According to our records, documentation or other evidence of corrective action has not been received or is incomplete for violations cited during the Unified Program facility inspection performed on 5/24/2017 at:

Family Auto Service
7191 ALVARADO RD
LA MESA, CA 91941
Record ID: DEH2010-HUPFP-212875
CERS ID: 10360678

The Hazardous Materials Division (HMD) of the Department of Environmental Health is the Certified Unified Program Agency (CUPA) for the County of San Diego. As the local CUPA, the HMD implements the Unified Program in the County and regulates businesses that manage hazardous materials, hazardous wastes, medical wastes, aboveground petroleum storage tanks, and underground storage tanks.

On 5/24/2017, Donelle Griffin of the HMD inspected your business at 7191 ALVARADO RD, LA MESA, CA 91941. Our records indicate that the HMD has not received evidence of correction and/or certification of return to compliance as required by the California Health and Safety Code (H&SC) for the violations observed during the inspection. A copy of this inspection is enclosed.

Uncorrected violations from the 5/24/2017 inspection of your business are listed on the reverse of this page. Submit a written response indicating how these violations were corrected, along with any applicable supporting documentation within ten (10) business days (by 9/4/2017). You may use the enclosed Corrective Action Form to show return to compliance as long as you also submit adequate supporting documentation.

If a re-inspection is required to determine compliance, you will be charged a re-inspection fee of $342. The HMD may initiate formal enforcement actions, including the imposition of substantial penalties, for any significant violations. Violations that are not promptly corrected will result in liability for additional days in violation and additional penalties. Any failure to provide the information requested will also be a factor in determining penalties. For these purposes, "significant violations" include violations that represent a significant threat to human health or safety or the environment, chronic violations, violations committed by a recalcitrant violator, and Class I hazardous waste violations (California Code of Regulations (CCR) 66260.10 and H&SC 25110.8.5).

Violation #	Description of Violation
3030010	Accumulated waste too long (>180 or 270 days) (>90 days for an acutely hazardous waste). (40 CFR 262.34(e) and (f).) HSC 25201(a); 22 CCR 66262.34(d)
HMD0226	Did not accumulate waste in a container or tank. (40 CFR 262.34(d)(2).) 22 CCR 66262.34(d)(2)

Mail your response to:

On the above date, the County inspected your facility under the authority of the California Health and Safety Code (H&SC), to determine compliance with applicable provisions of the H&SC, the California Code of Regulations (CCR), and the San Diego County Code of Regulatory Ordinances (SDCC). **This report serves as a Notice to Comply (H&SC 25187.8 & 25404.1.2) for any minor violations as defined in H&SC 25404 and 25117.6.** This report may contain both minor and more significant (Class II) violations. Minor violations do not include repeat violations or violations remaining uncorrected for more than 30 days (or as specified below). Minor violations do not include knowing, willful, intentional, or chronic violations; nor do they include violations showing a pattern of neglect or disregard. The remarks below are intended to provide guidance to correct any violations indicated on the attached violation report. You must submit a written response to this report within 30 days (or as specified below) demonstrating that all violations have been corrected or include a written notice of disagreement that clearly states the reason for any disputed violations. Prompt correction can protect you from penalties for a "minor violation". Penalties can be imposed for each day in violation for all other violations even if they are corrected promptly. However, correction within 30 days (or as specified below) will make a penalty less likely.

NOTE: Reinspection fees will be charged if additional inspections are required to determine compliance.

CONSENT TO CONDUCT INSPECTION GRANTED BY: Chris Parker TITLE: Operations Manager

INTRODUCTION:
The Hazardous Materials Division (HMD) is the Certified Unified Program Agency (CUPA) for the County of San Diego, regulating businesses that manage hazardous waste, hazardous materials, aboveground petroleum storage tanks, and underground storage tanks. The HMD also acts as the local enforcement agency for the Medical Waste Management Act (MWMA).

This is a routine compliance inspection, the scope included hazardous waste generation and the Hazardous Materials Business Plan. Business changed name but not ownership to Family Auto Service, La Mesa this month. Business repairs and maintains automobiles.

Facility is a small quantity hazardous waste generator that generates ~ 2000 gal waste oil, ~700 gal. waste antifreeze, 40 gal. parts washer waste and ~10 gal. waste brake fluid per year. EPA ID#CAL000355851 active at the time of this inspection per the DTSC on-line database.

On site at the time of this inspection new oil/lubricants (2 x 185 gal., 1 x 110 gal., 3 x 55 gal., 8 x 66 gal. containers), used oil (8 x 55 gal. drums, antifreeze 4 x 55gal. drums, waste antifreeze 2 x 55 gal. drums, 1 x 16 gal. drum waste brake fluid and a parts washer (20 gal).

On site at below reportable quantities oxygen 1 x 80 cu ft., acetylene 1 x 55 cu ft., nitrogen 1 x 200 cu ft, and 1 x 200 cu ft. compressed air (zero).

VIOLATION # 1
HMD0226 Did not accumulate waste in a container or tank. (40 CFR 262.34(d)(2).) 22 CCR 66262.34(d)(2)

Classification: Class II

Observations:
Hazardous waste observed during the inspection to not be accumulated in an appropriate container or tank. Waste oil located in the open-top drums used to accumulate oil filters before crushing ~1" in both and in the secondary containment of the waste oil drums. Chris Parker stated that oil is removed when waste hauler picks up the oil.

Corrective Action Due By: 06/23/2017

Immediately transfer the hazardous waste in to a properly labeled hazardous waste container or tank with a closable lid. Complete the attached corrective action form and send with supporting documentation to donelle.griffin@sdcounty.ca.gov or FAX to her attention @ 858-505-6786.

VIOLATION # 2
3030010 Accumulated waste too long (>180 or 270 days) (>90 days for an acutely hazardous waste). (40 CFR 262.34(e) and (f).) HSC 25201(a); 22 CCR 66262.34(d)

Classification: Minor

Observations:
This facility observed to be storing hazardous waste in exceedance of hazardous waste generator requirements (>180 days). Control (DTSC). Waste filters/oily debris 55 gal. drum start date 7/16/2016 and waste brake fluid 16 gal drum state date 5/2015.

Corrective Action Due By:06/23/2017
Within 30 days have waste removed by a registered hazardous waste hauler. Complete the attached corrective action form and send with supporting documentation to donelle.griffin@sdcounty.ca.gov or FAX to her attention @ 858-505-6786.

INSPECTION REMARKS:
CERS changes to quantities in inventory, name change and site map changes including location of emergency equipment were completed at the time of this inspection.

GEOTECHNICAL BORING CONSTRUCTION PERMIT

SITE NAME: SDG&E LINE 49-17 (5)

SITE ADDRESS: 7255 ALVARADO RD., LA MESA, CA 91942

PERMIT FOR: **1 GEOTECHNICAL BORING**

PERMIT APPROVAL DATE: FEBRUARY 23, 2015

PERMIT EXPIRES ON: JUNE 23, 2015

RESPONSIBLE PARTY: SAN DIEGO GAS & ELECTRIC (JOHN BLACK)

PERMIT CONDITIONS:

1. All borings must be sealed from the bottom of the boring to the ground surface with an approved sealing material as specified in California Well Standards Bulletin 74-90, Part III, Section 19.D. **Drill cuttings are not an acceptable fill material.**

2. All borings must be properly destroyed within 24 hours of drilling.

3. Placement of any sealing material at a depth greater than 30 feet must be done using the tremie method.

4. This work is not connected to any known unauthorized release of hazardous substances. Any contamination found in the course of drilling and sampling must be reported to DEH. All water and soil resulting from the activities covered by this permit must be managed, stored and disposed of as specified in the SAM Manual in Section 5, II, D-4. (http://www.sdcounty.ca.gov/deh/lwq/sam/manual_guidelines.html) In addition, drill cuttings must be properly handled and disposed in compliance with the Stormwater Best Management Practices of the local jurisdiction.

5. Within 60 days of completing work, submit a well/boring construction report, including all well and/or boring logs and laboratory data to the Well Permit Desk. This report must include all items required by the SAM Manual, Section 5, Pages 6 & 7.

6. **This office must be given 48-hour notice of any drilling activity on this site and advanced notification of drilling cancellation. Please contact the Well Permit Desk at (858) 505-6688.**

Proposed locations for subsurface work:

Property Address: San Diego Metropolitian Transit Systems (MTS)
MTS 70th Street Station Parking Lot, 7255 Alvarado Rd, La Mesa, CA 91942

Assessor's Parcel Number (APN): 4690203400

I, Paul Jablonski, owner of the property/properties listed above, give my permission to Kleinfelder West, Inc. (consulting company, contractor) to conduct the following work at the locations stated above.

☐ Install _____ monitoring wells ☐ Destroy _____ monitoring wells ☒ Drill 1 soil borings

I understand that Kevin Crennan (registered professional) of Kleinfelder West, Inc. (consulting company) and an authorized signer for Cascade Drilling (drilling company) have submitted a signed application to the Department of Environmental Health in which they have agreed to complete the above-stated work according the requirements of the current SAM Manual, all ordinances and laws of the County of San Diego and the State of California pertaining to well/boring construction and destruction. I have arranged with the Responsible Party, the person who causes to have monitoring wells/borings installed or existing wells destroyed on this property, to ensure proper closure of the monitoring wells/borings.

Natural Gas Line 49-17 (Boring 5)
7255 Alvarado Road
La Mesa, California

APN: 469-020-34
Permit No. LMWP-001561
EST # NONE

Dear Ms. Tavizon:

Kleinfelder, Inc. (Kleinfelder), on behalf of Campos EPC, LLC performed a geotechnical and environmental study as part of a Pipeline Safety Enhancement Program (PSEP) for the proposed San Diego Gas and Electric (SDG&E) Natural Gas Line 49-17. Prior to our work at the site, Kleinfelder obtained permit number LMWP-001561 from the County Department of Environmental Health for one geotechnical soil boring. The project vicinity is shown on the attached Vicinity Map, Figure 1, and boring location is presented on Figure 2, Boring Location Map.

The drilling was conducted on February 25, 2015. Total depth, annular material volume, and backfill date are detailed in Table 1 below. A copy of the boring log and the approved boring/well permit are included for your reference in Appendix A and B, respectively. Please note the following information concerning our exploration:

1. Cascade Drilling Company performed drilling of the boring using a track-mounted Resonant Sonic drill rig. The boring was drilled using 6-inch outside diameter (OD) sonic drilling stems.
2. After drilling, the test boring was backfilled with bentonite grout using the tremie method to one-foot bgs and patched at surface with concrete and or asphalt to match existing site conditions. The table below gives approximate volumes of backfill used:

Copyright 2015 Kleinfelder

550 West C Street, Suite 1200, San Diego, CA 92101 **p** | 619.831.4600 **f** | 619.232.1039

Table 1
Summary of Exploratory Borings

BORING NO.	TOTAL DEPTH (FT.)	VOLUME OF BENTONITE GROUT BACKFILL (CU.FT.)	DATE OF EXPLORATION	DATE OF BACKFILLING
B-5	45	8.8	2/25/2015	2/25/2015

3. The boring was drilled for in-situ soil sampling, visual soil classification purposes, and environmental testing. Excess soil cuttings were stored in Department of Transportation (DOT) approved 55-gallon drums and characterized prior to offsite disposal according to San Diego County SAM Manual guidelines. Laboratory analytical results are included in Appendix C. Based on the results of the analytical testing, environmental impairment of the soil cuttings was not found.
4. The following analytical methods were used for waste characterization of the soil:
   - Total Petroleum Hydrocarbons by EPA Method 8015B;
   - Volatile Organic Compounds (including BTEX) by EPA Method 8260B;
   - Organo Chlorine Pesticides (OCPS) by EPA Method 8081A;
   - Poly-Chlorinated Biphenyls (PCBs) by EPA Method 8082;
   - Poly-Aromatic Hydrocarbons (PAHs) by EPA Method 8270C; and
   - Title 22 Metals by EPA Method 6010B.
5. No monitoring wells were installed or destroyed as part of our study.

Please contact the undersigned at (619) 831-4600 if you have any questions.

Sincerely,

KLEINFELDER

Kevin Crennan, PE, GE 2511
Senior Engineer

- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

UNIFIED SOIL CLASSIFICATION SYSTEM (ASTM D 2487)

COARSE GRAINED SOILS (More than half of material is larger than the #200 sieve)	**GRAVELS** (More than half of coarse fraction is larger than the #4 sieve)	CLEAN GRAVEL WITH <5% FINES	$Cu \geq 4$ and $1 \leq Cc \leq 3$		**GW**	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES
			$Cu < 4$ and/ or $1 > Cc > 3$		**GP**	POORLY GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES
		GRAVELS WITH 5% TO 12% FINES	$Cu \geq 4$ and $1 \leq Cc \leq 3$		**GW-GM**	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE FINES
					GW-GC	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE CLAY FINES
			$Cu < 4$ and/ or $1 > Cc > 3$		**GP-GM**	POORLY GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE FINES
					GP-GC	POORLY GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE CLAY FINES
		GRAVELS WITH > 12% FINES			**GM**	SILTY GRAVELS, GRAVEL-SILT-SAND MIXTURES
					GC	CLAYEY GRAVELS, GRAVEL-SAND-CLAY MIXTURES
					GC-GM	CLAYEY GRAVELS, GRAVEL-SAND-CLAY-SILT MIXTURES
	SANDS (More than half of coarse fraction is smaller than the #4 sieve)	CLEAN SANDS WITH <5% FINES	$Cu \geq 6$ and $1 \leq Cc \leq 3$		**SW**	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE OR NO FINES
			$Cu < 6$ and/ or $1 > Cc > 3$		**SP**	POORLY GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE OR NO FINES
		SANDS WITH 5% TO 12% FINES	$Cu \geq 6$ and $1 \leq Cc \leq 3$		**SW-SM**	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE FINES
					SW-SC	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE CLAY FINES
			$Cu < 6$ and/ or $1 > Cc > 3$		**SP-SM**	POORLY GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE FINES
					SP-SC	POORLY GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE CLAY FINES
		SANDS WITH > 12% FINES			**SM**	SILTY SANDS, SAND-GRAVEL-SILT MIXTURES
					SC	CLAYEY SANDS, SAND-GRAVEL-CLAY MIXTURES
					SC-SM	CLAYEY SANDS, SAND-SILT-CLAY MIXTURES

FINE GRAINED SOILS (More than half of material is smaller than the #200 sieve)	SILTS AND CLAYS (Liquid Limit less than 50)	**ML**	INORGANIC SILTS AND VERY FINE SANDS, SILTY OR CLAYEY FINE SANDS, SILTS WITH SLIGHT PLASTICITY
		CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
		CL-ML	INORGANIC CLAYS-SILTS OF LOW PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
		OL	ORGANIC SILTS & ORGANIC SILTY CLAYS OF LOW PLASTICITY
	SILTS AND CLAYS (Liquid Limit greater than 50)	**MH**	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SAND OR SILT
		CH	INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS
		OH	ORGANIC CLAYS & ORGANIC SILTS OF MEDIUM-TO-HIGH PLASTICITY

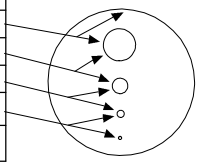
GRAIN SIZE

DESCRIPTION		SIEVE SIZE	GRAIN SIZE	APPROXIMATE SIZE
Boulders		>12 in. (304.8 mm.)	>12 in. (304.8 mm.)	Larger than basketball-sized
Cobbles		3 - 12 in. (76.2 - 304.8 mm.)	3 - 12 in. (76.2 - 304.8 mm.)	Fist-sized to basketball-sized
Gravel	coarse	3/4 -3 in. (19 - 76.2 mm.)	3/4 -3 in. (19 - 76.2 mm.)	Thumb-sized to fist-sized
	fine	#4 - 3/4 in. (#4 - 19 mm.)	0.19 - 0.75 in. (4.8 - 19 mm.)	Pea-sized to thumb-sized
Sand	coarse	#10 - #4	0.079 - 0.19 in. (2 - 4.9 mm.)	Rock salt-sized to pea-sized
	medium	#40 - #10	0.017 - 0.079 in. (0.43 - 2 mm.)	Sugar-sized to rock salt-sized
	fine	#200 - #10	0.0029 - 0.017 in. (0.07 - 0.43 mm.)	Flour-sized to sugar-sized
Fines		Passing #200	<0.0029 in. (<0.07 mm.)	Flour-sized and smaller

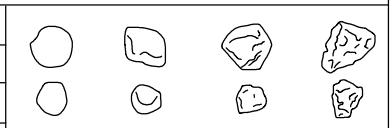


Munsell Color

NAME	ABBR
Red	R
Yellow Red	YR
Yellow	Y
Green Yellow	GY
Green	G
Blue Green	BG
Blue	B
Purple Blue	PB
Purple	P
Red Purple	RP
Black	N

ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular	Particles are similar to angular description but have rounded edges
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges
Rounded	Particles have smoothly curved sides and no edges



Particles Present

Amount	Percentage
trace	<5
few	5-10
little	15-25
some	30-45
and	50
mostly	50-100

PLASTICITY

DESCRIPTION	LL	FIELD TEST
Non-plastic	NP	A 1/8-in. (3 mm.) thread cannot be rolled at any water content.
Low (L)	< 30	The thread can barely be rolled and the lump or thread cannot be formed when drier than the plastic limit.
Medium (M)	30 - 50	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump or thread crumbles when drier than the plastic limit
High (H)	> 50	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump or thread can be formed without crumbling when drier than the plastic limit

MOISTURE CONTENT

DESCRIPTION	FIELD TEST
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

REACTION WITH HYDROCHLORIC ACID

DESCRIPTION	FIELD TEST
None	No visible reaction
Weak	Some reaction, with bubbles forming slowly
Strong	Violent reaction, with bubbles forming immediately

APPARENT / RELATIVE DENSITY - COARSE-GRAINED SOIL

APPARENT DENSITY	SPT-N_{60} (# blows/ft)	MODIFIED CA SAMPLER (# blows/ft)	CALIFORNIA SAMPLER (# blows/ft)	RELATIVE DENSITY (%)
Very Loose	<4	<4	<5	0 - 15
Loose	4 - 10	5 - 12	5 - 15	15 - 35
Medium Dense	10 - 30	12 - 35	15 - 40	35 - 65
Dense	30 - 50	35 - 60	40 - 70	65 - 85
Very Dense	>50	>60	>70	85 - 100

NOTE: AFTER TERZAGHI AND PECK, 1948

CONSISTENCY - FINE-GRAINED SOIL

CONSISTENCY	UNCONFINED COMPRESSIVE STRENGTH (q_u)(psf)	CRITERIA
Very Soft	< 1000	Thumb will penetrate soil more than 1 in. (25 mm.)
Soft	1000 - 2000	Thumb will penetrate soil about 1 in. (25 mm.)
Firm	2000 - 4000	Thumb will indent soil about 1/4-in. (6 mm.)
Hard	4000 - 8000	Thumb will not indent soil but readily indented with thumbnail
Very Hard	> 8000	Thumbnail will not indent soil

STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. thick, note thickness
Laminated	Alternating layers of varying material or color with the layer less than 1/4-in. thick, note thickness
Fissured	Breaks along definite planes of fracture with little resistance to fracturing
Slickensided	Fracture planes appear polished or glossy, sometimes striated
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness
Homogeneous	Same color and appearance throughout

CEMENTATION

DESCRIPTION	FIELD TEST
Weakly	Crumbles or breaks with handling or slight finger pressure
Moderately	Crumbles or breaks with considerable finger pressure
Strongly	Will not crumble or break with finger pressure

LABORATORY RESULTS

GROUNDWATER LEVEL INFORMATION:
▽ Groundwater was observed at approximately 8 ft. below ground surface during drilling.

GENERAL NOTES:
The exploration location and elevation are approximate and were estimated by Kleinfelder.
A Garmin E-trex GPS unit was used to locate the exploration with an accuracy of 10 feet.

DEH Permit

PERMIT # LMWP-001561
A.P.N. # 469-020-34-00
EST # NONE

COUNTY OF SAN DIEGO
DEPARTMENT OF ENVIRONMENTAL HEALTH
LAND AND WATER QUALITY DIVISION
MONITORING WELL PROGRAM
GEOTECHNICAL BORING CONSTRUCTION PERMIT

SITE NAME: SDG&E LINE 49-17 (5)

SITE ADDRESS: 7255 ALVARADO RD., LA MESA, CA 91942

PERMIT FOR: **1 GEOTECHNICAL BORING**

PERMIT APPROVAL DATE: FEBRUARY 23, 2015

PERMIT EXPIRES ON: JUNE 23, 2015

RESPONSIBLE PARTY: SAN DIEGO GAS & ELECTRIC (JOHN BLACK)

PERMIT CONDITIONS:

1. All borings must be sealed from the bottom of the boring to the ground surface with an approved sealing material as specified in California Well Standards Bulletin 74-90, Part III, Section 19.D. **Drill cuttings are not an acceptable fill material.**

2. All borings must be properly destroyed within 24 hours of drilling.

3. Placement of any sealing material at a depth greater than 30 feet must be done using the tremie method.

4. This work is not connected to any known unauthorized release of hazardous substances. Any contamination found in the course of drilling and sampling must be reported to DEH. All water and soil resulting from the activities covered by this permit must be managed, stored and disposed of as specified in the SAM Manual in Section 5, II, D-4. (http://www.sdcounty.ca.gov/deh/lwg/sam/manual_guidelines.html) In addition, drill cuttings must be properly handled and disposed in compliance with the Stormwater Best Management Practices of the local jurisdiction.

5. Within 60 days of completing work, submit a well/boring construction report, including all well and/or boring logs and laboratory data to the Well Permit Desk. This report must include all items required by the SAM Manual, Section 5, Pages 6 & 7.

6. **This office must be given 48-hour notice of any drilling activity on this site and advanced notification of drilling cancellation. Please contact the Well Permit Desk at (858) 505-6688.**

PROPERTY OWNER CONSENT

Proposed locations for subsurface work:

Property Address: San Diego Metropolitian Transit Systems (MTS)
MTS 70th Street Station Parking Lot, 7255 Alvarado Rd, La Mesa, CA 91942

Assessor's Parcel Number (APN): 4690203400

I, Paul Jablonski, owner of the property/properties listed above, give my permission to Kleinfelder West, Inc. (consulting company, contractor) to conduct the following work at the locations stated above.

☐ Install _____ monitoring wells ☐ Destroy _____ monitoring wells ☒ Drill 1 soil borings

I understand that Kevin Crennan (registered professional) of Kleinfelder West, Inc. (consulting company) and an authorized signer for Cascade Drilling (drilling company) have submitted a signed application to the Department of Environmental Health in which they have agreed to complete the above-stated work according the requirements of the current SAM Manual, all ordinances and laws of the County of San Diego and the State of California pertaining to well/boring construction and destruction. I have arranged with the Responsible Party, the person who causes to have monitoring wells/borings installed or existing wells destroyed on this property, to ensure proper closure of the monitoring wells/borings.

Property Owner Signature: _____ Date: 2/17/15

Print Name: Paul Jablonski Title: CEO

Company: Metropolitan Transit System

Mailing Address: 1255 Imperial Avenue, Suite 1000, San Diego California 92101

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 15-02-1923 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 02/25/15. They were assigned to Work Order 15-02-1923.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 15-02-1923 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

COUNTY OF SAN DIEGO CUPA
DEPARTMENT OF ENVIRONMENTAL HEALTH
HAZARDOUS MATERIALS DIVISION
P.O. BOX 129261, SAN DIEGO, CA 92112-9261
PHONE: (858) 505-6990; FAX: (858) 505-6786; EMAIL: hmdutych@sdcounty.ca.gov

CERS ACCESS/I.D. REQUEST FORM

All Certified Unified Program Agency (CUPA) regulated businesses are required by law (Assembly Bill 2286) to submit business information electronically through the California Environmental Reporting System (CERS). This includes information related to your:

- Unified Program Facility Permit
- Hazardous Materials Business Plan
- Hazardous Waste
- Hazardous Waste Onsite Treatment
- Hazardous Waste Tank Closures
- Remote Waste Consolidation
- Recyclable Materials Reports
- Underground Storage Tanks
- Aboveground petroleum storage over 1,320 gallons
- Medical Waste**

A CERS I.D. is required in order to obtain or maintain a valid Unified Program Facility Permit. Please send your completed form to the County of San Diego Hazardous Materials Division (address above). When your CERS account is established, your designated lead users will receive an email with directions to begin electronic reporting.

** In San Diego County, Medical Waste Generators are required to report in CERS in order to receive a valid permit

☐ **Change of Owner (C/O):** a business is sold to a new owner.
☐ **Relocation:** a business moves to a new address and owner remains the same.
☒ **New Business:** a business opens in a vacant or newly constructed building.
☐ **CERS Assistance Requested:** none of the above are applicable. I need access to my CERS account.

INSPECTION CONTACT: **Robert Menzer**
TITLE: **Pharmacy Technician**
PHONE: **(619) 383-3572**
E-MAIL: **mdelarosa@apibhs.com**

On the above date, the County inspected your facility under the authority of the California Health and Safety Code (H&SC), to determine compliance with applicable provisions of the H&SC, the California Code of Regulations (CCR), and the San Diego County Code of Regulatory Ordinances (SDCC). **This report serves as a Notice to Comply (H&SC 25187.8 & 25404.1.2) for any minor violations as defined in H&SC 25404 and 25117.6.** This report may contain both minor and more significant (Class II) violations. Minor violations do not include repeat violations or violations remaining uncorrected for more than 30 days (or as specified below). Minor violations do not include knowing, willful, intentional, or chronic violations; nor do they include violations showing a pattern of neglect or disregard. The remarks below are intended to provide guidance to correct any violations indicated on the attached violation report. You must submit a written response to this report within 30 days (or as specified below) demonstrating that all violations have been corrected or include a written notice of disagreement that clearly states the reason for any disputed violations. Prompt correction can protect you from penalties for a "minor violation". Penalties can be imposed for each day in violation for all other violations even if they are corrected promptly. However, correction within 30 days (or as specified below) will make a penalty less likely.

NOTE: Reinspection fees will be charged if additional inspections are required to determine compliance.

CONSENT TO CONDUCT INSPECTION GRANTED BY: Robert Menzer TITLE: Pharmacy Technician

INTRODUCTION:
The Hazardous Materials Division (HMD) is the Certified Unified Program Agency (CUPA) for the County of San Diego and acts as the local enforcement agency for the Medical Waste Management Act (MWMA).

Initial inspection for compliance with the Medical Waste Management Act. BH-SD Rx is doing business as 4 Front Rx. Facility is a small quantity medical waste generator that expects to generate ~50 lbs. of sharps waste per year. On site at the time of this inspection 1 x 5 lb sharps container (empty). No medical waste has been generated to date. Open date fo this phamacy was 4/9/2018.

Please update CERS to include facility phone number - 619-383-3572 and update the largest container to 5 lbs, largest qty on site at one time to 5 lbs and average amount on site to 2.5 lbs. Please contact Donelle Griffin@ 858-260-1898 if myou have any questions.

Each violation checked below is for the section(s) of the California health and Safety Code (HSC), California Code of Regulation (CCR), or the San Diego County Code (SDCC) indicated in italics. All violations must be corrected. Submit documentation of return to compliance to your Specialist. You may use the Corrective Action Form (HM-926) to document your return to compliance. Please call (858) 505-6880 or your Specialist if you have any questions. UPF = Unified Program Facility; MW = Medical Waste; USPS = United States Postal Service; DOT = Department of Transportation

MEDICAL WASTE GENERATORS

STORAGE AND LABELING

#	VIOLATION DESCRIPTION
☐ HMD4201	UPF Permit not obtained. HSC 117705; SDCC 68.905, 68.906, 68.1202
☐ HMD4216	Failed to submit or report in CERS chemical inventory information for hazardous waste and/or medical waste, and keep up to date. SDCC 68.904(a)(2)
☐ HMD4202	Medical waste (MW) not separated from other waste at the point of origin. HSC 118275
☐ HMD4203	Enclosure or designated accumulation area for MW containers not secured. HSC 118307, 118310
☐ HMD4204	MW designated accumulation area not posted with an approved, legible biohazardous waste "warning sign" in English & Spanish or in another language, in addition to English which can be read from a distance of at least 25 feet. HSC 118310
☐ HMD4205	Medical SOLID WASTE not secured to deny access to unauthorized persons. SDCC 68.1211
☐ HMD4206	Leak or spill of MW not properly decontaminated. HSC 118300
☐ HMD4207	Sharps not stored in approved container or labeled with the words "sharps waste" or with the international biohazard symbol and the word "BIOHAZARD". HSC 118285(a) & (d)
☐ HMD4208	Full sharps container not taped closed or tightly-lidded to preclude loss of contents. HSC 118285(b)
☐ HMD4209	Primary containers accumulating MW not labeled with an electronic tracking system label or a label with generator's name, address and phone number. SDCC 68.1205
☐ HMD4210	Medical waste not stored in approved and properly marked biohazard bags. HSC 118275(a)
☐ HMD4211	Biohazard bags not tied off to prevent leakage or expulsion of contents during storage and handling. HSC 118280(a)
☐ HMD4212	Biohazardous bags not containerized in rigid, leak resistant, and covered containers or bins when placed for storage, handling, or transport. HSC 118280(c)
☐ HMD4213	Waste container or bin not labeled with the words "Biohazardous Waste" or with the international biohazard symbol and the word "BIOHAZARD" on the lid and sides. HSC 118280(c)
☐ HMD4214	Reusable containers or bins for MW storage not thoroughly washed and decontaminated and maintained in a clean and sanitary manner. HSC 118295, 118305
☐ HMD4215	Frozen (0°C/32°F) biohazardous waste stored for not more than 90 days. HSC 118280(e)(2)
☐ HMD4306	Full sharps container stored not more than 30 days at >0°C. HSC 118285(c)
☐ HMD4307	Biohazard bag waste stored not more than 7 days at >0°C (for generators of 20 or more pounds a month). HSC 118280(e)(1)(A)
☐ HMD4308	Biohazard bag waste stored >30 days at >0°C (for generators of <20lbs/month). HSC 118280(e)(1)(B)
☐ HMD4219	MW interim storage area not marked with warning signs or international biohazard symbol legible from a distance of 5 feet. HSC 118307, 118310
☐ HMD4220	MW interim storage area not properly secured. HSC 118307

TREATMENT AND DISPOSAL

#	VIOLATION DESCRIPTION
☐ HMD4251	MW treated by unapproved method/procedure. HSC 118215
☐ HMD4252	Standard written operating procedures for steam sterilization not established. HSC 118215(a)(2)(A)
☐ HMD4253	Recording thermometer not calibrated annually. HSC 118215(a)(2)(B)
☐ HMD4254	No records of annual thermometer calibration checks onsite for at least the past 2 years. HSC 118215(a)(2)(B)
☐ HMD4255	Heat-sensitive tape or other approved method not used for each load treated onsite. HSC 118215(a)(2)(C)
☐ HMD4256	Monthly biological indicator or other approved indicator not used to confirm proper sterilization. HSC 118215(a)(2)(D)
☐ HMD4257	Onsite steam sterilization did not reach 121° C (250° F) for at least 30 minutes. HSC 118215(a)(2)(B)

NOTICE: *You are hereby notified that on* 2/22/88, DOUG LIPERA, Hazardous Materials Specialist of County Department of Health Services, conducted an inspection for the removal and/or abandonment of underground storage tanks of hazardous substances. A summary of conditions found is noted as follows: FOUR

[ ] No indication of soil or groundwater contamination apparent this date. Excavation may be backfilled.

[X] The conditions noted below must be reported and corrected in accordance with Chapters 6.5 and 6.7 of the *California Health and Safety Code and Chapters 9 and 10 of the San Diego County Code.*

[ ] Hazardous substance/waste is ponded in the excavation. Immediately take steps to remove the ponded hazardous liquid from the excavation. This liquid is a hazardous waste that shall be properly transported, under manifest, by a licensed hazardous waste hauler to a licensed recycling or disposal facility.

[X] *Contaminated soil and/or contaminated groundwater is suspected in the excavation. Determining the* extent and impact of this contamination and completing any required clean-up is the responsibility of the tank owner/operator. Within 5 work days, the tank owner/operator or his agent must submit a written UNAUTHORIZED RELEASE REPORT to the Department of Health Services including all of the following information that is known at the time of filing the report:

a. Describe the type, quantity and concentration of the hazardous substance released.
b. Provide the results of all investigations completed at this time to determine the extent of soil, groundwater, or surface water contamination due to the release.
c. Describe the method of cleanup implemented to date, proposed cleanup actions, and approximate costs of actions taken to date.
d. Indicate the method and location of disposal of the released hazardous substance and any contaminated soils or groundwater or surface water. (If any contaminated soil/water is hauled off-site, include copies of the hazard waste manifests).
e. Include the tank operator's name and telephone number, the name and telephone number of any consultants retained, and a projection of proposed activity schedule.

Subsequent mitigation actions will be discussed upon review of the submitted Report and consultation with other appropriate agencies.

E. APPLICATION SUBMITTAL, PLAN APPROVAL, PERMIT ISSUANCE, AND REQUIRED INSPECTIONS:

Submit three (3) copies of this application package, including plan drawings, with the required fee to the Department of Health Services, Hazardous Materials Management Unit, Room 311, 1700 Pacific Highway, San Diego, CA 92101. Checks should be made payable to the County of San Diego.

A permit will be issued by the Department of Health Services (DHS) upon review and approval of the application and plans. The required fees must be submitted with the application package. Information in addition to that presented in this application package may be needed in order to obtain final approval. No work is to begin on the proposed project until a permit has been issued. The required inspections cannot be scheduled until a permit has been issued.

Once the permit has been issued, it is the permittee's responsibility to notify the DHS at least two (2) working days in advance to schedule each required inspection.

Construction stages at which inspections are required are indicated in each subpart of this application form (i.e., Part II, III and IV).

F. Indicate the Company/Person you wish to have our plan check comments directed to by circling the appropriate section letter above or if different enter below.

G. PROJECT WORK TO BE COMPLETED: Check Applicable Box	COMPLETE APPLICATION PARTS	FEE CODE (TABLE H.)	CODES FOR OFFICE USE ONLY
[ ] Installation/Construction of new tank(s) only (without removing/abandoning any existing tanks.)	I & II	1	NT
[ ] Removal/Destruction of existing tanks with installation of new tanks (tank replacement).	I, II & III	1 & 2	NR
[X] Removal/Destruction of existing tank(s) with no new tank installation.	I & III	2	AT
[ ] Removal only of one tank less than 1000 gallon with no new tank installation.	I & III	4	AT
[ ] Repiping of an existing tank facility.	I & II (Sections E thru N Only)	3	NM
[ ] Interior coating of an existing tank facility.	I & IV	1	NM

H. FEES: The fees shown below cover plan review and approval and the required field inspections. Use the appropriate Fee Code as determined in Section G above.

Fee Code

[1] Base fee for one tank ($372) Fee: $ _____

Fee for additional tanks ($102 each) Fee: $ _____

[2] Fee to abandon 1 tank ($156) Fee: $ 156.-

Fee for additional abandoned tanks ($78 each) Fee: $ 234.-

[3] Fee per Facility ($312) (Repipe Only) Fee: $ _____

[4] Fee to remove only one tank less than 1000 gallons ($65) Fee: $ _____

TOTAL FEE: $ 390.-

CASH _____ CHECK # 2821

I. PERMITS REQUIRED BY OTHER AGENCIES:

UNDERGROUND HAZARDOUS MATERIALS STORAGE TANK FACILITY

PART III

APPLICATION FOR PERMIT TO ABANDON

Complete all sections of Part III. If information is not known or applicable please indicate on application.

A. Total number of tanks to be abandoned 4

B. Tank Information - Complete the following information for each tank to be abandoned. Attach additional sheets as necessary.

Tank Number (Label tanks on plot plan to correspond to application)		1	2	3	4
Tank Capacity (gallons)		2000 gas	550 waste oil	550 waste oil	550 waste oil
Date Tank Installed		unknown	unknown	unknown	unknown
Tank Composition (Steel, Fiberglass, Fiberglass Coated Steel, Concrete, etc.)		steel	steel	steel	steel
Tank Manufacturer		unknown	unknown	unknown	unknown
Tank Presently in Use? (Yes-No)		no	yes	yes	yes
Materials Stored in Tank	Material: dates:	GAS ? to	w/o ? to 88	w/o ? to 88	w/o ? to 88
	Material: dates:	to	to	to	to
Has Tank System Leaked? (Yes, No, Not Known)	Tank	unknown	unknown	unknown	unknown
	Piping	"	"	"	"
Basis of determination (Inventory records, tank system testing/monitoring, environmental monitoring)			FAILED PRESISION TESTS ON 11/18/86		
Is any part of the system cathodically protected? (Yes-No-Not Known)					
	Tank	no	no	no	no
	Piping Lines	"	"	"	"
Piping materials					

C. PREVIOUS OWNERS AND [redacted]RS OF THE TANK(S):

Dates	[redacted]ner/Operator

D. Approximate depth to groundwater: unknown

Basis of Determination: _____

E. Proposed method of abandonment: |XX| Removal |___| Destruction in place

NOTE: Removal of the tank(s) is the preferred method of abandonment. Destruction of the tank in place, for example, by filling with an inert substance, will only be considered in special cases upon submittal of additional information to determine the risks and hazards of contamination. Additional information required includes recent tank testing results, soils data, special site characteristics and approval from the local Fire Department.

F. Future use/disposal site of tank: scrap

G. ATTACH A PLOT PLAN ON 8-1/2" x 11" paper showing the following:

1. Property Lines, Site Address, Scale, North Arrow
2. Location of 100 year flood plain, if applicable
3. Location of all existing and proposed structures
4. Location of all existing and proposed underground storage tank facilities
5. Location of underground tank(s) to be abandoned (number tanks to correspond to application)
6. Location of underground utility lines and vaults

H. REQUIRED INSPECTION - PERMIT TO ABANDON

A representative of the Department of Health Services (DHS) must be on site at the time the tank(s) is removed from the ground to evaluate the condition of the tank and the surrounding soil and/or groundwater. Any evidence of an unauthorized release of a hazardous material from the tank will require the submittal of additional information by the permittee to the DHS.

When a permit has been issued by the DHS to destroy a tank in place, the DHS will inspect to verify that the tank has been properly emptied and purged of all hazardous materials immediately prior to filling with an approved inert substance.

I. I declare that to the best of my knowledge and belief the statements and information provided are correct and true. I understand that information in addition to that provided above may be needed in order to obtain final approval by the Department of Health Services.

I understand that tests and procedures that may be required by other departments and agencies to demonstrate adequate site safety or suitability for future development (e.g., soil compaction testing) are in addition to the requirements of the Department of Health Services.

I will notify the Department of Health Services at least two working days (48 hours) before work is to begin in order to schedule the required inspections. I understand that site and worker safety are solely the responsibility of the property owner or his agent and that this responsibility is not shared nor assumed by the County of San Diego.

Dear Ms. Gustavson:

UNDERGROUND STORAGE TANK (UST) CASE
LA MESA RV CENTER, 7601 ALVARADO ROAD, LA MESA, CA 92041
UNAUTHORIZED RELEASE #H02651-001

This letter confirms the completion of site investigation and remedial action for the underground storage tanks formerly located at the above described location. Enclosed is the Case Closure Summary for the referenced site for your records.

Based upon the available information, including the current land use, and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721(e). If a change in land use is proposed, the owner must promptly notify this agency.

Please telephone Carol Spangenberg at (619)338-2257 if you have any questions regarding this matter.

Sincerely,

CHUCK PRYATEL, Chief

3	550	product motor oil	Removed	2/22/88
4	2000	leaded gasoline	Removed	2/22/88

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release: Numerous holes were noted in the underground storage tanks at removal.			
Site Characterization complete? Yes	Date Approved By Oversight Agency: June 13, 1996		
Monitoring Wells Installed? Yes	Number: 3	Proper Screened Interval? Yes	
Highest GW Depth Below Ground Surface: 4.18 feet	Lowest Depth: 8.71 feet	Flow Direction: West	
Most Sensitive Current Use: Municipal			
Are Drinking Water Wells Affected? No	Aquifer Name: Mission San Diego of Lower San Diego HA		
Is Surface Water Affected? No	Nearest SW name: Alvarado Creek		
Off-Site Beneficial Use Impacts (addresses/locations): None			
Report(s) on file? Yes	Where is Report(s) Filed? County of San Diego, Environmental Health		

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL

Material	Amount (Include Units)	Action (Treatment or Disposal w/Destination)	Date
Tank	Four	Tanks were cleaned and taken to Nelco, San Diego	2/22/88
Piping	All associated piping	Disposed at Nelco, San Diego, CA	2/22/88
Free Product	None		
Soil	400 cubic yards	Southwest Disposal, Highway 95, Somerton, AZ 85350	5/20/92
Groundwater	purge water from groundwater monitoring events	San Diego Metropolitan Wastewater Department	
Barrels	None		

Case Closure Summa
Leaking Underground Fuel Storage Tank Program

III. RELEASE AND SITE CHARACTERIZATION INFORMATION (Continued)

MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS -- BEFORE AND AFTER CLEANUP

Contaminant	Soil(ppm)		Water (ppm)		Contaminant	Soil (ppm)		Water (ppm)	
	Before	After	Before	After		Before	After	Before	After
TPH (Gas)	980	174	<.5	<.5	Xylene	1.455	1.455	.0125	<.0005
TPH (Diesel)	271	271	<.5	<.5	Ethylbenzene	<1	.712	.002	<.0005
Benzene	<1	<.05	<.0005	<.0005	Oil & Grease	27,000	9,140	1.000	<.500
Toluene	<1	<.05	.0329	<.0005	Heavy Metals	Pb 26.7	Pb 26.7		
Other: EPA 8080	< detection				Other: EPA 8010	<detection			
Organic Pb	1.5	1.5	<5	<.6	MTBE			.0007	<0.0006

Comments (Depth of Remediation, etc.): Petroleum contaminated soil was excavated from the area of the tanks to 15 feet below grade surface.

There remains residual petroleum contaminated soil, approximately 1212 cubic yards, on site. Based on the Total Petroleum Hydrocarbon (TPH) analyses and the Total Recoverable Petroleum Hydrocarbons (TRPH) analyses performed, 99% is in the motor oil carbon range.

Based on the conclusions of the consultant, Environmental Business Solution, Inc., and the groundwater monitoring data which shows that the residual levels of petroleum contaminants in groundwater are below Drinking Water Maximum Contaminant Levels, it is concluded that the petroleum contamination levels remaining in groundwater and soil do not pose a threat to public health.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes

Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes

Does corrective action protect public health for current land use? Yes

Site Management Requirements: None

Should corrective action be reviewed if land use changes? Yes

Monitoring Wells Decommissioned: None | Number Decommissioned: 0 | Number Retained: 3

Groundwater	purge water from groundwater monitoring events	San Diego Metropolitan Wastewater Department	
Barrels	None		

Case Closure Summary
Leaking Underground Fuel Storage Tank Program

III. RELEASE AND SITE CHARACTERIZATION INFORMATION (Continued)

MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS -- BEFORE AND AFTER CLEANUP

Contaminant	Soil(ppm)		Water (ppm)		Contaminant	Soil (ppm)		Water (ppm)	
	Before	After	Before	After		Before	After	Before	After
TPH (Gas)	980	174	<.5	<.5	Xylene	1.455	1.455	.0125	<.0005
TPH (Diesel)	271	271	<.5	<.5	Ethylbenzene	<1	.712	.002	<.0005
Benzene	<1	<.05	<.0005	<.0005	Oil & Grease	27,000	9,140	1.000	<.500
Toluene	<1	<.05	.0329	<.0005	Heavy Metals	Pb 26.7	Pb 26.7		
Other: EPA 8080	< detection				Other: EPA 8010	<detection			
Organic Pb	1.5	1.5	<5	<.6	MTBE			.0007	<0.0006

Comments (Depth of Remediation, etc.): Petroleum contaminated soil was excavated from the area of the tanks to 15 feet below grade surface.

There remains residual petroleum contaminated soil, approximately 1212 cubic yards, on site. Based on the Total Petroleum Hydrocarbon (TPH) analyses and the Total Recoverable Petroleum Hydrocarbons (TRPH) analyses performed, 99% is in the motor oil carbon range.

Based on the conclusions of the consultant, Environmental Business Solution, Inc., and the groundwater monitoring data which shows that the residual levels of petroleum contaminants in groundwater are below Drinking Water Maximum Contaminant Levels, it is concluded that the petroleum contamination levels remaining in groundwater and soil do not pose a threat to public health.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes

Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes

Does corrective action protect public health for current land use? Yes

ADDRESS 7601 ALVARADO RD CITY LA MESA ZIP 92041

TELEPHONE (619) 462-5260

You are hereby notified that it is our information that the underground hazardous substance storage facility located at (address) 7601 ALVARADO RD (city) LA MESA (zip) 92041 has experienced an Unauthorized Release (leak). This information was provided to this Department by WESTERN PUMP.

The conditions created by the Unauthorized Release must be reported and corrected in accordance with Chapter 6.7 of the California Health and Safety Code and Title 23, Chapter 3, Subchapter 16 of the California Administrative Code.

It is the responsibility of the tank owner or operator to determine the extent and impact of the Unauthorized Release and to complete any required clean-up.

Within five working days of receipt of this Official Notice, the tank owner/operator or his agent must submit a written Unauthorized Release Report to the Hazardous Materials Management that includes all of the following information that is known at the time of filing the report:

a. List of type, quantity, and concentration of hazardous substance released.

b. The extent of the soil or groundwater or surface water contamination due to the release based on the results of all investigations completed at the time the report is submitted.

c. Method of clean-up implemented to date and proposed clean-up actions.

d. Method and location of disposal of the released hazardous substance and any contaminated soils or groundwater or surface water.

Subsequent mitigation actions will be discussed upon review of the submitted report and consultation with other responsible agencies.

IMPORTANT NOTES:

1. Notify the local Fire Department immediately if a fire or explosion hazard is present.

2. Notify the Regional Water Quality Control Board (265-5114) with 24 hours regarding this Unauthorized Release.

3. Until the clean-up is complete, the owner or operator shall submit a status report to the Hazardous Materials Management Unit (HMMU) every 3 months or at a more frequent interval specified by the HMMU.

4. It is the responsibility of the tank owner/operator or his agent to maintain the site in a safe and secure manner.

5. Any contaminated soil/liquid removed from the site must be handled, transported and disposed of or recycled as a hazardous waste.

6. Copies of all manifests used to haul and dispose of contaminated soils, groundwater, or materials from the site must be submitted to the HMMU.

7. It shall be unlawful for a person to construct, install, modify, operate, maintain, remove or destroy an underground storage tank used for the storage of hazardous substances without first obtaining a permit as specified in Ordinance No. 7023, Chapter 10, Division 8, Title 6 of the San Diego County Code.

Jim Buchanan
La Mesa RV Center
7601 Alvarado Road
La Mesa, CA 92041

RE: UNAUTHORIZED RELEASE #T 1H02651
7601 Alvarado Road La Mesa, CA

Dear Mr. Buchanan:

Information provided to this Department by inspector during Tank Removal indicates that the underground hazardous substance storage facility at the location referenced above has experienced an Unauthorized Release (leak).

The conditions created by the Unauthorized Release must be reported and corrected in accordance with Sections 25295 and 25297 of Chapter 6.7 of the California Health and Safety Code (H&SC) and Section 2652, Subchapter 16, Chapter 3, Title 23 of the California Administrative Code (CAC), and Chapter 6.5 of the H&SC and Title 22 of the CAC.

As the owner/operator of the underground storage tank, it is your responsibility to:

1. Take immediate action to prevent further unauthorized release;
2. Determine the extent and impact of the unauthorized release;
3. Submit a written Unauthorized Release Report to this Department within five workdays of receipt of this Notice;
4. Complete and distribute within five workdays the enclosed State Water Resources Control Board's "Underground Storage Tank Unauthorized Release(Leak)/Contamination Site Report";
5. Submit supplemental report as required to update the initial report; and,
6. Complete any site mitigation (cleanup) required.

The Unauthorized Release Report must address all six Elements listed on the reverse side of this Official Notice, to the extent of the best information known at this time. Additional information and responsibilities are also listed. Please note Item G concerning responsibility for payment for staff time expended on the investigation.

Subsequent site characterization and mitigation actions will be determined upon evaluation of the written report and consultation with the Regional Water Quality Control Board and other appropriate regulatory agencies.

Please call me at (619) 236-2222 if you have any questions regarding this Official Notice.

Sincerely,

Hazardous Materials Specialist

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001
7601 ALVARADO ROAD, LA MESA, CA 92041

A review of the Hazardous Materials Management Division's (HMMD) files indicates that the unauthorized release issue associated with an underground storage tank at this site has not been resolved. The last activity on this site appears to be greater than three (3) months ago.

The California Code of Regulations, Title 23, Chapter 3, Subchapter 16, Section 2652 (d) states that until cleanup is complete, reports shall be submitted to the local agency and the Regional Water Quality Control Board (RWQCB) every three months or at a more frequent interval if specified.

Within thirty (30) days of receipt of this letter, submit a written update report to the HMMD and the RWQCB summarizing the site activities and the proposal for any further work. Submit the updates at the frequency previously specified by the HMMD, not to exceed the minimum of every three months (October 15th, January 15th, April 15th, July 15th). Updates must be submitted until which time the unauthorized release is resolved.

Please be reminded that the State Water Resources Control Board (SWRCB) will bill the responsible party for all local agency time expended on the unauthorized release investigation. Site assessments and remediation activities completed in a comprehensive and timely manner may minimize the amounts billed by the SWRCB.

Please contact Mo Lahsaie, Hazardous Materials Specialist, at (619) 338-2256, if you have questions regarding this matter.

Sincerely,

Darryl Fowler

OFFICIAL NOTICE

James Buckner 462-5660
La Mesa RV Center
7601 Alvarado Rd.
La Mesa, CA 92041

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001
LA MESA RV CENTER
7601 ALVARADO RD., LA MESA, CA 92041

A review of the Hazardous Materials Management Division's (HMMD) files indicates that there has been no site assessment report submitted since the tanks were removed February 22, 1988. As the responsible party, you are required to take corrective action in response to an unauthorized release in accordance with the California Health and Safety Code, Chapter 6.75, Article 4, Section 25299.37 (a-c).

The HMMD letter to you dated January 16, 1992 states that the work plan you submitted was approved. The HMMD has not received any update reports that document completed or projected site assessment and mitigation activities. Your update report is **PAST DUE.**

In the HMMD letter to you dated May 23, 1991 you were instructed to submit update reports at a minimum of every 90 days. Until such time as the HMMD considers this case resolved, the HMMD will require that you submit an update report every 30 days in accordance with the provisions of the California Code of Regulations, Title 23, Chapter 3, Subchapter 16, Article 5, Section 2652 (d).

Additionally, you can not use the information from the old stockpiled soil data to characterize conditions on site. The disposal of the old stockpiled soil does not constitute significant progress towards defining the extent of contamination on-site. You

are required to perform a complete site assessment and any required remediation in order to protect the public health and the environment.

Please submit your written update report describing current and anticipated site activities. The report must contain conclusions and recommendations based on current site conditions. If further site assessment or remediation activities are necessary, you must submit a work plan outlining those activities. The update report is due within ten working days of receipt of this notice.

If you have any questions on this matter, please contact me at (619) 338-2396.

Sincerely,

LARS SKINNER, Hazardous Materials Specialist
Hazardous Materials Management Division

NOTICE OF REIMBURSEMENT RESPONSIBILITY

Fredna Gustavson
c/o: La Mesa RV Center
7601 Alvarado Rd.
La Mesa, Ca 91941

Dear Ms Gustavson:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001
LA MESA RV CENTER, 7601 ALVARADO RD., LA MESA, CA 91941

This letter is to notify you of the billing procedure for the unauthorized release (leak) investigation at the above referenced underground storage tank site. The County of San Diego is under contract with the State Water Resources Control Board (SWRCB) to oversee the investigation and remediation (clean-up) of unauthorized releases. All costs incurred on this case by the Hazardous Materials Management Division (HMMD) are being invoiced to the SWRCB who will bill you.

A previous reimbursement notification may have been sent regarding this site. If this case is resolved, please retain this letter with your records. Active cases should be resolved in a prompt and effective manner to help minimize the amount billed by the SWRCB.

The HMMD has identified the following party(ies) as being responsible for the implementation of the environmental investigation and cleanup of this Unauthorized Release:

Fredna Gustavson 1100 Westwood Rd. Santa Cruz, CA 95060	La Mesa RV Ctr 7601 Alvarado Rd. La Mesa, CA 91941	Fredna Gustavson c/o: La Mesa RV Ctr. 7601 Alvardo Rd La Mesa, CA 91941

The California Health and Safety Code (HS&C) Chapters 6.7 and 6.75 requires the tank owner, tank operator, property owner or other responsible parties to take corrective action in response to an Unauthorized Release. The California Code of Regulations (CCR), Title 23, Division 3, Chapter 16, Underground Storage Tank Regulations provides the release reporting and initial abatement requirements.

With regard to the contract, the SWRCB requires the HMMD notify you of the following:

> *"Whereas the federal Petroleum Leaking Underground Storage Tank Trust Fund provides funding to pay the local agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks; and Whereas the Legislature has authorized funds to pay the local and state agency administrative and oversight costs associated with the*

cleanup of releases from underground storage tanks; and Whereas the direct and indirect costs of overseeing removal or remedial action at the above site are funded, in whole or in part, from the federal Trust Fund; and Whereas the above individual(s) or entity(ies) have been identified as the party or parties responsible for investigation and cleanup of the above site; YOU ARE HEREBY NOTIFIED that pursuant to Title 42 of the United States Code, Section 6991b(h)(6) and Sections 25297.1 and 25360 of the Health and Safety Code, the above Responsible Party or Parties shall reimburse the State Water Resources Control Board the following:

FOR all direct and indirect costs incurred by any and all state and local agencies while overseeing the cleanup of the above referenced underground storage tank site (prior to January 1, 1991); FOR not more than 150 percent of the total amount of site specific oversight costs actually incurred while overseeing the cleanup of the above underground storage tank site (beginning January 1, 1991); and the above Responsible Party or Parties shall make full payment of such costs within 30 days of receipt of a detailed invoice from the State Water Resources Control Board."

The Underground Storage Tank (UST) Cleanup Fund provides funding to eligible responsible parties for corrective action and third party liability costs resulting from the unauthorized release of petroleum hydrocarbons. For more information on the UST Cleanup Fund, please contact the SWRCB at (916) 739-2475.

If you have any questions concerning this Notice, please contact the undersigned at (619) 338-2396.

Sincerely,

LARS SKINNER, Hazardous Materials Specialist
Hazardous Materials Management Division

TOPIC: La Mesa RV SIA Update

SUMMARY: Dave called & update me on his SIA activities. He apparently has excavated the cont. soil in both Gasoline and W. end area & has removed 250 y^3 soil & even soil below H_2O table the G-H_2O looks impacted. Three St. Piles were generated Gasoline Pile, overburden & waste oil. He is planning to characterize all 3 piles before Disposal can be approved by HMMD. Two Excavation were connected & cross Contamination could have happen between both. we talked about remediation options & soil Lab analysis - He said one side wall Sample right above G-H_2O table had TPH = 980 PPM [redacted]. He said that his client wants to get rid of the stockpile as soon as possible.

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001
7601 ALVARADO RD., LA MESA, CA 92041

The proposed workplan for additional site assessment and remediation submitted by Halliburten Nus dated December 11, 1991 regarding the referenced site has been reviewed.

Based on the information within the workplan, this Department and the Regional Water Quality Control Board (RWQCB) finds the proposed scope of work acceptable.

Further site characterization and mitigation actions will be determined following evaluation of the written report and consultation with the RWQCB and other appropriate regulatory agencies.

If you have further questions, please call me at (619) 338-2256.

Sincerely,

M.A. Lahsaizadeh

December 9, 1993

James Buckner
La Mesa RV Center
7601 Alvarado Rd.
La Mesa, CA 92041

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001
LA MESA RV CENTER, 7601 ALVARADO RD., LA MESA, CA 92041

The staff of the Site Assessment and Mitigation Division (SAM) have reviewed this case. This letter has been prepared in accordance with the requirements set forth in Title 23 (State Underground Storage Tank Regulations), Division 3, Amendment to Chapter 16, Article 11, Section 2722. The purpose of this letter is to notify the Responsible Party of the status of the workplan dated November 24, 1993.

The workplan prepared by Dan Johnson/Environmental Business Solutions (EBS) covers one of the following phases of corrective action:

Interim Remedial Action	( )
Preliminary Site Assessment	(X)
Soil and Water Investigation	( )
Corrective Action Plan Implementation	( )
Verification Monitoring	( )

The workplan proposing to continue the soil and ground water investigation has been:

( ) approved.
( ) disapproved-call the undersigned for further instructions.
(X) approved with the following changes or conditions:

- The soil sample with the highest result for total petroleum hydrocarbons (TPH) must also be analyzed for volatiles by method 8020, and organic lead.

  The final report must include cross-sections of the soil contamination that depict the delineation achieved.

- The location proposed for MW-3 may not allow for accurate calculation of the ground water flow direction, based on the locations of wells MW-1 and 2 and the suspected local gradient to the north/northwest. It is recommended that well MW-3 be relocated to the east of sample points OES-15 and OES-6, approximately ten feet east of the edge of the previous excavation. This will also allow for lateral delineation of soil contamination in this area.

  However, there is still a requirement for lateral delineation of soil contamination in the vicinity of the previous location proposed for MW-3, i.e., to the south of OES-9 and OES-12. It is recommended that a soil boring, rather than a well, be placed at this location, in order to define the horizontal limits of soil contamination in this direction.

Keep this letter for your records as it may be required for corrective action cost reimbursement under Senate Bill 2004 (California Health and Safety Code, Chapter 6.75, Article 6).

Please submit a report describing the results of the activities described in the workplan to SAM and the Regional Water Quality Control Board (RWQCB) by January 30, 1994.

Please call me at (619) 338-2396, if you have any questions.

Sincerely,

LARS SKINNER, Hazardous Materials Specialist
Site Assessment and Mitigation Division

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001
LA MESA RV CENTER
7601 ALVARADO RD., LA MESA, CA 92041

Your written update report for the site referenced above is **PAST DUE**. You are required to submit this report in accordance with the provisions of the California Code of Regulations, Title 23, Chapter 3, Subchapter 16, Article 5, Section 2652 (d). The report should contain a brief summary of completed and projected site assessment and mitigation activities. You are required to submit an update report every 30 days.

As a reminder, in order to qualify for SB 2004 funds you must be in compliance with all underground tank laws. Your lack of compliance can affect your eligibility to receive SB 2004 funds.

As a responsible party, you are required to complete the investigation to define the horizontal and vertical extent of contamination at this site. You are required to complete this additional investigation as part of corrective actions in accordance with the provisions of the California Health and Safety Code, Chapter 6.75, Article 4, section 25299.37 (a-c).

The Site Assessment and Mitigation Division (SAM) requires that a work plan be submitted for approval of all additional activities at the site. You were previously requested to submit a workplan in the letter to you dated June 2, 1993; the workplan was due July 5, 1993.

Please submit your written update report and a workplan for the next phase of work on this site no later than November 29, 1993. Failure to do so may result in the initiation of enforcement action.

If you have any questions on this matter, please contact me at (619) 338-2396.

Sincerely,

LARS SKINNER, Hazardous Materials Specialist
Site Assessment and Mitigation Division

OFFICIAL NOTICE

James Buckner
La Mesa RV Center
7601 Alvarado Rd.
La Mesa, CA 92041

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001/LA MESA RV CENTER
7601 ALVARADO ROAD, LA MESA, CA 92041

Site Assessment and Mitigation (SA/M) staff have reviewed the Halliburton NUS report, dated August 28, 1992. Based on the information contained in the report, the extent of contamination of soil and groundwater has not been adequately defined. SA/M and the Regional Water Quality Control Board (RWQCB) require additional delineation of the soil and groundwater contamination. Please submit a proposed work plan for further site assessment activities. The work plan should specifically address the following:

- Investigate soil contamination in all areas, horizontally and vertically. Future sampling must follow SA/M guidelines for supplementary tests on waste oil-impacted samples. All additional samples must be analyzed for both Total Petroleum Hydrocarbons (TPH) and Total Recoverable Petroleum Hydrocarbons (TRPH).

- Provide a chain-of-custody for all of the samples designated "LMRV-OES", as well as copies of summary tables II and III, which were missing from the report. Please account for the discrepancy in total yards of soil stockpiled, versus the estimated number of yards of soil disposed of off-site, for which receipts have been provided.

- Describe the extent of ground water impact. Please refer to the SA/M manual for guidance on groundwater monitoring well

siting, design, installation, and sampling. You must provide a geologic explanation for the contaminant distribution in light of site geology, groundwater gradient, and contaminant source.

Please submit a work plan addressing the above points by July 5, 1993.

If you have any questions on this matter, please contact me at (619) 338-2396.

Sincerely,

L. Skinner

SITE ASSESSMENT AND MITIGATION DIVISION

June 19, 1995

Mr. James Buckner
La Mesa RV Center, Inc.
c/o Stephen L. Marsh, Esq.
Luce, Forward, Hamilton & Scripps
600 W. Broadway, Suite #2600
San Diego, CA 92101

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE H02651-001
LA MESA RV CENTER, 7601 ALVARADO RD., LA MESA, CA 92041

This letter has been prepared in accordance with the requirements set forth in Title 23 (State Underground Storage Tank Regulations), Division 3, Chapter 16, Article 11, Section 2722. The purpose of this letter is to notify the Responsible Party of the status of the Quarterly Groundwater Monitoring Report for the First Quarter 1995 and Workplan Describing Additional Site Assessment Activities (Workplan) dated May 1, 1995.

The Workplan prepared by Environmental Business Solutions, Inc. proposes to drill four soil borings to provide additional information on the horizontal and vertical spread of petroleum hydrocarbon contamination.

The Workplan has been approved with the following changes or conditions:

The Workplan proposes to use a pre-existing boring (B4A) to provide confirmation of the vertical extent of contamination at B4. This is acceptable if the registered professional can demonstrate that the soil samples collected at B4A are representative, ie; soil classification at both locations is the same and soil sample collection protocol was appropriate for collecting the soil samples at B4A.

Please include EPA 8240 or EPA 8010 to the analyses required for the next groundwater monitoring. The 1995 SAM manual requires that the groundwater monitoring wells be screened, at least once, for the presence of volatile organic compounds.

Keep this letter for your records as it may be required for corrective action cost reimbursement under Senate Bill 2004 (California Health and Safety Code, Division 20, Chapter 6.75, Article 6).

The need for further site characterization and mitigation actions will be determined following evaluation of the written report and consultation with the San Diego Regional Water Quality Control Board (RWQCB) .

If you have any questions, please call me at (619) 338-2257.

Sincerely,

Carol Spangenberg

SITE ASSESSMENT AND MITIGATION DIVISION

February 7, 1995

James Buckner
La Mesa RV Center
7601 Alvarado Rd.
La Mesa, CA 92041

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001
LA MESA RV CENTER, 7601 ALVARADO RD., LA MESA, CA 92041

Staff of the Site Assessment and Mitigation Division (SAM) have reviewed the Environmental Business Solutions (EBS) report dated March 30, 1994. The report describes the second phase of soil and ground water investigation at this site.

Based on the information contained in the report, additional work should address the following points:

- Additional soil delineation is required in the following areas: west/northwest of GES-11 and MW-1, west of OES-11, southwest of OES-12 and 13, and vertically below B-4 and B-1. If soil data from MW-3, B-3 and B-6 are intended to provide lateral delineation of contamination, additional information must be provided as to the estimated mean and maximum concentrations and volumes of contaminated soil still in-place. This information must also be provided for all areas of the site as a whole. As part of this, please provide in the next report a contour map of soil contamination. In addition, to better clarify the differential distribution of waste oil versus gasoline, include a plot plan of sample results using a ratio of TPH to TRPH data.

- The apparent distribution of waste oil contamination at the site (versus gasoline contamination) is much broader than usual for such a contaminant, particularly in view of where the tanks were located. Please provide an explanation of contaminant distribution and migration based on site lithology and hydrogeology.

- The report stated that a number of samples were obtained using an air percussion drill rig. Please indicate what the protocol was to minimize excessive aeration of samples obtained in such a way.

- The report indicates that significant soil contamination was/is in close proximity to and below the water table at this site. It is somewhat unexpected that the monitoring wells did not show any resulting contamination. In addition, decisions on ground water contamination are made based on at least several rounds of sampling and the last samples were obtained some time ago. Consequently, SAM will require at least one to two additional rounds of quarterly sampling of the wells on-site.

Quarterly monitoring shall include collection of groundwater samples from all wells using acceptable purging and sampling procedures. Laboratory analysis for ground water samples must include Total Petroleum Hydrocarbons (DHS TPH Method), Total Recoverable Petroleum Hydrocarbons (TRPH), and Benzene, Toluene, Ethylbenzene, Xylene, and methyl tertiary-butyl ether (MTBE) (EPA Method 8020). For at least the next quarter, any samples that are not non-detect for TRPH should also be analyzed by method 8310 or 8270 for polyaromatic hydrocarbons (PAHs) to help characterize the more mobile constituents in the waste oil. Groundwater levels should be measured, and any free product detected should be removed on a weekly basis, or more or less frequently as conditions may warrant. This information shall be submitted in a report to SAM.

Quarterly sampling and reporting should be done according to the following schedule:

Sampling Period	Report Due Date
January, February, March	April 30
April, May, June	July 30
July, August, September	October 30
October, November, December	January 30

You should initiate your sampling/reporting program in the current quarter (January-March), and the report will be due to SAM by April 30, 1995. Based on the quarterly monitoring schedule you will be adhering to, it is not necessary to have your attorney continue to provide 30 or 90-day update reports.

Please submit a workplan for the next phase of work on this site no later than March 20, 1995. Due to administrative changes, this file has been transferred to Ms. Carol Spangenberg, to whom you should direct all future inquiries. She can be reached at (619) 338-2257, if you have any questions on this matter. If you have

any questions regarding the previous handling of this case, please contact me at (619) 338-2396.

Sincerely,

LARS SKINNER, Hazardous Materials Specialist
Site Assessment and Mitigation Division

Subject: Suspect soil contamination at La Mesa RV 7601 Alvarado Rd La Mesa. AT1124

Dear Vicki Church:

After the tanks were removed from the excavation Alm Services took soil samples in several locations to determine the presence or degree of contamination.

The 8 soil samples were gathered in glass jars and placed in a cooler with ice. They were taken the same day (2/22/88) to QA Laboratoryfor analysis.

Please review the attatched lab report, plot plan and chain of custody.

I am told a few of the tanks have not stored product for several years. Please contact Jim Buckner with La Mesa RV 462-5660 for a more exact history of the site to make your determination.

Sincerely,

Robert Alm

Attn: Jim Buckner

Subject: Quotation for the removal of (4) underground fuel tanks.

Alm Services will perform the following work to remove your tanks;

- Pull all permits required
- Uncover (1) 2,000 gallon gas tank and (3) 550 gallon waste oil tanks. Assist the tank cleaner (hired by La Mesa RV), demo concrete and A/C over tanks on a Saturday to be determined.
- Remove the tanks on the following Monday during the scheduled inspection with the HMMD and S.D. Fire Dept.. Assuming there is no soil contamination, we will backfill and compact the soil to open the area for traffic.
- Patch tank hole areas with 3" A/C on a weekday of your choice.
- Haul away tanks, A/C, and concrete for disposal.
- Removal of contaminated soil or soil sampling is not included.

Total Cost $7,700.

Work could begin Feb. 20, 1988

Payment terms will be;

10%	Before pulling permits	$770
84%	After tank removal and backfill	$6468
6%	After paving	$462

Invoices will be due upon receipt, delinquent after 10 days. A late charge of 1½% per month on past due amounts.

Subject: Soil sampling at La Mesa RV, 7601 Alverado Rd., La Mesa
Plan check AT1124, EST #H02651.

Dear Vicki Church:

In order to resolve the high levels of TPH at the location of the old oil tanks, we have performed the following work:

- Excavated approximately 20 yds. of discolored and oily soil.
- Gathered 3 soil samples per plot plan.
- Backfilled hole with clean fill.
- Stockpiled oil soil at back of lot.

The samples were gathered in glass jars and placed in a cooler, on Saturday May 14th. They were stored in a refrigerator over the weekend and taken to QA Lab on Monday morning per chain of custody report.

The samples were taken in the native material. It was mostly clay with rocks roughly 3" round. No ground water was encountered.

Please review the attached lab results.

Contact myself or Jim Buckner at La Mesa RV with questions on the site.

Sincerely,

Robert Alm

COMMENTS
Removal of Tanks and Tests cost over $10,000. The contamination soil is to be removed and sent to a hazardous dump site. Amount and cost unknown at this time. Contractor is ALM Services PO Box 2354 Lakeside Cal. 92040 (Bob ALM)

HSC 05 (4/87)

INSTRUCTIONS

EMERGENCY
Indicate whether emergency response personnel and equipment were involved at any time. If so, a Hazardous Material Incident Report should be filed with the State Office of Emergency Services (OES) at 2800 Meadowview Road, Sacramento, CA 95832. Copies of the OES report form may be obtained at your local underground storage tank permitting agency. Indicate whether the OES report has been filed as of the date of this report.

LOCAL AGENCY ONLY
To avoid duplicate notification pursuant to Health and Safety Code Section 25180.7, a designated government employee should sign and date the form in this block. A signature here does not mean that the leak has been determined to pose a significant threat to human health or safety, only that notification procedures have been followed if required.

REPORTED BY
Enter your name, telephone number, and address. Indicate which party you represent and provide company or agency name.

RESPONSIBLE PARTY
Enter name, telephone number, contact person, and address of the party responsible for the leak. The responsible party would normally be the tank owner.

SITE LOCATION
Enter information regarding the tank facility and surrounding area. At a minimum, you must provide the facility name and full address.

IMPLEMENTING AGENCIES
Enter names of the local agency and Regional Water Quality Control Board involved.

SUBSTANCES INVOLVED
Enter the name and quantity lost of the hazardous substance involved. Room is provided for information on two substances if appropriate. If more than two substances leaked, list the two of most concern for cleanup.

DISCOVERY/ABATEMENT
Provide information regarding the discovery and abatement of the leak.

SOURCE/CAUSE
Indicate source(s) of leak. Provide details on tank age; capacity and material if known. Check box(es) indicating cause of leak.

CASE TYPE
Indicate the case type category for this leak. Check one box only. Case type is based on the most sensitive resource affected. For example, if both soil and ground water have been affected, case type will be "Ground Water". Indicate "Drinking Water" only if one or more municipal or domestic water wells have actually been affected. A "Ground Water" designation does not imply that the affected water cannot be, or is not, used for drinking water, but only that water wells have not yet been affected. It is understood that case type may change upon further investigation.

CURRENT STATUS
Indicate the category which best describes the current status of the case. Check one box only. The response should be relative to the case type. For example, if case type is "Ground Water", then "Current Status" should refer to the status of the ground water investigation or cleanup, as opposed to that of soil.

IMPORTANT: THE INFORMATION PROVIDED ON THIS FORM IS INTENDED FOR GENERAL STATISTICAL PURPOSES ONLY AND IS NOT TO BE CONSTRUED AS REPRESENTING THE OFFICIAL POSITION OF ANY GOVERNMENTAL AGENCY

REMEDIAL ACTION
Indicate which actions have been used to cleanup or remediate the leak. Descriptions of options follow:

Cap Site - install horizontal impermeable layer to reduce rainfall infiltration.
Containment Barrier - install vertical dike to block horizontal movement of contaminant.
Excavate and Dispose - remove contaminated soil and dispose in approved site.
Excavate and Treat - remove contaminated soil and treat (includes spreading or land farming).
Remove Free Product - remove floating product from water table.
Pump and Treat Groundwater - generally employed to remove dissolved contaminants.
Enhanced Biodegradation - use of any available technology to promote bacterial decomposition of contaminants.
Replace Supply - provide alternative water supply to affected parties.
Treatment at Hookup - install water treatment devices at each dwelling or other place of use.
No Action Required - incident is minor, requiring no remedial action.

COMMENTS - Use this space to elaborate on any aspects of the incident.
SIGNATURE - Sign the form in the space provided.
DISTRIBUTION

If the form is completed by the tank owner or his agent, retain the last copy and forward the remaining copies in tact to your local tank permitting agency for distribution.

1. Original - Local Tank Permitting Agency
2. State Water Resources Control Board, Division of Water Quality, Underground Tank Program, P. O. Box 100, Sacramento, CA 95801
3. Regional Water Quality Control Board
4. County Board of Supervisors or designee to receive Proposition 65 notifications.
5. Owner/responsible party.

