by constructing

freeway through undeveloped area); *City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal. App. 3d 1325, 1337 (growth-inducing impact of road and sewer project "to provide a catalyst for further development in the immediate area"); *Stanislaus Audubon Society v. County of Stanislaus* (1995) 33 Cal. App. 4th 144 (growth-inducing impact of golf course project that would attract residential development in surrounding area).

Please see response 62 above regarding electric transmission lines, which are not part of the Project. Again, limited extensions of existing high voltage (above 50 kV) transmission lines to supply a new well pad or facility would not have the type of development-scale growth-inducing impact recognized in CEQA cases.

0044-239 cont'd

0044-240

As explained in the EIR, pages 4.13-9 – 11, in the absence of any dramatic technical advances, substantial increases in oil and gas production in the County and substantial increases in the population and housing activity associated with oil and gas production are not anticipated to increase appreciably above the baseline 2012 level. Further as production is not only based on technical advances but the price of a barrel of oil globally, at the time of this Response to Comments, employment has actually declined based on the current price of under $50 a barrel. The baseline 2012 level was during an historic high of over $100 a barrel. There is no evidence in the record that even a technical advance would escalate oil prices higher and therefore, dramatically increase the employment necessary for such production increases. Please see GR 15 and GR 18. The well forecasts utilized as the basis for impact analysis were based on historic data, including wide fluctuations in the number of new well completions per year in response to the price of oil, available technology, available reserves, and changing regulatory requirements. Please see GR 6 regarding the baseline and GR 8 regarding well projections. As the commenter notes, the Project Objectives include "ongoing economic development by the oil and gas industry" including jobs for oil and gas workers. Maintaining that oil and gas industry's contribution to County and state economies and tax revenues are also anticipated benefits of the Project. See GR Alt-1 and GR-Alt 2, which describe the potential loss of jobs, economic "multiplier effects" and tax revenues under alternatives that would ban or severely restrict industry activity. However, the industry's current economic contribution, and the negative economic consequences of ban alternatives, are not inconsistent with the discussion of growth-inducing impacts in the EIR, which is based on industry activity forecasts supported by substantial evidence. Moreover, the Revised Amended Ordinance caps the number of new well permits that can be issued annually at 3,649 based on the well forecasts. This provision will ensure that impacts, including growth-inducing impacts, will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

The comment that significant growth-inducement will result from existing oil and gas workers retiring and remaining in Kern County, while new workers immigrate into the County to replace them, is speculative and unsupported by evidence such as worker retirement rates and locations, the origins of new workers or immigration rates.

0044-241

244a [¶ starting "The Project is located…"]

This comment is noted for the record.

244b [¶ starting "The oil and gas industry…"]

Portions of Kern County are classified as severe non-attainment of the federal primary and secondary ambient ozone standards, which are set at the same level. The primary standard is set at a level that protects public health and the secondary standard is set at a level to protect public welfare, which includes adverse effects on vegetation. The cited technical paper by Wilkinson et al.[1] sites studies that explore how high levels of ozone may adversely affect crops. The basis for the current secondary ozone standard, as explained in the ozone criteria document,[2] includes a vast body of research. The ozone standards have been proposed by the United States Environmental Protection Agency and will likely be set at even lower levels than the existing standards. Areas that are not in attainment with these standards are required to develop USEPA-approved plans to improve air quality and continue to reduce airborne concentrations of ozone unit compliance with the standards are achieved. Once this occurs, because the secondary ozone standard is protective of vegetation, there would be no detrimental impacts on crops due to ozone exposure.

The San Joaquin Valley Air Pollution Control District has adopted ozone plans[3] as required by federal requirements to demonstrate how the SJVAPCD will attain the national ambient air quality standards for ozone. These ozone plans indicate that high ozone levels (*i.e.*, above the standards) that are generated in the Valley are the result of precursor (VOC and NO_X) emissions transported eastward from the San Francisco Bay Area during the day, as well as emissions from sources within the Valley. Thus, the plans to reduce ozone are required to address transported as well as local emission sources. The SJVAPCD and the California Air Resources Board have developed extensive plans to control and reduce emissions of precursors from both stationary and mobile sources. Oil and gas development in Kern County is subject to these requirements and, as such, will not be allowed to materially degrade ozone air quality or stall the trend for continual improvement.

Please also see GR Air-1. Please also see the responses to the appendices attached to this comment letter for responses to specific attachments.

244c [¶ starting "Given the existing…"]

As explained in the DEIR, MMs 4.3-1–4.3-8 will reduce impacts to less than significant and will ensure that there is a no net increase of criteria air pollutant emissions. Please also see GR Air-1 and GR-16.

244d [¶ starting "For example, the DEIR's primary air quality…"]

Mitigation measures should not be viewed in isolation. MM 4.3-1 is one of a *package* of air quality mitigation measures that, collectively, reduce the Project's air quality impacts to a level less than significant. Please also see GR Air-1, GR-16 and GR-22.

244e [¶ starting "The DEIR's other air quality…"]

Please see GR Air-1. GR Air-3, and GR-16. The mitigation measures in the DEIR do not delegate to the applicant the responsibility to enforce mitigation. All of the mitigation measures are measurable and enforceable by the County and in some instance by the SJVAPCD.

244f [¶ starting "At the same time…"]

Commenter suggests that Alternative 5, the Low-Emission Enhanced Oil Recovery (EOR) Alternative, should be included as mitigation. Such mitigation is infeasible within the meaning of CEQA Guidelines § 15364.

Under Alternative 5 all new and replacement steam generators for thermal EOR activities would be required to install low-emission steam generation technology. However, low-emission steam generation technologies are still in the demonstration and prototype phase. ClearSign Duplex (CSD) technology, which is referenced as a possible technology in Alternative 5, involves ceramic tile and burner modification. One operator (Aera) is conducting pilot testing of CSD. At least one other operator (Chevron) is considering pilot testing low-emission steam generation technologies. All technologies currently under consideration require additional testing and validation in actual operating conditions and environments before they can be considered field-proven.

Long-term effectiveness and commercial viability of either technology still remain to be determined, and no company has deployed either technology to date. Furthermore, because the technologies are still in development, the cost of installing the equipment is high compared to the resulting emissions decreases. As such, the technology is not yet readily available on a commercial scale for implementation in oil and gas production in Kern County. The commenter has not provided any evidence suggesting that low-emission steam generation technology is economically or technologically feasible at this time. For these reasons, a finding of infeasibility is appropriate (CEQA Guidelines § 15126.6(f)(1)).

The technological infeasibility of Alternative 5 is further demonstrated by the current Best Available Control Technology (BACT) Guideline for oilfield steam generators in the San Joaquin Valley Air Pollution Control District (SJVAPCD). The federal Clean Air Act requires implementation of BACT, defined as as an emission limitation that the relevant permitting entity "determines is achievable." 42 USC § 7479. Similarly, the SJVAPCD defines BACT as the most stringent emission limitation or control technique (1) achieved in practice; (2) contained in any State Implementation Plan, if presently achievable; (3) contained in an applicable New Source Performance Standard; (4) "Any other emission limitation or control technique, including process and equipment changes of basic or control equipment, found … to be cost effective and technologically feasible …" Rule 2201, Section 3.10. The SJVAPCD BACT guideline was last updated in March of 2014 and currently requires 6 ppm NOx at 3% O_2 for steam generators that operate at 85 MMBtu/hr; and 7 ppm NOx at 3% O_2 for steam generators that operate at less than 85 MMBtu/hr.[4] By comparison, the low-emission steam generation technology contemplated by Alternative 5 would be expected to achieve rates comparable to or lower than 5 ppm NOx at 3% O_2 for steam generators operating at 55 MMBtu/hr. The fact that the rates in the current SJVAPCD BACT guideline are higher than what is contemplated by Alternative 5 further supports the conclusion that the technology required by Alternative 5 has not yet been achieved in practice, has not been shown to be presently achievable and is not technologically feasible. Alternative 5 was therefore properly rejected as an alternative and does not constitute feasible mitigation. Moreover, at such time as the SJVAPCD determines that low-emission steam generation technology has become feasible, it would be expected to update its BACT guidelines accordingly.

244g [¶ starting "Despite the patent…"]

The comment is a general conclusion and it is noted for the record. Please see GR Air-1.

0044-241 cont'd

0044-242

This introductory comment noted. Please see Responses 0079-243 to 0079-246, below.

0044-243

Per CEQA, the EIR need only contain sufficient concrete information about each alternative to allow meaningful evaluation, analysis and comparison with the Project in order to foster informed decision making and public participation. CEQA Guideline § 15126.6(d); *Laurel Heights Improvement Assn. v. Regents of the University of Cal*. (1988) 47 Cal.3d 376, 406 ("Laurel Heights").

The level of analysis of alternatives is subject to a rule of reason and need not be exhaustive; a crystal ball inquiry is not required. *Laurel Heights* at 406; *Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 547 ("*Sierra Club*"); *Foundation for San Francisco's Architectural Heritage v. City & County of San Francisco* (1980) 106 Cal.App.3d 893, 910. "Absolute perfection is not required; what is required is the production of information sufficient to permit a reasonable choice of alternatives so far as environmental aspects are concerned. It is only required that the officials and agencies make an objective, good-faith effort to comply." *Residents Ad Hoc Stadium Comm. v. Board of Trustees* (1979) 89 Cal.App.3d 274, 286.

The EIR fully evaluates six alternatives to the Project: No Project Alternative (Alternative 1); CUP Alternative (Alternative 2); Reduced Ground Disturbance Alternative (Alternative 3); No Hydraulic Fracturing Alternative (Alternative 4); Low-Emission Enhanced Oil Recovery (EOR) Technology Alternative (Alternative 5); Recycled Water Alternative (Alternative 6). For each alternative, the EIR provides a detailed description of the alternative, compares its impacts to those of the Project, and evaluates the relationship between the alternative and the Project objectives. In addition, Table 6-1 of the Draft EIR sets forth a matrix that provides a summary comparison of the significant impacts of each alternative to the project and the remaining alternatives for each impact category analyzed in the EIR.

By way of example, the information set forth on Table 6-1 demonstrates that Alternative 1 and Alternative 6 would have relatively greater aesthetic impacts than would the Project, that Alternative 4 and 5's aesthetic impacts would be roughly the same as the Project, and that Alternative 2 and 3's aesthetic impacts would be somewhat less than the Project. A similar comparison is made for each impact category. This analysis, combined with the detailed evaluation of each alternative's impacts as compared to the Project provides the information necessary to permit a reasonable choice of alternatives. CEQA requires no more. Indeed, CEQA Guideline § 15126.6(d) is quite clear that "[a] matrix displaying the major characteristics and significant environmental effects of each alternative[,]" such as Table 6-1, "may be used to summarize the comparison." Moreover, reviewing courts have upheld EIR's that compare project alternatives using a matrix like that set forth in Draft EIR Table 6-1. See, e.g., *Sierra Club* at 547; *Del Mar Terrace Conservancy, Inc. v. City Council* (1992) 10 Cal.App.4th 712, 740.

CEQA does not require the EIR to provide a detailed narrative analysis and a comprehensive discussion that compares the full extent of each alternatives’ impacts to one another.

0044-244

As explained in the Draft EIR at page 4.3-121, mitigation measures that suggested by the public during the EIR scoping period were considered only for those areas in which Project impacts were determined to exceed applicable significance thresholds. If significance thresholds were not exceeded, suggested mitigation measures were not considered because they would not address an impact as defined by CEQA. If significance thresholds were exceeded, however, suggested mitigation measures were considered and compared with the mitigation measures identified in the Draft EIR. If the Draft EIR did not contain equivalent or more effective mitigation, suggested mitigation measures were assessed to determine whether they would be feasible under CEQA and, if infeasible, were not included in the Draft EIR. Also, suggested mitigation measures were excluded from the Draft EIR if other mitigation measures that are included in the Draft EIR were determined to adequately mitigate significant Project impacts to less than significant levels.

During the EIR scoping process, one suggested mitigation measure proposed requiring oil and gas projects to generate their own clean electricity during production using photovoltaic (PV) solar, direct line power, or both, to eliminate all needs for operation power diesel generators onsite, thus reducing emissions associated with such generators. As explained on page 4.3-121 of the Draft EIR, this suggested measure was not included in the Draft EIR because other mitigation measures identified in the Draft EIR (i.e., MM 4.3-8) require emissions of designated criteria air pollutants to be fully offset by funding emission reduction programs in the air basin, obviating the need for mandatory clean energy production. In no event did the Draft EIR reject suggested mitigation measures related to renewable energy on the ground that they are part of the Project alternatives. They were eliminated because the County has determined to fully mitigate relevant impacts by other equally or more effective means. Since the EIR requires Project emissions to be fully offset, the EIR need not include additional mitigation requiring emitters to use clean electricity for a specific percentage of their operational energy needs, as the commenter suggests. Please see Global Response Alt-1 for more information regarding the feasibility of requiring well permit applicants to power all or a portion of well operations with renewable energy sources.

The Draft EIR includes mitigation measures that address the treatment and re-use of produced water. For example, MM 4.17-2 requires the applicant to increase the re-use of produced water, and reduce its use of municipal and industrial quality water (M&I water) to the extent feasible. This mitigation measure further requires, by the end of 2016, the applicants to review water use data submitted to DOGGR under Senate Bill 1281 and identify the five biggest oil industry users of M&I water by volume. The five biggest oil industry users of municipal and industrial water are further required to cooperate in the development and implementation of a plan identifying new measures to reduce M&I water use by 2020. The required plan must address the following activities, as appropriate: steam generation; drilling and completions (including hydraulic fracturing); dust control; compaction activities related to construction; and landscaping. Through the KernFLOWS initiative or other efforts (e.g., Groundwater Sustainability Agency), the five biggest oil industry users of municipal-and-industrial water must also work with local agricultural producers and water districts to identify new opportunities to increase the use of produced water for agricultural irrigation and other activities, as appropriate. Any produced water treated and used for agricultural irrigation or other activities shall be tested and monitored to assure compliance with applicable standards for such agricultural irrigation or other uses.

Moreover, MM 4.17-3 requires the applicant, as part of the County's required participation for the formulation of a Groundwater Sustainability Agency, to work with the County to integrate into the Groundwater Sustainability Plan for the Tulare Lake-Kern Basin, best practices from the oil and gas industry to encourage the re-use of produced water from oil and gas activities, and (with appropriate treatment) to produce new water

supplies for other uses such as agricultural irrigation and groundwater recharge. The produced water re-use goal is 30,000 acre-feet per year, which would offset more than the current use of imported water and groundwater from non-oil bearing zones by the oil and gas industry. In addition, MM 4.17-4, the applicant must work with the County on the Groundwater Sustainability Plan to increase applicant use of reclaimed waters and reduce the applicant's use of imported M&I surface water or groundwater.

0044-247

Please see GR 20 regarding recirculation.

0044-248

The drafter of this exhibit is a geologist and consultant on unconventional oil and gas sustainability issues. It is noted that he is a Fellow in the Post Carbon Institute, and has published articles against continued extraction of fossil fuels. The author identifies the Monterey Shale Formation as a "potential new play" that could result in substantial increases in oil production in Kern County which exceed the oil production estimates included in the Draft EIR.

This Exhibit has been reviewed, and the author's opinion of the "potential new play" of dramatic increases in Monterey Shale production in Kern County is noted. This opinion is not shared by expert agencies, as discussed in the Draft EIR at p. 4.13-9, or by experts retained by the County.

0044-249

This exhibit is a permit from the San Joaquin Valley Air Pollution Control District for a cogeneration plant that is part of its corn processing operations in Stockton, California.

This Exhibit has been reviewed, and is determined not to support commenter's assertion that the County has underestimated the need for new cogeneration plants for oil and gas production under the Amended Ordinance. The exhibit has no other relevance to the EIR.

0044-250

This exhibit is an excerpt from a California Planning book which includes a chapter describing "Growth Management and Smart Growth," within which are examples of "Housing and Population Caps," "Commercial and Industrial Caps," "Urban Growth Boundaries," and other growth controls such as limiting Infrastructure and downzoning to less intense uses. The section on "Commercial and Industrial Caps" provides as the only example a bi-annual square footage cap adopted by one Bay Area city for office buildings, and height restrictions.

This exhibit is noted, and determined not to support commenter's assertion that a "cap" on industrial or mineral extraction activity is "a common planning tool" in California. In fact, unlike traditional zoning decisions that may increase or decrease the development potential of land, restricting access to or extraction of mineral resources without compensation is a compensatory taking under State and Federal law. The exhibit has no relevance to the EIR.

0044-251

This exhibit is an unpublished appellate court decision that concluded, among other things, that a Sacramento-area city had failed to demonstrate the effectiveness of a new fee program to mitigate for the conversion of farmland to urban use by acquiring additional farmland. The court explained that the city's actions were improper not because the impacts to farmland were significant and unavoidable, but because the city had not shown that the fee would mitigate to the extent feasible as required by CEQA. Here, by contrast, the DEIR found that impacts to farmland would be less than significant after mitigation. DEIR at 4.2-19, -23. Therefore, the case is inapplicable. In addition, the County has in the past successfully mitigated potential impacts to farmland through fees and similar mitigation that, like the current Project, required a ratio of 1:1.

0044-252

This exhibit is an article examines fragmentation of agricultural land by urban development, and three strategies for managing urban development to reduce agricultural land fragmentation.

This Exhibit has been reviewed, and the author's critique of urban development "sprawl" patterns are noted. This article is cited for the general proposition that agricultural fragmentation is problematic.

Kern County is ranked among the nation's top-producing agricultural and oil production counties, and both of these economic sectors have continued to prosper as immediate neighbors, (and in the case of split estates with agricultural surface uses) as overlapping land uses. This exhibit is not relevant to the EIR.

0044-253

This exhibit is an article describing the experience of homeowners in North Dakota who have 25 wells within 2 miles of their home, including some wells located very close to their home. The homeowners were surface owners of a split estate, and the article goes on to describe other conflicts between surface and mineral rights owners in a state that, like California, holds that mineral rights holders have the dominant property right on split estates.

The article is noted. Please see GR-5, which describes the scores of procedural and substantive measures that have been included in the Revised Ordinance and EIR to reduce adverse impacts to surface owners, and provide surface and mineral owners with the enforced opportunity to reach a collaborative agreement (should they desire to do so) within the constraints of existing property rights laws.

0044-254

The exhibit is an article describing oil and gas regulatory activities outside California, and is cited as evidence that oil and gas extraction may preclude farming activities beyond the boundaries of the well paid itself.

The article is noted. The differences between oil and gas production in Kern County and other states, with respect to well stimulation practices, is addressed in Appendix U of the Draft EIR. The mission and conduct of regulators from other states is not relevant to the EIR. Agricultural and oil extraction activities have thrived in Kern County for more than a century, often as immediate neighbors or even co-located uses. It is noted that oil facilities on split estates do decrease the size of agricultural operations that could have occurred in the absence of oil activities, but that practice is consistent with (and an inevitable consequence of) the dominant mineral rights on split estates.

0044-255

This exhibit is another article describing landcover change generally, and forest This article is noted. There are no forest lands in the Project Area. Oil and gas development has been a major land use in Kern County for more than a century, and occurs both on and adjacent to lands that have for decades been under agricultural cultivation based on market conditions (e.g., the price of agricultural products, and the availability and price of irrigation waters). The successful co-location of agriculture with oil and gas production is the existing setting, and anticipated future condition, in Kern County. The Pennsylvania conditions described in the Exhibit are not relevant to this EIR.fragmentation specifically, in Pennsylvania attributed to shale-gas development.

0044-256

This exhibit is another article, describing primarily the impact of urban development patterns on agricultural lands, particularly suburban scale development patterns.

This exhibit is noted, and determined to have no relevance to this EIR.

0044-257

This exhibit presents an economic analysis of the 2015 drought on California agriculture prepared by a team of scientists from various

institutions. The analysis provides statistics regarding the many adverse economic and other consequences of the drought, and includes several recommendations – such as better groundwater management planning and practices – to address these challenges.

This exhibit is noted. The overdraft of groundwater in the Project Area is described in the Draft EIR, as are the relatively minor impacts of oil and gas production activities to groundwater conditions. The Draft EIR includes several mitigation measures to address water supply and water quality impacts, and to offset oil and gas use of higher quality surface and groundwater with increased treatment and agricultural irrigation use of produced water.

0044-258

This Exhibit is an article published by Circle of Blue, an internet site combining water and climate advocacy efforts. The article describes the California drought in relation to Kern County's agricultural, and oil and gas producers. This information is noted. Please also see Appendix T, the Water Supply Assessment for the Project. Appendix T uses published reports and other reliable sources, along with the most current modeling data available, to both estimate the baseline (2012) water demand and to project future water use. This Exhibit does not rely on all of the same sources as Appendix T. Projections in Appendix T about future water use are conservative, and include a 10% contingency. Appendix T does confirm that it is consistent with DOGGR data (convergence approximately >95%), which is also referenced in this Exhibit. Note also that Appendix T uses the metric of acre feet, while this Exhibit primarily uses gallons or barrels, which may account for certain inconsistencies, if any. As explained in Appendix T, projections about future water demand will vary and depend on changes in technology and applicable regulations or policies.

0044-259

This exhibit includes an article from the High Country News describing produced water surface disposal practices in the North Belridge oilfield specifically, and produced water disposal practices more generally. The DEIR includes a discussion of this issue. *See* DEIR 4.9-69. In addition, please note that the use of surface impoundments for produced water disposal by Aera Energy LLC (Aera) mentioned in the article was discontinued in 2008 and the lawsuit between Starrh and Starrh Cotton Growers and Aera was settled in 2013.

0044-260

This exhibit is a Penn State publication regarding the soil compaction problems caused by the use of heavy farm equipment, and the adverse agricultural production consequences of compacted soil. The exhibit has no direct relevance to this EIR, but is cited by the author for its conclusion that soil compaction is permanent.

This exhibit is noted. Soil compaction from heavy agricultural surface equipment use is not relevant to this EIR.

0044-261

This exhibit is also produced by Penn State, and describes soil compaction, and recommended measures to address such compaction, in the Marcellus Shale gas production areas of Pensylvania. The article notes that mitigating compacted soils requires the use of very heavy equipment, and deep tillage practices.

This exhibit is noted. There are substantial differences between gas extraction practices in the Marcellus Shale, and oil and gas production in Kern County, as described in Appendix U. There is no documented soil compaction problem in Kern County from oil and gas development practices. This exhibit is not relevant to this EIR.

0044-262

This exhibit suggests modifications to 30 of the 88 mitigation measures included in the Draft EIR. Fourteen of these modifications impose new requirements to obtain surface owner "agreement" or "permission" to engage in mitigation activities that are required to be implemented under the Amended Ordinance. For example, many of the comments propose that surface owner permission or agreement is required to be obtained before an applicant can engage in the required pre-construction surveys for sensitive biological or cultural resources. As explained in Global Response 4, under the California Constitution and relevant statutes the mineral owner holds the "dominant" property right on split estates. Requiring surface owner permission or agreement as requested by commenter would reverse this property right priority and provide surface owners with effective control over when, how or whether a mineral rights owner can access and extract minerals by prohibiting such activity absent surface owner permission or agreement. The requested elevation of surface ownership to dominant estate status is legally infeasible under CEQA.

Commenter also suggests monetary compensation to surface owners as a mandatory mitigation measure for replacement and re-vegetation of crops and/or orchards. As described in Global Response 4, surface owners have a right to such compensation in other states based on the laws

of those states; however, this compensation is not required under California law, nor does lawful use of property create any economic mitigation obligation to a private property owner under CEQA.

As discussed in greater detail in response to commenter's letter, as initially drafted the Amended Ordinance expanded on the mandatory notice requirements to surface owners, and created a separate and more lengthy permit processing track for split estates where surface owner signatures were not obtained as part of the Site Plan process. The notice requirements have been expanded in the Revised Amended Ordinance (included in Section 7.1.3 of this Final EIR), and surface owner notice is now required when an application is filed, and the contents of the required notice have been expanded to include all of the activities for mitigation activities for which commenter requests surface owner agreement or permission, including notice regarding the location of access roads (existing and new), materials used to complete required road soil stabilization for unpaved roads, and for access to complete required biological and cultural resource surveys. Notice is also required for all activities for which this comment requests landowner notice, including drainage plans and hazardous materials spills and cleanup activities. The County lacks jurisdiction to require surface owner notice of application-related activities that occur prior to the filing of an application, since this falls outside the scope of the County's zoning authority and falls within statutory and common law authorities governing mineral and surface estate owners.

This comment also requests specific exclusions or modifications to mitigation measures when applied to agricultural lands. There is no specific rationale provided for any of these modifications, and the County has determined that none avoid, or substantially minimize or mitigate, a significant adverse impact to the environment. Mitigation measure revisions accepted by the County are noted.

The comment on MM 4.1-2 requests that that operators have 45 days rather than 90 days to remove derricks, boilers and other drilling equipment from a drill site to mitigate a temporary aesthetic impact. The aesthetic impact remains temporary under either duration, and shortening this duration – which is one of six mandatory mitigation measures imposed to reduce aesthetic impacts – does not avoid or substantially reduce the temporary degradation of the visual character or quality of the site and its surroundings. **This mitigation measure revision is not warranted.**

The comment on MM 4-1-4 requests an exception to aesthetics screening (e.g., shrubs, trees or solid screen fencing) for oil or gas tanks located on agricultural lands, even where such tanks are in public view and located within 200 feet of a sensitive receptor. **This mitigation measure revision is accepted to avoid the need for non-crop planting on agricultural lands.** This comment further requests that screening fencing be required within 1000 feet (instead of the 500 feet specified in the Draft EIR) of any dwelling. The aesthetic benefit of fencing is effective at the 500 feet distance included in the EIR. **This mitigation measure revision is not warranted.**

The comment on MM 4.2-2 and 4.2-3 request that speed limits on unpaved roads be limited to 15 miles per hour instead of the 25 miles per hour included in the Draft EIR, and allowed by applicable San Joaquin Valley Air Pollution Control District regulations. The County has determined that the District's speed limit, and compliance with the District-mandated dust supression measures that are also required to be implemented under MM 4.3-2, is effective in reducing dust impacts to a less than significant level and the further reduction in the speed limit proposed by the commenter to reduce dust impacts is not warranted. Similarly, commenter requests that the speed limit for biologically sensitive areas be decreased from 20 miles per hour to 15 miles per hour, notwithstanding expert biological opinion and agency support for the 20 miles per hour speed limit. **These mitigation measure revisions are not warranted.**

The comment on MM 4.3-5 requests deletion of a mitigation measure option of relocating residents to an area hotel for avoiding significant temporary adverse noise impacts during construction activities. The intent of this mitigation was to acknowledge that temporary relocation was an effective means of avoiding adverse noise impacts from well construction activities, but to also limit use of this mitigation measure to circumstances in which residents voluntarily agreed to such a relocation. Commenter offers no rationale for precluding implementation of this technically feasible mitigation measure; however, clarification is appropriate since involuntary relocation is not legally feasible. **The following revision to this mitigation measure is accepted:** "Assist and pay to relocate residents to temporary lodging during well construction, drilling, and completion activities, if such residents voluntarily agree to such relocation."

The comment on MM 4.4-15(p) and (q) requests an expansion of the 50-foot buffer distance between extra work areas (such as staging areas and spoil storage areas) and wetlands or waterbodies, and a 100-foot buffer distance to wash water disposal (which may not be discharged from the site), to also apply to cultivated land or crop land. This measure is designed to protect the biological resource values of wetlands and waterbodies, including plants and animals using these riparian features. Commenter provides no biological resource rationale for applying this riparian buffer distance to agricultural lands. **These mitigation measure revisions are not warranted**. MM 4.4-15(v) requests that topsoil segregation and seed bank preservation be required only for areas with native vegetation (and by implication not apply to cultivated agricultural lands). Because this mitigation measure was intended to help preserve seed banks for previously-undisturbed vegetation and not cultivated agricultural lands, **the following revision to this mitigation measure is accepted**: "If ground disturbance is intended to be temporary **and does not occur on cultivated and crop lands,** perform topsoil segregation . . .[remaining text unchanged from Draft EIR]."

The comment on MM 4.8-3(b) requests that this measure requiring that fuel and lubricants in staging areas be stored at least 100 feet away from the edge of cultivated and crop lands also include a 100-foot buffer distance away from cultivated and crop lands. The buffer distance to riparian features reflects the greater potential for species to be present near such riparian species. Because other parts of this same mitigation measure already require secondary containment such as berms or dikes around tanks, and the storage of non-tank fuels and lubricants in tanks also requires secondary spill containment, **the requested revision to this mitigation measure is not warranted** and could have the adverse consequence of increasing the amount of ground disturbance required for staging areas.

The comment on MM 4.8-15 requests that surface owners and their employees have access to training and appropriate personnel protective equipment (PPE) at locations where larger quantities of acutely hazardous chemicals are stored, as described further in the mitigation measure. Surface owners and their employees may voluntarily agree to undertake such training, but responsibility and liability for managing acutely hazardous chemicals remains with the applicant. Therefore, **this mitigation measure is not warranted.** However, in response to this and similar requests, MM 4.8-1 has been amended to provide that the Worker Environmental Awareness program provided to the employees of an

oil and gas operation shall also be provided to the surface owner at the time of the application pathway process so the surface owner may educate employees as well.

The comment on MM 4-8-19 requests that "operators" of oil and gas activities comply with all applicable policies of the Kern County Airport Land Use Compatibility Plan. The Draft EIR requires compliance by "Applicants" rather than "operators." The Amended Ordinance applies to new Applicants, and not existing operators. **The requested revision to this mitigation measure is not warranted.**

The comment on MM 4.12-2 requests that new oil and gas wells be located a minimum of 1,000 feet, rather than 190 feet, from the nearest sensitive receptor. A revised noise study has informed, and increased, the required setback distance between wells and sensitive receptors to 210 feet. (See revised MM 4.12-2) There is no rationale for increasing this noise setback distance to 1000 feet, hence **the requested revision to this mitigation measure is not warranted.**

The comment on MM 4.16-1 requests establishment of a grant maintenance program for unpaved roadway maintenance and improvements, "particularly unpaved roads associated with active agricultural operations on and in the vicinity of split-estate properties." A compensatory mitigation program for private roadways owned by split estate surface owners is a monetary mandate that is inconsistent with laws establishing mineral owners as the dominant estate. Funding for public roadway wear and tear is already included in this Mitigation Measure. **The requested revision to this mitigation measure is not warranted.**

0044-263

This exhibit is the 2014 Kern County Agricultural Crop Report. This report was cited for statistical information about agricultural production in Kern County. The report is noted. Information about Kern County's agricultural industry and land uses is included in the EIR at pages 4.2-1 – 4.2-6.

0044-264

This exhibit provides generalized information about grazing lands in the United States, as reported by the United States Department of Agriculture Natural Resources Conservation Service.

This exhibit is cited as a reference for generalized statements about rangeland, and is noted. The Draft EIR identifies grazing lands in the Project Area. EIR page p. 4.2-5.

0044-265

This exhibit is a University of California report on the effects of the state's Williamson Act funding cuts on California ranch lands.

This exhibit is cited for the general assertion that rangelands provide important benefits. The exhibit is noted.

0044-266

This exhibit is an article from the Journal of the California Native Plant Society on the benefits of conserving and managing grasslands, prairie, and vernal pool landscapes.

Grazing is a common land use in rural portions of the Project Area that are not used for irrigated croplands or urban uses. The Draft EIR identifies grazing lands in the Project Area. EIR page p. 4.2-5.

0044-267

This exhibit is an article from the September-October 2002 edition of California Agriculture discussing various social, demographic, and economic factors that, as of 2002, were affecting the cattle industry in California. The article notes that "California's greatest concentration of cattle are in the Central Valley counties of Fresno, Kern, Merced, Stanislaus and Tulare, and the arid southern region comprised by Imperial, Riverside and San Bernardino counties." The article does not discuss whether the oil and gas industry has any effect on the cattle industry; nor does it discuss loss of grazing land as a significant issue for the cattle industry. There is also no information included as to whether the issues faced by the cattle industry in 2002 remain areas of concern.

0044-268

This Exhibit is an "Intended Decision" in the matter Center for Biological Diversity v. San Benito County et al. (Monterey Superior Court Case No. M123956), filed July 21, 2014. The case involved review of a decision by San Benito County to prepare a mitigated negative declaration for an exploratory oil extraction project and as such is inapposite to the County's decision to prepare an EIR for the Revised Amended Ordinance. Further, trial court decisions are not precedent in California.

0044-269

This Exhibit is an April 2015 article from Science Magazine concerning the impacts of increased production of oil and gas wells in central North America since 2000 on crop and rangelands. The article does not discuss oil and gas activities in California generally or Kern specifically, or indicate whether the oil and gas development in central North America included area where, as in Kern, agricultural and oil & gas uses have coexisted for 100-plus years.

0044-270

This Exhibit was not included in the CD provided by the commenter.

0044-271

This Exhibit is an article discussing incentives for landowners to lease their property for oil production utilizing hydraulic fracturing, focusing on Eastern states.

The article is noted. Well stimulation practices in Eastern states are not relevant to practices in California under different geological conditions. Please also see GR-5, which describes the scores of procedural and substantive measures that have been included in the Revised Ordinance and EIR to reduce adverse impacts to surface owners, and provide surface and mineral owners with the enforced opportunity to reach a collaborative agreement (should they desire to do so) within the constraints of existing property rights laws. This Exhibit is noted but is not relevant to this EIR.

0044-272

This Exhibit is an article discussing conflicts between development of mineral rights and agricultural land values in states that, like California, holds that mineral rights holders have the dominant property right on split estates.

The article is noted. Please see GR-5, which describes the scores of procedural and substantive measures that have been included in the Revised Ordinance and EIR to reduce adverse impacts to surface owners, and provide surface and mineral owners with the enforced opportunity to reach a collaborative agreement (should they desire to do so) within the constraints of existing property rights laws.

0044-273

This Exhibit is an article discussing conflicts between development of mineral rights and agricultural land values in states that, like California, holds that mineral rights holders have the dominant property right on split estates.

The article is noted. Please see GR-5, which describes the scores of procedural and substantive measures that have been included in the Revised Ordinance and EIR to reduce adverse impacts to surface owners, and provide surface and mineral owners with the enforced opportunity to reach a collaborative agreement (should they desire to do so) within the constraints of existing property rights laws.

0044-274

This comment suggests several changes to most sections of the Amended Ordinance to address commenter's opinion that the information presented by the County Planning Director during a workshop on the Draft EIR was not consistent with the Amended Ordinance included in the Draft EIR.

First, the purpose of the public review process for the Amended Ordinance and Draft EIR is to obtain meaningful feedback from the public and other stakeholders, and to carefully consider and make changes in response to such feedback. There were three workshops on the Draft EIR, and a staff report that described and made preliminary recommendations regarding the Amended Ordinance. Staff recommendations regarding the administrative procedures in the Amended Ordinance evolve, and continued to evolve, and generally are not relevant to the physical components of the Project described and evaluated in this EIR. For example, the level of procedural specificity described for an application review process that includes, or excludes, a surface owner signature for a split estate does not change either the physical character of the oil and gas activities regulated by the Amended Ordinance, nor is it relevant to the impacts or mitigation measures included in the EIR.

Second, all of the commenter's suggested revisions to the Amended Ordinance to conform to the workshop staff report have been considered. Based on feedback from several commenters on the Amended Ordinance, the application review procedures and other administrative details have continued to evolve, and a Revised Amended Ordinance is included in this Final EIR. The mitigation measures from the EIR, and

compliance with the California Environmental Quality Act more generally, also continue to be included in the Revised Amended Ordinance.

Changes that have been accepted are incorporated into the Revised Amended Ordinance are included in Section 7.1.3 of the Final EIR.

0044-275

Commenter's suggestions regarding changes to the Site Plan Requirements in the Amended Ordinance were considered, as were other comments on the Amended Ordinance. A Revised Amended Ordinance has been included in Section 7.1.3 that clarifies and expands on the amount of surface owner notice, and documentation, required during the Site Plan Review process.

0044-276

This Exhibit is a letter from DOGGR to USEPA regarding DOGGR's actions in response to the USEPA audit of the California Underground Injection Control (UIC) program.

The UIC program and USEPA audit are discussed throughout the DEIR. *See, e.g.*, pp. 4.9-72, 4.9-96–98, and 4.9-107–4.9-108. Please also see GR-Water 2 which describes the correspondence between DOGGR and USEPA and provides a detailed discussion of the UIC program and review status.

0044-277

This Exhibit is a report by the United States Government Accountability Office which found, among other things, that USEPA received twenty-four allegations of groundwater contamination from underground injection wells in California between 2009 and 2012. The report does not constitute substantial evidence that such contamination actually occurred (as opposed to just allegations) and the DEIR contains more recent and contrary evidence. *See, e.g.*, DEIR at 4.9-75. Please also see GR-20, 21, Water-2 and Water-6, which describe the investigations and conclusions of California agencies on this topic.

0044-278

This Exhibit is DOGGR's July 15, 2015 Preliminary Assessment of Eleven Aquifers Historically Treated as Exempt. Please see GR Water-2, which references and contains an analysis of this report.

0044-279

This Exhibit is newspaper article describing the status of an enforcement matter by the Central Valley Regional Water Quality Control Board. The DEIR already describes the CVRWCQB's enforcement efforts in this area. *See* DEIR at 4.9-101–4.9-108. *See also* GR-Water 1.

0044-280

This Exhibit is a newspaper article discussing California's drought conditions in 2014. The DEIR already considers California's drought conditions. *See, e.g.*, DEIR at 4.9-9–4.9-10.

0044-281

This Exhibit is an article analyzing drought conditions, including whether they are caused by climate change. The analysis is not specific to California or Kern County. The DEIR already considers California's drought conditions. *See, e.g.*, DEIR at 4.9-9–4.9-10.

0044-282

This Exhibit is an article analyzing California's drought conditions, including whether they are caused by climate change. The DEIR already considers California's drought conditions. *See, e.g.*, DEIR at 4.9-9–4.9-10.

0044-283

This Exhibit is an article analyzing California's drought conditions, including whether they are caused by climate change. The DEIR already considers California's drought conditions. *See, e.g.*, DEIR at 4.9-9–4.9-10.

0044-284

This Exhibit is an article analyzing California's drought conditions, including whether they are caused by climate change. The DEIR already considers California's drought conditions. *See, e.g.*, DEIR at 4.9-9–4.9-10.

0044-285

This Exhibit is an article analyzing California's drought conditions, including whether they are caused by climate change. The DEIR already considers California's drought conditions. *See, e.g.*, DEIR at 4.9-9–4.9-10.

0044-286

This Exhibit is an article analyzing California's drought conditions, including whether they are caused by climate change. The DEIR already considers California's drought conditions. *See, e.g.*, DEIR at 4.9-9–4.9-10.

0044-287

This Exhibit is an excerpt from Volume II of the CCST's Independent Scientific Assessment of Well Stimulation in California. The DEIR already includes and considers the relevant findings from the CCST's review of well stimulation. *See, e.g.*, DEIR at Ch. 4.6, 4.8 and 4.9. See also GR-20, 21 and Geo-1 and Water-6.

0044-288

Exhibit 1 is a close-up photograph of existing wells on Highway 46. AES 1 is cited for the proposition that the photos provided in Appendix G of the DEIR are misleading.

This photograph is noted. The DEIR uses Key Observation Points ("KOPs") in order to create a representation of the Project's aesthetic impacts on typical views in the Project area and views from sensitive locations. DEIR at 4.1-21. Several of the KOPs were taken from roads and highways similar to Highway 46 and represent the views of such locations. *See, e.g.*, DEIR at 4.1-22–26. Further, the mitigation measures included in the DEIR will help minimize the significant, but unavoidable impacts on aesthetic resources. DEIR at 4.1-40–41; 4.1-50.

0044-289

This Exhibit is a map of parks and recreational areas located in Kern County. It is cited for the proposition that the County has failed to assess aesthetic impacts on such areas.

This map is noted. The DEIR uses Key Observation Points ("KOPs") in order to create a representation of the Project's aesthetic impacts on typical views in the Project area and views from sensitive locations. DEIR at 4.1-21. Four of the ten selected KOPs assess views from local and county parks. These KOPs are representative of views from parks and recreational areas.

0044-290

This Exhibit is a list of industrial solar projects in Kern County. It used to support the proposition that the DEIR did not adequately analyze cumulative aesthetic impacts.

This list is noted. Under CEQA Guidelines § 15130, an agency may conduct its assessment of cumulative impacts using a summary of projections contained in an adopted local, regional, or statewide plan that describes and evaluates conditions contributing to the cumulative effect. The DEIR does so, relying on both the Kern County General Plan and the regional growth plan and projections included in the Kern COG Regional Transportation Plan/Sustainable Communities Strategy approved in 2014.

0044-291

This Exhibit is a list of industrial wind projects in Kern County. It used to support the proposition that the DEIR did not adequately analyze cumulative aesthetic impacts.

This list is noted. Under CEQA Guidelines § 15130, an agency may conduct its assessment of cumulative impacts using a summary of projections contained in an adopted local, regional, or statewide plan that describes and evaluates conditions contributing to the cumulative effect. The DEIR does so, relying on both the Kern County General Plan and the regional growth plan and projections included in the Kern COG Regional Transportation Plan/Sustainable Communities Strategy approved in 2014.

0044-292

This Exhibit is the executive summary of the Draft Desert Renewable Energy Conservation Plan. It used to support the proposition that the DEIR did not adequately analyze cumulative aesthetic impacts.

This executive summary is noted. Under CEQA Guidelines § 15130, an agency may conduct its assessment of cumulative impacts using a summary of projections contained in an adopted local, regional, or statewide plan that describes and evaluates conditions contributing to the cumulative effect. The DEIR does so, relying on both the Kern County General Plan and the regional growth plan and projections included in the Kern COG Regional Transportation Plan/Sustainable Communities Strategy approved in 2014.

0044-293

This Exhibit is a study of traffic noise reduction in Europe. The comment is noted. This EIR has an extensive analysis of noise impacts, including from traffic, in Kern County. DEIR, Ch. 4.12. Please see GR Noise-1.

0044-294

This Exhibit is an acoustical review of this EIR's noise analysis. The comment is noted. Please see GR Noise-1.

0044-295

This Exhibit is a review of the Traffic and Trasnportation analysis done for this EIR. The comment is noted. Please see GR TR-1.

0044-296

This exhibit is a CARB fact sheet showing the conversion of 1 MMT CO2 to familiar equivalents. This article was cited for the fact that GHG emissions from the oil and gas sector in 2012 are equivalent to 3.5 million passenger cars. The exhibit is noted.

GHG emissions from the oil and gas industry in 2012 are part of the baseline of the DEIR. In addition, as explained in the DEIR, Project GHG emissions would be mitigated to a level of no net increase. DEIR at 4.7-32 – 39.

0044-297

This exhibit is CARB's Climate Change Scoping Plan which lays out the agency's plan to meet the AB 32 GHG reduction levels. The comment letter states that the Scoping Plan incorporates the 2050 GHG reduction goal laid out in E.O. S-3-05. The exhibit is noted.

While the Scoping Plan mentions the 2050 goal of an 80% reduction in GHG emissions from 1990 levels by 2050 laid out in E.O. S-3-05, it does not craft any measures to attempt to meet this goal nor is it supposed to. The reductions laid out in the Scoping Plan are linked to the AB 32 requirement to reduce GHG emissions by 20% from 1990 levels by 2020. AB 32 does not mandate CARB to craft measures to meet the aspirational 2050 goal set out in E.O. S-3-05. See also GR GHG-1.

0044-298

This exhibit is CARB's First Update to the Climate Change Scoping Plan which analyzes the state's progress toward meeting the 2020 GHG emission reductions mandated by AB 32 and explains the agency's plan to build upon the first Scoping Plan in working towards further GHG emission reductions. The comment letter states that the First Update to the Scoping Plan incorporates the 2050 GHG emission reduction goals as longer term goals of the state. The exhibit is noted.

While both the Scoping Plan and First Update to the Scoping Plan address longer term GHG emission reduction goals, these goals (be they 2050 or beyond) are not mandated by AB 32 or any other California law. As such, the DEIR is not required to address these goals. See also GR GHG-1.

0044-299

This exhibit is *Cleveland National Forest Foundation v. San Diego Association of Governments* (2014) 231 Cal.App.4th 1056 (*SANDAG)*. This case was cited for the fact that one Court of Appeal has reasoned that omitting an analysis of a project's inconsistency with E.O. S-3-05 is not appropriate under CEQA. The case is noted.

The *SANDAG* case is currently on appeal to the California Supreme Court and thus has no precedential value for the DEIR. In any case, *SANDAG* is distinguishable as the project at issue in that case was a long-term regional transportation plan specifically geared toward addressing how to reduce GHG emissions over time. The Project here does not have as one of its purposes reducing GHG emissions over time. See also GR GHG-1.

0044-300

This exhibit is SJVAPCD's Best Performance Standards for Components at Light Crude Oil and Natural Gas Production, Natural Gas Processing Facilities, Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants. The comment letter states that BPS are not mitigation measures. The exhibit is noted.

The exhibit states that "BPS is not a required mitigation of project related impacts" but does not assert that BPS can never be used as mitigation. In fact, as described in the DEIR, SJVAPCD's District Policy: Addressing GHG Emission Impacts from Stationary Source Projects Under CEQA When Serving as the Lead Agency states that BPS is used to determine a Project's potentially significant impacts on GHG emissions. DEIR at 4.7-31 – 32. BPS that are implemented by GHG-emitting sources will reduce the GHG emissions from those sources and therefore also reduce the amount of GHG emissions that require further mitigation.

0044-300 cont'd

0044-301

This exhibit is a California Air Pollution Control Officers Association (CAPCOA) white paper about CEQA and Climate Change. The comment letter states that this white paper contains numerous mitigation measures for reducing GHG impacts. The exhibit is noted.

This document lists the following mitigation measures:

MM C-1: Certified Diesel Construction Equipment MM C-2: Alternative Fuel Construction Equipment MM C-3: Local Building Materials MM C-4: Recycle Demolished Construction Material MM C-1: Certified Diesel Construction Equipment is a mitigation measure for some criteria pollutants and diesel particulates (DPM), but the measure indicates that it has an adverse impact on GHG, as it "Increases CO_2 emissions when trapped CO and carbon particles are oxidized." DEIR mitigation measures such as MM 4.3-3, which requires that off-road engines meet the Tier 3 emission standards, would substantially reduce emissions of criteria pollutants (without increasing GHG emissions).

The CAPCOA document includes MM C-2: Alternative Fuel Construction Equipment, but states that this measure is also adverse with respect to some criteria pollutants. The measure suggests "Use alternative fuel types for construction equipment. At the tailpipe biodiesel emits 10% more CO_2

than petroleum diesel. Overall lifecycle emissions of CO_2 from 100% biodiesel are 78% lower than those of petroleum diesel." However, the use of biodiesel may also result in a 10% increase in NOx which would contribute to the nonattainment status for the State and federal ozone standard. *See* EPA. A Comprehensive Analysis of Biodiesel Impacts on Exhaust Emissions. EPA420-P-02-001. October 2002. As such, MM 4.3-3 in the DEIR was recommended to reduce emissions of nitrogen oxides and particulate matter instead of a measure like MM C-2.

The CAPCOA document also lists MM C-3: Local Building Materials. The use of local building materials is frequently practiced by the construction industry to minimize the costs and time associated with transporting building materials and will likely be a practice used for Project construction activities.

Lastly, the CAPCOA document lists MM C-4: Recycle Demolished Construction Material. Section 4.17 Utilities and Service Systems of the DEIR discusses how the Kern County Waste Management Department (WMD) operates seven landfills, five transfer stations and three bin sites throughout the county. The WMD also operates two special waste facilities and provides information on recycling and waste to minimize waste generation. This DEIR section also discusses The California Solid Waste Reuse and Recycling Access Act of 1991 which requires expanded or new development projects to incorporate storage areas for recycling bins into the project design. Reuse and recycling of construction debris would reduce operating expenses and save valuable landfill space. To comply with this Act, the DEIR has included the following mitigation measure:

MM 4.17-5 During construction activities for Project facilities, the Applicant shall not store construction waste onsite for longer than the duration of the construction activity, or transport any waste to any unpermitted facilities. The Applicant shall also reduce construction waste transported to landfills by recycling solid waste construction materials, such as taking materials to recycling and reuse locations listed in the brochure on

recycling construction and demolition materials available on the Kern County Waste Management Department website. Thus, the MM 4.17-5 is comparable to MM C-4.

In addition, as stated in the DEIR, GHG emissions from Project activities will be mitigated to a level of no net increase. DEIR at 4.7-32 – 39. See also GR GHG-2.

0044-302

This Exhibit is a press report on the U.S. Energy Information Administration's reduction in its estimate of the amount of recoverable oil in the Monterey Shale Formation.

This Exhibit has been reviewed. The Exhibit supports the conclusion in the Draft EIR, p. 4.13-9, that in the absence of dramatic technological advances, substantial development of the Monterey Shale and resulting population, housing and growth inducing impacts are not anticipated. Please see GR 32 regarding technological constraints on developing the Monterey Shale.

0044-303

This Exhibit is a press report on the value of oil stocks. The Exhibit states that the oil industry exhibits boom and bust cycles.

This Exhibit has been reviewed. The DEIR took historic patterns in the oil and gas industry into account in developing the baseline and well forecasts. Please see GRs 10 and 13.

0044-304

The Exhibit is a press statement by the Western States Petroleum Association regarding the oil and gas industry's existing contribution of jobs and tax revenue to California and Kern County.

This Exhibit has been reviewed. The industry's existing contribution to the state and local economy is considered one of the benefits of the Project. This is not inconsistent with the discussion of population, housing and growth inducing impacts in the Draft EIR.

0044-305

This exhibit is an article from the Bakersfield Californian explaining the level of air quality in Kern County. This article was cited for the fact that air quality in Kern County is at nonattainment levels. The article is noted.

Information about the current air quality in Kern County's is included in the Draft EIR at DEIR at 4.3-4 – 9. Although Kern County is nonattainment for certain criteria pollutants, the DEIR would ensure that air quality impacts are mitigated to a level of less than significance through mitigation. DEIR at 4.3-70; 4.3-103. See also GR Air-1.

0044-306

This exhibit is an article describing the health risks of air emissions from the development of unconventional natural gas resources. The article was cited for the fact that emissions from the oil and gas industry are linked to poor health outcomes. The article is noted.

McKenzie (2012) conducted two evaluations of health risks, one based on the median value of air measurements and another based on a 95th percentile upper confidence limit (UCL) estimates. The study concludes: "These preliminary results indicate that health effects resulting from air emissions during development of unconventional natural gas resources are most likely to occur in residents living nearest to the well pads and warrant further study." However, the results showed that there are no significant chronic, sub-chronic health or cancer risk for risks for either the median or UCL exposure estimates for locations greater than ½ mile. Based on worst-case (70 year continuous outdoor exposure at a fixed location) rather than reasonable maximum exposure assumptions, the study indicated that estimated hazard indices less than 0.5 (<1 indicates no health risk) and cancer risk less than 7 in a million (10 in a million is commonly used by EPA and other air districts to be an acceptable risk level – see response 0049-9). For locations at or within ½ mile, the study indicates that median measured concentrations also indicated risks at acceptable levels for all three health effects. Within ½ mile the UCL risk estimates are higher indicating a hazard index of 1 for chronic effects, 5 for sub-chronic effects and 10 in a million for lifetime cancer risk. Given that the UCL values are representative wells that are much less than ½ mile away and that worst case (see above) exposure assumptions are used, these values are likely to be overestimates. In addition, even the worst case scenario presented risks at 10 in a million, lower than the SJVAPCD threshold for CEQA impacts. See also GR Air-5 and Air-6.

0044-307

This exhibit is an article on birth outcomes and maternal residential proximity to natural gas development in Colorado. The article was cited for the fact that emissions from the oil and gas industry are linked to poor health outcomes. The article is noted.

McKenzie (2014) studied birth outcomes statistics as related to natural gas well locations but did not examine concentrations of ambient air pollutants. Thus, while this type of epidemiological study can determine if there may be positive associations between distance and specific birth outcomes, these methods do not establish definitive cause and effect relationships. The study found that among the birth effects studied that there was a positive association between greater density and proximity of natural gas wells within a 10 mile radius and congenital heart defects. The study did not find significant correlations with other birth outcomes or address what pollutants may be involved or the specific types of sources or activities that may be implicated by the noted positive association. The authors conclude that given the limitation of the present study, that more comprehensive and rigorous research is warranted. This study does not suggest that emissions from the oil and gas industry are linked to poor health outcomes. See also GR Air-5 and Air-6.

0044-308

This exhibit is an article addressing how ozone pollution is reducing the food supply. This article was cited for the fact that air emissions from the oil and gas industry are linked to reduced agricultural yields. The article is noted.

This paper sites studies that explore how high levels of ozone may adversely affect crops. The basis for the current secondary ozone standard, as explained in the ozone criteria document (Air Quality Criteria for Ozone and Related Photochemical Oxidants Volume I, (EPA 600/R-05/004aF) Section 9 ENVIRONMENTAL EFFECTS: OZONE EFFECTSON VEGETATION AND ECOSYSTEMS), includes a vast body of research. The ozone standards have been proposed by EPA and will likely be set at even lower levels than the existing standards. Areas that are not in attainment with these standards are required to develop EPA-approved plans to improve air quality and continue to reduce airborne concentrations of ozone unit compliance with the standards are achieved. Once this occurs, because the secondary ozone standard is protective of vegetation, there would be no detrimental impacts on crops due to ozone exposure.

0044-309

This exhibit is a U.S. EPA discussion of oil and natural gas pollution standards. This article was cited for the fact that VOCs which are emitted from oil and gas operations contribute to the formation of ground level ozone. The article was not attached to the comment letter; however, we are aware that EPA's oil and natural gas pollution standards aim to reduce emissions of methane and VOC in order to address climate change and public health impacts.

While VOCs contribute to the formation of ground level ozone, all VOCs from the Project were considered in the air quality analysis in the DEIR. DEIR at 4.3-70 – 103. In addition, the air quality mitigation measures in the DEIR will ensure that air quality impacts from VOCs are less than significant after mitigation. *See* DEIR at 4.3-68 – 70; 4.3-103; 4.3-110 – 112; 4.3-120 – 121. See also GR Air-1.

Re: Comments on the Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance 2015 C

Dear Mr. Mynk:

On behalf of the Center for Biological Diversity and its members, I am writing to submit the following comments regarding the Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance (the DEIR). 0045-1

The DEIR, which the County offers as a project-level EIR intended to take the place of all environmental review of oil and gas activity in the County for the foreseeable future, is contrary to basic environmental protections and public participation rights. Moreover, substantial, irreversible harm to our air, water, health, and climate will result from these activities. Rather than encourage the expansion of dangerous oil and gas activity through these amendments (written by the industry), the County should begin the transition toward a cleaner, safer, healthier economy. 0045-2

Time to Review Is Insufficient

Given the length of the DEIR and the improperly broad scope of the proposed Revisions to the Kern County Zoning Ordinance (the proposed Project), it is unreasonable to ask the public to provide comments in such a short time period. The Notice of Completion was issued July 8, 2015, and the Kern County Planning and Community Development Department originally gave only the statutory minimum of 45 days to respond. Calls from the public to allow for more time to review were initially rejected. Only after multiple requests for an extension were submitted did the County grant a limited, 15-day extension and allow comments to be submitted until September 11, 2015. Even with 60 days, the 1,800-page DEIR—together with the thousands of pages of appendices where much of the critical information is located—is nearly impossible to review and puts an unfair and prejudicial burden on those attempting to provide meaningful public comments. 0045-3

The Scope of the Project Is Improperly Broad

0045-4

The sum of all environmental impacts caused by all oil and gas activities for the indefinite future is far too broad to provide any meaningful review of the activities at issue. This is especially true where, as here, the County is proposing to process ministerial permits for many types of harmful activities, which would not be further reviewed by the County. In other cases, the County proposes that no permit at all be necessary. Given the broad array of potential and actual harms at each step of the oil and gas development process, and the variety of operations within Kern County, each individual well deserves close environmental scrutiny. The DEIR attempts to aggregate the various harms from construction, site preparation, drilling, well reworks and workovers, well completion, well stimulation, enhanced oil recovery, wastewater management, wastewater disposal, plugging and abandonment, and other ancillary activities. A single analysis cannot possibly be adequate to serve as a project-level analysis for all oil and gas activities for the foreseeable future.

0045-5

Further, the County improperly states that the EIR, once certified, will be used to satisfy the requirements of the California Enviornmental Quality Act (CEQA) for the following discretionary approvals: Kern County Ordinance amendments; Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR) permitting; San Joaquin Valley Air Pollution Control District permitting for oil and gas equipment, Regional Water Board Waste Discharge Requirements (WDR), Department of Toxic Substances Control oversight of cleanups, Kern County Water Agency permits, Department of Transportation encroachment permits. To claim that no further environmental review is necessary for any of these activities is an untenable and incorrect interpretation of CEQA requirements.

0045-6

The County's justifications for a project-level DEIR for all oil and gas activity in Kern County does not withstand scrutiny. The DEIR states that it is able to analyze site-specific impacts, but the DEIR does no such thing. To cite just one example, the air quality impacts are based on just 9 air monitors, and only for a select number of air pollutants. There is no concrete data that would allow the public to understand what the likely local impacts would be.

0045-7

The DEIR also states that the project-level analysis would allow the public to review environmental harms at the time the County Ordinance is changed. This would be true of a programmatic EIR as well, and thus it is not an argument for attempting to conduct a project-level EIR that could foreclose future evaluation of oil and gas projects. The final reason offered for conducting a project-level EIR is that it would give other agencies more detailed analysis upon which they could rely when issuing discretionary permits. Again programmatic EIRs would do the same. Moreover, this DEIR does not provide the level of specificity necessary to make any informed determinations on the impact of individual wells and projects. Aside from the lack of specificity, it is also an extremely long document, making it virtually incomprehensible and unusable on a project-by-project basis.

0045-8

Kern County has failed to take a hard look at the health and environmental consequences of widespread oil and gas activity in the past. It cannot hope to analyze each and every concern in a single document, building upon no previous systematic review. Further, Kern County seems to indicate that this review would serve as the sole evaluation for all oil and gas development *ad infinitum* and would preclude future review of oil and gas projects. There is no assurance from the County that the environmental harms would be reevaluated at a certain point in the future. In a field

where new studies and information are constantly increasing our understanding of the relationship between the oil industry and environmental and health risks, it is certain that the EIR will need to be reevaluated. For instance, studies on the environmental health risks of hydraulic fracturing ("fracking") are rapidly informing the public about the true extent of the dangers of this extreme extraction technique.[1] Only a few years ago, many were unaware of the severity of the dangers associated with fracking and other forms of oil and gas extraction.

0045-8
Continued

The Alternatives Analysis Is Inadequate

0045-9

The DEIR does not adequately analyze feasible alternatives to the project.

0045-10

First, it fails to even consider certain feasible alternatives to the Project. These alternatives deliver real benefits to the environment and public health and deserve at least a comprehensive analysis so the public and decision-makers understand the full cost of allowing rampant oil and gas production.

0045-11

The DEIR rejected a ban on all drilling as infeasible. Not only is an end to drilling feasible, over the long term, it is necessary to avoid the effects of catastrophic climate change. Gov. Brown recently noted that one third of the world's oil must remain in the ground.[2] Climate experts have indicated that even a greater portion of oil must stay undeveloped. Kern County has an opportunity to set an example for the world by moving away from climate change-inducing fossil fuel development and phasing in a robust renewable energy sector. The environmental and health risks from the oil and gas industry, enumerated by the DEIR and those that were not, could be nearly eliminated by phasing out these dangerous practices in the County.

0045-12

Another rejected alternative was to have fewer operating wells over time. The DEIR incorrectly states that it is legally infeasible. This appears to be a result of a misunderstanding of local governments' authority to protect public health and safety. Local governments have the constitutional right to decide what land uses are compatible with their general plans where the decision is reasonably related to a matter of public health and safety. Indeed, San Benito County has enacted a ban on well stimulation and all new oil and gas in residential zones. Despite threats from the industry of legal action, the new ordinance went virtually unchallenged[3], a testament to its solid legal foundation. The California Supreme Court deemed it an "unquestioned right."[4] The State Attorney General has also opined that local governments may enact bans on oil and gas activity.[5] Given this broad local government authority, Kern County cannot use legal infeasibility as an excuse for dismissing alternatives that include much needed limits on oil and gas activity.

0045-13

The zero net gain alternative was also improperly rejected without an analysis. The DEIR mistakenly claims that it would not reduce any of the significant environmental harm of the Project. To the contrary, the DEIR itself describes the marginal harm resulting from the addition of thousands of

wells per year. If an older well were decommissioned for every new well added, these marginal harms would decrease substantially. 0045-13 Continued

Among the alternatives considered, the option banning fracking and other well stimulation was improperly characterized as legally questionable due to pending litigation. At this time, there are no cases challenging the authority of a local government in California to ban fracking. As stated above, the San Benito County ban on fracking was not even challenged in court. Given the absence of legal barriers to a ban on fracking, the DEIR should fully consider this alternative. 0045-14

Any of these alternatives is feasible and environmentally superior to the proposed Project, and must be afforded a full analysis so the public can evaluate the true costs of the Project compared to the environmental benefits of the alternatives. 0045-15

The Baseline Calculation Is Unclear and Incomplete

The DEIR uses 2,697 new wells as an estimate in some places, but uses 4,083 and 3,647 in other places. The DEIR should be clear about which estimate is being used, and provide support for using that estimate. It is unclear whether the reactivation of idle wells is included in this tally. 0045-16

The number of projected well stimulation treatments is based on an outdated figure from fracfocus.org when disclosure was completely voluntary. Subsequent projections have predicted much higher numbers of annual well stimulation. For example, the California Council on Science and Technology (CCST) estimated that California as a state could average as many as 175 fracking events per month, and another 25 acidizing operations. In sum, this would mean 2,400 statewide well stimulations per year, double the DEIR's highest estimate for Kern County. Although not all well stimulation occurs in Kern County, the proportion is far greater than half. The DEIR fails to adequately explain why its estimation differs drastically from other surveys. 0045-17

The DEIR does not provide an estimate of how many pits and sumps would be required to meet the wastewater disposal demands of thousands of wells each year. The DEIR should include this figure and fully analyze its effect on soil, groundwater, air, and biological resources. 0045-18

The DEIR does not analyze the environmental effect of cogeneration facilities, yet states that 54 new cogeneration facilities will be necessary to supply energy to the expanded oil and gas industry.[6] 0045-19

The DEIR asserts that the environmental effect of enhanced oil recovery wells has been analyzed as though DOGGR has passed new regulations for EOR wells. But DOGGR has not even released a draft of these regulations, making it impossible to know how these new regulations will affect EOR operations in Kern County. Any analysis that attempts to predict how new regulations will affect EOR operations is entirely speculative. 0045-20

The Project Puts Public Health at Risk

A recent state-commissioned study by the CCST found that residents near active oil and gas wells are at higher risk of being exposed to harmful chemicals, and as a result have higher risk of 0045-21

[6] DEIR at 469.

0045-21 Continued

developing health problems. Significant exposures can occur at least as far as two miles from an active well.[7]

0045-22

The public health risk to California is serious. About 5.4 million Californians live within *one* mile of an active oil and gas well[8], within the distance scientifically shown to increase the risks to populations. Many more millions live within the 2-mile radius that studies have found to increase the risk to people's health. The risk is particularly serious for vulnerable populations more susceptible to developing health effects from pollution exposure, such as children, the elderly, or pregnant women.

0045-23

The risk also disproportionately affects minority populations. Four million people, a majority of those living within a mile of an active well (58 percent), are people of color.[9]

0045-24

Given the danger, the CCST study called for science-based setback distances that would help reduce the harm from oil and gas wells. But the DEIR's setbacks offer inadequate protection for these populations. The distances suggested in the DEIR are not far enough to protect nearby populations. Contrary to the County's determination, there are studies showing that wells within this radius of a well significantly raise the likelihood of harm.[10]

0045-25

The DEIR improperly ignores the health risks, and wrongly proposes minimum setback distances that would continue to put public health at risk. Under the proposed ordinance, the minimum distance between an active well and a residence would be 190 feet; the minimum setback from a school would be 300 feet; and the minimum distance from a commercial building would be 100 feet.[11] These distances are wholly inadequate to protect public health. They are inconsistent with peer-reviewed scientific studies that show significant risk at much greater distances.

0045-26

They are also inconsistent with the minimum setback the DEIR itself states are needed to avoid significant health effects. When the cumulative risk of multiple operations enters the equation, the DEIR admits that cancer risks are significant within 701 feet in the Western Subarea (and 625 feet and 478 feet in other areas).[12]

0045-27

In addition, the Health Risk Assessment that was conducted (Appendix M) is flawed and incomplete. Nowhere does the HRA even mention the risks of fracking and other well stimulation techniques. Where over half of new wells undergo some sort of well stimulation, this omission renders the HRA misleading and unusable. Furthermore, chemicals used in oil and gas development are not fully known or understood. Over 100 chemicals used in fracking have not been properly identified, including two of the top twenty most commonly used chemicals in fracking.[13] Two-thirds of the chemicals used in fracking have incomplete or no information on toxicity.[14] There are also no studies

[14] CCST at 76.

on what chemicals are created as a result of well stimulation, after chemicals have reacted with one another and with the formation into which it was injected. Without more information on well stimulation chemicals, the HRA cannot provide a full picture of the harms to communities living near oil and gas wells. What information we do have indicates that public health is at risk. Fourteen chemicals used in fracking are among the most toxic substances in the world.[15]

0045-27 Continued

The paucity of data is not limited to fracking and other forms of well stimulation. Drilling muds, biocides used in enhanced oil recovery, acids used in well completion or well maintenance, and equipment cleaning solvents are just some of the many chemical-laden processes that are not reported or disclosed in any manner. For example, methylene chloride, a common solvent at well sites, which is an extremely dangerous chemical, is not mentioned in the HRA. Any HRA analysis must contain a full inventory and analysis of *all* chemicals used at the well site that may endanger nearby residents.

0045-28

Incredibly, the DEIR states that some wells have no significant health risks no matter how close they are to sensitive receptors. The DEIR also asserts, without any evidence, that the distances from wells at which significant health risk occur will shrink over time.[16] Given that we do not yet know the full extent of the dangers of the chemicals used in oil and gas development processes, it is wholly premature to conclude that oil and gas operations will become less dangerous to nearby communities over time.

0045-29

Both the HRA and DEIR fail to fully account for the cumulative effects of multiple wells operating over time. The projected 2,697 new production wells per year would certainly have a cumulative effect on air quality and public health. Yet the HRA is silent regarding the cumulative impact, and the DEIR's analysis is cursory and provides no real assessment of cumulative impacts to health.

0045-30

Furthermore, the setback requirements are not legally enforceable. The DEIR states that if setback distances cannot be met, the minimum distances condition may be waived.[17]

0045-31

The HRA was also based on just three locations. Health risks from oil and gas will vary from site to site based on factors such as the chemicals used in the process, where the sensitive receptors are relative to the well, how many other operations are in the vicinity, wind direction at that particular location, elevation and geography, and many other factors. The public cannot be informed of the true extent of the risks from a study of just three locations. Other than the unsupported claim that these sites are "representative," there is no assurance that these sites were representative of other sites in the Project area. Given that a common practice, well stimulation, was left out of the analysis, evidence suggests that these sites are not at all representative of the broader oil industry harms to public health. The HRA posted to the Kern County website is also missing critical appendices that should explain how the consultants reached their conclusions.

0045-32

The lack of specificity is an illustration of the shortcomings of the DEIR. It cannot accurately describe the harms and risks of each individual site, and in attempting to aggregate the "typical" site, only glosses over real dangers from oil and gas operations.

0045-33

[15] CCST at 79.
[16] DEIR at 500-501.
[17] DEIR at 504.

The Air Quality Analysis Is Inadequate

0045-34

Air quality impacts are significant and unavoidable. As discussed above, the identity, quantity, and toxicity of airborne chemicals is grossly understated or unknown in the DEIR. For air pollutants that are discussed in the DEIR, evidence indicates that the amount of air pollution from oil and gas sites in Kern County are seriously undercounted. The DEIR also admits that "the information used for evaluating well construction activities was obtained from detailed records compiled during the construction of ten new oil and gas production wells in 2010 and 2011."[18] Using such a small sample size, without any explanation of how those particular sites were selected among the thousands of potential sites, renders the analysis unreliable.

0045-35

A recent assessment of oxides of nitrogen (NOx) emitted from well sites showed that operator-reported numbers, based on false and unproven assumptions, are often drastically lower than what actual emissions could be.[19] It found that "in most cases, NOx emissions estimated by project proponents in Kern County are significantly lower on a comparable basis [to other jurisdictions]. Without appropriate actual field data and strong verification of claims made by project proponents…, it is not possible to simply rely on the claims of the proposed NOx emissions from oil[] and gas drilling activities in Kern County."[20]

0045-36

A number of DEIR calculations undercount emissions. For example , it is unclear why the DEIR excludes construction emissions from the calculations in Table 4.3-42. It only includes operational project emissions and ignores the second category of emissions, those from construction operations.

0045-37

The issue of local air pollution is entirely unexplored in the DEIR. Assessments of air quality impacts are based primarily on nine air monitors for the entire project area.[21] With so few data points, it is impossible for residents to read the DEIR and know how air pollution will affect their particular community.

0045-38

It appears that the DEIR only attempts to addresses 10 toxic air contaminants, when in fact many more toxic air contaminants are associated with oil and gas activity.[22] The DEIR must include a complete list of potential air pollutants and potential airborne byproducts of oil and gas operations and assess the harm caused by each in order to better assess the true extent of the damage caused by the oil and gas industry. Worker safety is also largely ignored in the DEIR. Silicosis and lung cancer can result from on-site exposure to dust particles from the sand used in fracking. The DEIR does not adequately analyze the projection of silica-related illnesses. Hydrogen sulfide and volatile organic compounds from storage tanks is also a substantial threat to air quality.

0045-39

The DEIR also does not credibly explain how the addition of 2,697 wells per year could be consistent with the Air District's air quality plan. San Joaquin Valley Air District is in nonattainment for multiple criteria pollutants, including ozone and particulate matter. The Air District also will be

[18] DEIR at 4.3-73.
[19] Dr. Ranajit Sahu "On the Underestimation of NOx from Oil Well Drilling in Kern County, CA" (2015)
[20] Id. at 7.
[21] DEIR at 400.
[22] DEIR at 412.

0045-39
Continued

submitting a new 8-hour ozone exposure plan in 2015. Compliance with these plans are highly doubtful given the amount of air pollution emitted from oil and gas sites. The DEIR states that oil and gas emissions "*could* conflict with or obstruct implementation of the applicable air quality plan or potentially be inconsistent with the General Plan Measures and therefore could be significant."[23] There should be no room for ambiguity—it will be impossible for Kern County and the Air District to meet air quality plans given the massive scale of the Project. The DEIR gives no legitimate explanation of how mitigation could lead to compliance with an air pollution control plan. The DEIR's own calculations show that estimated air pollution will exceed emission limits for almost every criteria pollutant by a substantial margin.[24] Assertions that per-well emissions will decrease in the future are speculative, and if proven incorrect, would mean that County-wide emissions are even higher.

0045-40

In addition, the emission calculations are flawed because they only show incremental air emissions from new wells drilled each year. For example, the emissions from a well drilled in year 1 do not cease in year 2. Emissions in year 2 would be the sum of wells drilled in year 2 *in addition to* the emissions of wells drilled in year 1 that continue to operate and emit harmful pollutants. Yet the DEIR seems to omit these emissions, as demonstrated in Table 4.3-27. The chart purports to show "total" emissions from the Project, but only shows the yearly incremental air pollution from new sources. The calculations should show an increase each year because older wells are still emitting while new wells are drilled. (Tables showing yearly emissions should also include a summation at the bottom of the chart)

0045-41

The assessment that the Project—2,697 new wells per year, combined with all existing oil and gas wells in Kern County—would not expose sensitive receptors to substantial pollutant concentrations is simply untrue. As stated above, wells would be allowed to operate dangerously close to sensitive receptors. Scientific studies show that living close to an active well leads to significantly higher risk of adverse health effects. Furthermore, offsets will not mitigate the localized harm of air pollution. Even if emission could be offset elsewhere[25],the residents nearby active oil and gas wells would still be suffering from the effects of air pollution. The mitigation measure, therefore, does not change the significant impact of air pollution, especially since there are no absolute setback requirements offered in the proposed ordinance. This applies to both the cumulative analysis, as admitted in the DEIR: Emissions "would not be counterbalanced by the above efforts to reduce emissions undertaken at the State and local levels."[26] It also applies to individual well sites. An offset does not relieve nearby communities of the disproportionate environmental and health risks of active oil and gas wells.

0045-42

The mitigation measure are vague and/or unenforceable and do not sufficiently mitigate the harm to air quality and public health.

The Greenhouse Gas Emissions Are Substantial

[23] DEIR at 461 (emphasis added).
[24] See DEIR 470.
[25] The DEIR admits it cannot offset emissions to net zero. (DEIR at 496)
[26] DEIR at 511.

0045-43

The Project's impact on greenhouse gas emissions is undeniable. Thousands of new wells, each extracting more and more fossil fuel for combustion, cumulatively counted over 20 or 25 years, would result in such a large quantity of greenhouse gas emissions that it can scarcely be denied that the impact is significant. When viewed cumulatively, together with all past and existing oil and gas activity in Kern County, the emissions are staggering.

0045-44

The analysis is inadequate in several ways. First, the ultimate step of oil and gas development—combustion—is omitted from greenhouse gas calculations, despite the fact that this is an inevitable result of oil and gas development. CEQA mandates that all direct and indirect impacts be included, so long as they are reasonably foreseeable. Here, combustion is the entire purpose of the production process, an easily foreseeable consequence of oil and gas development.

0045-45

Second, the true effect of methane emissions is incorrectly calculated. The DEIR uses an outdated coefficient for methane's global warming potential over a 100-year time horizon: 25. The International Panel on Climate Change has calculated that number to be 37.[27] Moreover the use of the long-term effect hides the global warming potential of methane over a shorter time period. In the first 20 years after a molecule of fossil methane is emitted, it is 87 times more powerful than a molecule of carbon dioxide.[28] Given the analysis is focused on the next 20-25 years of oil and gas development, it is illogical to use only the 100-year figure, especially one that is no longer scientifically supported.

0045-46

The mitigation measures are vague and unenforceable and do not sufficiently mitigate the harm of producing vast amounts of greenhouse gas.

The Assessment of Harm to Water is Inadequate.

0045-47

The proposed Project's damage to Kern County's water supply will be substantial. But the DEIR fails to adequately describe these harms.

<u>Wastewater and other oil and gas fluids contain harmful chemicals</u>

0045-48

The wastewater from oil and gas operations is a toxic mix of chemicals harmful to human health. A study of Kern County produced water showed high concentrations of benzene, a known carcinogen. In some samples, benzene concentrations were as high as 18.0 mg/L, thousands of times above safe levels for drinking water.[29] Water testing in this DEIR does not disclose benzene levels for a majority of samples.

0045-49

A review of fracking flowback fluid similarly found high levels of benzene, as well as other harmful chemicals such as hexavalent chromium, naphthalene, toluene, and ethylbenzene.[30] These tests do not fully capture the extent of the risk because drilling muds, well completion fluids, biocides, solvents, surfactants, well maintenance acids, corrosion inhibitors, lubricants, and other fluids also

[27] G. Myhre et al., *Anthropogenic and Natural Radiative Forcing*, in Climate Change 2013: The Physical Science Basis. Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change IPCC Table 8.7 at 714 (Cambridge Univ. Press 2013)
[28] Id.
[29] DOGGR, *Benzene in water produced in Kern County oil fields containing fresh water* (1993).
[30] [Los Angeles Times, Center for Biological Diversity; DOGGR database.

contain a mix of harmful chemicals. Without full disclosure of these chemicals used throughout the oil and gas development process, it is impossible for the DEIR to accurately describe the full scope of threats to our water. The chemicals used and the manner in which it is handled will also vary from site to site, making a project-level EIR for all of oil and gas untenable. 0045-49 Continued

Spills and leaks occur will troubling regularity in California. One survey found that there were 575 spills of produced water from 2011 to 2014, and 18 percent of those spills affected waterways.[31] There were 31 chemical spills in oil fields, nine of them acid spills.[32] One acid spill ruptured beyond a secondary containment apparatus and spilled 5,500 gallons of hydrochloric acid.[33] These high rates of accidents illustrate that spills are unavoidable. The DEIR acknowledges that there have been 613 spills and 87 well leaks reported from 2009 through 2014. The number of incidents reported is likely smaller than the number of actual spills and leaks, either because they have not yet been discovered, or operators have not reported them. 0045-50

The data indicate that blowout rates of thermal EOR wells is four times higher than non-thermal recovery fields.[34] 0045-51

Shallow fracking is a serious threat.

A recent study found roughly 75% of fracking is conducted at shallow depths, the same depth as groundwater.[35] Because shallow fracking can occur at the same depth as groundwater, fracking in California is extremely dangerous, and the CCST report lists a number of potential pathways through which contaminants could migrate to groundwater. The distance between well activity and groundwater is much shorter than in other parts of the country, making this a particular concern in California. The DEIR does not adequately disclose this heightened risk. 0045-52

More concerning still, California's long history of oil and gas development means that older, unmapped wells may be in the vicinity. These wells can act as a conduit for chemicals when a new well is operating. Due to these unknown, unmarked wells, California's oil and gas activity may be riskier than in other states. 0045-53

The DEIR's statement that there have been no confirmed impacts to groundwater in the Project Area directly connected to well stimulation is misleading. The issue has not been studied; therefore, whether groundwater has been contaminated is unknown. But given confirmed cases in other states where fracking has occurred, and because fracking occurs *closer* to groundwater in California, the potential for groundwater contamination is significant. 0045-54

Water usage estimates fail to describe the extent of the threat to water supplies.

Besides the water being used directly, the chemicals used in the oil and gas industry have the potential to contaminate vast amounts of water, far beyond what the DEIR discloses. Water that is 0045-55

[31] CCST at 127
[32] CCST at 127.
[33] CCST at 128.
[34] DEIR at 1157.
[3535] CCST at 406.

used for oil and gas is also different from other uses for water in that it is mixed with soluble chemicals, both known and unknown, and make the water difficult to treat and dangerous to discharge.

0045-55 Continued

It is also unclear whether the full scope of water use was included. The DEIR states that it "primarily evaluated [water impacts] on the basis of the projected increase in production wells…"[36] But it is unclear whether other wells, such as injection wells, are included in water usage statistics. Injection wells, such as steamflooding and waterflooding wells, use substantial amounts of water and should not be excluded from the water analysis. The oil industry estimates a 37 percent increase in water needed for the oil and gas industry by 2035.[37] While this number is itself problematic for the County, it may very well underestimate the water needed. The County should conduct its *own* estimate for the amount of water needed to meet the demands of oil and gas activity. The industry, as applicants hoping to push through the Ordinance and minimize environmental risks, have an incentive to understate the amount of water needed. During a time of drought, the County has a responsibility to ensure that water is accurately accounted for, and that Kern County has enough water to sustain communities well into the future.

0045-56

The charts depicting water use projections are also uninformative and confusing. For example, Table 4.9-27 has subtotals for water use, oil and gas water demand, M&I produced water, and oil and gas produced water waste disposal. These subtotals do not add up to the "Total" amounts on the bottom row.

0045-57

<u>The risks of injection wells are not fully disclosed.</u>

Injection wells are clearly a threat to water resources in the state. Around the country, disposal wells have already been the cause of leaks and spills doing tremendous amounts of damage to groundwater and surface water.[38]

0045-58

Aside from accidental spills and leaks, there are a number of ways in which water is threatened by oil and gas activity. The DEIR falsely asserts that there "have been no confirmed reports of drinking or agricultural groundwater quality impacts as a result if injection activity."[39]Already, DOGGR has admitted that thousands of injection wells, mostly in Kern County, have been operating in aquifers that are supposed to receive protection under the federal Safe Drinking Water Act.

0045-59

These aquifers, which constitute underground sources of drinking water, have been receiving toxic oil industry wastewater, in some cases for decades, and may be irreparably harmed. In many cases, operators are continuing injection into these protected aquifers even after it has become clear that an aquifer should not be subjected to ongoing operations. As a result, what was once a viable source of drinking water may now be unusable. It is unclear why the DEIR does not describe these circumstances as groundwater contamination. These injections have been confirmed, and there is no doubt that harmful chemicals have been injected into underground sources of drinking water.

0045-60

[37] DEIR at 1211.
[38] Flesher, Drilling boom means more harmful waste spills, Associated Press, Sept. 8, 2015, available at http://bigstory.ap.org/article/39786bbf509e412a9feb9b58a6534a36/drilling-boom-brings-rising-number-harmful-waste-spills
[39] DEIR at 1158.

0045-61

The DEIR's analysis of water does not estimate the volume of water that will be damaged through illegal injection, illicit dumping, and underground percolation and migration of chemicals into underground sources of drinking water. Without such an analysis, the DEIR is incomplete.

Wastewater pits and sumps are contaminating water already

0045-62

The DEIR admits that produced water, completion fluids, stimulation fluids have been discharged. Drilling muds and drill cuttings are also discharged into unlined pits. These practices allow toxic chemicals to percolate through the soil and into groundwater beneath the pits. The DEIR attempts to dismiss this harm, claiming that there are "no confirmed reports of impacts to surface water or groundwater quality associated with unpermitted discharges to drilling sumps in the Project Area."[40]

0045-63

This statement is inaccurate and misleading. The CCST report notes that there is "ample evidence of groundwater contamination from percolation pits in California and other states."[41] Although unpermitted sumps are a serious problem, permitted sumps can also cause harm to groundwater supplies. It is unclear whether the DEIR considered the harm for permitted sumps, but it should make clear that sumps, whether permitted or not, present a serious risk to groundwater supplies and in fact have already contaminated drinking water sources. To the extent that the County has not examined this readily available evidence, it is willfully ignoring data that would show the extent of the threat to groundwater. The DEIR also makes no attempt to estimate the number of pits that will be used in the future, nor the expected rate of spills, leaks and water contamination caused by those pits.

Using wastewater for irrigation is dangerous

0045-64

A portion of oil field wastewater is used for irrigation. But given that the oil industry fails to fully disclose the chemicals used at various stages of development, it is infeasible if not impossible to treat the water and provide assurance that harmful chemicals have been completely removed. Chemicals from drilling, well completion, or well maintenance may still be present in the wastewater, and without knowing what those chemicals or their post-reaction byproducts are, it is unclear how a treatment facility could remove all the possible contaminants before sending the water to crop fields.

0045-65

Already, wastewater from oil fields that have been recently fracked has been used for irrigation in at least two cases.[42] Removing fracking chemicals cannot be accomplished through usual treatment techniques. According to the CCST, "It is probable that standard practice for oil-water separation and treatment prior to reuse are unlikely to remove most well stimulation chemicals or their byproducts that may be found in produced water."[43]

0045-66

The DEIR correctly concludes that impacts to water would be significant.[44] But the DEIR incorrectly states that mitigation measures will change the impact on water to less than significant. The

0045-66 Continued

mitigation measures are vague or unenforceable and do not substantially mitigate the harm to water resources.

The Evaluation of Geology and Soils Is Inadequate.

0045-67

The DEIR improperly discounts the existing science linking induced seismic activity to oil and gas activity. Numerous studies have concluded that such activity, in particular wastewater injection, causes earthquakes. The DEIR's assertion that California is at lower risk of induced seismicity is contradicted by recent peer-reviewed analysis. A study by the CCST found evidence of a link between injection well activity and a cluster of earthquakes in California.[45] The link is consistent with studies of other regions of the country that have experienced a sharp rise in seismic activity as oil and gas activities have proliferated near faults.

0045-68

The CCST report concluded that the risks of induced seismic activity is at least as high in California as it is elsewhere: "Based just on the observed depths of earthquakes relative to injection depths in the reported cases … it would appear that the overall potential for seismicity to be induced by wastewater injection may be at least as high in CA as in the center US."[46] The Report also states "Magnitude 5-6 events are observed to occur at relatively shallow depths in California, which suggests that induced earthquakes could be *at least as large as* those experienced to date in the continental interior."[47] The DEIR incorrectly states that earthquakes caused by oil and gas activity has not damaged structures. To the contrary, the M5.7 earthquake in Oklahoma was large enough to cause property damage to 14 homes.[48] California has yet to determine just how much seismic activity to attribute to oil and gas activity in the state, nor measure the increased risk of seismic activity in the future if injections continue. The DEIR's statement that the risks of earthquakes are less than significant after mitigation is not supported by the evidence. The mitigation measures do not prohibit injection or drilling near fault lines and thus do not adequately mitigate the risks of earthquakes.

0045-69

The DEIR also claims that DOGGR prohibits "over-pressuring" injection wells. This is not the case. DOGGR has admitted that Class II injection wells are routinely allowed to operate at pressures above the fracture gradient despite its own regulations prohibiting such dangerous practices.[49] The DEIR confirms that the maximum allowable pressure must be below the fracture pressure.[50] There is inadequate analysis of how injection wells operating above the fracture pressure will increase the likelihood of land subsidence, well failure, or the risk to water and soil.

Soils are also harmed by reckless waste discharge practices such as discharge into percolation ponds and sumps. The soil beneath these unlined pits is contaminated, perhaps permanently. In 2009, Aera Energy was ordered to pay $9 million to the owner of a cotton and nut farm after wastewater percolating from an unlined pit destroyed 2,000 acres of crops. The DEIR makes no mention of how

[50] DEIR at 1192.

or whether such soils could be remediated once a percolation pit has been used. In addition, some well operators have reported spraying wastewater into land. The DEIR does not include a study of these sprayed soils.

0045-70

Soils are also contaminated by discharging drilling muds and drill cuttings into unlined sumps, where remediation of the site entails covering it back up with soil. The DEIR inaccurately states that drilling muds are non-hazardous. Chemicals used in drilling are not disclosed and those at are known include hazardous chemicals.[51] The DEIR also acknowledges the use of chemical soil stabilizer, with no further explanation of how these compounds affect the natural chemistry of the soil.[52]

0045-71

Soil has also been contaminated by leaks and spills. An Associated Press analysis of data from leading oil- and gas-producing states found more than 180 million gallons of wastewater spilled from 2009 to 2014 in incidents involving ruptured pipes, overflowing storage tanks, deliberate dumping and other mishaps.[53] There were some 21,651 individual spills. And these numbers are incomplete because many releases go unreported.

0045-72

The mitigation measures are vague and unenforceable and do not sufficiently mitigate the harm to soils nor the risk of induced seismicity.

The DEIR's Evaluation of Noise Impact is Inadequate.

0045-73

Although "it is the policy of the state" to "[t]ake all action necessary to provide the people of this state with . . . freedom from excessive noise,"[54] the DEIR fails to adequately analyze and mitigate the significant impact of noise caused by well stimulation activities. Noise is not merely a nuisance, but is generally viewed as a biological stressor. Excessive exposure to noise may contribute to the development and aggravation of stress related conditions such as high blood pressure, coronary disease, ulcers, colitis and migraine headaches, as well as increasing susceptibility to viral infection and toxic substances.[55] It may also be related to birth defects and low birth-weight babies.[56]
First, the DEIR must more clearly explain the significance of the decibel (dBA) thresholds it discusses. It should include that the EPA identifies a 24-hour exposure level of 70 dBA as the level of environmental noise which will prevent any measurable hearing loss over a lifetime. [57] Further, Table 4.12-1 should be amended to include qualitative descriptions of the impacts of various noises on sleep interference and biological functioning.

0045-74

Secondly, while the DEIR identifies the stages of construction and operation of a well, it fails to consider that drilling operation is not restricted to daylight hours. Drilling operations often continues

[57]Environmental Protection Agency, *EPA Identifies Noise Levels Affecting Health and Welfare*, (Apr. 2, 1974), *available at* http://www2.epa.gov/aboutepa/epa-identifies-noise-levels-affecting-health-and-welfare

24 hours a day until completion, meaning that surrounding areas can be exposed to noise from drill rigs, air compressors, drill pipe connections and power generators during nighttime hours.[58] Thirdly, the DEIR fails to identify or quantify the noise impacts of venting and flaring. Flaring can continue 24 hours per day for up to months at a time. As a significant, long-term source of noise, the noise impact of flaring must be considered.

0045-75

The DEIR fails to explain the basis upon which mitigation of noise impacts to 65 dB was chosen. All sound testing undertaken for the DEIR used 60 dBA as the maximum measured volume. The DEIR must explain the basis for choosing as a maximum acceptable volume level a volume louder than was tested for., and which, according Table 4.12-1, is "annoying" and "intrusive."
Noise does not only affect humans living and working in proximity to oil and gas wells. It also affects wildlife. Noise pollution from energy facilities has been linked to lower densities and reproductive success of birds. Sound is an important sensory tool for animals and noise pollution from oil and gas production has been shown to alter their behavior, distribution, and reproductive rates.[59] Other studies on noise pollution impacts have found that songbirds that were found in areas near noiseless energy facilities had a total density 1.5 times higher than areas near noise-producing sites, indicating avoidance of noise producing infrastructure;[60] and that the reproductive success of ovenbirds was diminished by chronic background noise originating from wellpads.[61] Despite this, the DEIR completely fails to consider the impact of the noise from well construction, operation and abandonment activities, on wildlife populations in the County. The DEIR must be amended to consider, and therefore appropriate mitigation measures to reduce, the noise impacts upon wildlife. Mitigation Measure 4.12-1 fails to set out the decibel level to which noise must be reduced in order for the mitigation measure to be satisfied. While the implementation of mitigation measures to reduce noise impacts are important, such measures are rendered largely meaningless without any indication of the likely reduction in noise, or the volume to which noise must be reduced.

0045-76

Where noise reduction to the maximum determined acceptable volume (which should be lower than 65 dBA) is technologically infeasible, the well project should not be permitted to proceed. Mitigation Measure 4.12-2 requires that no new wells be constructed within 190 feet of a sensitive receptor. The basis for this setback is unclear and inadequate. According to the limited data in the DEIR of noise exposure levels, a setback of 190 feet means that, absent other mitigation measures, noise impacts from all stages of well construction, well stimulation and diesel-powered well production, will exceed 60 dB. The estimated noise from pumper trucks conducting hydraulic

fracturing would be between 85 and 104 dBA, a volume akin to a jet takeoff or car horn, and which comes close to the pain threshold for human hearing.[62]

0045-78

In contrast, a prohibition on construction of new wells within 1,500 feet of a sensitive receptor, would result in most well construction and operation activities being experienced at the nearest sensitive receptor at volumes of less than 50 dBA (well advancement and stimulation would still generate noise of between 55 and 60 dBA 1,500 feet from the well location; and the noise level of pumper strucks would be between 75 and 69 dBA).

0045-79

While the DEIR acknowledges that "Cumulatively significant noise impacts could occur even if noise levels associated oil and gas activities are under 65 dBA, depending on the location of another nearby project, its noise levels, and the distance to a sensitive noise receptor,"[63] it fails to set out any mitigation measures for addressing this cumulative impact. Given the manner in which the impact is described, it is clear that Mitigation Measures 4.12-1 and 4.12-2 will be inadequate to address this impact. The DEIR should include a Mitigation Measure prohibiting the construction of any new well if its noise impact will result in a cumulative impact of noise levels of 65 dBA or more at the external boundary of a sensitive receptor.

0045-80

Additionally, site-specific permit conditions additional to those identified in Mitigation Measure 14.2-1 should be implemented in order to further mitigate noise impacts. These may include requiring the measurement of ambient noise levels prior to beginning operations, specifying daytime and nighttime noise level limits, using noise reduction equipment, limiting certain noisy activities to specific hours, installing temporary sound barriers, providing advance notice of the drilling schedule to nearby receptors, and limiting hydraulic fracturing operations to a single well at a time.

The DEIR's Analysis of Traffic Impacts Is Inadequate

0045-81

Impact 14.6-1 identifies wear and tear on roadways bearing oil and gas development traffic as a significant impact. It goes on to analyze the need for pavement improvements like to be needed at various points during the anticipated lifetime of the DEIR. However, the analyses of traffic impacts and road wear and tear appear to exclude vehicle trips associated with workers driving to and from the project site. The DEIR must be amended to include this potentially significant source of traffic.

0045-82

Further, the DEIR fails to consider the significance of the fact that much of the increase in traffic caused by oil and gas development is truck trips. The useful life of a roadway is directly related to the frequency and weight of truck traffic using the roadway, and roadways consistently experiencing greater annual truck traffic will generally require reconstruction sooner than similar roadways with less truck traffic.[64]

0045-83

The damage to a road increases exponentially with vehicle weight.[65] In fact, because of the weight of water transport truck, the impact of water hauled to one site is the equivalent of nearly 3.5 million

[62] DEIR, Table 4.12-1.
[63] DEIR 4.12-30.
[64] Abramzon, Shmuel, et al. *Estimating the Consumptive Use Costs of Shale Natural Gas Extraction on Pennsylvania Roadways*, Journal of Infrastructure Systems (Mar. 2014), 2.
[65] *Id*.

0045-83 Continued

car trips.[66] Further, evidence from Pennsylvania suggests that natural gas operators run trucks that are carrying loads greater than the legal limit. In February 2010, an enforcement effort in Susquehanna County found more than half of the 194 trucks checked were over the weight limit.[67] One truck was even found to be carrying more than double its legally allowed load.[68]

0045-84

There is a variety of literature available that calculates the cost of road damage resulting from oil and gas production traffic. In Colorado, the cost of damage to roadways as a result of increased traffic from gas production was calculated to be as much as $18,762 per well.[69] The cost of additional heavy truck traffic on Pennsylvania state-maintained roadways resulting from Marcellus Shale gas production was calculated to be as much as $23,000 per well.[70] The Texas Department of Transportation has estimated that annually, the impact of oil and gas-related traffic in the Eagle Ford area has an annual cost of about $4 billion.[71] These calculations demonstrate the inadequacy of Mitigation Measure 4.16-1, which will impose a road maintenance mitigation fee on $1,500 on each permit.

0045-85

As well as being demonstrably inadequate, no explanation is given as to how Mitigation Measure 4.16-1 was decided upon. The DEIR does not even attempt to quantify the cost of the road repairs and upgrades the report concludes will be necessary due to the increase in traffic that oil and gas development will cause. Absent any justification as to how the permit fee was reached, it cannot be determined whether this mitigation measure will be sufficient to rectify the impacts of oil-and-gas-related traffic impacts.

0045-86

The DEIR must analyze the true impact on local roads of the increased truck traffic from well stimulation activities, and also must analyze the impacts on freeways, arterials and collector roads. The DEIR must take into account that truck traffic is far more damaging to roads that light vehicle traffic. The dollar value of the damage to roadways as a result of increased traffic should be calculated, and the mitigation measure set to reflect the actual cost of oil-and-gas-related traffic impacts.

0045-87

Currently, the traffic analysis portion of the DEIR analyzes traffic impacts only from a level of service ("LOS") framework. The DEIR is silent as to the greenhouse gas emissions impacts of increases in traffic. The DEIR should be amended to include consider greenhouse gas emissions from motor vehicles as a transportation and traffic impact. In September 2013, Governor Brown signed Senate Bill 743, which directs the Governor's Office of Planning and Research to propose changes to California Environmental Quality Act ("CEQA") analysis of transportation impacts in transit priority areas. Senate Bill 743 requires that the focus of transport analysis shift from driver delay to reduction of greenhouse gas emissions, creation of multimodal networks, and promotion of a mix of land uses. In August 2014, the Office of Planning and Research circulated a draft of

revisions to the CEQA Guidelines, to satisfy the requirements of SB 743. The draft proposed that the revisions apply not only in transit priority areas, but across California.

0045-88

Although the draft regulatory amendments are not final, the DEIR should still have analyzed traffic and transportation impacts from the perspective of the greenhouse gas emissions that they will produce. There is no prohibition on Kern County adopting the approach in the draft revisions. Adopting the approach that will be required in future under law will assist in ensuring the ongoing utility and relevance of the DEIR. An analysis prioritizing greenhouse gas emissions from traffic and transportation will also support the state's greenhouse gas emissions reduction targets and strategies.

The Assessment of Impacts to Biological Resources is Inadequate

0045-89

The impacts analysis and mitigation measures proposed in the Biological Resources section fail to meet CEQA's requirements in several key regards. As detailed below, the DEIR (1) improperly excludes many special-status species from analysis; (2) fails to adequately disclose and analyze the direct and indirect impacts of the Project; (3) proposes mitigation measures that are impermissibly vague, improperly deferred, and unenforceable; (4) fails to include feasible mitigation measures to reduce significant Project impacts; and (5) contains a flawed cumulative impacts analysis.

<u>The DEIR improperly excludes many special-status animal and plant species from analysis</u>

0045-90

CEQA guidelines require the analysis of habitat impacts to "species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service" as well as movement impacts to "any native resident or migratory fish or wildlife species."[72] However, the DEIR improperly excludes analyses of numerous species that meet these criteria. The DEIR specifically excludes 77 Category 3 species from analysis, which are species "identified during the literature review or by local experts as potentially occurring in the vicinity of the Project Area, and for which suitable habitat is present," and which "may also be present in the Project Area."[73] The DEIR states that these 77 Category 3 species were not analyzed because "they lack official status as a State of California or a federally threatened or endangered species."[74] However, an EIR must analyze impacts not only to ESA listed species, but also to sensitive, special-status, native resident, and migratory species, as required by CEQA guidelines. The DEIR errs in excluding species from analysis that are (1) state or federally listed and occur in the Project Area, such as the Southwestern willow flycatcher which occurs in the western subarea;[75] (2) identified as sensitive or special-status species by wildlife agencies and occur in the Project Area, such as Tracy's eriastrum which is classified as "rare" by CDFW and occurs in the western subarea;[76] and (3) identified as sensitive or special-status species in local or regional plans, such as the Conservancy fairy shrimp and Valley

[72] CEQA Guidelines, Appendix G, for Biological Resources, requires analysis of the following impacts: "Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations or by the CDFW or USFWS; Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites."
[73] DEIR at 548.
[74] DEIR at 548.
[75] DEIR at 598.
[76] DEIR at 563.

elderberry longhorn beetle which are covered by the Kern Water Bank HCP. The DEIR also appears to exclude many special-status species from analysis because they are "not expected" in the Project Area (i.e., see Tables 4.4-26 and 4.4-36). However, the DEIR acknowledges that there is suitable habitat for these species in the Project Area, and the County should require on-the-ground surveys to determine their presence or absence before excluding them from analysis and mitigation requirements.

0045-91

<u>The DEIR fails to adequately disclose and analyze the direct and indirect impacts of the Project on biological resources</u>

0045-92

The DEIR is wholly inadequate in disclosing and analyzing the direct and indirect impacts of the Project on biological resources The Project involves a broad range of actual and potential harms from oil and gas exploration, development, and production activities in the Project Area involving the construction and operation of an estimated 67,425 new producing wells and 30,000 well stimulations over a 25 year period. Each year the Project proposes an average of 2,697 new producing wells, 48 water disposal wells, 158 water flood injectors, 381 non-cycle idle wells, 56 observation wells, 304 steam flood injectors, 5 gas disposal wells, 1,645 cyclic wells, 1,200 well stimulations, and 2,221 plugged and abandoned wells.[77]

0045-93

The DEIR fails to adequately disclose and analyze the direct and indirect impacts from Project construction and operation including but not limited to: (1) habitat fragmentation, edge effects, and density effects; (2) declines and extirpations of animal and plant populations; (3) well stimulation impacts; (4) oil and chemical spills; (5) noise pollution; (6) reduced water quantity; and (7) reduced water quality. Each of these deficiencies is detailed below.

0045-94

(1) Habitat fragmentation, edge effects, and density effects: The DEIR fails to disclose and analyze the significant impacts of habitat fragmentation, edge effects, and density effects that will result from the construction and long-term operation of the proposed 67,425 new producing wells and associated infrastructure. Numerous scientific studies demonstrate that habitat fragmentation from the construction of oil and gas infrastructure such as well pads, roads, pipelines, and other linear corridors negatively affects species by impeding movement and dispersal, reducing home range size, reducing patch size below what is needed for foraging and life history activities, increasing habitat isolation, altering physical characteristics such as light, moisture, and temperature, facilitating the spread of invasive species, and altering species dynamics including interactions and abundance.[78] Fragmentation also increases the proportion of disturbed edge habitat to undisturbed interior habitat which can increase the likelihood of predation, parasitism, and human disturbance. For example, in the Marcellus shale, while each drilling pad and associated infrastructure results in the clearing of 8.8 acres of forest, each drilling pad affects 30 acres of forest after accounting for ecological edge effects.[79] Similarly, in the Big Piney-LaBarge field in Wyoming, a study found that while the overall

[79] Johnson, N. 2010. "Pennsylvania energy impacts assessment: Report 1: Marcellus shale natural gas and wind," Nature Conservancy – Pennsylvania Chapter, http://www.tcgasmap.org/media/PA%20Assessment%20of%20Gas%20Impacts%20TNC.pdf, (accessed June 26, 2012)

area of oil and gas infrastructure covered 4% of the total area, 97% of the total area fell within one-quarter mile of oil and gas infrastructure.[80] As a result, oil and gas infrastructure impacted all the habitat of the greater sage-grouse in the area and road densities adversely affected elk. Numerous studies have also documented density effects whereby wildlife species decrease use of preferable habitat areas or avoid habitat areas altogether in areas with increasing densities of oil and gas development, leading to indirect habitat loss.[81] For example, mule deer are significantly less likely to occupy areas in proximity to well pads than those farther away.[82] One study found that mule deer have a significantly lower likelihood of using habitat within 2.7 to 3.7 kilometers of well pads, concluding that "indirect habitat losses may be substantially larger than direct habitat losses."[83] In addition, changes in habitat selection appeared to be immediate with no evidence of acclimation, leading to increasing use of non-preferred habitats.

In the Project Area, a recent study of habitat suitability for the San Joaquin kit fox found that kit foxes are unable to persist in highly fragmented habitat and called for the "urgent need to focus protection efforts on high suitability habitat and to do so in a manner that increases patch size of protected lands and reduces fragmentation."[84] Another study in the saltbrush scrub habitat of the San Joaquin Valley similarly found that a number of native species are unable to persist in areas with high levels of habitat disturbance: LeConte's thrashers, burrowing owls, San Joaquin antelope squirrels, short-nosed kangaroo rats, American badgers, and San Joaquin kit foxes.[85] 0045-95

Despite these well-documented impacts, the DEIR fails to analyze the effects of habitat fragmentation, edge effects, and density effects on special-status species. The DEIR includes only one analysis of the habitat impacts of the Project that severely underestimates impacts. For a subset of special-status species, the DEIR calculates the amount of new land disturbance resulting from projected oil and gas development in each subarea. The DEIR estimates these habitat impacts using land disturbance factors provided in Appendix F, Table 11. However, these factors include only the direct footprint of oil and gas infrastructure (i.e., the direct footprint of well pads, roads, etc) and fail to include the indirect footprint of habitat loss due to edge effects and density effects (i.e., areas adjacent to infrastructure may no longer provide suitable habitat). These factors also fail to include the effects of habitat fragmentation, meaning that areas that are heavily crisscrossed and disrupted by 0045-96

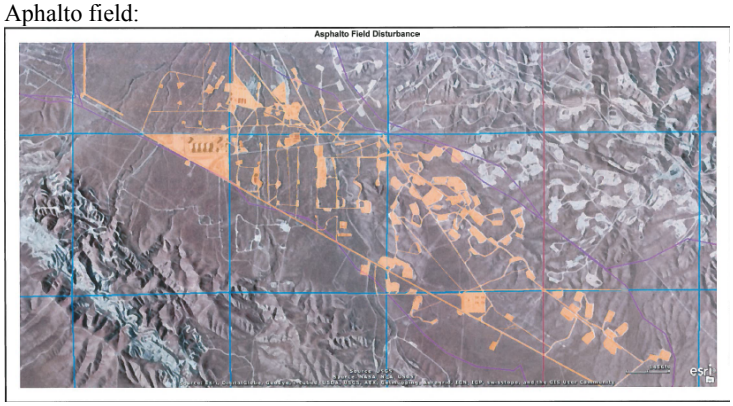
infrastructure are not included in the calculation of disturbed land. As a result, the analysis significantly underestimates the amount of habitat loss and modification resulting from the Project.

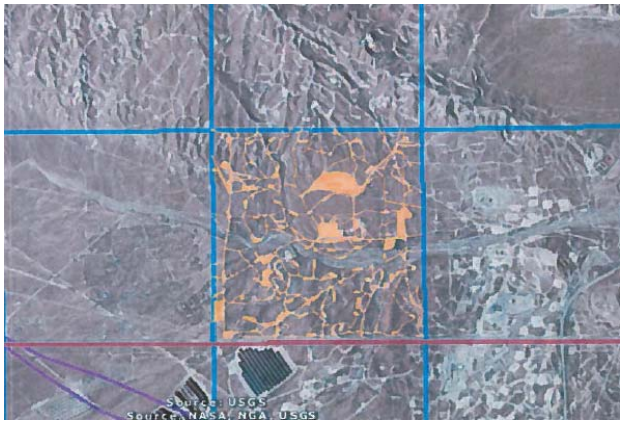
0045-97

To provide two illustrations below, total land disturbance is calculated as the sum of the orange-highlighted areas where infrastructure is present. However, in the Asphalto field, the total area of habitat disturbance is obviously much greater if fragmentation, edge effects, and density effects are considered. In the Buena Vista field, for example, the DEIR calculates the total land disturbance as 123 acres (e.g., the sum of the orange-highlighted areas),[86] but the disturbed area is closer to ~590 acres, or about 5 times larger, if the entire square of fragmented habitat is considered.

Aphalto field:



Buena Vista field:



[86] DEIR, Appendix F at 53.

0045-98

(2) Declines and extirpations of animal and plant populations: The DEIR fails to disclose that declines in abundance and local extirpations of birds, mammals and fish have been linked to oil and gas development.[87] In the heavily impacted saltbrush scrub habitat of the San Joaquin Valley, one study found that native species decline with increasing oil field development, and most were not detected in areas with high levels of development (generally 70% habitat disturbance), including LeConte's thrashers, burrowing owls, San Joaquin antelope squirrels, short-nosed kangaroo rats, American badgers, and San Joaquin kit foxes.[88]

0045-99

(3) Well stimulation impacts: The DEIR fails to disclose and analyze the impacts associated with well stimulation, including fracking-enabled habitat loss and fragmentation, harms from toxic chemicals used in well stimulation, and increased noise pollution from fracking operations, although these risks are well-documented. The CCST reports that fracking has led to increased habitat loss and fragmentation in Kern County by enabling oil and gas development in previously unexploited natural habitat and by increasing well densities in developed areas. Kern County has experienced the vast majority (61%) of the habitat loss and fragmentation attributable to fracking-enabled production in the state, estimated at 13,400 hectares of altered natural habitat and 6,700 hectares of other altered land areas.[89] Fracking has become an increasingly important driver for enabling oil and gas production in the state: 20% of the land area that was newly developed for oil and gas production between October 2012 and September 2014 was attributed to fracking.[90] Fracking-enabled activity exerts high local impacts on habitat in the southwestern San Joaquin Valley "where frequently stimulated fields overlap with high-quality habitat for rare species."[91]

0045-100

The DEIR also fails to disclose and analyze the impacts from the toxic chemicals used in well stimulation. One comprehensive study found that 40 percent of the chemicals added to fracking fluids have been found to have ecological effects, indicating that they can harm wildlife.[92] Studies have documented that fracking fluid discharges into streams have killed aquatic invertebrates and fish, including federally listed species;[93] fracking fluid applications to forest lands have caused

widespread mortality of trees and damage to surface soil;[94] and exposure to fracking activity has caused negative health effects and death to wildlife and domestic animals.[95]

0045-101

(4) Oil and chemical spills: The DEIR fails to adequately disclose and evaluate the impacts of spills of oil, fracking fluids, produced water, and other chemicals on species and ecosystems. Oil and chemical spills can have well-known catastrophic ecological impacts due to their toxic effects, the potentially large volume of spills, and the difficulty of containment and clean-up (i.e., produced water spills cannot be contained by traditional oil spill response methods.) The CCST reports that oil and gas development in Kern County has resulted in chronic spills. According to the Office of Emergency Services, between January 2009 and December 2014, a total of 575 produced water spills and 31 chemical spills were reported, equivalent to 99 produced water spills per year.[96] Kern County has the highest concentration of produced water spills (55%) and chemical spills (42%) of any county in the state.[97] Moreover, nearly 18% of produced water spills and 10% of chemical spills affected waterways.[98] Yet the DEIR fails to analyze the impacts of these chronic spills on species and ecosystems.

0045-102

(5) Noise pollution: The DEIR fails to adequately disclose and analyze the impacts of noise pollution on species and ecosystems. Oil and gas exploration, development and production create significant intermittent and chronic noise pollution due to construction, drilling, fracking, truck transport, compressors, human activity, and other noise sources. Noise pollution from drilling and well stimulation is particularly significant.[99] Although the DEIR does not report the specific decibel levels of oil and gas activities, DOGGR reports the noise from pumping during a frack job at 107 decibels[100] while noise from pumping during acid matrix stimulation can range between 75 to 100 decibels.[101] Numerous studies demonstrate that noise pollution from oil and gas-related activities can cause wildlife to alter their spatial distributions and temporarily or permanently abandon habitat areas[102] and negatively impacts abundance, stress levels, and behaviors.[103] For example, in areas where sage grouse were exposed to intermittent anthropogenic sounds associated with natural gas drilling and roads, male attendance at leks decreased up to 73%.[104] Importantly, the noise levels associated with drilling and fracking are even greater that those shown to disturb wildlife and

ecosystem processes.[105] The DEIR attempts to avoid any analysis of noise impacts on biological resources by claiming that they are discussed in other sections.[106] However, nowhere does the DEIR assess the impacts of Project noise pollution on species and ecosystems, making disclosure and analysis inadequate.

0045-102 Continued

(6) Reduced water quantity: The DEIR fails to adequately disclose and evaluate the impacts of Project activities on water availability for species and ecosystems. The DEIR must acknowledge that oil and gas development and production activities can decrease water availability for species due to pumping from groundwater and surface sources. Water withdrawals can harm species by reducing surface or soil water availability at wildlife drinking water sources, and at wetlands, riparian, and other aquatic habitats. The DEIR must evaluate the local and regional impacts of past, current, and future surface and ground water withdrawals on species and ecosystems, particularly in areas where wells are concentrated and well owners/operators permanently remove millions of gallons of water from fresh surface and sub-surface supplies. The DEIR must also examine these impacts in the context of limited water availability due to drought conditions and competing agricultural, industrial, and municipal water needs.

0045-103

(7) Reduced water quality: The DEIR fails to adequately disclose and evaluate the impacts of Project activities on water quality. The DEIR only briefly acknowledges the impacts on water quality through disruption of local surface hydrology and increased erosion: "indirect impacts to habitat could include alterations to existing topographical and hydrological conditions, increased erosion and sediment transport."[107] The DEIR must disclose and analyze the full range of impacts to water quality such as (1) clearing and grading of well pads that increase sediment runoff; (2) construction, maintenance, and/or use of access roads that elevate runoff rates, increase sedimentation and turbidity in receiving water bodies, and alter timing and volume of stream flow, water chemistry, and stream channel morphology; and (3) construction, maintenance, and/or use of culverts, pipelines, and other structures that alter water flow.[108] In addition, the DEIR must disclose and analyze the impact of spills of fracking chemicals, produced water, oil, and other toxins that can result in temporary and permanent habitat reduction and degradation.[109]

0045-104

<u>Mitigation measures are impermissibly vague, improperly deferred, and unenforceable</u>

Many of the mitigation measures proposed by the DEIR are impermissibly vague and improperly deferred. These measures are also effectively unenforceable because there is no clear mechanism in the Proposed Ordinance to ensure that future permits comply with the mitigation measures. These measures offer no assurance that the significant impacts of the project will be mitigated, making them invalid under CEQA.

[108] Brittingham, M.C. et al. 2014.

[109] Brittingham, M.C. et al. 2014.

Examples of vaguely defined and deferred mitigation measures, which are "cursorily described," are "nonexclusive, undefined, untested and of unknown efficacy," and create "no objective criteria for measuring success" (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 93), include but are not limited to the following: 0045-106

MM 4.4-1, which provides that that the purpose is to confirm the presence or absence of special status wildlife species and "identify and implement feasible avoidance and minimization measures for such species." 0045-107

MM 4.4-3, which provides that exclusion barriers and buffers "may be used, where effective and feasible" to avoid take of protected species and minimize take of sensitive species. 0045-108

MM 4.4-5, which provides that if an active bat maternity roost cannot feasibly be avoided, USFWS and CDFW must be contacted "to identify appropriate impact minimization measures prior to initiating any disturbance." 0045-109

MM 4.4-7, which provides that if an active badger maternity den cannot feasibly be avoided, CDFW must be contacted "to identify appropriate impact minimization measures prior to initiating any disturbance." 0045-110

MM 4.4-10, which provides that in the case of behavioral changes of nesting birds, USFWS and CDFW "should be consulted for additional avoidance and minimization measures." 0045-111

MM 4.4-12, which provides that "all detected plant populations of Protected Species and Sensitive Species shall be identified in the field during the surveys with temporary flags or other appropriate materials to avoid and minimize impacts to the plant populations from any disturbance activities." 0045-112

<u>The DEIR fails to include feasible mitigation measures to reduce significant project impacts</u>

(1) First, as detailed in these comments, a large body of scientific research demonstrates that many harms to species and habitats from oil and gas exploration, development, and production activities are permanent and significant—including impacts from habitat loss, habitat fragmentation, degradation of water quantity and quality, and oil and chemical spills,—and cannot be reduced to a less-than-significant level even with feasible mitigation. 0045-113

(2) The DEIR incorrectly asserts that mitigation measures MM 4.4-1 to 4.4-16 will mitigate the significant adverse impacts on habitat to a less than significant level. However, none of the 16 mitigation measures requires habitat avoidance for special-status species, or sets any limit on the cumulative allowable habitat loss and fragmentation for special-status species over the 25 years of the Project (i.e., the surface disturbance from oil and gas activities cannot exceed 10% of habitat). As such, the DEIR provides no assurances that habitat losses will be reduced from the significant levels projected in its analysis. To correct this deficiency, the EIR should require that development and production are sited outside of the boundaries of identified habitat for special-status species, including scientifically defensible buffer zones surrounding these habitat areas that account for the sensitivities of affected species to noise pollution, light pollution, human activity, and other human 0045-114

disturbance resulting from the Project. No development should be permitted within high and moderate suitability habitat for special-status species, movement corridors, or designated critical habitat (i.e., Buena Vista Lake ornate shrew, California condor, red-legged frog, and California tiger salamander).

0045-114 Continued

A recent study by Cypher et al. (2013) illustrates the importance of requiring avoidance of important habitat for special-status species. Persistent kit fox populations occur only in areas with relatively large patches of high suitability habitat or a mix of high and medium suitability habitat, and kit foxes are unable to persist in areas with high fragmentation or areas with primarily medium suitability habitat. The study estimated that most of the San Joaquin kit fox's historic habitat has already been lost: only 4,267 km^2 of high suitability habitat and 5,569 km^2 of medium habitat suitability remain. The largest remaining areas of high suitability habitat (51%) and medium suitability habitat (41%)) are located in Kern County. The study warned that there is an "urgent need to focus protection efforts on high suitability habitat and to do so in a manner that increases patch size of protected lands and reduces fragmentation," providing a clear scientific basis for mitigation measures that require protection of all remaining high suitability and medium suitability habitat in the Project Area from further oil and gas development and production.

0045-115

Finally, where oil and gas infrastructure is permitted, the EIR should include specific mitigation measures that require that previously disturbed areas and existing roads are used; infrastructure is consolidated and co-located to reduce disturbance; and pipelines are routed along existing roads and elevated to minimize surface disturbance and allow wildlife to pass underneath, in addition to the full range of other feasible mitigation.

0045-116

(3) MM 4.4-2 incorrectly states that incidental take of Fully Protected Species under the California Fish and Game Code would be allowed with a permit. However, as summarized by the California Department of Fish and Wildlife, "no Section 2081(b) permit may authorize the take of "fully protected" species and "specified birds" (Fish and Game Code Sections 3505, 3511, 4700, 5050, 5515, and 5517). If a project is planned in an area where a fully protected species or a specified bird occurs, an applicant must design the project to avoid all take; the Department cannot provide take authorization for the species under CESA."[110] Thus, mitigation measures must specify that incidental take of the Fully Protected species in the Project Area is forbidden, such that take of the blunt-nosed leopard lizard, ringtail, golden eagle, bald eagle, and white-tailed kite, all of which occur in the Project area, must be completely avoided.

