NOTICE OF PREPARATION
OF AN ENVIRONMENTAL IMPACT REPORT FOR
THE RESIDENCES @ SHORELINE GATEWAY

As the Lead Agency, the City of Mountain View will prepare an Environmental Impact Report (EIR) for the above referenced project and would like your input regarding the scope and content of the environmental information to be addressed in the EIR. The project description, location, and a brief summary of potential environmental effects are attached.

A Public Scoping Meeting will be held on **Wednesday, September 26, 2018 at 4:00 p.m.** to take comments regarding the scope and content of the Draft EIR. The Scoping Meeting will be held at Mountain View City Hall, 500 Castro Street, Mountain View.

Per State law, the deadline for your response is 30 days after receipt of this notice; however, we would appreciate an earlier response, if possible. The comment period is September 13, 2018 to October 15, 2018. Written comments will be accepted until Monday, October 15, 2018 at 5:00 p.m.

Please identify a contact person, and send your response to:

City of Mountain View
Community Development Department

NOTICE OF PREPARATION
OF AN ENVIRONMENTAL IMPACT REPORT FOR
THE RESIDENCES @ SHORELINE GATEWAY

A. INTRODUCTION

The purpose of an Environmental Impact Report (EIR) is to inform decision makers and the general public of the environmental effects of a proposed project. The EIR process is intended to provide environmental information sufficient to evaluate a proposed project and its potential for significant impacts on the environment; to examine methods of reducing adverse environmental impacts; and to consider alternatives to the project. Upon finding the EIR complete and compliant with the California Environmental Quality Act (CEQA) of 1970, as amended, the City Council will consider certification of the EIR at a public hearing and may take action on the proposed Residences @ Shoreline Gateway Project (Project). Certification of an EIR does not constitute Project approval.

The City of Mountain View determined that analysis of the environmental effects of the Project buildout is best provided through use of an EIR. The EIR for the Project will be prepared and processed in accordance with CEQA, and will include:

- A summary of the Project,
- A Project description,
- A description of the existing environmental setting, potential environmental impacts, and mitigation measures,
- Alternatives to the Project as proposed, and
- Environmental consequences, including: (a) any significant environmental effects which cannot be avoided if the Project is implemented; (b) the growth-inducing impacts of the proposed Project; and (c) cumulative impacts.

B. PROJECT LOCATION

The Project site is located at 1001 North Shoreline Boulevard at the corner of North Shoreline Boulevard and Terra Bella Avenue, south of U.S. Highway 101 (U.S. 101) in the north central portion of the City of Mountain View (City), in northern Santa Clara County. The 7.81-acre Project site includes two parcels (APNs 153-15-032 and 153-15-033) generally bounded by North Shoreline Boulevard on the west, Terra Bella Avenue on the south, Linda Vista Avenue on the east and U.S. Highway 101 (U.S. 101) on the north.

Existing uses at the Project site include an approximately 111,443-square foot four-story office building and associated features, including a surface parking lot, landscaping, and outdoor private recreational amenity space.

Location and vicinity maps of the Project site are attached to this NOP as Figures 1 and 2. A Project Illustrative Site Plan is attached to this NOP as Figure 3.

C. DESCRIPTION OF THE PROJECT

The Project applicant proposes to remove existing surface parking, landscaping, and private recreation areas and construct three new buildings with recreation facilities and common amenity space in these areas.

The Project would include a new, seven- to eight-story residential structure with approximately 3,000 square feet of ground floor retail, two levels of podium parking and 203 apartment units; and a new, seven-story residential structure with two levels of podium parking and 100 condominium units, to the north and east of the existing office building. The existing office building would remain at the site. The Project would also include a six-story parking structure to accommodate parking for the existing office building.

The Project would include the following City actions, which will be analyzed in the EIR:

- **2030 General Plan Text and Map Amendment.** The Project would require text and map amendments to the City of Mountain View 2030 General Plan to change the Project site land use designation from *General Industrial* to *Mixed-Use Center*. This would allow the addition of the Project's residential uses in the Moffett/Whisman Planning Area.
- **Rezoning.** The Project would also require changing the existing Zoning Ordinance and Map designation of *General Industrial* (MM) on the eastern portion of the Project site and *Limited Industrial* (ML) on the western portion of the Project site, to *Planned Community* (P) for the entire site.
- **Planned Community Permit.**
- **Development Review Permit.**
- **Heritage Tree Removal Permit.**
- **Vesting Tentative Subdivision Map.**

D. ENVIRONMENTAL EFFECTS OF THE PROJECT

The EIR will address potential environmental effects of the Project in the following areas:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology/Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology/Water Quality
- Land Use
- Noise
- Population/Housing
- Public Services
- Recreation
- Transportation
- Utilities and Service Systems

E. SCOPING COMMENTS

We are requesting your input on the scope and content of the environmental information appropriate to your agency's statutory responsibilities or of interest to your organization; specifically, we are requesting the following:

1. Identify significant environmental effects and/or mitigation measures you believe need to be explored in the EIR with supporting discussion of why you believe effects may be significant.
2. Describe special studies and other information you believe are necessary for the City to analyze the significant environmental effects, alternatives, and mitigation measures you have identified.
3. For public agencies that provide infrastructure and public services, identify any facilities that will be required to provide services to the Project development.
4. Indicate whether staff from your agency would like to meet with City staff to discuss the scope and content of the EIR's environmental information;
5. Provide the name, title, telephone number, postal address, and email address of the contact person from your agency or organization that we can contact regarding your comments; and
6. Identify alternatives you believe need to be explored in further detail in the EIR.

Comments may be sent to:

CITY OF MOUNTAIN VIEW

1001 N. SHORELINE BOULEVARD PROJECT
ENVIRONMENTAL IMPACT REPORT (EIR)
PUBLIC SCOPING MEETING

PLAZA CONFERENCE ROOM, 2ND FLOOR
SEPTEMBER 26, 2018, 4:00 PM

AGENDA

1.	Welcome, Introductions, and Brief Project Overview	Clarissa Burke, Project Planner
2.	Environmental Review/Environmental Impact Report (EIR) Process • What is an EIR? • Why an EIR is being prepared • EIR review and adoption process • Scoping and environmental issues to be addressed in the EIR • Opportunities for public participation	Jill Feyk-Miney, Deputy Project Manager, ESA
3.	Questions/Public Comments on the Scope of the EIR	

If you would like to receive a copy of the Notice of Availability of the Draft EIR for this project, please indicate on a Response Card at tonight's meeting or contact Clarissa Burke at clarissa.burke@mountainview.gov.

CITY OF MOUNTAIN VIEW

ENVIRONMENTAL REVIEW PROCESS AND OPPORTUNITIES FOR PUBLIC PARTICIPATION

∗ = Opportunities for public involvement in EIR process

PUBLIC SCOPING PROCESS

Notice of Preparation of an EIR* **(September 13 – October 15, 2018)**

30 day comment period – agencies and the public can provide written comments on what issues should be addressed in the EIR

Public Scoping Meeting* **(September 26, 2018)**

Agencies and the public can provide written or oral comments on what issues should be addressed in the EIR

EIR PREPARATION AND REVIEW

Draft EIR -- 45-day public review period * **(Spring 2019)**

Agencies and the public can review the Draft EIR and provide comments on the adequacy of the environmental analysis and provide additional information

Opportunity for public to provide oral comments at a public comment meeting during circulation of the Draft EIR

The Draft EIR will be available in public libraries as well as on the City of Mountain View's website

Responses to Comments – Final EIR **(Summer 2019)**

The Final EIR consists of the Draft EIR, responses to comments received on the Draft EIR, and revisions to the text of the Draft EIR.

Provided to commenters a minimum of 10 days before EIR certification date

Public Hearings * **(Summer - Fall 2019)**

Certification of the Final EIR

Opportunity for public testimony on the contents of the EIR at hearing

Decision on Project

Opportunity for public testimony on the merits of the project at hearing
Notice of Determination – establishes Statute of Limitations

CITY OF MOUNTAIN VIEW

CITY OF MOUNTAIN VIEW

EIR Scoping Meeting

1001 N. Shoreline Blvd. Project

September 26, 2018

CITY OF MOUNTAIN VIEW

Welcome and Introductions:

- **Clarissa Burke, Planner, Comm. Dev. Department, City of Mountain View**
- **John Schwarz, Consulting Planner**
- **Elizabeth Kanner, Sr. Managing Associate, ESA**
- **Jill Feyk-Miney, Associate, ESA**

CITY OF MOUNTAIN VIEW

Purpose of a Scoping Meeting:

- To provide an overview of the environmental review process
- To solicit written comments regarding the scope of the environmental analysis for the 1001 N. Shoreline Blvd. Project

CITY OF MOUNTAIN VIEW

Agenda:

- Project Overview
- Purpose of the California Environmental Quality Act (CEQA) and the Environmental Impact Report (EIR)
- CEQA Process
- Public Comments on Scope of EIR
- Resource Topic Analysis in EIR
- Anticipated Schedule and Next Steps
- How to Provide a Scoping Comment

CITY OF MOUNTAIN VIEW

Project Site:

- 7.81 acres

- Current Designations:
  - GP: General Industrial
  - Zoning: MM (General Industrial) & ML (Limited Industrial)

- Existing Office Building, parking, & landscaping

CITY OF MOUNTAIN VIEW

Project Overview:

- 203 apartment units within 7-8 story residential building
  - with ~3,000 square feet (sf) of retail
  - 2 levels of podium parking
- 100 condominium units within 7-story structure
  - 2 levels of podium parking
- Existing Office Bldg. to remain
- General Plan Amendment to *Mixed-Use Center*
- Rezoning to *Planned Community (P)* Zoning District

CITY OF MOUNTAIN VIEW

CITY OF MOUNTAIN VIEW

View from Terra Bella Ave. looking northeast

View of southeast corner of site from Terra Bella Ave. looking northwest

CITY OF MOUNTAIN VIEW

View from Linda Vista Ave. looking west

View from Shorline Blvd. looking northeast

CITY OF MOUNTAIN VIEW

Purpose of CEQA and the EIR:

- INFORM decision-makers and public of the project's potential environmental effects
- ENGAGE the public in environmental review process
- DISCLOSE potential project impacts on the environment
- AVOID and/or REDUCE potential impacts of the projects with alternatives and/or mitigation measures

CITY OF MOUNTAIN VIEW

CEQA Process:

1. Notice of Preparation (NOP)

- 30-day public review and comment period (9/13/2018 through 10/15/2018)
- Public scoping meeting

2. Prepare & Publish Draft EIR

- 45-day public review and comment period

3. Prepare & Publish Final EIR

- Response to comments on Draft EIR
- Corrections or clarifications to Draft EIR

4. City Considers Final EIR and Project

- Environmental Planning Commission (EPC) recommendation
- City Council consideration and action

CITY OF MOUNTAIN VIEW

Public Comments on Scope of EIR:

- ❑ Range of Environmental Topics
- ❑ Specific Issues of Concern
- ❑ Approaches to Conducting Certain Analysis
- ❑ Potential Alternatives to the Project
- ❑ Other Environmental Considerations

- ***"I request that the Project EIR consider…"***

CITY OF MOUNTAIN VIEW

Resource Topic Analysis in EIR:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology/Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology/Water Quality
- Land Use
- Noise
- Population/Housing
- Public Services
- Recreation
- Transportation
- Utilities and Service Systems

CITY OF MOUNTAIN VIEW

Anticipated Schedule and Next Steps:

- Notice of Preparation: September-October 2018
- Draft EIR Available: Spring 2019
- Final EIR Available: Early Summer 2019
- EIR Hearings: Late Summer-Early Fall 2019

CITY OF MOUNTAIN VIEW

How to Provide a Scoping Comment:

- Verbal or Written Comment at Scoping Meeting
- Email: Clarissa.Burke@mountainview.gov
- Mail:

  Clarissa Burke, Planner
  City of Mountain View, Community Development Department
  P.O. Box 7540
  Mountain View, CA 94039-7540
- *Comments on NOP due* ***Monday, October 15, 2018***

Address: 793 San Carlos Ave, MTV Phone: 650-450-6026

COMMENTS:

The EIR report should consider:

privacy 1) impact of high-story buildings to privacy of the neighborhood right next to it;

traffic 2) the potential negative impact on traffic to the SFH residents in the San Carlos / Pablo / Rafel Aves.

Safety 3) the potential concern on safety.

green space 4) potential loss in public facilities such as green space.

PLEASE PRINT CLEARLY. PLEASE NOTE THAT ALL COMMENTS BECOME PART OF THE PUBLIC RECORD.

The Residences @ Shoreline Gateway– Notice of Preparation

Dear Clarissa Burke:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project. Our comments are based on the Notice of Preparation (NOP).

Project Understanding
The project applicant proposes to remove existing surface parking, landscaping, and private recreation areas and construct three new buildings with recreation facilities and common amenity space. A total of 303 residential units are proposed. The Project would include a new, seven- to eight-story residential structure with approximately 3,000 square feet of ground floor retail, two levels of podium parking and 203 apartment units. A new seven-story residential structure with two levels of podium parking and 100 condominium units would be constructed to the north and east of the existing office building. The existing office building would remain at the site. The project would also include a six-story parking structure to accommodate parking for the existing office building. The project is adjacent to the US 101 / N Shoreline Boulevard interchange.

Project Description
Please clarify the number of parking spaces proposed by the project and incorporate Transportation Demand Management strategies.

Cultural Resources
As part of the environmental review for the proposed project, pursuant to California Environmental Quality Act (CEQA) Guidelines Section 15064.5, we recommend that the City of Mountain View conduct a cultural resource technical study that at a minimum includes a records search at the Northwest Information Center of the California Historical Resources Information

System (CHRIS), a field survey of the project area by a qualified archaeologist and a qualified architectural historian, and Native American consultation.

If an encroachment permit is needed for work within Caltrans right-of-way, we may require that cultural resource technical studies be prepared in compliance with CEQA, Public Resources Code (PRC) 5024, and the Caltrans Standard Environmental Reference (SER) Chapter 2 (http://www.dot.ca.gov/ser/vol2/vol2.htm). Should ground-disturbing activities take place within Caltrans right-of-way and there is an inadvertent archaeological or burial discovery, in compliance with CEQA, PRC 5024.5, and the SER, all construction within 60 feet of the find shall cease and the Caltrans District 4 Office of Cultural Resource Studies (OCRS) shall be immediately contacted.

Encroachment Permit
Please be advised that any work or traffic control that encroaches onto the state right-of-way requires an encroachment permit that is issued by the Department. To apply, a completed encroachment permit application, environmental documentation, and six (6) sets of plans clearly indicating state right-of-way must be submitted to: Office of Permits, California DOT, District 4, P.O. Box 23660, Oakland, CA 94623-0660. To download the permit application and obtain more information, visit http://www.dot.ca.gov/hq/traffops/developserv/permits/.

Lead Agency
As the Lead Agency, the City of Mountain View is responsible for all project mitigation, including any needed improvements to the STN. The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures.

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, please contact Jannette Ramirez at (510) 286-5535 or jannette.ramirez@dot.ca.gov.

Sincerely,

PATRICIA MAURICE

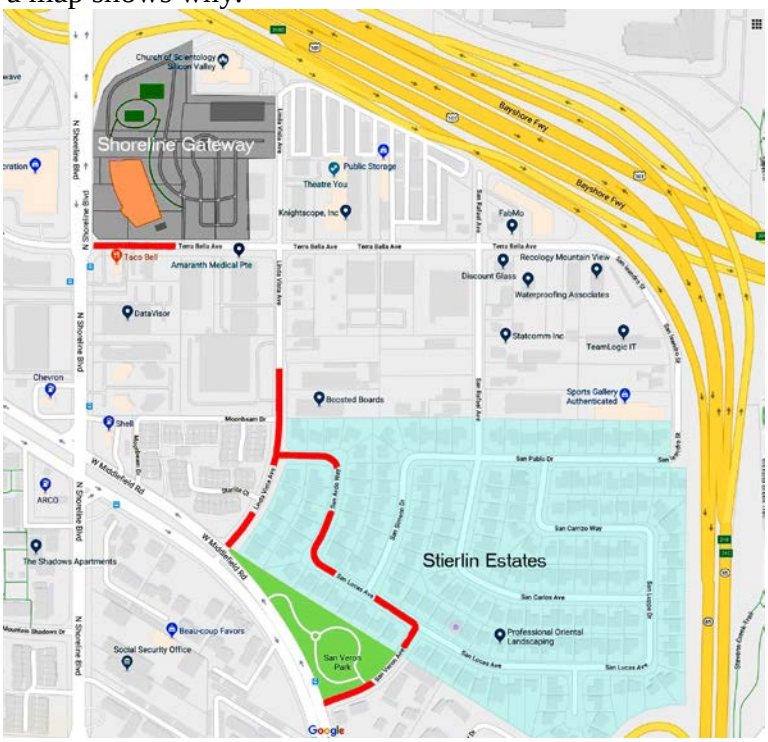
Re: 1001 N. Shoreline "Shoreline Gateway"

There are a number of questions that must be answered before this project is allowed to go ahead. At a very high level, the City is currently formulating a vision for the Terra Bella area, to be followed by a Precise Plan which will guide future development in the area. How can the City allow such a massive project to go ahead which may be in conflict with the eventual plans for the area? Ironically, the placement of this project at one of the few gateways to the Terra Bella area may actually limit future development further due to traffic issues. It would seem to be prudent to put the project on hold until the Precise Plan has been established. There are two nearby significant projects which must be taken into account when planning this one: 777 W. Middlefield (Village Lakes) which plans to build 711 apartments to replace the 208 existing ones, and 555 W. Middlefield (Avalon Eaves) which plans to add 341 apartments to the 402 existing. The combination of all three projects would significantly impact traffic, schools and infrastructure and must be addressed in the Precise Plan.

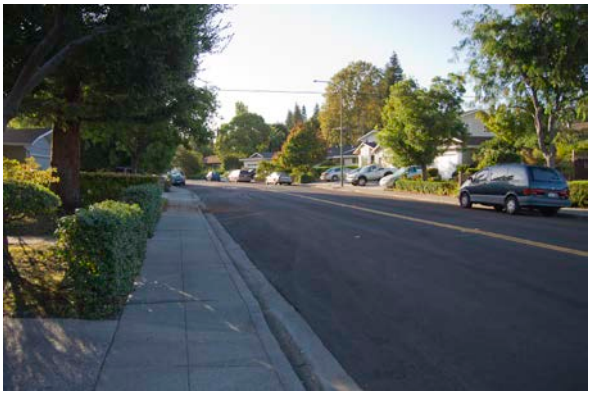
Traffic is indeed one of the main concerns residents such as myself in the nearby Stierlin Estates neighborhood have with this and other large scale developments in the east Terra Bella area, and a map shows why.



There are only 3 streets, shown in red, leading into and out of the area: Terra Bella, Linda Vista, and San Veron, and the latter two are limited because they connect with Middlefield Rd. which is divided and non-signaled. It is well known that Shoreline Blvd. is heavily congested during the morning rush hour between 8:30am and 10am, and the intersection at Terra Bella Ave. is already a choke point because a lot of drivers choose to make a U-turn there to get onto northbound Shoreline. Adding more drivers trying to come out of Terra Bella will delay traffic on Shoreline even further. In addition, the future reversible bus lane will remove the left turn pocket for southbound highway 85, forcing drivers to use Moffett Blvd. instead. It will be easier for drivers to use Linda Vista and San Veron to get onto eastbound Middlefield to get to Moffett, adding to traffic cutting through Stierlin Estates.

Through traffic is a big safety concern as the number of young families with children increases in the neighborhood. San Veron in particular passes by San Veron Park which has a children's play area. Children have to cross Shoreline Blvd. to reach neighborhood schools. More traffic and more children from the proposed development will make that even more dangerous. A detailed traffic study including surveys and simulation should be done to assess the impact the project will have on local traffic. In particular, I ask that *current* traffic conditions be compared with the study done 3 years ago for the office building at 1001 N. Shoreline to test the validity of that study, and hence, future studies.

Parking is another hot button for current residents. I frequently see cars from San Veron Apartments parked on our street of San Lucas. Constantly seeing unfamiliar cars and drivers in front of your house is unsettling and decreases the feeling of safety. Street parking also decreases the effective width of the street making it more dangerous to drive and decreases visibility when pulling out of driveways. Finally, a street full of cars is less aesthetic than one without cars. Other cities have imposed strict laws limiting street parking.



The Shoreline Gateway project proposes to provide only 1.2 parking stalls per housing unit in an effort to discourage car ownership. In locations where there are viable transportation alternatives, like the Madera Apartments across the street from the Mountain View Transit Center, this may be successful. However, the Shoreline Gateway project is far from any practical mass transit, and the nearest strip mall is half a mile away.

RE: 1001 N. Shoreline Air Quality Analysis, Mountain View, CA

SUBJECT: Construction Air Quality Analysis

This memo provides the updated construction air pollutant emissions modeling and health risk assessment. Our original analysis was submitted March 7, 2019. The City's consultant, ESA, reviewed this assessment and requested clarification and additional information. This memo has been updated to provide the requested information. *Attachment 1* provides ESA's memorandum with their requests and our responses.

At this time, specific construction schedules or anticipated equipment usage are not known. Therefore, Illingworth & Rodkin, Inc. developed project construction inputs based on default assumptions that the California Emissions Estimator Model (CalEEMod Version 2016.3.2) would apply to the project. Two model runs were developed that reflect construction of each project area: 1) to represent Block A and 2) to represent Block B and the Office Parking Structure. Two modeling scenarios were developed to address the potential sequence of construction: 1) Block B would be constructed, followed by Block A and 2) Block A and Block B would be constructed simultaneously. The sequenced construction would occur from the years 2020-2023, while simultaneous construction would occur from the years 2020-2021. The results for both construction scenarios are described and compared below. The construction inputs are attached to this memo.

We understand the additional information should apply to the project construction assumptions:

1. No pile driving is planned;
2. Construction work hours will be limited to the allowable hours per City requirements; and
3. No nighttime construction is anticipated at this time.

Construction Emissions Modeling

The CalEEMod model was used to compute emissions of air pollutants and diesel particulate matter (DPM) from construction of the project. Inputs to the model are provided in the construction worksheets that are provided as *Attachment 2*. The CalEEMod model was used to develop construction assumptions that include schedule, equipment usage, and traffic generation. The CalEEMod default site acreages were used to conservatively estimated construction activity and emissions, as these acreages are larger than the project construction sites. These inputs were reviewed by the Project Team to verify the best estimates for each construction phase (i.e., demolition, site preparation, grading, trenching, building construction, architectural coating, and paving) and provide or confirm estimates for hauling during demolition and grading.

Demolition estimates were based on the estimated square footages of buildings and asphalt to be removed. For asphalt areas, the thickness of pavement was estimated to be three inches. According to CalRecycle, asphalt and concrete waste is about 2,400 pounds per cubic yard (cy). The Project Team estimated that there would be approximately 3,900 cy of fill needed and 1,200 cy of cut material. The net import would be 2,700 cy. To account for shrinkage or expansion, the amount of import was estimated at 3,240 cy. Note that the modeling conservatively assumed 1,000 cy of export in addition to the import estimate. The CalEEMod default trip generation, trip types, and trip lengths were used to model construction criteria pollutants using the demolition and grading hauling inputs described above.

For the simultaneous construction, June 2020 was assumed to be the start of construction for both Blocks A and B. For the sequenced construction, Block B was assumed to start June 2020 and Block A was assumed to occur after construction of Block B in June 2022. Two model runs were developed to predict emissions from each construction project.

Criteria Air Pollutant Emissions

Total emissions from each construction project were computed for both construction scenarios. The simultaneous construction would occur over an estimated 340 workdays. The sequenced construction would occur over at least three years. The Block A project is estimated by CalEEMod to require at least 300 construction workdays, while Block B and the Office Parking construction would require 320 construction workdays. Table 1 reports total construction emissions from the project and the average daily construction emissions.

Table 1. Project Construction Air Pollutant Emissions

Description	ROG	NOx	PM_{10} Exhaust	$PM_{2.5}$ Exhaust
Simultaneous Construction Emissions				
Block A & B Construction Emissions (tons)	3.89	7.97	0.35	0.33
Average Daily Emissions (pounds per day)[1]	22.88	46.88	2.06	1.94
Sequenced Construction Emissions				
Block A Construction Emissions (tons)	2.38	3.71	0.17	0.17
Block B & Office Parking Emissions (tons)	1.51	4.26	0.17	0.16
Average Daily Emissions (pounds per day)[2]	12.5	25.7	1.1	1.0
BAAQMD Thresholds (pounds per day)	***54***	***54***	***82***	***54***
Exceed Threshold?				
Simultaneous Construction	No	No	No	No
Sequenced Construction	No	No	No	No

[1]Assumes 340 workdays. [2]Assuming 620 construction workdays.

Construction Toxic Air Contaminant Emissions

Diesel particulate matter emissions are the primary toxic air contaminant (TAC) that would be emitted during construction that could lead to community risk impacts. In addition, fine particulate matter (i.e., $PM_{2.5}$) emitted as exhaust and fugitive dust could lead to elevated annual $PM_{2.5}$ concentrations that also result in community risk impacts. Emissions of these contaminants/pollutants during construction are summarized in Table 2. Note that these emissions only include on- and near-site traffic emissions. A construction travel distance of one mile was applied to all construction travel in CalEEMod to represent these local traffic emissions. Since truck haul routes are not known but likely to travel away from sensitive receptors south of the site (i.e., along U.S. 101 or Shoreline Boulevard north of U.S. 101), the emissions were assigned to the project site. CalEEMod output files are included in *Attachment 2*.

Table 2. Localized Project Construction Emissions of DPM and $PM_{2.5}$(in tons)

Description	Exhaust PM_{10} (considered DPM)	Total $PM_{2.5}$
Block A and B Construction Emissions	0.3422	0.1808
Block A Construction Emissions – Year 1	0.1006	0.1810
Block A Construction Emissions – Year 2	0.0705	0.0695
Block B and Office Parking Emissions - Year 1	0.1006	0.1821
Block B and Office Parking Emissions - Year 2	0.0705	0.0687

Construction Health Risk Assessment

Construction emissions of DPM and $PM_{2.5}$ predicted using CalEEMod (see Table 2) were used with dispersion modeling to predict exposures at sensitive receptors within 1,000 feet of the project site. Cancer Risk methodology recommended by the California Office of Environmental Health Hazard Assessment (OEHHA) and the Bay Area Air Quality Management District (BAAQMD) were used to compute cancer risk associated with these exposures. The cancer risk methodology is described in *Attachment 3*.

Sensitive Receptors

There are groups of people more affected by air pollution than others. The California Air Resource Board (CARB) has identified the following persons who are most likely to be affected by air pollution: children under 16, the elderly over 65, athletes, and people with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive receptors. Locations that may contain a high concentration of these sensitive population groups include residential areas, hospitals, daycare facilities, elder care facilities, elementary schools, and parks. For cancer risk assessments, children are the most sensitive receptors, since they are more susceptible to cancer causing TACs. Residential locations are assumed to include third trimester, infant, and small children exposure. The closest sensitive receptors to the proposed project site is a single-family home (in a commercially zoned area along Linda Vista Avenue) about 200 feet southeast of the project site. Other sensitive receptors include residences in the townhome developments approximately 700 feet south of the project site. These sensitive receptors, which are within 1,000 feet of the project site, were included in the dispersion modeling and health risk assessment.

Construction Emissions

The CalEEMod model provided total annual PM_{10} exhaust emissions (assumed to be DPM) for the off-road construction equipment and for exhaust emissions from on-road vehicles, with total emissions from all construction stages as 0.3422 tons (684 pounds). These are shown by phase and construction year in Table 2.

Most of the construction emissions, approximately 88 percent, are the result of on-site use of off-road and portable construction equipment. The on-road emissions are a result of hauling truck travel during demolition and grading activities, worker travel, and vendor deliveries during construction. A trip length of one mile was used to represent vehicle travel while at or near the construction site. It was assumed that these emissions from on-road vehicles traveling at or near the site would occur at the construction site.

Fugitive $PM_{2.5}$ dust emissions were calculated by CalEEMod as 0.1808 tons (362 pounds) for the overall construction period.

Dispersion Modeling

The U.S. EPA AERMOD dispersion model was used to predict concentrations of DPM and $PM_{2.5}$ concentrations at sensitive receptors (residences) in the vicinity of the project construction area. The AERMOD dispersion model is a BAAQMD-recommended model for use in modeling analysis of these types of emission activities for California Environmental Quality Act (CEQA) projects.[1] The modeling utilized four area sources to represent the on-site construction emissions; two for exhaust emissions and two for fugitive dust emissions. To represent the construction equipment exhaust emissions, an emission release height of 6 meters (19.7 feet) was used for the area source. The elevated source height reflects the height of the equipment exhaust pipes plus an additional distance for the height of the exhaust plume above the exhaust pipes to account for

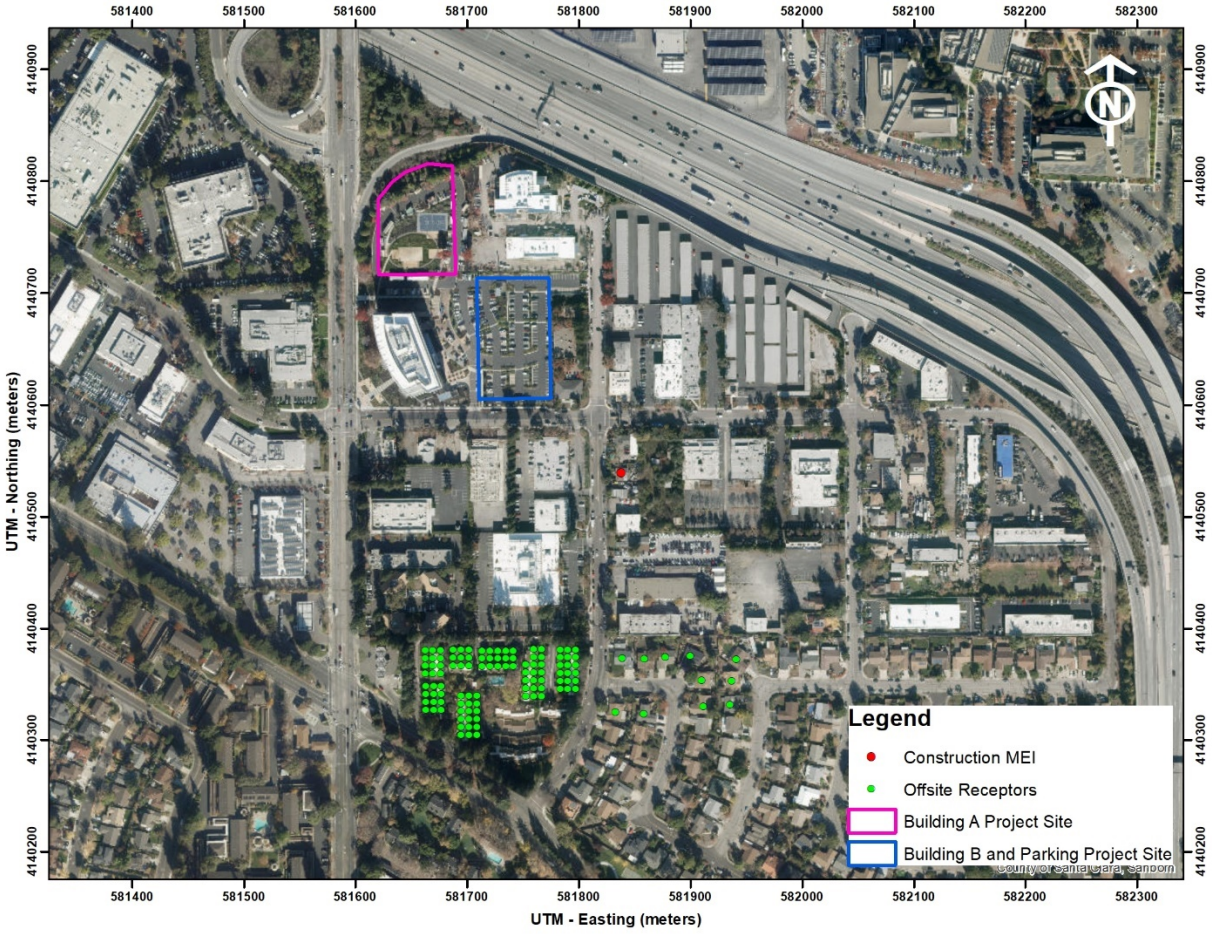
1 Bay Area Air Quality Management District (BAAQMD), 2012, *Recommended Methods for Screening and Modeling Local Risks and Hazards, Version 3.0.* May.

plume rise of the exhaust gases. For modeling fugitive $PM_{2.5}$ emissions, a near-ground level release height of 2 meters (6.6 feet) was used for the area source. Emissions from the construction equipment and on-road vehicle travel were distributed throughout the modeled area sources. Construction emissions were modeled as occurring daily between 7:00 a.m. to 6:00 p.m., which is the range of hours the City of Mountain View allows for construction noise.

The modeling used a five-year data set (2009 - 2013) of hourly meteorological data from the Moffett Federal Airfield Airport prepared by CARB for use with the AERMOD model. DPM and $PM_{2.5}$ concentrations from construction activities in 2020-2023 were calculated using the model. DPM and $PM_{2.5}$ concentrations were calculated at nearby residential locations at a receptor height of 1.5 meters (4.9 feet) and 4.5 meters (14.8 feet) to represent the first and second building levels of nearby multi-story residences. Figure 1 shows the construction area and DPM point sources modeled and the locations of nearby residential receptors.

The maximum-modeled annual DPM and $PM_{2.5}$ concentrations, which includes both the DPM and fugitive $PM_{2.5}$ concentrations, were identified at nearby sensitive receptors (as shown in Figure 1) to find the maximally exposed individuals (MEIs). Using the maximum annual modeled DPM concentrations, the maximum increased cancer risks were calculated using BAAQMD recommended methods and exposure parameters described in *Attachment 3*. The cancer risk calculations are based on applying the BAAQMD recommended age sensitivity factors to the TAC concentrations. Age-sensitivity factors reflect the greater sensitivity of third trimester gestations, infants, and small children to cancer causing TACs. Non-cancer health hazards and maximum $PM_{2.5}$ concentrations were also calculated and identified. *Attachment 4* includes the construction health risk modeling outputs and calculations.

Figure 1. Project Site, Construction Modeling Sources, Residential Receptor Locations, and Location of Maximum TAC Impacts (Cancer Risk and $PM_{2.5}$ Concentration)



Community Risk Results

Results of this assessment indicated that the construction MEI, where the maximum-modeled $PM_{2.5}$ and DPM concentrations would occur, was located at the single-family home east of Linda Vista Avenue, which is approximately 200 feet away from the project site. Table 3 and Table 4 summarize the risks impacts at the construction MEI for both construction scenarios. In both cases, the maximum cancer risk does exceed the BAAQMD single-source threshold of 10.0 per million for cancer risk. The unmitigated $PM_{2.5}$ concentration at the construction MEI in Table 4 also exceeds the BAAQMD single-source threshold of 0.3 $\mu g/m^3$ for $PM_{2.5}$ concentrations. The mitigated cancer risk, maximum $PM_{2.5}$ concentration, and HI risk values do not exceed the BAAQMD single-source thresholds for each respective risk. Mitigated results are based on the identified feasible construction mitigation plan that reduces construction emissions by 90 percent.

Table 3. Sequenced Construction Risk Impacts at the MEI

Source	Cancer Risk (per million)	$PM_{2.5}$ Concentration ($\mu g/m^3$)	Acute and Chronic Hazard (HI)
Construction MEI			
Unmitigated	**45.7**	0.30	0.03
Mitigated	4.6	0.05	<0.01

Significant?			
Unmitigated	**Yes**	**Yes**	No
Mitigated	No	No	No
BAAQMD Single-Source Threshold	***>10.0***	***>0.3***	***>1.0***

Recommended Mitigation

Selection of equipment during construction to minimize emissions. Such equipment selection would include the following:

The project shall develop a plan demonstrating that the off-road equipment used on-site to construct the project would achieve a fleet-wide average 77- to 81-percent reduction of DPM, considered as PM_{10} exhaust. One feasible plan to achieve this reduction would include the following:

1. *All diesel-powered off-road equipment, larger than 25 horsepower, operating on the site for more than two days continuously shall, at a minimum, meet U.S. EPA particulate matter emissions standards for Tier 3 engines and this equipment would need to include CARB-certified Level 3 Diesel Particulate Filters[2] or equivalent. Equipment that meets U.S. EPA Tier 4 standards for particulate matter emissions or use of equipment that is electrically powered or uses non-diesel fuels would meet this requirement.*

2. *Use electric-powered building cranes.*

2 See http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm

3. *Use of electric-powered portable equipment, which includes air compressors and welders.*

4. *Minimize diesel generator use by providing line power to the construction sites prior to building construction.*

5. *Implement Best Management Practices identified in the BAAQMD CEQA Air Quality Guidelines that include:* During any construction period ground disturbance, the applicant shall ensure that the project contractor implement measures to control dust and exhaust. Implementation of the measures recommended by BAAQMD and listed below would reduce the air quality impacts associated with grading and new construction to a less than significant level. The contractor shall implement the following best management practices that are required of all projects:

    1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.

    2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered.

    3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.

    4. All vehicle speeds on unpaved roads shall be limited to 15 miles per hour (mph).

    5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.

    6. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points.

    7. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.

8. Post a publicly visible sign with the telephone number and person to contact at the Lead Agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.

Effectiveness of Mitigation

With the recommended mitigation, the computed maximum increased lifetime residential cancer risk from construction, assuming infant exposure, would be 4.6 or 5.4 in one million or less, the maximum annual $PM_{2.5}$ concentration would be 0.05 or 0.08 $\mu g/m^3$, depending on the construction scenario. The Hazard Index would be <0.01 at the construction MEI. As a result, impacts would be reduced to *less-than-significant* with respect to community risk caused by construction activities in either construction scenario.

Attachment 1: Response to ESA Requests for Clarification/Information Regarding the Initial Construction Assessment

1.	On page 1 of the memo it is stated that "the sequenced construction would occur from the years 2002-2023." Please confirm and revise the memo to read 2020-2023. Response: Corrected typo.
2	The memo lists only 3 project construction assumptions on page 1, please confirm that following should also be included as construction assumptions, and provide sources and/or other justification for these assumptions in the memo: Response: Cut/Fill volumes – the memo has been updated to explain the cut/fill volumes provided by the Project Team. Schedule Assumptions - the memo has been updated to explain the schedule that was developed initially by CalEEMod and then confirmed as the best estimate based on review by the Project Team. Demolition Assumptions - the memo has been updated to document that these are based on estimated measurements using Google Earth of building and asphalt areas. Diesel to electric for some construction equipment – while electric cranes and some of the portable equipment are planned, these are considered mitigation. Trenching Assumptions – See "Schedule Assumptions" above.
3	Construction travel distance. Response: The CalEEMod default travel lengths were used to estimate criteria air pollutant emissions. A travel length of one mile was used to represent vehicle emissions in the health risk assessment for activity within 1,000 feet of the project site. This is a localized assessment, where emissions from travel well away from the project site and sensitive receptors would not influence the outcome of the health risk assessment. Truck haul routes are assumed to travel away from sensitive receptors along U.S. 101 or north of Shoreline Boulevard.
4 & 5	Location of Sensitive Receptors. Response: The memo has been updated to describe the nearest sensitive receptors, including the sensitive receptor along Linda Vista Avenue. The distance from the single-family on Linda Vista Avenue to the project site has been corrected to 200 feet. The distance from the project site to other sensitive receptors has been corrected to 700 feet.
6	Remove Operational portion of Attachment 2. Response: The operational portion of the CalEEMod output has been removed.
7	Provide AERMOD files. Response:

	AERMOD files provided in zip files. <u>Simultaneous Construction (2 Files)</u> *1001_N_Shoreline_Cont_1-5_Unmit_Simultaneous* *1001_N_Shoreline_Cont_1-5_Mit_Simultaneous* <u>Sequence Construction (8 Files)</u> *1001_N_Shoreline_Cont_1-5_Unmit_B_20_Sequence* *1001_N_Shoreline_Cont_1-5_Unmit_B_21_Sequence* *1001_N_Shoreline_Cont_1-5_Unmit_A_22_Sequence* *1001_N_Shoreline_Cont_1-5_Unmit_A_23_Sequence* *1001_N_Shoreline_Cont_1-5_Mit_B_20_Sequence* *1001_N_Shoreline_Cont_1-5_Mit_B_21_Sequence* *1001_N_Shoreline_Cont_1-5_Mit_A_22_Sequence* *1001_N_Shoreline_Cont_1-5_Mit_A_23_Sequence*
8.	Construction scenario "Sequenced" would have Block B complete and operational before Block A construction begins. HRA scenario that includes new residences in Block B should be provided. Response: According to the Project Team, if Block B is completed before Block A is completed, the amount of remaining construction would be minor and associated with interior improvements and landscaping. This short portion of the construction is not anticipated to result in significant impacts to new occupants. It should be noted that mitigation requirements will apply to construction activities at Block A, reducing construction emissions substantially.
9.	Provide the potential haul truck/vendor truck routes. Potential routes should be modeled in AERMOD as line sources within the 1000-foot project radius and incorporated into the HRA. Routes that may be closer to sensitive receptors than the main construction area(s) should be modeled as such. Response: Haul truck/vendor truck routes are not known but assumed that most would be away from sensitive receptors. It is likely that trucks would travel along U.S. 101 or north on Shoreline Boulevard. Therefore, emissions were computed for a 1-mile travel length and assigned to the project site. Note that these truck emissions make up only 12-percent of the total emissions.
10.	Provide clarification on why the third trimester group was excluded. Additionally, the Air District recommends that the cancer risk be evaluated assuming that the average daily dose for short-term exposure lasts a minimum of three years for projects lasting three years or less. Response: Third-trimester exposure parameters were included in the cancer risk evaluation. Per the BAAQMD *Recommended Methods for Screening and Modeling Local Risk Hazards (May 2012)*, the averaging time used in models should reflect the time a receptor is exposed. The receptors would be exposed to construction from 2020-2021 or from 2020-2023. Therefore, it would be appropriate for the construction analysis to reflect either one or three years of exposure. These recommendations comply with the BAAQMD CEQA Guidelines.

memorandum

date	March 27, 2019
to	Clarissa Burke, City of Mountain View John Schwarz, JHS Consulting
from	Jill Feyk-Miney, ESA Elizabeth Kanner, ESA
subject	1001 N. Shoreline Air Quality Construction Inputs

On March 12, 2019, an Air Quality Analysis Technical Memorandum was submitted on behalf of Sares Regis for review by the City of Mountain View in the context of the Residences @ Shoreline Gateway Project. Illingworth & Rodkin prepared the report, which is dated March 7, 2019. For your ease in reference, an electronic copy of the report accompanies this memorandum.

At your request, ESA has completed its review of the memorandum. Toward finding it to be suitable for reliance as one of multiple sources of data informing the analysis of potential environmental impacts of the Residences @ Shoreline Gateway Project, we request the following clarifications or that additional data be provided:

1. On page 1 of the memo it is stated that "the phased construction would occur from the years 2002-2023." Please confirm and revise the memo to read 2020-2023.

2. The memo lists only 3 project construction assumptions on page 1, please confirm that following should also be included as construction assumptions, and provide sources and/or other justification for these assumptions in the memo:

    - Cut/fill volumes,
    - Schedule assumptions – the only overlapping activity is trenching and grading,
    - Demolition assumption - estimated tons based on measured area with 3" thickness and 2400lbs/yd3,
    - Diesel to electric for some construction equipment - specify which pieces and why for the unmitigated scenario, and
    - Trenching equipment assumptions.

3. Page 3 of the memo states "construction travel distance of one mile was applied to all construction travel in CalEEMod to represent local traffic emissions." Please provide justification for this change. Are there construction waste and haul providers located within 1 mile of the project site? The same question applies on page 4 of the memo for the health risk assessment assumptions.

4. Page 3 of the memo states that a possible sensitive receptor is located approximately 350 feet southeast of the project site. The City has confirmed that there is one single family home (nonconforming use currently) on Linda Vista about 200 feet away from the project site. Please revise to include this sensitive receptor on Figure 1 and remove the potential sensitive receptor discussion.

5. Also on page 3, please revise the residential subdivision distance to 700 feet south of the project site.

6. Attachment 2 – this is a construction run only, please remove operational information from the output. Explain why the strip mall land use is associated with retail, and not user defined retail, as the traffic analysis conservatively modeled it using the ITE's Trip Generation Manual, 10th Edition rates for Land Use Code 936 "Coffee/Donut Shop without Drive-Through Window."

7. Attachment 4 provides some of the HRA inputs but does not have any of the air modeling files (AERMOD files). The emission rates were averaged over 11 hours a day and 365 days per year; can it be verified that the appropriate variable emission scenario was utilized? Please provide AERMOD input/output files for verification.

8. Construction scenario "Phased" would have Block B complete and operational before Block A construction begins. There should be a Block A construction HRA completed with the new residential Block B sensitive receptors included.

9. Attachment 4 discusses two area sources for construction emissions which is assumed to contain the haul truck/vendor truck emissions calculated with a one-mile distance (referenced in question 3) in CalEEMod. Please provided the potential haul truck/vendor truck routes. Potential routes should be modeled in AERMOD as line sources within the 1000-foot project radius and incorporated into the HRA. Routes that may be closer to sensitive receptors than the main construction area(s) should be modeled as such.

10. Attachment 4, the HRA for construction scenario "Simultaneous", please provide clarification on why the third trimester group was excluded. Additionally, the Air District recommends that the cancer risk be evaluated assuming that the average daily dose for short-term exposure lasts a minimum of three years for projects lasting three years or less.

If there are questions about this memo, or you would like to discuss what is being requested, please do not hesitate to contact Jill Feyk-Miney, who can facilitate a call among the interested parties. Jill can be reached via e-mail (jfeyk-miney@esassoc.com) or by phone (510.463.6737).

	Other Equipment?									

Equipment listed in this sheet is to provide an example of inputs

It is assumed that water trucks would be used during grading

Add or subtract phases and equipment, as appropriate

Modify horepower or load factor, as appropriate

Typical Equipment Type & Load Factors

OFFROAD Equipment Type	HP	Load Factor
Aerial Lifts	62	0.31
Air Compressors	78	0.48
Bore/Drill Rigs	205	0.5
Cement and Mortar Mixers	9	0.56
Concrete/Industrial Saws	81	0.73
Cranes	231	0.29
Crawler Tractors	208	0.43
Crushing/Proc. Equipment	85	0.78
Dumpers/Tenders	16	0.38
Excavators	158	0.38
Forklifts	89	0.2
Generator Sets	84	0.74
Graders	187	0.41
Off-Highway Tractors	122	0.44
Off-Highway Trucks	400	0.38
Other Construction Equipment	171	0.42
Other General Industrial Equipment	150	0.34
Other Material Handling Equipment	167	0.4
Pavers	130	0.42
Paving Equipment	132	0.36
Plate Compactors	8	0.43
Pressure Washers	13	0.2
Pumps	84	0.74
Rollers	80	0.38
Rough Terrain Forklifts	100	0.4
Rubber Tired Dozers	247	0.4
Rubber Tired Loaders	199	0.36
Scrapers	361	0.48
Signal Boards	6	0.82
Skid Steer Loaders	64	0.37
Surfacing Equipment	253	0.3
Sweepers/Scrubbers	64	0.46
Tractors/Loaders/Backhoes	97	0.37
Trenchers	80	0.5
Welders	46	0.45

Project Name: 1001 N. Shoreline Block A

Bldg A 2.2 acres — CalEEMod = 7.71

Block A 203 Dwelling Units — 273500.0 s.f. apartments

Block A 3000 s.f. retail

Block A 100300 s.f. parking garage — 244

Construction Hours am to pm

Complete ALL Portions in Yellow

CalEEMod Modeling Output

1001 N Shoreline Block A (Criteria)

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	244.00	Space	2.20	99,629.00	0
Apartments Mid Rise	203.00	Dwelling Unit	5.34	273,500.00	581
Strip Mall	3.00	1000sqft	0.07	3,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2023
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - PG&E Rate

Land Use - Using building sizes provided and CalEEMod default acreages

Construction Phase - Added trenching phase

Off-road Equipment - add aerial lifts

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - added trenching equipment

Trips and VMT - added trenching worker trips

Demolition - estimated tons based on measured area ~5k sy with 3" thickness and 2400lbs/yd3 rounded up

Grading - material import

Construction Off-road Equipment Mitigation - Electric cranes and stationary equipment

1001 N Shoreline Block B and Office Parking (Criteria)

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	51.95	1000sqft	1.19	51,951.00	0
Unenclosed Parking with Elevator	130.82	1000sqft	3.00	100,300.00	0
Condo/Townhouse High Rise	100.00	Dwelling Unit	1.56	152,421.00	286

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2022
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - PG&E Rate

Land Use - Building sizes provided and CalEEMod default acreages

Construction Phase - Added trenching phase

Off-road Equipment - added trenching equipment

Trips and VMT - added trenching worker trips

Demolition - estimated tons based on measured area with 3" thickness and 2400lbs/yd3

Grading - material import

Construction Off-road Equipment Mitigation - Electric cranes and stationary equipment

Off-road Equipment - add aerial lifts

1001 N Shoreline Block B and Office Parking (TAC)

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	51.95	1000sqft	1.19	51,951.00	0
Unenclosed Parking with Elevator	130.82	1000sqft	3.00	100,300.00	0
Condo/Townhouse High Rise	100.00	Dwelling Unit	1.56	152,421.00	286

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2022
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - PG&E Rate

Land Use - Building sizes provided and CalEEMod default acreages

Construction Phase - Added trenching phase

Off-road Equipment - add aerial lifts

Off-road Equipment - added trenching equipment

Trips and VMT - added trenching worker trips, TAC Trip length 1 mile

Demolition - estimated tons based on measured area with 3" thickness and 2400lbs/yd3

Grading - material import

Construction Off-road Equipment Mitigation - Electric cranes and stationary equipment, BMPS, Tier 3 DPF 3

3.1 Mitigation Measures Construction

Use Alternative Fuel for Construction Equipment

Use Cleaner Engines for Construction Equipment

Use DPF for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2020

Unmitigated Construction On-Site

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	244.00	Space	2.20	99,629.00	0
Apartments Mid Rise	203.00	Dwelling Unit	5.34	273,500.00	581
Strip Mall	3.00	1000sqft	0.07	3,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2023
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - PG&E Rate

Land Use - Using building sizes provided and CalEEMod default acreages

Construction Phase - Added trenching phase

Off-road Equipment - add aerial lifts

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - added trenching equipment

Trips and VMT - added trenching worker trips

Demolition - estimated tons based on measured area ~5k sy with 3" thickness and 2400lbs/yd3 rounded up

Grading - material import

Construction Off-road Equipment Mitigation - Electric cranes and stationary equipment, Tier 3, DPF 3

3.1 Mitigation Measures Construction

Use Alternative Fuel for Construction Equipment

Use Cleaner Engines for Construction Equipment

Use DPF for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2022

Unmitigated Construction On-Site

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	244.00	Space	2.20	99,629.00	0
Apartments Mid Rise	203.00	Dwelling Unit	5.34	273,500.00	581
Strip Mall	3.00	1000sqft	0.07	3,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2022
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - PG&E Rate

Land Use - Using building sizes provided and CalEEMod default acreages

Construction Phase - Added trenching phase

Off-road Equipment - add aerial lifts

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - added trenching equipment

Trips and VMT - added trenching worker trips

Demolition - estimated tons based on measured area ~5k sy with 3" thickness and 2400lbs/yd3 rounded up

Grading - material import

Construction Off-road Equipment Mitigation - Electric cranes and stationary equipment, Tier 3, DPF 3

3.1 Mitigation Measures Construction

Use Alternative Fuel for Construction Equipment

Use Cleaner Engines for Construction Equipment

Use DPF for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2020

Unmitigated Construction On-Site

Attachment 3: Health Impact Evaluation Methodology

A health risk assessment (HRA) for exposure to Toxic Air Contaminates (TACs) requires the application of a risk characterization model to the results from the air dispersion model to estimate potential health risk at each sensitive receptor location. The State of California Office of Environmental Health Hazard Assessment (OEHHA) and California Air Resources Board (CARB) develop recommended methods for conducting health risk assessments. The most recent OEHHA risk assessment guidelines were published in February of 2015.[3] These guidelines incorporate substantial changes designed to provide for enhanced protection of children, as required by State law, compared to previous published risk assessment guidelines. CARB has provided additional guidance on implementing OEHHA's recommended methods.[4] This HRA used the 2015 OEHHA risk assessment guidelines and CARB guidance. The BAAQMD has adopted recommended procedures for applying the newest OEHHA guidelines as part of Regulation 2, Rule 5: New Source Review of Toxic Air Contaminants.[5] Exposure parameters from the OEHHA guidelines and the recent BAAQMD HRA Guidelines were used in this evaluation.

Cancer Risk

Potential increased cancer risk from inhalation of TACs are calculated based on the TAC concentration over the period of exposure, inhalation dose, the TAC cancer potency factor, and an age sensitivity factor to reflect the greater sensitivity of infants and children to cancer causing TACs. The inhalation dose depends on a person's breathing rate, exposure time and frequency and duration of exposure. These parameters vary depending on the age, or age range, of the persons being exposed and whether the exposure is considered to occur at a residential location or other sensitive receptor location.

The current OEHHA guidance recommends that cancer risk be calculated by age groups to account for different breathing rates and sensitivity to TACs. Specifically, they recommend evaluating risks for the third trimester of pregnancy to age zero, ages zero to less than two (infant exposure), ages two to less than 16 (child exposure), and ages 16 to 70 (adult exposure). Age sensitivity factors (ASFs) associated with the different types of exposure are an ASF of 10 for the third trimester and infant exposures, an ASF of 3 for a child exposure, and an ASF of 1 for an adult exposure. Also associated with each exposure type are different breathing rates, expressed as liters per kilogram of body weight per day (L/kg-day). As recommended by the BAAQMD for residential exposures, 95th percentile breathing rates are used for the third trimester and infant exposures, and 80th percentile breathing rates for child and adult exposures. For children at schools and daycare facilities, BAAQMD recommends using the 95th percentile breathing rates. Additionally, CARB and the BAAQMD recommend the use of a residential exposure duration of 30 years for sources with long-term emissions (e.g., roadways). For workers, assumed to be adults,

3 OEHHA, 2015. *Air Toxics Hot Spots Program Risk Assessment Guidelines, The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*. Office of Environmental Health Hazard Assessment. February.
4 CARB, 2015. *Risk Management Guidance for Stationary Sources of Air Toxics*. July 23.
5 BAAQMD, 2016. *BAAQMD Air Toxics NSR Program Health Risk Assessment (HRA) Guidelines*. December 2016.

a 25-year exposure period is recommended by the BAAQMD.

Under previous OEHHA and BAAQMD HRA guidance, residential receptors are assumed to be at their home 24 hours a day, or 100 percent of the time. In the 2015 Risk Assessment Guidance, OEHHA includes adjustments to exposure duration to account for the fraction of time at home (FAH), which can be less than 100 percent of the time, based on updated population and activity statistics. The FAH factors are age-specific and are: 0.85 for third trimester of pregnancy to less than 2 years old, 0.72 for ages 2 to less than 16 years, and 0.73 for ages 16 to 70 years. Use of the FAH factors is allowed by the BAAQMD if there are no schools in the project vicinity that would have a cancer risk of one in a million or greater assuming 100 percent exposure (FAH = 1.0).

Functionally, cancer risk is calculated using the following parameters and formulas:

Cancer Risk (per million) = $CPF \times Inhalation\ Dose \times ASF \times ED/AT \times FAH \times 10^6$

Where:

CPF = Cancer potency factor $(mg/kg\text{-}day)^{-1}$
ASF = Age sensitivity factor for specified age group
ED = Exposure duration (years)
AT = Averaging time for lifetime cancer risk (years)
FAH = Fraction of time spent at home (unitless)

Inhalation Dose = $C_{air} \times DBR \times A \times (EF/365) \times 10^{-6}$

Where:

C_{air} = concentration in air $(\mu g/m^3)$
DBR = daily breathing rate (L/kg body weight-day)
A = Inhalation absorption factor
EF = Exposure frequency (days/year)
10^{-6} = Conversion factor

The health risk parameters used in this evaluation are summarized as follows:

Parameter	*Exposure Type* →	Infant		Child		Adult
	Age Range →	3rd Trimester	0<2	2 < 9	2 < 16	16 - 30
DPM Cancer Potency Factor $(mg/kg\text{-}day)^{-1}$		1.10E+00	1.10E+00	1.10E+00	1.10E+00	1.10E+00
Daily Breathing Rate (L/kg-day) 80th Percentile Rate		273	758	631	572	261
Daily Breathing Rate (L/kg-day) 95th Percentile Rate		361	1,090	861	745	335
Inhalation Absorption Factor		1	1	1	1	1
Averaging Time (years)		70	70	70	70	70
Exposure Duration (years)		0.25	2	14	14	14
Exposure Frequency (days/year)		350	350	350	350	350
Age Sensitivity Factor		10	10	3	3	1
Fraction of Time at Home		0.85-1.0	0.85-1.0	0.72-1.0	0.72-1.0	0.73

Non-Cancer Hazards

Potential non-cancer health hazards from TAC exposure are expressed in terms of a hazard index (HI), which is the ratio of the TAC concentration to a reference exposure level (REL). OEHHA has defined acceptable concentration levels for contaminants that pose non-cancer health hazards. TAC concentrations below the REL are not expected to cause adverse health impacts, even for sensitive individuals. The total HI is calculated as the sum of the HIs for each TAC evaluated and the total HI is compared to the BAAQMD significance thresholds to determine whether a significant non-cancer health impact from a project would occur.

Typically, for residential projects located near roadways with substantial TAC emissions, the primary TAC of concern with non-cancer health effects is diesel particulate matter (DPM). For DPM, the chronic inhalation REL is 5 micrograms per cubic meter ($\mu g/m^3$).

Annual $PM_{2.5}$ Concentrations

While not a TAC, fine particulate matter ($PM_{2.5}$) has been identified by the BAAQMD as a pollutant with potential non-cancer health effects that should be included when evaluating potential community health impacts under the California Environmental Quality Act (CEQA). The thresholds of significance for $PM_{2.5}$ (project level and cumulative) are in terms of an increase in the annual average concentration. When considering $PM_{2.5}$ impacts, the contribution from all sources of $PM_{2.5}$ emissions should be included. For projects with potential impacts from nearby local roadways, the $PM_{2.5}$ impacts should include those from vehicle exhaust emissions, $PM_{2.5}$ generated from vehicle tire and brake wear, and fugitive emissions from re-suspended dust on the roads.

Supplemental Air Quality and Greenhouse Gas Emissions Information

Residences @ Shoreline Gateway - Operation 2021

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	203.00	Dwelling Unit	2.00	275,867.00	453
Condo/Townhouse High Rise	100.00	Dwelling Unit	1.00	152,421.00	222
Enclosed Parking with Elevator	244.00	Space	0.50	99,629.00	0
Enclosed Parking with Elevator	128.00	Space	0.50	51,951.00	0
Unenclosed Parking with Elevator	359.00	Space	0.55	130,820.00	0
Parking Lot	52.00	Space	1.22	53,324.00	0
Strip Mall	3.00	1000sqft	0.07	3,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2021
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Per PG&E emissions factors for 2020

Land Use - 5.84 development area lot acerage, bldg sq ft per plans, population based on 2.4 pph and 7.5% vacancy

Construction Phase - Operation only

Off-road Equipment - Operation only

Grading - Operation only

Trips and VMT - Operation only

Vehicle Trips - Trip rates adjusted per Hexagon TIA

Woodstoves - No woodstoves. 1 outdoor gas fireplace assumed for Block B amenities.

Energy Use -

Water And Wastewater - Residential bldg water use estimated per Utility Impact Study, sewer treated at Palo Alto RWC Plant

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Per PG&E emissions factors for 2020

Land Use - 5.84 development area lot acerage, bldg sq ft per plans, population based on 2.4 pph and 7.5% vacancy

Construction Phase - Operation only

Off-road Equipment - Operation only

Trips and VMT - Operation only

Grading - Operation only

Vehicle Trips - Trip rates adjusted per Hexagon TIA

Woodstoves - No woodstoves. 1 outdoor gas fireplace assumed for Block B amenities.

Energy Use -

Water And Wastewater - Residential bldg water use estimated per Utility Impact Study, sewer treated at Palo Alto RWC Plant

Off-road Equipment - Operation Only

Off-road Equipment - Operation only

Off-road Equipment - Operation only

How to Use the Distance Adjustment Multiplier Tool for Gasoline Dispensing Facilities (GDF)

This distance multiplier tool refines the screening values for cancer risk and chronic hazard index found in the District's Stationary Source Screening Analysis Tool to represent adjusted risk and hazard impacts that can be expected with farther distances from the source of emissions (GDF's).

1. Obtain the GDF cancer risk and/or chronic hazard index from the District's Stationary Source Screening Analysis tool for facilities where the Plant No. is preceded with a 'G'. If the distance to the nearest receptor is less than 20 meters, the distance adjustment multiplier table cannot be used and an air dispersion modeling analysis using site-specific information is needed to refine the cancer risk and/or chronic hazard index estimate.

2. Determine the shortest distance from the GDF to the nearest receptor.

3. In the table below, enter the cancer risk and/or chronic hazard index found in step 1 for the GDF in the row which aligns with the shortest distance from each GDF to the nearest receptor (found in step 2). If the shortest distance to the receptor falls between two distance values, select the multiplier corresponding to the smaller distance. For distances beyond 300 meters, use the multiplier 0.015. The resulting product is the adjusted cancer risk in a million or the adjusted chronic hazard index for the GDF.

Note: These distance adjustment multipliers may be used only for the screening level health risk values indicated in the District's Stationary Source Screening Analysis tool for gasoline dispensing facilities. This distance multiplier tool may not be used to adjust values from an HRA if an HRA for the facility was conducted.

Residences @ Shoreline Gateway - Operation - Santa Clara County, Annual

Residences @ Shoreline Gateway - Reduced Density Alt Operation

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	196.00	Space	0.50	79,703.00	0
Enclosed Parking with Elevator	103.00	Space	0.50	41,561.00	0
Parking Lot	52.00	Space	1.22	53,324.00	0
Unenclosed Parking with Elevator	359.00	Space	0.55	130,820.00	0
Apartments Mid Rise	162.00	Dwelling Unit	2.00	220,694.00	326
Condo/Townhouse High Rise	80.00	Dwelling Unit	1.00	121,937.00	212
Strip Mall	3.00	1000sqft	0.07	3,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2021
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Per PG&E emissions factors for 2020

Land Use - 5.84 development area lot acerage, bldg sq ft per plans, population based on 2.4 pph and 7.5% vacancy

Construction Phase - Operation only

Off-road Equipment - Operation only

Trips and VMT - Operation only

Grading - Operation only

Vehicle Trips - Trip rates adjusted per Hexagon TIA

Woodstoves - No woodstoves. 1 outdoor gas fireplace assumed for Block B amenities.

Energy Use -

Water And Wastewater - Residential bldg water use adjusted per Utility Impact Study, sewer treated at Palo Alto RWC Plant

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2021
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Per PG&E emissions factors for 2020

Land Use - 5.84 development area lot acerage, bldg sq ft per plans, population based on 2.4 pph and 7.5% vacancy

Construction Phase - Operation only

Off-road Equipment - Operation only

Trips and VMT - Operation only

Grading - Operation only

Vehicle Trips - Trip rates adjusted per Hexagon TIA

Woodstoves - No woodstoves. 1 outdoor gas fireplace assumed for Block B amenities.

Energy Use -

Water And Wastewater - Residential bldg water use estimated per Utility Impact Study, sewer treated at Palo Alto RWC Plant

1.0 Assignment & Introduction

I have been retained by LH Shoreline LP / Barry D. Green, to provide an update to my earlier arborist reports which covered Phase 1 of this project at 1001 North Shoreline Boulevard in Mountain View.

This update will provide current tree inventory information for all new trees added during Phase 1 as well as refreshed data for the existing trees. Heritage trees are marked specifically and their suitability for either saving or transplanting is addressed, taking into consideration practicality factors including tree health, location, and cost-effectiveness. By request, particular attention was paid to calculating average crown size of trees #156, 158-59, 161-62, 188-89, and 191-93.

Project plans and drawings were made available via cloud-based storage by the team. I have reviewed tree-related issues and I have selected the "Tree Disposition Plan" (Sheet L3.1, dated 07/17/2018) with tree numbers from my initial survey added by the Landscape Architect to serve as a "Tree Map" to accompany this updated report. The annotated map is attached in section 3 of this report.

2.0 Discussion with Leading Summary

2.1 Summary

At time of survey, three hundred forty-one (341) trees were associated with Phase 2 of this project, either as site trees, adjacent off-site street trees in close proximity, or overhanging neighbors' trees. The "Tree Disposition Plan" (Sheet L3.1) includes a legend explaining general tree categories with further information.

This report follows the "Landscape Guidelines" published by the City of Mountain View.

Of the 341 trees, 32 have protected status as "Heritage" size by industry-standard measurement. Of those 32 Heritage trees, nine (9) are currently slated to be retained in place, fifteen (15) can be categorized as likely successes for recycling/transplant/relocation, and eight (8) are not recommended for relocation due to structural challenges, species problems, and/or overall tree health, and therefore are recommended for removal.

See summary charts below:

Tree Frequency Charts & Tables

Non-HT Summary	
HT size =	32
Non-HT =	309
	341

2.2 Discussion

General Dialogue:

The Phase 1 building's construction footprint is complete; adjacent trees to the southwest will not have new construction impacts. However, with Phase 2 construction set to begin, the remainder of the site will undergo such substantial changes that most of the interior trees are unlikely to survive.

Despite their current status, most of these trees planted during Phase 1 have not become wholly dependent upon their current locations – many of those could be expected to be successful transplants/relocates on another similarly-sized development. Further financial analysis regarding the feasibility of transplanting versus removal and replanting would be required by a combination of the contractor, owner, and landscape firm.

As referred to in the summary, there are challenges with moving most Heritage size trees. Expense is a major factor, as the initial cost of transplanting a mature tree can run $50,000 to $100,000, in addition to the ongoing costs of 10+ years of post-op care to ensure their successful acclimation to their new locations.

However, certain species are not likely to survive despite ideal relocation circumstances. Eucalyptus trees are not good relocation candidates due to species-specifics like propensity to internal decay, poor structure, and a predisposition to the phenomenon of "sudden summer branch drop." Fern pines also have serious structural challenges which limit their transplant candidacy. Despite the fact that some healthy specimens associated with this project have had

positive growing conditions at the edge of the site, they are not likely to be more successful transplants than others of their species.

General: Heritage Trees:
Mountain View Municipal Code defines "Heritage Tree" to be any tree 48-inch circumference (15.3-inch diameter) at 54-inches above grade, plus any oak, redwood, or cedar 12-inch circumference (3.8-inch diameter)].

Heritage Trees at Shoreline Gateway Project: 1001 N Shoreline Blvd, Mtn Vw.

Heritage Trees: Listing to remain

T #	Name, Common	Diam.	Circ.	Overall	Comments
8	London Plane	34.8"	109.3"	77% Good	Three in Shoreline Boulevard frontage at new Phase I building; no new impacts.
115	Sweetgum	21.3"	66.9"	50% Fair	
120	Sweetgum	15.6"	49"	55% Fair	
161	Pine, Fern	19.6"	61.6"	70% Good	Had been in parking lot against freeway fence; now in new building footpirnt. Despite structure and logistics challenges for these trees on this site, we have a high likelihood of success if contractor follow TPMs (Tree Protection Measures).
162	Pine, Fern	15.6"	49.0"	55% Fair	
189	Pine, Fern	15.3"	48.1"	51% Fair	
191	Pine, Fern	17.7"	55.6"	44% Poor

410	Oak, So. Live	3.9"	12.2"	60% Fair	East of new phase 1 building … & in new work footprint.

Required Mitigations:

Three types of mitigation are required by local Planning Departments:

A. Heritage Tree removal in Mountain View calls for two-to-one replanting of a new tree of at least a 24-inch-box-size.

B. Tree replanting/replacement of smaller size removals does not call out a specific size and/or quantity but the Planners are looking for a general landscape plan that follows the City's published Landscape Guidelines.

C. Mitigation in the form of Tree Protection Measures (TPMs) are required to promote preservation of trees being retained in order to reduce the likelihood of tree decline/death due to construction stresses. My Tree Preservation Guidelines at the end of this report addresses that. Some of the most important measures include:

C.1 Exclusionary protective fence to keep traffic and other construction impacts off of as much of the trees' root zones as possible.

C.2 Spread a layer of "chipper chips" wood chip mulch to buffer the root zones – from the trunk to at least the branch tips, if possible. Mulch buffer depth depends of the traffic load and the Project Arborist can advise.

C.3 Provide supplemental water to the root zones – a deep soaking every two to four weeks during the heat of the year.

C.4 Make no cuts or fills or other grade changes or hardscape installations within trees' driplines unless reviewed and signed-off by the Project Arborist.

C.5 All trenching/excavation in the root zones must be with the advice and/or monitoring of the Project Arborist. Generally, keep all gas, water, phone, drainage, irrigation, and foundation work out beyond trees' branch tips.

C.6 No parking, re-fueling, stockpiling spoils, equipment storage, or driving over unprotected root zones.

C.7 Qualified Tree Care Contractors must be retained for any tree work. Your Project Arborist can advise as to qualifications of firms as well as write the appropriate pruning specifications.

2.3 Impacts to Heritage Trees and Proposed Mitigation

The Project Landscape Architect has provided two sheets particularly relevant at this stage. Besides being part of the submittal set, I have included thumbnails of them in the next section: Sheet L3.1 ("Tree Disposition Plan") and Sheet L4.1 ("Conceptual Planting Plan – Site"). L4.1 contains a Mitigation Tree Table … copied here:

MITIGATION TREES TABLE						
Heritage Trees			Required Mitigation Tree	Proposed Mitigation Trees		
Total	Remain	Remove	2:1 Ratio, 24" Box Min.	Mitigation Trees 36" Box	Other 36" Box	Other 24" Box
32	9	23	46	50	54	78

Overall, the project proposes to remove 243 trees and would provide 180 new trees on the site and residential podiums. Of this total, 50 new trees would be new heritage trees.
There are 23 heritage trees on the site; of this total, the project would retain in place 9 trees and remove 23 trees.

As required by the City of Mountain View, the project would provide mitigation for loss of heritage trees at a 2:1 ratio (46 trees at a minimum size of 24" box). The project proposes to provide 50 new heritage trees in total, of which 78 would be 24" box and 54 would be 36" box. This would provide adequate mitigation to address project impacts under the City of Mountain View's ordinance

3.3 Legend - Tree Inventory Headers

Observations were made and data gathered during my on-site inspections (2012 - July 2018). Further conclusions and protection measures were refined from office research, seminar information, and past experience based on those observations and data.	
Unless otherwise defined as a limited inventory, all site trees larger than a minimum diameter (usually ≥4-inch) were numbered and inspected.	
The gathered data was entered into a Microsoft® Excel database. The data is encapsulated into the accompanying "Tree Inventory Data" section. The categories are typically self-descriptive with only the following notes.	
Tree Number:	Since 2012, I sequentially assigned tree numbers from 1 to 547, but now there are gaps as trees have been removed … and for control monitoring. A 1" by 3" aluminum tag can be stapled to each tree at about eye level …
	… with a leading two-digit prefix designating the year when the data was last taken … e.g., "16" for 2016, "17" for 2017, to identify each as linked with my inventories, thus differentiating it from any other numbering system.
Names:	We employ the initial common names from McMinn, if listed, otherwise from Sunset. Scientific/botanical names are included to minimize confusion. As applicable, we used McMinn's key and/or Sunset's descriptions.
DSH:	Diameter at Standard Height: Trunk diameter measured at the standard height defined by the jurisdiction in which the trunk grows. The industry standard is 54 inches above ground level, taken with a standard surveyor's diameter tape, recorded in inches.
	Multi-trunked tree's diameters are measured below the lowest branch swelling and/or individual stems at 54 inches, or an average, depending on which level's measurement is deemed to produce the best representative figure.
Trunk Circum-ference:	City of Mountain View Planning Department has preferred that I convert the standard diameter measurements to circumference. This column shows my arithmetic results of multiplying the diameters by pi (3.141592).
Av. Crown Radius:	The averaged radii's measurement is shown in feet.
Ht (Height):	Estimated distance foliage crown extends above grade, recorded in feet.

Vigor:	Rating for tree's growth and vitality as a blend of elements like leaf or bud size and color, twig growth (elongation), accumulation of deadwood, cavities, woundwood development, trunk expansion (growth "cracks"), etc.
Form:	Structure rating for tree's architecture as a composite of factors like branch attachment, lean and balance, effects of prior breakage, crossing-tangled-twisted limbs, codominant trunks and/or branches, decay and cavities, anchorage (roots), etc.
Overall Condition:	Percentage rating assessing the tree's overall vigor, recent growth, insects/diseases, and structural defects. Relative text rating included in the same cell as: Excellent, Good, Fair, Poor, Very Poor.
	This corresponds to the "Condition Percentage" factor in tree valuations per the Council of Tree and Landscape Appraisers (CTLA) system used by the International Society of Arboriculture. (CTLA, 1992.)
	It combines foliage, branches, limbs, trunk, and root ratings into a composite condition score. This rating is used in the calculation of these trees' appraised value required by some cities, like Palo Alto.
Overall Aptitude:	Considers the species' tolerance to construction impacts and the tree's condition (vigor & structure), longevity/age, adaptability, and aesthetics.
	This rating takes into account any announced intentions of changes in area/lot use. Degrees: High, Moderate, Low, Very Low.
	• High: Tree in great condition and any existing defects or stresses are minor or can be easily mitigated.
	• Moderate: Notable vigor and/or stability problems but which can be moderated with treatment &/or increased tree protection zone.
	• Low: Significant problems, including shorter life expectancy. Difficult to retain but potential with much larger tree protection zone.
	• Very Low: Substantial existing problems, defects, stresses. Unlikely to survive impact of any project.
Age / Longevity:	Rates tree's relative age: Young (Long) / Semi-Mature / Mature / Over-Mature (Short).
Heritage Tree:	In this cell, "HT" is a "Heritage Tree", "N's" is a "Neighbor's overhanging tree", "ST" is a municipal street tree.
	Municipal code defines "Heritage Tree" … any tree 48-inch circumference (15.3-inch diameter) at 54-inches above grade or an oak, redwood, or cedar 12-inch circumference (3.8-inch diameter)].
K / X / Relo?	K=Plan to Keep; X=Plan to Remove; Relo?= Possible Relocation/Transplant candidate.
Comments:	Notes; most obvious defects, insects, diseases or unique characteristics.
	… a heritage-size tree is any tree 48-inch circumference (15.3-inch diameter) at 54-inches above grade or an oak, redwood, or cedar 12-inch circumference (3.8-inch diameter)].

4.0 Tree Preservation Guidelines: Pre-Construction Maintenance notes

4.1 Supplemental watering should be provided. A rule of thumb for construction site stressed trees is 10-20 gallons per trunk diameter inch per month, particularly critical during hot weather. This is modified by the Project Arborist on site with root zone inspections and monitoring as water demands will obviously be lower during cool, damp weather. Inspection should find soil between 3" and 18" below grade moist enough for roots to thrive.

4.2 Many of these small trees were given a good start at the nursery-level, but now would benefit from early structural pruning to select good form if they are to be retained or relocated.

Otherwise, no pruning is absolutely needed at this time, unless project design cannot avoid clearance issues. Nevertheless, deadwood removal and endweight reduction is commonly performed to improve existing site trees. And, usually project trees benefit from "Crown Cleaning" for deadwood removal and "Crown Thinning" to lighten branch endweights) at sometime before the close of the project. Then the owner has a benchmark against which to compare future status of the trees. All work must conform to published ANSI A-300 Standards

4.3 Approaching project commencement, when the foundations, driveways, and other hardscape features (including trenches) have been staked/located, then some pruning may likely be needed. Raising/clearance can be minimized for space to work. Root pruning along the lines within 15-feet on either side of mature trees' trunks can sever roots cleanly, reducing shock to these trees' systems..

4.4 All project tree work performed before, during, or after construction is to be done by WCISA Certified Tree Workers under the supervision of an ISA Certified Arborist (or equivalents, if they possess sufficient skill for approval by Project Arborist). This includes all pruning, removals (including stump removals) within driplines of trees to be preserved, root pruning, and repair or remedial measures.

5.0 Tree Preservation Guidelines: Tree Protection Measures

5.1 Fencing and other root zone protection

Must be in place before demolition or any other project site work.

Though generally expected to extend to the dripline, here the TPF can be installed as close to that as possible.

One 24- to 36-inch opening or gate should be left for inspection access to each area.

Fence material is to be 6-foot-high chain link fence supported by 8-foot long, 2-inch diameter galvanized fence posts driven 2-feet into the soil.

Where no plant material root zone buffer is growing (e.g. ivy, shrubs, turf), a wood chip mulch is to be spread evenly to a 4-inch depth from the dripline to 6-inches from the base of the trunk. Taper to existing ground level at the base of the trunk with a slope of about 2:1.

Additional root zone areas requiring protection can be buffered as Project Arborist requires, e.g., if project scope changes. Commonly acceptable buffer materials often include wood chips, crushed rock, plywood, steel trench plates, and/or a combination of such materials. Consult Project Arborist for depth specifications (which vary depending on use of area and/or specific traffic).

Root zone areas to be protected may be modified by the Municipal Arborist or Project Arborist as plans develop.

5.2 Prohibited Acts & Admonishments/Requirements

5.2.1 No parking or vehicle traffic over any root zones, unless using buffers approved by Project Arborist.

5.2.2 Monitor root zone moisture and maintain as per above.

5.2.3 Have a certified arborist repair any damage promptly.

5.2.4 No pouring or storage of fuel, oil, chemicals, or hazardous materials under these foliage canopies.

5.2.5 No grade changes (cuts, fills, etc.) under these foliage crowns without prior Project Arborist approval. For instance, hand excavation and thinner base prep may be required in the redwood root zone areas.

5.2.6 Any additional pruning required must be performed under arborist supervision – including root pruning – clean, smooth cuts with no breaking, scraping, shattering, or tearing of wood tissue and/or bark.

5.2.7 No storage of construction materials under any foliage canopy without prior Project Arborist approval.

5.2.8 No trenching within the critical root zone area. Consult Project Arborist before any trenching or root cutting beneath any tree's foliage canopy. It is best to route all trenching out from under trees' driplines. Often trenches in root zones must be hand excavated to leave roots intact.

5.2.9 No clean out of trucks, tools, or other equipment over the critical root zone. Keep this debris outside of any existing or future root zone.

5.2.10 No attachment of signs or other construction apparatus to these trees.

5.3 Construction-time Maintenance

5.3.1 Monitor root zone moisture and maintain as per above (§4.1).

5.3.2 Maintain/repair tree protection fences and/or root zone mulch/buffer material.

5.3.3 Have a certified arborist promptly repair any damage to trees.

5.3.4 Routine survival monitoring for the first five years is required by the City and typically includes at least quarterly project arborist inspections with summary report and recommendations faxed to Planning and to Owner.

Remedial measures/actions are also required to be stated in this tree preservation plan: for trees that consistently fail customary performance standards, the mitigation measures will be hand-crafted at that time to meet the specific degree of failure – may include efforts as minor as adjusting irrigation … and/or pruning … or increased frequency of inspections … or (ultimately, if necessary) replacement with additional tree(s) planted of acceptable size and species.

6.0 Certification

I certify that all the statements of fact in this report are true, complete, and correct to the best of my knowledge, ability, and belief, and are made in good faith.

Thank you for the opportunity to apply my knowledge and expertise working with your trees. Good luck with the construction project and tree care decisions ahead of you. If I can answer any further questions for you, the City staff, tree care contractors, or anyone with concerns about your trees, please call or e-mail to inform me.

Respectfully submitted,

Raymond J. Morneau
ISA Certified Arborist #WE-0132A
ISA Tree Risk Assessment Qualified

Special-Status Species Table

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
SPECIES LISTED OR PROPOSED FOR LISTING			
Plants			
San Mateo thorn-mint *Acanthomintha duttonii*	FE/CE/1B.1	Chaparral and valley grassland. Affinity for serpentine soil. 30 – 260m. Blooms April – June	**Absent.** Suitable habitat not found onsite.
Tiburon paintbrush *Castilleja affinis* ssp. *neglecta*	FE/CT/1B.2	Open serpentine grassland slopes. 60 -400m. Blooms April – June	**Absent.** Suitable habitat not found onsite.
Coyote ceanothus *Ceanothus ferrisae*	FE/--/1B.1	Chaparral and valley grassland. Affinity to serpentine soil. 140 – 530m. Blooms January – March	**Absent.** Suitable habitat not found onsite. Serpentine soils are not present.
Robust spineflower *Chorizanthe robusta* var. *robusta*	FE/--/1B.1	Cismontane woodland, coastal dunes, coastal scrub, sandy terraces and bluffs or in loose sand. 3-120 m. Blooms April – September	**Absent.** Suitable habitat not found onsite.
Crystal Springs fountain thistle *Cirsium fontinale* var. *fontinale*	FE/CE/1B.1	Chaparral, valley grassland, wetland riparian communities and in seeps. Occurs almost always under natural conditions in wetlands. Affinity to serpentine soil. Blooms March – October	**Absent.** Suitable habitat not found onsite. Serpentine soils are not present.
Santa Clara Valley dudleya *Dudleya setchellii*	FE/--/1B.1	Valley grassland and foothill woodlands. Affinity to serpentine soil. 50 – 890m. Blooms April – October	**Absent.** Suitable habitat not found onsite. Serpentine soils are not present.
San Mateo woolly sunflower *Eriophyllum latilobum*	FE/CE/1B.1	Foothill woodland. Affinity to serpentine soil. 20 – 630m. Blooms March – June	**Absent.** Suitable habitat not found onsite. Serpentine soils are not present.
Marin western flax *Hesperolinon congestum*	FT/CT/1B.1	Chaparral and grassland, usually on serpentine barrens. 4 – 420m. Blooms April – July	**Absent.** Suitable habitat not found onsite. Serpentine soils are not present.
Santa Cruz tarplant *Holocarpha macradenia*	FT/CE/1B.1	Coastal prairie, valley and foothill grassland. Found on light, sandy soil or sandy clay; often with non-natives. 10-260 m. Blooms June - October	**Absent.** Suitable habitat not found onsite.
Contra Costa goldfields *Lasthenia conjugens*	FE/--/1B.1	Valley and foothill grassland, vernal pools, cismontane woodland, swales, low depressions, in open grassy areas. 1-445 m. Blooms March – July	**Absent.** Suitable habitat not found onsite.
Dudley's lousewort *Pedicularis dudleyi*	--/Rare/1B.2	Chaparral, valley grassland, and redwood forest in coastal areas. 8 – 360m. Blooms April – June	**Absent.** Suitable habitat not found onsite.
Metcalf Canyon jewelflower *Streptanthus albidus* ssp. *albidus*	FE/--/1B.1	Valley grassland. Affinity to serpentine soil. Blooms April – July	**Absent.** Suitable habitat not found onsite. Serpentine soils are not present.
California seablite *Suaeda californica*	FE/--/1B.1	Margins of coastal salt marshes and swamps. 0-5 m. Blooms July – October	**Absent.** Suitable habitat not found onsite.
Two-fork clover *Trifolium amoenum*	FE/--/1B.1	Valley grassland and wetland-riparian areas. Usually occurs in wetlands, but occasionally not wetlands. 8 – 160m. Blooms April – June	**Absent.** Suitable habitat not found onsite.
Invertebrates			
Vernal pool fairy shrimp *Branchinecta lynchi*	FT/--	Ephemeral freshwater vernal pools.	**Absent.** Suitable habitat not found onsite.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
SPECIES LISTED OR PROPOSED FOR LISTING (cont.)			
Invertebrates (cont.)			
San Bruno elfin butteryfly *Callophrys mossii bayensis*	FE/--	Coastal scrub and bunchgrass grassland habitats, with larval foodplant, broadleaf stonecrop (*Sedum spathulifolium*). Adults nectar on bladder parsnip (*Lomatium utriculatum*), common yarrow (*Achillea millefolium*), coast rock cress (*Arabis blepharophylla*), San Francisco wallflower (*Erysimum franciscanum*), California buttercup (*Ranunculus californicus*), and wood strawberry (*Fragaria vesca*).	**Absent.** Suitable habitat for this species is not found in the project study area.
Monarch butterfly *Danaus plexippus pop. 1*	--/*	Eucalyptus groves (wintering sites).	**Low.** Individuals may be present on a transient basis. Protected wintering sites do not occur on the project site.
Bay checkerspot butterfly *Euphydryas editha bayensis*	FT/--	Restricted to native grasslands on outcrops of serpentine soil in the vicinity of San Francisco Bay. *Plantago erecta* is the primary host plant; *Castilleja exserta,* and *C. densiflora* are the secondary host plants.	**Absent.** Suitable habitat and host plants not found onsite.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE/--	This species inhabits vernal pools and swales in the City of Fremont and Sacramento Valley containing clear to highly turbid water.	**Absent.** Suitable habitat not found onsite.
Amphibians and Reptiles			
California tiger salamander *Ambystoma californiense*	FT/CT	Needs underground refuges, especially ground squirrel burrows and vernal pools or other seasonal water sources for breeding	**Absent.** Suitable foraging, dispersal, and refugia habitat not is present within the project site.
Foothill yellow-legged frog *Rana boylii*	--/CT, CSC	Partly-shaded, shallow streams and riffles with a rocky substrate in a variety of habitats. Needs at least some cobble-sized substrate for egg-laying. Needs at least 15 weeks to attain metamorphosis.	**Absent.** Suitable habitat is not found within the project site.
California red-legged frog *Rana draytonii*	FT/CSC	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to aestivation habitat.	**Absent.** Suitable foraging, dispersal, and refugia habitat is not present within the project site.
San Francisco garter snake *Thamnophis- sirtalis tetrataenia*	FE/CE, CFP	Densely vegetated ponds near open hillsides with abundant small mammal burrows.	**Absent.** Suitable habitat not found onsite.
Birds			
Tricolored blackbird *Agelaius tricolor*	--/CE, CSC	Nests in cattail, tule, blackberry thickets, or thistle patches adjacent to freshwater sources.	**Absent.** Suitable habitat not found onsite.
Golden eagle *Aquila chrysaetos*	BCC/FP	Rolling foothills, mountain areas, sage-juniper flats, and desert. Cliff-walled canyons and large trees in open areas provide nesting habitat.	**Absent.** Suitable habitat not found onsite.
Marbled murrelet *Brachyramphus marmoratus*	FT/CE	Coniferous forests near the coast during breeding season. Builds nests in large horizontal branches high in the tree.	**Absent.** Suitable habitat not found onsite.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
SPECIES LISTED OR PROPOSED FOR LISTING (cont.)			
Birds (cont.)			
Swainson's hawk *Buteo swainsoni*	--/CE	Breeds in open areas with scattered trees at low to middle elevations in valleys, dry meadows, and foothills. Requires grasslands for foraging.	**Absent.** Suitable habitat not found onsite.
Western snowy plover *Charadrius alexandrinus nivosus*	FT/CSC	Sandy beaches, salt pond levees and shores of large alkali lakes. Needs sandy, gravelly or friable soils for nesting.	**Absent.** Suitable habitat not found onsite.
Western yellow-billed cuckoo *Coccyzus americanus occidentalis*	FT/CE	Woodlands with low, scrubby, vegetation, overgrown orchards, abandoned farmland, and dense thickets along streams and marshes.	**Low (no potential to nest).** Uncommon to the region but may occur on a transient basis during migration.
American peregrine falcon *Falco peregrinus anatum*	DL/DL&FP	Woodlands, coastal habitats, riparian areas, coastal and inland waters, human made structures that may be used as nest or temporary perch sites.	**Low.** May forage within the project area. Suitable nesting habitat is not present within the project area.
California black rail *Laterallus jamaicensis coturniculus*	BCC/CT, FP	Inhabits freshwater marshes, wet meadows and shallow margins of saltwater marshes bordering larger bays. Needs water depths of about 1 inch that does not fluctuate during the year and dense vegetation for nesting habitat.	**Absent.** Suitable habitat not found onsite.
California brown pelican *Pelicanus occidentalis californicus*	DL/DL, FP	Nests on protected islets near freshwater lakes and marine waters.	**Absent.** Suitable habitat not found onsite.
California Ridgway's (clapper) rail *Rallus obsoletus*	FE/CE, FP	Salt-water and brackish marshes traversed by tidal sloughs in the vicinity of San Francisco Bay. Associated with abundant growths of pickleweed, but feeds away from cover on invertebrates from mud-bottomed sloughs.	**Absent.** Suitable habitat not found onsite.
California least tern *Sternula antillarum browni*	FE/CE, FP	Nests along the coast from San Francisco Bay south to northern Baja California. Colonial breeder on bare or sparsely vegetated, flat substrates: sand beaches, alkali flats, landfills, or paved areas.	**Absent.** Suitable habitat not found onsite.
Least Bell's vireo *Vireo bellii pusillus*	FE/CE	Coastal scrub, riparian areas, and woodland habitats. Gleans insects from foliage. Recent breeding range in California is documented from Gilroy to San Diego County.[1]	**Absent.** Suitable habitat not found onsite. Outside of documented breeding range.
Mammals			
Salt-marsh harvest mouse *Reithrodontomys raviventris*	FE/CE, FP	Only in the saline emergent wetlands of San Francisco Bay and its tributaries. Found primarily in pickleweed (*Salicornia* spp.). Does not burrow, builds loosely organized nests. Requires higher areas for flood escape.	**Absent.** Suitable habitat not found onsite.