INSTRUCTIONS ON THE BACK

1-10-92

December 11, 1991

Mr. James Buckner
La Mesa RV Center
7601 Alvarado Road
La Mesa, California 92041

Attention: Mr. James Buckner

Subject: Environmental Engineering Services
Relating to Unauthorized Release
Case Number T0427/H02651-001
HALLIBURTON NUS Proposal No. P9111053

Dear Mr. Buckner:

In response to your request, HALLIBURTON NUS Environmental Corporation (HALLIBURTON NUS) is pleased to submit this proposal to provide environmental engineering services relating to the unauthorized release (UAR) at the La Mesa RV Center. La Mesa RV is located at 7601 Alvarado Road in La Mesa, California.

The information presented below summarizes our understanding of the circumstances associated with the UAR at the site and proposes a scope of work to address these circumstances.

TECHNICAL UNDERSTANDING AND APPROACH

A representative of HALLIBURTON NUS previously visited the subject site with Mr. Chris Tomlin of Horizon Hoist Company of San Diego. During the survey of the site, Mr. Tomlin indicated that Alm Services, a local tank removal contractor, had removed four underground storage tanks (UST) from the site on February 22, 1988. The four UST's consisted of one 550 gallon used oil tank, two 550 gallon new oil tanks, and one 2000 gallon regular leaded gasoline tank.

While surveying the site, a concrete patch was observed at the location of the former gasoline UST at the southwest corner of the north service garage. In addition, an asphalt patch was observed at the location of the former oil UST on the south side of the southwest corner of the north service garage. An extensive asphalt parking and driveway complex surrounds the service

December 11, 1991
Proposal No. P9111053

and sales buildings. The former UST locations are situated in areas that could potentially disrupt the activities of the dealership during proposed excavation activities.

A survey of areas adjacent to the dealership indicate the site is bordered to the ~~south~~ North by Alvarado Road and Interstate 8, to the west and south by commercial properties and to the east by a residential property. Located immediately east of the residential property is the site of a former gasoline service station that is currently undergoing investigation and remediation activities associated with an unauthorized release at the site.

Review of Correspondence and Laboratory Data

A review of the "Abandoned Underground Tank Report", prepared by Mr. Donn Lipera of the San Diego County Department of Health Services-Hazardous Materials Management Division (DHS-HMMD) confirms that four UST's were removed from the site on February 22, 1988. The report further indicates that all of the tanks possessed holes ranging from pinhole size to three quarters of an inch in diameter. Odors within the excavation were indicated to be slight with some soil discoloration. Groundwater impact was not noted, although groundwater was observed within the excavation at a depth of seven feet below ground surface.

Correspondence from Mr. Bob Alm to Ms. Vicki Church of the DHS-HMMD, dated March 21, 1988 indicates that Alm Services obtained a total of six soil samples from the bottom of the two excavations. Four of the soil samples were obtained from the excavation, formerly containing the used oil tank and the two new oil tanks. A review of the laboratory results of these four soil samples indicates that total recoverable petroleum hydrocarbon (TRPH) concentrations (EPA Test Method 418.1) in the samples ranged from 32 to 2900 milligrams/kilogram (mg/kg). Benzene, toluene, and xylene concentrations (EPA Test Method modified 8020) in one sample were 7.7, 44, and 82 mg/kg , respectively. Two soil samples were obtained from the second excavation, formerly containing a regular leaded gasoline tank. A review of the laboratory results indicates that total petroleum hydrocarbon (TPH) concentrations (EPA Test Method modified 8015) in the samples was 20 and 100 mg/kg. Benzene, toluene, and xylene concentrations in one sample were <0.5, 1.4, and 19 mg/kg (EPA Test Method modified 8020), respectively. Two additional soil samples were obtained from two soil stockpiles generated from the excavation and removal of the four tanks. One soil sample obtained from a 20 cubic yard soil stockpile originating from the oil tank excavation possessed a TRPH concentration of 77 mg/kg. The other soil sample obtained from a 20 cubic yard soil stockpile originating from the gasoline tank excavation possessed a TPH concentration of 20 mg/kg.

ACCURATE Summary

December 11, 1991
Proposal No. P9111053

On May 14, 1988, Mr. Alm reportedly obtained three additional soil samples from the oil tank excavation. A review of the laboratory data for these three soil samples indicates that TRPH concentrations were 250, 340, and <930 mg/kg. Benzene, toluene, xylene and solvent concentrations were below detection limits.

Based on the information summarized above, it is the understanding of HALLIBURTON NUS that the client's objective is to obtain regulatory site closure of the UAR reported for the site. In accordance with current regulatory guidelines, the horizontal and vertical extent of hydrocarbon impacts to the soil at the site must be estimated and potential impacts to groundwater must be addressed. In the event that hydrocarbon impacts in excess of cleanup standards established by regulatory agencies are encountered, mitigation of this impact may be required by regulatory officials. HALLIBURTON NUS would recommend methods for the mitigation and could provide the necessary equipment and expertise to accomplish any required cleanup.

SCOPE OF SERVICES

Based on our understanding of your requirements as conveyed above, we propose to provide environmental engineering services on behalf of La Mesa RV for the purpose of obtaining regulatory closure of the UAR for the subject site. The scope of services proposed is designed to provide a cost effective approach to attempt to satisfy the goal of site closure. However, following regulatory review of the results of the first phase of services, the performance of additional services may be required.

- Provide consultation including a review of the proposed workplan with the appropriate representatives of the DHS-HMMD and the San Diego Regional Water Quality Control Board (RWQCB) prior to the commencement of the field activities. - Estimated man hours = 2 HALLIBURTON NUS

- Prepare a Health and Safety Plan that would identify potential health and safety hazards anticipated during the performance of the excavation activities. The plan would be prepared prior to the commencement of field activities and would be reviewed by all field personnel. - Estimated man hours = 2 HALLIBURTON NUS

- Obtain the services of an underground utility locating service and review available client "As Built" drawings in an effort to identify the presence of underground utilities in proximity to the proposed excavations. - Estimated man hours = 2 HALLIBURTON NUS and 3 contractor

- Notify Underground Service Alert as required by law and obtain a "Ticket Number" at least 48 hours prior to the commencement of excavation activities. - Estimated man hours = 1 HALIBURTON NUS

- Sawcut asphalt and concrete in the areas designated for excavation of the trenches. Estimated man hours = 1 HALLIBUTON NUS and 4 contractor

- Excavate trenches perpendicular to the perimeter of the excavation sidewalls in an attempt to identify the contact between the fill and formational soils. Based on the information obtained during the excavation of the perpendicular trenches, perimeter trenches would be excavated parallel to each sidewall, where possible. Soil samples would be collected at various depths as necessary to aid in the estimation of the extent of possible hydrocarbon impact to the soil. Based on available information, it is estimated that the trenches would extend to the depth of groundwater or a depth of approximately 13 feet below the ground surface, whichever is less. - Estimated man hours = 18 HALLIBURTON NUS and 18 contractor

- Provide site security either with barricades or trench plates. - Estimated man hours = 2 HALLIBURTON NUS

- Perform vapor headspace surveys on soil samples collected from the trenches at each former UST location. An organic vapor analyzer (OVA) would be used to attempt to obtain indicators of the presence of petroleum hydrocarbons. It should be noted that use of the headspace survey is generally more effective on soil impacted by gasoline than on soils containing used oil. - Hours required to perform this task are included as part of the excavation activities as referenced above.

- Obtain soil samples. Soil samples obtained throughout the performance of the field activities would be subjected to analysis by an on-site California Department of Health Services certified mobile laboratory. The results of the laboratory analysis would be used to guide additional trenching activities and provide analytical confirmation of the possible extent of hydrocarbon impact to the soil.

December 11, 1991
Proposal No. P9111053

It is anticipated that approximately 12 soil samples would be obtained and analyzed for the presence of TRPH using EPA Method 418.1. Approximately 12 additional soil samples would be obtained and analyzed for the presence of total petroleum hydrocarbons (TPH) using EPA Method DHS-8015. One soil sample from the used oil trenching would be analyzed for solvents by EPA Test Method 8010 while a soil sample from the gasoline UST trenching would be analyzed for benzene, toluene, xylene, and ethylbenzene (BTXE) by EPA Test Method 8020-modified. Analysis using EPA Test Methods 418.1 and DHS-8015 cost approximately $80 per sample while EPA Test Methods 8010 and 8020-modified cost approximately $100 per sample.

Quality assurance/control procedures would be followed during all excavation and soil sampling activities. Soil samples would be placed in laboratory prepared containers and transported to an on site mobile laboratory for analytical testing. Chain-of-custody documentation would be provided for all soil samples. - Hours required to perform this task are included as part of the excavation activity.

- Segregate soil. Soil excavated during the trenching activities at each former UST location according to origin and by estimates of TRPH and TPH concentrations. The soil would be stockpiled on-site and placed on, and covered with, visqueen in accordance with regulatory protocol. The client would be responsible for disposition of the stockpiled soil. Estimated man hours = 2 HALLIBURTON NUS. At The client's request, HALLIBURTON NUS can assist in arranging with third parties for transportation and disposal of the stockpiled soil. Fees for this service will be additional.

- Provide health and safety monitoring during all trenching/excavation activities. The hours required to perform this task are included as part of the excavation activities.

- Fill trenches with rock/gravel and replace asphalt and concrete at ground surface, whichever is appropriate. The cost for this item is not included in the proposal as the amount of rock/gravel and concrete and asphalt required cannot be determined at this time.

- Prepare a report summarizing the results of the field activities and provide recommendations for additional environmental services, if required. Estimated man hours = 20 HALLIBURTON NUS

- Provide consultation with the client and representatives of the regulatory agencies following completion of the field activities. The purpose of the consultation would be to present the results obtained during the performance of the field activities. - Estimated man hours = 4 HALLIBURTON NUS

Very important to remember

It should be noted that the scope of services referenced above is for a first phase exploration of the possible horizontal and vertical extent of the hydrocarbon impacts to the soil at the site. Based on discussions with regulatory representatives, additional services, consisting of monitoring of the groundwater will be required by regulatory agencies. The nature of the groundwater monitoring activities will be dependent upon the results obtained from the first phase of the exploration activities. HALLIBURTON NUS would keep the client apprised of work progress and the possible need for additional services. No additional services would be performed without the client's consent.

TERMS AND CONDITIONS

The terms and conditions of this agreement are specified in the "Master Environmental Services Agreement" attached as Exhibit "A".

PROJECT STAFFING

This project will be managed by Mr. David Eminhizer, an environmental scientist/geologist with more than 8 years experience as a science professional and more than 6 years as a consultant and site manager in San Diego County.

PROJECT SCHEDULE

HALLIBURTON NUS can begin to provide these services upon contract award and authorization. Based upon the above-referenced Scope of Services, it is anticipated that a report regarding the site trenching activities could be completed within four weeks of the completion of the field activities.

Dear Mr. Fowler:

We were unaware of California Code of Regulations Title 23, Chapter 3, Subchapter 16, Section 2652 (d) prior to your letter.

We have been obtaining estimates from Leighton and Associates, Geotechnical and Environmental Engineering Consultants and Geocon, Environment Consultants, subconsultants to Horizon Hoists Company.

We have reached an agreement with Chris Tomlin of Horizon Hoists and signed a work order for Geocon. They will begin within the first two weeks of July 1991.

If you need more specific information please contact Chris Tomlin care of Horizon Hoist Co., 1991 Arnheim Court, El Cajon, CA 92021 (619) 444-9166.

Sincerely,

Jim Buckner
Director of Fixed Operations

Interim Report on Soil Assessment and Mitigation

Gentlemen:

On behalf of La Mesa RV Center and in accordance with the "Proposal" dated December 11, 1992, HALLIBURTON NUS Environmental Corporation (HALLIBURTON NUS) has performed assessment and mitigation services for the subject site located at 7601 Alvarado Road in La Mesa, California.

During 1988, La Mesa RV Center removed four underground storage tanks from the subject property. In December 1991, representatives of La Mesa RV Center retained HALLIBURTON NUS to attempt to assess and mitigate potential hydrocarbon impacts to the soil at the site. The attached "Interim Report" presents a synopsis of the efforts of HALLIBURTON NUS to accomplish those tasks and provide recommendations for additional services.

If there are any questions concerning the contents of this report, please contact the undersigned at your convenience.

Sincerely,

INTERIM REPORT ON SOIL ASSESSMENT AND MITIGATION

SECTION ONE: INTRODUCTION AND BACKGROUND

INTRODUCTION

This report presents the results of a soil assessment and mitigation efforts conducted for the unauthorized release (UAR No. T0427/H02651-001) reported for a group of four underground storage tanks (USTs) formerly located at 7601 Alvarado Road in La Mesa, California. La Mesa RV Center operated the USTs at the site at the time of the reported UAR and remain the current occupants of the site. The Assessor's Parcel Number for the property is 469-021-02.

Site Location

The subject site, currently occupied by La Mesa RV Center is located at 7601 Alvarado Road in La Mesa, California. The business is engaged in the sale and maintenance of recreation vehicles. The site is located adjacent to, and on the south side of Alvarado Road. Alvarado Creek (a concrete lined channel) bounds Alvarado Road to the north and Interstate 8 bounds Alvarado Creek to the north. Motel "6" bounds the subject property to the east; a steep bank and residential housing bound the subject property to the south; and a drainage channel and mobile home and trailer park bound the site to the west. A gasoline service station, reportedly the site of a UAR, was formerly located several hundred yards to the east of the subject property. The approximate location of the site is presented on the Vicinity Map, Figure No. 1.

Site Improvements

Located on the site are several office, sales, storage, and service/maintenance structures. These facilities are contained in four separate structures, generally constructed of concrete blocks. Most of the subject site has been paved with asphaltic concrete with areas of soil and grass surfaces only along the south and western boundaries of the property and ranging as a strip with

a width generally ranging between 15 and 30 feet. A chain-link fence bounds the property to the east, south, and west. A wrought-iron fence bounds the property to the north with two gates providing access to the site. Most of the site is under surveillance with video cameras to monitoring site security. The Site Plan, presented on Figure 2, presents an approximate depiction of the site.

BACKGROUND

Preliminary Site Visit

A representative of HALLIBURTON NUS previously visited the subject site with Mr. Chris Tomlin of Horizon Hoist Company of San Diego. During the survey of the site, Mr. Tomlin indicated that Alm Services, a local tank removal contractor, had removed four underground storage tanks (UST) from the site on February 22, 1988. The four USTs consisted of one 550 gallon used oil tank, two 550 gallon new oil tanks, and one 2000 gallon regular leaded gasoline tank.

While surveying the site, a concrete patch was observed at the location of the former gasoline UST at the southwest corner of the north service garage. In addition, an asphalt patch was observed at the location of the former oil UST on the south side of the southwest corner of the north service garage. An extensive asphalt parking and driveway complex surrounds the service and sales buildings.

Review of Correspondence and Laboratory Data

A review of the "Abandoned Underground Tank Report", prepared by Mr. Donn Lipera of the San Diego County Department of Health Services-Hazardous Materials Management Division (DHS-HMMD) confirms that four UST's were removed from the site on February 22, 1988. The report further indicates that all of the tanks possessed holes ranging from pinhole size to three-quarters of an inch in diameter. Odors within the excavation were indicated to be slight

with some soil discoloration. Groundwater impact was not noted, although groundwater was observed within the excavation at a depth of seven feet below ground surface. Following the removal of the USTs from the site, La Mesa RV Center submitted an "Unauthorized Release Report" with the HMMD. Copies of the "Abandoned Underground Tank Report", the "Unauthorized Release Report", and the responsible party's UST Cleanup Fund Claim Form are provided in Appendix A.

Correspondence from Mr. Bob Alm to Ms. Vicki Church of the DHS-HMMD, dated March 21, 1988 indicates that Alm Services obtained a total of six soil samples from the bottom of the two excavations. Four of the soil samples were obtained from the excavation, formerly containing the used oil tank and the two new oil tanks. A review of the laboratory results of these four soil samples indicates that total recoverable petroleum hydrocarbon (TRPH) concentrations (EPA Test Method 418.1) in the samples ranged from 3.2 to 2900 milligrams/kilogram (mg/kg). Benzene, toluene, and xylene concentrations (EPA Test Method modified 8020) in one sample were 7.7, 44, and 82 mg/kg , respectively. Two soil samples were obtained from the second excavation, formerly containing a regular leaded gasoline tank. A review of the laboratory results indicates that total petroleum hydrocarbon (TPH) concentrations (EPA Test Method modified 8015) in the samples was 20 and 100 mg/kg. Benzene, toluene, and xylene concentrations in one sample were <0.5, 1.4, and 19 mg/kg (EPA Test Method modified 8020), respectively. Two additional soil samples were obtained from two soil stockpiles generated from the excavation and removal of the four tanks. One soil sample obtained from a 20 cubic yard soil stockpile originating from the oil tank excavation possessed a TRPH concentration of 77 mg/kg. The other soil sample obtained from a 20 cubic yard soil stockpile originating from the gasoline tank excavation possessed a TPH concentration of 20 mg/kg.

3 MONTHS LATER

On May 14, 1988, Mr. Alm reportedly obtained three additional soil samples from the oil tank excavation. A review of the laboratory data for these three soil samples indicates that TRPH concentrations were 250, 340, and 930 mg/kg. Benzene, toluene, and xylene concentrations

(using EPA Method 8020) and solvent concentrations (using EPA Method 8010) were below detection limits.

Based on the information summarized above, it is the understanding of HALLIBURTON NUS that the client's objective is to obtain regulatory site closure of the UAR reported for the site. In accordance with current regulatory guidelines, the horizontal and vertical extent of hydrocarbon impacts to the soil at the site must be estimated and potential impacts to groundwater must be addressed. In the event that hydrocarbon impacts in excess of cleanup standards established by regulatory agencies are encountered, mitigation of this impact may be required by regulatory officials. HALLIBURTON NUS would recommend methods for the mitigation and could provide the necessary equipment and expertise to accomplish any required cleanup.

SECTION TWO: SCOPE OF SERVICES

BACKGROUND

On January 10, 1992, a meeting was conducted at the office of the HMMD for the purpose of obtaining regulatory input concerning a proposed scope of services presented in a "Workplan for Site Assessment and Mitigation" for the La Mesa RV site by HALLIBURTON NUS. Present at the meeting were Mo Lahsaie and Darryl Fowler of the HMMD, James Munch of the RWQCB, James Buckner of La Mesa RV Center, and David Eminhizer of HALLIBURTON NUS. Based on our understanding of the regulatory requirements and La Mesa RV's desire to pursue assessment and eventual closure of the UAR reported for the site, HALLIBURTON NUS proposed and performed the following scope of services.

SCOPE OF SERVICES

- Provided consultation including a review of the proposed workplan with the appropriate representatives of the DHS-HMMD and the San Diego Regional Water Quality Control Board (RWQCB) prior to the commencement of the field activities.

- Prepared a Health and Safety Plan that identified potential health and safety hazards anticipated during the performance of the excavation activities. The plan, prepared prior to the commencement of field activities, was reviewed by all field personnel.

- Reviewed available client "As Built" drawings in an effort to identify the presence of underground utilities in proximity to the proposed excavations.

- Notified Underground Service Alert as required by law and obtained a "Ticket Number" at least 48 hours prior to the commencement of excavation activities.

- Attempted to excavate trenches perpendicular to the perimeter of the excavation sidewalls for the purpose of identifying the contact between the fill and formational soils. Based on the information obtained during the excavation of the perpendicular trenches, perimeter trenches were to be excavated parallel to each sidewall, where possible. Soil samples were to be collected at various depths as necessary to aid in the estimation of the extent of possible hydrocarbon impact to the soil. Based on available information, it was estimated that the trenches would extend to the depth of groundwater or a depth of approximately 13 feet below the ground surface, whichever was less.

- Provided site security with barricades.

- Performed vapor headspace surveys on soil samples collected from the excavations at each former UST location. An organic vapor analyzer (OVA) was used to attempt to obtain indicators of the presence of petroleum hydrocarbons. It should be noted that use of the headspace survey is generally more effective on soil impacted by gasoline than on soils containing used oil.

- Obtained soil samples throughout the performance of the field activities. The soil samples were subjected to analysis by an on-site California Department of Health Services certified mobile laboratory. The results of the laboratory analysis were used to guide additional excavation activities and provide analytical confirmation of the possible extent of hydrocarbon impact to the soil. It was anticipated that approximately 12 soil samples would be obtained and analyzed for the presence of TRPH using EPA Method 418.1. Approximately 12 additional soil samples would be obtained and analyzed for the presence of total petroleum hydrocarbons (TPH) using EPA Method DHS-8015. One soil sample from the used oil excavation soils was analyzed for solvents by EPA Test Method 8010 while a soil sample from the gasoline UST trenching was analyzed for benzene, toluene, xylene, and ethylbenzene (BTXE) by EPA Test Method 8020-modified.

  Quality assurance/control procedures were followed during all excavation and soil sampling activities. Soil samples were placed in laboratory prepared containers and transported to an on site mobile laboratory for analytical testing. Chain-of-custody documentation was provided for the soil samples. Sampling equipment was washed with an Alconox and tap water solution and rinsed with tap water before each sample was collected.

- Segregated soil excavated during the trenching activities at each former UST location according to origin and by estimates of TRPH and TPH concentrations. The soil was stockpiled on-site and placed on, and covered with, visqueen in

accordance with regulatory protocol. The client was responsible for disposition of the stockpiled soil.

- Provided health and safety monitoring during all trenching/excavation activities.
- Filled excavations with rock/gravel and replaced asphalt at the ground surface, as appropriate.
- Prepared this report summarizing the results of the field activities and provided recommendations for additional environmental services, as necessary.
- Provided consultation with the client and representatives of the regulatory agencies following completion of the field activities.

It should be noted that the scope of services referenced above was for a first phase exploration of the possible horizontal and vertical extent of the hydrocarbon impacts to the soil at the site. Based on discussions with regulatory representatives, additional services, consisting of monitoring of the groundwater will likely be required by regulatory agencies.

SECTION THREE: ASSESSMENT AND MITIGATION

PRE-FIELD ACTIVITIES

Review of Background Information

Information relating to the former UST located on the subject site, and the associated UAR reported for the site, was provided to HALLIBURTON NUS by Mr. Chris Tomlin of Horizon Hoist Company and Mr. James Buckner of La Mesa RV Center. The information reviewed was as follows:

- "Abandoned Underground Tank Report" prepared by Mr. Donn Lipera of the HMMD.

- Field notes prepared by Mr. Bob Alm of Alms Services, the underground storage tank removal contractor who removed the four USTs at the site.

- Laboratory data sheets prepared by Quality Assurance Laboratory of San Diego, California.

In addition to the review of this information, HALLIBURTON NUS surveyed the site and conducted informal interviews with a few of the employees at La Mesa RV Center.

Preparation of a Workplan

A "Workplan for Site Assessment and Mitigation" was prepared and submitted to the HMMD and the RWQCB on January 10, 1992 by HALLIBURTON NUS. The plan was prepared after reviewing the above referenced information and the guidelines presented in the HMMD's "Site Assessment and Mitigation Manual". During the meeting with the regulatory representatives on January 10, 1992, comments offered by the regulatory representatives were incorporated into the workplan.

Preparation of a Health and Safety Plan

A "Health and Safety Plan For La Mesa RV Center, La Mesa, California", was prepared by HALLIBURTON NUS prior to the performance of the field activities. Potential health hazards were addressed and action levels for ambient air monitoring in the field were established. These action levels identified situations in which levels of personal health protection are upgraded or field activities are terminated, pending a review of the potential health risks.

The personal protective equipment recommended in the Health and Safety Plan and utilized during field activities included Level D protection consisting of limited dermal protection including hardhats, steel-toed rubber boots, and chemically protective gloves.

FIELD ACTIVITIES/SOIL EXCAVATION

Introduction

Following completion of the pre-field activities, preparations were made to begin the trenching activities at the site during the week of March 9, 1992. Underground Dig Alert was notified of the intent to excavate at the site, with representatives of the various affected utilities visiting the site on Tuesday, March 10, 1992 and Wednesday, March 11, 1992. No commercial utilities were identified in the areas to be excavated, however, a sewer line was identified to the west of the excavation locations.

With concurrence from the HMMD and the RWQCB, and in accordance with the proposed "Workplan", excavation of soil at the site began on Wednesday, March 11, 1992. A copy of the "Workplan is provided in Appendix B. For the ease of presentation and understanding of the progression of the soil excavation field activities, details of the soil assessment and mitigation effort are presented in chronological order.

Completion of Field Activities/Soil Excavation

Wednesday, March 11, 1992. Following a survey of the site by representatives of potentially affected utilities in the area, and confirmation by these representatives as to the location of utilities in the area, removal of concrete and asphalt from the parking lot area adjacent to the west end of the service bays began by mid-morning. This area is identified on the Site Plan, Figure No. 2, as the former fuel tank location. After the asphalt was removed, a trench was excavated in the approximate center of the former UST location. At this time a

PVC water line connecting the service bays was encountered and cut by the backhoe. The existence of the water line was unknown prior to the initiation of the field activities. The water was shut off and the line repaired prior to continuing with the work with the release of approximately 10 gallons of water during the entire event.

The original "Workplan" called for trenching through the center and around the perimeter of each former UST location, however, upon initial excavation of soil from the area of the former location of the fuel UST, it became apparent that soil impacted with petroleum hydrocarbons had been placed back into the excavation following removal of the UST some three years earlier. The first excavation soil sample (LMRV-GES-1) was obtained from the capillary zone at a depth of approximately eight feet Below Ground Surface (BGS) from the center of the former location of the fuel UST. An analysis of the soil sample for total petroleum hydrocarbons (TPH) by an on-site DHS certified mobile laboratory indicated that the soil sample possessed a TPH concentration of 280 milligrams per kilogram (mg/kg) of gasoline and 130 mg/kg of diesel fuel. While only gasoline was reportedly stored in the fuel UST, the presence of diesel fuel suggests that either the fuel UST or the used oil UST had contained diesel fuel at one time.

Since concentrations of TPH exceeding the cleanup level of 100 mg/kg were encountered upon initial excavation of soil at the site, the client was consulted regarding whether he wished to pursue the trenching only or if he wished to removed soil potentially impacted with petroleum hydrocarbons above the cleanup level established for soil at the site. The client opted for soil removal and instructed HALLIBURTON NUS to proceed with soil removal in the area of the former location of the fuel UST.

Thursday, March 12, 1992. Excavation and removal of soil from the area of the former location of the fuel UST resumed in the morning with soil excavated from an area approximately ten foot square by approximately nine feet BGS, approximately one foot below the groundwater surface. Three soil samples were obtained from the north sidewall of the excavation. Soil sample LMRV-GES-2 was obtained at the east end of the north sidewall, from the capillary zone, at a depth of approximately eight feet BGS. Soil sample LMRV-GES-3 was obtained from

the west end of the north sidewall, from the capillary zone, from a depth of approximately eight feet BGS. Soil sample LMRV-GES-4 was obtained from the center of the north sidewall at a depth of approximately 5.5 feet BGS. The spacing between the samples was approximately six feet. An analysis of the three soil samples for TPH indicated that concentrations of TPH were not measured above the detection limit of the laboratory equipment and methods used.

Soil was removed from the excavation to the west end of the service bays with a vertical wall cut flush with the foundation of the building. Further excavation to the east was not possible without undermining the building. Three soil samples were obtained from the east sidewall of the excavation. Soil sample LMRV-GES-5 was obtained from the north end of the east sidewall, approximately five feet south of soil sample LMRV-GES-2 at a depth of approximately 8.5 feet BGS (the capillary zone). Soil sample LMRV-GES-6 was obtained at the south end of the east sidewall, approximately nine feet south of soil sample LMRV-GES-5 at a depth of approximately nine feet BGS (the capillary zone). Soil sample LMRV-GES-7 was obtained from the center of the east sidewall at a depth of approximately 5.5 feet BGS.

An analysis of soil sample LMRV-GES-5 for TPH indicated that concentrations of TPH were not measured above the detection limit of the equipment and methods used. An analysis of soil sample LMRV-GES-6 for TPH indicated a TPH concentration of 920 mg/kg. Odors indicative of oil were detected in the sample, therefore, this soil sample was also analyzed for total recoverable petroleum hydrocarbons (TRPH) using EPA Method 418.1. A review of the laboratory results indicated a TRPH concentration of 27,000 mg/kg. Soil sample LMRV-GES-7 was analyzed for TPH with a concentration of 27 mg/kg detected.

Three soil samples were obtained from the south sidewall of the excavation. Soil sample LMRV-GES-8 was obtained at the east end of the south sidewall, approximately six feet west of soil sample LMRV-GES- 6 at a depth of approximately 8.5 feet BGS (the capillary zone). Soil sample LMRV-GES-9 was obtained from the west end of the south sidewall, approximately six feet west of soil sample LMRV-GES-8, at a depth of approximately 8.5 feet BGS (the

capillary zone). Soil sample LMRV-GES-10 was obtained from the center of the south sidewall at a depth of approximately 6.5 feet BGS.

An analysis of the soil samples indicated that soil sample LMRV-GES-8 possessed a TPH concentration of 470 mg/kg; soil sample LMRV-GES-9 possessed a TPH concentration of 590 mg/kg; and soil sample LMRV-GES-10 did not possess a TPH concentration above the detection limit of the laboratory equipment and methods used.

The excavation was extended to the west several feet where a sewer pipe was encountered running in a north-south direction and bounding the excavation on the west side. The pipe was estimated to be buried at a depth of approximately five to six feet BGS. The existence of the sewer pipe was not identified by the representative of the responsible sewer authority. No further excavation was attempted to the west to avoid causing damage to the pipe.

Three soil samples were obtained from the west sidewall. Soil sample LMRV-GES-11 was obtained from the south end of the west sidewall, approximately six feet north of soil sample LMRV-GES-9, at a depth of approximately 8.5 feet BGS (the capillary zone). Soil sample LMRV-GES-12 was obtained from the north end of the west sidewall, approximately six feet north of soil sample LMRV-GES-11, at a depth of approximately 8.5 feet BGS (the capillary zone). Soil sample LMRV-GES-13 was obtained from the center of the west sidewall at a depth of approximately 6.5 feet BGS.

An analysis of the three soil samples for TPH indicated that soil sample LMRV-GES-11 possessed a TPH concentration of 980 mg/kg; soil sample LMRV-GES-12 possessed a TPH concentration of 140 mg/kg; and soil sample LMRV-GES-13 did not possess TPH at a concentration above the detection limit of the laboratory equipment and methods used.

Soil samples LMRV-GES-11 and LMRV-GES-12 were also analyzed for TRPH by EPA Method 418.1 with 3,300 mg/kg and 450 mg/kg detected, respectively.

The TPH laboratory results are presented on "Table I, Summary of Laboratory Test Results, Fuel Tank Excavation". The TRPH laboratory test results are presented on Table II, Summary of Laboratory Test Results, Fuel Tank Excavation".

The locations of the soil samples are presented on the Site Excavation Plan, Figure No. 3 and on the excavation cross-sections presented on Figure Nos. 4 and 5. The laboratory test results are presented in Appendix C, Excavation Laboratory Results.

Further excavation of soil from the area of the former location of the fuel UST was terminated at this time pending excavation of soil from the area of the former location of the three oil USTs and further analysis of the results obtained from the completed excavation activities.

After stopping any further soil removal from the first excavation at about noon, the excavation contractor moved to the former location of the oil USTs and proceeded to excavate a trench in the center of the former excavation. Within fifteen minutes, it became apparent that soil impacted with petroleum hydrocarbons had been placed into the excavation following the removal of the three 550 gallon tanks some three years earlier. It was decided by the client that soil removal in this area should be performed the same as in the first excavation.

Starting at around noon, soil was removed from the area formerly containing the three oil USTs. The excavation measured approximately ten feet north-south and 20 feet east-west, and extended to a depth of approximately 13 feet BGS. These dimensions appeared to roughly correspond to the dimensions and location of the original excavation created by the tank removal contractor when the tanks were removed. At about 1800 hours the soil removal was stopped pending the results of soil sampling to be performed on Saturday.

Friday, March 13, 1992. The excavation contractor moved the soil from the fuel UST excavation and stockpiled the soil on asphalt at the southwest corner of the property. This stockpile, identified as Soil Stockpile No. 3 on Figure No. 6, Soil Stockpiles, consisted of approximately 100 cubic yards of soil.

Saturday, March 14, 1992. As a result of logistical constraints, the client decided to have the fuel UST excavation backfilled before proceeding with additional excavation activities. The excavation contractor lined the bottom of the excavation with Typar filter fabric and placed three-quarter inch gravel on the filter fabric to a depth of approximately six to seven feet BGS. Typar filter fabric was placed on top of the gravel and the remaining excavation was backfilled to the ground surface with clean imported fill soil.

While backfilling of the fuel UST was being completed, the bottom of the oil UST excavation was being mucked out in preparation for soil sampling. Between thursday night and Saturday morning, groundwater accumulated in the bottom of the excavation and measured a depth of approximately two feet. While the surface of the water was approximately 11 feet BGS, it was apparent that the source of the water was a perched groundwater zone observed on the top of a heavily cemented zone of gravels, cobbles and boulders, encountered at a depth of approximately 6.5 feet BGS. An approximate one foot thick layer of organic soil was observed on top of the cemented zone with water seeping from this organic layer. No water was observed to be flowing from anywhere in the cemented layer.

Following removal of soil that had sloughed into the excavation, three-quarter inch gravel was placed into the excavation to a depth of approximately ten feet BGS to prevent any further sloughing of soil into the water.

The collection of soil samples started on the north sidewall with soil sample LMRV-OES-1 obtained from the east end of the north sidewall, approximately six feet west of the east end of the excavation, at a depth of approximately eight feet BGS, the depth estimated to be the capillary zone from the work performed in the previous excavation. In this excavation, however, this depth was approximately 1.5 feet below the surface of the cemented zone, and no water was observed in this area. Collection of the soil samples from the cemented layer was extremely difficult as penetration with any mechanical means met with great resistance.

Soil sample LMRV-OES-2 was obtained from the center of the east sidewall, approximately five feet south of soil sample LMRV-OES-1, at a depth of approximately eight feet BGS, from the cemented layer. Two soil samples were obtained from the south sidewall, both at a depth of approximately eight feet BGS, from the cemented layer. Soil sample LMRV-OES-3 was obtained approximately six feet west of soil sample LMRV-OES-2 and soil sample LMRV-OES-4 was obtained approximately thirteen feet west of soil sample LMRV-OES-3.

Analysis of these four soil samples for TRPH using EPA Method 418.1 indicated that these soil samples did not possess TRPH concentrations above the detection limit for the laboratory equipment and methods used. These results were not unexpected due to the high degree of cementation observed in this layer.

Based on observations of the excavation, such as groundwater seeping along the horizontal surface of the cemented zone, and a review of the laboratory data it became evident that the organic layer on the horizontal surface (contact) of the cemented zone was the likely location to observe the potential worst case impact created by the petroleum hydrocarbons in the area of this excavation. Some organic soil was observed in the north sidewall at a depth ranging from four to 6.5 feet, with a concentration of organic material observed between 5.5 and 6.5 feet. Soil sample LMRV-OES-5 was obtained from the north sidewall at a depth of approximately five feet BGS, directly above soil sample LMRV-OES-1. An analysis of this sample for TRPH indicated a concentration of 15 mg/kg. Soil sample LMRV-OES-6 was obtained between soil samples LMRV-OES-1 and LMRV-OES-5, at a depth of slightly more than six feet BGS. This soil sample was obtained from the organic layer, directly on top of the cemented layer. An analysis of this soil sample indicated a TRPH concentration of 8,200 mg/kg, supporting the hypothesis that the petroleum hydrocarbons had flowed along the upper surface of the cemented layer.

Following confirmation of the presence of petroleum hydrocarbons on the surface of the cemented layer, soil sample LMRV-OES-7 was obtained from the center of the east sidewall at a depth of slightly more than 5.5 feet BGS. An analysis of this sample indicated that the sample

did not possess concentrations TRPH above the detection limit of the laboratory equipment or methods used.

Soil samples LMRV-OES-8 and LMRV-OES-9 were obtained from the south sidewall at depth of approximately 5.5 feet BGS, from the organic layer on top of the cemented layer. Soil sample LMRV-OES-8 was obtained from a location directly above the location of soil sample LMRV-OES-3 and soil sample LMRV-OES-9 was obtained from an area directly above soil sample LMRV-OES-4. An analysis of the two soil samples indicated that soil sample LMRV-OES-8 did not possess concentrations of TRPH above the detection limit for the laboratory equipment and methods used and that soil sample LMRV-OES-9 possessed a TRPH concentration of 260 mg/kg.

At this time the excavation was extended around the corner of the service bays in the direction of the former location of the fuel UST. It appeared that the petroleum hydrocarbon impact extended to the south end of the previous excavation, therefore it was decided to connect the oil UST excavation with the now backfilled fuel UST location. Figure No. 3, Site Excavation Plan depicts the locations of the excavations and the connection that was made between the two.

From observations made during the collection and analysis of the soil samples, it was decided to remove the overburden soil from between the two excavations to a depth of approximately five feet and treat the soil as potentially clean. This approximate 80 cubic yards of soil was transported to the southwestern corner of the property and placed into a stockpile designated Soil Stockpile No. 2. The location of the stockpile is presented on the Stockpile Location Map, Figure No. 6. Following removal of the overburden soil, potentially impacted soil was removed to a depth of approximately 10 feet BGS. This soil was placed, along with soil from the oil UST location, on a stockpile located at the southwestern corner of the property. The total volume of this stockpile, designated Soil Stockpile No. 4 was estimated to be approximately 200 cubic yards.

Following removal of the soil to below the depth of the groundwater, soil sample LMRV-OES-10 was obtained from the east sidewall, approximately eight feet BGS, directly beneath the foundation of the service bays. An analysis of this soil sample indicated a TRPH concentration of 15,600 mg/kg. Further excavation in this direction was not possible at this time without undermining the service bay structure.

Soil sample LMRV-OES-11 was obtained from the west sidewall at a location approximately across from the location of soil sample LMRV-OES-10. The soil sample was obtained from a depth of approximately eight feet BGS (the capillary zone). An analysis of the sample indicated a TRPH concentration of 16,000 mg/kg.

Soil sample LMRV-OES-12 was obtained from the west sidewall, approximately nine feet west of soil sample LMRV-OES-9, at a depth of approximately eight feet (the capillary zone). An analysis of this sample indicated a TRPH concentration of 18,000 mg/kg.

Soil sample LMRV-OES-13 was obtained from the west sidewall, approximately nine feet north of soil sample LMRV-OES- 12, at a depth of approximately eight feet BGS (the capillary zone). An analysis of this soil sample indicated a TRPH concentration of 23,000 mg/kg.

Further excavation to the west was not attempted at this time due to the presence of a sewer pipeline.

The last excavating to be performed at the site in this phase was completed on the north sidewall of the oil UST excavation. Approximately three feet of the sidewall was removed in an attempt to estimate the possible extent of the TRPH impact on the surface of the cemented layer in that area. Soil sample LMRV-OES-14 was obtained from the north sidewall, approximately six feet east of the corner of the service bay structure, at a depth of approximately six feet. An analysis of this sample indicated a TRPH concentration of 8,000 mg/kg, relatively consistent with the concentration observed in soil sample LMRV-OES-6, previously obtained from this sidewall.

Soil sample LMRV-OES-15 was obtained from the north sidewall, approximately six feet east of soil sample LMRV-OES-14, from a depth of approximately six feet BGS. An analysis of this soil sample indicated a TRPH concentration of 7,700 mg/kg.

Further excavation in the direction of the service bays was not attempted at this time due to the risk of undermining the structure.

The TRPH laboratory results are presented on "Table III, Summary of Laboratory Test Results, Oil Tank Excavation".

The locations of the soil samples are presented on the Site Excavation Plan, Figure No. 3 and on the excavation cross-sections presented on Figure Nos. 4 and 5. The laboratory test results are presented in Appendix C, Excavation Laboratory Results.

Sunday, March 15, 1992. After completing the excavation and soil sampling activities at approximately 2130 hours the night before, the client opted to have the oil UST excavation backfilled to the ground surface with gravel and clean fill soil and pave the excavations at the surface with asphaltic concrete. The excavation contractor placed gravel to a depth of approximately eight to ten feet BGS and placed Typar filter fabric on top of the gravel. Clean fill soil was then placed and compacted into the excavation and the entire excavated area was paved over with asphaltic concrete. These services were completed by the end of the day with normal operations resuming at the facility the following day.

SUMMARY OF FIELD ACTIVITIES AND LABORATORY RESULTS

Soil Excavation

Overburden and hydrocarbon impacted soil was removed at the site from March 11, 1992 through March 15, 1992. Pre-excavation plans were to excavate trench through the center and around the perimeter of each former UST location, however, conditions encountered at the site necessitated the excavation and removal of soil from each of the former UST locations. The presence of the service bay structure and a sewer pipeline limited the extent to which soil could be excavated. In general, where possible, soil was removed until TPH or TRPH concentrations below the cleanup level were encountered.

Soil samples obtained from the north sidewall of the former location of the fuel UST indicate that the extent of the hydrocarbon impact to the soil in that direction had been reached during the excavation activities. Soil samples obtained from the east and south sidewall of the former location of the oil USTs indicates that in general the excavation approached the limit of the hydrocarbon impact in those directions.

Soil samples obtained from the east excavation sidewall along the service bay structure and along the north excavation sidewall of the former location of the oil USTs indicate that both TPH and TRPH concentrations above the cleanup level exist under the corner of the service bay structure. The zone of this impact appears to be generally limited to the capillary zone, a thickness of approximately one foot on the east sidewall and to a zone approximately one half to one foot thick on top of the cemented layer, at a depth of approximately 5.5 to 6.5 feet BGS. The dip of the cemented layer trends in the area of the former oil USTs towards the northwest, in the direction of the former location of the fuel UST.

Soil samples obtained from the west sidewall of both excavations indicate that both TPH and TRPH concentrations in the capillary fringe along that sidewall exceed the cleanup level established for the site. Additional excavation in that direction would have been performed a had a sewer pipeline not bounded the excavation on that side.

Both excavations were backfilled with gravel, Typar filter fabric, and clean import soil. Following completion of the backfilling, the entire excavation area was paved with asphaltic concrete.

Stockpile Disposition

During May 1988, four underground storage tanks (USTs) were excavated and removed from the subject site. Excavation work performed by the contractor generated a soil stockpile of approximately 30 cubic yard capacity from the former gasoline UST location. This soil was stockpiled on-site in the southwest corner of the property. This stockpile was designated as Soil Stockpile #1.

During the performance of the soil assessment and mitigation activities by HALLIBURTON NUS, three soil stockpiles were generated as the result of the excavation of soil from the former fuel tank excavation, a former used and new oil tank excavation (originally containing three tanks), and the area between the two tanks excavations. The approximately 80 cubic yards of soil excavated from the vadose zone between the two former UST locations was identified as Soil Stockpile No. 2. Approximately 100 cubic yards of soil excavated from the former fuel UST location is identified as Soil Stockpile No. 3. Soil Stockpile No. 4, comprising approximately 200 cubic yards of soil was generated from the excavation of soil from the former used and new oil UST location. The soil stockpiled at the site was placed on an asphalt surface and covered with visqueen pending its disposal following regulatory guidelines. The approximate location of the soil stockpiles is depicted on the Stockpile Location Map, Figure 6.

On March 24, 1992, HALLIBURTON NUS personnel obtained 19 soil samples from the four soil stockpiles. The soil samples were randomly selected from the stockpiles following the soil sampling protocol as outlined in the County of San Diego 1992 SA/M Manual, Soil Sampling, Section 3, pages 3 through 7. Three soil samples were obtained from Stockpile No. 1, containing approximately 20 cubic yards of soil (see Figure 6). Four soil samples were obtained from Soil Stockpile No. 2, containing approximately 80 cubic yards of soil and four soil samples were obtained from Soil Stockpile No. 3, containing approximately 100 cubic yards of soil (see Figure No. 6). Eight soil samples were obtained from Soil Stockpile No. 4, containing approximately 200 cubic yards of soil (see Figure No. 6). The soil samples were obtained using an Alconox washed and tap water rinsed stainless steel hand auger, placed in laboratory supplied glassware, and delivered to an on-site California certified mobile laboratory.

Review of laboratory analyses. The soil samples from Soil Stockpile No. 1 were analyzed for total petroleum hydrocarbons (TPH) by the DHS Method. A review of the results indicates that all three samples did not possess TPH concentrations above the laboratory detection limit of 10 milligrams/kilogram (mg/kg). The soil samples from Soil Stockpile No. 2 were analyzed for total recoverable petroleum hydrocarbons (TRPH) by EPA Method 418.1 A review of the laboratory results for these samples indicated TRPH concentrations of 156 mg/kg, 82 mg/kg, 73 mg/kg, and 312 mg/kg. The soil samples from Soil Stockpile No. 3 were analyzed for TPH by the DHS Method. A review of the laboratory results indicated that three of the samples possessed TPH concentrations of less than the laboratory detection limit of 10 mg/kg while one sample possessed a TPH concentration of 153.2 mg/kg. The sample possessing the TPH concentration of 153.2 mg/kg was analyzed for benzene, toluene, xylene, and ethylbenzene (BTXE). A review of the laboratory results indicates concentrations of BTXE of 1.190 mg/kg, .410 mg/kg, 1.390 mg/kg, and 1.180 mg/kg, respectively (EPA Method 8020, modified for DHS).

The soil samples from Soil Stockpile No. 4 were analyzed for TRPH by EPA Method 418.1. A review of the laboratory results indicates TRPH concentrations ranging from 156 mg/kg to 24,700 mg/kg. The soil sample possessing a TRPH concentration of 24,700 mg/kg was

analyzed for Title 22 Metals, purgeable halocarbons (EPA Method 8010), total PCBs (EPA Method 8080), cyanide, and flashpoint. For potential disposal purposes, an additional soil sample was obtained on March 31, 1992 from the location of the highest measured TRPH concentration. This sample was analyzed for pH and sulfide. Copies of the laboratory data sheets are provided in Appendix D.

Please note that in addition to the analyses performed on the soil stockpile samples, one soil sample from the gasoline tank excavation was analyzed for BTXE and organic lead. This sample, possessing the highest measured TPH concentration of the soil samples analyzed from the excavation or the stockpiles, possessed a TPH concentration of 980 mg/kg. A review of the laboratory results indicates BTE concentrations of less than the laboratory detection limit of 1.0 ug/kg and a xylene concentration of 585 ug/kg. The organic lead concentration was less than the laboratory detection limit of 0.5 mg/kg (DHS Method). Copies of these laboratory data sheets are provided in Appendix D.

The TRPH laboratory data for the soil stockpiles is provided on Table IV, Summary of Laboratory Test Results, Soil Stockpile. BTXE laboratory results for a soil sample from the fuel tank excavation and from Soil Stockpile No. 2 are provided on Table V, Summary of Laboratory Test Results, Fuel Tank Excavation and soil Stockpile. Laboratory test results for Title 22 metals on a soil stockpile sample are presented on Table VI, Summary of Laboratory Test Results, Soil Stockpile. Miscellaneous laboratory tests required for soil disposal are presented on Table VII, Summary of Laboratory Test Results, Soil Stockpile.

Stockpile statistics. Statistical analysis performed on the three soil stockpiles indicated that Stockpile Nos. 1, 2, and 3 were suitable for disposal at a Class III Landfill while Stockpile No. 4 was not suitable for Class III Landfill disposal.

Based on the results of the analysis of the soil samples obtained from the four soil stockpiles located on the subject site, La Mesa RV Center requested Hazardous Materials Management Division (HMMD) and Regional Water Quality Control Board (RWQCB) approval for the

disposal of Soil Stockpile Nos. 1, 2, and 3, totaling an estimated 200 cubic yards, at the County of San Diego Class III Landfill at Sycamore Canyon. A "Request for Class III Landfill Disposal of Hydrocarbon Contaminated Soil for 7601 Alvarado Road, La Mesa, California" was prepared and submitted to the HMMD and RWQCB on April 27, 1992.

Following an extended period of time in which La Mesa RV Center waited for permission to dispose of the three soil stockpiles at the Sycamore Canyon Class III Landfill, La Mesa RV Center elected to transport all four soil stockpiles to the Class II Landfill located at the Southwest Disposal facility in Somerton, Arizona. On May 25, 1992, the soil in all four stockpiles was transported and recycled at the Southwest Disposal facility. Copies of the Non-hazardous Waste Data Forms and the receipts for disposal are provided in Appendix E.

SITE GEOLOGY AND HYDROGEOLOGY

Geology

The subject site is located in Mission Valley, adjacent to Alvarado Creek. Located at an elevation of approximately 430 feet mean sea level (MSL), the site has been mapped in "Bulletin 200, Geology of the San Diego Area, California" as consisting of soils of the Poway Group, specifically the Stadium Conglomerate Formation. This formation, consisting mostly of non-marine sandstone and coarse cobble conglomerate is characterized by a cobble conglomerate with a dark yellowish brown coarse-grained sandstone matrix. Dispersed lenses of fossiliferous crossbedded sandstone are present as is general cementation of the soil matrix.

Soil encountered during the performance of the assessment and mitigation effort generally consisted of three to five of feet soils ranging from sandy to clayey in character. In the area of the former location of the oil USTs, this soil was underlain by organic soils possessing a silty fine sand matrix. This organic layer was observed to contain visible pieces of decomposed stems and leaves. This organic layer, generally one foot in thickness was underlain by heavily cemented gravels, cobbles, and boulders. Their appeared to be a general dip of the cemented

layer in a northwesterly direction. The cemented layer was generally encountered at a depth of approximately 6.5 feet BGS and extended to the maximum depth explored, approximately 13 feet BGS.

The area between the two excavations was characterized by what appeared to be a bisection of the previously described soil layers. Erosion of the formational material appeared to occur in an east-west trending direction, the general direction of flow of Alvarado Creek. The channel created by the erosion of the formational materials was then apparently filled with unconsolidated alluvial material consisting generally of coarse sand, gravel, cobbles, and boulders. This material was present from a depth of approximately five feet BGS to the maximum depth explored, approximately ten feet BGS.

The area of the former location of the fuel UST was characterized by a continuation of the channel and unconsolidated material observed in the areas between the two excavations.

The soils discussed in this report are depicted on the profiles of the locations of the soil samples. These profiles are provided on Cross-Sections (A-A' and B-B'), Figure No. 4; and on Cross-Sections (C-C' and D-D'), Figure No. 5.

Hydrogeology

A review of the "Comprehensive Water Quality Control Plan, Basin 9", indicates that the subject site is located in the Lower Sweetwater hydrographic subunit of the San Diego hydrographic unit. This RWQCB document dated 1975, designates the groundwater in this area as having beneficial uses for municipal and domestic supply, agricultural supply, and industrial uses. Potentially beneficial uses of this water are for industrial process water and for groundwater recharge.

General cleanup levels for soil and groundwater in beneficial groundwater use areas have been established by the RWQCB. The cleanup level for TPH in soil is generally 100 mg/kg, and 1.0

ug/l for benzene in groundwater. While these are general guidelines, each case is site specific and other levels may be established by the RWQCB.

Groundwater was generally encountered in the area of the former location of the oil USTs in a perched condition, generally seeping along the surface of the cemented layer. Groundwater was not generally observed in the cemented layer.

Groundwater in the area of the former location of the fuel UST was encountered at a depth of approximately 8.5 to 9 feet BGS. The capillary zone was generally observed at a depth ranging between 8 and 9 feet BGS. Soil of the capillary zone was generally characterized by unconsolidated materials consisting of coarse sands, gravel, cobbles, and scattered boulders.

Groundwater level measurements suggesting a general groundwater flow could not be estimated with the available data; however a general flow of groundwater to the northwest towards Alvarado Creek would be anticipated. The presence on cemented conglomerate material and the observation of groundwater at different depths would suggest the area of the site generally possesses areas of perched groundwater at different depths.

CONCLUSIONS

1. Soil and groundwater at the site was impacted by the release of petroleum hydrocarbons (gasoline, diesel, and new and used oil) on the site. Vadose and capillary zone soils were impacted as the hydrocarbons migrated vertically until they reached the groundwater surface. Soil impacted with petroleum hydrocarbons remain beneath the service bays and to the capillary soils to the west of the excavation.

2. Soil possessing TPH and TRPH concentrations above the cleanup level of 100 mg/kg were encountered and removed at the site with the exception of the two areas mentioned in item No. 1. The remaining volume of hydrocarbon impacted soil in these areas is unknown at this time.

3. Groundwater in the area of the excavations appears to have been impacted with petroleum hydrocarbons. The degree of this impact is unknown at this time.

4. Soil totaling approximately 400 cubic yards was excavated and stockpile on-site. Following regulatory protocol, the soil was statistically characterized and eventually transported off-site under non-hazardous waste data forms to the Southwest Disposal facility in Somerton, Arizona. The soils are reportedly being landfarmed and recycled.

5. The excavations created during the soil assessment and mitigation activities were backfilled with gravel and clean fill and paved over at the ground surface with asphaltic concrete.

RECOMMENDATIONS

1. Conduct a meeting with the appropriate regulatory representatives and discuss the results of the mitigation effort and additional work required at the site to complete the mitigation effort. Prepare and present a workplan to regulatory specialists that details the remaining services to be performed.

2. Perform an additional assessment of the extent of petroleum hydrocarbon impact to the soil and the groundwater at the site. This assessment would likely consist of the excavation of backhoe pits and the collection of soil samples to the west of the previously performed excavation activities. In general, this type of soil sampling will be necessary as a result of the cemented soil conditions and the presence of the hydrocarbon impact in a fairly thin capillary zone. Groundwater samples will likely be obtained through the installation of shallow temporary groundwater monitoring wells. The type of drillrig used to advance these wells must be capable of penetrating difficult soils comprised of cemented gravels, cobbles, and boulders.

3. Soil and groundwater samples should be analyzed for TPH, BTXE, and TRPH.

4. Prepare a final report summarizing the results of the additional assessment services performed following the submission of this report, as appropriate.

REPORT LIMITATIONS

This interim report has been prepared for the use of the La Mesa RV Center and for review by Mr. James Munch of the San Diego Regional Water Quality Control Board and Mr. Lars Skinner of the San Diego County Hazardous Materials Management Division.

The client should recognize that the assessment and mitigation effort including soil excavation and limited sampling and laboratory testing described in this report should not be interpreted as a characterization and statistical evaluation of the entire site but is intended to provide confirmation of the effort to assess and mitigate the hydrocarbon impact to the soil at the site created by the release of petroleum hydrocarbons from the USTs formerly located on the site. The assessment and mitigation of hydrocarbon impacts in the area of the former location of the USTs does not preclude the possibility of the presence of hazardous materials in other areas of the site.

The information obtained in assessing and mitigating the hydrocarbon impacts at the site can vary at different times and different locations and the interpolation or extrapolation of such data results in some degree of uncertainty. Additionally, the client should recognize that regulatory agencies possess the final authority relative to site closures and may require the performance of additional services beyond those proposed or performed and described in this report.

Therefore, the conclusions and recommendations presented in this report should only be considered conclusive with respect to the information contained herein. No guarantee of the results presented in this report is implied or intended. All services performed were conducted in accordance with the local standard of care in the geographic region at the time the services were rendered.

NOTICE: You are hereby notified that on 2/23/88, [illegible] Hazardous Materials Specialist of County Department of Health Services, conducted an inspection for the removal and/or abandonment of FOUR underground storage tanks of hazardous substances. A summary of conditions found is noted as follows:

[ ] No indication of soil or groundwater contamination apparent this date. Excavation may be backfilled.

[X] The conditions noted below must be reported and corrected in accordance with Chapters 6.5 and 6.7 of the California Health and Safety Code and Chapters 9 and 10 of the San Diego County Code.

[ ] Hazardous substance/waste is ponded in the excavation. Immediately take steps to remove the ponded hazardous liquid from the excavation. This liquid is a hazardous waste that shall be properly transported, under manifest, by a licensed hazardous waste hauler to a licensed recycling or disposal facility.

[X] Contaminated soil and/or contaminated groundwater is suspected in the excavation. Determining the extent and impact of this contamination and completing any required clean-up is the responsibility of the tank owner/operator. Within 5 work days, the tank owner/operator or his agent must submit a written UNAUTHORIZED RELEASE REPORT to the Department of Health Services including all of the following information that is known at the time of filing the report:

a. Describe the type, quantity and concentration of the hazardous substance released.
b. Provide the results of all investigations completed at this time to determine the extent of soil, groundwater, or surface water contamination due to the release.
c. Describe the method of cleanup implemented to date, proposed cleanup actions, and approximate costs of actions taken to date.
d. Indicate the method and location of disposal of the released hazardous substance and any contaminated soils or groundwater or surface water. (If any contaminated soil/water is hauled off-site, include copies of the hazard waste manifests).
e. Include the tank operator's name and telephone number, the name and telephone number of any consultants retained, and a projection of proposed activity schedule.

Subsequent mitigation actions will be discussed upon review of the submitted Report and consultation with other appropriate agencies.

APPENDIX B

WORKPLAN

December 11, 1991

Mr. James Buckner
La Mesa RV Center
7601 Alvarado Road
La Mesa, California 92041

Attention: Mr. James Buckner

Subject: Environmental Engineering Services
Relating to Unauthorized Release
Case Number T0427/H02651-001
Workplan

Dear Mr. Buckner:

In response to your request, HALLIBURTON NUS Environmental Corporation (HALLIBURTON NUS) is pleased to submit this Workplan proposing environmental engineering services relating to the unauthorized release (UAR) at the La Mesa RV Center. La Mesa RV is located at 7601 Alvarado Road in La Mesa, California.

The information presented below summarizes our understanding of the circumstances associated with the UAR at the site and proposes a scope of work to address these circumstances.

TECHNICAL UNDERSTANDING AND APPROACH

A representative of HALLIBURTON NUS previously visited the subject site with Mr. Chris Tomlin of Horizon Hoist Company of San Diego. During the survey of the site, Mr. Tomlin indicated that Alm Services, a local tank removal contractor, had removed four underground storage tanks (UST) from the site on February 22, 1988. The four UST's consisted of one 550 gallon used oil tank, two 550 gallon new oil tanks, and one 2000 gallon regular leaded gasoline tank.

While surveying the site, a concrete patch was observed at the location of the former gasoline UST at the southwest corner of the north service garage. In addition, an asphalt patch was observed at the location of the former oil UST on the south side of the southwest corner of the north service garage. An extensive asphalt parking and driveway complex surrounds the service

Quality assurance/control procedures would be followed during all excavation and soil sampling activities. Soil samples would be placed in laboratory prepared containers and transported to an on site mobile laboratory for analytical testing. Chain-of-custody documentation would be provided for all soil samples. - Hours required to perform this task are included as part of the excavation activity.

- Segregate soil. Soil excavated during the trenching activities at each former UST location according to origin and by estimates of TRPH and TPH concentrations. The soil would be stockpiled on-site and placed on, and covered with, visqueen in accordance with regulatory protocol. The client would be responsible for disposition of the stockpiled soil.

- Provide health and safety monitoring during all trenching/excavation activities.

- Fill trenches with rock/gravel and replace asphalt and concrete at ground surface, whichever is appropriate.

- Prepare a report summarizing the results of the field activities and provide recommendations for additional environmental services, if required.

- Provide consultation with the client and representatives of the regulatory agencies following completion of the field activities. The purpose of the consultation would be to present the results obtained during the performance of the field activities.

It should be noted that the scope of services referenced above is for a first phase exploration of the possible horizontal and vertical extent of the hydrocarbon impacts to the soil at the site. Based on discussions with regulatory representatives, additional services, consisting of monitoring of the groundwater will be required by regulatory agencies. The nature of the groundwater monitoring activities will be dependent upon the results obtained from the first phase of the exploration activities, consent.

- Notify Underground Service Alert as required by law and obtain a "Ticket Number" at least 48 hours prior to the commencement of excavation activities.

- Sawcut asphalt and concrete in the areas designated for excavation of the trenches.

- Excavate trenches perpendicular to the perimeter of the excavation sidewalls in an attempt to identify the contact between the fill and formational soils. Based on the information obtained during the excavation of the perpendicular trenches, perimeter trenches would be excavated parallel to each sidewall, where possible. Soil samples would be collected at various depths as necessary to aid in the estimation of the extent of possible hydrocarbon impact to the soil. Based on available information, it is estimated that the trenches would extend to the depth of groundwater or a depth of approximately 13 feet below the ground surface, whichever is less.

- Provide site security either with barricades or trench plates.

- Perform vapor headspace surveys on soil samples collected from the trenches at each former UST location. An organic vapor analyzer (OVA) would be used to attempt to obtain indicators of the presence of petroleum hydrocarbons. It should be noted that use of the headspace survey is generally more effective on soil impacted by gasoline than on soils containing used oil. - Hours required to perform this task are included as part of the excavation activities as referenced above.

- Obtain soil samples. Soil samples obtained throughout the performance of the field activities would be subjected to analysis by an on-site California Department of Health Services certified mobile laboratory. The results of the laboratory analysis would be used to guide additional trenching activities and provide analytical confirmation of the possible extent of hydrocarbon impact to the soil. It is anticipated that approximately 12 soil samples would be obtained and analyzed for the presence of TRPH using EPA Method 418.1. Approximately 12 additional soil samples would be obtained and analyzed for the presence of total petroleum hydrocarbons (TPH) using EPA Method DHS-8015. One soil sample from the used oil trenching would be analyzed for solvents by EPA Test Method 8010 while a soil sample from the gasoline UST trenching would be analyzed for benzene, toluene, xylene, and ethylbenzene (BTXE) by EPA Test Method 8020-modified.

On May 14, 1988, Mr. Alm reportedly obtained three additional soil samples from the oil tank excavation. A review of the laboratory data for these three soil samples indicates that TRPH concentrations were 250, 340, and 930 mg/kg. Benzene, toluene, xylene and solvent concentrations were below detection limits.

Based on the information summarized above, it is the understanding of HALLIBURTON NUS that the client's objective is to obtain regulatory site closure of the UAR reported for the site. In accordance with current regulatory guidelines, the horizontal and vertical extent of hydrocarbon impacts to the soil at the site must be estimated and potential impacts to groundwater must be addressed. In the event that hydrocarbon impacts in excess of cleanup standards established by regulatory agencies are encountered, mitigation of this impact may be required by regulatory officials. HALLIBURTON NUS would recommend methods for the mitigation and could provide the necessary equipment and expertise to accomplish any required cleanup.

SCOPE OF SERVICES

Based on our understanding of your requirements as conveyed above, we propose to provide environmental engineering services on behalf of La Mesa RV for the purpose of obtaining regulatory closure of the UAR for the subject site. The scope of services proposed is designed to provide a cost effective approach to attempt to satisfy the goal of site closure. However, following regulatory review of the results of the first phase of services, the performance of additional services may be required.

- Provide consultation including a review of the proposed workplan with the appropriate representatives of the DHS-HMMD and the San Diego Regional Water Quality Control Board (RWQCB) prior to the commencement of the field activities.

- Prepare a Health and Safety Plan that would identify potential health and safety hazards anticipated during the performance of the excavation activities. The plan would be prepared prior to the commencement of field activities and would be reviewed by all field personnel.

- Obtain the services of an underground utility locating service and review available client "As Built" drawings in an effort to identify the presence of underground utilities in proximity to the proposed excavations.

QA/QC DIRECTOR

QUALITY CONTROL TERMINOLOGY

•LCS - LABORATORY CONTROL STANDARD. REPORTED AS % RECOVERY OF AN INDEPENDENT STANDARD CARRIED THROUGH ALL SAMPLE PREPARATION PROCEDURES TO VERIFY METHOD PERFORMANCE. ACCEPTABLE RANGE IS BASED ON HISTORICAL LABORATORY CONTROL DATA, BUT IS GENERALLY WITHIN A 80%-120% RECOVERY RANGE.
•SPIKE - ENVIRONMENTAL SAMPLE IS MATRIX SPIKED WITH METHOD COMPOUNDS AND % RECOVERY OF CONCENTRATION SPIKED INTO SAMPLE IS CALCULATED. REPORTED AS % RECOVERY. ACCEPTABLE RANGE FOR "NORMAL MATRIX SAMPLE" IS BASED ON HISTORICAL LABORATORY CONTROL DATA, BUT IS GENERALLY WITHIN A 75%-125% RECOVERY RANGE.
•SURROGATES - COMPOUNDS REPRESENTATIVE OF A GROUP OF COMPOUNDS. SURROGATES ARE SPIKED INTO ENVIRONMENTAL SAMPLES AND % RECOVERY OF CONCENTRATION SPIKED IS CALCULATED AND REPORTED. ACCEPTABLE RANGE VARIES BETWEEN

ON SAMPLE MATRIX AND ANALYSIS METHOD.

SOUTHWEST DISPOSAL

RECEIPT OF SOILS AND LANDFARM COMMENCEMENT ADVISORY LETTER

May 28, 1992

To Whom It May Concern:

Soils received by Southwest Disposal on 5-21-92, from La Mesa R.V. Center at 7601 Alvarado Road in La Mesa CA are currently in the process of being landfarmed. Once these soils have reached below California non-hazardous levels (non-detect per STLC, TTLC) they will be used for cover material and roadbase, thus establishing them as a recycled and reused solid waste.

Test results of your soils current level can be made available upon your request. There is a $250.00 charge for testing. You may contact our Montebello office for information concerning testing of landfarmed soils at (213) 724-3918.

The aforementioned soils pertain to Non-Hazardous Data Form numbers: 11283, 11285, 11276, 11278, 11286, 11279, 11281, 11282, 11280, 11291, 11289, 11277.

Sincerely,

Harold A. Arsenian
Hazardous Waste Coordinator

SOUTHWEST DISPOSAL

RECEIPT OF SOILS
AND
LANDFARM COMMENCEMENT
ADVISORY LETTER

May 28, 1992

To Whom It May Concern:

Soils received by Southwest Disposal on 5-22-92, from La Mesa R.V. Center at 7601 Alvarado Road in La Mesa CA are currently in the process of being landfarmed. Once these soils have reached below California non-hazardous levels (non-detect per STLC, TTLC) they will be used for cover material and roadbase, thus establishing them as a recycled and reused solid waste.

Test results of your soils current level can be made available upon your request. There is a $250.00 charge for testing. You may contact our Montebello office for information concerning testing of landfarmed soils at (213) 724-3918.

The aforementioned soils pertain to Non-Hazardous Data Form numbers: 11292, 11295, 11296, 11299, 11297, 11298, 11293, 11294.

Sincerely,

Harold A. Arsenian

SOUTHWEST DISPOSAL

RECEIPT OF SOILS
AND
LANDFARM COMMENCEMENT
ADVISORY LETTER

May 28, 1992

To Whom It May Concern:

Soils received by Southwest Disposal on 5-25-92, from La Mesa R.V. Center at 7601 Alvarado Road in La Mesa CA are currently in the process of being landfarmed. Once these soils have reached below California non-hazardous levels (non-detect per STLC, TTLC) they will be used for cover material and roadbase, thus establishing them as a recycled and reused solid waste.

Test results of your soils current level can be made available upon your request. There is a $250.00 charge for testing. You may contact our Montebello office for information concerning testing of landfarmed soils at (213) 724-3918.

The aforementioned soils pertain to Non-Hazardous Data Form numbers: 11300.

Sincerely,

Harold A. Arsenian
Hazardous Waste Coordinator

HALLIBURTON NUS
Environmental Corporation

16885 WEST BERNARDO DRIVE • SUITE 100 • SAN DIEGO, CALIFORNIA 92127 • (619) 451-2131

April 27, 1992

County of San Diego
Department of Health Services
Environmental Health Services (HMMD)
1255 Imperial Avenue, 3rd Floor
San Diego, California 92101

Attention: Mr. Mo Lahsaieza

Subject: La Mesa RV Center
Assessment Case No. T0427/H02651-001
Request for Class III Landfill Disposal
of Hydrocarbon Contaminated Soil

Gentlemen:

At the request of Mr. James Buckner, on behalf of the owners of the La Mesa RV Center, HALLIBURTON NUS Environmental Corporation (HALLIBURTON NUS) has provided environmental engineering consultation services for the subject property. The property is located at 7601 Alvarado Road in La Mesa, California. The approximate location of the site is depicted on the Vicinity Map, Figure 1.

HALLIBURTON NUS is presently preparing a report that contains the results of site exploration activities that were performed by HALLIBURTON NUS during March 1992. The report will likely be completed in May 1992. The purpose of this letter is to request Class III landfill disposal of three soil stockpiles generated during tank rmoval activities (February 1988) and site assessment and mitigation activities performed during March 1992. In accordance with the County of San Diego "Site Assessment and Mitigation Manual", prepared by the Department of Health Services, Environmental Health Services in January 1992, HALLIBURTON NUS has provided those items listed in "Stockpile Soil Sampling Protocol", Section 3, page 6, item 6 for each of the three soil stockpiles.

April 27, 1992
Project No. 2N60

BACKGROUND

During May 1988, four underground storage tanks (UST's) were excavated and removed from the subject site. These included one gasoline tank and three tanks used for the storage of either new or used oil. Excavation work performed by the contractor generated a soil stockpile of approximately 20 cubic yard capacity from the former gasoline UST location. This soil was stockpiled on-site in the southwest corner of the property. For the purposes of this letter, this stockpile will be referred to as Soil Stockpile No. 1.

During the recent performance of soil assessment and mitigation activities by HALLIBURTON NUS, three additional soil stockpiles were generated as the result of the excavation of soil from the previously referenced gasoline tank excavation, the former used and new oil tank excavation (originally containing three tanks), and the vadose zone between the two excavations. Approximately 80 cubic yards of soil excavated from the vadose zone between the two former UST locations is identified in this letter as Soil Stockpile No. 2. Approximately 100 cubic yards of soil excavated from the former gasoline UST location is identified in this letter as Soil Stockpile No. 3. Soil Stockpile No. 4, comprising approximately 200 cubic yards of soil generated from the excavation of soil from the former used and new oil UST location, while mentioned in this letter, was not found suitable for Class III landfill disposal and is not included in this request for Class III landfill disposal. Each of the stockpiles at the site was placed on an asphalt surface and covered with visqueen pending its disposal following regulatory guidelines. The approximate location of the soil stockpiles is depicted on the Stockpile Location Map, Figure 2.

On March 24, 1992, HALLIBURTON NUS personnel obtained 19 soil samples from the four soil stockpiles. The soil samples were randomly selected from the stockpiles following the soil sampling protocol as outlined in the County of San Diego 1992 SA/M Manual, Soil Sampling, Section 3, pages 3 through 7. Three soil samples were obtained from Stockpile No. 1, containing approximately 20 cubic yards of soil (see Figure 2).

April 27, 1992
Project No. 2N60

Four soil samples were obtained from Soil Stockpile No. 2, containing approximately 80 cubic yards of soil and four soil samples were obtained from Soil Stockpile No. 3, containing approximately 100 cubic yards of soil (see Figure No. 2). Eight soil samples were obtained from Soil Stockpile No. 4, containing approximately 200 cubic yards of soil (see Figure No. 2). The soil samples were obtained using an Alconox washed and tap water rinsed stainless steel hand auger, placed in laboratory supplied glassware, and delivered to an on-site California Department of Health Services (CDHS) Certified mobile laboratory.

REVIEW OF LABORATORY ANALYSES

The soil samples from Soil Stockpile No. 1 were analyzed for total petroleum hydrocarbons (TPH) by the DHS Method. A review of the results indicates that all three samples did not possess TPH concentrations above the laboratory detection limit of 10 milligrams/kilogram (mg/kg). The soil samples from Soil Stockpile No. 2 were analyzed for total recoverable petroleum hydrocarbons (TRPH) using EPA Method 418.1 A review of the laboratory results for these samples indicates TRPH concentrations of 156 mg/kg, 82 mg/kg, 73 mg/kg, and 312 mg/kg. The soil samples from Soil Stockpile No. 3 were analyzed for TPH using CDHS Method 8015. A review of the laboratory results indicates that three of the four samples possessed TPH concentrations of less than the laboratory detection limit of 10 mg/kg while one sample possessed a TPH concentration of 153.2 mg/kg. The sample possessing the TPH concentration of 153.2 mg/kg was also analyzed for benzene, toluene, xylene, and ethylbenzene (BTXE) using EPA Method 8020, modified for CDHS. A review of the laboratory results indicates concentrations of BTXE of 1.190 mg/kg, .410 mg/kg, 1.390 mg/kg, and 1.180 mg/kg, respectively.

