Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RB Case Number:	Not reported
File Location:	Not reported
Potential Media Affected:	Not reported
Potential Contaminants of Concern:	Dichloroethene (DCE), Trichloroethylene (TCE)
Site History:	The site formerly was used as the Santa Clara County vector control maintenance yard. Soil, soil vapor, and groundwater sampling showed contamination by petroleum hydrocarbons and/or VOCs. Under DTSC oversight, the County conducted several investigations and a soil removal. The City purchased the property and conducted additional investigation (soil, soil vapor, and groundwater) to evaluate on-site sources and extent of VOCs in 2013. Following completion of this work, the City installed site monitoring wells. The U.S. Environmental Protection Agency (EPA) determined groundwater contamination at this site is part of the MEW Superfund Study Area; lead regulatory agency oversight transitioned to EPA in February 2015.

Completed Date: 12/28/2007
Comments: Site characterization completed. VOC groundwater contamination was determined to be form an offsite source. Remediation of the groundwater contamination will not be included as part of the Removal Action Workplan (RAW). The RAW will focus on the mitigation of residual soil VOC and TPH contamination associated with the Catch Basin. The results of the Site groundwater investigation indicates that the source(s) of the VOC groundwater contamination is from off-site and conveyed through the utility corridor.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

EMT LABS (Continued) **S120762579**

Case Worker:	CH
Local Agency:	Not reported
RB Case Number:	43S1215
File Location:	All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected:	Indoor Air, Soil Vapor
Potential Contaminants of Concern:	Trichloroethylene (TCE)
Site History:	Electro Magnetic Testing Labs (EMT) business has operated at the address for approximately 20 years. The business is an engineering laboratory providing EMC compliance testing services to local manufacturers of consumer electronics. EMT will be expanding their operations and building a new lab building. The site is within the footprint of the Teledyne and Spectra-Physics plume of volatile organic compound (VOC)-affected groundwater. In 2016, trichloroethene was detected at 190 micrograms per liter in groundwater samples collected near the site. The VOC-affected groundwater creates a vapor intrusion concern at the proposed development and should be fully evaluated and mitigated to protect the health of future building occupants. Based on groundwater monitoring data from nearby sites, groundwater flow direction is north-northwest and shallow groundwater is between approximately 5 and 20 feet below grade (Montwood site).

Completed Document Type: Phase 1
Completed Date: 04/15/2016
Comments: DTSC performed a site screening to determine whether any releases of hazardous substances or wastes have occurred at the site that require DTSC to pursue corrective actions. Arrowhead Development Company operated an amusement park equipment manufacturing facility from 1960 through 1980 on and 8-acre project that included the site. TCE was reportedly used at the facility for vapor degreasing. There were subsequent changes in the site ownership. Sanmina purchased the property in 1999 and operated four hazardous waste treatment units under permit-by-rule, including two Memtek wastewater treatment units, a batch treatment unit, and ion-exchange unit. The site is part of the Plymouth Street Site where the Regional Water Quality Control Board has been overseeing the investigation and remediation.

Case Type:	Cleanup Program Site
Case Worker:	RWP
Local Agency:	SANTA CLARA VALLEY WATER DISTRICT
RB Case Number:	43S0217
File Location:	Regional Board
Potential Media Affected:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Other Chlorinated Hydrocarbons, Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History:	The Montwood plume is within a much larger plume extending from the Teledyne/Spectra-Physics Superfund site. Groundwater extraction reduced on-property and nearby chlorinated VOCs (CVOCs) in groundwater to asymptotic levels. However, the CVOC plume extends off-property through and beyond the downgradient site at 1600 Plymouth Street,- presently owned by Peery/Arrillaga (P/A). The off-property charcacterizaion of the groundwater-CVOC plume has been completed with grab groundwater samples and additional wells. Off-property groundwater-CVOC extent has attenuated with natural attenuation. Responding to persistent Regional Water Board suggestions to re-characterize the site with high-resolution technology, the Responsible Party (UP) used MIP data plus three other data layers to successfully locate on-site CVOC source areas. Based on the data, the consultant selected enhanced reductive dechlorination (ERD) as the final remedy that is now in process at the on-property area. ERD has significantly decreased the on-property groundwater-CVOC levels with TCE now below MCLs. UP is about to conduct the first off-property ERD remedial task after extended access negotiations with Google. The off-property vapor intrusion evaluation may be incomplete.

Description:	Caller states this release began a few years ago, the water was found to be bubbling up from the ground on UP property. Remediation is on going. A storm drain is impacted with an unknown amount of contaminated water. Per a report, the water is contaminated with TCE, unknown what that stands for. The release stops for awhile and starts again periodically. A CalOES Hazardous Materials report had been made for this release years ago but no one has that report number.

WDS:

Facility ID:	San Francisco Bay 43I014394
Facility Type:	Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Background Info:	Facility size is approx. 7.06 acres. Sites include a grease rack and vehicle wash rack. A draft PA was completed in February 1999 and a final SI work plan was prepared in August 2000. The greas e rack was constructed in the early 1950s and is no longer used. The Army considers the wash rack to be a compliance (RCRA) issue for funding purposes. Minimal shallow soil sampling was conducte d in 1997 around the grease rack. Contaminants of concern are pr imarily grease oil, fuels, and solvents. Groundwater is shallow, approx 15 ft below ground furfact. Impacts to groundwater are u nknown, but will be determine by the August 2000 SI field work.

Completed Document Type: Site Screening
Completed Date: 04/11/2001
Comments: DTSC completed a Site Inspection Re-Assessment for the U.S. Environmental Protection Agency. As the lead regulatory agency for the Site, DTSC had approved a Removal Action Workplan for the Site on October 30, 1998. It was noted in the Site Inspection Re-Assessment that implementation of the Removal Action Workplan had been significantly delayed due to the City of Mountain View's building permit process and the Site owner's funding problem for construction of the multifamily residential buildings. Based on the Site Inspection Re-Assesment it was determined the Site did not qualify for further remedial site assessment under the Comprehensive Environmental Response, Compensation, and Liability Act.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Land Use Restriction - Site Inspection/Visit
Completed Date: 09/10/2009
Comments: The capped area includes the driveway entrance to the townhouse complex and includes parking areas, landscaped areas, and a sandbox. The concrete cap appeared to be in good condition, no major cracks were observed. There was no evidence of any activities prohibited by the Deed Restriction.

CA BOND EXP. PLAN:

Reponsible Party:	RWQCB REFERRAL SITE
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	This site is proposed for the National Priority List. The RWQCB will continue to have lead responsibility for monitoring the RP's remedial activities. Until such time as the RWQCB refers the site to DHS for follow-up using Bond funds, no money will be budgeted from the fund for this site.
Site Description:	CTS Printex Corporation (Printex) is located on 5.6 acres of land at 1950 Colony Street in Mountain View, California. Currently, the site is inactive. From 1966 to 1985 Printex operated a printed circuit board manufacturing facility onsite.
Hazardous Waste Desc:	Soil under the site contains elevated levels of copper, lead, trichloroethylene (TCE) and 1,1,1-trichloroethane (TCA). Contaminants in the ground water include TCA, TCE and 1,1-dichloroethylene (DCE).
Threat To Public Health & Env:	Roughly 188,000 people in Mountain View depend on ground water drawn from the aquifer of concern for their drinking water. The nearest municipal well drawing from the aquifer, Mountain View #10, is 1.1 mile from the site. The alternative surface drinking water sources appear to be inadequate to supply the large population currently relying on local ground water.
Site Activity Status:	Site investigation and remediation activities at the Printex facility were started in December, 1984. Organic chemical contamination appears to have resulted from the wet floor operation. Approximately 255 cubic yards of soil from the wet floor areawere excavated for offsite disposal. A quarterly monitoring program has been in implementation for all existing wells. The down gradient spread of chemicals has tentatively been established at approximately 600 feet beyond the property boundary. Ground water extraction facilities have been designed and wells constructed in order to contain the spread of contaminants in ground water. The Regional Water Quality Control Board issued a cleanup and abatement order in March, 1987.

INNERCONN TECH & UNION BK (Continued) **S101542366**

Trichloroethylene (TCE)

Site History: In 1983, Union Bank of California took over ownership of the site when Innerconn Technologies, the owner and operator of the site at the time, went bankrupt and defaulted on their loan. Trichloroethylene (or TCE) was discovered in the groundwater at about this time. TCE was a common solvent used and stored by the electronics manufacturing industry. Union Bank conducted a site investigation shortly after inheriting the site. The Board issued Site Cleanup Requirements in 1989 naming Union Bank and Innerconn Technologies as responsible parties. In 1989, the former manufacturing building was razed and a strip mall was built in approximately the same footprint. The strip mall continues to operate today. In 1992, Union Bank installed a pump and treat system to reduce TCE levels and to control off-site migration. In 2001, we allowed Union Bank to turn off the pump and treat system because TCE concentrations had declined and operating the system was no longer necessary. We expect that TCE concentrations will continue to decline over time due to natural degradation processes. While TCE concentrations are still above the drinking water cleanup goals, the residual contamination does not present an immediate threat to human health or the environment because the concentrations are relatively low, the groundwater plume is not migrating, and the shallow groundwater aquifer in this area is not currently used for any purpose.