0045-117

(4) MM 4.4-15a fails to include feasible mitigation measures to avoid adverse effects from roads and vehicles, including road mortality, acoustic masking, and negative population-level effects.[111] Road mortality is a major factor affecting the conservation status of state and federally listed species in California, including the San Joaquin kit fox and blunt-nosed leopard lizard. Studies of San Joaquin kit foxes in the Elk Hills oil field reported that the proportion of fox deaths due to road accidents was four times greater in developed areas versus undisturbed areas, and that vehicle-related mortality rates were approximately double in oil-developed areas versus undeveloped areas.[112] Roads can

cause particularly high mortality and negative population-level effects on amphibians, and mitigation techniques do not have a track record of protecting amphibian populations over the long-term.[113] Category 1 and 2 amphibian species occurring in the Project Area include the Tehachapi slender salamander, western spadefoot, California red-legged frog, California tiger salamander, Kern County slender salamander, and yellow-blotched salamander.[114]

0045-118 Continued

The DEIR projects that the Project will generate the equivalent of 19,300 trips per day by 2035, which includes worker trips and truck trips delivering equipment and materials.[115] MM 4.4-16 states: "all vehicles shall observe a 20-mile-per-hour speed limit in all areas of disturbance and on unpaved road unless otherwise posted." However, this measure fails to evaluate whether this speed limit would be protective of sensitive wildlife, and fails to include other feasible mitigation measures such as road closures during critical periods such as breeding, dispersal, and migration, and wildlife crossings and under-road tunnels.[116] Roads should also be prohibited from crossing wetlands, riparian areas, and perennial or seasonal watercourses.

0045-119

(5) The DEIR fails to include feasible mitigation measures to avoid adverse effects of light pollution on special-status species. Oil and gas activities can lead to significant amounts of light pollution. Drilling sites are lighted at night to allow for 24-hour operation of the drill rig, and that well drilling lasts an average of 23 days but can continue for more than 60 days.[117] Light pollution has been shown to disrupt animal foraging, breeding, and migratory behaviors; cause disorientation; disrupt natural day-night cycles of plants; lead to mortality and predation; and change community composition.[118] MM 4.4-15b briefly states that "night time disturbance activity for drilling purposes shall use directed lighting, shielding methods, or reduced lumen intensity." However, this measure should also specify that site lighting should be directly downward and internally, avoiding site casting, uplighting, wall washes, and lighting where the bulb protrudes from the fixture. Other mitigation measures should be required such as scheduling activities that require night lighting outside of important periods for affected species.

0045-120

(6) MM 4.4-16, which provides for compensatory mitigation for ground disturbance, is inadequate to offset or compensate for the destruction of native vegetation and habitat. The DEIR proposes a mitigation ratio of 1:0.5 (i.e., one acre of new disturbance requires a half acre of mitigation) for Tier 1 area that contain existing disturbance of 70% or greater, a 1:1 mitigation ratio in most other areas, and no mitigation for ground that has been previously disturbed such as vegetation clearing, unpaved roads, and unvegetated well pads. However, many Tier 1 areas contain high-quality habitat for federally or state listed species and special-status species, and previously disturbed habitats can provide important habitat for native species if allowed to revegetate.[119] There is no justification for why the mitigation ratio for these habitat areas should be so low. Indeed, regional mitigation ratios are much higher. The BLM's Resource Management Plan for the Bakersfield Field Office requires a

0045-121 Continued

compensation ratio for San Joaquin Valley species of 3:1 for permanent impacts and 1.1:1 for temporary impacts on previously disturbed habitat, with higher ratios for some species and sensitive habitats such as a 9:1 for permanent impacts and 6:1 for temporary impacts on known populations of the Kern mallow. [120]

0045-122

Although no loss of special-status species habitat should be permitted, the EIR must also require that land used for compensation must be of equal or greater value than the land impacted, and that it support the species targeted for compensation. The EIR must also include performance metrics to ensure that restoration and compensation techniques in MM 4.4-16 can effectively replace the value, structure, and function of native habitats that are destroyed and require a timeline for when mitigation must be completed.

0045-123

(7) The DEIR fails to mitigate the effects on biological resources from noise pollution. Neither the Biological Resources or Noise sections includes any mitigation measures for noise that take species and ecosystems into account. The EIR should require feasible mitigation measures to reduce noise pollution from oil and gas activities, such as installing sound-dampening devices, walls, and/or insulation around pumpjacks, compressor stations, and other infrastructure; switching from diesel and gas engines to electric engines; switching from conventional pumps to quieter pump designs (pneumatic pumps or progressive cavity pumps); co-locating infrastructure to a central location rather than disparate locations to minimize the sources of noise pollution (i.e., using a central compressor with sound barrier walls rather than compressors at individual wells); requiring infrastructure with design features that reduce noise; and seasonally restricting activity in areas with sensitive species such as during migration, breeding, and dispersal.

0045-124

(8) The DEIR fails to mitigate the effects on biological resources from surface and ground water reductions and adverse effects on water quality such as oil and chemical spills. The mitigation measures in Sections 4.8 (Hazards and Hazardous Materials) and 4.9 (Hydrology and Water Quality) have no requirements to avoid adverse effects on species and habitats. For example, in the case of an oil or chemical spill, the DEIR has no requirement to demonstrate an ability to effectively protect wildlife species and habitats and rehabilitate affected individuals.

0045-125

(9) The DEIR does not mitigate the harms to wildlife from lined and unlined wastewater pits and sumps which have been documented to cause injury and mortality of numerous wildlife species.[121] Wastewater pits can contain numerous contaminants, including volatile organic compounds, benzene, and radioactive materials, that can harm wildlife.[122] In the San Joaquin Valley, giant kangaroo rats, blunt-nosed leopard lizards, and San Joaquin kit foxes have been found drowned in wastewater.[123] The Central Valley Regional Water Quality Control Board found that 36% of 843 known evaporation-percolation ponds in Kern County were unpermitted,[124] and an independent

0045-125 Continued

investigation by the CCST found that three-quarters (76%) of sampled ponds with fluid in Kern County had no netting in place.[125] The DEIR must require mitigation measures prohibiting the storage of oil and gas-related fluids in pits and sumps, and requiring netting over all existing pits and sumps.

0045-126

(10) The DEIR fails to mitigate the impacts to species from air pollution. Oil and gas development and production emit pollutants that are harmful to species including nitrogen oxides (NO*x*), sulfur dioxide (SO_2), carbon monoxide (CO), volatile organic compounds (VOCs), and particulate matter.[126] For example, NOx and VOCs have direct toxicity and contribute to ozone (O_3) formation which is a significant pulmonary and respiratory irritant in mammals[127] and negatively affects growth, reproduction, and survival of plants.[128] However, the DEIR has no mitigation measures specifically for reducing these harms to species.

0045-127

(11) The DEIR fails to mitigate impacts to wildlife from the proliferation of linear corridors and elevated structures like transmission poles and power lines that can facilitate increased predation and parasitism.[129]

0045-128

(12) The DEIR provides no mitigation measures to ensure that oil and gas activities do not interfere substantially with wildlife movements, corridors, and nursery sites. The DEIR asserts without basis that implementation of the biological resources mitigation measures "would reduce wildlife movement impacts." Although it identifies science-based wildlife movement corridors in the Project Area (i.e., Section 4.4.2 and Figure 4.4-11), it provides no mitigation measures to ensure that these important corridors are not developed. The EIR should require that oil and gas development and production be cited outside of these important identified movement corridors.

<u>The cumulative impacts analysis for biological resources is flawed</u>

0045-129

An adequate cumulative impacts analysis requires a thorough assessment of the incremental significance of the Project's impacts over time in consideration of other "other projects causing related impacts."[130] However, the DEIR fails to list other projects or ongoing activities that cause cumulative impacts to biological resources in the Project Area, rendering the analysis inadequate.

0045-130

The DEIR concludes that the Project will cause significant and unavoidable cumulative impacts even with the application of proposed mitigation measures. However, the DEIR fails to conduct an analysis to support this conclusion, in violation of CEQA's substantial evidence standard. The DEIR also fails to propose feasible mitigation measures to reduce significant cumulative impacts such as avoiding oil and gas development and production in special-status species habitats, important movement corridors, and sensitive natural communities, and setting limits on cumulative habitat loss for the ~164 special-status species and 15 sensitive natural communities in the Project Area in light of other projects.

[129] Brittingham, M.C. et al. 2014.
[130] Guidelines, <u>§ 15130, subd. (a)(1)</u>.

0045-131

The failings of the cumulative impacts analysis are particularly troubling because many native species in Kern County are already at risk of extinction, and natural habitat areas are already heavily and fragmented by oil and gas development and production. More than a third (37%) of the land area in California developed for oil and gas production occurs in Kern County.[131] As revealed by the DEIR, the Project would eliminate much of the remaining habitat for special-status species, for example, the loss of 18% of high-quality habitat and 3% of moderate to poor quality habitat for the endangered San Joaquin kit fox; 28% of high-quality habitat and 5% of moderate to poor quality habitat for the endangered giant kangaroo rat; and 26% of high-quality habitat and 4% of moderate to poor quality habitat for the San Joaquin antelope squirrel. At present, the significant, long-lasting, and inadequately mitigated impacts from the Project's proposed oil and gas development threaten to preclude the recovery of listed species, degrade sensitive natural communities, and further imperil special-status species.

CONCLUSION

0045-132

For the above reasons, the DEIR is flawed, violates the law, and fails to allow meaningful input from the public to address harmful oil and gas activity.

Respectfully submitted,

Hollin Kretzmann

0045-9

This introductory comment is noted. Please see Responses 0045-10 through 0045-15.

0045-10

Chapter 6 of the Draft EIR identified and fully evaluated a reasonable range of six potentially feasible alternatives to the Project: No Project Alternative (Alternative 1); CUP Alternative (Alternative 2); Reduced Ground Disturbance Alternative (Alternative 3); No Hydraulic Fracturing

Alternative (Alternative 4); Low-Emission Enhanced Oil Recovery (EOR) Technology Alternative (Alternative 5); Recycled Water Alternative (Alternative 6).

0045-11

It is assumed that the comment's reference to a "ban on all drilling" alternative is meant to refer to the Drilling Ban on All Lands Alternative described on page 6-12 of the Draft EIR. Please see Global Response Alt-1.

The comment's claims regarding statements made by Governor Brown and unidentified climate experts are noted.

The comment's suggestion that Kern County work to phase in a robust renewable energy sector is noted. In fact, Kern County is a leader in the promotion of renewable energy development. According to the California Energy Commission, as of June 30, 2015, Kern County has 100 renewable energy facilities online, providing 4,372 megawatts renewable capacity (CEC, 2015). These numbers far exceed any other county in California.

The comment's claims regarding the potential benefits of phasing out oil and gas production in Kern County are noted.

0045-12

It is assumed that the comment's reference to a "fewer operating wells over time" alternative is meant to refer to the Fewer Wells Within the Project Footprint Alternative described on page 6-13 of the Draft EIR. Please see Global Response Alt-1.

0045-13

Please see Global Response Alt-1.

0045-20

The comment states that the EIR's impacts’ analysis assumes DOGGR's proposed enhanced oil recovery (EOR) regulations have taken affect. If the comment is meant rot refer to the well stimulation treatment (WST) regulations promulgated pursuant to SB 4, those regulations became effective July 1, 2014. Please see GR 10: DOGGR Regulations, for further analysis of the SB 4 regulations. If the comment is referring to the current rulemaking underground injection control (UIC), which is inclusive of EIR activities, the EIR did not assume these proposed regulations were in affect when undertaking the impact analysis as it would be improper to speculate concerning the contents of these forthcoming regulations.

0045-34

The commenter states that the identity, quantity, and toxicity of airborne chemicals is grossly understated or unknown in the DEIR. The commenter is incorrect. The DEIR accurately estimated Project emissions and mitigated for those emissions. Please see GR Air-1, GR Air-3, GR-Air-4, GR-Air-5, and GR Air-6 for discussions of the adequacy of the air quality analysis in the DEIR.

0045-35

Please see GR-Air-4 regarding air quality methodology and emission estimates. All emissions, including both construction and operation, were included in the totals generated in the DEIR.

0045-36

Table 4.3-42 contains only operational emissions but the conclusion is that the Project would have a cumulatively considerable impact on air quality in any event. DEIR at 4.3-20.

0045-37

The comment states that the issue of local air pollution is unexplored in the DEIR and challenges the number of air monitors. Existing monitors are used for the SJVAPCD's air quality planning and monitoring, and are sited in accordance with federal regulations to provide representative sampling of air quality in the region. With mitigation, including setbacks if feasible and applicable or risk management or other measures, impacts from the Project are considered less than significant. Project emissions are not expected to have significant local air quality impacts. Estimated acute and chronic risks associated with drilling, oil processing, and gas processing are below the hazard index standard in each Project subarea. Tables 4.3-36 and 4.3-37; see DEIR at 4.3-103, et seq. and Appendix M (Health Risk Assessment, CATC 2015), performed following OEHHA, Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA 2015).

0045-38

The HRA prepared for the Project includes all relevant sources of toxic air contaminants for the Project. Please see GR Air-3 and GR Air-6 for a discussion of the HRAs. Please see GR Air-8 for a discussion of why WST emissions are not included in the air quality analysis.

The commenter also states that worker safety is ignored in the DEIR and that silicosis and lung cancer can result from on-site exposure to dust particles from the sand used in fracking.

For the reasons outlined below, the use of silica-containing proppant does not pose a risk to non-workers or other offsite persons and industry practices already address potential health risks of silica-containing proppant for workers.

What is Silica-Containing Proppant?

Silica-containing sand is used as a "proppant", *i.e.*, to hold open the fractures created by the hydraulic fracturing process with sufficient pore space to allow oil and gas to flow. Silica proppant is processed so that it is close as possible to spherical and contains a small range of particle sizes. Sizes of proppant depend on specific needs but are generally in the range of about 0.4 to 0.8 millimeters average diameter. Smaller particles may become airborne during transportation and handling, and workers can be exposed if they inhale the particles.

The Use of Silica-Containing Proppant Does Not Pose a Risk to Offsite Persons / Non-Workers

The use of silica-containing proppant creates a potential risk that is localized to well sites and specific to potential exposure in the work environment. The U.S. Occupational Health and Safety Administration (OSHA) and National Institute of Occupational Safety (NIOSH) have issued a "Hazard Alert: Worker Exposure to Silica during Hydraulic Fracturing." The Hazard Alert states that a "combination of engineering controls, work practice, protective equipment, and product substitution where feasible, along with worker training, is needed to protect workers who are exposed to silica during hydraulic fracturing operations." NIOSH identified seven primary points of silica dust exposure during hydraulic fracturing operations:

Dust ejected from access ports on top of sand movers during refilling operations while the machines are running; Dust ejected through open side fill ports on sand movers during refilling operations; Dust generated by on-site vehicle traffic; Dust released from the transfer belt under the sand movers; Dust created as sand drops into, or is agitated in, the blender hopper and on transfer belts; Dust released from operations of transfer belts between the sand mover and the blender; and Dust released from the top of the end of the sand transfer belt on sand movers.

Crystalline silica is a natural component of silica sand. Worker-related health concerns are related to the tiniest crystalline silica particles, less than 10 micrometers in aerodynamic diameter, which if inhaled are small enough to enter the gas-exchange regions of the lungs. At sufficient concentrations and exposure durations, respirable crystalline silica inhalation can lead to silicosis (inflammation of tissue around trapped silica particles) and lung disorders. Respirable crystalline silica particles are listed by the California Office of Environmental Health Hazard Assessment (OEHHA) as a chemical known to the state to cause cancer.

All of the potential exposure points identified by NIOSH are centered on the well undergoing well stimulation or the immediate site area surrounding such well. In addition, respirable crystalline silica inhalation can be harmful, but only where a person is exposed to certain concentrations over long durations, which is unlikely for individuals not working at a well site.

Because the use of silica-containing proppant does not pose a risk to offsite persons or non-workers, it was not necessary to consider its potential use in the Health Risk Assessment analysis.

Industry Practices to Address Health Risks of Silica-Containing Proppant

If air samples show levels above OSHA's calculated Permissible Exposure Limit (PEL) for crystalline silica, approximately 0.1 milligrams per cubic meter ($mg/m^{3)}$,employers are required to take actions to reduce worker exposures. In addition, OSHA and NIOSH recommend that employers take the following actions to further reduce worker exposures below the NIOSH Recommended Exposure Limit (REL) of 0.05 mg/m^3:

Work practice and procedural changes:

Cap unused fill ports on sand movers to help reduce the dust released, especially during filling; Reduce the drop height between the sand transfer belt and T-belts and blender hoppers; Limit the distance that sand falls through the air to help reduce dust; Limit the number of workers, and the time workers must spend in areas where dust and silica levels may be elevated, and consider ways to perform dusty operations remotely; and Apply fresh water to roads and around the well site to reduce the dust.

Practices that involve equipment changes:

Enclose points where dust is released. Install thick plastic stilling or staging curtains around the bottom sides of the sand movers to limit dusts released from belt operation. Enclosures can also be added along and at the ends of the sand transfer belt; Where possible, use enclosed cabs or booths; Consider configuring operator cabs and booths with High Efficiency Particulate Arrestance (HEPA) filtration and climate controls; Use local exhaust ventilation to collect silica-containing dusts and prevent dust escape. Install dust collection systems onto machines or equipment that can release dust; and Replace transfer belts with screw augers on sand movers in new designs or retrofits. Moving sand through an auger system rather than a belt will help contain the sand and reduce dust release.

OSHA's Hazard Communication standard requires that employers provide workers with training and information about hazardous chemicals used in the workplace, including crystalline silica.

In addition, the National STEPS Network (Service, Transmission, Exploration and Production Safety), which promotes safety, health and environmental improvement in the oil and gas industry, organized the "Respirable Silica Focus Group" which issued a list of "Quick Fix Suggestions" (September 2, 2013) to mitigate respirable silica exposure in hydraulic fracturing. The practices include:

Exposure reduction work practices and procedures, such as capping unused fill ports, minimizing sand fall distances during transfer operations, and using enclosed cabs/booths; Repiratory protection requirements; Decontamination/hygiene requirements; Exposure monitoring; Informing management about silica hazards and company actions to reduce exposure; Worker silica awareness training; Signage identifying the seven points of silica dust exposure identified by NIOSH (listed above); Identifying the proppant used and reviewing material safety data sheets in pre-job safety meetings; Signage identifying potential silica exposure in or near exposure zones; Limiting non-essential workers in potential exposure zones; Ensuring that workers required to wear respirators are provided appropriate equipment and properly trained; Requiring workers to wash hands and face before eating, drinking, smoking and leaving location; Instructing workers on cleaning silica from clothing or change clothes at the end of the shift, and on handling silica-contaminated clothing; and Cleaning enclosed worker congregation areas if the area becomes contaminated with silica dust. When engineering and work practice controls are not feasible or do not reduce silica levels below OSHA PELs, employers must provide workers with respirators. However, under some workplace conditions, effective respirator use is difficult to achieve and may present other safety concerns; for example, respirators may limit vision and communication. Because respirators are less reliable than engineering and work practice controls and may create other problems, OSHA believes that primary reliance on respirators to protect workers is generally inappropriate when feasible engineering and work practice controls are available.[2]

Engineering and work practice controls provide consistent levels of protection to a large number of workers, allow for predictable performance levels. Engineering controls that reduce the risk of worker exposure also have the effect of reducing off-site emissions of silica dust that could expose off-site receptors. In addition, Mitigation Measure MM 4.3-2 in the Draft EIR requires implementation of a fugitive dust control plan, in compliance with San Joaquin Valley Air Pollution Control District regulations for fugitive dust suppression. Dust control measures required to be implemented include stabilizing of on-site unpaved using water or chemical soil stabilizers, and covering of haul trucks (including those hauling sand) with tarps or other enclosures to reduce fugitive dust emissions. Compliance with these requirements will serve to ensure that health risks to workers and offsite receptors are minimized.

The commenter's statement with regard to hydrogen sulfide and volatile organic compounds from storage tanks is unsubstantiated. Gases in storage tanks containing hydrocarbons are collected and controlled in compliance with strict SJVAPCD regulations (RULE 4623 STORAGE OF ORGANIC LIQUIDS)[1][1]. As such emissions to the atmosphere of H_2S as well as VOCs will be virtually eliminated and thus will not affect air quality.

[1][1] https://www.valleyair.org/rules/currntrules/r4623.pdf

0045-39

The comment states that the County and SJVAPCD will be unable to meet air quality plans given the scale of the Project and questions the effectiveness of Project mitigation. While the DEIR recognizes that the District is in nonattainment for multiple criteria pollutants and that emissions exceed significance thresholds, mitigation specified in the DEIR will reduce all emission increases to net zero.[2][2] Please see GR-Air-1 and GR-Air-2, and GR-16 regarding mitigation measures generally. Thus, the DEIR determined that although oil and gas activities that would be authorized under the Project have the potential to obstruct implementation of the applicable air quality plan or potentially be inconsistent with the General Plan measures, after mitigation these impacts are less than significant. The SJVAPCD's thresholds of significance for criteria pollutants are based on District Rule 2201 (New Source Review) offset requirements. The District's attainment plans demonstrate that project-specific net emissions increase below New Source Review (NSR) offset requirements will not prevent the District from achieving

attainment. Consequently, emission impacts from sources permitted consistent with NSR requirements are not individually significant or cumulatively significant. Nonetheless, since the County does not have legal authority over air quality planning, and is also relying on the SJVAPCD for achievement of certain air quality mitigation, the County is conservatively finding that potential cumulative impacts are significant and unavoidable. However, this finding does not result from inadequate mitigation. As described in GR-Air-1 and GR-Air-2, the Project's operational emissions are required to be fully offset under the suite of Air Quality Mitigation measures. In addition, per-well emissions will decrease in the future due to phase-in of CARB engine emission standards and fleet turnover. See, e.g., DEIR pp. 4.3-36, 4.3-102.

[2][2] The commenter states the SJVAPCD will be submitting a new 8-hour ozone exposure plan in 2015; however, as described in this response, Project emissions will be mitigated to net zero and would not conflict with a new plan.

0045-39 cont'd

0045-40

The comment suggests emission calculations are flawed because they fail to show total emissions from the Project and instead only show yearly incremental emissions from new sources. The commenter states tables showing yearly emissions should also include a summation. Table 4.3-27 shows total estimated emissions from both construction and operational activities for the Project in tons per year. The annual emissions from operation of permitted equipment have been calculated by dividing the projected change in the permitted equipment emissions at Project build out in 2035 by the number of Project years from 2015 to 2035 (i.e., 21 years). In addition, Table 4.3-28 presents the total estimated emissions from the Project from construction and operation, including equipment and mobile sources, and excluding the permitted emissions requiring offsets under SJVAPCD regulations. Because the baseline year of 2012 also included construction of 3,392 new wells and other construction and operational Project activity, Table 4.3-29 shows the incremental new emissions from the Project compared to 2012. Table 4.3-29 presents the total estimated incremental increase in emissions from the same Project non-permitted equipment and activities in tons per year as for Table 4.3-28. Average annual incremental emissions are also shown.

The tables, thus, show estimated annual incremental emissions increases, which is a reasonable methodology for the Project at issue. As explained in the DEIR at p. 4.3-101, the number of well permits issued annually will vary based on a variety of factors. Air emissions modelling used in the DEIR conservatively assumed a higher well count (maximum 4,083) than the Project maximum 3,647. The estimated incremental emission is provided in Table 4.3-32, which shows the next 21 years of permitting and the emissions each year for an individual well. The emission totals include all Project-related construction and operational activities that are not subject to the SJVAPCD's stationary source permitting and emission offset rules, such as mobile sources like construction equipment, maintenance trucks, employee automobile trips, construction of access roads and well pads, drilling, accessory activities, well operation, and eventual abandonment. Emissions from idled wells are also included. The annual totals also include mandatory emission reductions from existing legal requirements, such as federal and state mandated changes for certain types of engines which will cause NOx emissions to increase slightly while PM10 declines. These Project-related construction and operational emissions that are not required to be offset under SJVAPCD stationary source permitting rules are then averaged for all wells over a 20-year period to illustrate how the OG-ERA will generate totals.

In addition, the DEIR methodology of treating construction of all new wells as new emissions rather than summing against current (pre-project) annual drilling emissions is highly conservative from a CEQA perspective and actually overstated impacts. Please see also GR-6, GR-8.

0045-41

Please see GR-Air 3 regarding the sufficiency of the Health Risk Assessment, GR-Air-5 regarding cumulative air effects, GR-Air-6 regarding the revised Health Risk Assessment and SJVAPCD methodology, and GR-Air-11 regarding emissions from sumps, ponds, and pits. 0045-47

The comment is a general introduction. No response is necessary and it is noted for the record.

0045-48

Benzene is a naturally occurring constituent of the oil bearing formations from which produced water comes. The potential for impacts related to benzene and other naturally occurring constituents in produced water depends on the use to which the produced water is put. Produced water that is disposed of by underground injection must be injected into formations that are not suitable sources of drinking, e.g., containing hydrocarbons or very high salinity, or otherwise exempt aquifers. Please see GR Water-02. Produced water that is treated for reuse in oil and gas operations is injected back into petroleum formations for enhanced oil recovery. Produced water may not be disposed of in percolation ponds if it constitutes hazardous waste. Please see RTCs 02-11 – 02-12. Finally, produced water treated for agricultural irrigation has been found to meet all regulatory and permit limits for such use. Please see GR Water-8.

The comment includes references to, but has not provided the County copies of, various technical studies. Documents that are simply named in a comment letter, or named along with a reference to a general Web site, have not been made readily available to the public agency and, therefore, are not submitted pursuant to Cal. Pub. Res. Code § 21167.6, subd. (e)(7). *Consolidated Irrigation Dist. v. Superior Court* (2012) 205 Cal. App. 4th 697. However, the County has reviewed the referenced documents and considered them in formulating responses to comments.

0045-49

The comment states that the DEIR fails to disclose and analyze the impacts from chemical used during oil and gas activities.

The Draft EIR identifies representative potentially hazardous materials used in Kern County oil and gas drilling and production in 2014 (excluding chemicals used in well stimulation treatments). DEIR, pp. 4.8-4 – 4.8-5, Table 4.8-1. Table 4.8-3 sets forth representative WST chemicals used in Kern. The Draft EIR also identifies maximum daily onsite volumes of such hazardous materials as reported to Kern County Environmental Health Division (KCEH). Though the total number of wells drilled in a given year could increase compared to baseline under the Project (see GR 9 – Well Projections), the well sites themselves are anticipated to be similar in size and intensity to past industry practices. Thus, it is reasonably foreseeable that the types and volumes of hazardous materials used in oil and gas fields will remain substantially the same as those disclosed in the DEIR.

Further, the EIR imposes various mitigation measures that reference and implement industry standards concerning oil management of hazardous materials at oil and gas production sites. The standards include Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development: The Gold Book (Bureau of Land Management 2007), Environmental Protection for Onshore Oil and Gas Production Operations and Leases (American Petroleum Institute 2009), or equivalent standards. See MM 4.8-6 - 4.8-7. Mitigation Measures 4.8-10 – 4.8-14 also address spill and release prevention and response. With these measures, as well as implementation of DOGGR regulations concerning WST activities (see GR-10), the EIR correctly concludes that potential impacts for use, storage and transport of hazardous materials are less than significant.

Further, the chemicals used in WST fluids must be disclosed as part of the new SB 4 regulations promulgated by DOGGR, effective July 1, 2015. Please see GR 10 – DOGGR Regulations. To further address uncertainties regarding well stimulation fluid content and transport, this EIR has added MM 4.8-16, requiring toxicity testing, as included in Section 7.1.4.

Finally, the comment includes references to, but has not provided the County copies of, various technical studies. Documents that are simply named in a comment letter, or named along with a reference to a general Web site, have not been made readily available to the public agency and, therefore, are not submitted pursuant to Cal. Pub. Res. Code § 21167.6, subd. (e)(7). *Consolidated Irrigation Dist. v. Superior Court* (2012) 205 Cal. App. 4th 697. However, the County has reviewed the referenced documents and considered them in formulating responses to comments.

0045-49 cont'd

The comment states that the DEIR fails to disclose and analyze the impacts from chemical used during oil and gas activities.

The Draft EIR identifies representative potentially hazardous materials used in Kern County oil and gas drilling and production in 2014 (excluding chemicals used in well stimulation treatments). DEIR, pp. 4.8-4 – 4.8-5, Table 4.8-1. Table 4.8-3 sets forth representative WST chemicals used in Kern. The Draft EIR also identifies maximum daily onsite volumes of such hazardous materials as reported to Kern County Environmental Health Division (KCEH). Though the total number of wells drilled in a given year could increase compared to baseline under the Project (see GR 9 – Well Projections), the well sites themselves are anticipated to be similar in size and intensity to past industry practices. Thus, it is reasonably foreseeable that the types and volumes of hazardous materials used in oil and gas fields will remain substantially the same as those disclosed in the DEIR.

Further, the EIR imposes various mitigation measures that reference and implement industry standards concerning oil management of hazardous materials at oil and gas production sites. The standards include Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development: The Gold Book (Bureau of Land Management 2007), Environmental Protection for Onshore Oil and Gas Production Operations and Leases (American Petroleum Institute 2009), or equivalent standards. See MM 4.8-6 - 4.8-7. Mitigation Measures 4.8-10 – 4.8-14 also address spill and release prevention and response. With these measures, as well as implementation of DOGGR regulations concerning WST activities (see GR-10), the EIR correctly concludes that potential impacts for use, storage and transport of hazardous materials are less than significant.

Further, the chemicals used in WST fluids must be disclosed as part of the new SB 4 regulations promulgated by DOGGR, effective July 1, 2015. Please see GR 10 – DOGGR Regulations. The Final EIR has proposed a new MM 4.8-16 to require toxity testing for WST fluids. This measure will further mitigate potential impacts from chemicals used during oil and gas activities.

Finally, the comment includes references to, but has not provided the County copies of, various technical studies. Documents that are simply named in a comment letter, or named along with a reference to a general Web site, have not been made readily available to the public agency and, therefore, are not submitted pursuant to Cal. Pub. Res. Code § 21167.6, subd. (e)(7). *Consolidated Irrigation Dist. v. Superior Court* (2012) 205 Cal. App. 4th 697. However, the County has reviewed the referenced documents and considered them in formulating responses to comments.

0045-50

The comment summarizes the CCST Study's findings concerning spills and leaks from oil and gas activities. The County recognizes the CCST study discusses spills that have occurred within Kern County and finds that "oil and gas development within Kern County has resulted in chronic spills." It is expected a higher percentage of spills will occur within Kern County compared to the remainder of California since the vast majority of California oil and gas production occurs within Kern County. In 2012, Kern County produced 80 percent of the on-shore oil and gas produced in California (Kern County 2015), yet from January 2009 to December 2014 attributed only 55 percent of the produced water release events and only 42 percent of the chemical release events; hardly chronic in nature. CCST at 127. Section 4.8 of the Draft EIR evaluates the nature of spills within Kern County oilfields over the previous five years. During the CCST study period (January 2009 through December 2014), of the 31 chemical spills reported within California, "none of the reported spills contained chemicals used for hydraulic fracturing." CCST at 127.

A 2015 report cited by another commenter (see Comment 47-132 – 47-135) analyzing the number of spills in Kern County and other areas throughout the state found that the number of spills in Kern County has generally decreased over recent years. Caryotakis et al 2015. The study also found that Kern County had the lowest number of spills per year compared to other counties studied. In addition, the cited report

shows that most hazardous substance spills in California were of non-petroleum substances, such as sewage, that are unrelated to oil and gas production. The study further shows that most spills are properly reported and contained per existing regulations. For example, the study notes:

On average, only about10% of total spills that occurred in California were not contained; of the spills that affected waterbodies, only about 16% were not contained over the period studied.

In California overall, over 73% of spills were either cleaned-up or didn’t require clean-up.

This EIR also includes has numerous mitigation requirements concerning reporting and clean-up of contamination. MM 4.8-1 requires a Worker Training Awareness Program to implement all mitigation measures; MM 4.8-2 requires that the transportation, storage and disposal of hazardous materials be done in accordance with the Hazardous Materials Transportation Act; MM 4.8-3 requires implementation of eight (8) specific measures related to storage and cleaning up of hazardous materials; MM 4.8-4 has been modified by this Final EIR to include new reporting and relocation requirements for pipeline leaks (see FEIR section 7.1.4); MM 4.8-5 requires reporting, testing, and, where necessary, clean up of contamination discovered during grading or excavation work; MM 4.8-6 requires implementation of 15 measures to prevent the release or accidental spillage of wastes, including oil and other petroleum products consistent with American Petroleum Institute (API) or other accepted environmental standards; and MM 4.8-7 requires that all exploration and development activities be conducted consistent with API or other environmental standards, including secondary containment standards and implementation of spill contingency plans consistent with DOGGR regulations. The remaining mitigation measures identified in DEIR Ch. 4.8 also contribute to the containment and clean-up of hazardous materials.

0045-51

The comment is a citation to the DEIR. No response is necessary.

0045-52

Please see GR Water-6.

0045-53

The comment states that "older, unmarked wells … can act as a conduit for chemicals when a new well is operating." The comment has not cited any evidence to support this statement. Further, new WST wells are subject to significant regulations promulgated pursuant to SB 4, which became effective July 1, 2015, including requirements for well casings and other protection that mitigate the risk of chemical migration. Please see GR 10 – DOGGR: Regulations. Finally, idle well, whether mapped or not, are part of the environmental baseline and are not an impact of this Project. Please see GR Haz-2 – Idle Wells.

0045-69

Commenter references a regulation (14 CCR 1724.10(i)) from DOGGR's UIC program for the premise that DOGGR has admitted that Class II injection wells are routinely allowed to operate at pressures above the fracture gradient. To the contrary, that regulation actually states that step-rate tests are required to determine the maximum allowable surface injection pressure for UIC wells, but that the requirement for a step-rate test (not the requirement to operate below a certain pressure) may be waived if DOGGR "determines that surface injection pressure for a particular well will be maintained considerably below the estimated pressure required to fracture the zone of injection." Therefore, Class II injection wells are always required to operate with a pressure below the fracture gradient.

It is the case that production wells sometimes inject cyclic steam at or above fracture pressure. Such operations are not regulated under the UIC program. However, please see response to DOGGR comment letter, comments 63-57 and 63-58 for an explanation of how such practices are regulated, and how any potential impacts are mitigated in this EIR.

0045-70

Please see RTC 00045-49 for a discussion of the Hazards and Hazardous Materials mitigation Please see GR Water-1.

0045-71

Please see GR Water-1.

0045-72

The referenced newspaper article describes data relating to spills during oil and gas production activities. MMs 4.8.1 to 4.8.9 will reduce potential impacts associated with spills to less than significant.

0045-73

The EIR imposes various mitigation measures that reference and implement industry standards concerning oil management of hazardous materials at oil and gas production sites. The standards include Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development: The Gold Book (Bureau of Land Management 2007), Environmental Protection for Onshore Oil and Gas Production Operations and Leases (American Petroleum Institute 2009), or equivalent standards. See MM 4.8-6 - 4.8-7. Mitigation Measures 4.8-10 – 4.8-14 also address spill and release prevention and response. With these mitigation measures, risks to soils from leaks and spills are mitigated to the less than significant level. Please see GR-16 – Mitigation Measures, for a discussion concerning the level of specificity and feasibility of the proposed mitigation measures. Please see GR Geo-1 - CCST: Produced Water and Earthquake Risk, for a discussion of the lack of risk of induced seismicity from oil and gas activities.

0045-74

Please see GR Noise-1.

0045-75

The comment states that the DEIR fails to identify and quantify noise impacts from venting and flaring. According to the Applicant, flare noise levels are similar to other measured equipment sources in DEIR, Appendix V - Environmental Noise Assessment. Existing vents and flare are part of the environmental baseline, and noise from such vents and flares are not a function of this Project. Any newly constructed flares would be subject to MM 4.12-1 for construction noise (please see FEIR, Appendix V-1 and FEIR section 7.1.4 - Revised Summary of Impacts, Mitigation Measure & Significance Conclusions for revisions to MM 4.12-1). Operation of new flares would be subject to the County's noise ordinance, which requires sound levels to be at 65db DNL regardless of distance, as well as MM 4.12-2, which requires a minimum of a 190-feet setback from the closest sensitive receptor. For remaining noise comments, please see GR Noise-1.

0045-90

The comment is a summary of the comments that follow concerning Biological Resources. Please see RTCs 91-132.

0045-91

The comment states that the "DEIR specifically excludes 77 Category 3 species from analysis." Page 4.4-36 of the Draft EIR explains that Category 3 species were not analyzed because they either do not occur in the region or they are not considered to be a sensitive species within the Project Area. This determination was based on a screening analysis conducted by the County. This screening analysis included a search of the CNDDB for known special-status species to occur in the Project Area, followed by a review of qualified biologists to determine those warranting further study. Species were screened from further consideration based on the following criteria:

a. No records for a species were found in the Project Area and suitable habitat is not present or not expected;

b. Species occurrence in the Project Area is migratory or transient, with little or no chance of impact from Project activities; and

c. Occurrence data for species within Project Area was found to be erroneous.

In addition, species considered on "watch lists" were included in Category 3 unless the review of their distribution and status indicated that the portion of the species distribution within the Project Area warranted further consideration of Project impacts. Furthermore, most wildlife species are migratory, with some wildlife species traveling a longer distance such as birds versus smaller mammals that do not travel as far. Thus, occurrence of species in the Project Area that are known to be migratory or transient, with little or no chance of impact from Project Area activities, or occurrence data for species within Project Area that was found to be erroneous, were not analyzed. DEIR, Appendix N - Biological Resources Species Modeled Figures and Category 3 Species Review.

The comment mentions four specific species that were excluded from analysis:

As explained in Table 4.4-36, the Southwestern willow flycatcher nests in riparian vegetation, willows, and coast live oak. Due to the lack of dense riparian tree and shrub communities associated with rivers, lakes, and swamps in the San Joaquin Valley Floor portion of Kern County, Southwestern willow flycatcher was not included in the Category 3 species for detailed analysis.

As explained in Table 4.4-26, Tracy's eriastrum usually occurs in chaparral habitats at elevations from 1,000 to 5,500 feet. Chaparral habitat in Kern County is generally found in the higher elevations of the Pacific Coast Range and Sierra Nevada. As shown in Table 4.4-86, there is a total of approximately 8 acres of mixed chaparral habitat that could be affected by the Proposed Project. Given the limited area of anticipated impact, Tracy's eriastrum was not included in the Category 3 species for detailed analysis.

As explained in Table 4.4-36, the Conservancy fairy shrimp is not a stated listed species nor is it expected to be found in the Project Area. Thus, Conservancy fairy shrimp was not included in the Category 3 species for detailed analysis.

As explained in Table 4.4-36, the Valley elderberry longhorn beetle is not a stated listed species nor is it expected to be found in the Project Area. Thus, Valley elderberry longhorn beetle was not included in the Category 3 species for detailed analysis.

The comment further states that the "County should require on-the-ground surveys to determine their presence or absence before excluding them from analysis and mitigation requirements." The suite of biology-related mitigation measures starts with pre-disturbance surveys (MM 4.4-1, 4.4-5, 4.4-8, 4.4-10, 4.4-11, 4.4-12, and 4.4-17). The mitigation measures specify that surveys must be completed by qualified biologists in accordance with approved protocols. Where pre-disturbance surveys reveal the presence of sensitive species or habitats, the mitigation measures stress avoidance. In addition to general directives to avoid sensitive species, the mitigation measures establish species-specific buffer distances (MM 4.4-4, 4.4-5, 4.4-6, 4.4-7, 4.4-8, 4.4-9, and 4.4-10), exclusion fencing (MM 4.4-3), and other species-specific exclusion or avoidance strategies.

Please see FEIR section 7.1.4 for text revisions to various mitigation measures.

0045-92

The comment, which states a legal conclusion, is noted.

0045-93

The comment, which states conclusions concerning the potential scope of the Project, is noted. Please see RTCs 95-105.

0045-94

The comment summarizes the issues raised in comments 95-105 and is noted. Please see RTCs 95-105.

0045-95

The comment states that the DEIR fails to disclose and analyze the effects of habitat fragmentation, edge effects, and density effects that will result from the Project.

Generally, as described in the EIR, oil & gas field development in Kern County does not displace wildlife or interfere substantially with wildlife movement in the same manner as other development activities such as agricultural or urban development. Existing regional conservation documents such as the San Joaquin Valley (SJV) Recovery Plan acknowledge that oil & gas production retains more habitat value for special-status species of the southern San Joaquin Valley compared to agricultural lands (USFWS, 1998). Initial oil & gas field development in natural lands affects small patches of land (e.g., well locations) and results in some linear disturbance (e.g., access roads and pipelines), but the ability of wildlife to utilize adjacent habitat and traverse active oil & gas field areas is less impeded than it is for more intensive development types such as agriculture and urban lands. This conclusion is demonstrated by the documented use of oil and gas field production areas by species such as the San Joaquin kit fox (Fiehler and Cypher, 2011). Please see RTC 116.

The effects of habitat disturbance and fragmentation as a result of oil & gas development have been an ongoing subject of study in the San Joaquin Valley. *The Ecosystem Analysis of Oil Fields in Western Kern County*, California study conducted for BLM in 2008-2010, found that native species (including some special-status species) persist in areas of oil & gas field development up to a "medium level of disturbance" (ranging from 15 percent to 70 percent of the area disturbed). The study found that species such as Le Conte's Thrasher, San Joaquin antelope squirrel, and short-nosed kangaroo rat were present on all but the most disturbed study plots, and at high levels of oil/gas field development (Fiehler and Cypher, 2011). The vast majority of oil field areas of moderate to high disturbance occur within the DOGGR-delineated productive zones, which are variously subject to current or proposed conservation planning by Bureau of Land Management (BLM) or Habitat Conservation Plans, which seek to minimize the effects of habitat disturbance and fragmentation.

The effects of oil and gas field development disturbance in other habitat types, such as hardwood forests or sagebrush scrub, are not an accurate predictor of the effects on special status wildlife species in Kern County. The majority of the upland special-status species that occur within the southern San Joaquin Valley lands require dry, open grassland or habitats with scattered shrubs (USFWS, 2010b; USFWS, 2010c; USFWS, 1998). Dense herbaceous vegetation in uplands of the southern San Joaquin Valley (largely due to the growth of non-native grasses) may decrease habitat suitability for many of these species. Germano et al., 2012. The creation of small barren areas (unpaved access roads and well pads) can create open areas that are used by species such as blunt-nosed leopard lizard and giant kangaroo rats, especially in areas of previously dense non-native vegetation. In addition, roads and pipeline rights-of-way are utilized by San Joaquin kit fox for movement and foraging. The avoidance and minimization measures included in the DEIR provide additional protection for special status species that utilize active oil/gas fields.

The persistence of special-status species in Kern County oil & gas fields is attributed to their "permeability" for movement and dispersal. Medium levels of disturbance and below provide for habitat connectivity for movement and dispersal as documented by Fiehler and Cypher (2011). For example, San Joaquin kit foxes are relatively common in the oil & gas fields of western Kern County, and appear to be tolerant of oil & gas field development (Cypher et al 2013). Please see RTC 116. A study conducted in the former Naval Petroleum Reserves in California (NPRC) found that conversion of 30 percent of the native habitat to oil & gas field development did not impact movements and home ranges of San Joaquin kit foxes in the area. San Joaquin kit foxes within the NPRC have smaller home ranges when compared to the size of home ranges in other portions of the geographic range of the species, indicating that NPRC lands provide some of the highest quality habitat remaining for kit foxes in the San Joaquin Valley (Zoellick et al., 2002). Unlike highways, agricultural fields, and urban areas, which may present an insurmountable barrier to many species, the development associated with oil & gas fields (i.e. dirt access roads, utility ROW, and well pads) is generally porous

to most wildlife.

The mitigation lands that will be provided pursuant to MM 4.4-16 will include the dedication of regionally important wildlife habitats identified in large scale, regional conservation plans, such as the Lokern HCP or Elk Hills HCP, or acquisition of credits from agency-approved mitigation banks or other similar entity that are protecting habitat of regional importance for special status species. The regional HCPs and mitigation banks include lands that have been identified in recovery goals established for special status species (i.e., recovery goals established in the SJV Recovery Plan) and seek to protect land in large blocks to minimize edge effects, increase the likelihood that ecosystem functions will remain intact, and facilitate management. Such planning also seeks to connect blocks of conservation lands, allowing greater movement of wildlife between blocks. For example, future conservation lands identified in the Lokern HCP and the Elk Hills HCP would expand existing contiguous areas of intact habitat along the western side of the southern San Joaquin Valley that will further enhance the value of existing conservation lands by providing habitat connectivity and wildlife movement corridors.

Finally, the comment includes references to, but has not provided the County copies of, numerous studies concerning habitat fragmentation caused by oil and gas activities in other regions of the country and/or in other habitat types (e.g., impacts to forest regions near the Marcellus shale in Pennsylvania). Documents that are simply named in a comment letter, or named along with a reference to a general Web site, have not been made readily available to the public agency and, therefore, are not submitted pursuant to Cal. Pub. Res. Code § 21167.6, subd. (e)(7). *Consolidated Irrigation Dist. v. Superior Court* (2012) 205 Cal. App. 4th 697. However, the County has reviewed the referenced documents and concluded that the Kern-specific analysis relied upon in the EIR is more appropriate.

0045-96

Please see comment 95.

0045-97

The comment references two graphics from Appendix F of the DEIR. The information presented in Appendix F of the Draft EIR describes the methodology used to estimate the acreage of land disturbance that, on average, occurs per producible well. This methodology accounts for well pad size and ancillary disturbance variability (such as tanks, roads, and administrative facilities) that reflects construction and operational conditions. The information presented in Appendix F was not intended to be used as a tool to measure habitat fragmentation or edge effects.

There are several recent research efforts that evaluate the effects of new development on sensitive biological resources, including the effects of oil and gas activities. Most notable is the “Ecosystem Analysis of Oil Fields in Western Kern County, California” (Fiehler and Cypher 2011), which is an in-depth analysis of sensitive biological resources in Kern County. This research effort found that oil & gas field

development in Kern County does not displace wildlife or interfere substantially with wildlife movement in the same manner as other development activities such as agricultural or urban development. Other notable sensitive biological resources studies found similar findings, including the “Movements and Home Ranges of San Joaquin Kit Foxes (Vulpes Macrotis Mutica) Relative to Oil-Field Development” (Zoellick et al. 2002), “Quantity and distribution of suitable habitat for endangered San Joaquin kit foxes: conservation implications” (Cypher 2013), “Urban carnivores: ecology, conflict, and conservation” (Cypher 2010), and the SJV Recovery Plan (USFWS 1998). The analyses in the EIR and these reports provides substantial evidence supporting the County’s analysis and determinations concerning impacts to biological resources, including habitat fragmentation and related topics.

0045-98

The comment states that the DEIR fails to disclose that declines in abundance and local extirpations of birds, mammals and fish linked to oil & gas production activities.

Page 4.4-222 of the Draft EIR states that development of oil and gas activities “with more than 70% disturbance could reduce species movement, and potential impacts to wildlife movement in higher density locations would be significantly impacted by project activities without mitigation.” For this reason, the County-developed a suite of biology-related mitigation measures that start with pre-disturbance surveys (MM 4.4-1, 4.4-5, 4.4-8, 4.4-10, 4.4-11, 4.4-12, and 4.4-17). The mitigation measures specify that surveys must be completed by qualified biologists in accordance with approved protocols. Where pre-disturbance surveys reveal the presence of sensitive species or habitats, the mitigation measures stress avoidance. In addition to general directives to avoid sensitive species, the mitigation measures establish species-specific buffer distances (MM 4.4-4, 4.4-5, 4.4-6, 4.4-7, 4.4-8, 4.4-9, and 4.4-10), exclusion fencing (MM4.4-3), and other species-specific exclusion or avoidance strategies. Please see FEIR section 7.1.4 for revisions to mitigation measures.

Page 4.4-134 of the Draft EIR states the “5-year review of the San Joaquin kit fox listing found that the most robust kit fox populations occur in the portions of the Project Area that are most heavily used for oil and gas production” (USFWS 2010b). The San Joaquin kit fox is identified as an “umbrella species” in the SJV Recovery Plan, meaning that it is a good indicator for numerous other sensitive species to co-exist. Also, pages 4.4-134 and 4.4-135 of the Draft EIR state “The SJV Recovery Plan indicates that oil and gas production may provide greater opportunities for potential connectivity and conservation than agricultural land uses (USFWS 1998).” Please see RTC 45-115.

The Project includes economic and regulatory incentives to focus oil and gas activities in areas that have already been previously developed which are not located within established sensitive communities. It is also expected that the conformity review process authorized by the Revised Amended Ordinance, along with enforcement programs (please see GR-19), are designed to ensure that new development is compatible with and complements existing land uses.

Finally, the comment includes references to, but has not provided the County copies of, various technical studies. Documents that are simply named in a comment letter, or named along with a reference to a general Web site, have not been made readily available to the public agency and, therefore, are not submitted pursuant to Cal. Pub. Res. Code § 21167.6, subd. (e)(7). *Consolidated Irrigation Dist. v. Superior Court* (2012) 205 Cal. App. 4th 697. However, the County has reviewed the referenced documents and considered them in formulating responses to comments.

0045-99

Relying primarily on the CCST Study, the comment states that the DEIR fails to analyze the impacts of well stimulation treatment (WST) activities on habitat loss and fragmentation. According to the CCST Study, impacts related to habitat loss, hazardous materials, and noise “are not directly caused by the process of well stimulation, but are common to any form of oil and gas production.” CCST at 311. “Oil and gas production contribute to habitat loss and fragmentation through the construction of well pads and support infrastructure and related land disturbance, not directly by hydraulic fracturing itself.” CCST at 321. “In California, it is difficult to isolate the impact of hydraulic fracturing on habitat from the impacts of oil and gas production in general. This is because most hydraulic fracturing is occurring on lands that would be used for oil and gas production regardless of hydraulic fracturing.” CCST at 321. Thus, the impacts of WST activities are coextensive with the impacts from oil and gas activities, generally. As described in GR Bio-1, the mitigation program implemented by the EIR adequately mitigates impacts from oil and gas activities authorized by the Project to less than significant. Please see FEIR section 7.1.4 for revisions to the mitigation measures.

References:

California Council on Science and Technology (CCST). 2015. Well Stimulation Technologies and their Past, Present, and Future Use in California, An Independent Scientific Assessment of Well Stimulation in California. Volume II, July 2015, 481p.

0045-100

Relying primarily on the CCST Study, the comment states that the DEIR fails to analyze the impacts of well stimulation treatment (WST) activities on habitat loss and fragmentation. According to the CCST Study, impacts related to habitat loss, hazardous materials, and noise "are not directly caused by the process of well stimulation, but are common to any form of oil and gas production." CCST at 311. "Oil and gas production contribute to habitat loss and fragmentation through the construction of well pads and support infrastructure and related land disturbance, not directly by hydraulic fracturing itself." CCST at 321. "In California, it is difficult to isolate the impact of hydraulic fracturing on habitat from the impacts of oil and gas production in general. This is because most hydraulic fracturing is occurring on lands that would be used for oil and gas production regardless of hydraulic fracturing." CCST at 321. Thus, the impacts of WST activities are coextensive with the impacts from oil and gas activities, generally. As described in GR Bio-1, the mitigation program implemented by the EIR adequately mitigates impacts from oil and gas activities authorized by the Project to less than significant. Please see FEIR section 7.1.4 for revisions to the mitigation measures.

References:

California Council on Science and Technology (CCST). 2015. Well Stimulation Technologies and their Past, Present, and Future Use in California, An Independent Scientific Assessment of Well Stimulation in California. Volume II, July 2015, 481p.

0045-101

The comment states that the DEIR fails to adequately disclose the impacts of spills from oil and gas activities on biological resources, citing the CCST Study. The County recognizes the CCST study discusses spills that have occurred within Kern County and finds that “oil and gas development within Kern County has resulted in chronic spills.” It is expected a higher percentage of spills will occur within Kern County compared to the remainder of California since the vast majority of California oil and gas production occurs within Kern County. In 2012, Kern County produced 80 percent of the on-shore oil and gas produced in California (Kern County 2015), yet from January 2009 to December 2014 attributed only 55 percent of the produced water release events and only 42 percent of the chemical release events; hardly chronic in nature. CCST at 127. Section 4.8 of the Draft EIR evaluates the nature of spills within Kern County oilfields over the previous five years. During the CCST study period (January 2009 through December 2014), of the 31 chemical spills reported within California, “none of the reported spills contained chemicals used for hydraulic fracturing.” CCST at 127.

A 2015 report cited by another commenter (see Comment 47-132 – 47-135) analyzing the number of spills in Kern County and other areas throughout the state found that the number of spills in Kern County has generally decreased over recent years. Caryotakis et al 2015. The study also found that Kern County had the lowest number of spills per year compared to other counties studied. In addition, the cited report shows that most hazardous substance spills in California were of non-petroleum substances, such as sewage, that are unrelated to oil and gas production. The study further shows that most spills are properly reported and contained per existing regulations. For example, the study notes:

On average, only about10% of total spills that occurred in California were not contained; of the spills that affected waterbodies, only about 16% were not contained over the period studied.

In California overall, over 73% of spills were either cleaned-up or didn’t require clean-up.

This EIR also includes has numerous mitigation requirements concerning reporting and clean-up of contamination. MM 4.8-1 requires a Worker Training Awareness Program to implement all mitigation measures; MM 4.8-2 requires that the transportation, storage and disposal of hazardous materials be done in accordance with the Hazardous Materials Transportation Act; MM 4.8-3 requires implementation of eight (8) specific measures related to storage and cleaning up of hazardous materials; MM 4.8-4 has been modified by this Final EIR to include new reporting and relocation requirements for pipeline leaks (see FEIR section 7.1.4); MM 4.8-5 requires reporting, testing, and, where necessary, clean up of contamination discovered during grading or excavation work; MM 4.8-6 requires implementation of 15 measures to prevent the release or accidental spillage of wastes, including oil and other petroleum products consistent with American Petroleum Institute (API) or other accepted environmental standards; and MM 4.8-7 requires that all exploration and development activities be conducted consistent with API or other environmental standards, including secondary containment standards and implementation of spill contingency plans consistent with DOGGR regulations. The remaining mitigation measures identified in DEIR Ch. 4.8 also contribute to the containment and clean-up of hazardous materials. These measures serve to reduce the impacts of spills on species and ecosystems.

0045-102

The comment states that the “DEIR fails to adequately disclose and analyze the impacts of noise pollution on species and ecosystems.” Impact 4.12-3: A Substantial Permanent Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project, and Impact 4.12-4: A Substantial Temporary or Periodic Increase in Ambient Noise Levels in the Project Vicinity Above Levels Existing Without the Project, evaluated the effects of noise in the oil and gas fields associated with the Proposed Project. Both MM 4.12-1 and MM 4.12-2 were developed to reduce anticipated effects on sensitive receptors; though not specifically crafted for biological resources, the effect of these measures will be to reduce noise impacts overall, including for biological resources.

Oil and gas activities have been ongoing in Kern County for over 100 years, and the noise associated with those activities is generally part of the ambient condition. Wildlife species have long since adapted to the ambient noise conditions in Kern County, and any such changes to their spatial distribution, abundance, stress levels, or behaviors occurred long ago. As described in DEIR Ch. 4.12 – Noise, the Project will not significantly alter the noise patterns currently experienced, as the Project is a continuation of activities that are already occurring and would continue to occur even without the Project, though now subject to the conformity review process and related mitigation requirements. Over the last 100 years, the technological advances in oil and gas extraction has afforded the industry the ability to reduce the quantity of infrastructure required to operate the oil and gas fields as well as centralize the processing and distribution activities that ultimately benefit wildlife species by concentrating noise in fewer locations versus 100 years ago.

Finally, the comment includes references to, but has not provided the County copies of, various technical studies. Documents that are simply named in a comment letter, or named along with a reference to a general Web site, have not been made readily available to the public agency and, therefore, are not submitted pursuant to Cal. Pub. Res. Code § 21167.6, subd. (e)(7). *Consolidated Irrigation Dist. v. Superior Court* (2012) 205 Cal. App. 4th 697. However, the County has reviewed the referenced documents and considered them in formulating responses to comments.

0045-102 cont'd

0045-103

The EIR includes a comprehensive evaluation of available water supplies, including the significant current overdraft of groundwater, as explained in the Water Supply Assessment (Appendix T) and as further updated in GR Water 5. Based on supply and demand estimates developed from the detailed water management plans and reports, the WSA concluded that there is no surplus water in the Project Area and that the Kern County Subbasin is in an existing overdraft condition. This information was incorporated into the analysis of available groundwater supplies for purposes of the EIR. While this consideration did not expressly take into consideration the effect of existing and ongoing overdraft and drought conditions on biological resources, the EIR does fully disclose that available groundwater supplies are a significant issue for the Project Area and results in a significant and unavoidable impact. CEQA analysis requires reasonable disclosure based on best available information, but does not require “perfect” information; please see GR 21.

It should also be noted that, as part of implementation of the Sustainable Groundwater Management Act (SGMA), local groundwater management authorities are being established to further define groundwater resources; establish sustainable groundwater use rates; and allocate groundwater among users. See GR Water-3 regarding the SGMA. The SGMA will play a significant role in future supply estimates. The County is required to participate in the Kern groundwater sustainability effort underway, and the basin has now been designated by the Department of Water Resources as being in critical overdraft. SGMA will require that agricultural, municipal, and industrial activities account for current and future uses of water and create sustainable plans for managing the resource. Pursuant to California Water Code section 10933(a)(8), this effort will also take into account “adverse impacts on local habitat and local streamflows.” While the EIR finds that oil and gas activity uses very little groundwater compared to other uses, significant impacts to groundwater supply are identified and mitigation measures are proposed. MM 4.17-2 and 4.17-3 require the Applicant to work with the County to increase the re-use of produced water from oil and gas activities. These measures are intended to help reduce the industry’s dependence on groundwater, which will contribute to alleviating stress on this limited resource in the future. These measures will also insure that impacts to habitat and species are considered as part of any groundwater planning exercise.

0045-104

The DEIR includes extensive analysis of the Project’s impacts to water quality, as well as a suite of mitigation measures designed to reduce these impacts to less than significant. These measures include 4.9-1 – 4.6-6. Implementation of these measures will water quality generally, including indirect effects to habitat and species that might arise from the Project as disclosed in the DEIR, p. 688.

0045-105

The comment, which states a legal conclusion concerning the adequacy of various mitigation measures, is noted. Please see GR 1 – Ministerial Permit Process and GR 19 – Mitigation Monitoring and Reporting Program, for discussion of enforceability of mitigation measures.

0045-106

The comment, which states a legal conclusion concerning the adequacy of various mitigation measures, is noted. Please see GR 1 – Ministerial Permit Process and GR 19 – Mitigation Monitoring and Reporting Program, for discussion of enforceability of mitigation measures.

0045-107

These comments restate excerpts from MMs 4.4-1, 4.4-3, 4.4-5, 4.4-7, 4.4-10 and 4.4-12. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments, as well as to add specificity and remove discretion so that the measures, as implemented, will be consistent with the ministerial conformity review process adopted by the Revised Amended Ordinance. The revised mitigation measures are set forth in section 7.1.4 of this Final EIR. Specifically, MMs 4.4-1, 4.4-3 and 4.4-12 have been modified. Please see GR 16 – Mitigation Measures.

0045-114

Please see GR Bio-1 - Mitigation Measures, Mitigation Criteria and Ratios and GR 16 – Mitigation Measures, for a discussion concerning the adequacy of the EIR's mitigation measures for Biological Resources. The Final EIR has also made revisions to numerous mitigation

measures to address concerns raised by comments, as well as to add specificity and remove discretion so that the measures, as implemented, will be consistent with the ministerial conformity review process adopted by the Revised Amended Ordinance. The revised mitigation measures are set forth in section 7.1.4 of this Final EIR.

0045-114 cont'd

0045-115

Habitats used by the San Joaquin kit fox are typically grassland and saltbush scrub in areas of flat or rolling topography (Cypher et al. 2013). However, this taxon is quite tolerant of human-caused impacts and will, to a varying extent, utilize urban areas, oil fields and cultivated agricultural lands (Fiehler and Cypher 2011). For example, the San Joaquin kit fox is known to use oil fields, even those with intensive impacts, for all life-history activities such as foraging, cover, reproduction, and traveling (CEC, 1996). A study conducted in the former Naval Petroleum Reserves in California (NPRC) found that conversion of 30 percent of the native habitat to oil/gas field development did not impact movements and home ranges of San Joaquin kit foxes in the area (Zoellick et al. 2002). San Joaquin kit foxes within the NPRC have smaller home ranges when compared to the size of home ranges in other portions of the geographic range of the species, indicating that NPRC lands provide some of the highest quality habitat remaining for kit foxes in the San Joaquin Valley (Zoellick et al., 2002). It is notable that remaining suitable habitat for San Joaquin kit fox is currently concentrated on the west side of the southern San Joaquin Valley Floor from the Lokern Natural Area to Maricopa (Cypher 2013), which overlaps with areas where oil and gas activities have been focused for over a century.

The comment notes recent studies by Cypher et al (2013) that emphasize the need to protect high suitability habitat for San Joaquin kit fox. The cited study by Cypher emphasizes that the historic losses of habitat are largely due to agricultural conversion and urban development. As described above, the largest blocks of remaining suitable habitat are located in the area of the southern San Joaquin Valley that is also associated with more than 100 years of intensive oil and gas development. The blocks of contiguous habitat in Kern County include lands that are proposed for conservation in regional plans such as the Lokern HCP and the Elk Hills HCP that will be important for the long-term survival and recovery of the species by protecting core populations identified in the SJV Recovery Plan (USFWS, 1998). Please see GR Bio-1 - Valley Floor HCP, LoKern HCP, and Elk Hills Hills HCP. Mitigation Measure 4.4-16 in the DEIR will provide a mechanism for the dedication and conservation of wildlife habitats, including lands in the Lokern area, the Elk Hills area, and other lands along the west side of the southern San Joaquin Valley that are considered highly suitable for San Joaquin kit fox (Cypher et al 2013).

San Joaquin kit foxes in the southern San Joaquin Valley occur in and adjacent to several urban areas including the cities of Taft (Zoellick et al. 2002), Tulare, Visalia, and Porterville (USFWS 1998), and Bakersfield, where kit foxes have been observed throughout the city (Frost 2005). Additionally, urban kit foxes have been found to den close to human activities and structures, including water sumps (catchment basins) and landscaped areas in and adjacent to urban development in Bakersfield (Frost 2005). Frost (2005) concluded that urban habitat can support viable kit fox populations when sufficient food and den sites are available, mortality is minimal, and reproduction occurs at reasonable rates, then (Frost 2005). As noted by Cypher et al. (2013), several hundred kit foxes may inhabit the City of Bakersfield in Kern County despite the general absence of natural habitat. This urban population of kit fox is persistent and stable (Cypher and Frost 1999, Cypher 2010).

In 2005, a study was undertaken to investigate the effects of roads on urban kit fox populations. The study found that arterial roads accounted for 72.9% of kit fox strikes and approximately 90% of road kill were retrieved from roads with posted speed limits of greater than 45 mph (Bjurlin et al. 2005). These data contrast with all other studies on San Joaquin kit fox outside of urban areas in which vehicle strike rarely exceeded 10% of mortalities and was not considered a significant influence on fox demographics or population ecology (Bjurlin et al. 2005). Based on this information, Mitigation Measure 4.4-11, which places a speed limit of 10 mph on dirt access roads, should be reasonably sufficient to prevent vehicle strikes of San Joaquin kit fox.

As described in Global Response BIO – 1, the avoidance and minimization requirements in the mitigation measures are modelled after measures typically required by the USFWS or CDFW to reduce potential effects to ESA and CESA-listed species With their incorporation as conditions of the Project, these measures would be applied to all oil and gas activities under the purview of the County, including entities that do not typically undertake Section 7 or Section 10 consultation for ESA-listed species or Section 2081 for CESA-listed species. Where complete avoidance is not possible, Mitigation Measures 4.4-2, 4.4-11 and 4.4-12 prohibit take of listed species such as San Joaquin kit fox without authorization from the USFWS or CDFW.

Finally, the comment includes references to, but has not provided the County copies of, various technical studies. Documents that are simply named in a comment letter, or named along with a reference to a general Web site, have not been made readily available to the public agency and, therefore, are not submitted pursuant to Cal. Pub. Res. Code § 21167.6, subd. (e)(7). *Consolidated Irrigation Dist. v. Superior Court* (2012) 205 Cal. App. 4th 697. However, the County has reviewed the referenced documents and considered them in formulating responses to comments.

0045-116

The comment states that the EIR should provide “specific mitigation measures that require that previously disturbed areas and existing roads are used; infrastructure is consolidated and co-located to reduce disturbance; and pipelines are routed along existing roads and elevated to minimize surface disturbance and allow wildlife to pass underneath, in addition to the full range of other feasible mitigation.”

Impact 4.4-1 of the Biological Resources section recognizes that 90.1% (2,430) of the annual number of future production wells subject to the Revised Amended Ordinance’s conformity review process (2,697) would be located in Tier 1 areas, which are currently subject to the highest level of existing disturbance from prior oil and gas exploration and production activities. (DEIR, at pp. 4.4-173 – 4.4.174.) Despite these projections, the DEIR conservatively anticipated that new disturbance would occur on land not currently undergoing active disturbance. DEIR, at p. 4.4-174. To minimize impacts to undisturbed land, the DEIR includes a comprehensive biological mitigation framework that requires applicants to use previously disturbed areas for future oil and gas extraction activities to the extent feasible. Specifically, MM 4.4-15, subdivision (l) states that “[a]ll activity shall use previously disturbed areas to the maximum extent feasible to minimize the amount of new disturbance.” MM 4.4-15, subdivision (m) also provides assurances to limit vehicle disturbance: “Vehicle, equipment, and material storage must be limited to previously disturbed areas. . .” The existing mitigation is consistent with the comment’s suggested avoidance measures.

With regard to impacts to the movement of migratory fish or wildlife species, as discussed in DEIR Impact 4.4-4, oil and gas exploration and production activities maintain wildlife movement to a greater extent than urban development and some agricultural uses that modify surface vegetation, soils and irrigation. DEIR, at p. 4.4-222. The DEIR recognizes that even moderately developed oilfields retain capacity for wildlife movement. Implementing MM 4.4-15, subdivision (l) and (m), described above, would further reduce any impacts to wildlife movement.

The suggestion that the County require elevation of pipelines above grade as mitigation is legally infeasible because it would conflict with federal jurisdiction over pipeline design and pipeline safety regulations. Specifically, hazardous liquid pipelines are under the jurisdiction of the U.S. Department of Transportation (USDOT) and are subject to the regulations in 49 CFR Part 195, as authorized by the Hazardous Liquid Pipeline Safety Act of 1979 (49 USC Sections 60101–60133). Other important federal requirements are contained in 40 CFR Parts 109, 110, 112, and 113 under the Oil Pollution Act of 1990 requiring Oil Spill Prevention, Control; Countermeasures (SPCC) Plans; and 49 CFRs 191, 192, and 199 [“Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards”], which identify safety regulations for natural gas pipelines. Collectively, these regulations are intended to ensure adequate protection for the public, pipeline workers, contractors, and employees and to prevent pipeline accidents and failures.

Public Resources Code section 21002 prohibits an agency from approving a project without requiring the implementation of any feasible mitigation measures. However, “an EIR need not analyze ‘“‘every *imaginable* alternative or mitigation measure; its concern is with *feasible* means of reducing environmental effects.’”’ [Citation.]” (*Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1055-1056.) The Project’s robust biological mitigation framework addresses the commenter’s concerns and is consistent with CEQA’s mandates.

Please see GR 10 – Mitigation Measures and FEIR section 7.1.4 for revisions to mitigation measures made in this Final EIR.

0045-117

MM 4.4-2 does not authorize the incidental take of any species, but rather states that appropriate regulatory authorizations must be obtained before the take of any identified category of species is authorized. If no authorization is forthcoming, no incidental take could occur. Please see FEIR section 7.1.4 for text revisions to MM 4.4-2.

0045-119

Please see RTC 45-116. Further, the comment includes references to, but has not provided the County copies of, various technical studies. Documents that are simply named in a comment letter, or named along with a reference to a general Web site, have not been made readily available to the public agency and, therefore, are not submitted pursuant to Cal. Pub. Res. Code § 21167.6, subd. (e)(7). *Consolidated Irrigation Dist. v. Superior Court* (2012) 205 Cal. App. 4th 697. However, the County has reviewed the referenced documents and considered them in formulating responses to comments.

0045-120

The comment states that the DEIR fails to include feasible mitigation measures to avoid adverse effects of light pollution on special-status species. The comment further states that MM 4.4-15, subdivision (b) specify “that site lighting should be directly downward and internally, avoiding site casting, uplighting, wall washes, and lighting where the bulb protrudes from the fixture” and that other mitigation measures should be required such as scheduling activities that require night lighting outside of important periods for affected species.

Under the current regulatory framework, oil and gas exploration and production operations and related facilities are exempt from the outdoor lighting requirements of Chapter 19.81.050 of the existing Kern County Zoning Ordinance. However, the Project would apply Chapter 19.81 of the Zoning Ordinance, known as the “Outdoor Lighting – Dark Skies Ordinance” to future oil and gas extraction activities. DEIR, Project Description Attachment A, at pp. 14-16. This chapter of the Kern County Zoning Ordinance provides requirements for outdoor lighting within specified unincorporated areas of Kern County.

The comment proposes mitigation that is already captured by the County’s existing Dark Skies Ordinance. Consistent with the requirements of Chapter 19.81, all new temporary or permanent outdoor lighting fixtures associated with oil and gas extraction activities would have to meet the following requirements outlined by Section 19.81.040 of the Revised Amended Ordinance:

Site lighting should be directed downward and internally. Revised Amended Ordinance, § 19.81.040(A). Uplighting is only allowed where: (1) the light is effectively contained by the structure; (2) no glare is visible from off site; and (3) the fixture is fully shielded so that none of the light which is emitted above the horizontal plane crosses over the property line of the parcel where the subject light is located. Revised Amended Ordinance, § 19.81.040(F). All lighting must be fully shielded, installed, and aimed properly to comply with the Dark Skies Ordinance. Revised Amended Ordinance, § 19.81.040(E). All facilities must comply with Hours of Operation (Curfew) and Security Lighting schedules. Revised Amended Ordinance, § 19.81.040(J).

Furthermore, the DEIR’s extensive biological mitigation scheme (MM 4.4-1 to MM 4.4-20) assures that impacts to special-status species are minimized. For example, MM 4.4-1 requires pre-disturbance surveys for each application and consultation and concurrence by the California Department of Fish and Wildlife and the United States Fish and Wildlife Service. MM 4.4-2 prohibits incidental take of special status species without a permit or other written authorization from state or federal regulatory agencies. The Project’s robust biological mitigation framework is consistent with CEQA’s mandates. See Pub. Resources Code, § 21002 [prohibiting an agency from approving a project without requiring implementation of feasible mitigation measures]; *Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1055-1056 [“an EIR need not analyze ‘“‘every *imaginable* alternative or mitigation measure; its concern is with *feasible* means of reducing environmental effects.’”’ [Citation.]”].

The County is cognizant of its legal obligation under CEQA to substantially lessen or avoid significant environmental effects to the extent feasible. (Pub. Resources Code, § 21002.) However, the County’s expert staff and environmental consultants have determined that the proposed Project contains ample provisions to ensure that adverse effects of light pollution on special status species will be avoided. Accordingly, no additional mitigation is required. (See Pub. Resources Code, § 21100(b)(3); CEQA Guidelines, § 15126.4(a)(1) [mitigation measures must be designed to minimize significant environmental impacts, not necessarily eliminate them].)

0045-125

The comment states that the DEIR does not mitigate the harms to wildlife from lined and unlined wastewater pits and sumps which have been

documented to cause injury and mortality of wildlife species. The comment states that the DEIR should require mitigation measures prohibiting the storage of oil and gas-related fluids in pits and sumps, and requiring netting over all existing pits and sumps.

The DEIR recognizes potential harms to wildlife from lined and unlined wastewater pits and sumps and includes several mitigation measures to minimize impacts to wildlife. As provided by MM 4.1-3 of the DEIR, “[s]umps and ponds shall be permitted only to the extent authorized by the Central Valley Regional Water Quality Control Board (via waiver, Waste Discharge Requirements, or other form of authorized written documentation) and shall comply with all applicable legal requirements and mitigation measures for sumps serving as storage, percolation or evapotranspiration ponds for produced water.” DEIR, at pp. 1-29, 4.1-41.

Consistent with MM 4.1-3, all oil and gas extraction activities under the Project will be required to comply with California Code of Regulations, title 14, section 1770, which provides strict guidance regarding the siting and location of sumps so as to not be a hazard to “people, livestock, or wildlife including birdlife.” Cal. Code Regs., tit. 14, § 1770, subd. (b). Specific protections include the following:

(1) To protect people, sumps in urban areas shall be enclosed in accordance with Section 1778 (a) or (e) and (c).

(2) In non-urban areas, to protect people and livestock and to deter wildlife, an enclosure shall be constructed around sumps in accordance with Section 1778 (b) or (e).

(3) Any sump, except an operations or drilling sump, which contains oil or a mixture of oil and water shall be covered with screening to restrain entry of wildlife in accordance with Section 1778(d).

(4) A sump need not be individually fenced if the property or the production facilities of which the sump is a part is enclosed by proper perimeter fencing.

This regulation is further augmented by the requirements of California Code of Regulations, title 14, section 1778, which identifies detailed enclosure specifications. Cal. Code Regs., tit. 14, § 1778. Requiring greater restrictions for the storage of oil and gas-related fluids would be legally infeasible because they would conflict with the state’s jurisdiction over sump design and safety regulations.

MM 4.4-9 provides further assurances that sumps constructed pursuant to the Project minimize effects to wildlife by requiring “[a]ll tanks, liquid storage facilities, and any open area containing water or other liquid materials, including drilling sumps . . . be covered or otherwise shielded in a manner that prevents . . . intrusion and potential entrapment.” (DEIR, at pp. 1-38, 4.4-9.) Although specifically geared towards minimizing impacts to California condor, other special-status species will benefit from this requirement.

The Project’s biological mitigation framework addresses the commenter’s concerns and is consistent with CEQA’s mandates. (See Pub. Resources Code, § 21002 [prohibiting an agency from approving a project without requiring implementation of feasible mitigation measures]; *Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1055-1056 [“an EIR need not analyze ‘“‘every *imaginable* alternative or mitigation measure; its concern is with *feasible* means of reducing environmental effects.’”’ [Citation.]”].) Accordingly, no additional mitigation is required. Please see GR 16 – Mitigation Measures.

0045-125 cont'd

0045-126

MM 4.3-8 requires the Applicant to fund emission reduction programs through the San Joaquin Valley Air Pollution Control District that will avoid “any net increase” in oxides of nitrogen, reactive organic gases, and particulate matter of 10 microns or less. While this measure has not been specifically drafted to reflect its positive benefit to non-humans, the “no net increase” performance standard will ensure that species benefit.

0045-127

The comment states that the DEIR fails to mitigate impacts to wildlife from the proliferation of linear corridors and elevated structures like transmission poles and power lines that can facilitate increased predation and parasitism.

As noted in the DEIR, construction of new transmission lines is not within the scope of the Project. DEIR, at p. 40. However, for the purposes of the DEIR’s analysis, it was assumed that for each well, 467 feet of distribution line would be constructed. The DEIR assumed the following for distribution lines constructed as a part of the Project:

Distribution lines are assumed to be suspended from wooden poles 30 feet tall. Electrical conductor (wire that conducts electricity) is 12 kV and is stepped down to 480 volts before being connected to individual motors. Electrical distribution poles are typically approximately 200 feet apart and would be scattered throughout the site, depending upon the number of wells or other equipment requiring electricity. Distribution poles are assumed to be constructed along the existing access road rights-of-way (ROWs) or within the well pad area. Therefore, ground disturbance for distribution line construction was assumed to be included in the new oil and gas well disturbance acreages.

Recognizing potential impacts generated by distribution or transmission lines, the DEIR included MM 4.4-9, subdivision (f), which places limitations on the installation of transmission lines. Specifically, “[n]o overhead transmission lines may be used at the site without the prior approval of the United States Fish and Wildlife Service and the California Department of Fish and Wildlife.” Although specifically geared towards minimizing impacts to California condor, other special-status species will benefit from this consultation requirement. MM 4.2-2, subdivision (h) provides additional safeguards to wildlife by requiring overhead electrical or communication lines to be aligned to the greatest extent possible with existing access roads.

No specific mitigation has been proposed for County consideration. However, the Project’s existing biological mitigation framework addresses the comment’s concerns and is consistent with CEQA’s mandates. (See Pub. Resources Code, § 21002 [prohibiting an agency from approving a project without requiring implementation of feasible mitigation measures]; *Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1055-1056 [“an EIR need not analyze ‘“‘every *imaginable* alternative or mitigation measure; its concern is with *feasible* means of reducing environmental effects.’”’ [Citation.]”].) Accordingly, no additional mitigation is required.

Please see GR 16 – Mitigation Measures.

0045-128

Please see GR-16 - Mitigation Measures.

0045-129

The comment states that the DEIR fails to provide a thorough assessment of the Project's impacts over time by failing to list other projects or ongoing activities that cause cumulative impacts to biological resources in the Project Area.

CEQA requires that an EIR evaluate a project's cumulative impacts. Cumulative impacts are the project's impacts combined with the impacts of other related past, present, and reasonably foreseeable future projects. (CEQA Guidelines, § 15355, subd. (b).) As set forth in the CEQA Guidelines, the discussion of cumulative impacts must reflect the severity of the impacts, as well as the likelihood of their occurrence; however, the discussion need not be as detailed as the discussion of environmental impacts attributable to the project alone. (*Ibid*.) Public Resources Code, Section 21083, subdivision (b)(2) further provides that "a project may have a significant effect on the environment if the possible effects of a project are individually limited but cumulatively considerable."

As further defined by Section 15355 of the CEQA Guidelines:

"Cumulative impacts" refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.

The individual effects may be changes resulting from a single project or a number of separate projects.

The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

An adequate discussion of cumulative impacts will use one of the following methods, known respectively as the "list" approach and the "plan/projections" approach:

A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or

A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect . . .

(CEQA Guidelines, § 15130, subd. (b)(1); see also *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 276-279 (*Preserve Wild Santee*).)

For the purposes of the DEIR's cumulative effects analysis, the plan/projection approach was used to determine whether the Project would result in cumulative impacts. As stated in the DEIR:

An adequate discussion of significant cumulative impacts must include either a list of past, present, and probable future projects producing related or cumulative effects, or a summary of projections from an adopted local, regional, or statewide plan, related planning document, or related environmental document that describes conditions contributing to the cumulative effect (CEQA Guidelines Section 15130(b)(1)). This cumulative analysis uses the plan/projection approach, and includes both the KCGP and the regional growth plan and projections included in the Kern COG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) approved in 2014.

(DEIR, at p. 3-80.)

The decision to rely on the KCGP and RTP/SCS was due, in part, to the large size of the Project area where the proposed ordinance amendment would take effect. Please see RTC 43-132 and RTC 43-169.

The DEIR recognized that future oil and gas extraction activities could contribute to a significant cumulative impact on Project area biological resources because the County does not regulate all lands within its boundaries. DEIR, at pp. 4.4-229 – 4.4-230. Given the scope of the Project, the EIR's cumulative analysis of Biological Resources is adequate under a "practical and reasonable standard." See *Preserve Wild Santee, supra,* 210 Cal.App.4th at pp. 276-279 [upholding a plan/project cumulative analysis methodology for biological resources].

Cumulative Mitigation

The comment states that the DEIR fails to propose feasible mitigation measures to reduce significant cumulative impacts such as avoiding oil and gas development and production in special-status species habitats, important movement corridors, and sensitive natural communities, and setting limits on cumulative habitat loss for the 164 special-status species and 15 sensitive natural communities in the Project area.

As mentioned above, the DEIR recognized that future oil and gas extraction activities could contribute to a significant cumulative impact on Project area biological resources because the County does not regulate all lands within its boundaries. DEIR, at pp. 4.4-229 – 4.4-230. Accordingly, the DEIR called for the implementation of MM 4.4-1 through MM 4.4-20 to minimize cumulative impacts generated by the proposed Project. DEIR, at p. 4.4-230.

The comment proposes mitigation that is already captured by the existing Biological Resources mitigation framework. For example, MM 4.4-15, subdivision (l) states that "[a]ll activity shall use previously disturbed areas to the maximum extent feasible to minimize the amount of new disturbance." MM 4.4-15, subdivision (m) also provides assurances to limit vehicle disturbance: "Vehicle, equipment, and material storage must be limited to previously disturbed areas. . ." The existing mitigation is consistent with the commenter's suggested avoidance measures. To the extent commenter suggests limits on habitat disturbance, such limits would be logistically infeasible.

With regard to impacts to the movement of migratory fish or wildlife species, as discussed in DEIR Impact 4.4-4, oil and gas exploration and production activities maintain wildlife movement to a greater extent than urban development and some agricultural uses that modify surface

vegetation, soils and irrigation. DEIR, at p. 4.4-222. The DEIR recognizes that even moderately developed oilfields retain capacity for wildlife movement. (*Ibid.*) Implementing MM 4.4-15, subdivision (l) and (m), described above, would further reduce impacts to wildlife movement.

Under CEQA, "an EIR need not analyze ‘"‘every *imaginable* alternative or mitigation measure; its concern is with *feasible* means of reducing environmental effects.’"’ [Citation.]" (*Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1055-1056.) The Project's robust biological mitigation framework addresses the commenter's concerns and is consistent with CEQA's mandates.

Please see GR 16 – Mitigation Measures.

See RTC 129.

0045-132

The comment is a general conclusion. No response is necessary and it is noted for the record.

0045-133

CBD submitted a compact disk received by the County on September 15, five days after the deadline for submitting comments.

The compact disk included most of the documents referenced in the footnotes included in CBD's 30-page comment letter. Missing from the compact disk was a 1953 judicial opinion (Beverly Oil Co. v City of Los Angeles, 40 Cal.2d 552, 558) and a 1976 Attorney General Opinion (59 Ops. Cal. Attn. Gen. 461, 465), a statutory reference (Pub. Res. Code 21001(b)) and two regulations (CEQA Guidelines section 15130 and 14 Cal. Code. Reg. 1724).

All of these footnote reference documents, and the missing legal authorities, were reviewed as within the context of responding to the CBD comment letter. No additional responses are warranted for these materials.

CBD also submitted an additional 144 documents on its CD. The CBD submittal did not include a list or index of these additional documents, nor did it include any explanation as to the CBD's intended use of these documents or their relevance to the EIR. A list of these unreferenced documents has been prepared, numbered and is attached to this response.

The additional non-indexed materials were reviewed for relevance to the Draft EIR. 87 documents are scientific reports, news articles, fragments of studies and opinion pieces about oil and gas development outside California. 23 documents (numbered 7, 34,47, 51,52,53,61,63,64,65,68,72,73, 89,92,97, 104,105,106, 109, 125,129,135 relate to oil and gas development and potential seismic issues related to well stimulation and drilling in Oklahoma, Arkansas, Texas, Ohio, Colorado, Canada and generally in the United States and Europe. The relationship between potential seismic activity being triggered or intensified by oil and gas activities in Kern County is discussed in the DEIR in chapter 4.5 Geology and Soils. The conditions and events outside California have been noted for the record but are not relevant, based on both very different geological formations as well as well stimulation practices to impacts in Kern County. The differences between oil and gas production in Kern County and other states, with respect to well stimulation practices, is addressed in Appendix [U] of the Draft EIR. The conditions, events and evaluation of potential impacts described in these documents in not relevant to the DEIR and the commenter did not provide any explanation of the relevance for review. 30 documents relate to oil and gas development in the Marcella Shale in Pennsylvania (numbered 32,33,67,74,75,87,90,99, 130) and New York (numbered11,42,43,44,45,57,59,66,77,85,88,96,98,100,101,103,113,119,127,128,138) that are scientific reports, news articles, fragments of studies and statements and opinion pieces. 5 documents (numbered 6, 54,116,136, 140) are scientific studies on impacts to wildlife from oil sands production in Canada. The studies look at specific species of birds and impacts from tailings ponds, reclaimed wetlands after oil sands extraction and other associated activities. Oil sands , such as natural bitumen /tar sands in Canada, do not exist in extractable quantities in Kern County and no oil sand extraction or practices are occurring or authorized in California. The differences between oil and gas production in Kern County and other states, with respect to well stimulation practices, is addressed in Appendix [U] of the Draft EIR. The mission and conduct of regulators from other states is not relevant to the EIR. The conditions,events and evaluation of potential impacts described in these documents in not relevant to the DEIR and the commenter did not provide any explanation of the relevance for review. 10 documents(numbered 9,10,58,62,102,115,131,133,139,132) are scientific reports, news articles, fragments of studies and statements and opinion pieces regarding impacts from natural gas and shale oil extraction in Wyoming, primarily focused on Coalbed Methane development. Coalbed methane production is a form of natural gas extracted from coal beds. The US Department of Energy

EIA website shows that zero production of natural gas from coal beds has ever occurred in California. (http://www.eia.gov/dnav/ng/ng_prod_coalbed_s1_a.htm). The conditions,events and evaluation of potential impacts described in these documents in not relevant to the DEIR and the commenter did not provide any explanation of the relevance for review. 6 documents (numbered 5,41,50,124, 134,141) are scientific, technical reports and a conference program notes for analysis of specific impacts on specific instances of exposure of fish and wildlife to specific oilfield development in Kentucky, West Virginia, Pennsyvalnnia and New York. The differences between oil and gas production in Kern County and other states, with respect to well stimulation practices, is addressed in Appendix [U] of the Draft EIR. The conditions,events and evaluation of potential impacts described in these documents in not relevant to the DEIR and the commenter did not provide any explanation of the relevance for review. 11 documents (numbered 35,36,37,46,60,69,70,83,93,137,144) are scientific reports, news articles, fragments of studies , statements and opinion pieces regarding potential health impacts on human and animal health from oil and natural gas extraction. The site specific studies are for Colorado communities. The Draft EIR comprehensively details the potential impacts to health from the specific oil and gas activities conducted in Kern County. Detailed analysis and site specific Health Risk Assessment have been included and mitigation measures included to reduce the health impacts on both workers and people living near oilfield and construction activities. The conditions,events and evaluation of potential impacts described in these documents in not relevant to the DEIR and the commentor did not provide any explanation of the relevance for review. 1 document (numbered 86) is the MIT Study on the Future of Natural Gas with a focus on shale gas development. The document is noted for the record. 1 document (numbered 121) is a US EPA report from 2012 on Ocean Discharge for Oil and Gas Exploration Facilties in Alaska. Kern County has no coastal proximity (over 40 miles away) and therefore, no impacts to the ocean environment. The conditions,events and evaluation of potential impacts described in these documents in not relevant to the DEIR and the commentor did not provide any explanation of the relevance for review.

57 documents are scientific reports, State, Federal and Air District correspondence, presentations and regulatory reports, news articles, fragments of studies and opinion pieces about oil and gas development in California.

15 documents (numbered 1218,19,21,22,23,24,25,26,31,91,117,118,122,126) are public correspondence, powerpoint presentations and transcripts from the State of California legislative hearings, Department of Conservation and Division of Oil and Gas and Geothermal Division, Cal EPA and US Environmental Protection Agency on the UIC program, and proposed monitoring programs for Well Stimulation regulations. The comments are noted for the record. 9 documents (numbered 16,17,39,40,84,108, 110,120,123) are scientific abstracts or studies down on San Joaquin Kit Fox and Giant Kangaroos Rats in Kern County oilfield areas (Elk Hills and LoKern) and Western Spadefoot Toads and California Condors generally in Kern County. These studies were already in the record for the biological analysis completed for the Draft EIR. No further comment is warranted. 3 documents (numbered 80, 81,82) are reports on the potential impacts of oil production on fish species in southern California from off-shore oil platforms, mussels in Monterey Bay and the Sespe Oil Field in Ventura County. Kern County has no coastal proximity (over 40 miles away) and therefore, no impacts to the ocean environment. The described Sespe Oil Field is not under the jurisdiction of the Kern County Board of Supervisors or within the boundary area of the Draft EIR. The conditions, events and evaluation of potential impacts described in these documents in not relevant to the DEIR and the commenter did not provide any explanation of the relevance for comment.

One document (numbered 107) titled " On the Underestimation of NOx Emissions from Oil Well Drilling Activities in Kern County, CA " by Dr. Sahu was submitted as with EarthJustice comment Letter and a response has been provided.

6 documents (numbered 13,14,20, 56,112,142) include a August 6, 2015 Map on overdrafted groundwater basins, website pages on State wide oil production in 2011and wastewater disposal a public update on the Drought Response from the State of California, a San Joaquin Air District permit approval and an abstract of a paper presented at a conference on induced and triggered Earthquake Theory`. These are noted for the record. 2 documents ( numbered 38, 143) are unlabeled data without cover sheets which have no location or explanation of relevance or provenance. 21 documents ( numbered 1,2,3,4,8,15,27,28,29,30,48,49,55,71`,76,78,79,94,95,111,114) are news articles on various allegations by the public on environmetntal damage from oil and gas production and well stimulaiton, private environmental organizations statements and requests to Governor Brown for a moratorium on Fracking, public outreach materials from private environmental organizations on the dangers of continued fossil fuel use and production and copies of filed lawsuits that are still in litigation proceedings. These are noted for the record.

Re: Comments on Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting

Dear Mr. Mynk:

The Center on Race, Poverty & the Environment submits these comments on behalf of itself, Committee for a Better Arvin, Committee for a Better Shafter, Delano Guardians Committee, and Greenfield Walking Group. The Draft Environmental Impact Report ("DEIR") for this project does not comply with the California Environmental Quality Act ("CEQA")[1] and the proposed project violates state civil rights law. The Legislature enacted CEQA to protect the environment of California, to protect the environmental health of Californians, to prevent the elimination of plant and animal species due to man's activities, to create and maintain ecological and economic sustainability, and to "take all action necessary to protect, rehabilitate, and enhance the environmental quality of the State."[2] 0046-1

The purpose of an EIR is "to identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be 0046-2

[1] Cal. Pub. Res. Code § 21000 et seq.
[2] *Id* at 21000 (a), (b), (d), (g); 21001 (a), (b), (e).

mitigated or avoided," before a project is approved.[3] Each public agency must mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever feasible.[4] Moreover, the "purpose of an environmental impact report is to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment."[5]

0046-2 Continued

The DEIR is improperly drafted as a project level EIR, fails to fully inform the County and the public of the environmental consequences of the zoning revisions, has not provided adequate opportunities for public participation, fails to require all feasible mitigation, fails to adequately identify and analyzes impacts, and fails to analyze and adopt feasible alternatives. Accordingly, the County must substantially revise the DEIR and recirculate it for public comment.

0046-3

I. THE COUNTY FAILED TO ADEQUATELY CONSIDER ENVIRONMENTAL JUSTICE

Environmental justice ensures that all people, regardless of race, color, national origin, or income, have the right to live, work, and play in a clean and healthy environment. The San Joaquin Valley has a long history of marginalizing its low income communities and communities of color. Unfortunately, the County's proposed zoning amendments and corresponding DEIR continue this trend by perpetuating the disparate impacts of oil and gas development in the County, inadequately considering the cumulative impacts of this project, and limiting the ability of Spanish speaking residents to participate in the CEQA review process.

0046-4

A. This Project Perpetuates and Fails to Remedy the Historical Disparate Impacts of Oil and Gas Permitting in Kern County.

California's anti-discrimination statute, Government Code section 11135, prohibits the state, its agencies, and recipients of any state funds from intentional or unintentional discrimination on the basis of race, color or national origin. The statute's implementing regulations define discrimination to include practices that result in disparate impacts and prohibit practices that "utilize criteria or methods of administration that have the purpose or effect of subjecting a person to discrimination."[6] According to the California Code of Regulations, it is a discriminatory practice for an agency "to make or permit selections of sites or locations of facilities: that have the purpose or effect of excluding persons from, denying them benefits of, or otherwise subjecting them to discrimination under any program or activity."[7] As a recipient of state funding, Kern County must abide by section

0046-5

[3] *Id* at 21002.1(a).
[4] *Id* at 21002.1(b).
[5] CEQA Guidelines § 15201.
[6] Cal. Code Regs., tit. 22, § 98101, subd. (i)(l) (emphasis added)
[7] Cal. Code Regs., tit. 22, § 98101, subd. (j)(l)

11135 and ensure that its actions do not have a disparate impact on communities of color in the County.

0046-5 Continued

If the County approves the proposed zoning ordinance amendments, it will violate section 11135 because the amendments result in a significantly adverse or disproportionate impact on minorities. As acknowledged by the DEIR, the project will have significant and unavoidable impacts. The project's significant and unavoidable air quality impacts and toxic exposure risks will impact residents near oil and gas activities permitted under the zoning ordinance to a greater degree than other populations. The close proximity of oil and gas operations and constant threat of accidental toxic releases negatively impacts nearby residents' mental health and sense of safety and well-being. These impacts will disproportionately affect Latinos and other people of color.

0046-6

In California, 5.4 million people live within one mile of the approximately 82,000 oil and gas wells in California listed as new and/or active by DOGGR.[8] Forty-five percent of those people are Hispanic or Latino.[9] Compare that to the fact that the Hispanic or Latino population makes up only 38% of California's total population.[10] This disparity holds true for African Americans as well; eight percent of people living within one mile of an oil and gas well are African American as compared with six percent of the population statewide.[11] The disparities become even more pronounced when you consider communities identified as most vulnerable by the California Office of Environmental Health Hazard Assessment's CalEnviroScreen 2.0. Nearly ninety two percent of Californians within both a mile of an oil and gas well and in a vulnerable community are people of color.[12] In Kern County, 76 percent of people living both within a mile of a well and in a vulnerable community are people of color.[13]

0046-7

Statistical trends show that as the number of Latino and students of color in a school or school district increases, so does the number of oil and gas wells found in the district and near the schools. The top 11 school districts with the highest well counts are located in the San Joaquin Valley.[14] Ten of those school districts are located in Kern County, the other is located in Fresno County.[15] Taft Union High School District in Kern County has 33,155 oil and gas wells within its

0046-9
Continued

boundaries, the highest of all California school districts.[16] Kern Union High School District in Kern County has 19,800 oil and gas wells within its boundaries, the second highest of all California school districts.[17] Sequoia Elementary School in Shafter is the only school in California located within a half mile of three separate stimulated wells.[18] One stimulated well, API 403043765, is less than 1200 feet from the school.[19] Over 800 students attend Sequoia Elementary with 89.5% students of color and 86% Latino students.[20] A Latino student is 20.4% more likely to attend a school within 1.5 miles of an active well than a non-Latino student.[21] A student of color is 24.7% more likely to attend a school within 1.5 miles of an active well than a white student.[22] By perpetuating and not including mechanisms in its zoning amendments to remedy this disparity, the County has violated section 11135.

B. The County Failed to Adequately Analyze Cumulative Impacts.

0046-10

Environmental justice communities are often overburdened by multiple sources of pollution. Cumulative impacts are of particular concern in Kern County where the air basin is in extreme non-attainment for harmful air contaminants and where 55 census tracts – 330,000 Kern residents – are listed as some of the most vulnerable communities by the CalEnviroScreen 2.0.[23] Thirty-five percent Kern County's population, more than 290,000 residents, live within one mile of an oil or gas well. 122,000 Kern County residents live close to an oil and gas well *and* are in a vulnerable community according to CalEnviroScreen 2.0.[24] Shafter and Wasco rank in the 98.8 percentile for communities most exposed and burdened by PM2.5 in California.[25] A solid analysis of the cumulative impacts caused by this ordinance should be a top priority for the County, however, for reasons detailed in Center for Biological Diversity's ("CBD") and Earthjustice's comment letters, the DEIR's cumulative impact analysis is woefully inadequate.

C. The County Failed to Translate the DEIR into Spanish, Violating CEQA's Public Participation Requirements.

0046-12

"Public Participation is an essential part of the CEQA process." [26] However, the County has made the complete DEIR inaccessible to the public by failing to translate the DEIR into a language that can be understood by the communities most affected by this project. According to the 2013 U.S. Census, Kern County is 51% Latino or Hispanic and 42% of the population speaks a language other than English at home. Through our work in Kern County we know that many residents are monolingual Spanish speakers. By failing to translate the DEIR into Spanish, the County made it impossible for these Kern County residents to make an independent, reasoned judgment about the environmental documentation relied upon, and as a result, denied the public its statutory right under CEQA to comment meaningfully upon its conclusions.[27] California courts have interpreted CEQA's "plain language" requirements to ensure that the public has access to EIR documents. "The message of this regulatory scheme is clear: an EIR in this state must be written and presented in such a way that its message can be understood by governmental decisionmakers and members of the public who have reason to be concerned with the impacts which the document studies."[28] To ensure the public has an adequate opportunity to understand the consequences of the project and provide comment, the County must translate the DEIR and extend the comment period before approving the project.

II. THE COUNTY MUST PREPARE A PROGRAM EIR FOR ITS REVISIONS TO THE ZONING CODE

0046-13

The DIER defines the County's amendments to its oil and gas zoning ordinance as a project, even though it covers nearly all types of oil and gas exploration, construction and operation in the entire County for at least the next 20 to 25 years.[29] A project EIR focuses on the changes in the environment that results from a development project, the scope of this DEIR is too broad for a project level EIR.[30] It does not contain the level of specificity that the County and the public require to make informed decisions on the impacts and mitigations needed for individual projects. The County's only purpose for trying to define what clearly should be a programmatic EIR as a project is to impermissibly circumvent CEQA requirements for a more detailed review of each permit. The County intends this DEIR to satisfy any future CEQA analysis for the vast majority of future oil and gas production activities.[31] The County's purported purpose for a project level EIR – to identify the most effective development standards and mitigation

[26] CEQA Guidelines § 15201.

[31] DEIR at 2-23.

0046-13
Continued

requirements and comprehensively analyzing impacts – would be best accomplished with a program level EIR. In fact, the County's goals cannot be accomplished in this project DEIR. By attempting to complete all environmental review for the next 20 to 25 years with this one inadequate document, the County fails to protect the health and welfare of Kern County residents. The County boasts that its "long experience with oil and gas exploration and development allows it to identify and analyze reasonably foreseeable actions and impacts associated with the ordinance amendment at a project level review."[32] This statement blatantly ignores the changes in methods that have occurred as oil and gas becomes increasingly difficult and ultimately impossible to extract using conventional techniques. The County has ignored the science emerging around the country and in California that overwhelmingly point to severe environmental and health impacts of these practices.

0046-14

The County improperly attempts to define the permitting process as ministerial to circumvent future CEQA analysis.[33] A ministerial decision is one in which there is no discretion and the agency only needs to apply fixed standards or objective measurements.[34] A project that contains both ministerial and discretionary actions is deemed discretionary and subject to CEQA requirements.[35] For the reasons addressed in Earthjustice's comment letter, subsequent permitting of oil and gas projects is not ministerial. The County should prepare a program EIR and clarify that subsequent site-specific activities will require further CEQA review based on CEQA's tiering requirements. However, since County has presented this as a project DEIR, below are a number of ways in which this DEIR fails to adequately analyze mitigation, impacts, and alternatives.

III. THE COUNTY FAILED TO IMPLEMENT FEASIBLE MITIGATION MEASURES

0046-15

The mitigation measures proposed in the DEIR are woefully inadequate to address the "project's" impacts in a variety of ways. The County cannot approve this project if there are "feasible mitigation measures available which would substantially lessen the significant environmental effects" of the project.[36] The County must adopt additional feasible mitigation to reduce the project's impact before certifying the DEIR.

[32] DEIR at 2-24.
[33] DEIR at 2-23.
[34] CEQA Guidelines §15369.
[35] *Id.*
[36] Cal. Pub. Res. Code § 21002; see also, Cal. Code Reg. tit 14, § 15002(a)(3) (agencies must prevent avoidable damage "whenever it finds measures to be feasible").

A. The Proposed Setbacks Are Inadequate to Reduce the Impacts to Less Than Significant.

0046-16

The proposed ordinance requires dangerously inadequate setbacks: 100 feet (0.02 miles) from a public highway, 190 feet (0.04 miles) from dwelling units, 300 feet (0.06 miles) from schools, and 100 feet (0.02 miles) from commercial buildings.[37] The proposed ordinance allows the Planning Commission to waive any of the setbacks.[38] The setbacks in Mitigation Measure 4.3-5 are woefully inadequate, ignore the findings of numerous studies – including the California Council on Science and Technology's ("CCST") recent study,[39] are not enforceable, and will not reduce the significant impacts of exposure. Measure 4.3-5 requires a site plan application to show the location of sensitive receptors within 3000 feet (0.51 miles) of the construction site for new wells, ancillary facilities, or equipment (excluding pipelines). If there are no sensitive receptors then no mitigation is required. If there are sensitive receptors, then the following setbacks are proposed, but not required. In the Western and Central Subareas, 367 feet (0.07 miles) for well depth of 10,000 feet, 116 feet (0.02 miles) for a well depth of 5000 feet, and no setback required for well depths of 2,000 feet or less. In the Eastern Subarea a setback of 296 feet (0.06 miles) is only required for a well depth of 10,000 feet.[40] If the setbacks cannot be met, the applicant can still move forward if it implements listed, or other, measures.

0046-17

These inadequate setbacks do not mitigate impacts 4.3-3 or 4.8-3 to less than significant levels or protect the health of nearby residents. Numerous studies have documented that proximity to oil and gas production increases a population's exposure to air pollutant emissions, toxic air contaminants, dust, chemicals, noise, and light.[41] While many studies recently focus on fracking, the CCST found that health risks may be independent of whether hydraulic fracturing was used. The most significant health impacts are documented at half a mile away.[42] Harmful exposure to toxic air contaminants can occur as far out as two miles from the source.[43] The mitigation measures, therefore, fail to address or reduce impacts between one half mile and two

0046-18 Continued

miles from oil and gas operations entirely.

0046-19

The DEIR references a Health Risk Assessment, explaining that "The HRA shows that the potential cancer risk exceeds the CEQA significance thresholds of 10 in 1 million for drilling a 10,000-foot well in 2015 to a distance 367 feet, and for drilling a 5,000-foot well in year 2015 to a distance of 116 feet, and for operations of the oil processing equipment to a distance of 701 feet. By 2018, due to emission reductions resulting from compliance deadlines occurring from CARB current diesel regulations, the risks associated with drilling a 5,000-foot (or shallower) well would not exceed the 10 in one million threshold." This analysis suggests that there could be health risks for schools located less than 0.25 miles or 700 feet from oil processing equipment or located less than 367 feet from drilling of a 10,000-foot well. The HRA also assumes that new CARB rules will go into effect and be effective. There are no assurances that the high cancer risk will be mitigated to below a level of significance.

0046-20

The Health Risk Assessment ("HRA") only partially addresses the potential health impacts of oil and gas production. It ignores the health risks of fracking and other stimulation techniques and it does not analyze all the chemicals that could be used at the well sites. The HRA focuses on potential cancer risks, while exposure to the air pollution, chemicals, and toxics associated with oil and gas production also causes or contributes to respiratory disorders, asthma, birth defects, neurological and cardiovascular damage, and premature death. Further, the County's reliance on a 10 in 1 million cancer risk to determine significant impacts is unreasonably high. Most agencies use a 1 in a million cancer risk to determine unreasonable threat. The County's use of a significance threshold that is ten times greater than EPA's and most other environmental agencies is not supported by substantial evidence.

0046-21

At a minimum, the mitigation measure should require the site plan application to locate sensitive receptors within 10,560 feet (2 miles) of the project, require a minimum of a 2640 foot (0.5 miles) setback from all sensitive receptors and consider a more protective setback, between 5280 and 10,560 feet (1 to 2 miles) in areas where the most vulnerable populations could be impacted, such as schools, hospitals, and senior centers. These setbacks should be uniform throughout the project area and be required for all well depths. The County should not authorize any exceptions to the setback requirement minimums.

0046-22

B. Mitigation Measures 4.3-1, 4.3-3, and 4.3-4 Will Not Lead to a Less than Significant Level of Impact.

0046-23

The DEIR correctly determines that the project will conflict with or obstruct the implementation of the Valley's Air Quality Plan (Impact 4.3-1) and violate air quality standards or contribute substantially to existing air quality violations (Impact 4.3-2). However, it incorrectly determines – without analysis – that by simply complying with existing air district regulations and California laws, these impacts will be reduced to a less than significant level. This finding is

unsupported by evidence and simply unrealistic. In fact, current air district rules are insufficient to bring the Valley into attainment even without the added pollution that is estimated from this project.

0046-23 Continued

C. Additional Mitigation Measures Should Be Implemented.

The air quality analysis in the DEIR is inadequate. As explained in greater detail in other comments (see eg. CBD's and Earthjustice's comment letters), the County's assumptions and estimations of emissions from oil and gas activities are unsupported. Evidence demonstrates that actual emissions are much higher and more significant than those addressed in the DEIR. Communities which already experience some of the worst air in the nation request that the County require the most technologically advanced air monitors to be placed at each drilling site by the applicant.

0046-24

The County should include additional mitigation to address pipeline accidents, especially in light of the two pipeline leaks and ruptures that have occurred in Arvin and Lamont during the past year. The DEIR should provide for testing and immediate public disclosure of any and all testing results when a pipeline leaks, clarity in agency roles and response when a pipeline leaks or ruptures, and reimbursements and relocation aid when pipeline leaks displace or otherwise harm nearby residents.

0046-25

IV. THE COUNTY DOES NOT ADEQUATELY ANALYZE THE ENVIRONMENTAL AND HEALTH IMPACTS OF THIS PROJECT

CEQA Guidelines mandate that "[a]n EIR should be prepared with a sufficient degree of analysis to provide decisionmakers with information which enables them to make a decision which intelligently takes account of environmental consequences."[44] Because of the DEIR's broad scope, it is impossible for the County to adequately analyze the numerous significant impacts of 67,425 projected new oil and gas wells over the next 25 years across 3,700 square miles.[45] The County's analysis does not incorporate relevant findings from the CCST study. While it was widely known that the third and final analysis was due to be released before this DEIR is certified, the County chose to release the DEIR without accounting for the findings in the CCST study.

0046-26

A. The County Does Not Adequately Analyze Air Quality Impacts.

The San Joaquin Valley air basin is a nonattainment area for criteria pollutants such as ozone and PM2.5. The Valley is an extreme nonattainment area for the 1997 and 2008 8-Hour Ozone National Ambient Air Quality Standards (NAAQS), a serious nonattainment area for the 1997 PM2.5 NAAQS, and a moderate nonattainment area for the 2006 PM2.5 NAAQS. Kern County is

0046-27

[44] Cal. Code Regs. tit. 14, § 15151.
[45] DEIR at 3-6, 3-30.

0046-27
Continued

consistently in the American Lung Association's top ranking counties for particulate matter and ozone pollution.[46] The proposed project will significantly increase criteria emissions. While the DEIR states that there will be significant air quality impacts, the County has severely underestimated the amount of those impacts (see Earthjustice's and CBD's comment letters) and has not adequately mitigated those impacts (see above).

0046-28

B. The County Does Not Adequately Analyze Greenhouse Gas Emissions.

CEQA requires the County to analyze all reasonably foreseeable impacts of a project. The DEIR fails to do this because it does not analyze oil and gas combustion when calculating the greenhouse gas emissions impacts of this project. In addition, the analysis does not use the most recent ARB greenhouse gas inventory data that looks at emissions through 2013. This data was available months before the DEIR was released. Finally, as detailed in CBD's comment letter, the methane calculation used in the DEIR is not scientifically supported and masks the short term effects of methane.

0046-29

In addition, the DEIR relied upon the air district's threshold of significance to determine that the zoning change would not result in a significant greenhouse gas impact. When adopting thresholds of significance, a lead agency may only rely on thresholds of significance previously adopted by another public agency if the decision to adopt such thresholds is supported by substantial evidence. [47] Here, there is no evidence to suggest that the air district's greenhouse gas threshold of significance is sufficient to ensure that the County's compliance with the standard actually avoids impacts from greenhouse gas emissions. Without such evidence, the County's reliance on this threshold is inappropriate. The Air District's threshold was tied to AB 32's emission target of reducing GHG emission to 1990 levels by 2020 which ARB projects to be a 29% reduction. This target was reached as a compromised political target and the Air District did not review the scientific basis or environmental effectiveness of this target.

C. The County Does Not Adequately Analyze Hazards and Hazardous Materials.

0046-30

The County's inadequate Hazards and Hazardous Materials analysis highlights why a project level EIR is inappropriate for these zoning amendments. The DEIR acknowledges that the County cannot identify the hazardous materials used in the oil fields and instead simply explains that different operators will use different materials. Without knowing which hazardous materials will be used in the oil and gas operations authorized by this zoning change, the County cannot adequately analyze and mitigate the project's hazardous materials impacts as required by a project level EIR.[48]

---

[46] State of the Air, American Lung Association, *available at* http://www.stateoftheair.org.
[47] CEQA Guidelines § 15064.7c.
[48] DEIR at 4.8-2.

0046-31

The DEIR also fails to adequately analyze the potential hazardous impacts of transporting oil and gas. Transporting oil and gas by rail has resulted in a number of high-profile disastrous accidents. While the DEIR states that the number of derailments releasing hazardous materials has decreased, it fails to address the increasing number of oil train explosions.[49] Oil train explosions release more hazardous materials farther from the site of impact than train derailments. The County must analyze and mitigate all of the potential hazardous impacts associated with transporting oil and gas from the oilfields, including the combustion and explosion of oil trains.

0046-32

The DEIR must analyze both the direct and indirect impacts of the proposed project. The DIER must, therefore, analyze the impacts of waste disposal associated with oil and gas production. Hazardous waste generated from oil and gas production is disposed at commercial hazardous waste landfills in Buttonwillow and Kettleman City; both of which are located in the vicinity of the Project Area.[50] Those two hazardous waste facilities are located in low income Latino farmworker communities. In fact, all of California's three hazardous waste facilities are located in low income Latino farmworker communities. Therefore, the disposal of hazardous waste within the state has disparate impacts which must be avoided under Government Code section 11135 as discussed above. The impacts of transporting and disposing of oil and gas waste to these facilities, and others in predominantly low income communities and communities of color should be included as part of an environmental justice analysis.

V. THE COUNTY HAS NOT ADEQUATELY ANALYZED ALTERNATIVES

0046-33

The California Supreme Court has described the alternatives and mitigation sections as "the core" of an EIR.[51] The requirement to set forth project alternatives in the EIR "is crucial to CEQA's substantive mandate that avoidable significant environmental damage be substantially lessened or avoided where feasible."[52] CEQA guidelines provide that "[a]n EIR shall describe a range of reasonable alternatives to the proposed project, or to the location of the project that could feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives."[53]

0046-34

The DEIR is required to examine in detail the alternatives the County determines could feasibly attain most of the objectives of the project. CEQA does not require all alternatives to meet all project objectives, only most of them.[54] The County must foster meaningful public participation and informed decision making in deciding the range of feasible alternatives to be discussed in the

[53] Cal. Code Regs., tit. 14, § 15126(a).

DEIR.[55] The County can eliminate alternatives from detailed consideration in the DEIR for: "(i) failure to meet most of the basic project objectives, (ii) infeasibility, or (iii) inability to avoid significant environmental impacts."[56] However, "if the agency finds certain alternatives to be infeasible, its analysis must explain in meaningful detail the reasons and facts supporting that conclusion."[57]

0046-34 Continued

A. The Project Objectives Improperly Elevate the Desires of One Stakeholder.

0046-35

The DEIR is for the revision of Kern County's zoning ordinance. While this revision was requested and paid for by the Oil and Gas Industry, that does not make them "project applicants" in the same sense as for other types of projects. The Industry is one stakeholder in this process, but there are many other stakeholders, each with various objectives for a countywide zoning ordinance revision. To list the Industry's project objectives in the DEIR and determine the feasibility of alternatives based on those objectives places the special interest of a single stakeholder above all other stakeholders.

0046-36

No matter who requested and paid for it, the zoning revisions and the environmental review should have been considered as an independent project undertaken by the County and that equally considered all stakeholders. Instead, it is clear from the Project Description and Objectives that this was not an independent review. It is also clear from a review of documents obtained through a public records act request that the Industry and the Planning Department employees had regular phone calls, meetings, and email exchanges during the entire revision and environmental review process. This access was not public knowledge, nor was it offered or granted to any other stakeholders.

0046-37

The County should revise the Project Objectives to remove the "Applicant's Objectives" and revise the County Objectives to include ones that are not industry biased. For example, instead of an objective to "[e]ncourage ongoing economic development by the oil and gas industry that creates quality, high paying jobs and promotes capital investment in Kern County…,"[58] the objective should be to encourage economic development from the energy sector that creates quality, high paying jobs. This opens the possibility of adopting better alternatives with fewer impacts to public health and the environment. Other objectives should focus on transitioning Kern County's energy to cleaner renewable energy, becoming not only energy independent but fossil fuel independent, and minimizing health and environmental impacts of oil and gas extraction.

[58] DEIR at 6-9 to 6-11.

0046-38

B. The DEIR Should Analyze the Drilling Ban on All Lands Alternative.

The County rejected a ban on all drilling in Kern as infeasible and not meeting any of the applicant's objectives and four of the County's objectives.[59] First, as detailed above, assessing the alternatives in light of the Industry's objectives and with industry biased County objectives is improper. Second the DEIR analysis mistakenly states that legal restrictions prevent the County from banning drilling. As explained in CBD's comment letter, the County has constitutional authority to determine what land uses will protect health and safety and has been done in other counties.

0046-39

C. The DEIR Fails to Explain Why the No Fracking Alternative Was Rejected.

The County fails to support its conclusion in its Alternatives section that Alternative 4 – No Hydraulic Fracturing would create greater Air Quality and Greenhouse Gas Emissions Impacts than the proposed project. The County states a ban on hydraulic fracturing may cause an increased use of Enhanced Oil Recovery techniques,[60] but offers no evidence to support that contention and does no further analysis on the probability or amount of that increased use. The County's conclusory statement, without analysis, that an increased used of EOC could cause an increase in emission of greenhouse gases and criteria air pollutants, is not supported by substantial evidence.[61]

0046-40

D. The County Should Analyze An Alternative that Excludes Unconventional Oil Extraction.

The County does not analyze an alternative that involves no extreme stimulation and extraction or enhanced oil recovery techniques, such as fracking, acidization, or steam injection. Given the controversy and potential impacts associated with all types of unconventional oil extraction, the County should analyze this alternative. Alternative 4 examines an alternative where only hydraulic fracturing was prohibited, but allowed acid fracturing, acid matrix well stimulation, and Enhanced Oil Recovery techniques.[62]

[59] DEIR at 6-12.
[60] DEIR at 6-24.
[61] DEIR at 6-24.
[62] DEIR at 6-23.

0046-41

VI. CONCLUSION

For the reasons stated above, the County needs to revise and recirculate the DEIR to comply with CEQA and Government Code § 11135.

With respect to issues of Spanish translation please Response to Comment 12, below.

0046-5

Commenter's legal references are noted and included in the Final EIR. California Government Code section 11135 generally prohibits recipients of state financial assistance, including the County, from conducting programs or activities in a manner that results in disparate impacts based on race and other factors. Section 11135 does not require a prospective disparate impact or environmental justice analysis. While section 11135 of the does create a private right of action based on disparate impacts, section 11135 exists wholly outside of CEQA. Section 11135 does not create a basis for objecting to an EIR.

An environmental justice analysis (*i.e.*, analysis of impacts by race and income) is also not required under CEQA. Neither the statute nor Guidelines contain provisions that call for a special analysis of demographics either in the project or cumulative impact analysis. *See Friends of Davis v. City of Davis* (2000) 83 Cal.App.4th 1004, 1019 ("under CEQA, the question is not whether a project will affect particular persons, but whether it will affect the environment of persons in general"), CEQA Guidelines § 15064(e) ("economic and social changes resulting from a project shall not be treated as significant effects on the environment"). Further the Guidelines provide that the required environmental analysis shall not be interpreted "in a manner which imposes procedural or substantive requirements beyond those explicitly stated" in the statute or CEQA Guidelines. CEQA § 21083.1.

Consistent with CEQA, the Draft EIR analyzed the potential impacts of the proposed Project on the environment. CEQA defines the environment as the physical conditions that exist within the area affected by the proposed project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. CEQA requires analysis of project human health impacts. For example, a lead agency must adopt a mandatory finding of significance where the effects of a project on the physical environment will cause substantial adverse effects on human beings. Therefore, the analysis performed for the Project, evaluated effects on sensitive receptors (*e.g.*, school, hospitals, daycare centers). It also used health-based standards, for example, in the analysis of air quality that were based on vulnerable populations including children, fetus, seniors and others. Therefore, the analysis performed was appropriately conservative and took into consideration issues frequently associated with environmental justice.

