Purge Logs and Field Forms

Daily Field Memorandum

Field Personnel: Bob Johnson Date: 9-18-12

Project Name: Raytheon Canoga Time Arrived Site:

Project/Phase/Task Number: 2009025/06/0630 Time Left Site:

Project Manager: Jacques Murcillac Travel Time:

Regulator(s) on Site/Time:

Client(s) on Site/Time:

Tasks Completed/Equipment Used/Times: T3 Area baseline sample Gauge RW-11, 14, 15.

RW-11 - sample with (12 volt) 12 V. monsoon pump, no dedicated recovery pump in csg. TOC container broke in cooler. Lab delivers new container & well is resampled on 9-19-12 For TOC, metals Field Filtered

RW-14 - Pull recovery pump From well & sample with 12 volt monsoon pump. metals Field-Duplicate = Dup 5-9-18-12 From RW-14. Filtered.

RW-15 - sampled & purged thru dedicated 220 volt recovery pump (throttled down with no bypass.) metals Field Filtered.

All purge water treated thru G.W. treatment system.

Trip Blank - TB1-9-18-12.

Tasks Completed/Equipment Used/Times:

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-09-1094

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

Work Order Number: 12-09-1166

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

1.0 SUMMARY OF CONCLUSIONS

Subject to the qualifications and limitations stated in Chapter 2.0, Introduction, on behalf of Multi Employer Pension Trust (MEPT) West Hills, LLC, and its legal counsel Allen Matkins Leck Gamble & Mallory, LLP (AMLGM), ENVIRON International Corporation (ENVIRON) performed a Phase I/II Environmental Site Assessment of the West Hills Corporate Village facility located at 8501-8531 Fallbrook Avenue in Canoga Park, California (Property, see Figure 1). The Property was part of the Hughes Aircraft Company Missile Systems Group Facility (Site or Facility), that covered approximately 80 acres. ENVIRON understands that the Phase I/II Environmental Site Assessment was requested as part of MEPT's potential purchase of the Property. The Phase I Environmental Site Assessment was performed in conformance with the scope and limitations of the American Society of Testing and Materials (ASTM) Practice E 1527-00, and according to ENVIRON's proposal to Mr. John Allen of AMLGM dated November 8, 2001. Any exceptions to, or deletions from, this practice are described in Section 2.4 of this report. The Phase II work, consisted of indoor air quality sampling, and was performed according to ENVIRON's proposal to Mr. John Allen of AMLGM dated February 22, 2002.

Based on our visual observation of the Property, review of sources of historical information, a review of regulatory agency databases, the results of the indoor air quality sampling, and ENVIRON's professional judgment, "recognized environmental conditions," or "historical recognized environmental conditions" as defined by ASTM (see pages 3 and 5), were identified at the Property, as follows:

- The Property was occupied by aerospace research and development companies from 1966 through 1994. During this period, several underground storage tanks, clarifiers, pits, and trenches were installed. Based on the information reviewed by ENVIRON, these structures appear to have been removed or closed in place. To date, regulatory closures have not been issued for all of the underground storage tanks (USTs). Soil and ground water in proximity to certain of the USTs and clarifiers have been impacted by volatile organic compounds (VOCs) and/or petroleum hydrocarbons (TPH). Numerous subsurface investigations have been conducted since chemicals were first detected in soil and ground water in the mid-1980s. A corrective action plan was prepared in 1992 (1992 CAP) and revised in 1994. The California Regional Water Quality Control Board – Los Angeles Region (LARWQCB) has provided oversight for the soil and ground water remediation at the Property. Based on correspondence from the Department of Toxics Substances Control (DTSC), soil and ground

water cleanup standards established for the Property in the 1992 CAP, were based on the lowest numbers produced from a health risk assessment, background measurement, or maximum contaminant levels (MCLs). Based on ENVIRON's review of available documents, the ground water cleanup goals appeared to be 10 times greater than the MCL, and soil cleanup goals were established for total chlorinated VOCs at 100 milligrams per kilogram (mg/kg). ENVIRON understands that in the purchase and sale agreements for the Property, Raytheon retains all responsibility and liability for the investigation and remediation of chemicals in soil and ground water underlying the Property.

Given the known occurrence of chemicals in soil and ground water underlying the Property, the fact that certain areas of the Property have not been investigated, and stated cleanup goals, which indicate that residual chemical concentrations will remain in soil and ground water, ENVIRON recommended conducting indoor air sampling to evaluate the potential health risks from VOCs to workers inside the buildings. This air monitoring was conducted on February 28 and March 14, 2002, and is described in Section 3.2 of this report. Twelve VOCs were detected at concentrations above applicable detection limits, five of which are Proposition 65 listed chemicals. Detected VOC concentrations were well below worker Permissible Exposure Levels (PELs, 8 hr, time-weighted average) specified by the Occupational Safety and Health Administration (OSHA). Furthermore, ENVIRON reviewed the results for the five Proposition 65-listed VOCs to evaluate if the facility would be subject to Proposition 65 requirements. The results of this assessment indicated that Proposition 65 requirements are not applicable inside the buildings. Therefore, the presence of VOCs and petroleum hydrocarbons in soil and/or ground water underlying the Property does not appear to have resulted in a significant health risk to workers inside the buildings.

- In June 1998, hexavalent chromium contaminated soils were encountered during the demolition of the former Hazardous Waste Storage Area (HWSA). Because the hexavalent chromium contaminated soils were encountered at depths of 5 to 13 feet below ground surface (bgs), Raytheon (which purchased Hughes) believed that the soils would not pose a health threat; therefore, no removal was planned. In 1999, hexavalent chromium was detected in ground water samples collected from wells adjacent to the former HWSA. Seven ground water monitoring wells were installed in proximity to the HWSA in June of 2000, and monitoring for the presence of hexavalent chromium. Sampling results indicated that the state MCL for hexavalent chromium in drinking water, currently 50 micrograms per liter (µg/l), was exceeded at two monitoring wells (MW-32S and MW-32D), both located within the footprint of the former HWSA. It should be noted that the California Environmental

Protection Agency Office of Environmental Health Hazard Assessment (OEHHA) is reviewing the public health goal (PHG) and drinking water standard for hexavalent chromium, and the standards may be decreased in 2003. However, because the former HWSA is paved and located outside the footprint of currently constructed buildings, and due to the absence of a complete exposure pathway, the localized occurrence of hexavalent chromium in ground water at the former HWSA does not appear to represent a significant health risk to workers at the Property.

The following are other pertinent findings, which are not representative of recognized environmental conditions:

- Two Resource Conservation and Recovery Act (RCRA) permitted waste storage facilities were located at the Property: Tank T-3 and the hazardous waste storage area (HWSA). DTSC is the lead agency for RCRA closure of these two waste storage facilities. In a 1995 memorandum, DTSC outlined seven areas of concern (AOCs) and several solid waste management units (SWMUs) at the Property. Correspondence from DTSC indicates that the agency has not been fully satisfied with the investigations of the AOCs, the closure of the SWMUs, or post closure of the hazardous waste management unit (Tank T-3).

- Based on historical documents reviewed, the Property was used for agricultural purposes from at least 1928 until the mid- to late 1950s, when commercial structures were built. From 1966 to 1994, the Property was occupied by aerospace research and development companies. In the late 1990s, several buildings were demolished and the remaining buildings were completely remodeled. One additional building was constructed on the Property in 2000. The Property buildings are currently used for office space.

  Prior asbestos documents reviewed indicated that several types of asbestos-containing materials (ACMs) were present within the Property buildings (except for the recently constructed building). Based on a review of prior documents, interviews conducted, and the site visit, it appears that the previously identified ACMs were removed from the Property prior to remodeling activities. Therefore, it is unlikely that ACMs are present in the Property buildings.

- Based on interviews and the site visit conducted, it appears that painted materials previously located within the Property buildings were removed prior to remodeling activities. Therefore, it is unlikely that lead-based paint is present in the Property buildings.

- Based on a review of prior documents, interviews conducted, and visual observations of readily accessible areas during site visit, it does not appear that areas of water leaks or stains, or areas of mold are located in the Property buildings.

- The Property is listed in the Environmental Data Resources (EDR) report on the Historical Underground Storage Tanks (HIST UST), Resource Conservation and Recovery Information Systems (RCRIS), Facility Index System (FINDS), RCRIS – Transport, Storage and Disposal (RCRIS-TSD), RCRIS- - Corrective Action Sites (CORRACTS), Comprehensive Environmental Response, Compensation and Liability Information System - No Further Action Planned (CERCLIS-NFRAP), California Hazardous Substances Release Sites (Cal-Sites), Hazardous Waste and Substances Sites List (Cortese), and Leaking Underground Storage Tank (LUST) databases. These listings appear to include the former Hughes facility at the Property and southern adjacent area. As described above, remediation activities are currently being conducted by Raytheon at the Property.

- Several off-site facilities were identified in the database report, within the specified search radii. Based on the regulatory status and/or direction from the Property, it is unlikely that these listed facilities have adversely affected the Property.

2.0 INTRODUCTION

ENVIRON was retained by AMLGM on behalf of MEPT to conduct a Phase I/II Environmental Site Assessment of the West Hills Corporate Village located at 8501-8531 Fallbrook Avenue in Canoga Park, California ("Property"). ENVIRON understands that the Phase I Environmental Site Assessment was requested as part of MEPT's potential purchase of the Property. The Phase I Environmental Site Assessment described in this report was performed in conformance with the scope and limitations of the ASTM Practice E 1527-00, and ENVIRON's proposal to Mr. John Allen of AMLGM, dated November 8, 2001. The purpose of the assessment was to identify recognized environmental conditions. The term "recognized environmental conditions" is defined by ASTM as:

> "The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products in structures on the property or into the ground, ground water, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not represent a material risk of harm to public health and environment and that generally would not be the subject of enforcement action if brought to the attention of appropriate governmental agencies."

ENVIRON undertook tasks, as necessary, to provide information required under ASTM Practice E1527-00. In addition, ENVIRON performed Phase II work, consisting of indoor air quality sampling, which was performed according to ENVIRON's proposal to Mr. John Allen of AMLGM dated February 22, 2002.

2.1 Scope of Phase I/II Environmental Site Assessment

The assessment included the following activities:

- A visit to the Property to observe and evaluate visible site conditions (see Appendix A for site photographs), ENVIRON was escorted by Ms. Rosa Amelia Samaniego, Property Manager with Insignia/ESG, Inc. (Insignia).

- A review of historical aerial photographs (dated 1928, 1952, 1965, 1976, 1989, and 1994) provided by Environmental Data Resources (EDR).

- A review of a city directory abstract dated November 19, 2001 (for the years from 1920 to 2000), provided by EDR.

- A review of historical topographic maps (dated 1903, 1947, and 1967) provided by EDR.

- A request for Sanborn maps of the Property and vicinity from EDR. EDR indicated that Sanborn maps are not available for the area of the Property.

- A review of publicly available reports pertaining to geology and hydrogeology in the vicinity of the Property.

- A request, through Environmental Support Services of Santa Ana, California (ESS) for available documents pertaining to the Property from the following agencies: The Los Angeles County Environmental Health Department (Health Department), and City of Los Angeles Building and Fire Departments (Building and Fire Departments).

- A review of available documents pertaining to the Property at the LARWQCB.

- A review of the results of an environmental regulatory database search of environmentally impaired sites located in the vicinity of the Property, conducted by EDR, dated November 19, 2001 (see Appendix B). EDR conducted searches of the following federal databases: the United States Environmental Protection Agency (USEPA) Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS); the USEPA National Priority List (NPL); the USEPA Emergency Response Notification System (ERNS); the USEPA Resource Conservation and Recovery Information System (RCRIS); and, the USEPA Corrective Action Reports (CORRACTS). State databases searched were: State Hazardous Waste Sites (SHWS), Solid Waste Sites & Facilities (LF), Leaking Underground Storage Tank List (LUST), Underground Storage Tank Database (UST), Historic UST Database (HIST UST), Known Hazardous Waste Sites (Cal-Sites), California hazardous Material Incident Report System (CHMIRS), and Hazardous Waste Information System (HAZNET).

Because the environmental databases themselves are sometimes not updated by the specific regulatory agencies for periods of up to one year (depending on the database and the agency), the database search conducted herein will not necessarily list all facilities or sites recently identified as having, or suspected of having, environmental problems and for which an environmental investigation/listing has been initiated, or reflect the current status of activities at a particular site, subsequent to the last update of a given list. The dates of the most recent updates for the searched environmental databases are listed in Appendix B.

- A review of the 2001 Munger Map Book, California-Alaska Oil and Gas Fields, to identify oil and gas wells located on or adjacent to the Property.

- A review of previous reports relating to soil and ground water sampling, remediation, and asbestos surveys and abatement at the Property, a complete list of all reports reviewed by ENVIRON is included in Section 5.0 of this report.

- An assessment of indoor air quality at the Property, performed in the existing buildings, to evaluate the potential health risks from VOCs detected in soil and ground water to workers inside the buildings. This air monitoring was conducted on February 28 and March 14, 2002, and is described in Section 3.2 of this report.

2.2 Definitions

The following terms are used in this report:

- The word "Property" refers to the property within the approximate boundaries depicted on Figure 2,

- "Immediate vicinity" refers to properties immediately adjacent to the Property that share a common boundary with the Property, and

- "Vicinity" refers to the area within an approximate 1/4-mile radius of the Property.

- "Historical Recognized Environmental Condition" is based on the definition in ASTM E 1527-00 and refers to an environmental condition which in the past would have been considered to be Recognized Environmental Condition, but has been satisfactorily remediated or addressed in such a manner that it is no longer considered to be a Recognized Environmental Condition.

The term "hazardous" is used herein in general accordance with 40 CFR Part 261, Federal Code of Regulations. No legal distinction is implied between the three terms "material," "waste," and "substance" as used herein. The word "impact" or "impacted" is used herein to indicate the result of a release of a hazardous substance.

2.3 Data Evaluation and Report Compilation

This report presents the results of ENVIRON's evaluation. It is based primarily upon a site visit, a review of available historical documents, and a review of lists of environmentally impaired sites. No environmental samples, other than indoor air quality samples, were collected as part of this review. Chain-of-title documents were not provided for ENVIRON's review. Although, where possible, reasonable attempts were made to verify information provided to ENVIRON, this report is accurate and complete only to the extent that information provided to ENVIRON was itself accurate and complete. However, we have found no reason to question the information received.

Antecedent to this Introduction (Chapter 2.0), ENVIRON's conclusions are presented in Chapter 1.0. The findings for the Phase I/II environmental assessment for the Property are presented in Chapter 3.0. Limitations are presented in Chapter 4.0, and references are presented in Chapter 5.0.

2.4 Exceptions to/Deletions from ASTM Practice E 1527-00

Resumes for ENVIRON personnel conducting the assessment are not included in this report, but will be provided upon request. Due to security clearance restrictions, ENVIRON was able to access only a portion of Building C, located on the Property. No other exceptions to, or deletions from, ASTM Practice E 1527-00 were made during this assessment.

3.1.1.3 Utilities

Electricity, domestic water, and sewer services are provided to the Property by the Los Angeles Department of Water and Power (LADWP). Natural gas is supplied by the Southern California Gas Company.

3.1.2 Site Reconnaissance

As described previously, the Property consists of approximately 30 acres of land, improved with four office buildings and associated parking and landscaped areas. ENVIRON's site visit to the Property was conducted on December 18, 2001. ENVIRON was escorted during the visit by Ms. Samaniego of Insignia. Ms. Samaniego indicated that three of the Property buildings (A through C) were completely remodeled in the year 2000. According to Ms. Samaniego, all interior building materials, with the exception of the steel framing and concrete flooring were removed and the building interiors were re-built. The roofing materials also were reportedly removed and replaced during this remodeling. Light and other electrical fixtures, as well as plumbing also were replaced.

Ms. Samaniego indicated that ground water remediation has been ongoing during the year that she has managed the Property. She stated that approximately ten soil borings were drilled in the northwestern portion of the Property during the past month. Remedial activities and subsurface investigations at the Property are further discussed in Section 3.3.3 and Appendix D of this report.

Ms. Samaniego indicated that the buildings are comprised of office space and no manufacturing is conducted at the Property. She also indicated that no chemicals are stored or used on-site, other than janitorial supplies and a small amount of paint.

The four buildings at the Property are referred to as Buildings A through D. Building A has the address of 8501 Fallbrook Avenue and is located in the northeastern portion of the Property. Building A was previously known as Building 262, when occupied by Hughes Missile Systems Company (Hughes). This building has 157,674 square feet of rentable space covering 2½ floors. The ground floor is the ½ floor and is partially below grade. Building A has two hydraulic passenger elevators and one hydraulic freight elevator. Electrical rooms, janitorial rooms, and restrooms are located on each floor of the building. Building A is occupied by Xerox, Software Dynamics, and Countrywide, all of which use the space for offices. Asphalt paved parking areas are located to the east and north of the building.

Building B has the address of 8521 Fallbrook Avenue and is located in the southwestern portion of the Property. This building was previously known as Building 268, when occupied by Hughes. Building B has 153,892 rentable square feet covering 2½ floors. Again the ground floor is the ½ floor and is partially below grade. This building has two hydraulic passenger elevators and one hydraulic freight elevator. Electrical rooms, janitorial rooms, and restrooms are located on each floor of the building. This building is occupied by Pitney Bowes, IBM, Boeing, and Countrywide, all of which use the space for offices. One tenant suite in Building B is currently vacant, and was previously occupied by Vast Solutions, a paging company. Asphalt parking areas are located to the north and south of this building.

Building C has the address of 8531 Fallbrook Avenue and is located in the northwestern corner of the Property. This building was previously known as Building 270, when occupied by Hughes. Building C has 2 floors, with a portion of the ground floor located partially below grade. This building has 100,000 square feet of rentable space, all of which is occupied by Boeing. Only the entrance and front hallway of this building were accessible to ENVIRON during the site visit due to security clearance requirements. The portion accessed was observed to consist of office space and the remainder of the building is reportedly also used for offices. This building has two hydraulic passenger elevators and one hydraulic freight elevator. A diesel-operated emergency generator is located within a fenced enclosure at the southeastern exterior of the building. Asphalt parking areas are located to each side of this building. Numerous monitoring wells were observed in these parking areas.

Building D has the address of 8511 Fallbrook Avenue and is located in the north-central portion of the Property. This building was constructed during the year 2000, and was not a part of the former Hughes facility. Building D has 141,386 square feet of rentable space in four floors. An unfinished portion of the first floor (located in the south-central part of the building) is partially below grade, and was designed to be used as an auditorium. The interior spaces on the first floor, with the exception of the lobby, and the fourth floor have not been finished. The building is currently leased by Sterling Software/Computer Associates, which occupies the second floor. The first and fourth floors were also to be occupied by this tenant, however, construction has been halted. The third floor is subleased to Countrywide. The occupied areas of this building are used for office space. Two hydraulic passenger elevators and one hydraulic freight elevator are located in the building. Restrooms, electrical rooms, and janitorial rooms are located on each floor. A diesel-operated emergency generator and large electrical transformer are located in a fenced enclosure on the eastern exterior of this building. Asphalt parking areas are located to the north and west of the building.

As described above, asphalt parking areas are located adjacent to each of the buildings. Numerous ground water wells and former soil boring locations were observed in the northern and northwestern portions of the parking areas. These wells and borings are associated with past and current remediation activities at the Property (Figures 3 and 4). These activities are discussed further in Section 3.3.3 and Appendix D of this report.

A large landscaped area, consisting of grass, planters, a pond, and two streams, is located in the center of the Property, to the south of Building D, between Buildings A and B. According to Ms. Samaniego, the water in the pond and connected streams is recirculated through a biofilter, and no chlorine or other chemicals are used in the water. Landscaping services are provided by an on-site contractor which uses the West Hills Corporate Park site adjacent to the south of the Property to store equipment.

A water reclaim system, used for watering landscaped areas on the Property, is located along the northern Property boundary, to the north of Building D. The reclaim system is located within a fenced enclosure and consists of large water holding tanks and PVC piping. According to Ms. Samaniego, ground water extracted at the Property is processed through the system and delivered by PVC piping to planter areas throughout the Property. Based on information provided in the ground water monitoring and remediation reports reviewed for the Property, treated ground water is used for the irrigation of landscaping. Several steel drums, labeled "purge water" were observed within the fenced enclosure. Based on ENVIRON's observations at the time of the site visit, it appears that these drums are used during monitoring well sampling.

A fenced trash enclosure is also located along the northern Property boundary. Several trash dumpsters, placed in the enclosure area, are used by the Property tenants. Minor staining was observed on the asphalt beneath the dumpsters.

A remediation system is located in a locked, fenced enclosure along the northern Property boundary. This enclosure was not accessible at the time of the site visit, however portions were observed through the fencing. The systems appear to include several units labeled as "aqua scrub" and "carbon." According to Ms. Samaniego, ground water sampling and remediation activities currently are being conducted at the Property. These remediation activities are discussed further in Section 3.3.3.

As described above, Ms. Samaniego indicated that several soil borings were recently drilled along the northern portion of the parking area. Four roll-off bins and approximately 20 steel drums were observed in the area of the recent borings. The bins appear to contain soil, and the drums are labeled as containing "non-classified waste decon water." The drums and bins were placed on the asphalt surface without secondary containment; however, no sign of leaks or spills were observed around these containers at the time of ENVIRON's site visit.

3.1.2.1 Chemical Use and Chemical Waste Storage

Ms. Samaniego indicated that significant quantities of chemicals are not used at the Property. No chemical waste reportedly is generated at the Property, and no waste storage areas (other than municipal waste dumpsters) were observed during the site visit. Chemicals observed, or reported to be used on-site, consist of janitorial cleaners, small amounts of paint, hydraulic fluid for the elevators, and diesel in the emergency generators. Paint cans are stored in a small flammable cabinet in the maintenance room located in Building B. The paint reportedly is used for touch-up jobs only.

One 55-gallon drum of hydraulic fluid, without secondary containment, was observed in the elevator machine room in Building B. No containers of hydraulic fluid were observed in the elevator equipment rooms of the remaining buildings. ENVIRON did not observe staining on the concrete floor beneath or adjacent to the elevator equipment in the machine rooms during the site visit.

Diesel is stored in tanks that are an integral part of the emergency generators. Ms. Samaniego was not aware of the capacity of these tanks. No staining was observed on the raised concrete pads beneath the generators.

3.1.2.2 Non-Hazardous and Hazardous Solid Waste

No hazardous solid waste was observed or reported to be stored (with the exception of the possible hazardous drill cuttings generated from recent investigations at the Property). Non-hazardous waste observed at the Property consists of general office trash. This waste is collected in dumpsters located in the enclosure at the northern side of the Property, as described above. Minor staining was observed on the asphalt beneath the dumpsters.

3.1.2.3 Asbestos

Based on the construction date of Building D (built in 2000), it is unlikely that asbestos-containing materials (ACMs) were used in this building. As previously mentioned, Ms. Samaniego indicated that Buildings A through C were completely remodeled during 1999-2000. Several previous reports relating to asbestos surveys and abatement activities conducted in these buildings were provided for ENVIRON's review and are summarized in Appendix C of this report.

Based on a review of available reports, it appears that the majority of floor tiles and associated mastics and pipe, elbow, and tee insulation in the Property buildings were found to contain asbestos. Portions of the wall materials, exterior stucco (paint) materials, and roofing materials also were found to contain asbestos. As reported by Ms. Samaniego, all building materials, other than metal, wood, and concrete, reportedly were removed during recent remodeling activities. Ms. Samaniego also indicated the roofing materials were removed and replaced during the remodeling. Reports describing the abatement of various ACMs were reviewed (see Appendix C), however reports documenting the removal of all ACMs from the buildings were not provided to ENVIRON. A June 2000 Environmental Impact Report prepared by AllWest stated that a review of a November 1999 report by J&H indicated that *"all asbestos containing material identified in the interiors of the buildings"* (Buildings A and B at 8521 and 8531 Fallbrook Avenue) had been abated. During the site visit, the building materials observed appeared to have been installed recently, and ENVIRON believes it is unlikely that the current building materials contain ACMs.

3.1.2.4 Lead-Based Paint

Based on the construction date of Building D (built in 2000), it is unlikely that lead-based paint was used. As described above, Ms. Samaniego indicated that Buildings A through C were completely remodeled during 1999-2000. The only materials reportedly left in-place were metal, wood, and concrete, which were not painted. Property areas accessed during the site visit appeared to have been recently painted, and no areas of peeling or chipping paint were observed. Black paint was not observed during the site visit.

One report relating to paint sampling was provided to ENVIRON during the site visit. The report entitled "*Lead Inspection, Westhills Corporate Village, Building 8521,*" prepared by J&H, and dated November 15, 1999, was reviewed. Based on this

report, the paint sampled during this inspection was collected from the ceiling area on the first floor of Building B. Four bulk samples of the black paint were collected and found to contain between 0.050% and 0.056% lead. These results are below the Los Angeles County Department of Health Services and U.S. Department of Housing and Urban Development's standards for lead-based paint. No recommendations were included in the report.

3.1.2.5 Polychlorinated Biphenyls ("PCBs")

Small, dry-type transformers are located in various areas throughout the Property. Because the transformers are dry-type units, PCB-containing fluid is not expected to be present in the transformers.

Pad-mounted transformers are located within fenced enclosures adjacent to Buildings C and D. These transformers are not labeled, but are assumed to be owned by the electric utility company, LADWP. Ms. Samaniego indicated that the transformers were installed during the buildings' remodeling activities in 1999 or 2000. Based on this installation date, it is unlikely that the transformers are PCB-containing. No staining was observed on the concrete pads beneath and adjacent to the transformers.

Fluorescent light fixtures are present throughout the buildings at the Property. Ms. Samaniego indicated that the fixtures were installed during the remodeling conducted in 1999-2000. Based on this installation date, it is unlikely that these fixtures and ballasts contain PCBs.

3.1.2.6 Air Emissions

Air emissions sources observed at the Property appear to be limited to the two diesel emergency generators, which are only operated during routine testing and power outages. Emissions from the generators are expected to be limited in duration and quantity and are not expected to adversely affect soil and/or ground water underlying the Property. Permits for the generators, issued by the South Coast Air Quality Management District (SCAQMD), were observed at the Property.

In addition, the remediation system located at the Property likely generates air emissions and would, therefore, require a permit from the SCAQMD. ENVIRON was not provided with access to this system to check whether such a permit is posted near the equipment.

3.1.2.7 Wastewater Discharges

According to Ms. Samaniego, sources of wastewater generated at the Property consist of sanitary effluent from the sinks and toilets. Rainwater runoff on the western side of the Property is directed into concrete gutters that flow to an unlined creek located between the Property and adjacent residences. This creek was dry at the time of the site visit. Rainwater runoff on the remainder of the Property appears to flow toward the south and southeast, to street gutters.

Treated ground water arising from the remediation system is collected in the water reclaim system and used in the landscaped areas of the Property.

3.1.2.8 Soil and Ground Water Contamination

As previously mentioned, numerous monitoring wells are located at the Property. Moreover, evidence of previous soil borings was observed during the site visit. Ground water remediation activities currently are being conducted at the Property. Soil and ground water contamination at the Property is a result of past Property use by Hughes. The contamination and remediation activities are discussed in Section 3.3.3 and Appendix D of this report. No current Property uses that would contribute to soil or ground water contamination were observed by ENVIRON during the site visit.

3.1.2.9 Mold

During the site visit, ENVIRON observed the readily accessible areas of the Property buildings for indications of water stains and/or mold. No signs of such stains or mold were observed within the Property buildings at the time of the site visit. Additionally, Ms. Samaniego indicated that she is not aware of any such areas within the buildings, or of any current roof or pipe leaks.

Ms. Samaniego indicated that there had a been an area of mold previously identified in Building A, and provided ENVIRON with a report pertaining to the sampling of the mold. This area was identified due to visual observation from an employee. According to an April 9, 2001 letter report prepared by J&H regarding "mold inspection, sampling and report," an inspection for mold was conducted in Building A on March 30, 2001. The inspection included Cubicle 109A, the adjacent area, and Cubicle 112A. At the time of the inspection, no visible signs of mold reportedly were observed; however, three tape lift samples were collected from the carpet of the

above referenced areas. The sample collected from the carpet adjacent to cubicle 109A was found to have a minor, abundant, and major density of acremonium, aspergillus/penicillium, and hyphae, respectively. Penicilium phialides reportedly was also observed. The sample collected from the carpet beneath the desk in cubicle 109A was found to have a trace density of cladosporium, aspergillus/penicillium, and hyphae, and the sample collected from the carpet in cubicle 112A was found to have a trace density of cladosporium and hyphae. J&H concluded that "no toxic molds" were found. However, Ms. Samaniego stated that the materials in the area of concern were removed and the area was cleaned with a biocide substance.

3.1.3 Immediate Vicinity Reconnaissance

A reconnaissance of the immediate vicinity of the Property was conducted by ENVIRON on December 18, 2001. ENVIRON's reconnaissance of the immediate vicinity consisted of walk- and drive-by observations from the public streets. ENVIRON did not enter any sites near or adjacent to the Property. The immediate vicinity of the Property was observed to consist of residences, a park/recreation area, a reservoir, and office buildings. During ENVIRON's reconnaissance of the immediate vicinity, ENVIRON did not identify facilities that are listed in the EDR database report.

3.2 Indoor Air Sampling

ENVIRON conducted indoor air sampling in the four buildings at the Property to evaluate the potential health risks from VOCs to workers inside the buildings. This air monitoring was conducted on February 28 and March 14, 2002. On February 28, 2002, ENVIRON placed nine Summa canisters, with flow controllers, at the Property (see Figure 5). The sample locations included three on the ground floor of Building A, three on the ground floor of Building B, one on the ground floor of Building C, one at the exterior of Building C, and one on the ground floor of Building D. The sample located exterior to Building C malfunctioned, and the canister was not full after 8 hours, therefore, VOC detection limits for this sample were elevated. This sample was recollected on March 14, 2002. In all cases, the canisters were retrieved after approximately eight hours , and submitted to Performance Analytical Inc. Air Quality Laboratory (Performance) under chain-of-custody protocol for VOC analysis using EPA Method TO-15. Air samples were analyzed on an expedited turnaround.

Based on the analytical results, the following 12 compounds were detected at various concentrations in Buildings A, B, C, and/or D: acetone, benzene, chloromethane, methylene chloride, 2-butanone, o-xylene, ethylbenzene, 4-methyl-2-pentanone, toluene, tetrachloroethene, methyl-t-butyl ether (MTBE), and p/m-xylene. Tables summarizing sampling results, and the laboratory data report are

included in Appendix E. Using these data, ENVIRON calculated the average indoor concentration for each detected analyte, according to the building in which the samples were retrieved. The three samples obtained in Building A were retrieved in office working areas where employees could be expected to work an entire 8-hour day. The average compound concentration of each detected analyte in the three samples was calculated and assumed to be representative of the compounds' concentrations in Building A. Similarly, the average compound concentration of each detected analyte in the three samples obtained in Building B (office working areas) were assumed to be representative of the compound concentrations in Building B. In Building C, the representative compound concentrations were assumed to be the values obtained from the one indoor sample (C1) located in the building's front lobby. For the sole sample obtained from Building D, the concentrations observed from the sampling result were considered to be representative of average concentrations inside the building. Building D was under construction at the time of the sampling.

The average concentration of each detected VOC was compared to the 8-hr time-weighted-average (TWA) Permissible Exposure Level (PEL) specified by OSHA and/or the OSHA Limit for Air Concentrations specified in 29 CFR 1910.1000 Tables Z-1 and Z-2. For all 12 compounds in all four buildings, the representative concentrations were well below the OSHA thresholds.

To evaluate compliance with California Proposition 65 requirements, the 12 chemicals detected inside the buildings were compared with the Proposition 65 list of applicable chemicals for either developmental or carcinogenic effects listing. Two compounds were identified on the developmental effects listing: chloromethane and toluene. Three compounds were identified on the carcinogenic effects listing: benzene, methylene chloride, and tetrachloroethene.

Certain interpretations of Proposition 65 exposure thresholds employ a daily intake limitation, therefore as a conservative measure, daily human intake values were calculated as exposure through the inhalation pathway using the average concentration for each Proposition 65 listed VOC. The daily intake amount was calculated by multiplying the compound concentration by the amount of air an exposed human would breathe during the 8-hour exposure period (i.e., 10 cubic meters). The California Office of Environmental Health Hazard Assessment (OEHHA) has established the maximum allowable daily limit (MADL) for each compound with developmental effects and the no significant risk level (NSRL) for each listed carcinogenic compound. The MADL and NSRL are specified in the Proposition 65 Status Report, dated February 2001. The results of ENVIRON's evaluation are presented in Appendix E. The representative toluene concentrations were found to be less than the established MADL. As such, no further evaluation for toluene was necessary. The MADL for chloromethane has not yet been established and, therefore, the compound could not be evaluated. The representative methylene chloride concentrations were less than the established

NSRL. As such, no further evaluation for methylene chloride was necessary. The representative concentrations for benzene and tetrachloroethene were greater than the NSRLs in all four buildings. Therefore, the incremental lifetime cancer risks for benzene and tetrachloroethene were calculated for each building.

To conduct these calculations, ENVIRON used guidance provided by OEHHA, which calculates risk as the average chronic daily dose multiplied by the established cancer slope factor. A few conservative assumptions are utilized in the equation for calculating the average chronic daily dose, such as exposure duration, average body weight, and inhalation rate. For this evaluation, the average exposure duration was assumed to be 20.9 years of exposure in Buildings A, B, and C, using US EPA exposure factors. Since Building D was under construction, exposure duration of 2 years was assumed for a construction worker. As shown in data tables included in Appendix E, an exposure scenario was generated for each building, assuming an 8-hour day for 250 days per year for the exposure period, a daily exposure breathing volume of 10 cubic meters, and the average compound concentration for each building. In all scenarios, the calculated incremental cancer risks were below 1 in 100,000 (i.e., 1.0 E-05). Given these exposure scenarios, Proposition 65 requirements are not applicable for benzene and tetrachlorothene inside the buildings.

3.3 Historical Review

To evaluate the historical uses of the Property, ENVIRON reviewed topographic maps (dated 1903, 1947, and 1967), historic aerial photographs (dated 1928, 1952, 1965, 1976, 1989, and 1994), and city directories (dated 1920 to 2000). Sanborn maps were also requested from EDR. EDR indicated that Sanborn maps were not available for the Property. ENVIRON also conducted an interview with Ms. Samaniego, the current Property manager, and reviewed numerous reports pertaining to the Property. The results of ENVIRON's historical review are presented below.

3.3.1 Historical Operations Interview

During the site visit, ENVIRON interviewed Ms. Samaniego regarding the history of the Property. Ms. Samaniego indicated that the Property was previously owned and occupied by Hughes, then later owned by Coast Federal Savings. The Property is currently owned by West Hills Corporate Village/Shamrock. As discussed previously, Ms. Samaniego indicated that Buildings A through C had been completely remodeled during 1999-2000 and all interior building materials, with the exception of concrete floors and framing, had been removed. Ms. Samaniego also indicated that Building D was constructed in 2000. According to Ms. Samaniego, tenants occupying the Property buildings since the time of the remodeling have

used the spaces for offices, and no manufacturing or chemical use are conducted at the Property.

Ms. Samaniego indicated that additional soil borings had been drilled in the northern portion of the Property during the past month, and that she has been told that the current remediation activities will be completed within approximately the next two years.

3.3.2 Chronological Summary of Historical Topographic Maps, Aerial Photographs, and City Directories

- The 1903 topographic map depicts the Property and surrounding areas as vacant, undeveloped land. The roads currently adjacent to the Property and the reservoir are not shown on this map. The vicinity is depicted as primarily undeveloped land.

- The Property address of 8501 Fallbrook Avenue was not listed in the city directories dated from 1920 to 2000. The surrounding site addresses were not listed in the city directories dated from 1920 to 1961.

- In the 1928 aerial photographs, the Property and adjacent area appear to be agricultural land. Unpaved roads are visible to the east and south of the Property. The vicinity is primarily agricultural land.

- The 1947 topographic map shows the Property as vacant, undeveloped land. Fallbrook Avenue is depicted as an unpaved road adjacent to the east of the Property. Several residential-type structures are shown beyond this road to the east. The Chatsworth Reservoir is depicted to the north of the Property, and vacant, undeveloped land is shown to the west and south. Roscoe Boulevard is depicted further south. The Property vicinity land use is shown as a mixture of agriculture, undeveloped land, and scattered residences.

- In the 1952 aerial photograph, the Property appears to be agricultural land. An unpaved road is located adjacent to the north and west of the Property, and Fallbrook Avenue is visible to the east. Undeveloped land and a small lake are visible to the west of the Property. The Chatsworth Reservoir is located to the north of the Property, north of the unpaved road. Several small structures, which are likely related to the apparent agricultural activities, are located to the south and southeast of

the Property. The remainder of the land to the south of the Property and the vicinity also appears to be used for agricultural purposes.

- Residences are listed in the 1962 city directory for surrounding sites. Surrounding site addresses were not listed in the city directories dated from 1963 to 1969.

- Three of the current Property buildings are visible in the 1965 aerial photograph. Associated paved parking areas are discernable to the east and west of the buildings. Additional commercial structures and parking areas (which appear to be part of the same complex as the Property) are located to the south. A small commercial structure and an apparent residential development are visible to the east of the Property, beyond Fallbrook Avenue. Undeveloped land and a small lake are visible to the west of the Property. Other than the large structures observed south of the Property, the vicinity appears to have been primarily developed for residential uses.

- Three structures are depicted on the 1967 topographic map at the Property. The structures correspond to the current buildings (Buildings A and C). An unnamed road, then the Chatsworth Reservoir, is shown to the north of the Property. Fallbrook Avenue is depicted to the east of the Property, with several small structures, one larger commercial structure and a residential development shown further east. Undeveloped land and Lees Lake are to the west of the Property, with a residential development further west. The vicinity is primarily residential, with scattered areas of agricultural use.

- In the 1970 city directory, the neighboring site address of 8500 Fallbrook Avenue was listed as North American Rockwell and "Rocketdyne/A Division of North America."

- The surrounding site addresses are not listed in the 1971 to 1990 city directories.

- No major changes were noted in the 1976 aerial photograph from the 1965 photograph, with the exception of a residential development to the west of the Property, surrounding the small lake. The Property and vicinity appear to have changed from the 1976 to the 1989 aerial photograph..

- Residences were listed in the 1991 and 1995 city directories for neighboring sites. Surrounding site addresses were not listed in the 2000 city directory.

- The 1994 aerial photograph shows the Property as it is currently developed. The adjacent areas and vicinity appear similar to the 1989 photograph.

3.3.3 Previous Reports Review

ENVIRON reviewed numerous prior reports that included information regarding historical uses of, and activities conducted at, the Property. A detailed summary of each report/letter reviewed by ENVIRON is presented in Appendix D.

3.3.4 Summary of Historical Reviews

Based on available historical aerial photographs and topographic maps, the Property and vicinity appear to have been used for agricultural purposes from the early 1900s to the late 1950s. The first structures were built at the Property in 1959 and were used by several occupants. The historical documents reviewed did not provide details of the operations conducted at the Property from 1959 to 1966. Hughes first occupied the Property in 1966 and was the sole occupant of the Site from 1976 to 1994.

Hughes operations were mainly related to aerospace research and development programs. Six buildings were located at the Property (Buildings 262, 268, 269, 270, 272, and 282); activities conducted in these buildings included solvent cleaning, painting, coating, lubricating, etching, degreasing, soldering, as well as laboratory and garage/repair shop operations. The Property buildings were damaged during the 1994 Northridge earthquake, and it appears from review of various documents, that the buildings were then vacated due to this damage. In November 1995, the Hughes facility, including the Property and adjacent areas to the south, were purchased by Coast Federal Bank. The Property was then sold to Regent Properties, Inc. (Regent) in 1997. During 1997 and/or 1998, Buildings 269, 272, and 282 were demolished. Shamrock later purchased Regent, and the Property is currently owned by West Hills Corporate Village/Shamrock. Only Buildings 262, 268, and 270 remain from the original buildings.

A hazardous waste storage shed also was located at the northern boundary of the Property. Eight USTs were located at the Property (Tanks T-1 to T-4, T-12 to T-14, and T-17). Most of these tanks have been removed; tank T-4 was abandoned in-place; and, according to McLaren/Hart tank T-14 actually was an aboveground storage tank. Soils in the vicinity of these tanks reportedly were impacted by VOCs. The local regulatory agency has not issued closure letters for the USTs.

Two clarifiers were present immediately east of Building 269 (which has been demolished). Soil and ground water investigations have been conducted in the areas surrounding the clarifiers; however, it appears that the clarifiers were backfilled and capped in-place (it is not clear whether they were subsequently removed). A clarifier reportedly also was located in or immediately north of Building 268; according to McLaren/Hart, this clarifier was located on the second floor of the building and received only photographic laboratory effluent. A system of pits and trenches were also located in Building 268. Soil samples in this area showed no detectable contamination; therefore, the pits and trenches were backfilled with sand or slurry and covered with a concrete cap. A large cooling pond reportedly was located between Buildings 268 and 269.

Based on information contained in the Order issued by the LARWQCB in December 1994, in 1985 Hughes discovered that soil and ground water at the Site were impacted with VOCs. Since then, numerous investigations have been conducted to delineate the nature and extent of these impacts. Three areas of the Site are known to be contaminated: (1) Northwestern corner from Building 269 to western edge of the Site (northwestern part of the Property); (2) area of monitoring well CM-8D (outside the Property to the south); and (3) area of monitoring well CM-10 (outside the Property to the south).

In 1990, Hughes and the DTSC entered into a consent agreement whereby Hughes would comply with LARWQCB requirements for the ground water remediation and monitoring at the Site. A CAP was prepared in 1992, and amended in 1994. In 1995, DTSC and the LARWQCB agreed to include the Site on the SB1082 list. It appears that the LARWQCB has provided oversight for the soil and ground water remediation at the Site, while DTSC is the lead agency for RCRA closure at the Site. Two RCRA permitted facilities were located at the Property: Tank T-3 and the HWSA. In a 1995 memorandum, DTSC outlined seven AOCs at the Property: Buildings 272/282, portions of Building 262, Building 268, Building 269, Building 270, Tank T-12, and Tanks T-14/T-16. In addition, several SWMUs were identified at the Property. ENVIRON has not been able to find one document that details all the SWMUs, but based on available records, the following were identified: SWMU#1 at Building 272, SWMU#2 at Building 282, SWMU#3 at Building 269 P-1 and P-2, and SWMU#6 at Tanks T-1/T-2 and associated pump area.

Correspondence from DTSC indicates that the agency has not been fully satisfied with the investigations of the AOCs, the closure of the SWMUs, or post closure of the HWMU. In a letter dated March 12, 1999, DTSC indicated that Raytheon's (Raytheon purchased Hughes

in 1997) approach thus far of investigating small portions of the Facility and submitting such data to DTSC for closure of SWMUs or AOCs was not adequate. DTSC was requiring a RCRA Facility Investigation Workplan, which summarized all SWMUs, AOCs, and HWMUs identified at the Facility and investigations and corrective actions conducted to date. DTSC would then work with Raytheon to prioritize these areas. However, since Raytheon had elected to stop its fee-for-service agreement with DTSC, DTSC staff could not perform significant work on the corrective action activities. DTSC further indicated that Raytheon was in violation of requirements to submit post-closure permit application for Tank T-3.

As previously mentioned, the Property is undergoing remediation. The remediation system includes a ground water recovery system consisting of 17 recovery wells (first started in February 1995 and fully operational since March 1995); the treated effluent is reused for on-site irrigation purposes. An SVE system, which has operated since August 1995, included 54 manifolded extraction wells. The air sparging system operated since March 1996 and consisted of 30 manifolded wells, which are connected to an air compressor. A dual-phase treatment system was tested at the Property in 1999, but has not been fully implemented. Since late 1999, the SVE and air sparging wells have not been in operation. Moreover, as of December 2000, only ten recovery wells have been connected to the treatment system at the Property.

In a letter dated October 12, 1995, the DTSC indicated that initially soil and ground water cleanup standards were established for the Site (1992 CAP) based on the lowest numbers produced from a health risk assessment, background measurement, or MCLs. Based on ENVIRON's review of available documents, the ground water cleanup goals appeared to be 10 times greater than the MCL, and soil cleanup goals were established for total chlorinated VOCs at 100 milligrams per kilogram (mg/kg).

The main chlorinated VOCs detected in soils and ground water at the Property are dichloroethene (DCE), 1,1-dichloroethane (1,1-DCA), 1,2-dichloroethane (1,2-DCA), Tetrachloroethene (PCE), trichloroethane (TCA), and trichloroethene (TCE). In addition, benzene is detected in several wells, and is known to be present in soils near former tanks. Based on the latest available ground water monitoring report (June 2001), DCE, 1,1-DCA, and benzene are still detected in several wells at concentrations exceeding the CAP cleanup goals; however, in general VOCs concentrations have been declining in the monitored wells, which shows progress towards Site cleanup.

During the demolition of the HWSA in June 1998, hexavalent chromium contamination was encountered in soils in this area. At that time, Fluor Daniel/Groundwater Technology, Inc. (FD/GTI) did not recommend any additional subsurface investigation or soil removal because the hexavalent chromium contaminated soils were encountered at minimal depths of 5 to 13 feet bgs. Furthermore, FD/GTI indicated that future grading in this area would raise the ground surface by approximately 5 feet. Therefore, FD/GTI did not believe that the hexavalent chromium encountered in the soils would pose a health threat. FD/GTI recommended sampling monitoring wells located up- and down-gradient of the former HWSA for hexavalent chromium on a quarterly basis for a period of one year to evaluate whether the impacted soils would result in impact to ground water. In its March 1999 letter, the DTSC indicated that Raytheon's plan to keep hexavalent chromium contaminated soils in-place and monitor the ground water in this area was not acceptable.

In 1999, hexavalent chromium was detected in three ground water samples collected from Well RW-15, with concentrations ranging from 0.083 to 0.1 milligrams per liter (mg/L). RW-15 is located adjacent to the former HWSA. RW-15 was disconnected from the remediation system and the LARWQCB and DTSC were notified. Seven ground water monitoring wells were installed in proximity to the HWSA in June of 2000, and monitoring for the presence of hexavalent chromium. Sampling results indicated that the MCL for hexavalent chromium, currently 50 micrograms per liter (µg/l), was exceeded at two monitoring wells (MW-32S and MW-32D), both located within the footprint of the former HWSA. It should be noted that the California Environmental Protection Agency Office of Environmental Health Hazard Assessment (OEHHA) is reviewing the public health goal (PHG) and drinking water standard for hexavalent chromium, and the standards may be decreased in 2003.

3.4 Regulatory Review

To assess the potential for soil and/or ground water contamination at the Property due to on- and off-site sources, ENVIRON conducted a review of federal and state regulatory agency database lists of environmentally impacted sites. Sites from the searched databases are summarized in Table 1 in Section 3.4.3.

3.4.1 Geologic and Hydrogeologic Setting

In the evaluation of the potential for environmental problems from other sites to impact the Property, one must consider the possibility that ground water could transport contamination from sites in the vicinity to the Property. Therefore, the depth and flow direction of ground

water are important. To evaluate the possibility of migration of contaminants from other sites onto the Property, this section presents a discussion regarding the geologic and hydrogeologic setting of the Property.

The geologic and hydrogeologic setting at the Property presented below is generated from a review of numerous previous reports. The Property overlies consolidated bedrock of the Miocene Modelo Formation, over the Lower Miocene-aged Topanga Formations. The Modelo Formation consists of siltstone, clayey siltstone and shale with minor interbedded diatomaceous shale. Soils at the Property and vicinity are comprised of Cenozoic-aged Basin fill, which consists of flat-lying, poorly sorted unconsolidated sands, silts, and clays, with some gravels. A layer of construction fill lies above the native soils.

Shallow ground water is encountered at the Property at depth of 15 to 50 feet bgs. Ground water flow direction across the Property is generally to the south and southeast, however the flow is to the southwest in the northwestern portion of the Property (influenced by the remediation system).

3.4.2 Regulatory Agency File Review

ENVIRON requested, through Environmental Support Services of Santa Ana, California (ESS), information regarding the Property address of 8501 Fallbrook Avenue from the Los Angeles County Environmental Health Department, City of Canoga Park Fire Department, and the City of Canoga Park Building Department. According to ESS, the Health Department and Fire Department did not have files for this address. The Building Department files included a demolition permit for Building 269 (previously located on the Property, adjacent to Building 270, currently Building C). The permit was issued in October 1997 to Coast Federal Bank.

ESS also requested information from the above agencies for the former Property address of 8433 Fallbrook Avenue. ESS has not provided ENVIRON with this information as of the date of this report.

ENVIRON also reviewed available files pertaining to the Property, at the LARWQCB. ENVIRON reviewed available reports for the Property provided by Trammel Crow and Insignia. These documents are summarized in Appendix D.

3.4.3 Regulatory Agency Databases

EDR conducted an environmental regulatory agency database search of sites located within the ASTM radii from the Property. The EDR report is presented in Appendix B. Findings of the database search for sites within the search radii required by ASTM are presented in this section.

The EDR report indicated there was poor or inadequate address information for several sites located in the vicinity of the Property; therefore, these sites could not be mapped by EDR. Because the location of these sites with respect to the Property could not be evaluated, ENVIRON is limited in its ability to express an opinion regarding the potential for impact to the Property from these sites. However, ENVIRON reviewed the list of unmappable sites and could not identify sites located adjacent to the Property that were listed as environmentally impaired.

In this section, only facilities that were listed on databases of environmentally impaired sites, and that are located in the immediate vicinity of the Property or are located upgradient (but are not necessarily located near the Property) are discussed. These facilities were selected based on the assumption that a hazardous material released to the subsurface generally does not migrate laterally within the unsaturated soil for a significant distance, but a hazardous material can migrate in the ground water in a generally downgradient direction; however, there are limitations to this interpretation. A list of these facilities is presented in Table 1.

TABLE 1

Regulatory Data Base Search Results

Site	Location Relative to Property	Data Base(s) Listings	Regulatory Status/ Comments
LA City Fire Station #106 23004 Roscoe Boulevard	Approximately 1/6 mile southwest	LUST RCRIS FINDS HAZNET	This facility is listed as having had a tank release, which occurred during repair and impacted soils. No action reportedly has been taken by the responsible party. This facility is also reported to be a small quantity generator of hazardous waste, with wastes listed as unspecified aqueous solution, unspecified oil-containing waste, asbestos-containing waste, and tank bottom waste.
Missile Systems Group/Hughes	Former Property and	HIST UST FINDS	Facility is listed as having had 14 USTs, which stored gasoline, waste, and other

TABLE 1

Regulatory Data Base Search Results

Site	Location Relative to Property	Data Base(s) Listings	Regulatory Status/ Comments
Aircraft Company 8433 Fallbrook Avenue	southern adjacent area	RCRIS RCRIS-TSD CORRACTS CERC-NFRAP Cal-Sites Cortese LUST	substances. A solvents tank release reportedly impacted the ground water. The abatement method for the site is described as excavation and disposal of contaminated soil, and the status is listed as remedial action in progress. The Facility was assigned a low corrective action priority on the CORRACTS database, and has a status of "no further remedial action planned on the CERCLIS database." The Cal-Sites listing indicates that DTSC action is not required, and the case has been referred to a RCRA lead. The Facility is a large quantity generator of hazardous waste and a TSD facility. Violations are reported as "TSD-other requirements," "TSD-closure/post closure requirements," and "TSD-financial responsibility requirements."
Hughes Aircraft Company/Missile Systems group 8433 Fallbrook Avenue	Former Property and southern adjacent area	CA FID UST HIST UST	This facility is listed as an inactive UST location, that had three waste USTs installed in 1981.

The former occupant of the Property, Hughes, is identified on several databases. These listings appear to include the former Hughes facility at the Property and southern adjacent area. As discussed in Section 3.3.3 and 3.3.4, remediation activities currently are being conducted at the Property.

Listings on the UST, RCRIS, HAZNET, ERNS, or FINDS databases are not necessarily indicative of environmental impairment at a facility, therefore facilities listed on those databases are not included in the table above. As indicated above, there is one LUST listing identified as being located in proximity of the Property. However, this facility is located downgradient of the Property, and therefore, is not expected to have adversely impacted the Property.

3.4.4 Munger Map Book

According to the 2001 Munger Map Book of California and Alaska Oil and Gas Fields, oil or gas wells are not located, and were not previously located, on or within ½ mile of the Property.

3.4.5 Radon

Based on radon information included in the EDR database report, the Property is located in an area noted as Zone 2. Zone 2 has average indoor radon levels of greater than 2 pico Curies per liter (pCi/L) and less than 4 pCi/L. The continuous exposure limit established by the EPA is 4.0 pCi/L, which is the limit at which further testing or remedial action is indicated.

The radon survey results listed in the EDR report cannot predict the radon exposure level measurement in any existing or future buildings at the Property. The only way to determine the amount of radon present in a particular structure is to conduct a radon survey in that structure. However, the results detected in the survey are indicative of similar results that could be expected from a survey conducted at other locations and at other times within this same region, which includes the Property.

4.0 LIMITATIONS

This Assessment has been prepared exclusively for use by AMLGM and MEPT and may not be relied upon by any other person or entity without ENVIRON's express written permission. The conclusions presented in this report represent ENVIRON's professional judgment based upon the information available to us and conditions existing as of the date of the Assessment, and are true and correct to the best of ENVIRON's knowledge as of the date of the Assessment. Future conditions may differ from those described herein and this report is not intended for use in future evaluations of the Property. In performing its assignment, ENVIRON must rely upon publicly available information, information provided by the client, and information provided by third parties. Accordingly, the conclusions in the report are valid only to the extent that the information provided to ENVIRON was accurate and complete. ENVIRON does not make any warranties or representations, whether expressed or implied, regarding the accuracy of such information, and shall not be held accountable or responsible in the event that any such inaccuracies are present.

This report is not intended as a substitute for legal advice. Nor is it an exhaustive review of site conditions. ENVIRON makes no representations or warranties about the condition of the Property.

ENVIRON performed the activities cited herein in conformance with the ASTM Practice E 1527-00 for Phase I environmental site assessments. The work was conducted objectively in accordance with generally accepted professional practice standards for this type of work. ENVIRON's scope of work for this assignment did not include collecting samples of any environmental media. As such, this Assessment cannot rule out the existence of latent conditions, and is intended, consistent with normal standards of practice and care, to assist the client in identifying the risks of such conditions.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

TARGET PROPERTY INFORMATION

ADDRESS

8501 FALLBROOK AVENUE
CANOGA PARK, CA 91304

COORDINATES

Latitude (North):	34.220100 - 34° 13' 12.4"
Longitude (West):	118.624000 - 118° 37' 26.4"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	350404.2
UTM Y (Meters):	3787558.0

USGS TOPOGRAPHIC MAP ASSOCIATED WITH TARGET PROPERTY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the ASTM E 1527-00 search radius around the target property for the following databases:

FEDERAL ASTM STANDARD

NPL..... National Priority List
Proposed NPL..... Proposed National Priority List Sites
CERCLIS..... Comprehensive Environmental Response, Compensation, and Liability Information System
ERNS..... Emergency Response Notification System

STATE ASTM STANDARD

AWP..... Annual Workplan Sites
CHMIRS..... California Hazardous Material Incident Report System
Notify 65..... Proposition 65 Records
Toxic Pits..... Toxic Pits Cleanup Act Sites
SWF/LF..... Solid Waste Information System
WMUDS/SWAT..... Waste Management Unit Database
CA BOND EXP. PLAN..... Bond Expenditure Plan
UST..... List of Underground Storage Tank Facilities

FEDERAL ASTM SUPPLEMENTAL

CONSENT..... Superfund (CERCLA) Consent Decrees

EXECUTIVE SUMMARY

ROD..... Records Of Decision
Delisted NPL..... National Priority List Deletions
FINDS..... Facility Index System/Facility Identification Initiative Program Summary Report
HMIRS..... Hazardous Materials Information Reporting System
MLTS..... Material Licensing Tracking System
MINES..... Mines Master Index File
NPL Liens..... Federal Superfund Liens
PADS..... PCB Activity Database System
RAATS..... RCRA Administrative Action Tracking System
TRIS..... Toxic Chemical Release Inventory System
TSCA..... Toxic Substances Control Act
FTTS..... FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)

STATE OR LOCAL ASTM SUPPLEMENTAL

AST..... Aboveground Petroleum Storage Tank Facilities
CLEANERS..... Drycleaner Facilities
CA WDS..... Waste Discharge System
CA SLIC..... Spills, Leaks, Investigation & Cleanup Cost Recovery Listing
LOS ANGELES CO. HMS.... HMS: Street Number List
LA Co. Site Mitigation..... Site Mitigation List
AOCONCERN..... San Gabriel Valley Areas of Concern

EDR PROPRIETARY DATABASES

Coal Gas..... Former Manufactured Gas (Coal Gas) Sites

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS 1 degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. EDR's definition of a site with an elevation equal to the target property includes a tolerance of +/- 10 feet. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property (by more than 10 feet). Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

CERCLIS-NFRAP: As of February 1995. CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund Action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to

promote economic redevelopment of unproductive urban sites.

A review of the CERC-NFRAP list, as provided by EDR, and dated 07/12/2001 has revealed that there is 1 CERC-NFRAP site within approximately 0.375 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2N*	*B6*	*13*

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 09/20/2001 has revealed that there is 1 CORRACTS site within approximately 1.125 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2N*	*B6*	*13*

RCRIS: The Resource Conservation and Recovery Act database includes selected information on sites that generate, store, treat, or dispose of hazardous waste as defined by the Act. The source of this database is the U.S. EPA.

A review of the RCRIS-TSD list, as provided by EDR, and dated 06/21/2000 has revealed that there is 1 RCRIS-TSD site within approximately 0.625 miles of the target property.

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, has revealed that there are 3 Cortese sites within approximately 1.125 miles of the target property.

STATE OR LOCAL ASTM SUPPLEMENTAL

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, has revealed that there are 2 HAZNET sites within approximately 0.25 miles of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List
Source: EPA
Telephone: N/A
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/26/01
Date Made Active at EDR: 08/28/01
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 08/06/01
Elapsed ASTM days: 22
Date of Last EDR Contact: 11/05/01

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 07/12/01
Date Made Active at EDR: 10/16/01
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 09/24/01
Elapsed ASTM days: 22
Date of Last EDR Contact: 09/24/01

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 07/12/01
Date Made Active at EDR: 10/16/01
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 09/24/01
Elapsed ASTM days: 22
Date of Last EDR Contact: 09/24/01

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 09/20/01
Date Made Active at EDR: 10/30/01
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 09/24/01

Date of Last EDR Contact: 09/11/01

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-424-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 06/21/00
Date Made Active at EDR: 07/31/00
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 07/10/00
Elapsed ASTM days: 21
Date of Last EDR Contact: 11/07/01

ERNS: Emergency Response Notification System
Source: EPA/NTIS
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 08/08/00
Date Made Active at EDR: 09/06/00
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 08/11/00
Elapsed ASTM days: 26
Date of Last EDR Contact: 10/25/01

FEDERAL ASTM SUPPLEMENTAL RECORDS

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/99
Database Release Frequency: Biennially
Date of Last EDR Contact: 09/18/01
Date of Next Scheduled EDR Contact: 12/17/01

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: N/A
Database Release Frequency: Varies
Date of Last EDR Contact: N/A
Date of Next Scheduled EDR Contact: N/A

ROD: Records Of Decision
Source: NTIS
Telephone: 703-416-0223
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 09/30/00
Database Release Frequency: Annually

Date of Last EDR Contact: 10/09/01
Date of Next Scheduled EDR Contact: 01/07/02

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: N/A
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/26/01
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 11/05/01
Date of Next Scheduled EDR Contact: 02/04/02

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report
Source: EPA
Telephone: N/A
Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 07/13/01
Database Release Frequency: Quarterly

Date of Last EDR Contact: 10/08/01
Date of Next Scheduled EDR Contact: 01/07/02

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4526
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 05/31/01
Database Release Frequency: Annually

Date of Last EDR Contact: 10/22/01
Date of Next Scheduled EDR Contact: 01/21/02

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 05/29/01
Database Release Frequency: Quarterly

Date of Last EDR Contact: 10/08/01
Date of Next Scheduled EDR Contact: 01/07/02

Telephone: 205-564-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Last EDR Contact: 08/21/01
Date of Next Scheduled EDR Contact: 11/19/01

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-260-3936
PCB Activity Database. PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 03/30/01
Database Release Frequency: Annually
Date of Last EDR Contact: 10/25/01
Date of Next Scheduled EDR Contact: 11/12/01

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95
Database Release Frequency: No Update Planned
Date of Last EDR Contact: 09/13/01
Date of Next Scheduled EDR Contact: 12/10/01

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-260-1531
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/99
Database Release Frequency: Annually
Date of Last EDR Contact: 09/24/01
Date of Next Scheduled EDR Contact: 12/24/01

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-1444
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/98
Database Release Frequency: Every 4 Years

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

STATE OF CALIFORNIA ASTM STANDARD RECORDS

AWP: Annual Workplan Sites
Source: California Environmental Protection Agency
Telephone: 916-323-3400
Known Hazardous Waste Sites. California DTSC's Annual Workplan (AWP), formerly BEP, identifies known hazardous substance sites targeted for cleanup.

Date of Government Version: 11/08/00
Date Made Active at EDR: 03/02/01
Database Release Frequency: Annually
Date of Data Arrival at EDR: 01/31/01
Elapsed ASTM days: 30
Date of Last EDR Contact: 10/30/01

CAL-SITES: Calsites Database
Source: Department of Toxic Substance Control
Telephone: 916-323-3400
The Calsites database contains potential or confirmed hazardous substance release properties. In 1996, California EPA reevaluated and significantly reduced the number of sites in the Calsites database.

Date of Government Version: 10/01/00
Date Made Active at EDR: 11/22/00
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 10/30/00
Elapsed ASTM days: 23
Date of Last EDR Contact: 10/16/01

CHMIRS: California Hazardous Material Incident Report System
Source: Office of Emergency Services
Telephone: 916-464-3283
California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

Date of Government Version: 12/31/94
Date Made Active at EDR: 04/24/95
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 03/13/95
Elapsed ASTM days: 42
Date of Last EDR Contact: 08/29/01

CORTESE: "Cortese" Hazardous Waste & Substances Sites List
Source: CAL EPA/Office of Emergency Information
Telephone: 916-327-1848
The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

Date of Government Version: 04/01/01
Date Made Active at EDR: 07/26/01
Database Release Frequency: Varies
Date of Data Arrival at EDR: 05/29/01
Elapsed ASTM days: 58
Date of Last EDR Contact: 10/30/01

NOTIFY 65: Proposition 65 Records
Source: State Water Resources Control Board
Telephone: 916-657-0696
Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

Date of Government Version: 10/21/93
Date Made Active at EDR: 11/19/93
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 11/01/93
Elapsed ASTM days: 18
Date of Last EDR Contact: 10/22/01

TOXIC PITS: Toxic Pits Cleanup Act Sites
Source: State Water Resources Control Board
Telephone: 916-227-4364
Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

Date of Government Version: 07/01/95
Date Made Active at EDR: 09/26/95
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 08/30/95
Elapsed ASTM days: 27
Date of Last EDR Contact: 11/05/01

SWF/LF (SWIS): Solid Waste Information System
Source: Integrated Waste Management Board
Telephone: 916-341-6320
Active, Closed and Inactive Landfills. SWF/LF records typically contain an inve ntory of solid waste disposal facilities or landfills. These may be active or i nactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 09/20/01
Date Made Active at EDR: 10/19/01
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 09/21/01
Elapsed ASTM days: 28
Date of Last EDR Contact: 09/21/01

WMUDS/SWAT: Waste Management Unit Database
Source: State Water Resources Control Board
Telephone: 916-227-4448
Waste Management Unit Database System. WMUDS is used by the State Water Resources Control Board staff and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. WMUDS is composed of the following databases: Facility Information, Scheduled Inspections Information, Waste Management Unit Information, SWAT Program Information, SWAT Report Summary Information, SWAT Report Summary Data, Chapter 15 (formerly Subchapter 15) Information, Chapter 15 Monitoring Parameters, TPCA Program Information, RCRA Program Information, Closure Information, and Interested Parties Information.

Date of Government Version: 04/01/00
Date Made Active at EDR: 05/10/00
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 04/10/00
Elapsed ASTM days: 30
Date of Last EDR Contact: 09/13/01

LUST: Leaking Underground Storage Tank Information System
Source: State Water Resources Control Board
Telephone: 916-445-6532
Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

Date of Government Version: 08/07/01
Date Made Active at EDR: 09/07/01
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 08/09/01
Elapsed ASTM days: 29
Date of Last EDR Contact: 11/08/01

CA BOND EXP. PLAN: Bond Expenditure Plan
Source: Department of Health Services
Telephone: 916-255-2118
Department of Health Services developed a site-specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds. It is not updated.

Date of Government Version: 01/01/89
Date Made Active at EDR: 08/02/94
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 07/27/94
Elapsed ASTM days: 6
Date of Last EDR Contact: 05/31/94

CA UST:

UST: Active UST Facilities
Source: SWRCB
Telephone: 916-341-5700
Active UST facilities gathered from the local regulatory agencies

Date of Government Version: 10/30/01
Date Made Active at EDR: 11/14/01
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 11/05/01
Elapsed ASTM days: 9
Date of Last EDR Contact: 10/15/01

CA FID UST: Facility Inventory Database
Source: California Environmental Protection Agency
Telephone: 916-445-6532
The Facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resource Control Board. Refer to local/county source for current data.

Date of Government Version: 10/31/94
Date Made Active at EDR: 09/29/95
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 09/05/95
Elapsed ASTM days: 24
Date of Last EDR Contact: 12/28/98

HIST UST: Hazardous Substance Storage Container Database
Source: State Water Resources Control Board
Telephone: 916-227-4408
The Hazardous Substance Storage Container Database is a historical listing of UST sites. Refer to local/county source for current data.

Date of Government Version: 10/15/90
Date Made Active at EDR: 02/12/91
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 01/25/91
Elapsed ASTM days: 18
Date of Last EDR Contact: 07/26/01

STATE OF CALIFORNIA ASTM SUPPLEMENTAL RECORDS

AST: Aboveground Petroleum Storage Tank Facilities
Source: State Water Resources Control Board
Telephone: 916-227-4382
Registered Aboveground Storage Tanks.

Date of Government Version: 08/21/01
Database Release Frequency: Quarterly
Date of Last EDR Contact: 11/05/01
Date of Next Scheduled EDR Contact: 02/04/02

CLEANERS: Drycleaner Facilities
Source: Department of Toxic Substance Control
Telephone: 916-225-0873
A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaner's agents; linen supply; coin-operated laundries and cleaning; drycleaning plants, except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

Date of Government Version: 07/27/01
Database Release Frequency: Annually
Date of Last EDR Contact: 10/08/01
Date of Next Scheduled EDR Contact: 01/07/02

CA WDS: Waste Discharge System
Source: State Water Resources Control Board
Telephone: 916-657-1571
Sites which have been issued waste discharge requirements.

Date of Government Version: 07/19/01
Database Release Frequency: Quarterly
Date of Last EDR Contact: 09/25/01
Date of Next Scheduled EDR Contact: 12/24/01

HAZNET: Hazardous Waste Information System
Source: California Environmental Protection Agency
Telephone: 916-255-1136
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

Date of Government Version: 12/31/00
Database Release Frequency: Annually
Date of Last EDR Contact: 08/17/01
Date of Next Scheduled EDR Contact: 11/12/01

EDR PROPRIETARY DATABASES

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

HISTORICAL AND OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 1999 from the U.S. Fish and Wildlife Service.

GEOCHECK®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

PARCEL C
8501 FALLBROOK AVENUE
CANOGA PARK, CA 91304

TARGET PROPERTY COORDINATES

Latitude (North):	34.220100 - 34° 13' 12.4"
Longitude (West):	118.624001 - 118° 37' 26.4"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	350404.2
UTM Y (Meters):	3787558.0

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

USGS TOPOGRAPHIC MAP ASSOCIATED WITH THIS SITE

Target Property: 2434118-B5 CANOGA PARK, CA
Source: USGS 7.5 min quad index

GENERAL TOPOGRAPHIC GRADIENT AT TARGET PROPERTY

Target Property: General SE

Source: General Topographic Gradient has been determined from the USGS 1 Degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
LOS ANGELES, CA	YES - refer to the Overview Map and Detail Map

0601370035C / CBPP

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CANOGA PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Site-Specific Hydrogeological Data*:

Search Radius:	2.0 miles
Status:	Not found

AQUIFLOW®

Search Radius: 2.000 Miles.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
A2	1 - 2 Miles East	SW
A3	1 - 2 Miles East	NW
4	1 - 2 Miles East	SSW
B5	1 - 2 Miles SE	S
B6	1 - 2 Miles SE	SSE

For additional site information, refer to Physical Setting Source Map Findings.

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Mesozoic
System:	Cretaceous

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

Soil Layer Information

	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Surficial Soil Types:
loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Shallow Soil Types:
fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types:
stratified

clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 1999 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the national Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-260-2805
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-260-2805
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

STATE RECORDS

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations for District 2 and 6
Source: Department of Conservation
Telephone: 916-323-1779

RADON

Area Radon Information: The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones: Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

APPENDIX C

Summary of Asbestos Reports

Appendix C
Summary of Asbestos Reports

Asbestos Survey Results, Hughes Aircraft Missile Systems Group, Building 269
This document consists of only a table with sample numbers, sample locations, descriptions, analytical results, and friability. No text report or cover page was included with this document.

Based on a review of this document, materials that were sampled from Building 269 (no longer located at the Property) included: several types of ceiling tiles, ceiling tile mastic, door gasket, drywall, pipe elbow insulation, valve packing, pipe valve insulation, and duct tape. The materials found to contain asbestos included: door gasket in oven #1 in room 1570, pipe elbow insulation, valve packing, and pipe valve insulation in mezzanine 03.

Interdepartmental Correspondence, Hughes Aircraft Company, regarding an asbestos survey conducted by International Technology, Inc. (IT), dated June 27, 1989
This survey included portions of Buildings 262 (Building A) and 270 (Building C). Suspect ACMs sampled in Building 262 included pipe and elbow insulation, pipe insulation debris, drywall, ceiling tile, fireproofing, ceiling tile mastic, plaster, and duct tape. Materials that were found to contain asbestos included pipe and elbow insulation and associated debris, plaster, and drywall. One sample of the drywall material and two samples of the plaster material were found to contain a trace amount of asbestos. The remaining samples of these materials were found to be non-detect for asbestos. Suspect ACMs sampled and found to contain asbestos in Building 270 included valve and gauge insulation pipe and elbow insulation and related debris. It is not known if other materials were sampled in this building. The pipe, elbow, valve, and gauge insulation materials reportedly were rated in a condition of 2 to 6. The rating system appears to be qualitative with 1 (worst condition) to 7 (best condition).

Interdepartmental Correspondence, Hughes Aircraft Company, dated June 20, 1989
This document refers to Buildings 272, 274, and 279, however only information relating to Building 272 (no longer at the Property) was reviewed as part of this scope of work. The remaining buildings were not located at the Property. Suspect ACMs sampled in this building included: drywall and drywall mud material. No asbestos was detected in the samples analyzed. Vinyl floor materials were reportedly assumed to contain asbestos.

Asbestos Survey Buildings 261, 264, and 268, September 13, 1989

Only information for Building 268 (Building B) was reviewed from this report. The remaining buildings were not part of the Property. Suspect ACMs sampled as part of this survey included: pipe elbow insulation, pipe trap insulation, transite vent pipe, "clean out" insulation at the roof drain, plaster, drywall, ceiling tiles, and duct tape. It is not known if the joint compound associated with the drywall was sampled. Sampled materials that were found to contain asbestos included: pipe elbow insulation, "clean out" insulation, and transite vent pipe. The ACMs were reportedly observed in conditions from 2 to 6.

Hughes Interdepartmental Correspondence, dated November 7, 1989

This memorandum indicates that ACM was identified on "some water pipes above the ceilings, drain lines, and in duct chaseways" in Building 262 (Building A). These materials were reportedly planned for removal between November and December 1989. No abatement reports or closeout documents were available to confirm the removal activities.

Asbestos Sampling and Laboratory Testing of Wall & Ceiling Construction Materials in Building 262 and 265 at the Hughes Missile Systems Group Facility, by E&A Environmental Services, Inc. (E&A), dated February 18, 1994

Only information pertaining to Building 262 is included in this review. Building 265 is not a part of the Property. According to this report, plaster and button board materials were sampled due to damage that occurred during the 1994 earthquake. The table of laboratory results included in this report was not legible, however, the text portion indicates that asbestos was detected in the plaster material on the first floor east end stairwell of the building. The material was reported to be damaged, and repair was recommended.

Asbestos Bulk Sampling at The Hughes Missile Systems Group, Building 262 & 268, by E&A, dated April 29, 1994

According to this report, suspect ACMs that were sampled in each of the buildings included: ceiling tiles, floor tiles and associated mastic, vapor barrier, drywall and joint compound, pipe insulation, roofing materials, vibration damper, and exterior paint. Materials that were found to contain asbestos in each of the buildings included: various floor tiles and mastic, drywall joint compound, mastic on an exterior wall base, exterior wall paint, pipe insulation, and roof mastic. The majority of these materials were reported as being in good condition, with damage reported on some pipe insulation and drywall.

Asbestos Bulk Sampling at The Hughes Missile Systems Group, Building 270, by E&A, dated April 20, 1994

According to this report, the suspect ACMs sampled were roofing materials. Asbestos was detected in roof flashing and black mastic patches. These materials were reported as being in good condition.

Visual Asbestos Survey of the Facility Located at 8433 Fallbrook, Canoga Park, California, by Earth Tech, November 30, 1994

This survey includes Buildings 261, 263, 264, 265, 268, 274, 276, 277, and 281. Only those portions of the report related to Building 268 were reviewed. The remaining buildings were not located at the Property. The purpose of the survey reportedly was to inspect the known ACMs and note any change in condition. The building was previously surveyed by IT in 1989.

The report indicates that damaged materials were observed in Building 268. Some areas of this building were not inspected because they were unsafe (presumably from earthquake damage). No information on the types of ACMs or locations was included in the report. According to this report, the majority of the damaged and/or friable pipe insulation identified in various buildings (assumed to include Building 268) in the 1989 IT survey, had been removed. Floor tiles and associated mastic were assumed to contain asbestos during the 1989 survey and reportedly were still in place during this survey.

Asbestos Inspection Report #R970732-2, Coast Federal Bank Facility, Buildings 262, 268, 269, 270, 272 & 282, by J&H Environmental, Inc. (J&H), dated July 21, 1997

This inspection reportedly was conducted to verify the extent of abatement work that had been performed and to collect samples to confirm the existence of non-friable ACMs. As part of the inspection, J&H reviewed prior asbestos documents, dated from 1989 to 1994. The buildings were not occupied at the time of the inspection, due to earthquake damage.

According to the J&H report, flooring materials, drywall joint compound, pipe insulation, exterior stucco (paint), and roofing materials in Buildings 262, 268, 269, and 270 had been found to contain asbestos. Drywall joint compound and roofing materials in Building 272 had been found to contain asbestos, and none of the suspect materials sampled in Building 282 were found to contain asbestos.

Asbestos Inspection Report, Coast Federal Bank Facility, Buildings 262, 268, 269, 270, 272, & 282, by J&H, dated August 6, 1997

The findings of this report are similar to the July 21, 1997 J&H report, moreover, confirmation of the removal of pipe insulation was included in this report. Based on this report, the majority of accessible asbestos-containing pipe insulation had been removed and replaced with fiberglass.

Asbestos Abatement Observation Report, Bldg #268, Coast Federal Bank Facility, by J&H, dated April, 1998

According to this report, floor tiles and mastic were removed from Building 268 during March and April 1998. Clearance air sample results were within the allowable limits. The quantity of material removed is not included in the report.

Emergency Asbestos Clean Up, Patch and Repair Report, Westhills Corporate Village, Building 8521, by J&H, dated November 6, 1999

The cleanup referenced in this report consisted of asbestos pipe insulation and debris located in and near the HVAC system on the roof of Building 8521 (known as Building B). Repairs were also made to damaged pipe, tee, and elbow insulation. Clearance air sampling was conducted and the results were within the allowable limits.

Asbestos Inspection Report, West Hills Corporate Village, Buildings 8501 and 8531, by J&H, dated November 15, 1999

Suspect ACMs sampled as part of this inspection included pipe insulation, silver paint, roof mastic, and several types of insulation. The pipe insulation was found to contain asbestos, and the remainder of the materials were reported as not containing asbestos. J&H recommended abatement of the ACMs, due to the poor condition.

APPENDIX D

Summary of ENVIRON's Review of Previous Reports

Appendix D
Summary of ENVIRON's Review of Previous Reports

Letter, dated July 12, 1988

The earliest dated document available for ENVIRON's review is a letter from Calscience Engineering & Laboratories, Inc. (CEL) dated July 12, 1988, regarding supplemental information on excavation pits T-3 and T-13 (both of which were located at the Property). The letter indicated that two USTs were closed by abandonment at the Hughes Aircraft Company Missile Systems Group Facility, Canoga Park (Site or Facility), that comprised an area much larger than that of the Property. The letter further indicated that pits were excavated in those areas to approximate depths of 23 feet and samples were collected from the bottom and sides of the pits, and were analyzed for total recoverable petroleum hydrocarbons (TRPH). The letter reported that analytical results showed minimal contamination in pit T-13, while elevated concentrations were detected in pit T-3, and therefore, the extent of contamination in that area had not been delineated.

Potential Source Area Investigation Report for the Hughes Missile Systems Group, Canoga Park, California, prepared by McLaren Hart (Mclaren), dated November 30, 1989

Mclaren indicated that the Site covers approximately 80 acres; the report indicated that a plan view of the Facility showing all areas of chemical use and concern was included (this figure was not included in the report, but was provide to ENVIRON by AMLGM). McLaren further indicted that operations at the Site began in 1959 under ownership and occupants other than Hughes. Hughes first occupied the Site in 1966, and was still operating at the Facility in 1989 (mainly research and development activities in fifteen buildings). Mclaren reported that the main chemicals of concern at the Site included paints, solvents, and petroleum products including oils, diesel and gasoline; corrosives were also used in printed wire board plating. Since 1959, storage tanks have been used at the Site, including twenty-nine ASTs used primarily for processed water storage, six active USTs used for diesel and gasoline storage, seven abandoned USTs previously used for storage of oils and solvents, two polypropylene lined concrete pits, and several areas for drum storage. The USTs reportedly had resulted in releases and have impacted the Site with benzene, trichloroethene (TCE), 1,1-dichloroethene (DCE), and 1,1-dichloroethane (1,1-DCA). Eight of the aforementioned USTs were located at the Property.

Mclaren indicated that the Facility had been investigated for potential sources of contamination and that 53 areas of concern were identified and detailed on a figure, which was later provided to ENVIRON by AMLGM.

The McLaren report included a brief summary of activities in each of the buildings at the Site; only those buildings currently or previously located at the Property are summarized below:

- Building 262: areas used for solvent cleaning, paint storage, coating and lubrication operations.

- Building 268: areas where solvents, lubricants, spray paint and ferric chloride are used, copper etching was also conducted. A clarifier has been active since 1982 and receives photographic lab waste.

- Building 269: areas used for cleaning, vapor degreasing, bonding, metal machining, plating, painting, etching, soldering, photographic developing and laboratory operations.

- Building 270: areas used for degreasing, soldering, solvent cleaning, bonding, laboratory operations.

- Building 272: solvents, acids, bases, caustic materials, flammable and nonflammable liquid storage.

- Building 282: garage with gasoline, motor oil, antifreeze, and kerosene use.

- Hazardous Waste Storage Shed or Area (HWSA): solvent storage.

In addition to tank T-3 area, Mclaren recommended investigations at five areas, all of which are located at the Property:

1) Waste neutralization sump P-2 (clarifier near former building 269)
2) Buildings 269/270 plating areas
3) Building 270 UST T-12
4) Building 272 chemical storage area
5) Former drum storage area east of building 272.

Radioisotope Review and Comparison for the Hughes Missile Systems Group Facility, Canoga Park, California, by Mclaren, dated July 30, 1991

It is not clear what prompted this study. Mclaren reported that the objective was to evaluate whether radioactivity levels observed in ground water beneath the Facility were consistent with background levels within the region.

Uranium was identified as a naturally occurring radioisotope in rock and soil in nearby formations. Mclaren also reviewed a summary of the reported radioisotopes concentrations in ground water in the San Fernando Valley Area. On a regional basis, gross alpha, gross beta, total uranium, and radium-226 were detected at mean concentrations ranging from 2 to 41, 3.7 to 11.9, 18.3, and 0.1 to 0.8 picoCuries per liter (pCi/L), respectively. These radioisotopes were detected in ground water at the Site in the following ranges: Gross alpha 2.5 to 43.4 pCi/L, gross beta 5.5 to 20.4 pCi/L, total uranium 1.0 to 49.7 pCi/L, and radium-226 from 0.1 to 1.9 pCi/L. The drinking water standards (maximum contaminant levels or MCLs) for these radioisotopes are: Gross alpha 15 pCi/L, gross beta 50 pCi/L, total uranium 20 pCi/L, and radium-226 5 pCi/L.

Mclaren indicated that, although rock deposits at the Site have not been tested for radioisotopes, research suggests that uranium and radium are naturally occurring in this area. Mclaren concluded that, although radioisotopes are slightly elevated at the Site in comparison to other parts of San Fernando Valley, the occurrence could be attributed to uranium in geologic deposits. Mclaren recommended continuing to monitor the on-site ground water for uranium and radium-226 on a quarterly basis.

Feasibility Study for Ground Water Remediation at Hughes Aircraft Company Missile System Group Facility, by Groundwater Technology Inc. (GTI), February 14, 1992

ENVIRON was only provided with the executive summary and some of the figures from this report; the reviewed portions did not detail the contaminants present at the Property. The purpose of GTI's feasibility study was to evaluate the remedial activities for ground water containing dissolved-phase volatile organic compounds (VOCs) at the Site (which included the Property).

Based on its calculations of the volume of dissolved VOCs present in the ground water at the northeast portion of the Site, the estimated transmissivity of the underlying aquifer, and using a numerical ground water modeling program, GTI indicated that the capture zones produced by pumping would be sufficiently large to capture and remediate the existing plume within 20 years. GTI further indicated that the ground water pump-and-treat system using liquid-phase carbon would

be the most appropriate remedial technology for this Site. GTI recommended installing a minimum of nine ground water recovery wells to fully contain of the dissolved-phase plume.

Investigation of Radioactivity in Groundwater at the Hughes Aircraft Company, Canoga Park Facility, Canoga Park, California, prepared by Groundwater Resources Consultants, Inc. (GRCI), dated January 23, 1992

GRCI indicated that it collected ground water samples from twenty-seven monitoring wells at the Site. Only the summary and recommendations section of this report was available for ENVIRON's review. GRCI indicated that based on the analytical results from monitoring wells at the Site, all adjusted gross alpha results were below the drinking water standards. Several samples had uranium concentrations that exceeded the proposed MCL; these were attributed to naturally occurring uranium in the region's soils.

Phase I Environmental Report: Areas of Potential Chemical Release to Soil and Ground Water, Hughes Missile Systems Company, prepared by GTI, dated December 28, 1993

This report indicated that thirteen USTs exist or existed at the Site. Based on available figures from other reports, eight USTs were present at the Property (Tanks T-1 to T-4, T-12 to T-14, and T-17). GTI indicated that there are reports documenting the removal of ten tanks (T-1 to T-3, T-5 to T-10, and T-13). T-4 reportedly was abandoned in-place. Soils in the vicinity of these tanks reportedly have been impacted by VOCs.

Two storage pits (likely referring to the clarifiers) are reported to be present immediately east of Building 269, Mclaren identified one of them as a source of contamination. Two large cooling ponds reportedly were present between Buildings 262/263 (outside the Property) and 268/269 (at the Property). Two main chemical storage areas were identified at the Site as Building 272 and the HWSA, both located at the Property.

Report on Facility-Wide Site Assessment, Hughes Missile Systems Company, prepared by GTI, dated January 4, 1994

GTI indicated that investigations have been conducted at the Site since early 1980s but have not been thorough. GTI reported that three areas of the Site are known to be contaminated: (1) Northwestern corner from Building 269 to western edge of the Site (northwestern part of the Property); (2) area of monitoring well CM-8D (outside the Property); and (3) area of monitoring well CM-10 (outside the Property). As part of this investigation, GTI installed seven additional monitoring wells (central and eastern portions of the Facility) and advanced twenty soil borings (near

former plating areas by Building 269, along main sewer line from pit P-2, on periphery of Building 270, and at four random locations). Ground water samples were collected from these seven wells and from three existing wells. Soil samples were analyzed for metals and VOCs.

GTI reported that based on soil sampling analytical results, there was no evidence of releases in the areas sampled. VOCs were detected, however, in the ground water. Freon 11 was detected in samples collected from well CM-10.

Corrective Action Plan Addendum, Hughes Missile Systems Company, prepared by GTI, dated March 29, 1994

The GTI report indicated that VOCs are present in ground water at concentrations exceeding 100 micrograms per liter (µg/L) at three main areas of the Site:

- Northwestern corner of the Facility from north of Building 269 to the extreme northwestern edge of the Site (total petroleum hydrocarbons in the gasoline range [TPH-g] has also been detected in ground water in this area; furthermore, soils in this area are impacted with VOCs and TPH-g). The area includes former Tanks T-1 and T-2 (vicinity of Building 282), and T-3 (near monitoring well M-1).

- Area around monitoring well CM-8D, where tanks T-5, T-6, and T-10 were previously located (outside the Property).

- Area around monitoring well CM-10, ground water impacted with Freon 11 (outside the Property).

The report indicated that an interim ground water remediation system is operating at the Site, and consists of recovery wells RW-1 to RW-5 (operating since early 1993). GTI indicated that this report offers an addendum to the corrective action plan (CAP) previously prepared in 1992. ENVIRON does not have a copy of the 1992 CAP, which reportedly outlined a phased approach to Site remediation, as follows:

- Phase I: Containing the ground water contamination to prevent off-site migration (installing and operating 5 recovery wells).

- Phase II: Continuing Site Assessment and conducting pilot testing of alternative remedial technologies.

- Phase III: Designing and implementing an expanded Facility-wide remediation system.

- Phase IV: Verifying that remediation objectives have been met and requesting Site closure.

GTI indicated that Phase I was partially completed because a system has been installed; however, the system had not been operated because extracted ground water was found to be high in total dissolved solids (TDS) and could not be discharged to the storm drain. Hughes was obtaining a permit from the Regional Water Quality Control Board – Los Angeles Region (LARWQCB) to reuse the extracted ground water for on-site irrigation.

GTI also indicated that a pilot test of vapor extraction, air sparging and ground water pumping was conducted in May 1993. Moreover, in August and October 1993, additional assessments reportedly were conducted at the Facility, and no additional source areas were identified. The main contaminants at the Site are TPH-g, 1,1-DCE, and TCE with maximum concentrations detected in ground water at 24,000, 5,100, and 310 µg/L, respectively. 1,1,1-trichloroethane (TCA), 1,1-DCA, and tetrachloroethene (PCE) were also detected at lower concentrations. The chlorinated VOCs reportedly were detected down to 25 to 30 feet below the ground water table. GTI proposed the following: Seventeen ground water recovery wells (some of which had already been installed as part of Phase I), twenty five vapor extraction wells, and twenty nine air sparging/vapor extraction combination wells. The recovery wells were proposed to be screened from 5 feet above to 35 feet below the ground water table. GTI proposed no remediation but only monitoring of ground water in the area of CM-8D.