CA BOND EXP. PLAN:

Reponsible Party:	NPL SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	This site has been proposed for listing on the NPL. It is expected that the RP will remediate this site with oversight by EPA. DHS will perform a limited role of oversight and monitoring of the remedial activities at this site. DHS has budgeted $50,000 for oversight and monitoring costs. DHS will recover 100 percent of direct costs plus staff costs and overhead related to the project.
Site Description:	The Jasco Chemical Corporation has formulated chemical products at this 2.05-acre site in Mountain View since 1976. The site is bordered on the northeast by the Central Expressway and Southern Pacific Railroad, and on the remaining sides by residential units. The facility handles and stores numerous chemicals onsite in underground tanks and 55 gallon drums.
Hazardous Waste Desc:	The contaminants detected in the soil and ground water onsite include trichloroethane (TCA), dichloroethane (DCA), dichloroethylene (DCE), phenol and

JASCO CHEMICAL CORPORATION (Continued) **S105960435**

methylene chloride (MCL).

Threat To Public Health & Env: Within a 3-mile radius of the site there are approximately 199,000 people who depend on ground water as a source of drinking water. Contaminants have migrated at least 10 feet beyond the property boundary, as evidenced by the detection of DCA and TCA in an offsite well. Mountain View wells #17 and #10 are located within 1,500 feet and 3,100 feet of the site, respectively.

Site Activity Status: Investigations at the site were initiated in 1984. Both soil and ground water contamination has been detected onsite. Discharges of surface runoff from the rear of the facility appear to be a major source of contaminants. Up to 11,000 parts per million (ppm) paint thinner was detected in soil samples taken near a runoff outfall. Jasco Chemical has been extracting contaminated ground water from one well since February, 1987.

Completed Date: 06/11/2015
Comments: The Results of Sub-Slab Soil Vapor Assessment report presents the findings of a sub-slab soil vapor assessment that was performed by the Site owner to determine whether former operations by Austin's Fremont Laundry impacted the Site. Sub-slab sampling of soil vapor was performed at six locations in the building that occupies the Site. Elevated concentrations of tetrachloroethene (PCE) were detected in the soil vapor samples. The highest PCE concentrations were detected on the eastern side of the building and were about an order of magnitude lower on the western side of the building.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

HIST FTTS INSP: FIFRA/TSCA Tracking System Inspection & Enforcement Case Listing
A complete inspection and enforcement case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

UTM Y (Meters):	4140468.8
Elevation:	37 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5641106 MOUNTAIN VIEW, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

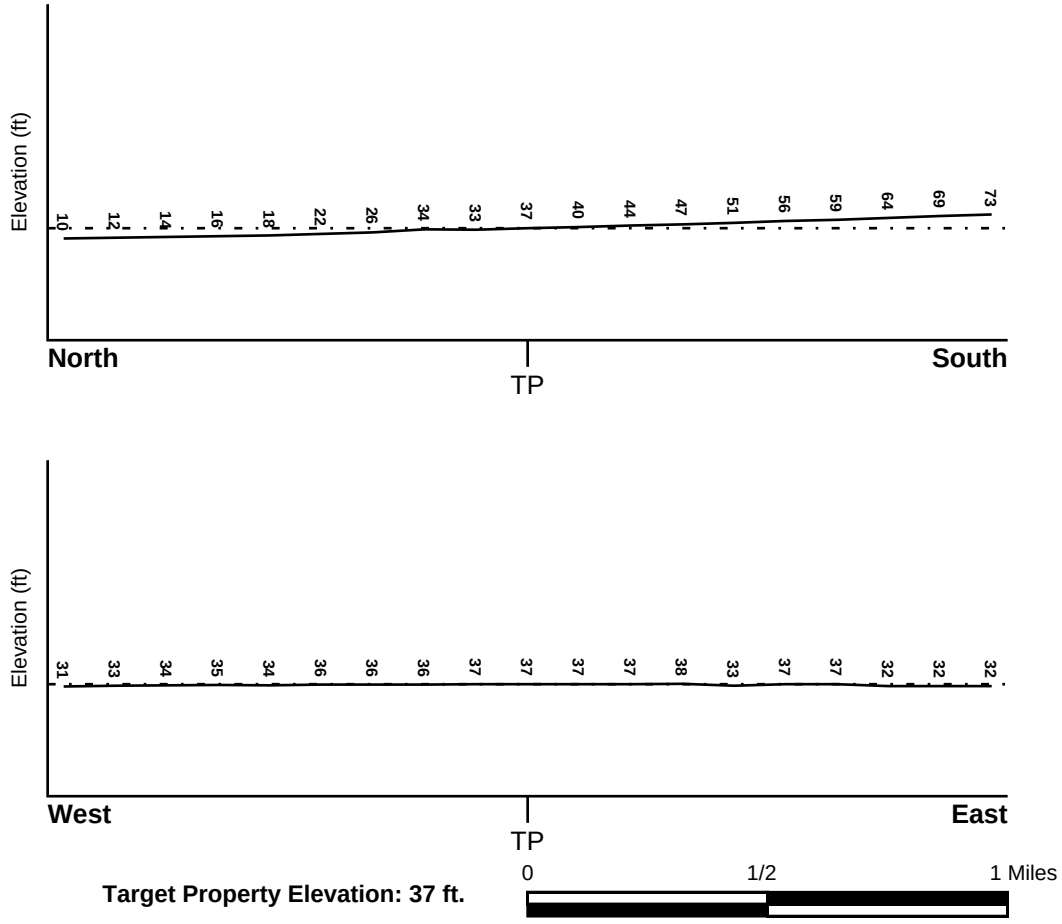
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General North

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Target Property Elevation: 37 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06085C0037H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06085C0036H	FEMA FIRM Flood data
06085C0045H	FEMA FIRM Flood data
06085C0038H	FEMA FIRM Flood data
06085C0039H	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MOUNTAIN VIEW	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	0 - 1/8 Mile ESE
Site Name:	JASCO CHEMICAL CO
Site EPA ID Number:	CAD981677107
Groundwater Flow Direction:	North-Northeast
Measured Depth to Water:	13.5 to 15 feet, 20 to 23.5 feet, and 26 to 29 feet in three discrete perched zones at the site.
Hydraulic Connection:	The upper perched aquifers and lower aquifer at the site are separated by a dense blue clay aquitard, although aquifer interconnections exist in the site vicinity.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	BOTELLA
Soil Surface Texture:	clay loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	MODERATE
Depth to Bedrock Min:	> 60 inches
Depth to Bedrock Max:	> 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	9 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.30 Min: 5.60
2	9 inches	41 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60
3	41 inches	76 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: No Other Soil Types

Surficial Soil Types: No Other Soil Types

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: No Other Soil Types

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

- Princeton University, B.S.E. Geological Engineering, 1985

Registrations/Certifications

- Forty-hour HAZWOPER Training Course
- Eight-hour Health and Safety Training Course for Supervisors

Summary of Experience

Dr. King has over thirty years of experience and a background in environmental chemistry, geological engineering, and environmental engineering. She specializes in working with clients and regulatory agencies to facilitate risk-based remedial actions for redevelopment of contaminated properties and former military bases, transfer of environmental cleanup responsibility at military bases, overseeing and performing human health risk assessments, performance of site assessments including vapor intrusion assessments, and evaluation of the fate and mobility of organic and inorganic chemicals in soil and aqueous environments. She also directs investigations of the vadose zone and aquifers containing volatile organic compounds (VOCs) and metals, evaluations of groundwater treatment systems, and assessments of the potential for chemical transformations. Dr. King plays a key role in evaluating chemical and physical data from the field and identifying the processes that potentially control the fate of the chemicals of concern in environmental systems.

Project Experience

- Dr. King is currently working on several Brownfield redevelopment projects in California to direct environmental due diligence followed by oversight of the site characterization, identification of chemicals of concern, estimation of human health risks, and development of proposed remedial actions or risk management measures that are appropriate and consistent with the planned future use of the specific sites. As part of these projects, Dr. King presents the technical arguments to the responsible party and the regulatory agencies to support an approach that will address identified environmental concerns in a cost-effective manner and within the timing and phasing of planned redevelopment. Many of these projects have required the performance of vapor intrusion assessments and evaluation of mitigation options.
- Dr. King is currently EKI's program manager for environmental activities associated with the reuse of approximately 1,000 acres at Moffett Federal Airfield. Dr. King oversaw the preparation of the Environmental Issues Management Plan (EIMP), which provides a framework to manage environmental concerns during design and construction for the reuse of the property. Dr. King serves as a liaison to communicate environmental issues among the key stakeholders, including the client, the regulatory agencies, NASA, the design team, and the general contractor. Dr. King also oversees EKI's technical approach and deliverables on the project. Primary environmental concerns include residual petroleum hydrocarbons and VOCs in soil, soil gas, and groundwater as well as PCBs and lead on the Hangar 1 structure. As part of this project, Dr. King has overseen the vapor intrusion assessment ad design of the vapor intrusion mitigation system as part of the retrofit and restoration of a large hangar.
- At a Superfund Site in Mountain View, California, Dr. King represents a group of property owners that own approximately 85 percent of the commercial property within the footprint of the Superfund Site. Her role is to provide technical advocacy with regard to issues such as vapor intrusion assessment, monitoring, and mitigation and evaluation of alternate groundwater remedial actions. Dr. King, in

conjunction with the owners and outside counsel, were successful at having United States Environmental Protection Agency (U.S. EPA) Region 9 modify the vapor intrusion remedy to address the property owner's interests. Separate from the owners' group, Dr. King also represents several of the commercial property owners at the Superfund Site and she has overseen vapor intrusion assessments and mitigation.