However, as mentioned above, social and economic impacts are not considered environmental effects. Except to the extent that social impacts can lead to further environmental impacts, as in the case of blight, such effects are outside of CEQA's scope and are not a necessary part of an environmental evaluation. As required by CEQA, the DEIR evaluated impacts on the physical environment, including Project and cumulative impacts on human beings, regardless of economic or social status

The concept of "environmental justice" is discussed in Government Code section 65040.12. While that statute specifically discusses numerous environmental justice programs to be implemented by the Office of Planning and Research, nowhere does it require that environmental justice issues be analyzed as part of the CEQA process. For example, subdivision (c) states that the Office of Planning and Research must develop guidelines for cities and counties to address environmental justice requirements in their respective general plans – but it makes no mention of such guidelines for the CEQA process.

Section 65040.12 was originally enacted by the State Legislature in 1999 via SB 115. Initial versions of that bill, which were reviewed in committee, stated that the Office of Planning and Research was to recommend changes to the CEQA Guidelines to mitigate environmental effects on minority and low-income populations. However, when the bill finally reached the Assembly Floor, it no longer contained those provisions. Below is the excerpt from the September 3, 1999 version of SB 115, showing the tracked changes and deletion of the referenced CEQA language:

This bill would require, by July 1, 2001, the office to recommend proposed changes in, and the secretary to certify and adopt revisions to, the guidelines to provide for the identification and mitigation by public agencies of disproportionately high and adverse environmental effects of projects on minority populations and low-income populations and to promote effective public participation by those affected populations. The bill would require the office, by July 1, 2000, in consultation with other state agencies, to review its available data bases and other available data bases and information to identify affected communities and populations. The bill would require the office and the secretary to coordinate their efforts and to share information with the Council on Environmental Quality and the United States Environmental Protection Agency in implementing those provisions, as specified.

The Assembly Floor Analysis of the bill even stated the following:

This bill establishes OPR as the state's lead agency for implementation of environmental justice programs. Earlier versions of this bill enacted a more detailed program intended to track the key requirements of the federal environmental justice policy and programs. The bill was amended in Assembly Appropriations to delete these provisions.

Thus, the Legislature considered including environmental justice (*e.g.*, analysis based on race and income) as a separate topic to be analyzed in a CEQA document, but it elected not to do so.

0046-5 cont'd

0046-6

While an environmental justice analysis is not called for under CEQA, an analysis of many issues commonly associated with environmental justice (*e.g.*, impacts to sensitive and vulnerable populations) are required under CEQA. *See, e.g.*, analysis of potential impacts to sensitive populations and worker receptors that could be affected by future oil and gas activities, including impacts related to aesthetics (Section 4.1), air quality (Section 4.3), hazards (Section 4.8) and noise (Section 4.13). Land uses that are considered to be sensitive individuals in the DEIR include residences and residential communities, schools, playgrounds, childcare centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. Sensitive individuals considered in the DEIR include persons with compromised immune systems, such as children and the elderly and worker receptors include employees and locations where people work. The DEIR identifies several mitigation measures (MM), such as oil and gas activity minimum setbacks, accident prevention and operational requirements, that avoid significant impacts to sensitive receptors, including the following:

MM 4.1-4, which requires that except in agricultural areas, oil or gas tanks located within 200 feet of any sensitive receptor be partially screened from public view by shrubs, trees or solid screen fencing, pump sites (including multiple well pump sites) within 500 feet of any dwelling must be surrounded by a fence, at least 6 feet in height, constructed of dark-colored chain-link with wood or metal slates, dark green or brown fabric material, or other more visually restrictive fencing material, and the height of all pumping units not exceed 80 feet and be painted in accordance with the Kern County Zoning Ordinance.

MM 4.1-6, which requires that permanent nighttime lighting will only be installed as required for safety or security, shielded and oriented downward, and that bare bulbs will be fully screened from view from sensitive viewing receptors such as residences, and that on-demand lighting and/or timers must minimize the visual impacts of lighting in compliance with the standards in amended Chapter 19.81 – Outdoor Lighting "Dark Sky Ordinance" of the County Zoning Code.

MM 4.3-5 which requires that a Site Plan Application must include a Site Vicinity Figure showing the location of any sensitive receptor(s) within 3,000 feet of the construction site (potential impact area) for a proposed new well or other ancillary facility or equipment (excluding pipelines), and requires several equipment placement and operational measures (including the possibility of temporarily relocating sensitive receptors at an applicant's expense) to avoid potential air quality impacts if the minimum setbacks cannot be met.

MM 4.8-4, which requires that a Site Review Plan identify all gas, oil and produced water pipelines to be used for each new or reworked well site and the location of any sensitive receptor located within 200 feet of any such pipeline. Any pipeline located within 200 feet of a sensitive receptor is subject to additional requirements, including the provision of evidence that the pipeline has been integrity tested using pressure testing or other accepted test methods by a qualified professional within a two-year period prior to submittal of the Site Review Plan.

MM 4.12-1, which requires that a Site Plan Application include a Site Vicinity Figure showing the location of any sensitive receptor(s) within 3,000 feet of a construction site (potential impact area) for the proposed new well or other ancillary facility or equipment (excluding pipelines), and requires several additional noise shielding and reduction measures if there are sensitive human noise receptors within the potential impact area and noi se levels cannot be reduced to a maximum of 65 dBA at the nearest exterior wall of a sensitive receptor or more than 1 dBA higher than the ambient noise levels, if in excess of 65 dBA.

MM 4.12-2, which requires that new oil and gas wells be located at least f 210 from the closest sensitive receptor.

As discussed in the DEIR, these and other mitigation measures reduce potential project-related impacts to sensitive receptors to less than significant levels, except for significant and unavoidable impacts to Project Area visual quality and nighttime lighting levels. Visual and nighttime lighting impacts are regional in scale and not limited to specific locations within the Project Area. The DEIR mitigation measures ensure that the proposed Zoning Amendments result in the fair treatment of all sensitive receptors irrespective of race, culture, and income, and that the burdens of project-related impacts, including pollution, will not be focused on sensitive populations and communities.

Again, although not required by CEQA, for informational purposes only in response to the issues raised by the commenter, an analysis of Kern County census tract 5-year American Community Survey (ACS) demographic and poverty data for the period was conducted to provide additional context regarding the location of Tier 1 oil and gas activity areas and County demographic and poverty rates. The ACS is conducted by the United States Census Bureau and generates community and local data for one, two and 5-year periods. The most recent 5-year data was collected by the Census Bureau during 2009-2013 and provides an annual average estimate of smaller area demographics, population, poverty level and other data during that period. According to the Census Bureau, the 5-year data is the most accurate form of ACS data, has the largest sample size, and is the only ACS data that covers very small populations.
(http://www.census.gov/programs-surveys/acs/guidance/estimates.html, accessed August 2015).

The analysis was conducted by downloading census tract-level data from the ACS 5-year database for all Kern County census tracts (151 in total), including each tract's total population, percentage of the population represented by several demographic groups, and the percentage of the population below the standard poverty level threshold (http://factfinder.census.gov, accessed August 2015). Census tract data was used because it provides the smallest community-level dataset that is available with reasonable accuracy within the County.

As discussed in the DEIR, more than 90% of all future oil and gas activity subject to the proposed County Oil Gas Conformity Review process will occur in the Tier 1 areas. The total Tier 1 acreage in each census tract was identified to analyze the demographics and poverty data for the locations where the significant majority of all future oil and gas activity will occur. Of the 151 census tracts in Kern County, 31 contain Tier 1 acreage, and 120 contain no Tier 1 acreage. Figure 1 shows the location of each census tract and Tier 1 acreage in the County.

Tables 1-3 summarize the ACS population, demographic and poverty data for the County as a whole, the 120 census tracts that contain no Tier 1 acreage (the "non-Tier 1 tracts"), and the 31 census tracts that contain Tier 1 acreage (the "Tier 1 tracts"). As shown in Table 1, the County's 151 census tracts (including Non-Jurisdictional areas such as incorporated cities and land owned by state and federal agencies) include about 5,223,940 acres. The non-Tier 1 tracts include about 1,926,762 acres, and the Tier 1 tracts include 3,297,178 acres. As discussed in the DEIR, the total amount of Tier 1 acreage in the County is 206,856 acres. Tier 1 areas overlay about 4% of the County and 6% of the Tier 1 tracts.

According to the ACS 2009-2013 data, the County (including Non-Jurisdictional areas) had an average population of 848,204 people over the 5-year survey period. As shown in Table 2, about 661,039 residents, or 78% of the total County population, was located in non-Tier 1 tracts. About 187,165 residents, or 22% of the County population, was located in Tier 1 tracts. Table 2 also shows that the average percentage of the population identified in the ACS data as Hispanic or Latino (of any race), Black or African American, American Indian and Alaska Native, Asian, and Pacific islander, other race, or two or more races is lower in Tier 1 tracts than in the County as a whole and in non-Tier 1 census tracts. The percentage of the population identified as White is higher in Tier 1 tracts than in the County as a whole and in the non-Tier 1 tracts.

The 5-year ACS data provides poverty level information for an average of 814,695 individuals over this period. As shown in Table 3, the percentage of the population below the poverty level in the Tier 1 tracts (16.7%) is lower than in the County as a whole and in the non-Tier 1 census tracts (22.9%-24.7%).

Table 1

Kern County Census Tract Overview

	Kern County	Census Tracts Without Tier 1 Acreage	Census Tracts With Tier 1 Acreage
Number of Census Tracts	151	120	31
Total Census Tract Acreage	5,223,940	1,926,762	3,297,178
Acreage of Tier 1 in Census Tracts	206,856	-	206,856
Percentage of Census Tract Acreage in a Tier I Location	4%	0%	6%

Table 2

Kern County Census Tract Demographics

	Kern County	Census Tracts Without Tier 1 Acreage	Census Tracts With Tier 1 Acreage
Total population	848,204	661,039	187,165
Percent of Total County Population	100%	78%	22%
Percent Hispanic or Latino (of any race)	49.8%	52.1%	41.7%
Percent White	37.9%	34.5%	50.0%
Percent Black or African American	5.3%	6.1%	2.4%

Percent American Indian and Alaska Native	0.7%	0.7%	0.6%
Percent Asian	4.1%	4.3%	3.4%
Percent Pacific islander, other race, two or more races	2.2%	2.3%	1.9%

Table 3

Kern County Census Tracts, Population in Poverty

	Kern County	Census Tracts Without Tier 1 Acreage	Census Tracts With Tier 1 Acreage
Population for Which Poverty Level Was Determined	814,695	635,065	179,630
Total Population Below Poverty Level	186,811	156,751	30,060
Percent total population below poverty level	22.9%	24.7%	16.7%

To provide additional information about the demographic and poverty rates in locations that could be more affected by future oil and gas activity, the ACS 5-year data was further analyzed for three subsets of the Tier 1 tracts: (a) the 10 Tier 1 tracts that contain the most Tier 1 acreage; (b) the 10 Tier 1 tracts with the most population; and (c) the 10 Tier 1 tracts with the highest percentage coverage by Tier 1 areas.

Tables 4-6 summarize the ACS population, demographic and poverty data for the 10 Tier 1 tracts that contain the most Tier 1 acreage and compares the results with data for the County and the non-Tier 1 tracts. As shown in Table 4, these 10 census tracts include about 97% of the total Tier 1 acreage in the County (200,654 of 206,856 acres).

As shown in Table 5, according to the 5-year ACS data, on average about 5.2% of the total County population (43,804 of 848,204 residents) was located in the 10 Tier 1 tracts that contain the most Tier 1 acreage. The percentage of the population identified in the ACS data as Hispanic or Latino (of any race), Black or African American, Asian, and Pacific islander, other race, or two or more races is lower in the 10 Tier 1 tracts that contain the most Tier 1 acreage than in the County as a whole and in the non-Tier 1 tracts. The percentage of the population that is identified as American Indian and Alaska Native is slightly higher (0.8% versus 0.7%), and the percentage identified as White is significantly higher in the 10 Tier 1 tracts that contain the most Tier 1 acreage.

As shown in Table 6, the percentage of the population below the poverty level in the 10 Tier 1 tracts that contain the most Tier 1 acreage is significantly lower (14.5%) than in the County and in the census tracts that contain no Tier 1 acreage (22.9%-24.7%).

Table 4

Population for Which Poverty Level Was Determined	814,695	635,065	39,183
Total Population Below Poverty Level	186,811	156,751	5,697
Percent Total Population Below Poverty Level	22.9%	24.7%	14.5%

Tables 7-9 summarize the ACS population, demographic and poverty data for the 10 Tier 1 tracts that have the highest population.

As shown in Table 4, the 10 most heavily populated Tier 1 tracts include about 4% of the total Tier 1 acreage in the County (8,855 of 206,856 acres).

As shown in Table 8, the 5-year ACS data indicates that an average of about 12.3% of the total County population (104,426 of 848,204 residents) was located in the 10 most heavily populated Tier 1 tracts. These tracts also contain about 56% of total population located in the Tier 1 tracts (104,426 of 187,165 residents) The percentage of the population that is identified in the ACS data as Hispanic or Latino (of any race), Black or African American, American Indian and Alaska Native, or Pacific islander, other race, or two or more races is lower in the 10 Tier 1 tracts that contain the most population than in the County as a whole and in the non-Tier 1 tracts. The percentage of the population that is identified as Asian is slightly higher (5% versus 4.1-4.3%), and the percentage identified as White is significantly higher in the 10 Tier 1 tracts that contain the most population.

As shown in Table 9, the percentage of the population below the poverty level in the 10 census that contain the most Tier 1 acreage is significantly lower (13.9%) than in the County as a whole and in the non-Tier 1 tracts (22.9%-24.7%).

Percent Total Population Below Poverty Level	22.9%	24.7%	13.6%

Tables 10-12 summarize the ACS population, demographic and poverty data for the 10 Tier 1 tracts that have the highest percentage of Tier 1 coverage (the ratio of Tier 1 to total tract acreage). As shown in Table 10, the 10 Tier 1 tracts with the largest percentage of Tier 1 coverage include about 87% of the total Tier 1 acreage in the County (180,279 of 206,856 acres).

As shown in Table 11, the 5-year ACS data indicates that an average of about 5.4% of the total county population (46,020 of 848,204 residents) was located in the 10 Tier 1 tracts with the largest percentage of Tier 1 coverage. The percentage of the population that is identified in the ACS data as Asian, Black or African American, American Indian and Alaska Native is lower than in the County as a whole and in the non-Tier 1 tracts. The percentage of the population that is identified as Pacific islander, other race, two or more races is about the same in these tracts as in the County as a whole and in the non-Tier 1 tracts. The percentage of the population that is identified as Hispanic or Latino (of any race) is slightly higher in the 10 Tier 1 tracts with the largest percentage of Tier 1 coverage (51.5%) than in the County as a whole (49.8%) and lower than in the non-Tier 1 tracts (52.1%). The percentage identified as White is significantly higher in the 10 Tier 1 tracts with the largest percentage of Tier 1 coverage.

As shown in Table 12, the percentage of the population below the poverty level in the 10 Tier 1 tracts with the largest percentage of Tier 1 coverage is lower (20.2%) than in the County and in the non Tier 1 tracts (22.9%-24.7%).

Percent Total Population Below Poverty Level	22.9%	24.7%	20.2%

The Tier 1 areas identified in the DEIR represent the locations where over 90% of future oil and gas activity subject to the proposed County Oil and Gas Conformity Review process will occur. The 5-year ACS census tract data summarized in Tables 1-12 indicate that Tier 1 areas do not appear to be spatially distributed in a manner that would unfairly focus future oil and gas environmental impacts on sensitive populations or communities. The 31 Tier 1 tracts include 22% of the County's population. About 78% of the County resides in 120 census tracts that have no Tier 1 acreage. On average, the ACS data show that Tier 1 tracts have a greater proportion of White residents, a lower proportion of Hispanic or Latino (of any race), Black or African American, American Indian and Alaska Native, Asian and Percent Pacific islander, other race, two or more race residents, and lower poverty rates than the County and non-Tier 1 tracts (see Tables 1-3). These data indicate that Tier 1 areas, and the substantial majority of future oil and gas activities, are more likely to be occur in census tracts that have a higher proportion of White and less impoverished residents, and a lower proportion of other major demographic groups, than in the rest of the County.

impoverished residents, and a lower proportion of other major demographic groups, than in the rest of the County.
The analysis of the top 10 Tier 1 census tracts by largest Tier 1 acreage, most population, and highest level of Tier 1 coverage is consistent with these results. Each of these Tier 1 census tract groupings has a higher proportion of White residents, a lower proportion of Black or African American residents, and a lower poverty rate, than the averages for the County as a whole and non-Tier 1 census tracts. The average proportion of Hispanic or Latino (of any race), American Indian and Alaska Native, Asian, and Percent Pacific islander, other race, two or more race residents is also lower in most cases, or in certain instances is about the same or just slightly higher than in the County and non-Tier 1 census tracts (see Tables 4-12). These results also indicate that Tier 1 areas do not appear to be spatially distributed in a manner that unfairly focuses future oil and gas environmental impacts on sensitive populations or communities.

0046-7

Response to first half of paragraph:

The County has no jurisdiction over state-wide drilling practices, and the comment is noted. For informational purposes only, it is also observed that the statistics provided do not appear to identify a disparate impact condition under section 11135 because there is no evidence that the one-mile unit of analysis is an appropriate unit of measures.

The use of statistics to prove a *prima facia* case (that is, a case that is accepted as correct until proved otherwise) nder section 11153 issue was addressed in *Darensburg v. Metro. Transp. Comm'n*, 636 F.3d 511 (9th Cir. 2011). In that case, a class action was brought against the (San Francisco Bay Area) Metropolitan Transportation Commission ("MTC"). Plaintiffs alleged that MTC created disparate impacts by funding more heavily rail transit, which on average is used more by Whites, than bus service, which is on average more heavily by people of color. Therefore, the plaintiffs argued MTC's funding practices have the effect of discriminating against people of color. *Id.* at 518.

To establish whether plaintiffs made out a *prima facie* case, the court found that "plaintiffs [must] employ an 'appropriate measure' for assessing disparate impact." *Id.* at 519, *quoting N.Y City Envtl. Justice Alliance v. Giuliani*, 214 F.3d 65, 69 (2d Cir. 2000) (*additional citations omitted*). The court found further that, "[a trial] court may not find the existence of disparate impact "on the sole basis of a statistic unless it reasonably finds that the statistic would be a reliable indicator of a disparate impact. Courts and defendants are not obliged to assume that plaintiffs' statistical evidence is reliable." *Id*. (*internal brackets and citations omitted*).

Against this framework, the court identified that the plaintiffs did not use an "appropriate measure." Rather than analyzing the impact of the funding decision on entire transit systems ridership, plaintiffs focused only on bus riders of color. The court held that the "statistics [offered by the plaintiffs] say nothing about the particular ridership of the planned expansion. . . . It is a real possibility that a particular bus project… will serve a largely white ridership On the other hand, a rail expansion project… may benefit minority riders more than white riders…" *Id.* at 521. Without a more particularized showing, the court found that the plaintiffs had not made their *prima facie* showing and dismissed the case.

Reaching this conclusion, the court analogized to *Bean v. Southwestern Waste Management Corp.*, 482 F.Supp. 672 (S.D.Tex 1979), which "illustrates the importance of providing an appropriately precise statistical measure." *Darensburg*, 636 F.3d at 521. In that case, African American plaintiffs changed the siting of a hazardous waste facility in their community, offering statistical evidence to demonstrate discrimination. Specifically, the *Bean* plaintiffs showed that if their city were divided into four quadrants the concentration of hazardous waste management facilities are shown to be disproportionately located in minority-quadrants. However, when the "court viewed where the waste management facilities were placed from the perspective of more precise census tract data, it found that their placement actually favored minorities, and the plaintiffs' aggregate data was only compelling on its surface." *Id.* at 522 (*internal punctuation and citation omitted*).

Here, commenter statistics are not detailed and site specific. Commenter's analysis relies on the assumption that residents living up to one mile away from an oil or gas well— commenter's geographic measure— are adversely impacted. However, based on air quality modeling presented in the DEIR for deep well development, only a hypothetical sensitive receptor (resident) living 296 feet to 367 feet away from operational activity would be exposed to air emissions in excess of the threshold used in the DEIR Modeling also shows that under the Zoning Ordinance Amendment operational impacts would be below the significance threshold at between 478 feet to 701 feet. (Under revised Health Risk Assessment included as Appendix T-1, these setbacks are not required as calculated, but these setbacks have been retained as mitigation measures in this Final EIR.) Therefore, the use of the one mile geographic measure proposed by the commenter does not appear to be a reliable indicator of a disparate impact. Moreover, in light of the census tract analysis presented above and the fact that the Project imposes more and not few environmental restrictions on oil and gas development, an inference of disparate impact based on Project impacts appears misplaced.

Response to second half of paragraph:

Comment noted. As discussed above, a demographic impact assessment (cumulative or otherwise) is not within the scope of the required CEQA analysis It is also noted that the Project addresses prospective oil and gas developments and not those already developed. Nonetheless, as discussed above, the average percentage of the population identified as Hispanic or Latino (of any race), Black or African American, American Indian and Alaska Native, Asian, and Pacific islander, other race, or two or more races is lower in Tier 1 tracts— locations where more than 90% of all future oil and gas activity subject to the proposed County Oil Gas Conformity Review Process will occur-- than in the County as a whole and in non-Tier 1 census tracts. Moreover, the percentage of the population identified as White is higher in Tier 1 tracts than in the County as a whole and in the non-Tier 1 tracts. This differential is based on the fact that the significant majority of Tier 1 tracts are located outside of urbanized area where the concentration of Whites tends to be higher.

It is further noted, that commenter's choice of geographic measures (*i.e.*, one-mile distance and census tracts that rank high on the California Communities Environmental Health Screening Tool ("CalEnviroScreen)) do not correspond to impacts from well development or operations. Indeed, as discussed above, the risk assessment for toxic air contaminants prepared as part of the DEIR demonstrates that at a fraction of this one mile distance risks from well development and operation are below the air district's significance threshold. Further, the showing that minority populations tend to be located closer to census tracts that rate high on CalEnvironScreen is likely indicative of the CalEnviroScreen methodology. As discussed below, CalEnviroScreen ranks census tracts, in part, based on populations characteristics that are highly correlated with minority status. Therefore, it is unsurprising minority status correlates to census tracts with higher concentrations of people of color.

In addition, commenter's reliance CalEnviroScreen is misplaced, as it assumes there is a relationship between CalEnviroScreen scores and Project cumulative impacts. CalEnviroScreen scores are not indicative of environmental impacts caused by the Project or any particular project. The CalEnviroScreen 2.0 Guidance at pages iii-vi, provides:

[S]coring results are not directly applicable to the cumulative impacts analysis required under the California Environmental Quality Act (CEQA). The statutory definition of 'cumulative impacts' contained in CEQA is substantially different than the working definition of 'cumulative impacts' used to guide the development of CalEnviroScreen. … Moreover, CalEnviroScreen assesses environmental factors and effects on a regional or community-wide basis and cannot be used in lieu of performing an analysis of the potentially significant impacts of any specific project. … Also, this tool considers some social, health and economic factors that may not be relevant when doing an analysis under CEQA.").[1]

The problems with the use of CalEnviroScreen in the context of CEQA and this Project are manifold. By way of background, CalEnviroScreen generally works as follows:

- The tool utilizes numeric data, compiled for census tracts throughout California, on multiple indicators in two broad categories: pollution burden and population characteristics. These two categories are given equal weight in calculating the overall CalEnviroScreen score.

- Pollution burdens include, for example, air contaminant concentrations, drinking water contaminants or the presence of cleanup sites.
- Population characteristics are simply descriptions of the population, such as education attainment, poverty, linguistic isolation and unemployment levels, number of emergency room visits, and the like.
- From these datasets, a single composite score is calculated by multiplying the calculated pollution burden score by the calculated populations characteristics. Census tracts throughout the state are ranked based on their composite scores.

The CalEnviroScreen methodology does not create substantial evidence of potentially significant cumulative impacts under CEQA for several reasons. First, as the CalEnviroScreen guidance document notes, composite scores are partly based on socioeconomic factors which do not represent CEQA impacts. CEQA Guidelines § 15064(e). Second, CalEnviroScreen scores incorporate existing environmental conditions, which would continue to exist, even if there were no proposed project. Pre-existing conditions are properly part of the CEQA baseline, and are not project-generated environmental impacts. CEQA Guidelines § 15125. Third, while pre-existing conditions are considered during the cumulative impact analysis, they are considered only to the extent that the pre-existing conditions can be meaningfully aggregated with impacts from the project. Because the CalEnviroScreen produces a composite unitless score, including some factors that have nothing to do with the Project impacts, the presence of a high CalEnviroScreen score does not indicate the presence of a cumulative impact. Fourth, the CalEnviroScreen calculation also presents a variety of technical issues. For instance, it arbitrarily assumes numerical equivalence between some disparate variables (*e.g.*, toxic releases are weighted exactly the same as traffic density). The tool also arbitrarily assigns different weights to other variables (*e.g.*, groundwater threats have exactly half the weight of traffic density), and treats some interdependent variables (*e.g.*, ozone and traffic density, poverty and unemployment) as though they were independent.

In sum, the commenters' reliance on CalEnviroScreen composite scores and a one mile unit of analysis does not constitute substantial evidence of a potential environmental impact.

---

0046-8

The Commenter makes note of the *Romo v. Brown* lawsuit, which was filed under section 11135 on behalf of two children who attend Sequoia Elementary School. The suit alleges that the children and other schoolchildren of color have suffered adverse, racially disparate effects from stimulation of oil wells near Sequoia Elementary School. As discussed above, CEQA does not call for analysis based on demographic analysis, and it is not the right venue to address claims made under 11135. However, for informational purposes it is noted (and discussed above) that almost 90% of oil and gas production occurs in Tier 1 areas where the dominant land use is oil and gas production. School district boundaries overlay these areas, even though there are no schools and very residence residences. Therefore, a school district boundary is not an appropriate geographic unit of analysis. It is also noted, that a geographic unit of 1.5 miles from an active well does not appear suited to evaluate impacts. Therefore, commenter has not identified any particular impact to schools or pupils in reference to the Project.

In addition, this Project does not directly affect existing conditions at Sequoia Elementary School or other school within the County. This Project addresses future drilling and well stimulation, not prior actions. Indeed, in evaluating the environmental effect of the Project the circumstances of past drilling and stimulation are part of the environmental setting or baseline and are considered in the cumulative impacts assessment.

The Amended Ordinance would impose more than one hundred new procedural and substantive requirements on oil and gas activities within the County. Among other things, the proposed Amended Zoning Ordinance includes updated development, implementation standards and conditions to reduce address environmental impacts of drilling and other oil and gas related equipment and facilities. In addition, based on the analysis of potential significant impacts in this EIR, the County has identified mitigation measures that must be incorporated into the Project that oil and gas operators must comply with in conducting future well drilling and stimulation. Some mitigation measures are triggered specifically based on proximity to sensitive receptors, for example, MM 4.3-5 (setbacks to avoid toxic air contaminants from drilling and other construction sites causing significant impacts due to exposure of sensitive populations) and 4.12-1 (setbacks to avoid noise from construction activities causing significant impacts on sensitive populations). In addition, as described in Chapters 4.6 (Geology and Soils), 4.8 (Hazards and Hazardous Materials), and 4.9 (Hydrology and Water Quality), DOGGR recently adopted regulations regarding well stimulation that will affect how that activity will be conducted in the future. In the future, the harms alleged in the *Romo v. Brown* lawsuit will be reduced or avoided through the Ordinance and state well stimulation regulations.

In evaluating the Project, this EIR takes a comprehensive look at oil and gas development activities in the County. The complaint in *Romo v. Brown* focusses on well stimulation. However, as explained in the Chapter 3, Project Description, stimulation treatments typically last only a few hours or days. Following flowback of fluids, the air emissions associated with a stimulated well are not measurably different from wells that have not been stimulated. Therefore, rather than focusing just on well stimulation, this EIR analyzes the impacts, including air emissions impacts, of all phases of oil and gas development, and has developed appropriate mitigation measures.

For the purposes of further analysis, the wells near the Sequoia Elementary School were analyzed for potential impacts under a hypothetical drilling and stimulation scenario conducted in a manner consistent with the proposed Amended Zoning Ordinance. The wells closest to Sequoia Elementary School are summarized below.

Table XX-YY: Wells Closest to Sequoia Elementary School

Well Name	API No.	Drilled Date	Stim Date	Depth	Distance*
Eckmann 2-4H	03043765	10/29-12/3/2011	12/18-28/2011	11,458	1250

Tulare 3-16H	03049883	2/16-3/23/2013	3/29-4/1/2013	8,496	1800

*Approximate distance in feet to school fenceline.

The Tulare 3-12H well is the closest well to the school, and is approximately 800 feet from the school's fenceline. It is 11,319 feet deep. The Health Risk Assessment prepared for the hypothetical project shows that a well greater than 10,000 feet deep drilled in 2015 would have a significant impact on a sensitive receptor if it were 367 feet or closer to the sensitive receptor. *See Draft EIR*, *Appendix M, Health Risk Assessment for Proposed Drill and Oil and Gas Operations*. Even if this well were drilled upwind from the school, it would not be expected to cause a significant impact on the children or others present at the school.

Additionally, it is important to note that oil and gas development is widespread throughout the Project Area, and there are examples of intensively developed oil and gas fields identified as Core Areas in close proximity to the County's wealthier and neighborhoods, as well. For example, the Kern River and Kern Front oil fields (described at page 3-18 and shown on Figure 3-3 of the Draft EIR) border neighborhoods in the northeastern portion of the City of Bakersfield, in proximity to schools with a predominantly white student body, such as Garces Memorial High School.

The Amended Zoning Ordinance, together with the mitigation measures included in this EIR, will reduce public health and other environmental impacts across the region, benefitting all school children.

0046-9

Please see Response to 0046-8.

0046-10

Response to first half of paragraph:

Comment noted. For the reasons discussed above, including the fact the CalEnviroScreen scores are partly based on socioeconomic factors which do not represent CEQA impacts, the CalEnviroScreen methodology does not create substantial evidence of potentially cumulative considerable impacts under CEQA.

Moreover, as discussed above, the Project includes numerous measures that impose new environmental regulations on the development and operation of oil and gas wells that are designed to mitigated avoid significant impacts. Issues of air quality impacts, including cumulative impacts to sensitive populations have been considered in the DEIR and further addressed in GR Air-6. Except for impacts visual quality and nighttime lighting levels the Project has no significant and unavoidable to the Project Area. These impacts are not related to air quality concerns.

Response to second half of paragraph:

The comment is noted. Issues of air quality impacts, including cumulative impacts to sensitive populations have been considered in the DEIR and further addressed in GR Air-6.

0046-11

Please see response to 0046-10.

0046-12

Commenter's legal reference noted. Neither CEQA nor the CEQA Guidelines require translation of an environmental compliance document into Spanish or any other language. Such an obligation would be inconsistent with CEQA's admonition that it shall not be interpreted "in a manner which imposes procedural or substantive requirements beyond those explicitly stated" in the statute or CEQA Guidelines. CEQA § 21083.1.

In 2014 the California legislature passed a bill which would have required the Office of Planning and Research to develop guidelines for when a lead agency must translate CEQA documents into non-English languages. On September 25, 2014, Governor Brown vetoed that legislation,[1] further confirming that translation is not mandated under CEQA. In vetoing the legislation, Governor Brown noted that translating documents is sometimes good practice, depending on the circumstances, and identified two examples of cases where the lead agency found that translation was merited. Even in those cases, the lead agencies only translated certain notices and other public documents, not the full environmental impact reports.

Here, Spanish language translators were present at all three DEIR workshops, but no translation services were requested or use. Subsequently, the County did not find it necessary to translate the environmental review documents in this matter, and it was not required to do so under CEQA.

California courts have interpreted CEQA's "plain language" requirements to ensure that the public has access to EIR documents. "The message of this regulatory scheme is clear: an EIR in this state must be written and presented in such a way that its message can be understood by governmental decisionmakers and members of the public who have reason to be concerned with the impacts which the document studies."

The commenter suggests that the County violated CEQA by failing to translate the DEIR into Spanish or other non-English languages, pointing, in particular, to two cases (*Emmington v. Solano County Redevelopment Agency*, 195 Cal.App.3d 491 (1987) and *San Franciscans for Reasonable Growth v. City and County of San Francisco*, 193 Cal.App.3d 1544, 1549 (1987)). Neither of these cases stands for the proposition that a lead agency is required to translate environmental review documents into non-English languages. Environmental review documents must be understandable, but there is no obligation that they be translated.

[1] http://www.leginfo.ca.gov/pub/13-14/bill/asm/ab_0501-0550/ab_543_vt_20140925.html.

0046-13

The comment states that the County should have prepared a program EIR instead of a project EIR for the Project is noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration (as are all responses in this Final EIR). The County has the discretion to prepare a comprehensive project EIR for the Project, and has exercised its discretion to so here. Please refer to GR-2 for further discussion on the adequacy of this project-level review.

0046-13 cont'd

0046-14

Please see GR-1 for a description of how the conformity review process will be implemented.

0046-15

Please see GR 16. The Final EIR has made revisions to numerous mitigation measures to address concerns raised by comments, as well as to add specificity and remove discretion so that the measures, as implemented, will be consistent with the ministerial conformity review process adopted by the Revised Amended Ordinance. The revised mitigation measures are set forth in section 7.1.4 of this Final EIR.

0046-16

The cited setbacks are from the ordinance, not the HRA setbacks. Please see GR Air-3, GR Air-5, and GR Air-6 for a discussion of the adequacy of the HRA setbacks. Please see GR Air-9 for a discussion of the CCST study. The Final EIR has revised several mitigation measures relating to setbacks, which have been included in the Revised Amended Ordinance. For example, the required operational setback distance from sensitive receptors has been increased from 190 to 210 for noise impacts. The Revised Amended Ordinance also clarifies several terms, including the "public highway" reference used for the 100 foot setback. (The Revised Amended Ordinance is set forth in Section 7.1.3 of the Final EIR.) Revised setback distances required to protect human health and the environmental are described in responses to comments to this Final EIR.

0046-17

Please see RTC 45-14 above. In addition, the two references by McKenzie, *et al.* cited by in this comment were obtained and reviewed to determine whether they support the assertions made in the comment."McKenzie (2012) Human health risk assessment of air emissions from development of unconventional natural gas resources"[1], and "McKenzie (2014) Birth Outcomes and Maternal Residential Proximity to Natural Gas Development in Rural Colorado"[2].

McKenzie (2012) conducted two evaluations of health risks, one based on the median value of air measurements and another based on a 95th percentile upper confidence limit (UCL) estimates. The study concludes: "These preliminary results indicate that health effects resulting from air emissions during development of unconventional natural gas resources are most likely to occur in residents living nearest to the well pads and warrant further study." However, the results showed that there are no significant chronic, sub-chronic health or cancer risk for risks for either the median or UCL exposure estimates for locations greater than ½ mile. Based on worst-case (70 year continuous outdoor exposure at a fixed location) rather than reasonable maximum exposure assumptions, the study indicated that estimated hazard indices less than 0.5 (<1 indicates no health risk) and cancer risk less than 7 in a million (10 in a million is commonly used by EPA and other air districts to be an acceptable risk level – see response (0049-9). For locations at or within ½ mile, the study indicates that median measured concentrations also indicated risks at acceptable levels for all three health effects. Within ½ mile the UCL risk estimates are higher indicating a hazard index of 1 for chronic effects, 5 for sub-chronic effects and 10 in a million for lifetime cancer risk. Given that the UCL values are representative wells that are much less than ½ mile away and that worst case (see above) exposure assumptions are used, these values are likely to be overestimates.

McKenzie (2014) studied birth outcomes statistics as related to natural gas well locations but did not examine concentrations of ambient air pollutants. Thus, while this type of epidemiological study can determine if there may be positive associations between distance and specific birth outcomes, these methods do not establish definitive cause and effect relationships. The study found that among the birth effects studied that there was a positive association between greater density and proximity of natural gas wells within a 10 mile radius and congenital heart defects. The study did not find significant correlations with other birth outcomes or address what pollutants may be involved or the specific types of sources or activities that may be implicated by the noted positive association. The authors conclude that given the limitation of the present study, that more comprehensive and rigorous research is warranted.

0046-18

0046-18 cont'd

Please see GR Air-8.

0046-19

Oil processing equipment must complete a site-specific HRA in conjunction with SJVAPCD permitting in order to obtain an Authority to Construct (ATC) permit. Thus, potential toxic emissions risks will be addressed for oil processing equipment through permitting. It is also reasonable to assume that a state agency's proposed rules will eventually go into effect and be effective. Please see GR Air-3, GR Air-5, and GR Air-6 for a further discussion of the Project's HRAs.

0046-20

The commenter states that the County's reliance on a 10 in one million cancer risk threshold is unreasonably high and that most agencies use a 1 in a million cancer risk to determine unreasonable threat, including the U.S. Environmental Protection Agency.

The HRA in Appendix M of the DEIR uses a 10 in one million threshold to determine the setbacks in MM 4.3-5. This threshold is lower than the threshold utilized by the SJVAPCD in their HRA analyses. The SJVAPCD uses a 20 in one million threshold which was adopted on June 30, 2015 in response to the changes in OEHHA's HRA modeling. *See* SJVAPCD APR – 1906, "Framework for Performing Health Risk Assessments", dated June 30, 2015.[1] The staff report for the update to SJVAPCD's threshold states that it is revising the District's HRA threshold to 20 in one million due to the changes in OEHHA's March 2015 guidance document and that it believes that this threshold will be equally protective of public health. SJVAPCD Final Staff Report, "Update to District's Risk Management Policy to Address OEHHA's Revised Risk Assessment Guidance Document", May 28, 2015, p. 21.

The comment that EPA and most other environmental agencies use a 1 in one million cancer risk level to determine significance is incorrect. 10 in a million has been a common significance criteria, and, as stated above, some agencies such as the SJVAPCD have recently moved to a higher threshold of 20 in one million. EPA's risk criteria for several regulatory programs are described below, in addition to many examples of California agencies’ significance criteria for CEQA purposes.

In practice, EPA's determination of acceptable risk in particular instances ranges from 100 in one million, as specified in OSWER (Office of Solid Waste and Emergency Response) Directive 9355.0-30, "Role of the Baseline Risk Assessment in Superfund Remedy Selection Decisions" issued April 22, 1991[2] to 10 chances in one million. For instance, EPA has used 10 in one million as an acceptable level associated with recent Superfund site remediation activities. *See* New Bedford Harbor Cleanup Plans, Technical Documents and Environmental Data and Hudson River PCBs Superfund Site Cleanup Plans and Documents.[3] The 10 in one millionrisk level is also cited in EPA's Human "Health Risk Assessment Protocol (HHRAP) for Hazardous Waste Combustion Facilities, Chapter 7: Characterizing Risk and Hazard".[4]

Various other California agencies also use a threshold higher than 1 in one million:

Mojave Desert AQMD uses a 10 in one million CEQA significance threshold for health risk assessments. *See* on page 10 of *California Environmental Quality Act (CEQA) And Federal Conformity Guidelines*, August 2011, p. 10.[5] Santa Barbara County APCD defines a "Significant Risk" as 10 in one million.[6] Ventura County APCD gives significance criteria of 10 in one million. *Ventura County Air Quality Assessment Guidelines*, October 2013, p. 3-5.[7] South Coast AQMD Air Quality thresholds are 10 in one million.[8] on the web site The California Energy Commission also uses 10 in one million as a significance level. *See Final Staff Assessment for the Carlsbad Energy Center Project Amendment*, February 2015, p. 4.8-6.[9] Thus, the 10 in one million threshold used in the HRA in Appendix M of the DEIR is appropriate.

0046-21

The comment is noted for the record and has been considered; however, neither the health risk assessments, noise assessment, nor the vibration assessments that have been completed by experts using appropriate methodologies provide scientific support for commenter's requested expanded setback distances. Please see GR Air-3, GR Air-5, and GR Air-6 for a discussion of the Project's HRAs.

0046-22

All air quality mitigation measures, including the "no net increase" measure included in MM 4.3-8, must be implemented under this EIR. MM 4.3-8 requires that the Project cause "no net increase" in air emissions for pollutants that are not required to be offset under existing District permit regulations, such as emissions from maintenance vehicles, as described further in Section 4.3. Additionally, stationary source emissions for which offsets are required under District permitting rules must offset at an even greater ratio (1:1.5 – or for each ton of new emissions, one and one-half tons of emission reductions must be achieved) than this "no net increase" standard. However, based on the remaining scientific uncertainty about how to appropriately calculate reductions of one pollutant as equivalent to reductions to another pollutant, it is not possible to conclude that every molecule of each pollutant will be offset under the ERA. This EIR requires the Applicant to offset more emissions than are required in current District attainment plans, and will accordingly assist the region in complying with applicable ambient air quality standardsThe commenter misunderstands the mitigation measures in the DEIR. Please see GR Air-1 for a discussion of these mitigation measures. In addition, the point in the last sentence of the comment is not germane. Chapter 4.3 of the DEIR provides a comprehensive presentation of the Valley air baseline and regulatory process for achievement of legal attainment standards.

0046-23

See response to comment above.

0046-23 cont'd

0046-24

Please see GR Air-4. The San Joaquin Valley Air Pollution Control District is the agency designated by the State of California to monitor and report information on air conditions in the Project Area, and to adopt regulations as well as make recommendations on achieving the air emission reductions required to attain applicable ambient air quality standards. Placing individual air monitors on up to 3647 new wells permits annually is not a recommendation of the Air District, and there is no evidence in the record that such an action is scientifically warranted toprovide useful information, nor will such monitors reduce any impact below the levels mandated by the mitigation mesures included in this EIR.

0046-25

Please see GR Haz-1 for a discussion of pipelines, including mitigation measure revisions to expand on the procedures applicable to pipeline maintenance, release reporting, and public notice and response actions.

0046-29

Please see GR GHG-1.

0046-30

The Draft EIR identifies representative potentially hazardous materials used in Kern County oil and gas drilling and production in 2014 (excluding chemicals used in well stimulation treatments). DEIR, pp. 4.8-4 – 4.8-5, Table 4.8-1. Table 4.8-3 sets forth representative WST chemicals used in Kern. The Draft EIR also identifies maximum daily onsite volumes of such hazardous materials as reported to Kern County Environmental Health

Division (KCEH). Though the total number of wells drilled in a given year could increase compared to baseline under the Project (see GR 9 – Well Projections), the well sites themselves are anticipated to be similar in size and intensity to past industry practices. Thus, it is reasonably foreseeable that the types and volumes of hazardous materials used in oil and gas fields will remain substantially the same as those disclosed in the DEIR. Further, the EIR imposes various mitigation measures that reference and implement industry standards concerning oil management of hazardous materials at oil and gas production sites. The standards include *Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development: The Gold Book* (Bureau of Land Management 2007), *Environmental Protection for Onshore Oil and Gas Production Operations and Leases* (American Petroleum Institute 2009), or equivalent standards. See MM 4.8-6 - 4.8-7. Mitigation Measures 4.8-10 – 4.8-14 also address spill and release prevention and response. With these measures, as well as implementation of DOGGR regulations concerning WST activities (see GR-10), the EIR correctly concludes that potential impacts for use, storage and transport of hazardous materials are less than significant.

0046-31

As described on pp. 4.8-3 – 4.8-4 of the EIR, "[r]ail is used as one of the modes of transport for hazardous materials utilized in oil and gas activities within the Project Area, and is used to transport crude oil to the Project Area, but not to transport crude oil generated within the Project Area." Thus, the oil & gas activities authorized by the Project will not result in an increase in the volume of total crude or gas transported by rail or the number of train trips that involve such transport, or any attendant risk associated with such trips. As such, the Project has no impact in this issue and no mitigation is necessary or warranted.

0046-32

Comment noted. As discussed above, an environmental justice analysis is not required under CEQA, and a DEIR is not the appropriate venue to address a potential issue under section 11135. While CEQA does not require an impact analysis that takes racial demographics into consideration, for informational purposes only it is noted that commenter has not presented facts that suggest that the residents of Button Willow or Kettleman City, whether Latino or otherwise, would be adversely impacted by the transport or disposal of wastes at facilities located within those communiities. . The Clean Harbors Buttonwillow Hazardous Waste Facility is permitted by Kern County under a fully compliant Conditonal Use Permit and is in compliance with all requirements for operation with the State and Federal government. It is located near the unincorporated community of Buttonwillow in Kern County.

The Waste Management Kettleman Hills Facility is located in Kettleman City, an unincoroporated community, in Kings County and permitted by the Kings County Board of Supervisors. The Kettleman Landfill takes both hazardous and municipal waste for disposal. Kern County has no jurisdiction or authority over the Waste Management Kettleman Hills Facilty.

It is further noted for informational purposes that in August 2012, the United States Office of Civil Right ("EPA" or "Office of Civil Rights") evaluated claims that the hazardous waste disposal facilities in Buttonwillow, Kettleman City and another city created a disparate impact on people of color through the facilities’ respective operations. EPA dismissed and closed the Title VI complaint. *See,* EPA Letter, To: Debbie Raphael, Director, California Department of Toxic Substances Control, From: Rafael DeLeon, Director, EPA Office of Civil Rights, *Dismissal and Closure of Title VI Compliant* (August 30, 2012) (*EPA Dismissal Letter*), available at the following URL: http://www.epa.gov/civilrights/TitleVIcases/decisions/padres/Padres_complaint_01-95-R9_decision-ltr_DTSC_20120830.pdf. Last checked September 17, 2015.

The Office of Civil Rights based its conclusion on an investigation of the potential impacts of the facilities with respect to: accidental releases from hazardous chemicals; groundwater contamination and drinking water; surface water contamination and drinking water; earthquakes; particulate matter (PM) (*e.g.*, dust) emissions; ozone precursor emissions; and air toxics emissions. Among other things, the Office of Civil Rights found:

"the potential lifetime cancer risk from dioxins at several receptor locations were below 1 in a million. The modeling results for worst-case hypothetical spill scenarios showed concentrations would remain below Acute Exposure Guideline Levels, which represent threshold exposure benchmarks for the general public, at nearby receptors." *EPA Dismissal Letter* at 4. "no risk of adverse health effects from contamination of

groundwater by any of the three facilities." *Id.* at 5. "very little risk of adverse health effects from the facilities contaminating surface water." *Id.* at page 5. "very little risk of adverse health effects from releases of hazardous waste from the facilities resulting from an earthquake." *Id.* at 6. "due to ongoing dust suppression practices, [particulate matter] emissions from the facilities were found to be less than the likely emissions from the pre-construction naturally occurring emissions." *Id.* at 6. "the facilities' emissions do not have a discernible impact on ozone levels at any site in the San Joaquin Valley . . ."" *Id.* at 6. "very little risk of adverse health impacts [from air toxics emissions] because inhalation cancer risks and non-cancer hazard indices from facility emissions are below threshold levels of concern. OCR found that no current residential locations have estimated lifetime cancer risks higher than 1 in a million from all the chemical emissions combined at each facility." *Id.* at 7. Based on these findings the EPA Office of Civil Right dismissed and closed the compliant "because not no violation of Title VI [of the Civil Rights Act of 1964] was found." *Id.* at 7.

Further, concurrent with the review of the Kettleman City facilities’ request for permit renewal, which was granted, the California Department of Toxic Substance Control (DTSC) conducted an Environmental Justice Review. DTSC, Environmental Justice Review, *The Kettleman Hills Facility Chemical Waste Management*, Inc. (June 2013) (*EJ Review*) available at the following URL: https://www.dtsc.ca.gov/HazardousWaste/Projects/upload/Kettleman_EJReview_0613.pdf. In the *EJ Review*, "DTSC acknowledges the multiple environmental pollution burdens borne by the Kettleman City community, and the presence of poverty, language barriers and other factors which tend to make those people vulnerable to the impacts of pollution." *EJ review* at 4. However, the *EJ Review* did not make any finding or conclusions with respect to the facility's contribution to impacts, and DTSC subsequently issued it renewed the facility's Final Hazardous Waste Facility Permit on May 21, 2014. Nonetheless, as part of the permitting process the applicant agreed to an enforceable plan to reduce truck emissions. According to the *EJ Review*, "[t]his plan will reduce the impact of diesel emissions of NOx and PM10 (particulate matter 10 micrometers in diameter and smaller). NOx emissions could be reduced by as much as 165,000 pounds per year and PM10 emissions by as much as 7,000 pounds per year in Kettleman City, Avenal and the San Joaquin Valley Air Basin."

While an environmental justice evaluation is not appropriate within the context of CEQA, commenter has not presented substantial evidence to suggest that the transport and disposal of hazardous materials to the appropriately permitted facilities will create significant impacts.

0046-33

This introductory comment is noted. Please see Responses 33-39 to this comment, and Global Response (GR) Alt-1.

0046-34

This introductory comment is noted. Please see Responses 0049-33 through 0046-39, and Global Response (GR) Alt-1.

0046-34 cont'd

0046-35

As this comment correctly notes, the project applicants in this matter are private parties with interests in Kern County oil and gas production. As this comment also correctly notes, the project applicants did apply for the amendments to the Kern County Zoning Ordinance described in Draft EIR Chapter 3, *Project Description*, and elsewhere in this EIR, as is their legal right. Section 19.112.010 of the Kern County Code of Ordinances expressly provides that "any interested person" may apply to the County for a legislative zoning amendment.

The CEQA Guidelines require the EIR's project description to include a statement of the objectives sought by the proposed Project that includes the underlying purpose of the Project. 14 Cal. Code Regs. § 15124(b). The CEQA Guidelines further provide that the EIR shall describe a range of reasonable alternatives to the project which would feasibly attain most of the project objectives. 14 Cal. Code Regs. § 15126.6(a). CEQA permits the County broad discretion to formulate the project objectives. *See Cal. Oak Foundation v. Regents of the University of Cal.* (2010) 118 Cal.App.4th 227, 276. CEQA does not prohibit the County from formulating project objectives designed to establish an administrative process intended to facilitate the growth of an important sector of the County economy. As recognized by the courts, "CEQA does not restrict an agency's discretion to identify and pursue a particular project designed to meet a particular set of objectives." *Id*.

The Project objectives in this case do not place the special interest of a single stakeholder above others. As described on pages 1-5 through 1-6 of the Draft EIR, the Project objectives in this matter are focused on a broad spectrum of County interests and include:

Reducing or eliminating potential significant adverse environmental impacts, to the extent feasible, of future oil and gas activities … and thereby ensure that current County ordinances reflect the County's interest in protecting the health, safety and general welfare of residents and visitors;

Encouraging ongoing economic development by the oil and gas industry that creates quality, high paying jobs and promotes capital investment in Kern County which enables the County to invest in capital improvement projects and social programs, which benefit County residents, retail businesses, and capital industries which ensures the County's fiscal stability;

Ensuring the protection of environmental resources by emphasizing the conservation of productive agricultural lands, the encouragement of planned urban growth, the promotion of clean air strategies to address existing air quality issues, and the promotion of long-term water conservation strategies which will ensure the quality and adequacy of surface and groundwater supplies for future growth of all of Kern County's industries;

Containing new development within an area large enough to meet generous projections of foreseeable need but in locations that will not impair the economic strength derived from residential developments, agriculture, rangeland, mineral resources, or diminish the other amenities that exist in Kern County; and

Increasing oil and gas exploration and production in Kern County as a means of increasing employment opportunities and economic prosperity to Kern County's residents, businesses, and local government.

As explained in Draft EIR Chapter 6, Alternatives, each Project alternative was evaluated to determine its ability to achieve these objectives and did not restrict such evaluation to objects focused on a single stakeholder.

0046-36

This comment does not raise a significant environmental issue. The CEQA Guidelines expressly authorize the lead agency to cooperate with the project applicant and with the applicant's consultants in the preparation of an environmental impact report. 14 Cal. Code Regs. 15084(d)(3). The public has been provided multiple opportunities to participate in the preparation of this EIR, including through properly noticed EIR scoping meetings, and by reviewing the Draft EIR and submitting comments during the noticed public review period required by CEQA. The public will also be able to participate in all upcoming public hearings conducted by the County Planning Commission and Board of Supervisors concerning this EIR and the Project, which public hearings shall be properly noticed in accordance with law.

0046-37

This comment does not raise a significant environmental issue. Please see Responses 33 and 34.

0046-38

Please see Global Response Alt-1 and Responses 33 and 34.

0046-39

Please see Global Response Alt-2.

0046-40

Please see Draft EIR pages 6-23 through 6-24 wherein the Alternative 4 – No Hydraulic Fracturing Alternative was fully evaluated. Alternative 4 would prohibit hydraulic fracturing, as this comment suggests. Please also see Global Response Alt-2 which explains why, on further review, the County has determined that Alternative 4 is legally infeasible on the basis of preemption. Any alternative that would ban other forms of well stimulation treatments, such as acidization, or forms of enhanced oil recovery, such as steam injection, would also be legally infeasible for the same reasons described in Global Response Alt-2's discussion of Alternative 4. The EIR is not required to consider alternatives that are legally infeasible. *See* 14 Cal. Code Regs. § 15126.6(f)(1); *see also, Save San Francisco Bay Assn. v. San Francisco Bay Conservation & Development Dist.* (1992) 10 Cal.App.4th 908, 922.

Re: **Comments on the Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance 2015(C)**

Dear Mr. Mynk:

The following comments on the Draft Environmental Impact Report ("DEIR") for proposed Revisions to the Kern County ("County") Zoning Ordinance 2015(C) are submitted on behalf of the Sierra Club, a national nonprofit organization of more than 620,000 members. Sierra Club is dedicated to exploring, enjoying, and protecting the wild places of the earth; to practicing and promoting the responsible use of the earth's ecosystems and resources; to educating and encouraging humanity to protect and restore the quality of the natural and human environment; and to using all lawful means to carry out these objectives. Sierra Club's particular interest in the County's revisions to its oil and gas zoning ordinance stem from its interests in reducing reliance on fossil fuels and protecting the health of overburdened and vulnerable communities, including those located in and around the County. These comments are submitted because the County is attempting to evade necessary CEQA review for future oil and gas activities throughout its jurisdiction. 0047-1

The DEIR's analytic scope is impermissibly broad and expansive, making it impossible to sufficiently analyze the activity that will occur in the Project Area as a result of the oil and gas zoning ordinance. As such, it fails in its basic purpose of being an informational document for the public and decisionmakers to be made aware of the environmental consequences of their decisions before they are made. (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564.) 0047-2

Rather than providing a means for the County to adequately identify, consider, analyze and mitigate the range of environmental impacts caused by oil and gas activities throughout the County, the DEIR impermissibly attempts to insulate all oil and gas exploration throughout the County's jurisdiction from further CEQA review for the next 25 years. (DEIR, 3.5, Attachment A, Kern County Zoning Ordinance (07/15) Draft.) This is a grossly inappropriate use of CEQA's environmental review and public notice requirements and it violates the statute's core principles. (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (2007) 24 Cal.App.4 713, 732 [citing *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 829-830, to state that "affected outsiders" and decision makers 0047-3

must be able to "balance [a] proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal … and weigh alternatives in the balance"].) Indeed, because of the numerous, potentially devastating impacts that oil and gas exploration has, and will continued to have on the environment and on public health, further environmental review will undoubtedly be needed for new and ongoing exploration, construction, and operation in a more than 3,000 square mile area that is already overburdened with numerous pollution sources. Yet, because the County has erroneously and impermissibly framed the DEIR as a project-level EIR, as part of its attempt to obviate later CEQA review of project-level impacts, it has precluded its potential to comply with CEQA now, and into the future.

0047-3 Continued

In addition to these flaws, the DEIR wholly ignores the importance of public opinion weighing in on matters of substantial, widespread concern. Oil and gas exploration and extraction activities are not only highly burdensome to the environment and to human health, but they are also highly controversial, and as the DEIR acknowledges, imply numerous significant unmitigable effects. (*See* DEIR at 1-14—1-18 [documenting significant and unavoidable impacts to aesthetics and visual resources, air quality, agricultural resources, biological resources, cultural resources, greenhouse gases, hydrology and water quality, and utilities and service systems].) At the same time, California's political and natural environments are rapidly changing. The state and the nation increasingly recognize the need to move away from fossil fuel production and consumption.[1] California is also entering its fourth year of a catastrophic drought, and as climate change more generally transforms California into a hotter, drier state, more demands will be put on scant water resources, including water resources used for oil and gas drilling.[2] Over the next 20 years there will be numerous reasons to reevaluate the conclusions of this EIR and to perform site-specific environmental review on subsequent oil and gas activities. The DEIR nonetheless explicitly precludes such review unless the County finds reason to re-evaluate the ordinance's total projected activity, and the number of wells being drilled in a given year exceeds the DEIR's generous projection of over 67,000. (DEIR, 3-30.)

0047-4

Moreover, the DEIR process suffers from severe deficiencies that further preclude public input and taint the County's environmental review of the zoning ordinance. Despite a request from a number of organizations for more time to evaluate the environmental and health impacts resulting from the County's proposed actions, the County denied the public sufficient time to comment on a 1,800 page, highly technical and at many times misleading document.[3] Indeed, the County refused to provide more than a meager 60 days to comment on the sufficiency of its review of an action that would drastically impact local communities and public health, and would substantially affect the region and the state's air, water and biological resources for the next 25 years. As result of the limited time period for comments, Sierra Club and other commenters can only address a subset of the deficiencies in the DEIR.

0047-5

For these and the additional reasons expressed herein, we strongly urge the County to reject the DEIR as an informational document, and to require a reconceived, re-drafted and re-circulated DEIR.

[3] *See* Exhibit A, Commenters' Request for Extension of Time, Dated July 20, 2015 and County Response, Dated July 23, 2015 [denying extension of time request].

I. The DEIR Fails to Provide an Adequate Project Description and Is Impermissibly Framed As a Project-level EIR.

"An accurate, stable and finite project description" has been upheld as "the *sine qua non* of an informative and legally sufficient EIR." (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193.) Here, although the EIR is framed as a Project-level EIR, the description of the "project" purportedly analyzed is far too broad in both temporal and spatial scale for a project-level EIR. 0047-7

A project EIR, which is the most common type of EIR, typically focuses "primarily on the changes in the environment that would result from [a] development project." (CEQA Guidelines § 15161; *see also Friends of Mammoth v. Town of Mammoth Lakes Redevelopment Agency* (2000) 82 Cal.App.4th 511, 533-534.)) Yet, the DEIR here encompasses a far broader set of actions and activities than a single development, and the frequency and extent to which such activities will take place over the next 20 years is inconsistently identified throughout the document. Notably, the DEIR purports to evaluate **all** oil and gas activities in a 3,000 square mile area for the next 20 years, which includes **all** well exploration, construction and operation; re-working of old wells; unconventional drilling and extraction (such as fracking and acid fracturing); and the construction and operation of any and all ancillary facilities related to oil and gas, such as electrical distribution lines, oil and gas pipelines, and wastewater disposal facilities. (DEIR 3-303-71.) The DEIR fails, however, to state any detail regarding any project-level or site-specific components of the project, rendering any form of meaningful project-level analysis of the "project" impacts entirely impossible. The Project description itself therefore renders the DEIR virtually incomprehensible and unusable as a project-level document, and its attempt to evaluate a "project" that spans such a broad range of activities, and such a large area and timescale, appears unprecedented for any project-level EIRs. 0047-8

Moreover, the Project description is inconsistent with the analytic time-frame used for purposes of the DEIR's impacts analyses. While the Project description states that the activities under review will take place over the next 25 years, the DEIR only uses a 20 year time-frame to analyze the impacts from oil and gas well activities in the Project's projected thousands of wells per year. (*cf* DEIR, 3-30 [projecting total Project activity to take place over the next 25 years]; and DEIR 4.3-61 [setting forth the methodology for the DEIR's impacts analysis for activities being conducted between 2015 and 2035].) This inconsistency creates incoherence in the DEIR's description of the project and in its analytic approach, thereby violating CEQA. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 89 [holding that an EIR fails as an informational document where its Project description is inconsistent].) The variation in years between the Project description and the DEIR's analysis of the "Project's" impacts is not only confusing to the public and to decision makers as they review the DEIR's analyses and proposed mitigation, but it renders the DEIR's impacts analyses incomplete and inadequate. (*See id*.) 0047-9

The DEIR must be revised to provide an accurate, stable and finite project description, by which the County can meaningfully evaluate the impacts of the activities included in the project under review. (*County of Inyo v. City of Los Angeles, supra,* 71 Cal.App.3d, 193.) Specifically, if the DEIR is to comport with CEQA's requirements for a project-level EIR document, it must be able to provide the County with known project-level information including an accurate and stable description of the "project's" activities and their duration, sufficient to enable the County and the public to be aware of the environmental consequences of their decisions *before* those decisions are made. (*Citizens of Goleta Valley v. Board of* 0047-10

0047-10 Continued

Supervisors (1990) 52 Cal.App.3d 553, 564 [emphasis added].) The County's decisions cannot be made based on incomplete, vague, obscure, or inadequate information stated in the Project Description, as is the case in the DEIR as drafted. (*Communities for a Better Env't v. City of Richmond*, 184 Cal.App.4th, 89.) Here, the project time-frame and duration of the "project's" activities must be reconciled with the analytic temporal scope used for the purpose of identifying, analyzing and mitigating the Project's impacts. An accurate and stable project description that adequately sets forth the "project's" activities may also be impossible without scaling back the scope of the project. As currently described in the DEIR, the project is so vast that it renders the information too general to be useful in understanding the projected environmental effects of the "project," and the description of the project's duration is inconsistently and incoherently set forth throughout the DEIR's analyses.

II. The County's Framing of the EIR as a Project-level EIR is Not Only Misleading, but it Precludes Necessary Future Environmental Review of Oil and Gas Projects, in Violation of CEQA.

0047-11

Notwithstanding the clear inappropriateness of project-level review, the County states that it chose a project-level EIR for three reasons:

> First, by examining both the broad implications of the ordinance changes and the detailed site-specific impacts, this approach facilitates identification of the most effective development standards and mitigation requirements to be incorporated into the site plan review process. Second, a project-level EIR allows the Board of Supervisors and the public to be informed by a comprehensive analysis of impacts at the time the Board considers whether and how to modify existing County ordinances. Finally, a project level EIR provides responsible agencies with the level of completed CEQA process required to inform and reach final decisions regarding subsequent discretionary approvals and other actions regarding these County oil and gas activities.

(DEIR at 2-24.) None of these reasons, however, is availing, as each "benefit" of a project-level EIR is also accomplished by conceiving of the DEIR as a program EIR. Just like a project EIR, a program EIR can help identify the "most effective development standards and mitigation requirements" and help provide a comprehensive look at oil and gas drilling. For many reasons, including those explained above and in further detail throughout this comment, a program-level or first-tier EIR would also be the more appropriate means of accomplishing the objective of examining holistically the environmental impacts of a change as broad in scope as the County's oil and gas zoning ordinance revisions.

0047-12

Unfortunately, it appears that avoiding future environmental review is the only real "benefit" that the County gains by deeming this a project-level EIR. Attempting to evaluate the impacts of oil and gas activities in a single EIR for the largest oil-producing area in California, with no ongoing process for evaluating the effects of particular projects, however, makes little sense, and is a direct violation of CEQA. (*See In re Bay-Delta Programmatic Envtl. Impact Report Coordinated Proceedings*, (200843 Cal.4th 1143, 1169-1170) [requiring subsequent, detailed project-level analysis when first-tier analyses are aimed at broadly analyzing the implementation of a broader set of actions].)

0047-13

While the County attempts to characterize its approach to the EIR process for the oil and gas zoning ordinance as mere "streamlining," it is in fact attempting to avoid future environmental review. Rather than provide for future CEQA review, the DEIR insulates future

development from any form of public notice or project-level review. (*See* DEIR, 2.6.3 [making clear that the DEIR does not envision future review of oil and gas activities encompassed in the oil and gas zoning ordinance].) The County must, at a minimum reconceive and re-draft the DEIR as a "program" or first-tier EIR, and it must rewrite the proposed ordinance revisions to state that future oil and gas approvals are discretionary, not ministerial, in order to ensure future opportunity for public notice and environmental review of oil and gas projects over time, as further explained below. (*See* Section II(B), *infra*.)

0047-13 Continued

A. The DEIR's Project-level Analysis is Improper, and the Document Fails to Provide a CEQA-Compliant Program-level or First-Tier Analysis of the County's Oil and Gas Zoning Ordinance.

0047-14

"[A] *program* EIR is distinct from a *project* EIR, which is prepared for a specific project and must examine in detail site-specific considerations," as noted above. (*Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156, 1184 [quoting *In re Bay-Delta Etc.* (2008) 43 Cal.4th 1143, 1169] [holding that subsequent "specific project" that was part of a program EIR required a tiered project EIR][emphasis added].) Program EIRs are designed to "(1) Provide an occasion for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on an individual action, (2) Ensure consideration of cumulative impacts that might be slighted in a case-by-case analysis, (3) Avoid duplicative reconsideration of basic policy considerations, (4) Allow the lead agency to consider broad policy alternatives and program wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts, [and] (5) Allow reduction in paperwork." (14 Cal. Code Regs. § 15168(b) ("CEQA Guidelines").)

0047-15

"For a subsequent project that is consistent with the program or plan analyzed in a first tier EIR, CEQA requires a lead agency to prepare an initial study to determine if the later project may cause significant environmental effects not examined in the first tier EIR. If the later project will cause such effects, the lead agency must prepare another EIR." (*Friends of Mammoth v. Town of Mammoth Lakes Redevelopment Agency* (2000) 82 Cal.App.4th 511, 528; *see also* CEQA Guidelines § 15168(c)(1).) In other words, a program EIR is only the first step in environmental review, and an agency must prepare subsequent site-specific review for activities carried out under the program. (*Id.*)

0047-16

Here, the extremely broad DEIR, which covers both amendments to the County's oil and gas zoning ordinance and all future oil and gas permitting in the County by multiple agencies, is inappropriately framed as a project EIR, and also fails to meet the requirements of a first-tier or program EIR. If the DEIR was to satisfy the requirements of a programmatic or first-tier document, the DEIR would have to provide for all subsequent site-specific impacts to be evaluated in an initial study to assess the direct, indirect and cumulative impacts of the particular activity, along with an opportunity for public notice and comment. (*In re Bay-Delta Programmatic Envtl. Impact Report Coordinated Proceedings*, 43 Cal.4th, 1173 [noting that when a program EIR is broad and fails to discuss site-specific effects, *"later* project-level EIR's may not simply tier from the [program EIR] analysis and will require an independent determination and disclosure of significant environmental impacts"].) A programmatic EIR would also have to clarify that the County and other agencies must file a notice of determination for any subsequent program activity that it finds requires no further environmental review. (*Comm. For Green Foothills v. Santa Clara Cnty. Bd. of Supervisors* (2010) 48 Cal. 4th 32, 56 ["such a notice would seem to be required under the general rule that an agency file an NOD '[w]henever [it] approves or determines to carry out a project that is subject to' CEQA. (§§ 21108, subd. (a), 21152, subd. (a).)]".) This iterative process is essential to ensuring CEQA compliance now, and into the future, and would enable the County to make a good faith effort at evaluating the cumulative impacts of oil drilling at a high level. (*In*

0047-16
Continued

re Bay-Delta Programmatic Envtl. Impact Report Coordinated Proceedings, at 1173.) The process is also critical to assessing the efficacy of applied mitigation measures while allowing for needed ongoing public involvement and evaluation of oil and gas drilling activity throughout the County, and throughout the region, over time.

0047-17

Continued reevaluation of the site-specific impacts caused by oil and gas production also enables the County to incorporate the newest technologies and the newest environmental, safety, public health and resource protection strategies as standard mitigation measures in its master planning document, consistent with CEQA principles. Because of rapid changes in oil and gas production technologies as well as equally significant changes in the environmental setting throughout the state, such reevaluation should take place at least every five years. (CEQA Guidelines § 15179 [requirement that master EIRs, which serve a similar purpose to program EIRs, not be used to authorize future projects undertaken more than five years after the master EIR is certified, unless there are no changed circumstances and no new information].) Again, with an always changing regulatory and environmental landscape, continuing to evaluate oil and gas drilling at a high level and at regular intervals is both prudent public policy, and necessary to ensuring CEQA compliance. (*Id*.)

B. By Attempting to Insulate Future Well Approvals from Further Environmental Review, the Proposed Ordinance Violates CEQA.

0047-18

The County's proposed changes to Chapter 19.98 of the Kern County Zoning Ordinance would establish "Oil and Gas Conformity Review" and "Minor Activity Review" ministerial permit procedures for County approval of future well drilling and operations. (DEIR at 1-6.) This purports to allow the County to approve most oil and gas activities for the next 25 years ministerially and without further public notice or environmental review, as long as the Planning Director "determines that the proposed use meets the implementation standards and conditions specified in the applicable provisions of [the oil and gas zoning code]." (Proposed Kern County Zoning Ordinance §§ 19.98.090(B); 19.98.100(C); 19.98.120(B).) Because this review is necessarily not ministerial, however, the ordinance, and the County's approval of future oil and gas activities without further environmental review, violates CEQA.

0047-19

The CEQA Guidelines define discretionary projects as government actions requiring "the exercise of judgment, deliberation or decision," CEQA Guidelines § 15357, and further provide, in part, that "CEQA applies in situations where a governmental agency can use its judgment in deciding whether and how to carry out or approve a project. A project subject to such judgmental controls is called a 'discretionary project.'" (CEQA Guidelines § 15002, subd. (i).) Ministerial decisions, in contrast, require the agency official to apply only "fixed standards" or "objective measurements" and preclude the use of "personal, subjective judgment in deciding whether or how the project should be carried out." (CEQA Guidelines §15369.) Thus, "The term 'ministerial' is limited to those approvals which can be legally compelled without substantial modification or change." (*Friends of Westwood, Inc. v. City of Los Angeles* (1987) 191 Cal.App.3d 259, 269.) Typical examples of ministerial permits include automobile registration, dog licenses, and marriage licenses. Any doubt about whether a project is ministerial or discretionary should be resolved in favor of the latter characterization. (*Id.* at 271; *NRDC v. Arcata Nat'l Corp.* (1976) 59 Cal.App.3d 959, 970; *Friends of Mammoth v. Board of Supervisors* (1972) 8 Cal.3d 247, 259 [CEQA must "be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language."].) "Where a project involves an approval that contains elements of both a ministerial action and a discretionary action, the project will be deemed to be discretionary and will be subject to the requirements of CEQA." (CEQA Guidelines 15268, subd. (d).)

Whether an activity is ministerial is a question of law and subject to *de novo* review by courts. (*Great Oaks Water Co. v. Santa Clara Valley Water Dist.* (2009) 170 Cal.App.4th 956, 967.) "[A] municipality's classification of a certain approval process as ministerial is *not* conclusive. 'The applicability of CEQA cannot be made to depend upon the unfettered discretion of local agencies, for local agencies must act in accordance with state guidelines *and the objectives of CEQA*.'" (*Friends of Westwood, Inc. v. City of Los Angeles* (1987) 191 Cal.App.3d 259, 270 [quoting *Davy v. City of Glendale* (1975) 51 Cal.App.3d. 817, 822].)

0047-19
Continued

The County's attempt to "streamline" environmental review of future well activity is made clear throughout the DEIR; yet the "streamlining" envisioned in the EIR is more akin to insulating future well activity from environmental review, than actually streamlining that review. As Section 2.6.3 of the DEIR states:

> Based on the comprehensive analyses, mitigation measures, and performance standards included in the EIR and revised ordinance, it is anticipated that in the vast majority of future oil and gas production activities, implementation of the new ordinance will **not** result in the need for the County, or for responsible agencies with ministerial authority or discretionary review and approval processes to prepare additional CEQA documents for individual well or field development proposals.

(DEIR, 2.6.3 [emphasis added].)

Despite the DEIR's position, however, subsequent approval of oil and gas projects is not ministerial under CEQA, and therefore requires environmental review. (CEQA Guidelines § 15002, subd. (i).) The County must make a discretionary decision when it determines, generally, whether "the proposed use meets the implementation standards and conditions specified" in the zoning code, and more specifically whether individual oil and gas permits comply with the mitigation measures outlined in the DEIR. (Proposed Kern County Zoning Ordinance §§ 19.98.090(B); 19.98.100(C); 19.98.120(B).)

0047-20

For instance, mitigation measure 4.17-2 requires that an oil and gas applicant "shall increase the re-use of produced water, and reduce its use of municipal and industrial-quality ground or surface water *to the extent feasible*." (Emphasis added.) Per the County's proposed ordinance, the County may deny the permit if the Planning Director determines that the applicant has not complied with this mitigation measure. (Proposed Kern County Zoning Ordinance §§ 19.98.060(D); 19.98.040(E); 19.98.090(B); 19.98.100(C); 19.98.120(B).) But whether the applicant has reduced its use of water *to the extent feasible* requires subjective judgment. Accordingly, the County's finding that an applicant has or has not adequately reduced its use of water to the extent feasible is a discretionary determination, and the County's approval of permits is not ministerial. (CEQA Guidelines §15369.)

0047-21

Other areas where there are no "fixed standards" or "objective measurements" and where the County must use expert judgment in determining whether the project applicant has complied with the mitigation measures set forth in the DEIR, include, but are not limited to:

0047-22

- Enforcement of mitigation measure 4.2-1, which requires that for oil and gas activities on farmland, the applicant submit to the County evidence of one or more measures to achieve mitigation, including the option for the applicant to "participat[e] in any agricultural land mitigation program adopted by Kern County that provides equal or more effective mitigation" than other listed mitigation measures;

- Enforcement of mitigation measure 4.3-5(c), which allows the County to waive setback distances to sensitive receptors if setbacks cannot be met, as long as the County finds that the applicant can demonstrate the it has achieved a level of risk less than the threshold risk level;
- Enforcement of mitigation measure 4.3-8, which allows the County to waive the requirement to pay an air quality mitigation fee if the applicant demonstrates that it can "reduce emissions for one or more designated criteria emissions through actual reductions in air emissions from other Applicant sources, as submitted to the County and validated by the [Air] District";
- Enforcement of mitigation measure 4.4-3, which provides that exclusion barriers or buffers *may* be used to avoid take of protected and sensitive species "where effective and feasible";
- Enforcement of mitigation measure 4.4-15(l), which requires that all site activity use previously disturbed areas to minimize habitat disturbance "to the maximum extent *feasible*";
- Enforcement of mitigation measure 4.4-16, which allows the County to approve new disturbance mitigation through a number of potential measures, or a combination of measures;
- Enforcement of mitigation measure 4.7-4, which requires the applicant to offset greenhouse gas emissions not covered by the Cap-and-Trade program or other mandatory greenhouse gas emission reduction measures, to ensure no net increase in greenhouse gas emissions, and which necessarily requires the County to use expert judgment to determine whether the applicant has accurately reported the emissions required to be offset and has adequately reduced those emissions;
- Enforcement of mitigation measure 4.8-3, which requires that fuel and lubricant tanks have "*appropriate*" secondary spill containment;
- Enforcement of mitigation measure 4.8-6, which requires the applicant to implement "the most up-to-date best management practices" including using closed loop mud systems "*when practical*"; design systems with the smallest volumes possible to minimize waste generation; reduce and reuse oil-based muds and high density brines "*when practical*"; construct "*adequate*" berms around materials and waste storage areas to contain spills; and use "*strongly suggested*" containment for produced water tanks;
- Enforcement of mitigation measure 4.8-8, which requires applicants to use the "*appropriate*" American Petroleum Institute Standards, or "the same or equivalent standards";
- Enforcement of mitigation measure 4.8-15, which requires applicants who intend to use more than 10,000 pounds of acutely hazardous chemicals within .25 miles of a school to "evaluate whether other alternative chemicals that are less hazardous could be used";
- Enforcement of mitigation measure 4.9-2, which requires applicants to prepare a drainage plan which specifies "best management practices" and is designed to minimize runoff and the potential for impeding or redirecting 100-year flood flows; and
- Enforcement of mitigation measure 4.12-1, which requires that if noise levels are shown to exceed 65 dBA in an area where there are sensitive human noise receptors, then a variety of mitigation measures or combination of measures could be taken to reduce the impact, and the applicant must submit to the County details on "the combination and methods used to determine the level of reduction."

Enforcement of all of these mitigation measures leaves it to the County's expert judgment to determine whether a certain mitigation measure is "feasible," "appropriate," "adequate," or "practical," can be waived or substituted, or can be demonstrated through a combination of mitigation measures. The County thus has wide discretion to disapprove the permit application if it finds that the applicant has not adequately demonstrated, in the County's judgment, that the mitigation measures are met.

0047-22
Continued

Because the County must use its judgment in determining how and if a project is to be carried out, and because it may approve or deny a project based on subjective judgments, the County's approval of oil and gas permits is not ministerial under CEQA. (CEQA Guidelines §15369; *Friends of Westwood, Inc. v. City of Los Angeles* (1987) 191 Cal.App.3d 259, 274 [holding that power to determine what building components were "adequate" rendered the permit approval discretionary]; *Natural Resources Defense Council, Inc. v. Arcata Nat. Corp.* (1976) 59 Cal.App.3d 959, 970 [holding that review of whether logging plan had "adequate" drainage and utilized the general contours of the land "to the full extent practicable" rendered approval discretionary].) To the extent the ordinance attempts to authorize County approvals of oil and gas permits without complying with CEQA's requirement that the County prepare an initial study and issue public notice, it is invalid.

0047-23

III. The DEIR's Proposed Mitigation Measures Are Impermissibly Vague and Unenforceable.

0047-24

Many of the mitigation measures proposed by the DEIR are impermissibly vague and improperly deferred. They are also all effectively unenforceable, because there is no mechanism in the Proposed Ordinance to ensure that future permits comply with the measures. For these reasons, the mitigation measures are invalid under CEQA.

CEQA requires that an agency issuing an EIR identify mitigation measures that, if implemented, would reduce the impacts of the project below the "significance" threshold. (Cal. Pub. Res. Code § 21081.) For each significant impact, an agency must either identify measures that the project will include that will mitigate the impact, identify measures that another agency has jurisdiction to adopt, or find that the necessary mitigation measures are infeasible. (Cal. Pub. Res. Code § 21081.) In the latter case, the agency must issue a statement of overriding considerations describing why the project should go forward even without the infeasible mitigation measures. (*Sacramento Old City Assn. v. City Council* (Ct. App. 1991) 280 Cal. Rptr. 478, 492 [citing Pub. Res. Code § 21081(a)].) Mitigation measures must be "fully enforceable through permit conditions, agreements or other measures." (Pub. Res. Code § 21081.6(b); CEQA Guidelines § 15126.4(a)(2); *Sierra Club v. Cnty. of Fresno* (2014) 226 Cal. App. 4th 704, 750, review filed (July 8, 2014).) Agencies must support their finding that mitigation measures are adequate with substantial evidence.

0047-25

Many of the mitigation options proposed by the DEIR are "cursorily described," are "nonexclusive, undefined, untested and of unknown efficacy," and create "no objective criteria for measuring success." (*Communities for a Better Environment v. City of Richmond*, 184 Cal.App.4th, 93). For example, MM 4.9-2 vaguely requires applicants to prepare a drainage plan which specifies "best management practices." And MM 4.3-8 provides unlimited options for applicants to reduce criteria air emissions, as long as the County approves the proposed method. With regard to the toxic emissions caused by the ordinance's permitted activities, the DEIR and its appendices only vaguely refer to unspecified "mitigation" measures that are assumed to be 100% efficient, causing "0.000000" ammonia and formaldehyde emissions from well activity. (*See* Exhibit B, 3) Because these vaguely defined and deferred mitigation measures offer no assurance that the significant impacts of the project will be mitigated, they are invalid. (*Communities for a Better Environment v. City of Richmond*, at 93).

0047-26

The mitigation measures provided for in the DEIR also lack adequate enforcement because there is no clear mechanism in the proposed zoning ordinance for ensuring, before permits are issued, that all mitigation measures are included. Under the proposed Oil and Gas Conformity Review, a project applicant need only provide basic information to the Planning Department about the proposed oil and gas activity (e.g., the name and telephone number of the property owner and the topography of the

0047-27

site), and does not need to demonstrate compliance with the mitigation measures. (Proposed Kern County Zoning Ordinance § 19.98.080.) The Planning Director then may issue a permit if she determines that "the proposed use meets the implementation standards and conditions" of the zoning ordinance. (Proposed Kern County Zoning Ordinance §§ 19.98.090(B); 19.98.100(C).)

0047-27 Continued

There is thus no mechanism within the zoning ordinance for the Planning Director to confirm that all mitigation measures have been included in the project, because the project applicant has no duty, pre-permit, to demonstrate that it has incorporated mitigation measures into the project. The only duty to demonstrate mitigation under the Oil and Gas Conformity Review is the vague requirement under § 19.98.060(D) that applicants demonstrate compliance with mitigation measures, along with the "self-certification" provided by the applicant post-completion of the project. And even that self-certification doesn't apply to Oil and Gas Conformity Review under section 19.98.100 (for Oil and Gas Conformity Review without the required surface owner signature). (*See* Proposed Kern County Zoning Ordinance § 19.98.130.) This self-certification is inadequate because mitigation measures must be structured as a condition of *future* permit approval; not, as in this case, included only as an after-the-fact self-certification. (*Woodward Park Homeowners Ass'n, Inc. v. City of Fresno* (2007) 150 Cal.App.4th 683, 729-30 [finding mitigation payment inadequate when it was not structured as a condition on site-plan approval and use-permit issuance].) Moreover, even if an after-the-fact certification could be adequate, the provision for self-certification lacks any specificity as to what exactly an applicant must include in self-certification, and how the measures would be enforced through self-certification and by whom, rendering it impermissibly vague and therefore invalid. (*See Sierra Club v. Cnty. of Fresno* (2014) 226 Cal. App. 4th 704, 750, review filed (July 8, 2014) [finding that mitigation measures that were vague as to how they would be enforced were invalid].)

0047-28

The Minor Activity Review, unlike the Oil and Gas Conformity Review, at least requires that the applicant provide a "[d]escription of proposed oil and gas activity and documentation of compliance with applicable Mitigation Measures" in order to receive a permit. (Proposed Kern County Zoning Ordinance § 19.98.110(E).) However, this provision still lacks specificity as to what "documentation" is required to show compliance with the mitigation measures, and is therefore invalid. (*See Sierra Club v. Cnty. of Fresno* (2014) 226 Cal. App. 4th 704, 750, review filed (July 8, 2014); Pub. Res. Code § 21081.6(b); CEQA Guidelines § 15126.4(a)(2).)

0047-29

At a minimum, the proposed zoning ordinance should be revised to require detailed documentation of mitigation measures to be provided in the Application Contents that are submitted to the Planning Director, as a condition of permit approval, for both Oil and Gas Conformity Review and Minor Activity Review. The ordinance should specify exactly what must be submitted to the Planning Director, and should track the list of mitigation measures included in the DEIR. In turn, the Planning Director's approval should include a specific requirement to review and determine compliance with the mitigation measures listed in the DEIR. This should include completion of a checklist detailing each mitigation measure proposed by the DEIR and require a description of how each mitigation measure will be met, using specific criteria to measure the effectiveness of the mitigation measures. As discussed above, because this is a discretionary process, notice and opportunity for public comment should also be provided on the mitigation measures proposed to be employed. (*See Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 93 ["Fundamentally, the development of mitigation measures, as envisioned by CEQA, is not meant to be a bilateral negotiation between a project proponent and the lead agency after project approval; but rather, an open process that also involves other interested agencies and the public."].) To better ensure enforceability of the mitigation measures, the proposed zoning ordinance should also be revised to incorporate the proposed mitigation

0047-30

measures as substantive zoning requirements, to the extent they are not already included in Chapter 19.98 of the zoning code.

0047-30 Continued

IV. The DEIR's Impacts Analyses are Severely Flawed.

0047-31

As detailed above, the DEIR's scope is far too broad and is improper for a project-level EIR. Because the DEIR is nonetheless classified and structured as a project EIR, the document circumvents current and future analyses of numerous significant direct, indirect and cumulative impacts caused by the oil and gas zoning ordinance and future well activity. With regard to the Air Quality impacts caused by the Project, the County cannot move forward with approval of the zoning code changes without an accurate and thorough assessment of the detrimental, cumulatively considerable impacts caused by current and future oil and gas well activity. Such impacts are particularly acute and potentially devastating in the Project Area as it is located in a basin that suffers extreme non-attainment for harmful air contaminants. Similarly, with regard to hydrology, water quality and water supply, the DEIR's failure to adequately analyze the Project's direct, indirect and cumulative impacts precludes the County from making an informed decision regarding the Project, particularly in light of current and foreseeable drought and climate change conditions. The DEIR also fails to account for the potentially devastating public health impacts that may result from degradation of groundwater quality and quantity.

0047-32

A. The DEIR's Air Quality Analysis is Based on an Impermissibly Broad Scope, Flawed and Underestimated Assumptions of Well Activity in and Around the Project Area, and Inadequate Mitigation.

0047-33

As further detailed in the attached expert report by Dr. Ron Sahu, there are at least three primary flaws in the DEIR's approach to analyzing the air impacts resulting from the oil and gas zoning ordinance. (*See* Exhibit B.) First, because the scope of the DEIR's analysis is far too broad in terms of time, spatial-scale, and both the extent and intensity of future well activity, the document fails to adequately analyze the true range of air quality impacts that will be caused by oil and gas activities permitted throughout the County. Second, where incorporated into the DEIR's analyses of the air emissions associated with future well activity, the DEIR's assumptions of what that activity consists of are erroneous and are unsupported by evidence contained in the DEIR's appendices or elsewhere. Third, while the DEIR concedes that many of the air quality impacts from the oil and gas zoning ordinance will be significant and unavoidable with mitigation, the DEIR sets forth largely inadequate and ineffective mitigation measures to address air quality impacts overall. As explained above, many of the DEIR's mitigation measures are improperly vague and wholly unenforceable. Still others are simply inadequate to actually address the emissions caused by the oil and gas activity envisioned in the ordinance and purportedly encompassed in the DEIR's environmental review.

0047-34

With regard to the broad analytic scope of the oil and gas zoning ordinance's permitted activity, the DEIR's attempt to assess and mitigate the air emissions from drilling over 2,500 wells each year for the next 20 years is futile. (*See* Exhibit B, 2.) Both conceptually and practically, it is impossible to determine the extent to which this level of future oil and gas well activity will impact an air basin that already suffers from extreme non-attainment. Moreover, the significance of air emissions impacts from numerous individual projects cannot be determined without knowledge of future environmental and regulatory conditions. Thus, the need for future and continuous environmental review is paramount.

0047-35

The DEIR's assumptions and projections regarding future well activity are also severely flawed

0047-35 Continued

and unsupported by objective sources of information on the record. For example, the DEIR applies a constant projection of well depth that fails to account for changing technologies, and oil and gas resource accessibility. Dr. Sahu points out that it is only logical to foresee, based on patterns in the oil and gas industry as well as decreasing oil and gas supplies, that as oil and gas resources at shallower depths become less plentiful, well depth will increase in the future. (Exhibit B, 8.) This increased well depth will be accompanied by an increase in air emissions as the intensity at which drilling and extraction activities are conducted will increase, resulting in the need to evaluate emissions associated with varying well-depths over time. (*Id*.) The DEIR nonetheless assumes for the purpose of analyzing the air emissions associated with the oil and gas zoning ordinance, that all wells drilled in the Project Area through the year 2035 will be 10,000 feet or shallower. (*Id*.) However, this assumption is unsupported by data compiled in the year 2012, which the DEIR references throughout its various impacts analyses and which shows that numerous wells were drilled at depths greater than 10,000 feet throughout the County. (*Id*.) Indeed, according to the data compiled in that year alone, roughly 25% of wells drilled in the Central Zone of the Project Area were at least 12,000 feet deep. (*Id*.)

0047-36

Beyond its flawed assumptions regarding well depth, the DEIR fails to state any support for its assumed VOC factor intensity in the crude oils extracted throughout the Project Area; it fails to base its emissions calculations on an accurate assessment of the emissions from all emission sources – including all pumps, valves, connectors, flanges and other well components; and it assumes that the number of idle wells will remain constant over time. (Exhibit B, 9.) Notably, the DEIR's preferred data set from which it derives its well-activity assumptions for the purpose of air emissions and other impacts analyses is almost exclusively comprised of voluntarily reported industry data. For example, the DEIR bases its conclusions of Project emissions on projections of well activity from the petroleum industry, applying industry-based estimates of what the well activity will be throughout the duration of the "Project." (DEIR, 4.3-79.) The DEIR also states that "the information used for evaluating well construction activities was obtained from detailed records compiled during the construction of ten new oil and gas production wells in 2010 and 2011." (DEIR 4.3-73.) The DEIR fails to explain, however, the precise source of those records, and why these particular ten oil and gas production wells would accurately predict or project the range of impacts from potentially thousands of new oil and gas wells each year, through 2035.

0047-37

In large part because of the severe inadequacies in the DEIR's evaluation of the air quality impacts that oil and gas well activities will have in and around the Project Area, the document's proposed mitigation measures fail to minimize the Project's true impacts. Dr. Sahu points out that in many instances, despite the DEIR's findings of significance in the area of air quality impacts, the DEIR attempts to mask several of the air impacts associated with the zoning ordinance's activity through applying ineffective mitigation. (Exhibit B, 4.) It does this by failing to quantify the actual reductions in emissions from mitigation applied to various sources associated with well activity, and in many instances it improperly relies on "alternative" forms of mitigation that are not associated with actual emission reductions but may instead involve payment into "mitigation funds" or similarly ineffective efforts. (Exhibit B, 6-7 [describing the inadequacies of MM 4.3-1 through 4.3-4 in failing to provide any quantitative reductions in tons of emissions of specific pollutants from drilling and well activity].) As Dr. Sahu notes, "paying into a mitigation fund cannot 'mitigate' emissions if actual emitting sources cannot be identified from which such real reductions are to be obtained." (Exhibit B, 7.) The use of mitigation fund payments in lieu of actual, quantifiable emissions reductions indeed raises serious concerns that there are simply not enough sources in the Project area from which any meaningful further reductions can be extracted or otherwise obtained. (*Ibid*.)

0047-38

Finally, an additional major flaw in the DEIR's analyses and in its ability to enable meaningful

0047-38 Continued

public comment is its failure to include the report prepared by Vector Environmental, Inc., which forms the basis of many of the EIR's projections and conclusions. While certain tables from the report are included in the text of the DEIR, the report itself is missing from the DEIR's appendices, thereby precluding meaningful review and comment on the contents of that report, in violation of CEQA. (Pub. Res. Code § 21003.1 (b) [Requirement that "[i]nformation relevant to the significant effects of a project, alternatives and mitigation measures which substantially reduce the effects shall be made publicly available as soon as possible by the lead agency"].)

B. The DEIR's Analysis of the Project's Direct and Indirect Water Quality and Water Supply Impacts is Severely Flawed.

0047-39

Much like the DEIR's analysis of the air emissions impacts that will result from the oil and gas zoning ordinance, its analysis of both the quantitative and qualitative impacts to the County's and to the region's hydrological resources suffers numerous deficiencies. As a preliminary matter, because the DEIR applies projections of future well activity based on voluntarily reported industry data, the extent and concentration of such activity is underestimated, tainting the document's impacts analyses overall, including its analysis of water quality and water supply impacts. In addition to this significant flaw, the DEIR applies an unrealistically low estimate of well failures during the construction phase of individual projects, which similarly taints the document's analysis of severe, detrimental impacts that are caused by chemical and other accidental leaks of well-stimulation material into both surface and groundwater sources. The DEIR projects that only 2 well-construction failures will take place each year throughout the life of the Project. A common sense analysis, however, suggests this is highly unlikely with the estimated 2,697 new wells projected to be permitted and constructed each year.

0047-40

0047-41

Moreover, the DEIR's reliance on the use of "produced water" to mitigate the Project's groundwater impacts is severely problematic. The DEIR itself concedes that the use of produced water to replace project-related groundwater use is subject to various technical and logistical variables, and is therefore uncertain. (DEIR 4.9-140.) It also carries serious risks that are not analyzed and are improperly dismissed in the DEIR. (See, e.g., DEIR at 4.9-138-139 [dismissing risks from UIC steam-water injections into non-exempt groundwater aquifers].) These impacts include those associated with the use of produced water in enhanced oil recovery ("EOR") activities.

0047-42

The DEIR states that at least "2,021 EOR wells, including 1,721 wells in DOGGR District 4, which generally encompasses the project area" could be "discharging into non-exempt aquifers" in violation of the Safe Drinking Water Act's Underground injection control ("UIC") program and criteria, causing potentially devastating groundwater impacts. (DEIR 4.9-138.) Without analyzing these impacts, however, the DEIR uses a May 2015 letter from the State Water Resources Control Board and DOGGR to the EPA to negate the significance of the impacts that have been, and will continue to be caused by the past, current, and foreseeable future discharges from injection wells located in and around the Project Area, which are in fact part of the Project's proposed "mitigation" to address Project-related groundwater impacts. (DEIR 4.9-129.) The DEIR summarily dismisses the impacts from discharges into non-exempt aquifers based on DOGGR and the regional water board's claim that the discharges are "'very unlikely to pose a threat' to water supply wells." *(Ibid*.) A mere single statement made in an unofficial letter, however, cannot take the place of the substantial evidence required to support the DEIR's findings. (*San Joaquin Raptor Rescue Center v. County of Merced*, 149 Cal.App.4th 645, 652-653 [holding that the focus of a reviewing court's inquiry into the sufficiency of an EIR is not on the document's findings, rather it is on whether those findings have the support of substantial evidence contained in the lead agency's record of decision].) The DEIR does not account for discharges into

underground sources of drinking water protected by the Safe Drinking Water Act, and it fails to provide groundwater testing data from drinking water wells, throughout the Project Area, to determine the extent of impacts from the use of produced water. The DEIR, therefore, cannot rely on the use of a practice that on its own may cause significant impacts that must be mitigated, without conducting CEQA review. (*California Clean Energy Committee v. City of Woodland*, 225 Cal.App.4th 173, 200 (2014) [holding that an EIR which purported to be a program EIR was inadequate, notwithstanding its attempt to tier subsequent EIRs, because it failed to provide adequate mitigation for the impacts known at the time of its drafting].)

0047-42 Continued

Finally, and in addition to the fact that use of produced groundwater itself carries risks that are not analyzed or mitigated in the DEIR, because the DEIR both fails to account for the level of use of groundwater resources from other industrial and agricultural activities, and fails to apply a verifiably accurate projection of current and future well activity, the use of produced groundwater to mitigate Project-related groundwater use is inadequate.

0047-43

C. The DEIR Fails to Adequately Analyze the Cumulatively Considerable Impacts of the Proposed Zoning Ordinance Revisions.

0047-44

An EIR must always discuss the cumulative impacts of a project when its incremental effects are "cumulatively considerable." (Pub. Res. Code § 21083(b)(2); CEQA Guidelines § 15130(a).) Moreover, in the specific context of a programmatic EIR, one of the key purposes of the EIR is to "ensure consideration of cumulative impacts that might be slighted in a case-by-case analysis." (CEQA Guidelines § 15168(b)(2).) Programmatic EIRs play an instrumental role in allowing the lead agency to consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems in program implementation, or cumulative impacts. (CEQA Guidelines § 15168(b)(4).) Accordingly, the CEQA Guidelines require lead agencies to explain how implementing the particular requirements in the plan, regulation or program under review "ensure[s] that the project's incremental contribution to the cumulative effect is not cumulatively considerable." (Guidelines § 15064, subd. (h)(3).)

Cumulative impacts are defined as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." (CEQA Guidelines § 15355.) "Cumulatively considerable" impacts are present when "the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects" and activities. (Pub. Res. Code § 21083(b)(2); CEQA Guidelines § 15065(a)(3).) As is the case for all impact categories, a lead agency's threshold findings of significance with regard to cumulative impacts must "be supported by substantial evidence"; and, where found, cumulatively considerable impacts must be adequately mitigated. (*See* CEQA Guidelines § 15064.7 (b).)

0047-45

Here, the DEIR concludes throughout its impacts analyses that the Project will cause significant and unavoidable impacts including significant and unavoidable cumulative impacts, notwithstanding the application of its proffered mitigation measures. These findings are particularly troubling in light of the current non-attainment status of the air basin in which the Project is located, the proximity of wells to sensitive receptors, and current as well as future extreme drought conditions. Notably, the document's findings of significant and unavoidable impacts prohibit the County from approving the Project without adopting a "statement of overriding considerations." (Pub Res. Code § 21081, subd. (b); Guidelines, § 15093.) The role of a statement of overriding considerations is to ensure that "the elected decision

0047-46

0047-46 Continued

makers have their noses rubbed" in the Project's environmental effects, and still vote to move forward. (*Vedanta Society of So. California v. California Quartet, Ltd.*(*Vedanta*)(2000) 84 Cal.App.4th 517, 530.) As such, it is critical that the DEIR contain an accurate assessment of the extent to which the significant and unavoidable impacts caused by the Project may tip the balance in favor of rejecting, rather than approving, the Project. Given their significance, and given the current and reasonably foreseeable conditions surrounding the Project, the Project's cumulatively considerable impacts fall among those that the County must thoroughly consider before approving the Project. (*Vedanta*, 84 Cal.App.4th, 530.)

i. The Project's Cumulatively Considerable Air Quality Impacts Are Underestimated in the DEIR.

0047-47

Despite the DEIR's conclusion that the Project will cause significant and unavoidable impacts to air quality in and around the Project Area, the DEIR still underestimates the severity of the Project's air quality impacts.

0047-48

As noted in the Air Quality impacts analysis above, and as further detailed in the expert report by Dr. Ron Sahu, attached at Exhibit B, the DEIR fails to account for the full range of emissions sources in well operations. (Exhibit B, 2-3.) Moreover, there is a significant risk that the DEIR's projections of well activity underestimate the extent to which such activity will take place, and is already taking place, in and around the County, because the DEIR applies estimates of current and future well activity from arbitrary data points.

0047-49

An adequate cumulative impacts analysis and discussion requires a thorough assessment of the incremental significance of the Project's impacts over time, and in consideration of "other projects causing related impacts." (Guidelines, § 15130, subd. (a)(1).) In its cumulative air quality impacts analysis, however, the DEIR fails to list other projects or ongoing activities that cause cumulative air quality and health burdens for Kern County residents. This failure renders the DEIR non-compliant with one of CEQA's fundamental purposes, which is "to ensure that governmental agencies regulate their activities 'so that major consideration is given to preventing environmental damage, while providing a decent home and satisfying living environment for every Californian.'" (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1214 [citations omitted].)

0047-50

Numerous existing well operations in and around the County are already sited in the vicinity of a number of sensitive receptors, including schools. The majority of county residents, including children that attend school in close proximity to existing well operations, are already exposed to the worst air pollution in the country. The San Joaquin Valley's current non-attainment status for NOx and PM 2.5, and the presence of high levels of other hazardous air pollutants, is caused by a number of ongoing activities including heavy diesel truck traffic for the transportation of goods and for the purpose of well operations; ongoing agricultural and heavy industrial activities including industrial recycling activities; and food processing activities such as dairy processing and rendering, among many others. Yet, the DEIR fails to explicitly address and evaluate the Project's cumulatively considerable impacts in relation to these and other ongoing activities in and around the Project Area; it fails to account for existing health burdens and it underestimates the Project's own direct impacts over time, which in turn taints the document's ability to analyze the incremental and cumulative significance of those impacts. Moreover, the Project's proposed mitigation measures are wholly inadequate to address the Project's contribution to existing cumulatively considerable health burdens in the Project Area. For example, while the DEIR proposes a minimum well setback distance for wells in each Project subarea at depths of 2,000, 5,000, and 10,000 feet, its setback distances are insufficient and fail to adequately protect the public from the impacts of well operations.

0047-51

Where operators cannot comply with the set-back distances, they are permitted to avoid them entirely by implementing "alternative mitigation" measures, which are "demonstrated by the Applicant to achieve a level of risk less than the threshold level." (DEIR at 4.3-111.) These mitigation options fail to actually mitigate the environmental and health impacts caused by close proximity to well operations, and they specifically fail to address the impacts that well operations have on vulnerable, overburdened Kern County residents. While applicants can choose from some specified alternative mitigation measures (which include relocating rigs and/or engines; retrofitting off-road and other equipment to reduce emissions; using electricity rather than engines when possible; using automatic rigs; shutting down equipment when not being used; limiting idling of equipment; and relocating residents during well construction, drilling, and completion), they are also permitted to devise their own unspecified alternative mitigation measures. (DEIR at 4.3-111-112.) The DEIR fails to describe how applicants' claims regarding the effectiveness of their proposed mitigation measures will be evaluated, and fails to include any evaluation or assessment of the effectiveness of its own specified alternative mitigation measures. For example, the DEIR omits any discussion about how mitigation measures such as moving engines further away from sensitive receptors would actually mitigate health risks caused by drilling and maintenance operations when the entire well area is already dangerously close to sensitive receptors based on the minimum setback distances.

0047-52

Long-term exposures to air toxics are associated with respiratory and neurological conditions in children and adults, and can cause cancer, birth defects and immune system damage. Acute exposures can also cause nausea, headaches and nosebleeds. Children, the elderly and those already suffering from chronic health issues are more vulnerable to these and other impacts, yet the DEIR fails to evaluate the Project's contribution to their cumulative health burdens. Because the DEIR fails to adequately analyze the incremental significance of the Project's impacts in relation to existing cumulatively considerable air quality impacts, the DEIR fails to account for these and other significant environmental and health impacts caused by the Project.

0047-53

These deficiencies in the DEIR's analyses cannot be dismissed as harmless or insignificant, and require analysis and mitigation to comply with CEQA as they could have grave public health consequences. *Bakersfield Citizens for Local Control v. City of Bakersfield* 124 Cal.App.4th, 1220.

ii. <u>The DEIR's Assessment of the Project's Cumulatively Considerable Impacts on Hydrology, Water Quality and Water Supply Raises Serious Concerns</u>.

0047-54

The DEIR's analysis of the Project's impacts on hydrology, water quality, and ground and surface water supply raises critical problems for the County and for the public at large. While the DEIR acknowledges that groundwater supplies in the County and specifically in the Project Area are depleting, it fails to consider the incremental significance of the Project's use of diminishing groundwater resources in the context of a rapid decline in both surface and ground water resources state-wide.

0047-55

According to the DEIR and its supporting documents, including its water supply assessment (WSA), current water demand in the Project Area stems from the following three general use categories: urban municipal and industrial (M&I) use, agricultural use, and use for oil and gas activities including those contemplated as part of the Project. (Appendix T at 77.) The resources used to meet the concurrent demands from each of these use areas include a combination of both diverted and local surface water resources as well as groundwater resources, which alone comprise a third of the total available water in Kern County. (Appendix T at 1, 77.) While the DEIR is likely correct in assuming that

0047-55
Continued

agricultural uses throughout the Project Area will continue to comprise the vast majority of the County's water demand, the DEIR incorrectly relies on overly conservative assumptions regarding the continued, future water resource demand from the agricultural industry, which taints the document's analysis of the cumulatively considerable impacts this Project will have on water quality and water supply. (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1217 [citing *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 870 to point out the importance of alerting decision makers and the public of the possibility that the water supply may not be sufficient to meet user demand in an environmentally sound way]; *San Franciscans for Reasonable Growth v. City and County of San Francisco* (1984) 151 Cal.App.3d 61, 63 [invalidating an EIR based on its "underestimation" of new and ongoing projects, masking "the true severity and significance" of the cumulative impacts of the project under review].) While the DEIR concludes that the Project will cause significant and unavoidable impacts to the County's groundwater resources, its analysis is based on dangerous underestimations of future agricultural demand for increasingly scarce groundwater resources in and around the Project area.

0047-56

Specifically, the WSA, which is used as the basis to support the DEIR's findings, applies groundwater use and impacts projections throughout the life of the Project based on an assumption that agricultural demand will remain the same as it is under current-level conditions. (*See* WSA at 77.) The assumption is problematic notwithstanding the DEIR's findings of significance largely because it hides flaws in the DEIR's proposed mitigation measures, including its proposed use of produced water to replace water used by both oil wells and agricultural activities. To the extent the projections are based on the continued current-level demand for agricultural use, such mitigation measures are likely to be wholly inadequate to mitigate impacts from increased demand for a rapidly decreasing resource.

0047-57

Moreover, because the DEIR's analyses are improperly set forth as project-level analyses, they preclude the County and the public from assessing the true project-level impacts of future well activity in the Project Area, which would not be subject to future environmental review in violation of CEQA. (*In Re Bay Delta Programmatic Envtl. Impact Report Coordinated Proceedings*, 43 Cal.4th, 1173.) Just some of the estimates that should be subject to future project-specific environmental review include:

- The DEIR's estimates of current and continued groundwater resource use for well operations throughout the course of the Project;
- The DEIR's estimates of other uses of ground and surface water resources in and around the Project Area, specifically including increased groundwater resource use for both agricultural and M&I uses over the course of the Project;
- The DEIR's conclusions regarding the incremental or cumulative significance of the Project's ground and surface water resource use, particularly in light of potentially worsening drought conditions over time.

In sum, despite the DEIR's acknowledgment that Project Area demand for groundwater resources is projected to exceed supply through the year 2035 in both single and multiple dry years, and despite its findings of significance with regard to the Project's cumulatively considerable impacts to hydrology and water quality, the DEIR fails to accurately set forth the Project's impacts on groundwater and water resource supply in the County, and it obscures the level of analysis required to comply with CEQA. (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1217 ["Proper cumulative impacts analysis is absolutely critical to meaningful environmental review"].)

V. The DEIR's Alternatives Analysis Impermissibly Rejects Feasible Alternatives

0047-58

The alternatives analysis is critical to the integrity of an EIR. (*In re Bay-Delta Programmatic Envtl. Impact Report Coordinated Proceedings*, 43 Cal. 4th 1143, 1162 (2008) ["The EIR is the heart of CEQA, and the mitigation and alternatives discussion forms the core of the EIR."]). An EIR must "ensure that all reasonable alternatives to proposed projects are thoroughly assessed by the responsible official." (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus*, 27 Cal. App. 4th 713, 735 (1994); *see also* Cal. Pub. Res. Code § 21002.1(a).)

0047-59

The County must identify and "consider a reasonable range of potentially feasible alternatives that will foster informed decisionmaking and public participation." (CEQA Guidelines § 15126.6(a).) This reasonable range must include alternatives that "feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project." (*Id*.) Furthermore, "an agency may not approve a proposed project if feasible alternatives exist that would substantially lessen its significant environmental effects." (*Save Panoche Valley v. San Benito Cnty.*, 217 Cal. App. 4th 503, 521 (2013) (citations omitted); *see also* Cal. Pub. Res. Code § 21081 (a); CEQA Guidelines, § 15091 (a)(3).) An agency's finding that an alternative is infeasible "must be supported by substantial evidence in the record." (*Id.*; Pub. Resources Code § 21081.5; Pub. Resources Code § 21081(a)(3).)

The CEQA Guidelines state:

> An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain *most* of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.

(3 14 Cal. Code. Regs § 1526.6(a) (emphasis added)). Thus, that an alternative may be inconsistent with some project objectives may not justify eliminating it from review. (*See id*. §§(c), (f).) The Guidelines also provide that:

> Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

(*Id*. §§ 15126(b).) Given that the alternatives analysis is central to an EIR, the County cannot merely go through the motions of analyzing and summarily dismissing alternatives.

In the DEIR, the County purported to evaluate six alternatives, including a no project alternative. (DEIR 1-22-24.) The County's evaluation of these alternatives was deeply flawed. Furthermore, because

0047-60

the DEIR's discussion of alternatives is based on improper project purposes, the County impermissibly failed to analyze several additional alternatives.

0047-60 Continued

A. The DEIR Impermissibly Rejects Various Alternatives

0047-61

The DEIR impermissibly dismisses several alternatives that, if appropriately analyzed and characterized, could reduce environmental impacts. Despite identifying environmental benefits associated with several of these alternatives, the DEIR determines that five of the six alternatives are not environmentally superior to the Project. The DEIR does not adequately support its conclusion that only Alternative 5 (Low-Emission Enhanced Oil Recovery Technology Alternative) is "environmentally superior." (DEIR 1-27.) Furthermore, the EIR could combine the benefits of various alternatives.

i. <u>"No Project" Alternative (Alternative 1)</u>

0047-62

This alternative has not been given adequate consideration, and must be reconsidered. The DEIR concludes that this alternative "is environmentally inferior to the proposed Project" because "none of the Project's proposed development standards or conditions would be implemented in the County on a consistent basis for all new oil and gas wells in the future." (DEIR 6-18, 6-19.) The DEIR states that Alternative 1 "would not create an effective regulatory and permitting process for oil and gas exploration and production," but does not explain what it means by "effective." (DEIR 6-19.)

0047-63

Furthermore, this analysis ignores the fact that the proposed Project aims to increase oil and gas development in the County, which would have negative environmental and public health impacts, and to "streamline" regulations – *i.e*., preclude true project-level, site-specific environmental review that could reduce the impacts of individual drilling projects. Project-specific, site-specific CEQA analysis is required because each location and each well in the County has its own set of environmental considerations and other concerns including, but not limited to: community and environmental justice concerns, local water supply and hydrology, geology, faults and seismology, neighboring wells (i.e. offset wells), and threatened or endangered species impacts. To ensure full disclosure of each drilling project's local impacts and to adopt mitigation measures for those site-specific impacts, CEQA review at the level of individual oil and gas drilling projects is required.

ii. <u>CUP Alternative (Alternative 2)</u>

0047-64

This alternative, "[i]n effect, … would amend the Zoning Ordinance to eliminate all unrestricted, and ministerial approval of, oil and gas exploration, development, and production activities." (DEIR 6-20.) Even though this "would require a discretionary conditional use permit approval from the County that would incorporate site-specific and project-specific conditions of approval to minimize or avoid each project's potential environmental effects," the DEIR nevertheless concludes that "Alternative 2 is ultimately environmentally inferior to the proposed Project." (DEIR 6-20.) The DEIR's assertion that it is less environmentally protective to "consider the potential environmental effects each oil or gas well permitted in the County on a case-by-case basis" – and that it is preferable to implement a one-size-fits-all approach that precludes project-specific, site-specific CEQA review – is unconvincing and unsupported by substantial evidence.

0047-65

The County further asserts that this alternative "would not streamline the County's current oil and gas permitting procedures because it would impose a lengthy and cumbersome discretionary permitting process on all new oil and gas development within the County." (DEIR 6-21.) Attempting to eliminate comprehensive environmental review in order to create a "streamlined" regulatory process for the benefit of the oil industry is improper.

iii. Reduced Ground Disturbance Alternative (Alternative 3)

0047-66

This alternative would "prohibit all new well drilling activities outside existing DOGGR-designated 'Administrative Boundary' areas"; "require subsurface oil and gas to be extracted from surface equipment located within such Administrative Boundary areas"; and "limit the disturbance footprint on existing agricultural lands to requiring clustering of new wells in locations immediately adjacent to existing oil and gas equipment." (DEIR 6-22.) The DEIR notes that this alternative would "result in less overall ground disturbance than the Project," thereby reducing impacts to agricultural, biological, aesthetic, and hydrologic resources, but finds that because it would lead to more horizontal and directional subsurface drilling activities, it would increase air quality, greenhouse gas, and toxic air emission impacts. However, the DEIR does not provide adequate information regarding the magnitude of these potential impacts, and also fails to weigh the reduced environmental impacts against the potential increased impacts. The DEIR also fails to consider an alternative that is identical to Alternative 3 but does not allow horizontal and directional drilling to access oil and gas outside of the Administrative Boundary areas.

iv. No Hydraulic Fracturing Alternative (Alternative 4)

0047-67

The DEIR states that a ban on fracking "*could* cause an increased use of Enhanced Oil Recovery techniques in the Project Area," which would "cause a corresponding increase in the emission of greenhouse gases and criteria air pollutants." (DEIR 6-23, 6-24 [emphasis added].) The DEIR fails to provide adequate information regarding the likelihood of increased use of EOR techniques, or sufficient detail regarding the resulting impacts. The DEIR also states that "hydraulic fracturing uses a variety of hazardous materials and non-hazardous materials, though the significant majority of such materials have been determined to have a low hazard potential in terms of oral toxicity and there is no confirmed degradation of groundwater in the Project Area attributable to hydraulic fracturing or to other well stimulation techniques." (DEIR 6-24.) This analysis ignores the recent findings in the CCST report (including its conclusions regarding the uncertainties surrounding many of the impacts of fracking), as outlined, *infra*, in section VI of these comments.

v. Low-Emission Enhanced Oil Recovery (EOR) Technology Alternative (Alternative 5)

0047-68

This alternative would "require oil and gas well permit applicants to implement low-emission EOR technology as a condition of permit approval for new and replacement steam generators, and to replace existing steam generators constructed prior to 1990 within five years of enactment of the amended Ordinance." (DEIR 6-25.) The DEIR states that this would reduce air quality and greenhouse gas

0047-68 Continued

impacts. The DEIR concludes that this alternative is "environmentally superior" but does not propose to combine the benefits of this alternative with other alternatives. In addition, the DEIR states that this alternative would meet "most" of the Project objectives, but does not explain which objectives it would not meet. (DEIR 6-26.)

vi. Recycled Water Alternative (Alternative 6)

0047-69

This alternative would require Applicants "to treat an amount [of] produced water that is currently being disposed of via underground injection wells which is equivalent to the amount of M&I water used in Applicant's operations." (DEIR 6-26.) The DEIR fails to provide sufficient detail or analysis regarding the potential impacts of this alternative, and fails to weigh the enumerated potential benefits (reduction of hydrology and water quality impacts) against the listed potential impacts (adverse impacts associated with construction and operation of water treatment plants).[4] (DEIR 6-27.)

0047-70

The DEIR states that "[t]he increased cost of oil and gas development and production attributable to this alternative's funding obligations could … discourage, rather than encourage, ongoing economic development by the oil and gas industry…" (DEIR 6-28.) This statement illustrates why growth of the oil and gas industry is an improper project purpose: essentially any requirement to reduce environmental and public health impacts could be construed as at odds with this purported project objective, as most such requirements impose some sort of financial burden on industry. Notably, the stated project purpose directly conflicts with policy goals to reduce California's reliance on fossil fuels.[5]

B. The DEIR Impermissibly Refuses to Analyze Various Alternatives

i. Drilling Ban on Agriculturally Productive Land Alternative

0047-71

This alternative, which would "prohibit all new oil and gas exploration, development and production activities on lands zoned either Exclusive Agricultural (A) or Limited Agricultural (A-1) if such land is being used for agricultural production at the time of drilling permit application," was rejected for several reasons. (DEIR 6-11.) First, the DEIR states that because the Project's agricultural mitigation program would not apply, "there would be less agricultural lands conserved in perpetuity in the County, and there would be less restoration of agricultural lands to productive use through the removal of legacy oil and gas production equipment." (DEIR 6-11.) This position – that it is better for agricultural land to allow oil and gas drilling on it than to prohibit such drilling – is untenable and not supported by substantial evidence. Furthermore, prohibiting drilling on agriculturally productive land does not preclude restoring other agricultural lands by removing legacy equipment.

[4] For the overall Project is It was assumed that for every 27 wells, a centralized water treatment plant would be constructed, and the average water treatment plant would require 0.11 acres of disturbance. (DEIR, 3-44)

[5] *See, e.g.*, Governor Edmund G. Brown's Inaugural Address, as prepared on January 5, 2015, available at: https://www.gov.ca.gov/news.php?id=18828 (last accessed on September 11, 2015).

0047-72

The DEIR also states that, under this alternative, "it is more likely that otherwise prohibited oil and gas activities on agricultural lands would be displaced to non-agricultural lands with greater habitat and wildlife resource values than are typically found on previously disturbed and actively farmed irrigated agricultural land, potentially causing greater overall environmental harm." (DEIR 6-11-12.) However, the DEIR does not provide adequate analysis to substantiate this possibility.