The soil samples from Soil Stockpile No. 4 were analyzed for TRPH using EPA Method 418.1. A review of the laboratory results indicates TRPH concentrations ranging from 156 mg/kg to 24,700 mg/kg. The soil sample possessing a TRPH concentration of 24,700 mg/kg was also analyzed for Title 22 Metals, purgeable halocarbons (EPA Method 8010), total PCB's (EPA Method 8080), cyanide, and flashpoint. For potential

disposal purposes, an additional soil sample was obtained on March 31, 1992 from the location of the highest measured TRPH concentration and analyzed for pH and sulfide. Copies of the laboratory data sheets are provided in Appendix A.

Mr. Mo Lahsaieza of the HMMD indicated that analysis of excavation soil samples for BTXE and organic lead would be useful in assisting in characterizing the soil stockpiles. Please note that in addition to the analyses performed on the soil stockpile samples, one soil sample from the gasoline tank excavation was analyzed for BTXE and organic lead. This sample, possessing the highest measured TPH concentration of the soil samples analyzed from the excavation or the stockpiles, possessed a TPH concentration of 980 mg/kg. A review of the laboratory results indicates BTE concentrations of less than the laboratory detection limit of 1.0 ug/kg and a xylene concentration of 585 ug/kg. The organic lead concentration was less than the laboratory detection limit of 0.5 mg/kg (DHS Method). Copies of these laboratory data sheets are provided in Appendix A.

STOCKPILE STATISTICS

Soil Stockpile No. 1. Since the TPH concentrations of soil samples obtained from Soil Stockpile No. 1 were not above the laboratory detection limits for the method employed, and the organic lead concentration from one excavation soil sample was not above laboratory detection limits, no further statistical analysis of Soil Stockpile No. 1 is likely necessary. Please note that due to the age of the soil stockpile, which is greater than four years, and that relatively low levels of BTXE were observed in the soil samples, analysis of any soil samples from this stockpile for BTXE was deemed unnecessary by Mr. Mo Lahsaieza of the County of San Diego Hazardous Materials Management Division (HMMD). Based on this information, La Mesa RV Center requests regulatory approval for disposal of Soil Stockpile No. 1 at the County of San Diego Class III Landfill at Sycamore Canyon. The "Request For Class III Landfill Disposal of Hydrocarbon Contaminated Soil" form for Soil Stockpile No. 1 is enclosed.

Soil Stockpile No. 2. A total of four soil samples were obtained from Soil Stockpile No. 2 and analyzed for TRPH. The sample mean was calculated to be 155.75, the sample variance at 12233.58, the sample standard deviation at 110.606, the degrees of freedom

at 3, and the standard error of the mean was 55.30. Please refer to the "Stockpile Statistics Worksheet" provided in Appendix B for the completed required calculations. Given that the generally accepted regulatory threshold for disposal of TRPH impacted soil at Class III Landfills is 2000 mg/kg, and soil from Soil Stockpile No. 2 is below this threshold, La Mesa RV Center requests regulatory approval for disposal of Soil Stockpile No. 2 at the County of San Diego Class III Landfill at Sycamore Canyon. The "Request For Class III Landfill Disposal of Hydrocarbon Contaminated Soil" form for Soil Stockpile No. 2 is enclosed.

Soil Stockpile No. 3. A total of four soil samples were obtained from Soil Stockpile No. 3 and analyzed for TPH. The sample mean was calculated to be 38.30, the sample variance at 5867.56, the standard deviation at 76.60, the degrees of freedom at 3, and the standard error of the mean at 38.30. Please refer to the "Stockpile Statistics Worksheet" provided in Appendix B for the completed required calculations. Given that the generally accepted regulatory threshold for disposal of TPH impacted soil at Class III Landfills is 100 mg/kg, and soil from Soil Stockpile No. 3 is below this threshold, La Mesa RV Center requests regulatory approval for disposal of Soil Stockpile No. 3 at the County of San Diego Class III Landfill at Sycamore Canyon. The "Request For Class III Landfill Disposal of Hydrocarbon Contaminated Soil" form for Soil Stockpile No. 2 is enclosed.

Soil Stockpile No. 4. A total of eight soil samples were obtained from Soil Stockpile No. 4 and analyzed for TRPH. A review of the laboratory results of these analyses indicates that the concentration of TRPH in this soil stockpile exceeds the threshold concentration allowed for the disposal of TRPH impacted soil at County Class III landfills. Based on these results, La Mesa RV Center is planning to dispose of this soil stockpile at an approved Class II landfill. Additional analyses were performed on the soil from this stockpile and the results were submitted to the In-koo-pah Indian Reservation for their acceptance of the soil for disposal at their facility. A representative of the La Mesa RV Center has indicated that the Indian Reservation has accepted the soil for disposal.

April 27,1992
Project No. 2N60

Based on the results of the analysis of the soil samples obtained from the four soil stockpiles located on the subject site, La Mesa RV Center requests HMMD and Regional Water Quality Control Board (RWQCB) approval for the disposal of Soil Stockpile Nos. 1, 2, and 3, totaling an estimated 200 cubic yards, at the County of San Diego Class III Landfill at Sycamore Canyon. If there are any questions regarding the above information, please contact the undersigned at your convenience.

Sincerely,

David A. Eminhizer

QA/QC DIRECTOR

QUALITY CONTROL TERMINOLOGY

•LCS - LABORATORY CONTROL STANDARD. REPORTED AS % RECOVERY OF AN INDEPENDENT STANDARD CARRIED THROUGH ALL SAMPLE PREPARATION PROCEDURES TO VERIFY METHOD PERFORMANCE. ACCEPTABLE RANGE IS BASED ON HISTORICAL LABORATORY CONTROL DATA, BUT IS GENERALLY WITHIN A 80%-120% RECOVERY RANGE.
•SPIKE - ENVIRONMENTAL SAMPLE IS MATRIX SPIKED WITH METHOD COMPOUNDS AND % RECOVERY OF CONCENTRATION SPIKED INTO SAMPLE IS CALCULATED. REPORTED AS % RECOVERY. ACCEPTABLE RANGE FOR "NORMAL MATRIX SAMPLE" IS BASED ON HISTORICAL LABORATORY CONTROL DATA, BUT IS GENERALLY WITHIN A 75%-125% RECOVERY RANGE.
•SURROGATES - COMPOUNDS REPRESENTATIVE OF A GROUP OF COMPOUNDS. SURROGATES ARE SPIKED INTO ENVIRONMENTAL SAMPLES AND % RECOVERY OF CONCENTRATION SPIKED IS CALCULATED AND REPORTED. ACCEPTABLE RANGE VARIES DEPENDING ON SAMPLE MATRIX AND ANALYSIS METHOD.

Stockpile Statistics Worksheets

STOCKPILE STATISTICS WORKSHEET
SIMPLE RANDOM SAMPLING AND SYSTEMATIC RANDOM SAMPLING

SOIL STOCKPILE NO. 2

1	List sample results from laboratory	1 156	2 82	3 73
	Analytical Method 418.1 (TRPH)	4 312	5 —	6 —
	Units (i.e. mg/kg) mg/Kg	7 —	8 —	9 —
2	Determine number of sample values n		n = 4	
3	Calculate sample mean With n = number of sample measurements $\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}$		$\bar{x} = \frac{(156+82+73+312)}{4} =$ 155.75	
4	Calculate sample variance $s^2 = \frac{\sum_{i=1}^{n} x_i^2 - \frac{(\sum_{i=1}^{n} x_i)^2}{n}}{n-1}$		$s^2 = \frac{(133733.0 - 97032.25)}{3} =$ 12233.58	
5	Calculate sample standard deviation $s = \sqrt{s^2}$		s = 110.606	
6	Calculate degrees of freedom $df = n-1$		df = 3	
7	Calculate standard error of the mean $s_{\bar{x}} = \frac{s}{\sqrt{n}}$		$s_{\bar{x}} = \frac{110.606}{\sqrt{4}} = 55.30$	
8	Obtain student's 't' value corresponding to the degree of freedom value determined in #6 above. (See attached Table reproduced on the back of this page.)		t_{20} = 1.638	
9	Calculate the confidence interval $CI = \bar{x} \pm t_{20}\, s_{\bar{x}}$		$CI = 155.75 \pm 1.638 \times 55.30$ $= 155.75 - 90.58 =$ 65.17, 246.33	
10	Obtain regulatory threshold for the contaminant of concern RT		RT = 2000	
11	Calculate $\Delta = RT - \bar{x}$		$\Delta = 2000 - 155.75 =$ 1844.25	
12	Estimate minimum number of samples $n_{min} = \frac{t_{20}^2\, s^2}{\Delta^2}$		$n_{min} = \frac{(1.638)^2 \cdot 12233.58}{\Delta^2} =$ 0.00965	

PLEASE NOTE: In accordance with the California Code of Regulations, Title 22, Section 66694, the HMMD follows the sampling guidelines set forth in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, Third Edition", U.S. Environmental Protection Agency, 1986. This worksheet is based on information found in Volume II, Part III, Chapter 9, of "SW-846" and is provided as an aid for stockpile characterization. For circumstances requiring data manipulation beyond that indicated on the worksheet, refer to "SW-846".

STOCKPILE STATISTICS WORKSHEET
SIMPLE RANDOM SAMPLING AND SYSTEMATIC RANDOM SAMPLING

SOIL STOCKPILE NO. 3

1	List sample results from laboratory	1 <10	2 <10	3 <10
	Analytical Method TPH BY DHS METHOD	4 153.2	5 —	6 —
	Units (i.e. mg/kg) mg/kg	7 —	8 —	9 —
2	Determine number of sample values n		$n = 4$	
3	Calculate sample mean With n = number of sample measurements $\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}$		$\bar{x} = \frac{(0+0+0+153.2)}{4} = 38.30$	
4	Calculate sample variance $s^2 = \frac{\sum_{i=1}^{n} x_i^2 - \frac{(\sum_{i=1}^{n} x_i)^2}{n}}{n-1}$		$s^2 = \frac{23470.24 - 5867.56}{3} = 5867.56$	
5	Calculate sample standard deviation $s = \sqrt{s^2}$		$s = 76.60$	
6	Calculate degrees of freedom $df = n-1$		$df = 4-1 = 3$	
7	Calculate standard error of the mean $s_{\bar{x}} = \frac{s}{\sqrt{n}}$		$s_{\bar{x}} = \frac{76.60}{\sqrt{4}} = 38.30$	
8	Obtain student's 't' value corresponding to the degree of freedom value determined in #6 above. (See attached Table reproduced on the back of this page.)		$t_{20} = 1.638$	
9	Calculate the confidence interval $CI = \bar{x} \pm t_{20} s_{\bar{x}}$		$CI = 38.30 \pm 1.638(38.30) = -24.435, 101.035$	
10	Obtain regulatory threshold for the contaminant of concern RT		$RT = 100$	
11	Calculate $\Delta = RT - \bar{x}$		$\Delta = 100 - 38.30 = 61.70$	
12	Estimate minimum number of samples $n_{min} = \frac{t_{20}^2 s^2}{\Delta^2}$		$n_{min} = \frac{(1.638)^2(5867.56)}{\Delta^2} = 4.135$	

PLEASE NOTE: In accordance with the California Code of Regulations, Title 22, Section 66694, the HMMD follows the sampling guidelines set forth in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, Third Edition", U.S. Environmental Protection Agency, 1986. This worksheet is based on information found in Volume II, Part III, Chapter 9, of "SW-846" and is provided as an aid for stockpile characterization. For circumstances requiring data manipulation beyond that indicated on the worksheet, refer to "SW-846".

Re: Unauthorized Release #T0427/H02651-001
La Mesa RV Center
7601 Alvarado Road, La Mesa, CA 92041

Subject: Thirty-Day Update Report

Dear Mr. Skinner:

I am writing to provide a thirty-day update report as required by your October 26, 1993 letter and official notice. This update will cover activities occurring since my last update of November 29,1993.

A workplan for additional site assessment activities prepared by Environmental Business Solutions on behalf of La Mesa RV was submitted on November 29, 1993. By your letter of December 9, 1993 the Site Assessment and Mitigation Division (SA/M) approved La Mesa RV's workplan with minor changes and conditions. La Mesa RV plans to utilize the suggested changes contained in that letter.

The drilling and installation of wells has been scheduled with the subcontractor, Tri-County Drilling. However, we are informed that due to a large volume of site assessment activities underway in the San Diego County area, the drilling rig which will be used pursuant to the approved workplan will not first become available until February 10 and 11, 1994. We have scheduled the rig for use on the site on those two dates. Consequently, we must request an extension of the date within which the report of site activities must be provided to your office.

Your December 9, 1993 letter required a report to be submitted

LUCE, FORWARD, HAMILTON & SCRIPPS

ATTORNEYS AT LAW
FOUNDED 1873

APPROVED, BUT NOTHING PAST THIS.

not later than January 30, 1994 to SA/M and the Regional Water Quality Control Board. We request that this date be extended an additional sixty days to March 30, 1994 to permit sampling activities to be performed, laboratory results to be analyzed and a formal report to be prepared. Please advise at your earliest convenience.

Additionally, in light of the schedule of activities described above, La Mesa RV requests that it be permitted to return to a ninety-day reporting schedule pursuant to Title 23, C.C.R. § 2652.

We thank you in advance for your courtesy and cooperation in this matter. If you have any questions, please do not hesitate to call me at (619) 699-2418.

Very truly yours,

Stephen L. Marsh

Re: Unauthorized Release #T0427/H02651-001
La Mesa RV Center
7601 Alvarado Road, La Mesa, CA 92041

Subject: Update Report and Work Plan Submittal

Dear Mr. Skinner:

This office has been retained by La Mesa RV Center to assist it in its efforts to respond to the County's official notices and comply with the requirements to conduct site assessment and mitigation activities with respect to the above-described unauthorized release. La Mesa RV Center requests that the County direct further communications concerning this matter to my attention.

This letter is intended to serve as an update report as required by your October 26, 1993 official notice and prior correspondence. This letter will also serve as the transmittal of the enclosed work plan describing the additional site assessment activities as required by your June 2, 1993 and October 26, 1993 official notices.

By correspondence dated July 12, 1993 and your telephone conversation of July 6, 1993, Mr. Jim Buckner of La Mesa RV provided a partial response to the requirements of the June 2, 1993 letter. Thereafter, Mr. Buckner contacted a number of prospective consultants in an attempt to obtain bids for preparation of a work plan. However, Mr. Buckner was unable to obtain the requisite three bids and therefore, subsequently retained our services to assist in this endeavor.

Over the past thirty days we have prepared a request for proposal regarding preparation of a work plan and the conducting of site assessment activities to determine the lateral and vertical extent of contamination at the site. We obtained bids from several consultants and ultimately awarded the contract to Environmental Business Solutions, Inc.

Enclosed you will find a work plan dated November 24, 1993, prepared by Environmental Business Solutions, which I believe you will find self explanatory. La Mesa RV Center is prepared to begin implementation of the site assessment activities described in the work plan upon approval of the work plan by the County of San Diego, Site Assessment and Mitigation Division.

If you have any questions concerning this update report or the enclosed work plan, please do not hesitate to contact me.

Very truly yours,

Stephen L. Marsh

RE: Workplan Describing the Additional Site Assessment Activities Pursuant to the Request of San Diego County Site Assessment and Mitigation Division for the La Mesa RV Center - 7601 Alvarado Road, La Mesa, California (site)

Dear Mr. Skinner:

Environmental Business Solutions, Inc. (EBS) is pleased to present this workplan for your consideration relative to the requirements of the Site Assessment and Mitigation Division (SAM) for the above-referenced site.

EBS has prepared this written workplan which is intended to satisfy the requirements of the SAM prior to performing additional soil and groundwater investigation at the site. This workplan describes the site background, the procedures to be utilized during the field investigation, the type of laboratory analyses to be performed on soil and groundwater samples, and the type of report to be prepared.

Background

We understand that four underground storage tanks (USTs) of various capacities were previously located at the site and were recently removed. The underground tanks were reported to store new and used oil, and gasoline. The USTs were located immediately west and south of a service-bay building at the site (Figure 1). The four USTs at the site were reported to consist of one 550-gallon used oil UST, two 550-gallon new oil USTs, and one 2,000-gallon regular gasoline UST.

The USTs were reported to have been removed by a contractor, Alm Services (Alm), in February, 1988. The "Abandoned Underground Tank Report" prepared for the site by the County inspector indicated that each of the USTs had holes ranging from pinhole size to three-quarters of an inch in diameter. Groundwater impact was not noted during the USTs removal, although groundwater was observed at a depth of approximately seven feet below grade in the excavation.

Correspondence from Alm to the County in March of 1988 indicates that six soil samples from the USTs excavation were collected. Detectable concentrations of both total petroleum hydrocarbons (TPH) and total recoverable petroleum hydrocarbons (TRPH) were found in each of the samples collected. In May of 1988, Alm was reported to have collected an additional three samples from the new and used oil USTs excavation. Detectable concentrations of TRPH were found in each of the three samples.

In March of 1992, subsequent to the submission and approval of a workplan, we understand that Halliburton NUS (Halliburton) conducted a multi-day exploratory excavation program at the site. We understand approximately 400 cubic yards of soil was excavated from the vicinity of the former gasoline and oil USTs. Numerous confirmation samples were collected during the excavation program (see Figure 1), but we understand that confirmation samples indicate that soil with elevated concentrations of both TPH and TRPH remains in the vicinity of the excavation (including laterally underneath the service bay building). We also understand that Halliburton concluded that groundwater in the area of the excavations may be impacted.

In preparing this workplan, EBS personnel reviewed two letters addressed to Mr. James Buckner from you. In addition, we contacted you to go over the contents of the letters and to discuss additional site assessment activities at the site. In addition to the above-described activities, personnel of EBS visited the site to confirm site conditions. The site visit took place on November 9, 1993.

The program described in this proposal has been designed in general accordance with the requirements of the SAM, our site visit, the data gathered and interpreted in preparing this workplan, as well as our professional judgment and experience in this type of investigation.

OBJECTIVES

The objectives of this proposed scope of services are to:

- Further assess the extent of petroleum hydrocarbon impacted soil in the vicinity of former gasoline, and new and used oil USTs at the site;
- To assess the groundwater depth, gradient and flow direction; and,
- To assess the degree of likelihood that the shallow groundwater at the site has or has not been impacted by petroleum hydrocarbons.

SCOPE OF SERVICES

The scope of services that will be used to meet the objectives includes the following Phases:

Phase I **Preparation of a Workplan and Site Health and Safety Plan, Groundwater Monitoring Well Design, Preparation of Well Permits, Subcontractor Management and Scheduling, and Utility Search and Mark Out**

EBS has prepared this written workplan which is intended to satisfy SAM requirements. This workplan is intended to describe the field procedures to be utilized in the field investigation, including the type of laboratory analyses to be performed on the soil and groundwater samples, and soil and groundwater sample collection methods. This workplan includes the proposed location for additional soil borings and groundwater monitoring wells (Figure 1). The soil boring program has been designed to assess the lateral and vertical extent of petroleum impacted soil in the vicinity of the former USTs. The groundwater monitoring wells are to be placed in locations

designed to reflect the anticipated groundwater flow direction at the site, and to detect a possible release into the groundwater from the former USTs.

A health and safety plan for the site will be prepared to reflect the current work scope. A health and safety plan for work conducted at the site and workers within the "exclusion" zone is required pursuant to the regulations found in 29 Code of Federal Regulations (CFR) Part 1910.120. As such, a health and safety plan will be prepared which will outline the potential chemical and physical hazards that may be encountered during drilling and sampling activities. The appropriate personal protective equipment and emergency response procedures for the site-specific chemical and physical hazards will be detailed in this plan. EBS and contracted personnel involved with the proposed field work will be required to sign this document in order to encourage proper health and safety practices.

Prior to drilling the soil borings and installing the monitoring wells, the monitoring wells must be designed and one permit per well (or soil boring which intersects groundwater) will be completed and submitted to the SAM for approval along with the required fee. The permits will reflect monitoring well designs and completions in accordance with California Department of Water Resource and San Diego County requirements. The permits will be signed by the appropriately licensed professional and submitted with the required fee to the SAM.

Prior to mobilizing for field work, EBS will notify and schedule the appropriate subcontractors including but not limited to, the laboratory, the drilling company, the surveyor, the concrete coring company, concrete masons, Underground Service Alert (USA), and the well material supply company. In addition, prior to drilling soil borings, time is included for EBS to work with USA and a private underground utility search company to attempt to locate subsurface utilities and improvements at the site to minimize the likelihood of drilling into an underground utility.

Phase II **Drilling and Sampling of Seven Soil Borings and the Conversion of Three Soil Borings to Groundwater Monitoring Wells**

Drilling and Sampling Seven Soil Borings

Seven soil borings will be drilled, logged, and sampled to depths of between 15 and 20 feet below grade at the site (or until a depth where soil samples with non-detectable concentrations of petroleum hydrocarbons are found). Three borings will be drilled to depths of 20 feet below grade (or until refusal is met) in the vicinity of the western and southern perimeter of excavation at the site. These soil borings will be converted to groundwater monitoring wells (MW1, MW2, and MW3, see Figure 1). Four soil borings (B1 through B4) will be drilled near the former new and used oil UST locations (see Figure 1).

The location of these borings has been designed to provide additional information about the possible migration of petroleum hydrocarbons west, south and east from the former new and used oil and gasoline USTs area.

We anticipate that one of the soil borings (B3) will be drilled inside the building at the site, to the east of the former gasoline UST and to the north of the former used and new oil USTs.

The drilling program at the site will be monitored by a professional geologist from EBS. Our on-site representative will be either a State-certified Engineering Geologist (CEG), or a Registered Geologist (RG) with over 10 years of experience in field investigation programs.

A brief presentation of the rationale for soil boring/groundwater monitoring well locations is presented below. The proposed soil boring/groundwater monitoring well locations are presented on the attached Figure 1.

Soil Boring/Monitoring Well No.	Location/Rationale
B1	Located in the immediate vicinity west of soil sample OES-13 (23,000 mg/kg) and near OES-11 (16,000 mg/kg) and OES-12 (18,000 mg/kg). To assess the vertical extent, migration and concentration of petroleum hydrocarbons near the above-mentioned soil sample locations.
B2	Located near the northeastern portion of the excavation near the former new and used oil USTs. Located near soil samples OES-15 (7,700 mg/kg) and OES-6 (8,200 mg/kg). To assess the lateral and vertical migration of petroleum hydrocarbons in this area.
B3	Located inside the RV service bay. To assess the potential horizontal migration of gasoline to the east of soil samples GES-6 and GES-8 (920 and 470 mg/kg, respectively) and to assess the possible migration of petroleum east of soil sample OES-10 (15,600 mg/kg) and to the north of the new and used oil USTs area.
B4	Located near soil sample GES-6 (920 mg/kg). To assess the vertical migration and extent of gasoline-impacted soil in this area.
MW1	Located west of the former gasoline UST. To assess the potential occurrence of impacted soil to the west of soil samples OES-9 and OES-11 and to provide an assessment of groundwater quality in the inferred downgradient direction from the former gasoline UST.
MW2	Located west of the used and new oil USTs excavation area. To assess the lateral extent of impacted soil to the west of samples OES-11, 12, and 13 and to provide an assessment of the groundwater

	quality to the west of the former new and used oil USTs.
MW3	Located south of the former new and used oil USTs. This soil boring/monitoring well is intended to provide baseline information about the possible migration of contaminants in the soil and groundwater to the south of the used and new oil UST area. This monitoring well is also intended to provide control on the assessment of gradient and groundwater flow direction at the site.

We will drill six soil borings outside using a truck-mounted Canterra 450 high-torque drill rig. The one boring inside the building will be drilled using a Simco 3000 truck-mounted drill rig (the boring inside the building will require the use of the Simco 3000 drill rig because of the low overhead clearance). Because difficult drilling conditions are anticipated at the site, EBS solicited drilling bids from three different drilling companies. We selected the bid from Tri-County Drilling based on their representations of having a high probability of success in drilling in the anticipated difficult-to-drill conditions at the site (Stadium Conglomerate).

Should site drilling conditions allow, the first soil boring drilled at the site will be profiled utilizing continuous coring. This should greatly assist in our assessment of the subsurface soil conditions at the site. In particular, it should assist us in our assessment of possible zones of greater or lesser permeability which could affect the migration of petroleum hydrocarbons in the subsurface soil or groundwater.

Because groundwater is reported at relatively shallow depths, and some distinct soil lithologies were reported at depths of five to six and eight to ten feet below grade, we anticipate collecting soil samples from soil borings at approximately 5, 8, 10, 15 and 20 feet below grade or at significant lithologic changes.

Each of the borings not converted to a groundwater monitoring well will be backfield with an approved grout. As required by San Diego County guidelines, either pre-steam washed augers will be on-site or a steam cleaner will be on-site to steam wash the augers between soil borings to minimize the likelihood of "cross-contaminating" the borings and to minimize the potential for a "false positive" in the soil samples analyzed.

During the drilling of the soil borings, soil samples will be collected, when possible, with a split-spoon type or similar sampler. Soil samples will be driven into brass or stainless steel tubes. The tubes will be covered with teflon sheeting, tightly closed with end caps, and taped for handling and transportation activities. The sample containers will be packed in ice-filled coolers or stored in the refrigerator of the on-site mobile laboratory. Chain-of-custody procedures will be implemented for sample tracking. A written analytical report will be provided by the laboratory upon the completion of the sample testing. Please note that site conditions may not allow for the collection of drive samples. If this is the case, we will make best efforts to collect representative samples from the subsurface.

Installation of Three Groundwater Monitoring Wells

Three groundwater monitoring wells (wells) will be installed at the site to the west and south of the former USTs. The well placements will be designed to investigate the possible impact to groundwater from a petroleum hydrocarbon release from the former USTs. Based upon a review of the United States Geologic Survey La Mesa Quadrangle Map, and the groundwater information provided by Halliburton for the site, we anticipate a groundwater depth of approximately 9 to 10 feet and a regional flow direction roughly corresponding with Alvarado Creek, generally towards the west.

Based on the reported depth to groundwater at the site, we anticipate the wells be drilled to a maximum depth of approximately 20 feet below grade. The wells will be constructed using four-inch diameter PVC casing and screen. The surface completion will consist of a flush-mounted traffic-rated road box. As required by the San Diego County, a well permit will be obtained prior to drilling the wells. Soil cuttings generated from drilling of the wells will be placed in 55 gallon drums and labeled and left on site.

During well installation, the wells will be developed in general accordance with SAM guidelines. Within approximately one week of well development, the newly installed wells will be purged and sampled in general accordance with SAM guidelines. Development and purging water will be placed in appropriately labeled drums and stored on site.

Surveying of Groundwater Monitoring Wells

The well locations and elevations will be surveyed by a licensed surveyor to allow an assessment of the depth to groundwater and hydraulic gradient. Both vertical and horizontal control will be surveyed to 1/100 of a foot.

Monitoring, Purging and Sampling of Groundwater Monitoring Wells

After surveying, the wells will be monitored using an electronic interface probe. This instrument is capable of detecting both product and groundwater, with a reported accuracy of 1/100 of a foot. The depth to water and depth to and thickness of product (if present) will be measured and recorded. A clear bailer will be lowered into each well to collect a sample of groundwater to visually evaluate the presence of product.

In order to prepare for sampling, we anticipate that each well will be purged using a submersible pump. Purged water will be placed in appropriate drums, labeled, and left on site. After one volume of water is purged, groundwater levels will be monitored. If the wells are interpreted to be slow recharging, groundwater samples will be collected after two hours of purging. Otherwise, samples will be collected after three borehole volumes of water have been removed. Samples will be collected using a disposable bailer. Samples will be decanted into appropriately preserved volatile organic analysis (VOA) vials, capped, sealed, labeled, and placed on ice. The samples will be delivered to a State certified hazardous waste laboratory using chain-of-custody documentation.

Sample Analyses

EBS will retain a mobile laboratory to conduct on-site analytical testing. This way, should impacted soil extend further vertically or laterally than target depths or soil boring locations, additional soil samples can be collected while personnel and equipment are already mobilized at the site. As many as four soil samples from each boring (including at least one sample collected from within the field interpreted saturated zone) will be analyzed for total petroleum hydrocarbons (TPH) in general accordance with modified EPA Method 8015 and for total recoverable petroleum hydrocarbons (TRPH) in general accordance with EPA Method 418.1 Based on our understanding of the June 2, 1993 letter to James Buckner, all additional samples collected from the site must be analyzed for both TPH and TRPH.

In addition, the soil sample with highest reported TRPH concentration from a soil boring in the vicinity of the former new and used oil USTs will be analyzed for polychlorinated biphenyls, chlorinated solvents, benzene, toluene, ethylbenzene and xylenes, (BTEX) and organic lead. This sample will be analyzed in general accordance with EPA methods 8010, 8020, and 8080, and the Department of Health Services Method for organic lead. These additional analyses are also based on our understanding of the June 2, 1993 letter to Mr. James Buckner. & HIGHEST TPH FOR 8020, O.Pb.

One water sample per well will be collected and will be analyzed for total petroleum hydrocarbons in general accordance with modified EPA Method 8015 and BTEX in general accordance with EPA Method 8020. One water sample per well will also be analyzed for total lead, in general accordance with SAM guidelines.

Phase III **Data Evaluation, Figure and Table Preparation, Soil Boring and Monitoring Well Log Preparation and Report Preparation**

Based on the findings of the field investigation and laboratory results from the above scope of services and the historical findings provided by the Client, an assessment report (Report) will be written in general accordance with SAM guidelines. The Report will include laboratory reports, chain-of-custodies, permits, illustrations reflecting the sampled subsurface, logs of the soil borings and construction "as builts" of the wells, tabulated analytical results, and appropriate support documentation. The report will include an assessment of the depth of groundwater, groundwater flow direction, gradient, and the impact to shallow soil and groundwater from TPH and BTEX.

The Report will be peer reviewed and signed by a California Certified Engineering Geologist.

In addition to the above described report, in order to comply with the requirements of the well/soil boring permits, a "thirty day" report will be prepared and submitted to the SAM.

Estimated Schedule

We estimate that the total time necessary to complete the above phased scope of services is approximately 30 to 35 working days.

EBS appreciates the opportunity to provide you with a workplan on this important project. Should you have any questions regarding this letter please contact the undersigned at (619) 571-5500.

Respectfully,
ENVIRONMENTAL BUSINESS SOLUTIONS, INC.

RE: Your letter of June 2, 1993 and our telephone conversation of July 6, 1993

Dear Mr. Skinner:

Enclosed are copies of the Chain of Custody LMRV-OES 1 thru 15 and summary tables II and III.

The estimated 400 cubic yards of soil was all hauled to the Class II site in Arizona. The weight was 460.99 tons. The explanation for the low conversion number of 1.15 may have something to do with the fact that some of the soil was dry from laying there since May 1988, along with the estimate of 400 cubic yards being high.

I left a message on your voice mail today requesting a copy of the consultants list. I have called Odgen, (no response) and Woodward Clyde, (not interested), hope I'll have better luck with list.

SENT 7-15 (.3)

Sincerely,

Jim Buckner
Director of Fixed Operations

Subject: Ninety-Day Update Report

Dear Mr. Skinner:

I am writing to provide a ninety-day update report pursuant to Title 23 C.C.R. § 2652 and as required by your official notices. This update will cover activities occurring since my last update of September 30, 1994.

We previously submitted a report of site assessment activities prepared by Environmental Business Solutions, as required. Subsequently, all purge water and soil cuttings were disposed of under permit and in accordance with applicable requirements. A report of these activities was submitted. According to the conclusions and recommendations of the report of Environmental Business Solutions, it would appear that no further action is required at this time. We continue to await your concurrence.

All additional required applicable information remains unchanged. Our next update report will be due on March 30, 1995.

If you have any questions, please do not hesitate to call me at (619) 699-2418.

Very truly yours,

Stephen L. Marsh

Subject: Thirty-Day Update Report

Dear Mr. Skinner:

I am writing to provide a thirty-day update report pursuant to Title 23 C.C.R. § 2652 and as required by your official notices. This update will cover activities occurring since my last update of May 31, 1994.

During our telephone conversation on Tuesday, you advised you have no objections to our returning to a 90-day reporting schedule. Therefore, we will do so. Accordingly, our next report will be due on September 30, 1994.

You also suggested I contact Mark Fitzmaurice of SA/M since the case was being transferred to him. I spoke to Mr. Fitzmaurice Thursday, and he advised me that the matter has not yet been transferred to him and that I should continue reporting to you. Therefore, until further notice, we will continue to submit all communications to your attention.

All additional required applicable information remains unchanged.

If you have any questions, please do not hesitate to call me at (619) 699-2418.

Very truly yours,

Stephen L. Marsh

Subject: Thirty-Day Update Report

Dear Mr. Skinner:

I am writing to provide a thirty-day update report pursuant to Title 23 C.C.R. § 2652 and as required by your official notices. This update will cover activities occurring since my last update of April 30, 1994.

Enclosed please find a Report of Disposal of Soil Cuttings and Groundwater prepared by Environmental Business Solutions. This report summarizes the disposal activities which took place on the site between March 18, 1994 and April 21, 1994.

All purge water and soil removed during previous site assessment activities have now been removed from the site.

At your request, we have been providing periodic status update reports on a 30-day reporting schedule pursuant to Title 23, C.C.R. § 2652. In light of the nature of activities at the site in compliance with applicable regulations, we request that we be returned to the usual 90-day reporting schedule. If you approve, our next report will be due August 30, 1994.

All additional required applicable information remains unchanged.

If you have any questions, please do not hesitate to call me at (619) 699-2418.

Very truly yours,

Stephen L. Marsh

RE: Disposal of Soil Cuttings and Purged Groundwater
La Mesa R. V. Center, 7601 Alvarado Road, La Mesa, California (site)

Dear Mr. Marsh:

Environmental Business Solutions, Inc. (EBS) is pleased to present this letter describing the disposal of soil cuttings and purged groundwater generated from the assessment that EBS recently performed at the subject site. The work described in this letter was conducted by EBS in response to your request and authorization, and in general accordance with Agreement For Services 93E1163.1, Change Order Number 3 and the contract between EBS and La Mesa R. V. Center, Inc. (client). The contract was fully executed on February 3, 1994.

BACKGROUND

The site assessment activities performed by EBS included the drilling of nine soil borings, converting three of the soil borings to groundwater monitoring wells (wells), and the sampling of the three wells. Soil cuttings from the soil borings and groundwater removed from the wells during well development and pre-sampling purging were placed in drums, labeled (including data on the material stored in each drum), sealed, and stored along the western wall of the service bay.

On March 3, 1994, Change Order Number 3 was submitted for the disposal of soil cuttings and purged groundwater. The change order was approved on March 11, 1994. Work in Change Order Number 3 included:

- Collecting one composite soil sample from the drums and testing the sample using TCLP procedures for chrome, lead, and cadmium;
- Preparation and submission of an application for batch discharge to the San Diego Industrial Waste Program (IWP);
- Disposal of the drummed groundwater into the sanitary sewer; and,
- Transportation by Alternative Disposal, Inc., of the drummed soil to the Pen-Rob facility in Joseph City, Arizona, for treatment and disposal.

Collecting one composite soil sample from the drums and testing the sample using TCLP procedures for chrome, lead, and cadmium

On March 18, 1994, a representative from EBS visited the site and collected one composite soil sample. The sample was collected from drums containing soil from soil borings B-4 and B-1, the soil borings with

the highest reported concentration of total recoverable petroleum hydrocarbons. Approximately equal volumes of soil were removed from each drum, mixed, and packed into a laboratory-supplied jar. The jar was labeled, sealed, and placed in an ice chest containing blue ice. A "Chain of Custody" form was filled out.

The soil sample was submitted to Analytical Technologies, Inc. (ATI) for analysis. As requested by Pen-Rob, a TCLP extract of the sample was made, and the extract tested for chrome, lead, and cadmium in general accordance with EPA Method 6010. As indicated on the attached laboratory test report, the sample was reported to contain no detectable concentrations of chrome, lead, and cadmium.

Preparation and submission of an application for batch discharge to the San Diego Industrial Waste Program (IWP)

On April 1, 1994, a Groundwater Discharge Authorization Request was submitted to Mr. Toby Shipley of the IWP. On April 11, 1994, the request was approved. A copy of the request is attached.

Disposal of purged groundwater and soil cuttings

On April 21, 1994, a representative from EBS was present at the site to assist in the disposal of the purged groundwater and soil cuttings. Four drums of purged groundwater were moved to the recreational vehicle sewage holding tank clean out located in the southwest portion of the site. Water from the drums was removed with a five-gallon bucket and placed into the sewer inlet at the disposal site. Approximately 100 gallons of water were disposed.

Approximately 15 drums of soil were loaded onto a truck provided by Alternative Disposal, Inc. A representative of La Mesa R. V. Center, Inc. was present to sign the necessary papers. All of the drums were transported to the Pen-Rob facility for treatment. A copy of the Non-Hazardous Waste Data Form is attached.

It was a pleasure working on you with this important project. If we may provide any further assistance, please do not hesitate to contact us.

Respectfully,
ENVIRONMENTAL BUSINESS SOLUTIONS, INC.

RE: Report of Soil and Groundwater Investigation Pursuant to the Requirements of the San Diego County Site Assessment and Mitigation Division (SAM) for La Mesa R. V. Center, Inc., Located at 7601 Alvarado Road, La Mesa, California (site)

Dear Mr. Marsh:

Environmental Business Solutions, Inc. (EBS) is pleased to submit this report which summarizes the soil and groundwater assessment recently conducted at the subject site (Figure 1). The work described in this Report was conducted by EBS in response to your request and authorization and in general accordance with Agreement For Services 93P1163.1 and Change Order's 1, 2, and 3 to the contract between EBS and La Mesa R. V. Center, Inc. (client). The contract was fully executed on February 3, 1994.

BACKGROUND

It is our understanding that four underground storage tanks (USTs) of various capacities were previously located at the site and were recently removed. The underground tanks were reported to store new and used oil and gasoline. The USTs were located immediately to the west and south of a service-bay building at the site (Figure 2). The four USTs at the site were reported to consist of one 550-gallon used oil UST, two 550-gallon new oil USTs, and one 2,000-gallon regular gasoline UST.

The USTs were reported to have been removed by a contractor, Alm Services (Alm), in February, 1988. The "Abandoned Underground Tank Report" prepared for the site by the County inspector indicated that each of the USTs had holes ranging from pinhole size to three-quarters of an inch in diameter. Groundwater impact was not noted during the USTs removal, although groundwater was observed at a depth of approximately seven feet below grade in the excavation.

Correspondence from Alm to the County in March of 1988 indicates that six soil samples from the USTs excavation were collected. Detectable concentrations of both total petroleum hydrocarbons (TPH) and total recoverable petroleum hydrocarbons (TRPH) were found in each of the samples collected. In May of 1988, Alm was reported to have collected an additional three samples from the new and used oil USTs excavation. Detectable concentrations of TRPH were found in each of the three samples.

In March of 1992, subsequent to the submission and approval of a workplan, we understand that Halliburton NUS (Halliburton) conducted a multi-day exploratory excavation program at the site. We understand that approximately 400 cubic yards of soil were excavated from the vicinity of the former gasoline and oil USTs. Numerous confirmation samples were collected during the excavation program (see Figure 2 and Tables 1 and 2), but we understand that confirmation samples indicated that soil with elevated concentrations of both TPH and TRPH remains in the vicinity of the excavation (including laterally underneath the service bay building).

We also understand that Halliburton concluded that groundwater in the area of the excavations may be impacted.

It is our understanding, based on review of a letter issued by the SAM on June 2, 1993, that the SAM had requested an additional assessment of the lateral and horizontal extent of petroleum-hydrocarbon-bearing soil and an assessment of groundwater quality.

Site Identification

Site Name:	La Mesa R. V. Center
Site Address:	7601 Alvarado Road, La Mesa, California 92401
SAM Case No.:	T0427/H02651-001
A. P. N.:	469-021-02

Site Location/Description

The site is located south of Interstate 8 in the commercial/retail section of La Mesa, California (Figure 1). Currently the site is used for the sales and service of recreational vehicles. Site improvements include offices, showrooms, service bay areas, and associated driveways and parking areas.

OBJECTIVES

The objectives of the scope of services were to:

- Further assess the vertical and horizontal extent of petroleum-hydrocarbon-bearing soil in the vicinity of the former gasoline, and new and used USTs at the site;
- To assess the groundwater depth, gradient, and flow direction; and,
- To assess the degree of the likelihood that the shallow groundwater at the site has, or has not, been impacted by petroleum-hydrocarbons.

SCOPE OF SERVICES

The scope of services that was developed to meet the objectives included the following phases:

Preparation of a Workplan and Site Health and Safety Plan, Groundwater Monitoring Well Design, Preparation of Well Permits, and Utility Search and Mark Out

EBS prepared a written workplan which was intended to satisfy SAM requirements. The workplan described the field procedures to be utilized in the field investigation, including the type of laboratory analyses to be performed on the soil and groundwater samples, and the soil and groundwater sample collection methods. The workplan included the proposed location for additional soil borings and groundwater monitoring wells. On November 24, 1993, the workplan was submitted to the SAM. On December 3, 1993, the SAM issued a letter stating that the workplan was approved on the condition that the soil sample with the highest reported TPH concentration be analyzed for volatiles in general accordance with EPA Method 8020 and organic lead, that

monitoring well MW-3 be located to the east of the former USTs, and that one additional soil boring be drilled and sampled. A copy of the SAM approval letter is attached in the Appendix.

A health and safety plan for the site was prepared to reflect the current work scope. A health and safety plan for work conducted at the site and workers within the "exclusion" zone is required pursuant to the regulations found in 29 Code of Federal Regulations (CFR) Part 1910.120. As such, a health and safety plan was prepared which outlined the potential chemical and physical hazards that may have to be encountered during drilling and sampling activities. The appropriate personal protective equipment and emergency response procedures for the site-specific chemical and physical hazards were detailed in this plan. EBS and contracted personnel involved with the proposed field work were required to sign this document in order to encourage proper health and safety practices.

Prior to drilling the soil borings and installing the monitoring wells, the monitoring wells were designed and one permit per well (or soil boring which intersects groundwater) was completed and submitted to the SAM for approval along with the required fee. The permits were submitted to the SAM on January 20, 1994. The permits were approved by the SAM on February 3, 1994. A copy of the approved well permit is attached in the Appendix.

Prior to mobilizing for field work, EBS notified the Underground Service Alert (USA). USA issued ticket number 698190 for the fieldwork and notified Cox Cable, Helix Water District, Pacific Bell, San Diego Gas and Electric, the City of San Diego Water District, the County of San Diego Water Authority, and the City of La Mesa. In addition, EBS used the services of a private underground utility search company to attempt to locate subsurface utilities and improvements at the site to minimize the likelihood of drilling into an underground utility.

Field Activities

TECH. USED TO AVOID AERATION OF SAMPLES—?

On February 10 and 11, 1994, eleven soil borings (B-1, B-1A, B-2, B-3, B-4, B-4A, B-5, B-6, MW-1, MW-2, and MW-3) were drilled, logged, and sampled to depths of between 15 and 20 feet below grade at the site. Groundwater monitoring wells (MW-1, MW-2, and MW-3) were installed in three of the soil borings. Because of the anticipated difficulty in drilling conditions, a Canterra 450 High Torque drill rig was used. Initially, the soil borings were drilled using hollow-stem augers. However, because of refusal encountered at approximately 10 feet below grade, the drill rig was converted to air percussion to continue the drilling operation. It should be noted that soil borings B-2 and B-3 were drilled using a Simco 2000 drill rig. This drill rig was used because of limited access in these two locations.

When possible, soil samples were collected at five-foot intervals using a split-spoon sampler. Due to difficult drilling and sampling conditions, it was not possible to continuously core the first soil boring drilled as originally planned. Additionally, due to difficult drilling and sampling conditions, no sample recoveries were obtained from the soil boring in which well MW-2 was installed. The soil samples were used for description and for laboratory testing. Soil samples were logged by a California certified engineering geologist who described samples in general accordance with the Unified Soil Classification System. Soil boring and well logs are attached in the Appendix. Samples for laboratory testing were tightly packed into laboratory supplied glass jars, sealed, labeled, double bagged and placed in an ice-filled cooler or stored in the refrigerator of an on-site mobile laboratory provided by Transglobal Environmental Geochemistry (TEG). Chain-of-Custody procedures were implemented for sample tracking.

Soil borings were backfilled using appropriate grout. As stipulated by San Diego County guidelines, a steam cleaner was on site to steam clean the augers between soil borings to minimize the likelihood of "cross-contaminating" a given boring and to minimize the potential for a "false-positive" in the soil samples analyzed.

Sampling equipment was cleaned using a four bucket wash; a tri sodium phosphate (TSP) water cleaner, two tap water rinses, and a final spray rinse with deionized water. Decontamination water from the steam cleaning and sampling wash was placed in drums, labeled, and left on site. Soil cuttings were placed in DOT rated 55-gallon drums, labeled, and left on site.

Three wells (MW-1, MW-2, and MW-3) were installed using four-inch diameter screen and casing. It was originally planned to install the wells to a depth of approximately 20 feet below grade. After the drilling of the soil borings in which wells MW-1 and MW-2 were to be installed, the lower five feet of each of the boreholes (approximately 15 to 20 feet below grade) collapsed, and sealed off the lower five feet of the soil boring. Therefore, wells MW-1 and MW-2 were installed to a depth of approximately 15 feet below grade. It should be noted that a distinctive cemented gravel layer was encountered in wells MW-1 and MW-2 at a depth of approximately 15 feet below grade. This same layer was encountered during the drilling of the soil boring in which well MW-3 was installed. In this boring, the cemented gravel layer was encountered at a depth of approximately eight feet below grade. Well MW-3 was terminated at a depth of approximately 15 feet below grade. Well construction diagrams are presented on the attached logs.

After the sand pack was placed and before bentonite was poured, the wells were developed using a surge block. Development water was removed from the casing using a bailer and poured into drums, labeled, and left on site. After the development was completed additional sand was placed, as needed, and the bentonite seal installed.

On February 17, 1994, the three wells were monitored, purged, and sampled. The wells were monitored using an electronic interface probe, which is capable of detecting both water and product. In addition, a bailer was lowered into each well to visually assess the presence of free product. Free product was not observed or detected. The wells were purged using a hand bailer. All downhole sampling and monitoring equipment was cleaned using a four bucket wash; a TSP-water cleaner, two tap rinses, and a final spray rinse with deionized water. Decontamination water was placed in drums, labeled, and left on site. Three borehole volumes of water were removed and placed in a drum, labeled, and left on site. After the water levels in the wells recharged to at least 80 percent of the pre-purging level, a water sample was collected using a disposable bailer. The water samples were decanted into laboratory-supplied containers, capped, labeled and placed in an ice-filled cooler. Chain-of-custody procedures were implemented for sample tracking. The samples were delivered to TEG and Analytical Technologies, Inc. (ATI) for analysis.

On February 26, 1994, Hopwood Surveying, a licensed land surveyor, established relative elevations for the top of the casing (TOC) for each well and also established the horizontal location of each well and soil boring.

Laboratory Analysis

All soil samples were tested for TPH as gasoline and diesel in general accordance with modified EPA Method 8015 (California DOHS Method) and TRPH in general accordance with EPA Method 418.1. The soil sample with the highest reported TRPH concentration (sample B1-10') was also tested for volatile halogenated and aromatic hydrocarbons in general accordance with EPA Method 8010/8020, organic lead in general accordance with EPA Method 6010, and organochlorine pesticides and PCBs in general accordance with EPA Method 8080. Soil sample laboratory test results are attached in the Appendix.

All groundwater samples were tested for TPH as gasoline and diesel in general accordance with modified EPA Method 8015 (California DOHS Method), and benzene, toluene, ethylbenzene, and xylenes (BTEX) in general accordance with EPA Method 8020. The groundwater sample collected from well MW-2 was also tested for total lead in general accordance with EPA Method 7421. Laboratory test results are attached in the appendix.

FINDINGS

Site Geology and Hydrogeology

As mapped by Kennedy (1975, Geology of the San Diego Metropolitan Area, California: C.D.M.G. Bull. 200), the site is interpreted to be underlain by the Eocene Stadium Conglomerate. Geologic materials encountered during our assessment include fill soils, topsoil, and Alluvium. A brief description of these units is presented below:

- Fill

  Fill soil was encountered in all the soil borings. These deposits generally consisted of dark gray brown gravelly silty sand (SM), black silty gravelly sand (SW), and yellow brown clayey sand (SC). Fill soil was observed to extend to a maximum depth of approximately eight feet below grade.

- Topsoil

  Topsoil was encountered in soil borings and wells B-1, B-3, B-4, B-5, MW-1, and MW-2. Topsoil generally consisted of a dark brown silty sand/sandy silt (SM/ML). Topsoil was encountered to a maximum depth of approximately 12 feet below grade.

- Alluvium

  Alluvium was encountered in all soil borings and wells. These deposits generally consisted of red brown gravel/silty gravel (GW/GM), yellow brown gravelly clayey sand (SC) and a distinctive and cemented yellow brown gravelly clayey sand (SC). It should be noted that the cemented layer was encountered in all soil borings and wells, and appeared to be dipping towards the west.

As interpreted from maps prepared by the Regional Water Quality Control Board, San Diego Region (RWQCB) Comprehensive Water Quality Control Plan Report, dated 1979, the site is located within the Chollas Hydrologic Subarea (8.22) of the San Diego Mesa Hydrologic Area (8.20) of the Pueblo San Diego Hydrologic Unit (8.00). As stated in the RWQCB Resolution No. 91-79, this basin does not have any existing or potential municipal and industrial beneficial uses of groundwater. It should be noted that the site is located near the northern boundary of the Chollas Hydrologic Subarea, and that the basin interpreted to be to the north (Mission San Diego Hydrologic Subarea) has potential beneficial municipal groundwater uses.

✓ w/ JRO

As shown on Table 3, the shallow groundwater beneath the site is generally encountered at a depth of approximately four and one half to nine feet below grade. The shallow groundwater is interpreted to generally flow towards the west (Figure 3) at a gradient of approximately 0.08 (eight feet of elevation difference for every 100 feet of horizontal distance). It should be noted that the interpreted flow direction is away from the Mission San Diego Hydrologic Subarea. - PARALLEL -

The shallow groundwater at the site is interpreted to be a perched water table. As previously stated, there was a cemented zone that was encountered during the drilling activities. It is our professional opinion that this cemented zone is a confining layer on which the shallow groundwater is perched. Figure 4 is an interpretation of the groundwater conditions at the site.

maybe..

Soil Sample Analytical Results

Total Petroleum Hydrocarbons as Gasoline and Diesel

Thirty soil samples were tested for TPH as gasoline (TPH_g) and diesel (TPH_d) in general accordance with modified EPA Method 8015. As shown on Table 4, and Figures 5, 6, 7, 8, and 9, soil samples with reported concentrations of TPH_g and TPH_d were only collected from soil borings B-1, B-4 and well MW-1.

Soil boring B-1 is located 15 feet southwest of the former gasoline UST. Soil samples collected from soil boring B-1 had reported TPH_g concentrations ranging from 66 to 174 milligrams/kiliograms (mg/kg), and TPH_d concentrations ranging from 131 to 271 mg/kg. It should be noted that the soil sample collected from a depth of approximately 15 feet below grade was reported to have no detectable concentrations of TPH_g and TPH_d.

Soil boring B-4 is located in the reported location of former gasoline UST. Soil samples collected from soil boring B-4 had reported TPH_g concentrations ranging from 14 to 82 mg/kg. It should be noted that the soil samples collected from below a depth of approximately 15 feet below grade were reported to have no detectable concentrations of TPH_g. Only one soil sample collected from soil boring B-4 was reported to have detectable TPH_d concentrations. The soil sample collected at a depth of approximately eight feet below grade was reported to have a TPH_d concentration of 87 mg/kg.

Well MW-1 is located approximately 15 feet west of the former gasoline UST. Only two soil samples collected from well MW-1 were reported to have a detectable TPH_g concentration. The soil samples collected from depths of approximately eight and ten feet below grade had reported TPH_g concentrations of 17 and 36 mg/kg, respectively. Only two soil samples collected from well MW-1were reported to have detectable TPH_d concentrations. The soil samples collected at depths of approximately eight and ten feet below grade were reported to have TPH_d concentrations of 14 and 29 mg/kg, respectively.

Total Recoverable Petroleum Hydrocarbons

Thirty soil samples were tested for TRPH in general accordance with EPA Method 418.1. As shown on Table 4, and Figures 5, 6, 7, 8, and 9, soil samples collected from all soil borings and wells, with the exception of soil boring B-5, had reported TRPH concentrations. Reported TRPH concentrations ranged from 11 to 9,140 mg/kg. It should be noted that the samples with the highest reported TRPH concentrations were collected from soil boring B-1, located to the west, in the interpreted downgradient direction of the former used and new oil USTs. It should also be noted that the soil samples collected from well MW-3, located to the east, upgradient of the former used and new oil USTs had reported TRPH concentrations of less than 100 mg/kg.

Benzene, Toluene, Ethylbenzene, and Xylenes

The soil sample with the highest reported TPH_g and TRPH concentrations (soil sample B1-10') was also tested for BTEX in general accordance with EPA Method 8020. It should be noted that this soil sample was collected near the field interpreted water table. As shown on the attached laboratory test report, this soil sample was reported to have no detectable BTEX concentrations.

Aromatic Hydrocarbons

Soil sample B1-10' was also tested for aromatic hydrocarbons in general accordance with EPA Method 8010. As shown on the attached laboratory test report, this soil sample was reported to have no detectable concentrations of aromatic hydrocarbons.

PCBs and Organochlorine Pesticides

Soil sample B1-10' was also tested for PCBs and organochlorine pesticides in general accordance with EPA Method 8080. As shown on the attached laboratory test report, this soil sample was reported to have no detectable concentrations of PCBs or organochlorine pesticides.

Organic Lead

Soil sample B1-10' was also tested for organic lead in general accordance with EPA Method 6010. As shown on the attached laboratory test report, this soil sample was reported to have an organic lead concentration of 1.5 mg/kg.

Groundwater Sample Test Results

Total Petroleum Hydrocarbons as Gasoline and Diesel

Groundwater samples were tested for TPH_g and TPH_d in general accordance with modified EPA Method 8015. As shown on Table 5, all three water samples were reported to have no detectable concentrations of TPH_g and TPH_d.

Benzene, Toluene, Ethylbenzene, and Xylenes

Each groundwater sample was tested for BTEX in general accordance with EPA Method 8020. As shown on Table 5, all three water samples were reported to have no detectable BTEX concentrations.

Total Lead

The groundwater sample collected from well MW-2 was tested for total lead by ATI in general accordance with EPA Method 7421. As shown on the attached laboratory test report, the sample collected from well MW-2 had a reported total lead concentration of 0.002 mg/l.

DISCUSSION

Assessment of the Vertical and Horizontal Extent of Petroleum-Hydrocarbon-Bearing Soil

Gasoline and Diesel-Bearing Soil

As shown on Figures 5, 6, 7, 8, and 9, the extent of gasoline and diesel-bearing soil has been interpreted to be limited to the immediate vicinity of the former gasoline UST pit. The basis for this interpretation is presented below:

- The northern extent of gasoline and diesel-bearing soil is estimated using the laboratory test results from soil samples GES-3, GES-4, and GES-2. As shown on Figure 5 and on Table 4, these soil samples were collected from approximately five to eight feet below grade and were reported to have no detectable TPH_g and TPH_d concentrations.

- The eastern extent of gasoline and diesel-bearing soil is estimated using the laboratory test results from soil samples GES-5, GES-7 and the soil samples collected from soil boring B-3. As shown on Figure 5 and on Table 4, with the exception of soil sample GES-7, all these soil

samples were reported to have no detectable concentrations of TPH. Soil sample GES-7 was reported to have a TPH_g concentration of 27 mg/kg.

Review of laboratory test results and observations made during the drilling activities indicate that the released fuel travelled along the top of the cemented layer which appears to dip towards the west. Therefore, this augments our professional opinion that the eastern extent of fuel-bearing soil is limited.

- The southern extent of gasoline and diesel-bearing soil is estimated using the laboratory test results from soil boring B-5. As shown on Figure 5 and on Table 4, all of the soil samples collected from soil boring B-5 were reported to have no detectable concentrations of TPH.

  It should be noted that soil boring B-5 was drilled south of the excavation, approximately 35 feet south of the former gasoline UST. It is our professional opinion that the southern extent of fuel-bearing soil is to the north of soil boring B-5.

- The western extent of gasoline-bearing soil can be estimated using the laboratory test results from soil boring B-6 and well MW-1. As shown on Figure 5 and on Table 4, all of the soil samples collected from soil boring B-6, located in an interpreted downgradient location from the former USTs, were reported to have no detectable concentrations of TPH_g and TPH_d. As shown on Figure 5 and on Table 4, only three soil samples collected from well MW-1, located in an interpreted downgradient location from the former USTs were reported to have detectable concentrations of TPH_g and TPH_d, and these three soil samples were reported to have TPH_g and TPH_d concentrations of less than 29 mg/kg.

  It should be noted that soil boring B-6 was drilled approximately 50 feet to the west of the former gasoline UST. It is our professional opinion that the western extent of fuel-bearing soil is well to the east of soil boring B-6.

The vertical extent of gasoline and diesel-bearing soil is interpreted to extend to a maximum depth of approximately 15 feet below grade. As shown on Figures 5, 6, 7, 8, and 9, and on Table 4, it is our professional opinion that the cemented layer has limited the vertical migration of gasoline and diesel fuel into the subsurface.

TRPH-Bearing Soil

- The southern extent of TRPH-bearing soil (soil with TRPH concentrations greater than 1,000 mg/kg) is estimated using the laboratory test results from soil boring B-5. As shown on Figure 5 and on Table 4, all of the soil samples collected from soil boring B-5 were reported to have no detectable concentrations of TRPH.

  It should be noted that soil boring B-5 was drilled south of the excavation, approximately 10 feet south of the former oil USTs. It is our professional opinion that the southern extent of TRPH-bearing soil is to the north of soil boring B-5.

- The eastern extent of TRPH-bearing soil is estimated using the laboratory test results from well MW-3. As shown on Figure 5 and on Table 4, all of the soil samples collected from soil boring MW-3 were reported to have TRPH concentrations of less than 100 mg/kg.

- The western extent of gasoline-bearing soil can be estimated using the laboratory test results

from soil boring B-6. As shown on Figure 5 and on Table 4, all of the soil samples collected from soil boring B-6, located in an interpreted downgradient location from the former USTs were reported to have TRPH concentrations of less than 100 mg/kg.

It should be noted that soil boring B-6 was drilled approximately 50 feet to the west of the former oil USTs. It is our professional opinion that the western extent of TRPH-bearing soil is well to the east of soil boring B-6.

Assessment of Groundwater Quality at the Site

Three wells have been installed and sampled at the site. Groundwater monitoring wells MW-1 and MW-2 are located adjacent to, and in the interpreted downgradient direction from the former gasoline and oil USTs. Well MW-3 is located adjacent to, and upgradient from the former gasoline and oil USTs. As shown on Table 5, all of the groundwater samples were reported to have no detectable TPH_g, TPH_d, and BTEX concentrations.

Because groundwater samples collected from the downgradient wells were reported to have no detectable BTEX concentrations, it is our professional opinion that there is a low likelihood that the shallow groundwater at the site has been impacted by petroleum-hydrocarbons.

Based on a review of the laboratory test results of the collected groundwater samples, and the observed westerly shallow groundwater flow direction, it is our professional opinion that there is a low likelihood that the shallow groundwater at the site is a source of groundwater degradation to the Mission San Diego Hydrologic Subarea. As stated previously, the Mission San Diego Hydrologic Subarea is interpreted to be located up and crossgradient from the site.

CONCLUSIONS

Based on the data reviewed and obtained as part of this assessment, current regulatory guidelines, and our experience, in our professional judgement we have made the following conclusions:

- The horizontal extent of gasoline and diesel-bearing soil is generally limited to the immediate vicinity of the former UST excavation at the site. Gasoline and diesel-bearing soil extends to a maximum depth of approximately 15 feet below grade.

- The horizontal extent of TRPH-bearing soil (soil with TRPH concentrations greater than 1,000 mg/kg) has generally been assessed. Using available data, the western, southern, and eastern limits of TRPH-bearing soil have been inferred. The maximum extent of TRPH-bearing soil has been inferred to extend approximately 30 feet in the interpreted downgradient direction from the former oil USTs.

- Shallow groundwater at the site is interpreted to exist as a perched groundwater table. Groundwater generally occurs at a depth of approximately five to eight feet below grade. Locally, groundwater generally flows towards the west at a gradient of 0.08.

- Groundwater samples collected from wells at the site indicate that there is a low likelihood that groundwater at the site has been impacted with petroleum-hydrocarbons.

RECOMMENDATION

- This report should be sent to the SAM and RWQCB for review. Upon SAM and RWQCB review of this report, we recommend that you request a meeting with representatives of the SAM and RWQCB to discuss establishing site action levels for TRPH and TPH in soil.

It has been a pleasure working with you on this project. If we may provide any further assistance, please do not hesitate to contact us.

Respectfully,
ENVIRONMENTAL BUSINESS SOLUTIONS, INC.

P.O. BOX 85261
SAN DIEGO, CA 92186-5261
(619) 338-2222

December 9, 1993

James Buckner
La Mesa RV Center
7601 Alvarado Rd.
La Mesa, CA 92041

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE #T0427/H02651-001
LA MESA RV CENTER, 7601 ALVARADO RD., LA MESA, CA 92041

The staff of the Site Assessment and Mitigation Division (SAM) have reviewed this case. This letter has been prepared in accordance with the requirements set forth in Title 23 (State Underground Storage Tank Regulations), Division 3, Amendment to Chapter 16, Article 11, Section 2722. The purpose of this letter is to notify the Responsible Party of the status of the workplan dated November 24, 1993.

The workplan prepared by Dan Johnson/Environmental Business Solutions (EBS) covers one of the following phases of corrective action:

Interim Remedial Action	( )
Preliminary Site Assessment	(X)
Soil and Water Investigation	( )
Corrective Action Plan Implementation	( )
Verification Monitoring	( )

The workplan proposing to continue the soil and ground water investigation has been:

( ) approved.
( ) disapproved-call the undersigned for further instructions.
(X) approved with the following changes or conditions:

- The soil sample with the highest result for total petroleum hydrocarbons (TPH) must also be analyzed for volatiles by method 8020, and organic lead.

  The final report must include cross-sections of the soil contamination that depict the delineation achieved.

- The location proposed for MW-3 may not allow for accurate calculation of the ground water flow direction, based on the locations of wells MW-1 and 2 and the suspected local gradient to the north/northwest. It is recommended that well MW-3 be relocated to the east of sample points OES-15 and OES-6, approximately ten feet east of the edge of the previous excavation. This will also allow for lateral delineation of soil contamination in this area.

  However, there is still a requirement for lateral delineation of soil contamination in the vicinity of the previous location proposed for MW-3, i.e., to the south of OES-9 and OES-12. It is recommended that a soil boring, rather than a well, be placed at this location, in order to define the horizontal limits of soil contamination in this direction.

Keep this letter for your records as it may be required for corrective action cost reimbursement under Senate Bill 2004 (California Health and Safety Code, Chapter 6.75, Article 6).

Please submit a report describing the results of the activities described in the workplan to SAM and the Regional Water Quality Control Board (RWQCB) by January 30, 1994.

Please call me at (619) 338-2396, if you have any questions.

Sincerely,

LARS SKINNER, Hazardous Materials Specialist
Site Assessment and Mitigation Division

SOIL BORING AND WELL LOGS

Major Soil Divisions			Group Symbol	Descriptions
Coarse Grained Soils (>50 % of material is larger than No. 200 sieve.)	GRAVELS (% gravel > % sand.)	Clean Gravels (<5 % fines)	GW	Well graded gravels, little or no fines.
			GP	Poorly graded gravels or gravel-sand mixtures, little or no fines.
		Gravel With Fines (>15 % fines)	GM	Silty gravels, gravel-sand-silt mixtures, non-plastic fines.
			GC	Clayey gravels, gravel-sand-clay mixtures, plastic fines.
	SANDS (% sand ≥ % gravel.)	Clean Sands (<5 % fines)	SW	Well graded sands or gravelly sands, little or no fines.
			SP	Poorly graded sands, little or no fines.
		Sands With Fines (>15 % fines)	SM	Silty sands, sand-silt mixtures, non-plastic fines.
			SC	Clayey sands, sand-clay mixtures, plastic fines.
Fine Grained Soils (> 50 % of material is smaller than No. 200 sieve.)	SILTS AND CLAYS (Liquid limit is <50 %)		ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity.
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.
			OL	Organic silts and organic silty clays of low plasticity.
	SILTS AND CLAYS (Liquid limit is >50 %)		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
			CH	Inorganic clays of high plasticity, fat clays.
			OH	Organic clays of medium to high plasticity, organic silts.
Highly Organic Soils			Pt	Peat and other highly organic soils.

FINES	SAND			GRAVEL		COBBLES	BOULDERS
(Silt or Clay)	Fine	Medium	Coarse	Fine	Coarse

SUBJECT: DATA REPORT - LA MESA R.V. CENTER, 7601 ALVARADO RD., SAN DIEGO, CA - EBS PROJECT #93E1163.1

TEG Project #940210T3

Mr. Pulver:

Please find enclosed a data report for soil samples from the above referenced project for Environmental Business Solutions. The samples were analyzed in TEG's California DOHS certified mobile laboratories (CERT #1317). TEG personnel conducted the following analyses:

- 30 soils for total petroleum hydrocarbons (TPH) by DOHS Modified EPA Method 8015.
- 30 soils for total recoverable petroleum hydrocarbons (TRPH) by EPA Method 418.1

The results of the analyses are summarized in the attached tables. Applicable detection limits and QA/QC data are included on the tables.

TEG appreciates the opportunity to provide analytical services to Environmental Business Solutions for this project. If you have any questions relating to these data or report, please do not hesitate to contact us.

Sincerely,

Sheri W. Hartman

ANALYTICAL PROCEDURES

SAMPLE PREPARATION

Waters

Separate water aliquots are extracted for TPH analysis (gasoline and diesel) by liquid-liquid extraction with freon 113 using a modified EPA Method 3510. For volatile aromatics and chlorinated hydrocarbons (EPA 601 & 602), water samples are purged of volatiles in a Tekmar LSC-2000 purge & trap following EPA Method 5030.

Soils

Soil samples are extracted with methanol for volatile chlorinated hydrocarbon compounds (EPA 8010) and with freon 113 for volatile aromatic hydrocarbon compounds (EPA 8020) and fuel compounds (DOHS approved EPA 8015m) by hand-shaking for 2 minutes and sonification for 10 minutes.

GAS CHROMATOGRAPHY

Volatile Chlorinated Hydrocarbons

Water samples and soil extracts are purged in a Tekmar LSC-2000 purge & trap, and backflushed into a Shimadzu 14A gas chromatograph equipped with megabore capillary columns and photoionization detector (PID) and Hall electrolytic detectors following EPA Methods 601/8010 and 602/8020.

Volatile Aromatic Hydrocarbons (BTEX) & Total Fuel Hydrocarbons (TPH)

An aliquot of the soil extract is injected on-column into a Shimadzu gas chromatograph equipped with megabore capillary columns, photoionization (PID) and flame ionization detectors (FID).

TOTAL RECOVERABLE HYDROCARBONS

Extracts are scrubbed with silica gel and measured on a BUCK 404 Infrared Analyzer following EPA 418.1 protocols.

DATA ACQUISITION & PROCESSING

Data from the gas chromatographs are integrated and plotted by Hewlett-Packard 3393A computing integrators. Separate chromatograms are printed for each detector. The resulting chromatograms are inspected at the end of each run and the data entered into an IBM-compatible computer for on-site processing and evaluation.

Attention: B. PULVER

Analytical Technologies, Inc. has received the following sample(s):

Date Received	Quantity	Matrix
February 14, 1994	1	SOIL

The sample(s) were analyzed with EPA methodology or equivalent methods as specified in the enclosed analytical schedule. The symbol for "less than" indicates a value below the reportable detection limit. Please note that the Sample Condition Upon Receipt Checklist is included at the end of this report.

The results of these analyses and the quality control data are enclosed.

SUBJECT: **DATA REPORT - LA MESA R.V. - EBS PROJECT #93E1165.1**

RECEIVED
MAR 02 1994
Environmental Business Solutions Inc

TEG Project #940217-8

Mr. Pulver:

Please find enclosed a data report for water samples from the above referenced site for Environmental Business Solutions. All samples were analyzed in TEG's California DOHS certified mobile laboratory (CERT #1839). TEG personnel conducted the following analyses:

- 3 waters for volatile aromatic hydrocarbons (BTEX) by EPA Method 8020.
- 3 waters for total petroleum hydrocarbons (TPH) by DOHS Modified EPA Method 8015.

The results of the analyses are summarized in the attached table. Applicable detection limits and QA/QC data are included on the table.

TEG appreciates the opportunity to provide analytical services to Environmental Business Solutions for this project. If you have any questions relating to these data or report, please do not hesitate to contact us.

Sincerely,

Sheri Hartman

teg

ANALYTICAL PROCEDURES

SAMPLE PREPARATION

Waters

Separate water aliquots are extracted for TPH analysis (gasoline and diesel) by liquid-liquid extraction with freon 113 using a modified EPA Method 3510. For volatile aromatics and chlorinated hydrocarbons (EPA 601 & 602), water samples are purged of volatiles in a Tekmar LSC-2000 purge & trap following EPA Method 5030.

Soils

Soil samples are extracted with methanol for volatile chlorinated hydrocarbon compounds (EPA 8010) and with freon 113 for volatile aromatic hydrocarbon compounds (EPA 8020) and fuel compounds (DOHS approved EPA 8015m) by hand-shaking for 2 minutes and sonification for 10 minutes.

GAS CHROMATOGRAPHY

Volatile Chlorinated Hydrocarbons

Water samples and soil extracts are purged in a Tekmar LSC-2000 purge & trap, and backflushed into a Shimadzu 14A gas chromatograph equipped with megabore capillary columns and photoionization detector (PID) and Hall electrolytic detectors following EPA Methods 601/8010 and 602/8020.

Volatile Aromatic Hydrocarbons (BTEX) & Total Fuel Hydrocarbons (TPH)

An aliquot of the soil extract is injected on-column into a Shimadzu gas chromatograph equipped with megabore capillary columns, photoionization (PID) and flame ionization detectors (FID).

TOTAL RECOVERABLE HYDROCARBONS

Extracts are scrubbed with silica gel and measured on a BUCK 404 Infrared Analyzer following EPA 418.1 protocols.

DATA ACQUISITION & PROCESSING

Data from the gas chromatographs are integrated and plotted by Hewlett-Packard 3393A computing integrators. Separate chromatograms are printed for each detector. The resulting chromatograms are inspected at the end of each run and the data entered into an IBM-compatible computer for on-site processing and evaluation.

The sample(s) were analyzed with EPA methodology or equivalent methods as specified in the enclosed analytical schedule. The symbol for "less than" indicates a value below the reportable detection limit. If any flags appear next to the analytical data in this report, please see the attached list of flag definitions.

The results of these analyses and the quality control data are enclosed. Please note that the Sample Condition Upon Receipt Checklist is included at the end of this report.

Wastewater Information

Describe process generating wastewater: Purged groundwater from three groundwater monitoring wells

List known and suspected contaminants: Non-detect for Benzene, Toluene, Ethylbenzene, Xylenes and Total Petroleum Hydrocarbons

Describe any wastewater pretreatment methods used: N/A

Volume of wastewater to be discharged: Approx. 400 Gallon Flow 25 gal/min

Description of discharge point, include address and map as needed: Sewer hook-up used for Recreational Vehicle Sewage Holding Tank clean out

Proposed Date(s) of Discharge: 4-11-94 Time: 9:00 am

Lab Analysis

Attach a copy of lab analysis. For hydrocarbon only contaminated sites, analysis must include: Oil & Grease for TPH, Total Lead, Benzene, and Flash Point. For sites with contamination other than hydrocarbons, please contact the Industrial Waste Program for guidance prior to having the analysis performed. *Samples used for analysis must be representative of the wastewater to be discharged.*

Approval does not relieve the discharger of obligations regarding compliance with any and all applicable local, State, and Federal pretreatment standards or hazardous waste disposal requirements including any such standards or requirements that may become effective after the issuance of approval.

Subject: Thirty-Day Update Report

Dear Mr. Skinner:

I am writing to provide a thirty-day update report pursuant to Title 23 C.C.R. § 2652 and as required by your official notices. This update will cover activities occurring since my last update of March 30, 1994.