- On behalf of a Brownfields developer, Dr. King managed the preparation of the human health risk assessment, feasibility study, and remedial action plan (FS/RAP) at an 86-acre, near-bay site with more than 100 years of industrial activity that resulted in the release of pyrite cinders and associated acid and metals leaching to soil and groundwater, VOCs in soil and groundwater, PCBs in soil, and thiocarbamate pesticides in groundwater. The FS/RAP is the first in California to specifically address contingencies for potential future sea level rise as part of the remedy. Additionally, because the future land use at this site has not yet been defined, the FS/RAP provides a "menu" of potential remedial actions depending on the planned future land use, which is particularly significant for the vapor intrusion pathway. Dr. King oversaw the preparation and implementation of an accelerated PCB removal that was performed in consultation with U.S. EPA. In addition to significant technical challenges associated with the complex geochemistry at the site, Dr. King must consider and balance the interests of multiple stakeholders, including the client, the responsible party, State of California Department of Toxic Substances Control (DTSC), an active community group, and the insurer.
- At a residential site impacted with benzene, methyl tert butyl ether (MTBE), and other petroleum hydrocarbons and fuel oxygenates in shallow groundwater, Dr. King oversaw the evaluation of potential human health risks and remediation options. The project faces unique challenges because the source area is located underneath single-family homes, and the fine-grained soils limit the effectiveness of common remediation technologies. A dual-phase extraction (DPE) system has been installed at the site to remediate the source area and mitigate off-site migration of the chemicals of concern. In addition, sub-slab soil gas sampling is routinely performed to assess the vapor intrusion pathway.
- Dr. King provided expert services on behalf of a property owner regarding the appropriate petroleum hydrocarbon cleanup levels to apply at a former asphalt plant site in Northern California. The facility started operations in the 1960s. The most recent tenant is responsible for the remediation; however, the cleanup implemented by the tenant is not consistent with unrestricted commercial or industrial land use. Dr. King is advocating for cleanup levels that consider protection of human health and the environment.
- Dr. King supported the Presidio Trust in its negotiations with the U.S. Army for the transfer of $100 million and cleanup responsibilities to the Trust. These negotiations included extensive side-bar discussions to obtain buy-in from key stakeholders, including the National Park Service, U.S. EPA Region 9, DTSC, and California Regional Water Quality Control Board (RWQCB) staff. As Project Manager, she oversaw the preparation of an alternative remedial action document and a series of detailed engineering cost estimates that were used as the basis of negotiations. Since transfer, Dr. King has managed fast track remediation at petroleum release sites at the Presidio. She has also assisted the Trust with project planning and strategy at many areas of the former base including former landfills. In addition to managing site investigations and the preparation of various engineering documents (e.g., feasibility studies, remedial action plans) for submittal to the DTSC, she also managed the development of a contingency plan to address contamination that may be encountered during construction or other subgrade activities. Dr. King oversaw the development of a land use control management report for the Trust to implement long-term risk management measures. Dr. King is currently overseeing the development (a) of a database to compile closure documentation for more than 400 petroleum tank sites and (b) a site-wide approach to address potential residual contamination along fuel distribution system pipelines that formerly extended

more than 10 miles throughout the Presidio. Dr. King worked with the DTSC and a potential tenant to address vapor intrusion issues at a historical building.

- Dr. King assisted the City of Concord with reuse planning and environmental advocacy associated with the 5,200-acre Concord Naval Weapons Station, a National Priorities List (NPL) site. As part of this project, Dr. King oversaw the preparation of the hazardous materials chapter of the Environmental Impact Report (EIR) for the City's reuse plan. She has prepared comment letters on the Navy's proposed cleanup plans and is participating in discussions with the Navy, U.S. EPA Region 9, DTSC, and the RWQCB regarding the adequacy of investigation and cleanup at the 430-acre "bunker city" site that is impacted by arsenic as well as other sites.
- Dr. King oversaw the performance of a risk assessment and development of risk-based action levels at a former mercury mine that was active between 1890 and 1960. The mercury mine and associated tailings piles were located at a park in a residential neighborhood in Redwood City, CA. Dr. King evaluated available information on bioavailability of mercury to support the risk assessment and to advocate for a higher action level for mercury.
- Dr. King evaluated the proposed remedial actions at a former aerospace facility impacted with chlorinated solvents relative to the planned reuse as a commercial office space, residential, and public open space. Dr. King evaluated the incremental costs to remediate the site in a manner consistent with the planned re-use. Dr. King was deposed as part of arbitration on this project regarding cost allocation. She also oversaw preparation of a risk management plan to identify mitigation measures for protection of human health during and after construction. The risk mitigation measures included procedures to address unknown contamination encountered during construction, protocols for designing utilities, foundations, and other below-grade structures, and a sub-slab depressurization system to prevent vapor intrusion of VOCs to indoor air.
- Dr. King assisted a native-owned corporation with the evaluation of environmental conditions and transfer of cleanup responsibility at the former Adak Naval Air Facility in Alaska, a NPL site. As part of this work, Dr. King developed and advocated a risk-based cleanup approach consistent with planned residential and commercial/industrial reuse, including discussions with U.S. EPA Region 10.
- At a former manufactured gas plant property undergoing redevelopment, Dr. King managed the site remediation under the City and County of San Francisco's (CCSF) Maher Ordinance. A primary aspect of the development was the excavation and off-site disposal of approximately 100,000 cubic yards of soil. Dr. King oversaw negotiations with the CCSF and landfills to allow for soil characterization prior to excavation, thereby streamlining the excavation and disposal.
- On behalf of the Golden Gate National Parks Conservancy, Dr. King managed the evaluation and review of environmental investigations and the remedial action selection process performed by the U.S. Army for Crissy Field at the Presidio of San Francisco. As part of this project, she has negotiated with the Army, DTSC, and U.S. EPA Region 9 to implement remedial actions that were consistent with the restoration of Crissy Field to wetlands. This area is now a major attraction and recreational area used by thousands of residents and visitors annually.
- At several sites in the San Francisco Bay Area undergoing redevelopment, Dr. King has managed and written site-specific risk management plans (RMPs) or site management plans (SMPs) that provide a framework to manage risks to human health and the environment due to chemicals in the soil and groundwater to be implemented as a core element of redevelopment work. She has worked closely with the DTSC and the RWQCB staff and local agencies on these projects, ultimately resulting in a more streamlined review process. Implementation of these plans allows remediation to occur concurrently and cost-effectively with construction. The plans also typically include protocols for long-term management of residual chemicals on-site post-construction.

- Dr. King has performed and evaluated risk assessments for properties containing petroleum hydrocarbons, chlorinated solvents, PCBs and metals in soil and groundwater. She has worked closely with RWQCB and DTSC staff regarding exposure pathway analysis, exposure assumptions, and calculation of remedial goals as part of many site-specific risk assessments.
- At a manufacturing facility in Northern California, Dr. King provided project oversight for the preparation of an interim remedial action plan for a solvent release site adjacent to a creek. She managed the remedial design and construction of the groundwater extraction and treatment system, which has effectively curtailed further migration of VOCs into the creek. A dual-phase extraction system was installed to reduce VOC concentrations in soil and groundwater in the identified source area.
- As Project Scientist, Dr. King investigated the geology and groundwater chemistry of an industrial landfill containing sugar processing residues. By using the chemical equilibrium model, HYDRAQL, and chemical fingerprinting techniques, she demonstrated that the landfill had not impacted groundwater.
- At several sites, Dr. King, as Project Scientist, has analyzed the fate and transport of VOCs in the vadose zone using the computer code, VLEACH. She has also used VLEACH to determine potential impacts of VOCs to groundwater. In one case, Dr. King used VLEACH to show that the VOCs detected in the vadose zone originated from an off-site groundwater source, rather than an on-site source.
- For her doctoral thesis, Dr. King evaluated the ability of pyrite and ferrous iron bearing minerals to transform halogenated organic compounds. This research involved extensive laboratory analyses using gas chromatography, ion chromatography, and liquid scintillation counting to identify the transformation products of the VOCs. Additionally, the near-surface technique of x-ray photoelectron spectroscopy was used to evaluate the reaction products on the mineral surfaces.
- As a Fulbright Scholar in New Zealand, Dr. King assessed the seasonal fate of arsenic in a hydroelectric lake that was contaminated by runoff from a geothermal field and geothermal power station effluent. Field and laboratory testing indicated that arsenic (III), the more toxic form of arsenic, was released from the sediments to the lake when the lake was stratified in the summer months. From her laboratory testing, she published protocols for the storage of natural water samples containing metals such as iron and arsenic.

Honors

Outside Reviewer for San Francisco Regional Water Quality Control Board Draft Updated Environmental Screening Levels, 2011-2012.

Vice Chair, San Francisco Chapter of the National Brownfields Associations, 2009.

Invited attendee at California Environmental Protection Agency Health and Environmental Risk Division Off-Site at Asilomar, CA, November 2008.

Reviewer for Environmental Science & Technology and Environmental Toxicology and Chemistry.

Certificate of Merit for Presentation at American Chemical Society Meeting, Boston, MA, April 1990.

Fulbright Scholar to New Zealand, July 1985 – July 1986.

Elected to Sigma Xi, 1985.

James D. Yoon, PE

Civil / Environmental Engineer

Education

- California Institute of Technology, B.S. Chemical Engineering, 2007

Registrations/Certifications

- Professional Civil Engineer in California (C#81882)
- Forty-hour Hazwoper Training Course

Summary of Experience

For over ten years, Mr. Yoon has been providing engineering technical support for EKI's projects in southern and northern California. He designs remedial systems, collects samples and data as part of remediation system operations and site investigations, develops and runs simulation models, estimates remedial action costs, compiles investigation databases, assists with contractor selection and communications, and prepares technical reports. In particular, Mr. Yoon works on engineering assessments of environmental data, evaluations of remedial technologies, prepares engineering cost estimates for site-specific applications of remedial actions at contaminated sites, writes technical specifications for construction plans, and implements remedial system designs. His experience includes technical environmental issues associated with dry cleaning facilities, metals processing and plating shops, transit centers, former oilfields, horse racetracks, jet fuel storage and distribution facilities, vehicle fueling and service stations, storefronts and grocery stores, meat processing facilities, sports arenas, airports and airplane hangars, and high-pressure natural gas lines.