0047-73

The DEIR states that "this alternative *could* result in more horizontal and directional subsurface drilling activities needed to recover subsurface oil and gas," which "would generate greater air quality, greenhouse gas, and toxic air contaminant emissions than would the proposed Project." (DEIR 6-12.) However, the DEIR fails to provide sufficient detail or analysis regarding the potential impacts of this alternative, and fails to weigh the benefits of banning drilling on agriculturally productive land against the potential increased impacts. Nor does it consider an alternative that prohibits horizontal and directional drilling to access oil and gas located beneath agricultural zoning districts.

ii. Drilling Ban on All Lands Alternative

0047-74

The County's reasons for eliminating this alternative from further consideration are arbitrary and unacceptable. The County must analyze this alternative. The County's first reason is that this alternative "would not achieve most Project objectives." (DEIR 6-12.) Several of these objectives, however, are improper. Specifically, "[i]ncreas[ing] oil and gas exploration and production in Kern County" (DEIR 6-11) – which is included in two of the applicants' enumerated objectives – is an improper project purpose that conflicts with the goal of decreasing reliance on fossil fuels such as oil and natural gas.[6] The County's second reason for refusing to analyze this alternative is that it is "infeasible due to existing legal restrictions on the County's authority to prohibit access to subsurface mineral interests without liability." (DEIR 6-12.) However, there is no additional explanation for why this alternative is legally infeasible.

iii. Fewer Wells within the Project Footprint Alternative

0047-75

This alternative was rejected "because it would not achieve the basic Project objectives of the Applicant (i.e., to provide for growth of the Kern County oil and gas industry through creation of streamlined environmental review and permitting process for all Kern County oil and gas operations)." (DEIR 6-13.) As discussed above, growth of the oil and gas industry in Kern County is an improper project purpose that conflicts with the goal of decreasing reliance on oil and natural gas. (*See* CEQA Guidelines, Appendix F.) [7]

0047-76

The county's second reason for refusing to analyze this alternative is that "a permit cap is legally infeasible due to legal restrictions on the County's authority to prohibit access to subsurface mineral interests without liability." (DEIR 6-13.) However, there is no additional explanation for why this alternative is legally infeasible.

[6] *See id*.
[7] *Id*.

iv. Renewable Energy Alternatives

a. Wind Energy Alternative

0047-77

The County rejected this alternative because it "it would not offer significant environmental advantages over the Project." (DEIR 6-15.) The DEIR states that wind turbine development would exacerbate environmental effects associated with well site development – e.g., additional ground disturbance and construction, noise impacts from subsonic noise generation, and avian mortality impacts. (DEIR 6-15.) Although the DEIR notes that this alternative "would reduce overall Project emissions by reducing each well site's reliance on pollution fossil fuel combustion to power well operations," it makes no attempt to weigh this reduction in air pollution impacts against the potential additional impacts associated with wind energy. As a result, it is unclear whether the benefits of the wind energy alternative may outweigh any potential impacts.

0047-78

In addition, the County refuses to analyze this alternative because "the energy storage technology necessary to make this alternative technically feasible is not presently commercially available." (DEIR 6-15.) The County does not provide any information or analysis to substantiate this claim. In fact, the Public Utilities Commission has very significant procurement targets for energy storage with the intent of transforming the market for energy storage and that will significantly increase the amount of storage deployed in California.[8]

b. Solar Energy Alternative

0047-79

The County rejected this alternative because it "it would not offer significant environmental advantages over the Project." (DEIR 6-16.) The DEIR states that solar photovoltaic technology would expand each well site footprint and result in additional ground disturbance and construction, thereby exacerbating the environmental effects associated with well site development. (DEIR 6-16.) Although the DEIR notes that this alternative "might reduce the Project emissions overall by reducing reliance on polluting fossil fuel combustion to power well site operations," it makes no attempt to weigh this reduction in air pollution impacts against the potential additional impacts associated with solar PV electric generation. As a result, it is unclear whether the benefits of the solar energy alternative may outweigh the potential impacts.

0047-80

In addition, the County refuses to analyze this alternative because "the energy storage technology necessary to make this alternative technically feasible is not presently commercially available." (DEIR 6-16.) The County does not provide any information or analysis to substantiate this claim. In fact, the Public Utilities Commission has very significant procurement targets for energy storage with the intent

[8] Public Utilities Commission, D.13-10-040 (Oct. 17, 2013), available at: http://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M079/K533/79533378.PDF ; *see also*, http://www.greentechmedia.com/articles/read/california-dreaming-5000mw-of-applications-for-74mw-of-energy-storage-at-pg and http://www.climatecentral.org/news/california-developing-energy-storage-18529 [demonstrating California's flourishing energy storage economy, in light of regulatory and market developments].

of transforming the market for energy storage and that will significantly increase the amount of storage deployed in California.[9]

0047-80 Continued

v. Zero Net Gain Alternative

0047-81

The County rejected this alternative "because it would not achieve most of the Applicant's Project objectives," including its objectives to "achieve an efficient and streamlined environmental review and permitting process for all oil and gas operations covered by the Project"; to "provide for economically feasible and environmentally responsible growth of the Kern County oil and gas industry"; and to "increase oil and gas exploration and production in Kern County…." (DEIR 6-16.) As discussed above, growth of the oil and gas industry and increasing oil and gas exploration and production are not proper Project objectives. As such, they cannot be used as a rationale for refusing to analyze feasible alternatives.

VI. The DEIR Fails to Adequately Incorporate the California Council on Science and Technology's Findings, Points of Analysis, and Recommendations Regarding All Oil and Gas Well Stimulation in the County and Throughout the Region.

0047-82

Pursuant to state law, the California Council on Science and Technology ("CCST"), a non-profit organization commissioned by the California Natural Resources Department, conducted a state-wide survey of oil and gas well activities, in order to assess current and potential future well stimulation practices and to determine, to the extent feasible, the impacts that such practices will continue to have on the environment and public health.[10] While the first volume of this report was made publicly available in January 2015, the full report including its two additional volumes, overarching conclusions, and recommendations from the CCST and other contributors, was released to the public one day after the Notice of Availability of the DEIR and the DEIR itself were published.[11] The complete three volumes now set forth a comprehensive, working analysis of current gaps in knowledge and information regarding oil and gas well stimulation activities throughout the State, including impacts on water resources, seismic activity, wildlife, vegetation and human health, *inter alia*. [12]

0047-83

Despite the insights and updated information contained in the Report, its conclusions and recommendations, the DEIR fails to incorporate numerous points raised throughout the report in its analyses. The CCST Report's two new volumes and Executive Summary stress the importance of assessing the full range of impacts including the indirect and cumulative impacts of all well stimulation activity, specifically including fracking and acid matrix techniques that are most prevalent throughout the San Joaquin Valley. This information is critical to providing a meaningful analysis of the impacts that

[9] *Id*.
[10] *See* California State Senate Bill 4, D. Pavely, 2013, An act to amend Sections 3213, 3215, 3236.5, and 3401 of, and to add Article 3 (commencing with Section 3150) to Chapter 1 of Division 3 of, the Public Resources Code, and to add Section 10783 to the Water Code, relating to oil and gas.
[11] *See* Notice of Availability of the DEIR, which together with the DEIR was published and circulated for public review on July 8, 2015. *See also* Exhibit D, the CCST Press Release regarding the release of the complete report, dated July 9, 2015.
[12] *See* CCST Report and Executive Summary, which are hereby incorporated into the Count's administrative record of decision, available at: http://ccst.us/publications/2015/2015SB4-v2ES.pdf; https://ccst.us/projects/hydraulic_fracturing_public/SB4.php (last accessed on September 11, 2015).

0047-83 Continued

can be anticipated from the oil and gas zoning ordinance and its permitted well activity over time. Rather than apply the CCST's findings throughout its analysis, however, the DEIR merely references some of the data contained in the Report's initial volume, while failing entirely to refer to the same or updated information in its impacts analyses.

0047-84

For example, in reference to water quality and supply impacts, the DEIR uses the CCST report's finding that hydraulic fracturing or fracking in California uses less water than other uses and less water than is used in other states. (DEIR 4.9-18.) Yet the DEIR fails to reference any of the CCST report's findings or its conclusions regarding the need to assess the adequacy of regulations to address the numerous indirect impacts of fracking; the need to limit the use of poorly understood chemicals in fracking and related well-stimulation activities; the need to properly manage all produced water from hydraulically fractured or acid stimulated wells appropriately; the need to test for and evaluate groundwater chemistry regularly; the need to comprehensively evaluate trade-offs in determining whether to used certain waste water disposal practices; and the need to add protections to avoid groundwater contamination from fracking and related well-stimulation activities.[13]

0047-85

The CCST Report also finds that leakage of highly dangerous fracking chemicals can and does occur from numerous wells throughout the state, and that emissions concentrated near all oil and gas production could present serious health hazards to nearby communities. (*See* Exhibit D.) As noted above, the DEIR's failure to account for the incremental significance of future oil and gas well activity in light of the cumulatively considerable existing health burdens that already impact vulnerable communities throughout the County is fatal. Now, in light of the findings made in the recent CCST Report, it is even more important to take these impacts seriously, as they can cause devastating consequences for vulnerable County residents.

0047-86

The DEIR's omission of information from the Report that specifically focuses on oil and gas activities in Kern County and its surrounding area is particularly egregious, in light of the Report's clear insights into the need for further review of the oil and gas zoning ordinance's impacts. For example, Chapter Five of the CCST Report, entitled "Potential Impacts of Well Stimulation on Wildlife and Vegetation," includes a section focused on Kern County, which "has the highest density of hydraulic fracturing and matrix acidizing in the state." (CCST, Vol. II, p. 316.) Yet the DEIR, which was released the day before Volumes II and III of the Report were released,, fails to incorporate what was learned in the CCST study, specifically as it applies to oil and gas drilling and other well-stimulation issues throughout the County.

0047-87

The DEIR also fails to make use of the findings of the CCST Report's case study of the potential risks associated with fracking in existing oil fields in the San Joaquin Basin. The case study "evaluates specific risks to water, air and public health associated with continued well stimulation in the San Joaquin Basin." (CCST Vol III, p. 270.) The introduction explains that the goal of the case study "is to develop an understanding of the risk from future well stimulation, with an emphasis on hydraulic fracturing, to water and air resources, public health, and wildlife and vegetation in the San Joaquin Basin." (*Id*. at 269.) Like the rest of the CCST report, the case study acknowledges future uncertainties that highlight the need for future environmental review. (*See, e.g., id*. ["The risks that may occur in the future will depend on how production in the basin develops."].)

[13] *See id*.

0047-88

The Report notes that a "general concern about hydraulic fracturing is that stimulation chemicals could leak into the environment, including drinking water wells, via potential subsurface leakage paths." (*Id.* at 268.) Because most fracking in the San Joaquin Basin currently occurs at depths shallower than 1,000 feet, this can "present a hazard if there is nearby protected groundwater." (*Id*. at 268.) Furthermore, reservoirs in the basin "have a high density of existing wells, which may provide potential pathways for leakage of stimulation fluids into groundwater," and the density of faults in the basin "indicates that tens of shallow hydraulic fractures each year may intersect faults that are sufficiently large to potentially extend to protected groundwater." (*Id*. at 268.) Although "[n]o incidents of groundwater contamination due to stimulation have been found in the San Joaquin Basin to date" the Report points out that "*there has also been no targeted monitoring of groundwater quality*, nor have there been specific efforts to determine the extent of potentially compromised wellbore integrity." (*Id.* at 268 [emphasis added].) In addition, "if leaks are relatively small, as can be expected for the majority of leaky wells, they are not easily detectable in the groundwater, even when dedicated monitoring is conducted." (*Id*.)

0047-89

The Report further notes that "oil and gas production accounts for an appreciable portion of some air pollutants released in Kern County, *but very little data have been collected to evaluate air emissions from oil and gas wells*." (*Id*. at 268 [emphasis added].) Furthermore, oil and gas production is the dominant source of hydrogen sulfide (96%) and a major contributor to other emissions such as formaldehyde (26%). (*Id*. at 268.) The Report also reinforces the impacts that wells have to nearby sensitive receptors as described above in relation to the ordinance's air quality and human health impacts. The study points out that "[t]he concentration of air contaminants is larger closer to the source of emissions, so those in close proximity to production wells could be exposed to higher than average concentrations. Of the population both within the San Joaquin Valley Air Pollution Control District and a county with more than one oil and gas field, 21% live within 2 km (1.2 mi.) of a well for oil and gas production. Of this population, 21% are estimated to be in such proximity to a hydraulically fractured well, which is 3.4 % of the total population. Thus, to the extent exposure to air contaminants from oil and gas wells is a concern, it is a concern for all wells, not just those that are hydraulically fractured." (*Id*. at 268.)

0047-90

The study further hints at clear potential mitigation measures that have not been considered by the County in drafting the DEIR. These include preventing the elimination of natural landscape migration corridors between and through fields with predominantly fractured pools in the southwestern San Joaquin Basin. (*Id*. at 269.) The study recommends requiring best management practices that would reduce future oil and gas development in these areas in order to provide migration pathways between the surrounding wildlife habitats and to "consolidate facilities to retain some percentage (to be tested) of undisturbed habitat in reserve areas." (*Ibid*.)

0047-91

The DEIR further fails to account for the need to for additional information to assess the impacts of well stimulation activities. For example, with regard to water resources, the CCST notes the following uncertainties and data gaps, among others:

- Chemical additives: "100 chemicals could be the minimum number of completely unknown materials" (CCST, Volume II, at 81)
- "The amount and fate of the injected fracturing fluids that is left behind in the subsurface is unknown" (*Id*., at 90)
- "The fraction of injected chemicals that return to the surface, and the time period over which they return, are unknown" (*Id*., at 98)

0047-91
Continued

- "[M]ost groundwater sampling studies do not even measure stimulation chemicals, partly because their full chemical composition and reaction products were unknown" (*Id*., at 129)
- "The use of produced water from unconventional production raises specific or unique concerns, because of the variety of chemicals used during well stimulation that may end up mingled with produced water and the unknowns concerning the toxicity and environmental profile of those chemicals" (*Id*., at 114)
- "It is important to note that groundwater quality beneath the majority of active disposal pits, especially along the West San Joaquin Valley, is not known" (*Id*., at 141)
- "Currently, a large number of chemicals are used in well stimulation that have poor or unknown environmental profiles" (*Id*., at 148)
- "The types and amounts of well stimulation additives found in these waters is unknown, so it is not certain what treatment methods are adequate to allow reuse. Additionally, potentially hazardous chemicals resulting from degradation of the added chemicals and the interaction of the stimulation fluid with the formation need to be carefully evaluated" (*Id*., at 150)
- "Hydraulic fracturing fluids contain complex mixtures, and the interactions of these chemicals in the environment is unknown" (*Id*., at 156)
- "Lack of knowledge concerning the fate of the injected stimulation fluids in the subsurface, and the potential for them to be transformed, or to mobilize formation constituents over the lifetime of production from the well, needs to be determined. The nature of the reaction byproducts, the amounts and types of materials returning to the surface during the lifetime of the well, and hazards associated with these reaction byproducts are entirely unknown and need to be investigated" (*Id*., at 157)
- "Significant data gaps exist regarding current knowledge of groundwater quality in California, including the location and extent of protected groundwater that contains less than 10,000 mg L-1 TDS" (*Id*., at 166)
- "The transport of contaminants through induced fractures to groundwater has not been established, but should be evaluated in California, where fracturing depths are much shallower than in other parts of the country. Other potential subsurface release mechanisms include leakage through compromised wells and leakage through natural subsurface fractures, however the importance of these pathways is also unknown" (*Id*., at 166-67)

The Report further notes that additional data gaps and uncertainties in other areas exist, and points out that they should be addressed through increased review efforts and continued assessments of new information. Just some of these include: "uncertainty in the observational literature about the precise level of CH_4 emissions from the California oil and gas industry"(*id*., at 259); significant gaps in "our understanding of the impacts of discharges of stimulation fluids and wastewater to wildlife and vegetation"(*id*., at 261); significant lack of knowledge regarding the degree to which oil and gas activities can lead to the "introduction of invasive species, releases of harmful fluids to the environment, water use, litter, noise, light and traffic" (*id*., at 363); and critical gaps in data concerning the "public health impacts associated with proximity to oil and gas production" in California, which warrants "detailed studies of the relationship between health risks and distance from oil and gas development sites"(*id*., at 410). The Report further highlights the fact that "[t]he quantity of specific chemicals emitted to the atmosphere per unit of injected well stimulation fluid is completely lacking from the existing literature."(*Id*., at 436.)

Despite these significant data gaps and uncertainties, the DEIR purports to eliminate the need for future CEQA analysis of oil and gas drilling activities in Kern County for the next 20 years. In so doing,

0047-92

the DEIR's entirely discounts the need for ongoing investigation and analyses that not only formed the basis of the CCST report's purpose, but which is also one of its most critical recommendations. 0047-92 Continued

VII. CONCLUSION 0047-93

For the reasons set forth above, we urge the County to reject the DEIR.

Sincerely,

Yana Garcia

Re: Extending Comment Period for Draft EIR

Dear Ms. Oviatt and Mr. Mynk:

The Center for Biological Diversity, the Center on Race, Poverty and the Environment, Earthjustice, the Natural Resources Defense Council and Sierra Club ("Environmental Advocates") request a 60-day extension to comment on Kern County's draft environmental impact report ("DEIR") for the Amendment to Title 19-Kern County Zoning Ordinance Chapter 19.98 (Oil and Gas Production) for Oil and Gas Permitting. Environmental Advocates seek sixty (60) days more than the minimum 45-day public review period to comment on the DEIR.

The extension request is eminently reasonable given the vast scope of the DEIR, which evaluates zoning ordinance changes that, if adopted, seek to create ministerial permitting for almost every activity related to oil and gas production in Kern County. A recent news article reports that Kern County has spent two and half years and employed 125 people, mostly consultants and three full-time staff, on preparing the DEIR.[1] To date, the oil industry has paid 12.2 million dollars in accrued costs for this DEIR.[2] By any measure, this DEIR is a massive

[1] John Cox, *Kern's New Oil Revew: 8 Things to Know*, THE BAKERSFIELD CALIFORNIAN (Jul. 12, 2015, 12:17 AM), http://www.bakersfield.com/News/2015/07/12/a-second-look-at-kern-s-oil-and-gas-review.html.
[2] *Ibid*.

effort and, if approved with the concurrent zoning ordinance, will affect Kern County communities and the environment for at least the next 25 years.

In order to respond adequately to this massive undertaking and the multiple issues that the project poses, Environmental Advocates seek 60 more days than the minimum public review period. DEIR identifies "significant and unavoidable" harm for a number of environmental categories. Moreover, there is no statutory or regulatory deadline forcing the adoption of these ordinances or DEIR at any particular time. Despite the length and complexity of this report, and the fact it was issued during the summer when many people already have scheduled vacations, the current deadline for public comments is set at the statutory minimum of 45 days.

Furthermore, two additional reports that are directly related to this DEIR were released virtually at the same time, and, therefore, were not adequately incorporated into the DEIR as required. On July 1st, 2015, the Final Environmental Impact Report on SB-4, "Analysis of Oil and Gas Well Stimulation Treatments in California," was issued. On July 9th, 2015, a day after the DEIR was issued, the California Council on Science and Technology (CCST) released the final volumes of its report on the environmental effects of well-stimulation techniques. It was well-publicized that the CCST report would be released on July 9th, but the County released its DEIR without analyzing this independent scientific assessment of well stimulation treatments in California. Since the County did not take into account these additional voluminous studies, Environmental Advocates must now review and analyze how those studies impact the analysis and findings in the DEIR.

For the foregoing reasons, Environmental Advocates respectfully request an extension of sixty (60) days more than the minimum public review period to submit a comment. Comments would then be due on October 23rd, 2015.

Re: Draft Environmental Impact Report (SCH#2013081079)
Extension of Time Request – Revisions to the Kern County Zoning Ordinance – 2015 C, focused on Oil and Gas Local Permitting (PP13016)

Dear Mr. William Rostov:

The Kern County Planning and Community Development Department has received your letter dated July 20, 2015 requesting an extension of time for public review of the above reference environmental impact report. As specified in CEQA Guidelines §15105(a), "the public review period for a draft EIR should not be less than 30 days nor longer than 60 days except in unusual circumstances. When a draft EIR is submitted to the State Clearinghouse for review by State agencies, the public review period shall not be less than 45 days." Section 15087(e) of the State CEQA Guidelines further specifies that "the public review period shall be at least as long as the review period established by the Clearinghouse."

Circulation of the Oil and Gas Draft EIR began on July 8, 2015. Per CEQA Guidelines §15105(a) and 15087(e), the Draft EIR for the proposed project is currently circulating for a 45-day public review and comment period which is scheduled to conclude on August 24, 2015.

Please be advised however that while the comment period will close consistent with the above listed CEQA Guidelines, it is a policy of the Kern County Planning and Community Development Department to accept all comments on the Draft EIR, Final EIR, and the proposed project throughout the entire application process. Currently, the project is tentatively scheduled to be considered by the Kern County Planning Commission on October 5, 2015, and then will be considered at a noticed public hearing before the Board of Supervisors at the end of the year or soon thereafter. All of these hearings are mandated by law for consideration of an amendment to the Zoning Ordinance, and none can be combined or eliminated. The tentative schedule, therefore, provides a period of five months after release of the Draft EIR (estimated 150 days) for opportunities to provide written and verbal comments. All comments received will be included in the administrative record for consideration by the decision makers, and written replies will be provided through the Final EIR Response to Comments and staff reports at the hearings.

Staff also will be hosting three workshops during the 45-day review period, and comments may also be submitted during these workshops.

A joint public briefing workshop with the Kern County Board of Supervisors and the Kern County Planning Commission will be held on July **27, 2015** at 9:00 a.m., at the Chambers of the Board of Supervisors, First Floor, Kern County Administrative Center, 1115 Truxtun Avenue, Bakersfield, California.

The second workshop will be held at the Shafter Veterans Building, Room 2, 309 California Avenue, Shafter CA, on **August 10, 2015**, at 6:00 p.m.

The third workshop will be held at the Taft Veterans Hall, Room 1, 218 Taylor Street, Taft, CA, on **August 17, 2015**, at 6:00 p.m.

The Draft EIR and all related documents have been available during the entire public review circulation period. No information has been provided to Staff regarding the document or public circulation process that would qualify as an unusual circumstances warranting an extension of the comment period under the CEQA Guidelines. Therefore, it is Staff's determination that an extension of time is not warranted.

Should you have any further questions, please do not hesitate to contact either Christopher Mynk, AICP at (661) 862-8607 or via email at MynkC@co.kern.ca.us.

Sincerely,

Lorelei H. Oviatt

Comments on the Draft Environmental Impact Report (DEIR) for the Proposed Amendment to Kern County Zoning Ordinance Chapter 19.98

by

Dr. Ranajit (Ron) Sahu, Consultant
sahuron@earthlink.net
Ph: 702.683.5466

Introduction

The DEIR, whose Air Quality section is the subject of these comments, is for an ambitious project of large spatial and temporal scale. The stated description of the Project per the DEIR is as follows:

> "The proposed Project consists of an Amendment to Chapter 19.98 (Oil & Gas Production) of the Kern County Zoning Ordinance and related sections of the Kern County Zoning Ordinance to include updated procedures, development standards, and conditions for future oil and gas exploration, development, and production activities in unincorporated Kern County."[1]

The spatial scale of the project is immense:

> "The Project Area encompasses 3,700 square miles and generally includes most of the San Joaquin Valley (SJV) Floor or western portion of Kern County… The western portion of Kern County, where the Project is located is regulated by the San Joaquin Air Pollution Control District (SJVAPCD)."[2]

Similarly, the temporal scale of the project and the annual scope are also immense and broad:

> "Over the next 25 years, this EIR conservatively assumes that an average of 2,697 new producing wells per year could be drilled in the Project Area as part of the potential future oil and gas development scenario included in the proposed Project."[3]

The Goal of the DEIR is Disingenuous

While the DEIR states many goals and objectives for the Project, both from the standpoint of the County as well as from the viewpoint of the oil companies who are the driving force behind the Project, it is clear that a major goal of this so-called Project EIR is to avoid future CEQA reviews

[1] DEIR, p. 1-1.

[2] DEIR, p. 4.3-1

[3] DEIR, p. 1-7.

0047-94
Continued

for individual oil and gas drilling (or similar) projects – thereby effecting a "streamlined" approval process. As Section 2.6.3 of the DEIR states:

> "Based on the comprehensive analyses, mitigation measures, and performance standards included in the EIR and revised ordinance, it is anticipated that in the vast majority of future oil and gas production activities, implementation of the new ordinance will not result in the need for the County, or for responsible agencies with ministerial or discretionary review and approval processes, to prepare additional CEQA documents for individual well or field development proposals."

It is the opinion of this commenter that, given the broad spatial and temporal scale of the Project and even its annual scope of drilling over 2500 wells per year for the next 20+ years in the project areas as a whole, that no reasonable analysis – and certainly not the analysis presented in the Air Quality section – can substitute for the more appropriate, detailed analysis that can only be done when appropriate individual project-specific details are known contemporaneous with their installation.

Thus, even at a conceptual level, a project EIR is simply inappropriate as a blanket approval for all future projects, at least from an Air Quality perspective. "Streamlining" the CEQA process in this regard is simply akin to avoiding any meaningful CEQA review altogether.

That this approach (i.e., essentially avoiding all future CEQA reviews for literally thousands of individual drilling projects whose specific details are not known and not knowable at the present time, by putting in place this generic and flawed EIR for the next 20+ years) would even be contemplated for any such "Project" in California makes a mockery of CEQA and is bad enough. But it is simply astounding that it would be given serious consideration in Kern County, which, as the DEIR admits and describes, has some of the worst ambient air quality in the entire nation. As the DEIR dutifully notes but then ignores,[4] the Project area currently fails to meet the national ambient air quality standards for ozone and fine particulate matter, and is "unclassified" as to attainment status for many additional pollutants.

And, as the DEIR itself makes clear, even with assumptions that are optimistic or deeply flawed (as will be discussed via examples subsequently), the increases in air emissions associated with this Project are dramatic and large. Thus, these large future increases of air emissions into an air shed that is currently not meeting many national and state standards would be essentially blessed via approval of this DEIR. Although the DEIR discusses "mitigation" of these increases, it is apparent that the proposed mitigation strategies are nothing more than unenforceable and generic wishes for the future – and are simply fig leaves designed to provide "cover" for the large projected increases.

Thus, as a general matter, it is simply inappropriate to attempt a generic and assumption-driven "analysis" of air quality impacts 20+ years into the future, with little specific detail known at the time of "analysis."

[4] DEIR, Table 4.3-2.

0047-94
Continued

The Air Quality Analysis Presented is Incomplete and Not Transparent

Even before I discuss the technical details of the air quality analysis as presented in the DEIR, Section 4.3, it is clear that the entire Section 4.3 is poorly structured and omits much of the actual details of the analysis. Instead, the Section is loaded with page after page of material that should have been properly relegated to suitable appendices – with the actual results of the analyses presented in several summary tables at the very end. None of the actual analyses (and the myriad underlying assumptions) leading to the summary tables are actually presented in Section 4.3.

Instead, the actual air quality analysis is contained in a report by a contractor, Vector Environmental[5] – whose report (and supporting tables etc.) are nowhere to be found in the 2-volume DEIR. Nor is the Vector report posted to the website where all of the other DEIR materials are presented. Calls to the County to make the Vector report available went unanswered. This commenter had to obtain the Vector report from other commenters.

Thus, by not making the Vector Environmental reports and analysis available in a timely manner, the Air Quality analysis section fails the primary test of any CEQA document – namely as a tool to inform the public of the impacts of a Project, along with appropriate backup analysis.

Air Quality Impacts Due To the Project Will Be Adverse and Large

It is clear, and not surprising, that the projected air quality impacts due to the Project are significant, adverse, and large. Even with its many flawed assumptions, some of which I will discuss as examples, the DEIR's own analysis is forced to conclude as follows:

> "The Project would continue to generate odors. With implementation of MM 4.3-7, impacts would still be **significant and unavoidable**."[6]
>
> "The construction and operational activities of oil and gas activities that would be authorized under the Project would result in an increase of criteria pollutants (oxides of nitrogen [NOx], volatile organic compounds [VOC], carbon monoxide [CO], particulate matter less than 10 microns and less than 2.5 microns in diameter [PM10 and PM2.5, respectively]) in excess of the recommended criteria pollutant significance threshold adopted by the SJVAPCD Board. Emission sources in Kern County contribute between 11% and 21% of criteria pollutant emissions in the San Joaquin Valley Air Basin. The Project would contribute between 2% and 14% of these pollutants in the San Joaquin Valley Air Basin or between 19% and 97% of Kern County's contribution. This analysis indicates that most sulfur dioxide (SO2) emissions in Kern County would originate from oil and

[5] "Source data and emissions associated with the Project were determined based on the Air Quality Technical Report prepared by Vector Environmental, Inc." DEIR p. 4.3-71.

[6] DEIR, Table 1-1.

0047-94
Continued

> gas activities and the majority of NOX emissions. Therefore, the proposed Project would have a **cumulatively considerable** contribution of criteria pollutant (NOX, PM10, PM2.5, CO and SO2) emissions to the Kern County portion of the SJVAB."[7]

Actual emission increases projected are provided in tables in Section 4.3 of the DEIR. For example, see Table 4.3-29. The DEIR's own analysis anticipates emissions increases in thousands of tons per pollutant per year.

Yet, in spite of these large projected increases summarized in the DEIR, and the acknowledgement above that certain impacts (such as odors and cumulative impacts) cannot be mitigated down to non-significance, the DEIR attempts to neutralize several other impacts via certain mitigation measures. As the DEIR states:

> "After full analysis, the following effects were determined to be less than significant with the incorporation of mitigation measures...
> - Impact 4.3-1: Conflict With or Obstruct Implementation of the Applicable Air Quality Plan
> - Impact 4.3-2: Violate Any Air Quality Standard as Adopted in (c)i or (c)ii, or Established by United States Environmental Protection Agency or Air District or Contribute Substantially to an Existing or Projected Air Quality Violation
> - Impact 4.3-3: Expose Sensitive Receptors to Substantial Pollutant Concentrations"[8]

This is more than just optimistic. It is misleading and erroneous. The DEIR's strategy to minimize these large projected impacts is a set of 8 air quality mitigation measures. I discuss some of them below.

> "MM 4.3-1 Consistent with the requirements of the San Joaquin Valley Air Pollution Control District Regulation II-Permits, the Applicant shall obtain an Authority to Construct permit and a Permit to Operate for any facility or equipment requiring a permit from the San Joaquin Valley Air Pollution Control District, such as stationary sources required to obtain permits pursuant to District Rule 2010. All emissions increases from permitted equipment shall comply with District Rule 2201.
>
> "MM 4.3-2 The Applicant shall develop and implement a Fugitive Dust Control Plan in compliance with San Joaquin Valley Air Pollution Control District fugitive dust suppression regulations to further reduce emissions, during construction, of particulate matter that is 10 microns or less and 2.5 microns or less in diameter....

[7] DEIR, Table 1-1.

[8] DEIR, p. 1-9.

0047-94
Continued

> **"**MM 4.3-3 All off-road construction diesel engines not registered under California Air Resources Board's Statewide Portable Equipment Registration Program, which have a rating of 50 horsepower or more, shall meet, at a minimum, the Tier 3 California Emission Standards for Off-road Compression-Ignition Engines....
>
> "MM 4.3-4 To further reduce emissions of oxides of nitrogen from on-road heavy-duty diesel haul vehicles:
> a. 2007 engines or pre-2007 engines shall comply with California Air Resources Board retrofit requirements set forth in California Code of Regulations Title 13 Section 2025.
> b. All on-road construction vehicles, except those meeting the 2007/California Air Resources Board-certified Level 3 diesel emissions controls, shall meet all applicable California on-road emission standards and shall be licensed in the State of California...

It is on the strength of these mitigation measures that the DEIR boldly declares that Impact 4.3-1 noted above "…would be less than significant with mitigation."

Yet, this statement in the DEIR is not supported by any analysis. There is no quantitative support whatsoever. For example, there is absolutely no discussion of the actual emissions (in tons per year, for specific pollutants) that would be reduced by any one or all four of the mitigation measures above. So it is ridiculous to simply conclude that impacts (which are thousands of tons over the significance thresholds) will be "less than significant."

Even qualitatively, it expresses an article of faith rather than any analysis – namely that by obtaining the requisite permits and meeting the applicable current regulations (which are, after all, what these mitigations consist of), there should be no problem conflicting with the implementation of the various AQ Plans as expected in Impact 4.3-1. This does not make sense. If permits and regulations were enough to mitigate impacts, then the Project area should not have the current poor air quality that it does. The fact is that even currently, with all of the measures listed in the four mitigation measures above, the region does not meet several of the state and national air quality standards. Yet the DEIR maintains that by doing the very same thing, thousands of additional tons of pollution due to the Project will simply vanish. This wishful thinking has no place in a CEQA document.

Let us consider the last mitigation measure, MM 4.3-8:

> MM 4.3-8 For Project facilities or equipment that are not required to offset emissions under a District rule as described in MM 4.3-1, and for Project vehicle and other mobile source emissions, the County will enter into emission reduction agreement with the San Joaquin Valley Air Pollution Control District, pursuant to which the Applicant shall pay fees to fully offset Project emissions of oxides of nitrogen, reactive organic gases, and particulate matter of 10 microns or less in diameter (including as applicable mitigating for reactive organic gases by additive

reductions of particulate matter of 10 microns or less in diameter) (collectively, "designated criteria emissions") to avoid any net increase in these pollutants. The air quality mitigation fee shall be paid to the County as part of the Site Plan review and approval process, and shall be used to reduce designated criteria emissions to fully offset Project emissions that are not otherwise required to be fully offset by District permit rules and regulations.

As an alternative to paying the fee, an Applicant may reduce emissions for one or more designated criteria emissions through actual reductions in air emissions from other Applicant sources, as submitted to the County and validated by the District. This Project offset requirement shall be enforced by the County and verified by San Joaquin Valley Air Pollution Control District. If a voluntary emission reduction agreement is not executed by the County and San Joaquin Valley Air Pollution Control District, then each Applicant must mitigate for the full amount of designated criteria pollutants as verified by the San Joaquin Valley Air Pollution Control District, with evidence of such District-verified offsets presented as part of the Site Plan Conformity Review application documentation.

Examples of feasible air emission reduction activities that may be funded by air quality fees paid by Applicant or proposed and implemented by the Applicant under the emission reduction agreement include, but are not limited to, the following:
a. Replacing or retrofitting diesel-powered stationary equipment such as motors on generators, pumps and wells with electric or other lower-emission engines that are not subject to Title V reductions.
b. Replacing or retrofitting diesel-powered school, transit, municipal and other community mobile sources such as buses, car fleets, and maintenance equipment, with electric or other lower-emission engines.
c. Reducing emissions from public infrastructure sources such as water and wastewater treatment and conveyance facilities, and reducing water-related emissions through water conservation and reclamation.
d. Funding lower-emission equipment and processes for local businesses, schools, non-profit and religious institutions, hospitals, city and county facilities.

The flaw in this mitigation measure is obvious. First, like MM 4.3-1 through 4.3-4 discussed above, there is no quantitative analysis discussing how many tons of emissions of specific pollutants would actually be diminished (which is the whole goal of a mitigation measure) via this measure. While it provides examples of where emissions reductions might come from, it fails to quantify even the broad ranges of reductions that may be available from the example sources. For example, how many tons per year of NOx or PM2.5 would actually be reduced, say, in 2020 (or 2035 for that matter) by "[R]eplacing or retrofitting diesel-powered stationary equipment such as motors on generators, pumps and wells with electric or other lower-emission engines that are not subject to Title V reductions"? The DEIR does not say. And similarly for the other three examples.

0047-94
Continued

In fact, it is more likely than not that there are simply not enough sources in the Project area from which any meaningful further reductions can be extracted – especially as far into the future as 2035 – thus making a mockery of this so-called mitigation measure. Simply paying into a mitigation fund cannot "mitigate" emissions if actual emitting sources cannot be identified from which such real reductions are to be obtained. This mitigation measure fails any basic credibility test.

For reasons of brevity, I do not discuss the other three mitigation measures, MM 4.3-6 through MM 4.3-7. Yet a simple review of these measures shows that they are similarly flawed. They are qualitative, non-enforceable, and meaningless from any real reduction standpoint.

Thus, I disagree with the DEIR's hopeful but unsupported conclusion that Impacts 4.3-1, 4.3-2, and 4.3-3 have can be mitigated below significance. The projected air emissions increases due to the Project, even as analyzed by Vector Environmental, are so large, that there are not enough real and viable candidate sources in the Project area that can provide the necessary actual mass of emissions reductions – regardless of available dollars that may be generated by implementing MM 4.3-8. Certainly, the "analysis" as presented in the DEIR does not even attempt to quantify the extent of the emissions reductions that would be realistically available from actual emitting sources in the Project area.

Key Assumptions in the Air Quality Analysis Are Unsupported or Erroneous

Now I turn to some of the more glaring shortcomings of the actual air quality analysis itself, which are contained in the Vector Environmental report and tables. Based on this, it is my opinion that the projected emissions increases, large though they are as compared to the corresponding significance thresholds, should actually have been even greater.

I stress that the discussion below only highlights some of the flawed assumptions in the analysis. It is not meant to be an exhaustive critique of the entire analysis. Thus, these are just examples.

1. Improper Projection of Well Depths For Future Years

Table 3-2 of the DEIR clearly shows that over the years, oil (and gas) production has continued to decline even though more wells have been drilled in recent years. As such, it is more likely than not that wells in the future will have to be drilled deeper in order to maintain or reduce the rate of decline in oil and gas production. Therefore, a fundamental assumption in the air quality analysis makes no sense – namely that the distribution of wells drilled, by depth, in 2012 will be the same in all future years, including 2035, the last year of analysis. There is no stated justification (nor can there be) as to why the depth distribution of wells in 2035 should be the exact same as that in 2012. Common sense dictates that as the more accessible (and less costly to extract) oil and gas resources in the shallow depths are exhausted or become so minimal as to preclude economic extraction, that future wells will have to be drilled deeper.

0047-94
Continued

There is (or, in a proper analysis, should be) a strong (and non-linear) sensitivity of air emissions associated with drilling depth – with air emissions and impacts associated with a deeper wells being more significant than one associated with shallower wells.

Thus, the expected air emissions with the Project, which are already so high as noted in the DEIR itself, are in fact, likely significantly underestimated.

2. The Air Quality Analysis Only Considers Wells Drilled to A Maximum Depth of 10,000 feet

Related to the comment above, the analysis presented in the Air Quality Section limits well depths to 10,000 feet or shallower. The rationale, as stated in the analysis, is that only 3%[9] or so of the wells drilled in 2012 exceeded this depth. As noted above, by limiting the maximium depths to just 10,000 feet, in effect, the entire analysis simply assumes that all wells drilled in the Project area through 2035 would only be 10,000 feet or shallower. Thus, it is simply not correct nor relevant to limit depths to 10,000 feet based on 2012 data.

In fact, the 2012 data show that far greater depths are being drilled even in 2012. For example, in file: KC_WELL_STATS_BY_ZONE.xls, there are many wells in the Central zone with depths greater than 10,000 feet – in fact, in this part of the Project area, roughly 25% of the wells drilled in 2012 were 12000 feet deep.

Thus, the exclusion of deeper depths is a fatal flaw in the Air Quality analysis. It is meaningless, based on this assumption, to rely on projections of air emissions from drilling (and all related activities) for 20+ years into the future.

3. The Analysis Assumes That The Number of Idle Wells Will be The Same Each Year

In file: KC_FUG_VOC_WELLS_V1.xls, Vector Envinronmental has assumed, without comment or explanation, that there will be the same number of idle wells for each year through 2035. The basis for this assumption is not clear and should be clarified.

4. Emission Factors for VOC Fugitive Emissions Are Not Supported

(a) In file: KC_FUG_VOC_WELLS_V1.xls and also in files similarly named (ending in *V1A.xls and *V1B.xls) the FRac Light Oil fractions for the Western, Central, and Eastern zones are stated to be 0.4043, 0.9613, and 0.0273, respectively. However, the basis of these assumed (or calculated?) values is not clear. Therefore, it is not clear why the fraction in the Eastern Zone is so much lower than the fraction in the Western or Central Zones, or why the fraction in the Western Zone is so much lower than the fraction in the Central Zone.

(b) The heavy oil VOC and light oil VOC factors used in the calculations of fugitive emissions are 0.016 and 0.773 lb/day, respectively, based on calculations in two tables in the file: WELL_HEAD_COMPONENT_COUNTS.pdf. Numerous assumptions in these calculations are not supported or explained. First, the calculations assume that at each well head there are just 8

[9] DEIR p. 4.3-104.

valves, 0 pump seals, 6 "other" components, 3 connectors, 10 flanges, and 0 open ended lines in Light Crude Oil service – however, no citation is provided to support these values. Second, the calculations assume that the leak fractions of these components is as follows: only 0.5% leakers for valves, connectors and flanges; and only 1% leakers for pump seals and "other" components – again no basis is provided for these assumed leak fractions. EPA audit data show much higher leaking fractions – around 5% in some cases,[10] with higher leak thresholds than what is assumed in the DEIR.

(c) The spreadsheet file: KC_FUG_VOC_WELLS_V1.xls indicates that the source of some of the data for calculation of fugitive emissions is as follows: "[W]eight fraction of VOC for light oil and heavy oil was obtained from 'U.S. Dept of Interior, Users Guide for 2014 Gulfwide Offshore Activities Data System (GOADS-2014).'" It is entirely unclear why the "Gulfwide Offshore" data are relevant for this analysis in Kern County.

As a consequence of the many unsupported assumptions, some of which are noted above, the estimate of fugitive VOC emissions from all of the many components associated with drilling activities is simply not reliable. All assumptions should be supported.

5. The Analysis Assumes that All Air Toxics Emissions with Be Zero After Mitigation

An excerpt from file: KC_OGW_TAC_ALL.xls is shown below, showing only a couple of compounds. All of the other compounds are treated similarly in the full table.

Kern County 2012 Baseline Versus 2035 Buildout and Mitigated Emissions					
CARB Emittent ID	Chemical Name or Synonym	Stationary Source TAC Emissions (TPY)			Change After Mitigation
		2012 Baseline	2035 Total	Change in TAC	
7664417	Ammonia	237.844198	454.014437	216.170239	0.000000
50000	Formaldehyde	87.290418	166.626348	79.335930	0.000000

For all toxics calculations, whether all TACs or all EPA Urban Air Toxics, the "Change After Mitigation" column is shown as 0 for all compounds – which implies 100% effectiveness of control by the unspecified "mitigation." This makes no sense and should be fully explained.

6. The Activity Assumptions for Drilling Are Not Supported

The table below was created from tables in file:
REVISED_KCOGW_OFR2011_INPMATRIX_V2A.xls.

It shows the equipment and activity levels assumed in the analysis for drilling wells of different depths. As noted earlier, even though the DEIR considers wells that are 10,000 feet or shallower, the details tables do contain data for deeper wells. Thus, the equipment types, sizes,

[10] EPA, Leak Detection and Repair – A Best Practices Guide, Section 6.
http://www2.epa.gov/compliance/leak-detection-and-repair-best-practices-guide

and activity levels associated with wells of 5000, 10000, 15000, 20000, and 25000 feet deep are shown below, from the tables in the file noted above.

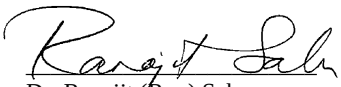
Only equipment that has changes in engine power at the different depths are highlighted in yellow in the table above. None of the assumptions made in these tables are explained or annotated. For example, while there are increases in the sizes of the various engines with depth, the analysis assumed that the number of days required to drill any of these wells from 5000 feet to 25000 feet would be 18 days, with 22 hours per day. Yet, the assumption of constant days/hours to drill wells, no matter the depth – even with the assumed increases in equipment sizes – is not supported in the calculations.

As mentioned in the beginning of this section, the above are merely examples of curious or simply unsupported assumptions that permeate the entire analysis. None of these assumptions are discussed in Section 4.3 at all (other than the exclusion of wells deeper than 10,000 feet). Yet these detailed assumptions affect all of emissions calculations, whose final results are provided in summary form in the tables at the end of Section 4.3.

It is therefore paramount that all of the calculation methodologies, assumptions, and justifications be fully discussed in Section 4.3 itself. Given the many questionable assumptions already noted, it is unlikely that the summary emissions data tabulated in Section 4.3 are accurate, even as projections of an uncertain future. In most instances, making more realistic assumptions will cause future projected emissions to increase.



Dr. Ranajit (Ron) Sahu

ATTACHMENT A - RESUME

RANAJIT (RON) SAHU, Ph.D, QEP, CEM (Nevada)

CONSULTANT, ENVIRONMENTAL AND ENERGY ISSUES

311 North Story Place
Alhambra, CA 91801
Phone: 702.683.5466
e-mail (preferred): sahuron@earthlink.net

EXPERIENCE SUMMARY

Dr. Sahu has over twenty three years of experience in the fields of environmental, mechanical, and chemical engineering including: program and project management services; design and specification of pollution control equipment for a wide range of emissions sources; soils and groundwater remediation including landfills as remedy; combustion engineering evaluations; energy studies; multimedia environmental regulatory compliance (involving statutes and regulations such as the Federal CAA and its Amendments, Clean Water Act, TSCA, RCRA, CERCLA, SARA, OSHA, NEPA as well as various related state statutes); transportation air quality impact analysis; multimedia compliance audits; multimedia permitting (including air quality NSR/PSD permitting, Title V permitting, NPDES permitting for industrial and storm water discharges, RCRA permitting, etc.), multimedia/multi-pathway human health risk assessments for toxics; air dispersion modeling; and regulatory strategy development and support including negotiation of consent agreements and orders.

Specifically, over the last 20+ years, Dr. Sahu has consulted on several municipal landfill related projects addressing landfill gas generation, landfill gas collection, and the treatment/disposal/control of such gases in combustion equipment such as engines, turbines, and flares. In particular, Dr. Sahu has executed numerous projects relating to flare emissions from sources such as landfills as well as refineries and chemical plants. He has served as a peer-reviewer for EPA in relation to flare combustion efficiency, flare destruction efficiency, and flaring emissions.

He has over twenty one years of project management experience and has successfully managed and executed numerous projects in this time period. This includes basic and applied research projects, design projects, regulatory compliance projects, permitting projects, energy studies, risk assessment projects, and projects involving the communication of environmental data and information to the public. Notably, he has successfully managed a complex soils and groundwater remediation project with a value of over $140 million involving soils characterization, development and implementation of the remediation strategy including construction of a CAMU/landfill and associated groundwater monitoring, regulatory and public interactions and other challenges.

He has provided consulting services to numerous private sector, public sector and public interest group clients. His major clients over the past twenty three years include various steel mills, petroleum refineries, cement companies, aerospace companies, power generation facilities, lawn and garden equipment manufacturers, spa manufacturers, chemical distribution facilities, and various entities in the public sector including EPA, the US Dept. of Justice, California DTSC, various municipalities, etc.). Dr. Sahu has performed projects in over 44 states, numerous local jurisdictions and internationally.

In addition to consulting, Dr. Sahu has taught numerous courses in several Southern California universities including UCLA (air pollution), UC Riverside (air pollution, process hazard analysis), and Loyola Marymount University (air pollution, risk assessment, hazardous waste management) for the past

seventeen years. In this time period he has also taught at Caltech, his alma mater (various engineering courses), at the University of Southern California (air pollution controls) and at California State University, Fullerton (transportation and air quality).

Dr. Sahu has and continues to provide expert witness services in a number of environmental areas discussed above in both state and Federal courts as well as before administrative bodies (please see Annex A).

EXPERIENCE RECORD

2000-present **Independent Consultant.** Providing a variety of private sector (industrial companies, land development companies, law firms, etc.) public sector (such as the US Department of Justice) and public interest group clients with project management, air quality consulting, waste remediation and management consulting, as well as regulatory and engineering support consulting services.

1995-2000 Parsons ES, **Associate, Senior Project Manager and Department Manager for** Air Quality/Geosciences/Hazardous Waste Groups, Pasadena. Responsible for the management of a group of approximately 24 air quality and environmental professionals, 15 geoscience, and 10 hazardous waste professionals providing full-service consulting, project management, regulatory compliance and A/E design assistance in all areas.

Parsons ES, **Manager for Air Source Testing Services**. Responsible for the management of 8 individuals in the area of air source testing and air regulatory permitting projects located in Bakersfield, California.

1992-1995 Engineering-Science, Inc. **Principal Engineer and Senior Project Manager** in the air quality department. Responsibilities included multimedia regulatory compliance and permitting (including hazardous and nuclear materials), air pollution engineering (emissions from stationary and mobile sources, control of criteria and air toxics, dispersion modeling, risk assessment, visibility analysis, odor analysis), supervisory functions and project management.

1990-1992 Engineering-Science, Inc. **Principal Engineer and Project Manager** in the air quality department. Responsibilities included permitting, tracking regulatory issues, technical analysis, and supervisory functions on numerous air, water, and hazardous waste projects. Responsibilities also include client and agency interfacing, project cost and schedule control, and reporting to internal and external upper management regarding project status.

1989-1990 Kinetics Technology International, Corp. **Development Engineer.** Involved in thermal engineering R&D and project work related to low-NOx ceramic radiant burners, fired heater NOx reduction, SCR design, and fired heater retrofitting.

1988-1989 Heat Transfer Research, Inc. **Research Engineer**. Involved in the design of fired heaters, heat exchangers, air coolers, and other non-fired equipment. Also did research in the area of heat exchanger tube vibrations.

EDUCATION

1984-1988 Ph.D., Mechanical Engineering, California Institute of Technology (Caltech), Pasadena, CA.

1984 M. S., Mechanical Engineering, Caltech, Pasadena, CA.

1978-1983 B. Tech (Honors), Mechanical Engineering, Indian Institute of Technology (IIT) Kharagpur, India

TEACHING EXPERIENCE

Caltech

"Thermodynamics," Teaching Assistant, California Institute of Technology, 1983, 1987.

"Air Pollution Control," Teaching Assistant, California Institute of Technology, 1985.

"Caltech Secondary and High School Saturday Program," - taught various mathematics (algebra through calculus) and science (physics and chemistry) courses to high school students, 1983-1989.

"Heat Transfer," - taught this course in the Fall and Winter terms of 1994-1995 in the Division of Engineering and Applied Science.

“Thermodynamics and Heat Transfer,” Fall and Winter Terms of 1996-1997.

U.C. Riverside, Extension

"Toxic and Hazardous Air Contaminants," University of California Extension Program, Riverside, California. Various years since 1992.

"Prevention and Management of Accidental Air Emissions," University of California Extension Program, Riverside, California. Various years since 1992.

"Air Pollution Control Systems and Strategies," University of California Extension Program, Riverside, California, Summer 1992-93, Summer 1993-1994.

"Air Pollution Calculations," University of California Extension Program, Riverside, California, Fall 1993-94, Winter 1993-94, Fall 1994-95.

"Process Safety Management," University of California Extension Program, Riverside, California. Various years since 1992-2010.

"Process Safety Management," University of California Extension Program, Riverside, California, at SCAQMD, Spring 1993-94.

"Advanced Hazard Analysis - A Special Course for LEPCs," University of California Extension Program, Riverside, California, taught at San Diego, California, Spring 1993-1994.

“Advanced Hazardous Waste Management” University of California Extension Program, Riverside, California. 2005.

Loyola Marymount University

"Fundamentals of Air Pollution - Regulations, Controls and Engineering," Loyola Marymount University, Dept. of Civil Engineering. Various years since 1993.

"Air Pollution Control," Loyola Marymount University, Dept. of Civil Engineering, Fall 1994.

“Environmental Risk Assessment,” Loyola Marymount University, Dept. of Civil Engineering. Various years since 1998.

“Hazardous Waste Remediation” Loyola Marymount University, Dept. of Civil Engineering. Various years since 2006.

University of Southern California

"Air Pollution Controls," University of Southern California, Dept. of Civil Engineering, Fall 1993, Fall 1994.

"Air Pollution Fundamentals," University of Southern California, Dept. of Civil Engineering, Winter 1994.

University of California, Los Angeles

"Air Pollution Fundamentals," University of California, Los Angeles, Dept. of Civil and Environmental Engineering, Spring 1994, Spring 1999, Spring 2000, Spring 2003, Spring 2006, Spring 2007, Spring 2008, Spring 2009.

International Programs

"Environmental Planning and Management," 5 week program for visiting Chinese delegation, 1994.

"Environmental Planning and Management," 1 day program for visiting Russian delegation, 1995.

"Air Pollution Planning and Management," IEP, UCR, Spring 1996.

"Environmental Issues and Air Pollution," IEP, UCR, October 1996.

PROFESSIONAL AFFILIATIONS AND HONORS

President of India Gold Medal, IIT Kharagpur, India, 1983.

Member of the Alternatives Assessment Committee of the Grand Canyon Visibility Transport Commission, established by the Clean Air Act Amendments of 1990, 1992-present.

American Society of Mechanical Engineers: Los Angeles Section Executive Committee, Heat Transfer Division, and Fuels and Combustion Technology Division, 1987-present.

Air and Waste Management Association, West Coast Section, 1989-present.

PROFESSIONAL CERTIFICATIONS

EIT, California (# XE088305), 1993.

REA I, California (#07438), 2000.

Certified Permitting Professional, South Coast AQMD (#C8320), since 1993.

QEP, Institute of Professional Environmental Practice, since 2000.

CEM, State of Nevada (#EM-1699). Expiration 10/07/2011.

PUBLICATIONS (PARTIAL LIST)

"Physical Properties and Oxidation Rates of Chars from Bituminous Coals," with Y.A. Levendis, R.C. Flagan and G.R. Gavalas, *Fuel*, **67**, 275-283 (1988).

"Char Combustion: Measurement and Analysis of Particle Temperature Histories," with R.C. Flagan, G.R. Gavalas and P.S. Northrop, *Comb. Sci. Tech.* **60**, 215-230 (1988).

"On the Combustion of Bituminous Coal Chars," PhD Thesis, California Institute of Technology (1988).

"Optical Pyrometry: A Powerful Tool for Coal Combustion Diagnostics," *J. Coal Quality*, **8**, 17-22 (1989).

"Post-Ignition Transients in the Combustion of Single Char Particles," with Y.A. Levendis, R.C.Flagan and G.R. Gavalas, *Fuel*, **68**, 849-855 (1989).

"A Model for Single Particle Combustion of Bituminous Coal Char." Proc. ASME National Heat Transfer Conference, Philadelphia, **HTD-Vol. 106**, 505-513 (1989).

"Discrete Simulation of Cenospheric Coal-Char Combustion," with R.C. Flagan and G.R.Gavalas, *Combust. Flame*, **77**, 337-346 (1989).

"Particle Measurements in Coal Combustion," with R.C. Flagan, in "**Combustion Measurements**" (ed. N. Chigier), Hemisphere Publishing Corp. (1991).

"Cross Linking in Pore Structures and Its Effect on Reactivity," with G.R. Gavalas in preparation.

"Natural Frequencies and Mode Shapes of Straight Tubes," Proprietary Report for Heat Transfer Research Institute, Alhambra, CA (1990).

"Optimal Tube Layouts for Kamui SL-Series Exchangers," with K. Ishihara, Proprietary Report for Kamui Company Limited, Tokyo, Japan (1990).

"HTRI Process Heater Conceptual Design," Proprietary Report for Heat Transfer Research Institute, Alhambra, CA (1990).

"Asymptotic Theory of Transonic Wind Tunnel Wall Interference," with N.D. Malmuth and others, Arnold Engineering Development Center, Air Force Systems Command, USAF (1990).

"Gas Radiation in a Fired Heater Convection Section," Proprietary Report for Heat Transfer Research Institute, College Station, TX (1990).

"Heat Transfer and Pressure Drop in NTIW Heat Exchangers," Proprietary Report for Heat Transfer Research Institute, College Station, TX (1991).

"NOx Control and Thermal Design," Thermal Engineering Tech Briefs, (1994).

“From Puchase of Landmark Environmental Insurance to Remediation: Case Study in Henderson, Nevada,” with Robin E. Bain and Jill Quillin, presented at the AQMA Annual Meeting, Florida, 2001.

“The Jones Act Contribution to Global Warming, Acid Rain and Toxic Air Contaminants,” with Charles W. Botsford, presented at the AQMA Annual Meeting, Florida, 2001.

PRESENTATIONS (PARTIAL LIST)

"Pore Structure and Combustion Kinetics - Interpretation of Single Particle Temperature-Time Histories," with P.S. Northrop, R.C. Flagan and G.R. Gavalas, presented at the AIChE Annual Meeting, New York (1987).

"Measurement of Temperature-Time Histories of Burning Single Coal Char Particles," with R.C. Flagan, presented at the American Flame Research Committee Fall International Symposium, Pittsburgh, (1988).

"Physical Characterization of a Cenospheric Coal Char Burned at High Temperatures," with R.C. Flagan and G.R. Gavalas, presented at the Fall Meeting of the Western States Section of the Combustion Institute, Laguna Beach, California (1988).

"Control of Nitrogen Oxide Emissions in Gas Fired Heaters - The Retrofit Experience," with G. P. Croce and R. Patel, presented at the International Conference on Environmental Control of Combustion Processes (Jointly sponsored by the American Flame Research Committee and the Japan Flame Research Committee), Honolulu, Hawaii (1991).

"Air Toxics - Past, Present and the Future," presented at the Joint AIChE/AAEE Breakfast Meeting at the AIChE 1991 Annual Meeting, Los Angeles, California, November 17-22 (1991).

"Air Toxics Emissions and Risk Impacts from Automobiles Using Reformulated Gasolines," presented at the Third Annual Current Issues in Air Toxics Conference, Sacramento, California, November 9-10 (1992).

"Air Toxics from Mobile Sources," presented at the Environmental Health Sciences (ESE) Seminar Series, UCLA, Los Angeles, California, November 12, (1992).

"Kilns, Ovens, and Dryers - Present and Future," presented at the Gas Company Air Quality Permit Assistance Seminar, Industry Hills Sheraton, California, November 20, (1992).

"The Design and Implementation of Vehicle Scrapping Programs," presented at the 86th Annual Meeting of the Air and Waste Management Association, Denver, Colorado, June 12, 1993.

"Air Quality Planning and Control in Beijing, China," presented at the 87th Annual Meeting of the Air and Waste Management Association, Cincinnati, Ohio, June 19-24, 1994.

Annex A

Expert Litigation Support

1. Occasions where Dr. Sahu has provided Written or Oral testimony before Congress:

(a) In July 2012, provided expert written and oral testimony to the House Subcommittee on Energy and the Environment, Committee on Science, Space, and Technology at a Hearing entitled "Hitting the Ethanol Blend Wall – Examining the Science on E15."

2. Matters for which Dr. Sahu has have provided affidavits and expert reports include:

(b) Affidavit for Rocky Mountain Steel Mills, Inc. located in Pueblo Colorado – dealing with the technical uncertainties associated with night-time opacity measurements in general and at this steel mini-mill.

(c) Expert reports and depositions (2/28/2002 and 3/1/2002; 12/2/2003 and 12/3/2003; 5/24/2004) on behalf of the United States in connection with the Ohio Edison NSR Cases. *United States, et al. v. Ohio Edison Co., et al.*, C2-99-1181 (Southern District of Ohio).

(d) Expert reports and depositions (5/23/2002 and 5/24/2002) on behalf of the United States in connection with the Illinois Power NSR Case. *United States v. Illinois Power Co., et al.*, 99-833-MJR (Southern District of Illinois).

(e) Expert reports and depositions (11/25/2002 and 11/26/2002) on behalf of the United States in connection with the Duke Power NSR Case. *United States, et al. v. Duke Energy Corp.*, 1:00-CV-1262 (Middle District of North Carolina).

(f) Expert reports and depositions (10/6/2004 and 10/7/2004; 7/10/2006) on behalf of the United States in connection with the American Electric Power NSR Cases. *United States, et al. v. American Electric Power Service Corp., et al.*, C2-99-1182, C2-99-1250 (Southern District of Ohio).

(g) Affidavit (March 2005) on behalf of the Minnesota Center for Environmental Advocacy and others in the matter of the Application of Heron Lake BioEnergy LLC to construct and operate an ethanol production facility – submitted to the Minnesota Pollution Control Agency.

(h) Expert Report and Deposition (10/31/2005 and 11/1/2005) on behalf of the United States in connection with the East Kentucky Power Cooperative NSR Case. *United States v. East Kentucky Power Cooperative, Inc*., 5:04-cv-00034-KSF (Eastern District of Kentucky).

(i) Affidavits and deposition on behalf of Basic Management Inc. (BMI) Companies in connection with the BMI vs. USA remediation cost recovery Case.

(j) Expert Report on behalf of Penn Future and others in the Cambria Coke plant permit challenge in Pennsylvania.

(k) Expert Report on behalf of the Appalachian Center for the Economy and the Environment and others in the Western Greenbrier permit challenge in West Virginia.

(l) Expert Report, deposition (via telephone on January 26, 2007) on behalf of various Montana petitioners (Citizens Awareness Network (CAN), Women's Voices for the Earth (WVE) and the Clark Fork Coalition (CFC)) in the Thompson River Cogeneration LLC Permit No. 3175-04 challenge.

(m) Expert Report and deposition (2/2/07) on behalf of the Texas Clean Air Cities Coalition at the Texas State Office of Administrative Hearings (SOAH) in the matter of the permit challenges to TXU Project Apollo's eight new proposed PRB-fired PC boilers located at seven TX sites.

(n) Expert Testimony (July 2007) on behalf of the Izaak Walton League of America and others in connection with the acquisition of power by Xcel Energy from the proposed Gascoyne Power Plant – at the State of Minnesota, Office of Administrative Hearings for the Minnesota PUC (MPUC No. E002/CN-06-1518; OAH No. 12-2500-17857-2).

0047-94
Continued

(o) Affidavit (July 2007) Comments on the Big Cajun I Draft Permit on behalf of the Sierra Club – submitted to the Louisiana DEQ.

(p) Expert Report and Deposition (12/13/2007) on behalf of Commonwealth of Pennsylvania – Dept. of Environmental Protection, State of Connecticut, State of New York, and State of New Jersey (Plaintiffs) in connection with the Allegheny Energy NSR Case. *Plaintiffs v. Allegheny Energy Inc., et al.,* 2:05cv0885 (Western District of Pennsylvania).

(q) Expert Reports and Pre-filed Testimony before the Utah Air Quality Board on behalf of Sierra Club in the Sevier Power Plant permit challenge.

(r) Expert Report and Deposition (October 2007) on behalf of MTD Products Inc., in connection with General Power Products, LLC v MTD Products Inc., 1:06 CVA 0143 (Southern District of Ohio, Western Division)

(s) Experts Report and Deposition (June 2008) on behalf of Sierra Club and others in the matter of permit challenges (Title V: 28.0801-29 and PSD: 28.0803-PSD) for the Big Stone II unit, proposed to be located near Milbank, South Dakota.

(t) Expert Reports, Affidavit, and Deposition (August 15, 2008) on behalf of Earthjustice in the matter of air permit challenge (CT-4631) for the Basin Electric Dry Fork station, under construction near Gillette, Wyoming before the Environmental Quality Council of the State of Wyoming.

(u) Affidavits (May 2010/June 2010 in the Office of Administrative Hearings))/Declaration and Expert Report (November 2009 in the Office of Administrative Hearings) on behalf of NRDC and the Southern Environmental Law Center in the matter of the air permit challenge for Duke Cliffside Unit 6. Office of Administrative Hearing Matters 08 EHR 0771, 0835 and 0836 and 09 HER 3102, 3174, and 3176 (consolidated).

(v) Declaration (August 2008), Expert Report (January 2009), and Declaration (May 2009) on behalf of Southern Alliance for Clean Energy et al., v Duke Energy Carolinas, LLC. in the matter of the air permit challenge for Duke Cliffside Unit 6. *Southern Alliance for Clean Energy et al., v. Duke Energy Carolinas, LLC*, Case No. 1:08-cv-00318-LHT-DLH (Western District of North Carolina, Asheville Division).

(w) Declaration (August 2008) on behalf of the Sierra Club in the matter of Dominion Wise County plant MACT.

(x) Expert Report (June 2008) on behalf of Sierra Club for the Green Energy Resource Recovery Project, MACT Analysis.

(y) Expert Report (February 2009) on behalf of Sierra Club and the Environmental Integrity Project in the matter of the air permit challenge for NRG Limestone's proposed Unit 3 in Texas.

(z) Expert Report (June 2009) on behalf of MTD Products, Inc., in the matter of *Alice Holmes and Vernon Holmes v. Home Depot USA, Inc., et al.*

(aa) Expert Report (August 2009) on behalf of Sierra Club and the Southern Environmental Law Center in the matter of the air permit challenge for Santee Cooper's proposed Pee Dee plant in South Carolina).

(bb) Statements (May 2008 and September 2009) on behalf of the Minnesota Center for Environmental Advocacy to the Minnesota Pollution Control Agency in the matter of the Minnesota Haze State Implementation Plans.

(cc) Expert Report (August 2009) on behalf of Environmental Defense, in the matter of permit challenges to the proposed Las Brisas coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

(dd) Expert Report and Rebuttal Report (September 2009) on behalf of the Sierra Club, in the matter of challenges to the proposed Medicine Bow Fuel and Power IGL plant in Cheyenne, Wyoming.

(ee) Expert Report (December 2009) and Rebuttal reports (May 2010 and June 2010) on behalf of the United States in connection with the Alabama Power Company NSR Case. *United States v. Alabama Power Company*, CV-01-HS-152-S (Northern District of Alabama, Southern Division).

(ff) Pre-filed Testimony (October 2009) on behalf of Environmental Defense and others, in the matter of challenges to the proposed White Stallion Energy Center coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

(gg) Pre-filed Testimony (July 2010) and Written Rebuttal Testimony (August 2010) on behalf of the State of New Mexico Environment Department in the matter of Proposed Regulation 20.2.350 NMAC – *Greenhouse Gas Cap and Trade Provisions,* No. EIB 10-04 (R), to the State of New Mexico, Environmental Improvement Board.

(hh) Expert Report (August 2010) and Rebuttal Expert Report (October 2010) on behalf of the United States in connection with the Louisiana Generating NSR Case. *United States v. Louisiana Generating, LLC*, 09-CV100-RET-CN (Middle District of Louisiana) – Liability Phase.

(ii) Declaration (August 2010), Reply Declaration (November 2010), Expert Report (April 2011), Supplemental and Rebuttal Expert Report (July 2011) on behalf of the United States in the matter of DTE Energy Company and Detroit Edison Company (Monroe Unit 2). *United States of America v. DTE Energy Company and Detroit Edison Company*, Civil Action No. 2:10-cv-13101-BAF-RSW (US District Court for the Eastern District of Michigan).

(jj) Expert Report and Deposition (August 2010) as well as Affidavit (September 2010) on behalf of Kentucky Waterways Alliance, Sierra Club, and Valley Watch in the matter of challenges to the NPDES permit issued for the Trimble County power plant by the Kentucky Energy and Environment Cabinet to Louisville Gas and Electric, File No. DOW-41106-047.

(kk) Expert Report (August 2010), Rebuttal Expert Report (September 2010), Supplemental Expert Report (September 2011), and Declaration (November 2011) on behalf of Wild Earth Guardians in the matter of opacity exceedances and monitor downtime at the Public Service Company of Colorado (Xcel)'s Cherokee power plant. No. 09-cv-1862 (D. Colo.).

(ll) Written Direct Expert Testimony (August 2010) and Affidavit (February 2012) on behalf of Fall-Line Alliance for a Clean Environment and others in the matter of the PSD Air Permit for Plant Washington issued by Georgia DNR at the Office of State Administrative Hearing, State of Georgia (OSAH-BNR-AQ-1031707-98-WALKER).

(mm) Deposition (August 2010) on behalf of Environmental Defense, in the matter of the remanded permit challenge to the proposed Las Brisas coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

(nn) Expert Report, Supplemental/Rebuttal Expert Report, and Declarations (October 2010, November 2010, September 2012) on behalf of New Mexico Environment Department (Plaintiff-Intervenor), Grand Canyon Trust and Sierra Club (Plaintiffs) in the matter of Plaintiffs v. Public Service Company of New Mexico (PNM), Civil No. 1:02-CV-0552 BB/ATC (ACE). (US District Court for the District of New Mexico).

(oo) Expert Report (October 2010) and Rebuttal Expert Report (November 2010) (BART Determinations for PSCo Hayden and CSU Martin Drake units) to the Colorado Air Quality Commission on behalf of Coalition of Environmental Organizations.

(pp) Expert Report (November 2010) (BART Determinations for TriState Craig Units, CSU Nixon Unit, and PRPA Rawhide Unit) to the Colorado Air Quality Commission on behalf of Coalition of Environmental Organizations.

(qq) Declaration (November 2010) on behalf of the Sierra Club in connection with the Martin Lake Station Units 1, 2, and 3. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Case No. 5:10-cv-00156-DF-CMC (US District Court for the Eastern District of Texas, Texarkana Division).

(rr) Pre-Filed Testimony (January 2011) and Declaration (February 2011) to the Georgia Office of State Administrative Hearings (OSAH) in the matter of Minor Source HAPs status for the proposed Longleaf Energy Associates power plant (OSAH-BNR-AQ-1115157-60-HOWELLS) on behalf of the Friends of the Chattahoochee and the Sierra Club).

0047-94
Continued

(ss) Declaration (February 2011) in the matter of the Draft Title V Permit for RRI Energy MidAtlantic Power Holdings LLC Shawville Generating Station (Pennsylvania), ID No. 17-00001 on behalf of the Sierra Club.

(tt) Expert Report (March 2011), Rebuttal Expert Report (Jue 2011) on behalf of the United States in *United States of America v. Cemex, Inc.*, Civil Action No. 09-cv-00019-MSK-MEH (US District Court for the District of Colorado).

(uu) Declaration (April 2011) and Expert Report (July 16, 2012) in the matter of the Lower Colorado River Authority (LCRA)'s Fayette (Sam Seymour) Power Plant on behalf of the Texas Campaign for the Environment. *Texas Campaign for the Environment v. Lower Colorado River Authority,* Civil Action No. 4:11-cv-00791 (US District Court for the Southern District of Texas, Houston Division).

(vv) Declaration (June 2011) on behalf of the Plaintiffs MYTAPN in the matter of Microsoft-Yes, Toxic Air Pollution-No (MYTAPN) v. State of Washington, Department of Ecology and Microsoft Corporation Columbia Data Center to the Pollution Control Hearings Board, State of Washington, Matter No. PCHB No. 10-162.

(ww) Expert Report (June 2011) on behalf of the New Hampshire Sierra Club at the State of New Hampshire Public Utilities Commission, Docket No. 10-261 – the 2010 Least Cost Integrated Resource Plan (LCIRP) submitted by the Public Service Company of New Hampshire (re. Merrimack Station Units 1 and 2).

(xx) Declaration (August 2011) in the matter of the Sandy Creek Energy Associates L.P. Sandy Creek Power Plant on behalf of Sierra Club and Public Citizen. *Sierra Club, Inc. and Public Citizen, Inc. v. Sandy Creek Energy Associates, L.P.,* Civil Action No. A-08-CA-648-LY (US District Court for the Western District of Texas, Austin Division).

(yy) Expert Report (October 2011) on behalf of the Defendants in the matter of *John Quiles and Jeanette Quiles et al. v. Bradford-White Corporation, MTD Products, Inc., Kohler Co., et al.,* Case No. 3:10-cv-747 (TJM/DEP) (US District Court for the Northern District of New York).

(zz) Declaration (February 2012) and Second Declaration (February 2012) in the matter of *Washington Environmental Council and Sierra Club Washington State Chapter v. Washington State Department of Ecology and Western States Petroleum Association,* Case No. 11-417-MJP (US District Court for the Western District of Washington).

(aaa) Expert Report (March 2012) and Supplemental Expert Report (November 2013) in the matter of *Environment Texas Citizen Lobby, Inc and Sierra Club v. ExxonMobil Corporation et al.,* Civil Action No. 4:10-cv-4969 (US District Court for the Southern District of Texas, Houston Division).

(bbb) Declaration (March 2012) in the matter of *Center for Biological Diversity, et al. v. United States Environmental Protection Agency,* Case No. 11-1101 (consolidated with 11-1285, 11-1328 and 11-1336) (US Court of Appeals for the District of Columbia Circuit).

(ccc) Declaration (March 2012) in the matter of *Sierra Club v. The Kansas Department of Health and Environment*, Case No. 11-105,493-AS (Holcomb power plant) (Supreme Court of the State of Kansas).

(ddd) Declaration (March 2012) in the matter of the Las Brisas Energy Center *Environmental Defense Fund et al., v. Texas Commission on Environmental Quality,* Cause No. D-1-GN-11-001364 (District Court of Travis County, Texas, 261st Judicial District).

(eee) Expert Report (April 2012), Supplemental and Rebuttal Expert Report (July 2012), and Supplemental Rebuttal Expert Report (August 2012) on behalf of the states of New Jersey and Connecticut in the matter of the Portland Power plant *State of New Jersey and State of Connecticut (Intervenor-Plaintiff) v. RRI Energy Mid-Atlantic Power Holdings et al.,* Civil Action No. 07-CV-5298 (JKG) (US District Court for the Eastern District of Pennsylvania).

(fff) Declaration (April 2012) in the matter of the EPA's EGU MATS Rule, on behalf of the Environmental Integrity Project

(ggg) Expert Report (August 2012) on behalf of the United States in connection with the Louisiana Generating NSR Case. *United States v. Louisiana Generating, LLC*, 09-CV100-RET-CN (Middle District of Louisiana) – Harm Phase.

(hhh) Declaration (September 2012) in the Matter of the Application of *Energy Answers Incinerator, Inc.* for a Certificate of Public Convenience and Necessity to Construct a 120 MW Generating Facility in Baltimore City, Maryland, before the Public Service Commission of Maryland, Case No. 9199.

(iii) Expert Report (October 2012) on behalf of the Appellants (Robert Concilus and Leah Humes) in the matter of Robert Concilus and Leah Humes v. Commonwealth of Pennsylvania Department of Environmental Protection and Crawford Renewable Energy, before the Commonwealth of Pennsylvania Environmental Hearing Board, Docket No. 2011-167-R.

(jjj) Expert Report (October 2012), Supplemental Expert Report (January 2013), and Affidavit (June 2013) in the matter of various Environmental Petitioners v. North Carolina DENR/DAQ and Carolinas Cement Company, before the Office of Administrative Hearings, State of North Carolina.

(kkk) Pre-filed Testimony (October 2012) on behalf of No-Sag in the matter of the North Springfield Sustainable Energy Project before the State of Vermont, Public Service Board.

(lll) Pre-filed Testimony (November 2012) on behalf of Clean Wisconsin in the matter of Application of Wisconsin Public Service Corporation for Authority to Construct and Place in Operation a New Multi-Pollutant Control Technology System (ReACT) for Unit 3 of the Weston Generating Station, before the Public Service Commission of Wisconsin, Docket No. 6690-CE-197.

(mmm) Expert Report (February 2013) on behalf of Petitioners in the matter of Credence Crematory, Cause No. 12-A-J-4538 before the Indiana Office of Environmental Adjudication.

(nnn) Expert Report (April 2013), Rebuttal report (July 2013), and Declarations (October 2013, November 2013) on behalf of the Sierra Club in connection with the Luminant Big Brown Case. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Civil Action No. 6:12-cv-00108-WSS (Western District of Texas, Waco Division).

(ooo) Expert Report (May 2013) and Rebuttal Expert Report (July 2013) on behalf of the Sierra Club in connection with the Luminant Martin Lake Case. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Civil Action No. 5:10-cv-0156-MHS-CMC (Eastern District of Texas, Texarkana Division).

(ppp) Declaration (August 2013) on behalf of A. J. Acosta Company, Inc., in the matter of A. J. Acosta Company, Inc., v. County of San Bernardino, Case No. CIVSS803651.

(qqq) Comments (October 2013) on behalf of the Washington Environmental Council and the Sierra Club in the matter of the Washington State Oil Refinery RACT (for Greenhouse Gases), submitted to the Washington State Department of Ecology, the Northwest Clean Air Agency, and the Puget Sound Clean Air Agency.

(rrr) Statement (November 2013) on behalf of various Environmental Organizations in the matter of the Boswell Energy Center (BEC) Unit 4 Environmental Retrofit Project, to the Minnesota Public Utilities Commission, Docket No. E-015/M-12-920.

(sss) Expert Report (December 2013) on behalf of the United States in *United States of America v. Ameren Missouri*, Civil Action No. 4:11-cv-00077-RWS (Eastern District of Missouri, Eastern Division).

(ttt) Expert Testimony (December 2013) on behalf of the Sierra Club in the matter of Public Service Company of New Hampshire Merrimack Station Scrubber Project and Cost Recovery, Docket No. DE 11-250, to the State of New Hampshire Public Utilities Commission.

(uuu) Expert Report (January 2014) on behalf of Baja, Inc., in Baja, Inc., v. Automotive Testing and Development Services, Inc. et. al, Civil Action No. 8:13-CV-02057-GRA (District of South Carolina, Anderson/Greenwood Division).

(vvv) Declaration (March 2014) on behalf of the Center for International Environmental Law, Chesapeake Climate Action Network, Friends of the Earth, Pacific Environment, and the Sierra Club (Plaintiffs) in

the matter of Plaintiffs v. the Export-Import Bank (Ex-Im Bank) of the United States, Civil Action No. 13-1820 RC (United States District Court for the District of Columbia).

(www) Direct Prefiled Testimony (June 2014) on behalf of the Michigan Environmental Council and the Sierra Club in the matter of the Application of DTE Electric Company for Authority to Implement a Power Supply Cost Recovery (PSCR) Plan in its Rate Schedules for 2014 Metered Jurisdictional Sales of Electricity, Case No. U-17319 (Michigan Public Service Commission).

(xxx) Expert Report (June 2014) on behalf of ECM Biofilms in the matter of the US Federal Trade Commission (FTC) v. ECM Biofilms (FTC Docket #9358).

(yyy) Declaration (July 2014) on behalf of Public Health Intervenors in the matter of EME Homer City Generation v. US EPA (Case No. 11-1302 and consolidated cases) relating to the lifting of the stay entered by the Court on December 30, 2011 (US Court of Appeals for the District of Columbia).

3. Occasions where Dr. Sahu has provided oral testimony <u>in depositions, at trial or in similar proceedings</u> include the following:

(zzz) Deposition on behalf of Rocky Mountain Steel Mills, Inc. located in Pueblo, Colorado – dealing with the manufacture of steel in mini-mills including methods of air pollution control and BACT in steel mini-mills and opacity issues at this steel mini-mill.

(aaaa) Trial Testimony (February 2002) on behalf of Rocky Mountain Steel Mills, Inc. in Denver District Court.

(bbbb) Trial Testimony (February 2003) on behalf of the United States in the Ohio Edison NSR Cases, *United States, et al. v. Ohio Edison Co., et al.*, C2-99-1181 (Southern District of Ohio).

(cccc) Trial Testimony (June 2003) on behalf of the United States in the Illinois Power NSR Case, *United States v. Illinois Power Co., et al.*, 99-833-MJR (Southern District of Illinois).

(dddd) Deposition (10/20/2005) on behalf of the United States in connection with the Cinergy NSR Case. *United States, et* al*. v. Cinergy Corp., et al.*, IP 99-1693-C-M/S (Southern District of Indiana).

(eeee) Oral Testimony (August 2006) on behalf of the Appalachian Center for the Economy and the Environment re. the Western Greenbrier plant, WV before the West Virginia ????.

(ffff) Oral Testimony (May 2007) on behalf of various Montana petitioners (Citizens Awareness Network (CAN), Women's Voices for the Earth (WVE) and the Clark Fork Coalition (CFC)) re. the Thompson River Cogeneration plant before the Montana Board of Environmental Review.

(gggg) Oral Testimony (October 2007) on behalf of the Sierra Club re. the Sevier Power Plant before the Utah Air Quality Board.

(hhhh) Oral Testimony (August 2008) on behalf of the Sierra Club and Clean Water re. Big Stone Unit II before the South Dakota Board of Minerals and the Environment.

(iiii) Oral Testimony (February 2009) on behalf of the Sierra Club and the Southern Environmental Law Center re. Santee Cooper Pee Dee units before the South Carolina Board of Health and Environmental Control.

(jjjj) Oral Testimony (February 2009) on behalf of the Sierra Club and the Environmental Integrity Project re. NRG Limestone Unit 3 before the Texas State Office of Administrative Hearings (SOAH) Administrative Law Judges.

(kkkk) Deposition (July 2009) on behalf of MTD Products, Inc., in the matter of *Alice Holmes and Vernon Holmes v. Home Depot USA, Inc., et al*.

(llll) Deposition (October 2009) on behalf of Environmental Defense and others, in the matter of challenges to the proposed Coleto Creek coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

(mmmm) Deposition (October 2009) on behalf of Environmental Defense, in the matter of permit challenges to the proposed Las Brisas coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

(nnnn) Deposition (October 2009) on behalf of the Sierra Club, in the matter of challenges to the proposed Medicine Bow Fuel and Power IGL plant in Cheyenne, Wyoming.

(oooo) Deposition (October 2009) on behalf of Environmental Defense and others, in the matter of challenges to the proposed Tenaska coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH). (April 2010).

(pppp) Oral Testimony (November 2009) on behalf of the Environmental Defense Fund re. the Las Brisas Energy Center before the Texas State Office of Administrative Hearings (SOAH) Administrative Law Judges.

(qqqq) Deposition (December 2009) on behalf of Environmental Defense and others, in the matter of challenges to the proposed White Stallion Energy Center coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

(rrrr) Oral Testimony (February 2010) on behalf of the Environmental Defense Fund re. the White Stallion Energy Center before the Texas State Office of Administrative Hearings (SOAH) Administrative Law Judges.

(ssss) Deposition (June 2010) on behalf of the United States in connection with the Alabama Power Company NSR Case. *United States v. Alabama Power Company*, CV-01-HS-152-S (Northern District of Alabama, Southern Division).

(tttt) Trial Testimony (September 2010) on behalf of Commonwealth of Pennsylvania – Dept. of Environmental Protection, State of Connecticut, State of New York, State of Maryland, and State of New Jersey (Plaintiffs) in connection with the Allegheny Energy NSR Case in US District Court in the Western District of Pennsylvania. *Plaintiffs v. Allegheny Energy Inc., et al.,* 2:05cv0885 (Western District of Pennsylvania).

(uuuu) Oral Direct and Rebuttal Testimony (September 2010) on behalf of Fall-Line Alliance for a Clean Environment and others in the matter of the PSD Air Permit for Plant Washington issued by Georgia DNR at the Office of State Administrative Hearing, State of Georgia (OSAH-BNR-AQ-1031707-98-WALKER).

(vvvv) Oral Testimony (September 2010) on behalf of the State of New Mexico Environment Department in the matter of Proposed Regulation 20.2.350 NMAC – *Greenhouse Gas Cap and Trade Provisions,* No. EIB 10-04 (R), to the State of New Mexico, Environmental Improvement Board.

(wwww) Oral Testimony (October 2010) on behalf of the Environmental Defense Fund re. the Las Brisas Energy Center before the Texas State Office of Administrative Hearings (SOAH) Administrative Law Judges.

(xxxx) Oral Testimony (November 2010) regarding BART for PSCo Hayden, CSU Martin Drake units before the Colorado Air Quality Commission on behalf of the Coalition of Environmental Organizations.

(yyyy) Oral Testimony (December 2010) regarding BART for TriState Craig Units, CSU Nixon Unit, and PRPA Rawhide Unit) before the Colorado Air Quality Commission on behalf of the Coalition of Environmental Organizations.

(zzzz) Deposition (December 2010) on behalf of the United States in connection with the Louisiana Generating NSR Case. *United States v. Louisiana Generating, LLC*, 09-CV100-RET-CN (Middle District of Louisiana).

(aaaaa) Deposition (February 2011 and January 2012) on behalf of Wild Earth Guardians in the matter of opacity exceedances and monitor downtime at the Public Service Company of Colorado (Xcel)'s Cherokee power plant. No. 09-cv-1862 (D. Colo.).

(bbbbb) Oral Testimony (February 2011) to the Georgia Office of State Administrative Hearings (OSAH) in the matter of Minor Source HAPs status for the proposed Longleaf Energy Associates power plant (OSAH-BNR-AQ-1115157-60-HOWELLS) on behalf of the Friends of the Chattahoochee and the Sierra Club).

(ccccc) Deposition (August 2011) on behalf of the United States in *United States of America v. Cemex, Inc.*, Civil Action No. 09-cv-00019-MSK-MEH (US District Court for the District of Colorado).

(ddddd) Deposition (July 2011) and Oral Testimony at Hearing (February 2012) on behalf of the Plaintiffs MYTAPN in the matter of Microsoft-Yes, Toxic Air Pollution-No (MYTAPN) v. State of Washington, Department of Ecology and Microsoft Corporation Columbia Data Center to the Pollution Control Hearings Board, State of Washington, Matter No. PCHB No. 10-162.

(eeeee) Oral Testimony at Hearing (March 2012) on behalf of the United States in connection with the Louisiana Generating NSR Case. *United States v. Louisiana Generating, LLC*, 09-CV100-RET-CN (Middle District of Louisiana).

(fffff) Oral Testimony at Hearing (April 2012) on behalf of the New Hampshire Sierra Club at the State of New Hampshire Public Utilities Commission, Docket No. 10-261 – the 2010 Least Cost Integrated Resource Plan (LCIRP) submitted by the Public Service Company of New Hampshire (re. Merrimack Station Units 1 and 2).

(ggggg) Oral Testimony at Hearing (November 2012) on behalf of Clean Wisconsin in the matter of Application of Wisconsin Public Service Corporation for Authority to Construct and Place in Operation a New Multi-Pollutant Control Technology System (ReACT) for Unit 3 of the Weston Generating Station, before the Public Service Commission of Wisconsin, Docket No. 6690-CE-197.

(hhhhh) Deposition (March 2013) in the matter of various Environmental Petitioners v. North Carolina DENR/DAQ and Carolinas Cement Company, before the Office of Administrative Hearings, State of North Carolina.

(iiiii) Deposition (August 2013) on behalf of the Sierra Club in connection with the Luminant Big Brown Case. Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC, Civil Action No. 6:12-cv-00108-WSS (Western District of Texas, Waco Division).

(jjjjj) Deposition (August 2013) on behalf of the Sierra Club in connection with the Luminant Martin Lake Case. Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC, Civil Action No. 5:10-cv-0156-MHS-CMC (Eastern District of Texas, Texarkana Division).

(kkkkk) Deposition (February 2014) on behalf of the United States in *United States of America v. Ameren Missouri*, Civil Action No. 4:11-cv-00077-RWS (Eastern District of Missouri, Eastern Division).

(lllll) Trial Testimony (February 2014) in the matter of *Environment Texas Citizen Lobby, Inc and Sierra Club v. ExxonMobil Corporation et al.,* Civil Action No. 4:10-cv-4969 (US District Court for the Southern District of Texas, Houston Division).

(mmmmm) Trial Testimony (February 2014) on behalf of the Sierra Club in connection with the Luminant Big Brown Case. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Civil Action No. 6:12-cv-00108-WSS (Western District of Texas, Waco Division).

(nnnnn) Deposition (June 2014) and Trial (August 2014) on behalf of ECM Biofilms in the matter of the US Federal Trade Commission (FTC) v. ECM Biofilms (FTC Docket #9358).

EXHIBIT C

On the Underestimation of NOx Emissions from Oil Well Drilling Activities in Kern County, CA

BY
DR. RANAJIT (RON) SAHU
CONSULTANT
SAHURON@EARTHLINK.NET

REPORT FUNDED BY THE ROSE FOUNDATION FOR COMMUNITIES AND THE ENVIRONMENT,
COMMISSIONED BY THE KERN-KAWEAH CHAPTER OF THE SIERRA CLUB

A. INTRODUCTION AND SUMMARY

Kern County is a significant producer of oil and gas in California. As a result, significant numbers of oil and gas related projects request and receive approvals in Kern County annually. For example, in just 2013 and 2014 respectively, 2586 and 2207 permits were issued for well drilling by the State of California, Department of Conservation, Division of Oil, Gas and Geothermal Resources (hereafter "DOGGR") field office in District 4, with jurisdiction over Kern County. In addition, for 2013 and 2014 respectively, 1661 and 2257 permits were issued for rework of existing wells; and 1608 and 1363 permits were issued for well abandonment.[1] To illustrate the point relating to underestimation of NOx emissions from drilling activities, we will focus just on a few of the many new drilling projects proposed by various operators. We have every reason to believe that such underestimate is also occurring (and not just for NOx emissions but for other associated pollutants as well) for well rework and well abandonment activities as well as for emissions associated with related activities such as installation, rework or abandonment of Underground Injection wells, etc.

Well drilling activities for oil and gas[2] in Kern County involve fuel (mainly diesel) combustion in internal combustion engines of various sizes that are used for drilling activities. Sometimes such engines directly drive devices such as pumps; in other instances they provide power for generators and electrical energy from the generators is then used to drive motors. In any case, diesel combustion in engines results in emissions of NOx, among other pollutants such as carbon monoxide (CO), various sizes of particulate matter (PM), uncombusted fuels (including volatile and semi volatile organic compounds), numerous toxic and hazardous air pollutants (HAPs) as well as greenhouse gases such as carbon dioxide (CO2). We focus on just NOx emissions in this analysis.

We reviewed several recent project submittals to DOGGR District 4 by various project operators dealing with environmental impacts, including estimated air emissions for NOx and other pollutants. These include:

- the Rhythm Project Initial Study/Mitigated Negative Declaration (April 2015);
- the Terrebonne Project Initial Study/Mitigated Negative Declaration (April 2015);
- the Sherman 1 23 Initial Study/Mitigated Negative Declaration (July 2014);
- the Blackwells Corner Initial Study/Mitigated Negative Declaration (May 2014); and
- the Rio Viejo Initial Study/Mitigated Negative Declaration (May 2014).

In addition, we also reviewed summary information relating to estimated NOx emissions from drilling for the Jedessa, Tamarack 1, Patricia McKellar, and Rancho Grande 1 projects from 2012 2013.

Our review indicates the following: (a) that underlying activity assumptions made by various operators for developing emissions estimates are often either not supported or are inconsistent across projects; (b) to the extent activity assumptions to support emission estimates are provided, there is no mechanism to verify if subsequent actual activity levels in the field, are, in fact, consistent with the assumptions made in developing emission estimates in the pre project planning and environmental analyses; (c) the DOGGR review of submitted documents lacks depth and critical analysis and rarely, if ever, challenges assumptions by project proponents; (d) there is no review of such emission estimates by the local air quality planning agency; (e) to the extent that the public is provided the opportunity to comment on such documents they do not appear to have any impact on project approvals by DOGGR; (f) there appears to be no coordination between DOGGR approval of projects and the local air quality planning agency thus, directly and adversely affecting air quality emissions inventories and air quality planning, including plans to bring the area into attainment for several National Ambient Air Quality Standards, including for ozone and fine particulate matter (PM2.5); and (g) NOx emission estimates associated with drilling activities (a subset of such emissions

associated with oil and gas well drilling, development, completion, reworking, and abandonment) appear to be significantly lower than estimated emissions in other jurisdictions.

During the course of this study, it also became apparent that accessing relevant project documents at the local DOGGR office relating to past and current projects as a member of the public is not an easy task further impeding the already opaque and inconsistent approval process for drilling projects by DOGGR.

As a result of our review and analysis which indicates significant underestimation of NOx emissions associated with oil and gas well drilling activities in Kern County, it is likely that such projects, which currently obtain approvals from the DOGGR for the California Environment Quality Act (CEQA) compliance via Mitigated Negative Declarations (MNDs), might need a full fledged Environmental Impact Reports (EIRs), as least as far as air quality impacts are concerned.

This analysis concludes with a set of recommendations to improve and strengthen the procedural and technical flaws identified with the current review (and approval) process for such projects by DOGGR.

B. ANALYSIS OF KERN COUNTY PROJECTS

Table 1 in Attachment B shows a summary of the NOx emissions as estimated by each of the projects analyzed in this study. Shown in Table 1 are NOx emissions from just the drilling activities alone. To the extent provided in the underlying project documents, Table 1 shows the equipment name (such as cranes, forklifts, drill motors, generators, etc.), the sizes of the combustion engines in hp, the assumed load factors for each of the equipment engines, and the activity levels (in hours per day and days per year) expected for each project. Collectively, the overall drilling activity is therefore an expected number of hp hours for a given project. This is also calculated and provided in Table 1.

NOx emissions are usually estimated by multiplying the activity level (i.e., expected hp hr) by an emission factor (typically in grams of NOx/hp hr) to arrive at the mass emissions (grams, or converted to pounds or tons) of NOx for a given time period (such as hourly, daily, or for the project). The assumed NOx emission factors for each project, to the extent determinable from the underlying documents are also shown in Table 1.

To make comparisons meaningful, NOx emissions for projects are shown in Table 1 for not only a project as a whole (which may involve the drilling of multiple wells), but also on a per well basis since some of the project documents provide breakouts for just 1 well. In other words, in subsequent comparisons shortly, we will only compare 1 well NOx emissions from various projects in order to determine variability or consistency.

In addition to the activity level (in hp hours) for the equipment engines and associated NOx emissions, Table 1 also provides an indicator of the well itself typically the depth of the well. Obviously, the engine hp hr activities at a given well pad ultimately should relate to the effort required to drill the well. Well depth (for vertical wells) is therefore used as the parameter of the underlying project goal. Thus, Table 1 shows, for each project where well depth is provided, the normalized engine activity level per 1000 ft of well depth (i.e., hp hr/1000 ft). Finally, Table 1 also shows the estimated NOx emissions from the different projects in pounds/1000 ft well depth. These normalized parameters make it easier to compare across projects.

Next, we review specific findings from the data presented in Table 1.

First, it is clear that the level of reporting for NOx emissions development varies from project to project. While some of the recent 2014/2015 projects provide details of the equipment that will be used as well as line by line details of the equipment activity factors

and associated NOx emissions (including emission factors), that is not always the case, especially for the older projects. Project documents for the older projects were not always transparent with regards to such details. They should be. Without such granular detail, it is not clear how DOGGR could have reviewed the underlying documents. Certainly, such lack of detail and transparency is not acceptable from a public review standpoint.

Second, as Table 1 shows, even for the projects with equipment detail, the level of detail varies. While some projects provide more detail for equipment types, others do not. There does not appear to be any standardization in such calculations. Clearly DOGGR could request information from applications on a more standard basis. That does not seem to be occurring.

Third, the load factors used for the various engines and activities are not supported in any of the documents. Thus, the basis for using 0.37 for the backhoe in a given project; or using 0.5 for the main drill rig motor in another project is not at all clear. It is important to note that these load factors directly affect the activity levels (i.e., hp hr) that are then used in the emission calculations.

Fourth, the sizes (hp) of the equipment and the NOx emission factors used are typically not consistent across the projects. Table 2 shows the various types of equipment that are proposed to be used in the drilling phase for the projects analyzed, along with the engines sizes and the assumed NOx emission factors.

While the size of the equipment is a choice made by the project proponent, NOx emission factors should typically be consistent for similar equipment. Currently, different engine emission standards (Tier 3 or Tier 4, for example) apply to engines in California depending on when the engines were manufactured. Clearly, when a specific project is being proposed, the project proponents know what engines will be used; and therefore there should be solid support for the emission factor whether from actual test data or from manufacturers (via guarantees, supported, in turn, by test data). In Table 2, there appears to be considerable variation in the emission factors for the mid range engines between 300 600 hp.

TABLE 2
EQUIPMENT SIZES AND NOX EMISSION FACTORS

EQUIPMENT-PROJECT	SIZE [HP]	NOX EF [G/HP-HR]
Welder-Blackwells Corner	20	2.247
Small Generator-Rhythm	45	3.592
Small Generator-Terrebone	45	3.592
Small Generator-Sherman 1-23	45	3.592
Generator-Rio Viejo	45	3.731
Generator-Sherman 1-23	75	3.731
Backhoe-Blackwells Corner	91	2.057
Drill Rig Motor #1-Sherman 1-23	200	2.043
Draw Works-Sherman 1-23	200	1.979
Crane-Rhythm	226	2.196
Crane-Terrebone	226	2.196
Crane-Sherman 1-23	226	2.196
Mud Pumps-Sherman 1-23	300	3.02
Crane-Rio Viejo	375	1.805
Backhoe-Rhythm	400	1.602
Backhoe-Terrebone	400	1.602
Backhoe-Sherman 1-23	400	1.602
Forklift-Blackwells Corner	400	1.277
Backhoe-Rio Viejo	400	1.654
Forklift-Rio Viejo	400	1.277
Crane-Blackwells Corner	485	1.805
Generator-Blackwells Corner	500	2.656
Draw Works-Blackwells Corner	540	1.607
Pump-Blackwells Corner	1000	3.851
Drill Rig Motor #1-Rhythm	1477	1.504
Drill Rig Motor #1 (Idle)-Rhythm	1477	1.504
Drill Rig Motor #2-Rhythm	1477	1.504
Drill Rig Motor #2 (Idle)-Rhythm	1477	1.504
Backup Drill Rig Motor #3-Rhythm	1477	1.504
Drill Rig Motor #1-Terrebone	1477	1.504
Drill Rig Motor #1 (Idle)-Terrebone	1477	1.504
Drill Rig Motor #2-Terrebone	1477	1.504
Drill Rig Motor #2 (Idle)-Terrebone	1477	1.504
Backup Drill Rig Motor #3-Terrebone	1477	1.504
Drill Rig Motor #1 (Idle)-Sherman 1-23	1477	1.504
Drill Rig Motor #2-Sherman 1-23	1477	1.504
Drill Rig Motor #2 (Idle)-Sherman 1-23	1477	1.504
Backup Drill Rig Motor #3-Sherman 1-23	1477	1.504
Drill Rig Motor-Rio Viejo	1600	1.491
Drill Rig Motor-Rio Viejo	1600	1.491
Idle Drill Rig Motor-Rio Viejo	1600	1.491

It is also worth comparing the NOx emission factors against the relevant CA emission standards. For example, for the largest engines, size 750 hp (560 kW) and greater, the NOx standard for engines manufactured after 2006 2010 is 3.5 grams/kW hr or 2.61 grams/hp hr.[3] Yet, the vast majority of the NOx emission factors used for these sized engines is significantly lower at around 1.5 grams/hp hr. Why that is so or what makes these engines able to meet the lower (and unenforceable) assumed emission factor is not explained by DOGGR. We note that in one instance, the assumed emission factor of 3.851 grams/hp hr for a 1000 hp engine was significantly higher than the standard for 2006 and later engines likely because an older engine was proposed to be used. Why a 2014 project would be allowed to use a pre 2006 engine is also not explained by DOGGR.

The factors for the Terrebonne and Rhythm projects are consistent because both projects are proposed by the same operator; however, that is generally not the case. While most project proponents purport to use computer programs as a basis for the NOx emission factor, it is not clear what options are used in such programs (such as engine descriptions, controls, if any on such engines, the age and type of the engines, etc.) to derive the resultant emission factors. As we will discuss later, as a general matter, the emission factors appear to be significantly lower than factors used in other jurisdictions. While engines used for such activities may, indeed, have lower emission factors, since there is no verification of the NOx emission factors assumed by the project proponents, there is simply no reliable means to verify that actual engines used in the field are comparable to those used in the analyses put forth by the operators. This is a significant shortcoming.

Fifth, we compare the calculated activity levels (in hp hr/1000 ft of well drilled) for the various projects (where the data was available to make this comparison), in Table 3.

The projects are listed, in order to increasing well depth. While there is some reason to believe that the activity level might increase as the well depth increases, there does not seem to be any consistency whatsoever. For example, for the two relatively shallow wells at Blackwells Corner and Sherman 1 23, the difference (and directionality) of the activity levels is striking. The shallower well at Blackwells Corner is estimated to use almost 5 times the hp hr as the deeper well as Sherman 1 23. Similarly, there appears to be directionality (i.e., increase in activity levels with depth), the large differences in the calculated activity levels are not clear or supported. For example, why there should be an almost 50% increase in activity level at Terrebonne as compared to Rhythm (both proposed by the same project proponent) is not clear. Nor it is clear why either of these two projects should be so much smaller in activity as compared to the slightly deeper well at Rio Viejo. It is this type of comparison, during review, that DOGGR should be conducting so that the basis of the differences, to the extent there are any, can be fleshed out and understood. Whether these large differences and inconsistencies can be explained by underlying geological differences or not should be

TABLE 3
NORMALIZED ACTIVITY LEVELS AND WELL DEPTHS COMPARISON

PROJECT	WELL DEPTH	ACTIVITY LEVEL (HP-HR/1000-FT)
Blackwells Corner	1,300	63,309
Sherman 1-23	2,150	13,842
Rhythm	12,500	25,409
Terrebonne	13,500	37,198
Rio Viejo	14,000	64,743

TABLE 4
COMPARISON OF NOX EMISSIONS ON A PER WELL AND PER 1000-FT DRILLED BASIS

PROJECT	WELL DEPTH [FT]	NOX [TONS/ WELL]	NOX [LB/1000 FT]
Blackwells Corner	1,300	0.27	415.4
Sherman 1-23	2,150	0.08	74.4
Rhythm	12,500	0.54	86.8
Terrebone	13,500	0.86	127.1
Rio Viejo	14,000	1.50	214.3
Tamarack #1	14000	2.43	[1]
Jedessa		0.82	[1]
Patricia McKellar		5.5	[1]
Rancho Grande 1		1.1	[1]

[1] Not enough detail to calculate

explored. To the extent formation differences cannot explain such differences, it is clear that there are likely to be fault assumptions in activity factors.

Sixth, and finally, we compare the NOx emissions levels on a per well as well as per 1000 ft drilled basis in Table 4.

Not surprisingly, given the significant unexplained variations in the NOx emission factors as well as the activity factors, we have significant reported variations in the NOx emissions on both per well and per 1000 ft basis even for similar depth wells. For example, note the wide difference in the NOx emissions per well between Blackwells Corner and Sherman 1 23. There is no explanation for why the Sherman 1 23 well drilling emissions are as low as estimated. Similarly, note the wide range in the NOx emissions for the 4 deeper wells ranging from 0.54 to 2.43 pounds on a per well basis (a factor of 4+) and also on a per 1000 ft depth basis ranging from 86.8 pounds to 214.3 pounds a factor of almost 3, for the three projects for which this parameter could be computed.

C. COMPARISONS TO OTHER JURISDICTIONS

In the previous section, we have shown the significant and unexplained variations in activity levels, emission factors, and resultant NOx emissions from the various projects, on normalized (i.e., per well, and per 1000 ft drilling) basis.

We have also shown that NOx emission factors, particularly for the larger engines, appear to be too low in most instances.

Since oil and gas drilling is not limited to just Kern County, we reviewed NOx emissions analyses or studies conducted by others. Below we report on some of our findings.

In 2009 and later in 2014, Texas undertook a fairly extensive analysis of drill rig emissions associated with oil and gas exploration in parts of Texas. Actual activity data were solicited via phone and e mail and collected from numerous rig operators and companies. Based on this, and using emission factors consistent with EPA's standards and models, NOx (and other pollutant emissions) inventories were developed. Distinct differences were noted in rig types for three sets of wells: vertical wells less than 7000 feet; vertical wells greater than 7000 feet; and horizontal/directional wells. Table 5 below shows the summary of rig and activity parameters.

Most useful for our comparison, the Texas study also developed emission factors for various pollutants, including NOx for the vertical (less than 7000 ft and greater than 7000 ft) and horizontal/directional wells. The study reported that the estimated NOx emissions in 2013 2015 per 1000 ft were around 0.36 tons or

TABLE 5
SUMMARY OF RIG AND ACTIVITY PARAMETERS FROM TEXAS (2009)[4]

MODEL RIG CATEGORY	RIG TYPE	ENGINE TYPE	# OF ENGINES	AVERAGE AGE (YRS)	ENGINE SIZE (HP)	HOURS/1,000 FT DRILLED	AVERAGE LOAD (%)
Vertical <= 7,000 ft	Mechanical	Draw Works	1.60	7	442	30.8	51.8
		Mud Pumps	1.69	6	428	29.4	45.9
		Generator	0.97	4	330	28.3	70.4
Vertical > 7,000 ft	Mechanical	Draw Works	2.01	25	455	35.9	47.4
		Mud Pumps	1.62	18	761	33.2	46.0
	Electrical		2.15	2	1,381	62.6	48.5
Horizontal/Directional	Mechanical	Draw Works	2.00	15	483	50.1	41.1
		Mud Pumps	2.00	6	1,075	36.4	42.6
		Generator	2.00	10	390	26.8	69.0
	Electrical		2.03	2	1,346	47.3	52.5
All	All	Completion	1.00	Default	350	10.0	43.0

720 pounds per 1000 ft for the vertical wells less than 7000 feet. For vertical wells greater than 7000 feet the study estimated the NOx emissions to be 0.0876 tons (or 175 pounds in 2013), 0.0828 tons (or 166 pounds in 2014) and 0.0746 tons (or 149 pounds in 2015) all per 1000 feet.[5]

Comparing the calculated NOx emissions per 1000 ft as provided in Table 4 (and Table 1, Attachment B) for the various Kern County projects, we see that the emission for the two shallow well projects Blackwells Corner (415.4 pounds) and Sherman 1 23 (74.4 pounds) are significantly lower than the 720 pounds per 1000 ft as estimated by the Texas study the value for Sherman 1 23 at almost 10 times smaller.

While the comparisons for the deeper well projects are a little better, the factors calculated for the Rhythm (86.8 pounds) or Terrebonne (127.1 pounds) are also significantly smaller than the values estimated by Texas.

A different Texas study discussed the NOx emission factors for various drilling operations. For example, hydraulic pump (or mud pump) engine emission factors were determined to be 5.081 grams/hp hr in 2013 and 4.775 grams/hp hr in 2014.[6] While newer engines may be in used in Kern County which may explain the much lower emission factors used, as shown in Table 2 above, one cannot be certain given the lack of verification that actual factors are not, in fact, much higher as indicated in the Texas study.

In yet another study conducted in 2012 by the Ozone Transport Commission, relying on work done in the Western US by WRAP, the overall drilling emissions from oil and gas wells were reported to be in the range of 2.26 tons/well to 9.78 tons/well.[7] This is a significantly bigger range compared to the calculated values for NOx emissions per well in Table 4. Except for the Tamarack #1 and Patricia McKellar projects, estimated Kern County project NOx emissions are significantly smaller.

The comparisons to studies done by other jurisdictions above indicates that, in most cases, NOx emissions estimated by project proponents in Kern County are significantly lower on a comparable basis. Without appropriate actual field data and strong verification of claims made by project proponents (and accepted by DOGGR), it is not possible to simply rely on the claims of the proposed NOx emissions from oils and gas drilling activities in Kern County.

D. RECOMMENDATIONS

In view of the significant uncertainties and likely significant underestimation of NOx emissions from oils and gas drilling activities, we recommend the following:

i. improve the transparency and usefulness of the documents submitted to DOGGR by requiring a minimum of set of project related details such as:
   - well depth and direction;
   - specific lists of equipment;
   - specific details for each engine including manufacturers data and test results;
   - support for assumed load factors for each engine;
   - support for the assumed activity levels, particularly on a per well basis (i.e., the hp hr/well) consistent with well depth and formation details;
   - support for each NOx emission factor used, including test data;

ii. improve the DOGGR website so that the public can access details on actual activity levels post project such as actual numbers of days of drilling; actual equipment used, etc.; and

iii. improve verification of actual field equipment used and activity levels as compared to those in the submitted documents pre project; and document actions taken to resolve uncertainties between pre project and post project data.

ENDNOTES

1 See Weekly Activity Report issued by DOGGR dated December 27, 2014 available at ftp://ftp.consrv.ca.gov/pub/oil/weekly_summary/2014.

2 We note that drilling activities with attendant emissions of various pollutants, including NOx, are not just limited to drilling for oil and gas. For example, numerous wells are also drilled in the area for water as well. We have not included emissions from non-oil related well drilling activities.

FOR IMMEDIATE RELEASE
July 9, 2015

California Council on Science and Technology and Berkeley Lab Release Scientific Assessment of Hydraulic Fracturing in California

SACRAMENTO—In collaboration with the Lawrence Berkeley National Laboratory (Berkeley Lab), the California Council on Science and Technology (CCST) today released a peer-reviewed independent scientific assessment that discusses how hydraulic fracturing and acid well stimulation could affect water, atmosphere, seismic activity, wildlife and vegetation, and human health in California. The report also identifies knowledge gaps and alternative practices that could avoid or mitigate these possible impacts.

The report was prepared for the California Natural Resources Agency in response to Senate Bill 4. Issued today are the second and third volumes in a three-volume CCST study of hydraulic fracturing and acid well stimulation in California. Volume I was released in January 2015.

"We applaud state leaders for seeking an independent scientific assessment to inform policy choices about hydraulic fracturing and acid stimulation. CCST was created as an independent organization via the Legislature to do exactly this kind of careful scientific evaluation," said CCST Executive Director Dr. Susan Hackwood.

A science team composed of Berkeley Lab researchers and subcontractors developed the findings based on publically available data, original analyses, and a review of relevant literature.

CCST appointed members of a steering committee based on technical expertise and a balance of viewpoints. "CCST assembled a steering committee for this report from some of the finest experts on oil and gas production, environment, water, risk assessment and geology," said CCST's Dr. Jane C. S. Long, the Steering Committee Chairman and science lead of the assessment.

Dr. Jens Birkholzer, the Principal Investigator of the assessment and Division Deputy of Berkeley Lab's Earth Sciences Division, added, "A highly qualified group of scientists with many years of research experience worked intensely for over a year

to collect, analyze and interpret a wide variety of available information on hydraulic fracturing and acid stimulation in the state. " Dr. Long adds, "This study would not have been possible in this short timeframe without the expertise and Herculean effort of the Berkeley Lab team."

The steering committee in collaboration with the science team developed conclusions and recommendations under seven major principles designed to improve the safety of hydraulic fracturing and acid stimulation in California:

Maintain, expand and analyze data on the practice of hydraulic fracturing and acid stimulation in California. Based on a review of published literature and official and voluntary databases, one-fifth of oil and gas production in California over the last decade came from wells that had been subject to hydraulic fracturing. Compared to practices in other states, current hydraulic fracturing in California tends to be performed in shallower vertical wells as opposed to horizontal and requires much less water per well. Operators in California use about 800 acre-feet (about a million m^3) of water per year for hydraulic fracturing. This does not represent a large amount of freshwater compared to other human water use. Depending on the local scarcity of water, recycling the water used to create hydraulic fractures may have modest benefits. Far more water is used for enhanced oil recovery using water or steam flooding in the same fields, and large volumes of water of various salinities and qualities get produced along with the oil. Produced water from oil and gas production, appropriately tested and treated, has potential for beneficial reuse. The report recommends identifying opportunities for water conservation and reuse in the oil and gas industry as a whole.

The report also points out the need for improving and modernizing public record keeping for oil and gas development

Prepare for potential future changes in hydraulic fracturing and acid stimulation practice in California. Near-term expanded production in the Monterey Formation seems unlikely, but the state should request a reliable, scientific assessment of this potential. The report identifies the footprint of potential production in the Monterey Formation and none of this geography is more than 20 km from existing oil and gas production. The state should monitor drilling into this formation as an indication of potential new production. Use of hydraulic fracturing will most likely continue in and near existing oil fields in the San Joaquin Basin and to a lesser extent in other areas of California.

Account for and manage both direct and indirect impacts. *Direct* impacts of hydraulic fracturing are caused by the activity of hydraulic fracturing itself. All the major potential direct impacts identified in this study (such as potential contamination of groundwater) are due to the use of hazardous chemicals. The report recommends full disclosure of chemicals used, disallowing the use of any chemical that has unknown environmental properties, and limiting the use of hazardous chemicals to avoid some of the potential impacts.

Hydraulic fracturing enables oil and gas development where it would otherwise not occur. The impacts of this development are *indirect* impacts of hydraulic fracturing. The report recommends evaluation of indirect impacts of concern (such as disposal of produced water, habitat disruption, emissions, health impacts, oil spills *etc*.) for all oil and gas development, rather than just the portion of development enabled by well stimulation.

Manage water produced from hydraulically fractured or acid stimulated wells appropriately. The report finds that operators dispose of over half of the produced water from hydraulically fractured in pits which allow water to percolate into the ground and thus could contaminate groundwater. The report recommends phasing out disposal in percolation pits unless appropriate testing, treatment and regulatory oversight are implemented.

The report also concludes that, to date, there have been no recorded cases of induced seismicity linked to disposal of produced water by underground injection in California, but given the risks seen in other regions and California's propensity for earthquakes, more research and monitoring is needed.

Add protections to avoid groundwater contamination: This assessment did not find recorded negative impacts from hydraulic fracturing chemical use in California, but no agency has systematically investigated possible impacts. The report does identify a few locations in the San Joaquin Valley and Los Angeles Basin where shallow hydraulic fracturing occurs near protected groundwater. This presents the possibility that groundwater may be at risk and recommends that these situations get closer attention, monitoring and oversight.

One important possible pathway for hydraulic fracturing chemicals to leak is through hydraulic fractures intersecting other nearby wells. The report recommends a review of the effectiveness of regulations designed to prevent these potential subsurface contamination pathways.

Understand and control emissions and their impact on environmental and human health: In California, oil produced from hydraulically fractured reservoirs emits fewer greenhouse gases per barrel than oil produced in other ways, such as steam injection.

The report also notes that toxic air pollutant concentrations may be more elevated near active oil and gas development than regional averages. The report recommends measuring toxic air contaminant concentrations and monitoring health risks and impacts near all oil and gas wells to assess the need for further controls. Such controls may include emissions controls and limits on the proximity of oil and gas development to human populations to protect human health.

Take an informed path forward: The report identifies a set of important data gaps and detailed research priorities to address many remaining unanswered questions

about the impacts of well stimulation-enabled oil and gas production in California, and recommends establishing a standing scientific advisory committee to inform decisions on the regulation of oil and gas development.

The full three-volume report, a summary report and an executive summary can be viewed at: http://ccst.us/publications/WST

Volume I, which was released in January 2015, describes how well stimulation technologies work, how and where operators deploy these technologies for oil and gas production in California, and where they might enable production in the future.

Volume II, issued today, discusses how hydraulic fracturing and acid stimulation could affect water, atmosphere, seismic activity, wildlife and vegetation, and human health in California.

Volume III, also released today, presents four case studies that assess environmental issues and qualitative risks for specific geographic regions: Offshore, the Los Angeles Basin, the Monterey Formation, and the San Joaquin Basin.

The **Summary Report** summarizes the issues in all three volumes and provides all the conclusions and recommendations for the series.

0047-10 cont'd

0047-11

Please see GR-2 regarding the approach to County-wide analysis of the Project. Kern County currently contains approximately 75 active oil and gas fields, and the analysis of well projections forecasts up to 3,659 permits per year. (Please see GR 8 regarding the well forecasts.) It is not practical for the County to prepare a program EIR for the Revised Amended Ordinance, to be followed by future project environmental reviews to be conducted on every single well or groups of wells. The County lacks the resources to process thousands of oil and gas Negative Declarations and/or EIRs each year. The economic consequences for operators would be severe, delaying drilling for many months during the preparation of costly individualized CEQA documents. Moreover, such individualized review would be highly repetitive, as the thousands of Negative Declarations and EIRs would re-analyze the same impacts and prescribe the same mitigation for each new well or group of wells throughout the County. Accordingly, an important purpose of the Revised Amended Ordinance and this EIR is to eliminate time-consuming and costly discretionary reviews of individual well and field development activities, by establishing a ministerial site plan review process which incorporates mitigation identified in this EIR. As such, future County actions processing individual site plans will not trigger further CEQA review by the County. In addition, in the vast majority of cases, this process will avoid the need for responsible agencies to prepare additional CEQA documents for individual well or field development proposals when they are considering the discretionary decisions within their respective jurisdictions.

The Revised Amended Ordinance has been further revised to include a cap of 3,649 well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR. Any well permit applications over this cap may be processed only during the following year, or with additional CEQA review as described in the Revised Amended Ordinance. This provision will ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0047-21

See GR-01: Ministerial Permit Process.

0047-22

The comment states that the DEIR could have done more to discuss various categories of mitigation measures that are "feasible" and "possibly environmentally superior," but does not suggest any specific mitigation measures for the County to consider.

CEQA does not require analysis of every imaginable mitigation measure. (*Gilroy Citizens for Responsible Planning v. City of Gilroy* (2006) 140 Cal.App.4th 911, 935; *San Franciscans for Reasonable Growth v. City & County of San Francisco* (1989) 209 Cal.App.3d 1502, 1519.) An EIR should focus on mitigation measures that are feasible, practical, and effective. (*Napa Citizens for Honest Gov’t v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 365; *Concern Citizens of South Central Los Angeles v. Los Angeles Unified School District* (1994) 24 Cal.App.4th 826, 841.) The mitigation measures selected for inclusion in the DIER meet these criteria. (See also *Los Angeles Unified School District v. City of Los Angeles* (1997) 58 Cal. App. 4th 1019, 1028–1030 ["In keeping with the statute and guidelines, an adequate EIR must respond to specific suggestions for mitigating a significant environmental impact unless the suggested mitigation is facially infeasible."].)

Please see GR 16, which further addresses the level of specificity required in the mitigation measures. Please see GR-1 regarding the ministerial permit process.