On April 21, 1994 Environmental Business Solutions accomplished removal and disposal of the soil cuttings and purge water, which has been temporarily stored on site, after obtaining all necessary permits. We expect that a report of those activities will be prepared by E.B.S. and we will provide a copy to SA/M with our next report.

Additionally, at your request, we will continue to provide periodic status update reports on a thirty-day reporting schedule pursuant to Title 23, C.C.R. § 2652. Accordingly, our next report will be due May 30, 1994.

All additional required applicable information remains unchanged.

If you have any questions, please do not hesitate to call me at (619) 699-2418.

Very truly yours,

Stephen L. Marsh

Subject: Thirty-Day Update Report

Dear Mr. Skinner:

I am writing to provide a thirty-day update report pursuant to Title 23 C.C.R. § 2652 and as required by your official notices. This update will cover activities occurring since my last update of January 28, 1994.

The drilling and installation of wells, pursuant to the approved workplan for additional site assessment activities prepared by Environmental Business Solutions with your suggested changes, was completed as scheduled on February 10 and 11, 1994. Additionally, samples of groundwater were taken and tested on February 18, 1994. Preliminary test results indicate that groundwater is not impacted.

We will submit a full report of site assessment activities, as required, on or before March 30th.

Additionally, at your request, we will continue to provide periodic status update reports on a thirty-day reporting schedule pursuant to Title 23, C.C.R. § 2652. Accordingly, our next report will accompany the site assessment report.

All additional required applicable information remains unchanged.

If you have any questions, please do not hesitate to call me at (619) 699-2418.

Subject: Thirty-Day Update Report

Dear Mr. Skinner:

I am writing to provide a thirty-day update report pursuant to Title 23 C.C.R. § 2652 and as required by your official notices. This update will cover activities occurring since my last update of December 29, 1993.

The drilling and installation of wells, pursuant to the approved workplan for additional site assessment activities prepared by Environmental Business Solutions with your suggested changes, is scheduled to take place February 10 and 11, 1994.

Your December 9, 1993 letter required a report to be submitted not later than January 30, 1994 to SA/M and the Regional Water Quality Control Board. On January 6, 1994 you telephonically approved our request that this date be extended an additional sixty days to March 30, 1994. We will submit a full report of site assessment activities on or before March 30th.

Additionally, at your request, we will continue to provide periodic status update reports on a thirty-day reporting schedule pursuant to Title 23, C.C.R. § 2652. Accordingly, our next report is due Feb. 28, 1994.

All additional required applicable information remains unchanged.

If you have any questions, please do not hesitate to call me at (619) 699-2418.

RE: Well Purging/Sampling Logs for the La Mesa RV Center at 7601 Alvarado Road, La Mesa, California (Site)

Dear Ms. Spangenberg:

As you requested, please find enclosed copies of the Well Purging/Sampling Logs for the above-referenced Site. The Logs are for wells MW-1, MW-2, and MW-3, which were sampled on March 28, 1995.

Should you have any questions regarding these documents, please call us at (619) 571-5500.

Respectfully,
ENVIRONMENTAL BUSINESS SOLUTIONS, INC.

RE: Disposal of Groundwater Monitoring Well Purge Water at the Property Located at 215 East Main Street, El Cajon, California (Site)

Dear Mr. Shipley:

On May 9, 1995, EBS disposed of approximately 24 gallons of groundwater monitoring well purge water at the Site. This purge water was discharged to the sewer in accordance with the approved Groundwater Batch Discharge Authorization (enclosed).

If you have any questions regarding this matter, please contact us at (619) 571-5500.

Respectfully,

RE: Quarterly Groundwater Monitoring Report for the First Quarter 1995 and Workplan Describing Additional Site Assessment Activities Pursuant to the Request of San Diego County Site Assessment and Mitigation Division (SAM) for the La Mesa RV Center at 7601 Alvarado Road, La Mesa, California (Site)

Dear Mr. Buckner:

Environmental Business Solutions, Inc. (EBS) is pleased to present this Quarterly Groundwater Monitoring Report for the first quarter 1995 pursuant to the requirements of the SAM for the above-referenced Site (Figure 1). The work described in this report was conducted in general accordance with the Scope of Services Change Number 4 to Exhibit "1" to the Consulting Agreement (Contract) between EBS and La Mesa RV, Inc. (Client). The Contract was fully executed on February 3, 1994.

EBS has prepared this written workplan which is intended to satisfy the requirements of the SAM prior to performing an additional soil investigation at the Site. This workplan describes the Site background, the procedures to be followed during the field investigation, the type of laboratory analyses to be performed on soil samples, and the type of report to be prepared.

BACKGROUND

The following background information is from previously reported data and reports prepared by others and by EBS. Four underground storage tanks (USTs) of various capacities were recently removed from the Site. The USTs stored new oil, used oil, and gasoline. The USTs were located immediately to the west and south of a service bay building at the Site (Figure 2). The four USTs consisted of one 550-gallon used oil UST, two 550-gallon new oil USTs, and one 2,000-gallon regular gasoline UST.

The USTs were removed in February 1988 by Alm Services (Alm). The "Abandoned Underground Tank Report" prepared for the Site by the county inspector indicated that each of the USTs had holes ranging from pinhole size to three-quarters of an inch in diameter. Groundwater impact was not noted during the USTs' removal, although groundwater was observed at a depth of approximately 7 feet below grade in the excavation.

Correspondence from Alm to the County of San Diego in March 1988 indicates that six soil samples from the UST excavation were collected. Detectable concentrations of both total petroleum hydrocarbons (TPH) and total recoverable petroleum hydrocarbons (TRPH) were found in each of the samples collected. In May 1988, Alm was reported to have collected an additional three samples from the new and used oil UST excavation. Detectable concentrations of TRPH were found in each of the three samples.

In March 1992, subsequent to the submission and approval of a workplan, we understand that Halliburton NUS (Halliburton) conducted a multi-day exploratory excavation program at the Site. Approximately 400 cubic yards of soil was excavated from the former vicinity of the USTs. Numerous confirmation samples were collected during the excavation program (Figures 2 and 5). Confirmation samples indicated that soil with concentrations of both TPH and TRPH remains in the vicinity of the excavation.

In February 1994, subsequent to the approval of a workplan, EBS conducted a soil and groundwater investigation at the Site. During this investigation, 11 soil borings were drilled, 3 of which were converted to groundwater monitoring wells MW1, MW2, and MW3 (Figure 2). Portions of the borings were drilled using air percussion drilling methods. To reduce the potential for aeration effects from the circulation of air down the boring during drilling, samples were collected with a split-spoon sampler driven 12 to 18 inches ahead of the bit, and only the lowermost sample tube was submitted to the laboratory for analysis to improve the likelihood that the sample was representative of the subsurface conditions.

Based on the soil sample results, the horizontal extent of gasoline-bearing and diesel-bearing soil was interpreted to be generally limited to the immediate vicinity of the former UST excavation, and to a maximum depth of approximately 15 feet below grade. The horizontal extent of TRPH-bearing soil was concluded to generally have been assessed, and was interpreted to extend a maximum of approximately 30 feet downgradient from the former oil USTs. Groundwater was detected in the wells at depths ranging from approximately 5 to 8 feet below grade, and was interpreted to be perched water. Groundwater sample results were reported to be below laboratory detection limits for TPH as gasoline (TPH_g) and as diesel (TPH_d), and for benzene, toluene, ethylbenzene, and total xylenes (BTEX).

GROUNDWATER MONITORING CONDUCTED BY ENVIRONMENTAL BUSINESS SOLUTIONS, INC.

On March 28, 1995, EBS personnel monitored the wells at the Site. Depth-to-water measurements were taken, and the potential presence of free floating product was monitored with an electronic interface probe with a manufacturer's reported accuracy of 1/100 of a foot. Free floating petroleum product was not detected in any of the three wells nor observed in a clear bailer lowered in the wells. The locations and elevations of the wells were previously surveyed by Hopwood Surveying, a licensed surveyor.

As shown on the attached Table 1, shallow groundwater was encountered at depths ranging from approximately 4.5 to 8 feet below grade. Based on the depth-to-groundwater measurements and the information from the licensed surveyor, a groundwater flow direction for the Site was estimated by solving a three-point problem. The shallow groundwater is interpreted to generally flow towards the west (Figure 3) with a gradient of approximately 0.07. The estimated groundwater flow direction and gradient are consistent with the previous groundwater flow direction estimated by EBS.

After being monitored, each well was prepared for sampling by the removal of approximately 1 borehole volume of water with a bailer. All three wells were interpreted to be slow-recharging wells. Sampling equipment was cleaned between wells with a soapy water wash and a tap water rinse. Purged water from the wells was placed in drums, labeled, and left on-site. Approximately 24 gallons of purged groundwater

was generated. EBS is in the process of obtaining permission to dispose of the purged water to the sanitary sewer. Samples were collected approximately 2 hours after purging was completed. The water samples were collected with a single-use disposable bailer. Groundwater samples were decanted into volatile organics analysis (VOA) vials, capped with Teflon-lined caps, sealed, labeled, and placed on ice. The samples were delivered to Analytical Technologies, Inc. (ATI), a state-certified hazardous waste laboratory, under chain-of-custody protocol.

The samples were tested for the following:

- TRPH in general accordance with EPA Method 418.1;
- TPH_g and TPH_d in general accordance with modified EPA Method 8015 (California Department of Health Services Method);
- BTEX and methyl tertiary butyl ether (MTBE) in general accordance with EPA Method 8020; and
- Polynuclear aromatic hydrocarbons (PAHs) in general accordance with EPA Method 8310.

The laboratory results from ATI indicated that TPH_g, TPH_d, BTEX, and PAHs were not detected. TRPH was detected in all three groundwater samples. TRPH concentrations were reported to range from 410 to 1,000 micrograms/liter (µg/l). Table 2 presents the latest and historical groundwater sampling results, and Figure 4 illustrates the latest groundwater sampling results. The laboratory report is included in the attached Appendix.

WORKPLAN

It is our understanding, based on review of a letter issued by the SAM on February 7, 1995, that the SAM has requested additional assessment of the vertical and horizontal extent of petroleum hydrocarbon-bearing soil.

The program described in this proposed workplan has been designed in general accordance with the requirements of the SAM, the data gathered and interpreted in preparing this workplan, as well as our professional judgment and experience in this type of investigation.

Objective

The objective of this proposed scope of services is to:

- Further assess the extent of petroleum hydrocarbon-bearing soil in the vicinity of the former gasoline and new and used oil USTs at the Site.

Scope of Services

The scope of services that will be used to meet the objective includes the following Phases:

Phase I **Preparation of a Workplan and Site Health and Safety Plan, Preparation of Soil Boring Permits, Subcontractor Management and Scheduling, and Utility Search and Mark Out**

EBS has prepared this written workplan which is intended to satisfy SAM requirements. This workplan is intended to describe the field procedures to be followed in the field investigation, including the type of laboratory analyses to be performed on the soil samples, and soil sample collection methods. This workplan includes the proposed locations and rationale for additional soil borings and sample locations (Figure 5). The soil boring program has been designed to further assess the lateral and vertical extent of petroleum hydrocarbon-bearing soil in the vicinity of the former UST locations.

The existing health and safety plan for the Site will be revised to reflect the current work scope. A health and safety plan for work conducted at the Site and workers within the "exclusion zone" is required pursuant to the regulations in 29 Code of Federal Regulations (CFR) Part 1910.120. Therefore, a health and safety plan will be prepared which will outline the potential chemical and physical hazards that may be encountered during drilling and sampling activities. The appropriate personal protective equipment and emergency response procedures for the site-specific chemical and physical hazards will be detailed in this plan. EBS and contracted personnel involved with the proposed field work will be required to sign this document in order to encourage proper health and safety practices.

Because the soil borings are anticipated to intersect groundwater, soil boring permits will be prepared and submitted to the SAM with the appropriate fee. The permits will be signed by the appropriately licensed professional.

Prior to mobilizing for field work, EBS will notify and schedule the appropriate subcontractors including but not limited to, the laboratory, the drilling company, the surveyor, the concrete coring company, concrete masons, Underground Service Alert (USA), and the material supply company. In addition, before the soil borings are drilled, EBS will work with USA and a private underground utility search company to attempt to locate subsurface utilities and improvements at the Site to minimize the likelihood of drilling into an underground utility.

Phase II **Drilling and Sampling of Four Soil Borings**

Drilling of Four Soil Borings

Four soil borings will be drilled, logged, and sampled to depths of approximately 20 feet below grade, or until refusal is met. The borings will be drilled in the vicinity of the western and southwestern perimeter of the former excavation at the Site. The proposed locations of the borings have been designed to provide additional information about the possible migration of petroleum hydrocarbons west and northeast of the former USTs at the Site.

The following is a brief presentation of the rationale for soil boring locations. The proposed soil boring locations are illustrated on the attached Figure 5.

Soil Boring No.	Location/Rationale
B-7	Located west/northwest of soil sample GES-11 (3,300 mg/kg of TRPH) and well MW-1 (59 to 962 mg/kg of TRPH). To further assess the vertical and lateral extent and concentration of petroleum hydrocarbons downgradient from the above-mentioned soil sample/well locations.
B-8	Located west of soil sample OES-11 (16,000 mg/kg of TRPH) and boring B-1 (31 to 9,140 mg/kg of TRPH). To further assess the lateral and vertical extent of petroleum hydrocarbons downgradient from the above-mentioned soil sample/boring locations.
B-9	Located adjacent to borings B-1 and B-1A. To assess the vertical extent of petroleum hydrocarbons beneath the 15-foot sample in B-1A (433 mg/kg of TRPH).
B-10	Located southwest of soil samples OES-12 and OES-13 (18,000 and 23,000 mg/kg of TRPH, respectively). To further assess the vertical and lateral extent of petroleum hydrocarbons in the vicinity of the above-mentioned soil samples.

An additional soil boring to assess the vertical extent of petroleum hydrocarbons beneath the bottom of B-4 is not proposed. Soil boring B-4A is located approximately 5 feet from boring B-4 and had two soil samples collected from a greater depth than the bottom of B-4. Therefore, it is our opinion that this data may be used to assess the vertical extent of petroleum hydrocarbons beneath B-4.

The soil borings are anticipated to be drilled by using an air rotary rig with a dual-wall drilling system or with driven casing. This type of rig will be used due to the difficult drilling conditions encountered previously at the Site (colluvium and alluvium with abundant gravel and cobble). In addition, caving occurred in some of the borings, resulting in difficulties in collecting samples. Sample collection is anticipated to be more efficient if a dual-wall or driven casing system is used. A qualified, licensed drilling contractor will be selected at a later date.

We anticipate collecting soil samples from soil borings at approximately 5, 8, 10, 15 and 20 feet below grade and at interpreted significant lithologic changes. The 8-foot sample is intended to provide data at the interpreted water table, but its depth may vary depending on the boring location.

The soil borings will be backfilled with an approved grout. As required by San Diego County guidelines, either pre-steam washed augers or down-hole air percussion drilling equipment will be on-site or a steam cleaner will be on-site to steam wash the augers or down-hole air percussion drilling equipment between soil borings to minimize the likelihood of "cross-contaminating" the borings and to minimize the potential for a "false positive" in the soil samples analyzed. All soil cuttings generated from drilling will be placed in 55-gallon drums, which will be labeled and left on-site pending laboratory analysis results.

A California-registered geologist will be on Site to observe the drilling activity, and describe collected soil samples in general accordance with the United Soil Classification System. During the drilling of the soil borings, soil samples will be collected, when possible, with a split-spoon type or similar sampler. Soil samples will be driven into brass or stainless steel tubes. The tubes will be covered with Teflon sheeting,

tightly closed with end caps, and delivered immediately to an on-site mobile laboratory. The sample containers will be packed in ice-filled coolers. Chain-of-custody procedures will be implemented for sample tracking. A written analytical report will be provided by the laboratory upon the completion of the sample testing. Please note that based on previous drilling, Site conditions may not allow for the collection of drive samples. If this is the case, we will attempt to collect representative samples from the subsurface.

Sample Analyses

EBS will retain a mobile laboratory to conduct on-site analytical testing of soil samples. This way, should impacted soil extend further vertically or laterally than target depths or soil boring locations, additional soil samples can be collected while personnel and equipment are already mobilized at the Site. As many as four soil samples from each boring (including at least one sample collected from within the field-interpreted saturated zone) will be analyzed for TPH_g and TPH_d in general accordance with modified EPA Method 8015 (California Department of Health Services Method), and for TRPH in general accordance with EPA Method 418.1

In addition, the one soil sample with the highest reported TPH concentration per soil boring will be analyzed for BTEX in general accordance with EPA Method 8020. Based on previous soil sampling results for polychlorinated biphenyls (PCBs), chlorinated solvents, and total lead, analyses for other constituents are not proposed.

Phase III Data Evaluation, Figure and Table Preparation, Soil Boring Log Preparation, and Report Preparation

Based on the findings of the field investigation and laboratory results from the above scope of services and the historical findings provided by the Client, an assessment report (Report) will be written in general accordance with SAM guidelines. The Report will include laboratory reports, chain-of-custody documents, permits, illustrations reflecting the sampled subsurface, logs of the soil borings, tabulated analytical results, and appropriate support documentation. The Report will include a description of the work performed, discussion of the results, and our conclusions and recommendations as deemed appropriate. In addition, the report will include figures illustrating the extent of petroleum hydrocarbon-impacted soil and the ratio of TPH to TRPH concentrations, and an explanation of petroleum hydrocarbon distribution and migration, in general accordance with SAM guidance as presented in the letter to Mr. Buckner, dated February 7, 1995.

The Report will be peer reviewed and signed by a California Certified Engineering Geologist.

In addition to the above-described Report, in order to comply with the requirements of the soil boring permits, a "thirty day" report will be prepared and submitted to the SAM.

Estimated Schedule

We estimate that the total time necessary to complete the above phased scope of services is approximately 30 to 35 working days.

EBS appreciates the opportunity to provide you with a Quarterly Groundwater Monitoring Report and workplan on this important project. Should you have any questions regarding this letter, please contact the undersigned at (619) 571-5500.

Respectfully,

La Mesa RV Center, 7601 Alvarado Rd., La Mesa, CA 92041

Dear Ms. Spangenberg:

I enjoyed talking with you on the telephone regarding this site and the additional work required by Lars Skinner's letter of February 7, 1995. During our telephone conversation you agreed to combine the dates for submission of a workplan and submission of the report of quarterly groundwater monitoring to be due on the same date, April 30, 1995. This will permit our consultant to have the groundwater monitoring data available for use in preparation of the workplan for further site work.

We thank you for your courtesy and cooperation.

Very truly yours,

Stephen L. Marsh

RE: Proposed Groundwater Monitoring Well Destruction Activities Performed Pursuant to the Approval of the San Diego County Site Assessment and Mitigation Division (SAM) at La Mesa R.V. Center, 7601 Alvarado Road, La Mesa, California

Dear Ms. Spangenberg:

Environmental Business Solutions, Inc. (EBS) is pleased to present this letter (Letter) regarding the proposed groundwater monitoring well destruction activities. Please find enclosed a copy of the well destruction permit that was submitted on July 12, 1996. We understand that Ms. Helen Dennin has approved the well destruction permit as of our conversation with her on July 15, 1996. The well destruction activities are scheduled for July 30, 1996. The wells will be destroyed in general accordance with SAM guidelines and the conditions of the approved well destruction permit. Cuttings and well destruction materials generated during the well destruction activities will be properly disposed of.

Lemon St 96161

In addition, on July 10, 1996, five soil drums were removed from the site and transported to Soil Wash Technologies, Inc. for treatment and disposal. A copy of the waste manifest is attached.

It has been a pleasure working with you on this project. If you have any questions or concerns, please do not hesitate to contact our office at (619) 571-5500.

Respectfully,
ENVIRONMENTAL BUSINESS SOLUTIONS, INC.

Re: La Mesa RV Center, 7601 Alvarado Road, La Mesa, California

see "Technical Reports" Section for this report

Dear Ms. Spangenberg:

Enclosed is the May 2, 1996 *Report of Groundwater Assessment Activities For the Property at 7601 Alvarado Road, La Mesa, California*, prepared by Environmental Business Solutions, Inc. On the basis of this report, previous environmental investigations of soil and groundwater and removal of approximately 400 cubic yards of impacted soils, we are requesting that a "no further action" letter be issued for the subject site.

The following is a summary of soil and groundwater investigations conducted at the subject facility by various environmental consulting firms. Our request for a "no further action" letter is based on the information provided in these reports.

ENVIRONMENTAL SUMMARY

La Mesa RV Center engages in the sale and maintenance of recreational vehicles. Several office, sales, storage, and service/maintenance structures are located on the subject site and most of the surface has been paved with asphaltic concrete with a few areas of vegetation. Four underground storage tanks (USTs) were located in the southern portion of the subject site and were removed in February 1988. One 550-gallon UST stored used oil, two 550-gallon USTs stored new oil, and one 2,000-gallon gasoline/diesel UST. According to the San Diego County Hazardous Materials Management Division (HMMD) inspector, each of the USTs had holes ranging from pinhole size to three-quarters of an inch in diameter. The inspector did not note any adverse impacts to groundwater during the USTs' removal, although perched groundwater was observed at a depth of approximately 7 feet below grade in the excavation.

Six soil samples from the UST excavation were collected and analyzed. Detectable concentrations of both total petroleum hydrocarbons (TPH) and total recoverable petroleum hydrocarbons (TRPH) were found in each of the samples collected. Three additional soil samples were collected from the new and used oil area of the UST excavation in May 1988 and detectable concentrations of TRPH were found in each of the three samples analyzed.

A removal program was conducted at the subject site in March 1992 in which approximately 400 cubic yards of soil was excavated in the vicinity of the former USTs. Confirmation soil samples collected and analyzed after the excavation project indicated that concentrations of both TPH and TRPH remained in the vicinity of the excavation.

Eleven soil borings were drilled at the subject site in February 1994, with three of these borings converted to groundwater monitoring wells. Shallow groundwater beneath the subject site was encountered at a depth of approximately 4 to 9 feet below grade and appeared to flow generally toward the west at a gradient of about 0.08. Thirty soil samples were collected and tested for TPH as gasoline (TPH-gas) and diesel (TPH-diesel). Soil samples with reported concentrations of TPH were only identified in three soil borings. TPH-gas concentrations ranged from 14 to 174 mg/kg and TPH-diesel concentrations ranged from 14 to 271 mg/kg. Thirty soil samples were analyzed for TRPH and ten of the eleven soil borings showed detectable concentrations ranging from 11 to 9,140 mg/kg. The sample with the highest TPH-gas and TRPH concentrations was analyzed for benzene, toluene, ethylbenzene, and total xylenes (BTEX) and aromatic hydrocarbons. No concentrations of BTEX or aromatic hydrocarbons were found in the sample. Organic lead was identified at a concentration of 1.5 mg/kg in one soil sample.

Samples from the three groundwater monitoring wells were analyzed. There were no concentrations of TPH-gas, TPH-diesel, or BTEX identified in any of the samples. One groundwater sample showed a concentration of 0.002 mg/l total lead.

Additional assessment activities were conducted at the subject site in November 1995. Three soil borings were drilled and a round of monitoring, purging and sampling of the three wells was conducted. TRPH, TPH-gas, TPH-diesel and benzene concentrations were not found in any of the groundwater well samples analyzed. Concentrations of toluene (32.9 ug/l), ethylbenzene (2.0 ug/l), total xylenes (12.5 ug/l), and MTBE (0.7 ug/l), none of which exceed MCL's or recommended action levels, were identified in one well.

In March 1996, the three groundwater monitoring wells were monitored, purged, and sampled. Laboratory analytical results indicate that no TRPH, TPH-gas, TPH-diesel, BTEX, or MTBE were detected in groundwater samples collected from the three monitoring wells.

CONCLUSION

On the basis of soil sample analytical results, the horizontal extent of petroleum hydrocarbon impacted soils is limited to the immediate vicinity of the former UST excavation and to a maximum vertical depth of approximately 15 feet below grade. Groundwater has not been impacted by releases from the former underground storage tanks (USTs). Four groundwater monitoring events have been conducted at the subject site over a period of two years. At no time has any concentration of BTEX been reported to exceed maximum contaminant levels (MCLs) for drinking water nor have any detectable levels of benzene ever been reported. The subject site has been adequately characterized and does not pose a threat to human health or the environment. Furthermore, based on these facts, the La Mesa RV site meets the April 1, 1996 Regional Water Quality Control Board *Interim Guidance on Required Cleanup at Low-Risk Fuel Contaminated Sites* criteria for a "low risk soils only case." As a result, we are requesting that a "no further action" letter be issued for the La Mesa RV site at your earliest convenience.

Very truly yours,

Christine Baumgardt for

RE: Report of Groundwater Assessment Activities Performed Pursuant to the Request of San Diego County Site Assessment and Mitigation Division (SAM) for the La Mesa R.V. Center at 7601 Alvarado Road, La Mesa, California (Site)

Dear Ms Spangenberg:

Environmental Business Solutions, Inc. (EBS) is pleased to present this letter report (Report) which summarizes the results of a groundwater assessment recently performed at the Site. The work described in this report was conducted in general accordance Exhibit "2" to the Consulting Agreement (Contract) between EBS and La Mesa R.V., Inc. (Client). The Contract was fully executed on February 3, 1994.

SITE INFORMATION

SITE LOCATION/DESCRIPTION

The Site is located in a commercial/retail portion of the City of La Mesa (Figure 1). Topographically, the Site is located along a relatively level terrace. Steep slopes are located along the southern portion of the Site.

The Site is used as a recreational vehicle sales and service facility. Site improvements include offices, showrooms, service bays, and associated driveways and parking areas. The northern portion of the Site is generally used for showrooms, vehicle parking, and sales offices. The southern portion of the Site is used for the repair and servicing of vehicles. Four underground storage tanks (USTs) were formerly located in the southern portion of the Site (Figure 2).

SITE IDENTIFICATION

Site Name:	La Mesa R. V. Center
Site Location:	7601 Alvarado Road, La Mesa, California 92041
SAM Case Number:	HO2651-001, T0427

BACKGROUND

The following background information is from previously reported data and reports prepared by others and by EBS. Four USTs of various capacities were removed from the Site. The USTs stored new oil, used oil, and gasoline. The USTs were located immediately to the west and south of a service bay building at the Site (Figure 2). The four USTs consisted of one 550-gallon used oil UST, two 550-gallon new oil USTs, and one 2,000-gallon regular gasoline UST.

UST REMOVAL OF FEBRUARY 1988

The USTs were removed in February 1988 by Alm Services (Alm). The "Abandoned Underground Tank Report" prepared for the Site by the San Diego County Hazardous Materials Management Division (HMMD) inspector indicated that each of the USTs had holes ranging from pinhole size to three-quarters of an inch in diameter. Groundwater impact was not noted during the USTs' removal, although groundwater was observed at a depth of approximately 7 feet below grade in the excavation.

Correspondence from Alm to the HMMD in March 1988 indicated that six soil samples from the UST excavation were collected. Detectable concentrations of both total petroleum hydrocarbons (TPH) and total recoverable petroleum hydrocarbons (TRPH) were found in each of the samples collected. In May 1988, Alm was reported to have collected an additional three samples from the new and used oil area of the UST excavation. Detectable concentrations of TRPH were found in each of the three samples.

ASSESSMENT/REMEDIATION ACTIVITIES PERFORMED BY HALLIBURTON NUS IN MARCH 1992

In March 1992, subsequent to the submission and approval of a workplan, we understand that Halliburton NUS (Halliburton) conducted an exploratory excavation program at the Site. Approximately 400 cubic yards of soil was excavated from the vicinity of the former USTs. Numerous confirmation samples were collected during the excavation program. Confirmation samples indicated that soil with concentrations of both TPH and TRPH remained in the vicinity of the excavation.

WORKPLAN PREPARED BY EBS IN NOVEMBER 1993

In November 1993, EBS submitted a workplan to Mr. Lars Skinner of the SAM for review and approval. The workplan described an assessment which included the following:

- Drilling and sampling of seven soil borings and converting three of the soil borings to groundwater monitoring wells (wells);
- Monitoring, purging, and sampling the three wells; and
- Performing laboratory analysis on the collected soil and groundwater samples.

The workplan was approved by Mr. Skinner on December 9, 1993.

SOIL AND GROUNDWATER ASSESSMENT PERFORMED BY EBS IN FEBRUARY 1994

In February 1994, 11 soil borings (B-1, B-1A, B-2, B-3, B-4, B-4A, B-5, B-6, MW-1, MW-2, and MW-3) were drilled, three of which were converted to groundwater monitoring wells MW-1, MW-2, and MW-3. Work performed during this investigation included the collection and analysis of soil and groundwater samples. A report[1] summarizing the assessment activities was prepared and submitted to the SAM in March 1994.

Site Hydrogeology

The Site is interpreted to be located in the Mission San Diego Hydrologic Subarea of the Lower San Diego Hydrologic Area of the San Diego Hydrologic Unit. According to the Regional Water Quality Control Board (RWQCB), groundwater within this hydrologic subarea has existing or potential beneficial uses for municipal, agricultural, and/or industrial supplies.

The hydrologic areas and water use designations were presented in the RWQCB's "Comprehensive Water Quality Plan" (Plan) originally adopted in 1974. Recent amendments to the Plan, adopted in September 1994 by the RWQCB, were reviewed and used in the preparation of this Report.

---

[1] Report of Soil and Groundwater Investigation Pursuant to the Requirements of the San Diego County Site Assessment and Mitigation Division (SAM) for La Mesa R. V. Center, Inc., Located at 7601 Alvarado Road, La Mesa, California (Site).

As previously reported, the shallow groundwater at the Site is generally encountered at a depth of approximately 4 to 9 feet below grade. The shallow groundwater is interpreted to flow generally towards the west at a gradient of approximately 0.08 (8 feet of elevation difference for every 100 feet of horizontal distance).

SAM LETTER OF FEBRUARY 7, 1995

On February 7, 1995, Mr. Lars Skinner issued a letter regarding his review of the assessment report prepared by EBS, and subsequently requested that additional assessment of petroleum hydrocarbon-bearing soil and groundwater be performed.

WORKPLAN AND QUARTERLY GROUNDWATER MONITORING REPORT PREPARED BY EBS

On May 1, 1995, EBS submitted a workplan and quarterly groundwater monitoring report[2] to the SAM. Prior to preparing the May 1995 report, the three wells were monitored, purged, and sampled.

The workplan presented a scope of work intended to assess the shallow soil at the Site. This scope of work included the drilling, sampling, and logging of four additional soil borings; monitoring, purging and sampling of three wells; and laboratory analysis of collected soil and groundwater samples.

SAM WORKPLAN APPROVAL LETTER OF JUNE 19, 1995

On June 19, 1995, Ms. Carol Spangenberg of the SAM issued a workplan approval letter.

REPORT PREPARED BY EBS

In November, 1995, EBS conducted additional assessment activities at the Site which included drilling three soil borings and an additional round of monitoring, purging and sampling the three wells. Work performed during this investigation included

---

[2] Quarterly Groundwater Monitoring Report for the First Quarter of 1995 and Workplan Describing Additional Site Assessment Activities Pursuant to the Request of San Diego County Site Assessment and Mitigation Division (SAM) for the La Mesa R. V. Center at 7601 Alvarado Road, La Mesa, California (Site).

the collection and analysis of soil and groundwater samples. A report[3] summarizing the assessment activities was prepared and submitted to the SAM in March 1996.

OBJECTIVES

The objectives of this scope of services were to:

- Assess shallow groundwater at the Site for flow direction, gradient, and concentration of dissolved petroleum hydrocarbons.

SCOPE OF SERVICES

The scope of services that were used to meet the objectives are as follows:

AMENDMENTS TO THE PREVIOUSLY PREPARED SITE HEALTH AND SAFETY PLAN, SUBCONTRACTOR SCHEDULING, AND PROJECT MANAGEMENT

Preparation of a Site Health and Safety Plan

A health and safety plan for work conducted at the Site and workers within the "exclusion zone" is required pursuant to the regulations in 29 Code of Federal Regulations (CFR) Part 1910.120. Therefore, the previously prepared health and safety plan, which outlined the potential chemical and physical hazards that may be encountered during sampling activities, was amended for the current work scope. The appropriate personal protective equipment and emergency response procedures for the site-specific chemical and physical hazards were detailed in this plan. EBS personnel involved with the proposed field work were required to sign this document in order to encourage proper health and safety practices.

Subcontractor Management and Scheduling

Prior to mobilizing for field work, EBS notified and scheduled the analytical laboratories (Transglobal Environmental Geochemistry [TEG] and Geotest).

MONITORING, PURGING, AND SAMPLING THREE WELLS

On March 31, 1996, three groundwater monitoring wells (MW-1, MW-2, and MW-3) were monitored, purged, and sampled. The wells were monitored with an electronic

---

[3] Report of Soil and Groundwater Investigation Pursuant to the Requirements of the San Diego County Site Assessment and Mitigation Division (SAM) for La Mesa R. V. Center, Inc., Located at 7601 Alvarado Road, La Mesa, California (Site).

interface probe to measure depth to water. The interface probe is reported to measure groundwater level to within an accuracy of 1/100 foot. No free floating petroleum product was encountered during the monitoring activities. Both current and historical monitoring data are shown in Table 1.

After the wells were monitored they were purged and sampled in general accordance with SAM guidelines. Wells MW-1 and MW-3, were purged with a bailer. Purge water was placed in appropriate drums and left on-site. Well MW-2 was purged with a submersible pump. Approximately 1.5 borehole volumes of water was purged from each well. After approximately 2 hours after purging, the wells did not recharge to at least 80 percent of the pre-purging static water level. The wells were judged to be slow recharging and were sampled.

Groundwater was sampled with a disposable bailer. The groundwater samples were decanted into laboratory-supplied vials, capped, labeled, and placed in an ice-filled chest. Chain-of-custody procedures were implemented for sample tracking.

Laboratory Analysis of Collected Groundwater Samples

Groundwater samples were kept in an ice-filled cooler until analysis by TEG and analyzed for the following:

- TPH[4] in general accordance with modified EPA Method 8015;
- BTEX in general accordance with EPA Method 8020; and
- TRPH in general accordance with EPA Method 418.1.

In addition, a duplicate set of groundwater samples was submitted to Geotest and analyzed for the following:

- MTBE in general accordance with EPA Method 8020.

Groundwater laboratory test results are shown in Table 2. Laboratory test reports are attached.

---

[4] "Full scan" includes gasoline and diesel ranges.

FINDINGS

HYDROGEOLOGY

The shallow groundwater at the Site was generally encountered at a depth of approximately 4 to 8 feet below grade. The shallow groundwater is interpreted to generally flow towards the west (Figure 2) at a gradient of approximately 0.08 (8 feet of elevation difference for every 100 feet of horizontal distance).

GROUNDWATER SAMPLES

Total Petroleum Hydrocarbons

All groundwater samples were reported to have no detectable TPH concentrations.

Total Recoverable Petroleum Hydrocarbons

All groundwater samples were reported to have no detectable TRPH concentrations.

Benzene, Toluene, Ethylbenzene, and Xylenes

All groundwater samples were reported to have no detectable BTEX concentrations.

Methyl Tertiary Butyl Ether

All groundwater samples were reported to have no detectable MTBE concentrations.

DISCUSSION

- Groundwater samples have been analyzed for MTBE and for BTEX. These are typically very soluble components of gasoline,[5] and their presence is frequently an indicator of gasoline. No detectable concentrations of MTBE or BTEX were reported for the collected groundwater samples.

- Groundwater samples were also analyzed for TPH and TRPH. No detectable TPH or TRPH concentrations were reported for the collected groundwater samples.

---

[5] MTBE is a gasoline additive.

- Groundwater samples have previously been analyzed for polynuclear aromatic hydrocarbons[6] (PAHs). No detectable PAH concentrations were reported for the collected groundwater samples.

ASSESSMENT OF GROUNDWATER QUALITY AT THE SITE

Based on the groundwater samples collected from the Site to date, it is our opinion that groundwater at the Site has not been impacted[7] by release(s) from the former USTs.

There have been four groundwater monitoring events at this Site. As shown in Table 2, at no time has any concentration of BTEX been reported to exceed maximum contaminant levels[8] (MCLs) for drinking water. It should be stressed that all of the groundwater samples were reported to have no detectable benzene concentrations (Table 2).

No detectable MTBE concentrations were reported during this round of sampling. Groundwater sample MW-2, collected on November 28, 1995, was reported to have an MTBE concentration of 0.7 µg/l. It should be noted that the detection level for MTBE was 0.6 µg/l. The State "action level" for MTBE is 35 µg/l.

No detectable concentrations of TPH or TRPH were reported in collected groundwater samples.

CONCLUSIONS

Based on the data reviewed and obtained as part of this assessment, current regulatory guidelines, and our experience, in our professional judgement we have drawn the following conclusions:

- There is a low likelihood that the shallow groundwater at the Site has been impacted from a release(s) from the former USTs.

---

[6] Quarterly Groundwater Monitoring Report for the First Quarter of 1995 and Workplan Describing Additional Site Assessment Activities Pursuant to the Request of San Diego County Site Assessment and Mitigation Division (SAM) for the La Mesa R. V. Center at 7601 Alvarado Road, La Mesa, California (Site).

[7] Impact to groundwater for the purposes of this report is defined as concentrations of chemicals that exceed MCLs, as defined in CCR Title 22, or the presence of free product or groundwater.

[8] MCL as defined in California Code of Regulations, Title 23.

RECOMMENDATIONS

- We recommend, based on the groundwater sample analytical results collected at the Site to date, that the SAM consider issuing a "no further action" letter (Site closure).

- After receiving Site closure, the Client should consider properly destroying the existing three groundwater monitoring wells.

We have enjoyed working with you on the important project. If we may be of further assistance or you have any question, please feel free to contact the undersigned at 619-571-5500.

Respectfully,
ENVIRONMENTAL BUSINESS SOLUTIONS, INC.

REPORT USAGE AND FUTURE SITE CONDITIONS

This report is intended for the sole usage of La Mesa R.V. Center, its designated agents, and the SAM. Use of this report is subject to the provisions of the fully executed Consulting Agreement (Contract) between La Mesa R.V. Center and Environmental Business Solutions, Inc. Any third party usage of this report shall be subject to the provisions of the Contract and any unauthorized misuse of or reliance upon the report shall be without risk or liability to Environmental Business Solutions, Inc.

The conclusions of this report are judged to be relevant at the time the work described in this report was conducted. Future conditions may differ and this report should not be relied upon to represent future Site conditions unless a qualified consultant familiar with the practice of environmental assessments in San Diego County is consulted to assess the necessity of updating this report.

Although this assessment has attempted to assess the likelihood that the Site has been impacted by a hazardous material/waste release, potential sources of impact may have escaped detection for reasons which include, but are not limited to: 1) our reliance on inadequate or inaccurate information rightfully provided to us by third parties, such as public agencies and other outside sources; 2) the limited scope of this assessment; 3) the presence of undetected, unknown or unreported environmental releases; and 4) the heterogeneous and complex nature of subsurface materials.

LABORATORY REPORTS

teg

April 9, 1996

Mr. Barry Pulver
Environmental Business Solutions
8799 Balboa Avenue
Suite 290
San Diego, CA 92123

RECEIVED
APR 12 1996

SUBJECT: DATA REPORT - LA MESA RV CENTER - 7691 ALVARADO ROAD, LA MESA, CA - EBS PROJECT #93E163.2

TEG Project # 960401-9

Mr. Pulver:

Please find enclosed a data report for the above referenced location. Water samples were analyzed in TEG's DOHS certified mobile laboratory (CERT #1746).

Project Summary

The following analyses were conducted:

- 3 waters for total petroleum hydrocarbons (TPH) by DOHS Modified EPA Method 8015
- 3 waters for volatile aromatic hydrocarbons (BTEX) by Modified EPA Method 8020
- 3 waters for total recoverable petroleum hydrocarbons (TRPH) by EPA Method 418.1

The samples were received chilled in appropriate containers with appropriate labels, seals, and chain-of-custody documentation.

Project Narrative

The results for all analyses and required QA/QC analyses are summarized in the enclosed tables. All calibrations, blanks, surrogates, and spike recoveries fulfill quality control criteria. No data qualifiers (flags) apply to any of the reported data.

TEG appreciates the opportunity to provide analytical services to EBS on this project. If you have any questions relating to this data or report, please do not hesitate to contact us.

Sincerely,

Sheri Hartman

REPORT TO:	BARRY PULVER	GEOTEST PROJECT NO.:	961138-03
		CLIENT ID:	93E1163.2
PROJECT NAME:	LA MESA RV CENTER		
SITE LOCATION:	7601 ALVARADO ROAD LA MESA, CA		

GEOTEST is pleased to provide you with analytical data for your above referenced project. Samples were collected on 03/31/96 and received intact and cool on 04/03/96. In accordance with the chain of custody, the samples were analyzed for the following analytical parameters:

ANALYTICAL TEST	PAGE
Total Lead	2-3
MBTE	4-5

In addition, the analysis for flashpoint was subcontracted to an outside laboratory with results issued on a separate laboratory report.

REVIEWED AND APPROVED: Richard Villafania, Laboratory Manager

REPORT DATE: 4-8-96

This report pertains only to the samples investigated and does not necessarily apply to other apparently identical or similar materials. All samples are analyzed on an as received (wet weight) basis. Any results listed as "ND" are not detected above the indicated limit of detection. All method numbers referenced are EPA method numbers except where otherwise noted. This report is submitted for the exclusive use of the client to whom it is addressed and is only valid in its entirety. ELAP certification #1225.

RE: Report of Soil and Groundwater Assessment Activities Performed Pursuant to the Request of San Diego County Site Assessment and Mitigation Division (SAM) for the La Mesa R.V. Center at 7601 Alvarado Road, La Mesa, California (Site)

Dear Mr. Buckner:

Environmental Business Solutions, Inc. (EBS) is pleased to present this letter report (Report) which summarizes the results of a soil and groundwater assessment recently performed at the Site. The work described in this report was conducted in general accordance Exhibit "2" to the Consulting Agreement (Contract) between EBS and La Mesa R.V., Inc. (Client). The Contract was fully executed on February 3, 1994.

SITE INFORMATION

SITE LOCATION/DESCRIPTION

The Site is located in a commercial/retail portion of the City of La Mesa (Figure 1). Topographically, the Site is located along a relatively level terrace. Steep slopes are located along the southern portion of the Site.

At the time of the assessment, the Site was observed to be used for the sale and repair of recreational vehicles. Site improvements include offices, showrooms, service bays, and associated driveways and parking areas. The northern portion of the Site is generally used for showrooms, vehicle parking, and sales offices. The southern portion of the Site is used for the repair and servicing of vehicles. Four underground storage tanks (USTs) were formerly located in the southern portion of the Site.

SITE IDENTIFICATION

Site Name:	La Mesa R. V. Center
Site Location:	7601 Alvarado Road, La Mesa, California 92041
SAM Case Number:	HO2651-001, T0427

BACKGROUND

The following background information is from previously reported data and reports prepared by others and by EBS. Four USTs of various capacities were removed from the Site. The USTs stored new oil, used oil, and gasoline. The USTs were located immediately to the west and south of a service bay building at the Site (Figure 2). The four USTs consisted of one 550-gallon used oil UST, two 550-gallon new oil USTs, and one 2,000-gallon regular gasoline UST.

UST REMOVAL OF FEBRUARY 1988

The USTs were removed in February 1988 by Alm Services (Alm). The "Abandoned Underground Tank Report" prepared for the Site by the San Diego County Hazardous Materials Management Division (HMMD) inspector indicated that each of the USTs had holes ranging from pinhole size to three-quarters of an inch in diameter. Groundwater impact was not noted during the USTs' removal, although groundwater was observed at a depth of approximately 7 feet below grade in the excavation.

Correspondence from Alm to the HMMD in March 1988 indicated that six soil samples from the UST excavation were collected. Detectable concentrations of both total petroleum hydrocarbons (TPH) and total recoverable petroleum hydrocarbons (TRPH) were found in each of the samples collected. In May 1988, Alm was reported to have collected an additional three samples from the new and used oil area of the UST excavation. Detectable concentrations of TRPH were found in each of the three samples.

ASSESSMENT/REMEDIATION ACTIVITIES PERFORMED BY HALLIBURTON NUS IN MARCH 1992

In March 1992, subsequent to the submission and approval of a workplan, we understand that Halliburton NUS (Halliburton) conducted an exploratory excavation program at the Site. Approximately 400 cubic yards of soil was excavated from the vicinity of the former USTs. Numerous confirmation samples were collected during the excavation program (Tables 1 and 2, and Figure 2, 3). Confirmation samples indicated that soil with concentrations of both TPH and TRPH remained in the vicinity of the excavation.

WORKPLAN PREPARED BY EBS IN NOVEMBER 1993

In November 1993, EBS submitted a workplan to Mr. Lars Skinner of the SAM for review and approval. The workplan described an assessment which included the following:

- Drilling and sampling of seven soil borings and converting three of the soil borings to groundwater monitoring wells (wells);
- Monitoring, purging, and sampling the three wells; and
- Performing laboratory analysis on the collected soil and groundwater samples.

The workplan was approved by Mr. Skinner on December 9, 1993.

SOIL AND GROUNDWATER ASSESSMENT PERFORMED BY EBS IN FEBRUARY 1994

During this investigation, 11 soil borings (B-1, B-1A, B-2, B-3, B-4, B-4A, B-5, B-6, MW-1, MW-2, and MW-3) were drilled, three of which were converted to groundwater monitoring wells MW-1, MW-2, and MW-3 (Figure 2). Work performed during this investigation included the collection and analysis of soil and groundwater samples. A report[1] summarizing the assessment activities was prepared and submitted to the SAM in March 1994. Pertinent portions of the March 1994 report are presented as follows.

Site Geology

Geologic materials encountered during the assessment included fill soils, topsoil, and alluvium. A brief description of these units is presented below:

Fill

Fill soil was encountered in all of the soil borings. These deposits generally consisted of dark gray brown gravelly silty sand (SM), black silty gravelly sand

[1] *Report of Soil and Groundwater Investigation Pursuant to the Requirements of* the San Diego County Site Assessment and Mitigation Division (SAM) for La Mesa R. V. Center, Inc., Located at 7601 Alvarado Road, La Mesa, California (Site).

(SW), and yellow brown clayey sand (SC). Fill soil was observed to extend to a maximum depth of approximately 8 feet below grade.

Topsoil

Topsoil was encountered in soil borings and wells B-1, B-3, B-4, B-5, MW-1, and MW-2. Topsoil generally consisted of a dark brown silty sand/sandy silt (SM/ML). Topsoil was encountered to a maximum depth of approximately 12 feet below grade. It should be noted that the topsoil layer was observed to contain significant amounts of naturally occurring organic matter such as plant roots and other plant matter in varying degrees of decomposition. The topsoil layer was observed to be underlain by alluvium.

Alluvium

Alluvium was encountered in all soil borings and wells. These deposits generally consisted of red brown gravel/silty gravel (GW/GM), yellow brown gravelly clayey sand (SC), and a distinctive and cemented yellow brown gravelly clayey sand (SC). The cemented layer was generally encountered at a depth of approximately 10 feet below grade. It should be noted that the cemented layer was encountered in all soil borings and wells, and appeared to be dipping towards the west. The cemented layer was observed to have a thickness of approximately 10 feet.

Site Hydrogeology

As interpreted from maps prepared by the Regional Water Quality Control Board, San Diego Region (RWQCB) in the Comprehensive Water Quality Control Plan Report, dated 1979, the Site is located within the Chollas Hydrologic Subarea of the San Diego Mesa Hydrologic Area of the Pueblo San Diego Hydrologic Unit. As stated in RWQCB Resolution 91-79, this basin does not have any existing or potential municipal and industrial beneficial uses of groundwater.

The shallow groundwater at the Site is generally encountered at a depth of approximately 4 to 9 feet below grade. The shallow groundwater is interpreted to flow generally towards the west at a gradient of approximately 0.08 (8 feet of elevation difference for every 100 feet of horizontal distance).

The shallow groundwater is interpreted to be a perched water table. The cemented layer encountered at the Site is interpreted to be a confining layer on which the shallow groundwater is perched.

Soil Sample Analytical Results

All soil samples collected during the February 1994 assessment were tested for TPH and TRPH in general accordance with modified EPA Method 8015 (California Department of Health Services modified) and EPA Method 418.1, respectively. Laboratory test results are presented in Figure 3 and Table 3. TPH concentrations were reported to range from not detected to 271 milligrams per kilogram (mg/kg). TRPH concentrations were reported to range from not detected to 9,140 mg/kg.

In addition, the soil sample with the highest reported TRPH concentration (sample B1-10) was also analyzed for the following:

- Benzene, toluene, ethylbenzene, and total xylenes (BTEX) in general accordance with EPA Method 8020;
- Halogenated volatile organic compounds (HVOCs) in general accordance with EPA Method 8010;
- Polychlorinated biphenyls (PCBs) in general accordance with EPA Method 8080; and
- Organic lead in general accordance with EPA Method 6010.

Soil sample B1-10 was reported to have no detectable concentrations of BTEX, HVOCs, and PCBs. Soil sample B1-10 was reported to have an organic lead concentration of 1.5 mg/kg.

Groundwater Sample Test Results

All groundwater samples collected during this assessment were tested for TPH and BTEX in general accordance with modified EPA Method 8015 and EPA Method 8020, respectively. Laboratory test results are presented in Table 4. All samples were reported to have no detectable concentrations of TPH or BTEX.

Conclusions

Conclusions presented in the March 1994 report included:

- The horizontal extent of gasoline- and diesel-bearing soil is generally limited to the immediate vicinity of the former UST excavation. Gasoline and diesel-bearing soil extends to a maximum depth of approximately 15 feet below grade.

- The horizontal extent of TRPH-bearing soil (soil with TRPH concentrations greater than 1,000 mg/kg) has generally been assessed. Based on available data, the western, southern, and eastern limits of TRPH-bearing soil have been inferred. The maximum extent of TRPH-bearing soil has been inferred to extend approximately 30 feet in the interpreted downgradient direction, with respect to shallow groundwater flow, from the former oil USTs.

- There were no reported concentrations of TRPH, TPH, or BTEX in the groundwater samples collected from wells at the Site.

SAM LETTER OF FEBRUARY 7, 1995

On February 7, 1995, Mr. Lars Skinner issued a letter regarding his review of the assessment report prepared by EBS. Mr. Skinner requested that the following be performed:

- Provide additional assessment of petroleum hydrocarbon-bearing soil in the following areas:

  — West/northwest of soil sample GES-11 and well MW-1;

  — West of soil sample OES-11;

  — Southwest of soil samples OES-12 and OES-13; and

  — Vertically below soil borings B-1 and B-4.

- Provide an estimate of the volume of petroleum hydrocarbon-bearing soil remaining on Site, and the mean and maximum TPH and TRPH concentration of this soil.

- Provide a contour map of TPH and TRPH concentrations remaining in the soil.

- Clarify the distribution of TPH and TRPH in soil.

- Provide an explanation for the distribution of TRPH-bearing soil.

- Perform additional groundwater monitoring and sampling.

WORKPLAN AND QUARTERLY GROUNDWATER MONITORING REPORT PREPARED BY EBS

On May 1, 1995, EBS submitted a workplan and quarterly groundwater monitoring report[2] to the SAM. Prior to preparing the May 1995 report, the three wells were monitored, purged, and sampled. Laboratory test results are presented in Table 4. Groundwater monitoring data are presented in Table 5. All samples were analyzed for the following:

- TRPH in general accordance with EPA Method 418.1;
- TPH in general accordance with modified EPA Method 8015;
- BTEX in general accordance with EPA Method 8020;
- Methyl tertiary butyl ether (MTBE) in general accordance with EPA Method 8020; and
- Polynuclear aromatic hydrocarbons (PNA) in general accordance with EPA Method 8310.

All groundwater samples were reported to have no detectable concentrations of TPH, BTEX, MTBE, and PNA. TRPH concentrations ranged from 410 (sample MW-1) to 1,000 (sample MW-2) micrograms per liter (µg/*l*).

The workplan presented a scope of work intended to assess the shallow soil at the Site. This scope of work included the drilling, sampling, and logging of four soil borings; monitoring, purging and sampling of three wells; and laboratory analysis of collected soil and groundwater samples.

SAM WORKPLAN APPROVAL LETTER OF JUNE 19, 1995

On June 19, 1995, Ms. Carol Spangenberg of the SAM issued a workplan approval letter, which is included in the Appendix.

OBJECTIVES

The objectives of this scope of services were to:

---

[2] Quarterly Groundwater Monitoring Report for the First Quarter of 1995 and Workplan Describing Additional Site Assessment Activities Pursuant to the Request of San Diego County Site Assessment and Mitigation Division (SAM) for the La Mesa R. V. Center at 7601 Alvarado Road, La Mesa, California (Site).

- Further assess the extent of petroleum hydrocarbon-bearing soil in the vicinity of the former gasoline and new and used oil USTs at the Site.

- Assess shallow groundwater at the Site for flow direction, gradient, and concentration of dissolved petroleum hydrocarbons.

SCOPE OF SERVICES

The scope of services that were used to meet the objectives are as follows:

PREPARATION OF A SITE HEALTH AND SAFETY PLAN; PREPARATION OF SOIL BORING PERMIT APPLICATIONS; SUBCONTRACTOR MANAGEMENT AND SCHEDULING; AND UTILITY SEARCH AND MARK OUT

Preparation of a Site Health and Safety Plan

A health and safety plan for work conducted at the Site and workers within the "exclusion zone" is required pursuant to the regulations in 29 Code of Federal Regulations (CFR) Part 1910.120. Therefore, a health and safety plan was prepared which outlined the potential chemical and physical hazards that may be encountered during drilling and sampling activities. The appropriate personal protective equipment and emergency response procedures for the site-specific chemical and physical hazards were detailed in this plan. EBS and contracted personnel involved with the proposed field work were required to sign this document in order to encourage proper health and safety practices.

Preparation of Soil Boring Permit Applications

Because the soil borings were anticipated to intersect groundwater, soil boring permit applications were prepared. The permit applications were signed by the appropriately licensed professional and submitted to the SAM with the appropriate fee on August 29, 1995.

The permits were approved on September 5, 1995. Copies of the approved permits are included in the Appendix.

Subcontractor Management and Scheduling

Prior to mobilizing for field work, EBS notified and scheduled the appropriate subcontractors including, but not limited to, the laboratories (Transglobal Environmental Geochemistry [TEG] and Geotest), the drilling company (West HazMat Drilling Corp. [West Hazmat]), Underground Service Alert (USA), and the private utility search company (Cable Pipe Locators [CPL]).

Utility Search and Mark Out

As required by state law, EBS contacted USA prior to performing field work. USA issued ticket numbers 196-623 and 210-149. USA contacted Cox Cable, Mt. Helix Water District, Pacific Bell, San Diego Gas and Electric, the cities of La Mesa and San Diego, and the San Diego County water utility districts. In addition, before the soil borings were drilled, EBS retained the services of CPL to attempt to locate subsurface utilities and improvements at the Site to minimize the likelihood of drilling into an underground utility.

DRILLING, LOGGING, AND SAMPLING FOUR SOIL BORINGS TO MAXIMUM DEPTHS OF APPROXIMATELY 21 FEET BELOW GRADE; MONITORING, PURGING, AND SAMPLING THREE WELLS; AND LABORATORY ANALYSIS OF COLLECTED SOIL AND GROUNDWATER SAMPLES

Drilling, Sampling, and Logging Four Soil Borings to Maximum Depths of Approximately 21 Feet Below Grade

Drilling Procedures

In general accordance with the approved workplan, four soil borings (soil borings B-7, B-8, B-9[3], and B-10) were drilled, logged, and sampled to depths of approximately 21 feet below grade. Soil boring locations are shown in Figure 2. The soil borings were drilled in the vicinity of the western and southwestern perimeter of the former excavation at the Site. The proposed locations of the borings were intended to provide additional information about the possible migration of petroleum hydrocarbons west, northeast and southwest of the former USTs at the Site.

The soil borings were drilled by West Hazmat using a CME-75 drill rig equipped with an Odex casing advance drilling system. This system used a down-hole air percussion hammer to advance the boring. Casing is advanced as the borehole is deepened. This type of rig was used due to the difficult drilling conditions encountered previously at the Site (colluvium and alluvium with abundant gravel and cobble with caving soil).

---

[3] Attempts were made to collect soil samples from soil boring B-9 at depths of approximately 15 and 20 feet below grade. The sample collected at a depth of approximately 15 feet below grade was judged to be possibly not representative based on the blow counts and the visual condition of the sample. Soil boring B-9A was drilled in the vicinity of soil boring B-9 in an attempt to collect a sample from a depth of approximately 15 to 16 feet below grade.

Soil cuttings were placed in appropriate 55-gallon drums and left on the Site pending disposal. Upon completion of drilling and sampling the soil borings, the boreholes were backfilled with a bentonite slurry from the bottom of the borehole to approximately 1 foot below grade. The upper foot was backfilled with concrete.

Sampling Procedures

A California-registered geologist was on the Site to observe the drilling activity and describe collected soil samples in general accordance with the Unified Soil Classification System. Soil boring logs are presented in the Appendix. Soil samples were generally collected at 5-foot intervals, at interpreted significant geologic contacts, and at the field interpreted water table.

During the drilling of the soil borings, soil samples were collected with a split-spoon type or similar sampler. In order to attempt to maximize the quality of the soil sample, the sampler was driven as far as possible from the bottom of the borehole.[4] The materials encountered during drilling limited the depth that the sampler could be driven. The sampler was "set" by driving the sampler an initial 6 inches[5] prior to driving the sampler to collect the sample. The initial 6 inches of sample collected in the sampler was discarded.

Soil samples were either collected in brass tubes or transferred to laboratory-supplied jars. When tubes were used, the tubes were covered with Teflon™ sheeting, tightly closed with end caps, and labeled. When laboratory-supplied jars were used, the jars were capped and labeled. All samples were either placed in an ice-filled chest or delivered immediately to an on-site mobile laboratory. Chain-of-custody procedures were implemented for sample tracking.

Decontamination Procedures

As required by San Diego County guidelines, a steam cleaner was on-site to steam-clean the augers, casing, and percussion hammer and connecting rods between each soil boring. The soil sampler was cleaned between sampling events with a four-bucket wash: a Alconox-water solution, followed by two tap water rinses, and a final spray rinse with distilled water. Steam cleaner and sampler cleaning water were placed in appropriate drums, labeled, and left on the Site.

---

[4] This method was also followed in the previous soil sampling performed by EBS.

[5] The number of blow counts recorded in the soil boring logs reflects the blows after the initial drive to "set" the sampler.

Monitoring, Purging, and Sampling Three Wells

On November 27, 1995, three groundwater monitoring wells (MW-1, MW-2, and MW-3) were monitored, purged, and sampled. The wells were monitored with an electronic interface probe to measure depth to water and depth to product (if encountered). Monitoring data are shown in Table 5.

After the wells were monitored they were purged and sampled in general accordance with SAM guidelines. The wells were purged with a bailer. Purge water was placed in appropriate drums and left on-site. Approximately 1 borehole volume of water was purged from each well. After approximately 2 hours after purging, the wells did not recharge to at least 80 percent of the pre-purging water table. The wells were judged to be slow recharging and were sampled. Well purging logs are included in the Appendix.

Groundwater was sampled with a disposable bailer. The groundwater samples were decanted into laboratory-supplied vials, capped, labeled, and placed in an ice-filled chest or immediately delivered to an on-site mobile laboratory. Chain-of-custody procedures were implemented for sample tracking.

Laboratory Analysis of Collected Soil and Groundwater Samples

Soil Samples

All soil samples were delivered to an on-site mobile laboratory supplied by TEG and analyzed for the following:

- TPH[6] in general accordance with modified EPA Method 8015;
- TRPH in general accordance with EPA Method 418.1; and
- BTEX in general accordance with EPA Method 8020.[7]

In addition, the sample with the highest reported TRPH concentration (sample B9-10) was submitted to Geotest and analyzed for California Code of Regulations (CCR) Metals in general accordance with EPA Method 6010. This analysis was performed as required for soil disposal approval.

---

[6] "Full scan" includes gasoline and diesel ranges.

[7] BTEX analysis was performed on the sample, per soil boring, with the highest reported TPH concentration, or if there were no reported TPH concentrations, the sample with the highest reported TRPH concentration.

TPH, TRPH, and BTEX results are shown in Figure 4, and Tables 6 and 7. Laboratory test reports are provided in the Appendix.

Groundwater Samples

Groundwater samples were delivered to an on-site mobile laboratory supplied by TEG and analyzed for the following:

- TPH[8] in general accordance with modified EPA Method 8015;
- BTEX in general accordance with EPA Method 8020; and
- TRPH in general accordance with EPA Method 418.1.

In addition, a duplicate set of groundwater samples was submitted to Geotest and analyzed for the following:

- HVOCs in general accordance with EPA Method 8010/8020; and
- MTBE in general accordance with EPA Method 8020.

Groundwater laboratory test results (with the exceptions of HVOCs and PNAs) are shown in Table 4. Laboratory test reports are attached.

FINDINGS

SITE GEOLOGY AND HYDROGEOLOGY

Geologic materials encountered during the most recent drilling activity were similar to those from previous assessment activities, with the exception that fill soil was not interpreted to have been encountered. A brief description of two units encountered during this phase of work is presented below:

Topsoil

Topsoil generally consisted of a dark brown silty sand/sandy silt (SM/ML). Topsoil was encountered to a maximum depth of approximately 12 feet below grade. The topsoil was observed to contain significant amounts of naturally occurring organic matter and be underlain by alluvium.

---

[8] "Full scan" includes gasoline and diesel ranges.

Alluvium

Alluvium generally consisted of red brown gravel/silty gravel (GW/GM), yellow brown gravelly clayey sand (SC), and a distinctive and cemented yellow brown gravelly clayey sand (SC). The top of the cemented layer was generally encountered at a depth of approximately 10 feet below grade. It should be noted that the cemented layer appeared to dip to the west.

Hydrogeology

The shallow groundwater at the Site was generally encountered at a depth of approximately 4 to 9 feet below grade (Table 5). The shallow groundwater is interpreted to generally flow towards the west (Figure 5) at a gradient of approximately 0.08 (8 feet of elevation difference for every 100 feet of horizontal distance). The shallow groundwater at the Site is interpreted to be a perched along the top of the cemented layer.

SOIL SAMPLE ANALYTICAL RESULTS

Total Petroleum Hydrocarbons

Fifteen soil samples were collected and analyzed for TPH. Only one soil sample (sample B9-10) was reported to have detectable TPH concentrations. As shown in Table 6, sample B9-10 was reported to have TPH as gasoline and diesel concentrations of 25 and 63 mg/kg, respectively.

Total Recoverable Petroleum Hydrocarbons

Fifteen soil samples were tested for TRPH. As shown in Table 6, these soil samples were reported to have TRPH concentrations ranging from not detected to 4,550 mg/kg (sample B9-10). In general, the soil samples collected near the top of the cemented layer (samples B7-10, B8-10, B9-10, and B10-10) were reported to have the highest TRPH concentration per soil boring.

Benzene, Toluene, Ethylbenzene, and Xylenes

All soil samples were reported to have no detectable concentrations of benzene and ethylbenzene. With the exception of soil sample B9-10, all soil samples were reported to have no detectable concentrations of toluene and xylenes. As shown in Table 7, soil sample B8-12 was reported to have toluene and xylene concentrations of 0.110 and 0.066 mg/kg, respectively.

GROUNDWATER SAMPLES

Total Petroleum Hydrocarbons

All groundwater samples were reported to have no detectable TPH concentrations.

Total Recoverable Petroleum Hydrocarbons

All groundwater samples were reported to have no detectable TRPH concentrations.

Benzene, Toluene, Ethylbenzene, and Xylenes

All three groundwater samples were reported to have no detectable benzene concentrations. Only one sample (the sample collected from well MW-2) was reported to have detectable concentrations of toluene (32.9 µg/l), ethlybenzene (2.0 µg/l), and xylenes (12.5 µg/l).

Methyl Tertiary Butyl Ether

With the exception of the groundwater sample collected from well MW-2 (sample MW-2), all groundwater samples were reported to have no detectable concentrations of MTBE. As shown in Table 4, groundwater sample MW-2 was reported to have a MTBE concentration of 0.7 µg/l.

Halogenated Volatile Organic Compounds

All groundwater samples were reported to have no detectable concentrations of HVOCs.

DISCUSSION

DESCRIPTION OF RELEASE

Substance Released

As reported by Halliburton,[9] gasoline, diesel fuel, and new and used oil were released from the former USTs. Based on review of laboratory test results of soil samples collected by EBS, it is our professional opinion that the vast majority of petroleum hydrocarbons released to the shallow subsurface are typical of oil. The rationale for this opinion is as follows:

---

[9] Interim Report on Soil Assessment and Mitigation for La Mesa RV Center, 7601 Alvarado Road, San Diego [sic], California report dated August 1992.

- The interpreted extent of gasoline- and diesel-bearing soil is limited to the immediate vicinity of the former USTs; TRPH-bearing soil appears to encompass a larger area.[10]

- An analysis of the reported TPH and TRPH concentrations of soil samples collected by EBS was performed in general accordance with the request and procedure detailed by Mr. Lars Skinner in his February 7, 1995, letter. The procedure used was to calculate the percentage of TRPH relative to TPH[11] in order to evaluate the amount of gasoline and diesel in relation to oil.

  The basis for this analysis is that the TRPH analysis (EPA Method 418.1) and TPH analysis (modified EPA Method 8015) have a slight overlap. The TRPH analysis quantifies petroleum hydrocarbons with carbon chain lengths of C_5 to C_{40}. This range includes gasoline, diesel, and waste oil. The TPH analysis performed by TEG quantified petroleum hydrocarbons with carbon chain lengths of C_5 to C_{24}. This range includes gasoline and diesel fuel, but not oil.

  The concentration of petroleum hydrocarbons with carbon lengths of C_{25} to C_{40} may be estimated using the difference between the reported TRPH and TPH concentrations. This carbon chain range includes oils, but not gasoline or diesel.

  The results of this analysis, as shown in Figure 6 and Table 8, indicate that the vast majority of reported petroleum hydrocarbons have carbon chain lengths of C_{25} to C_{40}. This suggests that the released petroleum hydrocarbons are predominantly oil.

- Selected soil samples were analyzed for BTEX. BTEX is a commonly found additive to gasoline and its presence is frequently an indicator of gasoline. Only relatively minor concentrations of BTEX compounds were reported. This suggests that gasoline was not a significant component of the released petroleum hydrocarbons.

- Groundwater samples were analyzed for PNAs. This analysis was performed per the request of the SAM. It is our understanding that

---

[10] The interpreted extent of petroleum hydrocarbon-bearing soil is discussed in a following section.

[11] For this analysis TPH is the sum of the reported concentration of TPH as gasoline and as diesel. A value of zero was assigned to samples with "no detectable" concentrations.

naphthalene is a highly soluble component of diesel fuel and frequently used as an indicator of diesel fuel. The laboratory reported no detectable concentrations of PNAs. This suggests that diesel fuel was not a significant component of the released petroleum hydrocarbons.

- Groundwater samples have been analyzed for MTBE and for BTEX. These components are very soluble components of gasoline,[12] and their presence is frequently an indicator of gasoline. Only minor quantities of MTBE, toluene, ethlybenzene, and xylenes have been reported for the collected groundwater samples. This suggests that gasoline was not a significant component of the released petroleum hydrocarbons.

Mechanisms of Migration of Released Petroleum Hydrocarbons

Based on review of the laboratory test results and our understanding of the Site geology and hydrogeology, it appears that the released petroleum hydrocarbons migrated in two pathways as described below:

- Initially the petroleum hydrocarbons migrated vertically from the point of release[13] within the vadose zone.

- After the petroleum hydrocarbons migrated and intersected the cemented layer, the petroleum hydrocarbons generally migrated towards the west, either along the perched water table or along the top of the previously described cemented layer.

INTERPRETED EXTENT OF PETROLEUM HYDROCARBON-BEARING SOIL[14]

Interpreted Horizontal Extent of Petroleum Hydrocarbon-Bearing Soil

As shown in Figures 7 and 8, it is our interpretation that the horizontal extent of petroleum hydrocarbon-bearing soil has been assessed. The rationale for this interpretation is as follows:

---

[12] MTBE is a gasoline additive.

[13] The exact location and mechanisms of the release(s) are unknown. However, it is assumed that the release(s) occurred from the UST system. The former USTs are assumed to be considered, for this discussion, the point of release.

[14] For discussion purposes only, petroleum hydrocarbon-bearing soil is defined as soil with TRPH concentrations in excess of 100 mg/kg.

- The highest reported TRPH concentrations were from soil samples collected at depths of approximately 8 to 10 feet below grade. This is consistent with the migration pathway along the perched water table as discussed above. Therefore, soil samples collected from depths of approximately 8 to 10 feet below grade have been used to assess the horizontal extent of petroleum hydrocarbon-bearing soil. Soil samples used to assess the horizontal extent of petroleum hydrocarbon-bearing soil are as follows:

  — The northern extent of petroleum hydrocarbon-bearing soil is assessed by using analysis of soil samples GES-2, GES-3, GES-5 and B7-8.

  — The eastern extent of petroleum hydrocarbon-bearing soil is assessed by using analysis of soil samples GES-5, MW3-8, and MW3-10.

  — The southern extent of petroleum hydrocarbon-bearing soil is assessed by using analysis of soil sample B5-10.

  — The western extent of petroleum hydrocarbon-bearing soil is assessed by using analysis of soil samples B6-8, B7-10, and B10-10.

Interpreted Vertical Extent of Petroleum Hydrocarbon-Bearing Soil

As in the March 1994 report,[15] it is our opinion that petroleum hydrocarbon-bearing soil extends to a maximum depth of approximately 15 feet below grade. The rationale for this opinion is as follows:

- The cemented layer encountered at the Site has acted as a confining layer for the perched groundwater. This layer would minimize the vertical downward movement not only of water, but also of petroleum hydrocarbons.

- Laboratory test results indicate that there is a marked decrease in TRPH concentrations between soil samples collected from the same soil boring

[15] Report of Soil and Groundwater Investigation Pursuant to the Requirements of the San Diego County Site Assessment and Mitigation Division (SAM) for La Mesa R. V. Center, Inc., Located at 7601 Alvarado Road, La Mesa, California (Site)

at depths of approximately 10 feet below grade and soil samples collected at depths of approximately 15 feet below grade. For example[16]:

- Soil samples B3-10' and B3-15' with TRPH concentrations of 904 and 17 mg/kg, respectively.
- Soil samples B7-10 and B7-16 with TRPH concentrations of 108 and <10 mg/kg, respectively.
- Soil samples B9-10' and B9-15' with TRPH concentrations of 4,550 and 79 mg/kg, respectively.
- Soil samples B10-10' and B3-15' with TRPH concentrations of 117 and <10 mg/kg, respectively.

- All soil samples collected from a depth of approximately 20 feet below grade were reported to have TRPH concentrations of less than 60 mg/kg as shown below:
  - Soil sample B4A-20 with a reported TRPH concentration of 27 mg/kg.
  - Soil sample B10-20 with a reported TRPH concentration of 19 mg/kg.
  - Soil sample MW1-20 with a reported TRPH concentration of 59 mg/kg.

Distribution of Petroleum Hydrocarbon-Bearing Soil

As previously stated, initially the released petroleum hydrocarbons migrated vertically from the point of release, and then migrated horizontally along the cemented layer. The soil excavation activity performed by Halliburton removed the majority of the petroleum hydrocarbon-bearing soil in the immediate vicinity of the former USTs. The remaining petroleum hydrocarbon-bearing soil is located in an approximately 7-foot thick zone, extending from approximately 7 to 14 feet below grade, along the top of the cemented layer.

As shown in Figure 8, the concentration distribution of petroleum hydrocarbon-bearing soil is as expected given the Site geology and hydrogeology and the nature of the release. The highest concentrations are generally in the immediate

[16] The examples include data only from soil borings from which soil samples were collected from depths of approximately 10 and 15 feet below grade.

vicinity of the former USTs. The concentrations of petroleum hydrocarbons generally decrease with distance from the former USTs.

VOLUME OF PETROLEUM HYDROCARBON-BEARING SOIL

Based on the available data, the volume of petroleum hydrocarbon-bearing soil remaining in place was estimated to be 1,212 cubic yards. The assumptions used in making this estimate are as follows:

- The areal extent of petroleum hydrocarbon-bearing soil is assumed to be rectangular with dimensions of approximately 85 feet in length and 55 feet in width.

- Hydrocarbon-bearing soil is limited to a layer encountered between approximately 7 and 14 feet below grade.