Detailed Experience

- Mr. Yoon provides technical engineering support for facility closure planning and evaluation. He has provided engineering design, review, and management of operations and monitoring for a remediation system at a 238-acre commercial horse racing track located in metropolitan Los Angeles, including assistance with soil vapor extraction (SVE) remediation system design for a former dry cleaner impacted by tetrachloroethene (PCE); preparation of contractor bid documents; assistance with contractor selection and contractor communications; technical support during SVE system installation and operations; collection of samples and reporting data to the Regional Water Quality Control Board (RWQCB); collection of samples during rebound testing; and preparation of remedial design strategies based on rebound data evaluation.
- Mr. Yoon has designed a combined SVE and free product skimming remediation system to assist vacuum enhanced product recovery for remediation of solvents such as PCE and subsurface free phase cutting oil under different levels of vacuum at a former faucet manufacturing facility. He provided technical engineering assistance during data collection and evaluation; assisted with design of the final remediation system; and performed ongoing evaluation and implementation of the final remediation system, including modifications to the final remedial strategy based on changing subsurface conditions.
- Mr. Yoon has provided technical engineering support for redevelopment of a large former commercial property, including preparation of construction documents and specifications and assistance with environmental sampling and reporting during earthwork.
- Mr. Yoon has provided technical engineering support for a free hydrocarbon product recovery system at a 20 million gallon above-ground fuel storage facility at Los Angeles International Airport (LAX), including review and oversight of operation and maintenance of a recovery system for Jet A fuel free hydrocarbon product and a groundwater extraction and treatment system processing 130 gallons per minute of groundwater impacted by jet fuel, volatile organic compounds (VOCs), and 1,4-dioxane, including monitoring and reporting obligations under a National Pollutant Discharge Elimination System (NPDES) general permit. As part of the project team, Mr. Yoon assisted with preparation of a

remedial strategy update, evaluation of historical reports and data, presentations to the RWQCB, and assistance with remediation system decommissioning and monitoring well destruction.

- Mr. Yoon has provided technical engineering support for the California Environmental Quality Act ("CEQA") process for a large commercial facility in metropolitan Los Angeles, including assistance with preparation of the hazardous materials section of an Environmental Impact Report; and preparation and evaluation of hazardous materials management strategies as part of a soil management plan.
- Mr. Yoon assists field investigations by designing investigation work plans to meet project goals; preparing contractor work authorizations; communicating and coordinating with contractors, clients, and field personnel; conducting field sampling activities as part of work plan implementation; conducting operations and maintenance for remediation systems; and preparing field documentation and reports.
- Mr. Yoon has prepared Phase I environmental site assessments (ESAs) for properties throughout California and in several states and countries. Mr. Yoon has reviewed files from the RWQCB, Department of Toxic Substances Control (DTSC), California Division of Oil, Gas, and Geothermal Resources (DOGGR), and other state and municipal government archives, and conducted site visits and interviews as part of Phase I ESA preparation.
- Mr. Yoon has provided technical support for municipal brownfields programs in Los Angeles County, including preparation of Phase I and Phase II ESAs, site visits to evaluate potential brownfields properties, data evaluation, preparation of databases of brownfield property information for municipal planning use, design of Quality Assurance Project Plans (QAPP) and Sampling and Analysis Plans approved by the U.S. EPA, and evaluation of city-wide groundwater contamination areas.
- Mr. Yoon has modeled and analyzed contaminant discharges to air using AERMOD, an EPA-approved model, including calculation of modeling parameters; obtaining meteorological data from the National Climatic Data Center; model preparation and execution; and model analysis and report preparation.
- Mr. Yoon has used Summation Blaze litigation support software and database software to review and sort historical files related to environmental assessment liability issues for a large petrochemical facility in Kentucky and a large manufacturing facility in metropolitan Los Angeles.
- Mr. Yoon supports remedial efforts by developing scopes of work, cost estimates, contractor bidding documents, work authorizations, and health and safety plans.
- Mr. Yoon prepared a SWPPP and associated training program for a Jet A fuel storage facility at a Los Angeles area airport, assisted in preparing regulatory submittals, and compiled associated training materials including federal and state regulatory requirements for SWPPPs.
- Mr. Yoon has provided technical support for a NPDES monitoring program for a commercial manufacturing facility in Northern California, including review of NPDES permit documents, communications with contractors, and technical review of monitoring data and reports.
- Mr. Yoon has conducted field investigations and prepared investigation reports to describe environmental conditions based on soil, soil vapor, and groundwater analytical results and field investigation data.

PROJ: B80116.00

FROM: Richard A. Kagel, Ph.D. RAK
Laboratory Director by AB 3/27/19

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT B80116.00

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
1001-SG-01-0.5-1.0	SOIL	3/20/2019	14:10	180840
1001-SG-01-2.5-3.0	SOIL	3/20/2019	14:17	180841
1001-SG-02-0.5-1.0	SOIL	3/20/2019	14:55	180842
1001-SG-02-2.5-3.0	SOIL	3/20/2019	15:00	180843
1001-SG-03-0.5-1.0	SOIL	3/20/2019	12:45	180844
1001-SG-03-2.5-3.0	SOIL	3/20/2019	12:50	180845
1001-SG-04-0.5-1.0	SOIL	3/20/2019	13:15	180846
1001-SG-04-2.5-3.0	SOIL	3/20/2019	13:23	180847
1001-SG-06-0.5-1.0	SOIL	3/20/2019	11:20	180848
1001-SG-06-2.5-3.0	SOIL	3/20/2019	11:25	180849
1001-SG-07-0.5-1.0	SOIL	3/20/2019	10:35	180850
1001-SG-07-2.5-3.0	SOIL	3/20/2019	10:45	180851
1001-SG-08-0.5-1.0	SOIL	3/20/2019	9:44	180852
1001-SG-08-2.5-3.0	SOIL	3/20/2019	9:59	180853
1001-SG-09-0.5-1.0	SOIL	3/20/2019	8:45	180854
1001-SG-09-2.5-3.0	SOIL	3/20/2019	8:48	180855

The above listed sample group was received on 3/21/2019 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

ACCT: 9115
PROJ: B80116.00

FROM: Richard A. Kagel, Ph.D. RAK
Laboratory Director 64 AB
3/27/19

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT B80116.00

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
1001-BH-07-0.5-1.0	SOIL	3/21/2019	15:41	180856
1001 BH-07-2.5-3.0	SOIL	3/21/2019	15:47	180857

The above listed sample group was received on 3/21/2019 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

ACCT: 9115
PROJ: B80116.00

FROM: Richard A. Kagel, Ph.D. RAK
Laboratory Director by AB
3/29/19

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT B80116.00

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
1001-BH-01-0.5-1.0	SOIL	3/22/2019	9:30	180922
1001-BH-01-2.5-3.0	SOIL	3/22/2019	9:35	180923
1001-BH-02-0.5-1.0	SOIL	3/22/2019	7:45	180924
1001-BH-02-2.5-3.0	SOIL	3/22/2019	7:55	180925
1001-BH-04-0.5-1.0	SOIL	3/22/2019	9:00	180926
1001-BH-04-2.5-3.0	SOIL	3/22/2019	9:05	180927
1001-BH-05-0.5-1.0	SOIL	3/22/2019	8:35	180928
1001-BH-05-2.5-3.0	SOIL	3/22/2019	8:40	180929
1001-BH-06-0.5-1.0	SOIL	3/22/2019	8:05	180930
1001-BH-06-2.5-3.0	SOIL	3/22/2019	8:10	180931
1001-BH-3-0.5-1.0	SOIL	3/23/2019	12:15	180932
1001-BH-3-2.5-3.0	SOIL	3/23/2019	12:30	180933

The above listed sample group was received on 3/25/2019 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

FROM: Richard A. Kagel, Ph.D. RAK
Laboratory Director SY AB 3/29/19

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT B80116.00

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
1001-SG-01	AIR	3/22/2019	12:58	180934
1001-SG-02	AIR	3/22/2019	12:15	180935
1001-SG-03	AIR	3/22/2019	11:55	180936
1001-SG-04	AIR	3/22/2019	12:36	180937
1001-SG-05	AIR	3/22/2019	13:21	180938
1001-SG-06	AIR	3/22/2019	11:25	180939
1001-SG-07	AIR	3/22/2019	11:05	180940
1001-SG-08	AIR	3/22/2019	10:40	180941
1001-SG-09	AIR	3/22/2019	10:14	180942
1001-SG-DUP	AIR	3/22/2019	11:25	180943

The above listed sample group was received on 3/25/2019 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

ACCT: 9115
PROJ: B80116.00

FROM: Richard A. Kagel, Ph.D. RAK
Laboratory Director by AB
5/17/19

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT B80116.00

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
1001-BH-02-2.5-3.0	SOIL	3/22/2019	7:55	180925
1001-BH-04-2.5-3.0	SOIL	3/22/2019	9:05	180927
1001-BH-05-2.5-3.0	SOIL	3/22/2019	8:40	180929

The above listed sample group was received on 3/25/2019 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

CORNERSTONE EARTH GROUP

Date:	May 8, 2019
Project No.:	1014-1-1
Prepared For:	Ms. Elizabeth Kanner, Senior Managing Associate Ms. Jill Feyk-Miney, Senior Associate **ENVIRONMENTAL SCIENCE ASSOCIATES** 550 Kearney Street, Suite 800 San Francisco, California 94108
Re:	**Peer Review Letter** *Draft Phase I Environmental Site Assessment and Phase II Subsurface Investigation* 1001 North Shoreline Boulevard Mountain View, California

Dear Ms. Kanner and Ms. Feyk-Miney:

Per your request, Cornerstone Earth Group, Inc. (Cornerstone) is pleased to present this Peer Review Letter of the Draft *Phase I Environmental Site Assessment* (Phase I ESA) *and Phase II Subsurface Investigation* (Phase II Investigation), *1001 North Shoreline Boulevard, Mountain View, California* prepared by eki environment & water (EKI), dated April 25, 2019.