[1] Kus, B. 2002. Least Bell's Vireo (*Vireo bellii pusillus*). *In* The Riparian Bird Conservation Plan: a strategy for reversing the decline of riparian-associated birds in California. California Partners in Flight. Available online at: http://www.prbo.org/calpif/pdfs/riparian_v-2.pdf Accessed on May 3, 2019.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
OTHER SPECIAL-STATUS SPECIES			
Plants			
Franciscan onion *Allium peninsulare var. franciscanum*	--/--/1B.2	Clay, volcanic, or serpentine substrate in valley and foothill grassland and cismontane woodland. 20 – 740m. Blooms May – June	**Absent.** Suitable habitat not found onsite. No serpentine soils present.
Bent-flowered fiddleneck *Amsinckia lunaris*	--/--/1B.2	Coastal bluff scrub, cismontane woodland, and valley and foothill grassland. 30 – 680m.	**Absent.** Suitable habitat is not found in the project study area.
King's Mountain manzanita *Arctostaphylos regismontana*	--/--/1B.2	Chaparral, mixed evergreen forest, and north coastal coniferous forest. 200 – 660m. Blooms January – April	**Absent.** Suitable habitat not found onsite.
Alkali milk-vetch *Astragalus tener* var. *tener*	--/--/1B.2	Alkali playa and flats, valley, annual, and foothill grassland, vernal pools, low ground, and flooded lands. 1-170 m. Blooms March – June	**Absent.** Suitable habitat not found onsite.
California androsace *Androsace elongata* ssp. *acuta*	--/--/4.2	Chaparral, cismontane woodland, coastal sage scrub, valley and foothill grassland. 150-1200m. Blooms March – June	**Absent.** Suitable habitat not found onsite.
Brittlescale *Atriplex depressa*	--/--/1B.2	Chenopod scrub, meadows, playas, valley and foothill grassland, vernal pools. Usually in alkali scalds or alkali clay in meadows or annual grassland; rarely associated with riparian, marshes, or vernal pools. 1-320m. Blooms April – October	**Absent.** Suitable habitat not found onsite. No saline or alkaline soils present.
Lesser saltscale *Atriplex minuscula*	--/--/1B.1	Chenopod scrub, playas, valley and foothill grassland. In alkali sink and grassland in sandy, alkaline soils. 15-200m. Blooms May – October	**Absent.** Suitable habitat not found onsite. No saline or alkaline soils are present.
Brewer's calandrina *Calandrinia breweri*	--/--/4.2	Chaparral, northern coastal scrub, coastal sage scrub and in disturbed areas. 50 – 1150m. Blooms March – June	**Absent.** Suitable habitat not found onsite.
Chaparral harebell *Campanula exigua*	--/--/1B.2	Chaparral and rocky sites; usually found on serpentine soils in chaparral. 275-1250m. Blooms May – June	**Absent.** Suitable habitat not found onsite.
Congdon's tarplant *Centromadia parryi* ssp. *congdonii*	--/--/1B.1	Valley and foothill grassland. Alkaline soils, sometimes described as heavy white clay. 1-230m. Blooms May – October	**Absent.** Suitable habitat not found onsite. No alkaline soils are present.
Point Reyes bird's-beak *Chloropyron maritimus* ssp. *palustris*	--/--/1B.2	Coastal salt marsh usually with *Salicornia*, *Distichlis*, *Jaumea*, *Spartina*, etc. 0-15m. Blooms June – October	**Absent.** Suitable habitat not found onsite.
Lost thistle *Cirsium praeteriens*	--/--/1A	Presumed extinct; habitat unknown. Blooms June – July	**Absent.** Species presumed extinct.
Santa Clara red ribbons *Clarkia concinna* ssp. *automixa*	--/--/4.3	Cismontane woodland, chaparral. Found on slopes and near drainages. 90-1500m. Blooms May – June	**Absent.** Suitable habitat not found onsite.
Lewis' clarkia *Clarkia lewisii*	--/--/4.3	Chaparral, foothill woodland, and northern coastal scrub. 5 – 112m. Blooms May – July	**Absent.** Suitable habitat not found onsite.
Round-headed Chinese-houses *Collinsia corymbosa*	--/--/1B.2	Coastal dunes and coastal prairie. Blooms April – June	**Absent.** Suitable habitat not found onsite.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
OTHER SPECIAL-STATUS SPECIES (cont.)			
Plants (cont.)			
San Francisco collinsia *Collinsia multicolor*	--/--/1B.2	On humus-covered soil derived from mudstone in closed-cone coniferous forest and coastal scrub. 10 – 430m. Blooms March – May	**Absent.** Suitable habitat not found onsite.
Clustered lady's-slipper *Cypripedium fasciculatum*	--/--/4.2	Yellow pine forest, redwood forest, Douglas-fir forest, and wetland-riparian areas. Occurs in stream banks and seeps. 640 – 1890m. Blooms March – August	**Absent.** Suitable habitat not found onsite.
Weatern leatherwood *Dirca occidentalis*	--/--/1B.2	Chaparral, foothill woodland, mixed evergreen forest, closed-cone pine forest, north coastal coniferous forest, and wetland-riparian areas. Equally likely to occur in wetlands and non-wetlands. 12 – 560m. Blooms January – March	**Absent.** Suitable habitat not found onsite.
Ben Lombond buckwheat *Eriogonum nudum* var. *decurrens*	--/--/1B.1	Chaparral, foothill woodland, and yellow pine forest in coastal areas. Occurs almost always under natural conditions in non-wetlands. 80 – 220m. Blooms June – October	**Absent.** Suitable habitat not found onsite.
Hoover's button-celery *Eriogonum aristulatum* var. *hooveri*	--/--/1B.1	Found in alkaline depressions, vernal pools, roadside ditches and other wet places near the coast. 3-45m. Blooms in July	**Absent.** Suitable habitat not found onsite.
Jepson's coyote-thistle *Eryngium jepsonii*	--/--/1B.2	Valley and foothill grasslands, vernal pools, and wetlands. 6 – 110m.	**Absent.** No suitable habitat is present in the project study area.
San Joaquin spearscale Extriplex joaquinana	--/--/1B.2	Chenopod scrub, meadows and seeps, playas, valley and foothill grassland; seasonal wetlands or alkali sink scrub. 1 – 835m.	**Absent.** Suitable habitat is not found within the project study area.
Minute pocket moss *Fissidens pauperculus*	--/--/1B.2	North coast coniferous forest with damp coastal soils. 10 – 1024m.	**Absent.** Suitable habitat not found onsite.
Fragrant fritillary *Fritillaria liliacea*	--/--/1B.2	Coastal scrub, valley and foothill grassland, coastal prairie. Often on serpentine; usually on clay soils, in grassland. 3 - 410m. Blooms February –April	**Absent.** Suitable habitat not found onsite.
Loma Prieta hoita *Hoita strobilina*	--/--/1B.1	Mixed evergreen forest and chaparral. Affinity for serpentine soil. 90 – 1170m. Blooms May – July	**Absent.** Suitable habitat not found onsite.
Coast iris *Iris longipetala*	--/--/4.2	Coastal prairie, lower montane coniferous forest, meadows and seeps, mesic sites. 5 – 430m. Blooms March – May	**Absent.** Suitable habitat not found onsite.
Legenere *Legenere limosa*	--/--/1B.1	Vernal pools. Found in beds of vernal pools. 1-880m. Blooms April – June	**Absent.** Suitable habitat not found onsite.
Bristly leptosiphon *Leptosiphon acicularis*	--/--/4.2	Chaparral, cismontane woodland, coastal prairie, valley and foothill grassland. Grassy areas, woodland, chaparral. 55-1500m. Blooms April – July	**Absent.** Suitable habitat not found onsite.
Woolly headed lessingia *Lessingia hololeuca*	--/--/3	Valley grassland, yellow pine forest, northern coastal scrub. Occurs almost always under natural conditions in non-wetlands. Affinity for serpentine soil. 10 – 880m. Blooms June – October	**Absent.** Suitable habitat not found onsite.
arcuate bush-mallow *Malacothamnus arcuatus*	--/--/1B.2	Chaparral. Found in gravelly alluvium. 0 – 590m. Blooms April – September	**Absent.** Suitable habitat not found onsite.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
OTHER SPECIAL-STATUS SPECIES (cont.)			
Plants (cont.)			
Davidson's bush-mallow *Malacothamnus davidsonii*	--/--/1B.2	Chaparral, northern coastal scrub, coastal sage scrub, and riparian areas. Usually occurs in non-wetlands but occasionally found in wetlands. 140 – 1850m. Blooms June – January	**Absent.** Suitable habitat not found onsite.
Hall's bush-mallow *Malacothamnus hallii*	--/--/1B.2	Chaparral. Some populations found on serpentine soils. 10-550m. Blooms May – September	**Absent.** Suitable habitat not found onsite.
Mt. Diablo cottonweed *Micropus amphibolus*	--/--/3.2	Valley grassland, foothill woodland, and mixed evergreen forest. Affinity to serpentine soil. 30 – 550m. Blooms March – May	**Absent.** Suitable habitat not found onsite.
San Antonio Hills monardella *Monardella antonina* ssp. *antonina*	--/--/3	Cismontane woodland, chaparral. Rocky slopes and ephemeral drainages. 320-1000m. Blooms June – August	**Absent.** Suitable habitat not found onsite.
Woodland woollythreads *Monolopia gracilens*	--/--/1B.2	Mixed evergreen forest, redwood forest, and chaparral. Affinity to serpentine soil. 60 – 1360m. Blooms March – July	**Absent.** Suitable habitat not found onsite.
Pincushion navarretia *Navarretia myersii* ssp. *myersii*	--/--/1B.1	Found in vernal pools; often in acidic soils. 20 – 330m. Blooms April – May	**Absent.** Suitable habitat not found onsite. No vernal pools present.
Patterson's navarretia *Navarretia paradoxiclara*	--/--/1B.3	Meadows and seeps. 150-430m. Blooms May - July	**Absent.** Suitable habitat not found onsite.
Prostrate vernal pool navarretia *Navarretia prostrata*	--/--/1B.1	Coastal scrub, valley and foothill grassland, vernal pools. Found in alkaline soils in grassland, or in vernal pools. Mesic, alkaline sites. 15-1210m. Blooms April – July	**Absent.** Suitable habitat not found onsite. No alkaline soils present.
White-flowered rein orchid *Piperia candida*	--/--/1B.2	Yellow pine forest, northern coastal coniferous forest. Affinity to serpentine soil. 40 – 730m. Blooms May – September	**Absent.** Suitable habitat not found onsite. No serpentine soils present.
Choris's popcorn-flower *Plagiobothrys chorisianus* var. *chorisianus*	--/--/1B.2	Mesic sites in chaparral, coastal scrub, and coastal prairie. 4 – 300m. Blooms March – June	**Absent.** Suitable habitat not found onsite.
Hairless popcorn-flower *Plagiobothrys glaber*	--/--/1A	Meadows and seeps, marshes and swamps. Coastal salt marshes and alkaline meadows. 15-180m. Blooms March - May	**Absent.** Suitable habitat not found onsite.
Lobb's aquatic buttercup *Ranunculus lobbii*	--/--/4.2	Valley grassland, foothill woodland, redwood forest, freshwater wetlands, wetland-riparian areas and vernal pools. Occurs almost always under natural conditions in wetlands. 12 – 810m. Blooms February – May	**Absent.** Suitable habitat not found onsite.
Chaparral ragwort *Senecio aphanactis*	--/--/2B.2	Foothill woodland, northern coastal scrub, and coastal sage scrub. 15 – 1190m. Blooms January – April	**Absent.** Suitable habitat not found onsite.
Long-styled sand-spurrey *Spergularia macrotheca var. longistyla*	--/--/1B.2	Alkaline meadows, seeps, marshes and swamps. 6 – 170m.	**Absent.** Suitable habitat not found onsite.
Most beautiful jewel-flower *Streptanthus albidus* ssp. *peramoenus*	--/--/1B.2	Chaparral, valley and foothill grassland, cismontane woodland, serpentine outcrops, and on ridges and slopes. 120-730 m. Blooms April – September	**Absent.** Suitable habitat not found onsite.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
OTHER SPECIAL-STATUS SPECIES (cont.)			
Plants (cont.)			
Slender-leaved pondweed *Stuckenia filiformis*	--/--/2B.2	Marshes and swamps, in shallow, clear water of lakes and drainage channels. 15-2,310m. Blooms May – July	**Absent.** Suitable habitat not found onsite.
Santa Cruz clover *Trifolium buckwestiorum*	--/--/1B.1	Broadleafed upland forest, cismontane woodland coastal prairie, mixed evergreen forest, 105-610m. Blooms April – October	**Absent.** Suitable habitat not found onsite.
Saline clover *Trifolium hydrophilum*	--/--/1B.2	Marshes and swamps, valley and foothill grassland, vernal pools. Mesic, alkaline sites. 0-300m. Blooms April – June	**Absent.** Suitable habitat not found onsite.
Caper-fruited tropidocarpum *Tropidocarpum capparideum*	--/--/1B.1	Valley and foothill grassland. Alkaline clay. 1-455m. Blooms March – April	**Absent.** Suitable habitat not found onsite.
Methuselah's beard lichen *Usnea longissima*	--/--/4.2	Found on tree branches in old growth hardwood or coniferous forests, broadleaf upland forests, and north coast coniferous forests. 50 – 1460m.	**Absent.** Suitable habitat not found onsite.
Invertebrates			
Mimic tryonia (=California brackishwater snail) *Tryonia imitator*	--/--/*	Inhabits coastal lagoons, estuaries and salt marshes, from Sonoma County south to San Diego County. Found only in permanently submerged areas in a variety of sediment types; able to withstand a wide range of salinities.	**Absent.** Suitable habitat not found onsite.
Unsilvered fritillary *Speyeria adiaste adiaste*	--/--/*	Openings in redwood and coniferous forests, oak woodlands, and chapparal. Preferred caterpillar hosts is the goosefoot yellow violet (*Viola purprea*).[2]	**Absent.** Suitable habitat not found onsite.
Amphibians and Reptiles			
Santa Cruz black salamander Aneides flavipunctatus niger	--/CSC	Damp environments on land; mixed deciduous and coniferous woodlands and coastal grasslands; found under rocks, talus, and damp woody debris.	**Absent.** Suitable habitat not found onsite.
Northern California legless lizard Anniella pulchra	--/CSC	Coastal dunes, sandy coastal grassland, foothill grassland.	**Absent.** Suitable habitat not found onsite.
California giant salamander *Dicamptodon ensatus*	--/CSC	Wet coastal forests in or near cold, permanent and semi-permanent streams and seepages.	**Absent.** Suitable habitat not found onsite.
Western pond turtle *Emys marmorata*	--/CSC	Aquatic turtle of ponds, marshes, rivers, streams and irrigation ditches with aquatic vegetation. Needs basking sites and suitable (sandy banks or grassy open fields) upland habitat for egg-laying.	**Absent.** Suitable habitat not found onsite.
Red-bellied newt *Taricha rivularis*	--/CSC	Stream or river habitat; found in coastal woodlands and redwood forest along the coast. Larvae go into vegetation and under stones during the day.	**Absent.** Suitable habitat not found onsite.

[2] Butterflies and Moths of North America, 2019. Available online at: http://www.butterfliesandmoths.org/ Accessed on May 3, 2019.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
OTHER SPECIAL-STATUS SPECIES (cont.)			
Birds			
Cooper's hawk *Accipiter cooperi*	--/CDFW WL&3503.5	Woodland, chiefly of open, interrupted or marginal type. Nest sites are mainly in riparian growths of deciduous trees but also relatively common in urban areas.	**Low - Moderate.** Suitable nesting and foraging habitat is present within the project area.
Sharp-shinned hawk *Accipiter striatus*	--/CDFW WL&3503.5	Woodland, hunt on forest edges. Breeds in deep forests and favors conifer trees to build nests in.	**Low.** Suitable habitat is not present within the project site. Tends to avoid human developments.
Great blue heron *Ardea herodias*	--/* (rookery site)	Colonial nester in tall trees, cliff sides, and sequestered spots on marshes. Rookery sites in close proximity to foraging areas: marshes, lake margins, tide-flats, rivers and streams, wet meadows.	**Low.** Suitable habitat is not present within the project site.
Short-eared owl *Asio flammeus*	--/CSC	Open country including grasslands, marshlands, and coastal scrub. Nests on the ground sheltered by tall grass or bushes.	**Low.** Suitable habitat is not present within the project site.
Long-eared owl *Asio otus*	--/CSC	Nests in conifer, oak, riparian, pinyon-juniper, and desert woodlands that are either open or are adjacent to grasslands, meadows, or shrub lands for foraging. Key habitat components are dense cover for nesting and roosting, suitable nest platforms, and open foraging areas.	**Low.** Suitable habitat is not present within the project site.
Burrowing owl *Athene cunicularia*	--/CSC	Open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel.	**Low.** Suitable habitat is not present within the project site. Documented within 1.5 miles east of the project site at the NASA-Ames Research Center.
Great horned owl *Bubo virginianus*	--/3503.5	Often uses abandoned nests of corvids or squirrels; nests in large oaks, conifers, eucalyptus.	**Low.** May nest in mature trees within the project area though absence of foraging habitat nearby could dissuade use of the project site trees for nesting.
Red-tailed hawk *Buteo jamaicensis*	--/3503.5	Usually nests in large trees, often in woodland or riparian deciduous habitats. Also known to nest in urban parks and neighborhoods. Forages over open grasslands and scrublands.	**Moderate.** Species is ubiquitous throughout the region. May nest in mature trees within the project site.
Red-shouldered hawk *Buteo lineatus*	--/3503.5	Usually nests in large trees, often in woodland or riparian deciduous habitats. Forages over open grasslands and woodlands.	**Moderate.** May nest in mature trees within the project site.
Northern harrier *Circus cyaneus*	--/CSC	Coastal salt and fresh-water marsh. Nests and forages in grasslands. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.	**Low.** Suitable habitat is not present within the project site.
Yellow rail *Coturnicops noveboracensis*	--/CSC	Freshwater marshes, brackish marshes, coastal salt marshes with moist soil or low standing water, and grassy meadows; prefers densely vegetated marshes.	**Low.** Suitable habitat is not present within the project site. Documented historical occurrence of this species southwest of the project site, but has not been documented in over 100 years.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
OTHER SPECIAL-STATUS SPECIES (cont.)			
Birds (cont.)			
Snowy egret *Egretta thula*	--/* (rookery site)	Colonial nester, with nest sites situated in protected beds of dense tules. Rookery sites situated close to foraging areas: marshes, tidal-flats, streams, wet meadows, and borders of lakes.	**Low.** Suitable habitat is not present within the project site.
White-tailed kite *Elanus leucurus*	--/FP	Rolling foothills and valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	**Low.** Species may occur over the project site on a transient basis. Suitable nesting and foraging habitat is not present.
American kestrel *Falco sparverius*	--/3503.5	Frequents generally open grasslands, pastures, and fields; primarily a cavity nester in large trees near open areas.	**Low.** Suitable nesting habitat is present within the project site though preferred foraging habitat is not located nearby.
Saltmarsh common yellowthroat *Geothlypis trichas sinuosa*	BCC/CSC	Resident of the San Francisco Bay region, in fresh and salt water marshes. Requires thick, continuous cover down to water surface for foraging; tall grasses, tule patches, willows for nesting.	**Absent.** No suitable habitat found onsite.
Alameda song sparrow *Melospiza melodia pusillula*	BCC/CSC	Resident of salt marshes bordering central eastern San Francisco Bay. Inhabits pickleweed marshes; nests low in *Grindelia* (high enough to escape high tides) and in pickleweed.	**Absent.** No suitable habitat found onsite.
Black-crowned night heron *Nycticorax nycticorax*	--/3503.5	Lowland and foothill areas. Nests in dense emergent wetlands and dense-foliaged trees.	**Low.** May roost in mature trees within the project site though no evidence of active roosts observed.
Double-crested cormorant *Phalacrocorax auritus*	--/WL, 3503.5	Rookery breeder in coastal areas and inland lakes in fresh, saline, and estuarine waters.	**Absent.** Suitable habitat is not present within the project site.
Black skimmer *Rynchops niger*	--/CSC	Open sandy beaches, gravel or shell bars with sparse vegetation, saltmarsh, or beach wrack.	**Absent (no potential to nest).** Suitable habitat is not found within the project study area. Regional occurrences are documented near the eastern shoreline of San Francisco Bay.
Mammals			
Pallid bat *Antrozous pallidus*	--/CSC/ WBWG: H	Deserts, grasslands, shrublands, woodlands and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	**Low-Moderate.** Habitat generally unsuitable for this species, although may migrate through the project site. Documented occurrence of this species southwest of the project site.
Townsend's big-eared bat *Corynorhinus townsendii*	--/CSC/ WBWG: H	Mesic sites. Roosts in caves and open, hanging from walls and ceilings. Very sensitive to human disturbance.	**Low-Moderate.** Habitat generally unsuitable for this species, although may migrate through the project site. Documented occurrence of this species southwest of the project site.

SPECIAL-STATUS SPECIES CONSIDERED IN EVALUATION OF RESIDENCES @ SHORELINE GATEWAY PROJECT STUDY AREA

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/Other	General Habitat	Potential for Species Occurrence Within Project Site
OTHER SPECIAL-STATUS SPECIES (cont.)			
Mammals (cont.)			
Hoary bat *Lasiurus cinereus*	--/*/WBWG: M	Prefers open habitats or habitat mosaics, with access to trees for cover and open areas or habitat edges for feeding. Roosts in dense foliage of medium to large trees. Feeds primarily on moths.	**Low-Moderate.** Suitable roost habitat is present within the project area. May roost in trees onsite, particularly during migration periods in spring and fall. Documented occurrence of this species southwest of the project site.
Yuma myotis *Myotis yumanensis*	--/*/WBWG: LM	Optimal habitats are open forests and woodlands with water sources to feed over. Roosts in buildings, trees, mines, caves, bridges, and rock crevices. Maternity colonies active May through July.	**Low-Moderate.** Suitable roost habitat is present within the project area. May roost in trees onsite.
San Francisco dusky-footed woodrat *Neotoma fuscipes annectens*	--/CSC	Prefers forest habitats with moderate canopy, year-round greenery, a brushy understory, and suitable nest building materials. Feeds mainly on woody plants, especially live oak, maple, coffeeberry, alder, and elderberry when available.	**Absent.** Dense vegetation is present throughout the project site but no nests observed.
Salt-marsh wandering shrew *Sorex vagrans halicoetes*	--/CSC	Salt marshes of the south arm of San Francisco Bay. Found at medium to high marsh 6-8 ft above sea level where abundant driftwood is scattered among pickleweed.	**Absent.** Suitable habitat not found onsite.
American badger *Taxidea taxus*	--/CSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils and open, uncultivated ground. Preys on burrowing rodents.	**Absent.** Suitable habitat not found onsite.

STATUS CODES

Federal (U.S. Fish and Wildlife Service [USFWS]):
FE = Listed as Endangered (in danger of extinction) by the federal government.
FT = Listed as Threatened (likely to become Endangered within the foreseeable future) by the federal government.
DL - Delisted

State (California Department of Fish and Wildlife [CDFW]):
CE = Listed as Endangered by the State of California.
CT = Listed as Threatened by the State of California.
CR = Listed as Rare by the State of California (plants only)
DL = Delisted
CSC = California Species of Special Concern.
FP = Fully Protected
WL = Watch List
3503.5 = Protection for species of Falconiformes (hawks) and Strigiformes (owls).
*Special animal—listed on CDFW's Special Animals List.

California Rare Plant Rank (CRPR):
Rank 1A=Plants presumed extinct in California.
Rank 1B=Plants rare, Threatened, or Endangered in California and elsewhere.
Rank 2= Plants rare, Threatened, or Endangered in California but more common elsewhere.
Rank 3= Plants about which we need more information – a review list
Rank 4= Plants of limited distribution – a watch list

An extension reflecting the level of threat to each species is appended to each rarity category as follows:
.1 – Seriously endangered in California.
.2 – Fairly endangered in California.
.3 – Not very endangered in California.

Western Bay Working Group (WBWG):
WBWG: H = High priority; Species that are imperiled or at a high risk of imperilment.
WBWG: M = Medium priority; Species that warrant a closer evaluation due to potential imperilment.
WBWG: LM = Low to medium priority species.

Subject: Residences @ Shoreline Gateway Project – Cultural Resources Survey and Inventory

Dear Ms. Burke:

This report documents the methods and results of a cultural resources survey and inventory completed by Environmental Science Associates (ESA) for the Residences @ Shoreline Gateway Project (Project), in the City of Mountain View, Santa Clara County, California (**Maps 1** and **2**). Calvano/CRP Mountain View, LLP and other private entities (collectively *Applicant*) propose the Project, which would demolish the existing surface parking lots along with portions of the landscaping and subsequently develop two residential buildings and a parking structure at two parcels (Assessor's Parcel Numbers [APNs] 153-15-032 and 153-15-033), referred to as 1001 North Shoreline Boulevard, Mountain View, California.

The Project is subject to review under the California Environmental Quality Act (CEQA), with the City of Mountain View (City) acting as lead reviewing agency for CEQA. The work performed for preparation of this report consisted of background and archival research, including a records search of the California Historical Resources Information System (CHRIS), and a cultural resources pedestrian survey of the Project Area. For the purposes of this document, *cultural resources* include: architectural resources, archaeological resources, and human remains. All maps referred to in this document are provided in **Attachment A**, and other figures are provided in **Attachment B**.

ESA Archaeologist Ben Curry, who meets the Secretary of the Interior's Professional Qualifications Standards (SOI PQS) for Archeology, is the primary author of this report. ESA Archaeologist Heidi Koenig, who meets the SOI PQS for Archaeology, conducted the pedestrian survey of the Project Area. ESA Archaeologist Robin Hoffman, who meets the SOI PQS for Archeology and History, acted as Principal Investigator for this study.

The term *indigenous*, rather than *prehistoric*, is used as a synonym for *Native American-related* (except when quoting), while *pre-contact* is used as a chronological adjective to refer to the period prior to Euroamerican arrival in the subject area. *Indigenous* and *pre-contact* are often, but not always, synonymous, since the former refers to a cultural affiliation and the latter chronological.

Project Description

The Project site encompasses 7.81 acres (APNs 153-15-032 and 153-15-033) in the Southeast ¼ of Section 16 and the Southwest ¼ of Section 15 of Township 6 South, Range 2 West (Mount Diablo Base Meridian), in the City of Mountain View, Santa Clara County (**Map 1**), as depicted on the *Mountain View, California* U.S.

Geological Survey 7.5-minute series topographic quadrangle map (**Map 2**) (USGS, 1981). The Project site is relatively flat, with elevations ranging from approximately 30 to 37 feet above mean sea level, at a southeast aspect. Project development activities, however, would only occur within approximately 5.84 acres of the Project site.

The Project would demolish the existing surface parking lots along with portions of the surrounding landscaping to develop two residential buildings and a parking structure, and the existing office building would remain. The residential development would consist of two separate buildings, "Block A" and "Block B". The Block A building would consist of six stories of residential units above a two-story concrete parking podium, and would extend up to eight stories, or 92 feet above existing grade. The Block B building would consist of five stories of residential units above a two-story concrete parking podium, and would extend up to seven stories, or 91 feet above existing grade. Block B would also include a six-level parking garage adjacent to the condominium building. The Project would also include: construction of private entrance driveways, removal of existing vegetation and replacement with new trees and other landscaping elements, and utility improvements and connections.

CEQA Area of Potential Effects

The definition of the CEQA Area of Potential Effects (C-APE) is modeled after the federal Area of Potential Effects, as defined in the Code of Federal Regulations Title 36 § 800.16(d), which is used for compliance with the National Historic Preservation Act. The C-APE is the geographic area or areas within which a project may directly or indirectly cause alterations in the character or use of historical resources (i.e., resources that meet the criteria for listing in the California Register of Historical Resources [California Register]), if any such resources are present. The C-APE is influenced by the scale and nature of an undertaking and may be delineated differently for direct physical effects and for indirect effects (such as changes in the historical setting or introduction of intrusive noise) that may result from the undertaking.

For the Project a single C-APE has been defined to account for impacts to archaeological, architectural, and tribal cultural resources (TCR[s]). The C-APE is comprised of all areas in the Project Area where the Project proposes ground-disturbing activities and encompasses the depths of excavation (i.e., vertical C-APE), including all construction areas and staging areas. The C-APE consists of all areas in which ground-disturbing construction activities related to the construction of Block A, Block B, and the parking garage adjacent to Block B would occur, including: demolition of the existing parking lot and associated landscaping features, grading, tree removal, general site preparation followed by construction of the buildings and associated structure, landscaping, and trenching for domestic water lines, fire water and wastewater lines, and other improvements as needed to tie Project infrastructure into the existing infrastructure. The Project depth of impact will be limited to grading, foundation pad construction, and trenching for utility installation. The Project site, which encompasses all parcels included in the Project, encompasses 7.81 acres, while the C-APE, consisting of the Project footprint and work area encompasses 5.84 acres. The C-APE extends vertically to 3 feet below ground surface for all Project components other than utility trenching, where the C-APE extends to 8 feet below ground surface.

Background Context

Indigenous Archaeology and Ethnohistory

Categorizing the indigenous pre-contact period into cultural stages allows researchers to describe a range of archaeological resources with similar cultural patterns and components during a given time frame, creating a regional chronology. Milliken et al. (2007) provide a temporal framework for the interpretation of the San Francisco Bay Area, by dividing the human history prior to European contact and colonization in California into three periods: *Early Period*, *Middle Period*, and *Late Period.* Economic patterns, stylistic aspects, and regional phases further subdivide cultural periods into shorter phases. This scheme uses economic and technological types, socio-politics, trade networks, population density, and variations of artifact types to differentiate between cultural periods.

The Early Period (Lower Archaic, 10,000-5500 years Before Present [BP]) in the San Francisco Bay Area is characterized by geographic mobility, millingslab and handstone technology for grinding acorns and seeds, and large wide-stemmed and leaf-shaped projectile points. The first cut shell beads, and the mortar and pestle, are first documented in burials during the Early Period (Middle Archaic, 5500-2500 BP), indicating the beginning of a shift to sedentism. During the Middle Period, which includes the Lower Middle Period (Initial Upper Archaic, 2500-1550 BP), and Upper Middle Period (Late Upper Archaic, 1550-950 BP), geographic mobility may have continued, although groups began to establish longer term base camps in localities from which a more diverse range of resources could be exploited. The first rich black middens are recorded from this period. The addition of milling tools, obsidian, and chert concave-base projectile points, as well as the occurrence of sites in a wider range of environments, suggest that the economic base was more diverse. By the Upper Middle Period, mobility was being replaced by the development of numerous small villages. Around 1550 BP, a dramatic cultural disruption occurred as evidenced by the sudden collapse of the *Olivella* saucer bead trade network. During the Initial Late Period (Lower Emergent, 950-450 BP), social complexity developed toward lifeways of large, central villages with resident political leaders and specialized activity sites. Artifacts associated with the period include the bow and arrow, small corner-notched projectile points, and a diversity of beads and ornaments.

Based on a compilation of ethnographic, historic, and archaeological data, Milliken (1995) describes a group known as the Ohlone, who once occupied the general vicinity of the C-APE. Levy (1978) describes the language group spoken by the Ohlone, known as Costanoan, which is a linguistic term used currently to reference a larger language family that consisted of at least eight spoken languages (as different as Spanish is from French). The languages of the Costanoan language family were spoken by numerous distinct sociopolitical groups of Ohlone peoples. Traditional anthropological literature portrayed the Ohlone peoples as having a static culture, but today it is better understood that many variations of culture and ideology existed within and between villages. California's Native Americans never saw themselves as members of larger cultural groups, as described by anthropologists. Instead, they saw themselves as members of specific villages, or small networks of villages, and related to others primarily by marriage or kinship ties, but with their particular village as the primary identifier of their origins. The Project would occur within the former territory of the *Puichon* people, an Ohlone village group who spoke the *Tamyen* dialect of the Costanoan language family (Levy, 1978; Milliken 1995:3, 36, 65; Milliken et al., 2009).

During and after European contact, Ohlone society was severely disrupted by missionization, disease, and displacement. Today, the Ohlone still have a strong presence in the San Francisco Bay Area, and are highly interested in their historic and pre-contact past.

Historical Context

In 1770, the Pedro Fages Party made the earliest documented European expedition into Santa Clara Valley, in which the C-APE is located. Seven years later, in 1777, Spanish missionaries established Mission Santa Clara de Asís (Mission Santa Clara) southwest of Puichon territory. Later in the same year, citizen-settlers established the pueblo of San José de Gaudalupe (San Jose). Over the next 33 years, at least 4,470 Ohlone from the Santa Clara Valley region were baptized at Mission Santa Clara, and settled in communities in and around the central mission quadrangle (Milliken 1995:66-67, 274; Milliken et al., 2009:140-141). The Ohlone population at Mission Santa Clara declined due to disease, poor living conditions, and harsh working conditions, but many Ohlone remained in the Santa Clara Valley after the mission was secularized. Following the independence of Mexico, the mission's property was divided into ranchos and distributed to private citizens, and some Ohlone. The C-APE was immediately east of the Mexican land grant known as Rancho Pastoria de las Borregas, a 9,066-acre land grant deeded to Francisco Estrada in 1842, but the C-APE was not part of a rancho.

Following the U.S. annexation of California, the C-APE became part of a 160-acre farm owned by Conrad Stierlin, a Swiss immigrant who arrived in Mountain View in 1852. By 1940, the majority of this portion of north Mountain View was still largely in agricultural use, primarily fruit trees, with limited rural residential development. The Bayshore Freeway, just to the north of the C-APE, was completed through Mountain View in 1937, and later widened to four lanes in the late 1950s to become Highway 101. Aerial photography and topographic maps from the 1940s and 1950s identify approximately ten, identically-shaped small residences fronting Stierlin Road (now Shoreline Boulevard), and surrounded by fruit trees on both sides of the road. These small buildings may have housed farm workers at one time. Between the late 1950s and the end of the 1980s all but two of the homes and agricultural fields near the C-APE were replaced by commercial and industrial uses as the area experienced rapid development during the post-World War II period.

Methods and Results

Records Search

On January 18, 2019, ESA Archaeologist Robin Hoffman conducted an in-person record search at the Northwest Information Center (NWIC) of the CHRIS, at Sonoma State University, Rohnert Park (File # 18-1361). The NWIC maintains the official CHRIS records of previous cultural resources studies and recorded cultural resources for the C-APE and vicinity. The purpose of the records search was to: (1) determine whether known cultural resources have previously been recorded in or within 0.5 mile of the C-APE; (2) assess the likelihood for unrecorded cultural resources to be present based on historical references and the distribution of nearby resources; and (3) develop a context for the identification and preliminary evaluation of cultural resources. The records search consisted of an examination of the following documents:

- **NWIC base maps:** *Mountain View, California* (USGS 7.5-minute topographic map)
- **Resource Inventories:** *National Register of Historic Places (National Register), California Inventory of Historical Resources (California Register). California Historical Landmarks, California Points of Historical Interest, Historic Properties Directory Listing*

Attachment B provides documentation of the records search, including relevant site records.

Previously Recorded Resources

The NWIC has record of two previously recorded cultural resources (P-43-003149, -003150) in the C-APE, and two cultural resources (P-43-003148, -003151) immediately adjacent to the C-APE. The four resources in and immediately adjacent to the C-APE are historic-era buildings, and were each evaluated as ineligible for the California Register by ESA architectural historian Brad Brewster (Koenig and Brewster, 2014). The NWIC also has record of 13 additional cultural resources within 0.5 mile of the C-APE, all of which are buildings, and none of which are in close proximity to the C-APE. The California Office of Historic Preservation's Historic Properties Directory for Santa Clara County does not list any buildings or structures in the C-APE or immediate vicinity. Similarly, the City of Mountain View's register of historic resources does not include any buildings in or near the C-APE. **Table 1** summarizes the previously recorded resources identified during the records search.

TABLE 1. PREVIOUSLY RECORDED CULTURAL RESOURCES IN OR WITHIN 0.5 MILE OF C-APE

Primary (P-43-)	Trinomial (CA-SCL-)	Type	Age/ Affiliation	Name/ Description	Recorder(s)	Recorded Distance from C-APE	Note
003149	[none]	Architectural	Historic	House at 1062 Linda Vista Avenue. Demolished post 2014	Brewster (2014)	Within	Demolished; Evaluated as Not eligible for California Register
003150	[none]	Architectural	Historic	House at 1062 Linda Vista Avenue. Demolished post 2014	Brewster (2014)	Within	Demolished; Evaluated as Not eligible for California Register

003124	[none]	Architectural	Historic	House at 950 San Leandro	Gallup (1987)	~1,700 ft SE	

Previous Cultural Resources Studies

The NWIC has record of 27 previous cultural resources studies conducted within 0.5 mile of the C-APE, five of which include portions of the current C-APE. One previous study (S-45758 [Koenig and Brewster, 2014]) was conducted for a previous project on the same parcels as the current Project. That study resulted in the original recordation of the four historic-era buildings (P-43-003148, -003149, -003150, -003151) previously recorded in the C-APE, and also evaluated the four buildings as not eligible for the California Register (Koenig and Brewster, 2014). The project for which the Koenig and Brewster (2014) report was produced resulted in the demolition of P-43-003148, -003149, -003150, and -003151. **Table 2** summarizes the previous cultural resources studies that have been conducted in or within 0.5 mile of the APE.

TABLE 2. PREVIOUS CULTURAL RESOURCES STUDIES IN OR WITHIN 0.5 MILE OF C-APE

Study	Title	Author (Date)	In C-APE
1137	Cultural Resources Along the Sacramento River from Keswick Dam to Sacramento	Johnson and Johnson (1974)	Yes
3134	An Archaeological Assessment within Reclamation District 1500 and the Tisdale Bypass, Sutter County, California Part of the Cultural Resources Inventory and Evaluation for U.S. Army Corps of Engineers, Sacramento District, PL 84-99 Levee Rehabilitation	Shapiro and Syda (1997)	Yes
8345	Archaeological Survey Report, 04-SCL-101, Portions of P.M. 38.3/52.5, Improvements to Route 101 Between Route 17 in San Jose and Embarcadero Road in Palo Alto, Santa Clara County, 04393-389131, 04393-396171	Melandry (1980)	Yes

Archaeological Sensitivity

The goal of this archaeological sensitivity analysis is to identify the relative potential of encountering previously unrecorded buried archaeological resources within the C-APE, with attention given to the relationship between the general potential for the presence of archaeological deposits and the potential significance of any buried cultural resources that might be encountered. The general potential for the presence of buried archaeological resources is determined by assessing the age of surficial and subsurface geology and soil units, the proximity of perennial freshwater sources, the density of nearby previously recorded archaeological resources, the regional context in which archaeological resources are often encountered, and the proximity of known ethnohistoric indigenous sites or historic-era resources that could have left archaeological traces. The potential significance of possible buried cultural resources is based upon an informed estimate of the likelihood of encountering relatively undisturbed archaeological deposits that are likely to yielded, or have the potential to yield, information important to the pre-contact archaeology or history of the local area, California or the nation, such that the archaeological deposit has the potential to be eligible for the California Register. The “level” of sensitivity (e.g., low, moderate,

high) represents the relationship between the general potential for buried archaeological resources and an estimation of the likelihood of encountering potentially significant archaeological deposits.

The C-APE is underlain by Holocene-age alluvial fan deposits. Active alluvial deposits are generally less than 5,000 years old and overlie older land surfaces (including stabilized or abandoned Pleistocene-age surfaces). In many places, the interface between older land surfaces and Holocene-age alluvial deposits is marked by a well-developed buried soil profile, or a paleosol. Paleosols preserve the composition and character of the earth's surface prior to subsequent sediment deposition; thus, paleosols have the potential to preserve archaeological resources if the area was occupied by humans (Rosenthal and Meyer, 2004). There are also two freshwater sources relatively close to the C-APE. The seasonal Permanente Creek is approximately 0.5 mile to the west and the perennial Stevens Creek is 0.4 mile to the east. In addition, numerous deeply buried sites have been uncovered in the Santa Clara Valley, at depths varying between 1 foot and more than 10 feet below the ground surface. In fact, more than 60 percent of recorded archaeological sites in this region have been found in a buried context (Meyer and Rosenthal, 2007). The soil type and age, nearby freshwater sources, and the buried context in which many Santa Clara Valley archaeological sites are encountered all indicate a moderately-high potential for the presence of archaeological deposits in the C-APE.

Conversely, while the C-APE is within the ethnohistorical territory of the *Puichon*, there are no known ethnographic sites nearby. There are also no previously recorded indigenous or historic-era archaeological sites within 0.5 mile of the C-APE, and the surrounding area was predominately agricultural land until the early-twentieth century. Finally, the previous development and agricultural uses in the C-APE likely resulted in a fair amount of ground disturbance, making it unlikely that the C-APE contains undisturbed archaeological resources, at least at shallow depths.

The Holocene age of the surrounding alluvial soils, and the presence of nearby natural freshwater sources, and discovery of numerous buried archaeological resources in the region all indicate a moderately-high general potential for the presence of buried archaeological resources in the C-APE, but the absence of known nearby indigenous or historic-era archaeological resources lowers the general potential, and the history of ground disturbance in the C-APE and vicinity indicates a low potential for encountering intact significant archaeological resources in the C-APE. Therefore, overall, the C-APE has a moderate archaeological sensitivity.

Native American Heritage Commission Outreach

ESA contacted the California Native American Heritage Commission (NAHC) on January 25, 2018 via email to request a search of the NAHC's Sacred Lands File (SLF) and a list of Native American representatives who may have interest in the Project. The NAHC replied to ESA by email on January 26, 2018. The NAHC reply indicated that the SLF has no record of any cultural resources in the C-APE, and also included a list of Native American representatives who may be interested in the Project. On November 7, 2018 the City sent a letter with a description of the Project and an attached map to each of the six Native American representatives listed on the NAHC reply. To date there has been no responses to the letters by any of the Native American representatives

contacted. **Attachment C** provides documentation of the correspondence with the NAHC and copies of the letters sent.

Pedestrian Survey

On January 26, 2019, ESA Archaeologist Heidi Koenig conducted a pedestrian survey of the C-APE. The C-APE is currently a parking lot, therefore modified pedestrian survey methods were used, consisting of intensively examining areas of visible ground and observing the overall condition of the C-APE. Digital photographs were taken to document survey conditions. Ground conditions in the C-APE consisted of two asphalt paved parkinglots with landscaping in adjacent planters. Ground visibility during the pedestrian survey was very poor due to the paved surface of the parking lot, and was consistently below 10%. **Photos 1** to **3** depict conditions in the C-APE during the survey.

No cultural resources were identified in the C-APE, including no evidence of the two previously recorded demolished historic-era buildings.

Impacts Assessment

There are no architectural historical resources in the C-APE, so this section primarily assesses the potential impacts to previously unrecorded archaeological resources, both as historical resources according to CEQA Guidelines (codified at Title 14 California Code of Regulations Section 15000 *et seq*) Section 15064.5, as well as unique archaeological resources, as defined in California Public Resources Code (PRC) Section 21083.2(g). Human remains, including those buried outside of formal cemeteries, are also protected under several state laws, including PRC Section 5097.98 and California Health and Safety Code (HSC) Section 7050.5. In addition, CEQA requires that a project's impacts on TCRs be considered as part of the overall analysis of project impacts (PRC Sections 21080.3.1, 21084.2, 21084.3). TCRs are:

- Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
    - included or determined to be eligible for inclusion in the California Register; or
    - included in a local register of historical resources, as defined in PRC Section 5020.1(k).

TCRs are also any resource determined by the CEQA lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in PRC Section 5024.1(c). In applying these criteria, the lead agency would consider the significance of the resource to a California Native American tribe. A cultural landscape that meets the criteria of PRC Section 21074(a) is also a TCR if the landscape is geographically defined in terms of the size and scope. Also, an historical resource as described in PRC Section 21084.1, a unique archaeological resource as defined in PRC Section 21083.2, or a non-unique archaeological resource as defined in PRC Section 21083.2 may also be a TCR if it meets the criteria of PRC Section 21074(a).

A significant impact would occur if the Project would:

- Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5;
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5;
- Disturb any human remains, including those interred outside of formal cemeteries; or
- Cause a substantial adverse change in the significance of a TCR as defined in PRC Section 21074.

No evidence of archaeological resources in the C-APE was identified by the background research, records search, or pedestrian survey conducted for the Project. Based on the archaeological sensitivity analysis conducted for this investigation, the C-APE has a moderate archaeological sensitivity. There is no indication that the C-APE contains human remains, but the possibility cannot be completely discounted. The discovery of previously unknown archaeological resources or human remains is always possible in the alluvial Holocene-age soils of the Santa Clara Valley, such as those present in the C-APE. If previously unrecorded archaeological deposits are present in the C-APE, and if they are found to qualify as archaeological resources, pursuant to CEQA Guidelines Section 15064, impacts to the resources resulting from the Project would be potentially significant. Similarly, if any previously unknown human remains are present in the C-APE, impacts to them from the Project would be potentially significant. Outreach to the NAHC and local Native American representatives did not result in the identification of any TCRs that could be impacted by the Project. As discussed above, if any previously unrecorded archaeological resources and/or human remains are present in the C-APE, were encountered during Project construction, and found to be a TCR, impacts to the resource resulting from the Project would be potentially significant.

Though there are no known archaeological resources, human remains, or TCRs that would be impacted by the Project, as described above, there remains the possibility that previously unknown or unrecorded such resources could be impacted by the Project. Any such impacts would be reduced to a less than significant level with implementation of the following recommended mitigation measures.

- **Protocol for Inadvertent Discovery of Archaeological Resources**

  To reduce potential impacts to archaeological resources during Project construction, the following mitigation measure is recommended:

  > If indigenous or historic-era archaeological resources are encountered during Project construction activities, all activity within 100 feet of the find shall cease and the find shall be flagged for avoidance. The City of Mountain View and a qualified archaeologist, defined as one meeting the U.S. Secretary of the Interior's Professional Qualifications Standards for Archeology, shall be immediately informed of the discovery. The qualified archaeologist shall inspect the find within 24 hours of discovery and notify the City of Mountain View of their initial assessment. Indigenous archaeological materials might include obsidian and chert flaked-stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil (midden) containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, handstones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic-era

materials might include building or structure footings and walls, and deposits of metal, glass, and/or ceramic refuse.

If the City of Mountain View determines, based on recommendations from the qualified archaeologist, that the resource may qualify as a historical resource or unique archaeological resource (as defined in CEQA Guidelines Section 15064.5), or a tribal cultural resource (as defined in PRC Section 21074), the resource shall be avoided if feasible. Avoidance means that no activities associated with the Project that may affect cultural resources shall occur within the boundaries of the resource or any defined buffer zones. If avoidance is not feasible, the City of Mountain View shall consult with appropriate Native American tribes (if the resource is indigenous), and other appropriate interested parties to determine treatment measures to avoid, minimize, or mitigate any potential impacts to the resource pursuant to PRC Section 21083.2 and CEQA Guidelines Section 15126.4. This shall include documentation of the resource and may include data recovery or other measures. Treatment for most resources would consist of (but would not be not limited to) sample excavation, artifact collection, site documentation, and historical research, with the aim to target the recovery of important scientific data contained in the portion(s) of the significant resource. The resource and treatment method shall be documented in a professional-level technical report to be filed with the California Historical Resources Information System. Work in the area may commence upon completion of approved treatment and under the direction of the qualified archaeologist.

- **Protocol for Inadvertent Discovery of Human Remains:**

  To reduce potential impacts to human remains during Project construction, the following mitigation measure is recommended:

  If human remains are uncovered during Project construction, all work shall immediately halt at the find and the Santa Clara County Coroner shall be contacted to evaluate the remains, and follow the procedures and protocols set forth in CEQA Guidelines Section 15064.5(e)(1). If the County Coroner determines that the remains are Native American, the County shall contact the NAHC, in accordance with Health and Safety Code Section 7050.5(c) and PRC Section 5097.98. Per PRC Section 5097.98, the City of Mountain View shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located is not damaged or disturbed by further development activity until the City of Mountain View has discussed and conferred, as prescribed in this section (PRC Section 5097.98), with the most likely descendants regarding their recommendations, if applicable, taking into account the possibility of multiple human remains.

Summary

The background research conducted for the current investigation identified two previously recorded cultural resources within the C-APE (P-43-003149, -003150). Both cultural resources were historic-era buildings, were demolished subsequent to being recorded in 2014, and are no longer in the C-APE. The background research did

not identify any archaeological resources in the C-APE, and outreach to the NAHC and relevant Native Americans did not result in the identification of any TCRs that might be impacted by the Project. The background research also did not identify any known human remains in the C-APE. The cultural resources pedestrian survey of the C-APE documented in this report did not identify any cultural resources in the C-APE, nor any indication of human remains. The C-APE has a moderate archaeological sensitivity, though previous ground-disturbing activities in the C-APE make it unlikely that intact significant archaeological deposits will be encountered by the Project. Though it is unlikely that the Project will encounter archaeological resources, human remains, or TCRs ESA recommends implementation of two mitigation measures for the Project (*Protocol for Inadvertent Discovery of Archaeological Resources*; *Protocol for Inadvertent Discovery of Human Remains*) to reduce any potential impacts to unknown cultural resources in the C-APE to a less than significant level.

Please contact me with any questions or comments,

Sincerely,

Ben Curry, PhD, RPA

Project Description:

Environmental Science Associates (ESA) has been contracted to assess potenetial impacts to cultural resources as part of the Residences @ Shoreline Gateway Project in Mountain View, CA. The project area is shown in the attached Figure, as depicted on the Mountain View US Geological Survey 7.5 minute topographic quadrangle. The project would redevelop existing surface parking and landscaping into an apartment building, a condominium building, and a six-level parking garage. A recently constructed office building would remain on-site.

RE: Residences at Shoreline Gateway, Santa Clara County

Dear Ms. Feyk-Miney,

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not preclude the presence of cultural resources in any project area. Other sources for cultural resources should also be contacted for information regarding known and/or recorded sites.

Enclosed is a list of Native Americans tribes who may have knowledge of cultural resources in the project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these tribes, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at 916-573-1033 or frank.lienert@nahc.ca.gov.

Sincerely,

Frank Lienert

Dear Mr. Lopez:

The City of Mountain View has received an application for development of the Residences @ Shoreline Gateway Project (proposed project), located at 1001 N. Shoreline Boulevard in Mountain View. The proposed project is subject to the California Environmental Quality Act (CEQA), with the City of Mountain View acting as lead CEQA agency. In accordance with Senate Bill 18, and consistent with Assembly Bill 52, as discussed below, the City of Mountain View would like to invite Native American tribes and individuals to participate in the local planning process.

The proposed project would include removing existing surface parking, landscaping, and private recreation areas, and constructing three new buildings with recreation facilities and common amenity space in these areas. The proposed project would include a new, seven- to eight-story residential structure with approximately 3,000 square feet of ground floor retail, two levels of podium parking, and 203 apartment units; and a new, seven-story residential structure with two levels of podium parking and 100 condominium units, to the north and east of an existing office building on the project site. The existing office building would remain at the site. The proposed project would also include a six-story parking structure to accommodate parking for the existing office building. The proposed project would require text and map amendments to the City of Mountain View 2030 General Plan. Please see the attached map for the proposed project location (Attachment).

A records search of the California Historical Resources Information System indicates that no archaeological resources have been previously identified in or within 0.5 miles of the proposed project site.

The City of Mountain View would like to provide you with an opportunity to communicate concerns you might have regarding historical resources or tribal cultural resources important to your community that could be impacted by the proposed project. The City of Mountain View requests your participation in the identification and protection of historical resources and tribal cultural resources that could be impacted by the proposed project, with the understanding that you or other members of your community might possess specialized knowledge of the area.

Please consider this letter and preliminary project information as formal notification of a proposed project as required under CEQA, specifically Public Resources Code § 21080.3.1 and Chapter 532 Statutes of 2014 (i.e. Assembly Bill 52). Please respond in writing within 30 days, pursuant to PRC § 21080.3.1(d) if you

wish to request consultation regarding possible significant effects that the proposed project may have on tribal cultural resources. Please provide a designated lead contact person if you have not already provided such information.

If you or any of your tribal members have any questions or concerns regarding the proposed project please contact me:

Clarissa Burke, Associate Planner
City of Mountain View

Dear Ms. Perez:

The City of Mountain View has received an application for development of the Residences @ Shoreline Gateway Project (proposed project), located at 1001 N. Shoreline Boulevard in Mountain View. The proposed project is subject to the California Environmental Quality Act (CEQA), with the City of Mountain View acting as lead CEQA agency. In accordance with Senate Bill 18, and consistent with Assembly Bill 52, as discussed below, the City of Mountain View would like to invite Native American tribes and individuals to participate in the local planning process.

The proposed project would include removing existing surface parking, landscaping, and private recreation areas, and constructing three new buildings with recreation facilities and common amenity space in these areas. The proposed project would include a new, seven- to eight-story residential structure with approximately 3,000 square feet of ground floor retail, two levels of podium parking, and 203 apartment units; and a new, seven-story residential structure with two levels of podium parking and 100 condominium units, to the north and east of an existing office building on the project site. The existing office building would remain at the site. The proposed project would also include a six-story parking structure to accommodate parking for the existing office building. The proposed project would require text and map amendments to the City of Mountain View 2030 General Plan. Please see the attached map for the proposed project location (Attachment).

A records search of the California Historical Resources Information System indicates that no archaeological resources have been previously identified in or within 0.5 miles of the proposed project site.

The City of Mountain View would like to provide you with an opportunity to communicate concerns you might have regarding historical resources or tribal cultural resources important to your community that could be impacted by the proposed project. The City of Mountain View requests your participation in the identification and protection of historical resources and tribal cultural resources that could be impacted by the proposed project, with the understanding that you or other members of your community might possess specialized knowledge of the area.

Please consider this letter and preliminary project information as formal notification of a proposed project as required under CEQA, specifically Public Resources Code § 21080.3.1 and Chapter 532 Statutes of 2014

(i.e. Assembly Bill 52). Please respond in writing within 30 days, pursuant to PRC § 21080.3.1(d) if you wish to request consultation regarding possible significant effects that the proposed project may have on tribal cultural resources. Please provide a designated lead contact person if you have not already provided such information.

If you or any of your tribal members have any questions or concerns regarding the proposed project please contact me:

***P3a. Description:**

The property at 1062 Linda Vista Avenue in Mountain View is a two story, 13,000-square-foot commercial office and warehouse building with a rectangular plan, constructed of concrete with painted concrete plaster walls, and a flat roof, designed in the Modern style of architecture. The front of the building facing Linda Vista Avenue is a two-story office building, with a high-bay single-story warehouse connected to the back. The office structure has a series of vertical concrete 'fins' located between each set of windows, running the full height of the building, and projecting about three feet from the front facade. The front entrance is located at the northeast corner of the building, and is demarcated by a pebbled stone cladding above the front door. A remnant steel frame awning and faded signage is also located above the front door, which consists of a dark metal frame commercial unit with inset glass. Other fenestration consists of fixed and casement style windows with metal frames. Ground floor windows are covered by steel security bars. The rear of the building contains approximately 7 bays, each bay with a roll-up garage door. Paved parking areas are located to the east and north sides of the property. A near-twin office/warehouse is located further to the north.

1066 Linda Vista Avenue is a near-twin building, constructed simultaneously, and sharing the same central parking lot

B9a. Architect: Danforth E. Apker, CE
b. Builder: Penn Construction Co.
***B10. Significance: Theme:** N/A
Area: N/A
Period of Significance: N/A
Property Type: N/A
Applicable Criteria: N/A

The property at 1062 Linda Vista Avenue was constructed in 1959 as a two-story commercial office and warehouse building as this area of Mountain View was transitioning from earlier agricultural uses to commercial office and high-tech industrial uses during the post-war period. The property and its near-twin at 1066 Linda Vista Avenue were developed for owner Walter S. Butler, designed by civil engineer Danforth Apker, and constructed by Penn Construction Co. Tenants included Mechrolab, Inc. (1964) and Data Technology Corporation (1967). The property was constructed during a period of rapid commercial and industrial expansion, not only in Mountain View and Santa Clara County, but also nationwide. The buildings appears to have been used most recently for the sales and storage of electronic parts, as indicated by the faded signage stating it was "An Electronics Supermarket." Although the property is associated with Mountain View's post-World War II commercial/industrial growth, as well as its current position as a high-tech center of Silicon Valley, it does not appear to be significantly associated with these events, nor did research reveal any significant associations with other important local events. Research also did not reveal any associations with important individuals who may have worked at the property. There is no indication that developer Walter Butler was considered a locally important individual. Finally, the property is a relatively common, rather than a representative, example of the Modern style of commercial architecture. Research did not indicated that the building's designer, civil engineer Danforth Apker, was considered a master engineer. For these reasons, 1062 Linda Vista Avenue does not appear to be eligible for listing in the local, state, or national registers of historical resources. This property would not meet the definition of a historical resource for CEQA purposes.

***P3a. Description:**

The property at 1150 Terra Bella Avenue in Mountain View is a single-story, 1,356-square-foot residence with a rectangular plan, a side gable roof clad in asphalt shingles, and stucco siding designed in the Ranch style of architecture. The base of the front façade is clad in brick, while the base of the sides are clad in horizontal ship-lap siding. The construction type is wood framing over a concrete foundation. Fenestration consists of wood frame, double hung windows with 2-over-2 panes, covered by steel mesh screens. The front door is covered by a metal security grill. The enclosed eaves have wood trim with aluminum gutters. The entry is accessed through a recessed front porch supported by wood posts. The front façade is dominated by a large, exterior brick chimney on a projecting gable end. Four outbuildings are located within the rear yard of the property, to the north of the residence. These buildings consists of gable-roofed sheds entirely clad in corrugated metal.

Area:
Period of Significance: N/A **Property Type:** N/A **Applicable Criteria:** N/A

The property at 1150 Terra Bella Avenue was constructed in 1947 as a single family residence when the majority of this portion of Mountain View was still largely in agricultural use. The property was developed for use as a primary residence for owners Marco and Roberta Burtozzi (now deceased) who raised their family there and on an adjoining property at 1015 N. Shoreline Blvd. Aerial maps from 1948 identify this home surrounded by agricultural fields, primarily fruit trees. Nearly all of the other homes in the area, as well as the former agricultural fields, were subdivided and replaced by commercial and industrial uses when this area experienced rapid development during the post-World War II period. Although the property contains some agricultural outbuildings in the rear yard, some of which were developed in the early 1970s according to building permits on file with the City of Mountain Veiw, it is more closely related to post-war suburban expansion than to Mountain View's agricultural past. This property does not appear to be significantly associated with post-war suburban expansion, as this event occurred not only throughout Mountain View and Santa Clara County, but also on a nationwide level. There is no indication that Marco or Roberta Burtozzi were considered locally important persons. Finally, the property is a relatively common, vernacular, example of the Ranch style of architecture, which was a popular style for residences designed in the 1940s – 1960s. For these reasons, the property at 1150 Terra Bella Avenue does not appear to be eligible for listing in the local, state, or national registers of historical resources. This property would not meet the definition of a historical resource for CEQA purposes.

***P3a. Description:**

The property at 1015 N. Shoreline Boulevard in Mountain View is a single-story, approximately 800-square-foot single-family residence with a square plan, a cross-gable roof clad in asphalt shingles, and stucco siding. The home was designed in a vernacular version of the Ranch style of architecture. The construction type is wood framing over a concrete foundation. A front porch, which runs the length of the front façade, has a shed roof supported by three wood posts and concrete floor. Fenestration consists of wood frame, double hung windows with 1-over-1 panes. Decorative wood shutters are located on the front windows. The front door is solid wood with wood framing. The enclosed eaves have wood trim. Wood attic vents are located in the gable peaks. A shed roof addition, possibly an in-filled rear porch, is located at the northeast corner of the building.

Period of Significance: N/A **Property Type:** N/A **Applicable Criteria:** N/A

The property at 1015 N. Shoreline Boulevard (formerly Stierlin Road) was constructed on lands that were once part of the 160-acre farm owned by Conrad Stierlin, a Swiss immigrant who arrived in Mountain View in 1852. By the time the subject property was constructed circa 1940, the majority of this portion of north Mountain View was still largely in agricultural use. Aerial photography and topographic maps from the 1940s and 1950s identify this residence, as well as approximately ten other identically-shaped buildings, fronting Stierlin Road and surrounded by fruit trees on both side of the road. As such, these small buildings, including the subject property, may have housed farm workers at one time. The building and surrounding properties at the corner of Shoreline Blvd. and Terra Bella Avenue were purchased by Marco and Roberta Burtozzi circa 1947. Burtozzi built a primary residence at 1150 Terra Bella Avenue in 1947, and various family members lived in the subject property, which they called the 'little house.' By the 1980s, all of the other homes aside from the subject property, as well as the surrounding agricultural fields, had been subdivided and replaced by commercial and industrial uses as this area experienced rapid development during the post-World War II period. Stierlin Road was renamed N. Shoreline Boulevard in 1987. Although this property may have once been associated with Mountain View's agricultural past, it was constructed toward the end of this era, and does not appear to be significantly associated with this local event. The formerly rural/agricultural setting of this property has entirely disappeared, which has reduced its overall integrity of setting and its understanding as a potential former farm worker residence. Research also did not reveal any associations with important individuals who may have lived or worked at the property. The property is not directly associated with early Mountain View farmer, Conrad Stierlin, as the property is located some 1,000 feet south of the original 1870s Stierlin family farmhouse (demolished). There is no indication that Marco or Roberta Burtozzi were considered locally important persons. Finally, the property is a relatively common, vernacular, example of the Ranch style of architecture, which was a popular style for residences designed in the 1940s – 1960s. For these reasons, the property at 1015 N. Shoreline Boulevard does not appear to be eligible for listing in the local, state, or national registers of historical resources. This property would not meet the definition of an historical resource for CEQA purposes.

***P3a. Description:**

The property at 1160 Terra Bella Avenue in Mountain View is a single-story, 7,840-square-foot commercial office building with a rectangular plan, constructed of concrete with painted concrete plaster walls, and a flat roof, designed in the Modern style of architecture. The building has a recessed entry in the center of symmetrical front façade. The front portico is supported by square concrete columns. Windows to either side of the front entry are single-pane fixed commercial units with dark metal frames. Recessed and scored plaster walls are located between the windows. Doors are dark metal frame commercial units with smoked glass panels. Paved parking areas are located to the side of the property. Areas in front of the building along Terra Bella Avenue are landscaped with juniper bushes and ornamental street trees.

The property at 1160 Terra Bella Avenue was constructed in 1960 as a single-story commercial office building as this area of Mountain View was transitioning from earlier agricultural uses to commercial, industrial, and high-tech uses during the post-World War II period. According to the building permits on file with the City of Mountain View, tenants included Prime Publications (1967), Information Terminals (1972), and Alto Design (1990). The building was constructed during a period of rapid commercial and industrial expansion, not only in Mountain View and Santa Clara County, but also nationwide. Although the property is associated with Mountain View's post-war commercial growth and its current position as a high-tech center of Silicon Valley, it does not appear to be significantly associated with this event, nor did research reveal any significant associations with other important local events. Research also did not reveal any associations with important individuals who may have lived or worked at the property. Finally, the property is a relatively common, rather than a representative, example of the Modern style of commercial architecture. For these reasons, 1160 Terra Bella Avenue does not appear to be eligible for listing in the local, state, or national registers of historical resources. This property would not meet the definition of a historical resource for CEQA purposes.

Subject: Geotechnical Investigation
Proposed Mixed-Use Development
The Residences at Shoreline Gateway - Phase II
1001 North Shoreline Boulevard
Mountain View, California

Dear Ms. Yuen,

We are pleased to present our geotechnical investigation report for the proposed mixed-use development to be constructed at 1001 North Shoreline Boulevard in Mountain View, California. Our geotechnical investigation was performed in accordance with our proposal dated July 14, 2017.

The site for Phases I and II of the project consists of four relatively level lots, designated as Lots 1 through 4 on the current civil drawings (C1.0) prepared by BKF Engineers, and encompasses approximately 7.81 acres. The four lots are bordered by Terra Bella Avenue to the south, North Shoreline Boulevard to the west, Highway 101 on-ramp and two-story buildings to the north, and one-story commercial and office buildings to the east. Phase II of the project consists of Lots 1, 3, and 4, which are currently occupied by asphalt-paved parking. Lot 2 is currently under construction as part of Phase I of the project and is not included in this report.

Plans for Phase II include demolishing the asphalt-paved parking lots and constructing an apartment building at the northwestern corner of the site (Lot 1) and a condominium building and parking structure at the southeastern corner of the site (Lots 3 and 4). The apartment building will consist of five levels of wood-framed apartment units over a two-story concrete parking podium and will be constructed near existing site grade. The condominium building will consist of five levels of wood-framed residential units over two levels of reinforced-concrete parking and the parking structure will consist of six levels of reinforced-concrete. Both the condominium building and parking structure will be constructed at grade. Site improvements will also include courtyards, pedestrian

walkways, drive aisles, and landscaping. New pedestrian and vehicular pavements will generally consist of concrete, asphalt, and pavers.

From a geotechnical standpoint, we conclude the site can be developed as planned, provided the recommendations presented in this report are incorporated into the project plans and specifications and properly implemented during construction. The primary geotechnical concerns at the project site are:

- the potential for up to about 4 inches of seismically induced settlement due to liquefaction beneath the proposed buildings;
- foundation settlement due to compression of the underlying clay soils, some of which are lightly to moderately over-consolidated; and
- the presence of highly expansive near-surface soil.

We conclude the proposed buildings may be supported on shallow foundation systems, such as spread footings or a mat, bearing on improved soil. We believe drilled displacement sand-cement (DDSC) columns would be the most economical ground improvement method; however, other soil improvement methods, such as soil-cement (SMX) columns are also feasible. Alternatively, the proposed new buildings may be supported by deep foundation systems.

The recommendations contained in our report are based on a limited subsurface exploration. Consequently, variations between expected and actual subsurface conditions may be found in localized areas during construction. Therefore, we should be engaged to observe grading and foundation installation during which time we may make changes in our recommendations, if deemed necessary.

We appreciate the opportunity to provide our services to you on this project. If you have any questions, please call.

Sincerely yours,
ROCKRIDGE GEOTECHNICAL, INC.

GEOTECHNICAL INVESTIGATION
PROPOSED MIXED-USE DEVELOPMENT
THE RESIDENCES AT SHORELINE GATEWAY – PHASE II
1001 NORTH SHORELINE BOULEVARD
Mountain View, California

1.0 INTRODUCTION

This report presents the results of the geotechnical investigation performed by Rockridge Geotechnical, Inc. for Phase II of the proposed mixed-use development to be constructed at 1001 North Shoreline Boulevard in Mountain View, California. The site is located at the eastern side of North Shoreline Boulevard between Terra Bella Avenue and Highway 101, as shown on the attached Site Location Map (Figure 1).

The site for Phases I and II of the project consists of four relatively level lots, designated as Lots 1 through 4 on the current civil drawings (C1.0) prepared by BKF Engineers, and encompasses approximately 7.81 acres. The four lots are bordered by Terra Bella Avenue to the south, North Shoreline Boulevard to the west, Highway 101 on-ramp and two-story buildings to the north, and one-story commercial and office buildings to the east. Phase II of the project consists of Lots 1, 3, and 4, which are currently occupied by asphalt-paved parking. Lot 2 is currently under construction as part of Phase I of the development, and is not included in this report.

Plans for Phase II include demolishing the asphalt-paved parking lots and constructing a mixed-use development consisting of an apartment building at the northwestern corner of the site (Lot 1) and a condominium building and parking structure at the southeastern corner of the site (Lots 3 and 4). The apartment building will consist of five levels of wood-framed apartment units over a two-story concrete parking podium. The condominium building will consist of five levels of wood-framed residential units over two levels of reinforced-concrete parking and the parking structure will consist of six levels of reinforced-concrete. All three buildings will be constructed at grade. Site improvements will also include courtyards, pedestrian walkways, drive aisles, and landscaping. New pedestrian and vehicular pavements will generally consist of concrete, asphalt, and pavers.

Structural design loads were not available at the time this report was prepared. Based on our experience with similar buildings, we estimate the average apartment and condominium building pressures will each be on the order of approximately 800 psf and the average building pressure for the parking structure will be on the order of about 1100 psf.

2.0 SCOPE OF SERVICES

Our investigation was performed in accordance with our proposal dated July 14, 2017. Our geotechnical investigation included exploring subsurface conditions at the site by drilling two test borings, performing seven cone penetration tests (CPTs), and performing laboratory testing on selected soil samples. We used the data from our subsurface investigation and previous subsurface investigations in the site vicinity to perform engineering analyses to develop conclusions and recommendations regarding:

- site seismicity and seismic hazards, including the potential for liquefaction and liquefaction-induced ground failure
- the most appropriate foundation type(s) for the proposed structures
- design criteria for the recommended foundation type(s), including vertical and lateral capacities for each of the foundation type(s)
- estimates of foundation settlement
- design groundwater level
- site grading and excavation, including criteria for fill quality and compaction
- subgrade preparation for slabs-on-grade and exterior concrete flatwork
- 2016 California Building Code (CBC) site class and design spectral response acceleration parameters
- corrosivity of the near-surface soil and the potential effects on buried concrete and metal structures and foundations
- construction considerations.

3.0 DATA REVIEW

We gathered and reviewed readily available information related to the subsurface conditions at and in the vicinity of the site, including regional geologic and geotechnical maps, and

geotechnical reports prepared for previous investigations. In addition, we were provided a copy of a previous geotechnical investigation that was performed at the site by Cornerstone Earth Group (Cornerstone) for Phase I of the proposed development.

We previously performed a preliminary geotechnical investigation for a project within the site vicinity, the results of which were presented in a report dated April 17, 2017. The site is located at 1012 Linda Vista Avenue and 1110 Terra Bella Avenue, which is adjacent to the southeastern corner of the project site. Our preliminary investigation consisted of performing three cone penetration tests (CPTs), each to a depth of about 44 feet below the ground surface (bgs), and advancing two hand auger borings to depths ranging from 2 to 6 feet bgs.

At the southwestern corner of the site, Cornerstone previously performed a geotechnical investigation and prepared a design-level geotechnical report for a four-story, at-grade office building, asphalt pavement, and concrete flatwork. The results of their investigation were presented in their report dated May 2, 2014 and titled *Geotechnical Investigation, 1001 North Shoreline Blvd., Mountain View, California*. Cornerstone's investigation included drilling two exploratory borings to depths ranging from 25 to 45 feet bgs and performing two CPTs to depths ranging from 65 to 100 feet bgs. Their investigation also included shear wave velocities measurements of the soil while advancing CPT-1, as well as laboratory testing on soil samples obtained from the borings.

The approximate locations of the borings and CPTs from the two previous investigations are shown on the Site Plan, Figure 2. Subsurface data from the previous investigations was used in our evaluation of subsurface conditions at the site is presented in Appendix C of this report.

4.0 FIELD INVESTIGATION AND LABORATORY TESTING

We investigated the subsurface conditions beneath the site by drilling two borings, advancing four CPTs, and performing laboratory tests on selected soil samples. The approximate locations of the borings and CPTs are shown on the Site Plan (Figure 2). Prior to mobilizing to the site, we contacted Underground Service Alert (USA) to notify them of our work, as required by law,

and obtained a drilling permit from the Santa Clara Valley Water District (SCVWD). We also retained Precision Locating, LLC, a private utility locator, to check that the boring and CPT locations were clear of buried utilities. Details of the field investigation and laboratory testing are described below.

4.1 Test Borings

Two borings, designated as B-1 and B-2, were drilled on September 18, 2017 by Pitcher Drilling Company of East Palo Alto, California at the approximate locations shown on Figure 2. Borings B-1 and B-2 were drilled to depths of 45 and 44 feet bgs, respectively, using a truck-mounted drill rig equipped with rotary-wash drilling equipment. During drilling, our field engineer logged the soil encountered and obtained samples for visual classification and laboratory testing. The logs of Borings B-1 and B-2 are presented in Appendix A on Figures A-1a through A-2b. The soil encountered in the boring was classified in accordance with the classification chart shown on Figure A-3.

Soil samples were obtained using the following samplers:

- Sprague and Henwood (S&H) split-barrel sampler with a 3.0-inch outside diameter and 2.5-inch inside diameter, lined with 2.43-inch inside diameter brass/stainless steel tubes.
- Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside and 1.5-inch inside diameter, without liners.
- Pitcher Tube (PT), which is a thin-walled stainless steel tube with a 3-inch outside diameter.

The S&H and SPT samplers were driven with a 140-pound, automatic hammer falling 30 inches per drop. The samplers were driven up to 18 inches and the hammer blows required to drive the samplers were recorded every six inches and are presented on the boring logs. A "blow count" is defined as the number of hammer blows per six inches of penetration or 50 blows for six inches or less of penetration. The blow counts required to drive the S&H and SPT samplers were converted to approximate SPT N-values using factors of 0.8 and 1.2, respectively, to account for sampler type and approximate hammer energy. The converted SPT N-values are presented on the boring logs.

The PB tubes were advanced to obtain relatively undisturbed samples of clayey soils. PB tube samplers were advanced by circulating drilling fluid to cut away the soil around the perimeter of the sample and pushing the tube using the hydraulic pressure of the rig.

Upon completion, the boreholes were backfilled with neat cement grout in accordance with SCVWD grouting guidelines. The soil cuttings and drilling fluid generated by the drilling operation were placed in 55-gallon drums and subsequently disposed of offsite.

4.2 Cone Penetration Tests

California Push Technologies, Inc. (CPT Inc.) of San Leandro, California performed seven CPTs, designated as CPT-1 through CPT-7, on September 18 and September 19, 2017. The CPTs were advanced to depths ranging from about 100 to 121 feet bgs by hydraulically pushing an approximately 1.7-inch-diameter cone-tipped probe with a projected area of 15 square centimeters into the ground using a 30-ton truck rig. The cone-tipped probe measured tip resistance and the friction sleeve behind the cone tip measured frictional resistance. Electrical strain gauges within the cone continuously measured soil parameters for the entire depth advanced. Soil data, including tip resistance, frictional resistance, and pore water pressure, were recorded by a computer while the test was conducted. Accumulated data were processed by a computer to provide engineering information such as the soil behavior types, approximate strength characteristics, and the liquefaction potential of the soil encountered. The CPT logs, showing tip resistance, friction ratio, and pore water pressure by depth, as well as correlated soil behavior type (Robertson, 2010), are presented in Appendix A on Figures A-4 through A-10A. Depth to groundwater was estimated using pore pressure dissipation test data in all CPTs, with the exception of CPT-4, and is noted on each of the CPT logs. Upon completion, the CPTs were backfilled with cement grout in accordance with SCVWD grouting guidelines.

Shear wave velocities of the soil were measured while advancing CPT-7. Shear wave velocity was measured at approximately 3.3-foot intervals. Advancement of the cone was stopped at these intervals to record an impulse generated at the ground surface. An accelerometer mounted just above the friction sleeve recorded an impulse generated at the surface when a beam pressed

against the ground under a CPT rig outrigger was struck with a hammer. The arrival time from the source (hammer striking the beam) to the accelerometer inside the cone was converted to a vertical travel path and the difference between successive 3.3-foot measurements was used to determine the shear wave travel time over the interval. This method is also called the pseudo-time interval method. Plots of the measured shear wave velocity at each interval are presented on Figure A-10B in Appendix A.

4.3 Laboratory Testing

Geotechnical laboratory tests were performed on selected soil samples to assess their engineering properties and physical characteristics. Soil samples were tested by B. Hillebrandt Soils Testing, Inc. of Alamo, California to measure moisture content, dry density, plasticity (Atterberg limits), fines content, strength, and compressibility (consolidation characteristics). Corrosivity testing of a near-surface soil sample was performed by Project X Corrosion Engineering of Murrieta, California. The results of the geotechnical laboratory tests are presented on the boring logs and in Appendix B.

5.0 SUBSURFACE CONDITIONS

The site is underlain by Holocene-age alluvial deposits (Qha), as shown on the Regional Geology Map, Figure 3. Alluvial fan deposits generally consist of a mixture of fine-grained and coarse-grained deposits and are deposited by rivers and streams. The results of our borings and CPTs, as well as boring and CPTs from previous investigations, indicate the site is underlain by alluvium consisting of interbedded layers of sand and gravel with varying fines content and clay with variable amounts of sand and gravel to the maximum depth explored of 121 feet bgs. In the upper approximately 65 feet, the sand and gravel is generally medium dense to dense and the clay is generally medium stiff to very stiff. Below a depth of about 65 feet, the sand and gravel become dense to very dense and the clay and silt becomes very stiff to hard.

The Atterberg limits test results indicate the surficial clay deposits are highly expansive. Expansive clay is subject to large volume changes with changes in moisture content.

5.1 Groundwater Conditions

The depth to groundwater was estimated using pore pressure dissipation test data at depths ranging from about 7 to 9-1/2 feet bgs in each of the CPTs, with the exception of CPT-4. The groundwater level was obscured by the drilling fluid in both borings B-1 and B-2.

Groundwater was measured during Cornerstone's investigation at a depth of about 10-1/2 feet bgs during or immediately after drilling the test borings. It should be noted the groundwater level was likely not given adequate time to stabilize at the time the measurements were taken. Based on our review of available historic groundwater information within the site vicinity, we estimate the historic high groundwater level at the site is about 5 feet bgs. The groundwater level at the site is expected to fluctuate several feet seasonally with potentially larger fluctuations annually, depending on the amount of rainfall.

Based on the available groundwater measurements, we conclude a groundwater depth of 5 feet bgs should be used for design.

6.0 SEISMIC CONSIDERATIONS

Because the project site is in a seismically active region, we evaluated the potential for earthquake-induced geologic hazards, including ground shaking, ground surface rupture, liquefaction,[1] lateral spreading,[2] and cyclic densification[3]. The results of our evaluation regarding seismic considerations for the project site are presented in the following sections.

---

1 Liquefaction is a phenomenon where loose, saturated, cohesionless soil experiences temporary reduction in strength during cyclic loading such as that produced by earthquakes.

2 Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

3 Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is compacted by earthquake vibrations, causing ground-surface settlement.

6.1 Regional Seismicity and Faulting

The major active faults in the area are the San Andreas, Hayward, Calaveras, and San Gregorio, faults. These and other faults of the region are shown on Figure 4. The fault systems in the Bay Area consist of several major right-lateral strike-slip faults that define the boundary zone between the Pacific and the North American tectonic plates. Numerous damaging earthquakes have occurred along these fault systems in recorded time. For these and other active faults within a 50-kilometer radius of the site, the distance from the site and estimated mean characteristic moment magnitude[4] [Working Group on California Earthquake Probabilities (WGCEP, 2008) and Cao et al. (2003)] are summarized in Table 1.

[4] Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

TABLE 1
Regional Faults and Seismicity

Fault Segment	Approximate Distance from Site (km)	Direction from Site	Mean Characteristic Moment Magnitude
Monte Vista-Shannon	8	Southwest	6.5
N. San Andreas - Peninsula	12	Southwest	7.2
N. San Andreas (1906 event)	12	Southwest	8.1
Total Hayward	19	Northeast	7.0
Total Hayward-Rodgers Creek	19	Northeast	7.3
Total Calaveras	24	East	7.0
N. San Andreas - Santa Cruz	27	South	7.1
San Gregorio Connected	31	West	7.5
Zayante-Vergeles	37	Southeast	7.0
Mount Diablo Thrust	42	Northeast	6.7
Greenville Connected	46	Northeast	7.0

In the past 200 years, four major earthquakes (i.e., Magnitude > 6) have been recorded on the San Andreas Fault. In 1836, an earthquake with an estimated maximum intensity of VII on the Modified Mercalli (MM) Intensity Scale occurred east of Monterey Bay on the San Andreas Fault (Toppozada and Borchardt 1998). The estimated moment magnitude, M_w, for this earthquake is about 6.25. In 1838, an earthquake occurred on the Peninsula segment of the San Andreas Fault. Severe shaking occurred with an MM of about VIII-IX, corresponding to an M_w of about 7.5. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas Fault from Shelter Cove to San Juan Bautista approximately 470 kilometers in length. It had a maximum intensity of XI (MM), an M_w of

about 7.9, and was felt 560 kilometers away in Oregon, Nevada, and Los Angeles. The most recent earthquake to affect the Bay Area was the Loma Prieta Earthquake of October 17, 1989 with an M_w of 6.9. This earthquake occurred in the Santa Cruz Mountains about 45 kilometers south of the site.

In 1868, an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward Fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably an M_w of about 6.5) was reported on the Calaveras Fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake (M_w = 6.2).

The U.S. Geological Survey's 2014 Working Group on California Earthquake Probabilities has compiled the earthquake fault research for the San Francisco Bay area in order to estimate the probability of fault segment rupture. They have determined that the overall probability of moment magnitude 6.7 or greater earthquake occurring in the San Francisco Region during the next 30 years (starting from 2014) is 72 percent. The highest probabilities are assigned to the Hayward Fault, Calaveras Fault, and the northern segment of the San Andreas Fault. These probabilities are 14.3, 7.4, and 6.4 percent, respectively.

6.2 Geologic Hazards

During a major earthquake on a segment of one of the nearby faults, strong to very strong ground shaking is expected to occur at the project site. Strong shaking during an earthquake can result in ground failure such as that associated with soil liquefaction, lateral spreading, and cyclic densification. We used the results of the borings and CPTs performed within the site vicinity to evaluate the potential of these phenomena occurring at the project site.

6.2.1 Ground Shaking

The ground shaking intensity felt at the project site will depend on: 1) the size of the earthquake (magnitude), 2) the distance from the site to the fault source, 3) the directivity (focusing of earthquake energy along the fault in the direction of the rupture), and 4) site-specific soil

conditions. The site is about 12 kilometers from the San Andreas Fault and 19 kilometers from a segment of the Hayward Fault. Therefore, the potential exists for a large earthquake to induce strong to very strong ground shaking at the site during the life of the project.

6.2.2 Ground Surface Rupture

Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no known active or potentially active faults exist on the site. We therefore conclude the risk of fault offset at the site from a known active fault is very low. In a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure from previously unknown faults is also very low.

6.2.3 Liquefaction and Liquefaction-Induced Settlement

When a saturated, cohesionless soil liquefies, it experiences a temporary loss of shear strength created by a transient rise in excess pore pressure generated by strong ground motion. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits. Flow failure, lateral spreading, differential settlement, loss of bearing strength, ground fissures and sand boils are evidence of excess pore pressure generation and liquefaction. As shown on Figure 5, the site is within a liquefaction hazard zone, defined by the map titled *State of California, Seismic Hazard Zones, Mountain View Quadrangle, Official Map,* prepared by the California Geological Survey (CGS), dated October 18, 2006.

Liquefaction susceptibility was assessed using the software CLiq v2.0 (GeoLogismiki, 2016). CLiq uses measured field CPT data and assesses liquefaction potential given a user-defined earthquake magnitude and peak ground acceleration (PGA). We performed a liquefaction triggering analysis using the CPT and boring log data within the site vicinity in accordance with the methodology by Boulanger and Idriss (2014).

Our analysis was performed using a high groundwater depth of 5 feet bgs. In accordance with the 2016 CBC, we used a peak ground acceleration of 0.53 times gravity (g) in our liquefaction evaluation; this peak ground acceleration is consistent with the Maximum Considered Earthquake Geometric Mean (MCE_G) peak ground acceleration adjusted for site effects (PGA_M). We also used a Moment magnitude 8.1 earthquake, which is consistent with the mean characteristic Moment magnitude for the San Andreas Fault 1906 event, as presented in Table 1.

Our analyses indicate there are relatively thin soil layers between depths of approximately 6 and 55 feet bgs that are susceptible to liquefaction during a major earthquake. To estimate potential ground deformations due to liquefaction, we considered three mechanisms of seismically-induced building settlement: volumetric-induced, shear-induced, and ejecta-induced. Settlement due to volumetric strain, typically designated as "free-field" settlement, occurs due to: 1) post-liquefaction sedimentation resulting from high pore pressures generated during strong ground shaking; and 2) post-liquefaction consolidation as excess pore pressures dissipate. Shear-induced ground deformations are caused by shear stresses exerted on the underlying soil by a structure subjected to cyclic loading, which can result in a partial bearing capacity failure (punching failure) or ratcheting displacement due to soil-structure interaction. Ejecta-induced deformations occur when soil beneath the foundation of a structure is brought to the ground surface during strong shaking. When soil ejecta occurs during a major seismic event, the settlements are typically large and difficult to quantify; therefore, deformations due to soil ejecta are not included in the liquefaction-induced settlement calculations and are further discussed in the section below regarding liquefaction-induced ground failure.

We estimated free-field settlement due to liquefaction using the methodology developed by Zhang et al. (2002) and shear-induced building settlement during a major earthquake using methodology developed by Bray et al. (2017). For our settlement analyses, we assumed average building pressures of approximately 800 and 1100 psf for the residential buildings and parking structure, respectively.

Based on the results of our seismically-induced settlement analyses, we estimate total and differential settlements of the proposed apartment and condominium buildings associated with liquefaction after an MCE_G event generating a PGA_M of 0.53g will be on the order of about 3 inches and 1-1/2 inches over horizontal distance of 30 feet, respectively. We estimate total and differential settlements of the proposed parking structure due to liquefaction after an MCE_G event will be on the order of approximately 4 inches and 2 inches over horizontal distance of 30 feet, respectively. These are the 84th percentile (median plus one standard deviation) ground-deformation estimates, indicating that approximately 16 percent of sites would experience seismically-induced settlement greater than the estimates presented above and about 84 percent would experience less settlement given the expected ground motions generated by an MCE_G event, current soil conditions, and estimated building loads.

The median and standard deviation values of seismically-induced settlement (free-field plus shear-induced) estimated at each CPT location for the proposed residential buildings and the parking structure are presented in Table 2 and Table 3, respectively.

TABLE 2
Seismically-Induced Ground Deformations
Proposed Apartment and Condominium Buildings

CPT No.	Median – σ (inches)	Median (inches)	Median + σ (inches)
CPT-1	1.6	2.1	2.9
CPT-2	0.8	1.1	1.6
CPT-3	1.8	2.3	3.2
CPT-4	1.2	1.5	2.1
CPT-5	1.6	2.1	3.0
CPT-6	1.2	1.6	2.4
CPT-7	1.3	1.8	2.6

TABLE 3
Seismically-Induced Ground Deformations
Proposed Parking Structure

CPT No.	Median – σ (inches)	Median (inches)	Median + σ (inches)
CPT-4	1.5	2.1	3.0
CPT-5	2.0	2.9	4.2
CPT-6	1.6	2.3	3.4
CPT-7	1.7	2.5	3.7

As discussed in later sections of this report, we judge the anticipated differential settlements due to both static and seismic load conditions exceed the typical tolerance of a conventional shallow foundation system. The potential for liquefaction-induced settlement within the relatively shallow layers should be mitigated if the building is to be supported on a shallow foundation system. If the upper 65 feet of soil beneath the proposed new buildings is improved, we estimate that total building settlement associated with liquefaction of the remaining layers will be less than about one inch and liquefaction-induced differential settlement will be about 1/2 inch over a horizontal distance of 30 feet.

6.2.4 Liquefaction-Induced Ground Failure

The potential for liquefaction-induced ground failure depends on the thickness of the liquefiable soil layer relative to the thickness of the overlying non-liquefiable material. Ishihara (1985) presented empirical relationship that provides criteria that can be used to evaluate whether liquefaction-induced ground failure, such as sand boils, would be expected to occur under a given level of shaking for a liquefiable layer of given thickness overlain by a resistant, or protective, surficial layer.

We evaluated the potential for surface manifestation of liquefaction using an empirical relationship developed by Ishihara (1985). We also computed the post-liquefaction bearing capacity using methodology by Meyerhof and Hanna (1978) for a two-layered system to

determine whether a punching failure is likely to occur during an MCE_G event. On the basis of our evaluation, we conclude the potentially liquefiable layers are sufficiently thin and have high enough fines content such that the potential for surface manifestations from liquefaction, such as sand boils, and loss of bearing capacity for shallow foundations is low.

Lateral spreading is a phenomenon in which a surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. The surficial blocks are transported downslope or in the direction of a free face, such as a channel, by earthquake and gravitational forces. Lateral spreading is generally the most pervasive and damaging type of liquefaction-induced ground failure generated by earthquakes.

Although numerous thin, potentially liquefiable layers were encountered, the layers do not appear to be continuous and the topography of the site and surrounding area is relatively flat. Therefore, we conclude the risk of lateral spreading is low.

6.2.5 Cyclic Densification

Cyclic densification (also referred to as differential compaction) of non-saturated sand (sand above groundwater table) can occur during an earthquake, resulting in settlement of the ground surface and overlying improvements. Based on the subsurface data from our field investigations, we conclude the soil above the groundwater table is sufficiently cohesive such that the risk of cyclic densification is low.

7.0 DISCUSSION AND CONCLUSIONS

Based on the results of our engineering analyses using the subsurface data collected from within the site vicinity, we conclude the site may be developed as proposed provided the geotechnical issues discussed below are properly addressed. The primary geotechnical issues affecting the proposed development are: 1) the potential for up to about 4 inches of seismically-induced settlement due to liquefaction beneath the proposed buildings, 2) foundation settlement due to compression of the underlying clay soils, some of which are lightly to moderately over-

consolidated, and 3) the presence of highly expansive near-surface soil. These issues are discussed in more detail below.

7.1 Expansive Soil

Atterberg limits tests performed on samples of the existing near-surface clay indicate this material is highly expansive. Expansive near-surface soil is subject to volume changes during fluctuations in moisture content. These volume changes can cause movement and cracking of foundations, pavements, and slabs. Therefore, foundations, pavements, and slabs should be designed and constructed to resist the effects of the expansive soil. In general, the effects of expansive soil can be mitigated by moisture-conditioning the expansive soil, providing select, non-expansive fill or lime-treated soil below interior and exterior slabs and behind retaining walls, and either supporting foundations below the zone of severe moisture change or by providing a stiff, shallow foundation that can limit deformation of the superstructure as the underlying soil shrinks and swells.

7.2 Foundation Support

The site is underlain by moderately compressible clay layers that extend to a depth of about 65 feet bgs. If the proposed new buildings are supported on a shallow foundation system, settlement will occur due to compression of the underlying clay under static foundation loads. Based on our analyses using the assumed average building pressures presented in Section 1.0, we estimate long-term total and differential settlement of the two proposed residential buildings supported on shallow foundation systems will be on the order of 2 inches and 1 inch over a horizontal distance of 30 feet, respectively. We estimate total long-term total and differential settlement of the proposed new parking structure will be on the order of 2-1/2 inches and 1-1/4 inch over a horizontal distance of 30 feet, respectively. As previously discussed, a major earthquake could result in additional differential settlements of up to 1-1/2 inches and 2 inches for the proposed new residential buildings and parking structure, respectively.

On the basis of our experience, we judge the anticipated differential settlements of unimproved soil due to both static load conditions and post-liquefaction reconsolidation exceed the typical tolerance of shallow foundation systems, such as spread footings or a mat foundation.

We conclude a shallow foundation system, such as footings or a mat, supported on improved soil would be an appropriate foundation system for the proposed new at-grade buildings, provided: (1) the soil improvement is implemented to mitigate liquefaction, and (2) the soil improvement extends to a depth that would reduce differential settlement of the structure under both static and seismic conditions to a tolerable amount. On the basis of our experience, we believe the most appropriate ground improvement method for the site conditions consists of drilled displacement sand-cement (DDSC) columns.

DDSC columns are installed by advancing a continuous flight, hollow-stem auger that mostly displaces the soil and then pumping a sand-cement mixture into the hole under pressure as the auger is withdrawn. This system results in low vibration during installation and generates little to no drilling spoils for off-haul. DDSC columns are installed under design-build contracts by specialty contractors. The required size, spacing, length, and strength of columns should be determined by the contractor, based on the desired level of improvement. The replacement ratio for ground improvement should be selected to mitigate liquefaction, as well as to address static settlement concerns associated with the moderately compressible clay layers. We recommend a preliminary design, including calculations of static and seismic settlement, be prepared by the ground improvement contractor and submitted for our review.

Alternatively, the proposed buildings may be supported on deep foundation systems such as auger cast-in-place (ACIP) piles or Torque Down piles, both of which can be installed with minimal noise and vibrations. We can provide deep foundation recommendations upon request.

7.3 Construction Considerations

The soil to be excavated generally consists of variable amounts of clay, sand, and gravel which can be excavated with conventional earth-moving equipment such as loaders and backhoes. If

site grading is performed during the rainy season, the near-surface clay will likely be wet and will have to be dried before compaction can be achieved. Heavy rubber-tired equipment, such as scrapers and vibratory rollers, could cause excessive deflection (pumping) of the wet clay and, therefore, should be avoided. If the project schedule or weather conditions do not permit sufficient time for drying of the soil by aeration, the subgrade can be treated with lime prior to compaction or imported granular fill can be used. The appropriate amount of lime should be determined during construction based on a visual examination and, if necessary, laboratory testing of the soil to be treated. It is also important that the moisture content of subgrade soil is sufficiently high to reduce the expansion potential. If the grading work is performed during the dry season, moisture-conditioning may be required.

Excavations that will be deeper than five feet and will be entered by workers should be sloped or shored in accordance with CAL-OSHA standards (29 CFR Part 1926). The contractor should be responsible for the construction and safety of temporary slopes.

7.4 Soil Corrosivity

Corrosivity testing was performed by Project X Corrosion Engineering of Murrieta, California on a near-surface soil sample obtained from Boring B-2 at a depth of approximately 3 feet bgs. The results of the corrosivity tests are presented in Appendix B.

Based on the resistivity test results, which indicate the resistivity of the soil at its in-situ moisture content is 2,144 ohm-centimeters, we conclude the near-surface soil should be considered as "moderately corrosive" to buried metals. Accordingly, all buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric-coated steel or iron should be protected against corrosion depending upon the critical nature of the structure. The test results indicate that sulfate and chloride concentrations are insufficient to damage reinforced concrete structures below ground, and the pH of the soil does not present a problem with buried iron, steel, mortar-coated steel, and reinforced concrete.

8.0 RECOMMENDATIONS

Recommendations for site grading, foundation design, ground improvement, and seismic design are presented in this section of the report.

8.1 Site Preparation and Grading

Site clearing should include the removal of all existing underground utilities and buried foundations, if any. In general, abandoned underground utilities should be removed to the property line or service connections and properly capped or plugged with concrete. Where existing utility lines are outside of the proposed building footprint and will not interfere with the proposed construction, they may be abandoned in-place provided the lines are filled with lean concrete or cement grout to the property line. Voids resulting from demolition activities should be properly backfilled with compacted fill following the recommendations provided later in this section.

The near-surface clay at the site is highly expansive. To mitigate the detrimental effects of expansive near-surface clay, at-grade slabs-on-grade should be underlain by at least 12 inches (measured below the bottom of capillary moisture break) of non-expansive soil, which may consist of on-site low-plasticity soil, lime-treated on-site clay, or imported select fill compacted per the requirements presented in Table 4. The soil subgrade beneath proposed improvements or areas for new fill should be scarified to a depth of at least 12 inches, moisture-conditioned to at least four percent above optimum moisture content, and compacted to between 87 and 92 percent relative compaction[5].

On-site soil may be used as general fill, provided the material is free of organic matter, contain no rocks or lumps larger than three inches in greatest dimension, and be approved by the Geotechnical Engineer. If material to be used as fill is imported to the site, it should meet the

[5] Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557-09 laboratory compaction procedure.

requirements for select fill provided below in Section 8.1.1. A summary of the compaction requirements for the various types of fill that may be used at the site is presented in Table 4.

TABLE 4
Summary of Compaction Requirements

Location	Required Relative Compaction (percent)	Moisture Requirement
Building pad subgrade – native high-plasticity clay	87 – 92	4+% above optimum
General fill – lime-treated clay and low-plasticity on-site and imported	90+	Above optimum
General fill – native high-plasticity clay	87 – 92	4+% above optimum
Utility trench backfill – native high-plasticity clay	87 – 92	4+% above optimum
Utility trench backfill – low-plasticity	90+	Above optimum
Utility trench - clean sand or gravel	95+	Near optimum
Pavement subgrade – native high-plasticity clay	90+	2+% above optimum
Pavement subgrade – low-plasticity	95+	Above optimum
Pavement - aggregate base	95+	Near optimum
Exterior slabs – native high-plasticity clay	87 – 93	4+% above optimum
Exterior slabs – low-plasticity	90+	Above optimum
Exterior slabs – select fill	90+	Above optimum

Where the above recommended compaction requirements are in conflict with the City of Mountain View standard details for pavements and sidewalks within the public right-of-way, the City Engineer or inspector should determine which compaction requirements should take precedence.

8.1.1 Soil Subgrade Stabilization

In some areas, soft, wet soil may be exposed during grading, causing the subgrade to deflect and rut under the weight of grading equipment. Although, the majority of the soil beneath the site consists of stiff to very stiff clay, if heavy wheeled equipment is used during the rainy season, these materials may become disturbed and soften. In these areas, some form of subgrade stabilization may be required if disturbance occurs. Several options for stabilizing subgrade are presented below.