The addendum to the CAP did not re-list the cleanup goals, reportedly established in the CAP.

Contingent Closure and Post Closure Plans, Hughes Aircraft Company, Missile Systems Group, Canoga Park Facility, prepared by CH2M Hill, dated November 21, 1994

The Department of Toxics Substances Control (DTSC) had requested a contingent closure plan for Tank T-3, which was permitted under the Resource Conservation and Recovery Act (RCRA) when it was removed in 1988. Two RCRA permitted facilities reportedly were present at the Site: the HWSA, and the Tank T-3 (both are located at the Property). CH2M Hill reported that all remedial activities at T-3 area will be completed during closure, therefore, post closure care is not anticipated.

The contingent closure plan indicated that soil remediation in the tank vicinity was conducted in accordance with the CAP and was detailed in the Final Report for Remediation of Former Tank T-3 Site (November 1991, ENVIRON has no copies). CH2M Hill further reported that soils were excavated in the area of this tank and confirmation soil samples were compared to RCRA Universal Treatment Standards (UTS) and found to be below these standards. Ground water, however, was found to contain 1,1-DCE, TCA, TCE and PCE above UTS. The ground water was being remediated under oversight from the LARWQCB.

Technical Memorandum Records Review and Limited Site Investigation, Hughes Missile Systems Company, prepared by Earth Tech, dated November 28, 1994

Earth Tech conducted the work for a potential buyer with the purpose of: (1) evaluating whether current or past environmental investigations and remedial actions carried out by Hughes sufficiently identified past environmental conditions; (2) evaluating whether Hughes adequately mitigated areas of environmental impacts; and (3) documenting the current regulatory status of the Site. The portion of the Site considered for purchase lies outside the Property (to the south) and includes Buildings 261, 263, 264, 265, 271, 274, 276, 277, and 281. The report reiterates the three main areas of contamination at the Site (same as those described in the GTI 1994 report).

Earth Tech also indicated that based on its reviews, the following additional concerns were identified at the Site: (1) Hughes was still in the process of obtaining regulatory closure for its hazardous waste storage building from DTSC. (2) Chemical staining and powder residues were noted in Building 272 at the Property. (3) No sampling has been conducted for drain lines inside buildings; however, based on sampling in outside areas, contamination would be expected to be minor. (4) Earth Tech recommended that Clarifiers P-1 and P-2 be removed. (5) Although all tanks have been removed, no closure letters were available. Earth Tech conducted supplemental soil sampling in areas of several former USTs (figure shows locations), which did not reveal additional sources of VOCs or TPH-g.

LARWQCB, Order Number 95-012, Waste Discharge Requirements for Hughes Missile Systems (File No. 94-45), dated December 14, 1994

The Order indicated that in 1985 Hughes discovered that soils and ground water at the Facility were contaminated with VOCs, and that the lateral and vertical extent of contamination is believed to have been defined. The Order also indicated that Hughes has prepared a CAP, which has been approved by the LARWQCB. The CAP indicates that shallow ground water will be pumped and treated on-site using activated carbon; the treated water would be reused on-site for irrigation purposes. The

Order lists maximum discharge limitations for treated water for benzene, toluene, ethylbenzene, and xylenes (BTEX), chlorinated VOCs, oil and grease, TDS, sulfate, chloride, and boron. The Order requires quarterly monitoring of ground water and treatment systems at the Site; in addition, an annual summary is required to be submitted to the LARWQCB in March of each year.

Proposed Negative Declaration for Hughes Missile Systems, Canoga Park Facility Closure Plan, prepared by DTSC and dated January 1995

The document was prepared by DTSC for the closure units: HWSA and Tank T-3 (both located at the Property). The negative declaration describes the closure requirements and indicates that Hughes will prepare a final closure certification report upon completion of the closure activities; and if acceptable, the DTSC will issue a letter approving the certification to release DTSC of its financial assurance responsibility; the DTSC, however, indicated that it could still impose additional corrective action to be addressed during post closure if any credible evidence is obtained indicating there are new solid waste management units at the Site.

Memorandum regarding Areas of Concern for Hughes Missile Systems Group, prepared by DTSC and dated February 1995

The memorandum outlines tentative solid waste management units (SWMUs) and areas of concern (AOCs), based on existing data to date. Only areas located at the Property are listed below:

- Buildings 272 and 282, which are located at the Property north of Building 270, were previously used for hazardous waste storage and identified as sources of chlorinated solvents contamination. These buildings are SWMUs that require remediation.

- Portions of Building 262 at the Property are considered AOCs because of the long history of chemical usage and because wells located semi-downgradient (CM-8d, CM-9d, and CM-18) have 1,1-DCE. Further evaluation is required.

- Building 268, located at the Property, had several areas of active chemical use. Well CM-12 is located approximately 100 feet downgradient of this building and has high concentrations of 1,1-DCE. According to DTSC, this building is considered an AOC and a soil gas survey should be conducted in this area.

- Building 269, located at the Property, has been identified as a source of soil and ground water contamination; however, according to DTSC, not all potential sources in this building

have been investigated; therefore, the building remained an AOC requiring additional investigations. DTSC requested that a soil gas survey be conducted in this area.

- Building 270, located at the Property, had several source areas. The DTSC indicated that investigations have been conducted outside the building; however, the building would still need to be considered an AOC requiring further evaluation with respect to the previous interior uses and waste disposal. The DTSC further indicated that a soil gas survey is required as an initial step to evaluate this AOC.

- Tanks T-1, T-2 and associated pump island are located near Building 272 at the Property, are considered SWMUs. Also tanks T-5, T-6, T-7, T-8, T-9, and T-10, which appear to be south of the Property (near Buildings 281 and 263) are considered SWMUs.

- Tank T-12, located at the Property south of Building 270, was used for storage of waste solvent. T-13 was also a short distance away from T-12; both are AOCs requiring further evaluation.

- Tank T-14 reportedly was located south of Building 269, and another tank T-16 is shown on a map south of Building 269; neither tanks are discussed and would be considered AOCs until further evaluation was completed by Hughes.

Report on Soil Gas Surveying at Former Hughes Missile Systems Company, Canoga Park, prepared by GTI, dated August 1, 1995

Only the results and discussions portion of this report was available for ENVIRON's review. VOCs were detected in most soil gas samples. It appears that GTI divided the Site into 5 areas, as follows:

Area 1: East of Building 269, no evidence that there is additional sources other than T-3, T-1 and T-2.

Area 2: South of Building 270, no evidence of sources in this area.

Area 3: Southwest of Building 263 (outside the Property), no evidence of sources in this area.

Area 4: Southeast of Building 263 (outside the Property), no clear source area was identified; therefore GTI was not able to point to the origin of contamination detected in well CM-8D.

Area 5: Southeast of Building 265 (outside the Property), a Freon anomaly was detected in this area and could be attribute to releases from the sewer lines.

Letter, dated October 12, 1995

In a letter dated October 12, 1995, the DTSC indicated that initially soil and ground water cleanup standards were established for the Site based on the lowest numbers produced from a health risk assessment, background measurement, or MCLs. However, since those cleanup levels were established, the LARWQCB has issued a Waste Discharge Requirement (WDR) permit with limitations that are lower than MCLs. The DTSC was requesting from the LARWQCB a determination regarding which cleanup goals to use for the Site.

Letter, dated January 26, 1996

In a letter dated January 26, 1996 to the LARWQCB, the DTSC was requesting confirmation of the lead agency for the corrective action conducted at the Site. The letter indicated that on November 28, 1995, DTSC and LARWQCB agreed to include the Site on the SB1082 list. However, back in August 1990, Hughes and DTSC had entered into a consent agreement and order wherein Hughes would comply with LARWQCB requirements for the ground water remediation and monitoring. The LARWQCB responded in a letter dated January 30, 1996 that it has no objections to the DTSC's request to be the lead agency. The LARWQCB, however, requested to be copied on all future correspondence/reports regarding this case.

Quarterly Ground Water Monitoring Report, Fourth Quarter 1995, by Groundwater Resources Consultants Inc. (GRCI), January 10, 1996

ENVIRON reviewed only a text summary of this report, which did not include figures and tables. GRCI reported that in December 1995, the depth to ground water measured at the Site ranged from approximately 10 feet to 63 feet below ground surface (bgs). During the period from September 1995 to December 1995, water levels generally declined in peripheral wells and rose in wells located in or near the reclamation well field.

GRCI reported that the direction of ground water flow in the shallow portion of the saturated zone was generally to the south and southwest, which was consistent with previously reported ground

water flow. Ground water extraction from reclamation wells in the northwest portion of the Facility was reported to have resulted in a cone of depression. The portions of the report reviewed by ENVIRON did not include analytical results from the sampling activities.

Groundwater Monitoring, Quarterly Report, January-March 1996, Hughes Missile Systems Company, by Groundwater Technology, dated March 27, 1996

Based on this report, a ground water recovery system was in operation at the Site. Seventeen recovery wells reportedly were pumping on a cyclic basis, thirty-four monitoring wells (located on and off the Property) were gauged monthly for depth to ground water, while sixteen monitoring wells were sampled on a quarterly basis. GTI reported that the recovery system was permitted for treatment of up to 22,000-gallons per day (gpd) of extracted ground water. On average 4,000 and 11,000 gpd were treated and reused on-site for irrigation purposes. GTI estimated that remediation of the ground water would be completed sometime between 2001 and 2003.

Based on the first quarter 1996 monitoring, the depth to ground water in shallow wells ranged from 12.78 to 46.40 feet bgs, and the gradient was to the southwest in the northwest portion of the Site and to the south-southeast in the remainder of the Site. Treated ground water effluent reportedly met the discharge requirements specified in the WDR permit. Quarterly ground water sampling results had detectable VOCs in two of the monitoring wells and in twelve of the recovery wells.

Letter, dated August 6, 1996

In a letter dated August 6, 1996, the DTSC approved the Negative Declaration for Hughes' closure plan.

Limited Review of Potential Environmental Impacts to Former Hughes Missile System Company, by AllWest Geoscience, Inc. (Allwest), dated October 11, 1996

This review, conducted by Allwest, included Buildings 262, 268, 270, 272, and 282, all of which are currently, or were previously, located on the Property. The review included a site visit, file reviews at local regulatory agencies, and review of previous documents pertaining to the Property.

Based on its review of previous reports and site visit, Allwest reported the following findings:

- The area of the Property beneath Building 269, and northward to the Property boundary has soil and ground water contaminated with chlorinated VOCs and TPH-g. At the time of Allwest's site visit, this area was undergoing remediation, which included ground water

pumping/treatment, air sparging, and soil vapor extraction (SVE)/treatment. Allwest indicated that GTI was conducting quarterly ground water monitoring at the Site.

- Six USTs were previously located at the Property, and were used for storage of gasoline, waste oil, hydraulic fluid, solvent waste, fuel oil, and water. The tanks reportedly had been removed, however at the time of Allwest's report, no formal closure documents were available from regulatory agencies (most likely would have to be obtained from the Fire Department).

- Two clarifiers, located to the east of Building 269, reportedly were closed in-place. Allwest recommended excavating and removing the clarifiers, as well as sampling the soils beneath these structures.

- A clarifier and a system of pits and trenches were located in Building 268 (current Building B). Allwest recommended removing the pits and trenches and sampling the soils beneath this area.

- Stained floor areas were observed by Allwest in Buildings 268 and 269. Allwest recommended that these areas be sampled for solvents and heavy metals.

- Based on the age of the buildings at the Site, Allwest recommended that asbestos surveys and a structural inspection be conducted in the buildings.

Operation & Maintenance Program, Former Hughes Site, Canoga Park, prepared by GTI, dated February 25, 1997

In a letter submitted to the LARWQCB, GTI described its remediation system and detailed the proposed monitoring and maintenance activities that would be conducted at the Site. The remediation is described to include a ground water recovery system consisting of 17 recovery wells (first started in February 1995 and fully operational since March 1995); the recovery wells are connected to a holding tank, followed by two liquid-phase granular activated carbon (GAC) vessels. The treated effluent is reused for on-site irrigation purposes. An SVE system, which has operated since August 1995, included 54 manifolded extraction wells, which were originally connected to a thermal oxidizer (permitted by the South Coast Air Quality Management District-SCAQMD). The thermal oxidizer was removed in October 1995 and replaced by four vapor-phase GAC vessels

(SCAQMD permitted). The air sparging system operated since March 1996 and consisted of 30 manifolded wells, which are connected to an air compressor.

Environmental Sampling and Testing under Floor Slabs and Clarifiers, Former Hughes Missile Systems Company, by Allwest, dated June 27, 1997

Following its review in 1996, Allwest conducted additional sampling at the Property. Allwest advanced four borings in the pit and trench areas of Building 268, two borings near the former solvent tank in Building 269, and four borings near the clarifiers at Building 269 (all at the Property). Soil samples were collected at a depth of 2 feet bgs in all areas except near the clarifiers where samples were collected at 8 feet bgs. The samples were analyzed for VOCs by EPA Method 8260 and CAM metals by EPA 7000 Series methods.

No VOCs were detected in the soil samples collected during this investigation. Moreover, metals were reported to be within naturally occurring background levels.

Summary Review of Environmental Documents, Former Hughes Missile Systems Company, by Allwest, dated July 10, 1997

The purpose of Allwest's review of environmental documents was (a) to evaluate whether current and past investigations and remedial actions were sufficient to identify environmental conditions at the Property, (b) to evaluate whether areas with environmental impacts have been adequately mitigated, and (c) to document the current regulatory status of the Property.

Allwest summarized the following findings:

- Soil and ground water remediation conducted in the northwestern area of the former Hughes site appeared to be several years from completion.

- All USTs had reportedly been removed, however tank closures had not been granted by regulatory agencies (in this case, the Fire Department) and would reportedly not be granted until "all soil and ground water remediation at the Site is completed."

- Although no detectable contamination was found from soil samples collected from the sides of the clarifiers located near Building 269, additional soil sampling was recommended if the clarifiers were to be removed during demolition of this building.

- Allwest recommended that the pits and trenches in Building 268 be backfilled with sand or slurry and covered with a concrete cap. Soil sampling in this area reportedly showed no detectable contamination.

- Soil sampling in areas below the former solvent tanks at Building 269 reportedly showed no detectable contamination due to solvents or heavy metals.

Allwest concluded that the "existing contamination poses no health threat and will not interfere with the occupancy of the exiting or proposed buildings, provided that requirements of the Remedial Action Plans" were followed.

Letter, dated November 14, 1997

In a letter dated November 14, 1997, DTSC discusses the RCRA closure issues at the Site, which included Hazardous Waste Management Units (HWMUs), Corrective Action SWMUs, and AOCs. The letter does not detail all the RCRA closures required at the Site. The letter, however, indicated that one of the HWMUs is the former HWSA, where much of the closure plan requirements had been implemented. DTSC also indicated that the ground water remediation conducted at the Site also was cleaning up contamination from the other HWMU at the Site (the former underground hazardous waste storage tank T-3). The remediation also was believed to be removing contamination from beneath SWMU #1 (Building 272) and SWMU#2 (Building 282). However, DTSC indicated that additional investigations still were required near many of the SWMUs and AOCs, and would be clarified in a future Corrective Action Order to be issued for the Site (anticipated to be issued in January 1998). Finally, the DTSC letter indicated that Tank T-3 will be subject to post-closure monitoring requirements under Title 22, Article 6.

Letter, dated January 9, 1998

In a letter dated January 9, 1998, DTSC approved the Corrective Action (Solid Waste Management Units and Areas of Concern) Plan (SWMU CAP) proposed by Hughes (ENVIRON has not copies of the SWMU CAP). The DTSC letter indicated that Hughes could proceed with the demolition and disposal of the HWSA. Again, DTSC required that Hughes submit a Post-Closure Operation Plan for the Tank T-3 HWMU.

Ground Water and Remediation System Monitoring, October-December 1997 Quarterly Report and 1997 Annual Report for Raytheon Missile Systems Company by Fluor Daniel GTI, February 20, 1998

This report summarizes the remediation and monitoring activities conducted at the Site in 1997. Fluor Daniel GTI (FD/GTI) monitored ground water conditions and maintained the remediation systems for Raytheon Missile Systems Company. As previously mentioned, the remediation system included ground water recovery/treatment, SVE/treatment, and air sparging.

FD/GTI indicated that approximately 6,800 pounds of VOCs including 500 pounds of chlorinated solvents had been removed since start-up. VOCs were detected in three of the ten ground water monitoring wells sampled on a semiannual basis (none located at the Property); VOCs were also detected in eleven of the seventeen recovery wells sampled on a semiannual basis (RW-1, RW-6 through RW-8, RW-10 through RW-12 and RW-14 through RW-17). Additional samples were collected semiannually from Wells RW-6 and RW-12 and analyzed for TPH-g and BTEX, which reportedly were not detected. VOCs were also detected in two of the twenty-four monitoring wells (CM-13 and CM-18, both located at the Property) sampled annually. Boron, sulfate, chloride and total dissolved solids were detected in the treated ground water effluent samples collected annually.

Letter, dated May 15, 1998

In a letter to Raytheon Missile Systems Company dated May 15, 1998, FD/GTI provided a summary of the status of on-going ground water and soil vapor treatments at the Site. Influent VOCs concentrations measured in the vapor stream were reported to reaching an asymptotic limit of 3 to 4 part per million by volume (ppmv).

FD/GTI reported that demolition and construction activities at the Site had damaged several components of the SVE and air sparging systems.

Letters, dated May 19, 1998 and June 18, 1998

In a letter dated May 19, 1998, the DTSC indicated that Raytheon was in violation of Title 22, because it had failed to provide DTSC with the required post closure plan for T-3. In a letter dated June 18, 1998, DTSC indicated to the LARWQCB that Hughes has not complied with its RCRA closure requests.

Letter, dated June 30, 1998

In a letter dated June 30, 1998, DTSC acknowledged the request for change of ownership at the Facility from Hughes to Raytheon.

Plan for Modification of Remediation the Systems at the Former Hughes Missile Systems Company, prepared by Errol L. Montgomery & Associates, September 16, 1998

Errol L. Montgomery & Associates (EM&A), reported that recent sampling had showed that VOCs concentrations were below the established ground water cleanup criteria in eight of the forty-three ground water monitoring wells sampled. The EM&A report included a table listing the established cleanup goals for soils and ground water at the Site. The ground water cleanup goals appeared to be 10 times greater than the MCL. Furthermore, based on the EM&A table, soil cleanup goals were not established for individual chlorinated VOCs at the Site; the table lists a total chlorinated VOCs cleanup goal of 100 milligrams per kilogram (mg/kg). Finally, the EM&A table did not list any established goals for hexavalent chromium.

EM&A proposed some modifications to the remediation system to expedite cleanup. Based on EM&A's recommendations, Raytheon planned to install additional wells in areas of the Site where concentrations of VOCs in ground water remained above the cleanup criteria. Raytheon also planned to deactivate sixteen air sparging wells, twenty-seven SVE wells and four ground water reclamation wells located at portions of the Site where concentrations of VOCs in ground water were consistently measured to be below the cleanup criteria. In addition, EM&A reported that Raytheon planned to continue pilot testing high-vacuum dual-phase treatment at selected ground water recovery wells.

Summary Report of Supplemental Sampling and Analysis Performed at the Locations of Former Buildings 269, 272, 282; Raytheon Former Canoga Park Facility, Canoga Park, California, by Raytheon Systems Company, dated October 5, 1998

Raytheon prepared and submitted this letter report summarizing recent sampling events conducted by FD/GTI to DTSC. The letter indicated that no metals were detected in these areas above background levels. VOCs impacted soils and ground water were encountered in an area where metal working, finishing, and cleaning operations were known to have occurred within the former Building 269. FD/GTI recommended additional sampling along the western boundary of this area to further delineate the contamination plume. FD/GTI also recommended increasing the number of recovery wells to expedite cleanup, as outlined in the Plan for Modification of Remediation Systems dated September 16, 1998.

Previous sampling conducted by Allwest Geosciences in 1998 concluded that "there have been no environmental impacts from VOCs or metals to subsurface soil directly under the concrete floor slabs or adjacent to the clarifiers due to leaks or migration of contaminants through the concrete slabs." This sampling addressed the following SWMUs and AOCs:

- SWMU#1: Building 272
- SWMU#2: Building 282
- SWMU#3: Building 269, Pits 1 and 2
- AOC#13: Tank T-14

Therefore, Raytheon requested that DTSC remove these SWMUs and AOC from its RCRA Closure requirements (no indication whether DTSC approved this request).

Results of Follow-up Sampling and Analysis, Conducted September 21, 1998, in the HWSA, by FD/GTI, dated October 30, 1998

The FD/GTI sampling was conducted in accordance with a workplan submitted to the DTSC in August 1998 and revised in September 1998.

FD/GTI indicated that the demolition of the former HWSA started in June 1998, and included soil excavation and backfilling. Soil samples reportedly were collected from the walls and floor of the excavation in this area prior to its backfilling. Hexavalent chromium was previously detected at concentrations exceeding the DTSC approved closure plan level of 0.19 mg/kg in the acid and alkaline storage bays of the former HWSA. The purpose of the follow-up sampling conducted by FD/GT was to assess the lateral and vertical extent of hexavalent chromium in subsurface soils beneath the former HWSA. FD/GTI drilled five soil borings: three within the former HWSA, one to the south of the area and one to the east of the area. Samples were collected at depths of 13, 19, and 27 feet bgs within the former HWSA and at depths of 2, 5, 13, 19, and 27 feet bgs at the adjacent areas.

Samples from the former HWSA were analyzed for hexavalent chromium using EPA Method 7196, total organic carbon (TOC) using Test Method SM 5310B, total iron (Fe) using EPA Method 601D, ferrous iron using Test Method SM3500-Fe D, and manganese using EPA Method 6010. The samples collected south and east of the former HWSA were analyzed for hexavalent chromium only. Hexavalent chromium was detected at concentrations ranging from non-detect to 78 mg/kg. The highest detections were encountered at a depth of 19 feet bgs. The TOC concentrations ranged from

1,420 mg/kg to 16,400 mg/kg, the total Fe ranged from 8,800 mg/kg to 26,000 mg/kg, the ferrous Fe was non-detect for all samples analyzed, and the manganese concentrations ranged from 47 mg/kg to 480 mg/kg.

FD/GTI did not recommend any additional subsurface investigation or soil removal because the hexavalent chromium contaminated soils were encountered at minimal depths of 5 to 13 feet bgs. Furthermore, FD/GTI indicated that future grading in this area would raise the ground surface by approximately 5 feet. Therefore, FD/GTI did not believe that the hexavalent chromium encountered in the soils would pose a health threat. FD/GTI recommended sampling monitoring wells located up- and down-gradient of the former HWSA for hexavalent chromium on a quarterly basis for a period of one year to evaluate whether the impacted soils would result in impact to ground water.

Summary Review of Environmental Documents and Potential Environmental Impacts, Building A (Former Building 262), West Hills Corporate Village; prepared by Allwest, dated January 15, 1999
Allwest indicated that based on a 1995 Facility inspection and subsequent document review, the DTSC had concerns that the past usage of solvents may have impacted the soils at the sewer lines connecting to the main sewer from Building 262 (now Building A). Allwest indicated that Hughes was responding to DTSC's recommendations for additional investigations in this area. Allwest further reported that Hughes cleaned and washed down Building A prior to its remodeling. Building A is not captured by the current remediation system at the Property, but no source areas have been identified in this building, to date. Tank T-4 was located at the southeast corner of this building. Although all tanks have been removed, as previously mentioned, closure would not be issued until ground water remediation is completed at the Site. Allwest concluded that environmental conditions at Building A have been adequately characterized and would not interfere with future occupancy of Building A.

Letter, dated January 20, 1999
In a letter dated January 20, 1999, the LARWQCB approved Hughes' request to deactivate select air sparging, SVE, and ground water reclamation wells in areas of the Site where VOCs have been consistently detected at concentration below the established cleanup criteria. The LARWQCB also approved the installation of five additional recovery wells to prevent off-site migration of contaminants in the northwestern part of the Site.

Letter, dated January 21, 1999

In a letter dated January 21, 1999 and marked as URGENT, the DTSC expressed concerns over planned demolition and development activities at the Facility, which may affect areas considered to be SWMUs, AOCs or HWMUs; DTSC considered activities such as grading, demolition or development as unauthorized and would proceed with legal action against Raytheon and Regent Properties, Inc. DTSC requested that the Site owners/developers contact the Attorney General's office for further information.

Letter, dated January 26, 1999

In a letter dated January 26, 1999, Raytheon responded to DTSC and indicated that it does not plan to conduct redevelopment activities in areas of the Site considered to be SWMUs, HWMUs or AOCs. However, Raytheon indicated that it has requested closure of some of these areas from DTSC and has not received a response to date.

Ground Water and Remediation System Monitoring October-December 1998 Fourth Quarter and 1998 Annual Summary, prepared by IT Corporation (IT), dated February 20, 1999

During 1998, IT monitored remediation activities at the Site. The ground water recovery system generally remained at full operating capacity during 1998. The treated effluent was monitored weekly to ensure compliance with limits set by the LARWQCB. Sixty-nine monitoring and vapor extraction wells were gauged quarterly. Ten perimeter monitoring wells and seventeen recovery wells were sampled on a semiannual basis and analyzed for VOCs. During 1998, VOCs were detected in ten of the seventeen recovery wells (RW-1, RW-3, RW-7 RW-10 through RW-12, and RW-14 through RW-17). Additional samples were collected semiannually from wells RW-6 and RW-12 and analyzed for TPH-g and BTEX, which were not detected.

The high-vacuum, dual-phase extraction system were applied to targeted ground water recovery wells RW-1, RW-10, RW-11, RW-14 and RW-15. The evaluation period demonstrated that ground water recovery and vapor-phase volatile organics transport temporarily increased following application of the vacuum.

Letter, dated March 12, 1999

In a letter dated March 12, 1999, DTSC indicated that Raytheon's approach thus far of investigating small portions of the Facility and submitting such data to DTSC for closure of SWMUs or AOCs was not adequate. DTSC was requiring a RCRA Facility Investigation Workplan, which summarized all SWMUs, AOCs, and HWMUs identified at the Facility and investigations and corrective actions

conducted to date. DTSC would then work with Raytheon to prioritize these areas. However, since Raytheon had elected to stop its fee-for-service agreement with DTSC, DTSC staff could not perform significant work on the corrective action activities. DTSC further indicated that Raytheon was in violation of requirements to submit post-closure permit application for Tank T-3. Finally, DTSC indicated that Raytheon's plan to keep hexavalent chromium contaminated soils in-place and monitor the ground water in this area was not acceptable.

Letter, dated March 25, 1999

Raytheon responded to DTSC's comments in a letter dated March 25, 1999 and indicated that much of the data gaps referred to by DTSC had been filled in reports recently submitted to DTSC.

Additional Site Assessment Report, Sampling and Analysis at Former Building 269, Former Raytheon Systems Company, prepared by IT, dated April 1999

According to the IT report, this work included sampling soil and ground water in five temporary ground water wells in the location of former Building 269. The samples were analyzed for VOCs, and none were detected in the soil samples and ground water samples from four of the wells. PCE and TCE were detected in ground water samples collected from one of the wells at the respective concentrations of 5.1 and 13 µg/L.

IT concluded that the contamination was confined to an area of former metal working, finishing, and cleaning operations, and was being addressed by the on-going ground water and soil remediation. Therefore, no additional sampling was recommended in this area.

Letter, dated June 11, 1999

In a letter dated June 11, 1999, the LARWQCB approved Raytheon's request to modify the ground water remediation system at the Facility. The LARWQCB also permitted Raytheon to deactivate some of the air sparging/vapor extraction wells and the ground water extraction wells at the Facility. The pilot testing of the dual-phase treatment system at selected ground water recovery wells was to be continued. The letter also indicated approval of the modification plan to install additional wells in the areas of the Site where VOC concentrations in the ground water remain above the cleanup criteria.

Letter, dated July 22, 1999

In a letter dated July 22, 1999, DTSC reiterated that Raytheon has failed to provide the required closure and post-closure permit application for HWMUs at its Facility.

Letter, dated August 17, 1999

In a letter dated August 17, 1999, Raytheon indicated that it has agreed to include hexavalent chromium in its semiannual sampling events. Hexavalent chromium had been detected in ground water samples collected from Well RW-15 (located at the Property).

Letter, dated August 19, 1999

In a letter dated August 19, 1999, Raytheon responded to DTSC's July letter and indicated that it was making a diligent effort to meet the approved closure requirements for the HWSA.

Environmental Health Concerns, Planned Building D, West Hills Corporate Center, prepared by Allwest, dated September 13, 1999

This report concluded that with the continued operation of the ground water remediation system, there were no environmental impacts on the health or safety of the occupants of planned Building D. Allwest did not conduct a health risk assessment, rather it based its conclusion on the low concentrations of VOCs detected in near surface soils in this area.

Quarterly Remediation System and Ground Water Monitoring Report, July-September 1999, Third Quarter, Raytheon Company, Canoga Park, California, prepared by IT, dated October 1999

The remediation system continued to operate as described in previous monitoring reports. Samples were collected as part of a rebound sampling effort approved by the LARWQCB. VOCs were detected in both ground water and soil gas samples collected during this sampling event.

Hexavalent chromium was detected in three ground water samples collected from Well RW-15, with concentrations ranging from 0.083 to 0.1 milligrams per liter (mg/L). Hexavalent chromium was not detected in the remaining five ground water wells that were sampled during this event (CM-16, M-1, MW-17, RW-13 and RW-16). Upon detection of hexavalent chromium, RW-15 was disconnected from the remediation system and the LARWQCB and DTSC were notified. RW-15 is located adjacent to the former HWSA.

Letter, dated October 27, 1999

In a letter dated October 27, 1999, DTSC indicated that based on available records it does not appear that releases have occurred in the area of the proposed Building D at the Facility and therefore, DTSC did not believe that further investigations or remediation were required in this area prior to the construction of the new building.

Letters, dated December 16, 1999 and January 7, 2000

In a letter dated December 16, 1999, the LARWQCB approved Raytheon's request to install additional ground water monitoring wells as proposed in a letter dated December 10, 1999. Three wells were proposed in areas close to the former HWSA. However, in a letter dated January 7, 2000, DTSC indicated that the proposed workplan was inadequate for accurately determining the nature and extent of releases from the HWSA. The DTSC requested that a rationale be provided for the number, design and placement of ground water monitoring wells, as well as boring logs for nearby wells to justify design protocols.

Letters, dated April 13, 14, and 20, 2000

In letters dated April 13 and 20, 2000, the LARWQCB approved a proposed pilot test plan to evaluate a treatment system for the hexavalent chromium, detected in the ground water at Well RW-15. However, in a letter dated April 14, 2000, DTSC indicated that a workplan that was submitted for the delineation of contamination in the former HWSA was inadequate.

Environmental Impacts, West Hills Corporate Village, prepared by Allwest, dated June 14, 2000

Allwest indicated that its report conclusions are based on several conversations with DTSC and the LARWQCB staff regarding potential environmental health concerns at the Property (Buildings A to D). Moreover, Allwest reviewed select documents pertaining to previous investigations and monitoring conducted at the Property.

1,1-DCE, 1,1-DCA, PCE and TCE were noted as the primary VOCs of concern in the ground water at the Property. The ground water undergoing remediation is at depths of 30 to 40 feet bgs; the lead agency for the remediation is the LARWQCB; while the DTSC is the lead agency for RCRA closure at the Site. Allwest reported that the ground water remediation was progressing to the satisfaction of the LARWQCB. DTSC, however, had remaining concerns regarding identification of all sources of soil and ground water contamination and closure of SWMUs and other AOCs. According to Allwest, Raytheon was actively working with DTSC to address these concerns.

Allwest reported that, with the exception of delineating the hexavalent chromium contamination near the HWSA, adequate soil and ground water investigations had been conducted near the buildings.

Allwest concluded that based on available information, there were no anticipated health or safety impacts on occupants of the buildings.

Ground Water and Remediation System Monitoring October-December1999, Fourth Quarter, and 1999 Annual Report, prepared by IT, and dated August 2000

IT reported that treated ground water effluent continued to meet all discharge requirements specified in the WDR permit with the exception of naturally occurring boron. The treated ground water was reused on-site for irrigation purposes. Influent concentrations of petroleum fuel hydrocarbons had decreased over time to below laboratory detectable levels. Influent concentrations of halogenated VOCs (mainly TCA, 1,1-DCA and TCE) had also decreased over time.

The ground water flow gradient had remained relatively constant, with some anomalies in the northwestern portion of the Site due to fluctuations in the operation of the pumping wells.

Due to redevelopment activities, the SVE and air sparging systems were shut down since December 1998. As of December 1999, the SVE system, which had been operating since August 1995, was estimated to have removed 7,400 pounds of VOCs from the vadose zone. Influent concentrations of TPH-g and chlorinated VOCs had decreased over time.

During the second quarter of 1999, IT initiated a rebound sampling effort as described in the LARWQCB-approved Plan for Modification of Remediation Systems dated September 16, 1998. The main wells where VOC concentrations exceeded cleanup criteria were located along the northern boundary of the Site or in the vicinity of the eastern portion of the former Building 269. 1,1-DCE and 1,2-dichloroethane (1,2-DCA) were the main contaminants detected above their respective cleanup criteria. Soil gas samples were also collected during the third and fourth quarters of 1999. The main contaminants detected in the soil gas samples were 1,1-DCE and TCE.

Hexavalent chromium was detected in ground water samples collected from RW-15 with concentrations ranging from 0.083 to 0.1 mg/L. Hexavalent chromium was also detected in one of the ground water samples collected from Well M-1, at a concentration of 0.02 mg/L. This was the first occurrence of hexavalent chromium in this well, which is not connected to the ground water recovery system. Hexavalent chromium was not detected above the laboratory detection limit of

0.01 mg/L in the remaining four wells sampled in 1999. The six wells selected for hexavalent chromium sampling surround the former HWSA. A workplan to delineate the boundaries of hexavalent chromium in ground water and soil in the vicinity of the former storage area was developed and submitted to the DTSC.

Annual Ground Water Monitoring and Ground Water Remediation System Report January-December 2000, prepared by TN & Associates, Inc., dated January 29, 2001

TN & Associates, Inc. (TN&A) conducted annual ground water sampling and remediation system monitoring for 2000. As of December 2000, ten recovery wells were still pumping; four recovery wells were shut down during the first quarter of 2000 due to continuously low VOCs concentrations. Recovery well RW-15 was shut down during the second quarter of 2000 due to the presence of hexavalent chromium.

The SVE and air sparging systems were not in operation in 2000 because of Site demolition and construction activities.

The main contaminant detected in the influent samples to the ground water treatment system was DCE. Other VOCs detected in the influent ground water samples included: benzene, 1,1-DCA, 1,2-DCA, PCE, TCA and TCE. No VOCs were detected in the effluent samples. DCE was also detected in nine of the monitoring wells and four of the recovery wells at concentrations ranging from 110 to 1,900 µg/L (exceeding the CAP cleanup criteria of 60 µg/L). Other VOCs detected above their respective cleanup criteria were benzene, 1,2-DCA, and TCE.

A pilot test was completed at recovery well RW-15 in May of 2000 to test the effectiveness of the existing system in treating hexavalent chromium. It is not clear how the existing system of carbon vessels would be adequate in treating hexavalent chromium. The pilot test results reportedly showed that the existing remediation system was adequate for treating the hexavalent chromium plume. Nonetheless, RW-15 remained shut off until all the data and options for addressing the hexavalent chromium concentrations were evaluated.

In order to evaluate the extent of hexavalent chromium contamination, TN&A advanced four borings in the vicinity of the former HWSA area to total depths of 55 to 60 feet bgs. One of the borings was drilled through the footprint of the former HWSA and the other three were drilled adjacent to the former HWSA area in up-, cross-, and down-gradient locations. Nested monitoring wells were installed at each of the four locations, and were screened from 35 to 45 feet and 50 to 55 bgs.

Hexavalent chromium was detected in all ground water samples at concentrations ranging from 0.03 µg/L in the deep ground water zone to 120 µg/L in the shallow ground water zone.

Semiannual Ground Water Monitoring and Ground Water Remediation System Report, prepared by TN&A, dated September 12, 2001

TN&A summarized the semiannual ground water monitoring and remediation for January to June 2001. Concentrations of DCE for the first and second quarter 2001 influent samples were 290 µg/L and 220 µg/L, respectively. Other VOCs detected in the influent samples included: benzene, 1,1-DCA, 1,2-DCA, PCE, TCA and TCE. No VOC concentrations were detected in any of the effluent samples.

Weekly influent organic vapor readings from the SVE system ranged from 1 to 3 ppmv. Trace concentrations of DCE (0.19 ppmv), and TCA (0.75 ppmv), were the only contaminants detected in the monthly Tedlar bag samples collected from the influent vapor to the SVE system.

In June 2001, seven of the fourteen recovery wells sampled had DCE concentrations ranging from 100 to 800 µg/L, exceeding the CAP ground water cleanup goal of 60 µg/L. The sample from RW-6 had a benzene concentration at 2.5 µg/L, exceeding the CAP cleanup goal of 1 µg/L and the sample from well RW-14 had a 1,1-DCA concentration at 5.2 µg/L, exceeding the CAP cleanup goal of 5 µg/L.

TN&A was planning to implement a ground water sampling and analysis plan for the HWSA to monitor hexavalent chromium in the ground water. As of September 2001, the plan was still under review by DTSC.

Results of Quarterly Groundwater Monitoring, Former Hazardous Waste Storage Area; Former Raytheon Facility, 8433 Fallbrook Avenue, Canoga Park, California, prepared by TN&A, dated January 23, 2002

TN&A reported the results of ground water monitoring for hexavalent chromium near the former HWSA. Eight wells, seven of which were installed in June of 2000, were monitored. Ground water levels were measured on October 29, 2001 and ground water samples were collected from the eight wells on October 29 and November 1, 2001. Hexavalent chromium concentrations ranged from less than 0.1 µg/l to 370 µg/l. The highest concentrations were found in the samples collected from wells MW-32S and MW-32D, both located within the footprint of the former HWSA.

Indoor Air Monitoring Results, Calculations and Laboratory Data Reports

Table 1
Exposure Calculations

SUMMARY OF DETECTED VOCS, OSHA PELS, AND PROPOSITION 65 NSRLS AND MADLS

Compounds Name	CAS Number	Molecular Weight (g/gmol)	OSHA PELs 8-hr Permissible Exposure Levels (ug/m^3)	Prop 65 Listed?	Prop 65 NSRL[4] (ug/day)	Prop 65 MADL[4] (ug/day)
Acetone	67641	58.1	2,400,000[3]	no	NA	NA
Benzene	71432	78.1	3,190 (1 ppm [2]) 31,900 (10 ppm [3])	yes, cancer	7.0	NA
Chloromethane	74873	50.5	207,000 (100 ppm [2])	yes, developmental	NA	not established[5]
Methylene Chloride	75092	84.9	86,750 (25 ppm [2])	yes, cancer	200.0	NA
2-Butanone	78933	72.1	590,000[3]	no	NA	NA
o-Xylene	95476	106.2	435,000[3]	no	NA	NA
Ethylbenzene	100414	106.2	435,000[3]	no	NA	NA
4-Methyl-2-Pentanone	108101	100.2	410,000[3]	no	NA	NA
Toluene	108883	92.1	754,000 (200 ppm[2],[3])	yes, developmental	NA	7000.0
Tetrachloroethene	127184	165.8	687,000 (100 ppm [2],[3])	yes, cancer	14.0	NA
Methyl-t-Butyl Ether (MTBE)	1634044	88.1	(not established)	no	NA	NA
p/m-Xylene	13302071/ 136777612	106.2	435,000[3]	no	NA	NA

Building A Compounds Name	Measured Concentrations A1 (ug/m^3)	A2 (ug/m^3)	A3 (ug/m^3)	Average Concentration (ug/m^3)	Is conc. above PEL ?	Daily Intake[1] ug/day	Is intake above Prop65 NSRL or MADL?
Acetone	38.0	45.0	40.0	41.0	no	410	NA
Benzene	3.2	3.7	3.3	3.4	no	34	yes, NSRL
Chloromethane	1.9	1.6	1.7	1.7	no	17	unable to compare[6]
Methylene Chloride	2.2	2.4	2.1	2.2	no	22	no
2-Butanone	5.4	6.1	5.2	5.6	no	56	NA
o-Xylene	2.2	2.8	2.5	2.5	no	25	NA
Ethylbenzene	1.9	2.3	2.2	2.1	no	21	NA
4-Methyl-2-Pentanone	ND	3.2	1.8	2.5	no	25	NA
Toluene	14.0	14.0	18.0	15.3	no	153	no
Tetrachloroethene	2.6	2.3	2.3	2.4	no	24	yes, NSRL
Methyl-t-Butyl Ether (MTBE)	8.9	10.0	9.3	9.4	NA	94	NA
p/m-Xylene	ND	7.3	6.8	7.1	no	71	NA

Sample ID Nos.: A1 (#01109); A2 (#01500); A3 (#01187)

Building B Compounds Name	Measured Concentrations B1 (ug/m^3)	B2 (ug/m^3)	B3 (ug/m^3)	Average Concentration (ug/m^3)	Is conc. above PEL ?	Daily Intake[1] ug/day	Is intake above Prop65 NSRL or MADL?
Acetone	34.0	37.0	34.0	35.0	no	350	NA
Benzene	3.3	3.4	3.3	3.3	no	33	yes, NSRL
Chloromethane	ND	1.7	1.5	1.6	no	16	unable to compare[6]
Methylene Chloride	2.1	2.3	2.0	2.1	no	21	no
2-Butanone	5.3	9.7	4.8	6.6	no	66	NA
o-Xylene	2.2	2.2	2.1	2.2	no	22	NA
Ethylbenzene	1.7	1.9	1.8	1.8	no	18	NA
4-Methyl-2-Pentanone	4.3	12.0	2.3	6.2	no	62	NA
Toluene	12.0	14.0	12.0	12.7	no	127	no
Tetrachloroethene	1.6	1.9	1.7	1.7	no	17	yes, NSRL
Methyl-t-Butyl Ether (MTBE)	8.8	9.0	8.8	8.9	NA	89	NA
p/m-Xylene	5.6	5.9	5.5	5.7	no	57	NA

Sample ID Nos.: B1 (#00357); B2 (#01162); B3 (#01605

Table 1
Exposure Calculations

Building C	Measured Concentrations		Representative	Is conc.	Daily	Is intake
	C1	C2[7]	Concentration	above	Intake[1]	above Prop65
Compounds Name	(ug/m^3)	(ug/m^3)	(ug/m^3)	PEL ?	ug/day	NSRL or MADL?
Acetone	30.0	27.0	30.0	no	300	NA
Benzene	3.5	ND	3.5	no	35	yes, NSRL
Chloromethane	ND	ND	NA	no	NA	NA
Methylene Chloride	2.1	ND	2.1	no	21	no
2-Butanone	4.2	ND	4.2	no	42	NA
o-Xylene	3.6	ND	3.6	no	36	NA
Ethylbenzene	2.4	ND	2.4	no	24	NA
4-Methyl-2-Pentanone	6.7	ND	6.7	no	67	NA
Toluene	13.0	14.0	13.0	no	130	no
Tetrachloroethene	1.8	ND	1.8	no	18	yes, NSRL
Methyl-t-Butyl Ether (MTBE)	9.7	8.7	9.7	NA	97	NA
p/m-Xylene	8.5	ND	8.5	no	85	NA

Sample ID Nos.: C1 (#01326); C2 (#01132)

Building D	Measured Concentration	Representative	Is conc.	Daily	Is intake
	D1	Concentration	above	Intake[1]	above Prop65
Compounds Name	(ug/m^3)	(ug/m^3)	PEL ?	ug/day	NSRL or MADL?
Acetone	32.0	32.0	no	320	NA
Benzene	3.6	3.6	no	36	yes, NSRL
Chloromethane	ND	NA	no	NA	NA
Methylene Chloride	2.1	2.1	no	21	no
2-Butanone	4.2	4.2	no	42	NA
o-Xylene	2.4	2.4	no	24	NA
Ethylbenzene	1.9	1.9	no	19	NA
4-Methyl-2-Pentanone	ND	NA	no	NA	NA
Toluene	13.0	13.0	no	130	no
Tetrachloroethene	1.9	1.9	no	19	yes, NSRL
Methyl-t-Butyl Ether (MTBE)	10.0	10.0	NA	100	NA
p/m-Xylene	6.2	6.2	no	62	NA

Sample ID No.: D1 (#01277)

Notes:

[0] Each sample was obtained using SUMMA canister and 8-hour flow controller; samples were analyzed by EPA Method TO-15.

[1] Intake = Maximum Concentration * Occupational Breathing Rate

10 m^3/day; 8-hr Occupational Breathing Rate,

[2] NIOSH Pocket Guide to Chemical Hazards; June 1997; OSHA Permissible Exposure Level (PEL) 8-hr time weighted average (TWA).

[3] Limits for Air Contaminants. - 29 CFR 1910.1000 TABLE Z-1 and Table Z-2; August 4, 1997.

[4] Proposition 65 Status Report, No Significant Risk Levels (NSRL) for Carcinogens and Maximum Allowable Daily Levels (MADL) for Chemicals Causing Reproductive Toxicity; February 2001.

[5] The MADL has not been established for Chloromethane. It is on the 3rd priority list, which is not likely to be developed for at least 3 years from February 2001.

[6] The California Office of Environmental Health and Hazard Assessment (OEHHA) has not established a chronic Reference Exposure Level (REL) for Chloromethane.

[7] This sample did not obtain a reasonable amount of sample air; hence, the detection limits were roughly 5 times higher.

C:\windows\TEMP\[MEPT_measurements.xls]VOCs

Table 2
Cancer Risk Calculations under Proposition 65

Carcinogenic Risk Calculations for Inhalation Pathway:

Risk = CPS x Dose

where,

Risk - Cancer Risk, 1×10^{-5} (Proposition 65 No Significant Risk Level)

CPS - Cancer Potency Slope, $(mg/kg\text{-}day)^{-1}$, OEHHA, December 2001

Dose, mg/kg-day = (C x IR x EF x ED x CF) / (BW x AT)

C - Concentration in air, ug/m^3 (maximum measured level indoor)

IR - Inhalation Rate - 20 m^3/day for adults and adolescents (24 hrs/day),

Note: half the daily-IR will be used to represent 8 hrs/day due to activity.

EF - Exposure Frequency - 250 days/year for workers (5 days/wk and 50 wks/yr)

ED - Exposure Duration - 20.1 years for workers

CF - Conversion Factor (0.001 mg/ug)

BW - Body Weight - 70 kg for adults

AT - Averaging Time, 25550 days for lifetime

SUMMARY OF OCCUPATIONAL EXPOSURE SCENARIOS

Building A - Adult Workers (8 hours/day, National Median: 20.1 years*):

	Risk	CPS	Dose	C	IR	EF	ED*	CF	BW	AT
Benzene	**9.55E-06**	1.0E-01	9.6E-05	3.4	10	250	20.1	0.001	70	25550
Tetrachloroethene	**1.42E-06**	2.1E-02	6.7E-05	2.4	10	250	20.1	0.001	70	25550

Building B - Adult Workers (8 hours/day, National Median: 20.1 years*):

	Risk	CPS	Dose	C	IR	EF	ED*	CF	BW	AT
Benzene	**9.37E-06**	1.0E-01	9.4E-05	3.3	10	250	20.1	0.001	70	25550
Tetrachloroethene	**1.02E-06**	2.1E-02	4.9E-05	1.7	10	250	20.1	0.001	70	25550

Building C - Adult Workers (8 hours/day, National Median: 20.1 years*):

	Risk	CPS	Dose	C	IR	EF	ED*	CF	BW	AT
Benzene	**9.83E-06**	1.0E-01	9.8E-05	3.5	10	250	20.1	0.001	70	25550
Tetrachloroethene	**1.06E-06**	2.1E-02	5.1E-05	1.8	10	250	20.1	0.001	70	25550

Building D - Adult Workers (8 hours/day, Construction Worker: 2 years):

	Risk	CPS	Dose	C	IR	EF	ED**	CF	BW	AT
Benzene	**1.01E-06**	1.0E-01	1.0E-05	3.6	10	250	2	0.001	70	25550
Tetrachloroethene	**1.12E-07**	2.1E-02	5.3E-06	1.9	10	250	2	0.001	70	25550

LABORATORY REPORT

Client:	Environ International Corporation	Date of Report:	03/07/02
Address:	707 Wilshire Blvd., Suite 4950	Date Received:	02/28/02
	Los Angeles, CA 90017	PAI Project No:	P2200394
Contact:	Ms. Debbie Scanlon	Purchase Order:	Verbal

Client Project ID: MEPT / Canoga Park

Nine (9) Stainless Steel Summa Canisters labeled:

"C1" "C2" "D1" "A1" "A2" "A3" "B1" "B2" "B3"

The samples were received at the laboratory under chain of custody on February 28, 2002. The samples were received intact. The client requested and received 3 day rush results. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the samples at the time that they were received at the laboratory.

Volatile Organic Compound Analysis

The samples were analyzed by combined gas chromatography/mass spectrometry (GC/MS) for volatile organic compounds. The analyses were performed according to the methodology outlined in EPA Method TO-15. The analyses were performed by gas chromatography/mass spectrometry, utilizing a direct cryogenic trapping technique. The analytical system used was comprised of a Hewlett Packard Model 5972 GC/MS/DS interfaced to a Tekmar AutoCan Elite whole air inlet system/cryogenic concentrator. A 100% Dimethylpolysiloxane capillary column (RT_x-1, Restek Corporation, Bellefonte, PA) was used to achieve chromatographic separation

The results of analyses are given on the attached data sheets.

Attention: Mr. Neal Holdridge, Environmental Manager

Subject: COAST WESTHILLS PROPERTY
8433 FALLBROOK AVENUE
CANOGA PARK, CALIFORNIA
"ENHANCED" PHASE I ENVIRONMENTAL SITE ASSESSMENT

Dear Mr. Holdridge:

In accordance with your request on behalf of MEPT West Hills LLC (MEPT) or its nominated assignee, Environmental Asset Services, Inc. (EASI) and Trammell Crow So. Cal. Properties, Inc. (TCSCPI), Geocon Environmental Consultants, Inc. (Geocon) has conducted an "Enhanced" Phase I Environmental Site Assessment (ESA) of the subject property. The approximately 30-acre property is located to the northwest of the intersection of Fallbrook Avenue and Roscoe Boulevard, in the Canoga Park area of the City of Los Angeles, Los Angeles County, California. The property is further identified by Los Angeles County Assessor's Parcel Numbers 2005-002-001 and 2005-002-002.

We trust the accompanying report provides MEPT, TCSCPI, and EASI and with the information you require at this time. If you have any questions regarding the information presented in the report, or if Geocon may be of further service, please contact us at (213) 538-1282.

Very truly yours,

GEOCON ENVIRONMENTAL CONSULTANTS, INC.

Robin J. Ferber, R.G., R.E.A.
Senior Managing Geologist

Robin M. Blanchard
Project Environmental Scientist

(1) John J. Allen, Esq., Sonnenschein Nath & Rosenthal

EXECUTIVE SUMMARY

This report presents the results of an *"Enhanced" Phase I Environmental Site Assessment,* performed in general conformance with the scope and limitations of ASTM Designation E 1527-97 of Subdivision B of the property located at 8433 Fallbrook Avenue in the Canoga Park area of the City of Los Angeles, Los Angeles County, (the "subject property") further identified by Los Angeles County Assessor's Parcel Numbers 2005-002-001 and 2005-002-002. Any exceptions to, or deletions from this practice are described in Section 1.3 of this report. The term "Enhanced", as referenced in this report, refers to the extensive review of pertinent environmental documents provided by Environmental Asset Services, Inc. (EASI) and present in files at the offices of the California Regional Water Quality Control Board, Los Angeles Region (CRWQCB) and the California - Environmental Protection Agency, Department of Toxic Substances Control (DTSC) that was specifically requested by Mr. Neal H. Holdridge, Environmental Manager of EASI.

The subject property occupies approximately 30 acres and includes nine buildings and landscaped and paved parking areas. It was formerly a part of an approximately 86-acre property used by Hughes Aircraft Company and Hughes Missiles Systems Company (hereinafter Hughes) as an aerospace research and development facility. The former Hughes property was subsequently divided into subdivisions A, B, C, and D (hereinafter referred to as Lots A, B, C, D). The subject property occupies Lot B, and is currently owned by Home Savings of America (Home) as successor to Coast Federal Bank (Coast). The nine buildings at the subject property were not occupied at the time of the reconnaissance. With the exception of onsite features associated with the ongoing groundwater monitoring program and potential impacts associated with the Raytheon soil vapor and groundwater extraction and treatment systems, evidence of "recognized environmental conditions" was not observed during our site reconnaissance of the subject property.

Hughes sold the site to Coast in 1995; however, it remained responsible for responding to certain environmental impacts discovered on the site during the late 1980's. Raytheon Missiles Systems Group (Raytheon) acquired Hughes in December 1997 and has assumed financial responsibility for certain ongoing and future environmental investigations and remediation activities at the former Hughes facility, including the subject property.

Obvious evidence of hazardous materials use, storage or disposal was not observed onsite in the aerial photographs reviewed. The subject property appears to have been used for agricultural purposes prior to development as an aerospace research and development facility in 1959. Construction of onsite buildings and features occurred roughly from 1959 to 1986.

The USGS topographic map dated 1967 (photorevised 1979) for the Calabasas, California quadrangle depicts onsite elevations ranging from approximately 840 to 900 feet above mean sea level (MSL). Onsite topography slopes to the south, east, and west from a high point located roughly at the center of the northern subject property boundary. Groundwater beneath the subject property flows to the south-southeast with the exception of the Lot C area northwest of the subject property where groundwater flows to the west towards Chatsworth Creek.

A 50-year Chain-of-Title Report was not provided for review. The current owner of the subject property is reported to be Home as successor to Coast.

The subject property was identified in the information sources reviewed by VISTA Information Solutions, Inc. (VISTA). All of the subject property listings appear to relate to the ongoing soil and groundwater investigations at the subject property. Several businesses listed by VISTA in their report were within the appropriate search radii used for this ESA. The properties listed by VISTA are not considered likely to impact soil and groundwater beneath the subject property with hazardous materials based on their distance from the subject property, their location relative to the local hydraulic gradient (interpreted to flow generally to the south-southeast), and/or the absence of information indicating releases of hazardous materials originating from the listed properties.

Releases of diesel fuel, chlorinated and non-chlorinated volatile organic compounds (VOCs), aromatic VOCs, and semi-volatile organic compounds (SVOCs) to soil and/or groundwater have been documented at the former Hughes facility, including the subject property. Investigation of impacts to soil and groundwater from these substances has been ongoing since 1989 under the direction of various regulatory agencies including the City of Los Angeles Fire Department, CRWQCB, California Department of Health Services, and the DTSC. The DTSC and the CRWQCB are currently the key environmental agencies involved at the subject property and neighboring Lots A, C and D comprising the former Hughes properties.

Four underground storage tanks (USTs) containing fuel oil and two USTs containing waste oil and sulfuric acid were formerly operated on Lot B. Five of the six USTs exhibited evidence of leakage.

Historical remedial activity on Lot B consisted of excavation and offsite disposal of soils impacted by the five USTs.

The review of environmental documents indicates that soil and groundwater beneath the subject property have been impacted by chlorinated and non-chlorinated VOCs in two areas. One is located to the south of Building No. 281. Groundwater samples collected from groundwater monitoring well CM-8D have shown the presence of VOCs from an unknown source. Hughes' environmental consultant estimated that the release of approximately 0.2 gallons of VOCs caused the impact to groundwater discovered in that area. Identifying the source of the VOCs detected in the well CM-8D area has been and remains a primary DTSC concern. Soil vapor samples collected in the area of well CM-8D have not been conclusive in identifying a source of the VOCs detected in the groundwater. DTSC could require Raytheon to conduct further environmental investigations in this area. In addition, it may be prudent to conduct indoor air monitoring for VOCs in Building Nos. 263, 264, and 281 to evaluate potential exposure concerns to future building tenants.

Groundwater impacts by VOCs were also detected near monitoring well CM-10 located offsite (on Lot A) to the south-southeast of Building No. 274. Freon 11 was the primary constituent of concern detected here. A soil vapor plume comprised primarily of Freon 11 and other VOCs was identified onsite and to the south of this building in an area hydraulically upgradient of well CM-10. In addition, groundwater well MW-31, located onsite in the central portion of the area where Freon 11 was found in soil vapor, contained Freon at concentrations equal to the US EPA Maximum Contaminant Level (MCL) established for groundwater. Raytheon believes the Freon 11 soil vapor plume is from air conditioning equipment repairs that were conducted in the unpaved portions of the parking lot during the 1960s.

The DTSC identified eight Areas of Concern (AOCs) and three Solid Waste Management Units (SWMUs) on the subject property which may require further investigation. Based on the findings of a soil and groundwater investigation documented in a September 1998 report prepared by GTI, Raytheon requested that DTSC de-list two of the SWMUs and three of the AOCs, all of which are located in the southern portion of the subject property. DTSC has declined to "de-list" SWMUs or AOCs until it is satisfied that its concerns have been adequately addressed.

DTSC has identified additional SWMUs and AOCs for Lot C, which is adjacent to and to the north of the subject property. Lot C also has a former Hazardous Waste Storage Area (for which Raytheon has not yet completed its DTSC approved Closure Plan), and a UST designated as T-3, which is a

regulated hazardous waste unit subject to post-closure care requirements as specified in the California Code of Regulations, Title 22. These two units were and still are under RCRA Permit. Soil vapor and water extraction and treatment systems are active in the northern portion of Lot C. Treated water from the extraction system is used only on Lot C for irrigation of landscaped areas, under NPDES permit from the CRWQCB; however, the treatment system is currently shut down due to construction activities ongoing in the northern portion of Lot C.

According to a November 21, 1994 interview with Hughes employees, mercury may have been present in a soundproofing coating on foam "cones" formerly present on the walls and ceilings of the anechoic chamber present in Building No. 274. This soundproofing material was reportedly removed under appropriate manifest to a disposal site in Arizona. During our site reconnaissance, a minor amount of residual soundproofing material was noted on the floor of the anechoic chamber. A Certified Industrial Hygienist should be retained to evaluate for the presence of mercury in the residual soundproofing material observed in the anechoic chamber.

Personal interviews with DTSC staff suggest that the City of Los Angeles may require DTSC concurrence prior to issuance of future building permits at the subject property if concerns regarding the SWMUs and AOCs are not resolved. DTSC communications with DeVry Inc. who is developing Lot A to the south of the subject property, indicated that the DTSC may require access to that property for soil and groundwater investigations/remediation should future evidence of environmental impacts be discovered on Lot A. Appropriate personnel at the City of Los Angeles should be contacted to evaluate the potential involvement of the DTSC in the acquisition of Building Permits for the subject property. In addition, DTSC input should be obtained regarding new structures to be built in designated areas of the subject property.

Groundwater beneath the subject property and adjoining lots contains levels of uranium and radium above drinking water standards. Groundwater monitoring wells CM-8D and CM-10 generally contain higher levels of uranium and radium in the groundwater, when compared to the other wells throughout the former Hughes facility that were sampled. Previous investigations concerning the presence of these radioactive materials concluded they were naturally occurring and due to local variations in geological deposits. The prior investigations concluded that no man-made radionuclides were indicated. No surface soil investigations regarding the presence of radioactive materials have been conducted at the site. Documents listing the radioactive materials formerly used by Hughes indicate that Hughes' operations have not served as the source for the radioactivity discovered in

groundwater. It may be prudent to conduct a radon gas investigation in the buildings onsite to investigate potential radioactive exposure concerns to Lot B building tenants.

The northern portion of Lot C is undergoing remediation under the guidance of the DTSC and CRWQCB. According to the DTSC, Raytheon is in violation of Title 22, California Code of Regulations for not having submitted an application for post-closure of UST T-3. In addition, the DTSC has asked Raytheon to investigate the lateral and vertical extent of hexavalent chromium detected in soil beneath the former hazardous waste storage area. Raytheon has issued written complaints to the DTSC regarding the DTSC's lack of administrative response concerning environmental issues at the site. The effect of these outstanding issues between the DTSC and Raytheon on the proposed acquisition of Lot B is considered of minimal impact because they appear to only impact Lot C.

PHASE I ENVIRONMENTAL SITE ASSESSMENT

1. INTRODUCTION

This report has been prepared by Geocon Environmental Consultants, Inc. (Geocon) in accordance with the request of Mr. Neal H. Holdridge on behalf of the MEPT West Hills LLC (MEPT) or its nominated assignee, Environmental Assets Services, Inc. (EASI), and Trammell Crow So. Cal. Properties, Inc. (TCSCPI). The report presents the results of a "Enhanced" Phase I Environmental Site Assessment (Enhanced-ESA) and document review of the Coast Westhills Property, an approximately 30-acre property located to the northwest of the intersection of Fallbrook Avenue and Roscoe Boulevard (Lot B of 8433 Fallbrook Avenue), in the Canoga Park area of the City of Los Angeles, Los Angeles County, California (the "subject property"). The term "Enhanced", as referenced in this report, refers to the review of pertinent environmental documents provided by EASI and present in the available files at the offices of the California Regional Water Quality Control Board, Los Angeles Region (CRWQCB) and the California - Environmental Protection Agency, Department of Toxic Substances Control (DTSC) that was specifically requested by EASI.

1.1. Purpose

The purpose of this ESA is to review past and present land use practices and site operations to evaluate the potential presence of recognized environmental conditions at the subject property. This assessment was accomplished by, and limited to, a site reconnaissance, a drive-by survey of the subject property vicinity, interviews, review of information provided by TCSCPI and EASI, review of records available at the CRWQCB, DTSC, and other agencies, and a review of presently and readily available pertinent documentation through Geocon's standard resources. Representatives of the CRWQCB and DTSC were also contacted by telephone or in person regarding environmental issues and/or the status of the site investigations. These tasks were performed to evaluate past and current land use for indications of the manufacture, generation, use, storage, and/or disposal of hazardous materials at the subject property. This ESA includes a preliminary evaluation of the potential for soil and/or groundwater impacts resulting from past and present subject property land use activities and nearby offsite operations, based upon the scope of services described. The ESA was conducted in general conformance with ASTM Designation: E1527-97. The collection of soil, groundwater, asbestos, and radon samples or performance of analytical laboratory testing was not included as a part of our scope of services, nor is the sampling and testing of these materials within the normal scope of a Phase I ESA. The guidelines 'used for the definition of hazardous materials/hazardous wastes, as used in this report, are referenced in the *California Code of Regulations (CCR)* "Title 22, Division 4.5".

1.2. Credential

This report has been prepared by Geocon Environmental Consultants, Inc. (Geocon) under the professional supervision of the principal whose seal and signature appears herein. The information contained in this report has received appropriate technical review and approval. The conclusions represent professional judgments and are founded upon the findings of the investigations identified in the report and the interpretation of such data based on our experience and expertise according to the existing standard of care.

1.3. Scope of Services

EASI's Consulting Service Agreement with Geocon, dated December 8, 1998, outlines the scope of services proposed for the ESA. Geocon performed the services outlined in the referenced Consulting Service Agreement with the following exceptions:

- Historical Sanborn Fire Insurance Maps were sought from the Los Angeles County Public Library collection of maps for the west coast of the United States. No historical Sanborn, Inc. Fire Insurance Maps were available for the subject property from this source.
- Some documents provided by EASI and reviewed at the DTSC and CRWQCB were not summarized in the attached Tables 1, 2, and 3 because they were evaluated as not providing relevant information regarding the environmental status of the subject property. In addition, because Geocon's primary focus was on the environmental condition of Lot B, only generalized environmental information affecting the other subdivided former Hughes lots (i.e., Lots A, C, and D) was provided.

1.4. Site Location

The subject property is located to the northwest of the intersection of Fallbrook Avenue and Roscoe Boulevard and is identified as the Coast Federal Bank – West Hills Property, or as Lot "B". It was formerly one of 4 lots forming the approximately 85.7-acre property occupied by Hughes Aircraft Company and Hughes Missile System Group (hereinafter Hughes) until 1994. The entire former Hughes property is bounded by the Chatsworth Reservoir and residential neighborhoods. The approximate location of the subject property is depicted on the reproduction of a portion of the USGS topographic map for the Calabasas, California quadrangle, dated 1967 (photorevised 1979) and presented as Figure 1. A Site Plan is included as Figure 2. The subject property is further identified by Los Angeles County Assessor's Parcel Numbers 2005-002-001 and 2005-002-002.

2. GEOLOGIC AND GROUNDWATER CONDITIONS

2.1. Geologic Conditions

Geologic information was obtained from the September 3, 1998 Fluor Daniel GTI (GTI) *Additional Site Assessment Report – Vicinity of CM-10 and Buildings 265, 274, and 276* and compared with the State of California Department of Conservation Geologic Map of California Los Angeles Sheet. The GTI Report and review of the USGS "Calabasas, California" topographic quadrangle indicated that the subject property is located at an elevation of approximately 840 to 900 feet above mean sea level (MSL). Surface topography generally slopes to the south, east, and west from a high point located at the center of the northern boundary of the subject property. Surface water is directed to storm drains that flow west to the adjacent Chatsworth Creek. The nearest surface water indicated on the topographic map is the Chatsworth Reservoir and Spillways located within 1/8-mile to the north of the subject property and Chatsworth Creek and Lees Lake located adjacent to the west of the subject property.

According to the GTI Report, the geologic materials found near the surface in the vicinity of the subject property are generally composed of flat-lying, poorly sorted, unconsolidated sands, silts, and clays with occasional gravels. These materials are collectively termed the Cenozoic-age Basin fill and overlie more consolidated geologic units. The thickness of these deposits range from approximately 20 feet along the northern portion of the facility, to nearly 75 feet along the southern portion of the facility. A thin layer (up to 10 feet) of construction fill is present across the subject property.

The subject property is situated on the consolidated bedrock of the Miocene-age Modelo Formation, which locally overlies the Lower Miocene-age Topanga Formation. Older Formations include the Cretaceous Chatsworth Formation, which crops out in the nearby Simi hills. The Modelo Formation is comprised of grayish siltstone and shale, brownish siltstone, clayey siltstone, and clayey shale, with some interbedded grayish diatomaceous shale. Beds of the Modelo Formation appear to dip 45 degrees to the south, as seen from exposures in nearby roadcuts and from lithologic samples taken from onsite soil borings. Near the surface and near the contact with the younger Basin fill, the Modelo Formation is highly weathered.

2.2. Groundwater Quality and Occurrence

Based on a review of a April 15, 1998 GTI Report, groundwater throughout the former Hughes facility (Lots A, B, C, D) was encountered at depths ranging from 9.5 feet to 62 feet below grade. Groundwater in two borings drilled to the south of Building No. 274 on the subject property was

encountered by GTI in September 1998 at depths ranging between 36 feet to 48 feet below grade. The Los Angeles County Department of Public Works Hydrologic Records Section records indicate that depth to water in Well #4699, located approximately 1½ miles to the southeast of the subject property, was measured at 21.9 feet bgs on November 12, 1997. The groundwater gradient across the subject property is generally to the south/southeast, with the exception of the western portion of the subject property where groundwater apparently flows to the west towards Chatsworth Creek. Local water quality tends to be unusable for drinking due to concentrations of total dissolved solids (TDS) exceeding 1,000 mg/L. Because of the high TDS groundwater and because of relatively low yields, no drinking water is reportedly pumped locally from the Cenozoic valley fill sediments or the Modelo Formation.

3. SITE RECONNAISSANCE

Representatives of Geocon conducted a reconnaissance of the subject property on December 28, 1998. Geocon representatives were accompanied during portions of the site visit by Mr. Neal Holdridge of EASI and by Mr. Grant Baker of Home Savings of America. The purpose of the site reconnaissance was to observe existing subject property conditions and to evaluate for evidence of recognized environmental conditions, including hazardous materials and/or wastes. Observations noted during the site reconnaissance are summarized below. Selected photographs of the subject property are presented as Appendix A of this report.

3.1. Onsite Reconnaissance

The subject property was occupied by nine recently vacated buildings, a helipad, and landscaped and paved parking areas at the time of the site reconnaissance. Coast Federal Bank (Coast), as predecessor to Home Savings and Loan (Home), occupied the subject property from 1994 to 1998, using it as professional office space. Most of the office furnishings installed by Coast remained at the time of Geocon's reconnaissance on December 28, 1998. According to Mr. Baker, Coast's use of hazardous materials at the subject property was limited to chemicals used in the Central Engineering Plant (Building No. 263), such as corrosive inhibitors, Freon, petroleum based oils and lubricants, ammonia used in onsite duplicating machinery, and general maintenance and cleaning supplies. Observations made for each of the onsite buildings are provided below.

Building No. 264

Building No. 264 was constructed in 1959 as a kitchen and cafeteria and has retained that use to the time of Geocon's onsite reconnaissance. Evidence of use or storage of hazardous materials or wastes in the building, such as storage drums or containers or staining of the floors and walls, was not

observed during the site visit, nor was it reported historically. A grease trap was verbally reported at Building No. 264 by Mr. Grant, but was not available for observation during the site reconnaissance. One grease dumpster was observed in a car washdown room located adjacent to the west of the Building No. 264. The dumpster was labeled as belonging to Baker Commodities and was observed to be approximately half full of grease. Mr. Baker reported that the grease would be transported offsite for recycling or disposal. We did not observe evidence of environmental concerns inside Building No. 264.

Adjacent to the east of Building No. 264 was an air refrigeration unit associated with the walk-in coolers located in the building. No chemicals or evidence of staining were observed in the area of the refrigeration unit. A patched asphalt area and two apparent monitoring wells were observed in this area. This area is reported as the site of former 10,000-gallon UST (T-10), which contained diesel fuel, and was removed from the subject property in 1991. This UST was connected by piping to three other former diesel USTs (T-7, T-8, and T- 9) located further to the east (discussed under Building No. 281 section). The areas near these former USTs and associated piping is included in the ongoing investigation for the entire former Hughes property, as directed by the CRWQCB and DTSC.

Building No. 281

Building No. 281 was constructed in 1986 and contains office space, a large auditorium, a conference room and a main lobby entrance area. Evidence of use or storage of hazardous materials or wastes in the building, such as storage drums or containers or staining of the floors and walls, was not observed during the site visit. Two hydraulic elevators are present in the building and are serviced monthly by an outside contractor. The elevator equipment rooms were observed to contain elevator machinery consisting of self-contained units with built-in oil reservoirs. A minor amount of oil was observed in the pan of one of the units, however, no evidence of spillage or leakage was observed on the floor of the room.

According to Mr. Baker and the November 30, 1989 McLaren Historical Chemical Use Inventory for the Hughes Missile Systems Group Facility, Building No. 281 contained two maintenance shops and a "control material storage" area, on the basement and first floors. Hazardous materials reported in these areas were limited to insecticide storage and use of dichloromethane (methylene chloride) in the maintenance shops. The extent of use of these materials was described as "quantifiably insignificant" and no further investigation was required. No concerns were identified with regard to chemical, use, storage or disposal at Building No. 281.

Three 12,000-gallon USTs (T-7, T-8, and T-9), containing diesel fuel were removed from the parking area located to the southeast of Building No. 281 in 1991. Soil and groundwater impact from releases from these USTs and associated piping was identified and the area is included in the ongoing onsite soil and groundwater investigation and remediation activities, under guidance of the CRWQCB and DTSC. One monitoring well, CM-8D, was observed in this area. Sampling performed by Fluor Daniel/GTI indicates that groundwater in the vicinity of well CM-8D contains chlorinated volatile organic compounds (VOCs) from an unknown source.

Building No. 271

Building No. 271 was constructed in approximately 1959 and has been used as a paint and maintenance shop. An approximately 135,000-gallon concrete or masonry water test tank is present beneath the building. The water test tank was empty at the time of Geocon's site reconnaissance and was observed from the access point in the floor of the building. According to Mr. Baker, this water test tank was formerly filled with water and used for specialized sonar testing, not for storage of regulated material. Spray painting was reportedly conducted in the building in the late 1980's; however; no evidence of environmental impact was observed or reported from these operations.

Building No. 263

Building No. 263 was constructed in 1959 as the Central Engineering Plant for the entire site. All of the major building systems equipment; i.e. boilers, chillers, air handlers, cooling towers, are located within this building. Hazardous materials observed in the Central Plant included: Freon 11 and 12, corrosion control water treatment chemicals, and small quantities of miscellaneous oils and lubricants stored in flammable materials cabinets. No concerns were noted with regard to handling or storage of these materials and no evidence of significant spillage or leakage was noted on the floors or walls. One hydraulic elevator is present in the building. Observation of the elevator equipment did not reveal evidence of leakage or spillage of hydraulic fluid to the surrounding concrete slab.

A series of concrete filled trenches was observed in the ground floor of the boiler room of Building No. 263. According to Mr. Grant, these trenches formerly contained diesel fuel lines connecting the former USTs located to the east of Building Nos. 264 and 281 with the former diesel boilers located within the building. The current boilers are fueled by natural gas, and the chillers by electricity. These areas were investigated as part of the soil and groundwater investigative and remedial activities conducted at the subject property under the direction of the CRWQCB and DTSC and no evidence of impact to subsurface soils has reportedly been encountered beneath the buildings.

A Los Angeles Department of Water and Power (LADWP) transformer yard was observed adjacent to the east of Building No. 263, containing six large liquid-cooled distribution transformers. The northwesternmost transformer appeared to have staining around its base. According to Mr. Donald Giddings of the LADWP, these transformers are owned and maintained by the LADWP and they are not considered to contain polychlorinated biphenyls (PCBs) as a component of their cooling oil. One monitoring well was observed in the parking area to the east of the transformer yard.

Two former 500 gallon USTs (T-4 and T-5) containing waste oil and sulfuric acid were removed from outside the western area of Building No. 263 in 1984. Two large cooling towers are now present in the former locations of these USTs. Impacts to soil and groundwater from releases of chlorinated and non-chlorinated volatile organic compounds and semi-volatile organic compounds from these tanks have been investigated under the ongoing sitewide investigation and remediation program directed by the CRWQCB and DTSC. One monitoring well and two apparent grout-filled borings were observed near the location of the former USTs.

Building No. 265

Building No. 265 was constructed in 1959 and contained offices, maintenance shops, and two anechoic chambers for the testing of radar impacts to missile guidance systems. At the time of the site visit, only office and document storage areas were observed in the building. Previous investigations did not identify this building as a potential source for soil and groundwater impacts. One hydraulic elevator is present in the building. Observation of the elevator equipment did not reveal evidence of leakage or spillage of hydraulic fluid to the surrounding concrete slab.

A diazo blueprint reproducing unit was observed in a small room on the basement level of the building. No ammonia or other chemicals were observed in the room, however a binder containing Material Safety Data Sheets (MSDS) was observed and containing MSDS' for citric metal cleaner and ammonia. No evidence of chemical mishandling or spillage was observed in this area. The east end of the basement of the building was observed to have numerous cuts in the concrete slab. According to Mr. Baker, these areas were formerly occupied by a loading dock and maintenance shops. Mr. Baker further reported that no significant chemical use occurred in these areas and that the concrete cuts marked the locations of former trenches containing electrical and plumbing conduits for the machinery formerly present. Evidence of water staining was noted in the northern basement areas on walls and floors, however, this is not anticipated to represent an environmental concern.

An enclosed fenced area was observed adjacent to the outside of the northeast corner of the building and was labeled as containing corrosive materials. No storage containers or evidence of hazardous

materials or waste storage, including staining, was observed in this area at the time of the site reconnaissance. Mr. Baker reported that this enclosure originally housed a self-contained emergency generator and later was used for storage of waste ammonia and other photo-processing chemicals pending offsite disposal. Mr. Baker further reported that Safety Kleen was contracted to remove these materials from the subject property; however, manifests of pickup and disposal were not available for review onsite. This area has been investigated by the CRWQCB and DTSC as part of the ongoing sitewide soil and groundwater investigation and remediation program and no concerns have been identified with regard to Building No. 265.

Building No. 274

Building No. 274 was constructed in 1981 and houses a large anechoic chamber for testing of radar impacts to missile guidance systems. At the time of the site visit, the chamber soundproofing had been removed from the exposed steel walls and portion of the building had been used by Coast Federal Bank to house the onsite telephone system equipment. According to a transcript of a November 21, 1994 interview with Hughes employees, mercury may have been present in a soundproofing coating on foam "cones" of the anechoic chamber and, according to Mr. Baker, this material was removed under appropriate manifest to a disposal site in Arizona. No documentation of this removal was available for review onsite. During our site visit, a minor amount of soundproofing material was noted on the floor of the anechoic chamber.

A battery bank associated with an uninterrupted power supply system was observed within the building. An emergency electrical generator with an associated 1,500-gallon aboveground storage tank (AST) containing diesel fuel was observed adjacent to the southwest of the outside of the building. No concerns were noted with regard to these features and no evidence of spillage or leakage from the batteries or the outdoor generator system was observed during the site visit.

The area to the south/southeast of Building No. 274 has been investigated during the course of the sitewide soil and groundwater investigation and remediation activities directed by the CRWQCB and DTSC, most recently in September of 1998.

Building No. 277

Building No. 277 was constructed in 1986 as office space. With the exception of less than 5 gallons of photo-processing chemicals observed in a room in this building, no evidence of hazardous materials or hazardous waste use, storage or disposal was observed. The drain in the photo-processing room did not exhibit staining, nor did the floor. According to Mr. Baker, all used photo-

processing and diazo blueprint chemicals were collected for offsite disposal by Safety Kleen and no such materials were discharged to onsite drains. According to a 1989 Phase I ESA report by McLaren, waste photo-processing chemicals were stored in fifty-gallon drums in Building No. 277 (location not identified) and transported offsite for disposal. The McLaren report also identified the use of "quantifiably insignificant" amounts of mineral oil on the first floor of this building; however, no environmental concerns were noted with regard to the use, storage or disposal of the mineral oil.

One hydraulic elevator is present in the building. Observation of the elevator equipment did not reveal evidence of leakage or spillage of hydraulic fluid to the surrounding concrete slab. A self-contained emergency electrical generator was observed outside the southwest end of the building. This generator was equipped with a built-in diesel fuel reservoir. No evidence of leakage or spillage of fuel or oil was observed on the ground surrounding the generator.

Two fenced enclosures were observed to the southwest of the building. These areas were not accessed but appeared to contain electrical supplies for parking area lights. No evidence of chemical use or storage was observed in these areas.

A helicopter landing pad was observed further to the southwest of Building No. 277. No evidence of onsite fueling or servicing of helicopters or other vehicles was observed or reported.

Building No. 276

Building No. 276 was constructed in 1984 as office space. No evidence of hazardous materials or waste use, storage or disposal was observed, with the exception of one former photo-processing room. No hazardous materials or wastes remained in this room and the drain in the photo-processing room did not exhibit staining, nor did the floor. According to Mr. Baker, all used photo-processing and diazo blueprint chemicals were collected for offsite disposal by Safety Kleen and no such materials were discharged to onsite drains. According to a 1989 Phase I ESA report by McLaren, waste photo-processing chemicals were stored in fifty-gallon drums in Building No. 277 (location not identified) and transported offsite for disposal.

A self-contained emergency electrical generator was observed outside the north end of the building. This generator was equipped with a built-in diesel fuel reservoir. No evidence of leakage or spillage of fuel or oil was observed on the ground surrounding the generator.

Building No. 261

Building No. 261 was constructed in 1959 as office space. This building sustained structural damage from the Northridge earthquake in 1994 and reportedly has been vacant since that time. No evidence of the use, storage, or disposal of hazardous materials or wastes at this building was observed or reported. One room in the basement was identified as a print-shop, however, Mr. Baker indicated that only computer generated forms were printed in this location and no wet or dry inks, paints, solvents, or thinners were used at this location. No evidence of such activities, such as staining of walls or floors or evidence of chemical storage was observed in this room. Two cable-type elevators were observed at this building. No hydraulic oils are used in these systems, and as the elevator machinery is located on the roof of the building, the potential for environmental impact from releases of any hazardous materials is considered remote.

A self-contained emergency electrical generator was observed outside the east end of the building. This generator was equipped with a built-in diesel fuel reservoir. Minor staining was noted around the base of the generator, apparently from leakage or spillage of motor oil or diesel fuel. The extent of the staining does not indicate a significant potential for environmental impact to subsurface soils from hazardous materials and this area has been investigated during the course of removal and remediation of the soils surrounding former USTs T-5 and T-6 which were located at the western end of the building in the current location of the cooling towers.

Other Site Features

With the exception of the LADWP electrical transformer station described above, only type "AA" or "dry-type" electrical transformers were observed within the onsite buildings. These types of electrical transformers do not use oil as a coolant and are not considered to pose an environmental concern at the subject property.

Other than the empty former water test tank present beneath Building No. 271, evidence of USTs remaining onsite was not observed. Six USTs have been removed from the subject property since 1984 and releases from five of these UST systems are currently monitored under the sitewide soil and groundwater investigation and remediation program, as directed by the CRWQCB and DTSC. One , approximately 1,500-gallon "Con-Vault" AST containing diesel fuel for an associated emergency electrical generator is present adjacent to Building No. 274.

Eleven monitoring wells are currently present onsite, associated with the ongoing sitewide soil and groundwater investigation and remediation. Treated groundwater discharged from the treatment

units located offsite on Lot C, to the north of the subject property, is used for irrigation on Lot C, under appropriate permits from Los Angeles County and the CRWQCB.

Dumpsters for solid waste were observed at each building location. The dumpsters are owned and maintained by Foothill Waste Disposal Company and evidence of improper dumping or disposal of hazardous materials or wastes was not observed in the dumpster areas.

Utilities reported as providing service to the site were identified as follows:

Electricity:	Los Angeles County Department of Water and Power
Natural Gas:	Southern California Gas Company
Water:	Los Angeles County Department of Water and Power
Sewer:	Los Angeles County Sanitation District
Refuse:	Foothill Waste Disposal Company

With the exception of areas and features noted above and the ongoing soil and groundwater investigation and remediation program, evidence of recognized environmental conditions were not observed at the site. Evidence of dumping of hazardous materials, distressed vegetation, significant soil disturbance or discoloration, ponded or pooled water, septic systems, pits, ponds, or sumps, or indications of hazardous materials use, storage or disposal, was not observed on the subject property.

3.2. Off-Site Observations

Representatives of Geocon observed the adjacent properties from the subject property and from public thoroughfares on December 28, 1998, to assess if facilities and/or structures located on these properties are operated by entities that potentially use, store, generate, or dispose of hazardous materials/wastes.

The subject property is bounded by Lot C (Regent's Property) to the north. At the time of Geocon's site reconnaissance, substantial construction work was underway at the buildings on this property. Reportedly, Lot C is being redeveloped as a business park. Lot C has been impacted by releases of hazardous materials dating from the Hughes occupancy of the entire site and is part of the ongoing soil and groundwater investigation and remediation activities directed by the CRWQCB and DTSC. The subject property has been environmentally impacted by hazardous materials and wastes originating from Lot C. Beyond Lot C is open space containing spillways for the adjacent north Chatsworth Reservoir.

To the east is Fallbrook Avenue followed by residential neighborhoods and a playground for Rockwell Employees. Further east from the playground is Rockwell AID/C at 8500 Fallbrook

Avenue. The Rockwell facility was not visible from Fallbrook Avenue and was not observed during the site visit.

To the south of the subject property are Lots A and D. A large building, reportedly a private school owned by DeVry Inc., is under construction at Lot A. Lot D remains as paved parking areas but is projected to be developed as a Los Angeles Police Department (LAPD) 911 Emergency Center. Roscoe Boulevard, lined by commercial properties follows to the south.

To the west is open space and Lees Lake and the Chatsworth Creek followed by residential areas.

4. SITE HISTORY

4.1. Review of Historical Aerial Photographs

Historical aerial photographs available from Continental Aerial Photography, Inc. (Continental) for the years 1952, 1970, 1972, 1979, 1986, 1988, 1990, 1993, and 1995 were reviewed. Historical Sanborn Fire Insurance maps and City Directories were sought from the Los Angeles County Public Library but were not available for the subject property and vicinity. Observations noted during the historical photograph review are discussed below. In addition, copies of three undated, low-altitude, oblique aerial photographs of the subject property were provided by EASI and are presented in the rear portion of Appendix A.

1952 Aerial Photograph – The subject property appeared as agricultural land with one cluster of rural residential buildings located roughly at the center of the property. Surrounding properties were also agricultural with an area of construction or grading in the location of the residential neighborhood present today to the east of Fallbrook Avenue. A cluster of rural residential type structures was also present to the northeast of the subject property and the Chatsworth Reservoir was present in its current location.

1970 Aerial Photograph - The subject property was developed with Building Nos. 261, 263, 264, 265 and 271, the helipad, and paved parking areas. A few small unidentifiable features appeared in the parking lot to the east of Building No. 264, the current location of the well CM-8D plume. To the north of the subject property was the remainder of the Hughes facility (currently Lot C), including cooling ponds in the center of that property. Areas to the west and south remained undeveloped and residential neighborhoods were present to the east, across Fallbrook Avenue.

1972 Aerial Photograph – The subject property and vicinity appeared similar to the configuration observed on the 1970 photograph.

1979 Aerial Photograph - The subject property appeared to be developed with the five buildings observed on the 1970 photograph and with eight additional structures which were not present during

the December 28, 1998 site visit. These buildings appeared in the center of subject property, to the west of Building No. 265. Offsite areas appeared developed similar to areas observed during the December 28, 1998 site visit.

1986 Aerial Photograph - The subject property was developed with the five buildings observed since 1970 and Building No. 276. Three of the eight structures observed in the 1979 photograph remained as well. An excavated or otherwise disturbed area appeared roughly in the area of the former location of USTs T-7, 8, and 9, to the west of the current location of Building No. 281. Other areas appeared similar to their depiction in the 1972 photograph.

1988 Aerial Photograph - The subject property was depicted essentially the same as during the December 28, 1998 site visit with all nine buildings present. North of the subject property was Lot C, to the east was Fallbrook Avenue followed by residential areas, to the south were Lots A and D. Lot A remained paved parking and Lot D was occupied by a recreation area with fields and a baseball diamond. To the west was paved parking and vacant land.

1990 – 1993 Aerial Photographs - The subject property and vicinity appeared similar to the 1988 photographs.

1995 Aerial Photograph - The subject property and surrounding properties appeared relatively unchanged from the 1993 photograph; however, large piles of assumed construction debris were present in several of the parking lots onsite.

4.2. Historical Ownership

A Chain-of-Title report was not provided for review. Based on a review of historical documentation Geocon has compiled the following chronology of subject property ownership. The subject property was originally developed as an aerospace research and development facility in 1959 by Bunker Ramo. Prior to this time the subject property was used as agricultural land, and may have also been used as a filming site. Hughes Aircraft Company and Bunker Ramo jointly operated onsite through the 1960's when Hughes assumed sole ownership of the site. Rocketdyne was a tenant of the property at one time, according to the DTSC. Hughes vacated the site in approximately 1994 and Coast Federal Bank acquired the property and divided it into four lots which exist today. Coast Federal Bank and its successer Home Savings and Loan maintained administrative offices and a training center onsite until they vacated the subject property in 1998. Raytheon Missiles Systems Group (Raytheon) acquired Hughes in December 1997 and since that time has assumed financial responsibility for ongoing and future environmental investigations and remediation activities at the former Hughes facility, including the subject property.

4.3. Interview - Property Owner Representative

Mr. Grant Baker, of Home Savings of America was interviewed regarding historical use of the subject property. Mr. Baker was an employee of Hughes Aircraft Company for nineteen years and has extensive knowledge of subject property conditions and operations. Information obtained from Mr. Baker regarding historical subject property operations is presented in Section 3.0.