General Comments

1) Based on prior discussions with ESA, the City, Project Applicant and EKI, on March 6, 2019, Cornerstone recommended the following for a Phase II Investigation proposed by the Project Applicant and their Environmental Consultant, EKI:

    a. Cornerstone to review the EKI sampling locations to evaluate if they are appropriately located to known and other potential areas of concern.
    b. EKI to prepare a Work Plan detailing sampling protocols and laboratory test methods; Cornerstone to review prior to EKI mobilizing to perform the field work.
    c. EKI to perform ground water sampling in conjunction with soil vapor sampling as this data would be helpful in evaluating the protocols for handling ground water during construction, designing a vapor mitigation system, and preparing CEQA mitigation measures.

2) EKI prepared a Work Plan, entitled *Work Plan for Subsurface Investigation, 1001 North Shoreline Boulevard, Mountain View, California*, dated March 12, 2019.

    a. On March 19, 2019, Cornerstone approved the Work Plan with a request that a shallow soil sample be collected at a former on-Site structure that may have been a greenhouse and/or a structure

with lead-based paint. In addition, per verbal communication with EKI, Cornerstone confirmed that the soil sampling depth would be approximately ½ foot beneath the native soil surface, the layer most likely impacted by historical agricultural activities and most likely impacted by flaking lead-based paint and/or termite control pesticides.

3) The EKI Draft *Phase I Environmental Site Assessment* (Phase I ESA) *and Phase II Subsurface Investigation* (Phase II Investigation), *1001 North Shoreline Boulevard, Mountain View, California* was performed in general compliance with the Work Plan and Cornerstone's request for an additional soil sample location.

   Cornerstone provides the following comments:

   a. Per the Geotechnical Investigation (Cornerstone 2014), approximately 1 to 2 feet of undocumented fill consisting of fat clay mixed with varying percentages of gravel and sand was observed beneath the surface asphaltic concrete pavement. Section 3.2 of the Phase I ESA and Phase II Investigation report (EKI 2019) also describes 1 to 2 feet of sand beneath the asphalt surface. These materials likely do not represent native soils; these materials likely represent fill imported to the Site for the original Site commercial development.

      Per Section 9.2.1 of the Phase I ESA and Phase II Investigation report, "EKI collected soil samples from intervals of 0.5 to 1.0 foot bgs [below ground surface]" [1]. In our opinion, this sampling depth may not represent soil historically used for agricultural activities and may not represent soil potentially impacted by lead-based paint or termite control pesticides. We recommend that EKI analyze the surface of native soils or provide rationale that the fill material was historically used for agricultural activity and likely representative of soil that may be impacted by lead-based paint or termite control pesticides.

   b. Polychlorinated biphenyl (PCBs) were detected at a concentration of 0.622 mg/kg at a former transformer pad. EKI compared this detection to the High Occupancy Use Cleanup Level of 1 milligram per kilogram (mg/kg) established in the Toxic Substances Control Act (TSCA). Based on our experience working with US EPA on PCB soil remediation projects, it's our opinion that the US EPA Residential Regional Screening Level (0.24 mg/kg)[2] is the more appropriate screening level.

   c. Investigative-derived wastes were profiled for removal. The Project Applicant shall provide documentation that these waste

[1] Cornerstone does accept the approximate ½ to 1-foot sampling depth, but the sampling depth should be measured from the surface of native soil and not pavement.

[2] November 2018.

materials have been appropriately disposed off-Site.

d. The Phase I ESA and Phase II Investigation report provides limited recommendations. Cornerstone provides more detailed recommendations below.

Recommendations

Implementation of mitigation measures would help provide that workers, the general public and future residents would not be exposed to unacceptable levels of VOCs. Cornerstone recommends the following mitigation measures for the proposed residential development:

- The Site is impacted by a release of VOCs above regulatory limits, mainly TCE, the source of which appears to be from a nearby, up-gradient property. The Project Applicant and subsequent Site owners and occupants shall cooperate with the Santa Clara County Department of Environmental Health (DEH - the lead oversight agency), the San Francisco Bay Regional Water Quality Control Board (Water Board) and any other state or local oversight agency for the on-going investigation and, if necessary, remediation/mitigation activities at the Site as well as the implementation of the vapor intrusion remedy. In addition, the Project Applicant and subsequent Site owners and occupants shall provide access for future indoor air and soil vapor monitoring activities that may be required and shall not interfere with the implementation of remedies selected by the DEH, the Water Board and responsible parties. These requirements shall be specified in Covenants, Conditions and Restrictions that shall run with the property.

- The Project Applicant shall prepare (and obtain DEH written approval) a Soil Management Plan and Air Monitoring Plan (SMP) that shall include:

    - Protocols and procedures for determining when soil and air sampling and analytical testing should be performed.

    - Monitoring of vapors during excavation and grading activities.

        - NIOSH/MSHA-approved respirators equipped with combination organic vapor and P-100 HEPA air purifying cartridges are required for workers entering excavations and trenches approximately 5 feet or deeper.

        - If respirators are no longer desired to be worn by workers entering excavations, the sampling or screening for TCE shall be conducted by either (1) sampling air in the excavation or collecting personal air samples using TCE sampling badges (e.g., Radiello 130 or Radiello 145 samplers or equivalent) or (2) screening air in the excavation using a portable GC-MS (e.g., Hapsite GC-MS or equivalent). Sampling or screening for TCE shall be conducted for a minimum period of one full work day within representative source areas. Air samples shall be analyzed and reported on a 24-hour turnaround time and screening with a portable GC-MS shall be conducted, at a minimum, on an hourly basis.

        - If sampling or screening data collected over a minimum period of one full work day demonstrates that TCE is either (1) below a reporting limit of

5 µg/m^3 in the excavation or (2) is present in the excavation at concentrations less than the EPA's Accelerated Response Action Level (7 µg/m^3), the use of respiratory protection during excavation entry may be discontinued, and the Contractor may terminate sampling or screening for TCE[3]. Personnel entering the excavation will resume using respiratory protection and the Contractor will resume sampling or screening for TCE if any of the following conditions occur:

  - Ground water begins to enter the excavation; and
  - The excavation is enlarged by 20 feet or greater; or
  - Excavation activities commence in a new excavation area within an area suspected to have elevated TCE Vapors.

- If sampling or screening data, with a reporting limit of 5 µg/m^3 or lower, demonstrates that TCE is present at concentrations greater than 7 µg/m^3, the use of respiratory protection and ventilation fans during all excavation entry shall continue, and the Environmental Professional shall notify the DEH within 24 hours.

- If sampling or screening data demonstrates that TCE is present at concentrations less than 50 µg/m^3, the Contractor may terminate sampling or screening for TCE while workers continue to wear respiratory protection (with fan ventilation of the excavation). If sampling or screening data demonstrates that TCE is present at concentrations greater than 50 ug/m^3, the Contractor should implement additional engineering controls within the excavation, re-evaluate respiratory protection and upgrade as necessary, and continue sampling or screening until sampling or screening data demonstrates that TCE is present at concentrations less than 50 ug/m^3. TCE air sampling or screening outside of the excavation shall be performed if TCE concentrations within the excavation cannot be reduced to levels below 50 µg/m^3.

- Excavated soil in contact with ground water shall be assumed contaminated. This soil shall be segregated and stockpiled at a designated, plastic-lined stockpile area and sampled per Department of Toxic Substances Control's (DTSC's) protocols to determine if soil can be reused on-Site or if soil is required to be disposed off-Site at a permitted facility.

- Protocols for management of ground water discharges during excavation dewatering. Protocols shall be prepared to evaluate water quality and discharge/disposal alternatives. The pumped water shall not be used for on-Site dust control or any other on-Site use.

- Protocols for management of Site risks during earthwork activities in areas where impacted soil, soil vapor and/or ground water are present or suspected. Worker training requirements, health and safety measures and soil handling procedures shall be described.

[3] The Project Certified Industrial Hygienist may elect to continue air monitoring for TCE in a known or suspected TCE source area even if concentrations are documented to be less than 7 ug/m^3.

- During earthwork excavation activities (trenching approximately 5 feet or deeper) and/or any trench with ponded ground water, daily ambient air samples shall be collected at the Site perimeter. Ambient air samples shall be collected in 6-liter Summa canisters, each equipped with a 24-hour flow controller. The Summa canisters and flow controllers shall be certified for low level Selected Ion Monitoring (SIM). The air samples shall be analyzed for TCE (Test Method TO-15SIM) on an accelerated one-day response time. The TCE analytical reporting limits for the time-integrated samples for perimeter monitoring shall be 0.48 $\mu g/m^3$ (TCE's residential indoor air Tier 1 screening level). A response action level for TCE (0.48 $\mu g/m^3$ above the ambient TCE concentration [upwind data compared to downwind data]) shall trigger the mitigation actions (to be developed by the Environmental Professional). In addition, if the response action level is exceeded, DEH must be notified within two working days. An ambient air monitoring result shall be considered elevated if analytical data exceeds the US EPA Region 9 recommended guidance level for TCE of 2 $\mu g/m^3$ (residential accelerated response action level) or 6 $\mu g/m^3$ (residential urgent response action level). If these action levels are exceeded, response actions (to be developed by Environmental Professional) are required to determine if mitigation and worker protection measures are necessary.