0047-37

Please see GR Air-1 and GR Air-2 regarding the air quality analysis in the DEIR and the effectiveness of mitigation measures and the Emission Reduction Agreement (ERA). The San Joaquin Valley Air Pollution Control District is in agreement with the County with regard to use of ERAs, and has used them for many projects in in the past.[1]

[1] *See, e.g.*, SJVAPCD *2014 Annual Report, Indirect Source Review Program* (2014) at p.1 ("a developer can further reduce the project's impact on air quality by entering into VERA with the District to address the mitigation requirements under California Environmental Quality Act (CEQA). Under a VERA, the developer may fully mitigate project emission impacts by providing funds to the District, which funds are then used by the District to administer emission reduction projects on behalf of the project proponent. The District has entered into over twenty VERAs since 2005."), http://www.valleyair.org/ISR/Documents/2014-AnnualISRReport.pdf.

0047-38

Please see GR Air-2 regarding the Emission Reduction Agreement. Please also see GR-16. The commenter notes that the data prepared by Vector Environmental, Inc. was not included in the DEIR. The report to which the commenter refers was a draft report created as part of the air quality analysis, but was never completed. All of the supporting information used in both the incomplete Vector report draft and in drafting the DEIR was available to the public upon request to the County. Some parties obtained the supporting information via a California Public Records Act request. It is evident from the comment that the commenter received the supporting information for review. The DEIR was not required to include this material. To keep the EIR to a manageable length, source documents used in preparing an EIR need not be included in the EIR. *See* CEQA Guidelines § 15148. Scientific, engineering, and technical reports and similar documents relied on in preparing an EIR need not be incorporated into the body of the EIR or in an EIR appendix. *Id.*; *see also Ebbetts Pass Forest Watch v. Department of Forestry & Fire Protection* (2008) 43 Cal. 4th 936, 958 (nothing in CEQA requires that source materials be physically incorporated in an EIR); *Mount Shasta Bioregional Ecology Ctr. v. County of Siskiyou* (2012) 210 Cal. App. 4th 184, 219 (an EIR may summarize information in a technical report without appending the report or incorporating the report by reference); *Anderson First Coalition v. City of Anderson* (2005) 130 Cal. App. 4th 1173 (the EIR's hydrological analysis was not incomplete when a study relied on in determining the drainage report was not included in the EIR).

0047-38 cont'd

0047-39

See GR-08: Future Well Projections.

0047-40

The commenter's states that a "common sense analysis" suggests that higher numbers of well failures will take place each year than estimated in the EIR. The analysis of well failure rates in the EIR, page 4.6-7, is supported by substantial evidence from DOGGR and the California Council on Science and Technology (CCST). The EIR also cited the study by Jordan and Benson (2009), which analyzed well blowout rates in California Oil and Gas District 4, which includes Kern County, in order to assess well blowout risks between 1991 and 2008. The analysis quantifies probabilities of well blowout risks for several well types, including wells in non-thermal fields, thermal fields, steam injection wells, and thermally enhanced production wells. Based on multiple data sources from DOGGR, Jordan and Benson (2009) conclude an annual blowout rate of two wells per year in District 4 for between 2005 and 2008. Based on the continual improvement of industry practices in well construction and production, together with DOGGR's permanent SB 4 regulations relating to well stimulation treatment, it was reasonable for the EIR to rely on the study's well failure rate of 2 wells per year in District 4. This study represents the best available information; please see GR 21.

0047-41

Please see GR-Water-02 regarding exempt aquifers and underground injection, GR-Geo-1 regarding produced water and induced seismicity, and GR-21 regarding the use of best available information.

0047-42

Please see GR-Water-02 regarding underground injection and exempt aquifers. GR-Water-02 discusses subsequent correspondence between DOGGR and UICEPA regarding the further evaluation of injection wells. These are not "unofficial letters" but compliance reports required of DOGGR by USEPA exercising its oversight authority for the UIC program.

0047-43

An updated water supply assessment has been included in the final EIR in Appendix T-1

0047-44

The commenter's legal citations are noted for the record and included in the final EIR.

0047-45

The commenter's legal citations are noted for the record and included in the final EIR.

0047-46

The comment is correct that, because the EIR finds some impacts significant and unavoidable, the County must adopt a statement of overriding considerations in order to approve the Project. The County will comply with this requirement.

0047-46 cont'd

0047-47

The commenter's opinion regarding the quality of the cumulative air impacts analysis is noted for the record.

0047-48

The comment states the Project's cumulative air quality impacts are underestimated in the DEIR and the DEIR fails to list other projects or ongoing activities that cause cumulative air quality and health burdens for Kern County residents. The commenter does not specify any other projects or ongoing activities that it states should have been addressed. An adequate discussion of significant cumulative impacts must include either a list of past, present, and probable future projects producing related or cumulative effects, or a summary of projections from an adopted local, regional, or statewide plan, related planning document, or related environmental document that describes conditions contributing to the cumulative effect. CEQA Guidelines §15130(b)(1). The DEIR's cumulative analysis uses the plan/projection approach, and includes both the KCGP and the regional growth plan and projections included in the Kern COG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) approved in 2014.

As discussed in Section 4.3.5 of the DEIR, implementation of these regional plans (Section 3.7, Cumulative Projects), and any projects associated with these plans would be required to comply with the goals, policies, and implementation measures of applicable federal and local laws and land use standards imposed by the respective jurisdictions within which each related project is located. DEIR at 4.3-115. The SJVAPCD's attainment plans are designed to ensure the future attainment of State and federal ambient air quality standards. A lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program, including, but not limited to an air quality attainment or maintenance plan that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located. Cal Code Regs. §15064(h)(1). Please see GR-22.

The DEIR analyzed the Project's consistency with existing air quality plans, assessed localized impacts, and provided a detailed comparison of the Project's operational emissions to emissions of the entire SJVAB and the Kern County SJVAB to assess the Project's contribution to cumulative air quality impacts. DEIR at 4.3-117 – 4.3-120. Forecasts reflect both anticipated growth and controls, as updated by CARB. DEIR at 4.3-119. As described in the DEIR (see Table 4.3-42), the Project would contribute between two and 14% of criteria pollutant emissions in the SJVAB, or between 19% and 79% of Kern County's contribution. The DEIR determined that the contribution of Project-related impacts to air quality would remain significant and unavoidable after mitigation based on the current nonattaintment status of regional pollutants resulting from past and present development. As the DEIR explains, air pollution is largely a cumulative impact and future attainment of State and Federal ambient air quality standards is a function of successful implementation of the SJVAPCD's attainment plans. The SJVAPCD's thresholds of

significance for criteria pollutants are based on District Rule 2201 (New Source Review) offset requirements. The District's attainment plans demonstrate that project-specific net emissions increase below New Source Review (NSR) offset requirements will not prevent the District from achieving attainment. Consequently, emission impacts from sources permitted consistent with NSR requirements are not individually significant or cumulatively significant. While emissions exceed significance thresholds, as described in GR-Air-1 and GR-Air-2, the Project's operational emissions are required to be fully offset under the suite of Air Quality Mitigation measures. Nonetheless, since the County does not have legal authority over air quality planning, and is also relying on the SJVAPCD for achievement of certain air quality mitigation, the County is conservatively finding that potential cumulative impacts are significant and unavoidable.

The DEIR's analysis of cumulative air quality impacts satisfies CEQA and CEQA Guidelines requirements. *See, e.g.*, CEQA Guidelines § 15130. Authority cited by the commenter, *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1214, which provides a general statement of the purpose of CEQA, is noted for the record, but does not affect this conclusion. Please see GR Air-1 for a discussion of the air quality impacts analysis in the DEIR.

0047-49

Please see comment 48.

0047-50

Please see GR Air-3 regarding the Health Risk Assessments. As explained in the DEIR, MMs 4.3-1–4.3-4 will ensure that emissions of criteria pollutants will not increase due to the Project.

0047-51

Please see GR-Air-3 and GR Air-6 regarding setbacks.

0047-52

See Global Response (GR)-Air 2.

0047-53

The comment is a general conclusion. No response is necessary and it is noted for the record.

0047-54

The EIR includes a comprehensive evaluation of available water supplies, including the significant current overdraft of groundwater, as explained in the Water Supply Assessment (WSA, Appendix T) and as further updated in GR Water 5. Please note that the WSA has been revised to reflect minor corrections or additional information as described in GR Water-05. None of the revisions significantly affects the EIR analysis or conclusions.

0047-55

Please see response 54. Data on groundwater supplies were obtained by reviewing detailed publicly available reports and water management plans prepared by the local water agencies and water districts within the Project Area. These local agencies are the best sources of information on available groundwater resources and management, and are required to update their management plans every five years. Based on supply and demand estimates developed from the detailed water management plans and reports, including agricultural demand, the WSA concluded that there is no surplus water in the Project Area and that the Kern County Subbasin is in an existing overdraft condition. This information was incorporated into the analysis of available groundwater supplies for purposes of the EIR. CEQA analysis requires reasonable disclosure based on best available information, but does not require "perfect" information; please see GR 21. Please also see GR Water 03 regarding the Sustainable Groundwater Management Act (SGMA). The SGMA creates a new process for addressing regional groundwater supplies throughout the state. The SGMA will require that agricultural, municipal, and industrial activities account for current and future uses of water and

create sustainable plans for managing the resource. Under these circumstances, it would be speculative to predict long-term allocations to any sector, as those will result from the SGMA process. While the EIR finds that oil and gas activity uses very little groundwater compared to other uses, significant impacts to groundwater supply are identified and mitigation measures are proposed. MM 4.17-2 and 4.17-3 require the Applicant to work with the County in the SGMA process to increase the re-use of produced water from oil and gas activities.

0047-55 cont'd

0047-60

This introductory comment is noted. Please see Responses 0046-61 through 0046-82.

0047-60 cont'd

0047-61

Please see Global Responses Alt-1 and Alt-2. Regarding the comment's suggestion that the EIR combine the unspecified benefits of various alternatives, such analysis is not required by CEQA. The EIR fully evaluates six alternatives to the Project: No Project Alternative (Alternative 1); CUP Alternative (Alternative 2); Reduced Ground Disturbance Alternative (Alternative 3); No Hydraulic Fracturing Alternative (Alternative 4); Low-Emission Enhanced Oil Recovery (EOR) Technology Alternative (Alternative 5); Recycled Water Alternative (Alternative 6). For each alternative, the EIR provides a detailed description of the alternative, compares its impacts to those of the Project, and evaluates the relationship between the alternative and the Project objectives. In addition, Table 6-1 of the Draft EIR sets forth a matrix that provides a summary comparison of the significant impacts of each alternative to the project and the remaining alternatives for each impact category analyzed in the EIR. This analysis, combined with the detailed evaluation of each alternative's impacts as compared to the Project provides the information necessary to weigh the relative advantages and disadvantages of each alternative and to permit a reasonable choice thereof. As such, the EIR is not defective for not discussing variations on the alternatives it does consider. *See Village of Laguna of Laguna Beach, Inc. v. Board of Supervisors* (1982) 134 Cal.App.3d 1022, 1028-1029.

0047-62

Please see Global Response Alt-2.

0047-63

Please see Global Response Alt-2. To the extent this comment intends to suggest that the Project would allow more oil and gas development in the Project Area, and thus cause greater impacts, than would otherwise occur under "no project" conditions, this comment is incorrect. The Project would establish a new administrative approval process for new oil and gas well permits, but it would not allow for greater oil and gas development in the Project Area than would otherwise be authorized under "no project" conditions. In fact, the EIR contains substantial evidence demonstrating that future oil and gas development in the Project Area will have fewer adverse impacts than would otherwise occur under "no project" conditions. Moreover, there is no evidence that future oil and gas activities in the Project Area would have reduced environmental impacts, as compared to Project conditions, simply by subjecting each oil and gas well to an individual discretionary approval process.

Please see Responses 0062-61 and 0079-246, and Global Response Alt-2. Please see GR-Water-4 regarding the feasibility of a potable water use ban.

0047-70

Please see Response 0049-33 and Global Response Alt-2. The Project objectives related to the promotion of the oil and gas industry in Kern County do not conflict with state policy. As commenter correctly notes, it is a policy of the state to reduce reliance on fossil fuels. However, it also a policy of the state to regulate "all methods and practices known to the oil industry for the purpose of increasing the ultimate recovery of underground hydrocarbons[.]" Pub. Res. Code § 3106(b). Moreover, Kern County is a leader in the promotion of renewable energy development. According to the California Energy Commission, as of June 30, 2015, Kern County has 100 renewable energy facilities online, providing 4,372 megawatts renewable capacity (CEC, 2015). These numbers far exceed any other county in California. Please see GR-Water-4 regarding the feasibility of a potable water use ban.

Re: Comments on the Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015(c), Including Implementation of All future Activities Undertaken Pursuant to the Amendment

To Mr. Mynk:

On behalf of the Natural Resources Defense Council (NRDC), which has 1.4 million members and activists, 250,000 of whom are Californians, we write to submit comments on the Draft Environmental Impact Report (DEIR) for an Amendment to Chapter 19.98 of the Kern County Zoning Ordinance and future oil and gas activities undertaken pursuant to that amendment. 0048-1

I. Introduction

The Kern County Planning and Community Development Department (KCPCDD) has prepared an Environmental Impact Report (EIR) pursuant to the California Environmental Quality Act (CEQA) in order to identify and evaluate potential impacts associated with future oil and gas exploration, development, and production activities in the Project Area expected to be undertaken pursuant to the Amended Zoning Ordinance. The proposed Project includes (1) an amendment to Title 19 of the Kern County Zoning Ordinance, Chapter 19.98 (Oil and Gas Production) and related sections of the Kern County Zoning Ordinance for future oil and gas activities and (2) all future activities undertaken pursuant to that amendment. 0048-2

The DEIR assumes 2,697 new producing wells per year or 67,425 wells in the next 25 years. DEIR Section 3.5 p. 3-30. Chapter 19.98, as amended, would require a permit from the Kern County Planning and Community Development Department prior to drilling any new exploratory or production wells. As part of that permit process there would be "Conformity Review," which the amendment seeks to make a non-discretionary or ministerial process. Applicants would be left to self-certify their project's compliance with the Zoning Ordinance during construction and upon completion. 0048-3

In short, under this proposed permitting scheme no further CEQA review would be required until those, i.e. 25-year and/or 67,425 well, thresholds are crossed, at which point the County will consider if further review is mandated.

0048-4

Our evaluation of the Project concludes it that fails to consider recent scientific recommendations for mitigating the impacts of well stimulation and it impermissibly attempts to avoid future CEQA review by grossly abusing the definition of a "project" under CEQA. The DEIR's alternatives analysis eliminates feasible, possibly environmentally superior options without basis. Finally, as detailed *below*, the Project will result in significant environmental impacts that have not been disclosed or mitigated in the DEIR.

0048-5
Continued

KCPCDD can and must do more to describe and mandate various categories of mitigation that existing studies demonstrate are likely to be important and feasible methods of reducing impacts at many sites across Kern County. These mitigation measures should set a floor for future mitigation that KCPCDD in further, site-specific CEQA review, would require. (See arguments below for why this EIR cannot serve as the final CEQA review for any well.) For example, as we discuss below, KCPCDD can and must do more to describe and mandate mitigation for the air quality, groundwater, surface water, hazards and hazardous materials, and seismic impacts of well stimulation.

0048-6
Continued

The DEIR includes numerous mitigation commitments that are not enforceable because they are not included in the proposed regulations or any supplemental permit conditions. Mitigation measures that are suggested in the DEIR itself that are unenforceable (i.e., not codified through regulatory or other mechanisms) should be acknowledged as such and reduced efficacy of mitigation due to the lack of enforcement should be analyzed and disclosed.

0048-7
Continued

II. The DEIR lacks the insights of the state's scientific study on the impacts of well stimulation.

The state recently underwent an independent scientific assessment (CCST Study) of well stimulation in California,[1] as mandated by Senate Bill 4. The study makes several findings and recommendations that should be considered and incorporated in the Final Kern County EIR.

0048-8

Those recommendations include, among several others, measures to identify opportunities for water conservation and reuse in the oil and gas industry; a recognition that oil resource assessments and future use in the Monterey Formation of California "remain uncertain"; acknowledgement that important investigation of impacts of fracking on hydrology have not been investigated; a recommendation that the use of hazardous and poorly understood chemicals should be limited; a determination that further work is needed to limit habitat fragmentation and wildlife impacts; a recognition that we should phase out disposal of produced water in percolation pits; a recommendation for better testing to evaluate the water chemistry of fracking and acid stimulation produced water chemistry; a call for further testing before reuse for irrigation is permitted; a recognition that underground injection as a disposal method brings with it risks of seismic activity; a stated need to control toxic air emissions from oil and gas

0048-9
Continued

[1] Available here: https://ccst.us/projects/hydraulic_fracturing_public/SB4.php.

production wells and measure their concentrations; and a finding that we need to better assess the current level of and impact on public health and worker safety near and from oil and gas activity. 0048-9 Continued

A few key findings and conclusions from the recent report include: 0048-10

- "Operators currently dispose of wastewater from hydraulically fractured wells in percolation pits and also likely have occasionally injected wastewater contaminated with stimulation chemicals into protected groundwater. These practices should stop."
- "Operators have unrestricted use of many hazardous and uncharacterized chemicals in hydraulic fracturing. [T]he use of chemicals with unknown environmental profiles should be disallowed. The overall number of different chemicals should be reduced, and the use of more hazardous chemicals and chemicals with poor environmental profiles should be reduced, avoided, or disallowed." 0048-11
- "Shallow hydraulic fracturing presents a higher risk of groundwater contamination, which groundwater monitoring may not detect. This situation warrants additional scrutiny. Operations with shallow fracturing near protected groundwater could be disallowed or be subject to additional requirements regarding design, control, monitoring, reporting, and corrective action..." 0048-12
- "The majority of impacts associated with hydraulic fracturing are caused by the indirect impacts of oil and gas production enabled by the hydraulic fracturing." 0048-13
- "Emissions concentrated near all oil and gas production could present health hazards to nearby communities in California." 0048-14

Given what we already know about the dangers of well stimulation, it is irresponsible to proceed without incorporating the best science related to an assessment of the risks specific to California. Regulating in the scientific dark unnecessarily increases the risks to human health and the environment. All three volumes of the statewide study should inform the Kern County EIR process. 0048-15 0048-16

III. The DEIR is inappropriately framed as a project-level EIR.

At the behest of Western States Petroleum Association (WSPA), California Independent Petroleum Association (CIPA), and Independent Oil Producers Agency (IOPA) (collectively "Applicants"), the KCPCDD hereby seeks to create a "streamlined permitting" process whereby no further CEQA review would be required for an expansive spectrum of future oil and gas activities within unincorporated Kern County for the next 25 years, or 67,425 wells, and potentially beyond. DEIR at 2-23. 0048-17

As an initial matter, the DEIR is inappropriately framed as a *project* EIR. Instead, the DEIR should be treated as a *program* EIR, which could be used to tier off of but would require additional cite-specific review on a case-by-case basis. The DEIR's scope is far too extensive for project-level EIR analysis. 0048-18

A project EIR typically focuses "primarily on the changes in the environment that would result from [a single] development project." 14 Cal Code Regs §15161 ("CEQA Guidelines"). By way of contrast, and pursuant to CEQA Guidelines section 15168, a program EIR is "used for a series of related actions that can be characterized as one large project." *Ctr. for Sierra Nevada Conservation v. Cnty. of El Dorado*, 202 Cal. App. 4th 1156, 1171 (2012). Because it covers and 0048-19

0048-19 Continued

considers a series of actions, a program EIR often requires further analysis, but can save time and effort by being the first "tiered EIR." *See Natural Resources Defense Council, Inc. v. City of Los Angeles*, 103 Cal.App.4th 268, 282 (2002).

0048-20

As the California Supreme Court has explained, "a *program* EIR is distinct from a *project* EIR" in that the latter is "prepared for a specific project and must examine in detail site-specific considerations." *Ctr. for Sierra Nevada Conservation*, 202 Cal. App. 4th at 1184. The proposed Kern County DEIR contemplates not one but a "series of related actions," and the temporal, geographic, and substantive breadth and scope of those covered actions render the level of site-specific analysis and consideration that CEQA requires at the *project* level not just impracticable but impossible. *Id*. at 1171.

0048-21

The DEIR purports to consider and reach conclusions as to the impact of an unprecedented amount of activity for a project-level EIR: a suite of oil and gas activities in a 3,700 square mile area for the next 25 years. This attempt to preemptively conduct CEQA review on a wide-ranging list of activities (from hydraulic fracturing to building evaporation ponds and constructing pipelines), across a diverse and complex County, and deep into future decades during a drought and time of both climate change and technological advancement, is an abuse of CEQA and—if permitted—would render CEQA and the public environmental review process it mandates a farce.

0048-22

Under CEQA, a project EIR must include an accurate, stable, and consistent description of the proposed project. The project description must contain sufficient specific information about the project to allow a complete evaluation and review of its environmental impacts. CEQA Guidelines § 15124. Here, the DEIR lists twenty hypothetical categories of construction activities and seventeen hypothetical operational activities that are to be considered, and therefore covered, by this environmental impact review. DEIR at 3-35, 3-36.

0048-23

The activities covered by this DEIR include:
Geophysical or "seismic" surveys; well pad preparation; well testing; road construction; electrical distribution line and substation construction; well drilling; well completion; construction of oil or gas treatment facilities; construction of water treatment facilities; steam generator construction; construction of tankage and containment structures; pipeline installation; construction of sumps, evaporation ponds, and percolation ponds; installation of produced water injection wells; construction of fencing; administrative facility construction; well re-working and workovers; well stimulation; decommissioning and abandonment of wells; reactivation of idle wells; geophysical monitoring; treatment of produced water, oil, and gas; water management; enhanced oil recovery activities; injection wells; sump pits; percolation and evaporation ponds; vegetation control; spill prevention procedures; non-hazardous solid waste management; well, pipeline, tank, and vessel testing and maintenance; centralized oil/water separation; operating steam generators; operating electrical substations; operating administrative buildings and personnel housing; and distribution of crude oil. DEIR at 3-35-59.

0048-24

Any one of those activities might warrant project-level CEQA review, and yet, here the DEIR attempts to consider them all at once and for the next 25 years. Such a boundless project description entirely defeats the purpose and mandate of CEQA. A "finite project description is indispensable to an informative, legally adequate EIR." *County of Inyo v. City of Los Angeles*, 71

CA3d 185, 192 (1977). Without an accurate description on which to base the EIR's analysis, CEQA's objective of furthering public disclosure and informed environmental decision making are stymied.

0048-24
Continued

In *Santiago County Water Dist. v. County of Orange*, the Court of Appeal considered the sufficiency of a project-level EIR that purported to examine the consequences of permitting a company to operate a sand and gravel mining operation. *Santiago Cnty. Water Dist. v. Cnty. of Orange*, 118 Cal. App. 3d 818 (Ct. App. 1981). Because that EIR failed to give sufficient information concerning the delivery of water to the proposed sand and gravel mine, the court held that it was as a whole inadequate. *Id.* at 829. As that court explained, a project description that omits integral components of the project results in an EIR that fails to disclose all of the impacts of the project. *See id.* Here, the integral components of the EIR, and the ones that are lacking, are impossible for the agency, public, or a court to identify because the huge scope and concomitant high level of generality of the DEIR. Without such specific identification of the components of the project, any environmental review is rendered meaningless.

0048-25
Continued

As the court stated in *San Joaquin Raptor/Wildlife Rescue Ctr. v County of Stanislaus*, "[a]n accurate project description is necessary for an intelligent evaluation of the potential environmental effects of a proposed activity." *San Joaquin Raptor/Wildlife Rescue Ctr. v. Cnty. of Stanislaus*, 27 Cal. App. 4th 713, 730 (1994), *as modified* (Sept. 12, 1994). It is basic logic that an accurate and stable project description is necessary so that the lead agency and the public have enough information to "ascertain the project's environmentally significant effects, assess ways of mitigating them, and consider project alternatives." *Sierra Club v. City of Orange* 163 Cal. App. 4th 523, 533 (2008).

0048-26

In this case, the "project" is so broadly defined—and the activities included are at such a high level of generality and hypothetical—that the site-specific review required for a project level EIR is not just lacking, it's not possible. To pretend otherwise is to deprive the public and decision-makers from the level of considered environmental review CEQA demands.

0048-27

The sole potential benefit of a project-level EIR for such an expansive amount of activity is a reduction in the administrative burden on the County, which hopes to eliminate the need for any further CEQA review of the listed oil and gas activities. As attractive as that reduction in paperwork may be, a wholesale evaluation of 67,425 oil and gas wells, and all related activities, in the largest oil producing County in California, with no continuing process for re-evaluating the effects of specific projects, sets a dangerous precedent, is a disservice to the public and our environment, and makes a mockery of CEQA.

0048-28
Continued

It makes no sense to rely on a static document to protect our health and environment for the next 25 years from a changing industry, environment, and climate. Oil and gas drilling is a heavy industrial activity with—as the DEIR as well as the California statewide EIR acknowledge—numerous significant unmitigable effects. There are constant technological advances in this field that must be considered both for their potential negative impact to the environment and for any possible new mitigation to ameliorate those impacts. Furthermore, we live in a time of climate change, drought, and uncertain oil futures. For all these reasons, environmental review far into the future is untenable and ill-conceived.

0048-29

0048-30

For these reasons, the DEIR should be reconceived of as a program EIR that will serve as a first-tier general document. The DEIR should make clear that future oil and gas activity in unincorporated Kern County will require site-specific CEQA review. *See In re Bay-Delta Programmatic Envtl. Impact Report Coordinated Proceedings*, 43 Cal.4th 1143, 1173 (2008) (when a program EIR is broad "later project-level EIR's may not simply tier from the [program EIR] analysis and will require an independent determination and disclosure of significant [site-specific] environmental impacts").

0048-31

IV. The DEIR and proposed zoning ordinance's "ministerial" permit process fails to recognize that the County retains significant discretion in decision-making.

0048-32

The proposed amendment to Chapter 19.98 of Kern County's zoning laws attempts to establish a ministerial permit procedure dubbed the "Oil and Gas Conformity Review" or "Minor Activity Review" for approval of future oil and gas activity. DEIR at 3-9. Under this proposed system, applicants would self-certify compliance and obtain permits for oil and gas wells, including fracking and acid matrix stimulation wells, without further public notice or environmental review. *See* Proposed Kern County Zoning Ordinance §§ 19.98.090(B); 19.98.100(C); 19.98.120(B).

0048-33

Approval of the proposed permits, however, necessarily requires discretion, and any attempt to shield them from CEQA by misnaming them ministerial is a violation of CEQA.

0048-34

Discretionary projects are defined by the CEQA Guidelines as actions requiring "the exercise of judgment, deliberation or decision," § 15357; *see also* CEQA Guidelines § 15002(i) ("CEQA applies in situations where a governmental agency can use its judgment in deciding whether and how to carry out or approve a project.") A ministerial decision, on the other hand, "cannot use personal, subjective judgment in deciding whether or how the project should be carried out." CEQA Guidelines §15369. Significant for purposes of this DEIR, a ministerial permit is "limited to those approvals which can be legally compelled without substantial modification or change." *Friends of Westwood, Inc. v. City of Los Angeles* (1987) 191 Cal.App.3d 259, 269. "Where a project involves an approval that contains elements of both a ministerial action and a discretionary action, the project will be deemed to be discretionary and will be subject to the requirements of CEQA." CEQA Guidelines § 15268(d).

0048-35
Continued

Because the review required in this case is necessarily not ministerial, however, the zoning ordinance, and any County approval of future oil and gas activities without further environmental review is in direct violation of CEQA. The DEIR and zoning ordinance themselves require the County to make discretionary decisions to determine (1) whether "the proposed use meets the implementation standards and conditions specified" in the zoning code, Proposed Kern County Zoning Ordinance §§ 19.98.090(B); 19.98.100(C); 19.98.120(B), and (2) whether individual oil and gas permits comply with the specific mitigation measures—many of which themselves require specific consideration of site-specific conditions, practicability, availability, adequacy, and/or feasibility—outlined in the DEIR.

0048-36

For example, Hazards and Hazardous Materials mitigation measure MM 4.8-6 requires that in order to minimize the risk of an oil spill, applicants adhere to best management practices, including, among others, using closed mud systems "when practical," sizing reserve pits "properly," selecting less toxic alternatives "when possible," minimizing waste generation,

recycling oil-based muds and brines when "practical," and training personnel to use "sensible" waste management practices." DEIR at 4.8-86-87. Each of these considerations, and enforcement thereof, requires discretion. 0048-36 Continued

Air quality mitigation measures MM 4.3-5(c), as a second example, allows the County to waive setback distances to sensitive receptors if setbacks are not met, as long as the County determines that the applicant can demonstrate it has achieved a certain level of risk. DEIR at 4.3-111. That determination also requires judgment and discretion. 0048-37

In summary, the proposed ordinance and DEIR outline an approval system whereby the County retains significant discretion to deny the permit application if it finds that the mitigation measures are not met. Because such consideration requires subjective judgment by the County, and because the County may deny project approval based on its own analysis, the County's approval of oil and gas permits cannot be ministerial and is subject to full review under CEQA. 0048-38

V. The DEIR's alternatives analysis eliminates feasible, possibly environmentally superior options without basis. 0048-39

The alternatives analysis is central to an EIR. As the California Supreme Court has written, "The EIR is the heart of CEQA, and the mitigation and alternatives discussion forms the core of the EIR." *In re Bay-Delta Programmatic Envtl. Impact Report Coordinated Proceedings*, 43 Cal. 4th 1143, 1162 (2008). A major goal of any EIR is to "ensure that all reasonable alternatives to proposed projects are thoroughly assessed by the responsible official." *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 735; *see also* Cal. Pub. Res. Code § 21002.1(a). 0048-40

Given the central importance of the alternatives analysis to the integrity of its EIR, Kern County must do far more than merely go through the motions of analyzing and summarily dismissing alternatives before selecting its preferred alternative. Rather, the agency must identify and "consider a reasonable range of potentially feasible alternatives that will foster informed decisionmaking and public participation." CEQA Guidelines, § 15126.6(a). This range must include alternatives that "feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project." *Id.* 0048-41

"[A]n agency may not approve a proposed project if feasible alternatives exist that would substantially lessen its significant environmental effects." *Save Panoche Valley v. San Benito Cnty.*, 217 Cal. App. 4th 503, 521 (2013) (citations omitted); *see also* Cal. Pub. Res. Code § 21081 (a); CEQA Guidelines, § 15091 (a)(3); *California Native Plant Soc. v. City of Santa Cruz*, 177 Cal. App. 4th 957, 1002 (2009). An agency's finding that an alternative is infeasible "must be supported by substantial evidence in the record." *Id.*; Pub. Resources Code § 21081.5; Pub. Resources Code § 21081(a)(3). 0048-42

In this DEIR, Kern County eliminates several alternatives from further consideration for false or misleading reasons. 0048-43

First, in considering a ban on agriculturally productive land, it determines that because the majority of the Project Area would be off limits to oil and gas activity under this alternative, it is not legally feasible. For the same reason, i.e. illegality, the second alternative—a ban on all new drilling within the County—was impermissibly eliminated as infeasible. Contrary to the 0048-44

0048-44 Continued

representations made in the DEIR, the County has broad discretion to dictate where—the location—of oil and gas activity within its jurisdiction, and it is simply incorrect that the County lacks legal authority to exclude agricultural or other lands from oil exploration and production.

0048-45

Under the California Constitution, "[a] county or city may make and enforce within its limits all local, police, sanitary, and other ordinances and regulations not in conflict with general laws." "This inherent local police power includes broad authority to determine, for purposes of the public health, safety, and welfare, the appropriate uses of land within a local jurisdiction's borders…" *City of Riverside v. Inland Empire Patients Health and Wellness Center, Inc*., 56 Cal.4th 729, 738 (2013) (emphasis added). A County's zoning power is "one of the most essential powers of the government, one that is the least limitable," and to hold otherwise would "preclude development and fix a city [or County] forever in its primitive conditions." *Beverly Oil Company v. City of Los Angeles*, 40 Cal. 2d 552, 557 (1953) (*quoting Hadacheck v. Sebastian*, 239 U.S. 394 (1915)). In *Marblehead Land Co. v. City of Los Angeles*, for example, the Ninth Circuit upheld the denial of an injunction against a Los Angeles zoning ordinance prohibiting oil well drilling operations on the basis of the "inherent right of the city to control or prohibit [oil and gas] production" even after the landowner had leased the land to drill on it and expended a considerable sum of money on preliminary work. 47 F.2d 528 (9th Cir. 1931).

0048-46

The More Wells Within the Project Footprint alternative (DEIR at 6-13) would cap the total wells permitted per year within the Project Area at 3,500. That alternative was eliminated because it would cap the total wells and "may exacerbate the Project's significant environmental effects." DEIR at 6-13. The current proposed project has no cap on total annual wells, only an estimate and a total potential cap after 25 years. Accordingly, under the current project a total of *over* 3,500 wells per year could be drilled. Therefore, limiting wells logically would not have a greater impact on the environment than the proposed alternative, which does not limit total wells per year. DEIR at 6-13.

0048-47

The Fewer Wells Within the Project Footprint alternative (DEIR at 6-13) was eliminated for two insufficient bases. First, it was determined that limiting the number of wells to 1,500 per year would not meet the objective to provide for growth of the oil and gas industry and streamline environmental review. An additional 1,500 wells per year is growth. Furthermore, this alternative has the potential to meet all the other stated objectives and have a lower environmental impact. "An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain *most* of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives." CEQA Guidelines § 1526.6(a) (emphasis added). That an alternative may be inconsistent with some project objectives, therefore, may not justify its elimination from review. *See also id*. §§(c), (f). Second, the alternative was rejected as legally infeasible. For the reasons explained above, this is incorrect. A County has broad authority to limit the number of total permits per year as an exercise of its land use and police powers. This alternative warrants further consideration in the Final EIR.

0048-48

The Renewable Energy alternatives (DEIR at 6-14) would require that new oil and gas drilling operations be powered by renewable electric generation sources, such as wind and solar, rather than fossil-fuel powered electric generation sources. These alternatives were eliminated because of the variability inherent in these energy sources, but this ignores the ability to store wind and solar energy. Wind is further eliminated because it would generate noise, but that noise

is never compared to the noise of on-site generators using fossil fuel. Solar is discounted for its ground disturbance, but the degree of ground disturbance and the ability to potentially consolidate that disturbance is not quantified or considered. The alternative offers significant advantages to the Project in the impact area of air quality by reducing each well site's reliance on polluting fossil fuel combustion, and this alternative is, as the County concedes, feasible and warrants further evaluation as well.

0048-48 Continued

The Zero Net Gain alternative (DEIR at 6-16) assumes without explanation that if well permits were limited to the number abandoned there could not be growth in the County and other objectives would not be met. This is not correct. Wells are constantly retired, and new permits may be somewhat limited by the number of wells retired in any given year, but because some number of new wells would be permitted, growth would continue. Furthermore, this would have only a small impact on the ability to streamline environmental review and the other stated objectives. This alternative too warrants further consideration.

0048-49

The No Project alternative (DEIR at 6-17) is eliminated for the stated reason that it would be environmentally inferior and not meet several of the Project's objectives. The rationale for finding that the No Project alternative would be environmentally inferior is that the proposed amendments to the zoning ordinance would not be made and the status quo would continue, which authorizes "unrestricted drilling" with no County permit in much of the project area. This representation misrepresents the status quo and ignores the statewide permit process and mitigation measures mandated by the statewide EIR.

0048-50

The No Project alternative is concerned with the consequences of disapproving the project. CEQA Guidelines § 15126.6(e)(1). Here, the failure to amend Kern's zoning ordinance and implement a Kern County EIR would revert to a status quo that does not allow for oil and gas activity without any review, but rather, includes a state permit process, where the Division of Oil, Gas, and Geothermal Resources (DOGGR) acts as the Lead Agency. Under that DOGGR process, the mitigation measures set forth in the statewide programmatic EIR in addition to any further CEQA review would be required for each proposed well. Accordingly, an accurate representation of the environmental impact of the No Project alternative must consider the relative environmental impact of statewide CEQA review on a well-by-well basis with the Kern County proposed EIR process, which would conduct only a 1-time review for 25 years or 67,425 wells-worth of activity, with almost no site-specific information and without the mitigation mandated by the statewide EIR. Under these corrected comparison parameters, the No Project alternative would almost certainly be environmentally superior to the Project.

0048-51

Furthermore, contrary to the finding in the DEIR, the No Project alternative would meet almost all of the County's and industry applicants' stated objectives, except for updating the zoning ordinance, and would more fully meet some objectives than the Project. Under the No Project alternative, oil and gas industry activity would be permissible and could grow. The process would necessarily consult and cooperate with state and federal law; the applicants would have a more "streamlined" process, because only one state permit would be required; and areas warranting protection—e.g. environmentally sensitive or agricultural lands—would be not suffer lower coverage under the statewide EIR process, and indeed, because that process would be flexible over time and more responsive to changes in climate and current conditions, it would be more likely to adapt and conserve resources than the proposed 1-time CEQA review followed by a "ministerial" permit process contemplated here. Applicants' objectives would also be fully met

0048-52

0048-52 Continued

under this alternative. Applicants would enjoy greater statewide conformity and consistency, and it would be easier, not harder, to develop industry-wide best practices, performance standards, and mitigation measures because they would apply across the state and not just to one specific county, i.e. Kern. In sum, the No Project alternative is viable, environmentally superior, and can achieve most project objectives.

0048-53

The DEIR's consideration of the CUP Alternative (DEIR 6-19-21) is equally flawed. Alternative Two would be the same as the Project in all respects except it would require a conditional use permit for each well, instead of the "unrestricted, and ministerial approval of, oil and gas exploration, development, and production activities." DEIR 6-20. The DEIR claims that because the Project would mitigate with a blind eye (i.e. without site-specific analysis) it would at times have the potential to "overmitigate with respect to some oil and gas wells." (DEIR 6-21). What this analysis ignores is that the Project would be just as likely to *under*mitigate because it would be wholly unresponsive to local and site specific conditions, as well as any changes to conditions in the County that might occur over the course of the next 25 years. The DEIR makes the claim that future applicants, under the Project, "will not have the opportunity to avoid compliance with many of the Project's new development standards or conditions," but that is unsupported by the mitigation measures detailed in the DEIR, which frequently provide for applicants to employ mitigation as "feasible," or "practicable," or "available." *See e.g.* Hazardous Materials Mitigation at DEIR at 4.8-86-87. The CUP alternative meets almost all of the stated objectives, and it would also build in long-term flexibility and incorporate site-specific analysis. Both of these additions would lead to an environmentally preferable alternative, and Alternative Two warrants further consideration.

0048-54

The No Hydraulic Fracturing alternative (DEIR 6-23) was eliminated for the stated reason that any reduction in hydraulic fracturing would lead to an increased use of Enhanced Oil Recovery (or EOR) techniques. And, EOR would have a relatively higher level of emissions of greenhouse gases and criteria air pollutants. DEIR at 6-24. There is, however, no analysis included in the DEIR to help inform decision makers and to explain these conclusions. Indeed, it is questionable whether the same oil reserves that are made available using hydraulic fracturing could also be extracted using EOR. These are two distinct process that are typically used to surmount distinct extraction obstacles, and the elimination of one well stimulation process would not obviously result in a direct and corollary increase in EOR. Furthermore, there is no side-by-side comparison offered here of the GHG or emissions releases of hydraulic fracturing compared to EOR; there is compelling science that suggests quite the contrary, i.e. that the impact of hydraulic fracturing is typically greater than EOR. And, if a reduction in hydraulic fracturing led to a total reduction in oil and gas exploration in the County, it is likely that GHG and other emissions would be reduced. Finally, an elimination of hydraulic fracturing would have added environmental benefits of reducing the impacts associated with hazardous materials throughout the process. The No Hydraulic Fracturing alternative is likely environmentally superior to the Project and warrants full consideration.

0048-55

No basis is provided for rejection of the Low-Emissions Enhanced Oil Recovery Technology alternative. This alternative would replace certain existing pre-1990 steam generators within five years with new low-emissions steam generators. This alternative should be adopted, or this requirement should be adopted as a mitigation measure that is part of the Project. There is no stated basis for rejecting this alternative in the DEIR, and it meets all of the objectives while being environmentally superior. *See* DEIR at 6-25-26.

0048-56

The Recycled Water alternative also warrants further consideration. The only bases for eliminating this alternative are the initial up-front impacts of water treatment plant construction and the concern that requiring water treatment would impose economic hardship on industry and, therefore, slow the growth of oil and gas development in Kern County. First, the construction of water treatment facilities is an up-front impact with long-term benefits. The benefits of reused water must be accurately weighted against the harms of long-term shipping of fresh water across the state to supply the Kern oil operations and also the harms of injecting produced water in underground injection wells. The risks of underground injection include contamination of aquifers and must be considered in weighing the Project against this alternative. On the cost side of the equation, no analysis was conducted, or at least presented, to help inform decision makers and the public of the degree of any anticipated increased costs. And, those costs must be compared with the projected cost of fresh water during this historic drought and over the next 25 years. This alternative has numerous environmental advantages to the Project.

0048-57

To implement the policy of reducing significant environmental impacts, CEQA requires that an EIR identify both feasible mitigation measures and feasible alternatives that could avoid or substantially lessen the project's significant environmental effects. The requirement that EIRs identify and discuss alternatives to the project stems from the fundamental statutory policy that public agencies should require the implementation of feasible alternatives or feasible mitigation measures to reduce the project's significant environmental impacts. Pub Res Code § 21002.

0048-58

Here, the DEIR excludes from consideration alternatives that are apparently viable, environmentally superior, and can achieve most of the Project's stated objectives.

0048-59

VI. The DEIR understates the Project's significant air quality impacts and fails to properly mitigate these impacts.

0048-60

The San Joaquin Valley Air District is in extreme nonattainment for ozone and nonattainment for PM 2.5. The job of the Air District to bring itself into attainment for ozone will get tougher when EPA announces its new ozone rule, expected in a month or two. The DEIR has a table of ozone and PM 2.5 exceedances on pp. 4.3-8 – 4.3-9, showing 85 days of ozone nonattainment in 2012 in Arvin and 55 days of nonattainment in 2012 in Bakersfield. Diesel particulate matter emissions in 2009 were over 6,000 tons/year, with on-road diesel-fueled vehicles contribute approximately 61% of the total and an additional 38% attributed to other diesel-fueled mobile sources such as construction and agricultural equipment. DEIR 4.3-25. In Kern County in 2012, NOx emissions (an ozone precursor) were 72.3 tons/day. DEIR 4.3-31. These numbers are a public health disaster.

0048-61

Kern County will be subject to increased emissions of particulate matter and ozone (and its precursors) from the project. Emission increases associated with activities under the Project's permitted sources would come from boilers, cogeneration plants, process heaters, reciprocating internal combustion engines, steam generators, production tanks, thermally enhanced oil recovery wells, and VOCDD (flares). There will be additional emissions from unpermitted sources. DEIR 4.3-67. Off-road construction equipment will also contribute to emissions of NOx (an ozone precursor) and PM.

0048-62

The DEIR presents figures for the project's increased emissions but it is impossible to tell how those numbers were derived. There are references in terms of emissions to reports from a

consultant called “Vector” but those reports are not part of, or linked to in, the DEIR; nor are they available on the County's website. This omission violates the CEQA requirement to provide understandable and comprehensive data to the public and to decision makers and so, by itself, invalidates the entire air quality analysis in the DEIR. 0048-62 Continued

The approach of the DEIR to the permitted emissions from the project is that they will be reduced below significance by existing regulations. If that were true, the SJVAQMD would not be in nonattainment in the first place. Moreover, to the extent that permitted emissions rely on offsets or credits for their legality, there is no assurance or proof that those offsets or credits will exist or will be real, excess, permanent and enforceable if they do. 0048-63

With respect to the unpermitted emissions from the project, the DEIR takes the view that voluntary agreements will reduce these emissions below significance. This is faith-based planning and not the concrete, verifiable, enforceable mitigation measures that CEQA requires. 0048-64

The mitigation measures presented in the DEIR are weak and ineffective. The DEIR should evaluate a mitigation measure, discussed below, that would require the multi-year oil and gas drilling project to reduce emissions in the San Joaquin Valley Air District, not merely hold them even. 0048-65

A. The DEIR shows huge, negative air quality effects from the Project. 0048-66

If the Vector data and analyses are correct – which is impossible to determine from the DEIR – the DEIR shows huge, negative air quality impacts from construction and operational emissions associated with the project. 0048-67

Tables 4.3-12 and 4.3-13 (at pp. 4.3-77 to 78) show that emissions associated with well construction activities would exceed SJVAPCD Construction Emissions Threshold. Since the San Joaquin Valley Project region is nonattainment for PM10, PM2.5, and ozone, well construction-related criteria pollutant emissions would result in considerable net increase of the criteria pollutants NOX, VOC, CO, PM10 and PM2.5 and would be significant impacts. 0048-68

With respect to operational emissions, the DEIR admits that such emissions would exceed the SJVAPCD Operational Emissions and therefore would represent a potentially significant impact. The annual contribution of PM10 and PM2.5 would be almost 30 times the threshold. The emissions of ozone precursors (NOx, ROG, and CO) would exceed their respective thresholds: NOX would be almost 50 times the threshold, VOC more than 170 times the threshold, and CO more than eight times the threshold. 0048-69

The EIR claims that all emissions increases from permitted equipment plus the 10% allowance from non-permitted equipment would be required to be fully offset pursuant to District Rule 2201. But, as noted above, there is no showing that such offsets would exist or would be consistent with CAA requirements. 0048-70

The DEIR summarizes air quality impacts from permitted stationary sources, permit-exempt equipment, and mobile sources at a Project level as resulting in emissions levels that would exceed SJVAPCD Operational Emissions Threshold. Only the permitted stationary sources would be required to be offset because it is a condition of SJVAPCD air permits. Since the remaining emissions would exceed the SJVAPCD Construction Emissions Threshold and would 0048-71

not be offset, operational emission would result in considerable net increase of the criteria pollutants NOX, VOC, CO, PM10 and PM2.5 and would be significant. 0048-71 Continued

The DEIR also asserts that mandated emission reductions will be achieved by a menu of options that range from paying a calculated mitigation fee for use in doing emission reduction projects through a grant-type program, to applicants' changing equipment on existing operations or proposing projects for implementation instead of paying the fee. As we will discuss below, the mitigation measures required in the DEIR come nowhere close to this. 0048-72

Based on this imaginary mitigation, the DEIR claims that impacts from the project will not be significant after mitigation. This conclusion is unsupported in the record. 0048-73

The disclosed air quality impacts due to the Project are significant, adverse, and large. The Project's impacts, however, are understated. The Project is expansive and includes a wide spectrum of activity (see discussion of activity *above*), and accordingly the sources of emissions are also myriad. In its current form, however, the DEIR's source list of volatile organic compounds (VOCs) and other air toxic emissions is incomplete. Well stimulation emissions in the DEIR are restricted to diesel particulate emissions from pumps/engines. This anemic universe of potential emissions sources is not consistent with Federal rulemaking. The sources of air emissions covered by the 2012 New Source Performance Standards, for example, include emissions from completion of hydraulically fractured wells, equipment leaks, pneumatic controllers, pneumatic pumps, storage tanks, and compressors (in some cases).[2] Here, the DEIR's analysis is missing fugitive VOCs from completions of hydraulically fractured wells. There is also no consideration of air quality threats from equipment leaks, compressors, infiltration ponds, sumps, or separators none of which are currently subject to permits or emission limits. As noted above, the potential for health threats from the volatilization of stimulation chemicals present in produced water or wastewater was not included in the DEIR. 0048-74

In addition, the Project would have significant, unavoidable odor impacts. The analysis of odors, however, is incomplete. The odor analysis includes no discussion of the chemical constituents responsible for odors and whether air quality issues may be the source. Nor does the DEIR discuss the public health impacts from the chemicals causing the odors. 0048-75

B. The proposed mitigation measures will not be effective. 0048-76

The proposed mitigation measures appear at DEIR pages 4.3-68 et seq. The DEIR identifies Impact 4.3-1 as: Conflict with or Obstruct Implementation of the Applicable Air Quality Plan. The proposed mitigation measures, which allegedly will reduce the impacts below significance, are: 0048-77

- *MM 4.3-: Get a permit and comply with AQMD rules*. As noted above, if this were effective, the SJVAQMD would not be in non-attainment for PM and ozone. Also, the permit system depends heavily on offsets which may or may not exist or comply with the Clean Air Act at the time they are needed. 0048-78
- *MM 4.3-2: Develop a fugitive dust control plan*. This does nothing for particles smaller than PM 10 or for NOx emissions. The mitigation measure claims to reach particles as 0048-79

[2] *See* http://www.epa.gov/airquality/oilandgas/pdfs/og_table_081815.pdf.

small as PM 2.5 but, in general, particles that small are not generated from fugitive dust but rather from combustion emissions, which this mitigation measure does not address. 0048-79 Continued

- *MM 4.3-3: Off-road construction equipment requirements*. This requires most construction equipment to meet California Tier 3 standards and limits idling to 5 minutes. However, there is cleaner, Tier 4 equipment available and, given the SJVAQMD's state of non-attainment, it should be required. See EPA Tier 4 rules; California Tier 4 rules. 0048-80
- *MM 4.3-4: On-road heavy duty diesel haul equipment*. For NOx control, California 2007 or Tier 3 engines are required. However, cleaner California and EPA 2010 engines are available and should be required; these are notable for much lower NOx emissions that 2007 engines. 0048-81

Impact 4.3-2 is: Violate Any Air Quality Standard as Adopted in (c)i or (c)ii, or Established by EPA or Air District or Contribute Substantially to an Existing or Projected Air Quality Violation. The proposed mitigation measures are MM 4.3-1 through MM 4.3-4 as discussed above. The DEIR asserts that the Level of Significance After Mitigation will be less than significant. This is pure fantasy – there is no showing that the four mitigation measures listed above will keep the SJVAQMD in attainment or are the best or most feasible mitigation measures available. 0048-82

Impact 4.3-3 is: Expose Sensitive Receptors to Substantial Pollutant Concentrations. The health risk assessment shows that the potential cancer risk exceeds the current CEQA significance thresholds (as of May 2015), for drilling a 10,000-foot well in any Project year, and for drilling a 5,000-foot well in year 2015, and for operations of the oil processing equipment. 4.3-110. The DEIR claims that the health risk assessment was prepared using the OEHHA 2015 guidelines; if that is not so, the numbers would likely be higher by as much as a factor of three. The emission factors used in the modeling are said to be from the totally opaque Vector study. Nonetheless, the DEIR asserts that the Level of Significance After Mitigation will be Less than significant. 0048-83

The setback distances provided for by the DEIR are based only on risks related to diesel particulate matter during well construction. The setback distance fails to consider VOC/air toxics emissions from completions, air toxics emissions from processing equipment, or emissions during well production. Although cancer risk was considered significant (10 in a million) at distances under 800 feet from oil processing equipment, no setback distance was included to protect public health or schools at these distances. The setback distances for wells in the DEIR are also inconsistent with CARB Recommended Minimum Setback Distances between sources of diesel PM and sensitive populations (500 ft. minimum). 0048-84

Finally, the CCST Study noted that "most of the hydraulic fracturing in the San Joaquin Basin occurs shallower than 300m (1,000 ft.)"[3]. Therefore many wells in Kern County will be below the threshold of depth requiring a setback in the DEIR (<2,000 ft.). The DEIR fails to explain that as described many of the wells in Kern County will not have setback requirements. This directly contradicts the findings from the CCST Study noting the concentration of emissions at production sites which could threaten human health and the recommendation that health-protective setbacks be required to protect the health of vulnerable populations. 0048-85

[3] CCST 2015. An Independent Scientific Assessment of Well Stimulation in California Volume III p.268

0048-86

The identified mitigation measures are: 0048-87

- MM 4.3-5: The Site Plan Application shall include a Site Vicinity Figure showing the location of any sensitive receptor(s) within 3,000 feet of the construction site (potential impact area) for the proposed new well or other ancillary facility or equipment (excluding pipelines). 0048-88
    a. If there are no sensitive receptors within this potential impact area, then no construction mitigation measures shall be required.
    b. If there are sensitive receptors within the potential impact area, then additional information must be provided showing the setback from the closest edge of the well pad to the property line of the nearest sensitive receptor. The minimum distances shall be as follows: ….4.3-111 0048-89
    c. If the above setbacks cannot be met, the Applicant shall implement the following risk minimization measures, or other such measures that are demonstrated by the Applicant to achieve a level of risk less than the threshold risk level: 0048-90
        1. Placement of engines in the potential impact area away from the sensitive receptors. 0048-91 0048-92
        2. Utilize directional drilling to locate rig away further from the sensitive receptor(s). 0048-93
        3. Use of late-model engines, low-emission diesel products, alternative cleaner fuels (e.g., natural gas or liquefied petroleum gas), engine retrofit technology, add-on devices such as diesel particulate filters or oxidation catalyst, and/or other options as such become available to reduce emissions from off-road and other equipment. 0048-94
        4. Utilize electricity line power if available. 0048-95
        5. Shutdown all equipment when not in use, and otherwise minimize engine idling by limiting idling to 15 minutes. 0048-96
        6. Use of automatic rigs. 0048-97
        7. Assist and pay to relocate residents to an area hotel during well construction, drilling, and completion activities. 0048-98
- MM 4.3-6: Applicants shall include in their Worker Environmental Awareness Program information on how to recognize the symptoms of Valley Fever and to promptly report suspected symptoms of work-related Valley Fever to a supervisor. Workers exposed to fugitive dust shall be provided with the option of using a filter fitted over their nose and mouth, secured by a strap, including training for appropriate mask practices as part of the Worker Environmental Awareness Training Program. 0048-99

It is impossible to assess the strength of these mitigation measures because the underlying emissions factors cannot be tested given the information in or linked to the DEIR. 0048-100

- Impact 4.3-5: Results in a Cumulatively Considerable Net Increase of Any Criteria Pollutant for which the Project Region is Nonattainment Under an Applicable Federal or State Ambient Air Quality Standard including Releasing emissions which exceed quantitative threshold for ozone precursor. 0048-101
- Implement MM 4.3-1 through MM 4.3-4, as described above. As we have discussed, there is no showing that these mitigation measures will be available or effective in the future. 0048-102

0048-103

- MM 4.3-8: For Project facilities or equipment that are not required to offset emissions under a District rule as described in MM 4.3-1, and for Project vehicle and other mobile source emissions, the County will enter into emission reduction agreement with the San Joaquin Valley Air Pollution Control District, pursuant to which the Applicant shall pay fees to fully offset Project emissions of oxides of nitrogen, reactive organic gases, and particulate matter of 10 microns or less in diameter (including as applicable mitigating for reactive organic gases by additive reductions of particulate matter of 10 microns or less in diameter) (collectively, "designated criteria emissions") to avoid any net increase in these pollutants. The air quality mitigation fee shall be paid to the County as part of the Site Plan review and approval process, and shall be used to reduce designated criteria emissions to fully offset Project emissions that are not otherwise required to be fully offset by District permit rules and regulations.

0048-104

As an alternative to paying the fee, an Applicant may reduce emissions for one or more designated criteria emissions through actual reductions in air emissions from other Applicant sources, as submitted to the County and validated by the District. This Project offset requirement shall be enforced by the County and verified by San Joaquin Valley Air Pollution Control District. If a voluntary emission reduction agreement is not executed by the County and San Joaquin Valley Air Pollution Control District, then each Applicant must mitigate for the full amount of designated criteria pollutants as verified by the San Joaquin Valley Air Pollution Control District, with evidence of such District-verified offsets presented as part of the Site Plan Conformity Review application documentation.

0048-105

Examples of feasible air emission reduction activities that may be funded by air quality fees paid by Applicant or proposed and implemented by the Applicant under the emission reduction agreement include, but are not limited to, the following:

0048-106

a. Replacing or retrofitting diesel-powered stationary equipment such as motors on generators, pumps and wells with electric or other lower-emission engines that are not subject to Title V reductions.

0048-107

b. Replacing or retrofitting diesel-powered school, transit, municipal and other community mobile sources such as buses, car fleets, and maintenance equipment, with electric or other lower-emission engines.

0048-108

c. Reducing emissions from public infrastructure sources such as water and wastewater treatment and conveyance facilities, and reducing water-related emissions through water conservation and reclamation. Funding lower-emission equipment and processes for local businesses, schools, non-profit and religious institutions, hospitals, city and county facilities.

0048-109

Mitigation fees in this sense are a license to pollute, without any showing that the projects funded by the fees will reduce emissions of NOx, ozone and other pollutants enough to make a difference. Not surprisingly, the DEIR lists the Level of Significance After Mitigation for this cumulative impact as significant and unavoidable.

0048-110

C. The DEIR fails to analyze additional mitigation measures that may be effective.

0048-111

Only two additional mitigation measures are discussed, both of which are quickly rejected at page 4-3.122:

0048-112

> Require oil and gas projects to generate their own clean electricity during production using photovoltaic (PV) solar, direct line power, or both, to eliminate all needs for operational power diesel generator onsite.

0048-113

> There should be a percent limit on the amount of time they can flare gas.

0048-114

What is not discussed is the obvious measure that no well should be drilled and/or operated until the well proponent can show real, surplus, effective mitigation measures such that there will be a *reduction* in emissions of ozone, ozone precursor or PM 2.5 emissions in the SJV Air Basin. Holding emissions to no net increase will harm, not help, the Air District's long and so far ineffective efforts to come into attainment for these criteria pollutants. At minimum, the Air District should obtain U.S. EPA approval for forward-looking attainment demonstrations for these substances before a single new well is begun.

0048-115

The air quality analysis in the DEIR is so flawed that it needs to be re-done. All the emissions modeling inputs, methodology and outputs should be available to the public and to the decision makers. The proposed mitigation measures are laughably weak and need to be enhanced. Otherwise, the Air District is looking at additional decades of unhealthy air.

0048-116

VII. The DEIR fails to fully disclose, analyze, and mitigate the Project's potential impacts to hydrology and water quality.

0048-117

A. The DEIR's water supply and demand scenarios fail to consider potential demand increases that could result from development of the Monterey Formation.

0048-118

The three future water supply and demand scenarios considered in the DEIR do not adequately assess the range of possible activity, in particular the possibility of development of unconventional resources in the Project Area and resultant impacts on water demand and waste water handling needs and methods. As stated in the DEIR, "The three scenarios focus on potential variation in the amount of surface pond disposal, injection well disposal, and reuse of produced water that could occur under future conditions." In other words, the scenarios focus primarily on potential changes in water disposal practices, and none of the three scenarios considers the potentially significant increase in water demand and wastewater management needs that could result from development of the Monterey Formation source rock play.

0048-119

Development of the Monterey Formation source rock play would likely require the use of high volume hydraulic fracturing, as has been used to develop other tight oil plays such as the Bakken in North Dakota and Eagle Ford in Texas. As stated in the DEIR, the average fracturing operation in California uses about 0.38 AF of water. A limited number of wells that target Monterey Formation unconventional resources exist in California, and these wells use water

0048-119 Continued

volumes for hydraulic fracturing greatly in excess of this average. Horizontal wells in the Rose Field targeting the McClure Shale member of the Monterey Formation used an average of 1.3 acre feet of water per well for hydraulic fracturing, or more than three times the CA average.[4] Horizontal wells in the Lost Hills Field targeting the McDonald Shale member of the Monterey Formation used an average of 8 acre feet of water per well for hydraulic fracturing, or more than 21 times the CA average.[5]

0048-120

While the prospect for large-scale development of this play is highly uncertain, production of these resources is likely to require much larger volumes of fresh water than current production methods in the project area and could significantly increase the volumes of wastewater that subsequently need to be managed. The analysis of hydrology and water quality is incomplete due to the failure to analyze a scenario that considers development of unconventional resources.

B. The DEIR's claims regarding spill incidence and volume are unsupported and its mitigation measures for spills are inadequate.

0048-121

0048-122

The DEIR states that the frequency of occurrence of spills and spill volumes are expected to be low in all phases of oil and gas operations. The supposed support for this claim is the statewide DEIR for well stimulation, which includes the number of spills in the Project Area from 2009-2014 and the range of spill sizes. This analysis however does not include a statistical analysis of the frequency of occurrence or size of spills. A 2015 report prepared for the Natural Resources Defense Council (NRDC) by the UCLA Institute of the Environment and Sustainability (UCLA-IES) found that while the number of spills in Kern County was found to have decreased, this was attributed to the decrease in oil and gas production rather than a change in operational practices.[6]

0048-123

Moreover, the spill analysis in the statewide DEIR is far from complete. The spills represented only include spills of hazardous materials reported to the California Office of Emergency Services (OES). As detailed in the UCLA-IES report for NRDC, spills reported to OES are subject to reporting thresholds and only include listed hazardous substances and therefore do not represent a full accounting of all spilled materials that may have adverse environmental or health impacts.[7] The statewide DEIR clearly states, "It is additionally noted that this data is considered incomplete due to differences in how reporting is logged and variations in local regulations for when reporting is required." The UCLA-IES report concurs with this, stating, "…the CA OES data format is incomplete, disorganized, and difficult to analyze effectively."[8] As such, the claims made in the DEIR that the incidence of spills and volumes are expected to be low are completely unsupported.

[7] *Ibid.*

[8] *Ibid.*

0048-124

Among the most commonly cited environmental impacts of oil and gas production are degradation of soils and water caused by releases of hydrocarbons and produced water.[9] The critical importance of properly mitigating the risk of spills and leaks is demonstrated by the many tens of studies describing the environmental impacts of hydrocarbon and produced water releases.[10] A multi-year, interdisciplinary study of hydrocarbon and produced water releases at an oil production site in Oklahoma undertaken by the United States Geological Survey ("USGS") found that soil and groundwater at the site were still polluted after more than 60 years of natural attenuation.[11] Contamination caused by releases of hydrocarbons and produced water can be extremely technologically and financially difficult to remediate, if not impossible. The DEIR does not include any mitigation to address impacts to hydrology and water quality from spills beyond stating that operators must comply with existing law. This is completely inadequate and unacceptable.

0048-125

C. The DEIR fails to adequately disclose and mitigate the potential impact of drilling fluids.

0048-126

Regarding the potential impacts of drilling fluids, the DEIR states, "…drilling activities do not typically utilize high concentrations of potential constituents of concern," and, "…the generally low concentrations of drilling or rework-related constituents added to drilling fluids reduces the likelihood that temporary drilling fluid and mud contact with water-bearing formations would cause a significant impact to groundwater quality." These statements are completely unsupported. California does not require operators to disclose the chemical contents of drilling fluids, which can include chemical products such as weighting agents, clay, organic colloids, polymers, thinners, surfactants, inorganic chemicals, lost circulation material, and other specialty chemicals. The DEIR contains only a generic list of possible drilling fluid additives, listed by trade name, as reported by one operator. The well-by-well identity of the chemical components of drilling fluids, and therefore the potential environmental or human health impacts, are unknown. This is a significant undisclosed and unmitigated impact to hydrology and water quality.

0048-127
Continued

D. The DEIR fails to adequately disclose, analyze, and mitigate the potential impacts of improperly designed, constructed, or maintained wells.

0048-128

Proper well design and construction are crucial first step to ensuring long-term mechanical integrity. Oil and gas wells represent one of the most likely pathways for contaminants to reach protected water because the wellbore directly connects protected water and introduced or naturally occurring contaminants.[12] Casing, cement, and other well construction materials must

0048-129
Continued

therefore isolate these sources of contaminants from protected water. Failure to do so, as a result of poor well design and/or construction, is a frequently cited cause of environmental impacts to groundwater.[13] Proper well design, construction, maintenance, and plugging are therefore paramount to protecting groundwater. California's current well construction rules are outdated and inadequate and must be updated to reflect technological advancements in oil and gas extraction techniques. Operators must demonstrate that wells will be designed and constructed to ensure both internal and external mechanical integrity. The DEIR must include mitigation measures to ensure proper well design, construction, and maintenance.

E. The DEIR fails to adequately disclose, analyze, and mitigate the potential impacts of the use of produced water for irrigation.

0048-130
Continued

The recent statewide scientific study of well stimulation by the California Council on Science and Technology (CCST) found that required testing and treatment of produced water destined for reuse may not detect or remove contaminants of concern.[14] The DEIR must include mitigation measures requiring disclosure, testing, and treatment of produced water destined for reuse to detect and remove chemicals of concern including but not limited those that are naturally present and also chemicals used in drilling, stimulation, maintenance, workover, and enhanced recovery operations.

F. The DEIR fails to adequately disclose, analyze, and mitigate the potential impacts of percolation pits.

0048-131

0048-132
Continued

California is one of the few states that allow the outdated practice of disposing of potentially toxic oil and gas waste water into percolation pits/ponds, which are designed to allow this waste to infiltrate groundwater. The DEIR that, "…the disposal of produced water to earthen, unlined ponds in Project Area has impacted groundwater quality." The recent statewide scientific study completed by the California Council on Science and Technology highlighted the significant risk that these pits pose to groundwater and recommended that the practice should be stopped.[15] The DEIR does not include any mitigation to address the significant threat to hydrology and water

quality from percolation pits beyond stating that operators should comply with current law. This is completely inadequate. 0048-133 Continued

G. The DEIR fails to adequately disclose, analyze, and mitigate the potential impacts of underground injection operations, including disposal and enhanced oil recovery (EOR). 0048-134

California's rules for underground injection are outdated and inadequate and oversight and enforcement of the program is lax, endangering the drinking water of millions of people. A 2010 review of California's Underground Injection Control (UIC) program found a number of significant deficiencies, which may be endangering groundwater and have yet to be corrected.[16] More recently, it was revealed that the State of California has improperly permitted more than 2,500 Class II Underground Injection Control (UIC) wells to inject oil and gas wastewater and other fluids into federally protected Underground Sources of Drinking Water (USDWs).[17] There are also potentially hundreds or thousands more wells located geographically within the boundary of an exempt aquifer, but where the fluids being injected in to that well are migrating into non-exempt USDWs. These actions seriously endanger California's dwindling and drought-threatened groundwater as well as the public health and safety of Californians who rely on this groundwater for drinking, irrigation, or other uses. The DEIR does not include any mitigation to address the significant threat to hydrology and water quality from underground injection operations beyond stating that operators should comply with current law. This is completely inadequate. 0048-136

H. The DEIR fails to adequately disclose, analyze, and mitigate the potential impacts of well stimulation operations, including hydraulic fracturing and acidizing. 0048-137

As discussed above, the CCST recently published the first ever statewide, comprehensive scientific assessment of the potential environmental impacts of well stimulation in California. The researchers found that well stimulation activities and oil and gas development in general can result in a range of impacts to the environment and human health, including to hydrology and water quality, but much more data is needed to completely analyze the risks. The reports also include a long list of recommendations to begin addressing these impacts. The DEIR fails to disclose or analyze the significant impacts detailed in the CCST Study or to implement the recommended mitigation measures. 0048-138

VIII. The DEIR fails to fully disclose, analyze, and mitigate the Project's potential hazards and hazardous materials impacts to public health, air, and water quality. 0048-139

The DEIR's evaluation of stimulation chemicals is incomplete and its findings are not incorporated into health risk analysis. Chemical information was obtained from FracFocus.org, a voluntary chemical disclosure registry, from reports dated between 2012 and 2014 in Kern County. Reporting to FracFocus is voluntary; as such, only three of the six major operators in 0048-140

[16] Horsley Witten Group, Inc. 2011. *California Class II Underground Injection Control Program Review.*
[17] California Department of Conservation Division of Oil, Gas and Geothermal Resources, 2015. "General Information Underground Injection Control (UIC)." Web. 10 Sept. 2015.

Kern County (Aera Energy LLC, Chevron USA, Inc; and California Resources Corporation, formerly Occidental Oil and Gas) have submitted a substantial number of chemical disclosure reports. In addition, voluntary reporting yields little accountability for operators to report well stimulation activities and quality of reporting can vary greatly. Additionally, chemical information is disorganized and strewn throughout the document; this lack of organization directly obstructs the ability of readers to understand and analyze this information further.

0048-140
Continued

Toxicity data used to evaluate impacts to public health from stimulation chemicals were sparse and incomplete. The DEIR analysis did not include other exposure pathways (e.g. inhalation, skin contact, etc.) that were included in the CCST Study. This report also failed to evaluate endocrine disruption and bioaccumulation potential, both relevant health endpoints for stimulation chemicals. Additionally, no regulatory thresholds were applied to chemicals to evaluate potential health hazards.

0048-141
Continued

The DEIR failed to conduct a robust health hazard assessment regarding chemicals used in well stimulation fluids. The minimal, and inadequate, analysis that was conducted was not included in the health risk analysis and therefore ignored when discussing the potential for hazards and threats to public health. The DEIR concludes that risks would not be significant after implementation of mitigation measures; however, that conclusion lacks analysis and is not consistent with the CCST Study. That recent independent report concluded that data gaps in the identity and toxicity of chemicals used for well stimulation result in significant uncertainties regarding the potential impacts of those chemicals.

0048-142
Continued

As noted above, the DEIR does not consider the CCST Study's recommendation that applicants be required to restrict stimulation chemicals to those with known and non-toxic risk profiles. The Final EIR should consider this feasible mitigation measure that would have potential positive impacts to human health, air, and water quality.

0048-143

IX. Conclusion

KCPCDD's proposed Project attempts to shield all oil and gas activity, including well stimulation, in unincorporated Kern County from any further CEQA review. By purporting to analyze hypothetical, future conditions that are largely unknown and unknowable at this time, the profound risks to public health and safety from the Project have been completely obscured, robbing the public of its right to engage in the CEQA process and impeding decision-makers in contravention of the very purpose of CEQA review.

0048-144
Continued

The DEIR fails to adequately disclose, analyze, and mitigate the Project's significant environmental impacts. KCPCDD must give full consideration to the alternatives that would provide environmental benefits not provided by the Project and were eliminated without adequate basis or rationale, including a drilling ban on agriculturally productive lands, a drilling ban on all lands, the fewer wells alternative, the renewable energy alternative, the no project alternative, the CUP alternative, the no hydraulic fracturing alternative, the low-emissions EOR technology alternative, and the recycled water alternative.

0048-145
Continued

KCPCDD should impose a moratorium on well stimulation in Kern County until it can address the flaws in, and recirculate for public comment, a revised DEIR.

I. Executive Summary

Our team analyzed reported hazardous material releases in California to assess the number, volume, characteristics and trends over time, with particular attention paid to oil and gas related releases. Within a nine-year period from 2006 to 2014, we analyzed characteristics that included substance, location, site characteristics, containment, water body impacts, injuries or fatalities, and cleanup services. Our analysis found that spill frequency remained constant in California from 2006 to 2014, but total spill volume increased 69% from 2013 to 2014. Oil and gas spills in Kern County decreased, mirroring the decrease in California oil production. We also sought to determine if there were differences in the number of spills associated with unconventional oil and gas production (hydraulic fracturing) compared to conventional production; however, we were unable to conduct a meaningful statistical analysis due to data limitations relating to both spills and oil wells. We include recommendations for the Division of Oil, Gas, and Geothermal Resources (DOGGR) and the California Office of Emergency Services (Cal OES) around improving the quality and accessibility of their data.

II. Introduction

The United States' oil production is at a 15 year high (Heinberg, 2013). New methods of oil extraction, namely hydraulic fracturing, have allowed oil and gas producers across the nation and in California to extract more oil than was possible in decades before. However, with these new methods of extraction come a host of new concerns, including the potential for groundwater contamination and hazardous chemical spills.

The goal of this project was to analyze hazardous materials spills in California, to understand their frequency, location, and characteristics, and to determine if there are relationships between oil and gas production methods and hazardous materials spills.

This report provides: a background on the processes and regulations relating to oil and gas production and hazardous material releases (Section C), our analysis methodology (Section D), and the results, conclusions and recommendations resulting from our research (Sections E-H).

III. Background

A. Non-Traditional Oil and Gas Production: Well Stimulation Treatments

1. Production Process

Hydraulic fracturing, often called "fracking", is a well stimulation process used to extract oil and natural gas from reservoir rocks of low permeability, usually fine-grained sandstones and shales (FracFocus, 2015a). In hydraulic fracturing, large amounts of water and chemical additives are injected into a well at high pressures to fracture the rock formation and allow for extraction of the trapped hydrocarbons.

After hydraulic fracturing has occurred but before production begins (i.e. before oil or gas begins flowing through the well), fracturing fluid may return through the wellbore to the surface as flowback water which is then stored and reused in other drilling operations. However, up to 90% of fracking fluid may remain underground (Lutz et al., 2013). After production has begun, "produced water", which has had contact with oil and gas, returns to the surface (Geological Society of America, 2015; EPA, 2012b).

Based on available well data, an estimated 100 to 150 wells per month are hydraulically fractured in California, mostly for heavy crude oil (Jordan et al., 2014).

2. Chemicals Used

Although water comprises over 99% of fracking fluid by weight, a variety of chemicals are also used. The composition of fracking fluid is adapted to the requirements of each well. Common components include acids to dissolve material and reduce clogging, friction reducers, and surfactants to improve flow through pipes (Colborn et al, 2011).

A study conducted by Congressional Committee on Energy and Commerce shows that a about 2500 products and 750 chemicals are used by 14 companies (Waxman, 2011). The most widely used chemical was methanol (found in 342 products), followed by isopropyl alcohol (274 products), 2-butoxyethanol (126 products) and ethylene glycol (119 products). (Waxman, 2011). Twenty-nine of the reported products were known or possible carcinogens, regulated contaminants under the Safe Drinking Water Act, or hazardous air pollutants under the Clean Air Act. Additionally, many unconventional oil and gas operators use proprietary chemicals in their fracking fluids. These "trade secret" chemicals are protected from disclosure (Waxman, 2011).

When flowback water returns to the surface, it is made up mostly of the original fluid and chemical mix with a salinity content that increases as a function of time since initial injection. Produced water, on the other hand, contains hydrocarbons as well as naturally occurring chemicals from within the rock formations. These chemicals typically include hyper saline reservoir water, oil and other hydrocarbons, and toxic elements like radium, barium and strontium. All of these chemical characteristics vary with the geology of the exploited formation (Vengosh et al., 2014).

Due to the overlap of many chemicals used in both processes, it is difficult to differentiate between spills and contamination from traditional oil and gas operations and those from WSTs. However, efforts have been made to more effectively and appropriately attribute spills to WSTs, such as using boron and lithium as tracers from shale formations (Warner et al., 2014). These techniques, coupled with greater transparency for proprietary chemical disclosures, are promising advances in tracing spills and contaminant migration to unconventional oil and gas sources.

3. Pollution Pathways

In hydraulic fracturing, waste materials are generated during both the fracturing and production phases. The main areas of concern lie in pollution from above ground spills during the handling, transport, and storage of waste and in the potential for unrecovered subsurface fracturing fluid to migrate to aquifers, and groundwater contamination from natural gas leaks around fractured wells (Vengosh et al., 2014). Pollution pathways are divided into direct and indirect processes.

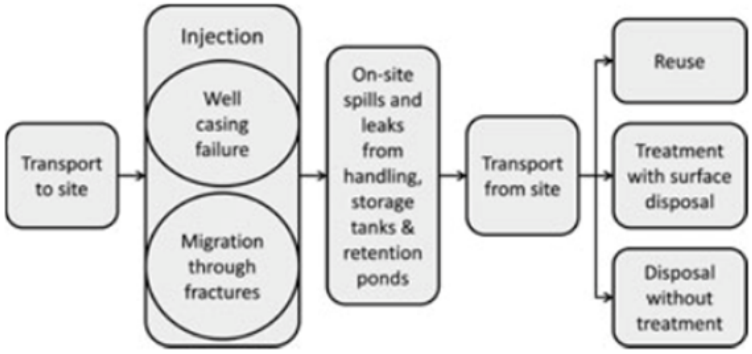

Figure 1: Potential pollution pathways from hydraulic fracturing. (Source: Rozell & Reavan, 2012)

a) Direct Pollution

Direct pollution is the (mostly subsurface) contamination of soil or groundwater resulting from high-pressure fracturing and the withdrawal of fluids and hydrocarbons. There is concern that the high-pressure fracturing process can create pathways for fracking fluid and hydrocarbons, especially methane, to migrate into aquifers used for drinking water and irrigation. Other pathways are well-casing failures and seal failure near the mouth of the wellbore. Statistical analysis of hydraulic fracturing contamination events suggests that well failure, not high-pressure fracturing, causes most groundwater pollution (Darrah et al., 2014).

Another study suggested that fluid migration through fractures is a high potential risk, but waste disposal contamination risk is several orders of magnitude larger (Rozell et al., 2012). In nearly all studies of this kind, uncertainty over pollution pathways made it difficult to determine the degree of threat posed by fluid migration. Nearly all studies emphasize the much greater risk that mishandling, illicit dumping, and unregulated disposal of produced water waste poses to natural resources in the U.S.

b) Indirect Pollution

Indirect pollution is soil or water contamination resulting from processes related to hydraulic fracturing that occur beyond the fracturing and withdrawal process. This includes the transport, storage, and disposal of flowback and produced water.

Although hydraulic fracturing generates less wastewater than conventional methods per unit of resource produced, especially in California, proper disposal of produced water from unconventional oil and gas operations is a serious environmental concern (Lutz et al., 2013). According to an EPA study, the most common disposal process for hydraulic fracturing waste involves separating fracturing fluids from the recovered oil and gas, pumping it into trucks, treating it to proper disposal standards at a plant, and injecting it into wells (California Research Bureau, 2014). Every step of this process presents a possible pollution pathway for produced water. Wastewater treatment facilities are sometimes used for disposal, but are often unable to completely remove the radioactive elements and total

dissolved solids (TDS) that produced water carries (Lutz et al., 2013). Because of this, between 95-98% of wastewater from fracking in the US is injected into Safe Drinking water Act (SDWA) Class II underground injection control (UIC) wells (see section Oil and Gas Regulations) (Lutz et al., 2013).

Offsite commercial disposal is used mostly by small operators for whom building, running, and closing an onsite disposal facility is not economically feasible (Argonne, 2009). In California, the water that is not injected underground is mostly disposed of through settling ponds or is treated for beneficial reuse, such as agriculture (Argonne, 2009). In Kern County, increased scrutiny has fallen on the use of unlined ponds for produced water disposal. Several studies, including one in 2014 by Clean Water Action, demonstrated that waste in unlined pits near McKittrick, CA migrated into wells used for irrigation and drinking water (Clean Water Action, 2014).

B. Public Health and Environmental Effects of Well Stimulation Treatments

1. Water Pollution:

This review looked for instances of the release of chemicals from fracturing operations into water resources via the pathways previously discussed. Excluded were studies on the disposal of treated hydraulic fracturing wastewater directly into surface waters, as the majority of fracturing fluid in California is disposed of via underground injection or in wastewater pits (DOGGR, 2014). The discussion below includes two studies on contamination of water resources via underground pathways, one on surface spills, and one on instances of improper underground injection disposal of hydraulic fracturing waste.

a) Indirect:

A study by Gross et al., in the *Journal of the Air and Waste Management Association* analyzed whether surface spills at hydraulic fracturing operations led to groundwater contamination, specifically of benzene, toluene, ethylbenzene, and xylene (BTEX) chemicals. The Colorado Oil and Gas Conservation Commission (COGCC) database provided data on surface spills at sites in Weld County, Colorado between July 2010 and July 2011 (Gross et al, 2013). Researchers analyzed 77 spills. Groundwater samples collected at the spill sites showed that benzene levels were 2.2 times higher, toluene levels 3.3 times higher, ethylbenzene levels 1.8 times higher, and xylene levels 3.5 times higher than groundwater samples collected outside the spill area. BTEX levels tended to decrease rapidly with time and distance from the spill site (Gross et al, 2013). However, the study serves as a demonstration of the potential of surface spills to directly affect groundwater quality.

The second study provides a recent example of mismanagement of underground fracking wastewater disposal occurred within Californian Class II injection wells. In September 2014, the State Water Board conceded to the EPA that 9 underground injection control wells injected wastewater from natural gas operations into drinking water aquifers

protected under the Safe Drinking Water Act. The board tested 8 public wells within a 1 mile radius of the UIC wells in question and found that four exceeded the Maximum Contaminant Level (MCL) for nitrate, arsenic, and thallium (Bishop, 2014; Schon, 2014).

b) Direct:

A study by Fontenot et al., in *Environmental Science and Technology* looked at water quality in 100 private wells surrounding the Barnett Shale formation in North Texas. Historic levels of arsenic, nitrates and volatile organic compounds (VOCs) from the United States Geological Survey were compared to current groundwater quality in 91 wells within a 5 kilometer radius of active natural gas extraction operations, 4 wells with no active operations within a 14 kilometer radius, and 5 inactive, control wells (Fontenot et al, 2013). The results showed that mean total dissolved solids (TDS) in active extraction areas exceeded the maximum contaminant level (MCL) set by the EPA, but historical data indicated similar levels for the region. Similarly, researchers observed methanol and ethanol in samples from both the active and inactive study areas. The chemicals were not correlated with distance to the nearest gas well (Fontenot et al, 2013). The constituents found to be higher in active areas than inactive areas were arsenic, selenium, and strontium. The researchers suggest a variety of contributing factors to this contamination, including mechanical disturbances from drilling activity, reduction of the water table from groundwater withdrawals, and faulty drilling equipment and well casings (Fontenot et al, 2013).

A study by Osborn et al., in the *Proceedings of the National Academy of Science* looked at methane contamination in drinking-water wells in the Marcellus and Utica shale formations in northeastern Pennsylvania and upstate New York, comparing wells within areas of active natural gas exploration and wells in inactive areas. Of 60 wells studied, 51 showed methane contamination. Concentrations of methane were 17-times higher nearby natural gas drilling operations (Osborn et al, 2011). Even more, the authors used stable isotope analysis to differentiate between shallow, naturally occurring methane and deep, thermogenic methane associated with fracking. Thermogenic methane was found to be the source of contamination at active sites, while biogenic methane was common at inactive sites (Osborn et al, 2011). The study also looked at general groundwater contamination associated with fracturing fluids. Using a contemporary sample of 68 wells and the historical data of 124 wells in the Catskill and Lockhaven aquifers, the researchers used three indicators of contamination: major inorganic chemicals, stable isotope signatures of water, and isotopes of dissolved constituents. The study found no connection between active drilling areas and general contamination in nearby wells (Osborn et al, 2011).

It is important to keep in mind that much of the literature on public health effects of WST fluid or spill contamination is limited by knowledge of the specific chemical composition of fracturing fluid. Incomplete MSDS information, a lack of Chemical Abstract Service (CAS) numbers to uniquely identify chemicals and chemical mixes, and trade secret claims by operators limited the all of the above studies and others of their kind. In addition, without baseline information on water quality or isotope tracking, it is difficult to impossible to causally link hydraulic fracturing operations to groundwater contamination. The study by Gross et al provided no measure of historical background levels of BTEX, therefore causality is not certain. In fact, a review by Samuel Schon faults the study by

Osborn et al., for not providing geochemical measurements of dissolved methane (Schon, 2014).

Next, it is worthy to note that many of the studies on hydraulic fracturing chemicals and accidental release come from outside California. The study from the *Journal of Human and Ecological Risk Assessment* obtained product and chemical information from Colorado, Wyoming, New Mexico, Texas, Washington, Montana, Pennsylvania, and New York. The three other cited studies come from the Barnett, Marcellus, and Utica shale formations. In all, much of the published literature on hydraulic fracturing and its effects on groundwater are from study areas outside of California, likely due to the fact that the state does not have as extensive of a hydraulic fracturing industry as other parts of the US (US Department of Energy, 2011). Thus, one should keep in mind the difference between California fracking and general American fracking amount when weighing the probability of groundwater quality damage from fracking.

In all, the above studies give context for the public health concerns of hydraulic fracturing fluid and the ways in which it may enter groundwater. More research is needed to steadfastly claim a causal connection between fracking and groundwater contamination; however, data point to probable risk.

2. Air Pollution:

A recent independent study by P. Macey et al, "Air Concentrations of Volatile Compounds near Oil and Gas Production" examined the air concentrations of volatile compounds in hydraulic fracturing sites through a community-based exploratory study in five American states: Ohio, Pennsylvania, Arkansas, Colorado, and Wyoming. A total of 75 volatile organics were measured through passive air samples near industrial operations. Levels of eight of these volatile chemicals were found to exceed federal guidelines (Macey, 2014). Benzene, formaldehyde, and hydrogen sulfide were the most common compounds to exceed acute and other health-based risk levels (Macey, 2014). For instance, the exposure to benzene experienced in five minutes at one Wyoming site was equal to the exposure experienced living in LA for two years. Benzene is known to cause irritation of the skin, eyes, and upper respiratory tract (U.S. EPA 2011). Long-term exposure may cause blood disorders, reproductive and developmental disorders, and cancer (Outdoor Air, 2011). Hydrogen sulfide levels in the Wyoming site were also 90 to 60,000 times greater than the recommended levels at one given time during the study period (Francis, 2014). Hydrogen sulfide can cause respiratory tract and eye irritation, headaches, poor memory, and loss of appetite among other symptoms (Francis, 2014).

C. Environmental Justice

According to the EPA, environmental justice is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies (U.S. EPA, 2014a).

A study by Srebotnjak et al. examined which communities were the most disproportionately at risk due to oil and gas drilling in California. According to their research, approximately 5.4 million Californians (14 % of the state's population) live within

one mile of an existing oil and gas well (Srebotnjak, 2014). In addition, 1.8 million of these individuals live in already environmentally polluted areas (Rotkin-Ellman, 2014). Approximately 92% of the individuals within those 1.8 million are people of color. The demographics of the population living near wells in California consist primarily of Hispanics/ Latinos (Srebotnjak, 2014).

A separate study analyzed one particular oil and gas community in Kern County, California. Kern County has more than 63,000 of the state's 84,434 active and new oil and gas wells (Rotkin-Ellman, 2014). The researchers found that one in three residents live within one mile of an oil or gas well (35% of the county's population) (Rotkin-Ellman, 2014). These individuals are at a greater risk of potential health impacts. According to the Desert Renewable Energy Conservation Plan, Kern County's total population size is about 839,153 with 61.4% belonging to a minority group (Desert Renewable Energy Conservation Plan, 2014). The percent of low-income individuals in Kern County is 22.5%. California as a whole has a minority population of 59.9%, with 15.3% falling within the low-income population. (Desert Renewable Energy Conservation Plan, 2014)

D. Regulatory Background

1. Hazardous Materials and Oil and Gas Regulation

a) Hazardous Material Release Regulations

Reporting is to be made to the Office of Emergency Services. The California Code hat the immediate reporting of a hazardous material spill to land is only required if there is "reasonable belief" that the spill may pose a threat to public health, property, or the environment. A written report of the spill initially called into OES is required 30 days after the release and sent to the Chemical Emergency Planning and Response Commission. The reportable quantities of chemicals can be found on two lists. The first is the Extremely Hazardous Substances list. The second is the more detailed Consolidated List of Chemicals (California Office of Emergency Services, 2014a).

b) Oil and Gas Regulations

i. Federal Level Regulations

Some hazardous material from conventional oil and gas production has been exempted from CERCLA, CWA, and RCRA. CERCLA requires the clean up of hazardous substances, however, substances derived from oil and gas production are not required to be reported under CERCLA unless reaching waters of the United States and creating a "sheen" or "film". The Clean Water Act regulates the discharges of pollutants into the waters of the United States. It excludes sediment as a pollutant when it is generated from oil and gas production. Last, RCRA governs the disposal of hazardous wastes. It exempt oil and gas produced water and drilling fluids from monitoring and disposal requirements (U.S. EPA, 2002, 2012, 2014b).

ii. State Level regulations :

In California, DOGGR monitors oil and gas production in California. DOGGR oversees the drilling, operation, maintenance, and plugging and abandonment of oil, natural gas, and geothermal wells (California Department of Conservation, 2014).In recent years, DOGGR acknowledged the gaps in regulations placed on oil and gas production and the information provided to the division about hydraulic fracturing (California Department of Conservation, Division of Oil Gas and Geothermal Resources (DOGGR), 2014). In 2011, Senator Pavley drafted Senate Bill 4 in 2013, passed in September 2013, which directly deals with WST reporting. Senate Bill 4 was enacted by the California legislature due to five concerns: (1) Hydraulic fracturing and well stimulation treatments are increasing in California. (2) The state considers current scientific information on the risks of well stimulation treatments incomplete. (3) The legislature believes that government and industry transparency is vital. (4) Public disclosure is important so as to allow the public to determine if they are being exposed to WST chemicals, (5) the legislature would like to understand the components of produced water used in WST so that it may be reused or treated (California Environmental Law and Policy Center, 2015)

SB4 requires: (1) an independent scientific study on well stimulation treatments to be conducted by the Secretary of California's Natural Resources Agency, (2) development of WST regulations by DOGGR including threshold values for acid volume used, disclosure requirements of chemical composition of well stimulation fluids, and source and volume information of all water used, (3) public disclosure of WST fluid composition (4) an end to the ability of operators and suppliers to claim trade secret protections on many of their products, (5) the creation of a permitting process for WST operation, (6) that landowners within 500 feet of a horizontal project of a WST or within a 1500 foot radius of the wellhead be notified of treatment, (6) that SWRCB to develop regional or well specific groundwater monitoring criteria by July 15, 2015 (California Environmental Law and Policy Center, 2015).

Currently, the California Office of Emergency Services (Cal OES) is responsible for receiving spill reports. The Comprehensive Environmental Response and Liability Act, the Emergency Planning and Community Right-to-Know Act, and various California laws require that hazardous substance releases in excess of reportable quantities must be reported by the responsible party to the National Response Center. Furthermore, if there is an accidental release that exceeds minimum reportable quantities, it must be reported to the State Emergency Response Commission and to the Local Emergency Planning Committees. This includes any spills relating to oil and gas. Regarding oil and gas spills, any release that has caused harm or the potential to cause harm must be reported to Cal OES. Any discharge of oil into state waters must be immediately reported. The federal and state regulations on spill reporting, along with regulations specific to oil and gas spills, are summarized in the below tables.

Table 1: Summary of US Federal and State regulations governing spill reporting (Farella, Braun, and Martel, 2013).

Type of Release	Law	When to Report & to Whom	Who Reports
Oil discharge	Clean Water Act	Immediately report to	Any person in

(film/sheen/discoloration) to water surface or shoreline, or violation of water quality standards and discharge of hazardous substance [equal to or above Reportable Quantity (RQ)]	311 Code of Federal Regulations Title 33: 153.203, Title 40: 110.6	National Response Center: (800) 424-8802 or (202) 267-2675	charge of a vessel or facility (offshore or onshore)
Discharge of oil or petroleum product to surface or groundwater of the state	Water Quality Control Act California Water Code: 13272	Immediately report to the Cal OES (800)852-7550 or the appropriate Regional Water Quality Control Board	The person who causes or permits the discharge
Discharge of oil or petroleum product to marine water of the state	Oil Spill Prevention And Response Act California Government Code: 8670.25.5, 8670.26, 8670.64-8670.67, California Health And Safety Code: 25501, 25507, California Code Of Regulations: 2703, 2705	Immediately provide verbal report to Cal OES, but not later than 30 minutes after discovery of the spill or threatened release; Submit written emergency release follow-up notice within 30 days of the release and sent to Chemical Emergency Planning and Response Commission Local Emergency Planning Committee (LEPC) Notify Coast Guard in certain circumstances (800) 424-8802	Any party responsible for the discharge or threatened discharge; Responding local or state agency
Discharge of one barrel or more oil (cannot pass into or threaten the waters) in the gas and oil lease fields.	California Public Resources Code 3233	Immediately report to the Cal OES	Facility owner or operator
5 barrels or more uncontained in certain San Joaquin Valley oil fields - if no threat to state waters; 10 barrels or more contained in certain San Joaquin Valley oil fields if identified in spill contingency plan - if no threat to state waters.	San Joaquin Valley Field Rule (August 1998)		
Every rupture, explosion, or fire involving a pipeline	Elder California Pipeline Safety Act of 1981 California Government Code 51018	Immediately report to the fire department having fire suppression responsibilities and to the Cal OES.	Pipeline operator

Unauthorized release of a flammable or combustible liquid, including petroleum products and oil that escapes from secondary containment of a underground storage tank, or from primary containment if no secondary containment exists; increases the hazard of fire or explosion; or causes deterioration of the secondary containment	Underground Storage Tank Law California Health and Safety Code, 25295, 25299 California Code Of Regulations, Title 23: 2650-2652	Verbal report within 24 hours after the release was detected or should have been detected; written report within 5 working days of the release	Owners and operators of USTs
Spill or other release of one barrel (42 gallons) or more of petroleum from an aboveground storage tank, that is required to be reported	Aboveground Petroleum Storage Tank Act California Health and Safety Code 25270., 25270.12	Immediately report to the Cal OES and the CUPA/AA using the appropriate 24-hour emergency number or the 911 number, as established by the CUPA, or by the governing body of the CUPA	Owner or operator of aboveground tank facility
Any facility that accidentally releases into the environment one of the following types of chemicals in an amount greater than or equal to the minimum reportable quantity as required by the Emergency Planning and Notification regulation http://www.gpo.gov/fdsys/pkg/CFR-1996-title40-vol14/pdf/CFR-1996-title40-vol14-part355.pdf	Emergency Planning and Community Right-to-Know Act Section 304	Immediately report to the State Emergency Response Commissions and the National Response Center for any area that is likely to be affected by the release. A written follow-up is required.	Facility
PCB spill (equal to or greater than 50 parts per million) with release to surface water, drinking water supplies, sewers, grazing lands, etc.	Toxic Substances Control Act (TSCA) 40 CFR 761.120 & 761.125	Report within 24 hours to National Response Center (NRC) at 1-800-424-8802, EPA Region 7 Spill Line at 913-281-0991, and LEPC, SERC,TERC. Follow up as required by agency.	Person in charge
Hazardous substance release (equal to or greater than RQ)	Comprehensive Environmental, Response, Compensation, and Liability Act (CERCLA or Superfund) 40 CFR 302.6(a)	Report within 15 minutes to LEPC, SERC, TERC or local emergency response personnel (911 in case of transportation-related release)	Person in charge of vessel or facility

Release, fire, or facility explosion that threatens health outside the facility	Resource Conservation and Recovery Act (RCRA) 40 CFR 262.34; 263.30; 264.56 & .196; 265.56 & .196; 270.14 & .30; 273.17, .37 & .54; 279.43 & .53; 280.50, .52, .53, .60 & .61	Report within 24 hours to National Response Center (NRC) at 1-800-424-8802, EPA Region 7 Spill Line at 913-281-0991, and LEPC, SERC,TERC	Emergency coordinator or owner/operator

At the state level, hazardous material releases are regulated by three California codes: the California Government Code, the California Health and Safety Code, and the California Code of Regulations. These regulations establish the Office of Emergency Services as responsible for coordinating the reporting of spills in the state. The follow-up reporting on these spills is the responsibility of the Chemical Emergency Planning and Response Commission. The table below summarizes the most important regulations that govern spill reporting in California (Cal OES, 2014).

Table 2: California regulations governing spill reporting (Cal OES, 2014).

Law	Content
California Government Code (GC) 8589.7	The Office of Emergency Services (OES) shall serve as the central point in state government for the emergency reporting of spills, unauthorized releases, or other accidental releases of hazardous materials and OES shall coordinate the notification of the appropriate state and local administering agencies that may be required to respond (the State Lands Commission, Coastal Commission, or regional water boards for oil spills; the State Fire Marshal for a rupture or explosion involving a pipeline, DOGGR for a crude oil spill, etc) Any person subject to Section 25510 of the Health and Safety Code shall immediately report all releases to the local administering agency and each local administering agency shall notify OES.
California Health and Safety Code (HSC) Sections 25500-25519: Legislative Intent	Establishes business and area plans relating to the handling and release or threatened release of hazardous materials. Basic information on the location, type, quantity, and health risks of hazardous materials in the state is required to be submitted to firefighters, health officials, planners, and other interested persons.
HSC 255510: Release Reporting Requirements	The handler or an employee, representative, agent, etc, shall immediately report any release or threatened release of a hazardous material to the unified program agency.
HSC 25515.2: Administrative Enforcement	A business that violates the HSC article is liable to a penalty not greater than $2,000 for each day in which the violation occurs. If the violation results in or contributes to an emergency, including a fire or health problem, the business shall also be assessed the full cost of the county,

	city, fire district, or local EMS agency emergency response as well as the cost of cleaning up the hazardous materials.
California Code of Regulations, Title 19, Division 2, Chapter 4, Section 2701: Reporting Requirements	A person shall provide an immediate verbal report of any release to the administering agency and the California Emergency Management Agency as soon as (1) a persons had knowledge of the release, (2) notification can be provided without impeding control of the release (3) notification can be provided without impeding medical measures. The reporting shall include at a minimum (1) the exact location (2) the name of the person reporting, (3) the hazardous materials involved, (4) an estimate of the quantity, (5) the potential hazards involved in the release or threatened release Immediate reporting is not required if there is reasonable belief that the release poses no significant present or potential hazards to human health and safety, property, or the environment.
California Code of Regulations, Title 19, Division 2, Chapter 4, Section 2705	A written emergency release follow-up notice pursuant to 42 U.S.C section 11004(c) shall be prepared using the form specified in subsection (c) of this section and shall be sent to the Chemical Emergency Planning and Response Commission (CEPRC) no more than one month after the release.

A copy of the Emergency Release Follow-Up Notice Reporting Form can be found in Appendix A.

Continuous releases, or those releases that are continuous and stable in quantity and rate, occur without interruption or abatement, or are routine, anticipated, or intermittent, are subject to different reporting requirements than discrete hazardous material releases (EPA, 2015). Regulated federally under CERCLA and EPCRA, these releases may be subject to reduced reporting requirements. The responsible party must notify the National Response Center, or the respective State Emergency Response Commission, when the release is first identified. Afterwards, a first-year anniversary report is required to be submitted to quantify the total effect of the continuous release over the year. A complete guide to the reporting requirements for continuous releases can be found in the Appendix E.

IV. Methodology

A. Data Sources

1. Spill Data

We used data from the California Office of Emergency Services, now called California Office of Emergency Services, for hazardous material release information. The data was downloaded in January 2015 from the Cal OES website for the years 2006-2014. Recently, the data was moved to the CA OES website, however the formatting is the same. Each Microsoft Excel spreadsheet file for a specific year contains a list of all spills called into the CA OES Warning Center for the given year. . Appendix A has a link to the new data location on the CA OES website.

The following table explains the different columns within the Historical Hazmat Spill Notification spreadsheet. "Column Name" provides the spreadsheet letter and heading of each column. "Column Description" provides a definition for each column's content (written by the team and not provided by Cal EMA). "Example Entries" gives real examples of entries within each column and clarifies the idiosyncrasies and challenges of the dataset.

Not every column in the dataset is listed below, only those that were used in this project and referred to throughout this paper.

Table 2: Denoted below is the column name, a description of the data found in that column, a few examples for each column, and the analyses in which we used data from that column.

Column Name	Column Description	Example Entries	Analyses Used
A: Control #	A unique number identifier for each spill; the first two digits of the control number indicate the spill year.	'13-2536, '06-2805, '11-6123	None
D: 1. Substance	The primary substance released. Self-reported, one substance may be reported in several different ways.	Crude Oil, Oil-Crude, Diesel, Paint Flakes, Antifreeze	Types of substances spilled
E: 1. Quantity	The amount of material spilled, if known. May be a finite number, a range, or other format (such as date or time-dependent).	0.4, 500, 120-140, Apr-4, 4 GPM, a drop, N/A	Annual spill volume and box and whisker
F: 1. Measure	The unit a spill is measured in. May be volumetric or mass-based.	Bbl. (s), gallons, cups, pints, grams, pounds, tons, sheen, N/A, unknown	Annual spill volume and box and whisker

G: 1. Type	A broader category than Substance that specifies the kind of substance spilled.	Petroleum, Radiological, Railroad, Vapor, Chemical, Other, Unspecified	Types of substances spilled, number of spills, spill volume
Y: Description	Detailed description of the situation surrounding the spill.	"Caller states substance is seeping from the ground at two locations approximately 150 ft apart in an area that is known for this to occur…"	Kern oil and gas spill filtering process
Z: Contained	Indicates whether the spill was contained or not.	Yes, No, Unknown, 80%, 50%	Containment analysis
AA: Water?	Indicates whether the spill affected waterbodies or not.	Yes, No, Unknown	Spills affecting waterbodies
AC: Location	Street address, PLSS section, or rough location of the spill.	Section 3 Township 31S Range 22E, ½ Mile off Highway 65	Kern oil and gas spills spatial analysis
AD: City	City in which the spill occurred	Fellows, Orcutt, Unincorporated Kern County	None
AE: County	County in which the spill occurred.	Kern County, Los Angeles County, Santa Barbara County	Annual spill volume, box and whiskers, spill characteristic analyses
AI: Spill Site	General category that specifies the type of location the spill occurred in.	Oil Field, Refinery, Pipe Line, Merchant/Business, Residence	Spill frequency in Los Angeles and Kern counties
AS: Cleanup	Indicates who cleaned up the spill.	Contractor, Responsible Party, Site Personnel	Clean up analysis

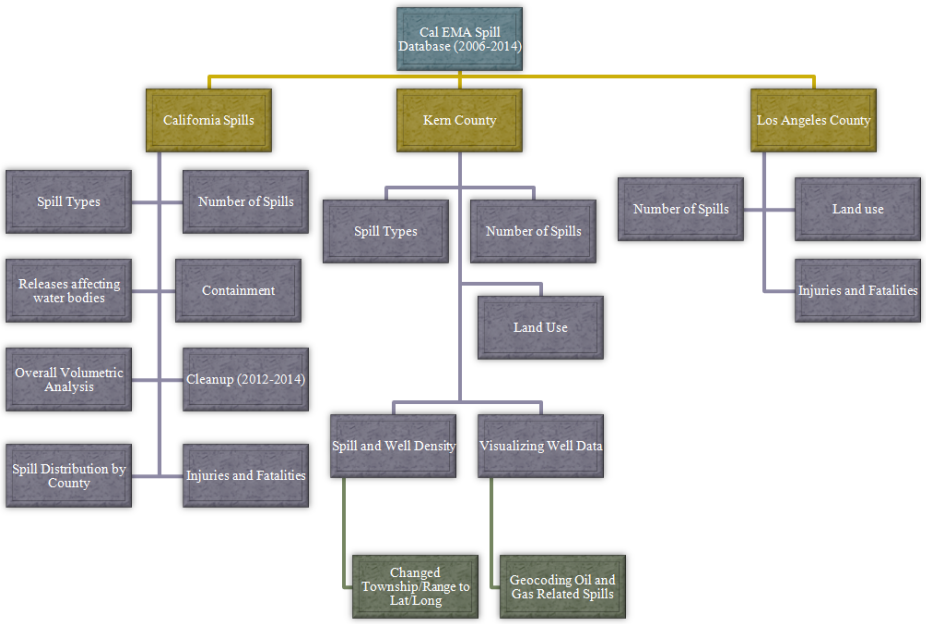

Figure 2: Methodology tree of the different analyses and procedures performed on the datasets.

B. Spill Volume vs. Spill Count

Analyses of the spill database were done both by aggregating the volume of each spill in a particular subset and in by counting each individual spill in a particular subset. The table below outlines which procedures dealt with spill volume and which dealt with spill count. The type analysis using the database column "Type" involved both volume and spill count. Petroleum type was summarized by total volume, while the remaining type categories (such as radiological or sewage) were summarized by number. The spill distribution by county analysis also involved both volume and number summaries, as a volumetric analysis was done for Kern and LA counties while remaining counties were analyzed by number of spills.

Table 3: Below is a breakdown of the procedures which analyzed spill volume and spill count.

Procedure	Spill Volume	Spill Count
Box and Whisker Plot	X	

Type Analysis	X	X
Containment Analysis		X
Waterbody Analysis		X
Injuries and Fatalities Analysis		X
Cleanup Analysis		X
Spill Frequency Analysis	X	
Spill Distribution by County Analysis	X	X

C. Number and Volume of Spills

1. Spill Count

The first step in analyzing spills in California was to understand the total number of spills reported each year. This analysis was done for all of California as well as for Kern County, Los Angeles County, Kern County oil and gas production spills, and petroleum spills (denoted as Type-Petroleum in Column G). Kern and Los Angeles counties were chosen for additional analysis since these are the two top oil producing counties in the state, accounting for 75 and 12 percent of the state's oil production, respectively, in 2009 (California Department of Conservation, 2009). Kern County oil and gas production was chosen as it provides more specific insight into oil and gas spills in Kern County. Petroleum type was chosen for additional analysis for an overall picture of oil and gas spills across the state, since oil and gas spills could not be individually filtered out for the entire state due to time limitations. We also calculated the annual number of spill incidents for each county in California from 2006 to 2014.

The analysis of spill count and all subsequent analyses excluded vapor and railroad incidents. We had insufficient data to convert vapor releases to a liquid equivalent; furthermore, such releases are likely to have impacted air quality only rather than soils or surface/ground water and therefore did not fit the traditional definition of "spills". Railroad incidents rarely involved spills, but rather were primarily train collisions involving automobiles or humans.

2. Volumetric Analysis

The total volume of spills was calculated for each year from 2006 to 2014 for all of California in addition to subtotals for Kern County, Los Angeles County, TYPE = Petroleum (Column G), and Kern County oil and gas production spills. Excluded from the calculation of petroleum spills in California is a spill of nearly 3 million gallons of kerosene in 2011. The description of this spill, number '11-5972, repeatedly refers to the spill as a "drill".

Spill quantity was reported in 12 different units (excluding "Unknown" or "N/A" values) some of which were volumetric and some of which were mass measures. To solve this problem, all volumetric measures were converted to gallons as it was the most

frequently used unit for volume. All volumetric measures had direct conversion factors to gallons except barrels; the team used the standard 42:1 gallon to barrel conversion factor used in the oil and gas industry. Spill reported in units of mass (e.g. tons, pounds, ounces, and grams) were left out of the analysis, along with "N/A" and "Unknown" measures, due to time constraints and uncertainties related to converting from mass to volume. We believe that, despite this omission, the volumetric analysis provides a good representation of the data. On average, spills reported in mass units comprised only 5.2% of all reported spills with a maximum of 9.2% in 2006 and a minimum of 3.9% in 2012. In the volumetric calculation process, several formatting changes had to be made to values in "1. Quantity" (Column E), in order for the addition function to work properly. A summary of these formatting changes can be found in the Appendix B.

We generated box and whisker plots in R to examine the statistical distribution of spill volumes across years. Each individual datum from the "Quantity" column was converted into gallons and then analyzed in R. Data that could not be analyzed in volumetric form, such as unclear quantities and mass measures, were omitted for this analysis.

D. Spill Characteristics

1. What types of hazardous materials were released?

We generated pivot tables in Microsoft Excel to analyze spill count per type category. On average, there were 18 type categories per year in California overall, which we consolidated into 7 categories: petroleum, chemical, radiological, railroad, sewage, vapor, and unspecified/other. Identical type categories were generated for Kern County and Los Angeles County spills.

We created tables to show the top 20 substances spilled each year. The tables summarized the column "1.Substance" (Column D) by spill frequency. However, inconsistent data entry into the Cal OES database required significant reformatting before the data could be analyzed.

First, many substances were reported as "unknown", "N/A", "unknown material", etc. These substances were discarded.

Second, one substance might be reported in multiple ways. It was therefore necessary to merge repeated instances of a given substance type into the summarized row by adding all the counts (e.g. "Diesel", "Diesel Fuel", "Diesel Oil", "Fuel – Diesel", "#2 Diesel", into "Diesel"). Merging all instances of repeat substance for all eight years was prohibitively time-consuming, so only rows with more than 5 counts were merged. Finally, we calculated what portion of the total yearly volume of spills these substances represented.

Through this analysis, we also want to see how well all the spills are categorized. Among those most frequently reported substances, substances such as motor oil or mineral oil are also classified into the petroleum type in Cal OES database. Although these substances are petroleum products, they are not necessary related to oil and gas production. Therefore, spills of the petroleum type cannot be used to analyze the spills of oil and gas production, since this would be an overestimation.

2. What percentage of releases were contained?

Possible responses in the "Contained" column (Column Z) within the Cal OES spills database included: "Yes", "No", "Unknown", or "X%" (see Fig. 1). Partially

contained spills were difficult to categorize based on their percentage and only accounted for <1 % of total data, so we excluded them from our analysis. We use pivot tables to generate summary statistics on spill containment.

3. What percentage of releases affected waterbodies?

The "Water?" column (Column AA) within the Cal OES spills database contained a "Yes", "No", or "Unknown" with regards to whether a spill involved water when it was released (see Fig. 1). We used pivot tables to count the annual total of each response and summarize their results.

4. Were there reported injuries or fatalities?

An analysis of injuries, fatalities, and evacuations was performed on three levels: all California spills, all Kern County Spills, and all Kern County oil and gas spills. This was done using columns "Injuries #" (Column AN), "Fatals #" (Column AP), and "Evacs" (Column AR) from the Cal OES spills database.

5. Who provided clean-up services?

The "Cleanup" column (Column AS) within the Cal OES spills database was analyzed in a grouped pivot table. This time-intensive analysis was only done on a subset of years from 2012 to 2014. Before grouping in the pivot table, an average of 7,453 unique clean-up descriptions existed for each year from 2012 to 2014. The entries frequently described the same yet reworded cleanup method and thus were ultimately grouped into 9 categories. In order from highest to lowest occurrence, the following categories were chosen: N/A, onsite, contractor, public agency, fire department, county, city, private company, and other. Explanations for each category and sample entries found within each can be found in the Appendix C. These 9 categories were chosen to organize the cleanup responses in a more understandable manner and to better understand spill severity.

E. Spatial Analysis

1. Distribution of Oil and Gas Related Spills in Kern County

Understanding the more detailed spatial characteristics of spills in California was limited by our available time, so we focused on spills related to oil and gas production in Kern County, by far the most productive county in the state.

We began with the complete Cal OES spills database and conducted a number of steps to remove all spills that were not associated with oil and gas production in Kern County. These steps were done successively from general to more specific details and only spills that were clearly not associated with oil and gas production were removed. The steps are as follows:

Filter 1: Remove all spills where the "County" column ≠ Kern

Filter 2: Sort the "1.Substance" column to remove spills where the involved substances were not oil or gas products.

Filter 3: Sort the "Agency" column to remove spills where the responsible reporting agency is not an oil or gas well operator.

Filter 4: Sort through the "Description" columns to further remove spills unrelated to oil and gas production. We used our best judgment to remove spills that did not occur on a production site.

Filter 5: Lastly, the "Spill Site" column was sorted through to remove spills containing the following keywords which indicated they did not occur on a production site: Service Station, Utility Substation, Railroad, Road Collision, Pipeline, Merchant Business, Refinery.

To verify that no spills were improperly removed from our final set of Kern County Oil and Gas Production Related Spills, we sorted the set of removed spills by "Spill Site" and added any spills with keywords "well" or "oil field" back into the dataset.

The table below shows the total spills remaining in the dataset after each successive filter was applied.

Table 4: Spills that were not directly involved with the production of oil or gas were removed from the database with each successive filter.

Year	No Filter	Filter #1	Filter #2	Filter # 3	Filter # 4
	Original Data	Filtered by "Type" column	Filtered by "County" = Kern	Filtered by spills related to oil and gas production	Excluding refinery and pipeline spills**
2006	7424	5599	291	186	158
2007	7769	5764	322	207	207
2008	8812	6146	321	181	172
2009	8391	5967	261	133	117
2010	7713	5370	223	141	121
2011	7358	5146	288	131	125
2012	7687	5396	273	97	90
2013	7630	5554	248	94	80
2014	7013	5209	218	89	77

2. Geocoding Oil and Gas Related Spills in Kern County

Responses for the "Location" column of the Cal EMA spills database were predominantly reported using the Public Land Survey System (PLSS) and were thus formatted as Township-Range-Section (TRS). For the data to be spatially represented using ArcGIS, these TRS entries needed to be converted to latitude and longitude. Because of irregular formatting of TRS entries in the database, locations were manually converted to Latitude and Longitude using the EarthPoint online conversion service (see Appendix D). Any data that was either incomplete or unreadable by EarthPoint was discarded. Due to accuracy limitations in the PLSS (where the smallest geographical units – sections – are roughly 1 square mile) the converted spills were given the latitude and longitude for the centroid of their respective PLSS section.

Additionally, locations reported as addresses or in Degrees-Minutes-Seconds were formatted so that they could be properly geocoded in ArcMap. All addresses that were

incomplete or improperly entered into the database were discarded. After conversion and formatting, all remaining data was geocoded in ArcMap 10.2/10.3 using the US-Composite Address Locator available from UCLA MapShare.

Table 5: Geocoding success.

Year	Spills Visualized	Success Rate
2014	77/89	86.9%
2013	88/94	93.6%
2012	91/96	94.8%
2011	111/125	88.8%
2010	129/141	91.5%
2009	127/160	79.4%
2008	171/215	79.5%
2007	179/206	86.9%
2006	133/148	89.9%
Total	**1106/1274**	**86.8%**

3. Visualizing Well Data

We acquired the data for conventional wells from the DOGGR AllWells database. Unconventional well data was acquired from Appendix M of the SB 4-mandated interim report conducted by the California Council on Science and Technology (CCST). Appendix M combined data from FracFocus, South Coast Air Quality Management District, Central Valley Regional Water Quality Control Board, and DOGGR and was composed entirely of hydraulically fractured wells mostly spanning 2002 to 2014. These sources contained data of varying accuracy and breadth, as different agencies have varying reporting requirements. Using their best judgment, CCST integrated the most accurate of these data based on how comprehensive reporting requirements were for a source.

For this analysis, we focused on wells that were active as of May 2015. We assumed that wells that are active have been active for at least 9 years (since 2006) and that wells which have been plugged, cancelled, buried, or idle have been so for 9 years. This assumption introduces error but is necessary because there is no date of abandonment on the majority of wells, and the list spans over 100 years. This reduces the list of traditional wells we are interested in from 138,959 to 68,129. The AllWells data included 144 wells where longitude = 0, so they were removed, bringing the total number of active conventional wells in Kern County to 67,985. Hydraulically fractured wells from Appendix M lack a similar status column, so we assume that all listed wells have been active throughout our study period.

The AllWells database contained both conventional and hydraulically fractured wells, so we eliminated the latter by deleting features from AllWells which spatially overlapped with the hydraulically fractured wells from Appendix M. We assume the accuracy of well coordinates from both AllWells and Appendix M is high enough that overlapping wells are indeed hydraulically fractured. A total of 2,965 wells were designated as hydraulically fractured and erased from AllWells. The total number of hydraulically fractured wells from AppendixM was 3,922.

4. Spill and Well Density

The accuracy of our spills was limited to anywhere within the roughly 1 square mile area of their PLSS section. To avoid overstating the accuracy of our data, we represented spill density as the number of spills within a PLSS section square. The densities of both conventional and hydraulically fractured wells were represented in the same way for the PLSS sections on which they were sited.

5. Land Use Analysis

Land use designation data was acquired from Kern County Engineering, Surveying, and Permit Services and from Bakersfield IT Division. The land use data for Kern County and the City of Bakersfield did not overlap, so they were joined and similar land-use designations were merged into large, generic classes for more coherent analysis. Wells and spills sited on lands designated for human habitation pose a greater public health risk than those on vacant land. With this in mind, we grouped land designated specifically for human habitation – like "Mobile Home", "High-density Residential", or "Suburban" – into a group to identify the frequency of high-risk spills and wells. The land use designation for every parcel on which wells and spills occurred was summed, generating a list that indicates where, according to official zoning, all spills and wells are sited.

F. Spills from Conventional and Unconventional Oil and Gas Production

1. Spill volume per unit production in Los Angeles and Kern Counties

The largest oil producing counties in the state, Los Angeles and Kern, differ in the fraction of wells which are hydraulically fractured. If hydraulic fracturing has an effect on spills, it might manifest in a comparison between these two counties. The team compared the ratio of oil spill volume to annual oil production in Los Angeles and Kern counties.

For purposes of this analysis, we looked oil spills in which the reported "Spill Site" (Column AI) was "Oil Field". To ensure that no natural gas spills were included in this sample of the data, the Type column (Column D) was filtered to exclude "vapor" spills. Spills at oil fields were used as a proxy for spills known to be associated with oil production. It was beyond the scope of this project to use the filtering process described in section 4B to identify oil production spills in areas aside from Kern County.

Oil production statistics (annual barrels produced) were obtained from the California Department of Conservation website. California oil production was reported by

county for the years 2006-2009 in the Annual Reports of the State Oil & Gas Supervisor. For the years 2010-2013, an annual report was not provided on the Department of Conservation website. To account for this gap, we took the average portion of California oil production that Los Angeles and Kern Counties accounted for over the years 2006-2009. This portion, calculated as a percentage, was then used to estimate the oil production for LA and Kern counties for the years 2010-2013. We found that, on average, LA County represents 12% percent of California oil production while Kern County represents 77% of California oil production.