5. GOVERNMENTAL AGENCIES - RECORDS REVIEW

VISTA Environmental Solutions, Inc., retained by Geocon, performed a search of federal and state governmental information sources according to prescribed search distances referenced in American Society for Testing and Materials (ASTM) Designation E 1527-97. A reproduction of the report prepared by VISTA is presented in Appendix B.

5.1. VISTA Report

The report prepared by VISTA entitled *Site Assessment Plus Report* dated January 5, 1998, includes a Site Distribution Summary, a Map of Sites Within 1¼-Miles, a Map of Sites Within 3/8-Mile, a Street Map, a Site Inventory, a Description of the Databases Searched, and Details of the Property, Adjacent Area, and Unmapped Sites. The Unmapped Sites included in the report identified sites that have incomplete address information and could not be plotted. Based on a review of the Unmapped Sites list and comparison with local street maps, none of the Orphan sites appear to be within one mile of the subject property.

A description of each database referenced by VISTA is provided in the report presented as Appendix B. The acronyms used in the VISTA report are defined in the rear portion of the VISTA report. The findings of the VISTA report are discussed as follows. The identification number as plotted in the VISTA report for each listed property is reported in parenthesis to the right of each facility name.

5.1.1 Subject Property

The subject property was identified in the VISTA Report on the ERNS, LA County Site Mitigation, UST, CORTESE, RCRA-Large Generator, CORRACTS, RCRA-Violations, RCRA-TSD CORRACTS, State Equivalent CERCLIS, State LUST, and NFRAP lists. It is referenced variously as part of the Hughes Aircraft, Hughes Aircraft Company, Hughes Missile Systems, Hughes Missile Systems Company, and Hughes T-3 Site. The site description and address refers to the entire former Hughes facility which includes not only the subject property (Lot B) but also Lots A, C, and D. According to the VISTA report, the Hughes facility has had releases of gasoline (not described), volatile organic compounds (VOCs) (not described), solvents (not described) and formaldehyde (20-

gallons). The current site status is reported as "remediation underway". Fourteen various sized USTs used for storing unleaded gasoline and miscellaneous chemicals are reported as closed and removed from the entire former Hughes facility. According to the State LUST list information contained in the VISTA report, solvents and VOCs were released from the onsite USTs and investigation of the releases is currently underway. Nine undefined RCRA violations are reported from 1989 to 1994. The site is not identified on the EPA NPL (Superfund) list.

5.1.2. Offsite Properties

- Rockwell AID/C (2), at 8500 Fallbrook, is located across Fallbrook Avenue to the northeast of the subject property and is likely hydraulically cross-gradient of the subject property. The Rockwell AID property is reported as a registered UST site and as an RCRA Small Quantity Generator of hazardous waste (SmGen). SmGen's are defined as facilities which generate at least 100 kilograms but less than 1,000 kilograms per month of non-acutely hazardous waste. One registered UST is reported at the property but no other information regarding the UST was reported. According to the VISTA report, no indications of violations or release of hazardous materials are identified for this property and based on this information, it is not considered to have significant potential to have affected environmental conditions at the subject property.

- Chatsworth Reservoir (2), at 8600 Fallbrook, is located approximately 1/8-mile to the north of the subject property and is potentially hydraulically upgradient of the subject property. The Chatsworth Reservoir property is reported as having one registered UST. Information regarding the status of this UST is not documented in the VISTA report. According to the VISTA report, no indications of violations or release of hazardous materials are identified for this property and based on this information, it is not considered to have significant potential to have affected environmental conditions at the subject property.

- Fire Station 106 (3), at 23004 Roscoe Boulevard, is located slightly less than ¼-mile to the south of the subject property and is likely to be hydraulically downgradient of the subject property. This site is identified as a registered UST site with one UST of unreported status, and as an RCRA SmGen. According to the VISTA report, no indications of violations or release of hazardous materials are identified for this property and based on this information, it is not considered to have significant potential to have affected environmental conditions at the subject property.

- Lakeview Cleaners (4), at 22736 Roscoe Boulevard, is located slightly over ¼-mile to the southeast of the subject property and is likely to be hydraulically downgradient of the subject property. This site is identified as an RCRA Large Quantity Generator of Hazardous Wastes (LgGen). LgGen's are defined as facilities which generate at least 1,000 kilograms per month of non-acutely hazardous waste or 1 kilogram per month of acutely hazardous waste. According to the VISTA report, no indications of violations or release of hazardous materials are identified for this property and based on this information, it is not considered to have significant potential to have affected environmental conditions at the subject property.

5.2. Agency Communications and Review of Records at Public Agencies

5.2.1. California Department of Conservation Division of Oil, Gas and Geothermal Resources (DOGGR)

The California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR) Field Map (W 1-2) (June 19, 1986) was reviewed by a representative of Geocon to obtain information concerning the subject property and properties situated within approximately ¼-mile of the subject property. The map depicts the location of oil and gas wells. The map did not indicate the existence of oil or gas wells within ¼-mile of the subject property.

5.2.2. City of Los Angeles Building and Safety Department

The City of Los Angeles Building and Safety Department was visited in person on December 29, 1998. Building permits for the original buildings constructed by Bunker Ramo in 1959-1961 on the entire former Hughes Aircraft Company were identified, as well as various tenant improvements, plumbing and electrical permits. No indications of the use or storage or hazardous materials at the subject property was identified from this review. Mr. Baker of Home Savings of America stated that Hughes Aircraft Company had requested many of the original building permits to be destroyed for security reasons.

5.2.3. Los Angeles City Fire Department – Underground Storage Tank Division

The Los Angeles City Fire Department (LAFD) was visited by Geocon on December 29, 1998. Files reviewed at this agency documented the removal of onsite USTs T-10, T-7, T-8, and T-9, as well as removal of soil impacted by diesel fuel and VOCs. The file also contained information regarding removal and investigation of USTs and clarifiers located on Lot C, located adjacent to the north of the subject property. Oversight for the site investigation was referred to the CRWQCB on December 23, 1991 and no closure letters for removal of the USTs was found in the files.

5.2.4. Health Department, Los Angeles County

The Los Angeles County Health Department was contacted in writing on December 23, 1998. At the time of this report writing, Geocon has not received a response from this agency. Geocon will report any pertinent information received from this agency in a letter addendum to this report.

5.2.5. Department of Public Works, Los Angeles County

The Los Angeles County Department of Public Works (LACDPW) was visited in person on January 13, 1999 and reported that no environmental files were found for the subject property. The LACDPW is not an oversight agency for areas which are contained within City of Los Angeles boundaries.

5.2.6. California Regional Water Quality Control Board (CRWQCB)

Ms. Regina Simms of the CRWQCB reported by telephone on December 23, 1998 that files were found for the subject property in the Site Cleanup Section of the CRWQCB. No files were reported by the WIP, SLIC, NPDES or UST Sections. CRWQCB staff reported that all files previously held by these sections had been transferred to the Site Cleanup Section. The Site Cleanup Section files were reviewed on January 11, 1999 by Mr. Robin Ferber, Senior Managing Geologist, of Geocon. The subject property is included in an ongoing investigation of soil and groundwater impacts from onsite USTs T-5, T-6, T-7, T-8, T-9, and T-10, in addition to environmental impacts from USTs and other features formerly located on Lot C, located adjacent to the north of the subject property. The review of these files is described in detail in Table 2.

5.2.7. South Coast Air Quality Control Board (SCAQMD)

Ms. Flor Tumambing of the SCAQMD reported in writing on January 6, 1999 that numerous files were found for the subject property. A list of permitted equipment was provided comprising equipment permitted between 1967 and 1994. It is not possible to discern which permits apply to the subject property rather than those applicable to Lots A, C, and D. Permitted equipment included: soldering equipment, storage tanks, plating equipment, ovens, degreasers, spray booths, solvents, scrubbers, chemical mills, film cleaning, cooling towers, boilers, flues, circuit board etchers and cleaners, internal combustion engines (emergency generators), and soil vapor extraction treatment systems. A complete list of the equipment provided by SCAQMD is provided in Appendix C.

5.2.8. California – EPA, Department of Toxic Substance Control (DTSC)

Mr. Glen Castillo of the DTSC reported by telephone on January 5, 1999 that files were found for the subject property. The files were reviewed on January 14, 1999 by Mr. Robin Ferber of Geocon. The subject property is included in an ongoing investigation of soil and groundwater impacts from onsite USTs T-5, T-6, T-7, T-8, T-9, and T-10, VOCs detected monitoring wells CM-8D and CM-10, eight Areas of Concern and three Solid Waste Management Units identified by the DTSC, in addition to environmental impacts from USTs and other features formerly located on Lot C, located

adjacent to the north of the subject property. The review of these files is described in detail in Table 3.

5.3. Interviews with Representatives of the CRWQCB and DTSC

5.3.1. Interview with Ms. Manjulika Chakrabarti of the CRWQCB

An interview was conducted with Ms. Manjulika Chakrabarti, Technical Support Unit, CRWQCB Los Angeles Region by Mr. Robin Ferber, Senior Managing Geologist with Geocon on January 5, 1999. Ms. Chakrabarti is currently the project manager for the Raytheon (formerly Hughes) Canoga Park project. Ms. Chakrabarti indicated some existing monitoring wells will be closed and some new wells may be added in Lot C. Ms. Chakrabarti indicated to the best of her knowledge, Raytheon (formerly Hughes) has complied with the requests of the CRWQCB.

5.3.2. Interviews with Mr. Phil Blum and Mr. Phil Chandler of the DTSC

Mr. Phil Blum, Project Manager, Southern California Permitting Branch, DTSC and Mr. Philip Chandler, Supervising Hazardous Substances Engineering Geologist, Southern California Permitting Branch, DTSC were interviewed together on January 14, 1999 by Mr. Robin Ferber of Geocon and Mr. Neal H. Holdridge, Environmental Manager of EASI. Mr. Blum was also interviewed by telephone by Mr. Ferber on January 8, 1999.

During the January 8, 1999 telephone conversation with Mr. Ferber, Mr. Blum indicated that he has been managing the project actively since April 1998. Mr. Blum indicated that the DTSC has notified Raytheon to conduct activities at the site and that Raytheon has not performed these activities. The activities include providing a post-closure permit application for UST T-3 and sampling for hexavalent chromium in the area beneath the former Hazardous Waste Storage Area. Mr. Blum indicated that Raytheon has also been asked to do Corrective Action activities for environmental concerns associated with Building No. 269 (Lot C). Mr. Blum indicated that the DTSC has been shorthanded in response to information and clarifications requested by Raytheon. Mr. Blum indicated the most significant groundwater problem is where the VOCs are present beneath UST T-3. In Mr. Blum's opinion, Raytheon has not defined the lateral and vertical extent of contamination beneath UST T-3. Mr. Blum indicated that Raytheon has contested the necessity of providing a post-closure permit application for UST T-3. Mr. Blum indicated that a DTSC compliance enforcement action may be needed if Raytheon continues to contest the post-closure permit application required for UST T-3.

Mr. Blum indicated that Mr. Chandler is a more senior level DTSC representative and recommended discussing the project with both of them during Mr. Ferber's file review on January 14, 1999. During the joint interview with Mr. Blum and Mr. Chandler on January 14, 1999, Mr. Chandler indicated that Raytheon's position is that the post-closure permit application for UST T-3 is unnecessary. Mr. Chandler indicated that the DTSC has sent three letters to Raytheon to indicate they are not in compliance with the post-closure requirements. The DTSC indicated that they are in the process of preparing a letter providing Raytheon with 90-days to respond and comply to the post-closure application requirements for UST T-3.

Both Mr. Chandler and Mr. Blum indicated that the DTSC still needs to sign off on the AOCs and SWMUs previously identified and that further investigations associated with AOCs and SWMUs are possible for the subject property (i.e., Lot B). Mr. Chandler and Mr. Blum both indicated that they have been short staffed and have not responded to Raytheon's requests in a timely manner. They indicated the DTSC is the lead agency for Corrective Action and closure and post-closure of the permitted units under RCRA. The CRWQCB was described by Mr. Chandler as the lead agency for groundwater protection for the whole former Hughes facility.

Mr. Chandler indicated that the City of Los Angeles may request an environmental clearance by the DTSC prior to authorizing the construction of any building on the former Hughes property. Mr. Chandler also stated that the DeVry Inc. property (Lot A) located south of the subject property had to acquire an environmental clearance letter for the City of Los Angeles from the DTSC prior to the construction of their building.

Mr. Chandler was aware of the elevated uranium and radium levels detected previously in groundwater beneath the site, but did not have an explanation as to the source of the detections. Mr. Chandler did not rule out the possibility that the DTSC may further investigate the radioactivity issue at a later time. Mr. Chandler indicated that Rocketdyne was reportedly a tenant at the site in the past.

6. CONCLUSIONS AND RECOMMENDATIONS

The conclusions and recommendations resulting from the performance of this Enhanced ESA are summarized below:

- During a site reconnaissance of the subject property, the approximately 30-acre subject property was occupied by nine buildings and landscaped and paved parking areas. With the exception of onsite features associated with the ongoing groundwater monitoring program and potential impacts associated with the Raytheon soil vapor and groundwater extraction and treatment

systems, evidence of "recognized environmental conditions" was not observed during our site reconnaissance of the subject property.

- Raytheon acquired Hughes in December 1997 and since that time has assumed financial responsibility for ongoing and future environmental investigations and remediation activities at the former Hughes facility, including the subject property.

- Obvious evidence of hazardous materials use, storage or disposal was not observed onsite in the aerial photographs reviewed. The subject property appears to have been used for agricultural purposes prior to development as an aerospace research and development facility in 1959. Construction of onsite buildings and features occurred roughly from 1959 to 1986.

- Onsite topography slopes to the south, east, and west from a high point located roughly at the center of the northern boundary of the subject property. Groundwater beneath the subject property flows to the south-southeast with the exception of the Lot C area northwest of the subject property where groundwater flows to the west towards Chatsworth Creek.

- The subject property was identified in the information sources reviewed by VISTA. All of the subject property listings appear to relate to the ongoing soil and groundwater investigations at the subject property. Several businesses listed by VISTA in their report were within the appropriate search radii used for this ESA. The properties listed by VISTA are not considered likely to impact soil and groundwater beneath the subject property with hazardous materials based on their distance from the subject property, their location relative to the local hydraulic gradient, and/or the absence of information indicating releases of hazardous materials originating from the listed properties.

- Releases of diesel fuel, chlorinated and non-chlorinated volatile organic compounds (VOCs), aromatic VOCs, and semi-volatile organic compounds (SVOCs) to soil and/or groundwater have been documented onsite. Investigation of impacts to soil and groundwater from these substances has been ongoing since 1989 under the direction of various regulatory agencies including the City of Los Angeles Fire Department, CRWQCB, California Department of Health Services, and the DTSC. The DTSC and the CRWQCB are currently the key environmental agencies involved at the subject property and neighboring former Hughes properties.

- Four USTs containing fuel oil (T-7, T-8, T-9, and T-10) and two USTs containing waste oil and sulfuric acid (T-5 and T-6) were identified at the subject property. Five of these USTs exhibited evidence of leakage; one of the USTs containing fuel oil did not apparently leak. Historical

remedial activity on Lot B consisted of excavation and offsite disposal of soils impacted by the five USTs, which has been documented in previously generated environmental reports.

- The review of environmental documents indicate that soil and groundwater beneath the subject property have been impacted by VOCs in two areas. One of the areas where groundwater has been impacted by VOCs is located to the south of Building No. 281 and east of Building No. 264. Groundwater samples collected from groundwater monitoring well CM-8D have shown the presence of VOCs from an unknown source. Hughes' environmental consultant estimated that approximately 0.2 gallons VOCs caused the impact to groundwater discovered in that area. Identifying the source of the VOCs detected in the well CM-8D area has been and remains one of the major concerns of the DTSC. Soil vapor samples collected in the area of well CM-8D have not been conclusive in identifying a source of the VOCs detected in the groundwater. The possibility exists that the DTSC may require Raytheon to conduct further environmental investigations in this area. It may be prudent to conduct indoor air monitoring for VOCs in Building Nos. 263, 264, and 281 to evaluate potential exposure concerns to future building tenants.

- The second area where groundwater impacts by VOCs were detected is in the area of monitoring well CM-10 located offsite to the south-southeast of Building No. 274. Freon 11 was the primary constituent of concern detected in groundwater from this well. A soil vapor plume comprised primarily of Freon 11 and other VOCs was identified onsite and to the south of Building No. 274 in area hydraulically upgradient of monitoring well CM-10. In addition, groundwater well MW-31, located onsite in the central portion of the Freon 11 soil vapor plume contained Freon at concentrations equal to the US EPA Maximum Contaminant Level (MCL) established for groundwater. The source of the Freon 11 soil vapor plume is speculated by Raytheon to be from air conditioning equipment repairs that were conducted in the unpaved portions of the parking lot during the 1960s. Aside from groundwater monitoring, Raytheon has recommended that further investigation of the Freon 11 soil vapor and groundwater plume be discontinued. The DTSC has not accepted Raytheon's recommendation for this area and therefore, the potential exists that the DTSC will require future soil and/or groundwater investigations in this area.

- The DTSC identified eight Areas of Concern (AOCs) and three Solid Waste Management Units (SWMUs) on the subject property that may require further investigation. Based on the findings of a soil and groundwater investigation documented in a September 1998 report prepared by GTI, Raytheon requested that the DTSC de-list two of the SWMUs and three of the AOCs located in southern portion of the subject property. Geocon did not find a written response from

the DTSC regarding Raytheon's request for de-listing. The DTSC should be contacted to evaluate the status of the AOCs and SWMUs and whether any of them have been de-listed.

- Other SWMUs and AOCs were identified by the DTSC for Lot C, located adjacent to and to the north of the subject property. Lot C also has a former Hazardous Waste Storage Area for which Raytheon has not yet completed its DTSC approved Closure Plan, and a UST designated as T-3, which is a regulated unit and subject to post-closure care requirements as specified in the California Code of Regulations, Title 22. Soil vapor and water extraction and treatment systems are active in the northern portion of Lot C. Treated water from the extraction system is solely on Lot C, for irrigation of landscaped areas, under permit from the CRWQCB; however, the treatment system is currently shut down due to construction activities ongoing in the northern portion of Lot C.

- According to a November 21, 1994 interview with Hughes employees, mercury may have been present in a soundproofing coating on foam "cones" of the anechoic chamber present in Building No. 274. This soundproofing material was reportedly removed under appropriate manifest to a disposal site in Arizona. During our site reconnaissance, a minor amount of residual soundproofing material was noted on the floor of the anechoic chamber. A Certified Industrial Hygienist should be retained to evaluate for the presence of mercury in the residual soundproofing material observed in the anechoic chamber.

- Personal interviews conducted with the DTSC indicate that the City of Los Angeles may request DTSC approval prior to issuance of future building permits at the subject property. DTSC communications with DeVry Inc. who is developing Lot A to the south of the subject property indicated that the DTSC may require access to their property for soil and groundwater investigations/remediation should future evidence of environmental impacts be discovered on Lot A. Appropriate personnel at the City of Los Angeles should be contacted to evaluate the potential involvement of the DTSC in the acquisition of Building Permits for the subject property. In addition, DTSC input should be obtained regarding their concerns if new structures are built in designated areas of the subject property.

- Groundwater beneath the subject property and adjoining lots contains levels of uranium and radium above drinking water standards. Groundwater monitoring wells CM-8D and CM-10 generally contain higher levels of uranium and radium in the groundwater, when compared to the other wells throughout the former Hughes facility that were sampled. Previous investigations concerning the presence of these radioactive materials concluded they were naturally occurring and due to local variations in geological deposits. The prior investigations concluded that no man-made radionuclides were indicated. No surface soil investigations regarding the presence

of radioactive materials have been conducted at the site. Documents listing the radioactive materials formerly used by Hughes indicate that Hughes' operations have not served as the source for the radioactivity discovered in groundwater. It may be prudent to conduct a radon gas investigation in the buildings onsite to investigate potential radioactive exposure concerns to Lot B building tenants.

- The northern portion of Lot C is undergoing remediation under the guidance of the DTSC and CRWQCB. According to the DTSC, Raytheon is in violation of Title 22, California Code of Regulations for not having submitted an application for post-closure of UST T-3. In addition, the DTSC has asked Raytheon to investigate the lateral and vertical extent of hexavalent chromium detected in soil beneath the former hazardous waste storage area. Raytheon has issued written complaints to the DTSC regarding the DTSC's lack of administrative response concerning environmental issues at the site. The effect of these outstanding issues between the DTSC and Raytheon on the proposed acquisition of Lot B is considered of minimal impact in compliance with all directives issued by the oversight agencies. No additional environmental concerns were identified based on the scope of work performed for this Phase I ESA.

As of the date of this report, one regulatory agency referenced in Section 1.3 has not responded to Geocon's request for environmental information. If a response is received from the referenced agency which affects the conclusions of this report, an addendum letter will be provided to TCSCPR, EASI and MEPT.

7. LIMITATIONS

This Phase I environmental site assessment report has been prepared solely for TCSCPI, EASI, and MEPT in consideration of TCSCPI's, EASI's, and MEPT's requirements. Other parties may rely on the findings and conclusions of the report for informational purposes only. However, TCSCPI, and EASI and other parties who may rely on the findings and conclusions of the report should recognize that this report is not a comprehensive site characterization and should not be construed as such. The findings and conclusions in this report are predicated on a site reconnaissance, a review of specified regulatory records, and a review of the historical usage of the property as presented in this report.

The information obtained is only relevant for the dates of the records reviewed or as of the date of the latest site visit. Thus, the information contained herein is only valid as of the date of the report, and will require an update to reflect recent records review/site visits. Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee of the results of the study is implied within the intent of this report or any subsequent report, correspondence or consultation, either expressed or implied. The services performed were conducted in accordance with the local standard of care in the geographic region at the time the services were rendered. TCSCPI, EASI and MEPT should also understand that asbestos, lead-based paint, radon, lead in drinking water, wetlands, and methane gas were not addressed in the scope of services of this report.

-o0o-

We trust this report provides TCSCPI, EASI, and MEPT with the information you require at this time. Should you have any questions regarding the information presented in this report, please call us at (213) 538-1282.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
11/30/89	McLaren	Hughes Missile Systems Company (HMSC)	Potential Source Area Investigation Report	This report presents the results of the historical chemical use inventory performed at the Hughes Missile System Group Facility in Canoga Park, California. This report was requested by California Regional Water Quality Control Board. The reports summarized the chemical use inventories for all the buildings at the Hughes facility. This includes Building Nos. 261, 263, 264, 265, 271, 274, 276, 277, and 281. The purpose of the report was to document all relevant chemical use areas at the facility and identify those potential source areas which may have released chemicals to the ground. No chemical use was indicated for Building No. 261. Prior to 1987, a paint spray room existed in Building No. 263, Room 1300. The paint spray room was relocated to Building No. 271 in 1987. The report indicated that there do not appear to be any significant contaminant source areas within Building No. 263. No chemical use was indicated for Building No. 264. Building No. 265 contained two active chemical use areas that involved cleaning, soldering and solvent cleaning operations. General housekeeping practices were determined to be of good quality. There did not appear to be any significant chemical source areas that could impact subsurface soil beneath Building No. 265. Building No. 271 contained one active chemical use area which included a spray paint booth that utilized chemical solvents. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 271. Building No. 274 had one active chemical use area. Solvent cleaning had reportedly been conducted in Room 305 since after the construction of the building in 1980/1981. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 274. Building No. 276 had two active chemical use areas. Cleaning operations in Room 1252 and photographic processing operations in Room 1282 had been conducted since sometime after

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				construction of the building in 1986. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 276. Building No. 277 had one active chemical use area. Mineral oil had been used for lubrication in Room 1528. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 277. Building No. 281 had two active chemical use areas. Insecticide had been stored in the controlled materials storage area of Room 211 since approximately 1986, when construction of the building was completed. In addition, anti-freeze and mineral oil had been used in the maintenance shop of Room 1261. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 281.
07/29/91	Ecology and Environment, Inc.	Environmental Protection Agency, Region 9	RCRA Preliminary Assessment	Preliminary Assessment (PA) for the Hughes Aircraft facility located in Canoga Park, California. In 1959, the site was developed by an electrical component design and testing company called Bunker Ramo and it was operated as an industrial park. From 1966 to 1976, Hughes was a co-occupant of the site with Rocketdyne, a division of Rockwell International, and Bunker Ramo. Hughes purchased the entire site in the mid-1970s and became the sole occupant. The report listed and described underground storage tanks (USTs) that were used at the facility. There were three areas of concern identified at the Hughes facility. The first area is the northwest portion of the site (i.e., Lot C) which has historically handled and stored chemicals. Soil and groundwater in this area is contaminated with petroleum hydrocarbons and VOCs that include halogenated compounds. The second area is the southwest corner of Building No. 281. A fuel oil UST was located in this area. Soil and groundwater in this area is contaminated with VOCs that include halogenated compounds. The third area is the recreation center in the southeast corner of the site (i.e., Lot A). Soil and groundwater in this area are contaminated with Freon 11. Elevated levels of radioactivity, above drinking water standards, also appeared in groundwater in this area; however Hughes believes this

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				radioactivity is due to high background levels in the area. The types of radioactive isotopes were not identified. The report indicated that no groundwater wells are used for drinking water within four miles of the Hughes facility. The report summarized the following Hazard Ranking System factors associated with the Hughes facility: (1) low potential for release to air and surface water; (2) low potential for exposure to contaminated soils; and (3) no drinking water wells are located within four miles of the site. The EPA's recommendation was to defer to another authority: RCRA.
11/25/91	American Environmental Management Corp.	Los Angeles City Fire Department	Letter regarding Soil and Groundwater Contamination	This letter requested that the California Regional Water Quality Control Board be allowed to serve as the lead agency for environmental investigations and remediation activities ongoing at the site.
12/02/91	HMSG	Los Angeles City Fire Department	Letter regarding Soil and Groundwater Contamination	This letter confirmed that the California Regional Water Quality Control Board would serve as the lead agency for investigative and remedial activities ongoing at the site.
12/23/91	Los Angeles City Fire Department	HMSC	Letter regarding Groundwater Contamination	This letter indicated that because groundwater contamination was discovered at the site, the California Regional Water Quality Control Board would serve as the lead agency for ongoing investigative and remedial activities at the site.
12/28/93	Groundwater Technology	HMSC	Phase I Environmental Report: Areas of Potential Chemical Release to Soil and Groundwater	GTI was contracted by Hughes to conduct a Phase I ESA of its research and development facility in Canoga Park, California. The review was conducted to identify potential sources of chemical release to area soil and groundwater. This Phase 1 ESA identified soil and groundwater contamination at the site originating from leaking USTs located both on the subject property and in the current Lot C area. USTs located on the site included UST #s T-5, T-6, T-7, T-8, T-9 and T-10. UST #s T-5 and T-6 reportedly contained chlorinated and non-chlorinated VOCs and one semi-volatile compound. UST #s T-7, T-8, and T-9 reportedly contained diesel fuel. The report indicated areas of potential release to be the east end of Building No. 269 and the Building No. 272 hazardous materials and waste storage area. The report also indicated that an additional area of low level environmental concern for metals was the main sewer line route.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
01/04/94	Groundwater Technology	HMSG	Report on Facility-Wide Site Assessment	This report provide details on a site investigation to evaluate the VOCs previously detected in the CM-8D (Lot B) and CM-10 (Lot A) monitoring well areas. GTI indicated that chlorinated VOCs at a combined concentration of just over 1,000 ug/L have been detected in groundwater from well CM-8D. The source of the VOCs is not definitely known; however, three monitoring wells located south of well CM-8D contained detectable concentrations of VOCs. Building No. 264 is located central between the VOC detected in the associated with well CM-8D. GTI estimated the volume of released chlorinated VOCs in groundwater in the well CM-8 D area as 0.2 gallons. The total estimated volume of VOCs near well CM-8D is thought to be sufficiently small that no threat to human health or the environment exists. Freon 11 at a concentration up to 190 ug/L was detected in groundwater from monitoring well CM-10. No Freon 11 has been detected in nearby wells, MW-29, MW-30, or CM-17. A volumetric estimation was not made for Freon 11 in the well CM-10 area. It was thought that the Freon 11 in the well CM-10 area poses no environmental threat. A "Leave in Place" with groundwater monitoring was proposed for the well CM-8D area. Computer modeling suggested that the VOCs will not migrate off the property and that with time the VOCs will degrade to lower concentrations than are now present.
8/30/94	Earth Tech	Coast Federal Bank	Consultation Letter Regarding Property Transfer and Summary of Preliminary Records Review	This report summarized a review of California Regional Water Quality Control Board (CRWQCB) for files from the years 1986 through March 1993 *(these files were not available for review by Geocon on January 11, 1999 at the CRWQCB)*. As related to the subject property, the report indicated that groundwater in the area of Building No. 264 requires continued monitoring for VOCs in Wells MW-25, MW-26 and MW-27, at a minimum. The report indicated that a detailed review of hazardous chemicals used at each building at the site would need to be reviewed. For off-site concerns that could impact the subject property, the report indicated the gasoline plume in northwestern area of the site had not been adequately delineated. Documents reviewed by Earth Tech relating to concerns about radioactivity in groundwater, include reports entitled *Groundwater Quality Analytical Results for Radioisotopes, Off-site Wells*, McLaren

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				Hart Environmental December 1990 and January 1991; *Investigation of Radioactivity in Groundwater at Hughes,* Groundwater Resources Consultants, Inc., January 23, 1992; and *Results of Radiological Sampling of Wells,* Groundwater Resources Consultants, Inc., July 1, 1992.
11/14/94	Groundwater Technology	HMSC	Letter- Analytical Results for Soil Samples	This document contained a December 7, 1994 facsimile cover sheet for a Nov. 14, 1994 report entitled *Analytical Results for Soil Samples, Remediation System Wells, Hughes Missile Systems Co., Canoga Park, California,* prepared by Groundwater Technology and submitted to Hughes. The report indicated that a vadose and groundwater remediation system was under construction at Hughes and include two groundwater recovery, air sparging, and vapor extraction wells. 71 wells are involved including 17 groundwater recovery wells, 30 combination air sparge/vapor extraction wells, and 24 vapor extraction wells. A plume map prepared for VOCs in soil in the report was unreadable because of poor resolution.
11/18/94	Earth Tech	Coast Federal Bank	Potential Source Area Investigation	This is simply a transmittal of the November 30, 1989 *Potential Source Area* report prepared by McLaren and referenced above.
11/21/94	N/A	N/A	Interview conducted by Coast Federal Bank of Hughes Employees	This is the transcript of a verbal interview conducted by Coast Federal Bank of various Hughes employees. One of the questions asked was *Do you know of any radioactive materials used on the property?* The Hughes employees indicated that *"minor"* amounts were used in the form of *"flat-packs". Geocon's discussions with Grant Baker, formerly of Hughes, currently with Coast Federal Bank, indicated that the referenced flat-packs were used to monitor the quality of electric circuits in printed circuit boards.* The employees were also asked *Do you know of any radioactive materials released or disposed at the property?* The Hughes employees responded that there were *"none".* One of the employees mentioned that mercury may have been present in the "cones" (i.e., soundproofing material) of the "chamber" (i.e., anechoic chamber) present in Building No. 274.
11/21/94	CH2M Hill	HMSC	Contingent Closure and Post Closure Plans	This document, stamped draft, was requested by the California EPA and presents a Contingent Closure Plan for UST T-3 prepared by CH2M Hill for Hughes. The UST was removed in 1991 and was reportedly a 4,000-gallon fiberglass tank that was used to store waste oils and waste oils mixed with solvents. Associated contaminated soils were removed in September 1991 under a Corrective Action Plan (CAP). The Contingent Closure Plan was reportedly prepared in accordance with EPA guidance. The report documents remediation of soil associated with UST T-3. The remediation consisted of excavation and off-site disposal of 1,321 cubic yards of soil contaminated with

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				petroleum hydrocarbons, DCE, and VOCs. Soils were excavated by using three-foot diameter boreholes to an average depth of 40 feet below the ground surface. A cement/sand slurry was backfilled into the excavated boreholes. A final cover, using asphalt concrete, was placed over the backfilled boreholes. Groundwater remediation will consist of groundwater pumping and treatment, air sparging, and vapor extraction. The report indicated that groundwater remediation was expected to take approximately 4-8 years. The report indicated groundwater monitoring wells would be used to monitor groundwater conditions associated with contamination originating from UST T-3. The site would be considered successfully remediated when concentrations of VOCs averaged per well over the most recent four sampling periods are below the target cleanup levels at all recovery wells. In addition, the report indicated soil vapor constituents would be monitored as part of the groundwater remediation system.
11/28/94	Earth Tech	Coast Federal Bank	Technical Memorandum Records Review Limited Site Investigation	This report documents the Earth Tech's review of reports and documents made available for public review and selected reports and documentation made available by Hughes. The purpose of the review was to evaluate (1) whether current and past environmental investigations in remedial actions carried out by Hughes sufficiently identified past environmental conditions, (2) whether Hughes adequately mitigated areas identified as having environmental impacts, and (3) document the current regulatory status of the site. The report identified areas subject to remediation/corrective action. The three areas that were identified as having resulted in soil and groundwater contamination included: the northwestern area of Lot C with chlorinated VOCs and gasoline contamination reported in both soil and shallow groundwater; the Lot B area of monitoring well CM-8 D containing chlorinated VOCs and groundwater; and the Lot A area of monitoring well CM-10 with Freon 11 contamination in groundwater. The report indicated that USTs T-5 and T-6, formerly located beneath the existing water cooling towers, were investigated by the placement of two vertical, continually sampled boreholes to a depth of approximately 25 feet below ground surface. The chemical test results did not indicate the presence of VOCs or semi-VOCs at concentrations above laboratory instrument detection limits in a soil sample collected at 24 feet below ground surface. It is not known why shallower soil samples

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				were not analyzed for the VOCs and SVOCs. Although selected soils were chemically tested for CCR metals, it is not known why these results were not reported. Relatively low levels of BTEX were encountered in some of the soil samples. Soils that were encountered included siltstone and interbedded claystone.
12/21/94	Department of Toxic Substances Control	Hughes Missile Systems Group	Letter regarding Notice of Deficiency of Closure Plan	DTSC provided their comments in a Notice of Deficiency to the Draft Closure Plan dated April 1994 provided by Hughes for the facility hazardous waste storage area and UST T-3. The DTSC letter indicated that the Hughes Closure Plan did not meet the closure performance standards of Title 22, California Code of Regulations, Chapter 15, Article 8. Additional information will be required from Hughes to revise the Draft Closure Plan as well as corresponding information to develop a response to the requirements of the California Departmental Quality Act. The DTSC letter focused on written comments to the April 1994 Closure Plan associated with off-site (i.e., Lot C facilities).
02/07/95	Hughes Missile Systems Company	Department of Toxic Substances Control	Submittal of Response to Notice of Deficiency and Revised Closure Plan	Hughes issued a written response to the DTSC Notice of Deficiency on Feb. 7, 1995. The revised Hughes Closure Plan replaced and superseded the Closure Plan for the Hughes facility dated April 1994. Hughes also provided an itemized response to the comments enclosed in the DTSC's Notice of Deficiency. All the comments primarily addressed the T-3 UST area and the hazardous waste storage area which are located in Lot C, upgradient of the site.
02/27/95	Department of Toxic Substances Control	HMSC	Letter regarding areas of concern for Hughes Missile System Group	This DTSC letter notified Hughes that an attached DTSC memorandum (dated February 28, 1995 and discussed below) identifies the solid waste management units (SWMUs) and areas of concern (AOCs) that were identified by the DTSC from the various environmental data developed with reference to the subject site. The DTSC letter also indicated that a revised Closure Plan had been received from Hughes and was undergoing review.
02/28/95	Department of Toxic Substances Control	Department of Toxic Substances Control	Internal Memo regarding areas of concern	The DTSC memornadum primarily discussed Area of Concerns at buildings located in the current Lot C. In regards to specific concerns identified on Lot B, DTSC indicated that Building No. 263, which contained spray paint operations prior to 1987 and used a degreaser and solvents apparently utilized in boiler room cleaning until operations ceased, is located relatively nearby and upgradient of monitoring well CM-8D. DTSC indicated the monitoring well had exhibited concentrations of DCE as high as 760 ug/L. DTSC indicated that Building No. 263 should be considered an Area of Concern and further investigation, such as a soil gas survey, needed to be performed.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				DTSC also indicated that Building No. 265 should be considered an Area of Concern until Hughes demonstrates that soils underlying or adjacent to the basement are not responsible for Freon 11 impacts discovered in monitoring well CM-10. DTSC indicated a necessity to evaluate operations formerly conducted in Building No. 265 (in greater detail) and probably a soil vapor investigation of those potential pathways. DTSC indicated Building No. 271 contained a spray paint booth and considers this building an Area of Concern. DTSC recommended a limited soil vapor investigation. DTSC indicated Building No. 274 was an Area of Concern because it was used for solvent cleaning and is located upgradient of the Freon 11 impacted groundwater well CM-10. A soil vapor survey was recommended by DTSC for this building. DTSC identified Building No. 276 as an Area of Concern because of the minor amounts of TCA used in the building. DTSC recommended a soil gas investigation as the first logical step. DTSC identified Building No. 281 as an Area of Concern because of the use of methylene chloride in this building. DTSC recommended that a limited soil gas investigation be performed as *"an initial element"*. DTSC recommended a soil gas investigation in the area of the former T-5 and T-6 USTs. DTSC noted that halogenated and aromatic VOCs were reported in the soil from USTs T-5 and T-6 and the cleanups of the T-7, T-8, and T-9 UST cluster had left some soil hydrocarbon contamination in place. DTSC identified all five of these USTs as Solid Waste Management Units; however, DTSC indicated that designation did not necessarily mean that DTSC will necessarily require any further activity at either location. DTSC indicated that diesel UST T-10, located south of Building No. 281, should not be considered an Area of Concern or Solid Waste Management Unit. DTSC implied that the T-7, T-8, and T-9 UST cluster may be a potential release point to groundwater. DTSC indicated their concern that the main sewer line onsite may be a conduit for the Freon 11 detected in monitoring well CM-10. Wherever the source area or areas for the Freon 11 contamination in monitoring well CM-10 is or are, DTSC indicated it or they should be considered

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				Areas of Concern. DTSC indicated that Hughes needs to fully extend its soil gas survey to include such source types upgradient from well CM-10 to evaluate the Area of Concerns.
05/08/95	Groundwater Technology	Department of Toxic Substances Control	Letter regarding areas of concern	The resolution and quality of this letter was very poor and it was difficult to discern the referenced building numbers. This letter was written by Groundwater Technology, Inc. (GTI) in response to the DTSC's Feb. 28, 1995 letter listing environmental Areas of Concern for the site. GTI indicated that the soil gas survey would be conducted south and east (near well CM-8D) of Building No. 263. GTI indicated that no further investigation of Building No. 265 or 271 was required, and that Building No. 274 should no longer be considered an Area of Concern. GTI indicated that the soil gas survey associated with the CM-8D investigation would include the area south of Building No. 281 and no further investigation of Building No. 281 was required. GTI indicated that the former UST T-5 and T-6 areas would be included in a soil gas survey but no further investigation was required in the UST T-7, T-8, and T-9 area. GTI indicated that the source of the Freon 11 detected in well CM-10 was not known. The soil gas survey near CM-10, and near the main sewer line junction and the sewer line terminus may help to determine the source if a surface or near surface Freon 11 anomaly can be located. Other information on this letter was difficult to discern because of the poor quality of the copy.
05/11/95	Department of Toxic Substances Control	HMSC	Comments to February 1995 Modified Closure Plan submitted by Hughes	This letter provided comments to the Feb. 1995 modified Closure Plan provided by Hughes to the DTSC. All the comments primarily addressed the T-3 UST area and the hazardous waste storage area which are located in Lot C, upgradient of the site.
05/11/95	Groundwater Technology	Department of Toxic Substances Control	Letter regarding DTSC Areas of Concern	This letter appears to be an identical copy of the May 8, 1995 letter prepared by GTI. This letter was finalized and put on letterhead.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
10/11/95	Groundwater Resources Consultants, Inc.	HMSC	Quarterly Groundwater Monitoring Report 3rd Quarter 1995	This report summarized the results of the second quarter 1995 groundwater monitoring at the Hughes facility. The depth to groundwater throughout the whole facility, as measured in monitoring wells, ranged from approximately 9 feet to 62 feet below ground surface. Groundwater appears to move towards the southwest, south, and southeast in various areas of the site. Groundwater extraction from reclamation wells in the northwest portion of the facility appears to be causing a cone of depression which can be observed on the site-wide map. The analytical results for VOCs in samples from the monitoring wells were summarized in a figure.
11/29/95	Camp Dresser and McKee, Inc.	Los Angeles Department of Public Works	Environmental Analytical Results of Soil and Groundwater Samples – Valley Communications Dispatch Center	This report described the results of sampling of soil and groundwater to assess whether VOCs, TPH, or metals contamination had impacted the proposed Valley Communications Dispatch Center (formerly Hughes Aircraft Missile System facility) located 8433 Fallbrook Avenue. The proposed Valley Communications Dispatch Center is located in Lot D and offsite to the west of Building No. 276. Four soil borings were drilled to 20 feet below ground surface to collect soil samples. One soil boring was drilled to about 50 feet below ground surface to collect soil and groundwater samples. The work was performed on Nov. 3, 1995. Non-detect to low levels of TRPH were detected (<52 ppm TRPH). No soil samples contained CCR metals exceeding California TTLCs. VOCs, SVOCs, and organochlorine pesticides and PCBs were not detected in the soil samples above laboratory instrument detection limits. VOCs (excluding 51 ug/l Freon 11), SVOCs, organochlorine pesticides, and PCBs, and fuel range hydrocarbons were not detected in the groundwater samples collected. The groundwater exceeded the MCL for chloride, manganese, nitrate, sulfate, and total dissolved solids.
12/11/95	City of Los Angeles City Engineer	Los Angeles Police Chief Department	Letter regarding Soil and Groundwater Contamination	This letter was from the Los Angeles City Engineer to the Los Angeles Police Department regarding the proposed Valley Communications Dispatch Center (Lot D). The letter summarized the results of the November 29, 1995 investigation described above. The letter stated that the report revealed no significant soil or groundwater contamination at the site. It was recommended that the City ensure the previous occupants (i.e., Hughes) assume all responsibility for the minor groundwater contamination that exists under the southern parcel and for any contamination which may migrate into the groundwater in the future.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
12/18/95	Department of Toxic Substances	General Public	Public Notice – Draft Closure Plan	The DTSC issued a *Notice of Public Comment On a Draft Closure Plan and Proposed Negative Declaration for a Hazardous Waste Storage Area and Underground Storage Tank T-3 Hughes Missile Systems.* The letter indicated that written comments on the draft Closure Plan and proposed Negative Declaration would be accepted the for 60-day period commencing on December 20, 1995.
01/10/96	Groundwater Resources Consultants Inc.	HMSC	Quarterly Groundwater Monitoring Report-Fourth Quarter, 1995	This report summarized the results of the fourth quarter 1995 groundwater monitoring at the Hughes facility. The depth to groundwater throughout the whole facility, as measured in monitoring wells, ranged from approximately 9 feet to 62 feet below ground surface. Groundwater appeared to move towards the Southwest, South, and Southeast in various areas of the site. Groundwater extraction from reclamation wells in the northwest portion of the facility appeared to be causing a cone of depression which can be observed at the scale of the site-wide map. The analytical results for VOCs in samples from the monitoring wells were summarized in a figure.
03/27/96	Groundwater Technology	HMSC	Groundwater Monitoring Report	This report indicated that static groundwater depths measured approximately 13 to 46 feet below grade for the wells measured on Feb. 12, 1996. Some of the metal cables in the recovery wells had to be replaced with polypropylene rope. Some flow rates were increased for recovery wells. VOCs were detected in two monitoring wells, CM-8D (located onsite and south of Building No. 281) and monitoring well CM-10 (located off-site and south of Building No. 274).
07/09/97	Fluor Daniel GTI	HMSC	Groundwater and Remediation System Monitoring Report	This reports summarized the results and observations for the second quarter 1997 groundwater monitoring at the former Hughes facility. Groundwater depths ranged from approximately 12 feet to 63 feet below grade for the monitoring wells measured on May 12, 1997. Groundwater flowed to the west on the northwest portion of the Lot C and to the south-southeast over the remainder of the site (i.e., Lot B). Detectable VOCs were detected in four monitoring wells and in ten recovery wells (including onsite wells CM-8D and CM-10).
01/07/98	Harding Lawson Associates	Home Savings of America	Environmental Site Assessment	**Historical Land-Use**: Vacant agricultural land from 1903-1958; ranch house observed onsite in 1952; Bunker-Ramo developed site into aerospace research and development facility in 1959. In 1965, Rockwell, Westinghouse, and General Electric acquired short term leases for use of the office space until the site was purchased by Hughes Aircraft Company in 1966. Hughes Aircraft Company Missile Systems Group shared the property with Bunker-Ramo until 1976, when Hughes became the only occupant; Coast federal Bank purchased the property in 1994 and in 1997 divided the property into four subdivisions (A-D).

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				Recognized Environmental Conditions: Evidence of six historical USTs at the site. Two 500-gallon waste oil/sulfuric acid USTs; three 12,000-gallon diesel USTs; and one 10,000-gallon diesel UST. Other USTs, one waste pit, and two clarifiers were found on the property located adjacent to and north of the site. Paints, solvents, petroleum products including oils, diesel, and gasoline, and corrosive materials used in printed wiring board plating were used at the site. Contaminated soil and groundwater have been documented onsite and on the property to the north. The are ~35 groundwater monitoring wells located onsite and on immediate surrounding properties. Groundwater flows southeast and is ~30.11 to 47.56 bgs at the site. Two areas of known releases are documented at the site. 15 yards of VOC and SVOC-impacted soil removed from the waste oil/sulfuric acid UST area and more than 1,000 cubic yards of hydrocarbon impacted soil removed from diesel UST area. One groundwater monitoring well onsite, well CM-8D, has documented chlorinated VOCs in groundwater. It is the prior location of a diesel UST (Tank # 10) and associated underground pipelines. DCE and TCE were detected in the well above MCLs. Well CM-8D is the only well onsite being monitored for contamination and no remedial activities were conducted on the site. City of Los Angeles Fire Department letters dated December 23, 1991 and September 20, 1989 noted the presence of groundwater contamination and referred the matter to the RWQCB. **Offsite:** Contaminated soil and groundwater have been documented on the Hughes property located adjacent to and north of the site. As of February 25, 1997, the SVE system operated by Fluor Daniel GTI has been online since August 1995 and has removed 7,188 pounds of volatile and chlorinated hydrocarbons from the vadose zone. The main sewer line that crosses the site can be considered a combined sanitary sewer and process waste water disposal line. Chlorinated VOCs have impacted groundwater monitoring wells located to the north and potentially upgradient of the site. The RWQCB has approved a reduction in groundwater monitoring from quarterly to semi-annually.
1/23/98	N/A	N/A	Figure- Chemical Use and Associated Activities by Area	This figure highlighted areas of historical chemical use, USTs, chemical storage, and the location of groundwater monitoring wells at the site.

* Some documents provided by EASI were not summarized because they were evaluated as not providing relevant information regarding the environmental status of the site. In addition, because Geocon's primary focus was on the environmental condition of Lot B, only generalized environmental information affecting the other subdivided former Hughes lots (i.e., Lots C, A, and D) was provided.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
09/15/95	Environmental Support Technologies, Inc.	Groundwater Technology, Inc. (GTI)	Phase 2 Soil and Gas Survey Report	This report provides the results of a soil gas survey performed in the area of the CM-10 groundwater monitoring well where Freon 11 was previously detected. A map produced in the report displayed isoconcentration contours for Freon 11 in ug/l units. Soil vapor probes were installed to a depth of five feet below ground surface. The soil gas samples collected during the survey contained concentrations of Freon 12, Freon 11, Freon 113, 1,1-DCE, PCE, ethylbenzene, and total xylenes. Freon 12, at a concentration of 16 ug/l, was detected in the probe placed adjacent to Building No. 274. PCE was detected at a concentration of 1 ug/l in a probe placed approximately 50 feet southeast of Building No. 274. The highest isoconcentration contour (1,000 ug/l) for Freon 11 was detected approximately 50 feet to the southwest of Building No. 274 and extended approximately another 150 feet to the southwest. The soil vapor plume as measured was approximately 450 feet to the northwest (and hydraulically upgradient) of monitoring well CM-10.
09/21/95	Groundwater Technology, Inc.	California Department of Toxic Substances Control (DTSC)	Letter regarding Additional Soil and Gas Surveying, Area 5	This report provides the results of a soil gas survey documented in the Environmental Support Technologies report dated September 15, 1995 (see above description). The study was performed in the area of the CM-10 groundwater monitoring well where Freon 11 was previously detected. A map produced in the report displayed isoconcentration contours for Freon 11 in ug/l units. GTI indicated that a Freon 11 soil gas high, not associated with any surface or underground feature, is puzzling. Although there is some linearity to the plume outline that might suggest Building No. 274 is a source, the center of the Freon 11 high is located over 100 feet from the nearest corner of the building. Probes placed around building's cooling unit encountered only low concentrations of Freon 11. GTI speculated that drums or other containers may have been placed in the area proximal to the high and that from 1960 to 1963 this area consisted of exposed soil. GTI indicated the Freon 11 high is positioned "*...precisely upgradient of monitoring well CM-10*". Monitoring well CM-10 is the only Hughes' facility well which has consistently contained concentrations of dissolved Freon 11.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
10/11/96	Allwest Geoscience	Regent Properties, Inc.	Limited Review of Potential Environmental Impacts to Subject Property Due to Past Onsite Activities	This report presented a limited review of potential environmental impacts on the adjoining Lot C (located to the north of the site, i.e., Lot B) due to previous environmental activities occurring at Lot C. The documents reviewed related to Building Nos. 262, 268, 269, 270, 272, and 282 which are located on Lot C. The summary of environmental concerns indicated that soil and groundwater remediation is currently being performed in the northwestern area of the property and will likely continue for several years. The report indicated Hughes should remain the responsible party for the remedial activities and that Regent Properties should be included on the distribution list for all environmental related reports. The report indicated that Hughes should remain responsible for any environmental problems found during the removal of clarifiers, concrete floor areas, and asbestos abatement.
07/10/97	Allwest Geoscience	Regent Properties, Inc.	Portion of a Report:- UST Summary, Clarifiers, Summary of Environmental Concerns, and Conclusions	This report, relating to be proposed development of Lot C by Regent/Shamrock, provided the same general conclusions as Allwest Geosciences' report dated October 11, 1996. In addition, the report concluded that *" The existing contamination poses no health threat and will not interfere with the occupancy of the existing or proposed buildings, provided the requirements of the Remedial Action Plan continue to be followed."* The report further indicated that *" The property's environmental condition has been adequately characterized, and the soil and groundwater condition will not interfere with Regent/Shamrock's proposed ownership, use, construction or occupancy of the property."* Finally, the documents reviewed by Allwest Geoscience were considered acceptable to assure that Hughes will remain the responsible party for all environmental impacts from Hughes releases to the property, both previously discovered and potentially found during redevelopment of the site.
06/27/97	Allwest Geoscience	Regent Properties, Inc.	Portion of Report:- Findings, Conclusions and Figures	This report presented information regarding Building Nos. 268 and 269 located in Lot C to the north of the site. The report indicated that for Building No. 268, the bottom of the westernmost pits were stained a dark brown to black color. The eastern pit reportedly had a line of *"efflorescence"* along the sidewall of the pit. In Building No. 269, the chemical analysis of three soil samples collected from beneath a former solvent tank showed no detectable concentrations of VOCs. The 17 CAM metals analyzed showed that the metals were generally within acceptable concentrations and probably indicative of naturally occurring background levels. Four soil samples collected from the bottom of four

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
				borings drilled in the area of clarifiers adjacent to and east of Building No. 269, showed no detectable concentrations of VOCs or elevated metals concentrations.
2/20/98	Flour Daniel GTI	Los Angeles Regional Water Quality Control Board (CRWQCB)	Groundwater and Remediation System Monitoring October-December 1997 Quarterly Report and 1997 Annual Report	This report summarized the remediation systems in operation at the Raytheon (former Hughes) facility. The remediation system has been operational since August 1995. The report primarily dealt with VOC recovery data and the condition of the remediation system. The groundwater gradient in the northwestern portion of the site has consistently shown it is being influenced by groundwater extraction so that capture zones, sufficiently large to completely contain and capture contaminated groundwater, are created. GTI indicated that the groundwater recovery system generally remained at full operating capacity during the year 1997. Approximately 6,800 pounds of VOCs and 500 pounds of total chlorinated compounds comprise the total mass removed by the system since start-up. Of 10 perimeter monitoring well sampled on a semi-annual basis, VOCs were identified in groundwater samples collected from three of the wells (CM-8D, CM-10, and MW-19S). Of the three wells where VOCs were detected, only well CM-8D is located onsite, to the south of Building No. 281.
3/31/98	Raytheon Missile Systems Company (RMSC)	CRWQCB	Letter regarding cost reimbursement account for Former RMSC	Raytheon submitted this letter to the CRWQCB and has not initially agreed to establish a Cost Reimbursement Account with the CRWQCB because they already have a reimbursement account established with the DTSC and have concerns about paying two agencies both under the auspices of the California EPA. Raytheon suggested that a meeting be conducted between the DTSC and the CRWQCB to discuss the cost reimbursement account. In addition, Raytheon described their facility as a former "research and development facility", rather than an "aerospace parts manufacturer". They indicated that the chemical use at their facility was in smaller quantities and under much more controlled conditions than would be found in an aerospace parts manufacturing business. Raytheon further indicated that while groundwater beneath the Canoga Park site may technically be considered a "Water of the State" with "potential beneficial uses", the naturally high Total Dissolved Solids severely limits the realistic beneficial uses of the water.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
04/15/98	Fluor Daniel GTI	CRWQCB	Portion of Report:- Summary and Figures of the First Quarter 1998 Groundwater Monitoring Report.	The results of the first quarter 1998 groundwater monitoring activities at the former Hughes facility were summarized in this report. The general depth of groundwater range from approximately 9.5 feet to 62 feet below grade. The groundwater gradient in the northwestern portion of the site was 0.022 ft/ft and apparent flow was to the west. Over the remainder of the site, the groundwater gradient ranged from 0.027 to 0.043 ft/ft, and apparent flow was to the south-southeast. Treated groundwater effluent met discharge requirements specified in the Waste Discharge Requirements (WDR).
05/08/98	RMSC	CRWQCB	Letter regarding Request for Modification of the Waste Discharge Requirements Permit for the Groundwater Remediation System	The purpose of this letter was to request a modification of the WDR Permit for management of water treated by the groundwater remediation system at the site. The letter indicated that due to issues associated with redevelopment of the property by the new owners, discharge of treated groundwater in this matter has become problematic. Therefore, Raytheon was seeking modification of the WDR permit in order to allow discharge of treated groundwater to a storm drain, as well as continued use for irrigation. The storm drains at the site discharge to Chatsworth Creek, which in turn drains to the Los Angeles River approximately 2.5 miles from the site.
06/12/98	RMSC	DTSC	Letter regarding Response to DTSC Letter of 19 May Requiring Post-Closure Permit Application for RMSC	Raytheon indicated to the DTSC that they were surprised and troubled to receive DTSC's May 19, 1998 letter requiring a " post-closure permit application" and finding Raytheon in violation for failure to submit the application. In a reported Feb. 10, 1998 meeting, Raytheon understood that the post-closure permit issue had been postponed. That understanding was reportedly reiterated in the Raytheon March 11 1998 letter. According to Raytheon, they are not in violation of the California Code of Regulations. Raytheon believed that the post-closure is not applicable for the former tank T-3, and that remedial activities on-going at the site are effectively addressing the contamination and should be allowed to continue without unnecessary hindrance. Raytheon requested a 90-day extension to the June 22, 1998 date for submitting the post-closure permit application. Raytheon indicated they would like to meet with DTSC to continue discussions towards resolution of this issue. Raytheon also criticized DTSC for not realizing that they had been properly notified regarding fieldwork in the Building No. 269 and monitoring well CM-10 area. Raytheon indicated that they have aggressively pursued remedial activities at the site and have made tremendous progress. Raytheon criticized DTSC for unacceptable and serious administrative delays.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
06/18/98	California Environmental Protection Agency (Cal EPA)	CRWQCB	Letter regarding RCRA Closure/Post-Closure and Corrective Action at the RMSC Company	DTSC wrote the CRWQCB to notify them that there are still two permitted hazardous waste management units at the site. DTSC indicated that Raytheon has not yet completed its approved Closure Plan for one unit, a small hazardous waste area. The second unit was a UST which did not have secondary containment and from which RCRA wastes were released into the adjacent soils and groundwater. Under Title 22, California Code of Regulations, the UST is a regulated unit and subject to post-closure care requirements as specified in Title 22. DTSC indicated that the application for post-closure has not been received from Raytheon. DTSC reportedly notified Raytheon in a Nov. 14 1997 letter about the post-closure application requirement. A second letter was forwarded to Raytheon from DTSC on May 19, 1998, which indicated that the Raytheon facility is in violation of Title 22. The DTSC letter indicated that Raytheon believed that it had met the cleanup goals for the CRWQCB and would be shutting down its remediation system. However, upon review by DTSC, it became clear that significant amounts of RCRA waste from UST T-3 would be left in-place in the uppermost aquifer unit. DTSC indicated that Hughes and Raytheon have disputed the evaluation of the Solid Waste Management Units and Areas of Concerns identified by the DTSC. DTSC indicated it is currently revising a draft Correction Action Order that it will share with Raytheon within the next two months.
06/30/98	Cal EPA	RMSC	Letter regarding Conditional Approval of a Class I Permit Modification Ownership and Facility Name Change	The DTSC received Raytheon's notification, dated December 19, 1997, that Raytheon plans to have a Class I Permit Modification application for the ownership and facility name change at the former Hughes facility. Raytheon indicated that the new facility owner would be Raytheon Company and that the facility would be operated under the new name of Raytheon Systems Company, Sensor and Electronics Systems. DTSC also determined that Raytheon's facility's financial assurance document, as required in Raytheon's Permit was not satisfactory. DTSC noted that Raytheon indicated they would submit a revised financial document. DTSC approved the Class I Permit Modification with the condition that Raytheon must submit the revised approval financial assurance document within 90 calendar days.
08/11/98	Flour Daniel GTI	RMSC	Groundwater Contour Map	A groundwater contour map prepared by GTI indicated that the groundwater flow direction in the area of Lot B was to the south-southeast. Groundwater flow in the northwestern portion of the site appeared to flow to the west-southwest, apparently due to the groundwater remediation activities conducted in this portion of the site.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
09/02/98	Flour Daniel GTI	RMSC	Letter regarding Additional Site Assessment Report	This is a cover letter that summarizes the findings of the GTI report dated September 3, 1998 (summarized by Geocon below).
09/03/98	Flour Daniel GTI	RMSC	Additional Site Assessment Report	This report summarized the field observations and laboratory analytical results at the former Raytheon facility in Canoga Park, California. The report was based on the results of drilling three temporary monitoring wells and one fixed monitoring well (MW-31) in the vicinity of CM-10 and Building Nos. 265, 274, and 276 at the site. GTI indicated that Freon 11 was not detected in the groundwater samples collected from two temporary wells in the area of Building Nos. 265 and 276. Freon 11 was detected in groundwater samples collected from the remaining temporary well (WP-DEV-1) and fixed groundwater monitoring well MW-31 (23 ug/l and 150 ug/l, respectively). The primary MCL for Freon 11 is 150 ug/l. No other VOCs were detected. GTI recommended a course of action that consists of "Monitor Only", indicating that it continues to be appropriate for the CM-10 area of concern. No additional subsurface soil or groundwater assessment activities were recommended for the CM-10 area by GTI. GTI indicated that quarterly sampling and analysis of groundwater collected from MW-31 and CM-10 were recommended to confirm Freon 11 levels remained at or below State MCLs established for this compound. GTI recommended that quarterly monitoring of these wells should continue until samples from four consecutive quarters contained concentrations of Freon 11 less than the State MCL and cleanup criteria of 150 ug/l.
09/08/98	RMSC	Cal DTSC	Letter regarding report of Additional Site Assessment	Raytheon prepared this cover letter that summarizes the findings of a GTI report, entitled *"Additional Site Assessment Report, Sampling and Analysis for Vicinity of CM-10 and Parking Area Adjacent to Building Nos. 265, 264 and 276"*, dated September 23, 1998 (not noted in GTI records by Geocon). Raytheon believes that the results of this assessment support that the Building Nos. 274/276 parking area is the source of the Freon 11 observed in monitoring well CM-10. Further, Raytheon believes that the Freon 11 contamination is derived from air conditioning repairs that were performed on the cooling units at Building No. 263 in 1966, as discussed in the GTI report. Raytheon believes the GTI report addressed the DTSC's concerns expressed in their June 5, 1997 letter regarding the following SWMUs and AOCs:

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
				SWMU No. 4 Parking area between Building Nos. 274 and 276 SWMU No. 4 Cooling unit at the northeast corner outside Building No. 274 AOC No. 3 Building No. 265 AOC No. 8 Building No. 274 AOC No. 9 Building No. 276 Raytheon requested the DTSC remove the above SWMUs and AOCs from their list as presented in their June 5, 1997 letter. Raytheon indicated that they provided additional data regarding other SWMUs and AOCs that would support Raytheon's request remove those from the DTSC list as well. Raytheon indicated DTSC revised list was promised by DTSC at the February 1998 meeting, but has not been received to date.
09/23/98	Flour Daniel GTI	RMSC	Summary Report, Supplementary Sampling and Analysis	This report summarizes the results of sampling and analysis activities for the Building Nos. 269, 272, and 282 SWMUs and AOCs, in accordance with a GTI work plan submitted to the DTSC on April 16, 1998. GTI indicated no evidence of residual soil contamination beneath former Building Nos. 272 and 282, or in the area of former Pits 1 and 2 at Building No. 269. There was no evidence of residual soil contamination from VOCs beneath the former UST T-14. There was no evidence of residual soil contamination by metals from plating, stripline, or degreasing operations conducted in Building No. 269. Finally, soil and groundwater samples from two new wells indicated soil and groundwater contamination by VOCs. GTI indicated the western extent of this residual contamination had not been determined. However, GTI believed the residual contamination is contained within the limits of the area influenced by the soil in groundwater treatment system that is operating currently.
11/03/98	RMSC	DTSC	Letter regarding Results of Follow-on Sampling and Analysis	This letter relates to Lot C which is located north of the subject site (i.e., Lot B.). Raytheon indicated that GTI detected hexavalent chromium in soil underlying the former acid and alkaline storage base of the former Hazardous Waste Storage Area. Raytheon indicated that GTI indicated that the impacted area has been delineated, and is localized directly beneath the former storage bays. The affected soil is, at a minimum, 5 to 13 feet below grade. Raytheon indicated that the existing groundwater data does not suggest that the hexavalent chromium has impacted the groundwater. As part of ongoing redevelopment plans for this portion of the Lot C parcel, Raytheon requested approval from the DTSC to leave this soil in place and allow for the addition of approximately five feet of overlying soil to accommodate a proposed multi-story parking area

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
				and other site-wide grade modifications. Raytheon requested the DTSC respond to this request before the end of the 1998 calendar year.
11/23/98	RMSC	DTSC	Letter regarding DTSC Review of Hazardous Waste Storage Area Closure Workplan	Raytheon submitted this letter to the DTSC complaining about the DTSC's lack of attention to work plan modifications and fieldwork (that was conducted on June 4, 1998). Raytheon indicated they provided DTSC with prior notification regarding the proposed modifications to the workplan and implementation, but that the DTSC was late in responding to their notifications and only issued a voice mail outlining the DTSC's concerns the day before the field activities were to be performed. Raytheon indicated that notwithstanding the DTSC's lack of attention to the site, Raytheon has made a tremendous amount of progress remediating the site in moving towards final close out. They indicated that again, DTSC administrative progress on this project continues to be seriously lagging. Raytheon indicated the delays are unacceptable, particularly in light of ongoing site development by the new property owners.
11/23/98	RMSC	DTSC	Letter regarding Administrative Progress in Close-out	Raytheon submitted this letter to the chief of the DTSC complaining about the lack of DTSC administrative progress on this project. Raytheon provided a list of five documents that have not been acted upon by DTSC. Of the five documents, only one related to the subject site, Lot B: *Comments on Report of Additional Assessment in the Vicinity of CM-10,* dated September 8, 1998. The September 8 1998 Raytheon letter requested revision of the DTSC's list of proposed SWMUs and AOCs, and again requested the list of priority areas where the DTSC feels additional work, if any, is needed at the site. Raytheon indicated their desire to complete the remediation and exit the Canoga Park facility as soon as possible. Raytheon indicated they no longer own the facility, nor do they have any control over site redevelopment activities. Raytheon indicated that they would appreciate comments on the five listed documents before the years end and that a meeting should be scheduled in January 1999, almost one year since their last meeting.

* Some documents reviewed at the CRWQCB were not summarized because they were evaluated as not providing relevant information regarding the environmental status of the site. In addition, because Geocon's primary focus was on the environmental condition of Lot B, only generalized environmental information affecting the other subdivided former Hughes lots (i.e., Lots C, A, and D) was provided.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
01/24/85	Latham & Watkins	Regional Water Quality Control Board (CRWQCB)	Letter regarding proposed monitoring wells near tank clusters	This letter documents location of a proposed single groundwater monitoring well at a hydraulically downgradient location from USTs T-7, T-8, and T-9 that were formerly located in the area of Building No.281. It appears this plan was submitted before actual removal of the USTs.
06/12/88	Calscience Engineering & Laboratories, Inc. (CEL)	Don Stevens Hughes Aircraft Company (HAC)	Letter regarding supplemental information for IRT excavation pits	This letter documents that the UST T-3 area on Lot C was backfilled with contaminated soil from pits T-13 and T-3 followed by clean dry backfill material. The consultant indicated that additional site assessment work is required. The letter also indicated that if remediation of UST T-3 was attempted, there would be no guarantee that the vertical or lateral extent of contamination could be reached. Further, the letter stated that if the limits of contamination were reached, the cost to load, transport, and dispose the contaminated soil off-site would be cost prohibitive.
08/20/90	CA, DOHS, TSC Program	Hughes/Public Notice	Consent Agreement and Order	This document was Enclosure B to the DTSC letter dated January 26, 1996 (summarized below). This document is a CA, Department of Health Services, Toxic Substances Control Program (DOH) "Consent Agreement and Order" entered between Hughes and the DOH, wherein Hughes agreed to comply with the orders of the DOH regarding groundwater monitoring and site remediation as a result of environmental violations observed during past site inspections. The Consent Agreement and Order alleges that Hughes violated provisions of the Hazardous Waste Control Act (HWCA) and the regulations with respect to its hazardous waste operations at the Fallbrook facility and orders certain corrective action. Both Hughes and the DOH entered into the Consent Agreement and Order pursuant to a compromise and settlement of disputed claims. Hughes agreed to pay $5,500 in settlement of the DOH's claims. As part of the agreement, Hughes agreed to work with the CRWQCB to develop and implement a site characterization plan to determine the extent of the soil and groundwater contamination associated with a leaking UST. The document did

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				not identify the UST; however, Geocon believes the UST to be T-3. After the characterization was completed, a revised closure plan and post-closure plan, if necessary, was to be submitted to the DOH within sixty days. Hughes was required to comply with the orders of the CRWQCB including the orders regarding groundwater monitoring and site mitigation. Hughes was required to permit the DOH to inspect and copy all sampling, testing, monitoring, and other data generated by Hughes or on their behalf.
07/30/91	McLaren/Hart Environmental Engineering Corporation	Hughes Missile Systems Group (HMSG)	Radioisotope Review and Comparison for the Hughes Missile Systems Group Facility	This report presented research concerning radioisotope levels in geological deposits in Southern California and within groundwater in the San Fernando Valley. These levels were compared to levels reported at the Hughes Missiles Systems Group facility in Canoga Park. The results indicated that, although geological deposits at Hughes have not been tested for radioisotopes, research strongly suggests that uranium and radium are naturally occurring in rock and soil at the site. The report also indicated that the maximum values of uranium in groundwater at the Hughes site are slightly elevated when compared to seven other sampling locations in the region. The maximum value for radium at the site exceeds the upper limit of the combined range of the other sampling locations by a factor of five. The report indicated these elevated levels are likely due to local variations in geological deposits. The report recommended a one-time sampling and analysis of groundwater from wells CM-8D, CM-10, and CM-9D for isotopic uranium to evaluate if the observed levels are of natural or man-made origin. In addition, the report recommended quarterly monitoring for uranium and radium at the site.
01/23/92	Groundwater Resources Consultants, Inc.	HMSG	Investigation of Radioactivity in Groundwater at the Hughes Aircraft Company, 3rd Quarter 1991.	This report indicated that groundwater sampled from monitoring wells at the site contained uranium at concentrations that exceeded the proposed MCL established for uranium. The is attributed to the fact that groundwater at the site commonly has natural background TDS concentrations from 3 to 5 times the

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				Secondary Drinking Water Standard of 500 mg/l, resulting in a proportional increase in uranium salts concentrations. All radium results were below the proposed EPA MCL of 20 picoCuries per liter (pCi/l). The Gross Beta results indicated that there were no man-made radioisotopes present. The letter concluded stating that *"Because no man-made radionuclides are indicated by the data from this investigation, no additional radionuclide sampling is warranted."*
02/14/92	Groundwater Technology	HMSG	Feasibility Study for Groundwater Remediation	This feasibility study was performed to evaluate remedial alternatives for groundwater containing dissolved-phase VOCs. It was determined that a groundwater pump-and-treat system using liquid-phase carbon would be the most appropriate remedial technology. The report recommended at least nine groundwater recovery wells be employed for full containment of the dissolved-phase plume. The remediation project was estimated to continue for least 20 years.
03/27/92	Groundwater Resources Consultants, Inc	HMSG	Results of Radiological Sampling of Monitor Wells, December 1991	This report conveyed the same conclusions and recommendations as their report dated January 23, 1992 (described above). The levels of uranium and radium detected in groundwater monitoring wells CM-10 and CM-8D, when compared to similar levels and other wells, were on the average more than five times higher in concentration. No explanation is provided for these variations. Monitoring well CM-18 also had elevated levels of uranium and radium when compared to the other wells. A groundwater gradient map (prior to the influence of pump-and-treat) as well as several cross sections interpreting the local geologic strata are presented in this report.
05/92	Hughes	CRWQCB	Support Documentation for the Radioactive Materials Investigation the Hughes Aircraft Company	This document identifies the equipment used by Hughes that contains radioactive materials. Most of the radioactive source materials listed appeared to be of a small quantity and used for thickness measuring, static illumination, leak detection, and scanning electron microscopy (x-rays). Some irradiated equipment parts were also indicated.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
06/18/92	HMSG	CRWQCB	Letter Regarding Radiological Results from Groundwater Monitoring	This report provided tabulated radiological results from the groundwater monitoring project at Hughes. Groundwater monitoring wells CM-8D and CM-10 exhibited elevated levels of radium and uranium when compared to most of the other wells outside.
01/04/94	Groundwater Technology	HMSG	Report on Facility-Wide Site Assessment	This report is identical to the summary provided in Table 1 (i.e., documents provided by EASI).
03/29/94	Groundwater Technology	HMSG	Corrective Action Plan Addendum	This report provides a four-phased approach for contaminant cleanup of the VOCs-contaminated groundwater at the Hughes site. Phase 1 consists of groundwater containment. Phase 2 consists of continued site assessment/characterization and field pilot testing of alternative remedial technologies. Phase 3 consists of site remediation. Phase 4 consists of closure. The report indicated that Phases 1 and 2 are complete. The report indicated that five groundwater recovery wells were drilled during December 1992 and January 1993. Manifolding of wells, pump installation, and activated carbon installation followed. The report indicated full-time operation of the system had not commenced, due to the difficulty of disposing of treated water (high TDS). The report indicated Hughes has proposed using the treated water for irrigation and the Waste Discharge Permit application has been submitted to the California Regional Water Quality Control Board for review.
11/28/94	Earth Tech	Coast Federal Bank	Technical Memorandum Records Review and Limited Site Investigation	This is the same document provided by EASI for review and is summarized in Table 1.
02/27/95	HMSC	Department of Toxic Substances Control (DTSC)	Waste Discharge Requirements (WDRs)	This transmittal letter provides the DTSC with a copy of the WDRs (dated December 14, 1994) applicable to the use of treated groundwater for landscape irrigation at their Canoga Park facility. The letter also indicated that the CRWQCB is designated as the lead agency for this remediation program.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				The attached letter describing WDRs from the CRWQCB also included a table of constituents providing the discharge limitations maximum in mg/l and ug/l for the treated water.
09/18/95	GTI	DTSC	Closure Plan Cleanup Criteria	This letter references DTSC letter dated August 16, 1995 pertaining to establishing cleanup criteria and performance standards for the Closure Plan. GTI indicated the DTSC letter suggests that cleanup criteria for certain compounds should be based on WDRs implemented by the CRWQCB for managing the discharge of treated water at the site. GTI indicated the CRWQCB offered the following comments: (1) WDR discharge limits are not cleanup levels for groundwater but are surface discharge limits; (2) To establish target cleanup levels for soil, the CRWQCB recommends using MCLs along with CRWQCB-specified attenuation factors, as described in the *Interim Guidance for Remediation of VOC Impacted Sites*, January 1995. DTSC's response to this letter is provided below.
10/12/95	DTSC	CRWQCB	Letter regarding waste discharge levels	This letter documents that Hughes submitted a revised Closure Plan on Sept. 18, 1995 to the DTSC for the two permitted RCRA units at the facility, which DTSC proposed to approve following notification to the public for review and comments. The RCRA units were identified as the Hazardous Waste Storage Area ("HWSA") and the former UST T-3. Simultaneously, the DTSC noted, Hughes is engaged in a groundwater cleanup under the supervision of the CRWQCB, for waste discharged into the groundwater from at least three USTs, one of which is T-3. The revised Closure Plan established soil cleanup standards based on (for particular compounds) lowest numbers produced by health risk assessment calculations, background measurement, or the MCLs with the attenuation factors

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				described in the CRWQCB's *Interim Guidance for Remediation of the VOC Impacted Sites,* January 1995. On Feb. 9, 1995, the CRWQCB issued to Hughes the WDRs, which are lower, in several instances, than their respective MCLs. DTSC indicated that CRWQCB's WDRs must be incorporated within DTSC permitting process which includes closure, post-closure, and corrective action. DTSC indicated that the conflicting closure standards with respect to VOCs (the WDRs levels vs. MCLs) are critical issues that need resolution due to Hughes concern of setting a precedent for the post closure process of T-3.
11/28/95	DTSC	CRWQCB	Lead Agency Designation	DTSC indicated to the CRWQCB that the DTSC will be the lead agency for corrective action at the former Hughes facility.
11/29/95	DTSC	Groundwater Technology, Inc.	Letter regarding clean-up levels	DTSC requested that Hughes use WDRs in its calculations to derive closure standards. The DTSC said *"Note that we use the term closure standard, <u>not</u> cleanup criteria."* DTSC indicated that the WDRs are discharge limits for treated water. DTSC indicated that the WDRs are not cleanup levels; however, they represent the level of protection which the CRWQCB requires to protect the San Fernando Basin as per the CRWQCB's Basin Plan. It is the DTSC's position, until DTSC receives a formal response from CRWQCB, that no more waste should be discharged into the groundwater and Hughes former facility from residual soil contamination than would be allowed to be discharged as treated water under the existing WDRs. In summary, this letter did not specify what the actual groundwater cleanup criteria are for the former Hughes site.
01/26/96	DTSC	CRWQCB	Lead Agency Confirmation	This interagency letter from the DTSC to the RWQCB requested clarification and preference of the CRWQCB regarding the Lead Agency status for Corrective Action at the Hughes facility. Since one of the UST's was permitted under RCRA, provisions regarding long-term care and monitoring under a Post Closure process needs to be implemented. This letter suggests that DTSC should

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				acquire lead agency status for the remediating groundwater contamination underlying the Hughes site.
01/30/96	CRWQCB	DTSC	Lead Agency Confirmation	This interagency letter from the CRWQCB indicated that they have no objections to the DTSC serving as the lead agency for the underground storage tank investigation and cleanup at the former Hughes site under the RCRA corrective action process. The CRWQCB requested to be copied on all future correspondence from the DTSC for this case, especially when closure is pending.
Unknown Date in 1996	DTSC	Unknown, General Public?	Proposed Negative Declaration	This Proposed Negative Declaration for the Hughes facility indicated that Hughes, as part of its RCRA Hazardous Waste Permit, is seeking approval of a revised Closure Plan from the DTSC for its Hazardous Waste Storage Area HWSA and UST T-3. The letter indicated that as a result of Notices of Deficiencies issued to Hughes by the DTSC dated December.1, 1994 and June 6, 1995, the Closure Plan dated February 1995 was revised in August 1995 and modified by the DTSC in December 1995. The letter described the fieldwork, confirmation sampling, and chemical testing remaining for closure of the HWSA. DTSC proposed and described a Contingent Closure and Contingent Post Closure for UST T-3 to comply with DTSC regulations. DTSC indicated that a records review led to the conclusion that hazardous waste residues in soil and groundwater underlying UST T-3 still exists despite tank\soil removal under CRWQCB oversight. DTSC indicated a final Closure Certification Report will be prepared by Hughes (i.e., currently Raytheon) documenting the completion of closure activities. DTSC indicated that the *"DTSC can still impose corrective action to be addressed during the post closure process if any credible evidence(s) is obtained indicating that they are new solid waste management units."*

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				DTSC indicated that the current groundwater remediation and monitoring activities underlying the UST T-3 are performed under the CRWQCB's oversight. DTSC determined that this project will not have a significant effect on the environment. DTSC indicated that the HWSA closure or the contingent post closure will not result in the creation of any health hazard or adverse environmental effect.
08/06/96	DTSC	N/A	Negative Declaration Approval	This letter provides approval of the Negative Declaration. The DTSC found that on the basis of the Initial Study and comments received on the Negative Declaration that there is no substantial evidence that this project will have a significant effect on the environment.
08/06/96	California Environmental Protection Agency (EPA)	??	Response to Comments on the Modified Closure Plan and the Proposed Negative Declaration	This document was an attachment to the DTSC Negative Declaration Approval dated August 6, 1996. The letter includes comments by Hughes and responses by the DTSC. Of note, the DTSC indicated that the soil remediation (i.e., closure) of UST T-3, which was performed under the supervision of the CRWQCB, does not constitute closure under RCRA and that the DTSC finds that hazardous waste residuals is soil still remain and are continuously contributing to groundwater contamination. DTSC noted *"Furthermore, the hazardous waste constituents contained in T-3 cause contamination of groundwater underlying T-3, hence, T-3 is subject to post closure. Since T-3 did not have a secondary containment, it must be closed under landfill requirements which automatically require a post closure permit. These requirements included, at a minimum, groundwater remediation and monitoring that are both subject to RCRA standards".*
02/06/97	DeVry Inc.	??	Portion of Report	This report indicated that Lot A, south of the site (i.e., Lot B) is in an area of minimal flooding potential (Zone C) as defined by the Federal Insurance Administration.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
02/05/98	Raytheon Missile Systems Group (RMSG)	DTSC	Letter regarding the Upcoming Meeting Regarding Designation of Solid Waste Management Unit s and Areas of Concern	Raytheon summarized their position regarding corrective action at the proposed Areas of Concern (AOCs) and Solid Waste Management Units (SWMUs) identified by the DTSC at the former Hughes facility. This letter was prepared prior to a proposed face-to-face February 10, 1998 meeting between Raytheon and the DTSC. Raytheon conclusions and recommendations based on DTSC input are summarized into four categories or groups (summarized herein only for the AOCs and SWMUs on Lot B): **Group 1: Designated as Areas for Consideration of Further Action:** The DTSC-proposed AOCs/SWMUs in this category for Lot B (i.e., the site) are: SWMU No. 4 – The parking area between Building Nos. 274/276 SWMU No. 5 – Building No.274 cooler unit AOC No. 8 – Building No.274 AOC No. 9 – Building No.276 **Group 2: Designated as Areas Being Adequately Addressed Through the Ongoing Groundwater/Soil Remediation Currently Being Conducted Under the CRWQCB August 1990 Consent Order:** The DTSC-proposed AOC/SWMU in this category for Lot B (i.e., the site) is: AOC No. 11 – Former USTs T- and T-6 **Group 3: Areas Being Adequately Addressed Through Natural Attenuation:** The DTSC-proposed AOCs/SWMUs in this category for Lot B (i.e., the site) are: SWMU No. 7 – Sewer line near B-SL-4 AOC No. 1 – Building No.263 AOC No. 3 – Building No.265

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				Group 4: Areas with Inadequate Evidence of a Release: The DTSC-proposed AOCs/SWMUs in this category for Lot B (i.e., the site) are: AOC No. 7 – Building No.271 AOC No. 10 – Building No.281 AOC No. 12 – USTs T-7 and T-9 Raytheon stated that post-closure care for former UST T-3 was not applicable because the unit was "clean-closed" through ongoing corrective action. Raytheon stated that the 1990 Consent Agreement also prevents DTSC from requiring post-closure care for UST T-3. Raytheon further stated that the substantive requirements associated with post-closure make little sense for this site. Raytheon believes that contaminated soils have already been removed from beneath the UST T-3 former location. Raytheon stated that *"Because we continue to firmly believe that post closure is not applicable to Tank T-3, RMSC has no plans to prepare a post-closure operation plan, as requested by DTSC and its letter dated 14 November 1997."* Raytheon concluded that *"...the site poses no threat to human health and the environment, based on all data and reports that have been generated to date."* (Review below, the DTSC's May 19, 1998 Response to this Raytheon Letter) (Also review Raytheon's September 8, 1998 request to DTSC to de-list several of the above-mentioned AOCs and SWMUs)
02/06/98	N/A	N/A	Summary Data Obtained from DTSC that summarizes Radionuclide Data	This is compilation of radiological data obtained from the DTSC that represents groundwater sampling events conducted from December 1990 to March 1992. The radionuclide data has been described previously; however, this is the first table that summarizes the documented sampling events. None of these data appear to test for man-made radionuclides aside from uranium and radium.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
03/21/98	RMSG	CRWQCB	Letter regarding Cost Reimbursement Account	This letter is identical to the letter reviewed at the CRWQCB (see Table 2) that questions Raytheon' s payment to both the CRWQCB and DTSC as part of Cal-EPA's Cost Reimbursement Program.
05/19/98	EPA	RMSG	Letter regarding Post-Closure Permit Application Requirement	DTSC indicates to Raytheon that they have failed to provide the Post-Closure Application for the former UST T-3. Raytheon is in violation of Title 22 California Code of Regulations. DTSC contends T-3 is subject to post closure requirements per Title 22. DTSC again requires Raytheon to submit a post-closure application for T-3 within 30 days of receipt of their letter.
05/29/98	Langdon Wilson	DTSC	Letter regarding DeVry Institute of Technology	DeVry Institute has prepared a Conditional Use Permit for the private school they are planning to build in Lot A. DeVry requested that the DTSC help them with a Hazardous Material Treatment and Disposal Plan that needs to be submitted to LA City Planning and Dept. of Public Works that certifies that remediation has been completed prior to issuance of a building permit. The attached City of LA, Department of Building and Safety letter to DeVry indicated the following: *Hazardous material treatment and disposal plans shall be submitted to the Department of City Planning and the Department of Public Works for approval and by providing a certification by the DTSC that remediation has been completed in compliance with all applicable federal, state and local regulations and in accordance with approved work plans will be required prior to initiation of construction of the proposed project.* **EASI/TCSCRI should evaluate if the City of LA will require the same for any proposed construction project on Lot B.**
07/02/98	RMSG	DTSC	Letter regarding Response to DTSC Comments on Hazardous Waste Storage Area Closure Workplan	Raytheon provided comments to DTSC's comments to their March 11, 1998 workplan for demolition and disposal of their former HWSA in Lot C. Most of the comments to DTSC comments which apply to Lot C do not appear to impact Lot B use and are therefore not described in detail here. Raytheon indicated that a Clean Closure Certification Report will be submitted to DTSC within 8 weeks

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				of completion of all closure activities and upon receipt of signed disposal manifests.
07/27/98	DTSC	DeVry Inc.	Letter Informing DeVry of No Contamination on Lot A	DTSC notified DeVry that they did not believe that a release has occurred on the DeVry Parcel (i.e., Lot A) of the former Hughes facility and that DTSC does not believe any investigation or remediation is necessary subject to certain conditions: It is possible that the sewer line, which crosses the DeVry parcel, may need to be investigated in the future even though it is not being required at this time. DTSC desires notification 7 calendar days before initiation of excavation activities so that DTSC can observe the sidewalls or bottom of the excavation. DeVry must provide for access should future borings or wells be needed. DeVry or any subsequent owner may be required to provide site access to areas on their parcel requiring corrective action if identified in the future. Such activities may include, but are not limited to, soil excavation and/or groundwater extraction and treatment. Providing such access may require the owner to vacate and/or demolish existing and/or future facilities at the site.
09/08/98	RMSG	DTSC	Letter regarding Report of Additional Site Assessment in Vicinity of CM-10 and Parking Area Adjacent to Building Nos. 265, 274, and 276	This letter is identical to the letter of the same date reviewed at the CRWQCB (see Table 2 summary).
09/16/98	Errol L. Montgomery & Associates, Inc.	Unknown, Raytheon possibly	Plan for Modification of Remediation Systems	Report indicates that VOCs in groundwater in the vicinity of well CM-8D continue to show a decreasing trend and are presently below groundwater cleanup criteria. In addition, notes no indication that VOCs are migrating down-gradient away from the CM-8D area and is no indication that this area of VOCs will require active remediation in order to meet groundwater cleanup criteria established for the site. No further investigations or remedial actions were recommended for the CM-10 area.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
09/18/98	RMSG	CRWQCB	Letter regarding Modification of Remedial System	Raytheon described modifications (deactivation of some wells and addition of new wells) in order to enhance and expedite the ongoing remediation effort at the former Hughes facility (Lot C). Indicated remediation has been in progress since early 1995. Even though Raytheon has concerns about paying for two agencies involvement, Raytheon requested that a Cost Recovery Account be established to pay for both DTSC and CRWQCB regulatory oversight.
10/05/98	RMSG	DTSC	Letter regarding Summary Report of Supplemental Sampling and Analysis Performed at the Locations of Former Building Nos. 269, and 272, 282.	The letter summarized the findings of site investigations performed on the northern portion of Lot C in the Building Nos.269, 272, and 282 building areas. Raytheon requested that DTSC remove several of the SWMUs and AOCs from their list. Raytheon indicated they need DTSC's response on two key issues: (1) A revised list from DTSC of SWMUs and AOCs. They indicated additional data to remove other SWMUs and AOCs was submitted to the DTSC on February 17, 1998 and September 8, 1998. (2) DTSC's final decision regarding post-closure for former UST T-3. They indicated Raytheon will not proceed with plans for site close-out until the post-closure issue is resolved.
12/11/98	DeVry Institute	DTSC	Letter Describing Exposed Sewer Line on Lot A	DeVry wrote the letter to the DTSC to inform them that they observed an existing sewer line crossing a portion of Lot A. The sewer line was observed to be metal and did not exhibit evidence of leakage.

* Some documents reviewed at the DTSC were not summarized because they were evaluated as not providing relevant information regarding the environmental status of the site. In addition, because Geocon's primary focus was on the environmental condition of Lot B, only generalized environmental information affecting the other subdivided former Hughes lots (i.e., Lots C, A, and D) was provided.