Aeration

Aeration consists of mixing and turning the soil to naturally lower the moisture content to an acceptable level. Aeration typically requires several days to a week of warm, dry weather to effectively dry the material. Material to be dried by aeration should be scarified to a depth of at least 12 inches; the scarified material should be turned at least twice a day to promote uniform drying. Once the moisture content of the aerated soil has been reduced to acceptable levels, the soil should be compacted in accordance with our previous recommendations. Aeration is typically the least costly subgrade stabilization alternative; however, it generally requires the most time to complete and may not be effective if the soft material extends to great depths. Aeration will likely not be effective if the building subgrade extends below or near the groundwater table; however, it depends on the time of year construction is performed.

Overexcavation

Another method of achieving suitable subgrade in areas where soft, wet soil is exposed is to overexcavate the soft subgrade soil and replace it with drier, granular material. If the soft material extends to great depths, the upper 18 to 24 inches of soft material may be overexcavated and a geotextile tensile fabric (Mirafi 500X or equivalent) placed beneath the granular backfill to help span over the weaker material. The fabric should be pulled tight and placed at the base of the overexcavation, extending at least two feet laterally beyond the limits of the overexcavation in all directions. The fabric should be overlapped by at least two feet at all seams. Granular

material such as Class 2 aggregate base should then be placed and compacted over the geotextile tensile fabric.

Where very soft subgrade conditions are encountered, a bi-directional geogrid, such as Tensar TriAx TX-140 or equivalent, may be required in lieu of tensile fabric. Where geogrids are used, the depth of overexcavation will likely be on the order of 12 to 18 inches. The geogrids should be overlapped by at least two feet and tied with hog rings or nylon ties at a spacing not to exceed 10 feet. The geogrids should be covered with a well-graded granular fill such as Class 2 aggregate base; open-graded rock should not be used. All backfill placed over the geogrid should be compacted in accordance with our previous recommendations.

Chemical Treatment

Lime and/or cement have been successfully used to dry and stabilize fine-grained soils with varying degrees of success. Lime- and/or cement-treatment will generally decrease soil density, change its plasticity properties, and increase its strength. The degree to which lime will react with soil depends on such variables as type of soil, mineralogy, quantity of lime, and length of time the lime-soil mixture is cured. Cement is generally used when a significant amount of granular material or low-plasticity silt is present in the soil. The quantity of lime and/or cement added generally ranges from 3 to 7 percent by weight and should be determined by laboratory testing. The specialty contractor performing the chemical treatment should select the most appropriate additive and quantity for the soil conditions encountered.

If chemical treatment is used to stabilize soft subgrade, a treatment depth of about 18 inches below the final soil subgrade will likely be required. The soil being treated should be scarified and thoroughly broken up to full depth and width. The treated soil should not contain rocks or soil clods larger than three inches in greatest dimension. Treated soil should be compacted to at least 90 percent RC, and at least 95 percent RC in the upper six inches of pavement subgrade.

8.1.2 Select Fill

Select fill should consist of imported soil that is free of organic matter, contain no rocks or lumps larger than three inches in greatest dimension, have a liquid limit less than 40 and plasticity index less than 15, and be approved by the geotechnical engineer. Select fill should be placed in lifts not exceeding eight inches in loose thickness, moisture-conditioned to above optimum moisture content, and compacted to at least 90 percent relative compaction beneath concrete flatwork and sidewalks. Beneath vehicular pavements, the select fill should be compacted to at least 95 percent relative compaction. Samples of proposed select fill material should be submitted to the geotechnical engineer at least three business days prior to use at the site.

The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not provided, a minimum of two weeks will be required to perform any necessary analytical testing.

8.1.3 Exterior Flatwork Subgrade Preparation

We recommend a minimum of six inches of engineered (select) fill be placed beneath proposed exterior concrete flatwork, including patio slabs and sidewalks; the select fill should extend at least one foot beyond the slab edges. Select fill beneath exterior slabs-on-grade, such as patios and sidewalks, should be moisture-conditioned and compacted in accordance with the requirements provided above in Table 4.

Even with six inches of select fill, exterior slabs may experience some cracking due to shrinking and swelling of the underlying expansive soil. Thickening the slab edges and adding additional reinforcement will control this cracking to some degree. In addition, where slabs provide access to buildings, it would be prudent to dowel the entrance to the building to permit rotation of the slab as the exterior ground shrinks and swells and to prevent a vertical offset at the entries.

8.1.4 Utility Trench Backfill

Excavations for utility trenches can be readily made with a backhoe. All trenches should conform to the current CAL-OSHA requirements. To provide uniform support, pipes or conduits should be bedded on a minimum of four inches of sand or fine gravel. After the pipes and conduits are tested, inspected (if required) and approved, they should be covered to a depth of six inches with sand or fine gravel, which should be mechanically tamped. Backfill for utility trenches and other excavations is also considered fill, and should be placed and compacted in accordance with the recommendations previously presented. If imported clean sand or gravel (defined as soil with less than 10 percent fines) is used as backfill, it should be compacted to at least 95 percent relative compaction. If fill thickness is five feet or greater, it should be compacted to at least 95 percent relative compaction. Jetting of trench backfill should not be permitted. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements, resulting in damage to the pavement section.

Foundations for the proposed building should be bottomed below an imaginary line extending up at a 1.5:1 (horizontal to vertical) inclination from the base of utility trenches. Alternatively, the portion of the utility trench (excluding bedding) that is below the 1.5:1 line can be backfilled with controlled low-strength material (CLSM) with a 28-day unconfined compressive strength of at least 100 pounds per square inch (psi) or Class 2 AB compacted to at least 95 percent relative compaction.

Where utility trenches enter the building pad, an impermeable plug consisting of CLSM, at least three feet in length, should be installed where the trenches enter the building footprint. Furthermore, where sand- or gravel-backfilled trenches cross planter areas and pass below asphalt or concrete pavements, a similar plug should be placed at the edge of the pavement. The purpose of these recommendations is to reduce the potential for water to become trapped in trenches beneath the building or pavements. This trapped water can cause heaving of soils beneath slabs and softening of subgrade soil beneath pavements.

8.1.5 Drainage and Landscaping

Positive surface drainage should be provided around the buildings to direct surface water away from foundations. To reduce the potential for water ponding adjacent to the buildings, we recommend the ground surface within a horizontal distance of five feet from the building slope down away from the building with a surface gradient of at least two percent in unpaved areas and one percent in paved areas. In addition, roof downspouts should be discharged into controlled drainage facilities to keep the water away from the foundation. The use of water-intensive landscaping around the perimeter of the at-grade building should be avoided to reduce the amount of water introduced to the expansive clay subgrade.

Care should be taken to minimize the potential for subsurface water to collect beneath pavements and pedestrian walkways. Where landscape beds and tree wells are immediately adjacent to pavements and flatwork that are not designed as permeable systems, we recommend vertical cutoff barriers be incorporated into the design to prevent irrigation water from saturating the subgrade and AB. These barriers may consist of either flexible impermeable membranes or deepened concrete curbs.

Storm water treatment systems (infiltration basins, rain gardens, bio-retention systems, vegetated swales, flow-through planters, etc.), if constructed at the site, should be provided with underdrains, as well as impermeable liners. Due to the low permeability of the near-surface soil, these systems should not be designed for exfiltration in to the subgrade soil. The drainage layer beneath the "treatment" soil should consist of a minimum 12-inch-thick layer of Caltrans Class 2 Permeable drainage material and include a minimum 6-inch-diameter perforated drain pipe with a filter sock. If the perforated pipe is placed with the perforations facing downward, the filter sock may be omitted. An impermeable liner consisting of a high-density polyethylene membrane (or equivalent) that is at least 10 mils thick should line the entire bottom and sides of the system.

Prior experience and industry literature indicate that some species of high water-demand[6] trees can induce ground-surface settlement by drawing water from the expansive clay, causing it to shrink. Where these types of trees are planted near the proposed new buildings, the ground-surface settlement may result in damage to structure. This problem usually occurs 10 or more years after planting, as the trees reach mature height. To reduce the risk of tree-induced settlement, we recommend trees of the following genera not be planted within 25 feet of the at-grade portion of the building, unless adequate deep irrigation is provided at the tree locations: *Eucalyptus, Populus, Quercus, Crataegus, Salix, Sorbus* (simple-leafed), *Ulmus, Cupressus, Chamaecyparis,* and *Cupressocyparis.* Because this is a limited list and does not include all genera that may induce ground-surface settlement, a tree specialist should be consulted prior to selection of trees to be planted at the site.

8.2 Foundation Design

We recommend the proposed new at-grade buildings be supported on a shallow foundation system, such as footings or a mat, bearing on improved soil. The foundation should be designed to resist the effects of expansive near-surface soil. The following sections present our recommendations for the design and construction of conventional spread footings bearing on soil improved with DDSC columns for the new buildings. We can also provide recommendations for other ground improvement methods or deep foundation systems upon request.

8.2.1 Footings on Improved Soil

The proposed buildings may be supported on spread and continuous footings bearing on improved ground. Individual spread footings may be used at interior column locations; a continuous, deepened perimeter footing should be used around the perimeter of the building. The perimeter footings should be deepened to act as barriers to reduce the potential for moisture change beneath the slab-on-grade floors. Where the exterior footings will consist of individual

[6] "Water-demand" refers to the ability of the tree to withdraw large amounts of water from the soil subgrade, rather than soil suction exerted by the root system.

spread footings, a deepened, turned-down slab edge may be used in lieu of a continuous footing between the individual footings.

Continuous footings should be at least 16 inches wide and isolated spread footings should be at least 24 inches wide. Perimeter footings should be bottomed at least 36 inches below the lowest adjacent outside grade. The perimeter footing embedment depth may be decreased by six inches where pavement or concrete flatwork is adjacent to the new building. Interior footings should extend at least 24 inches below the bottom of the capillary moisture break.

For preliminary design of spread footings bearing on improved ground, we recommend assuming ground improvement elements will extend below the potentially liquefiable soil layers to a depth of about 65 feet bgs. Based on discussions with contractors with experience installing DDSC columns in the Bay Area, we anticipate the ground improvement systems described in Section 7.2, if properly designed, should be capable of increasing the average allowable bearing pressure for footings to at least 5,000 pounds per square foot (psf) for dead-plus-live-loads and limiting combined static and seismic differential settlements to less than one inch over a horizontal distance of 30 feet. Although higher allowable bearing pressures can be achieved with closer spacing of the DDSC columns, we recommend the initial foundation design be performed using an allowable bearing pressure of 5,000 psf. These values may be increased by one-third for total loads. The actual design allowable bearing pressures and estimated settlements should be evaluated by the design-build ground improvement contractor, as they will be based on the diameter, depth, and spacing of the ground improvement elements

Lateral loads may be resisted by a combination of passive pressure on the vertical faces of the footings and friction between the bottoms of the footings and the supporting soil. Lateral resistance may be computed using an allowable passive pressure of 2,000 psf (uniform distribution) for transient loads, including wind and seismic, and an equivalent fluid weight (triangular distribution) of 260 pcf for sustained loads. The upper foot of soil should be ignored unless confined by a slab or pavement. Allowable frictional resistance along the base of the footings should be calculated based on parameters provided by the design-build ground

improvement contractor. For preliminary design, frictional resistance should be computed using a base friction coefficient of 0.35; this value includes an approximate factor of safety of 1.5. The passive pressure and frictional resistance values include a factor of safety of at least 1.5 and may be used in combination without reduction.

Footing excavations should be free of standing water, debris, and disturbed materials prior to placing concrete. The bottoms and sides of the footing excavations should be moistened following excavation and maintained in a moist condition until concrete is placed. We should check footing excavations prior to placement of reinforcing steel.

8.3 Floor Slabs

Slab-on-grade floors may be used for the proposed structures; however, the floor slab may settle differentially up to 1-1/2 inches relative to the footings following a major earthquake. If the potential for this differential settlement is not acceptable, the floor slabs should either be designed to span between footings/grade beams or supported on improved soil. As discussed in Section 8.1, the slab-on-grade floors for the building should be underlain by at least 12 inches of non-expansive soil consisting of either on-site low-plasticity soil or select fill. The capillary break material discussed below should not be counted as part of the non-expansive soil.

To reduce water vapor transmission through the floor slab, we recommend installing a capillary moisture break and water vapor retarder beneath the slab. A capillary moisture break and vapor retarder are generally not required below parking slabs because there is sufficient air circulation to limit condensation of moisture on the slab surface. Where a capillary moisture break/vapor retarder is not used, we recommend six inches of Class 2 aggregate base compacted to at least 95 percent relative compaction be placed beneath the parking garage slab.

A capillary moisture break consists of at least four inches of clean, free-draining gravel or crushed rock. The vapor retarder should meet the requirements for Class B vapor retarders stated in ASTM E1745. The vapor retarder should be placed in accordance with the requirements of

ASTM E1643. These requirements include overlapping seams by six inches, taping seams, and sealing penetrations in the vapor retarder.

If required by the structural engineer, the vapor retarder may be covered with two inches of sand to aid in curing the concrete and to protect the vapor retarder during slab construction. The sand overlying the vapor retarder should be moist at the time concrete is placed. However, excess water trapped in the sand could eventually be transmitted as vapor through the slab. Therefore, if rain is forecast prior to pouring the slab, the sand should be covered with plastic sheeting to avoid wetting. If the sand becomes wet, concrete should not be placed until the sand has been dried or replaced. The particle size of the capillary break material and sand (if used) should meet the gradation requirements presented in Table 5.

TABLE 5
Gradation Requirements for Capillary Moisture Break

Sieve Size	Percentage Passing Sieve
Gravel or Crushed Rock	
1 inch	90 – 100
3/4 inch	30 – 100
1/2 inch	5 – 25
3/8 inch	0 – 6
Sand	
No. 4	100
No. 200	0 – 5

Concrete mixes with high water/cement (w/c) ratios result in excess water in the concrete, which increases the cure time and results in excessive vapor transmission through the slab. Therefore, concrete for the floor slab should have a low w/c ratio - less than 0.50. If the concrete is poured directly over the vapor retarder, we recommend the w/c ratio of the concrete not exceed 0.45. In either case, water should not be added to the concrete mix in the field. If necessary, workability should be increased by adding plasticizers. In addition, the slab should be properly cured.

Before the floor covering is placed, the contractor should check that the concrete surface and the moisture emission levels (if emission testing is required) meet the manufacturer's requirements.

8.4 Permanent Below-Grade Walls

Below-grade walls, if any, should be designed to resist static lateral earth pressures, lateral pressures caused by earthquakes, vehicular surcharge pressures, and surcharges from adjacent foundations, where appropriate. We recommend below-grade walls at the site be designed for the more critical of the following criteria:

- At-rest equivalent fluid weight of 60 pcf above the design groundwater table and 90 pcf below.
- Active pressure of 40 pcf plus a seismic increment of 20 pcf (triangular distribution) above the design groundwater level, and 80 pcf plus a seismic increment of 10 pcf (triangular distribution) below the groundwater level.

The recommended lateral earth pressures above are based on a level backfill condition with no additional surcharge loads. Where the below-grade wall is subject to traffic loading within 10 feet of the wall, an additional uniform lateral pressure of 100 psf, applied to the upper 10 feet of the wall, should be used.

To protect against moisture migration, below-grade walls should be waterproofed and water stops should be placed at all construction joints. The design pressures recommended for above the design water level are based on fully drained walls. Although part of the below-grade walls will be above the groundwater level, water can accumulate behind the walls from other sources, such as rainfall, irrigation, and broken water lines, etc. One acceptable method for backdraining a below-grade wall is to place a prefabricated drainage panel against the back of the wall. The drainage panel should extend down to a perforated PVC collector pipe at the design high groundwater level (or higher if allowed by the structural engineer). The pipe should be surrounded on all sides by at least four inches of Caltrans Class 2 permeable material or 3/4-inch drain rock wrapped in filter fabric (Mirafi NC or equivalent). A proprietary, prefabricated collector drain system, such as Tremdrain Total Drain or Hydroduct Coil (or equivalent), designed to work in conjunction with the drainage panel may be used in lieu of the perforated

pipe surrounded by gravel described above. The pipe should be connected to a suitable discharge point; a sump and pump system may be required to drain the collector pipes.

If backfill is required behind below-grade walls prior to pouring the building slabs, the walls should be braced, or hand compaction equipment used, to prevent unacceptable surcharges on walls (as determined by the structural engineer).

8.5 Flexible and Rigid Pavement Design

Design recommendations for asphalt concrete and Portland cement concrete pavements are presented in the following sections.

8.5.1 Flexible (Asphalt Concrete) Pavement Design

The State of California flexible pavement design method was used to develop the recommended asphalt concrete (AC) pavement sections. On the basis of our experience, we selected an R-value of 5, which is appropriate for highly expansive clay soils. Recommended pavement sections for traffic indices (TIs) ranging from 4.5 to 7.5 are presented in Table 6. The Civil Engineer for the project should check that the TI's presented in this report are appropriate for the intended use. We can provide additional pavement sections for different TIs upon request.

TABLE 6
AC Pavement Sections

Traffic Index	Asphaltic Concrete (inches)	Class 2 Aggregate Base R = 78 (inches)
4.5	2.5	9.5
5.0	3.0	10.0
5.5	3.0	12.0
6.0	3.5	13.0
6.5	4.0	13.5
7.0	4.0	15.5
7.5	4.5	16.5

The upper 12 inches of the subgrade should be moisture-conditioned and compacted in accordance with requirements presented in Section 8.1. The aggregate base should be moisture-conditioned to near optimum and compacted to at least 95 percent relative compaction and be non-yielding.

If pavements are adjacent to irrigated landscaped areas (including infiltration basins), curbs adjacent to those areas should extend through the aggregate base and at least three inches into the underlying soil to reduce the potential for irrigation water to infiltrate into the pavement section. If drip irrigation is used in the landscaping adjacent to the pavement, however, the deepened curb is not required.

8.5.2 Rigid (Portland Cement Concrete) Pavement

Concrete pavement design is based on a maximum single-axle load of 20,000 pounds and a maximum tandem axle load of 32,000 pounds and moderate truck traffic (i.e., several garbage trucks per week). The recommended rigid pavement section for these axle loads is 6.5 inches of Portland cement concrete over six inches of Class 2 aggregate base. For areas that will receive fire truck traffic, the pavement section should consist of seven inches of Portland cement concrete over six inches of Class 2 aggregate base.

The modulus of rupture and unconfined compressive strength of the concrete should be at least 500 and 3,200 pounds per square inch (psi) at 28 days, respectively. Contraction joints should be placed at maximum spacing of 15-foot spacing. Where the outer edge of a concrete pavement meets asphalt pavement, concrete pavement, or interlocking concrete pavers, the concrete slab should be thickened by 50 percent at a taper not to exceed a slope of 1 in 10. Dowelling is not required where new pavement abuts existing pavement. Concrete slabs subject to vehicular traffic should be reinforced with a minimum of No. 4 bars at 16-inch spacing on center in both directions.

The soil subgrade beneath Portland cement concrete pavements should be prepared and compacted in accordance with the recommendations presented in Section 8.1. In addition, the subgrade should be a firm and non-yielding surface. The subgrade should be proof-rolled to confirm it is non-yielding prior to placing the aggregate base under the direction of our field engineer. The Class 2 aggregate base should be moisture-conditioned to near optimum moisture content and compacted to at least 95 percent relative compaction.

8.6 Pavers

8.6.1 Non-Permeable Concrete Pavers

Non-permeable concrete pavers for pedestrian traffic should be underlain by at least 6 inches of select fill or lime-treated on-site soil and compacted to at least 90 percent relative compaction. The soil subgrade beneath pavers should be scarified to a depth of at least eight inches, moisture-conditioned and compacted in accordance with the compaction requirements in Table 4.

Where concrete pavers will be subject to vehicular traffic, we recommend they consist of fully dentated, interlocking shapes and be at least 80 millimeters (3.15 inches) thick. The pavers should be placed on a 1- to 2-inch-thick sand leveling course underlain by at least 12 inches of Class 2 aggregate base. The subgrade and aggregate base should be compacted in accordance with the recommendations for PCC pavement in Section 8.5.2.

8.6.2 Permeable Concrete Pavers

We recommend permeable interlocking concrete pavements (ICP) be designed in accordance with the guidelines presented by the Interlocking Concrete Pavement Institute (ICPI 2005). These guidelines include specific recommendations for permeable aggregate subbase, base, and bedding courses to be placed beneath ICP pavements. We recommend permeable pavements for both vehicular and pedestrian traffic be designed for **no exfiltration** of water into the subgrade soil. This requires installing a subdrain system at the base of the pervious aggregate materials, which are underlain by an impermeable liner. ICPI's generalized paver section for no exfiltration is presented Figure 6.

The soil subgrade beneath ICP pavements should be prepared and compacted in accordance with the recommendations presented in Section 8.1. In addition, the subgrade should be a firm and non-yielding surface. The subgrade should be proof-rolled under the observation of our field engineer to confirm it is non-yielding prior to placing the impermeable membrane and aggregate base materials. The soil subgrade at the bottom of the permeable section should slope down toward the drain pipe trench at a gradient of at least two percent. The perforated pipe should slope down to a suitable outlet at a minimum gradient of one percent. The pipe should be placed with the perforations down on a minimum of two inches of permeable subbase.

ICPI's guidelines call for 1-1/2 to 2 inches of bedding material consisting of ASTM No. 8 aggregate directly below the pavers. This material is also recommended for fill material between the pavers. As shown in Table 7 below, this material consists of fine gravel with 10 to 30 percent sand.

TABLE 7
Gradation Requirements for ASTM No. 8 Aggregate

Sieve Size	Percentage Passing Sieve
1/2 inch	100
3/8 inch	85 – 100
No. 4	10 – 30
No. 8	0 – 10
No. 16	0 – 5

The ASTM No. 8 bedding should be underlain by a permeable base course of ASTM No. 57 crushed aggregate. As shown in Table 8, ASTM No. 57 aggregate consists of open-graded gravel with a gradation between that of the 3/4-inch drain rock and the ASTM No. 8 aggregate.

TABLE 8
Gradation Requirements for ASTM No. 57 Aggregate

Sieve Size	Percentage Passing Sieve
1-1/2 inch	100
1 inch	95 – 100
1/2 inch	25 – 60
No. 4	0 – 10
No. 8	0 – 5

The ASTM No. 57 permeable base course should be underlain by a permeable subbase course of ASTM No. 2 crushed aggregate. The gradation requirements for ASTM No. 2 crushed aggregate subbase are presented in Table 9.

TABLE 9
Gradation Requirements for ASTM No. 2 Aggregate

Sieve Size	Percentage Passing Sieve
3 inch	100
2-1/2 inch	90-100
2 inch	35-70
1-1/2 inch	0-15
3/4 inch	0 -5

The No. 2 aggregate subbase course should be placed in lifts not exceeding 6 inches in loose thickness and compacted using a smooth-drum roller that weighs a minimum of 10 tons, operated in static (non-vibratory) mode. The subsequent course of No. 57 aggregate may be placed in one lift and should be compacted with a smooth-drum roller in vibratory mode with sufficient passes to create an unyielding surface. Placement and compaction of the permeable aggregate base and subbase should be performed under the observation of our field engineer. Following compaction of the No. 57 aggregate, the No. 8 bedding, not exceeding 2 inches in loose thickness, should be placed and spread to a level, undisturbed surface immediately prior to paver installation.

The required thicknesses of the permeable aggregate base and subbase courses depends on the infiltration and water storage design requirements, as well as the traffic loading demand. Our recommendations for the minimum permeable ICP pavement section for pedestrian traffic and vehicular traffic (including fire and garbage trucks) are presented in Table 10.

TABLE 10
Recommended Pavement Sections for
Permeable Interlocking Concrete Pavers

Pavement Type	ASTM No. 8 Bedding Aggregate (inches)	ASTM No. 57 Stone Base (inches)	ASTM No. 2 Stone Subbase (inches)
Pedestrian	1.5-2.0	4.0	6.0
Vehicular	1.5-2.0	4.0	10.0

The above recommended ICP pavement sections are based on the ICPI technical guidelines (ICPI 2005). From a geotechnical standpoint, it is acceptable to design the pedestrian ICP section to exclude the No. 2 subbase course, in which case the No. 57 base course should be increased to 10 inches. If this approach is used, the perforated pipe should include a filter fabric sleeve to prevent the finer aggregate from entering the perforations.

8.7 Seismic Design

We understand the proposed new buildings will be designed using the seismic provisions in the 2016 California Building Code (CBC). Although the CBC calls for a Site Class F designation for sites underlain by potentially liquefiable soil, we conclude a Site Class D designation is more appropriate because: 1) the potentially liquefiable layers are relatively thin and discontinuous, and 2) the proposed ground improvement system should be designed to sufficiently reduce liquefaction potential; therefore, the site will not incur significant nonlinear behavior during strong ground shaking.

The latitude and longitude of the site are 37.4094° and -122.0768°, respectively. Hence, in accordance with the 2016 CBC, we recommend the following:

- S_S = 1.50 g, S_1 = 0.60 g
- S_{MS} = 1.50 g, S_{M1} = 0.90 g
- S_{DS} = 1.00 g, S_{D1} = 0.60 g
- PGA_M = 0.53g

- Seismic Design Category D for Risk Categories I, II, and III.

9.0 GEOTECHNICAL SERVICES DURING CONSTRUCTION

Prior to construction, Rockridge Geotechnical should review the project plans and specifications to verify that they conform to the intent of our recommendations. During construction, our field engineer should provide on-site observation and testing during placement and compaction of fill, ground improvement, and installation of foundations. These observations will allow us to compare actual with anticipated soil conditions and to verify that the contractor's work conforms to the geotechnical aspects of the plans and specifications.

10.0 LIMITATIONS

This geotechnical investigation has been conducted in accordance with the standard of care commonly used as state-of-practice in the profession. No other warranties are either expressed or implied. The recommendations made in this report are based on the assumption that the subsurface conditions do not deviate appreciably from those disclosed in the exploratory borings and CPTs. If any variations or undesirable conditions are encountered during construction, we should be notified so that additional recommendations can be made. The foundation recommendations presented in this report are developed exclusively for the proposed development described in this report and are not valid for other locations and construction in the project vicinity.

LABORATORY TEST DATA

Type of Strength Test	Confining Pressure Lbs/Sq Ft	Shear Strength Lbs/Sq Ft	Fines %	Natural Moisture Content, %	Dry Density Lbs/Cu Ft

Boring terminated at a depth of 44 feet below ground surface.
Boring backfilled with cement grout.
Groundwater level obscured by rotary wash drilling method.

[1] S&H & SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.8 & 1.2 to account for sampler type & approximate hammer energy.

ROCKRIDGE GEOTECHNICAL

Project No.: 17-1382
Figure: A-2b

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions		Symbols	Typical Names
Coarse-Grained Soils (more than half of soil > no. 200 sieve size)	Gravels (More than half of coarse fraction > no. 4 sieve size)	GW	Well-graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	Sands (More than half of coarse fraction < no. 4 sieve size)	SW	Well-graded sands or gravelly sands, little or no fines
		SP	Poorly-graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
Fine -Grained Soils (more than half of soil < no. 200 sieve size)	Silts and Clays LL = < 50	ML	Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL	Organic silts and organic silt-clays of low plasticity
	Silts and Clays LL = > 50	MH	Inorganic silts of high plasticity
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic silts and clays of high plasticity
Highly Organic Soils		PT	Peat and other highly organic soils

GRAIN SIZE CHART

Classification	Range of Grain Sizes	
	U.S. Standard Sieve Size	Grain Size in Millimeters
Boulders	Above 12"	Above 305
Cobbles	12" to 3"	305 to 76.2
Gravel coarse fine	3" to No. 4 3" to 3/4" 3/4" to No. 4	76.2 to 4.76 76.2 to 19.1 19.1 to 4.76
Sand coarse medium fine	No. 4 to No. 200 No. 4 to No. 10 No. 10 to No. 40 No. 40 to No. 200	4.76 to 0.075 4.76 to 2.00 2.00 to 0.420 0.420 to 0.075
Silt and Clay	Below No. 200	Below 0.075

Unstabilized groundwater level

Stabilized groundwater level

SAMPLE DESIGNATIONS/SYMBOLS

- Sample taken with Sprague & Henwood split-barrel sampler with a 3.0-inch outside diameter and a 2.43-inch inside diameter. Darkened area indicates soil recovered
- Classification sample taken with Standard Penetration Test sampler
- Undisturbed sample taken with thin-walled tube
- Disturbed sample
- Sampling attempted with no recovery
- Core sample
- Analytical laboratory sample
- Sample taken with Direct Push sampler
- Sonic

SAMPLER TYPE

C	Core barrel
CA	California split-barrel sampler with 2.5-inch outside diameter and a 1.93-inch inside diameter
D&M	Dames & Moore piston sampler using 2.5-inch outside diameter, thin-walled tube
O	Osterberg piston sampler using 3.0-inch outside diameter, thin-walled Shelby tube
PT	Pitcher tube sampler using 3.0-inch outside diameter, thin-walled Shelby tube
S&H	Sprague & Henwood split-barrel sampler with a 3.0-inch outside diameter and a 2.43-inch inside diameter
SPT	Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside diameter and a 1.5-inch inside diameter
ST	Shelby Tube (3.0-inch outside diameter, thin-walled tube) advanced with hydraulic pressure

APPENDIX B: LABORATORY TEST PROGRAM

The laboratory testing program was performed to evaluate the physical and mechanical properties of the soils retrieved from the site to aid in verifying soil classification.

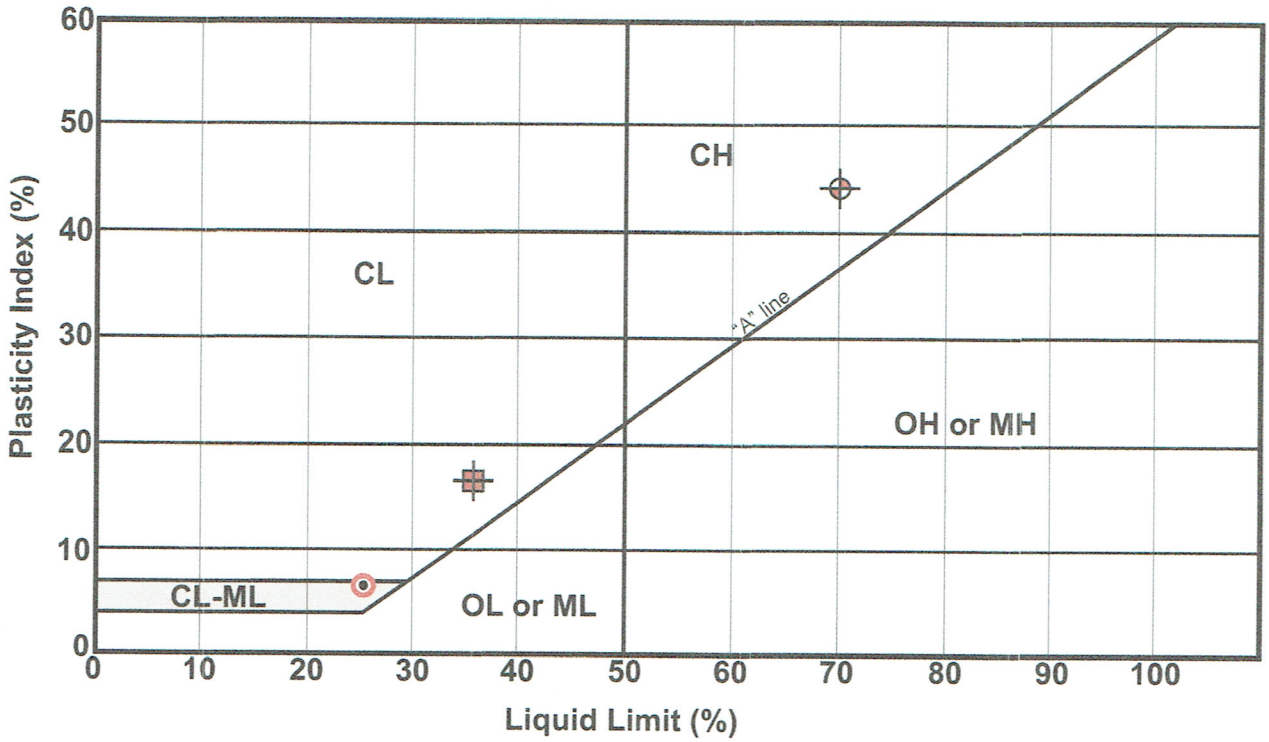
Moisture Content: The natural water content was determined (ASTM D2216) on 25 samples of the materials recovered from the borings. These water contents are recorded on the boring logs at the appropriate sample depths.

Dry Densities: In place dry density determinations (ASTM D2937) were performed on 16 samples to measure the unit weight of the subsurface soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Washed Sieve Analyses: The percent soil fraction passing the No. 200 sieve (ASTM D1140) was determined on five samples of the subsurface soils to aid in the classification of these soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Plasticity Index: Four Plasticity Index determinations (ASTM D4318) were performed on samples of the subsurface soils to measure the range of water contents over which this material exhibits plasticity. The Plasticity Index was used to classify the soil in accordance with the Unified Soil Classification System and to evaluate the soil expansion potential. Results of these tests are shown on the boring logs at the appropriate sample depths and are presented graphically in this appendix.

Plasticity Index (ASTM D4318) Testing Summary



Symbol	Boring No.	Depth (ft)	Natural Water Content (%)	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index	Passing No. 200 (%)	Group Name (USCS - ASTM D2487)

Subject: Phase I Environmental Site Assessment and Phase II Subsurface Investigation
1001 North Shoreline Boulevard
Mountain View, California
(EKI B80116.00)

Dear Ms. Williams:

EKI Environment & Water, Inc. ("EKI") is pleased to present to the Sares Regis Group ("SRG"), who is acting as the development manager for LH Shoreline LP ("Client") the enclosed report entitled *Phase I Environmental Site Assessment and Phase II Subsurface Investigation, 1001 North Shoreline Boulevard, Mountain View, California,* dated 14 June 2019. EKI's services were performed in accordance with the Agreement between Client and EKI, dated 20 February 2019, and Addendum No. 2, dated 12 March 2019.

The Phase I ESA was performed by EKI in general conformance with the scope and limitations of American Society for Testing and Materials ("ASTM") *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*, Designation: E1527-13 (published on 1 November 2013), and the requirements issued by the U.S. Environmental Protection Agency ("U.S. EPA") in 40 CFR Part 312, *Standards and Practices for All Appropriate Inquiries*, *Final Rule,* dated 1 November 2005 ("Final EPA AAI Rule"). The ASTM 1527-13 standard and the Final EPA AAI Rule similarly prescribe accepted reasonable efforts to identify conditions indicative of releases and threatened releases of hazardous substances on, at, in, or to the Subject Property, e.g., Recognized Environmental Conditions ("RECs").

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in 40 CFR Section 312.10. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject Property. We have developed and performed the all appropriate inquiries in general conformance with the standards and practices set forth in 40 CFR Part 312.

We are pleased to have the opportunity to work with you on this project. Please call if you have any questions or need further assistance.

Very truly yours,

EKI ENVIRONMENT & WATER, INC.

Michelle K. King, Ph.D.
President

Executive Summary

EKI Environment & Water, Inc. ("EKI") (formerly Erler & Kalinowski, Inc.) is pleased to present to LH Shoreline LP (the "User") this report documenting the results of the Phase I Environmental Site Assessment ("ESA") and Phase II subsurface investigation for a portion of the property located at the southeastern intersection of Shoreline Boulevard and Highway 101 and identified as 1001 North Shoreline Boulevard in Mountain View, California (the "Subject Property," Figure 1). The Subject Property is approximately 6.0 acres in area and consists of a portion of the parcel identified as Assessor's Parcel Number ("APN") 153-15-032.[1] The larger parcel on which the Subject Property is located is currently occupied by an office building, parking area, and recreational amenities; this Phase I ESA and the Subject Property defined herein includes only the parking area and recreational amenities, as shown on Figure 2. EKI understands that the User owns the Subject Property and has proposed to redevelop the Subject Property with multi-family residential units and limited retail space.

The Phase I ESA was performed by EKI in conformance with the scope and limitations of ASTM International ("ASTM") *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment* Process, Designation: E1527-13 (published on 1 November 2013), and the requirements issued by the U.S. Environmental Protection Agency ("U.S. EPA") in 40 CFR Part 312, *Standards and Practices for All Appropriate Inquiries*, *Final Rule,* dated 1 November 2005 ("Final EPA AAI Rule"). The ASTM 1527-13 standard and the Final EPA AAI Rule similarly prescribe accepted reasonable efforts to identify conditions indicative of releases and threatened releases of hazardous substances or petroleum products on, at, or in, the Subject Property, e.g., Recognized Environmental Conditions ("RECs"). A Phase II subsurface investigation was also conducted as part of the assessment.

Summary of Phase I ESA Findings

EKI's Phase I ESA findings and opinions are presented below. The following REC was identified in connection with the Subject Property:

- Soil gas and groundwater on the Subject Property have been impacted by offsite sources, including the migration of trichloroethene ("TCE") and breakdown products cis-1,2-dichloroethene ("cDCE") and vinyl chloride originating from the 1155 Terra Bella Avenue property to the south. Three groundwater monitoring wells were installed on the southeastern portion of the Subject Property and sampled in 1988 and 2005 (Figure 3). In 1988, TCE was detected in the three wells at concentrations ranging from 16 micrograms per liter ("ug/L") to 300 ug/L. When the wells were sampled in 2005, TCE was detected at concentrations ranging from 33 ug/L to 46 ug/L. In 2019, EKI collected groundwater and soil gas samples across the Subject Property. TCE, cDCE, and vinyl chloride were detected

[1] The full parcel is approximately 7.3 acres in size.

in soil gas and/or groundwater in some locations. Detected TCE concentrations in groundwater ranged from 93.5 ug/L to 14.1 ug/L (with the maximum concentrations at the southeastern portion of the Subject Property adjacent to 1155 Terra Bella Avenue); TCE was not detected in the groundwater samples collected in the northwestern portion of the Subject Property. Based on the detected concentrations in groundwater and investigations conducted on behalf of the property owner of 1155 Terra Bella Avenue, the TCE appears to have been released from a former UST on the upgradient 1155 Terra Bella Avenue property.

The following Historical REC ("HREC") associated with the Subject Property was identified in the performance of this Phase I ESA:

- Several known petroleum hydrocarbon release sites are located south and upgradient of the Subject Property, including the Texaco site located at 975 North Shoreline Boulevard and the Shippen Property site located at 1175 Terra Bella Avenue, as well as other release sites located further to the south. The Texaco and the Shippen Property sites have undergone remediation and both sites received regulatory closure in 2011 and 2001, respectively.

  Given that both the Texaco and the Shippen Property sites have received regulatory closure and the very low concentrations of constituents of concern detected in groundwater at the Subject Property during EKI's 2019 sampling event, these groundwater impacts are not likely to significantly impact the planned future use of the Subject Property.

Summary of EKI 2019 Subsurface Investigations

In March 2019, EKI conducted subsurface investigations at the Subject Property that included the collection and analysis of soil, soil gas, and groundwater samples. The sample locations are shown on Figures 3 and 4, and the analytical results are presented in Tables 1, 2, and 3 of this report. A summary of the findings is presented below.

Results of Soil Sampling

EKI collected and analyzed soil samples from 14 locations on the Subject Property from depths of approximately 0.5 to 1 foot below ground surface ("bgs") and from 7 locations on the Subject Property from depths of approximately 2.5 to 3 feet bgs for analysis of organochlorine pesticides, arsenic, and lead. EKI also collected soil samples from one borehole on the Subject Property in the location of a former transformer pad from depths of approximately 0.5 to 1 foot and 2.5 to 3 feet bgs for analysis of polychlorinated biphenyls ("PCBs"). According to the analytical results, arsenic and lead concentrations in the soil samples were consistent with background levels, and organochlorine pesticides and PCBs were not detected above residential screening levels. Based

on this sampling, EKI did not identify soil with evidence of environmental impacts on the Subject Property.

Results of Soil Gas Sampling

EKI collected soil gas samples from 9 soil gas probes on the Subject Property for analysis of volatile organic compounds ("VOCs"). The primary VOCs detected in soil gas included TCE, cDCE, vinyl chloride, tetrachloroethene ("PCE"), benzene, and chloroform, which were detected at concentrations above the residential land use Environmental Screening Levels ("ESL") for soil gas. TCE, cDCE, and vinyl chloride concentrations in soil gas in the southeastern portion of the Subject Property are consistent with the concentrations of these chemicals observed in groundwater samples collected immediately south of the Subject Property at 1155 Terra Bella Avenue, where a release of TCE has resulted in an identified groundwater plume migrating to the north, i.e., beneath the Subject Property. cDCE and vinyl chloride are likely breakdown products of the TCE in the plume.

It should also be noted that an elevated level of PCE was detected at borehole SG-6, outside the plume originating from 1155 Terra Bella Avenue. PCE was not detected in any of the groundwater samples and no historic source is apparent. Two additional soil gas samples were collected in close proximity to SG-6 and contained PCE at elevated concentrations, although somewhat lower than the concentrations detected in SG-6. As such, the PCE detection at SG-6 appears to be limited in area.

Results of Groundwater Sampling

EKI collected groundwater samples from five locations on the Subject Property for analysis of VOCs. TCE and cDCE were detected in groundwater samples at concentrations above screening levels. The concentrations of these compounds detected in groundwater are shown on Figure 3. The TCE and cDCE detected in groundwater are consistent with those in soil gas and with the plume known to be migrating to the Subject Property from the upgradient 1155 Terra Bella Avenue property to the south.

Taken together, these data suggest the following:

- the TCE, cDCE, and vinyl chloride in soil gas detected the Subject Property likely originate from offsite groundwater migrating to the Subject Property from 1155 Terra Bella Avenue to the south;
- it is unlikely that any significant release of VOCs, including TCE, occurred on the Subject Property; and
- potential historical uses of organochlorine pesticides, arsenic, lead, and PCBs do not appear to affect shallow soil on the Subject Property.

Recommendations

Chlorinated VOCs (PCE, TCE, cDCE and vinyl chloride) are present in all of the soil gas and groundwater samples collected in the southeastern portion of the Subject Property and in soil gas samples collected from locations SG-6, SG-10, and SG-11 in the northwestern portion of the Subject Property. Although the concentrations of these compounds are relatively low, to be conservative, vapor intrusion mitigation measures should be incorporated into any proposed at-grade occupied spaces in the southeastern portion of the Subject Property.

In the northwestern portion of the Subject Property, vapor intrusion mitigation measures should be incorporated into any proposed at-grade occupied spaces from location SG-6 on the east to location SG-7 on the west. Soil gas samples collected from locations SG-7, SG-8, and SG-9 and groundwater samples collected from locations GW-4 and GW-5 did not contain VOCs at concentrations above vapor intrusion screening criteria, and vapor intrusion mitigation is not warranted for the areas north and west of location SG-7.

Shallow soil samples collected during this investigation did not contain organochlorine pesticides, arsenic, or lead at concentrations above residential screening criteria, and remediation, treatment, or mitigation of this soil is not warranted. A materials management program should be put in place as part of construction management for redevelopment to guide soil export and import requirements as well as protocols for dewatering water that may be generated as part of development.

1 INTRODUCTION

EKI is pleased to present to the User this Phase I ESA for the 1001 North Shoreline Boulevard property in Mountain View, California (Figure 1). The Subject Property is approximately 6.0 acres in area and is part of a larger parcel identified by APN 153-15-032. The larger parcel where the Subject Property is located is currently occupied by an office building, parking area, and recreational amenities; the Subject Property and this Phase I ESA include only the parking area and recreational portions of this larger parcel, as shown on Figure 2.

The Phase I ESA was performed by EKI in conformance with the scope and limitations of ASTM *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*, Designation: E1527-13 (published on 1 November 2013), and the requirements issued by the U.S. EPA in the Final EPA AAI Rule. The ASTM 1527-13 standard and the Final EPA AAI Rule similarly prescribe accepted reasonable efforts to identify conditions indicative of releases and threatened releases of hazardous substances or petroleum products on, at, or in, the Subject Property, e.g., RECs.

EKI's services were performed in accordance with the Agreement between the User and EKI, dated 20 February 2019, and Addendum No. 2, dated 12 March 2019.

1.1 Purpose for Phase I ESA

The purpose of the Phase I ESA was to identify RECs for the Subject Property as defined in ASTM E1527-13. EKI understands that the User owns the Subject Property and is proposing to redevelop the northwestern and southeastern portions of the Subject Property with multi-family residences and limited retail space.

1.2 Reliance on Phase I ESA

This report was prepared pursuant to the Agreement between EKI and the User and, as such, is for the sole use and reliance of the User. Unless specifically authorized in writing in an agreement acceptable to EKI in its sole discretion, the reliance on this report by any other entity is not permitted or authorized. Reliance on the information contained in this report by any third party without authorization by EKI does not make the third party a beneficiary to EKI's Agreement with the User. Any such unauthorized reliance on or use of this report, including any of its information or conclusions, will be at third party's risk. The User of this report, as defined by ASTM E1527-13, and as accepted under the Final EPA AAI Rule, is LH Shoreline LP, its affiliates and assigns.

1.3 Phase I ESA Scope of Work

EKI's work in connection with this Phase I ESA included the following tasks:

- Reviewed available historical land use information for the Subject Property and surrounding area, e.g., historical aerial photographs and historical topographic maps provided by Environmental Data Resources, Inc. ("EDR") (see Appendix A);

- Purchased and reviewed a regulatory agency database report for the Subject Property and surrounding area prepared by EDR, dated 15 March 2019 (referred to as EDR Radius Map Report; see Appendix E);

- Reviewed publicly-available files for the Subject Property made available by the City of Mountain View Building Department, the City of Mountain View Fire Department Hazardous Materials Division, and the California Department of Water Resources ("DWR");

- Reviewed environmental reports prepared for nearby upgradient reported chemical release sites available on-line through the State of California Water Resources Control Board ("SWRCB") GeoTracker database and EnviroStor websites;

- Purchased and reviewed an Environmental Lien Search report for the Subject Property, prepared by EDR, dated 15 March 2019 (see Appendix C);

- Obtained specialized knowledge of the Subject Property provided by the User of the Phase I ESA, in the form of responses to a User Questionnaire and from reports provided by the User;

- Performed a walk-through visual survey of the Subject Property on 10 April 2019, to observe the current site setting (see photographs in Appendix B).

2 GENERAL SITE CHARACTERISTICS

2.1 Site Location

The Subject Property is approximately 6.0 acres in area and is generally located east of North Shoreline Boulevard, south of Highway 101 and the Highway 101 southbound on-ramp, west of Linda Vista Avenue, and north of Terra Bella Avenue. In addition, the Subject Property is located approximately 2,200 feet west of Stevens Creek and the Stevens Creek Trail (see Figure 1). The Subject Property is located at 1001 North Shoreline Boulevard. The neighborhood is a mix of office, industrial, commercial, and residential buildings. EKI identified 11 addresses that were formerly associated with the Subject Property. In addition, the street currently known as North Shoreline Boulevard was previously known as Stierlin Road. Thus, the six former North Shoreline Boulevard addresses associated with the Subject Property were also associated with a Stierlin Road address of the same number.

The addresses formerly associated with the Subject Property include 1130 and 1150 Terra Bella Avenue; 1001, 1043, and 1091 North Shoreline Boulevard / Stierlin Road; and 1062 Linda Vista Avenue. Small portions of the 1160-1170 Terra Bella Avenue and 1015 and 1023 North Shoreline Boulevard properties are associated with the Subject Property (Figure 2).

2.2 Site Description and Current Site Uses

The Subject Property is currently occupied by parking, landscaped areas, and recreational amenities.

2.3 Adjoining Properties

This part of Mountain View is made up of a mix of commercial office and light industrial buildings, and residential areas. Highway 101 and the southbound on-ramp is located immediately to the north of the Subject Property. An office building that is located on the same parcel as the Subject Property is located adjacent to and immediately to the southwest of the Subject Property. In addition, two two-story office buildings are located to the north/northeast of the Subject Property. Directly to the east lies an office building as well as an industrial/office building and storage facility beyond Linda Vista Avenue. Office and commercial buildings and a Taco Bell restaurant are located beyond Terra Bella Avenue to the south. Office buildings are located to the west and southwest, beyond North Shoreline Boulevard. Further information about the area surrounding the Subject Property and adjoining properties observed during the site walk-through can be found below in Section 6.3.

3 ENVIRONMENTAL SETTING

Information on the environmental setting of the Subject Property was obtained from the following sources:

- *Final Revised Focused Feasibility Study, Former Spectra Physics Lasers, Inc., and Former Teledyne Semiconductor Sites, Mountain View, California,* prepared by Arcadis U.S., Inc., dated 31 July 2018 (Arcadis, 2018a).

- *Preliminary Soil Vapor Quality Evaluation*, 1001 North Shoreline Boulevard, Mountain View, California, prepared by Cornerstone Earth Group, dated 16 June 2015 (CEG, 2015a).

- *Additional Investigation Report, Former Texaco-branded Service Station 21-1179 975 North Shoreline Boulevard Mountain View, California,* prepared by Stantec, dated 16 December 2010 (Stantec, 2010a).

- *First Quarter 2010 Semi-Annual Groundwater Monitoring Report Former Texaco-branded Service Station 21-1179 975 North Shoreline Boulevard Mountain View, California,* prepared by Stantec, dated 16 December 2010 (Stantec, 2010b).

3.1 Regional Physiography and Geologic Conditions

The Subject Property is situated in the northern portion of the Santa Clara Valley along the edge of San Francisco Bay. The Santa Clara Valley is a gently northward sloping alluvial plain, flanked by the Diablo Range to the east-southeast and the Santa Cruz Mountains to the west-southwest. The Subject Property is located within the Santa Clara Valley Groundwater Basin and the northern portion of the Santa Clara sub-basin. The water-bearing formations of the Santa Clara subbasin include the Santa Clara Formation and the overlying younger alluvium, which together are greater than 1,500 feet thick (Arcadis, 2018a). The alluvium is considered the most important water-bearing unit in the Santa Clara subbasin and is comprised of unconsolidated gravel, sand, silt, and clay formed by a series of convergent alluvial fans (Arcadis, 2018a). A confined zone is present within the alluvium in the northern portion of the subbasin (and in the vicinity of the Subject Property) due to the presence of a low permeability clay layer (Arcadis, 2018a).

3.2 Soil and Geologic Conditions

EKI observed shallow soil on the Subject Property to approximately 15 feet bgs as part of Phase II sampling investigations conducted in March 2019, as described in Section 9 below. The Subject Property is generally underlain by interbedded layers of sand, clay with sand, sandy silt, and silty sand. In areas with asphalt parking surfaces, approximately 1 to 2 feet of sand is present directly beneath the asphalt surface, followed by clay with sand or sandy clay to approximately 10 feet bgs. The clay with sand unit has medium plasticity and varies from brown to dark gray as the depth from ground surface increases. Beneath this sandy clay is a layer of sand or silty sand, which is where shallow groundwater is generally first encountered under semi-confined

conditions at depths of approximately 12 to 15 feet bgs; the hydrostatic head of this groundwater, as measured during Phase II investigations conducted by EKI in March 2019, was approximately 6.7 to 12 feet bgs. Below this water-bearing layer, soil borings advanced by Stantec in 2010 describe medium stiff to very stiff lean clay with variable amounts of sand and sandy silt interbedded with layers of loose to very dense clayey sand and poorly graded sand, silt, and clayey sand reportedly present to a depth of 45 feet bgs (Stantec, 2010a). Very stiff clays and silts interbedded with thin layers of silty or clayey sand are reportedly present from a depth of 45 to 100 feet bgs (CEG, 2015a). Cornerstone Earth Group's ("CEG") soil data was based on a geotechnical investigation that was reportedly carried out in May 2014. EKI did not receive a copy of this investigation, and CEG's 2015 report does not provide other information as to specific locations throughout the Subject Property and the adjacent office building property where this soil data was collected.

3.3 Surface Water Characteristics

The Subject Property lies at a surface elevation of approximately 30 to 35 feet above mean sea level ("ft MSL") (USGS Mountain View Quadrangle, 1997). The majority of the Subject Property is covered with asphalt-paved parking areas, recreational areas (e.g., basketball court and volleyball court), and surrounding landscaped areas. Surface water runoff on the Subject Property presumably flows via the paved surfaces down to the street level and into onsite storm drains, in storm drains in the street gutters, or into a swale located along the northern boundary of the Subject Property. Surface water in the landscaped areas likely infiltrates into the ground. For more information regarding surface drainage and exterior observations at the Subject Property see Section 6.1.

3.4 Shallow Groundwater Characteristics

According to subsurface investigations that were carried out by Stantec in the area immediately southwest of the Subject Property, between February and October 2010, groundwater was encountered between 6.7 and 7.25 feet bgs. According to groundwater monitoring performed southwest of the Subject Property as part of the upgradient former Texaco investigations, groundwater beneath the Subject Property flows generally to the north (Stantec, 2010b). In addition, extensive groundwater monitoring activities carried out in relation to the nearby Former Teledyne Semiconductor/Spectra Physics Inc. Superfund Site, located approximately 650 feet west of the Subject Property, also indicate that shallow groundwater in the area of the Subject Property flows generally to the north (Arcadis, 2018a). During Phase II sampling activities conducted by EKI in March 2019, the hydrostatic head of groundwater was measured at approximately 6.7 to 12 feet bgs.

4 HISTORICAL LAND USE INFORMATION

Information on historical uses of the Subject Property and vicinity was obtained primarily from the following sources:

- Review of historical aerial photographs provided by EDR for selected years between 1939 and 2016 (see Appendix A).
- Review of historical USGS topographic maps provided by EDR for selected years between 1897 and 2012 (see Appendix A).
- Review of publicly available information for the Subject Property provided by the City of Mountain View Community Development Department Building Division and City of Mountain View Fire Department, Hazardous Materials Division, (see Appendix A);
- Review of historical City Directory information provided by EDR (see Appendix A).

According to EDR, Sanborn Fire Insurance maps for the Subject Property and surrounding area are not available.

4.1 Late 1890s through 1950s

On the 1897, 1899, and 1902 USGS topographic maps, the Subject Property and adjoining areas are generally depicted as vacant and undeveloped. Some small structures, likely farmhouses and other agricultural buildings are depicted sporadically in the areas to the north, east, south, and southwest of the Subject Property.

On the 1939, 1943, 1948, 1950, and 1956 aerial photographs, the Subject Property and adjoining properties are being used for agriculture. The Subject Property appears to have been used primarily for row crops. A large orchard is present directly to the west and southwest of the Subject Property. Several small structures, likely farmhouses and other agricultural buildings, are present on the northern portion of the Subject Property in the 1939 and 1943 photographs (along with what is currently North Shoreline Boulevard and Linda Vista Avenue). Additional structures of this type are present in the southern portion of the Subject Property in the 1948 through 1956 photographs. Residential structures formerly located on the Subject Property at the addresses of 1150 Terra Bella Avenue and 1015 North Shoreline Boulevard are among these additional structures that appear beginning in 1948.

Rows of trees in a gridded pattern that look like small orchards are present on portions roughly in the center of the Subject Property in the 1939 through 1956 photographs. Several likely farmhouses and agricultural buildings are located directly adjacent to the Subject Property to the southwest and north. Roads generally consistent with the current North Shoreline Boulevard and Highway 101 are present by 1939. In the 1956 aerial photograph, two large rectangular

greenhouses are located on the northern end of the Subject Property and extend to the north/northeast of the Subject Property.

4.2 1960s Through Present-Day

In the 1968 aerial photograph, the previously mentioned smaller structures remain on the northern portion of the Subject Property, but the agricultural activities characteristic of the Subject Property and surrounding areas appear to be diminishing. The orchard to the west is no longer present, and the adjoining properties to the east, northeast, southwest (1160 and 1170 Terra Bella), and south have been improved with commercial, industrial, and office buildings. The current US Highway 101 located to the north of the Subject Property has been expanded with additional lanes and the present-day cloverleaf interchange has been constructed at the location of the two large greenhouses.

In the 1974 aerial photograph, the former farmhouse/agricultural buildings remain on the northwestern portion of the Subject Property associated with the former address 1091 North Shoreline Boulevard. The western portion of the Subject Property associated with the former address 1043 North Shoreline Drive has been improved with a commercial building. The eastern portion of the Subject Property has been improved with the multi-tenant industrial/office building at the portion of the Subject Property associated with the former address 1062 Linda Vista Avenue. The adjoining properties to the east and southwest have been improved with the current commercial storage facility and office buildings and associated paved areas. The western portion of the Subject Property associated with 1023 North Shoreline Boulevard appears as a paved parking lot, with an office building that is not present until at least 1982. In addition, the adjacent office buildings currently located to the west of the Subject Property, beyond North Shoreline Boulevard, are present in the 1982 aerial photograph. The industrial building located at the portion of the Subject Property associated with the former address 1130 Terra Bella Avenue was also constructed by 1982.

By 1991, the Subject Property was improved with buildings and associated paved areas that were present until recent redevelopment activities from 2016 to 2018. The adjoining properties on all sides appear in their current configuration with the exception of the directly adjoining property to the northeast. The northern portion of this adjacent office/industrial building had been demolished and removed from the site by 1998. The southern portion of this building remains present in the 2005 aerial photograph, in addition to a new separate industrial/office building in the approximate space of the former structure. By 2005, the surrounding properties have been improved with their current configuration. One notable change is the addition of the Verizon cellphone tower that was constructed on the portion of the Subject Property associated with the former address 1062 Linda Vista Avenue in approximately 2014.

In the 2016 aerial photograph, the Subject Property appears to have been redeveloped, and all buildings present in the 2012 aerial photograph have been demolished. The current-day office building adjacent to the Subject Property to the southwest (not part of this Phase I ESA) is under construction, with a crane is visible on the property. A temporary construction building, trailers,

and vehicles are visible on the Subject Property, and the outlines of landscaping and parking areas currently present on the Subject Property are visible.

The following paragraphs summarize historic uses associated with the former addresses that comprise portions of the Subject Property:

1160 and 1170 Terra Bella Avenue
As depicted on Figure 2, only a small portion of this property is included in the Subject Property. This property was improved with a multi-tenant industrial/office building and associated asphalt driveways and parking areas. Former occupants include Plastic Center from 1968 through 1982, MHI in the mid-1980s, and Telewave Inc and Alto Design Group in the early 1990s. Oxigraf Inc. was the last tenant present prior to demolition of the building. Oxigraf's operations consisted of manufacturing fast laser diode oxygen analyzers and oxygen sensors. See Section 8.4.1.3 for more information obtained from the City of Mountain View Fire Department regarding on-site chemical usage and storage associated with this property. This property is now occupied by the adjacent office building with a small piece of landscaping on the Subject Property.

1015 North Shoreline Boulevard, formerly Stierlin Road
As depicted on Figure 2, approximately one-quarter of this property is included in the Subject Property. This property was improved with a single-family residential building on its western portion and associated paved driveway and landscaped areas. The central and eastern portion of this property was a paved parking area. Prior to redevelopment, this building was used as storage space for the restaurant located at 1005 North Shoreline Boulevard. Trash and debris, including wood and furniture scraps, old light fixtures, rusted metal parts, pieces of grills/stoves, parts of outdoor heating lamps, and cylinders of compressed gas, including propane, were stored on the exterior portions of this parcel. This property is now occupied by the adjacent office building with a small portion of parking and landscaping on the Subject Property that forms the entrance to the adjacent office building.

1023 North Shoreline Boulevard, formerly Stierlin Road
As depicted on Figure 2, approximately one-third of this property is included in the Subject Property. This property was improved with an unoccupied multi-tenant office building and associated asphalt driveways and parking areas prior to redevelopment. This property is now occupied by the adjacent office building with parking and landscaping on the portion that is part of the Subject Property.

1043 North Shoreline Boulevard, formerly Stierlin Road
As depicted on Figure 2, most of the property associated with the former address of 1043 North Shoreline Boulevard is located within the Subject Property. This portion of the Subject Property was improved with a multi-tenant office building and associated asphalt driveways and parking areas prior to demolition and redevelopment of the current asphalt parking and landscaping.

1150 Terra Bella Avenue

This property was improved with an unoccupied single-family residential building on its southern portion, a storage shed, and associated paved driveway and landscaped areas. Several free-standing storage shed structures and a small chicken coop were located to the north of the main residential building. The majority of the northern portion of the area was a paved parking area. This parcel is currently occupied by parking associated with the adjacent office building.

1062 Linda Vista Avenue

This property was improved with a multi-tenant industrial/warehouse/office building and associated asphalt driveways and parking areas. It was occupied by various electronics testing companies since at least the 1960s, with Haltek Electronics Test Lab Co being the most recent identified former occupant from 1975-1991. This building was unoccupied at the time of redevelopment from 2016 to 2018. The exterior area of this property to the east of the building is a fenced off area that houses a Verizon cell-phone tower. See Section 8.4.1 for more information obtained from the City of Mountain View Fire Department regarding on-site chemical usage and storage associated with the cellular tower. This parcel is currently occupied by the cell tower and parking associated with the adjacent office building.

1130 Terra Bella Avenue

This parcel was improved with an unoccupied industrial/office building and associated asphalt driveways and parking areas. Identified former occupants included International Semiconductor Technologies and Mesa Technologies (AKA Olin Mesa Corporation) from 1986 to 1991. Datanet was observed as the most recent occupant. This parcel is currently occupied by parking associated with the adjacent office building.

1091 North Shoreline Boulevard, formerly Stierlin Road

This parcel was improved with an industrial/office building and associated asphalt driveways and parking areas prior to demolition and redevelopment of the current asphalt parking and landscaping.

5 RESULTS OF PRIOR SITE INVESTIGATIONS

The User provided EKI with nine previous Phase I ESAs, one combined Phase I/Phase II ESA report, and one Preliminary Soil Vapor Quality Evaluation that were completed for all or portions of the Subject Property. The results of these previous reports are summarized below.

5.1 Summary of Findings of Prior Phase I and II ESA for 1005 & 1015 North Shoreline Boulevard and 1150 Terra Bella Avenue

As discussed above and depicted in Figure 2, a portion of the property associated with the former address of 1015 North Shoreline Boulevard is located on the Subject Property, the property associated with the former address of 1150 Terra Bella Avenue is located entirely within the Subject Property, and the property associated with the former address of 1005 North Shoreline Boulevard is located offsite and to the southwest of the Subject Property. At the time that ERS completed this combined Phase I/Phase II ESA (ERS, 2011) on behalf of Calvano Development, the sites were improved with a retail building (Fiesta Del Mar restaurant) as well as two residential dwellings. Based on the age of the buildings, ERS noted a potential presence of asbestos-containing materials and/or lead based paint. The identified off-site adjoining leaking underground storage tank ("LUST") case to the south located at 975 North Shoreline Boulevard was in the process of receiving closure. ERS indicated that this release had impacted the properties and constituted a REC. ERS also indicated that indoor air sampling results at 1015 North Shoreline did not show that significant vapor intrusion was occurring as a result of impacted groundwater onsite. ERS did not specify what constituents were tested for or the concentration of the constituents in this indoor air sampling event. ERS concluded that this LUST closure was in the public review comment period, that the current Subject Property owner was not identified as a responsible party, and that the responsible party (Texaco) had issued an indemnification letter to the current property owner, which is transferable to future property owners. A copy of this letter is included in Appendix D.

In addition, ERS identified the closed LUST case associated with the Shippen Property located at 1175 Terra Bella Avenue, south of the Subject Property. ERS indicated that low levels of petroleum contamination were identified in groundwater samples collected at the Subject Property from a soil boring (DP-3) located at the southwestern corner of 1150 Terra Bella Avenue at the time of closure. However, ERS indicated that these identified concentrations were below applicable environmental screening thresholds and the LUST case achieved regulatory closure. See Section 8.3.3 for EKI's summary of the 1175 Terra Bella Avenue LUST case. ERS concluded that this release had not significantly impacted the Subject Property and that no additional action was necessary, and classified the condition as an HREC.

As part of a Phase II Investigation conducted in March 2011, ERS advanced four hand auger borings to a maximum depth of three feet bgs in the areas near where materials including paints and lubricants were observed in the fenced-in area to the north and east of the residential building located at 1015 North Shoreline Boulevard. The ERS report does not include a figure showing these borehole locations, but based on the description of the borehole locations, it is

likely that some or all of these boreholes were located on the Subject Property. Soil samples were collected from 0.5 and 2.5-3 feet bgs and submitted for VOC analysis. No VOCs were detected in any of the soil samples and ERS did not recommend additional sampling activities at that time.

ERS also noted that an open drinking water well was located on 1150 Terra Bella Avenue portion of the Subject Property. This well was reportedly not in use at the time of the investigation. ERS noted that this well did not constitute a REC but could act as a potential conduit for contamination to enter or migrate through the groundwater. ERS recommended that this well be properly sealed by a licensed well driller.[2]

5.2 Summary of Findings of Prior Phase I ESA for 1023 North Shoreline Boulevard

As discussed above and depicted on Figure 2, a portion of the property associated with former address of 1023 North Shoreline Boulevard is located on the Subject Property. According to the Phase I ESA that was performed on behalf of Calvano Development (AWR, 2013a), Applied Water Resources ("AWR") indicated that the building at this address was constructed in approximately 1974 and appears to have been used as offices since that time. Based on the age of the building, AWR noted the potential presence of that asbestos-containing materials and/or lead-based paint. AWR also noted that the site was near, but did not appear to be impacted by, several known solvent releases impacting groundwater over a large area west of North Shoreline Boulevard.

AWR identified one former groundwater monitoring well (MW-22H) that was installed near the northern edge of the 1023 Shoreline Boulevard, on the Subject Property, in 1990 during the investigation of a LUST case at the former Texaco Station at 975 Shoreline Boulevard. Groundwater sampling conducted from 1990 through 1992 revealed gasoline impacts in the groundwater samples from MW-22H. The concentrations decreased following remediation activities. Between 1992 and 1994, the concentrations of gasoline and related constituents in the groundwater samples collected from MW-22H dropped significantly and stabilized at lower concentrations. AWR (2013a) indicates that from 2002 onward, TPHg and related constituents were not detected in any of the groundwater samples collected from MW-22H during 30 separate groundwater monitoring events. This site achieved regulatory closure in July 2011. See Section 8.3.4 for EKI's summary of the former LUST case at 975 Shoreline Boulevard. AWR classified this former impact as a HREC and did not recommend additional investigation of the 1023 North Shoreline Boulevard portion of the Subject Property.

[2] According to a well completion report provided to EKI by the DWR, this well was abandoned in September 2011 under permit by the SCVWD. See Section 8.4.6 for a description of the well abandonment records provided by the DWR.

5.3 Summary of Findings of Prior Phase I ESA for 1043 Shoreline Boulevard

As discussed above and depicted on Figure 2, most of the property associated with the former address of 1043 North Shoreline Boulevard is located within the Subject Property. According to the Phase I ESA that was performed on behalf of Calvano Development (AWR, 2013b), AWR indicated that the 1043 North Shoreline Boulevard portion of the Subject Property was improved with an office building since approximately 1970 and that it was used as orchards and a residence prior to that time. Aside from general office usage, AWR also observed a space within the building that appeared to have been used as a small research laboratory, although this space was unoccupied at the time of the ESA. According to AWR (2013b), based on the age of the building, there was a potential presence of asbestos-containing materials and/or lead-based paint.

AWR noted the groundwater sampling events described above in the Phase I ESA for 1023 N Shoreline Boulevard (the adjacent portion of the Subject Property to the south). AWR classified this former impact to the up-gradient offsite location as a HREC. AWR also concluded that the site did not appear to be impacted by several known solvent releases impacting groundwater over a large area west of North Shoreline Boulevard. AWR did not recommend additional investigation of the 1043 North Shoreline Boulevard portion of the Subject Property.

5.4 Summary of Findings of Prior Phase I ESA for 1062 Linda Vista

According to the Phase I ESA that was completed on behalf of Calvano Development (AWR, 2013c), AWR indicated that the former warehouse/industrial building at the 1062 Linda Vista Avenue portion of the Subject Property was occupied by an instrument and electronics company from its time of construction in the 1960s through the 1970s. It was then used as a retail store for electrical components in the 1980s through 1990s. Since that time, it was used primarily for storage of clothing, artwork, supplies, and equipment purchased from storage locker auctions. According to AWR (2013c), based on the age of the building, there was a potential presence of asbestos-containing materials and/or lead-based paint. AWR also concluded that the property did not appear to be impacted by several known solvent releases impacting groundwater over a large area west of North Shoreline Boulevard.

According to AWR (2013c) the property owner and occupant of 1062 Linda Vista Avenue indicated that their procedure was that any chemicals discovered in their purchased collections do not enter the building; rather they are stored outside at the rear of the facility for a short time and then taken to a household hazardous waste collection. At the time of the ESA, chemicals observed inside the building were limited to various paints, lubricants, and cleaners used to clean and repair purchased items for subsequent resale. A hazardous material storage cabinet was observed in the north-central part of the building. All of the containers in the building appeared to be 1-gallon or less retail size containers and AWR did not observe evidence of a release but recommended that additional visual assessment be conducted once the building had been cleared of its contents.

AWR indicated that a Verizon Wireless tower was constructed at the site in a fenced enclosure behind the building in September 2013 and appeared to be in very good condition. AWR was unable to enter the fenced enclosure during the site reconnaissance, but based on observations from the perimeter, a generator with an attached 132-gallon diesel tank was identified as well as signage indicating the presence of batteries for emergency backup power. AWR observed no evidence of a spill or release associated with the wireless tower and support operations at the site. AWR did not recommend additional assessment for the 1062 Linda Vista Avenue portion of the Subject Property.

5.5 Summary of Findings of Prior Phase I ESA for 1160-1170 Terra Bella Avenue

As discussed above and depicted on Figure 2, a portion of the property associated with 1160-1170 Terra Bella Avenue is located on the Subject Property. According to the Phase I ESA that was completed on behalf of Calvano Development, AWR indicated that the office/industrial building located at this address at the time of the ESA was constructed in approximately 1960 (AWR, 2014a). According to AWR (2014a), based on the age of the building, asbestos-containing materials and/or lead-based paint were potentially present. AWR did not identify significant hazardous material use or storage in the building during the course of their investigation.

AWR indicated that a monitoring well was installed just off of the southeastern corner of the 1160-1170 Terra Bella Avenue property for the investigation associated with a release originating on the property directly south of the subject site at 1175 Terra Bella Avenue. For more information regarding this former LUST case, see Section 8.3.3. In addition, monitoring wells were installed on the properties west of 1160-1170 Terra Bella Avenue for the investigation associated with a release of gasoline from the former LUST site located at 975 Shoreline Boulevard. For more information regarding this former LUST case, see Section 8.3.4. AWR indicated that no sampling appears to have been done on the 1160-1170 Terra Bella Avenue property for either of the releases. AWR concluded that since both of these off-site releases had achieved regulatory closure, and that the Subject Property was never named as a possible source of the impacts, potential impacts from the former LUST sites are classified as an HREC. AWR also concluded that the 1160-1170 Terra Bella Avenue portion of the Subject Property did not appear to be impacted by several known solvent releases impacting groundwater over a large area west of North Shoreline Boulevard. AWR did not recommend additional investigation or identify ongoing continuing obligations of this portion of the Subject Property.

5.6 Summary of Findings of Prior Phase I ESA for 1130 Terra Bella Avenue

According to the Phase I ESA that was completed on behalf of Calvano Development (AWR, 2014b), at the time of the ESA this portion of the Subject Property was improved with an office/warehouse building. In addition, AWR noted that based on the age of the building, asbestos-containing materials and/or lead-based paint were potentially present. AWR indicated that three monitoring wells (MW-1, MW-2, and MW-3) were installed at the 1130 Terra Bella Avenue portion of the Subject Property in August 1988 to evaluate the potential of the Subject Property to have been a contributor to the regional groundwater impacts in the area. AWR

identified documents indicating that VOCs had been stored at the 1130 Terra Bella Avenue portion of the Subject Property in the past. In 1989, the Mountain View Fire Department granted Olin Mesa Corporation a facility closure for the hazardous materials stored and used at 1130 Terra Bella Avenue.

According to the most recent groundwater sampling of wells MW-1, MW-2, and MW-3 (Figure 2) that was performed on 27 July 2005, TCE and cis-1, 2-DCE were detected at respective concentrations of 46 ug/L and 9.0 ug/L in samples from well MW-3, which was located on the upgradient portion of 1130 Terra Bella Avenue. These values were above the ESLs for drinking water applicable at that time, but below applicable ESLs for vapor intrusion for residential/unrestricted land use (RWQCB, 2013). AWR concluded based on the relative concentrations detected in the three wells, it was likely that the source of the VOC contamination was from an upgradient, offsite source.

AWR did not identify evidence of this portion of the Subject Property being an agency-listed site and concluded that there had been no identified release of hazardous materials onto the 1130 Terra Bella Avenue portion of the Subject Property. AWR (2014b) further concluded that the groundwater contamination detected in the onsite monitoring wells appeared to be the result of the migration of VOCs from an upgradient, off-site source and that the source of the chlorinated solvent impacts had not been conclusively determined at the time of this investigation. AWR concluded that the unresolved impacts, regardless of whether the source was on or off the Subject Property, constituted a REC. In addition, AWR identified an agreement establishing a restriction prohibiting the use of chlorinated solvents at the 1130 Terra Bella Avenue portion of the Subject Property was recorded in connection with the sale of the property in 2005.[3]

5.7 Summary of Findings of Prior Phase I ESA for 1091 North Shoreline Boulevard

According to this Phase I ESA that was completed on behalf of Calvano Development, at the time of the ESA, this portion of the Subject Property was improved with a two-story multi-tenant office building (AWR, 2014c). According to AWR (2014c), based on the age of the building, asbestos-containing materials and/or lead-based paint were potentially present. AWR noted that prior to the construction of that building, the 1091 North Shoreline Boulevard portion of the Subject Property had been used in part for orchards going back to at least 1939. AWR indicated that the site did not appear to have been impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. AWR did not recommend further investigation or identify ongoing continuing obligations for the 1091 North Shoreline Boulevard portion of the Subject Property.

[3] A copy of the 2005 agreement is provided in Appendix C. EKI notes that this private-party agreement has since been voided.

5.8 Summary of Findings for Preliminary Soil Vapor Quality Evaluation for 1001 North Shoreline Boulevard (CEG, 2015a)

On 11 May 2015, CEG installed four dual-depth vapor probes (SV-1 through SV-4) within the footprint of the planned 4-story office building that is currently located immediately west of the Subject Property. Soil vapor probes were installed at depths of approximately 4 to 5 and 9 to 9.5 feet bgs, in order to collect soil vapor samples from the subsurface (CEG, 2015a). CEG collected a total of seven soil vapor samples on 14 May 2015; one each from the upper and lower probes at locations SV-2 and SV-3, two from the upper probe at location SV-1, and one from the upper probe at location SV-4. Low flow conditions reportedly prevented the collection of samples from the lower probes at locations SV-1 and SV-4. These soil vapor samples were subsequently analyzed for VOCs, total petroleum hydrocarbons-gasoline (TPHg), carbon dioxide, oxygen, and methane. Key findings from the soil vapor quality evaluation are summarized below:

- Benzene was detected above laboratory reporting limits in 5 samples and exceeded the current residential and commercial/industrial ESLs of 3.2 and 14 micrograms per cubic meter ("ug/m^3"), respectively, in the samples collected from location SV-2 at 69 ug/m^3 and location SV-4 at 99 ug/m^3.

- PCE was detected above the current residential and commercial/industrial ESLs of 15 and 67 ug/m^3, respectively, in both of the samples collected from the shallow probe at the SV-1 location. The concentrations in the initial and duplicate SV-1 samples were 720 ug/m^3 and 740 ug/m^3, respectively. PCE was not detected in the other soil vapor samples analyzed.

- TCE was detected above the current residential ESL of 16 ug/m^3 of in both of the samples collected from the shallow probe at the SV-1 location at a concentration of 91 ug/m^3, which was less than the current commercial/industrial ESL of 100 ug/m^3. TCE was not detected in the other soil vapor samples analyzed.

- Chloroform was detected at concentrations above the 2015 residential and commercial ESLs of 4.1 and 18 ug/m^3, respectively, in samples collected from the shallow probe at the SV-3 location (41 ug/m^3) and the probe at the SV-4 location (66 ug/m^3). Chloroform was not detected in the other soil vapor samples analyzed.

- TPHg and other VOCs were detected but in concentrations below the respective residential and commercial screening levels for potential vapor intrusion risk.

- Oxygen concentrations ranged from 2.6% to 18% and carbon dioxide ranged from 0.86% to 16% in the soil vapor samples. Methane was not detected in any soil vapor samples.

CEG concluded that vapor intrusion mitigation measures did not appear to be required based on the planned commercial development;[4] however, a liner was installed under the current commercial building constructed adjacent to the Subject Property between 2016 and 2018.

5.9 Summary of Findings of Prior Phase I ESA for 1001 North Shoreline Boulevard by Langan

Langan Engineering and Environmental Services, Inc. ("Langan") prepared a Phase I ESA for the Subject Property in April 2018 (Langan, 2018). At the time of the Phase I, Langan observed that the Subject Property had been recently redeveloped, and the office building adjacent to the Subject Property was under construction and vacant. Langan did not identify any RECs at the Subject Property but identified two Controlled Recognized Environmental Conditions ("CRECs"), which are RECs resulting from past releases that have been addressed to the satisfaction of the applicable regulatory agency and allowed to remain in place subject to the implementation of controls (including land use restrictions, engineering controls, etc.). The CRECs identified by Langan were as follows:

- VOCs in soil gas and groundwater were detected above the ESLs and were attributed to upgradient sources that migrated onto the Subject Property. Langan referenced the mitigation measures in the Site Management Plan ("SMP") prepared by CEG and approved by the Santa Clara County Department of Environmental Health ("SCCDEH"), including the vapor barrier installed in the adjacent office building, as controls justifying the designation of the soil gas and groundwater as a CREC.

- The former acid neutralization sump located in the eastern portion of the Subject Property was used to neutralize acids prior to discharge to the sanitary sewer system. In 1987, following a fire and termination of the industrial waste discharge permit, the sump was removed. Groundwater monitoring wells were installed upgradient and downgradient of the sump, and TCE was detected in groundwater above the ESL of 5 ug/L. The highest concentration of TCE was detected in in the upgradient monitoring well. The site achieved regulatory closure by the City of Mountain View Fire Department. Langan classified the sump as a CREC.

[4] The data listed above are compared to current ESLs, which are more stringent than the 2013 ESLs. The VOC concentrations in the soil vapor samples collected by CEG were all below than the 2013 commercial ESLs.

6 RESULTS OF SITE WALK-THROUGH VISUAL SURVEY

On 10 April 2019, Jacki Lee of EKI conducted a visual reconnaissance of the Subject Property. Ms. Lee conducted the site walk-through under the supervision of James Yoon, an Environmental Professional as defined in 40 CFR Section 312.10, and as accepted by ASTM 1527-13 (see resume in Appendix F). The majority of the Subject Property is parking and landscaped areas with recreational amenities. The building currently present at 1001 North Shoreline Boulevard is not included in the Subject Property and is currently occupied by Google.

Observations of the Subject Property and adjoining areas are discussed below. Selected photographs taken during the walk-through of the Subject Property are presented in Appendix B of this report.

The Subject Property consists of parking lots, driveways, landscaped areas, pathways, a basketball court, and a volleyball court. The area immediately to the southwest of the Subject Property is occupied by a new four-story office building with the street address of 1001 North Shoreline Boulevard; the building and the property immediately west and south of the building are not included in the scope of this Phase I ESA.

Stormwater on the Subject Property infiltrates to the subsurface in the landscaped areas. Within the paved parking areas and roadways, stormwater is directed towards culverts located along the asphalt to a subgrade stormwater collection system.

A fenced-in area containing a Verizon cellphone tower and associated equipment was observed near the center of the Subject Property in a location associated with the former 1062 Linda Vista Avenue address. This area was locked and EKI was unable to enter and inspect the area. From outside of the fenced area, EKI observed a diesel-storage tank labeled with a 132-gallon capacity. No evidence of leaks or spills were observed.

Outside of the diesel tank located within the Verizon cellphone tower area, EKI did not observe hazardous substances, unidentified substances, petroleum products, or containers of either hazardous or unidentified substances or petroleum products, odors, storage tanks, pools of liquid, drums, stains, corrosion or stained soil/pavement, sumps, ponds, pits or lagoons, stressed vegetation, solid waste, or wells.

Electrical transmission at the Subject Property is located underground; no pole-mounted transformers were observed in the area of the Subject Property. During a prior site visit by EKI to the Subject Property in 2015, prior to demolition, a pad-mounted transformer was observed southeast of the building formerly located at the 1091 North Shoreline Boulevard portion of the Subject Property. Significant dark staining was observed around the pad-mounted transformer (see Figure 2). This staining appeared to be emanating from the base of the transformer and over the concrete pad and into the surrounding planter/landscaped area. The transformer was not labeled with respect to PCB content. To determine whether transformer oil and PCBs may have

been released to the soil surrounding this transformer pad, soil samples were collected from the area as part of the Phase II investigations described in Section 9.2.1 below.

EKI observed evidence of drilling and sampling immediately south of the Subject Property, on the north side of Terra Bella Avenue. This sampling is likely associated with that requested by SCCDEH for the 1155 Terra Bella Avenue site (see Section 8.3.2).

6.1 Surrounding Areas

This part of Mountain View is made up of a mix of commercial, office, industrial, and residential buildings. Highway 101 and associated on-ramps are located immediately north of the Subject Property.

To the west, beyond North Shoreline Boulevard lies paved parking and landscaped areas that surround two large industrial/office buildings. The buildings located at 1274 and 1212 Terra Bella Avenue are currently occupied by Teledyne Technologies Inc. and Iridex Corporation, respectively.

To the southwest of the Subject Property, beyond the intersection of North Shoreline Boulevard and Terra Bella Avenue, lies an additional large industrial/office building and associated paved and landscaped areas that is identified as 1215 Terra Bella Avenue, and is currently occupied by Glowlink Communications Technology, Inc.

To the south beyond Terra Bella Avenue lie several commercial, office, and industrial buildings and associated paved and landscaped areas. These buildings include a commercial building occupied by Taco Bell located at 975 North Shoreline Boulevard, an apparently vacant industrial/office building located at 1175-1185 Terra Bella Avenue, a vacant commercial building located at 1155 Terra Bella Avenue, and an office/industrial building that is occupied by Amaranth Medical located at 1145 Terra Bella Avenue.

To the east lies a vacant office building located at 1110 Terra Bella Avenue and an office building occupied by Terra Bella Academy located at 1012 Linda Vista Avenue. The western wall of this building directly adjoins the Subject Property. To the east, beyond Linda Vista Avenue is Design Spaces Co-working Office located at 1045 Linda Vista Avenue and a commercial storage facility occupied by Public Storage and located at 1040 Terra Bella Avenue. Directly adjoining the Subject Property to the northeast (north of 1062 Linda Vista Avenue and east of 1091 North Shoreline Boulevard) lie two office/commercial buildings and associated paved and landscaped areas located at 1066 and 1080 Linda Vista Avenue occupied by the Church of Scientology. Stevens Creek is located approximately 2,200 feet to the east of the Subject Property.

7 INFORMATION PROVIDED BY USER AND OWNER

According to the ASTM E 1527-13 standard, certain tasks that may help identify the presence of RECs associated with the Site are generally conducted by the Phase I ESA User. These tasks include: providing, or authorizing the *environmental professional* to obtain recorded land title records for environmental liens or activity and land use limitations; providing specialized knowledge related to RECs at the Site (e.g., information about previous ownership or environmental litigation); providing commonly known or *reasonably ascertainable* information within the local community about the *property* that is material to RECs in connection with the *property*; and informing the *environmental professional* if, as believed by the User, the purchase price of the *property* is lower than the fair market value due to contamination. A completed User Questionnaire as well as previous reports have been received and information has been incorporated, as appropriate, into this Phase I ESA report.

7.1 Results of Environmental Lien Search

EKI purchased from EDR an environmental lien search report for the Subject Property using APN 153-15-032. A copy of the EDR lien search report, dated 15 March 2019, is included in Appendix C of this report. EDR found no records of environmental liens filed or recorded against the Subject Property, or any Activity and Use Limitations ("AULs") recorded for the property.

8 RESULTS OF REGULATORY AGENCY FILE REVIEWS

To identify conditions indicative of releases and threatened releases of hazardous substances on, at, in, or to the Subject Property, i.e., known or potential contamination of soil or groundwater, or reported chemical use, EKI contracted with EDR to perform a search of available, selected federal, state, and local environmental regulatory agency databases. EDR performed a search for the Subject Property area and properties located within selected radii of the Subject Property. A copy of the resulting "radius map report" provided by EDR is located in Appendix E. Refer to the EDR report for a complete list of the federal, state, and tribal databases searched.

8.1 Results of EDR Database Search for Subject Property

According to the EDR Report, two of the former addresses associated with the Subject Property are listed on various regulatory agency databases. Olin Mesa Corporation, formerly located at 1130 Terra Bella Avenue, was identified on the RCRA-SQG, FINDS, and CA EMI databases. McCandless Land and Cattle Company, formerly located at 1091 North Shoreline Boulevard, was identified on the CA HAZNET database. Specific information regarding these on-site facilities as presented in the EDR Report are discussed below.

Olin Mesa Corporation (1130 Terra Bella Avenue):

> Listed as a Small Quantity Generator of hazardous materials in 1986 and 1990 under the EPA ID#: CAD981395205. Listed on the FINDS database with the registry ID: 110002692676. Listed on the CA EMI database in 1987 as facility ID 2136 within the Bay Area AQMD. Olin emitted 9 tons/year of Total Organic Hydrocarbon Gases, 5 tons/year of Reactive Organic Gases, 1 ton/year of Particulate Matter, and 1 ton/year of Particulate Matter 10-micrometers and smaller. No violations associated with these database listings were reported.

McCandless Land and Cattle Company (1091 North Shoreline Boulevard):

> In 1999 McCandless was listed on the CA HAZNET database for being in the waste category of "Waste oil and mixed oil" with the disposal method listed as "other". McCandless reportedly disposed of .0834 tons of hazardous material. McCandless was identified by the following ID numbers: Envid #: S112905361; GEPAID#: CAC002223889; TSD EPA ID#: CAD059494310. No violations associated with this database listing were reported.

The information in the EDR Report indicates that chemicals were used or stored, and/or that hazardous wastes were generated at in certain areas of the Subject Property. In addition, the EDR indicates that particulate matter was emitted from the Subject Property. The database listings, however, do not indicate documented releases of chemicals at the facilities.

8.2 Off-Site Properties with Reported Chemical Use

As discussed in Section 3.3, groundwater in the vicinity of the Subject Property flows to the north towards San Francisco Bay.

Based on the EDR Report, the following facilities, which are located within approximately one-quarter mile and up-gradient (generally to the south) of or adjacent to the Subject Property, are listed on specific chemical use, storage, or disposal regulatory agency databases, or other databases of potential environmental concern. These facilities are listed in the order of increasing distance from the Subject Property, as reported by EDR.

Site Name	Site Address	Regulatory Agency Databases	Approximate Distance and Direction based on EDR
ADVANCED MARINE SERVICE	1049 LINDA VISTA AV	CUPA Listings	0.009 E
CSI MOUNTAIN VIEW GARD-MORE CIRCUITS INC COMM. BLDG ROBB-JACK CORP.	**1066/1080 LINDA VISTA AVENUE**	**RCRA-SQG, CPS-SLIC, CERS, RCRA-SQG, FINDS, ECHO, CA FID UST, SWEEPS UST, HIST LUST, HIST CORTESE, CERS, HIST UST**	**0.009 ENE**

The above-listed facilities at the addresses shown are included on regulatory agency databases that reflect use and storage of chemicals, as well as off-site disposal of hazardous wastes. It should be noted that only those sites indicated above in **bold** are located up-gradient (generally to the south) or adjacent to the Subject Property and reported by EDR as a release site. These sites are discussed in Section 8.3 below. Adjacent and nearby properties that are identified by the EDR but do not have identified releases do not present an environmental concern for the Subject Property.

8.3 Off-Site Properties with Reported Chemical Releases

According to the EDR Report, there are seven reported release sites located in the proximity of (within approximately one-quarter of a mile) and potentially up-gradient of (generally to the south) or adjacent to the Subject Property with regard to reported shallow groundwater flow direction. EKI has also included the downgradient property located at 1066/1080 Linda Vista Avenue given that it is located adjacent to the Subject Property.

EKI reviewed potentially relevant information for the reported release sites available on the SWRCB on-line GeoTracker database as well as the California Department of Toxic Substances Control's ("DTSC's") on-line EnviroStor database, Santa Clara Valley Water District's ("SCVWD's") online historic solvent case files database, and the SCCDEH Local Oversight Program online database when GeoTracker files were not available. A summary of these off-site reported release sites and the potential for impacts to the Subject Property are discussed below.

8.3.1 *Review of CSI Mountain View/Gard-More Circuits/Robb-Jack Corp Site Files (1066/1080 Linda Vista Avenue)*

The CSI Mountain View/Gard-More Circuits/Robb-Jack Corp. site is located adjacent to the Subject Property to the northeast and is downgradient of the eastern portion of the Subject Property. EKI reviewed the Underground Storage Tank Case Closure Letter for the Robb-Jack Corp. site, dated 26 June 1996, available on the GeoTracker website (RWQCB, 1996).

According to closure documentation, the site was identified as a LUST in May 1986 due to a 1,000-gallon gasoline UST that was observed to have holes at the time of removal. The "most affected soil" associated with the UST was reportedly excavated in 1986 and again in 1994, and confirmation soil sampling was performed following excavation in 1994. Three groundwater monitoring wells were installed and sampled 12 times between 1990 and 1994. In 1994, the maximum detected concentrations of TPHg and associated VOCs were reported as follows: TPHg (200 ug/L), benzene (3.5 ug/L), toluene (0.72 ug/L), and xylene (1.4 ug/L) (RWQCB, 1996). The site achieved regulatory closure in 1996.

In the *Limited Phase II Grab Groundwater Sampling Activities and Conceptual Site Model* report, SCS stated that previous sampling was conducted at the property in 2008 and identified TCE, PCE, and breakdown products in soil and groundwater, and based on these partial results (not

included in the SCS report), SCS performed additional sampling at the property in 2016 (SCS, 2016). Maximum concentrations of PCE and TCE in groundwater in 2016 were 76 ug/L (near the northeastern Subject Property boundary) and 180 ug/L (in the southeastern corner of 1080 Linda Vista Avenue), respectively (SCS, 2016). Sub-slab soil gas concentrations under the 1066 Linda Vista Avenue building of chlorinated VOCs such as PCE (up to 2,900 ug/m^3) and TCE (up to 420 ug/m^3) were above the residential and commercial land use ESLs applicable at that time (SCCDEH, 2018a). Based on the results of indoor air sampling conducted in the 1066 Linda Vista Avenue building, the SCCDEH determined that the concrete slab at the building was providing sufficient protection from vapor intrusion, and the site achieved regulatory closure in 2018 (SCCDEH, 2018a). The VOCs detected in groundwater on 1066/1080 Linda Vista Avenue appear to be comingled with the plume originating from 1155 Terra Bella Avenue (see Section 8.3.2), but additional sources originating on the 1066/1080 Linda Vista Avenue property may be present.

8.3.2 *Review of Former Telewave Property Site Files (1155 Terra Bella Avenue)*

The Former Telewave Property site is located adjacent and to the south of the eastern portion of the Subject Property, just south of Terra Bella Avenue. EKI reviewed a Phase I & II Environmental Site Assessment for the Former Telewave Property site, dated 15 November 2016 (WHA, 2016). The site was used for fabrication of radio equipment from the 1980s to 2008; from 2008 to 2016 the site was used as storage (WHA, 2016). Manufacturing activities at the site included acid etching, painting, and assembly of metal parts. According to the Phase I & II report, a UST was reportedly removed from the site prior to 2016, although documentation for the UST removal was unavailable (WHA, 2016). The UST may have been used to store solvents. Soil, soil gas, and groundwater at the site were impacted with chlorinated VOCs including TCE, PCE, cDCE, and vinyl chloride (WHA, 2016). Maximum concentrations of compounds in groundwater during the 2016 investigation included TCE at 6,600 ug/L, PCE at 26 ug/L, cDCE at 1,500 ug/L, tDCE at 280 ug/L, and vinyl chloride at 32 ug/L. Maximum concentrations of compounds in soil during the 2016 investigation included TCE at 72 milligrams per kilogram ("mg/kg") and cDCE at 0.5 mg/kg. Maximum concentrations of compounds in soil gas during the 2016 investigation included TCE at 25,000 ug/m^3, PCE at 770 ug/m^3, and TPHg at 140,000 ug/m^3 (WHA, 2016).

In October 2018, SCCDEH requested that the property owner perform groundwater sampling on the north side of Terra Bella Avenue, immediately south of the Subject Property, to characterize the extent of VOCs in groundwater (SCCDEH, 2018b). Based on a conversation with WHA on 11 April 2019, EKI understands that the sampling has been performed and the data verify that the VOCs in groundwater from 1155 Terra Bella Avenue extend to the Subject Property.

Given the proximity, the groundwater flow direction, and concentrations of chlorinated VOCs in groundwater, a plume of chlorinated VOCs including TCE, cDCE, and vinyl chloride is migrating from the 1155 Terra Bella Avenue site to the Subject Property. The March 2019 Phase II investigations conducted by EKI described in Section 9 below further confirm the presence of these compounds at concentrations above residential and commercial ESLs for soil gas and groundwater at the Subject Property.