The last step in this analysis was to divide annual oil field spill volume for California, Kern County, and Los Angeles county by each area's respective annual oil production. In the process of this analysis, we chose to also look at these ratios for Ventura and Santa Barbara counties, the 3rd and 4th largest oil producing counties in the state after Kern and LA counties.

2. Effect of Hydraulic Fracturing on Spill Frequency

To ascertain any effect which hydraulic fracturing may have on the frequency of spills, we calculated the number of spills per well in every PLSS section for each year from 2006 to 2014. We first looked at spills that occurred in PLSS sections with hydraulically fractured wells, then we looked at spills in sections with conventional wells but no hydraulically fractured wells. If hydraulic fracturing leads to a greater frequency of spills, we would expect the first set of spills per well to be greater than the second set occurring only due to conventional oil production.

V. Results

A. Number and Volume of Spills

1. Number of Reported Spills

Table 6 breaks down the number of spills by the subsets of primary interest – all spills, LA County, Kern County, Kern County oil and gas production spills, and petroleum spills.

Table 6: Number of spills for LA County, Kern County, California overall, and petroleum type.

Year	California – All Spills	LA County – All Spills	Kern County – All Spills	Kern County Oil and Gas Production	Petroleum Spills
2006	6,301	952	277	131	3,607
2007	6,927	1,296	310	157	3,813
2008	7,941	1,253	317	147	4,127
2009	7,126	1,083	225	112	3,654
2010	6,863	1,094	223	136	3,646
2011	6,472	983	247	110	3,449
2012	6,794	1,039	225	93	3,584
2013	6,639	1,140	240	93	3,654
2014	6,024	977	204	71	3,387

In general, Los Angeles County has the highest number of spills each year, ranging from 1,139 to 1,538 spills per year (Table 8). The second highest spills location is San Diego County, about 545 to 909 spills per year. The number of spills occurred in Kern County ranges from 254 to 358 spills per year.

The number of spills in California each year ranges between about 6,500 and 8,000 (Table 6). On average, petroleum spills account for about half of all spills in the state each year.

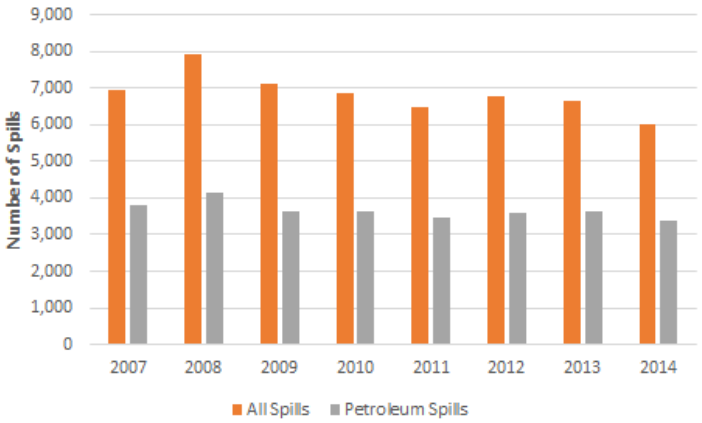

Figure 3: Number of Spills: All and Petroleum.

The number of spills in Los Angeles fluctuates over the years but shows no increasing or decreasing trend. Kern County spills have generally decreased compared to before 2008, while Kern County oil and gas spills show a fairly consistent decrease since 2008.

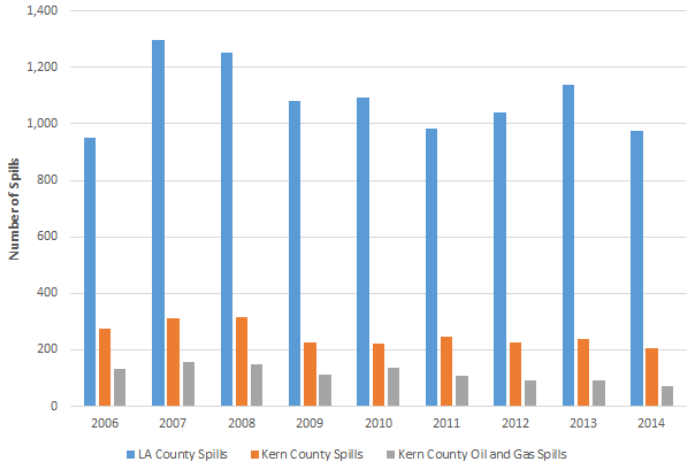

Figure 4: Number of Spills for LA County, Kern County, and Kern County Oil and Gas.

2. Annual Volumetric Analysis of Spills

The results below describe spill volume in California, Kern County, Los Angeles County, Petroleum, and Kern Oil and Gas calculations. As was mentioned in Methods, the spill volume calculations exclude vapor releases and railroad incidents.

Annual hazardous spill volume in California peaks in 2007, is fairly stable from 2008 to 2012, and rises from 2013 to 2014. The peak in 2007 is due to a spill of 160 million gallons of treated sewage at the Terminal Island wastewater treatment plant. Since this spill skewed the shape of the graph of California spill volume, it is removed in Figure 5 below.

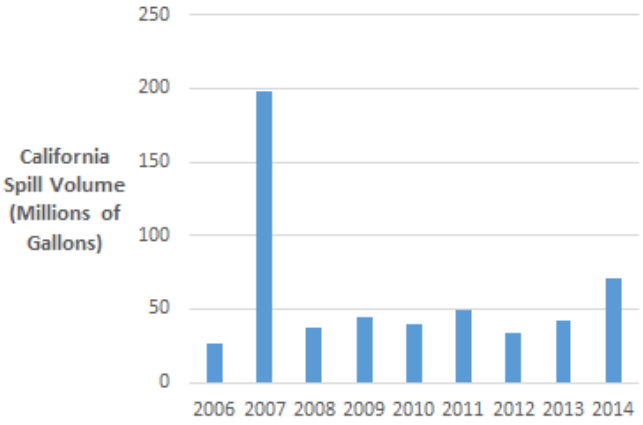

Figure 5: California Spill Volume

Kern County spill volume is fairly stable from 2007 to 2014 except for a spike in 2009 (Figure 6). This spike is primarily due to a spill of 3 million gallons of sewage.

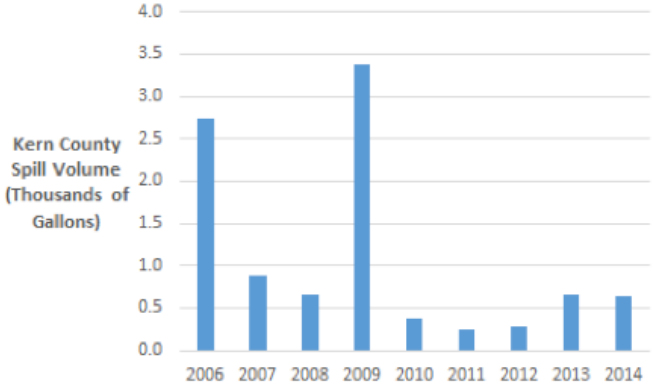

Figure 6: Kern County Spill Volume

LA County spill volume is similar to Kern County's, fairly stable with a spike in one year (Figure 7). LA spill volume also spiked in 2007 due to the large Terminal Island sewage spill seen in the California analysis, but the release is left out of this analysis so trends in LA spills can be seen more clearly. The smaller spike in LA County spill volume in 2014 is due

to spill '14-4269 of 20 million gallons of "drinking water" into Ballona Creek, reported by the LA City Watershed Protection Division.

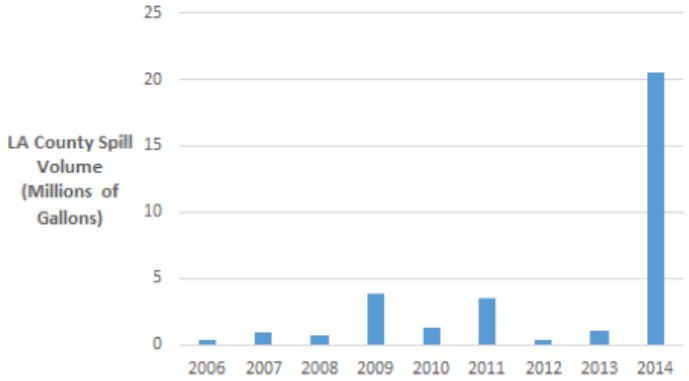

Figure 7: LA County Spill Volume

The annual volume of petroleum spilled in California exhibits a decreasing trend, falling from about 800 millions gallons in 2006 to about 500 million gallon in 2014 (Figure 8). Excluded from the calculation of petroleum spills in California is a spill of nearly 3 million gallons of kerosene in 2011. The description of this spill, number '11-5972, repeatedly refers to the spill as a "drill". During the same time period, California oil production also exhibited a downward trend.

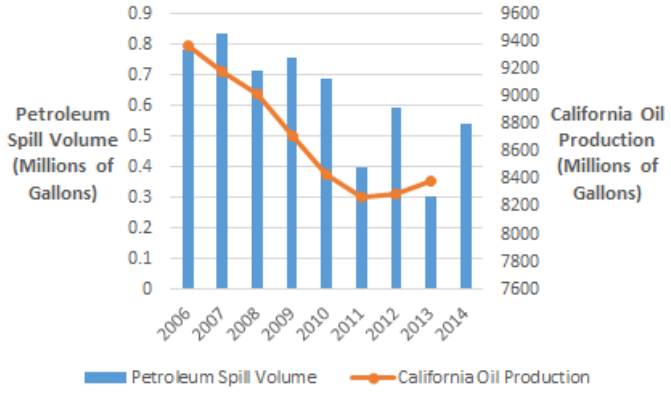

Figure 8: California Petroleum Spill Volume and California Oil Production

Oil and gas spills in Kern County for the years 2006-2014 show a general downward trend as well (Figure 9). Kern County spills predictably track the petroleum spills trend, since Kern County accounts for about 77% of the state's oil production from 2006-2013 (see section 3A).

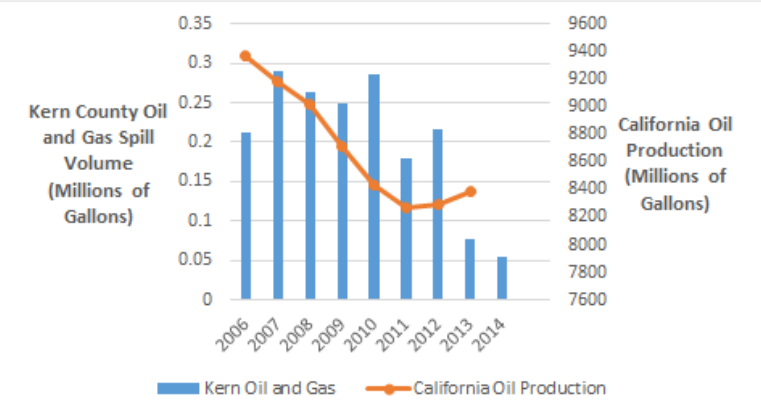

Figure 9: Kern County Oil and Gas Spills and California Oil Production

3. Statistical Distribution of Spill Volumes

Box and whisker plots of spill volume were created for all of California, Kern County, and Los Angeles County (Figures 10-12) exhibit distinct characteristics, with Kern County showing the highest median spill volume on average, followed by Los Angeles and all of California, which are very similar. Each year was also fairly consistent for all of California and Los Angeles County, with the most variation from Kern County.

The box and whiskers revealed that for all of California the median for spills from 2006-2014 stays consistent year after year. Furthermore, the plots show that there is little variation in the interquartile range. When looking at the outliers, there is one in 2007 that is higher than the rest. This is due to a large sewage spill in Los Angeles.

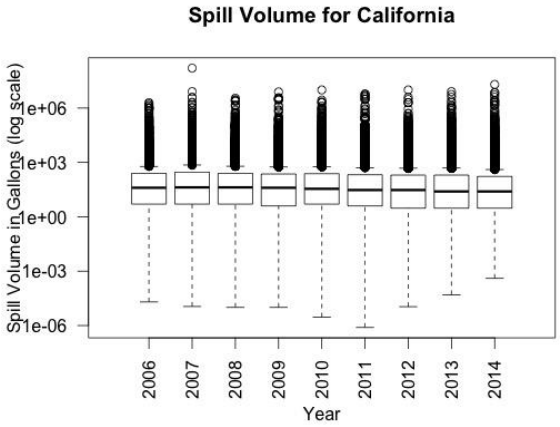

Figure 10: Box and Whisker Plot of All Spills in California

Kern County's median spill volume was higher than both LA county and California. Nevertheless, the median was still consistent for all years. However, the interquartile ranges are much higher than for all of California and for Los Angeles County. The interquartile ranges were roughly the same for all years, but did show some variation.

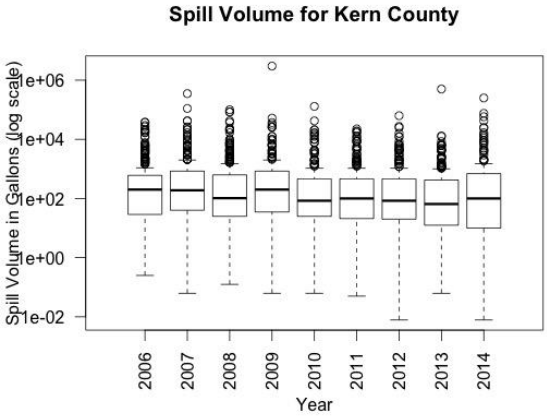

Figure 11: Box and Whisker Chart of Kern County Spill Volume

Los Angeles County's median is on a slight decreasing trend after 2007, indicating the spill volume is decreasing through time. 2007 has the highest median value and the maximum whisker length. Additionally, there is more variation in the interquartile range and the whisker lengths. The spill volume stays relatively constant throughout time.

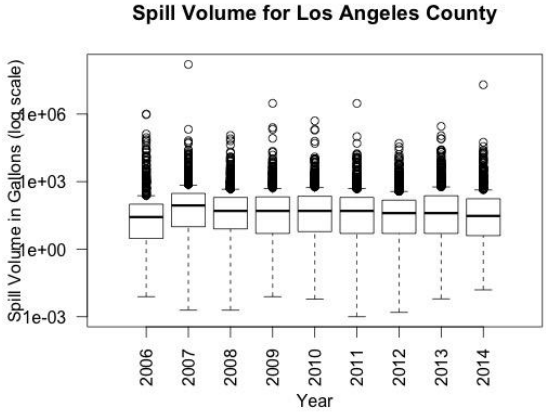

Figure 12: Box and Whisker Chart for LA County Spill Volume

B. Spill Characteristics

1. What types of hazardous materials were released?

The number of petroleum spills was greatest amongst the six categories (petroleum, sewage, chemical, other, unspecified, and radiological). Petroleum spills occurred at an average of 54% for California overall (**Figure 13**), 81% for Kern County (**Figure 14**), and 52% for Los Angeles County (**Figure 15**). The second highest category of spill by count reported for California overall and for Los Angeles County was sewage spills, followed by chemical. For Kern County the second highest category was chemical, followed by sewage.

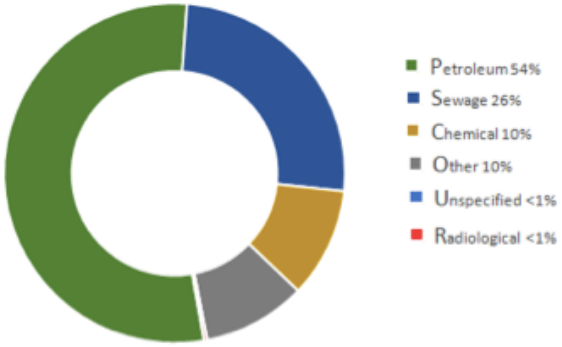

Figure 13: Average spill count by type in California (2006 - 2014)

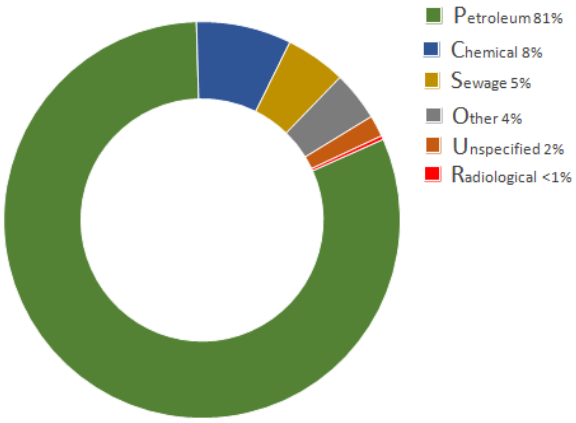

Figure 14: Average spill count by type in Kern County (2006 - 2014)

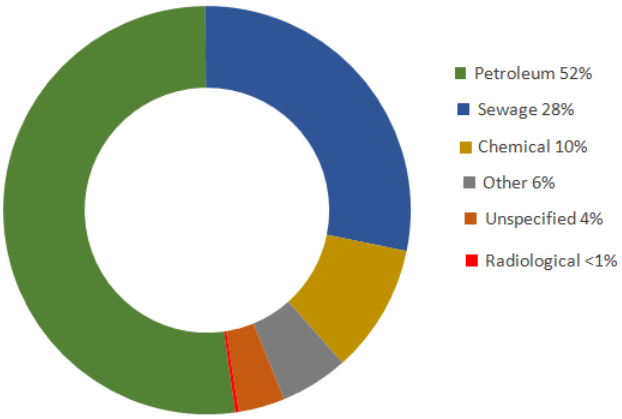

Figure 15: Average spill count by type in Los Angeles County (2006 - 2014)

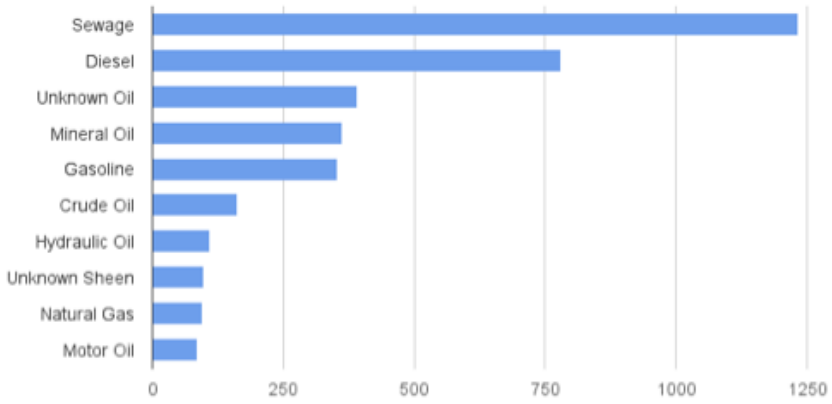

Figure 16: Most frequently reported substances by average number of spills (2006 - 2014)

The specific substance most reported in each year is sewage, followed by diesel (Figure 16). Overall, substances related to oil production have the second highest occurrence. In fact, those most frequently reported substances represent a large portion of all the hazardous materials reported. By count, on average, about 60% of reports are for a petroleum-type substance. The remaining 40% include substances with lower reported occurrences or those frequent petroleum-type substances reported using different descriptors, or both.

2. What percentage of releases were contained?

The percentage of spills that were contained after release is relatively constant from 2006 to 2014. On average, about 10% of total spills that occurred in California were reported as not contained, about 73% of total spills were contained, and about 17% were unknown.

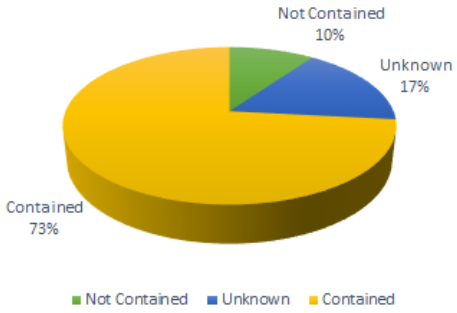

Figure 17: Percentage of spills in California by containment status as reported (2006 - 2014)

3. What percentage of releases affected waterbodies?

The percentage of releases that affected waterbodies is also relatively constant from 2006 to 2014. On average, about 37% of total spills affected water bodies (Figure 17).

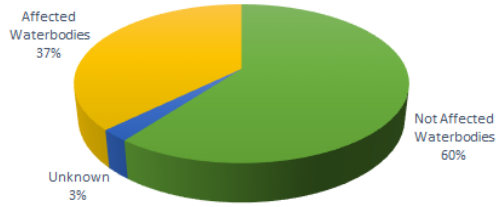

Figure 18: Average number of spills and their relation to waterbodies in California (2006 - 2014)

Of those spill that affected waterbodies, about 16% on average were not contained when reported, and about 29% have no information about containment.

4. Were there reported injuries or fatalities?

The number of injuries, fatalities, and evacuations that occurred due to hazardous spills in California was relatively consistent from 2006-2014. Some minor spikes in the data are observed, especially with the Total Evacuations line, but no discernable trend can be ascertained.

Table 7: Total counts of injuries, fatalities, and evacuations associated with spills in California and Kern County from 2006 to 2014

Location	Total Spills	Total Injuries	Total Fatalities	Total Evacuations
California	58,035	2,935	506	15,714
Kern County	2,189	137	17	611
Kern County Oil and Gas	1,213	43	3	150

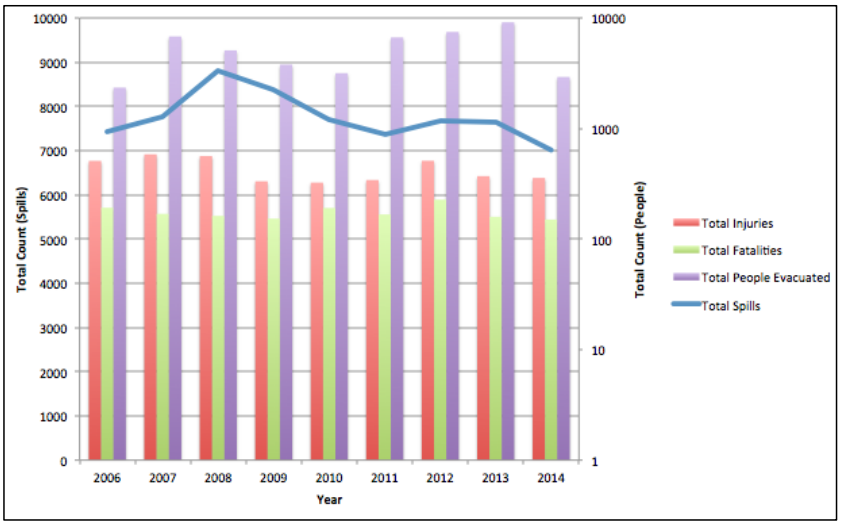

Figure 19: Injuries, fatalities, and evacuations in California from hazardous materials spills (2006 - 2014)

The number of injuries, fatalities, and evacuations that occurred due to hazardous spills in Kern County was highly variable from 2006-2014. There are major spikes in the data that do not follow any meaningful trend. This dataset has a much smaller sample size than the complete California data, so there is more volatility in the data over the years. The extreme volatility of the number of evacuations per year is generally a byproduct of one or two spills in a certain year resulting in the evacuation of 50-100 people.

Table 8: Injuries, fatalities, and evacuations in Kern County from Oil and Gas Production from 2006 – 2014.

Year	Total Spills	Total Injuries	Total Fatalities	Total People Evacuated
2006	182	2	0	0
2007	203	40	3	0
2008	171	0	0	0
2009	128	0	0	0
2010	133	0	0	0
2011	121	0	0	50
2012	95	0	0	0
2013	92	0	0	100
2014	88	1	0	0

5. Who provided clean-up services?

In California overall, 42% of spills were cleaned-up on site, usually by onsite personnel or attendants. 28% of spills were grouped as N/A, meaning these spills were either not cleaned up at the time of the call, dissipated, or a clean up was not necessary according to the reporting party. 23% of spills were cleaned by an outside contractor that could be identified as a separate entity from the responsible party. 4% of spills were cleaned by a public agency such as public works, sewer districts, or environmental health departments. The remainder of spills, less than 4%, were cleaned by the fire department, city, or county.

Table 9: Parties responsible for cleaning up hazardous releases in California (2006 – 2014)

	Onsite	N/A	Contractor	Agency	Fire Dept	City	County	Blank	Total
2012	2,894	2,053	1,420	254	100	53	23	7	6,804
2013	2,703	1,836	1,642	290	94	54	24	22	6,665
2014	2,580	1,539	1,454	274	80	67	17	13	6,024
All	8,177	5,428	4,516	818	274	174	64	42	19,493
Percent of Total	42%	28%	23%	4%	1%	1%	0.3%	0.2%	100%

C. Spatial Analysis

1. Spatial Distribution of Oil and Gas Related Spills in Kern County

Due to spill locations that were converted from PLSS to latitude and longitude, the highest spatial resolution shared by all spill and well data is approximately 1 square mile. We represented these data as PLSS sections with values for the number of overlying events. The distribution of these PLSS sections can be seen in Figures 20-22.

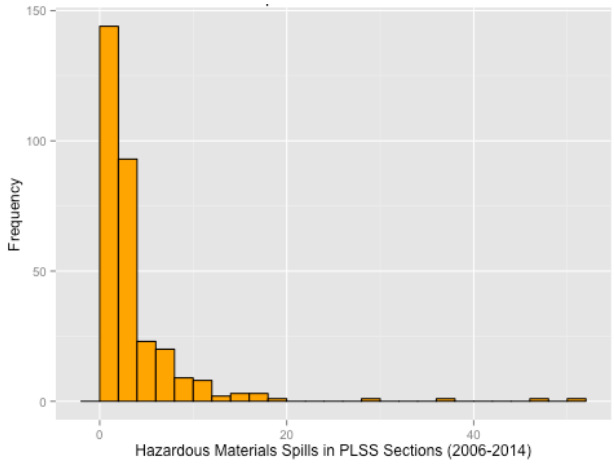

Figure 20: Distribution of hazardous material releases across Kern County PLSS sections (2006 – 2014)

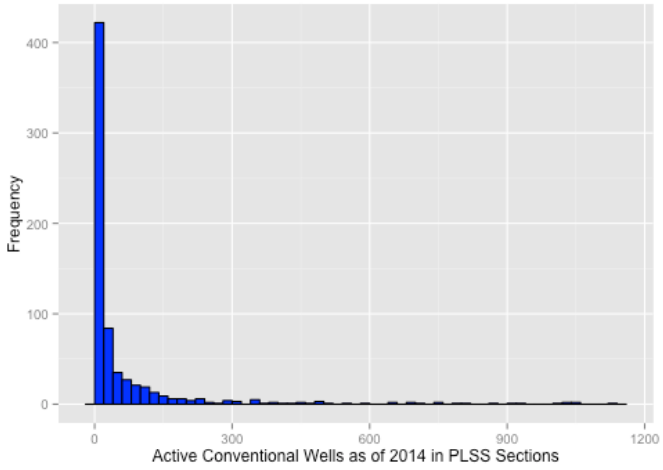

Figure 21: Distribution of convention wells across Kern County PLSS sections (2006 – 2014)

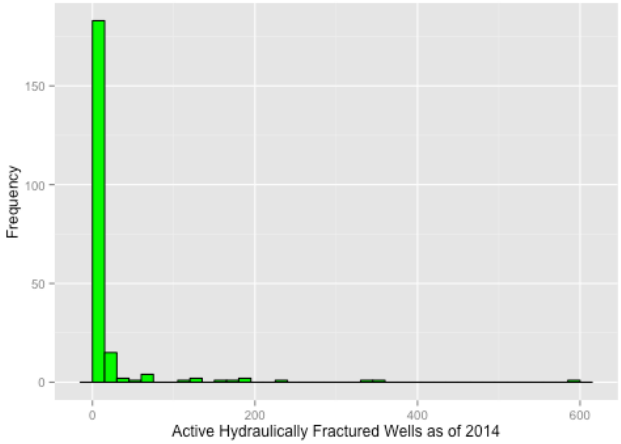

Figure 22: Distribution of hydraulically fractured wells across Kern County PLSS sections (2006 – 2014)

To maintain a scale for these histograms at which all values were visible, PLSS sections with no spills were omitted. The distribution of conventional wells, hydraulically fractured wells, and spills across PLSS sections are strongly positively skewed. This is a consequence of the spatial clustering of wells and spills – there are many PLSS sections with few or no events, and a small number of sections with a great number of clustered events.

2. Spill and Well Density

Figures 23-25 display the densities of wells and oil and gas production spills in Kern County from 2006 to 2014. The majority of wells, both conventional and hydraulically fractured, are located in the oilfields that lie in the western hills of Kern County. The rest are clustered to the north and east of Bakersfield, where several large oilfields reside. Consequently, spills related to oil and gas production are also clustered around those areas but with more sporadic, non-clustered events. This makes sense given that wells are intentionally placed on oilfields and tend to cluster on productive geology, whereas spills are unplanned. Visualizing spill and well density uncovered a number of sites with intensely frequent spills and well activity.

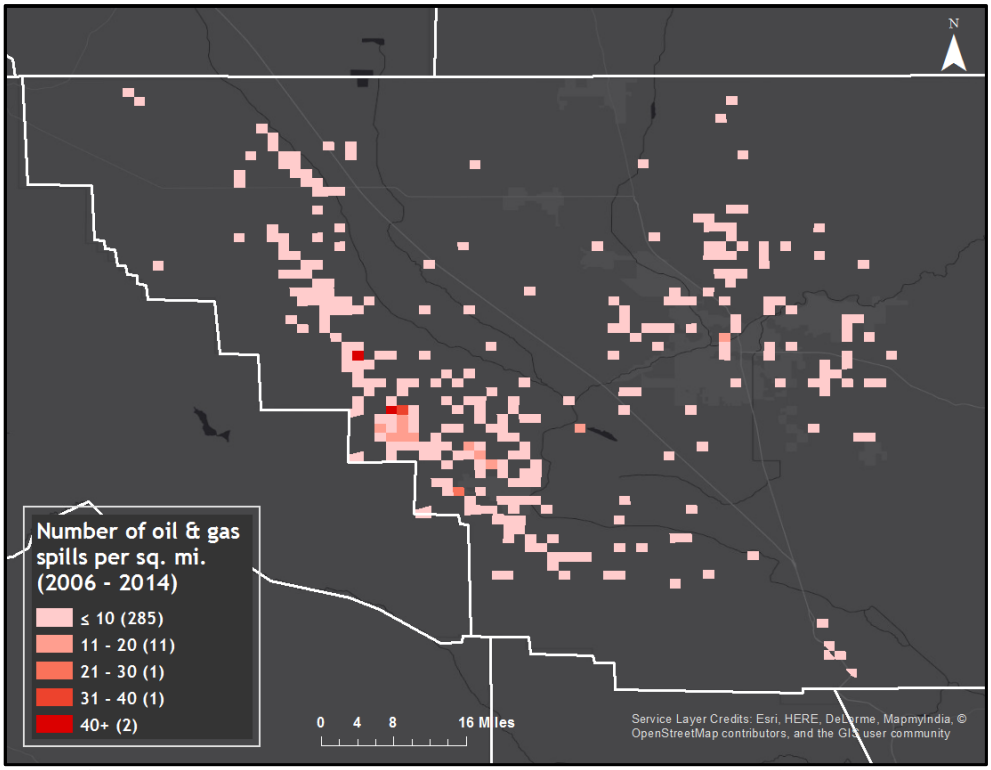

Figure 23: Density map of all hazardous material spills from oil and gas production in Kern County per PLSS section, roughly one square mile. The value assigned to the sections corresponds to the number of all overlying spills that occurred during the study period from 2006 to 2014.

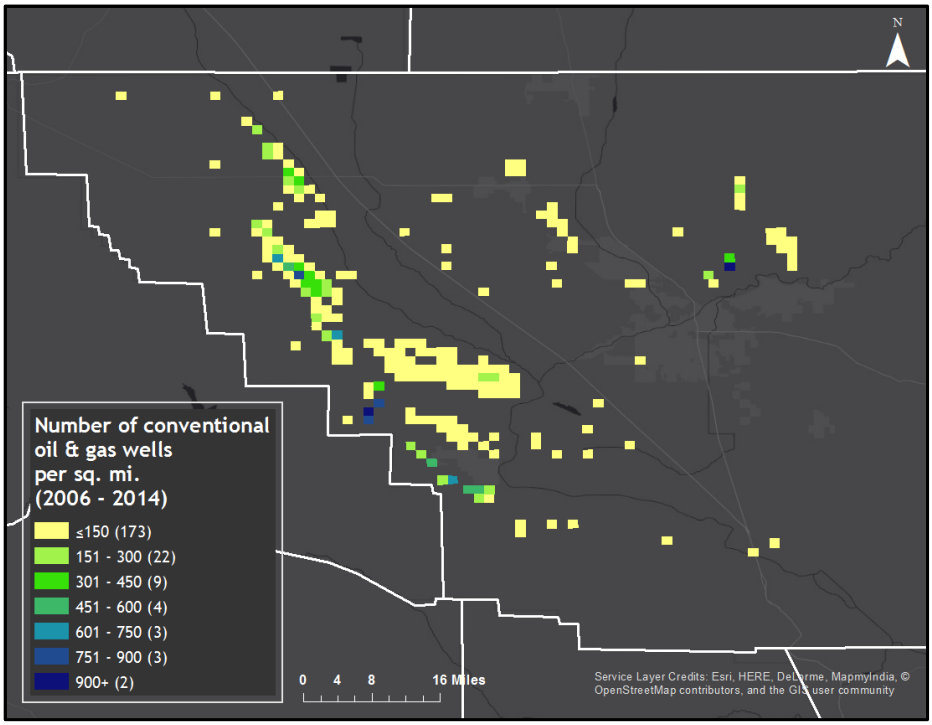

Figure 24: Density map of all conventional oil and gas wells in Kern County per PLSS section, roughly one square mile. The value assigned to the sections corresponds to the number of all overlying active conventional wells as of 2014.

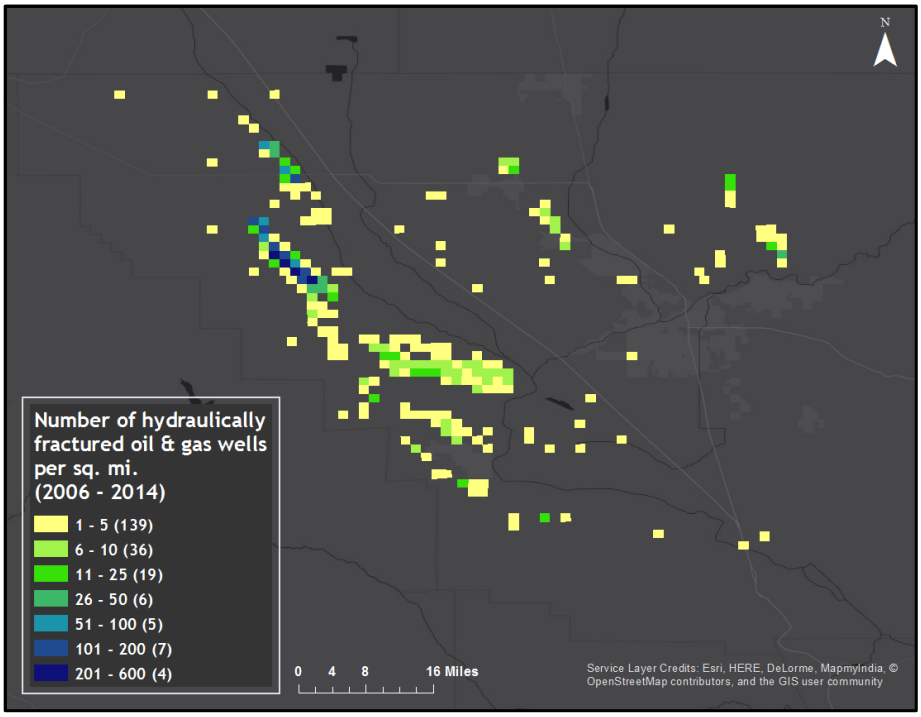

Figure 25: Density map of all hydraulically fractured oil and gas wells in Kern County per PLSS section, roughly one square mile. The value assigned to the sections corresponds to the number of all overlying active hydraulically fractured wells as of 2014.

3. Land Use Analysis

Land designated for human habitation contained 226 conventional wells, 1 hydraulically fractured well, and witnessed 52 spills related to oil and gas production from 2006 to 2014. The overwhelming number of wells and spills were sited on land that was designated by the City of Bakersfield and the County of Kern as agricultural.

Table 10: Land use designations for spills and wells in Kern County (2006 - 2014)

Land Use Type	Number of conventional wells (2006 – 2014)	Number of hydraulically fractured wells (2006 – 2014)	Number of spills (2006 – 2014)
Agriculture	56480	3894	972
Mineral Petroleum	0	0	19
Resource Management Area	3402	22	57
Heavy Industrial	632	0	38
Light Industrial	314	1	9
Service Industrial	242	1	16
Parks and Rec	298	0	1
Low Density	105	2	21

Residential

D. Spills from Conventional and Unconventional Oil and Gas Production

1. Spill volume per unit production in Los Angeles and Kern Counties

Kern County has a higher volume of oil production-related spills per unit of oil produced than Los Angeles County, with 3 gallons of oil spilled per 100,000 gallons of oil produced compared to 2 gallons , respectively. However, other counties such as Santa Barbara and Ventura County exhibit much higher ratios although they contribute less oil production to the state overall. Santa Barbara County has a ratio almost 4 times greater than Kern's, at 11 gallons spilled per 100,000 gallons of oil produced in the county (Table 11).

Table 11: Oil production-related spills per unit of oil produced in the four most productive counties in California

	California	Kern County	LA County	Ventura County	Santa Barbara County
Average Annual Oil Field Spill Volume (gallons)	308,700	217,000	23,600	25,000	13,700
Average Annual Oil Production (Hundreds of thousands of gallons)	87,060	65,830	10,480	3,000	1,290
Oil Spill Density (per every 100,000 gallons of production)	3.5	3.3	2.3	8.3	10.6

2. Effect of Hydraulic Fracturing on Spill Frequency

Table 12 displays the median and average number of spills per well for two sets of PLSS sections – those with hydraulically fractured wells, and those with only conventional wells. The median number of spills per well for each PLSS section is the same for sections with hydraulically fractured wells as it is for those with only conventional wells. The average number of spills per well also does not show an appreciable difference between the two sets of PLSS sections.

Table 12: Average ratio of spills per well for two sets of 1 sq. mi. PLSS sections – those with hydraulically fractured wells, and those with conventional wells but no hydraulically fractured wells.

	Spills per well in PLSS sections with hydraulically fractured wells	Spills per well in PLSS sections with conventional wells but no hydraulically fractured wells
2006	1.69	1.69
2007	6.76	2.14
2008	3.76	3.99
2009	0.78	1.60
2010	7.81	11.26
2011	0.29	1.34
2012	5.33	7.63
2013	0.22	0.25
2014	0.86	0.36
Median	1.69	1.69
Average	3.05	3.36

Our analysis of spill volume per spill for each set of PLSS sections yielded similar results, with slightly lower average spill volume for PLSS sections with hydraulically fractured wells (Table 13).

Table 13: Average ratio of spill volume per spill for two sets of 1 sq. mi. PLSS sections – those with hydraulically fractured wells, and those with conventional wells but no hydraulically fractured wells.

	Average volume per spill in PLSS sections with hydraulically fractured wells (gallons)	Average volume per spill in PLSS sections with conventional wells but no hydraulically fractured wells (gallons)

2006	1361.7	770.3
2007	1777.8	2027.6
2008	2302.5	1556.5
2009	4599.6	1457.4
2010	3664.4	8826.1
2011	2008.2	1233.2
2012	2048.7	4741.0
2013	1476.3	578.9
2014	1542.7	549.5
Average	2309.1	2415.7

VI. Discussion and Conclusions

NRDC proposed eleven research questions for our project, including: the total number and volume of releases reported annually in California, differences in characteristics between unconventional and conventional oil and gas production operations, and seven different general characteristics of hazardous spills including substance, health and environmental effects, location, site characteristics, containment, water body impacts, injuries or fatalities, and clean-up services. The last research objective was to provide conclusions and recommendations to reduce the frequency and severity of spills in California's oil and gas industry.

In general, we were able to definitively answer several questions about spill number, volume, and characteristics. The annual number of spills for all spills, petroleum spills, and LA County spills stays fairly constant throughout the study period. The number of spills for Kern County and Kern County oil and gas, however, decreases over the study period. Likewise, annual spill volume in Kern County and for Kern oil and gas spills is decreasing, mirroring the decrease in California oil production from 207 million barrels in 2009 to 199 million barrels in 2013 (California 2013 Annual Report). The volume of petroleum spills is also decreasing with time, although the number of petroleum spills stays roughly constant.

It is interesting that the number of petroleum spills does not decrease with time but the number of Kern County spills does. This could be due to the fact that petroleum spills also result from highway crashes, spills at gas stations, pipeline leaks, etc. Thus, the petroleum spill and volume analyses do not necessarily imply similar results for oil and gas production.

Our team was also asked to discern any difference in characteristics between conventional and unconventional oil and gas production. Because we were unable to associate specific spills with either mode of production-- no distinction was made in the database-- and the spatial resolution of geocoded spills was limited to one square mile, we were unable to answer this question. A lack of comprehensive data on the year in which wells were drilled also made it difficult for the team to attribute spills in certain years to certain wells.

The database did allow us to answer many questions on spill characteristics. Broadly, about half of all spills are of a petroleum substance, followed by about a quarter of sewage. Looking more closely at spill substance, we found that petroleum spills are heavily split between substances such as diesel, motor oil, or "unknown" oil.

The county with the highest annual number of releases is Los Angeles, followed by San Diego and San Bernardino. Kern County is the seventh highest county in terms of annual spill count.

73% of spills were contained, although it is unclear what exactly that may mean. It is unknown whether the 10% of spills not contained and the 17% unknown were contained after the call or simply were released into the environment without clean-up efforts. When spills were cleaned, efforts were mostly undertaken on-site by the responsible party or not at all, indicating that most spills are smaller in nature and do not require the assistance of the city, county, local government agency, or the fire department.

Our analysis of injuries and fatalities indicates that these spill events are significant and likely disruptive to businesses and local economies, since from 2006-2014 there were a total 15,714 evacuations.

We were not able to answer the questions of spill characteristics that related to health and environmental effects and site characteristics. The spills reported to the database are highly variable, thus it is difficult to predict what kinds of sites are prone to spills or to sum up the wide variety of health and environmental risks that may result from California's hazardous material releases.

An overall conclusion resulting from our study process is that the CA OES data format is incomplete, disorganized, and difficult to analyze effectively. The numerous entries of "unknown" or "N/A" indicate a lack of follow-up data entry. Although follow-up reports are required to be sent to CEPRC, these reports are apparently not coordinated with OES data collection and are not publicly available in an aggregate form. Further, a more user-friendly reporting process, such as online submittal or a mobile application, may fix some of these issues by allowing for more accurate location and substance data.

Similarly, we conclude that more user-friendly DOGGR well data could allow for a more conclusive study on the connection between unconventional oil and gas production and hazardous spills. The team acknowledges the budgetary barriers to modifying the DOGGR website to allow users to download data on specific wells across the state. However, we hope that at least new regulations under SB4 on fracking disclosure will allow for more transparent well locations in the future.

Last, our understanding of spill reporting requirements indicates that the higher spill frequency in Santa Barbara and Ventura Counties may be due to releases entering water and thus forcing the responsible parties to report, even if a spill is under the required reporting threshold. 59% of spills in Santa Barbara affected water, and if these spills had large enough volumes, spill volume per oil production could be affected. Another potential explanation for this pattern is that Kern and LA counties, being the top two oil-producing locations in the state, are more experienced in oil production so as to lower incidents and releases as barrels of production increase.

VII. Recommendations

A. The California Office of Emergency Services (Cal OES)

Compared to the call center currently used to report spills, an online reporting system might be more efficient for both Cal OES and response parties. Instead of doing the calling, people can simply report a spill by filling an online form. In order to make the reporting process more convenient, we suggest designing a mobile application as well.

When reporting the spilled substance, there should be a drop down list for the reporter to choose from in order to avoid the problem of one substance reported in multiple ways. One major reason for one substance reported in multiple ways is the lack of standardization of substance names. For example, hydraulic oil can be reported as

"hydraulic fuel" or "oil - hydraulic type". This can be solved if the drop down list is better constructed and adding searching functions when choosing the substance. Another reason for one substance reported in multiple ways is that people try to add the details of the substances when they report it. For example, diesel can be reported as "diesel, unleaded" or "#2 diesel". Instead of putting these details into the substance name, the new reporting system should allow people to add details of a substance in another field after they choose it from the drop down list.

One major obstacle we encountered when doing the spatial analysis was the inaccuracy of the spill location, especially those spills reported with township and range, because this has extremely low spatial resolution (one square mile). Therefore, it is recommended to require reporting of the well number (where applicable) as well as latitude and longitude. That is another important reason for using an mobile application since it is much easier to report one's latitude and longitude using a smartphone.

Moreover, too many of the database's fields are listed as "unknown" when describing the material, the amount released or clean-up methods. It is possible that sometimes the caller is unsure about the spill volume and doesn't know who is responsible for the cleanup, but this information needs to eventually be provided. There should be a follow-up requirement, especially for spills over threshold volume (e.g. oil spills over 42 gallons). to provide the data initially missing, thereby improving the completeness and utility of the database.

Finally, CA OES should produce an annual report of hazardous material spills and make it publically available. Currently, this information is not being disseminated or discussed.

B. The California Division of Oil, Gas, and Geothermal Resources (DOGGR)

Any robust analysis of well activity in California is severely limited by the data made available through DOGGR. Although the AllWells database included comprehensive identifying information for each well, like API number, operator, and spud date (when drilling begins on a well), there is no production information, drilling completion date, and the vast majority of abandonment dates are left blank. This information exists on DOGGR Well Finder, but the configuration of that database is such that users must click on wells individually in the interactive map to access information. Both our research and the SB 4 interim report conducted by CCST found that accessing this information in any large quantity was impossible. So that their data is useful to interested parties, we recommend that DOGGR allow users to download this information in bulk. To reduce downloads to a reasonable size while still encouraging bulk download for holistic research, DOGGR could restrict bulk download to individual oil fields or survey townships.

VII. Appendices

Appendix A:

Cal OES updated spills notification database:

http://www.caloes.ca.gov/cal-oes-divisions/fire-rescue/hazardous-materials/spill-release-reporting

Appendix B:

Formatting changes to spill quantity.

- Taking the midpoint of any quantities given in range format, such as 10-20 (changed to 15) or Apr-5 (actually Excel mis-formatting for 4-5, changed to 4.5)
- Taking the midpoint of any "less than" quantities (Less than 100 changed to 50)
- Making conversions where possible, such as changing 100 cubic yards to cubic feet
- Making positive any negative quantities
- Some quantities had to be thrown out, such as "more than" quantities, unknown quantities, sheen, time dependent values such as gallons per minute, concentrations, such as parts per million, or estimations such as "a drop" or "several thousand".

Appendix C:

Determining the party responsible for spill cleanups.

- N/A: entries including "n/a", "no", "not necessary", "substance dissipated", etc
- Onsite: entries including "onsite", "personnel", "attendant onsite", etc
- Contractor: entries including the keyword "contractor" or the name of a confirmed environmental contractor
- Public Agency: entries including public works, sewer districts, environmental health departments
- Fire Department: City or County fire department
- Private Company: A private entity cleaned the spill, aside from a private contractor, such as "Chevron" or "SoCal Gas"
- Other: entries that did not fall into any of the above category, less than 10 per year

Appendix D:

EarthPoint PLSS Conversion service used to get the latitude and longitude for Kern County oil and gas production releases that were reported as township and range.

http://www.earthpoint.us/TownshipsSearchByDescription.aspx

Appendix E:

Extended background research.

I. Introduction

In recent years there has been a rapid development of well stimulation treatment (WST) technologies such as hydraulic fracturing, acid fracturing, and matrix acidizing within the United States (Long et al, 2015). In California, for more than 30 years, oil and gas companies have utilized WSTs as production stimulation methods to increase recovery of conventional oil and natural gas reservoirs (Long et al., 2015). An independent assessment by the Lawrence Berkeley National Laboratory on the subject of WSTs found that, in the last decade, this unconventional oil production method has grown to about one fifth of total production in the state (Long et al, 2015).This assessment found that operators have used hydraulic fracturing on 125 to 175 wells out of the approximately 300 wells drilled each month in California. The independent assessment also concludes that almost all hydraulic fracturing in California occurs primarily in the fields of the San Joaquin Basin, particularly in Kern County, where oil is the primary resource obtained.

Of particular importance to this literature review is a 2014 study conducted by *EnergyWire* (Soraghan, 2014) that found that, although drilling activity decreased in 2013 across the country, the number of spills at oil and gas production sites increased by about 17%. This study determined that the combined volume of spills in 2013 included more than 26 million gallons of oil, hydraulic fracturing fluid, wastewater, and other miscellaneous fluids, all of which are dangerous to humans, animals, and the environment. Although the study states that the increase in spills may be caused by changes in reporting practices, such as lower spill reporting thresholds, there has been no quantitative examination of the cause for the increase in spills. Therefore, an analysis of the relationship between unconventional oil and gas production technologies and the increased frequency of hazardous material gas spills is urgently required.

Our research will attempt to address this need. [for your final paper, this is where you would expand to include an overview of the entire report, but this is fine for now] After reading this literature review, the reader should better understand (1) how conventional and unconventional oil and gas production processes differ, (2) the potential environmental and public health risks are of both types of production, and (3) the regulatory landscape of oil and gas production and hazardous material spills in California.

II. Traditional Oil and Gas Production

A. Production Process

Once an oil or natural gas reserve is identified, the process of preparing the land for production begins. First, the land must be researched to compile an environmental impact assessment. To prepare the location for drilling to commence, the area must be cleared and

leveled to accommodate the drilling platform. In remote regions, access roads will be constructed (Freudenrich, 2010).

Once the land is ready, drilling can begin. To start the drilling, first a large shallow hole is constructed and lined with a conductor pipe (Freudenrich, 2010). There are seven primary components to an oilrig. The power system includes a powerful engine to provide the power for drilling. The mechanical aspect of the rig is made up of a hoisting apparatus and a turntable. The mechanism that enables rotary drilling is composed of a swivel, Kelly (polygonal tubing), turntable, drill pipe, drill collars, and drill bits. Casings provide structural support for the well. The circulation system of the rig pumps the drilling slurry into the earth at strong pressures. The derrick is the most visually recognizable aspect of the oilrig apparatus. This structure is the tall support structure that can be seen for a distance. To prevent hazards, blowout preventers mitigate pressure buildups that can lead to spills (Freudenrich, 2010)

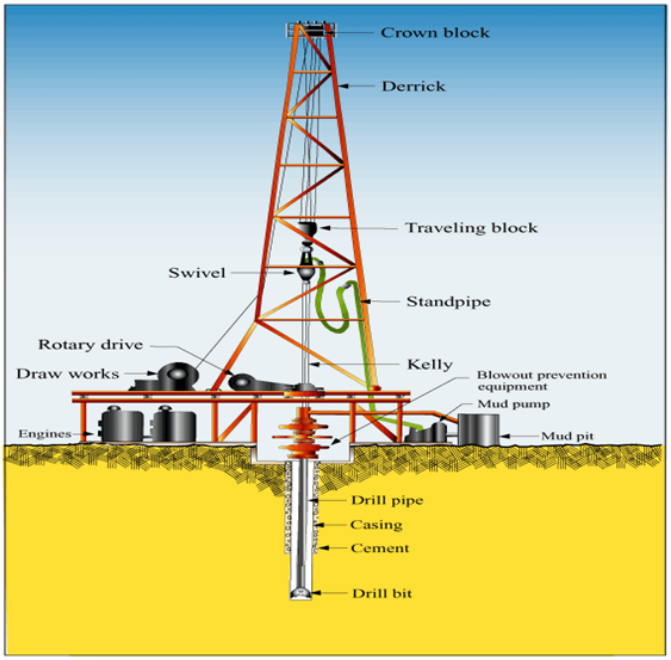

Figure 1: Oil Right Anatomy. (Source: California Department of Conservation, 2013).

Once this rig is constructed, drilling begins. Operators drill to a depth known to be above the depth that oil is expected. Once this depth is reached, cement casings are installed in the well hole to provide structural support for the system. From here on, drilling is done incrementally. Operators drill, then reinforce, then drill, and so on until they reach the oil reserves (Borchart, 1989). Once the well casing is in place, oil flow can be established through the rig. This is achieved by using a device called a perforating gun to create holes, which allow oil to flow into the well casing (Borchart, 1989). Tubing is lowered into the

well to bring oil and gas to the earth's surface. To initiate the flow of oil or gas through the well, a perforating gun is lowered into the depths of the well and used to puncture holes in the well walls. This gun often uses high-pressure gas or fires some sort of projectile to perform this function (Borchart, 1989). With the oil flowing, the oilrig is removed and the extraction process beings.

With the removal of the oilrig, a pump is installed on the well. This pump has a lever that is driven by an electric motor. The pump brings oil up the well by creating suction. In cases where the oil is too thick to pump up the well by these means, a process called enhanced oil recovery is applied. Enhanced oil recovery may be able to assist in the capture of 20-40% of the reservoir's original capacity (U.S. Department of Energy, 2015). In this process, a second hole is drilled into the same oil reserve. Steam is injected into this hole, which loosens the thick oil making it less viscous and freer flowing up the well (Freudenrich, 2010). Gas injections are sometimes used to assist in pushing the oil to the Earth's surface.

B. Chemicals Used

There are a multitude of chemicals used in the process of traditional oil and gas production. Over the lifetime of an average oil or gas production well, hundreds of different chemicals will have been injected. There are four primary chemical classes used in the oil and gas production industry, seen below in Table 1.

Drilling Completion Fluid Additives, commonly referred to as drilling muds, serve the purpose in assisting the drill bit in performing its duty. These chemicals lubricate and cool the drill bit. By doing so, drilling can be faster, safer, and reach greater depths. (Borchart, 1989)

Cementing additives are used in the cement slurry used to make the well walls. These chemicals serve the primary purpose of controlling the amount of time the cement takes to set and the strength of the cement once it is set. The cement casing must be capable of sustaining immense pressure along with a great amount of wear and tear over the lifetime of the well (Borchart, 1989). These cement additives are intended to make the well more durable, enabling the cement to survive against corrosion and other natural occurring phenomenon that can damage the well structure over time.

Completion Fluids are used in the final stages of preparing the well for production and continue to be used throughout the well's lifespan. Their first function is assisting the perforating tool in penetrating the well wall in a controlled and effective way. Once this is complete, different chemicals are used during the extraction of oil and gas. These chemicals serve a wide variety of purposes, including reducing loss of fluids, altering viscosity of the product, and maintaining the well in working condition. (Borchart, 1989)

Table 1: Chemicals used at oilfield well sites (Source: Ailey, Clouse, Hill, 1997)

Drilling Completion Fluid Additives	Cementing Additives	Stimulation Fluid Additives	Production Chemicals
Deflocculants	Accelerators	Bactericides	Bactericides
Defoamers/Foamers	Dispersants	Breakers	Demulsifiers

Fluid-loss reducers	Extenders	Clay stabilizers	Gels
Lubricants	Fluid-loss reducers	Corrosion inhibitors	Inhibitors
pH controllers	Gas migration controllers	Crosslinkers	Oxygen Scavengers
Pipe-freeing agents	Retarders	Diverting agents	Surfactants
Polymeric viscosifiers	Spacers and chemical washes	Fluid-loss reducers	
Shale inhibitors		Mutual solvents	
Specialty Salts		pH controllers	
Surfactants		Polymeric viscosifiers	

C. Potential Pollution Pathways

There are a variety of negative environmental effects that come as a byproduct of the normal process of drilling, extracting, transporting refining, and using these resources (Soraghan, 2014). However, for the sake of this study, it is relevant for us to focus only on the pollution that can occur on oil fields as a result of oil and gas production. These oil and gas reserves are under severely pressurized conditions, so once drilling reaches the reserve these substances can escape their previous confinement with great force.

In the event of an abnormal event at an oil or natural gas extraction site, catastrophic effects to the environment may be incurred. Despite improved technology in drilling and extraction techniques, spills do still occur. Regions exposed to major oil spills have historically taken a great period of time to recover (Office of Indian Energy and Economic Development, 2015). In the case of oil spills, there are a few natural processes that work to rid the area of the spilled material. Firstly, some evaporation of hydrocarbons with low boiling points occurs over the course of a few months. Similarly, dissolution of hydrocarbons also targets the molecules with low boiling points. Dissolution is an extremely slow process, though. Biochemical degradation of the spill is dependent upon the presence of proper nutrients to support the necessary plant or bacterial organisms. If these nutrients are present, this process can occur very quickly (Blumer, Ehrhardt, and Jones, 1973). The Office of Response and Restoration is responsible for responding to hazardous materials spills. Under the National Contingency Plan, the National Oceanic and Atmospheric Administration is charged with providing scientific support for spills. Implications of oil spills linger for many years and have irreversible effects on the environment. (U.S. Environmental Protection Agency, 2014b)

III. Non-Traditional Oil and Gas Production: Well Stimulation Treatments

A. Production Process

Hydraulic fracturing, often called "fracking", is a well stimulation process used to extract oil and natural gas from reservoir rocks of low permeability, usually fine-grained sandstones and shales (FracFocus, 2015a). In hydraulic fracturing, large amounts of water and chemical additives are injected into a well at high pressures to fracture the rock formation and allow for extraction of the trapped hydrocarbons. These rock formations lay thousands of feet below the water table (Halliburton, 2015). The amount of water used can vary from 50,000 - 350,000 gallons for tight formations and up to 5 million gallons for shale formations (EPA, 2012b). Once the rock is fractured, the pressure between the petroleum-bearing rock pores and the wellbore must be equalized, so proppants such as sand or ceramic beads are pumped in to prop fractures open and allow for oil or gas to flow up the well (Daneshy, 2010).

After hydraulic fracturing has occurred but before production begins (i.e. before oil or gas begins flowing through the well), fracturing fluid may return through the wellbore to the surface as flowback water which is then stored and reused in other drilling operations. However, up to 90% of fracking fluid may remain underground (Lutz et al., 2013). After production has begun, "produced water", which has had contact with oil and gas, returns to the surface (Geological Society of America, 2015; EPA, 2012b).

California's largest shale plays are the Monterey and Monterey-Temblor formations. These make up an active drilling area of 1,752 square miles across the San Joaquin and Los Angeles basins. Based on available well data, an estimated 100 to 150 wells per month are hydraulically fractured in California, mostly for heavy crude oil (Jordan et al., 2014). Some wells are stimulated using acidization in which acids, generally hydrochloric (HCl) or hydrofluoric (HF), are injected into wells to dissolve rocks and permit access to oil and gas reserves (Jordan et al, 2014). Currently, acidizing occurs about 10% as often as fracking in California, and like fracking, is concentrated almost entirely in the San Joaquin Basin. Most experts do not foresee acidizing becoming a significant WST in California on par with fracking, mainly due to the lack of carbonate reservoirs in which acidizing is most effective (Jordan et al., 2014). For this reason, the literature review will focus mostly on the environmental hazards of hydraulic fracturing which accounts for about 20% of oil production in California (California Council on Science and Technology, 2015).

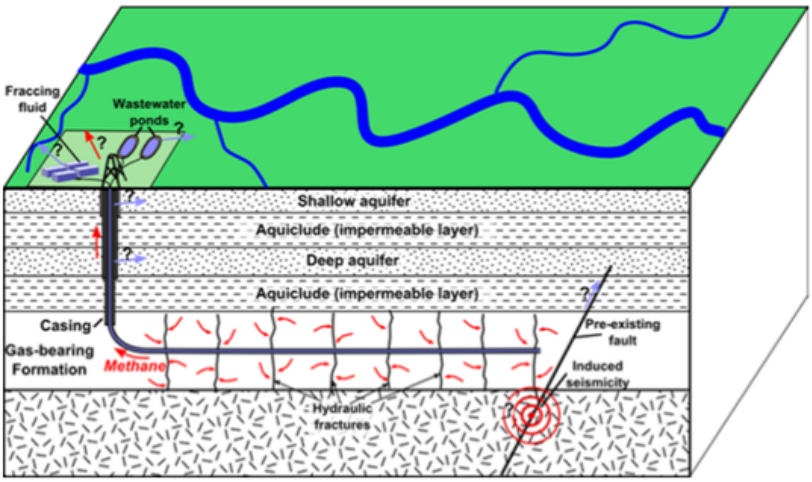

Figure 2: Potential pathways for fluid migration in horizontal hydraulic fracturing well (Source: Geological Society of America, 2015).

B. Chemicals Used

Although water comprises over 99% of fracking fluid by weight, a variety of chemicals are also used. The composition of fracking fluid is adapted to the requirements of each well. Common components include acids to dissolve material and reduce clogging, friction reducers, and surfactants to improve flow through pipes (Colborn et al, 2011).

In 2011 the Congressional Committee on Energy and Commerce conducted a study on chemicals in hydraulic fracturing products. The committee sent letters to 14 oil and gas companies asking for the chemical content of their fluid between 2005 and 2009. They received a list of 2500 products and 750 chemicals used by 14 companies (Waxman, 2011). Ingredients ranged from salt and citric acid, to instant coffee and walnut hulls, to the very toxic chemicals benzene and lead. The most widely used chemical was methanol (found in 342 products), followed by isopropyl alcohol (274 products), 2-butoxyethanol (126 products) and ethylene glycol (119 products). BTEX chemicals (benzene, toluene, ethylbenzene, and xylene) were found in 60 products (Waxman, 2011). Twenty-nine of the reported products were known or possible carcinogens, regulated contaminants under the Safe Drinking Water Act, or hazardous air pollutants under the Clean Air Act. Additionally, many unconventional oil and gas operators use proprietary chemicals in their fracking fluids. These "trade secret" chemicals are protected from disclosure (Waxman, 2011).

When flowback water returns to the surface, it is made up mostly of the original fluid and chemical mix with a salinity content that increases as a function of time since initial injection. Produced water, on the other hand, contains hydrocarbons as well as naturally occurring chemicals from within the rock formations. These chemicals typically include hyper saline reservoir water, oil and other hydrocarbons, and toxic elements like radium, barium and strontium. All of these chemical characteristics vary with the geology of the exploited formation (Vengosh et al., 2014).

Due to the overlap of many chemicals used in both processes, it is difficult to differentiate between spills and contamination from traditional oil and gas operations and those from WSTs. However, efforts have been made to more effectively and appropriately attribute spills to WSTs, such as using boron and lithium as tracers from shale formations (Warner et al., 2014). These techniques, coupled with greater transparency for proprietary chemical disclosures, are promising advances in tracing spills and contaminant migration to unconventional oil and gas sources.

C. Pollution Pathways

In hydraulic fracturing, waste materials are generated during both the fracturing and production phases. The main areas of concern lie in pollution from aboveground spills during the handling, transport, and storage of waste and in the potential for unrecovered subsurface fracturing fluid to migrate to aquifers. Similar concerns surround the potential for groundwater contamination from natural gas leaks around fractured wells (Vengosh et al., 2014). Pollution pathways are divided into direct and indirect processes.

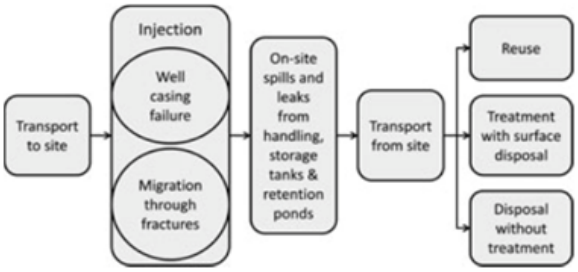

Figure 3: Potential pollution pathways for hydraulic fracturing. (Source: Rozell & Reavan, 2012)

1. Direct Pollution

Direct pollution is the (mostly subsurface) contamination of soil or groundwater resulting from high-pressure fracturing and the withdrawal of fluids and hydrocarbons. There is concern that the high-pressure fracturing process can create pathways for fracking fluid and hydrocarbons, especially methane, to migrate into aquifers used for drinking water and irrigation.

Well-casing failures represent another subsurface pollution pathway. The wellbore for hydraulic fracturing consists of multiple concentric steel tubes surrounded by cement for multiple layers of protection against leakage (FracFocus, 2015b). The outer cement layer is often the weakest link in a fracking wellbore, with as much as 10 - 50% of shale wells in parts of Pennsylvania suffering cement damage (Vengosh et al., 2014). Even without casing leaks, seal failure near the mouth of the wellbore are common in the petroleum industry and can allow stray gases to flow up through the gaps between concentric pipes (Darrah et al., 2014). According to one estimate, the rate of seal failure is 1-3% in the Marcellus Shale (Vidic et al., 2013). Consistent with the studies above, statistical analysis of hydraulic fracturing contamination events suggests that well failure, not high-pressure fracturing, causes most groundwater pollution (Darrah et al., 2014).

Another study, which analyzed pollution risk using models based on best and worst case probability bounds, suggested that fluid migration through fractures is a high potential

risk, but waste disposal contamination risk is several orders of magnitude larger (Rozell et al., 2012). In nearly all studies of this kind, uncertainty over pollution pathways made it difficult to determine the degree of threat posed by fluid migration. Nearly all studies emphasize the much greater risk that mishandling, illicit dumping, and unregulated disposal of produced water waste poses to natural resources in the U.S.

2. Indirect Pollution

Indirect pollution is soil or water contamination resulting from processes related to hydraulic fracturing that occur beyond the fracturing and withdrawal process. This includes the transport, storage, and disposal of flowback and produced water.

Although hydraulic fracturing generates less wastewater than conventional methods per unit of resource produced, especially in California, proper disposal of produced water from unconventional oil and gas operations is a serious environmental concern (Lutz et al., 2013). According to an EPA study, the most common disposal process for hydraulic fracturing waste involves separating fracturing fluids from the recovered oil and gas, pumping it into trucks, treating it to proper disposal standards at a plant, and injecting it into wells (California Research Bureau, 2014). Every step of this process presents a possible pollution pathway for produced water. Wastewater treatment facilities are sometimes used for disposal, but are often unable to completely remove the radioactive elements and total dissolved solids (TDS) that produced water carries (Lutz et al., 2013). Because of this, between 95-98% of wastewater from fracking in the US is injected into Safe Drinking water Act (SDWA) Class II underground injection control (UIC) wells (see section Oil and Gas Regulations) (Lutz et al., 2013).

Offsite commercial disposal is used mostly by small operators for whom building, running, and closing an onsite disposal facility is not economically feasible (Argonne, 2009). In California, the water that is not injected underground is mostly disposed of through settling ponds or is treated for beneficial reuse, such as agriculture (Argonne, 2009). In Kern County, increased scrutiny has fallen on the use of unlined ponds for produced water disposal. Several studies, including one in 2014 by Clean Water Action, demonstrated that waste in unlined pits near McKittrick, CA migrated into wells used for irrigation and drinking water (Clean Water Action, 2014).

IV. Public Health and Environmental Effects of Well Stimulation Treatments

A. Water Pollution:

This review looked for instances of the release of chemicals from fracturing operations into water resources via the pathways previously discussed. Excluded were studies on the disposal of treated hydraulic fracturing wastewater directly into surface waters, as the majority of fracturing fluid in California is disposed of via underground injection or in wastewater pits (DOGGR, 2014). The discussion below includes two studies on contamination of water resources via underground pathways, one on surface spills, and one on instances of improper underground injection disposal of hydraulic fracturing waste.

1. Indirect:

A study by Gross et al., in the *Journal of the Air and Waste Management Association* analyzed whether surface spills at hydraulic fracturing operations led to groundwater contamination, specifically of benzene, toluene, ethylbenzene, and xylene (BTEX) chemicals. The Colorado Oil and Gas Conservation Commission (COGCC) database provided data on surface spills at sites in Weld County, Colorado between July 2010 and July 2011 (Gross et al, 2013). Researchers analyzed 77 spills. Groundwater samples collected at the spill sites showed that benzene levels were 2.2 times higher, toluene levels 3.3 times higher, ethylbenzene levels 1.8 times higher, and xylene levels 3.5 times higher than groundwater samples collected outside the spill area. BTEX levels tended to decrease rapidly with time and distance from the spill site (Gross et al, 2013). However, the study serves as a demonstration of the potential of surface spills to directly affect groundwater quality.

The second study provides a recent example of mismanagement of underground fracking wastewater disposal occurred within Californian Class II injection wells. In September 2014, the State Water Board conceded to the EPA that 9 underground injection control wells injected wastewater from natural gas operations into drinking water aquifers protected under the Safe Drinking Water Act. The board tested 8 public wells within a 1 mile radius of the UIC wells in question and found that four exceeded the Maximum Contaminant Level (MCL) for nitrate, arsenic, and thallium (Bishop, 2014; Schon, 2014).

2. Direct:

A study by Fontenot et al., in *Environmental Science and Technology* looked at water quality in 100 private wells surrounding the Barnett Shale formation in North Texas. Historic levels of arsenic, nitrates and volatile organic compounds (VOCs) from the United States Geological Survey were compared to current groundwater quality in 91 wells within a 5 kilometer radius of active natural gas extraction operations, 4 wells with no active operations within a 14 kilometer radius, and 5 inactive, control wells (Fontenot et al, 2013). The results showed that mean total dissolved solids (TDS) in active extraction areas exceeded the maximum contaminant level (MCL) set by the EPA, but historical data indicated similar levels for the region. Similarly, researchers observed methanol and ethanol in samples from both the active and inactive study areas. The chemicals were not correlated with distance to the nearest gas well (Fontenot et al, 2013). The constituents found to be higher in active areas than inactive areas were arsenic, selenium, and strontium. The researchers suggest a variety of contributing factors to this contamination, including mechanical disturbances from drilling activity, reduction of the water table from groundwater withdrawals, and faulty drilling equipment and well casings (Fontenot et al, 2013).

A study by Osborn et al., in the *Proceedings of the National Academy of Science* looked at methane contamination in drinking-water wells in the Marcellus and Utica shale formations in northeastern Pennsylvania and upstate New York, comparing wells within areas of active natural gas exploration and wells in inactive areas. Of 60 wells studied, 51 showed methane contamination. Concentrations of methane were 17-times higher nearby natural gas drilling operations (Osborn et al, 2011). Even more, the authors used stable isotope analysis to differentiate between shallow, naturally occurring methane and deep, thermogenic methane

associated with fracking. Thermogenic methane was found to be the source of contamination at active sites, while biogenic methane was common at inactive sites (Osborn et al, 2011). The study also looked at general groundwater contamination associated with fracturing fluids. Using a contemporary sample of 68 wells and the historical data of 124 wells in the Catskill and Lockhaven aquifers, the researchers used three indicators of contamination: major inorganic chemicals, stable isotope signatures of water, and isotopes of dissolved constituents. The study found no connection between active drilling areas and general contamination in nearby wells (Osborn et al, 2011).

It is important to keep in mind that much of the literature on public health effects of WST fluid or spill contamination is limited by knowledge of the specific chemical composition of fracturing fluid. Incomplete MSDS information, a lack of Chemical Abstract Service (CAS) numbers to uniquely identify chemicals and chemical mixes, and trade secret claims by operators limited the all of the above studies and others of their kind. In addition, without baseline information on water quality or isotope tracking, it is difficult to impossible to causally link hydraulic fracturing operations to groundwater contamination. The study by Gross et al provided no measure of historical background levels of BTEX, therefore causality is not certain. In fact, a review by Samuel Schon faults the study by Osborn et al., for not providing geochemical measurements of dissolved methane (Schon, 2014).

Next, it is worthy to note that many of the studies on hydraulic fracturing chemicals and accidental release come from outside California. The study from the *Journal of Human and Ecological Risk Assessment* obtained product and chemical information from Colorado, Wyoming, New Mexico, Texas, Washington, Montana, Pennsylvania, and New York. The three other cited studies come from the Barnett, Marcellus, and Utica shale formations. In all, much of the published literature on hydraulic fracturing and its effects on groundwater are from study areas outside of California, likely due to the fact that the state does not have as extensive of a hydraulic fracturing industry as other parts of the US (US Department of Energy, 2011). Thus, one should keep in mind the difference between California fracking and general American fracking amount when weighing the probability of groundwater quality damage from fracking.

In all, the above studies give context for the public health concerns of hydraulic fracturing fluid and the ways in which it may enter groundwater. More research is needed to steadfastly claim a causal connection between fracking and groundwater contamination; however, data point to probable risk.

B. Air Pollution:

A recent independent study by P. Macey et al, "Air Concentrations of Volatile Compounds near Oil and Gas Production" examined the air concentrations of volatile compounds in hydraulic fracturing sites through a community-based exploratory study in five American states: Ohio, Pennsylvania, Arkansas, Colorado, and Wyoming. A total of 75 volatile organics were measured through passive air samples near industrial operations. Levels of eight of these volatile chemicals were found to exceed federal guidelines (Macey, 2014). Benzene, formaldehyde, and hydrogen sulfide were the most common compounds to exceed acute and other health-based risk levels (Macey, 2014). For instance, the exposure to benzene experienced in five minutes at one Wyoming site was equal to the exposure experienced living in LA for two years. Benzene is known to cause irritation of the skin, eyes, and upper respiratory tract (U.S. EPA 2011). Long-term exposure may cause blood

disorders, reproductive and developmental disorders, and cancer (Outdoor Air, 2011). Hydrogen sulfide levels in the Wyoming site were also 90 to 60,000 times greater than the recommended levels at one given time during the study period (Francis, 2014). Hydrogen sulfide can cause respiratory tract and eye irritation, headaches, poor memory, and loss of appetite among other symptoms (Francis, 2014).

C. Environmental Justice

According to the EPA, environmental justice is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies (U.S. EPA, 2014a).

A study by Srebotnjak et al. examined which communities were the most disproportionately at risk due to oil and gas drilling in California. According to their research, approximately 5.4 million Californians (14 % of the state's population) live within one mile of an existing oil and gas well (Srebotnjak, 2014). In addition, 1.8 million of these individuals live in already environmentally polluted areas (Rotkin-Ellman, 2014). Approximately 92% of the individuals within those 1.8 million are people of color. The demographics of the population living near wells in California consist primarily of Hispanics/ Latinos (Srebotnjak, 2014).

A separate study analyzed one particular oil and gas community in Kern County, California. Kern County has more than 63,000 of the state's 84,434 active and new oil and gas wells (Rotkin-Ellman, 2014). The researchers found that one in three residents live within one mile of an oil or gas well (35% of the county's population) (Rotkin-Ellman, 2014). These individuals are at a greater risk of potential health impacts. According to the Desert Renewable Energy Conservation Plan, Kern County's total population size is about 839,153 with 61.4% belonging to a minority group (Desert Renewable Energy Conservation Plan, 2014). The percent of low-income individuals in Kern County is 22.5%. California as a whole has a minority population of 59.9%, with 15.3% falling within the low-income population. (Desert Renewable Energy Conservation Plan, 2014)

V. Oil and Gas and Hazardous Material Regulation

A. Oil and Gas Regulation

Oil and gas production is subject to regulation at the state and federal level, although with many exemptions as described further below. Those regulations include the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), the Clean Water Act (CWA), the Safe Water Drinking Act (SDWA), and the Resource Conservation and Recovery Act (RCRA) (U.S. EPA 2014b; U.S. EPA, 2006). A specific point of concern is the regulation of hydraulic fracturing, which is also occasionally exempted from regulations placed on conventional production. There are many agencies that intersect with oil and gas production regulation, including the US Environmental Protection Agency (EPA), the Department of Oil, Gas, and Geothermal Resources (DOGGR), the Department of Energy, and the Department of Conservation. At the federal level, the US EPA has constructed some legislation that applies to oil and gas

production. At the California state level, regulation was nearly nonexistent until the passage of Senate Bill 4 (signed into law on Sept 20, 2013).

The US EPA monitors conventional oil and gas production. The oil and gas industry is subject to regulation under the CWA and the SDWA. Under Section 311 of the CWA, regulations mandate prevention and preparedness for oil discharges into navigable waters of the US. A 1994 amendment also requires that storage facilities prepare Facility Response Plans for such an event (U.S. EPA, 2014b). In addition, oil companies may apply for National Pollutant Discharge Elimination System (NPDES) permits for the discharge of wastewater, under section 402 of the CWA (U.S. EPA, 2012). Furthermore, conventional oil and gas production is subject to air pollution standards under the CAA that reduce emissions of smog-forming volatile organic compounds. (U.S. EPA, 2015).

Hydraulic fracturing and other WSTs have been exempted from major components of environmental legislation. This includes exemption from the Safe Water Drinking Act and the Clean Water Act (Brady, 2012). This exemption was placed into effect after 2005 amendments to the Energy and Policy Act freed water contamination from WSTs from regulation (Rabe, 2013). The exemption states that underground injection control requirements do not have to be adhered to unless diesel fuels are part of the mixture being injected to frack the well (Clean Water Action, 2014). However, the EPA mandates that storm water regulation and spill prevention, control, and countermeasure plans be created to prevent the release of toxic chemical discharge into water supplies.

In California, the Division of Oil, Gas and Geothermal Resources (DOGGR), which is a subdivision of the Department of Conservation, monitors oil and gas production in California. DOGGR oversees the drilling, operation, maintenance, and plugging and abandonment of oil, natural gas, and geothermal wells (California Department of Conservation, 2014). DOGGR is also responsible for the administration of the California Environmental Quality Act (CEQA) over oil and gas development in the state. CEQA is designed to identify potential environmental impacts and to avoid or mitigate environmental damage (California Natural Resources Agency, 2014). Similar to CEQA notification is the Emergency Planning and Community Right-to-Know Act. This requires that companies and manufacturers release a detailed Toxic Release Inventory for chemicals utilized and released into the environment. However, the oil and gas industry is completely exempted from this TRI reporting.

In recent years, DOGGR acknowledged the gaps in regulations placed on oil and gas production and the information provided to the division about hydraulic fracturing (California Department of Conservation, Division of Oil Gas and Geothermal Resources (DOGGR), 2014). In 2011, Fran Pavley, a California state senator, requested information on hydraulic fracturing in California from DOGGR. The agency had "no information" on water use, "no data on the safety, efficacy and necessity" of WSTs and "no permitting process" relating to hydraulic fracturing (Sharp, 2012). In response, Pavley drafted Senate Bill 4 in 2013, passed in September 2013, which directly deals with WST reporting. SB4 will be discussed in detail in the next subsection.

Table 2: Regulations on Oil and Gas in California and the United States. (Source: U.S. EPA, 2002, 2012, 2014b; Brady, 2012; Clean Water Action, 2014; California Natural Resources Agency, 2014)

Regulation	Content	Traditional Production	Non-Traditional Production

CERCLA	Cleans up controlled releases of specified hazardous substances.	Regulated when oil discharge reaches waters of the United States. Must be reported if discharge creates a "sheen" or "film." However, some toxic chemicals included on the hazardous substances list are exempted if they are included in oil and gas production.	Same as traditional production.
Clean Water Drinking Act	Regulates discharges of pollutants into waters of the United States.	Excludes sediment as a pollutant when it is generated from oil and gas production.	Same as traditional production.
Safe Water Drinking Act	Protects America's drinking water from pollutants, whether it is from groundwater or above ground resources.	Not exempted from regulation.	Exempted from SWDA. However, if diesel is used to frack a well, a SWDA permit must be issued.
RCRA	Governs disposal of solid and hazardous wastes.	Exempts oil and gas produced water, and drilling fluids from requirements for monitoring and disposal.	Hydraulic fracturing fluids and produced waters are exempted.
Emergency Planning and Community Right-to-Know Act	Requires companies and manufacturers meeting specified criteria to report detailed Toxic Chemical Reports.	Exempted, even if criteria is met.	Exempted, even if criteria is met.
Senate Bill 4	Specific to WSTs. Requires filing of satisfactory certifications under penalty of law. This includes monitoring of groundwater before and after drilling, neighbor notification, and public disclosure of chemicals.	Not included.	Subject to regulation.
CEQA	Requires that environmental impact reports be generated.	Subject to regulation	Subject to regulation

1. Senate Bill 4

Senate Bill 4 was enacted by the California legislature due to five concerns enumerated within the legislation. First, hydraulic fracturing and well stimulation treatments are increasing in California. Second, the state considers current scientific information on the risks of well stimulation treatments incomplete. Third, the legislature believes that government and industry transparency are vital. Fourth, public disclosure is important so as to allow the public to determine if they are being exposed to WST chemicals. Fifth, the legislature would like to understand the components of produced water used in WST so that it may be reused or treated (California Environmental Law and Policy Center, 2015)

First, SB4 requires an independent scientific study on well stimulation treatments to be conducted by the Secretary of California's Natural Resources Agency. The study will provide information on existing and potential oil and gas reserves and analyze risks of WSTs (California Environmental Law and Policy Center, 2015). Study completion was set for January 1st, 2015. On January 14th, 2015, the department of Conservation released Volume I of the study, titled "An Independent Scientific Assessment of Well Stimulation Technologies in California: Well Stimulation Technologies and their Past, Present, and Potential Future Use in California." (California Council on Science and Technology, 2015). It describes what WSTs are, the operations involved, and where they are practiced. The California Council on Science and Technology and the Lawrence Berkeley National Laboratory prepared the study. Volumes II and III of the study are set to be released in July 2015. Volume II is of most interest to our project; it will detail the effects of WSTs on water bodies, among other natural resources. Volume III will focus on how WSTs will affect the environment in specific geographic regions (California Council on Science and Technology, 2015)

Next, SB4 requires the development of WST regulations by DOGGR. These include threshold values for acid volume used, disclosure requirements of chemical composition of well stimulation fluids, and source and volume information of all water used, be it base or waste fluid (California Environmental Law and Policy Center, 2015).

Third, SB4 requires public disclosure of WST fluid composition. The composition must be provided online within 60 days of the termination of treatment on a well. This information is to be posted on the DOGGR website beginning in January 1, 2016. Currently, the information is required to be posted via FracFocus.org (California Environmental Law and Policy Center, 2015)

Fourth, SB4 ends the ability of operators and suppliers to claim trade secret protections on many of their products. It requires that the supplier disclose all chemical additives or constituents used in well stimulation treatment to DOGGR, even if the information is claimed as trade secret. If DOGGR finds that a trade secret claim is invalid, it may release the information to the public. Under the New Public Resources Code section 3160(J)(2) the following may no longer be protected as a trade secret:

1. The identities of the chemical constituents of additives
2. The concentration of additives in the well stimulation treatment fluid
3. Air or other pollution monitoring data
4. Health and safety data associated with WST fluids; and
5. The chemical composition of flowback fluid

Fifth, SB4 creates a permitting process for WST operations. A well operator must provide in the well permit application the time and location of the WST, a complete list of chemicals to be used, water management and groundwater monitoring plans, and the source and disposal method of fluids used in the operation. The permit is valid for one year from

DOGGR's approval date. Permits are made available online by DOGGR five days after approval date (California Environmental Law and Policy Center, 2015).

Sixth, SB4 requires that landowners within 500 feet of a horizontal project of a WST or within a 1500 foot radius of the wellhead be notified of treatment. Operations may not commence until 30 days after notification of nearby landowners.

Last, SB4 directs the SWRCB to develop regional or well specific groundwater monitoring criteria by July 15, 2015. DOGGR along with industry and agriculture stakeholders are responsible for providing input into the monitoring plan (California Environmental Law and Policy Center, 2015)

Environmental groups withdrew support of SB4 when a provision was added that would allow the continuance of WSTs while DOGGR finalizes its comprehensive fracturing regulations. In addition, Section 3161, which requires DOGGR to complete an Environmental Impact Report (EIR) on WST across the state by July 1, 2015 allowed some local governments, namely Kern County, to attempt to complete their own independent EIRs before the statewide report could be finalized (California Environmental Law and Policy Center, 2015).

Kern County has not yet released an approved EIR. In August 2013, however, Kern County released a notice of preparation of a draft EIR. This EIR will be programmatic, that is environmental conditions of the entirety of Kern County will be considered, not conditions specific to each well. Should a Kern County oil and gas EIR be approved, DOGGR must consider only Kern's EIR instead of the statewide EIR when approving WST permit applications (Kern County Planning and Community Development Department, 2013).

B. Hazardous Material Release Regulations

The federal law that regulates hazardous materials spills is the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). It requires hazardous materials spills which exceed minimal reportable amounts to be reported to the National Response Center by any responsible parties (U.S. EPA, 2006).

In California, hazardous material spills are regulated by two pieces of law: the California Water Code section 13271 and the California Code of Regulations Title 19, Division 2, Chapter 4, Hazardous Material Release Reporting (California Water Code, 2015; California Code of Regulations, 2008)

The California Water Code section 13271 requires that any release of hazardous substances or sewage to the waters of the state must be verbally reported immediately to the California Emergency Management Agency, or once knowledge of the discharge is available or notification is possible without impeding cleanup and emergency measures (California Water Code, 2015). The California Emergency Management Agency is responsible for notifying the local health officer and director of environmental health of the spill. If the spill is of high enough concern to the health board, the public will be notified. Failure to comply with the notification requirements will result in misdemeanor charge or a fine of up to $20,000 to involved parties. Substances that are listed as hazardous wastes in Section 25410 of the Health and Safety code are assigned reportable quantities by the department of Toxic Substances Control (California Water Code, 2015). Sewage is assigned reportable quantities by the California State Water Board.

The California Code of Regulations chapter on hazardous materials expands on the reporting requirements to include the minimum information required in the release report (California Code of Regulations, 2008). This includes the

1. Exact location of the release or threatened release;
2. The name of the person reporting the release or threatened release;
3. The hazardous materials involved in the release or threatened release;
4. An estimate of the quantity of hazardous materials involved; and
5. If known, the potential hazards presented by the hazardous material involved in the release or threatened release;

Reporting is to be made to the Office of Emergency Services and a telephone number is provided. Interestingly, the California Code adds to the Water Code by clarifying that the immediate reporting of a hazardous material spill to land is only required in there is "reasonable belief" that the spill may pose a threat to public health, property, or the environment. Written reporting is only sometimes required, pursuant to 42 U.S.C. section 11004(c). If required, the written notice is sent to the Chemical Emergency Planning and Response Commission no later than 30 days after the release. The written notice form can be found on the next page figure 4 (California Code of Regulations, 2008).

The reportable quantities of chemicals can be found on two lists (California Office of Emergency Services, 2014a). The first is the Extremely Hazardous Substances list. The second is the more detailed Consolidated List of Chemicals. However, besides these two lists, according to California Hazardous Materials Spill / Release Notification Guidance, if the responsible parties are doubtful of whether or not the release should be reported, the release should be reported (California Office of Emergency Services, 2014a).

0048-1

The comment includes a general introduction. No response is necessary.

0048-2

The comment generally describes the DEIR and the Project. No response is necessary.

0048-3

Please see GR-1 for a description of the ministerial review process. The Site Conformity Review process requires that applicants submit comprehensive Site Plans, as well as evidence of compliance with designated third party agency requirements as specified in many of the mitigation measures.

0048-4

The Revised Amended Ordinance would establish a ministerial permit system. Please see GR-1 regarding the ministerial permitting process. The Revised Amended Ordinance has been further revised to include a cap of 3,649 well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR. Any well permit applications over this cap may be processed only during the following year, or with additional CEQA review as described in the Revised Amended Ordinance. This provision will ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0048-5

The commenter's opinion is noted. The comment is an introduction to later comments.

0048-5 cont'd

0048-5 cont'd

0048-6

The commenter's opinion is noted. For decades, the established framework for zoning ordinances throughout the state of California, and in Kern County, has followed the practice of establishing categories of activities that are prohibited, permissible subject to compliance with specified standards and mitigation measures, and conditionally permissible subject to further discretionary review and approval (including CEQA review). Please see GR 1 and 2.

0048-6 cont'd

0048-7

Comment noted. Please see GR regarding enforcement of mitigation measures. The absence of codification in a third party regulation does not dilute the enforceability of the mitigation measures by the County under its zoning authority and its role as lead agency under CEQA (including MMRP implementation). Please see GR 16 and GR 19.

0048-7 cont'd

0048-21

Please see GR-1, GR-2 and GR-3.

0048-22

Please see GR-1, GR-2 and GR-3.

0048-23

The comment is a quote from the Draft EIR. The Project is the Revised Amended Ordinance together with the implementation of oil and gas exploration and production activities that will be authorized under the Site Plan Conformity Review process. As such, the extensive list of

activities quoted by the commenter as included in the EIR is appropriate, as CEQA review must apply to the "whole of the project." Please see GR-2.

0048-24

The commenter's case citation and opinion are noted. Please see GR-2. The project description is accurate and stable in describing the activities subject to, and regulated by, the Revised Amended Ordinance. The project description satisfies the basic purpose of an EIR, to disclose potentially significant environmental impacts to the public and decision makers and receive public input in mitigation measures and alternatives.

0048-24 cont'd

0048-25

The commenter's case citation is noted and included in the record. *Santiago County Water District v. County of Orange* (1981) 118 Cal. App. 3d 818, found an EIR defective for too narrowly focusing on impacts of a proposed mining operation, but failing to provide information on delivery of water to the mine. Since the commenter's objection is that the EIR is too broad, the case is not relevant to this comment. More relevant is *City of Carmel-by-the-Sea v. Board of Supervisors of Monterey County* (1986) 183 Cal.App.3d 229, which held that CEQA review for a zoning amendment should have fully evaluated the major development project that was foreseeable at the time of the zoning amendment, rather than deferring to a leter EIR on the development project. *See also Laurel Heights Improvement Ass’n v. Regents of University of California* (1988) 47 Cal. 3d 376 (environmental analysis should be prepared as early as feasible; EIR must analyze environmental effects of future expansion or other actions that are reasonably foreseeable consequences of the initial project).

Please see also responses 43-171 – 43-191 regarding the extensive analysis of water supply and demand in the EIR. [Note for EnE, this is a reference to the Shute Mihaly letter, #43 on the TOC we have].

0048-25 cont'd

0048-25 cont'd

0048-26

The commenter's case citations are noted and included in the record. Please see GR-2 which discusses these cases.

0048-27

Please see above responses and GR-2.

0048-28

The commenter's opinion is noted. Please see GR-1 regarding the ministerial permitting process and GR-2 regarding the approach to County-wide analysis of the Project. The County's current zoning ordinance allows oil and gas activities to occur in many zoning districts within the County with neither ministerial nor discretionary review, based on prior determinations regarding the general land use compatibility of continued oil and gas extraction activities and the sufficiency of regulation by other agencies to protect the environment. The County directed that the current ordinance be updated to expand the County's oversight and enforcement role. Pursuant to the Revised Amended Ordinance, many new procedural and substantive requirements will be applicable to Project activities, including those identified as mitigation measures in the EIR. The Board of Supervisors directed that this ordinance update process be procedurally structured to avoid imposing excessive administrative burdens, while assuring effective implementation and enforceability. That is the "streamlining" objective to be met. The commenter appears to misconstrue "streamlining" as "shortcutting" or "failing to protect people or the environment", neither of which will occur under the Revised Amended Ordinance and MMRP.

The Revised Amended Ordinance has been further revised to include a cap of 3,649 well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR. Any well permit applications over this cap may be processed only during the following year, or with additional CEQA review as described in the Revised Amended Ordinance. This provision will ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA (Pub. Res. Code 21166).

0048-28 cont'd

0048-29

The commenter's opinion is noted. Please see GR-2 and GR-3 and above responses. Zoning ordinances, like other regulations, do not have an expiration date. However, as noted above, the Revised Amended Ordinance has been further revised to ensure that impacts and mitigation measures will be re-evaluated if and when required by CEQA, including as a result of technology breakthroughs permitting greatly increased production. See Pub. Res. Code 21166). The likelihood of reasonably foreseeable major increases in oil and gas activity was evaluated and found to be speculative and unlikely, while substantial evidence supports the well forecasts upon which the EIR impact analyses are based. Please see GR 6, GR 8 and GR 18.

0048-30

The commenter's case citation and opinion are noted. Please see GR-2 for discussion of the project-level approach in the EIR. While this comment is identified as a request for a program-level EIR, judicial interpretation have confirmed that, whether an EIR is called "program" or "project", it must include the level of information and analysis available to examine the whole of the project. The commenter appears to be requesting a fundamental change to the structure of the Revised Amended Ordinance to require case-by-case discretionary approvals subject to CEQA review, and also to litigation rights. While this policy position is advocated by the commenter, local government agencies have the constitutional and statutory authority to manage land uses categorically through zoning. The structure of the Revised Amended Ordinance is consistent with longstanding zoning practice and CEQA caselaw allowing certain activities to be approved with ministerial permits; see GR-1.

0048-31

Please see GR-1, which discusses the ministerial permitting process and includes discussion of the case cited by the commenter.

0048-32

Please see GR-1, which discusses the ministerial permitting process and includes discussion of the case cited by the commenter.

0048-33

Please see GR-1, which discusses the ministerial permitting process and includes discussion of the case cited by the commenter.

0048-34

Please see GR-1, which discusses the ministerial permitting process and includes discussion of the case cited by the commenter.

0048-35

The discretionary approval under consideration in this case is adoption of the Revised Amended Ordinance, which is a legislative act by the Kern County Board of Supervisors for which CEQA compliance is required. This EIR provides CEQA compliance for that action.

0048-35 cont'd

0048-35 cont'd

0048-36

Please see generally GR-1 for discussion of ministerial approvals, which require the project to meet applicable standards. In addition, MM 4.8-6

has been revised to eliminate the reference to "best management practices" and include more prescriptive references to standards. Please see section 7.1.4, Revised Summary of Impacts, Mitigation Measures and Significance Conclusions.

0048-36 cont'd

0048-37

Mitigation Measure 4.3-5 does not allow the County to waive setback distances to sensitive receptors. MM 4.3-5(c) has been modified in the Final EIR as follows:

c. If the above setbacks cannot be met, and for existing wells, the Applicant shall provide a site-specific or other risk assessment to the SJVAPCD, which may include implementation of one or more of the following risk minimization measures, or such measures that are demonstrated by the Applicant to the SJVAPCD, to achieve a level of risk less than the threshold risk level, and shall provide confirmation from the SJVAPCD that the activity that is the subject of the application will not exceed the risk threshold:"

This will ensure that sensitive receptors are not exposed to emissions below the risk threshold. Please also see GR-1 and GR Air-10.

0048-38

The comment states that under the Revised Amended Ordinance, the County would retain significant discretion to deny permit applications if it finds that mitigation measures are not met. Accordingly, commenter argues that the permits cannot be considered "ministerial" and should be subject full review under CEQA. Please see GR-1 concerning the ministerial permit process and GR-16 concerning the revised mitigation measures.

The fact that the County will have the authority to deny permits if the proposed projects do not satisfy mitigation requirements does not create a discretionary permitting process. The mitigation measures cited by commenter contain specific standards that the County will use to determine if the mitigation requirements are satisfied and the permit should be issued. (*See Sierra Club v. Napa County Board of Supervisors* (2012) 205 Cal. App. 4th 162 [certain lot line adjustments in ordinance were properly identified as ministerial where the lot line application was required to comply with specified standards]; *San Diego Citizenry Group v. County of San Diego* (2013) 219 Cal.App.4th 1 [upholding an EIR for a Zoning Ordinance amendment to allow by-right wineries, where the EIR identified impact avoidance measures built into the Zoning Ordinance]; *Health First v. March Joint Powers Authority* (2009) 174 Cal. App. 4th 1135 [where a design plan for a development project complied with conditions set forth by specific plan that had been approved pursuant to CEQA, approval of the design plan via a 125-question checklist was ministerial and the project was exempt from CEQA review.] Because the proposed Amended Ordinance incorporates impact avoidance measures and provides a method for determining whether such measures have been met without the exercise of the County's discretion, the ordinance properly sets forth a ministerial permitting process.

0048-46

As explained on Draft EIR Table 3-5, page 3-32, this EIR assumes that 2,697 new production wells, and 952 other well types that are ancillary to production wells (e.g., water disposal wells, observation wells, steam flood injectors, etc.), would be drilled annually. In practice, however, annual well drilling levels would likely be lower. The methodology used to formulate this annual well count projection, and the substantial evidence on which the projection is based, is described in detail in Global Response 13: Well Projections. In sum, the well projections used in the Draft EIR were based on the best information available to the County at the time preparation of the EIR commenced, including the business forecasts of the companies who would carry out the oil and gas development. The forecasts were validated by the County and its consultant, and adjusted upward so that the EIR would analyze a reasonably high maximum impact case. As stated at page 3-30 of the Draft EIR, it is likely that the actual development will be less than the forecast. Although the More Wells Within the Project Footprint Alternative assumes that annual production well construction would be capped at 3,500, substantial evidence demonstrates that the Project's uncapped 2,697 annual production well projection presents a good faith, reasoned and conservative forecast of new production well development on a yearly basis. It follows that the EIR also reasonably assumes that construction 3,500 production wells annually, as proposed by this alternative, may exacerbate the Project's significant environmental effects.

In any case, the Draft EIR provided that, at "the point that either the annual Project activity level or total projected activity level is exceeded, the County will need to consider whether the exceedance triggers further CEQA review in accordance with the criteria provided in CEQA (Pub. Res. Code) Section 21166 and CEQA Guidelines Section 15162 (e.g., due to new or substantially more severe significant environmental impacts than those considered in this EIR). If the criteria for subsequent or supplemental CEQA review are met, further review would be required for continued reliance on the Conformity Review Process." Moreover, since the Draft EIR was published, it was determined that the Project's proposed Amended Zoning Ordinance would be modified to cap the annual total number of wells (i.e., the total number of production wells, together with all other related well types) approved pursuant to the Conformity Review at 3,649, which is the total annual well count assumed by this EIR. Thereafter, no new well can be approved until the following year, unless any such additional well first obtains a discretionary conditional use permit subject to further CEQA review. Thus, while the Project would not absolutely cap the annual number of wells that may be approved by the County in any one year, it will ensure that every well annually approved pursuant to the ministerial Conformity Review process either falls within the scope of this EIR or is subject to additional CEQA review.

0048-59

This is a section title and a response is not required.

0048-60

This comment is noted for the record. The facts stated in this comment concern the baseline environmental conditions, and do not relate to the impacts of the proposed Project.

0048-61

Please see GR Air-1. Although it is true that emissions of certain pollutants will increase due to project implementation, all emissions from the Project will be mitigated to less than significant with mitigation. Emission increases from all Project sources are described in the DEIR at 4.3-72–4.3-103.

0048-62

The commenter states that the absence of the "Vector report" invalidates the air quality analysis. The report to which the commenter refers was a draft report created as part of the air quality analysis, but was never completed. All of the supporting information used in both the incomplete Vector report draft and in drafting the DEIR was available to the public upon request to the County. Some parties obtained the supporting information via a California Public Records Act request. The DEIR was not required to include this material. To keep the EIR to a manageable length, source documents used in preparing an EIR need not be included in the EIR. *See* CEQA Guidelines § 15148. Scientific, engineering, and technical reports and similar documents relied on in preparing an EIR need not be incorporated into the body of the EIR or in an EIR appendix. *Id.*; *see also Ebbetts Pass Forest Watch v. Department of Forestry & Fire Protection* (2008) 43 Cal. 4th 936, 958 (nothing in CEQA requires that source materials be physically incorporated in an EIR); *Mount Shasta Bioregional Ecology Ctr. v. County of Siskiyou* (2012) 210 Cal. App. 4th 184, 219 (an EIR may summarize information in a technical report without appending the report or incorporating the report by reference); *Anderson First Coalition v. City of Anderson* (2005) 130 Cal. App. 4th 1173 (the EIR's hydrological analysis was not incomplete when a study relied on in determining the drainage report was not included in the EIR).

0048-62 cont'd

0048-63

Please see GR Air-1, GR Air-2 and GR-16. It is important to note that determining whether a Project's air quality impacts are "significant" for purposes of CEQA is not equivalent to determining whether the relevant air district is in attainment or nonattainment for particular pollutants. The attainment status of the San Joaquin Valley Air Pollution Control District is part of the baseline environmental conditions, and does not relate to the impacts of the proposed Project. As stated by commenter, SJVAPCD Rule 2201, Regulation 3.2.1 requires that any offset or emission reduction credit be "real, enforceable, quantifiable, surplus, and permanent." The County assumes that SJVAPCD will enforce its own rules and regulations, and thus will assure that any offsets or credits used to satisfy Rule 2201 meet these requirements. There is no requirement to prove that future offsets will exist in order to utilize such a method for mitigation.

0048-64

Please see GR Air-1, GR Air-2 and GR-16.

0048-65

Please see GR Air-1, GR Air-3 and GR-16. CEQA does not require that mitigation measures improve upon existing environmental conditions. *Paulek v. Dep’t of Water Resources* (2014) 231 Cal. App. 4th 35, 44 ("Environmental problems that would continue to exist even in the absence of any project are part of the baseline conditions rather than [project]-generated environmental impacts.")

0048-66

This is a section title and a response is not required.

0048-67

The commenter's opinion regarding the air quality impacts associated with the Project is noted for the record. Please see GR Air-4 for a discussion of the air quality analysis methodology.

0048-68

Please see GR Air-1. The emissions increases noted by commenter are expected to occur from Project implementation. However, any impacts from such emissions will be mitigated to less than significant by the mitigation measures in the DEIR. CEQA does not require that a project have no adverse impacts. Rather, CEQA requires that potentially significant adverse impacts be mitigated to the extent feasible. CEQA § 21002(b); CEQA Guidelines § 15126.4(a)(1). Some significant impacts may remain significant and unavoidable, as long as feasible mitigation is imposed. CEQA Guidelines § 15126.2(b).

0048-69

Please see GR Air-1. Please also see response to comment 78, above.

0048-70

Please see GR Air-1. Please also see comment 3 from the San Joaquin Valley Air Pollution Control District. SJVAPCD notes that only operational emissions which exceed the SJVAPCD's thresholds for equipment subject to Rule 2201 will be required to be offset. To the extent offsets are not required by Rule 2201, the EIR ensures that the potentially significant impacts from emissions increases will be reduced to less than significant.

0048-71

Please see GR Air-1. Please also see comment 3 from the San Joaquin Valley Air Pollution Control District. SJVAPCD notes that only operational emissions which exceed the SJVAPCD's thresholds for equipment subject to Rule 2201 will be required to be offset. To the extent offsets are not required by Rule 2201, the EIR ensures that the potentially significant impacts from emissions increases will be reduced to less than significant.

0048-73

The commenter's opinion is noted for the record.

0048-74

Please see GR Air-1, GR Air-3, and GR Air-6. The DEIR fully addresses all criteria and toxic pollutant emissions from Project activities. The HRA in Appendix M focused on diesel particulate matter (DPM) emissions because those represent nearly 99% of the risk driver for cancer risk from Project activities. Drilling is by far the biggest contributor to risk from Project activities and given the relative magnitude of projected DPM emissions, it is by far the most important toxic air contaminant to consider from a public health perspective. The HRA does not consider emissions from WST because there are minimal if any, toxic emissions due to WST. Please see GR Air-8 on this topic. Both the HRA in the DEIR and the revised HRA consider emissions from a co-located drilling sump. Please see GR Air-11 on this topic. The DEIR also considers fugitive emissions, including VOCs, which would be captured by the DEIR's 10% buffer for emissions from non-permitted sources. Finally, the revised HRA completed for the project in Appendix M-1 considers VOC emissions from well completion. Thus, all emissions from Project activities are fully captured in the air quality analysis. Please also see GR-Air-9.

0048-75

The DEIR identifies reduced sulfur compounds in the extracted gas and oil, of which the principal component is hydrogen sulfide, as posing the most potential for odors. Reduced sulfur compounds, especially H_2S, have the lowest odor thresholds relative to their abundance. As noted in the DEIR, volatile hydrocarbons in the extracted gas and oil are also odoriferous but generally have the aromatic smell of petroleum with odor thresholds which are much higher than for the reduced sulfur compounds. As such, petroleum odors are generally localized. As noted in the DEIR, the concentration levels for hydrogen sulfide that affect human health are several orders of magnitude greater than the concentrations at which odor could be a nuisance. Thus, the presence of a reduced sulfur odor under most circumstances does indicate potential harmful exposure.

As a point of clarification, the reference to "natural gas" on the top of DEIR at 4.3-31 refers to "processed natural gas" such as natural gas from which sulfur compounds, water and heavy hydrocarbons have been removed. That reference should not be confused with "produced natural gas," which contains the noted odoriferous impurities

0048-76

This is a section title and a response is not required.

0048-77

The commenter's correct citation to the DEIR is noted for the record.

0048-78

Please see GR Air-1 and GR-16. Commenter's statement that the San Joaquin Valley Air Pollution Control District's permitting scheme is inadequate because the San Joaquin Valley Air Basin is non-attainment for certain pollutants is not correct. Implementation of SJVAPCD's rules, regulations and policies ensure that the Air Basin continues to move toward attainment. SJVAPCD's rules and regulations have resulted in numerous air quality benefits and improvements. For example, the Air Basin is in attainment for major criterial pollutants such as NOx and SOx.[1]

[1] https://www.valleyair.org/aqinfo/attainment.htm.

0048-79

The commenter states that MM 4.3-2 (requiring operators to develop a fugitive dust plan) does not address emissions of small particles, such as PM2.5. The San Joaquin Valley Air Pollution Control District has a dust control plan template that details all of the emissions sources and control measures that must be included in the plan.[1] These sources include bulk material handling, storage and transport as well as other construction activities such as work in disturbed soil, travel on dirt roads, trackout, and wind erosion. The dust control plan template requires the identification of what activities will occur at the site and which measures must be used to reduce emissions. A fugitive dust control plan is effective for reducing the portion of fugitive dust in the fine (*i.e.*, PM2.5) and respirable particulate (*i.e.*, PM10) size ranges. Based on Section 13.2.4.3 of EPA's Compilation of Air Pollutant Emission Factors (AP42), a portion of the fugitive dust emissions consist of particles of 2.5 microns or less as well as PM10.[2] This is further corroborated by many other studies on fugitive dust, such as the Western Regional Air Partnership's (WRAP) *Fugitive Dust Handbook*, which states: "The PM2.5/PM10 ratio for fugitive dust from construction and demolition activities is 0.1 based on the analysis conducted by MRI on behalf of WRAP."[3] The *Fugitive Dust Handbook* also provides analyses which show the cost effectiveness of fugitive dust controls for PM10 as well as PM2.5. As such, mitigation measures designed to suppress the generation of fugitive dust are effective at controlling particulate matter with particle sizes of less than 10 and 2.5 microns.

0048-84

The commenter did not identify its source for "CARB Recommended Minimum Setback Distances." A 2005 CARB document titled "Air Quality And Land Use Handbook: A Community Health Perspective" includes suggested setback distances of 500 feet or 1000 feet for new sensitive receptors to be located near existing industrial and transportation facilities such as freeways, distribution centers, railyards and refineries.[1] In the handbook, CARB states: "These recommendations are advisory. Land use agencies have to balance other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues." The CARB recommendations were made for the siting of sensitive receptors near large, relatively continuous sources of diesel particulate emissions. As such, they are not relevant to the question of appropriate setback distances for diesel emissions from well construction, which will typically only last for 66 days or less.

Emissions from processing equipment are not considered in the HRA because oil and gas processing facilities must complete site-specific HRAs in order to obtain an Authority to Construct (ATC) from the District. Thus, risk levels and appropriate setbacks will be determined for oil and gas processing equipment on a case-by-case basis. The revised HRA in Appendix M-1 does consider emissions from completions, including VOCs.

0048-113

Commenter states that there should be a percent limit on the amount of time that flaring can occur. Flares and flaring emissions are subject to San Joaquin Valley Air Pollution Control District permitting requirements and rules. Any source that proposes to include a flare will be required to meet the applicable requirements when obtaining an authority to construct permit or a permit to operate. SJVAPCD requires the incorporation of feasible control technology and imposes operating limitations. SJVAPCD also requires the offsetting of emissions increases. Flares must also comply with SJVAPCD Rule 4311, which limits the emissions of NOx, VOC, and SOx. Each new flare proposed within the jurisdiction of the SJVAPCD will be reviewed by the agency for necessary operating-hours limitations and other appropriate permit restrictions.

Please also see GR Air-1 and GR-16.

0048-114

Commenter suggests that the Project should not be approved until the Applicant can show mitigation measures that will cause a reduction in emissions of ozone, ozone precursors or PM 2.5. CEQA does not require that a Project or CEQA mitigation measures improve air quality or address environmental conditions that are part of the baseline conditions in the Project area. *Paulek v. Dep’t of Water Resources* (2014) 231 Cal. App. 4th 35, 44 ("Environmental problems that would continue to exist even in the absence of any project are part of the baseline conditions rather than [project]-generated environmental impacts.") The San Joaquin Valley Air Basin's attainment status for certain criteria pollutants is part of this baseline and thus the Project is not required to prove that it can reduce baseline emissions via its mitigation measures.

0048-122

The commenter states that the EIR's assumptions about the potential frequency and volume of spills from the Project are underestimated. The commenter references a 2015 report analyzing the number of spills in Kern County and other areas throughout the state. Caryotakis, A., Davies, I., Hafiz, S., Niketen, J., Noakes, D., Wang, R., and Wu, A. (2015), *An Analysis of Hazardous Materials Spills with a Focus on Oil and Gas Production: A 2015 Undergraduate Practicum Project for the UCLA Institute of the Environment and Sustainability* (report prepared for the Natural Resources Defense Council). As the comment notes, that study found that the number of spills in Kern County has generally decreased over recent years. *Id.*, p. 30. The study also found that Kern County had the lowest number of spills per year compared to other counties studied. *Id.*, p. 27. In addition, the study found that most hazardous substance spills in California were of non-petroleum substances, such as sewage, that are unrelated to oil and gas production. *Id.*, p. 34. The study therefore does not contain evidence suggesting that the assumptions

in the EIR about the potential frequency or volume of spills related to the Project was underestimated

The study (p. 37) further shows that most spills are properly reported and contained per existing regulations. For example, the study notes:

On average, only about10% of total spills that occurred in California were not contained; of the spills that affected waterbodies, only about 16% were not contained over the period studied.

In California overall, over 73% of spills were either cleaned up or did not require clean-up.

Thus, the study does not contain evidence suggesting that it is unreasonable for the EIR to assume that operators will comply with spill prevention, control and reporting regulations. It is permissible for the EIR to rely on such programs as mitigation. *See Oakland Heritage Alliance v. Oakland* (2011) 195 Cal. App. 4th 884, 906 ("a condition requiring compliance with regulations is a common and reasonable mitigation measure, and may be proper where it is reasonable to expect compliance").

The commenter is correct that the EIR data on spill frequency came from the Office of Emergency Services – which was also relied on by DOGGR for the SB 4 EIR – and that this dataset does not include small spills beneath reportable quantities. Non-reportable spill events involve low volumes which are quickly curtailed and cleaned up, and are unlikely to result in environmental impacts. As stated in the EIR, DOGGR reported that 613 spills were reported in the Project Area from 2009 through 2014, and the volume of the spills ranged from extremely small (0.025 of a gallon) to 63,000 gallons. Almost all of the spills (85%) were related to crude oil and produced water (DOGGR 2015a). The EIR acknowledged that while "these data indicate that the incidence of drilling mud and fluid related spills in the Project Area is low and that potential drilling-related spill volumes would be relatively small," there "could be a significant impact if a spill occurred." EIR, p. 4.9-131. The EIR's conclusion is unchanged by the additional possibility of low-volume, non-reportable spills. The commenter did not reference any source of quantitative data on non-reportable spills. An EIR must utilize best available data but is not required to achieve "perfection." See GR 21.

0048-123

The commenter states that the EIR's assumptions about the potential frequency and volume of spills from the Project are underestimated. The commenter did not reference any source of quantitative data on non-reportable spills. An EIR must utilize best available data but is not required to achieve "perfection." See GR 21.

0048-124

The comment cites a 2003 study in Oklahoma, demonstrating the continued presence of soil and groundwater contamination at petroleum production sites after 60 years of natural attenuation. This necessarily implies that the spills occurred more than 60 years ago, when industry practices in Oklahoma were far less protective of the environment than industry practices in California today.

0048-125

Remediation of spills is required by applicable laws enforced by a variety of regulatory agencies. In addition, MM 4.8-4 requires operators to immediately contain leaks and spills from oil and gas operations, clean up contaminated media and repair the leak prior to recommencing

operations. MM 4.8-5 requires reporting of contamination above regulatory limits to the Kern County Public Health Services Department which will direct any required response.

0048-126

This is a section title and a response is not required.

0048-127

Comments note quotes a section of the EIR that discusses drilling operations. The EIR describes the typical chemicals used in drilling fluids, p. 4.4-49 – 50. However, as described in the EIR, pp. 4.9-131 - 132, the conclusion that potential groundwater impacts from contact with drilling fluids does not depend only on the types of chemicals used in drilling fluids. Drilling muds and fluids are managed either using a closed loop system of pumps, storage tanks and fluid and mud lines trucked to and temporarily staged on the construction site, or in permitted drilling mud sump. MM 4.8-6 requires use of closed loop mud systems where practical, particularly with oil based muds; while MM 4.9-3 requires all drilling operations to either use a closed loop system or obtain specified permit coverage. Moreover, the best available data that indicate that "the incidence of drilling mud and fluid related spills in the Project Area is low and that potential drilling-related spill volumes would be relatively small, but could be a significant impact if spills occurred." The EIR acknowledges that blowouts during construction could result in release of fluids, but also cites evidence that blowout rates have declined over time. The best available data indicates that a well construction failure is expected to occur about once every two years assuming future construction of about 2,600 new wells per annum. The EIR also includes MM 4.9-1, requiring applicants to comply with applicable laws, regulations, and standards, including well drilling management, construction, monitoring, blowout prevention, fluid and mud containment, and emergency response measures. Compliance with these laws, regulations, and standards would reduce potential groundwater quality impacts from contact with drilling muds or fluids during drilling and construction to less than significant levels. See GR 21 regarding use of best available information in CEQA documents and GR 22 regarding reliance on regulatory requirements as CEQA mitigation.

0048-127 cont'd

0048-128

This is a section title and a response is not required.

0048-129

The comment is correct that proper well design and construction are crucial for ensuring long-term mechanical integrity. The EIR, pp. 4.9-71 – 4.9-72, discusses the proper well casing and cementing process. The commenter's opinion that California's current well construction rules are outdated and inadequate is noted. As discussed in the EIR, recent studies have indicated that well failure or blowout rates in the Project Area have been significantly reduced over time by improved well construction technologies. Blowout rates due to well operations in California Oil and Gas District 4 from 1991 to 2005 ranged from one per 10,000 to one per 60,000 well-years, depending on the oilfield activity taking place at the time of the blowout. In District 4, the well blowout rate was one in 20,000 well-years for all wells in operation, with a rate of one per 15,000 well-years in thermal-recovery fields and one per 60,000 well years in non-thermal-recovery fields during this period. As stated in the EIR, evidence suggests that rates have decreased "due to improvements in production practices, such as improved cementing of steam-injection wells and management of geomechanical processes in reservoirs. These downward trends do not correlate with changes in production activity in the district. This demonstrates that risk in the hydrocarbon industry has and can be significantly reduced with focused effort (Jordan and Benson 2009)." EIR, pp. 4.9-71 – 4.9-72.

Well integrity requirements were also updated as part of the SB 4 implementing regulations; see 14 Cal. Code Regs. §§1782, 1784.1 (requiring mechanical integrity testing and maintenance, and providing that well stimulation must not damage the well casing, tubing, cement, or other well equipment). See also GR 10 regarding DOGGR regulations. MM 4.8-13 requires compliance with all DOGGR requirements for assuring safe drilling and drill casing practices, well design, construction and well management requirements, blowout requirements and all other provisions of applicable DOGGR regulations, as well as compliance with specified industry standards. No additional mitigation is required.

Re: **Comments on the Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance 2015(C)**

Dear Mr. Mynk:

I submit these comments on behalf of the hundreds of members of the Kern-Kaweah Chapter of the Sierra Club on the Draft Environmental Impact Report for proposed Revisions to the Kern County Zoning Ordinance 2015(C). These comments, which are being submitted in addition to the comments submitted on behalf of the Sierra Club by Earthjustice, largely focus on issues of specific local concern. Kern-Kaweah chapter members are particularly concerned about the DEIR's inadequate review of the environmental impacts of the proposed oil and gas extraction and other well-stimulation activities in the county. 0049-1

The EIR's Project Description violates CEQA.

Oil and gas development in Kern County is massive. The DEIR states that there are at least 43,000 oil/gas well currently operating in Kern County, and it projects (without substantiation or substantial evidence) that there will be 82,000 more such wells in 2035. The EIR's description of these future projects and the resulting significant impacts is legally inadequate. 0049-2

An accurate project description is indispensable for an intelligent and adequate evaluation of the potential environmental effects a proposed project. San Joaquin Raptor/Wildlife Rescue Center V. County of Stanislaus (1994) 27 Cal.App.4th 713, 730. To be adequate, the project description must provide enough information to enable the decision-makers and the public to understand the full scope of 0049-3

the project and its potential environmental impacts. Dry Creek Citizens Coalition v. County of Tulare (1999) 70 Cal.App.4th 20, 28.