- If the above actions levels are not exceeded in the first three days of perimeter air monitoring, the monitoring shall be reduced to one event per work week.

- Excavated soils from approximately 5 feet or deeper shall be field-screened for the presence of VOCs. Field screening (approximately every 10 lineal feet of trench or 50 cubic yards [CYs] of excavated soil) shall occur using a sensitive PID (such as the ppbRAE 3000). Soil that is field-screened and "cleared" (less than 500 ppb_v – or a similar level approved by the oversight agency) can be considered "clean" and can be reused for on-Site fill. Potentially contaminated soil shall be segregated and stockpiled at a designated, plastic-lined stockpile area for subsequent testing and laboratory analyses to determine if the soil can be reused on-Site or if it is required to be disposed off-Site at a permitted facility.

- Evaluation and documentation of the quality of any soil imported to the Site shall follow the *Information Advisory Clean Imported Fill Material* (DTSC, October 2001). Soil containing chemicals exceeding the current residential (unrestricted use) screening levels or typical background concentrations of metals shall not be accepted.

- Evaluation of the residual contaminants to determine if they will adversely affect the integrity of below ground utility lines and/or structures (e.g., the potential for corrosion).

- Measures to reduce soil vapor and ground water migration through trench backfill and utility conduits. Such measures shall include placement of low-permeability backfill "plugs" at specified intervals on-Site and at all locations where the utility trenches extend off-Site. In addition, utility conduits that are placed below ground water shall be installed with water-tight fittings to reduce the potential for ground water to migrate into the conduits.

- Any removed utility line that is approximately 3 inches or greater in diameter shall be observed for sediment. If sediment is present, it shall be stockpiled as potentially contaminated material and sampled in accordance with the protocols outlined in the SMP.

- Prior to the start of any construction activity that involves below ground work (e.g., mass grading, foundation construction, excavating or utility trenching), information regarding Site risk management procedures (e.g., a copy of the SMP) shall be provided to the Contractors for their review, and each Contractor shall provide such information to its Subcontractors.

- The Project Applicant's Environmental Professional shall assist in the implementation of the SMP and shall, at a minimum, perform part-time observation services during excavation, grading and trenching activities. Within 60 days of completion of soil disturbance activities, the Environmental Professional shall prepare a report documenting compliance with the SMP; this report shall be submitted to the City and the DEH. Written approval of this report by the DEH should be required by the City prior to approving occupancy permits.

- Each contractor working at the project Site shall prepare a Health and Safety Plan (HSP) that addresses the safety and health hazards of each phase of site operations that includes the requirements and procedures for employee protection. Workers conducting site investigation and earthwork activities in areas of contamination shall complete a 40-hour HAZWOPER training course (29 CFR 1910.120 (e)). The contractor shall be responsible for the health and safety of their employees as well as for compliance with all applicable federal, state, and local laws and guidelines.

- A vapor mitigation system shall be installed for all occupied structures. The *Vapor Intrusion Mitigation Advisory* (DTSC, October 2011) provides useful guidance in selecting, designing, and implementing appropriate response actions for sites where a potential vapor intrusion risk has been identified.

- Pre-construction, the Project Applicant shall submit Vapor Intrusion Mitigation System drawings and specifications to a third-party reviewer selected by the City. Finalized drawings and specifications shall then be provided to DEH for their review and written approval. Upon DEH's approval, these drawings and specifications shall be incorporated into the City building permit design check.

- Post construction (within 60 days), the Project Applicant shall provide a Vapor Mitigation Completion Report to the City and the DEH. The report shall document installation of the vapor control measures identified in the Vapor Intrusion Mitigation Plan, including final as-built design drawings, and present an Operation, Maintenance and Monitoring Plan. The Project Applicant also shall provide Institutional Controls and Financial Assurance[4] to ensure that future Site occupants are not exposed to unacceptable levels of VOC vapors. DEH written approval of the above should be a condition of the occupancy permit.

- PCBs were detected at a concentration of 0.622 mg/kg at a former transformer pad, exceeding its residential screening level (0.24 mg/kg). Under the oversight of DEH, the

[4] Proof that adequate funds are available for long-term maintenance and monitoring of the vapor intrusion mitigation system

lateral and vertical extent of PCB contamination shall be defined and the impacted soil over-excavated and disposed at a permitted facility. Confirmation samples shall be collected and analyzed to document that the impacted soil has been appropriately over-excavated.

- The source of the elevated concentration of PCE in soil vapor (detected at soil vapor probe SG-6) is unknown. DEH shall be contacted regarding this elevated PCE concentration to determine if further investigation/remediation will be required for this area.

- If a deep foundation system is proposed, the foundation of the building shall incorporate measures to help reduce the potential for the downward migration of contaminated ground water. These measures shall be identified in the Geotechnical Investigation report and the SMP and implemented as a part of the development plans.

Limitations

Cornerstone performed this Peer Review to support ESA and the City in the preparation of a CEQA Study at The Residences @ Shoreline Gateway, Mountain View, California. Conclusions and recommendations presented in this letter are based on selected, readily available information. This study is inherently limited because findings are developed based on information obtained from others. Cornerstone does not accept liability for deficiencies, errors, or misstatements that have resulted from inaccuracies in the publicly available information or from information published by others. Cornerstone reviewed and relied on the information presented in these reports and cannot be responsible for their accuracy. Cornerstone makes no warranty, expressed or implied, except that our services have been performed in accordance with the environmental principles generally accepted at this time and location.

We thank you for this opportunity to work with you on this important development. Should you have any questions, please contact us at your convenience.

Sincerely,

Cornerstone Earth Group, Inc.
Ron L. Helm, C.E.G.

CORNERSTONE EARTH GROUP

Date:	June 24, 2019
Project No.:	1014-1-1
Prepared For:	Ms. Elizabeth Kanner, Senior Managing Associate Ms. Jill Feyk-Miney, Senior Associate **ENVIRONMENTAL SCIENCE ASSOCIATES** 550 Kearney Street, Suite 800 San Francisco, California 94108
Re:	**Second Peer Review** *Phase I Environmental Site Assessment and Phase II Subsurface Investigation* 1001 North Shoreline Boulevard Mountain View, California

Dear Ms. Kanner and Ms. Feyk-Miney:

Per your request, Cornerstone Earth Group, Inc. (Cornerstone) is pleased to present this Second Peer Review of the *Phase I Environmental Site Assessment* (Phase I ESA) *and Phase II Subsurface Investigation* (Phase II Investigation), *1001 North Shoreline Boulevard, Mountain View, California* prepared by eki environment & water (EKI), revised date of June 14, 2019. This EKI report was a revision of their first draft report (EKI, April 25, 2019), which was edited based on comments presented by Cornerstone in the First Peer Review (May 8, 2019).

Draft

General Comments

Cornerstone provided the following comment in our first Peer Review (May 2019) for the EKI Phase I ESA and Phase II Investigation (April 2019):

a. Per the Geotechnical Investigation (Cornerstone 2014), approximately 1 to 2 feet of undocumented fill consisting of fat clay mixed with varying percentages of gravel and sand was observed beneath the surface asphaltic concrete pavement. Section 3.2 of the Phase I ESA and Phase II Investigation report (EKI 2019) also describes 1 to 2 feet of sand beneath the asphalt surface. These materials likely do not represent native soils; these materials likely represent fill imported to the Site for the original Site commercial development.

   Per Section 9.2.1 of the Phase I ESA and Phase II Investigation report (April 2019), "EKI collected soil samples from intervals of 0.5 to 1.0 foot bgs [below ground surface]" [1]. In our opinion, this sampling depth may not represent soil historically used for agricultural activities and may not represent soil potentially

[1] Cornerstone does accept the approximate ½ to 1-foot sampling depth, but the sampling depth should be measured from the surface of native soil and not pavement.

impacted by lead-based paint or termite control pesticides. We recommend that EKI analyze the surface of native soils or provide rationale that the fill material was historically used for agricultural activity and likely representative of soil that may be impacted by lead-based paint or termite control pesticides.

To address the above, EKI analyzed the deeper soil samples (2½ to 3 foot depth) and modified / reissued their report. Cornerstone provides the following comments regarding the reissued EKI report (June 2019):

In March 2019, EKI advanced 14 borings to collect soil samples at approximate depths of ½ to 1 and 2½ to 3 feet. EKI stated that "Generally, shallower samples were located within sandy material likely brought to the Subject Property as fill during development, and deeper samples were located within silty or clayey native material, several of which were within the upper foot of historical native soil; however, the sandy material was not present at all locations, and some of the shallow samples were collected from probable native material". The soil samples reported as characteristic of native material and within its upper foot consist of the following:

Draft

SG-04-0.5-1.0
SG-07-2.5-3.0
SG-08-0.5-1.0
BH-01-0.5-1.0
BH-03-0.5-1.0
BH-05-0.5-1.0

Note that 5 of 14 soil samples collected at the ½ to 1 foot depth interval and 1 of 8 soil samples collected at the 2½ to 3 foot depth interval were reported by EKI as collected in the upper foot of native soil. It's Cornerstone's opinion that if these six samples are representative of the upper foot of native soil as reported by EKI, no further sampling appears required at this time.

Considering the difficulty in classifying fill versus native soils, Cornerstone also notes that the Site will be capped by the proposed development (and the existing layer of fill generally covering the Site), limiting exposure of the future residents to native soils.