Based on these assumptions, the volume of petroleum hydrocarbon-bearing soil is estimated as follows:

- 85 ft. x 55 ft. x 7 ft. = 32,725 cubic feet

- 32,725 cubic feet x (1 cubic yard/27 cubic feet) = 1,212 cubic yards

ASSESSMENT OF GROUNDWATER QUALITY AT THE SITE

It is our opinion that groundwater at the Site has not been impacted[17] by release(s) from the former USTs. In addition, because the vast majority of the petroleum hydrocarbons present in the shallow soil appears to be similar to oil, and the solubility of oil in water is extremely low, it is our opinion that there is a low likelihood that the petroleum hydrocarbon-bearing soil remaining in place will result in impact to the shallow groundwater.

There have been three groundwater monitoring events at this Site. As shown in Table 4, at no time has any concentration of BTEX been reported to exceed maximum contaminant levels[18] (MCLs) for drinking water. It should be stressed that all of the groundwater samples were reported to have no detectable benzene concentrations (Table 4).

---

[17] Impact to groundwater for the purposes of this report is defined as concentrations of petroleum hydrocarbons that exceed MCLs, as defined in CCR Title 22, or the presence of free product or groundwater.

[18] MCL as defined in California Code of Regulations, Title 23.

MTBE was only reported to be detectable in one sample collected. Groundwater sample MW-2, collected on November 28, 1995, was reported to have an MTBE concentration of 0.7 µg/l. It should be noted that the detection level for MTBE was 0.6 µg/l. It should be noted the State action level for MTBE is 35 µg/l

In addition to TPH, TRPH, BTEX, and MTBE, groundwater samples collected during this and previous groundwater sampling events have been analyzed for PNAs and HVOCs. There have been no reported detectable concentrations of PNAs or HVOCs.

Detectable concentrations of TRPH were reported in collected groundwater samples. However, it should be noted that there are no known action levels for dissolved concentrations of TRPH in groundwater.

There are various means to estimate the potential for impact to groundwater from the release(s) from the former USTs. These methods may include modeling the solubility and transportation of petroleum hydrocarbons to groundwater, or using laboratory test methods to mimic the potential for leaching. All of these methods are indirect methods and as such are limited by the assumptions incorporated into the methodology.

At this Site we have a direct method of estimating the potential impact to groundwater. The USTs were removed almost eight years ago, and at that time evidence of a release from the USTs was noted. It is reasonable to assume that the release(s) had occurred prior to the time of the UST removal. However, at a minimum, petroleum hydrocarbon-bearing soil has been in contact with groundwater for at least eight years, and to date, there has been no evidence to indicate that groundwater has been impacted. This is strong direct evidence to suggest that the potential for future impact to groundwater is very low.

POTENTIAL RISK OF THE PRESENCE OF PETROLEUM HYDROCARBON-BEARING SOIL AT THE SITE

Potential Risk to Human Health[19]

It is our judgment that there is a very low risk to human health due to the presence of petroleum hydrocarbon-bearing soil at the Site. Our reasons for this judgment are as follows:

- The remaining petroleum hydrocarbon-bearing soil is located at least 7 feet below grade. This 7-foot separation from the surface to the zone of petroleum hydrocarbon-bearing soil effectively prevents human contact

[19] Potential risks to human health are based on the current Site land use.

with the soil, and therefore the potential for ingestion or for dermal exposure.

- The vast majority of released petroleum hydrocarbons are typical of oil. Laboratory test reports indicate that there is a very low concentration of BTEX in the soil. Therefore, the potential for the migration of vapors with BTEX concentrations which may pose a threat to human health is very low to nonexistent.

Also no PNAs

Potential Risk to Groundwater

As previously stated, due to the nature of the petroleum hydrocarbons present in soil, there is a very low potential risk to the shallow groundwater.

CONCLUSIONS

Based on the data reviewed and obtained as part of this assessment, current regulatory guidelines, and our experience, in our professional judgement we have drawn the following conclusions:

- The vast majority of the petroleum hydrocarbons released from the former USTs are typical of oil.
- The interpreted horizontal and vertical extent of petroleum hydrocarbon-bearing soil has generally been assessed.
- Approximately 1,200 cubic yards of petroleum hydrocarbon-bearing soil is present in the immediate vicinity of the former USTs.
- There is a low likelihood that the shallow groundwater at the Site has been impacted from a release(s) from the former USTs.

RECOMMENDATIONS

- Because the remaining petroleum hydrocarbon-bearing soil is judged not to pose a risk to public health nor present a potential impact to groundwater, the SAM should consider issuing a "no further action" letter (site closure).
- After receiving site closure, the Client should consider properly destroying the existing three groundwater monitoring wells.

We have enjoyed working with you on the important project. If we may be of further assistance or you have any question, please feel free to contact the undersigned at 619-571-5500.

Report Usage and Future Site Conditions

This report is intended for the sole usage of La Mesa R.V. Center and its designated agents. Use of this report is subject to the provisions of the fully executed Consulting Agreement (Contract) between La Mesa R.V. Center and Environmental Business Solutions, Inc. Any third party usage of this report shall be subject to the provisions of the Contract and any unauthorized misuse of or reliance upon the report shall be without risk or liability to Environmental Business Solutions, Inc.

The conclusions of this report are judged to be relevant at the time the work described in this report was conducted. Future conditions may differ and this report should not be relied upon to represent future Site conditions unless a qualified consultant familiar with the practice of environmental assessments in San Diego County is consulted to assess the necessity of updating this report.

Although this assessment has attempted to assess the likelihood that the Site has been impacted by a hazardous material/waste release, potential sources of impact may have escaped detection for reasons which include, but are not limited to: 1) our reliance on inadequate or inaccurate information rightfully provided to us by third parties, such as public agencies and other outside sources; 2) the limited scope of this assessment; 3) the presence of undetected, unknown or unreported environmental releases; and 4) the heterogeneous and complex nature of subsurface materials.

Mr. James Buckner
La Mesa RV Center, Inc.
c/o Stephen L. Marsh, Esq.
Luce, Forward, Hamilton & Scripps
600 W. Broadway, Suite #2600
San Diego, CA 92101

Dear Mr. Buckner:

RE: UNAUTHORIZED RELEASE H02651-001
LA MESA RV CENTER, 7601 ALVARADO RD., LA MESA, CA 92041

This letter has been prepared in accordance with the requirements set forth in Title 23 (State Underground Storage Tank Regulations), Division 3, Chapter 16, Article 11, Section 2722. The purpose of this letter is to notify the Responsible Party of the status of the Quarterly Groundwater Monitoring Report for the First Quarter 1995 and Workplan Describing Additional Site Assessment Activities (Workplan) dated May 1, 1995.

The Workplan prepared by Environmental Business Solutions, Inc. proposes to drill four soil borings to provide additional information on the horizontal and vertical spread of petroleum hydrocarbon contamination.

The Workplan has been approved with the following changes or conditions:

The Workplan proposes to use a pre-existing boring (B4A) to provide confirmation of the vertical extent of contamination at B4. This is acceptable if the registered professional can demonstrate that the soil samples collected at B4A are representative, ie; soil classification at both locations is the same and soil sample collection protocol was appropriate for collecting the soil samples at B4A.

Please include EPA 8240 or EPA 8010 to the analyses required for the next groundwater monitoring. The 1995 SAM manual requires that the groundwater monitoring wells be screened, at least once, for the presence of volatile organic compounds.

Keep this letter for your records as it may be required for corrective action cost reimbursement under Senate Bill 2004 (California Health and Safety Code, Division 20, Chapter 6.75, Article 6).

The need for further site characterization and mitigation actions will be determined following evaluation of the written report and consultation with the San Diego Regional Water Quality Control Board (RWQCB) .

If you have any questions, please call me at (619) 338-2257.

Sincerely,

Carol Spangenberg

SUBJECT: DATA REPORT - LA MESA RV - 7601 ALVARADO, LA MESA, CA - EBS PROJECT #93E1163.2

TEG Project #951128W1 & 951129-11

Mr. Pulver:

Please find enclosed a data report for the above referenced project. All samples were analyzed on-site in TEG's DOHS certified mobile laboratory (CERT #1745).

Project Summary

The following analyses were conducted:

- 15 soils and 3 waters for total petroleum hydrocarbons (TPH) by DOHS Modified EPA Method 8015
- 4 soils and 3 waters for volatile aromatic hydrocarbons (BTEX) by Modified EPA Method 8020
- 15 soils and 3 waters for total recoverable petroleum hydrocarbons (TRPH) by EPA Method 418.1

Samples were received on-site in appropriate containers with appropriate labels, seals, and chain-of-custody documentation.

Dee 11/28 RPD

Project Narrative

The results for all analyses and required QA/QC analyses are summarized in the enclosed tables. All calibrations, blanks, surrogates, and spike recoveries fulfilled quality control criteria.

TEG appreciates the opportunity to provide analytical services to Environmental Business Solutions on this project. If you have any questions relating to these data or report, please do not hesitate to contact us.

Sincerely,

Blayne Hartman

8799 BALBOA AVENUE, SUITE 290
SAN DIEGO, CA 92123

REPORT TO:	BARRY PULVER	GEOTEST PROJECT NO.:	961138-03
		CLIENT ID:	93E1163.2
PROJECT NAME:	LA MESA RV		
SITE LOCATION:	7601 ALVARADO ROAD LA MESA, CA		

GEOTEST is pleased to provide you with analytical data for your above referenced project. The sample was collected on 12/04/95 and received intact and cool on 12/06/95. In accordance with the chain of custody, the sample was analyzed for the following analytical parameters:

ANALYTICAL TEST	PAGE
CCR Metals	2-3

REVIEWED AND APPROVED: [signature]
FOR Dr. Louis Sangermano, Laboratory Director

REPORT DATE: 13DEC95

This report pertains only to the samples investigated and does not necessarily apply to other apparently identical or similar materials. All samples are analyzed on an as received (wet weight) basis. Any results listed as "ND" are not detected above the indicated limit of detection. All method numbers referenced are EPA method numbers except where otherwise noted. This report is submitted for the exclusive use of the client to whom it is addressed and is only valid in its entirety. ELAP certification #1225.

DATE: 10/2/87

MEMORANDUM FOR: California Regional Water Quality Control Board, San Diego Region

FROM: Hazardous Materials Management Unit (HMMU)

SUBJECT: UNAUTHORIZED RELEASE OF HAZARDOUS MATERIAL FROM AN UNDERGROUND STORAGE TANK T# 0772

Evidence of an unauthorized release of a hazardous material has been noted by HMMU staff at the site described below:

Site Address: 7651 ALVARADO RD (Street) | LA MESA (City) | 92041 (Zip Code)

Property Owner: CHEVRON USA (Name)

1201 S. BEACH BLVD (Street) | CA HABRA (City) | 90631 (Zip Code)

Telephone: _____

Tank Operator: CHEVRON (Name) | 462-2860 (Telephone)

The following information is provided for your consideration and action in accordance with the authority and responsibilities of the Regional Board.

Suspected Source(s): TANK

Amount Released: UNK (Gallons) UNK (Time Period)

Release Detected By:

- ✓ Routine Tank Testing
- ___ Test of Piping
- ___ Inventory Audit
- ___ Monitoring Device/Well
- ___ Evidence of Soil Contamination Detected During Tank Removal
- ___ Evidence of Leaky Tank Detected During Tank Removal
- ___ Other

Description of underground tank systems on property (number, type, age, capacity, material stored, evidence of leakage). REGULAR TANK FAILED TIGHTNESS TEST

Date Release Reported to or Detected by HMMU 10/2/87

Contact With Other Agencies _____

Additional Comments:

Please call the HMMU at 236-2222 if you have questions or comments regarding the above.

OFFICIAL NOTICE

10/2/87

CHEVRON USA
1201 SOUTH BEACH BLVD LA HABRA CA 90631
N.D. WOLFF

RE: UNAUTHORIZED RELEASE #T 0772
7651 ALVARADO RD LA MESA 92041 # 93521

Dear N.D. WOLFF:

Information provided to this Department by REGULAR TANK FAILED PRECISION TEST indicates that the underground hazardous substance storage facility at the location referenced above has experienced an Unauthorized Release (leak).

The conditions created by the Unauthorized Release must be reported and corrected in accordance with Sections 25295 and 25297 of Chapter 6.7 of the California Health and Safety Code (H&SC) and Section 2652, Subchapter 16, Chapter 3, Title 23 of the California Administrative Code (CAC), and Chapter 6.5 of the H&SC and Title 22 of the CAC.

As the owner/operator of the underground storage tank, it is your responsibility to:

1. Take immediate action to prevent further unauthorized release;
2. Determine the extent and impact of the unauthorized release;
3. Submit a written Unauthorized Release Report to this Department within five workdays of receipt of this Notice;
4. Complete and distribute within five workdays the enclosed State Water Resources Control Board's "Underground Storage Tank Unauthorized Release(Leak)/Contamination Site Report";
5. Submit supplemental report as required to update the initial report; and,
6. Complete any site mitigation (cleanup) required.

The Unauthorized Release Reports must address all six Elements listed on the reverse side of this Official Notice, to the extent of the best information known at this time. Additional information and responsibilities are also listed. Please note Item 6 concerning responsibility for payment for staff time expended on the investigation.

Subsequent site characterization and mitigation actions will be determined upon evaluation of the written report and consultation with the Regional Water Quality Control Board and other appropriate regulatory agencies.

Please call me at (619) 236-2222 if you have any questions regarding this Official Notice.

Sincerely,

MIKE VERNETTI
Hazardous Materials Specialist

RE: UNAUTHORIZED RELEASE #T0772/H12687
7651 ALVARADO RD., LA MESA, CA

Dear Ms. Wolff:

Your written supplemental report to update the Unauthorized Release Report for the site referenced above is PAST DUE. You are required to submit this report every four weeks weeks to update the progress of activities at that site, in accordance with the provisions of the California Administrative Code, Title 23, Chapter 3, Subchapter 16, Article 5, Section 2652. The report was due 11/02/87.

Please submit your written supplemental report to update the Unauthorized Release Report to this Department within five work days of receipt of this Notice.

If you have any questions on this matter, please contact me at (619) 236-2222.

Sincerely,

MIKE VERNETTI

Tank #1 UL 10,000
#2 SUL 5,000
#3 REG 10,000
#4 DIESEL N/A

Present: C.R.J. INC.,

On June 9,12 1987 the above tank systems were precision tested using the Petro Tite Precision tank testing equipment. This method complies with the NFPA #329 guidelines for precision testing and section 2643 of the California Underground Storage Tank Regulations. These guidelines require 0.05 gallons per hour leak rate accuracy.

We have found from precise liquid level measurement, product circulation and temperature correction analysis combined that the above tank system meets the above criteria. This concludes our test and findings on this date. We found a loose union on the vent line, made necessary repairs and then retested. The Regular leaded tank then met the above criteria.

Sincerely,

Robert W. Jackson, President

Gentlemen:

On March 24, 1988, we precision tested the 1,000 gallon waste oil tank, which was filled with diesel fuel, using the "Petro-Tite" system.

The tank had a leak rate of -.037 gallons per hour. This leak rate is within the NFPA criteria of 0.05 gallons per hour; therefore, this tank and attached piping can be considered liquid tight at this time.

The test results are attached.

Please call if you have any questions.

Very truly yours,

SCOTT-BROADWAY SERVICE

Brea, CA 92822-2292

Dear Mr. Bogaczyk:

UNDERGROUND STORAGE TANK (UST) CASE #H12687-002
CHEVRON STATION #9-3521
7651 ALVARADO ROAD, LA MESA, CA 90632

This letter confirms the completion of a site investigation and corrective action for the underground storage tank system formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank system is greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank site is in compliance with the requirements of subdivisions (a) and (b) of Section 25299.37 of the Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.77 of the Health and Safety Code. No further action related to the petroleum releases at the site is required.

This notice is issued pursuant to subdivision (h) of Section 25299.37 of the Health and Safety Code. Please contact Scott Weldon at (619) 338-2539 if you have questions regarding this matter.

Sincerely,

GARY W. ERBECK, Director

Soil	2300 Cubic Yards	Excavated, characterized, and placed back in ground.	1992
Groundwater	Unknown Amount (Rinsate +groundwater=1000 gallons)	Mixed with rinsate and disposed of to Crosby and Overton	1-16-92
Barrels	None	N/A	N/A

Case Closure Summary
Leaking Underground Fuel Storage Tank Program

III. RELEASE AND SITE CHARACTERIZATION INFORMATION (Continued) H12687-002

MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS - - BEFORE AND AFTER CLEANUP - - N/A MEANS NOT ANALYSED

Contaminant	Soil (ppm)		Water (ppm)		Contaminant	Soil (ppm)		Water (ppm)	
	Before	After	Before	After		Before	After	Before	After
TPH (Gas)	6700	6700	21	< 0.0005	MTBE	N/A	N/A	0.012	< 0.010
TPH (Diesel)	N/A	N/A	N/A	N/A	Ethylbenzene	39	39	0.320	< 0.0005
Benzene	7.6	7.6	0.053	0.00056	TRPH	14,000	14,000	N/A	N/A
Toluene	65	65	0.022	0.0013	Organic Lead	1.7	1.7	N/A	N/A
Xylene	73	73	0.640	< 0.0015	Other				

Comments: Soil samples obtained during the tank removal activities indicated that petroleum hydrocarbon releases had occurred beneath the former used oil UST and also beneath two of the fuel dispenser islands. 2300 cubic yards of impacted soil were excavated at the site beneath each of the impacted areas. The soil in each of these areas was excavated to levels less than 100 mg/kg TPH, as determined by confirmation sampling. The excavated soil was then characterized, and it was determined that all of the excavated soil met the criteria for on-site re-use.

Five groundwater monitoring wells were then installed at the site. Quarterly groundwater monitoring occurred from 1992 through 1996. TPHg and benzene levels in groundwater during the last monitoring event, completed in November 1996, were less than the detection limit of 500 µg/l and 0.56 µg/l, respectively.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes

Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes

Does corrective action protect public health for current land use? Yes
Case oversight completed based upon the current/future site use as a RV sales lot.

Site Management Requirements: Any contaminated soil excavated as part of subsurface construction work must be managed in accordance with the legal requirements at that time.

Should corrective action be reviewed if land use changes? No

Monitoring Wells Decommissioned: No	Number Decommissioned: 3	Number Retained: 2

List Enforcement Actions Taken: Notice of Corrective Action and Reimbursement Responsibility

List Enforcement Actions Rescinded: None

V. LOCAL AGENCY REPRESENTATIVE DATA

Name: Kevin Heaton	Title: Senior Hydrogeologist Land and Water Quality Division
Signature:	Date: 7/16/2001

VI. RWQCB NOTIFICATION

Date Submitted to RB: 7-12-01	RB Response: Concurs with closure	
RWQCB Staff Name: Sue Pease	Title: Environmenati Specialist III	Date: 7-13-01

VII. ADDITIONAL COMMENTS, DATA, ETC.

The two remaining groundwater monitoring wells (MW-3 and MW-4) will be properly destroyed under permit within 90 days.

This document and the related CASE CLOSURE LETTER shall be retained by the lead agency as part of the official site file.

OFFICIAL NOTICE

December 28, 1990

Chevron USA
Attn: M. Kanitra
1300 S. Beach Blvd.
La Habra, CA 90632

Dear Mr. Kanitra:

RE: UNAUTHORIZED RELEASE #T1722/H12687-002
7651 ALVARADO DR., SAN DIEGO, CA

Your written supplemental report to update the Unauthorized Release Report for the site referenced above is PAST DUE. You are required to submit this report every thirty (30) days to update the progress of activities at that site, in accordance with the provisions of the California Code of Regulations, Title 23, Chapter 3, Subchapter 16, Article 5, Section 2652. The report was due October 27, 1990.

Please submit your written supplemental report to update the Unauthorized Release Report to this Department within five work days of receipt of this Notice.

If you have any questions on this matter, please contact me at (619) 338-2207.

Sincerely,

Mary Peters

Dear Ms. Hadley:

RE: UNAUTHORIZED RELEASE H#12687/T#1722
7651 ALVARADO DR., SAN DIEGO, CA

The Unauthorized Release Report for the above referenced site has been reviewed.

The report as submitted satisfies the initial reporting requirements for a failed integrity test.

Based on the information you have provided, the cause of the integrity test failure has not yet been identified. A written update to the Report must be submitted to this Department within two weeks of receipt of this letter. The update should include a summary of all investigative work planned or completed at that time. Include a copy of all integrity test results, and a description of the source and cause of the integrity test failure, and amount of hazardous substance lost for each system.

Please call me at (619) 338-2222 if you have any questions regarding the above.

Your timely cooperation in these matters is appreciated.

Sincerely,

Mary Peters

OFFICIAL NOTICE

August 22, 1990

Kim Wiseman, Hydrogeologist - Environmental Projects
Chevron USA
P.O. Box 2833
La Habra, CA 90632-2833

Dear Ms. Wiseman:

This letter is to clarify the policies that must be followed by the tank owner/operator after a failed integrity test result has been reported to Hazardous Materials Management Division (HMMD). A failed integrity test is considered an unauthorized release. Upon receipt of 24-hour notification of the uauthorized release, the HMMD will send an Official Notice to the tank owner/operator requiring submittal of a written report to the HMMD within five working days.

HMMD has been notified of 12 Chevron sites with failed integrity tests. To date HMMD has not received a 5-day report on any of these sites. Numerous notices have been sent to Libby Hadley and Jim Vigil, in addition to the telephone messages to Ms. Hadley notifying her of the outstanding 5-day reports.

For your reference I am enclosing a copy of the County of San Diego policy on reporting requirements of integrity test failures. In addition, Section 2652 Unauthorized Releases requiring reporting, of the California Administrative Code, Title 23 Waters, Subchapter 16 Underground Tank Regulations is enclosed.

A copy of these documents have been sent to Libby Hadley along with the previous notices. It is very important to identify the cause of the integrity test failure as soon as possible to minimize the cost and extent of any necessary clean-up. Please submit 5-day reports for the Chevron sites listed within 5 days of receipt of this notice.

Should you have any questions regarding this notice, please contact Mary Peters at (619) 338-2207.

Sincerely,

Mary Peters

RE: UNAUTHORIZED RELEASE #T 1722 /H 12687
1 tank at 7651 Alvarado Rd, S.D failed integrity test

Dear Ms. Hadley:

Information provided to this Department by Tankology Corp. indicates that the underground hazardous substance storage facility at the location referenced above has experienced an Unauthorized Release (leak), resulting in possible or confirmed contamination. The conditions created by the Unauthorized Release must be reported and corrected in accordance with the California Health and Safety Code (H&SC) Chapters 6.5 and 6.7 and the California Code of Regulations (CCR), Titles 22 and 23. It is the underground storage tank owner's/operator's responsibility to:

1. Take immediate action to prevent further unauthorized release;
2. Determine the extent and impact of the unauthorized release;
3. Submit a written Unauthorized Release Report to this Department within five working days of receipt of this Notice;
4. Complete and submit within five workdays the enclosed State Water Resources Control Board's (SWRCB) "Underground Storage Tank Unauthorized Release (Leak)/Contamination Site Report";
5. Submit supplemental reports as required to update the initial report; and
6. Complete any site mitigation (cleanup) required. Contaminated wastes must be analyzed for hazardous properties and managed appropriately.
7. Please note **Item H** (on the reverse side) concerning responsibility for payment for staff time expended on the investigation.

The Unauthorized Release Report must address all six elements listed on the reverse side of this Official Notice, to the extent of the best information known at this time. Additional information and responsibilities are also listed. Subsequent site characterization and mitigation actions will be determined upon evaluation of the written report and consultation with the Regional Water Quality Control Board and other appropriate regulatory agencies

Please call me at (619) 338-2207 if you have any questions regarding this Official Notice.

Sincerely,

Mary Peters

NOTICE OF REIMBURSEMENT AND REPORTING REQUIREMENTS

July 1, 1991

Jane Fruin
Chevron, USA
P. O. Box 2833
La Habra, CA 90632-2833

Dear Ms. Fruin:

RE: UNAUTHORIZED RELEASE #T01722/H12687-002
FORMER CHEVRON SERVICE STATION #9-3521, 7651 ALVARADO ROAD,
LA MESA, CA 91941

Information provided to this Department indicates that the underground hazardous substance storage facility at the location referenced above has had an Unauthorized Release (leak), and identifies you as the party, or one of the parties, responsible for investigation and cleanup of the Unauthorized Release.

As described in the paragraph below, federal and state law require the responsible party(ies) to reimburse the State Water Resources Control Board for local and state agency costs associated with oversight of the investigation and cleanup of the Unauthorized Release. Please take note of the following:

> Whereas the Federal Petroleum Leaking Underground Storage Tank Trust Fund provides funding to pay the local and state agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks; and Whereas the Legislature has authorized funds to pay the local and state agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks; and Whereas the direct and indirect costs of overseeing removal or remedial action at the above site are funded, in whole or in part, from the Federal Trust Fund; and Whereas the above individual(s) or entity(ies) have been identified as the party or parties responsible for investigation and cleanup of the above site; YOU ARE HEREBY NOTIFIED that pursuant to Title 42 of the United States Code, Section 6991b(h)(6) and Sections 25297.1 and 25360 of the Health and Safety Code, the above Responsible Party or Parties shall reimburse the State Water Resources Control Board not more than 150 percent of the total amount of site specific oversight costs actually incurred while overseeing the cleanup of the above underground storage tank site, and the above Responsible Party or Parties shall make full payment of such costs within 30 days of receipt of a detailed invoice from the State Water Resources Control Board.

Ms. Jane Fruin July 1, 1991

The following individual(s) and/or entity(ies) are being notified as responsible parties for the Unauthorized Release at the above referenced site:

Jane Fruin
Chevron USA
P. O. Box 2833
La Habra, CA 90632-2833

Fredna Gustavson
110 Westwood Drive
Santa Cruz, CA 95060

In accordance with the California Health and Safety Code, Chapter 6.5 and 6.7, and the California Code of Regulations, Title 22 and 23, the tank owner/operator must report and correct the conditions created by the Unauthorized Release. It is the tank owner's/operator's responsibility to:

1. Take immediate action to prevent further unauthorized release.
2. Determine the extent and impact of the unauthorized release.
3. Submit a written Unauthorized Release Report within five workdays of receiving this Official Notice. This requirement is satisfied by submitting the enclosed State Water Resources Control Board form entitled "UNDERGROUND STORAGE TANK UNAUTHORIZED RELEASE (LEAK)/CONTAMINATION SITE REPORT". The completed form, with attached comments if necessary, must address the Unauthorized Release Report items described on the final page of this Notice. Submit the completed form to this office for distribution.
4. Submit supplemental reports as required to update the initial report.
5. Complete any site mitigation (cleanup) required.
6. Reimburse the State Water Resources Control Board for local and state agency costs associated with oversight of the investigation and cleanup.

The Unauthorized Release Report must address all six items listed on the final page of this Notice, to the extent of the best information known at this time. Additional information and responsibilities are also listed. Subsequent site characterization and mitigation actions will be determined upon evaluation of the written report and consultation with the Regional Water Quality Control Board and other appropriate regulatory agencies.

If you have any questions concerning this Notice, please contact the undersigned at (619) 338-2315, or the Division of Clean Water Programs, State Water Resources Control Board, P.O. Box 944212, Sacramento, CA 94224-2120.

Sincerely,

Michael G. Porter

ADDITIONAL INFORMATION/RESPONSIBILITIES

A. Notify the local Fire Department immediately, if a fire/explosion hazard exists.

B. Cease the unauthorized release immediately by removing the hazardous substance from the system's leaking component(s), as necessary. Give careful consideration to proper tank ballast in areas of high groundwater. Ballast should be inert and compatible with tank residues (i.e., water).

C. Maintain the site in a safe and secure manner. The excavation, if any, may be back-filled for safety reasons until site decontamination activities commence.

D. Send copies of all correspondence to the Regional Water Quality Control Board. San Diego Region (619) 265-5114, Colorado River Basin Region (619) 346-7491.

E. Before any drilling, trenching, grading, digging, dewatering or moving of soil begins, submit a work activity proposal to this Department. The proposal must identify all actions to preclude offsite nuisances or other adverse consequences.

F. Obtain necessary permits for repair or removal of the underground tanks/piping from this Department, and other agencies, for onsite treatment or offsite discharge.

G. Issuance of a permit to install new tanks at a site does not imply that any unauthorized release at the site has been mitigated to the satisfaction of this Department or any other regulatory agency.

UNAUTHORIZED RELEASE REPORTING REQUIREMENTS

Each of the following must be addressed in the Unauthorized Release Report (CCR, Title 23, Chapter 3, Subchapter 16, Section 2652):

1. Describe the type, quantity and concentration of the hazardous substance released.

2. Describe the extent of the soil, groundwater, and/or surface water contamination due to the release based on the results of all investigations completed at the time the report is submitted.

3. Describe the method of clean-up implemented to date, proposed clean-up actions, and approximate costs of actions taken to date.

4. Indicate the method and location of disposal of the released hazardous substance and any contaminated soils or groundwater. (If any contaminated soil or water is removed from the site, include copies of the hazardous waste manifests).

5. Describe the proposed method of repair or replacement of the underground tank/piping.

6. Include the tank operator's name and telephone number, the name and telephone number of any consultants retained, and a projection of scheduled and proposed activities.

Additional information and responsibilities are also listed. Subsequent site characterization and mitigation actions will be determined upon evaluation of the written report and consultation with the Regional Water Quality Control Board and other appropriate regulatory agencies.

If you have any questions concerning this Notice, please contact the undersigned at (619) 338-2315, or the Division of Clean Water Programs, State Water Resources Control Board, P.O. Box 944212, Sacramento, CA 94224-2120.

Sincerely,

Michael Porter

WP\T01722.2

ADDITIONAL INFORMATION/RESPONSIBILITIES

A. Notify the local Fire Department immediately, if a fire/explosion hazard exists.

B. Cease the unauthorized release immediately by removing the hazardous substance from the system's leaking component(s), as necessary. Give careful consideration to proper tank ballast in areas of high groundwater. Ballast should be inert and compatible with tank residues (i.e., water).

C. Maintain the site in a safe and secure manner. The excavation, if any, may be back-filled for safety reasons until site decontamination activities commence.

D. Send copies of all correspondence to the Regional Water Quality Control Board. San Diego Region (619) 265-5114, Colorado River Basin Region (619) 346-7491.

E. Before any drilling, trenching, grading, digging, dewatering or moving of soil begins, submit a work activity proposal to this Department. The proposal must identify all actions to preclude offsite nuisances or other adverse consequences.

F. Obtain necessary permits for repair or removal of the underground tanks/piping from this Department, and other agencies, for onsite treatment or offsite discharge.

G. Issuance of a permit to install new tanks at a site does not imply that any unauthorized release at the site has been mitigated to the satisfaction of this Department or any other regulatory agency.

UNAUTHORIZED RELEASE REPORTING REQUIREMENTS

Each of the following must be addressed in the Unauthorized Release Report (CCR, Title 23, Chapter 3, Subchapter 16, Section 2652):

1. Describe the type, quantity and concentration of the hazardous substance released.

2. Describe the extent of the soil, groundwater, and/or surface water contamination due to the release based on the results of all investigations completed at the time the report is submitted.

3. Describe the method of clean-up implemented to date, proposed clean-up actions, and approximate costs of actions taken to date.

4. Indicate the method and location of disposal of the released hazardous substance and any contaminated soils or groundwater. (If any contaminated soil or water is removed from the site, include copies of the hazardous waste manifests).

5. Describe the proposed method of repair or replacement of the underground tank/piping.

6. Include the tank operator's name and telephone number, the name and telephone number of any consultants retained, and a projection of scheduled and proposed activities.

OFFICIAL NOTICE

Chevron USA
1300 South Beach Boulevard
La Habra, CA 90632
Attn: Mike Kanitra

Dear Mr. Kanitra:

RE: T#1724/H00295: 5404 EL CAJON BOULEVARD, SAN DIEGO, CA
T#1900/H13428-002: 1832 WEST WASHINGTON, SAN DIEGO, CA
T#1715/H12636-002: 5111 COLLEGE AVENUE, SAN DIEGO, CA
T#1722/H12687-002: 7651 ALVARADO ROAD, SAN DIEGO, CA

The information submitted regarding the integrity test failure at the above referenced sites has been reviewed.

A failed integrity test was reported to the Hazardous Materials Management Division (HMMD) on May, 7, 1990, for the 10,000 gallon Unleaded tank (T1724/H00295). An Unauthorized Release Report was submitted to HMMD for review and on September 27, 1990, a notice acknowledging the receipt of the Unauthorized Release Report was sent to Libby Hadley. A past due notice was sent to your attention on January 2, 1991 and to date no update reports have been submitted. Within fourteen working days submit an update report to this office for review.

Integrity test results submitted by CRJ., Inc. indicate the 10,000 gallon Super Unleaded tank failed January 28, 1990. An Official Notice (T1900/H13428-002) was sent to your attention on December 5, 1990. On January 23, 1991, we received a packet which included the Official Notice, an a Unauthorized Release Report form, a letter from Robert Jackson stating repairs were made to the top of the tank , and the re-test results (passed February 2,1990). Debbie Cebelak of HMMD contacted CRJ, Inc. December 21, 1990 requesting a work order documenting the repairs and to date we have not received that information. I am sending back the original notice and the Unauthorized Release Report form for completion. Submit the completed form and a work order from CRJ, Inc. within fourteen working days.

Integrity test results submitted by Tanknology Corporation indicate the 7,500 gallon Super Unleaded tank failed May 16, 1990 (T1715/H12636-002). A review of the files show that an Unauthorized Release Report form was not completed for this site, nor have any updates been submitted. Enclosed is an Unauthorized Release Report form to be submitted within fourteen working days.

Integrity test results submitted by Tanknology Corporation indicate the 10,000 gallon Unleaded tank failed February 23, 1990 (T1722/H12687-002). An Unauthorized Release Report was submitted to this office for review. However, since the last Official Notice sent to your attention December 28, 1990, no further updates have been submitted. Within fourteen working days submit your supplemental update report for this site.

I appreciate your efforts in resolving these open cases. Please contact me at (619) 338-2207 if you have any questions.

Sincerely,

Mary Peters

Name: Bill Lines / GTI

[ ] Peer Review — Name: _____

TOPIC: 7651 Alvarado Rd, La Mesa

SUMMARY:
told him of my priorities for site:
(1) backfill gasoline excavation
(2) cover stockpiles and secure gate
(3) begin monitoring groundwater @ site to see if there is a problem
(4) finish excavating soil @ site

- asked him for a structural map of the contact between the Stadium conglomerate and Colluvium.
- asked him to re-analyze the next two highest waste oil samples for total PCB - because of low recoveries & TRPH was low.

OFFICIAL NOTICE

July 20, 1992

Ruben O. Avilez, Environmental Engineering
Chevron U.S.A. Products Company
P.O. Box 2833
La Habra, CA 90632-2833

Dear Mr. Avilez:

RE: UNAUTHORIZED RELEASE #H12687-002/T01722, FORMER CHEVRON #9-3521
7651 ALVARADO ROAD, LA MESA, CA 91941

The initial Unauthorized Release Report submitted by yourself dated July 6, 1992, for the site referenced above conforms to the initial written reporting requirements, as prescribed in the California Health and Safety Code, Chapter 6.7 and the California Code of Regulations, Title 23. For the duration of the site mitigation process, you are required to provide periodic, brief, written update reports to this office and the Regional Water Quality Control Board (RWQCB). These reports must be submitted every 90 days and should include a brief summary of the completed and projected site assessment and mitigation activities. The initial update report has already been submitted.

The extent of contamination must be determined as soon as possible and a comprehensive site assessment report submitted to this office and the RWQCB within 120 days. The comprehensive report addressing the items on the enclosed "Site Assessment Report Check List" has already been submitted.

If during the site mitigation process any significant situation is encountered that was not known nor anticipated, please immediately notify me and provide a written statement describing the situation to amend the Unauthorized Release Report. As a reminder, a copy of each manifest for hauling any hazardous waste generated as a result of the site assessment and mitigation procedure must be included with the written supplemental reports.

If you have any questions on this matter please contact me at (619) 338-2539.

Sincerely,

Michael G. Porter

C) Designated employee stated that discharge/threatened discharge is likely to cause substantial injury to the public health or safety. YES _____ NO _____

DATE INVESTIGATED 6-29-92 MGP

ACTION TAKEN Chevron contacted and requested to immediately cover stockpiles w/ plastic sheeting. Later this week a decision will be made about whether stockpiles will be backfilled onsite or taken to a landfill. Stockpiles have been analyzed for lead and benzene and, respectively, have less than 1.7 mg/kg (organic Pb) and 0.49 mg/kg.

SITE VISIT FORM

SITE: Former Chevron
ADDRESS: 7651 Alvarado Rd, La Mesa
H & T #'s: H12687-002 TO1722
DATE & TIME: 6-5-13-92 6:42 → 8:48 4J9782 Z04
MILEAGE: 26702 (HOME) → 26709 (site) → 26722 (HQ)
PERSONNEL: Mike Porter-HAMD, Bill Lines & Barry Pulver GTI

NOTES:

- met Bill & Barry @ the site to discuss the scope of the field mapping they are planning to conduct
- they showed & explained the difficulties w/ the excavation exposures and how the exposures won't tie together to make a "perfect" fence diagram
- discussed how limited the exposures are in the excavations
- Bill & Barry worried that they may not be able to come up w/ some great, grand stratigraphic model for the site that may or help explain the hydrogeology.
- I told them not to worry about positive or negative conclusions - just see if the stratigraphy is mappable. If it is mappable, conclusions may possibly be drawn from this site. They are not under any obligation to

(OVER)

come up w/ a concrete explanation or model for the Stadium Conglomerate @ this site.

- I suggested that they visit the road cuts that have been made by the installation of Hwy 125 in La Mesa. This roadcut is located near Fletcher and Amoya

- Asked them to try to tie into their model of the stratigraphy, the groundwater elevations in the wells, in the excavations, and the stream level in Alvarado Creek.

- Bill asked if they can backfill the stockpile.
- I asked him to submit to me the stockpile analyses, excavations maps and analyses and I'll make a decision.

TOPIC: 7651 Alvarado Rd., La Mesa

SUMMARY:

got soil sample results back for stockpile
12/32 are > 100 ppm TPH
high = 520 ppm TPH

- excavation confirmation highest was < 100 ppm NDD
- he talked w/ Chevron about fence and bar diagrams
- Chevron said no to diagrams.
- I said I will require these instead of additional wells
- Next property user wants to pave property and will sell RV's
- prop user will respect wells - I suggested putting a Chevron representative from Chevron & GTI
- 1 well in corner was hit, it is most down gradient

[X] Telephone Conversation S/to — Phone: (___) 453-8415
Name: Bill Cinea / GTI

[ ] Peer Review — Name: _____

TOPIC: 7651 Alvarado Rd, La Mesa

SUMMARY:

update - will characterize stockpile this week
- Chevron hopes to backfill some of the soil and haul some of it
- finished delineation
* - I asked for fence diagrams to describe geology this may require the need for a larger gw investigation
- NO → very hot

MW-1 - clean (east)
MW-2 = 800 ppb TPH (North corner)
48 ppb Benzene
MW-3 - 51,000 ppb TPH side gradient

- lease is up in one month
- they'll need to "clear the soils"
- I explained difference between random stockpile characterization and gridded (directive) sampling. May have to require re-sample (some of the stockpiles) if stockpile surgery performed.

[X] Telephone Conversation from — Phone: (___) ___-____ Name: Bill Lines / GTI

[] Peer Review — Name: _____

TOPIC: 7651 Alvarado Rd, La Mesa former Chevron

SUMMARY:

- Chevron project manger is now Ruben Ciliez
- Bill is concerned about perched water system @ site (going dry after time) and then having dry wells
- I told him that perched aquifer is the primary one I am interested in
- I suggested that he research the hydrologs of nearby sites on the Fletcher Valley to see if ground water system is perenial or ephemeral.
- asked him to send me a general Community Health & Safety plan and a general workplan for the site.
- He was worried about the waste oil contam. stockpiles and 90 day window.
- I said to get the remaining waste oil contam. out of the ground 1st. - But keep stockpiles covered and prevent runoff

SITE ADDRESS: 7651 ALVARADO RD, LA MESA, CA

PERMIT FOR: 3 MONITORING WELLS

PERMIT APPROVAL DATE: 02/05/92

PERMIT EXPIRES ON: 06/03/92

PERMIT CONDITIONS:

1. All borings must be destroyed in accordance with Department of Water Resources Bulletin 74-81 and 74-90.

2. All wash water must be contained and disposed of properly.

3. Submit complete laboratory data for both soil and groundwater with the well logs.

4. Submit all the information specified in the SA/M Manual in:

   Section 1, C., 4., c).

5. All water and soil that is placed in drums must be labeled and stored as specified in the SA/M Manual in:

   Section 1, C., 5.

6. This office must be given 48 hour notice of any drilling activity on this site.

7. This office must be given advanced notification of drilling cancellation.

MONITORING WELL AND BORING CONSTRUCTION AND DESTRUCTION PERMIT

SITE NAME: CHEVRON ALVARADO

SITE ADDRESS: 7651 ALVARADO ROAD, LA MESA, CA 92040

PERMIT FOR: 3 GROUND WATER MONITORING WELLS

PERMIT APPROVAL DATE: 12/22/93

PERMIT EXPIRES ON: 4/20/94

PERMIT CONDITIONS:

1. The wells shall be constructed with the well screen extending no deeper than 5 feet in the saturated zone.

2. All borings must be destroyed in accordance with Department of Water Resources Bulletin 74-81 and 74-90.

3. All wash water must be contained and disposed of properly.

4. Submit complete laboratory data for both soil and groundwater with the well logs.

5. Submit all the information specified in the SA/M Manual in:

   Section 1, C., 4., c).

6. All water and soil that is placed in drums must be labeled and stored as specified in the SA/M Manual in:

   Section 1, C., 5.

7. This office must be given 48 hour notice of any drilling activity on this site. Please contact Edward Sanko at (619)338-2339.

8. This office must be given advanced notification of drilling cancellation. Please contact Edward Sanko at (619)338-2339.

NOTE: This permit does not constitute approval of a workplan as defined in Section 2722 of Article 11 of C.C.R. Title 23. Workplans are required for all unauthorized release investigations in San Diego County.

Name: tenant of Michael Habib

TOPIC: 7651 Alvarado Road, La Mesa

SUMMARY:

- tenant of Michael Habib
- he received a copy of the letter to Habib asking for access
- he has always given access to Chevron consultant
- he wants to know where additional wells will be located
- I said that Chevron has not prepared the locations to me because they cannot get access from Habib.
- He then realized the problem was Habib - he'll talk to Habib.

Dear Mr. Habib:

RE: UNAUTHORIZED RELEASE #T01722/H12687-002
FORMER CHEVRON STATION 9-3521
7651 ALVARADO RD., LA MESA, CA 91941-3611

It has come to my attention that you have not granted Chevron U.S.A Products Company (Chevron) access to your property. According to Jeffrey E. Cole of Chevron, Chevron employees have repeatedly requested, of you, access to your property for the purpose of completing their required environmental investigation.

As you remember, we had a telephone conversation on August 10, 1992. During the conversation, I requested that you grant access to Chevron, so they can complete the ongoing environmental investigation (site assessment).

Chevron is willing to complete their investigation of the release of gasoline from their station. To accomplish this, Chevron needs access to your property.

If you do not grant Chevron access to your property by August 30, 1993, this project will be transferred to the State of California, Environmental Protection Agency, San Diego Regional Water Quality Control Board for enforcement actions. Enforcement actions may include the requirement that you initiate site assessment and remediation activities on your property as a discharger.

If you have any questions on this matter please contact me at (619) 338-2539.

Sincerely,

Michael G. Porter

Dear Mr. Bauer:

RE: UNAUTHORIZED RELEASE #H12687-002
WORKPLAN APPROVAL
FORMER CHEVRON SERVICE STATION #9-3521
AT 7651 ALVARADO ROAD, LA MESA, CA 91941-3611

This letter has been prepared in accordance with the requirements set forth in Title 23 (State Underground Storage Tank Regulations), Division 3, Amendment to Chapter 16, Article 11, Section 2722. The purpose of this letter is to notify the Responsible Party of the status of the Workplan received by the San Diego County Site Assessment and Mitigation Division (SAM) on June 8, 1995.

The Workplan, dated June 6, 1995, and prepared by Timothy Busby of Groundwater Technology, covers one of the following phases of corrective action:

Preliminary Site Assessment	( )
Soil and Water Investigation	( )
Corrective Action Plan	( )
Verification Monitoring	( )
Interim Remedial Action	( )
Other	(X)

The workplan proposes to destroy three groundwater monitoring wells.

The Workplan has been:

(X) approved.
( ) disapproved-call the undersigned for further instructions.
( ) approved with the following changes or conditions:

Keep this letter for your records as it may be required for corrective action cost reimbursement under Senate Bill 2004 (California Health and Safety Code, Division 20, Chapter 6.75, Article 6).

The need for further site characterization and mitigation actions will be determined following evaluation of the written report and consultation with the San Diego Regional Water Quality Control Board.

If you have any questions please call me at (619) 338-2539.

Sincerely,

Michael G. Porter

OFFICIAL NOTICE

February 25, 2002

Chevron Products Co.
Attn: Jerry Bogaczyk
SAR Project Manager
P.O. Box 2292
Brea, CA 92822-2292

Dear Mr. Bogaczyk:

MONITORING WELL CONSTRUCTION DEFICIENCIES
Former Chevron Station #9-3521, 7651 Alvarado Rd., La Mesa, CA 91941
APN: 470-020-12 PERMIT #W92595/W93952 ESTABLISHMENT#H12687-002

The site assessment case for this establishment was closed in July 2001. As part of the conditions for closure, the two remaining wells at this site, MW-3 and MW-4, were to be destroyed within 90 days of closure.

On February 15, 2002, staff of the Department of Environmental Health (DEH), Site Assessment and Mitigation Program (SAM) inspected this site for compliance with the closure document. MW-3 is still in place and MW-4 could not be found, although no permit was ever issued to destroy that well.

Abandoned and poorly maintained wells are considered a nuisance as defined in San Diego County Code Section (SDCCS) 67.430 and 67.431. A well destruction permit must be submitted to DEH **by March 11th, 2002.**

Sincerely,

MCrystal

INSTRUCTIONS

EMERGENCY
Indicate whether emergency response personnel and equipment were involved at any time. If so, a Hazardous Material Incident Report should be filed with the State Office of Emergency Services (OES) at 2800 Meadowview Road, Sacramento, CA 95832. Copies of the OES report form may be obtained at your local underground storage tank permitting agency. Indicate whether the OES report has been filed as of the date of this report.

LOCAL AGENCY ONLY
To avoid duplicate notification pursuant to Health and Safety code Section 25180.7, a designated government employee should sign and date the form in this block. A signature here does not mean that the leak has been determined to pose a significant threat to human health or safety, only that notification procedures have been followed if required.

REPORTED BY
Enter your name, telephone number, and address. Indicate which party you represent and provide company or agency name.

RESPONSIBLE PARTY
Enter name, telephone number, contact person, and address of the party responsible for the leak. The responsible party would normally be the tank owner.

SITE LOCATION
Enter information regarding the tank facility. At a minimum, you must provide the facility name and full address.

IMPLEMENTING AGENCIES
Enter names of the local agency and Regional Water Quality Control Board involved.

SUBSTANCES INVOLVED
Enter the name and quantity lost of the hazardous substance involved. Room is provided for information on two substances if appropriate. If more than two substances leaked, list the two of most concern for cleanup.

DISCOVERY/ABATEMENT
Provide information regarding the discovery and abatement of the leak.

SOURCE/CAUSE
Indicate source(s) of leak. Check box(es) indicating cause of leak.

CASE TYPE
Indicate the case type category for this leak. Check one box only. Case type is based on the most sensitive resource affected. For example, if both soil and ground water have been affected, case type will be "Ground Water". Indicate "Drinking Water" only if one or more municipal or domestic water wells have actually been affected. A "Ground Water" designation does not imply that the affected water cannot be, or is not, used for drinking water, but only that water wells have not yet been affected. It is understood that case type may change upon further investigation.

CURRENT STATUS
Indicate the category which best describes the current status of the case. Check one box only. The response should be relative to the case type. For example, if case type is "Ground Water", then "Current Status" should refer to the status of the ground water investigation or cleanup, as opposed to that of soil. Descriptions of options follow:

No Action Taken - No action has been taken by responsible party beyond initial report of leak.
Leak Being Confirmed - Leak suspected at site, but has not been confirmed.
Preliminary Site Assessment Workplan Submitted - workplan/proposal requested of/submitted by responsible party to determine whether ground water has been, or will be, impacted as a result of the release.
Preliminary Site Assessment Underway - implementation of workplan.
Pollution Characterization - responsible party is in the process of fully defining the extent of contamination in soil and ground water and assessing impacts on surface and/or ground water.
Remediation Plan - remediation plan submitted evaluating long term remediation options. Proposal and implementation schedule for appropriate remediation options also submitted.
Cleanup Underway - implementation of remediation plan.
Post Cleanup Monitoring in Progress - periodic ground water or other monitoring at site, as necessary, to verify and/or evaluate effectiveness of remedial activities.
Case Closed - regional board and local agency in concurrence that no further work is necessary at the site.

IMPORTANT: THE INFORMATION PROVIDED ON THIS FORM IS INTENDED FOR GENERAL STATISTICAL PURPOSES ONLY AND IS NOT TO BE CONSTRUED AS REPRESENTING THE OFFICIAL POSITION OF ANY GOVERNMENTAL AGENCY

REMEDIAL ACTION
Indicate which action have been used to cleanup or remediate the leak. Descriptions of options follow:

Cap Site - install horizontal impermeable layer to reduce rainfall infiltration.
Containment Barrier - install vertical dike to block horizontal movement of contaminant.
Excavate and Dispose - remove contaminated soil and dispose in approved site.
Excavate and Treat - remove contaminated soil and treat (includes spreading or land farming).
Remove Free Product - remove floating product from water table.
Pump and Treat Groundwater - generally employed to remove dissolved contaminants.
Enhanced Biodegradation - use of any available technology to promote bacterial decomposition of contaminants.
Replace Supply - provide alternative water supply to affected parties.
Treatment at Hookup - install water treatment devices at each dwelling or other place of use.
Vacuum Extract - use pumps or blowers to draw air through soil.
Vent Soil - bore holes in soil to allow volatilization of contaminants.
No Action Required - incident is minor, requiring no remedial action.

COMMENTS - Use this space to elaborate on any aspects of the incident.

SIGNATURE - Sign the form in the space provided.

DISTRIBUTION
If the form is completed by the tank owner or his agent, retain the last copy and forward the remaining copies intact to your local tank permitting agency for distribution.

1. Original - Local Tank Permitting Agency
2. State Water Resources Control Board, Division of Loans and Grants, Underground Storage Tank Program, P.O. Box 944212, Sacramento, CA 94244-2120
3. Regional Water Quality Control Board
4. County Board of Supervisors or designee to receive Proposition 65 notifications.
5. Owner/responsible party.

INTRODUCTION

Site Identification

Site Address:	7651 Alvarado Road La Mesa, CA 92041
Company Name:	Chevron U.S.A. Inc.
Service Station No.:	9-3521
APN:	AT2244
HMMD No.:	H12687
Contact Person:	Mr. Roger Uhden Chevron U.S.A. Inc. 20031 Golden West Street Huntington Beach, CA 92648

Site Description

Chevron Service Station No. 9-3521 is located at the corner of Alvarado Road and Comanche Drive in La Mesa, California (Fig. 1). Three gasoline tanks and one used oil tank were removed on June 13, 1991. The locations of these former tanks are shown on Figure 2. Personnel present included Amy Canegaly from the La Mesa Fire Department, Robert Rapista of the San Diego Hazardous Materials Management Division, Gary Jacobs of Hofer and Sons Construction, and William Lines from Groundwater Technology, Inc. (GTI). The service station building, pumps, and other above ground structures were demolished prior to June 13, 1991. Upon arrival, two irregularly shaped excavations were present (Fig 2). The used oil tank excavation was approximately seventeen feet long by five feet wide. The gasoline tank excavation was approximately forty feet long by forty feet wide.

SITE PLAN

FIGURE 2

TANK REMOVAL

Prior to removal of the used oil tank, all fluids were evacuated and placed in three 55 gallon drums. Transport and disposal of the drums was coordinated by Julio Paredes of Chevron U.S.A. Inc.. Prior to removal of the gasoline tanks, gasoline vapors were displaced using dry ice. At the request of the Amy Canegaly the gasoline tanks were monitored for explosive vapors with an explosimeter provided by Hofer and Sons. All tanks contained less than 5% of the lower explosive limit (LEL) for gasoline vapors. Upon approval from the Fire Department, the tanks were removed from the excavation and loaded onto flatbed trailers. The tanks were transported to Hofer and Sons to be cut and scrapped prior to disposal at Pacific Steel.

Description of Tanks

The gasoline tanks were located in the central portion of the site and were oriented north-south with the fill spouts located on the southern end and the turbines and product piping located on the northern end. The used oil tank was located between the gasoline tanks and the former building and was oriented north-south with a fill spout on the southern end (Fig. 2). All of the tanks were constructed of single-walled steel and were installed in the 1972. A copy of the HMMD Underground Tank Removal/Closure Report is included as Appendix 1. A brief description of the tanks is summarized below in Table 1.

TABLE 1
FORMER UNDERGROUND STORAGE TANK DESCRIPTIONS

GTI Tank I.D.	Capacity (gallons)	Contents	HMMD Tank I.D.	Condition
1	1,000	Used Oil	AT 2244 T001	Poor condition, many small holes in north end (maximum 1/4" diameter), extensive pitting and heavy corrosion.
2	9,562	Gasoline (Regular)	AT 2244 T002	Good condition, no holes, medium corrosion, slight pitting, staining at north end.
3	9,562	Gasoline (Supreme)	AT 2244 T003	Good condition, no holes, medium corrosion, slight pitting, staining at north end.
4	5,760	Gasoline (Unleaded)	AT 2244 T004	Good condition, no holes, medium corrosion, slight pitting, staining at north end.

SITE GEOLOGY AND HYDROGEOLOGY

The site is located along the south side of an east west trending valley (Fig. 1). A stream bed runs down the center of the valley to the north of the site. The site topography slopes from south to north with a decrease in elevation of approximately 12 feet across the site. Based on observations made on the excavation walls, a geologic cross section has been prepared to illustrate site geology and is included as Figure 3. The site geology consists of approximately two to five feet of fill material over two to five feet of colluvium/alluvium. This overlays the Stadium Conglomerate which consists of clayey sand, cobbles and boulders. The contact between the Stadium Conglomerate and the colluvium/alluvium slopes gently slope towards the north.

what's the structural attitude of this contact?

APPROX. SCALE IN FEET

Perched water was observed at the site on top of the Stadium Conglomerate and may be the result of irrigation on the hill to the south of the site. After the fill material was excavated from the tank pits, water was observed seeping into the excavation along the formational contact. The rate of infiltration appears to be extremely slow and the excavation has less than one foot of water in the bottom after one month.

The site lies in Cholla hydrologic sub unit (HSA 8.22) of the Pueblo San Diego hydrologic unit (8.00). This hydrologic unit is adjacent to the Mission San Diego Hydrologic Subunit (HSA 7.11) of the San Diego hydrogeologic unit (7.00). Groundwater in the 8.22 subunit is listed as non beneficial use as designated by the Regional Water Quality Control Board (RWQCB), while the 7.11 subunit has beneficial uses listed as agricultural, industrial service, and industrial process supply, as well as potential municipal and domestic water supply uses. A conversation with Jim Munch of the RWQCB on October 11, 1991 indicated that because the valley drains into the 7.11 subarea, the site would be considered to be within the Mission San Diego HSA.

SOIL SAMPLE COLLECTION AND ANALYSIS

Soil sampling activities have been divided into four areas as follows:

1) Used oil tank sampling (June 13 and 21, 1991).
2) Gasoline tank pit sampling (June 13, 1991).
3) Pump island, product line, and test pit sampling (June 14 and 21, 1991).
4) Stockpile characterization (August 20, 1991).

Sampling activities completed in each area are discussed in the following sections. All soil samples were collected and handled in general accordance with the Quality Assurance and Quality Control Documentation (QA/QC) included in Appendix 2. All samples were shipped to GTEL Environmental Laboratories in Torrance, California with a chain-of custody for analysis.

Used Oil Tank Excavation Soil Sample Collection

On June 13, 1991, soil samples were collected from beneath each end of the used oil tank. Samples were collected at a depth of approximately two feet beneath the tank pit backfill within native material. Soil sample locations are presented on Figure 4. The samples were analyzed for Petroleum Hydrocarbons (TPH_{ir}) in soil by Infrared Modified EPA Method 3550/SM503E/418.1 and Purgeable Aromatics (BTEX) and Total Petroleum Hydrocarbons (TPH_g) as Gasoline in Soil by Modified EPA Method 8020/8015. Sample "1N", collected during the tank pull activities, was also analyzed for Halogenated Volatile Organics in Soil by EPA Method 8010 and for Pesticides and PCB's in Soil by EPA Method 8080. Based on these results, further excavation and soil sampling was performed on June 21, 1991. Analytical results are summarized below in Table 2 and Laboratory reports are included in Appendices 3 and 4.

TPH IN SOIL- USED OIL TANK PIT

FIGURE 4

Laboratory results indicate that TPH_{ir} concentrations of remaining soils are above 100 ppm. No halocarbons or PCB compounds were detected in samples 1N. Sample 1NE contained 8.7 ppm total BTEX. Samples collected from beneath the northern end of the tank (1N12) and within a heavily stained area on the eastern wall (1NE) contained greater than 1,000 ppm TPH_{ir}.

Gasoline Tank Excavation Soil Sample Collection

On June 13, 1991, thirteen soil samples were collected from the gasoline tank pit. Samples were collected from beneath the ends of each tank after the tank pit backfill materials were excavated and stockpiled. Soil samples were collected at a depth of approximately two feet below the tank pit backfill within native material. Immediately after the removal of the tanks, water was observed at a depth of approximately 13 feet below grade and groundwater was observed seeping into the excavation along the top of the Stadium Conglomerate formation. Soil samples were collected from the tank pit sidewalls at a depth of 12 feet just above the water level in the excavation. Samples were also collected from the excavation sidewalls at a depth of 8 feet just above the formational contact. Samples were analyzed for BTEX and TPH_g by Modified EPA Method 8020/8015. Laboratory reports are included in Appendix 4 and summarized below in Table 4. Soil sample locations and TPH_g concentrations are shown on Figure 5.

TPH IN SOIL- GASOLINE TANK PIT

FIGURE 5

Laboratory results of soil samples collected from the gasoline tank pit excavation indicated that TPH concentrations were below method detection limits in all samples. The highest concentration of benzene was 0.011 ppm.

Pump Island and Product Line Soil Sample Collection

On June 14, 1991, soil samples were collected from beneath each pump island and at three locations along the product lines. Samples were collected at depths approximately two feet beneath the product line backfill in native material. Soil sample locations and TPH_g concentrations are shown on Figure 6. The samples were analyzed for Purgeable Aromatics (BTEX) and Total Petroleum Hydrocarbons (TPH_g) as Gasoline in Soil by Modified EPA Method 8020/8015. The sample which contained the highest TPH_g concentration was also analyzed for Total Organo Lead in Soil by Flame Atomic Adsorption DHS Method. Based on the results of these analyses additional samples were collected at depth beneath the former pump islands. Laboratory reports are presented in Appendices 4 and 5 and are summarized below in Table 4.

APPROX SCALE IN FEET

NOT TRUE ... there are no regulatory guidelines

Laboratory results of soil samples collected from beneath the pump islands indicated TPH_g concentrations above regulatory guidelines (100 ppm) beneath pump islands "P1" and "P3". Soil samples collected from beneath pump island "P2" contained TPH_g concentrations less than 100 ppm. Soil samples collected from beneath the product lines indicated TPH_g concentrations ranging from 13 to 27 ppm. Organic lead concentrations in sample "P1" were below method detection limits. The TPH_g concentration in soil beneath pump island P1 decreases with depth while the TPH_g concentration in soil beneath pump island P3 increases with depth.

Review of these results indicated that further excavation and soil sampling was necessary to evaluate the extent of gasoline hydrocarbons in the areas beneath the former pump islands "P1" and "P3".

Soil samples collected from the gasoline tank pit and product lines indicated benzene and TPH_g concentrations were below regulatory guidelines (<100 ppm) and these areas were not excavated further.

Pump island "P1" is located directly adjacent to the south side of the gasoline tank pit and further excavation could not be completed. The area in the vicinity of pump island "P3" was evaluated by excavating and sampling ten test pits. Results of the test pit sampling are summarized below.

Test Pit Soil Sample Collection

On June 21, 1991 seven test pits ("A" through "G") were excavated in the area adjacent to former pump island "P3" to evaluate the horizontal and vertical extent of gasoline hydrocarbons. Two additional soil samples were also collected. Sample #1 was collected along the northwestern property line adjacent to a concrete footing and sample #2 was collected 10 feet to the east of pump island "P3". During excavation beneath the former pump islands, the soil above the formational contact, approximately five feet in depth, contained the highest concentrations of gasoline vapors based on field observations (i.e. odors, TLV). Soil samples were collected just above the contact and submitted for laboratory analysis of BTEX and TPH_g. Laboratory reports are included in Appendix 5. After review of the analytical results, three additional test pits ("H","I",and "J") were excavated and sampled on August 20, 1991. Laboratory results of the samples collected on August 20 are included with those from the stockpile characterization in Appendix 5. Laboratory reports are included in Appendix 4 and soil sample locations and TPH_g concentrations are shown on Figure 6 and are summarized below in Table 5.

B = Benzene, T = Toluene, E = Ethylbenzene, X = Xylene
<number = Below Method Detection Limit
BDL = Below Method Detection Limits for all analytes
-- = Below Method Detection Limits for all BTEX compounds
Sample I.D. (ex. 1N) = Tank I.D. No. 1, orientation (NSEW)

Laboratory results indicated only three samples (C6, D5, and F5) with TPH_g concentrations above the regulatory guidelines (100 ppm TPH_g). These samples were collected just above the formational contact. Review of these results indicates that soils with TPHg greater than 100 ppm extend 30 to 50 feet north of pump islands "P2" and "P3". The vertical extent will require further evaluation. Samples could not be obtained at depth within the Stadium Conglomerate formation because the formation is difficult to excavate with standard equipment.

STOCKPILE CHARACTERIZATION

Soil stockpiles from the initial tank removal operations and from further excavation activities were characterized on August 20, 1991. The characterization was performed by applying the following sampling protocol to each 100 cubic yards of stockpiled soil.

Dividing each 100 cubic yard section into quadrants (A,B,C, and D)

Collecting one sample from each quadrant utilizing a random number generator applied to a three dimensional grid.

Collecting the sample with a backhoe or shovel to within one foot of the designated location.

Submitting the sample for laboratory analysis.

The analytical results for each quadrant are then evaluated by utilizing the procedures outlined in the EPA Publication SW-846. This provides a method for estimating the mean concentration of a given compound within the soil mass and the minimum number of samples necessary to calculate this mean to within a specified confidence level.

Used Oil Tank Stockpile Characterization

Approximately 50 cubic yards of soil is located to the west of the used oil tank excavation (Fig 7). The stockpiled soil was characterized according to the method outlined above. Soil samples were analyzed for TPH_{ir}. Laboratory analytical results are summarized below in Table 6 and are included in Appendix 6. Soil sample locations are illustrated on Figure 8.

TABLE 6
USED OIL STOCKPILE CHARACTERIZATION
SOIL SAMPLE ANALYTICAL RESULTS
TPH_{IR} IN SOIL BY
EPA METHOD 418.1

Sample I.D.	Depth (feet)	TPH_{ir}
WOA	2	2,400
WOB	2	240

A full characterization of the used oil tank stockpile was not completed as further excavation is anticipated in this area. Soils from future excavation activities will be added to the existing stockpile and a full stockpile characterization will be performed.

Gasoline Tank Stockpile Characterization

The gasoline tank and pump island excavation activities resulted in approximately 500 cubic yards of soil (Fig. 7). These stockpiles were characterized as one pile divided into five sections labeled I,II,III,IV, and V (Fig.7). Soil samples were analyzed for TPH_g and laboratory analytical results are included in Appendix 5 and are summarized below in Table 7. Soil sample locations are illustrated on Figures 8 and 9.

NOTICE: You are hereby notified that on 6/13/91, a Hazardous Materials Specialist conducted an inspection for the closure of FOUR (4) hazardous substance underground storage tanks. A summary of the conditions follows:

☐ A determination of this site's status is pending receipt of Laboratory Analyses Results for samples taken this date. Results must be submitted within 30 days. To avoid delays, have the Laboratory send a copy of the results directly to _____ (print) of the (HMMD) see address below:

☒ Contamination of the excavation area has been noted by observations made during the tank removal this date. **BEGIN SITE ASSESSMENT PHASE**-(See reverse for details).

☐ **COMPLETE THE SITE SAMPLING WITHIN 5 WORK DAYS OF THIS REMOVAL OR A FULL SITE ASSESSMENT WILL BE REQUIRED.**

TANK OWNER/OPERATOR REQUIREMENTS FOR UNDERGROUND TANK REMOVALS

SITE SAFETY

* Notify the local Fire Department immediately if a fire or explosion hazard is present.

* In the event a hazardous substance is ponded in the excavation, immediately take steps to remove any ponded hazardous liquid from the excavation. This liquid is considered to be a Hazardous Waste and must be handled in accordance with current Hazardous Waste Requirements.

* It is the responsibility of the tank owner/operator or their agent to maintain the site in a safe and secure manner. The backfilling of an excavation for safety purposes in no way indicates that an UNAUTHORIZED RELEASE at a site has been mitigated to the satisfaction of this Department or any other regulatory agency.

* Issuance of a permit to install new tanks at a site where old tanks have been removed/closed in place does not imply that an UNAUTHORIZED RELEASE at a site has been mitigated to the satisfaction of this Department, or any other regulatory agency.

* The owner/operator of the tank is responsible for paying all costs associated with the site assessment and cleanup activities including the costs of the HMMD to oversee those activities.

* **FAILURE TO COMPLY** with the permit conditions, Fire Code, or County of San Diego HMMD requirements may prevent approval of the work performed. In such cases a reinspection fee will be required. In addition there may be civil or criminal actions filed against responsible parties as prescribed by law.

REPORTING/SITE ASSESSMENT

Determining the extent and impact of contamination and completing any required clean-up is the responsibility of the tank owner/operator. **Within 5 working days**, the tank owner/operator or their agent must submit a written **UNAUTHORIZED RELEASE REPORT** to HMMD (address on front) in accordance with provisions of the California Health and Safety Code, Division 20, Chapter 6.7, and the California Code of Regulations Title 23, Chapter 3, Subchapter 16.

Completion of the Underground Storage Tank Unauthorized Release (Leak) Contamination Site report **HSC 05 (4/87)** form is required.

Subsequent mitigation actions will be discussed upon review of the submitted report and consultation with other appropriate agencies.

SOIL SAMPLING
TECHNIQUES AND QUALITY ASSURANCE

To prevent cross contamination between samples, the sampler was washed prior to each sampling using the "three bucket" wash system. This system involves:

1. Washing the split-spoon sampler in a TSP and water solution.
2. Rinsing sampler in tap water.
3. Rinsing sampler in distilled water.

To maintain the integrity of each soil sample the following procedures were performed. After extraction soil samples were:

1. Collected in 6-inch brass sample tubes.
2. Sealed with foil or teflon caps.
3. Wrapped with duct tape.
4. Properly labeled with complete custody forms.
5. Waterproofed in plastic containers.
6. Placed in a cooler and chilled with on ice.
7. Delivered to a state certified laboratory.

All soil samples were frozen and stored at the laboratory for 30 days in anticipation of the need for subsequent analysis.

Dear Mr. Lines,

Attached please find the analytical results for the samples received by GTEL on 6-15-91. The samples were received and analyzed as indicated on the chain of custody.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

QA Conformance Summary

Pesticides and PCBs in Soil
EPA Method 8080

GTEL Sample No. Range: 1A Date of Analysis: 6-19-91

1.0 Blanks

The Reagent blank was below the detection limit as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for PCBs in the aqueous independent QC check sample as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were met for the surrogate compound (Hexachlorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for PCBs in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for PCB in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were no exceptional conditions requiring dilution of samples.

a - Test Methods for Evaluating Solid Waste, SW-846, Third Edition, Revision 0, US EPA November 1986; Methanolic extraction by EPA Method 5030 (purge and trap).

GTEL ENVIRONMENTAL LABORATORIES, INC.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T106294
Report Issue Date: June 20, 1991

QA Conformance Summary

Purgeable Halocarbons in Soil
EPA Method 8010

GTEL Sample No. Range: 1A Date of Analysis: 6-19-91

1.0 Blanks

0 of 29 target compounds found in Reagent blank as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 7 out of 8 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were met for the surrogate compound (1.4-Dichlorobutane) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 8 of 8 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criteria was met for 8 of 8 compounds in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were no exceptional conditions requiring dilution of samples.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T106294
Report Issue Date: June 20, 1991

Dear Mr. Lines,

Attached please find the analytical results for the samples received by GTEL on 6-15-91. The samples were received and analyzed as indicated on the chain of custody, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

QA Conformance Summary

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM503E/418.1

GTEL Sample No. Range: 1A-2A Date of Analysis: 6-17-91

1.0 Blanks

The method blank was below the detection limit as shown in Table 2.

2.0 Calibration Verification Standards

2.1 The control limits were met for the initial calibration verification standard (ICVS) as shown in Table 3.

3.0 Matrix Spike (MS) Accuracy

The control limits were met for the MS as shown in Table 4.

4.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for the sample duplicate as shown in Table 5.

5.0 Sample Handling

5.1 Sample handling and holding time criteria were met for all samples.

5.2 There were no exceptional conditions requiring dilution of samples.

QA Conformance Summary

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM503E/418.1

GTEL Sample No. Range: 1A-5A Date of Analysis: 6-28-91

1.0 Blanks

The method blank was below the detection limit as shown in Table 2.

2.0 Calibration Verification Standards

2.1 The control limits were met for the initial calibration verification standard (ICVS) as shown in Table 3.

3.0 Matrix Spike (MS) Accuracy

The control limits were met for the MS as shown in Table 4.

4.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for the sample duplicate as shown in Table 5.

5.0 Sample Handling

5.1 Sample handling and holding time criteria were met for all samples.

5.2 There were no exceptional conditions requiring dilution of samples.

Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Road, Suite B
San Diego, CA 92121

Dear Mr. Lines,

This report replaces the original report issued on June 27, 1991, due to the typographical error on page 2.Attached please find the analytical results for the samples received by GTEL on 6-22-91. The samples were received and analyzed as indicated on the chain of custody, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

QA Conformance Summary

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

GTEL Sample No. Range: 1A-15A Date of Analysis: 6/24, 25, 26/91

1.0 Blanks

0 of 4 target compounds found in Reagent blank and the Reagent blank was below detection limit for gasoline as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 4 out of 4 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were not met for the surrogate compound (Bromofluorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 4 of 4 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criteria was met for 4 of 4 compounds and gasoline in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were exceptional conditions requiring dilution of samples.

QA Conformance Summary

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

GTEL Sample No. Range: 1A-22A Date of Analysis: 6/17-18/91

1.0 Blanks

0 of 4 target compounds found in Reagent blank and the Reagent blank was below detection limit for gasoline as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 4 out of 4 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were met for the surrogate compound (Bromofluorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 4 of 4 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criteria was met for 4 of 4 compounds and gasoline in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were exceptional conditions requiring dilution of samples.

Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Road, Suite B
San Diego, CA 92121

Dear Mr. Lines,

Attached please find the analytical results for the samples received by GTEL on 6-17-91. The samples were received and analyzed as indicated on the chain of custody, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

QA Conformance Summary

Total Organo Lead in Soil by Flame AA
DHS Method

GTEL Sample No. Range: 1A Date of Analysis: 6-21-91

1.0 Blanks

The method blank was below the detection limit as shown in Table 2.

2.0 Calibration Verification Standards

2.1 The control limits were met for the initial calibration verification standard (ICVS) as shown in Table 3.

3.0 Matrix Spike (MS) Accuracy

The control limits were met for 1 of 1 elements in the MS as shown in Table 4.

4.0 Sample Duplicate Precision

Relative percent difference criterion was met for the sample duplicate as shown in Table 5.