0049-3 Continued

0049-4

An EIR's project description must at minimum include the following four mandatory items:

> (1) a detailed map with the precise location and boundaries of the proposed project, (2) a statement of project objectives, (3) a general description of the project's technical, economic, and environmental characteristics, and (4) a statement briefly describing the intended uses of the EIR and listing the agencies involved with and the approvals required for implementation. (Guidelines, § 15124.)

Cal. Oak Found. v. Regents of Univ. of Cal. (2010) 188 Cal. App. 4th 227, 269-70.

0049-5

The appropriate level of specificity of an EIR is determined, not by the EIR's label, but "by the nature of the project and the "rule of reason" [Citation.]" [] quoting *Al Larson, supra*, 18 Cal.App.4th at pp. 741–742.)

Citizens for a Sustainable Treasure Island v. City & Cty. of S.F. (2014) 227 Cal. App. 4th 1036, 1048

> "It is the substance, rather than the form, of [the environmental] document which determines its nature and validity. [Citations.]" (*Natural Resources Defense Council, Inc. v. California Coastal Zone Conservation Com.* (1976) 57 Cal.App.3d 76, 91 [129 Cal. Rptr. 57].) As a general statement of CEQA practice, "[t]he degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR. [¶] … An EIR on a construction project will necessarily be more detailed in the specific effects of the project than will be an EIR on the adoption of a local general plan … ." (Guidelines, § 15146.) (9) Recently, it was reaffirmed, "'the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible.'

Id., at 376.

0049-6

The EIR must address the environmental impacts of this Project to a "degree of specificity" consistent with the underlying activity being approved through the EIR. Id.

0049-7

Here, the County artificially strives to parade this document as a project level EIR in order to obviate the need for any future environmental review for all future oil and gas projects in Kern County, regardless of size or location. Yet, this Draft EIR lacks the level of specificity required to accomplish this stated goal. The County ignores "the rule of reason" by insisting that despite the overly general level of detail and analysis in this EIR, it sufficiently addresses the potential environmental impacts of every future oil and gas project.

0049-8

Where, as here, the EIR concerns the adoption or amendment of a zoning ordinance, the EIR must necessarily focus on the "secondary effects" of the adoption of the ordinance, not the specific

0049-9

construction projects that may follow the ordinance's adoption. See CEQA Guideline 15164(b), which provides that

0049-9 Continued

> An EIR on a project such as the adoption or amendment of a comprehensive zoning ordinance or a local general plan should focus on the secondary effects that can be expected to follow from the adoption, or amendment, but the EIR need not be as detailed as an EIR on the specific construction projects that might follow.

Where the circumstances do not permit a detailed analysis of specific projects that may follow the approval of the more general project - such as where the project involves the adoption or amendment of a zoning ordinance or a plan - the lead agency may prepare an EIR that focuses on secondary or cumulative impacts of the project as appropriate. Such an EIR may be deemed adequate only where the agency commits to the future analysis of the specific projects that may follow the approval of the ordinance or a plan.

0049-9 Continued

This was the case in Rio Vista Farm Bureau Ctr. v. Cty. of Solano (1992) 5 Cal. App. 4th 351, 372-73, where the EIR only generally analyzed the environmental impacts of the Solano County's adoption of a hazardous waste management Plan. Petitioner argued the EIR was inadequate because it failed to analyze the potential impacts of the hazardous waste facilities that the County agreed would likely follow its adoption of the Plan. The appellate court upheld the validity of the EIR but only because the County had committed to analyzing the environmental impacts of each future hazardous waste facility. The court stated:

0049-10

0049-11

> The Plan is not, as we read it, the first part of a fragmented project; rather, it provides the general guidelines required by law for any separate, but as yet undetermined, future hazardous waste management project. The scope of the Plan, as appropriately described in the FEIR, is limited to recitation of policies, requirements, and siting criteria, and designation of general areas in which future facilities may permissibly be located. No specific facility has been proposed, and the County has not committed to a definite course of action. Moreover, any future projects have been expressly made contingent upon CEQA compliance. The Plan is easily divisible from any potential future projects, which the County has committed to subjecting to the EIR process if and when a specific hazardous waste facility is proposed.

0049-12

Id., at 373.

Here, the DEIR purports to analyze both the "big picture" cumulative impacts of the general guidelines that would govern future oil and gas exploration in the County, as well as the impacts associated with as-yet undetermined oil and gas projects in as yet undetermined locations. Most significantly, rather than committing to reviewing any future oil and gas project that may be proposed in the future, the County has committed to *not* conduct any such review. The County's approach is both unreasonable and in violation of CEQA.

0049-13

0049-14

0049-15

0049-15
Continued

The EIR's unlawfully broad project description, encompassing both the cumulative impacts of oil and gas rules and the project-specific impacts of each future project, will result in additional CEQA violations, as explained below.

0049-16

0049-17

0049-18

0049-19

The project description is inadequate and violates CEQA also because the EIR fails to include or require the applicants to provide concrete details such as depth, fracking, type and quantity of chemicals used, process water generated, etc. The proposed ordinance would continue to allow oil companies to leave everyone in the dark, continuing a century-long tradition of not disclosing project details that are crucial for understanding environmental impacts. The Ordinance should require disclosure of well depth, whether fracking or not, quantities of chemicals used, etc. See Comments of Ron Sahu (filed concurrently) for recommendations. To pass muster under CEQA, the County must require all potential applicants to ensure all oil and gas development permits and well records contain complete and accurate information as to the nature of the permitted project, and make this information publicly available via a dedicated agency-run website.

0049-20

0049-21

An accurate and adequate Project Description must include the following information for each distinct oil and gas project:

- Physical location of future oil/gas activity including location of wellheads, welltoes, and paths;
- Full baseline of geological, seismicity (-3 to +3RM), natural resources, groundwater, and mineral information for the potential field that would be delineated via successful completion of a proposed well within the Project Area;
- Full description of any/all well development, completion, and/or stimulation methods to be used for construction and reconstruction activities within the Project Area;
- Full description of disposition of any/all "produced water" arising from initial drilling and for later field development and production within the Project Area;
- Full description for any enhanced oil/gas recovery processes within the Project Area, including the nature and quantity of waters/gas/steam required;
- Full historic review for any unrecorded, suspected, and or abandoned well within each section of proposed wells and all intervening sections, assuming a continuous well field designation.
- All fields must be delineated by vertical and horizontal parameters as many fields may have stacked reservoirs or pools that have not been included in the current delineation of the surface field boundaries.
- Similarly, all pools, reservoirs, and leases that have been explored but not yet commercially produced and as such would fall within the jurisdiction of the Amendment must be identified, delineated, and dimensioned in the EIR.

The County's approach precludes meaningful alternatives analysis as required by CEQA.

0049-22

The discussion of alternatives and mitigation measures is "the core of an EIR." Citizens of Goleta Valley v. Brd of Supervisors (1990) 52 Cal.3d 553, 564. Yet, by essentially "pre-approving" all future

oil and gas projects subject to compliance with the proposed rules and regulations, the County has essentially denied itself the option of evaluating each individual project on its own merits and based on the project's specific environmental impacts.

0049-22 Continued

This approach violates CEQA's prohibition against approving projects that are capable of causing significant impacts unless there are no feasible alternatives or mitigation measures to address the project's significant impacts. Pub. Res. Code § 21002. The County's proposed approach as explained in the DEIR violates CEQA because it would result in the *de facto* approval of all oil and gas projects, even those with significant impacts, even where environmentally superior alternatives may exist to avoid those impacts. For example, a project that is proposed in an area that contains high quality designated habitat of protected species (such as the San Joaquin kit fox) could potentially avoid a significant biological impact by relocating to an alternative location that does not contain sensitive habitat. According to the EIR, (table 4.4-79) significant impact on high quality habitat for the kit fox would occur in Tier 1 locations and in the Western Subarea. Under the County's proposed approach, a project with significant impacts would be approved in the Western Subarea without any consideration of environmentally superior alternatives in other subareas that do not contain high quality kit fox habitat.

0049-23

The County's approach also ignores CEQA's mandate that the lead agency consider a "no project" alternative. The purpose of the discussion of a "no project" alternative is to compare the environmental impacts of a proposed project with the effects of not approving it. CEQA Guideline §15126(e)(1). The no-project alternative must be evaluated even if it is infeasible. Planning and Conservation League v. Dept. Water Resources (2000) 83 Cal.App.4th 892, 917 ("PCL"). By treating all potential future oil and gas projects as one single massive project and subject only to ministerial approval, the County has abrogated its responsibility under CEQA to analyze a true "no-project" alternative to each proposed oil and gas project.

0049-24

The DEIR's analysis of no-project alternative is flawed also because it assumes that, in most zoning districts, "no review or permit would be
required under the 'No Project' Alternative for the drilling of any well intended for the exploration for, or development or production of, oil, gas, and other hydrocarbon substances …" DEIR at 6-18. This analysis and conclusion is false and misleading in that it ignores the fact that currently, the Division of Oil, Gas, and Geothermal Resources ("DOGGR") is responsible for undertaking environmental review of oil and gas projects. Accordingly, without the proposed amendments to the County ordinance, DOGGR would continue to undertake environmental review of proposed oil and gas projects. See, PCL, supra (EIR's no-project alternative violated CEQA because the no-project alternative falsely assumed that "paper-water" would continue to be available).

0049-25

The EIR's rejection of Alternative 2 (CUP) is unreasonable and in violation of CEQA

The EIR's Alternative 2 would subject all future oil and gas projects to a conditional use permit (CUP) process. According to this alternative, an oil and gas project would require a CUP if it is proposed

0049-26

0049-26
Continued

within one of the following zones: Exclusive Agriculture (A); Limited Agriculture (A-1); Medium Industrial (M-2); Heavy Industrial (M-3); Natural Resource (NR); Light Industrial (M-1); Recreation-Forestry (RF); Estate District (E); Low, Medium, and High-Density Residential(R-1, R-2, R-3); Commercial Office (CO); Neighborhood Commercial (C-1); General Commercial (C-2); Highway Commercial (CH); Platted Lands (PL); Floodplain Primary (FPP); and Special Planning (SP).

0049-27

The EIR disingenuously concludes that this alternative would be environmentally inferior to the proposed project because under this alternative every oil and gas project would not be required to implement every mitigation measure required by the proposed rules. The EIR's reasoning and analysis is flawed and not supported by substantial evidence.

0049-28

The EIR contends:

> Alternative 2 would consider the potential environmental effects each oil or gas well permitted in the County on a case-by-case basis without benefit of a comprehensive industry-wide mitigation strategy specifically designed to address regional conservation priorities. In practice, the Project's ministerial approval procedure would be more protective of the environment overall than would Alternative 2.

The EIR creates a false dichotomy between case-by-case analysis of each project on the one hand and a comprehensive industry-wide mitigation strategy on the other. In truth, the County could well develop a comprehensive oil and gas mitigation strategy that would be implemented on a case-by-case basis. In other words, the County need not abandon the idea of a comprehensive approach to mitigation of oil and gas projects even if it decides to evaluate oil and gas projects on a case-by-case basis as required by CEQA.

0049-29

Moreover, the argument that Alternative 2 would be less environmentally protective than the proposed project must be rejected because it is not based on the law. The EIR bases this conclusion on the claim that "under the proposed project each development standard and condition will apply to every well project irrespective of whether the proposed well development and operations would actually cause the environmental impacts such development standards and conditions are designed to reduce or avoid." To the extent that "development standards and conditions" are mitigation measures, they should not imposed on any project that would not cause a corresponding impact.

The EIR's analysis of Alternative 2 is flawed also because it fails to recognize that in many instances, case-by-case review could result in more stringent mitigation than is required by the broad regulation. Even more importantly, case-by-case review could result in the denial of those oil and gas proposals that would result in unacceptably significant environmental impacts. Under the proposed project, the County has no discretion to deny a project regardless of the extent or severity of the project impacts.

Case-by-case review could result in fewer environmental impacts also because following such review, the County could conclude that environmentally superior alternatives exist that could reduce the project's potential impacts. For example, a project that is proposed in protected species habitat could potentially avoid those impacts by relocating to an alternative location that does not contain sensitive habitat. Under the proposed project, no possibility of site-specific alternatives analysis exists.

0049-29 Continued

The County must adopt a statement of overriding considerations for each oil and gas project that has a significant environmental impact

0049-30

CEQA mandates that whenever an agency approves a project with significant environmental impacts, it must adopt a statement that because of the project's overriding benefits, it is approving the project despite its environmental harm. CEQA Guideline § 15043. This requirement reflects a strong public policy that agencies must weigh a proposed project's benefits against its environmental harm and approve such a project only if the project's environmental risks are "acceptable" because its benefits outweigh the harm. Pub. Res. Code §21081(b), CEQA Guideline §15093(b).

By defining all future project approvals as a "ministerial act," the County's approval of the proposed project amounts to "pre-approving" all future oil and gas projects, regardless of the balance between any given project's benefits and harms. Some projects would result in significant harm by, for example, destroying valuable habitat for protected species or plants, such as the Bakersfield cactus. The benefit of such a project (i.e. limited production of oil and gas) would not necessarily outweigh its harm. The proposed approach precludes the County from complying with CEQA by weighing the pros and cons of each discrete oil and gas project and approving only those projects whose benefits outweigh the environmental harm.

0049-31

The County's objective of increasing and facilitating oil and gas projects violates CEQA Guidelines

0049-32

Several project objectives call for increased, easier and quicker oil and gas extraction in Kern County, in violation of CEQA Guidelines Appendix F goals of "decreasing reliance on natural gas and oil" and "increasing reliance on renewable energy sources," and contradicting current science (some references below) which calls for leaving large portions of fossil fuels in the ground. These objectives effectively call for increasing greenhouse gas (GHG) emissions.

0049-33

These objectives are inconsistent with the State of California's stated goal of drastically reducing GHG emissions and will likely undermine the State's goal of reducing GHG emissions to 50% of 1990 levels by 2050.

0049-34

0049-35

The EIR should adopt the goal of decreasing reliance on fossil fuels and consider an alternative that advances that objective

Given that climate science concludes that large portions of fossil fuel reserves should be left unused, the EIR should include an alternative incorporating CEQA Guidelines Appendix F goals of "decreasing reliance on natural gas and oil" and "increasing reliance on renewable energy sources." While the Project Objectives nonetheless call for increasing oil and gas production, CEQA Guidelines 15126.6 (b) states, "Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, *even if these alternatives would impede to some degree the attainment of the project objectives*, or would be more costly" (emphasis added). We note that the DEIR considers the cumulative impact of the project on GHG emissions to be significant and unavoidable. A Decreasing Reliance on Fossil Fuels Alternative could help in "substantially lessening" this significant effect of the project. In addressing this Alternative, the County should assess other incentives to lessen production.

0049-36

Under the proposed scheme, mitigation measures would not be adequately monitored or enforced

The DEIR does not contain any adequate measures to ensure the required mitigation measures are monitored and enforced to prevent the type of flagrant abuse and neglect that is depicted in the picture below. As many of the impacts of any failure to strictly adhere to the terms and conditions of the permits will be felt locally, it is essential for the County to establish a vigorous monitoring and enforcement program. The DEIR must require verification of actual field equipment used and activity levels as compared to those in the submitted documents pre-project. Even with a more robust mitigation and monitoring program, however, the DEIR's proposed mitigation would still be inadequate for reasons explained above. Instead, in many instances the DEIR allows the oil companies to "self-certify" that they have done what they promised. The County should be responsible for ensuring strict adherence to the permit requirements and should not rely on DOGGR and RWQCB.

0049-36
Continued

Adequate analysis of the DEIR is impossible because a number of studies are not included and the basis for assumptions and conclusions are not provided.

0049-37

Critically, an air quality study is not provided. There is no study to support the climate change analysis and estimate of greenhouse gas emissions. There is no biological resources study. It is therefore impossible to verify accuracy of assumptions and conclusions without substantial background information and justification.

0049-38
0049-40

Likewise, the basis for many of the DEIR's assumptions and conclusions are not identified or do not amount to substantial evidence.

0049-41

The following examples relate to DEIR pages 4.3-73, 74, 79; 4.7-33 below.

1. The DEIR states, "The information used for evaluating well construction activities was obtained from detailed records compiled during the construction of ten new oil and gas production wells in 2010 and 2011." In Table 4.3-11, these ten wells are the basis for data sources and assumptions for New Well Activities, Onroad and Offroad Sources, Ancillary Equipment, and Duration. The conclusion drawn from this date is speculative and unreliable because there is no reason to think that the chosen ten wells from 2010 and 2011 accurately describe construction activities of the tens of thousands of new wells in the next twenty years. Which ten wells were used? Are they typical? To rely on this data, the DEIR must explain why the data from these wells are representative of all future wells in the County.

2. Another of many examples, according to Table 4.3-15, 2012 NOx emissions per well in the Western Subarea averaged 2.47 tons/well. What is the basis for the values and the emission factors in Table 4.3-15? NOx drilling emissions calculated in a recent DOGGR Mitigated Negative Declaration air study for the ELH 2-1 and 35-1 wells in the Western Subarea are listed at 5.2306 tons/well, more than twice as much as the DEIR would attribute to the project. Which of the two computations is in error? It is not clear how these fees would be calculated or what projects they would fund. The DEIR must be revised to clarify these issues. Before the County can rely on the NOx data, the basis for these computations must be adequately explained and the discrepancy with DOGGR data must be explained.
3. Similarly, according to Table 4.3-15, 2012 NOx emissions per well in the Central Subarea averaged 9.96 tons/well, while NOx drilling emissions calculated in a recent DOGGR Mitigated Negative Declaration air study for CRC's Port Arthur project in the Central Subarea are listed at 2.5882 tons/well, less than one-third of the NOx that the DEIR would attribute to the project. Which of the two computations is in error? We note that similar discrepancies hold for CRC's Goldings, Terrebonne, and Rhythm projects in the Central Subarea.

   How would the VERA project fee be determined per MM 4.3-8 for these projects? How effectively can any fees generated through the VERA process be used to reduce air pollution over the life of the "project"? Which projects would

0049-41 Continued

0049-42

0049-43

The DEIR impermissibly relies on potentially unreliable and unverified data supplied by the project applicant.

0049-44

The DEIR unreasonably relies on unverified information submitted by the oil industry. For example, on page 4.3-79, the DEIR states, "The petroleum industry provided projected well counts during the Project period 2015 through 2035." Information submitted by oil and gas operators could be biased since it comes from an industry that has a material and financial interest in the analysis of the DEIR, the type of mitigation and rules imposed by the County, and the County's proposed "streamlined" process. In order for decision-makers and the public to judge the accuracy of these submissions and the conclusions drawn from them, in each instance of oil industry submissions, the County must (1) provide for public inspection of all documents and information submitted by the oil industry and (2) conduct its own investigation and peer review before drawing conclusions based on such information.

0049-45

While the applicant is obviously free to supply the County with studies in support of the project, the County is required to independently evaluate all information provided by the applicant. Foundation for San Francisco's Architectural Heritage v. City and County of San Francisco (1980) 106 Cal.App.3d 893, 908 ("CEQA does not prohibit the applicant from providing the data, information and reports required for the preparation of the EIR," but mandates that "the agency independently perform its reviewing,

0049-46

0049-47

analytical and judgment functions and to participate actively and significantly in the preparation and drafting process.") Accord, Eureka Citizens for Responsible Government v. City of Eureka (2007) 147 Cal.App.4th 357, 369 (citations omitted) (California courts have emphasized that agencies may enlist and even rely on the applicant's consultants for drafting the EIR or submitting data and analysis, so long as "the agency sufficiently exercised independent judgment over the environmental analysis and exposition that constitute the EIR.")

0049-48

The DEIR fails to recognize the difference between the number of new permits and the number of new wells. Many projects have more than one well. For example, four new CRC projects have twelve wells total, three wells per permit. The Rio Viejo project has six wells with a single permit. Table 4.3-18 lists 2104 wells abandoned in 2012 while the December 29, 2012 DOGGR Weekly Summary lists 2396 wells abandoned in District 4 to that date in 2012. Potential inconsistencies between statewide DOGGR data and DEIR data must be addressed.

The DEIR fails to adequately analyze the project's aesthetic impacts

0049-49

The DEIR is inadequate as an informational document because owing to the size of the geographic area and the type of activities it covers, it is unable to adequately analyze the project's potential aesthetic impacts.

0049-50

The DEIR encompasses a whopping 3,700 square miles, including most of the San Joaquin Valley Floor portion of Kern County up to an elevation of 6,000 feet. DEIR at 4.1-3. The project area is larger than the state of Delaware, which is only 2,489 square miles. The project also encompasses the unincorporated areas of Metropolitan Bakersfield area.

0049-51

It is not surprising that the project area encompasses diverse terrain, some that includes high scenic value, as well as terrain that is urban or already visually degraded because of ongoing oil exploration or industrialization:

> The Project Area contains a range of visual resources and areas with differing visual character. Most of the terrain within the Project Area is flat to gently rolling with some hilly and steeply rolling terrain near the west, south, and east boundaries of the Project Area (Figure 4.1-1). The central part of the Project Area is mostly flat and contains a variety of wetlands with natural vegetation. Several stream corridors, including the Kern River, that descend into the valley from the east also contain natural riparian vegetation. However, most of the Project Area consists of diverse agricultural croplands, orchards, and grazing lands or oil and gas development and oil and gas facilities are often interspersed in the agricultural areas. 4.1-2

The DEIR proceeds to discuss potential development scenarios in each of the different sub-areas. The DEIR's ability to actually analyze project impacts is severely hampered because important details of potential oil and

gas projects in each subarea is unknown. Owing to this absence of detailed information, the DEIR is unable to adequately analyze the Project's environmental impacts as required by CEQA. 0049-51 Continued

The DEIR's analysis of aesthetic impacts on each subarea is inadequate as a matter of law. For example, with respect to the western subarea (DEIR 3.1-33), the DEIR states: 0049-52

> This KOP is representative of similar areas in the Project Area where operation activities for oil and gas development may occur without existing oil and gas development noticeable in the view. Intactness, unity, and vividness are high or moderately high for the existing view for this KOP. Operation activities would introduce new well pads with wells of varying types and sizes, new access roads, power poles, equipment and equipment storage areas, aboveground collection and distribution pipes, and occasional vehicles and dust in views with high visual sensitivity…

Based on the foregoing, the DEIR generically concludes that aesthetic impacts of oil and gas exploration would result in a significant impact. This analysis is inadequate, however, because it is too vague and general and is not based on an actual environmental baseline. It is simply not enough for the DEIR to generically conclude that a theoretical project's impact would be significant. Without the details of any actual project, the EIR cannot provide the decision-makers and the members of the public with sufficient information to judge a project's aesthetic impacts. Napa Citizens for Honest Gov. v. Napa County Brd of Supervisors (2001) 91 Cal.App.45h 342, 356.

The DEIR's summary of aesthetics impacts aptly demonstrates that the DEIR does not and cannot adequately analyze the future aesthetic impacts of the many thousands of new oil and gas wells that would be constructed in Kern County in the next 25years. The EIR's summary of aesthetics impacts states: 0049-53

> Although most future oil and gas activities would occur in Tier 1 and Tier 2, and more than 2,000 wells could also be removed annually from these areas, there is the potential that areas that are currently primarily agricultural or open space and that have a predominantly rural or natural aesthetic character could be converted to a predominantly industrial developed character with the addition of large numbers of highly visible and noticeable construction and exploratory equipment, materials, vehicles, and construction activities including well stimulation, and decommissioning/abandonment.

DEIR 4.1-40. The EIR's conclusion that the mass conversion of rural/agricultural open space to an oil-and-gas producing industrial area could result in a significant impact is self-evident. CEQA requires site-specific, project-specific analysis of aesthetics impact in order to afford the decision-makers the ability to understand the environmental impacts of each particular oil and gas project.

0049-54

The EIR's analysis of Air Impacts is flawed

0049-55

There is no air study. There are only five pages of tables with no associated units or justification, merely stating, "Assumptions and description of how the emissions listed in the tables were derived are presented in the report." See, Sahu Report, filed concurrently with Earth Justice comments on behalf of the Sierra Club.Assumptions and descriptions are not supported by reliable evidence:

0049-56

Page 4.3-73 states: "The number of wells that underwent hydraulic stimulation during 2012 was determined from records obtained from Frac-Focus." Participation in Frac-Focus is voluntary and not subject to quality control, therefore there is no reason to think that the information provided is accurate.

0049-57

The same page also states that "the information used for evaluating well construction activities was obtained from detailed records compiled during the construction of ten new oil and gas production wells in 2010 and 2011." Furthermore, the DEIR states: "Durations of other tasks required for completing a specific phase of a construction activity were obtained from the records of the construction of 10 wells in 2010 and 2011." As stated earlier in these comments, there is no reason to think that the chosen ten wells from 2010 and 2011 are representative of future wells or accurately describe construction activities of the many thousands of new wells in the next twenty years.

0049-58

The DEIR also states: "Since historic information on the equipment used for well abandonment was not available, the vehicle and equipment list used for routine well maintenance was used for calculating emissions from well abandonment." How can this accurately describe emissions from well abandonment for the next twenty years? At a minimum, the DEIR should explain why data from well maintenance equipment can be used a proxy for information about well abandonment equipment and vehicles.

0049-59

At Page 4.3-74, the DEIR states: "The number of days required to complete drilling, completion, rework, and abandonments depends on the well depth, and was estimated by interpolating data reported in DOGGR well records." What is this data? How was this data used? Recent DOGGR well records are nonexistent or incomplete.

0049-60

Page 4.3-79 states: "The well count numbers for drilling, rework, well stimulation, and well abandonment for the baseline year 2012 were determined using preliminary information obtained from the California Division of Oil, Gas and Geothermal Resources (DOGGR) District-4 Field Office." This preliminary information must be available to the public. "The petroleum industry provided projected well counts during the Project period 2015 through 2035." As explained above, CEQA requires the agency not to blindly rely on data provided by applicant, and instead requires the lead agency to use its own experts to independently verify the accuracy of data supplies by the industry.

0049-61

Tables 4.3-15, -16, -17, and -18 (pages 4.3-80, 81) are inconsistent with the DOGGR Weekly Summary, December 29, 2012. Drilling permits may have more than one well. Justifications for significantly lower emission factors in 2035 does not appear to be provided. Table 4.3-23 is ambiguous as to whether the emission factors include indirect emissions from power plants necessary to generate the electricity

0049-61 Continued

required for operations. The EIR must explain what percentage of pumps use IC engines, whether these emissions have been included in the overall assessment of the "project's" impact on air quality?

Tables 4.3-21 and 4.3-23 have different total numbers for active wells in 2035, 70037 vs. 82135. Why the inconsistency? Which one is in error? Where do these numbers come from?

0049-62

Emissions from routine well operations don't seem to include emissions associated with the pump motor, direct or indirect. The DEIR must be revised to correct this.

0049-63

MM 4.3-8 The DEIR's discussion of Voluntary Emission Reduction Agreements VERA) is not clear. According to the DEIR, site plan review by County Staff does not incorporate VERA. Under existing regulation, the Air Board calculates project fees to fund a VERA based on the information in the air study about the project's operational and construction air emissions. How can individual project fees be determined if there is no air study that calculates the project's emissions? Moreover, the DEIR must describe and evaluate the type of mitigation measure would be required for those projects that are not required to offset their emissions under a District rule? See Sahu Report.

0049-64
0049-65

The DEIR's discussion of project impacts on Agriculture and Agricultural mitigation measures is inadequate

The DEIR admits that project impacts on agricultural land would be significant. To address this impact, MM 4.2-1a, provides that "Funding and/or purchasing agricultural conservation easements **or similar instrument acceptable to the County (to be managed and maintained by an appropriate entity)**." (emphasis added)] This mitigation measure does not pass legal muster because:

- The notion of a "similar instrument acceptable to the County" is vague and unclear and subject to potential misinterpretation and mismanagement. What is the criteria for being acceptable to the County?
- Similarly, the notion of an "appropriate entity" is unduly vague. What is the criteria for such an entity? In order to ensure that the mitigation is administered by a competent organization, the condition should require that the "appropriate entity" be accredited by the Land Trust Accreditation Commission. See http://www.landtrustaccreditation.org.

The DEIR does not address impacts of use of produced water on agriculture. DEIR Page 4.9-139. Sierra Club members and other local residents are concerned that food crops grown with oilfield produced water could contain dangerous chemicals. The DEIR must discuss whether this is the case, and if so, it must further discuss the health effects of eating such foods. Likewise, the DEIR must discuss whether the use of produced water in agriculture could have any long-term effect on the long-term viability of agricultural operations, marketability of agricultural products produced using produced water

0049-66

The EIR must be revised to fully analyze the range of impacts that could result from the use of produced water for agricultural purposes.

0049-67

On page 4.2-21, the DEIR states, "Future oil and gas exploration and production activities authorized under the proposed Project would not result in the loss of forest land or conversion of forest land to non-forest use because there is no forest land or timberland in the Project Area. No impact is identified for this issue." Trees and other plants in increasing elevation are negatively impacted by mobile and stationary source pollution from motor vehicles and industry. Sequoia National Forest and Sequoia-Kings Canyon National Parks are some of the most polluted parks and forests in the federal system. This pollution is directly attributed to San Joaquin Valley activities. See, for example, http://www.elsevier.com/books/ozone-air-pollution-in-the-sierra-nevada-distribution-and-effects-on-forests-2/bytnerowicz/978-0-08-044193-1 or http://www.fs.fed.us/psw/southernsierrascience/speakers/pdf/cisneros.pdf. The DEIR is deficient in not having examined and mitigated the cumulative air pollution effects of this project on forest resources.

Water supply impacts

0049-68

Local residents have specific concerns about water impacts. The Ordinance must close the Halliburton loophole, which exempts the injection of fracking fluids from the federal Safe Drinking Water Act's underground injection control ("UIC") program. The County should draft regulations equivalent to the federal UIC safeguards to close this loophole.

0049-69

The Ordinance should be revised to require groundwater testing performed prior to any well stimulation operations to establish baseline water quality and subsequent to all drilling and well stimulation. Without such a baseline, it is impossible to determine any given oil and gas project's long term impact.

0049-70

According to Table 4.9-1, about 30,223 AF of produced water was disposed into surface ponds. The DEIR fails, however, to state the location of the ponds or propose any means to provide fo adequate monitoring of these sites. The DEIR must be revised accordingly.

0049-71

Regarding drilling sumps, on page 4.9-69, the DEIR states, "Published reports indicate that, as of March 2015, the CVRWQCB had identified 355 inactive ponds previously used for produced water disposal, 370 ponds that are active and permitted, and 208 active ponds that were not issued WDRs or other disposal permits. According to the Project applicants, the CVRWQCB's initial list was based, in part, on outdated aerial maps, and the agency is currently updating this list of permitted and unpermitted ponds based on new information supplied by the oil and gas industry. The CVRWQCB has indicated that it intends to bring all active produced water ponds into regulatory compliance or require closure of any produced water ponds that cannot meet applicable water quality standards by December 2016 (BakersfieldNow.com 2015)." The DEIR is deficient in that it has not studied the impacts of these disposal ponds using information independent of the oil industry which has a vested interest in downplaying these impacts.

On page 4.9-103, the DEIR states, "The CVRWQCB has indicated that it will issue enforcement orders to oil and gas disposal pond facilities as necessary to bring them into compliance with applicable laws and regulations. If beneficial uses of groundwater have been impaired as a result of historical usage of an unlined pond, investigation and remediation may be required." Mitigation measure MM 4.9-5 states, "Where waters with beneficial uses are present and could be adversely impacted, unlined impoundments may have to be retrofitted with liner systems…" This is vague and unenforceable. The DEIR should determine whether "beneficial uses of groundwater have been impaired" and, if so, should give specific criteria under which "unlined impoundments have to be retrofitted with liner systems." 0049-72

Table 4.9-20 gives produced water quality data from 1989. Fracking has increased in the intervening 26 years, and produced water from fracking could contain dangerous chemicals. This data is too old to be believable without vigorous substantiation, and the DEIR has not produced sufficient validation. The DEIR must be revised to address this glaring data gap. 0049-73

On page 4.9-70, the DEIR states, "Based on the information submitted by oil and gas operators, the CVRWQCB determined that unpermitted discharges of well completion fluids, produced water, or stimulation fluids had occurred to drilling sumps in other Project Area locations." Information submitted by oil and gas operators could be biased since it comes from an industry whose profits are partially dependent on downplaying and understating these impacts. The DEIR is deficient in that it has not independently studied the issues associated with unpermitted discharges into drilling sumps. 0049-74

Regarding a BLM study, on page 4.9-86, the DEIR states, "There are no publicly recorded instances of subsurface release of contaminated fluids into potable groundwater in California; additional studies and data collection are needed to fully evaluate this potential concern." The DEIR is deficient in that it has not done the additional studies and data collection "needed to fully evaluate this potential concern." 0049-75

Table 4.9-27 on page 4.9-126, includes three scenarios for oil and gas water supply and demand,. The fact that the EIR considers three different scenarios demonstrates that the County lacks sufficient information to adequately forecast either the supply or demand. With this much uncertainty and speculation, the County should be preparing a program, not a project, EIR. 0049-76

Indirect Impacts 0049-77

When evaluating whether a project will have significant environmental impacts, the lead agency must consider both the direct effects of the project and the reasonably foreseeable indirect effects. 14 Cal. Code Regs. § 15064. "An indirect physical change in the environment is a physical change in the environment which is not immediately related to the project, but which is caused indirectly by the project." 14 Cal. Code Regs. § 15064(d)(2). CEQA is clear that lead agencies must evaluate impacts outside the project area: "[N]o statute (in CEQA or elsewhere) imposes any per se geographical limit on otherwise appropriate CEQA evaluation of a project's environmental impacts." *Muzzy Ranch Co. v. Solano Cnty. Airport Land Use Comm'n*, 41 Cal. 4th 372, 387 (2007). "Indeed, the purpose of CEQA would be undermined if the appropriate governmental agencies went forward without an awareness of 0049-78

the effects a project will have on areas outside of the boundaries of the project area." *Napa Citizens for Honest Gov't v. Napa Cnty. Bd. of Supervisors*, 91 Cal. App. 4th 342, 369 (2001).

0049-78 Continued

The EIR entirely fails to mention, let alone evaluate, indirect effects of the proposed project. When burned as fuel, the oil and gas produced by this project will contribute to air pollution and global warming. While some of that contribution may be mitigated through regulation of end users, surely a significant portion of the emissions will not be mitigated and will contribute to air pollution and climate change. This contribution must be quantified and mitigated.

0049-79

Unmitigated GHG emissions from burning the oil and gas produced in Kern County oilfields. The DEIR is deficient in that it fails to adequately analyze the following:

- It does not compute the amount of annual unmitigated GHG emissions from burning the oil and gas produced in Kern County oilfields.
- It does not assess the impact of unmitigated GHG emissions from burning the oil and gas produced in Kern County oilfields.
- It does not require mitigation for unmitigated GHG emissions from burning the oil and gas produced in Kern County oilfields.

A recent article (see http://link.springer.com/article/10.1007/s10584-013-0986-y) traces large percentages of anthropogenic greenhouse gas emissions to fossil fuel producers. The DEIR should adequately analyze the proposed "project's" GHG impacts and require Kern oil producers to mitigate this significant cumulative impact.

0049-80
0049-81

OTHER CONSIDERATIONS

Local residents have specific concerns about drilling waste. The drilling mud waste, which includes the cuttings from the formations found in the borehole, and crude oil mixed with the clay for additional lubrication in the drilling mud, is usually hauled away by diesel trucks for disposal. For each well, several dozen such waste loads often end up in landfills, perhaps in Avenal to the north. Hauling away the drilling waste must be considered for both the transportation pollution and the landfill impacts.

0049-82

Since the applicants represent most exploration and production companies within the County, the applicants must provide information available to them regarding the Project and existing conditions, and not just "generally available" information; specifically the EIR must contain a complete bibliography of all information from reports, DOGGR applications, articles, conferences' presentations, etc. and an online searchable database must be provided to be linked to the bibliography.

0049-83

Idle wells not properly abandoned. CEQA Guidelines state, "An EIR must include a description of the physical environmental conditions in the vicinity of the project." CEQA Guideline §15125. Among many other shortcomings, we find no accounting for wells that are idle and not properly abandoned. According to Table 4.3-21 on pages 4.3-85,86, there were 11,827 idle wells in the project area in 2012, and the DEIR anticipates 11,773 idle wells in 2035. The DEIR states, "The number of idle wells is the

0049-84

same for every Project year 2015 – 2035, and was calculated as the average of the number of idle wells reported to DOGGR from 1999 through 2014."

0049-84 Continued

- Given the large increase in the number of active wells over this time period, on what basis does the DEIR speculate that the number of idle wells will be constant?
- Given DOGGR's poor record in keeping track of other oilfield facilities (e.g., 208 active disposal ponds without permits), the DEIR is deficient in blindly accepting DOGGR's numbers on idle wells. How many idle wells have gone unreported to DOGGR?
- How will the County determine when an idle well has been deserted?
- How many idle wells in Kern County have been deserted?
- How much does it cost to properly abandon an idle well? Are fees for idle wells large enough to incentivize proper abandonment?
- Is there a time limit for idle wells that would trigger proper abandonment?
- The DEIR is deficient in not having assessed and mitigated the impacts of idle, deserted, and/or not properly abandoned wells on the County environment.
- PRC § 3206.5 allows the County to request proper abandonment of idle or deserted wells. TheCounty must established a program to properly abandon deserted or long-time idle wells before approving new oil and gas wells.

0049-84 Continued

As the DEIR notes on page 4.7-15, the EPA has found that GHGs "endanger the public health and the public welfare of current and future generations" and that "emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that endangers public health and welfare." A recent article (see http://link.springer.com/article/10.1007/s10584-013-0986-y) traces large percentages of anthropogenic greenhouse gas emissions to fossil fuel producers. The DEIR is deficient in that it has not addressed public health issues associated with motor vehicle and other GHG emissions resulting from the fuel produced from the expected oil and gas extracted from the Kern oilfields during the life of this EIR.

0049-85

A recent article by Mera, Massey, Rupp, Mote, Allen, and Frumhoff in the journal *Climactic Change* (referenced at http://link.springer.com/article/10.1007/s10584-015-1474-3) attributes an increase in heat stress to human induced climate change and states, "In California's Central Valley, heat waves have become progressively more severe in recent decades due to higher humidity and warmer nighttime temperatures. . . . Among the most affected was the Latino community in agricultural regions (Knowlton et al. 2009), who face relatively high exposure to extreme heat due to extensive outdoor work. In fact, the Latino population continues to be at disproportionately high climate risk across the United States, supporting the relatively wide sentiment within the Latino community that climate change is a serious problem that should be addressed." The DEIR is deficient in that it has not addressed environmental justice public health issues associated with motor vehicle and other GHG emissions resulting from the fuel produced from the expected oil and gas extracted from the Kern oilfields during the life of this EIR.

0049-86

On page 268, the San Joaquin Basin Case Study included as Chapter 5 of Volume 3 of the CCST SB 4 EIR (see http://ccst.us/projects/hydraulic_fracturing_public/SB4.php) states, "there has also been no targeted monitoring of groundwater quality, nor have there been specific efforts to determine the extent of potentially compromised wellbore integrity." The DEIR contains no discussion whatsoever of wellbore integrity. The EIR must address these issues.

0049-87

On page 340, the San Joaquin Basin Case Study states, "Current well construction requirements in the San Joaquin Basin are not designed to protect groundwater with 3,000 to 10,000 mg/L TDS that is not otherwise exempt from protection." Such groundwater "has not historically been methodically determined and mapped" (page 339). The EIR must methodically map such groundwater, must impose strict well construction requirements to protect such groundwater, and must require strict monitoring and enforcement of such requirements to ensure that such groundwater is protected.

0049-88

On page 340, the San Joaquin Basin Case Study states, "the likelihood of leakage of stimulation fluids or reservoir gases via faults opened during hydraulic fracturing is not known. This likelihood should be investigated further, perhaps in simulation assessments and/or dedicated field studies. In the meantime, it is important to ensure that site characterization efforts conducted will detect existing faults of a size sufficient to connect the reservoir to protected groundwater before a hydraulic fracturing operation is conducted." The DEIR is deficient in that it does not contain such an investigation, nor does it contain requirements for appropriate "site characterization efforts."

0049-89

0049-90

On page 267, the San Joaquin Basin Case Study states, "One of the current methods for produced water disposal from pools with hydraulic fracturing in the San Joaquin Basin is discharge into evaporation-percolation pits. This presents a potential risk for contamination of potable groundwater resources and should be phased out in the future." While the DEIR speculates about three scenarios regarding disposal of produced water, the DEIR requires no mechanism for phasing out the use of evaporation-percolation pits. For that matter, on page 4.9-141, the DEIR admits, "The extent to which surface disposal can be reduced by 90% as projected in Scenario 3 is uncertain." Mitigation Measure 4.9-5 passes the buck to the CVRWQCB. The DEIR fails to address this important issue.

The comment proposes modifications to the Revised Amended Ordinance states that the Project Description should be modified to reflect the suggested modifications. Adoption of a zoning ordinance or zoning ordinance amendment is a legislative act and as such is subject to the discretion of the legislative body, provided the ordinance is not arbitrary or capricious. *Arnel Development Co. v. City of Costa Mesa* (1980) 28 Cal. 3d 511, 516–518 (rezoning is legislative act regardless of size of parcel rezoned or number of landowners affected). Since a zoning ordinance is a legislative act, there are no specific requirements for its content. An accurate, stable, and finite project description is the sine qua non of an informative and legally sufficient EIR. The project must be described accurately to allow reviewers and decision makers to balance the project's benefits against its environmental costs, to consider mitigation measures, and to assess the advantages of the no-project and other alternatives. *County of Inyo v. City of Los Angeles* (1977) 71 Cal. App. 3d 185, 192–193. The Project Description (DEIR, Ch. 3) describes the Revised Amended Ordinance and the activities authorized thereunder. It would violate CEQA to change the Project Description to include information and requirements not included in the Revised Amended Ordinance.

0049-23

The Project does not violate CEQA. If the Project is approved, proposed oil and gas facilities that qualify for ministerial review under the Revised Amended Ordinance will not be considered a "project" for purposes of CEQA. Under the CEQA Guidelines, the term "project" refers to an activity subject to CEQA. 14 Cal. Code Regs. § 15002(d). Pursuant to Public Resources Code § 20180(b)(1), CEQA does not apply to ministerial projects proposed to be carried out or approved by a public agency. However, if the Project is approved, proposed oil and gas facilities that do not qualify for ministerial review under the Revised Amended Ordinance, and instead require a conditional use permit, will be subject to discretionary review. Unlike ministerial actions, discretionary actions proposed to be carried out by a public agency are considered "projects" pursuant to CEQA and thus require environmental review. *See* Pub. Res. Code § 21080(a). If the Project is adopted, no proposed oil and gas facilities will be approved, *de facto* or otherwise, unless and until such facilities obtains a valid ministerial or discretionary permit, as required by the Revised Amended Ordinance. This comment also wrongfully presupposes that all discretionary actions that are, in fact, subject to CEQA must undergo an alternatives analysis in order to comply with CEQA. This is not so. Under CEQA, an alternatives analysis is only required for projects that may have a significant impact on the environment and thus require environmental analysis under a full environmental impact report. *See* Pub. Res. Code §§ 21080(d); 21100(b)(4). If, however, the discretionary action would not have a significant effect on the environment, then the lead agency must prepare a negative declaration to that effect. *See* Pub. Res. Code § 21080(c). A negative declaration is not required to include an alternatives analysis. *See* 14 Cal. Code Regs. § 15071. Please see Global Response 1.

0049-24

This comment misstates the requirements of CEQA. Please see Response 0067-25, above. The EIR's evaluation of the required No Project alternative is set forth on Draft EIR pages 6-17 through 6-19. Please also see Response 0067-25, and Global Responses (GR)- 01, 02 and ALT-02.

0049-29 cont'd

0049-30

A statement of overriding considerations is anticipated to be adopted for the project. A statement of overriding considerations is required with a final EIR where a project will have significant impacts that can’t be "reduced or substantially lessened," but specific economic, legal, social, technological, or other benefits outweigh those impacts. CEQA Guidelines § 15093; Pub. Res. Code § 21080. A statement of overriding considerations is thus not required for every project that has a significant environmental impact, but only when mitigation measures are insufficient to reduce or substantially lessen significant environmental impacts. *Id*. A statement of overriding considerations must be supported by substantial evidence in the record. CEQA Guidelines § 15093(b); *Koster v. County of San Joaquin* (1996) 47 Cal.App.4th 29, 32. The County anticipates that a statement of overriding considerations will be adopted with the final EIR, which will have to be supported by substantial evidence in the record in order to meet the requirements of CEQA. (Draft EIR, p. 1-2.)

The Draft EIR consists of a project-level analysis that analyzes the environmental impacts of a wide range of oil and gas projects, which will all be taken into account by the County in either adopting a statement of overriding considerations, or rejecting the proposed Ordinance. (Draft EIR, p. 2-23.) Please refer to GR-1 for additional discussion of the project-level review. The Draft EIR is anticipated to cover "the vast majority," but not necessarily all such future projects. (*Id*.) Where an application for Oil and Gas Conformity Review indicates that a proposed future project does not fall within the scope review of the Draft EIR, the Draft EIR indicates that additional review under Public Resources Code Section 21166 and CEQA Guidelines Section 15162 may be required. (*Id*.) CEQA Guidelines Section 15162 requires additional CEQA review where: (1) substantial changes to a project require revisions to the EIR due to new or increased significant environmental effects; (2) substantial changes to surrounding circumstances occur and require revisions to the EIR due to new or increased significant environmental effects; or (3) new information shows that a project will have effects not discussed in the prior EIR, more severe effects than were previously examined, or new mitigation measures not analyzed or adopted would substantially reduce one or more significant effects. CEQA Guidelines § 15162(a). If additional CEQA review is required and the criteria necessitating a statement of overriding considerations is met by the future project, the lead agency must adopt a statement of overriding considerations at that future time. CEQA Guidelines § 15093.

Accordingly, any concern that future oil and gas projects that will have additional impacts not analyzed in the current EIR will be able to escape additional CEQA review—and the possibility of having to adopt a statement of overriding considerations if the criteria are met—is unfounded. See *Citizens for a Sustainable Treasure Island v. City & Cty. of S.F.* (2014) 227 Cal. App. 4th 1051 (rejecting argument that program level EIR for 20 year, multi-phase project allowed lead agency to evade future CEQA review where, as here, the EIR indicated future projects would require additional review if standards of Pub. Res. Code § 21166 were met.)

Please also see GR-1.

0049-31

This is a section title and a response is not required.

0049-32

The comment suggests that the Project objectives conflict with CEQA Guidelines Appendix F, which states that "decreasing reliance on fossil fuels such as coal, natural gas and oil" is a way to meet energy conservation goals.

A lead agency is not required to align its Project objectives with the goals stated in Appendix F. Rather, Appendix F is an advisory document that was created by the State Resources Agency in response to AB 1575, which amended Public Resources Code Section 21100(b)(3) to require

EIRs to consider the consumption of energy caused by a project. Thus, the only requirement in Appendix F is the requirement to consider the energy impacts of a project in the EIR. (See *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 206, 209 (*Woodland*) ["Appendix F of the CEQA Guidelines requires that projects assess the energy impacts of a project when a fair argument can be made that the project will have significant environmental impact."].)

Pursuant to Appendix F and Public Resources Code Section 21100(b)(3), the DEIR thoroughly discusses the potential energy impacts of the Project. (See DEIR at pp. 5-8–5.14). The DEIR ultimately determined that oil and gas production operators would use energy efficiently and that in-state oil production would reduce the amount of crude oil the state must import, an energy intensive process.

Nothing further is required by Appendix F.

Please also see GR GHG-1 and GR Air-12.

0049-33

The comment suggests that the Project objectives conflict with CEQA Guidelines Appendix F, which states that "decreasing reliance on fossil fuels such as coal, natural gas and oil" is a way to meet energy conservation goals.

A lead agency is not required to align its Project objectives with the goals stated in Appendix F. Rather, Appendix F is an advisory document that was created by the State Resources Agency in response to AB 1575, which amended Public Resources Code Section 21100(b)(3) to require EIRs to consider the consumption of energy caused by a project. Thus, the only requirement in Appendix F is the requirement to consider the energy impacts of a project in the EIR. (See *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 206, 209 (*Woodland*) ["Appendix F of the CEQA Guidelines requires that projects assess the energy impacts of a project when a fair argument can be made that the project will have significant environmental impact."].)

Pursuant to Appendix F and Public Resources Code Section 21100(b)(3), the DEIR thoroughly discusses the potential energy impacts of the Project. (See DEIR at pp. 5-8–5.14). The DEIR ultimately determined that oil and gas production operators would use energy efficiently and that in-state oil production would reduce the amount of crude oil the state must import, an energy intensive process.

Nothing further is required by Appendix F.

Please also see GR GHG-1 and GR Air-12.

0049-34

The comment states that the Project's objectives conflict with the State of California's goal of drastically reducing GHG emissions and that the Project will likely undermine the State's goal of reducing GHG emissions.

The Project objectives do not call for "increased, easier and quicker oil and gas extraction." To the contrary, the County's objectives include adding procedures and compliance standards for the oil and gas industry "for the purpose of reducing or eliminating potential significant adverse environmental effects," in addition to a goal of increasing monitoring by the County. (DEIR at p. 1-5.) To meet these objectives, the proposed Amended Zoning Ordinance increases the County's oversight over oil and gas extraction and includes over 100 new procedural and substantive requirements that apply to Project activities.

The potential of the Project to result in climate change effects by increasing GHGs was fully analyzed in the DEIR. (See DEIR pp. 4.7-1–4.7-45.) The DEIR specifically addressed whether the Project will interfere with the State's ability to achieve its GHG targets for 2030 and 2050 and concluded that the proposed Project, as mitigated, is consistent with the State's goals. (DEIR at pp. 4.7-43–4.7-44.)

0049-35

The comment suggests that the EIR should adopt the goals stated in Appendix F for decreasing reliance on fossil fuels and increasing reliance on renewable sources. Commenter also requests that the DEIR consider an alternative that advances that objective.

As stated in responses 34 –35, above, Appendix F does not require EIRs to include its goal of decreasing reliance on fossil fuels and increasing reliance on renewable sources as projective objectives, it only requires that EIRs consider the energy effects of the proposed project.

Energy effects of the project were analyzed. (See DEIR at pp. 5-8 to 5-14). The DEIR ultimately determined that oil and gas production operators would use energy efficiently and that in-state oil production would reduce the amount of crude oil the state must import, an energy intensive process.

Further, renewable energy alternatives were considered in the DEIR. (See DEIR at pp. 6-14–6-17.) For more information, please see GR GHG-1, GR Alt-1 and GR Alt-2.

0049-36

Please see GR 1 – Ministerial Permitting Process and GR 19 – Mitigation Monitoring and Reporting Program, for a description concerning how the Revised Zoning Ordinance will be implemented and enforced.

0049-37

The comment states a legal conclusion and is noted for the record.

0049-38

The commenter states that the absence of an air quality study and a GHG analysis and estimate invalidates the air quality and GHG analysis in the DEIR. All of the supporting information used in drafting the DEIR was available to the public upon request to the County. Some parties obtained the supporting information via a California Public Records Act request. The DEIR was not required to include this material. To keep the EIR to a manageable length, source documents used in preparing an EIR need not be included in the EIR. *See* CEQA Guidelines § 15148. Scientific, engineering, and technical reports and similar documents relied on in preparing an EIR need not be incorporated into the body of the EIR or in an EIR appendix. *Id.*; *see also Ebbetts Pass Forest Watch v. Department of Forestry & Fire Protection* (2008) 43 Cal. 4th 936, 958 (nothing in CEQA requires that source materials be physically incorporated in an EIR); *Mount Shasta Bioregional Ecology Ctr. v. County of Siskiyou* (2012) 210 Cal. App. 4th 184, 219 (an EIR may summarize information in a technical report without appending the report or incorporating the report by reference); *Anderson First Coalition v. City of Anderson* (2005) 130 Cal. App. 4th 1173 (the EIR's hydrological analysis was not incomplete when a study relied on in determining the drainage report was not included in the EIR).

Please see GR Air-1, GR Air-4, and GR GHG-1 for further explanation of the air quality and GHG analysis.

0049-40

0049-41

Please see GR-Air 4 regarding air quality methodology and emission estimates.

The NOx emissions from well drilling reported in the DOGGR mitigated declaration for ELH 2-1 and 35-1 differ from the factor used in the DEIR for the Western Subarea for a variety of reasons. The most obvious is the difference in well depth. The depth of the ELH 2-1 and 3-5 wells were reported to be 16,000 feet. The average depth of the wells in the Western Subarea is 2,400 feet. Approximately 99% of the wells in the Western Subarea have a depth less than 16,000 feet. It takes a greater amount of time to drill deep wells relative to shallow wells. Consequently, the emissions estimate for the ELH-35 2-1 and 3-5 wells (16,000 foot wells) is greater than the emission factor considered representative of a well in the Western Subarea.

The NOx emissions calculated for the Port Arthur project, which is located in the Central Subarea, are less than those predicted by the Kern County analysis for a variety of reasons. It appears that for the most part, the NOx emissions reported for the Port Arthur project only include the emissions from site preparation and from well drilling. In the Kern County analysis, well construction includes the NOx emissions resulting from the following:

Site preparation Pre-drilling activity Drilling activity Well completion Construction of well interconnect flow lines Construction of electrical system required to operate the well Installation of the well pumping unit required for producing the well

In the Port Arthur project it was assumed that two of the 4 drilling ring engines were idle. However, representatives from drilling companies, such as Nabors drilling explained that on most deep wells (like the Port Arthur project wells) all engines are usually operated at load during the drilling activity. Other assumptions used in the Port Arthur project result in lower emission estimates compared to the Central Subarea drilling factor used in the Kern County analysis. In addition, the fact that the Port Arthur Project NOx calculations were lower than the calculated NOx emissions in the EIR refutes the notion that emissions are understated in the EIR and supports the idea that the air quality analysis is a conservative assessment of Project emissions.

Please see GR-Air-2 regarding the OG-ERA as mitigation.

0049-44

The comment states that the County must exercise its independent judgment when relying upon information provided by the Applicant. The County agrees. CEQA authorizes applicants to provide information to a lead agency for purposes of an EIR. 14 Cal. Code Reg. § 15084(d)(3); see *Friends of La Vina v. County of Los Angeles* (1991) 232 Cal. App. 3d 1446, 1453 (preparation by applicant's consultant was acceptable because the Lead Agency exercised independent review and judgment over the document); see also *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal. App. 4th 357 (preparation by applicant's counsel was acceptable because Lead Agency exercised independent review and judgment over the document); *Sunset Drive Corp. v. City of Redlands* (1999) 73 Cal. App. 4th 215, 220, (preparation by applicant's consultant was acceptable because City exercised its independent review and judgment). Here, the County

exercised its independent judgment in reviewing the information provided by the Applicant (*see* DEIR at 1-3 *see also* 2-214 Cal. Code Reg. § 15084(e); *City of Poway v. City of San Diego* (1984) 155 Cal. App. 3d 1037, 1042–1043) and determined that it was the best available information for purposes of preparing the environmental analysis. Please see GR 21 – Best Available Information. The information reviewed by the County to support development of the EIR is included in the technical appendices to the EIR (DEIR, Appendices A-W), all of which was available for public review (DEIR, Vol. I, Notice of Availability for Public Review).

Please see GR-Air-4 regarding air quality methodology and emission estimates and GR-21. The DEIR acknowledges that it must reflect the independent judgment of the County. *See* DEIR at 1-3, 2-2.

0049-45

As is usual and customary in CEQA proceedings with an applicant, the applicant team was required to submit information about their proposed project activities as well as various technical reports. The County in all cases engaged in an independent assessment of of this data, augmented or replaced this data with data that was determined to be superior (see, e.g., Appendix X which rejected the "land disturbance estimates" calculated by teh Applicant's consultant and replaced tehse with higher estimates), etc.

0049-46

0049-47

Please see GR-Air 4 regarding air quality methodology and emission estimates.

The NOx emissions from well drilling reported in the DOGGR mitigated declaration for ELH 2-1 and 35-1 differ from the factor used in the DEIR for the Western Subarea for a variety of reasons. The most obvious is the difference in well depth. The depth of the ELH 2-1 and 3-5 wells were reported to be 16,000 feet. The average depth of the wells in the Western Subarea is 2,400 feet. Approximately 99% of the wells in the Western Subarea have a depth less than 16,000 feet. It takes a greater amount of time to drill deep wells relative to shallow wells. Consequently, the emissions estimate for the ELH-35 2-1 and 3-5 wells (16,000 foot wells) is greater than the emission factor considered representative of a well in the Western Subarea.

The NOx emissions calculated for the Port Arthur project, which is located in the Central Subarea, are less than those predicted by the Kern County analysis for a variety of reasons. It appears that for the most part, the NOx emissions reported for the Port Arthur project only include the emissions from site preparation and from well drilling. In the Kern County analysis, well construction includes the NOx emissions resulting from the following:

Site preparation

Pre-drilling activity

Drilling activity

Well completion

Construction of well interconnect flow lines

Construction of electrical system required to operate the well

Installation of the well pumping unit required for producing the well

In the Port Arthur project it was assumed that two of the 4 drilling ring engines were idle. However, representatives from drilling companies, such as Nabors drilling explained that on most deep wells (like the Port Arthur project wells) all engines are usually operated at load during the drilling activity. Other assumptions used in the Port Arthur project result in lower emission estimates compared to the Central Subarea drilling factor used in the Kern County analysis. In addition, the fact that the Port Arthur Project NOx calculations were lower than the calculated NOx emissions in the EIR refutes the notion that emissions are understated in the EIR and supports the idea that the air quality analysis is a conservative assessment of Project emissions.

Please see GR-Air-2 regarding the OG-ERA as mitigation.

0049-48

The comment states that the EIR fails to recognize the difference between the number of new permits and the number of new wells, The comment cites examples where projects have several wells operating under a single permit. The air quality analysis in the DEIR analyzes the impact of drilling 3,647 wells per year, regardless of how many permits this would constitute. *See* DEIR at 4.3-71 (stating the "authorized number of new wells per year, that is 3,647 wells each year"); 4.3-98 (stating that the maximum number of new wells that may be authorized is 3,647). This is clear by reference to Table 4.3-31 which shows the total number of new authorized wells per year as 3.547. The analysis in the air quality chapter thus considers 3,647 wells per year, and the County does not plan to authorize more than that under the Ordinance. As such, the Revised Amended Ordinance has been further revised to include a cap of 3,647 new well permit ministerial approvals annually, consistent with the projected number of annual wells evaluated in this EIR. While, in some circumstances, an operator may be able to undergo a single conformity review for a multi-well project, each well would require its own permit, and these permits would count toward the annual cap.

The DEIR does state that the County will not authorize more than 3,647 permits (*see e.g.,* DEIR at 4.3-71, 99) which previously could have been interpreted to mean multiple wells under one permit, but the revised ordinance and other portions of the DEIR make clear that the cap is 3,647 wells.

The comment also states that potential inconsistencies between DOGGR data and EIR data must be addressed. With respect to potential inconsistencies with DOGGR data, please refer to GR-14 and GR Air-4.

0049-49

It has been suggested that the DEIR fails to adequately analyze the Project's visual and aesthetic effects. Oil and gas operations are distributed throughout the Project Area, with particular intensity in Tier 1 and a strong presence in Tier 2. Continuing this pattern of historic land development will cause visual changes within the immediate vicinity of the new equipment. However, these changes are generally consistent with existing visual patterns. The analysis in an EIR "need not be exhaustive." CEQA Guidelines § 15151. "A legally adequate EIR . . . ‘must contain sufficient detail to help ensure the integrity of the process of decisionmaking by precluding stubborn problems or serious criticism from being swept under the rug.’" *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 692, 733. The EIR must contain facts and analysis to reflect the analytic route the agency traveled from evidence to action. *Id.*

Kern County has established an Environmental Checklist to determine whether a project would have a significant impact on aesthetics. Under the County's checklist, a significant impact occurs if the project would:

Have a substantial adverse effect on a scenic vista; Substantially damage scenic resources, including but not limited to, trees, rock, outcroppings, and historic buildings within a state scenic highway; Substantially degrade the existing visual character or quality of the site and its surroundings; or Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. The DEIR evaluated all four of these impacts. It was determined that there were no designated scenic vistas within the Project area. DEIR at 4.1-28. Further, there are no designated State Scenic highways within the Project Area. *Id.* In determining whether the Project would substantially degrade the existing visual character of the site, 10 key observation points ("KOPs") were selected. *Id.* at 4.1-19. These KOPs were selected to represent a range of typical views within the Project Area where oil and gas development would occur and from sensitive areas. *Id.* The KOPs and the subsequent photosimulations illustrate potential likely oil and gas development that could occur during construction and operation. *Id.* The KOPs were assessed across of variety of factors, *id.* at 4.1-19–21, at various points of oil and gas development, *id.* at 4.1-29–40.

By conducting a project-level review of the Amended Zoning Ordinance and future development pursuant to the ordinance at this time, the EIR informs the policy decisions reflected in the Ordinance, and allows the County to identify performance standards and mitigation measures that most effectively and efficiently address both the large scale and localized effects of oil and gas development. The impact analysis has been performed on a landscape or regional scale, and the EIR also contains extensive analysis and mitigation measures at the micro scale. As such, the EIR meets CEQA's requirements for a project-level review both for the Amended Zoning Ordinance and the development undertaken in the future under the Ordinance. The EIR undertakes a detailed analysis of site-specific impacts and mitigation measures by using the Kern County Data Basin, a publicly accessible science-based mapping and analysis platform that supports learning, research, and sustainable environmental stewardship, and provides map-based data in support of county planning efforts. *See* Global Response 2.

The accurate citation to *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal. App. 4th 342, 356 is noted and included in the final EIR. The commenter's opinion that the DEIR analysis has been hampered by a lack of information is noted for the record.

0049-50

It has been suggested that the DEIR fails to adequately analyze the Project's visual and aesthetic effects. Oil and gas operations are distributed throughout the Project Area, with particular intensity in Tier 1 and a strong presence in Tier 2. 0049-60

Please see GR-Air-4 regarding air quality methodology and emission estimates and GR-6 regarding the 2012 baseline.

0049-61

Emissions from pumps using IC engines are included in the overall assessment of the Project's impact on air quality. Please see GR-Air-4 regarding air quality methodology and emission estimates and GR-Air-12 regarding lifecycle analysis.

0049-61 cont'd

0049-62

Please see GR-Air-4 regarding air quality methodology and emission estimates.

0049-63

Please see GR-Air-2 regarding the emission reduction agreement as mitigation. Under the Project, there will be no individual air study conducted for each oil and gas activity. The Project EIR serves as the air study for future Project activities. The EIR has determined air emissions based on well depth by year and determined an associated mitigation fee. The air study for determination of the appropriate fee has therefore been conducted up front. No further activity-specific study is needed to calculate fees.

0049-64

The comment states a legal conclusion and is noted for the record.

0049-65

The comment states that MM 4.2-1 is inadequate for purposes of mitigating the Project's impacts to agricultural resources. Please see GR Ag-1.

The comment also states that the EIR failed to address use of produced water for agricultural irrigation. Please see GR Water-8.

0049-66

Please see GR Water-8.

0049-67

As noted in the EIR, the "Project Area does not support woodlands or forest lands. According to the California Department of Forestry and Fire Protection's Fire and Resource Assessment Program, there are no Timberland Production Zones in Kern County (CAL FIRE 2010). Therefore,

forest and timberlands are not analyzed in this section." DEIR, p. 4.2-6. Thus, the EIR did not analyze the potential for cumulative air pollution to impact forest resources.

0049-68

The comment states that the County should draft regulations for underground injection control (UIC) activities. As explained in the DEIR (section 2.6.4), state agencies such as DOGGR have occupied the field with regard to the regulation of subsurface oil and gas activities. Please see GR Water-02.

0049-69

The comment states that the County should require groundwater testing prior to well stimulation treatment activities. Such testing is already required by the permanent SB 4 regulations promulgated by DOGGR, which became effective July 1, 2015. Please see GR-10.

0049-70

Please see GR Water-1.

0049-71

Please see GR Water-1.

0049-72

Please see GR Water-1.

0049-73

The comment states that the EIR should not have relied upon information from DOGGR concerning produced water quality. As the state agency with primary oversight over oil and gas operations throughout the state, DOGGR has the most relevant information for purposes of analyzing impacts form oil and gas activities, including the quality of produced water. Further, the technical consultant used his expert judgment when reviewing and relying upon that data. DEIR, Appendix S – Water Quality Assessment. Pursuant to 14 Cal. Code Reg. § 15151, an "EIR should be prepared with a sufficient degree of analysis to provide decisionmakers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure." The County and the EIR may permissibly rely on generally available information. Please see GR-21.

0049-74

Please see GR Water-1.

0049-75

The comment states that the DEIR should conduct additional studies and data collection to fully evaluate the potential for the subsurface release of contaminated fluids to potable ground water in California caused by well stimulation treatment activities. In the independent judgment of the County, it has relied upon the best available information to prepare the EIR (please see GR-21), and the analysis and conclusion in the EIR are supported by substantial evidence.

0049-76

Please see GR-2 and GR-21.

0049-77

The comment is a section heading and is noted for the record.

0049-78

Please see GR Air-12 regarding lifecycle analysis, and section 3.4.2 of the DEIR on page 3-23.

With regard to impacts outside of the Project Area, the commenter states that the analysis is inadequate because it failed to assess the Project's impacts on areas outside the San Joaquin Valley Air Basin. As described below, the air and climate analyses fully evaluated potential impacts in the Project Area, and analysis outside that area is not necessary.

The Project Area is Completely Within the San Joaquin Valley Air Basin

The development standards and conditions for new oil wells contained in the proposed Amendment to Chapter 19.98 of the Kern County Zoning Ordinance would apply throughout the unincorporated portions of the County. However, the project description states that, "for purposes of this EIR, the ‘Project Area’ is defined as the portion of unincorporated Kern County that is depicted in Figure 3-1 (Project Area)." Figure 3-1 in the EIR defines the Project Area as the western portion of Kern County, which is part of the San Joaquin Valley Air Basin. The San Joaquin Valley portion of the County was chosen as the Project Area because it includes the oil and gas producing zones of the County, primarily consisting of the Valley Floor area. Hence, the Project Area is the geographic area subject to foreseeable environmental impacts from the Project.

CEQA requires a public agency to mitigate or avoid its projects’ significant effects on the environment, with "environment" defined as "the physical conditions which exist within the area which will be affected by a proposed project." CEQA § 21060.5. The "area involved shall be the area in which significant effects would occur either directly or indirectly as a result of the project." CEQA Guidelines § 15360 (emphasis added). That area is the Project Area as defined by the EIR. Although there may be minor air quality impacts outside of the Project Area, the EIR has identified the area in which any potentially significant impacts would occur to be the Project Area and thus the EIR analysis has been limited to that region. CEQA does not require an agency "to conduct an exhaustive analysis of all conceivable impacts a project may have in areas outside its geographical boundaries." Save the Plastic Bag Coalition v. Manhattan Beach (2011) 52 Cal.4th 155, 174. The decision to address air quality impacts only in the San Joaquin Valley Air Basin is thus reasonable because: (1) the state is separated into various air basins that address unique air pollution issues, as described in more detail below; and (2) the Project Area is contained within one air basin.

The Geography of the San Joaquin Valley Air Basin Ensures Air Quality Impacts are Localized

The state is divided into 15 air basins for purposes of managing the state's air resources. Air basins are not designated based on political boundaries but on physical boundaries in order to recognize real differences in atmospheric conditions and air quality across the state and thus to effectively manage air pollution in different areas. California's air basins were created by the California Air Resources Board (CARB) (17 C.C.R. §§ 60100–60114) under authority of the California Health & Safety Code (§ 39601) which allows CARB to adopt standards, rules and regulations to execute its powers. As noted above, the Project Area is completely within the San Joaquin Valley Air Basin, and is under the jurisdiction of the San Joaquin Valley Air Pollution Control District (SJVAPCD) for air quality purposes.

Air pollution is directly related to a region's topographic features. As described in the EIR, the San Joaquin Valley Air Basin is in the southern half of California's Central Valley. EIR p. 4.3-1. It is 250 miles long and bordered by mountains on three sides. The bowl shaped topography of the Valley inhibits movement of pollutants out of the Valley. In addition, air quality transport mitigation requirements adopted by CARB for the San Joaquin Valley (see 17 C.C.R. § 70600(c)) will further assure that Project activities do not adversely affect air quality outside of the Project Area. Several commenters asserted that the GHG analysis is inadequate because it failed to assess the Project's impacts on climate change in areas outside of the San Joaquin Valley Air Basin portion of the County. As described below, the GHG analysis fully evaluated potential GHG impacts in the Project Area, and addressed the global nature of climate change through the cumulative analysis and the global perspective of the GHG analysis in the EIR. Thus, the GHG analysis appropriately addresses the global impact of climate change and is adequate under CEQA.

Global Change Impacts were Assessed

Climate change, by its nature, is a cumulative impact resulting from innumerable GHG sources around the world. Climate change is a global issue with global solutions and global effects. The DEIR recognizes this and discusses the global nature of GHG emissions and climate change

in the physical and regulatory setting and in its analysis of GHG impacts. *See, e.g.,* p. 4.7-9. The regulatory setting in the GHG chapter describes policies for GHG reduction at international, federal, state, and local levels. *See* pp. 4.7-13 – 4.7-25. The DEIR also recognizes that "the study area for climate change and the impact analysis of GHG emissions is broad because climate change is influenced by global emissions and their associated effects." EIR p. 4.7-30.

The cumulative analysis in the GHG chapter analyzes Project emissions in conjunction with the mitigation measures in the Kern Council of Governments Regional Transportation Plan (RTP), which are intended to reduce cumulative GHG emissions. *See* pp. 4.7-42 – 44. This analysis finds that Project emissions are consistent with the GHG emission reduction goals in both EO S-3-05 and EO B-30-15, but that impacts from cumulative GHGs emissions would remain significant and unavoidable. This analysis clearly addresses GHG impacts outside of the Project area because it analyzes the Project's impacts on climate change, a global issue. In addition, the Office of Planning and Research (OPR) has noted that GHG emissions and climate change are primarily a cumulative, rather than a project-specific issue. *See* OPR's Technical Advisory on CEQA and Climate Change online at: http://opr.ca.gov/docs/june08-ceqa.pdf (stating that climate change is ultimately a cumulative impact). SJVAPCD Guidance also states that project specific GHG emissions should be evaluated in terms of their cumulative impact on global climate change. *See* EIR p. 4.7-32.

Further, courts have stated that no one project can be tied to a global phenomenon such as climate change. *Wild Earth Guardians v. U.S. Forest Serv.* (D.C. Cir. 2015) 2015 U.S. Dist. LEXIS 109690 at *80-81 (stating that EIS which said "… it is impossible to determine what effect any given amount of GHG emissions resulting from an activity might have on the phenomena of global warming, climate change, or the environmental effects stemming from it. It is therefore not currently possible to associate any particular action and its specific project-related emissions with the creation or mitigation of any specific climate-related effects at any given time or place" was adequate under NEPA); *see also Ctr. for Biological Diversity v. Nat’l Highway Traffic Safety Admin.* (9th Cir. 2008) 538 F.3d 1172, 1217 (stating that the impact of GHG emissions on climate change is a cumulative impact). The DEIR also recognizes that "analytical tools have not been developed that can determine the effect on worldwide global warming from a particular Project-specific increase in GHG emissions, or the effect of global GHG emissions on the climate at a particular location." P. 4.7-31.

Finally, because climate change is truly a global issue, any GHG emissions will have the same impact, regardless of where the emissions are located or where the effect is studied, because the impact is the result of cumulative emissions of GHG into the atmosphere. Thus, any potential impacts due to project implementation will be the same in the SJVAPCD portion of Kern County as in any other location in the world. Put another way, there are no potential climate impacts that could occur outside of the SJVAPCD portion of the county that are not already mentioned and analyzed in the EIR's analysis of potential GHG impacts in the SJVAPCD portion of the County, or in the cumulative GHG analysis.

For these reasons, the DEIR does consider the global effects of GHG emissions due to Project implementation and thus addresses impacts from GHG emissions from a global perspective. This analysis is adequate under CEQA. *See Save the Plastic Bag Coal. v. City of Manhattan Beach* (2011) 52 Cal.4th 155, 174 (CEQA does not require an agency "to conduct an exhaustive analysis of all conceivable impacts a project may have in areas outside its geographical boundaries").

0049-82

As described in the Project Description, the regular disposal of hazardous and non-hazardous wastes are a component of the oil and gas activities authorized pursuant to the Revised Amended Ordinance. Specifically, oilfield-related wastes that exhibit hazardous waste characteristics or that are listed hazardous wastes (e.g., spent solvents), and that are not otherwise excluded or exempt, are typically sent offsite for disposal at facilities authorized by the DTSC or are sent out of state for disposal." DEIR, p. 3-67. The analysis of Project-related traffic

includes all truck trips related to daily operations. DEIR, p. 4.16-43; DEIR, Appendix W - Traffic Impact Study and Roadway Assessment, pp. 11-13. As described in the Chapter 4.17, Utilities and Service Systems, the Project Area is served by landfills with sufficient capacity, including landfills licensed to receive hazardous waste. DEIR, pp. 4.17.61 – 4.17-62. Thus, the EIR analyzes and mitigates both the traffic- and landfill-related impacts from hauling drilling waste from oil fields to appropriate landfills; nor is there any evidence that hauling drilling wastes result in unique or different impacts not identified in the EIR.

0049-83

The comment requests additional information be provided by the Applicant for purposes of the EIR. Pursuant to 14 Cal. Code Reg. § 15151, an "EIR should be prepared with a sufficient degree of analysis to provide decisionmakers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure." The County and the EIR may permissibly rely on generally available information. Please see GR-21. There is no legal support that the types and volumes of information identified in the comment must be provided for an EIR to be legally adequate.

0049-84

Please see GR Haz-2.

0049-84 cont'd

0049-85

Commenter states that the DEIR is deficient because it did not address environmental justice public health issues. CEQA does not require analysis of environmental justice issues. CEQA section 21083.1 expressly states that CEQA is not to be interpreted so as to impose procedural or substantive requirements beyond those expressly stated by the Legislature or in the CEQA Guidelines.

Re: Comments on Draft Environmental Impact Report (focused on Oil and Gas Local Permitting)

Dear Mrs. Oviatt:

On behalf of 1,400 members of the Kern County Farm Bureau, I am writing to thank you and the Board of Supervisors for extending the comment period for the Oil and Gas Draft Environmental Impact Report ("DEIR") to September 11, 2015. We appreciate your recognition of the strain the harvest season we are currently in places on growers and their schedules. We have used the additional time you granted to thoroughly and carefully review the DEIR. We focused our review on surface impacts and effects on farming operations, which are set forth in the DEIR as Tier 2. We respectfully request your thoughtful consideration of the following comments. 0050-1

Ordinance Comments:

- In Section 19.98.010 – a reference is made to Figure 19.98.015 but is not included in the Ordinance. Requesting to be provided the figure 19.98.015 referenced with an opportunity to comment on after receipt. 0050-2
- In Section 19.98.020 – a reference is made to definitions of activities are located in Appendix A but is not included in the Ordinance. Requesting to be provided the Appendix A referenced with an opportunity to comment on after receipt. 0050-3
- In Section 19.98.050(D) – Time limitations – No mention of surface owner notification or considerations. Surface owner should be notified upon the decision to extend the permit and/or terminate within 15 days prior to the action. 0050-4
- In Section 19.98.060(A)(1) – what is the definition of public highway? Depending on the definition of public highway this could impact the location of a drill pad which could determine the ability to the continued use of the surface.
- In Section 19.98.070 – No Permit Required section has concerns from a surface owner perspective. Depending on the following items, the surface owner has no notification of these actions and could impede their ability to continue to use the surface with no ability to have any input.
    - What is the difference between a reworked well and well workover and reactivation of Idle well? These definitions could cause misunderstandings between the applicant and the surface owner with no ability from the County to regulate since no permit is required. The surface owner is not provided any notification or notice prior to the activity to occur.
    - What is geophysical monitoring? Depending on the definition, this activity could interfere with the surface activities and no notification is required. Provide the definition for us to have an opportunity to comment.
    - What is well testing? And since no permit is required is this meaning existing operating well? Depending on the definition, this activity could interfere with the surface activities and no notification is required. Provide the definition for us to have an opportunity to comment.
    - What is vegetation? If this means cleaning the area for weeds and debris surface owner should be notified since some property surface is classified as organic and with the requirements of the Irrigated Lands Program, the surface owner needs to know what is being used. Please provide the definition for us to have an opportunity to comment.

0050-4
Continued

  - Why are fencing, well abandonment and revegetation under no permit required? This means no surface owner notification or input. For well abandonment, the surface owner might be interested in knowing the depth of the abandonment so that future deep ripping practices might occur with no incident. Also, there might be a surface access agreement in place which could cause a misunderstanding between the applicant and the surface owner. If the drill site is leased to a new applicant, these activities without a permit required and no notification to the surface owner could impede the surface activities.
- In Section 19.98.080(F)– Provide surface owner with mitigation list as part of the site plan requirement
- In Section 19.98.080(F) – If in Tier 2 provide surrounding land use on site plan
- In Section 19.98.080(F) – Provide information on sumps location and type (earthen?)
- In Section 19.98.080(F) – If lighting is being required, provide information on the site plan of the location and also the power lines to service the site. Overhead electrical or communication lines shall be aligned to the greatest extent feasible with the existing access roads and the minimum distance between the access road and the well installation. If the use of existing roads is not feasible, lines shall be routed to minimize the surface disturbance and minimize the impacts to surface activity.
- In Section 19.98.080(F) – Underground pipelines serving the Project shall be shown on the site plan with locations marked and recorded with USAA and periodically inspected and maintained.
- In Section 19.98.080(F) – If Spill Prevention Countermeasure and Contingency Plan is required, a copy should be provided to the surface owner during the pathway process
- In Section 19.98.080(F) – If a stormwater prevention plan (SWPPP) is required a copy shall be provided to the surface owner for approval prior to submission to the Regional Water Quality Control Board especially since the surface owner must consider any impacts to their requirements under the Irrigated Lands Program
- In Section 19.98.080(F) – If a Fugitive Dust Control Plan is required a copy shall be provided to the surface owner for approval prior to submission to the San Joaquin Valley Air District since the site will be located within farming activities and should not interfere with those activities (traffic speeds, grading activities, dust control measures, etc.) Today agricultural activities must comply with Rule 8081 and Rule 4550 and this could cause a conflict between the activities of the surface owner and the applicant and possibly put the surface owner in violation of a Rule that is not currently a requirement. .
- In Section 19.98.080(F) – If a Worker Environmental Awareness Program is required a copy shall be provided to the surface owner for their ability to educate their employees as well.
- In Section 19.98.090(B) & (G) – Notification of the issuing of the permit to the surface owner should be a requirement. And notification should be in a required signature delivery.
- In Section 19.98.090(A) - The surface owner should be provided all the required items in Section 19.98.090 and as such the sentence should read," For Tier 2, 3 and 5 areas, a copy of the application shall be provided to the Land/Surface owner per the requirements of 19.98.080 above." Remove (F) from the sentence.
- In Section 19.98.100 – These comments are based on the staff report presented to the Board of Supervisors on July 27th, 2015 and to match up the proposed pathway to the staff report.
  - (A) The surface owner should be provided all the required items in Section 19.98.090 and as such the sentence should read. "For Tier 2, 3 and 5 areas, a copy of the application shall be provided to the Land/Surface owner per the requirements of 19.98.080 above." Remove (F) from the sentence.
  - (B) Mandatory 30 day first review. Notice to be provided to the surface owner that the process is under a mandatory 30 day first review with an invitation for the surface owner to meet with staff to understand the process, including the mitigation measures.
  - (C) Mandatory 30 day second review. Notice to be provided to the surface owner that the process is under a mandatory 30 day second review with an invitation for the surface owner to meet with staff to understand the process, including the mitigation measures.
  - (G) After the permit is issued a 30 day mandatory waiting period for drilling activity. Notice to be provided to the surface owner that the process is under a mandatory 30 day waiting period and that the permit has been issued. The notice is also to advise the surface owner that during the construction of the oil facility a county inspector is required to be on site at all times. The surface owner should be provided the contact information of the county inspector.

- Add (H) Must comply with Section 19.98.140 of this Ordinance (inspection compliance)

0050-4 Continued

- In Section 19.98.120(A) – The surface owner should be provided all the required items in Section 19.98.090 and as such the sentence should read, "For Tier 2, 3 and 5 areas, a copy of the application shall be provided to the Land/Surface Owner per the requirements of Section 19.98.080 above. Remove (F) from the sentence.
- In Section 19.98.120(B) & (G) – Notification of the issuing of the permit to the surface owner should be a requirement. And notification should be in a required signature delivery.
- In Section 19.98.130 – once a violation occurs, the existing permit as well as the next issued permit must be under an inspection compliance as stated in Section 19.98.140 (Inspection Compliance)
- In Section 19.98.140 – Indicate that the cost for the county inspector is the requirement of the applicant.
- In Section 19.98.140 – add that the applicant shall be responsible for complying with the issued Oil and Gas Conformity site plan as well as the mitigation item MM 4.8-6 and all other mitigations during the construction and continued operations.
- In Section 19.98.150(B) – Notification to the surface owner should be a requirement 30 days prior to the activity so that the surface owner may be able to work through the depth of the abandonment with the applicant.

Mitigation Comments:

0050-5

- MM 4.1-2 & 3 – In Tier 2, confirm earthen sumps are still allowed to be used in the drilling process under the Regional Water Quality Control Board standards and if they are, require that this must appear on the site plan for the surface owner to be notified and given the right to approve in the process as well as the surface owner to be notified prior to the fill in of the sump so as to confirm that it was handled properly. Prior to any use of the agreed upon earthen sump, soil testing shall occur and compared to soil testing after the clean up of the earthen sump. With the requirement of Irrigated Lands Program, the soil tests shall be provided to the surface owner.

0050-6

- MM 4.1-4 – In Tier 2 prior to any construction or planting of any shrubs, the surface owner shall be notified and approval obtained

0050-7

- MM 4.1-6 – In Tier 2, if permanent lighting is required provide the information on the location of the light facilities on the site plan as well as the power lines to service so that the surface owner is notified and given the right to approve in the process

0050-8

- MM 4.2-1 – The ratio of 1:1 needs to include the gross loss of farmland including any new roads or disruption of land due to power lines or accessory equipment placement or the establishment of "no man" farming islands. Due to size of land being converted is approximately 2 to 5 acres, the only mitigation item to be considered to meet the conversion of farm land would be the mitigation funds being deposited into a fund established to the abandonment of any idle existing well either in close proximity to the new well, common ownership or a well on a list generated by the County of Kern with the assistance of the Kern County Farm Bureau. This established conservation bank fund shall either be held by the County of Kern or the Kern County Farm Bureau where an oil applicant may deposit the ratio of 1:1 funds. This conservation bank fund may also be used by other industries (developers, solar companies, etc.) to meet their ag conversation requirements. At no time should any funds leave the County of Kern.

0050-9

- MM 4.2-2(b) – If a Spill Prevention Countermeasure and Contingency Plan is prepared, a copy should be provided at least to the surface owner at the time of the application process

0050-10

- MM 4.2-2(c) – The speed limit established should be the same speed limit as the surface owner's Conservation Management Practices application submitted to the San Joaquin Valley Air Pollution Control District which is normally 15 mph and already posted on existing roads

0050-11

- MM 4.2-2(d) – Unpaved roads shall not be treated with any other dust suppression except water without the permission from the surface owner due to the Irrigated Lands Program and the classification of existing soils (organic)

0050-12

- MM 4.2-2(e) – In Tier 2, the Control entrances should not be allowed without the permission of the surface owner. Existing dirt roads shall be left as they exist today and no new entrances shall be allowed without the permission of the surface owner. To place a 50 ft length of a 3 inch thick layer of gravel one inch or larger in diameter will damage farm equipment and not allow the free movement of the farm equipment as exists today. Currently, agricultural operations such as harrowing, terracing and leveling, and soil preparation and agricultural activities (farming) are exempt from the State Water Board's Storm Water Pollution Prevention Plan (SWPPP) and this mitigation requirement removes the exemption from the surface owner's activities of farming.
- MM 4.2-2(f) – See comment above (Impact 4.2-2(e)

0050-13

- MM 4.3-2 – In Tier 2 we are requesting that this mitigation be removed as written and that the applicant shall comply with the surface owners Conservation Management Practices application. On-field agricultural sources and activities are exempt from submitting and/or complying with Rule 8011 Fugitive Dust Control Plan but must comply with Rule 8081 and Rule

0050-14

4550. If not removed this will cause a conflict between the activities of the surface owner and the applicant and possibly put the surface owner in violation of a Rule that is not currently a requirement. 0050-14 Continued

- MM 4.3-8 – In Tier 2, the applicant shall first look for compliance mitigation with the surface owner impacted by the project and if none available then shall work with Kern County Farm Bureau to locate compliance mitigation opportunities. At no time should any dollars leave Kern County. 0050-15
- MM 4.4-1 – In Tier 2, confirm that farming activities (farmed 5 years or more out of the last 10 years) is considered ground disturbance so that no focused surveys shall be required. No biological focused surveys are allowed without the surface owner's approval. 0050-16
- MM 4.4-2 thru 4.4-16 – In Tier 2, confirm that farming activities (farmed 5 years or more out of the last 10 years) is considered ground disturbance so that no requirements exist. Surface Owner shall be the first notified under any of the mitigation items within these sections and no surveys are allowed without the surface owner's approval. 0050-17
- MM 4.4-17 – In Tier 2, confirm that farming activities (farmed 5 years or more out of the last 10 years) is considered ground disturbance so that no pre-disturbance survey shall be required. No surveys are allowed without the surface owner's approval.
- MM 4.5-1 – In Tier 2 confirm that farming activities (farmed 5 years or more out of the last 10 years) is considered ground disturbance so that no conformity review would be required. No intensive pedestrian ground-surface survey shall be required on disturbed farm land especially without the surface owner's approval.
- MM 4.5-4 – In the event archaeological materials are encountered, in Tier 2 the surface owner shall be notified immediately.
- MM 4.5-5 – In the event human remains are uncovered, in Tier 2 the surface owner shall be notified immediately. 0050-18
- MM 4.7-1 thru 4.7-4– In Tier 2, the applicant shall first look for compliance mitigation with the surface owner impacted by the project and if none available then shall work with the Kern County Farm Bureau to locate compliance mitigation opportunities. At no time should any dollars leave Kern County. 0050-19
- MM 4.8-1 – In Tier 2, the Worker Environmental Awareness Program shall be provided to the surface owner at the time of the application pathway process for the surface owner to educate his employees as well. 0050-20
- MM 4.8-3(f) – In Tier 2 if berms and/or dykes are constructed those constructed shall not change and/or interfere with the existing grade established by the surface owner unless approved by the surface owner 0050-21
- MM 4.8-5 – In Tier 2, if the applicant observes visual or olfactory evidence of contamination or if soil contamination is suspected the applicant shall notify the surface owner as well as the appropriate health and safety departments. 0050-22
- MM 4.8-6 thru MM 4.8-9 In Tier 2, this mitigation should be placed in Section 19.98.140 of the Ordinance so that the inspector and surface owner have an understanding of what the applicant needs to comply with. 0050-23
- MM 4.8-14 – In Tier 2, the applicant shall notify the surface owner of any contamination
- MM 4.8-15 – In Tier 2, if the applicant intends to use acutely hazardous chemicals, the surface owner shall be notified and given proper training in case of a spill 0050-24
- MM 4.9-1 – In Tier 2, the applicant shall comply with the stormwater construction general permit however must not interfere with the surface owner activities. 0050-25
- MM 4.9-2 – In Tier 2, the applicant's drainage plan shall be approved by the surface owner so that the plan does not interfere with the surface owner activities and must comply with the surface owner's requirements under Irrigated Lands Program 0050-26
- MM 4.9-3 – In Tier 2, any surface ponds or sumps must be indicated on the site plan for the surface owner to approve. When the surface ponds or sumps are cleared of fluids the surface owner may request that the soils be tested so that the surface owner has the information necessary to comply with the Irrigated Lands Program 0050-27
- MM 4.12-1 - Confirm that the setback distances includes road right of way as well as any existing easements.

Kern County is the second largest agricultural producing county in the nation and we depend very much on the oil industry to fuel our farming operations. We realize the impact this DEIR has on Kern County's permitting process going forward. As a Farm Bureau, we want to thank you again for your proactive relationship with our growers and your willingness to make yourself and your staff available to us. We hope we can continue this dialogue with you and our Board of Supervisors to provide meaningful solutions for Kern County. We look forward to working with you and your staff. 0050-28 0050-29

Sincerely,

Greg Wegis
President

The Unified Voice of Kern County's Farming Community Since 1914

0050-1

The commenter's acknowledgement of the extension of time provided to review the Draft EIR, which enabled commenter to complete a thorough review, is noted. The commenter's focus on surface issues and effects on farming operations is also noted.

0050-2

The commenter's request for a copy of a Figure depicting the unincorporated Kern County area that is referenced in the Amended Ordinance (Figure 19.98.015) is noted. The Figure is included in the Draft EIR. The Amended Ordinance has been revised based on consideration of these and other comments, and this Figure is included in the Revised Amended Ordinance is included in section 7.1.3. No changes were made to this Figure in response to comments.

0050-3

The commenter's request for an Appendix of definitions referenced in the Amended Ordinance is noted. The Amended Ordinance has been revised based on consideration of these and other comments, and it was determined that additional definitions were not needed and thus the reference to this Appendix has been deleted from the Revised Amended Ordinance. Revisions to the Revised Amended Ordinance have been made to clarify certain terms throughout the chapter. Definitions already in the Zoning Ordinance (e.g., regarding "accessory" uses) continue to apply. The Project Description in the Draft EIR includes descriptions of all Project activities, including the activities included in the Revised Amended Ordinance.

0050-4

Many of the remaining comments on the Amended Ordinance request additional surface owner notifications, requests that surface owners receive copies application submittals and other documents, opportunities for more meetings between County staff and surface owners, and clarifications that applicants must pay for all inspector costs. The Revised Amended Ordinance substantially expands the surface owner notification requirements. For example, the Revised Amended Ordinance requires surface owner notifications of many types of applicant activities, and is not limited to notice of applications being filed and being approved. The Revised Amended Ordinance also requires that surface owners in Tier 2, 3 and 5 be sent a full copy (with an expanded set of contents) of the project application documents, as well as other specified documents.

The commenter also requested clarifications of some of the zoning terms used in the ordinance. The Revised Amended Ordinance includes many of the requested clarifications. For example, the commenter sought clarification of the definition of a public highway, relating to the required 100-foot setback distance, is noted. A public highway refers to an existing, publically-owned roadway. The Amended Ordinance has been revised based on consideration of these and other comments, and clarifies highway as either "Major" or "Secondary", are currently defined in Sections 19.04.447 and 19.04.657 of the Zoning Ordinance.

Some of the comments did not result in ordinance amendments, but relate to environmental topics for which mitigation measures were included in the Draft EIR (or were added to the Final EIR). For example, commenter requested a definition of geophysical monitoring. Based on comments on the Draft EIR section 4.12 (Noise and Vibration), additional information about geosurveys was provided, and new setback distances were included in MM 4.12-2 for geotechnical survey techniques that could cause adverse vibration impacts.

Some suggested changes to the ordinance that staff did not agree were warranted. For example, fencing, revegetation, and well abandonment issues are addressed in the EIR, but requiring a new County permit for these activities was not warranted.

0050-4 cont'd

0050-4 cont'd

0050-5

Earthen sumps for produced water disposal is allowed only with approval from the Regional Water Quality Control Board, but unlined pits and sumps can no longer be used for the disposal of produced water from WST operations. See MM 4.9-3 and GR- Water-01. Written evidence of lawful produced water disposal is required as part of the Site Conformity Review process. As included in MM 4.9-3, the RWQCB requirements also address cleanup requirements for ponds and sumps. Additional surface owner notification procedures have been included in the Revised

Amended Ordinance. Pre- and post-testing of earthen pond locations by the County as a mitigation measure is not warranted given these RWQCB legal requirements.

0050-6

MM 4.1-4 was modified to remove the vegetation screening requirement in agricultural lands for aesthetic purposes, as described in response to [PACIFIC AG EXHIBIT AG-13]. This addresses commenter's concern.

0050-7

MM 4.1-6 was modified to apply to lighting for new wells. Surface owner approval requirements for implementation of mitigation measures is not appropriate for reasons described in GR-04 and elsewhere regarding the dominant estate held by mineral owners.

0050-8

Commenter's requests regarding revisions to the compensatory mitigation measure for agricultural lands have been considered, and MM 4.2-1 has been modified to prioritize acquisition of conservation easements on large block lands, and on removal of legacy equipment to reduce fragmentation.

0050-9

Commenter's request regarding obtaining a copy of any Spill Prevention Countermeasure and Contingency Plan is noted. Because this would not reduce or eliminate any significant environmental impact, this mitigation measure change is not warranted.

0050-10

Commenter's request that 15 mph be established as a maximum speed limit is noted. Speed limits of 25 mph are allowed under applicable SJVAPCD regulations under specified circumstances (e.g., dust supression). EIR mitigation measures have been modified to clarify which measures do not apply if vehicle travel is restricted to 15 mph.

0050-11

Commenter's request to require surface owner permission for the use of chemicals for dust suppression has not been accepted for reasons previously described. MM 4.2-2(d) has been modified to note that dust suppression is not required if vehicle speeds are restricted to 15mph.

0050-12

Commenter's request to require surface owner approvals for new entrances has not been accepted for reasons previously described. Commenter's further suggestion that substantial improvements be made to unpaved roads is not required to address a significant adverse environmental impact. This MM measure does not apply to, or affect the current regulatory status of, farming activities.

0050-13

Please refer to the prior response.

0050-14

Commenter requests that the Fugitive Dust Control Plan (MM 4.3-2) be removed and applicants instead be required to comply with the Conservation Management Practices included in surface owner applications. Compliance with SJVAPCD dust control regulations is required to address particulate matter emissions, hence the requested change cannot be accepted. It is recognized that this results in different requirements for oil and agricultural operators.

0050-14 cont'd

0050-15

Commenter's requested modifications to MM 4.3-8 have been considered, and prioritization of air emission reductions in Kern County has been included. Cost-effective air emission reductions will continue to be part of the VERA program, but the comment will be considered in the context of structuring the ERA required for this project.

0050-16

Farmed lands have habitat values for some sensitive species, and hence farmed lands are not considered "disturbed" for purposes of requiring biological resource surveys.

0050-17

Farmed lands have cultural resource artifacts, and hence farmed lands are not considered "disturbed" for purposes of requiring cultural resource surveys. Surface owner permission is inappropriate for this mitigation measure for reasons previously described.

0050-18

MM 4.5-4 and 4.5-5 have been amended to require surface owner notification as requested by commenter.

0050-19

Commenter's request for sequencing GHG emission reductions are noted, and can be considered as part of the implementation of this GHG reduction mitigation requirement.

0050-20

Commenter's request that the Worker Environmental Awareness Program be provided upon request to the surface owner has been included in revised MM 4.8-1.

0050-21

Commenter's request that surface owner permission be required prior to constructing earthern berms or dikes have not been included for reasons previously discussed.

0050-22

Commenter's request for surface owner notification of spills and releases has been included in revised MM 4.8-4(b).

0050-23

Commenter's request for inclusion of MM 4.8-6 through 4.-8-9 in the ordinance is not warranted since compliance with mitigation measures is required under the ordinance. Surface owners will also receive copies of additional documentation, and will receive more notices, under the Revised Amended Ordinance and EIR Mitigation Measures.

0050-24

Commenter's request for surface owner notification of contamination has been added to MM 4.8-4(c).

0050-25

Commenter's suggestion that compliance with applicable stormwater regulations not be allowed to interfere with surface owner activities is noted, but the County cannot create exceptions to applicable state laws

0050-26

Commenter's request that surface owner approval be required for drainage plans has not been included for reasons previously discussed.

0050-27

Commenter's request that surface ponds and sumps be identified in the Site Plan application has been accepted and included in the amended Ordinance.

0050-28

Applicant's request that construction noise setback distances include rights-of-way and easements are noted. The setback distances apply to the sensitive receptor, and not a right-of-way or easement.

0050-29

Commenter's concluding remarks regarding the importance of agriculture to the County, the need for an effective permitting process, and the proactive relationship between County planning staff and the agricultural industry, are all noted.

51 Sequoia Riverland Trust

Sequoia Riverlands Trust
Conserving California's Heartland

August 31, 2015

County of Kern
Planning and Community Development Department
Attn.: Lorelei H. Oviatt, AICP, Director
Christopher B. Mynk, AICP, Supervising Planner
2700 M Street, Suite 100
Bakersfield, CA 93301-2323

RE: Proposed Revisions to Kern County Zoning Ordinance (Oil and Gas Permitting)

Dear Ms. Oviatt and Mr. Mynk,

I am writing on behalf of Sequoia Riverlands Trust (SRT) to comment on the Draft Environmental Impact Report (DEIR) for proposed revisions to the Kern County Zoning Ordinance. As an accredited regional land trust that works with farmers, ranchers and others to conserve farmland and rangeland in Kern County, we are grateful for the opportunity to participate in this process. 0051-1

Like agriculture, which brought over $7.5 billion into Kern County in 2014,[1] oil and gas production is an important part of the local economy. We share the County's view that this industry needs a clearly-defined permitting process that can be relied upon by both County and State agencies,[2] and strongly support the development of a "consistent and comprehensive" approach to mitigation.[3] We also favor streamlined permitting for projects that avoid unnecessary impacts, minimize necessary ones, and provide compensatory mitigation in accordance with regional conservation priorities. But a ministerial system under which the County 1) does not set site-specific conditions for oil and gas operations, and 2) does not give surface owners and conservation easement holders sufficient leverage to set such conditions,[4] offers inadequate protection for farms, ranches and wildlife habitat. As the DEIR acknowledges, this could result in the conversion of up to 11.6 square miles of farmland by 2040[5] and impacts to significant percentages of high quality habitat for threatened and endangered species such as 0051-2

0051-2
Continued

the giant kangaroo rat, San Joaquin antelope squirrel and San Joaquin kit fox.[6] In order to address these issues, we respectfully request that the County strengthen both permitting and mitigation requirements for oil and gas operations as described below.

0051-3

I. The County Should Retain the Ability to Set Site-Specific Restrictions on Oil and Gas Operations in All Zones.

Under the Draft Zoning Ordinance, permitting for oil and gas operations in most zones, including Exclusive Agriculture (A), Limited Agriculture (A-1), Natural Resource (NR), Recreation Forestry (RF) and Floodplain Primary (FPP), would be ministerial rather than discretionary.[7] In contrast to the County's system for granting surface mining permits, which requires a hearing and allows the Planning Commission to impose site-specific conditions for public health, safety and environmental protection,[8] ministerial permitting involves "little or no personal judgment by the public official as to the . . . manner of carrying out the project" and is typically used for routine, low-level permits such as car registrations, dog licenses and marriage licenses.[9]

The County's rationale for adopting this system is that it seeks to implement a "comprehensive industry-wide mitigation strategy specifically designed to address regional conservation priorities."[10] While we strongly support regional advance mitigation planning, the first two steps in an effective mitigation program are avoidance and minimization. Industry-wide best practices can avoid certain broad classes of impacts, such as blowouts and oil spills, but minimizing impacts to a particular farm, ranch or other landscape is impossible without reference to the physical and biological conditions of the specific area that would be altered by drilling. Just as the Planning Commission sets conditions for individual surface mining projects,[11] the County should retain the authority to set site-specific conditions for oil and gas operations. For this reason, we respectfully recommend that the County adopt a discretionary, rather than ministerial, permitting system for all zones affected by the project.

0051-4

II. For Oil and Gas Operations on Split Estate Lands, the County Should Give Surface Owners and Conservation Easement Holders More Leverage in the Application Process.

The permitting process contemplated in the DEIR would be less time-consuming for oil and gas companies that obtain signatures from surface owners on split estate lands,[12] but would

[11] Kern County Ordinance Code §§ 19.100.040(C) and 19.102.130(C).
[12] Compare DEIR, Ch. 1, Attachment A (Draft Zoning Ordinance, 19.98.090(B)-(E)) (turnaround times for oil and gas conformity review where applicant has landowner signature) with DEIR,

0051-4
Continued

ultimately provide landowners no way to compel oil companies to minimize the footprint of their operations. Holders of existing conservation easements—who, like surface owners, have a legitimate interest in maintaining the agricultural productivity, biodiversity and aesthetic value of specific properties—would have even less leverage. In order to reduce conflicts between land uses, we would respectfully recommend that the County provide more leverage for landowners and easement holders to push applicants to minimize the footprint of their operations. Under a discretionary system, landowners and easement holders could be given significant input into site-specific conditions set by the County. If the County does not adopt a discretionary system for all zones, we would recommend that 1) applicants be required to obtain signatures from any holders of conservation easements on the property in addition to any surface owners, and 2) applications where any landowner or easement holder signature is absent be treated as discretionary and subject to site-specific conditions.

0051-5

III. The County Should Require that Oil and Gas Operations Provide 1:1 Mitigation for Impacts to Grazing Land.

The permitting regime contemplated in the DEIR requires 1:1 mitigation for impacts to farmland, but has no equivalent requirement for rangeland. As Kern County's 2014 crop report indicates, grazing land plays an essential role in the local economy, with milk and cattle products together accounting for over $1.3 billion in crop receipts.[13] It also contributes to habitat corridors essential to protecting biodiversity in a changing climate, as well as watersheds that channel melted snowpack from the peaks of the Sierra to the Valley floor, making it a significant priority for any comprehensive, regional approach to mitigation.[14] For these reasons, we respectfully recommend that the County require at least 1:1 mitigation for both rangeland and farmland.

0051-6

IV. The County Should Specify the Appropriate Holders of Mitigation Easements.

Like the County, we believe that the permanent protection of agricultural land and habitat through conservation easements is essential to providing effective mitigation.[15] We would respectfully request, however, that the EIR specify that the appropriate holder of conservation easements is an entity whose mission includes the acquisition and stewardship of conservation

---

Ch. 1, Attachment A (Draft Zoning Ordinance, 19.98.100(B)-(D)) (turnaround times for oil and gas conformity review where applicant lacks landowner signature).

[15] DEIR, 1-30 and 1-42 – 1-43.

0051-6
Continued

easements,[16] and whose resources and internal organization enable it to carry out this mission. The County could address these concerns by adding the following language to Mitigation Measures 4.2-1 and 4.4-16, as well as any future mitigation measure involving conservation easements: "Conservation easements acquired pursuant to this measure shall be held by a Land Trust Alliance-accredited land trust."

0051-7

V. Given the Magnitude of Expected Impacts to Agriculture and Habitat, the County Should Strengthen Mitigation Measures to Protect Farmland and Rangeland.

The DEIR estimates that the overall project could lead to conversion of up to 7,450 acres (11.6 square miles) of important farmland by 2040.[17] Due in part to impacts on rangeland, it would also degrade significant portions of the County's remaining high quality habitat for a number of threatened and endangered species, including the following:

- Le Conte's thrasher (up to 28.8%);
- Giant kangaroo rat (up to 27.7%);
- San Joaquin antelope squirrel (up to 25.7%);
- San Joaquin coachwhip (up to 22.4%);
- Short-nosed kangaroo rat (up to 20.3%);
- Blunt-nosed leopard lizard (up to 18.7%);
- San Joaquin kit fox (up to 17.6%);
- Western pond turtle (up to 17.6%);
- Tulare grasshopper mouse (up to 15.9%);
- Burrowing owl (up to 11.1%); and
- San Joaquin pocket mouse (up to 10.8%).[18]

The DEIR provides for 1:1 mitigation for farmland and for most habitat[19] and allows this requirement to be met in part through removal of legacy oil and gas equipment.[20] In order to strengthen these requirements and minimize lasting harm to farmland and rangeland, we respectfully recommend that the County 1) expand Mitigation Measure 4.2-1 to actively support the removal and remediation of long term idle wells, 2) expand Mitigation Measure 4.1-2 to

[16] Cf. Tulare County Association of Governments. 2014. Resolution No. 2014-144 (resolution certifying EIR for 2014 Tulare RTP/SCS and specifying that conservation easements acquired to comply with mitigation requirements should be held by "a local, regional, or statewide organization or agency whose purpose includes the acquisition and stewardship of . . . conservation easements").
[17] DEIR, 4.2-18.
[18] DEIR, 4.4-196 - 4.4-203.
[19] DEIR, 1-30 and 1-42 – 1-43. The exception is areas of 70% or greater existing disturbance where "oil and gas activity is the primary land use," which would be mitigated at 1 to 0.5. DEIR, 1-42; DEIR, Ch. 1, Attachment A (Draft Zoning Ordinance, 19.98.030(A)).
[20] DEIR, 1-30 and 1-43.

0051-7
Continued

require remediation of contaminated soil and drill pad impacts, and 3) provide an additional mitigation measure addressing land use conflicts.

0051-8

A. Mitigation Measure 4.2-1 (County List of Long Term Idle Wells)

The following language should be added to Mitigation Measure 4.2-1:

- Every five years the County shall request from the State Oil and Gas Supervisor a list of long term idle wells pursuant to Public Resources Code Section 3206.5. Upon receiving the list, the County shall identify those wells that have no reasonable expectation of being reactivated as provided by Section 3206.5 and formally request the Supervisor to make a determination whether the wells should be plugged and abandoned. The County will then use this list ("County List") to identify feasible mitigation projects for loss of farmland and grazing land and, where applicable, other natural resource areas.
- Using the County List, mitigation for conversion must first occur on-site or common ownership, by abandoning any idle wells on the County's list, or removing any out of service facilities, and returning the surface to the surface owner after performing soil tests and remediating any contamination. The property shall be restored to allow for agricultural use. This includes plugging wells to a depth that allows for reasonably foreseeable cultural practices such as deep ripping. No conservation easement is required to mitigate loss of farmland caused by a new well(s) that has been offset by abandoning the same number and surface footprint of idle wells.
- If no idle wells or out of service facilities exist on-site, the Applicant must offset the conversion of farmland by remediating idle wells from the County List or removing out of service facilities on other farmland within Kern County. Only if such offsets are not available or feasible may other mitigation measures as listed below, such as purchasing conservation easements, be employed.
- If the County List is exhausted, other means of mitigation may be used subject to the following:
    - Mitigation must be provided for the total area of lost agricultural use, not just the ground disturbance footprint area, at a ratio of 1:1 for actual ground disturbance area for oil and gas activities (inclusive of temporary construction and permanent operational impact areas). For example, if the roads and well pads are intermittent across the parcel such that it is no longer economically feasible to plant a row crop or tree crop and large portions of the parcel are not farmable, this surface area shall be added to the lost farmland total.
    - Prior to ground disturbing activity, the Applicant shall submit to the County written evidence of completion of one or more of the following measures to achieve this 1:1 mitigation ratio.
    - Mitigation must be provided for conversion of all lands designated prime farmland, farmland of statewide importance, unique farmland or grazing land, regardless of

0051-8
Continued

whether the lands have been actively farmed or grazed 5 years or more out of the last 10 years.
    - Mitigation lands shall meet the definition of prime farmland, farmland of statewide importance, unique farmland or grazing land, and be of comparable or higher agricultural quality as the lost lands, as established by the California Department of Conservation. Completion of the selected measure or, with the Kern County Planning and Community Development Director's approval, a combination of measures, are to occur on qualifying land in Kern County.
- Other vehicles for mitigation include:
    - Funding and/or purchasing agricultural conservation easements (to be managed and maintained by a Land Trust Alliance-accredited land trust).
    - Purchasing of credits for conservation of agricultural lands from an established agricultural farmland mitigation bank.
    - Participating in any agricultural land mitigation program adopted by Kern County that provides equal or more effective mitigation than the measures listed above.
- The following will apply:
    - Agricultural conservation easements must be located within Kern County or, if no such easements are available, within 10 miles of County borders.
    - Agricultural conservation easements must be held by a Land Trust Alliance-accredited land trust. The DEIR should list standard terms for such easements.
    - Any County farmland preservation or mitigation program must be established in advance of approving the proposed zoning ordinance. A farmland preservation or mitigation program may also be established by a Land Trust Alliance-accredited land trust.

B. Mitigation Measure 4.1-2 (Remediation of Soil Contamination and Drill Pad Impacts)

0051-9

The following language should be added to this mitigation measure:

- The Applicant shall perform soil testing and remove/remediate any contaminants found, returning soil character to that of a baseline sample taken prior to the commencement of drilling.
- The Applicant shall reduce the size of the drill pads to the extent feasible after drilling is complete. Oil pads shall be no larger than necessary while in operation, and shall be removed entirely once oil and gas operations are complete.

C. Additional Mitigation Measures to Minimize Land Use Conflicts

0051-10

To minimize land use conflicts, the County should add a mitigation measure that includes the following:

0051-10
Continued

- The location of roads and improvements must avoid irrigation systems or the applicant must arrange to have them rerouted at the Applicant's expense.
- The Applicant shall maintain the surface free of debris, weeds, graffiti and equipment in disrepair. These conditions are a nuisance and will be subject to abatement by the County with costs paid by the mineral owner.
- On split estate lands, the Applicant shall comply with any applicable deed restriction in the mineral estate severance deed.
- The location of all wells and improvements shall be clustered to the extent feasible and shall not disturb more surface area than necessary. If a well on the property is designated as active but has not produced for two years, the well may remain but the Applicant shall restore the well pad area and return it to the surface owner.
- Locations for wells, roads, pipelines and other production facilities, and the means of operation shall prevent or reduce impacts of the oil and gas operation on the surface use to the extent feasible. The County will consult with the surface owner and, if applicable, conservation easement holder regarding current surface operations in considering whether this requirement has been met.

We appreciate the opportunity to comment and look forward to your response.

Sincerely,

Soapy Mulholland
Executive Director
Sequoia Riverlands Trust

0051-1

The comment is noted for the record.

0051-2

The comment states its support for certain goals of the Project, but also raises summary concerns regarding the ministerial permit process being established by the Revised Amended Ordinance, the relationship between surface and mineral rights owners, and impacts to farmland and species. The comments are noted for the record. Please see RTCs 50-3 – 50-10.

0051-2 cont'd

0051-3

Please see GR 1 – Ministerial Permit Process, GR 16 – Mitigation Measures, and GR 19 – Mitigation Monitoring and Reporting Program, for a description concerning how the conformity review process established by the Amended Zoning Ordinance takes into account site-specific issues and concerns, and imposes conservative mitigation for all impacts.

0051-4

See GR-04: Surface Owners and Agriculture. **0051-4 cont'd**

0051-5

See GR-AG-02: Rangeland.

0051-6

0051-7 cont'd

0051-8

Please see GR Ag-1 - Agricultural Impacts and Farmland Mitigation Program, GR Ag-2 – Rangeland, and GR Bio-1 - Mitigation Measures, Mitigation Criteria and Ratios, and GR Haz-2 – Idle Wells.

0051-8 cont'd

0051-9

MM 4.2-1, cited in the comment, mitigates impacts to Aesthetics. Other mitigation measures in the EIR address the comment's request, including:

MM 4.8-5, which requires testing for and remediation of contamination during grading or excavation work, if necessary;

4.8-14, which requires reporting and clean-up of contamination, consistent with state and federal requirements; and

MM 4.8-8, which requires Applicants to minimize the environmental footprint for exploration and production activities consistent with established industry standards.

0051-10

The comment is noted and included in the record. The EIR established a comprehensive mitigation program (please see GR 16 – Mitigation Measures) that mitigate Land Use conflicts to less than significant.

RE: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance - 2015 C, focused on Oil and Gas Local Permitting

Dear Mr. Mynk,

0052-1

Thank you for the opportunity to comment on the Draft Environmental Impact Report (DEIR) for revisions to the Kern County Zoning Ordinance regarding Oil and Gas Permitting here on the valley floor portion of Kern County.

To begin, it is unclear why only verbal comments provided after the close of comments on August 24, 2015, (now continued to September 11, 2015) but still within the public hearing process at the October 5, 2015 Planning Commission meeting are being considered. [See Notice of Availability] Without knowing when the Response to Comments will be available for public review, it is sometimes necessary and appropriate for the public to be able to submit further written comments to address issues that arise from the review process. All comments up until the time of the close of the public hearing before the vote by the Kern County Board of Supervisors are timely and considered valid under CEQA.

0052-2

Although the County of Kern, as lead agency, is not labeling this environmental document a programmatic EIR, when the project area consists of over 3,110 square miles and approximately 2,697 new wells drilled annually, each requiring some level of review from multiple agencies, this is in fact what it becomes. Review by the lead agency is only a partial part of the review process and this must be coordinated with multiple other agencies at the State, Federal and regional levels. Due to the fact that the County of Kern has jurisdiction over the zoning and is making changes to their Zoning Ordinance, it does not make any other permit redundant or unnecessary. The responsible agencies comments and input are critical to well thought out, fair and impartial decision making. This process should have included duel lead agencies and the California Division of Oil, Gas and Geothermal Resources [DOGGR], as the actual permitting entity, be included in all decisions regarding this change in the permitting process. By this I do not mean responding to this document, but acting in the capacity of the permitting agency, and thus the co-lead agency.

0052-2
Continued

Additionally, this is more of a policy change and not so much a project in and of itself. The project(s), approximately 2,697 new wells, will account for many different applicants located within the 3 designated subareas. The parameters for the conditions (although not currently detailed in writing for review within the document) are defined yet the project(s) themselves might be vastly different and require further, extensive review.

For example, the proposed language for the Zoning Ordinance states that the *"1. The nonhazardous oilfield fluid waste or production water is produced and disposed of within the same designated oilfield; or 2. The nonhazardous oilfield fluid waste or production water disposed of outside the designated oilfield of origin is produced by and disposed of solely and only by the same individual, corporation, or entity."* How is the public to know if it's hazardous without a list of constituents that may be added to facilitate release of underground oil and gas? This designation and the reporting requirements are the responsibility of DOGGR. How will the county be noticed from DOGGR in the proposed 7 day turnaround time frame? How will other County of Kern departments guarantee a 7 day turnaround? Have they committed to this proposal?

How will the County actually perform the said permit reviews in 7 days? Will staff be added? What happens to other projects in queue for permits? By allowing for the Conditional Use Permit process, you are utilizing a ministerial process, yet you are allowing the Planning Commission to find and use waivers, thus making it a discretionary process and this leads to unequal application of the law and zoning ordinance. Different sections allow for permission of the Director, yet fail to detail what the parameters for the decision making process will be. Please include a detailed description of possible requirements and outcomes that may be under the jurisdiction of the Director alone and those possibly determined by the Planning commission. Include fee schedules that will be applicable. Even though CEQA does not generally analyze economic factors, because this will be a major component of the project, these fees should be included for discussion.

0052-3

The following is from the DEIR, yet actually does not specify what these processes will require in many of the proposed procednures.

"Require all new oil and gas wells for exploration or production obtain approval from the Kern County Planning and Community Development Department prior to drilling commencement.

Implement the Tier System to address the different land uses and Zone Districts where oil and gas activities occur.

Require an Oil and Gas Conformity Review as part of the Drilling by Ministerial Permit Section, which would require consistent and comprehensive mitigation based on surrounding land uses.

Update the Development Standards and Conditions Section to include mitigation measures in this EIR as well as other regulatory requirements.

Require a signature block and set a review schedule for all Oil and Gas Conformity Review Site Plans submitted to the County.

Set a specific application processing procedure and timeline for applications on split estate lands without a signature block signed by the Land/Surface Owner.

Outline a new fee structure to support mitigation compliance and County application review costs."

0052-3
Continued

Since this is, in actuality, a policy revision, all requirements must be spelled out and these details must be provided within the DEIR for public, responsible agency and decision makers to review and comment upon. After the fact creation of the above mentioned policies circumvents the CEQA process and renders it nothing more than an exercise in futility.

0052-4

The revisions to the permitting process are deleting the Engineering, Surveying and Permit Services Department, which is still tasked with code compliance and perhaps most importantly, land development. The Public Works Department is not even listed on the website so I couldn't find the director or the responsibilities tasked to that department. Why this is being changed and what are the advantages? By a telephone conversation with Mr. Mynk this was clarified that the Public Works Department with encompass the Engineering, Surveying and Permit Services Department but the date of the finalization is not clear and should be clarified in response to comments.