RE: Upcoming Meeting Regarding Designation of Solid Waste Management Units(SWMUs) and Areas of Concern (AOCs) at former Hughes Missile Systems Company facility at Canoga Park, EPA ID CAD 041162124

Dear Mr. Chandler:

Raytheon Missile Systems Company (RMSC, formerly known as Hughes Missile Systems Company) appreciates the opportunity to meet with DTSC on 10 February 1998 to review RMSC's conclusions regarding DTSC's designation of Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) at the Canoga Park facility. A proposed agenda for the meeting will be sent to your attention via telefax on Monday. RMSC will be prepared to provide status of the Hazardous Waste Storage Area closure, the ongoing Groundwater and Soil Remediation system, and redevelopment activities at the site, and to discuss the DTSC-proposed AOCs/SWMUs and post-closure of former Tank T-3.

In preparation for the upcoming meeting, RMSC would like to summarize our position regarding corrective action at proposed AOCs/SWMUs at the site, and post-closure at former Tank T3, as follows:

- **Corrective Action:** Many of the AOCs/SWMUs proposed by DTSC in its 5 June 1997 letter are being addressed through the Corrective Action Plan (CAP) and Addendum. For many of those that remain, DTSC has not demonstrated that actual releases have occurred. The California Health & Safety Code 25187(a) gives DTSC the authority to issue corrective action orders "whenever...the department... determines that there is or has been a release of hazardous waste or constituents into the environment from a hazardous waste facility". DTSC has proposed AOCs/SWMUs at the Canoga Park facility based on the *possibility* that hazardous materials could have been handled or disposed of inappropriately, and a suspicion that a release may have occurred. However, under this provision, "suspected" releases, are not enough. Corrective action cannot be required until actual releases of

hazardous waste or constituents from the unit at issue have been proven. It is not sufficient merely to suggest, as DTSC has, that the record does not yet prove that a particular proposed AOC/SWMU could not be a potential source for contamination observed elsewhere. In addition, there is no evidence that suggests mismanagement of hazardous materials.

Based on the foregoing, RMSC and its consultants have reviewed DTSC's 5 June 1997 letter, and the existing relevant data for each of the AOCs and SWMUs proposed by DTSC. RMSC's conclusions and recommendations based on that review are summarized in four categories or groups below. At our meeting next week, we will be prepared to review in detail the available analytical data (through January 1998) for any and all of the DTSC-proposed AOCs/SWMUs.

Group 1- Areas for consideration of further action. RMSC and its consultants have concluded that additional data might be useful to further characterize certain areas. For example, because Building 269 has been demolished by the new owner's subcontractors and further redevelopment plans are uncertain, RMSC will voluntarily collect additional samples in the area in the near future.

The DTSC-proposed AOCs/SWMUs in this category are:

SWMU No. 3 - Pits at Bldg. 269
SWMU No. 4 - Parking area between Bldgs. 274/276
SWMU No. 5 - Bldg. 274 Cooler Unit
AOC No. 5 - Bldg. 269
AOC No. 8 - Bldg. 274
AOC No. 9 - Bldg. 276

Group 2 - Areas being adequately addressed through the ongoing Groundwater/Soil Remediation currently being conducted under the Los Angeles Regional Water Quality Control Board (LARWQCB), in accordance with the August 1990 Consent Order. These areas are located primarily in the northwestern corner of the site. This group also includes areas that have been adequately addressed through activities such as soil excavation, such as former Tank T-3.

The DTSC-proposed AOCs/SWMUs in this category are:

SWMU Nos. 1 and 2 - Bldgs. 272/282
SWMU No. 6 - Bldg. 272/282 Pump Island (Tanks T-1 and T-2)

Group 2 (cont'd) -
AOC No. 6 - Bldg. 270
AOC No.11 - former Tanks T-5 and T-6
Former Tank T-3

Group 3 - Areas being adequately addressed through natural attenuation, as approved in the 1992/4 Corrective Action Plan & Addendum. This category pertains primarily to CM-10, which contains FREON in concentrations below the maximum contaminant level for drinking water, and CM-8D, which contains DCE at concentrations that have been declining significantly. This category also includes areas in which constituent levels are considered to be naturally-occurring, such as the sewerline near soil boring B-SL-4.

The DTSC-proposed AOCs/SWMUs in this category are:

SWMU No. 7 - Sewerline near B-SL-4
AOC No. 1 - Bldg. 262
AOC No. 2 - Bldg. 263
AOC No. 3 - Bldg. 265

Group 4 - Areas with inadequate evidence of a release.
Most of these are buildings that are suspected by DTSC as possible sources for the contamination observed at CM-10 and CM-8D. However, as discussed above, it is RMSC's position that there is no evidence that these areas are associated with any release.

The DTSC-proposed AOCs/SWMUs in this category are:

AOC No. 4 - Bldg. 268
AOC No. 7 - Bldg. 271
AOC No.10 - Bldg. 281
AOC No.12 - former Tanks T-7 and T-8
AOC No. 13 - former Tank T-14

- **Post-closure care for former Tank T-3:** Post-closure is not applicable to the former Tank T3 because the regulations do not authorize post-closure for tanks that can be clean closed through ongoing corrective action. Post-closure care applies only to those facilities at which "all hazardous wastes, waste residues, contaminated materials and contaminated soils *will not* be removed during closure." In fact, owners/operators of tank systems may only

be required to satisfy post-closure standards where "the owner or operator demonstrates that not all contaminated soils *can be* practicably removed or decontaminated....". The regulations do not specify any time limit for achieving the removal of contaminated soils. RMSC has already removed all contaminated soils associated with releases from Tank T3. While there is no evidence to suggest that any residual contaminants remain in deeper soils or groundwater, if that were the case, those contaminants are being properly addressed through the ongoing corrective action process. Therefore, DTSC is without legal authority to require post-closure care for this tank. [22 C.C.R. § 66264.110(b)(3)]. Neither does section 66264.197(c) of the regulations authorize post-closure for Tank T-3. That section requires only that an owner/operator of a tank without secondary containment include in its closure plan a contingent plan which discusses post-closure care. RMSC met that requirement in its Closure Plan approved August 1996.

The 1990 Consent Agreement also prevents DTSC from requiring post-closure care for Tank T3. The agreement resolved RMSC's liability concerning the closure of Tank T3. In accordance with the agreement, RMSC worked with the LARWQCB, developed the various plans required, obtained LARWQCB approval of the plans, and provided DTSC for opportunities for review and comment. An effective groundwater and soil remediation system has been in place since 1995. All contaminated soils have been excavated and removed, as demonstrated by confirmation sampling. DTSC's attempt to effectively revise the clean closure standards, and thereby require post-closure care, is precluded by RMSC'S satisfactory implementation of the approved Remedial Action Plan and Corrective Action Plan (CAP), in accordance with the Consent Agreement.

Post-closure care is not necessary for Tank T3 in light of ongoing remedial activities at the site. The substantive requirements associated with post-closure care make little sense for this site. For example, installation of a cap to prevent downward migration of percolation waters for a period of 100 years would provide no benefit because contaminated soils have already been removed. Requiring RMSC to obtain a post-closure permit under these circumstances would significantly increase RMSC's costs without advancing the goals of protecting human health and the environment and quickly completing corrective action at this site. Such an order would also run counter to an emerging national trend in favor of the use of corrective action in lieu of post-closure permits. EPA and other states in Region IX have recognized the benefits of corrective action's emphasis on achieving clean closure and are moving away from requiring post-closure permits. In early

1998, EPA will finalize a proposed rule removing the current requirement for a post-closure permit and allowing EPA to use alternative authorities to address facilities with units requiring long-term corrective action. DTSC should follow EPA's lead and continue to rely on its corrective action authority to allow RMSC to continue its efforts to achieve clean closure of Tank T3 through corrective action as an alternative to a post-closure permit

Because we continue to firmly believe that post closure is not applicable to Tank T3, RMSC has no plans to prepare a post-closure operation plan, as requested by DTSC in its letter dated 14 November 1997.

In closing, RMSC would like to emphasize that we vacated the Canoga Park site more than three years ago. We have worked with the agencies to develop an appropriate exit strategy, and have performed more than enough work to adequately investigate and remediate this site. As a result, the site poses no threat to human health and the environment, based on all data and reports that have been generated to date. Because we no longer own the facility, and have no control over current owners and their redevelopment contractors, we must be completely out of this site by the end of this year. However, we continue to be ready and willing to address any legitimate concerns that DTSC may have, if we can successfully agree on a clear path to overall site closure that is prudent, rational, and expeditious.

We look forward to our upcoming meeting, and are hopeful that together we can come to agreement regarding actions that will lead to a prompt and final closure of this site.

Sincerely,

RAYTHEON MISSILE SYSTEMS COMPANY

CERTIFIED MAIL

Mr. Ken Rutkowski
Vice President
DeVry, Inc.
One Tower Lane, Suite 1000
Oakbrook Terrace, Illinois 60181-4624

Dear Mr. Rutkowski:

DEVRY INSTITUTE OF TECHNICAL, WEST HILL SITE, 22801 ROSCOE BOULEVARD, WEST HILLS, CALIFORNIA (PARCEL CREATED FROM FORMER HUGHES MISSILE SYSTEMS CANOGA PARK FACILITY, 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (EPA ID NO. CAD041162124

Mr. Bill Woodson of Langdon and Wilson contacted the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) in DeVry Inc.'s behalf regarding a parcel that was created out of the former Hughes Missile Systems Company (HMSC) Canoga Park facility in Canoga Park. A condition has been required by the City of Los Angeles with respect to construction on any of the parcels created out of the former HMSC facility due to releases of hazardous waste that had occurred previously at various parts of the facility. This condition is that DTSC indicate that there is either no problem or that it has been satisfactorily cleaned up.

The HMSC site, as a whole, remains subject to Resource Conservation and Recovery Act (RCRA) corrective action requirements because HMSC had received a permit to store hazardous wastes under RCRA and because there have been documented releases of hazardous wastes at various parts of the facility.

As a result of the request by Mr. Woodson, DTSC has reviewed its files concerning the former Hughes Missile Systems Canoga Park facility as well as the following materials submitted by Mr. Woodson, on July 9, 1998 and July 15, 1998:

"Technical Memorandum, Records Review, and Limited Site Investigation, Hughes Missile System Company, 8433 Fallbrook Avenue, Canoga Park", prepared by Earth Tech, dated November 28, 1994

"Corrective Action Plan Addendum, Hughes Missile System Company, 8433 Fallbrook Avenue, Canoga Park", prepared by Groundwater Technology, Inc., dated March 29, 1994

"Phase I Environmental Report: Areas of Potential Chemical Release to Soil and Groundwater, Hughes Missile System Company, Canoga Park, California", prepared by Groundwater Technology, Inc., dated December 28, 1993

"Report of Geotechnical Investigation Proposed DeVry Institute of Technology Facility", prepared by Law/Crandall, dated February 6, 1997

One set of seven aerial photograph enlargements, dated from 1952 to 1979

Based upon our review, we have not determined that any release has occurred on the DeVry parcel of the former HMSC property and DTSC does not at this time believe any investigation or remediation is necessary subject to the following conditions:

1. It must be noted that the main sewer line, into which HMSC discharged various materials — perhaps including some of the compounds found in ground water elsewhere on the site — crosses the DeVry parcel. It is possible that this segment of the sewer line may need to be investigated although that is not being required at this time.

2. DTSC wishes to be notified at least seven (7) calendar days in advance of the initiation of excavation in order to observe and possibly sample the sidewalls and/or bottom of the excavations for the proposed driveway and any other structures.

3. Since corrective action is not complete with regards to remaining parcels, there may be a need for further installation of borings and groundwater monitoring wells. DeVry must provide access for such installation and allow maintenance of existing and future wells.

4. If DTSC determines the need for further investigation on the DeVry parcel, DTSC reserves the right to do so under its statutory authority. If such investigations identify contaminated areas requiring corrective action, DeVry or any subsequent owner may be required to provide access to such areas to facilitate all necessary remediation activities. Such activities may include, but are not limited to soil excavation and/or groundwater

extraction and treatment. Providing such access may require the owner to vacate and/or demolish existing and/or future facilities on the site.

If you have questions regarding the foregoing, please call Mr. Phil Blum at (818) 551-2961.

Sincerely,

RE: Report of Additional Site Assessment in Vicinity of CM-10 and Parking Area Adjacent to Buildings 265, 274, and 276 at Raytheon Former Canoga Park Facility, 8433 Fallbrook Avenue, Canoga Park, California;
EPA ID CAD 041-162-124

Dear Mr. Blum:

Enclosed please find a copy of the report titled "Additional Site Assessment Report, Sampling and Analysis for Vicinity of CM-10 and Parking Area Adjacent to Buildings 265, 274, and 276". The conclusions and recommendations of Fluor Daniel GTI (FD/GTI), who performed the assessment and prepared the report, are summarized in their attached letter of transmittal to Raytheon.

FD/GTI concludes that the areal extent of the FREON-11 impacts to groundwater beneath the monitor well CM-10 area have been defined. Concentrations in CM-10 remain at or below the State maximum contaminant level (MCL) for drinking water, and have been at that level since June 1995. Sampling in the area of what DTSC believes to be the source of the FREON-11 in CM-10, specifically the parking area adjacent to Buildings 265, 274, and 276, indicates the presence of this constituent also at the MCL. FREON-11 was not detected at significant levels in soil or groundwater at any of the other areas sampled during this assessment.

Raytheon believes that the results of this assessment support the Bldg. 274/276 area as the source of the FREON-11 observed in CM-10. Further, we believe that the FREON-11 contamination is derived from air conditioning repairs that were performed on the cooling units at Building 263 in 1966, as discussed further in Section 2.0 of the enclosed report. The report also concludes that the current "monitor only" strategy continues to be the appropriate course of action for the CM-10 area.

As FD/GTI indicates in their transmittal letter, the assessment in the CM-10 area addresses DTSC's concerns expressed in their 5 June 1997 letter regarding the following SWMUs and AOCs:

SWMU No. 4	Parking Area between Buildings 274 and 276
SWMU No. 4	Cooling unit at the northeast corner outside Building 274
AOC No. 3	Building 265
AOC No. 8	Building 274
AOC No. 9	Building 276

Therefore, Raytheon is requesting that DTSC remove the above SWMUs and AOCs from their list as presented in the 5 June 1997 letter. Also, on 17 February 1998, RMSC provided additional data relating to other SWMUs and AOCs which support our request to remove those from the list as well. DTSC's revised list was promised by Phil Chandler at our February meeting, but has not been received to date.

Please contact me at (520)794-9320 should you have any questions about the enclosed document.

Sincerely,

RAYTHEON MISSILE SYSTEMS COMPANY

Re: **Additional Site Assessment Report, Vicinity of CM-10 and Buildings 265, 274, and 276, Former Raytheon Missile Systems Company Facility, 8433 Fallbrook, Canoga Park, California**

Dear Ms. Roberts:

The attached report summarizes the field observations and laboratory analytical results at the former Raytheon Missile Systems Company Facility, 8433 Fallbrook, Canoga Park, California. The data for this report was based on results from drilling three temporary monitoring wells and one fixed monitoring well in the vicinity of CM-10 and Buildings 265, 274, and 276.

The objectives of this additional site assessment were to determine areal extent of Freon 11 contamination in groundwater in the vicinity of Buildings 265, 274, and 276. These objectives were accomplished by collecting and analyzing groundwater samples from specific sampling locations, and collecting and analyzing soil samples from borings used to construct temporary and fixed wells.

This assessment should address issues raised by the California Environmental Protection Agency (CalEPA) and Department of Toxic Substances Control (DTSC) in their June 5, 1997 letter, with respect to the following SWMUs and AOCs:

SWMU #4	Parking Area between Buildings 274 and 276
SWMU #5	Cooling Unit at the northeast corner outside Building 274
AOC #3	Building 265
AOC #8	Building 274
AOC #9	Building 276

In the Corrective Action Plan Addendum (Groundwater Technology, Inc., 1994) issued for the former Hughes Missile Systems Company Facility, no remedial action was proposed for the CM-10 are of concern because Freon 11 concentrations were below the State Drinking Water Standard or Maximum Contaminant Level (MCL) for this constituent. Based on the findings of the current assessment and the observed continuing decline in Freon 11 concentrations over time, a course of action that consists of "Monitor Only" continues to be appropriate for the CM-10 area of concern. No additional subsurface soil or groundwater assessment activities are recommended at this time. Continued quarterly sampling and analysis of groundwater collected from MW-31 and CM-10 are recommended to confirm Freon 11 levels remain at or below State MCLs established for this compound. It is recommended that quarterly monitoring of these wells continue until samples from four consecutive quarters contain concentrations of Freon 11 less than State MCL and cleanup criteria of 150 μg/L.

If you should have any questions or comments on this Information, please feel free to contact either Dan Grasmick or Bob Davis at (805) 644-9811. Thank you.

Sincerely,

Attachment

- Surrogate spike recoveries in EPA Method 8240/8260 analyses were within acceptable ranges in all soil and groundwater samples.

- Matrix spike and matrix spike duplicate recoveries in EPA Method 8260 were within acceptable ranges.

4.0 SUMMARY

Sampling and analysis activities for the CM-10 area of concern have been implemented in accordance with the April 1998 work plan prepared for this assessment activity. Activities described in the work plan have been completed. Introductory, historical, and background information are provided in Section 1.0 of this report. Field observations and laboratory analytical results are summarized in Section 2.0 of this report. QA/QC procedures implemented during this site assessment are reviewed in Section 3.0 of this report. A summary of findings of these assessment activities is presented below.

- Geologic materials encountered during subsurface drilling consisted of unconsolidated fill, interbedded siltstone, shale, clayey siltstone, and clayey shale, with some interbedded diatomaceous shale.

- The depths to water in temporary groundwater wells WP-265-1, WP-276-1, and WP-DEV-1 were 44, 44.5, and 35.8 feet, respectively. The depth to water in fixed groundwater monitoring well MW-31 was 48.3 feet. Depths to groundwater are generally consistent with data of previous site assessments and ongoing groundwater monitoring and compliance sampling and analyses.

- A trace concentration of trichlorofluoromethane (Freon 11) was encountered in one soil sample collected from soil boring location WP-276-1, at 50 feet below grade surface. However, Freon 11 was not detected in a duplicate soil sample collected at the same location and depth. No other VOCs were detected in any of the soil samples submitted for chemical analyses using EPA Method 8260.

- Freon 11 was not detected above method detection limits in groundwater samples collected from temporary wells WP-265-1 and WP-276-1. These wells were positioned near Buildings 265 and 276, respectively, and near subsurface utilities (subsurface electrical conduit lines and a sewer main, respectively).

- Freon 11 was detected in groundwater samples collected from the temporary well WP-DEV-1, and fixed groundwater monitoring well MW-31 (23 μg/L and 150 μg/L, respectively). No other VOC constituents were detected. The primary maximum contaminant level (MCL) for Freon 11 is 150 μg/L (as promulgated in California's Safe Drinking Water Standard, Title 22 of California Code of Regulations [CCR], Division 4, Chapter 15). Based on concentrations of Freon 11 in WP-DEV-1 and

MW-31, and ongoing analytical data collected from groundwater monitoring well CM-10, Freon 11 concentrations in groundwater underlying the CM-10 area of concern are at, or below, the State MCL.

Based upon the findings of this and previous site assessment activities (ENSR, 1991; Groundwater Technology Inc., 1995 and 1995a; McLaren Hart 1989), the lateral extent of potential impacts to groundwater underlying the CM-10 area of concern has been defined. Installation of a groundwater monitoring well at what is believed to be the sole source area of Freon 11 impacts to groundwater shows groundwater concentrations at the State MCL for this constituent. Further, groundwater quality data collected from temporary wells indicate that Buildings 265 and 276 are not source areas contributing to Freon 11 impacts to groundwater. Finally, downgradient concentrations of Freon 11 in CM-10 and temporary well WP-DEV-1 are below the State MCL for Freon 11.

5.0 RECOMMENDATIONS

In the Corrective Action Plan Addendum (Groundwater Technology, Inc., 1994) issued for the former Hughes Missile Systems Company Facility, no remedial action was proposed for the CM-10 are of concern because Freon 11 concentrations were below the State Drinking Water Standard or Maximum Contaminant Level (MCL) for this constituent. Based on the findings of the current assessment and the observed continuing decline in Freon 11 concentrations over time, a course of action that consists of "Monitor Only" continues to be appropriate for the CM-10 area of concern. No additional subsurface soil or groundwater assessment activities are recommended at this time. Continued quarterly sampling and analysis of groundwater collected from MW-31 and CM-10 are recommended to confirm Freon 11 levels remain at or below State MCLs established for this compound. It is recommended that quarterly monitoring of these wells continue until samples from four consecutive quarters contain concentrations of Freon 11 less than State MCL and cleanup criteria of 150 μg/L.

Glendale, California 91201

RE: Summary Report of Supplemental Sampling and Analysis Performed at the Locations of Former Buildings 269, and 272, 282; Raytheon Former Canoga Park Facility, 8433 Fallbrook Avenue, Canoga Park, California; EPA ID CAD 041-162-124

Dear Mr. Blum:

Enclosed please find a copy of the referenced report, summarizing recent sampling efforts conducted at Raytheon's former Canoga Park facility. RMSC's consultant, Fluor Daniel GTI (FD/GTI), performed the assessment and prepared the enclosed report. The report bears the stamp of a California registered professional engineer.

FD/GTI concludes that concentrations of metals were not detected in soil samples at levels that indicate the need for further action. Further, VOC-impacted soil and groundwater occurs in an area where metal working, finishing, and cleaning operations were known to have occurred within the former Building 269. The lateral extent of the contamination to the east and south has been defined, and the ongoing remediation is adequately addressing the impacted groundwater in those areas. FD/GTI recommends additional sampling to establish the western extent, and a workplan for that effort will be submitted to DTSC in the near future. The contamination in the western area of the former building is being adequately contained by the ongoing remediation. FD/GTI also recommends augmentation of the existing treatment system in order to expedite cleanup. RMSC submitted a plan ("Plan for Modification of Remediation Systems, former Hughes Missile Systems Company Facility", 16 September 1998; copy to DTSC) to the LARWQCB describing proposed system modifications.

In addition to the sampling performed by Raytheon, sampling in the area of the former Building 269 was previously performed by Regent Properties, current owner of the property where the building was formerly located. A copy of their report, titled "Environmental Sampling and Testing Under Floor Slabs and Clarifiers, former Hughes Missile Systems Company", 27 June 1997, was submitted to DTSC on 11 March 1998. The sampling was conducted by Allwest Geosciences in the area beneath the former solvent tank, and in the area of the clarifiers (Pits 1 & 2) at the southeastern corner of the

former building. The Allwest report concluded that "there have been no environmental impacts from VOCs or metals to subsurface soil directly under the concrete floor slabs or adjacent to the clarifiers due to leaks or migration of contaminants through the concrete slabs". Another copy of the Allwest report is enclosed for your convenience.

The assessment in the Building 269/272/282 area, along with the Allwest report, addresses DTSC's concerns expressed in their 5 June 1997 letter regarding the SWMUs and AOCs listed below. Therefore, Raytheon is requesting that DTSC remove the following SWMUs and AOCs from their list:

SWMU No. 1	Building 272
SWMU No. 2	Building 282
SWMU No. 3	Building 269, Pits 1 & 2
AOC No. 13	Tank T-14

With the submittal of the enclosed report, Raytheon has completed several significant investigations at the site. We are anxious to proceed with remaining activities, if any, to satisfy DTSC's concerns and complete site closeout. However, before further plans can be made, we need DTSC's response on two key issues:

1) a revised list of SWMUs and AOCs, which was promised by Phil Chandler at our 17 February meeting. Additional data supporting our request to remove other SWMUs and AOCs from DTSC's list was submitted on 17 February and 8 September.

2) DTSC's final decision regarding post-closure for former Tank T-3. This issue is extremely critical to completion of site close-out. We have thoroughly presented our position regarding the issue on several occasions, and cannot proceed with plans for site close-out until it is resolved.

We would be glad to meet with you to review the recent sampling and assessment activities and our plans for augmenting the remediation system. I will be out of the office until 19 October 1998, but will contact you upon my return to discuss a potential meeting.

Sincerely,

RAYTHEON MISSILE SYSTEMS COMPANY

I. Jean Roberts

I. Jean Roberts, Project Manager
Environmental, Health, & Safety

EXECUTIVE SUMMARY

The former Raytheon Missile Systems Company facility at 8433 Fallbrook Avenue in Canoga Park, California has been the site of environmental assessment work since 1984. A soil and groundwater remediation system has been operating since 1995 to address soil and groundwater containing volatile organic compounds (VOCs) in the northwest part of the property.

The site is currently being redeveloped. Redevelopment activities, specifically building demolition, have created access to obtain soil and groundwater samples from areas which were not completely accessible previously.

This report describes assessment activities and analytical results for an area previously occupied by Building Nos. 269, 272 and 282. These were described as SWMU Nos. 1, 2, 3, and AOC Nos. 5 and 13 in the June, 1997 letter from DTSC. Although this area lies within the area influenced by the currently-operating remediation system, it had been identified as an area of concern by the California Environmental Protection Agency, Department of Toxic Substances Control.

The work performed as part of this assessment included collection and chemical analysis of soil, soil gas, and groundwater samples. The sampling program was designed to determine whether former operations conducted in the subject buildings may have impacted soil and groundwater from releases of metal or VOC constituents.

With respect to concentrations of metals in soil, a total of 36 samples were collected from nine soil borings and analyzed for 14 metals. No samples contained concentrations greater than the Soluble Threshold Limit Concentration for any of the 14 metals. Two metals, silver and hexavalent chromium, were not detected in any of the 36 samples analyzed. Concentrations of other metals detected in certain samples were within ranges considered typical for natural soils in California.

Because significant concentrations of metals were not detected in soil samples, groundwater samples were not analyzed for concentrations of metals.

With respect to VOCs, concentrations of chlorinated hydrocarbons were detected in about half of the soil and soil vapor samples, and four of the five groundwater samples. Although concentrations of VOCs detected in groundwater samples were consistent with adjacent areas (and under influence of the currently-operating remediation system), certain soil samples contained concentrations of VOCs which may warrant further investigation and remedial efforts.

RESULTS OF RADIOLOGICAL SAMPLING OF MONITOR WELLS

DECEMBER 1991

HUGHES MISSILE SYSTEMS GROUP

CANOGA PARK FACILITY

CANOGA PARK, CALIFORNIA

INTRODUCTION

This report presents the results of radiological analyses of groundwater samples collected from monitor wells at the Hughes Missile Systems Group Facility at 8433 Fallbrook Avenue in Canoga Park, California. The groundwater samples were collected from 27 monitor wells on December 10 through 13, 1991. The samples were collected according to the sampling protocol described in the December 1991 workplan (Groundwater Resources Consultants, Inc., 1991a). According to contractual arrangements, the samples were analyzed for Gross Alpha, Gross Beta, isotopic uranium, and radium- 226/radium 228 if Gross Alpha for the sample exceeded five (5) pico curies per liter (pCi/l). Final analytical results were received by this office on March 11, 1992.

The samples were analyzed by IT Analytical Services of Richland Washington, an EPA certified laboratory. The detection limits for the radiological constituents are listed in Table 1. The laboratory results are included as Appendix A.

The proposed EPA Maximum Contaminant Levels (MCLs) for radiological constituents in community and all non-transient, non-community public water systems are summarized in Table 2 (Federal Register, Vol. 56, No. 138, pp. 33050 - 33127, July 18, 1991).

ANALYTICAL RESULTS

GROSS ALPHA RESULTS

Gross Alpha screening is considered to be an indicator of naturally occurring radiological constituents (Federal Register, Vol. 56, No. 138, pp. 33050 - 33127, July 18, 1991). The primary constituents that make up the naturally occurring Alpha emitters are uranium, radium-226, and radon-222. The groundwater samples from the monitor wells were analyzed for both uranium isotopes and radium-226. No samples were analyzed for the volatile gas radon-222 because of the impracticality of sample collection and analysis and because radon is a naturally occurring constituent that could be of interest from a regional standpoint but would not be specific to the Facility and would not have resulted from industrial activities at the Facility.

The proposed EPA Adjusted Gross Alpha MCL of 15 pico-Curies per liter (pCi/l) involves the subtraction of the activity of uranium isotopes, radium-226, and radon-222. The EPA has developed separate MCLs for the common alpha-contributing isotopes (Table 2). Even without the subtraction of radon-222, none of the samples exceeded the Adjusted Gross Alpha MCL of 15 pCi/l (Table 3). The most elevated observed value for adjusted Gross Alpha was 3.8 pCi/l, in the sample from CM-6D.

URANIUM ISOTOPES

The groundwater samples were analyzed for individual uranium isotopes, uranium-234, uranium-235, and uranium-238. The results of the uranium isotope analyses are summarized in **Table 4** in both mass and activity units. Laboratory results were given in terms of activity units. The equation used for the conversion to mass units is illustrated in **Table 5.**

Samples from three wells, CM-8D, CM-10, and CM-18, exceeded the EPA activity level MCL for uranium (30 pCi/l). The EPA MCLs were developed for community water supplies. Community water supplies would commonly have total dissolved solids concentrations (TDS) concentrations of 500 milligrams per liter (mg/l) or less. Elevated uranium levels are attributed to the fact that groundwater at the Facility has elevated natural background TDS ranging up to 2,600 mg/l resulting in proportional elevation in uranium salts concentration.

The EPA defines naturally occurring uranium as (Federal Register, Vol. 56, No. 138, pp. 33050 - 33127, July 18, 1991):

> ...uranium with combined uranium-234 plus uranium-235 plus uranium-238 which has a varying isotopic composition but typically is 0.006% uranium-234, 0.7% uranium-235, and 99.27% uranium-238.

For the groundwater samples in which all three isotopes of uranium were detected above the laboratory detection limit, the associated isotopic mass

percentages fall within the range expected for naturally occurring uranium (Table 4).

This data does not indicate any enrichment of uranium-235 which could be associated with man-made fuels and there would be no reason on the basis of these data to suspect any non-natural alpha emitters.

RADIUM 226

Radium-226 is a naturally occurring alpha emitter. The proposed EPA MCL for radium-226 is 20 pCi/l. The results of the radium-226 analyses are summarized in Table 3. Samples were analyzed for Radium-226 if Gross Alpha exceeded 5 pCi/l. All results were reported to be less than the MCL. The results ranged from less than the detection limit for most samples to 11.3 pCi/l for the sample from MW-21D.

GROSS BETA AND RADIUM-228

The Gross Beta emitter analysis is generally considered to be an indicator of the presence of man-made radionuclides, although there is at least one common naturally-occurring beta emitter, radium-228. Samples were analyzed for radium-228 if Gross Alpha exceeded 5 pCi/l. The Gross Beta and radium-228 analyses are summarized in Table 6. The EPA compliance screening level for Gross Beta is 50 pCi/l and the proposed MCL for radium-228 is 20 pCi/l. All Beta results were below the compliance screening level and ranged from less than the detection limit to 33.7 pCi/l in a sample from CM-

18. All radium-228 results were below the MCL and ranged from below the detection limit to 1.84 pCi/l in a sample from MW-16.

These results do not give any indication of the presence of man-made radionuclides.

SUMMARY AND RECOMMENDATIONS

These analytical results of groundwater samples from monitor wells at the Facility indicate the following:

1. All Adjusted Gross Alpha results were below the proposed EPA MCL of 15 pCi/l.

2. Several samples had uranium concentrations that exceeded the proposed MCLs for uranium. This is attributed to the fact that the groundwater at the Facility commonly has natural background TDS concentrations of from three to five times the Secondary Drinking water standard of 500 mg/l resulting in proportional increase in uranium salts concentrations. An analysis of the isotopic mass percentages of the samples with elevated uranium levels indicates that the percentages conform to the EPA definition of naturally occurring uranium.

3. All radium-226 results were below the proposed EPA MCl of 20 pCi/l.

4. All Gross Beta results were below the compliance screening level of 50 pCi/l. This would indicate that there are no man-made radionuclides present.

5. All radium-228 results were below the proposed EPA MCL of 20 pCi/l.

Because no man-made radionuclides are indicated by the data from this investigation, no additional radionuclide sampling is warranted.

TABLE 2

EPA PROPOSED MAXIMUM CONTAMINANT LEVELS[1/]

	MCL	REMARKS
1. Adjusted gross alpha emiters	15 pCi/l	Gross alpha minus emission of uranium, radium-226, and radon-222
2. Beta and photon emitters[2/]	4 mrem ede/yr	Beta and photon emitters minus radium-228. Mrem ede/yr refers to the dose committed over a period of 50 years to reference man with an annual intake of two liters of drinking water per day.
3. Uranium	20 µg/l (30 pCi/l)	Mass concentration (activity level); Includes uranium-234, uranium-235, uranium-238.
4. Radium-226	20 pCi/l	
5. Radium-228	20 pCi/l	
6. Radon-222	300 pCi/l	

(µg/l) = micrograms per liter
(pCi/l) = picocuries per liter

1/ Proposed regulations published in Federal Register, Vol. 56, No. 138, July 18, 1991. The proposed regulations would apply to all community and non-transient, non-community public water systems.

2/ The screening level for compliance with the MCL for Gross Beta level is 50 pCi/l.

July 28, 2006

Unmack Corporation Project # 06.109.03

1. EXECUTIVE SUMMARY

Unmack Corporation (UC) was retained by Trammell Crow Company to perform a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-00 at the DeVry University located at 22801 Roscoe Boulevard in West Hills, California 91304 herein referred to as the SITE. Any exceptions to, or deletions from, this practice is described in Section 1 of this report.

The purpose of a Phase I is not only to assist a purchaser or lender to qualify for the innocent landowner defense under the federal Superfund statute, it is also intended to provide reliable, early information on the environmental condition of the property and on the possible need for additional, more extensive and costly investigation.

In short, the Phase I assessment is designed to recognize and catalog those concerns or problems that the environmental professional believes deserve further investigation. A major purpose of the Phase I assessment is to evaluate the need for more intrusive research. The recommendations provided in a Phase I report reflect professional judgments made by the assessment team based on observations of the SITE and a thorough review of available agency and other historical records, including information provided by the SITE's owner or representative, within the time constraints of the reporting period. Precise information about actual SITE contamination can only be obtained through a different and subsequent level of investigation, as would occur in a Phase II study, which might involve sampling of soil and/or groundwater to determine actual levels of contamination, or of building materials to determine the presence of asbestos or lead containing materials.

In performing this Phase I investigation, Unmack Corporation's team completed the following steps: review of government records and databases for evidence of possible environmental contamination; site reconnaissance through a site walk of the property; interviews with current owners and occupants of the property or their representative(s), as well as with appropriate government agency staff; and an evaluation of the evidence developed during the site assessment presented in a written report to the individual ordering the performance of the Phase I.

This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the SITE.

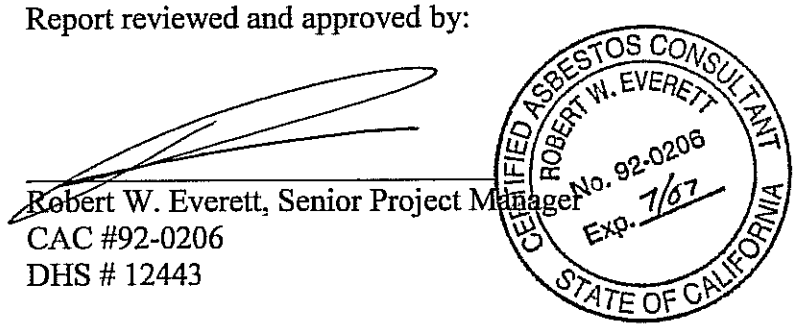
In conclusion, the SITE presents evidence of low environmental risk, stemming from any undocumented underground storage tanks (USTs), underground piping and the former adjoining northern property previously owned and occupied by Hughes Missile System Company.

Based on the results of the Phase I Environmental Site Assessment, Unmack Corporation recommends the following:

- A closure letter should be obtained from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding the four groundwater monitoring wells located on the SITE if these wells are considered to be a no further action activity.

- Prior to any renovation or demolition of the current building, a Hazardous Materials Survey should be performed to determine if any hazardous materials such as asbestos containing materials or lead-containing materials are present in the building.

Report reviewed and approved by:



Robert W. Everett, Senior Project Manager
CAC #92-0206
DHS # 12443

I. INTRODUCTION

Purpose

Property and Client

The property subject to this Phase I Environmental Site Assessment is the DeVry University located at 22801 Roscoe Boulevard in West Hills, California 91304. The Unmack Corporation retained W&K to prepare this assessment.

Purpose of a Phase I Environmental Site Assessment

Under the federal Comprehensive Environmental Response, Compensation and Liability Act (CERCLA, or "Superfund"), owners of property where hazardous substances have been released (including deposited or disposed of) are strictly liable for the costs of response and cleanup. This liability, which can amount to millions of dollars, generally extends to landowners who receive title after the release has occurred, unless the landowner can demonstrate that at the time of acquisition, he had no knowledge or reason to know of the release or disposal. Such an "innocent landowner" must meet certain statutory requirements and bears the burden of proof in establishing this defense. Generally, the landowner must demonstrate that prior to acquisition, he undertook "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice in an effort to minimize liability."[1] Potential environmental liability may also result under other federal and state laws, and under common law tort suits based on contamination. In addition, the Federal Deposit Insurance Corporation since 1993 has required that all insured lending institutions have in place "appropriate safeguards and controls to limit exposure to potential environmental liability associated with real property held as collateral or as an investment... Examiners will review the institution's compliance with its own environmental risk program as part of the examination of lending and investment activities."[2] As a result, essentially all nonresidential real estate transactions now include an environmental site assessment.

The legal standard exists defining what a site assessment must include, both the Environmental Protection Agency (EPA) and the American Society for Testing and Materials (ASTM) has published a standard defining recommended elements to be included. However, the standard does not take effect until December 2006. According to this standard[3], the goal of the Phase I Environmental Site Assessment process is to identify *recognized environmental conditions*, which means:

> the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimus

---

[1] 42 USC 9601(35)(B)

[2] Poling, Stanley J., Director, Federal Deposit Insurance Corporation, *Guidelines for an Environmental Risk Program*, FIL-14-93, February 25, 1993.

[3] ASTM E 1527-05, page 1

conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies.[4]

The purpose of a Phase I is not only to assist a purchaser or lender qualify for the innocent landowner defense; it is also intended to provide reliable, early information on the environmental condition of the property and on the possible need for additional, more extensive and costly investigation. In the terminology currently used in the industry, site investigation and cleanup entails up to three discrete steps: Phase I, which involves nonintrusive investigation designed to spot the most common contamination problems and sources; Phase II, which involves sampling and analysis to characterize the nature and extent of contamination, considering the Phase I findings; and Phase III, which covers the actual site cleanup, based on information from the Phase II study.

More specifically, a Phase I Environmental Site Assessment entails nonintrusive research to identify areas of potentially significant liability for the current or prospective owner. Conditions suggesting possible onsite contamination are described, and the client notified that further investigation may be warranted to confirm the existence and/or extent of contamination; cleanup remedies and costs can then be more confidently evaluated. Such a subsequent investigation involves intrusive measures such as soil and/or groundwater testing; this level of investigation is termed a "Phase II" study. In short, the Phase I assessment is designed to recognize and catalog those concerns or problems that the environmental professional believes deserve further investigation. A major purpose of the Phase I assessment is to evaluate the need for more intrusive research. The recommendations provided in a Phase I report reflect professional judgments made by the assessment team based on observations of the site and a thorough review of available agency and other historical records; precise information about actual site contamination can only be obtained through a different and subsequent level of investigation, as would occur in a Phase II study.

This Environmental Site Assessment has been performed to meet the ASTM standard and to assist in fulfilling both purposes described above.

Detailed Scope-of-Services

A Phase I Environmental Site Assessment generally has four elements: Review of government records and databases for evidence of possible environmental contamination; site reconnaissance through a site walk of the property; interviews with current owners and occupants of the property, as well as with appropriate government agency representatives; and an evaluation of the evidence developed during the site assessment presented in a written report to the individual ordering the performance of the Phase I.

Significant Assumptions

None

---

[4] *op cit.*, p. 6

Limitations and Exceptions of Assessment

Consistent with customary practice and the ASTM standard, this Phase I did not include a specific evaluation of the potential presence of asbestos, radon, lead-based paint, lead in drinking water, or fungus/mold.

Any sketch appearing in or attached to this report, or any statement of dimensions, capacities, quantities or distances, are approximate and are included to assist the reader in visualizing the property. No survey of the property has been made as part of this Phase I assessment. W&K assumes that there are no hidden, unapparent or latent conditions or defects in or of the property, subsoil, or structures, other than those noted in this report. No responsibility for such conditions or for their repair is assumed. Information, estimates and opinions furnished to W&K and contained in this report were furnished from sources considered reliable and believed to be true and correct. However, no independent investigation as to such matters has been made, and W&K assumes no further responsibility for their accuracy.

A Phase I Environmental Site Assessment is not an audit of a facility's compliance with applicable environmental, health and safety standards. Although such a compliance audit may sometimes be useful in connection with the acquisition of a commercial or industrial enterprise, it involves a different approach as well as higher levels of scrutiny and effort than those involved in a Phase I scope of work.

Special Terms and Conditions

None

User Reliance

An environmental professional is not required to verify independently the information provided but may rely on information provided unless he or she has *actual knowledge* that certain information is incorrect or unless it is *obvious* that certain information is incorrect based on other information obtained in the Phase I Environmental site assessment or otherwise actually known to the *environmental professional.*

II. SITE DESCRIPTION

Location and Legal Description

The SITE consists of the DrVry University located at 22801 Roscoe Boulevard in community of West Hills in the City of Los Angeles, California 91739. The SITE is located on approximately 15.25 acres of land and 106,190 square feet of building and consists of Parcel A with APN number of: 2005-002-001 in the City of Los Angeles, County of Los Angeles, California.

A topographic map is provided in Exhibit A.

Site and Vicinity General Characteristics

Fallbrook Avenue is to the east and adjoining to the SITE, Roscoe Boulevard is to the south and adjoining to the SITE, residential development is to the west and adjoining to the SITE and West Hills Corp Pointe commercial center is to the north and adjoining to the SITE. Residential developments are located along the east side of Fallbrook Avenue and the south side of Roscoe Boulevard.

Current Use of Property

The SITE is currently occupied by DeVry University a computer training school and the adjoining parking lots.

Site Structures, Roads and Other Improvements

The SITE is currently occupied by DeVry University, a two-story 106,000 square foot building on approximately 15.25 acres of land with several parking lots. West Hills Corp Pointe commercial center is to the north, Fallbrook Avenue is to the east, Roscoe Boulevard is to the south and residential development is to the west.

Current Uses of Adjoining Properties

At present, West Hills Corp Pointe commercial center is to the north with the remainder of the surrounding area predominately residential development. West Hills Corp. Pointe used to be the Hughes Missile System Company complex.

Site Plan

A site plan sketch is included in Exhibit B showing the general layout of the properties.

III. USER PROVIDED INFORMATION

Title Records

No current title records were requested nor provided to Winzler & Kelly Consulting Engineers.

Environmental Liens or Activity and Use Limitations

Mr. Kenneth Katich of Trammell Crow Company the representative of MEPT West Hills, LLC, the potential buyer reported that to the best of their knowledge, there are no pending, threatened or past litigation, administrative proceedings, liens, or notices from any governmental entity regarding possible violation of environmental laws or possible liability regarding hazardous substances or petroleum products.

Specialized Knowledge

If the *user* is aware of any specialized knowledge or experience that is material to *recognized environmental conditions* in connection with the property, it is the user's responsibility to communicate any information based on such specialized knowledge or experience to the *environmental professional.* No specialized knowledge was reported to Winzler & Kelly.

Valuation Reduction for Environmental Issues

No reduction in value to compensate for environmental issues is known to the Unmack Corporation.

Owner, Property Manager, and Occupant Information

DeVry University is the current owner.

Reason for Performing Phase I

The Phase I Environmental Site Assessment was performed to investigate the site for potential purchase.

Previous Environmental Investigations

There have been numerous environmental investigations of the SITE which was included in the Hughes Missile Systems Company site. Unmack Corp provided Winzler and Kelly with a copy of several reports including the following:

1. *Technical Memorandum Records Review and Limited Site Investigation* performed by Earth Tech, November 28, 1994
2. *Environmental Assessment* performed by Environmental Planning Associates, Inc. August 15, 1996

3. *Traffic Impact Study* performed by Environmental Planning Associates, Inc. August 15, 1996
4. *Report of Geotechnical Investigation* performed by Law Crandall February 6, 1997.
5. *Site Assessment* performed by Fluor Daniel GTI September 2, 1998.

The conclusions and recommendations of these reports are as follows:

1. *Technical Memorandum Records Review and Limited Site Investigation* performed by Earth Tech, November 28, 1994

This report reviewed various records that dealt with the buildings associated with the Hughes Missile Systems Company since the DeVry building was not built until 1999. The impact of the Hughes facility on the subject SITE is the possible groundwater contamination from the previous activities at the Hughes facility. According to records reviewed by Earth Tech at the Los Angeles Regional Water Quality Control Board (LARWQCB) groundwater monitoring wells were installed throughout the Hughes property and the Subject SITE and Quarterly groundwater monitoring was ongoing since 1990.

2. *Environmental Assessment* performed by Environmental Planning Associates, Inc. August 15, 1996.

This report appears to be a documentation of the impact on the surrounding area if the DeVry University site is built.

3. *Traffic Impact Study* performed by Environmental Planning Associates, Inc. August 15, 1996

This report appears to be a documentation of the impact on the surrounding streets and traffic flow if the DeVry University site is built.

4. *Report of Geotechnical Investigation* performed by Law Crandall February 6, 1997.

This report is of the geotechnical investigation for the proposed DeVry facility building. This report dealt with geotechnical aspects of construction of the subject SITE.

5. *Site Assessment* performed by Fluor Daniel GTI September 2, 1998.

This report dealt with additional sampling and analysis of the groundwater monitoring, CM-10 which is the nearest groundwater monitoring well. In previous groundwater monitoring events Freon 11 was found in this groundwater monitoring well. Fluor Daniel GTI's recommendation was to continue quarterly groundwater monitoring until the concentrations of Freon 11 become less than the State Maximum Contaminant Level (MCL) for Freon 11 which is 150 µg/L. Part of this report is included in Exhibit I.

IV. RECORDS REVIEW

Standard Environmental Record Sources

W&K contracted with Environmental Data Resources, Inc. (EDR) to review databases constructed by federal, state, and local regulatory agencies. This review was designed to identify facilities and properties recently or currently under investigation for environmental contamination within a specific radius of the site. Additionally, this search noted any reported hazardous waste sites, landfills, Superfund sites, or businesses generating or treating hazardous wastes within the radius area. Finally, records of spills and other types of releases of hazardous materials were reviewed for properties within a smaller radius.

W&K does not assert to the completeness or accuracy of the database report. Our review is therefore only as current and accurate as that given in the database report, and this may not represent all known or potential hazardous waste or contaminated sites. Further, there may be errors in the database information reported for a site resulting from a number of different operations involved in processing the search. These errors could result in a site being included in the database due to a similar street name as a street within the search radius, when in fact the site is outside the search distance for the report. Additionally, a site within the search radius may be omitted resulting from errors in the data entry phase of the search process. While W&K periodically reviews the EDR Information database report against another leading vendor's database report for the same site to ensure quality assurance and control, the accuracy and completeness of each report cannot be guaranteed by W&K. *What follows is an interpretation of this information, based on a careful evaluation of the database report, a USGS topographical map, an area street map, knowledge of the region, and professional judgment about potential environmental conditions.* A complete copy of the regulatory agency database search report is included with this report as Exhibit E in the Appendices. The Site Information Map, contained in the database report, illustrate the locations of the site relative to the listed properties that are discussed and reviewed in the following section.

In each case, the radius distance was chosen on the basis of the potential hazards that identified neighboring properties could pose to the SITE, the type of information provided, and the extent of overlap with other, more extensive databases. The resulting database search provided information that meets or exceeds the ASTM requirements. The date of the most recent update for each database is noted parenthetically below, following a description of the database. The name, address, status, and distance from subject site for each site identified by the database are also given.

The results are organized by listing sites, which were identified on a particular database. Since some of the sites appear on more than one database, these sites may be listed more than once.

These sites are listed according to closest proximity relative to the subject site. Further, information on the topographic gradient relative to the subject site is given to aid in the assessment of potential impact to the subject site from groundwater contamination. This information is based on the assumption, as explained in the section on hydrogeology, that the

direction of groundwater flow in the shallow groundwater aquifer generally follows topography. Also, the database report site number is noted parenthetically.

Subject Property

The database review indicates that at this time, the SITE is not known to have released hazardous substances, or to currently be under investigation by a state or federal environmental regulatory agency, or to have been a facility involved in generating, treating, or disposing of hazardous waste onsite, or to have stored or used hazardous materials.

Adjoining Properties

The database review indicates that, at this time, there are two properties immediately adjoining the site that are listed as being identified or under investigation by a state or federal environmental regulatory agency, or to have been a facility involved in generating, treating, or disposing of hazardous wastes onsite. In addition to these two sites there are two other sites listed.

Table: AREA WIDE REGULATORY CASES

Site name, address & ID number	*Database(s) & Status*	*Distance & Direct from Subject Site*	*Risk*
Hughes Aircraft Company (Map ID #C9) 8433 Fallbrook Avenue	CERCLIS-NFRAP: No Further Action CORRACTS: RCRA corrective action–low priority RCRA Info: RCRA TSDF closed CORTESE: Cal-EPA listing of leaking UST LUST: solvents –Remedial Action Underway	<0.125 mile north; up gradient Adjoining northern site	Low

Table: AREA WIDE REGULATORY CASES			
Site name, address & ID number	***Database(s) & Status***	***Distance & Direct from Subject Site***	***Risk***
Quest Diagnostics (Map ID B6) 8401 & 8403 Fallbrook Avenue	RCRA Info: Large Quantity Generator; no violations found	<0.125 mile northeast; up gradient	Low
Lakeview Cleaners (Map ID 1) 22736 Roscoe Blvd.	RCRA Info: Small Quantity Generator-No violations found	0.125-0.25 mile southeast; down gradient	Low
LA Fire Station 106 (Map ID A3) 23004 Roscoe Blvd.	RCRA Info: Small Quantity Generator-No violations found HAZNET: Asbestos-containing waste LUST: Diesel- soil only affected	0.125-0.25 mile west; down gradient	Low

Orphan Sites

Two sites were listed as "orphan sites," in other words, there was a lack of available information in the agency databases to precisely identify the site or its location relative to the subject site, other than its shared zip code or city name. However, upon closer review, all sites with open agency files were located beyond the radius search distance from the subject site.

Summary of Database Review

The review of regulatory agency database lists indicates that at this time, the SITE is not known to have released hazardous substances, or to currently be under investigation by a state or federal environmental regulatory agency, or to have been a facility involved in generating, treating, or disposing of hazardous waste onsite, or to have stored or used hazardous materials.

There are two adjoining property: Hughes Aircraft Company located at 8433 Fallbrook Avenue is listed on the CERCLIS-NFRAP list as a site that has been removed and archived from the inventory of CERCLIS sites and the EPA has determined no further action for this site. It is also listed on several other lists including: CORRACTS as a RCRA site with a low corrective action priority; as a RCRA Large Quantity Generator and as a Treatment, Storage, Disposal Facility (TSDF) both of which are now closed; as a LUST site from the numerous underground storage tanks that had leaked but now have been removed with groundwater monitoring wells in place. The second adjoining site is Quest Diagnostics located at 8401 and 8403 Fallbrook Avenue and is listed as a large quantity generator with no violations.

Two other properties were listed: Los Angeles Fire Station #106 located at 23004 Roscoe Boulevard. is listed as a Small Quantity Generator of hazardous waste with the waste being asbestos-containing materials that had been removed and it is listed on the LUST list as a site with a leaking underground storage tank that leaked diesel fuel but only affected the soil. The second site listed is the Lakeview cleaners located at 22736 Roscoe Boulevard is listed as a RCRA Small Quantity Generator of hazardous waste from dry cleaning

Physical Setting

General property information and property use are summarized in Table 2. Refer to the Vicinity Map (included in Exhibit A).

TABLE 2	
Summary of Property Information	
Topographic Map:	Canoga Park/Calabasas
Topography:	Slopes to the southeast at approximately 25 feet per mile.
General Location:	The northwest corner of Roscoe Boulevard and Fallbrook Avenue in West Hills, California
Assessor's Parcel Numbers:	2005-002-001
Regional Groundwater Flow Direction:	South / southeast
Existing use:	DeVry University computer training school

An Assessor's Parcel Map is included in Exhibit H.

Site Geology

Regionally, the SITE is mapped as being underlain by primarily consolidated bedrock of the Miocene Modelo Formation (Geological Map of California). This formation consists of tan to grayish siltstone, clayey siltstone and shale with minor interbedded diatomaceous shale. The SITE is located upon recent alluvium and stream bed deposits that make up the valley fill and outwash from the nearby surrounding hills and mountains. The Modelo Formation is believed to be present below the valley fill. Ground water has historically been used for private and agricultural purposes.

Site Geohydrology

The SITE is located within the Central Basin of the Los Angeles County Groundwater Basin as shown in the Hydrologic Report of the Los Angeles County Department of Public Works (1989). The SITE is located within the San Fernando Ground Water Basin of the South Coast Hydrologic Region as shown in the Hydrologic Report of the State of California Bulletin No. 118 (2003). The Chatsworth Creek Channel is located approximately one-quarter mile to the west of the SITE.

Groundwater Well Information

According to the most recent available well data records that were obtained on July 25, 2006 from Carnie with the Los Angeles County Department of Public Works (LACDPW), Hydraulic/Water Conservation Division, the closest active groundwater well to the SITE, Well # 4699, is located southeast at Valerio Street and Glade Avenue, which is approximately one and one-half miles southeast of the SITE. The depth to groundwater at this well was last recorded on May 8, 2006 as being 21.3 feet below ground surface. The ground surface elevation at that location is 807.7. Therefore, the water surface level is at 786.4 feet above Mean Sea Level. The shallow groundwater gradient would be expected to follow the local topographical gradient, which is to the southeast.

The depth to groundwater recorded in the well data is *generally not* the first encountered groundwater. It is the depth to the main potable, or deep, aquifer. As a general rule, topography is often indicative of the groundwater flow direction for the perched aquifer, or the first encountered groundwater. Local groundwater contamination usually affects this shallow-level aquifer.

In the evaluation of the regulatory records, the hydrogeologic conditions of a listed property relative to the subject site is given to aid in the evaluation of the potential hazard or

threat to the subject site of groundwater contamination from the listed site. In this evaluation, it is assumed that the shallow-level aquifer follows topography. Reference to the hydrogeologic conditions is given by stating the relationship of the listed site, either up-, down-, or cross-gradient relative to the site. There is a greater threat of migration of contaminated groundwater when the listed site is up-gradient versus down or cross-gradient from the site. Further, the threat decreases with distance from the listed site.

Historical Use Information on the Property

Building Records

A request for information with regards to the building records was made at the City of Los Angeles Building and Safety. These records showed the following highlights:

Date	Type of Permit	Activity	Owner
01/10/1952	Building	Erect a new single family house	Mr. & Mrs. Thomas R. Dempsey
07/16/1998	Building	Demo dwelling and garage	DeVry Inc.
08/06/1998	Building	Erect a school building	DeVry Inc.

Copies of some of these permits are included as Exhibit D.

Aerial Photo Review

Aerial photos of the site were reviewed for the period from 1928 through 2002 at the collection of Environmental Date Resources (EDR). Highlights include:

Date	Site Description
1928	The SITE consists of agricultural land. The main street of Roscoe Boulevard is in place A creek appears to in place west of the SITE.
1938	The SITE is unchanged; Fallbrook Avenue is in place to the east.
1947	Same as previous.
1956	Same as previous
1965	The SITE is now graded vacant land.
1976	Same as previous
1989	The eastern side of the SITE is now a baseball field. The remainder of the SITE is still vacant.
1994	Same as previous
2002	The SITE has the current building and parking lots on it.

Sanborn Insurance Maps

Historical Sanborn fire insurance maps were not available for the SITE or the surrounding area in the EDR collection for the period covering the years 1894 – 1970.

Division of Oil, Gas and Geothermal Resources Records

A review of California Department of Conservation, Division of Oil, Gas and Geothermal Resources Map Website indicates that there were no oil wells located within one

mile of the SITE. However, it is possible that wildcat drilling may have occurred in the area in the past.

Historical Use Information on Adjoining Properties

Aerial photos of the site were reviewed for the period from 1938 through 2002 at the collection of Environmental Date Resources (EDR). Highlights include:

Date	Surrounding Site Description
1928	The surrounding area consists of agricultural land. The main street of Roscoe Boulevard is in place A creek appears to in place west of the SITE. The Chatsworth Reservoir is visible to the far north.
1938	Same as previous. Fallbrook Avenue is now in place to the east.
1947	Same as previous. There is a road in place that surrounds the northern property.
1956	The northern property now has a small building in the center of it and another building to the east of the center building. The surrounding area is still agricultural land.
1965	The northern adjoining property (Hughes Missile Systems Company) is now built. There is residential development to the south and east of the SITE.
1976	Same as previous
1989	Same as previous with heavy residential development in all directions.
1994	Same as previous
2002	Same as previous

Sanborn Insurance Maps

Historical Sanborn fire insurance maps were not available for the SITE or the surrounding area in the EDR collection for the period covering the years 1894 – 1970.

Summary of Historical Use Information

Site history information was obtained from aerial photographs and City of Los Angeles Building and Safety permits. The aerial photographs indicate the SITE had been agricultural land from at least 1928 until 1989 when the eastern portion was a baseball field. In 1999 the current building and parking lots were constructed.

V. SITE RECONNAISSANCE

Methodology and Limiting Conditions

The methodology used to observe the site was to walk the entire site, both interior and exterior areas, and to observe the adjoining properties from public areas, i.e., sidewalks and streets.

General Site Setting

Current Use of the Property

Ms. Candice M. Cassato of Winzler and Kelly performed a site walk investigation of the site on the morning of July 24, 2006. The weather was sunny and hot. The temperature was in the low 90s (F). Access to the site was unimpeded.

The site is currently occupied by a 106,190 square feet two-story steel and glass building on 15.25 acres of land which is primarily asphalt-paved parking lots. The building is currently occupied by DeVry University a computer training school. The SITE is bounded by Fallbrook Avenue on the east, Roscoe Boulevard on the south, residential development to the west and West Hills Corp Pointe commercial development (formerly Hughes Missile Systems Company) on the north. Photographs taken during the site walk are included as Exhibit C.

Past Use of the Property

The aerial photographs indicate the SITE had been agricultural land from at least 1928 until 1989 when the eastern portion was a baseball field. In 1999 the current building and parking lots were constructed.

Current Uses of Adjoining Properties

Table 3 summarizes the current roads and site uses observed during the site reconnaissance.

TABLE 3
Adjacent Streets and Property Use

Direction	Adjacent Street	Adjacent Property Use
North	None	West Hills Corp Pointe
East	Fallbrook Avenue	Residential
South	Roscoe Boulevard	Residential
West	None	Residential

Past Use of Adjoining Properties

Based on the aerial photos and other information, the adjoining properties had been agricultural land from 1928 to 1965.

Current or Past Uses in the Surrounding Area

Generally the area has been agricultural land from at least 1928 to 1965.

TABLE 4 Summary of Site Reconnaissance		
Feature	**Observed**	**Not Observed**
Structures (existing)	X	
Evidence of past uses		X
Hazardous Substances and/or petroleum products (including containers)	X	
Aboveground storage tanks (ASTs)		X
Underground storage tanks (USTs) or evidence of USTs		X
Strong, pungent, or noxious odors		X
Pools of liquid likely to be hazardous materials or petroleum products		X
Drums / Areas of Storage containers	X	
Unidentified substance containers		X
Pad-mounted transformer/Pole-mounted transformer	X	
Subsurface hydraulic equipment		X
Heating/ventilation/air-conditioning (HVAC)	X	
Stains or corrosion on floors, walls, or ceilings		X
Floor drains and sumps		X
Pits, ponds, or lagoons		X
Stained soil and or/pavement		X
Stressed vegetation		X
Waste or wastewater discharges to surface or surface waters on subject site (including stormwater)		X
Wells (irrigation, domestic, dry, injection, abandoned, monitoring wells)	X	
Utilities	X	
Petroleum and/or natural gas pipelines		X
Suspect asbestos containing building materials	X	
Suspect lead-based painted surfaces and/or lead-containing substances	X	
Septic systems		X

General Description of Structures

The site is currently occupied by a 106,190 square feet two-story steel and glass building on 15.25 acres of land which is primarily asphalt-paved parking lots. The building is currently occupied by DeVry University a computer training school. The 1st floor consists primarily of classrooms with a cafeteria and the 2nd floor is offices.

Roads

Fallbrook Avenue is directly east and adjoining to the SITE. Roscoe Boulevard is directly south and adjoining to the SITE. Valley Circle Boulevard is approximately two miles to the west. The Chatsworth Reservoir is to the north. All streets are within the community of West hills in the City of Los Angeles, California.

Potable Water Supply

The City of Los Angeles Department of Water and Power (LACDWP) is the provider of potable water for the site and surrounding area.

Interior and Exterior Observations

Hazardous Substances and Petroleum Products in Connection with Identified Uses

There is one diesel powered emergency generator observed in the pump room on the 1st floor. No stains or spills were observed. There are two other battery operated emergency

backup lighting systems. No stains or spills were observed. The maintenance room had several five gallon paint containers and other small quantities of lubricating oils and maintenance supplies. The room is kept locked. There is a locked cleaning supply room; the cleaning itself is performed by an outside contractor. The HVAC equipment is located on the roof; all areas were observed to be clean and free of stains or spills at the time of the SITE visit.

PCBs

Transformers, elevators, hydraulic lifts, and fluorescent lighting ballasts are potential sources of PCB-containing insulating fluids. One elevator was observed inside the building. It is a hydraulic elevator, however, no stains or spills were observed in the elevator room. One LACDWP pad-mounted transformer was observed on the eastern side of the building. No stains or spills were observed during the SITE visit.

Interior Observations

Hazardous Materials, Hazardous Waste and Petroleum Products

There is one diesel powered emergency generator observed in the pump room on the 1st floor. No stains or spills were observed. There are two other battery operated emergency backup lighting systems. No stains or spills were observed. The maintenance room had several five gallon paint containers and other small quantities of lubricating oils and maintenance supplies. The room is kept locked. There is a locked cleaning supply room; the cleaning itself is performed by an outside contractor.

Asbestos-Containing Materials

Suspect asbestos-containing building materials were observed throughout the building. Materials included wallboard systems, various colored 12" x 12" resilient vinyl floor tiles, vinyl baseboard, 2' x 4' drop-in ceiling panels, carpet mastic and roofing materials. Based on the age of construction, 1999, the potential for asbestos-containing building materials is low.

Lead-Based Paints

No peeling paint was observed either inside or outside the building. Based on the age of construction, 1999, the potential for lead-based paints is low.

PCBs

Transformers, elevators, hydraulic lifts, and fluorescent lighting ballasts are potential sources of PCB-containing insulating fluids. One elevator was observed inside the building. It is a hydraulic elevator, however, no stains or spills were observed in the elevator room. One LACDWP pad-mounted transformer was observed on the eastern side of the building. No stains or spills were observed during the SITE visit.

Exterior Observations

Wells

There were three groundwater monitoring wells observed in the parking lots. According to the last site assessment report performed in 1998, these wells were to be monitored on a quarterly basis.

VI. INTERVIEWS

Interview With Owner

Mr. Kenneth Katich, the Project Manager for Trammell Crow Company, was interviewed on July 24, 2006. Mr. Katich has been associated with the SITE for more than five years with the SITE. Mr. Katich answered the Transaction questionnaire which is included in Exhibit G.

Proceedings Involving the Property

Mr. Katich reported that to the best of his knowledge, there are no pending, threatened or past litigation, administrative proceedings, liens, or notices from any governmental entity regarding possible violation of environmental laws or possible liability regarding hazardous substances or petroleum products.

Previous Environmental Investigations

There were five previous Environmental Reports given to W&K and are detailed in Section III.

Interview with Site Manager

Mr. Katich is the on-site manger of the SITE.

Interviews with Local Government Officials

Los Angeles Regional Water Quality Control Board (LARWQCB)

A written request for information was faxed to the Los Angeles Regional Water Quality Control Board with regards to the groundwater monitoring wells observed on the SITE. To date, there has been no response from LARWQCB. Should any negative environmental information be obtained from any files the LARWQCB might have, an addendum letter will be issued to the client from W&K.

City of Los Angeles Fire Department Hazardous Materials Division

A written request for information was faxed to the City of Los Angeles Fire Department, Hazardous Materials Division with regards to the SITE address. There are no records for the SITE address. The request and response documentation is included in Exhibit G.

City of Los Angeles Fire Department Underground Storage Tank Division

A written request for information was faxed to the City of Los Angeles Fire Department, Underground Storage Tank Division with regards to the SITE address. There are no records for the SITE address. To date, there has been no response from Fire Department. Should any negative environmental information be obtained from any files the Fire Department might have, an addendum letter will be issued to the client from W&K. The request documentation is included in Exhibit G.

VII. CONCLUSIONS AND RECOMMENDATIONS

Conclusions

Winzler & Kelly Consulting Engineers (W&K) was retained by Unmack Corporation to perform a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-00 at the DeVry University located at 22801 Roscoe Boulevard in West Hills, California 91304 herein referred to as the SITE. Any exceptions to, or deletions from, this practice is described in Section I of this report.

This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the SITE.

In conclusion, the SITE presents evidence of low environmental risk, stemming from any undocumented underground storage tanks (USTs), underground piping and the former adjoining northern property previously owned and occupied by Hughes Missile System company.

Based on the results of the Phase I Environmental Site Assessment, W&K recommends the following:

- A closure letter should be obtained from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding the four groundwater monitoring wells located on the SITE if these wells are considered to be a no further action activity.

- Prior to any renovation or demolition of the current building, a Hazardous Materials Survey should be performed to determine, if any, hazardous substances such as asbestos-containing substances or lead-based substances are present in the building.

VIII. SIGNATURE AND QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONAL

Qualifications

Ms. Candice M. Cassato, an Environmental Analyst of W&K, directed the performance and reporting of this Phase I Environmental Site Assessment. Ms. Cassato has performed environmental site assessments and project management since 1989. Ms. Cassato is an experienced auditor, performing evaluations of facilities ranging from office buildings to industrial factories to assess their compliance with all applicable health, safety, and environmental standards. She has conducted audits throughout the western United States. She has performed Phase I Environmental Site Assessments for property transfers and financing, prepared independent reviews of Phase I reports, and managed asbestos surveys. Ms. Cassato is a California Certified Asbestos Consultant and a California Certified Lead-Related Construction Inspector/Assessor.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT. Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

22801 ROSCOE BOULEVARD
WEST HILLS, CA 91304

COORDINATES

Latitude (North):	34.219900 - 34° 13' 11.6"
Longitude (West):	118.624400 - 118° 37' 27.8"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	350367.0
UTM Y (Meters):	3787536.5
Elevation:	845 ft. above sea level

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

FEDERAL RECORDS

NPL	National Priority List
Proposed NPL	Proposed National Priority List Sites
Delisted NPL	National Priority List Deletions
NPL RECOVERY	Federal Superfund Liens
CERCLIS	Comprehensive Environmental Response, Compensation, and Liability Information System
ERNS	Emergency Response Notification System

HMIRS	Hazardous Materials Information Reporting System

EDR Historical Cleaners.... EDR Proprietary Historic Dry Cleaners

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

CERCLIS-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 02/01/2006 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2N*	*C9*	*15*

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/15/2006 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/09/2006 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2 N*	*C9*	*15*

STATE AND LOCAL RECORDS

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, and dated 04/01/2001 has revealed that there is 1 Cortese site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2N*	*C9*	*15*

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 04/10/2006 has revealed that there are 2 LUST sites within approximately 0.5 miles of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/19/2006
Date Data Arrived at EDR: 05/05/2006
Date Made Active in Reports: 05/22/2006
Number of Days to Update: 17

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL RECOVERY: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/01/2006

Next Scheduled EDR Contact: 09/18/2006
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Data Release Frequency: Quarterly

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Data Release Frequency: Quarterly

NFE: Properties Needing Further Evaluation

This category contains properties that are suspected of being contaminated. These are unconfirmed contaminated properties that need to be assessed using the PEA process. PEA in Progress indicates properties where DTSC is currently conducting a PEA. PEA Required indicates properties where DTSC has determined a PEA is required, but not currently underway.

Date of Government Version: 08/08/2005

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Historical Auto Stations: EDR Proprietary Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

GEOCHECK®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

DEVRY UNIVERSITY
22801 ROSCOE BOULEVARD
WEST HILLS, CA 91304

TARGET PROPERTY COORDINATES

Latitude (North):	34.21990 - 34° 13' 11.6"
Longitude (West):	118.6244 - 118° 37' 27.8"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	350367.0
UTM Y (Meters):	3787536.5
Elevation:	845 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	34118-B6 CALABASAS, CA
Most Recent Revision:	1967
East Map:	34118-B5 CANOGA PARK, CA
Most Recent Revision:	1967

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

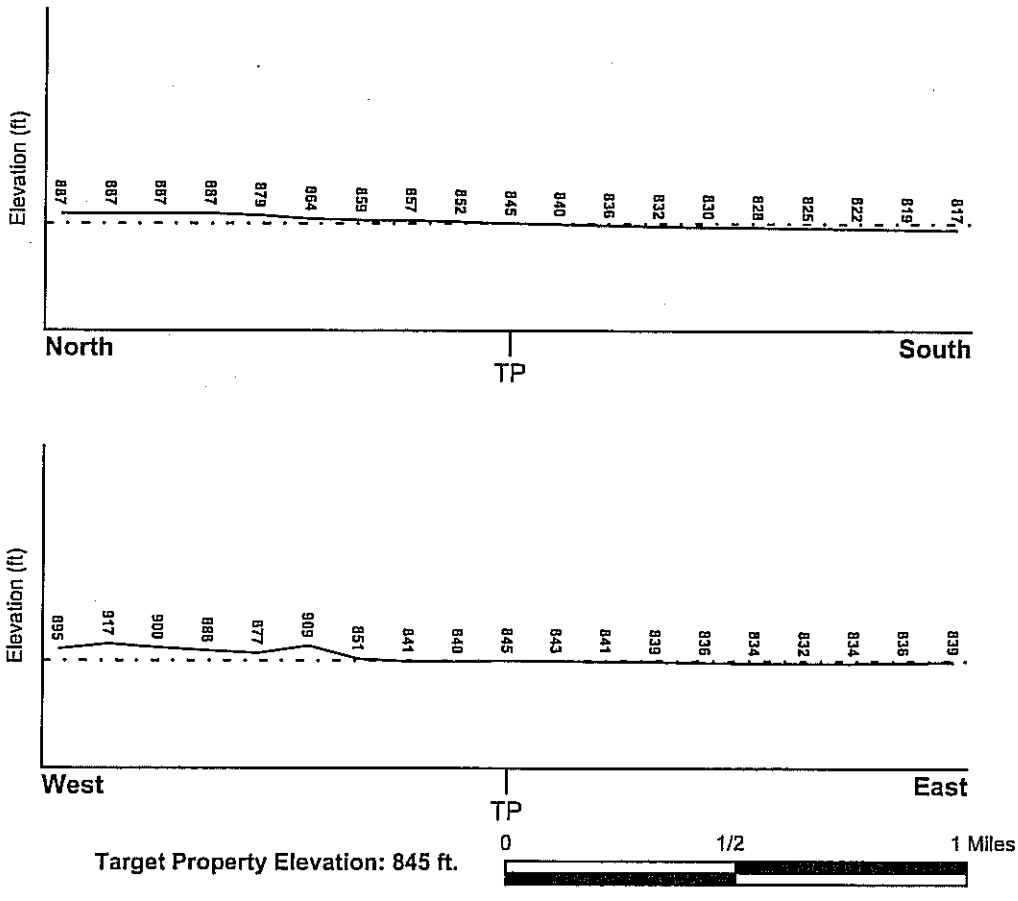
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
LOS ANGELES, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 0601370026C

Additional Panels in search area: 0601370017C

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CANOGA PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Mesozoic
System:	Cretaceous
Series:	Upper Cretaceous
Code:	uK *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	URBAN LAND
Soil Surface Texture:	variable
Hydrologic Group:	Not reported
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	Not Reported
Depth to Bedrock Min:	> 10 Inches
Depth to Bedrock Max:	> 10 Inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Surficial Soil Types:
loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Shallow Soil Types:
fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types:
stratified
clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

CONSULTING ENGINEERS

8. Are there currently, or to the best of your knowledge have there been previously, any *pits, ponds, or lagoons* located on the *property* in connection with waste treatment or waste disposal.

☐ Yes ☒ No ☐ Unknown on adjoining northerly property

9. Is there currently, or to the best of your knowledge has there been previously, any stained soil on the *property*? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

10. Are there currently, or to the best of your knowledge have there been previously, any registered or unregistered storage tanks (above or underground) located on the *property*?

☐ Yes ☒ No ☐ Unknown ~~on adjoining~~ northerly property

11. Are there currently, or to the best of your knowledge have there been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property* or adjacent to any structure located on the *property*? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

12. Are there currently, or to the best of your knowledge have there been previously, any flooring, drains, or walls located within the facility that are stained by substances other than water or are emitting foul odors? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

13. Is the property served by a private well or non-public water system, or is all water service provided by the city or other water agency?

☐ Private well or non-public water system (Go to 13a) ☒ City or other water agency

13a. *If the property is served by a private well or non-public water system:* Have contaminants been identified in the well or system that exceed guidelines applicable to the water system or has the well been designated as contaminated by any government/health agency?

☐ Yes ☒ No ☐ Unknown _____

14. Do you have any knowledge of environmental liens or governmental notification relating to past or recurrent violations of environmental laws with respect to the *property* or any facility located on the *property*? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

15. Have you been informed of the past or current existence of *hazardous substances or petroleum products* or environmental violations with respect to the *property* or any facility located on the *property*? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

16. Do you have any knowledge of any environmental site assessment of the *property* that indicated the presence of *hazardous substances or petroleum products* on, or contamination of, the *property* or recommended further assessment of the *property*? If yes, describe.

26. Has the facility ever had electric transformers, capacitors, or hydraulic equipment such as elevators or car repair lifts? If yes, describe.

☐ Yes ☑ No ☐ Unknown _____

27. Are you aware of the presence of any asbestos-containing or presumed asbestos-containing building materials at the property? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

28. Are you aware of the presence of any lead-based paint in the building? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

1.0 INTRODUCTION

The former Raytheon Missile Systems Company (RMSC) facility at 8433 Fallbrook Avenue in Canoga Park, California (Figure 1-1), has been the subject of environmental assessment work since 1984. The facility, which was used to conduct research and development of advanced military missile systems, made use of a variety of solvents and other chemicals in moderate quantities. Thirteen underground storage tanks (USTs) were maintained for holding fuel, hydraulic oil, waste oil, and spent solvents. All USTs which contained fuel hydrocarbons, oil, or solvents were removed between 1984 and 1991.

Soil and groundwater assessment began in 1984 and has continued to date. Groundwater monitoring involving approximately 30 wells has been conducted regularly since 1991. An extensive facility-wide soil assessment was performed in 1993. Remediation methods, including excavation and in-situ techniques, have been employed to address several petroleum hydrocarbon or solvent releases to soil and/or groundwater at various locations within the facility.

The California Environmental Protection Agency (CalEPA), Department of Toxic Substances Control (DTSC) has been provided extensive information on investigation and remediation activities at the site. In a letter from Yolanda Garza of DTSC to Pamela Beilke of RMSC, dated June 5, 1997, several solid waste management units (SWMUs) and areas of concern (AOCs) at the former RMSC, Canoga Park facility were identified by the DTSC. Based on the DTSC's review of past site investigation and cleanup summary documentation, the SWMUs and AOCs were identified as needing additional investigation. The criteria for including each SWMU and AOC in the list were also described in the June 1997 letter and attachment.

In the June 5, 1997 letter, the DTSC expressed concern that the area within, at, or nearby Building 274 may be a source of trichlorofluoromethane (Freon 11). The DTSC noted that "Building 274 was reported in the Potential Source Area Investigation Report (PSAIR) as having been used for solvent cleaning...specific solvents listed... included 1,1,1-TCA and Freon 11..." The DTSC's letter also indicated that groundwater samples taken from quasi-downgradient monitoring well CM-10 exhibited significant amounts of Freon 11.

The primary objective of the Additional Site Assessment was to, in response to the DTSC's concerns, assess the lateral extent of Freon 11 in groundwater near the area of monitoring well CM-10 and near buildings 265 and 274. This report describes the scope of work, methods, and procedures that were carried out to delineate potentially impacted groundwater and soil in this area.

Included in the CAP are brief descriptions of work by Hargis & Associates, Cal Science Engineering, McLaren/Hart Environmental, ENSR Consulting and Engineering, American Environmental Management Corporation, Ground Water Resources Consultants, Inc., and Groundwater Technology, Inc. The work included UST removals, excavation of petroleum hydrocarbon-containing soil from areas adjoining USTs, UST-related soil assessment activities, installation and sampling of groundwater monitoring wells, and remediation pilot testing. Post-1992 work at the site included facility-wide assessment (*Report on Facility-Wide Assessment*, Groundwater Technology, Inc., January 4, 1994), additional pilot testing (*Report on Pilot Testing of Remedial Technologies*, Groundwater Technology. Inc., July 20, 1993), and soil sampling and analyses completed during construction of the soil and groundwater remediation system (*Analytical Results for Soil Samples, Remediation System Wells*, Groundwater Technology, Inc., December 12, 1994).

In 1995, a series of soil gas investigations were conducted to delineate the areal extent of Freon 11 contaminated soil. These investigations have shown a limited area of Freon 11 soil gas concentrations in excess of 100 μg/l to the southeast of buildings 265 and 274 (Figure 2-1). This area is believed to be the sole source of Freon 11 contamination to groundwater.

Aerial photographs of the facility show that the area to the southeast of Building 265 was not paved until at least 1960. Between 1963 and 1965, the pavement was extended to the west, to the present location of Building 276. Referring to Figure 2-2, the center of mass of the Freon 11 plume (as delineated through soil vapor sampling) lies on the edge of the original pavement to the southeast of Building 265. Moreover, conversations with former facility maintenance personnel revealed that in 1966, the cooling units in Building 263 were overhauled. The method by which spent Freon 11 was disposed is unknown.

Table 1-1 shows an inventory of coolant used at the former RMSC. As can be seen from Table 1-1, the only location where Freon 11 was used was Building 263. Therefore, the source of Freon 11 could not be from the cooling unit adjacent to Building 274, because Freon 11 was not used in that building.

If the Freon 11 were introduced solely through the asphalt parking lot near the cooling unit adjacent to Building 274, one would expect a more diffuse soil plume closer to the cooling unit. However, as Figure 2-1 shows, the center of mass appears to be localized around the former edge of the original parking lot on the southeastern side of Building 265.

2.0 FIELD SAMPLING PLAN

The installation of three temporary wells and one fixed groundwater monitoring well and subsequent groundwater sampling in the area near buildings 265, 274, and 276 were used to assess the areal extent of Freon 11 encountered in groundwater in this localized area of the facility.

2.1 Basis for Temporary and Fixed Groundwater Monitoring Well Sample Locations

As discussed above, the likely area for the source of contamination would be close to the center of mass of the Freon 11 plume as delineated by the soil vapor surveys. To further delineate the areal extent of groundwater contamination associated with the Freon 11, three temporary groundwater wells and one fixed groundwater monitoring well were constructed around the area of elevated soil gas concentrations.

Figure 2-3 shows the locations for the three temporary groundwater wells and one fixed groundwater monitoring well. The basis for selection of the locations was as follows:

Temporary Groundwater Wells

One temporary groundwater well was installed near the southeast corner of Building 276 to define the southwestern edge of the groundwater plume. Another temporary well was installed between the southwest corner of Building 265 and the northeastern corner of Building 276 to delineate the northwestern edge of the groundwater plume. The third temporary groundwater well was positioned at a location approximately midway between the Freon 11 soil gas plume and the existing groundwater monitoring well, CM-10.

Fixed Groundwater Monitoring Well

One groundwater monitoring well (MW-31) was installed within the center of mass of the soil gas plume located in the parking area between Buildings 274 and 276.

Previous groundwater investigations and groundwater monitoring events have shown "none detected" for Freon 11 in monitoring wells MW-29 and MW-30. Furthermore, hydropunch samples taken from the parking area near the northeastern edge of Building 265 have also shown "none detected" for Freon 11 (ENSR Consulting and Engineering, 1991). In light of this data, no fixed groundwater monitoring wells or temporary wells were proposed for the northeastern or east edge of the groundwater plume.

2.2 Soil Sample Collection Procedures

A truck-mounted hollow stem auger rig equipped with 8-inch diameter augers was used to drill the boreholes for the wells. During drilling activities, soil samples were collected in the vadose zone at 10-foot intervals beginning at 10 feet bgs and continuing to down until shallow groundwater was encountered.

Soil samples were collected within the vadose zone at depth intervals of 10 feet beginning at 10 feet bgs. Each soil sample was collected using a California Modified Split Spoon Sampler fitted with three pre-cleaned stainless steel sleeves. Each sampler and stainless steel sleeve was decontaminated prior to and between each sampling interval. After each sampling event, the sampler was washed in a detergent solution, rinsed in tap water, and then rinsed in distilled water. This method decontaminates the sampler and prevents cross contamination between sampling events. The augers were also decontaminated (steam cleaned) between each boring.

Soil samples were field screened using a hand held organic vapor analyzer equipped with a photoionization detector (PID). Four soil samples from each boring (a total of 36 samples) were submitted to NEL Laboratories, a California-certified analytical laboratory, for analysis.

Soil samples were collected by a Fluor Daniel GTI site geologist under the supervision of a California Registered Geologist. Each sample was logged using the Unified Soil Classification System. In addition, field observations including color, moisture content, the presence or absence of hydrocarbon staining as well as odors were documented on a field log sheet.

Depending upon sample recovery, three soil-filled stainless steel sleeves were collected at 10-foot intervals. Of these three sleeves collected at each sampling point, the bottom sleeve was covered at each end with Teflon™ sheets and covered with plastic end caps. The selected samples were labeled with site name, date, time, and sample number. The samples were stored in plastic bags on ice in an ice chest until picked up by a NEL Laboratories courier who transported the samples, under chain-of-custody protocol, to NEL Laboratories, a California-certified laboratory, for analyses. The middle sleeve was screened for the presence of volatile organic vapors using a hand held PID in the following fashion:

> The soil sample was transferred into a ziplock baggie and sealed. The sealed baggie was then placed in the sun for a minimum of 5 minutes at which time the PID probe was inserted through a small opening made by separating the top seal. The highest PID reading was then written on the field log sheet.

The third and middle samples were used for field logging.

2.3 Groundwater Monitoring Well Installation and Sampling

2.3.1 Temporary Groundwater Well Completion

Upon completion of the soil boring, the borings were converted to temporary wells with 2-inch diameter, Schedule 40 PVC casing with threaded joints. The well screens consisted of 2-inch diameter, Schedule 40 PVC with 0.020-inch slots. Wells were screened based on field observations and conditions. Screened intervals were from 35 to 60 feet (WP-DEV-1), 45 to 70 feet (WP-265-1), and 75 to 100 feet (WP-276-1). Because the wells were temporary, a polyester filter sock was wrapped around the well screen in lieu of a sandpack. Upon completion, the temporary wells were allowed to stand a minimum of 24 hours prior to groundwater sample collection. The open boreholes were covered with plastic, then with plywood, and demarcated with traffic cones to avoid the possibility of surface contamination.

After groundwater sampling, the temporary wells were withdrawn, leaving no materials within the borings. The borings were then abandoned in accordance with state and local requirements. The borings were backfilled with bentonite grout upon removal of well materials. Soil cuttings generated during drilling were contained in 55-gallon drums on site pending chemical analytical results.

2.3.2 Groundwater Monitoring Well Completion

The fixed groundwater monitoring well (MW-31) was constructed in accordance with California State Monitoring Well guidelines. Monitoring well MW-31 was constructed to a depth of 70 feet bgs using an HSA drill rig, and completed with 2-inch diameter, Schedule 40 PVC casing with threaded joints, and 0.02-inch machine slotted screens. The screened interval extended from 45 feet to 70 feet below grade. Blank casing was installed from 45 feet bgs to the ground surface. Static groundwater was measured at 48.3 feet below grade using an interface probe.

The annular space extending from the bottom of the wells to 2 feet above the top of the screened interval (43 feet) was filled with Monterey Number 3 sand. The well was then surged to allow the sand pack to properly settle within the annular space. Sand was added as needed. A 2-foot thick seal of bentonite was then placed above the sand pack. The remaining annular space above the seal (41 feet to surface grade) was backfilled with neat cement/bentonite grout. A locking steel traffic box was placed around the PVC casing at the ground surface.

2.3.3 Groundwater Sample Collection Procedures

The following describes groundwater sampling procedures employed at the temporary and fixed groundwater monitoring wells.

Temporary Groundwater Monitoring Wells

Prior to sampling, the groundwater level was measured in each of the wells. Groundwater purging sampling was accomplished using a pre-cleaned peristaltic pump. During purging, key parameters including temperature, conductivity, and pH were measured with a portable electronic meter and recorded. Purging continued until the monitored parameters stabilized. Following purging, groundwater samples were collected with a Teflon™ bailer and discharged with a non-aerating, bottom-emptying device into sterilized glass VOC vials, capped with Teflon™ septa lids, and placed on ice in an ice chest for transport. Groundwater samples were transported to a State-certified analytical laboratory within 24 hours of collection. Groundwater samples were analyzed for VOCs using EPA Method 8260.

Fixed Groundwater Monitoring Wells

Prior to obtaining water samples, the fixed groundwater monitoring well was developed and purged of water. Approximately four well volumes of water were purged from the well and placed in DOT-approved steel 55-gallon drums. During purging, groundwater pH, temperature, specific conductivity and color were monitored and recorded. Purging continued until the monitored parameters stabilized. Following purging, groundwater samples were collected with a Teflon™ bailer and discharged with a non-aerating, bottom-emptying device into sterilized glass VOC vials, capped with Teflon™ septa lids, and placed on ice in an ice chest for transport. Groundwater samples were transported to a State-certified analytical laboratory within 24 hours of collection according to the April 1998 sampling and analysis work plan. Groundwater samples were analyzed for VOCs using EPA Method 8260.

2.4 Analytical Results for Soil Samples

On May 19 and 20, 1998, 30 soil samples were collected from the four soil borings used to construct the three temporary and one fixed groundwater monitoring wells. Soil samples were collected at 10-foot intervals in each soil boring. All soil samples were submitted to a California-certified analytical laboratory. However, as described in Section 2.2, a field OVA (PID) was used to screen soil samples for the potential presence of VOCs. Of the 30 soil samples collected, 16 were selected for laboratory chemical analyses, including soil samples collected at the maximum depth of each

boring, and samples with the highest OVA field measurements. The following soil samples were analyzed:

WP-265-1	WP-276-1	WP-DEV-1	MW-31
@10'	@10'	@10'	@10'
@40'	@20'	@40'	@20'
@50'	@40'	@50'	@40'
@70'	@50'	@60'	@70'

Summary tables of soil sample analytical results for temporary wells WP-265-1, WP-276-1, WP-DEV-1, and fixed well MW-31 are provided in Tables 2-1 through 2-4, respectively. Photocopies of laboratory summary reports are provided in Appendix B. Photocopies of field log notes, including OVA field measurements collected at each sample depth, are provided in Appendix C. With one exception, concentrations of VOCs in soil were below the reported analytical detection limits in samples collected from all four boring locations. The exception was the detection of trichlorofluoromethane (Freon 11) at a concentration of 7.2 μg/kg in soil sample WP-276-1@50' (Table 2-2).