5.0 Sample Handling

5.1 Sample handling and holding time criteria were met for all samples.

6.1 There were no exceptional conditions requiring dilution of samples.

Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Road, Suite B
San Diego, CA 92121

Dear Mr. Lines,

Attached please find the analytical results for the samples received by GTEL on 6-18-91. The samples were received and analyzed as indicated on the chain of custody, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

QA Conformance Summary

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

GTEL Sample No. Range: 1A Date of Analysis: 6-20-91

1.0 Blanks

0 of 4 target compounds found in Reagent blank and the Reagent blank was below detection limit for gasoline as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 4 out of 4 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were met for the surrogate compound (Bromofluorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 4 of 4 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criteria was met for 4 of 4 compounds and gasoline in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were no exceptional conditions requiring dilution of samples.

MS = Matrix Spike Sample
Source: Ultra Scientific, Lot #:STS-110

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T108379
Report Issue Date: September 4, 1991

Table 5

MATRIX SPIKE (MS) RECOVERY REPORT

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

Date of Analysis: 8-28-91
Sample Spiked: 23A
Reference: T108379
Units: mg/Kg

Analyte	Sample Result	Amount Added	MS Result	MS, % Recovery	Acceptability Limits, %[1]
Benzene	<0.005	3.43	1.47	42.8	30.9-88.4
Toluene	<0.005	3.43	1.45	42.3	29.3-95.3
Ethyl Benzene	<0.005	3.43	1.52	44.3	33.2-106
Xylene (total)	<0.015	10.3	4.57	44.4	36.1-99.7

1 = Acceptability limits are derived from the 99% confidence interval of matrix spikes run during the previous quarter.
<# = Not detected at the indicated detection limit.

Table 6

LABORATORY DUPLICATE SAMPLE RESULTS
AND RELATIVE PERCENT DIFFERENCE (RPD) REPORT

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

Date of Analysis: 8-28-91
Sample Used: 23A
Reference: T108379
Units: mg/kg

Analyte	Sample Result	Duplicate Result	RPD, %	Maximum RPD, %
Benzene	<0.005	<0.005	N/A	30
Toluene	<0.005	<0.005	N/A	30
Ethyl Benzene	<0.005	<0.005	N/A	30
Xylene (total)	<0.015	<0.015	N/A	30
TPH as Gasoline	<10	<10	N/A	30

NA = Not applicable, RPD is not applicable when sample concentration is less than 10 times the method detection limit.

Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Road, Suite B
San Diego, CA 92121

Dear Mr. Lines,

Attached please find the analytical results for the samples received by GTEL on 8-21-91. The samples were received and analyzed as indicated on the chain of custody, which is attached.

GTEL maintains a formal quality assurance program to ensure the integrity of the analytical results. All quality assurance criteria were achieved during the analysis unless otherwise noted in the footnotes to the analytical report.

The specific analytical methods used and cited in this report are approved by state and federal regulatory agencies. GTEL is certified for the analysis reported herein by the Department of Health Services under certificate number E723.

If you have any questions regarding this analysis, or if we may service any additional analytical needs, please give us a call.

Sincerely,
GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

QA Conformance Summary

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM 503E/EPA 418.1

GTEL Sample No. Range: 1A-2A Date of Analysis: 8-28-91

1.0 Blanks

The method blank was below the detection limit as shown in Table 2.

2.0 Calibration Verification Standards

2.1 The control limits were met for the initial calibration verification standard (ICVS) as shown in Table 3.

3.0 Matrix Spike (MS) Accuracy

The control limits were met for the MS as shown in Table 4.

4.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for the sample duplicate as shown in Table 5.

5.0 Sample Handling

5.1 Sample handling and holding time criteria were met for all samples.

5.2 There were no exceptional conditions requiring dilution of samples.

Project Number: GIT76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T108380
Report Issue Date: Sept. 4, 1991

Table 2

METHOD BLANK DATA

SAMPLE STATISTICS

STOCKPILE STATISTICS WORKSHEET [1] FOR TPH AS GASOLINE
SIMPLE RANDOM SAMPLING AND SYSTEMATIC RANDOM SAMPLING

1	List sample results from laboratory Analytical Method EPA 8015 Units (i.e. Mg/Kg) ppm	1 See	[2] Table 7	3
		4	5	6
		7	8	9
2	Determine number of sample values n	n = 20		
3	Calculate sample mean $\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}$ With n = number of sample measurements	$\bar{x}$ = 13. ✓		
4	Calculate sample variance $s^2 = \frac{\sum_{i=1}^{n} x_i^2 - \frac{(\sum_{i=1}^{n} x_i)^2}{n}}{n-1}$	s^2 = 3300		
5	Calculate sample standard deviation $s = \sqrt{s^2}$	s = 58		
6	Calculate degrees of freedom $df = n-1$	df = 19		
7	Calculate Standard Error of the Mean $s_{\bar{x}} = \frac{s}{\sqrt{n}}$	$s_{\bar{x}}$ = 13		
8	Obtain student's 't' value corresponding to the degree of freedom value determined in # 6 above. (See copy of Table 9-2 from SW846 3rd edition reproduced on the back of this page.	$t_{.20}$ = 1.328		
9	Calculate the Confidence Interval $CI = \bar{x} \pm t_{.20}\, s_{\bar{x}}$	CI = 13 ± 17		
10	Obtain regulatory threshold for the contaminant of concern RT	RT = 100		
11	Calculate $\Delta = RT - \bar{x}$	Δ = 87		
12	Estimate minimum number of samples $m' = \frac{t^2_{.20}\, s^2}{\Delta^2}$	m' = 0.57		

(1) Based on information found in the following document.
SW-846 THIRD EDITION, Test Methods for Evaluating Solid Waste, Vol II: Field Manual Physical/Chemical Methods Part III, Chapter 9, USEPA, Office of Solid Waste and Emergency Response, Washington, D.C. 20460, November 1986.

FIGURE 9

Benzene concentrations were below method detection limits in all samples except sample "IVA". A statistical analysis was completed assuming that <0.005 ppm = 4 ppb. Results of this analysis indicate that benzene concentrations are below regulatory thresholds (0.1 ppm). TPH_g concentrations were below method detection limits in all samples except sample "VC". A statistical analysis was completed assuming that <10 ppm = 9 ppm. Results of this analysis indicate that TPH_g concentrations are below regulatory thresholds (<100 ppm). Concentrations of toluene, ethyl benzene, total xylene, and total BTEX were generally two orders of magnitude less than the regulatory thresholds for these compounds. Therefore, statistical analyses were not completed for these compounds.

CONCLUSIONS

- Site specific remediation goals are issued by the RWQCB on a site by site basis and have not yet been established for this site. The site is located in a valley which drains into a beneficial use hydrologic sub unit. Therefore, it is anticipated that the goal for soil remediation at this site will be 100 ppm TPH.

- The TPH concentrations of soils in the vicinity of the former used oil tank are greater than 100 ppm and will require further excavation and analysis.

- The soils in the vicinity of the former gasoline storage tanks and beneath the former product lines and pump island "P2" contain less than 100 ppm TPH and do not require further evaluation.

- The soils beneath pump islands "P1" and "P3" contain greater than 100 ppm TPH. The horizontal extent of gasoline hydrocarbons has been delineated in the area surrounding "P3". Further excavation and soil sampling will be required in these areas to evaluate the extent of hydrocarbons in soil.

- The stockpiles of soil resulting from the removal of the gasoline tanks, the excavation of the tank pit backfill and test pits has been characterized. Results of this characterization indicate the BTEX and TPH_g concentrations are less than 0.1 ppm and 10 ppm respectively.

- Soil stockpiled from the used oil tank excavation activities contain TPH concentrations greater than 100 ppm. Soils from future excavation activities will be added to the existing stockpile at which time a full stockpile characterization will be performed prior to disposal.

- Upon approval from the HMMD and RWQCB, the soils resulting from the gasoline tank pit excavation should be backfilled in the original excavation.

Dear Mr. Porter:

Chevron formally requests assistance in securing an access agreement at the above referenced site. Several attempts have been made on the part of Messrs. Torwick, Avilez, Foster, and Holmquist of Chevron to get an access agreement from the property owners at the site. Copies of correspondence between Chevron and representatives of the current property owner are enclosed for your review.

If you have any questions, please call me at (310) 694-7969.

Sincerely,

Jeffrey E. Cole

S/C

Dear Mr. Porter:

It is unclear from Ruben Avilez' file whether this information was ever sent to you or the regional water quality control board. It was found out of place in Mr. Avilez' notes. My apologies for the confusion.

In my discussion with the consultant hired for this site, they were surprised to hear that you thought it might need further assessment. They informed me that the soil had been excavated from the site, effectively removing the source for contamination. Perhaps we can talk about this site at your earliest convenience. My number is (310) 694-7969.

Sincerely,

Jeffrey E. Cole

RE: CONFIRMATION SOIL SAMPLING
ADDENDUM TO COMPREHENSIVE SITE ASSESSMENT
DATED JUNE 12, 1992

SITE: FORMER CHEVRON SERVICE STATION NO. 9-3521
7651 ALVARADO ROAD, LA MESA, CALIFORNIA 92041
HMMD NO. H12687

Dear Ruben:

This letter summarizes the results of the confirmation soil sampling completed at the Chevron La Mesa site. As requested by Mike Porter of the Hazardous Materials Management Division (HMMD) additional soil samples were collected from the used oil tank excavation (Fig. 6) and the northern pump island excavation (Fig. 8). The samples were collected to obtain regulatory approval to backfill the excavations. This letter is an addendum to the Comprehensive Site Assessment report dated June 12, 1992.

On July 7, 1992, three soil samples were collected from the used oil tank pit and submitted to GTEL Environmental Laboratories for analysis of Total Recoverable Petroleum Hydrocarbons in soil by EPA Method 418.1 (TPH_{ir}). Soil sampling quality assurance and quality control methods are attached along with the laboratory reports. The results are summarized in the table below and on Figure 6.

Total Recoverable Petroleum Hydrocarbons
in Soil by EPA Method 418.1
Results in Parts Per Million (ppm)

Sample I.D.	Depth (feet)	TPH_{ir}
WA	12	5
WB	12	14
WC	12	13

TPH_{ir} = Total Recoverable Petroleum Hydrocarbons

023402346
2346L-7.14

On July 7, 1992, four soil samples were also collected from the northern pump island excavation. The samples were submitted for analysis of volatile organics in soil by EPA Methods Modified 8020 and Modified 8015. The results are summarized in the table below and on Figure 8.

Volatile Organics in Soil
by EPA Methods Modified 8020 and 8015
Results in Parts Per Million (ppm)

Sample I.D.	Depth (feet)	Benzene	Toluene	Ethyl-benzene	Total Xylene	Total BTEX	TPH_g
GA	7.5	<0.005	<0.005	<0.005	<0.015	–	<10
GB	8.5	<0.005	<0.005	<0.005	<0.015	–	<10
GC	8	<0.005	<0.005	<0.005	<0.015	–	<10
GD	8	<0.005	<0.005	<0.005	<0.015	–	<10

BTEX = Sum of Benzene, Toluene, Ethylbenzene, Total Xylene
TPH_g = Total Petroleum Hydrocarbons as Gasoline
<Number = Below Method Detection Limit
– = Below Method Detection Limits for BTEX compounds

As seen in the tables and figures, confirmation soil samples collected from the used oil tank excavation contained TPH_g concentrations less than 100 ppm. The confirmation samples collected from the northern pump island excavation contained BTEX and TPH_g concentrations below method detection limits.

If you have any questions please call me at (619) 453-8415.

Sincerely,

SOIL SAMPLING
QUALITY ASSURANCE AND QUALITY CONTROL

To prevent cross contamination and maintain the integrity of each soil sample, the following procedures were performed. Each soil sample was:

1.) Immediately placed in a pre-washed Mason jar.

2.) Tightly packed to reduce air space.

3.) Capped with aluminum foil.

4.) Sealed with plastic lids.

5.) Waterproofed with duct tape.

6.) Properly labeled with complete custody forms

7.) Placed in a cooler and chilled on ice.

8.) Delivered to a state certified laboratory.

All soil samples were frozen and stored at the laboratory for 30 days in anticipation of the need for subsequent analysis.

Dear Mr. Lines,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 7-8-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Mr. Steven E. Boehmer
McDougal, Love, Eckis and Grindle
Forty Sixty North Magnolia
Drawer 1466
El Cajon, CA 92022-1466

Dear Mr. Boehmer:

This letter is in response to your letter of August 4, 1992, to confirm our telephone conversation of September 2, 1992, and will only deal with the rental issue.

As I do not have all the facts about your concerns and claims regarding a damaged sidewalk, street resurfacing and proper grading of this property, I am referring that part of your letter to Rubin Avilez, Environmental Engineer, assigned to this project.

As Larry Foster advised you in his letter of July 8, 1992, and I confirmed in our telephone conversation, Chevron is firm in its position that we are not obligated to pay rent for the 30 days following the lease expiration date of May 31, 1992.

As I advised you upon receiving a copy of the executed Industrial Real Estate Lease between your client and your proposed tenant, I propose the following: If you and your client will agree that Chevron is not obligated to pay rent of $1,000.00 for the initial 30-day period, I will recommend to management that Chevron pay Mr. Habib $6,000.00 for the month of July 1992, the period of time that our activities precluded Mr. Habib's use of the property. Also, please refer to Jerry Holmquist's letter dated August 11, 1992, confirming that Chevron had finished its remediation efforts on July 29, 1992.

Please advise if the above is acceptable to you and your client.

As we discussed, we still need to have you execute the License Agreement so that we will have access to the monitoring wells.

If you have any questions regarding this matter, please do not hesitate to contact me at (310) 694-7840.

Very truly yours,

J. A. Torwick

Report of Field Density Tests
Gas Tank Backfill
Comanche and Alvarado
City of La Mesa

Gentlemen:

This is to present the results of the compaction tests performed at the subject site. In accordance with your request, in-place field density tests were taken in conformance with A.S.T.M., D1556-82 in the backfill placed in the excavations where gas tanks had been removed.

The results of the field density tests are presented on Page T-1 under "Table of Test Results". The laboratory determinations of the maximum dry densities and optimum moisture contents of the fill soils are set forth on Page L-1 under "Laboratory Test Results". The approximate locations of the filled ground and the field density tests are presented on Plate No. 1 entitled "Location of Field Density Tests".

Please read this report carefully. If you have any questions, please do not hesitate to call our office. This opportunity to be of service is sincerely appreciated.

Page L-1, Page T-1 and Plate No. 1 are parts of this report.

Respectfully submitted,

Joseph C. Smyth, Consulting Engineer,

LABORATORY TEST RESULTS

The maximum dry densities and optimum moisture contents of the fill materials as determined by the A.S.T.M., D1556-70, Method C, which uses 25 blows of a 10 pound hammer falling from a height of 18 inches on each of 5 layers in a 4 inch diameter 1/30 cubic foot compaction cylinder, are presented as follows:

Soil Type	Maximum Dry Density lb/cu.ft.	Optimum Moisture Content dry wt.
1 Light brown, fine to medium sandy, clay with gravel	128.0	8.0

TABLE OF TEST RESULTS

Landowner → Subject Mike Habbib (619) 460-8980 Response

Type	Date / Note	Time / Seq.	Response	Follow-up Date
			Background: Abandoned Station Lease expires 5/31/92	
			CRJ has backfilled. J. Holmquist wants letter for	
			owner stating that we could backfill. GTI has	
			proposal for 3 G.W wells. Soil is stadium Conglomerate	
			which makes it hard to drill through. Many stones	
			& cobbles (1 ft or greater) 18 in diameter solid stem auger	
	3/16		Letter given to J. Holmquist regarding backfill	
	3/16		Bill will get back to me on depth of wells. Proposal	
			is for 15 ft I think they should go deeper	
	3/16		Bill spoke with Mike Porter (Agency) and Mike wanted	
			well depth at 15 Ft; Mike feels water will be found	
			between 0-5 ft. Mike wants Community Health & Safety Plan and Work	
			That will cost [illegible] Bill is going to take some cost of	
			initial proposal & add on cost of workplans	
	3/23		Mailed Release to Bill Change Order amount $12,077	
			New Contract Total 21,519. Drilling may be cheaper	
			due to New Rig; Also material cost will go down	
	3/27		Bill. Called Well were dug with smaller rig. Everything	
			went well	
	3/31		Talked with Bill MW1 & MW3 showed water MW2 did	
			not have water. Mobil Lab will be there on 4/7/92 & will do	
			G.W. test on 4/8; Excavation scheduled for 4/6/92	
	4/1		Spoke with John Jackson about tank-backfilling. I	
			asked John to send me compaction report & more detailed	
			price breakdown. Also, I asked John to speak with	
			Bill Lines about getting a price for the additional	
			excavation needed around pump islands & waste oil tank.	
	4/6		MW2 - will run deeper sample	
			MW3 - will run deeper sample	
			All wells have water. 500 cu. yards have been	
			excavated. Bill will check depth of stream to	
			north of site	
	4/8		G.W. Samples sent to GTE tonight. Mike Porter (Agency) requested	
			additional samples from waste oil tank. Mobil Lab

			had problem 2nd Main Lab came out. 2nd couldn't stay till tommorrow. They have gotten GeoTest to go out. #1 Lab had Compressor problem. SE corner of excavation could possibly have gone off-site. Waiting for lab results.	
	4/13		Spoke with Bill, all contaminated soil has been dug up. Waiting on results of G.W. sampling. May need additional well near used oil tank pit since water was evident in pit. Next week we will characterize and haul to appropiate land fill. Estimated that a total of ≈ 1460 cu. yards of soil were excavated. I will ask Julie to put bid together.	
	4/21	10:00	Called Bill Characterization scheduled for 4/22 Soil piles add up to approx 2000 cuyds we will be taking about 80-90 sample. Asked him to call GTEL for 5% discount on lab Bob Jackson did excavation for 5 days & will help with soil sampling. Asked Bill to call Mike Porter & let him know our plans * Bill mentioned that soil characterization was 800 cu yds more than expected and 1 day more of excavation	
		2:40	Called Bill Lines he spoke with Mike Porter and Mike mentioned that we put together soil composite diagram. Expanded Geology Survey. He mentioned that this might prevent future well installations basically, there are small water pockets. We will address this item on a smaller scale in the report. (Not detail that Mike wanted). Other item was to grid concentration of soil piles. This would take twice as many samples we are not going to do this either	
	4/27	1:30	Spoke with Bill results of fieldwork will be in by May 1. At that time we will know how much of the soil has to be treated. Bill will mail me site plan showing MW locations	
		1:45	Spoke with Mr. Habbib (landowner) new renters are going to asphalt lot and sell motorhomes. We need to work out some type of of access agreement with new renters (Jerry H.) Mr. Habib said he could work this into lease. Mike Habib (619) 460-6958 / 11462 Shadow Ranch Road La Mesa Ca. 91941	
	5/4		Mailed License Agreement to Mike Habib Received map from Bill Lines and some Lab results

	5/5	2:20	Called Bill Lines he has not received any new lab results. He is trying to contact Mr. Porter to discuss above-ground treatment options		
		4:00	Spoke with Mike Porter (619) 338-2539. He asked me to do further characterization. The benefits would be 1) If it is determined that water we are finding is confined in discreet Lateral & Vertical pockets in the stadium conglomerate the required clean-up levels would be less stringent 2) Possibly fewer monitoring wells would be required; 3) To other Chevron site in area could benefit as well. I agreed to do this additional work		
	5/11	2:30	called Mike Habib let him know how things were going and asked him about License Agreement he did not see a problem with it		
	5/15	9:40	Spoke with Bill Line. Mr. Porter is going to base requirements for backfilling on the physical pounds of benzene being put back into the soil. Porter will accept mean average for benzene concentration. Bill will submit to Mike Porter by 5/20 results of benzene average as well as other required figures. Porter will then make his decision. Bill will be out of town on 5/21 & 5/22		
		10:10	Spoke with Jerry H. let him know it is unlikely we will be off property by end of May he said wait till about ten days before end of month and call him back.		
	5/21	9:10	Mike Habib called wanted to know situation; I explained we would need an additional two wks preferably another Month. He wants some kind of letter from Chevron.		
	5/27		Report will be submitted to Porter by the end of next week. Porter wants to set up meeting between Waterboard, HMMD, and Chevron to discuss site. Wants this to occur after Agency have had time to review Reports

Dear Mr. Habib:

Pursuant to your request for "something in writing," this letter confirms that Rubin Avilez, Chevron Environmental Engineer, and Mr. Mike Porter of the San Diego County Hazardous Material Management Department, informed you that Chevron finished with its remediation work July 29, 1992, and there is no reason to delay your future use of the property.

Chevron will be required to monitor the groundwater for approximately one year. We still need you to execute the License Agreement so we will have access to the monitoring wells.

Very truly yours,

J. A. Holmquist
Property Development Specialist

Re: **Chevron Service Station 9-3521**
7651 Alvarado Road, La Mesa, CA

Dear Mr. Torwick:

The law firm of McDougal, Love, Eckis & Grindle has been retained by Michael A. Habib and Sleiwa Y. Seman to represent their interests in connection with the above-referenced real property. It is my understanding that on or about July 30, 1971, Virgil F. Gafford, Wayne A. Gafford and Gary A. Gafford, as lessor, and Standard Oil Company of California, as lessee, entered into a lease agreement governing the installation, operation, and removal of a service station on the above-referenced property. It is also my understanding that Mr. Habib and Mr. Seman are successors in interest of the aforementioned lessors and have been assigned all the rights and obligations under the lease agreement.

At this time, I would like to discuss each issue that affects both Chevron and my clients, our position on each issue, and supporting documentation. It is our contention that Chevron was deemed a month-to-month tenant for the period of June 1, 1992 to June 30, 1992 pursuant to paragraph 7 of the lease agreement. Paragraph 7 provides as follows:

> If Lessee shall hold over after the expiration of the term of this lease, or any extension thereof, such tenancies shall be from month-to-month only and upon all terms, covenants and conditions hereof.

It is clear that Chevron remained in possession of the above-referenced real property after the expiration of the lease term. It, therefore, was considered a month-to-month tenant, and is obligated to pay the sum of $1,000 as a result thereof, regardless of the language in paragraph 5 of the lease agreement.

The next issue is whether Chevron is considered a holdover tenant from July 1, 1992 to the time it returns possession of the above-referenced real property to my clients, and it is obligated

to pay the fair market rental value as a result. Under the circumstances, it is our position that the answer to this question is yes. In support of this contention, I would like to remind you of the following facts. On June 1, 1992, Chevron was provided with a 30-day notice to terminate. Pursuant to this notice and California Code of Civil Procedure, Section 1946, Chevron became a holdover tenant. Accordingly, Chevron is chargeable for the reasonable value of the use of the subject property for the holdover period, which is $6,000 per month. (See Colyear v. Tobriner (1936) 7 Cal.2d 735).

Additional concerns include the replacement of damaged sidewalk and the resurfacing of portions of the street adjacent to the subject property, which is necessitated by the use of heavy equipment to address the contaminate problem.

Another issue involves the proper grading of the subject property by Chevron. It is our contention that the site has not been properly graded in accordance with paragraph 5 of the lease agreement. Finally, I ask that Chevron provide us with any "as-graded soils reports," hydrology studies, and soils compaction reports pertaining to the subject property and/or documentation indicating that the soil contaminate clean-up and remediation has been completed. Upon receipt of these materials, we will execute and return the licensing agreement previously presented by Chevron to Mr. Habib.

I have enclosed the following documents and photographs for your review:

1. Various photographs depicting damage caused by Chevron to the subject property.

2. Lease agreement between my clients and Anthony J. Morero, Charles Fagan and Faye Pyle.

If you have any questions, or require additional information, please do not hesitate to contact me. I look forward to your response to my letter.

Sincerely,

Steven E. Boehmer

Regarding: Former Chevron Station #9-3521
7651 Alvarado Road
La Mesa, California

Dear Mr. Tachousky:

It is my understanding that the City of La Mesa is requiring written verification from the San Diego County Hazardous Materials Management Division (HMMD) before a grading permit will be issued to backfill the above mentioned site. Mr. Michael Porter of the HMMD gave verbal permission to backfill the site on July 14, 1992. It is not the HMMD's policy to give written approval to backfill soils. I have discussed this situation with Mr. Porter. If the City of La Mesa requires any further approval, they may contact Mr. Porter directly at (619) 338-2539.

If you have any questions or require any additional information, please call me at (310) 694-7304.

Sincerely yours,

Ruben Avilez
Environmental Engineer

RE: CONFIRMATION SOIL SAMPLING
ADDENDUM TO COMPREHENSIVE SITE ASSESSMENT
DATED JUNE 12, 1992

SITE: FORMER CHEVRON SERVICE STATION NO. 9-3521
7651 ALVARADO ROAD, LA MESA, CALIFORNIA 92041
HMMD NO. H12687

Dear Ruben:

This letter summarizes the results of the confirmation soil sampling completed at the Chevron La Mesa site. As requested by Mike Porter of the Hazardous Materials Management Division (HMMD) additional soil samples were collected from the used oil tank excavation (Fig. 6) and the northern pump island excavation (Fig. 8). The samples were collected to obtain regulatory approval to backfill the excavations. This letter is an addendum to the Comprehensive Site Assessment report dated June 12, 1992.

On July 7, 1992, three soil samples were collected from the used oil tank pit and submitted to GTEL Environmental Laboratories for analysis of Total Recoverable Petroleum Hydrocarbons in soil by EPA Method 418.1 (TPH_{ir}). Soil sampling quality assurance and quality control methods are attached along with the laboratory reports. The results are summarized in the table below and on Figure 6.

Total Recoverable Petroleum Hydrocarbons
in Soil by EPA Method 418.1
Results in Parts Per Million (ppm)

Sample I.D.	Depth (feet)	TPH_{ir}
WA	12	5
WB	12	14
WC	12	13

TPH_{ir} = Total Recoverable Petroleum Hydrocarbons

023402348
2346L-7.14

On July 7, 1992, four soil samples were also collected from the northern pump island excavation. The samples were submitted for analysis of volatile organics in soil by EPA Methods Modified 8020 and Modified 8015. The results are summarized in the table below and on Figure 8.

Volatile Organics in Soil
by EPA Methods Modified 8020 and 8015
Results in Parts Per Million (ppm)

Sample I.D.	Depth (feet)	Benzene	Toluene	Ethyl-benzene	Total Xylene	Total BTEX	TPH_g
GA	7.5	<0.005	<0.005	<0.005	<0.015	--	<10
GB	8.5	<0.005	<0.005	<0.005	<0.015	--	<10
GC	8	<0.005	<0.005	<0.005	<0.015	--	<10
GD	8	<0.005	<0.005	<0.005	<0.015	--	<10

BTEX = Sum of Benzene, Toluene, Ethylbenzene, Total Xylene
TPH_g = Total Petroleum Hydrocarbons as Gasoline
<Number = Below Method Detection Limit
-- = Below Method Detection Limits for BTEX compounds

As seen in the tables and figures, confirmation soil samples collected from the used oil tank excavation contained TPH_g concentrations less than 100 ppm. The confirmation samples collected from the northern pump island excavation contained BTEX and TPH_g concentrations below method detection limits.

If you have any questions please call me at (619) 453-8415.

SOIL SAMPLING
QUALITY ASSURANCE AND QUALITY CONTROL

To prevent cross contamination and maintain the integrity of each soil sample, the following procedures were performed. Each soil sample was:

1.) Immediately placed in a pre-washed Mason jar.

2.) Tightly packed to reduce air space.

3.) Capped with aluminum foil.

4.) Sealed with plastic lids.

5.) Waterproofed with duct tape.

6.) Properly labeled with complete custody forms

7.) Placed in a cooler and chilled on ice.

8.) Delivered to a state certified laboratory.

All soil samples were frozen and stored at the laboratory for 30 days in anticipation of the need for subsequent analysis.

Dear Mr. Lines,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 7-8-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

La Mesa, California

Mr. Michael A. Habib
Mr. Sleiwa Y. Seman
11462 Shadow Ranch Road
La Mesa, CA 91941

Dear Messrs. Habib and Seman:

After our recent telephone conversation and review of the lease file, I have reached the following conclusions.

We are firm in our position that we are not obligated to pay rent for the 30 days following the lease expiration date of May 31, 1992. The lease is specific about the periods that the rent is due and payable. Chevron is not a tenant on the premises under the holdover provisions (Section 7) of the lease.

Section 4 of the lease provides in part that: "Lessee shall have the right during its occupancy of the leased premises to use such premises for the primary purpose of conducting thereon, a service station business, and for any other lawful business that will not materially interfere with said primary use."

After May 31, 1992, Chevron did not conduct a service station business (or any other business) on the premises. It simply conducted activities to comply with its obligations under Section 5 to remove improvements, etc. Section 5, as a specific section, would in any event control over the General Section 7 holdover provision. Section 5 does not call for any rent to be paid during the 30-day removal period.

We do conclude that you are entitled to compensation for the period of time after June 30, 1992, while our activities preclude use of the property.

As an access fee for the period of July 1, 1992, through July 31, 1992, I recommend an amount equal to that last paid under the lease. This amount was $1,000.00 for the month of May 1992.

If you have any questions, please contact Mr. John Torwick at (310) 694-7840. Mr. Torwick will return from vacation on July 14, 1992.

Very truly yours,

L. D. Foster

INSTRUCTIONS

EMERGENCY
Indicate whether emergency response personnel and equipment were involved at any time. If so, a Hazardous Material Incident Report should be filed with the State Office of Emergency Services (OES) at 2800 Meadowview Road, Sacramento, CA 95832. Copies of the OES report form may be obtained at your local underground storage tank permitting agency. Indicate whether the OES report has been filed as of the date of this report.

LOCAL AGENCY ONLY
To avoid duplicate notification pursuant to Health and Safety code Section 25180.5, a government employee should sign and date the form in this block. A signature here does not mean that the leak has been determined to pose a significant threat to human health or safety, only that notification procedures have been followed if required.

REPORTED BY
Enter your name, telephone number, and address. Indicate which party you represent and provide company or agency name.

RESPONSIBLE PARTY
Enter name, telephone number, contact person, and address of the party responsible for the leak. The responsible party would normally be the tank owner.

SITE LOCATION
Enter information regarding the tank facility. At a minimum, you must provide the facility name and full address.

IMPLEMENTING AGENCIES
Enter names of the local agency and Regional Water Quality Control Board involved.

SUBSTANCES INVOLVED
Enter the name and quantity lost of the hazardous substance involved. Room is provided for information on two substances if appropriate. If more than two substances leaked, list the two of most concern for cleanup.

DISCOVERY/ABATEMENT
Provide information regarding the discovery and abatement of the leak.

SOURCE/CAUSE
Indicate source(s) of leak. Check box(es) indicating cause of leak.

CASE TYPE
Indicate the case type category for this leak. Check one box only. Case type is based on the most sensitive resource affected. For example, if both soil and ground water have been affected, case type will be "Ground Water". Indicate "Drinking Water" only if one or more municipal or domestic water wells have actually been affected. A "Ground Water" designation does not imply that the affected water cannot be, or is not, used for drinking water, but only that water wells have not yet been affected. It is understood that case type may change upon further investigation.

CURRENT STATUS
Indicate the category which best describes the current status of the case. Check one box only. The response should be relative to the case type. For example, if case type is "Ground Water", then "Current Status" should refer to the status of the ground water investigation or cleanup, as opposed to that of soil. Descriptions of options follow:

- No Action Taken - No action has been taken by responsible party beyond initial report of leak.
- Leak Being Confirmed - Leak suspected at site, but has not been confirmed.
- Preliminary Site Assessment Workplan Submitted - workplan/proposal requested of/submitted by responsible party to determine whether ground water has been, or will be, impacted as a result of the release.
- Preliminary Site Assessment Underway - implementation of workplan.
- Pollution Characterization - responsible party is in the process of fully defining the extent of contamination in soil and ground water and assessing impacts on surface and/or ground water.
- Remediation Plan - remediation plan submitted evaluating long term remediation options. Proposal and implementation schedule for appropriate remediation options also submitted.
- Cleanup Underway - implementation of remediation plan.
- Post Cleanup Monitoring in Progress - periodic ground water or other monitoring at site, as necessary, to verify and/or evaluate effectiveness of remedial activities.
- Case Closed - regional board and local agency in concurrence that no further work is necessary at the site.

IMPORTANT: THE INFORMATION PROVIDED ON THIS FORM IS INTENDED FOR GENERAL STATISTICAL PURPOSES ONLY AND IS NOT TO BE CONSTRUED AS REPRESENTING THE OFFICIAL POSITION OF ANY GOVERNMENTAL AGENCY

REMEDIAL ACTION
Indicate which action have been used to cleanup or remediate the leak. Descriptions of options follow:

- Cap Site - install horizontal impermeable layer to reduce rainfall infiltration.
- Containment Barrier - install vertical dike to block horizontal movement of contaminant.
- Excavate and Dispose - remove contaminated soil and dispose in approved site.
- Excavate and Treat - remove contaminated soil and treat (includes spreading or land farming).
- Remove Free Product - remove floating product from water table.
- Pump and Treat Groundwater - generally employed to remove dissolved contaminants.
- Enhanced Biodegradation - use of any available technology to promote bacterial decomposition of contaminants.
- Replace Supply - provide alternative water supply to affected parties.
- Treatment at Hookup - install water treatment devices at each dwelling or other place of use.
- Vacuum Extract - use pumps or blowers to draw air through soil.
- Vent Soil - bore holes in soil to allow volatilization of contaminants.
- No Action Required - incident is minor, requiring no remedial action,

COMMENTS - Use this space to elaborate on any aspects of the incident.

SIGNATURE - Sign the form in the space provided.

DISTRIBUTION
If the form is completed by the tank owner or his agent, retain the last copy and forward the remaining copies intact to your local tank permitting agency for distribution.

1. Original - Local Tank Permitting Agency
2. State Water Resources Control Board, Division of Clean Water Programs, Underground Storage Tank Program, P.O. Box 944212, Sacramento, CA 94244-2120
3. Regional Water Quality Control Board
4. Local Health Officer and County Board of Supervisors or their designee to receive Proposition 65 notifications.
5. Owner/responsible party.

Mr. Michael Habbib
11462 Shadow Ranch Road
La Mesa, California 91941

Regarding: Former Chevron Service Station #9-3521
7651 Alvarado Road
La Mesa, California

Dear Mr. Habbib:

I have enclosed for your review, the site assessment report and cover letter as submitted to the San Diego Hazardous Materials Management Division (HMMD) and the San Diego Regional Water Quality Control Board (RWQCB). The assessment report was hand delivered to each agency on June 16, 1992.

My next action is to set up a meeting with both the HMMD and the RWQCB to discuss future activities for this site.

Mr. Habbib, to avoid any possible delays, it is imperative that the license agreement mailed to you on May 4, 1992, be signed and returned to Chevron. Per our telephone conversation on May 11, 1992, you mentioned that you did not see any problems with the license agreement. If you have any questions or concerns about the license agreement, please call me. Once again, to ensure that all work proceeds in a timely manner it is important that this agreement be signed and returned to Chevron as soon as possible.

If you have any questions or comments, please contact me at (310) 694-7304.

Sincerely yours,

Ruben Avilez

INTRODUCTION

Site Identification

Site Address:	Former Chevron Service Station No. 9-3521 7651 Alvarado Road La Mesa, California 92041
Assessor's Parcel Number:	470-020-12
HMMD Case Number:	H12687
Tank Owner/ Operator:	Chevron U.S.A. Products Company
Contact Person:	Mr. Ruben Avilez Chevron U.S.A. Products Company P.O. Box 2833 La Habra, California 90632-2833 (310) 694-7304

Site Description

The Chevron La Mesa site is located at the corner of Alvarado Road and Comanche Drive in La Mesa (Fig. 1). The site currently consists of an unpaved dirt lot (Fig. 2). Commercial properties are located to the west and south of the site. Interstate 8 and associated on/off ramps are located to the north and east, respectively. Future development of the site may include paving the lot for use as a recreational vehicle storage/sales area.

Background

This report summarizes the second phase of site assessment completed by Groundwater Technology. Figures which summarize the results of soil sample analyses from the Tank Removal Report dated November 6, 1991 are included in Appendix 1. A summary of this report is as follows:

SITE PLAN

FIGURE 2

- Three gasoline and one used oil underground storage tank were removed on June 13, 1991.

- Four out of fifteen soil samples collected from the used oil tank pit contained greater than 100 parts per million (ppm) of total petroleum hydrocarbons as used oil (TPH_{ir}).

- Soil samples collected from the gasoline tank pit contained less than 100 ppm total petroleum hydrocarbons as gasoline (TPH_g).

- *Soil Samples collected from beneath the former product lines and pump* island "P2" contained less than 100 ppm TPH_g.

- Soil samples collected from beneath the former southern pump island ("P1") and the former northeastern pump island ("P3") contained greater than 100 ppm TPH_g.

- Stockpiled soil from the removal of the gasoline tanks was characterized and backfilled in the original excavation upon approval from the Hazardous Materials Management Division (HMMD).

- Stockpiled soil from the removal of the used oil tank was allowed by the HMMD to remained on site until further excavation was completed.

MONITORING WELL INSTALLATION

On March 27, 1992, a Groundwater Technology geologist observed the installation of monitoring wells MW1, MW2, and MW3. The wells were installed by H.E.M.C. Environmental Drilling of Irvine, California. Prior to drilling, a well permit was obtained from the HMMD. A copy of this permit is included in Appendix 2. As required by the well permit, a 30-day report was completed and submitted to the HMMD. The wells were completed in general accordance with Bulletins 74-81 and 74-90 "Water Well Standards: State of California". Well logs are included in Appendix 3. A worker health and safety plan was also prepared prior to drilling. As requested by the HMMD, a community health and safety plan was also prepared. The locations of the wells is shown on Figure 2. Drill cuttings were stockpiled on site. Soil from later excavation activities was added to the drill cuttings stockpile.

Soil samples were collected during the drilling process. Soil sample collection quality assurance and quality control (QA/QC) methods are included in Appendix 4. Soil samples were field screened with an HNU portable photo-ionization detector (PID). Results of the field screening are presented on the well logs. The samples were submitted to GTEL Environmental Laboratories in Torrance, California for analysis of purgable aromatics (BTEX) and total petroleum hydrocarbons as gasoline (TPH_g) in soil by Modified EPA Method 8020/8015. Laboratory reports are included in Appendix 4 and are summarized in Table 1 and on Figure 3. The wells were developed by a combination of surging and bailing.

FIGURE 3

GROUNDWATER MONITORING

The monitoring wells were gauged on March 31, April 6 and 8, 1992 with an interface probe to determine the depth to groundwater and to evaluate the presence of phase-separated hydrocarbons (PSH). Groundwater monitoring data sheets are included in Appendix 5. The depth to groundwater ranged from 6 to 11 feet. No PSH was detected on these dates.

Groundwater elevations from the April 8, 1992 monitoring are shown on the groundwater data map included as Figure 4. The groundwater elevations were not contoured for the following reasons:

- Groundwater conditions at this site do not represent a continuous, unconfined aquifer because the groundwater occurs in laterally-discontinuous gravel lenses. The groundwater conditions are discussed in greater detail in the Geology and Hydrogeology section of this report.

- There are only three wells at the site, this is the minimum required for contouring.

- Groundwater recharge is extremely slow. For example, well MW2 was installed on March 27, 1992 and was still dry 4 days later on March 31.

GROUNDWATER SAMPLE COLLECTION AND ANALYSIS

Groundwater samples were collected from all monitoring wells on April 8, 1992. Since all three wells were classified as slow recharging (i.e. <80% recharge in two hours), one bore hole volume of groundwater was purged prior to sample collection. Purged groundwater was stored in drums. The purged water was then removed from the drums by a pump truck. A copy of the pump truck receipt is included in Appendix 6. Samples were collected with a Teflon™ bailer in accordance with QA/QC methods included in Appendix 7. Laboratory reports are included in Appendix 7 and are summarized in Table 2 and on Figure 4.

SOIL EXCAVATION ACTIVITIES

Soil excavation activities were conducted at the site from April 6 to 10, 1992. A Groundwater Technology geologist was on site to observe the excavation activities and collect soil samples. The excavation was completed by C.R.J. Inc. with a trac-mounted backhoe. A mobile laboratory was on site to analyze soil samples. Mobile laboratory services were provided by GTEL Environmental Laboratories on April 6, 7, and 8 and by GeoTest Laboratories on April 9 and 10. The following areas were excavated:

- The used oil tank pit,
- The southern pump island ("P1"),
- The northeastern pump island ("P3").

Excavated soils were stockpiled on site. Figure 5 illustrates the locations of the excavations and stockpiles. A summary of the activities at each excavation is presented in the following sections.

Used Oil Excavation

Approximately 100 cubic yards of soil have been excavated from the used oil tank pit area since the tank was removed in June 1991. The excavation is approximately 20 feet long, 10 feet wide and 12 feet deep. Twenty soil samples were collected from the tank pit and analyzed for total petroleum hydrocarbons (TPH_{ir}) in soil by Infrared Modified EPA Method 3550/SM503E/EPA 418.1. Soil samples were collected according to the QA/QC methods presented in Appendix 4.

Composite sample WO5,6,7, which contained 7,800 ppm TPH_{ir}, was also analyzed for the following:

- Purgable aromatics in soil by Modified EPA Method 8020,
- PCB's in soil by EPA Method 8080,
- Total organo lead in soil by Flame AA DHS Method,
- Halogenated volatile organics in soil by EPA Method 8010.

Analytical reports are included in Appendix 8 and are summarized in Table 3. TPH_{ir} concentrations are presented on Figure 6.

Thirteen samples represent soil left in place. TPH_{ir} concentrations of soils left in place ranged from <10 to 68 ppm. TPH_{ir} concentrations of excavated soil ranged from <10 to 7,800 ppm. Composite sample WO5,6,7, which contained the highest concentration of TPH_{ir}, also contained 0.23 ppm xylene and 1.7 ppm organo lead.

Southern Pump Island Excavation

Approximately 100 cubic yards of soil was excavated from the southern pump island area. The excavation is approximately 30 feet long by 8 feet wide by 8 feet deep. Six confirmation soil samples were collected from the excavation and analyzed for BTEX and TPH_g in soil by Modified EPA Method 8015/8020. Soil samples were collected according to the QA/QC methods presented in Appendix 4. Analytical reports are included in Appendix 9 and are summarized in Table 4. TPH_g concentrations are presented on Figure 7.

TPH_g = Total Petroleum Hydrocarbons as gasoline
<number = Less than method detection limit

As seen in Table 4 and on Figure 7, no benzene or TPH_g was detected in soil samples collected from the southern pump island excavation.

Northeastern Pump Island Excavation

Approximately 2,100 cubic yards of soil was excavated from the northeastern pump island area. The excavation is approximately 90 feet long by 60 feet wide. The depth of the excavation ranges from 7 to 11 feet. Sixty two soil samples were collected from the excavation and analyzed for BTEX and TPH_g in soil by Modified EPA Method 8015/8020. Soil samples were collected according to the QA/QC methods presented in Appendix 4. Analytical reports are included in Appendix 9 and are summarized in Table 5. Benzene and TPH_g concentrations are presented on Figure 8. The GTEL Mobile Laboratory reported a TPH_g detection limit of 10 ppm and the GeoTest Mobile Laboratory reported a TPH_g detection limit of 1.0 ppm.

Notes:
TPH_g = Total Petroleum Hydrocarbons as gasoline
<number = Less than method detection limit
* = Represents excavated soil

TPH_g concentrations were less than 100 ppm in 46 of the 62 samples analyzed. Benzene concentrations were less than 0.1 ppm in 39 of the 62 samples analyzed. Samples representing excavated soil contained TPH_g concentrations ranging from <10 to 6,500 ppm. Samples representing soils left in place contained TPH_g concentrations ranging from <10 to 95 ppm. As seen in Table 5 and on Figure 8, soils which contained greater than 100 ppm TPH_g were excavated.

STOCKPILE CHARACTERIZATION

Soil stockpiles were characterized on April 22 and 23, 1992 in general accordance with the HMMD Site Assessment and Mitigation manual guidelines. The location of the stockpiles is presented on Figure 5. The characterization was performed by applying the following sampling protocol to each 100 cubic yards of stockpiled soil:

- Each 100 cubic yard section was divided into quadrants (A, B, C, and D),
- One sample was collected from each quadrant utilizing a random number generator applied to a three dimensional grid,
- Each sample was collected using a backhoe or shovel to within approximately one foot of the designated location,
- Samples were submitted for laboratory analysis.

The analytical results were then evaluated by utilizing the procedures outlined in the EPA Publication SW-846. This procedure estimates the mean concentration of a given compound within a soil mass and the minimum number of samples necessary to calculate this mean to within a specified confidence level. Statistical calculations are included in Appendix 11.

Pump Islands Stockpile Characterization

Approximately 2,200 cubic yards of soil were excavated from beneath the former pump islands (Stockpile sections 1 - 21, and 23, Fig. 5). The stockpiled soil was characterized according to the method outlined above. Soil samples were analyzed for BTEX and TPH_g. Laboratory results are summarized below in Table 6 and are included in Appendix 10. Soil sample locations are illustrated on Figures 9, 10, and 11. Figure 9 represents stockpile sections 1 - 10, Figure 10 represents stockpile sections 11 - 19, and Figure 11 represents stockpile sections 20 - 23. Samples were collected at various depths within the stockpiles. Sample depths are indicated in Table 6 as the elevations above grade. Samples collected at "0" feet in elevation represent samples collected at the bottom of the pile.

STOCKPILE SECTIONS 20-23

FIGURE 11

TPH_g concentrations were < 100 ppm in 73 of 88 samples and benzene concentrations were less than 0.1 ppm in 79 of 88 samples. The remaining 15 samples contained TPH_g concentrations ranging from 100 to 520 ppm and benzene concentrations ranging from 0.10 to 0.49 ppb.

TPH_g concentrations < 10 ppm were assumed to equal 9 ppm for the calculations. The mean TPH_g concentration was 49 ppm with a confidence interval of + or - 14 ppm. The mean benzene concentration was 0.035 ppm with a confidence interval of + or - 0.013 ppm. Statistical calculations are included in Appendix 11.

Used Oil Tank Stockpile Characterization

Approximately 100 cubic yards of soil is located to the west of the used oil tank excavation (Stockpile section 22, Fig. 5). The stockpiled soil was characterized according the method outlined above. Soil samples were analyzed for TPH_{ir}. Laboratory results are summarized below in Table 7 and are included in Appendix 10. Soil sample locations are illustrated on Figure 11.

TPH_{ir} = Total Petroleum Hydrocarbons by infrared Method 418.1

Statistical calculations are included in Appendix 11. The mean TPH_{ir} concentration was 71 ppm with a confidence interval of + or - 31 ppm.

GEOLOGY AND HYDROGEOLOGY

The following observations were made regarding the site geology and hydrogeology based on the previous site assessment activities:

- The site is located along the south side of an east-west trending valley (Fig. 1). A stream bed runs down the valley approximately 100 feet to the northeast of the site.

- The site topography slopes from south to north with a decrease in elevation of approximately 12 feet across the site.

- The site lies in the Cholla hydrologic sub unit (HSA 8.22) which is adjacent to the Mission San Diego Hydrologic Subunit (HSA 7.11). Groundwater in the 8.22 subunit is listed as non-beneficial use as designated by the Regional Water Quality Control Board (RWQCB; December 17, 1990). The 7.11 subunit is listed as having beneficial uses.

Groundwater is beneficial under site.

A geologic map of the area and its legend are included as Figures 12a and 12b. As seen on the geologic map, the area geology consists of quaternary alluvium and slopewash over the Stadium Conglomerate formation (Kennedy, Michael P., 1975).

LEGEND FOR GEOLOGIC MAP

FIGURE 12b

As requested by Mike Porter of the HMMD, geologic mapping of the selected excavation walls was completed. The locations of the mapped walls is indicated on Figure 13. Due to the irregular shape of the excavation walls, maps A - A' and B - B' (Fig. 14) are schematic (i.e. not to scale). Excavation wall C - C' (Fig. 15) was chosen for scaled mapping because it was the most linear. Wall C - C' was surveyed relative to the monitoring wells in order to evaluate groundwater conditions. Results of this mapping indicate the following:

- An approximate 5-foot thick layer of fill material was observed. The fill material consists of clayey sand with traces of debris (asphalt, concrete, wood, trash etc.).
- A 1 to 3-foot thick layer of silty sand was observed beneath the fill material.
- Stadium conglomerate was observed beneath the silty sand layer.
- An approximate 1-foot thick layer of sand was observed between the fill material and silty sand along the northern side of the excavation
- Laterally discontinuous lenses of gravel and sandy silt were observed within the silty sand layer.

Groundwater was observed seeping from the gravel lenses during the excavation activities. Other areas varied from dry to damp. The groundwater elevation observed in well MW1 was equal to elevation of the gravel lense mapped along the southern wall (C - C'). These lenses were observed to be laterally discontinuous with a maximum length of 4 - 6 feet.

SUMMARY

- Soil samples collected during the drilling of wells MW1, MW2, and MW3 contained less than 100 ppm TPH_g.

- The highest concentration of TPH_g in groundwater was observed in well MW3 (21,000 ppb).

- Approximately 100 cubic yards of soil containing greater than 100 ppm TPH_{ir} was excavated from the used oil tank area. Confirmation samples collected from the excavation walls and bottom (WO23-12') contained less than 100 ppm TPH_{ir}.

- Approximately 100 cubic yards of soil was excavated from the southern pump island area. Confirmation samples collected from the excavation walls and bottom did not contain detectable benzene or TPH_g concentrations.

- Approximately 2,100 cubic yards of soil was excavated from the northeastern pump island area. Confirmation samples collected from the excavation walls and bottom contained less than 100 ppm TPH_g.

- Statistical calculations indicated a mean TPH_g concentration of 49 ppm and a confidence interval of + or - 14 ppm for the 2,200 cubic yards of soil excavated from the pump island areas.

- Statistical calculations indicated a mean benzene concentration of 0.035 ppm and a confidence interval of + or - 0.013 ppm for the 2,200 cubic yards of soil excavated from the pump island areas.

- Statistical calculations indicated a mean TPH_{ir} concentration of 71 ppm and a confidence interval of + or - 31 ppm for the 100 cubic yards of soil excavated from the used oil tank area.

- The site geology consists of fill material and silty sand over the stadium conglomerate formation. The silty sand contains laterally-discontinuous lenses of gravel.

- Based on the observations made during the excavation activities and during the subsequent geologic mapping, groundwater occurs within the gravel lenses and does not represent a continuous-unconfined aquifer.

- Since excavation activities began in April, no significant amounts of groundwater have been observed in the excavation.

MONITORING WELL AND BORING CONSTRUCTION AND DESTRUCTION PERMIT

SITE NAME: CHEVRON

SITE ADDRESS: 7651 ALVARADO RD, LA MESA, CA

PERMIT FOR: 3 MONITORING WELLS

PERMIT APPROVAL DATE: 02/05/92

PERMIT EXPIRES ON: 06/03/92

PERMIT CONDITIONS:

1. All borings must be destroyed in accordance with Department of Water Resources Bulletin 74-81 and 74-90.

2. All wash water must be contained and disposed of properly.

3. Submit complete laboratory data for both soil and groundwater with the well logs.

4. Submit all the information specified in the SA/M Manual in:

   Section 1, C., 4., c).

5. All water and soil that is placed in drums must be labeled and stored as specified in the SA/M Manual in:

   Section 1, C., 5.

6. This office must be given 48 hour notice of any drilling activity on this site.

7. This office must be given advanced notification of drilling cancellation.

APPROVED BY: Kevin M. Hall DATE: 2/5/92

COMMENTS:

Static water level is measured from top of casing.

SOIL SAMPLING
TECHNIQUES AND QUALITY ASSURANCE

To prevent cross contamination between samples, the sampler was washed prior to each sampling using the "three bucket" wash system. This system involves:

1. Washing the split-spoon sampler in a TSP and water solution.
2. Rinsing sampler in tap water.
3. Rinsing sampler in distilled water.

To maintain the integrity of each soil sample the following procedures were performed. After extraction soil samples will be:

1. Collected in 6-inch brass sample tubes or 8 ounce glass jars.
2. Sealed with foil or teflon caps.
3. Wrapped with duct tape.
4. Properly labeled with complete custody forms.
5. Waterproofed in plastic containers.
6. Placed in a cooler and chilled on ice until analysis.
7. Delivered to a state certified laboratory.

All soil samples were frozen and stored at the laboratory for 30 days in anticipation of the need for subsequent analysis.

9940 Mesa Rim Rd., Suite B
San Diego, CA 92121

Dear Mr Lines,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 3/28/92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

QA Conformance Summary

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

GTEL Sample No. Range: 1A-6A Date of Analysis: 3/31/92-4/1/92

1.0 Blanks

0 of 4 target compounds were found in Reagent blank and gasoline was below detection limit as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 4 out of 4 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were met for the surrogate compound (Bromofluorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 4 of 4 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for 4 of 4 compounds and gasoline in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were no exceptional conditions requiring dilution of samples.

Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Road, Suite #B
San Diego, CA 92121

Dear Mr. Lines,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 4-7-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

QA Conformance Summary

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

GTEL Sample No. Range: 1A-2A Date of Analysis: 4/8-9/92

1.0 Blanks

0 of 4 target compounds were found in Reagent blank and gasoline was below detection limit as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 4 out of 4 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were met for the surrogate compound (Bromofluorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 4 of 4 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for 4 of 4 compounds and gasoline in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were no exceptional conditions requiring dilution of samples.

WATER SAMPLING
QUALITY ASSURANCE AND QUALITY CONTROL

To prevent cross contamination between samples, the Teflon™ surface sampler was washed prior to each sampling using the "three bucket" wash system. This system involves:

1. Washing the surface sampler in a TSP and water solution.
2. Double rinsing the sampler in tap water.
3. Double rinsing the sampler in distilled water.

To maintain the integrity of each sample the following procedures were performed.

1. Only collected from developed monitoring wells.
2. Collected with Teflon™ sampling equipment.
3. Secured in air tight laboratory cleaned sampling vesicles (vials, jars, bottles, etc.)
4. Properly labeled with complete custody forms.
5. Placed in a cooler and chilled on ice until analysis.
6. Delivered to a state certified laboratory.

All water samples were refrigerated and stored at the laboratory for 30 days in anticipation of the need for subsequent analysis.

Ms. Kathy Gerber
Groundwater Technology, Inc.
9940 Mesa Rim Rd., Suite #B
San Diego, CA 92121

Dear Ms. Gerber,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 4-9-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

cc: Roger Uhden

QA Conformance Summary

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM 503E/EPA 418.1

GTEL Sample No. Range: 1A-12A Date of Analysis: 4/7-8/92

1.0 Blanks

The method blank was below the detection limit as shown in Table 2.

2.0 Calibration Verification Standards

2.1 The control limits were met for the initial calibration verification standard (ICVS) as shown in Table 3.

3.0 Matrix Spike (MS) Accuracy

The control limits were met for the MS as shown in Table 4.

4.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for the sample duplicate as shown in Table 5.

5.0 Sample Handling

5.1 Sample handling and holding time criteria were met for all samples.

5.2 There were exceptional conditions requiring dilution of samples.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T204137
Report Issue Date: April 10, 1992

Table 2

METHOD BLANK DATA

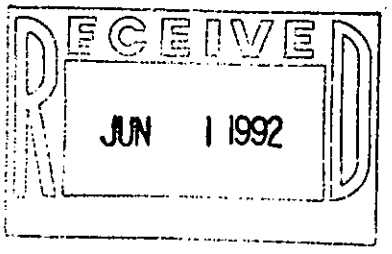
Work Order Number: T204121
Report Issue Date: May 27, 1992



Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Rd., Suite B
San Diego, CA 92121

Dear Mr. Lines,

This report replaces the previous report dated 4-16-92, due to incorrect Client ID Number. Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 4-8-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

cc: Ruben Avilez

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T204121
Report Issue Date: May 27, 1992

Table 1

ANALYTICAL RESULTS

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM 503E/EPA 418.1

Sample Identification		Date Sampled	Date Extracted	Date Analyzed	Concentration, mg/Kg[1]
GTEL No.	Client ID				
1A	WO 5,6,7	4-7-92	4-10-92	4-10-92	7800

1 = Method detection limit = 5 mg/Kg; analyte below this level would not be detected.

QA Conformance Summary

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM 503E/EPA 418.1

GTEL Sample No. Range: 1A Date of Analysis: 4-10-92

1.0 Blanks

The method blank was below the detection limit as shown in Table 2.

2.0 Calibration Verification Standards

2.1 The control limits were met for the initial calibration verification standard (ICVS) as shown in Table 3.

3.0 Matrix Spike (MS) Accuracy

The control limits were met for the MS as shown in Table 4.

4.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for the sample duplicate as shown in Table 5.

5.0 Sample Handling

5.1 Sample handling and holding time criteria were met for all samples.

5.2 There were no exceptional conditions requiring dilution of samples.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T204121
Report Issue Date: May 27, 1992

Table 2

Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Rd., Suite #B
San Diego, CA 92121

Dear Mr. Lines,

This report replaces the previous report dated 4-20-92, due to the incorrect Client ID Number. Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 4-8-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

QA Conformance Summary

Total Organo Lead in Soil by Flame AA
DHS Method

GTEL Sample No. Range: 1A Date of Analysis: 4-17-92

1.0 Blanks

The method blank was below the detection limit as shown in Table 2.

2.0 Calibration Verification Standards

2.1 The control limits were met for the initial calibration verification standard (ICVS) as shown in Table 3.

3.0 Matrix Spike (MS) Accuracy

The control limits were met for 1 of 1 elements in the MS as shown in Table 4.

4.0 Sample Duplicate Precision

Relative percent difference criterion was met for the sample duplicate as shown in Table 5.

5.0 Sample Handling

5.1 Sample handling and holding time criteria were met for all samples.

6.1 There were no exceptional conditions requiring dilution of samples.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521

QA Conformance Summary

Halogenated Volatile Organics in Soil
EPA Method 8010[a]

GTEL Sample No. Range: 1A Date of Analysis: 4-14-92

1.0 Blanks

0 of 29 target compounds found in Reagent blank as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 8 out of 8 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were met for the surrogate compound (1.4-Dichlorobutane) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 8 of 8 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criteria was met for 8 of 8 compounds in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were no exceptional conditions requiring dilution of samples.

Ms. Kathy Gerber
Groundwater Technology, Inc.
9940 Mesa Rim Road, Suite #B
San Diego, CA 92121

Dear Ms. Gerber,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 4-9-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

QA Conformance Summary

Purgeable Aromatics and Total Petroleum Hydrocarbons as Gasoline in Soil EPA Method 8020/8015

GTEL Sample No. Range: 1A-38A Date of Analysis: 4/7-8/92

1.0 Blanks

1 of 4 target compounds found in Reagent blank and the Reagent blank was below detection limit for gasoline as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 4 out of 4 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were met for the surrogate compound (Bromofluorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 4 of 4 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criteria was met for 4 of 4 compounds and gasoline in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were exceptional conditions requiring dilution of samples.

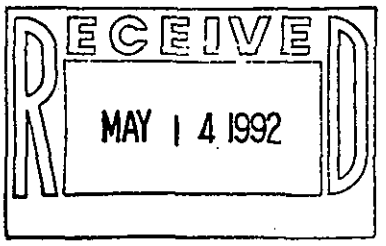
Report Issue Date: May 6, 1992



Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Rd., Suite #B
San Diego, CA 92121

Dear Mr. Lines,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 4-24-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

cc: Ruben Avilez

QA Conformance Summary

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

GTEL Sample No. Range: 1A-52A Date of Analysis: 4/27-30/92

1.0 Blanks

0 of 4 target compounds were found in Reagent blank and gasoline was below detection limit as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 4 out of 4 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were not met for the surrogate compound (Bromofluorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 4 of 4 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for 4 of 4 compounds and gasoline in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were exceptional conditions requiring dilution of samples.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T204486
Report Issue Date: May 6, 1992

Table 2

REAGENT BLANK DATA

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

Date of Analysis: 4-27-92

Analyte	Concentration, mg/Kg
Benzene	<0.005
Toluene	<0.005
Ethyl Benzene	<0.005
Xylene (total)	<0.015
Gasoline	<10

Project Number: GTI76.CHV01

Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Rd., Suite B
San Diego, CA 92121

Dear Mr. Lines,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 4/24/92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

cc: Ruben Avilez

QA Conformance Summary

Purgeable Aromatics and Total Petroleum Hydrocarbons
as Gasoline in Soil
EPA Method 8020/8015

GTEL Sample No. Range: 1A-36A Date of Analysis: 4/24,25,27/92

1.0 Blanks

0 of 4 target compounds were found in Reagent blank and gasoline was below detection limit as shown in Table 2.

2.0 Independent QC Check Sample

The control limits were met for 4 out of 4 QC check compounds as shown in Table 3.

3.0 Surrogate Compound Recoveries

Percent recovery limits were not met for the surrogate compound (Bromofluorobenzene) for all samples as shown in Table 4.

4.0 Matrix Spike (MS) Accuracy

Percent recovery limits were met for 4 of 4 compounds in the MS as shown in Table 5.

5.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for 4 of 4 compounds and gasoline in the sample duplicate as shown in Table 6.

6.0 Sample Handling

6.1 Sample handling and holding time criteria were met for all samples.

6.2 There were exceptional conditions requiring dilution of samples.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T204488
Report Issue Date: April 30, 1992

Table 2

REAGENT BLANK DATA

Report Issue Date: April 30, 1992

RECEIVED
MAY 14 1992

Mr. Bill Lines
Groundwater Technology, Inc.
9940 Mesa Rim Rd., Suite #B
San Diego, CA 92121

Dear Mr. Lines,

Enclosed please find the analytical results for the samples received by GTEL Environmental Laboratories, Inc. on 4-24-92.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria unless otherwise stated in the footnotes.

GTEL is certified by the state of California under Certification #E723.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,

GTEL Environmental Laboratories, Inc.

Minsoon Song
Laboratory Director

cc: Ruben Avilez

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T204487
Report Issue Date: April 30, 1992

Table 1

ANALYTICAL RESULTS

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM 503E/EPA 418.1

Sample Identification		Date Sampled	Date Extracted	Date Analyzed	Concentration, mg/Kg[1]
GTEL No.	Client ID				
1A	22A	4-22-92	4-29-92	4-29-92	81
2A	22B	4-22-92	4-29-92	4-29-92	64
3A	22C	4-22-92	4-29-92	4-29-92	30
4A	22D	4-22-92	4-29-92	4-29-92	110

1 = Method detection limit = 5 mg/Kg; analyte below this level would not be detected.

GTEL ENVIRONMENTAL LABORATORIES, INC.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521

QA Conformance Summary

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM 503E/EPA 418.1

GTEL Sample No. Range: 1A-4A Date of Analysis: 4-29-92

1.0 Blanks

The method blank was below the detection limit as shown in Table 2.

2.0 Calibration Verification Standards

2.1 The control limits were met for the initial calibration verification standard (ICVS) as shown in Table 3.

3.0 Matrix Spike (MS) Accuracy

The control limits were met for the MS as shown in Table 4.

4.0 Sample Duplicate Precision

Relative percent difference (RPD) criterion was met for the sample duplicate as shown in Table 5.

5.0 Sample Handling

5.1 *Sample handling and holding time criteria were met for all samples.*

5.2 There were no exceptional conditions requiring dilution of samples.

Project Number: GTI76.CHV01
Contract Number: 6CSW23231X
Facility Number: 9-3521
Work Order Number: T204487
Report Issue Date: April 30, 1992

Table 2

METHOD BLANK DATA

Petroleum Hydrocarbons in Soil by Infrared
Modified EPA Method 3550/SM 503E/EPA 418.1

Date of Analysis: 4-29-92

Analyte	Concentration, mg/Kg
Petroleum Hydrocarbons	<5

< # = Not detected at the indicated detection limit.

GTEL ENVIRONMENTAL LABORATORIES, INC.

SIMPLE RANDOM SAMPLING AND SYSTEMATIC RANDOM SAMPLING

1	List sample results from laboratory Analytical Method EPA 418.1 Units (i.e. mg/kg) mg/Kg (ppm)	1 81	2 64	3 30
		4 110	5	6
		7	8	9
2	Determine number of sample values n		n = 4	
3	Calculate sample mean With n = number of sample measurements $\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}$		$\bar{x}$ = 71	
4	Calculate sample variance $\frac{(81^2+64^2+30^2+110^2) - \frac{(285)^2}{4}}{3}$ $s^2 = \frac{\sum_{i=1}^{n} x_i^2 - \frac{(\sum_{i=1}^{n} x_i)^2}{n}}{n-1}$		s^2 = 1100	
5	Calculate sample standard deviation $s = \sqrt{s^2}$		s = 33	
6	Calculate degrees of freedom $df = n-1$		df = 3	
7	Calculate standard error of the mean $s_{\bar{x}} = \frac{s}{\sqrt{n}}$		$s_{\bar{x}}$ = 19	
8	Obtain student's 't' value corresponding to the degree of freedom value determined in #6 above. (See attached Table reproduced on the back of this page.)		$t_{.20}$ = 1.638	
9	Calculate the confidence interval $CI = \bar{x} \pm t_{.20}\, s_{\bar{x}}$		CI = 71 ± 31	
10	Obtain regulatory threshold for the contaminant of concern RT		RT = 100	
11	Calculate $\Delta = RT - \bar{x}$		Δ = 29	
12	Estimate minimum number of samples $n_{min} = \frac{t_{.20}^2\, s^2}{\Delta^2}$		n_{min} = 3.5	

PLEASE NOTE: In accordance with the California Code of Regulations, Title 22, Section 66694, the HMMD follows the sampling guidelines set forth in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, Third Edition", U.S. Environmental Protection Agency, 1986. This worksheet is based on information found in Volume II, Part III, Chapter 9, of "SW-846" and is provided as an aid for stockpile characterization. For circumstances requiring data manipulation beyond that indicated on the worksheet, refer to "SW-846".

HEALTH SERVICES

June 16, 1992

Mr. Michael Porter
Hazardous Materials Management Division
P.O. Box 85261
San Diego, California 92138-5261

Regarding: Former Chevron Service Station #9-3521
7651 Alvarado Road
La Mesa, California 92041

Dear Mr. Porter:
Chevron is pleased to submit the attached report, completed by Groundwater Technology Inc., summarizing the assessment activities at the above mentioned site. In general, the soils containing greater than 100 parts per million (ppm) TPH have been excavated from the used oil tank and pump island areas. The stockpiled soils were characterized in accordance with EPA Publication SW-846. Characterization of the 2,200 yards of soils excavated from beneath the former pump islands indicated the following:

- A mean TPH concentration of 49 ppm and a confidence interval of + or - 14 ppm,
- A mean benzene concentration of 0.035 and a confidence interval of + or - 0.013 ppm,
- TPH concentrations were <100 ppm in 73 of 88 samples,
- Benzene concentrations were <0.1 ppm in 79 of 88 samples.

The geologic and hydrogeologic study of the site indicated that the groundwater does not represent a continuous aquifer. Due to the site's hydrogeology, it is unlikely that any dissolved-phase gasoline hydrocarbons originating from the site would migrate to the stream bed located to the north of the site.

Future development at the site may include paving the lot for use as a recreational vehicle sales/storage area. The monitoring well roadboxes will be incorporated into the new site development and a quarterly groundwater monitoring and sampling program will begin in the third quarter of this year.

Based on the stockpile characterization presented in the Groundwater Technology report dated June 12, 1992, Chevron is requesting approval to backfill the soil excavated from beneath the former pump islands and used oil excavation.

If you have any questions or comments, please call me at (310) 694-7304.

Sincerely yours,

Ruben Avilez

La Mesa, California

Mr. Michael Habib
11462 Shadow Ranch Road
La Mesa, CA 91941

Dear Mr. Habib:

We received your letter dated June 1, 1992, and your 30-day notice to terminate the lease on the subject property.

Please refer to Paragraph 5 of the lease, which expired on May 31, 1992. Paragraph 5 grants Chevron 30 days after the termination of the lease to remove our improvements and backfill excavations resulting from the removal of underground tanks. Mr. Avilez estimates that we should complete our work by the end of June, provided timely response is received from the San Diego County HMMD.

In the event we do not receive the closure approval from HMMD and have to remain on the property after June 30, 1992, causing delay in the commencement of rent for your new use, we are willing to discuss an appropriate license fee, provided you grant us access by executing the license agreement previously forwarded to you.

If you have any questions, or wish to discuss this matter further, please feel free to contact me or Mr. Avilez.

Very truly yours,

J. A. Holmquist
Property Development Specialist

FROM LEASE
DATED 7/30/71

roadways and use sidewalks for vehicles to pass to and from the leased premises. Upon the expiration of this lease, or any extension or renewal thereof, Lessee agrees to replace all curbs and sidewalks cut or removed by Lessee during Lessee's occupancy of the premises. If it is or becomes unlawful for Lessee or anyone holding under Lessee directly or indirectly, to conduct any particular operation or to erect or maintain any particular structure or equipment on the leased premises, or if any part of the leased premises of the approaches thereto are condemned or changed by public authority, or if any highway or street change is made diverting or rerouting traffic away from the leased premises, so that in any such case enumerated above it becomes impossible or impracticable to use the leased premises as they were being used at the time such use is declared unlawful or such condemnation or change is effected, then Lessee shall have the right at any time thereafter to terminate this lease by giving Lessor ten (10) days notice in writing of such termination.

5. Lessee shall have the right at any time during Lessee's occupancy of the leased premises to remove any and all buildings, improvements, fixtures and equipment owned or placed by Lessee, its Sublessees or Licensees, in, under or upon the leased premises, or acquired by Lessee whether before or during the term hereof, and Lessee shall, within thirty (30) days after the termination of this lease, remove all such buildings, improvements, fixtures and equipment in, under or upon the leased premises and to backfill any excavations resulting from

such removal to an approximation of original grade.

6. Lessee agrees to pay direct to the taxing authorities of the city, county or state in which the leased premises are located all real property taxes, except special taxes or assessments, and all property taxes on personal property located on the leased premises, levied or assessed upon or against the leased premises during the fifteen (15) year period of the term of this lease as provided in Paragraph 1 hereof, or any extension thereof. If Lessor's tax bills prior to the commencement date of said fifteen (15) year period include property other than that covered by this lease, Lessor agrees to arrange with said taxing authorities to have the leased premises separately assessed, and such assessment shall be a condition precedent to Lessee's obligation to pay the taxes hereinabove provided for. For any fraction of a tax year at the beginning or end of said fifteen (15) year period, or any extension thereof, Lessee's obligation hereunder shall be prorated as of the commencement or end of said fifteen (15) year period, or any extension thereof. For any such fraction of a tax year at the beginning of said fifteen (15) year period, Lessee agrees to reimburse Lessor for its portion of such taxes within sixty (60) days after presentation to Lessee of receipted copies of the bills covering the same, together with an estimated segregation of such taxes obtained from the particular taxing authority involved if such tax bills include property other than that covered by this lease. For any such fraction of a tax year at the end of said fifteen (15) year period, or any extension thereof, Lessor agrees to reimburse Lessee for Lessor's portion

Regarding: Update of activities at Chevron Station #9-3521, 7651 Alvarado Road, La Mesa, California

Dear Mr. Habbib:

This letter is to inform you that Chevron will be performing environmental activities at the above mentioned site for an additional month. I will notify you immediately if there is any change to this date.

Chevron has excavated the hydrocarbon impacted soil at station #9-3521, in accordance with the County of San Diego, HMMD. Additional cross-sectional drawings, as required by Mr. Mike Porter of the HMMD, have also been developed. A report of these findings will be submitted to the County of San Diego, HMMD, and the San Diego Regional Water Quality Control Board the week of June 8th. Once both agencies have reviewed the report, Chevron will respond accordingly. In order to avoid any possible delays, Chevron requests that the license agreement mailed on May 4, 1992, be signed and returned. Per our telephone conversation on May 11, 1992, you mentioned that you did not see any problems with the license agreement.

If you have any questions or comments, please contact me at (310) 694-7304.

Sincerely yours,

Ruben Avilez

THIRTY (30) DAY NOTICE TO TERMINATE

TO: Standard Oil Company of California
7651 Alvarado Road
La Mesa, California 91941

PLEASE TAKE NOTICE that your month-to-month tenancy of the above-described premises is hereby terminated as of the date thirty (30) days after service of this NOTICE upon you and you are hereby required to quit and surrender possession thereof to the undersigned no later than thirty (30) days after service of this NOTICE upon you.

This is intended as a thirty (30) day legal notice for the purpose of terminating your tenancy in accordance with California Civil Code Section 1946. This NOTICE is being served upon you because the landlord seeks in good faith to recover possession of the above-described premises.

DATE: 6-1, 1992

June 01, 1992

Dear Mr. Avilez:

Enclosed is a 30 day notice to terminate our lease agreement.