8.3.3 *Review of Shippen Property Site Files (1175 Terra Bella Avenue)*

The Shippen Property site is located adjacent and to the south of the central portion of the Subject Property, just south of Terra Bella Avenue. EKI reviewed the Fuel Leak Site Case Closure for the Shippen Property site, dated 17 July 2001, available through the GeoTracker website (SCVWD, 2001). According to the site closure documentation, the facility was identified in the LUST database beginning in August 1998 as a result of the removal of a leaking former 500-gallon gasoline UST and received closure from SCVWD in July 2001. Approximately 20 cubic yards of impacted soil were removed along with the leaking UST in 1998. In November 2000, three soil borings were advanced on the Shippen Property site, and one boring was advanced on the southern portion of the 1150 Terra Bella Avenue portion of the Subject Property (location DP-3). In the groundwater samples collected upgradient of the Subject Property, on the Shippen Property, TPHg, toluene, ethylbenzene, xylenes and methyl tert-butyl ether ("MTBE") were detected at maximum concentrations of 2,600 ug/L, 4.4 ug/L, 26 ug/L, 70 ug/L, and 11 ug/L, respectively. These concentrations of TPHg, xylenes, and MTBE exceeded their ESLs for groundwater that is a potential drinking water source of 100 ug/L, 20 ug/L, and 5 ug/L, respectively. In addition, the concentration of ethylbenzene was above the ESL for vapor intrusion for residential land use of 3.5 ug/L. This site achieved regulatory closure from SCVWD in July 2001.

In the grab groundwater sample collected from the 1150 Terra Bella Avenue portion of the Subject Property, benzene was detected at a concentration of 1.8 ug/L, which was above the California drinking water standard of 1 ug/L and the vapor intrusion screening ESL for unrestricted/residential land use of 0.42 ug/L. TPHg, toluene, and xylenes were also detected in this groundwater sample, at concentrations below their respective drinking water and vapor intrusion screening levels (SCVWD, 2001) (Figure 3).

Given the proximity of Shippen Property site to the Subject Property, the groundwater flow direction, and the low detections of petroleum chemicals in the sample collected from the southern edge of the Subject Property, low concentrations of petroleum hydrocarbons in groundwater may have migrated from this site to the Subject Property. However, given the low concentrations detected in groundwater on the Subject Property in 2000, impacts to the Subject Property would likely be very minimal. Moreover, natural degradation of these chemicals would be expected to have occurred since the last groundwater sampling event in 2000.

8.3.4 *Review of Texaco (CVX #21-1179) Site Files (975 North Shoreline Boulevard, formerly 975 Stierlin Road)*

The Texaco site is located south of the western portion of the Subject Property beyond Terra Bella Avenue to the south.[5] This site was identified by EDR as being listed on several LUST-related

[5] The EDR Radius Report identifies this property as both Texaco and Exxon; however, regulatory agency files reviewed by EKI generally identify the property as Texaco.

databases. EKI reviewed the Fuel Leak Site Case Closure dated 26 July 2011, a Quarterly Monitoring Report dated 16 December 2010, and a well destruction report dated 24 June 2011, available through the GeoTracker website (SCCDEH, 2011; Stantec, 2010b; Stantec, 2011). This site was identified as a LUST site in June 1988 and achieved regulatory closure from SCCDEH in July 2011.

According to the closure documentation, releases of gasoline and diesel occurred at the site, and free product was observed in shallow groundwater monitoring wells beginning in 1988. Several remedial actions and extensive soil, soil vapor, and groundwater sampling activities were conducted, including (1) the removal of three gasoline USTs, two diesel USTs, two hydraulic lifts, and one waste oil UST in 1992, (2) the additional excavation of at least 1,520 cubic yards of impacted soil and pumping/removal of 1,000-gallons of groundwater and product in 1993, (3) the installation of a soil vapor extraction ("SVE") system that was operated for two months in 1994 and reportedly removed 14.04 pounds of petroleum hydrocarbons (SCCDEH, 2011).

As a part of the Texaco site investigation and monitoring, four shallow groundwater monitoring wells were installed downgradient of the site, three proximate to the office building immediately south of the Subject Property and one in the southwestern corner of the Subject Property.[6] Three of these wells were sampled in 2010 for total petroleum hydrocarbons as gasoline ("TPHg"), TPHd, benzene, toluene, ethylbenzene, and xylenes ("BTEX") compounds, and MTBE (i.e., monitoring wells MW-22E, MW-22G, and MW-22H, see Figure 2). The groundwater sample collected from monitoring well MW-22E (just south of the former 1015 North Shoreline Boulevard residence) contained the following:

- TPHg was detected at a concentration of 7,700 ug/L, above the drinking water ESL of 100 ug/L;
- TPHd was detected at a concentration of 3,300 ug/L, above the drinking water ESL of 100 ug/L;
- Benzene was detected at a concentration of 58 ug/L, above the drinking water ESL of 1 ug/L, the vapor intrusion risk ESL for residential/unrestricted land use of 0.42 ug/L, and the vapor intrusion risk ESL for commercial/industrial land use of 1.8 ug/L; and
- Toluene, ethylbenzene, xylenes, and MTBE were detected above laboratory reporting limits, but below respective screening levels for drinking water and vapor intrusion risk (SCVWD, 2011).

Petroleum hydrocarbons and related constituents were not detected above laboratory reporting limits in Subject Property monitoring well MW-22H during the most recent sampling events in October 2010, and February 2010, respectively, or in upgradient wells MW-22F and MW-22G which was last sampled in 2006 (Figure 2). All four of the wells that were formerly located on the Subject Property and the adjacent office building area related to this LUST case were abandoned

[6] These wells were destroyed in 2011, as discussed in Section 8.4.5, below.

in June 2011 (Stantec, 2011). This site achieved regulatory closure from SCCDEH in July 2011. Texaco issued an indemnification agreement in 2009 in relation to this LUST case to The Roberta & Marco Bertozzi Family Trust (owner of the 1005 and 1015 N Shoreline Boulevard and 1150 Terra Bella Avenue properties at the time). A copy of this letter is provided in Appendix D.

In addition, the EDR identified a listing for "Exxon" located at 925 Shoreline Road, an address which would be located south of the Subject Property. The Exxon site at this address was identified on the CA HIST CORTESE database; however, the GeoTracker, EnviroStor, SCVWD, and SCCDEH online databases do not contain files associated with this address. In addition, the EDR identified 975 Stierlin Road as an Exxon site. Therefore, it is likely that the EDR listing for the Exxon site also refers to the Texaco site at 975 North Shoreline.

Given the proximity of the Texaco site to the Subject Property, the groundwater flow direction, and detected historical concentrations of petroleum hydrocarbon and associated VOCs in shallow groundwater immediately upgradient of the Subject Property, there is a potential that low levels of petroleum hydrocarbon contamination in shallow groundwater may have migrated from the Texaco site to the Subject Property; however, the source of the contamination on the Texaco site appears to have been remediated and the site received closure from the SCCDEH in 2011. In addition, benzene and other petroleum-related compounds were not detected at significant concentrations in soil and groundwater on the Subject Property during sampling activities conducted during the March 2019 Phase II subsurface investigation, and benzene was only detected at low concentrations in soil gas, as described in Section 9 below.

8.3.5 *Review of Shoreline Shell #59 Site Files (807 North Shoreline Boulevard, formerly 807 Stierlin Road)*

The Shoreline Shell #59 site is located approximately 740 feet south of the Subject Property, on the opposite side of Terra Bella Avenue. EKI reviewed the Fuel Leak Site Case Closure for this site, dated 6 August 2008, available through the GeoTracker website (SCCDEH, 2008). The Shell site was identified as a LUST site in August 1988, due to a reported gasoline release and achieved regulatory closure from SCCDEH in August 2008. In that time period, remediation activities included the removal of three gasoline USTs and one diesel UST in 1991, the removal of 2,075 cubic yards of soil in two events that took place in 1991 and 2002, soil vapor extraction activities in 1994, and the removal of approximately 125,000 gallons of groundwater from a tank pit in 2002.

At the time of closure, residual groundwater contamination remained on this site at the following concentrations: TPHg (910 ug/L), TPHd (170 ug/L), tert-Butyl alcohol ("TBA") (16 ug/L), and MTBE (21 ug/L). Residual soil contamination was present onsite at the following concentrations: TPHg (2,800 mg/kg), TPHd (61 mg/kg), benzene (0.65 mg/kg), and MTBE (4.7 mg/kg). The SCCDEH determined this residual contamination did not pose a risk to groundwater, human health, or the environment and the site achieved regulatory closure in 2008 (SCCDEH, 2008).

Given the distance between the Shell site and the Subject Property, petroleum hydrocarbon impacts related to this release are not likely to have migrated from this site to the Subject Property.

8.3.6 *Review of Chevron #9-6377 Site Files (808 North Shoreline Boulevard, formerly 808 Stierlin Road)*

The Chevron site is located approximately 770 feet south/southwest of the Subject Property beyond Terra Bella Avenue and North Shoreline Boulevard. EKI reviewed the Fuel Leak Site Case Closure for this site, dated 18 May 2005, available through the GeoTracker website (SCCDEH, 2005). This site was identified as a LUST in April 1988, due to a reported gasoline release, and received closure from SCCDEH on 18 May 2005. Remediation activities included the removal of six gasoline USTs and one used oil UST from the site in 1988, and the treatment and disposal of 14,300 gallons of groundwater in 2001. During the most recent groundwater sampling event that took place prior to closure in February 2004, residual groundwater contamination was present at the following concentrations: TPHg (6,800 ug/L), benzene (47 ug/L), MTBE (64 ug/L). According to closure documentation, this residual contamination could pose an unacceptable risk under certain development activities, leading to ongoing site management restrictions related to future grading, excavation, or water well installation activities (SCCDEH, 2005). In 2008, additional soil and groundwater sampling was performed at the Chevron site as part of a property transaction (Stantec, 2008). One groundwater sample, located on the downgradient portion of the Chevron site, contained TPHd at a concentration of 1,200 ug/L, above the drinking water ESL of 100 ug/L. This site achieved regulatory closure from SCCDEH on 18 May 2005.

Given the distance between the Chevron site and the Subject Property, petroleum hydrocarbons related to this release are unlikely to have migrated from this site to the Subject Property.

8.3.7 *Review of ARCO Site Files (790 North Shoreline Boulevard, formerly 790 Stierlin Road)*

The ARCO site is located approximately 960 feet south/southwest of the Subject Property, just south of West Middlefield Road. EKI reviewed the Fuel Leak Site Case Closure for the ARCO site, dated 26 July 2004 (SCVWD, 2004), and a letter of correspondence from the SCCDEH, dated 10 December 2014 (SCCDEH, 2014), available through the GeoTracker website.

According to available records, the ARCO site was identified as a LUST in July 1986 due to a reported gasoline release. In that time period, remediation activities included the removal of five gasoline USTs, one used oil UST, and one oil/water separator from the site. In addition, at least 1,030 cubic yards of impacted soil was excavated and removed for the site in June 1988, and 35,000 gallons of groundwater were pumped and transported offsite in November 2002. This site achieved regulatory closure from SCCDEH in July 2004.

During the most recent groundwater sampling performed in August 2003, concentrations of petroleum hydrocarbons and associated VOCs detected in shallow groundwater were as follows: TPHg (3,800 ug/L), benzene (600 ug/L), toluene (48 ug/L), ethylbenzene (66 ug/L), and xylenes

(220 ug/L). According to closure documentation, the presence of residual contamination could pose an unacceptable risk under certain development activities, leading to management restrictions on future onsite activities (SCVWD, 2004). These management restrictions were upgraded to a deed restriction that was filed for the site in June 2013. This deed restriction includes the following restrictions: no groundwater extraction, no residential development, and health and safety requirements for onsite construction workers. The deed restrictions are summarized in a letter, dated 10 December 2014, that also indicates that levels of residual impacts are expected to reduce with time, but that previously unidentified contamination at this site may require further investigation or cleanup (SCCDEH, 2014).

Given the distance between the ARCO site and the Subject Property, petroleum hydrocarbon impacts related to this release are not likely to have migrated to the Subject Property.

8.3.8 *Review of 1250 W Middlefield Road and 1300 Terra Bella Avenue*

The Teledyne Semiconductor (formerly Telcom Semiconductor) and Spectra-Physics Laser, Inc. Sites are located approximately 650 feet west and southwest Subject Property (likely cross-gradient) and are not a directly adjoining or upgradient property. However, EKI has included the following summary due to chemical usage at the site and known impacts on nearby properties. EKI reviewed several documents available through the GeoTracker database, including a *Final Revised Focused Feasibility Study* and the most recent groundwater monitoring report for the Teledyne Semiconductor and Spectra-Physics Laser, Inc. Sites (Arcadis, 2018a; Arcadis, 2018b).

A variety of synthetic chemicals, including VOCs, were used in manufacturing processes at both sites (LFR, 2009). According to available reports, VOCs were released from these sites and have impacted shallow and intermediate zone groundwater (LFR, 2009). These sites are jointly currently undergoing remediation for contamination in groundwater. According to the *Final Revised Focused Feasibility Study*, groundwater at the Teledyne Semiconductor portion of the site is being treated by enhanced reductive dechlorination ("ERD") to reduce VOC concentrations in source areas (Arcadis, 2018a). As a part of this remediation and associated monitoring, a network of extraction and monitoring wells spans from the area of the Teledyne Semiconductor and Spectra-Physics Laser, Inc. Sites and downgradient approximately one mile, on the north side of Highway 101. The plume consists primarily of TCE and its breakdown products, cDCE, and vinyl chloride. Based on the data presented in groundwater monitoring reports, the Subject Property is cross-gradient to and lies east of the outer edge of the groundwater VOC plume (Arcadis, 2018b). Therefore, VOCs from the Teledyne Semiconductor and Spectra-Physics Laser, Inc. sites are not expected to impact the Subject Property.

8.4 Review of Available Regulatory Agency Files for Subject Property

EKI submitted requests to the following environmental regulatory and public agencies to review available files regarding the Subject Property:

- San Francisco Regional Water Quality Control Board ("RWQCB")
- City of Mountain View Fire Department, Hazardous Materials Division
- City of Mountain View Community Development Department Building Division
- Department of Toxic Substances Control
- Bay Area Air Quality Management District ("BAAQMD")
- Santa Clara County Department of Environmental Health
- California Department of Water Resources

In addition, EKI searched online databases maintained by DTSC, RWQCB, SCVWD, and SCCDEH. EKI reviewed City of Mountain View Fire Department, City of Mountain View Community Development Department Building Division, SCCDEH, DTSC, BAAQMD, and DWR documents regarding the Subject Property. The RWQCB did not provide any files regarding the Subject Property. Copies of selected files are included in Appendix A of this report. Brief summaries of the available file information reviewed by EKI are presented below.

8.4.1 *Summary of City of Mountain View Fire Department, Hazardous Materials Division Files*

The City of Mountain View Fire Department Files primarily relate to the following former addresses associated with the Subject Property, as shown on Figure 2.

8.4.1.1 *1062 Linda Vista Avenue*

The City of Mountain View provided records for the Verizon Wireless facility located on the 1062 Linda Vista Avenue portion of the Subject Property. Documents reviewed include a Hazardous Materials and Waste Storage permit that was issued in June 2015. According to this permit, 132-gallons of combustible liquid (diesel fuel #2) and 50-gallons of corrosive liquid (lead acid battery) are stored onsite, presumed to be associated with the cell tower facility. Hazardous waste is not reported to be generated onsite.

8.4.1.2 *1130 Terra Bella Avenue*

The City of Mountain View provided records for Olin Mesa (formerly known as Mesa Technology prior to 1989), which formerly occupied the 1130 Terra Bella Avenue portion of the Subject Property. Documents reviewed ranged in date from 1984 to 1989, and include hazardous materials storage permits and inventory statements, emergency response plans, hazardous waste manifests, and a closure plan and associated documents.

According to these documents, the 1130 Terra Bella Avenue property was occupied for industrial use since approximately 1972, including by Olin Mesa who began to occupy this site in 1983. Olin Mesa's operations included the manufacturing of Tape Automated Bonding (TAB) tape, as well as related research and development activities. Processes related to these operations involved several chemicals and included pre-cleaning, developing, tin plating, stripping, gold-plating, etching, and coating/back-coating. Permitting documents also indicate that an atomic absorption spectrometer was utilized onsite. Multiple hazardous waste inventory lists identify several

chemicals including corrosive, poisonous, and flammable liquids, which were stored onsite in quantities ranging from 30 to 275 gallons, as well as corrosive solids stored onsite in quantities up to 375 pounds.

A December 1984 General Facility Map indicates that the area directly north of the former onsite building was used for "outside storage." In addition, an Emergency Response-related document from 1987 includes a site map that depicts a hazardous material storage and waste area as well as an above-ground acid neutralization system and sump in that same location. In December 1985, Mesa Technology was issued an industrial wastewater discharging to the City of Mountain View sanitary sewer collection system. On 26 October 1987 a fire occurred at this building, which caused a container holding acid to spill and reach an outside storm water drain inlet. This spill was successfully contained and cleaned up by the Fire Department at that time. These documents also include a "Registration of Radiation Sources" with an illegible issuing date and a hand-written note indicating that it expired in June of 1990.

The 1988 closure plan included in these documents indicates that the trench and sump area to the north of the building were tested and "chipped out", and that the tested materials would be disposed of if contamination was identified. The 1988 closure plan indicates that elevated levels of metals were detected due to the presence of soil particles in the samples, implying that the groundwater samples were likely unfiltered. A subsequent waste manifest details the removal of 5,200 pounds of copper contaminated soils and concrete in December 1989.

Letters of correspondence between Olin Mesa and the Fire Department as well as a "Preliminary Environmental Assessment and Groundwater Investigation" completed by Aqua Terra Technologies ("ATT") in 1988 indicate that three groundwater monitoring wells (MW-1, MW-2, and MW-3) were installed on-site, each to a depth of 19 feet bgs (see Figure 3). Chlorinated solvents were reportedly detected in all three wells in groundwater samples collected in 1988. ATT (1988) also indicates that arsenic, barium, chromium, and mercury were detected in groundwater samples at concentrations exceeding MCLs and states that these concentrations were due to presence of soil particles in the samples (i.e. the samples were unfiltered).[7] The reported concentrations are generally consistent with background concentrations of total metals in unfiltered groundwater samples for the region. ATT (1988) concluded that the source of the chlorinated solvents may be either on-site or off-site. Olin Mesa indicates that "research quantities" of TCE were utilized onsite but that they have never had a spill of these materials. Groundwater sampling results from these three wells are shown on Figure 3 and are discussed further in Section 5.6.

[7] The maximum concentrations of arsenic, barium, chromium, and mercury detected in unfiltered groundwater samples were 0.08 J mg/L, 20 mg/L, 3.1 mg/L, and 0.004 mg/L, which exceed their current MCLs of 0.01 mg/L, 1 mg/L, 0.05 mg/L, and 0.002 mg/L, respectively. In addition, the maximum detected concentration of copper (2.1 mg/L) slightly exceeds its current California State Action Level of 1.3 mg/L.

8.4.1.3 *1170 Terra Bella Avenue*

The City of Mountain View provided records for the 1170 Terra Bella Avenue portion of the Subject Property that ranged in date from 1985 to 2015. As discussed above, and depicted in Figure 2, only a small portion of the property associated with the former 1170 Terra Bella Avenue property is located on the Subject Property. The documents include a Hazardous Materials and Waste Storage permit that was issued to Oxigraf Inc. in July 2015. According to this permit, Oxigraf stored 5-gallons of flammable liquid (acetone, isopropanol, and methanol) and 4,879 cubic feet of various nonflammable gases onsite.

Historical documents include a hazardous materials storage permit code-permit application for MHI, a former building occupant who was present from at least 1985 until they vacated the site in 1986. This application includes a hand-drawn site map indicating that onsite storage took place on the exterior portion of this property, adjacent to the northwest corner of the former building, and not likely on the Subject Property. A 1986 Facility Permit Fee Worksheet indicates that 65-gallons of flammable liquid were being stored onsite at that time.

Hazardous Materials Safety Notice and Storage Permits from 1990 identify Telewave Inc. as a former occupant of this building of the Subject Property. These documents indicate that approximately 110 gallons of City Required Materials (CRM-L) and 5 gallons of flammable liquid were being stored onsite. A hand drawn map from May 1990 indicates that the exterior parking area to the west of the onsite building was used for "storage". A closure plan from January 1991 indicates that there was no observable spill or contamination onsite, that no soil or groundwater sampling was required, and that all materials had been relocated to 1145 Terra Bella Avenue (a property that adjoins the Subject Property to the south) at that time.

8.4.2 *Summary of City of Mountain View Building Department Files*

EKI viewed available records for the Subject Property at the City of Mountain View Building Department. In addition, EKI reviewed information provided in the EDR Building Permit Report (EDR, 2019). Information of potential environmental interest for the Subject Property is summarized below.

8.4.2.1 *1001 North Shoreline Boulevard*

Permits for the new commercial building at 1001 North Shoreline Boulevard (not included in the scope of this Phase I ESA) were issued from 2016-2018, including a grading permit, building plan checks, and fire protection plan checks.

8.4.2.2 *1015 North Shoreline Boulevard*

A demolition permit for the 800 square foot building at this property was issued in November 2015; no other permits were provided for this property.

8.4.2.3 *1023 North Shoreline Boulevard*

Permits issued for the 1023 North Shoreline Boulevard portion of the Subject Property include a plan checks for tenant improvements from 2003 to 2011, fire protection plan checks, and a demolition permit for the 15,513 square foot building in November 2015.

8.4.2.4 *1130 Terra Bella Avenue*

Based on plumbing and electrical records, the former building at this address appears to have been constructed in approximately 1982. Records also include a permit for a "containment area" that was constructed in 1987. Building layout plans indicate that a "clean room" with multiple "camera" and "exposure" stations was formerly located in the southwestern portion of the building. In addition, these records indicate that the exterior area to the north of the building formerly contained a tank farm as well as an onsite waste treatment system that consisted of a trench that fed into a sump before draining into an acid neutralization system. A demolition permit for the building was issued in November 2015.

8.4.2.5 *1043 North Shoreline Boulevard*

A demolition permit for the 12,850 square foot building at this property was issued in November 2015; no other permits were provided for this property.

8.4.2.6 *1091 North Shoreline Boulevard*

Permits issued for the 1091 North Shoreline Boulevard portion of the Subject Property include plan checks for tenant improvements from 2004 to 2012, fire protection plan checks, and a demolition permit for the 30,268 square foot building in December 2015.

8.4.2.7 *1150 Terra Bella Avenue*

A building permit indicates that an onsite septic tank was abandoned in 1995 and that the residential building located at this address was connected to the sewer system at that time. A demolition permit for the 1,200 square foot building was issued in November 2015.

8.4.2.8 *1160-1170 Terra Bella Avenue*

A 1990 permit for "spray booth relocation" and associated maps indicate that a paint spray booth and a storage area were formerly located in the northwestern corner of the current building. The occupant at that time was Alto Design Group. A demolition permit for the 7,840 square foot building at 1160 Terra Bella Avenue was issued in November 2015.

8.4.2.9 *1062 Linda Vista Avenue*

These documents range in date from 2012 to 2014 and describe the Verizon cell-phone tower that was constructed in the fenced-off area to the east of the current building in approximately 2014. Building plans indicate that in addition to the tower (described as a wireless antenna and

a monopole) the fenced in area houses several "mod cell" cabinets and one lead-acid battery cabinet. A "proposed signage" document indicates that corrosive liquids, hydrogen gas, and diesel fuel are stored onsite. A demolition permit for the 13,000 square foot building was issued in November 2015, and a plan check for modifications to the Verizon cell-phone tower was dated December 2016.

No other Building Department documents reviewed indicated the presence or use of chemicals at the Subject Property.

8.4.3 *Summary of DTSC Files*

DTSC provided records for 1130 Terra Bella Avenue, but no other addresses associated with the Subject Property. Records provided by DTSC ranged in date from 1981 through 1995. These records are summarized below.

These records identify Mesa Technology (AKA Olin Mesa Corporation) as the site occupant, and indicate that onsite operations included the development, manufacturing, and sales of materials and equipment for semi-conductor packaging and assembly, including microinterconnect tape. This tape comprises copper foil and a laminate with polyamide film backing. The manufacturing process involves "the cleaning of copper foil, coating the foil on both sides with a positive acting photoresist, exposing a pattern, chemically etching or plating the copper foil to define a pattern, stripping the photoresist from both sides of the foil, cleaning the patterned copper foil and plating the patterned foil with tin, nickel, gold, or solder."

The manufacturing process reportedly created three waste streams including ammonium persulfate, hydrochloric acid, and an organic stripper solution. These materials were recycled through the manufacturing process until they were considered unusable when copper concentrations built up to a reported range of 700 to 14,000 mg/L. A waste treatment system (acid-neutralization unit), designed to handle a peak flow of 15 gallons per minute and maintain a pH range of 6.5 to 9.0, was built onsite in 1987. Waste effluent was conveyed from the building interior to a sump located north of the building via a polypropylene drain located in a concrete trench, and then pumped through the neutralization unit. Following pH adjustment, the effluent was discharged to the sanitary sewer, which ultimately flowed to the Palo Alto Wastewater Treatment Plant.

A building map from 1987 displays storage areas for flammable and corrosive materials, solvents, and acid in the northern portion of the former building. In addition, a wet lab, camera room, SCBA station, test lab, photo resist application and drying area, and solder coating station are labelled throughout the northern portion of the building. Furthermore, a sump, aboveground neutralization system, and hazardous materials storage (waste) area is labeled on the exterior portion of the property, to the north of the building.

DTSC records also include a 1989 "Denial of Variance Application" relating to a request to dilute concentrated waste solutions and dispose of them into the sewer as non-hazardous waste. This

letter also indicates that the wastewater pretreatment system had not received the necessary DTSC variance or permit at that time. Subsequent letters of correspondence indicate that Olin Mesa Corp requested a variance from the DTSC in October 1987 for "three waste streams…to allow the discharge of copper bearing waste streams which are greater than 25 mg/l", but the DTSC was unable to process it at that time. A letter of correspondence from February 1989 indicates that drums of waste corrosive liquids were temporarily stored at the Subject Property prior to being shipped offsite.

8.4.4 *Summary of SCCDEH Files*

EKI reviewed SCCDEH documents for the Subject Property available on the GeoTracker website. According to these documents, the former Subject Property Owner, which also owned the adjoining property to the west where the new office building is currently located, applied to the SCCDEH for oversight of the proposed redevelopment activities under the Voluntary Cleanup Program ("VCP") in August 2015. Files available on GeoTracker include the soil vapor sampling report prepared by CEG (2015a) and summarized in Section 5.8 above, and a SMP for the adjoining office building prepared by CEG and dated 15 September 2015 (CEG, 2015b).

The SMP was approved by SCCDEH on 23 October 2015 and describes general groundwater, soil, and soil vapor management procedures to be implemented during the redevelopment of the adjoining office building as a 30,000-square-foot office building and paved parking areas. Among other things, the SMP includes provisions for evaluating and handling potential unknown contamination, sampling of soil for onsite reuse, sampling of import fill material, construction of a vapor barrier (liner) beneath the proposed building, management of construction dewatering water, and worker health and safety (CEG, 2015b). On 31 January 2019, on behalf of the former Subject Property owner, Ramboll submitted a report documenting installation of the liner under the adjoining office building and implementation of the SMP (Ramboll, 2019). The liner includes a 2-inch sand layer, a base layer of a high-density polyethylene ("HDPE") bonded to a polypropylene geotextile, a 60-millimeter-thick asphaltic spray-on membrane, and a second layer of HDPE bonded to polypropylene geotextile (Ramboll, 2019). In addition to the installation of the liner, 3,461 cubic yards of soil were excavated for installation of footings, utilities, and site grading and disposed at Dumbarton Quarry (Ramboll, 2019).

8.4.5 *Summary of BAAQMD Files*

The BAAQMD provided files for the portion of the Subject Property associated with the address 1130 Terra Bella Avenue. The document identifies Olin Mesa Corporation as the occupant from at least 1986 through 1989. In 1986, application #31470 was identified for a project described as "Etching copper foil". The final disposition with respect to this application is reported as "Waived A/C". In 1987, application #32375 was identified for a project described as "Photoresist applic" The final disposition with respect to this application is reported as "A/C granted". This document indicated that operations were ceased and that the facility was dismantled on 26 September 1989.

The BAAQMD did not provide files for any other addresses associated with the Subject Property.

8.4.6 *Summary of DWR Files*

The DWR provided well completion reports for the portions of the Subject Property associated with the addresses 1005, 1015, and 1043 North Shoreline Boulevard and 1150 Terra Bella Avenue. In addition, a Water Well Drillers Report from November 1990 was provided for the well located at 1015 North Shoreline Boulevard. The DWR did not provide records for any other addresses associated with the Subject Property. The provided records are summarized below.

8.4.6.1 *1005, 1015, and 1043 North Shoreline Boulevard*

These well completion reports document the destruction of monitoring wells that were constructed as part of the Texaco site remediation on the property to the south (i.e., MW-22E, MW-22F, MW-22G, and MW-22H; see Section 8.3.4). These well completion reports indicate that all four wells were "filled with neat Portland grout" to their terminal depths on 2 June 2011, and consistent with the 2011 Well Destruction report completed by Stantec on 24 June 2011 (Stantec, 2011).

8.4.6.2 *1150 Terra Bella Avenue*

DWR provided a well completion report documenting the destruction of a water supply well that was formerly located at 1150 Terra Bella Avenue. According to this report, this well was located to the north of the residential dwelling located on this portion of the Subject Property and had a depth of 85 feet bgs. This well was abandoned in accordance with DWR permitting procedures on 14 November 2011.

9 RESULTS OF PHASE II SUBSURFACE INVESTIGATIONS (EKI 2019)

Based on the findings from the prior assessments and at the request of the User given the intended redevelopment, EKI implemented subsurface sampling investigations at the Subject Property. The purpose for the sampling was to:

- Screen for the presence of organochlorine pesticides and lead and arsenic in shallow soil on the Subject Property to assess whether agricultural uses and lead-based paint have affected shallow soil on the Subject Property.
- Screen for the presence of PCBs in soil near the location of a transformer formerly located on the Subject Property.
- Screen for the presence of VOCs in groundwater and soil gas to assess potential vapor intrusion risks from chemicals migrating onto the Subject Property, including the TCE/cDCE/VC plume from 1155 Terra Bella to the south, and potentially from the acid neutralization system formerly located on the Subject Property.

9.1 Pre-Field Activities

Prior to commencement of field sampling activities, EKI performed the following tasks:

- Coordinated sampling schedule and access.
- Coordinated with a drilling sub-contractor to provide drilling services, including preparation of a Work Authorization with the sub-contractor.
- Coordinated with the analytical laboratory regarding sample containers, delivery, and schedule.
- Retained a private utility locating company to screen for the presence of buried utilities in the planned drilling locations, and contacted Underground Services Alert, as required by law.
- Prepared a site-specific Health and Safety Plan for the proposed work.

9.2 Collection of Soil, Soil Gas, and Groundwater Samples

In March 2019, EKI advanced a total of 15 boreholes on the Subject Property using a hand auger to collect soil samples and install temporary soil gas probes (see boreholes labeled SG-1 through SG-9 and BH-1 through BH-6 on Figure 4). EKI also advanced a total of five boreholes on the Subject Property using a direct push drill rig to collect grab groundwater samples (see boreholes labeled GW-1 through GW-5 on Figure 3). In April 2019, EKI advanced two additional boreholes approximately five feet north and south of borehole SG-6 to collect additional soil gas samples.

9.2.1 *Collection of Soil Samples*

EKI collected soil samples from 14 of the 17 soil and soil gas sampling boreholes advanced at the Subject Property; the only boreholes without soil sample collection were the borehole advanced near the former acid neutralization tank (SG-5) and the two boreholes advanced near SG-6 in April 2019 (SG-10 and SG-11). For all 14 boreholes, EKI collected soil samples from intervals of 0.5 to 1 foot bgs and 2.5 to 3 feet bgs. Generally, shallower samples were located within sandy material likely brought to the Subject Property as fill during development, and deeper samples were located within silty or clayey native material, several of which were within the upper foot of historical native soil; however, the sandy material was not present at all locations, and some of the shallower samples were collected from probable native material. The samples collected from apparent native material during the investigation are as follows:

- BH-1 from 0.5 to 1 foot bgs: sandy silt with root pieces
- BH-3 from 0.5 to 1 foot bgs: dark brown silty clay
- BH-5 from 0.5 to 1 foot bgs: stiff sandy silt
- SG-4 from 0.5 to 1 foot bgs: clay (75%) with sand
- SG-7 from 2.5 to 3 feet bgs: sandy clay (70-80%)
- SG-8 from 0.5 to 1 foot bgs: silty clay (70-90%)

The 0.5 to 1-foot bgs soil samples from all boreholes except the borehole advanced near the former transformer location (BH-6) were analyzed for organochlorine pesticides, arsenic, and lead. The 2.5 to 3-foot bgs soil samples from these boreholes were initially placed on hold at the analytical laboratory. Following the receipt of results from the 0.5 to 1-foot bgs soil samples, seven of the 2.5 to 3-foot bgs soil samples were analyzed for organochlorine pesticides,[8] arsenic, and lead. Both soil samples from the borehole near the former transformer location (BH-6) were analyzed for PCBs.

Soil samples were labeled with a unique identification number, placed in a chilled ice chest, and submitted to the analytical laboratory under chain-of-custody procedures. The analytical results for the soil samples are presented in Section 9.4.1, below.

[8] The 2.5 to 3-foot bgs soil samples were analyzed outside of the holding time for organochlorine pesticides; however, due to the low volatility and stable nature of these compounds, the exceedance of the holding time would not have significantly affected the analytical results.

9.2.2 *Collection of Soil Gas Samples*

At boreholes SG-1 through SG-11 on the Subject Property, following soil sample collection, EKI installed temporary soil gas probes ("SGPs") for collection of soil gas samples. The SGPs were constructed in general accordance with the California-Environmental Protection Agency's ("Cal-EPA") July 2015 guidance entitled *Advisory – Active Soil Gas Investigations*. The boreholes, approximately 4-inches in diameter, were logged under the supervision of a State of California professional geologist and an organic vapor meter equipped with a photoionization detector ("PID") was used to screen the soil for VOCs.

Each SGP consisted of a 6-inch long, ½-inch diameter stainless-steel wire mesh screen attached to a length of continuous ¼-inch diameter flexible fluorinated ethylene propylene ("FEP") tubing, sealed at the top using a stainless-steel laboratory-grade plug valve with Swagelok-type compression fittings. The borehole annular space around the SGP screen was backfilled with a 1.5-foot vertical filter pack of prewashed silica sand. Above the filter pack, each SGP borehole was backfilled with a minimum six-inch layer of dry medium granular bentonite, per Cal-EPA guidance. Above the dry granular bentonite, each borehole was sealed to existing grade with medium bentonite chips, emplaced and hydrated in approximately 6-inch lifts. Bentonite at the top of the seal was covered with approximately 6 to 8 inches of sand.

Consistent with current Cal-EPA guidance, soil gas samples were collected approximately 48-hours after installation of the SGPs. The soil gas samples were collected in laboratory-provided, pre-cleaned and pre-evacuated 1-liter SUMMA-passivated stainless-steel sample canisters equipped with flow controllers set at a flow rate of approximately 100 milliliters per minute ("mL/min"). Each SUMMA canister was individually certified as clean below the laboratory reporting limits.

A shroud was maintained around each SGP during sample collection to allow a controlled atmosphere containing the leak-detection compound 1,2-difluoroethane ("DFA"), to be maintained around the SGP and sampling apparatus. At each of the SGP sampling locations, the air inside the shroud was sampled to determine the concentration of DFA around the sampling apparatus.

Immediately before sampling, each SGP was purged at least three times the volume of the tubing and sand pack. The sampling canister was allowed to fill until a small residual vacuum remained, at which point the valve was closed. At each location, the air inside the shroud was sampled using a separate SUMMA canister and analyzed for DFA, so that the concentration ratio between shroud sample and SGP sample could be used to estimate dilution in the event of leakage.

Following completion of soil gas sampling, the SGPs were destroyed by removing the tubing from the SGPs, augering out the bentonite seals, and grouting the boreholes to the pavement surface with neat cement.

The soil gas samples were labeled with a unique identifying number, the date and time of collection, and other pertinent information, and transported to K-Prime by courier under chain-of-custody procedures. The analytical results for the soil gas samples are presented in Section 9.4.2, below.

9.2.3 *Collection of Groundwater Samples*

During the investigation, EKI advanced a total of five boreholes on the Subject Property using hand auger and direct-push drilling techniques to collect groundwater samples (see boreholes labeled GW-1 through GW-5 on Figure 3). Each of the boreholes for groundwater sampling was advanced to 15-17.5 feet bgs, and a temporary well casing of 2-inch polyvinyl chloride ("PVC") pipe with 10 feet of perforated well screen was placed in each borehole. After letting groundwater recharge into the well screens, groundwater was encountered between 6.7 to 12 feet bgs prior to sampling. A new, unused check valve and new polyethylene tubing was used to collect groundwater samples directly into laboratory-supplied containers. No sheen was observed in any of the temporary wells.

Groundwater samples collected from each borehole were placed in laboratory-supplied containers, labeled with a unique identification numbers, and placed in a chilled ice chest for transport to the analytical laboratory under chain-of-custody procedures.

The groundwater in each of the five locations was analyzed by K-Prime for VOCs using U.S. EPA Method 8260. The analytical results for the groundwater samples are presented in Section 9.4.3, below.

9.3 Grouting of Boreholes and Investigation-Derived Wastes

Following completion of soil, soil gas, and groundwater sampling from the boreholes, each of the boreholes was grouted to a few inches below the pavement or ground surface with neat cement. Surface completion of boreholes within the landscaped areas was with soil or other plant materials; and surface completion of boreholes in asphalt paved areas consisted of concrete dyed black to better match the existing asphalt color.

9.3.1 *Investigation-Derived Wastes*

The investigation-derived wastes ("IDW"), i.e., soil cuttings, were placed in 55-gallon metal drums. The drums were stored at the Subject Property. Samples of the wastes were submitted to K-Prime for analysis for waste characterization for disposal purposes. Based on the waste characterization analyses, the IDW was classified as non-hazardous waste by Belshire Environmental Services, Inc. ("Belshire"). Belshire has removed the IDW from the Subject Property and will provide EKI and the User with waste removal and disposal documentation once the IDW has been disposed at a proper disposal facility.

9.4 Analytical Results for Soil, Soil Gas, and Groundwater Samples

Analytical results for soil, soil gas, and groundwater samples collected by EKI are presented below.

9.4.1 *Analytical Results for Soil Samples*

The analytical results for the soil samples are summarized in Table 1; laboratory data sheets from K-Prime are included in Appendix G. The 0.5 to 1-foot bgs soil samples from boreholes SG-1, SG-3, SG-4, SG-6 through SG-9, BH-1 through BH-5, and BH-7 were submitted to the laboratory and analyzed for organochlorine pesticides using U.S. EPA Method 8081A and arsenic and lead using U.S. EPA Method 6020. Arsenic and lead concentrations in the soil samples were consistent with background levels, and below the ESLs for residential soil or background concentration of 11 mg/kg for arsenic (Duverge, 2011). Organochlorine pesticides were either not detected or were present at concentrations below the respective ESLs for residential land use. Following receipt of the results from the 0.5 to 1-foot bgs soil samples, given that some of the shallow soil samples were collected from likely fill soil that was imported to the Subject Property, seven of the 2.5 to 3-feet bgs soil samples that were placed on hold were analyzed for pesticides, lead, and arsenic. The highest pesticide concentrations were detected in the 2.5 to 3-feet bgs sample from location SG-7, which was in the upper foot of the native soil. In all of the deeper samples, organochlorine pesticides, lead, and arsenic were not detected or were present at concentrations below the respective ESLs for residential land use and concentrations were generally similar to the shallower samples (Table 1).

Both of the soil samples collected from the former transformer area were analyzed for PCBs using U.S. EPA Method 8082. Aroclor 1260 was detected at a concentration of 0.622 mg/kg in the 0.5 to 1 foot bgs sample, which is below the most conservative High Occupancy Use Cleanup Level of 1 mg/kg established in the Toxic Substances Control Act ("TSCA"; 40 CFR 761.61). The High Occupancy Cleanup Level is consistent with residential and commercial land use.[9] Aroclor 1260 was not detected in the 2.5 to 3 feet bgs sample.

9.4.2 *Analytical Results for Soil Gas Samples*

Each of the 12 soil gas samples collected from locations SG-1 through SG-11 on the Subject Property (including one duplicate sample collected from location SG-6) as shown on Figure 3 was analyzed by K-Prime for VOCs using EPA Method TO-15 and 1,1-DFA using EPA Method TO-3. Each of the shroud samples was also analyzed for 1,1-DFA by EPA Method TO-3.

[9] High occupancy area means any area where PCB remediation waste has been disposed of on-site and where occupancy for any individual not wearing dermal and respiratory protection for a calendar year is: 840 hours or more (an average of 16.8 hours or more per week) for non-porous surfaces and 335 hours or more (an average of 6.7 hours or more per week) for bulk PCB remediation waste. Examples could include a residence, school, day care center, sleeping quarters, a single or multiple occupancy 40 hours per week work station, a school class room, a cafeteria in an industrial facility, a control room, and a work station at an assembly line (40 CFR 761.3).

The analytical results for the soil gas samples are summarized in Table 2 of this report. The analytical laboratory reports for the soil gas samples provided by K-Prime are included in Attachment H. The results were screened against the soil gas vapor intrusion human health risk level ESLs (RWQCB, 2019).

The VOCs detected in soil gas above the residential ESLs are TCE, cDCE, vinyl chloride, PCE, benzene, and chloroform. TCE was detected above the residential ESL of 15 ug/m^3 at four locations (SG-1 through SG-4) at concentrations from 70.5 to 140 ug/m^3. cDCE was detected above the residential ESL of 280 ug/m^3 at one location (SG-1) at a concentration of 439 ug/m^3. Vinyl chloride was detected above the residential ESL of 0.32 ug/m^3 at four locations (SG-1, SG-2, SG-4, and SG-5) at concentrations from 2.07 to 20.9 ug/m^3. PCE was detected above the residential ESL of 15 ug/m^3 in four locations (SG-3, SG-6, SG-10, and SG-11) at concentrations from 33.7 to 372 ug/m^3. Benzene was detected above the residential ESL of 3.2 ug/m^3 in two locations (SG-2 and SG-5) at concentrations from 4.74 to 7.76 ug/m^3. Chloroform was detected above the residential ESL of 4.1 ug/m^3 at two locations (SG-4 and SG-10) at concentrations from 4.29 to 11.8 ug/m^3.

1,1-DFA (leak check compound) was not detected in any of the soil gas samples; thus, no significant leaks of ambient air into the sample containers or significant dilution of the soil gas samples occurred during the collection of the samples.

9.4.3 *Analytical Results for Groundwater Samples*

The five groundwater samples and one duplicate sample collected from locations GW-1 through GW-5 on the Subject Property as shown on Figure 3 were analyzed by K-Prime for VOCs using U.S. EPA Method 8260. The analytical results for the groundwater samples are summarized in Table 3 of this report. TCE was detected in three of the five collected groundwater samples (GW-1, GW-2, and GW-3) at concentrations from 14.1 to 93.5 ug/L, which are above the California MCL of 5.0 ug/L and the residential vapor intrusion ESL of 1.2 ug/L. cDCE was detected in one groundwater sample (GW-2) at a concentration of 208 ug/L, which is above the California MCL of 6.0 ug/L and the residential vapor intrusion ESL of 49 ug/L. cDCE was detected in two additional groundwater samples (GW-1 and GW-4) at concentrations from 9.79 to 27.5 ug/L, which are above the California MCL, but below the residential vapor intrusion ESL. All other detected VOCs in groundwater are present at levels below the respective MCLs and ESLs.

10 SUMMARY OF PHASE I ESA FINDINGS AND OPINIONS

EKI's findings and opinions regarding conditions indicative of releases and threatened releases of hazardous substances or petroleum products on, at, or in, the Subject Property, e.g., RECs are presented below.

10.1 Summary of Phase I ESA Findings

EKI's Phase I ESA findings and opinions are presented below. The following REC was identified in connection with the Subject Property:

- Soil gas and groundwater on the Subject Property have been impacted by offsite sources, including the migration of TCE and breakdown products cDCE and vinyl chloride originating from the 1155 Terra Bella Avenue property to the south. Three groundwater monitoring wells were installed on the southeastern portion of the Subject Property and sampled in 1988 and 2005 (Figure 3). In 1988, TCE was detected in the three wells at concentrations ranging from 16 ug/L to 300 ug/L. When the wells were sampled in 2005, TCE was detected at concentrations ranging from 33 ug/L to 46 ug/L. In 2019, EKI collected groundwater and soil gas samples across the Subject Property. TCE, cDCE, and vinyl chloride were detected in soil gas and/or groundwater in some locations. Detected TCE concentrations in groundwater ranged from 93.5 ug/L to 14.1 ug/L (with the maximum concentrations at the southeastern portion of the Subject Property adjacent to 1155 Terra Bella Avenue); TCE was not detected in the groundwater samples collected in the northwestern portion of the Subject Property. Based on the detected concentrations in groundwater and investigations conducted on behalf of the property owner of 1155 Terra Bella Avenue, the TCE appears to have been released from a former UST on the upgradient 1155 Terra Bella Avenue property.

The following HREC associated with the Subject Property was identified in the performance of this Phase I ESA:

- Several known petroleum hydrocarbon release sites are located south and upgradient of the Subject Property, including the Texaco site located at 975 North Shoreline Boulevard and the Shippen Property site located at 1175 Terra Bella Avenue, as well as other release sites located further to the south. The Texaco and the Shippen Property sites have undergone remediation and both sites received regulatory closure in 2011 and 2001, respectively.

  Given that both the Texaco and the Shippen Property sites have received regulatory closure and the very low concentrations of constituents of concern detected in groundwater at the Subject Property during EKI's 2019 sampling event, these groundwater impacts are not likely to significantly impact the planned future use of the Subject Property.

10.2 Identified Phase I ESA Data Gaps

According to the Final U.S. EPA AAI Rule, a "data gap" is lack of or inability to obtain information required by the AAI Rule that affects the ability of the environmental professional to identify conditions indicative of releases or threatened releases to the Subject Property despite good faith efforts made by the environmental professional. No potentially significant data gaps were identified in the performance of this Phase I ESA.

11 SUMMARY OF EKI 2019 SUBSURFACE INVESTIGATIONS

In March 2019, EKI conducted subsurface investigations at the Subject Property that included the collection and analysis of soil, soil gas, and groundwater samples. In April 2019, EKI collected two additional soil gas samples at the Subject Property. The sample locations are shown on Figures 3 and 4, and the analytical results are presented in Tables 1, 2, and 3 of this report. A summary of the findings is presented below.

11.1 Results of Soil Sampling

EKI collected and analyzed soil samples from 14 locations on the Subject Property from depths of approximately 0.5 to 1 foot bgs and from 7 locations on the Subject Property from depths of approximately 2.5 to 3 feet bgs for analysis of organochlorine pesticides, arsenic, and lead. EKI also collected soil samples from one borehole on the Subject Property in the location of a former transformer pad from depths of approximately 0.5 to 1 foot and 2.5 to 3 feet bgs for analysis of PCBs. According to the analytical results, arsenic and lead concentrations in the soil samples were consistent with background levels, and organochlorine pesticides and PCBs were not detected above residential screening levels. Based on this sampling, EKI did not identify soil with evidence of significant environmental impacts on the Subject Property.

11.2 Results of Soil Gas Sampling

EKI collected soil gas samples from 9 soil gas probes on the Subject Property for analysis of VOCs. The primary VOCs detected in soil gas included TCE, cDCE, vinyl chloride, PCE, benzene, and chloroform, which were detected at concentrations above the residential land use ESLs for soil gas. TCE, cDCE, and vinyl chloride concentrations in soil gas in the southeastern portion of the Subject Property are consistent with the concentrations of these chemicals observed in groundwater samples collected immediately south of the Subject Property at 1155 Terra Bella Avenue, where a release of TCE has resulted in an identified groundwater plume migrating to the north, i.e., beneath the Subject Property. cDCE and vinyl chloride are likely breakdown products of the TCE in the plume.

It should also be noted that an elevated level of PCE was detected at borehole SG-6, outside the plume originating from 1155 Terra Bella Avenue. PCE was not detected in any of the groundwater samples and no historic source is apparent. Two additional soil gas samples were collected in close proximity to SG-6 in April 2019 and contained PCE at elevated concentrations, although somewhat lower than the concentrations detected in SG-6. As such, the PCE detection at SG-6 appears to be limited in area (e.g., from a small historic release).

11.3 Results of Groundwater Sampling

EKI collected groundwater samples from five locations on the Subject Property for analysis of VOCs. TCE and cDCE were detected in groundwater samples at concentrations above screening levels. The concentrations of these compounds detected in groundwater are shown on Figure 3.

The TCE and cDCE detected in groundwater are consistent with those in soil gas and with the plume known to be migrating to the Subject Property from the upgradient 1155 Terra Bella Avenue property to the south.

Taken together, these data suggest the following:

- the TCE, cDCE, and vinyl chloride in soil gas detected the Subject Property likely originate from offsite groundwater migrating to the Subject Property from 1155 Terra Bella Avenue to the south;
- it is unlikely that any significant release of VOCs, including TCE, occurred on the Subject Property; and
- potential historical uses of organochlorine pesticides, arsenic, lead, and PCBs do not appear to affect shallow soil on the Subject Property.

11.4 Recommendations

Chlorinated VOCs (PCE, TCE, cDCE and vinyl chloride) are present in all of the soil gas and groundwater samples collected in the southeastern portion of the Subject Property and in soil gas samples collected from locations SG-6, SG-10, and SG-11 in the northwestern portion of the Subject Property. Although the concentrations of these compounds are relatively low, to be conservative, vapor intrusion mitigation measures should be incorporated into any proposed at-grade occupied spaces in the southeastern portion of the Subject Property.

In the northwestern portion of the Subject Property, vapor intrusion mitigation measures should be incorporated into any proposed at-grade occupied spaces from location SG-6 on the east to location SG-7 on the west. Soil gas samples collected from locations SG-7, SG-8, and SG-9 and groundwater samples collected from locations GW-4 and GW-5 did not contain VOCs at concentrations above vapor intrusion screening criteria, and vapor intrusion mitigation is not warranted for the areas north and west of location SG-7.

Shallow soil samples collected during this investigation did not contain organochlorine pesticides, arsenic, or lead at concentrations above residential screening criteria, and remediation, treatment, or mitigation of this soil is not warranted. A materials management program should be put in place as part of construction management for redevelopment to guide soil export and import requirements as well as protocols for dewatering water that may be generated as part of development.

12 LIMITATIONS AND EXCEPTIONS OF ASSESSMENT

The Phase I ESA is not an audit of current Subject Property operations for compliance with hazardous material usage laws or other regulations or operating permit requirements, including occupational health and safety issues regarding occupants of the Subject Property, wastewater discharge limitations such as National Pollutant Discharge Elimination System ("NPDES") permits, or hazardous waste facility operating permits such as may be required under Resource Conservation and Recovery Act ("RCRA") or State hazardous waste control laws or regulations.

The assessment by EKI did not include "non-scope considerations" as defined in ASTM Section 13.1.5, such as cultural or historic resources, ecological resources, endangered species, wetlands, drinking water quality, radon, indoor air quality, asbestos, lead paint, PCBs in building materials and equipment, and mold.

The conclusions and recommendations presented herein are our professional opinion and are not a warranty or guaranty as to the presence, absence, or extent of contamination at the Subject Property or of releases from or near the Subject Property. The facts presented herein are based on available information obtained by EKI and represent existing conditions at the Subject Property at the time the information was collected.

EKI's performance of the requirements prescribed by the Final EPA AAI Rule is deemed completed and is consistent with EKI's scope of work in the Agreement between the User and EKI, dated 20 February 2019, and Addendum No. 2, dated 12 March 2019.

PCBs: polychlorinated biphenyls

TABLE 1
SUMMARY OF SOIL SAMPLE ANALYTICAL RESULTS FOR
ORGANOCHLORINE PESTICIDES, PCBS, AND METALS
1001 North Shoreline Boulevard, Mountain View, California

Notes

(a) Soil samples were analyzed by K-Prime, Inc. using U.S. EPA Method 8081A for organochlorine pesticides, U.S. EPA Method 6020 for metals, and U.S. EPA Method 8082 for PCBs. Only detected compounds are shown. Compounds detected above the residential screening level are presented in **bold**.

(b) Residential screening levels are the Direct Exposure Human Health Risk Level (Table S-1) ESLs (RWQCB, 2019).

(c) The ESL for arsenic is less than the typical background concentration in soil. The RWQCB has established a regional background concentration of 11 mg/kg for arsenic in soil (Duverge, 2011).

(d) In lieu of ESLs, PCB results were compared to the High Occupancy Use Cleanup Level of 1 mg/kg established in the Toxic Substances Control Act (40 CFR 761.61).

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by EKI Environment & Water, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # B93F-4E92-976B

PO # B80116.00

Project 1001 N Shoreline Blvd

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: B93F-4E92-976B

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E 1527-13 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use(s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EDR Environmental Lien and AUL Search

The EDR Environmental Lien Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Legal Description

TRACT ONE:

PARCEL A:

ALL OF PARCEL 1, AS SHOWN ON THE PARCEL MAP LOT MERGER FILED FOR RECORD IN THE OFFICE OF THE RECORDER OF THE COUNTY OF SANTA CLARA, STATE OF CALIFORNIA, ON MAY 11, 2016 IN BOOK 892 OF MAPS, PAGES 14 THROUGH 20.

PARCEL B:

A PRIVATE NON-EXCLUSIVE EASEMENT FOR THE INSTALLATION, MAINTENANCE AND REPAIR OF UTILITIES, UNDER, UPON, OVER AND ACROSS THAT CERTAIN "UTILITY EASEMENT AREA" AS DESCRIBED IN THAT CERTAIN UTILITY EASEMENT AGREEMENT RECORDED MAY 14, 2004 AS INSTRUMENT NO. 17789791, OFFICIAL RECORDS, BEING MORE PARTICULARLY DESCRIBED AS FOLLOWS:
BEGINNING AT THE MOST EASTERLY CORNER OF SAID PARCEL B; THENCE FROM SAID POINT OF BEGINNING ALONG THE GENERAL EASTERLY LINE OF SAID PARCEL B THE FOLLOWING COURSES: NORTH 88° 18' 09" WEST 38.736 METERS; ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 17.069 METERS, THROUGH A CENTRAL ANGLE OF 22° 38' 52" FOR AN ARC LENGTH OF 6.747 METERS; THENCE LEAVING SAID GENERAL EASTERLY LINE NORTH 63° 42' 25" WEST 12.996 METERS TO THE TRUE POINT OF BEGINNING FOR THIS DESCRIPTION; THENCE FROM SAID TRUE POINT OF BEGINNING NORTH 63° 42' 25" WEST 46.271 METERS; THENCE NORTH 63° 07' 58" WEST 17.931 METERS; THENCE FROM A TANGENT BEARING OF SOUTH 79° 00' 51" WEST ALONG A CURVE TO THE LEFT WITH A RADIUS OF 39.397 METERS, THROUGH A CENTRAL ANGLE OF 1° 42' 58" FOR AN ARC LENGTH OF 1.180 METERS TO A POINT OF COMPOUND CURVATURE; THENCE ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 62.045 METERS, THROUGH A CENTRAL ANGLE OF 8° 18' 56" FOR AN ARC LENGTH OF 9.005 METERS; THENCE SOUTH 68° 58' 57" WEST 24.371 METERS; THENCE FROM A TANGENT BEARING OF SOUTH 29° 36' 35" WEST ALONG A CURVE TO THE RIGHT WITH A RADIUS OF 1.981 METERS, THROUGH A CENTRAL ANGLE OF 39° 22' 22" FOR AN ARC LENGTH OF 1.361 METERS; THENCE SOUTH 68° 58' 57" WEST 3.063 METERS TO A POINT IN THE WESTERLY LINE OF SAID PARCEL B; THENCE ALONG SAID WESTERLY LINE SOUTH 1° 11' 32" WEST 8.074 METERS; THENCE LEAVING SAID WESTERLY LINE NORTH 68° 58' 57" EAST 25.603 METERS; THENCE ALONG A TANGENT CURVE TO THE RIGHT WITH A RADIUS OF 45.718 METERS, THROUGH A CENTRAL ANGLE OF 20° 12' 11" FOR AN ARC LENGTH OF 16.121 METERS TO THE INTERSECTION THEREOF WITH A LINE PARALLEL WITH AND DISTANCE 7.000 METERS SOUTHWESTERLY, MEASURED AT RIGHT ANGLES FROM ABOVE SAID COURSE WITH A LENGTH OF 17.931 METERS; THENCE ALONG SAID PARALLEL LINE AND A LINE PARALLEL WITH AND DISTANT 7.000 METERS SOUTHWESTERLY, MEASURED AT RIGHT ANGLES, FROM ABOVE SAID COURSE WITH A LENGTH OF 46.271 METERS THE FOLLOWING TWO COURSES: SOUTH 63° 07' 58" EAST 10.917 METERS AND SOUTH 63° 42' 24" EAST 48.577 METERS; THENCE LEAVING SAID PARALLEL LINE NORTH 8° 35' 03" EAST 7.348 METERS TO THE TRUE POINT OF BEGINNING.

PARCEL C:

A PRIVATE NON-EXCLUSIVE EASEMENT FOR THE INSTALLATION, MAINTENANCE AND REPAIR OF UTILITIES, UNDER, UPON, OVER AND ACROSS THAT CERTAIN "STREET EASEMENT AREA" AS DESCRIBED IN THAT CERTAIN UTILITY EASEMENT AGREEMENT RECORDED MAY 14, 2004

AS INSTRUMENT NO. 17789791, OFFICIAL RECORDS, BEING MORE PARTICULARLY DESCRIBED AS FOLLOWS:

BEGINNING AT THE MOST EASTERLY CORNER OF SAID PARCEL B; THENCE FROM SAID POINT OF BEGINNING ALONG THE GENERAL EASTERLY LINE OF SAID PARCEL B THE FOLLOWING COURSES: NORTH 88° 18' 09" WEST 38.736 METERS; ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 17.069 METERS, THROUGH A CENTRAL ANGLE OF 22° 38' 52" FOR AN ARC LENGTH OF 6.747 METERS TO THE TRUE POINT OF BEGINNING FOR THIS DESCRIPTION; THENCE FROM SAID TRUE POINT OF BEGINNING ALONG SAID GENERAL EASTERLY LINE THE FOLLOWING TWO COURSES: FROM A TANGENT BEARING SOUTH 69° 02' 59" WEST, ALONG A CURVE TO THE LEFT WITH A RADIUS OF 17.069 METERS, THROUGH A CENTRAL ANGLE OF 67° 51' 04" FOR A LENGTH OF 20.213 METERS AND SOUTH 1° 11' 54" WEST 5.673 METERS; THENCE LEAVING SAID GENERAL EASTERLY LINE, FROM A TANGENT BEARING OF NORTH 21° 56' 33" WEST ALONG A CURVE TO THE LEFT WITH A RADIUS OF 18.500 METERS, THROUGH A CENTRAL ANGLE OF 9° 24' 30" FOR AN ARC LENGTH OF 3.038 METERS TO A POINT OF REVERSE CURVATURE; THENCE ALONG A TANGENT CURVE TO THE RIGHT WITH A RADIUS OF 12.200 METERS, THROUGH A CENTRAL ANGLE OF 39° 56' 06" FOR AN ARC LENGTH OF 8.503 METERS; THENCE NORTH 8° 35' 03" EAST 16.314 METERS; THENCE SOUTH 63° 42' 25" EAST 12.996 METERS TO THE TRUE POINT OF BEGINNING.

PARCEL D:

A PRIVATE NON-EXCLUSIVE EASEMENT FOR INGRESS AND EGRESS, UNDER, UPON, OVER AND ACROSS THAT CERTAIN "INGRESS-EGRESS EASEMENT" AS DESCRIBED IN THAT CERTAIN EASEMENT AGREEMENT RECORDED MAY 14, 2004 AS INSTRUMENT NO. 17789792, OFFICIAL RECORDS, BEING MORE PARTICULARLY DESCRIBED AS FOLLOWS:

BEGINNING AT A POINT IN THE EASTERLY LINE OF SAID PARCEL B; SAID POINT BEARS, ALONG SAID EASTERLY LINE, NORTH 1° 11' 54" EAST 7.297 METERS FROM THE SOUTHEAST CORNER OF SAID PARCEL B; THENCE FROM SAID POINT OF BEGINNING, ALONG SAID EASTERLY LINE, NORTH 1° 11' 54" EAST 7.315 METERS; THENCE LEAVING SAID EASTERLY LINE NORTH 88° 46' 47" WEST 79.037 METERS; THENCE ALONG A TANGENT CURVE TO THE RIGHT WITH A RADIUS OF 8.000 METERS, THROUGH A CENTRAL ANGLE OF 90° 02' 27" FOR AN ARC LENGTH OF 12.572 METERS; THENCE NORTH 1° 15' 40" EAST 45.723 METERS; THENCE SOUTH 66° 38' 18" WEST 9.137 METERS TO A POINT IN THE WESTERLY LINE OF SAID PARCEL B; THENCE ALONG SAID WESTERLY LINE SOUTH 1° 11' 32" WEST 22.678 METERS TO A WESTERLY CORNER OF SAID PARCEL B; THENCE SOUTH 88° 48' 28" EAST 0.964 METERS TO A POINT IN A LINE PARALLEL WITH AND DISTANT 7.315 METERS WESTERLY, MEASURED AT RIGHT ANGLES, FROM ABOVE SAID COURSE WITH A LENGTH OF 45.723 METERS; THENCE ALONG SAID PARCEL LINE SOUTH 1° 15' 40" WEST 31.563 METERS; THENCE LEAVING SAID PARALLEL LINE, ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 3.000 METERS, THROUGH A CENTRAL ANGLE OF 90° 02' 27" FOR AN ARC LENGTH OF 4.715 METERS TO A POINT IN A LINE PARALLEL WITH AND DISTANT 7.315 METERS SOUTHERLY, MEASURED AT RIGHT ANGLES, FROM ABOVE SAID COURSE WITH A LENGTH OF 79.037 METERS; THENCE ALONG SAID PARALLEL LINE SOUTH 88° 46' 47" EAST 91.363 METERS TO THE POINT OF BEGINNING.

TRACT TWO:

BEGINNING AT A POINT ON THE NORTHWESTERLY LINE OF PARCEL 2 AS DESCRIBED IN THE DIRECTOR'S DEED (STATE PARCEL NO. 11987-DD) FROM THE STATE OF CALIFORNIA TO GEORGE T. HEMMETER AND ANNE B. HEMMETER, HIS WIFE, AS JOINT TENANTS RECORDED JANUARY 17, 1961 IN VOLUME 5043 OF OFFICIAL RECORDS, PAGE 683, SANTA CLARA COUNTY

RECORDS, SAID POINT BEING AT THE NORTHEASTERLY TERMINUS OF THE COURSE DESCRIBED IN SAID PARCEL 2 AS "NORTH 66° 37' 26" EAST 325.40 FEET"; THENCE FROM SAID POINT OF BEGINNING, ALONG SAID NORTHWESTERLY LINE, FROM A TANGENT BEARING OF NORTH 66° 38' 18" EAST ALONG A CURVE TO THE RIGHT WITH A RADIUS OF 200.00 FEET, THROUGH A CENTRAL ANGLE OF 1° 09' 44", FOR AN ARC LENGTH OF 4.06 FEET; THENCE LEAVING SAID NORTHWESTERLY LINE, FROM A TANGENT BEARING OF NORTH 67° 53' 44" WEST ALONG A CURVE TO THE LEFT WITH A RADIUS OF 71.18 FEET, THROUGH A CENTRAL ANGLE OF 31° 30' 51", FOR AN ARC LENGTH OF 39.15 FEET; THENCE SOUTH 80° 35' 25" WEST 203.11 FEET; THENCE ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 200.00 FEET, THROUGH A CENTRAL ANGLE OF 67° 56' 09", FOR AN ARC LENGTH OF 237.14 FEET; THENCE SOUTH 12° 39' 16" WEST 66.01 FEET TO A POINT IN THE NORTHWESTERLY LINE OF PARCEL 1 AS DESCRIBED IN SAID DIRECTOR'S DEED; THENCE ALONG LAST SAID NORTHWESTERLY LINE, THE SOUTHEASTERLY LINE OF PARCEL 2 AS DESCRIBED IN SAID STATE PARCEL NO. 11986 AND SAID NORTHWESTERLY LINE OF SAID PARCEL 2 AS DESCRIBED IN SAID DIRECTOR'S DEED, FROM A TANGENT BEARING OF NORTH 12° 39' 16" EAST ALONG A CURVE TO THE RIGHT WITH A RADIUS OF 150.00 FEET, THROUGH A CENTRAL ANGLE OF 53° 59' 02", FOR AN ARC LENGTH OF 141.33 FEET: AND NORTH 66° 38' 18" EAST 354.11 FEET TO THE POINT OF BEGINNING.

APPENDIX D

OTHER SUPPORTING DOCUMENTATION

March 16, 2011

Calvano Development
900 Bush Street, Penthouse 1
San Francisco, CA 94109

Attn: Mr. Mark Calvano

RE: Phase I and II Environmental Site Assessment (ESA) Report
1005 & 1015 North Shoreline Blvd. and 1150 Terra Bella Ave.
Mountain View, California

Dear Mr. Calvano:

Enclosed is the Phase I and II ESA Report for the above referenced property. Please review this Report, especially the Site Reconnaissance and Conclusion sections. Our investigation has revealed the following findings in connection with the site.

- A petroleum release occurred on the adjacent and upgradient former Texaco at 975 North Shoreline. Three of the monitoring wells for this release are on the subject property. MW-22G is located between the Fiesta Del Mar restaurant building and North Shoreline Boulevard on 1005 North Shoreline. MW-22E is located south of the building at 1015 North Shoreline and MW-22F is located on the eastern portion of the Fiesta Del Mar parking area.

  In the most recent groundwater-monitoring event for which reports were available (first quarter 2010), contamination was detected in MW-22E, which is on the subject site just south of the building at 1015 North Shoreline. Specifically, TPH-GRO was detected at 9,900 ug/L, benzene was detected at a concentration of 130 ug/L, toluene was detected at a concentration of 4.2 ug/L. ethyl benzene was detected at a concentration of 11 ug/L, and MTBE was detected at a concentration of 1 ug/L.

Recent air sampling at 1015 North Shoreline indicates that there does not appear to be significant vapor intrusion into the building as a result of the impacted groundwater at the site.

This release has impacted the subject site. However, the source of the release is not on the property and the responsible party has been identified. Furthermore, the release is in public comment period for the proposed site closure and is expected to be closed within the next few months. Texaco also issued an indemnification to the current property owners, which is transferable to future property owners (the Indemnity agreement is included in Appendix K).

This release is a Recognized Environmental Condition (REC) as defined by ASTM since it has impacted the subject site. However, given the current status moving toward closure, the fact a responsible party has been identified and is actively addressing the release, and the indemnification agreement, this issue appears to have been sufficiently addressed, and no additional investigation is recommended.

If the release is closed, the monitoring wells, including those on the subject site, should be abandoned in accordance with applicable regulations. The responsible party for the release (in this case Texaco) is typically the well owner and financially responsible for sealing the wells.

- The Shippen Property at 1175 Terra Bella is a closed release south of the site. Gasoline contamination was discovered in 1998 and the release was closed in 2001. Although the release is closed, contamination remained on the release property at the time of closure. In addition to several borings on the release property, one soil boring for the investigation was advanced on the subject property at the southwest corner of 1150 Terra Bella, the corner of the subject site closest to the release. Low levels of petroleum contamination (below regulatory screening thresholds) were detected in the groundwater sample collected from this boring. Given the investigation results and the subsequent site closure, this release does not appear to have significantly impacted the subject site. It is classified as a Historical Recognized Environmental Condition (HREC) since it is closed and is no additional investigation, monitoring, or remediation is required.

- There is an open drinking water well at the 1150 Terra Bella property. According to Mr. Maleti, the well is no longer used. Santa Clara Valley Water District regulations state wells that are not used for more than one year should be appropriately sealed. We recommend that the well be properly sealed by a

licensed well driller in accordance with Santa Clara Valley Water District requirements. The well is not a REC but it could potentially be a conduit for contamination to enter or migrate through the groundwater.

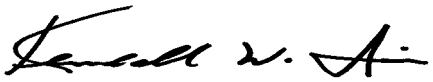
- No volatile organic compounds were detected in the four surface soil sampling in the fenced enclosure behind 1015 Shoreline. No additional sampling or analysis is recommended in this area.

- Based on information reviewed, the buildings were constructed prior to 1980. Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead-based paint have been used at the site. If it has not already been done, a full survey should be completed prior to any demolition or renovation at the site. This is not a REC as defined by the ASTM standard.

No other investigation is recommended.

Thank you for choosing ERS to perform this project. If you have any questions, comments or concerns, please contact me at (408) 496-0801.

Sincerely,



Kendall W. Price, CEG, REA
Regional Manager/Principal Consultant

PHASE I AND II ENVIRONMENTAL SITE ASSESSMENT

1005 & 1015 North Shoreline Blvd.
and 1150 Terra Bella Ave.
Mountain View, California

March 16, 2011

Prepared For:

Calvano Development
900 Bush Street, Penthouse 1
San Francisco, CA 94109

Environmental Risk Specialties Corporation

EXECUTIVE SUMMARY

Consultant:	Environmental Risk Specialties Corporation (ERS)
Subject Property:	1005 & 1015 North Shoreline Blvd. and 1150 Terra Bella Ave. Mountain View, California
Client:	Calvano Development 900 Bush Street, Penthouse 1 San Francisco, California 94109
Location:	The site addresses are 1005 & 1015 North Shoreline Blvd. and 1150 Terra Bella Ave., City of Mountain View, Santa Clara County, California. The Santa Clara County Assessor Parcel Numbers (APNs) are 153-15-015 (1005 North Shoreline), 153-15-016 (1015 North Shoreline), and 153-15-022 (1150 Terra Bella).
Current Use:	The site is occupied by the Fiesta Del Mar restaurant at 1005 North Shoreline, a former residence used for Fiesta Del Mar restaurant storage at 1015 North Shoreline, and a residence and open land at 1150 Terra Bella Avenue.
Current Owner:	Annette Kavanaugh, Marco J Bertozzi Jr. & Robert S Bertozzi Trustees
Site Characteristics:	The site consists of three separate adjoining parcels. Parcel 153-15-015 is 1005 North Shoreline and is occupied by the Fiesta Del Mar Restaurant. It can be accessed from both North Shoreline and Terra Bella. Parcel 153-15-016 is at 1015 North Shoreline and contains a former residence that is used by Fiesta Del Mar for storage. The western portion of this parcel is used as a parking lot and unpaved open area that was formerly storage. Parcel 153-15-022 is at 1150 Terra Bella and contains a residence, a garage, a green house, several storage sheds, and open areas formerly used for storage.

Vicinity Characteristics: The property is in a mixed-use area within the City of Mountain View, California.

Purpose: This Phase I Environmental Site Assessment (ESA) was performed to (1) identify any recognized environmental conditions (RECs), and (2) permit a user to satisfy one of the requirements to qualify for the innocent landowner defense under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability protection (42 U.S.C. §9601). All components of this ESA were performed or overseen by Environmental Professionals as defined in the All Appropriate Inquiries (AAI) Standard and the American Society for Testing and Materials (ASTM) E 1527-05.

Conclusions:

Our investigation has revealed the following findings in connection with the site.

- A petroleum release occurred on the adjacent and upgradient former Texaco at 975 North Shoreline. Three of the monitoring wells for this release are on the subject property. MW-22G is located between the Fiesta Del Mar restaurant building and North Shoreline Boulevard on 1005 North Shoreline. MW-22E is located south of the building at 1015 North Shoreline and MW-22F is located on the eastern portion of the Fiesta Del Mar parking area.

  In the most recent groundwater-monitoring event for which reports were available (first quarter 2010), contamination was detected in MW-22E, which is on the subject site just south of the building at 1015 North Shoreline. Specifically, TPH-GRO was detected at 9,900 ug/L, benzene was detected at a concentration of 130 ug/L, toluene was detected at a concentration of 4.2 ug/L. ethyl benzene was detected at a concentration of 11 ug/L, and MTBE was detected at a concentration of 1 ug/L.

  Recent air sampling at 1015 North Shoreline indicates that there does not appear to be significant vapor intrusion into the building as a result of the impacted groundwater at the site.

This release has impacted the subject site. However, the source of the release is not on the property and the responsible party has been identified. Furthermore, the release is in public comment period for the proposed site closure and is expected to be closed within the next few months. Texaco also issued an indemnification to the current property owners, which is transferable to future property owners (the Indemnity agreement is included in Appendix K).

This release is a Recognized Environmental Condition (REC) as defined by ASTM since it has impacted the subject site. However, given the current status moving toward closure, the fact a responsible party has been identified and is actively addressing the release, and the indemnification agreement, this issue appears to have been sufficiently addressed, and no additional investigation is recommended.

If the release is closed, the monitoring wells, including those on the subject site, should be abandoned in accordance with applicable regulations. The responsible party for the release (in this case Texaco) is typically the well owner and financially responsible for sealing the wells.

- The Shippen Property at 1175 Terra Bella is a closed release south of the site. Gasoline contamination was discovered in 1998 and the release was closed in 2001. Although the release is closed, contamination remained on the release property at the time of closure. In addition to several borings on the release property, one soil boring for the investigation was advanced on the subject property at the southwest corner of 1150 Terra Bella, the corner of the subject site closest to the release. Low levels of petroleum contamination (below regulatory screening thresholds) were detected in the groundwater sample collected from this boring. Given the investigation results and the subsequent site closure, this release does not appear to have significantly impacted the subject site. It is classified as a Historical Recognized Environmental Condition (HREC) since it is closed and is no additional investigation, monitoring, or remediation is required.

- There is an open drinking water well at the 1150 Terra Bella property. According to Mr. Maleti, the well is no longer used. Santa Clara Valley Water District regulations state wells that are not used for more than one year should be

appropriately sealed. We recommend that the well be properly sealed by a licensed well driller in accordance with Santa Clara Valley Water District requirements. The well is not a REC but it could potentially be a conduit for contamination to enter or migrate through the groundwater.

- No volatile organic compounds were detected in the surface soil sampling in the fenced enclosure behind 1015 Shoreline. No additional sampling or analysis is recommended in this area.

- Based on information reviewed, the buildings were constructed prior to 1980. Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead-based paint have been used at the site. If it has not already been done, a full survey should be completed prior to any demolition or renovation at the site. This is not a REC as defined by the ASTM standard.

No other investigation is recommended.

1.0 INTRODUCTION

On behalf of Calvano Development (hereinafter referred to as the "Client"), Environmental Risk Specialties Corporation (ERS), performed a Phase I and II Environmental Site Assessment (ESA) of the property located at 1005 & 1015 North Shoreline Blvd. and 1150 Terra Bella Ave., City of Mountain View, Santa Clara County, California (hereinafter referred to as the "subject property").

1.1 Purpose

This ESA was performed to provide a record of the site conditions at the subject property and to evaluate what, if any, recognized environmental conditions exist at this site. Additional goals of this ESA are to identify recognized environmental conditions (RECs) from current and historical practices on the subject property and surrounding area and to assist the Client to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability.

1.2 Detailed Scope of Services

The following tasks were performed in accordance with the Scope of Services:

- Visual site inspection of the subject property to investigate for recognized environmental conditions. ERS is not responsible for inspecting areas covered by parked vehicles, overgrown vegetation, and other obstacles preventing access.

- A historical review of the use and improvements of the subject property through a review of aerial photographs, historical topographic maps, city directories, fire insurance maps, title reports, and/or building department records.

- A review of available geologic and hydrogeologic literature concerning the property and surrounding area.

- Interviews of persons familiar with the history of the subject property, including key site managers, owners, tenants, past tenants, and/or previous owners.

- Review of appropriate federal, state, and local regulatory agencies to reveal known hazardous wastes sites or significant leaks or spills of hazardous materials that may have occurred at the subject property and immediate vicinity.

- Interviews with applicable local agencies familiar with the areas in the vicinity of the subject property such as local fire departments, health departments, Regional Water Quality Control Board, and/or other local government agencies.

- Collecting soil samples from the rear yard at 1015 North Shoreline and analyzing the samples for volatile organic compounds.

1.3 Significant Assumptions

No significant assumptions were made during this Phase I and II ESA.

1.4 Limitations and Exceptions of Agreement

ERS has performed the services for this project in accordance with our proposal, and within the current standards of the American Society for Testing and Materials (ASTM 1527-05) for Phase I Environmental Site Assessments and the standards for All Appropriate Inquiries (AAI) approved by the Federal Environmental Protection Agency. Except for the representations set forth in this Phase I ESA, no other representations, guarantees, or warrantees are either expressed or implied. A record search was limited to reasonably ascertainable information that could be obtained within 20 calendar days.

The review was limited to a search for RECs at the subject property. The term REC means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

There is no investigation that is thorough enough to preclude the presence of hazardous materials that presently, or in the future, may be considered hazardous at the site. Because

regulatory evaluation criteria are constantly changing, concentrations of contaminants presently considered low may, in the future, fall under more stringent regulatory standards that require remediation.

The Site Reconnaissance was limited to visual observation of surface conditions at the subject property. Interviews with public agency personnel were conducted. Reasonably ascertainable information was reviewed. This approach reflects current ASTM standards and AAI regulations.

Where there is a conflict between the environmental database and ERS's actual knowledge with regard to the distance and direction from the subject property of sites listed on the database, information obtained by ERS from the site reconnaissance was used. Whenever feasible, ERS notes such conflict within the text of the report.

This ESA addresses recognized environmental conditions at the subject property. However, certain conditions, such as those listed below may not be revealed:

1) naturally occurring toxic materials in subsurface soils, rocks, or water, or toxicity of onsite flora;
2) toxicity of substances common in current habitable environments, such as stored household products, building materials, and consumables;
3) biological pathogens;
4) contaminant plume below the depths sampled or from remote source;
5) contaminants or contaminant concentrations that do not violate present regulatory standards, but may violate future standards; and
6) unknown site contamination, such as illegal dumping and/or accidental spillage which may occur following the site visit by ERS.

Opinions and judgments expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions. This document and the information contained herein have been prepared solely for the Client and any reliance on this report by third parties not authorized by the Client shall be at such party's sole risk.

Conducting an AAI Phase I ESA alone does not provide a landowner with protection against CERCLA liability. Landowners who want to qualify as bona fide prospective purchasers or contiguous property owner must comply with all of the statutory requirements identified in CERCLA Section 107(r) and 107(q).

1.5 Special Terms and Conditions

No special terms or conditions were agreed upon for conducting this Phase I ESA.

1.6 User Reliance

As specified in ASTM E 1527-05, Sections 7.5.2 and 7.5.2.1, ERS is not required to independently verify the information provided by the User (Client), obtained from interviews, previous environmental reports, and/or reviewed documents during records review.

2.0 SITE DESCRIPTION

2.1 Location and Legal Description

The site addresses are 1005 & 1015 North Shoreline Blvd. and 1150 Terra Bella Ave., City of Mountain View, Santa Clara County, California. The Santa Clara County Assessor Parcel Numbers (APNs) are 153-15-015 (1005 North Shoreline), 153-15-016 (1015 North Shoreline), and 153-15-022 (1150 Terra Bella. The full legal description is included with the title and lien search report in Appendix J.

2.2 Site and Vicinity General Characteristics

The property is in a mixed-use area. Adjoining properties are residential, light industrial, and commercial.

2.3 Current and Proposed Use of the Property

The site is occupied by the Fiesta Del Mar restaurant at 1005 North Shoreline, a former residence used for Fiesta Del Mar restaurant storage at 1015 North Shoreline, and a residence and open land at 1150 Terra Bella Avenue.

No information on the proposed use of the property was provided to ERS.

2.4 Description of Structures, Road, and Other Improvements

The site consists of three separate adjoining parcels. Parcel 153-15-015 is 1005 North Shoreline and is occupied by the Fiesta Del Mar Restaurant. It can be accessed from both North Shoreline and Terra Bella. Parcel 153-15-016 is at 1015 North Shoreline and contains a former residence that is used by Fiesta Del Mar for storage. The western portion of this parcel is used as a parking lot and unpaved open area that was formerly storage. Parcel 153-15-022 is at 1150 Terra Bella and contains a residence, a garage, a green house, several storage sheds, and open areas formerly used for storage.

The subject property is connected to the Mountain View municipal water and sanitary and storm sewer systems.

2.5 Current Uses of the Adjoining Properties

The property is in a mixed-use area.

3.0 USER PROVIDED INFORMATION

3.1 Title Records

An Environmental Liens Search was performed by EDR as a part of this Phase I ESA. The lien search, including the most recent grant deeds, is included in Appendix J. No additional title information was provided by the user.

3.2 Environmental Liens or Activity and Use Limitations

The Environmental Professional is required to search for Activity and Use Limitations (AULs) if such records are available in *"publicly available lists or registries."* Typical AULs include land use restrictions (LURs), institutional controls (ICs), and Engineering Controls (ECs). Typical ICs include: 1) governmental controls such as zoning; 2) proprietary controls such as covenants or easements; 3) enforcement documents such as orders or consent decrees; and 4) information devices such as land record or deed notices. Typical ECs include: 1) passive measures such as vapor barriers and setbacks; 2) active measures such as remediation systems; and 3) monitoring of passive and/or active measures. According to 40 CFR Part 312.26 (b)(7), ICs are to be investigated on the subject property

and according to 40 CFR Part 312.26 (b)(6) and (c)(2)(ii), ECs are to be reviewed to a 0.5 mile radius of the subject property. ASTM 1527-05 recommends that ECs be reviewed only for the subject property.

An Environmental Liens Search was performed for the subject property. The lien search report is included as Appendix J. The Environmental Liens Search did not report any environmental liens or other activity use limitations (AULs) associated with the subject property.

3.3 Specialized Knowledge

ERS was informed that the property had been impacted by a release at a former Texaco filling station at 975 North Shoreline (formerly known as 975 Stierlin Road). An indemnity agreement signed by Texaco is included in Appendix K. Please refer to section 4.1.2 for additional information on this release.

3.4 Commonly Known or Reasonably Ascertainable Information

ERS did not discover any other commonly known or reasonable ascertainable information associated with the subject property or the area in the vicinity of the subject property.

3.5 Valuation Reduction for Environmental Issues

ERS was not provided with purchase price information.

3.6 Owner, Property Manager, and Occupant Information

According to the title provided by EDR, the current owner of the subject property is Annette Kavanaugh, Marco J Bertozzi Jr. & Robert S Bertozzi Trustees, who acquired it from First American Title Company in October 2007. According to Mr. Sal Maleti, their cousin and the broker representing the property, these are siblings who inherited the property, which has been in their family for several decades.

The subject site is currently occupied by the Fiesta Del Mar restaurant at 1005 North Shoreline, which also uses the former residence at 1015 North Shoreline for storage. The property at 1150 Terra Bella is a residence.

The property owners manage the property.

3.7 Reason for Performing the Phase I ESA

ERS has performed this Phase I ESA for a prospective property sale.

3.8 Other

ERS was provided with no additional information or previous reports for the subject site.

4.0 RECORDS REVIEW

Table 1, Records Review, located below lists the government environmental agency databases ERS reviewed. Shaded cells indicate that, in accordance with ASTM 1527-05, the Environmental Database was not searched to the corresponding distance. The database obtained from Environmental Data Resources, Inc. (EDR) is included as Appendix C. When locations and distances reported by EDR were observed to be incorrect, ERS amended the information to provide a more accurate assessment.

ERS also requested information from the Mountain View Fire Department, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the San Francisco Bay Regional Water Quality Control Board, and the California Department of Toxic Substance Control Envirostor database.

4.1 Standard Environmental Record Sources

4.1.1 Subject Site

The subject site address was not identified on any of the searched databases.

4.1.2 Offsite Listings

ERS reviewed files for nearby releases on the Geotracker, Envirostor, and Santa Clara County Environmental Health Department websites. Based on the documents reviewed, groundwater appears to be 5-15 feet below ground surface with a general regional gradient to the north. Based on the presumed northerly groundwater flow direction, offsite listings that are adjacent to or south of the subject site have the greatest potential to impact the subject site.

- *Texaco (CVX#21-1179) at 975 North Shoreline - listed on the LUST, HIST LUST, HIST CORTESE databases (also listed as Texaco at 975 Steirlin Road in Terra Bell - on the HIST UST database and Exxon at 975 N Shoreline on the CA FID UST and SWEEPS UST databases)*

  The listing is a former Texaco-branded service station located at the southeastern corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue in Mountain View, California (also formerly known as 975 Stierlin Road).

  It is an open release directly upgradient from the subject property. According to documents ERS obtained from the GeoTracker database, former station features include one 6,000-gallon gasoline underground storage tank (UST), four 4,000-gallon gasoline USTs, and one waste oil UST. In 1992, the six USTs, associated product piping, and dispensers were removed. The former Texaco station property was later redeveloped as a fast-food restaurant.

  Following removal of USTs, approximately 1,520 cubic yards of petroleum hydrocarbon impacted soil and approximately 1,000 gallons of petroleum hydrocarbon-impacted groundwater were removed from the former UST area.

  From January 13 to February 9, 1994, ENTRIX, Inc. (ENTRIX) operated a soil vapor extraction (SVE) system at the Site. The SVE system was shut down for rebound evaluation from February 9 to 24, 1994. On February 24, 1994, ENTRIX

restarted and sampled the SVE system and concluded that no rebound had occurred. ENTRIX concluded that the SVE system appeared to achieve remedial objectives. The SVE system was decommissioned following the rebound test to facilitate Site redevelopment.

Twelve groundwater monitoring wells have been installed on or near the release property. Eight groundwater monitoring wells (MW-22A, MW-22B, MW-22D, and MW-22L through MW-22P) were installed on the release property, and four groundwater monitoring wells (MW-22E through MW-22H) were installed at off-site locations to assess the lateral and down-gradient extent of petroleum hydrocarbons in groundwater. Groundwater monitoring has been performed at the Site since 1988. Historically, the direction of groundwater flow at the Site has been towards the north.

Three of the monitoring wells for this release are on the subject property. MW-22G is located between the Fiesta Del Mar restaurant building and North Shoreline Boulevard on 1005 North Shoreline. MW-22E is located south of the building at 1015 North Shoreline and MW-22F is located on the eastern portion of the Fiesta Del Mar parking area.

In the most recent groundwater monitoring event for which reports were available (first quarter 2010), contamination was detected in MW-22E, which is on the subject site just south of the building at 1015 North Shoreline. Specifically, TPH-GRO was detected at 9,900 ug/L, Benzene was detected at a concentration of 130 ug/L, toluene was detected at a concentration of 4.2 ug/L. ethyl benzene was detected at a concentration of 11 ug/L, and MTBE was detected at a concentration of 1 ug/L.

Recent air sampling at 1015 North Shoreline indicates that there does not appear to be significant vapor intrusion into the building as a result of the impacted groundwater at the site.

This release has impacted the subject site. However, the source of the release is not on the property and the responsible party has been identified. Furthermore, the release is in public comment period for the proposed site closure and is expected to be closed within the next few months. Texaco also issued an indemnification to the current property owners, which is transferrable to future property owners (the Indemnity agreement is included in Appendix K). This

release is a Recognized Environmental Condition (REC) as defined by ASTM since it has impacted the subject site. However, given the current status moving toward closure, the fact a responsible party has been identified and is actively addressing the release, and the indemnification agreement, this issue appears to have been sufficiently addressed, and no additional investigation is recommended.

If the release is closed, the monitoring wells, including those on the subject site, should be abandoned in accordance with applicable regulations. The responsible party for the release (in this case Texaco) is typically the well owner and financially responsible for sealing the wells.

- *Shippen Property at 1175 Terra Bella - listed on the HIST CORTESE, LUST and HIST LUST databases*

  This release is a closed release south of the site. Gasoline contamination was discovered in 1998 and the release was closed in 2001. Although the release is closed, contamination remained on the release property at the time of closure. In addition to several borings on the release property, one investigation boring for the investigation was advanced on the subject site at the southwest corner of 1150 Terra Bella, the corner of the subject site closest to the release. Low levels of petroleum contamination (below regulatory screening thresholds) were detected in the groundwater sample collected from this boring. Given the investigation results and the subsequent site closure, this release does not appear to have significantly impacted the subject site. It is classified as a Historical Recognized Environmental Condition (HREC) since it is closed and is no additional investigation, monitoring, or remediation is required.

- *Regional NPL listings at Intel Corporation (365 Middlefield Road), Printex Corporation (Plymouth and Colony Streets), Jasco Chem Corp (1710 Villa Street), Moffett Naval Air Station (Moffett Field NAS), Spectra Physics Inc (1250 W Middlefield Road) and Telcom Semiconductors (1300 Terra Bella)*

  These are separate releases that have mingled and impacted a large area of Mountain View with chlorinated solvents and other volatile organics. The majority of impacts appear to be west of Shoreline Avenue or north of Highway 101. The subject site does not appear to be within the impacted areas defined for these releases.

Selected documentation for the former Texaco release including the Indemnification agreement is included in Appendix K.

Based on our evaluation of the distance, direction, regulatory status, and nature of the databases, none of the other offsite listings are likely to adversely impact the subject site.

4.1.3 Other Sites of Potential Environmental Concern

ERS did not identify any other sites of environmental concern. ERS reviewed the sites in the EDR Database that were unable to be mapped. None of the listings appeared to correspond to the site or adjacent properties. None of the listings appear likely to impact the site.

4.2 Additional Environmental Record Sources

Mountain View Fire Department
ERS reviewed files at the Mountain View Fire Department. The Mountain View Fire Department maintains hazardous material business plans and other tank and hazardous material records for properties within the City of Mountain View. The Fire Department inspections for 1005 North Shoreline were primarily just building/occupancy inspections and files for this parcel dated back to 1999. There were concerns in late 2010 regarding grease buildup and leaking tallow storage, but these appear to have been resolved and are not indicative of a recognized environmental condition as defined by the ASTM standard. The files for 1015 North Shoreline dealt primarily with structural and potential explosion concerns in 2001 with the use of the building, which was reported to be in a dilapidated condition for restaurant storage of materials including alcohol, which is flammable. It appears the requested repairs were made and the storage is now in accordance with fire code requirements. The only file for 1150 Terra Bella was an inspection on 2001, which listed the primary residence as vacant and classified the remainder of this parcel as an outdoor storage facility. None of the information in the Mountain View Fire Department files is indicative of a recognized environmental condition.

Santa Clara County Environmental Health Department
ERS reviewed available files for petroleum releases at the Santa Clara County Environmental Health Department. The site was not listed as a release site. Files for

the adjacent properties at 975 Shoreline and 1175 Terra Bella were reviewed. Please refer to Section 4.1.2 for additional information on these releases.

Santa Clara Valley Water District
ERS reviewed available files for solvent releases at the Santa Clara Valley Water District. The site was not listed as a release site.

Geotracker Database
ERS reviewed available files for nearby releases on the Geotracker database. The site was not listed as a release site. The site was not listed as a release site. Files for the adjacent properties at 975 Shoreline and 1175 Terra Bella were reviewed. Please refer to Section 4.1.2 for additional information on these releases.

DTSC Envirostor Database
ERS reviewed files on the DTSC Envirostor database. Neither the site nor adjacent properties were listed on the Envirostor database. None of the other listings in the surrounding area appear to have impacted the subject site.

4.3 Physical Setting Sources(s)

The EDR Report in Appendix C indicates that the underlying geology consists of Cenozoic Era, Quaternary Series Stratified Sequence deposits. Surface soils in the vicinity of the site are classified by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS) as Botella clay loam. A representative profile of these soils consists of loam to a depth of 9 inches below ground surface (bgs), silty clay loam from 9 to 41 inches bgs, and sandy clay loam from a depth of 41 to 76 inches bgs.

Current site-specific information on groundwater flow direction, depth, and quality can only be confirmed through the installation and survey of a minimum of three on-site groundwater-monitoring wells, which was beyond the scope of this assessment. Based on the documents reviewed for releases in the general vicinity of the subject site, including monitoring wells on the subject site, groundwater appears to be 5 to 15 feet below ground surface with a general regional gradient to the north.

According to the 1999 USGS Mountain View, CA Quadrangle Map, the site elevation is approximately 38 feet above mean sea level with a slight regional topographic gradient downward to the north.

4.4 Historical Use Information on the Property

ERS reconstructed a brief history of the subject property through a review of historical Sanborn® Fire Insurance Maps; Topographic Maps; the EDR City Abstract; available records, permits and other documents available at the City of Gilroy and Santa Clara County; and historical aerial photographs provided by EDR. A summary of historical sources can be found in Section 12.0 of this Report with pertinent documents available in Appendices.