Cornerstone provided the following comment in our first Peer Review (May 2019) for the EKI Phase I ESA and Phase II Investigation (April 2019):

b. Polychlorinated biphenyl (PCBs) were detected at a concentration of 0.622 mg/kg at a former transformer pad. EKI compared this detection to the High Occupancy Use Cleanup Level of 1 milligram per kilogram (mg/kg) established in the Toxic Substances Control Act (TSCA). Based on our experience working with US EPA on PCB soil remediation projects, it's our opinion that the US EPA

Residential Regional Screening Level (0.24 mg/kg)[2] is the more appropriate screening level.

Cornerstone provides the same comment regarding the reissued EKI report (June 2019). We recommend contacting Santa Clara County Department of Environmental Health (DEH – the lead oversight agency) to determine whether additional investigation/soil removal in this area will be required.

Cornerstone provided the following comment in our First Peer Review (May 2019) for the EKI Phase I ESA and Phase II Investigation (April 2019):

c. Investigative-derived wastes were profiled for removal. The Project Applicant shall provide documentation that these waste materials have been appropriately disposed off-Site.

The investigative waste was reported as removed in the EKI June 2019 revised report.

Cornerstone provided the following comment in our First Peer Review (May 2019) for the EKI Phase I ESA and Phase II Investigation (April 2019):

d. The Phase I ESA and Phase II Investigation report provides limited recommendations. Cornerstone provides more detailed recommendations below.

Cornerstone's more detailed recommendations have not changed. Please review our First Peer Review (May 2019) for these recommendations.

Subject: **The Residences at Shoreline Gateway**
Environmental Noise Study
Salter Project: 19-0142

Dear Kerry:

As requested, we have conducted an environmental noise study for the proposed project. The project consists of two residential buildings on the same parcel with an existing office building and parking garage. Each building consists of five floors of wood-frame structure over a two-story concrete podium, totaling approximately 290,000 square feet. Block A includes 203 market-rate rental units, and Block B includes 100 upscale for-sale condominiums. The purpose of the study is to determine the noise environment at the proposed site, compare the measured data with applicable standards, and propose mitigation measures as necessary. This report summarizes the results of our study.

PROJECT CRITERION

Mountain View General Plan

The Mountain View General Plan contains land use compatibility guidelines for environmental noise in the community. Noise levels are characterized in terms of Day/Night Average Sound Levels[1] (DNL). The guidelines for multi-family residential projects are summarized in Table 1 below.

[1] DNL (Day-Night Average Sound Level) – A descriptor for a 24-hour A-weighted average noise level. DNL accounts for the increased acoustical sensitivity of people to noise during the nighttime hours. DNL penalizes sound levels by 10 dB during the hours from 10 PM to 7 AM. For practical purposes, the DNL and CNEL are usually interchangeable. DNL is sometimes written as L_{dn}.

Table 1: Land Use Compatibility for Community Noise Environments

Exterior Noise Exposure (DNL)	Land Use Compatibility Level for Office Buildings
60 dB[2] or less	*Normally Acceptable* – Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
60 to 70 dB	*Conditionally Acceptable* – New construction or development should be undertaken only after a detailed analysis of the noise reduction requirement is made and needed noise insulation features included in the design.
70 to 75 dB	*Normally Unacceptable* – New construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
75 dB or greater	*Clearly Unacceptable* – New construction or development clearly should not be undertaken.

In addition, Policy NOI 1.2 of the Mountain View General Plan states the following:

- New multi-family developments shall maintain a standard of DNL 65 dB for exterior noise in private and community outdoor active use areas. Noise standards do not apply to private decks or balconies.
- Interior noise levels shall not exceed DNL 45 dB in all new multi-family residential units, as consistent with the California Building Code.
- Where new multi-family residential units would be exposed to intermittent noise from major transportation sources such as train or airport operations, occurring four or more times per day, new construction shall achieve an interior noise level of 65 dB through measures such as site design or special construction materials.[3]

[2] A-Weighted Sound Level (dB) — The sound level is obtained by use of a standard sound level meter and is expressed in decibels.

[3] The site is within the Airport Influence Area, but outside the CNEL 60 dB noise contour of Moffett Federal Airfield (Mountain View 2030 General Plan, Figure 7.2: Aircraft Noise Contours, 2022, and Airport Influence Area). It is over 4,000 feet from an active railroad right-of-way used daily by Caltrain and freight trains.

California Building Code (CBC)

The California Building Code limits indoor noise from outdoor sources to DNL 45 dB in habitable rooms of attached housing.[4]

California Green Building Code (CALGreen)

Section 5.507.4 of the 2016 California Green Building Standards Code (CALGreen) addresses acoustical issues for nonresidential spaces. There is a requirement for mitigating exterior noise where buildings are exposed to a noise level of 65 dB $L_{eq}(h)$[5] or greater. If this is the case, then the building envelope must have wall and roof-ceiling assemblies designed to provide an interior noise environment not exceeding an $L_{eq}(h)$ of 50 dBA in occupied areas during hours of operation.

We assumed that the hours of operation for the building will be from 7 a.m. to 8 p.m. and used the loudest $L_{eq}(h)$ during that period as the basis for design.

NOISE ENVIRONMENT

The project is located approximately 300 feet southwest of US-101, bounded by North Shoreline Boulevard, Terra Bella Avenue, Linda Vista Avenue, and the US-101 southbound on-ramp. The site is located approximately 7,000 feet from the Moffett Federal Airfield and is located outside of the 60 CNEL[6] Moffett Federal Airfield 2022 noise contour[7]. The noise environment at the site is predominantly controlled by vehicular traffic along North Shoreline Boulevard and US-101.

To quantify the existing noise environment, we conducted four long-term noise measurements between 21 and 27 February 2019. The meters measured continuous noise levels and recorded "loud" noise events, allowing us to identify the source of the noise (e.g., truck noise, motorcycles, and plane flyovers). The noise monitors were at a height of 12 feet above grade. Short-term "spot" and pole measurements were also conducted to determine the change in noise levels at higher elevations. The measured levels and description of the monitor locations are shown in Figure 1. Table 1 shows a summary of the measured data.

---

4 California Code of Regulations, Title 24, Part 2: 2016 California Building Code, Chapter 12, Section 1207: Sound Transmission.

5 L_{eq} – The equivalent steady-state A-weighted sound level that, in a stated period of time, would contain the same acoustic energy as the time-varying sound level during the same period.

6 CNEL (Community Noise Equivalent Level) – A descriptor for a 24-hour A-weighted average noise level. CNEL accounts for the increased acoustical sensitivity of people to noise during the evening and nighttime hours. CNEL penalizes sound levels by 5 dB during the hours from 7 PM to 10 PM and by 10 dB during the hours from 10 PM to 7 AM. For practical purposes, the CNEL and DNL are usually interchangeable.

Table 1: Measured Environmental Noise Levels

Site	Location		Leq(h)	DNL
L1	US-101 On-ramp Monitor, 12' height Approximately 320' southwest of US-101 centerline and 325' east of N Shoreline center		70 dB	73 dB
L2	Linda Vista Monitor[8], 12' height Approximately 25' west of roadway centerline		65 dB	68 dB
L3	Terra Bella Monitor, 12' height Approximately 25' south of roadway centerline		66 dB	68 dB
L4	N Shoreline Monitor, 12' height Approximately 55' west of roadway center		76 dB	76 dB
S1A	Approximate location of Block A building northeast corner Approximately 340' southwest of US-101 centerline and 325' east of N Shoreline center	5' height	65 dB*	68 dB*
S1B		35' height	73 dB*	76 dB*
S2A	Approximate location of Block B building northeast corner Approximately 155' west of Linda Vista centerline	5' height	61 dB*	64 dB*
S2B		35' height	68 dB*	71 dB*

*Calculated from simultaneous offset from long-term monitor

In addition, the typical maximum instantaneous noise level ($L_{max}30$[9]) from airplane passbys was 77 dB at monitor L3. Train noise was immeasurable at the site, as the nearest train tracks were over 4,000 feet away.

[8] Measurements taken at Linda Vista included numerous instances of truck noise, such as stalled motor noise and horn noise due to reversing, without certainly identifiable sources, so our calculations treat this noise as a temporary source. This may be modified in the future once truck originations are identified.

[9] L_{max30} (Typical Maximum Sound Level) – There is no standardized metric to quantify "typical" maximum sound levels in an environment (instead of the absolute maximum sound level for a measurement period). The metric L_{max30} comes from a paper by Rob Greene ("Max Level Intrusive Noise Limit: 1982 National Conference on Environmental and Occupational Noise"). It is based on the logarithmic average of the noisiest 30 percent of single events (e.g., train passbys, aircraft flyovers).

ANALYSIS AND RECOMMENDATIONS

Land Use Compatibility

Estimated future noise levels at the planned setback of the residential buildings range from under DNL 60 dB in the courtyards, due to shielding provided by the project and surrounding buildings in addition to increased setback distance from noise generators (e.g., roadways), to approximately DNL 78 dB closest to US-101. Therefore, the project will need to incorporate noise reduction measures into the design to meet the City's indoor noise goals, as discussed in the next section.

Exterior-to-Interior Noise

Based on the noise levels that were measured at the site, we calculated the expected noise levels at the project facades. Using peak-hour traffic volumes from the 10 December 2018 Draft Transportation Impact Analysis[10]: traffic volumes along North Shoreline Boulevard will increase by 16%, which corresponds with approximately 1 dB increase in noise level, and traffic volumes along Terra Bella Avenue will increase by 80%, which corresponds with approximately 3 dB increase in noise from traffic on Terra Bella. These values have been incorporated into our calculations.