2.5 Analytical Results for Groundwater Samples

On May 21 and 22, 1998, groundwater samples were collected from temporary groundwater monitoring wells WP-265-1, WP-276-1, and WP-DEV-1, and the fixed monitoring well MW-31. A summary of groundwater sample analytical results is provided in Table 2-5. Photocopies of laboratory summary reports are provided in Appendix B. For comparison, analytical results for a groundwater sample collected from groundwater monitoring well CM-10 is also summarized in Table 2-5. Groundwater monitoring well CM-10 was sampled May 12, 1998 as part of ongoing groundwater and remediation system monitoring performed at the former RMSC facility. Trichlorofluoromethane (Freon 11) was detected in groundwater samples collected from the temporary monitoring well WP-DEV-1 (23 μg/L) and the new fixed groundwater monitoring well MW-31 (150 μg/L).

The groundwater sample collected from groundwater monitoring well CM-10 on May 12, 1998 had a trichlorofluoromethane (Freon 11) concentration of 120 μg/L. No other VOC constituents targeted by EPA Method 8260 were encountered above reported analytical detection limits.

2.6 Analytical Results for Trip and Equipment Blanks (Water)

One trip blank was submitted for chemical analysis each day of soil and groundwater sampling. Laboratory prepared trip blank samples (TB-1, TB-2, and TB-4) were analyzed for VOCs using EPA Method 8260. VOC concentrations were below reported method detection limits in all of the trip blank samples referenced above. Photocopies of trip blank sample laboratory summary reports are provided in Appendix B.

Equipment blank samples were also collected during soil and groundwater sampling activities. Equipment blank samples EB-1, EB-2, and EB-4 were analyzed for VOCs using EPA Method 8260. VOC concentrations were below reported method detection limits in all of the equipment blank samples. Photocopies of equipment blank sample laboratory summary reports are provided in Appendix B.

3.0 QUALITY ASSURANCE/QUALITY CONTROL REVIEW

This section presents the quality assurance/quality control (QA/QC) procedures employed in both the field and the laboratory, and includes their respective results. These procedures were performed in accordance with the April 1998 sampling and analysis work plan.

3.1 Field QA/QC Procedures and Review

Field QA/QC samples were collected to document the accuracy and representativeness of the confirmation samples. They are discussed below.

3.1.1 Field Duplicate Samples

Field duplicate soil samples were collected at a frequency of 10 percent. Each field duplicate was obtained by collecting an additional sample from the same location and time as the original sample, with the same sampling procedures.

Duplicate soil samples were collected from temporary well location WP-276-1 at 50 feet below grade, and from temporary well location WP-DEV-1 at 40 feet below grade surface. The only VOC constituent detected in any of the paired original and duplicate soil samples was trichlorofluoromethane (Freon 11) in WP-276-1@50' (7.2 µg/kg and <5 µg/kg, respectively). The

relative percent difference (RPD) calculated for this sample pairing and constituent was 36 percent. The RPD for the remaining VOC constituents below detectable limits were not calculated.

3.1.2 Equipment Blank Samples

Equipment blank samples are organics-free water aliquots that are placed in contact with nondedicated sampling equipment (e.g., concrete chisel) after the equipment has been decontaminated. Analytical results from these samples are used to evaluate the integrity of the decontamination process and to identify possible cross-contamination of samples. A minimum of one equipment blank sample per day was collected where nondedicated sampling equipment was used. As indicated in Section 2.6, targeted constituents of concern were not detected in equipment blanks collected during sampling activities.

3.1.3 Trip Blank Samples

Trip blank samples are organics-free water aliquots used to evaluate the potential cross-contamination of samples that may occur during sample handling. The trip blank usually originates at the contract laboratory and accompanies the sample bottles to the site. Trip blank bottles and sample analyses are usually limited to 40-ml volatile organic analytes (VOAs). A minimum of one trip blank accompanied each cooler containing VOA samples. As indicated in Section 2.6, VOCs were not detected in trip blanks collected during sampling activities.

3.2 Laboratory QA/QC Procedures and Review

Laboratory QA/QC procedures included the following:

- Laboratory analyses were performed within the required holding times for all samples.
- Appropriate minimum detection limits were achieved for the selected analytical method.
- A state-certified analytical laboratory conducted the required analyses.
- The laboratory provided for each sample a signed laboratory report which included the sample designation, date of sample collection, date of sample analysis, laboratory analytical method employed, sample volume, and the minimum detection level.

- Surrogate spike recoveries in EPA Method 8240/8260 analyses were within acceptable ranges in all soil and groundwater samples.
- Matrix spike and matrix spike duplicate recoveries in EPA Method 8260 were within acceptable ranges.

4.0 SUMMARY

Sampling and analysis activities for the CM-10 area of concern have been implemented in accordance with the April 1998 work plan prepared for this assessment activity. Activities described in the work plan have been completed. Introductory, historical, and background information are provided in Section 1.0 of this report. Field observations and laboratory analytical results are summarized in Section 2.0 of this report. QA/QC procedures implemented during this site assessment are reviewed in Section 3.0 of this report. A summary of findings of these assessment activities is presented below.

- Geologic materials encountered during subsurface drilling consisted of unconsolidated fill, interbedded siltstone, shale, clayey siltstone, and clayey shale, with some interbedded diatomaceous shale.
- The depths to water in temporary groundwater wells WP-265-1, WP-276-1, and WP-DEV-1 were 44, 44.5, and 35.8 feet, respectively. The depth to water in fixed groundwater monitoring well MW-31 was 48.3 feet. Depths to groundwater are generally consistent with data of previous site assessments and ongoing groundwater monitoring and compliance sampling and analyses.
- A trace concentration of trichlorofluoromethane (Freon 11) was encountered in one soil sample collected from soil boring location WP-276-1, at 50 feet below grade surface. However, Freon 11 was not detected in a duplicate soil sample collected at the same location and depth. No other VOCs were detected in any of the soil samples submitted for chemical analyses using EPA Method 8260.
- Freon 11 was not detected above method detection limits in groundwater samples collected from temporary wells WP-265-1 and WP-276-1. These wells were positioned near Buildings 265 and 276, respectively, and near subsurface utilities (subsurface electrical conduit lines and a sewer main, respectively).
- Freon 11 was detected in groundwater samples collected from the temporary well WP-DEV-1, and fixed groundwater monitoring well MW-31 (23 μg/L and 150 μg/L, respectively). No other VOC constituents were detected. The primary maximum contaminant level (MCL) for Freon 11 is 150 μg/L (as promulgated in California's Safe Drinking Water Standard, Title 22 of California Code of Regulations [CCR], Division 4, Chapter 15). Based on concentrations of Freon 11 in WP-DEV-1 and

MW-31, and ongoing analytical data collected from groundwater monitoring well CM-10, Freon 11 concentrations in groundwater underlying the CM-10 area of concern are at, or below, the State MCL.

Based upon the findings of this and previous site assessment activities (ENSR, 1991; Groundwater Technology Inc., 1995 and 1995a; McLaren Hart 1989), the lateral extent of potential impacts to groundwater underlying the CM-10 area of concern has been defined. Installation of a groundwater monitoring well at what is believed to be the sole source area of Freon 11 impacts to groundwater shows groundwater concentrations at the State MCL for this constituent. Further, groundwater quality data collected from temporary wells indicate that Buildings 265 and 276 are not source areas contributing to Freon 11 impacts to groundwater. Finally, downgradient concentrations of Freon 11 in CM-10 and temporary well WP-DEV-1 are below the State MCL for Freon 11.

5.0 RECOMMENDATIONS

In the Corrective Action Plan Addendum (Groundwater Technology, Inc., 1994) issued for the former Hughes Missile Systems Company Facility, no remedial action was proposed for the CM-10 are of concern because Freon 11 concentrations were below the State Drinking Water Standard or Maximum Contaminant Level (MCL) for this constituent. Based on the findings of the current assessment and the observed continuing decline in Freon 11 concentrations over time, a course of action that consists of "Monitor Only" continues to be appropriate for the CM-10 area of concern. No additional subsurface soil or groundwater assessment activities are recommended at this time. Continued quarterly sampling and analysis of groundwater collected from MW-31 and CM-10 are recommended to confirm Freon 11 levels remain at or below State MCLs established for this compound. It is recommended that quarterly monitoring of these wells continue until samples from four consecutive quarters contain concentrations of Freon 11 less than State MCL and cleanup criteria of 150 μg/L.

Subject: Draft RCRA Facility Assessment (RFA) Comments
Former Canoga Park Facility (EPA ID CAD041162124)
Canoga Park, CA

Dear Mr. Collins:

Enclosed is Raytheon's response to the draft RFA prepared by the California Department of Toxic Substance Control (DTSC) for the former Canoga Park Facility. Raytheon has always worked closely with the DTSC to ensure protection of human health and the environment, and appreciates the opportunity to review the RFA in draft form. We are providing comment to correct some of the factual inaccuracies in the draft RFA.

Over the years, Raytheon has performed numerous investigations and corrective actions at seven proposed Solid Waste Management Units (SWMUs), including two former RCRA-permitted units, and thirteen proposed Areas of Concern (AOCs) designated in June 1997 by the DTSC. Those activities have been conducted in coordination with, and under the oversight of the DTSC. All AOCs and SWMUs have been investigated, and data of sufficient quantity and quality have been collected to ensure adequate site characterization.

Remedial activities were performed in accordance with the DTSC approved Closure Plan (1996), including but not limited to excavation of contaminated soil at the two former RCRA-permitted units for which the Closure Certification Report was submitted to the DTSC in November 2002. The groundwater remediation activities, initiated in 1995, are continuing under the Corrective Action Plan (CAP) approved by the Los Angeles Regional Water Quality Control Board (LARWQCB).

Raytheon is committed to achieving RCRA closure at the former Canoga Park facility. It is Raytheon's position that all obligations to the DTSC have been fulfilled. All activities to date support acceptance of the closure certification report. Raytheon looks forward to working with you and the DTSC to achieve final closure of the site. Should the DTSC have questions regarding the closure certification, on-going remediation activities, or the numerous investigative reports, Raytheon would be pleased to respond, either in writing or at a meeting.

Sincerely,

Daniel Santamaría Samorano, P.E.
Remediation Project Manager

Enclosure: Raytheon Response to November 2009 Draft RFA

	Raytheon Comment
Section/Para. No.	**Comment**
Executive Summary, p. ii paragraph 2 bullet 3	SWMU-6 and SWMU-7 are part of Zone 3 (South Plume Area), however, they are not included in any of the Zones. Please add.
Executive Summary, p. ii, item 2	AOC 4 is located in the area designated Zones 1 by the DTSC. This SWMU should be removed from list. Former Bldg. 269 footprint and adjacent areas have been well characterized (McLaren Hart, 1989, GTI, 1995, FDGTI, 1998, Allwest, 1997, IT, 1999). This area is currently under remedial action for VOCs via EISB through LARWQCB (TN&A, 2008). LTM program through LARWQCB has determined that this is not a source contributor to the Northwest area.
1.1, Page 1, paragraph 4, item 2	Please provide a definition of an AOC for proper reference.
2.1, Page 3, paragraph 1, last sentence	On Aug. 7, 2009, the City Council approved a zone change to "Light Manufacturing".
2.3., Page 5, paragraph 1, second to last sentence	In October/ November 2009 emulsified soybean oil injections were performed to address areas of the Northwest area in accordance with LARWQB approved workplan.
3.1, Page 6, paragraph 2, second sentence	The groundwater recovery and treatment system is also permitted under WDR 95-012 to treat VOCs.
3.1, Page 6, paragraph 4, last sentence	A study of radiological conditions in groundwater has been completed and the LARWQCB issued a No Further Action Letter on 10/31/09. In addition, all wells in the southern parcels of the property have been removed from the monitoring and reporting program (MRP 95-012) by the LARWQCB. Raytheon requested a No further action (NFA) status in June 2006fIn light of the radiological completion, it is anticipated that the area will receive full NFA status for the Southern Plume since groundwater concentration hav been below CAP/MCLs levels for 10 years.

	Raytheon Comment
5.0, Page 9, last paragraph, last sentence	This sentence should be deleted. Table 2 is historical chemical usage report from the McLaren Hart report(1989) and not a list of AOCs and SWMUs .
5.1, Page 11, paragraph 5, first sentence	The concentrations are relatively low: use of the term "high levels" is inappropriate as the levels are orders of magnitude below the EPA Region 9 PRG for Industrial Soils.
5.1, Page 11, paragraph 5, sentence 3	There is actually 10 feet of fill on top of former HWSA per survey data.
5.1, Page 11, paragraph 5, sentence 4	Currently the native soils underlying the former HWSA are more than 20 feet below grade due to the excavation, and surface capping by an asphalt parking lot.
5.1, Page 11, paragraph 5, last sentence	The USEPA Region IX PRG is actually 64 mg/kg for hexavalent chromium in industrial soils, not 6.4 mg/kg. Raytheon plans to re-evaluate the closure performance standards via a site specific human health risk assessment (HHRA).
5.1, Page 12, paragraph 2, last sentence	There is no current potential for surface water release being that the HWSA no longer exists and its former location is beneath 10 feet of fill. In addition, the HWSA was constructed with a berm system. During closure of the HWSA, the soil impacts were discovered immediately under the foundation at which point the soild was excavated under in accordance with DTSC approved Closure Work Plan
5.1, Page 12, paragraph 4, first sentence	Vertical and lateral extent has been defined per the Sep. 22, 2000 delineation report by TN&A. This area is part of the LARWQCB approved EISB work plan with activities planned in 2010.
5.1, Page 12, paragraph 4, last sentence	There is no potential for surface water impacts due to the 10 feet of fill and asphalt cap currently in place over the Former HWSA.
5.2, Page 14, paragraph 3	This same scenario (area paved over) is valid for SWMU-1 above, therefore SWMU-1 should also be characterized as low potential to impact surface water.
5.2, Page 14, *Recommendation for Further Action*	Raytheon has performed clean up of the site under the oversight of the LARWQCB and submitted a Closure Certification Report (1996)for the permitted units in 2002 to the DTSC. It is our understanding that the surface closure of the T3 units complete.. Please define the DTSC's

	Raytheon Comment
	"verification process" if it differs from the submittal of a closure certification report,
5.3, Page 15, *Remedial Action Taken*	CAP goals were approved by DTSC's acceptance of closure plan.
5.3, Page 16, paragraph 1, first sentence	"Remedial Action Taken" section states that this area is well defined. The potential for the soil to contribute to groundwater has been assessed: 15 years of groundwater monitoring data does not indicate a contributing source.
5.4, Page 17, *Recommendation for further Action*	No additional assessment is warranted. This SWMU should be removed from the list. Bldg. 282 has been well characterized (H&A, 1989, McLaren Hart, AEMC, 1991, AEMC, 1992, FDGTI, 1998) along with the entire Northwest area to support the remediation system design inclusive of dozens of soil borings and monitoring / extraction wells, more than 60 AS/SVE wells and more than 100 soil vapor locations. These results have been documented via dozens of investigation reports submitted between 1988 and 1998. Furthermore, the adjacent monitoring well network and associated 15 years of monitoring has determined that no soil remains that is a threat to groundwater as no significant increases have been observed since monitoring and remediation began. No sustained increases over historical high levels have been observed in wells CM-2D, CM-13, MW-23, RW-13.
5.5, Page 18, *Recommendation for Further Action*	No additional investigation is warranted. The pits and adjacent areas have been well characterized (McLaren Hart, 1989, GTI, 1995, FDGTI, 1998, Allwest, 1997, IT, 1999). This area is currently under remedial action for VOCs via EISB through LARWQCB (TN&A, 2008). Raytheon proposes to integrate cadmium and beryllium levels into HHRA as they are significantly below residential or industrial soil PRGs to achieve NFA on this SWMU.
5.6, Page 19, *History of Releases*	Radioactivity not an historical release per the LARWQCB, 2009.
5.6, Page 19, *Remedial Action Taken*	The selected remedy for this area is Monitored natural attenuation (MNA). Groundwater monitoring has confirmed the effectiveness of this strategy.
5.6, Page 20, paragraph 1, first sentence	The most recent data for Freon in November 2008 for CM-10 is 32 ug/L. The groundwater monitoring results continue to support MNA.
5.7. Page 21, *History of Releases*	Freon release delineated in GTI, 1994. SWMU-6 has already addressed this release.
5.7. Page 21, *Soil/Groundwater Release Potential*	The most recent concentration for Freon in November 2008 is 87 ug/L.

	Raytheon Comment
5.7, Page 21, *Recommendation for Further Action*	SWMU-7 should be removed from the SWMU list, all discussion per Freon distributions are identical to SWMU-6 above. Raytheon does not agree to multiple SWMU's / AOCs based on data for one area that has been well delineated. SWMU-6 should replace SWMU-7.
5.8, Page 22, *Remedial Action Taken*, last sentence	Raytheon has performed clean up of the site under the oversight of the LARWQCB and submitted a Closure Certification Report (1996)for the permitted units in 2002 to the DTSC.
5.8, Page 23, *Recommendation for Further Action*	This SWMU should be removed from the list. The USTs have been removed and area has been characterized (McLaren Hart, 1989, AEMC, 1991, FDGTI, 1998). Northwest remediation systems (GRTS, SVE/AS) has treated this area sufficiently, no BTEX detections have been detected over MCLs since 2002 (benzene at 1.4 ug/L in RW-06). The monitoring well network and last 15 years of monitoring (CM-13, RW-06, MW-23) have indicated significant reductions of BTEX components shortly after initial system start-up in 1995, with no re-bounds or increasing trends even after shut-off in 2005. This has made the determination that no soil remains at concentrations contributing to groundwater and therefore, NFA is appropriate.
5.9, Page 23, *History of Releases*, last sentence	Please note that the sewer line is deeper than the soil sample with elevated arsenic levels.
5.9, Page 24, *Surface Water Release Potential*	We do not understand this logic, sanitary sewer conveys waste effluent to a publicly owned treatment works (POTW) water treatment plant and does not discharge to surface water.
5.9, Page 24, Recommendation for Further Action	Investigation of the sewer system indicates it is not a source and should be removed from SWMU list. No industrial sewer discharge permit violations are on record against Hughes. The entire sewer line was assessed (FDGTI, 1994) inclusive of 10 locations to 30 feet bg at each location with no indicatation of a release. The one detection of arsenic at 42 mg/kg (B-SL-4) at 5 feet bg, which exceeded the closure performance standard is generally consistent with high background concentration levels in Southern California (Hunter et. al., March 2005), which concludes a level of 33.9 mg/kg as the 99th percentile upper bound. The B-SL-4 location was west of Bldg.'s 268 and 277, which have no use history involving arsenic. Furthermore, the sample was collected above the sewer line, which is approximately 8 feet bg indicating that the arsenic level at 5 feet has no correlation to a sewer discharge. In addition, the well network and monitoring for the last 15 years

	Raytheon Comment
	of downgradient wells CM-12, CM-17, CM-11, CM-11A, CM-15, MW-21S/D, MW-22 S/D and MW-30 has demonstrated no significant impacts along the sewer line, as any significant releases would have manifested into groundwater plumes.
5.10, Page 25, *History of Releases*	Bldg. 262 is >950 feet north of CM-8D and cross-gradient to it. MW-24, which is downgradient from Bldg. 262 has been ND for 16 years.CM-8D concentrations likely from loading dock area. Therefore this AOC-1 should be removed from the list.
5.10, Page 25, *Soil/Groundwater Release Potential*	Correction, CM-8 is ## ppb is part of the EISB strategy approved by the LARWQCB. The EISB strategy has been successful and concentration s continue to decline. as for the other two wells, CM-9D has been ND for 1,1-DCE since 1998 and CM-18 has been ND for 1,1-DCE since 2002. Please make the appropriate changes to the text.
5.10, Page 25, *Recommendation for Further Action*	AOC-1 should be removed from list, downgradient wells MW-24/CM-09D have been ND for 15 years. CM-8D concentrations likely from spill in loading dock area. No historical industrial sewer permit violations exist. Also, there is no technical merit to surface water releases as industrial sewer was connected to a POTW. AOC-13 should replace AOC-1.
5.11, Page 26, *Soil, Groundwater Release Potential*, first sentence.	No POTW violations exist during Hughes occupancy, Hughes/Raytheon has not been facility operator or user of the sewer system since 1997.
5.11, Page 26, *Surface Water Release Potential*	Raytheon is not aware of anye connection between sanitary sewer lines and surface water impacts at the site. Please elaborate if warranted.
5.11, Page 27, *Recommendation for Further Action*	AOC-2 should be removed from list. CM-8D concentrations likely from spill in loading dock area. No historical industrial sewer permit violations exist. Also, there is no technical merit to surface water releases as industrial sewer was connected to a POTW. AOC-13 should replace AOC-2.
5.12, Page 28, *History of Releases*	Source has been well identified as the eastern edge of SWMU-6 (parking area), no indication of any releases exist at Bldg. 265 (GTI, 1994).
5.12, Page 28, *Soil/Groundwater Release Potential*	As above, Freon source has been well defined as the parking area itself, not Bldg. 265.
5.12, Page 28, *Recommendation for Further Action*	AOC-3 should be replaced by SWMU-6. SWMU-6 has been identified as the source of Freon in groundwater.
5.13, Page 28, *Unit Description*, first sentence	AOC-4 is located in the northwestern portion of the site, not northeastern.

	Raytheon Comment
5.13, Page 30, *Recommendation for Further Action*	This SWMU should be removed from list. Former Bldg. 269 footprint and adjacent areas have been well characterized (McLaren Hart, 1989, GTI, 1995, FDGTI, 1998, Allwest, 1997, IT, 1999). This area is currently under remedial action for VOCs via EISB through LARWQCB (TN&A, 2008). LTM program through LARWQCB has determined that this is not a source contributor to the Northwest area. To date, semi-annual sampling of RW-07, RW-08 and RW-09, directly downgradient from Bldg. 269, have indicated no detectable VOCs or VOCs below CAP levels since 1995.
5.14, Page 31, *History of Releases*	Bldg. 271 is >800 feet north of CM-8D, and located cross-gradient to it and is unlikely the source of the CM-8D concentrations.
5.14, Page 31, *Air Release Potential*	Probably mean air here, not surface water.
5.14, Page 31, *Recommendation for Further Action*	Should be removed from list, Bldg. 271 area has been characterized (McLaren Hart, 1989, GTI, 1995) and most recently sampled by Environ (2009) as part of the "secondary staircase" construction project. No historical industrial wastewater permit violations exist. Down/cross gradient wells MW-24 and CM-9D have been non-detect since 1998 indicating no significant source at Bldg. 271 location. Bldg. 271 is more than 800 feet north and cross-gradient of CM-8D and could not be a source of the CM-08D concentrations, AOC-13 should replace this AOC.
5.15, Page 32, *Waste Managed,* second to last sentence	Freon source has been delineated as eastern portion of SWMU-6.
5.15, Page 33, *Recommendation for Further Action*	AOC-6 should be replaced by SWMU-6. SWMU-6 has been identified as the source of Freon in groundwater.
5.16, Page 34, *History of Releases*	Freon source has already been identified as east portion of SWMU-6.
5.16, Page 34, *Recommendation for Further Action*	AOC-7 should be replaced by SWMU-6. SWMU-6 has been identified as the source of Freon in groundwater.
5.17, Page 35, *History of Releases*	Distributions of 1,1-DCE per CM-8D, CM-9D and MW-27 are not consistent with any releases at Bldg. 281.
5.17, Page 36, *Recommendation for Further Action*	AOC-8 should be removed from list. Bldg. 281 chemical use history (antifreeze, insecticides, dichloromethane) not consistent with concentrations detected in CM-8D. Downgradient well CM-09D has no detected concentrations above MCLs since 1998 and no detections of any site COCs since 2005. AOC-13 should replace AOC-8.

	Raytheon Comment
5.19, Page 38, *Remedial Action Taken,* last sentence, Figure 4 reference.	Figure 4 is a photo of the SVE equipment, not the former excavation.
5.19, Page 38, *Recommendation for Further Action*	AOC-10 should be removed from list. Area well characterized and remediated (McLaren-Hart, 1989, AEMC, 1991, AEMC, 1992). All tanks/piping and 2,153 tons of diesel impacted soil was removed, very limited soil volume left in place. Soil with a concentration of 13,184 ppm TPH-d was excavated, AEMC 1992 report indicates a level of 861 ppm TPH-d was highest concentrations left in place. Well CM-9D located immediately adjacent and downgradient was ND for TPH in 1993 and all BTEX components have been ND for 15 years.
5.20, Page 40, *Recommendation for Further Action*	This SWMU should be removed from list. Tank T-14 has been removed and adjacent areas have been well characterized (McLaren Hart, 1989, FDGTI, 1998, Allwest, 1997, IT, 1999). The LTM program through LARWQCB has determined that this is not a source contributor to the Northwest area. Sampling of downgradient wells CM-6D and RW-09 have been non-detect or below CAP goals since 1995.
5.21, Page 40, *Unit Description*	There is no storm sewer system on-site. The site is designed with elevation changes and swales to facilitate drainage via sheet flow on the parking lot surface to perimeter collection points and on to the regional storm system.
5.21, Page 40, *Waste Managed,* second sentence	At no time has groundwater been discharged to the storm water system. Any purge water from groundwater monitoring activities have been processed in the GRTS. WDR-95-012 for the GRTS permitted Raytheon to use the treated water for a beneficial use; property owners agreed to use the treated water for on-site irrigation in the planters.
5.21, Page 41, *Surface Release Water Potential*	No discharge to storm drain system ever occurred all of the site investigation reports.
5.21, Page 41, *Recommendation for Further Action*	AOC-12 should be removed from the AOC list. The justification for identifying it as an AOC is very vague and without technical merit. The existence of the structure identified as the storm water system is unclear. Raytheon has no construction records of a site wide storm water system. MRP 95-012 was for groundwater collected from extraction wells to be treated through granular activated carbon and pumped to the site irrigation system and never discharged to storm drains. There is no record of any discharges to a storm water system. Furthermore, this is inconsistent with the previous SWMU/AOC lists identified in 1997.

	Raytheon Comment
8.1, Page 45, *Removal Considerations/Interim Measures*	Suggestion for continued investigative activities are not inconsistent with statements in Section 6.2 stating that the extent and cause of the groundwater contamination has been delineated as well as several other statements per the SWMU's and AOCs saying they are well characterized. All VOC concentrations have been fully delineated, and remedial actions (soil excavations, groundwater extraction, vapor extraction, air sparging and EISB) have been implemented as necessary. Long term monitoring (LTM) as dictated by WDR MRP 95-012 and CI-8947 will continue under the direction of the LARWQCB.

TECHNICAL MEMORANDUM

Date: July 8, 2010

Prepared For: Dr. Ann Chang, Ph.D.
Site Cleanup Unit I
Los Angeles Regional Water Quality Control Board (LARWQCB)

Prepared By: Jacques Marcillac, CHG
Project Manager
Oneida Total Integrated Enterprises, LLC (OTIE)

Re: Request for No Further Action Status for Southern Parcels
Former Canoga Park Facility
8433 Fallbrook Avenue, Canoga Park, California
SCP No. 0693, Site ID 2043T00

Dear Dr. Chang,

This memorandum has been prepared by OTIE, on behalf of Raytheon Company (Raytheon), as a follow up to TN & Associates' June 27th, 2006 technical memorandum requesting No Further Action ("NFA") status for the southern parcels of the above referenced site (Figure 1). These parcels include Assessor Parcel Numbers (APN) 2005-002-011 and 2005-002-901 (Figure 2). Samples from each of the groundwater monitoring wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31) located on or in the vicinity of these parcels have indicated that no volatile organic compound (VOC) concentrations have been detected above the State of California maximum contaminant levels (MCLs) for drinking water for more than 10 years. Moreover, samples from all wells except for CM-10 and MW-31 have been non-detect for the site constituents of concern (chlorinated VOCs), for more than 15 years (Table 1). In a January 22, 2007 letter, the LARWQCB approved the removal of several of these southern parcel wells from the monitoring program, but did not approve their abandonment as there were some concerns about the potential presence of man-made radiological isotopes in wells (CM-10, CM-12 and CM-17) based on community concerns with previous data (GRC, 1992).

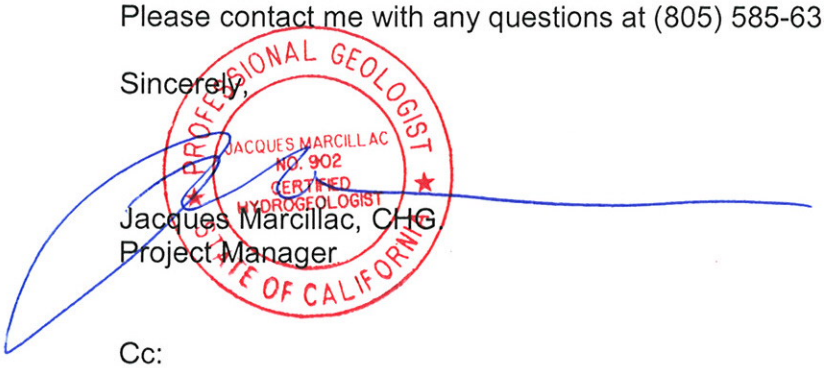
Between March 2008 and August 2009, Raytheon, OTIE and the LARWQCB worked together to evaluate radiological conditions at the site culminating in an August 2009 report documenting the activities and data evaluation (*Groundwater Investigation Report to Verify Current Radioactivity Conditions, Former Canoga Park Facility, 8433 Fallbrook Avenue, Canoga Park, California*, OTIE, August 2009). The results of the radiological evaluation indicated that the low level presence of radiological isotopes were attributable to naturally occurring sources in the underlying soil, bedrock and groundwater. The LARWQCB concurred and issued an "NFA" letter for the subject of radioactivity in groundwater at the site on October 30th, 2009.

In addition to the radiological sampling, OTIE, performed a confirmation sampling event of wells CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31 in November 2008 indicating that samples from each of these wells were non-detect for all VOCs (CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29 and MW-30) or below the MCL for the only detected VOC, trichlorofluoromethane (found in wells CM-10 and MW-31). Tables and graphs showing historical data are provided as Attachments.

Based on the NFA findings for radiological parameters and confirmation results for VOCs in the southern parcel wells, it is evident that water quality in this area has not been significantly impacted from historical site uses. In addition, the 15 years of data collection indicates that there are no potential sources in the soil that are degrading groundwater quality for these parcels. Raytheon requests that NFA status be issued for APN's 2005-002-011 and 2005-002-901 and as such, authorization to abandon wells CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31 be granted.

Please contact me with any questions at (805) 585-6382.

Sincerely,



Jacques Marcillac, CHG
Project Manager

Jacques Marcillac, CHG, Project Manager

Re: **First Quarter 2012 Enhanced *In Situ* Bioremediation Progress Report, Phase VI**
Former Canoga Park Site
8433 Fallbrook Avenue, Canoga Park, California
WDR Permit No. R4-2007-0019 (Series No. 092)
M&RP No. CI-8947; SCP No. 0693; Site ID No. 2043T00

1.0 INTRODUCTION

On behalf of Raytheon Company (Raytheon), Oneida Total Integrated Enterprises, LLC (OTIE) has prepared this Enhanced *In Situ* Bioremediation (EISB) Progress Report for the First Quarter of 2012. The report documents the progress of the Phase VI EISB program that was implemented in the Former Building 269 Area (Bldg 269) to address chlorinated volatile organic compounds (CVOCs) in groundwater and soil at the Former Canoga Park Facility (the Site) located at 8433 Fallbrook Avenue in Canoga Park, California (Figure 1). This report was prepared in accordance with the Waste Discharge Requirements (WDR) Order No. R4-2007-0019 (Series No. 092) and the Monitoring and Reporting Program (M&RP) No. CI-8947 issued by the Los Angeles Regional Water Quality Control Board (LARWQCB).

Based on the latest results, the EISB program is successfully remediating the groundwater and saturated soils in the area of Bldg 269, as no CVOC concentrations exceed their Corrective Action Plan (CAP) goals, as defined in the *Corrective Action Plan,* (Hughes Missile Systems Company [Hughes], 1992).

1.1 BACKGROUND

The predominant chemical of concern (COC) in groundwater at the Site is 1,1-dichloroethene (1,1-DCE) as defined in the CAP. The groundwater impacts are generally limited to the upper 25 feet of shallow groundwater in the northwest portion of the Site, which occurs from 25 to 50 feet below ground surface (bgs). A groundwater remediation program has been underway at the Site since 1995 to progress towards achieving cleanup criteria established in the CAP for the Site (60 micrograms per liter [µg/L] for 1,1-DCE).

Investigation activities at the Site have been ongoing since 1988 and a groundwater remediation program has been underway at the Site since 1995 to achieve cleanup criteria established in the original CAP (Hughes, 1992) for the site-specific COCs which include 1,1-DCE and other chlorinated ethenes. Clean up goals for the CVOCs are summarized below:

Chemical of Concern	CAP Goal (µg/L)
Tetrachloroethene (PCE)	50
Trichloroethene (TCE)	50
cis-1,2-Dichloroethene (cis-1,2-DCE)	60
1,1-Dichloroethene (1,1-DCE)	60
1,1-Dichloroethane (1,1-DCA)	50
1,2-Dichloroethane (1,2-DCA)	5

The LARWQCB is the lead oversight agency for the remediation activities at the Site. Remediation techniques used at the Site have included a groundwater recovery and treatment system (GRTS), soil vapor extraction (SVE), and an air sparge (AS) system. In May 2002, the LARWQCB approved an EISB pilot test to evaluate the ability of EISB to reduce chlorinated ethenes in saturated soil and groundwater below CAP goals. Based on the successful results of the pilot test, a full-scale EISB application was approved by the LARWQCB and three separate phases (Phase I through Phase III) were implemented between October 2005 and November 2008 to remediate COCs in treatment areas “A” through “D”. As a result, the AS/SVE systems and GRTS were phased out and currently serve as contingency options. EISB Phase IV was implemented in November 2009 and Phase V *In Situ* Chemical Reduction (ISCR) injections for the HWSA took place in June 2010. The most recent Phase VI EISB injection activities took place in May 2011 (Figure 2). Table 1 summarizes the EISB and ISCR programs at the Site.

In addition to the remediation progress monitoring related to the injection activities, routine Site-wide groundwater monitoring has been conducted since 1991. The current site-wide groundwater monitoring and sampling program is performed in accordance with M&RP No. CI-7483 issued by the California LARWQCB, File No. 94-45 as modified by August 26, 1997, and January 22, 2007, LARWQCB letters.

1.2 EISB PHASE VI MONITORING PROGRAM

The baseline, month #1, month #3, month #6, and month #9 sampling events for the Phase VI EISB activities have been performed in accordance with the LARWQCB’s second revision to M&RP No. CI-8947 dated September 9, 2009. To evaluate impacts associated with the EISB injection activity during Phase VI, the following monitoring wells were selected as RPM wells within treatment area "G":

- CM-16 – upgradient location;
- CM-4D – within treatment area location; and
- MW-38 – downgradient location.

The groundwater monitoring program includes collecting samples for water quality parameter measurements at the Site and off-site laboratory analyses at frequencies listed in M&RP No. CI-8947. Groundwater samples were sent to an off-site laboratory for the following analytes:

VOCs, volatile fatty acids (VFAs), dissolved gases, anions, ferrous iron, total dissolved solids (TDS), total organic carbon (TOC), dissolved cations, mercury, and hexavalent chromium [Cr(VI)] by the methods listed in M&RP No. CI-8947. Field measurements include dissolved oxygen (DO), oxidation-reduction potential (ORP), pH, specific conductivity, and temperature.

1.3 ENHANCED *IN SITU* BIOREMEDIATION PROGRAM, PHASE VI

Between May 9 and May 11, 2011, substrate was injected into four newly installed injection wells (IP-07 through IP-10) in the Bldg 269 area with screen intervals for each well from 40 to 60 feet bgs. A total of 385 gallons of EOS® 598B42 mixed with approximately 3,861 gallons of treated groundwater were injected. Additional details of the Phase VI injection activities were documented in OTIE's *Enhanced In Situ Bioremediation and In Situ Chemical Reduction Progress Report, Second Quarter 2011* (OTIE, 2011). EISB Phase VI injection details are summarized in Table 2.

2.0 FIELD ACTIVITIES

Groundwater monitoring for the first quarter of 2012 was conducted on March 27, 2012. Activities performed for the Phase VI month #9 EISB event are summarized below:

- Depth to water was measured in three wells; and
- Field parameters were measured and groundwater samples collected from the three RPM wells listed in the monitoring program per M&RP No. CI-8947.

The following sections discuss the groundwater monitoring activities performed including groundwater level gauging and monitoring well purging and sampling procedures.

2.1 GAUGING

Select wells were gauged for depth to groundwater in accordance with project-specific requirements and OTIE Standard Operating Practice (SOP) No. OTIE008E prior to groundwater purging and sampling activities within treatment area "G". An electronic interface probe, accurate to the nearest ± 0.01 feet, was used to measure the water levels in each well and for determining the presence or absence of substrate. Well construction details are summarized in Table 3 of the Fourth Quarter 2011 EISB and ISCR Progress Report (OTIE, 2012).

Static depth to groundwater measurements ranged from 32.90 feet btoc in well MW-38 to 41.96 feet btoc in well CM-16 on March 27, 2012. Groundwater elevations in the three RPM wells decreased on average by 0.80 feet since the December 2011 gauging event. Individual well decreases ranged from a drop of 1.09 feet in well CM-4D to 0.45 feet in well MW-38.

Table 3 summarizes the depths to groundwater and calculated groundwater elevation data for the March 2012 gauging. Field records are provided in Appendix A.

The groundwater contours for the month #9 event are shown in Figure 3. Because of the limited number of wells gauged, the hydraulic gradient was not calculated. Groundwater elevations for the three RPM wells since baseline are shown in Graph 1.

2.2 PURGING AND SAMPLING

The quarterly groundwater sampling event was conducted on March 27, 2011 and each of the wells identified in the M&RP were purged and sampled.

Following gauging activities, and prior to sample collection, each well was purged using the low flow purging method to minimize stress to the groundwater system in accordance with OTIE SOP No. OTIE008F. The overall goal of low flow purging is to produce a drawdown of less than 10% of the saturated screened interval during purging.

During groundwater purging, water quality parameters, such as temperature, pH, electrical conductivity, DO, ORP, and turbidity, were monitored continuously in a flow-through cell with a calibrated water quality meter in accordance with OTIE SOP No. OTIE005A. Water levels and measurements of water quality parameters were recorded every three to five minutes until water quality parameters stabilized to within 10% following three consecutive measurements.

There are several water quality parameters that serve as indicators of dechlorinating conditions in groundwater. Conditions that are conducive of EISB are low DO, negative ORP, low concentrations of sulfate and/or increased concentrations of methane. The following observations were made regarding water quality parameters:

- DO concentrations ranged from 0.40 milligrams per liter (mg/L) in well CM-4D to 0.82 mg/L in well MW-38, with an average of 0.66 mg/L.

- Values of ORP ranged from -163 millivolts (mV) in well CM-4D to +182 mV in well CM-16 with an average of -12 mV.
- The pH values ranged from 7.84 in well CM-4D to 8.29 in well MW-38 with an average of 8.03 in the three wells.

Upon stabilization of water quality parameters, groundwater samples were collected following project-specific requirements and in accordance with OTIE SOP No. OTIE008F in pre-labeled, laboratory-provided sample vials or containers. Immediately following collection, the samples were placed on ice, maintained at 4 degrees Celsius (°C) ± 2°C and transported under appropriate chain-of-custody protocol to the California State-certified analytical laboratory, Calscience Environmental Laboratories, Inc. located in Garden Grove, California.

All analyses were conducted at a laboratory certified for such analyses by the State of California and NELAC and in accordance with current United States Environmental Protection Agency (U.S. EPA) procedures or as specified in the M&RP.

3.0 ANALYTICAL RESULTS

The following sections discuss the analytical results for the groundwater samples and quality assurance/quality control (QA/QC) samples.

3.1 REMEDIAL PROGRESS MONITORING WELLS

Groundwater samples were collected from three RPM wells for all analytes listed in M&RP No. CI-8947. The following concentrations were observed in the RPM wells for the month #9 sampling event, conducted on March 27, 2012:

- Concentrations of 1,1-DCE; 1-1,DCA; and TCE were not detected (less than 1.0 µg/L) in any of the three RPM wells.
- PCE concentrations were detected only in well MW-38 at 3.1 µg/L.
- cis-1,2-DCE and 1,2-DCA concentrations were detected only in well CM-4D at 1.9 µg/L and 0.57 µg/L, respectively.
- Vinyl chloride (VC) concentrations were detected only in well CM-4D at 3.6 µg/L.
- VFAs were only detected in well CM-4D with 11 mg/L of acetic acid.
- Methane concentrations have decreased slightly in well CM-4D since November 2011 (7,370 µg/L to 6,110 µg/L), but are still elevated compared to baseline results from May 2011 (134 µg/L). Methane was detected in well MW-38 at 8.36 µg/L during this event, but not in well CM-16.
- Ethene and ethane concentrations were not detected above the reporting limit in any of the three wells during the March 2012 sampling event.
- Levels of TDS have increased in March 2012 in well CM-4D to 1,160 mg/L from 683 mg/L in May 2011, likely due to the presence of substrate. TDS in other wells show no significant change.
- TOC levels ranged from 25 mg/L (well MW-38) to 120 mg/L (well CM-4D) in March 2012. All TOC concentrations are significantly higher than at baseline (1.1 mg/L to 1.8 mg/L).
- Nitrate concentrations were not detected in any of the wells in March 2012. Since baseline, sulfate concentrations have decreased from 100 mg/L to below the reporting limit of 1.0 mg/L in well CM-4D and show no significant change in wells CM-16 and MW-38. Ferrous iron has only been detected in well CM-4D and in March 2012 was found at a concentration of 5.77 mg/L.

Historical CVOCs for the RPM wells are presented in Graphs 2 through 4, respectively, and on Figure 4. Historical results for the EISB Phase VI RPM events are summarized in Table 4. Selected geochemical parameters for the Former Bldg 269 area wells are presented in Figure 5.

3.2 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC) REPORT

All groundwater samples were shipped under appropriate chain of custody protocol at the method-specified temperature limit (4°C ± 2°C). All sample analyses were completed within the prescribed holding time.

For the month #9 EISB Phase VI event, one field duplicate was collected. The duplicate groundwater sample labeled “DUP-3-27-12” was collected from well CM-4D. The purpose of a duplicate sample is to assess the accuracy and consistency of the sampling program. The

relative percent differences (RPDs) between positive detections for the primary and duplicate samples were within the specified range for the sampling program.

Laboratory QA/QC procedures were carried out in accordance with EPA method specifications and the data was accepted based on the QA/QC criteria established by the EPA. Laboratory QA/QC samples included method blanks, laboratory control samples (LCS), LCS duplicates (LCSD), and matrix spike samples (MS) and MS duplicate (MSD) samples.

All method blanks were free of contamination and all LCS/LCSD samples were within their respective control limits. The percent recoveries were out of range on the MS/MSD spike concentrations for barium, calcium, iron, manganese, and sodium in sample CM-4D. However, spike recovery and relative percent difference control limits do not apply when the parameter concentration in the primary sample exceeds the added spike concentration by a factor of four or greater. Therefore, the data was reported without further clarification.

Recovery of the MS and MSD compounds were out of control due to matrix interference for magnesium and boron in sample CM-4D. However, the associated LCS and LCSD were in control and, therefore, the sample data were reported without further clarification.

4.0 CONCLUSIONS

Three RPM wells were included in the month #9 EISB Phase VI monitoring program per M&RP No. CI-8947. The results for the month #9 EISB Phase VI event conducted in first quarter 2012 are summarized below:

- The month #9 gauging and sampling event was conducted on March 27, 2012.
- Static depth to groundwater measurements ranged from32.90 feet btoc in well MW-38 to 41.96 feet btoc in well CM-16 on March 27, 2012. The hydraulic gradient was not calculated.
- The month #9 sampling event indicated that CVOC concentrations from all wells were below their CAP goals and maximum contaminant levels (MCLs) for all VOCs, except for VC. Concentrations of VC in the CM-4D sample were 3.6 µg/L (California MCL is 0.5 µg/L). VC is a transient daughter-product of the biodegradation process.
- Geochemical parameters measured (DO, ORP, sulfate, and methane) have indicated that favorable conditions have been induced in the treatment area and continue to be conducive to EISB.

Based on the latest results, the EISB program is successfully remediating the groundwater underlying in the Bldg 269 area, as no CVOC concentrations exceed the CAP goals.

The next remedial progress report is due to the LARWQCB in August for the Second Quarter 2012 monitoring event summary.

If you have any questions, please call me at 805-585-6382.

Sincerely,

Jacques Marcillac, CHG, CEG
Project Manager
Oneida Total Integrated Enterprises, LLC

Notes:

1) EISB = enhanced *in situ* bioremediation; DO = dissolved oxygen; ORP= oxidation-reduction potential; µg/L = micrograms per liter; mg/L = milligrams per liter; mV = millivolts; oC = degrees Celsius; mS/cm = milliSiemens per centimeter
2) " < " = Analyte was not detected above the stated reporting limit; "J" - quantitative estimate
3) "--" = Not applicable or not analyzed for; NS = not sampled/collected due to presence of soybean oil in well, obstruction, or insufficient water
4) ▭ - Shaded in gray and **bolded** are concentrations exceeding their Corrective Action Plan goal. See Section 1.2 of report.

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-03-1830

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Statement of Results

The PCA was conducted by ATC in response to the authorization by Mr. Kevin Wenzel of Metropolitan Life Insurance Company, in general accordance with the signed ATC Proposal dated August 19, 2008, between the Client and ATC.

ATC Associates Inc. (ATC) has performed a Property Condition Assessment (PCA) of the property located at 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue in Los Angeles, California. The scope of the PCA was generally consistent with the ASTM E2018-01 "Standard Guide for Property Condition Assessments: Baseline Property Condition Assessment Process", MetLife Scope of Work for Property Condition Assessment, and ATC Proposal dated August 19, 2008.

This report is for the use and benefit of, and may be relied upon by Metropolitan Life Insurance Company as lender and New Tower Trust Company Multi Employer Property Trust as owner and any of their respective affiliates; and third parties authorized in writing by Metropolitan Life Insurance Company and ATC, including their respective successors and assigns. The scope-of-services performed in execution of this investigation may not be appropriate to satisfy the needs of other users, and any use or re-use of this document or its findings, conclusions, or recommendations is at the risk of the user. ATC is not responsible for conclusions, opinions, or recommendations made by others based on this information.

The Report speaks only as of its date in the absence of a specific written update of the Report signed and delivered by ATC Associates Inc.

The report was completed and reviewed by the undersigned team members.

Respectfully submitted on September 9, 2008.

1.0 Executive Summary

1.1 Property Description

ATC Associates Inc. (ATC) performed a Property Condition Assessment (PCA) of the Property located at 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue in Los Angeles, California, hereinafter known as the Property.
The Property is an office facility comprised of 11 buildings. The buildings at the Property are named/designated as follows: 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521, 8531 and the 22801 Buildings, by their numerical address. However, based on our scope of services and the instructions of the designated site contact, only 10 of the 11 buildings are included in this report. The 10 buildings included in ATC's scope of work are identified as the 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Buildings. The remaining building at the Property, 22801 Building and associated parking areas at the south side of the Property, were not included in ATC's scope of work.

The Property is situated on eight irregular-shaped land parcels and is considered to be of generally good quality construction. The Property is located to the northwest of the northwest corner of Fallbrook Avenue and Roscoe Boulevard. The street address of the Corporate Pointe at West Hills is 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue.

The three story 8401 Building is generally "T"-shaped. The 8401 Building contains one commercial office/lab tenant (Unilab Corporation) and a wireless provider (Pacific Bell Wireless, LLC) on the building roof. The building was reportedly originally constructed in 1959 with renovations in 1999 and 2005. Detailed information regarding the renovations was not provided but appears to be similar to other buildings and includes exterior renovations and possible seismic strengthening in 1999 and tenant improvement and roof replacement in 2005. The ground floor of the building is partially below grade at the west side of the building due to the topography of the site. Additionally, there is a service yard with offices, storage areas and a loading dock to the southeast of the 8401 Building that was reportedly constructed by the current tenant in 2005.

The one story 8403 Building is generally rectangular-shaped. The 8403 Building contains one lab tenant (Unilab Corporation). The building was reportedly originally constructed in 1984 with renovations in 1999 and 2005. Detailed information regarding the renovations was not provided but appears to consist of exterior renovations in 1999.

The two story 8407 Building is generally rectangular-shaped. The 8407 Building contains two commercial office tenants (Blue Cross of California and Centex Title & Ancillary Services) and one vacant space on the second floor totalling approximately 8,246 square feet. The building was reportedly originally constructed in 1986, with renovations in 1999. Detailed information regarding the renovation was not provided but appears to consist of exterior renovations. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

The one story 8411 Building is generally rectangular-shaped. The 8411 Building contains one food service tenant (Sodexo Marriott Services). The building was originally constructed in 1959, with renovations including reconstruction of the building and surrounding areas currently being performed and scheduled for completion by the end of 2008, although original date of substantial completion was scheduled no later than April 18, 2008 and final completion no later than May 18, 2008 according to the signed contract. Access to the building and surrounding areas was not available during ATC's site visit as the construction company was no longer present. Due to the current construction at the 8411 Building, a temporary leased cafe structure and bungalow is located between the 8415 and 8501 Buildings that is being utilized by the tenant.

The two story 8413 Building with full basement is generally rectangular-shaped and is contiguous to the east of the 8415 Building. The 8413 Building is currently vacant. The building features an auditorium. The building was reportedly originally constructed in 1986, with renovations in 1999. Detailed information regarding the renovation was not provided but appears to consist of exterior renovations.

The one story 8415 Building is generally square-shaped and is contiguousto the west of the 8413 Building. The 8415 Building contains the Property central plant. The building was reportedly originally constructed in 1959.

The three story 8501 Building is generally "T"-shaped. The 8501 Building contains two commercial office tenants (Countrywide Home Loans, Inc. and Software Dynamics, Inc.), one vacant space totalling approximately 17,177 square feet on the ground floor and a wireless provider (New Cingular Wireless PCS) on the building roof. The building was reportedly originally constructed in 1959, with renovations in 1998/1999. According to available information, the renovations included reconstruction of the exterior walls including installing metal studs set outside the exterior walls and finished with plaster and set in windows, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the west and northwest sides of the building due to the topography of the site.

The four story 8511 Building is irregular-shaped. The 8511 Building contains one primary tenant (Sterling Software) who has sub-leased portions of the building. The building was originally constructed in 2000. The building has a large balcony with canopy at the north side of the fourth floor, two small balconies on the third and fourth floors at the south side of the building, auditorium and employee cafe on the ground floor.

The three story 8521 Building is generally "T"-shaped. The 8521 Building contains two commercial office tenants (Countrywide Home Loans, Inc. and The Boeing Company) and three vacant spaces totalling approximately 16,906 square feet on the ground floor. The building was reportedly originally constructed in 1959, with renovations in 1998/1999. According to available information, the renovations included reconstruction of the exterior walls including installing metal studs set outside the exterior walls and finished with plaster and set in windows, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

The two story 8531 Building is generally rectangular-shaped. The 8531 Building contains one research and development (R&D) tenant (The Boeing Company). The building was reportedly originally constructed in 1979, with renovations in 1998/1999. According to available information, the renovations included the building exteriors, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

Parking for the Property is provided by asphalt pavement at grade and by a two-level parking garage. The balance of the Property consists primarily of paved parking areas, service/drive lanes, a guard shack at the east main entrance drive, pedestrian walkways, landscaping, water feature with flowing creeks and small lake and surrounding seating areas and a service yard adjacent to the 8401 Building for Unilab Corporation.

The site contact indicated that the following work was performed during the last five years: Waterproofed the 8401 and 8501 Buildings in 2005 ($325,000 for the 8501 Building); renovated the central plant including replacement of two of the central plant chillers, boilers, piping distribution and related equipment in 2004/2005; replaced the 8401 Building roof in 2005; installed oil coolers to the elevators in the 8511 Building in 2006 ($22,000); replaced the central plant boilers at the end of 2007 due to issues with the boilers installed in 2005; miscellaneous parking enhancements in 2006/2007; seal coated and striped the parking areas at the 8511, 8401 and 8403 Buildings in 2007; asphalt overlay at the central parking area at the east side of the 8407 Building in 2007; asphalt overlay of the parking areas at the 8531 Building in 2008; constructed the two-level parking garage at the east side of the Property in 2006/2007; utility submetering installation in 2006/2007 ($425,000); replaced the lower roof and repaired and installed a polyurethane foam coating at the upper roof of the 8415 Building in 2008 ($110,000); added two concrete pads, furniture and landscape to pond area in 2007/2008 ($95,000); renovated the boundary wall at the west side of the Property in 2007/2008 ($125,000); renovation of the 8411 Building in 2008 (not to exceed $5,994,024.00 according to signed contract but reportedly is totalling approximately $11,000,000) and current exterior sitework around the 8411 Building ($1,621,686). Additionally, Ms. Life reported that renovations to the 8413

Building including exterior facades, relocation of the south exit stairway to the north side, the addition of an entry on the south side, renovation of the north main entry, adding a fitness center at the basement and renovating the auditorium is scheduled to be performed in 2009. The site contact also reported that no fires, floods, storms, or other major incidents have damaged the Property.

Based on ATC's document reviews, interviews, and field observations, it is ATC's opinion that the subject Property has been well maintained and is in overall good condition. The average condition of the construction systems reviewed and recommendations for their repair is summarized in the Property Summary Table following section 1.1 of this report. The table presents a summary of the condition of site and building components and equipment observed, and costs associated with Immediate Needs and Physical Needs Over the Term. These conditions and recommendations are explained in more detail in Sections 3.3 through 4.0 of this report. A detailed discussion of opinions of cost, Immediate Needs and anticipated Physical Needs Over the Term is presented in Section 5.0, with tabulated opinions of cost presented in Appendix A.

It is ATC's professional opinion that the Estimated Useful Life (EUL) of the Property is approximately 50 years and the Effective Age (EA) of the Property is approximately 15 years. Therefore the Remaining Useful Life (RUL) of the Property is approximately 35 years.

Based on our field observations and using the damage prediction method developed by Thiel and Zsutty, in addition to ASTM E2026-07, and ground fault, seismicity and acceleration data from EQFAULT, EQSEARCH and FRISKSP software, the Scenario Expected Loss (SEL) for Corporate Pointe at West Hills in the Los Angeles, California ranges from 11 to 17 percent (for DBE 475-year event) and from 15 to 23 percent (for MCE 2,375-year event) and the Scenario Upper Loss (SUL) ranges from 15 to 20 percent (for DBE 475-year event) and from 20 to 27 percent (for MCE 2,375-year event) of the replacement cost of the buildings.

2.0 Introduction

2.1 Scope of Work

ATC has conducted a building and site observation survey at the Property. See the Statement of Results and Appendix H for additional Scope of Services considerations.

ATC visited the Property and observed its improvements, reviewed available construction and maintenance documents, and interviewed persons familiar with the Property. The purpose of these observations was to assess the Property's general physical condition and maintenance status, and to recommend repair and maintenance items that, in ATC's opinion, are significant for continuation of the Property's current operation and/or for it to be restored to a good condition consistent with comparable facilities of similar age.

ATC's scope of work included a "Tier I" assessment of ADA accessibility in general accordance with ASTM E2018-01 "Standard Guide for Property Condition Assessments: Baseline Property Condition Assessment Process". The scope included a limited visual review of the following components: path-of-travel, parking, ADA compliant guestrooms (hotel/hospitality facilities only), public toilet rooms, and elevators. No measurements were conducted. The goal of ATC's review of accessibility to disabled persons is to identify accessibility problems and to provide a guide for making the facility more usable for people with disabilities. Significant items of non-conformance with ADA guidelines observed by ATC are noted without regard as to whether or not they are, by ADA definition, "readily achievable". The decision as to which actions are to be undertaken as "readily achievable" is to be determined by building ownership in consultation with its accountants, attorneys and design/construction professionals.

The evaluation period considered for the Physical Needs Over the Term Spreadsheet is seven years.

2.2 Assessment Procedures

2.2.1 Visual Survey

During the site visit, ATC performed a visual survey of the Property to make a field assessment as described above. The weather was sunny and warm (90°) on the day of the site visit. ATC visually observed the Property systems including site, structure, building envelope, roofing, mechanical, electrical, plumbing, fire suppression and life safety. In addition, ATC reviewed accessible interior areas at the Property including vacant units, tenant spaces, mechanical rooms, storage spaces and office areas. The areas that were locked and not accessible during ATC's site visit included as the construction company was no longer on site included the 8411 Building of which is currently under renovations (reconstruction).

2.2.2 Interviews

During the site visit, ATC interviewed the designated site contact and Mr. William Blackwell, Certified Journeymen Engineer with Able Engineering who provided information regarding the Property. The designated site contact has been affiliated with the Property for approximately 3.5 years and Mr. Blackwell has been affilicated with the Property for approximatley 4.5 years, and therefore were able to provide only limited information about the Property. A copy of the pre-survey questionnaire for the Property was completed and is included in Appendix C of this report. ATC interviewed the following persons during the course of the project:

Personnel Interviewed

Name	Title	Phone Number
Ms. Lani Life	Real Estate Manager, CB Richard Ellis	(818) 737-1198
Mr. William Blackwell	Certified Journeymen Engineer, Able Engineering	(818) 737-1207
General Inquiry - August 20, 2008	Los Angeles Fire Department - Arson Investigation Unit	(213) 485-6095

2.2.3 Document Review

The scope of services included reviews of construction and maintenance documents (if made available to ATC at our office or at the Property). ATC briefly reviewed the following documents:

Documents Reviewed

Name and Description of Document	Author	Date
Preliminary Structural Building Evaluation of West Hills / Coast Federal Bank Building Complex	Brandow & Johnston Associates, Los Angeles, California	January 15, 1999
ALTA/ACSM Land Title Survey of West Hills Corporate Village	Hennon Surveying & Mapping, Inc., La Canada, California	December 1, 1999 updated January 3, 2001
Property Condition Assessment of West Hills Corporate Village (8501-8531 Fallbrook Avenue)	Marx/Okubo Associates, Ltd., Denver, Colorado	January 4, 2002
Self-Contained Appraisal Report of Corporate Pointe at West Hills (Asset 166)	Capright Property Advisors, LLC, Chicago, Illinois	March 31, 2008
Asset Summary for Corporate Pointe at West Hills (166)	Unknown	June 30, 2008
Pre-Survey Questionnaire	Ms. Lani Life, Real Estate Manager, CB Richard Ellis	August 19, 2008

3.0 System Descriptions, Observations and Recommendations

3.1 Current Property Improvements

The Property is an office facility comprised of 11 buildings. The buildings at the Property are named/designated as follows: 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521, 8531 and the 22801 Buildings, by their numerical address. However, based on our scope of services and the instructions of the designated site contact, only 10 of the 11 buildings are included in this report. The 10 buildings included in ATC's scope of work are identified as the 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Buildings. The remaining building at the Property, 22801 Building and associated parking areas at the south side of the Property, were not included in ATC's scope of work.

The Property is situated on eight irregular-shaped land parcels and is considered to be of generally good quality construction. The Property is located to the northwest of the northwest corner of Fallbrook Avenue and Roscoe Boulevard. The street address of the Corporate Pointe at West Hills is 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue.

The three story 8401 Building is generally "T"-shaped. The 8401 Building contains one commercial office/lab tenant (Unilab Corporation) and a wireless provider (Pacific Bell Wireless, LLC) on the building roof. The building was reportedly originally constructed in 1959 with renovations in 1999 and 2005. Detailed information regarding the renovations was not provided but appears to be similar to other buildings and includes exterior renovations and possible seismic strengthening in 1999 and tenant improvement and roof replacement in 2005. The ground floor of the building is partially below grade at the west side of the building due to the topography of the site. Additionally, there is a service yard with offices, storage areas and a loading dock to the southeast of the 8401 Building that was reportedly constructed by the current tenant in 2005.

The one story 8403 Building is generally rectangular-shaped. The 8403 Building contains one lab tenant (Unilab Corporation). The building was reportedly originally constructed in 1984 with renovations in 1999 and 2005. Detailed information regarding the renovations was not provided but appears to consist of exterior renovations in 1999.

The two story 8407 Building is generally rectangular-shaped. The 8407 Building contains two commercial office tenants (Blue Cross of California and Centex Title & Ancillary Services) and one vacant space on the second floor totalling approximately 8,246 square feet. The building was reportedly originally constructed in 1986, with renovations in 1999. Detailed information regarding the renovation was not provided but appears to consist of exterior renovations. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

The one story 8411 Building is generally rectangular-shaped. The 8411 Building contains one food service tenant (Sodexo Marriott Services). The building was originally constructed in 1959, with renovations including reconstruction of the building and surrounding areas currently being performed and scheduled for completion by the end of 2008, although original date of substantial completion was scheduled no later than April 18, 2008 and final completion no later than May 18, 2008 according to the signed contract. Access to the building and surrounding areas was not available during ATC's site visit as the construction company was no longer present. Due to the current construction at the 8411 Building, a temporary leased cafe structure and bungalow is located between the 8415 and 8501 Buildings that is being utilized by the tenant.

The two story 8413 Building with full basement is generally rectangular-shaped and is contiguous to the east of the 8415 Building. The 8413 Building is currently vacant. The building features an auditorium. The building was reportedly originally constructed in 1986, with renovations in 1999. Detailed information regarding the renovation was not provided but appears to consist of exterior renovations.

The one story 8415 Building is generally square-shaped and is contiguousto the west of the 8413 Building. The 8415 Building contains the Property central plant. The building was reportedly originally constructed in 1959.

The three story 8501 Building is generally "T"-shaped. The 8501 Building contains two commercial office tenants (Countrywide Home Loans, Inc. and Software Dynamics, Inc.), one vacant space totalling approximately 17,177 square feet on the ground floor and a wireless provider (New Cingular Wireless PCS) on the building roof. The building was reportedly originally constructed in 1959, with renovations in 1998/1999. According to available information, the renovations included reconstruction of the exterior walls including installing metal studs set outside the exterior walls and finished with plaster and set in windows, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the west and northwest sides of the building due to the topography of the site.

The four story 8511 Building is irregular-shaped. The 8511 Building contains one primary tenant (Sterling Software) who has sub-leased portions of the building. The building was originally constructed in 2000. The building has a large balcony with canopy at the north side of the fourth floor, two small balconies on the third and fourth floors at the south side of the building, auditorium and employee cafe on the ground floor.

The three story 8521 Building is generally "T"-shaped. The 8521 Building contains two commercial office tenants (Countrywide Home Loans, Inc. and The Boeing Company) and three vacant spaces totalling approximately 16,906 square feet on the ground floor. The building was reportedly originally constructed in 1959, with renovations in 1998/1999. According to available information, the renovations included reconstruction of the exterior walls including installing metal studs set outside the exterior walls and finished with plaster and set in windows, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

The two story 8531 Building is generally rectangular-shaped. The 8531 Building contains one research and development (R&D) tenant (The Boeing Company). The building was reportedly originally constructed in 1979, with renovations in 1998/1999. According to available information, the renovations included the building exteriors, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

Parking for the Property is provided by asphalt pavement at grade and by a two-level parking garage. The balance of the Property consists primarily of paved parking areas, service/drive lanes, a guard shack at the east main entrance drive, pedestrian walkways, landscaping, water feature with flowing creeks and small lake and surrounding seating areas and a service yard adjacent to the 8401 Building for Unilab Corporation.

The site contact indicated that the following work was performed during the last five years: Waterproofed the 8401 and 8501 Buildings in 2005 ($325,000 for the 8501 Building); renovated the central plant including replacement of two of the central plant chillers, boilers, piping distribution and related equipment in 2004/2005; replaced the 8401 Building roof in 2005; installed oil coolers to the elevators in the 8511 Building in 2006 ($22,000); replaced the central plant boilers at the end of 2007 due to issues with the boilers installed in 2005; miscellaneous parking enhancements in 2006/2007; seal coated and striped the parking areas at the 8511, 8401 and 8403 Buildings in 2007; asphalt overlay at the central parking area at the east side of the 8407 Building in 2007; asphalt overlay of the parking areas at the 8531 Building in 2008; constructed the two-level parking garage at the east side of the Property in 2006/2007; utility submetering installation in 2006/2007 ($425,000); replaced the lower roof and repaired and installed a polyurethane foam coating at the upper roof of the 8415 Building in 2008 ($110,000); added two concrete pads, furniture and landscape to pond area in 2007/2008 ($95,000); renovated the boundary wall at the west side of the Property in 2007/2008 ($125,000); renovation of the 8411 Building in 2008 (not to exceed $5,994,024.00 according to signed contract but reportedly is totalling approximately $11,000,000) and current exterior sitework around the 8411 Building ($1,621,686). Additionally, Ms. Life reported that renovations to the 8413 Building including exterior facades, relocation of the south exit stairway to the north side, the addition of an entry on the south side, renovation of the north main entry, adding a fitness center at the basement and renovating the auditorium is scheduled to be performed in 2009. The site contact also reported that no fires, floods, storms, or other major incidents have damaged the Property.

Building Name	8401 Building
Number of Floors	3
Number of Units	4
Number of Basement Levels	0
Year Built:	1959
Building Special Features	None
Amenities	Service yard constructed by current tenant
Gross Floor Area	160,740
Net Leasable Area	160,740
Structure	Reinforced concrete
Exterior Walls	EIFS
Roof	Built-up
Foundation	Concrete slab-on-Grade
HVAC	Central Plant, Chiller, Cooling tower, Boiler, AHU, VAV
Electrical	Other
Vertical Transportation	Hydraulic elevator
Construction Quality	Good

Building Name	8403 Building

HVAC	Central Plant, Chiller, AHU, VAV
Electrical	Other
Vertical Transportation	Hydraulic elevator
Construction Quality	Good

3.2 General Condition and Remaining Useful Life of the Property

Based on ATC's document reviews, interviews, and field observations, it is ATC's opinion that the subject Property has been well maintained and is in overall good condition. The average condition of the construction systems reviewed and recommendations for their repair is summarized in the Property Summary Table following section 1.1 of this report. The table presents a summary of the condition of site and building components and equipment observed, and costs associated with Immediate Needs and Physical Needs Over the Term. These conditions and recommendations are explained in more detail in Sections 3.3 through 4.0 of this report. A detailed discussion of opinions of cost, Immediate Needs and anticipated Physical Needs Over the Term is presented in Section 5.0, with tabulated opinions of cost presented in Appendix A.

It is ATC's professional opinion that the Estimated Useful Life (EUL) of the Property is approximately 50 years and the Effective Age (EA) of the Property is approximately 15 years. Therefore the Remaining Useful Life (RUL) of the Property is approximately 35 years.

This RUL is based on the observed physical condition of the Property at the time of ATC's Property visit and is subject to possible effects of concealed conditions or the occurrence of extraordinary events, such as natural disasters or other "acts of God", which may occur subsequent to the date of the on-site visit. The RUL is further based on the assumption that the immediate repairs, long term and replacement repairs that are provided as capital reserves are completed in a timely and professional manner, and appropriate routine maintenance and replacement items are performed on an as needed basis.

3.3 Site Conditions

3.3.1 Topography

Observations: The Property slopes moderately down from the north to the south across the Property as the site is located near the base of a hillside. No abnormal features such as ground fractures, settlement areas, or areas of unintended ponding water were identified.

Recommendations: Based on the observed condition of the topography, only routine maintenance will be required during the evaluation period; no other action is currently recommended.

No immediate or short term needs were identified.

3.3.2 Storm Water Drainage

Observations: Water is drained from the roofing surfaces directly into the municipal sewer system via internal drains and piping. The pavement and open areas slope slightly away from each building with the exception of the north side of the 8413 Building where a concrete swale and catch basin has been added to mitigate water intrusion into the basement. Water runs off the Property by way of sheet flow to curbs and gutters, concrete swales and area catch basins located in the pavement and landscaped areas. The storm water is directed into the municipal sewer system.

No evidence of erosion or chronically standing water that would require correction was noted. Overall, Property drainage appeared to be good and the drainage infrastructure components appeared to be in good condition. No drainage deficiencies were reported to ATC, and no significant deficiencies were observed. Sand bags were observed adjacent to the stairs and curbing between the 8413 and 8501 Buildings at the east that were reportedly installed due to a soil erosion issue that has been mitigated by adding grass turf to the hillside. In general, storm water collection system components can be expected to provide 50 or more years of useful life.

Recommendations: It is recommended that the sand bags between the 8413 and 8501 Buildings at the east be removed during the course of routine maintenance operations. Based on the observed condition of the storm water drainage systems, only routine maintenance will be required during the evaluation period; no other action is currently recommended.

No immediate or short term needs were identified.

3.3.3 Site Access and Egress

Observations: There are four vehicular entrances to the Property of which one is located on the south side along Roscoe Boulevard and three are located on the east side along Fallbrook Avenue. The entrance drives are constructed with asphalt pavement, and were observed to be in good condition with no significant deficiencies. The entrance drives appeared to be adequate in terms of location and accessibility.

Recommendations: Based on the observed condition of the site access and egress elements, only routine maintenance will be required during the evaluation period; no other action is currently recommended.

No immediate or short term needs were identified.

3.3.4 Paving, Curbing and Parking

Observations: Parking space is provided by asphalt pavement at grade throughout the Property . The site contact reported that the pavement adjacent to the 8511, 8401 and 8403 Buildings was seal coated and striped in 2007, that the central parking asphalt pavement to the east of the 8407 Building was overlaid in 2007 and the asphalt pavement adjacent to the 8531 Building was overlaid in 2008. The site contact did not know when the remaining pavement areas were last sealcoated and restriped. The asphalt pavement and striping appeared to be generally in good to fair condition with localized medium to high severity alligator and linear cracking primarily observed at the west side of the 8407 Building, east side of the 8403 Building and northeast side of the 8413 Building. In general, asphalt pavement can be expected to provide approximately 25 years of useful life, with sealcoating and restriping of the pavement conducted every five years.

Additionally, an asphalt paved helipad and walkway was observed between the 8403 and 8407 Buildings. The asphalt pavement appeared to be in good to fair condition with deterioration observed at the perimeter and large linear cracks observed.

The Property is also improved with a two-level concrete parking structure at the northeast side of the Property.
The site contact reported that the concrete pavement was striped and upper deck was coated at the time of construction (2007). The concrete pavement appeared to be generally in good condition with no significant cracking or surface deterioration observed. The parking space markings and deck coating appeared to be in good condition with striping and curb markings clearly visible throughout. In general, concrete pavement can be expected to provide approximately 30 years of useful life, with re-striping of the parking spaces conducted every five years.

The paved areas are bordered primarily by cast-in-place concrete curbing with integral gutters and precast concrete bumpers with formed asphalt curbing observed at the west side of the Property. The curbing appeared to be in good condition throughout the parking area with the exception of cracked and localized heaved sections of asphalt curbing at the west side of the Property.

Parking for a reported total of 3,648 vehicles is provided throughout the Property and includes 2,591 surface parking spaces and 1,057 parking spaces at the parking structure. The existing parking design and number of parking spaces appeared and was reported to be generally sufficient for the current activities of the Property.

Recommendations: Based on the condition and EUL of the asphalt pavement, ATC recommends that the asphalt pavement be scheduled for repairs, sealcoat and restriping during the term.

The concrete pavement can be expected to last through the term, and funds to restripe the parking spaces and the re-application of the upper deck waterproof coating have been allocated over the term.

Based on the observed condition of the curbing, replacement of the asphalt curbing at the west side of the Property will be required over the term. Based on the observed condition of the remaining curbing, the curbing will require only routine maintenance during the evaluation period; no other action is currently recommended.

The existing parking design and number of parking spaces appeared and was reported to be generally sufficient for the current activities of the Property; no other action is currently recommended.

No short term needs were identified.

3.3.5 Loading Areas, Docks and Flatwork

Observations: The Property contains one loading dock space and drive-up ramp in one loading dock area situated at the east side of the 8415 Building. The dock area is constructed of asphalt pavement. The asphalt pavement appeared to be generally in good to fair condition. The loading dock at the 8415 Building features rubber bumpers. No dock levelers were observed. The dock has a metal roof canopy that was in good condition. No trip hazards or other areas of damage were observed.

The service yard at the 8401 Building contains four loading dock spaces in one loading dock area situated at the southeast side of the 8401 Building. The dock area is constructed of cast-in-place concrete pavement. The concrete pavement appeared to be generally in good condition with no significant cracking or surface deterioration observed. The loading dock at the service yard features hydraulic dock levelers and

rubber bumpers. A total of four dock levelers were observed by ATC and each was reported and appeared to be in good condition. It was reported that Unilab Corporation is responsible for all repairs and maintenance at the service yard. The dock has an intergrated metal roof canopy with the service yard structure that was in good condition. No trip hazards or other areas of damage were observed.

Concrete pedestrian walks provide access to the Property. The pedestrian walks appeared to be generally in good condition with localized areas of linear cracking observed. A localized trip hazard was observed at the northwest corner of the 8403 Building that appeared to be due to cracking and settleling of a concrete sidewalk section.

Dumpsters are located in masonry enclosures adjacent to some of the buildings at the Property. Dumpster enclosures are described in Section 3.3.6. The dumpsters are placed directly on concrete pads that appeared to be in good condition. No trip hazards or other areas of damage were observed.

Recommendations: Based on the observed condition, the loading docks can be expected to last through the evaluation period with routine maintenance; no other action is currently recommended.

Based on the observed condition, the pedestrian walks and flatwork can be expected to last through the evaluation period with routine maintenance. It is recommended that the cracked and settled sidewalk section at the northwest corner of the 8403 Building causing a trip hazard be removed and replaced as an immediate need.

Based on the observed condition, dumpster pads can be expected to last through the evaluation period with routine maintenance; no other action is currently recommended.

No short term needs were identified.

3.3.6 Landscaping and Appurtenances

Observations: The landscaping consists primarily of ground cover, grass turf, shrubs, flowers and trees. The Property has an irrigation system that services the landscaped areas. While the irrigation system was not observed in operation, no significant deficiencies were observed or reported. The landscaping components appeared to be generally in good condition with no significant deficiencies.

The Property is identified and advertised from the adjacent thoroughfares by a concrete with sandstone finish monument sign at the east side of the Property that is located adjacent to the main entrance. Informational and directional signage was observed at landscaped areas throughout. Additional informational signage is affixed to each building. The Property and building signage is in good condition with no significant deficiencies.

Exterior lighting consists of building- and pole-mounted high intensity discharge fixtures with ceiling-mounted flourescent fixtures at the ground level of the parking structure that appeared to be in good condition. Since the survey was conducted during daylight hours, Property lighting levels could not be accurately assessed; however, the lighting layout appears to provide adequate coverage and the site contact reported no deficiencies.

Painted concrete and CMU retaining walls varying in height were observed throughout the Property. A painted CMU with stucco finish and light fixtures boundary wall approximately five feet in height was observed along the northern portion of the west Property line. Chain link boundary fencing was observed along the north side of the Property. The substation at the east side of the 8415 Building was observed to be

enclosed by high chain link fencing. Additionally, chain link fencing enclosures were observed at the north side of the Property. Dumpster enclosures at the Property are primarily constructed of painted CMU walls approximately six feet in height. The walls and fencing appeared to be in good condition, with no significant deficiencies. However, localized missing CMU coping caps were observed at the dumpster enclosure at the north side of the 8531 Building.

There is an exterior water feature between the 8501, 8511 and 8521 Buildings at the north side of the Property that features two flowing creeks with wood framed bridges and small lake. The water feature is surrounded by pedestrian walkways and seating areas on concrete pads.

Recommendations: Repair and replacement of landscaping components is considered to be a part of routine maintenance; no action is required.

Based on the observed conditions, the signage can be expected to last through the evaluation period with only routine maintenance, such as repair and repainting; no other action is currently recommended.

The exterior light fixtures can be expected to last through the term with periodic repairs and replacement as part of routine maintenance, no other action is currently recommended.

It is recommended that the localized missing CMU coping caps at the dumpster enclosure at the north side of the 8531 Building be replaced as part of routine maintenance. The walls and fencing can be expected to last through the term with periodic repairs and painting as part of routine maintenance, no other action is currently recommended.

Based on the observed condition, the water feature and surrounding seating areas can be expected to last through the term with periodic repairs as part of routine maintenance, no other action is currently recommended.

No immediate or short term needs were identified.

3.4 Site Amenities

Observations: No recreational amenities were observed at the Property.

Recommendations: Not applicable.

3.5 Utilities

Observations: The site contact provided ATC with information regarding the utilities at the Property. Los Angeles Department of Water and Power (LADWP) provides domestic drinking water to the Property. The site contact did not know what type of material (i.e., PVC, cast iron, ductile iron, etc.) was used for construction of the water mains and laterals. LADWP supplies electricity to the Property from two separate stations. The Gas Company supplies natural gas to the Property. LADWP provides sanitary and storm sewer collection service to the Property. Tenants are individually metered for electric services. There are no special utility systems on the Property.

In general, main utility lines can be expected to provide 50 or more years of useful life, depending on the type and quality of materials and workmanship of the installation. The site contact reported that there have been no problems associated with the utilities at the subject Property.

Recommendations: Based on observations, utilities at the Property can be expected to last through the evaluation period with only routine maintenance; no other action is currently recommended.

No immediate or short term needs were identified.

3.6 Structural Frame and Building Envelope

Within the authorized scope of this evaluation, definitive determination of the structural systems was not possible because ATC was able to make only limited observations due to lack of physical accessibility, no destructive testing was performed and ATC did not have the opportunity to review a complete set of as-built structural drawings. Our non-invasive surface observations, review of available construction documentation and our experience with buildings of similar type and age indicate the following construction:

3.6.1 Foundation

Observations: The building foundation systems were not observed and a complete set of as-built structural drawings were not available.

No crawl spaces cellars were reported or observed. The 8413 Building features a full basement and the ground floor of the 8401, 8407, 8501, 8521 and 8531 Buildings are partially below grade on one side of the building due to the topography of the Property.

The ATC representative observed no improper alignment, cracking or other indications that the foundation systems are in less than adequate condition.

Recommendations: Based on observations, the foundation systems at the Property can be expected to last through the evaluation period with only routine maintenance; no other action is currently recommended.

No immediate or short term needs were identified.

3.6.2 Building Frame

Observations: The 8401, 8501 and 8521 Buildings frame consist primarily of perimeter and interior concrete columns supporting the upper level and roofing systems. The upper level and roof framing systems consists of two-way waffle slabs. According to available documentation, the buildings also feature reinforced concrete shear walls distributed throughout the buildings.

The 8403 Building frame consists primarily of a pre-engineered steel frame structure with CMU perimeter walls and steel columns supporting the roof framing system. The roof framing system consists of structural steel beams and light-gauge steel joists supporting the roofing system with vinyl-backed insulation below.

The 8407 and 8413 Buildings frame consist primarily of CMU walls with interior pilaster and interior steel columns supporting the upper level and a pre-engineered rigid steel frame structure with steel columns supporting the roof framing system. The upper level framing system consists of structural steel beams and open web steel joists supporting fluted metal decking with concrete topping. The roof framing system consists of structural steel beams and light-gauge steel purlins supporting the roofing system with vinyl-backed insulation below.

The 8415 Building frame consists primarily of concrete tilt-up wall panels with interior pilasters supporting the roof framing system. The roof framing system consists of structural open web steel trusses and beams supporting steel decking with concrete topping.

The 8511 Building frame consists primarily of a steel moment frame structure with steel columns supporting the upper level and roof framing systems. The upper level and roof framing systems consist of structural steel girders and beams supporting fluted metal decking with concrete topping.

The 8531 Building frame consists primarily of reinforced poured-in-place concrete walls and interior columns supporting the upper level and roof framing systems. The upper level and roof framing systems consist of poured-in-place pan-joist slabs. According to available documentation, the building also features reinforced concrete shear walls distributed throughout the building.

The ATC representative observed no improper alignment, cracking or other indications that the framing systems are in less than good condition. Efflorescence indicative of water intrusion was observed at the north side of the 8413 Building basement; however, a concrete swale and catch basin was installed at the north side of the building to mitigate the water intrusion issue as previously discussed in Section 3.3.2 of this report. The structural systems appeared to be in generally good condition and well maintained from a structural perspective, with no significant areas of distress observed. In general, structural systems can be expected to provide 50 or more years of useful life.

According to available documentation, the 8401 Building underwent seismic repairs and strenghtening after the 1994 Northridge earthquake that caused moderate to large diagonal shear cracks in all concrete shear walls, spalling of concrete at door openings, at jambs and corners, at pilaster bases and cracks in slab and waffle slab joists. Concrete cracks in walls, slabs and joists, which resulted from the Northridge earthquake, were repaired by epoxy injection. The building was strenghtened by the addition of new concrete shear walls adjacent to existing shear walls at the first and second floor levels. Concrete column capacities were increased at ends of shear wall by the addition of reinforcement and concrete incasement. Repair work and strengthening work was performed in compliance with the 1992 Los Angeles City Building Code and 1991 UBC.

According to available documentation, the 8407 Building underwent seismic repairs after the Northridge earthquake that consisted of repairing CMU wall cracks by epoxy injection and repairing spalled and cracked pilasters at beam and pilaster connections by epoxy injection and grouting. Repair work was performed in compliance with the 1992 Los Angeles City Building Code and 1991 UBC.

According to available documentation, the 8415 Building underwent seismic repairs after the Northridge earthquake that resulted in wall cracks, concrete spalls at the end intersections where the interior wall meets the exterior north and south walls. The earthquake damages were repaired by epoxy injection and grouting. Additionally, the structure was strengthened by replacing existing machine bolts with high strength bolts at horizontal diagonal lateral bracing connections, supplemental steel channel members were added to all the roof level chord continuity.

According to available documentation, a seismic retrofit was reportedly performed in 1999 at the 8501, 8521 and 8531 Buildings and included adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The seismic upgrade reportedly enabled each building to comply with the 1994 Uniform Building Code (UBC).

Recommendations: Based on observations, the building frame systems at the Property can be expected to last through the evaluation period with only routine maintenance; no other action is currently recommended.

No immediate or short term needs were identified.

3.6.3 Carports and Garages

Observations: The two-level parking structure at the east side of the Property is of a monolithic reinforced poured-in-place concrete structure with reinforced concrete slab-on grade and concrete columns supporting the upper deck. The upper deck consists of reinforced concrete girders and beams supporting a concrete slab. The parking structure features an expansion joint near the center of the structure with double columns and beams. The perimeter of the parking structure is enclosed by unpainted CMU walls. The ATC representative observed no improper alignment, cracking or other indications that the garages are in less than good condition. However, efflorescence was observed on both the exterior and interior faces of the CMU walls. This is indicative of moisture penetration into the wall core, causing the lime to leach out of the mortar or block itself. This process will continue unless the surfaces are sealed with a clear, spray applied masonry sealer.

Recommendations: Based on observations, the parking structure at the Property can be expected to last through the evaluation period with only routine maintenance. However, it is recommended that the CMU walls exhibiting efflorescence be pressure washed and a clear masonry sealer be applied at the CMU walls during the term.

For the parking structure, as a part of routine maintenance, a yearly preventive maintenance program should be implemented and include inspection for signs of distress (cracks), appropriate waterproofing, and joint integrity, as well as inspection for precursory and/or actual signs of concrete deterioration such as crack leaking, efflorescence, corrosion, and or spalling.

No immediate or short term needs were identified.

3.6.4 Exterior Finishes

Observations: The exterior walls consist of painted EIFS with sandstone tile wainscoting at the 8401 and 8403 Buildings, painted stucco with sandstone wainscoting at the 8407 Building, painted smooth plaster with granite panel wainscoting at the 8501, 8511, 8521 and 8531 Buildings, painted stucco at the 8413 Building and painted precast concrete tilt-up wall panels at the 8415 Building. Although the 8411 Building was not accessible, the exterior walls appear to consist of painted EIFS or stucco with stone wainscoting. The walls appeared to be generally in good condition with the exception of linear cracking observed throughout the base of the 8413 Building and an opened stucco section at the north side of the building. Also, localized linear cracking was observed at the 8407 Building. According to Ms. Life, the 8413 Building is scheduled for renovations in 2009 and the 8407 Building is scheduled for crack repairs and elastomeric painting ($200,000 per management) in 2009 as well.

The site contact reported that the 8401 and 8501 Buildings exteriors were painted in 2005/2006. The site contact did not know when the exterior of the remaining buildings were last painted. As the site contact was unaware of the last time the buildings were painted and she has been associated with the Property for approximately four years, it appears that the exteriors of the 8403, 8407, 8413, 8521 and 8531 Buildings were painted during the renovations performed in 1998/1999. The

exteriors of the 8511 Building appear to have been painted at the time of construction in 2000 and the exteriors of the 8411 Building appear to have been recently painted in 2008. The age of the exterior paint at the 8415 Building is unkown. In general, exterior painting can be expected to provide approximately eight years of useful life. The exterior paint appeared to be generally in good condition with the exception of localized peeling paint and staining observed at the 8431 Building. Ms. Lani provided two "Request for Services" from Duggan and Associates for painting and crack repairs dated July 15, 2008 and August 22, 2008, respectively. The requests total $33,010 and a copy of each is included in Appendix C of this report.

Recommendations: It was reported that the linear cracking at the 8407 Building is not currently causing leaking to occur at the building. Due to the condition and projected budget for the 8407 Building exteriors, crack repairs and elastomeric painting is recommended during year one of the term.

Due to the extensive stucco cracks and opening at the north side of the 8413 Building, it is recommended that the damaged stucco areas be replaced as a short term repair need with exterior painting to follow in year one of the term.

Based on the condition and EUL of the exterior paint, ATC recommends that the majority of the buildings' exteriors be scheduled for repainting during the term. Crack sealing and exterior painting of the 8531 Building is recommended a short term repair need.

3.6.5 Stairs, Steps and Balconies

Observations: A total of four sets of interior stairs were observed at the 8401, 8501 and 8521 Buildings, a total of two sets of interior stairs were observed at the 8407, 8511 and 8531 Buildings and a total of three sets of interior stairs were observed at the 8413 Building. The stairs are primarily metal pan construction with concrete-filled treads and landings with metal railings and of steel-framing with closed risers at the 8511 Building. The interior stairs appeared to be generally in good condition.

Several sets of exterior stairs and steps to building entrances and at elevation changes were observed at the Property. The stairs and steps are cast in place concrete with metal railings. Additionally, the parking structure has five dedicated stairways of metal pan construction with concrete-filled treads and landings with metal railings. The exterior stairs appeared to be generally in good condition.

Recommendations: The interior stairs can be expected to last through the term with periodic repairs as part of routine maintenance; no other action is currently recommended.

The exterior stairs can be expected to last through the term with periodic repairs as part of routine maintenance; no further action is required.

No immediate or short term needs were identified.

3.6.6 Exterior Doors

Observations: The main entrance to each building primarily consists of commercial grade all glass doors with top and bottom rails with a few buildings featuring aluminum doors with full glass panels set in metal frames. Metal overhead roll-up doors are located in the loading dock area of the 8415 Building and one observed at the southwest side of the 8407 Building. Auxiliary and emergency exit doors are constructed of aluminum doors with full glass panels set in metal frames with painted metal doors set in metal frames observed at the mechanical areas. The doors throughout the Property were

observed to be in good condition with no significant deficiencies noted. The locking and other hardware components of the doors appeared to be in good condition. In general, the entrance and service doors can be expected to provide 25 to 30 years of useful life.

Recommendations: The doors can be expected to last through the term with periodic repairs and repainting as part of routine maintenance; no other action is currently recommended.