Circa 1939 to 1948	Subject site appears to be farmland or orchards.
Circa 1956-1965	Based on aerial photographs, the subject site buildings at 1015 North Shoreline and 1150 Terra Bella appear to have been present since at least 1956. The lot at 1005 North Shoreline appears to be graded but no structures on the 1956 and 1965 aerial photograph.
Circa 1974-2005	Based on aerial photographs, by 1974, a building is present at 1005 North Shoreline similar to the current configuration. Outdoor storage is apparent at the 1150 Terra Bella property, which appears to be trailers, sheds, and vehicles, is apparent in the 1974-2005 aerial photographs, but the scale of the photos limits the determination of the materials stored.
Circa 1991	City Directories list 1005 North Shoreline as Eat N Run
Circa 2001-2011	City Directories and Fire Department Inspection reports list 1005 North Shoreline as Fiesta Del Mar restaurant.

5.0 SITE RECONNAISSANCE

The goal of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the subject property. The subject property is visually observed and any structures located on the property are observed to the extent not obstructed by bodies of water, adjacent buildings, and/or other obstructions.

5.1 Methodology and Limiting Conditions

The exterior site reconnaissance was performed by walking open areas of the property in a grid fashion. Special attention was given to observe surfaces adjacent to the structures and sidewalks, surfaces in storage areas, and potential conduits to the subsurface such as drains and sumps. The interior site reconnaissance was performed by systematically observing each room and open space of the property. Additional attention was given to doors, utility rooms, storage areas, areas where hazardous materials were used or stored, and any other accessible areas.

5.2 General Site Setting

On February 16, 2011, Ms. Janelle Amendola of ERS conducted a site reconnaissance at the subject property. Ms. Amendola was accompanied by Mr. Sal Maleti during the site visit. The following is a checklist of features that are searched for during the Site reconnaissance:

Feature	Observed	Not Observed
Existing structures	X	
Evidence of past uses (foundations, debris, roads)		X
Hazardous substances and/or petroleum products	X	
Aboveground storage tanks (ASTs) or evidence of ASTs		X
Underground storage tanks (USTs) or evidence of USTs		X
Strong, pungent, or noxious odors		X
Pools of liquid likely to be hazardous materials or petroleum products		X
Drums		X
Unidentified substance containers		X
PCB-containing equipment		X
Subsurface hydraulic equipment		X
Heating/ventilation/air conditioning (HVAC)	X	
Stains on walls or ceilings		X
Floor drains and sumps	X	
Pits, ponds or lagoons, drainage channels		X
Agricultural Area(s)		X
Stained soil and/or pavement		X
Distressed vegetation		X

Feature	Observed	Not Observed
Waste or wastewater discharge to surface or surface waters on subject property (including stormwater)		X
Wells (irrigation, domestic, dry, injection, abandoned, monitoring)	X	
Septic systems		X

5.3 Exterior Observations

Evidence was found of the presence of the following items during the site reconnaissance of the exterior of the building.

- The fenced area behind the former residence of 1015 North Shoreline appeared to have been used for restaurant maintenance storage and workshop area including numerous small containers of paints and fuel as well as various other materials. ERS recommended and conducted soil sampling in this area. Please see section 7.o for additional information on the soil sampling in this area.
- A well house was observed on the 1150 Terra Bella property. A hose extended from the well house, but the occupant of the house at 1150 Terra Bella and Mr. Sal Maleti indicated that the well is no longer used. Although this is not in itself a source of contamination, it could potentially be a conduit for contamination to enter or spread through the groundwater. If the well is no longer used, it should be sealed in accordance with Santa Clara Valley Water District requirements. If it is still in use, the ownership and responsibility for maintaining, testing, and reporting the well will transfer to the new property owner if the property is sold. We recommend that the well be properly sealed if it will no longer be used.
- Monitoring Wells – Three monitoring wells associated with the release investigation for the former Texaco at 975 North Shoreline were observed on the subject site. These wells should be properly sealed by the responsible party for the release (in this case Texaco) once the release is closed.
- Tallow Storage – Used tallow storage was observed next to the Rio Del Mar Restaurant. The type and quantity appeared typical and appropriate for this size and type of restaurant. This is not a REC as defined by ASTM.
- The majority of the 1150 Terra Bella property and the western portion of the 1015 North Shoreline property appeared to have been graded and covered with gravel for outdoor storage. No staining or stressed vegetation was observed in these areas.

- There were several sheds present with various debris including empty containers on the 1150 Terra Bella property. We recommend the materials be removed from the sheds and appropriately disposed prior to the property transfer.

5.4 Interior Observations

Evidence was found of the presence of the following items during the site reconnaissance of the interior of the building. A discussion of these items follows:

- HVAC equipment - The buildings have HVAC equipment typical for their use.
- Grease Trap at 1005 Terra Bella. A grease trap is present in the floor in the kitchen area of the restaurant at 1005 Terra Bella. The restaurant manager reported the trap is emptied regularly. This is typical of a restaurant and is not indicative of an ASTM REC.

5.5 Non-Scope Items

The following non-scope items were included as part of this report based on readily available information that was reviewed.

5.5.1 Suspect Asbestos Containing Building Materials/Lead-Based Paint

Based on information reviewed, the buildings were constructed prior to 1980. Based on the age of the building, it is possible that asbestos containing materials and/or lead-based paint have been used at the site. Any renovation or demolition should follow local regulations for asbestos and lead-based paint sampling. Asbestos containing materials and/or lead-based paint in structures at the site are not recognized environmental conditions (RECs) as defined by ASTM.

5.5.2 Radon

No radon survey was conducted. According to the EDR report, Santa Clara County is in zone 2, indicating the average indoor level is between 2 and 4 picocuries per liter (pCi/L). The US Environmental Protection Agency (USEPA) action level is 4 pCi/L.

6.0 INTERVIEWS

6.1 Interview with Owner

According to the title provided by EDR, the current owner of the subject property is Annette Kavanaugh, Marco J Bertozzi Jr. & Robert S Bertozzi Trustees, who acquired it from First American Title Company in October 2007. According to Mr. Sal Maleti, their cousin and the broker representing the property, these are siblings who inherited the property, which has been in their family for several decades. The property owners designated Mr. Maleti as their representative for this ESA. ERS received a completed questionnaire for the property from Mr. Sal Maleti, the broker representing the property who is also the cousin of the current property owners and nephew of the former owner. Mr. Maleti has been familiar with the property for decades. Mr. Maleti provided the indemnity agreement in Appendix K and reports for the release at the former Texaco at 975 North Shoreline. Mr. Maleti was not aware of any other environmental concerns in connection with the site.

6.2 Interview with Site Manager

The property owner manages the property.

6.3 Interviews with Occupants

ERS interviewed the Fiesta Del Mar restaurant manager and the occupant of the house at 1150 Terra Bella during the site reconnaissance. Information they provided was included in the site reconnaissance section.

6.4 Interviews with Local Government Officials

ERS requested information from the Mountain View Fire Department, the County of Santa Clara Environmental Health Department, the Santa Clara Valley Water District, and the California Department of Toxic Substance Control. Information from these requests is presented elsewhere throughout this report.

6.5 Interviews with Others

ERS conducted no other interviews for this Phase I ESA.

7.0 SOIL SAMPLING

Based on observations during the site reconnaissance, ERS recommended soil sampling in the rear fenced yard of 1015 North Shoreline. The sampling was completed on March 2, 2011.

ERS advanced four hand auger soil borings to a depth of 3 feet below ground surface in areas near where materials including paints and lubricants were observed during the site reconnaissance. A map showing the sample locations is included in Appendix L.

Soil samples were collected from 0-0.5 feet bgs and 2.5-3 feet bgs in each of the soil borings. The samples were submitted to Torrent Laboratory for analysis. The laboratory was instructed to analyze the 0-0.5 foot deep samples for volatile organic compounds. The 2.5-3 foot samples were held pending analysis of the surface samples. If the surface samples revealed impacts, the deeper samples would have been analyzed to determine if the impacts extended to that depth. The laboratory analysis report is included in Appendix L.

No volatile organic compounds were detected in any of the analyzed soil samples.

No additional sampling or analysis is recommended.

8.0 FINDINGS

Our investigation has revealed the following findings in connection with the site.

- A petroleum release occurred on the adjacent and upgradient former Texaco at 975 North Shoreline. Three of the monitoring wells for this release are on the subject property. MW-22G is located between the Fiesta Del Mar restaurant building and North Shoreline Boulevard on 1005 North Shoreline. MW-22E is

located south of the building at 1015 North Shoreline and MW-22F is located on the eastern portion of the Fiesta Del Mar parking area.

In the most recent groundwater-monitoring event for which reports were available (first quarter 2010), contamination was detected in MW-22E, which is on the subject site just south of the building at 1015 North Shoreline. Specifically, TPH-GRO was detected at 9,900 ug/L, benzene was detected at a concentration of 130 ug/L, toluene was detected at a concentration of 4.2 ug/L. ethyl benzene was detected at a concentration of 11 ug/L, and MTBE was detected at a concentration of 1 ug/L.

Recent air sampling at 1015 North Shoreline indicates that there does not appear to be significant vapor intrusion into the building as a result of the impacted groundwater at the site.

This release has impacted the subject site. However, the source of the release is not on the property and the responsible party has been identified. Furthermore, the release is in public comment period for the proposed site closure and is expected to be closed within the next few months. Texaco also issued an indemnification to the current property owners, which is transferable to future property owners (the Indemnity agreement is included in Appendix K).

This release is a Recognized Environmental Condition (REC) as defined by ASTM since it has impacted the subject site. However, given the current status moving toward closure, the fact a responsible party has been identified and is actively addressing the release, and the indemnification agreement, this issue appears to have been sufficiently addressed, and no additional investigation is recommended.

If the release is closed, the monitoring wells, including those on the subject site, should be abandoned in accordance with applicable regulations. The responsible party for the release (in this case Texaco) is typically the well owner and financially responsible for sealing the wells.

- The Shippen Property at 1175 Terra Bella is a closed release south of the site. Gasoline contamination was discovered in 1998 and the release was closed in 2001. Although the release is closed, contamination remained on the release property at the time of closure. In addition to several borings on the release

property, one soil boring for the investigation was advanced on the subject property at the southwest corner of 1150 Terra Bella, the corner of the subject site closest to the release. Low levels of petroleum contamination (below regulatory screening thresholds) were detected in the groundwater sample collected from this boring. Given the investigation results and the subsequent site closure, this release does not appear to have significantly impacted the subject site. It is classified as a Historical Recognized Environmental Condition (HREC) since it is closed and is no additional investigation, monitoring, or remediation is required.

- There is an open drinking water well at the 1150 Terra Bella property. According to Mr. Maleti, the well is no longer used. Santa Clara Valley Water District regulations state wells that are not used for more than one year should be appropriately sealed. We recommend that the well be properly sealed by a licensed well driller in accordance with Santa Clara Valley Water District requirements. The well is not a REC but it could potentially be a conduit for contamination to enter or migrate through the groundwater.

- No volatile organic compounds were detected in the surface soil sampling in the fenced enclosure behind 1015 Shoreline. No additional sampling or analysis is recommended in this area.

- Based on information reviewed, the buildings were constructed prior to 1980. Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead-based paint have been used at the site. If it has not already been done, a full survey should be completed prior to any demolition or renovation at the site. This is not a REC as defined by the ASTM standard.

8.1 Data Gaps

ERS was not able to review a Chain of Title Report for the subject property. It is ERS' opinion that the lack of this information does not pose a significant data gap, as an environmental lien search was performed for the subject property.

ERS was not able to conduct any interviews with the property owner or former occupants. However, based on the numerous other sources of information reviewed, it is ERS' opinion that the lack of this information does not pose a significant data gap.

8.2 Continuing Obligations

Continuing obligations start on the date that a landowner acquires title to a property. The landowner must: 1) comply with land use restrictions and institutional controls; 2) take "reasonable" steps with respect to hazardous substances releases; 3) provide full cooperation, assistance and access to persons that are authorized to conduct response actions or natural resource restoration; 4) comply with information requests and administrative subpoenas; and 5) provide all legally required notices. Continuing obligations must be satisfied to maintain liability protection under CERCLA for innocent landowners, bona fide prospective purchasers, and contiguous property owners.

9.0 OPINION

Please see section 8.o for a discussion of the findings and our opinion on whether or not they are AST RECs.

10.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 of 1005 & 1015 North Shoreline Blvd. and 1150 Terra Bella Ave., City of Mountain View, Santa Clara County, California, the subject property. Any exceptions to, or deletions from, this practice are described in Section 5.1 of this Report.

This assessment has revealed no evidence of Recognized Environmental Conditions in connection with the subject property, except the following:

- A petroleum release occurred on the adjacent and upgradient former Texaco at 975 North Shoreline. Three of the monitoring wells for this release are on the subject property. MW-22G is located between the Fiesta Del Mar restaurant building and North Shoreline Boulevard on 1005 North Shoreline. MW-22E is located south of the building at 1015 North Shoreline and MW-22F is located on the eastern portion of the Fiesta Del Mar parking area.

In the most recent groundwater-monitoring event for which reports were available (first quarter 2010), contamination was detected in MW-22E, which is on the subject site just south of the building at 1015 North Shoreline. Specifically, TPH-GRO was detected at 9,900 ug/L, benzene was detected at a concentration of 130 ug/L, toluene was detected at a concentration of 4.2 ug/L. ethyl benzene was detected at a concentration of 11 ug/L, and MTBE was detected at a concentration of 1 ug/L.

Recent air sampling at 1015 North Shoreline indicates that there does not appear to be significant vapor intrusion into the building as a result of the impacted groundwater at the site.

This release has impacted the subject site. However, the source of the release is not on the property and the responsible party has been identified. Furthermore, the release is in public comment period for the proposed site closure and is expected to be closed within the next few months. Texaco also issued an indemnification to the current property owners, which is transferable to future property owners (the Indemnity agreement is included in Appendix K).

This release is a Recognized Environmental Condition (REC) as defined by ASTM since it has impacted the subject site. However, given the current status moving toward closure, the fact a responsible party has been identified and is actively addressing the release, and the indemnification agreement, this issue appears to have been sufficiently addressed, and no additional investigation is recommended.

If the release is closed, the monitoring wells, including those on the subject site, should be abandoned in accordance with applicable regulations. The responsible party for the release (in this case Texaco) is typically the well owner and financially responsible for sealing the wells.

- The Shippen Property at 1175 Terra Bella is a closed release south of the site. Gasoline contamination was discovered in 1998 and the release was closed in 2001. Although the release is closed, contamination remained on the release property at the time of closure. In addition to several borings on the release property, one soil boring for the investigation was advanced on the subject property at the southwest corner of 1150 Terra Bella, the corner of the subject site closest to the release. Low levels of petroleum contamination (below regulatory

screening thresholds) were detected in the groundwater sample collected from this boring. Given the investigation results and the subsequent site closure, this release does not appear to have significantly impacted the subject site. It is classified as a Historical Recognized Environmental Condition (HREC) since it is closed and is no additional investigation, monitoring, or remediation is required.

The following are not recognized environmental conditions but are additional findings of our assessment:

- There is an open drinking water well at the 1150 Terra Bella property. According to Mr. Maleti, the well is no longer used. Santa Clara Valley Water District regulations state wells that are not used for more than one year should be appropriately sealed. We recommend that the well be properly sealed by a licensed well driller in accordance with Santa Clara Valley Water District requirements. The well is not a REC but it could potentially be a conduit for contamination to enter or migrate through the groundwater.

- No volatile organic compounds were detected in the surface soil sampling in the fenced enclosure behind 1015 Shoreline. No additional sampling or analysis is recommended in this area.

- Based on information reviewed, the buildings were constructed prior to 1980. Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead-based paint have been used at the site. If it has not already been done, a full survey should be completed prior to any demolition or renovation at the site. This is not a REC as defined by the ASTM standard.

No other investigation is recommended.

Specific records should be maintained to preserve potential CERCLA defense and liability protection. The relative importance of record keeping depends on whether the User is a Prospective Purchaser, Lending Institution, or Seller.

11.0 DEVIATIONS

ERS did not evaluate the purchase price versus property value as ERS is not qualified to evaluate this issue.

12.0 ADDITIONAL SERVICES

Other than the soil sampling discussed in Section 7.0, no additional services were performed in conjunction with this Phase I ESA.

RE: 1015 Shoreline

Work Order No.: 1103016

Dear Janelle Amendola:

Torrent Laboratory, Inc. received 8 sample(s) on March 02, 2011 for the analyses presented in the following Report.

As per CoC 4 samples On Hold.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

(S) 4-Bromofluorobenzene				50	118	135		55.8 - 141		

Laboratory Qualifiers and Definitions

DEFINITIONS:

Accuracy/Bias (% Recovery) - The closeness of agreement between an observed value and an accepted reference value.
Blank (Method/Preparation Blank) -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
Duplicate - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
Laboratory Control Sample (LCS ad LCSD) - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
Matrix - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
Matrix Spike (MS/MSD) - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
Method Detection Limit (MDL) - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
Practical Quantitation Limit (PQL) - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
Precision (%RPD) - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
Surrogate (S) or (Surr) - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
Tentatively Identified Compound (TIC) - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
Units: the unit of measure used to express the reported result - **mg/L** and ***mg/Kg*** (equivalent to PPM - parts per million in **liquid** and ***solid***), **ug/L** and ***ug/Kg*** (equivalent to PPB - parts per billion in **liquid** and ***solid***), **ug/m3**, ***mg.m3***, **ppbv** and ***ppmv*** (all units of measure for reporting concentrations in air), **%** (equivalent to 10000 ppm or 1,000,000 ppb), **ug/Wipe** (concentration found on the surface of a single Wipe usually taken over a 100cm2 surface)

LABORATORY QUALIFIERS:

B - Indicates when the anlayte is found in the associated method or preparation blank
D - Surrogate is not recoverable due to the necessary dilution of the sample
E - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
H- Indicates that the recommended holding time for the analyte or compound has been exceeded
J- Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather the quantitative
NA - Not Analyzed
N/A - Not Applicable
NR - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
R- The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
S- Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
X -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

Sample Receipt Checklist

Client Name: ERS (Santa Clara)

Project Name: 1015 Shoreline

Work Order No.: 1103016

Date and Time Received: 3/2/2011 15:32

Received By: NG

Physically Logged By: NG

Checklist Completed By: NG

Carrier Name: Client Droped off

Chain of Custody (COC) Information

Chain of custody present?	Yes
Chain of custody signed when relinquished and received?	Yes
Chain of custody agrees with sample labels?	Yes
Custody seals intact on sample bottles?	Not Present

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Not Present
Shipping Container/Cooler In Good Condition?	Yes
Samples in proper container/bottle?	Yes
Samples containers intact?	Yes
Sufficient sample volume for indicated test?	Yes

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes			
Container/Temp Blank temperature in compliance?	Yes	Temperature:	10	°C
Water-VOA vials have zero headspace?	No VOA vials submitted			
Water-pH acceptable upon receipt?				
pH Checked by:	pH Adjusted by:			

Samples received in cooler with ice.

INDEMNITY AGREEMENT

THIS INDEMNITY AGREEMENT ("***Agreement***") is entered into by and between **TEXACO INC.**, a Delaware corporation ("***Texaco***"), and The Roberta & Marco Bertozzi Family Trust ("***Owner***"). Texaco and Owner may hereinafter be referred to singularly as "Party" or jointly as "Parties".

RECITALS

A. Owner holds record title to those certain real properties located at 1005 and 1015 Shoreline Boulevard and 1150 Terra Bella Avenue, Mountain View, California (collectively, the "***Property***"), across Terra Bella Avenue from the former Texaco service station located at 975 N. Shoreline Boulevard (formerly known as 975 Stierlin Rd.), Mountain View, CA (the "***Station Property***");

B. Texaco has an open environmental case for the Station Property with the Santa Clara County Department of Environmental Health, Hazardous Materials Compliance Division, and the Santa Clara Valley Water District (collectively, the "***Agency***");

C. Texaco is currently performing environmental Work, as defined in Paragraph 5 (*Cleanup*) below, whereby Texaco, among other things, operates ground-water monitoring wells on the Property;

D. Owner has indicated its intention to market the Property to prospective buyers for valuable consideration and has asked Texaco to provide it with an indemnity that will run to subsequent owners;

E. Texaco has indicated it would be willing to provide Owner with the protections granted herein, which would be assignable to a buyer of the Property, provided Texaco was granted access to the Property to continue the Work, as defined in Paragraph 5 (*Cleanup*) below; and

F. Owner is willing to grant Texaco continued access to the Property for the above-described purposes.

TERMS AND CONDITIONS

NOW THEREFORE, in consideration of the foregoing and of the mutual promises set forth below, the Parties agree as follows:

1. EFFECTIVE DATE

This Agreement is effective upon the date last signed by a Party to the Agreement as evidenced below ("***Effective Date***").

2. REPRESENTATIONS

Owner warrants and represents that it will not operate a service station on the Property. In the event that Owner or its Successors (as defined in Paragraph 5(c) below) elects to operate a service station on the Property, in addition to any other remedies available to Texaco, Texaco's indemnity obligations under Paragraph 7 (*Indemnity*) shall terminate.

3. TERM

The license to access the Property granted herein shall terminate upon completion of the Work as defined in Paragraph 5 (*Cleanup*) below.

4. COVERED CONTAMINATION

As used herein, "***Covered Contamination***" means petroleum hydrocarbon and motor vehicle fuel additive contamination that: (a) originated from Texaco's operations and activities on the Station Property prior to the Effective Date; (b) must be remediated pursuant to applicable federal, state or local laws and regulations in effect on the Effective Date; and (c) is located on the Property on the Effective Date or has migrated from the Property.

5. CLEANUP

a) Texaco shall, at its sole cost and expense, perform or cause to be performed such investigation, monitoring, and cleanup of Covered Contamination, as may be validly directed by the Agency (the "***Work***"). Texaco shall have the right to challenge any Agency directive, order or request and not assume responsibility therefore if its challenge is based on a good faith belief that the contamination which is the subject of the directive, order or request does not meet the definition of Covered Contamination for which Texaco would be liable under this Agreement. Said Work may include, but not be limited to: (i) installation, maintenance, replacement, periodic sampling and abandonment of wells in compliance with all laws; (ii) installation, maintenance, replacement and removal of remediation or recovery systems and associated equipment; and (iii) other work deemed necessary by Texaco or the Agency.

b) Except as is otherwise provided in Paragraph 7 (*Indemnity*) below, Texaco's obligations under this Paragraph 5 shall cease when a no further action letter or its equivalent ("***NFA Letter***") is issued for the Property by Agency.

c) Texaco's obligation to cleanup the Covered Contamination shall extend to parties who take title to the Property, including institutional lenders, who may have obtained possession and title to the Property by way of default on a loan secured by the Property; and prior to the issuance of an NFA Letter or within fifteen (15) years of the Effective Date of this Agreement, whichever occurs first, ("***Successors***").

d) Texaco agrees to notify Owner in writing when it has completed the Work and when the NFA Letter is issued.

6. MANNER OF PERFORMANCE

a) The Work. Except as may otherwise be provided herein, Texaco shall perform the Work in a manner and at times which will not unreasonably interfere with Owner's use of the Property. Prior to the installation of any new equipment on the Property, Texaco and Owner shall work together to determine the appropriate location for the new equipment. Owner agrees to cooperate with Texaco, including the execution of additional documents, if necessary, in order to obtain permits or other documents from the Agency required to install, abandon or remove Texaco's equipment.

b) Access Rights Granted. As of the Effective Date, Owner hereby grants to Texaco, its employees, agents, representatives, consultants and contractors, a continued license over, under and across the Property for the purpose of performing the Work. The foregoing grant is subject and subordinate to the prior and continuing right and obligation of Owner and its licensees and lessees to use and maintain the Property which may be freely done at any time by Owner and its licensees and lessees without liability to Texaco or to any other party for compensation or damages. With the exception of routine maintenance of Texaco's equipment on the Property which shall not unreasonably interfere with Owner's and its licensees' and lessees' use of the Property, Texaco shall provide Owner with advance notice of its

intended schedule for access. Texaco shall not unreasonably interfere with the Owner's and its licensees' and lessees' constant, continuous and uninterrupted use of the Property at any time.

c) Agency Communications. Each Party shall promptly provide the other with copies of all final reports, laboratory test results, and other communications submitted to the Agency. If Owner shall for any reason request a meeting with any Agency regarding the Property or the performance of the Work, Owner shall provide Texaco with reasonable advance notice of any such requested meeting, such that Texaco may attend. Owner shall not communicate in writing to any Agency without first providing a copy of such written communication to Texaco at least ten (10) days in advance of the submission to the intended written communication to the Agency.

d) Notice to Texaco Prior to Construction. While Texaco is obligated to perform the Work pursuant to the terms of this Agreement, Owner shall give Texaco reasonable advance notice of any change in the intended use of the Property and/or construction plans.

e) Compliance. Texaco agrees, at its sole cost and expense, to conduct and perform the Work in a prompt, safe, efficient and workmanlike manner and in compliance with all Agency requirements.

f) Restoration. If entry onto the Property by Texaco, or exercise by Texaco of any of its rights or obligations under this Agreement, result in any physical damage to the Property (ordinary wear and tear excepted), Texaco shall promptly repair and restore the portions of the Property damaged to substantially the same condition as existed prior to the damage or exercise of such right or obligation.

7. INDEMNITY

a) Texaco agrees to indemnify, defend and hold Owner harmless from and against any liabilities, damages, costs, or losses arising from: (i) claims or lawsuits by third parties relating to the Covered Contamination or the performance of the Work by Texaco on the Property; and (ii) an Agency (or other governmental authority) demand or requirement to perform an investigation or cleanup action for Covered Contamination. Texaco shall not be responsible for any liabilities, damages, costs, or losses to the extent caused by the reckless, negligent or intentional acts or omissions of any Party asserting any right under this Paragraph 7. In the event underground storage tanks are installed on the Property subsequent to the date Texaco vacated the Property and the NFA Letter was issued, this indemnity is voided for any claims arising after the date of said tank installation.

b) Except as otherwise specified below, Texaco's indemnity obligation shall extend to Successors, as defined in Paragraph 5(c) (*Cleanup*).

c) Texaco shall not be liable to Owner or Successors for (i) any such claims described in Texaco's indemnity under Paragraph 7(a) if, and to the extent such claims are attributable to or arise from exacerbation of Covered Contamination resulting from construction on the Property by Owner or its Successors following the Effective Date of this Agreement that involve subsurface excavation, soil movement, or special handling, treatment or disposal of groundwater, or (ii) special, incidental or consequential damages including, without limitation, construction delays, loss of business, diminution in the value of the Property, or loss of goodwill by Owner or Successors.

d) Any Party claiming a right to be indemnified by Texaco under this Agreement shall not be entitled to such indemnification unless: (i) said Party agrees in writing to be bound by the terms of this Agreement; and (ii) after receiving notice of any such claim described in Texaco's indemnity under Paragraph 7(a), said Party provides Texaco with reasonable advance written notice of the claim and a demand that Texaco honor its indemnity obligations.

e) Any person benefiting from the indemnification set forth in this Paragraph 7, at any point in time, shall be deemed not to be a third person or third party.

8. LIENS

Texaco shall bear any and all costs and expenses associated with the Work. Texaco shall discharge at once or bond or otherwise secure against all liens and attachments that are filed in connection with the Work, and shall indemnify and save Owner and the Property harmless from and against any and all loss, damage, injury, liability and claims thereof resulting directly from such liens and attachments.

9. NOTICES

Any notices required to be made under this Agreement shall be made in writing to the address of the appropriate Party as set forth below. All such notices shall be deemed to have been duly given and received upon mailing, delivery by courier or personal delivery service, or by email, provided that email delivery shall be effective when the sender has received an electronic confirmation of delivery. Parties may alter or modify their notice address by delivery of written notice pursuant to the terms of this Agreement.

10. APPLICABLE LAW

This Agreement shall be interpreted, and any dispute arising hereunder shall be resolved, in accordance with the substantive laws of the State of California, without reference to choice of law rules.

11. ALTERNATIVE DISPUTE RESOLUTION (ADR)

If a dispute arises between the Parties relating to this Agreement, the Parties agree to use the following procedure prior to pursuing other legal remedies:

a) A meeting among the Parties shall promptly be held in California, attended by individuals with decision-making authority regarding the dispute, who will attempt in good faith to negotiate a resolution of the dispute.

b) If within fifteen (15) days after the meeting, the Parties have not succeeded in negotiating a resolution of the dispute, they agree to submit the dispute to mediation using a mediator who is mutually acceptable, and to bear equally the costs of the mediation.

c) The Parties agree to participate in good faith in the mediation process related to their dispute for a period of thirty (30) days from the commencement of mediation. If the Parties are not successful in resolving the dispute through mediation, then:

(i) the Parties may agree to submit the matter to binding arbitration or a private adjudication; or

(ii) either Party may initiate litigation upon ten (10) days advance written notice to the other Party.

12. COUNTERPARTS

This Agreement may be executed in counterparts, each of which together shall constitute one and the same agreement.

13. INTEGRATION

This document represents the entire agreement between the Parties. No modification of the terms hereof shall be effective unless in writing and duly executed by the authorized representatives of the respective Parties.

14. MUTUALLY DRAFTED AGREEMENT

This Agreement has been negotiated at arm's-length and between Parties represented by counsel. Accordingly, any rule or law (including California Civil Code §1635 et seq.) or legal decision that would require interpretation of any ambiguities in this Agreement against the Party that has drafted the applicable provision is not applicable and is waived. The provisions of this Agreement shall be interpreted in a reasonable manner to affect the purpose of the Parties and this Agreement.

15. NO ADMISSION OF LIABILITY

The Parties acknowledge and agree that neither this Agreement, the act of entering into it, or any act or omission pursuant hereto shall be construed as an admission of any nature.

16. CAPTIONS

The captions and headings used throughout this Agreement are for convenience or reference only, and the words contained therein shall in no way be held or deemed to define, limit, describe, explain, modify, amplify or aid in the interpretation, consideration or meaning of any provisions or the scope or the intent of this Agreement.

17. SEVERABILITY

If any part, clause or condition of this Agreement is held by a court of competent jurisdiction to be invalid, void or unenforceable, the remainder of the provisions shall remain in full force and effect and shall in no way be affected, impaired or invalidated; provided, however, in no event shall either Party be deprived of a material consideration by operation of this provision.

18. FIDUCIARY RELATIONSHIP

Texaco shall not for any reason, in the performance of the Work required by the terms of this Agreement, be considered to have a fiduciary relationship with Owner.

19. COMPLIANCE WITH LAWS

Throughout the term of this Agreement, Texaco and Owner shall at all times comply fully with all applicable laws, ordinances, rules, and regulations of any governmental agency having jurisdiction over the Property.

20. BINDING EFFECT

Subject to the limitations set forth in Paragraphs 5 (*Cleanup*) and 7 (*Indemnity*), this Agreement shall be binding upon and inure to the benefit of the Parties hereto and their respective heirs, successors and assigns. Owner shall promptly notify Texaco of any transfer of its interest in the Property and shall provide a copy of this Agreement to any and all transferees.

21. WARRANTY OF AUTHORIZED SIGNATORIES

Each of the signatories hereto warrants and represents that he or she is competent and authorized to enter into this Agreement on behalf of the Party for whom he or she purports to sign.

IN WITNESS WHEREOF, the Parties have caused this Agreement to be executed as of the last date set forth below.

Re: Phase I Environmental Site Assessment Conclusion Letter
1023 Shoreline Blvd.
Mountain View, CA

Dear Mr. Calvano:

Thank you for providing Applied Water Resources Corporation (AWR) the opportunity to assist you in identifying the environmental issues at 1023 Shoreline Blvd., in Mountain View, California.

The site is a two-story office building on an approximately ¾-acre rectangular parcel. The building was constructed in approximately 1974. Prior to this, the site appears to have been used as orchards and residences since at least 1939.

The building appears to have been used as offices since their initial construction. No indication of non-office use of the building was observed during the site reconnaissance or discovered during our historical research for this Phase I ESA.

The only hazardous materials observed at the site were routine janitorial and maintenance materials. No evidence of significant former hazardous material use or storage tanks were observed at the site.

A monitoring well was installed near the northern edge of the property in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1043 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed

significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

AWR looks forward to working with you on this project. Please contact me at 408.496.0801 or at kprice@erscorp.us if you have any questions or comments.

Best Regards
APPLIED WATER RESOURCES CORPORATION

APPLIED WATER RESOURCES

EXECUTIVE SUMMARY

Consultant:	Applied Water Resources Corporation (AWR)
Subject Property:	1023 Shoreline Blvd., Mountain View, California
Client:	Calvano Development
Location:	The site address is 1023 Shoreline Blvd., Mountain View, Santa Clara County, California. The site consists of one approximately 0.75 acre parcel. The site is located on the eastern side of Shoreline Blvd on the block south of Interstate 101. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-017.
Current Use:	The site is improved with a two-story office building totaling approximately 13,000 square feet. The property is occupied by several different office tenants.
Current Owner:	The property is currently owned by The Cooke Co., who has owned the property since 1986.
Site Characteristics:	The property is approximately ¾-acre and is improved with a two story office building. There is no elevator in the building. The remainder of the site is paved parking areas with landscaping near the building and around the property perimeter.
Vicinity Characteristics:	The property is in a mixed commercial and light industrial within the City of Mountain View, California.
Purpose:	This Phase I Environmental Site Assessment (ESA) was performed to (1) identify any recognized environmental conditions (RECs), and (2) permit a user to satisfy one of the requirements to qualify for the innocent landowner defense under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA)

liability protection (42 U.S.C. §9601). All components of this ESA were performed or overseen by Environmental Professionals as defined in the All Appropriate Inquiries (AAI) Standard and the American Society for Testing and Materials (ASTM) E 1527-05.

Conclusions:

A monitoring well was installed near the northern edge of the property in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1043 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

1.0 INTRODUCTION

On behalf of Calvano Development (hereinafter referred to as the "Client"), Applied Water Resources Corporation (AWR), performed a Phase I Environmental Site Assessment (ESA) of the property located at 1023 Shoreline Blvd., Mountain View, Santa Clara County, California (hereinafter referred to as the "subject property").

1.1 Purpose

This ESA was performed to provide a record of the site conditions at the subject property and to evaluate what, if any, recognized environmental conditions exist at this site. Additional goals of this ESA are to identify recognized environmental conditions (RECs) from current and historical practices on the subject property and surrounding area and to assist the Client to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability.

1.2 Detailed Scope of Services

The following tasks were performed in accordance with the Scope of Services.

- Visual site inspection of the subject property to investigate for recognized environmental conditions. AWR is not responsible for inspecting areas covered by parked vehicles, overgrown vegetation, and other obstacles preventing access.

- A historical review of the use and improvements of the subject property through a review of aerial photographs, historical topographic maps, city directories, fire insurance maps, title reports, and/or building department records.

- A review of available geologic and hydrogeologic literature concerning the property and surrounding area.

- Interviews of persons familiar with the history of the subject property, including key site managers, owners, tenants, past tenants, and/or previous owners.

- Review of appropriate federal, state, and local regulatory agencies to reveal known hazardous wastes sites or significant leaks or spills of hazardous materials that may have occurred at the subject property and immediate vicinity.

- Interviews with applicable local agencies familiar with the areas in the vicinity of the subject property such as local fire departments, health departments, Regional Water Quality Control Board, and/or other local government agencies.

1.3 Significant Assumptions

No significant assumptions were made during this Phase I ESA.

1.4 Limitations and Exceptions of Agreement

AWR has performed the services for this project in accordance with our proposal, and within the current standards of the American Society for Testing and Materials (ASTM 1527-05) for Phase I Environmental Site Assessments and the standards for All Appropriate Inquiries (AAI) approved by the Federal Environmental Protection Agency. Except for the representations set forth in this Phase I ESA, no other representations, guarantees, or warrantees are either expressed or implied. A record search was limited to reasonably ascertainable information that could be obtained within 20 calendar days.

The review was limited to a search for RECs at the subject property. The term REC means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

There is no investigation that is thorough enough to preclude the presence of hazardous materials that presently, or in the future, may be considered hazardous at the site. Because regulatory evaluation criteria are constantly changing, concentrations of contaminants presently considered low may, in the future, fall under more stringent regulatory standards that require remediation.

The Site Reconnaissance was limited to visual observation of surface conditions at the subject property. Interviews with public agency personnel were conducted. Reasonably ascertainable information was reviewed. This approach reflects current ASTM standards and AAI regulations.

Where there is a conflict between the environmental database and AWR's actual knowledge with regard to the distance and direction from the subject property of sites listed on the database, information obtained by AWR from the site reconnaissance was used. Whenever feasible, AWR notes such conflict within the text of the report.

This ESA addresses recognized environmental conditions at the subject property. However, certain conditions, such as those listed below may not be revealed:

1) naturally occurring toxic materials in subsurface soils, rocks, or water, or toxicity of onsite flora;
2) toxicity of substances common in current habitable environments, such as stored household products, building materials, and consumables;
3) biological pathogens;
4) contaminant plume below the depths sampled or from remote source;
5) contaminants or contaminant concentrations that do not violate present regulatory standards, but may violate future standards; and
6) unknown site contamination, such as illegal dumping and/or accidental spillage which may occur following the site visit by AWR.

Opinions and judgments expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions. This document and the information contained herein have been prepared solely for the Client and any reliance on this report by third parties not authorized by the Client shall be at such party's sole risk.

Conducting an AAI Phase I ESA alone does not provide a landowner with protection against CERCLA liability. Landowners who want to qualify as bona fide prospective purchasers or contiguous property owner must comply with all of the statutory requirements identified in CERCLA Section 107(r) and 107(q).

1.5 Special Terms and Conditions

No special terms or conditions were agreed upon for conducting this Phase I ESA.

1.6 User Reliance

As specified in ASTM E 1527-05, Sections 7.5.2 and 7.5.2.1, AWR is not required to independently verify the information provided by the User (Client), obtained from interviews, previous environmental reports, and/or reviewed documents during records review.

2.0 SITE DESCRIPTION

2.1 Site Location

The site address is 1023 Shoreline Blvd., Mountain View, Santa Clara County, California. The site consists of one approximately ¾ acre parcel. The site is located on the eastern side of Shoreline Blvd, on the block south of Interstate 101. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-017.

2.2 Site and Vicinity General Characteristics

The property is in a mixed commercial and light industrial area within the City of Mountain View, California.

2.3 Current and Proposed Use of the Property

The property is improved with a two story office building divided into multiple tenant spaces.

It is our understanding Calvano Development is proposing to purchase the site. No information on proposed use of the property was provided to AWR.

2.4 Description of Structures, Road, and Other Improvements

The site is a two-story office building on an approximately ¾-acre rectangular parcel. The building was constructed in approximately 1974.

The remainder of the site is occupied by asphalt parking and driving areas, sidewalks to and around the building, and landscaping near the building and around the property perimeter.

The site is a rectangular shaped parcel located on the eastern side of Shoreline Blvd and is accessed from Shoreline Boulevard with connected parking lots to 1043 Shoreline Blvd north of the site and properties on Linda Vista east of the site.

The subject property is connected to the municipal water and sanitary and storm sewer systems.

2.5 Current Uses of the Adjoining Properties

The property is in a mixed use area. North of the site is an office building. The remaining adjacent properties appear to be light industrial.

3.0 USER PROVIDED INFORMATION

3.1 Title Records

An Environmental Liens Search was performed by EDR as a part of this Phase I ESA. The lien search, including the most recent grant deed, is included in Appendix J. No additional title information was provided by the user.

3.2 Environmental Liens or Activity and Use Limitations

The Environmental Professional is required to search for Activity and Use Limitations (AULs) if such records are available in *"publicly available lists or registries."* Typical AULs include land use restrictions (LURs), institutional controls (ICs), and Engineering Controls (ECs). Typical ICs include: 1) governmental controls such as zoning; 2) proprietary controls such as covenants or easements; 3) enforcement documents such as orders or

consent decrees; and 4) information devices such as land record or deed notices. Typical ECs include: 1) passive measures such as vapor barriers and setbacks; 2) active measures such as remediation systems; and 3) monitoring of passive and/or active measures. According to 40 CFR Part 312.26 (b) (7), ICs are to be investigated on the subject property and according to 40 CFR Part 312.26 (b) (6) and (c) (2) (ii), ECs are to be reviewed to a 0.5 mile radius of the subject property. ASTM 1527-05 recommends that ECs be reviewed only for the subject property.

An Environmental Liens Search was performed for the subject property. The Environmental Liens Search did not report any environmental liens associated with the subject property.

3.3 Specialized Knowledge

AWR was not informed of any specialized knowledge associated with the subject property or the area in the vicinity of the subject property.

3.4 Commonly Known or Reasonably Ascertainable Information

AWR was did not discover any commonly known or reasonable ascertainable information associated with the subject property or the area in the vicinity of the subject property.

3.5 Valuation Reduction for Environmental Issues

AWR was not provided with purchase price information.

3.6 Owner, Property Manager, and Occupant Information

The property is currently owned by The Cooke Co, who has owned the property since 1986.

The property is occupied by several different office tenants.

No property manager was identified to AWR.

3.7 Reason for Performing the Phase I ESA

AWR has performed this Phase I ESA in preparation of a proposed property transfer.

3.8 Previous Reports

AWR was not provided with any previous reports for the subject site.

4.0 RECORDS REVIEW

The government environmental agency databases AWR reviewed are listed on pages 4 through 7 of the Map Findings Summary of the database obtained from Environmental Data Resources, Inc. (EDR), included as Appendix C. Please refer to the EDR report in Appendix C for additional information on the searched databases including the full names of the databases, the regulatory agency overseeing the databases, a summary of the types of facilities listed on each database, and the dates the information was obtained from the regulatory agencies. Where locations and distances reported by EDR were observed to be incorrect, AWR amended the information to provide a more accurate assessment.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database. Information from these sources for the subject site is included in Section 4.1.1. Information on nearby releases is included in Section 4.1.2.

4.1 Standard Environmental Record Sources

4.1.1 Subject Property

The site address was not listed on any of the searched databases.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database.

<u>Mountain View Fire Department</u>
AWR reviewed files for the site at the Mountain View Fire Department. The Mountain View Fire Department is the Certified Unified Program Agency (CUPA) for properties in

Mountain View. As a CUPA, the Mountain View Fire Department is responsible for implementing the following programs: Above Ground Storage Tanks, California Accidental Release Prevention Program (CalARP), Hazardous Materials Management Plans/Business Plans, Hazardous Waste Generator, On Site Treatment of Hazardous Wastes, and Underground Storage Tanks. The Mountain View Fire Department had no record of hazardous materials or underground storage tanks at the site. The only information available from the Mountain View Fire Department was life safety records such as sprinklers and fire extinguishers.

Santa Clara County Environmental Health Department

AWR reviewed files at the Santa Clara County Environmental Health Department Leaking Underground Storage Tank Oversight Program (LUSTOP). There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

California Department of Toxic Substance Control

AWR reviewed files at the California Department of Toxic Substance Control Envirostor database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

Regional Water Quality Control Board

AWR reviewed files at the Regional Water Quality Control Board Geotracker database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

US EPA Region 9

AWR reviewed files available online for the US Environmental Protection Agency (EPA) Region 9 Superfund sites. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

4.1.2 Offsite Listings

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs). Based on this inferred groundwater flow direction, offsite listings that are adjacent to or south of the subject site have the greatest potential to impact the subject site. The sites of note are discussed below:

- There are six federal national priority list (NPL) sites, also known as Superfund sites, within one mile of the site including two which are within ¼-mile of the site. The NPL listings are Moffett Naval Air Station, Intel Corp (Mountain View Plant) Teledyne Semiconductor, Spectra-Physics, Inc., Jasco Chemical Corp., and CTS Printex, Inc. The NPL listings are primarily for releases of solvents and several of the plumes are mingled. In addition, there are several state-overseen releases that have contributed to the regional impacts. AWR reviewed information in the EDR report as well as additional information obtained from EPA Region 9, California DTSC, and the RWQCB. Based on our review of the information, the site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area. It appears that the intermingled plumes are primarily west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes.

- Texaco (CVX #21-1179) at 975 Shoreline Blvd (formerly known as Sterlin Road) was identified on the CA LUST and CA HIST LUST databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. A monitoring well was installed near the southern edge of the subject site in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1023 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a

Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

- Robb-Jack Corp. at 1080 Linda Vista was identified on the CA LUST and CORTESE databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Based on our review of the information, groundwater impacts appear to have been minimal and it does not appear that this release impacted the subject site. The release was closed in 1996 indicating no additional investigation or remediation is required.

Based on the distance, direction, and/or nature of the remaining listings, in our opinion, none of the other listings are likely to impact the subject site.

4.1.3 Other Sites of Potential Environmental Concern

AWR did not identify any other sites of environmental concern. AWR reviewed the sites in the EDR Database that were unable to be mapped. None of the listings appeared to correspond to the site or adjacent properties. None of the listings appear likely to have the potential to impact the site.

4.2 Additional Environmental Record Sources

AWR reviewed information on this site from the Mountain View Fire Department, the California Department of Toxic Substance Control (DTSC) Envirostor database, the Santa Clara County Environmental Health Department LUSTOP program, the California Geotracker Database, and US EPA. Information from these sources for the subject site was discussed in Section 4.1.1. Information from these sources on the nearby properties was included in Section 4.1.2.

4.3 Physical Setting Sources(s)

The EDR Report in Appendix C indicates that the underlying hard rock geology consists of Cenozoic Quaternary stratified sequence. Surface soils in the vicinity of the site are classified by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS) as Botella clay loam.

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs).

Current site-specific information on groundwater flow direction, depth, and quality can only be confirmed through the installation and survey of a minimum of three on-site groundwater-monitoring wells, which was beyond the scope of this assessment.

According to the 1999 USGS Mountain View, California Quadrangle Map, the site elevation is approximately 36 feet above mean sea level with a slight regional topographic slope downward to the north.

4.4 Historical Use Information on the Property

AWR reconstructed a brief history of the subject property through a review of historical Topographic Maps; the EDR City Abstract; available records, permits and other documents available at Santa Clara County; and historical aerial photographs provided by EDR. A summary of historical sources can be found in Section 12.0 of this Report with pertinent documents available in Appendices.

According to historical sources, the subject property appears to have been used as orchards and residences since at least 1939 through approximately 1974 when the existing building was constructed at the site and the remainder of the property was improved similar to its current configuration. .The building appears to have been used as offices since its initial construction.

4.5 Historical Use Information on Adjoining Properties

The surrounding properties were primarily agricultural fields until being developed with light industrial development in the late 1960s and early 1974s.

5.0 SITE RECONNAISSANCE

The goal of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the subject property. The subject property is visually observed and any structures located on the property are observed to the extent not obstructed by bodies of water, adjacent buildings, and/or other obstructions.

5.1 Methodology and Limiting Conditions

The exterior site reconnaissance was performed by walking open areas of the property in a grid fashion. Special attention was given to observe surfaces adjacent to the structures and sidewalks, surfaces in storage areas, and potential conduits to the subsurface such as drains and sumps. The interior site reconnaissance was performed by systematically observing each room and open space of the property. Additional attention was given to doors, utility rooms, storage areas, areas where hazardous materials were used or stored, and any other accessible areas.

5.2 General Site Setting

On September 18, 2013, Ms. Janelle Amendola of AWR conducted a site reconnaissance at the subject property. Ms. Amendola was accompanied by Mr. Ted Eyre, the broker representing the current property owner during the site visit.

5.3 Exterior Observations

The majority of the site is occupied by the building and asphalt parking and drive areas with landscaping near the building and around the property perimeter. The site shares a common exterior area north of the building with the adjacent property at 1043 Shoreline.

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Interior Observations

The building was used as offices for several tenants at the time of the site assessment. No indication of current or former non-office use of the building was observed during the site reconnaissance.

The only hazardous materials observed at the site were routine janitorial and maintenance materials. No evidence of significant former hazardous material use or storage tanks were observed at the site.

There are no elevators in the site building.

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Non-Scope Items

The following non-scope items were included as part of this Report based on readily available information that was reviewed.

5.4.1 Suspect Asbestos Containing Building Materials and Lead-Based Paint

Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead based paint have been used at the site. A full survey should be completed prior to any demolition or renovation of the building at the site.

5.4.2 Radon

No radon survey was conducted. According to the EDR report, Santa Clara County is in zone 2, indicating the average indoor level is between 2 and 4 picocuries per liter (pCi/L). The US Environmental Protection Agency (USEPA) action level is 4 pCi/L.

6.0 INTERVIEWS

6.1 Interview with Owner Representative

AWR interviewed Mr. Ted Eyre, the broker representing the current property owner. Mr. Eyre has represented the property owner and this building for more than 20 years. Mr. Eyre provided information on the site development and current and former site tenants and operations.

6.2 Interview with Site Manager

No Site Manager was identified.

6.3 Interviews with Occupants

AWR conducted informal interviews with the site occupants during the site reconnaissance. Given that the current occupants only use the building for offices, formal interviews were not conducted.

6.4 Interviews with Local Government Officials

AWR reviewed information from the Mountain View Fire Department, the Santa Clara County Environmental Health Department, the San Francisco Bay Regional Quality Control Board, and the California Department of Toxic Substance Control. Information from these requests is presented elsewhere throughout this report.

6.5 Interviews with Others

AWR did not perform any interviews with others regarding the subject property.

7.0 FINDINGS

A monitoring well was installed near the northern edge of the property in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1023 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the

concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

7.1 Data Gaps

AWR was not able to review a Chain of Title Report for the subject property. It is AWR's opinion that the lack of this information does not pose a significant data gap, as an environmental lien search was performed for the subject property and revealed no issues.

AWR was also not able to interview past occupants or past owners. Given the office use of the site, in our opinion, this is not a significant data gap.

7.2 Continuing Obligations

Continuing obligations start on the date that a landowner acquires title to a property. The landowner must: 1) comply with land use restrictions and institutional controls; 2) take "reasonable" steps with respect to hazardous substances releases; 3) provide full cooperation, assistance and access to persons that are authorized to conduct response actions or natural resource restoration; 4) comply with information requests and administrative subpoenas; and 5) provide all legally required notices. Continuing obligations must be satisfied to maintain liability protection under CERCLA for innocent landowners, bona fide prospective purchasers, and contiguous property owners.

8.0 OPINION

The presence of elevated concentrations of petroleum compounds in the monitoring well located near the northern property line is classified as a Historical Recognized Environmental Condition (HREC) since they have been resolved to the satisfaction of the overseeing agency and concentrations in the well had decreased to non-detectable concentrations during the last 10 years it was being sampled.

The regional releases do not appear to have significantly impacted the site.

The potential for asbestos and/or lead based paint in the building materials at the site is not a REC but must be managed appropriately.

No other potential RECs were identified in conjunction with the site. No additional environmental assessment is recommended at this time.

9.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 of 1023 Shoreline Blvd., Mountain View, Santa Clara County, California, the subject property. Any exceptions to, or deletions from, this practice are described in Section 5.1 of this Report.

This assessment has revealed no evidence of Recognized Environmental Conditions in connection with the subject property, except the following:

A monitoring well was installed near the northern edge of the property in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1023 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

10.0 DEVIATIONS

AWR did not evaluate the purchase price versus property value as AWR is not qualified to evaluate this issue.

11.0 ADDITIONAL SERVICES

No additional services were performed in conjunction with this Phase I ESA.

Attn: Mark Calvano

Re: Phase I Environmental Site Assessment Conclusion Letter
1043 Shoreline Blvd.
Mountain View, CA

Dear Mr. Calvano:

Thank you for providing Applied Water Resources Corporation (AWR) the opportunity to assist you in identifying the environmental issues at 1043 Shoreline Blvd., in Mountain View, California.

The site is a two-story office building on an approximately ¾-acre rectangular parcel. The building was constructed in approximately 1970. Prior to this, the site appears to have been used as orchards and residences since at least 1939.

The building appears to have been used as offices since their initial construction. A space formerly used as a small research lab within a currently unoccupied tenant space was observed in the site building. No other indication of non-office use of the building was observed during the site reconnaissance or discovered during our historical research for this Phase I ESA.

The only hazardous materials observed at the site were routine janitorial and maintenance materials. No evidence of significant former hazardous material use or storage tanks were observed at the site.

A monitoring well was installed near the southern edge of the property in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1023 North Shoreline Blvd., approximately 30 feet into the

property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

AWR looks forward to working with you on this project. Please contact me at 408.496.0801 or at kprice@erscorp.us if you have any questions or comments.

Best Regards

PHASE I ENVIRONMENTAL SITE ASSESSMENT

1043 Shoreline Blvd.
Mountain View, California

October 10, 2013

Prepared For:

Calvano Development
900 Bush Street, Penthouse 1
San Francisco, CA 94109

APPLIED WATER RESOURCES

EXECUTIVE SUMMARY

Consultant:	Applied Water Resources Corporation (AWR)
Subject Property:	1043 Shoreline Blvd., Mountain View, California
Client:	Calvano Development
Location:	The site address is 1043 Shoreline Blvd., Mountain View, Santa Clara County, California. The site consists of one approximately 0.75 acre parcel. The site is located on the eastern side of Shoreline Blvd on the block south of Interstate 101. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-018.
Current Use:	The site is improved with a two-story office building totaling approximately 13,000 square feet. The property is occupied by several different office tenants.
Current Owner:	The property is currently owned by RS Company ABFI Assoc, who has owned the property since 1986.
Site Characteristics:	The property is approximately ¾-acre and is improved with a two story, approximately 13,000 square foot office building. There is no elevator in the building. The remainder of the site is paved parking areas with landscaping near the building and around the property perimeter.
Vicinity Characteristics:	The property is in a mixed commercial and light industrial within the City of Mountain View, California.
Purpose:	This Phase I Environmental Site Assessment (ESA) was performed to (1) identify any recognized environmental conditions (RECs), and (2) permit a user to satisfy one of the requirements to qualify for the innocent landowner defense under the Comprehensive

Environmental Response, Compensation and Liability Act (CERCLA) liability protection (42 U.S.C. §9601). All components of this ESA were performed or overseen by Environmental Professionals as defined in the All Appropriate Inquiries (AAI) Standard and the American Society for Testing and Materials (ASTM) E 1527-05.

Conclusions:

A monitoring well was installed near the southern edge of the property in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1023 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

1.0 INTRODUCTION

On behalf of Calvano Development (hereinafter referred to as the "Client"), Applied Water Resources Corporation (AWR), performed a Phase I Environmental Site Assessment (ESA) of the property located at 1043 Shoreline Blvd., Mountain View, Santa Clara County, California (hereinafter referred to as the "subject property").

1.1 Purpose

This ESA was performed to provide a record of the site conditions at the subject property and to evaluate what, if any, recognized environmental conditions exist at this site. Additional goals of this ESA are to identify recognized environmental conditions (RECs) from current and historical practices on the subject property and surrounding area and to assist the Client to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability.

1.2 Detailed Scope of Services

The following tasks were performed in accordance with the Scope of Services.

- Visual site inspection of the subject property to investigate for recognized environmental conditions. AWR is not responsible for inspecting areas covered by parked vehicles, overgrown vegetation, and other obstacles preventing access.

- A historical review of the use and improvements of the subject property through a review of aerial photographs, historical topographic maps, city directories, fire insurance maps, title reports, and/or building department records.

- A review of available geologic and hydrogeologic literature concerning the property and surrounding area.

- Interviews of persons familiar with the history of the subject property, including key site managers, owners, tenants, past tenants, and/or previous owners.

- Review of appropriate federal, state, and local regulatory agencies to reveal known hazardous wastes sites or significant leaks or spills of hazardous materials that may have occurred at the subject property and immediate vicinity.

- Interviews with applicable local agencies familiar with the areas in the vicinity of the subject property such as local fire departments, health departments, Regional Water Quality Control Board, and/or other local government agencies.

1.3 Significant Assumptions

No significant assumptions were made during this Phase I ESA.

1.4 Limitations and Exceptions of Agreement

AWR has performed the services for this project in accordance with our proposal, and within the current standards of the American Society for Testing and Materials (ASTM 1527-05) for Phase I Environmental Site Assessments and the standards for All Appropriate Inquiries (AAI) approved by the Federal Environmental Protection Agency. Except for the representations set forth in this Phase I ESA, no other representations, guarantees, or warrantees are either expressed or implied. A record search was limited to reasonably ascertainable information that could be obtained within 20 calendar days.

The review was limited to a search for RECs at the subject property. The term REC means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

There is no investigation that is thorough enough to preclude the presence of hazardous materials that presently, or in the future, may be considered hazardous at the site. Because regulatory evaluation criteria are constantly changing, concentrations of contaminants presently considered low may, in the future, fall under more stringent regulatory standards that require remediation.

The Site Reconnaissance was limited to visual observation of surface conditions at the subject property. Interviews with public agency personnel were conducted. Reasonably ascertainable information was reviewed. This approach reflects current ASTM standards and AAI regulations.

Where there is a conflict between the environmental database and AWR's actual knowledge with regard to the distance and direction from the subject property of sites listed on the database, information obtained by AWR from the site reconnaissance was used. Whenever feasible, AWR notes such conflict within the text of the report.

This ESA addresses recognized environmental conditions at the subject property. However, certain conditions, such as those listed below may not be revealed:

1) naturally occurring toxic materials in subsurface soils, rocks, or water, or toxicity of onsite flora;
2) toxicity of substances common in current habitable environments, such as stored household products, building materials, and consumables;
3) biological pathogens;
4) contaminant plume below the depths sampled or from remote source;
5) contaminants or contaminant concentrations that do not violate present regulatory standards, but may violate future standards; and
6) unknown site contamination, such as illegal dumping and/or accidental spillage which may occur following the site visit by AWR.

Opinions and judgments expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions. This document and the information contained herein have been prepared solely for the Client and any reliance on this report by third parties not authorized by the Client shall be at such party's sole risk.

Conducting an AAI Phase I ESA alone does not provide a landowner with protection against CERCLA liability. Landowners who want to qualify as bona fide prospective purchasers or contiguous property owner must comply with all of the statutory requirements identified in CERCLA Section 107(r) and 107(q).

1.5 Special Terms and Conditions

No special terms or conditions were agreed upon for conducting this Phase I ESA.

1.6 User Reliance

As specified in ASTM E 1527-05, Sections 7.5.2 and 7.5.2.1, AWR is not required to independently verify the information provided by the User (Client), obtained from interviews, previous environmental reports, and/or reviewed documents during records review.

2.0 SITE DESCRIPTION

2.1 Site Location

The site address is 1043 Shoreline Blvd., Mountain View, Santa Clara County, California. The site consists of one approximately ¾ acre parcel. The site is located on the eastern side of Shoreline Blvd, on the block south of Interstate 101. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-018.

2.2 Site and Vicinity General Characteristics

The property is in a mixed commercial and light industrial area within the City of Mountain View, California.

2.3 Current and Proposed Use of the Property

The property is improved with a two story approximately 13,000 square foot office building divided into multiple tenant spaces. .

It is our understanding Calvano Development is proposing to purchase the site. No information on proposed use of the property was provided to AWR.

2.4 Description of Structures, Road, and Other Improvements

The site is a two-story office building on an approximately ¾-acre rectangular parcel. The building was constructed in approximately 1970.

The remainder of the site is occupied by asphalt parking and driving areas, sidewalks to and around the building, and landscaping near the building and around the property perimeter.

The site is a rectangular shaped parcel located on the eastern side of Shoreline Blvd and is accessed from Shoreline Boulevard with connected parking lots to 1023 Shoreline Blvd south of the site and properties on Linda Vista east of the site.

The subject property is connected to the municipal water and sanitary and storm sewer systems.

2.5 Current Uses of the Adjoining Properties

The property is in a mixed use area. South of the site is an office building. The remaining adjacent properties appear to be light industrial.

3.0 USER PROVIDED INFORMATION

3.1 Title Records

An Environmental Liens Search was performed by EDR as a part of this Phase I ESA. The lien search, including the most recent grant deed, is included in Appendix J. No additional title information was provided by the user.

3.2 Environmental Liens or Activity and Use Limitations

The Environmental Professional is required to search for Activity and Use Limitations (AULs) if such records are available in *"publicly available lists or registries."* Typical AULs include land use restrictions (LURs), institutional controls (ICs), and Engineering Controls (ECs). Typical ICs include: 1) governmental controls such as zoning; 2) proprietary controls such as covenants or easements; 3) enforcement documents such as orders or

consent decrees; and 4) information devices such as land record or deed notices. Typical ECs include: 1) passive measures such as vapor barriers and setbacks; 2) active measures such as remediation systems; and 3) monitoring of passive and/or active measures. According to 40 CFR Part 312.26 (b)(7), ICs are to be investigated on the subject property and according to 40 CFR Part 312.26 (b)(6) and (c)(2)(ii), ECs are to be reviewed to a 0.5 mile radius of the subject property. ASTM 1527-05 recommends that ECs be reviewed only for the subject property.

An Environmental Liens Search was performed for the subject property. The Environmental Liens Search did not report any environmental liens associated with the subject property.

3.3 Specialized Knowledge

AWR was not informed of any specialized knowledge associated with the subject property or the area in the vicinity of the subject property.

3.4 Commonly Known or Reasonably Ascertainable Information

AWR was did not discover any commonly known or reasonable ascertainable information associated with the subject property or the area in the vicinity of the subject property.

3.5 Valuation Reduction for Environmental Issues

AWR was not provided with purchase price information.

3.6 Owner, Property Manager, and Occupant Information

The property is currently owned by RS Company ABFI Assoc, who has owned the property since 1986.

The property is occupied by several different office tenants.

No property manager was identified to AWR.

3.7 Reason for Performing the Phase I ESA

AWR has performed this Phase I ESA in preparation of a proposed property transfer.

3.8 Previous Reports

AWR was not provided with any previous reports for the subject site.

4.0 RECORDS REVIEW

The government environmental agency databases AWR reviewed are listed on pages 4 through 7 of the Map Findings Summary of the database obtained from Environmental Data Resources, Inc. (EDR), included as Appendix C. Please refer to the EDR report in Appendix C for additional information on the searched databases including the full names of the databases, the regulatory agency overseeing the databases, a summary of the types of facilities listed on each database, and the dates the information was obtained from the regulatory agencies. Where locations and distances reported by EDR were observed to be incorrect, AWR amended the information to provide a more accurate assessment.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database. Information from these sources for the subject site is included in Section 4.1.1. Information on nearby releases is included in Section 4.1.2.

4.1 Standard Environmental Record Sources

4.1.1 Subject Property

The site address was not listed on any of the searched databases.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database.

<u>Mountain View Fire Department</u>
AWR reviewed files for the site at the Mountain View Fire Department. The Mountain View Fire Department is the Certified Unified Program Agency (CUPA) for properties in

Mountain View. As a CUPA, the Mountain View Fire Department is responsible for implementing the following programs: Above Ground Storage Tanks, California Accidental Release Prevention Program (CalARP), Hazardous Materials Management Plans/Business Plans, Hazardous Waste Generator, On Site Treatment of Hazardous Wastes, and Underground Storage Tanks. The Mountain View Fire Department had no record of hazardous materials or underground storage tanks at the site. The only information available from the Mountain View Fire Department was life safety records such as sprinklers and fire extinguishers.

Santa Clara County Environmental Health Department

AWR reviewed files at the Santa Clara County Environmental Health Department Leaking Underground Storage Tank Oversight Program (LUSTOP). There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

California Department of Toxic Substance Control

AWR reviewed files at the California Department of Toxic Substance Control Envirostor database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

Regional Water Quality Control Board

AWR reviewed files at the Regional Water Quality Control Board Geotracker database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

US EPA Region 9

AWR reviewed files available online for the US Environmental Protection Agency (EPA) Region 9 Superfund sites. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

4.1.2 Offsite Listings

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs). Based on this inferred groundwater flow direction, offsite listings that are adjacent to or south of the subject site have the greatest potential to impact the subject site. The sites of note are discussed below:

- There are six federal national priority list (NPL) sites, also known as Superfund sites, within one mile of the site including two which are within ¼-mile of the site. The NPL listings are Moffett Naval Air Station, Intel Corp (Mountain View Plant) Teledyne Semiconductor, Spectra-Physics, Inc., Jasco Chemical Corp., and CTS Printex, Inc. The NPL listings are primarily for releases of solvents and several of the plumes are mingled. In addition, there are several state-overseen releases that have contributed to the regional impacts. AWR reviewed information in the EDR report as well as additional information obtained from EPA Region 9, California DTSC, and the RWQCB. Based on our review of the information, the site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area. It appears that the intermingled plumes are primarily west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes.

- Texaco (CVX #21-1179) at 975 Shoreline Blvd (formerly known as Sterlin Road) was identified on the CA LUST and CA HIST LUST databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. A monitoring well was installed near the southern edge of the subject site in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1023 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a

Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

- Robb-Jack Corp. at 1080 Linda Vista was identified on the CA LUST and CORTESE databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Based on our review of the information, groundwater impacts appear to have been minimal and it does not appear that this release impacted the subject site. The release was closed in 1996 indicating no additional investigation or remediation is required.

Based on the distance, direction, and/or nature of the remaining listings, in our opinion, none of the other listings are likely to impact the subject site.

4.1.3 Other Sites of Potential Environmental Concern

AWR did not identify any other sites of environmental concern. AWR reviewed the sites in the EDR Database that were unable to be mapped. None of the listings appeared to correspond to the site or adjacent properties. None of the listings appear likely to have the potential to impact the site.

4.2 Additional Environmental Record Sources

AWR reviewed information on this site from the Mountain View Fire Department, the California Department of Toxic Substance Control (DTSC) Envirostor database, the Santa Clara County Environmental Health Department LUSTOP program, the California Geotracker Database, and US EPA. Information from these sources for the subject site was discussed in Section 4.1.1. Information from these sources on the nearby properties was included in Section 4.1.2.

4.3 Physical Setting Sources(s)

The EDR Report in Appendix C indicates that the underlying hard rock geology consists of Cenozoic Quaternary stratified sequence. Surface soils in the vicinity of the site are classified by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS) as Botella clay loam.

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs).

Current site-specific information on groundwater flow direction, depth, and quality can only be confirmed through the installation and survey of a minimum of three on-site groundwater-monitoring wells, which was beyond the scope of this assessment.

According to the 1999 USGS Mountain View, California Quadrangle Map, the site elevation is approximately 36 feet above mean sea level with a slight regional topographic slope downward to the north.

4.4 Historical Use Information on the Property

AWR reconstructed a brief history of the subject property through a review of historical Topographic Maps; the EDR City Abstract; available records, permits and other documents available at Santa Clara County; and historical aerial photographs provided by EDR. A summary of historical sources can be found in Section 12.0 of this Report with pertinent documents available in Appendices.

According to historical sources, the subject property appears to have been used as orchards and residences since at least 1939 through approximately 1970 when the existing building was constructed at the site and the remainder of the property was improved similar to its current configuration. The building appears to have been used as offices since its initial construction.

4.5 Historical Use Information on Adjoining Properties

The surrounding properties were primarily agricultural fields until being developed with light industrial development in the late 1960s and early 1970s.

5.0 SITE RECONNAISSANCE

The goal of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the subject property. The subject property is visually observed and any structures located on the property are observed to the extent not obstructed by bodies of water, adjacent buildings, and/or other obstructions.

5.1 Methodology and Limiting Conditions

The exterior site reconnaissance was performed by walking open areas of the property in a grid fashion. Special attention was given to observe surfaces adjacent to the structures and sidewalks, surfaces in storage areas, and potential conduits to the subsurface such as drains and sumps. The interior site reconnaissance was performed by systematically observing each room and open space of the property. Additional attention was given to doors, utility rooms, storage areas, areas where hazardous materials were used or stored, and any other accessible areas.

5.2 General Site Setting

On September 18, 2013, Ms. Janelle Amendola of AWR conducted a site reconnaissance at the subject property. Ms. Amendola was accompanied by Mr. Ted Eyre, the broker representing the current property owner during the site visit.

5.3 Exterior Observations

The majority of the site is occupied by the building and asphalt parking and drive areas with landscaping near the building and around the property perimeter. The site shares a common exterior area south of the building with the adjacent property at 1023 Shoreline.

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Interior Observations

The building was used as offices for several tenants at the time of the site assessment. A space formerly used as a small research lab within a currently unoccupied tenant space was observed in the site building. No other indication of non-office use of the building was observed during the site reconnaissance.

The only hazardous materials observed at the site were routine janitorial and maintenance materials. No evidence of significant former hazardous material use or storage tanks were observed at the site.

There are no elevators in the site building.

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Non-Scope Items

The following non-scope items were included as part of this Report based on readily available information that was reviewed.

5.4.1 Suspect Asbestos Containing Building Materials and Lead-Based Paint

Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead based paint have been used at the site. A full survey should be completed prior to any demolition or renovation of the building at the site.

5.4.2 Radon

No radon survey was conducted. According to the EDR report, Santa Clara County is in zone 2, indicating the average indoor level is between 2 and 4 picocuries per liter (pCi/L). The US Environmental Protection Agency (USEPA) action level is 4 pCi/L.

6.0 INTERVIEWS

6.1 Interview with Owner Representative

AWR interviewed Mr. Ted Eyre, the broker representing the current property owner. Mr. Eyre has represented the property owner and this building for more than 20 years. Mr. Eyre provided information on the site development and current and former site tenants and operations.

6.2 Interview with Site Manager

No Site Manager was identified.

6.3 Interviews with Occupants

AWR conducted informal interviews with the site occupants during the site reconnaissance. Given that the current occupants only use the building for offices, formal interviews were not conducted.

6.4 Interviews with Local Government Officials

AWR reviewed information from the Mountain View Fire Department, the Santa Clara County Environmental Health Department, the San Francisco Bay Regional Quality Control Board, and the California Department of Toxic Substance Control. Information from these requests is presented elsewhere throughout this report.

6.5 Interviews with Others

AWR did not perform any interviews with others regarding the subject property.

7.0 FINDINGS

A monitoring well was installed near the southern edge of the property in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1023 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the

concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

7.1 Data Gaps

AWR was not able to review a Chain of Title Report for the subject property. It is AWR's opinion that the lack of this information does not pose a significant data gap, as an environmental lien search was performed for the subject property and revealed no issues.

AWR was also not able to interview past occupants or past owners. Given the office use of the site, in our opinion, this is not a significant data gap.

7.2 Continuing Obligations

Continuing obligations start on the date that a landowner acquires title to a property. The landowner must: 1) comply with land use restrictions and institutional controls; 2) take "reasonable" steps with respect to hazardous substances releases; 3) provide full cooperation, assistance and access to persons that are authorized to conduct response actions or natural resource restoration; 4) comply with information requests and administrative subpoenas; and 5) provide all legally required notices. Continuing obligations must be satisfied to maintain liability protection under CERCLA for innocent landowners, bona fide prospective purchasers, and contiguous property owners.

8.0 OPINION

The presence of elevated concentrations of petroleum compounds in the monitoring well located near the southern property line is classified as a Historical Recognized Environmental Condition (HREC) since they have been resolved to the satisfaction of the overseeing agency and concentrations in the well had decreased to non-detectable concentrations during the last 10 years it was being sampled.

The regional releases do not appear to have significantly impacted the site.

The potential for asbestos and/or lead based paint in the building materials at the site is not a REC but must be managed appropriately.

No other potential RECs were identified in conjunction with the site. No additional environmental assessment is recommended at this time.

9.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 of 1043 Shoreline Blvd., Mountain View, Santa Clara County, California, the subject property. Any exceptions to, or deletions from, this practice are described in Section 5.1 of this Report.

This assessment has revealed no evidence of Recognized Environmental Conditions in connection with the subject property, except the following:

A monitoring well was installed near the southern edge of the property in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). The monitoring well was located near the property line dividing the subject parcel from 1023 North Shoreline Blvd., approximately 30 feet into the property from Shoreline Boulevard. Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well at the site during 30 separate groundwater monitoring events. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to the former monitoring well or historical impacts in the groundwater samples collected from the well.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

10.0 DEVIATIONS

AWR did not evaluate the purchase price versus property value as AWR is not qualified to evaluate this issue.

11.0 ADDITIONAL SERVICES

No additional services were performed in conjunction with this Phase I ESA.

Re: Phase I Environmental Site Assessment Conclusion Letter
1062 Linda Vista
Mountain View, CA

Dear Mr. Calvano:

Thank you for providing Applied Water Resources Corporation (AWR) the opportunity to assist you in identifying the environmental issues at 1062 Linda Vista, in Mountain View, California.

The site appears to have been residential from 1939 through the early 1960s when the existing warehouse-type building constructed in the early 1960s. In the 1960s and 1970s, the site was operated as an instrument and electronics company and warehouse. During the 1980s and 1990s, the site was used as Haltek Electronics, a retail store for electrical components. Since that time, it has been used primarily for storage of a variety of clothing, artwork, supplies, and equipment purchased from storage locker auctions.

According to the property owner and occupant, the majority of the current occupants buy the contents of storage spaces that are being auctioned for delinquent rental fees and remove the items from the storage spaces to store the contents at the site until they can be resold. As a result, there is a wide variety of materials and equipment stored at the site that are not related to a particular business operation and past contents may be significantly different than the contents observed during the site reconnaissance. The property owner and occupant indicated that their procedure is any hazardous materials discovered in their purchased collections never enter the building but instead are stored outside at the rear of the facility for a short time then taken to a household hazardous waste collection. At the time of the assessment, several gallons of paint were observed at the site pending disposal. Although there is no evidence of a release from this practice, it is possible there may have been some small spills or releases from the hazardous

materials temporarily stored at the site. However, no major spills were noted during our inspection.

At the time of the site visit, storage in the site building and rear portion of the lot obscured much of the floor and ground surface limiting our ability to assess the condition of the site. No areas of significant staining or other evidence of a release was observed in the accessible and visible areas, but it is possible that there may be areas of staining on the floor or ground that were not visible during the site visit.

Hazardous materials observed in the building include various paints, lubricants, and cleaners used to clean and repair purchased items for subsequent resale. A hazardous material storage cabinet was observed in the north-central part of the building. All of the containers in the building appeared to be 1-gallon or less in retail size containers.

One of the site occupants repairs and rebuilds motorcycles as a hobby. The maintenance has been done in the rear yard of the site with some of the parts and materials stored in the building. Although there is no evidence of a release from this practice, it is possible there may have been some small spills or releases from the hazardous materials used to restore and rebuild motorcycles.

A Verizon Wireless tower was recently constructed at the site in a fenced enclosure behind the building. We were unable to enter the fenced enclosure during the site reconnaissance, but based on our observations from the perimeter, there is a generator with an attached 132 gallon diesel day tank. Based on the signage, it appears likely there are also batteries for emergency backup power. All of the equipment within the fenced enclosure was new (according to the property owner, the equipment was installed during August and September 2013) and appeared to be in very good condition. AWR observed no evidence of a spill or release associated with the wireless tower and support operations at the site.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes. Upon removal of the stored materials at the site, it would be prudent to inspect the property at that time.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition

(REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

AWR looks forward to working with you on this project. Please contact me at 408.496.0801 or at kprice@erscorp.us if you have any questions or comments.

Best Regards
APPLIED WATER RESOURCES CORPORATION

PHASE I ENVIRONMENTAL SITE ASSESSMENT

1062 Linda Vista

Mountain View, California

October 10, 2013

Prepared For:

Calvano Development

900 Bush Street, Penthouse 1

San Francisco, CA 94109

APPLIED WATER RESOURCES

EXECUTIVE SUMMARY

Consultant: Applied Water Resources Corporation (AWR)

Subject Property: 1062 Linda Vista, Mountain View, California

Client: Calvano Development

Location: The site address is 1062 Linda Vista, Mountain View, Santa Clara County, California. The site consists of one approximately 0.85 acre parcel. The site is located on the western side of Linda Vista Avenue on the block south of Interstate 101. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-024.

Current Use: At the time of the assessment, the site was used primarily for storage of a variety of clothing, artwork, supplies, and equipment purchased from storage locker auctions.

According to the property owner and occupant, the majority of the current occupants buy the contents of storage spaces that are being auctioned for delinquent rental fees and remove the items from the storage spaces to store the contents at the site until they can be resold. As a result, there is a wide variety of materials and equipment stored at the site that are not related to a particular business operation and past contents may be significantly different than the contents observed during the site reconnaissance.

One of the site occupants repairs and rebuilds motorcycles as a hobby.

A Verizon Wireless tower was recently constructed at the site in a fenced enclosure behind the building.

Current Owner: The property is currently owned by Manfred J and Audrey J Trees Trustees, who have owned the proper the property since 1985.

Site Characteristics: The rectangular property is approximately 0.85-acre and is improved with a warehouse type building with a second story in the front and single story high ceiling in the remainder of the building. There is no elevator in the building. The remainder of the site is paved parking and storage areas with landscaping near the building and around the property perimeter.

Vicinity Characteristics: The property is in a mixed commercial and light industrial within the City of Mountain View, California.

Purpose: This Phase I Environmental Site Assessment (ESA) was performed to (1) identify any recognized environmental conditions (RECs), and (2) permit a user to satisfy one of the requirements to qualify for the innocent landowner defense under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability protection (42 U.S.C. §9601). All components of this ESA were performed or overseen by Environmental Professionals as defined in the All Appropriate Inquiries (AAI) Standard and the American Society for Testing and Materials (ASTM) E 1527-05.

Conclusions:

According to the property owner and occupant, the majority of the current occupants buy the contents of storage spaces that are being auctioned for delinquent rental fees and remove the items from the storage spaces to store the contents at the site until they can be resold. As a result, there is a wide variety of materials and equipment stored at the site that are not related to a particular business operation and past contents may be significantly different than the contents observed during the site reconnaissance. The property owner and occupant indicated that their procedure is any hazardous materials discovered in their purchased collections never enter the building but instead are stored outside at the rear of the facility for a short time then taken to a household hazardous waste collection. At the time of the assessment, several gallons of paint were observed at the site pending disposal. Although there is no evidence of a release from this practice, it

is possible there have been some small spills or releases from the hazardous materials temporarily stored at the site.

At the time of the site visit, storage in the site building and rear portion of the lot obscured much of the floor and ground surface limiting our ability to assess the condition of the site. No areas of significant staining or other evidence of a release was observed in the accessible and visible areas, but it is possible that there may be areas of staining on the floor or ground that were not visible during the site visit.

Hazardous materials observed in the building include various paints, lubricants, and cleaners used to clean and repair purchased items for subsequent resale. A hazardous material storage cabinet was observed in the north-central part of the building. All of the containers in the building appeared to be 1-gallon or less in retail size containers.

One of the site occupants repairs and rebuilds motorcycles as a hobby. The maintenance has been done in the rear yard of the site with some of the parts and materials stored in the building. Although there is no evidence of a release from this practice, it is possible there have been some small spills or releases from the hazardous materials used to restore and rebuild motorcycles.

A Verizon Wireless tower was recently constructed at the site in a fenced enclosure behind the building. We were unable to enter the fenced enclosure during the site reconnaissance, but based on our observations from the perimeter, there is a generator with an attached 132 gallon diesel day tank. Based on the signage, it appears likely there are also batteries for emergency backup power. All of the equipment within the fenced enclosure was new (according to the property owner, the equipment was installed during August and September 2013) and appeared to be in very good condition. AWR observed no evidence of a spill or release associated with the wireless tower and support operations at the site.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent

plumes. . Upon removal of the stored materials at the site, it would be prudent to inspect the property at that time.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

1.0 INTRODUCTION

On behalf of Calvano Development (hereinafter referred to as the "Client"), Applied Water Resources Corporation (AWR), performed a Phase I Environmental Site Assessment (ESA) of the property located at 1062 Linda Vista, Mountain View, Santa Clara County, California (hereinafter referred to as the "subject property").

1.1 Purpose

This ESA was performed to provide a record of the site conditions at the subject property and to evaluate what, if any, recognized environmental conditions exist at this site. Additional goals of this ESA are to identify recognized environmental conditions (RECs) from current and historical practices on the subject property and surrounding area and to assist the Client to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability.

1.2 Detailed Scope of Services

The following tasks were performed in accordance with the Scope of Services.

- Visual site inspection of the subject property to investigate for recognized environmental conditions. AWR is not responsible for inspecting areas covered by parked vehicles, overgrown vegetation, and other obstacles preventing access.

- A historical review of the use and improvements of the subject property through a review of aerial photographs, historical topographic maps, city directories, fire insurance maps, title reports, and/or building department records.

- A review of available geologic and hydrogeologic literature concerning the property and surrounding area.

- Interviews of persons familiar with the history of the subject property, including key site managers, owners, tenants, past tenants, and/or previous owners.

- Review of appropriate federal, state, and local regulatory agencies to reveal known hazardous wastes sites or significant leaks or spills of hazardous materials that may have occurred at the subject property and immediate vicinity.

- Interviews with applicable local agencies familiar with the areas in the vicinity of the subject property such as local fire departments, health departments, Regional Water Quality Control Board, and/or other local government agencies.

1.3 Significant Assumptions

No significant assumptions were made during this Phase I ESA.

1.4 Limitations and Exceptions of Agreement

AWR has performed the services for this project in accordance with our proposal, and within the current standards of the American Society for Testing and Materials (ASTM 1527-05) for Phase I Environmental Site Assessments and the standards for All Appropriate Inquiries (AAI) approved by the Federal Environmental Protection Agency. Except for the representations set forth in this Phase I ESA, no other representations, guarantees, or warrantees are either expressed or implied. A record search was limited to reasonably ascertainable information that could be obtained within 20 calendar days.

The review was limited to a search for RECs at the subject property. The term REC means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

There is no investigation that is thorough enough to preclude the presence of hazardous materials that presently, or in the future, may be considered hazardous at the site. Because regulatory evaluation criteria are constantly changing, concentrations of contaminants presently considered low may, in the future, fall under more stringent regulatory standards that require remediation.

The Site Reconnaissance was limited to visual observation of surface conditions at the subject property. Interviews with public agency personnel were conducted. Reasonably ascertainable information was reviewed. This approach reflects current ASTM standards and AAI regulations.

Where there is a conflict between the environmental database and AWR's actual knowledge with regard to the distance and direction from the subject property of sites listed on the database, information obtained by AWR from the site reconnaissance was used. Whenever feasible, AWR notes such conflict within the text of the report.

This ESA addresses recognized environmental conditions at the subject property. However, certain conditions, such as those listed below may not be revealed:

1) naturally occurring toxic materials in subsurface soils, rocks, or water, or toxicity of onsite flora;
2) toxicity of substances common in current habitable environments, such as stored household products, building materials, and consumables;
3) biological pathogens;
4) contaminant plume below the depths sampled or from remote source;
5) contaminants or contaminant concentrations that do not violate present regulatory standards, but may violate future standards; and
6) unknown site contamination, such as illegal dumping and/or accidental spillage which may occur following the site visit by AWR.

Opinions and judgments expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions. This document and the information contained herein have been prepared solely for the Client and any reliance on this report by third parties not authorized by the Client shall be at such party's sole risk.

Conducting an AAI Phase I ESA alone does not provide a landowner with protection against CERCLA liability. Landowners who want to qualify as bona fide prospective purchasers or contiguous property owner must comply with all of the statutory requirements identified in CERCLA Section 107(r) and 107(q).

1.5 Special Terms and Conditions

No special terms or conditions were agreed upon for conducting this Phase I ESA.

1.6 User Reliance

As specified in ASTM E 1527-05, Sections 7.5.2 and 7.5.2.1, AWR is not required to independently verify the information provided by the User (Client), obtained from interviews, previous environmental reports, and/or reviewed documents during records review.

2.0 SITE DESCRIPTION

2.1 Site Location

The site address is 1062 Linda Vista, Mountain View, Santa Clara County, California. The site consists of one approximately ¾ acre parcel. The site is located on the western side of Linda Vista, on the block south of Interstate 101. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-024.

2.2 Site and Vicinity General Characteristics

The property is in a mixed commercial and light industrial area within the City of Mountain View, California.

2.3 Current and Proposed Use of the Property

According to the property owner and occupant, the majority of the current occupants buy the contents of storage spaces that are being auctioned for delinquent rental fees and remove the items from the storage spaces to store the contents at the site until they can be resold.

One of the site occupants repairs and rebuilds motorcycles as a hobby.

A Verizon Wireless tower was recently constructed at the site in a fenced enclosure behind the building.

It is our understanding Calvano Development is proposing to purchase the site. No information on proposed use of the property was provided to AWR.

2.4 Description of Structures, Road, and Other Improvements

The site has one building divided into several tenant spaces used primarily for storage of various materials. The building was constructed in the early 1960s and has a two story front with the majority of the building warehouse-style with high ceilings.

A wireless tower was constructed at the site earlier this year.

The remainder of the site is occupied by asphalt parking and storage areas and landscaping near the building and around the property perimeter.

The site is a rectangular shaped parcel located on the western side of Linda Vista and is accessed from Linda Vista with connected parking lots to 1080 Linda Vista north of the site.

The subject property is connected to the municipal water and sanitary and storm sewer systems.

2.5 Current Uses of the Adjoining Properties

The property is in a mixed use area. West and northwest are office buildings, south of the site is a school, east of the site, across Linda Vista, is a public storage facility. The remaining adjacent properties appear to be light industrial.

3.0 USER PROVIDED INFORMATION

3.1 Title Records

An Environmental Liens Search was performed by EDR as a part of this Phase I ESA. The lien search, including the most recent grant deed, is included in Appendix J. No additional title information was provided by the user.

3.2 Environmental Liens or Activity and Use Limitations

The Environmental Professional is required to search for Activity and Use Limitations (AULs) if such records are available in *"publicly available lists or registries."* Typical AULs include land use restrictions (LURs), institutional controls (ICs), and Engineering Controls

(ECs). Typical ICs include: 1) governmental controls such as zoning; 2) proprietary controls such as covenants or easements; 3) enforcement documents such as orders or consent decrees; and 4) information devices such as land record or deed notices. Typical ECs include: 1) passive measures such as vapor barriers and setbacks; 2) active measures such as remediation systems; and 3) monitoring of passive and/or active measures. According to 40 CFR Part 312.26 (b) (7), ICs are to be investigated on the subject property and according to 40 CFR Part 312.26 (b) (6) and (c) (2)(ii), ECs are to be reviewed to a 0.5 mile radius of the subject property. ASTM 1527-05 recommends that ECs be reviewed only for the subject property.

An Environmental Liens Search was performed for the subject property. The Environmental Liens Search did not report any environmental liens associated with the subject property.

3.3 Specialized Knowledge

AWR was not informed of any specialized knowledge associated with the subject property or the area in the vicinity of the subject property.

3.4 Commonly Known or Reasonably Ascertainable Information

AWR was did not discover any commonly known or reasonable ascertainable information associated with the subject property or the area in the vicinity of the subject property.

3.5 Valuation Reduction for Environmental Issues

AWR was not provided with purchase price information.

3.6 Owner, Property Manager, and Occupant Information

The property is currently owned by Manfred J and Audrey J Trees Trustees, who have owned the proper the property since 1985.

The property is occupied by the property owner and several different tenants.

No property manager was identified to AWR.

3.7 Reason for Performing the Phase I ESA

AWR has performed this Phase I ESA in preparation of a proposed property transfer.

3.8 Previous Reports

AWR was not provided with any previous reports for the subject site.

4.0 RECORDS REVIEW

The government environmental agency databases AWR reviewed are listed on pages 4 through 7 of the Map Findings Summary of the database obtained from Environmental Data Resources, Inc. (EDR), included as Appendix C. Please refer to the EDR report in Appendix C for additional information on the searched databases including the full names of the databases, the regulatory agency overseeing the databases, a summary of the types of facilities listed on each database, and the dates the information was obtained from the regulatory agencies. Where locations and distances reported by EDR were observed to be incorrect, AWR amended the information to provide a more accurate assessment.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database. Information from these sources for the subject site is included in Section 4.1.1. Information on nearby releases is included in Section 4.1.2.

4.1 Standard Environmental Record Sources

4.1.1 Subject Property

The site address was not listed on any of the searched databases.

- .

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database.

Mountain View Fire Department

AWR reviewed files for the site at the Mountain View Fire Department. The Mountain View Fire Department is the Certified Unified Program Agency (CUPA) for properties in Mountain View. As a CUPA, the Mountain View Fire Department is responsible for implementing the following programs: Above Ground Storage Tanks, California Accidental Release Prevention Program (CalARP), Hazardous Materials Management Plans/Business Plans, Hazardous Waste Generator, On Site Treatment of Hazardous Wastes, and Underground Storage Tanks. The Mountain View Fire Department had no record of hazardous materials or underground storage tanks at the site.

The only hazardous material information records for the site at the Mountain View Fire Department were a 40 pounds of ferric chloride stored at the site when it was operated as Haltek Electronics.

Santa Clara County Environmental Health Department

AWR reviewed files at the Santa Clara County Environmental Health Department Leaking Underground Storage Tank Oversight Program (LUSTOP). There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

California Department of Toxic Substance Control

AWR reviewed files at the California Department of Toxic Substance Control Envirostor database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

Regional Water Quality Control Board

AWR reviewed files at the Regional Water Quality Control Board Geotracker database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

US EPA Region 9

AWR reviewed files available online for the US Environmental Protection Agency (EPA) Region 9 Superfund sites. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

4.1.2 Offsite Listings

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs). Based on this inferred groundwater flow direction, offsite listings that are adjacent to or south of the subject site have the greatest potential to impact the subject site. The sites of note are discussed below:

- There are six federal national priority list (NPL) sites, also known as Superfund sites, within one mile of the site including two which are within ¼-mile of the site. The NPL listings are Moffett Naval Air Station, Intel Corp (Mountain View Plant) Teledyne Semiconductor, Spectra-Physics, Inc., Jasco Chemical Corp., and CTS Printex, Inc. The NPL listings are primarily for releases of solvents and several of the plumes are mingled. In addition, there are several state-overseen releases that have contributed to the regional impacts. AWR reviewed information in the EDR report as well as additional information obtained from EPA Region 9, California DTSC, and the RWQCB. Based on our review of the information, the site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area. It appears that the intermingled plumes are primarily west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes.

- Robb-Jack Corp. at 1080 Linda Vista was identified on the CA LUST and CORTESE databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Based on our review of the information, groundwater impacts appear to have been minimal and it does not appear that this release impacted the subject site. The release was closed in 1996 indicating no additional investigation or remediation is required.

Based on the distance, direction, and/or nature of the remaining listings, in our opinion, none of the other listings are likely to impact the subject site.

4.1.3 Other Sites of Potential Environmental Concern

AWR did not identify any other sites of environmental concern. AWR reviewed the sites in the EDR Database that were unable to be mapped. None of the listings appeared to correspond to the site or adjacent properties. None of the listings appear likely to have the potential to impact the site.

4.2 Additional Environmental Record Sources

AWR reviewed information on this site from the Mountain View Fire Department, the California Department of Toxic Substance Control (DTSC) Envirostor database, the Santa Clara County Environmental Health Department LUSTOP program, the California Geotracker Database, and US EPA. Information from these sources for the subject site was discussed in Section 4.1.1. Information from these sources on the nearby properties was included in Section 4.1.2.

4.3 Physical Setting Sources(s)

The EDR Report in Appendix C indicates that the underlying hard rock geology consists of Cenozoic Quaternary stratified sequence. Surface soils in the vicinity of the site are classified by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS) as Botella clay loam.

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs).

Current site-specific information on groundwater flow direction, depth, and quality can only be confirmed through the installation and survey of a minimum of three on-site groundwater-monitoring wells, which was beyond the scope of this assessment.

According to the 1999 USGS Mountain View, California Quadrangle Map, the site elevation is approximately 36 feet above mean sea level with a slight regional topographic slope downward to the north.

4.4 Historical Use Information on the Property

AWR reconstructed a brief history of the subject property through a review of historical Topographic Maps; the EDR City Abstract; available records, permits and other documents available at Santa Clara County; and historical aerial photographs provided by EDR. A summary of historical sources can be found in Section 12.0 of this Report with pertinent documents available in Appendices.

According to historical sources, the subject property appears to have been used as residences since at least 1939 through approximately 1961 when the existing building was constructed at the site. The building was used as an electronics company and warehouse in the 1960s and 1970s. In the 1980s and 1990s, it was operated as Haltek, an electronics retail store. Since then, it has been used primarily for storage.

4.5 Historical Use Information on Adjoining Properties

The surrounding properties were primarily agricultural fields until being developed with light industrial development in the late 1960s and early 1970s.

5.0 SITE RECONNAISSANCE

The goal of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the subject property. The subject property is visually observed and any structures located on the property are observed to the extent not obstructed by bodies of water, adjacent buildings, and/or other obstructions.

5.1 Methodology and Limiting Conditions

The exterior site reconnaissance was performed by walking open areas of the property in a grid fashion. Special attention was given to observe surfaces adjacent to the structures and sidewalks, surfaces in storage areas, and potential conduits to the subsurface such as drains and sumps. The interior site reconnaissance was performed by systematically observing each room and open space of the property. Additional attention was given to doors, utility rooms, storage areas, areas where hazardous materials were used or stored, and any other accessible areas.

At the time of the site visit, storage in the site building and rear portion of the lot obscured much of the floor and ground surface limiting our ability to assess the condition of the site. No areas of significant staining or other evidence of a release was observed in the accessible and visible areas, but it is possible that there may be areas of staining on the floor or ground that were not visible during the site visit.

5.2 General Site Setting

On September 20, 2013, Ms. Janelle Amendola of AWR conducted a site reconnaissance at the subject property. Ms. Amendola was accompanied by Ms. Audrey Trees, the property owner since 1985, during the site visit.