By attempting to create a one-size-fits-all environmental document of this scope, the County fails to have the actual authority to enforce, monitor or recognize the impacts that may occur as a result of the "projects". The proposal to use this document as the CEQA document for every possible scenario that might be involved is overreaching and difficult to even analyze, even with the extended comment period. This is a problem. Especially for the cumulative affects that result from the proposed projects. How will the cumulative affects be remediated? How will different agencies, especially when it comes to water and air quality impacts, be responsible for their areas of concern, in light of this document and the proposed 7 day turn-a-round? Who will be enforcing the mitigation measures? The public? All the words in the world or even this large document are not going to clean the air. Agreements are nothing without action. This document does not even list what those actions will actually require. Or how much they will cost!

While much of the land involved is already degraded by current and past use in the same genre, most of the mitigation is based on previous rules and regulations as required by other agencies. The actual mitigation required by the county is only applicable to the policies proposed. Therefore, there is a disconnect. A fatal flaw.

NATURAL RESOURCES

Water:

0052-5

It is difficult, at best, to analyze water, soil or air quality issues which "might" occur. Although there is plenty of data provided within the DEIR, this information, while project specific to over 3,000 + acres, does not adequately address specific issues.

Aquifers within the different sub-areas are made of distinctly different soils and compositions. Permeability varies and thus, different techniques are used for enhanced oil and gas extraction. How can one size fit all? While there is a tiered system for delineation of uses, and thus different levels of review within the county, it becomes an additional maze of regulations not even considering the requirements necessary from DOGGR.

How does this account for oil fields that may be adjacent to other properties that are under different uses and may share an aquifer and thus have fluids that are not compatible mingling with other waters. How will this issue be addressed? Within the actual tiered permitting system, I did not see a request for disposal of wastewater or a constituent list of possible additives to said water and the need for proper disposal of said water and drilling muds. Where is this information stored that the public and the responsible public safety agencies may access the data and use it for both emergency and otherwise everyday informed decisions.

How will the final CPA study, Assessments of Potential Impacts of Hydraulic Fracturing for Oil and Gas on drinking water (P 4.9-29) impact the project area? Especially the Eastern and Central sub-areas? If mitigation is based on disposal of fluids then it is critical to understand how the movement is tracked and if the fluids do in fact migrate as predicted.

Water quality issues are of immense importance, complex and multi-layered. The County lacks jurisdiction and control over much of the permitting actions and approvals that other agencies oversee and may cause cumulatively significant impacts to hydrology or water quality in the region; accordingly, this impact remains **significant and unavoidable**. On page 4.9-22 there is reference to the NORM (Naturally Occurring Radioactive Material) DOGGR study. How will this data be utilized in the permitting process? How can the County use the Overriding Considerations for actions not in their jurisdiction?

0052-5
Continued

Air:

Within the Air Quality section the DEIR notes that there are "Unavoidable impacts to Air Quality "but then labels the impact as odor! It is disingenuous to use the word odor as the "project" impact when in fact air pollution and the accompanying severe health issues that come with the criteria pollutants, as shown within the document in the adjacent column.

For instance, the Project would result in an increase of criteria pollutants (oxides of nitrogen [NOx], volatile organic compounds [VOC], carbon monoxide [CO], particulate matter less than 10 microns and less than 2.5 microns in diameter [PM10 and PM2.5, respectively]) in excess of the recommended criteria pollutant significance threshold adopted by the SJVAPCD Board. Emission sources in Kern County contribute between 11% and 21% of criteria pollutant emissions in the San Joaquin Valley Air Basin. The 2% and 14% of these pollutants in the San Joaquin Valley Air Basin or between 19% and 97% of Kern County's contribution. This analysis indicates that most sulfur dioxide (SO2) emissions in Kern County would originate from oil and gas activities and the majority of NOX emissions. Therefore, the proposed Project would have a **cumulatively considerable** contribution of criteria pollutant (NOX, PM10, PM2.5, CO and SO2) emissions to the Kern County portion of the SJVAB. These pollutants create more than odor!! They damage health, crops and in some sensitive receptors, can cause death.

0052-6

I did not see any mention of a recent study that found far more escaping methane at the well head than previously thought. This would make it imperative to begin a more active program to cap wells that are abandoned in a timely fashion. Methane, although not a measured criteria pollutant in the SJVUAPCD under the Clean Air Act, because it is non-photo chemically reactive, is a criteria pollutant in the Green House Gas (GHG) emissions inventory. The DEIR mentions in Growth Inducing Impacts 1.5.4 – that the "Ordinance would result in 2,697 new production wells being drilled annually, **while 2,231 wells would be plugged and abandoned**. Additionally, it is anticipated that 1,200 wells would receive some type of well stimulation treatment during this same timeframe."

0052-6
Continued

Where does this data come from? The market price for Kern River Crude is continuing to decline and fluctuate as of 8/17/15. How did the EIR come to the conclusions sited above? Are the 2,231 wells that would be plugged also an annual number? This is not clear. How many of these wells could be re-worked to become productive again?

0052-7

On-site mitigation is always in the best interest of the community involved and this includes the hard working people in the oil fields, as they are on the front line of exposure. I would appreciate the DEIR supplying on-site mitigation ideas. Cap and Trade is not necessarily a program that results in direct reduction of pollutants but scrubbers and trees can and do cut pollution at the source.

Sincerely,

Renee Donato Nelson
President
Clean Water and Air Matter (CWAM)

Cc: Mick Gleason, Supervisor, District 1

0052-1

The comment includes a general introduction. No response is necessary. The commenter also asserts that all comments up until the time of close of the public hearing before the vote by the County Board of Supervisors are timely and considered valid under CEQA. As the revised DEIR Notice of Availability for Public Review made clear, the comment period closed on September 11, 2015 and testimony at public hearings after that date may be limited to those issues raised during the public review period either orally or submitted in writing by 5:00 p.m. the date the comment period closed. See also GR-17 (EIR review and comment period).

0052-2

The comment is noted for the record. Please see Global Response 2 Project vs Program EIR. Staff consulted extensively with State Agencies who will be utilizing the EIR as a responsible agency for information and recommendations on mitigation measures. Please see Global Response 5.

0052-2 cont'd

0052-3

Comment is noted for the record. The requirements of the Revised Amended Zoning Ordinace including the mitigation measures will be fully enforced through Title 19 requirements (Global Response 19) which are under the full authority of the Kern County Board of Supervisors. Please also see Responses 44-168 through 44-196. Please see Global Response Water 1 through Water 8.

0052-3 cont'd

0052-4

The comment is noted for the record and raises questions outside the CEQA process. Please see Global Responses 1, 9, 10, and 22. The Revised amended Zoning Ordinance located in Section 7.1.3 includes details on the CUP process and the authority of the Planning Commission in considering any requests to change or eliminate standard and conditions contained in the ordinance. A request by an applicant to process a CUP for such consideration moves the project from a ministerial process to a discretionary process and the Commission, after full compliance with additional CEQA review can deny, approve or conditionally approve the request. Global Response 5 discusses the use of the EIR by Responsible Agencies such as the Division of Oil, Gas and Geothermal under their authority for underground activities.

0052-5

Comment is noted for the record. Please see Global response Air 1 through Air 12. Please also see Response 44-241.

The DEIR addresses both impacts due to criteria pollutant emissions and impacts from odor in its analysis. These are separate, but related, issues which are both discussed in the DEIR. See DEIR pp. 4.3-70 – 103 (for a discussion of criteria pollutant emissions and impacts) and DEIR pp. 4.3-112 – 115 (for a discussion of odor impacts). The DEIR has an extensive discussion of the various criteria air pollutants and related health effects. See DEIR pp. 4.3-10 – 30.

The commenter states that she did not see any mention of a recent study that found far more escaping methane at the well head than previously though. No study is referenced in the comment and thus it is unclear which study the commenter is referring to. We assume that she is referencing the study published on August 18, 2015 in the Environmental Science and Technology Journal (ES&T) by Marchese, et al., entitled *Methane Emissions from United States Natural Gas Gathering and Processing.*[1] The study found that methods applied by the United States Environmental Protection Agency (EPA) to estimate methane emissions from natural gas processing plants appear to overestimate actual emissions, but also that EPA methods may tend to underestimate methane emissions from gathering facilities within natural gas supply chains. Relying on that study, some commenters questioned whether methane emissions associated with the Project were similarly underestimated, and whether MMs 4.7-1 through 4.7-4 are sufficient to reduce impacts from greenhouse gas emissions (GHGs) to “less than significant.” The ES&T article has limited application to this EIR for several reasons, outlined below. Therefore, the findings of the article do not change the conclusions contained in the Draft EIR with regard to potential impacts from GHG emissions, including methane.

The ES&T study used data from facilities, all located outside California, owned by five companies (Access Midstream, Anadarko Petroleum Corporation, Hess Corporation, Southwestern Energy, and Williams Companies), none of which are among the companies that operate in Kern County or elsewhere in California.[2] Thus, the operating practices of these companies may not be representative of oil and gas producers in Kern County.

The operating companies and the facility locations are relevant because, as the ES&T study explains, methane emissions are a function of multiple design factors and operational parameters. According to the study, a wide range of factors can influence the level of methane emissions, including “facility type, facility design (*e.g.*, number of pneumatic devices, prime mover types), facility size / complexity (*e.g.*, number of fugitive leaks), facility operating pressures (*e.g.*, magnitude of fugitive leaks), facility pressure ratio (*e.g.*, number of stages of

compression), total facility throughput (*e.g.*, number of compressors; combustion emissions), and operating state (*e.g.*, normal, maintenance, etc.).” These many factors vary regionally, so that the practices in the regions included in the study may not be representative of those in Kern County.

In addition, unlike the natural gas production evaluated in the ES&T study, much of the natural gas produced in Kern County is a co-product of crude oil production. CCST 2015 at Figure 1.1-1 (“Natural gas is much less abundant than oil in California and most of the state’s natural gas production is a co-product of oil development, referred to as ‘associated’ gas production.”); CCST 2014 at Box 1.1 (“Wells that produce only gas occur primarily in the Sacramento Basin, but most of the gas in the state is associated with oil production in the San Joaquin Basin.”). As a result, the design and operation of the Kern County gas production facilities are likely to differ substantially from facilities in other states. Eight of the states[3] included in the ES&T study accounted for 83.5% of all United States natural gas gathered, and 82.2% of marketed production, in 2012. The relevance of the findings regarding gathering pipelines and facilities for primarily natural gas production in the ES&T study is limited, because Kern County production facilities and operations are not readily comparable to operations in other areas of the U.S.

For example, natural gas pneumatic devices are valve controllers, powered by pressurized natural gas, that automatically operate valves and control pressure, flow, temperature or liquid levels. Continuous bleed pneumatic devices are designed to release gas at a specified rate while activated. Both the USEPA and California Air Resources Board require “low bleed” (less than 6 standard cubic feet per hour (scfh)) pneumatic devices on any new equipment. However, most operations in Kern County do not use continuous bleed natural gas pneumatic devices in the gathering process. These devices may be utilized in gas operations in some remote locations, where gas from the production operation is readily available and electricity may not be available. However, with the low gas/oil ratio of the typical Kern County oil field, high-pressure gas generally is not available at the gathering stations, so compressed air valve control devices are used. Thus, the emissions assumptions for pneumatic devices in the ES&T study would not apply in Kern County.

Finally, oil and gas facilities in Kern County are subject to the strict air quality regulations of the California Air Resources Board and the San Joaquin Valley Air Pollution Control District, in particular with regard to emissions of ozone precursors such as volatile organic compounds (VOCs) and nitrogen oxides (NOx). These regulations are in effect because of the federal and California 8-hour ozone nonattainment status within the San Joaquin Valley portion of Kern County.[4] By contrast, among the thirteen states in the ES&T study, nine are in attainment of the ozone national ambient air quality standards (NAAQS) and the other states have only small areas of ozone NAAQS non-attainment. As a result, VOC emissions from natural gas production facilities in California are more highly controlled than in the states considered in the ES&T study. Facilities in California are also required to offset emissions increases to a higher degree compared to other states. The control of VOC emissions generally has the co-benefit of also controlling methane from oil and gas production facilities, meaning facilities in Kern County will likely emit less methane overall. As discussed in the Draft EIR, the California Air Resources Board also recently proposed a regulation that will further reduce methane emissions from oil and gas facilities. DEIR pp. 4.7-30–31.

For purposes of this EIR, GHG (including methane) emissions levels from operational activities were calculated using data from facilities subject to California’s GHG Mandatory Reporting Regulation (MRR), which was promulgated in 2010 and required reporting of 2011 GHG emissions by April of 2012. MRR requires operators of natural gas systems to report GHG emissions, including from gathering facilities and pipelines. See 17 CCR § 95150 *et seq*., Appendix A–B. The information in this EIR represents the best available information about methane emissions levels from natural gas production and pipelines within Kern County.

0052-7

Many of the mitigation measures in the DEIR are on-site mitigation. For example, MM 4.3-1 requires an applicant to obtain an Authority to Construct (ATC) from the SJVAPCD which would require control equipment on-site. In addition, the dust control plan in MM 4.3-2, the use of Tier 3 engines in MM 4.3-3, and the retrofit requirements in MM 4.3-4 would all apply to on-site activities.

Subject: Question about Alternative Choice in application to amend the Kern County Zoning Ordinance

RE: application to amend the Kern County Zoning Ordinance (Title 19), focusing on Chapter 19.98 (Oil & Gas Production

Dear Planning and Community Development Kern County,

I have prepared several reports for the Securities and Exchange Commission Whistleblower Program regarding a company called, Clearsign Combustion. I have been reading through the Draft Environmental Impact Report and have been reading interpretations of such online. There is seems to be a misunderstanding online as to what the "Alternative proposals" mean. 0053-1

On the internet there is a claim made about Clearsign Combustion's (CLIR) technology: 0053-2

"Summary: Proposed mandates would require installation of CLIR's Duplex on every new OTSG and on every existing OTSG within five years in Kern County, California."

From my reading this is not quite right.

Do I understand this correctly?

1. The proposal is to revise the Kern County Zoning Ordinance. 0053-3
2. There are also Alternatives to this proposal, such as the one mentioning Clearsign's technology, but these will only come in to play if the appropriate officials vote for one of them. 0053-4
3. If the original proposal passes as is, then none of the Alternatives mentioned in the report will be enacted. 0053-5

Or, would it be correct to say that proposed mandates would indeed require installation of Clearsign's Duplex technology on every new OTSG? 0053-6

Any information or guidance here would be greatly appreciated. 0053-7

Regards,
Matt Berry

0053-1

Thank you for your comment and participation in the public review of the Project and the environmental document. This introductory comment is noted. Please see response to comments 3 through 6 of this letter.

0053-2

Thank you for your comment and participation in the public review of the Project and the environmental document. This introductory comment is noted. Please see response to comments 3 through 6 of this letter.

0053-3

The comment is correct that the Project proposes to revise the Kern County Zoning Ordinance, as described in DEIR, Chapter 3, Project Description.

0053-4

The comment is correct that the DEIR evaluates certain alternatives to the Project. Alternative 5, if adopted, would require permit applicants to use lower-emission technology. Clearsign's technology is described in the DEIR only as one illustrative example of such lower-emission technology. If Alternative 5 were adopted, however, no specific technology made by any particular manufacturer would be required to be used by well permit applicants.

0053-5

The comment is correct that, if the proposed Project is adopted, then none of the alternatives evaluated in the DEIR would be adopted.

0053-6

It would not be correct to say that proposed mandates would require installation of Clearsign's Duplex technology on every new OTSG. Alternative 5, if adopted, would require permit applicants to use lower-emission technology. Clearsign's technology is described in the DEIR only as one illustrative example of such lower-emission technology. If Alternative 5 were adopted, however, no specific technology made by any particular manufacturer would be required to be used by well permit applicants.

0053-7

Thank you for your comment and participation in the public review of the Project and the environmental document.

Re: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015(C) Focused on Oil and Gas Local Permitting

Dear Mr. Mynk:

We are farmers in Kern County and have an almond orchard located in the Wasco area. Our orchard is on split estate land and there are currently no oil wells located on our property. There are, however, many wells near our property and we are concerned that future oil drilling may have serious consequences including the removal of producing almond acreage. 0054-1

I am not opposed to oil and gas development in Kern County, but I'm concerned that oil companies will drill new wells on my property and neighboring properties without sufficient protections for my crops, home, and workers. Kern County has an opportunity to ensure that new oil and gas wells will not endanger our health, quality of life, or the economic prosperity of Kern's agricultural industry. I do not believe the County's draft revisions to the zoning ordinance, or the mitigation measures in the Draft Environmental Impact Report (DEIR), go far enough. In addition, the DEIR for this project seriously understates the project's impacts—especially to the agricultural community. 0054-2

Please consider the following comments and revise the DEIR to accurately reflect the project's impacts and identify additional mitigation measures. As the DEIR stands now, I don't believe it complies with the County's responsibility to inform the public about the project's significant impacts and mitigate those impacts to the extent feasible as required under the California Environmental Quality Act. 0054-3

Project Description:

- The DEIR underestimates the number of new wells that could be drilled under the project, especially on agricultural lands. There has been an increase in drilling on agricultural lands over the last 10 years and it is unreasonable to assume that only 6% of future drilling will occur on agricultural lands 0054-4

Land Use Impacts:

- The DEIR concludes that there will be significant land use conflicts between oil and gas operations and surface uses, such as agricultural operations. But nothing in the proposed zoning ordinance will reduce these conflicts and the mitigation measures proposed don't address many of the types of conflicts that can occur. 0054-5

- The County should require surface owner sign-off for drilling on split estate lands to allow these conflicts to be worked out at the site-specific level. Other attorneys agree that the County has the authority to require sign-off without exposing the County to liability from mineral rights owners. 0054-6

- If surface owner sign-off is not required, the County should require a conditional use permit for development on split estate lands to enable the County to consult with surface owners and address site-specific conflicts. The County does not expect a significant number of permits on split estate lands and regardless the County can charge applicants for the costs to process these permits, including hiring additional staff if necessary. 0054-7

Agricultural Impacts:

- The DEIR underestimates the amount of farmland that will be converted to non-agricultural use because it does not consider that land in between or near oil and gas facilities cannot be farmed. 0054-8

- The DEIR must identify mitigation measures requiring oil and gas facilities to be clustered together, instead of being spread out across a farm. 0054-9

- The DEIR must discuss the problem of long-term idle wells and out of service facilities taking farmland out of production for longer than necessary. The DEIR's mitigation measures should require that unnecessary idle wells be abandoned and out of service equipment be removed before allowing other types of mitigation that do not restore farmland. 0054-10

Water Supply Impacts:

- The DEIR assumes there is more water available that is suitable for municipal and agricultural uses than there actually is. Farmers are finding salt levels in groundwater are increasing to the point where they are harming crops. Also, the DEIR doesn't identify which aquifers will be impacted the most by oil and gas development. As a result, I can't determine what the water supply impacts to my farm will be. 0054-11

- The DEIR concludes that the project will cause water shortages in Kern County. But it doesn't discuss what the impacts of those shortages will be. Who will be required to cut back? How will water shortages effect crops? 0054-12

- The DEIR should identify additional mitigation measures to reduce the project's impact on water supplies. For instance, the DEIR should require oil and gas operations to treat and reuse more of the produced water from their wells. 0054-13

Aesthetic Impacts:

- The DEIR concludes that the proposed Project would have significant unavoidable impacts to the County's rural character but it ignores mitigation such 0054-14

as limiting the number of drilling operations at any one time in scenic rural areas and requiring larger setbacks (e.g., 1,000 feet). 0054-14 Continued

Traffic Impacts: 0054-15

- The DEIR underestimates the amount of traffic that the proposed Project will generate and does not analyze hazardous conditions that could be caused by truck traffic. The DEIR must include additional mitigation for traffic safety impacts and emergency access.

Noise Impacts: 0054-16

- The DEIR does not consider increased noise from actual conditions as they currently exist on the ground. It therefore vastly underestimates the Project's noise impacts in rural areas of the County.

- The DEIR's mitigation for noise impacts, including a trivial 190-foot setback requirement, will not go far enough to reduce those impacts to a less than significant level. The DEIR should include more realistic and effective setback requirements. 0054-17

Air Quality Impacts: 0054-18

- The project will lead to even higher ozone levels in Kern County and negatively impact human health and agricultural yields. The DEIR must consider additional air quality mitigation measures.

Alternatives: 0054-19

- The DEIR must consider the Conditional Use Permit (CUP) alternative in detail. Under the CUP alternative, the County can impose industry-wide mitigation while preserving its ability to consider the environmental effects of each permit on a case-by-case basis.

Sincerely,

Robert W. Holtermann

Kristina L.B. Holtermann

Re: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015(C) Focused on Oil and Gas Local Permitting

Dear Mr. Mynk:

We are farmers in the Wasco area of Kern County involved in the production of almonds. We operate under the name of Holtermann Farms and The Tim and Karen Holtermann Trust. My farm is on split estate lands with multiple oil wells on four different sites. One well has already been approved to operate as an injection well while other wells are not producing. This has all happened in approximately the last fifteen years. The lack of dust control from the oil well operations has caused additional problems and costs to my operation. The release of uncontrolled oil has damaged my crop requiring it to be destroyed. 0055-1

We are not opposed to oil and gas development in Kern County, but we are concerned that oil companies will drill new wells on my property and neighboring properties without sufficient protections for my crops, home, and workers. Kern County has an opportunity to ensure that new oil and gas wells will not endanger our health, quality of life, or the economic prosperity of Kern's agricultural industry. We do not believe the County's draft revisions to the zoning ordinance, or the mitigation measures in the Draft Environmental Impact Report (DEIR), go far enough. In addition, the DEIR for this project seriously understates the project's impacts—especially to the agricultural community. 0055-2

Please consider the following comments and revise the DEIR to accurately reflect the project's impacts and identify additional mitigation measures. As the DEIR stands now, we don't believe it complies with the County's responsibility to inform the public about the project's significant impacts and mitigate those impacts to the extent feasible as required under the California Environmental Quality Act. 0055-3

Project Description:

- The DEIR underestimates the number of new wells that could be drilled under the project, especially on agricultural lands. There has been an increase in drilling on agricultural lands over the last 10 years and it is unreasonable to assume that only 6% of future drilling will occur on agricultural lands 0055-4

Land Use Impacts:

- The DEIR concludes that there will be significant land use conflicts between oil and gas operations and surface uses, such as agricultural operations. But nothing 0055-5

in the proposed zoning ordinance will reduce these conflicts and the mitigation measures proposed don't address many of the types of conflicts that can occur. 0055-5 Continued

- The County should require surface owner sign-off for drilling on split estate lands to allow these conflicts to be worked out at the site-specific level. Other attorneys agree that the County has the authority to require sign-off without exposing the County to liability from mineral rights owners. 0055-6

- If surface owner sign-off is not required, the County should require a conditional use permit for development on split estate lands to enable the County to consult with surface owners and address site-specific conflicts. The County does not expect a significant number of permits on split estate lands and regardless the County can charge applicants for the costs to process these permits, including hiring additional staff if necessary. 0055-7

Agricultural Impacts:

- The DEIR underestimates the amount of farmland that will be converted to non-agricultural use because it does not consider that land in between or near oil and gas facilities cannot be farmed. 0055-8

- The DEIR must identify mitigation measures requiring oil and gas facilities to be clustered together, instead of being spread out across a farm. 0055-9

- The DEIR must discuss the problem of long-term idle wells and out of service facilities taking farmland out of production for longer than necessary. The DEIR's mitigation measures should require that unnecessary idle wells be abandoned and out of service equipment be removed before allowing other types of mitigation that do not restore farmland. 0055-10

Water Supply Impacts:

- The DEIR assumes there is more water available that is suitable for municipal and agricultural uses than there actually is. Farmers are finding salt levels in groundwater are increasing to the point where they are harming crops. Also, the DEIR doesn't identify which aquifers will be impacted the most by oil and gas development. As a result, I can't determine what the water supply impacts to my farm will be. 0055-11

- The DEIR concludes that the project will cause water shortages in Kern County. But it doesn't discuss what the impacts of those shortages will be. Who will be required to cut back? How will water shortages effect crops? 0055-12

- The DEIR should identify additional mitigation measures to reduce the project's impact on water supplies. For instance, the DEIR should require oil and gas operations to treat and reuse more of the produced water from their wells. 0055-13

Aesthetic Impacts: 0055-14

- The DEIR concludes that the proposed Project would have significant unavoidable impacts to the County's rural character but it ignores mitigation such as limiting the number of drilling operations at any one time in scenic rural areas and requiring larger setbacks (e.g., 1,000 feet).

Traffic Impacts: 0055-15

- The DEIR underestimates the amount of traffic that the proposed Project will generate and does not analyze hazardous conditions that could be caused by truck traffic. The DEIR must include additional mitigation for traffic safety impacts and emergency access.

Noise Impacts: 0055-16

- The DEIR does not consider increased noise from actual conditions as they currently exist on the ground. It therefore vastly underestimates the Project's noise impacts in rural areas of the County.

- The DEIR's mitigation for noise impacts, including a trivial 190-foot setback requirement, will not go far enough to reduce those impacts to a less than significant level. The DEIR should include more realistic and effective setback requirements. 0055-17

Air Quality Impacts: 0055-18

- The project will lead to even higher ozone levels in Kern County and negatively impact human health and agricultural yields. The DEIR must consider additional air quality mitigation measures.

Alternatives: 0055-19

- The DEIR must consider the Conditional Use Permit (CUP) alternative in detail. Under the CUP alternative, the County can impose industry-wide mitigation while preserving its ability to consider the environmental effects of each permit on a case-by-case basis.

Sincerely,

Timothy H. Holtermann

Karen E. Holtermann

0055-1

Thank you for your comment and participation in the public review of the Project and the environmental document. The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. This introductory comment is noted and will be considered by County decision makers.

0055-2

Thank you for your comment and participation in the public review of the Project and the environmental document. Please see Global Response 4, Surface Owners and Agriculture.

0055-3

September 10, 2015

Kern County Planning and Community Development Department
Attn: Christopher Mynk, AICP
2700 "M" Street, Suite 100
Bakersfield, CA 93301

Vaquero Energy, Inc. and PetroRock LLC would like to thank you, along with WISPA, CIPA, and IOPA, and all the other who have assisted, in drafting the first Kern County EIR for permitting of oil and gas wells. The effort is certainly a step in the right direction and will provide operators with a sense of security when drilling wells for oil and gas. It will provide a well-documented, thorough permitting process to reduce exposure to unnecessary litigation from either environmental groups or the public who do not take the time to understand the science behind oil and gas drilling and development. There are already numerous prevention and mitigation measures taken by operators to be excellent environmental stewards. In addition, there are existing regulations that the industry currently complies with. We all know our livelihood is at stake with how we treat the environment and our community. After all, this is our home, too. 0056-1

With regards to the DEIR, we are impressed with the effort put forth to this point. There are no short cuts to create a document of this magnitude. The numerous pages contain a lot of substance which this short comments letter cannot do justice to mention. In an effort to keep this brief, I will only address the parts we feel could be improved on. The first is more of a general statement with a specific example for clarification. Many of the mitigation measures are too vague in their requirements when a development well is being drilled in an existing field. As an example, a required mitigation measure (MM 4.2-2) is graveling the transition from dirt roads to paved roads. The document contains specifics on amount of gravel required, but it does not specify which roads will require this measure. Will it only be required on new roadway entrances or will existing roadways that will be used to access the new well require upgrades, or does it go so far as to require upgrading all roads on that lease? 0056-2

In general, the permitting process, and costs, for drilling an infill well in a development field which will tie into existing infrastructure should be handled much differently than drilling a well which requires new infrastructure. This holds true for the majority of the fees, but specifically the Air Quality Mitigation fees. Air Quality Mitigation fees will be discussed further below. As we are primarily a developmental producer, most of the wells we drill are in the area of existing pipelines, roads, tanks, compressors, and other production related equipment. Once fees are paid for the permitting of one well, additional wells in that area should have greatly reduced fees as they will share many of the same resources, such as roads, pipelines, tanks, and compressors. 0056-3

15545 Hermosa Road • Bakersfield, California 93307
Phone: 661.363.7240 • Facsimile: 661.366.2959 • www.vaqueroenergy.com

VAQUERO ENERGY

The selection of which activities requires which type of review could also use more attention. For example, well work over does not require a permit, but well maintenance requires a seven day minor activity review. The two tasks require much of the same equipment; therefore, will have very similar environmental impacts, but they have different permitting requirements. In fact, well workover currently requires a DOGGR permit, whereas maintenance does not. Maintenance activities tend to be done on a much shorter timeframe as a downed well is no longer making money. Well workovers typically have more planning involved. 0056-4

Cyclic steam EOR is not covered as an activity in the Review Table. I would make the argument it should fall under no permit required in most cases as it typically grandfathered into the field rules of DOGGR. 0056-5

The definition of a small producer requires refinement. As it appears it will be defined by drilling somewhere in the range of 1-5 wells per year, does that include wells drilled outside of Kern County or just wells drill within the project boundaries? 0056-6

As a small producer, who drills fairly inexpensive wells, the permit fees could amount to 10% of the cost of our wells. This seems exorbitant, especially considering most of our wells tie into existing infrastructure. As I mentioned before, the biggest culprit is the Air Quality Mitigation fees. We already have the strictest standards in the country when it comes to air quality mitigation equipment and processes, testing, and reporting. These all come at a great cost to us. In addition, the San Joaquin Valley Air Pollution Control District is currently drafting new requirements which will dramatically increase our costs of necessary equipment, permits, testing and reporting, in an effort to reduce methane emissions, as they feel this is not already covered by current regulations. We will be double-dipped on emission costs as we pay for both the new regulations and their astronomical fees for the Kern County Permit. Consequently, we are getting hit many ways for the same goal. The air quality mitigation fees should be removed, or at a minimum, a fraction of what they are proposed to be. If they are adopted, they should be terminated upon the enforcement of the statewide methane emission reduction and reporting plan. Another option would be to consider the fees already spent annually towards emissions regulations when determining the additional per well fee, including AB32 credits. 0056-7

The permitting fees are aggressive and it appears there will be fees associated with returning idle wells to production. We propose getting permit credits or refunds when we plug and abandon wells and oilfield roads. There will no longer be associated emissions from that well, there is no longer traffic associated with the well, and the surface can be restored to the same use as its surroundings. 0056-8

15545 Hermosa Road • Bakersfield, California 93307

VAQUERO
ENERGY

Again, we do truly appreciate the time and effort which has gone into drafting this monumental report. It paves the way for responsible development of the counties vast energy resources. It documents many of the measures that are already in place by most oil and gas operators, and makes it easy to understand the lengths we all go to in conducting our business.

0056-9

Respectfully submitted,

Wyatt Shipley

VAQUERO
ENERGY
Operations Manager
15545 Hermosa Road

wshipley@Vaqueroenergy.com

0056-1

The comment is noted for the record and will be forwarded to the Planning Commission and Board of Supervisors for their consideration.

0056-2

MM 4.2-2(e) has been modified to remove the need for tracking improvements for vehicles travelling within a 15 mph speed limit. For vehicles exceeding this speed limit, tracking control is required. The SJVAPCD requires that tracking controls be a "sufficient length of paved/graveled interior roads to allow mud and dirt to drop off vehicles before exiting the site."

0056-3

Commenter's requests for fee adjustments for wells on existing fields are noted. The ordinance has been amended to clarify the types of activities that require County approvals and must comply with mitigation measures. Air emissions caused by Project constructions and operations are required to be mitigated under the ERA (MM 4.3-5). Although there are different mitigation requirements for some types of impacts in Tier 1, air mitigation is required to achieve no net increase in designated criteria pollutants for all Project emissions under CEQA. Commenter's other points about recommended lower fees for roads and other impacts for wells in existing fields are noted for the record and will be considered by the Planning Commission and Board of Supervisors.

0056-4

Commenters suggestion that the ordinance be clarified are noted, and the Revised Amended Ordinance was developed in response to this and other ordinance comments. Please see Section 7.1.3, which includes the Revised Amended Ordinance.

0056-5

The applicability of the Ordinance to cyclic steaming and idle wells has been clarified in the Revised Amended Ordinance included in Section 7.1.3.

0056-6

Commenter's question regarding "small producer" status is noted. This question does not involve the scope of the EIR's analysis of impacts or mitigation measures, but is noted for the record and will be considered by the Planning Commission and Board of Supervisors.

0056-7

Commenter's concerns about the cost of permit fees generally, and request for removal of the air quality mitigation fee in particular, is noted for the record and will be considered by the Planning Commission and Board of Supervisors. Mitigation of air quality impacts is required under CEQA for Project air emissions.

0056-8

Commenter's suggestion that a fee credit be created when wells are plugged and abandoned, and oil field wells are abandoned, is noted for the record and will be considered by the Planning Commission and Board of Supervisors. This fee structure comment does not involve the scope of the EIR's analysis or mitigation measures.

0056-9

Commenter's concluding statements are noted for the record and will be considered by the Planning Commission and Board of Supervisors.

57 Bakersfield Association of Realtors

BAKERSFIELD ASSOCIATION OF REALTORS®
GROWING A STRONGER COMMUNITY

September 11, 2015

PLANNING AND COMMUNITY DEVELOPMENT DEPARTMENT
Attn: Christopher B. Mynk, AICP
2700 "M" Street, Suite 100
Bakersfield, CA 93301-2323

Re: Oil/ Ag Environmental Impact Review

Dear Mr. Mynk;

The Bakersfield Association of REALTORS® strongly supports both our local agriculture and oil and gas industries. We value the contributions of both industries to our local community and economy. We would like to commend the Planning and Community Development Department for their long term efforts to find solutions and work through these complex local issues. The Bakersfield Association of REALTORS® (the "Association"), has reviewed the proposed amendments to the Kern County Zoning Ordinance (the "Zoning Ordinance"). The proposal would implement a new, streamlined permitting process for all new oil and gas wells and associated facilities. The proposal includes environmental review and introduces new processes to ensure that surface owners in split estate situations are afforded sufficient notice and the opportunity to enter into negotiated access agreements with oil and gas companies intending to drill. Our review is based on the proposed amendments to the Zoning Ordinance dated July 15, 2015 (the "Proposed Amendments"), provided by the Kern County Planning and Community Development Department, a Workshop Staff Report from the Kern County Planning and Community Development Department, dated July 27, 2015 (the "Staff Report")/ and the portions of the Draft Environmental Impact Report, dated July 2015 (the "Draft EIR"), required by the California Environmental Quality Act ("CEQA"), that describes the impact mitigation measures that may be incorporated into the Proposed Amendments after the Final EIR is released. 0057-1

Again, the Association recognizes that our local economy is heavily dependent on both the oil and gas and agriculture industries and that the continued operation and expansion of each industry is desirable for most residents. The Bakersfield Association has identified a few potential issues in the Zoning Ordinance below. Thank you for the opportunity to submit our comments, suggestions and questions. 0057-2

Issue: The Proposed Amendments do not account for good faith negotiations by oil and gas companies.

The permit process involving split estates where the mineral rights owner is unable to obtain the signature of the surface rights owner imposes substantial burdens on oil and gas companies applying for permits. As described in the Staff Report, the goal of this process is to incentivize the mineral owner and/or operator to negotiate access and compensation issues, rather than forcing the surface owner to sue for injunctive relief or for damages caused by the mineral owner's entry. The Staff Report further states that the proposal is intended to put the surface owner on equal footing with the mineral owner and "is not intended to give either parties an advantage over the other." It does this by requiring a longer approval 0057-3

2300 Bahamas Drive
Bakersfield, CA 93309

Since 1905

BAKERSFIELD ASSOCIATION OF REALTORS®
GROWING A STRONGER COMMUNITY

process to give the parties more time to negotiate and reach agreement and by requiring on-site inspectors to be present during all activities conducted under the permit. At any time during this process, if the mineral owner obtains the surface owner's signature, the review and inspection processes will be further processed as an application with a signature, under Section 19.98.090, allowing for faster review by the County and a self-certification process. 0057-3 Continued

Some surface owners requested that the County become more involved by either refusing to issue a permit when the site plan is not signed by the surface owner or by identifying and imposing mitigation measures to resolve the surface owner's concerns in the permit. The County declined to further insert itself into the private negotiations between the mineral owner and surface owner in a split estate permit application. However, the structure that it proposes holds applicants who have made good faith efforts to negotiate an entry agreement and failed to reach agreement to the same requirements as applicants who have not negotiated in good faith with surface owners. While most surface owners are likely to prefer entering into a fair agreement in which they have input over the location of access and activities, some may hold out for a variety of reasons, some of which may not be able to be resolved in an access agreement. Because the process created by the County is ministerial, there is no way for the County to give any relief in the event a surface owner either refuses to sign a site plan or refuses to sign for the notice letter required in 19.98.080. 0057-4

Recommendation: Provided that the extended permit review time provision and inspection requirements for permit applications without a surface owner's signature are included in the final version of the Proposed Amendments to the Zoning Ordinance, there is a potential for this structure to unnecessarily hamper the permitting process. The ministerial process meets the goal of streamlining the permitting of most oil and gas activities but it does not allow the County to make any exceptions to the application requirements. Perhaps the County could consider creating a relief-mechanism if the mineral owner can demonstrate good faith effort in negotiating an agreement to obtain the surface owner's signature. If this process is to be kept ministerial in nature, it should include objective standards. For example, the process could require that the mineral owner provide proof of submission of an access agreement to the surface owner, which offers comparable compensation as has been offered to similarly situated owners, and at least one revised offer that responds to a surface owner's counteroffer. 0057-5

Issue: The self-certification process is unclear. 0057-6

Section 19.98.130 allows a Conformity Review or Minor Activity Review permit holder to self certify compliance with the provisions of the Oil and Gas Activities Chapter during construction and operation under the permit. This certification is to be in writing, in a format to be specified by the County, and submitted when construction is complete. If a violation of the permit or applicable implementation standards occurs, a County inspector will conduct a "Certification and Finalization" process and the permit holder will be unable to self-certify under its next permit.

The process outlined in the self-certification section is unclear regarding the process and consequences for failures. Are there continuing compliance reporting obligations once construction is complete? If the self-certification reveals violations occurred but were appropriately and adequately remedied, is the

2300 Bahamas Drive
Bakersfield, CA 93309
661.635.2300 f.661.635.2317
Since 1905

BAKERSFIELD ASSOCIATION OF REALTORS®
GROWING A STRONGER COMMUNITY

permit holder prevented from further self certification? How is it determined that a violation occurred-is there County oversight or will the County rely on complaints? Is the information provided to the County in the self-certification statement publicly available? What inspection and compliance process applies to a permit holder that is no longer permitted to self-certify due to violations? 0057-6 Continued

Recommendation: Section 19.98.130, as drafted, is vague and needs to be clarified regarding when compliance is measured, how information provided by the permit holder will be used, and what alternative process is there for permit holders who have allowed violations to occur. **Issue:** It is not clear that the County has the capacity to review the Conformity Review and Minor Activity Review application materials within 7 days, since the documentation of compliance with the Mitigation Measures may be voluminous. 0057-7

Recommendation: As part of the proposed streamlining of the permit process, complete applications for Conformity Review (with surface owner signature) and Minor Activity Review will be reviewed within 7 days. If supplemental materials are submitted, the second review must be completed within 3 days. It appears that the time frame is not an absolute requirement in that the Proposed Amendments state that the Planning Director "shall make reasonable efforts" and the Proposed Amendments are silent regarding the consequences for failing to act on an application within the time frame specified. 0057-8

The County states that a staffing proposal, which would increase fees, add additional staff, and obtain new permitting software tools to address the increased permitting work load, will be presented to the Planning Commission and the Board of Supervisors for consideration. The volume of material to review in any given application is likely to be substantial. The Staff 0057-9

Report tentatively sets the fees for processing applications at $1,190 for Conformity Review and $890 for Minor Activity Review, for an estimated $2,142,000 to $4,339,930 collected annually based on the expected volume of permits. These fees would be used to fund the staffing proposal. Assuming most of the 88 mitigation measures proposed in the EIR are incorporated into the Mitigation Monitoring and Reporting Program, the applicant will have to demonstrate compliance with, or a plan for compliance with, or inapplicability of each. The County estimates that between 1,800 and 3,647 applications will be submitted annually. These figures translate to between 35 and 70 applications per week, or 7 to 10 per day on average, with peak volumes that could be much higher. The County currently has a substantial planning staff but the work of reviewing this volume of applications in compliance with the short review times will require substantially more people. 0057-10

Has the County determined how long it will take to review each application at both ideal and less-than-ideal staffing level? What does the County propose to do if the required fees for increased staff are denied by the Board of Supervisors? Perhaps the County should consider amending the proposal to provide the County sufficient time to complete a review. Will the final proposed application fees generate sufficient revenues to support the proposed increased staffing levels? Can those application fees be increased at a later time? Would it be beneficial to the County to consider third party certified inspectors? 0057-11

BAKERSFIELD ASSOCIATION OF REALTORS®
GROWING A STRONGER COMMUNITY

Issue: The Proposed Amendments should be revised to clarify inconsistent language and provide all attachments and figures referenced within the text. The Proposed Amendments contain several inconsistencies and the public draft does not contain all of the relevant referenced information. 0057-12

Section 19.98.020 references Appendix A, which supposedly includes the definitions of the "highly technical" oil and gas activities. Presumably, Appendix A also contains definitions of the capitalized terms used throughout the Chapter, including "Oil and Gas Production Boundary Area" and "Certification and Finalization." The Chapter also references Figure 19.98.01577, but that figure is not attached to the draft. 0057-13

Section 19.98.030 sets out the Tier designation (and references Figure 19.98.015 as showing which lands are in each Tier) and most of the sections reference the Tiers regarding the scope of applicability. However, the applicability of the Conditional Use Permit process references the areas to which it applies by zoning district rather than by Tier. In other sections the Proposed Amendments then use "Tier 4" to describe the lands subject to the Conditional Use Permit. 0057-14

Although Sections 19.98.090 and 19.98.100 have parallel structures, Section 19.98.090 does not have an introductory paragraph stating what activities it governs. Also, Subparagraph A of Sections 19.98.090, 19.98.100 and 19.98120 all start with the words "An applicant for a ministerial permit pursuant to this chapter." The Proposed Amendments distinguishes between Conformity Review and Minor Activity Report as two types of ministerial permits under the chapter. Each of these sections should distinguish between the two types of permit - otherwise three different sections all appear to apply to the same type of application. 0057-15

Section 19.98.090(A) cross-references to the Conformity Review application requirement that notice of the application be sent to the surface owner, but the cross-reference is to the incorrect subsection. 0057-16

The Conditional Use Permit process is applicable not only to lands in zoning districts listing oil and gas activities as a conditional use but also to lands outside of the lands mapped into Tiers I through 5, i.e. lands outside of the Project Area. However, the various application requirements outlined in the Proposed Amendments do not cover what is required for a Conditional Use Permit on land outside of the Project Area. Section 19.98.080 applies only to applications for Conformity Review in Tiers 1-3 and Tier 5 and Conditional Use Permits in Tier 4. 0057-17

The Staff Report states that Conformity Review under Section 19.98.100 will take a minimum of 120 days: 30 days' pre-application notice to the surface owner, 30 days for the first review, 30 days for a second mandatory review, and a 30 day waiting period before construction may begin. However, Section 19.98.100(C) indicates that the second review is not mandatory, but only required if the application was incomplete and required a second submission. 0057-18

Recommendation: There are several inconsistencies and omissions in the current draft of the Proposed Amendments and it is recommended that a detailed review of the Proposed Amendments be conducted to be sure that the final ordinance, as adopted, is internally consistent and establishes procedures for all available approval processes. 0057-19

2300 Bahamas Drive
Bakersfield, CA 93309

Since 1905

BAKERSFIELD ASSOCIATION OF REALTORS®
GROWING A STRONGER COMMUNITY

0057-20

Issue: Section 19.98.070 well workover, geophysical monitoring, well testing, vegetation, fencing, well abandonment and revegetation require no permits.

Recommendation: It is critical that all surface activities be subject to some type of permitting and notification process. A permitting process must be established for these activities. The surface owner should receive notification throughout every stage of the process. Additionally, we would recommend that County Staff offer every opportunity to the surface owner to assist with understanding the process.

0057-21

Issue: Mitigation Measure 4.4 – If an applicant wishes to complete a land study, the surface owner would not be notified as it is written now.

Recommendation: Any studies should require the surface owner's approval.

0057-22

Issue: Proposed Mitigation Fees

The Draft EIR proposes four mitigation fees, intended to offset the impacts created by the activity permitted under the Proposed Amendments. To offset the impacts to performance objectives of fire and police services, Mitigation Measure 4.14-1 will impose a fee of $150 per well on each Conformity Review permit until the purchase price of a new "Combination Walk in/Non-Walk-in Industrial Firefighting Vehicle," not to exceed $850,000, is reached. To offset potential increase in rural crimes, Mitigation Measure 4.14-2 imposes a $425 fee per Conformity Review permit to pay personnel in the Sheriff's Rural Crime Unit. To offset wear and tear on pavement on roads used by oil and gas industry traffic, Mitigation Measure 4.16-1 requires payment of $1,500 per permit for new wells to fund roadway maintenance and other improvements. To offset cumulative impacts of increases in "Criteria Pollutants," Mitigation Measures 4.3-8 requires the County to enter into an emissions reduction agreement with the San Joaquin Valley Air Pollution Control District, requiring the Applicant to pay fees to fully offset certain emissions. The Staff Report states that the mitigation fee range per well is estimated at between $8,000 and $17,850.

0057-23

These proposed mitigation fees are broader than typical development exactions because they are intended to offset the expense of providing new capital facilities and services (e.g. roads and firefighting equipment) and also to mitigate impacts to the environment. The imposition of the proposed fees as a condition for permitting will facilitate continued and expanded oil and gas exploration and production activities in the County under the streamlined permit process of the Proposed Amendments, which can only be adopted after completing the CEQA process (of which these mitigation measures are a part).

0057-24

The National Association of REALTORS® (NAR) and The Bakersfield Association of REALTORS® both have an adopted policy position opposing impact fees. Where impact fees exist, we urge their repeal. When impact fees are used, they should follow strict guidelines, for example: proceeds from impact fees should he segregated from other governmental revenues; impact fees should be used solely for capital improvements related to a specific new development. However, the Association realizes the importance of the proposed fees to the EIR process supporting the County's adoption of the Proposed Amendments, and the Association would consider supporting adoption of the fees.

2300 Bahamas Drive
Bakersfield, CA 93309

Since 1905

BAKERSFIELD ASSOCIATION OF REALTORS®
GROWING A STRONGER COMMUNITY

How were the proposed fees established? Will the adoption of the proposed fees set a precedent for imposing these types of fees for future developments or projects? The Association would strongly oppose the adoption of such fees in the future. 0057-24 Continued

Ag Land Conversions 0057-25

Regarding agriculture land conversions in Mitigation Measure 4.2-1, the Association would like to suggest a focus on item (c) restoring agricultural lands to productive use through the removal of legacy oil and gas production equipment, including well abandonment and removal of surface equipment. This could require that the County work with the Farm Bureau to establish an account where the funds to mitigate would be deposited and then there would be a list established by the County and Farm Bureau of wells that would need to be abandoned. The funds would remain in the county and also other industries like development, solar and wind may also mitigate by depositing their funds in the same account.

The Association supports streamlining the permitting process to reduce time and administrative hurdles businesses face in Kern County. The Association is also committed to the preservation of property rights. Again, the Bakersfield Association of REALTORS® applauds the Planning and Community Development Department and the efforts of the various stakeholders throughout this process. We appreciate the continued efforts to find middle ground that offers protection for surface owners and their land, without over regulation for the oil and gas industries.

Sincerely yours,
Bakersfield Association of REALTORS®

0057-1

Commenter's description of the importance oil and gas, and agriculture, to the County's economy is noted, as are commenter's conclusions that the Amended Ordinance does not differentiate between oil and gas operators who act in good faith to negotiate agreements with surface owners and those that do not. Commenter's request that the ordinance include a faster permit track for applicants who use good faith efforts to negotiate agreements with surface owners but remain unable to reach agreement is also noted, as is commenter's conclusion that it is difficult to make a ministerial conclusion about the extent a party has engaged in good faith negotiations. This is a policy recommendation that does not address impacts or mitigation relating to the physical environment, and is included in the record for further consideration.

0057-2

0057-20

Commenter suggests that cultural resources studies be allowed only with surface owner consent. As explained in GR 4, surface owners must provide access required to extract mineral resources (including related activiteis) to mineral owners under applicable laws, and it would be legally infeasible for the County to impose a surface owner approval requirement for a cultural resource study that is required to avoid disturbance of significant cultural resources as required by the EIR.

0057-21

Please see response to 0057-20.

0057-22

Commenter's concerns about the mitigation fees are for further consideration. Mitigation for impacts to roads and firefighting equipment is appropriate under CEQA given the impacts of the Project (e.g., higher levels of wear and tear from heavier well construction equipment, and specialized hazard emergency response needs for production-related accidents). Commenter's policy opposition to impact fees is also noted for further consideration.

0057-23

Please see response to 0057-22.

0057-24

Please see response to 0057-22.

0057-24 cont'd

0057-25

Commenter's endorsement of prioritizing legacy equipment removal as a compensatory agricultural impact mitigation measure is noted. MM 4-2-1 has been amended to prioritize preservation of larger blocks of agricultural lands, and removal of legacy equipment, in future County use of agricultural mitigation funding.

Bakersfield, CA 93301

Reference: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015 C, Focused on Oil and Gas Local Permitting

Dear Mr. Mynk;

The Kern County Home Builders Association (HBA) supports local agriculture as well as the oil and gas industry, and we value the benefits they bring to our community. We commend the Planning and Community Development Department for their long term efforts to find solutions and work through complex issues. The HBA has reviewed the proposed amendments to the Kern County Zoning Ordinance which will implement a streamlined permitting process for all new oil and gas wells and associated facilities. The proposal includes environmental review and introduces new processes to ensure that surface owners in split estate situations are afforded sufficient notice and the opportunity to enter into negotiated access agreements with oil and gas companies intending to drill. Our review is based on the proposed amendments to the Zoning Ordinance dated July 15, 2015, the Workshop Staff Report from the Kern County Planning and Community Development Department, dated July 27, 2015, and portions of the Draft Environmental Impact Report, dated July 2015 that describes the impact mitigation measures that may be incorporated into the Proposed Amendments after the Final EIR is released. Again, the HBA recognizes that our local economy is heavily dependent on both the oil and gas and agriculture industries and that the continued operation and expansion of each industry is important to our community. The HBA has identified a few potential issues in the Zoning Ordinance below and appreciate the opportunity to provide our comments. 0058-1

Mitigation Fees

Our primary concern is regarding the four proposed mitigation fees. These fees are intended to offset the impacts created by the activity permitted under the Proposed Amendments to the Zoning Ordinance as stated below. 0058-2

1. Mitigation Measure 4.14-1: Police and Fire fees are shown at $150 per well for each Conformity Review until the purchase price of a new "Combination Walk-in/Non-Walk-in Industrial Firefighting Vehicle until $850,000 is collected. 0058-3

P.O. Box 21118, Bakersfield, CA 93390
(661) 633-1316 www.kernhba.com

2. Mitigation Measure 4.14-2: $450 per Conformity Review to pay personnel in the Sheriff's Rural Crime Unit.
3. Mitigation 4.16-1: requires the payment of $1,500 per permit for new wells to fund roadway maintenance and other improvements.
4. Mitigation Measure 4.3-8: requires the County to enter into an emissions reduction agreement with the San Joaquin Valley Air Pollution Control District, requiring each Application to pay fees to fully offset certain emissions. The Staff Report states that the mitigation fee range per well is estimated between $8,000 and $17,850 per well.

0058-3 Continued

Please provide clarification for the following items:

0058-4

Fire Truck Mitigation Fee

The Draft EIR states that fire protection requirements are "based on the number of residents and workers in the primary service area." That is, demand is largely a factor of population size, not land use, because the majority of response calls provided by a fire department are medical calls. The Draft EIR then notes that the oil and gas exploration activities that will be conducted under the Proposed Amendments and the EIR are not expected to result in substantial population increases because the industry is already well established in the County and will employ existing members of the local workforce. The Draft EIR does note that the increase in the number of oil and gas facilities could cause significant impacts if the hazardous material response teams do not have sufficient firefighting equipment to deal with potential situations.

0058-5

Because oil and gas activities are not expected to generate measurable increases to population, any impact fee for firefighting services should only be based on the increase in requirements for responding to hazardous materials incidents. It is not clear whether the firefighting vehicle to be bought with the generated funds is primarily a vehicle required for hazardous materials response or is intended to fill a general need in the county firefighting arsenal.

Rural Crimes Unit Mitigation Fee

0058-6

The Draft EIR describes a recent increase in property crimes in rural areas of the county, particularly metal theft. It notes that the rise in crime is not attributed to oil and gas activity but suggests that activities could increase the level of demand for police because most oil and gas exploration will likely be in rural areas. Furthermore, it states that the oil and gas industry contributes approximately 30% of the property tax revenues collected by the County but claims that the industry does not contribute its fair share for firefighting and rural sheriff services.

0058-7

It is not clear that the continuation and expansion of oil and gas activities in unincorporated areas of the County will generate additional demand for police services. Also, the fee applies to all permits issued under Conformity Review without regard to whether the activities are within the areas served by the Rural Crimes Unit but does not apply to other developments in the rural areas of the county. Mitigation Measure 4.14-2 states that, if other sources of funding are secured, the fee may be reduced. This suggests that the need for the additional resources is more broad-based and not just attributable to the oil and gas industry.

Road Improvement Mitigation Fee

0058-8

Similar to the Rural Crimes Unit Mitigation Fee, the Road Improvement Mitigation Fee is not clearly related only to the impacts of oil and gas activities. The County identified 750 centerline miles of state and county roads and evaluated those roads for current pavement conditions. Of those miles, the County identified 400 centerline miles as primary and secondary routes for oil and gas traffic. It then assigned specific volumes of traffic to each of the primary and secondary routes and a "nominal volume" of traffic to the non-primary and non secondary routes. The study concluded that the additional traffic assigned to these routes "could contribute to the degradation of pavement conditions and the service life for roadways."

0058-9

The traffic study described in the Draft EIR does not appear to have considered actual traffic counts of oil and gas vehicles nor did it connect pavement degradation only to use of the roads by vehicles associated with oil and gas activities. The discussion of the cause of pavement degradation does not suggest that vehicles in other uses (i.e. personal vehicles or vehicles used in the agriculture industry) do not contribute to pavement degradation. Further, Mitigation Measures 4.16-1 requires the fee to be revaluated if a broad based sales tax dedicated to transportation funding becomes available. This suggests that the cause of the impact is more diverse than just oil and gas activities. Additionally, there is no discussion as to how the dollar amount of the fee was calculated. Is $1,500 per well expected to generate the full budget for performing maintenance and reconstruction each year or does it only account for the maintenance and reconstruction associated with vehicles serving oil and gas activities?

Emissions Mitigation Fee

0058-10

Mitigation Measure 4.3-8 calls for the County to enter into an emission reduction agreement with the San Joaquin Valley Air Pollution Control District (the "District") and establish the amount that each applicant will pay to reduce emissions. Emission reduction agreements are voluntary agreements typically entered into by developers whereby the developer pays fees to mitigate the development's impact on air quality. The District will then use the fees generated under these agreements to undertake specified emissions reduction projects. In 2014, the District's projects reduced targeted emissions by 165 tons, at a cost effectiveness of $6,974 per ton. Although the Staff Report suggests that the range of the fee imposed on each well will be $8,000 to $17,000, it is not clear what that estimate is based on. At this point there is insufficient information available to adequately assess this mitigation fee.

0058-11

These proposed mitigation fees above are very broad based because they are intended to offset the expense of providing new capital facilities and services (e.g. roads and firefighting equipment) and also to mitigate impacts to the environment. The imposition of these fees as a condition for permitting will facilitate continued and expanded oil and gas exploration and production activities in the County under the streamlined permit process of the Proposed Amendments, which can only be adopted after completing the CEQA process (of which these mitigation measures are a part).

0058-12

The HBA is sensitive to the precedent that implementation of these fees would establish. If impact fees are used, it should be under strict guidelines and the proceeds should be segregated from other governmental revenues; impact fees should be used solely for capital

improvements related to a specific new development. The HBA understands that the fees are important to this EIR process and, upon clarification of the items above, should be supported. 0058-12 Continued

Additional Concerns 0058-13

1. The Proposed Amendments should be revised to clarify inconsistent language and provide all attachments and figures referenced within the text. The Proposed Amendments contain several inconsistencies and the public draft does not contain all of the relevant referenced information.

Section 19.98.020 references Appendix A, which supposedly includes the definitions of the "highly technical" oil and gas activities. Presumably, Appendix A also contains definitions of the capitalized terms used throughout the Chapter, including "Oil and Gas Production Boundary Area" and "Certification and Finalization." The Chapter also references Figure 19.98.01577, but that figure is not attached to the draft. 0058-14

Section 19.98.030 sets out the Tier designation (and references Figure 19.98.015 as showing which lands are in each Tier) and most of the sections reference the Tiers regarding the scope of applicability. However, the applicability of the Conditional Use Permit process references the areas to which it applies by zoning district rather than by Tier. In other sections the Proposed Amendments then use "Tier 4" to describe the lands subject to the Conditional Use Permit. 0058-15

Although Sections 19.98.090 and 19.98.100 have parallel structures, Section 19.98.090 does not have an introductory paragraph stating what activities it governs. Also, Subparagraph “A” of Sections 19.98.090, 19.98.100 and 19.98120 all start with the words "An applicant for a ministerial permit pursuant to this chapter." The Proposed Amendments distinguishes between Conformity Review and Minor Activity Report as two types of ministerial permits under the chapter. Each of these sections should distinguish between the two types of permit - otherwise three different sections all appear to apply to the same type of application. 0058-16

Section 19.98.090(A) cross-references to the Conformity Review application requirement that notice of the application be sent to the surface owner, but the cross-reference is to the incorrect subsection. 0058-17

The Conditional Use Permit process is applicable not only to lands in zoning districts listing oil and gas activities as a conditional use but also to lands outside of the lands mapped into Tiers I through 5, i.e. lands outside of the Project Area. However, the various application requirements outlined in the Proposed Amendments do not cover what is required for a Conditional Use Permit on land outside of the Project Area. Section 19.98.080 applies only to applications for Conformity Review in Tiers 1-3 and Tier 5 and Conditional Use Permits in Tier 4. 0058-18

The Staff Report states that Conformity Review under Section 19.98.100 will take a minimum of 120 days: 30 days’ pre-application notice to the surface owner, 30 days for the first review, 30 days for a second mandatory review, and a 30 day waiting period before construction may begin. However, Section 19.98.100(C) indicates that the second review is 0058-19

not mandatory, but only required if the application was incomplete and required a second submission. 0058-19 Continued

There are several inconsistencies and omissions in the current draft of the Proposed Amendments and it is recommended that a detailed review of the Proposed Amendments be conducted to be sure that the final ordinance, as adopted, is internally consistent and establishes procedures for all available approval processes. 0058-20

2. Mitigation Measure 4.4 – If an applicant wishes to complete a land study, the surface owner would not be notified as it is written now. This should be amended to require the surface owner's approval. 0058-21

3. The permit process involving split estates where the mineral rights owner is unable to obtain the signature of the surface rights owner requires a longer approval process - to give the parties more time to negotiate and reach agreement - and by requiring on-site County inspectors to be present during all activities conducted under the permit. Use of private third party deputy inspectors should be added as an additional option for inspections. 0058-22

4. Section 19.98.070 well workover, geophysical monitoring, well testing, vegetation, fencing, well abandonment and revegetation require no permits. It is critical that all surface activities be subject to some type of permitting and notification process. A permit process must be established for these activities. The surface owner should receive notification throughout every stage of the process. Additionally, we recommend that County Staff offer every opportunity to the surface owner to assist with understanding the process. 0058-23

Thank you for the opportunity to provide comments during this process.

Sincerely,
The Home Builders Association of Kern County

Chris Mynk - kern draft EIR for oil and gas permitting comments

From: "Trudy Douglass (GMail)" <trudydouglass2@gmail.com>
To: <mynkc@co.kern.ca.us>
Date: 9/11/15 3:05 PM
Subject: kern draft EIR for oil and gas permitting comments

To: The Planning Department,

Your proposed EIR plan will erase many safe guards for our land, air and water in the goal of pleasing the oil production business. This plan is shortsighted and selfish, it calls for maximum stripping of oil resources in the next 25 years with no regard for the future needs of our grandchildren and great-grandchildren. It is a return to the greed that crippled our country in the 80's and 90's. 0059-1

You are choosing to turn over the keys to our county to a business that has proven it self to be neither honest nor trustworthy. I won't repeat their short comings because they have been well documented. 0059-2

This plan should not be approved for 25 years. Make it for 5 years, and then have a review of the air, water, and land quality and pollution levels before renewing it. 0059-3

A 5 year review will also check to see that the oil companies are using the best and most current safety practices to protect our air, land and water. Kern County is fairly famous for letting businesses get away with shoddy practices, don't let the oil companies slide by in this area any longer. 0059-4

It is not enough to make new laws, you must put together a team of experts to insure compliance. Inspection should be done twice a year and well documented. Fines and stop work orders should be issued for noncompliance. 0059-5

Neither state nor county make these companies follow the most basic rule learned in kindergarten: If you make a mess clean it up. Include a rule that sites must be returned to their original condition within a year of removing the pumping equipment. 0059-6

Are you really going to hold back on permitting solar farms in order to provide the oil companies more land to exchange for farm land they will usurp? That is very shortsighted. In the long run solar is a much better resource for our future. 0059-7

Please consider these recommendations before approving this EIR. 0059-8

0059-7

Kern County is a leader in the promotion of renewable energy development. According to the California Energy Commission, as of June 30, 2015, Kern County has 100 renewable energy facilities online, providing 4,372 megawatts renewable capacity (CEC, 2015). These numbers far exceed any other county in California.

0059-8

Lorelei Oviatt, Director
Kern County Planning and Development Department
Public Services Building
2700 "M" Street, Suite 100
Bakersfield, CA 93301-2370

Re: Draft EIR for Revisions to Kern County Zoning Ordinance – 2015 C, Oil & Gas Permitting, Public Comment

Dear Ms. Oviatt:

The California chapter of the National Association of Royalty Owners advocates to protect and preserve the rights of royalty and mineral rights owners, many of whom live or own rights within Kern County. On behalf of these royalty and mineral rights owners, we welcome the opportunity to offer comment on Kern County's Draft Environmental Impact Report (EIR). 0060-1

An owner of land in fee has the power to sever the mineral rights from surface rights. The mineral rights may be sold or leased, or they may be reserved or accepted in a sale of the land. In any case, the mineral owner or lessee has obtained an interest in real property called a **profit a prendre**, the right to take something, such as oil and gas, from the land itself. The profit a prendre has been considered to be analogous to an easement, but it has generally been considered something more. In most cases the profit a prendre includes an implied easement to use the land for the development of the minerals. Whatever the nuances controlling its definition, the ownership of a profit a prendre usually brings with it a general, exclusive, and potentially all pervasive right of surface entry. In the absence of contrary language in the instrument conveying the interest, a mineral owner or lessee can make any reasonable use of the surface of the land to develop the minerals, even to the complete exclusion of the surface owner. This is well established in state law. 0060-2

We appreciate the thorough work of the Planning Department, however, as we understand the current proposal, additional requirements for access of minerals could impose significant barriers to mineral extraction, decreasing the value of the minerals and resulting in a reduction in ad valorem property tax and potentially a reduction in services to the residence of Kern County. 0060-3

State laws first enacted nearly 150 years ago established the rights for mineral owners (*Civil Code DIVISION 2. PROPERTY [654-1422] (Heading of Division 2 amended by Stats. 1988, Ch. 160, Sec. 13.)*.) Many judicial rulings since then have confirmed and upheld these rights. 0060-4

179 Niblick Road, #418 • Paso Robles, CA 93446-4845
Office: (805) 801-5877 • info@naro-ca.org • www.naro-us.org

0060-5

As the dominant estate, mineral owners have specific rights to enter the surface pending the completion of the Section 848 process.

0060-6

When minerals are severed from the surface, many times there are specific rights deeded to the mineral owner. The County does not have the right to supersede these rights granted. Any attempt to constrict these rights would be detrimental to the value of the minerals and may require just compensation for that loss.

0060-7

As a result, the County may be forced into the unintended consequence of incurring costly legal expenses to defend this action. The current process, which is already codified in state law, is sufficient and does not expose the County to unnecessary legal burdens.

0060-8

Thank you for making this process inclusive and our organization hopes that the concerns addressed above will be reflected in the final EIR and ordinance language. Should you have any questions, feel free to contact me at (209) 481-7005.

Sincerely,

EDWARD S. HAZARD

Re: Draft Environmental Impact Report (EIR) for Revisions to the Kern County Zoning Ordinance – 2015 C, Oil and Gas Local Permitting

Dear Mr. Mynk,

Wonderful Orchards, and its associated agricultural entities, Wonderful Pistachios & Almonds ("WPA"), Wonderful Citrus ("WC"), and Vintage Nurseries LLC ("Vintage") (collectively "The Wonderful Company"), appreciate the opportunity to provide comments to the Kern County Planning and Community Development Department ("Department") regarding the Draft EIR for oil and gas permitting in unincorporated areas of Kern County. 0061-1

The Wonderful Company farms and markets pistachios, almonds, pomegranates, various citrus varietals and grapevine nursery stock throughout California's Central Valley. As a large agricultural landowner in Kern County, we feel strongly that agricultural operations and oil and gas activities, the backbone of the Kern County economy, can successfully co-exist, and appreciate the County's efforts to promote the continued viability of both industries. 0061-2

To this end, the Wonderful Company generally supports the proposed project to amend the Kern County Zoning Ordinance to include new site development standards for oil and gas exploration, extraction, and production in unincorporated Kern County; however, we respectfully request that the Department consider the following comments before finalizing the Ordinance. 0061-3

1. The Draft EIR assumes that an average of 2,697 new producing wells would be permitted annually through the proposed project. We seek clarification on the basis for this estimate. 0061-4

6801 East Lerdo Highway, Shafter, California 93263 · 661.399.4456 · 661.399.1735

Wonderful orchards

Agricultural Resources (Impact 4.2-1 & Impact 4.2-5)

2. We support the proposed requirement for applicants to provide mitigation for new ground disturbance, especially the option of "restoring agricultural lands to productive use through removal of legacy oil and gas production equipment", but are concerned that this option is not incentivized sufficiently. We request that this area of the proposal be reviewed and revised to promote restoration of lands containing legacy oil and gas facilities, particularly those that have been abandoned. 0061-5

   The restoration of legacy facilities and idle wells is a concern for surface owners and should take priority over the conservation easement mitigation option. This could be accomplished through the establishment of an abandonment fund during the permitting stage. Once cleanup of these facilities are complete, then the conservation easement option could be initiated. Furthermore, the current water situation does not make the conservation easement option reasonable at this time. 0061-6 0061-7

3. The proposal tentatively provides measures to "protect crops and structures adjacent to oil and gas activities on active agricultural lands" including the requirement to show underground pipeline on submitted site plans. The Wonderful Company urges the Department to also consider requiring applicants to show how they will minimize disturbance with underground agricultural pipelines and related facilities on these plans. 0061-8

Hazards and Hazardous Materials (Impact 4.8-1)

4. While we agree with the proposed mitigation measures for significant hazards to the public or environment, we believe the requirements under MM 4.8-3 should also include a requirement to provide adequate notice of the activities that will take place on the site. Accordingly, The Wonderful Company suggests that the Department include language providing that notice must be given within a specified time period before any actions are to be taken on the surface – this will provide protection to both the mineral owner and its employees and the surface owner and its employees. 0061-9

Transportation and Traffic (Impact 4.16-1)

5. The Department proposes to mitigate potential transportation and traffic issues by requiring that site plans include relevant information pertaining to the current transportation infrastructure. We support these measures, but believe that site plans should be required to include access routes as well. 0061-10

6801 East Lerdo Highway, Shafter, California 93263 · 661.399.4456 · 661.399.1735

Wonderful orchards

Utilities and Service Systems (Impact 4.17-4)

6. The proposal sets a goal that the additional oil and gas activities in unincorporated Kern County provide 30,000 acre-feet per year of agricultural irrigation water. We seek clarification on whether this estimate includes both agricultural irrigation water and groundwater recharge, and believe that groundwater recharge should also be an option for use of produced water. Additionally, The Wonderful Company would like to understand whether the 30,000 acre-feet per year estimate is in addition to the current produced water being supplied to agricultural water districts or whether the reuse goal already includes these existing sources, and would support that an additional 30,000 acre-feet of water be developed. 0061-11 0061-12

19.98.080 Oil and Gas Conformity Review

7. **Application Contents (Site Plan).** We agree with the currently listed requirements, but believe the site plan should not be considered complete without also including access routes, landscaping plans and notification requirements. 0061-13

8. **Notification Requirements – Tier 1, 2, 3, 4 and 5 Areas.** The Wonderful Company seeks further explanation on what is intended by the use of the word "sent" in the following statement: "The package shall be sent 30 days before submittal of application." If the Department interprets this to mean that the materials must be **delivered** to the recipient 30 days before submittal, we believe that this sentence should be modified as such. Without this clarification, there is little assurance that adequate notification to affected surface owners will be given. Furthermore, we also suggest providing additional language specifying the required delivery method (i.e., certified mail or a comparable method). 0061-14

The Wonderful Company appreciates the opportunity to provide feedback on the Draft EIR. We are available to discuss our comments should the Department require additional information. 0061-15

Sincerely,

Joseph C. MacIlvaine
President

6801 East Lerdo Highway, Shafter, California 93263 · 661.399.4456 · 661.399.1735

0061-1

Thank you for your comments on the Draft EIR. This introductory comment is noted.

0061-2

Thank you for your comments on the Draft EIR. This introductory comment is noted.

0061-3

This introductory comment is noted.

0061-4

See GR-08: Future Well Projections.**0061-5**

The agricultural land compensatory mitigation components of MM 4.2-1 has been revised to prioritize acquisition of larger agricultural properties and removal of legacy equipment.

0061-6

The Project addresses future permitting for future oil and gas activities, and does not apply to abandoned wells or other legacy equipment and structures. The state also has a fund for removal of abandoned equipment. The Revised Amended Ordinance also includes a new procedure for reporting potentially abandoned or idled wells to the County, which can then coordinate with DOGGR to assure regulatory compliance, and to withhold new permits from applicants DOGGR has determined to be in violation of idled well requirements.

0061-7

Comment's assessment of the difficulty of acquiring conservation easements during this drought period is noted. MM 4.2-1 provides a menu of options for mitigating impacts to agricultural lands. See also, prior response for prioritization of funding for conservation.

0061-8

The Site Plan must show the construction of new pipelines and other related facilities by oil and gas producers. Surface owners are encouraged to provide information about the location of underground agricultural pipelines and related facilities to the County, so this informatiion can be uploaded onto the Kern Gateway (a GIS site with multiple layers of data that will be publically accessible) to better inform oil and gas infrastructure locations. Surface owners are also encouraged to provide such information to Applicants. The Project does not include regulating agricultural operations, or imposing disclosure or other requirements on agricultural operators or surface owners.

0061-9

Commenter's request for expanding surface owner notice requirements are noted. Both the Revised Amended Ordinance and several mitigation measures have been revised to expand mandatory reporting obligations to surface owners.

0061-10

Commenter's suggestion that Site Plans include access road information has been included in the Revised Amended Ordinance.

0061-11

GR 5 water update for corrected number of ag irrigation (which does include GW faciliteis designed to be part of ag irrigation). Groundwater recharge is an option for managing produced water. 30K AFY is net addition to existing produced water being supplied to ag water districts.

0061-12

GR 5 water update for corrected number of ag irrigation (which does include GW faciliteis designed to be part of ag irrigation). Groundwater recharge is an option for managing produced water. 30K AFY is net addition to existing produced water being supplied to ag water districts.

0061-13

Commenter's recommendations regarding landscaping plans, access roads and surface owner notifications are noted. The Amended Ordinance and revised mitigation measures expand notice requirements, include access roads as a required component of site plans, and MM 4.1-4 has been modified to remove vegetation screening requirements on agricultural lands.

0061-14

The Revised Amended Ordinance includes more detailed information on the timing of required notices, and the need for notices to be sent with required signature receipts from recipients under designated circumstances.

0061-15

See comment 14.

Re: Comments on Draft Environmental Impact Report (focused on Oil and Gas Local Permitting) ("DEIR")

Dear Mr. Mynk:

I am writing this letter on behalf of South Valley Farms with operations growing almond and pistachio trees primarily in northern Kern County. As all residents of Kern County are aware, we recognize that the two largest economic drivers in this county are the oil industry and the agricultural industry, and we hope to have both industries thrive. In addition, as is the case with many farmers, our farmland is situated on split estate lands and is subject to the proposed ordinance amendments and analysis contained in the DEIR. Our hope is that this DEIR can operate as a vehicle to better the necessary relationship and cooperation between the surface owner and mineral owner in split estate situations through the land use authorities of Kern County. 0062-1

We are aware that the Kern County Farm Bureau ("KCFB") has submitted a comment letter regarding the DEIR dated September 10, 2015. By this letter, we support the KCFB letter and requests made in it, and we additionally request that you consider the following comments to revise the DEIR: 0062-2

Ordinance

(1) At least under Tier 2, for split estate scenarios, a signature by the Land/Surface Owner should be absolutely required on the site plan as set out in Section 19.98.080(G) with only one pathway forward. The timing for all permits, once the signature has been obtained, should remain as set out in Section 19.98.090. With land use issues at the very heart of these site plans as affecting the surface owners, who typically continue to own the land after the mineral owners set up their operations, it seems that this request is reasonable and respectful of the rights of both the surface owner and the mineral owner. 0062-3

(2) If the County continues on a dual pathway for split estate scenarios as established by Section 19.98.090 and 19.98.100, then we request that Section 19.98.080(H) be changed to provide a notification period to the Land/Surface Owner of 60 days before submittal of the application, as opposed to only 30 days. The minimum notification period by law is 30 days, and nothing prevents the County from extending the required notification period. An additional 30 days of notification allows time for the Land/Surface Owner and the mineral owner to come together and work out terms with the goal of getting a signature by the Land/Surface Owner and proceeding along the path of Section 19.98.090. This should be the goal of all parties involved, including the County. This can be particularly important for smaller farms that do not have the staff to deal with these kinds 0062-4

SOUTH VALLEY FARMS 15443 Beech Avenue • Wasco, CA 93280 • Ph: 661.391.9000 • Fax: 661.391.9012 • www.southvalleyfarms.com

of issues in a short timeframe, especially if the notice were to be received during harvest. An extra 30 days could make the difference. 0062-4 Continued

(3) Please include in Section 19.98.080(H) that the letter of notification to be provided to the Land/Surface Owner include a complete copy of the application for an Oil and Gas Conformity Review. 0062-5

Mitigations

(1) While we do not disagree with the general proposal for MM 4.2-1 as contained in the KCFB comment letter, dated September 10, 2015, we believe that a dollar amount for a mitigation measure needs to be meaningful and should be specified. Since we are talking about a method to return Ag land within the County at a ratio of 1:1, including land with currently idle and/or abandoned oil/gas wells, the dollar amount needs to be sufficient enough to return the land to Ag land as quickly as possible. We would suggest a dollar figure in the range of $20,000 - $25,000 per acre per permit. 0062-6

We thank you, again, for this opportunity to comment on the DEIR. Our hope is that issues can be balanced in a way to help both the Agricultural and Oil and Gas industries thrive to promote opportunities in Kern County. To that end, we look forward to your consideration of our requests above. 0062-7

Sincerely,

Eric Miller
General Manager

0062-1

Thank you for your comment and participation in the public review of the Project and the environmental document. The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. This comment is noted and will be considered by County decision makers. Please see Global Response 4, Surface Owners and Agriculture.

0062-2

BAKERSFIELD, CA 93301-2323

Kern County Oil/Gas Environmental Impact Report

Dear Mr. Mink,

Kern Citizens for Sustainable Government would like to applaud the efforts of Kern County Planning and Community Development Department on what is a complex issue that affects numerous stakeholders in Kern County. The County's determination to work with all interested parties has not gone unnoticed and our support is united with the understanding that this Environmental Impact Report will streamline processes for our oil and gas industry. Yet, there are some items we feel do not support our mission of sustainable government practices and allow the private sector to freely expand without overbearing fees. 0063-1

Below are a few items related to Section 4.14 Public Services and 4.16-1 we believe are unnecessary in the success and implementation of the Environmental Impact Report. In an effort to reduce burdensome and precedent setting mitigation measures, Kern Citizens for Sustainable Government opposes or questions the items below. 0063-2

With the recent drop in oil prices and slowing of projects in the industry, the fees associated with public services, transportation and traffic seem to be unsustainable and volatile. In relation to 4.14-1 and 4.14-2 where a fee is implemented per well: is there assurance that the fees will provide enough funding to sustain the costs incurred? What is the plan if fees are not able to adequately fund the rural crime unit and Industrial Firefighting vehicle? Will employees be laid off or will the county be liable for covering the personnel cost? 0063-3

In section 4.14-21 it is stated, *"the rise in crime is not attributed to oil and gas activity"*. Therefore, the rise in fees associated with the Sheriff's office seems to be a punishment, not a protectant. If it is assumed more activity in the oil and gas area would entice more criminal activity, then the applicants 30% contribution of property tax revenue should cover the assumed demand for fire-fighting and rural sheriff services. 0063-4

Kern Citizens for Sustainable Government
KERN CITIZENS FOR SUSTAINABLE GOVERNMENT
PO BOX 81075 • BAKERSFIELD, CA 93380

Kern Citizens for Sustainable Government

0063-5

"Additionally, in accordance with the KCGP, Public Services and Facilities, Policies 9 and 16 (see Section 4.14.3, Regulatory Setting), new developments would be required to pay a pro rata share of the local cost for the expansion of services under the Public Facilities Mitigation Program. Developers would be required to assume full responsibility for costs incurred in service extensions or improvements that are required to serve their project(s). Therefore, new projects would have to pay for the extension or improvement of fire, police, or other services to serve a specific development, if those services are not available and to ensure service objectives are met." These services should be covered through property and sales tax associated with an increase in economic growth. In essence this seems like a "hidden tax" to the applicant and/ or the "developer". The project area defined is within the County of Kern, which should have taken into consideration economic growth and hardship to mitigate the issues of providing public services. The level of significance after mitigation is more burdensome on the applicant than the public service. Overall, the connection of the additional fees needed for police and fire is not clear.

Sincerely,

Lauren M. Skidmore

Lauren Skidmore
Director,
Kern Citizens for Sustainable Government

Kern Citizens for Sustainable Government
KERN CITIZENS FOR SUSTAINABLE GOVERNMENT
PO BOX 81075 • BAKERSFIELD, CA 93380

0063-1

Commenter's support for the efforts of the Planning Department to work with all interested parties to develop a streamlined permitting process is noted for consideration. These comments are noted for the record and will be provided to the Planning Commission and Board of Supervisors for consideration.

0063-2

Commenter's concerns about the stability and feasibility of fees for public services, transportation, and the Rural Crimes program, are noted for further consideration. These fees were included to mitigate environmental impacts on public services and roads and are not development impact fees as defined by the government code as they mitigate the specific impacts of these activities. Mitigation fees must be paid for mitigation purposes, and are monitored and reported annually as part of the MMRP process.

0063-3

Please see response to 0063-1.

Lorelei Oviatt
KC Planning Department
2700 M Street, Suite 100
Bakersfield, CA 93301

Ms. Oviatt:

RE: Comments Oil and Gas EIR

KernTax is a member-supported, 501(c) 4 non-profit corporation, with the mission to bring about more accountable, effective, efficient, reliable government. Basing its actions on common sense, innovation, and the long-term view, KernTax crafts positions based on adopted values. Founded in 1939, KernTax is committed to being the taxpayers' guard dog. 0064-1 Continued

KernTax views any government collection of funds through any financial conduit to be taxation, be it clearly identified as a tax, a fee for government service or a regulated rate structure. If it is excessive or not appropriate, KernTax must, by charter, educate, expedite resolution and ensure fair representation and treatment. We do not seek subsidies; we seek fair a return to our local citizens from all regulatory bodies and their agents for levied taxes and fees. 0064-2

KernTax's Basic Values are:

- All Taxes/Fees must be fair, understandable, responsible and benefit the economy.
- All Expenditures must be fiscally accountable, economically viable and societally equitable 0064-3

The mitigation measures of the Oil and Gas EIR follow:

MITIGATION MEASURES

The Draft EIR presents 88 mitigation measures to reduce significant impacts from the project. A mitigation monitoring program will be provided with the staff report for the Planning Commission Hearing and after the preparation of the Response to Comments and Final EIR. 0064-4

The following is a summary of some of the mitigation measures: 0064-5

- Aesthetics — require compliance with Dark Shies Ordinance; limit pump units to 80-ft in height; paint pumping units with approved color palette

- Agricultural Resources — require compensation of loss of ag land at a ratio of 1:1; protection of crops from surface water runoff, stormwater control and spill prevention
- Air Quality — A reduction in criteria pollutants through dust minimization measures and payment of fees or completion of applicant initiated programs, both through an Emission Reduction Agreement (ERA). The agreement will be between the Kern County Board of Supervisors and the San Joaquin Valley Air Pollution Control District. It is similar in details to the ISR (Indirect Source Rule) and Voluntary Emission Reduction Agreements (VERAs) completed with developers. Biological Resources — A reduction in potential take of a protected species through worker education, preconstruction surveys and habitat compensation at a ratio of 1:1
- Cultural Resources — A reduction in destruction of potentially significant cultural remains or artifacts through worker education and preconstruction surveys
- Green House Gas - reduction of all GHG emissions not covered under Cap-and-trade through a VERA
- Hazards and Hazardous Materials — Worker awareness training; proper handling and disposal of hazardous materials; compliance with State and federal regulations
- Hydrology and Water Quality — Compliance with applicable State and Federal regulations, including Underground Injection Control (UIC)
- Noise — Reduce construction and operational noise levels to less than 65 dBA or to not exceed ambient levels above 65 dBA; require a minimum of 190-foot setback from existing residential structures
- Public Services — Payment of $150 for first 2000 wells drilled for purchasing by the County of an industrial firefighting vehicle, not to exceed $850,000; payment of $425 per well for funding to be used by the County Sheriff's Department for the Rural Crimes Unit
- Transportation and Traffic - Payment of $1500 per well for roads maintenance of roads utilized by the oil and gas industry
- Utilities and Service Systems — Coordination by the oil and gas industry with the County Groundwater Sustainability Agency

0064-5
Continued

0064-6

DRAFT PERMIT FEES - OIL CONFORMITY REVIEW		Estimated Wells per Year 1800-3647
County Fees	**Amount per Well**	**Estimated Range Collected**
Planning and Community Development	$300 (Minor Activity	$500,000 - $1,100,00
	$600 (OG Conformity Review)	$1,000,000 - $2,200,00
General Plan Surcharge	$200	$360,000 - $729,400
Online Permitting System/Maintenance	$200	$360,000 - $729,400
Code Compliance (dedicated Building	$70	$126,000 - $255,290
Public Works — Engineering/Drainage	$60	$120,000 - $218,820

0064-7

0064-7
Continued

Program Administration	$60	$120,000 - $218,820
Total Fees	**$1,190**	**$2,142,000 -**
Mitigation Fees	**Amount per Well**	**Estimated Range**
'Sheriff Rural Crimes Unit	$425	$765,000 - $1,500,000
'Fire Equipment	$150	$850,000
[3]Traffic	$1500	$2,700,000 to
Total County and Fees	**$2075**	**$3,735,000 -**
Additional Mitigation	**Amount per Well**	**Estimated Range**
[4]Air Quality (ERA))	$8,000 - $17,850	$14,400,000 —

Additional (if needed: Agricultural and Biological mitigation compensation
' Sheriff Rural Crimes Unit (State contribution - $366,000 in addition to Mitigation cost). Sergeant (Supervisor), two Senior Deputies (investigators) three Deputies, one Support (clerical), and helicopter usage. If the higher amount collected, then additional resources will Annual report on response and incidents.
'Fire Equipment. ***Combination Walk-in/Non-Walk-in Industrial Firefighting vehicle*** responding with a minimum of five firefighters with the tools and equipment necessary for industrial firefighting and rescue. Total: $850,000 (This temporary fee will be collected for three years depending on permit activity).
[3]Traffic. $60 million maintenance cost over 20 years. Annual report on usage.
Public Works Director in consultation with Roads Director. If Kern becomes Self-help County —then amount reevaluated.
[4]Air ERA — Emission Reduction Agreement ($6,974 per ton) RANGE: $8000 to $ 17,850 per well

KernTax has issues with the four proposed mitigation fees. These fees are intended to offset the impacts created by the activity permitted under the Proposed Amendments to the Zoning Ordinance.

1. Fire fees are shown at $150 per well for each permit to purchase a new fire truck until $850,000 is collected.
2. Sheriff's Rural Crime Unit are $450 per well.
3. Wear and tear on pavement and roads by oil and gas are $1,500 per well
4. Emissions reduction fees estimated between $8,000 and $17,850 per well

CEQA requires that the County consider mitigation measures for any impacts that the Proposed Amendments will have, but when proposing mitigation measures the County can only exercise powers that it normally has. It does not give them the authority to impose mitigation measures that it has without CEQA. These proposed mitigation fees look more like exactions and do not appear to meet the *Nollan/Dolan* dual nexus test.

0064-8

These mitigation fees look like a piecemeal implementation of portions of the old Capital Improvement Plan and sets a precedence. Where impact fees exist, KernTax has always fought them. If used, it should be under strict rules, and the proceeds should be separated from other governmental revenues. Impact fees should be used solely for capital improvements directly related to specific new exploration and must pass the "essential nexus" and be "roughly proportional" to the development's impact to be compliant with *Nolan/Dolan*. The proposed fees seem to be rather arbitrary.

0064-9

0064-9
Continued

KernTax worries that if the County implements fees like this to the oil companies, it will try and do the same on all new projects on a project basis.

Respectfully,

Michael Turnipseed

Michael Turnipseed

Kern DEIR SCH# 2013081079

These comments are made on my own behalf and on behalf of the Association of Irritated Residents which has members living in Kern County. 0065-1

Introduction:

These comments on the DEIR for oil and gas production in Kern County concern the protection of residents and prime farmland from groundwater contamination, exposure to toxic gases, and exposure to general air pollution. 0065-2

Kern County should protect resources such as prime farmland and the health of the general public above and beyond any protections imposed by DOGGR and other outside agencies. Kern County has the best perspective on how to protect these resources. 0065-3

The following six pages illustrate areas where the DEIR is lacking in needed protections. These are areas which DOGGR regulations have failed to address. Kern County must address these specific issues. 0065-4

How does Kern County, in the EIR, propose to mitigate this type of soil contamination on a well pad surrounded by prime farmland? 0065-5

This particular well is located within one mile of the City of Shafter and there are dozens more similar to this in the immediate area. Farmers in the area understand, from past history, that everything they spill or apply to the soil eventually ends up in the local groundwater. Please notice that the well pad is simply flat ground level with the surrounding fields. 0065-6

The solution to this problem is the county should require containment of all leakage from wells and pipes on an impermeable surface surrounded by curbs that prevent outflow or inflow of all liquids including spilled crude oil, waste water, and rain water. 0065-7

How does the Kern County EIR prevent flooding of the well pad area located on prime farmland during a rain event?

0065-8

This photo was taken about a quarter mile from the City of Shafter and Sequoia Elementary School. The contaminated soil surrounding the well head is flooded with water which will percolate into the ground and eventually into the ground water. Prime farmland and irrigated fields are immediately adjacent to this site and dozens of other similar flooded well heads in just a two mile radius of this site.

0065-9

Again, the solution to this problem is to require an impermeable well pad with curbs high enough to prevent rain water from flowing into the contaminated area of the well head. A plan also has to be made to pump out accumulated water and contamination and safely dispose of it when necessary.

0065-10

How does the Kern County EIR deal with wells no longer pumping but which allow rain water to run into the cavities surrounding these wells? This particular well has not had a pumping jack on it for many years but it is used for injection of waste water at over 1200 pounds of pressure per square inch according to the pressure gauge on the well head. There are many other wells in this area near Shafter which are abandoned and have obvious holes where rainwater can run into the soil immediately surrounding these old well heads.

0065-11

How often does the oil company have to monitor the pressure when injecting waste water such as in this photo? How would a small crack in the pipes and cement casing be detected when only a few gallons per minute are escaping and contaminating local irrigation and drinking water aquifers.

0065-12

The solutions to the above two points include requirements for impermeable surfaces around injection wells with curbs preventing rainwater infiltration. Also, older wells used for injection of waste products must be proven leak free through pressure testing monthly at pressure levels at least 50% higher than the pressure used for injection of the waste products.

0065-13

0065-14

How does Kern County propose to protect school children and residents from breathing toxic fumes and emissions from leaking oil wells and associated activity?

0065-15

This photo shows one of several oil wells that sit within half a mile of Sequoia Elementary School in Shafter. The smell of hydrocarbons and other VOC's in this area is frequent enough for the County to consider the safety of the students when they are on the playground.

0065-16

Solution: The county should not allow new drilling activity within one mile of a school where children play outside. Current wells, such as the one in the photo, which are pumping within one mile of a school should have weekly inspections for leakage of gases and liquids with remedial action performed on seals and joints immediately when leaks are detected. An infrared camera should be used weekly on these inspections for detection of any gases which are leaking from the wellhead, pipes, and seals. If any gases are detected the well must be shut down immediately until the remedies are in place because of the proximity of the school and adjoining residences.

How does Kern County propose to protect residents both near and far from the air pollution associated with oil field production?

0065-17

Here is an infrared photo calibrated to show VOC gases. It was taken in 2014 of the Shafter processing facility located approximately three quarters of a mile north of Sequoia Elementary School. There is a large cloud of VOC gases in the photo. The normal winds in the area will take these gaseous emissions to the school and into the residential areas immediately beyond the school. How does the Kern County EIR protect people and students from exposure to these toxic and dangerous emissions.

0065-18

Solution: If a facility like this is located within a mile of a school, then infrared testing for gases must be done weekly and all leaks minimized immediately. If the leaks cannot be minimized within an hour to undetectable levels or levels deemed safe by state and federal health agencies, then the leaking facilities and equipment must be shut down immediately.

0065-19

How does Kern County propose to protect land and residents from abandoned oil field property?

0065-20

An abandoned oil well, in the photo, sits next to agricultural fields on the south side of Shafter. This is a common site in this area and in the Rosedale area. This long unused oil well is a direct conduit of rusted metal and cracked cement to fresh groundwater aquifers in the area. The threat of contamination can come from percolation on the surface and through upward migration of contamination from closer to the bottom of the well. How long must farmers be faced with this sort of threat to their ground water after a well has been abandoned?

0065-21

The solution is to requiry an annual analysis of all unused oil wells located on prime farmland. All such wells should be fully abandoned properly unless there is complelling evidence of future use within two years. After evidence has been shown of future use and that use has not taken place within the two years, then these wells must be abandoned properly and completely within six months. The same should happen with abandoned tanks. They must be justified periodically to remain in place and removed when there is no compelling evidence of future use presented.

0065-22

0065-1

The commenter's statement that he is speaking on behalf of himself and the Association of Irritated Residents is noted for the record for consideration by the Planning Commission and Board of Supervisors.

0065-2

This is an introductory statement describing commenter's concerns for which specific responses are provided below.

0065-3

Commenter's opinion that the County has the best perspective on protecting prime farmland and the health of the general public is noted for the record for consideration by the Planning Commission and Board of Supervisors.

0065-4

Commenter's introductory statement regarding the shortcomings of DOGGR regulations is noted; specific responses are provided below.

0065-5

Commenter includes a photograph showing what appears to be oil leakage onto bare soil beneath a well, which commenter reports is on agricultural land. Commenter suggests that the County require containment of leakage from wells on impermeable surfaces with curbs that prevent outflow and inflow of liquids. The Draft and Final EIR includes more than 20 mitigation measures to address hazards and water quality, including containment and cleanup requirements for leaks and spills.

0065-6

Please see response to 0065-5.

0065-7

Please see response to 0065-5.

0065-8

Commenter includes a photograph of a well located in standing water during a rain event. The EIR includes numerous mitigation measures to water quality, including containment and cleanup requirements for leaks and spills. See, for example, revised MM 4.9-2.

0065-9

Please see response to 0065-8.

0065-10

Please see response to 0065-8.

0065-11

Commenter includes a photograph of a well with nearby standing rainwater. The Final EIR includes numerous mitigation measures to protect water quality, including an expanded stormwater management measure to address this type of situation. See, for example, revised MM 4.9-2.

0065-12

Please see response to 0065-11.

0065-13

Please see response to 0065-11.

0065-14

Commenter raises concerns about air quality emissions near schools, and suggests a one-mile setback between wells and school facilities. As described in response to comment 45 and related global responses referenced in that response, a comprehensive health risk assessment was included in the Draft EIR, and a revised Health Risk Assessment was included in the Final EIR, to inform the setback distances that are needed to protect sensitive receptors such as schools. These health risk assessments concluded that risks are higher during construction activities, and the EIR includes required setback requirements and performance standards that are protective of human health (including children) during the construction process. Operational emissions are lower, and compliance with the noise setback requirements is also protective for air emission-related risks. Commenter's picture of a Shafter Elementary School is noted; this school is in the City of Shafter and is outside the County's land use jurisdiction. Commenter's further recommendations regarding gas leak detection and evaluation requirements are noted, but this type of well equipment falls within the jurisdiction of other expert agencies and was not determined to be warranted for CEQA purposes. The EIR also includes accident preparation planning and response mitigation measures, as well as measures to require inspection, repair, reporting and as warranted evacuation of residents if gas leaks from pipes are detected. Revised mitigation measures are included in Section 7.1.4.

0065-15

Please see response to 0065-14.

0065-16

Please see response to 0065-14.

0065-17

Commenter's concerns about air pollution is noted, as is a photo that commenter explains was calibrated to show volatile gases at a well near Sequoia Elementary School. The commenter requests infrared, bi-weekly testing for gases, and the shutdown of equipment if gas leaks cannot be repaired immediately. Please see response 14-16.

0065-18

Please see response to 0065-17.

0065-19

Please see response to 0065-17.

0065-20

Commenter's concerns about abandoned oil equipment is noted, as is a photograph that commenter explains is of an abandoned well in Shafter. Commenter's request for an annual analysis of unused oil wells on prime farmland, including a requirement that wells and tanks that were unused for more than 2 years be abandoned. Idle and abandoned wells are regulated by DOGGR, as explained in the EIR and in GR Haz 2. The County has adopted a new procedure for working with members of the public, and DOGGR, to address idle well concerns (including the concerns that an idle well is actually abandoned).

0065-21

Please see response to 0065-20.

0065-22

Please see response to 0065-20.

66 Victoria Golden

Response to Request for Comment on Draft EIR – Oil and Gas

0066-1

There is a significant danger to the health and general welfare of the Public in providing more local control to a critical resource such as regulation of energy markets and enhanced and/or increased drilling activities since the short term needs for economic stability in Kern County should not outweigh the safety welfare of its people. Big Oil and the stability it can provide to local economy is given such weight by local officials at the local level that officials area prevented from a total impartial review of the project and its alternatives. The EIR states the Project was undertaken at the request of the Oil industry and if approved under the alternatives, with the exception of the no action alternative, will allow a significant expansion of activities that will ultimately and disproportionately affect and impact those living around or near oilfields and on the San Joaquin Valley Floor.

0066-2

Without significant revision to the Draft EIR to address additional alternatives and to require effective mitigation which not only imposes minimum standards but mitigates actually mitigates the actions proposed, the County can provide no assurances to the public that the actions that would be authorized under the newly expanded ordinance will be effectively regulated and/or monitored. All activities authorized under the EIR shall be completed in compliance with Section 15097 of CEQA guidelines and the County should implement and maintain records of its monitoring requirements in a diligent matter as required under CEQA:

Public Review

0066-3

Public Review of Draft Section 15087 of CEQA guidelines (g) – After inquiring over the phone with a librarian, I was informed that there was no copy of the Draft EIR available for Public Review at the local library.

Zoning Ordinance

0066-4

The Zoning Ordinance in Kern County contains a provision under Section 19.06.020 – Authority to Administer which allows for total discretion for interpretation all adopted provisions Zoning Ordinance. If the revised and expanded Oil and Gas ordinance were adopted, the total rules, standards and enforcement will be subject to and at the discretion of the Director of Planning. No adopted mitigation, condition or regulation included this Draft EIR can be ensured to be enforced since the County allows for modifications of any mitigation measure, condition or regulation to accommodate new activities not originally contemplated under this Draft EIR. Without effective enforcement of all adopted provisions in the Final Program EIR, as originally adopted, the processes included in the adopted EIR to provide necessary insurances to the public will slowly erode and undermine the value and integrity of the analysis contained in the Draft EIR without a reevaluation of effects. The Draft EIR should not be adopted by the considering bodies without a revision to the Zoning Ordinance that requires a discretionary review of all actions considered significant which deviate from the original actions considered under this EIR, such as a conditional use permit and the respective changes to Section to address the Oil and Gas Ordinance. Activities undertaken and not previously permitted under the EIR as should NOT be issued permit without consideration of penalties under 19.02.070 and a reevaluation of the project effects. Additionally, the consideration of variances under any revised adopted zoning ordinance should be denied, unless the use of the variances was considered in the Draft EIR, or is reevaluated under CEQA for effects and opened for Public comment. This is an important point since variances set precedent for the program and would allow actions outside of the original scope of this EIR.

0066-5

Alternatives Analyzed

The alternatives analyzed under the Oil and Gas Draft EIR did not include a complete review of potential alternatives. The report should have analyzed and considered the impacts of the limited action areas alternative or Alternative 3 and enhanced EOR (Alternative 5) since it would be feasible to implement and would likely be superior to environmental alternatives considered under the EIR. If that activities were jointly reviewed the benefits to impacted resources would be expanded across the board. Under the current list the likely Alternative 5 would allow for unrestricted drilling throughout the County and outside of the current adopted administrative oilfield boundaries with only minimal improvements to air quality. The Draft EIR should be considered inadequate since it did not include an alternative to address small footprint areas and EOR technologies as a joint strategy to reduce impacts to the environment so the combined benefits of both techniques/technology can concurrently be reviewed and considered under the EIR.

0066-6

Air Quality

The evaluation of effects under the Draft EIR contained no quantification of the amount of commuter trips associated with the expanded number of sites that would be Commuter trips are a cumulative impact from the activities that would be authorized under this document. Commuter Trips and the number vehicle miles traveled by passenger vehicles other than company owned and operated vehicle fleets are significant contributors to the decline in air quality in the San Joaquin region.

0066-7

The provisions included in the Draft EIR to address the EPA Air Quality Standards were not properly quantified to show the mitigation proposed will meet the EPA standard. The regulated pollutants, NOX, ROG AND PM10 should be quantified for the total project authorized under the Draft EIR and the mitigation proposed to address the increase in pollution must demonstrate that the EPA standards will not be exceeded and that the project is consistent with the State Implementation Plan. Without that assurance, the Draft EIR is a violation of EPA Standards. If the proposed project is undertaken under the current alternatives and mitigation, the project will lead to further air quality violations San Joaquin area is classified as Extreme Non-Attainment for the 2008 Ozone Standard and mitigation is adequate to assure the impacts will be offset by the mitigation proposed in the Draft EIR.

0066-8

The associated risks to health and safety from regulated State Air pollutants have not been adequately addressed in the Draft EIR, including the effects of expanded need and use of Hazardous Air Pollutants in the project area. The current EIR proposal to collect a fee for retrofitting engines will not address the increase in total pollutants and impacts to the population for chemicals regulated under Proposition 61. Oil and gas related activities and exposure to those chemicals have been known to cause cancer in laboratory animals and there is a need for mitigation to address the risks to health and safety of public. This issue was not adequately considered in the Draft EIR.

0066-9

Biologic Impacts

Unrestricted grading activities are particularly problematic in the Project area since the actions are authorized as a by-right use in the A Zone by County Ordinance. Unrestricted grading activities permitted under existing zoning have resulted to prior violations of the Endangered Species Act and the direct loss

0066-9
Continued

of habitat crucial to the survival of the Blunt Nosed Leopard Lizard and San Joaquin Kit Fox and other listed/protected species. Therefore any adopted ordinance should evaluate requiring an overlay zone classification for all oilfield related actions in order to address and curb unrestricted grading permitted in the A Zone. This will ensure that no grading occurs prior to permit review and consideration by the permitting agency under the adopted oil ordinance and without an overlay in the A Zone unrestricted grading will continue to be unchecked. Although the ESA allows for limited take under certain circumstances this EIR intends to authorize take of No Take Species specifically the Blunt Nosed Leopard Lizard in violation of the Endangered Species Act. The EIR should not in any warrant the taking of No take species since that would violate Section 7 and 10 of the ESA.

0066-10

Aesthetics

The Draft EIR states that Aesthetic impacts from Oil and Gas development Countywide were considered significant and unavoidable. However visual impact techniques could be employed to improve the aesthetic impacts from Oil and Gas development that have been used in other parts of the State and the Country. The question is the County should determine what techniques could be employed locally and mitigate future development for this impact. The effects are avoidable when there is the political will to impose visual standards on one of the most disruptive visual components to the landscape. The idea that this can be addressed is absurd, inadequate and not in the spirit of CEQA. The County must effectively explore techniques which will effectively reduce the aesthetic impacts to the landscape in all permits issued under the adopted ordinance.

Thank You for your consideration and inclusion in the record,

Victoria Golden, Concerned Resident of Kern County, District 5

Victoria Golden

0066-1

Thank you for your comment and participation in the public review of the Project and the environmental document. The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response.

0066-2

Thank you for your comment and participation in the public review of the Project and the environmental document. The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response.

0066-3

Thank you for your comment and participation in the public review of the Project and the environmental document. The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. The County's notice of availability of the DEIR was sent to all County libraries. The main Kern County Library in Bakersfield (Beale Library) received a full copy of the DEIR. As noted in the DEIR's notice of availability, the DEIR and the documents referenced in the DEIR were also made available for review at the Planning and Community Development Department, 2700 "M" Street, Suite 100, Bakersfield, CA 93301, and on the County's website (http://pcd.kerndsa.com/planning/latest-planning-news/420-oil-gas-eir, accessed September, 2015). In addition, free copies of the DEIR on CD-ROM available to the public from the County, free of charge. The County received no requests for a copy of the DEIR on CD-ROM.

0066-4

Thank you for your comment and participation in the public review of the Project and the environmental document. The comment does not state a specific concern related to the adequacy of the DEIR and therefore does not require a detailed response. Please see Global Response 1, Ministerial Permit Process, and Global Response 19, Enforcement of Mitigation Measures and Ordinance.

0066-5

Please see Global Responses Alt-1 and Alt-2. Regarding the comment's suggestion that the EIR combine various alternatives, such analysis is not required by CEQA. The EIR fully evaluates six alternatives to the Project: No Project Alternative (Alternative 1); CUP Alternative (Alternative 2); Reduced Ground Disturbance Alternative (Alternative 3); No Hydraulic Fracturing Alternative (Alternative 4); Low-Emission Enhanced Oil Recovery (EOR) Technology Alternative (Alternative 5); Recycled Water Alternative (Alternative 6). For each alternative, the EIR provides a detailed description of the alternative, compares its impacts to those of the Project, and evaluates the relationship between the alternative and the Project objectives. In addition, Table 6-1 of the Draft EIR sets forth a matrix that provides a summary comparison of the significant impacts of each alternative to the project and the remaining alternatives for each impact category analyzed in the EIR. This analysis, combined with the detailed evaluation of each alternative's impacts as compared to the Project provides the information necessary to weigh the relative advantages and disadvantages of each alternative and to permit a reasonable choice thereof. As such, the EIR is not defective for not discussing variations on the alternatives it does consider. *See Village of Laguna of Laguna Beach, Inc. v. Board of Supervisors* (1982) 134 Cal.App.3d 1022, 1028-1029.

0066-6

The DEIR does quantify emissions related to commuter trips. Please DEIR Appendix I for such emission estimates. Please also see Global Responses Air 1 through Air 12 for more information related to commenter's concerns.

0066-7

As explained in DEIR section 4.3.4, the EIR conducts a full evaluation of air quality impacts for the Project using air quality significance criteria consistent with the SJVAPCD CEQA significance criteria, approved CEQA air quality checklists, and considering other federal criteria. Project air quality impacts were also evaluated to determine consistency with applicable air quality plans, including SJVAPCD's one-hour ozone plan, eight-hour ozone plan, PM_{10} maintenance plan, 2008 $PM_{2.5}$ plan, and 2012 $PM_{2.5}$ plan. Project air emissions were also evaluated to determine whether they would violate any air quality standard, including those established by EPA and/or the Air District. Please see DEIR page 4.3-69 *et seq*. The EIR determined that that Project emissions will be mitigated to less than significant, though this impact would be significant and unavoidable on a cumulative basis. Please see Global Responses Air 1 through Air 12 for additional analysis related to commenter's concerns.

0066-8

The commenter's opinion of the EIR's analysis of health risks associated with Project air emissions is noted, as is commenter's failure to identify any specific deficiencies with such analysis. Please see Global Responses Air 1 through Air 12 for additional analysis related to commenter's concerns.

0066-9

This comment alleges unspecified past conflicts between "unrestricted" grading and certain protected species, and requests that the Revised Amended Ordinance include an "overlay zone classification" to address unrestricted grading in the Project Area. No such overlay zone is required, however, because Kern County Code of Ordinances Chapter 17.28, the grading ordinance, already regulates grading activities on a Countywide basis. In any case, grading activities that have the potential to take a protected species or its habitat are subject to the permit authority of the state and federal wildlife agencies. As a matter of law, the EIR will not, and could not, "warrant the take" of any protected species.

0066-9 cont'd

Subject: Oil and Gas EIR

To: Mr. Christopher Mynk,

I have worked in the oil industry in Kern County since 1978 doing Mechanical and civil construction, equipment fabrication, and engineering and project management. I have seen the permit process and other government regulations continually increase. This has placed a burden on the industry that has greatly delayed and sometime caused the cancelation of viable projects. 0067-1

I am very encouraged by your proposed project review plan. I hope you are able to implement the plan. The oil industry has been good for my family and for our community. I hope it continues to be an important part of Kern County's economy. 0067-2

Sincerely,
Mike Haddon
Senior Project Engineer

Re: Draft Environmental Impact Report for Revisions to the Kern County Zoning Ordinance – 2015(C) Focused on Oil and Gas Local Permitting

Dear Mr. Mynk:

I am a farmer in Kern County with a [type of orchard/farm] located [general vicinity]. My farm is on split estate lands [and there are already a number of wells located on my property that take land out of production.] [Option to add additional impacts from existing wells on your property here if you like]. 0068-1

I am not opposed to oil and gas development in Kern County, but I'm concerned that oil companies will drill new wells on my property and neighboring properties without sufficient protections for my crops, home, and workers. Kern County has an opportunity to ensure that new oil and gas wells will not endanger our health, quality of life, or the economic prosperity of Kern's agricultural industry. I do not believe the County's draft revisions to the zoning ordinance, or the mitigation measures in the Draft Environmental Impact Report (DEIR), go far enough. In addition, the DEIR for this project seriously understates the project's impacts—especially to the agricultural community. 0068-2

Please consider the following comments and revise the DEIR to accurately reflect the project's impacts and identify additional mitigation measures. As the DEIR stands now, I don't believe it complies with the County's responsibility to inform the public about the project's significant impacts and mitigate those impacts to the extent feasible as required under the California Environmental Quality Act. 0068-3

[Select any bullet points you would like to include]

Project Description: 0068-4

- The DEIR underestimates the number of new wells that could be drilled under the project, especially on agricultural lands. There has been an increase in drilling on agricultural lands over the last 10 years and it is unreasonable to assume that only 6% of future drilling will occur on agricultural lands

Land Use Impacts: 0068-5

- The DEIR concludes that there will be significant land use conflicts between oil and gas operations and surface uses, such as agricultural operations. But nothing

0068-5 Continued

in the proposed zoning ordinance will reduce these conflicts and the mitigation measures proposed don't address many of the types of conflicts that can occur.

- The County should require surface owner sign-off for drilling on split estate lands to allow these conflicts to be worked out at the site-specific level. Other attorneys agree that the County has the authority to require sign-off without exposing the County to liability from mineral rights owners. 0068-6

- If surface owner sign-off is not required, the County should require a conditional use permit for development on split estate lands to enable the County to consult with surface owners and address site-specific conflicts. The County does not expect a significant number of permits on split estate lands and regardless the County can charge applicants for the costs to process these permits, including hiring additional staff if necessary. 0068-7

Agricultural Impacts: 0068-8

- The DEIR underestimates the amount of farmland that will be converted to non-agricultural use because it does not consider that land in between or near oil and gas facilities cannot be farmed.

- The DEIR must identify mitigation measures requiring oil and gas facilities to be clustered together, instead of being spread out across a farm. 0068-9

- The DEIR must discuss the problem of long-term idle wells and out of service facilities taking farmland out of production for longer than necessary. The DEIR's mitigation measures should require that unnecessary idle wells be abandoned and out of service equipment be removed before allowing other types of mitigation that do not restore farmland. 0068-10

- Rangeland is an important part of Kern County and its agricultural economy. The DEIR must analyze the project's impacts to rangeland and fully mitigate for the loss of rangeland to oil and gas uses. 0068-11

Water Supply Impacts:

- The DEIR assumes there is more water available that is suitable for municipal and agricultural uses than there actually is. Farmers are finding salt levels in groundwater are increasing to the point where they are harming crops. Also, the DEIR doesn't identify which aquifers will be impacted the most by oil and gas development. As a result, I can't determine what the water supply impacts to my farm will be. 0068-12

- The DEIR concludes that the project will cause water shortages in Kern County. But it doesn't discuss what the impacts of those shortages will be. Who will be required to cut back? How will water shortages effect crops? 0068-13

- The DEIR should identify additional mitigation measures to reduce the project's impact on water supplies. For instance, the DEIR should require oil and gas operations to treat and reuse more of the produced water from their wells. 0068-13 Continued

Aesthetic Impacts: 0068-14

- The DEIR concludes that the proposed Project would have significant unavoidable impacts to the County's rural character but it ignores mitigation such as limiting the number of drilling operations at any one time in scenic rural areas and requiring larger setbacks (e.g., 1,000 feet).

Traffic Impacts: 0068-15

- The DEIR underestimates the amount of traffic that the proposed Project will generate and does not analyze hazardous conditions that could be caused by truck traffic. The DEIR must include additional mitigation for traffic safety impacts and emergency access.

Noise Impacts: 0068-16

- The DEIR does not consider increased noise from actual conditions as they currently exist on the ground. It therefore vastly underestimates the Project's noise impacts in rural areas of the County.

- The DEIR's mitigation for noise impacts, including a trivial 190-foot setback requirement, will not go far enough to reduce those impacts to a less than significant level. The DEIR should include more realistic and effective setback requirements. 0068-17

Air Quality Impacts: 0068-18

- The project will lead to even higher ozone levels in Kern County and negatively impact human health and agricultural yields. The DEIR must consider additional air quality mitigation measures.

Alternatives: 0068-19

- The DEIR must consider the Conditional Use Permit (CUP) alternative in detail. Under the CUP alternative, the County can impose industry-wide mitigation while preserving its ability to consider the environmental effects of each permit on a case-by-case basis.

Sincerely,

[Your name and signature]

Subject: Oil and Gas EIR

To: Mr. Christopher Mynk,

I support the current Oil and Gas EIR that is currently open for public comment. 0069-1

We should have local control over what gets approved in the oil industry. We know how things are done. We can do things quicker and take a better look at the impacts instead of having someone from Sacramento involved who is unfamiliar with Kern County. We really do know the issues and we really do want Kern County to be a great place. Oil and gas production plays an important role in this goal.

Subject: Oil and Gas EIR

To: Mr. Christopher Mynk,

This letter is to inform you that I am in support of the current Oil and Gas EIR that is currently open for public comment.

I, Kerrie Roberts have been working in the oil industry for 25 + years and have personally been involved with permitting in Kern County for the last 15 years. I want to express my opinion on the positive direction that Kern County Planning Department is taking by addressing all the impacts that are seen locally Kern County and laying them out in the Draft EIR so that our County can make decisions on whether or not to approve infrastructure and drilling in the oil industry. 0071-1

I personally have dealt with Kern County Environmental Health on water issues, SJVAPCD on emissions, Kern County Zoning Department on issues affecting public safety and nuisance, Kern County Roads Department on accessibility and ADA issues and all the different building departments on issues relating to civil, structural, mechanical and electrical. These departments all abide by all regulations that fall within the California Building Code. I have also dealt with State Department of Fish and Game for anything on Bureau of Land Management Property. I would just like to say that all of these departments have Kern County's best interest at heart. They are not looking to take short cuts or skipping over any issues. They are following State guidelines for everything and have the public's interest, safety and welfare in mind for everything. Outside environmentalists may oppose this but what they don't realize is that there are environmentalist working within the County who are very passionate about our local area and want us all to have clean air, clean drinking water and a safe and healthy public. These people work very hard to protect us and not only our endangered species but all wildlife. 0071-2

It only makes sense that we should have local control over what gets approved in the oil industry. We know how things are done, we can do things quicker and take a better look at the impacts instead of having someone from Sacramento do this work who has never been here. We really do know the issues and we really do want Kern County to be a great place. 0071-3

Respectfully,

Kerrie Roberts

Date: 7/16/15 5:49 PM
Subject: Draft EIR for Revisions to the Kern County Zoning Ordinance – 2015 C, Oil and Gas Local

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Gilbert Garcia

Subject: Draft EIR for Revisions to the Kern County Zoning Ordinance – 2015 C, Oil and Gas Local

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Andrew Taylor

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Guy Chaffin

Subject: Draft EIR for Revisions to the Kern County Zoning Ordinance – 2015 C, Oil and Gas Local Permitting

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

The California Council on Science & Technology, in collaboration with the Lawrence Berkeley National Laboratory, recently released its 858-page peer-reviewed independent scientific assessment produced for the California Natural Resources Agency. It found 'no science-based evidence' that fracking hurts the environment.

I strongly encourage to approve and implement this report that will allow for the next oil boom in Kern County and strengthen Kern County's economic future.

Sincerely, Jeff Nickell, MA

Subject: Draft EIR for Revisions to the Kern County Zoning Ordinance – 2015 C, Oil and Gas Local Permitting

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Alfredo Urdaneta

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Joseph Hampton

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Dear AICP Supervising Planner Mynk,

Hello, I am writing to voice my support of the Kern County oil and gas industry. I moved to Kern County ten years ago to pursue a career in food processing/agriculture at Paramount farms. I have always seen the combination of Ag/Oil as being a cornerstone of the areas prosperity. I am very happy to understand the revised ordinance will streamline the process while still providing environmental safeguards.

I strongly believe this ordinance should be passed.

Thanks,
Edward Paulsen

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

The U.S. has tremendous amounts of oil and natural gas, and the politicians need to allow these resources to be made available. It makes no sense to be dependent on oil from nations who declare openly they are our enemy. Please - stop playing games, stop "you scratch my back and I'll scratch yours" and simply use the common sense God gave you. WE NEED TO MAINTAIN THIS INDUSTRY IN KERN COUNTY AND THE ENTIRE U.S.

Subject: Draft EIR for Revisions to the Kern County Zoning Ordinance – 2015 C, Oil and Gas Local Permitting

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Rebecca Murillo

Dear AICP Supervising Planner Mynk,

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review.

Approval of the proposed KCEIR is critical to my livelihood. My livelihood is connected to the safe construction and stimulation of oil & gas wells in Kern County. I arrived in Kern County to work with fracturing stimulation crews in the mid 80s. As a professional petroleum engineer in the state of California I have been astonished at the misinformation used in attempt to slow and stop the new well construction process. Wow - would we rather purchase energy and export income to folks who hold us in contempt and threaten our well being?

Since 1986 I have made a living construction and stimulation Oil & gas wells in Kern County. I have bought 8 cars, three homes, paid for college educations.

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report. Our economy remains in a very fragile condition and I know several people that have already been laid off work in the oil fields. Oil and Ag are our lifeblood here in Kern County.

Sincerely,

Michael W. White

I am writing in support of our County's oil and gas industry and appreciate the opportunity to comment on the draft environmental review. As a resident of Kern County, we understand this industry's importance to not only our local economy and the well-being of our families, but to our national security and the goal to reduce our dependence on foreign oil. Once approved, this revised ordinance will continue to provide protection for our community and the environment, while stabilizing the permitting structure for oil and gas production, allowing for continued growth of this important industry in our county.

We thank you for the tremendous effort that has gone into studying the industry - utilizing science and factual data to arrive at a sensible permitting structure. We strongly urge approval and implementation of this report.

Sincerely,

Olu Adeoye