ATC recommends that the repainting of the metal exterior doors be conducted at the time of the repainting of the buildings exterior.

No immediate or short term needs were identified.

3.6.7 Exterior Windows

Observations: Windows at the Property consist of anodized or painted aluminum storefront systems, ribbon windows and single fixed single-pane tinted glass in aluminum. Double-pane insulated windows were observed at the 8407 and 8413 Buildings. The windows throughout the Property were observed to be in good condition with no significant deficiencies noted or reported.

Caulking around the windows, caulking between exterior frames, and glazing gaskets appeared to be in good condition where observed. However, Ms. Lani has reported past window leaks at the buildings that are repaired at the time of each occurance.

Recommendations: The windows can be expected to last through the term with periodic repairs and caulking replacement as part of routine maintenance. However, due to the past window leaks, a window caulking and glazing gasket replacement allowance is recommended during the term.

No immediate or short term needs were identified.

3.6.8 Roofing Systems

Observations: The roofing systems at the 8401, 8501, 8521 and 8531 Buildings consist of a built-up roof (BUR) with gravel surfacing. The roofing systems at the lower roof of the 8415 Building and the 8511 Building consist of a BUR with mineralized cap sheet surfacing. The roofing system at the upper roof of the 8415 Building consists of a polyurethane foam roof applied over the existing roof. The building roof systems at the 8403, 8407 and 8413 Building consist of metal standing seam panels. The roofing system at the 8411 Building appears to consist of a single ply adhered Polyvinyl Chloride (PVC) membrane. The type and quality of installation of underlying components of the roof membrane could not be determined without intrusive investigation and testing. Therefore, the base sheet, the number of inter-ply(s), thickness and pliability of asphalt bitumen inter-moppings, and the base sheet fastening system could not be verified. Roof access is provided by an external building-mounted ladder or penthouse door.

The site contact reported that there are no active roof leaks at the Property. It was reported that the roofs at the 8403, 8407 and 8413 Buildings were installed at the time of original construction (1984 and 1986), at the 8501, 8521 and 8531 Buildings were installed in 1999, at the 8511 Building was installed at the time of original construction (2000), at the 8401 Building in 2005 and at the 8411 and 8415 Buildings in 2008. According to the site contact, there are no active roof warranties for the majority of the buildings at the Property. According to available documentation and the site contact, the 8511 Building has a 15-year roof warranty for the roofing at the

building; however, no documentation was provided for review. It was reported that the 8411 Building roof will have a roof warranty when the building renovation is complete but the term length is unknown.

The roofs are low-slope and primarily pitched to internal primary and secondary drains with a gutter system and internal drains at the 8403, 8407 and 8413 Buildings and internal primary and overflow scuppers at the lower roof of the 8415 Building. The slope and drainage design of the roof appeared to be generally adequate. ATC observed several areas of leaves on the roofing gutter system of the 8403 Building. Roof-mounted HVAC units primarily supported by raised platforms with metal flashing is present. The 8401, 8403, 8411, 8501 and 8521 Buildings feature metal framed mechanical equipment vision screens. Other penetrations observed included plumbing vents and electrical power and control conduit lines. Felt base flashing, roof field material base flashing, galvanized sheet metal counter flashing, aluminum counter flashing, mastic and caulking are used at roofing termination and penetration locations and appeared to be adequately sealed and flashed.

The parapet walls are projections of the exterior walls. A continuous parapet ranging in height from approximately two to six feet delineates the perimeter of each roof. The interior surface of the parapet walls consists primarily of mineralized cap sheet with mechanically fastened metal counterflashing terminating at EIFS coping, mineralized cap sheet terminated at metal coping, metal panel siding with EIFS coping and painted stucco with base felt flashing and mechanically fastened metal counterflashing terminating at metal coping . The joints between metal coping sections were observed to be in good to fair condition. The metal coping at the 8501 Building was observed to be in fair condition with peeling paint and coping joints in need of caulking.

No skylights were observed at the Property. No attics were observed at the Property. No fire retardant treated (FRT) plywood was observed or reported at the Property.

The roof membranes appeared to be in good condition with no significant deficiencies observed. However, cracking and deterioration of the parapet flashing was observed throughout the perimeter of the 8511 Building roof. In general, BUR systems can be expected to provide approximately 20 years of useful life and metal systems can be expected to provide approximately 40 years of useful life.

Recommendations: Based on the condition of the metal coping at the 8501 Building, it is recommended that the metal coping be prepped and painted and coping joints be caulked as an immediate repair.

The observed areas of leaves at the 8403 Building should be cleaned during the course of normal maintenance operations.

Due to the current condition of the parapet flashing at the 8511 Building, it is recommended that the deteriorated flashing be replaced as an immediate repair. As the 8511 Building roof currently features a roof warranty, no costs have been associated with this recommendation.

Based on the condition and age of the roofing at each building, ATC anticipates that the roofing can be expected to last through the term with repairs as part of routine maintenance; no other action is currently recommended.

No short term needs were identified.

3.7 Plumbing Systems

3.7.1 Supply and Waste Piping

Observations: ATC observed and the site contact reported that the interior water supply lines are copper and waste lines are cast iron. No polybutylene piping was reported at the Property or observed by ATC within the limited areas of accessible plumbing. (Note that since destructive testing was not within the scope of services of this project, ATC was not able to visually evaluate if polybutylene piping exists within the concealed areas, walls or underground as supply piping.)

The site contact reported that the Property has not experienced abnormal plumbing problems with the exception of a drip leak which has ceased leaking on the first floor at the southeast side of the 8531 Building. Mr. Blarckwell reported that an approximate four fout section of copper piping has to be replaced in the building. ATC observed no items indicating that the plumbing systems are in less than good condition. In general, plumbing lines can be expected to provide 50 or more years of useful life, depending on the type and quality of materials and workmanship of the installation.

Recommendations: Based on the limited nature of work, replacement of the deficient pipe section at the 8531 Building is recommended as part of routine maintenance. The piping can be expected to last through the term with periodic repairs as part of routine maintenance; no other action is currently recommended.

No immediate or short term needs were identified.

3.7.2 Domestic Hot Water Production

Observations: Domestic hot water for the restrooms at the 8401 Building is provided by one natural gas water heater manufactured by A.O. Smith located on the third floor with a tank capacity of 81 gallons. Domestic hot water for the restrooms at the 8403 Building is provided by one electric water heater manufactured by A.O. Smith located in the mechanical room with a tank capacity of 30 gallons. Domestic hot water for the restrooms at the 8407 Building is provided by one natural gas water heater manufactured by American located on the second floor with a tank capacity of 50 gallons. Domestic hot water for the restrooms at the 8413 Building is provided by one electric water heater manufactured by Reliance located on the second floor with a tank capacity of 55 gallons. Domestic hot water for the restrooms at the 8501 Building is provided by one natural gas water heater manufactured by Universal located on the third floor with a tank capacity of 75 gallons. Domestic hot water for the restrooms at the 8511 Building is provided by four electric water heater manufactured by A.O. Smith with one located on each floor and tank capacities of 30 gallons. The 8511 Building also has a Raypak natural gas boiler with a 327 gallon hot water storage tank located on the building roof for the showers and cafe on the first floor. Domestic hot water for the restrooms at the 8521 Building is provided by one natural gas water heater manufactured by A.O. Smith located on the third floor with a tank capacity of 109 gallons. Domestic hot water for the restrooms at the 8531 Building is provided by one electric water heater manufactured by A.O. Smith located on the ground floor with a tank capacity of six gallons and one natural gas water heater manufactured by American located on the second floor with a tank capacity of 75 gallons. Additionally, supplemental water heaters and instantaneous tankless under sink water heaters are present at tenant spaces.

The water heaters observed appeared to be generally in good condition. Seismic straps were installed on the water heaters observed by ATC. However, the California Building Code states that properties subject to seismic activity requires a minimum of two sets of seismic straps securing water heaters. The water heaters observed at the

8407 and 8413 Buildings only had one seismic strap securing the water heaters. In general, water heaters and boilers can be expected to provide approximately 15 and 25 years of useful life, respectively. The water heaters varied in age and approximately three years old at the 8401, 8403 Buildings, two years old at the 8407 Building, one year old at the 8413 Building, eight years old at the 8501 Building, one and eight years old at the 8511 Building, 10 years old at the 8521 Building, and two and nine years old at the 8531 Building. The boiler at the 8511 Building was reported to be installed in 2000.

Recommendations: Based on the limited nature of work, installation of an additional seismic strap at the water heaters in the 8407 and 8413 Buildings is recommended as part of routine maintenance.

The majority of the water heaters and boiler can be expected to last through the term with periodic repairs and replacement performed as part of routine maintenance. It was reported that the maintenance and replacement of the water heaters serving the restrooms is the responsibility of the Property; therefore, funds have been allocated for replacement of the majority of the water heaters in the 8511 Building and the water heaters in the 8501 and 8521 Buildings over the term.

It was reported that the maintenance and replacement of the water heaters within tenant spaces and boiler at the 8511 Building is the responsibility of the individual tenants; therefore no funds have been allocated for replacement over the term.

No immediate or short term needs were identified.

3.7.3 Fixtures

Observations: The restroom fixtures and faucets in each building observed by ATC were in good condition and no evidence of inadequate venting or water pressure was noted. Tempered water response time at fixtures and faucets in each building was also adequate. In general, fixtures and faucets can be expected to provide 15 to 20 years of useful life.

Recommendations: Repair and replacement of the fixtures and faucets is considered to be a part of routine maintenance over the term; no other action is currently recommended.

No immediate or short term needs were identified.

3.8 HVAC Systems

3.8.1 Equipment

Observations: There is a central plant at the 8415 Building consisting of chillers, boilers, cooling towers and associated piping and circulating pumps providing chilled and heated water to air-handling units at each building. The air-handling units at each building intern have double ducts supplying cooled and heated air to VAV units within the tenant areas. Supplemental after hours heating and cooling at the 8401 Building consists of chillers, boilers, a flat plate heat exchanger, cooling towers and associated piping and pumps that are located on the building roof. Supplemental after hours cooling for a tenant at the 8407 Building consists of one air-cooled scroll compressor chiller located at the roof well. Additionally, supplemental after hours cooling at the 8431 Building consists of one air-cooled chiller.

The central heating plant consists of five hot water boilers and associated circulating pumps. The boilers are natural gas-fired and have a rated input capacity of 2,000,000

BTU/Hour. The boilers were reportedly installed in 2007. The boilers observed were manufactured by Ajax and appeared to be generally in good condition. In general, boilers can be expected to provide approximately 25 or more years of useful life with preventative maintenance and overhauls every 10 years.

There is a central chilled water system providing air conditioning to the Property supplied by three water-cooled centrifugal chillers with two cooling towers and circulating pumps. The chillers have a rating of 1,200 tons (chillers no. 1 and 2) and 600 tons (chiller no. 3) and use R-123 and R-11 as a refrigerant, respectively. The chillers observed were manufactured by Trane and appeared to be generally in good to fair condition. In general, chillers can be expected to provide approximately 25 or more years of useful life with ongoing preventative maintenance and refurbishing every 10 years. It was reported that chillers no. 1 and 2 were installed in 2005 and the chiller no. 3 was installed in 1987. Chillers no. 1 and 2 have not been eddy current tested due to their age. The designated site contact reported that chiller no. 3 was last eddy current tested in 2004 by Control Air.

The cooling towers are constructed of concrete and are located at ground level adjacent to the west side of the 8415 Building. The reported capacity of each cooling tower is 2,500 tons. The cooling towers observed were specifically constructed for the Property and appeared to be generally in good condition. In general, cooling towers of this type can be expected to provide a long useful life with ongoing preventative maintenance and overhauls. It was reported that the cooling towers were constructed in 1985.

There are two 100-HP hot water circulating pumps, two 250-HP and one 300-HP chilled water pumps and two 125-HP and one 100-HP condenser water pumps. The water circulation pumps were reportedly in good operating condition. ATC did not note excessive vibration, bearing deterioration sounds, or leakage. In general, these pumps can be expected to provide approximately 20 or more years of useful life with ongoing preventative maintenance. It was reported that the chilled water pumps and two of the condenser water pumps were installed in 2005. The age of the remaining water pumps is unknown.

The central plant and associated HVAC equipment is reportedly owned and maintained by the Property. The supplemental HVAC equipment at each building is reportedly owned and maintained by each individual tenant. The HVAC systems appeared to be in overall good condition, and were operable at the time of ATC's visit. According to the site contact, the Property has experienced no abnormal HVAC problems.

Recommendations: Based on the observed condition and estimated age of the equipment, the boilers can be expected to last through the term; no other action is currently recommended.

Funds have been allocated for replacement of chiller no. 3 over the term of the evaluation. Funds have also been allocated for refurbishing of chillers no. 1 and 2 over the term of the evaluation.

Due to the large capacity of the cooling towers and air handling and the ability to replace their internal components, the units have a long effective useful life, which can be extended when property maintained. An allowance is recommended for as-needed replacement of HVAC components and/or repair of compressors, valves, coils, etc. Additionally, as-needed replacement of VAV units is also included in the allowance.

Based on the observed condition and estimated age of the equipment, the chilled water, hot water and condensate pumps can be expected to last through the term; no other action is currently recommended.

No immediate or short term needs were identified.

3.8.2 Distribution Systems

Observations: The central plant heating and cooling distribution system has a centralized four pipe distribution system that provides hot and chilled water for heating and cooling to air-handling units at each building. The air-handling units at each building have double ducts providing heated and cooled air for heating and cooling to VAV boxes located within each building. Restrooms are ventilated with ceiling exhaust fans which are always on. The exhaust fans have discharge ducts to the buildings exteriors. It was reported that the ventilation arrangements meet the current needs of the tenants.

Recommendations: The majority of the HVAC distribution system components can be expected to last through the term with periodic repairs as part of routine maintenance. A repair and/or replacement allowance for the HVAC distribution system components has been recommended in the previous section of this report.

No immediate or short term needs were identified.

3.8.3 Control Systems

Observations: The central plant at the Property is equipped with an energy management system (EMS) manufactured by Siemens that reportedly serves the HVAC equipment. The software on the EMS was reportedly upgraded in 2008 and is in good operating condition. The majority of the HVAC equipment at the Property has variable frequency drives (VFDs) that were reported to be in good condition.

Recommendations: The majority of the HVAC control system components can be expected to last through the term with periodic repairs as part of routine maintenance; no other action is currently recommended.

No immediate or short term needs were identified.

3.9 Electrical Systems

3.9.1 Service and Metering

Observations: Primary electrical service is fed from a central high voltage (4,160-volt) substation at the east side of the 8415 Building. The substation is fed from two different LADWP stations and the substation is equipped with "Vista" switches that allows the Property to be switched to be fed from one of the LADWP stations in case of power interuption from one of the stations. The site contact reported that the Property owns and maintains each transformer at the substation. The central high voltage system in the 8415 Building supplies power via underground conduit to the meter and main service panels located at each building. The electric system to the 8401 Building consists of 5,000-ampere, 277/480-volt, three-phase, four-wire alternating current (AC). The electric system to the 8403 Building consists of 1,200-ampere, 277/480-volt, three-phase, four-wire AC. The electric system to the 8407 Building consists of 1,200-ampere, 277/480-volt, three-phase, four-wire and of 3,000-ampere, 208Y/120-volt, three-phase, four-wire AC. The electric system to the 8413 Building consists of 600-ampere, 277/480-volt, three-phase, four-wire AC. The electric system to the 8403 Building consists of 1,200-ampere, 277/480-volt, three-phase, four-wire AC. The electric system to the 8501, 8511 and 8521 Buildings consists of 3,000-ampere, 277/480-volt, three-phase, four-wire AC. The electric system to the 8531 Building consists of 2,500-ampere, 277/480-volt, three-phase, four-wire AC.

The electrical distribution panels at the Property were located in locked electrical rooms and the circuit breakers observed by ATC were labeled.

Interior light fixtures consist primarily of a combination of fluorescent fixtures. The fixtures were observed to be in good condition with no significant deficiencies observed.

ATC observed a Kohler diesel-powered emergency engine-generator with self-contained "belly" tank set with a capacity of 750 KVA at the 8401 Building that reportedly supplies emergency power to the fire and life safety systems, refrigerators, lab exhaust fans and IT equipment. ATC observed a Kohler diesel-powered emergency engine-generator with self-contained "belly" tank set with a capacity of 300 KVA at the 8511 Building that reportedly supplies emergency power to the building fire and life safety systems. ATC also observed a Spectrum Detroit Diesel diesel-powered emergency engine-generator with self-contained "belly" tank set with a capacity of 100 kW at the 8531 Building that reportedly supplies emergency power to the building fire and life safety systems, IT equipment and security systems. The condition of the generators appeared to be good with no significant deficiencies observed.

Recommendations: The majority of the electrical service and metering components can be expected to last through the term with periodic repairs as part of routine maintenance; no other action is currently recommended.

The generators can be expected to last through the term with routine maintenance; no other action required. The generators are reportedly owned and maintained by the tenants, (Unilab Corporation, Sterling Software and The Boeing Company). However, the designated site contact reported that the generator at the 8511 Building will be the Property's responsibility when the tenant's lease is up in 2010.

No immediate or short term needs were identified.

3.9.2 Distribution

Observations: The main service wiring and interior branch wiring was reported to be copper.

The site contact reported that the Property has experienced no abnormal electrical problems. Infra-red inspections of the electrical systems at each building are reportedly performed yearly. ATC observed no items indicating that the electrical systems are in less than good condition. The electrical systems appeared to be adequate to meet the tenant requirements with adequate capacity for future similar tenants.

Recommendations: The majority of the electrical distribution components can be expected to last through the term with periodic repairs as part of routine maintenance; no other action is currently recommended.

No immediate or short term needs were identified.

3.10 Conveying Systems

Only dumbwaiters and systems intended for the conveyance of passengers (elevators, escalators, moving walkways and ramps) are included in the scope of this assessment, all other conveyance systems, if any, are specifically excluded.

3.10.1 Elevators

Observations: There is a total of 20 hydraulic elevators and one handicap accessible vertical platform/wheelchair lift at the Property and are distributed as follows:

The 8401 Building has two hydraulic passenger elevators and two hydraulic freight elevators with one passenger and freight elevator serving floors one through three, one passenger elevator serving floors two and three and one freight elevator serving the first floor to the building roof penthouse (4-stop). The elevators were manufactured by Otis Elevator Company and have a capacity of 3,500 pounds for the passenger elevator serving the second and third floors, 3,500 pounds for the passenger and freight elevators serving the first through third floors and 6,000 pounds for the freight elevator serving the roof penthouse. The elevators were modernized and/or installed at the time of tenant renovations performed in 2005. ATC reviewed the most recent municipal certificate of inspection for the elevators that indicated an expiration date of January 3, 2009.

The 8407 Building has two hydraulic passenger elevators serving the first and second floors. The elevators were manufactured by Dover Elevator Company and Reliable Elevator Corporation and have a capacity of 2,500 pounds (Dover) and 4,000 pounds (Reliable). The Dover elevator appears to have been installed in 1999 during the reported building renovations and the Reliable elevator is original to the building having been installed in 1985/1986. ATC reviewed the most recent municipal certificate of inspection for the elevators that indicated an expiration date of January 3, 2009.

The 8413 Building has two hydraulic passenger elevators serving the basement through second floors. The elevators were manufactured by Reliable Elevator Corporation and have a capacity of 3,500 pounds. The elevators appear to be original to the building and were installed in 1986. ATC reviewed the most recent municipal certificate of inspection for the elevators that indicated an expiration date of December 8, 2008.

The 8415 Building has one hydraulic freight elevator serving the building finished floor to the ground level at the north side of the building. The elevator was manufactured by Reliable Elevator Corporation and has a capacity of 2,000 pounds. The age of the elevator is unknown but appears to be 20 plus years old. ATC reviewed the most recent municipal certificate of inspection for the elevator that indicated an expiration date of September 10, 2008.

The 8501 Building has two hydraulic passenger elevators serving floors one through three and one hydraulic freight elevator serving floors one through the roof penthouse. The passenger elevators were manufactured by Schindler Elevator Corporation and have a capacity of 3,500 pounds and the freight elevator was manufactured by United Elevator and has a capacity of 6,000 pounds. The two passenger elevators appear to have been modernized/installed in 1998 during building renovations and the freight elevator appears to be original and installed in 1959. ATC reviewed the most recent municipal certificate of inspection for the elevators that indicated an expiration date of January 7, 2009.

The 8511 Building has two hydraulic passenger elevators and one hydraulic freight elevator serving floors one through four. The elevators were manufactured by Schindler Elevator Corporation and have a capacity of 3,500 pounds (passenger) and 4,000 pounds (freight). ATC reviewed the most recent municipal certificate of inspection for the elevators that indicated an expiration date of September 25, 2008. Additionally, the building also has one handicap accessible vertical platform/wheelchair lift serving the building auditorium. The vertical platform/wheelchair lift was manufactured by Concord and has a capacity of 750

pounds. The elevators and vertical platform/wheelchair lift were installed during original construction (2000). ATC did not observe the most recent municipal certificate of inspection posted on the vertical platform/wheelchair lift.

The 8521 Building has two hydraulic passenger elevators serving floors one through three and one hydraulic freight elevator serving floors one through the roof penthouse. The passenger elevators were manufactured by Schindler Elevator Corporation and have a capacity of 3,500 pounds and the freight elevator was manufactured by United Elevator and has a capacity of 6,000 pounds. The two passenger elevators appear to have been modernized/installed in 1998/1999 during building renovations and the freight elevator appears to be original and installed in 1959. ATC reviewed the most recent municipal certificate of inspection for the elevators that indicated an expiration date of December 7 and 8, 2008.

The 8531 Building has two hydraulic passenger elevators serving the first and second floors. The elevators were manufactured by Schindler Elevator Corporation and have a capacity of 3,500 pounds. The elevators appear to have been modernized/installed in 1998/1999 during building renovations. ATC reviewed the most recent municipal certificate of inspection for the elevators that indicated an expiration date of January 7, 2009.

The elevators were observed to be in good to fair condition with no significant deficiencies observed. However, shuddering of the original freight elevator at the 8521 Building was noted near the top of the roof penthouse. Additionally, ATC observed that the 8511 Building freight elevator oil cooler installed in 2006 was leaking with a pan placed beneath the unit and the odor of the hydraulic oil could be noticed in the building lobby. The remaining units operated smoothly and wait times were reasonable for elevator cars to arrive at the various floor levels during our site tour. The elevator machine rooms appeared well maintained. The controller equipment for elevators can be expected to provide approximately 25 to 30 years of useful life. Repair and replacement of the elevator equipment at the 8401 Building is reportedly the responsibility of the tenant.

It was reported that Schindler Elevator Corporation provides elevator service on a monthly and an as needed basis at the Property. It was reported that Fujitech America, Inc. provides elevator service on a monthly basis at the 8401 Building. ATC interviewed Mr. Jene Gutierrez of the Schindler Elevator Corporation who reported that the elevators at the Property are in good to fair operating condition and the three original elevators at the Property should be considered for modernization.

Recommendations: Based on the observed condition and age of the equipment, the majority of the elevators can be expected to last through the term. Based on the observed condition and age of the equipment, it is expected that modernization of the original elevators at the 8407, 8413, 8415, 8501 and 8521 Buildings may be necessary during the term and funds have been allocated in the reserve table.

It is recommended that the freight elevator oil cooler at the 8511 Building be repaired as part of routine maintenance due to the fairly new installation.

ATC recommends that the appropriate authority be contacted during the course of routine maintenance to schedule an inspection for the vertical platform/wheelchair lift at the 8511 Building which did not have a certificate of inspection posted.

No immediate or short term needs were identified.

3.10.2 Escalators

Observations: No escalator systems were reported or observed at the Property.

Recommendations: Not applicable.

3.10.3 Moving Walkways and Ramps

Observations: No moving walkways or ramps were reported or observed at the Property.

Recommendations: Not applicable.

3.11 Life Safety/Fire Protection

3.11.1 Sprinklers and Suppression Systems

Observations: Each building at the Property is equipped with a wet-type sprinkler system that provides fire protection. The fire sprinkler systems throughout the Property appeared to be generally in good condition and were reportedly operational. During our site visit stained tiles indicating leakage from the fire supression system were not noted. No information was available on the square footage coverage per sprinkler head. The designated contact reported that the five-year test of the fire sprinkler systems at the Property are performed annually. Fire Department connections are available at the buildings' exterior at back flow preventers.

In general, fire sprinkler lines can be expected to provide 50 or more years of useful life, depending on the type and quality of materials and workmanship of the installation. According to the site contact, there have been no problems associated with the fire sprinkler system. Fire sprinkler heads subject to recalls were not reported to ATC at the Property. ATC observed that some of the spare fire sprinkler heads for the system, located within the red storage box at the fire sprinkler main shut-off valve room, were manufactured by Central and Gem Sprinkler Company. Some models of fire sprinkler heads manufactured by Central and Gem Sprinkler Company have been included in a voluntary recall from the manufacturer.

The parking structure at the east side of the Property is not equipped with a sprinkler system; however, fire hose cabinets with fire extinguishers were observed.

Fire extinguishers were observed throughout the Property. None of the fire suppression equipment was tested in the scope of this survey. However, the fire extinguishers checked were tagged as having been inspected within the past year. Fire hydrants are situated in various locations throughout the Property. ATC observed no items indicating that the fire protection components are in less than good condition. However, the exteropr fire sprinkler line at the fourth floor balcony of the 8511 Building exhibited corrosion.

The kitchen hood at the cafe of the 8511 Building is equipped with a chemical extinguishing system that was observed and reported to be in good condition. The most recent inspection of the system was performed on April 4, 2008 by Cal Protection according to the tag observed.

The main computer room at the 8401 Building is reportedly served by a FM-200 preaction system and reported to be in good condition.

The west stairs at the 8511 Building is reportedly provided with a pressurization and smoke evacuation system.

Recommendations: It is recommended that the exterior exposed fire sprinkler line at the 8511 Building be wire brushed and painted during the course of routine maintenance operations.

No immediate or short term needs were identified.

3.11.2 Alarm Systems

Observations: Hard-wired smoke and heat detectors, lighted exit signs, emergency lighting or battery back-up lighting, alarm pull boxes, as well as audible and visual alarms were observed at the Property. Alarm pull boxes as well as audible and visual alarms were not observed at the 8413 Building. Each building is equipped with a fully addressable fire alarm control panel that are monitored by a 24-hour monitoring company. The observed fire alarm control panels were manufactured by Siemens, Fire Lite Alarms and Notifier. The equipment was reportedly operable at the time of ATC's visit. ATC observed no items indicating that the system components are in less than good condition.

Recommendations: No action over the term is currently recommended.

No immediate or short term needs were identified.

3.11.3 Security and Other Systems

Observations: The Property is equipped with a variety of security alarm systems, each of which is owned and maintained by the individual tenants. The systems were reportedly operable at the time of ATC's visit. ATC observed no items indicating that the security system components are in less than good condition.

Recommendations: No action over the term is currently recommended.

No immediate or short term needs were identified.

3.12 Interior Elements

3.12.1 Common Areas

Observations: The common areas at the Property are limited to lobbies, corridors and restrooms at the 8407, 8501 and 8521 Buildings. The floors in each building are covered primarily with granite, carpeting and ceramic tile in the restrooms. Exposed concrete-slab-on-grade was observed at the mechanical portions of each building. The interior walls in each building consist primarily of painted gypsum wallboard and ceramic tile at the restrooms. The ceilings in each building consist primarily of suspended ceiling panels and painted gypsum drywall with the underside of the floor/roof deck visible throughout the mechanical areas. The common area interior finishes of each building appeared to be generally in good condition with no significant deficiencies observed.

Recommendations: It was reported that the replacement of the common area interior finishes in the 8407, 8501 and 8521 Buildings is the responsibility of the Property; therefore, an allowance has been allocated for repainting and replacement over the term as the finishes vary in age.

No immediate or short term needs were identified.

3.12.2 Tenant Areas

Observations: Interior walls and ceilings of the tenant areas are constructed of painted drywall and suspended ceiling panels. The floor finishes consist of carpeting, granite, ceramic tile and vinyl tile flooring. Overall, the finishes of the tenant areas appeared to be in good condition with no significant deficiencies.

Recommendations: It was reported that the replacement of the tenant area interior finishes is the responsibility of the tenants; therefore, no funds have been allocated for replacement over the term.

No immediate or short term needs were identified.

3.12.3 Dwelling Units or Guest Rooms

Observations: There are no dwelling units or guest rooms at the Property.

Recommendations: Not applicable.

3.12.4 Bathrooms

Observations: There are no bathrooms at the Property.

Each building has tenant and common area restrooms on each floor. The restroom floors and walls are primarily finished with ceramic tile. The ceilings primarily consist of painted drywall.

Recommendations: Based on their estimated age and observed condition, the interior finishes in the restrooms can be expected to last through the term.

No immediate or short term needs were identified.

3.12.5 Kitchens

Observations: There is a commercial kitchen at the cafe located at the ground floor of the 8511 Building. The kitchen is equipped with standard equipment utilized for storage and food preparation. According to the site contact, the majority of the kitchen equipment is in good operating condition. Generally, kitchen equipment can be expected to provide 30 or more years of service.

Additionally, the 8411 Building will also feature a commercial kitchen when the building renovation is complete.

Recommendations: It was reported that one of the tenants at the 8511 Building owns and maintains the equipment in the kitchen; therefore, no funds have been allocated during the term.

No immediate or short term needs were identified.

3.12.6 Laundry Areas

Observations: No laundry areas are present at the Property.

Recommendations: Not applicable.

4.0 Additional Considerations

4.1 Code Compliance

Observations: ATC contacted the building, fire and planning departments during the course of the project to obtain general Property information and identify currently outstanding code violations at the Property.

ATC has submitted a request for code compliance information. As of the date of this report, a reply has not been received. A report of outstanding building code violations, if any, will be issued under a separate cover.

According to the Los Angeles Fire Department - Arson Investigation Unit, code compliance information is obtained through submission of a written request. ATC submitted a request and a copy is included in Appendix C. As of the date of this report, a reply has not been received. A report of outstanding fire code violations, if any, will be issued under a separate cover.

ATC requested information regarding the zoning at the Property. A review of the zoning information provided by the Los Angeles Zone Information & Map Access System (ZIMAS) indicated that the Property was located within two zoning districts. The southern half of the Property where the 8401, 8403, 8407, 8411, 8413 and 8415 Buildings are located was within a A1-1 (Agriculture) zoning district and appeared to be a legal non-conforming use. The northern half of the Property where the 8501, 8511, 8521 and 8531 Buildings are located was within a M1-1 (Limited Industrial) zoning district and appeared to be a conforming use.

Recommendations: No needs over the term were identified; no action is currently recommended.

No immediate or short term needs were identified.

4.2 Accessibility to Disabled Persons

Observations: The subject Property, based on the operations observed, appears to fall into the category of a "public accommodation".

Exterior routes from public transportation stops, accessible parking spaces, and public sidewalks at the Property appeared to be generally conforming to ADA requirements. However, the exterior ramp at the north side of the 8403 Building did not have handrails on both sides as required by ADA guidelines. Exterior entrances provided at the Property appeared to be generally conforming to ADA requirements.

Of the 3,648 parking spaces reported at the Property, there are a total of 100 designated handicap accessible parking spaces including 20 "van accessible" parking spaces. According to ADA guidelines, 57 accessible parking space including five "van accessible" parking spaces are required at the Property in appropriate locations. The accessible parking spaces provided at the Property appeared to be generally conforming to ADA requirements.

Common toilet facilities in at the Property appeared to be generally conforming to ADA requirements.

The elevators at the Property appeared to be generally conforming to ADA requirements with the exception of missing infra-red cab door reopening device at the west elevator of the 8407 Building.

Recommendations: No needs over the term were identified.

The installation of handrailing at the north side of the ramp at the north side of the 8403 Building is recommended as an immediate need.

Due to the potential liability, the installation of an infra-red cab door reopening device at the 8407 Building west elevator is recommended as an immediate repair.

No short term needs were identified.

4.3 Microbial Visual Survey

Observations: A microbial visual survey was not included in the scope of work for this Property.

Recommendations: Not applicable.

4.4 Furnishings, Fixtures and Equipment

Observations: In accordance with the scope of work, furniture, fixtures and equipment (FFE) costs have not been assessed for this Property and are not included within this report.

Recommendations: Not applicable.

4.5 Seismic Assessment

Observations: According to Figure No. 16-2, the "Seismic Zone Map of the United States", in the 1997 Uniform Building Code, the Property is located within Zone 4, defined as an area of high probability of damaging ground motion. As such, according to ATC's scope of work, a Scenario Expected Loss (SEL) report was included as part of the scope of work for this project and is included as Appendix C. Based on our field observations and using the damage prediction method developed by Thiel and Zsutty, in addition to ASTM E2026-07, and ground fault, seismicity and acceleration data from EQFAULT, EQSEARCH and FRISKSP software, the Scenario Expected Loss (SEL) for Corporate Pointe at West Hills in the Los Angeles, California ranges from 11 to 17 percent (for DBE 475-year event) and from 15 to 23 percent (for MCE 2,375-year event) and the Scenario Upper Loss (SUL) ranges from 15 to 20 percent (for DBE 475-year event) and from 20 to 27 percent (for MCE 2,375-year event) of the replacement cost of the buildings.

Recommendations: No needs over the term were identified; no action is currently recommended.

No immediate or short term needs were identified.

4.6 FEMA Wind Zone

Presentation of FEMA Wind Zone information was not included in the scope of work for this Property.

5.0 Recommendations and Preliminary Opinions of Cost

5.1 Opinions of Cost

The opinions of cost presented are for the repair/replacement of readily visible materials and building system defects that might significantly affect the value of the Property during the loan period. These opinions are based on approximate quantities and values. They do not constitute a warranty that all items, which may require repair or replacement, are included.

Estimated cost opinions presented in this report are from a combination of sources. The primary sources are from Means Repair and Remodeling Cost Data and Means Construction Cost Data; past invoices or bid documents provided by Property management; as well as ATC's experience with costs for similar projects and city cost indexes.

The opinions of cost do not address the cost impact of the possible presence of lead-based paint (LBP), asbestos-containing materials (ACM) or other environmentally regulated materials on renovation or demolition activities. Replacement and repair opinions of cost are based on approximate quantities. Information furnished by Property personnel or the property management, if presented, is assumed by ATC to be reliable. A detailed inventory of quantities for cost estimating is not a part of the scope of this Report.

Actual costs may vary depending on such matters as type and design of remedy; quality of materials and installation; manufacturer of the equipment or system selected; field conditions; whether a physical deficiency is repaired or replaced in whole; phasing of the work; quality of the contractor(s); project management exercised; and the availability of time to thoroughly solicit competitive pricing. In view of these limitations, the costs presented herein should be considered "order of magnitude" and used for budgeting purposes only. Detailed design and contractor bidding is recommended to determine actual cost.

These opinions should not be interpreted as a bid or offer to perform the work. All costs are stated in present value. The recommendations and opinions of cost provided herein are based on the understanding that the facility will continue operating in its present occupancy classification and general quality level, unless otherwise stated.

5.2 Immediate Needs

Immediate Needs are those repairs that are beyond the scope of regular maintenance, and should be performed at this time. Work that requires action based on its being (i) an existing or potentially significant unsafe condition, (ii) material physical deficiency, (iii) poor or deteriorated condition of a critical element or system, (iv) significant building code violation, or (v) a condition that if left "as is," with an extensive delay in remedying it, has the potential to result in or contribute to a critical element or system failure and will probably result in a significant escalation of its remedial costs. Based on our property observations, any immediate need items identified are listed in the table in Appendix A of this report.

5.3 Short-Term Needs

Short-Term Needs are those costs to remedy physical deficiencies, such as deferred maintenance, which may not warrant immediate attention, but require repairs or replacements that should be undertaken on a priority basis in addition to routine preventative maintenance. The time frame for such repairs is generally within one year.

5.4 Physical Needs Over the Term

Physical Needs Over the Term are items needing repair or replacement that are beyond the scope of regular maintenance, but are necessary to maintain the overall condition of the Property. These include major recurring probable expenditures, which are neither commonly classified as an operation, nor maintenance expense. Physical Needs Over the Term are reasonably predictable both in terms of frequency and cost; however, they may also include components or systems that have an indeterminable life, but nonetheless have a potential liability for failure within an estimated time period. These are items of work that are beyond the scope of regular maintenance and which we feel are necessary to maintain the overall condition of the

Property over the evaluation period, from the date of our investigation. These items are listed in the table in Appendix A of this report.

6.0 Limitations and Qualifications

Our services described herein were performed and our findings and recommendations were prepared in accordance with generally accepted consulting practices for this geographical area at this time. No warranties are provided, either expressed or implied. While ATC has made every reasonable effort to properly evaluate the Property conditions within the contracted scope of services, it should be recognized that this investigation is limited in several important respects including, but not limited to, the following:

Our findings and conclusions were based primarily on the visual appearance of the Property at the time of our Property visit and on comparative judgments with similar properties in the ATC Property assessor's experience. Our Property observations included only areas that were readily accessible to our representative without opening or dismantling any secured components or areas. The scope did not include invasive investigation, component sampling, laboratory analysis, an environmental site assessment, or engineering evaluations of structural, mechanical, electrical, or other systems with related calculations and review of design assumptions. Note that since destructive testing was not within the scope of services of this report, ATC was not able to visually evaluate if aluminum branch wiring, fire retardant treated plywood, phenolic foam insulation or polybutylene piping exists within the concealed areas.

Some of our conclusions were partially based on information provided by others including representatives of the client, the Property owner, the Property manager, contractors servicing the Property, and local building code officials. For the purposes of this report, we have assumed this information to be complete and correct unless otherwise noted. ATC assumes no liability for incorrect information provided by others.

Our opinions of cost represent a preliminary opinion only and are neither a quote nor a warranty or representation as to the actual costs that may be incurred. These estimates are based on typical cost data that may not fully characterize the scope of the Property conditions and are further limited by possible future changes in technology, by regulatory requirements, by Property location, and by contingencies that cannot reasonably be discovered until after commencement of on-site construction activities. ATC shall not be liable to the Client nor any other party for any costs or expenses that may be incurred in excess of these estimates, for any losses that may be incurred as a result of these estimates being different from the actual costs, nor for any damages whatsoever in connection with these estimates.

This report is intended for the use of and may be relied upon only by the entities identified in the Statement of Results on the first page following the Table of Contents at the beginning of this report. The scope-of-services performed in execution of this investigation may not be appropriate to satisfy the needs of other users, and any use or re-use of this document or its findings, conclusions, or recommendations is at the risk of said user. ATC is not responsible for conclusions, opinions, or recommendations made by others based on this information.

Appendix A:

Immediate Needs and Physical Needs Over the Term Table

Component	AVE. EUL	EFF AGE	RUL	Quantity	Unit	Unit Cost	Immediate Need	Short Term Need	Yr. 1	Yr. 2	Yr. 3	Yr. 4	Yr. 5	Yr. 6	Yr. 7	Year 1-7 Totals
3.3.4 PAVING, CURBING AND PARKING																
Asphalt repair allowance including removal and replacement of alligatoring and sealing of linear cracks	-	-	-	1	LS	$100,000			$100,000							$100,000
Asphalt pavement sealcoat and striping allowance	5	var	var	910,000	SF	$0.15			$19,500	$19,500	$19,500	$19,500	$19,500	$19,500	$19,500	$136,500
Concrete deck coating	5	1	4	144,000	SF	$1.50						$216,000				$216,000
Asphalt curb machine formed	15	15+	0	425	LF	$5			$2,125							$2,125
Concrete parking space striping	5	1	4	1,057	EA	$15						$15,855				$15,855
3.3.5 LOADING AREAS, DOCKS AND FLATWORK																
Required - Remove and replace cracked and settled concrete sidewalk section at the northwest corner of the 8403 Building	-	-	-	40	SF	$5	$200									
3.6.3 CARPORTS AND GARAGES																
Pressure wash and apply clear masonry sealer at the unpainted CMU walls at the parking structure	-	-	-	1	LS	$10,000			$10,000							$10,000
3.6.4 EXTERIOR FINISHES																
Repair cracks and paint the exteriors of the 8407 Building	8	7	1	1	LS	$33,010			$33,010							$33,010
Repair cracks and elastomeric paint the 8407 Building	-	-	-	1	LS	$200,000			$200,000							$200,000
Repair stucco cracks throughout the 8413 Building	-	-	-	1,500	SF	$3.50	$5,250									
Paint exteriors of the 8413 Building	8	7	1	11,000	SF	$1			$11,000							$11,000
Paint EIFS exteriors of the 8403 Building	10	7	3	17,500	SF	$2					$35,000					$35,000
Paint exteriors of the 8415, 8511 and 8521 Buildings	8	var	var	80,000	SF	$1				$40,000	$40,000					$80,000
3.6.7 EXTERIOR WINDOWS																
Window caulking and glazing gasket replacement allowance	-	-	-	1	LS	$10,000			$10,000		$10,000		$10,000		$10,000	$40,000
3.6.8 ROOFING SYSTEMS																
Recommended - Caulk parapet coping joints and paint coping at the 8501 Building	10	10	0	1	LS	$4,000	$4,000									
Recommended - Replace parapet flashing at the 8511 Building under warranty	-	-	-	1	LS	$0	$0									
3.7.2 DOMESTIC HOT WATER PRODUCTION																
Replace 109 gallon water heater at the 8521 Building	15	10	5	1	EA	$2,200							$2,200			$2,200
Replace 75 gallon water heater at the 8521 Building	15	8	7	1	EA	$1,800									$1,800	$1,800
Replace 30 gallon water heaters at the 8511 Building	15	8	7	3	EA	$1,200									$3,600	$3,600
3.8.1 EQUIPMENT																
HVAC repair and/or replacement allowance	-	-	-	1	LS	$25,000				$25,000	$25,000	$25,000	$25,000	$25,000	$25,000	$150,000
Chiller (400 SF/ton)	20	18	2	600	TON	$900				$540,000						$540,000
Chiller refurbish	10	3	7	2,400	TON	$300									$720,000	$720,000
3.10.1 ELEVATORS																
Modernize 4,000 pound hydraulic elevator at the 8407 Building	25	22	3	1	LS	$50,000					$50,000					$50,000
Modernize hydraulic elevators at the 8413 Building	25	22	3	2	LS	$56,000					$112,000					$112,000

Component	AVE. EUL	EFF AGE	RUL	Quantity	Unit	Unit Cost	Immediate Need	Short Term Need	Yr. 1	Yr. 2	Yr. 3	Yr. 4	Yr. 5	Yr. 6	Yr. 7	Year 1-7 Totals
Modernize 6,000 pound hydraulic freight elevators at the 8501 and 8521 Buildings	25	25+	var	2	LS	$70,000			$140,000							$140,000
Modernize 2,000 pound fhydraulic reight elevator at the 8415 Building	25	25+	var	1	LS	$45,000				$45,000						$45,000
3.12.1 COMMON AREAS																
Allowance to refurbish common areas at the 8407, 8501 and 8521 Buildings	7	var	var	1	LS	$20,000				$20,000	$20,000	$20,000	$20,000	$20,000	$20,000	$120,000
4.2 ACCESSIBILITY TO DISABLED PERSONS																
Required - Install additional handrailing at the handicap accessible ramp at the north side of the 8403 Building	-	-	-	150	LF	$15	$2,250									
Required - Install infra-red cab door reopening device at the 8407 Building west elevator	-	-	-	1	LS	$2,300	$2,300

ATC ASSOCIATES INC.

Property Condition Assessment (PCA)
Pre-Survey Questionnaire

ATC Project No. 70.75068.8184, Task No. TBA

Please email completed questionnaire to hiett52@atc-enviro.com or fax to 323-517-9781. Thank you.

Please complete as much of this questionnaire as possible before our site visit. For those questions not applicable to the subject property, please respond "N/A". If you have any questions about how to answer any of the questions, please call Mr. Barry Hiett at ATC (323-517-9780). If additional pages for response are necessary, please attach them to this form. This document and your written responses will be an exhibit in ATC's Property Condition Report. Thank you very much.

GENERAL RETAIL/OFFICE/INDUSTRIAL PROPERTY DESCRIPTION

Property Name:	Corporate Pointe at West Hills	Address:	8401-8531 Fallbrook, West Hills, CA
Land Acres:	60	County:	Los Angeles
No. of Buildings:	9	Municipal Zoning:	M-1
No. of Tenants:	7	Current Occupancy (%):	91.8
		Tax ID/Parcel #:	52143830

Building Name	Stories	Year Built	Date(s) of Major Renovations	Age of Roof(s)	No. of Tenants	No. of Vacant Units	Leasable SF	Gross SF
Please see attachment #1								
Totals:								

GENERAL INFORMATION

Are there any significant deficiencies at the property? ☒ No, or ☐ Yes, Describe:

Are you in receipt of any notices of code violations from your municipality's building department, zoning and/or planning office, fire department, or health department? ☒ No, or ☐ Yes. If so, please disclose the nature of the violations, attach copies of the violations to this questionnaire and explain what actions are being undertaken to comply:

Are you in receipt of or have you solicited any proposals to perform any repairs or replacement work to the building(s) or any of its components that will exceed an aggregate cost of $2,000? ☐ No, or ☒ Yes, Describe:

See attached list

Any approved capital projects for the current year? ☐ No, or ☒ Yes, (List or attach capital expenditures budget):

see attached list

Any planned or anticipated capital projects for the next 5 years? ☐ No, or ☒ Yes, (List or attach capital expenditures budget):

See Attached list

During the last five years, have any major capital improvements been performed at the property? ☐ No, or ☒ Yes, Describe and provide approximate cost incurred:

See Attached list

Any major damage from fire, flood, storm, etc.? ☒ No, or ☐ Yes, Describe and state whether damage has been repaired:

Has a PCA been previously conducted by a consultant at the property? ☒ No, or ☐ Yes, List company name, report date and location of report:

Any knowledge of water leaks / infiltration and associated damage at the Property? ☐ No, or ☒ Yes, Describe and state whether damage has been repaired: Leaks from heavy rains each year. Each occurance repaired.

Has there been tenant occupant complaints concerning mold or microbial growth? ☐ No, or ☒ Yes, Describe location and state whether mold or microbial growth is still exists: previous tenant, xerox in 8501. mold remediation performed.

- 8511 Countrywide, ground FLOR, small area. Remediation performed.

Has mold or microbial growth ever been observed at the Property? ☐ No, or ☒ Yes, Describe location and state whether mold or microbial growth still exists: See previous Answer.

TOPOGRAPHY & SITE DRAINAGE

To where does the site drain? (Municipal storm sewer system at what street(s), creek, ponds, etc.): ☐ Not known, or describe: to gutters & storm drain to ocean

Are there sumps, dry wells or a lift station on site? ☐ No, or ☐ Yes, Describe quantity & location: Sumps - scattered in various locations, no drywells or lift stations

Any ground fractures, settlement areas or drainage problems (erosion, chronically standing water, etc.)? ☒ No, or ☐ Yes, Describe:

PAVING, CURBING & PARKING

Paving present ☐ No, ☒ Yes; Curbing present, ☐ No, ☒ Yes; Parking present ☐ No, ☒ Yes; Parking structure? ☐ No, ☒ Yes

Sufficient number of parking spaces? ☐ No, ☒ Yes

Responsibility for maintenance?: ☐ Tenant or ☒ Property Owner

Square footage of asphalt paving: ☒ Not known, ☐ N/A, or list majority of property is surface parking lot. See Attached site plan.

Square footage of concrete paving: ☐ Not known, ☐ N/A, or list

Year of last seal coat/restriping: ☒ Not known, ☐ N/A, or list 2007-8511; 2007-Eastdeck;

Quantity (SF) location and cost: ☒ Not known, ☐ N/A. or list 2005-8401 & 8403

Year of last asphalt overlay: ☐ Not known, ☐ N/A, or list 2008-8531; 2007 Central Plt; 2007 by helipad

Quantity (SF), location and cost: ☒ Not known, ☐ N/A, or list

Any abnormal problems in recent years? ☒ No, or ☐ Yes, Describe:

No. of parking spaces: ☒ Not known, ☐ N/A, or list

No. of standard ADA spaces: ☐ Not known, ☐ N/A, or list

No. of "van accessible" ADA spaces: ☐ Not known, ☐ N/A, or list

Is there a sufficient number of parking spaces? ☐ N/A, ☐ No, or ☒ Yes

Many additions & modifications. It didn't have one time.

LOADING AREAS, DOCKS & FLATWORK

Loading areas present, ☐ No, or ☐ Yes; Loading docks present, ☐ No, or ☒ Yes; Flatwork work present, ☒ No, or ☐ Yes; At Central Plant

Location(s) of flatwork: n/A

Responsibility for maintenance?: ☐ Tenant or ☐ Property Owner

No. of loading docks: 1

Location(s) of dock(s): Central Plant

Describe No. and type (manual, electric, hydraulic, etc.) of dock levelers: ☐ Not known, ☒ N/A, or list

Any abnormal problems in recent years? ☒ No, or ☐ Yes, Describe:

LANDSCAPING & APPURTENANCES

Landscaping present ☐ No, or ☒ Yes; Exterior lighting present ☐ No, or ☒ Yes, Exterior signage present ☐ No, or ☒ Yes

Type of irrigation system: ☐ None ☐ Manual or ☒ Automatic

Type of irrigation system piping: ☐ N/A, ☐ PVC, ☐ Steel, ☒ Not known, or ☐ Other, Describe:

Any abnormal irrigation system problems in recent years? ☐ N/A, ☒ No, or ☐ Yes, Describe:

Any exterior lighting problems? ☐ N/A, ☒ No, or ☐ Yes, Describe:

Any landscaping problems? ☐ N/A, ☒ No, or ☐ Yes, Describe:

Site amenities present (i.e. picnic areas, fitness center, etc.) ☐ No, or ☒ Yes, list: Picnic/pond area, food service bldg, Auditorium,

UTILITY PROVIDERS

Water: ☐ Not known, ☐ None, or list Los Angeles Dept Water & Power

Electricity: ☐ Not known, ☐ None, or list Los Angeles Dept Water & Power

Natural Gas: ☐ Not known, ☐ None, or list The Gas Company

Steam: ☐ Not known, ☒ None, or list

Storm Sewer: ☐ Not known, ☐ None, or list

Sanitary Sewer: ☐ Not known, ☐ None, or list Dept. water & Power

Chilled Water: ☐ Not known, ☐ None, or list Central Plant

Which utilities are separately metered (to tenants)? ☐ Water, ☐ Natural Gas, ☒ Electricity, ☐ Other, list

Any special utility systems? ☐No, or ☒Yes, Describe: Vista switches for electrical from City

Any abnormal utility problems in recent years? ☒No, or ☐Yes, Describe:

STRUCTURAL SYSTEMS

Type of foundation: ☐Not known or list Slab - concrete / Type of structural system: ☐Not known or list metal studs, block walls, different in buildings

Any structural problems in recent years? ☒No, or ☐Yes, Describe:

Any current or past basement water leaks / intrusion? ☐No, or ☐Yes, Describe and state whether leakage has been repaired:
2413 basement. Leak repaired

Any seismic upgrades performed? ☒N/A, ☐No, or ☐Yes, Describe location, work performed & date:

EXTERIOR WALLS, DOORS & WINDOWS

Describe the exterior walls of the building(s):
concrete, block wall, EFIS, stucco

When were exteriors last painted? ☐Not known, ☐N/A, or Cost of exterior painting: ☐Not known, ☐N/A, or list
list 2401 = 2006, 2501 = 2006, 2531 = 2008

Any exterior wall, door or window leaks in recent years? ☐No, or ☐Yes, Describe and state whether damage has been repaired:
Periodic leaks from rains in most Buildings. Repaired at time of leak

Has any exterior repair work been performed during the last 5 years? ☐No, or ☐Yes, Describe location, work performed & date:
2501 entire exterior caulked & elastomeric paint. 2401 same

Who is responsible for maintaining and replacing windows and doors?: ☐ Tenant or ☒ Property Owner unless w/in tenant suite

ROOFING SYSTEMS

Type of roofing: ☐Not known, or list See attached General Bldg Info. sheet Age of roofing: ☐Not known, or list

Any current roof or skylight leaks? ☐No, or ☐Yes, Describe, state location:
minor leaks found during rains

Any past roof or skylight leaks? ☐No, or ☐Yes, state location and date of leaks:
minor leaks found during rains

Roof warranty? ☒No, or ☐Yes, Please provide copy of warranty and describe length of term & expiration date:

Cost of recent roof replacement? ☐Not known, ☐N/A, or list Responsibility to maintain/replace roofing?: ☐ Tenant or ☒ Property Owner

Any fire retardant treated plywood roof sheathing at the property? ☒Not known, ☐No, or ☐Yes, State location and condition:

Any phenolic foam roof insulation at the property? ☐Not known, ☒No, or ☐Yes, State location and condition:

PLUMBING SYSTEMS

Plumbing systems present ☐No, or ☒Yes; Domestic hot water provided ☐No, or ☒Yes

Type of water supply lines: ☐Not known, ☒Copper, ☐PVC, ☐Galvanized Steel, ☐Polybutylene, or ☐Other, Describe:

Type of waste (drain) lines: ☐Not known, ☐Copper, ☐PVC, ☒Cast Iron, ☐Polybutylene, ☐ ABS, or ☐Other, Describe:

Is there polybutylene piping at the property? ☒Not known, ☐No, or ☐Yes, State location and history of defects:

Abnormal problems in recent years? ☐No, or ☐Yes, Describe: periodic leaks in old piping. Replacement done at time of leak

Inadequate hot water response time? ☒No, or ☐Yes, Describe:

Inadequate domestic water pressure or drainage problems? ☒No, or ☐Yes, Describe:

Type of water heaters: ☐None, ☒Electric, ☒Natural Gas, ☐Other, Describe: Capacity of water heaters: ☐Not known, ☐N/A, or list 50-80 gallons

Age of water heaters: ☐Not known, Responsibility to maintain/replace water heaters?: ☐ Tenant or ☒ Property Owner
☐N/A, or list 1-10 years - various throughout complex.

Are maintenance and/or complaint logs kept for the plumbing systems? ☐No ☐Yes Landlord & PM programs

Do you have wells ☒ No or ☐ Yes; sump pumps ☐ No or ☒ Yes; septic system ☐ No or ☒ Yes; grease traps ☐ No or ☒ Yes
Describe each item present: L 8531 L 2 cafes

HEATING, VENTILATING AND AIR CONDITIONING (HVAC) SYSTEMS

HVAC systems present: ☐ No, or ☒ Yes

Type of typical HVAC equipment: Double duct & VAV Systems - Central Plant

Who is responsible for maintaining and replacing the HVAC equipment: ☐ Tenant or ☒ Property Owner

Age of most HVAC equipment: central plant = 2-8 yrs Cost of recently replaced HVAC units: central plant renovated in 2006

Cooling equipment (type, manufacturer, age, capacity)

Trane Chillers - 3,000 tons total 2=2 yrs 1=1987

Heating equipment (type, manufacturer, age, capacity)

Ajax Boilers, 1 yrs old @ 1.9 million BTU x 5 Boilers

Ventilation equipment (type, manufacturer, age, capacity)

Air handlers supply/Return fans, capacity varies per Bldg, make varies

Is there an energy management system (EMS) ☐ No, or ☒ Yes, Indicate manufacturer, model, type and equipment controlled:
Siemens Apogee Ems - EP

Is there a centralized system? ☐ No, or ☐ Yes, Indicate: ☐ one, ☒ two, or ☐ four pipe distribution system.
central plant supply & return

When were the chillers' last eddy current tested and who performed the test? : ☐ Not known, ☐ N/A, or list
2 too new still Grayson

Refrigerant type: : ☐ Not known, ☐ N/A, or list R-11 & R123 Stored on site? ☒ No, or ☐ Yes, Location: except in equipment

Any refrigerant conversion plans? ☐ N/A, ☒ No, or ☐ Yes, Describe:

Is the cooling tower water treated? ☐ N/A, ☐ No, or ☒ Yes. If so, by whom? Chem Pro (310) 532-8611

Is the boiler water treated? ☐ N/A, ☐ No, or ☒ Yes. If so, by whom and date of last inspection?

Name and telephone number of HVAC service company: Grayson Inc (626) 961-9640

Any problems with inadequate drainage of condensate water (mold build-up)? ☒ No, or ☐ Yes, Describe location:

Abnormal problems in recent years? HVAC capacity, distribution or equipment deficiencies? ☒ No, or ☐ Yes, Describe:

ELECTRICAL SYSTEMS

Type of main transformer(s): ☒ Pad, ☐ Pole, ☐ Vault, ☐ Other, Describe: in Central Plant

Responsibility for maintaining and replacing main transformer(s)? ☐ Not known, ☐ Tenant or ☒ Property Owner, ☐ Utility, or list

Main supply amperage to building(s): ☐ Not known, or list 4160 volt 1500 - KVA

Property is equipped with: ☒ Circuit Breakers, or ☐ Fuses at panel at disconnects

Is there an emergency generator on site? ☐ No, or ☐ Yes 2 owned by tenants

How frequently is the generator tested? every 2 weeks

How frequently is generator exercised? every 2 weeks

How frequently is automatic transfer switch tested? 1 x per mo.

Generator fuel type: ☒ Diesel, ☐ Natural Gas, ☐ Propane, ☐ Other, Describe:

Generator capacity: ?

The generator supplies emergency power to what systems? Emergency lighting

Who is responsible for maintaining and replacing the emergency generator? ☒ Tenant or ☐ Property Owner,

Main service wiring: ☒ Copper, ☐ Aluminum, ☐ Not known

Interior branch wiring: ☒ Copper, ☐ Aluminum, ☐ Not known

How frequently are infrared inspections conducted? ☐ None, or list Every other year

Name of company performing inspections: Best Infrared / Pro Line

Abnormal electrical system problems in recent years? [X] No, or [ ] Yes, Describe:

VERTICAL TRANSPORTATION SYSTEMS

Elevator systems are present: [ ] No [X] Yes

Escalator systems are present: [X] No [ ] Yes

Who is responsible for maintaining and replacing the vertical transportation systems? [X] Tenant or [X] Property Owner Other Bldgs

Abnormal elevator problems in recent years? [ ] No, or [X] Yes, Describe: 8401 8511 Oil coolers installed to do excessive usage & Elev. malfunction

No. and capacity of passenger elevator(s): [ ] None, or list
8401 = 3, 8407 = 2, 8413 = 2, 8501 = 2, 8521 = 2, 8531 = 2

No. and capacity of freight elevator(s): [ ] None, or list
8401 = 1, 8501 = 1, 8521 = 1

Type of elevator(s): [X] Hydraulic, [ ] Overhead Traction, [ ] Other, Describe:

Elevator manufacturer: Schindler - most

Date of most recent state/city inspection: 10/2008

Elevator equipped with "fireman's" recall? [ ] No [X] Yes

Elevator age: See Attachment #1 Bldg Age + 8401 = 3 new elevators 2006

Is there a full-service contract in place? [ ] No [X] Yes

Elevator service/inspection frequency: [ ] Weekly, [X] Monthly, [ ] Quarterly [ ] As-Needed, [ ] Other, Describe: & when needed

Elevator maintenance contractor contact name and telephone number? Schindler (818) 336-3079

No. and location of escalators: [X] None, or list

Escalator manufacturer?

Date of most recent state/city inspection: ~~10/2007~~

Escalator age?

Is there a full-service contract in place? [ ] No [ ] Yes

Escalator service/inspection frequency: [ ] Weekly, [ ] Monthly, [ ] Quarterly [ ] As-Needed, [ ] Other, Describe:

Abnormal escalator problems in recent years? [ ] No, or [ ] Yes, Describe:

LIFE SAFETY AND FIRE PROTECTION SYSTEMS

Type of fire sprinkler systems: [ ] None, [X] Wet, [ ] Dry, [ ] Other, Describe: Some Tenants have pre-actions

Any fire sprinkler heads at the property subject to recalls? [X] No, or [ ] Yes, Describe:

Date of last 5-year sprinkler test:

5-year test inspection company:

Any fire sprinkler problems in recent years? [X] No, or [ ] Yes, Describe:

Name and telephone number of fire protection service company: Pyro-Comm (714) 902-8000

Is there a fire alarm throughout building(s)? [ ] No, or [X] Yes, Last tested: 11/2007

Is there a smoke evacuation system? [X] No, or [ ] Yes 8511 only Is there a stairwell pressurization system? [X] No, or [ ] Yes

Are there smoke detectors throughout building(s)? [ ] No, or [X] Yes, Last inspected:

Power for the smoke detectors throughout building(s): [ ] N/A, [ ] Battery, [X] Hardwired, or [ ] Both.

Are there fire extinguishers throughout building(s)? [ ] No, or [X] Yes, Last inspected: every November

Who is responsible for maintaining and replacing the fire suppression systems? [X] Tenant or [ ] Property Owner

The property features: [ ] None, [X] Fire Hoses, [X] Pull Boxes, [X] Lighted Exit Signs, [X] Audible Alarms, [X] Visible Alarms, [ ] Emergency Lighting, [X] Halon Systems, [ ] Chemical/Ansul Systems, [X] Fire Alarm Control Panel, [X] Other, Describe: L Cafe L Preaction in Tenants

Any special fire suppression systems at the property: [ ] None, or [ ] Yes, Describe:
8407 - Wellpoint & Countrywide 8501

Does the property feature a security alarm system? [ ] No, or [X] Yes, Describe:
L Tenants do - not property

Who is responsible for maintaining and replacing the security alarm systems? ☒ Tenant or ☐ Property Owner

INTERIOR FINISHES

Who is responsible for maintaining and replacing the interior finishes? ☒ Tenant or ☒ Property Owner - common areas in suites

For the common area interiors, what is your budget for repainting and replacement of finishes (carpet, vinyl, etc.)? ☐ None, ☐ N/A or describe: varies year to year

What is the age of the majority of finishes? ☐ Not known, or describe: varies by building

HANDICAP ACCESSIBILITY

Does the property generally comply with Americans with Disabilities Act (ADA) guidelines? ☐ No, or ☒ Yes. If no, Describe:

Has an ADA survey previously been completed for this property? ☒ Not known, ☐ No, or ☐ Yes, Please provide copy to ATC.

Have any ADA improvements been made to the property? ☐ Not known , ☐ No, or ☒ Yes, Describe: T.I's built to current ADA standards

Does a Barrier Removal Plan exist for the property? ☒ Not known, ☐ No, or ☐ Yes, Please provide copy to ATC.

Has the Barrier Removal Plan been reviewed/approved by an arms-length third party such as an engineering firm, architectural firm, building department, or other agency, etc.? ☒ Not known, ☐ N/A ☐ No, or ☐ Yes, Describe:

Have you received any accessibility complaints? ☒ No, or ☐ Yes, Describe:

Is any litigation pending related to ADA issues? ☒ No, or ☐ Yes, Describe:

QUESTIONNAIRE PREPARATION INFORMATION

Name: Lani Life Title: Real Estate Manager

Company: CB Richard Ellis Years with Property: 4

To the best of my knowledge, the statements contained in this document and the exhibits attached hereto are true and correct.

Signed: Lani Life Date: 8/19/08

Please have the following documents/drawings available for our review at the time of our site visit:

- ⇒ Past and Future Capital Budgets, Floor Plans, Site Plan, Construction Documents or Soils Report
- ⇒ ALTA/ACSM Land Title Survey
- ⇒ Certificates of Occupancy, Copies of Building Permits, Building and Fire Department violation schedules/notices, etc.
- ⇒ Fire protection and backflow inspection records
- ⇒ Elevator Maintenance Logs and Most Recent Inspection Certificate
- ⇒ Maintenance/Complaint Logs and Warranties (Roofing, Mechanical, Elevators, Fire Protection, etc.)
- ⇒ Tenant list
- ⇒ Mold Remediation Documents, previous engineering assessment reports
- ⇒ Provide means of access to roof; if none available, notify ATC prior to site visit

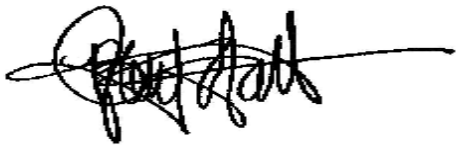
CERTIFICATION OF RESULTS

ATC Associates Inc. (ATC) has performed a Scenario Expected Loss (SEL) study of the Corporate Pointe at West Hills, located at 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue, in Los Angeles, California, hereinafter known as the Property. The scope of the SEL was consistent with MetLife Structural Review (Report) Guidelines and Criteria for SEL Analysis. This report includes ATC's findings, conclusions, and supporting documentation.

This report has been prepared for the exclusive use of MetLife Real Estate Investment. The report dated September 9, 2008 is for the use and benefit of, and may be relied upon, subject to the terms and conditions of our contract with MetLife Real Estate Investment, or any of its affiliates; and the agents and advisors, initial and subsequent holders from time to time of any debt and/or debt securities secured, directly or indirectly, by any participation interest in any such debt; any indenture trustee, servicer, or other agent acting on behalf of such holders of such debt and/or debt securities; any rating agencies; and the institutional provider(s) from time to time of any liquidity facility or credit support for such financing, and their successors and assigns. ATC Associates Inc. (ATC) acknowledges that MetLife Real Estate Investment, may rely on this report in consideration of financing for the Site. Photocopying of this document, in part or in whole, by parties other than those designated by MetLife Real Estate Investment, or use of this document for purposes other than is intended, is prohibited.

Respectfully submitted on September 9, 2008.

ATC ASSOCIATES INC.



Barry D. Hiett
Senior Project Manager

Peter Chang, P.E., S.E.
Senior Structural Engineer

1.0 EXECUTIVE SUMMARY

1.1 General Description

The Property is an office facility comprised of 11 buildings. The buildings at the Property are named/designated as follows: 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521, 8531 and the 22801 Buildings, by their numerical address. However, based on our scope of services and the instructions of the designated site contact, only 10 of the 11 buildings are included in this report. The 10 buildings included in ATC's scope of work are identified as the 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Buildings. The remaining building at the Property, 22801 Building and associated parking areas at the south side of the Property, were not included in ATC's scope of work.

The Property is situated on eight irregular-shaped land parcels and is considered to be of generally good quality construction. The Property is located to the northwest of the northwest corner of Fallbrook Avenue and Roscoe Boulevard. The street address of the Corporate Pointe at West Hills is 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue.

The three story 8401 Building is generally "T"-shaped. The 8401 Building contains one commercial office/lab tenant (Unilab Corporation) and a wireless provider (Pacific Bell Wireless, LLC) on the building roof. The building was reportedly originally constructed in 1959 with renovations in 1999 and 2005. Detail information regarding the renovations was not provided but appears to be similar to other buildings and includes exterior renovations and possible seismic strengthening in 1999 and roof replacement in 2005. The ground floor of the building is partially below grade at the west side of the building due to the topography of the site.

The one story 8403 Building is generally rectangular-shaped. The 8403 Building contains one lab tenant (Unilab Corporation). The building was reportedly originally constructed in 1984 with renovations in 1999 and 2005. Detail information regarding the renovations was not provided but appears to consist of exterior renovations in 1999.

The two story 8407 Building is generally rectangular-shaped. The 8407 Building contains two commercial office tenants (Blue Cross of California and Centex Title & Ancillary Services) and one vacant space on the second floor totalling approximately 8,246 square feet. The building was reportedly originally constructed in 1986, with renovations in 1999. Detail information regarding the renovation was not provided but appears to consit of exterior renovations. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

The one story 8411 Building is generally rectangular-shaped. The 8411 Building contains one food service tenant (Sodexo Marriott Services). The building was originally constructed in 1959, with renovations including reconstruction of the building and surrounding areas currently being performed and scheduled for completion by the end of 2008, although original date of substantial completion was scheduled no later than April 18, 2008 and final completion no later than May 18, 2008 according to the signed contract. Access to the building and surrounding areas was not available during ATC's site visit as the construction company was no longer present. Due to the current construction at the 8411 Building, a temporary leased cafe structure and bungalow is located between the 8415 and 8501 Buildings that is being utilized by the tenant.

The two story 8413 Building with full basement is generally rectangular-shaped and is contiguous and to the east of the 8415 Building. The 8413 Building is currently vacant. The building features an auditorium. The building was reportedly originally constructed in 1986, with renovations in 1999. Detail information regarding the renovation was not provided but appears to consit of exterior renovations.

The one story 8415 Building is generally square-shaped and is contiguous and to the west of the 8413 Building. The 8415 Building contains the Property central plant. The building was reportedly originally constructed in 1959.

The three story 8501 Building is generally "T"-shaped. The 8501 Building contains two commercial office tenants (Countrywide Home Loans, Inc. and Software Dynamics, Inc.), one vacant space totaling approximately 17,177 square feet on the ground floor and a wireless provider (New Cingular Wireless PCS) on the building roof. The building was reportedly originally constructed in 1959, with renovations in 1998/1999. According to available information, the renovations included reconstruction of the exterior walls including installing metal studs set outside the exterior walls and finished with plaster and set in windows, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the west and northwest sides of the building due to the topography of the site.

The four story 8511 Building is irregular-shaped. The 8511 Building contains one primary tenant (Sterling Software) who has sub-leased portions of the building. The building was originally constructed in 2000. The building has a large balcony with canopy at the north side of the fourth floor, two small balconies on the third and fourth floors at the south side of the building, auditorium and employee cafe on the ground floor.

The three story 8521 Building is generally "T"-shaped. The 8521 Building contains two commercial office tenants (Countrywide Home Loans, Inc. and The Boeing Company) and three vacant spaces totaling approximately 16,906 square feet on the ground floor. The building was reportedly originally constructed in 1959, with renovations in 1998/1999. According to available information, the renovations included reconstruction of the exterior walls including installing metal studs set outside the exterior walls and finished with plaster and set in windows, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

The two story 8531 Building is generally rectangular-shaped. The 8531 Building contains one research and development (R&D) tenant (The Boeing Company). The building was reportedly originally constructed in 1979, with renovations in 1998/1999. According to available information, the renovations included renovations to the exteriors, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

Parking for the Property is provided by asphalt pavement at grade and by a two-level parking garage. The balance of the Property consists primarily of paved parking areas, service/drive lanes, pedestrian walkways, landscaping, water feature with flowing creeks and small lake and surrounding seating areas and a service yard adjacent to the 8401 Building for Unilab Corporation.

The Property is located in Seismic Zone 4 based on the "Seismic Zone Map of the United States", Figure No. 16-2 in the 1997 Uniform Building Code. This area is defined as an area with a high probability of damaging ground motion. The Property is not located within an Earthquake Fault Zone as defined in the Alquist-Priolo Earthquake Fault Zoning Act.

1.2 Findings and Conclusions

Based on our field observations on August 28, 2008 and using the damage prediction method developed by Thiel and Zsutty and ground fault, seismicity and acceleration data from EQFAULT, EQSEARCH and FRISKSP software, the SEL for the Corporate Pointe at West Hills in Los Angeles, California range from 11 percent (for a 475-year return period) to 27 percent (for a 2,375-year return period) of the replacement cost of the buildings. The Modified Mercalli Intensity at the Property is X based on the nearest active fault, Northridge (E. Oak Ridge), less than one mile from the Property.

RESULTS SUMMARY TABLES

[1a] SITE SEISMICITY per evaluation of Scenario Loss (SL):

SCENARIO LOSS (SL)				
Scenario/ Ground Motion	**Select max. MMI (modified Mercalli earthquake intensity)**	**Corresponding PGA (peak ground acceleration values)**	**SEL - (scenario expected loss) Mean or 50% damageability**	**SUL - (scenario upper loss) 90% damageability**
BLDG 8401 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8403 DBE - 475 year event	X	0.54	15%	18%
MCE-2,375 year event	XI	0.89	20%	23%
BLDG 8407 DBE - 475 year event	X	0.54	17%	20%
MCE-2,375 year event	XI	0.89	23%	27%
BLDG 8411 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8413 DBE - 475 year event	X	0.54	17%	20%
MCE-2,375 year event	XI	0.89	23%	27%
BLDG 8415 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8501 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8511 DBE - 475 year event	X	0.54	11%	15%
MCE-2,375 year event	XI	0.89	15%	20%

SCENARIO LOSS (SL)				
BLDG 8521 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8531 DBE - 475 year event	X	0.54	15%	18%
MCE-2,375 year event	XI	0.89	21%	24%

SITE STABILITY:

		Very Low	Low	Medium	High	Very High

[4]	**SURFACE FAULT RUPTURE POTENTIAL**		X			
[5]	**LAND SLIDE POTENTIAL**		X			

[6] **SOIL PROFILE** Soil Type S_D – Defined in 1997 UBC as Soft Soil Profile

		Low (< 2 mos)	Medium (2 to 6 mos)	High (>6 mos)
[10]	**LOSS OF USE:**		X	

[*n*] refers to numbering of items above

1. Site Seismicity – determine the estimated Modified Mercalli Intensity (MMI) level for the site due to the given probabilistic earthquake scenarios of 10% probability of exceedance in 50 years (return period of 475 years – Design Basis Earthquake, DBE) and 2% probability of exceedance in 50 years (return period of 2,375 years – Maximum Capable Earthquake, MCE) unless other seismic scenarios are specifically requested for individual property reviews.. Alternate scenarios should be made available, at the option of MetLife, for substitution or addition in the report.
2. Overview of zone and faults associated with or near the site that are predicted to affect the building.
3. Liquefaction potential as Very Low, Low, Medium, High or Very High.
4. Surface fault rupture potential as Very Low, Low, Medium, High or Very High.
5. Landsliding potential as Very Low, Low, Medium, High or Very High.
6. Soil profile as defined by the latest edition of the Uniform Building Code.
7. Summary of site seismic hazards.
8. Earthquake physical damage estimate for the designated MMI levels.
9. Summary of seismic risk assessment in the tables below.
10. An estimate of the Loss of Use of the building as Low (less than 2 months), Medium (2 to 6 months) and High (greater than 6 months).

2.0 PURPOSE AND SURVEY APPROACH

2.1 Purpose

The purpose of this Scenario Expected Loss (SEL) report is to provide the client with a seismic loss assessment for an asset based on the interpretation of statistical calculations, and the structural and seismic condition of the Property as ascertained by field observations and available documentation. Our result is not intended to serve as a guarantee of how the Property will perform in a seismic occurrence. Rather, it is a review, based upon statistical and historical data, which is intended to suggest how the Property will be affected by a probable seismic event.

In the preparation of this report, ATC has provided a professional opinion regarding the damage to be expected as a result of projected earthquake ground motion based solely on the observed building type, condition and Property location. The opinion expressed in the SEL is an estimate based on probability of seismic activity and the resistance of this type facility to damage from the seismic activity. The actual loss value is highly variable and would be known only after an actual earthquake.

2.2 Survey Approach

At present, there is no single universally accepted methodology for estimating the seismic risk of structures. Methods that are currently used depend to a large degree on the subjective interpretations of the professional.

Scenario Expected Loss (SEL) is a term used historically to characterize building damageability in earthquakes: the financial loss that the property is likely to sustain as a result of future earthquake damages. It has had a number of significantly different explicit and implicit definitions. Per the ASTM E2026-99 "Standard Guide for the Estimation of Building Damageability in Earthquakes" it is widely acknowledged that this term is less accurate than the terms Probable Loss (PL) and Scenario Loss (SL), whose definitions are precise, and that these terms be used to characterize the earthquake damageability of buildings and groups of buildings.

Irrespective of the definition used, the loss estimation process reflects uncertainty in both the seismic environment and the building's performance. The fact that one cannot predict with certainty the actual amount of earthquake damage is reflected in the term "probable". Earthquake loss estimate explicitly recognizes that there is uncertainty implicit in the value given. The understanding of the earthquakes and the response of structures are not yet sufficient to make exact statements on damageability. The result of this series of uncertainties is that the current state-of-the-art requires that the earthquake loss estimates be determined in a probabilistic manner.

The damage estimate definition that is frequently used in the seismic assessment industry and therefore used in this report for determination of the damageability of the property:

Probable Loss (PL): For a given return period this is the amount of loss that a property is expected to meet or exceed on an average basis for a given return period. PL values are expressed as a percentage of building replacement current construction cost. The period of recurrence for the postulated earthquake (475-year earthquake in this case) in the scenario event is always stated with loss estimate.

Scenario Loss (SL): The earthquake loss to the building(s) from earthquake shaking, not including contents or equipment, resulting from a specified ground motions or specified scenario event on specific faults affecting the building. SL values are expressed as a percentage of building replacement current construction cost. The probability of SL value being exceeded in the scenario event is always stated with loss estimate.

The scenario ground motion very often used is the 475-year return period ground motion, which is also often stated as the ground motion, which has a 10% probability of being exceeded in 50 years. *This criterion has been used to estimate the earthquake loss of this subject property.*

The Scenario Upper Loss (SUL-PML_{90}) is the expected value of the loss in the event of the postulated earthquake (475-year earthquake in this case) having 90% confidence level (i.e., 9 out of 10 similar buildings will have damage equal to or less than the SUL value in the event of the postulated earthquake).

The Scenario Expected Loss (SEL-PML_{50}) is the expected value of the loss in the event of the postulated earthquake (475-year earthquake in this case) having average (mean) loss due to the scenario event.

Consistent with the industry practice, the earthquake loss estimates reported here do not include possible earthquake triggered losses from foundation soil failure, fires, water damage, or related business interruption or losses to the contents of the building.

Our analysis of this particular site employs the damage prediction method developed by Messrs. Charles C. Thiel, Jr. and Theodore C. Zsutty, (see "Earthquake Spectra" Vol. 3, No. 4: Nov. 1987 entitled **Earthquake Characteristics and Damage Statistics**) and ASTM E2026-99 "Standard Guide for the Estimation of Building Damageability in Earthquakes". This method is based on damage observations made after previous earthquakes discussed in the Applied Technology Council Publication No. 13. The standard damage prediction is based on construction type, geometry, quality of construction, on the geological characteristics of the site and its susceptibility to major ground motion and the soil response to a predicted ground motion, and is based on the perceived ability of the design to resist the predicted ground motion.

The process involved in developing the seismic assessment is not exact and is subject to a number of estimations and projections. These estimations typically include the:

- Underlying soil response.
- Possible magnitude and duration of the earthquake.
- Effects of the distance to the causative fault.
- Type of building structure.
- Quality of the structure's design and construction.

In order to implement the method cited above, the following factors were evaluated and quantified:

- Construction type and quality of the subject building including building geometry, structural systems to resist both vertical and lateral loads, and previous structural upgrades.
- Characteristics of the site.
- Projected intensity of ground motions.
- Nature of the foundation soil based on area-wide seismic and geological data.
- Appropriateness of the original design and details to resist seismic forces.

The seismic assessment is an estimate of losses expected to occur from an earthquake attributed to local geological faults reported as a percentage of building replacement value. This assessment was prepared utilizing data relative to the Property that was obtained during our Property visit. No calculation of structural capacity was made or reviewed as a part of this loss calculation. In the preparation of this report, ATC has provided a professional opinion regarding the damage to be expected as a result of projected earthquake ground motion based solely on the observed building type, condition and site location. A site-specific geologic study was not conducted as part of this investigation.

In performing this calculation, we visited the Property and observed the general building configuration, building exterior components, and portions of the accessible structure as well as the overall quality of construction. A complete set of structural design drawings were not available for our review.

3.0 SITE CHARACTERISTICS

3.1 Location

The Property is located to the northwest of the northwest corner of Fallbrook Avenue and Roscoe Boulevard. The street address of the Corporate Pointe at West Hills is 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue in Los Angeles, California.

3.2 Site Characteristics

The Property slopes moderately down from the north to the south across the Property as the site is located near the base of a hillside. No abnormal features such as ground fractures, settlement areas, or areas of unintended ponding water were identified.

3.3 Property Improvements

The Property is a office facility comprised of 11 buildings. The buildings at the Property are named/designated as follows: 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521, 8531 and the 22801 Buildings, by their numerical address. However, based on our scope of services and the instructions of the designated site contact, only 10 of the 11 buildings are included in this report. The 10 buildings included in ATC's scope of work are identified as the 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Buildings. The remaining building at the Property, 22801 Building and associated parking areas at the south side of the Property, were not included in ATC's scope of work.

The Property is situated on eight irregular-shaped land parcels and is considered to be of generally good quality construction. The Property is located to the northwest of the northwest corner of Fallbrook Avenue and Roscoe Boulevard. The street address of the Corporate Pointe at West Hills is 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue.

The three story 8401 Building is generally "T"-shaped. The 8401 Building contains one commercial office/lab tenant (Unilab Corporation) and a wireless provider (Pacific Bell Wireless, LLC) on the building roof. The building was reportedly originally constructed in 1959 with renovations in 1999 and 2005. Detail information regarding the renovations was not provided but appears to be similar to other buildings and includes exterior renovations and possible seismic strengthening in 1999 and roof replacement in 2005. The ground floor of the building is partially below grade at the west side of the building due to the topography of the site.

The one story 8403 Building is generally rectangular-shaped. The 8403 Building contains one lab tenant (Unilab Corporation). The building was reportedly originally constructed in 1984 with renovations in 1999 and 2005. Detail information regarding the renovations was not provided but appears to consist of exterior renovations in 1999.

The two story 8407 Building is generally rectangular-shaped. The 8407 Building contains two commercial office tenants (Blue Cross of California and Centex Title & Ancillary Services) and one vacant space on the second floor totalling approximately 8,246 square feet. The building was reportedly originally constructed in 1986, with renovations in 1999. Detail information regarding the renovation was not

provided but appears to consit of exterior renovations. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

The one story 8411 Building is generally rectangular-shaped. The 8411 Building contains one food service tenant (Sodexo Marriott Services). The building was originally constructed in 1959, with renovations including reconstruction of the building and surrounding areas currently being performed and scheduled for completion by the end of 2008, although original date of substantial completion was scheduled no later than April 18, 2008 and final completion no later than May 18, 2008 according to the signed contract. Access to the building and surrounding areas was not available during ATC's site visit as the construction company was no longer present. Due to the current construction at the 8411 Building, a temporary leased cafe structure and bungalow is located between the 8415 and 8501 Buildings that is being utilized by the tenant.

The two story 8413 Building with full basement is generally rectangular-shaped and is contiguous and to the east of the 8415 Building. The 8413 Building is currently vacant. The building features an auditorium. The building was reportedly originally constructed in 1986, with renovations in 1999. Detail information regarding the renovation was not provided but appears to consit of exterior renovations.

The one story 8415 Building is generally square-shaped and is contiguous and to the west of the 8413 Building. The 8415 Building contains the Property central plant. The building was reportedly originally constructed in 1959.

The three story 8501 Building is generally "T"-shaped. The 8501 Building contains two commercial office tenants (Countrywide Home Loans, Inc. and Software Dynamics, Inc.), one vacant space totaling approximately 17,177 square feet on the ground floor and a wireless provider (New Cingular Wireless PCS) on the building roof. The building was reportedly originally constructed in 1959, with renovations in 1998/1999. According to available information, the renovations included reconstruction of the exterior walls including installing metal studs set outside the exterior walls and finished with plaster and set in windows, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the west and northwest sides of the building due to the topography of the site.

The four story 8511 Building is irregular-shaped. The 8511 Building contains one primary tenant (Sterling Software) who has sub-leased portions of the building. The building was originally constructed in 2000. The building has a large balcony with canopy at the north side of the fourth floor, two small balconies on the third and fourth floors at the south side of the building, auditorium and employee cafe on the ground floor.

The three story 8521 Building is generally "T"-shaped. The 8521 Building contains two commercial office tenants (Countrywide Home Loans, Inc. and The Boeing Company) and three vacant spaces totaling approximately 16,906 square feet on the ground floor. The building was reportedly originally constructed in 1959, with renovations in 1998/1999. According to available information, the renovations included reconstruction of the exterior walls including installing metal studs set outside the exterior walls and finished with plaster and set in windows, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

The two story 8531 Building is generally rectangular-shaped. The 8531 Building contains one research and development (R&D) tenant (The Boeing Company). The building was reportedly originally constructed in 1979, with renovations in 1998/1999. According to available information, the renovations included renovations to the exteriors, replacement of the building roof, and seismic strengthening the building by adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The ground floor of the building is partially below grade at the east side of the building due to the topography of the site.

Parking for the Property is provided by asphalt pavement at grade and by a two-level parking garage. The balance of the Property consists primarily of paved parking areas, service/drive lanes, pedestrian walkways, landscaping, water feature with flowing creeks and small lake and surrounding seating areas and a service yard adjacent to the 8401 Building for Unilab Corporation.

The site contact indicated that the following work was performed during the last five years: Waterproofed the 8401 and 8501 Buildings in 2005 ($325,000 for the 8501 Building); renovated the central plant including replacement of two of the central plant chillers, boilers, piping distribution and related equipment in 2004005; replaced the 8401 Building roof in 2005; installed oil coolers to the elevators in the 8511 Building in 2006 ($22,000); re-replaced the central plant boilers at the end of 2007; miscellaneous parking enhancements in 2006/2007; seal coated and striped the parking areas at the 8511, 8401 and 8403 Buildings in 2007; asphalt overlay at the central parking at the east side of the 8407 Building in 2007; asphalt overlay at the parking areas at the 8531 Building in 2008; constructed the two-level parking garage at the east side of the Property in 2006/2007; utility submetering installation in 2006/2007 ($425,000); replaced the lower roof and repaired and installed a polyurethane foam coating at the upper roof of the 8415 Building in 2008 ($110,000); added two concrete pads, furniture and landscape to pond area in 2007/2008 ($95,000); renovated the boundary wall at the west side of the Property in 2007/2008 ($125,000); renovation of the 8411 in 2008 (not to exceed $5,994,024.00 according to signed contract but reportedly is totaling approximately $11,000,000) and current exterior sitework around the 8411 Building ($1,621,686). Additionally, Ms. Life reported that renovations to the 8413 Building including exterior facades, relocation of the south exit stairway to the north side, the addition of an entry on the south side, renovate the north main entry, add a fitness center at the basement and renovate the auditorium is scheduled to be performed in 2009. The site contact also reported that no fires, floods, storms, or other major incidents have damaged the Property.

3.4 Current Use of the Property

The Property is currently used for professional offices purposes.

3.5 Soil Type and Reference

The soil conditions at a site may influence the damageability of a structure in several ways including the fact that soft soils tend to amplify ground motion and collateral hazards such as soil liquefaction, sliding or rupturing can potentially result in considerable damage to a structure.

According to available documentation, the soils in the area of the Property are formed from alluvium. According to the Geologic Map of California, the area consists of Cenozoic aged land.

It should be noted that specific soil profile data, based on actual field borings, was not obtained for this site, since this would have been beyond the scope of these services.

3.6 Liquefaction Potential

Liquefaction of soil is a phenomenon wherein the soil is transformed into a fluid-like condition due to increased pore water pressure caused by strong ground shaking. Liquefaction potential has been found to be the greatest where the groundwater level is shallow and saturated, loose fine sands occur within a depth of about 50 feet or less. Liquefaction potential decreases as grain size and clay and gravel content increase. As ground acceleration and duration of shaking increase during an earthquake, liquefaction potential increases. The liquefied sands undergo a temporary loss of strength that commonly results in displacement of the ground surface due to factors such as loss of bearing capacity, ground settlement, and lateral spreading. The resulting damage to structures constructed over the liquefied soils can be significant.

Our review of the California State Department of Conservation's Geologic Map, 1991 and the Canoga Park Quadrangle of the Reconnaissance Seismic Hazard Maps (dated February 1, 1998) for the Property indicates that the Property location is associated with moderate liquefaction susceptibility.

3.7 Landslide Potential

Slopes that are susceptible to landslides and/or mudslides are often destabilized during severe earthquake shaking. Predicting this potential is difficult in all but the most precarious physical situations. Slope Stability, and a slope's performance during severe shaking is influenced by many factors, including the stratigraphy of soils, the angle of incidence of the slope, vegetation, soil drainage, and other factors.