We are reviewing the license agreement which you sent last month.

Please be advised that our new tenant is paying $6,000.00 per month triple net. This is the amount you should be sending until you leave the site. Please send the new rental amount to the same address as usual.

Thank you,

Mike Habib

If LEL readings exceed 20% at receptor sites, the sites must be evacuated and machinery shut down. The GTI project manager, Health and Safety Coordinator, and Chevron must be contacted. Evacuation routes and staging areas are presented in Appendix 1.

2.0 GENERAL

The purpose of the Community Health and Safety Plan is to provide the surrounding community and emergency responders with an understanding of potential chemical and physical hazards that exist or may arise while the tasks of this project are being performed.

A Site Health and Safety Plan has been developed to protect workers from potential hazards while on site. Primary objectives of the Community Health and Safety Plan are to educate the public and to provide direction for emergency response. Reduction of potential hazards, both chemical and physical, are other objectives of this plan.

3.0 SITE IDENTIFICATION AND CONDITIONS

3.1 Site Background

Chevron U.S.A has retained Groundwater Technology to complete the following activities at the La Mesa site:

Observe the installation of at least three groundwater monitoring wells. Collect soil samples during the drilling process.

Survey, monitor and sample these wells.

Observe excavation of gasoline and used oil bearing soils. Collect soil samples during the excavation process.

Collect soil samples from the stockpiles of excavated soil.

Observe excavation backfilling activities.

Gasoline and used oil bearing soils were observed during the tank pull and soil sampling activities completed in the fall of 1991.

3.2 Site Conditions

General site conditions at the site include a gently sloped dirt lot located in a river valley. The depth to groundwater is anticipated to be approximately 10 feet. A creek is located to the north of the site across Alvarado Road. The I-8 on ramp is located to the east of the site and a restaurant is located to the west of the site. An office building is located across Comanche Drive to the south of the site.

Gasoline and used oil bearing soils were observed during the tank pull and soil sampling activities completed in the fall of 1991.

Non-chemical hazards include overhead and underground utilities, collapse of excavations, traffic, heavy equipment, noise, dust, and slip-trip-fall danger.

Potential receptors include on-site workers, and travelers on adjacent streets. Other potential receptors include staff and patrons of nearby office buildings, restaurant, and motel.

Appendix 1 presents locations of on-site and surrounding structures, and topography (Fig. 1). Evacuation routes and prevailing wind direction are presented in Figure 2. Adjacent land uses, nearby receptors, and environments of special concern are illustrated in Figure 3. No day-care centers, schools, or medical facilities have been found within a 1,000 foot radius of the site.

4.0 SITE HAZARDS AND POTENTIAL COMMUNITY CONCERNS

The following site hazards are relevant to on-site workers and can affect the surrounding community. For further details regarding on-site hazards, please consult the Health and Safety Plan located at the office of Groundwater Technology, Inc.

4.1 Physical Hazards

- Slippery Surfaces:

  The public and site workers should avoid wet and oily surfaces. Skid proof soles are highly recommended.

- Oxygen:

  Air that contains an oxygen concentration greater than 23% pose an extreme fire hazard (the usual ambient oxygen level is approximately 20.5%). This hazard can be compounded by the fact that vapors typical of gasoline are highly flammable. All personnel encountering atmospheres that contain a level of Oxygen greater than 23% must evacuate the site immediately and must notify the Fire Department.

  If Oxygen level is less than 19.5%, do not enter the area. Evacuate affected personnel promptly.

- Noise:

  GTI and ANSI approved hearing protection must be worn by on-site personnel during noisy operations such as drilling. Every effort will be made to keep noise levels below 90 dB on-site. For nuisance noise, please contact a Chevron or GTI representative.

- Surface and Equipment Contamination:

  Contact with contaminated surfaces, or surfaces suspected of being contaminated should be avoided. This includes walking through, kneeling or placing equipment in puddles, mud, discolored surfaces, or on drums and other containers. Eating, smoking, drinking and/or the application of cosmetics is prohibited on this site, reducing the likelihood of contamination by ingestion.

- Falling Objects:

  Hard hats must be worn by all on-site personnel whenever construction-type activity is taking place. (ie., drilling, excavation, trenching). Every effort will be made to protect site workers and the community from falling objects.

- Vehicular traffic:

All on-site personnel will be required to wear a fluorescent safety vest at all times. Site workers and the community are hereby informed that increased traffic will occur as a result of on-site activities. Additional traffic control will be provided as needed.

4.2 Chemical Hazards

- Organic Vapors:

  The inhalation of volatile organic vapors during all operations can pose a potential health hazard. On-site hazard reduction procedures include monitoring the ambient air with a PID and/or FID and use of Personal Protective Equipment. Potential receptors should stand upwind of the source of contamination whenever possible. If ambient air levels exceed 100 ppm at the site perimeters, work will cease or slow until ambient air concentrations are reduced.

- Flammable Vapors:

  Presence of flammable vapors can pose a potential fire hazard and health hazard. Hazard reducing procedures include monitoring the ambient air with LEL meter. If the LEL reading exceeds 20% at the site, cease work, leave the site immediately and contact the fire department.

  If LEL readings are 20% at nearby buildings, machinery should be turned off, personnel evacuated, and the fire department contacted.

The chemicals described below are known or suspected to be present on-site. The Material Safety Data Sheets (MSDS) for these chemicals can be found in Appendix 2. Additional chemicals may be used during the remediation process.

Chemicals commonly found at this site are: gasoline, benzene, toluene, ethylbenzene, xylenes, and used oil. The following is a health analysis of some of these chemicals.

Gasoline constituents can be divided into five major groups: alkanes, alkenes, cycloalkanes, aromatics and additives. Aromatics are the constituents generally regarded to be of greatest toxic concern. The major aromatics in gasoline are benzene, toluene, ethyl benzene and xylenes. Of these, benzene is considered to be the most toxic. One characteristic effect of gasoline and its aromatic constituents is their ability to irritate the skin when repeated or prolonged exposure occurs.

Benzene

Benzene can enter the body through inhalation, ingestion and skin contact. Studies have noted that chronic exposure to benzene vapor can produce neurotoxic and hematopoietic (blood system) effects. Other effects can include headache, dizziness, nausea, convulsions, coma and possible death if exposure is not reversed. One significant effect from chronic benzene exposure is bone marrow toxicity. There is also an association between chronic exposures to benzene and the development of certain types of leukemia.

Toluene

Inhalation exposure to toluene vapor can produce effects such as central nervous system depression. Depending on exposure factors, signs and symptoms can include headache, dizziness, fatigue, muscular weakness, incoordination, drowsiness, collapse and possible coma. Toluene can be a skin and mucous membrane irritant and studies have shown that high levels of toluene exposure can cause liver and kidney damage.

Ethyl Benzene

Exposure to ethyl benzene at high vapor concentrations may produce irritation to the skin, eyes and upper respiratory tract. Overexposure to ethyl benzene vapors can produce central nervous system depression with symptoms of headache, nausea, dizziness, shortness of breath and unsteadiness. Prolonged skin exposure to ethyl benzene may result in drying and cracking of the skin (dermatitis). Solvent resistant gloves should be worn during sampling to prevent exposure to the skin.

Xylenes

Depending on exposure factors, inhalation exposure to xylene vapor may produce central nervous system excitation followed by depression. Exposure to xylene vapor can produce dizziness, staggering, drowsiness and unconsciousness. At very high concentrations, xylene vapor may produce lung irritation, nausea, vomiting and abdominal pain. Xylene is not known to possess the chronic bone marrow toxicity of benzene, but liver enlargement and nerve-cell damage have been noted from chronic overexposure.

5.0 SITE ENGINEERING CONTROLS

It is the intent of Chevron U.S.A to extend to the community the same protection given the on-site worker. The principal hazard to the public is inhalation of hydrocarbon vapors generated during site activities.

In order to protect the community, air monitoring will be performed per Groundwater Technology, Inc (GTI) corporate policy while site activities are occurring. Site activities may be conducted either by Groundwater Technology, Inc or other subcontractors of Chevron.

Air monitoring will be performed by a representative of either Chevron or Groundwater Technology, Inc. The air will be monitored for (a) flammable vapors, and (b) toxic vapors. Oxygen levels may be monitored as well. The following air monitoring procedures will be followed.

a. Flammable Vapors: Monitor for % of Lower Explosive Limit (LEL) with a O_2/LEL meter to determine whether ambient vapor concentrations are within the flammable range.

   If LEL readings exceed 20% on-site, personnel MUST leave the site immediately, work activities at the site must cease, and the GTI project manager and Health and Safety Coordinator must be contacted.

   If LEL readings exceed 20% at receptor sites, the sites must be evacuated and machinery shut down. The GTI project manager, Health and Safety Coordinator, and Chevron contact person must be contacted. Evacuation routes and staging areas are presented in Appendix 1.

b. Toxic Vapors: Monitor for toxic vapors with a PID and/or a hot wire device (e.g. TLV) to determine whether toxic vapors exceed GTI action levels.

   If PID readings exceed 100 ppm at receptor sites for more than five (5) consecutive minutes, work will be ceased or slowed to allow vapors to dissipate.

c. Oxygen Level: Monitor for % Oxygen with an O_2/LEL meter on-site, at the site, and at the site perimeter to ensure a minimum oxygen level of 19.5%.

   If oxygen is less than 19.5% in any location, work will be halted immediately and affected personnel evacuated promptly.

6.0 SITE MONITORING EQUIPMENT

All monitoring equipment must be calibrated and maintained in accordance with manufacturer's recommendations. If an HNU is used, the 10.2 eV lamp is required for accurate readings.

TABLE 2

HAZARD SUMMARY

Job Task	PPE Level	AIR MONITORING - BREATHING ZONE	
		Instrument	Frequency*
Monitoring Soil Excavations	D	PID or hot wire	At start of work and 30 min to continuously
Monitoring Remed. Sys. Installation	D	PID or hot wire	Start-up of work and 30 min to continuously
Monitoring Well Development	D	PID or hot wire	Start-up of work at each well location
Groundwater and Soil Sampling	D	PID or hot wire	At start of work and 30 min to continuously

All air monitoring data must be recorded on the Vapor Monitoring Sheet, Appendix 3. The monitoring records will maintained on-site and will available for review at the request of the HMMD or other local agencies.

7.0 SITE SAFETY MANAGER

Please see Emergency Response page at the front of the document. The primary Site Safety Manager is the Chevron contact person or their representative.

8.0 MITIGATION MEASURES FOR UNPLANNED RELEASES

The primary hazards to the community are elevated LEL concentrations with resultant fire and explosion danger, and exposure to toxic vapors. In either case, the protocols described in Site Engineering Controls (5.0) are designed to protect the general public. The protocols are worst case scenarios and will be taken if mitigation measures do not succeed.

In order to keep the LEL concentrations below those requiring evacuation, air monitoring will be performed during construction or drilling activities as stated above by the Site Safety Manager (designated by Chevron). If on-site vapor concentrations exceed GTI action levels, work will be slowed or ceased until concentrations drop. The same protocol will be followed for toxic vapors.

Other measures such as wetting the soil with water spray or HMMD-approved foam may be used during construction or drilling activities. If LEL concentrations exceed 10% on-site, an exclusion zone will be established. Equipment such as backhoes and drilling rigs will be started outside the exclusion zone and brought in to reduce sparking hazard.

Emergency protocols concerning operation of a remediation system will be addressed in Appendix 4 if and when a system is designed.

If a spill of hazardous waste occurs, the spill should be confined by absorbent booms and dikes. The spill itself should be cleaned up using sorbant material. The dikes, booms, and sorbant material will be kept on-site for quick emergency response. All used cleanup materials will be treated as hazardous waste and disposed of properly. The HMMD will be immediately notified of any spills. If the spill travels offsite, the Office of Emergency Services will be notified. **Please refer to Emergency Response telephone numbers at front of report.**

9.0 SCHEDULE OF SITE ACTIVITIES

Site activities with estimated schedules are as follow:

March 1992- Installation of monitoring wells and excavation of soil.

10.0 PUBLIC NOTIFICATION

SUITE 230
VENTURA, CA 93003

Print Date: August 08, 1990

This Material Safety Data Sheet contains environmental, health and toxicology information for your employees. Please make sure this information is given to them. It also contains information to help you meet community right-to-know/emergency response reporting requirements under SARA Title III and many other laws. If you resell this product, this MSDS must be given to the buyer or the information incorporated in your MSDS. Discard any previous edition of this MSDS.

Revised to update Sections 1, 10, 11 and 12.

1. PRODUCT IDENTIFICATION

CHEVRON Regular Gasoline

DANGER! - HARMFUL OR FATAL IF SWALLOWED - CAN ENTER LUNGS AND CAUSE DAMAGE
- VAPOR HARMFUL
- LONG-TERM EXPOSURE TO VAPOR HAS CAUSED CANCER IN LABORATORY ANIMALS
- MAY CAUSE EYE AND SKIN IRRITATION
- EXTREMELY FLAMMABLE
- CONTAINS LEAD
- KEEP OUT OF REACH OF CHILDREN

PRODUCT NUMBER(S): CPS201305
PRODUCT INFORMATION: (800)582-3835

Prepared According to the OSHA Hazard Communication Standard (29 CFR 1910.1200) by the Chevron Environmental Health Center, Inc., P.O. Box 4054, Richmond, CA 94804.

2. FIRST AID - EMERGENCY PHONE NUMBER (800) 457-2022

EYE CONTACT:
Flush eyes immediately with fresh water for at least 15 minutes while holding the eyelids open. Remove contact lenses if worn. No additional first aid should be necessary, however, if irritation persists, see a doctor.
SKIN CONTACT:
Remove contaminated clothing. Wash skin thoroughly with soap and water. See a doctor if any signs or symptoms described in this document occur. Discard contaminated non-waterproof shoes and boots. Wash contaminated clothing.
INHALATION:
If respiratory irritation or any signs or symptoms as described in this document occur, move the person to fresh air. If any of these effects continue, see a doctor.
INGESTION:
If swallowed, give water or milk to drink and telephone for medical advice. DO NOT make person vomit unless directed to do so by medical personnel. If medical advice cannot be obtained, then take the person and product container to the nearest medical emergency treatment center or hospital. Note to Physician: Ingestion of this product or subsequent vomiting can result in aspiration of light hydrocarbon liquid which can cause pneumonitis.

3. IMMEDIATE HEALTH EFFECTS - (ALSO SEE SECTIONS 11 & 12)

EYE CONTACT:
This substance is slightly irritating to the eyes and could cause prolonged (days) impairment of your vision. The degree of the injury will depend on the amount of material that gets into the eye and the speed and thoroughness of the first aid treatment. Signs and symptoms may include pain, tears, swelling, redness, and blurred vision. Eye contact with the vapors, fumes, or spray mist from this substance could also cause similar signs and symptoms. This hazard evaluation is based on the data from similar materials.
SKIN IRRITATION:
The skin irritation potential of this substance has not been determined. However, it may be a moderate skin irritant so contact with the skin could cause prolonged (days) injury to the affected area. The degree of injury will depend on the amount of material that gets on the skin and the speed and thoroughness of the first aid treatment. Signs and symptoms may include pain or a feeling of heat, discoloration, swelling, and blistering. Prolonged or frequently repeated contact may cause the skin to become cracked or dry from the defatting action of this material. This hazard evaluation is based on data from similar materials.
DERMAL TOXICITY:
If absorbed through the skin, this substance is considered practically non-toxic to internal organs. This hazard evaluation is based on data

2. FIRST AID - EMERGENCY PHONE NUMBER (800) 457-2022

EYE CONTACT:
Flush eyes immediately with fresh water for at least 15 minutes while holding the eyelids open. Remove contact lenses if worn. No additional first aid should be necessary, however, if irritation persists, see a doctor.
SKIN CONTACT:
Remove contaminated clothing. Wash skin thoroughly with soap and water. See a doctor if any signs or symptoms described in this document occur. Discard contaminated non-waterproof shoes and boots. Wash contaminated clothing.
INHALATION:
If respiratory irritation or any signs or symptoms as described in this document occur, move the person to fresh air. If any of these effects continue, see a doctor.

PRODUCT NUMBER(S): CPS201110
PRODUCT INFORMATION: (800)582-3835

Prepared According to the OSHA Hazard Communication Standard (29 CFR 1910.1200) by the Chevron Environmental Health Center, Inc., P.O. Box 4054, Richmond, CA 94804.

occurred. Malformations have not been reported following inhalation exposure. Because of the very high levels of exposure used in these studies, we do not believe that their results imply an increased risk of reproductive toxicity to workers exposed to xylene levels at or below the exposure standard.

Xylene has given negative results in several mutagen testing assays including the Ames assay. In a cancer study sponsored by the National Toxicology Program (NTP), technical grade xylene gave no evidence of carcinogenicity in rats or mice dosed daily for two years.

Whole gasoline exhaust was reviewed by the International Agency for Research on Cancer (IARC) in their Monograph Volume 46 (1989). Evidence for causing cancer was considered inadequate in animals and inadequate in humans. IARC placed this material in Category 2B, considering it possibly carcinogenic to humans.

****

The above information is based on the data of which we are aware and is believed to be correct as of the date hereof. Since the information contained herein may be applied under conditions beyond our control and with which we may be unfamiliar and since data made available subsequent to the date hereof may suggest modification of the information, we do not assume any responsibility for the results of its use. This information is furnished upon condition that the person receiving it shall make his own determination of the suitability of the material for his particular purpose.

protein-isoparaffin complex accumulates in the kidney tubules causing significant cell death and regrowth. It is thought that this continuous kidney injury may contribute to the eventual development of the tumors.

The data above is obtained from studies sponsored by the American Petroleum Institute (API).

12. ADDITIONAL HEALTH DATA

ADDITIONAL HEALTH DATA COMMENT:
This product contains benzene. The OSHA Benzene Standard (29 CFR 1910.1028) contains detailed requirements for training, exposure monitoring, respiratory protection and medical surveillance triggered by the exposure level. Refer to the OSHA Standard before using this product. Repeated or prolonged breathing of benzene vapors has been associated with the development of chromosomal damage in experimental animals and various blood diseases in humans ranging from aplastic anemia to leukemia (a form of cancer). All of these diseases can be fatal. No birth defects have been shown to occur in pregnant laboratory animals exposed to doses not toxic to the mother. However, some evidence of fetal toxicity such as delayed physical development has been seen at such levels. The available information on the effects of benzene on human pregnancies is inadequate but it has been established that benzene can cross the human placenta.

This product contains n-hexane. Prolonged or repeated skin contact or breathing of vapors may cause nerve damage characterized by progressive weakness and numbness in the arms and legs. Recovery ranges from no recovery to complete recovery depending upon the severity of the nerve damage.

This product contains toluene. Toluene has been reported to decrease immunological responses in test animals. It has also been reported that when young rats were exposed to 1000 ppm toluene for 14 hours daily, for two weeks, irreversible hearing loss was detected. The same daily exposure to 700 ppm for as long as 16 weeks was without effect. Since the level necessary to produce hearing loss is greater than 7 times the 1987-88 ACGIH TLV for toluene, worker exposures at or below 100 ppm is not expected to cause any adverse effect. There are also reports that chronic abusers (glue sniffers, solvent huffers) of solvents containing toluene have suffered liver, kidney and brain damage. Scientific studies on toluene have failed to demonstrate birth defects in rats and mice. However, toluene has been shown to cause delayed growth and extra ribs in the offspring of rats and mice at inhaled doses (266-399 ppm) that were non-toxic to the mother. Toluene has not conclusively been shown to cause adverse reproductive effects in humans.

This product contains xylene, a chemical that has been reported to cause developmental toxicity in rats and mice exposed by inhalation during pregnancy. The effects noted consisted of delayed development and minor skeletal variations; additionally, when pregnant mice were exposed by ingestion to a level that killed nearly one-third of the test group, lethality (resorptions) and malformations (primarily cleft palate)

11. PRODUCT TOXICOLOGY DATA

EYE IRRITATION:
NDA. The hazard evaluation was based on data from similar materials.
SKIN IRRITATION:
This material was not a skin sensitizer in the modified Buehler Guinea Pig Sensitization Test.
DERMAL TOXICITY:
NDA. The hazard evaluation was based on data from similar materials.
RESPIRATORY/INHALATION:
NDA. The hazard evaluation was based on data from similar materials.
INGESTION:
NDA. The hazard evaluation was based on data from similar materials.
ADDITIONAL TOXICOLOGY DATA:
Lifetime inhalation of whole gasoline vapor has caused increased liver tumors in female mice. The mechanism of this response is still being investigated but it is thought to be an epigenetic process unique to the female mouse. Inhalation exposure to whole gasoline vapor also caused kidney damage and eventually kidney cancer in male rats.

No other animal model studied has shown these adverse kidney effects and there is no physiological reason to believe that they would occur in man. The cause of the kidney toxicity is thought to be due to the interaction of isoparaffin hydrocarbons in the product with a specific serum protein, alpha-2-microglobulin. Male rats synthesize large amounts of this protein which is filtered, reabsorbed, and degraded by their kidneys. Isoparaffins or their metabolites combine with this protein and make it "undigestable" by the kidney proteases. With repeated exposure, the

8. ENVIRONMENTAL CONCERNS, SPILL RESPONSE AND DISPOSAL

CHEMTREC EMERGENCY PHONE NUMBER: (800) 424-9300 (24 hour).
SPILL/LEAK PRECAUTIONS:
Certain geographical areas have air pollution restrictions concerning the use of materials in work situations which may release volatile components to the atmosphere. Air pollution regulations should be studied to determine if this material is regulated in the area where it is to be used.

This material is considered to be a water pollutant and releases of this product should be prevented from contaminating soil and water and from entering drainage and sewer systems. Eliminate all sources of ignition in vicinity of spill or released vapor. Clean up small spills using appropriate techniques such as sorbent materials or pumping. Where feasible and appropriate, remove contaminated soil. Follow prescribed procedures for reporting and responding to larger releases.
DISPOSAL METHODS:
Place contaminated materials in disposable containers and dispose of in a manner consistent with applicable regulations. Contact local environmental or health authorities for approved disposal of this material.

9. EXPOSURE STANDARDS, REGULATORY LIMITS AND COMPOSITION

COMPOSITION COMMENT:
All the components of this material are on the Toxic Substances Control Act Chemical Substances Inventory.

The percent compositions are given to allow for the various ranges of the components present in the whole product and may not equal 100%.

PERCENT/CAS#	COMPONENT/REGULATORY LIMITS
100.0 %	CHEVRON Regular Gasoline
CONTAINING	
100.0 %	GASOLINE (GENERIC) 300ppm ACGIH TLV 500ppm ACGIH STEL

FLAMMABILITY: 1.4 - 7.6%
EXTINGUISHING MEDIA:
CO2, Dry Chemical, Alcohol Foam and Water Fog.
NFPA RATINGS: Health 1; Flammability 3; Reactivity 0; Special NDA;
HMIS RATINGS: Health 2; Flammability 3; Reactivity 0; Other NDA;
(Least-0, Slight-1, Moderate-2, High-3, Extreme-4). These values are obtained using the guidelines or published evaluations prepared by the National Fire Protection Association or, if applicable, the National Paint and Coating Association, and do not necessarily reflect the hazard evaluation of the Chevron Environmental Health Center. Read the entire document and label before using this product.
FIRE FIGHTING PROCEDURES:
This product presents an extreme fire hazard. Liquid very quickly evaporates, even at low temperatures, and forms vapor (fumes) which can catch fire and burn with explosive violence. Invisible vapor spreads easily and can be set on fire by many sources such as pilot lights, welding equipment, and electrical motors and switches.

For fires involving this material, do not enter any enclosed or confined fire space without proper protective equipment. This may include self-contained breathing apparatus to protect against the hazardous effects of normal products of combustion or oxygen deficiency. Read the entire document.
COMBUSTION PRODUCTS:
Normal combustion forms carbon dioxide and water vapor; incomplete combustion can produce carbon monoxide.

6. STORAGE, HANDLING, AND REACTIVITY

HAZARDOUS DECOMPOSITION PRODUCTS:
NDA.
STABILITY:
Stable.
HAZARDOUS POLYMERIZATION:
Polymerization will not occur.
INCOMPATIBILITY:
May react with strong oxidizing agents, such as chlorates, nitrates, peroxides, etc.
SPECIAL PRECAUTIONS:
Never siphon gasoline by mouth. READ AND OBSERVE ALL PRECAUTIONS ON PRODUCT LABEL. Use only as a motor fuel. Do not use for cleaning, pressure appliance fuel, or any other such use. DO NOT USE OR STORE near flame, sparks or hot surfaces. USE ONLY IN WELL VENTILATED AREA. Keep container closed. DO NOT TRANSFER LIQUID TO AN UNLABELED CONTAINER. DO NOT weld, heat or drill container. Replace cap or bung. Emptied container still contains hazardous or explosive vapor or liquid.

7. PHYSICAL PROPERTIES

SOLUBILITY: Soluble in hydrocarbons; insoluble in water.

from similar materials.
RESPIRATORY/INHALATION:
This substance is slightly toxic to internal organs if inhaled. The degree of injury will depend on the airborne concentration and duration of exposure. The target organ(s) is the nervous system. Inhalation of gasoline vapor at airborne concentrations exceeding 1000 ppm may cause signs and symptoms of central nervous system effects such as headache, dizziness, loss of appetite, weakness and loss of coordination. Vapor concentrations in excess of 5000 ppm may cause loss of consciousness, coma and death. Brief exposures to high vapor concentrations may also cause pulmonary edema and bronchitis. Intentional exposures to excessively high concentrations (e.g., when used as a drug of abuse) have been reported to result in clinical manifestations that may include convulsions, delirium, and hallucinations. These manifestations are not known to occur following accidental inhalation of gasoline vapor during normal operations. This hazard evaluation is based on data from similar materials.
INGESTION:
This substance is slightly toxic to internal organs if swallowed. The degree of injury will depend on the amount absorbed from the gut. The target organ(s) is the nervous system. Signs and symptoms of central nervous system effects may include one or more of the following: headache, dizziness, loss of appetite, weakness and loss of coordination. Because of the low viscosity of this substance, it can directly enter the lungs if it is swallowed (this is called aspiration). This can occur during the act of swallowing or when vomiting the substance. Once in the lungs, the substance is very difficult to remove and can cause severe injury to the lungs and death. This hazard evaluation is based on data from similar materials.

4. PROTECTIVE EQUIPMENT

EYE PROTECTION:
Do not get this material in your eyes. Eye contact can be avoided by wearing chemical goggles.
SKIN PROTECTION:
Avoid contact with skin or clothing. Skin contact should be minimized by wearing protective clothing including gloves.
RESPIRATORY PROTECTION:
No special respiratory protection is normally required. However, if operating conditions create airborne concentrations which exceed the recommended exposure standards, the use of an approved respirator is required. Refer to the OSHA Benzene Standard to determine what type of respirator is required based on exposure levels.
VENTILATION:
Use this material only in well ventilated areas.

5. FIRE PROTECTION

FLASH POINT: (P-M) < -49F (-45C)
AUTOIGNITION: NDA

X-000621 (01-89)

and death. Brief exposures to high vapor concentrations may also cause pulmonary edema and bronchitis. Intentional exposures to excessively high concentrations (e.g., when used as a drug of abuse) have been reported to result in clinical manifestations that may include convulsions, delirium, and hallucinations. These manifestations are not known to occur following accidental inhalation of gasoline vapor during normal operations.

INGESTION:

This substance is slightly toxic to internal organs if swallowed. The degree of injury will depend on the amount absorbed from the gut. The target organ(s) is the nervous system. Signs and symptoms of central nervous system effects may include one or more of the following: headache, dizziness, loss of appetite, weakness and loss of coordination. Because of the low viscosity of this substance, it can directly enter the lungs if it is swallowed (this is called aspiration). This can occur during the act of swallowing or when vomiting the substance. Once in the lungs, the substance is very difficult to remove and can cause severe injury to the lungs and death.

4. PROTECTIVE EQUIPMENT

EYE PROTECTION:

Do not get this material in your eyes. Eye contact can be avoided by wearing chemical goggles.

SKIN PROTECTION:

No special skin protection is usually necessary. Avoid prolonged or frequently repeated skin contact with this material. Skin contact can be minimized by wearing protective clothing.

RESPIRATORY PROTECTION:

No special respiratory protection is normally required. However, if operating conditions create airborne concentrations which exceed the recommended exposure standards, the use of an approved respirator is required. Refer to the OSHA Benzene Standard to determine what type of respirator is required based on exposure levels.

VENTILATION:

Use this material only in well ventilated areas.

5. FIRE PROTECTION

FLASH POINT: (P-M) < -49F (-45C)
AUTOIGNITION: NDA
FLAMMABILITY: 1.4 - 7.6%
EXTINGUISHING MEDIA:
CO2, Dry Chemical, Foam and Water Fog.
NFPA RATINGS: Health 1; Flammability 3; Reactivity 0; Special NDA;
HMIS RATINGS: Health 2; Flammability 3; Reactivity 0; Other NDA;
(Least-0, Slight-1, Moderate-2, High-3, Extreme-4). These values are obtained using the guidelines or published evaluations prepared by the National Fire Protection Association or, if applicable, the National Paint and Coating Association, and do not necessarily reflect the hazard evaluation of the Chevron Environmental Health Center. Read the entire

document and label before using this product.
FIRE FIGHTING PROCEDURES:
This product presents an extreme fire hazard. Liquid very quickly evaporates, even at low temperatures, and forms vapor (fumes) which can catch fire and burn with explosive violence. Invisible vapor spreads easily and can be set on fire by many sources such as pilot lights, welding equipment, and electrical motors and switches.

For fires involving this material, do not enter any enclosed or confined fire space without proper protective equipment. This may include self-contained breathing apparatus to protect against the hazardous effects of normal products of combustion or oxygen deficiency. Read the entire document.
COMBUSTION PRODUCTS:
Normal combustion forms carbon dioxide and water vapor; incomplete combustion can produce carbon monoxide.

6. STORAGE, HANDLING, AND REACTIVITY

HAZARDOUS DECOMPOSITION PRODUCTS:
NDA.
STABILITY:
Stable.
HAZARDOUS POLYMERIZATION:
Polymerization will not occur.
INCOMPATIBILITY:
May react with strong oxidizing agents, such as chlorates, nitrates, peroxides, etc.
SPECIAL PRECAUTIONS:
Never siphon gasoline by mouth. READ AND OBSERVE ALL PRECAUTIONS ON PRODUCT LABEL. Use only as a motor fuel. Do not use for cleaning, pressure appliance fuel, or any other such use. DO NOT USE OR STORE near flame, sparks or hot surfaces. USE ONLY IN WELL VENTILATED AREA. Keep container closed. DO NOT TRANSFER LIQUID TO AN UNLABELED CONTAINER. DO NOT weld, heat or drill container. Replace cap or bung. Emptied container still contains hazardous or explosive vapor or liquid.

7. PHYSICAL PROPERTIES

SOLUBILITY: Soluble in hydrocarbons; insoluble in water.
APPEARANCE: Orange to bronze liquid.
BOILING POINT: 25 - 225C (Variable)
MELTING POINT: NA
EVAPORATION: NDA

VAPOR PRESSURE: 5 - 15PSI (max.) @ 100F (Variable)
PERCENT VOLATILE (VOLUME %): 99+%
VAPOR DENSITY (AIR=1): 3-4

8. ENVIRONMENTAL CONCERNS, SPILL RESPONSE AND DISPOSAL

CHEMTREC EMERGENCY PHONE NUMBER: (800) 424-9300 (24 hour).
SPILL/LEAK PRECAUTIONS:
Certain geographical areas have air pollution restrictions concerning the use of materials in work situations which may release volatile components to the atmosphere. Air pollution regulations should be studied to determine if this material is regulated in the area where it is to be used.

This material is considered to be a water pollutant and releases of this product should be prevented from contaminating soil and water and from entering drainage and sewer systems. Eliminate all sources of ignition in vicinity of spill or released vapor. Clean up small spills using appropriate techniques such as sorbent materials or pumping. Where feasible and appropriate, remove contaminated soil. Follow prescribed procedures for reporting and responding to larger releases.
DISPOSAL METHODS:
Place contaminated materials in disposable containers and dispose of in a manner consistent with applicable regulations. Contact local environmental or health authorities for approved disposal of this material.

9. EXPOSURE STANDARDS, REGULATORY LIMITS AND COMPOSITION

COMPOSITION COMMENT:
All the components of this material are on the Toxic Substances Control Act Chemical Substances Inventory.

The percent compositions are given to allow for the various ranges of the components present in the whole product and may not equal 100%.

11. PRODUCT TOXICOLOGY DATA

EYE IRRITATION:
The Draize Eye Irritation Score (range, 0-110) in rabbits is 0.
SKIN IRRITATION:
The Draize Skin Primary Irritation Score (range, 0-8) for a 4-hour exposure (rabbits) is 0.98. This material was not a skin sensitizer in the modified Buehler Guinea Pig Sensitization Test.
DERMAL TOXICITY:
The dermal LD50 in rabbits is > 5 ml/kg.
RESPIRATORY/INHALATION:
NDA.
INGESTION:
The oral LD50 in rats is > 5 ml/kg.
ADDITIONAL TOXICOLOGY DATA:
Lifetime inhalation of whole gasoline vapor has caused increased liver tumors in female mice. The mechanism of this response is still being investigated but it is thought to be an epigenetic process unique to the female mouse. Inhalation exposure to whole gasoline vapor also caused kidney damage and eventually kidney cancer in male rats.

No other animal model studied has shown these adverse kidney effects and there is no physiological reason to believe that they would occur in man. The cause of the kidney toxicity is thought to be due to the interaction of isoparaffin hydrocarbons in the product with a specific serum protein, alpha-2-microglobulin. Male rats synthesis large amounts of this protein which is filtered, reabsorbed, and degraded by their kidneys. Isoparaffins or their metabolites combine with this protein and make it "undigestable" by the kidney proteases. With repeated exposure, the protein-isoparaffin complex accumulates in the kidney tubules causing significant cell death and regrowth. It is thought that this continuous kidney injury may contribute to the eventual development of the tumors.

The data above is obtained from studies sponsored by the American Petroleum Institute (API).

12. ADDITIONAL HEALTH DATA

ADDITIONAL HEALTH DATA COMMENT:
This product contains benzene. The OSHA Benzene Standard (29 CFR 1910.1028) contains detailed requirements for training, exposure

monitoring, respiratory protection and medical surveillance triggered by the exposure level. Refer to the OSHA Standard before using this product. Repeated or prolonged breathing of benzene vapors has been associated with the development of chromosomal damage in experimental animals and various blood diseases in humans ranging from aplastic anemia to leukemia (a form of cancer). All of these diseases can be fatal. No birth defects have been shown to occur in pregnant laboratory animals exposed to doses not toxic to the mother. However, some evidence of fetal toxicity such as delayed physical development has been seen at such levels. The available information on the effects of benzene on human pregnancies is inadequate but it has been established that benzene can cross the human placenta.

This product contains n-hexane. Prolonged or repeated skin contact or breathing of vapors may cause nerve damage characterized by progressive weakness and numbness in the arms and legs. Recovery ranges from no recovery to complete recovery depending upon the severity of the nerve damage.

This product contains toluene. Toluene has been reported to decrease immunological responses in test animals. It has also been reported that when young rats were exposed to 1000 ppm toluene for 14 hours daily, for two weeks, irreversible hearing loss was detected. The same daily exposure to 700 ppm for as long as 16 weeks was without effect. Since the level necessary to produce hearing loss is greater than 7 times the 1987-88 ACGIH TLV for toluene, worker exposures at or below 100 ppm is not expected to cause any adverse effect. There are also reports that chronic abusers (glue sniffers, solvent huffers) of solvents containing toluene have suffered liver, kidney and brain damage. Scientific studies on toluene have failed to demonstrate birth defects in rats and mice. However, toluene has been shown to cause delayed growth and extra ribs in the offspring of rats and mice at inhaled doses (266-399 ppm) that were non-toxic to the mother. Toluene has not conclusively been shown to cause adverse reproductive effects in humans.

This product contains xylene, a chemical that has been reported to cause developmental toxicity in rats and mice exposed by inhalation during pregnancy. The effects noted consisted of delayed development and minor skeletal variations; additionally, when pregnant mice were exposed by ingestion to a level that killed nearly one-third of the test group, lethality (resorptions) and malformations (primarily cleft palate) occurred. Malformations have not been reported following inhalation exposure. Because of the very high levels of exposure used in these studies, we do not believe that their results imply an increased risk of reproductive toxicity to workers exposed to xylene levels at or below the exposure standard.

Xylene has given negative results in several mutagen testing assays including the Ames assay. In a cancer study sponsored by the National Toxicology Program (NTP), technical grade xylene gave no evidence of carcinogenicity in rats or mice dosed daily for two years.

Whole gasoline exhaust was reviewed by the International Agency for Research on Cancer (IARC) in their Monograph Volume 46 (1989). Evidence for causing cancer was considered inadequate in animals and inadequate in

humans. IARC placed this material in Category 2B, considering it possibly carcinogenic to humans.

SUITE 230
VENTURA, CA 93003

Print Date: August 08, 1990

This Material Safety Data Sheet contains environmental, health and toxicology information for your employees. Please make sure this information is given to them. It also contains information to help you meet community right-to-know/emergency response reporting requirements under SARA Title III and many other laws. If you resell this product, this MSDS must be given to the buyer or the information incorporated in your MSDS. Discard any previous edition of this MSDS.

Revised to update Sections 1, 10, 11 and 12.

1. PRODUCT IDENTIFICATION

CHEVRON Supreme Unleaded Gasoline

DANGER! - HARMFUL OR FATAL IF SWALLOWED - CAN ENTER LUNGS AND CAUSE DAMAGE
- VAPOR HARMFUL
- LONG-TERM EXPOSURE TO VAPOR HAS CAUSED CANCER IN LABORATORY ANIMALS
- MAY CAUSE EYE AND SKIN IRRITATION
- EXTREMELY FLAMMABLE
- KEEP OUT OF REACH OF CHILDREN

PRODUCT NUMBER(S): CPS201060
PRODUCT INFORMATION: (800)582-3835

Prepared According to the OSHA Hazard Communication Standard (29 CFR 1910.1200) by the Chevron Environmental Health Center, Inc., P.O. Box 4054, Richmond, CA 94804.

2. FIRST AID - EMERGENCY PHONE NUMBER (800) 457-2022

EYE CONTACT:
Flush eyes immediately with fresh water for at least 15 minutes while holding the eyelids open. Remove contact lenses if worn. No additional first aid should be necessary, however, if irritation persists, see a doctor.
SKIN CONTACT:
No first aid procedures are required. As a precaution, wash skin thoroughly with soap and water. Remove and wash contaminated clothing.
INHALATION:
If respiratory irritation or any signs or symptoms as described in this document occur, move the person to fresh air. If any of these effects continue, see a doctor.
INGESTION:
If swallowed, give water or milk to drink and telephone for medical advice. DO NOT make person vomit unless directed to do so by medical personnel. If medical advice cannot be obtained, then take the person and product container to the nearest medical emergency treatment center or hospital. Note to Physician: Ingestion of this product or subsequent vomiting can result in aspiration of light hydrocarbon liquid which can cause pneumonitis.

3. IMMEDIATE HEALTH EFFECTS - (ALSO SEE SECTIONS 11 & 12)

EYE CONTACT:
This substance is slightly irritating to the eyes and could cause prolonged (days) impairment of your vision. The degree of the injury will depend on the amount of material that gets into the eye and the speed and thoroughness of the first aid treatment. Signs and symptoms may include pain, tears, swelling, redness, and blurred vision. Eye contact with the vapors, fumes, or spray mist from this substance could also cause similar signs and symptoms.
SKIN IRRITATION:
Prolonged or frequently repeated contact may cause the skin to become cracked or dry from the defatting action of this material.
DERMAL TOXICITY:
If absorbed through the skin, this substance is considered practically non-toxic to internal organs.
RESPIRATORY/INHALATION:
This substance is slightly toxic to internal organs if inhaled. The degree of injury will depend on the airborne concentration and duration of exposure. The target organ(s) is the nervous system. Inhalation of gasoline vapor at airborne concentrations exceeding 1000 ppm may cause signs and symptoms of central nervous system effects such as headache, dizziness, loss of appetite, weakness and loss of coordination. Vapor concentrations in excess of 5000 ppm may cause loss of consciousness, coma and death. Brief exposures to high vapor concentrations may also cause pulmonary edema and bronchitis. Intentional exposures to excessively high

concentrations (e.g., when used as a drug of abuse) have been reported to result in clinical manifestations that may include convulsions, delirium, and hallucinations. These manifestations are not known to occur following accidental inhalation of gasoline vapor during normal operations.
INGESTION:
This substance is slightly toxic to internal organs if swallowed. The degree of injury will depend on the amount absorbed from the gut. The target organ(s) is the nervous system. Signs and symptoms of central nervous system effects may include one or more of the following: headache, dizziness, loss of appetite, weakness and loss of coordination. Because of the low viscosity of this substance, it can directly enter the lungs if it is swallowed (this is called aspiration). This can occur during the act of swallowing or when vomiting the substance. Once in the lungs, the substance is very difficult to remove and can cause severe injury to the lungs and death.

4. PROTECTIVE EQUIPMENT

EYE PROTECTION:
Do not get this material in your eyes. Eye contact can be avoided by wearing chemical goggles.
SKIN PROTECTION:
No special skin protection is usually necessary. Avoid prolonged or frequently repeated skin contact with this material. Skin contact can be minimized by wearing protective clothing.
RESPIRATORY PROTECTION:
No special respiratory protection is normally required. However, if operating conditions create airborne concentrations which exceed the recommended exposure standards, the use of an approved respirator is required. Refer to the OSHA Benzene Standard to determine what type of respirator is required based on exposure levels.
VENTILATION:
Use this material only in well ventilated areas.

5. FIRE PROTECTION

FLASH POINT: (P-M) < -49F (-45C)

11. PRODUCT TOXICOLOGY DATA

EYE IRRITATION:
The Draize Eye Irritation Score (range, 0-110) in rabbits is 0.
SKIN IRRITATION:
The Draize Skin Primary Irritation Score (range, 0-8) for a 4-hour exposure (rabbits) is 0.98. This material was not a skin sensitizer in the modified Buehler Guinea Pig Sensitization Test.
DERMAL TOXICITY:
The dermal LD50 in rabbits is > 5 ml/kg.
RESPIRATORY/INHALATION:
NDA.
INGESTION:
The oral LD50 in rats is > 5 ml/kg.
ADDITIONAL TOXICOLOGY DATA:
Lifetime inhalation of whole gasoline vapor has caused increased liver tumors in female mice. The mechanism of this response is still being investigated but it is thought to be an epigenetic process unique to the female mouse. Inhalation exposure to whole gasoline vapor also caused kidney damage and eventually kidney cancer in male rats.

No other animal model studied has shown these adverse kidney effects and there is no physiological reason to believe that they would occur in man. The cause of the kidney toxicity is thought to be due to the interaction of isoparaffin hydrocarbons in the product with a specific serum protein, alpha-2-microglobulin. Male rats synthesis large amounts of this protein which is filtered, reabsorbed, and degraded by their kidneys. Isoparaffins or their metabolites combine with this protein and make it "undigestable" by the kidney proteases. With repeated exposure, the protein-isoparaffin complex accumulates in the kidney tubules causing significant cell death and regrowth. It is thought that this continuous kidney injury may contribute to the eventual development of the tumors.

The data above is obtained from studies sponsored by the American Petroleum Institute (API).

12. ADDITIONAL HEALTH DATA

ADDITIONAL HEALTH DATA COMMENT:
This product contains benzene. The OSHA Benzene Standard (29 CFR

1910.1028) contains detailed requirements for training, exposure monitoring, respiratory protection and medical surveillance triggered by the exposure level. Refer to the OSHA Standard before using this product. Repeated or prolonged breathing of benzene vapors has been associated with the development of chromosomal damage in experimental animals and various blood diseases in humans ranging from aplastic anemia to leukemia (a form of cancer). All of these diseases can be fatal. No birth defects have been shown to occur in pregnant laboratory animals exposed to doses not toxic to the mother. However, some evidence of fetal toxicity such as delayed physical development has been seen at such levels. The available information on the effects of benzene on human pregnancies is inadequate but it has been established that benzene can cross the human placenta.

This product contains n-hexane. Prolonged or repeated skin contact or breathing of vapors may cause nerve damage characterized by progressive weakness and numbness in the arms and legs. Recovery ranges from no recovery to complete recovery depending upon the severity of the nerve damage.

This product contains toluene. Toluene has been reported to decrease immunological responses in test animals. It has also been reported that when young rats were exposed to 1000 ppm toluene for 14 hours daily, for two weeks, irreversible hearing loss was detected. The same daily exposure to 700 ppm for as long as 16 weeks was without effect. Since the level necessary to produce hearing loss is greater than 7 times the 1987-88 ACGIH TLV for toluene, worker exposures at or below 100 ppm is not expected to cause any adverse effect. There are also reports that chronic abusers (glue sniffers, solvent huffers) of solvents containing toluene have suffered liver, kidney and brain damage. Scientific studies on toluene have failed to demonstrate birth defects in rats and mice. However, toluene has been shown to cause delayed growth and extra ribs in the offspring of rats and mice at inhaled doses (266-399 ppm) that were non-toxic to the mother. Toluene has not conclusively been shown to cause adverse reproductive effects in humans.

This product contains xylene, a chemical that has been reported to cause developmental toxicity in rats and mice exposed by inhalation during pregnancy. The effects noted consisted of delayed development and minor skeletal variations; additionally, when pregnant mice were exposed by ingestion to a level that killed nearly one-third of the test group, lethality (resorptions) and malformations (primarily cleft palate) occurred. Malformations have not been reported following inhalation exposure. Because of the very high levels of exposure used in these studies, we do not believe that their results imply an increased risk of reproductive toxicity to workers exposed to xylene levels at or below the exposure standard.

Xylene has given negative results in several mutagen testing assays including the Ames assay. In a cancer study sponsored by the National Toxicology Program (NTP), technical grade xylene gave no evidence of carcinogenicity in rats or mice dosed daily for two years.

Whole gasoline exhaust was reviewed by the International Agency for Research on Cancer (IARC) in their Monograph Volume 46 (1989). Evidence

for causing cancer was considered inadequate in animals and inadequate in humans. IARC placed this material in Category 2B, considering it possibly carcinogenic to humans.

****

COMMUNITY NOTIFICATION

COMMUNITY RIGHT-TO-KNOW NOTIFICATION
THIS SITE IS CLOSED TO THE PUBLIC

Chevron USA (Name of Responsible Party) will be involved in remediation and/or site investigation at their facility located at 7651 Alvarado Road, La Mesa, California (Location).

Activities may include installing monitoring wells, excavating soil, and sampling groundwater and soil (List Site Tasks).

site investigation (Activities) will begin on 3/27/92 (Date) and continue until 12/94 (Date). Onsite work generally will be limited to business hours.

Primary potential hazards include inhalation of vapors and dust, and additional site traffic. (List Primary Hazards)

Every precaution to minimize release of gasoline (What Type) vapors to the atmosphere will be taken.

If excessive odors, noise, or dust, or other safety concerns are noted at the site, please contact the following people:

Mr. Ruben Avilez
Name
CHEVRON U.S.A.
Responsible Party
1-310-694-7304
Telephone No.

Bill Lines/Buff Herbert
Name
Groundwater Technology, Inc.
Contractor /Consultant
1-619-453-8415
Telephone No.

Name: HMMD Specialist

HMMD Contact: Mike Vernetti

Telephone No. 338-2222

If further assistance is required, please contact the following agencies:

RE: PROPOSED HMMD WORKPLAN

SITE: FORMER CHEVRON SERVICE STATION NO. 9-3521
7651 ALVARADO ROAD, LA MESA, CALIFORNIA
HMMD# H12687 -002 T82

Dear Mike:

This letter contains the proposed scope of work for the above referenced site. The work completed in the past is summarized in the Tank Removal Report dated November 8, 1991. Past work included the removal of three underground gasoline storage tanks and one used-oil tank on June 13, 1991. Analytical results of soil samples collected from the tank pits, product lines, pump islands, and various test pits are summarized in the report. In summary, areas beneath the pump islands and used-oil tank contained petroleum hydrocarbons. Soils excavated from the gasoline tank pit were characterized according to HMMD guidelines. Upon your verbal approval these soils were backfilled in the original excavation. Soils excavated from the used oil tank pit were characterized and remain on site. These soils will be combined with soils from future excavation activities in that area, and characterized prior to treatment and/or disposal.

On March 27, 1992 three monitoring wells were installed. A site location map and site map, indicating the approximate locations of the wells, are attached. A summary of the well construction and soil sampling will be included in the next report. During the week of April 6 to 10, 1992 Groundwater Technology will survey, develop, monitor, and sample the wells. The scope of work is as follows:

- Complete a top of casing and well location survey of the monitoring wells. ✓
- Gauge the monitoring wells for depth to water, depth to bottom and the presence of separate-phase hydrocarbons with an interface probe. ✓
- Develop the groundwater monitoring wells, while purging, by a combination of surging and over pumping with a vacuum truck. ✓
- Collect groundwater samples from all monitoring wells and submit them for laboratory analysis of purgeable aromatics and total petroleum hydrocarbons as gasoline by Modified EPA Methods 8020/8015. ✓

survey → stream elevation

black

023402348
2346WKP4.02

The second phase of work proposed for the site involves excavation of hydrocarbon-bearing soil. The areas to be excavated are indicated on the attached figures. Beginning on April 6, 1992 Groundwater Technology will begin excavating the areas beneath the former pump islands and used-oil tank. As stated in the Tank Removal Report dated November 8, 1991, areas with hydrocarbon-bearing soil are limited to beneath the former pump islands and used oil tank. Hydrocarbon bearing soil was observed within the Stadium Conglomerate. This formation has been difficult to remediate with in-situ methods. Therefore, soil remediation will require excavation prior to treatment and/or disposal.

Prior to beginning the excavation activities Groundwater Technology will prepare a Community Health and Safety Plan as requested by the Hazardous Materials Management Division (HMMD). A copy of the plan will be submitted to the HMMD and Chevron by April 6, 1992. The original will be kept on file at Groundwater Technology's San Diego office. The scope of work for excavation is as follows:

- Continue excavation activities in the areas north of pump islands "P2" and "P3", beneath pump island "P1", and the former used oil tank.
- Excavation will be completed using a track-mounted backhoe. If necessary, heavier equipment will be utilized to excavate in the Stadium Conglomerate.
- Collect soil samples and perform analysis with a mobile laboratory.
- Analyze soil samples collected from beneath the former pump islands for purgeable aromatics and total petroleum hydrocarbons as gasoline in soil by Modified EPA Method 8020/8015.
- Analyze soil samples collected from beneath the former used oil tank for petroleum hydrocarbons in soil by Infrared Modified EPA Method 3550/SM503E/418.1.
- Approximately 500 cubic yards of soil are estimated to be excavated from the area north of pump islands P2 and P3 and approximately 300 cubic yards are estimated to be removed from beneath pump island "P1". Approximately 50 cubic yards of soil are estimated to be excavated from the area beneath the former used oil tank. The attached figures indicate the hydrocarbon distribution and estimated areas to be excavated.
- The extent of the excavation will be based upon mobile laboratory analysis of soil samples and field observations.
- Excavated soils will be segregated and stockpiled on site. Stockpiled soils will be characterized in accordance with the guidelines in the HMMD Site Assessment and Mitigation manual.
- Soil samples collected during stockpile characterization will be submitted to GTEL Environmental Laboratories for analysis.
- A report will be prepared which summarizes the results of the monitoring well installation and sampling activities as well as the soil excavation and characterization activities.

Soil treatment and disposal options can be evaluated based upon review of the report. It is Groundwater Technology, Inc.'s understanding that Chevron's lease on the property expires on May 31, 1992. In order to expedite regulatory closure at the site prior to May 31, 1992, it may be necessary to transport and dispose of excavated soils at an appropriate landfill. Future site activities may include the installation, monitoring, development, purging and sampling of additional groundwater monitoring wells.

If you have any questions, please call the undersigned at (619) 453-8415.

Sincerely,
GROUNDWATER TECHNOLOGY, INC.

RE: STOCKPILED USED-OIL BEARING SOIL

SITE: FORMER CHEVRON SERVICE STATION NO. 9-3521
7651 ALVARADO ROAD
LA MESA, CALIFORNIA 92041

Dear Mike:

This letter summarizes the soil excavation and stockpiling activities completed in the vicinity of the former used oil tank at the Chevron La Mesa site. It also includes a summary of the proposed future activities for this area.

The used oil tank removal on June 14, 1992 resulted in the excavation and stockpiling of approximately 50 cubic yards of used-oil bearing soil. Analytical results of two soil samples collected from the stockpile indicated TPH_{if} concentrations of 240 and 2,400 parts per million. Groundwater Technology's report dated November 8, 1991 describes the site activities in greater detail. The report states that "Soils from future excavation activities will be added to the existing stockpile at which time a full stockpile characterization will be performed prior to disposal.".

The Hazardous Materials Management Division (HMMD) Site Assessment and Mitigation guidelines states that "Any stockpiled soil demonstrated by sampling and laboratory analysis, or determined by the generator to be a hazardous waste, must be removed within 90 days of excavation.". The definition of "hazardous waste" under California Code of Regulations Title 22 includes listed wastes and wastes which exhibit the properties of toxicity, corrosivity, ignitability, or reactivity. Groundwater Technology experiences with similiar soils generated at Chevron sites have indicated that the majority of used-oil bearing soils are non-hazardous according to Title 22 criteria.

Groundwater Technology proposes to characterize the soils after the used oil excavation activities are completed. The excavation activities are proposed to begin by April 1992 and is anticipated to be completed by May 1992. If the HMMD does not agree with these proposed activities please notify me.

Sincerely,
GROUNDWATER TECHNOLOGY, INC.

RE: SOIL BACKFILLING ACTIVITIES

SITE: FORMER CHEVRON SERVICE STATION NO. 9-3521
7651 ALVARADO ROAD,
LA MESA, CALIFORNIA 92041

Dear Ruben:

This letter summarizes the backfilling activities that were completed at the La Mesa site. The former gasoline tank pit was backfilled by C.R.J., Inc. Construction during January and February 1992. Backfilling activities were delayed due to heavy rains. The excavation was backfilled with approximately 500 cubic yards of soil removed from the tank pit during tank removal activities in June 1991. Approximately 200 cubic yards of fill material was imported to account for the volume of the former underground storage tanks.

Groundwater Technology prepared a Tank Removal Report dated November 8, 1991 which summarized tank removal, soil excavation, and soil characterization activities. The soil stockpiled from the gasoline tank pit was characterized according to guidelines outlined in Section 3 of the San Diego County Hazardous Materials Management Division (HMMD) Site Assessment and Mitigation manual. The soil characterization was completed in accordance with procedures in EPA Publication SW-846. Results of this characterization indicated the benzene, toluene, ethyl-benzene, and xylene concentrations in soil were below 0.1 parts per million and total petroleum hydrocarbon concentrations in soil were below 10 parts per million.

Mr. Michael Porter of the HMMD gave **verbal** permission to backfill the gasoline tank pit soil in a telephone conversation with Groundwater Technology on January 14, 1992. Currently it is not the HMMD's policy to give **written** approval to backfill soils.

LICENSE AGREEMENT

1. Michael Habib, ("Owner") grants to Chevron U.S.A. Products Company, a division of Chevron U.S.A. Inc., a Pennsylvania corporation ("Chevron") a license over, under and across the real property located in the City of La Mesa, County of San Diego, State of California, commonly known as 7651 Alvarado Road, and more fully described in Exhibit 1 hereto, for the following purposes only:

A. Construction, installation, maintenance, inspection operation, and removal of existing and/or new monitoring wells as may be required by the County of San Diego, Hazardous Materials Management Division (herein called "HMMD") and/or other governmental agencies having jurisdiction;

B. Construction, installation, maintenance, inspection, operation, and removal of a hydrocarbon contamination recovery system as required by the HMMD and/or other governmental agencies having jurisdiction; and

C. Access to the wells and the recovery system if required.

2. The license granted herein shall terminate when the last to be removed of the existing wells, any additional wells and the recovery system, if any, is so removed.

3. This license shall run with the land and shall be binding on and shall inure to the benefit of the parties, their heirs, successors and assigns.

4. In consideration of the license granted herein, Chevron shall conduct its environmental investigation and/or remediation, as required by law, at its sole cost and expense.

IN WITNESS WHEREOF, Owner has caused this Agreement to be executed on May 1, 1992.

RE: WORK PLAN FOR THE INSTALLATION OF THREE MONITORING WELLS
FORMER CHEVRON SERVICE STATION NO. 9-3521
7651 ALVARADO ROAD, LA MESA, CA
APN # 420-020-12
CONTROL # H12687

Dear Mr. Porter:

The following workplan is for installation of three monitoring wells at the above site (Figures 1 and 2). The monitoring well locations were chosen to investigate the groundwater down-gradient of the site.

don't have these

BACKGROUND

The three wells currently present on site were installed by Groundwater Technology in June 1992. Three subsequent episodes of groundwater monitoring have detected no petroleum hydrocarbons in up-gradient well MW1. However, dissolved hydrocarbons have been detected in wells MW-2 and MW-3.

OBJECTIVE

The goals of this investigation are to obtain more data about the petroleum hydrocarbons down-gradient of the former Chevron service station. One of the proposed new wells will be installed in the parking lot of Sally's restaurant (Figure 1). The other two wells will be located in the sidewalk or parking lane of Alvarado Road.

023404779
4778L-11.23/#1

PROPOSED WORK

- Submit an application for SA/M well permits for the three proposed monitoring wells. Also permit the off-site wells with the City of LA Mesa.

- Drill the three wells to 15 feet below grade using a hollow-stem auger rig equipped with 10-inch augers. Soil samples will be collected at 5-foot intervals and will be screened using a Gastech or a photoionization detector (PID). At least one soil sample per boring will be submitted to a State-certified laboratory for analysis of total petroleum hydrocarbons as gasoline (TPH_g) and the purgeable aromatics. This sample will be collected as close to the soil-water interface as possible. In addition, the sample with the highest TPH_g concentration will be analyzed for organic lead; this analysis will not be performed if no TPH_g are detected. If field screening detects high concentrations of hydrocarbons, an additional sample may be submitted to the laboratory for analysis.

- Install three groundwater monitoring wells, which will be set at a depth of 15 feet, and consist of 10 feet of 4-inch Sch. 40 PVC screen with a 5-foot segment of blank casing. The wells will be developed by surging prior to installation of the bentonite seal in accordance with the guidelines in the Site Assessment and Mitigation Manual.

- A site assessment report will be prepared, and results of the soil sampling will be incorporated within the report.

install well @ water when encountered

Groundwater conditions at this site do not represent a continuous, unconfined aquifer because the groundwater occurs in laterally-discontinuous gravel lenses. The new off-site wells will be installed in the same manner as the on-site wells, and it is recognized that one or all the wells may be dry.

The actual drilling date is contingent on our receiving an easement agreement from the neighboring property owner, but is tentatively scheduled for the week of Dec. 6, 1993. Please contact us at (619) 453-8415 if you have any questions regarding this workplan.

Very truly yours,

Groundwater Technology, Inc.

QUARTERLY MONITORING REPORT

FOURTH QUARTER 1992
FORMER CHEVRON SERVICE STATION № 9-3521
7651 ALVARADO ROAD
LA MESA, CALIFORNIA
DELTA PROJECT № 45-92-739

1.0 INTRODUCTION

Delta Environmental Consultants, Inc. (Delta) was contracted by Chevron U.S.A. Products Company (Chevron) to conduct quarterly sampling of groundwater monitoring wells at Former Chevron Service Station № 9-3521 (the site) located at 7651 Alvarado Road in the City of La Mesa, San Diego County, California (see Figure 1). There are three monitoring wells associated with the site which are identified as MW1 through MW3 (see Figure 2). All of the monitoring wells were purged and sampled on December 1, 1992. Prior to purging, depth to water was measured in each well and is presented with the groundwater elevation data in Table 1. The quarterly monitoring was conducted in accordance with the Field Procedures included in Appendix A. The purging and sampling activities were documented in the field records contained in Appendix B. This report presents the data collected during the fourth quarter monitoring period, October through December, 1992.

2.0 ANALYTICAL RESULTS SUMMARY

All samples were relinquished to Coast-To-Coast Analytical Services, a California Department of Health Services certified laboratory, for chemical analysis. The samples were analyzed for total petroleum hydrocarbons as gasoline (TPH) according to Environmental Protection Agency (EPA) Modified Method 8015; and benzene, toluene, ethylbenzene, and xylenes (BTEX) according to EPA Method 602. The analytical results for TPH ranged in concentration from 11,000 micrograms per liter (μg/L) to below the practical quantitation limit (PQL). The analytical results for benzene ranged in concentration from 32 μg/L to below the PQL. Sample MW-4 was submitted as a duplicate for sample MW-2. The analytical results of sample MW-2 and its duplicate (MW-4) indicated a relative percent difference {(|sample - duplicate|) ÷ [(sample + duplicate) ÷ 2] x 100} of approximately 22%. Sample TB was submitted as a trip blank. The analytical results are summarized in Table 2 and presented in Figure 3. A copy of the chain of custody and laboratory report is included in Appendix C.

3.0 CONCLUSION

The analytical results indicated an increase in TPH concentration in the sample collected from monitoring wells MW3 as compared to the most recent historical sampling data. The analytical results also indicated a decrease in benzene concentration in the sample collected from monitoring well MW2 and an increase in benzene concentration in the sample collected from monitoring well MW3. Historical trends can be inferred by review of the data presented in Table 3 and shown graphically in the attached Graphs 1 through 3. The highest TPH and benzene concentrations were detected in the sample (MW-3) collected from monitoring well MW3 which is located northwest of the former underground storage tank field. The TPH and benzene concentrations in sample MW-3 were 11,000 μg/L and 32 μg/L, respectively. The general groundwater gradient is approximately 0.032 feet/foot in the northwestern direction as presented in Figure 3.

Field Procedures

FIELD PROCEDURES

The following section describes field procedures followed by Delta personnel during the performance of quarterly groundwater monitoring activities.

1.0 DEPTH TO PHASE-SEPARATED HYDROCARBONS AND GROUNDWATER

Prior to purging and sampling of groundwater monitoring wells, a petroleum product/water interface probe was utilized to determine the presence and/or thickness of phase-separated hydrocarbons (PSH) and depth to groundwater in each well. If a PSH layer was not detected by the interface probe and the presence of a PSH sheen was questionable, a water sample was collected by lowering a disposable bailer down the well and allowing the bailer to half-fill with water. The collected water sample was then inspected for a PSH sheen.

2.0 PHASE-SEPARATED HYDROCARBON RECOVERY

If a measurable PSH layer was detected, an attempt was made to recover as much PSH as possible using a top-fill polyvinyl chloride (PVC) bailer. In an effort to limit the amount of groundwater recovered and to skim the PSH from the groundwater table, the bailer was lowered down the well to just beneath the PSH/water interface. Recovery of the PSH was terminated when recovery by this method was no longer feasible. The recovered PSH was placed in a 55-gallon drum for temporary storage on-site.

3.0 GROUNDWATER MONITORING WELL PURGING AND SAMPLING

Prior to initiation of the well purging activities, the depth to water and the total depth of the well was measured to calculate the standing water column in each well. A submersible pump or PVC purging bailer was utilized to attempt to purge a minimum of three casing volumes of water from the wells. The temperature, pH, and specific conductance of the purge water were three parameters measured throughout the purging process. The purging process was terminated under one of the following two conditions:

1) Upon removal of a minimum three casing volumes of purge water and stabilization of the three parameters.

2) If at any time following the removal of the water within the well casing, recharge of the well was not sufficient to sustain the purging process.

The purge and decontamination water were placed in 55-gallon drums for temporary storage on-site. The drummed water was removed from the site by a Chevron-approved transporter using a vacuum truck and transported to an appropriate facility for recycling. The submersible pump and any hose that came in contact with the groundwater or the purging bailer was decontaminated prior to and between uses utilizing a three-container washing process. The three containers contained a phosphate-free detergent/tap water solution, tap water, and de-ionized or double purified water.

Subsequent to purging, groundwater levels were remeasured using a water level indicator. This post-purge water level data was used to calculate the percent recharge of each well. The wells were allowed to recharge to approximately 80% of the static water level or a minimum of two hours following completion of the purging. A water sample was then collected from each well using a dedicated disposable bailer. The retrieved samples were then placed in the appropriate container(s), labeled, identified on a Chevron chain of custody, and placed in a chilled cooler until delivery to a Chevron-contracted California Department of Health Services (CA DHS) certified hazardous waste laboratory. All samples were transported to the laboratory and analyzed within EPA-specified holding times for the requested analyses. Strict chain-of-custody procedures were followed to assure sample integrity.

LA MESA, CALIFORNIA
DELTA PROJECT Nº 45-92-739

1.0 INTRODUCTION

Delta Environmental Consultants, Inc. (Delta) was contracted by Chevron U.S.A. Products Company (Chevron) to conduct quarterly sampling of groundwater monitoring wells at Former Chevron Service Station Nº 9-3521 (the site) located at 7651 Alvarado Road in the City of La Mesa, San Diego County, California (see Figure 1). There are three monitoring wells associated with the site which are identified as MW1 through MW3 (see Figure 2). All of the monitoring wells were purged and sampled on September 10, 1992. Prior to purging, depth to water was measured in each well and is presented with the groundwater elevation data in Table 1. During the third quarter, the top of well casings MW2 and MW3 were lowered during construction at the site and were re-surveyed by Delta on November 11, 1992. The quarterly monitoring was conducted in accordance with the Field Procedures included in Appendix A. The purging and sampling activities were documented in the field records contained in Appendix B. This report presents the data collected during the third quarter monitoring period, July through September, 1992.

2.0 ANALYTICAL RESULTS SUMMARY

All samples were relinquished to Coast-To-Coast Analytical Services, a California Department of Health Services certified laboratory, for chemical analysis. The samples were analyzed for total petroleum hydrocarbons as gasoline (TPH) according to Environmental Protection Agency (EPA) Modified Method 8015; and benzene, toluene, ethylbenzene, and xylenes (BTEX) according to EPA Method 8020. The analytical results for TPH ranged in concentration from 8,400 micrograms per liter (μg/L) to below the practical quantitation limit (PQL). The analytical results for benzene ranged in concentration from 20 μg/L to below the PQL. Sample MW-4 was submitted as a duplicate for sample MW-2. The analytical results of sample MW-2 and its duplicate (MW-4) indicated a precision error range {[1-(sample/duplicate)]x100} of approximately ±43%. Sample TB-1 was submitted as a trip blank. The analytical results are summarized in Table 2 and presented in Figure 3. A copy of the chain of custody and laboratory report is included in Appendix C.

3.0 CONCLUSION

The analytical results indicated decreases in TPH concentrations in the samples collected from monitoring wells MW2 and MW3 as compared to the most recent historical sampling data. The analytical results also indicated decreases in benzene concentrations in the samples collected from monitoring wells MW2 and MW3. Historical trends can be inferred by review of the data presented in Table 3 and shown graphically in the attached Graphs 1 through 3. The highest TPH and benzene concentrations were detected in the sample (MW-3) collected from monitoring well MW3 which is located northwest of the former underground storage tank field. The TPH and benzene concentrations in sample MW-3 were 8,400 µg/L and 20 µg/L, respectively. The general groundwater gradient is approximately 0.04 feet/foot in the northwestern direction as presented in Figure 3.

Field Procedures

FIELD PROCEDURES

The following section describes field procedures followed by Delta personnel during the performance of quarterly groundwater monitoring activities.

1.0 DEPTH TO PHASE-SEPARATED HYDROCARBONS AND GROUNDWATER

Prior to purging and sampling of groundwater monitoring wells, a petroleum product/water interface probe was utilized to determine the presence and/or thickness of phase-separated hydrocarbons (PSH) and depth to groundwater in each well. If a PSH layer was not detected by the interface probe and the presence of a PSH sheen was questionable, a water sample was collected by lowering a disposable bailer down the well and allowing the bailer to half-fill with water. The collected water sample was then inspected for a PSH sheen.

2.0 PHASE-SEPARATED HYDROCARBON RECOVERY

If a measurable PSH layer was detected, an attempt was made to recover as much PSH as possible using a top-fill polyvinyl chloride (PVC) bailer. In an effort to limit the amount of groundwater recovered and to skim the PSH from the groundwater table, the bailer was lowered down the well to just beneath the PSH/water interface. Recovery of the PSH was terminated when recovery by this method was no longer feasible. The recovered PSH was placed in a 55-gallon drum for temporary storage on-site.

3.0 GROUNDWATER MONITORING WELL PURGING AND SAMPLING

Prior to initiation of the well purging activities, the depth to water and the total depth of the well was measured to calculate the standing water column in each well. A submersible pump or PVC purging bailer was utilized to attempt to purge a minimum of three casing volumes of water from the wells. The temperature, pH, and specific conductance of the purge water were three parameters measured throughout the purging process. The purging process was terminated under one of the following two conditions:

1) Upon removal of a minimum three casing volumes of purge water and stabilization of the three parameters.

2) If at any time following the removal of the water within the well casing, recharge of the well was not sufficient to sustain the purging process.

The purge and decontamination water were placed in 55-gallon drums for temporary storage on-site. The drummed water was removed from the site by a Chevron-approved transporter using a vacuum truck and transported to an appropriate facility for recycling. The submersible pump and any hose that came in contact with the groundwater or the purging bailer was decontaminated prior to and between uses utilizing a three-container washing process. The three containers contained a phosphate-free detergent/tap water solution, tap water, and de-ionized or double purified water.

Subsequent to purging, groundwater levels were remeasured using a water level indicator. This post-purge water level data was used to calculate the percent recharge of each well. The wells were allowed to recharge to approximately 80% of the static water level or a minimum of two hours following completion of the purging. A water sample was then collected from each well using a dedicated disposable bailer. The retrieved samples were then placed in the appropriate container(s), labeled, identified on a Chevron chain of custody, and placed in a chilled cooler until delivery to a Chevron-contracted California Department of Health Services (CA DHS) certified hazardous waste laboratory. All samples were transported to the laboratory and analyzed within EPA-specified holding times for the requested analyses. Strict chain-of-custody procedures were followed to assure sample integrity.

BIANNUAL MONITORING REPORT
Former Chevron Service Station #9-3521
La Mesa, California

INTRODUCTION

Enclosed is the biannual monitoring report for former Chevron Station No. 9-3521 located at 7651 Alvarado Road in the city of La Mesa (Figures 1 and 2). This report updates groundwater monitoring activities performed between July 1 and December 31, 1994.

On September 22, 1994 monitoring wells MW-1 through MW-5 were gauged and sampled. Samples were obtained sequentially from wells MW-1, MW-2, MW-5, MW-4, and MW-3 in order of increasing dissolved hydrocarbons as determined from previous laboratory analyses. A description of groundwater sampling procedures is presented in Appendix A. Gauging data are presented in Table 1 and were used to derive a groundwater contour map (Figure 3).

Purged groundwater was transported to the Chevron Refinery in El Segundo for recycling. Copies of the disposal documents are presented in Appendix A.

ANALYTICAL RESULTS SUMMARY

A duplicate sample from monitoring well MW-1 and trip blank were prepared and analyzed to verify the integrity of field and laboratory procedures. All groundwater and blank samples were tested for total petroleum hydrocarbons - gasoline using the California Department of Health Services Test Method 8015-M and purgeable aromatics and methyl tertiary butyl ether using EPA Test Method 602. A copy of the laboratory report and chain-of-custody form are included in Appendix B. Results of the laboratory analyses for samples obtained on September 22, 1994 are provided in Table 1. A summary of groundwater analyses is presented in Table 2.

Dissolved hydrocarbons were not detected in the sample and duplicate from well MW-1.

Results of the laboratory analyses indicate the concentration of TPH-gasoline was 3,500 ug/l in the sample from well MW-3. The level of benzene was 53 ug/l in the sample from well MW-3. Dissolved hydrocarbons were not detected in samples from wells MW-1, MW-2, MW-4, and MW-5. Concentrations of dissolved hydrocarbons are shown on Figure 4.

The level of methyl tertiary butyl ether was 12 ug/l in the sample from well MW-3. Methyl tertiary butyl ether was not detected in samples from wells MW-1, MW-2, MW-4, and MW-5.