5.3 Exterior Observations

According to the property owner and occupant, the majority of the current occupants buy the contents of storage spaces that are being auctioned for delinquent rental fees and remove the items from the storage spaces to store the contents at the site until they can be resold. As a result, there is a wide variety of materials and equipment stored at the site that are not related to a particular business operation and past contents may be significantly different than the contents observed during the site reconnaissance. The property owner and occupant indicated that their procedure is any hazardous materials discovered in their purchased collections never enter the building but instead are stored outside at the rear of the facility for a short time then taken to a household hazardous waste collection. At the time of the assessment, several gallons of paint were observed at the site pending disposal. Although there is no evidence of a release from this practice, it is possible there may have been some small spills or releases from the hazardous materials temporarily stored at the site.

One of the site occupants repairs and rebuilds motorcycles as a hobby. The maintenance has been done in the rear yard of the site with some of the parts and materials stored in the building. Although there is no evidence of a release from this practice, it is possible there have been some small spills or releases from the hazardous materials used to restore and rebuild motorcycles. It would be prudent to inspect the site after the stored materials have been removed.

A Verizon Wireless tower was recently constructed at the site in a fenced enclosure behind the building. We were unable to enter the fenced enclosure during the site reconnaissance, but based on our observations from the perimeter, there is a generator with an attached 132 gallon diesel day tank. Based on the signage, it appears likely there are also batteries for emergency backup power. All of the equipment within the fenced enclosure was new (according to the property owner, the equipment was installed during August and September 2013) and appeared to be in very good condition. AWR observed no evidence of a spill or release associated with the wireless tower and support operations at the site.

5.4 Interior Observations

At the time of the site visit, storage in the site building and rear portion of the lot obscured much of the floor and ground surface limiting our ability to assess the condition of the site. No areas of significant staining or other evidence of a release was observed in the accessible and visible areas, but it is possible that there may be areas of staining on the floor or ground that were not visible during the site visit.

Hazardous materials observed in the building include various paints, lubricants, and cleaners used to clean and repair purchased items for subsequent resale. A hazardous material storage cabinet was observed in the north-central part of the building. All of the containers in the building appeared to be 1-gallon or less in retail size containers.

There are no elevators in the site building.

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Non-Scope Items

The following non-scope items were included as part of this Report based on readily available information that was reviewed.

5.4.1 Suspect Asbestos Containing Building Materials and Lead-Based Paint

Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead based paint have been used at the site. A full survey should be completed prior to any demolition or renovation of the building at the site.

5.4.2 Radon

No radon survey was conducted. According to the EDR report, Santa Clara County is in zone 2, indicating the average indoor level is between 2 and 4 picocuries per liter (pCi/L). The US Environmental Protection Agency (USEPA) action level is 4 pCi/L.

6.0 INTERVIEWS

6.1 Interview with Owner Representative

AWR interviewed Mrs. Audrey Trees, the property owner, during the site visit. Mrs. Trees has owned the property with her husband since 1985. Mrs. Trees provided information on the current and former site tenants and operations.

6.2 Interview with Site Manager

No Site Manager was identified.

6.3 Interviews with Occupants

AWR conducted informal interviews with the site occupants during the site reconnaissance including Mrs. Audrey Trees, the property owner who also occupies the rear portion of the building. Given that the current occupant operations, formal interviews were not conducted with other site occupants.

6.4 Interviews with Local Government Officials

AWR reviewed information from the Mountain View Fire Department, the Santa Clara County Environmental Health Department, the San Francisco Bay Regional Quality Control Board, and the California Department of Toxic Substance Control. Information

from these requests is presented elsewhere throughout this report.

6.5 Interviews with Others

AWR did not perform any interviews with others regarding the subject property.

7.0 FINDINGS

According to the property owner and occupant, the majority of the current occupants buy the contents of storage spaces that are being auctioned for delinquent rental fees and remove the items from the storage spaces to store the contents at the site until they can be resold. As a result, there is a wide variety of materials and equipment stored at the site that are not related to a particular business operation and past contents may be significantly different than the contents observed during the site reconnaissance. The property owner and occupant indicated that their procedure is any hazardous materials discovered in their purchased collections never enter the building but instead are stored outside at the rear of the facility for a short time then taken to a household hazardous waste collection. At the time of the assessment, several gallons of paint were observed at the site pending disposal. Although there is no evidence of a release from this practice, it is possible there have been some small spills or releases from the hazardous materials temporarily stored at the site.

At the time of the site visit, storage in the site building and rear portion of the lot obscured much of the floor and ground surface limiting our ability to assess the condition of the site. No areas of significant staining or other evidence of a release was observed in the accessible and visible areas, but it is possible that there may be areas of staining on the floor or ground that were not visible during the site visit.

Hazardous materials observed in the building include various paints, lubricants, and cleaners used to clean and repair purchased items for subsequent resale. A hazardous material storage cabinet was observed in the north-central part of the building. All of the containers in the building appeared to be 1-gallon or less in retail size containers.

One of the site occupants repairs and rebuilds motorcycles as a hobby. The maintenance has been done in the rear yard of the site with some of the parts and materials stored in the building. Although there is no evidence of a release from this practice, it is possible there have been some small spills or releases from the hazardous materials used to restore and

rebuild motorcycles. It would be prudent to inspect the property after the stored materials have been removed.

A Verizon Wireless tower was recently constructed at the site in a fenced enclosure behind the building. We were unable to enter the fenced enclosure during the site reconnaissance, but based on our observations from the perimeter, there is a generator with an attached 132 gallon diesel day tank. Based on the signage, it appears likely there are also batteries for emergency backup power. All of the equipment within the fenced enclosure was new (according to the property owner, the equipment was installed during August and September 2013) and appeared to be in very good condition. AWR observed no evidence of a spill or release associated with the wireless tower and support operations at the site.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

7.1 Data Gaps

AWR was not able to review a Chain of Title Report for the subject property. It is AWR's opinion that the lack of this information does not pose a significant data gap, as an environmental lien search was performed for the subject property and revealed no issues.

AWR was also not able to interview past occupants or past owners. Given the use of the site and the length of time that the current owner has been involved with the site, in our opinion, this is not a significant data gap.

7.2 Continuing Obligations

Continuing obligations start on the date that a landowner acquires title to a property. The landowner must: 1) comply with land use restrictions and institutional controls; 2) take "reasonable" steps with respect to hazardous substances releases; 3) provide full cooperation, assistance and access to persons that are authorized to conduct response actions or natural resource restoration; 4) comply with information requests and administrative subpoenas; and 5) provide all legally required notices. Continuing obligations must be satisfied to maintain liability protection under CERCLA for innocent landowners, bona fide prospective purchasers, and contiguous property owners.

8.0 OPINION

Small quantities of a variety of hazardous materials have been used and stored at the site. In addition, much of the ground and building floor was not able to be observed due to the quantity of materials being stored at the site. There is no evidence of a release, but we recommend an additional visual assessment once the materials have been removed and the site can be more thoroughly viewed.

The regional releases do not appear to have significantly impacted the site.

The potential for asbestos and/or lead based paint in the building materials at the site is not a REC but must be managed appropriately.

No other potential RECs were identified in conjunction with the site. No additional environmental assessment is recommended at this time.

9.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 of 1062 Linda Vista, Mountain View, Santa Clara County, California, the subject property. Any exceptions to, or deletions from, this practice are described in Section 5.1 of this Report.

This assessment has revealed no evidence of Recognized Environmental Conditions in connection with the subject property, except the following:

Small quantities of a variety of hazardous materials have been used and stored at the site. In addition, much of the ground and building floor was not able to be observed due to the quantity of materials being stored at the site. There is no evidence of a release, but we recommend an additional visual assessment once the materials have been removed and the site can be more thoroughly viewed.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

10.0 DEVIATIONS

AWR did not evaluate the purchase price versus property value as AWR is not qualified to evaluate this issue.

11.0 ADDITIONAL SERVICES

No additional services were performed in conjunction with this Phase I ESA.

Attn: Mark Calvano

Re: Phase I Environmental Site Assessment
1160-1170 Terra Bella
Mountain View, CA

Dear Mr. Calvano:

Thank you for providing Applied Water Resources Corporation (AWR) the opportunity to assist you in identifying the environmental issues at 1160-1170 Terra Bella, in Mountain View, California.

The site is a single story approximately 8,000 square foot building divided into two suites on an approximately 20,000 square foot rectangular parcel. The building was constructed in approximately 1960. Prior to this, the site appears to have been used as agricultural land since at least 1939.

The building appears to have been used primarily as offices and light industrial uses since its initial construction. No indication of significant hazardous material use or storage in the building was observed during the site reconnaissance or discovered during our historical research for this Phase I ESA.

A monitoring well was installed just off of the southeastern corner of the property for a release originating on the property directly south of the subject site at 1175 Terra Bella. In addition, monitoring wells were installed on the properties west of the subject site for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southeast corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue), southwest of the subject site. No sampling appears to have been done on the subject site for either of the releases but based on the proximity to the site, there is a potential that groundwater and/or soil gas vapor impacts may extend onto the subject

site. Both releases were closed with the remaining impacts considered not likely to impact the site. The subject site was never named as a possible source of the impacts and the source releases have been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated and the release investigations have been closed indicating they have been resolved to the satisfaction of the overseeing regulatory agency.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

AWR looks forward to working with you on this project. Please contact me at 408.496.0801 or at kprice@erscorp.us if you have any questions or comments.

Best Regards

APPLIED WATER RESOURCES

EXECUTIVE SUMMARY

Consultant:	Applied Water Resources Corporation (AWR)
Subject Property:	1160-1170 Terra Bella, Mountain View, California
Client:	Calvano Development
Location:	The site address is 1160-1170 Terra Bella, Mountain View, Santa Clara County, California. The site consists of one approximately 20,000 square foot rectangular. The site is located on the northern side of Terra Bella. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-014.
Current Use:	The site is improved with one single-story building divided into two suites with addresses of 1160 and 1170 Terra Bella. The suite at 1160 Terra Bella is currently offices and the suite at 1170 Terra Bella is Oxigraf, a manufacturer of oxygen sensors and analyzers.
Current Owner:	The property is currently owned McCaul 1991 Trust, Bruce SP dated 6/19/91, who has owned the property since 1998.
Site Characteristics:	The property is approximately 20,000 square feet and is improved with a single story approximately 8000 square foot building divided into two suites. The remainder of the site is paved parking areas with landscaping near the front of the building.
Vicinity Characteristics:	The property is in a mixed commercial and light industrial within the City of Mountain View, California.
Purpose:	This Phase I Environmental Site Assessment (ESA) was performed to (1) identify any recognized environmental conditions (RECs), and (2) permit a user to satisfy one of the requirements to qualify for the innocent landowner defense under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability protection (42 U.S.C. §9601). All components of this ESA were performed or overseen by Environmental Professionals as defined in the All Appropriate Inquiries (AAI)

Standard and the American Society for Testing and Materials (ASTM) E 1527-05.

Conclusions:

The building appears to have been used primarily as offices and light industrial uses since its initial construction. No indication of significant hazardous material use or storage in the building was observed during the site reconnaissance or discovered during our historical research for this Phase I ESA.

A monitoring well was installed just off of the southeastern corner of the property for a release originating on the property directly south of the subject site at 1175 Terra Bella. In addition, monitoring wells were installed on the properties west of the subject site for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southeast corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue), southwest of the subject site. No sampling appears to have been done on the subject site for either of the releases but based on the proximity to the site, there is a potential that groundwater and/or soil gas vapor impact may extend onto the subject site. Both releases were closed with the remaining impacts considered not likely to impact the site. The subject site was never named as a possible source of the impacts and the source releases have been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated and the release investigations have been closed indicating they have been resolved to the satisfaction of the overseeing regulatory agency.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

1.0 INTRODUCTION

On behalf of Calvano Development (hereinafter referred to as the "Client"), Applied Water Resources Corporation (AWR), performed a Phase I Environmental Site Assessment (ESA) of the property located at 1160-1170 Terra Bella, Mountain View, Santa Clara County, California (hereinafter referred to as the "subject property").

1.1 Purpose

This ESA was performed to provide a record of the site conditions at the subject property and to evaluate what, if any, recognized environmental conditions exist at this site. Additional goals of this ESA are to identify recognized environmental conditions (RECs) from current and historical practices on the subject property and surrounding area and to assist the Client to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability.

1.2 Detailed Scope of Services

The following tasks were performed in accordance with the Scope of Services.

- Visual site inspection of the subject property to investigate for recognized environmental conditions. AWR is not responsible for inspecting areas covered by parked vehicles, overgrown vegetation, and other obstacles preventing access.

- A historical review of the use and improvements of the subject property through a review of aerial photographs, historical topographic maps, city directories, fire insurance maps, title reports, and/or building department records.

- A review of available geologic and hydrogeologic literature concerning the property and surrounding area.

- Interviews of persons familiar with the history of the subject property, including key site managers, owners, tenants, past tenants, and/or previous owners.

- Review of appropriate federal, state, and local regulatory agencies to reveal known hazardous wastes sites or significant leaks or spills of hazardous materials that may have occurred at the subject property and immediate vicinity.

- Interviews with applicable local agencies familiar with the areas in the vicinity of the subject property such as local fire departments, health departments, Regional Water Quality Control Board, and/or other local government agencies.

1.3 Significant Assumptions

No significant assumptions were made during this Phase I ESA.

1.4 Limitations and Exceptions of Agreement

AWR has performed the services for this project in accordance with our proposal, and within the current standards of the American Society for Testing and Materials (ASTM 1527-05) for Phase I Environmental Site Assessments and the standards for All Appropriate Inquiries (AAI) approved by the Federal Environmental Protection Agency. Except for the representations set forth in this Phase I ESA, no other representations, guarantees, or warrantees are either expressed or implied. A record search was limited to reasonably ascertainable information that could be obtained within 20 calendar days.

The review was limited to a search for RECs at the subject property. The term REC means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

There is no investigation that is thorough enough to preclude the presence of hazardous materials that presently, or in the future, may be considered hazardous at the site. Because regulatory evaluation criteria are constantly changing, concentrations of contaminants presently considered low may, in the future, fall under more stringent regulatory standards that require remediation.

The Site Reconnaissance was limited to visual observation of surface conditions at the subject property. Interviews with public agency personnel were conducted. Reasonably ascertainable information was reviewed. This approach reflects current ASTM standards and AAI regulations.

Where there is a conflict between the environmental database and AWR's actual knowledge with regard to the distance and direction from the subject property of sites listed on the database, information obtained by AWR from the site reconnaissance was used. Whenever feasible, AWR notes such conflict within the text of the report.

This ESA addresses recognized environmental conditions at the subject property. However, certain conditions, such as those listed below may not be revealed:

1) naturally occurring toxic materials in subsurface soils, rocks, or water, or toxicity of onsite flora;
2) toxicity of substances common in current habitable environments, such as stored household products, building materials, and consumables;
3) biological pathogens;
4) contaminant plume below the depths sampled or from remote source;
5) contaminants or contaminant concentrations that do not violate present regulatory standards, but may violate future standards; and
6) unknown site contamination, such as illegal dumping and/or accidental spillage which may occur following the site visit by AWR.

Opinions and judgments expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions. This document and the information contained herein have been prepared solely for the Client and any reliance on this report by third parties not authorized by the Client shall be at such party's sole risk.

Conducting an AAI Phase I ESA alone does not provide a landowner with protection against CERCLA liability. Landowners who want to qualify as bona fide prospective purchasers or contiguous property owner must comply with all of the statutory requirements identified in CERCLA Section 107(r) and 107(q).

1.5 Special Terms and Conditions

No special terms or conditions were agreed upon for conducting this Phase I ESA.

1.6 User Reliance

As specified in ASTM E 1527-05, Sections 7.5.2 and 7.5.2.1, AWR is not required to independently verify the information provided by the User (Client), obtained from interviews, previous environmental reports, and/or reviewed documents during records review.

2.0 SITE DESCRIPTION

2.1 Site Location

The site address is 1160-1170 Terra Bella, Mountain View, Santa Clara County, California. The site consists of one approximately 20,000 square foot parcel. The site is located on the northern

side of Terra Bella. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-014.

2.2 Site and Vicinity General Characteristics

The property is in a mixed commercial and light industrial area within the City of Mountain View, California.

2.3 Current and Proposed Use of the Property

The property is improved with a single story office building divided into multiple tenant spaces.

It is our understanding Calvano Development is proposing to purchase the site. No information on proposed use of the property was provided to AWR.

2.4 Description of Structures, Road, and Other Improvements

The site is a single-story rectangular building divided into two separate suites on an approximately 20,000 square foot rectangular parcel. The building was constructed in approximately 1960.

The remainder of the site is occupied by asphalt parking and driving areas, sidewalks to and around the building, and landscaping near the front of the building.

The site is a rectangular shaped parcel located on the northern side of Terra Bella and is accessed from Terra Bella.

The subject property is connected to the municipal water and sanitary and storm sewer systems.

2.5 Current Uses of the Adjoining Properties

The property is in a mixed use area. East of the site is a residence, west of the site is a closed restaurant, .southwest of the site is a Taco Bell restaurant, and the remaining adjacent properties appear to be a mixture of light industrial and commercial uses.

3.0 USER PROVIDED INFORMATION

3.1 Title Records

An Environmental Liens Search was performed by EDR as a part of this Phase I ESA. The lien search, including the most recent grant deed, is included in Appendix J. No additional title information was provided by the user.

3.2 Environmental Liens or Activity and Use Limitations

The Environmental Professional is required to search for Activity and Use Limitations (AULs) if such records are available in *"publicly available lists or registries."* Typical AULs include land use restrictions (LURs), institutional controls (ICs), and Engineering Controls (ECs). Typical ICs include: 1) governmental controls such as zoning; 2) proprietary controls such as covenants or easements; 3) enforcement documents such as orders or consent decrees; and 4) information devices such as land record or deed notices. Typical ECs include: 1) passive measures such as vapor barriers and setbacks; 2) active measures such as remediation systems; and 3) monitoring of passive and/or active measures. According to 40 CFR Part 312.26 (b) (7), ICs are to be investigated on the subject property and according to 40 CFR Part 312.26 (b) (6) and (c) (2) (ii), ECs are to be reviewed to a 0.5 mile radius of the subject property. ASTM 1527-05 recommends that ECs be reviewed only for the subject property.

An Environmental Liens Search was performed for the subject property. The Environmental Liens Search did not report any environmental liens associated with the subject property.

3.3 Specialized Knowledge

AWR was not informed of any specialized knowledge associated with the subject property or the area in the vicinity of the subject property.

3.4 Commonly Known or Reasonably Ascertainable Information

AWR was did not discover any commonly known or reasonable ascertainable information associated with the subject property or the area in the vicinity of the subject property.

3.5 Valuation Reduction for Environmental Issues

AWR was not provided with purchase price information.

3.6 Owner, Property Manager, and Occupant Information

The property is currently owned by McCaul 1991 Trust, Bruce SP dated 6/19/91, who has owned the property since 1998.

The property is occupied by several different office tenants.

No property manager was identified to AWR.

3.7 Reason for Performing the Phase I ESA

AWR has performed this Phase I ESA in preparation of a proposed property transfer.

3.8 Previous Reports

AWR was not provided with any previous reports for the subject site.

4.0 RECORDS REVIEW

The government environmental agency databases AWR reviewed are listed on pages 4 through 7 of the Map Findings Summary of the database obtained from Environmental Data Resources, Inc. (EDR), included as Appendix C. Please refer to the EDR report in Appendix C for additional information on the searched databases including the full names of the databases, the regulatory agency overseeing the databases, a summary of the types of facilities listed on each database, and the dates the information was obtained from the regulatory agencies. Where locations and distances reported by EDR were observed to be incorrect, AWR amended the information to provide a more accurate assessment.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database. Information from these sources for the subject site is included in Section 4.1.1. Information on nearby releases is included in Section 4.1.2.

4.1 Standard Environmental Record Sources

4.1.1 Subject Property

The site address was not listed on any of the searched databases.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database.

Mountain View Fire Department

AWR reviewed files for the site at the Mountain View Fire Department. The Mountain View Fire Department is the Certified Unified Program Agency (CUPA) for properties in Mountain View. As a CUPA, the Mountain View Fire Department is responsible for implementing the following programs: Above Ground Storage Tanks, California Accidental Release Prevention Program (CalARP), Hazardous Materials Management Plans/Business Plans, Hazardous Waste Generator, On Site Treatment of Hazardous Wastes, and Underground Storage Tanks. The Mountain View Fire Department had no record of hazardous materials or underground storage tanks at the site. The only information available from the Mountain View Fire Department was life safety records such as sprinklers and fire extinguishers.

Santa Clara County Environmental Health Department

AWR reviewed files at the Santa Clara County Environmental Health Department Leaking Underground Storage Tank Oversight Program (LUSTOP). There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

California Department of Toxic Substance Control

AWR reviewed files at the California Department of Toxic Substance Control Envirostor database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

Regional Water Quality Control Board

AWR reviewed files at the Regional Water Quality Control Board Geotracker database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

US EPA Region 9

AWR reviewed files available online for the US Environmental Protection Agency (EPA) Region 9 Superfund sites. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

4.1.2 Offsite Listings

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs).

Based on this inferred groundwater flow direction, offsite listings that are adjacent to or south of the subject site have the greatest potential to impact the subject site. The sites of note are discussed below:

- There are six federal national priority list (NPL) sites, also known as Superfund sites, within one mile of the site including two which are within ¼-mile of the site. The NPL listings are Moffett Naval Air Station, Intel Corp (Mountain View Plant) Teledyne Semiconductor, Spectra-Physics, Inc., Jasco Chemical Corp., and CTS Printex, Inc. The NPL listings are primarily for releases of solvents and several of the plumes are mingled. In addition, there are several state-overseen releases that have contributed to the regional impacts. AWR reviewed information in the EDR report as well as additional information obtained from EPA Region 9, California DTSC, and the RWQCB. Based on our review of the information, the site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area. It appears that the intermingled plumes are primarily west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes.

- Shippen Property at 1175 Terra Bella was identified on the CA HIST CORTESE, CA LUST and CA HIST LUST databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Monitoring wells were installed on the property adjacent to the site to the east and on the source property directly south of the subject site. No sampling appears to have been done on the subject site but based on the sampling results on the adjacent properties, it is possible the groundwater of soil gas at the site were impacted by this release. The subject site was never named as a possible source of the impacts and the source release has been closed since 2001. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency.

- Texaco (CVX #21-1179) at 975 Shoreline Blvd (formerly known as Sterlin Road) was identified on the CA LUST and CA HIST LUST databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Monitoring wells were installed on the property adjacent to the site to the northwest and the southwest in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at

975 Shoreline Blvd (at the southeast corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the wells near the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. No sampling appears to have been done on the subject site but based on the sampling results on the adjacent properties; it is possible the groundwater and soil gas at the site may have been impacted by this release. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency.

- Robb-Jack Corp. at 1080 Linda Vista was identified on the CA LUST and CORTESE databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Based on our review of the information, groundwater impacts appear to have been minimal and it does not appear that this release impacted the subject site. The release was closed in 1996 indicating no additional investigation or remediation is required.

Based on the distance, direction, and/or nature of the remaining listings, in our opinion, none of the other listings are likely to impact the subject site.

4.1.3 Other Sites of Potential Environmental Concern

AWR did not identify any other sites of environmental concern. AWR reviewed the sites in the EDR Database that were unable to be mapped. None of the listings appeared to correspond to the site or adjacent properties. None of the listings appear likely to have the potential to impact the site.

4.2 Additional Environmental Record Sources

AWR reviewed information on this site from the Mountain View Fire Department, the California Department of Toxic Substance Control (DTSC) Envirostor database, the Santa Clara County Environmental Health Department LUSTOP program, the California Geotracker Database, and US EPA. Information from these sources for the subject site was discussed in Section 4.1.1. Information from these sources on the nearby properties was included in Section 4.1.2.

4.3 Physical Setting Sources(s)

The EDR Report in Appendix C indicates that the underlying hard rock geology consists of Cenozoic Quaternary stratified sequence. Surface soils in the vicinity of the site are classified by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS) as Botella clay loam.

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs).

Current site-specific information on groundwater flow direction, depth, and quality can only be confirmed through the installation and survey of a minimum of three on-site groundwater-monitoring wells, which was beyond the scope of this assessment.

According to the 1999 USGS Mountain View, California Quadrangle Map, the site elevation is approximately 36 feet above mean sea level with a slight regional topographic slope downward to the north.

4.4 Historical Use Information on the Property

AWR reconstructed a brief history of the subject property through a review of historical Topographic Maps; the EDR City Abstract; available records, permits and other documents available at Santa Clara County; and historical aerial photographs provided by EDR. A summary of historical sources can be found in Section 12.0 of this Report with pertinent documents available in Appendices.

According to historical sources, the subject property appears to have been used as agricultural fields since at least 1939 through approximately 1960 when the existing building was constructed at the site and the remainder of the property was improved similar to its current configuration. .The building appears to have been used primarily as offices since its initial construction.

4.5 Historical Use Information on Adjoining Properties

The surrounding properties were primarily agricultural fields until being developed with light industrial development in the 1960s and early 1970s.

5.0 SITE RECONNAISSANCE

The goal of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the subject property. The subject property is visually observed and any structures located on the property are observed to the extent not obstructed by bodies of water, adjacent buildings, and/or other obstructions.

5.1 Methodology and Limiting Conditions

The exterior site reconnaissance was performed by walking open areas of the property in a grid fashion. Special attention was given to observe surfaces adjacent to the structures and sidewalks, surfaces in storage areas, and potential conduits to the subsurface such as drains and sumps. The interior site reconnaissance was performed by systematically observing each room and open space of the property. Additional attention was given to doors, utility rooms, storage areas, areas where hazardous materials were used or stored, and any other accessible areas.

5.2 General Site Setting

On December 13, 2013, Ms. Janelle Amendola of AWR conducted a site reconnaissance at the subject property. Ms. Amendola was unaccompanied during the site visit.

5.3 Exterior Observations

The majority of the site is occupied by the building and asphalt parking and drive areas east and west of the building with landscaping near the front of the building. The rear of the building is the northern property boundary

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Interior Observations

The building was used as offices for several tenants at the time of the site assessment. No indication of current or former non-office use of the building was observed during the site reconnaissance.

The only hazardous materials observed at the site were routine janitorial and maintenance materials. No evidence of significant former hazardous material use or storage tanks were observed at the site.

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Non-Scope Items

The following non-scope items were included as part of this Report based on readily available information that was reviewed.

5.4.1 Suspect Asbestos Containing Building Materials and Lead-Based Paint

Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead based paint have been used at the site. A full survey has been completed by AWR and will be forwarded under separate cover.

5.4.2 Radon

No radon survey was conducted. According to the EDR report, Santa Clara County is in zone 2, indicating the average indoor level is between 2 and 4 picocuries per liter (pCi/L). The US Environmental Protection Agency (USEPA) action level is 4 pCi/L.

6.0 INTERVIEWS

6.1 Interview with Owner Representative

No site owner representative was identified.

6.2 Interview with Site Manager

No Site Manager was identified.

6.3 Interviews with Occupants

AWR conducted informal interviews with the site occupants during the site reconnaissance. Given that the current occupants only use the building for offices, formal interviews were not conducted.

6.4 Interviews with Local Government Officials

AWR reviewed information from the Mountain View Fire Department, the Santa Clara County Environmental Health Department, the San Francisco Bay Regional Quality Control Board, and the California Department of Toxic Substance Control. Information from these requests is presented elsewhere throughout this report.

6.5 Interviews with Others

AWR did not perform any interviews with others regarding the subject property.

7.0 FINDINGS

The building appears to have been used primarily as offices and light industrial uses since its initial construction. No indication of significant hazardous material use or storage in the building was observed during the site reconnaissance or discovered during our historical research for this Phase I ESA.

A monitoring well was installed just off of the southeastern corner of the property for a release originating on the property directly south of the subject site at 1175 Terra Bella. In addition, monitoring wells were installed on the properties west of the subject site for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southeast corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue), southwest of the subject site. No sampling appears to have been done on the subject site for either of the releases but based on the proximity to the site, there is a potential that groundwater and/or soil gas vapor impacts may have extended onto the subject site. Both releases were closed with the remaining impacts considered not likely to impact the site. The subject site was never named as a possible source of the impacts and the source releases have been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated and the release investigations have been closed indicating they have been resolved to the satisfaction of the overseeing regulatory agency.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

7.1 Data Gaps

AWR was not able to review a Chain of Title Report for the subject property. It is AWR's opinion that the lack of this information does not pose a significant data gap, as an environmental lien search was performed for the subject property and revealed no issues.

AWR was also not able to interview past occupants or current or past owners. Given the office use of the site, in our opinion, this is not a significant data gap.

7.2 Continuing Obligations

Continuing obligations start on the date that a landowner acquires title to a property. The landowner must: 1) comply with land use restrictions and institutional controls; 2) take "reasonable" steps with respect to hazardous substances releases; 3) provide full cooperation, assistance and access to persons that are authorized to conduct response actions or natural resource restoration; 4) comply with information requests and administrative subpoenas; and 5) provide all legally required notices. Continuing obligations must be satisfied to maintain liability protection under CERCLA for innocent landowners, bona fide prospective purchasers, and contiguous property owners.

AWR identified no ongoing continuing obligations for the subject site.

8.0 OPINION

The petroleum release on the adjacent properties to the south and southwest of the subject site have both been remediated and closed by the overseeing regulatory agency but it is possible that groundwater and/or soil gas vapors at the site were impacted by these releases. The subject site was never named as a potential source of the impacts and both release have been closed by the overseeing regulatory agencies indicating that the releases have been resolved to their satisfaction. Any impacts to the site are considered to be historical recognized environmental conditions (HRECs) since the source sites have been closed.

The regional solvent releases do not appear to have significantly impacted the site.

The potential for asbestos and/or lead based paint in the building materials at the site is not a REC but must be managed appropriately.

No other potential RECs were identified in conjunction with the site. No additional environmental assessment is recommended at this time.

9.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 of 1160-1170 Terra Bella, Mountain View, Santa Clara County, California, the subject property. Any exceptions to, or deletions from, this practice are described in Section 5.1 of this Report.

This assessment has revealed no evidence of Recognized Environmental Conditions in connection with the subject property, except the following:

The building appears to have been used primarily as offices and light industrial uses since its initial construction. No indication of significant hazardous material use or storage in the building was observed during the site reconnaissance or discovered during our historical research for this Phase I ESA.

A monitoring well was installed just off of the southeastern corner of the property for a release originating on the property directly south of the subject site at 1175 Terra Bella. In addition, monitoring wells were installed on the properties west of the subject site for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southeast corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue), southwest of the subject site. No sampling appears to have been done on the subject site for either of the releases but based on the proximity to the site, there is a potential that groundwater and/or soil gas vapor may have extended onto the subject site. Both releases were closed with the remaining impacts considered not likely to impact the site. The subject site was never named as a possible source of the impacts and the source releases have been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated and the release investigations have been closed indicating they have been resolved to the satisfaction of the overseeing regulatory agency.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

10.0 DEVIATIONS

AWR did not evaluate the purchase price versus property value as AWR is not qualified to evaluate this issue.

11.0 ADDITIONAL SERVICES

AWR has also completed asbestos and lead sampling at the subject site. The results of that were presented under separate cover. No other additional services were performed in conjunction with this Phase I ESA.

Attn: Mark Calvano

Re: Phase I Environmental Site Assessment
1130 Terra Bella
Mountain View, CA

Dear Mr. Calvano:

Thank you for providing Applied Water Resources Corporation (AWR) the opportunity to assist you in identifying the environmental issues at 1130 Terra Bella, in Mountain View, California.

Three monitoring wells were installed at the site in August 1988 to evaluate the potential for the site to have been a contributor to the regional groundwater in the area. Documents indicate that volatile organic compounds have been stored at the site in the past. In 1989 the Mt. View Fire Department granted Olin Mesa Corporation facility closure with regards to all of the hazardous materials stored and used at the site.

The most recent grounding water sampling and analysis was performed on July 27, 2005. All groundwater samples were analyzed for VOCs using EPA Method 8260B. The laboratory results indicated the presence of TCE and cis-1, 2-DCE at respective concentrations of 46 ug/L and 9.0 ug/L. These results were from up gradient well sample MW-3. These values are above the current Environmental Screening Levels (ESLs) where groundwater is a potential source of drinking water (Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, RWQCBSF Bay region, Interim Final-February 2005, Table 1). These values were the highest detected in the water samples collected from the site. Since these test results represent the upgradient groundwater contaminant values, it is likely that the source of the VOC contamination is from an upgradient, offsite source."

The area around the subject site has numerous identified businesses that have had chemical or hazardous material releases. These sites are in various phases of investigation or remediation.

None of the documents we reviewed identified the subject site as being an agency listed site. Even though the site has a history of hazardous materials usage, it appears that there has been no identified release of hazardous materials onto the site. The groundwater contamination detected in the onsite monitoring wells appears to be the result of the migration of VOCs from an upgradient, off-site source.

The source of the chlorinated solvent impacts has never been conclusively determined. The unresolved impacts, regardless of whether the source is on or off of the site, are a recognized environmental condition as defined in the ASTM standard practice.

A deed restriction prohibiting the use of chlorinated solvents at the site was recorded in 2005.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

AWR looks forward to working with you on this project. Please contact me at 408.496.0801 or at kprice@erscorp.us if you have any questions or comments.

Best Regards

APPLIED WATER RESOURCES

EXECUTIVE SUMMARY

Consultant:	Applied Water Resources Corporation (AWR)
Subject Property:	1130 Terra Bella, Mountain View, California
Client:	Calvano Development
Location:	The site address is 1130 Terra Bella, Mountain View, Santa Clara County, California. The site consists of one approximately 0.86 acre rectangular. The site is located on the northern side of Terra Bella. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-026.
Current Use:	The site is improved with one single-story building divided into office and warehouse space. The site is currently occupied by DataNet IT, an IT consultant.
Current Owner:	The property is currently owned SpRK LLC, who has owned the property since 2006.
Site Characteristics:	The property is approximately 0.86 acre and is improved with a single story approximately 12,300 square foot building. The remainder of the site is paved parking areas with landscaping near the front of the building.
Vicinity Characteristics:	The property is in a mixed commercial and light industrial within the City of Mountain View, California.
Purpose:	This Phase I Environmental Site Assessment (ESA) was performed to (1) identify any recognized environmental conditions (RECs), and (2) permit a user to satisfy one of the requirements to qualify for the innocent landowner defense under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability protection (42 U.S.C. §9601). All components of this ESA were performed or overseen by Environmental Professionals as defined in the All Appropriate Inquiries (AAI) Standard and the American Society for Testing and Materials (ASTM) E 1527-05.

Conclusions:

Three monitoring wells were installed at the site in August 1988 to evaluate the potential for the site to have been a contributor to the regional groundwater in the area. Documents indicate that volatile organic compounds have been stored at the site in the past. In 1989 the Mt. View Fire Department granted Olin Mesa Corporation facility closure with regards to all of the hazardous materials stored and used at the site.

The most recent grounding water sampling and analysis was performed on July 27, 2005. All groundwater samples were analyzed for VOCs using EPA Method 8260B. The laboratory results indicated the presence of TCE and cis-1, 2-DCE at respective concentrations of 46 ug/L and 9.0 ug/L. These results were from up gradient well sample MW-3. These values are above the current Environmental Screening Levels (ESLs) where groundwater is a potential source of drinking water (Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, RWQCBSF Bay region, Interim Final-February 2005, Table 1). These values were the highest detected in the water samples collected from the site. Since these test results represent the upgradient groundwater contaminant values, it is likely that the source of the VOC contamination is from an upgradient, offsite source."

The area around the subject site has numerous identified businesses that have had chemical or hazardous material releases. These sites are in various phases of investigation or remediation. None of the documents we reviewed identified the subject site as being an agency listed site. Even though the site has a history of hazardous materials usage, it appears that there has been no identified release of hazardous materials onto the site. The groundwater contamination detected in the onsite monitoring wells appears to be the result of the migration of VOCs from an upgradient, off-site source.

The source of the chlorinated solvent impacts has never been conclusively determined. The unresolved impacts, regardless of whether the source is on or off of the site, are a recognized environmental condition as defined in the ASTM standard practice.

A deed restriction prohibiting the use of chlorinated solvents at the site was recorded in 2005.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please

refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

1.0 INTRODUCTION

On behalf of Calvano Development (hereinafter referred to as the "Client"), Applied Water Resources Corporation (AWR), performed a Phase I Environmental Site Assessment (ESA) of the property located at 1130 Terra Bella, Mountain View, Santa Clara County, California (hereinafter referred to as the "subject property").

1.1 Purpose

This ESA was performed to provide a record of the site conditions at the subject property and to evaluate what, if any, recognized environmental conditions exist at this site. Additional goals of this ESA are to identify recognized environmental conditions (RECs) from current and historical practices on the subject property and surrounding area and to assist the Client to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability.

1.2 Detailed Scope of Services

The following tasks were performed in accordance with the Scope of Services.

- Visual site inspection of the subject property to investigate for recognized environmental conditions. AWR is not responsible for inspecting areas covered by parked vehicles, overgrown vegetation, and other obstacles preventing access.

- A historical review of the use and improvements of the subject property through a review of aerial photographs, historical topographic maps, city directories, fire insurance maps, title reports, and/or building department records.

- A review of available geologic and hydrogeologic literature concerning the property and surrounding area.

- Interviews of persons familiar with the history of the subject property, including key site managers, owners, tenants, past tenants, and/or previous owners.

- Review of appropriate federal, state, and local regulatory agencies to reveal known hazardous wastes sites or significant leaks or spills of hazardous materials that may have occurred at the subject property and immediate vicinity.

- Interviews with applicable local agencies familiar with the areas in the vicinity of the subject property such as local fire departments, health departments, Regional Water Quality Control Board, and/or other local government agencies.

1.3 Significant Assumptions

No significant assumptions were made during this Phase I ESA.

1.4 Limitations and Exceptions of Agreement

AWR has performed the services for this project in accordance with our proposal, and within the current standards of the American Society for Testing and Materials (ASTM 1527-05) for Phase I Environmental Site Assessments and the standards for All Appropriate Inquiries (AAI) approved by the Federal Environmental Protection Agency. Except for the representations set forth in this Phase I ESA, no other representations, guarantees, or warrantees are either expressed or implied. A record search was limited to reasonably ascertainable information that could be obtained within 20 calendar days.

The review was limited to a search for RECs at the subject property. The term REC means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

There is no investigation that is thorough enough to preclude the presence of hazardous materials that presently, or in the future, may be considered hazardous at the site. Because regulatory evaluation criteria are constantly changing, concentrations of contaminants presently considered low may, in the future, fall under more stringent regulatory standards that require remediation.

The Site Reconnaissance was limited to visual observation of surface conditions at the subject property. Interviews with public agency personnel were conducted. Reasonably ascertainable information was reviewed. This approach reflects current ASTM standards and AAI regulations.

Where there is a conflict between the environmental database and AWR's actual knowledge with regard to the distance and direction from the subject property of sites listed on the database, information obtained by AWR from the site reconnaissance was used. Whenever feasible, AWR notes such conflict within the text of the report.

This ESA addresses recognized environmental conditions at the subject property. However, certain conditions, such as those listed below may not be revealed:

1) naturally occurring toxic materials in subsurface soils, rocks, or water, or toxicity of onsite flora;
2) toxicity of substances common in current habitable environments, such as stored household products, building materials, and consumables;
3) biological pathogens;
4) contaminant plume below the depths sampled or from remote source;
5) contaminants or contaminant concentrations that do not violate present regulatory standards, but may violate future standards; and
6) unknown site contamination, such as illegal dumping and/or accidental spillage which may occur following the site visit by AWR.

Opinions and judgments expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions. This document and the information contained herein have been prepared solely for the Client and any reliance on this report by third parties not authorized by the Client shall be at such party's sole risk.

Conducting an AAI Phase I ESA alone does not provide a landowner with protection against CERCLA liability. Landowners who want to qualify as bona fide prospective purchasers or contiguous property owner must comply with all of the statutory requirements identified in CERCLA Section 107(r) and 107(q).

1.5 Special Terms and Conditions

No special terms or conditions were agreed upon for conducting this Phase I ESA.

1.6 User Reliance

As specified in ASTM E 1527-05, Sections 7.5.2 and 7.5.2.1, AWR is not required to independently verify the information provided by the User (Client), obtained from interviews, previous environmental reports, and/or reviewed documents during records review.

2.0 SITE DESCRIPTION

2.1 Site Location

The site address is 1130 Terra Bella, Mountain View, Santa Clara County, California. The site consists of one approximately 0.86 acre parcel. The site is located on the northern side of Terra Bella. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-026.

2.2 Site and Vicinity General Characteristics

The property is in a mixed commercial and light industrial area within the City of Mountain View, California.

2.3 Current and Proposed Use of the Property

The property is improved with a single story building used by DataNet IT as an IT consulting company.

It is our understanding Calvano Development is proposing to purchase the site. No information on proposed use of the property was provided to AWR.

2.4 Description of Structures, Road, and Other Improvements

The site is a single-story rectangular building on an approximately 0.86 acre rectangular parcel.

The remainder of the site is occupied by asphalt parking and driving areas, sidewalks to and around the building, and landscaping near the front of the building.

The site is a rectangular shaped parcel located on the northern side of Terra Bella and is accessed from Terra Bella.

The subject property is connected to the municipal water and sanitary and storm sewer systems.

2.5 Current Uses of the Adjoining Properties

The property is in a mixed use area. West of the site is a residence, east of the site is a office building converted to a school, and the remaining adjacent properties appear to be a mixture of light industrial and commercial uses.

3.0 USER PROVIDED INFORMATION

3.1 Title Records

An Environmental Liens Search was performed by EDR as a part of this Phase I ESA. The lien search, including the most recent grant deed, is included in Appendix J. No additional title information was provided by the user.

3.2 Environmental Liens or Activity and Use Limitations

The Environmental Professional is required to search for Activity and Use Limitations (AULs) if such records are available in *"publicly available lists or registries."* Typical AULs include land use restrictions (LURs), institutional controls (ICs), and Engineering Controls (ECs). Typical ICs include: 1) governmental controls such as zoning; 2) proprietary controls such as covenants or easements; 3) enforcement documents such as orders or consent decrees; and 4) information devices such as land record or deed notices. Typical ECs include: 1) passive measures such as vapor barriers and setbacks; 2) active measures such as remediation systems; and 3) monitoring of passive and/or active measures. According to 40 CFR Part 312.26 (b) (7), ICs are to be investigated on the subject property and according to 40 CFR Part 312.26 (b) (6) and (c) (2) (ii), ECs are to be reviewed to a 0.5 mile radius of the subject property. ASTM 1527-05 recommends that ECs be reviewed only for the subject property.

An Environmental Liens Search was performed for the subject property by EDR. The Environmental Liens Search did not report any environmental liens associated with the subject property.

The client provided AWR with a preliminary title report and within that report was a link to an agreement Establishing Chemical Use Restriction" dated November 7, 2005, executed by and between Terra Bella, Inc. and Archie J. Snider and Randi Snider recorded April 24, 2006, Instrument No. 18898959, of Official Records, which document, among other things, contains or provides for: Terms and conditions as contained therein. This document states:

> "Under the terms of the Purchase Agreement, Grantee and Grantor agreed, as a result of potential liabilities associated with historic environmental contamination of the groundwater in the area of the Property, to restrict the use of certain chemicals found in the groundwater in future operations on the Property in order to limit Grantee and Grantor's future potential liability for such contaminants. NOW THEREFORE, for good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Grantee and Grantor agree as follows·
>
> **1. Restriction.** Grantee and all future owners and occupants of the Property shall not use, generate, store or otherwise have on the Property at any time any product, material, substance or waste containing any more than trace quantities of the following constituents: Tetrachloroethylene, Trichloroethylene, I, 1, I - Trichloroethane, Trans 1,2-Dichlorocthcne or any breakdown constituents of any of the foregoing, except in *de minimus* quantities as part of products used or

consumed in the ordinary course of Grantee's business operations Any and all future owners shall be required to notify any and all occupants of the Property of such restrictions in writing upon commencement of their occupancy. Any owner of the Property who after the date hereof violates the covenants and restrictions contained in this Paragraph I shall defend, indemnify and hold harmless all prior owners of the Property to the extent of any losses, costs, damages or liabilities (including, without limitation, any attorneys and consultants fees) suffered by such prior owner as a result of such breach.

2. **Covenants Running With the Land:** This instrument shall bind and inure to the benefit of Grantor and Grantee and each and all of their respective successors-in-interest, assigns, and transferees of the Property, and the terms and conditions of this instrument shall be "covenants running with the land." As used herein "Grantor" and "Grantee" shall include all such successors-interest, assigns, and transferees. Notwithstanding anything to the contrary contained in this Agreement, upon the date that the purchase money Promissory Note executed by Grantee and payable to Grantor (which promissory note is secured by a Deed Of Trust With Assignment Of Rents dated as of the date hereof encumbering the Property) is paid in full or otherwise satisfied, this Agreement shall be deemed void and of no further force and effect. Following payment of all amounts owed under the promissory note, upon the request of Grantee and/or their successors, Grantor shall execute and deliver a quitclaim deed in recordable form releasing any rights arising under this Agreement."

3.3 Specialized Knowledge

AWR staff while working for O'Brien & Gere Engineers had previously reviewed numerous reports for the subject site in 2007 for a different proposed property transfer. The letter report prepared by O'Brien & Gere is included with the previous reports in Appendix K.

In addition, as described in Section 3.2, the client provided AWR with a deed restriction limiting the use of certain chlorinated solvents at the site.

AWR was not informed of any other specialized knowledge associated with the subject property or the area in the vicinity of the subject property.

3.4 Commonly Known or Reasonably Ascertainable Information

AWR was did not discover any commonly known or reasonable ascertainable information associated with the subject property or the area in the vicinity of the subject property.

3.5 Valuation Reduction for Environmental Issues

AWR was not provided with purchase price information.

3.6 Owner, Property Manager, and Occupant Information

The property is currently owned SpRK LLC, who has owned the property since 2006.

The property is occupied by DataNet IT, and IT consulting company.

No property manager was identified to AWR.

3.7 Reason for Performing the Phase I ESA

AWR has performed this Phase I ESA in preparation of a proposed property transfer.

3.8 Previous Reports

AWR was provided with the text of a Phase I ESA prepared for the current site occupant in 2011 and a report summarizing groundwater well sampling from 2005. Copies of these reports are included in Appendix K.

The 2005 Toxichem report stated:

> "This letter has been prepared to complement and summarize the findings of the *Report for One Episode of Groundwater Monitoring* at the above referenced site, Sierra Environmental, Inc (Sierra), July 8, *2005].*
>
> The Sierra report presented a brief background of the site referencing *Preliminary*
> *Environmental Assessment and Groundwater Investigation* prepared by Aqua Terra Technologies, Inc. (ATT), September 7, 1988. The report indicated that the site was agricultural land during the 1950s, then utilized as a plaster contractors yard and private residence during the 1970's and finally developed in 1982 as Sharp·Industrial Park, a research and development facility and warehouse for Mesa Technology. The ATT report did indicate that the City of Mountain View Hazardous Materials Management Plan (HMMP) during site use: by Mesa Technology listed the storage of acids, caustic alkaline cleaner, cyanide, photo stripper, and flammable solvents. Additionally, industrial wastewa1er was treated on-site in a concrete sump, which according to Mesa Technology was for the neutralization of corrosives and acids under permit from the City of Mountain View.

In November, 1989 the concrete sump was removed and two soil samples were collet~. Based on the analytical results of .soil sampling, wipe sampling of hazardous materials storage, site walk-through and the proper manifest documentation for the removal of the concrete and soil; the City of Mountain View Fire Department, Hazardous Materials Division granted closure of the facility on December 20, 1989.

The ATT report also documented the installation and sampling of three groundwater monitoring wells at the site in August 1988. Groundwater was observed between 1.8 and 13 .4 feet below ground surface with a flow toward the northwest at a gradient of 0.012. Groundwater was initially analyzed for volatile organic compound& (VOCs by EPA Method 624) for semi-volatile organic compounds (SVOC; base/neutrals and acids by .EPA 625) and the Title 22 Priority Pollutant Metals. No SVOC compounds were reported above the method detection limits. Total metals were detected in the groundwater, however the A TI report suggested that the concentrations above the Maximum Contaminant Levels (MCL 's) for drinking water were likely due to the sorption of metals *to* soil particles suspended in the groundwater.

The Sierra report presented the groundwater analytic data provided in the original ATT report; however the VOC analytical results were subsequently re-issued by the laboratory (ETC-Multi-Tech) on September 8, 1988 due to issues of recalibration. Therefore, the amended groundwater analytical results for the VOC analyses are summarized below.

Trichloroethene (TCE) was detected in all three wells at the site during the August 31, 1988 sampling event; MW-I (1611&'L). MW-2 (300 µg/.L) and upgradient Well MW-3 (40 µg/L). Trans-1,2-Dicbloroethene (trans-l,2·DCE) was detected in Well MW-2 at 19 µg/L and upgradient Well MW-3 at *6* µg/L.

On June 27, 2005 Sierra performed a subsequent groundwater monitoring event on the three wells at the site. Groundwater was gauged at between 7.69 and 9.31 feet below the top of casing elevations and flowed to the northwest at a shallow gradient of approximately 0.004. TCE was detected in all three wells at similar concentrations ranging from 33 to *46* µg/L. Additionally, cis-1,2-DCE (a chlorinated transformation product of TCE) was detected in all the wells at concentrations ranging tram 5.2 to *9.0* µg/L. Trans-1,,2-DCE was only detected in upgradient Well MW-3 at 0.64 µg/L. No total petroleum hydrocarbons as gasoline or as diesel were detected in the three wells sampled. Methyl tertiary butyl ether was only detected in Well MW-1 at a concentration of 1.2 µg/L.

The most recent groundwater monitoring data indicates that TCE (in all wells) and cis-1,2-DCE (in Wells MW-1 and MW-3) arc above the respective Environmental Screening Levels (ESLs) where groundwater is a current or potential source of drinking water. The site is located proximal and lateral to or downgradient to many known sources of solvents released to groundwater

The upgradient well (Well MW-3) during the June 27, 200S monitor event contained the highest site concentrations for TCE (46 µg/L), cis-1.2-DCE (9.0 ug/L) and the only detected concentration of trans-1,2-DCE (0.64 ug/L). Therefore, even though limited drum storage of solvents was documented historically suggest the possibility for a source to exist at the site, it is likely that the current concentrations of TCE, cis-1,2-DCE and trans-1,2-DCE reported in the groundwater wells are predominantly from an upgradient, off-site source."

The 2011 Phase I concluded:

"Several documents were reviewed by ODIC pertaining to the previous occupants of the subject property (Olin Mesa Corporation and Mesa Technology). According to the documents, the facility operated under a hazardous materials management plan under the oversight of the Mountain View Fire Department. A wastewater treatment system and sump were located on the northern end of the property (outside of the building) and operated under continuous monitoring and secondary containment. Water and caustic were transferred from the onsite machinery to the outdoor sump. The sump carried the solution via aboveground piping to the aboveground treatment tank, which was also located outside of the building. Treated water was discharged to sewer under an industrial wastewater permit. The tanks reportedly all had secondary spill containment and interstitial sensors which were inspected daily.

The tanks and sump were removed from the property in October 1989 under the oversight of the Mountain View Fire Department. Soil and groundwater beneath the sump area was sampled and analyzed for copper. Analytical results indicated concentrations of copper in soil at 340 mg/kg. A groundwater investigation conducted at the site in September 1988 detected a number of groundwater contaminants including unspecified metals, TCE, DCE, and MtBE. However, the Mountain View Fire Department concluded that since DCE was never used by the site occupant, only research quantities of TCE were used at the site, and both chemicals were detected in an upgradient well, these chemicals were from an off-site source. Mountain View Fire Department concluded that after remediation (removal of sump, tanks, and associated concrete and soil) the site did not pose an environmental risk or health risk. Soil and concrete associated

with the sump area were removed offsite under waste manifest and disposed at the Waste Management landfill in Kettleman City, CA on November 14, 1989.

There is no information regarding the depth of the soil sample or the sampling procedure for either soil or groundwater in the documents reviewed by ODIC. The concentration of copper in soil (340 mg/kg) is above the current environmental screening level (SF RWQCB ESLs) in shallow soils of 230 mg/kg. No delineation of the lateral or vertical extent of copper contamination was performed according to the documents reviewed by ODIC so it is unclear whether or not the surrounding soil has been affected.

The presence of copper contamination in the subsurface soil, the presence of TCE, metals, DCE, and MtBE in groundwater, and data gaps associated with the former sump removal (unknown depth of sample, unknown analyses performed, unknown location of sample, no delineation of the lateral or vertical extent of contamination, unknown soil/groundwater sampling procedure) represent Recognized Environmental Conditions (RECs).

As discussed in section 3.3, current AWR staff working for O'Brien & Gere Engineers had previously reviewed reports for this site for a previous proposed property transfer. The O'Brien & Gere summary letter is included in Appendix K. The letter concluded:

O'Brien & Gere is presenting herein the results of our environmental data review of the documents you presented to us. The following is a list of the documents we reviewed:

- TOXICHEM Management Systems, Inc., Groundwater Monitoring Report 1130 Terra Bella Avenue, Mt. View, CA; dated September 19, 2005, Project TS-01.lA
- Sierra Environmental, Inc., REPORT FOR ONE EPISODE OF GROUNDWATER MONITORING, 1130 Terra Bella avenue, Mt. View, CA; July 8, 2005, Project 05-173.01
- City of Mt. View Hazardous Materials Division letter; dated December 20,1989, Re: 1130 terra Bella avenue, Mt. View
- Grubb & Ellis letter dated July 21, 1988, Re: 1130 Terra Bella Avenue, Mt. View
- Aqua Terra Technologies Consulting Engineers, Preliminary Environmental Assessment and Groundwater Investigation (No attachments) for 1130 Terra Bella Avenue, Mt. View, CA, September 7, 2005
- Olin Mesa Corporation, October 14, 1988, Re: 1130 Terra Bella Avenue, Mt. View, CA

- Aqua Terra Technologies Consulting Engineers, December 30, 1988, Re: Disposal of contaminated Groundwater 1130 Terra Bella Avenue, Mt. View, CA
- Aqua Terra Technologies Consulting Engineers, September 19, 1988, Re: Laboratory Data and Well Permits, 1130 Terra Bella avenue, Mt. view, CA
- Levine-Fricke, Computer Modeling of Recommended Alternative for the North Bayshore Area, July 29, 1987, file No. L-F 1709
- California RWQCB, Cleanup and Abatement order No. 86-011, Teledyne Semiconductor, Mt. View, CA
- SANTA CLARA COUNTY PRIVATE WELL SAMPLING PROGRAM, FINAL REPORT, Santa Clara County Health Department, January 1986.

The aforementioned documents address groundwater sampling that has occurred at the subject site and surrounding properties that have been identified as having environmental impairments. Three monitoring wells were installed at the site in August 1988 to evaluate the potential for the site to have been a contributor to the regional groundwater in the area. Documents indicate that volatile organic compounds have been stored at the site in the past. In 1989 the Mt. View Fire Department granted Olin Mesa Corporation facility closure with regards to all of the hazardous materials stored and used at the site.

The most recent grounding water sampling and analysis was performed on July 27, 2005. All groundwater samples were analyzed for VOCs using EPA Method 8260B. The laboratory results indicated the presence of TCE and cis-1, 2-DCE at respective concentrations of 46 ug/L and 9.0 ug/L. These results were from up gradient well sample MW-3. These values are above the current Environmental Screening Levels (ESLs) where groundwater is a potential source of drinking water (Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, RWQCBSF Bay Region, Interim Final-February 2005, Table 1). These values were the highest detected in the water samples collected from the site. Since these test results represent the upgradient groundwater contaminant values, it is likely that the source of the VOC contamination is from an upgradient, offsite source."

The area around the subject site has numerous identified businesses that have had chemical or hazardous material releases. These sites are in various phases of investigation or remediation. None of the documents we reviewed identified the subject site as being an agency listed site. Even though the site has a history of hazardous materials usage, it appears that there has been no identified release of hazardous materials onto the site. The groundwater contamination detected in the onsite monitoring wells appears to be the result of the migration of VOCs from an upgradient, off-site source.

4.0 RECORDS REVIEW

The government environmental agency databases AWR reviewed are listed on pages 4 through 7 of the Map Findings Summary of the database obtained from Environmental Data Resources, Inc. (EDR), included as Appendix C. Please refer to the EDR report in Appendix C for additional information on the searched databases including the full names of the databases, the regulatory agency overseeing the databases, a summary of the types of facilities listed on each database, and the dates the information was obtained from the regulatory agencies. Where locations and distances reported by EDR were observed to be incorrect, AWR amended the information to provide a more accurate assessment.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database. Information from these sources for the subject site is included in Section 4.1.1. Information on nearby releases is included in Section 4.1.2.

4.1 Standard Environmental Record Sources

4.1.1 Subject Property

The site address was listed on the CA EMI database as Olin Mesa Corporation and the RCRA-SQG and FINDS databases. These databases are for facilities operating with appropriate environmental permits and are not indicative of a release or material mishandling. .

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database.

Mountain View Fire Department

AWR reviewed files for the site at the Mountain View Fire Department. The Mountain View Fire Department is the Certified Unified Program Agency (CUPA) for properties in Mountain View. As a CUPA, the Mountain View Fire Department is responsible for implementing the following programs: Above Ground Storage Tanks, California Accidental Release Prevention Program (CalARP), Hazardous Materials Management Plans/Business Plans, Hazardous Waste Generator, On Site Treatment of Hazardous Wastes, and Underground Storage Tanks.

The Mountain View Fire Department records of hazardous material use by Olin Mesa Corporation as well as information on a former neutralization sump (treated as a tank) and the soil and groundwater sampling reports described elsewhere within this report. Other than Olin

Mesa/Mesa Technologies, none of the current or other former site occupants appeared to have used regulated amounts of hazardous materials and none of the other occupants appear to have operated any tanks at the subject site.

Santa Clara County Environmental Health Department

AWR reviewed files at the Santa Clara County Environmental Health Department Leaking Underground Storage Tank Oversight Program (LUSTOP). There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

California Department of Toxic Substance Control

AWR reviewed files at the California Department of Toxic Substance Control Envirostor database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

Regional Water Quality Control Board

AWR reviewed files at the Regional Water Quality Control Board Geotracker database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

US EPA Region 9

AWR reviewed files available online for the US Environmental Protection Agency (EPA) Region 9 Superfund sites. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

4.1.2 Offsite Listings

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs). Based on this inferred groundwater flow direction, offsite listings that are adjacent to or south of the subject site have the greatest potential to impact the subject site. The sites of note are discussed below:

- There are six federal national priority list (NPL) sites, also known as Superfund sites, within one mile of the site including two which are within ¼-mile of the site. The NPL listings are Moffett Naval Air Station, Intel Corp (Mountain View Plant) Teledyne Semiconductor, Spectra-Physics, Inc., Jasco Chemical Corp., and CTS Printex, Inc. The NPL listings are primarily for releases of solvents and several of the plumes are mingled. In addition, there are several state-overseen releases that have contributed to the regional impacts. AWR reviewed information in the EDR report as well as additional information obtained from EPA Region 9, California DTSC, and the RWQCB. Based on

our review of the information, the site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area. It appears that the intermingled plumes are primarily west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes.

- Shippen Property at 1175 Terra Bella was identified on the CA HIST CORTESE, CA LUST and CA HIST LUST databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Monitoring wells were installed on the property adjacent to the site to the east and on the source property southwest of the subject site. No sampling appears to have been done on the subject site but based on the sampling results on the adjacent properties, it is possible the groundwater of soil gas at the site were impacted by this release. The subject site was never named as a possible source of the impacts and the source release has been closed since 2001. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency.

- Texaco (CVX #21-1179) at 975 Shoreline Blvd (formerly known as Sterlin Road) was identified on the CA LUST and CA HIST LUST databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Monitoring wells were installed on the property adjacent to the site to the northwest and the southwest in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southeast corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the wells near the subject site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. No sampling appears to have been done on the subject site but based on the sampling results on the adjacent properties; it is possible the groundwater of soil gas at the site were impacted by this release. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a Historical Recognized Environmental Condition (HREC) since the impacts have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency.

- Robb-Jack Corp. at 1080 Linda Vista was identified on the CA LUST and CORTESE databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Based on our review of the information, groundwater impacts appear to have been minimal and it does not appear that this release impacted the subject site. The release was closed in 1996 indicating no additional investigation or remediation is required.

Based on the distance, direction, and/or nature of the remaining listings, in our opinion, none of the other listings are likely to impact the subject site.

4.1.3 Other Sites of Potential Environmental Concern

AWR did not identify any other sites of environmental concern. AWR reviewed the sites in the EDR Database that were unable to be mapped. None of the listings appeared to correspond to the site or adjacent properties. None of the listings appear likely to have the potential to impact the site.

4.2 Additional Environmental Record Sources

AWR reviewed information on this site from the Mountain View Fire Department, the California Department of Toxic Substance Control (DTSC) Envirostor database, the Santa Clara County Environmental Health Department LUSTOP program, the California Geotracker Database, and US EPA. Information from these sources for the subject site was discussed in Section 4.1.1. Information from these sources on the nearby properties was included in Section 4.1.2.

4.3 Physical Setting Sources(s)

The EDR Report in Appendix C indicates that the underlying hard rock geology consists of Cenozoic Quaternary stratified sequence. Surface soils in the vicinity of the site are classified by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS) as Botella clay loam.

Based upon a review of groundwater monitoring data collected at the site and nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north to northwest and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs).

Current site-specific information on groundwater flow direction, depth, and quality can only be confirmed through the installation and survey of a minimum of three on-site groundwater-monitoring wells, which was beyond the scope of this assessment.

According to the 1999 USGS Mountain View, California Quadrangle Map, the site elevation is approximately 36 feet above mean sea level with a slight regional topographic slope downward to the north.

4.4 Historical Use Information on the Property

AWR reconstructed a brief history of the subject property through a review of historical Topographic Maps; the EDR City Abstract; available records, permits and other documents available at Santa Clara County; and historical aerial photographs provided by EDR. A summary of historical sources can be found in Section 12.0 of this Report with pertinent documents available in Appendices.

According to historical sources, the subject property appears to have been used as agricultural fields in 1939 and Pennell Plastering and a residence from at least 1948 until the late 1970s. The current building was reportedly constructed in 1983 and the remainder of the property was improved similar to its current configuration. .

The site was operated as Olin Mesa which later became Mesa Technology until 1989. The site appears to have been used by various occupants including Products. The site has been occupied by DataNet, the current occupant, since 2005.

The building appears to have been used primarily as offices since its initial construction.

4.5 Historical Use Information on Adjoining Properties

The surrounding properties were primarily agricultural fields until being developed with light industrial development in the 1960s and early 1970s.

5.0 SITE RECONNAISSANCE

The goal of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the subject property. The subject property is visually observed and any structures located on the property are observed to the extent not obstructed by bodies of water, adjacent buildings, and/or other obstructions.

5.1 Methodology and Limiting Conditions

The exterior site reconnaissance was performed by walking open areas of the property in a grid fashion. Special attention was given to observe surfaces adjacent to the structures and sidewalks, surfaces in storage areas, and potential conduits to the subsurface such as drains and sumps. The interior site reconnaissance was performed by systematically observing each room and open space

of the property. Additional attention was given to doors, utility rooms, storage areas, areas where hazardous materials were used or stored, and any other accessible areas.

5.2 General Site Setting

On December 13, 2013, Ms. Janelle Amendola of AWR conducted a site reconnaissance at the subject property. Ms. Amendola was unaccompanied during the site visit.

5.3 Exterior Observations

The majority of the site is occupied by the building and asphalt parking and drive areas west of the building with landscaping near the front of the building and rear of the site. The eastern side of the building is the eastern property boundary

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Interior Observations

The site building is primarily an office building with research and development (R&D) space in the northern portion of the building (used for computer assembly).

Currently, the building is occupied by DataNet, Inc., a computer IT Service Company that supplies custom computer networking services, software, and hardware customization. DataNet, Inc. does not use or generate any hazardous materials/wastes at the subject property.

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Non-Scope Items

The following non-scope items were included as part of this Report based on readily available information that was reviewed.

5.4.1 Suspect Asbestos Containing Building Materials and Lead-Based Paint

Based on the age of the buildings, there is a potential that asbestos containing materials and/or lead based paint have been used at the site. A full survey has been completed by AWR and will be forwarded under separate cover.

5.4.2 Radon

No radon survey was conducted. According to the EDR report, Santa Clara County is in zone 2, indicating the average indoor level is between 2 and 4 picocuries per liter (pCi/L). The US Environmental Protection Agency (USEPA) action level is 4 pCi/L.

6.0 INTERVIEWS

6.1 Interview with Owner Representative

No site owner representative was identified.

6.2 Interview with Site Manager

No Site Manager was identified.

6.3 Interviews with Occupants

AWR conducted informal interviews with the site occupants during the site reconnaissance. Given that the current occupants only use the building for offices, formal interviews were not conducted.

6.4 Interviews with Local Government Officials

AWR reviewed information from the Mountain View Fire Department, the Santa Clara County Environmental Health Department, the San Francisco Bay Regional Quality Control Board, and the California Department of Toxic Substance Control. Information from these requests is presented elsewhere throughout this report.

6.5 Interviews with Others

AWR did not perform any interviews with others regarding the subject property.

7.0 FINDINGS

Three monitoring wells were installed at the site in August 1988 to evaluate the potential for the site to have been a contributor to the regional groundwater in the area. Documents indicate that volatile organic compounds have been stored at the site in the past. In 1989 the

Mt. View Fire Department granted Olin Mesa Corporation facility closure with regards to all of the hazardous materials stored and used at the site.

The most recent grounding water sampling and analysis was performed on July 27, 2005. All groundwater samples were analyzed for VOCs using EPA Method 8260B. The laboratory results indicated the presence of TCE and cis-1, 2-DCE at respective concentrations of 46 ug/L and 9.0 ug/L. These results were from up gradient well sample MW-3. These values are above the current Environmental Screening Levels (ESLs) where groundwater is a potential source of drinking water (Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, RWQCBSF Bay region, Interim Final-February 2005, Table 1). These values were the highest detected in the water samples collected from the site. Since these test results represent the upgradient groundwater contaminant values, it is likely that the source of the VOC contamination is from an upgradient, offsite source."

The area around the subject site has numerous identified businesses that have had chemical or hazardous material releases. These sites are in various phases of investigation or remediation. None of the documents we reviewed identified the subject site as being an agency listed site. Even though the site has a history of hazardous materials usage, it appears that there has been no identified release of hazardous materials onto the site. The groundwater contamination detected in the onsite monitoring wells appears to be the result of the migration of VOCs from an upgradient, off-site source.

The source of the chlorinated solvent impacts has never been conclusively determined, The unresolved impacts, regardless of whether the source is on or off of the site, are a recognized environmental condition as defined in the ASTM standard practice.

A deed restriction prohibiting the use of chlorinated solvents at the site was recorded in 2005.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

7.1 Data Gaps

AWR was not able to review a Chain of Title Report for the subject property. It is AWR's opinion that the lack of this information does not pose a significant data gap, as an environmental lien search was performed for the subject property and revealed no issues.

AWR was also not able to interview past occupants or current or past owners. Given the well documented use of the site from other sources, in our opinion, this is not a significant data gap.

7.2 Continuing Obligations

Continuing obligations start on the date that a landowner acquires title to a property. The landowner must: 1) comply with land use restrictions and institutional controls; 2) take "reasonable" steps with respect to hazardous substances releases; 3) provide full cooperation, assistance and access to persons that are authorized to conduct response actions or natural resource restoration; 4) comply with information requests and administrative subpoenas; and 5) provide all legally required notices. Continuing obligations must be satisfied to maintain liability protection under CERCLA for innocent landowners, bona fide prospective purchasers, and contiguous property owners.

AWR identified no ongoing continuing obligations for the subject site.

8.0 OPINION

The source of the chlorinated solvent impacts has never been conclusively determined. The unresolved impacts, regardless of whether the source is on or off of the site, are a recognized environmental condition as defined in the ASTM standard practice.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

The potential for asbestos and/or lead based paint in the building materials at the site is not a REC but must be managed appropriately.

No other potential RECs were identified in conjunction with the site.

9.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 of 1130 Terra Bella, Mountain View, Santa Clara County, California, the subject property. Any exceptions to, or deletions from, this practice are described in Section 5.1 of this Report.

This assessment has revealed no evidence of Recognized Environmental Conditions in connection with the subject property, except the following:

Three monitoring wells were installed at the site in August 1988 to evaluate the potential for the site to have been a contributor to the regional groundwater in the area. Documents indicate that volatile organic compounds have been stored at the site in the past. In 1989 the Mt. View Fire Department granted Olin Mesa Corporation facility closure with regards to all of the hazardous materials stored and used at the site.

The most recent grounding water sampling and analysis was performed on July 27, 2005. All groundwater samples were analyzed for VOCs using EPA Method 8260B. The laboratory results indicated the presence of TCE and cis-1, 2-DCE at respective concentrations of 46 ug/L and 9.0 ug/L. These results were from up gradient well sample MW-3. These values are above the current Environmental Screening Levels (ESLs) where groundwater is a potential source of drinking water (Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, RWQCBSF Bay region, Interim Final-February 2005, Table 1). These values were the highest detected in the water samples collected from the site. Since these test results represent the upgradient groundwater contaminant values, it is likely that the source of the VOC contamination is from an upgradient, offsite source."

The area around the subject site has numerous identified businesses that have had chemical or hazardous material releases. These sites are in various phases of investigation or remediation. None of the documents we reviewed identified the subject site as being an agency listed site. Even though the site has a history of hazardous materials usage, it appears that there has been no identified release of hazardous materials onto the site. The groundwater contamination detected in the onsite monitoring wells appears to be the result of the migration of VOCs from an upgradient, off-site source.

The source of the chlorinated solvent impacts has never been conclusively determined. The unresolved impacts, regardless of whether the source is on or off of the site, are a recognized environmental condition as defined in the ASTM standard practice.

A deed restriction prohibiting the use of chlorinated solvents at the site was recorded in 2005.

Based on the age of the building, there is a potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation. AWR is conducting an asbestos and lead based paint survey at the subject site and the results will be submitted under separate cover. Please refer to that report for information and recommendations for asbestos and lead-based paint at the subject site.

10.0 DEVIATIONS

AWR did not evaluate the purchase price versus property value as AWR is not qualified to evaluate this issue.

11.0 ADDITIONAL SERVICES

AWR has also completed asbestos and lead sampling at the subject site. The results of that were presented under separate cover. No other additional services were performed in conjunction with this Phase I ESA.

AGREEMENT ESTABLISHING CHEMICAL USE RESTRICTION

THIS AGREEMENT ESTABLISHING CHEMICAL USE RESTRICTION ("**Agreement**") is dated as of November 7th 2005, and is made by and between Terra Bella, Inc., a California corporation, whose address is 19776 Oakhaven Drive, Saratoga, CA 95070, and Archie J. Snider and Randi Snider, husband and wife, whose address is 3565 Victor Street, Suite F, Santa Clara, CA 95124 (jointly and severally and collectively, "Grantor"), and * , (joint and severally and collectively, "Grantee"). *Data Answers, Inc., a California corporation, whose address is 1130 Terra Bella, Mountain View, CA 94043

RECITALS

A. Grantee and Grantor entered into that certain Agreement for Purchase and Sale of Real Property dated as of **September 2005 (the "**Purchase Agreement**") for property located at 1130 Terra Bella Avenue, Mountain View, California.*** **September 30th, ***shown as Exhibit "A" attached hereto and made a part hereof.

B. Under the terms of the Purchase Agreement, Grantee and Grantor agreed, as a result of potential liabilities associated with historic environmental contamination of the groundwater in the area of the Property, to restrict the use of certain chemicals found in the groundwater in future operations on the Property in order to limit Grantee and Grantor's future potential liability for such contaminants.

NOW THEREFORE, for good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Grantee and Grantor agree as follows:

AGREEMENTS

1. **Restriction.** Grantee and all future owners and occupants of the Property shall not use, generate, store or otherwise have on the Property at any time any product, material, substance or waste containing any more than trace quantities of the following constituents: Tetrachloroethylene, Trichloroethylene, 1,1,1 –Trichloroethane, Trans 1,2-Dichloroethene or any breakdown constituents of any of the foregoing, except in *de minimis* quantities as part of products used or consumed in the ordinary course of Grantee's business operations Any and all future owners shall be required to notify any and all occupants of the Property of such restrictions in writing upon commencement of

their occupancy. Any owner of the Property who after the date hereof violates the covenants and restrictions contained in this Paragraph 1 shall defend, indemnify and hold harmless all prior owners of the Property to the extent of any losses, costs, damages or liabilities (including, without limitation, any attorneys and consultants fees) suffered by such prior owner as a result of such breach.

2. **Covenants Running With the Land**: This instrument shall bind and inure to the benefit of Grantor and Grantee and each and all of their respective successors-in-interest, assigns, and transferees of the Property, and the terms and conditions of this instrument shall be "covenants running with the land." As used herein "Grantor" and "Grantee" shall include all such successors-in-interest, assigns, and transferees. Notwithstanding anything to the contrary contained in this Agreement, upon the date that the purchase money Promissory Note executed by Grantee and payable to Grantor (which promissory note is secured by a Deed Of Trust With Assignment Of Rents dated as of the date hereof encumbering the Property) is paid in full or otherwise satisfied, this Agreement shall be deemed void and of no further force and effect. Following payment of all amounts owed under the promissory note, upon the request of Grantee and/or their successors, Grantor shall execute and deliver a quitclaim deed in recordable form releasing any rights arising under this Agreement.

3. **Execution in Counterparts**: This Agreement may be executed in one or more counterparts, each of which, when so executed, shall be deemed an original. Such counterparts shall together constitute one and the same instrument.

4. **Entire Agreement**. This Agreement shall constitute the entire agreement between the parties with regard to the subject matter of this Agreement, and shall supersede all other agreements respecting the subject matter of this Agreement.

Attn: Mark Calvano

Re: Phase I Environmental Site Assessment
1091 North Shoreline
Mountain View, CA

Dear Mr. Calvano:

Thank you for providing Applied Water Resources Corporation (AWR) the opportunity to assist you in identifying the environmental issues at 1091 North Shoreline, in Mountain View, California.

The site is a 1.8527 acre irregularly shaped parcel with a triangular-shaped two story multiple tenant office building. The building was constructed in approximately 1980. Interstate 101 was constructed north of the site between 1956 and 1965. In the 1956 aerial photograph, the site appears to have been partially occupied by the western part of a large building that extended north and west of the current site boundaries. Prior to this, the site appears to have been used as orchards and agricultural and residential structures since at least 1939.

The property is operated as an office building. Other than shared open spaces, OnLive, an online software company occupies the first floor, HUB Insurance occupies approximately 2/3 of the second floor, Agilone occupies the remainder of the second floor.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard and smaller releases closer to the site. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the buildings, there is a low potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

AWR looks forward to working with you on this project. Please contact me at 408.496.0801 or at kprice@erscorp.us if you have any questions or comments.

Best Regards
APPLIED WATER RESOURCES CORPORATION

PHASE I ENVIRONMENTAL SITE ASSESSMENT

1091 North Shoreline
Mountain View, California

April 25, 2014

Prepared For:

Calvano Development
900 Bush Street, Penthouse 1
San Francisco, CA 94109

APPLIED WATER RESOURCES

EXECUTIVE SUMMARY

Consultant:	Applied Water Resources Corporation (AWR)
Subject Property:	1091 North Shoreline, Mountain View, California
Client:	Calvano Development
Location:	The site is located on the western side of North Shoreline south of the on-ramp for interstate 101 in Mountain View, California.
Current Use:	The site has one building with three tenants and is primarily used for offices. The property is operated as an office building. Other than shared open spaces, OnLive, an online software company occupies the first floor, HUB Insurance occupies approximately 2/3 of the second floor, Agilone occupies the remainder of the second floor.
Current Owner:	The property is currently owned by JW Equties LLC.
Site Characteristics:	The site is a 1.8527 acre irregularly shaped parcel with a triangular-shaped two story multiple tenant office building. The building was constructed in approximately 1980. Interstate 101 was constructed north of the site between 1956 and 1965. In the 1956 aerial photograph, the site appears to have been partially occupied by the western part of a large building that extended north and west of the current site boundaries. Prior to this, the site appears to have been used as orchards and agricultural and residential structures since at least 1939.
Vicinity Characteristics:	The property is in a mixed use area with commercial, residential, and light industrial uses within the City of Mountain View, California.
Purpose:	This Phase I Environmental Site Assessment (ESA) was performed to (1) identify any recognized environmental conditions (RECs), and (2) permit a user to satisfy one of the requirements to qualify for the innocent landowner defense under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability protection (42 U.S.C. §9601). All components of this ESA were performed or overseen by Environmental Professionals as defined in the All Appropriate Inquiries (AAI)

Standard and the American Society for Testing and Materials (ASTM) E 1527-05.

Conclusions:

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard and smaller releases closer to the site. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the buildings, there is a low potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

1.0 INTRODUCTION

On behalf of Calvano Development (hereinafter referred to as the "Client"), Applied Water Resources Corporation (AWR), performed a Phase I Environmental Site Assessment (ESA) of the property located at 1091 North Shoreline, Mountain View, Santa Clara County, California (hereinafter referred to as the "subject property").

1.1 Purpose

This ESA was performed to provide a record of the site conditions at the subject property and to evaluate what, if any, recognized environmental conditions exist at this site. Additional goals of this ESA are to identify recognized environmental conditions (RECs) from current and historical practices on the subject property and surrounding area and to assist the Client to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability.

1.2 Detailed Scope of Services

The following tasks were performed in accordance with the Scope of Services.

- Visual site inspection of the subject property to investigate for recognized environmental conditions. AWR is not responsible for inspecting areas covered by parked vehicles, overgrown vegetation, and other obstacles preventing access.

- A historical review of the use and improvements of the subject property through a review of aerial photographs, historical topographic maps, city directories, fire insurance maps, title reports, and/or building department records.

- A review of available geologic and hydrogeologic literature concerning the property and surrounding area.

- Interviews of persons familiar with the history of the subject property, including key site managers, owners, tenants, past tenants, and/or previous owners.

- Review of appropriate federal, state, and local regulatory agencies to reveal known hazardous wastes sites or significant leaks or spills of hazardous materials that may have occurred at the subject property and immediate vicinity.

- Interviews with applicable local agencies familiar with the areas in the vicinity of the subject property such as local fire departments, health departments, Regional Water Quality Control Board, and/or other local government agencies.

1.3 Significant Assumptions

No significant assumptions were made during this Phase I ESA.

1.4 Limitations and Exceptions of Agreement

AWR has performed the services for this project in accordance with our proposal, and within the current standards of the American Society for Testing and Materials (ASTM 1527-13) for Phase I Environmental Site Assessments and the standards for All Appropriate Inquiries (AAI) approved by the Federal Environmental Protection Agency. Except for the representations set forth in this Phase I ESA, no other representations, guarantees, or warrantees are either expressed or implied. A record search was limited to reasonably ascertainable information that could be obtained within 20 calendar days.

The review was limited to a search for RECs at the subject property. The term REC means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

There is no investigation that is thorough enough to preclude the presence of hazardous materials that presently, or in the future, may be considered hazardous at the site. Because regulatory evaluation criteria are constantly changing, concentrations of contaminants presently considered low may, in the future, fall under more stringent regulatory standards that require remediation.

The Site Reconnaissance was limited to visual observation of surface conditions at the subject property. Interviews with public agency personnel were conducted. Reasonably ascertainable information was reviewed. This approach reflects current ASTM standards and AAI regulations.

Where there is a conflict between the environmental database and AWR's actual knowledge with regard to the distance and direction from the subject property of sites listed on the database, information obtained by AWR from the site reconnaissance was used. Whenever feasible, AWR notes such conflict within the text of the report.

This ESA addresses recognized environmental conditions at the subject property. However, certain conditions, such as those listed below may not be revealed:

1) naturally occurring toxic materials in subsurface soils, rocks, or water, or toxicity of onsite flora;
2) toxicity of substances common in current habitable environments, such as stored household products, building materials, and consumables;
3) biological pathogens;
4) contaminant plume below the depths sampled or from remote source;
5) contaminants or contaminant concentrations that do not violate present regulatory standards, but may violate future standards; and
6) unknown site contamination, such as illegal dumping and/or accidental spillage which may occur following the site visit by AWR.

Opinions and judgments expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions. This document and the information contained herein have been prepared solely for the Client and any reliance on this report by third parties not authorized by the Client shall be at such party's sole risk.

Conducting an AAI Phase I ESA alone does not provide a landowner with protection against CERCLA liability. Landowners who want to qualify as bona fide prospective purchasers or contiguous property owner must comply with all of the statutory requirements identified in CERCLA Section 107(r) and 107(q).

1.5 Special Terms and Conditions

No special terms or conditions were agreed upon for conducting this Phase I ESA.

1.6 User Reliance

As specified in ASTM E 1527-13, Sections 7.5.2 and 7.5.2.1, AWR is not required to independently verify the information provided by the User (Client), obtained from interviews, previous environmental reports, and/or reviewed documents during records review.

2.0 SITE DESCRIPTION

2.1 Site Location

The site address is 1091 North Shoreline, Mountain View, Santa Clara County, California. The site consists of one approximately 1.8527 acre parcel. The site is located on the western side of North Shoreline south of the on-ramp for interstate 101 in Mountain View, California. The site is referenced as Santa Clara County Assessor's Parcel Number 153-15-028.

2.2 Site and Vicinity General Characteristics

The property is in a mixed use area with commercial and light industrial uses adjacent to the site within the City of Mountain View, California.

2.3 Current and Proposed Use of the Property

The property is improved with an office building with three tenants. Other than shared open spaces, OnLive, an online software company occupies the first floor, HUB Insurance occupies approximately 2/3 of the second floor, Agilone occupies the remainder of the second floor.

It is our understanding Calvano Development is proposing to purchase the site. No information on proposed use of the property was provided to AWR.

2.4 Description of Structures, Road, and Other Improvements

The site is a 1.8527 acre parcel with a two-story triangular office building. The building was constructed in approximately 1980.

The site is an irregularly shaped parcel located on the eastern side of North Shoreline south of the on-ramp for Interstate 101 and is accessed from North Shoreline.

2.5 Current Uses of the Adjoining Properties

The property is in a mixed use area. Adjacent properties appear to be a mixture of light industrial and commercial uses.

3.0 USER PROVIDED INFORMATION

3.1 Title Records

An Environmental Liens Search was performed by EDR as a part of this Phase I ESA. The lien search, including the most recent grant deed, is included in Appendix J. No additional title information was provided by the user.

3.2 Environmental Liens or Activity and Use Limitations

The Environmental Professional is required to search for Activity and Use Limitations (AULs) if such records are available in *"publicly available lists or registries."* Typical AULs include land use restrictions (LURs), institutional controls (ICs), and Engineering Controls (ECs). Typical ICs include: 1) governmental controls such as zoning; 2) proprietary controls such as covenants or easements; 3) enforcement documents such as orders or consent decrees; and 4) information devices such as land record or deed notices. Typical ECs include: 1) passive measures such as vapor barriers and setbacks; 2) active measures such as remediation systems; and 3) monitoring of passive and/or active measures. According to 40 CFR Part 312.26 (b) (7), ICs are to be investigated on the subject property and according to 40 CFR Part 312.26 (b) (6) and (c) (2) (ii), ECs are to be reviewed to a 0.5 mile radius of the subject property. ASTM 1527-05 recommends that ECs be reviewed only for the subject property.

An Environmental Liens Search was performed for the subject property. The Environmental Liens Search did not report any environmental liens associated with the subject property.

3.3 Specialized Knowledge

AWR was not informed of any specialized knowledge associated with the subject property or the area in the vicinity of the subject property.

3.4 Commonly Known or Reasonably Ascertainable Information

AWR was did not discover any commonly known or reasonable ascertainable information associated with the subject property or the area in the vicinity of the subject property.

3.5 Valuation Reduction for Environmental Issues

AWR was not provided with purchase price information.

3.6 Owner, Property Manager, and Occupant Information

The property is currently owned by JW Equties LLC.

The property is operated as an office building. Other than shared open spaces, OnLive, an online software company occupies the first floor, HUB Insurance occupies approximately 2/3 of the second floor, Agilone occupies the remainder of the second floor.

No property manager was identified to AWR.

3.7 Reason for Performing the Phase I ESA

AWR has performed this Phase I ESA in preparation of a proposed property transfer.

3.8 Previous Reports

AWR was not provided with any previous reports for the subject site.

4.0 RECORDS REVIEW

The government environmental agency databases AWR reviewed are listed on pages 4 through 7 of the Map Findings Summary of the database obtained from Environmental Data Resources, Inc. (EDR), included as Appendix C. Please refer to the EDR report in Appendix C for additional information on the searched databases including the full names of the databases, the regulatory agency overseeing the databases, a summary of the types of facilities listed on each database, and the dates the information was obtained from the regulatory agencies. Where locations and distances reported by EDR were observed to be incorrect, AWR amended the information to provide a more accurate assessment.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database. Information from these sources for the subject site is included in Section 4.1.1. Information on nearby releases is included in Section 4.1.2.

4.1 Standard Environmental Record Sources

4.1.1 Subject Property

The site address was listed as McCandless Land and Cattle Company on the HAZNET database. According to the EDR report, a shipment of 0.834 tons of waste oil and mixed oil were sent from

the site for offsite disposal in 1999. Inclusion on this database does not imply a release has occurred and there is no evidence of release or material mishandling. This is not a REC as defined in the ASTM standard practice.

AWR also requested information from the San Francisco Bay Regional Water Quality Control Board, the Santa Clara County Environmental Health Department, the Santa Clara Valley Water District, the Mountain View Fire Department, and the California Department of Toxic Substance Control Envirostor database.

Mountain View Fire Department

AWR reviewed files for the site at the Mountain View Fire Department. The Mountain View Fire Department is the Certified Unified Program Agency (CUPA) for properties in Mountain View. As a CUPA, the Mountain View Fire Department is responsible for implementing the following programs: Above Ground Storage Tanks, California Accidental Release Prevention Program (CalARP), Hazardous Materials Management Plans/Business Plans, Hazardous Waste Generator, On Site Treatment of Hazardous Wastes, and Underground Storage Tanks. The Mountain View Fire Department had no record of hazardous materials or underground storage tanks at the site.

Santa Clara County Environmental Health Department

AWR reviewed files at the Santa Clara County Environmental Health Department Leaking Underground Storage Tank Oversight Program (LUSTOP). There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

California Department of Toxic Substance Control

AWR reviewed files at the California Department of Toxic Substance Control Envirostor database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

Regional Water Quality Control Board

AWR reviewed files at the Regional Water Quality Control Board Geotracker database. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

US EPA Region 9

AWR reviewed files available online for the US Environmental Protection Agency (EPA) Region 9 Superfund sites. There were no release files for the subject site address. Files reviewed for nearby releases potentially impacting the site are discussed in Section 4.1.2.

4.1.2 Offsite Listings

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs). Based on this inferred groundwater flow direction, offsite listings that are adjacent to or south of the subject site have the greatest potential to impact the subject site. The sites of note are discussed below:

- There are six federal national priority list (NPL) sites, also known as Superfund sites, within one mile of the site including two which are within ¼-mile of the site. The NPL listings are Moffett Naval Air Station, Intel Corp (Mountain View Plant) Teledyne Semiconductor, Spectra-Physics, Inc., Jasco Chemical Corp., and CTS Printex, Inc. The NPL listings are primarily for releases of solvents and several of the plumes are mingled. In addition, there are several state-overseen releases that have contributed to the regional impacts. AWR reviewed information in the EDR report as well as additional information obtained from EPA Region 9, California DTSC, and the RWQCB. Based on our review of the information, the site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area. It appears that the intermingled plumes are primarily west of Shoreline Boulevard. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes.

- Texaco (CVX #21-1179) at 975 Shoreline Blvd (formerly known as Sterlin Road) was identified on the CA LUST and CA HIST LUST databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Selected records are included in Appendix K. A monitoring well was installed on th4e property south of the subject site in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the adjacent property south of the site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples

collected from the monitoring well near the site during 30 separate groundwater monitoring events. In 2010, Boring B-1 was advanced on the subject site to test for possible impacts and all three of the samples collected from the boring (at 5 feet, 7.5 feet, and 10 feet below the surface) were non-detect for all the analyzed parameters. Based on the concentrations observed at the adjacent, upgradient property, it is possible the contamination extended onto the property prior to the source remediation. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a potential Historical Recognized Environmental Condition (HREC) since any former impacts appear to have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to this nearby release.

- Robb-Jack Corp. at 1080 Linda Vista was identified on the CA LUST and CORTESE databases. These are databases that list facilities that have had releases from underground storage tanks. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. Based on our review of the information, groundwater impacts appear to have been minimal and it does not appear that this release impacted the subject site. The release was closed in 1996 indicating no additional investigation or remediation is required.

Based on the distance, direction, and/or nature of the remaining listings, in our opinion, none of the other listings are likely to impact the subject site.

4.1.3 Other Sites of Potential Environmental Concern

AWR did not identify any other sites of environmental concern. AWR reviewed the sites in the EDR Database that were unable to be mapped. None of the listings appeared to correspond to the site or adjacent properties. None of the listings appear likely to have the potential to impact the site.

4.2 Additional Environmental Record Sources

AWR reviewed information on this site from the Mountain View Fire Department, the California Department of Toxic Substance Control (DTSC) Envirostor database, the Santa Clara County Environmental Health Department LUSTOP program, the California Geotracker Database, and US EPA. Information from these sources for the subject site was discussed in Section 4.1.1. Information from these sources on the nearby properties was included in Section 4.1.2.

4.3 Physical Setting Sources(s)

The EDR Report in Appendix C indicates that the underlying hard rock geology consists of Cenozoic Quaternary stratified sequence. Surface soils in the vicinity of the site are classified by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS) as Botella clay loam.

Based upon a review of groundwater monitoring data collected at nearby release investigations, groundwater beneath the subject property was calculated to flow toward the north and was encountered at depths ranging from 4 to 16 feet below ground surface (bgs).

Current site-specific information on groundwater flow direction, depth, and quality can only be confirmed through the installation and survey of a minimum of three on-site groundwater-monitoring wells, which was beyond the scope of this assessment.

According to the 1999 USGS Mountain View, California Quadrangle Map, the site elevation is approximately 35 feet above mean sea level with a slight regional topographic slope downward to the north.

4.4 Historical Use Information on the Property

AWR reconstructed a brief history of the subject property through a review of historical Topographic Maps; the EDR City Abstract; available records, permits and other documents available at Santa Clara County; and historical aerial photographs provided by EDR. A summary of historical sources can be found in Section 12.0 of this Report with pertinent documents available in Appendices.

According to historical sources, the subject property appears to have been used as orchards and agricultural and residential buildings since at least 1939 through approximately 1948. The current site building was constructed in approximately 1980. In the 1956 aerial photograph, a building appeared to be partially located on the site extending east and north of the current site boundaries. This building was gone by the 1965 photograph which showed the current on-ramp for Interstate 101 passing through the northern portion of the former building location.

4.5 Historical Use Information on Adjoining Properties

The surrounding properties were primarily agricultural fields until being developed with light industrial development in the 1960s and early 1970s.

5.0 SITE RECONNAISSANCE

The goal of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the subject property. The subject property is visually observed and any structures located on the property are observed to the extent not obstructed by bodies of water, adjacent buildings, and/or other obstructions.

5.1 Methodology and Limiting Conditions

The exterior site reconnaissance was performed by walking open areas of the property in a grid fashion. Special attention was given to observe surfaces adjacent to the structures and sidewalks, surfaces in storage areas, and potential conduits to the subsurface such as drains and sumps. The interior site reconnaissance was performed by systematically observing each room and open space of the property. Additional attention was given to doors, utility rooms, storage areas, areas where hazardous materials were used or stored, and any other accessible areas.

5.2 General Site Setting

On April 8, 2014, Ms. Janelle Amendola of AWR conducted a site reconnaissance at the subject property.

5.3 Exterior Observations

The majority of the site is occupied by the landscaping and parking and driving areas.

No staining, stressed vegetation, or unusual odors were observed at the site.

5.4 Interior Observations

The site is occupied by three tenants. A shared lobby and stairs/elevator area is located in the central portion of the site. OnLive is an online software company that occupies the remainder of the first floor and has been at the site for approximately one year. HUB Insurance occupies approximately 2/3 of the upstairs tenant spaces and has been at the site for approximately six year. Agilone, occupies the remainder of the second floor with offices for a tech company. Other than routine janitorial chemicals, no hazardous materials were observed in any of the tenants or common areas at the site.

Plastic tarps were observed on the second floor balconies at the site. According to the site representative, the tarps are there to prevent rain from collecting on areas that are planned to be renovated. AWR did not inspect under the tarps or above the ceiling panels on the first floor below the balcony but did not observe any significant water damage or other staining on the first floor or elsewhere in the building.

5.4 Non-Scope Items

The following non-scope items were included as part of this Report based on readily available information that was reviewed.

5.4.1 Suspect Asbestos Containing Building Materials and Lead-Based Paint

Based on the age of the buildings, there is a low potential that asbestos containing materials and/or lead based paint have been used at the site.

5.4.2 Radon

No radon survey was conducted. According to the EDR report, Santa Clara County is in zone 2, indicating the average indoor level is between 2 and 4 picocuries per liter (pCi/L). The US Environmental Protection Agency (USEPA) action level is 4 pCi/L.

6.0 INTERVIEWS

6.1 Interview with Owner Representative

The site owner representative provided access to the building and answered questions on the nature of the tenant operations at the site. .