The buildings at the site are situated on sloped terrain. The potential for landslide due to an active earthquake at the site is considered moderate.

3.8 Ground Fault Rupture Potential

The buildings at the Property are not located within an Earthquake Fault Zone as defined in the Alquist-Priolo Earthquake Fault Zoning Act. The potential for fault surface rupture potential due to an active earthquake at the site is considered low.

4.0 BUILDING CHARACTERISTICS AND SITE OBSERVATIONS

On August 28, 2008, ATC visited the Property to visually inspect the exterior and interior of the Property components, systems and elements that are visible and accessible for the purposes of identifying and classifying the characteristics of the building, review as-built conditions, and to identify structural deficiencies as they pertain to inadequate gravity and horizontal loading under current code requirements.

Based on our site observations, it is our opinion that the buildings at the subject Property have been well maintained and is in overall good condition. The structural systems appeared to be in generally good condition and well maintained from a structural perspective, with no significant areas of distress observed.

The following characteristics are present at the buildings at the Property:

Number of Stories:	See following paragraphs
Building Code Design Edition:	See following paragraphs
Year Constructed:	1958-1960; 1984-1986 and 2000
Year Renovated/Upgraded:	1994-2000
Structural Irregularities:	Generally Irregular and rectangular-shaped in plan view
Overall Construction Quality:	Good

The Corporate Pointe at West Hills Property has a six level concrete parking structure located west of the Corporate Pointe at West Hills Office Building. The parking structure appeared generally to be in generally good condition and well maintained from a structural perspective, with no significant areas of distress observed.

Within the authorized scope of this evaluation, definitive determination of the structural systems was not possible because ATC was able to make only limited observations due to lack of physical accessibility, no destructive testing was performed and ATC did not have the opportunity to review a complete set of as-built structural drawings. Our non-invasive surface observations, review of available construction documentation and our experience with buildings of similar type and age indicate the following construction:

Foundation

The foundation system for the onsite structures typically consists of the reinforced concrete spread footings and reinforced concrete tie beams. The 8413 Building features a full basement and the ground floor of the 8401, 8407, 8501, 8521 and 8531 Buildings are partially below grade on one side of the building due to the topography of the Property.

The allowable soil bearing values indicated on the structural strengthening drawings for imposed dead and live loads are 10,000 pounds per square foot. The interior columns are typically founded on rectangular concrete pad footings, and the concrete walls are supported on continuous footings. The footings bear on the shale bedrock. The ground floor of the buildings consists of a 5"-thick concrete slab-on-grade.

The columns of the steel space frame in Building 8511 are founded on rectangular pad footings. Reinforced concrete grade beams tie the pad footings supporting the moment-resisting frame columns. The grade-beams are detailed to provide rotational fixity for the column bases. The ground floor consists of a five-inch-thick concrete slab-on-grade reinforced with a rectangular grid of 1/2"-diameter steel bars spaced at 16" on-center each direction.

The building foundation systems were not observed, however a complete set of as-built structural drawings were available on site. The ATC representative observed no improper alignment, cracking or other indications that the foundation systems are in less than adequate condition.

The 8401, 8501, 8521 and 8531 Buildings frame consist primarily of perimeter and interior concrete columns supporting the upper level and roofing systems. The upper level and roof framing systems consists of two-way waffle slabs. According to available documentation, the buildings also feature reinforced concrete shear walls distributed throughout the buildings.

The building roof and floor structures are conventionally-reinforced concrete pan-joist, or waffle, slabs. The waffle slab system typically consists of a 2"- to 3"-thick concrete slab cast integrally with regularly spaced concrete joists arranged in a rectangular grid. The joists span between concrete girders which frame between interior and perimeter circular concrete columns.

According to available documentation, the 8401 Building underwent seismic repairs and strengthening after the 1994 Northridge earthquake that caused moderate to large diagonal shear cracks in all concrete shear walls, spalling of concrete at door openings, at jambs and corners, at pilaster bases and cracks in slab and waffle slab joists.

Concrete cracks in walls, slabs and joists, which resulted from the Northridge earthquake, were repaired by epoxy injection. The building was strenghtened by the addition of new concrete shear walls adjacent to existing shear walls at the first and second floor levels. Concrete column capacities were increased at ends of shear wall by the addition of reinforcement and concrete incasement. Repair work and strengthening work was performed in compliance with the 1992 Los Angeles City Building Code and 1991 UBC.

According to available documentation, a seismic retrofit was reportedly performed in 1999 at the 8501, 8521 and 8531 Buildings and included adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The seismic upgrade reportedly enabled each building to comply with the 1994 Uniform Building Code (UBC).

Lateral wind and seismic forces acting on the concrete structures are resisted by the concrete floor and roof diaphragms, or deep horizontal beams, which span between reinforced concrete shear walls distributed throughout the building plans. During the 1999 seismic retrofit of each building, the original shear walls were strengthened by adding reinforcing and several inches of pneumatically placed concrete against one wall face. New boundary elements also were provided at the ends of the strengthened walls. The lateral diaphragm forces are transferred to the concrete walls through embedded steel reinforcing bars; the concrete shear walls transfer the lateral forces to the concrete foundations.

The 8403 Building frame consists primarily of a pre-engineered steel frame structure with CMU perimeter walls and steel columns supporting the roof framing system. The roof framing system consists of structural steel beams and light-gauge steel joists supporting the roofing system with vinyl-backed insulation below.

The building is a one-story rectangular shaped pre-engineered steel framed building with transverse steel bent frame supporting long span "Z" purlin between bents. A system of diagonal rod bracing and metal decking provide roof diaphragm seismic bad transfer to bents in the transverse direction. In the longitudinal direction, a system of diagonal rod bracing, in the plane of the wall, transfers lateral loads to perimeter masonry block shear walls which extend approximately mid-height of the building.

As part of the tenant improvement work for the building, new wall openings were created and existing openings closed by the application of shotcrete. Repair and alteration work was performed in compliance with the 1992 Los Angeles City Building Code and 1991 Uniform building Code.

The 8407 and 8413 Buildings frame consist primarily of CMU walls with interior pilaster and interior steel columns supporting the upper level and a pre-engineered rigid steel frame structure with steel columns supporting the roof framing system. The upper level framing system consists of structural steel beams and open web steel joists supporting fluted metal decking with concrete topping. The roof framing system consists of structural steel beams and light-gauge steel purlins supporting the roofing system with vinyl-backed insulation below.

Both buildings are two-story rectangular building of hybrid construction. First floor level consists of conventional construction of exterior masonry wall with steel beam, bar joist and concrete fill over metal deck. The second level framed structure is a pre-engineered building consisting of steel bent frames supporting light steel roof purlins. The building experienced no significant damage as a result of the Northridge earthquake.

According to available documentation, the 8407 Building underwent seismic repairs after the Northridge earthquake that consisted of repairing CMU wall cracks by epoxy injection and repairing spalled and cracked pilasters at beam and pilaster connections by epoxy injection and grouting. Repair work was performed in compliance with the 1992 Los Angeles City Building Code and 1991 UBC.

The 8415 Building frame consists primarily of concrete tilt-up wall panels with interior pilasters supporting the roof framing system. The roof framing system consists of structural open web steel trusses and beams supporting steel decking with concrete topping.

The building is a rectangular one-story tilt-up concrete wall building with steel roof framing. Strategically located horizontal diagonal bracing transfers lateral building loads to exterior and interior concrete shear walls. Repair and limited strengthening were performed in compliance with the 1992 Los Angeles City Building Code and 1991 Uniform building Code.

According to available documentation, the 8415 Building underwent seismic repairs after the Northridge earthquake that resulted in wall cracks, concrete spalls at the end intersections where the interior wall meets the exterior north and south walls. The earthquake damages were repaired by epoxy injection and grouting. Additionally, the structure was strengthened by replacing existing machine bolts with high strength bolts at horizontal diagonal lateral bracing connections, supplemental steel channel members were added to all the roof level chord continuity.

The 8511 Building frame consists primarily of a steel moment frame structure with steel columns supporting the upper level and roof framing systems. The upper level and roof framing systems consist of structural steel girders and beams supporting fluted metal decking with concrete topping.

The vertical load-carrying system, i.e., roof and floor framing systems, beams and columns, and foundation system of the building, appears to have adequate strength and stiffness to resist the construction dead load plus code-specified live loads.

The lateral force-resisting systems for the building appear to be designed in accordance with the 1997 UBC and currently accepted standards of care. The office building appears to have sufficient redundancy of the lateral load resisting system to meet the stringent 1997 UBC criteria. The building moment frame configuration meets the strong column, weak beam criteria of the 1997 UBC.

The office building moment frames utilize Reduced Beam Section (RBS) connections, which are an improved alternate connection to the typical pre-Northridge earthquake moment frame connections used in the 1970s through early 1990s. This connection design was developed in response to the poor performance of the Pre-Northridge connection in the 1994 Northridge and other recent earthquakes. The connections are similar to those that performed poorly in the Northridge earthquake; however, they have important modifications that reduce the risk of failure compared to the pre-Northridge configuration. However, the connections may still be susceptible to premature failure in significant seismic events and therefore create some increased seismic risk for the building. The connections utilize steel girders that have notches or necked-down regions cut out of their top and bottom flanges adjacent the welded beam-to-column joints. The notches are provided to help assure that plastic-hinges develop in the moment-frame beams prior to fracture of the welded joint connections. The RBS connection can enhance the performance of the beam-to-column connections, but may not be the end-all solution to the connection dilemma. In determining an appropriate level of seismic risk to the building, consideration must be given to the fact that high tri-axial stresses, panel zone deformation, and variable material properties may still negatively contribute to the performance of the connections.

Lateral wind and seismic forces acting on the structure are resisted by composite floor and roof diaphragms spanning between the vertical resisting elements. The vertical lateral-force resisting elements of the building consist of specially detailed steel moment-resisting frames utilizing the Reduced Beam Section (RBS) joint connection, commonly referred to as the "dogbone connection". The moment frames consist of two, six-bay frames in the longitudinal direction and two, five-bay frames in the transverse direction. The lateral diaphragm forces are transferred to the moment frames through steel welded studs fastened to the top flange of the frame girders. The moment frames act primarily in shear and bending to transfer the lateral forces to the concrete foundations.

The 8531 Building frame consists primarily of reinforced poured-in-place concrete walls and interior columns supporting the upper level and roof framing systems. The upper level and roof framing systems consist of poured-in-place pan-joist slabs. According to available documentation, the building also features reinforced concrete shear walls distributed throughout the building.

According to available documentation, a seismic retrofit was reportedly performed in 1999 at the 8531 Building and included adding reinforcement and several inches of pneumatically placed concrete against one wall face and new boundary elements at the ends of the existing shear walls. The seismic upgrade reportedly enabled each building to comply with the 1994 Uniform Building Code (UBC).

The ATC representative observed no improper alignment, cracking or other indications that the framing systems are in less than good condition. Efflorescence indicative of water intrusion was observed at the north side of the 8413 Building basement; however, a concrete swale and catch basin was installed at the north side of the building to mitigate the water intrusion issue. The structural systems appeared to be in

generally good condition and well maintained from a structural perspective, with no significant areas of distress observed. In general, structural systems can be expected to provide 50 or more years of useful life.

The two-level parking structure at the east side of the Property is of a monolithic reinforced poured-in-place concrete structure with reinforced concrete slab-on grade and concrete columns supporting the upper deck. The upper deck consists of reinforced concrete girders and beams supporting a concrete slab. The parking structure features an expansion joint near the center of the structure with double columns and beams. The perimeter of the parking structure is enclosed by unpainted CMU walls. The ATC representative observed no improper alignment, cracking or other indications that the garages are in less than good condition. However, efflorescence was observed on both the exterior and interior faces of the CMU walls.

This is indicative of moisture penetration into the wall core, causing the lime to leach out of the mortar or block itself. This process will continue unless the surfaces are sealed with a clear, spray applied masonry sealer.

5.0 SEISMIC CHARACTERISTICS OF THE AREA

5.1 Site Seismicity

The Richter magnitude scale gives an indication of the absolute energy released in an earthquake. However, generally speaking, the further a building is from the epicenter, the less shaking it will experience. As such, just considering the magnitude of an earthquake does not give an adequate picture of the building's risk, since the distances from potential earthquake sources to the subject site must also be considered.

The Modified Mercalli Intensity (MMI) Scale considers the reduction, or attenuation, of ground motion as the distance between source and site increases; the scale is calibrated from I to XII. For example, in one large earthquake, a site near the fault may experience intensity IX shaking, while a site many miles away may experience only intensity VII shaking. A copy of the MMI Scale containing a brief description of the effect of each MMI level is included as an attachment to this Report.

Several earthquakes of moderate-to-large magnitude have occurred in California in recent history. The following table lists historical earthquakes with magnitude greater than 5.9 (Richter) and their corresponding effect (MMI) at the subject Property; these earthquakes are within a 100-mile radius of the subject Property as recorded since 1900:

HISTORIC EARTHQUAKES

North Latitude	West Longitude	Date	Richter Magnitude	Site Acceleration (g)	Site MMI	Approx. Distance to Site - Mi. (km.)
34.2130	118.5370	01/17/1994	6.70	0.309	IX	5.2 (8.3)
34.4110	118.4010	02/09/1971	6.40	0.113	VII	18.2 (29.3)

33.7500	117.0000	04/21/1918	6.80	0.038	V	98.7 (158.8)

5.2 Local Faults

Based on various geological and seismological characteristics, it is possible to estimate the theoretical maximum magnitude a given fault can generate. It is also possible to estimate the probability that a given magnitude earthquake will occur in a given future time window.

The following table lists the most potentially damaging faults (within a 50-mile radius) found in the area of the Property. The table shows the potential loss to the Property in the event of an earthquake of the Richter magnitude listed in the third column generated by the fault listed in the first column:

LOCAL FAULTS				
Fault or Source Name	**Approx. Distance Mi. (km.)**	**Maximum Earthquake Magnitude**	**Peak Site Acceleration (g)**	**Estimated Site MMI**
NORTHRIDGE (E. Oak Ridge)	<1.0 (<1.6)	7.0	0.571	X
SIMI-SANTA ROSA	6.8 (10.9)	7.0	0.310	IX
SANTA SUSANA	6.8 (11.0)	6.7	0.263	IX
ANACAPA-DUME	9.8 (15.8)	7.5	0.316	IX
SIERRA MADRE (San Fernando)	10.0 (16.1)	6.7	0.204	VIII
OAK RIDGE (Onshore)	10.1 (16.2)	7.0	0.238	IX
HOLSER	10.3 (16.6)	6.5	0.180	VIII
MALIBU COAST	10.4 (16.8)	6.7	0.198	VIII
VERDUGO	12.1 (19.4)	6.9	0.199	VIII
SANTA MONICA	12.1 (19.5)	6.6	0.169	VIII
HOLLYWOOD	13.2 (21.3)	6.4	0.143	VIII
SAN GABRIEL	14.5 (23.4)	7.2	0.167	VIII
SAN CAYETANO	16.6 (26.7)	7.0	0.166	VIII
NEWPORT-INGLEWOOD (L.A.Basin)	18.4 (29.6)	7.1	0.133	VIII

CHINO-CENTRAL AVE. (Elsinore)	49.3 (79.4)	6.7	0.062	VI

5.3 Effective Peak Ground Acceleration

The Property is located in Seismic Zone 4 based on the "Seismic Zone Map of the United States", Figure No. 16-2 in the 1997 Uniform Building Code. This area is defined as an area with a high probability of damaging ground motion.

The peak ground acceleration for the Property was determined using FRISKSP software. The peak ground acceleration is approximately 0.54g (for a 475-year return period) and 0.89g (for a 2,375-year return period). This calculation was made using the mean ground motion attenuation relations for a Type "D" site classification in Boore et al. (1997) and a probabilistic seismic hazard analysis. Dispersion was included by considering the mean-plus-one standard deviation attenuations in Boore et al.

6.0 SITE SEISMICITY AND PROBABLE MAXIMUM LOSS

The SEL is expressed as a damage ratio that is defined as the approximate repair cost resulting from the previously tabulated possible seismic sources divided by the replacement cost of the building. The SEL percentage consists of the structural and major architectural elements only and does not include special features such as finishes, MEP systems and so forth, nor does in take into account associated costs from death or injury or loss of service. In addition, replacement costs do not include the value of the land nor do they refer to the market value of the Property.

The effects from all of the faults in the area may be taken into account to derive composite estimates of the ground shaking that would affect the site. Two scenarios have been described. We refer to these seismic hazard scenarios as Lower Level Event (LLE) and Upper Level Event (ULE) hazards, having mean return periods of approximately 475 and 2,375 years, respectively. These anticipated accelerations have a 10% and 2% probability of exceedence in an assumed 50-year life of the buildings, respectively.

6.1 Earthquake Damage Estimate

Based upon the epicenter's location and the site soil conditions in conjunction with the information available at the time of this review, the SEL for this Property is shown below:

EARTHQUAKE DAMAGE ESTIMATE – CORPORATE POINTE AT WEST HILLS
(As a Percentage of Building Replacement Value)

SCENARIO LOSS (SL)				
Scenario/ Ground Motion	**Select max. MMI (modified Mercalli earthquake intensity)**	**Corresponding PGA (peak ground acceleration values)**	**SEL - (scenario expected loss) Mean or 50% damageability**	**SUL - (scenario upper loss) 90% damageability**
BLDG 8401 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8403 DBE - 475 year event	X	0.54	15%	18%
MCE-2,375 year event	XI	0.89	20%	23%
BLDG 8407 DBE - 475 year event	X	0.54	17%	20%
MCE-2,375 year event	XI	0.89	23%	27%
BLDG 8411 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8413 DBE - 475 year event	X	0.54	17%	20%
MCE-2,375 year event	XI	0.89	23%	27%
BLDG 8415 DBE - 475 year event	X	0.54	16%	19%

SCENARIO LOSS (SL)				
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8501 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8511 DBE - 475 year event	X	0.54	11%	15%
MCE-2,375 year event	XI	0.89	15%	20%
BLDG 8521 DBE - 475 year event	X	0.54	16%	19%
MCE-2,375 year event	XI	0.89	22%	25%
BLDG 8531 DBE - 475 year event	X	0.54	15%	18%
MCE-2,375 year event	XI	0.89	21%	24%

6.2 Loss of Use of the Complex

The loss of use estimate for the building at the Property in the event of maximum probable seismic activity is Medium (two to six months).

7.0 LOSS ASSESSMENT LIMITATIONS

The loss assessment included in this report focused on the primary structural and architectural systems of the building. The following primary structural and architectural systems are typical of what was included in the loss assessment:

7.1 Primary Structural Systems

1. Foundation systems which may include floor slabs, thick edge slabs, grade beams, foundation walls, retaining walls, piers, piles, caissons, column pads and other load bearing foundation systems and substructures.
2. Vertical structural systems that may include bearing walls, columns, posts, girders, beams, trusses and other principle vertical load transfer systems.
3. Horizontal structural systems that may include shear walls, floor, ceiling and roof diaphragms, braced frames, moment frames and other principal lateral load transfer systems.

7.2 Primary Architectural Systems

1. Building envelope that may include lath and plaster, siding, cladding, wall panels, wallboard, paint and coatings, window systems, veneer, door systems, storefronts, window walls, attached greenhouses, roofing systems, moisture resistant systems, insulation, and other components that enclose the building.
2. Architectural appendices which may include, but not limited to, attached decks, balconies, steps, exterior stairs, railings, overhangs, canopies, chimneys and parapets.
3. Interior construction which may include lath and plaster, gypsum board, veneer plaster, paneling, suspended ceiling systems, trim, non-bearing partitions, built-in cabinetry, glazing, door systems, stair and steps, hand railings, guard railings, fireplaces and barbecues.

Unless otherwise indicated above, building construction and site improvements not included in the loss assessment of the subject facility included items identified under the following general headings as defined by the Construction Specifications Institute (CSI).

- Site Work
- Finishes
- Specialties
- Equipment
- Furnishings
- Special Construction
- Conveying Systems
- Mechanical
- Electrical

In addition, personal injury or physical conditions of the building and site, resulting from seismic activity or its after effects was not included in the loss assessment. These may include:

- Personal Injury or Fatalities
- Loss of Personal Property
- Water and Flooding Damage
- Fire and Smoke Damage
- Weather Damage
- Tsunami Damage
- Structural Pounding Damage
- Landslide or Mudslide Damage
- Non Earthquake Differential Settlement
- Unrepaired Damage
- Damage Resulting from Deteriorated Construction
- Damage Resulting from Deferred Maintenance
- Damage Resulting from Unpermitted Modifications or Additions

8.0 LIMITATIONS AND QUALIFICATIONS

Our services described herein were performed, and our findings and recommendations were prepared in accordance with generally accepted consulting practices for this geographical area at this time. This warranty is in lieu of all other warranties, either expressed or implied. While ATC has made every reasonable effort to properly evaluate the Property conditions within the contracted scope of services, it should be recognized that this investigation is limited in several important respects including, but not limited to, the following:

Our findings and conclusions were based primarily on the visual appearance of the Property at the time of our site visit and on comparative judgments with similar properties in the ATC site inspector's experience. Our site observations included only areas that were readily accessible to our representative without opening or dismantling any secured components or areas. The scope did not include invasive investigation, component sampling, laboratory analysis, an environmental site assessment, or engineering evaluations of structural, mechanical, electrical, or other systems with related calculations and review of design assumptions. Within the authorized scope of this evaluation, definitive determination of the structural systems was not possible because ATC did not have the opportunity to perform destructive testing and was able to make only limited observations due to lack of physical accessibility.

Some of our conclusions were partially based on information provided by others including representatives of the client, the Property owner, the Property manager, contractors servicing the Property, and local building code officials. For the purposes of this report, we have assumed this information to be complete and correct unless otherwise noted. ATC assumes no liability for incorrect information provided by others.

Our cost estimates represent a preliminary opinion only and are neither a quote nor a warranty or representation as to the actual costs that may be incurred. These estimates are based on typical cost data that may not fully characterize the scope of the Property conditions and are further limited by possible future changes in technology, by regulatory requirements, by Property location, and by contingencies that cannot reasonably be discovered until after commencement of on-site construction activities. The cost estimates do not address the cost impact of the possible presence of lead-based paint (LBP), asbestos-containing materials (ACM) or other environmentally regulated materials on renovation or demolition activities. ATC shall not be liable to the Client nor any other party for any costs or expenses that may be incurred in excess of these estimates, for any losses that may be incurred as a result of these estimates being different from the actual costs, nor for any damages whatsoever in connection with these estimates.

This report is intended for the sole use of MetLife Real Estate Investment. The scope-of-services performed in execution of this investigation may not be appropriate to satisfy the needs of other users, and any use or re-use of this document or its findings, conclusions, or recommendations is at the risk of said user. ATC is not responsible for conclusions, opinions, or recommendations made by others based on this information.

9.0 APPENDICES

Appendix A: Modified Mercalli Intensity Scale
Appendix B: Interpretation of Earthquake Damage Ratios

Appendix A

Modified Mercalli Intensity Scale

MODIFIED MERCALLI INTENSITY SCALE (1931 ABRIDGED)	
I.	Not felt except by a very few under especially favorable circumstances
II.	Felt only by a few persons at rest, especially on upper floors of buildings. Delicately suspended objects may swing.
III.	Felt noticeably indoors, especially on upper floors of buildings, but many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibration likes passing of truck. Duration estimated.
IV.	During the day felt by many, felt outdoors by few. At night some awakened. Dishes, windows, doors disturbed; walls make creaking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V.	Felt by nearly everyone; many awakened. Some dishes, windows, etc. broken; a few instances of cracked plaster; unstable objects overturned. Disturbances of trees, poles, and other tall objects sometimes noticed. Pendulum clocks may stop.
VI.	Felt by all; many frightened and run outdoors. Some heavy furniture moved; a few instances of fallen plaster or damaged chimneys. Damage slight.
VII.	Everybody runs outdoors. Damage negligible in buildings of ordinary structures; considerable in poorly built or badly designed structures; some chimneys broken. Noticed by persons driving motor cars.
VIII.	Damage slight in specially designed structures; considerable in ordinary substantial buildings with partial collapse; great in poorly built structures. Panel walls thrown out of frame structures. Fall of chimney, factory stacks, columns, monuments, and walls. Heavy furniture overturned. Sand and mud ejected in small amounts. Changes in well water. Disturbs persons driving motor cars.
IX.	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb; damage great in substantial buildings, with partial collapse. Complex shifted off foundations. Ground cracked conspicuously. Underground pipes broken.
X.	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations; ground badly cracked. Rails bent. Landslides considerable from riverbanks and steep slopes. Shifted sand and mud. Water splashed (slopped) over banks.
XI.	Few, if any, (masonry) structures remain standing. Bridges destroyed. Broad fissures in ground. Underground pipe lines completely out of service. Earth slumps and land slips in soft ground. Rails bent greatly.
XII.	Damage total. Waves seen on ground surfaces. Lines of sight and level distorted. Objects thrown upward into the air.

Appendix B

Interpretation of Earthquake Damage Ratios

INTERPRETATION OF EARTHQUAKE DAMAGE RATIOS
(Modified from: Applied Technology Council ATC-13, 1985, Table 2.1)

Damage State	**PML** Damage Range	Average PML Damage Value	General Damage Description	Wood Frame Construction Damage Description	Loss of Occupancy Potential
Slight	0% - 1%	0.5%	Limited localized minor damage not requiring repair.	Window damage, contents shifting, drywall and stucco cracking.	None
Light	1% - 10%	5%	Significant localized damage of some components generally not requiring structural repair.	Major stucco cracks, drywall damage, many windows broken.	Low
Moderate	10% - 30%	20%	Significant localized damage of many components warranting structural repair.	Large X cracks in shear walls, extensive drywall damage, roof diaphragm distress. Overturning of unsecured water heater - potential fire ignition.	Medium
Heavy	30% - 60%	45%	Extensive damage requiring major repairs.	Shifting of foundation (without collapse).	High
Major	60% - 100%	80%	Major widespread damage that may result in the facility being razed, demolished or repaired.	Collapse, cripple wall failure, house out-of-plumb.	Almost Certain

Professional Resumes

JOSE REZA
SENIOR STAFF SCIENTIST

EDUCATION, TRAINING AND CERTIFICATIONS

- A.S. in Computer Aided Drafting, ITT Technical Institute
- ASTM training course on Property Condition Assessments, Los Angeles, California, 2001

PROFESSIONAL SUMMARY

Mr. Reza has five years of experience in conducting property condition consulting services for self-storage, commercial and industrial facilities, in addition to hotel, retail and multi-family residential properties. He has participated in a wide variety of professional services and building surveys, including Property Condition Surveys, Asbestos and Lead-Based Paint surveys.

Mr. Reza has special expertise in providing due diligence property condition survey and seismic assessment reports during real estate transactions in addition to development of procedures and methodologies related to the creation of as-built CAD drawings for financial and institutional clients nationwide.

Mr. Reza has performed over 500 properties condition/site screen surveys nationwide and abroad including projects in Tijuana, Baja California, Mexico; Playa del Carmen, Quintana Roo, Mexico; Manzanillo, Colimas, Mexico; and Farallon, Cocle, Panama.

PROFESSIONAL EXPERIENCE

Building Services

- **Property Condition Assessments / HUD – Real Estate Recovery Inc. / Southern California.** Conducted numerous engineering assessments of multi-family apartment facilities in accordance with Fannie Mae, United States Department of Housing and Urban Development (HUD) Mark-to-Market Program Physical Inspection Services Work Scope and ASTM standards. Projects involved detail evaluation of the condition of site and building components and equipment in affordable housing properties. Creation of recommended work items and cost estimates associated with critical repair items, 12-month physical needs, and long term physical needs (i.e., 20-year replacement reserves).

- **Due Diligence Assessment / Marcus and Millichap / Northridge, CA.** Conducted the pre-purchase condition evaluation of roofing and HVAC systems at a multiple-use facility including retail and medical office tenant spaces. Field

observation and appropriate inquiry of tenants and maintenance contractors identified several items needing immediate repair and others requiring replacement reserves, which were spread over the 10-year reserve period.

- **Physical Assessments / John Hancock Real Estate / Woodland Hills, CA.** Performed PCA and handicap compliance survey of multi-building, 300+ dwelling unit multi-family apartment complex.

- **Property Condition Assessments / Prudential Mortgage Capital Company / Southern California.** Performed multiple physical inspections for commercial and industrial properties including comprehensive evaluation of building systems, review of code compliance issues and life-cycle replacement reserve analysis.

- **Property Condition Assessments / Merrill Lynch Mortgage Capital / Southern California.** Performed multiple physical inspections on various retail, office and industrial properties throughout California.

- **Building Evaluations / Various Clients / California. C**ompleted numerous PCAs for multiple clients, including real estate investors/developers and financial institutions. Project sites have involved industrial, commercial, and multi-family residential properties. Services have included code compliance, cost estimating, termite and water damage inspections, and structural and HVAC system evaluations.

- **Property Condition Assessments / UBS Warburg / Southern California.** Performed multiple physical inspections in conformance with ASTM E2018-99 standards on U-Haul properties in southern California.

- **Property Condition Assessments / Sares Regis Group / Westminster, CA.** Performed due diligence PCA with handicap compliance survey of 32-building apartment complex in southern California.

- **Existing Condition Survey / ADR/Preferred Business Properties / West Hollywood, CA.** Performed field surveys, as-built measurements and drafting of floor plans of existing commercial office.

- **Property Condition Screening Report / Barceló Crestline Corporation / Manzanillo, Colimas, Mexico.** Performed a site screen inspection of an all-inclusive, 324-guestroom resort hotel known as the *Karmina Palace*. The project included the comprehensive evaluation of building systems and life cycle immediate and replacement reserve analysis.

- **Property Condition Screening Report / Barceló Crestline Corporation / Farallon, Cocle, Panama.** Performed a site screen inspection of an all-inclusive, 221-guestroom resort hotel known as *Playa Blanca Hotel & Resort*. The project included the comprehensive evaluation of building systems and life-cycle immediate and replacement reserve analysis.

- **Property Condition Screening Report / Barceló Crestline Corporation /, Playa del Carmen, Quintana Roo, Mexico.** Performed site screen inspection of three all-inclusive resort hotels. The project included the comprehensive evaluation of building systems and life-cycle immediate and replacement reserve analysis.

William D. Horner,
Branch Manager - Sacramento

LICENSE AND CERTIFICATIONS

Licensed Engineering Contractor (California A License)
Registered Environmental Assessor I (REA I-05415)
Certified Asbestos Consultant (CA #93-1120)

PROFESSIONAL SUMMARY

ATC Associates Inc, Sacramento, CA (2001-Current). Branch Manager for ATC Sacramento, California office. Responsible for oversight and management of environmental and engineering services provided by Sacramento ATC office, which includes Building Sciences (asbestos/lead/IAQ/mold), Engineering and Construction Management Services (PCA/PML/plan and draw reviews), Environmental (Phase I, II, subsurface, QMR), and Environmental Compliance (SPCC and SWPP). Responsible for overall sales, marketing and P&L. In addition, Mr. Horner is the Director for PCA Services for the Western Region, responsible for managing and coordinating the PCA and seismic surveys for WA, OR, CA, NV, AZ, NM, CO, UT, ID, MT and WY.

CAL Inc., Vacaville, CA (1992-2001). Vice President of Operations. Responsible for overall sales and operations for the company, including the construction, remediation, abatement, training and environmental consulting divisions. In addition, Mr. Horner was the Division Manager for the Construction and Abatement Divisions, responsible for estimating and managing construction projects in CA, NV, AL, and AR. The company's revenue increased from $2M/yr to $15M/yr during his tenure.

LWA & Associates Inc (1990-1992). Senior Project Manager and Instructor for LWA & Associates. Primarily conducted asbestos and lead surveys, including private and government, hospitals, commercial buildings and residential. Mr. Horner conducted site visits, prepared project designs, provided asbestos and lead consulting and on-site project management. As an instructor for a subsidiary of LWA (NCEI), Mr. Horner was responsible for development of training curriculum, classroom exercises, and environmental health and safety courses.

Department of Army, Sacramento Army Depot (1982-1990). Construction Inspector/ Construction Manager at Sacramento Army Depot, Sacramento, California. Mr. Horner reported to Base Facilities Engineer and Director for Engineering and Logistics, managing a construction program estimated at $10,000,000 per year. As the senior construction inspector, he performed inspections on a number of different types of construction projects, varying in size and complexity. Mr. Horner performed constructability reviews and design reviews for proposed projects. Mr. Horner also acted as the primary liaison with the Corps of Engineers and approved all draw requests at the base.

EDUCATION

- Sacramento City College, Engineering Drafting
- California State University, Sacramento, Construction Management

PROFESSIONAL EXPERIENCE

- **Property Condition Assessments / Various Clients / Various Locations Throughout the U.S.** Performed and reviewed over 300 property condition assessments at low/mid/high-rise office buildings, retail, hotel, senior living, apartments, and light industrial/ warehouse facilities throughout the country. The diversity of site locations has provided a wide range of experience with various construction methods and local regulatory environments. These assessments typically include investigation of pavements, site/civil, building structure, mechanical/electrical/ plumbing equipment, vertical transportation, fire protection, and architectural finishes. These assessments also typically include limited building code and zoning compliance reviews as well as a cursory Americans with Disabilities Act checklist. The assessments include identification of constraints on future development, suggested repair actions, and cost estimates and capital reserves for repairs.

- **Loan Monitoring Services / Various Clients / Various Locations Throughout the U.S.** These projects generally include performance of periodic site visits to determine the percentage of work completed, general condition of work performed, conformance with plans and specifications, and adherence to project schedule and budget; review of escrow draw documents submitted by borrower for accuracy and completeness; determination of whether budgeted project escrow funds remaining are sufficient to complete the work; evaluation of potential scheduling delays; evaluation of inflationary impacts on escrow budget; review and calculation of applicable retainage and stored values to verify compliance with requirements of loan documents; and provide written reports of observations.

- **Construction Management/ Various Clients/ Various Locations Throughout the U.S.** Estimated projects between $5,000 and $5M. Acted as the senior project manager for numerous construction projects varying in size and complexity. Projects included new construction and renovation for public and private entities including colleges, universities and military installations.

- **Construction Management/ Sacramento Army Depot.** Acted as the senior construction inspector and project manager for a $10M construction program. Acted as the primary liaison between the Corps of Engineers and the Sacramento Army Depot. Responsibilities included plan review, submittal review, draw reviews, inspection of construction, change order review/ approval and project administration.

- **Asbestos Abatement Consultant Services/ Various Clients / Various Locations in California and Nevada.** Performance of air monitoring and observation of contractor work practices during abatement. Responsibilities include maintenance of a field log documenting contractor work practices, progress of work and compliance with specifications; collection of area air samples for analysis; collection of bulk samples to be submitted to the laboratory for analysis by Polarized Light Microscopy; photographic documentation recording project site conditions, construction means and methods and various construction phases and activities; and compilation of progress meeting minutes.

- **Asbestos Survey Services / Various Clients / Various Locations in California and Nevada.** Performance of surveys of commercial/industrial buildings and schools in accordance with Asbestos Hazards Emergency Response Action (AHERA) protocol to determine the presence, location and quantity of ACM. These reports typically include the following for identified ACM: descriptions of hazard assessments, recommended preventative measures and/or response actions, plan for reinspection of ACM, program for informing workers and building occupants, and evaluation of resources needed to implement recommendations made.

- **Asbestos Abatement Construction Management/ Various Clients / Various Locations in California and Nevada.** Provide consulting services to building owners for abatement projects, including design development submittals, plan and specification preparation, addendum preparation, preparation of bidding documents, bid review/evaluation, contract administration, and contractor submittal review. Clients have included school districts and commercial property owners and managers.

SPECIALIZED TRAINING

Construction and Engineering

- ATC, Property Condition Assessment and Probable Maximum Loss Training
- Corps of Engineers Construction Quality Control and Verification Training
- Corps of Engineers, Flexible Pavement Inspection Training
- Corps of Engineers, Electrical Inspection Training
- University California Long Beach, PERT and CPM Training
- University of California, Long Beach, Public Works Contracting
- US Army Logistics Management College, Contracting Officers Representative

Asbestos, Lead, Microbial and IAQ

- ATC, Microbial Investigations and Assessments
- AHERA Asbestos Inspector/ Management Planner
- AHERA Project Designer
- AHERA Supervisor
- Radiation Safety Training
- Certified Operator for Niton X-Ray Fluorescence Analyzer
- Certified Advanced Operator of the Scitec X-Ray Fluorescence Spectrum Analyzer

Environmental

- University California Davis, Conducting Environmental Evaluations: Assessments and Audits
- University California Davis, UST Installation
- University California Davis Ground Water Modeling for Remedial Actions
- University California Davis Sampling Strategies and Techniques for Contaminated Soils
- University California Davis Field Monitoring and Sampling

Appendix F:

Condition Evaluation Definitions and Common Abbreviations

Definitions of the terms used in this PCA report to describe average or overall conditions are listed below.

Good: Average to above-average condition for the building system or materials assessed, with consideration of its age, design, and geographical location. Generally, other than normal maintenance, no remedial work is recommended or required.

Fair: Average condition for the building system evaluated. System is aging and some work is required or recommended, primarily due to normal aging and wear of the building system, to return the system to a good condition.

Poor: Below average condition for the building system evaluated. Significant work (major repair or replacement) should be anticipated to restore the building system or material to an acceptable condition.

Where it seemed more appropriate, ATC assigned combination assessments such as "good to fair" in evaluating various construction components.

Common Abbreviations

AC:	Alternating Current	**HID:**	High-Intensity Discharge (Lighting)
ADA:	Americans with Disabilities Act	**HP:**	Horsepower
AHU	Air Handling Unit	**HVAC:**	Heating, Ventilation & Air Conditioning
BLDG:	Building	**IN:**	Inches
BOCA:	Building Officials & Code Administrators	**KVA:**	Kilovolt Ampere
BTU:	British Thermal Unit	**LF:**	Linear Feet
BUR:	Built-Up Roofing	**MBH:**	Thousand BTUs per Hour
CF:	Cubic Feet	**MEP:**	Mechanical, Electrical and Plumbing
CFM:	Cubic Feet per Minute	**NLA:**	Net Leasable Area
CIP:	Cast Iron Pipe	**NO:**	Number
CMP:	Corrugated Metal Pipe	**NRA:**	Net Rentable Area
CMU:	Concrete Masonry Unit	**OSB:**	Oriented Strand Board
CY:	Cubic Yard	**PSI:**	Pounds per Square Inch
DC:	Direct Current	**PVC:**	Polyvinyl Chloride
EA	Each	**RTU:**	Roof-Top Unit (HVAC)
EIFS:	Exterior Insulation Finish System	**RUL**	Remaining Useful Life
EMT:	Electrical Metallic Tubing (Conduit)	**SBC:**	Standard Building Code
EPDM:	Ethylene Propylene Diene Monomer	**SF:**	Square Feet
EUL	Expected Useful Life	**SY:**	Square Yard
F:	Fahrenheit	**UBC:**	Uniform Building Code
FT:	Feet	**UL:**	Underwriters Laboratory
GBA:	Gross Building Area	**VAV:**	Variable Air Volume
GPM:	Gallons Per Minute	**VWC:**	Vinyl Wall Covering

Appendix G:

Work Item Recommendation Definitions

As part of this project, ATC has identified deferred maintenance and capital expense items recommended at the Property. Preliminary opinions of cost have been developed for each repair and maintenance recommendation, and each recommendation has been classified as Immediate Needs (items requiring work at this time) or Physical Needs Over the Term (items requiring work over the requested evaluation period).

Immediate Needs – Immediate Needs are those repairs that are beyond the scope of regular maintenance and that should be performed at this time. Work that requires action based on its being (i) a material existing or potentially unsafe condition, (ii) material building or fire code violation, (iii) a condition that if left unremedied, has the potential to result in or contribute to a critical element or system failure within one year and will probably result in a significant escalation of remedial costs, or (iv) poor or deteriorated condition of a critical element or system.

Immediate Needs shall be further categorized as "Required" or "Recommended." Required is defined that ATC understands a law, regulation, regulatory guideline or industry standard, mandates that the item be corrected. Recommended is defined that it is good industry practice to correct these deficiencies. Appendix A notes whether Immediate Needs are Required or Recommended.

Short-Term Needs – Costs to remedy physical deficiencies, such as deferred maintenance, which may not warrant immediate attention, but require repairs or replacements that should be undertaken on a priority basis in addition to routine preventative maintenance. The timeframe for such repairs or replacements is in Year 1.

Physical Needs Over the Term (Years 1 Through Reserve Term) – Physical Needs Over the Term are items needing repair or replacement that are beyond the scope of regular maintenance but are necessary to maintain the overall condition of the Property. These include major recurring probable expenditures, which are neither commonly classified as an operation, nor maintenance expense. Physical Needs Over the Term are reasonably predictable both in terms of frequency and cost; however, they may also include components or systems that have an indeterminable life, but nonetheless have a potential liability for failure within an estimated time period.

Routine Maintenance Needs – Routine Maintenance Needs are those repair and maintenance items that can be considered regular ongoing (annual) repair and maintenance that may be performed by property management as part of annual operating expenditures; therefore costs may be excluded from the report. Typical items considered to be routine maintenance may include, but are not limited to the following: asphalt pavement seal coat, restriping, and minor repair; concrete pavement restriping and minor repair; minor and recurring exterior painting, caulking and finish repair; minor and recurring pavement, parking garage, roof and HVAC equipment repairs; normal tenant space and common area interior finish repair and replacement; and tenant space build-out.

Appendix H:

Deviations from the Guide

This Property Condition Assessment was prepared in general accordance with the ASTM E2018-01 "Standard Guide for Property Condition Assessments: Baseline Property Condition Assessment Process". ASTM E2018-01 requires that any deviations from the guide be so stated in the report. Items required by ASTM E2018-01 have been included in this PCA and report. Additional "non-scope" items were addressed at the request of the Client or provided as value added considerations. These include the following:

- A limited assessment of ADA accessibility (Tier I) included a visual review of the following components: exterior path-of-travel, parking, elevators and public toilet rooms (each as applicable). No measurements were conducted.
- Preparation of the Immediate Needs, Short-Term Needs and Physical Needs Over the Term table based upon a reserve term provided by the Client.
- Provision of a statement on the Property's Remaining Useful Life.
- Provision of a Property Summary Table.
- Determination of geographic Uniform Building Code Seismic Zone.

Attention: Mr. William D. Messori

STATEMENT REGARDING REMEDIATION COVENANTS

THIS STATEMENT REGARDING REMEDIATION COVENANTS ("**Statement**") dated as of May 15, 1995, is executed by HUGHES AIRCRAFT COMPANY, a Delaware corporation ("**Hughes**"), and THE VALLEY JOB RECOVERY CORPORATION, a California nonprofit public benefit corporation ("**Valley**").

A. Substantially concurrently with the execution hereof, Hughes conveyed to Valley certain real property more particularly described in the legal description attached hereto as Exhibit "A" and incorporated herein by this reference (the "**Property**").

B. In connection therewith, Hughes and Valley desire to execute and record this Statement upon the terms set forth below.

NOW THEREFORE, in consideration of the covenants, conditions and agreements set forth herein, and other good and valuable consideration, the receipt and adequacy of which are hereby acknowledged, the parties hereto provide as follows:

1. **Definitions.**

1.1 **Current Environmental Laws.** "**Current Environmental Laws**" shall mean any and all federal, state, municipal and local laws, statutes, ordinances, rules, regulations, orders, and decrees, in effect as of the date hereof, pertaining to the use, generation, manufacture, production, storage, release, emission, discharge, disposal, handling, treatment, removal, decontamination, clean-up, transportation or regulation of any Hazardous Substance as defined in Paragraph 1.3 of this Statement. Environmental Laws shall include, without limitation, the Comprehensive Environmental Response Compensation Liability Act of 1980

("CERCLA"), 42 U.S.C. Sections 9601, et seq., the Resource Conservation and Recovery Act of 1976 ("RCRA") 42 U.S.C. Sections 6901, et seq., the Hazardous Materials Transportation Act, 49 U.S.C. Section 1801 et seq., the Clean Water Act, 33 U.S.C. § 1251 et seq., the California Health and Safety Code § 25100, et seq., the California Health and Safety Code § 25300 et seq., the Porter Cologne Water Quality Control Act, California Water Code § 13000 et seq., and the California Health & Safety Code § 25500 et seq.

1.2 **Updated Environmental Laws**. **"Updated Environmental Laws"** shall mean any and all federal, state, municipal and local laws, statutes, ordinances, rules, regulations, orders, and decrees, now in effect and as amended from time to time hereafter, pertaining to the use, generation, manufacture, production, storage, release, emission, discharge, disposal, handling, treatment, removal, decontamination, clean-up, transportation or regulation of any Hazardous Substance as defined in Paragraph 1.3 of this Statement. Updated Environmental Laws shall include, without limitation, CERCLA, RCRA, the Hazardous Materials Transportation Act, 49 U.S.C. Section 1801 et seq., the Clean Water Act, 33 U.S.C. § 1251 et seq., the California Health and Safety Code § 25100, et seq., the California Health and Safety Code § 25300 et seq., the Porter Cologne Water Quality Control Act, California Water Code § 13000 et seq., and the California Health & Safety Code § 25500 et seq. as such statutes may be amended from time to time hereafter.

1.3 **Hazardous Substance**. **"Hazardous Substance"** shall mean any "hazardous substance," "toxic substance," "hazardous waste" or "hazardous material" as defined in one or more Current Environmental Laws, petroleum hydrocarbons including crude oil or any fraction thereof, polychlorinated biphenyls, any toxic, flammable, explosive or radioactive substance, waste, material, or matter, and any other substance, material, waste, pollutant, contaminant or matter regulated by one or more Current Environmental Laws. However, Hazardous Substance shall exclude non-friable, un-released asbestos utilized in or incorporated into any existing building, structure, or other Improvement on the Property.

1.4 **Fee Owner**. **"Fee Owner"** shall mean any person or entity that acquires fee title to any portion or all of the Property after the date hereof.

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 3 of 25
Order: bob Comment:

1.5 **Release**. "**Release**" shall mean any release, discharge, emission or disposal as defined under any Current Environmental Law of a Hazardous Substance in, on, under, about or from the Property or any portion thereof, including any migration of a Hazardous Substance from the Property or any portion thereof to, in, on, under or about any adjacent or other portion of the Property or any other property.

1.6 **Releases and Conditions Relating to Hughes**.

1.6.1 **Known Releases**. "**Known Releases**" shall mean the Releases known to exist as of the date hereof and set forth on the list of known releases ("**List of Known Releases**") attached hereto as Exhibit "B."

1.6.2 **Hughes Party Release**. "**Hughes Party Release**" shall mean any Release which results from the acts or omissions of Hughes or any affiliate, agent, employee, tenant or contractor of Hughes or of any other occupant of the Property during periods of time during which Hughes (or any affiliate of Hughes) was the owner in fee of all or any portion of the Property (collectively, "**Hughes Responsible Parties**") on the Property which is required to be reported, investigated and/or remediated under any then effective Updated Environmental Law.

1.7 **Valley Release**. "**Valley Release**" shall mean any Release which results from the acts or omissions of Valley, any tenant or subtenant of Valley, any other occupant of any portion of the Property holding under Valley, or any of their respective affiliates, agents, employees or contractors (collectively, "**Valley Responsible Parties**") which is required to be reported, investigated and/or remediated under any then effective Updated Environmental Law. Notwithstanding the foregoing, the parties agree that the mere migration across or under the Property of a pre-existing Hughes Party Release shall not constitute a Valley Release hereunder.

1.8 **Fee Owner Release**. "**Fee Owner Release**" shall mean any Release which results from the acts or omissions of any Fee Owner, any tenant or subtenant of any Fee Owner, any other occupant of any portion of the Property holding under any Fee Owner, or any of their respective affiliates, agents, employees or contractors (collectively, "**Fee Owner Responsible Parties**") which is required to be reported, investigated and/or remediated under any Updated Environmental Laws.

95 786007

Order: bob Comment:

1.9 **Satisfaction of Jurisdictional Agencies**. **"Satisfaction of Jurisdictional Agencies"** means with respect to a particular act, condition or event which under then applicable Updated Environmental Laws requires the approval of one or more governmental entities asserting jurisdiction over the environmental condition of the Property (**"Jurisdictional Agencies"**), the approval, consent or other acknowledgment by the appropriate Jurisdictional Agency or Agencies that such Jurisdictional Agency or Agencies will not challenge or contest such act, condition or event; provided, however, that any reference contained herein to Satisfaction of Jurisdictional Agencies shall not prejudice the right of any party seeking the same to negotiate for, contest, challenge or appeal any particular decision, standards or determination of any Jurisdictional Agency.

2. **Notice and Identification Issues**.

2.1 **Hughes Notice to Valley and Fee Owners**. Hughes shall, within a reasonable period after its discovery thereof, notify Valley and any then current or prior Fee Owner of the portion of the Property affected, of the discovery (or receipt of written notice other than through this Paragraph 2) by Hughes of any Release in, on, under or about the Property required to be reported under any then effective Updated Environmental Law.

2.2 **Valley Notice to Hughes**. Valley shall, within a reasonable period of time after its discovery thereof, notify Hughes and any then current or prior Fee Owner of the portion of the Property affected, of the discovery (or receipt of written notice other than through this Paragraph 2) by Valley of any Release in, on, under or about the Property required to be reported under any then effective Updated Environmental Law.

2.3 **Fee Owner Notice to Hughes**. Each Fee Owner within a reasonable period of time after its discovery thereof, notify Hughes, Valley and any then current or prior Fee Owner of the portion of the Property affected, of the discovery (or receipt of written notice other than through this Paragraph 2) by such Fee Owner of any Release required to be reported under any then effective Updated Environmental Law.

3. Investigation, Remediation and/or Closure of Releases and Conditions.

3.1 General Covenants.

3.1.1 Procedure to Address Known Releases. Subject to the provisions of Paragraph 3.2, and except for the No-Action Releases (defined in Paragraph 3.2.1(b)), if not prepared prior to the date hereof, Hughes shall prepare or continue to prepare and/or process the remediation plan or plans (each, a "**Remediation Plan**") for each Known Release in, on, under, on or about the Property in order to obtain all required regulatory approvals for commencement of such Remediation Plans ("**Commencement Approvals**"), and Hughes shall, subject to any delays arising due to force majeure events following procurement of such Commencement Approvals, prosecute such Remediation Plans (as may be modified from time to time subject to the approval standards in Paragraph 3.2.5) to completion with reasonable diligence in compliance with any then effective Updated Environmental Laws and, if and to the extent required by the Jurisdictional Agencies, to the satisfaction of Jurisdictional Agencies. Upon completion of work under any such Remediation Plan, Hughes shall submit a written request, in a form substantially similar to Exhibit "C" attached hereto, for a written certificate of completion or closure from the appropriate Jurisdictional Agencies. In addition, Hughes shall use reasonable efforts (which the parties acknowledge may, depending on the circumstances, involve no further efforts) to obtain a reasonable written certificate of completion or closure (or other reasonable evidence of governmental approval or acknowledgment of completion or closure of such Remediation Plan), regarding the Known Releases in, under, on or about the Property covered by such Remediation Plan, if or to the extent such certificate of completion (or such other reasonable evidence) is required under the then prevailing practices of or is reasonably available from the Jurisdictional Agencies. As used in this Agreement, "force majeure events" shall mean any delays due to strikes, acts of God, governmental delays or other matters beyond the control of (and not arising due to the failure or misconduct of) the party asserting the force majeure event, but shall exclude the unavailability of labor or materials at reasonable prices and governmental delays to the extent caused by the acts or omissions of the parties hereto. Notwithstanding any provision of this Statement to the contrary, for purposes of this Statement, the term "**Remediation Plans for Known Releases**" shall include all closure plans with respect to Hughes Tank "T-3"

and the Hughes Hazardous Waste Storage Facility covered by the RCRA Permit EPA I.D. No. CA 0041162124 issued to Hughes.

3.1.2 **Procedure to Address Hughes Party Releases and Valley Releases.**

(a) In the event that at any time following the date of this Statement, a Hughes Party Release (which is not one of the Known Releases) or a Valley Release is discovered in, on, under or about the Property, Hughes with respect to such Hughes Party Release, or Valley with respect to such Valley Release, shall, within a reasonable period following discovery by such party (or delivery of written notice of such Release to such party from the other party, any Fee Owner, any Jurisdictional Agency or any third party), report such Release, if required under any then applicable Updated Environmental Law, and thereafter commence to investigate the scope and nature of the Release, the possible methods of remediation or closure thereof and the likely remediation standards applicable thereto under any then effective Updated Environmental Law.

(b) Thereafter with reasonable diligence, Hughes with respect to a Hughes Party Release in, on, under or about the Property, or Valley with respect to a Valley Release in, on, under or about the Property, shall prepare a Remediation Plan (which, if determined in good faith to be appropriate under the circumstances, may be a "No-Action Plan" (defined below) or the equivalent thereof) and submit the same for approval, in accordance with Paragraph 3.2, to the other party, any then Fee Owner of any Property affected by such Release and the Jurisdictional Agencies. Following receipt of the Commencement Approvals therefor and, if applicable pursuant to the provisions of this Statement, the approval of the other party or any affected Fee Owner thereof, such party shall, subject to any delays arising due to force majeure events following procurement of such Commencement Approvals, prosecute the implementation of such Remediation Plan (as the same may be modified from time to time subject to the approval standards in Paragraph 3.2.5) to completion with reasonable diligence in compliance with any then effective Updated Environmental Laws, and if and to the extent required by the Jurisdictional Agencies, to the satisfaction of Jurisdictional Agencies.

(c) Upon completion of work under any Remediation Plan, Hughes with respect to any Remediation Plan covering a Hughes Party Release in, on, under or about the Property,

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 7 of 25
Order: bob Comment:

and Valley with respect to any Remediation Plan covering a Valley Release in, on, under or about the Property, shall submit a written request, in a form substantially similar to Exhibit "C" attached hereto, for a written certificate of completion or closure from the appropriate Jurisdictional Agencies. In addition, Hughes shall use reasonable efforts (which the parties acknowledge may, depending on the circumstances, involve no further efforts) to obtain a reasonable written certificate of completion (or other reasonable evidence of governmental approval or acknowledgement of completion) with respect to such Remediation Plan if and to the extent such certificate of completion (or such other reasonable evidence) is required under the then prevailing practices of or is reasonably available from the Jurisdictional Agencies.

3.1.3 **Procedure to Address Fee Owner Releases.** In the event that a Fee Owner Release is discovered, the Fee Owner shall:

(a) within a reasonable period following discovery by such Fee Owner (or delivery of written notice of such Release to the Fee Owner from Hughes, Valley, any other Fee Owner, any Jurisdictional Agency or any third party), report such Release (if such reporting is required under any then applicable Updated Environmental Laws), and thereafter commence to investigate the scope and nature of the Release, the possible methods of remediation, and the likely remediation standards applicable thereto under any then applicable Updated Environmental Laws;

(b) thereafter with reasonable diligence, prepare a Remediation Plan and submit the same, in accordance with Paragraph 3.2, to Hughes, Valley, any then Fee Owner of any Property affected by such Release and the Jurisdictional Agencies;

(c) following receipt of the Commencement Approvals therefor and, if applicable pursuant to the provisions of this Statement, the approval of Hughes, Valley or any other affected Fee Owner thereof, subject to any delays arising due to force majeure events following procurement of such Commencement Approvals, promptly commence and thereafter prosecute the implementation of such Remediation Plan (as the same may be modified from time to time subject to the approval standards in Paragraph 3.2.5) to completion with reasonable diligence in compliance with any then effective applicable Updated Environmental Laws and, if and to the extent required by the Jurisdictional

Order: bob Comment:

Agencies, to the satisfaction of the Jurisdictional Agencies; and

(d) upon completion of any work under such Remediation Plan, submit a written request, in a form substantially similar to Exhibit "C" attached hereto, for a written certificate of completion or closure from the appropriate Jurisdictional Agencies. In addition, the Fee Owner shall use reasonable efforts (which the parties acknowledge may, depending on the circumstances, involve no further efforts), to obtain a reasonable written certificate of completion (or other reasonable evidence of governmental approval or acknowledgement of completion) with respect to such Remediation Plan if and to the extent such certificate of completion (or such other reasonable evidence) is required under the then prevailing practices of, or is reasonably available from, the Jurisdictional Agencies.

3.2 **Preparation of Remediation Plans.**

3.2.1 **Remediation Plans for Known Releases and Hughes Party Releases.**

(a) The parties hereto agree that, subject to the provisions of this Paragraph 3.2.1 and Paragraph 3.2.5 and both prior to and following the date hereof, Hughes shall have the sole control of the preparation, submission, negotiation and renegotiation, if any, to and with the Jurisdictional Agencies, of each Remediation Plan, if any, applicable to each Known Release and Hughes Party Release to be implemented by Hughes. Hughes shall provide copies of all Remediation Plans, correspondence, permits, reports and data submitted to or received from any Jurisdictional Agencies with respect to each such Release and/or Remediation Plan to Valley and any Fee Owner of any affected portion of the Property. Valley and the Fee Owners shall retain the right to report new Releases as required by Updated Environmental Laws and, subject to the prior approval of Hughes (which approval shall not be unreasonably withheld or delayed), to communicate and negotiate with the Jurisdictional Agencies to the extent necessary provide for Valley's or the Fee Owner's use, occupancy and development of the Property; provided, however, that any such communications and/or negotiations of Valley and/or the Fee Owners shall be reasonably coordinated with Hughes and shall not directly address the details of any proposed Remediation Plan for which Hughes shall be responsible. Notwithstanding the foregoing, in the case where Valley or any Fee Owner shall have agreed to bear (or Hughes has asserted that such

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 9 of 25
Order: bob Comment:

party should bear, to the extent that and for so long as such issue has not been resolved in favor of Valley or the Fee Owner) any direct cost of implementing any Remediation Plan applicable to a Known Release or a Hughes Party Release, Valley or the Fee Owner, as the case may be, shall have the right to review and reasonably approve, to the same extent as Hughes, the preparation, submission, negotiation and renegotiation of those issues relevant to those portions of the Remediation Plan with respect to which Valley or the Fee Owner, as the case may be, has agreed to bear the cost (or Hughes has asserted that such party should bear the cost).

(b) Valley acknowledges that with respect to certain of the Known Releases, described on Exhibit "B" as the "No-Action Known Releases" (the "**No-Action Releases**"), Hughes is proposing (or has previously proposed to the Jurisdictional Agencies) that the Jurisdictional Agencies approve Hughes' written plan not to remediate the No-Action Releases (the "**No-Action Plan**"). Subject to Valley's rights set forth in this Paragraph 3.2.1 and in Paragraph 3.2.5 and to any modification or reopening of such No-Action Plan based on new information or as required to comply with any Updated Environmental Laws or to satisfy Jurisdictional Agencies, Valley hereby approves and agrees to not contest or take any action to oppose or modify the No-Action Plan.

(c) The parties hereto agree that in the event that Hughes shall, following the date hereof, materially modify any Remediation Plan for a Known Release or a Hughes Party Release (or convert any portion of the No-Action Plan to a Remediation Plan) or any other Remediation Plan of Hughes previously approved by Valley pursuant to this Paragraph 3.2.1, that affects any portion of the Property owned by a Fee Owner during the Fee Owner's ownership of the same, such material modification shall be subject to the prior written approval of such Fee Owner, which approval shall be subject to the provisions of Paragraph 3.2.5.

(d) Notwithstanding any provision of this Statement to the contrary, for purposes of determining when any modification, revision or amendment of a particular Remediation Plan shall be considered a "material" amendment or modification, (i) all activities, actions or elements confirmed or reasonably contemplated by any proposed modification, revision or amendment to such Remediation Plan which are called for or contemplated by any other Remediation Plan previously submitted to Valley and any affected Fee Owner shall not be considered to be a

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 10 of 25
Order: bob Comment:

modification to the Remediation Plan in question and shall be disregarded in the consideration of whether the overall proposed modification, revision or amendment shall be considered a "material" modification or amendment thereto, and (ii) the parties shall consider only those new activities, actions or elements contained in or contemplated by the proposed modification, revision or amendment to the Remediation Plan in question (and which are not contained in or contemplated by any Remediation Plan previously submitted to Valley and any affected Fee Owner). The parties acknowledge that although the change reflected in a particular modification or amendment may not be material (and accordingly not subject to approval hereunder), the change reflected in an aggregate of several individually immaterial modifications may, as an aggregate, be considered material.

3.2.2 **Remediation Plans for Valley Releases**. The parties hereto agree that, subject to the provisions of Paragraph 3.2.5, Valley shall have the sole control of the preparation, submission, negotiation and renegotiation, if any, to and with the applicable Jurisdictional Agencies of the Remediation Plan applicable to each Valley Release to be implemented solely by Valley. Valley shall provide copies to Hughes of all Remediation Plans, correspondence, permits, reports and data submitted to or received from any Jurisdiction Agencies. Hughes shall retain, however, the right to report new Releases as required by Updated Environmental Laws. Notwithstanding the foregoing, in the case where Hughes shall have agreed to bear (or Valley has asserted that Hughes should bear, to the extent and for so long as such issue has not been resolved in favor of Hughes) any direct cost of implementing any Remediation Plan applicable to a Valley Release, Hughes shall have the right to review and reasonably approve, to the same extent as Valley, the preparation, submission, negotiation and renegotiation of those issues relevant to those portions of the Remediation Plan with respect to which Hughes has agreed to bear the cost (or Valley has asserted that Hughes should bear the cost).

3.2.3 **Remediation Plans for Fee Owner Releases**. Subject to the provisions of Paragraph 3.2.5, Fee Owner shall have the sole control of the preparation, submission, negotiation and renegotiation, if any, to and with the applicable Jurisdictional Agencies of the Remediation Plan applicable to each Fee Owner Release to be implemented solely by Fee Owner. Fee Owner shall provide copies to Hughes, Valley and prior Fee Owners of all

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 11 of 25
Order: bob Comment:

Remediation Plans, correspondence, permits, reports and data submitted to or received from any Jurisdiction Agencies. Hughes shall retain the right to report new Releases as required by Updated Environmental Laws. Notwithstanding the foregoing, in the case where Hughes shall have agreed to bear (or any Fee Owner has asserted that Hughes should bear, to the extent that and for so long as such issue has not been resolved in favor of Hughes) any direct cost of implementing any Remediation Plan applicable to a Fee Owner Release, Hughes shall have the right to review and reasonably approve, to the same extent as such Fee Owner, the preparation, submission, negotiation and renegotiation of those issues relevant to those portions of the Remediation Plan with respect to which Hughes has agreed to bear the cost (or such Fee Owner has asserted that Hughes should bear the cost).

3.2.4 **Remediation Plans for Releases Attributable to More Than One Entity.**

(a) Notwithstanding any provision of this Statement to the contrary, in the event that remediation or corrective action is required by the Jurisdictional Agencies of a Release or a condition that constitutes a mixture of a Known Release or a Hughes Party Release and a Valley Release and/or a Fee Owner Release ("**Mixed Release**"), and the Remediation Plans for the Releases can reasonably be severed, then Hughes as to any Known Release or Hughes Party Release, Valley as to any Valley Release and/or Fee Owner as to any Fee Owner Release, shall prepare, submit and negotiate with the Jurisdictional Agencies the Remediation Plans for the Release, provided, however, that in the event that the Remediation Plan for any Valley Release or Fee Owner Release affects Hughes' remediation, corrective action, closure or other obligations with respect to any Known Release or Hughes Party Release, the Remediation Plan for such Valley Release or Fee Owner Release shall be subject to Hughes' approval pursuant to Paragraph 3.2.5.

(b) In the event that remediation or corrective action is required for a Mixed Release and the Remediation Plan for the Valley Release or Fee Owner Release cannot reasonably be severed from one or more Remediation Plans applicable to one or more Known Releases or Hughes Party Releases (or the implementation thereof), Hughes, Valley and the Fee Owner shall reasonably cooperate in the negotiations with agencies and third parties and in the preparation of modifications to any existing Remediation Plan made necessary by the remediation or corrective action of the

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 12 of 25
Order: bob Comment:

Valley Release or Fee Owner Release, and any new Remediation Plans with respect to such Valley Releases or Fee Owner Releases shall be jointly prepared by Hughes, Valley and the Fee Owner, as the case may be, and subject to the joint approval of Hughes, Valley and/or Fee Owners pursuant to Paragraph 3.2.5.

(c) Notwithstanding any provision of this Statement to the contrary, in the case where (i) the existence, nature or Remediation Plan for a Valley Release or a Fee Owner Release which then independently requires remediation under then effective Updated Environmental Laws materially and adversely affects the cost of remediation of a Known Release or a Hughes Party Release, the party responsible for the Valley Release (Valley) or the Fee Owner Release (the appropriate Fee Owner) shall reimburse Hughes within a reasonable period following written request to do so for an equitable amount of any increased out-of-pocket costs of such remediation so incurred by Hughes, (ii) the existence, nature or Remediation Plan for a Known Release or Hughes Party Release which then independently requires remediation under then effective Updated Environmental Laws materially and adversely affects the cost of remediation of a Valley Release or a Fee Owner Release, Hughes shall reimburse Valley (or the Fee Owner, as the case may be), within a reasonable period following written request to do so, for an equitable amount of any increased out-of-pocket costs of such remediation so incurred by Valley or the Fee Owner, as the case may be, and (iii) Hughes and either Valley or a Fee Owner (or some combination thereof) are jointly remediating a Mixed Release, the costs of remediation of the Mixed Release shall be borne by the parties involved on an equitable basis, taking into account the nature and volume of the Release (to the extent then existing and not previously remediated) for which each party would otherwise be responsible hereunder and the reasonably expected cost of remediation of such Release had there been no mixture of such Releases.

3.2.5 **Remediation Plan Approval Standards.**

(a) Any disapproval by Hughes, Valley or any Fee Owner, of all or of any portion of any Remediation Plan (or modification thereof) shall be based upon one or more of the following and shall not be unreasonably withheld, conditioned or delayed:

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 13 of 25
Order: bob Comment:

(i) The proposed Remediation Plan would involve an unreasonable risk of possible bodily injury to individuals;

(ii) In the case of a Remediation Plan for a Known Release or a Hughes Party Release, implementation of the Remediation Plan would result in Hughes's or its agents', employees' or contractors' exclusive use or occupancy of more than five hundred (500) contiguous square feet of rentable area of any portion of the improvements located on the Property or ten (10) contiguous or twenty (20) total parking spaces such that the same would be untenantable for a continuous period of at least three (3) days, unless Hughes agrees to lease such untenantable area at its then net fair market rental value (which net fair market rental value shall be calculated so as to take into account all factors and costs reasonably relevant to the potential net rental value of such area, after deduction of leasing costs) ("**Net Fair Market Rental Value**") for the period of the interference; provided, however, that the provisions of this Paragraph 3.2.5(a)(ii) shall not apply to any such Remediation Plan submitted to any Fee Owner prior to the date hereof, except to the extent any such Remediation Plan is materially modified, revised or amended (and such modification or amendment is submitted to any Fee Owner following the date hereof) under circumstances where the change effected by the modification or amendment (or, if there are more than one such modification or amendment, the changes effected by the modifications and amendments in the aggregate) would result in an increase in Hughes' exclusive use or occupancy which, if viewed alone, would require that Hughes enter into a lease under this Paragraph 3.2.5(a)(ii).

(iii) In the case of a Remediation Plan with respect to a Known Release or a Hughes Party Release, implementation of the Remediation Plan would involve an unreasonable risk of permanent (or semipermanent) damage to the Property; or

(iv) The Remediation Plan does not comply with then applicable Updated Environmental Laws.

(b) Provided the above conditions for approval are met, (i) Hughes shall not be required to remediate any Hughes Party Release or Known Release to any higher, cleaner or more comprehensive standard necessitated by new more sensitive uses of the Property (other than office uses (including uses incidental thereto, to the extent relevant to a particular area) and the use of the existing baseball

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 14 of 25
Order: bob Comment:

field for recreational purposes) instituted following the date hereof, and (ii) where alternative remediation methods or technologies are available, Hughes shall retain sole control with respect to the selection of the method or technology to be implemented with respect to remediation of each Known Release or Hughes Party Release without regard to the length of time required to complete (or substantially complete) the remediation of Hazardous Substances thereunder. Notwithstanding the foregoing conditions for approval (or any other provision of this Statement to the contrary), Valley acknowledges and agrees that in no event shall Hughes be required to lease (or pay the Net Fair Market Rental with respect to) any portion of the Property or Improvements due to Hughes' implementation of any Remediation Plan submitted to Valley prior to the date hereof in accordance with the terms thereof (and excluding any modification, revision or amendment submitted following the date hereof).

(c) Each of Hughes, Valley and each Fee Owner shall have the right to reasonably disapprove any modification of all or any portion of any Remediation Plan based upon a determination that the proposed modification would materially extend the time required to complete such Remediation Plan or would materially adversely affect the quality of the results of the remediation, corrective action or closure set forth therein, and that alternative remediation methods are reasonably available which would not so materially extend the time required or materially adversely affect the quality of results.

4. **Records and Reporting**. Each of Hughes, Valley and each Fee Owner shall promptly, (a) provide to each of the other parties copies of any written notice, order, direction or other correspondence received from any regulatory agency, any tenant of the Property or any owner or tenant of any adjacent property or any other third party regarding the existence or release or suspected existence or release of any Hazardous Substance in, on, under or about the Property or any Known Release, Hughes Party Release, Valley Release or Fee Owner Release, and (b) within a reasonable period following receipt of written request to do so, make available for review by the other parties all non-privileged audits, reports and other written materials or communications and all sampling or testing data or results prepared or received by such party with respect to Hazardous Substances released in, on, under, about or from the Property or any Known Releases, Hughes Party Releases, Valley Releases or any Fee Owner Releases.

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 15 of 25
Order: bob Comment:

5. Implementation.

5.1 **License and Right of Entry**. Hughes and those agents, employees and contractors of Hughes identified in a written notice provided to Fee Owner not less than forty-eight (48) hours prior to Hughes's initial entry onto the Property pursuant to this Paragraph 17.5.3 (which notice Hughes shall reasonably update to Valley or any Fee Owner of any portion of the Property affected by Hughes' activities from time to time, on an as-needed basis) ("**Hughes Identified Representatives**") are hereby granted an irrevocable license and easement for the period ("**License Period**") commencing as of the date hereof and continuing until all remediation, closure, and investigative and other obligations of Hughes under this Statement have been completed, to enter the Property at any reasonable time (provided that the parties acknowledge that in some cases continuous access on a pre-arranged basis may be required) and from time to time (a) to conduct all investigation, remediation, effluent disposal investigation, corrective action, closure and monitoring activities contemplated hereunder or required for governmental reporting, including the installation, maintenance and removal of underground pipelines, a groundwater treatment plant and other facilities in, on, under or about the Property, and (b) to respond to and investigate, at reasonable times, any claimed Suspected Hughes Release or any third party claims with respect thereto. If Hughes or the Hughes Identified Parties require the exclusive use or occupancy of more than five hundred (500) contiguous square feet of rentable area of any portion of the improvements located on the Property or ten (10) contiguous or twenty (20) total parking spaces such that the same would be untenantable for a continuous period of at least three (3) days, Hughes agrees to lease the same at its then Net Fair Market Rental Value for the period of the interference; and provided, however, that in no event shall Hughes be required to lease (or pay Net Fair Market Rental Value with respect to) any portion of the Property or improvements due to Hughes' implementation of any Remediation Plan submitted to Valley prior to the date hereof in accordance with the terms thereof, except to the extent any such Remediation Plan is materially modified, revised or amended (and such modification or amendment is submitted to Valley or the Fee Owner following the date hereof) under circumstances where the change effected by the modification or amendment (or, if there are more than one such modification or amendment, the changes effected by the modifications and amendments in the aggregate) would result in an increase in Hughes' exclusive use or occupancy which,

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 16 of 25
Order: bob Comment:

if viewed alone, would require that Hughes enter into a lease under this Paragraph 5.1. Hughes shall be solely responsible for providing security for the personnel, property and equipment of Hughes and its agents, employees and contractors which enter or are located on the Property.

5.2 **Compliance With Law**. Each of Hughes, Valley and each Fee Owner shall comply with all Updated Environmental Laws applicable to (i) reporting Hazardous Substances known to or discovered by such party, and (ii) the handling, storage, use, generation, release, investigation and remediation of Hazardous Substances. Hughes shall, and shall cause its agents, employees and contractors who enter the Property after the date hereof to, comply with all federal, state and Local laws and regulations applicable to Hughes' use of the license as provided hereunder; provided, however, that the provisions of this sentence shall not apply to, and shall not affect, any party's rights and obligations hereunder with respect to any Release or the remediation thereof.

6. **Pump and Treat; Use of Treated Water in Irrigation**. The parties agree that subject to Hughes' obtaining applicable approvals from the Jurisdictional Agencies with respect thereto and complying with all then applicable Updated Environmental Laws, Valley and each Fee Owner shall (a) cooperate reasonably with (and permit Hughes to implement), at no cost to Valley or Fee Owners (except the cost and expense of Valley or Fee Owner's employees, agents or attorneys), any Remediation Plan proposed by Hughes with respect to a Known Release or a Hughes Party Release which proposes to dispose of treated water produced in connection with such remediation through irrigation (using the current landscape irrigation system) of landscaping on the Property and (b) allow Hughes to utilize other possible on- or off-site disposal methods (including but not limited to storm drain disposal, or use of on-site injection wells) to the extent approved by the applicable Jurisdictional Agencies; provided, however, that any such use or disposal of treated water shall not violate any present or future law, regulation or policy of any Jurisdictional Agency, result in a condition dangerous to human health or safety or cause damage to the existing landscaping on the Property (other than damage that can be and is repaired by Hughes promptly following Hughes' discovery or receipt of written notice from Valley or any Fee Owner thereof).

Order: bob Comment:

7. **Removal of Hughes' Remediation Equipment.** Following completion or other lawful termination of any Remediation Plan, Hughes shall, at its expense, remove the groundwater treatment plant and other facilities installed by Hughes on the Property in connection with its remediation activities hereunder and restore the surface of the Property to a reasonable condition (including reasonable compaction and paving) consistent with the surrounding Property and improvements; provided, however, that, in the case of underground pipelines and any other facilities now or hereafter installed below the surface of the Property, Hughes shall be permitted to reasonably abandon the same in place, subject to compliance with then applicable Updated Environmental Laws and, if and to the extent required by the Jurisdictional Agencies, to the Satisfaction of Jurisdictional Agencies, and in a manner that will not unreasonably interfere with Valley's or an affected Fee Owner's reasonable occupancy, use or development of the affected Property.

8. **Asbestos.**

8.1 **Acknowledgement Regarding Asbestos Containing Materials.** Notwithstanding any provision of this Statement or any agreement between Hughes and Valley or any Fee Owner to the contrary, each of Valley and each Fee Owner shall be responsible for, and hereby assume, responsibility for the proper remediation and containment in accordance with Updated Environmental Laws of any and all asbestos or asbestos derivatives now or hereafter located in the buildings or improvements on that portion of the Property owned by such party during such party's ownership of the same.

8.2 **Operations and Maintenance Program.** Each of Valley and each Fee Owner shall implement an operations and maintenance program in accordance with Updated Environmental Laws as to any and all asbestos and asbestos derivatives now or hereafter located in the buildings or improvements on that portion of the Property owned by such party during such party's ownership of the same.

9. **Additional Provisions.** Each of Hughes, Valley and each Fee Owner agree as follows:

9.1 **Hughes Retained Environmental Claims.** Hughes shall retain all claims, rights, actions and remedies (collectively, "**Hughes Retained Environmental Claims**") against each and every third party (i) whose acts or

95 786007

Description: Los Angeles,CA Document-Year.DocID 1995.786007 Page: 18 of 25
Order: bob Comment:

omissions cause (or caused) or contribute (or contributed) to any Hughes Party Release or Known Release or who otherwise would be legally responsible in whole or in part therefor and (ii) whose acts or omissions cause (or caused), or contribute (or contributed) to any increased obligation or expense assumed or incurred by Hughes pursuant to this Statement; provided, however, that Valley and each Fee Owner do not waive or release any claims, rights, actions or remedies they may independently have against third parties.

9.2 **Effect of Breach**. No breach by any Fee Owner (who is not Valley and is wholly independent of Valley) of any obligation provided in this Statement shall (i) constitute a breach by Valley hereunder or under this Statement, or (ii) except as otherwise specifically provided hereunder, modify or invalidate any of Valley's rights under this Statement.

10. **Miscellaneous**.

10.1 **Notices**. All notices or other communications required or permitted hereunder shall be in writing and shall be personally delivered (including by means of professional messenger service) or sent by registered or certified mail, postage prepaid, return receipt requested, by facsimile, or by recognized overnight air courier (e.g., Federal Express) and shall be deemed received upon the date of receipt thereof and addressed as follows:

Notice of change of address shall be given by written notice in the manner detailed in this Paragraph.

10.2 **Termination**. Notwithstanding any provision of this Statement to the contrary, each and all of the obligations of the parties hereto shall terminate and shall be of no further force or effect on the date which is five (5) years following (i) completion of work under all Remediation Plans for Known Releases and Hughes Party Releases in, on or about the Property, and (ii) final resolution or settlement of each claim, action or proceeding by Valley against Hughes or by Hughes against Valley under any provisions of this Statement. Upon the termination of this Statement under the terms hereof, Hughes and Valley shall execute and deliver (at no cost to Hughes and Valley) any and all instruments as may be appropriate to clear this Statement from title to the Property or any portion thereof.

10.3 **Arbitration of Disputes**. Any controversy or claim between or among Hughes, Valley or any Fee Owner relating to Hazardous Substances in, on, under or about the Property or any of the covenants, agreements, rights or obligations set forth in this Statement, shall at the written request of any party be determined by mandatory binding arbitration in accordance with California law and the applicable rules of the American Arbitration Association then in effect subject to reasonable opportunities for mutual discovery.

10.4 **Successors and Assigns**. This Statement shall be binding upon and inure to the benefit of the successors and assigns of the parties hereto.

10.5 **Covenants Running With the Land.** Each of the covenants contained in this Statement and in the Additional Agreement (defined below) shall run with the Property and are intended to and shall bind each and every person or entity having any fee interest in any part of the Property at any time and from time to time.

10.6 **Binding Effect.** Each and every agreement, covenant, promise, undertaking, condition, easement, right, privilege, option and restriction made, granted or assumed, as the case may be, by a party is made by such party not only personally for the benefit of the other parties but also as owner of a portion of the Property, and shall constitute an equitable servitude of such portion of the Property for the benefit of other portions of the Property. A transferee of any part of the Property shall automatically be deemed, by acceptance of the title to any portion of the Property, to have assumed all obligations of this Statement relating thereto and to have agreed with the then Fee Owner or Fee Owners of all other portions of the Property to execute any and all instruments and to do any and all things reasonably required to carry out the intention of this Statement.

IN WITNESS WHEREOF, this Statement has been executed by the parties hereto as of the date set forth above.

KNOWN RELEASES

1. Northwestern corner of the Property from north of Building 269 to near extreme northwestern edge of Property - chlorinated VOCs and petroleum hydrocarbons in groundwater, as described in the Corrective Action Plan ("**CAP**"), dated November 13, 1992, prepared by Hughes Environmental Systems and revised by Groundwater Technology.

2. North of Building 282 - gasoline in soil, as described in the CAP.

3. North of Building 282 to locations north, west and directly beneath Building 272 - gasoline at top of groundwater, as described in the CAP.

NO-ACTION KNOWN RELEASES

1. Chlorinated VOCs in groundwater in the vicinity of monitoring well CM-8D, as described in the Corrective Action Plan Addendum ("**Addendum**"), dated March 29, 1994, prepared by Groundwater Technology.

2. Trichlorofluoromethane (Freon 11) in groundwater in the vicinity of monitoring well CM-10, as described in the Addendum.

FORM OF REQUEST FOR CLOSURE

JURISDICTIONAL AGENCY
ADDRESS

Re: Request for Certification of Closure or Completion Hughes Aircraft Company Closure Plan/Remediation Plan Former Hughes Missile Systems Group Facility 8433 Fallbrook Avenue, Canoga Park, California 91304

Dear Sir/Madam:

Hughes has completed the closure/remediation of [permitted unit/release] under the Closure Plan/Remediation Plan in compliance with applicable laws and regulations. Please confirm you agency's concurrence by providing a written certification of closure or completion of remediation. For your convenience, we have enclosed as draft certification letter.

Sincerely

Hughes Representative

Enclosure

DRAFT CERTIFICATION LETTER

Dear Hughes Representative:

This letter confirms this agency's review of the remediation/closure activities at the former Hughes Missile System Group Canoga Park facility located at 8433 Fallbrook Avenue in the City of Los Angeles (the "Property"). Based upon this agency's review of Hughes' Closure Plan/Remediation Plan, records and documentation supplied by Hughes and our inspection of the Property, we find that the closure/ remediation is complete and no further environmental investigation or remediation is necessary or warranted at the Property with respect to the closure/remediation.

Sincerely,

Agency Representative

1.0 INTRODUCTION

The 1984 Resource Conservation and Recovery Act (RCRA) amendments provide authority for the U.S. Environmental Protection Agency (USEPA) to require comprehensive corrective action on Solid Waste Management Units (SWMUs) and other areas of concern at facilities applying for a Part B permit and those with RCRA Interim Status or facilities that operated in a manner that required a hazardous waste facility permit even though the facility had not obtained or applied for a hazardous waste permit. The Hughes Missile Systems Company operated the Canoga Park Facility with two permitted interim status units. These units were closed with closure certification pending. Interim Remediation is currently being under taken under the Los Angeles Regional Water Quality Control Board (LARWQCB).

In 1997 the Raytheon Missile Systems Company acquired the Hughes Missile Systems Company which then merged with Raytheon in 1998 to become the Raytheon Systems Company (Raytheon). Raytheon subsequently sold off the Canoga Park site but retains responsibility for site cleanup.

In order to accomplish the objective of corrective action, a RCRA Facility Assessment (RFA) of the Canoga Park Facility was conducted. This assessment consisted of a preliminary review (PR) of documentation of past site investigations and a Visual Site Inspections (VSI). The VSI was conducted on June 13, 2007.

This report is a summary of the PR and the VSI. The PR is based upon information found in files and reports at the Department of Toxic Substances Control (DTSC) including the facility operation plan, closure plan, and documents provided by Hughes/Raytheon. The documents that form the basis for this RFA are referenced and are considered as supplemental documents.

2.0 SITE DESCRIPTION

2.1 Location

The Canoga Park Facility is located at 8433 Fallbrook Avenue in Canoga Park, California. The facility is located in the northwest portion of the San Fernando Valley of Los Angeles County, California. The site is approximately 86 acres in area and ranges in elevation from approximately 900 feet above mean sea level (MSL) in the north-central portion to approximately 840 feet above MSL at its southern boundary. The site is bounded to the east by Fallbrook Avenue, to the south by Roscoe Boulevard, to the north by open space land adjacent to the Chatsworth reservoir, and to the west by single family residential housing (Figure 1 - Aerial photo). Residential neighborhoods are located across Fallbrook Avenue and Roscoe Boulevard.

2.2 Ownership History

In 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker-Ramo, an electrical component design and testing company. Bunker-Ramo was the sole occupant of the Facility from 1959 until 1966. From 1966 to 1976, Hughes

Missile Systems Company (Hughes) was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes purchased the entire Site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Facility. The January 17, 1994 Northridge Earthquake (Mw 6.7) damaged several buildings at the property and led to Hughes moving people and activities to Tucson, Arizona. In May 1995, the Facility was purchased from Hughes by Coast Federal Bank (CFB). At this time, land use changed from research, development and "prototyping" to commercial office space. The northern portion of the Site was sold to Regent Properties, Inc. (Regent) in 1997. Regent completed a major development project that included building redevelopment, remodeling and re-grading to raise the elevation of a portion of the Site. Parcels within the southern portion of the Site were subsequently purchased by DeVry Incorporated, Los Angeles Metropolitan Police Department and Trammel Crow. DeVry initiated a development project that included new building construction and re-grading. In September 2001, Regent sold its portion of the Facility to Shamrock Holdings, Inc., who in turn, sold the property to MEPT West Hills Limited Liability Corporation (LLC) in June 2002. MEPT West Hills LLC is the current property owner, although Trammell Crow Company acts as property manager for the Facility. As stipulated in the sales agreement with CFB in 1995, Hughes (now Raytheon) continued to address environmental impacts resultant from its former operations.

2.3 Past Waste Management Activities

Small amounts of hazardous wastes were collected in 55 gallon drums and stored in the HWSA, where flammables were physically separated from corrosives. Wastes handled include acids, bases, iron, tin, fluorine, gasoline, diesel, copper, chromium, Freon, oils, cyanides, flammable solvents and chlorinated solvents. The curbed storage area had a reinforced concrete base with a grated sump. Security was controlled by masonry, chain link walls and gated access. The area had a tarpaulin roof. Wastes were accumulated, and full containers were periodically sent to a hazardous waste facility.

Hazardous waste oils and solvents were collected in a four thousand gallon underground storage tank (T3) just northwest of the HSWA. Wastes were accumulated and were periodically sent by tanker to a hazardous waste facility.

2.4 Current Waste Management Activities

Currently the site is used as office space for a multitude of tenants. The waste activities are chiefly the remediation of the soil and groundwater at the identified hot spots in the north west and the central east portions of the site. Since 1995 the groundwater and soil in the northwest plume has been treated by a groundwater recovery and treatment system, (GRTS), a solvent vapor extraction system(SVE) and later enhanced with an air sparge system (AS). The water was treated by air stripping and carbon absorption of the volatile organics. The soil vapor was extracted by vacuum volatilization and carbon absorption. These were shutdown because of asymptotic conditions and replaced with an enhanced in-situ bioremediation process (EISB) starting in October of 2005. The EISB process was also applied to a smaller plume in the northeast of the site in December of 2006.

Current operations involve ground water monitoring on a quarterly basis to monitor the effectiveness of the EISB process.

2.5 Permit History for Hazardous Waste Management Units

Hughes Missile Systems Group operated at the site since 1965 and was issued a Hazardous Waste Facility Permit on June 28, 1985 for the HWSA and T3 RCRA units. Operations ceased in 1994. A Closure and Post Closure Plan was approved in late1995. This plan included a report of the T3 closure. A closure certification report for the HWSA was submitted in November 8, 2002. Both of these closures were incomplete with soil and ground water contamination at depth.

3.0 ENVIRONMENTAL SETTING

3.1 Site Geology

The shallow geologic deposits of the western San Fernando Valley in the vicinity of the project site are comprised of predominantly unconsolidated sands, silts and clays with occasional gravels. These alluvial fill deposits are of Quaternary age and range in thickness from thin veneer at the valley margins to more than 700 feet in the central portion of the San Fernando Valley. In the western portion of valley, the unconsolidated alluvial fill deposits are unconformably underlain by consolidated bedrock of the Modelo and Chatsworth Formations, respectively. The Modelo Formation consists of grayish siltstone, clayey siltstone and shale, with minor interbedded diatomaceous shale. A relatively thin weathered zone exists along the top of the formation where it is in contact with the shallow alluvial deposits. The Chatsworth Formation is comprised primarily of a turbidite sandstone sequence with interbedded shale and minor conglomerates. The bedrock of the Chatsworth Formation, which is the major rock comprising the Simi Hills, forms the distinct outcrops north of Chatsworth Reservoir (McLaren, 1989). A major portion of the Former Raytheon Facility is constructed on consolidated bedrock of the Miocene Modelo Formation. Near surface (to 50 or 100 ft bg), deposits are highly weathered. Beds of the Modelo are seen in road cuts and in drill-hole samples to be dipping at up to 45° from horizontal. Generally, dip direction is toward the south or southwest.