CONCLUSIONS

Comparison of laboratory data from the previous monitoring episode indicates concentrations of dissolved hydrocarbons decreased in the sample from well MW-3. Dissolved hydrocarbons continued to be below detection limits in samples from wells MW-1, MW-2, MW-4, and MW-5. The highest levels of dissolved hydrocarbons were present in the sample from well MW-3. Benzene exceeded action levels in the sample from well MW-3. Benzene concentrations over time are shown on Graphs 1 and 2. Levels of methyl tertiary butyl ether increased in the sample from well MW-3 and continued to be below detection limits in samples from wells MW-1, MW-2, MW-4, and MW-5.

Groundwater elevations increased by an average of 0.07 feet in wells MW-2, MW-4, and MW-5 and decreased by an average of 0.12 feet in wells MW-1 and MW-3 as compared to the previous monitoring episode. Groundwater elevations over time are shown on Graph 3. The direction of groundwater flow was northwesterly at a gradient of 0.03 foot per foot.

GROUNDWATER SAMPLING PROCEDURES

Prior to sampling, wells were purged of water using a stainless steel bailer. Fast recharging wells were purged of four casing volumes of water. Slow recharging wells were purged until dry and allowed to recover for two hours before sampling. Each casing volume of water was field tested for temperature, pH, and conductivity. The last casing volume was tested for redox potential and dissolved oxygen. Groundwater samples were field tested for turbidity. Field testing data are included in this appendix. Groundwater samples were obtained using a Teflon bailer equipped with a bottom emptying device and placed in VOA bottles with Teflon septums. All purging and sampling equipment was washed in non-phosphate soap and triple rinsed in distilled water between wells to reduce the potential for cross contamination.

In addition to the samples obtained from the wells, a trip blank and sample duplicate were prepared to verify the integrity of the field and laboratory procedures. Samples were placed on ice to reduce the potential for volatilization. Samples were transported to a certified laboratory for analyses under strict chain-of-custody procedures.

All groundwater samples were tested for total petroleum hydrocarbons using the California Department of Health Services Test Method 8015-M for gasoline. Samples were also tested for purgeable aromatics and methyl tertiary butyl ether using EPA Test Method 602.

Groundwater Monitoring Report

SA/M# T01722/H12687-002
Chevron Project #93521
7651 Alvarado Rd.
La Mesa, CA 91941

Dear Mr. Porter:

Enclosed is the groundwater monitoring report for the site referenced above for the third quarter of 1994. Monitoring at this site is being done on a biannual basis by Wayne Perry Construction, Inc.

Groundwater Technology, Inc. has recommended to me that we destroy wells MW-1, and MW-5. This is based on the facts that these wells have always been nondetect, the source of impact has been removed by excavation, and the contaminant levels continue to fall in MW-3. In addition, I would like to go to annual monitoring of wells MW-2 and MW-4.

If you have any questions please don't hesitate to call me at (310) 694-7698.

Sincerely,

Michael S. Bauer

EXECUTIVE SUMMARY

Chevron U.S.A. Products Company contracted Groundwater Technology, Inc. to provide consulting services at Chevron Service Station No. 9-3521 at 7651 Alvarado Road in La Mesa, California. The objective of the work was to delineate the groundwater plume down gradient and cross gradient of the former tanks and lines.

During this phase of work, one soil boring, B1, was drilled, and two off-site monitoring wells, MW4 and MW5, were drilled and installed. The boring was drilled to 10 feet below grade, and the wells were drilled to 13.5 feet below grade and 15 feet below grade, respectively. Only limited soil sampling could be conducted due to the presence of cobbles beneath the site; soil sample analytical results indicated that no gasoline hydrocarbons or associated volatile organic compounds were present at any of the three locations.

The groundwater was gauged and sampled by Wayne Perry Construction, Inc., and the results were made available to Groundwater Technology for inclusion in this report. The data indicated that the depth to water ranged from 3.5 to 10.77 feet below grade, and that the groundwater gradient, as measured on March 25, 1994, was to the northwest at 0.03 ft/ft. The analytical results showed that the extent of the plume has been delineated in all directions.

Past work at the site included extensive excavation and sampling of the soil around the source areas, and review of the historical data indicates that dissolved hydrocarbon concentrations have consistently decreased since the source was removed. No further assessment or remediation activities are recommended at this site.

1.0 INTRODUCTION

This report summarizes the site assessment activities conducted by Groundwater Technology, Inc., for Chevron at former Chevron Service Station No. 9-3521, located at 7651 Alvarado Road in La Mesa, California (Figures 1 and 2). In particular, the report presents the results of the off-site investigation performed in December 1993.

1.1 Site Identification

Site Address:	7651 Alvarado Road, La Mesa, California
Company Name:	Chevron U.S.A. Products Company
S.S. No.:	9-3521
A.P.N.:	420-020-12
Control No.:	H12687-002/T01722
Contact:	Mr. Michael Bauer Chevron U.S.A. Products Company P. O. Box 2833 La Habra, California 90632-2833 (310) 694-7698

2.0 BACKGROUND

Work at this site began in 1991 with the removal of three gasoline tanks, one waste oil tank, and associated dispensers and piping on June 13, 1991 (Figure 2). All the tanks were single-walled steel tanks, and had been installed at the facility in 1972. Soil samples collected during the tank removal from the gasoline tank pit (Figure 3), beneath the former product lines, and beneath the middle pump island (Figure 4) contained less than 100 mg/kg total petroleum hydrocarbons as gasoline (TPH_g). However, soil samples collected from beneath the southern and northeastern pump islands contained greater than 100 mg/kg TPH_g. Ten test pits were excavated in an attempt to delineate the extent of soil containing hydrocarbons; the results indicated that overexcavation of the area would be necessary (Figure 4). Also, four out of fifteen soil samples collected from the used oil tank pit (Figure 5) contained greater than 100 milligrams per kilogram (mg/kg) of total recoverable petroleum hydrocarbons (TRPH).

Stockpiled soil from the removal of the gasoline tanks was characterized and was found to have benzene and TPH_g concentrations below regulatory thresholds. The soil was backfilled in the original excavation upon approval from the Hazardous Materials Management Division (now Site Assessment and Mitigation Division - SAM). The results of this phase of work were discussed in the Groundwater Technology November 1991 *Tank Removal Report.*

In April 1992, additional excavation was conducted in the areas with hydrocarbon concentrations above 100 mg/kg - the waste oil tank, and the former southern and northeastern pump islands. Approximately 100 additional cubic yards of soil was removed from the waste oil tank area (Figure 6), 100 additional cubic yards was removed and from the southern pump island area (Figure 7), and 2,100 cubic yards of soil was over-excavated from the northeastern pump island area (Figure 8). Confirmation samples were collected from the over-excavated areas to verify that the soil left in place had hydrocarbon concentrations less than 100 mg/kg (Groundwater Technology, June 1992).

During the 1992 investigation, three borings were drilled and groundwater monitoring wells were installed on the site to evaluate hydrocarbon concentrations in the groundwater (Figure 9). Well MW1 has consistently had no detectable hydrocarbons; well MW2 has had no detectable hydrocarbons since October 1993; and well MW3, which was installed down gradient of the former pump islands, has shown decreasing hydrocarbon concentrations from 21,000 μg/L in April 1992 to 4,300 μg/L in March 1994. The decreasing hydrocarbon concentrations may be attributed to the removal of the source in April 1992; this is confirmed by the decrease in concentrations seen in both wells MW2 and MW3 in the sampling episode following the overexcavation (Appendix 1).

The site is currently an asphalt-paved lot occupied by a recreational vehicle sales business. Commercial properties are located to the north, south and west of the site, and on- and off-ramps for Interstate 8 are located to the east.

3.0 SITE GEOLOGY AND HYDROLOGY

The lithology at the site consists of fill, quaternary alluvium and slope wash to about 8 feet below grade, underlain by the Stadium Conglomerate Formation (Kennedy, Michael P., 1975).

In 1992, Mr. Michael Porter of the County SAM requested that geologic mapping of selected walls of the gasoline tank pit excavation be conducted. The results of this mapping were presented in the Groundwater Technology *Comprehensive Site Assessment Report* dated June 12, 1992. As seen on the excavation walls, the lithology at the site consisted of an approximately 5-foot thick layer of fill material consisting of clayey sand with traces of asphalt, concrete and wood debris. The fill material was underlain by a 1- to 3-foot-thick layer of silty sand, which in turn was underlain by the Stadium Conglomerate. An approximately 1-foot-thick layer of sand was observed between the fill material and silty sand along the northern side of the excavation, and laterally discontinuous lenses of gravel and sandy silt were mapped within the silty sand layer. These lenses were observed to be laterally discontinuous with a maximum length of 4 to 6 feet (Figures 10, 11A, and 11B).

During the off-site drilling conducted in December 1993, the Stadium conglomerate, or alluvium derived from the Stadium conglomerate, was encountered directly under the asphalt pavement.

The site is located along the south side of an east-west trending valley. A stream bed runs down the valley approximately 100 feet to the northeast of the site. The site topography slopes from south to north with a decrease in elevation of approximately 12 feet across the site.

Groundwater was observed seeping from the gravel lenses during the 1992 excavation activities. Other areas varied from dry to damp. The groundwater elevation recorded in well MW1 was equal to the elevation of the gravel lens mapped along the southern wall of the excavation. Groundwater was interpreted to occur in the silty sand layer above the Stadium Conglomerate; the permeability of facies in this zone is interpreted to vary, and to be greater within the discontinuous gravel lenses. The depth to groundwater ranges from approximately 6 feet below grade in well MW1 to approximately 11 feet below grade in well MW3.

The site lies in the Cholla hydrologic sub unit (HSA 8.22) which is adjacent to the Mission San Diego Hydrologic Subunit (HSA 7.11). Groundwater in the 8.22 subunit is listed as non-beneficial use as designated by the Regional Water Quality Control Board (RWQCB; December 17, 1990). The 7.11 subunit is listed as having beneficial uses.

4.0 FIELD ACTIVITIES

In December 1993, additional drilling was conducted to evaluate the extent of the dissolved hydrocarbon plume down gradient and cross-gradient of the former tanks and lines. Three off-site groundwater monitoring wells were proposed to be drilled to 15 feet below grade, with screened intervals from 5 to 15 feet. The results of this off-site investigation and subsequent groundwater monitoring are discussed in the following sections.

4.1 Permitting

A permit for the installation of three groundwater monitoring wells was obtained from SAM prior to drilling. Also, encroachment permits were obtained from the City of La Mesa for the two off-site wells located in the parking lane of Alvarado Road. Copies of the well permit and encroachment permit are included in Appendix 2. A work plan describing the field activities was submitted to and approved by SAM.

4.2 Health and Safety Plan

A copy of the site safety plan (SSP) was kept on site during field activities. All Groundwater Technology field personnel and subcontractors involved with the drilling and well installation were required to read and sign the SSP. A copy of the plan is on file in Groundwater Technology's San Diego office.

4.3 Drilling, Soil Sampling, and Well Installation

On December 28, 1993, soil borings MW4, MW5 and B1 were drilled by A & R Drilling Co. using a Mobile B61 HDX hollow-stem auger drill rig. Materials encountered while drilling underneath asphalt included sandy gravel with pebbles and cobbles; the less dense fill material that had been seen during previous on-site investigations was not encountered in the off-site borings. Refusal was met at 10 feet and 13.5 feet below grade in borings B1 and MW4, respectively. The drill logs are presented in Appendix 3.

Soil sample collection was attempted in each boring at 5-foot intervals using a split-spoon sampler; however, due to the presence of cobbles in the Stadium Conglomerate, only a limited number of

samples were obtained. One brass-sleeve from each sample location was screened in the field for hydrocarbons using a photoionization detector (PID); a second sleeve was packaged in accordance with the protocol in Appendix 4 for laboratory analysis.

Four soil samples were sent to Geotest Laboratories in Long Beach, California, under chain of custody. The samples were analyzed for TPH_g and benzene, toluene, ethylbenzene, and xylenes (BTEX) using modified EPA Methods 8015 and 8020. If any samples contained TPH_g, then the sample with the highest concentration was to be analyzed for organic lead by the DHS Method.

During drilling, groundwater was encountered at about 9 feet below grade in MW4, but saturated sediment was not encountered in well MW5. However, past work at this site had indicated that groundwater recharge was slow; therefore, monitoring wells consisting of 4-inch Schedule 40 PVC were installed in borings MW4 and MW5, with screened casing from 4 to 12 feet and 4 to 14 feet, respectively. The wells were developed using a surge block prior to setting the bentonite seal. Well construction diagrams are included in the drilling logs in Appendix 3.

4.4 Well survey

The newly installed wells were surveyed on January 7, 1994, by Land Technology, Inc., and the survey information was used to update the site plan. The wells were surveyed relative to an arbitrary elevation of 100 feet using the fire hydrant adjacent to the site as a bench mark.

4.5 Groundwater Sampling

Groundwater was sampled during the first quarter by Chevron's sampling consultants, Wayne Perry Construction, Inc.

5.0 ANALYTICAL RESULTS

5.1 Soil Sample Analytical Results

The soil sample analytical results from this phase of drilling are summarized in Table 1 and Figure 12, and a copy of the laboratory report is in Appendix 4.

No TPH_g or BTEX concentrations were detected above the detection limits of 10 mg/kg and 0.005 mg/kg, respectively, in any of the four samples analyzed. Organic lead was not analyzed since TPH_g and BTEX were not detected.

5.2 Groundwater Sample Analytical Results

The groundwater sample analytical results were presented by Wayne Perry Construction Inc. in their report dated March 31, 1994 (tables included in Appendix 1). A groundwater gradient map and hydrocarbon distribution map were prepared using their data (Figures 13 and 14). As shown on the figures, no petroleum hydrocarbons, including benzene and methyl-tertiary-butyl ether, were detected in the two newly installed off-site wells MW4 and MW5. As in past quarters, no hydrocarbons were detected in well MW1 or MW2. Hydrocarbon concentrations in well MW3 continued to decrease, with no toluene detected for the first time, and with the lowest benzene concentration (10 μg/L) detected since the well was installed.

6.0 SUMMARY AND CONCLUSIONS

- A release was first detected at former Chevron Service Station No. 9-3521 in 1991, when the station was demolished and the tanks and associated dispensing system were removed. Gasoline hydrocarbons were found in the soil beneath two pump islands, and TRPH were found in the soil beneath the former waste oil tank.
- The site is in a non-beneficial use water basin; however, due to its proximity to a beneficial use basin, Chevron applied action levels of 100 mg/kg TPH/TRPH to delineate the extent of hydrocarbons in soil.
- The extent of hydrocarbons in the soil was delineated through extensive excavation and sampling, and approximately 2,300 cubic yards of soil was removed. Samples collected from the base and sidewalls of the excavation confirmed that soil left in place had hydrocarbon concentrations below 100 mg/kg.
- Mapping indicated that groundwater occurs in a silty sand aquifer overlying the Stadium Conglomerate. With the exception of discontinuous gravel lenses, the permeability of the aquifer is interpreted to be low.
- Monitoring of three groundwater wells installed in 1992 has indicated that dissolved hydrocarbon concentrations have decreased since the source (soil containing hydrocarbons) was removed by excavation. No dissolved hydrocarbons are present in wells MW1 and MW2, and data from MW3 show a continuing trend of decreasing concentrations.
- Off-site groundwater monitoring wells MW4 and MW5 were drilled and installed to the east and north of the former service station in December 1993 to delineate the extent of the dissolved plume. A monitoring well was not installed in boring B1 because of drill refusal at 10 feet.

- Soil samples from all three borings did not contain TPH_g or BTEX at the reported detection limits.

- Groundwater data collected by Wayne Perry during the first quarter of 1994 indicate that the dissolved plume has been delineated, and that the extent of hydrocarbon contamination in the groundwater is limited to the area immediately down-gradient of the former tanks and lines. Hydrocarbon concentrations in this one well continue to decrease over time.

- Based on these factors, we recommend no further assessment or remedial action at this site. We also recommend that wells MW1, MW2, MW4, and MW5 be destroyed to prevent potential contamination from surface runoff.

COUNTY OF SAN DIEGO
DEPARTMENT OF HEALTH SERVICES

HAZARDOUS MATERIALS MANAGEMENT DIVISION

MONITORING WELL AND BORING CONSTRUCTION AND DESTRUCTION PERMIT

SITE NAME: CHEVRON ALVARADO

SITE ADDRESS: 7651 ALVARADO ROAD, LA MESA, CA 92040

PERMIT FOR: 3 GROUND WATER MONITORING WELLS

PERMIT APPROVAL DATE: 12/22/93

PERMIT EXPIRES ON: 4/20/94

PERMIT CONDITIONS:

1. The wells shall be constructed with the well screen extending no deeper than 5 feet in the saturated zone.

2. All borings must be destroyed in accordance with Department of Water Resources Bulletin 74-81 and 74-90.

3. All wash water must be contained and disposed of properly.

4. Submit complete laboratory data for both soil and groundwater with the well logs.

5. Submit all the information specified in the SA/M Manual in:

   Section 1, C., 4., c).

6. All water and soil that is placed in drums must be labeled and stored as specified in the SA/M Manual in:

   Section 1, C., 5.

7. This office must be given 48 hour notice of any drilling activity on this site. Please contact Edward Sanko at (619)338-2339.

8. This office must be given advanced notification of drilling cancellation. Please contact Edward Sanko at (619)338-2339.

NOTE: This permit does not constitute approval of a workplan as defined in Section 2722 of Article 11 of C.C.R. Title 23. Workplans are required for all unauthorized release investigations in San Diego County.

PERMIT APPLICATION SUPPLEMENT
GROUND WATER AND VADOSE MONITORING WELLS

1. Well design, logging and construction must be supervised by a Geologist, Engineering Geologist or Civil Engineer who is registered or certified by the State of California.

2. Provide verification of a well Drilling C-57 license.

3. Provide a plot plan giving location of existing improvements such as structures, underground tanks, underground utilities, underground piping, and the proposed monitoring and/or observation wells.

4. What is the proposed purpose of the well? Investigate the possible pressence of hydrocarbons in the soil/groundwater.

5. What procedures will be used to prevent the well from providing an avenue to contamination during construction?

The well will be constructed by placing the casing through the hollow-stem auger during construction.

What field procedures will be utilized to determine if contamination exists?

Soil samples will be field-screened using a photoionization detector.

What procedures will be used to determine whether samples will be sent for laboratory testing or archiving?

Field screening of the soil samples using photoionization detector.

What constituents will be monitored and tested?

Total screening of the soil samples using photoionization detector.

Subsequent samples will be tested for BTEX and TPH as per SA/M Manual.

9. How will samples be transported and preserved? The samples will be placed on ice in an ice chest and transported with a chain of custody.

10. What sampling methods will be used?

HSA/Split spoon sampler.

11. Are you proposing a variation from the methods and/or procedures presented in the requirements for the construction of Vadose and Ground Water Monitoring Wells (dated January 1992). If yes, specify these variations.

No.

12. What procedures will be used to ensure no contamination will be introduced by the drilling equipment?

The augers will be steam-cleaned prior to initiating drilling.

13. What methods will be used to clean sampling equipment? The sample rings will be washed with a degreaser and watermix, rinsed in tap water, and rinsed in distilled water.

14. What cleaning method will be used to clean casing and screen prior to installation?

Only new, factory-sealed casing will be used for the wells.

RECEIVED
DEC 14 1993

ENCROACHMENT PERMIT AGREEMENT AUTHORIZING WORK

Pursuant to Chapter 18.16 of the Municipal Code of the City of La Mesa, permission is hereby granted to GROUND WATER TECHNOLOGY to do work within the public street right of way of the City of La Mesa.

Whereas the permittee has requested the permission of the City of La Mesa to encroach on the following-described real property in the City of La Mesa TO INSTALL & MAINTAIN TWO MONITORING WELLS AS PER ATTACHED SPECS.

Fronting County Assessor Parcel No. _____ AKA 7651 ALVARADO ROAD

Whereas, the existing street improvements on (St.) COMMANCHE/ALVARADO

Consist of: Full Improvements X
~~Partial Improvements~~ ____

Now, therefore, in consideration of their mutual promises, and other good and valuable consideration, the parties hereto agree as follows:

Permission is hereby given by the City to permittee to install the above-mentioned encroachment on the real property of the City of La Mesa described above in accordance with the following conditions:

1. Said installation shall in no way interfere with any existing utility. Any changes of any utility due to the installation shall be at the sole expense of the permittee.

2. Maintenance, removal or relocation of the above-mentioned installation shall be the sole responsibility of the permittee, lessee, or the representative of the owner of lessee, or his successor in interest, at no expense to the City of La Mesa.

3. Said installation shall conform to the standards of the City of La Mesa and shall conform with the regulations of the Engineering Department.

4. The City will not be responsible for any damage to existing improvements during maintenance of the existing storm drain in the easement.

5. The City will not assume liability or responsibility for existing structures built in the easement.

ENCROACHMENT PERMIT AGREEMENT AUTHORIZING WORK Continued

This permit is revocable in accordance with Chapter 18.16 of the Municipal Code of said City of La Mesa upon 30 days notice to the permittee, or his successor in interest, and upon such notice the encroachment must be removed, or relocated, as may be specified by the permittor at permittee's expense at the said time.

Permittee hereby agrees to, and shall hold the City of La Mesa, its elective and appointive boards, officers, agents and employees, harmless from any liability for damagae or claims for damage for personal injury, including death, as well as from claims for property damage which may arise from permittee, or any of sub-contractors' operations under this permit, whether such operations be by permittee, or by any sub-contractor, or sub-contractors, or by any one or more persons directly or indirectly employed by, or acting as agent for permittee, or any subcontractor or subcontractors. Permittee agrees to, and shall defend the City of La Mesa and its elective and appointeve boards, officers, agents and employees, from any suits or actions at law, or inequity for damages caused, or alleged to have been caused, by reason of the aforesaid operations.

The undersigned permittee hereby accepts the foregoing encroachment permit upon the terms above set forth and agrees to all of the conditins and covenants on its part to be performed. It is understood and agreed that, in addition to the above conditions, all applicable conditions of Chapter 18.16 of the Municipal Code are incorporated herein by reference as if set out in full. It is further agreed that if any part of this interferes with the future use of the street right of way by the general public, it must be removed, or relocated, as designated by the City, at th expense of the permittee, or his successor in interest.

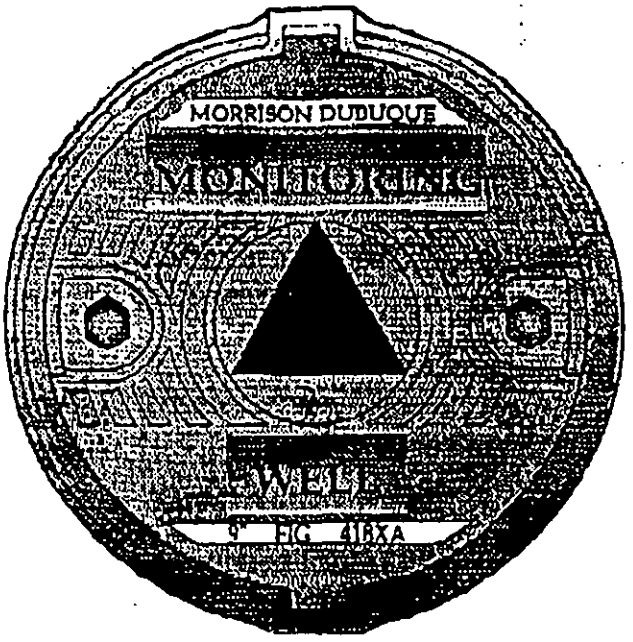
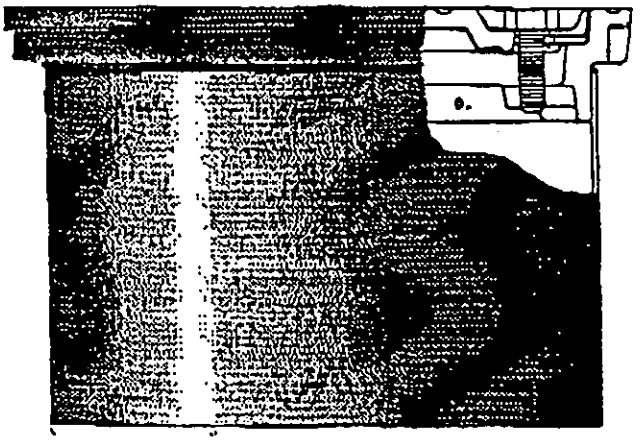
Morrison Manholes
Highway Specification Standards





DESCRIPTION

Manholes:

1. Fig 318 and 318XA Series (9" and 12")
2. Fig 418 XA Series (7", 9", and 12" sizes)
3. Fig 519 Series (9" and 12" sizes)

The above listed manholes have been tested by an official testing laboratory and results confirm their use and performance to meet the following:

1. Federal Specification RR-F-621E.
2. ASTM A48.
3. Section 206-3 of American Public Works Association. (Adopted by the Los Angeles County Dept of Public Works).
4. AASHTO standard for "H-20" truck loadings.

Testing was witnessed by an official from Los Angeles County of Public Works. Test results and other technical data is available from Morrison Bros Co.

MADE IN THE USA.

SOIL SAMPLING
WITH SPLIT-SPOON SAMPLER
QUALITY ASSURANCE AND QUALITY CONTROL

To prevent cross contamination between samples, the sampler was washed prior to each sampling using the "three bucket" was system. This system involves:

1. Washing the split-spoon sampler in a Simple Green™ and water solution,
2. Double rinsing the sampler in tap water, and
3. Double rinsing the sampler in distilled water.

To maintain the integrity of each soil sample, the following procedures were performed. The soil samples were:

1. Collected in 6-inch brass sample tubes,
2. Sealed with foil or teflon caps,
3. Wrapped with duct tape,
4. Properly labeled and custody forms completed,
5. Waterproofed in plastic containers,
6. Placed in a cooler and chilled on ice, and
7. Delivered to a State-certified laboratory.

All soil samples were frozen and stored at the laboratory for 30 days in case additional analyses were needed.

Recommended Actions

SA/M# H12687
Chevron Project #93521
7651 Alvarado
La Mesa, California 92041

5-24-94

Dear Mr. Porter:

Chevron recommends the following actions for the site captioned above:

1. Reduce frequency of monitoring to twice annually; monitor during the 1st and 3rd quarters of each year. Impacted soils were excavated prior to redevelopment of the site and dissolved concentrations in groundwater are dropping in response.
2. Destroy redundant well MW-5. Keep, then monitor annually
3. Stop analyzing samples for MTBE.
4. Close open case for site following 3 quarters of concentrations below action levels.

We can discuss these recommendations in our upcoming meeting on Tuesday, May 24, 1994. If you have any questions please don't hesitate to call me at (310) 694-7969.

Sincerely,

QUARTERLY MONITORING REPORT
Former Chevron Service Station #9-3521
La Mesa, California

INTRODUCTION

Enclosed is the quarterly monitoring report for former Chevron Station No. 9-3521 located at 7651 Alvarado Road in the city of La Mesa(Figures 1 and 2). This report updates groundwater monitoring activities performed between January 1 and March 31, 1994.

On March 25, 1994 monitoring wells MW-1 through MW-5 were gauged and sampled. Samples were obtained sequentially from wells MW-1, MW-2, MW-5, MW-4, and MW-3 in order of increasing dissolved hydrocarbons as determined from previous laboratory. A description of groundwater sampling procedures is presented in Appendix A. Gauging data are presented in Table 1 and were used to derive a groundwater contour map (Figure 3).

Purged groundwater was placed in drums and subsequently, transported under a Non-hazardous Data Form to the Gibson Facility in Bakersfield for recycling.

ANALYTICAL RESULTS SUMMARY

A duplicate sample from monitoring well MW-1 and trip blank were prepared and analyzed to verify the integrity of field and laboratory procedures. All groundwater and blank samples were tested for total petroleum hydrocarbons - gasoline using the California Department of Health Services Test Method 8015-M and purgeable aromatics and methyl tertiary butyl either using EPA Test Method 602. A copy of the laboratory report and chain-of-custody form are included in Appendix B. Results of the laboratory analyses for samples obtained on March 25, 1994 are provided in Table 1. A summary of groundwater analyses is presented in Table 2.

Dissolved hydrocarbons were not detected in the sample and duplicate from well MW-1.

Results of the laboratory analyses indicate the concentration of TPH-gasoline was 4,300 ug/l in the sample from well MW-3. The concentration of benzene was 10 ug/l in the sample from well MW-3. Dissolved hydrocarbons were not detected in samples from wells MW-1, MW-2, MW-4, and MW-5. Concentrations of dissolved hydrocarbons are shown on Figure 4.

Methyl tertiary butyl ether was not detected in samples from wells MW-1 through MW-5.

CONCLUSIONS

Comparison of laboratory data from the previous monitoring episode indicates concentrations of dissolved hydrocarbons decreased in the sample from well MW-3. Dissolved hydrocarbons continued to be below detection limits in samples from wells MW-1 and MW-2. The highest levels of dissolved hydrocarbons were present in the sample from well MW-3. Benzene exceeded action levels in the sample from well MW-3. Benzene concentrations over time are shown on Graphs 1 and 2.

Groundwater elevations increased by 0.12 feet and 0.17 feet in well MW-1 and MW-3, respectively, and decreased by 0.01 feet in well MW-2 as compared to the previous monitoring episode. Groundwater elevations over time are shown on Graph 3. The direction of groundwater flow was northwesterly at a gradient of 0.03 foot per foot.

o o O o o

This report has been prepared for the exclusive use of Chevron U.S.A., Inc. as it pertains to their site located at 7651 Alvarado Road, La Mesa, California. No warranty, expressed or implied, is made as to the professional advice in this report.

APPENDIX A

Groundwater Sampling Procedures
Field Testing Data

GROUNDWATER SAMPLING PROCEDURES

Prior to sampling, wells were purged of water using a stainless steel bailer. Fast recharging wells were purged of four casing volumes of water. Slow recharging wells were purged until dry and allowed to recover for two hours before sampling. Each casing volume of water was field tested for temperature, pH, and conductivity. Last casing volume was tested for redox potential and dissolved oxygen. Groundwater samples were field tested for turbidity. Field testing data are included in this appendix. Groundwater samples were obtained using a Teflon bailer equipped with a bottom emptying device and placed in VOA bottles with Teflon septums. All purging and sampling equipment was washed in non-phosphate soap and triple rinsed in distilled water between wells to reduce the potential for cross contamination.

In addition to the samples obtained from the wells, a trip blank, field blank, and sample duplicate were prepared to verify the integrity of the field and laboratory procedures. Samples were placed on ice to reduce the potential for volatilization. Samples were transported to a certified laboratory for analyses under strict chain-of-custody procedures.

All groundwater samples were tested for total petroleum hydrocarbons using the California Department of Health Services Test Method 8015-M for gasoline. Samples were also tested for purgeable aromatic and methyl tertiary butyl either compounds using EPA Test Method 602.

QUARTERLY MONITORING REPORT
Former Chevron Service Station #9-3521
La Mesa, California

INTRODUCTION

Enclosed is the quarterly monitoring report for former Chevron Station No. 9-3521 located at 7651 Alvarado Road in the city of La Mesa(Figures 1 and 2). This report updates groundwater monitoring activities performed between October 1 and December 31, 1993.

On November 23, 1993 monitoring wells MW-1 through MW-3 were gauged and sampled. Samples were obtained sequentially from wells MW-1, MW-2, and MW-3 in order of increasing dissolved hydrocarbons as determined from previous laboratory analyses. A description of groundwater sampling procedures is presented in Appendix A. Gauging data are presented in Table 1 and were used to derive a groundwater contour map (Figure 3).

Purged groundwater was placed in drums and subsequently, transported under a Non-hazardous Data Form to the Gibson Facility in Bakersfield for recycling.

ANALYTICAL RESULTS SUMMARY

A duplicate sample from monitoring well MW-2 and trip blank were prepared and analyzed to verify the integrity of field and laboratory procedures. All groundwater and blank samples were tested for total petroleum hydrocarbons - gasoline using the California Department of Health Services Test Method 8015-M and purgeable aromatics using EPA Test Method 602. A copy of the laboratory report and chain-of-custody form are included in Appendix B. Results of the laboratory analyses for samples obtained on November 23, 1993 are provided in Table 1. A summary of groundwater analyses is presented in Table 2.

Dissolved hydrocarbons were not detected in the sample and duplicate from well MW-2.

Results of the laboratory analyses indicate the concentration of TPH-gasoline was 5,500 ug/l in the sample from well MW-3. The concentration of benzene was 14 ug/l in the sample from well MW-3. Dissolved hydrocarbons were not detected in samples from wells MW-1 and MW-2. Concentrations of dissolved hydrocarbons are shown on Figure 4.

CONCLUSIONS

Comparison of laboratory data from the previous monitoring episode indicates concentrations of dissolved hydrocarbons increased in the sample from well MW-3. Dissolved hydrocarbons continued to be below detection limits in samples from wells MW-1 and MW-2. The highest levels of dissolved hydrocarbons were present in the sample from well MW-3. Benzene exceeded action levels in the sample from well MW-3. Benzene concentrations over time are shown on Graphs 1 and 2.

Groundwater elevations decreased by 0.07 feet in well MW-1 through MW-3 as compared to the previous monitoring episode. Groundwater elevations over time are shown on Graph 3. The direction of groundwater flow was toward the northwest at a gradient of 0.04 foot per foot.

o o O o o

This report has been prepared for the exclusive use of Chevron U.S.A., Inc. as it pertains to their site located at 7651 Alvarado Road, La Mesa, California. No warranty, expressed or implied, is made as to the professional advice in this report.

APPENDIX A

Groundwater Sampling Procedures
Field Testing Data

GROUNDWATER SAMPLING PROCEDURES

Prior to sampling, wells were purged of water using a stainless steel bailer. Fast recharging wells were purged of three casing volumes of water. Slow recharging wells were purged until dry and allowed to recover for two hours before sampling. Each casing volume of water was field tested for temperature, pH, and conductivity. Groundwater samples were field tested for turbidity. Field testing data are included in this appendix. Groundwater samples were obtained using a Teflon bailer equipped with a bottom emptying device and placed in VOA bottles with Teflon septums. All purging and sampling equipment was washed in non-phosphate soap and triple rinsed in distilled water between wells to reduce the potential for cross contamination.

In addition to the samples obtained from the wells, a trip blank, field blank, and sample duplicate were prepared to verify the integrity of the field and laboratory procedures. Samples were placed on ice to reduce the potential for volatilization. Samples were transported to a certified laboratory for analyses under strict chain-of-custody procedures.

All groundwater samples were tested for total petroleum hydrocarbons using the California Department of Health Services Test Method 8015-M for gasoline. Samples were also tested for purgeable aromatic compounds using EPA Test Method 602.

QUARTERLY MONITORING REPORT
Former Chevron Service Station #9-3521
La Mesa, California

INTRODUCTION

Enclosed is the quarterly monitoring report for former Chevron Station No. 9-3521 located at 7651 Alvarado Road in the city of La Mesa(Figures 1 and 2). This report updates groundwater monitoring activities performed for the third quarter of 1993.

On October 4, 1993 monitoring wells MW-1 through MW-3 were gauged and sampled. Samples were obtained sequentially from wells MW-1, MW-2, and MW-3 in order of increasing dissolved hydrocarbons as determined from previous laboratory analyses. A description of groundwater sampling procedures is presented in Appendix A. Gauging data are presented in Table 1 and were used to derive a groundwater contour map (Figure 3).

Purged groundwater was placed in drums and subsequently, transported under a Non-hazardous Data Form to the Gibson Facility in Bakersfield for recycling.

ANALYTICAL RESULTS SUMMARY

A duplicate sample from monitoring well MW-3, field blank, and trip blank were prepared and analyzed to verify the integrity of field and laboratory procedures. All groundwater and blank samples were tested for total petroleum hydrocarbons - gasoline using the California Department of Health Services Test Method 8015-M and purgeable aromatics using EPA Test Method 602. A copy of the laboratory report and chain-of-custody form are included in Appendix B. Results of the laboratory analyses for samples obtained on October 4, 1993 are provided in Table 1. A summary of groundwater analyses is presented in Table 2.

The analytical results of the duplicate and sample from well MW-3 indicate a relative difference of four percent for total dissolved hydrocarbons.

Results of the laboratory analyses indicate the concentration of TPH-gasoline was 4,800 ug/l in the sample from well MW-3. The concentration of benzene was 15 ug/l in the sample from well MW-3. Dissolved hydrocarbons were not detected in samples from wells MW-1 and MW-2. Concentrations of dissolved hydrocarbons are shown on Figure 4.

CONCLUSIONS

Comparison of laboratory data from the previous monitoring episode indicates concentrations of dissolved hydrocarbons decreased in samples from wells MW-2 and MW-3. Dissolved hydrocarbons continued to be below detection limits in the sample from well MW-1. The highest levels of dissolved hydrocarbons were present in the sample from well MW-3. Benzene exceeded action levels in the sample from well MW-3. Benzene concentrations over time are shown on Graphs 1 through 2.

Groundwater elevations increased by 0.01 feet in well MW-1 and decreased by an average of 0.15 feet in wells MW-2 and MW-3 as compared to the previous monitoring episode. Groundwater elevations over time are shown on Graph 3. The direction of groundwater flow was toward the north-northwest at a gradient of 0.04 foot per foot.

APPENDIX A

Groundwater Sampling Procedures
Field Testing Data

Project No. 93.390

GROUNDWATER SAMPLING PROCEDURES

Prior to sampling, wells were purged of water using a stainless steel bailer. Fast recharging wells were purged of three casing volumes of water. Slow recharging wells were purged until dry and allowed to recover for two hours before sampling. Each casing volume of water was field tested for temperature, pH, and conductivity. Groundwater samples were field tested for turbidity. Field testing data are included in this appendix. Groundwater samples were obtained using a Teflon bailer equipped with a bottom emptying device and placed in VOA bottles with Teflon septums. All purging and sampling equipment was washed in non-phosphate soap and triple rinsed in distilled water between wells to reduce the potential for cross contamination.

In addition to the samples obtained from the wells, a trip blank, field blank, and sample duplicate were prepared to verify the integrity of the field and laboratory procedures. Samples were placed on ice to reduce the potential for volatilization. Samples were transported to a certified laboratory for analyses under strict chain-of-custody procedures.

All groundwater samples were tested for total petroleum hydrocarbons using the California Department of Health Services Test Method 8015-M for gasoline. Samples were also tested for purgeable aromatic compounds using EPA Test Method 602.

Enclosed please find the analytical results for samples received by GTEL Environmental Laboratories, Inc. on 10/05/93.

A formal Quality Assurance/Quality Control (QA/QC) program is maintained by GTEL, which is designed to meet or exceed the EPA requirements. Analytical work for this project met QA/QC criteria, unless otherwise stated in the footnotes.

GTEL is certified by the California State Department of Health Services, Laboratory certification number E1075, to perform analyses for drinking water, wastewater, and hazardous waste materials according to EPA protocols.

If you have any questions concerning this analysis or if we can be of further assistance, please call our Customer Service Representative.

Sincerely,
GTEL Environmental Laboratories, Inc.

Groundwater Monitoring Report

SA/M# H12687
Chevron Project #93521
7651 Alvarado Road
La Mesa, CA 91941

Dear Mr. Porter:

Enclosed is the groundwater monitoring report for the site referenced above for the second quarter of 1995. Monitoring at this site is being done on a quarterly basis by Wayne Perry Construction, Inc. As you know, we recently destroyed three of the five monitoring wells at the site. The two remaining wells are MW-3 and MW-4. MW-3 is the only well which continues to be impacted while MW-4 is clean but down gradient. We continue in a monitor only mode until the levels in MW-3 drop low enough to warrant closure. As per our telephone conversation of today we will begin monitoring this site semiannually until there is some substantial change in the reports.

If you have any questions please call me at (310) 694-7698.

Sincerely,

Michael S. Bauer

QUARTERLY MONITORING REPORT
Former Chevron Service Station #9-3521
La Mesa, California

INTRODUCTION

Enclosed is the quarterly monitoring report for former Chevron Station No. 9-3521 located at 7651 Alvarado Road in the city of La Mesa (Figures 1 and 2). This report updates groundwater monitoring activities performed between April 1 and June 30, 1995.

On June 12, 1995, monitoring well MW-3 was gauged and sampled. Monitoring wells MW-1, MW-2, MW-4, and MW-5 were gauged but selectively not sampled. Monitoring wells MW-1, MW-2, and MW-5 will be permanently abandoned. A description of groundwater sampling procedures is presented in Appendix A. Gauging data are presented in Table 1 and were used to derive a groundwater contour map (Figure 3).

Purged groundwater was transported to the Chevron Refinery in El Segundo for recycling. Copies of the disposal documents are presented in Appendix A.

ANALYTICAL RESULTS SUMMARY

A trip blank was prepared and analyzed to verify the integrity of field and laboratory procedures. All groundwater and blank samples were tested for total petroleum hydrocarbons-gasoline using EPA Test Method 8015-Modified and benzene, toluene, ethyl benzene, xylenes, and methyl tertiary butyl ether using EPA Test Method 602. A copy of the laboratory report and chain-of-custody document are included in Appendix B. Results of the laboratory analyses for samples obtained on June 12, 1995, are provided in Table 1. A summary of groundwater analyses is presented in Table 2.

Results of the laboratory analyses indicate the concentration of TPH-gasoline was 3,770 ug/l in the sample from well MW-3. The level of benzene was 3.2 ug/l in the sample from well MW-3. Dissolved hydrocarbon concentrations are shown on Figure 4.

Methyl tertiary butyl ether was not detected in the sample from well MW-3.

CONCLUSIONS

Comparison of laboratory data from the previous monitoring episode indicates concentrations of dissolved hydrocarbons decreased in the sample from well MW-3. Benzene exceeded action levels in the sample from well MW-3. Benzene concentrations over time are shown on Graphs 1 and 2. Levels of methyl tertiary butyl ether decreased in the sample from well MW-3.

Groundwater elevations decreased by an average of 0.22 foot in wells MW-1 and MW-3 through MW-5 and increased by 3.03 feet in well MW-2 as compared to the previous monitoring episode. Groundwater elevations over time are shown on Graphs 3 and 4. The direction of groundwater flow was northwesterly at a gradient of 0.037 foot per foot.

GROUNDWATER SAMPLING PROCEDURES

Prior to sampling, wells were purged of water using a stainless steel bailer. Fast recharging wells were purged of four casing volumes of water. Slow recharging wells were purged until dry and allowed to recover for two hours before sampling. Each casing volume of water was field tested for temperature, pH, and conductivity. The last casing volume was tested for redox potential and dissolved oxygen. Groundwater samples were field tested for turbidity. Field testing data are included in this appendix. Groundwater samples were obtained using a Teflon bailer equipped with a bottom emptying device and placed in VOA bottles with Teflon septums. All purging and sampling equipment was washed in non-phosphate soap and triple rinsed in distilled water between wells to reduce the potential for cross contamination.

In addition to the samples obtained from the wells, a trip blank was prepared to verify the integrity of the field and laboratory procedures. Samples were placed on ice to reduce the potential for volatilization. Samples were transported to a certified laboratory for analyses under strict chain-of-custody procedures.

All groundwater samples were tested for total petroleum hydrocarbons using EPA Test Method 8015-Modified for gasoline. Samples were also tested for purgeable aromatics and methyl tertiary butyl ether using EPA Test Method 602.

Re: PACE Project No.: CL2467
Client Reference: 93.390, Alvarado / Commanche

Dear Mike Bauer:

Enclosed is a report of laboratory analysis for the above referenced project. Samples were received under chain-of-custody at the Pace - Southern California Laboratory in Camarillo, California, on 06/13/95.

This report has been reviewed for accuracy and completeness and conforms to your analytical requirements.

If you have any questions regarding this report, require sampling supplies, field services or information on our analytical services, please call me at (805) 389-1353.

Sincerely,

Pace, Inc. - Southern California Laboratory

Brian G. Satterfield
Project Manager

Subject: Work Plan to Destroy Three Monitoring Wells
Chevron Service Station 9-3521, 7651 Alvarado Road, La Mesa, California
GTI Project 023400112

Dear Mr. Porter:

The following document is a work plan to destroy two on-site and one off-site monitoring wells at Chevron Service Station 9-3521 located at 7651 Alvarado Road, La Mesa, California (Figures 1 and 2). The wells are being destroyed to prevent potential contamination from surface runoff. Wells MW-1, MW-2, and MW-5 consist of 4-inch diameter Schedule 40 PVC screen and casing and are set at approximately 15 feet below grade. The wells were drilled using a hollow stem auger rig equipped with 10-inch augers. Groundwater Technology proposes to use a Mobile B61 HDX drill rig to drill out the PVC and annular materials. Each well will be overdrilled by approximately 2-feet to insure that all well construction materials have been removed. Wells MW-1 and MW-2 will be grouted to near grade with bentonite grout using a tremie pipe and completed at the surface with concrete. Well MW-5, located within Alvarado Road, will be backfilled to City of La Mesa specifications (attached).

SCOPE OF WORK

The following is a summary of the proposed scope of services to be performed:

- Obtain well permits from the County of San Diego SAMD for the destruction of three wells.
- Obtain approval from the City of La Mesa to enter the public right-of-way to destroy MW-5. Traffic control will be provided by a subcontractor.
- Destroy three 15-foot monitoring wells as described above.
- Prepare a "30-Day" report.

Work will be scheduled immediately after approval of this work plan.

Should you have any questions regarding this letter, please call the undersigned at (619) 453-8415.

Respectfully submitted,

QUARTERLY MONITORING REPORT
Former Chevron Service Station #9-3521
La Mesa, California

INTRODUCTION

Enclosed is the quarterly monitoring report for former Chevron Station No. 9-3521 located at 7651 Alvarado Road in the city of La Mesa (Figures 1 and 2). This report updates groundwater monitoring activities performed between April 1, and June 30, 1996.

On May 6, 1996, monitoring well MW-3 was gauged and sampled and monitoring well MW-4 was selectively gauged per prior agreement between Michael Bauer of Chevron USA Products Company and Michael Porter of San Diego County, Site Assessment and Mitigation Unit. A description of groundwater sampling procedures is presented in Appendix A. Gauging data are presented in Table 1 and were used to derive a groundwater elevation map (Figure 3).

Purged groundwater was transported to the Chevron Refinery in El Segundo for recycling. Copies of the disposal documents are presented in Appendix A.

ANALYTICAL RESULTS SUMMARY

A trip blank was prepared and analyzed to verify the integrity of field and laboratory procedures. Groundwater and blank samples were tested for total petroleum hydrocarbons-gasoline using EPA Test Method 8015-Modified and benzene, toluene, ethyl benzene, and xylenes using EPA Test Method 8020. The sample from well MW-3 was also tested for volatile organics using EPA Test Method 8240 and methyl tertiary butyl ether using EPA Test Method 8020. A copy of the laboratory report and chain-of-custody document are included in Appendix B. Results of the laboratory analyses for samples obtained on May 6, 1996, are provided in Table 1. A summary of groundwater analyses is presented in Table 2.

Results of the laboratory analyses indicate concentrations of TPH-gasoline was 890 ug/l in the sample from well MW-3. The level of benzene was 4 ug/l in the sample from well MW-3. Dissolved hydrocarbon concentrations are shown on Figure 4.

The concentration of methyl tertiary butyl ether was 12 ug/l in the sample from well MW-3.

CONCLUSIONS

Comparison of laboratory data from the previous monitoring episode indicates concentrations of dissolved hydrocarbons increased in the sample from well MW-3. Benzene exceeded action levels in the sample from well MW-3. Benzene concentrations over time are shown on Graphs 1 and 2. Levels of methyl tertiary butyl ether increased in the sample from well MW-3.

Groundwater elevations increased by 0.12 foot in well MW-3 and decreased by 0.16 foot in well MW-4 as compared to the previous monitoring episode. Groundwater elevations over time are shown on Graphs 3 and 4.

o o O o o

This report has been prepared for the exclusive use of Chevron U.S.A. Products Company as it pertains to their site located at 7651 Alvarado Road, La Mesa, California. No warranty, expressed or implied, is made as to the professional advice in this report.

QUARTERLY MONITORING REPORT
Former Chevron Service Station #9-3521
La Mesa, California

GROUNDWATER SAMPLING PROCEDURES

Prior to sampling, wells were purged of water using a stainless steel bailer. Fast recharging wells were purged of four casing volumes of water. Slow recharging wells were purged until dry and allowed to recover for two hours before sampling. Each casing volume of water was field tested for temperature, pH, and conductivity. The last casing volume was tested for redox potential and dissolved oxygen. Groundwater samples were field tested for turbidity. Field testing data are included in this appendix. Groundwater samples were obtained using a Teflon bailer equipped with a bottom emptying device and placed in VOA bottles with Teflon septums. All purging and sampling equipment was washed in non-phosphate soap and triple rinsed in distilled water between wells to reduce the potential for cross contamination.

In addition to the samples obtained from the wells, a trip blank was prepared to verify the integrity of the field and laboratory procedures. Samples were placed on ice to reduce the potential for volatilization. Samples were transported to a certified laboratory for analyses under strict chain-of-custody procedures.

The groundwater samples were tested for total petroleum hydrocarbons as gasoline using EPA Test Method 8015-Modified and benzene, toluene, ethyl benzene, xylenes, and methyl tertiary butyl ether using EPA Test Method 8020. In addition, the sample was also analyzed for volatile organics using EPA Test Method 8240.

QUARTERLY MONITORING REPORT
Former Chevron Service Station #9-3521
La Mesa, California

INTRODUCTION

Enclosed is the quarterly monitoring report for former Chevron Station No. 9-3521 located at 7651 Alvarado Road in the city of La Mesa (Figures 1 and 2). This report updates groundwater monitoring activities performed between October 1 and December 31, 1995.

On November 7, 1995, monitoring well MW-3 was gauged and sampled. Monitoring well MW-4 was gauged but selectively not sampled in accordance with prior agreement between Mr. Michael Bauer of Chevron USA Products Company and Mr. Michael Porter of San Diego County Environmental Health Services, Site Assessment and Mitigation Division. A description of groundwater sampling procedures is presented in Appendix A. Gauging data are presented in Table 1 and were used to derive a groundwater elevation map (Figure 3).

Purged groundwater was transported to the Chevron Refinery in El Segundo for recycling. Copies of the disposal documents are presented in Appendix A.

ANALYTICAL RESULTS SUMMARY

A trip blank was prepared and analyzed to verify the integrity of field and laboratory procedures. The groundwater and blank samples were tested for total petroleum hydrocarbons-gasoline using EPA Test Method 8015-Modified and benzene, toluene, ethyl benzene, and xylenes using EPA Test Method 8020. The sample from well MW-3 was also analyzed for methyl tertiary butyl ether using EPA Test Method 8020. A copy of the laboratory report and chain-of-custody document are included in Appendix B. Results of the laboratory analyses for samples obtained on November 7, 1995, are provided in Table 1. A summary of groundwater analyses is presented in Table 2.

Results of the laboratory analyses indicate the concentration of TPH-gasoline was 2,100 ug/l in the sample from well MW-3. The level of benzene was 3 ug/l in the sample from well MW-3. Dissolved hydrocarbon concentrations are shown on Figure 4.

Methyl tertiary butyl ether was not detected in the sample from well MW-3.

CONCLUSIONS

Comparison of laboratory data from the previous monitoring episode indicates concentrations of dissolved hydrocarbons decreased in the sample from well MW-3. Benzene exceeded action levels in the sample from well MW-3. Benzene concentrations over time are shown on Graphs 1 and 2. Levels of methyl tertiary butyl ether remained below the limits of detection in the sample from well MW-3.

Groundwater elevations decreased by 0.08 foot and 0.02 foot in wells MW-3 and MW-4 as compared to the previous monitoring episode. Groundwater elevations over time are shown on Graphs 3 and 4.

o o O o o

GROUNDWATER SAMPLING PROCEDURES

Prior to sampling, wells were purged of water using a stainless steel bailer. Fast recharging wells were purged of four casing volumes of water. Slow recharging wells were purged until dry and allowed to recover for two hours before sampling. Each casing volume of water was field tested for temperature, pH, and conductivity. The last casing volume was tested for redox potential and dissolved oxygen. Groundwater samples were field tested for turbidity. Field testing data are included in this appendix. Groundwater samples were obtained using a Teflon bailer equipped with a bottom emptying device and placed in VOA bottles with Teflon septums. All purging and sampling equipment was washed in non-phosphate soap and triple rinsed in distilled water between wells to reduce the potential for cross contamination.

In addition to the samples obtained from the wells, a trip blank was prepared to verify the integrity of the field and laboratory procedures. Samples were placed on ice to reduce the potential for volatilization. Samples were transported to a certified laboratory for analyses under strict chain-of-custody procedures.

The groundwater and trip samples were tested for total petroleum hydrocarbons as gasoline using EPA Test Method 8015-Modified and benzene, toluene, ethyl benzene, and xylenes using EPA Test Method 8020. The sample from well MW-3 was also analyzed for methyl tertiary butyl ether using EPA Test Method 8020.

Groundwater Monitoring Report

SA/M# H12687
Chevron Project #93521
7651 Alvarado Road
La Mesa, CA 91941

Dear Mr. Porter:

Enclosed is the groundwater monitoring report for the site referenced above for the fourth quarter of 1996. As per our agreement in our recent meeting, we have discontinued groundwater monitoring at this site.

If you have any questions please call me at (562) 694-7698.

Sincerely,

Michael S. Bauer

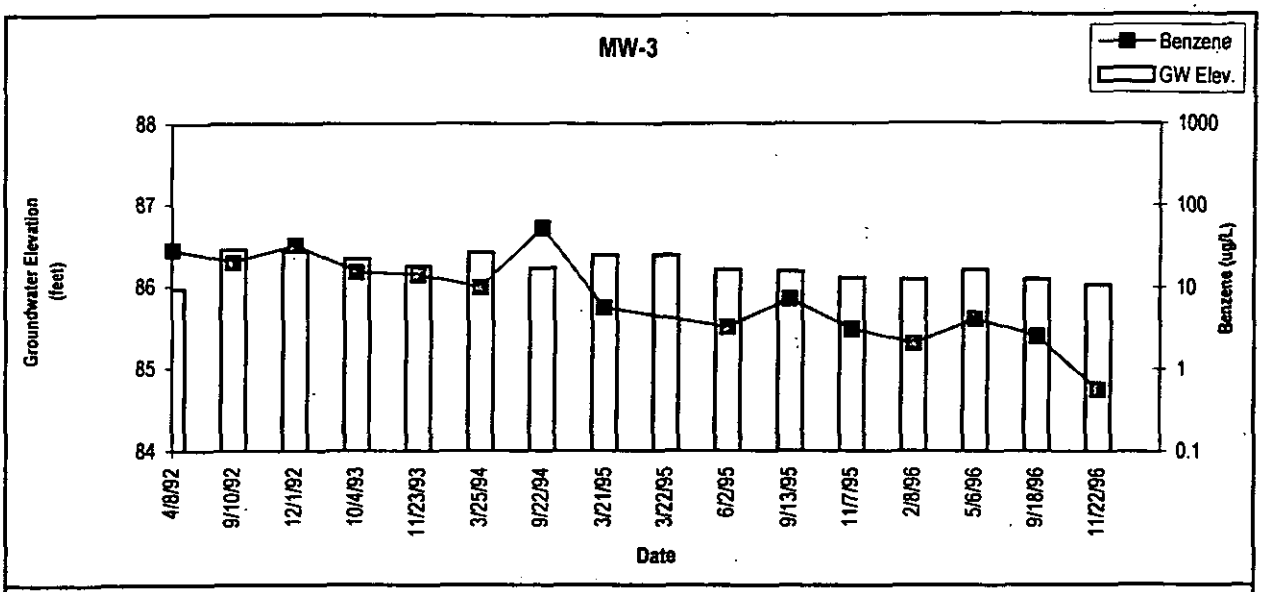

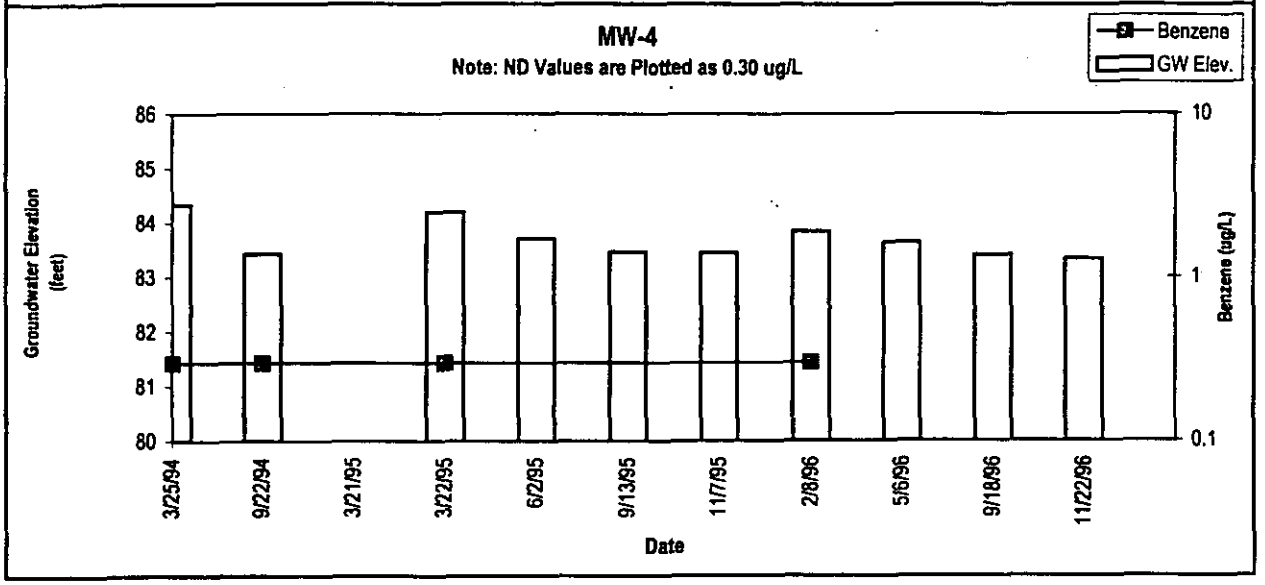

Exhibit 4
Field Procedures

Groundwater samples were collected using pre-packaged, disposable, bottom-filling/emptying bailers. The bailers were lowered down each well on virgin string until approximately two-thirds full and then extracted and inspected for a hydrocarbon odor or free product sheen. If any odor or sheen was detected, it was recorded on the GSFDS for the respective well. The bailers were then decanted into appropriate containers. The containers were filled to overflowing using volatile organic chemical samplers and quickly sealed with teflon-lined septum lids to reduce the potential for volatilization of dissolved hydrocarbons. Each sample container was then inverted and gently tapped to confirm the absence of headspace. The groundwater samples were collected from wells in the presumed order of increasing contaminant levels, where possible. Bailers and the associated string were discarded after the sampling of each well.

All sample containers were labeled and affixed with custody seals with a field technician's signature and date. The custody seals were affixed to the sample containers in such a manner as to provide evidence of any tampering which might occur prior to laboratory analysis. The containers were then placed in water-tight plastic bags and stored in a cooler with water ice or other frozen medium capable of sustaining a temperature of four degrees Celsius.

Duplicate samples were collected from one well and labeled as FD-1 in order to keep the source of the duplicate sample unknown to the laboratory. Two laboratory-prepared, VOA vial trip blanks were also maintained throughout the sampling event and submitted for laboratory analysis. The groundwater samples were kept chilled until relinquished to a courier along with a completed chain-of-custody form for delivery to the analytical laboratory.

Free Product Removal

Free product was removed from any of the wells in which it was detected with the vacuum truck or by hand bailing the wells. All field data recorded regarding free product removal is included on the GSFDS.

Disposal Of Purge And Decontamination Water

All purge water generated during the monitoring and sampling event was either transported off site the same day it was generated in the vacuum truck, stored in 55 gallon barrels and removed during a milk-run by vacuum truck, or treated by BBC Environmental, Inc.'s portable groundwater purge and treatment trailer and disposed of with a local sanitary sewer permit.

FIELD PROCEDURES

Groundwater Monitoring Procedures

Monitoring of the groundwater wells at the subject site was conducted with an interface probe. The probe was used to determine the depth from a surveyed datum point to any free product and the groundwater in each well.

Prior to the monitoring of each well, the interface probe was decontaminated by washing the probe and associated tape in a solution of Liqui-Nox detergent and tap water and rinsing them in two successive rinses of tap water. After decontamination, the probe was lowered down a well to the first-encountered fluid and the corresponding depth was measured to the nearest 0.01 foot and recorded. If the probe indicated that the first-encountered fluid was an oil product, the probe was lowered further into the well until groundwater was detected and the corresponding level was then measured and recorded in the same manner. After the liquid level(s) in a well had been monitored, the probe was lowered to the bottom of the well and the total depth was measured to the nearest 0.1 feet in the same manner indicated above and recorded. The probe was then extracted from the well and decontaminated in preparation for the monitoring of the next well.

The groundwater wells were monitored in the presumed order of increasing contaminant levels, when possible. All monitoring data is included on the Groundwater Sampling Field Data Sheets (GWFDS).

Monitoring Well Purging Procedures

After all groundwater wells had been monitored, the wells were purged in preparation for sample collection. Purging was conducted with either a vacuum truck, down-hole submersible pump, or by hand bailing.

During the purging process groundwater samples are collected so that temperature, pH, and conductivity can be monitored. The data are recorded on the GSFDS along with observations of water color, turbidity, and hydrocarbon odor.

Purging was continued until at least three casing volumes of groundwater had been removed and/or three successive reading were recorded for temperature, pH, and conductivity which varied by no more than 10% between each reading. All information recorded regarding purging volumes and times is included on the GSFDS III.

Groundwater Sample Collection Procedures

Prior to the collection of groundwater samples, each monitoring well is allowed to recharge to at least eighty percent of the original well volume, except slow recharging wells (wells which do not recharge to within eighty percent with in two hours), which are sampled as soon as sufficient water has accumulated with in the well. Recharge depths were measured using a decontaminated interface probe. The recharge depths and the corresponding times of measurement are recorded on the GSFDS.

Re: **Well Destruction Report**
Former Chevron Service Station No. 9-3521
7651 Alvarado Road
La Mesa, California
Establishment No. H12687-002
Permit No. W100439

Dear Ms. Crystal:

On April 25, 2002, SECOR International Incorporated (SECOR), on behalf of Chevron Products Company (Chevron), supervised the destruction two groundwater monitoring wells associated with the property referenced above (Figure 1 and Figure 2).

Field Activities

Prior to commencement of field activities, SECOR obtained a Monitoring Well Destruction Permit (Permit No. W100439) from the County of San Diego Department of Environmental Health Land and Water Quality Division (SAM). The well permit cover sheet is included for reference (Attachment 1).

Field activities were conducted in accordance with the 2002 SAM Manual guidelines and conditions of SAM permit No. W100439, issued on March 29, 2002. West Hazmat Drilling (West Hazmat) conducted well destruction activities using a CME 75 drill rig equipped with 10-inch diameter hollow-stem augers.

On April 25, 2002, the well casings of the two wells (MW-3 and MW-4), were over-drilled to approximately 2 feet below the total depth of the wells to remove the annular seal and filter pack materials used in the construction of the wells. Well MW-3, located in the along the northern property line, was originally installed to approximately 15 feet below ground surface (bgs) and well MW-4, located immediately northwest of well MW-3 on the adjacent property, was installed to 12 feet bgs. The original well completion logs are included for reference (Attachment 2). The well casings were removed and disposed of by West Hazmat. Each borehole was backfilled with approximately 100

gallons of bentonite grout. The bentonite grout mixture was comprised of approximately 1.5 50-pound bags of grout powder per 45 gallons of water. The augers were slowly removed and the bentonite grout was allowed to settle. The top 2 feet of each borehole was sealed with concrete. The exterior concrete seals around the former well boxes were removed using a jackhammer and a flush concrete patch was installed.

Non-Hazardous Waste Disposal

The non-hazardous soil cuttings generated from the well destruction activities were placed in labeled 55-gallon drums and temporarily stored onsite prior to disposal. TPS Technologies is scheduled to remove the drums from the site and recycle the soil.

If you have any questions regarding the foregoing, please contact Melissa R. Wendt at (714) 379-3366.

Respectfully Submitted,
SECOR International Incorporated

MONITORING WELL AND BORING CONSTRUCTION AND DESTRUCTION PERMIT

SITE NAME: FORMER CHEVRON STATION #9-3521

SITE ADDRESS: 7651 ALVARADO ROAD, LA MESA 91941

PERMIT FOR: **DESTROY 2 GROUNDWATER MONITORING WELLS**

PERMIT APPROVAL DATE: MARCH 29, 2002

PERMIT EXPIRES ON: JULY 27, 2002

PERMIT CONDITIONS:

1. **All material within the original borehole, which includes the casing, filter pack and annular seal must be removed. The borehole must be completely filled with an approved sealing material as specified in Department of Water Resources Bulletin 74-90.**

2. All wash water must be contained and disposed of properly.

3. All water and soil that is placed in drums must be labeled and stored as specified in the SAM Manual in: Section 5, page 7, (5).

4. Within 60 days of completing work, submit a well construction report, including all well and/or boring logs and laboratory data to the Well Permit Desk. This report must include all items required by the SAM Manual, Section 5, Pages 6 & 7.

5. This office must be given 48 hour notice of any drilling activity on this site and advanced notification of drilling cancellation. Please contact Well Permit Desk at (619) 338-2339.

NOTE: **This permit does not constitute approval of a work plan as defined in Section 2722 of Article 11 of C.C.R., Title 23. Work plans are required for all unauthorized release investigations in San Diego County.**

APPROVED BY: _____ DATE: 3/29/02

RÉSUMÉS

ALLISON O'NEAL

Education

BS – Geology, Humboldt State University, Arcata, 2018

Professional Experience

Ms. O'Neal is an Associate Professional with educational background and project experience involving geologic and groundwater analysis, soil sampling, and related fieldwork. She utilizes critical and geologic analytic techniques to produce, analyze, and interpret maps, cross-sections, and other graphics derived from field and laboratory reconnaissance. She collects and evaluate multi-media sampling (rock, sediment, and groundwater), and has completed field activities in a variety of terrains and conditions, including the use of field equipment (handheld GPS, survey level and rod, auger, assist flying drone) to provide data for analysis. Using several kinds of professional software (Microsoft Office, Global Mapper, Adobe Illustrator, ArcGIS), she can work on multiple projects simultaneously, and has contributed to technical reports and other professional communications. Her college coursework included hydrogeology, neotectonics, petrology, structural and sedimentary geology, geomorphology, and earth systems history.

Professional Experience

Mr. Montague is a professional geologist (PG) and licensed contractor with 16 years of experience in environmental consulting, general contracting, commercial and residential development, and property and asset management. He has performed and reviewed over 500 Phase I environmental site assessments (ESAs), and has completed subsurface investigations, human health risk assessments, removal action work plans, site remediation activities, geotechnical investigations, asbestos and lead-based paint surveys, and asbestos air monitoring. His development, general contracting, and property and asset management experience includes managing construction through lease-up; lease administration and property operations and maintenance; contract procurement and administration; oversight of subcontractors and staff; and interfacing with clients, owners, tenants, and regulatory agencies.

His project experience is summarized below.

Brixton Capital, Gasoline Service Station Redevelopment with Retail Buildings, Chula Vista, CA. As Project Manager, oversaw assessment, remedial planning, and remediation consisting of oversight, segregation, and on-Site burial of residual petroleum hydrocarbon-impacted soils from a former gasoline service station release property redeveloped with new retail buildings.

RD Brown Company, Leaking Underground Storage Tank (LUST) Case Assessment and Remediation, City of Imperial, CA. As Project Manager, oversaw several on- and off-site soil, soil vapor, and groundwater assessments, and is currently overseeing ongoing remediation and monitoring of a proposed senior living facility at a former gasoline service station.

San Diego County Water Authority (SDCWA), Environmental Consulting Services, San Diego, CA. As Project Manager, completed several ESAs and subsurface assessments to assist the SDCWA in obtaining easements required to complete the Carlsbad Desalination Project.

City of Encinitas, Site Investigation and Planning, Encinitas Community Park, Encinitas, CA. As Project Geologist, provided oversight for the mitigation and monitoring activities of pesticides in soil from the Hall Property, which consists of 43 acres of coastal bluff that was formerly used as a nursery and was redeveloped into a community park. Under the oversight of the County of San Diego Department of Environmental Health (DEH), work consisted of Phase II ESAs, remedial planning and implementation of on-site reuse/burial of 45,000 cubic yards of pesticide-impacted soil in a Soil Management Zone, and creation of a land-use covenant. SCS received an award for this project with the Industrial Environmental Association.

Los Angeles Unified School District (LAUSD), Assessment and Remediation, Various Locations in Los Angeles County, CA. Managed and performed the environmental characterization and cleanup of various proposed school redevelopment projects overseen by the California Department of Toxic Substances Control (DTSC) that required Phase I ESAs, preliminary environmental assessments or subsurface investigations, and preparation and implementation of removal action work plans to obtain "no further action' status prior to redevelopment.

City Heights Revitalization Corporation, Brownfields Assessment and Remediation, City Heights, CA. Managed a subsurface investigation for an entire Brownfields city block planned for redevelopment. The investigation included extensive drilling, trenching, and hand auguring to estimate the volume of lead- and hydrocarbon-impacted soil from residual contamination from a former service station and from lead-based paint. Work also included negotiation of cleanup levels with the local regulatory agency.

Casmalia Steering Committee, Remedial Investigation, Casmalia, CA. Managed and performed soil vapor sampling at the Casmalia Hazardous Waste Management Facility, a Class I hazardous waste site, for a remedial investigation and feasibility study of soil gas impacts submitted to the Environmental Protection Agency (EPA). Soil gas impacts to ecological receptors were assessed considering specific regulatory guidance, including the joint DTSC and Los Angeles Regional Water Quality Control Board (LARWQCB) Advisory on Active Soil Gas Investigations.

The Boeing Company, Underground Storage Tank (UST) Assessment, Long Beach, CA. Performed subsurface vapor intrusion to indoor air analysis at a former aeronautics manufacturing facility. Soil, soil vapor, and sub-slab soil vapor assessments were conducted to determine appropriate corrective actions associated with former solvent USTs. Work was performed under the corrective action consent agreement with the DTSC.

Trihydro Corporation, Soil Vapor Sampling, Hooven, OH. Performed soil vapor sampling from indoor air probes and outdoor multi-level probes at residences in Hooven, OH. This project focused on helping evaluate the potential for subsurface vapor intrusion to indoor air from volatilization of petroleum hydrocarbons in groundwater or light, non-aqueous phase liquid petroleum product, originating from an adjacent former fuel and asphalt petroleum refinery. The vapor intrusion pathway was evaluated based on a request by the EPA, Region V, and was performed in accordance with the EPA-issued document, *Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soil*, 2002.

CSK Auto, Phase I ESAs, Various Sites in the Western US. Conducted Phase I ESAs, subsurface investigations, and geotechnical investigations for the development of auto parts chain stores in the western US. Work included site investigations, drilling operations, and records research.

AT&T/Gianni & Associates, Phase I ESAs and Geotechnical Investigations, San Diego, CA. Completed Phase I ESAs, transaction screen assessments, National Environmental Policy Act (NEPA) reports, asbestos surveys, and geotechnical investigations involving the development of wireless communications sites.

Ford Mance Company, Construction and Property Management, Mixed-Use Building at 111 Chesterfield Drive, Encinitas, CA. Served as project manager during development and construction phases of a 2-story, Type V, 3,874-square-foot mixed-use building with subterranean parking. Responsibilities included managing all phases of construction and shell and tenant improvements, and assisting in construction supervision activities and lease up. Development activities included oversight and collaboration of architectural, mechanical, electrical, and plumbing plans preparation, assisting with design research and decisions, obtaining various permits, and preparing cost and budgets. After construction, Mr. Montague also served as the property and asset manager.

Ford Mance Company, Construction and Property Management, Del Norte Medical Plaza, Carlsbad, CA. Served as project manager during development and construction of a 2-story, Type II, medical building with subterranean parking. Responsibilities included contracting out all phases of shell construction of 22,000 square feet of rentable area for medical use, collaborative oversight concerning architectural, mechanical, electrical, and plumbing plans preparation, assisting with design research and decision-making, obtaining various permits, and preparing costs and budgets. After construction, Mr. Montague also served as property and asset manager.

California Department of Fish and Game, Carpinteria Creek Watershed Plan, Carpinteria, CA. Collaborated with local and state government representatives, and various stakeholders, to aid in preparing the Carpinteria Creek Watershed Plan under the Cachuma Resource Conservation District for the California Department of Fish and Game. Work consisted of research, meetings, various field assessments, report writing, and map creation. The Plan served as an amendment to the Water Quality Control Plan for the Central Coast Region.