6.2 Interview with Site Manager

No Site Manager was identified.

6.3 Interviews with Occupants

The site occupants provided access to their units and answered questions about their operations during the site reconnaissance.

6.4 Interviews with Local Government Officials

AWR reviewed information from the Mountain View Fire Department, the Santa Clara County Environmental Health Department, the San Francisco Bay Regional Quality Control Board, and the California Department of Toxic Substance Control. Information from these requests is presented elsewhere throughout this report.

6.5 Interviews with Others

AWR did not perform any interviews with others regarding the subject property.

7.0 FINDINGS

The building appears to have been used primarily as an office building. No indication of significant hazardous material use or storage in the building or on the site was observed during the site reconnaissance or discovered during our historical research for this Phase I ESA.

A release at a former Texaco (CVX #21-1179) at 975 Shoreline Blvd (formerly known as Sterlin Road) was identified on the CA LUST and CA HIST LUST databases may have historically impacted the subject site. AWR obtained additional information on this release from the Santa Clara County Environmental Health Department LUSTOP program. A monitoring well was installed on th4e property south of the subject site in 1990 for the investigation associated with a release of gasoline from former underground storage tanks at the former Texaco Station at 975 Shoreline Blvd (at the southwest corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue). Sampling conducted from 1990 through 1992 revealed significant gasoline impacts in the groundwater samples from the well at the adjacent property south of the site. When the remediation activities began at the subject site, the concentrations decreased. Between 1992 and 1994, the concentrations in the samples collected from the well at the site dropped significantly and stabilized at lower concentrations. From 2002 until the release investigation was closed and the well was properly abandoned, no impacts were detected in any of the groundwater samples collected from the monitoring well near the site during 30 separate groundwater monitoring events. In 2010, Boring B-1 was advanced on the subject site to test for possible impacts and all three of the samples collected from the boring (at 5 feet, 7.5 feet, and 10 feet below the surface) were non-detect for all the analyzed parameters. Based on the concentrations observed at the adjacent, upgradient property, it is possible the contamination extended onto the property prior to the source remediation. The subject site was never named as a possible source of the impacts and the source release has been closed. This is classified as a potential Historical Recognized Environmental Condition (HREC) since any former impacts appear to have been mitigated, the subject site no longer appears to be impacted, and the release investigation has been closed indicating it has been resolved to the satisfaction of the overseeing regulatory agency. No additional investigation is recommended with regards to this nearby release.

The site is near but does not appear to be impacted by several known solvent releases impacting groundwater over a large area west of Shoreline Boulevard and smaller releases closer to the site. The sources and responsible parties for the regional plumes are known and the investigation and remediation is ongoing. The subject site was never named as a possible source of the impacts and does not appear to have been significantly impacted by the regional solvent plumes. No additional investigation is recommended with regards to the regional solvent plumes.

Based on the age of the buildings, there is a low potential asbestos-containing materials and/or lead based paint are present in the building. Although this is not a recognized environmental condition (REC) as defined by the ASTM Standard Practice, any renovation or demolition must comply with applicable regulations regarding asbestos-containing materials and lead based paint including appropriate testing and if required, mitigation.

7.1 Data Gaps

AWR was not able to review a Chain of Title Report for the subject property. It is AWR's opinion that the lack of this information does not pose a significant data gap, as an environmental lien search was performed for the subject property and revealed no issues.

AWR was not able to interview current or past owners or occupants. Given the residential use of the site, in our opinion, this is not a significant data gap.

7.2 Continuing Obligations

Continuing obligations start on the date that a landowner acquires title to a property. The landowner must: 1) comply with land use restrictions and institutional controls; 2) take "reasonable" steps with respect to hazardous substances releases; 3) provide full cooperation, assistance and access to persons that are authorized to conduct response actions or natural resource restoration; 4) comply with information requests and administrative subpoenas; and 5) provide all legally required notices. Continuing obligations must be satisfied to maintain liability protection under CERCLA for innocent landowners, bona fide prospective purchasers, and contiguous property owners.

AWR identified no ongoing continuing obligations for the subject site.

8.0 OPINION

8.1 Opinion of Findings

The regional solvent releases do not appear to have significantly impacted the site. Any impacts to the site from the former petroleum release at the former Texaco at 975 Shoreline have been mitigated.

The low potential for asbestos and/or lead based paint in the building materials at the site is not a REC but must be managed appropriately.

No other potential RECs were identified in conjunction with the site.

8.2 Recommendations

AWR recommends no additional environmental sampling with regards to potential RECs identified at the site.

The low potential for asbestos and/or lead based paint in the building materials at the site is not a REC but must be managed appropriately.

9.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 of 1091 North Shoreline, Mountain View, Santa Clara County, California, the subject property. Any exceptions to, or deletions from, this practice are described in Section 5.1 of this Report.

This assessment has revealed no evidence of Recognized Environmental Conditions in connection with the subject property.

10.0 DEVIATIONS

AWR did not evaluate the purchase price versus property value as AWR is not qualified to evaluate this issue.

11.0 ADDITIONAL SERVICES

AWR has also completed no additional services in conjunction with this Phase I ESA.

CORNERSTONE EARTH GROUP

Type of Services	**Preliminary Soil Vapor Quality Evaluation**
Location	**1001 North Shoreline Boulevard Mountain View, California**

SECTION 1: INTRODUCTION

This report presents the results of the Preliminary Soil Vapor Quality Evaluation performed at 1001 North Shoreline Boulevard located in Mountain View, California as shown on Figures 1 and 2 (Site).

This work was performed in accordance with our agreement dated April 2, 2015. Cornerstone Earth Group (Cornerstone) prepared a Soil Vapor Quality Evaluation Work Plan (Work Plan – May 1, 2015), which was submitted to San Francisco Regional Water Quality Control Board (Water Board) and City of Mountain View (City).

1.1 SITE DESCRIPTION

The approximately 8-acre Site is bounded by existing commercial developments to the north and east, North Shoreline Boulevard to the west, and Terra Bella Avenue to the south. The Site is relatively level, but graded to drain to storm drainage facilities. The Site is currently occupied by several commercial buildings, parking lots, and storage sheds, which will be demolished prior to construction of the new office building and associated flatwork.

The project will consist of redeveloping the Site for a new Class A office complex (Figure 2). The new four-story office building will have a footprint of approximately 30,000 square feet. The building will be steel-frame construction. The remainder of the Site will be covered with at-grade asphalt concrete pavement and associated flatwork improvements. We also understand a one-level below-grade parking garage is also being considered but has yet to be finalized.

1.2 PURPOSE

Based on the proximity to the Teledyne Spectra-Physics ground water plume and the former Texaco Service Station at 975 North Shoreline Boulevard (Figure 2), a Preliminary Soil Vapor Evaluation was performed to determine if vapor intrusion mitigation measures are required for the proposed commercial development.

1.3 SUBSURFACE CONDITIONS

Based on the Geotechnical Investigation (Cornerstone, May 2014), approximately 1 to 2 feet of undocumented fill consisting of fat clay mixed with varying percentages of gravel and sand lies beneath the surface asphalt concrete pavement. The fill was underlain by very stiff, high plasticity clay to a depth of approximately 6½ to 7½ feet. Approximately 45 feet of medium stiff to very stiff lean clay with variable amounts of sand and sandy silt interbedded with layers of loose to very dense clayey sand, poorly graded sand with silt, and clayey sand was observed beneath the surficial clay. Cone penetration test (CPT) borings advanced to approximately 100

feet encountered stiff to very stiff clays and silts interbedded with occasional thin layers of silty or clayey sand beneath a depth of approximately 45 feet.

Shallow ground water was measured during the Geotechnical Investigation at approximately 10½ feet below the existing ground surface.

1.4 SCOPE OF WORK

As presented in the Work Plan, the scope of work performed included the following:

- Installation of four dual-depth vapor probes (approximate depths of 5 and less than approximately 10 feet) for the collection and laboratory analyses of soil vapor samples
- Preparation of this report

The limitations for this investigation are presented in Section 3.

SECTION 2: PRELIMINARY SOIL VAPOR QUALITY EVALUATION

2.1 PRE-FIELD ACTIVITIES

Prior to performing the field work, boring locations were marked and the regional underground utility locating service USA North was notified at least 48 working hours prior to drilling. A private utility locator was also contracted to clear the boring locations.

2.2 SUBSURFACE INVESTIGATION

Subsurface investigation activities were performed on May 11, 2015. Our field geologist directed a subsurface exploration (truck-mounted Geoprobe) and logged four temporary exploratory borings (SV-1 to SV-4) to approximate depths of 9½ feet in general accordance with the Unified Soil Classification System (ASTM D-2487). Exploratory boring locations are shown on Figure 2. Boring logs are presented in Appendix A.

2.2.1 Subsurface Materials and Ground Water

Similar to the previous geotechnical investigation conducted by Cornerstone, subsurface materials encountered in the exploratory borings generally consisted of clays with varying amounts of silt and sand. Fill consisting of sand with gravel was observed to a depth of approximately 1 to 2 feet in borings SV-1, SV-2 and SV-4. Ground water was not observed in the exploratory borings.

2.3 SOIL VAPOR QUALITY EVALUATION

Protocols presented below follow the general requirements of the April 2012 document entitled, “Advisory – Active Soil Gas Investigations”, prepared by the Department of Toxic Substances and Control and Los Angeles and San Francisco Regional Water Quality Control Boards

2.3.1 Soil Vapor Sampling

The temporary soil vapor probes were installed on May 11, 2015 with stainless steel porous tips affixed to stainless-steel tubing within sand intervals. The sand intervals extended from depths of approximately 4¼ to 5 feet and 8¾ to 9½ feet in SV-1, 3¼ to 4 feet and 8½ to 9¼ in SV-2, 4½ to 5¼ feet and 8¾ to 9½ feet in SV-3, and 4½ to 5¼ feet and 8¼ to 8¾ in SV-4.

The probes were constructed by first placing approximately 2 inches of coarse aquarium sand into the bottom of the borehole using a tremie pipe. The lower stainless steel tip and tubing was then lowered into the borehole via tremie pipe and additional sand was then placed in the borehole an approximately 1 foot sand pack interval around the vapor tip. Approximately 1 foot of granular bentonite (Benseal™) was placed on top of the sand pack via the tremie pipe. Bentonite "gel" was then placed on top of the dry granular bentonite to approximately ½ foot below the upper vapor probe. The process was repeated to install the upper vapor probes. The stainless steel tubing was be labeled with depth of placement and capped utilizing a vapor-tight Swagelok valve set in the "off" position. Well boxes were installed over the 3 vapor well locations within pavement areas.

2.3.2 Vapor Sampling Procedure

Vapor sampling was performed on May 14 and 15, 2015. The tubing emanating from the vapor points was affixed to a sample shut-off valve in the "off" position during the time needed to reach equilibrium, at least 48 hours after probe installation. No significant rain events occurred within 5 days prior to the vapor sampling.

A 167 milliliters-per-minute flow regulator inclusive of particulate filter was fitted to the shut-off valve and the other end to a "T" fitting. One end of the "T" was connected to the sampling summa canister. The other end of the "T" was affixed to a digital vacuum gauge and a 6-liter summa canister utilized for purging.

A minimum 1 minute vacuum tightness test was performed on the manifold and connections by opening and closing the 1-liter purge canister valve and applying and monitoring a vacuum on the vacuum gauge. The sample shut-off valve on the downhole side of the sampling manifold remained in the "off" position. When gauge vacuum was maintained for at least 1 minute without any noticeable decrease (less than approximately 0.1 inches of mercury (Hg) for properly connected fittings), purging began. The downhole shut off valve was opened and three purge volumes of vapor were removed using the 6-liter summa for purging. The volume of vapor removed was verified by the calculated pressure drop summa canister. Assuming the vapor probe has been properly sealed, the borehole sand pack vapor space will have equilibrated with the surrounding vapors following the equilibration period.

Sampling continued until the vacuum gauge indicates approximately 5 inches of Hg remaining. A datalogging photoionization detector (PID) will be utilized during sampling to monitor the atmosphere inside the shroud through a bulk-head fitting. The logged data (at minimum thirty [30] second intervals) was corrected to parts per million by volume isopropyl alcohol concentrations and utilized to evaluate the integrity of the sampling train.

Vapor samples were collected from the upper and lower probes in SV-2 and SV-3 and the upper probes only in SV-1 and SV-4. Attempts were made to collect samples from the lower probes in

SV-1 and SV-4, however due to low flow from the sampling train, sample collection was unsuccessful. A replicate sample from the upper probe in SV-1 also was collected.

2.3.3 Soil Vapor Laboratory Analyses

The seven soil vapor samples were analyzed for Volatile Organic Compounds (VOCs) by EPA Test Method TO-15, Total Petroleum Hydrocarbons (TPH) as gasoline by EPA Test Method TO-3, and for fixed gases carbon dioxide, oxygen and methane by ASTM Test Method D-1946. As a quality assurance measure, one trip blank provided by the laboratory also was analyzed for VOCs by TO-15. In addition, one air sample collected from the shroud atmosphere was analyzed for isopropyl alcohol.

2.3.4 Soil Vapor Sample Integrity Evaluation

Isopropyl alcohol (2-propanol, 91 percent) was utilized as a leak detection compound during sampling by applying approximately 9 to 14 drops to cotton gauze, placing the moistened gauze near the borehole, and allowing it to equilibrate within the shroud. Sampling began by opening the Summa canister valve. Immediately upon opening the sampling valve, the shroud was placed over and enclosed the atmosphere of the borehole and entire sampling train including all connections. 2-propanol was included in the analyses of the soil vapor samples collected and was detected above its laboratory reporting limit in 2 of 6 samples collected. The maximum detection of 2-propanol was 200 micrograms per cubic meter ($\mu g/m^3$) (SV-3, 9¼ feet) with an approximate calculated leakage rate of 0.18%. Analyses of the remainder of the samples did not detect 2-propanol above its laboratory reporting limits ranging from 12 $\mu g/m^3$ to 63 $\mu g/m^3$. This data indicates that the sample trains were sufficiently tight, and no significant leakage occurred.

A data logging photoionization detector (PID) was utilized during sampling to monitor the atmosphere inside the shroud through a bulk-head fitting. The logged data (at a minimum of 30 second intervals) was corrected to parts per million by volume (ppm_v) isopropyl alcohol concentrations and utilized to evaluate the integrity of the sampling train. To confirm the isopropyl alcohol atmosphere, one confirmation sample was collected from the shroud atmosphere of vapor probe SV-1 and analyzed for isopropyl alcohol. Laboratory analyses this shroud sample detected 2-propanol at 200,000 $\mu g/m^3$. During the same sampling time period (approximately 2 minutes), the shroud atmosphere was measured by the PID to contain approximately 16,000 $\mu g/m^3$. The PID appeared to underestimate the shroud atmosphere.

2.3.5 Quality Assurance

Data quality for the soil vapor samples was evaluated by implementing quality assurance procedures and review of analytical data, including analysis of a field replicate and travel blank. The following is a summary of the data quality review:

- Samples were analyzed within the required holding times for the requested analyses;
- The travel blank did not contain VOCs above the laboratory reporting limits;
- The results of the laboratory control and duplicate samples were within acceptable ranges; and

- Results for the field replicate sample (labeled as SV-1D4.5R) collected from location SV-1 (4½ feet) immediately following the collection of the SV-1 (4½ feet) sample generally agreed with respect to quantity and to detection of target compounds.

2.4 DISCUSSION OF RESULTS

Results from the seven soil vapor samples collected were compared to the residential and commercial regional screening levels (RSLs, US EPA, 2015) and the environmental screening levels (ESLs, Water Board, 2013) for soil gas. To compare to RSLs, the detected concentrations were compared to the calculated residential and commercial soil vapor screening levels derived by applying an attenuation factor to the indoor air RSLs, which assumes an exposure duration of 8 hours per day, 250 days per year for 25 years. The residential and commercial soil vapor screening levels were calculated by dividing the residential and commercial indoor air RSLs by attenuation factors (AF) of 0.001 and 0.0005, respectively (DTSC, 2011). The detected soil vapor concentrations of PCE were compared to the California-modified indoor air screening levels of 0.4 micrograms per cubic meter ($\mu g/m^3$) for residential exposure and 2 $\mu g/m^3$ for commercial exposure (EPA, 2013). The TCE detected concentrations were compared to calculated screening levels based on the residential and commercial RSLs of 0.21 $\mu g/m^3$ and 0.88 $\mu g/m^3$, respectively, and the TCE indoor air short-term response action levels of 2 $\mu g/m^3$ for residential exposure and 9 $\mu g/m^3$ for commercial exposure (EPA, 2013). The PCE and TCE soil vapor screening levels were calculated by dividing these residential and commercial indoor air screening levels by the same Attenuation Factors (AF=0.001 [residential] or AF=0.0005 [commercial]). The residential and commercial soil vapor ESLs were used for comparison for compounds where no indoor air RSLs are established.

Benzene was detected above laboratory reporting limits in 5 of 7 vapor samples analyzed (including one replicate sample), and exceeded its residential ESL of 42 $\mu g/m^3$ in 2 of 7 vapor samples analyzed (SV-2, 9 feet [69 $\mu g/m^3$] and SV-4, 4.75 feet [99 $\mu g/m^3$]). The benzene concentrations reported did not exceeded the commercial ESL (420 $\mu g/m^3$), the residential RSL (360 $\mu g/m^3$), or the commercial RSL (3,200 $\mu g/m^3$).

Tetrachloroethene (PCE) was detected above its residential ESL of 210 $\mu g/m^3$ and its residential Modified California Indoor Air Screening Level of 400 $\mu g/m^3$ in 2 of 7 soil vapor samples analyzed (720 $\mu g/m^3$ [SV-1, 4½ feet] and 740 $\mu g/m^3$ [SV-1 replicate, 4½ feet]). Note that these two PCE detections were detected from one soil vapor probe (SV-1), with one of the detections occurring in the replicate sample collected immediately after the SV-1 sample. The detected PCE concentrations did not exceed the commercial ESL (2,100 $\mu g/m^3$) or the commercial Modified California Indoor Air Screening Level (4,000 $\mu g/m^3$). PCE was not detected in the other soil vapor samples analyzed.

TPH as gasoline and other VOCs were detected but at concentrations below the respective residential and commercial screening levels.

In addition, laboratory analyses of soil vapor samples revealed: 1) oxygen at concentrations ranging between 2.6 and 18%; 2) methane was not detected; and 3) carbon dioxide ranging from 0.86 to 16%.

2.5 CONCLUSIONS

Based on these data, vapor intrusion mitigation measures do not appear required at this time for the planned commercial development. Contaminants were not detected at concentrations exceeding commercial screening levels. In addition, the concentrations of detected contaminants likely will decline with time due to on-going remediation efforts in the vicinity.

SECTION 3: LIMITATIONS

Cornerstone performed this investigation to support Calvano/CRP Mountain View Venture, LLC in evaluation of soil vapor quality at the Site. Calvano/CRP Mountain View Venture, LLC understands that the extent of soil vapor quality data obtained is based on the reasonable limits of time and budgetary constraints. In addition, the chemical information presented in this report can change over time and is only valid at the time of this investigation and for the locations sampled.

Cornerstone makes no warranty, expressed or implied, except that our services have been performed in accordance with the environmental principles generally accepted at this time and location.

eurofins | Air Toxics

5/31/2015

Mr. Ron Helm
Cornerstone Earth Group
1259 Oakmead Parkway

Sunnyvale CA 94085

Project Name: 1001 N. Shoreline Blvd
Project #: 693-1-2
Workorder #: 1505316A

Dear Mr. Ron Helm

The following report includes the data for the above referenced project for sample(s) received on 5/18/2015 at Air Toxics Ltd.

The data and associated QC analyzed by TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
EPA Method TO-15
Cornerstone Earth Group
Workorder# 1505316A

Eight 1 Liter Summa Canister samples were received on May 18, 2015. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Receiving Notes

Samples SV-3D9.25, SV-2D9 and SV-4D4.75 were received with significant vacuum remaining in the canister. The residual canister vacuum resulted in elevated reporting limits.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Mr. Ron Helm
Cornerstone Earth Group
1259 Oakmead Parkway

Sunnyvale CA 94085

Project Name: 1001 N. Shoreline Blvd
Project #: 693-1-2
Workorder #: 1505316B

Dear Mr. Ron Helm

The following report includes the data for the above referenced project for sample(s) received on 5/18/2015 at Air Toxics Ltd.

The data and associated QC analyzed by Modified ASTM D-1946 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
Modified ASTM D-1946
Cornerstone Earth Group
Workorder# 1505316B

Six 1 Liter Summa Canister samples were received on May 18, 2015. The laboratory performed analysis via Modified ASTM Method D-1946 for Methane and fixed gases in air using GC/FID or GC/TCD. The method involves direct injection of 1.0 mL of sample.

On the analytical column employed for this analysis, Oxygen coelutes with Argon. The corresponding peak is quantitated as Oxygen.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	***ASTM D-1946***	***ATL Modifications***
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A minimum of 5-point calibration curve is performed. Quantitation is based on average Response Factor.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a >/= 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections > 5 X's the RL.

Receiving Notes

Samples SV-3D9.25, SV-2D9 and SV-4D4.75 were received with significant vacuum remaining in the canister. The residual canister vacuum resulted in elevated reporting limits.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.
J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.
File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Dear Mr. Ron Helm

The following report includes the data for the above referenced project for sample(s) received on 5/18/2015 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 (5&20 ppbv) are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
EPA Method TO-15 Soil Gas
Cornerstone Earth Group
Workorder# 1505316D

One PAC250 Canister sample was received on May 18, 2015. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode. The method involves concentrating up to 50 mLs of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

Dilution was performed on sample SV-ID9.25 (IPA) due to the presence of high level target species.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Subject: Phase I Environmental Site Assessment
1001 North Shoreline Boulevard
Mountain View, California
Langan Project: 731709301

Dear Sir or Madam:

Langan Engineering and Environmental Services, Inc. (Langan) is pleased to submit this Phase I Environmental Site Assessment (ESA), for the property located at 1001 North Shoreline Boulevard in Mountain View, California.

In performing this Phase I ESA, we have endeavored to observe the degree of care and skill generally exercised by other consultants undertaking similar studies at the same time, under similar circumstances and conditions, and in the same geographical area.

We appreciate the opportunity to assist you with this project. If you have any questions or need any information clarified, please call Mr. Joshua Graber at (510) 874-7000.

Sincerely yours,
Langan Engineering and Environmental Services, Inc.

PHASE I ENVIRONMENTAL SITE ASSESSMENT
1001 North Shoreline Boulevard
Mountain View, California

E1.0 EXECUTIVE SUMMARY

Langan Engineering and Environmental Services, Inc. (Langan) has performed a Phase I Environmental Site Assessment (ESA) for the property located at 1001 North Shoreline Boulevard in Mountain View, California (Site) (Figure 1). The ESA was performed on behalf of Lighthouse Real Estate Investments, LLC (Client) to assist them with their due diligence for the Site.

This Phase I ESA was conducted in substantial conformance with the American Society for Testing and Materials (ASTM) Practice E1527-13 (Standard Practice for ESA: Phase I ESA Process), and the United States Environmental Protection Agency's (USEPA) 2006 All Appropriate Inquiry (AAI) Rule (40 CFR Part 312). Completion of a Phase I ESA in accordance with the ASTM Practice and AAI Rule is needed to qualify for the bona fide prospective purchaser liability protections available under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA). The objective of this Phase I ESA was to identify the presence or likely presence, use, or release of hazardous substances or petroleum products on the Site, as defined in ASTM E1527-13, as a recognized environmental condition (REC).

E1.1 Site Description

The Site is comprised of one irregularly-shaped parcel (Santa Clara County Assessor's Parcel Number [APN]: 153-015-032), approximately 7.15 acres in size, according to the Santa Clara County Assessor's Office, Book 153, Page 15. The Site has been recently redeveloped into a single, commercial office building, parking lot, and recreational facilities. Prior to redevelopment, the Site was divided into nine separate APNs (153-15-014, 153-15-015, 153-15-016, 153-15-017, 153-15-018, 153-15-022, 153-15-024, 153-15-026, and 153-15-028).

The Site is located in a mixed use area (including residential, commercial, and light industrial) within the City of Mountain View bounded by Highway 101 to the north, Linda Vista Avenue and commercial properties to the east, Terra Bella Avenue to the south, and North Shoreline Boulevard to the west. The Site currently contains one vacant building under construction, a paved parking lot, and completed recreational facilities (i.e. basketball court and sand volleyball court).

E1.2 Environmental Database and File Review

As part of the Phase I ESA, we have reviewed the environmental database report prepared by Environmental Data Resources, Inc. (EDR). The EDR report contains information from the environmental databases maintained by the USEPA, state, and local agencies within the approximate minimum search distance.

The addresses associated with the Site were listed on the California Hazardous Waste Information System (CA HAZNET), Facility Index System (FINDS), Resource Conservation and Recovery Act (RCRA) Generators List Database – Small Quantities Generator (SQG), California National Pollution Discharge and Elimination System (CA NPDES), and the California Spills, Leaks, Investigation, and Cleanup (CA SLIC) databases. The Site is currently enrolled in the Santa Clara County Local Oversight Program (SCCLOP) in connection with redevelopment activities to ensure appropriate environmental mitigation measures are implemented during construction given its location in an area that has area-wide groundwater impacts.

Inquiries were made and records searched at the California Department of Toxic Substances Control (DTSC), California State Water Resource Control Board (SWRCB), Santa Clara County Department of Environmental Health (SCCDEH), and the City of Mountain View Fire Department (CMVFD) regarding any additional files related to any fuel and hazardous materials leaks reported at the Site and surrounding properties.

Based on review of the aerial photographs, topographical maps, and city directories, the Site was used for agricultural purposes beginning in the late 1930s. The Site has since been developed by various previous occupants for residences, warehouses, office space, and light industrial activities. It is currently occupied by one large commercial building that is still undergoing construction.

E1.3 Conclusions

Recognized Environmental Conditions (RECs)

A REC is the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

Based on the databases searched by EDR, requests made for public documentation related to past or present environmental conditions at the Site and surrounding area, our Site reconnaissance, and the reports (provided to Langan by the Client) discussing the previous investigations conducted at the Site, Langan has identified no current recognized environmental conditions (RECs) associated with the Site during this Phase I ESA.

Controlled Recognized Environmental Conditions (CRECs)

A CREC is a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)."

The following Controlled RECs were identified:

CREC 1 – Presence of Volatile Organic Compound Contamination in Soil Gas and Groundwater beneath the Site

Previous investigations at the Site have identified low levels of volatile organic compounds (VOCs) in soil gas and groundwater above 2016 Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs). Previous reports concluded that this contamination most likely migrated onto the Site from an upgradient source(s) and that soil and groundwater management and health and safety issues could be addressed as part of potential Site development activities. A Site Management Plan (SMP) was prepared for the Site and approved under the Santa Clara County Local Oversight Program (SCCLOP). Langan understands that the SMPs mitigation measures, including a vapor barrier, were and are being implemented as part of recent Site redevelopment. Based on our understanding of the City of Mountain View development approval process, an SMP will be required prior to any additional Site redevelopment and vapor intrusion will be considered as part of the redevelopment process. Therefore, since the upgradient sources have been granted regulatory case closure and an approved SMP is in place at the Site, the presence of VOC contamination in soil gas and groundwater beneath the Site has been identified as a CREC.

CREC 2 – Former Acid Neutralization Sump (1130 Terra Bella Avenue)

A neutralization sump was utilized by Mesa Technology between 1970 and 1988. This sump was used to neutralize acids prior to discharge of industrial waste water from the Mesa Technology facility to the sanitary sewer. In 1987, a fire at 1130 Terra Bella Avenue address resulted in the suspension of Mesa Technologies industrial waste water discharge permit and subsequently the removal of the neutralization sump. All work associated with the removal of the neutralization sump was overseen by the CMVFD. Three monitoring wells (one upgradient and two downgradient) were installed in the vicinity of the former neutralization sump, and groundwater was collected and analyzed for VOCs and metals in 1988. During the 1988 investigation, analytical results indicated that TCE was detected above the established RWQCB Tier 1 ESLs for groundwater of 5 µg/L. The greatest concentration of TCE (240 µg/L) was detected downgradient of the former neutralization sump; however, concentrations of TCE were also detected from the upgradient sample at a concentration of 33 µg/L. At the time of the 1988 investigation, this upgradient detection resulted in an inconclusive determination of the source of the TCE in groundwater. In 1989, the CMVFD granted facility closure with regards to all of the hazardous materials stored and used at the 1130 Terra Bella site.

Additional sampling was conducted in July 2005 and TCE was again detected in all three monitoring wells at concentrations ranging from 33 to 46 µg/L. During this sampling event, the greatest concentration was detected from the upgradient well. As a result of this second round of sampling, previous reports determined the source of TCE was upgradient (to the south of the Site). Since the former acid neutralization sump was approved for closure by the CMVFD and VOC concentrations in groundwater were deemed from an upgradient source, the former acid neutralization sump has been identified as a CREC.

De Minimis Conditions

As defined by ASTM E1527-13, a de minimis condition is a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies. Possible environmental issues that in Langan's opinion are not likely historical, controlled or recognized environmental conditions but are de minimis conditions include the following at the Site.

- The presence of several historical and existing petroleum service stations upgradient of the Site could pose a risk for petroleum hydrocarbon related contamination to migrate beneath the Site.

- Several historical leaking underground storage tank (LUST) properties, an acid spill, and the former use of a sump on Site were identified at or upgradient of the Site during the EDR Vapor Encroachment Condition (VEC) evaluation and were identified as possible vapor encroachment concerns for the Site. However, soil gas concentrations observed on the Site were below commercial land use screening levels. Given that an approved SMP is associated with the Site and it states that 'the Developer/Owner shall install a vapor barrier system to effectively eliminate vapor intrusions into the proposed structures' and that soil gas concentrations are below commercial screening levels, the potential for vapor intrusion has been identified as a de minimus condition. However, given that the contamination is from upgradient sources, a site-specific vapor intrusion assessment should be conducted as part of any future development process and vapor mitigation should be employed, if necessary.

Conclusion

According to the Quality Assurance (QA) Reports (Appendix J) provided by EPRO Services, Inc., the installation of the vapor barrier has been confirmed and was properly tested prior to completion. Based on the regulatory closure granted, the installation of a vapor barrier beneath the recently constructed building and the approved SMP utilized at the site, no additional environmental action is recommended at this time.

1.0 INTRODUCTION

Langan Engineering and Environmental Services, Inc. (Langan) has completed this Phase I Environmental Site Assessment (ESA) for the property located at 1001 North Shoreline Boulevard in Mountain View, California (Site) (Figure 1). The ESA was performed on behalf of Lighthouse Real Estate Investors, LLC (Client and User), in support of the User's due diligence regarding the Site.

Our understanding is that the property is proposed for ownership transfer and this Phase I ESA report is for due diligence purposes.

1.1 Purpose

The purpose of this Phase I ESA is to:

(1) Identify Recognized Environmental Conditions (RECs) in connection with the Site, as defined in the American Society for Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process, Designation E1527-13, which states: The presence or likely presence of any hazardous substances or petroleum products in, on, or at a Site: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies.

(2) Satisfy the criteria of United States Environmental Protection Agency (USEPA) 40 Code of Federal Regulations (CFR) Part 312 Subpart C Standards and Practices §312.20 AAI Rule.

1.2 Scope of Phase I ESA

This Phase I ESA was conducted utilizing a standard of good commercial and customary practice that is consistent with ASTM E1527-13. Any significant scope-of-work additions, deletions, or deviations to ASTM E1527-13 are noted in Section 9.0 of this report. In general, the scope of this assessment consisted of obtaining information from the User; reviewing reasonably ascertainable information and environmental data relating to the Site; reviewing

maps and records maintained by federal, state, and local regulatory agencies; interviewing persons knowledgeable about the Site; and conducting a Site reconnaissance. The specific scope of this assessment included the following:

1. A Site reconnaissance to observe conditions and assess the Site's location with respect to adjoining and surrounding property uses and natural surface features. The reconnaissance included the surrounding roads and observations of surrounding properties from public rights-of-way to identify obvious potential environmental conditions on neighboring properties. The Site reconnaissance was conducted in a systematic manner focusing on the spatial extent of the Site and then progressing to adjacent and surrounding properties. Photographs taken as part of the Site reconnaissance are provided in Appendix A.

2. As per ASTM E1527-13, a questionnaire was provided to the Client and owner to obtain information related to the Site. The questionnaire was returned to Langan, but did not contain any information not currently included in this report and therefore, is not included in the report.

3. A review of environmental databases maintained by the USEPA, state, and local agencies within the approximate minimum search distance. Environmental Data Resources, Inc. (EDR) prepared the environmental database report, which is included in Appendix C.

4. Physical characteristics of the Site were determined through referenced sources for topographic, geologic, soils, and hydrologic data.

5. A review and interpretation of aerial photographs, Sanborn Fire Insurance Maps (Sanborn Maps), historical topographic maps, and city directories to identify previous activities on and in the vicinity of the Site. Copies are included in Appendices C, D, E, and F, respectively.

1.3 Assumptions, Limitations and Exceptions

This Phase I ESA report was prepared for the Client for the Site located in Mountain View, California. This report is intended to be used in its entirety. Excerpts taken from this report are not necessarily representative of the assessment findings. Langan cannot assume responsibility for use of this report for any property other than the Site addressed herein, or by any other third party without a written authorization from Langan.

Langan's scope of services, which is described in Section 1.2, was limited to that agreed to with the Client and no other services beyond those explicitly stated are implied. Reasonable effort has been made to check that the information obtained is factual and from reliable sources, but no responsibility is assumed for its accuracy. If no hazardous substances or conditions are reported to be on the Site, it should not be interpreted as a guarantee that they do not exist. Langan assumes no responsibility or liability for errors in the information used or statements from sources other than those of Langan. All conclusions and recommendations in this report concerning the Site are those professional opinions of the Langan personnel involved with the project, and this report should not be considered a legal interpretation of existing environmental regulations. Opinions presented herein apply to Site conditions existing at the time of our assessment, and cannot necessarily be taken to apply to Site changes or conditions of which Langan is not aware and have not had the opportunity to evaluate.

The services performed and agreed upon for this effort comports to those prescribed in the ASTM Standard E1527-13. Intrusive sampling (e.g., soil borings and groundwater sampling) was not performed as part of this Phase I ESA.

This Phase I ESA was not intended to be a definitive investigation of possible environmental impacts at the Site. The purpose of this investigation was limited to evaluating if there is reason to suspect the possibility of RECs at the Site. It should be understood that even the most comprehensive Phase I ESA may fail to detect environmental liabilities at a particular site. Therefore, Langan cannot "insure" or "certify" that the Site is free of environmental impacts. No expressed or implied representation or warranty is included or intended in this report, except that our services were performed, within the limits prescribed by our client, with the customary standard of care exercised by professionals performing similar services under similar circumstances within the same jurisdiction.

The conclusions, opinions, and recommendations provided in this report are based solely on the specific activities as required for the performance of ASTM E1527-13 and are intended exclusively for the purpose stated herein, at the specified Site as it existed at the time of our reconnaissance.

1.4 Special Terms and Conditions and User Reliance

The Client requested no special terms or conditions regarding this Phase I ESA. Langan has prepared this report specifically for the use of the Client. The findings contained within the report shall not, in whole or in part, be disseminated or conveyed to any other party, nor be

used by any other party, in whole or in part without written prior consent of the Client and Langan. Other parties cannot rely on this Phase I ESA and the conclusions therein, unless Langan receives a written request from the Client, at which time a "Reliance Letter" will be prepared for the interested party. The relying party will be subject to the same terms and conditions and limitations as agreed to by the Client.

2.0 SITE DESCRIPTION

2.1 Location and Legal Description

The Site is comprised of a single irregularly-shaped parcel covering approximately 7.15 acres, according to the Santa Clara County Assessor's Office, Book 153, Page 15. The Site has recently been redeveloped into a four-story commercial building, a paved parking lot, landscaping features, and recreation facilities (i.e. basketball and sand volleyball court). The Site is in a mixed use area (including residential, commercial, and light industrial) within the City of Mountain View, bounded by Highway 101 to the north, Linda Vista Avenue to the east, Terra Bella Avenue to the south, and North Shoreline Boulevard to the west.

2.2 Site and Vicinity General Characteristics

The Site is located in a mixed use area of Mountain View. According to the United States Geological Survey (USGS) Topographic Maps, reviewed by Langan in EDR's Historical Topographic Map Report, the Site is at approximately 37 feet above mean sea level (msl). The Site topography is generally flat, and slopes down toward the north. Photographs showing the current Site use are provided in Appendix A and historical topographic maps are included in Appendix F.

2.3 Current Use of the Site and Adjoining Properties

The Site contains one vacant, four-story commercial building, a paved parking lot, landscaping, and recreational facilities (i.e. basketball and sand volleyball court). The Site is currently an active construction site with storage containers, equipment, and materials staged throughout the Site. The following table summarizes the current ownership and use of the Site.

Assessor Parcel Number (APN)	Site Owner	Acres	Parcel Use
153-015-032	Calvano/CRP Mountain View, L.L.C., a Delaware limited liability company	7.15	Vacant commercial building, parking and recreation

The current uses of the adjoining properties include:

- North of the Site: Highway 101 and associated on-ramp;
- Northeast: active construction site;
- East of the Site: Linda Vista Avenue and commercial properties;
- West of the Site: North Shoreline Boulevard and commercial properties;
- South of the Site: Terra Bella Avenue and commercial properties.

2.4 Descriptions of Structures, Roads, and Other Site Improvements

The Site contains one vacant, four-story commercial building, a paved parking lot, landscaping, and recreational facilities (i.e. basketball and sand volleyball court). A detailed description of current uses of the Site observed during the Site reconnaissance is discussed in Section 5.0. Photographs showing the current Site use are provided in Appendix A.

3.0 USER PROVIDED INFORMATION

3.1 User/Owner Questionnaire

Per ASTM E1527-13, user and owner questionnaires were provided to the User to inquire about specialized information related to the Site. Langan understands that the User completed the questionnaire and that information from the User, beyond the information already known by Langan, was not identified.

Ms. Kate Velásquez-Heller of Goulstons & Storrs completed the User questionnaire. Ms. Velásquez-Heller is not aware of any environmental cleanup liens and/or land use limitations associated with the Site. The Owner Questionnaire was not received by Langan for inclusion in this report.

3.2 Title Records

The property's title is held by First American Title Insurance Company and the property owner is listed as Calvano/CRP Mountain View, L.L.C., a Delaware limited liability company. A copy of the Title Report is provided in Appendix B.

It should be noted that an Agreement Establishing Chemical Use Restriction was executed on the 1130 Terra Bella property on 7 November 2005 and the User stated that this restriction no longer affects the property. This previous restriction is not considered a REC.

3.3 Environmental Liens or Activity and Use Limitations

The User is not aware of any environmental cleanup or liens in connection to the Site.

3.4 Specialized Knowledge

The Client is not aware of any specialized knowledge beyond that of the environmental professional.

3.5 Commonly Known and Reasonable Ascertainable Information

The User is not aware of any commonly known and reasonable ascertainable information regarding the Site.

3.6 Owner, Site Manager, and Occupant Information

The title records indicate the Site is currently owned by Calvano/CRP Mountain View, L.L.C., a Delaware limited liability company.

3.7 Reason for Performing Phase I ESA

It is our understanding that the Client has requested this ESA be completed as part of their environmental due diligence regarding potential property transfer.

4.0 RECORDS REVIEW

4.1 Standard Environmental Record Sources

Langan reviewed an environmental database search report, prepared by EDR, for the Site and surrounding area. The EDR report is a listing of properties identified on select federal and state standard source environmental databases within the approximate search radius specified by ASTM Standard Practice for E1527-13. This information is reported to Langan by EDR, and to EDR by government sources; therefore, neither Langan nor EDR can verify the completeness and accuracy of the database information. Langan reviewed each environmental database on a record-by-record basis to evaluate if certain sites identified in the report are suspected to

represent a potential impact to the Site. A copy of regulatory database information was provided by EDR and is included in Appendix C.

The following summary table lists the number of properties by database within the prescribed search radius appearing in the EDR Radius Map Report:

Database (Date of government version)	Minimum Search Area	Site Listed	Properties Within Search Area
Federal			
National Priorities Listing (NPL) Site List Database (5/30/2017)	1 mile radius	No	6
Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) – Superfund Enterprise Management System (SEMS) Archive Database (7/11/2017)	1/2 mile radius	No	3
CERCLIS No Further Remedial Action Planned (NFRAP) Site List Database (7/11/2017)	1/2 mile radius	No	1
Resource Conservation and Recovery Act (RCRA) Corrective Action Reports (CORRACTS) Facilities List Database (9/13/2017)	1 mile radius	No	2
RCRA Generators List Database – Large Quantities Generator (9/13/2017)	1/4 mile radius	No	1
RCRA Generators List Database – Small Quantities Generator (SQG) (9/13/2017)	1/4 mile radius	Yes (1130 Terra Bella Avenue)	20
RCRA Generators List Database – Conditionally Exempt SQG (9/13/2017)	1/4 mile radius	No	1
Institutional Controls/Engineering Controls Registries Database (8/10/2017)	1/2 mile radius	No	2
State and Tribal			
Equivalent NPL – California (CA) RESPONSE Database (7/31/2017)	1 mile radius	No	2
Equivalent CERCLIS – CA ENVIROSTOR Database (7/31/2017)	1 mile radius	No	18
Leaking Storage Tank List – CA Leaking Underground Storage Tank (LUST) Database (9/11/2017)	1/2 mile radius	No	31
Leaking Storage Tank List – CA Spills, Leaks, Investigations, and Cleanups (SLIC) Database (9/11/2017)	1/2 mile radius	Yes	21
Leaking Storage Tank List – CA Historical (HIST) LUST Database (3/29/2005)	1/2 mile radius	No	20
Registered Storage Tank List – CA Underground Storage Tank (UST) Database (9/11/2017)	1/4 mile radius	No	8
Registered Storage Tank List – CA Aboveground Storage Tank (AST) Database (7/6/2016)	1/4 mile radius	No	5

Database (Date of government version)	Minimum Search Area	Site Listed	Properties Within Search Area
Others			
Local Lists of Landfill/Solid Waste Disposal Sites – CA Recycler Database (SWRCY) (9/11/2017)	1/2 mile radius	No	1
Local List of Hazardous Waste/Contaminated Sites – CA HIST Cal-Sites Database (8/8/2005)	1 mile radius	No	6
Local List of Registered Storage Tanks – CA Statewide Environmental Evaluation and Planning System (SWEEPS) UST Database (6/1/1994)	1/4 mile radius	No	10
Local List of Registered Storage Tanks – CA HIST UST Database (10/15/1990)	1/4 mile radius	No	20
Local List of Registered Storage Tanks – CA Facility Inventory Database (FID) UST Database (10/31/1994)	1/4 mile radius	No	8
Local Land Records – CA DEED Database (9/5/2017)	1/2 mile radius	No	4

Record of Decision Database (9/27/2017)	1 mile radius	No	6
CONSENT Database (6/30/2017)	1 mile radius	No	1
Facility Index System (FINDS) Database (7/23/2017)	< 1/8 mile radius	Yes	5
Enforcement and Compliance History Online (ECHO) Database (9/2/2017)	< 1/8 mile radius	No	1
CA BOND EXP. PLAN Database (1/1/1989)	1 mile radius	No	3
CA Cortese Hazardous Waste & Substances Sites List (Cortese) Database (9/21/2017)	1/2 mile radius	No	2
CA Certified Unified Program Agency (CUPA) Listing Database (8/7/2017)	1/4 mile radius	No	19
CA Emissions Inventory Data (EMI) Database (12/31/2015)	< 1/8 mile radius	No	1
CA hazardous Waste Tracking System (HAZNET) Database (12/31/2015)	< 1/8 mile radius	Yes	2
CA HIST CORTESE Database (4/1/2001)	1/2 mile radius	No	27
CA HWP (8/21/2017)	1 mile radius	No	2
New York (NY) MANIFEST Database (10/1/2017)	1/4 mile radius	No	1
CA National Pollution Discharge & Elimination System (NPDES) Database (8/14/2017)	< 1/8 mile radius	Yes	1
CA Notify 65 Database (6/16/2017)	1 mile radius	No	2
EDR High Risk Historical Records – EDR Historic Auto	1/8 mile radius	No	1

A description of the reviewed databases is provided in the EDR Radius Map Report (Appendix C). A summary of significant Site database listings and other properties identified within the prescribed search area is presented below.

Site (1001 North Shoreline Boulevard)

The 1001 North Shoreline Boulevard (or parcels associated with this property) was listed in the CA HAZNET, RCRA-SQG, CA SLIC, CA NPDES, and FINDS databases. Inquiries were made and records searched at the California Department of Toxic Substances Control (DTSC) EnviroStor website (Envirostor), California State Water Resources Control Board (SWRCB) GeoTracker website (GeoTracker), Santa Clara County Department of Environmental Health (SCCDEH), and City of Mountain View Fire Department (CMVFD) regarding any additional files related to any fuel and hazardous materials leaks reported at the Site. The Site is currently listed as an open case under a voluntary cleanup program within the SCCDEH.

According to the Site Management Plan (SMP) dated 15 September 2015 prepared by Cornerstone Earth Group (CEG), the property formerly located at 1130 Terra Bella Avenue had been used for agricultural purposes until 1939 and then used by Pennel Plastering and a residence from 1948 until the late 1970s. Mesa Technologies operated on a portion of the property until 1989 as an instrument and electronics company and warehouse. In 1987, a fire occurred at the Mesa Technologies facility, rupturing a container of holding acid, which in turn resulted in an acid spill reaching an outside storm water drain inlet. Per a letter dated 26 October 1987 from the City of Mountain View, the spill was successfully contained by the CMVFD and cleaned up by the Mountain View Maintenance Department. The SMP states that a groundwater assessment was completed in 1988 identifying that acids, caustic/alkaline cleaner, cyanide, photo resist stripper and flammable solvents had been stored at the Mesa Technology facility in 55-gallon drums, and that industrial wastewater was treated on-Site in a neutralization sump, consisting of a concrete pit in the ground permitted by the City of Mountain View for neutralization of corrosives and acids. Under the oversight of CMVFD, the neutralization pit was removed in 1989 and sampling within the vicinity of the former pit concluded that no releases of hazardous materials had occurred.

Additionally, an investigation in 1988 was conducted to determine if the former Mesa Technology facility at 1130 Terra Bella Avenue had contributed to a regional contaminant plume beneath the Site. Three monitoring wells (one upgradient and two downgradient) were installed in the vicinity of the former neutralization sump, and groundwater was collected and analyzed for volatile organic compounds (VOCs) and metals in 1988 to establish background and current

groundwater concentrations. During the 1988 investigation, analytical results indicated that TCE was detected above the established Regional Water Quality Control Board (RWQCB) Tier 1 Environmental Screening Levels (ESLs) for groundwater of 5 micrograms per liter (µg/L). Initially, the greatest concentration of trichloroethene (TCE) (240 µg/L) was detected downgradient of the former neutralization sump; however, concentrations of TCE were also detected from the upgradient sample at a concentration of 33 µg/L. At the time of the 1988 investigation, this upgradient detection resulted in an inconclusive determination of the source of the TCE in groundwater.

Additional sampling was conducted in July 2005 and TCE was again detected in all three monitoring wells at concentrations ranging from 33 to 46 µg/L. During this sampling event, the greatest concentration was detected from the upgradient well. As a result of this second round of sampling, previous reports determined the source of TCE was upgradient (to the south of the Site). Based on the results of the soil sampling and groundwater sampling following sump removal, the *Addendum to Olin Mesa Closure Plan, 1130 Terra Bella Avenue* documented that there were 'no environmental or health risks posted by the facility after completion of remediation' and 'because TCE and DCE were detected in the upgradient well, it appears these compounds originated from an off-site source' and the facility was closed by the CMVFD. A copy of the *Addendum to Olin Mesa Closure Plan, 1130 Terra Bella Avenue* is included as Appendix H.

All three monitoring wells were destroyed in September 2015. The Site is currently an open case, number 06S2W15M04s, and under SCCLOP oversight pending the completion of the current redevelopment activities and case closure.

A summary of the relevant files and documents are presented in Section 4.6.

Neighboring Properties

Based on our review of the neighboring properties, most of the nearby listings were closed by the regulatory agency, were hydrologically cross-gradient or downgradient, or were determined to be a significant distance (greater than a 1/4 mile) from the Site. Inquiries were made and records searched via the DTSC, SWRCB, SCCDEH, and CMVFD regarding any additional files related to any fuel and hazardous materials leaks reported at the Site. Below are summaries of neighboring properties of concern in regards to possible contamination at the Site and relevant files reviewed.

Former Texaco Station (975 North Shoreline Boulevard)

The Texaco Station at 975 North Shoreline Avenue was listed in the CA LUST, CA HIST CORTESE, CA SWEEPS UST, and CA HIST UST databases. The property is located to the south and upgradient to the Site.

In 1992, at the Former Texaco Station (975 North Shoreline Boulevard), one 6,000-gallon gasoline underground storage tank (UST), four 4,000-gallon gasoline USTs, and one waste oil UST were removed from the station while redeveloping the property into a fast food restaurant. Approximately 1,520 cubic yards of petroleum hydrocarbon-impacted soil and approximately 1,000-gallons of petroleum-impacted groundwater were removed from the former UST area. A soil vapor extraction (SVE) system and 12 groundwater monitoring wells were installed, four of which were installed in the southwest quadrant of the 1001 North Shoreline Blvd Site, to monitor impacts to groundwater. After operating the SVE system for approximately one month in early 1994, rebound testing was performed and it was concluded that no rebound had occurred and that the SVE system had achieved the remedial objectives. The system was decommissioned and the property was redeveloped. During the most recent groundwater monitoring event conducted during the first quarter of 2010, the following contaminants were detected from one of seven monitoring wells sampled, located in the southwest corner of the 1001 North Shoreline Blvd Site:

- Total petroleum hydrocarbons (TPH) as gasoline (TPH-g) at a concentration of 9,900 micrograms per liter (µg/L);
- Benzene at a concentration of 130 µg/L;
- Toluene at a concentration of 4.2 µg/L;
- Ethylbenzene at a concentration of 11 µg/L; and
- Methyl tert-butyl ether (MTBE) at a concentration of 1 µg/L.

The above concentrations of TPH-g and benzene exceed their respective RWQCB Tier 1 ESLs.

In 2010, an off-site indoor air evaluation at the single-story building formerly located at 1015 North Shoreline Avenue address (Site) was conducted to determine if the release at the former Texaco Station had caused a vapor intrusion risk at the property. Although concentrations of benzene and ethylbenzene were detected above their respective indoor air screening criteria, the indoor air levels matched concentrations of an ambient air sample collected outside of the

building. Because indoor and ambient air concentrations were detected within the same order of magnitude, no further vapor intrusion evaluation was deemed necessary.

Case closure was granted to the former Texaco Station on 1 July 2011 by the SCCDEH. All 12 groundwater monitoring wells were destroyed in June 2011. Based on groundwater concentrations detected in 2010, it is possible that contaminants originating at the Texaco property are present in groundwater beneath the Site. However, given the case closure and documents reviewed, it is unlikely that this property poses a significant environmental concern for the subject Site.

The Shippen Property (1175 Terra Bella Avenue)

The Shippen Property at 1175 Terra Bella Avenue was listed in the CA LUST, CA HIST LUST, and CA HIST CORTESE databases. This property is located approximately 50 feet to the south and upgradient of the subject Site.

In August 1998, a 500-gallon gasoline UST was removed from 1175 Terra Bella Avenue (Shippen Property). During the removal of the tank, numerous holes were noticed in the tank. Soil samples were collected from the tank excavation. TPH-g and benzene were detected in soil at concentrations of 1,900 milligrams per kilogram (mg/kg) and 1.7 mg/kg, respectively. A groundwater sample was collected from beneath the tank in September 1998 with TPH-g and benzene detected at 42,000 µg/L and 1,400 µg/L, respectively. In November 2000, three on-property and one off-property borings were advanced to approximately 16 feet below ground surface (bgs) for the collection of soil and groundwater. Benzene and TPH-g were detected in the off-property well at concentrations of 1.8 µg/L and 99 µg/L. TPH-g was also detected in an on-property well at a concentration of 2,600 µg/L. No other contaminants were detected in groundwater. The Shippen Property was granted case closure by SCCLOP on 17 July 2001. Based on the location of the Shippen property and documents reviewed, it is unlikely that this property poses a significant environmental concern for the subject Site.

Jasco Chemical Company (1090 Terra Bella Avenue)

The Jasco Chemical Company at 1090 Terra Bella Avenue was listed in the CA LUST database. This property is located approximately 50 feet to the east and cross-gradient to the subject Site. No pertinent records were received for this address. The summary provided on the GeoTracker database identifies solvents as the potential contaminant of concern and that case closure was granted on 1 October 1997 by the San Francisco Bay Regional Water Quality Control Board

(RWQCB). Based on the location of the Jasco Chemical Company property and documents reviewed, it is unlikely that this property poses a significant environmental concern for the subject Site.

Teledyne-Spectra Physics National Priority List Site (1250 West Middlefield Road)

The Teledyne-Spectra Physics property at 1250 Middlefield Road is a federally listed superfund site and was listed in the CA ENVIROSTOR, CA HIST Cal-Sites, CA HWP, CA SLIC, CA COERTESE, CA ENF, and CA HIST CORTESE data bases. This property is located approximately 650 feet west and cross-gradient to the subject Site.

VOC-impacted groundwater has been detected at the Teledyne-Spectra Physics National Priority List site, the source site for the regional groundwater plume known as the North Bayshore Area plume. TCE is the primary contaminant of concern at the Teledyne-Spectra Physics site with a maximum concentration in the shallow aquifer of 5,100 µg/L. This plume extends approximately one mile north from the Spectra-Physics property at 1250 Middlefield Road and is up to 2,000 feet wide. Based on the location of the Teledyne-Spectra Physics property and documents reviewed, it is unlikely that this property poses a significant environmental concern for the subject Site.

Shell Station (807 North Shoreline Boulevard)

The Shell Station at 807 North Shoreline Boulevard was listed in the CA SWEEPS, CA FID UST, CA UST, RCRA-SQG, FINDS, ECHO, CA CUPA Listings, CA HAZNET, CA LUST, CA HIST LUST, and CA HIST CORTESE databases. This property is located approximately 550 feet to the south and upgradient of the subject Site. In March 1991, three-10,000-gallon gasoline USTs and one 10,000-gallon diesel UST were removed from the Shell Station. Over-excavation of the former tank pit was completed to a depth of 20 feet bgs and soil samples of the sidewalls were collected yielding low levels of TPH-g, TPH as diesel (TPH-d), and benzene. An SVE system was operated at the Shell Station between April 1994 and September 1994 as an interim remedial measure. In May 1998, a joint investigation between Shell, Texaco, and Arco was performed. Soil and groundwater testing was conducted and maximum levels of contamination identified included 15,000 µg/L of TPH-g, 30 µg/L of benzene, and 1,500 µg/L of MTBE. Groundwater extraction and treatment was selected as the preferred remedial alternative. Groundwater was extracted at the Shell Station between June 1999 and 2004. The final groundwater sampling results in August 2004 indicated a significant decrease in contaminants (88 µg/L of TPH-g, 170 µg/L of TPH-d, 21 µg/L of MTBE, and 16 µg/L of tert butyl alcohol [TBA]).

Residual contaminants in soil include 2,800 mg/kg of TPH-g, 61 mg/kg of TPH-d, 0.65 mg/kg of benzene, and 4.7 mg/kg of MTBE as of August 2002.

Closure was granted to the Shell Station by the Santa Clara Valley Water District (SCVWD) on 6 August 2008 stating, "…a continuing threat to groundwater, human health and the environment from residual petroleum hydrocarbons does not exist at this site…". Based on the location of the Shell station and documents reviewed, it is unlikely that this property poses a significant environmental concern for the subject Site.

Chevron Station (808 North Shoreline Boulevard)

The Chevron Station at 808 North Shoreline Boulevard was listed in the CA HIST UST, RCRA-SQG, CA LUST, FINDS, ECHO, CA CUPA Listings, CA UST, CA SWEEPS UST, CA LUST, CA HIST LUST, CA FID UST, CA SLIC, and CA HIST CORTESE databases. This property is located approximately 600 feet to the south and upgradient of the subject Site.

In April 1988, two 5,000-gallon gasoline USTs, one 2,000-gallon gasoline UST, and one 550-gallon waste oil UST were removed from the Chevron Station. Limited over-excavation was performed, and soil samples collected beneath the former tanks indicated maximum concentrations of TPH-g at 11,000 mg/kg and benzene at 71 mg/kg. Quarterly groundwater monitoring was conducted between May 1998 and February 2004. During the last round of groundwater sampling, maximum concentrations of contaminants were 6,800 µg/L of TPH-g, 47 µg/L of benzene, and 64 µg/L of MTBE. Quarterly monitoring showed a steady attenuation of dissolved concentrations of contaminants.

Closure was granted to the Chevron Station by the SCVWD on 18 May 2005 stating, "…a continuing threat to groundwater, human health and the environment from residual petroleum hydrocarbons does not exist at this site…". Based on the location of the Chevron station and documents reviewed, it is unlikely that this property poses a significant environmental concern for the subject Site.

Arco Station (790 North Shoreline Boulevard)

The Arco Station at 790 North Shoreline Boulevard was listed in the CA HIST UST, RCRA-SQG, CA LUST, FINDS, ECHO, CA CUPA Listings, CA UST, CA SWEEPS UST, CA LUST, CA HIST LUST, CA FID UST, CA SLIC, and CA HIST CORTESE databases. This property is located approximately 950 feet to the south and upgradient of the subject Site.

In May 1988, four 6,000-gallon gasoline USTs, one 12,000-gallon gasoline UST, and one 550-gallon waste oil UST were removed from the Arco Station. Approximately 1,030 cubic yards of petroleum hydrocarbon impacted soil and 35,000-gallons of petroleum hydrocarbon impacted groundwater were removed from the former tank pits. Soil samples were collected from approximately 16 feet below ground surface (bgs) after removal of the tanks with maximum contaminant levels of 7,800 mg/kg TPHg, 7.9 mg/kg benzene, 21 mg/kg toluene, 15 mg/kg ethyl benzene, 1,140 µg/L xylenes, and 4,700 µg/L MTBE. Quarterly groundwater sampling continued at the Arco Station until August 2003. Maximum residual groundwater contamination at the Arco Station includes 3,800 µg/LTPH, 600 µg/L benzene, 48 µg/L toluene, 66 µg/L ethyl benzene, and 220 µg/L xylenes.

The Arco Station was granted closure by the SCVWD on 26 July 2004. Based on the location of the Arco station and documents reviewed, it is unlikely that this property poses a significant environmental concern for the subject Site.

Unocal (510 North Shoreline Boulevard)

The Unocal site at 510 North Shoreline Boulevard was listed in the CA LUST, CA HIST UST, and CA HIST CORTESE databases. The property is located approximately 2,350 feet to the south and upgradient of the subject Site.

In July 1989, one 550-gallon waste oil UST was removed from the Unocal property. Soil samples were collected from the former tank excavation. A maximum concentration of 170 mg/kg TPH as oil and grease (TPH-o&g) and 130 mg/kg TPH as oil (o) were detected in soil from a depth of eight feet bgs. In January 1990, five borings were advanced to delineate contamination from the former waste oil UST. A maximum of 35 mg/kg TPH-d and 87 mg/kg TPH-o&g was detected from approximately 10 feet bgs around the former UST. In August 1990, two 10,000-gallon gasoline USTs were removed from the Unocal facility and maximum concentrations of 2.1 mg/kg TPH-g and 0.11 mg/kg benzene were detected in soil from a depth of 14 feet beneath the tanks. Between June 1991 and September 1994, 10 monitoring wells were installed to monitor groundwater at the Unocal facility. Soil samples were collected during the construction of all 10 monitoring wells, and no TPH-g or benzene, toluene ethylbenzene, and xylenes (BTEX) were detected in any of the samples collected. The most recent groundwater samples were collected in 1995 and indicated maximum concentrations of 600 µg/L TPH-g and 17 µg/L benzene at the facility.

Based on the low levels of residual concentrations of petroleum hydrocarbons in groundwater, the Unocal site was granted closure by the SCVWD district on 4 December 1996. Based on the location of the Unocal property and documents reviewed, it is unlikely that this property poses a significant environmental concern for the subject Site.

LGM Manufacturing (723 Stierlin Road)

The LGM Manufacturing (LGM) facility at 723 Stierlin Road was listed in the State and Tribal Equivalent NPL CA RESPONSE database. The facility is located approximately 1,550 feet to the south and upgradient of the subject Site.

Per a DTSC Site Screening Form for this property, LGM printed circuit boards from 1969 to 1983. Chemicals used by LGM included ammonia, etch acids, brighteners, fusing oil, TCE, copper with formaldehyde, and methylene chloride. Chemical wastes were stored in drums and containers in a yard behind the LGM warehouse. An inspection of the LGM facility was conducted by the Department of Health Services, Toxic Substance Control Division (currently the DTSC) in October 1982 in response to a complaint of dying vegetation at an adjacent condominium complex. Drums with residual hazardous materials were washed in the LGM yard and waste water from this cleaning process was dumped onto the ground and allowed to run off-property. The DTSC collected soil and water samples from the storage yard and condominium complex. Fluoride and copper were detected at elevated levels (maximum concentrations of 1,600 mg/kg and 28 mg/kg, respectively) in samples, and the pH of most samples was at acidic levels. In late 1983 and early 1984, chemicals and contaminated soil were removed from the LGM yard and adjacent condominium complex. Confirmation samples were collected for copper and fluoride and detected levels were below health-based risk goals considered safe for residential use. No water sampling results were identified during the records reviewed for this property. Based on the location of the LGM Manufacturing property and documents reviewed, it is unlikely, that this property poses a significant environmental concern for the subject Site.

Orphan Listings

According to EDR, an orphan listing is a property that cannot be mapped due to poor or inadequate address information. Upon further research, Langan concluded that none of the orphan listings appear to be within applicable search distances to the Site and/or are not considered properties of concern.

4.2 Physical Setting Sources

Topography

According to the USGS Topographic Maps, reviewed by Langan in EDR's Historical Topographic Map Report, the Site is at approximately 37 feet above mean sea level (msl). The Site topography is generally flat, and slopes down toward the north. Photographs showing the current Site use are provided in Appendix A.

Geology and Hydrogeology

Subsurface information was obtained from environmental investigations conducted at the Site by other consultants. Shallow subsurface soil consists of sandy silty clay from approximately zero to 10 feet bgs. A sand and gravel layer extends from approximately 10 to 26 feet bgs.

Groundwater was encountered at a depth of approximately 10.5 feet bgs under confined conditions in the sand and gravel layer extending from approximately 10 to 26 feet bgs. The nearest surface water is Stevens Creek, approximately 0.5 miles east of the Site. The Site is approximately 1.8 miles south of the shoreline of the San Francisco Bay. Groundwater is anticipated to flow toward the north.

4.3 Surface Water and Flood Plain Conditions

Surface Water

Stevens Creek is the nearest surface water body, approximately 0.5 miles east of the Site.

Flood Plain

According to the Federal Emergency Management Agency Map Service Center, the Site is not in a flood plain area.

4.4 Nearby Well Locations

Langan's Site reconnaissance and our review of GeoTracker identified one active water supply well in the vicinity of the Site at the intersection of Terra Bella Avenue and North Shoreline Boulevard.

4.5 Historical Use Information on the Site, Adjoining Properties, and Surrounding Properties

Aerial Photograph Review

Langan reviewed aerial photographs to evaluate past uses and relevant characteristics of the Site and surrounding properties. We reviewed the following aerial photographs from EDR: 1939, 1943, 1948, 1950, 1956, 1963, 1968, 1974, 1982, 1991, 1998, 2005, 2006, 2009, 2010, and 2012. Appendix D contains copies of the aerial photographs from EDR.

In the 1939, 1943, 1948, 1950, and 1956 aerial photographs, the Site appears to be occupied by residential homes and agricultural structures and being used for agricultural purposes. The Site and surrounding land becomes increasingly developed with residential properties towards the end of this time period (1939 to 1956).

In 1963, portions of the Site and land south and east of the Site were redeveloped into light industrial warehouses. Sub-developments begin appearing within 0.25 miles of the Site, and Highway 101 is expanded from a two-lane highway to a three-lane highway.

By 1982, the Site and the surrounding land have become fully developed into mix-use residential and light industrial real estate, and by 1991 the Site has been developed entirely into light industrial and commercial real estate. Between 1991 and 2012 the Site remains relatively unchanged.

Sanborn Maps Review

Langan requested Sanborn Fire Insurance Maps from EDR for the Site and adjoining properties. Sanborn Maps provide information on structures related to building construction and materials that could impact fires, i.e. gasoline tanks, chemical storage, etc. within these structures. According to EDR, they have no Sanborn Fire Insurance Map coverage for the Site. The "No Coverage" page is included in Appendix E of this report.

Historical Topography Maps Review

Langan reviewed the following Historical Topography Maps from EDR: 1897, 1899, 1902, 1943, 1947, 1948, 1953, 1961, 1968, 1973, 1981, 1995, 1997, and 2012. Appendix F contains copies of the Historical Topography Maps.

The general topography at the Site ranges from approximately 39 to 34 feet above msl, with the average Site elevation listed on the EDR Radius Map report at 37 feet above msl.

City Directory Review

Langan reviewed the following city directory abstracts obtained from EDR. City Directories were reviewed for the years 1922 to 2014. The Site was listed on the EDR City Directory as previously occupied by various residences, telecommunications facilities, electronics manufacturers, insurance and consultant office buildings, a café, a plaster company, and a semiconductor parts manufacturer from 1957 through 2014. The adjacent properties are occupied by various private residences and commercial properties including a gasoline service station, a restaurant, laboratories, a construction company, a performing arts theatre, and technology companies from at least 1950 through 2014. Appendix G contains a copy of the City Directory Report.

4.6 Previous Environmental Reports

Langan has reviewed the following documents for the Site:

- Environmental Risk Specialties Corporation, *Phase I & II ESA, 1005 & 1015 North Shoreline Boulevard and 1150 Terra Bella Avenue, Mountain View, California*, date 16 March 2011;
- Applied Water Resources (AWR), *Phase I ESA, 1023 Shoreline Boulevard, Mountain View, California*, dated 10 October 2013;
- AWR, *Phase I ESA, 1062 Linda Vista, Mountain View, California*, dated 10 October 2013;
- AWR, *Phase I ESA, 1043 Shoreline Boulevard, Mountain View, California*, dated 10 October 2013;
- AWR, *Phase I ESA, 1130 Terra Bella, Mountain View, California*, dated 10 January 2014;
- AWR, *Phase I ESA, 1160-1170 Terra Bella, Mountain View, California*, dated 10 January 2014;
- AWR, *Phase I ESA, 1091 North Shoreline Boulevard, Mountain View, California*, dated 25 April 2014;
- Cornerstone Earth Group (CEG), *Preliminary Soil Vapor Quality Evaluation, 1001 North Shoreline Boulevard, Mountain View, California*, dated 16 June 2015;
- CEG, *Site Management Plan, 1001 North Shoreline Boulevard, Mountain View, California 94043*, dated 15 September 2015;

- County of Santa Clara, Department of Environmental Health, *Voluntary Cleanup Program: Calvano/CRP Mountain View, 1001 N Shoreline Blvd., Mountain View, CA; SCCo Case No. 06S2W15M04s*, dated 23 October 2015.

- TestAmerica Laboratories Inc., *Analytical Report – 1005 N. Shoreline*, dated 13 July 2016.

- West Environmental Services & Technology, *Summary of Environmental Site Assessments, 1001 N. Shoreline Boulevard, Mountain View, California,* dated 14 February 2017.

- West Environmental Services & Technology, *Groundwater Conditions Summary, 1001 N. Shoreline Boulevard, Mountain View, California,* dated 27 March 2017.

Significant findings are discussed below.

4.6.1 Environmental Risk Specialties Corporation, *Phase I & II ESA, 1005 & 1015 North Shoreline Boulevard and 1150 Terra Bella Avenue, Mountain View, California*, date 16 March 2011

As a part of the Phase II of this investigation, in March 2011, Environmental Risk Specialties Corporation collected soil samples from the rear fenced yard of former address 1015 North Shoreline Boulevard. Soil samples were collected using a hand auger from 0 to 0.5 feet bgs and 2.5 to 3 feet bgs at four locations. Soil samples were analyzed for VOCs by USEPA Method 8260B. No VOCs were detected in any of the analyzed soil samples.

4.6.2 Cornerstone Earth Group, Preliminary Soil Vapor Quality Evaluation, 1001 North Shoreline Boulevard, Mountain View, California, dated 16 June 2015

In June 2015, CEG conducted a Preliminary Soil Vapor Quality Evaluation at 1001 North Shoreline Boulevard Site to assess the need for vapor intrusion mitigation measures for the four-story office building planned for construction at the Site. Seven soil vapor samples were collected and compared to the 2015 RWQCB residential and commercial environmental screening levels (ESLs) for soil gas vapor intrusion human health risk levels. Benzene was detected above its laboratory reporting limit in five of seven samples. Two of the five detected concentrations of benzene (69 micrograms per cubic meter [µg/m^3] and 99 µg/m^3) were reported above the residential ESL of 42 µg/m^3, however, the 2015 commercial ESL [420 µg/m^3] was not exceeded. Tetrachloroethene (PCE) was detected above laboratory reporting limits from two of seven samples. Both detections of PCE (720 µg/m^3 and 740 µg/m^3) were above the 2015 residential ESL (210 µg/m^3); however, concentrations did not exceed the 2015 commercial ESL (2,100 µg/m^3).

TPH-g and other VOCs were detected in the soil vapor samples; however, detections of these compounds were below the respective commercial screening levels. Based on this data, vapor intrusion mitigation measures were determined not to be required for the planned commercial development.

4.6.3 CEG, Site Management Plan, 1001 North Shoreline Boulevard, Mountain View, California 94043, dated 15 September 2015.

CEG summarized the Site history referencing numerous Phase I ESAs and investigations completed by CEG and other consultants between 1990 and 2015 in their SMP dated 15 September 2015. CEG determined the Site was generally agricultural land until the late 1930s. Site uses since then have included residences, warehouses, office space, and light industrial activities.

According to the SMP, the property formerly located at 1130 Terra Bella Avenue had been used for agricultural purposes until 1939 and then used by Pennel Plastering and a residence from 1948 until the late 1970s. Mesa Technologies operated on a portion of the property until 1989 as an instrument and electronics company and warehouse. In 1987, a fire occurred at the Mesa Technologies facility, rupturing a container of holding acid, which in turn resulted in an acid spill reaching an outside storm water drain inlet. Per a letter dated 26 October 1987 from the City of Mountain View, the spill was successfully contained by the CMVFD and cleaned up by the Mountain View Maintenance Department. The SMP states that a groundwater assessment was completed in 1988 identifying that acids, caustic/alkaline cleaner, cyanide, photo resist stripper and flammable solvents had been stored at the Mesa Technology facility in 55-gallon drums, and that industrial wastewater was treated on-Site in a neutralization sump, consisting of a concrete pit in the ground permitted by the City of Mountain View for neutralization of corrosives and acids. Under the oversight of CMVFD, the neutralization pit was removed in 1989 and sampling within the vicinity of the former pit concluded that no releases of hazardous materials had occurred.

Additionally, the SMP summarizes investigations documenting regional groundwater impacts in the general area of the Site. An investigation in 1988 was conducted to determine if the former Mesa Technology facility at 1130 Terra Bella Avenue had contributed to a regional contaminant plume beneath the Site. One upgradient and two downgradient monitoring wells were installed at the Site to establish background groundwater chemical characteristics. TCE was detected in both upgradient and downgradient wells at the Site ranging between 13 and 240 µg/L. The greatest concentration of TCE (240 µg/L) was detected downgradient of the former

neutralization sump; however, concentrations of TCE were also detected from the upgradient sample at a concentration of 33 µg/L. Because TCE and trans 1,2-dichloroethene (trans 1,2-DCE) were detected in the upgradient well, the source of VOC contamination in groundwater was determined to likely be from an off-Site source.

Further sampling performed in July 2005, detected TCE in all three monitoring wells at concentrations ranging between 33 µg/L and 46 µg/L, with the greatest concentration detected from the upgradient well. Trans-1,2-DCE was also detected at a concentration of 0.64 µg/L in the upgradient well. No TPH compounds were detected in groundwater monitoring wells. All three monitoring wells were destroyed in September 2015. The Site is still an open case, number 06S2W15M04s under SCCLOP.

5.0 SITE RECONNAISSANCE

5.1 Methodology and Limiting Conditions

The Site reconnaissance was conducted in a systematic manner focusing on the spatial extent of the Site and then progressing to the adjacent and surrounding properties.

The assessment of the adjacent and surrounding properties was limited to identifying, if possible, any indications of past or current use that may involve the use, storage, disposal, or generation of hazardous substances or petroleum products; noting the general type of current use; the general topography of the surrounding area; and providing a general description of adjoining or adjacent structures.

Mr. Joshua Osborne of Langan performed a Site and vicinity reconnaissance on behalf of Langan on 6 December 2017. Appendix A contains photographs from the Site reconnaissance.

5.2 General Site Setting and Reconnaissance Observations

The Site contains one partially complete, four-story commercial building, a paved parking lot, landscaping, and recreational facilities (i.e. basketball and volleyball court).

The Site is in a mixed-use area (including residential, commercial, and light industrial) within the City of Mountain View. The Site building is currently under construction with parking and recreational area predominantly completed. Photographs showing the current Site use are provided in Appendix A.

Past Use of Site

Evidence of the previous occupants was not visible during the Site reconnaissance.

Description of Structures

The four-story commercial building under construction is a concrete wall, steel framed, slab-on-grade structure. At the time of the Site reconnaissance, the structure was under construction with the non-structural portions of the slab not yet installed. Construction crews are currently installing ground floor utilities with a vapor barrier and concrete slab to be completed by April 2018. There are no other structures at the Site.

Roads

The Site is bordered by Highway 101 to the north, Linda Vista Avenue to the east, Terra Bella Avenue to the south, and North Shoreline Boulevard to the west.

Storm Drains

Storm drains were observed at the intersection of North Shoreline Boulevard and Terra Bella Avenue, on North Shoreline Boulevard directly south of the Highway 101 on-ramp and at the northern most point of the Site parking lot. Several storm drains were also identified in landscaped areas surrounding the four-story commercial structure. Several other utility vaults and manhole covers were also observed to be located along the Site boundaries.

5.3 Site Observations

Observations of the Site are as follows:

- 1001 North Shoreline Boulevard: At the time of the Site walk, the four-story commercial structure at the Site is currently under construction. Ground floor utilities are currently being installed and interior walls on all four floors of the structure are being erected. Per the design plans for the building, a vapor barrier was installed along the structural footer of the building and additional vapor barrier material was included to facilitate the tie-in of the remaining vapor barrier once utilities have been installed and trenches have been backfilled. Based on a discussion with Dome Construction, construction at the Site will be completed by April 2018.

- The remnants of a stockpile was identified in the southeast corner of the Site at the time of the Site walk. The stockpile was on Visqueen plastic; however, the stockpile was not covered. The source of the stockpile is likely from the recent construction. Based on analytical data provided by the owner related to the soil stockpile, it appears the soil can be handled as a non-hazardous waste.

- A bucket of paint was observed at the time of the Site walk in the eastern most edge of the parking lot.

Hazardous Substances and Petroleum Products in Connection with Identified Uses

Langan did not observe any hazardous substances or petroleum products in connection with identified uses at the time of the Site reconnaissance; however, petroleum powered construction equipment (i.e. grade-all and skid-steer) was being operated at the Site for construction purposes implying that refueling of equipment is taking place at the Site. No above ground refueling tanks were observed during the Site reconnaissance so it is likely that equipment is being refueled via truck-mounted fuel tanks.

Hazardous Substances and Petroleum Product Containers in Connection with Unidentified Uses

Langan observed a five-gallon bucket of paint in the eastern most edge of the parking lot during the Site reconnaissance.

Storage Tanks

Langan did not observe any evidence of above ground or below ground storage tanks at the Site during the time of the Site reconnaissance.

Odors

Langan did not notice any noxious odors at the Site during the reconnaissance.

Pools of Liquids

Langan did not observe pools of liquid at the Site during the reconnaissance.

Drums

Langan did not observe any drums at the Site during the Site reconnaissance.

PCBs

Langan did not observe PCBs or PCB-containing equipment at the Site during the reconnaissance.

Pits, Ponds, or Lagoons

Langan did not observe any pits, ponds, or lagoons at the Site during the reconnaissance.

Stained Soil or Pavement

Langan did not observe any stained soil or pavement at the Site during the Site reconnaissance.

Stressed Vegetation

Langan did not observe stressed vegetation at the Site during the reconnaissance.

Solid Waste

Langan did not observe any solid waste at the Site during the Site reconnaissance.

Wastewater

Langan did not observe wastewater discharges at the Site during the reconnaissance.

Wells

Langan did not observe any wells at the Site during the reconnaissance.

Septic Systems

Langan did not observe septic systems at the Site during the reconnaissance.

Utilities

Utility vaults believed to be related to water lines, electrical lines, gas lines, and storm water lines are present along the Site boundaries.

6.0 INTERVIEWS

6.1 Subject Site User/Owner

For the Phase I ESA, the Site Owner and User of this report were not available for interview.

7.0 VAPOR ENCROACHMENT ASSESSMENT

An evaluation of potential vapor encroachment concern (VEC) was included as consideration for this assessment due to the presence of VOC and TPH contamination in groundwater beneath the Site. Migration, as defined by ASTM E1527-13 Section 3.2.56, is the movement of hazardous substances or petroleum products in any form, including, for example, solid and liquid at the surface or subsurface, and vapor in the subsurface. Vapor intrusion is defined as

the migration of volatile chemicals from the subsurface into overlying buildings. Our assessment for potential vapor encroachment concern or vapor migration at the Site was performed in general accordance with ASTM E1527-13, but did not include an assessment related to vapor intrusion.

Properties within 1/10th of a mile from the Site with current or historical known releases of petroleum hydrocarbons were evaluated as part of the vapor encroachment assessment. Within 1/3rd of a mile of the Site, properties with known or historical releases of other volatile chemicals were evaluated. Langan reviewed EDR's Radius Map Report with GeoCheck and the VEC Application (Appendix C) to evaluate potential vapor encroachment concerns from the surrounding properties meeting the above criteria.

Based on the analysis using the VEC application, Langan identified the following properties as potential sources of vapor encroachment to the Site: properties at 1001 North Shoreline Boulevard, 975 North Shoreline Boulevard, 1090 Terra Bella Avenue, 925 North Shoreline Boulevard, 973 Linda Vista Avenue, 807 North Shoreline Boulevard, 808 North Shoreline Boulevard, 924 San Rafael Avenue, 790 North Shoreline Boulevard, and 760 San Pablo Drive. These properties are within a 1/3 mile radius and upgradient of the Site. The cases for nine of the 10 properties listed above have been closed (1001 North Shoreline Boulevard is currently open); however, there is the potential for residual contamination from some/all of these addresses to exist in soil, soil gas and/or groundwater beneath the Site. As noted above, a vapor barrier is being installed in the current building as a protective measure. Future construction should also include plans for vapor mitigation.

Additional properties not discussed above were not considered by Langan as likely potential sources of vapor encroachment to the Site. Properties evaluated for VEC are included in Appendix C Vapor Encroachment Screen produced using the EDR VEC Application.

8.0 PHASE I ESA FINDINGS AND CONCLUSION

Langan's findings with respect to known and suspect RECs, CRECs, and de minimis conditions, and our opinion of these findings are as follows:

8.1 Known or Suspect RECs

Recognized Environmental Conditions (RECs)

A REC is the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

Based on the databases searched by EDR, requests made for public documentation related to past or present environmental conditions at the Site and surrounding area, our Site reconnaissance, and the reports (provided to Langan by the Client) discussing the previous investigations conducted at the Site, Langan has identified no current recognized environmental conditions (RECs) associated with the Site during this Phase I ESA.

Controlled Recognized Environmental Conditions (CRECs)

A CREC is a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)."

The following Controlled RECs were identified:

CREC 1 – Presence of Volatile Organic Compound Contamination in Soil Gas and Groundwater beneath the Site

Previous investigations at the Site have identified low levels of volatile organic compounds (VOCs) in soil gas and groundwater above 2016 Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs). Previous reports concluded that this contamination most likely migrated onto the Site from an upgradient source(s) and that soil and groundwater management and health and safety issues could be addressed as part of potential Site development activities. A Site Management Plan (SMP) was prepared for the Site and approved under the Santa Clara County Local Oversight Program (SCCLOP). Langan understands that the SMPs mitigation measures, including a vapor barrier, were and are being implemented as part of recent Site redevelopment. Based on our understanding of the City of

Mountain View development approval process, an SMP will be required prior to any additional Site redevelopment and vapor intrusion will be considered as part of the redevelopment process. Therefore, since the upgradient sources have been granted regulatory case closure and an approved SMP is in place at the Site, the presence of VOC contamination in soil gas and groundwater beneath the Site has been identified as a CREC.

CREC 2 – Former Acid Neutralization Sump (1130 Terra Bella Avenue)

A neutralization sump was utilized by Mesa Technology between 1970 and 1988. This sump was used to neutralize acids prior to discharge of industrial waste water from the Mesa Technology facility to the sanitary sewer. In 1987, a fire at 1130 Terra Bella Avenue address resulted in the suspension of Mesa Technologies industrial waste water discharge permit and subsequently the removal of the neutralization sump. All work associated with the removal of the neutralization sump was overseen by the CMVFD. Three monitoring wells (one upgradient and two downgradient) were installed in the vicinity of the former neutralization sump, and groundwater was collected and analyzed for VOCs and metals in 1988. During the 1988 investigation, analytical results indicated that TCE was detected above the established RWQCB Tier 1 ESLs for groundwater of 5 µg/L. The greatest concentration of TCE (240 µg/L) was detected downgradient of the former neutralization sump; however, concentrations of TCE were also detected from the upgradient sample at a concentration of 33 µg/L. At the time of the 1988 investigation, this upgradient detection resulted in an inconclusive determination of the source of the TCE in groundwater. In 1989, the CMVFD granted facility closure with regards to all of the hazardous materials stored and used at the 1130 Terra Bella site.

Additional sampling was conducted in July 2005 and TCE was again detected in all three monitoring wells at concentrations ranging from 33 to 46 µg/L. During this sampling event, the greatest concentration was detected from the upgradient well. As a result of this second round of sampling, previous reports determined the source of TCE was upgradient (to the south of the Site). Since the former acid neutralization sump was approved for closure by the CMVFD and VOC concentrations in groundwater were deemed from an upgradient source, the former acid neutralization sump has been identified as a CREC.

8.2 De Minimis Conditions

As defined by ASTM E1527-13, a de minimis condition is a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies. Possible environmental issues that in Langan's opinion are not likely historical,

controlled or recognized environmental conditions but are de minimis conditions include the following at the Site.

- The presence of several historical and existing petroleum service stations upgradient of the Site could pose a risk for petroleum hydrocarbon related contamination to migrate beneath the Site.

- Several historical leaking underground storage tank (LUST) properties, an acid spill, and the former use of a sump on Site were identified at or upgradient of the Site during the EDR Vapor Encroachment Condition (VEC) evaluation and were identified as possible vapor encroachment concerns for the Site. However, soil gas concentrations observed on the Site were below commercial land use screening levels. Given that an approved SMP is associated with the Site and it states that 'the Developer/Owner shall install a vapor barrier system to effectively eliminate vapor intrusions into the proposed structures' and that soil gas concentrations are below commercial screening levels, the potential for vapor intrusion has been identified as a de minimus condition. However, given that the contamination is from upgradient sources, a site-specific vapor intrusion assessment should be conducted as part of any future development process and vapor mitigation should be employed, if necessary.

8.3 Conclusions

According to the Quality Assurance (QA) Reports (Appendix J) provided by EPRO Services, Inc., the installation of the vapor barrier has been confirmed and was properly tested prior to completion. Based on the regulatory closure granted, the installation of a vapor barrier beneath the recently constructed building and the approved SMP utilized at the site, no additional environmental action is recommended at this time.

8.4 Data Gaps

The Site history could not be researched in five-year intervals back to 1940 because of a lack of readily available information. It is Langan's opinion that this variation from the ASTM standard does not significantly affect the results of this Phase I ESA or the ability to assess the presence of a REC at the Site, because land use did not change frequently enough to warrant a five year interval Site history evaluation.

9.0 DEVIATIONS

This Phase I ESA has been performed without deviation to, and in conformance with, ASTM Practice E 1527-05 and E1527-13 (Standard Practice for ESA: Phase I ESA Process) except as

noted. No expressed or implied representation or warranty is included or intended in the report, except that the services were performed within the limits prescribed by the Client, and with the customary thoroughness and competence of our profession.

10.0 ADDITIONAL SERVICES

The scope of services performed for this study did not include the following non-ASTM required Phase I ESA items: radon, asbestos containing materials (ACM), lead-based paint (LBP), lead in drinking water, polychlorinated biphenyl (PCB)-containing material, wetlands, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, mold, indoor air quality, and biological agents.

12.0 SIGNATURE OF ENVIRONMENTAL PROFESSIONAL

The signatures of the environmental professional(s) responsible for this Phase I ESA are provided on the submittal letter and/or cover page of this report.

13.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

The qualifications of the environmental professionals that conducted this ESA are presented in the resumes provided in Appendix I. Langan declares that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in

#312.10 of 40 CFR 312. Langan has the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Site. Langan has developed and performed the all appropriate inquiries in general conformance with the standards and practices set forth in 40 CFR Part 312.

Commitment

Thank You for your confidence and support. We at First American Title Insurance Company maintain the fundamental principle:

Customer First!

First American Title Insurance Company

INFORMATION

The Title Insurance Commitment is a legal contract between you and the company. It is issued to show the basis on which we will issue a Title Insurance Policy to you. The Policy will insure you against certain risks to the land title, subject to the limitations shown in the policy.

The Company will give you a sample of the Policy form, if you ask.

The Commitment is based on the land title as of the Commitment Date. Any changes in the land title or the transaction may affect the Commitment and the Policy.

The Commitment is subject to its Requirements, Exceptions and Conditions.

This information is not part of the title insurance commitment.

COMMITMENT FOR TITLE INSURANCE

Issued by

First American Title Insurance Company

Agreement to Issue Policy

We agree to issue a policy to you according to the terms of this Commitment.

When we show the policy amount and your name as the proposed insured in Schedule A, this Commitment becomes effective as of the Commitment Date shown in Schedule A.

If the Requirements shown in this Commitment have not been met within six months after the Commitment Date, our obligation under this Commitment will end. Also, our obligation under this Commitment will end when the Policy is issued and then our obligation to you will be under the Policy.

Our obligation under this Commitment is limited by the following:

The Provisions in Schedule A.

The Requirements in Schedule B-1.

The Exceptions in Schedule B-2.

The Conditions.

This Commitment is not valid without Schedule A and Sections 1 and 2 of Schedule B.

SCHEDULE A

1. Commitment Date: November 20, 2017 at 7:30 A.M.

2. Policy or Policies to be issued: Amount

   (A) ALTA Extended Owner's Policy 1402.06 (6-17-06) $TBD

   Proposed Insured:

   To Be Determined

   (B) To Be Determined $TBD

   Proposed Insured:

   To Be Determined

3. (A) The estate or interest in the land described in this Commitment is:

   Fee Simple as to Parcel A of Tract One and Tract Two, an Easement as to Parcels B, C and D of Tract One.

   (B) Title to said estate or interest at the date hereof is vested in:

   Calvano/CRP Mountain View Owner, L.L.C., a Delaware limited liability company

4. The land referred to in this Commitment is situated in the City of Mountain View, County of Santa Clara, State of California, and is described as follows:

   TRACT ONE:

   PARCEL A:

   ALL OF PARCEL 1, AS SHOWN ON THE PARCEL MAP LOT MERGER FILED FOR RECORD IN THE OFFICE OF THE RECORDER OF THE COUNTY OF SANTA CLARA, STATE OF CALIFORNIA, ON MAY 11, 2016 IN BOOK 892 OF MAPS, PAGES 14 THROUGH 20.

   PARCEL B:

   A PRIVATE NON-EXCLUSIVE EASEMENT FOR THE INSTALLATION, MAINTENANCE AND REPAIR OF UTILITIES, UNDER, UPON, OVER AND ACROSS THAT CERTAIN "UTILITY EASEMENT AREA" AS DESCRIBED IN THAT CERTAIN UTILITY EASEMENT AGREEMENT RECORDED MAY 14, 2004 AS INSTRUMENT NO. 17789791, OFFICIAL RECORDS, BEING MORE PARTICULARLY DESCRIBED AS FOLLOWS:

   BEGINNING AT THE MOST EASTERLY CORNER OF SAID PARCEL B; THENCE FROM SAID POINT OF BEGINNING ALONG THE GENERAL EASTERLY LINE OF SAID PARCEL B THE FOLLOWING COURSES: NORTH 88° 18' 09" WEST 38.736 METERS; ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 17.069 METERS, THROUGH A CENTRAL ANGLE OF 22° 38' 52" FOR AN ARC LENGTH OF 6.747 METERS; THENCE LEAVING SAID GENERAL EASTERLY LINE NORTH 63° 42' 25" WEST 12.996 METERS TO THE TRUE POINT OF BEGINNING FOR THIS DESCRIPTION;

THENCE FROM SAID TRUE POINT OF BEGINNING NORTH 63° 42' 25" WEST 46.271 METERS; THENCE NORTH 63° 07' 58" WEST 17.931 METERS; THENCE FROM A TANGENT BEARING OF SOUTH 79° 00' 51" WEST ALONG A CURVE TO THE LEFT WITH A RADIUS OF 39.397 METERS, THROUGH A CENTRAL ANGLE OF 1° 42' 58" FOR AN ARC LENGTH OF 1.180 METERS TO A POINT OF COMPOUND CURVATURE; THENCE ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 62.045 METERS, THROUGH A CENTRAL ANGLE OF 8° 18' 56" FOR AN ARC LENGTH OF 9.005 METERS; THENCE SOUTH 68° 58' 57" WEST 24.371 METERS; THENCE FROM A TANGENT BEARING OF SOUTH 29° 36' 35" WEST ALONG A CURVE TO THE RIGHT WITH A RADIUS OF 1.981 METERS, THROUGH A CENTRAL ANGLE OF 39° 22' 22" FOR AN ARC LENGTH OF 1.361 METERS; THENCE SOUTH 68° 58' 57" WEST 3.063 METERS TO A POINT IN THE WESTERLY LINE OF SAID PARCEL B; THENCE ALONG SAID WESTERLY LINE SOUTH 1° 11' 32" WEST 8.074 METERS; THENCE LEAVING SAID WESTERLY LINE NORTH 68° 58' 57" EAST 25.603 METERS; THENCE ALONG A TANGENT CURVE TO THE RIGHT WITH A RADIUS OF 45.718 METERS, THROUGH A CENTRAL ANGLE OF 20° 12' 11" FOR AN ARC LENGTH OF 16.121 METERS TO THE INTERSECTION THEREOF WITH A LINE PARALLEL WITH AND DISTANCE 7.000 METERS SOUTHWESTERLY, MEASURED AT RIGHT ANGLES FROM ABOVE SAID COURSE WITH A LENGTH OF 17.931 METERS; THENCE ALONG SAID PARALLEL LINE AND A LINE PARALLEL WITH AND DISTANT 7.000 METERS SOUTHWESTERLY, MEASURED AT RIGHT ANGLES, FROM ABOVE SAID COURSE WITH A LENGTH OF 46.271 METERS THE FOLLOWING TWO COURSES: SOUTH 63° 07' 58" EAST 10.917 METERS AND SOUTH 63° 42' 24" EAST 48.577 METERS; THENCE LEAVING SAID PARALLEL LINE NORTH 8° 35' 03" EAST 7.348 METERS TO THE TRUE POINT OF BEGINNING.

PARCEL C:

A PRIVATE NON-EXCLUSIVE EASEMENT FOR THE INSTALLATION, MAINTENANCE AND REPAIR OF UTILITIES, UNDER, UPON, OVER AND ACROSS THAT CERTAIN "STREET EASEMENT AREA" AS DESCRIBED IN THAT CERTAIN UTILITY EASEMENT AGREEMENT RECORDED MAY 14, 2004 AS INSTRUMENT NO. 17789791, OFFICIAL RECORDS, BEING MORE PARTICULARLY DESCRIBED AS FOLLOWS:

BEGINNING AT THE MOST EASTERLY CORNER OF SAID PARCEL B; THENCE FROM SAID POINT OF BEGINNING ALONG THE GENERAL EASTERLY LINE OF SAID PARCEL B THE FOLLOWING COURSES: NORTH 88° 18' 09" WEST 38.736 METERS; ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 17.069 METERS, THROUGH A CENTRAL ANGLE OF 22° 38' 52" FOR AN ARC LENGTH OF 6.747 METERS TO THE TRUE POINT OF BEGINNING FOR THIS DESCRIPTION; THENCE FROM SAID TRUE POINT OF BEGINNING ALONG SAID GENERAL EASTERLY LINE THE FOLLOWING TWO COURSES: FROM A TANGENT BEARING SOUTH 69° 02' 59" WEST, ALONG A CURVE TO THE LEFT WITH A RADIUS OF 17.069 METERS, THROUGH A CENTRAL ANGLE OF 67° 51' 04" FOR A LENGTH OF 20.213 METERS AND SOUTH 1° 11' 54" WEST 5.673 METERS; THENCE LEAVING SAID GENERAL EASTERLY LINE, FROM A TANGENT BEARING OF NORTH 21° 56' 33" WEST ALONG A CURVE TO THE LEFT WITH A RADIUS OF 18.500 METERS, THROUGH A CENTRAL ANGLE OF 9° 24' 30" FOR AN ARC LENGTH OF 3.038 METERS TO A POINT OF REVERSE CURVATURE; THENCE ALONG A TANGENT CURVE TO THE RIGHT WITH A RADIUS OF 12.200 METERS, THROUGH A CENTRAL ANGLE OF 39° 56' 06" FOR AN ARC LENGTH OF 8.503 METERS; THENCE NORTH 8° 35' 03" EAST 16.314 METERS; THENCE SOUTH 63° 42' 25" EAST 12.996 METERS TO THE TRUE POINT OF BEGINNING.