In the northwestern portion of the Facility, to the west and northwest of Building 270 and at other locations on the site periphery, the shallow subsurface is comprised of unconsolidated alluvial valley fill of Quaternary age. This material is present to depths of at least 75 feet. The beds are flat-lying, and consist primarily of mixed silt and fine sand, with lesser amounts of clay. The Modelo Formation is believed to be unconformably present beneath the valley fill. A thin (up to 10-foot) layer of construction fill material is locally present at the surface overlying

3.2 Surface Water Hydrology

Primary surface drainage in the site vicinity is Chatsworth Creek, lying immediately west of the Site. Portions of Chatsworth Creek, north and south of Hidden Lake (formerly Lees Lake) are contained within large underground culverts. Other portions are contained in lined or unlined structured channels. The portion of Chatsworth Creek in

the site vicinity is contained in underground cement-lined tunnels. Water from Chatsworth Creek eventually flows into the Los Angeles River about 2.5 miles down gradient. Hidden Lake is the only active reservoir within a 1-mile radius of the site. Hidden Lake is used as a recreational area by residents of the surrounding housing development. It should be noted that storm drainage, including storm drain discharge, from the site flows to Chatsworth Creek, the majority of which enters south and downstream of Hidden Lake.

3.3 Groundwater Hydrology

Groundwater gradient direction within the vicinity of the site regionally flows from northwest to southeast, from the Simi Hills to the San Fernando Valley. The depth to groundwater is approximately 25 feet bg near Roscoe Boulevard. The hydraulic gradient of the regional groundwater is approximately 0.0047 feet per foot (ft/ft). The water bearing materials comprising the western portion of the valley are generally fine grained alluvial sediments, which contain naturally-occurring total dissolved solids (TDS) in excess of 1,000 milligrams per liter (mg/L), exceeding the recommended USEPA drinking water guidelines. Due to the relatively low yields and excessive TDS, there are no drinking water wells in the vicinity of the facility. Essentially all drinking water consumed in the western San Fernando Valley is derived from the State Water project and the Los Angeles Aqueduct, which delivers water to southern California from the Sierra Nevada Mountains. Although the Los Angeles Department of Water and Power (LADWP) supplements its water supply with groundwater from the San Fernando Basin, all of the groundwater production well fields are located in the eastern quarter of the basin. The nearest active production well for supply of potable water to the public is more than 15 miles down gradient from the Site. In the vicinity of the site, groundwater occurs between 10 and 65 ft bg, depending on the location on the property. Groundwater gradient direction is generally to the southeast (i.e., from the Simi Hills to the San Fernando Valley), but on the western side of the property, there is a westward component due to the local topography Quarterly groundwater gauging of onsite monitoring wells has been conducted since December 1991 (with previous monthly gauging from August 1990). The groundwater gradient in the northwest portion of the site, which contains the main volatile organic compound (VOC) plume, is consistently westward and ranges from 0.01 to 0.02 ft/ft. In the extreme northwest corner of the site, the gradient becomes less steep and a localized depression is often observed even under static non-pumping conditions. This is likely due to the lithologic change from the Modelo formation to the alluvial unit in this area. The apparent groundwater gradient over the remainder of the Site is towards the southwest, south and south-southeast, with gradients ranging from 0.01 to 0.04 ft/ft. Water depths, groundwater gradients, and apparent groundwater flow directions are generally consistent with minor localized changes due to pumping activities during GRTS operation. Average hydraulic conductivities were calculated to be approximately 9 gallons per day per square foot (gpd/ft^2) for the Modelo Formation ($4.24x10^{-4}$ centimeters per second or cm/sec) and approximately 270 gpd/ft^2 for the alluvial fill ($1.27x10^{-2}$ cm/sec) (GTI, 1993).

4.0 SOLID WASTE MANAGEMENT UNITS And AREAS Of CONCERN

This Assessment has included all Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) identified by DTSC in 2002 from in a previous draft Corrective Action Consent Agreement; Table 1. The northeast plume at well CM-8 was also considered as an AOC. These units are indicated on the site drawing, Figure 2.

4.1 SWMUs

4.1.1 SWMU-1 (aka Hazardous Waste Storage Area, HWSA)

This unit was used to store carboy and drum quantities of hazardous wastes containing solvents, acids, bases, plating solutions and paint.

This unit was addressed in the *Modified Closure Plan for the Hazardous Waste Storage Area and Tank T3* [1] which was accepted by DTSC and dated August 1995. A document titled *Closure Certification Report for the Hazardous Waste Storage Area*[2] and dated 11/08/2002 documents the action taken. The closure process discovered arsenic, cadmium and hexavalent chromium that exceeded Closure Performance Standards in the underlying soils. After excavation to 14.5 feet below the former HWSA pad there still were high levels of hexavalent chromium. The pit was lined with polyethylene and back filled. Latter the area was regraded with about 8-9 feet of additional soil and paved. Additional borings were made to help define the extent of the chromium plume[3,4]. High levels of hexavalent chromium were detected in a narrow plume below the former HWSA all the way to groundwater. Since August 1999 Raytheon has been monitoring the groundwater at nearby wells for hexavalent chromium.

The Closure Certification Report was not accepted by DTSC as of the present. The extent of high levels of hexavalent chromium in subsurface soil and water must be defined and considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

Table 1
SOLID WASTE MANAGEMENT UNITS AND AREAS OF CONCERN
RAYTHEON MISSLE SYSTEMS COMPANY
CANOGA PARK, CALIFORNIA

EPA and DTSC DESIGNATION	NAME	RELEASES
SWMU-1 (HWSA)	Hazardous waste storage area	Release to soil and groundwater. COCs include hexavalent chromium
SWMU-2 (T3)	Underground Storage Tank (UST) for Waste	Release to soil and groundwater. Constituents include dichloroethylene (DCE)
SWMU-3	Building 272	Volatile organic compounds (VOCs) identified in vapor survey.
SWMU-4	Building 282 Former Drum Storage Room	Soil tested positive for chlorinated VOC vapors
SWMU-5	Pits #1 and #2 near Building 269	Releases to soil of cadmium and Beryllium. Groundwater contaminated with tetrachloroethylene (PCE).
SWMU-6	Parking area between Buildings 274 & 276	Releases to soil and groundwater. Constituents include Freon-11
SWMU-7	Cooling Unit outside of Building 274	Releases to soil. Constituents include Freon-11
SWMU-8	Former USTs T-1/T2 pump island near Buildings 272 & 282	Releases to soil and groundwater. Constituents include petroleum hydrocarbons
SWMU-9	Site wide sewer line	Releases to soil near soil boring BSL-4. Constituents include arsenic.
AOC-1	Building 262 drains and feeder sewer lines	Suspected release. Building is up gradient of wells CM-8d, CM-9d and CM-18 which have 1,1 DCE for which no source has been determined.
AOC-2	Building 263 drains, sumps and feeder sewer lines	Suspected release. Building is near and up gradient of well CM-8d which have 1,1 DCE.
AOC-3	Building 265 drains and feeder sewer lines	Suspected release. Down gradient SWMU-4 has contaminated soil with Freon-11
AOC-4	Building 269 interior: plating pit, drains, sumps, degreaser exterior clarifier pit and feeder sewer lines	Releases to soil at exterior clarifier pit, SWMU-5

Table 1
SOLID WASTE MANAGEMENT UNITS AND AREAS OF CONCERN
RAYTHEON MISSLE SYSTEMS COMPANY
CANOGA PARK, CALIFORNIA

Continued …

EPA and DTSC DESIGNATION	NAME	RELEASES
AOC-5	Building 271 industrial waste clarifier, drains and feeder sewer lines	Suspected release. Building associated with UST T-4. CM-8d nearly down gradient and groundwater contaminated with Freon-11
AOC-6	Building 274 drains and feeder sewer lines	Unknown. Building was used to store/use solvents including 1,1, TCA, Freon-11 and hydraulic fluid. Up gradient of CM-10 which had Freon-11 in groundwater..
AOC-7	Building 276 drains and feeder sewer lines	Unknown. Soil gas data from parking area toward Building 274 shows vapor phaseFreon-11. Building is up gradient of CM-10 which had Freon-11 in groundwater.
AOC-8	Building 281 drains and feeder sewer lines	Unknown. Building is up gradient of CM-8d and cross gradient from CM-9d which had Freon-11 in groundwater. Also next to former diesel USTs
AOC-9	Former USTs T-5 & T-6	Suspected releases. T-5 used for storage of hazardous waste including waste oil and sulfuric acid.
AOC-10	Former USTs T-7, T-8 and T-9	Diesel fuel contaminated soil was excavated in this area
AOC-11	Above ground tank, T-14	Unknown. Tank was located inside Building 269 and stored solvent waste such as acetone, 1,1,1 TCA and isopropyl alcohol.
AOC-12	Site wide storm water system	Releases suspected
AOC-13	Northeast plume	1,1 DCE, Freon

4.1.2 SWMU-2 (aka T3)

This tank was used to store bulk quantities of hazardous wastes which consisted of machine cutting fluids, some solvents used for cleaning and maintenance of machinery, and machine lubricating oils. Hazardous constituents present in these wastes were 1,1,l-trichloroethane (TCA), acetone, and oils. Contaminants detected in the soil in vicinity of T3 include TPH, 1,1dichloroethylene (l,l-DCE), 1,1-dichloroethane (l,l-DCA), and TCA.

Tank T3 was permitted under RCRA when it was removed. The tank was removed in June 1988 and associated contaminated soils were removed in September 1991 under a Corrective Action Plan (CAP) approved on March 18, 1991 by the CalEPA Los Angeles Regional Water Quality Control Board (LARWQCB). The document, *Final Report, Remediation of Former T3 Tank Site*[5] (November 1991), discusses the extent of soils removed. The soil was excavated to 40 feet below ground surface in the vicinity of the former T3 by boring three foot holes on a triangular pitch. The excavation left a cookie cutter pattern of soil wedges behind unexcavated. The holes were backfilled with a cement and sand slurry. Later the area was regraded with about 7 feet of additional soil and paved. CAP goals were used to determine the extent of excavation. The LARWQCB approved cleanup action levels for remediation of impacted soils at the T3 site were:

LARWQCB Corrective Action Plan Cleanup Action Levels	
Total petroleum hydrocarbons (TPH)	100 ppm
Total volatile organic compounds (VOCs)	20 ppm
1, l-dichloroethylene (1, 1-DCE)	6 ppm

The groundwater in the area is contaminated with a range chlorinated VOCs and has been undergoing a series of interim remediation under LARWQCB guidance. From 1995 to 2005 ground water has been treated via a Pump and Treat system with the treated water used for on site irrigation needs. The soil has been treated via a Soil Vapor Extraction system (SVE) for the same period. Contaminant levels became asymptotic by 2000 and an Enhanced In-Situ Bioremediation approach (EISB) was instituted in 2005[6]. Final cleanup levels have not been determined under DTSC protocol.

The Closure Certification Report was not accepted by DTSC as of this document. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.3 SWMU-3 (Building 272)

Building 272 is a small building associated with the former gas pump area. The building has been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water

must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[7]

4.1.4 SWMU-4 (Building 282)

Building 282 is a former drum storage room associated with the former gas pump area. The building has been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[8]

4.1.5 SWMU-5 (Pits #1 and #2 near Building 269)

These pits received photographic wastes and neutralized acids. Releases to soil of Cadmium and Beryllium have been noted. Groundwater is contaminated with tetrachloroethylene (PCE). These pits have been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs and metals in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.6 SWMU-6 (Parking area between Buildings 274 & 276)

The 1991 Preliminary Assessment authorized under US EPA cites the presence of Freon-11 and elevated radioactivity in this area.[8] It has been contended that elevated radioactivity is due to natural geologic variation.[9] This area is in the SE part of the site. The contamination is suspected to have resulted from maintenance work on cooling units next to the former Building 274. According to a 1998 Fluor Daniel GTI Site Assessment report[10] the cooling unit at Building 274 used Freon 22 and only Buildings 263 used Freon 11. In any event the plume was delineated as centered at the edge of a former parking area. At the time of the report it was concluded that the Freon levels were declining and below drinking water standards. Need to determine if any issues remain.

4.1.7 SWMU-7 (Cooling Unit outside of former Building 274)

The presence of Freon-11 was detected in the soil. This area is in the SE part of the site. The contamination is suspected to have resulted from maintenance work on the cooling units.[11] Need to determine if any issues remain.

4.1.8 SWMU-8 (Former USTs T1 & T2 for the gasoline pump island)

The release of petroleum hydrocarbons to soil and groundwater occurred. The area is within the NW treatment area that includes the EISB areas A, B & C. The extent of hydrocarbon contamination was assesses in 1991.[12] The plume is within the larger VOC plume in the northwest corner of the site and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered

in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.9 SWMU-9 (Site wide sewer line)

Site wide assessment in 1991 did not show up any metal contamination at detection limits.[13] One sample had a trace (0.009 mg/kg) of toluene. Sample B-SL had 0.3 mg/kg of toluene. No other VOCs were detected. Need to determine if any issues remain.

4.2 AOCs

4.2.1 AOC-1 (Building 262 drains and feeder sewer lines)

This building is up gradient of a release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.2 AOC-2 (Building 263 drains sumps and feeder sewer lines)

This building is adjacent to an area of release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels. In 1992 wells near Building 263 tested above EPA Maximum Concentration Limit (MCL) for uranium.[14]

4.2.3 AOC-3 (Building 265 drains and feeder sewer lines)

This building is next to an area with Freon contamination and could be a source of the contamination. Final cleanup levels have not been determined under DTSC protocol. The presence of Freon in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.4 AOC-4 (Building 269 drains and feeder sewer lines)

This building was in an area where soil is contaminated with VOCs and the sewer line may have been a source. The building was removed by 1988. It was in the area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[8,15]

4.2.5 AOC-5 (Building 271 drains and feeder sewer lines)

This small building was associated with a large concrete water basin, T4. This building is adjacent to an area of release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB

guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.6 AOC-6 (Building 274 drains and feeder sewer lines)

This small building was use for solvent parts cleaning and stored 1,1,1 TCA, Freon, and Hydraulic fluid. The building has been removed. Nearby is an area with Freon contamination and it could be a source of the contamination. Final cleanup levels have not been determined under DTSC protocol. The presence of contamination in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.7 AOC-7 (Building 276 drains and feeder sewer lines)

This building had 2 active chemical use areas, solvent cleaning and photographic processing operations. Freon has been detected at a down gradient well, CM-10. Final cleanup levels have not been determined under DTSC protocol. The presence of contamination in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.8 AOC-8 (Building 281 drains and feeder sewer lines)

This building is adjacent to an area of release and could be a source of the contamination. Generally it handled small quantities of in a maintenance shop setting. Chemicals included dichloromethane, insecticides, mineral oil and ethylene glycol. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Also it is next to the former diesel USTs. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs and hydrocarbons in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.9 AOC-9 (T5 and T6)

These USTs were used to store waste oil and sulfuric acid. These were glass lined 500 gallon vessels that were contained in a concrete vault located west of building 263. The tanks were removed in 1984 along with the vaults and soil was excavated.[16] Residual contamination consisting of toluene and xylenes need to be considered in the HRA. The presence of VOCs and hydrocarbons in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.10 AOC-10 (T7, T8 & T9)

These USTs were used to store diesel fuel. The tanks were removed in1991.[17]. Subsequently the soil was excavated to remove contaminated soil.[18]. A clean-up level of 100 ppm of TPHD was used. Currently most of this area has been covered with a bi-level parking lot. Residual diesel should be considered in a health and environmental risk assessment.

4.2.11 AOC-11 (T14)

This AOC is an above ground tank that was located in building B269. Building 269 was removed by 1998. The area is within the contaminant plume in EISB treatment areas A & B. The plume there has been characterized and has undergone SVE, pump and treat and currently EISB. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.12 AOC-12 Site Wide Storm Sewer System.

The Storm sewer system has not been investigated. Key points where runoff could carry contaminants and where leaks are more likely to occur may need to be tested for contamination.

4.2.13 AOC-13 Northeast Plume between B263, B264 & B281

This plume has had definition and is currently undergoing interim measures by EISB in area D.

4.3 SUMMARY OF CONSOLIDATED SWMUS AND AOCS.

The various SWMUs and AOCs can be regrouped in to several zones for Risk assessment and treatment purposes (figure 3). The following zones are defined.

4.3.1 Zone 1 The contiguous Northwest Plume consisting of:

- SWMU-1 former HSWA
- SWMU-2 former T3
- SWMU-3 former B272 gas station bldg
- SWMU-4 former B282 drum stg bldg
- SWMU-5 former P1 & P2 at B269
- SWMU-8 former T1 &T2 gasoline tanks
- AOC-4 former B-269
- AOC-11 former AST in B269

This zone has a known contamination of VOCs, CVOCs, chromium^{+6} and potential cadmium and beryllium at SWMU-5.

4.3.2 Zone 2 Sewer system network consisting of

- SWMU-9 Sewer System
- AOC-1 B262 sewer drains and feeders
- AOC-2 B263 sewer drains and feeders
- AOC-3 B265 sewer drains and feeders
- AOC-5 B271 sewer drains and feeders
- AOC-6 B274 sewer drains and feeders
- AOC-7 B276 sewer drains and feeders
- AOC-8 B281 sewer drains and feeders

4.3.3 Zone 3 South plume area (Freon 11 contamination)

- SWMU-6 B274,276 parking lot
- SWMU-7 former B-274; Chiller building

4.3.4 Other areas that remain individual AOCs. These are:

- AOC-9 former T5,T6; oil, sulfuric acid tanks
- AOC-10 former T-7,8,9; diesel tanks
- AOC-12 Storm sewer system
- AOC-13 Northeast plume

5.0 EXPOSURE PATHWAYS

5.1 Surface Water

Nearest stream is in adjacent neighborhood to the west where a small stream, Chatsworth Creek, enters and exits a small lake, Hidden Lake (aka Lees Lake), via culverts and continues south via lined and unlined structured channels. The property is graded to drain to the SE through storm drains which empty into this stream.

5.2 Groundwater

Groundwater flows to the West at the NW corner of the property but generally to the SSE on the rest of the property into the San Fernando Valley. With measured TDS of over 1000 ppm the water is not likely to be used for drinking water. There may be interaction between the groundwater and Hidden Lake to the west.

5.3 Air

The area is paved, built upon or vegetated with irrigated beds. There is potential for soil gas intrusion into buildings. Buildings are being used commercially as office space.

5.4 Surface Soil

There is essentially no exposed soil due to paving and buildings. Soil exposure could occur when it is disturbed during construction activities.

6.0 VISUAL SITE INSPECTIONS

The site was visited on Wednesday June 13, 2007. The site is a well landscaped business office site. The vast majority of the area is covered with office buildings, roadways, parking lots and walkways. The remaining area consists of a central park area and narrow vegetated corridors that border and subdivide the property. The primary treatment area is in the north western corner of the site. A new parking structure was nearly completed in the north east corner of the site.

Visual Evidence of SWMUs, AOCs and treatment systems are minimal. The GRTS and SVE equipment are idle behind a small fenced area. Well heads are flush to ground level and covered. Observations are photo documented (See figures 4 to 11).

7.0 RECOMMENDATIONS FOR FURTHER ACTION

- Continue Groundwater Remediation

- Determine data gaps to developing a site wide heath risk assessment using the current DTSC-modified model. A site conceptual model needs to be developed to address all exposure routes.

- Collect samples needed to fill in the data gaps.

- Complete a soil vapor survey using old and new data as appropriate to model vapor intrusion. This work is to be in accordance with the Department's publications: GUIDANCE FOR THE EVALUATION AND MITIGATION OF SUBSURFACE VAPOR INTRUSION TO INDOOR AIR and ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS. As these documents are under going revision it is important that this investigation be done with close coordination with the project manager.

- Prepare site wide HRA for all modes of exposure to define remediation goals acceptable to DTSC.

- Modify remediation effort as required to meet the DTSC remediation goals or existing CAP goals whichever is the more stringent.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 12/28/2011 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 08/19/2011 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/15/2012 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/15/2012 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

QUEST DIAGNOSTICS	8403 FALLBROOK AVENUE	0 - 1/8 (0.000 mi.)	A5	20

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/15/2012 has revealed that there are 4 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 11/05/2012 has revealed that there is 1 ENVIROSTOR site within approximately 1 mile of the target property.

Other Ascertainable Records

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 03/15/2012 has revealed that there is 1 RCRA-NonGen site within approximately 0.25 miles of the target property.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Waste name: 792

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D009
Waste name: MERCURY

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D007
Waste name: CHROMIUM

Waste code: D009
Waste name: MERCURY

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CRITERIA AND HAZARDOUS AIR POLLUTANT INVENTORY

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 06/07/2012

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 06/07/2012

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/27/2011

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 07/11/2012
Date Data Arrived at EDR: 09/12/2012

US HIST CDL: National Clandestine Laboratory Register

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 09/01/2007

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EPA WATCH LIST: EPA WATCH LIST
EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List
The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

West Map:	34118-B6 CALABASAS, CA
Most Recent Revision:	1967

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

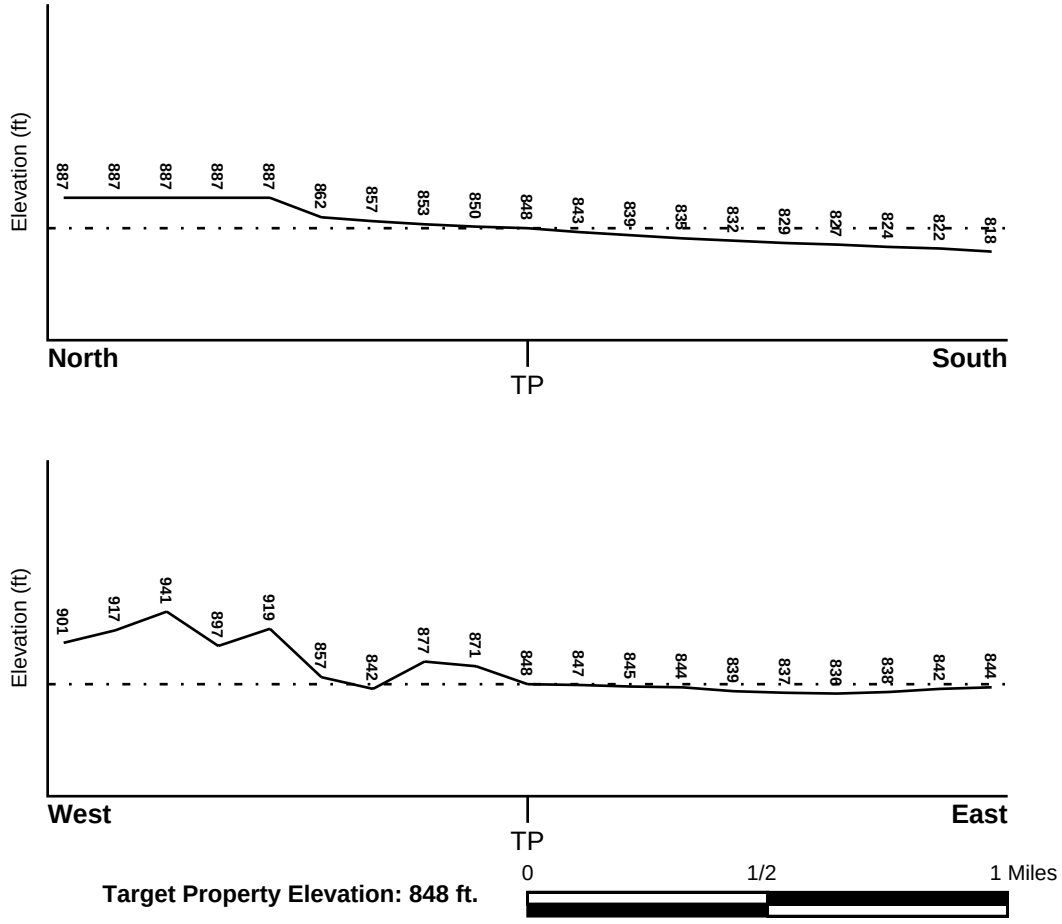
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
LOS ANGELES, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06037C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CANOGA PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Anacapa

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	24 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9
2	24 inches	48 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9
3	48 inches	72 inches	coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9

Soil Map ID: 2

Soil Component Name: Xerorthents

Soil Surface Texture: variable

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 89 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	59 inches	variable	Not reported	Not reported	Max: Min:	Max: Min:
2	59 inches	64 inches	weathered bedrock	Not reported	Not reported	Max: Min:	Max: Min:

Soil Map ID: 3

Soil Component Name: San Emigdio

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	18 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9
2	18 inches	77 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHASE I ENVIRONMENTAL SITE ASSESSMENT QUESTIONNAIRE

The following questionnaire is required by the ASTM Standard E 1527-13, which adheres to the All Appropriate Inquiries (AAI) Rule (United States Environmental Protection Agency) (40 CFR 312).

As defined by ASTM, the User of the report is the *"party seeking to use Practice E 1527 to complete an environmental site assessment of the property. A user may include, without limitation, a potential purchaser of property, a potential tenant of property, an owner of property, a lender, or a property manager. The user has specific obligations for completing a successful application of this practice."*

PROPERTY ADDRESS:	Corporate Pointe Land Parcel
PROPERTY CITY, STATE ZIP:	West Hills, CA

1. **Environmental liens that are filed or recorded against the property (40 CFR 312.25)**

   Did a search of recorded land title records (or judicial records) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?

   ☐ YES ☒ NO

2. **Activity and use limitations (AULs) that are in place on the property or that have been filed or records against the property (40 CFR 312.26(a)(1)(v) and (vi))**

   Did a search of recorded land title records (or judicial records) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

   ☐ YES ☒ NO

3. **Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28)**

   Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

   ☐ YES ☒ NO

4. **Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29)**
Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

☒ YES ☐ NO

---

5. **Commonly known or reasonably ascertainable information about the Property (40 CFR 312.30)**
Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases?

☐ YES ☒ NO

---

a. Do you know the past uses of the property?

☐ YES ☒ NO

---

b. Do you know of specific chemicals that are present or once were present at the property?

☐ YES ☒ NO Partners has all info we have received

---

c. Do you know of spills or other chemical releases that have taken place at the property?

☐ YES ☒ NO

---

d. Do you know of any environmental cleanups that have taken place at the property?

☐ YES ☒ NO

---

e. Do you have any prior knowledge that the property was developed as a gas station, dry cleaner, manufacturing/industrial facility in the past?

☐ YES ☒ NO

---

f. Are you aware of historical use of hazardous materials or petroleum products used or present on the property?

☐ YES ☒ NO

---

g. Do you know if the property is currently or was formerly equipped with underground storage tanks (USTs) or septic tanks?

☐ YES ☒ NO

h. Do you know of any past, threatened or pending lawsuits or administrative proceedings concerning a release or threatened release of any hazardous substance or petroleum products involving the property by any owner or occupant of the property?

☐ YES ☒ NO

6. The degree of obviousness of the presence or likely presence of contamination at the property**, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31)**

Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?

☐ YES ☒ NO

PROPERTY: **APN 2005-002-018, LOS ANGELES, CA**

PRELIMINARY REPORT

In response to the application for a policy of title insurance referenced herein, ***Chicago Title Company*** *hereby reports that it is prepared to issue, or cause to be issued, as of the date hereof, a policy or policies of title insurance describing the land and the estate or interest therein hereinafter set forth, insuring against loss which may be sustained by reason of any defect, lien or encumbrance not shown or referred to as an exception herein or not excluded from coverage pursuant to the printed Schedules, Conditions and Stipulations or Conditions of said policy forms.*

The printed Exceptions and Exclusions from the coverage and Limitations on Covered Risks of said policy or policies are set forth in Attachment One. The policy to be issued may contain an arbitration clause. When the Amount of Insurance is less than that set forth in the arbitration clause, all arbitrable matters shall be arbitrated at the option of either the Company or the Insured as the exclusive remedy of the parties. Limitations on Covered Risks applicable to the CLTA and ALTA Homeowner's Policies of Title Insurance which establish a Deductible Amount and a Maximum Dollar Limit of Liability for certain coverages are also set forth in Attachment One. Copies of the policy forms should be read. They are available from the office which issued this report.

This report (and any supplements or amendments hereto) is issued solely for the purpose of facilitating the issuance of a policy of title insurance and no liability is assumed hereby. If it is desired that liability be assumed prior to the issuance of a policy of title insurance, a Binder or Commitment should be requested.

The policy(s) of title insurance to be issued hereunder will be policy(s) of Chicago Title Insurance Company, a Florida corporation.

Please read the exceptions shown or referred to herein and the exceptions and exclusions set forth in Attachment One of this report carefully. The exceptions and exclusions are meant to provide you with notice of matters which are not covered under the terms of the title insurance policy and should be carefully considered.

It is important to note that this preliminary report is not a written representation as to the condition of title and may not list all liens, defects and encumbrances affecting title to the land.

Affects:	A portion of said land as more particularly described in said document.

71. This exception has been intentionally deleted.

72. This exception has been intentionally deleted.

73. Any right, title or interest of the debtor named in the financing statement shown above.

74. Any rights, claims or interests that may exist or arise by reason of the following facts disclosed by a map dated October 30, 2018 of an ALTA/NSPS Land Title Survey prepared by or under the responsible charge of Douglas R. Howard LS 6169, of/for Psomas, Project/Job No. 1BRO190100.

A. There is a sign on the east line of Parcel 1B.
B. A guy anchor attached to a power pole on Fallbrook Avenue extends an undisclosed distance onto Parcel 1B.
C. Parking improvements on Parcel 1B extend onto the westerly adjoining property.
D. A light on the north side of Parcel 1B extends onto the northerly adjoining property.
E. There is an "I box", storm drain manhole and fire hydrant on the west side of Parcel 1B.
F. There a back flow preventer utility pad on the south side of Parcel 1B.
G. There is a drain inlet on the north line of Parcel 1B.
H. The fact that Parcel 1B is labeled Parcel 1 on the survey.
I. The fact that the following matters set forth in the "Minimum Standard Detail Requirements for ALTA/NSPS Land Title Surveys" jointly established and adopted by ALTA and NSPS in 2016, have not been addressed or complied with by the survey in its present form. The numbers in parentheses refer to the specific standard in the requirements.

(7.) Surveyor's signature is not on the survey.

75. Any rights of the parties in possession of a portion of, or all of, said Land, which rights are not disclosed by the public records.

The Company will require, for review, a full and complete copy of any unrecorded agreement, contract, license and/or lease, together with all supplements, assignments and amendments thereto, before issuing any policy of title insurance without excepting this item from coverage.

The Company reserves the right to except additional items and/or make additional requirements after reviewing said documents.

76. Matters contained in that certain document

Entitled:	Private Covenants and Agreement Regarding Entitlements
Dated:	January 10, 2019
Executed by:	BSREP West Hills Office Campus LLC, a Delaware limited liability company
Recording Date:	January 14, 2019
Recording No:	2019-0037078 of Official Records

Reference is hereby made to said document for full particulars.

EXCEPTIONS
(Continued)

PLEASE REFER TO THE "INFORMATIONAL NOTES" AND "REQUIREMENTS" SECTIONS WHICH FOLLOW FOR INFORMATION NECESSARY TO COMPLETE THIS TRANSACTION.

END OF EXCEPTIONS

REQUIREMENTS SECTION

1. Unrecorded matters which may be disclosed by an Owner's Affidavit or Declaration. A form of the Owner's Affidavit/Declaration is attached to this Preliminary Report/Commitment. This Affidavit/Declaration is to be completed by the record owner of the land and submitted for review prior to the closing of this transaction. Your prompt attention to this requirement will help avoid delays in the closing of this transaction. Thank you.

   The Company reserves the right to add additional items or make further requirements after review of the requested Affidavit/Declaration.

2. The Company will require the following documents for review prior to the issuance of any title insurance predicated upon a conveyance or encumbrance from the entity named below:

   Limited Liability Company: BSREP West Hills Office Campus LLC, a Delaware limited liability company

   a) A copy of its operating agreement, if any, and all amendments, supplements and/or modifications thereto, certified by the appropriate manager or member.

   b) If a domestic Limited Liability Company, a copy of its Articles of Organization and all amendments thereto with the appropriate filing stamps.

   c) If the Limited Liability Company is member-managed, a full and complete current list of members certified by the appropriate manager or member.

   d) A current dated certificate of good standing from the proper governmental authority of the state in which the entity is currently domiciled.

   e) If less than all members, or managers, as appropriate, will be executing the closing documents, furnish evidence of the authority of those signing.

   f) If Limited Liability Company is a Single Member Entity, a Statement of Information for the Single Member will be required.

   g) Each member and manager of the LLC without an Operating Agreement must execute in the presence of a notary public the Certificate of California LLC (Without an Operating Agreement) Status and Authority form.

END OF REQUIREMENTS

INFORMATIONAL NOTES SECTION

1. None of the items shown in this report will cause the Company to decline to attach ALTA Endorsement Form 9 to an Extended Coverage Loan Policy, when issued.

2. The Company is not aware of any matters which would cause it to decline to attach CLTA Endorsement Form 116 indicating that there is located on said Land Commercial properties, known as APN 2005-002-018, located within the city of Los Angeles, California, , to an Extended Coverage Loan Policy.

3. Note: The policy of title insurance will include an arbitration provision. The Company or the insured may demand arbitration. Arbitrable matters may include, but are not limited to, any controversy or claim between the Company and the insured arising out of or relating to this policy, any service of the Company in connection with its issuance or the breach of a policy provision or other obligation. Please ask your escrow or title officer for a sample copy of the policy to be issued if you wish to review the arbitration provisions and any other provisions pertaining to your Title Insurance coverage.

4. Notice: Please be aware that due to the conflict between federal and state laws concerning the cultivation, distribution, manufacture or sale of marijuana, the Company is not able to close or insure any transaction involving Land that is associated with these activities.

5. Pursuant to Government Code Section 27388.1, as amended and effective as of 1-1-2018, a Documentary Transfer Tax (DTT) Affidavit may be required to be completed and submitted with each document when DTT is being paid or when an exemption is being claimed from paying the tax. If a governmental agency is a party to the document, the form will not be required. DTT Affidavits may be available at a Tax Assessor-County Clerk-Recorder.

6. Due to the special requirements of SB 50 (California Public Resources Code Section 8560 et seq.), any transaction that includes the conveyance of title by an agency of the United States must be approved in advance by the Company's State Counsel, Regional Counsel, or one of their designees.

END OF INFORMATIONAL NOTES

Wire Fraud Alert

This Notice is not intended to provide legal or professional advice. If you have any questions, please consult with a lawyer.

All parties to a real estate transaction are targets for wire fraud and many have lost hundreds of thousands of dollars because they simply relied on the wire instructions received via email, without further verification. **If funds are to be wired in conjunction with this real estate transaction, we strongly recommend verbal verification of wire instructions through a known, trusted phone number prior to sending funds.**

In addition, the following non-exclusive self-protection strategies are recommended to minimize exposure to possible wire fraud.

- **NEVER RELY** on emails purporting to change wire instructions. Parties to a transaction rarely change wire instructions in the course of a transaction.
- **ALWAYS VERIFY** wire instructions, specifically the ABA routing number and account number, by calling the party who sent the instructions to you. DO NOT use the phone number provided in the email containing the instructions, use phone numbers you have called before or can otherwise verify. **Obtain the phone number of relevant parties to the transaction as soon as an escrow account is opened**. DO NOT send an email to verify as the email address may be incorrect or the email may be intercepted by the fraudster.
- **USE COMPLEX EMAIL PASSWORDS** that employ a combination of mixed case, numbers, and symbols. Make your passwords greater than eight (8) characters. Also, change your password often and do NOT reuse the same password for other online accounts.
- **USE MULTI-FACTOR AUTHENTICATION** for email accounts. Your email provider or IT staff may have specific instructions on how to implement this feature.

For more information on wire-fraud scams or to report an incident, please refer to the following links:

FIDELITY NATIONAL FINANCIAL, INC.
PRIVACY NOTICE

Effective January 1, 2020

Fidelity National Financial, Inc. and its majority-owned subsidiary companies (collectively, "FNF," "our," or "we") respect and are committed to protecting your privacy. This Privacy Notice explains how we collect, use, and protect personal information, when and to whom we disclose such information, and the choices you have about the use and disclosure of that information.

A limited number of FNF subsidiaries have their own privacy notices. If a subsidiary has its own privacy notice, the privacy notice will be available on the subsidiary's website and this Privacy Notice does not apply.

Collection of Personal Information

FNF may collect the following categories of Personal Information:

contact information (*e.g.*, name, address, phone number, email address);

demographic information (e.g., date of birth, gender, marital status);

- identity information (*e.g.* Social Security Number, driver's license, passport, or other government ID number);
- financial account information *(e.g.* loan or bank account information); and
- other personal information necessary to provide products or services to you.
-
- We may *collect Personal Information* about you from:
- information we receive from you or your agent;
- information about your transactions with FNF, our affiliates, or others; and
- information we receive from *consumer reporting* agencies and/or governmental entities, either directly from these entities or through others.
-
- Collection of Browsing Information
- FNF automatically collects the following types of Browsing Information when you access an FNF website, online service, or application (each an "FNF Website") from your Internet browser, computer, and/or device:

Internet Protocol (IP) address and operating system;
browser version, language, and type;
domain name system requests; and
browsing history on the FNF Website, such as date and time of your visit to the FNF Website and visits to the pages within the FNF Website.

-
- Like most websites, our servers automatically log each visitor to the FNF Website and may collect the Browsing Information described above. We use Browsing Information for system administration, troubleshooting, fraud investigation, and to improve our websites. Browsing Information generally does not reveal anything personal about you, though if you have created a user account for an FNF Website and are logged into that account, the FNF Website may be able to link certain browsing activity to your user account.
-
- Other Online Specifics
- Cookies. When you visit an FNF Website, a "cookie" may be sent to your computer. A cookie is a small piece of data that is sent to your Internet browser from a web server and stored on your computer's hard drive. Information gathered using cookies helps us improve your user experience. For example, a cookie can help the website load properly or can customize the display page based on your browser type and user preferences. You can choose whether or not to accept cookies by changing your Internet browser settings. Be aware that doing so may impair or limit some functionality of the FNF Website.
-
- Web Beacons. We use web beacons to determine when and how many times a page has been viewed. This information is used to improve our websites.
-
- Do Not Track. Currently our FNF Websites do not respond to "Do Not Track" features enabled through your browser.
-
- Links to Other Sites. FNF **Websites may contain links to unaffiliated third-party websites. FNF is not responsible for the privacy practices or content of those websites. We recommend that you read the privacy policy of every website you visit.**

Copyright © 2017. Fidelity National Financial, Inc. All Rights Reserved

Use of Personal Information

FNF uses Personal Information for three main purposes:

To provide products and services to you or in connection with a transaction involving you.

- To improve our products and services.
- To communicate with you about our, our affiliates', and others' products and services, jointly or independently.
-
- When Information Is Disclosed
- We may disclose your Personal Information and Browsing Information in the following circumstances:
- to enable us to detect or prevent criminal activity, fraud, material misrepresentation, or nondisclosure;
- to nonaffiliated service providers who provide or perform services or functions on our behalf and who agree to use the information only to provide such services or functions;

to nonaffiliated third party service providers with whom we perform joint marketing, pursuant to an agreement with them to jointly market financial products or services to you;

to law enforcement or authorities in connection with an investigation, or in response to a subpoena or court order; or

in the good-faith belief that such disclosure is necessary to comply with legal process or applicable laws, or to protect the rights, property, or safety of FNF, its customers, or the public.

The law does not require your prior authorization and does not allow you to restrict the disclosures described above. Additionally, we may disclose your information to third parties for whom you have given us authorization or consent to make such disclosure. We do not otherwise share your Personal Information or Browsing Information with nonaffiliated third parties, except as required or permitted by law. We do share Personal Information among affiliates (other companies owned by FNF) to directly market to you. Please see "Choices with Your Information" to learn how to restrict that sharing.

We reserve the right to transfer your Personal Information, Browsing Information, and any other information, in connection with the sale or other disposition of all or part of the FNF business and/or assets, or in the event of bankruptcy, reorganization, insolvency, receivership, or an assignment for the benefit of creditors. By submitting Personal Information and/or Browsing Information to FNF, you expressly agree and consent to the use and/or transfer of the foregoing information in connection with any of the above described proceedings.

Security of Your Information

We maintain physical, electronic, and procedural safeguards to protect your Personal Information.

Choices With Your Information

If you do not want FNF to share your information among our affiliates to directly market to you, you may send an "opt out" request by email, phone, or physical mail as directed at the end of this Privacy Notice. We do not share your Personal Information with nonaffiliates for their use to direct market to you.

Whether you submit Personal Information or Browsing Information to FNF is entirely up to you. If you decide not to submit Personal Information or Browsing Information, FNF may not be able to provide certain services or products to you.

For California Residents: We will not share your Personal Information or Browsing Information with nonaffiliated third parties, except as permitted by California law. For additional information about your California privacy rights, please visit the "California Privacy" link on our website (https://fnf.com/pages/californiaprivacy.aspx) or call (888) 413-1748.

Copyright © 2017. Fidelity National Financial, Inc. All Rights Reserved

For Nevada Residents: You may be placed on our internal Do Not Call List by calling (888) 934-3354 or by contacting us via the information set forth at the end of this Privacy Notice. Nevada law requires that we also provide you with the following contact information: Bureau of Consumer Protection, Office of the Nevada Attorney General, 555 E. Washington St., Suite 3900, Las Vegas, NV 89101; Phone number: (702) 486-3132; email: BCPINFO@ag.state.nv.us.

For Oregon Residents: We will not share your Personal Information or Browsing Information with nonaffiliated third parties for marketing purposes, except after you have been informed by us of such sharing and had an opportunity to indicate that you do not want a disclosure made for marketing purposes.

For Vermont Residents: We will not disclose information about your creditworthiness to our affiliates and will not disclose your personal information, financial information, credit report, or health information to nonaffiliated third parties to market to you, other than as permitted by Vermont law, unless you authorize us to make those disclosures.

Information From Children

The FNF Websites are not intended or designed to attract persons under the age of eighteen (18).We do not collect Personal Information from any person that we know to be under the age of thirteen (13) without permission from a parent or guardian.

International Users

FNF's headquarters is located within the United States. If you reside outside the United States and choose to provide Personal Information or Browsing Information to us, please note that we may transfer that information outside of your country of residence. By providing FNF with your Personal Information and/or Browsing Information, you consent to our collection, transfer, and use of such information in accordance with this Privacy Notice.

FNF Website Services for Mortgage Loans

Certain FNF companies provide services to mortgage loan servicers, including hosting websites that collect customer information on behalf of mortgage loan servicers (the "Service Websites"). The Service Websites may contain links to both this Privacy Notice and the mortgage loan servicer or lender's privacy notice. The sections of this Privacy Notice titled When Information is Disclosed, Choices with Your Information, and Accessing and Correcting Information do not apply to the Service Websites. The mortgage loan servicer or lender's privacy notice governs use, disclosure, and access to your Personal Information. FNF does not share Personal Information collected through the Service Websites, except as required or authorized by contract with the mortgage loan servicer or lender, or as required by law or in the good-faith belief that such disclosure is necessary: to comply with a legal process or applicable law, to enforce this Privacy Notice, or to protect the rights, property, or safety of FNF or the public.

-
- Your Consent To This Privacy Notice; Notice Changes; Use of Comments or Feedback
- By submitting Personal Information and/or Browsing Information to FNF, you consent to the collection and use of the information in accordance with this Privacy Notice. We may change this Privacy Notice at any time. The Privacy Notice's effective date will show the last date changes were made. If **you** provide information to us following any change of the Privacy Notice, that signifies your assent to and acceptance of the changes to the Privacy Notice. We may use comments or feedback that you submit to us in any manner without notice or compensation to you.
-
- Accessing and Correcting Information; Contact Us
- If you have questions, would like to correct your Personal Information, or want to opt-out of information sharing for affiliate marketing, send your requests to privacy@fnf.com, by phone to (888) 934-3354, or by mail to:

Notice of Available Discounts

Pursuant to Section 2355.3 in Title 10 of the California Code of Regulations Fidelity National Financial, Inc. and its subsidiaries ("FNF") must deliver a notice of each discount available under our current rate filing along with the delivery of escrow instructions, a preliminary report or commitment. Please be aware that the provision of this notice does not constitute a waiver of the consumer's right to be charged the field rate. As such, your transaction may not qualify for the below discounts.

You are encouraged to discuss the applicability of one or more of the below discounts with a Company representative. These discounts are generally described below; consult the rate manual for a full description of the terms, conditions and requirements for each discount. These discounts only apply to transaction involving services rendered by the FNF Family of Companies. This notice only applies to transactions involving property improved with a one-to-four family residential dwelling.

FNF Underwritten Title Company
CTC - Chicago Title Company

FNF Underwriter
CTIC - Chicago Title Insurance Company

Available Discounts

CREDIT FOR PRELIMINARY REPORTS AND/OR COMMITMENTS ON SUBSEQUENT POLICIES (CTIC)
Where no major change in the title has occurred since the issuance of the original report or commitment, the order may be reopened within 12 months and all or a portion of the charge previously paid for the report or commitment may be credited on a subsequent policy charge within the following time period from the date of the report.

DISASTER LOANS (CTIC)
The charge for a lender's Policy (Standard or Extended coverage) covering the financing or refinancing by an owner of record, within 24 months of the date of a declaration of a disaster area by the government of the United States or the State of California on any land located in said area, which was partially or totally destroyed in the disaster, will be 50% of the appropriate title insurance rate.

CHURCHES OR CHARITABLE NON-PROFIT ORGANIZATIONS (CTIC)
On properties used as a church or for charitable purposes within the scope of the normal activities of such entities, provided said charge is normally the church's obligation the charge for an owner's policy shall be 50% to 70% of the appropriate title insurance rate, depending on the type of coverage selected. The charge for a lender's policy shall be 40% to 50% of the appropriate title insurance rate, depending on the type of coverage selected.

EMPLOYEE RATE (CTC and CTIC)
No charge shall be made to employees (including employees on approved retirement) of the Company or its underwritten, subsidiary title companies for policies or escrow services in connection with financing, refinancing, sale or purchase of the employees' bona fide home property. Waiver of such charges is authorized only in connection with those costs which the employee would be obligated to pay, by established custom, as a party to the transaction.

ATTACHMENT ONE

CALIFORNIA LAND TITLE ASSOCIATION
STANDARD COVERAGE POLICY – 1990

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance or governmental regulation (including but not limited to building or zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating (i) the occupancy, use, or enjoyment of the land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the land; (iii) a separation in ownership or a change in the dimensions or area of the land or any parcel of which the land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that a notice of the enforcement thereof or a notice of a defect, lien, or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
   (b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the public records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without knowledge.
3. Defects, liens, encumbrances, adverse claims or other matters:
   (a) whether or not recorded in the public records at Date of Policy, but created, suffered, assumed or agreed to by the insured claimant;
   (b) not known to the Company, not recorded in the public records at Date of Policy, but known to the insured claimant and not disclosed in writing to the Company by the insured claimant prior to the date the insured claimant became an insured under this policy;
   (c) resulting in no loss or damage to the insured claimant;
   (d) attaching or created subsequent to Date of Policy; or
   (e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the insured mortgage or for the estate or interest insured by this policy.
4. Unenforceability of the lien of the insured mortgage because of the inability or failure of the insured at Date of Policy, or the inability or failure of any subsequent owner of the indebtedness, to comply with the applicable doing business laws of the state in which the land is situated.
5. Invalidity or unenforceability of the lien of the insured mortgage, or claim thereof, which arises out of the transaction evidenced by the insured mortgage and is based upon usury or any consumer credit protection or truth in lending law.
6. Any claim, which arises out of the transaction vesting in the insured the estate of interest insured by this policy or the transaction creating the interest of the insured lender, by reason of the operation of federal bankruptcy, state insolvency or similar creditors' rights laws.

EXCEPTIONS FROM COVERAGE - SCHEDULE B, PART I

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:

1. Taxes or assessments which are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the public records.
   Proceedings by a public agency which may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the public records.
2. Any facts, rights, interests, or claims which are not shown by the public records but which could be ascertained by an inspection of the land or which may be asserted by persons in possession thereof.
3. Easements, liens or encumbrances, or claims thereof, not shown by the public records.
4. Discrepancies, conflicts in boundary lines, shortage in area, encroachments, or any other facts which a correct survey would disclose, and which are not shown by the public records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b) or (c) are shown by the public records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

ALTA HOMEOWNER'S POLICY OF TITLE INSURANCE

EXCLUSIONS

In addition to the Exceptions in Schedule B, You are not insured against loss, costs, attorneys' fees, and expenses resulting from:

1. Governmental police power, and the existence or violation of those portions of any law or government regulation concerning:
   a. building;
   b. zoning;
   c. land use;
   d. improvements on the Land;
   e. land division; and
   f. environmental protection.

   This Exclusion does not limit the coverage described in Covered Risk 8.a., 14, 15, 16, 18, 19, 20, 23 or 27.
2. The failure of Your existing structures, or any part of them, to be constructed in accordance with applicable building codes. This Exclusion does not limit the coverage described in Covered Risk 14 or 15.
3. The right to take the Land by condemning it. This Exclusion does not limit the coverage described in Covered Risk 17.
4. Risks:
   a. that are created, allowed, or agreed to by You, whether or not they are recorded in the Public Records;
   b. that are Known to You at the Policy Date, but not to Us, unless they are recorded in the Public Records at the Policy Date;
   c. that result in no loss to You; or
   d. that first occur after the Policy Date - this does not limit the coverage described in Covered Risk 7, 8.e., 25, 26, 27 or 28.
5. Failure to pay value for Your Title.
6. Lack of a right:
   a. to any land outside the area specifically described and referred to in paragraph 3 of Schedule A; and
   b. in streets, alleys, or waterways that touch the Land.

   This Exclusion does not limit the coverage described in Covered Risk 11 or 21.
7. The transfer of the Title to You is invalid as a preferential transfer or as a fraudulent transfer or conveyance under federal bankruptcy, state insolvency, or similar creditors' rights laws.
8. Contamination, explosion, fire, flooding, vibration, fracturing, earthquake, or subsidence.
9. Negligence by a person or an Entity exercising a right to extract or develop minerals, water, or any other substances.

LIMITATIONS ON COVERED RISKS

Your insurance for the following Covered Risks is limited on the Owner's Coverage Statement as follows:

- For Covered Risk 16, 18, 19, and 21 Your Deductible Amount and Our Maximum Dollar Limit of Liability shown in Schedule A.

The deductible amounts and maximum dollar limits shown on Schedule A are as follows:

	Your Deductible Amount	Our Maximum Dollar Limit of Liability
Covered Risk 16:	1.00% % of Policy Amount Shown in Schedule A or $2,500.00 (whichever is less)	$ 10,000.00
Covered Risk 18:	1.00% % of Policy Amount Shown in Schedule A or $5,000.00 (whichever is less)	$ 25,000.00
Covered Risk 19:	1.00% of Policy Amount Shown in Schedule A or $5,000.00 (whichever is less)	$ 25,000.00
Covered Risk 21:	1.00% of Policy Amount Shown in Schedule A or $2,500.00 (whichever is less)	$ 5,000.00

2006 ALTA LOAN POLICY (06-17-06)

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
   (i) the occupancy, use, or enjoyment of the Land;
   (ii) the character, dimensions, or location of any improvement erected on the Land;
   (iii) the subdivision of land; or
   (iv) environmental protection;

   or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.

(b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   (a) created, suffered, assumed, or agreed to by the Insured Claimant;
   (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   (c) resulting in no loss or damage to the Insured Claimant;
   (d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 13 or 14); or
   (e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law.
6. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
   (a) a fraudulent conveyance or fraudulent transfer, or
   (b) a preferential transfer for any reason not stated in Covered Risk 13(b) of this policy.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the Insured Mortgage in the Public Records. This Exclusion does not modify or limit the coverage provided under Covered Risk 11(b).

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

(Except as provided in Schedule B - Part II,(t(or T)his policy does not insure against loss or damage, and the Company will not pay costs, attorneys' fees or expenses, that arise by reason of:

(PART I

(The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the Public Records.

PART II

In addition to the matters set forth in Part I of this Schedule, the Title is subject to the following matters, and the Company insures against loss or damage sustained in the event that they are not subordinate to the lien of the Insured Mortgage:)

2006 ALTA OWNER'S POLICY (06-17-06)

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
   (i) the occupancy, use, or enjoyment of the Land;
   (ii) the character, dimensions, or location of any improvement erected on the Land;
   (iii) the subdivision of land; or
   (iv) environmental protection;

or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.

(b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.

2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   (a) created, suffered, assumed, or agreed to by the Insured Claimant;
   (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   (c) resulting in no loss or damage to the Insured Claimant;
   (d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 9 and 10); or
   (e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Title.
4. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction vesting the Title as shown in Schedule A, is
   (a) a fraudulent conveyance or fraudulent transfer; or
   (b) a preferential transfer for any reason not stated in Covered Risk 9 of this policy.
5. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the deed or other instrument of transfer in the Public Records that vests Title as shown in Schedule A.

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage, and the Company will not pay costs, attorneys' fees or expenses, that arise by reason of:

(The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown in the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and that are not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the Public Records.
7. (Variable exceptions such as taxes, easements, CC&R's, etc. shown here.)

ALTA EXPANDED COVERAGE RESIDENTIAL LOAN POLICY (12-02-13)

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
   (i) the occupancy, use, or enjoyment of the Land;
   (ii) the character, dimensions, or location of any improvement erected on the Land;
   (iii) the subdivision of land; or
   (iv) environmental protection;
   or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
   (b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   (a) created, suffered, assumed, or agreed to by the Insured Claimant;

(b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
(c) resulting in no loss or damage to the Insured Claimant;
(d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 16, 17, 18, 19, 20, 21, 22, 23, 24, 27 or 28); or
(e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.

4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury, or any consumer credit protection or truth-in-lending law. This Exclusion does not modify or limit the coverage provided in Covered Risk 26.
6. Any claim of invalidity, unenforceability or lack of priority of the lien of the Insured Mortgage as to Advances or modifications made after the Insured has Knowledge that the vestee shown in Schedule A is no longer the owner of the estate or interest covered by this policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching subsequent to Date of Policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11(b) or 25.
8. The failure of the residential structure, or any portion of it, to have been constructed before, on or after Date of Policy in accordance with applicable building codes. This Exclusion does not modify or limit the coverage provided in Covered Risk 5 or 6.
9. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
   (a) a fraudulent conveyance or fraudulent transfer, or
   (b) a preferential transfer for any reason not stated in Covered Risk 27(b) of this policy.
10. Contamination, explosion, fire, flooding, vibration, fracturing, earthquake, or subsidence.
11. Negligence by a person or an Entity exercising a right to extract or develop minerals, water, or any other substances.

OWNER'S DECLARATION

Escrow No.: 00098937-994-LT2-DB
Property Address: APN 2005-002-018
Los Angeles, CA

The undersigned hereby declares as follows:

1. (Fill in the applicable paragraph and strike the other)

   a. Declarant ("Owner") is the owner or lessee, as the case may be, of certain premises located at APN 2005-002-018, Los Angeles, CA, further described as follows: See Preliminary Report/Commitment No. for full legal description (the "Land").

   b. Declarant is the _____ of _____ ("Owner"), which is the owner or lessee, as the case may be, of certain premises located at APN 2005-002-018, Los Angeles, CA, further described as follows: See Preliminary Report/Commitment No. for full legal description (the "Land").

2. (Fill in the applicable paragraph and strike the other)

   a. During the period of six months immediately preceding the date of this declaration no work has been done, no surveys or architectural or engineering plans have been prepared, and no materials have been furnished in connection with the erection, equipment, repair, protection or removal of any building or other structure on the Land or in connection with the improvement of the Land in any manner whatsoever.

   b. During the period of six months immediately preceding the date of this declaration certain work has been done and materials furnished in connection with _____ upon the Land in the approximate total sum of $_____, but no work whatever remains to be done and no materials remain to be furnished to complete the construction in full compliance with the plans and specifications, nor are there any unpaid bills incurred for labor and materials used in making such improvements or repairs upon the Land, or for the services of architects, surveyors or engineers, except as follows: _____. Owner, by the undersigned Declarant, agrees to and does hereby indemnify and hold harmless Chicago Title Company against any and all claims arising therefrom.

3. Owner has not previously conveyed the Land; is not a debtor in bankruptcy (and if a partnership, the general partner thereof is not a debtor in bankruptcy); and has not received notice of any pending court action affecting the title to the Land.

4. Except as shown in the above-referenced Preliminary Report/Commitment, there are no unpaid or unsatisfied mortgages, deeds of trust, Uniform Commercial Code financing statements, regular assessments, special assessments, periodic assessments or any assessment from any source, claims of lien, special assessments, or taxes that constitute a lien against the Land or that affect the Land but have not been recorded in the public records. There are no violations of the covenants, conditions and restrictions as shown in the above-referenced Preliminary Report/Commitment.

5. The Land is currently in use as _____; _____ occupy/occupies the Land; and the following are all of the leases or other occupancy rights affecting the Land:

   _____

6. There are no other persons or entities that assert an ownership interest in the Land, nor are there unrecorded easements, claims of easement, or boundary disputes that affect the Land.

7. There are no outstanding options to purchase or rights of first refusal affecting the Land.

8. Between the most recent Effective Date of the above-referenced Preliminary Report/Commitment and the date of recording of the Insured Instrument(s), Owner has not taken or allowed, and will not take or allow, any action or inaction to encumber or otherwise affect title to the Land.

This declaration is made with the intention that Chicago Title Company (the "Company") and its policy issuing agents will rely upon it in issuing their title insurance policies and endorsements. Owner, by the undersigned Declarant, agrees to indemnify the Company against loss or damage (including attorneys fees, expenses, and costs) incurred by the Company as a result of any untrue statement made herein.

I declare under penalty of perjury that the foregoing is true and correct and that this declaration was executed on _____ at _____.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/27/2020 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/23/2020 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/23/2020 has revealed that there is 1

RCRA-TSDF site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/23/2020 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/23/2020 has revealed that there are 4 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/27/2020 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 3 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/23/2020 has revealed that there are 19 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
FAULKNER HARRY & DOL	22750 ROSCOE BLVD	ESE 0 - 1/8 (0.056 mi.)	F30	179

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 2 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

Hazardous Waste Summary:

QUEST DIAGNOSTICS INC (Continued) **1008402415**

. Waste code: 134
. Waste name: Aqueous solution with <10% total organic residues

. Waste code: 214
. Waste name: Unspecified solvent mixture

. Waste code: 331
. Waste name: Off-specification, aged, or surplus organics

. Waste code: 343
. Waste name: Unspecified organic liquid mixture

. Waste code: 352
. Waste name: Other organic solids

. Waste code: 551
. Waste name: Laboratory waste chemicals

. Waste code: 791
. Waste name: Liquids with pH < 2

. Waste code: 792
. Waste name: Liquids with pH < 2 with metals

. Waste code: D001
. Waste name: IGNITABLE WASTE

. Waste code: D002
. Waste name: CORROSIVE WASTE

. Waste code: D009
. Waste name: MERCURY

. Waste code: D011
. Waste name: SILVER

. Waste code: D022
. Waste name: CHLOROFORM

. Waste code: F002
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED

QUEST DIAGNOSTICS INC (Continued) **1008402415**

SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: U122
. Waste name: FORMALDEHYDE

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 255415

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 255415

Waste code: D009
Waste name: MERCURY
Amount (Lbs): 255415

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Amount (Lbs): 255415

QUEST DIAGNOSTICS INC (Continued) **1008402415**

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Amount (Lbs): 255415

Violation Date: 09-18-2019
Citation: 22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description: Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes: Returned to compliance on 09/18/2019. OBSERVATION: 3x15 gal drum of Non-RCRA Hazardous waste liquid located in the Hazardous waste storage room was observed without the following information on the label: no accumulation start date. CORRECTIVE ACTION: Submit photos to the CUPA demonstrating that the container listed above has been properly labeled. COS.
Violation Division: Los Angeles County Fire Department
Violation Program: HW
Violation Source: CERS

Site ID: 444767
Site Name: Thermo Fisher Scientific Corporation
Violation Date: 09-18-2019
Citation: 22 CCR 12 66262.34(e) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(e)
Violation Description: Failure to meet the following conditions of satellite accumulation regulations: G Accumulate up to 55 gallons of hazardous waste or one quart of acute hazardous waste at or near the initial point of

THERMO FISHER SCIENTIFIC CORPORATION (Continued) **S123522452**

accumulation which was under the control of the operator. G Total time hazardous waste can be accumulated onsite in any generator accumulation area is one year, i.e., the combined accmulation time at a satellite accumulation point and at a 90/180/270 accumulation area (depending on size of generator and distance transported), whichever comes first. G The generator complies with section 66265.171, 66265.172, and 66265.173(a). G The container must be clearly marked with the initial date that hazardous waste is first placed in the container and labelled with the words G Hazardous WasteG including specified information G Container must be labelled with the date the satellite accumulation limit is reached and moved within three days after reaching the 55 gallon (or one quart) limit to a G 90 dayG accumulation area G 55 gallons (or one quart of acute hazardous waste) of waste per process may be accumulated

Violation Notes: Returned to compliance on 10/18/2019. OBSERVATION: Failure of the Owner/Operator to comply with one or more satellite accumulation requirements. No accumulation start date. CORRECTIVE ACTION: Ensure that all hazardous wastes being accumulated pursuant to satellite accumulation meet all applicable requirements and submit documentation of compliance to the CUPA. Provide an accumulation start date within one year and manage annually.

Site History:	In 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker Ramo, an electrical component design and testing company. Bunker-Ramo was the sole occupant of the facility from 1959 until 1966. From 1966 to 1976, Hughes was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes purchased the entire Site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. The former facility was purchased from Hughes by Coast Federal Bank in May 1995. Parcels were subsequently

HUGHES AIRCRAFT COMPANY (Continued) **1000240986**

purchased by DeVry and the Los Angeles Metropolitan Police Department. The northern portion of the Site was sold to Regent Properties, Inc. in 1997. Regent sold its portion of the property to Shamrock Holdings, Inc. in 2001, who in turn, sold the property to MEPT West Hills, LLC (MEPT) in June 2002. In 2007, MEPT purchased the DeVry parcel and they remain the property owner for the entire property except for the Los Angeles Metropolitan Police Department parcel. CB Richard Ellis is the current property manager and is the primary contact for Site logistical issues. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Site. Remediation techniques used at the Site have included remedial excavation, a groundwater recovery and treatment system, a soil vapor extraction system, and an air sparge system. Reference: Corrective Action Plan Add. No. 5 Workplan for Insitu Chemical Oxidation and Enhanced Insitu Bioremediation dated 12/2015

Violation Program:	HMRRP
Violation Source:	CERS
Site ID:	59492
Site Name:	QUEST DIAGNOSTICS
Violation Date:	03-28-2019
Citation:	22 CCR 12 66262.34(e) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(e)
Violation Description:	Failure to meet the following conditions of satellite accumulation regulations: G Accumulate up to 55 gallons of hazardous waste or one quart of acute hazardous waste at or near the initial point of accumulation which was under the control of the operator. G Total time hazardous waste can be accumulated onsite in any generator accumulation area is one year, i.e., the combined accmulation time at a satellite accumulation point and at a 90/180/270 accumulation area (depending on size of generator and distance transported), whichever comes first. G The generator complies with section 66265.171, 66265.172, and 66265.173(a). G The container must be clearly marked with the initial date that hazardous waste is first placed in the container and labelled with the words G Hazardous WasteG including specified information G Container must be labelled with the date the satellite accumulation limit is reached and moved within three days after reaching the 55 gallon (or one quart) limit to a G 90 dayG accumulation area G 55 gallons (or one quart of acute hazardous waste) of waste per process may be accumulated
Violation Notes:	Returned to compliance on 04/16/2019. OBSERVATION: Failure of the Owner/Operator to comply with one or more satellite accumulation requirements. Waste containers not properly dated. CORRECTIVE ACTION: Ensure that all hazardous wastes being accumulated pursuant to satellite accumulation meet all applicable requirements and submit documentation of compliance to the CUPA. Use labeled satellite accumulation labels.

Citation:	22 CCR 12 66262.34(e) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(e)
Violation Description:	Failure to meet the following conditions of satellite accumulation regulations: G Accumulate up to 55 gallons of hazardous waste or one quart of acute hazardous waste at or near the initial point of accumulation which was under the control of the operator. G Total time hazardous waste can be accumulated onsite in any generator accumulation area is one year, i.e., the combined accmulation time at a satellite accumulation point and at a 90/180/270 accumulation area (depending on size of generator and distance transported), whichever comes first. G The generator complies with section 66265.171, 66265.172, and 66265.173(a). G The container must be clearly marked with the initial date that hazardous waste is first placed in the container and labelled with the words G Hazardous WasteG including specified information G Container must be labelled with the date the satellite accumulation limit is reached and moved within three days after reaching the 55 gallon (or one quart) limit to a G 90 dayG accumulation area G 55 gallons (or one quart of acute hazardous waste) of waste per process may be accumulated
Violation Notes:	Returned to compliance on 04/16/2019. OBSERVATION: Failure of the Owner/Operator to comply with one or more satellite accumulation requirements. Waste containers not properly dated. CORRECTIVE ACTION: Ensure that all hazardous wastes being accumulated pursuant to satellite accumulation meet all applicable requirements and submit documentation of compliance to the CUPA. Use labeled satellite accumulation labels.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERS Description:	Chemical Storage Facilities

Violations:

Site ID:	373443
Site Name:	Source Photonics USA, Inc.
Violation Date:	05-25-2018
Citation:	HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description:	Failure to complete and electronically submit a site map with all required content.
Violation Notes:	Please update site map with emergency shutoffs, storm drain. The site map could be improved by adding an inset with a "campus" orientation as well.
Violation Division:	Los Angeles City Fire Department
Violation Program:	HMRRP
Violation Source:	CERS

Evaluation:

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	05-25-2018
Violations Found:	Yes
Eval Type:	Routine done by local agency
Eval Notes:	Inspected facility with Debbie- Bernard, who provided consent to perform an inspection and take pictures as necessary. Verified hazardous materials submission which requires correction. Please uncheck Simple Asphyxiant for the Mixed Gas. Nitrogen/Hydrogen is not a simple asphyxiant. Please note: Nitrogen and Argon need only be reported in quantities in excess of 1000 cubic feet. Please update site map with emergency shutoffs, storm drain. The site map could be improved by adding an inset with a "campus" orientation as well. copy to: spencerm@arrowrecycling.com; Debbie.Bernard@sourcephotonics.com

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Site ID:	544260
Site Name:	The Oaks at West Hills
Violation Date:	01-20-2017
Citation:	2009-0009-DWQ - Construction General Permit
Violation Description:	SW - Deficient BMP Implementation
Violation Notes:	1. No perimeter BMPs 2. Ineffective housekeeping BMPs
Violation Division:	Water Boards
Violation Program:	CONSTW
Violation Source:	SMARTS

Evaluation:

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	01-22-2017
Violations Found:	No
Eval Type:	Industrial Storm Water Compliance Evaluation
Eval Notes:	BMPs implemented were not effectively containing sediment laden water discharge from the site. Sediment laden water was being discharged onto Fallbrook Street. Follow-up inspection is needed.
Eval Division:	Water Boards
Eval Program:	CONSTW
Eval Source:	SMARTS

Eval General Type:	Case Development Inspection
Eval Date:	04-26-2017
Violations Found:	No
Eval Type:	Industrial Storm Water Enforcement Follow-up
Eval Notes:	The project was in a early stages of construction. SWPPP and inspection reports were not available at the site (apparently it was in the QSP's vehicle). The SWPPP in the SMARTS was complete. BMPs - 1.

THE OAKS AT WEST HILLS (Continued) **S118470333**

Broken gravel bags were observed, 2. Anti-tracking BMPS were not maintained. I gave a verbal warning to Mr. Richard Baltes to implement effective BMPs at the site.
Eval Division: Water Boards
Eval Program: CONSTW
Eval Source: SMARTS

Eval General Type: Other/Unknown
Eval Date: 01-20-2017
Violations Found: Yes
Eval Type: Construction Storm Water Compliance Evaluation
Eval Notes: BMPs Violations; 1. Perimeter BMPs were not implemented. Sediment laden water was being discharged onto Fallbrook Street. 2. Ineffective housekeeping BMPs. Used paint cans were observed on the ground. The permittee was notified about the lack of BMPs at the site. Follow-up inspection is needed.
Eval Division: Water Boards
Eval Program: CONSTW
Eval Source: SMARTS

Eval General Type: Compliance Evaluation Inspection
Eval Date: 01-31-2017

Violation Description: Haz Waste Generator Program - Administration/Documentation - General
Violation Notes: Returned to compliance on 12/11/2017. OBSERVATION: Owner/Operator failed to submit the hazardous waste notification electronically to CERS. CORRECTIVE ACTION: Owner/Operator shall submit a notification of hazardous waste generated by the facility in accordance with HSC 25128 electronically to CERS. HSC 25404(e)(4) No later than three years after the statewide information management system is established, each CUPA, PA, and regulated business shall report program data electronically. The secretary shall work with the CUPAs to develop a phased in schedule for the electronic collection and submittal of information to be included in the statewide information management system, giving first priority to information relating to those chemicals determined by the secretary to be of greatest concern. The secretary, in making this determination shall consult with the CUPAs, the California Emergency Management Agency, the State Fire Marshal, and the boards, departments, and offices within the California [Truncated]

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Phase 1
Completed Date:	12/15/1995
Comments:	Pursuant to the MOU, DTSC has reviewed a Level I Environmental Assessment and other documents for Triad Health Care (THC). The subject property, West Valley Hospital, is an older multi- story acute care hospital which is currently vacant. THC is proposing to remodel the building in order to accommodate its use as a health care facility. A Supplemental Phase I Environmental Assessment Report was prepared by DTSC and concluded that no action was needed for this property; there is no contamination on the property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

Southeast Map:	5630737 CANOGA PARK, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

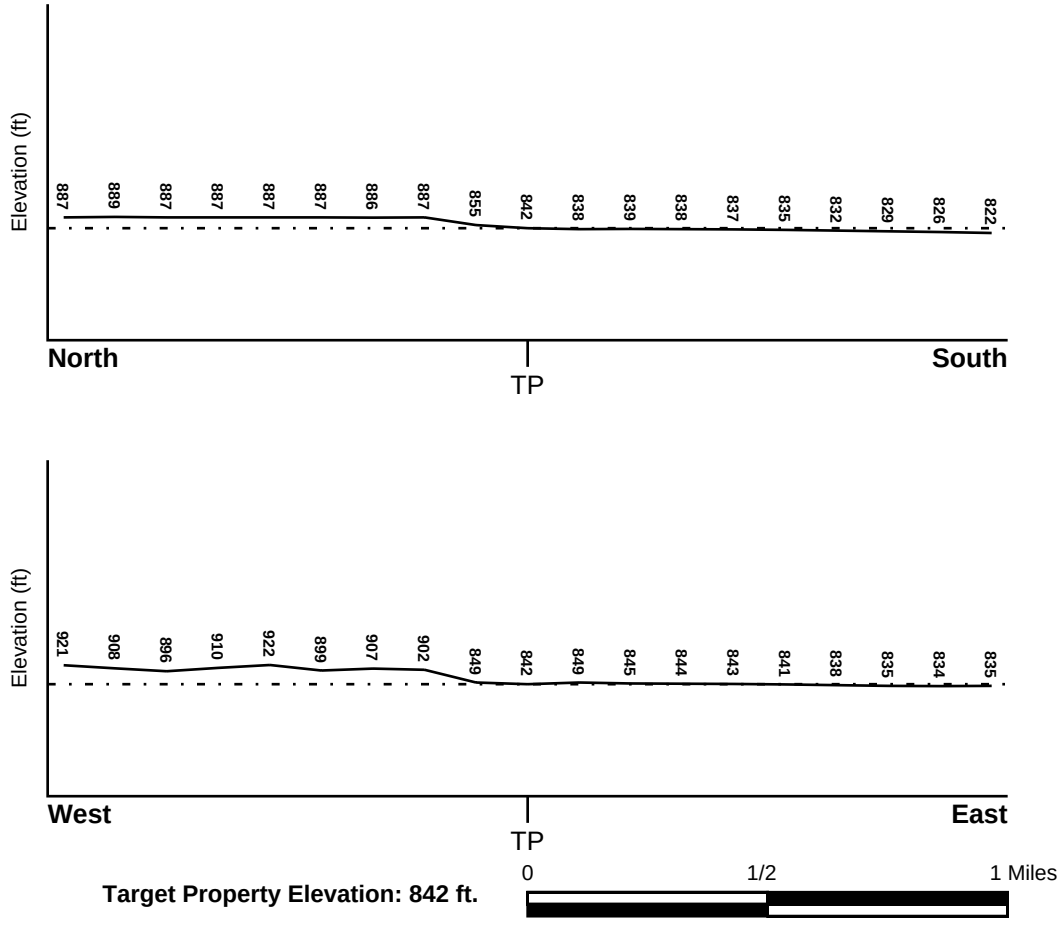
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1275F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06037C1280F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CALABASAS	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Xerorthents

Soil Surface Texture: variable

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 89 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	59 inches	variable	Not reported	Not reported	Max: Min:	Max: Min:
2	59 inches	64 inches	weathered bedrock	Not reported	Not reported	Max: Min:	Max: Min:

Soil Map ID: 2

Soil Component Name: Anacapa

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	24 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9
2	24 inches	48 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9
3	48 inches	72 inches	coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9

Soil Map ID: 3

Soil Component Name: Water

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Experience Summary

Ms. Blanchard is currently a Senior Environmental Assessor and her responsibilities include thorough site assessment and technical report writing in line with the American Society of Testing and Materials (ASTM) standard and US Environmental Protection Agency's All Appropriate Inquiry (AAI) as well as customized client formats. Her knowledge and ability to manage multiple services associated with real estate due diligence allows Ms. Blanchard to provide her clients with comprehensive information and identification of risks in order to make sound financial investments. In addition, Ms. Blanchard performs limited asbestos surveys, lead-based paint surveys and radon testing as required per scope of work.

At a previous firm, Ms. Blanchard was responsible for environmental due diligence and field implementation both locally and nationwide with emphasis on environmental site assessments related to property transactions, Phase II soil and groundwater investigations, due diligence audits, environmental compliance audits, hazardous waste management and corrective action implementation. She also served as project manager performing field staff supervision; subcontractor oversight; report review; and client management.

Project Experience

Ms. Blanchard has conducted, managed and directed hundreds of ESAs throughout her career and has been project manager, lead assessor, health and safety and field office manager for dozens of site investigations, characterization studies and remediation projects throughout California and the US. The following select projects summarize her experience and due diligence background:

Transaction Due Diligence

Environmental Assessment, California, Various Lenders and Clients, Freddie Mac, Fannie Mae and private investors and brokers. Ms. Blanchard performs due diligence services related to real estate transfers and property development, throughout California. She works closely with property managers and representatives to provide a smooth exchange between client and lenders. She is also responsible for review of third party reports, asbestos and lead surveys, and subsurface investigations.

Environmental Assessment, Southern California, The New Home Company. For two years Ms. Blanchard performed due diligence services related to real estate transfers and property development for The New Home Company, a large residential developer in Southern California. She was also responsible for review of third party reports, asbestos and lead surveys, coordination with regulatory agencies, and subsurface investigations.

Environmental Assessment, Southern California, Jiffy Lube. Ms. Blanchard performed and managed twelve environmental site assessments of vacant and operating vehicle fueling and repair stations proposed for redevelopment or sale. In addition, Ms. Blanchard was responsible for review of third party reports, asbestos and lead surveys, underground storage tank removals and other subsurface investigations.

Environmental Assessment, Southern California, Johnson & Johnson/DePuy. Ms. Blanchard performed environmental site assessments and limited compliance evaluations of six medical device/equipment manufacturers. She evaluated the current environmental regulations applicable to the facilities and any deficiencies or omissions.

Project Manager/Coordinator/Team Leader, Nationwide, U.S.A. (Confidential Client). Ms. Blanchard coordinated and performed over 220 Phase I and II investigations, including lead paint, lead in water, asbestos and radon surveys, compliance audits, storage tank investigation/removal/ remediation, decommissioning and environmental permit transfers for psychiatric and acute care hospitals, medical clinics and offices, throughout the United States. Her responsibilities included investigatory and research activities, serving as a liaison between the client, client attorneys, the potential buyers, individual project managers, staff, and subcontractors in many different offices. She also managed and projected budgets, performed Phase I and II investigations and compliance evaluations across the United States, and reviewed and technically edited all proposals and reports for those projects.

Project Office Manager/Project Coordinator/Sample Custodian, Two Delisted NPL Sites, Del Amo/Palo Alto, CA, Hewlett-Packard and Shell Oil/Dow Chemical. Ms. Blanchard served as onsite field office manager, database coordinator, and sample custodian for remedial investigation/feasibility studies for two large-scale projects under the guidance of the US EPA and the California Regional Water Quality Control Board. She coordinated field, office, and database personnel, served as client, public and agency (Regional Water Quality Control Board) liaison, prepared monthly status reports as well as budget and labor projections,

edited technical submittals to client and agencies, compiled and maintained an administrative public record and supervised five site and field office employees.

Subsurface Investigations/Demolition/Health & Safety

Health & Safety Third Party Oversight, Aircraft Engine Test and Repair Facility Demolition, Bob Hope Airport, Burbank, California, GE. Provided third-party health and safety oversight and reporting for demolition of a historic, closed aircraft engine test and repair facility that had been in operation since the 1930s. Her responsibilities included daily task assessment, oversight, preparation of health and safety task assessment, and incident reporting forms for a high profile international company. She was also accountable for the coordination between multiple consultants, the client, the airport and local agencies.

Field Project Manager, Site Remediation, Brea, CA, Birch Hills Golf Course/Chevron, 2013. Ms. Blanchard oversaw field operations, primarily large-scale soil excavations and health and safety of subcontractors for sampling and soil excavation (primarily for PCBs) at a former industrial plant that had been redeveloped as a golf course. Oversight of the project was provided by the US EPA and chemicals of concern included PCBs, metals, petroleum hydrocarbons and other volatile compounds.

Health & Safety Liason, Operating Resort Facility, Kapolei, HI, Disney Aulani Resort, 2012. Ms. Blanchard identified and followed up on health and safety task items for operations and subcontractors at a ten-acre leisure resort. Her duties included assessment of chemical use, storage and disposal, construction punch lists, compliance training and documentation, as well as chemical release monitoring and systems installation.

Field Project Manager, Chemical Plant Demolition, Santa Fe Springs, CA, Pilot Chemical Company, 2011-2012. Ms. Blanchard oversaw field operations and health and safety of subcontractors for demolition of a former industrial soap manufacturer under the guidance of the RWQCB. Her responsibilities included hazardous materials, lead, asbestos and mold abatement oversight, health and safety monitoring, as well as the removal of impacted soil, clarifiers, tanks, and unknown subsurface features encountered during demolition activities. Her ongoing activities included soil vapor and groundwater monitoring and reporting.

Assistant Project Manager, Former Research Laboratory Decommissioning, Montebello, CA, Chevron, 2005. Ms. Blanchard assisted with hazardous materials and waste identification, collection, characterization and disposal. She was responsible for historical and regulatory agency research, materials and equipment decommissioning, oversight of storage tank removal, clarifier and settling pond removal, as well as asbestos sampling and abatement, in preparation for demolition and/or conversion of a former research refinery and laboratory.

Municipal/State Contracts

Project and Field Project Manager, LAUSD Proposed School Sites, Los Angeles, CA, Los Angeles Unified School District (LAUSD), 1999-2014. Ms. Blanchard participated on the on-call environmental services contract under the district's environmental health and safety branch, which focused on clearing new proposed school sites by the California Department of Toxic Substances Control (DTSC). Her responsibilities included fast-track preparation, implementation and documentation of preliminary environmental assessments, focused investigations, removal action plans, and removal action completion reports. The projects she worked on included facility demolition and construction activities, soil, soil gas and groundwater investigation and

remediation, as well as health and safety and contractor oversight. Specific projects included: South Region Elementary Schools 3 and 7; South Region High School No's 2,3,7 and 9: Central Los Angeles Learning Center No.1, Central Region Elementary Schools No's 13 and 17; Carson-Gore Learning Academy; Valley Region High School No. 13, and Bell Adult Education Center.

PARTNER

Heather Hodgetts
Senior Scientist

Education

B.A. in Earth Sciences, University of Southern California

Training

40-Hour OSHA-approved Health & Safety Training
8-hour OSHA HAZWOPER Annual Refresher

Highlights

20 years in the environmental consulting industry
Phase I Environmental Site Assessments
Phase II and III Subsurface Investigations

Experience Summary

As a Senior Scientist for due diligence services within the Investment Advisory Group, Ms. Hodgetts focuses on providing solutions to clients' due diligence and engineering needs and sharing years of expertise with staff and clients. Previously, Ms. Hodgetts was a Senior Environmental Scientist for a Fortune 500 company and was responsible for managing due diligence projects throughout the United States.

Ms. Hodgetts has performed hundreds of Phase I Environmental Site Assessments, Third Party Reviews, Due Diligence Audits, and Record Search, Phase II Subsurface Investigations, Underground Storage Tank Investigations, Remedial Investigations, Limited asbestos surveys, Lead-based paint surveys, Radon Studies, and Lead-in-water sampling and analysis.

Ms. Hodgetts has worked with various clients including: individual investors, institutional investors, private and institutional equity companies, insurance companies, attorneys, brokers, developers, and multiple lenders.

Project Experience

Phase I Environmental Site assessments

Ms. Hodgetts has performed Phase I Environmental Site Assessments of commercial, residential, and industrial properties including schools, shopping centers, industrial parks, manufacturing facilities, drycleaners and gasoline stations.

Subsurface Investigations

Conducted soil and groundwater assessments at County of San Diego Department of Public Works Road Stations throughout San Diego County. Activities included field oversight of groundwater monitoring well installation using mud-rotary, air-rotary, and hollow-stem augers; soil and groundwater sampling; receptor surveys; and installed monitoring wells and soil borings.

Environmental Regulatory Compliance

Assisted in environmental regulatory compliance audit and ownership transfer activities. The audit included coordinating with local agencies to transfer environmental permits for air, wastewater, hazardous waste, and medical waste.

Storage Tank Programs
Completed UST Closure Reports, Limited Site Assessments, Soil Assessment Reports, Soil Closure Reports, and Corrective Action Plans for submittal to regulatory agencies for UST sites owned by various industrial and government entities.

School District Investigations
Worked in-house for San Diego Unified School District (SDUSD) for 15 months completing the environmental due diligence for Proposition MM, a bond measure passed by voters to fund modernization of 165 existing school and construction of 16 new/rebuilt schools. Activities included: conducting Phase I ESAs for proposed school sites, including information relevant to the California Department of Education (CDE) School Site Selection and Approval Guide; submitting Phase I ESAs for EPA Department of Toxic Substances Control review; preparing Public Participations Plans and assisting with public meeting presentations; and submitting site packages to CDE for site approval. In addition to SDUSD, Ms. Hodgetts has also worked on Los Angeles Unified School District, Coronado Unified School District, and Lake Elsinore Unified School District sites.

Subsurface Investigations
Conducted soil and groundwater assessments at County of San Diego Department of Public Works Road Stations throughout San Diego County. Activities included field oversight of groundwater monitoring well installation using mud-rotary, air-rotary, and hollow-stem augers; soil and groundwater sampling; receptor surveys; and installed monitoring wells and soil borings.

Environmental Regulatory Compliance
Assisted in environmental regulatory compliance audit and ownership transfer activities. The audit included coordinating with local agencies to transfer environmental permits for air, wastewater, hazardous waste, and medical waste.

Cellular Telephone Investigations
Performed environmental assessments for cellular telephone antenna installations for a major cellular operator. Tasks included: inspections of numerous buildings, installations, additions, collocations, and vacant land; and asbestos and lead sampling at these facilities throughout southern California.

Over 25 years of experience in the environmental service industry with a focus on due diligence assessments
Knowledgeable with ASTM, EPA's All Appropriate Inquiry (AAI), and customized client formats.
100+ Phase I Environmental Site Assessments

Experience Summary

As Technical Director for due diligence services as part of the Investment Advisory Group, Ms. Stott focuses on report quality, client service, and sharing her years of expertise with staff and clients.

Ms. Stott has performed hundreds of Phase I Environmental Site Assessments, Third Party Reviews, Due Diligence Audits, Record Search and Risk Assessments, Phase II and III Subsurface Investigations, Underground storage tank investigations, Remedial Investigations, Radon Studies, Mold Assessments, Methane Surveys, Indoor Air Quality Assessments, and Lead-in-water sampling and analysis.

Clients have varied and have included: individual investors, City of Los Angeles Agencies, Los Angeles County, City of Anaheim, institutional investors, private and institutional equity companies, insurance companies, attorneys, brokers, developers, and multiple lenders.

Project Experience

Ms. Stott has conducted, managed and directed thousands of ESAs throughout her career and has been Senior Project Manager for hundreds of site investigations, characterization studies and remediation projects throughout California and the US. The following select projects summarize her experience and due diligence background:

Transaction Due Diligence

Project Manager, Western US and Southern California, LBA Realty. For over 16 years performed due diligence services related to real estate transfers as well as asset refinances for LBA Realty. The relationship requires close coordination and communication with property managers and representatives to provide a smooth process with client and lenders. Services have also included review of third party reports, asbestos surveys, subsurface investigations, and development of soil management plans. Many projects involved multiple locations in several states thus requiring coordination with other offices and client contacts.

Environmental Lead, West Coast, Barings, LLC (Barings). Ms. Stott assists with management and review of environmental due diligence and environmental actions associated with acquisitions, property development, joint venture developments, property divestments and finance group loan transactions. Environmental due diligence includes Phase I ESAs, Phase II ESAs, indoor air quality assessments, mold assessment and mitigation planning, providing third party review, asbestos investigations, asbestos abatement, operation and maintenance plan development, remedial action development and implementation, regulatory correspondence and permitting.

Phase I ESAs – multiple clients throughout US.. Ms. Stott manages and oversees preparation of Phase I Environmental Site Assessments for several confidential clients. All are completed to ASTM guidelines with various special criteria specific to each client.

Subsurface Investigations/Vapor Intrusion

Project Manager, Whittier, CA, Confidential Client. Conducted several investigations to evaluate the potential for vapor intrusion associated with contaminated groundwater into client buildings. At one location a horizontal well system was installed to passively vent vapors. Site investigations involved the installation of multiple, multi-depth vapor probes through the property to map the plume and to assist in decision making for potential further investigation. Data collected from both soil vapor and indoor air monitoring was subjected to risk assessment in order to determine if indoor air quality had been negatively impacted and engineering controls needed to protect workers. Client was able to purchase and redevelop portions of the desired parcels for use as parking.

Project Manager and Environmental Lead, Berkeley, CA, LBA Realty. Evaluation of potential risks associated with the presence of trichloroethylene (TCE) and breakdown products cis 1,2- dichloroethene (cis 1,2-DCE) and vinyl chloride (VC), and methyl tert butyl ether (MTBE) in groundwater and ambient air at an existing building in Berkeley, CA. Worked with outside counsel to evaluate, summarize, and present the risks and potential risks of continued investment in the property. Remedial systems were installed under DTSC oversight, risk assessment performed and the building remodeled and reused for office space.

Municipal/State Contracts

Project Manager, ESAs for City of Anaheim widening of Lincoln Avenue. As a subcontractor to the geotechnical consultant, Partner provided Environmental Site Assessments for multiple properties along the project alignment. The parcel uses ranged from car wash, to older office and motel properties, automotive repair, banks, public school, and a church. Partner finished the multi-site project on time and within budget.