PARCEL D:

A PRIVATE NON-EXCLUSIVE EASEMENT FOR INGRESS AND EGRESS, UNDER, UPON, OVER AND ACROSS THAT CERTAIN "INGRESS-EGRESS EASEMENT" AS DESCRIBED IN THAT CERTAIN EASEMENT AGREEMENT RECORDED MAY 14, 2004 AS INSTRUMENT NO. 17789792, OFFICIAL RECORDS, BEING MORE PARTICULARLY DESCRIBED AS FOLLOWS:

BEGINNING AT A POINT IN THE EASTERLY LINE OF SAID PARCEL B; SAID POINT BEARS, ALONG SAID EASTERLY LINE, NORTH 1° 11' 54" EAST 7.297 METERS FROM THE SOUTHEAST CORNER OF SAID PARCEL B; THENCE FROM SAID POINT OF BEGINNING, ALONG SAID EASTERLY LINE, NORTH 1° 11' 54" EAST 7.315 METERS; THENCE LEAVING SAID EASTERLY

LINE NORTH 88° 46' 47" WEST 79.037 METERS; THENCE ALONG A TANGENT CURVE TO THE RIGHT WITH A RADIUS OF 8.000 METERS, THROUGH A CENTRAL ANGLE OF 90° 02' 27" FOR AN ARC LENGTH OF 12.572 METERS; THENCE NORTH 1° 15' 40" EAST 45.723 METERS; THENCE SOUTH 66° 38' 18" WEST 9.137 METERS TO A POINT IN THE WESTERLY LINE OF SAID PARCEL B; THENCE ALONG SAID WESTERLY LINE SOUTH 1° 11' 32" WEST 22.678 METERS TO A WESTERLY CORNER OF SAID PARCEL B; THENCE SOUTH 88° 48' 28" EAST 0.964 METERS TO A POINT IN A LINE PARALLEL WITH AND DISTANT 7.315 METERS WESTERLY, MEASURED AT RIGHT ANGLES, FROM ABOVE SAID COURSE WITH A LENGTH OF 45.723 METERS; THENCE ALONG SAID PARCEL LINE SOUTH 1° 15' 40" WEST 31.563 METERS; THENCE LEAVING SAID PARALLEL LINE, ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 3.000 METERS, THROUGH A CENTRAL ANGLE OF 90° 02' 27" FOR AN ARC LENGTH OF 4.715 METERS TO A POINT IN A LINE PARALLEL WITH AND DISTANT 7.315 METERS SOUTHERLY, MEASURED AT RIGHT ANGLES, FROM ABOVE SAID COURSE WITH A LENGTH OF 79.037 METERS; THENCE ALONG SAID PARALLEL LINE SOUTH 88° 46' 47" EAST 91.363 METERS TO THE POINT OF BEGINNING.

TRACT TWO:

BEGINNING AT A POINT ON THE NORTHWESTERLY LINE OF PARCEL 2 AS DESCRIBED IN THE DIRECTOR'S DEED (STATE PARCEL NO. 11987-DD) FROM THE STATE OF CALIFORNIA TO GEORGE T. HEMMETER AND ANNE B. HEMMETER, HIS WIFE, AS JOINT TENANTS RECORDED JANUARY 17, 1961 IN VOLUME 5043 OF OFFICIAL RECORDS, PAGE 683, SANTA CLARA COUNTY RECORDS, SAID POINT BEING AT THE NORTHEASTERLY TERMINUS OF THE COURSE DESCRIBED IN SAID PARCEL 2 AS "NORTH 66° 37' 26" EAST 325.40 FEET"; THENCE FROM SAID POINT OF BEGINNING, ALONG SAID NORTHWESTERLY LINE, FROM A TANGENT BEARING OF NORTH 66° 38' 18" EAST ALONG A CURVE TO THE RIGHT WITH A RADIUS OF 200.00 FEET, THROUGH A CENTRAL ANGLE OF 1° 09' 44", FOR AN ARC LENGTH OF 4.06 FEET; THENCE LEAVING SAID NORTHWESTERLY LINE, FROM A TANGENT BEARING OF NORTH 67° 53' 44" WEST ALONG A CURVE TO THE LEFT WITH A RADIUS OF 71.18 FEET, THROUGH A CENTRAL ANGLE OF 31° 30' 51", FOR AN ARC LENGTH OF 39.15 FEET; THENCE SOUTH 80° 35' 25" WEST 203.11 FEET; THENCE ALONG A TANGENT CURVE TO THE LEFT WITH A RADIUS OF 200.00 FEET, THROUGH A CENTRAL ANGLE OF 67° 56' 09", FOR AN ARC LENGTH OF 237.14 FEET; THENCE SOUTH 12° 39' 16" WEST 66.01 FEET TO A POINT IN THE NORTHWESTERLY LINE OF PARCEL 1 AS DESCRIBED IN SAID DIRECTOR'S DEED; THENCE ALONG LAST SAID NORTHWESTERLY LINE, THE SOUTHEASTERLY LINE OF PARCEL 2 AS DESCRIBED IN SAID STATE PARCEL NO. 11986 AND SAID NORTHWESTERLY LINE OF SAID PARCEL 2 AS DESCRIBED IN SAID DIRECTOR'S DEED, FROM A TANGENT BEARING OF NORTH 12° 39' 16" EAST ALONG A CURVE TO THE RIGHT WITH A RADIUS OF 150.00 FEET, THROUGH A CENTRAL ANGLE OF 53° 59' 02", FOR AN ARC LENGTH OF 141.33 FEET: AND NORTH 66° 38' 18" EAST 354.11 FEET TO THE POINT OF BEGINNING.

APN(s): 153-15-032 (Tract One) and 153-15-033 (Tract Two)

SCHEDULE B

SECTION ONE

REQUIREMENTS

The following requirements must be met:

(A) Pay the agreed amounts for the interest in the land and/or the mortgage to be insured.

(B) Pay us the premiums, fees and charges for the policy.

(C) Documents satisfactory to us creating the interest in the land and/or the mortgage to be insured must be signed, delivered and recorded.

(D) You must tell us in writing the name of anyone not referred to in this Commitment who will get an interest in the land or who will make a loan on the land. We may then make additional requirements or exceptions.

(E) Releases(s) or Reconveyance(s) of Item(s): 30, 33, 35, 37, 39 and 40

(F) Other: None

(G) You must give us the following information:
1. Any off record leases, surveys, etc.
2. Statement(s) of Identity, all parties.
3. Other: None

The following additional requirements, as indicated by "X", must be met:

[X] (H) Provide information regarding any off-record matters, which may include, but are not limited to: leases, recent works of improvement, or commitment statements in effect under the Environmental Responsibility Acceptance Act, Civil Code Section 850, et seq.

The Company's Owner's Affidavit form (as provided by company) must be completed and submitted prior to close in order to satisfy this requirement. This Commitment will then be subject to such further exceptions and/or requirements as may be deemed necessary.

[X] (I) An ALTA/NSPS survey of recent date, which complies with the current minimum standard detail requirements for ALTA/NSPS land title surveys, must be submitted to the Company for review. This Commitment will then be subject to such further exceptions and/or requirements as may be deemed necessary.

[X] (J) The following LLC documentation is required:
(i) a copy of the Articles of Organization
(ii) a copy of the Operating Agreement, if applicable
(iii) a Certificate of Good Standing and/or other evidence of current Authority to Conduct Business within the State
(iv) express Company Consent to the current transaction

[] (K) The following partnership documentation is required **:**
(i) a copy of the partnership agreement, including all applicable amendments thereto
(ii) a Certificate of Good Standing and/or other evidence of current Authority to Conduct Business within the State
(iii) express Partnership Consent to the current transaction

[] (L) The following corporation documentation is required:
(i) a copy of the Articles of Incorporation
(ii) a copy of the Bylaws, including all applicable Amendments thereto
(iii) a Certificate of Good Standing and/or other evidence of current Authority to Conduct Business within the State
(iv) express Corporate Resolution consenting to the current transaction

[**X**] (M) Based upon the Company's review of that certain partnership/operating agreement dated **Not disclosed** for the proposed insured herein, the following requirements must be met:

Any further amendments to said agreement must be submitted to the Company, together with an affidavit from one of the general partners or members stating that it is a true copy, that said partnership or limited liability company is in full force and effect, and that there have been no further amendments to the agreement. This Commitment will then be subject to such further requirements as may be deemed necessary.

[] (N) A copy of the complete lease, as referenced in Schedule A, #3 herein, together with any amendments and/or assignments thereto, must be submitted to the Company for review, along with an affidavit executed by the present lessee stating that it is a true copy, that the lease is in full force and effect, and that there have been no further amendments to the lease. This Commitment will then be subject to such further requirements as may be deemed necessary.

[X] (O) Approval from the Company's Underwriting Department must be obtained for issuance of the policy contemplated herein and any endorsements requested thereunder. This Commitment will then be subject to such further requirements as may be required to obtain such approval.

[X] (P) Potential additional requirements, if ALTA Extended coverage is contemplated hereunder, and work on the land has commenced prior to close, some or all of the following requirements, and any other requirements which may be deemed necessary, may need to be met:

[X] (Q) The Company's "Indemnity Agreement I" must be executed by the appropriate parties.

[X] (R) Financial statements from the appropriate parties must be submitted to the Company for review.

[X] (S) A copy of the construction contract must be submitted to the Company for review.

[X] (T) An inspection of the land must be performed by the Company for verification of the phase of construction.

[X] (U) The Company's "Mechanic's Lien Risk Addendum" form must be completed by a Company employee, based upon information furnished by the appropriate parties involved.

SCHEDULE B

SECTION TWO

EXCEPTIONS

Any policy we issue will have the following exceptions unless they are taken care of to our satisfaction. The printed exceptions and exclusions from the coverage of the policy or policies are set forth in Exhibit A attached. Copies of the policy forms should be read. (Affects Tract Two)

4. The lien of supplemental taxes, if any, assessed pursuant to Chapter 3.5 commencing with Section 75 of the California Revenue and Taxation Code.

5. Covenants, conditions, restrictions and easements in the document recorded January 29, 1929 in Book 442, Page 312 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

   (Affects Parcel A of Tract One)

6. Covenants, conditions, restrictions and easements in the document recorded May 07, 1932 in Book 616, Page 29 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

   (Affects Tract Two)

7. Covenants, conditions, restrictions and easements in the document recorded July 25, 1933 in Book 661, Page 38 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

   (Affects Parcel A of Tract One)

8. Covenants, conditions, restrictions and easements in the document recorded January 10, 1934 in Book 671, Page 396 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

   (Affects Tract Two)

9. Covenants, conditions, restrictions and easements in the document recorded September 24, 1934 in Book 699, Page 435 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

   (Affects Parcel A of Tract One with other property)

10. Covenants, conditions, restrictions and easements in the document recorded April 20, 1939 in Book 930, Page 134 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

    (Affects Parcel A of Tract One)

11. Covenants, conditions, restrictions and easements in the document recorded May 24, 1939 in Book 937, Page 47 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

    (Affects Parcel A of Tract One)

12. Covenants, conditions, restrictions and easements in the document recorded July 10, 1940 in Book 989, Page 481 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

    (Affects Parcel A of Tract One)

13. Covenants, conditions, restrictions and easements in the document recorded December 06, 1945 in Book 1320, Page 59 of Official Records, but deleting any covenant, condition or restriction indicating a preference, limitation or discrimination based on race, color, religion, sex, handicap, familial status, national origin, sexual orientation, marital status, ancestry, source of income or disability, to the extent such covenants, conditions or restrictions violate Title 42, Section 3604(c), of the United States Codes. Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.

    (Affects Parcel A of Tract One)

14. Abutter's rights of ingress and egress to or from freeway have been relinquished in the document recorded October 01, 1957 in Book 3902, Page 693 of Official Records.

    (Affects Tract One and Two)

15. An easement for public street and public utilities and incidental purposes, recorded September 22, 1960 in Book 4925, Page 284 of Official Records.

In Favor of:	City of Mountain View, a municipal corporation
Affects:	As described therein

Trustor:	Calvano/CRP Mountain View Owner, L.L.C., a Delaware limited liability company
Trustee:	Fidelity National Title Insurance Company
Beneficiary:	U.S. Bank National Association, a national banking association

The above deed of trust states that it is a construction deed of trust.

A document recorded July 15, 2016 as Instrument No. 23366896, of Official Records provides that the Deed of Trust/Mortgage or the obligation secured thereby has been modified.

39. Any statutory lien for labor or materials arising by reason of a work of improvement, as disclosed by a document recorded March 01, 2016 as Instrument No. 23232532 of Official Records.

40. A financing statement recorded March 01, 2016 as Instrument No. 23232533 of Official Records.

Debtor:	Calvano/CRP Mountain View Owner, L.L.C.
Secured party:	U.S. Bank National Association

41. A financing statement recorded March 01, 2016 as Instrument No. 23232534 of Official Records.

Debtor:	Calvano/CRP Mountain View Owner, L.L.C.
Secured party:	U.S. Bank National Association

An amendment to the financing statement was recorded July 15, 2016 as Instrument No. 23366897 of Official Records.

An amendment to the financing statement was recorded November 08, 2016 as Instrument No. 23490372 of Official Records.

42. Terms and provisions of an unrecorded lease dated December 17, 2016, by and between Calvano/CRP Mountain View Owner, L.L.C., a Delaware limited liability company as lessor and Google Inc., a Delaware corporation as lessee, as disclosed by a Memorandum of Lease recorded April 20, 2016 as Instrument No. 23281562 of Official Records.

Defects, liens, encumbrances or other matters affecting the leasehold estate, whether or not shown by the public records are not shown herein.

(Affects Tract One and Tract Two)

43. The terms and provisions contained in the document entitled "Memorandum of Agreement Regarding Lease and Purchase Options" recorded April 20, 2015 as Instrument No. 23281563 of Official Records. By and between Calvano/CRP Mountain View Owner, L.L.C., a Delaware limited liability company and Google Inc., a Delaware corporation.

(Affects Tract One and Tract Two)

44. An easement shown or dedicated on the map filed or recorded May 11, 2016 in Book 892, Page 14 through 20 of Maps

For:	Emergency vehicle access and incidental purposes.

(Affects Tract One)

45. An easement for state utilities, landscaping irrigation mainline, drainage and maintenance purpose and incidental purposes, recorded July 15, 2016 as Instrument No. 23366895 of Official Records.

In Favor of: The State of California
Affects: As described therein

(Affects Tract Two)

46. Abutter's rights of ingress and egress to or from adjacent state freeway have been relinquished in the document recorded July 15, 2016 as Instrument No. 23366895 of Official Records.

(Affects Tract Two)

47. The terms and provisions contained in the document entitled "Stormwater Management Facilities Operation and Maintenance Agreement" recorded August 30, 2017 as Instrument No. 23741562 of Official Records. By and between Calvano/CRP Mountain View Owner, L.L.C., a Delaware limited liability company and City of Mountain View, a California charter city and municipal corporation.

(Affects Parcel A of Tract One)

48. Any facts, rights, interests or claims which would be disclosed by a correct ALTA/NSPS survey.

49. Rights of parties in possession.

INFORMATIONAL NOTES

1. According to the latest available equalized assessment roll in the office of the county tax assessor, there is located on the land a Commercial Structure known as 3675 Mount Diablo Boulevard, Mountain View, California.

2. According to the public records, there has been no conveyance of the land within a period of twenty four months prior to the date of this report, except as follows:

   A document recorded July 15, 2016 as Instrument No. 23366895 of Official Records.

From:	The State of California
To:	Calvano/CRP Mountain View Owner, L.L.C., a Delaware limited liability company

   (Affects Tract Two)

3. This preliminary report/commitment was prepared based upon an application for a policy of title insurance that identified land by street address or assessor's parcel number only. It is the responsibility of the applicant to determine whether the land referred to herein is in fact the land that is to be described in the policy or policies to be issued.

The map attached, if any, may or may not be a survey of the land depicted hereon. First American Title Insurance Company expressly disclaims any liability for loss or damage which may result from reliance on this map except to the extent coverage for such loss or damage is expressly provided by the terms and provisions of the title insurance policy, if any, to which this map is attached.

CONDITIONS

1. **DEFINITIONS**
(a)"Mortgage" means mortgage, deed of trust or other security instrument.
(b)"Public Records" means title records that give constructive notice of matters affecting the title according to the state law where the land is located.

2. **LATER DEFECTS**
The Exceptions in Schedule B - Section Two may be amended to show any defects, liens or encumbrances that appear for the first time in the public records or are created or attached between the Commitment Date and the date on which all of the Requirements (a) and (c) of Schedule B - Section One are met. We shall have no liability to you because of this amendment.

3. **EXISTING DEFECTS**
If any defects, liens or encumbrances existing at Commitment Date are not shown in Schedule B, we may amend Schedule B to show them. If we do amend Schedule B to show these defects, liens or encumbrances, we shall be liable to you according to Paragraph 4 below unless you knew of this information and did not tell us about it in writing.

4. **LIMITATION OF OUR LIABILITY**
Our only obligation is to issue to you the Policy referred to in this Commitment, when you have met its Requirements. If we have any liability to you for any loss you incur because of an error in this Commitment, our liability will be limited to your actual loss caused by your relying on this Commitment when you acted in good faith to:

comply with the Requirements shown in Schedule B - Section One
or
eliminate with our written consent any Exceptions shown in Schedule B - Section Two.

We shall not be liable for more than the Policy Amount shown in Schedule A of this Commitment and our liability is subject to the terms of the Policy form to be issued to you.

5. **CLAIMS MUST BE BASED ON THIS COMMITMENT**
Any claim, whether or not based on negligence, which you may have against us concerning the title to the land must be based on this commitment and is subject to its terms.

First American Title

Privacy Information

We Are Committed to Safeguarding Customer Information

In order to better serve your needs now and in the future, we may ask you to provide us with certain information. We understand that you may be concerned about what we will do with such information - particularly any personal or financial information. We agree that you have a right to know how we will utilize the personal information you provide to us. Therefore, together with our subsidiaries we have adopted this Privacy Policy to govern the use and handling of your personal information.

Applicability

This Privacy Policy governs our use of the information that you provide to us. It does not govern the manner in which we may use information we have obtained from any other source, such as information obtained from a public record or from another person or entity. First American has also adopted broader guidelines that govern our use of personal information regardless of its source. First American calls these guidelines its Fair Information Values.

Types of Information

Depending upon which of our services you are utilizing, the types of nonpublic personal information that we may collect include:

- Information we receive from you on applications, forms and in other communications to us, whether in writing, in person, by telephone or any other means;
- Information about your transactions with us, our affiliated companies, or others; and
- Information we receive from a consumer reporting agency.

Use of Information

We request information from you for our own legitimate business purposes and not for the benefit of any nonaffiliated party. Therefore, we will not release your information to nonaffiliated parties except: (1) as necessary for us to provide the product or service you have requested of us; or (2) as permitted by law. We may, however, store such information indefinitely, including the period after which any customer relationship has ceased. Such information may be used for any internal purpose, such as quality control efforts or customer analysis. We may also provide all of the types of nonpublic personal information listed above to one or more of our affiliated companies. Such affiliated companies include financial service providers, such as title insurers, property and casualty insurers, and trust and investment advisory companies, or companies involved in real estate services, such as appraisal companies, home warranty companies and escrow companies. Furthermore, we may also provide all the information we collect, as described above, to companies that perform marketing services on our behalf, on behalf of our affiliated companies or to other financial institutions with whom we or our affiliated companies have joint marketing agreements.

Former Customers

Even if you are no longer our customer, our Privacy Policy will continue to apply to you.

Confidentiality and Security

We will use our best efforts to ensure that no unauthorized parties have access to any of your information. We restrict access to nonpublic personal information about you to those individuals and entities who need to know that information to provide products or services to you. We will use our best efforts to train and oversee our employees and agents to ensure that your information will be handled responsibly and in accordance with this Privacy Policy and First American's Fair Information Values. We currently maintain physical, electronic, and procedural safeguards that comply with federal regulations to guard your nonpublic personal information.

Information Obtained Through Our Web Site

First American Financial Corporation is sensitive to privacy issues on the Internet. We believe it is important you know how we treat the information about you we receive on the Internet.

In general, you can visit First American or its affiliates' Web sites on the World Wide Web without telling us who you are or revealing any information about yourself. Our Web servers collect the domain names, not the e-mail addresses, of visitors. This information is aggregated to measure the number of visits, average time spent on the site, pages viewed and similar information. First American uses this information to measure the use of our site and to develop ideas to improve the content of our site.

There are times, however, when we may need information from you, such as your name and email address. When information is needed, we will use our best efforts to let you know at the time of collection how we will use the personal information. Usually, the personal information we collect is used only by us to respond to your inquiry, process an order or allow you to access specific account/profile information. If you choose to share any personal information with us, we will only use it in accordance with the policies outlined above.

Business Relationships

First American Financial Corporation's site and its affiliates' sites may contain links to other Web sites. While we try to link only to sites that share our high standards and respect for privacy, we are not responsible for the content or the privacy practices employed by other sites.

Cookies

Some of First American's Web sites may make use of "cookie" technology to measure site activity and to customize information to your personal tastes. A cookie is an element of data that a Web site can send to your browser, which may then store the cookie on your hard drive.

FirstAm.com uses stored cookies. The goal of this technology is to better serve you when visiting our site, save you time when you are here and to provide you with a more meaningful and productive Web site experience.

Fair Information Values

Fairness We consider consumer expectations about their privacy in all our businesses. We only offer products and services that assure a favorable balance between consumer benefits and consumer privacy.

Public Record We believe that an open public record creates significant value for society, enhances consumer choice and creates consumer opportunity. We actively support an open public record and emphasize its importance and contribution to our economy.

Use We believe we should behave responsibly when we use information about a consumer in our business. We will obey the laws governing the collection, use and dissemination of data.

Accuracy We will take reasonable steps to help assure the accuracy of the data we collect, use and disseminate. Where possible, we will take reasonable steps to correct inaccurate information. When, as with the public record, we cannot correct inaccurate information, we will take all reasonable steps to assist consumers in identifying the source of the erroneous data so that the consumer can secure the required corrections.

Education We endeavor to educate the users of our products and services, our employees and others in our industry about the importance of consumer privacy. We will instruct our employees on our fair information values and on the responsible collection and use of data. We will encourage others in our industry to collect and use information in a responsible manner.

Security We will maintain appropriate facilities and systems to protect against unauthorized access to and corruption of the data we maintain.

EXHIBIT A
LIST OF PRINTED EXCEPTIONS AND EXCLUSIONS (BY POLICY TYPE)

1. CALIFORNIA LAND TITLE ASSOCIATION STANDARD COVERAGE POLICY - 1990
SCHEDULE B

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:

1. Taxes or assessments which are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the public records. Proceedings by a public agency which may result in taxes or assessments, or notice of such proceedings, whether or not shown by the records of such agency or by the public records.
2. Any facts, rights, interests, or claims which are not shown by the public records but which could be ascertained by an inspection of the land or which may be asserted by persons in possession thereof.
3. Easements, liens or encumbrances, or claims thereof, which are not shown by the public records.
4. Discrepancies, conflicts in boundary lines, shortage in area, encroachments, or any other facts which a correct survey would disclose, and which are not shown by the public records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the public records.

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance or governmental regulation (including but not limited to building and zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating to (i) the occupancy, use, or enjoyment of the land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the land; (iii) a separation in ownership or a change in the dimensions or area of the land or any parcel of which the land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that a notice of the enforcement thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
   (b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the public records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without knowledge.
3. Defects, liens, encumbrances, adverse claims or other matters:
   (a) whether or not recorded in the public records at Date of Policy, but created, suffered, assumed or agreed to by the insured claimant;
   (b) not known to the Company, not recorded in the public records at Date of Policy, but known to the insured claimant and not disclosed in writing to the Company by the insured claimant prior to the date the insured claimant became an insured under this policy;
   (c) resulting in no loss or damage to the insured claimant;
   (d) attaching or created subsequent to Date of Policy; or
   (e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the insured mortgage or for the estate or interest insured by this policy.
4. Unenforceability of the lien of the insured mortgage because of the inability or failure of the insured at Date of Policy, or the inability or failure of any subsequent owner of the indebtedness, to comply with applicable "doing business" laws of the state in which the land is situated.
5. Invalidity or unenforceability of the lien of the insured mortgage, or claim thereof, which arises out of the transaction evidenced by the insured mortgage and is based upon usury or any consumer credit protection or truth in lending law.
6. Any claim, which arises out of the transaction vesting in the insured the estate or interest insured by their policy or the transaction creating the interest of the insured lender, by reason of the operation of federal bankruptcy, state insolvency or similar creditors' rights laws.

2. AMERICAN LAND TITLE ASSOCIATION OWNER'S POLICY FORM B - 1970
SCHEDULE OF EXCLUSIONS FROM COVERAGE

1. Any law, ordinance or governmental regulation (including but not limited to building and zoning ordinances) restricting or regulating or prohibiting the occupancy, use or enjoyment of the land, or regulating the character, dimensions or location of any improvement now or hereafter erected on the land, or prohibiting a separation in ownership or a reduction in the dimensions of area of the land, or the effect of any violation of any such law, ordinance or governmental regulation.
2. Rights of eminent domain or governmental rights of police power unless notice of the exercise of such rights appears in the public records at Date of Policy.
3. Defects, liens, encumbrances, adverse claims, or other matters (a) created, suffered, assumed or agreed to by the insured claimant; (b) not known to the Company and not shown by the public records but known to the insured claimant either at Date of Policy or at the date such claimant acquired an estate or interest insured by this policy and not disclosed in writing by the insured claimant to the Company prior to the date such insured claimant became an insured hereunder; (c) resulting in no loss or damage to the insured claimant; (d) attaching or created subsequent to Date of Policy; or (e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the estate or interest insured by this policy.

3. AMERICAN LAND TITLE ASSOCIATION OWNER'S POLICY FORM B - 1970
WITH REGIONAL EXCEPTIONS

When the American Land Title Association policy is used as a Standard Coverage Policy and not as an Extended Coverage Policy the exclusions set forth in paragraph 2 above are used and the following exceptions to coverage appear in the policy.

SCHEDULE B

This policy does not insure against loss or damage by reason of the matters shown in parts one and two following:
Part One

1. Taxes or assessments which are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the public records.
2. Any facts, rights, interests, or claims which are not shown by the public records but which could be ascertained by an inspection of said land or by making inquiry of persons in possession thereof.
3. Easements, claims of easement or encumbrances which are not shown by the public records.
4. Discrepancies, conflicts in boundary lines, shortage in area, encroachments, or any other facts which a correct survey would disclose, and which are not shown by public records.
5. Unpatented mining claims; reservations or exceptions in patents or in Acts authorizing the issuance thereof; water rights, claims or title to water.
6. Any lien, or right to a lien, for services, labor or material heretofore or hereafter furnished, imposed by law and not shown by the public records.

4. AMERICAN LAND TITLE ASSOCIATION LOAN POLICY - 1970
WITH A.L.T.A. ENDORSEMENT FORM 1 COVERAGE
SCHEDULE OF EXCLUSIONS FROM COVERAGE

1. Any law, ordinance or governmental regulation (including but not limited to building and zoning ordinances) restricting or regulating or prohibiting the occupancy, use or enjoyment of the land, or regulating the character, dimensions or location of any improvement now or hereafter erected on the land, or prohibiting a separation in ownership or a reduction in the dimensions or area of the land, or the effect of any violation of any such law ordinance or governmental regulation.
2. Rights of eminent domain or governmental rights of police power unless notice of the exercise of such rights appears in the public records at Date of Policy.
3. Defects, liens, encumbrances, adverse claims, or other matters (a) created, suffered, assumed or agreed to by the insured claimant, (b) not known to the Company and not shown by the public records but known to the insured claimant either at Date of Policy or at the date such claimant acquired an estate or interest insured by this policy or acquired the insured mortgage and not disclosed in writing by the insured claimant to the Company prior to the date such insured claimant became an insured hereunder, (c) resulting in no loss or damage to the insured claimant; (d) attaching or created subsequent to Date of Policy (except to the extent insurance is afforded herein as to any statutory lien for labor or material or to the extent insurance is afforded herein as to assessments for street improvements under construction or completed at Date of Policy).
4. Unenforceability of the lien of the insured mortgage because of failure of the insured at Date of Policy or of any subsequent owner of the indebtedness to comply with applicable "doing business" laws of the state in which the land is situated.

5. AMERICAN LAND TITLE ASSOCIATION LOAN POLICY - 1970
WITH REGIONAL EXCEPTIONS

When the American Land Title Association Lenders Policy is used as a Standard Coverage Policy and not as an Extended Coverage Policy, the exclusions set forth in paragraph 4 above are used and the following exceptions to coverage appear in the policy.

SCHEDULE B

This policy does not insure against loss or damage by reason of the matters shown in parts one and two following:
Part One

1. Taxes or assessments which are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the public records.
2. Any facts, rights, interests, or claims which are not shown by the public records but which could be ascertained by an inspection of said land or by making inquiry of persons in possession thereof.
3. Easements, claims of easement or encumbrances which are not shown by the public records.
4. Discrepancies, conflicts in boundary lines, shortage in area, encroachments, or any other facts which a correct survey would disclose, and which are not shown by public records.
5. Unpatented mining claims; reservations or exceptions in patents or in Acts authorizing the issuance thereof; water rights, claims or title to water.
6. Any lien, or right to a lien, for services, labor or material theretofore or hereafter furnished, imposed by law and not shown by the public records.

6. AMERICAN LAND TITLE ASSOCIATION LOAN POLICY - 1992
WITH A.L.T.A. ENDORSEMENT FORM 1 COVERAGE
EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance or governmental regulation (including but not limited to building and zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating to (i) the occupancy, use, or enjoyment of the land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the land; (iii) a separation in ownership or a change in the dimensions or area of the land or any parcel of which the land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that a notice of the enforcement thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy;
   (b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.

2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the public records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without knowledge.
3. Defects, liens, encumbrances, adverse claims, or other matters:
(a) whether or not recorded in the public records at Date of Policy, but created, suffered, assumed or agreed to by the insured claimant;
(b) not known to the Company, not recorded in the public records at Date of Policy, but known to the insured claimant and not disclosed in writing to the Company by the insured claimant prior to the date the insured claimant became an insured under this policy;
(c) resulting in no loss or damage to the insured claimant;
(d) attaching or created subsequent to Date of Policy (except to the extent that this policy insures the priority of the lien of the insured mortgage over any statutory lien for services, labor or material or the extent insurance is afforded herein as to assessments for street improvements under construction or completed at date of policy); or
(e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the insured mortgage.
4. Unenforceability of the lien of the insured mortgage because of the inability or failure of the insured at Date of Policy, or the inability or failure of any subsequent owner of the indebtedness, to comply with the applicable "doing business" laws of the state in which the land is situated.
5. Invalidity or unenforceability of the lien of the insured mortgage, or claim thereof, which arises out of the transaction evidenced by the insured mortgage and is based upon usury or any consumer credit protection or truth in lending law.
6. Any statutory lien for services, labor or materials (or the claim of priority of any statutory lien for services, labor or materials over the lien of the insured mortgage) arising from an improvement or work related to the land which is contracted for and commenced subsequent to Date of Policy and is not financed in whole or in part by proceeds of the indebtedness secured by the insured mortgage which at Date of Policy the insured has advanced or is obligated to advance.
7. Any claim, which arises out of the transaction creating the interest of the mortgagee insured by this policy, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that is based on:
(i) the transaction creating the interest of the insured mortgagee being deemed a fraudulent conveyance or fraudulent transfer; or
(ii) the subordination of the interest of the insured mortgagee as a result of the application of the doctrine of equitable subordination; or
(iii) the transaction creating the interest of the insured mortgagee being deemed a preferential transfer except where the preferential transfer results from the failure:
(a) to timely record the instrument of transfer; or
(b) of such recordation to impart notice to a purchaser for value or a judgment or lien creditor.

7. AMERICAN LAND TITLE ASSOCIATION LOAN POLICY - 1992 WITH REGIONAL EXCEPTIONS

When the American Land Title Association policy is used as a Standard Coverage Policy and not as an Extended Coverage Policy the exclusions set forth in paragraph 6 above are used and the following exceptions to coverage appear in the policy.

SCHEDULE B

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:

1. Taxes or assessments which are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the public records.
2. Any facts, rights, interests, or claims which are not shown by the public records but which could be ascertained by an inspection of said land or by making inquiry of persons in possession thereof.
3. Easements, claims of easement or encumbrances which are not shown by the public records.
4. Discrepancies, conflicts in boundary lines, shortage in area, encroachments, or any other facts which a correct survey would disclose, and which are not shown by public records.
5. Unpatented mining claims; reservations or exceptions in patents or in Acts authorizing the issuance thereof; water rights, claims or title to water.
6. Any lien, or right to a lien, for services, labor or material theretofore or hereafter furnished, imposed by law and not shown by the public records.

8. AMERICAN LAND TITLE ASSOCIATION OWNER'S POLICY - 1992 EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance or governmental regulation (including but not limited to building and zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating to (i) the occupancy, use, or enjoyment of the land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the land; (iii) a separation in ownership or a change in the dimensions or area of the land or any parcel of which the land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that a notice of the enforcement thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
(b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the public records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without knowledge.
3. Defects, liens, encumbrances, adverse claims, or other matters:
(a) created, suffered, assumed or agreed to by the insured claimant;
(b) not known to the Company, not recorded in the public records at Date of Policy, but known to the insured claimant and not disclosed in writing to the Company by the insured claimant prior to the date the insured claimant became an insured under this policy;
(c) resulting in no loss or damage to the insured claimant;
(d) attaching or created subsequent to Date of Policy; or

(e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the estate or interest insured by this policy.

4. Any claim, which arises out of the transaction vesting in the insured the estate or interest insured by this policy, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that is based on:
(i) the transaction creating the estate or interest insured by this policy being deemed a fraudulent conveyance or fraudulent transfer; or
(ii) the transaction creating the estate or interest insured by this policy being deemed a preferential transfer except where the preferential transfer results from the failure:
(a) to timely record the instrument of transfer; or
(b) of such recordation to impart notice to a purchaser for value or a judgment or lien creditor.

9. AMERICAN LAND TITLE ASSOCIATION OWNER'S POLICY - 1992
WITH REGIONAL EXCEPTIONS

When the American Land Title Association policy is used as a Standard Coverage Policy and not as an Extended Coverage Policy the exclusions set forth in paragraph 8 above are used and the following exceptions to coverage appear in the policy.

SCHEDULE B

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:
Part One:

1. Taxes or assessments which are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the public records.
2. Any facts, rights, interests, or claims which are not shown by the public records but which could be ascertained by an inspection of said land or by making inquiry of persons in possession thereof.
3. Easements, claims of easement or encumbrances which are not shown by the public records.
4. Discrepancies, conflicts in boundary lines, shortage in area, encroachments, or any other facts which a correct survey would disclose, and which are not shown by public records.
5. Unpatented mining claims; reservations or exceptions in patents or in Acts authorizing the issuance thereof; water rights, claims or title to water.
6. Any lien, or right to a lien, for services, labor or material theretofore or hereafter furnished, imposed by law and not shown by the public records.

ALTA RESIDENTIAL TITLE INSURANCE POLICY (6-1-87)
EXCLUSIONS

In addition to the Exceptions in Schedule B, you are not insured against loss, costs, attorneys' fees, and expenses resulting from:

1. Governmental police power, and the existence or violation of any law or government regulation. This includes building and zoning ordinances and also laws and regulations concerning:
   (a) and use
   (b) improvements on the land
   (c) and division
   (d) environmental protection

   This exclusion does not apply to violations or the enforcement of these matters which appear in the public records at Policy Date.
   This exclusion does not limit the zoning coverage described in Items 12 and 13 of Covered Title Risks.
2. The right to take the land by condemning it, unless:
   (a) a notice of exercising the right appears in the public records on the Policy Date
   (b) the taking happened prior to the Policy Date and is binding on you if you bought the land without knowing of the taking
3. Title Risks:
   (a) that are created, allowed, or agreed to by you
   (b) that are known to you, but not to us, on the Policy Date -- unless they appeared in the public records
   (c) that result in no loss to you
   (d) that first affect your title after the Policy Date -- this does not limit the labor and material lien coverage in Item 8 of Covered Title Risks
4. Failure to pay value for your title.
5. Lack of a right:
   (a) to any land outside the area specifically described and referred to in Item 3 of Schedule A OR
   (b) in streets, alleys, or waterways that touch your land
   This exclusion does not limit the access coverage in Item 5 of Covered Title Risks.

11. EAGLE PROTECTION OWNER'S POLICY

CLTA HOMEOWNER'S POLICY OF TITLE INSURANCE - 1998
ALTA HOMEOWNER'S POLICY OF TITLE INSURANCE - 1998

Covered Risks 14 (Subdivision Law Violation). 15 (Building Permit). 16 (Zoning) and 18 (Encroachment of boundary walls or fences) are subject to Deductible Amounts and Maximum Dollar Limits of Liability

EXCLUSIONS

In addition to the Exceptions in Schedule B, you are not insured against loss, costs, attorneys' fees, and expenses resulting from:

1. Governmental police power, and the existence or violation of any law or government regulation. This includes ordinances, laws and regulations concerning:
   a. building
   b. zoning
   c. land use
   d. improvements on the land
   e. land division
   f. environmental protection

   This exclusion does not apply to violations or the enforcement of these matters if notice of the violation or enforcement appears in the Public Records at the Policy Date.
   This exclusion does not limit the coverage described in Covered Risk 14, 15, 16, 17 or 24.
2. The failure of Your existing structures, or any part of them, to be constructed in accordance with applicable building codes. This Exclusion does not apply to violations of building codes if notice of the violation appears in the Public Records at the Policy Date.
3. The right to take the Land by condemning it, unless:
   a. a notice of exercising the right appears in the Public Records at the Policy Date; or
   b. the taking happened before the Policy Date and is binding on You if You bought the Land without Knowing of the taking.
4. Risks:
   a. that are created, allowed, or agreed to by You, whether or not they appear in the Public Records;
   b. that are Known to You at the Policy Date, but not to Us, unless they appear in the Public Records at the Policy Date;
   c. that result in no loss to You; or
   d. that first occur after the Policy Date - this does not limit the coverage described in Covered Risk 7, 8.d, 22, 23, 24 or 25.
5. Failure to pay value for Your Title.
6. Lack of a right:
   a. to any Land outside the area specifically described and referred to in paragraph 3 of Schedule A; and
   b. in streets, alleys, or waterways that touch the Land.
   This exclusion does not limit the coverage described in Covered Risk 11 or 18.

12. THIRD GENERATION EAGLE LOAN POLICY AMERICAN LAND TITLE ASSOCIATION EXPANDED COVERAGE RESIDENTIAL LOAN POLICY (1/01/08)

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to (i) the occupancy, use, or enjoyment of the Land; (ii) the character, dimensions, or location of any improvement erected on the Land; (iii) the subdivision of land; or(iv) environmental protection; or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
   (b)Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   (a) created, suffered, assumed or agreed to by the Insured Claimant;
   (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   (c) resulting in no loss or damage to the Insured Claimant;
   (d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 16, 17, 18, 19, 20, 21, 22, 23, 24, 27 or 28); or
   (e) resulting in loss or damage which would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury, or any consumer credit protection or truth-in-lending law. This Exclusion does not modify or limit the coverage provided in Covered Risk 26.
6. Any claim of invalidity, unenforceability or lack of priority of the lien of the Insured Mortgage as to Advances or modifications made after the Insured has Knowledge that the vestee shown in Schedule A is no longer the owner of the estate or interest covered by this policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching subsequent to Date of Policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11(b) or 25.
8. The failure of the residential structure, or any portion of it, to have been constructed before, on or after Date of Policy in accordance with applicable building codes. This Exclusion does not modify or limit the coverage provided in Covered Risk 5 or 6.

13. AMERICAN LAND TITLE ASSOCIATION LOAN POLICY - 2006
EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or

expenses that arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to

   (i) the occupancy, use, or enjoyment of the Land;

   (ii) the character, dimensions, or location of any improvement erected on the Land;

   (iii) the subdivision of land; or

   (iv) environmental protection;

   or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.

   (b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.

2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.

3. Defects, liens, encumbrances, adverse claims, or other matters

   (a) created, suffered, assumed, or agreed to by the Insured Claimant;

   (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;

   (c) resulting in no loss or damage to the Insured Claimant;

   (d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 13, or 14); or

   (e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.

4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.

5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law.

6. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is

   (a) a fraudulent conveyance or fraudulent transfer, or

   (b) a preferential transfer for any reason not stated in Covered Risk 13(b) of this policy.

7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the Insured Mortgage in the Public Records. This Exclusion does not modify or limit the coverage provided under Covered Risk 11(b).

14. AMERICAN LAND TITLE ASSOCIATION LOAN POLICY - 2006 WITH REGIONAL EXCEPTIONS

When the American Land Title Association policy is used as a Standard Coverage Policy and not as an Extended Coverage Policy the exclusions set forth in paragraph 13 above are used and the following exceptions to coverage appear in the policy.

SCHEDULE B

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.

15. AMERICAN LAND TITLE ASSOCIATION OWNER'S POLICY - 2006 EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to

   (i) the occupancy, use, or enjoyment of the Land;

   (ii) the character, dimensions, or location of any improvement erected on the Land;

   (iii) the subdivision of land; or

   (iv) environmental protection;or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.

(b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.

2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.

3. Defects, liens, encumbrances, adverse claims, or other matters

(a) created, suffered, assumed, or agreed to by the Insured Claimant;

(b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;

(c) resulting in no loss or damage to the Insured Claimant;

(d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risks 9 and 10); or

(e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Title.

4. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors rights laws, that the transaction vesting the Title as shown in Schedule A, is

(a) a fraudulent conveyance or fraudulent transfer; or

(b) a preferential transfer for any reason not stated in Covered Risk 9 of this policy.

5. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the deed or other instrument of transfer in the Public Records that vests Title as shown in Schedule A.

16. AMERICAN LAND TITLE ASSOCIATION OWNER'S POLICY - 2006 WITH REGIONAL EXCEPTIONS

When the American Land Title Association policy is used as a Standard Coverage Policy and not as an Extended Coverage Policy the exclusions set forth in paragraph 15 above are used and the following exceptions to coverage appear in the policy.

SCHEDULE B

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.

HISTORICAL DOCUMENTS

Addendum to

OLIN MESA CLOSURE PLAN

1130 TERRA BELLA AVENUE

MOUNTAIN VIEW, CA

II. FINAL SITE INSPECTION AND ASSESSMENT:

E. A WIPE SAMPLE ANALYSIS WAS PERFORMED ACCORDING TO THE WIPE SAMPLE PLAN (ATTACHMENT V). THE RESULTS OF THE INITIAL ANALYSIS (ATTACHMENT VI) AND FINAL ANALYSIS (ATTACHMENT VII) AND RETEST **(ATTACHMENT IX)** ARE THE FOLLOWING:

BACKGROUND SAMPLES

COPPER	53.7 218 121	AVE: 130.9
ARSENIC	<0.5	
NICKEL	5.8	
CYANIDES, TOTAL	<2.0	
VOA	SEE ATTACHMENT VI	

AREA SAMPLES

	INITIAL	FINAL
AREA #1		
COPPER	149	23
NICKEL	5.7	NO RETEST
AREA #2		
COPPER	739	CONCRETE REMOVED
NICKEL	50.2	CONCRETE REMOVED
AREA #3A		
COPPER	297	7.2
CYANIDE	<2.0	NO RETEST
NICKEL	239	ND
ARSENIC	<0.5	NO RETEST

AREA #3B		
COPPER	228	55
CYANIDE	<2.0	NO RETEST
NICKEL	373	76
		RETEST
		12.3
ARSENIC	<0.5	NO RETEST
AREA #3C		
COPPER	86.1	24
CYANIDE	<2.0	NO RETEST
NICKEL	21.6	ND
ARSENIC	<0.5	NO RETEST
AREA #5		
COPPER	507	22
AREA #6		
VOA	SEE ATTACHMENT VI	NO RETEST
AREA #7		
COPPER	2960	32
AREA #8		
COPPER	1370	CONCRETE REMOVED
AREA #9		
COPPER	306	86
AREA #10		
pH	7 ATTACHMENT VIII	NO RETEST
AREA #11		
pH	7 ATTACHMENT VIII	NO RETEST

III. REMEDIATION:

F. THE SUMP AREA WAS TESTED (ATTACHMENT V), THE SUMP CONCRETE WAS CHIPPED OUT AND DISPOSED. SAMPLES WERE TAKEN OF THE SOIL BENEATH THE SUMP AREA AND TESTED FOR COPPER CONTAMINATION LEVELS. SOIL SAMPLE ANALYSIS SHOWED 340 MG/KG COPPER (ATTACHMENT VIII) AND **2.1 MG/L (ATTACHMENT X)**. NO FURTHER ACTION IS REQUIRED BASED ON THE SOIL ANALYSIS.

I. FOR WIPE SAMPLES DETECT CONTAMINATION ABOVE ACTION LEVELS, AFTER DECONTAMINATION WIPE SAMPLES WERE OBTAINED TO VERIFY DECONTAMINATION WAS COMPLETE (ATTACHMENT VII **& ATTACHMENT IX**).

J. ALL CONCRETE AND SOIL WILL BE REMOVED BY TUESDAY NOVEMBER 5, 1989.

IV. CONCLUSIONS

A. THERE ARE NO ENVIRONMENTAL OR HEALTH RISK POSED BY THE FACILITY AFTER COMPLETION OF REMEDIATION. OLIN MESA DID NOT EXPERIENCE ANY REPORTABLE SPILLS IN THE HISTORY OF THE COMPANY. IN SEPTEMBER 1988, A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND GROUNDWATER INVESTIGATION WAS COMPLETED. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE.

THE FINAL WIPE SAMPLE ANALYSIS SHOWED THAT ALL AREA SAMPLES WERE BELOW THE BACKGROUND SAMPLES FOR NICKEL AND COPPER EXCEPT AT AREA #3B WHERE THE FLOOR HAS BEEN RECLEANED AND AND A **RETEST WAS CONDUCTED 10/23/89. THE RESULTS ARE SUBMITTED WITH THIS ADDIENDUM.**

APPENDIX J
QA REPORTS

EPRO Services Inc.

QA REPORT

Project: *1001 North Shoreline, Mountain View, CA.*
VMS below slab remediation project
Date of Visit: *December 13, 2017*
Contractor: *ACT Inc.*
Report by: David Devine/NorCal Technical Representative
Subject: *VMS* / QA Observation

The following items are based on brief and limited observations of certain selected locations: all similar locations may have not been observed. Other issues of equal or greater importance may not be addressed at this time. These observations are the opinions of the author. Any recommendations are for consideration of the project team and are not directives to the project.

History: Epro contractor above requested a quality assurance observation of the Epro System III MB smoke testing for remediation at area 1 of 2 @ the first floor interior of this building.

FIELD REPORT

Observations:

1. The smoke test for this area was performed today prior to the installation of the e.shield 205 (PP) covering. All leaks found were repaired at this time and the membrane was covered and prepared for the new concrete. All coupon samples were @ 60+ dry mil. thickness as specified by Epro. Result=PASS.

1328 E Kellogg Drive Wichita, KS 67211
PO Box 347 Derby, KS 67037

2. Two areas near the footing at the north wall had some moisture present at this time. These areas were cleaned and the e. spray applied. The existing or new membrane was not installed in these areas.

Respectfully,

David Devine

QA REPORT

Project: *1001 North Shoreline, Mountain View, CA.*
VMS below slab remediation project
Date of Visit: *January 3, 2018*
Contractor: *ACT Inc.*
Report by: David Devine/NorCal Technical Representative
Subject: *VMS* / QA Observation

The following items are based on brief and limited observations of certain selected locations: all similar locations may have not been observed. Other issues of equal or greater importance may not be addressed at this time. These observations are the opinions of the author. Any recommendations are for consideration of the project team and are not directives to the project.

History: Epro contractor above requested a quality assurance observation of the Epro System III MB smoke testing for remediation at area 2 of 2 @ the first floor interior of this building.

FIELD REPORT

Observations:

1. The smoke test for this area was performed today prior to the installation of the e.shield 205 (PP) covering. All leaks found were repaired at this time and the membrane was covered and prepared for the new concrete. All coupon samples were @ 60+ dry mil. thickness as specified by Epro. Result=PASS.

2. Areas in each section were marked with paint where smoke was visible and remediated at this time. Area 2 ready for concrete installation.

Respectfully,

David Devine

Mr. Chris Stock
Hazardous Materials Specialist
Fire Department
Hazardous Materials Division
City of Mountain View
1000 Villa Street
Mountain View, CA. 94041

Dear Chris:

Olin Mesa is moving to Santa Clara by October 1, 1989.

The Olin Mesa Closure Plan is enclosed for your review.

All equipment will be moved to the new facility. All process piping will be removed from the site.

Wipe sample analysis will be performed per Exhibit A after the identified area is cleared. Proposed Demonstration Plan Closure

If you have any questions, please don't hesitate to contact me.

Sincerely,

Curt M. Richards

OLIN MESA CLOSURE PLAN

I. INTRODUCTION

A. 1130 TERRA BELLA AVENUE

B. COMPANY HEADQUARTERS & MANUFACTURING FACILITY FOR TAB (TAPE AUTOMATED BONDING) TAPE.

C. MESA TECHNOLOGY (NOW OLIN MESA CORP.) OCCUPIED THIS BUILDING IN MARCH 1983 AS A COMPANY HEADQUARTER & TAB TAPE MANUFACTURING FACILITY.

IN SEPTEMBER 1988, AQUA TERRA TECHNOLOGIES COMPLETED A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND GROUNDWATER INVESTIGATION FOR SNIDER PROPERTIES. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE.

II. INITIAL SITE INSPECTION AND ASSESSMENT

A. ALL HAZARDOUS MATERIALS ON SITE WILL BE TRANSPORTED TO OLIN MESA'S NEW LOCATION AT 3500 GARRETT DRIVE, SANTA CLARA. ALL HAZARDOUS WASTE WILL BE DISPOSED THROUGH EXISTING HAZARDOUS WASTE CONTRACTS WITH CHEMICAL WASTE MANAGEMENT AND SOLVENT SERVICES.

B. A MAP IDENTIFYING ALL CHEMICAL USE AND STORAGE AREAS IS ATTACHED, AS WELL AS, THE QUANTITIES.

C. HAZARDOUS MATERIALS USE AND STORAGE AREAS ARE CLEAN AND HAVE BEEN MAINTAINED.

D. ALL CHEMICALS AND PROCESS EQUIPMENT WILL BE MOVED OR PROPERLY DISPOSED PRIOR TO VACATING THE FACILITY

E. A WIPE SAMPLE ANALYSIS WILL BE PERFORMED ACCORDING TO EXHIBIT A.

III. REMEDIATION PROPOSAL

ALL SAVAGEABLE EQUIPMENT AND UTILITIES WILL BE RELOCATED.

A. ALL ROOF EXHAUST FANS AND DUCTS WILL BE REMOVED AND RELOCATED TO THE NEW FACILITY.

ALL FLASHINGS FOR REMOVED EQUIPMENT ARE TO BE REMOVED AND THE OPENINGS CLOSED AND RENDERED WATERTIGHT.

B. AIR COMPRESSORS ARE TO BE RELOCATED TO THE NEW FACILITY.
ALL PIPING (EXCLUDING CITY WATER AND SANITARY) WILL BE REMOVED.
ALL PIPING WILL BE FLUSHED IN PLACE PRIOR TO REMOVAL.
THE DI WATER SYSTEM WILL BE REMOVED BY POLYMETRICS.
ALL ELECTRICAL EQUIPMENT, PANELS AND WIRING NOT REQUIRED FOR AIR CONDITIONING UNITS WILL BE REMOVED.
THE NEUTRALIZATION SYSTEM WILL BE RELOCATED.

C. ALL PIPING (EXCLUDING CITY WATER AND SANITARY) WILL BE REMOVED.
ALL PIPING WILL BE FLUSHED IN PLACE PRIOR TO REMOVAL.
ALL INTERIOR DUCTS WILL BE REMOVED (EXCLUDING DUCTS FOR AIR CONDITIONING).
ALL ELECTRICAL EQUIPMENT, PANELS AND WIRING NOT REQUIRED FOR AIR CONDITIONING UNITS WILL BE REMOVED.
ALL PROCESS EQUIPMENT IS TO BE FLUSHED AND CLEANED AS NEEDED BEFORE REMOVAL

D. ALL EQUIPMENT REMAINING ON SITE WILL BE UTILITY EQUIPMENT.

E. ALL FLOORS WILL BE CLEANED WITH SOAP AND WATER AFTER THE PROCESSING EQUIPMENT HAS BEEN REMOVED.

F. THE TRENCH AND SUMP AREA IS TO BE TESTED PER EXHIBIT A, CHIPPED OUT AND DISPOSED OF BASED ON THE CONTAMINATION LEVEL, IF ANY.
SAMPLES WILL BE TAKEN OF THE GROUND BENEATH THE HAZARDOUS WASTE AREA AND TESTED FOR COPPER, NICKEL, STANNOUS CHLORIDE CONTAMINATION LEVELS. IF REQUIRED, EXCAVATION AND OR SOIL REMOVAL WILL BE PERFORMED TO REDUCE CONTAMINATION TO BELOW ACTION LEVELS.

G. THE HAZARDOUS WASTE CONTAINMENT AREA IS TO BE TESTED FOR CONTAMINATION PER EXHIBIT A, BROKEN UP AND DISPOSED ACCORDING TO THE LEVEL OF CONTAMINATION FOUND, IF ANY.
SAMPLES WILL BE TAKEN OF THE GROUND BENEATH THE HAZARDOUS WASTE AREA AND TESTED FOR COPPER, NICKEL, STANNOUS CHLORIDE CONTAMINATION LEVELS. IF REQUIRED, EXCAVATION AND OR SOIL REMOVAL WILL BE PERFORMED TO REDUCE CONTAMINATION TO BELOW ACTION LEVELS.
A GROUNDWATER ANALYSIS WAS COMPLETED IN SEPTEMBER 1988.

H. PREVIOUSLY ADDRESSED.

I. IF INITIAL WIPE SAMPLES DETECT CONTAMINATION ABOVE ACTION LEVELS,

AFTER DECONTAMINATION WIPE SAMPLES WILL BE OBTAINED TO VERIFY DECONTAMINATION IS COMPLETE.

IV. CONCLUSIONS

A. THERE SHOULD BE NO ENVIRONMENTAL OR HEALTH RISK POSED BY THE FACILITY AFTER COMPLETION OF REMEDIATION. OLIN MESA HAS NOT EXPERIENCED ANY REPORTABLE SPILLS IN THE HISTORY OF THE COMPANY. IN SEPTEMBER 1988, A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND GROUNDWATER INVESTIGATION WAS COMPLETED. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE.

December 20, 1989

Mr. Curt Richards
Olin Mesa Corp.
3500 Garrett Drive
Santa Clara, Ca 95054

Dear Mr. Richards:

We are in receipt of the final documents needed to properly close your facility at 1130 Terra Bella Ave., Mountain View, CA. This includes the wipe sample analysis of areas of hazardous materials storage or use as well as the hazardous waste manifest for the removal of contaminated concrete and soil.

In your final closure statement received in November 1989, you concluded that no significant human health risks remain at the facility. Furthermore, residual concentrations of elemental metals will not impact future site development activities. The wipe sample analysis presented tends to support these conclusions, however, in certain areas shown in your report wipe sample analysis exceeded background levels.

Based on all the submitted information, as well as the walk-through of the building to confirm that all hazardous materials have been properly removed and disposed of, your closure is considered complete and fulfills Section 24.19(h) of Chapter 24, Mountain View Municipal Code.

If you have any questions, feel free to call me at (415) 966-6378.

Sincerely,

Kurt Danziger
Hazardous Materials Specialist

Attention: Peter Brower

Subject: Analysis of 2 Soil Samples, Received 11/10/89

The samples were digested using EPA method 3050 prior to analysis. The digestate was analyzed for requested metals using Inductively Coupled Argon Plasma Spectroscopy or Atomic Absorption spectrophotometry following Test Methods for Evaluating Solid Waste (SW-846 3rd. Ed.,1986). The EPA method employed is listed alongside of the parameter. The results are presented in Table 1.

The samples were prepared by extraction in a citrate buffer for 48 hours. The resulting extract was filtered and acid digested using EPA Method 3010 and/or 3020 prior to analysis. The extract was then analyzed for requested metals using Inductively Coupled Argon Plasma spectroscopy or Atomic Absorption spectrophotometry. The resulting values are the soluble threshold limit concentrations for the requested metals. The results are presented in Table 2.

If you should have any technical questions, please contact the undersigned at (415)964-0844.

Approved by: Daniel L. Middleton
Client Services Manager

These results were obtained by following standard laboratory procedures; the liability of Acurex Corporation shall not exceed the amount paid for this report. In no event shall Acurex be liable for special or consequential damages.

Mountain View, CA. 94041

Dear Chris:

Olin Mesa is moving to Santa Clara by October 1, 1989.

The Olin Mesa Closure Plan is enclosed for your review.

All equipment will be moved to the new facility. All process piping will be removed from the site.

Wipe sample analysis will be performed per Exhibit A after the identified area is cleared.

If you have any questions, please don't hesitate to contact me.

Sincerely,

Curt M. Richards

OLIN MESA CLOSURE PLAN

I. INTRODUCTION

A. 1130 TERRA BELLA AVENUE

B. COMPANY HEADQUARTERS & MANUFACTURING FACILITY FOR TAB (TAPE AUTOMATED BONDING) TAPE.

C. MESA TECHNOLOGY (NOW OLIN MESA CORP.) OCCUPIED THIS BUILDING IN MARCH 1983 AS A COMPANY HEADQUARTER & TAB TAPE MANUFACTURING FACILITY.

IN SEPTEMBER 1988, AQUA TERRA TECHNOLOGIES COMPLETED A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND GROUNDWATER INVESTIGATION FOR SNIDER PROPERTIES. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE.

II. INITIAL SITE INSPECTION AND ASSESSMENT

A. ALL HAZARDOUS MATERIALS ON SITE WILL BE TRANSPORTED TO OLIN MESA'S NEW LOCATION AT 3500 GARRETT DRIVE, SANTA CLARA. ALL HAZARDOUS WASTE WILL BE DISPOSED THROUGH EXISTING HAZARDOUS WASTE CONTRACTS WITH CHEMICAL WASTE MANAGEMENT AND SOLVENT SERVICES.

B. A MAP IDENTIFYING ALL CHEMICAL USE AND STORAGE AREAS IS ATTACHED, AS WELL AS, THE QUANTITIES.

C. HAZARDOUS MATERIALS USE AND STORAGE AREAS ARE CLEAN AND HAVE BEEN MAINTAINED.

D. ALL CHEMICALS AND PROCESS EQUIPMENT WILL BE MOVED OR PROPERLY DISPOSED PRIOR TO VACATING THE FACILITY

E. A WIPE SAMPLE ANALYSIS WILL BE PERFORMED ACCORDING TO EXHIBIT A.

III. REMEDIATION PROPOSAL

ALL SAVAGEABLE EQUIPMENT AND UTILITIES WILL BE RELOCATED.

A. ALL ROOF EXHAUST FANS AND DUCTS WILL BE REMOVED AND RELOCATED TO THE NEW FACILITY.

ALL FLASHINGS FOR REMOVED EQUIPMENT ARE TO BE REMOVED AND THE OPENINGS CLOSED AND RENDERED WATERTIGHT.

B. AIR COMPRESSORS ARE TO BE RELOCATED TO THE NEW FACILITY.
ALL PIPING (EXCLUDING CITY WATER AND SANITARY) WILL BE REMOVED.
ALL PIPING WILL BE FLUSHED IN PLACE PRIOR TO REMOVAL.
THE DI WATER SYSTEM WILL BE REMOVED BY POLYMETRICS.
ALL ELECTRICAL EQUIPMENT, PANELS AND WIRING NOT REQUIRED FOR AIR CONDITIONING UNITS WILL BE REMOVED.
THE NEUTRALIZATION SYSTEM WILL BE RELOCATED.

C. ALL PIPING (EXCLUDING CITY WATER AND SANITARY) WILL BE REMOVED.
ALL PIPING WILL BE FLUSHED IN PLACE PRIOR TO REMOVAL.
ALL INTERIOR DUCTS WILL BE REMOVED (EXCLUDING DUCTS FOR AIR CONDITIONING).
ALL ELECTRICAL EQUIPMENT, PANELS AND WIRING NOT REQUIRED FOR AIR CONDITIONING UNITS WILL BE REMOVED.
ALL PROCESS EQUIPMENT IS TO BE FLUSHED AND CLEANED AS NEEDED BEFORE REMOVAL

D. ALL EQUIPMENT REMAINING ON SITE WILL BE UTILITY EQUIPMENT.

E. ALL FLOORS WILL BE CLEANED WITH SOAP AND WATER AFTER THE PROCESSING EQUIPMENT HAS BEEN REMOVED.

F. THE TRENCH AND SUMP AREA IS TO BE TESTED PER EXHIBIT A, CHIPPED OUT AND DISPOSED OF BASED ON THE CONTAMINATION LEVEL, IF ANY.
SAMPLES WILL BE TAKEN OF THE GROUND BENEATH THE HAZARDOUS WASTE AREA AND TESTED FOR COPPER, NICKEL, STANNOUS CHLORIDE CONTAMINATION LEVELS. IF REQUIRED, EXCAVATION AND OR SOIL REMOVAL WILL BE PERFORMED TO REDUCE CONTAMINATION TO BELOW ACTION LEVELS.

G. THE HAZARDOUS WASTE CONTAINMENT AREA IS TO BE TESTED FOR CONTAMINATION PER EXHIBIT A, BROKEN UP AND DISPOSED ACCORDING TO THE LEVEL OF CONTAMINATION FOUND, IF ANY.
SAMPLES WILL BE TAKEN OF THE GROUND BENEATH THE HAZARDOUS WASTE AREA AND TESTED FOR COPPER, NICKEL, STANNOUS CHLORIDE CONTAMINATION LEVELS. IF REQUIRED, EXCAVATION AND OR SOIL REMOVAL WILL BE PERFORMED TO REDUCE CONTAMINATION TO BELOW ACTION LEVELS.
A GROUNDWATER ANALYSIS WAS COMPLETED IN SEPTEMBER 1988.

H. PREVIOUSLY ADDRESSED.

I. IF INITIAL WIPE SAMPLES DETECT CONTAMINATION ABOVE ACTION LEVELS,

AFTER DECONTAMINATION WIPE SAMPLES WILL BE OBTAINED TO VERIFY DECONTAMINATION IS COMPLETE.

IV. CONCLUSIONS

A. THERE SHOULD BE NO ENVIRONMENTAL OR HEALTH RISK POSED BY THE FACILITY AFTER COMPLETION OF REMEDIATION. OLIN MESA HAS NOT EXPERIENCED ANY REPORTABLE SPILLS IN THE HISTORY OF THE COMPANY. IN SEPTEMBER 1988, A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND GROUNDWATER INVESTIGATION WAS COMPLETED. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE.

Gentlemen:

This letter is to inform you of our recent name change from "MESA Technology" to "Olin Mesa Corporation." The ownership, operations, and location remain the same, and no significant changes have occurred since our most recent submissions to your department.

Please make the neccesary changes for our files, registrations, and permits as applicable.

If you have any questions, please call me at (415) 961-6372.

Very truly yours,

Curt M. Richards

CITY OF MOUNTAIN VIEW
FIRE DEPARTMENT

EMERGENCY RESPONSE PLAN
Section I: Evacuation Procedures

This emergency response plan describes the personnel, procedures, and equipment your facility has available to respond to a release or threatened release of the hazardous materials you store or use. This plan is for the protection of your and your employees. For small facilities, this plan may be sufficient to adequately address all your emergency response concerns. For larger or more complex facilities, supplemental and detailed emergency response information should be maintained on site and be available for review by the Fire Department.

1. *By which method(s) is the Emergency Coordinator (EC) at your facility notified that an emergency (i.e., an actual or threatened hazardous materials release) is taking place? (Check applicable items.)*

- [X] Alarms: Name of Manufacturer ADT
  Last Test Date 03/27/89 Test Frequency monthly
- [ ] Horns: Last Test Date _____ Test Frequency _____
- [ ] Emergency Phone Number: Number _____
- [ ] Shouting
- [X] Other Intercom in manufacturing area

2. *Once the EC has been notified of an emergency situation, what outside agencies does he/she notify? (Check applicable items.)*

- [ ] Agency: *FIRE DEPARTMENT* Phone *9 1 1*
- [ ] Agency: *State Office of Emergency Services* Phone *1-800-852-7550*
- [ ] Agency: _____ Phone _____
- [ ] Agency: _____ Phone _____

3. *Indicate the extent of your evacuation pre-planning. (Check applicable items.)*

- [X] Immediate area evacuation routes defined and procedures developed.
- [X] Entire building evacuation procedures developed.
- [X] Assembly areas pre-planned.
- [ ] Evacuation maps posted.
- [ ] Other: _____

4. *Should personnel be injured during the emergency, your facility must have a nearby clinic/hospital available for treatment:*

Medical Facility Name El Camino Hospital
Medical Facility Address 2500 Grant Rd. Mt. View
Medical Facility Phone Number (24-hour) (415) 940-7051
Approximate Distance to Medical Facility 2 miles

EMERGENCY RESPONSE PLAN
Section III: Emergency Response Training Program

1. PERSON RESPONSIBLE FOR EMERGENCY RESPONSE TRAINING PROGRAM:
Name CURT M. RICHARDS Title DIR OPERATIONS Phone (415) 961-6372.

2. TRAINING REQUIREMENTS (Check all applicable items.)

All employees are trained in the following procedures:

- [X] Notification of emergency response coordinator
- [X] Notification of external emergency response organizations (e.g. Fire Department)
- [X] Location and content of emergency response plan
- [X] Evacuation

Chemical handlers are additionally trained in the following:

- [X] Safe methods for handling and storage of hazardous materials
- [X] Proper use of personal protection equipment
- [X] Locations and proper use of fire and spill control equipment
- [X] Specific hazards of each chemical to which they may be exposed, including the pathways of exposure (i.e., skin absorption, inhalation, ingestion)

Emergency response team members are additionally trained in the following procedures:

- [X] Shutdown of operations
- [X] Use, maintenance, and replacement of emergency response equipment

- [X] ALL PERSONNEL RECEIVE APPROPRIATE EMERGENCY RESPONSE TRAINING WITHIN SIX MONTHS OF HIRING
- [X] REFRESHER TRAINING IS PROVIDED AT LEAST ANNUALLY

3. PERSONNEL TRAINING RECORDS

The following training records are maintained for each employee:

- [X] Type and amount of introductory and continuing training
- [X] Date that training was completed
- [X] Description of facility emergency reponse drills
- [ ] Former employees' training records are retained for at least three years

Your Emergency Response Plan must be on-site and available for review by the Fire Department.

Gary Leinweber
Fire Department
City of Mountain View
Mountain View, CA 94041

Dear Gary:

This letter is written to follow up a conversation with Chris regarding permits required to operate an Atomic Absorption Spectrometer.

The vendor of the equipment, Perkin Elmer, was not aware of any permitting requirements and Chris confirmed that no permit is required.

Two (2) 1 B cylinders containing about 9000 liters of acetylene and four (4) # 1 size air cylinders containing about 6200 liters are required to operate the unit.

If you have any questions, please contact me at (415) 961-6372.

Sincerely,

Curt M. Richards

Director of Operations
Mesa Technology
1130 Terra Bella Avenue
Mountain View, California

RE: TEMPORARY REINSTATEMENT OF INDUSTRIAL WASTE DISCHARGE PERMIT

Dear Mr. Richards:

On October 26, 1987, at 0200 hours, a fire occurred at Mesa Technology. Due to this fire, your Industrial Waste Discharge Permit was suspended for a period not to exceed forty-five (45) days in accordance with City of Mountain View Municipal Code (MVMC), section 35.32.3. On October 27, 1987, you made a verbal request to the Industrial Waste Water Discharge Specialist that the Industrial Waste Discharge Permit be reinstated, based on the fact that an investigation showed no damage had occurred to the gold plating line, to the internal plumbing running under the damaged plating line, and to the waste treatment system. A joint site inspection was conducted by the Fire Marshal, the Hazardous Material Officer, and the Industrial Waste Water Discharge Specialist during the afternoon of October 27, 1987, in which we concurred with your findings. Based on these facts, the Industrial Waste Discharge Permit is reinstated, effective October 28, 1987, for a period of two (2) weeks, expiring at 2400 hours (midnight) on November 11, 1987.

Mesa Technology may resume discharging industrial wastes into the City of Mountain View sanitary sewer collection system in accordance with all conditions and regulations as outlined in the Industrial Waste Ordinance (MVMC 35.32). The following conditions shall also apply:

1a. Mesa shall immediately initiate a self-monitoring sampling program to monitor discharges of copper and lead. This program shall include four (4) consecutive daily composite samples taken each week for a period of not less than two (2) weeks. This program shall continue until compliance has been shown for a consecutive two (2) week period. Your discharge limits for copper and lead are 2.0 mg/L and 0.5 mg/L respectively.

1b. Each daily composite sample shall consist of hourly grab samples taken during each and all hours of operation. Upon compositing of the last hourly grab sample, the pH of the composite sample shall be measured. The pH, collection times, date, and name of the person collecting the sample shall be logged onto the sample bottle. The composite sample shall then be preserved by adding nitric acid until a pH of less than two (2) is obtained.

1c. Each composite sample shall be analyzed for both copper and lead concentrations by an analytical laboratory approved by the State of California Department of Health Services for such analysis. The analysis shall be conducted using Environmental Protection Agency (USEPA) approved standard methods for total digestion of heavy metals. Results of the analysis shall include the sample pH prior to preservation, the sample pH at the time of analysis, collection times, collection date, the name of the person collecting the sample, date of analysis, and method of analysis.

2a. Mesa also shall immediately initiate a self-monitoring sampling program to monitor discharges of cyanide. This program shall include consecutive hourly grab samples taken once each week during hours of operation of the gold plating line, for a period of not less than two (2) weeks. This program shall continue until compliance has been shown for a consecutive two (2) week period. Your discharge limits for cyanide are 1.0 mg/L.

2b. The pH prior to peservation, collection time, date, and name of the person collecting the grab sample shall be logged onto the cyanide sample bottle. The sample shall then be preserved by adding sodium hydroxide until a pH of greater than twelve (12) is obtained. The sample shall then be refrigerated in the dark at four (4) degrees centigrade.

2c. At the lab each cyanide grab sample shall be combined to produce a single composite sample. This composite sample shall be analyzed for cyanide concentrations using USEPA approved standard methods for total digestion of heavy metals. Results of the analysis shall include the sample pH prior to preservation, the sample pH at the time of analysis, collection times, collection date, the name of the person collecting the sample, date of analysis, and method of analysis.

3. The results of all self-monitoring compliance samples shall be forwarded as soon as they are available to:

Russ Frazer
Industrial Waste Water Discharge Specialist
City of Mountain View
231 North Whisman Road
Mountain View, California 94043

Full reinstatement of the Industrial Waste Water Discharge Permit shall occur when the self-monitoring program outlined above shows compliance with the Industrial Waste Ordinance. If we can be of any further assistance, please do not hesitate to call either Russ Frazer or myself at 415-966-6329.

Sincerely,

Thomas Frutchey

November 18, 1987

Mr. Ed Iglesias
Hansen Brothers Construction
3079 Lawrence Expressway
Santa Clara, CA 95051

Dear Mr. Iglesias:

This letter is a follow-up to our meeting concerning the H6 occupancy. I met with Bob Francone and John Stafford of the Fire Department and Gary Leinweber of the Hazardous Materials Division regarding your plans. In evaluating your plans, we as a group have developed the following list of requirements which must be included in your plan check and eventually integrated into the new construction at 1130 Terra Bella Avenue. The list of requirements is as follows:

1. Provide a site plan showing the HPM storage area with a north arrow and dimensions to property lines, other buildings and anything else that could clarify a plan check of the site. Also, indicate the path of travel from the storage area to the H6 area.

2. Provide complete drawings of the storage unit itself. These drawings should identify materials used in construction, containment systems, electrical and/or mechanical systems (if present), security systems, fire prevention systems and any other information that could clarify this storage area. I suggest a section of the building as the best way to answer some of these questions.

3. Provide manufacturer's literature on the HPM transportation vehicle.

4. In the revised drawings, please show the following: two exits from the gold line area, two exits from the camera room and two exits from the clean room. In all exiting situations, the doors must swing in the direction of egress and be equipped with panic hardware.

5. Two exits are required from the main H6 area, with one going directly to the outside. In your floor plan, the rear exits meet code, but the exit through Door 6 into the office must

be changed to a door entering a one-hour rated exit system (i.e., corridor). See Sheet A-2 for clarification of this requirement.

6. Label all rooms and identify the processes that take place in these rooms. This includes the area marked "Lab."

7. Give a complete explanation of the secondary containment system for the whole H6 area. Supply literature on the materials used and drawings clarifying the construction method. A suggestion here is to use another section detail in conjunction with other drawings.

8. Supply information regarding sprinkler densities and give verification that these densities are maintained.

9. Smoke detectors are required in the return air ducts in order that the HVAC systems would be shut down in case of a fire. For further explanation of this requirement, see Section 911(b)(3) in the 1985 UBC.

10. Supply cut sheets on all detection systems FOR ~~and~~ any and all equipment or processes taking place in this area.

11. Supply information on all hood and duct systems used in this area, including the scrubbers.

12. Supply information on the emergency power supply. This power must be capable of maintaining emergency systems in operation for a minimum of two hours in the event of emergency.

13. For any clarifications, I suggest that you refer to Section 911 of the 1985 UBC regarding H6 areas.

Sincerely,

Ron Geary

October 26, 1987

Mr. C. M. Richards
Director of Operations
Mesa Technology
1130 Terra Bella Avenue
Mountain View, California

RE: SUSPENSION OF INDUSTRIAL WASTE DISCHARGE PERMIT DUE TO FIRE

Dear Mr. Richards,

On October 26, 1987, at 0200 hours, a fire occurred at Mesa Technology. A preliminary investigation has suggested that the fire was caused by a malfunctioning immersion heater used to heat a deionized rinse water. The fire ruptured a container holding acid (NCl), which in turn resulted in an acid spill reaching an outside storm water drain inlet. This spill was successfully contained by the Fire Department and cleaned up by the Maintenance Department.

On December 18, 1985, Mesa Technology was issued an Industrial Waste Discharge Permit in accordance with the City of Mountain View Municipal Code (MVMC), section 35.32.1 (Industrial Waste Ordinance). Due to the fire, this permit is herewith suspended for a period not to exceed forty-five (45) days in accordance with MVMC 35.32.3. Mesa Technology shall immediately cease and desist all discharges of industrial wastes into the City of Mountain View sanitary sewer collection system (MVMC 35.32.3b). This includes all discharges except domestic sewage (restrooms, drinking water, etc.).

Mesa Technology is entitled to, upon request, an informal hearing before the City Manager, or his delegate, to discuss this suspension. If so desired, Mesa Technology must submit in writing to the Maintenance Director a request for an informal hearing within ten (10) calender days from the date of this letter (MVMC 35.32.4b). An informal hearing will be scheduled within five (5) working days from receipt of the request. All parties involved have the right to be represented by counsel (MVMC 35.32.4c).

Mesa Technology shall not resume discharging industrial wastes into the City of Mountain View sanitary sewer collection system until written notification has been received from the Maintenance Director stating that the Industrial Waste Discharge Permit has been reinstated. This permit can be reinstated as soon as no further conditions exist, either caused by the fire or not, that are in violation of the Industrial Waste Ordinance. Please contact Russ Frazer, the City's Industrial Waste Water Discharge Specialist, at 415-966-6329, to initiate the repermitting process.

If Russ or I can be of any further assistance, please do not hesitate to call .

Sincerely,

Thomas Frutchey

Gentlemen:

Olin Mesa Corp. generates small amounts of waste materials regulated by the California Department of Health Services. In addition, moderate amounts of hazardous materials are stored and used on-site.

As required by the Health and Safety Code, Olin Mesa is providing you with copies of the Emergency Response Plans, Contingency Plans, and Preparedness and Prevention Plans which discuss our operations and give pertinent information for your use in the event of an emergency situation.

If you have any questions, please call me at (415) 961-6372.

Very truly yours,

Curt M. Richards

CITY OF MOUNTAIN VIEW
FIRE DEPARTMENT

EMERGENCY RESPONSE PLAN
Section I: Evacuation Procedures

This emergency response plan describes the personnel, procedures, and equipment your facility has available to respond to a release or threatened release of the hazardous materials you store or use. This plan is for the protection of your and your employees. For small facilities, this plan may be sufficient to adequately address all your emergency response concerns. For larger or more complex facilities, supplemental and detailed emergency response information should be maintained on site and be available for review by the Fire Department.

1. *By which method(s) is the Emergency Coordinator (EC) at your facility notified that an emergency (i.e., an actual or threatened hazardous materials release) is taking place? (Check applicable items.)*

☒ Alarms: Name of Manufacturer ADT
Last Test Date 12/20/88 Test Frequency MONTHLY

☐ Horns: Last Test Date _____ Test Frequency _____

☐ Emergency Phone Number: Number _____

☐ Shouting

☐ Other _____

2. *Once the EC has been notified of an emergency situation, what outside agencies does he/she notify? (Check applicable items.)*

☐ Agency: *FIRE DEPARTMENT* Phone *9 1 1*

☐ Agency: *State Office of Emergency Services* Phone *1-800-852-7550*

☐ Agency: _____ Phone _____

☐ Agency: _____ Phone _____

3. *Indicate the extent of your evacuation pre-planning. (Check applicable items.)*

☐ Immediate area evacuation routes defined and procedures developed.

☐ Entire building evacuation procedures developed.

☐ Assembly areas pre-planned.

☐ Evacuation maps posted.

☐ Other: _____

4. *Should personnel be injured during the emergency, your facility must have a nearby clinic/hospital available for treatment:*

Contingency Plan
(1/19/89)

Introduction:

The Contingency Plan is based on the Business Plan for Emergency Response (HM 3-5) which is required for the City of Mountain View. It is attached for reference and supplemented by the following information. The attached HM 3-5 describes arrangements with the local authorities, emergency coordinators, emergency equipment, and the evacuation plan. Hazardous wastes are defined and discussed in the Waste Management Plan.

Purpose:

The purpose of the contingency plan is to minimize hazards to human health or the environment which results from fires or releases of hazardous wastes into the environment via the storm drains, the sewers or other means.

These provisions should be implemented as soon as possible whenever an incident occurs which threatens to harm human health or the environment by the release of hazardous wastes.

Procedures:

Upon the occurrence of an incident serious enough to harm human health or to threaten the environment the following steps shall be implemented immediately by the Emergency Coordinator (EC):

(a) Activate the internal alarm systems.

(b) Stop leak or continuing problem.

(c) Begin cleanup.

(d) The EC shall quantify the materials spilled and the threat to the environment.

(e) If help is required call the following as needed:

1) I.T. Corporation (415) 372-9100
3010 Zanker Road, San Jose
Emergency Spill Response/Clean Up
2) Ambulance - Call 911
3) El Camino Hospital (415) 940-7055
2500 Grant Road, Mountain View
4) Mountain View Fire Department - 911 or (415) 966-6378
5) Mountain View Police Department - 911 or (415) 966-6344
6) State Office of Emergency Services - 1-800-852-7550
2800 Meadowview Road, Sacramento 95832
7) Palo Alto Wastewater Treatment Plant - (415) 329-2117
2501 Embarcadero Way, P.O. Box 10250, Palo Alto 94303

(f) Upon the release of hazardous wastes to the environment the EC shall notify the State Office of Emergency Services and give the following information:

1) Name and phone number of reporter.

2) Name and address of facility.

3) Time and type of incident.

4) Name and quantities of materials.

5) Injuries, if any.

6) Possible hazards associated with the incident.

(g) During an emergency the EC shall take all necessary steps to ensure that additional fires or releases do not occur, recur, or spread. These measures include stopping operations, containing spilled wastes, etc.

(h) The EC shall provide for the clean up of spills or residues either by in-house personnel or by contract personnel, e.g., I.T. Corporation as listed. Minor spills should be cleaned up according to the Waste Management Plan.

(i) The EC shall provide for that no incompatible wastes are handled in the affected area until the clean up is completed and that all emergency equipment is cleaned and readied for future service before operations resume.

(j) The EC or other management personnel shall notify the Office of Emergency Services and others previously notified that the clean up is completed before resuming operations in the affected areas.

(k) Details of the incident including the time and date shall be entered into the operating record by memo and a written report made within 15 days to the State as per HSC 67145 (J) (1-7). The report shall include the following items:

1) Name, address, and telephone number of Olin Mesa.

2) Date, time and type of incident (e.g. fire, explosion).

3) Names and quantities of material involved.

4) Extent of injuries, if any.

5) An assessment of hazards, where applicable.

6) Quantity and disposition of recovered materials resulting from incident.

Mountain View, CA 94041

January 27, 1989

UPDATE

Gentlemen:

Olin Mesa Corp. generates small amounts of waste materials regulated by the California Department of Health Services. In addition, moderate amounts of hazardous materials are stored and used on-site.

As required by the Health and Safety Code, Olin Mesa is providing you with copies of the Emergency Response Plans, Contingency Plans, and Preparedness and Prevention Plans which discuss our operations and give pertinent information for your use in the event of an emergency situation.

On January 19, 1989, a Contingency Plan was sent to you, however, it failed to list Olin Mesa personnel who could be contacted in an emergency. The revised plan includes that list. Please destroy the previous plan.

If you have any questions, please call me at (415) 961-6372.

Very truly yours,

Curt M. Richards

Contingency Plan
(1/27/89 UPDATE)

Introduction:

The Contingency Plan is based on the Business Plan for Emergency Response (HM 3-5) which is required for the City of Mountain View. It is attached for reference and supplemented by the following information. The attached HM 3-5 describes arrangements with the local authorities, emergency coordinators, emergency equipment, and the evacuation plan. Hazardous wastes are defined and discussed in the Waste Management Plan.

Purpose:

The purpose of the contingency plan is to minimize hazards to human health or the environment which results from fires or releases of hazardous wastes into the environment via the storm drains, the sewers or other means.

These provisions should be implemented as soon as possible whenever an incident occurs which threatens to harm human health or the environment by the release of hazardous wastes.

Procedures:

Upon the occurrence of an incident serious enough to harm human health or to threaten the environment the following steps shall be implemented immediately by the Emergency Coordinator (EC):

(a) Activate the internal alarm systems.

(b) Stop leak or continuing problem after adequate ventilation is available.

(c) Begin cleanup after adequate ventilation is available.

(d) The EC shall quantify the materials spilled and the threat to the environment.

(e) If help is required call the following as needed:

Olin Mesa Personnel (EC by priority)
Curt Richards 20193 Marilla Ct., Saratoga (408) 996-2933
Phil Audet 585 Corliss Way, Campbell (408) 378-0742
Steven Shonk 39847 Riata Ct. Fremont (415) 490-2761
Scott Voss 5 Fremontia, Portola Valley (415) 851-3228
Jeannette Opalski 1700 Halford Ave.#319, Santa Clara (408) 296-6309

EMERGENCY RESPONSE PLAN
Section III: Emergency Response Training Program

1. PERSON RESPONSIBLE FOR EMERGENCY RESPONSE TRAINING PROGRAM:

Name Curt M. Richards Title Director Of Operations Phone (415)961-6372

2. TRAINING REQUIREMENTS (Check all applicable items.)

All employees are trained in the following procedures:

- [X] Notification of emergency response coordinator
- [X] Notification of external emergency response organizations (e.g. Fire Department)
- [X] Location and content of emergency response plan
- [X] Evacuation

Chemical handlers are additionally trained in the following:

- [X] Safe methods for handling and storage of hazardous materials
- [X] Proper use of personal protection equipment
- [X] Locations and proper use of fire and spill control equipment
- [X] Specific hazards of each chemical to which they may be exposed, including the pathways of exposure (i.e., skin absorption, inhalation, ingestion)

Emergency response team members are additionally trained in the following procedures:

- [X] Shutdown of operations
- [X] Use, maintenance, and replacement of emergency response equipment

- [X] ALL PERSONNEL RECEIVE APPROPRIATE EMERGENCY RESPONSE TRAINING WITHIN SIX MONTHS OF HIRING
- [X] REFRESHER TRAINING IS PROVIDED AT LEAST ANNUALLY

3. PERSONNEL TRAINING RECORDS

The following training records are maintained for each employee:

- [X] Type and amount of introductory and continuing training
- [X] Date that training was completed
- [ ] Description of facility emergency reponse drills
- [ ] Former employees' training records are retained for at least three years

Your Emergency Response Plan must be on-site and available for review by the Fire Department.

PLEASE ADDRESS THE INDICATED ITEMS

A PERMIT CANNOT BE ISSUED UNTIL THE INDICATED ITEMS ARE RESOLVED

Facility Name: Mesa Foundry 1130 Terra Bella St

Address: R P Riley

Due Date: N/A

FAILURE TO COMPLY BY THE ABOVE DATE COULD RESULT IN CIVIL PENALTIES ($500 PER DAY PER EACH VIOLATION, AND/OR 6 MONTHS IN JAIL.

___ Renew your application to store hazardous materials (HM-3), including appropriate fees. Permits must be renewed annually.

___ Submit your application to store hazardous materials (HM-3). The first year requiring a permit was 1985. If hazardous materials were stored since 1985 and permits were not obtained, additional application forms and appropriate back fees must be submitted. Forms are available at the Fire Department, 1000 Villa Street, (415) 966-6378.

Note: Permit fees were increased in 1987. If hazardous materials were stored prior to this, you must use the 1985/1986 Fee Worksheet to calculate the amount owed for these years.

___ Clarification or an amendment of your application is required. Refer to indicated items and any comments enclosed.

___ Signature & date is required.
___ Facility map is not clear.
___ Quantities stored are not clear and/or incorrect.
___ Waste(s) must be indicated.
___ Annual waste throughput must be noted on the form.
___ _____

___ Material Safety Data Sheets (MSDS's) are required.
___ Type of tank (above or below ground) needs to be clarified.
___ Application is incomplete. Fill out & submit enclosed form(s).
___ _____
___ _____

___ A recent inspection by the Fire Department indicates chemicals stored in quantities greater than what was reported. The attached form, "Storage Facility Permit Quantity Limit" must be revised to reflect this, and additional fees paid if reported quantity ranges increase.

___ Additional backfees are owed in the amount of $_____, for the storage of hazardous materials during the 1985/1985 year.

___ Due to your lateness in filing, deliquent fees (double permit fees) of $_____ are now owed for the _____ year.

___ An error was found on your Facility Permit Fee Worksheet. An additional $_____ is still owed.

✓ An error was found in your favor. You have a credit of $ 100 towards the 1988 year.

___ Copy of license(s) from the State Department of Health Services for storing or handling of radioactive material is required.

___ _____

BUSINESS PLAN FOR EMERGENCY RESPONSE
Section II: Evacuation Procedures

1) By which method(s) is the Emergency Coordinator at your facility notified that an emergency (i.e., an actual or threatened hazardous materials release) is taking place? (check applicable items).

☒ Alarms: Name of Manufacturer: American District Telegraph
Last Test Date: 2-25-87 Test Frequency: Monthly

☐ Horns: Last Test Date: _____ Test Frequency: _____

☒ Emergency Phone Number: Phone Number 800-231-0256

☐ Shouting ☒ Other Intercom in Manufacturing Area

2) Once the EC has been notified of an emergency situation, what outside agencies does he/she notify?

Agency: *Fire Department* Phone: *911*
Agency: *State Office of Emergency Services* Phone *1-800-852-7550*
Agency: _____ Phone: _____
Agency: _____ Phone _____

These phone numbers should be posted throughout the facility to allow any employee to report the emergency, should the emergency coordinator or his alternate not be available.

3) If the facility must be evacuated, all personnel should know where the nearest emergency exit is located, and should be aware of all evacuation routes. This can best be accomplished by POSTING EVACUATION MAPS throughout the facility showing the location of emergency exits and evacuation routes, and by PRACTICING EVACUATION DRILLS on a routine basis.

4) During the actual evacuation, each facility should have specific individuals assigned to specific tasks:

List the person(s) responsible to do the following tasks. Include the person's name title, and shift number. (Use additional sheets if required).

Inspect Bathrooms: Toni Koenen/Vic Conti
Inspect Breakroom: _____
Shut Off Gas Supply: Vic Conti
Shut Off Water Supply: Vic Conti
Shut Off Electricity (circuit breakers): Mark Davis
Provide CPR: _____
Provide Emergency First Aid: _____
Verify That All Personnel Have Been Evacuated (headcount): Curt M. Richards

5) Should personnel be injured during the emergency, your facility must have a nearby clinic/hospital available for treatment:

Medical Facility Name: El Camino Hospital
Medical Facility Address: 2500 Grant Road, Mountain View
Medical Facility Phone Number (24-hour): (415) 940-7055
Approximate Distance To Medical Facility: 3 miles

BUSINESS PLAN FOR EMERGENCY RESPONSE
Section III: Spill Control/Mitigation Procedures

1) If the chemical spill/release is considered too large for your facility to handle or if your facility is not equipped with the appropriate clean-up equipment, you should have available a phone number of a hazardous materials clean-up contractor to call. This number will also be used by the fire department during an emergency involving hazardous materials clean-up.

Contractor Name: Ocean

Contractor Address: Lower River Road, Charleston, TN 37312

Contractor Phone (24-hour): 1-800-OLIN-911

Contractor EPA ID Number: _____

2) If your facility has the ability to mitigate the spill/release, a list of personnel responsible for the use of all specialized protective clothing, chemical spill control and clean-up equipment must be established and maintained.

Name	Title	Specific Responsibilities

3) In addition to personnel, the protective equipment and spill control equipment must be maintained, tested, and inspected on a regular basis.

PLEASE COMPLETE ATTACHMENT 1: "EMERGENCY EQUIPMENT"

4) Are all Emergency Response Procedures posted on site? ☒ Yes ☐ No

If yes, list locations:

On file at Safety Manager's Office

Lunchroom

_____

_____

BUSINESS PLAN FOR EMERGENCY RESPONSE
Section IV: Employee Training Records

1. Are all personnel trained and drilled in proper evacuation procedures, and do they understand what additional responsibilities, if any, they may have during an evacuation? YES[X] or NO[ ]

2. Are all personnel familiar with proper means of notifying their manager/ emergency coordinator in the event of an emergency? YES[X] or NO[ ]

3. Are all personnel trained in the safe handling of hazardous materials which they use or may be exposed to in their job? YES[X] or NO[ ]

4. Are new personnel trained in proper notification, evacuation, and hazardous materials handling procedures within 6 months of their date of hire? YES[X] or NO[ ]

5. Are refresher courses in: emergency response (for emergency response personnel only), evacuation, notification, and hazardous materials handling procedures given at least annually? YES[X] or NO[ ]

6. Do in-house emergency response personnel receive specialized hazardous material incident response training as part of their overall job training? YES[ ] or NO[X]

7. Are copies of all Material Safety Data Sheets (MSDS's) included with this packet? YES[X] or NO[ ]

I hereby certify that our plan is in conformance with the requirements of the California Health and Safety Code, Chapter 6.95, as it relates to The Emergency Response Plan subsection of the Business Plan, and understand that I will be required to show proof of compliance (including training documentation) during any facility inspection conducted by local, county, or state authorities.

EMERGENCY EQUIPMENT

INSTRUCTIONS: In the blank form provided describe the safety, spill response, and communication equipment you have in place at your facility for use in emergency situations. If practical, report the equipment according to individual job, shop or work activity area within your facility. If applicable, include the elements listed in legend.

Personal Protective & Safety Equipment

- Aprons
- Gloves
- Coats
- Chemical Suits
- Boots
- Safety Glasses
- Faceshield
- Hard Hats
- Cartridge Respirators
- Self Contained Breathing Apparatus (SCBA)
- First Aid Kits
- Exhaust Hoods/Vapor Scrubbers
- First Aid Stations
- Chemical Antidotes
- Eye Wash/Safety Shower

Spill Control/Monitoring Equipment

- Fire Blankets
- Fire Extinguishers (Type (A, B, C) & D)
- Fire Hoses
- Chemical Vapor Monitoring Equipment (Type)
- Spill Cart
- Chemical Absorbants
- Neutralizers
- Sand
- Leak Repair Kits (Chlorine)
- Underground Tank Leak Detection Monitors one
- Overpak Drums
- Plugging/Diking Materials
- Pumps

Communications Equipment