The project can meet the meet the State code requirement of reducing interior noise from transportation sources to DNL 45 dB in living spaces, and to the CALGreen criterion of $L_{eq}(h)$ 50 dB in commercial spaces by means of sound rated windows and doors, and upgraded exterior wall assemblies in locations most exposed to noise from Highway 101. Exterior skin assemblies selected to meet these requirements will also reduce interior noise from individual aircraft to meet the maximum noise level requirement of L_{max30} 65 dB. The information included in this report, reflects the current design and assumptions being made. These should be reviewed and refined as needed during the design of the project to confirm the mitigation required. It is possible that higher or lower STC ratings and associated mitigation may be warranted based on the final design.

Using the floor plans and elevations dated 8 January 2019, we calculated the window and exterior door STC[11] ratings needed to meet the project criterion. These are shown in Figures 2-9, attached. It should be noted that where STC ratings are above 35, the balcony door STC is limited to 35.

We have assumed the following:

- Bedrooms will have carpet, all other rooms will have hard-surfaced flooring
- Windows will be punched and sized according to the elevations
- Floor-to-ceiling height is 9 feet, unless specified otherwise on the plans (i.e., amenity spaces, loft level, first and second story residential)

[10] Figure 6: Existing Traffic Volumes, Figure 14: Cumulative Plus Project Traffic Volumes. 10 December 2018 1001 North Shoreline Boulevard Residential Development DRAFT TIA

[11] STC (Sound Transmission Class) – A single-number rating defined in ASTM E90 that quantifies the airborne sound insulating performance of a partition under laboratory conditions. Increasing STC ratings correspond to improved airborne sound insulation.

- Exterior walls will be equivalent to 7/8-inch thick stucco over wood sheeting with batt insulation in stud cavities and 1 layer of gypsum board on the interior (approximately STC 45)

Our analysis assumes a standard exterior wall (e.g., STC 45). However, there are some locations where an "upgraded" exterior wall is needed (e.g., STC 50) to meet the interior noise requirements. This could consist of a staggered-stud assembly or could include sound-isolation clips (e.g., Kinetics IsoMax) as shown in Figures 10 and 11. All outlet boxes and other low-voltage devices in these walls will also need to be acoustically treated as shown in Figure 12.

The recommended STC ratings are for full window assemblies (glass and frame) rather than for glazing alone. For reference, standard construction grade dual-pane windows and sliding glass doors typically have sound insulation ratings of STC 26 to 28. Where sound insulation ratings are not indicated in Figures 2 through 9, these standard ratings are assumed. Typically, STC ratings above 34 to 36 require laminated glass with STC ratings above 38 requiring IGU assemblies thicker than one inch. This will vary depending on the window manufacturer. Tested sound-rated assemblies should be used.

Since windows will need to be closed to meet the interior noise criteria, the mechanical design should meet ventilation requirements with windows in the closed position, and the ventilation system will need to be designed such that it does not compromise sound insulation of the building shell. Outside air connections back to an individual forced-air unit for the residence could also be incorporated in most cases. The specific approach would need to be refined during the design phase.

Outdoor Use Spaces

Community outdoor use space is expected to be located at the Level 3 courtyard (podium level) of both Block A and B. At both building courtyards, estimated future traffic noise is expected to be below DNL 65 dB. Therefore, no mitigation is necessary.

* * *

This concludes our environmental noise study for The Residences at Shoreline Gateway project. Should you have any questions, please give us a call.

Executive Summary

This report presents the results of the transportation impact analysis (TIA) conducted for the proposed residential development at 1001 N. Shoreline Boulevard in Mountain View, California. The proposed residential project is Phase II of a 7.81-acre mixed-use development. Phase I, which is currently fully occupied, contains a 111,443 square foot (s.f.) office building with surface parking for 371 cars. Phase II is proposed to include 203 apartments in one building and 100 condominiums in a separate building. The proposed Phase II also includes 3,000 s.f. of retail space on the ground level of the apartment building. Both proposed residential buildings would be constructed over two floors of podium parking. In addition, the site will include surface parking and a separate parking garage serving the Phase I office space. Only the bottom floor of the office parking garage would be available for use by residents and their guests outside of normal business hours. Vehicular access to and from the project site would be provided via one full access driveway on Terra Bella Avenue and one full access driveway on Linda Vista Avenue.

The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Mountain View and the Santa Clara Valley Transportation Authority (VTA) Congestion Management Program (CMP). The study determined the traffic impacts of the proposed development on 12 signalized intersection during the weekday AM and PM peak hours of traffic. In addition, a freeway segment capacity analysis was conducted, and other traffic operations issues were addressed.

As required by the VTA's TIA Guidelines, an Auto Trip Reduction Statement (ATRS) form is included at the end of the Executive Summary.

Project Trip Generation

Trip generation estimates for the proposed project were based on trip rates published in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual, 10th Edition* (2017). Trips generated by the proposed residential development were estimated by applying the average rates for multifamily family (mid-rise) to the proposed/existing number of units. The retail tenant is unknown at this time. For the purpose of this study, the proposed retail component was assumed to be a coffee shop. This is a conservative assumption since a coffee shop would generate more trips than other retail uses that might occupy the space. Trips generated by the proposed retail component were estimated by applying the average rates for a coffee shop to the proposed square footage.

The gross project trip estimates were reduced to account for the mixed-use development and for retail pass-by trips. The proposed TDM Plan has not yet been finalized so the potential trip reduction achieved by TDM is uncertain. Thus, the traffic analysis does not assume any trip reductions based on TDM.

After applying the trip reductions, the project is estimated to generate 2,597 net new daily trips, with 291 net new trips (123 inbound trips and 168 outbound trips) occurring during the AM peak hour and 178 net new trips (103 inbound trips and 75 outbound trips) occurring during the PM peak hour.

Intersection Level of Service Analysis

The results of the intersection level of service analysis show that some intersections would operate at an unacceptable level (LOS E or F). However, the impact of the project traffic would be less than significant.

Freeway Segment Capacity Analysis

The project would contribute trips equivalent to less than one percent of the capacity on each of the studied freeway segments. Thus, the project would have an insignificant impact on nearby freeway segments.

Freeway Ramp Operations Analysis

The existing on-ramp storage is expected to be adequate to serve the vehicle queues that would occur with the addition of project-generated traffic.

Neighborhood Traffic Conditions

The project is expected to increase the daily traffic volumes on the following study segments by at least 25 percent:

- Linda Vista Avenue south of Terra Bella Avenue
- Terra Bella Avenue east of Shoreline Boulevard

According to the City's Neighborhood Traffic Management Program (NTMP), traffic-calming measures may be implemented to eliminate the perceived travel time savings incentive and to reduce the volume of cut through traffic. Installation of traffic-calming devices is conducted following a multi-step process that includes neighborhood meetings and a post-card survey of affected residents and property owners. Some traffic-calming measures require approval of the Council Transportation Committee and the full City Council.

Vehicle Miles Travelled (VMT) Analysis

Pursuant to SB 743, cities have until July 2020 to adopt the new procedures to identify environmental impacts based on VMT rather than level of service. The City of Mountain View has not yet adopted any standards or guidelines related to VMT. Therefore, the qualitative analysis of VMT presented in this report is for information only.

Compared to other locations in the City, the project site is expected to have a lower than average VMT per resident due to its proximity to the North Bayshore employment area, its location immediately adjacent to multiple transit routes and bike lanes on N. Shoreline Boulevard, and its proximity to multiple pedestrian/bike trails and to Caltrain and light rail service at the Mountain View Transit Center. In addition, the project will implement a Transportation Demand Management Plan with a combination of services, incentives, facilities, and actions that reduce single–occupant vehicle trips to help relieve traffic congestion, parking demand, and air pollution problems. Thus, the project is expected to help the City reduce the citywide average VMT per capita.

Intersection Vehicle Queuing

The vehicle queuing analysis shows that the maximum southbound left-turn vehicle queue at the Shoreline Boulevard/Terra Bella Avenue intersection would exceed the storage capacity during one or both peak hours under all scenarios. The project is expected to increase this queue by two to three vehicles during the peak hours exacerbating the existing queue storage deficiency. It may be possible to extend the left-turn pocket beyond the current length; however, it is not possible to accommodate the projected maximum queue length of 450 feet due to the planned bus lane that will run in the median.

The queue storage deficiency at this intersection is partly due to the existing congestion on the northbound US 101 off ramp to Shoreline Boulevard during the peak morning commute period. The North Bayshore Precise Plan identifies improvements to the northbound US 101 off ramp to Shoreline Boulevard that would alleviate the existing congestion at the off ramp eliminating the perceived travel time savings gained by making a U-turn at Terra Bella Avenue. Without the U-turn traffic, the 95th percentile queue at Terra Bella would be 275 feet. Thus, after the planned gateway transportation improvements are completed, the need for additional turn pocket storage would wane as queues would overflow the existing turn pocket storage in about one of every three signal cycles during the AM peak hour and only about one out of ten signal cycles during the PM peak hour.

Site Access and Circulation

Pedestrian and bicycle access to and within the project site is generally adequate. The project would provide a public pedestrian/bicycle path through the middle of the site to connect N. Shoreline Boulevard with Linda Vista Avenue. The project would provide secure bicycle storage for residents on the ground level of the parking garage in Block B and on both the ground level and the upper level of the parking garage in Block A. For ease of access and to avoid residents riding down the garage ramp or bringing bicycles into elevators, it is recommended the project applicant locate all bicycle storage at the ground level. Ramps used by vehicles to travel between different levels would have slopes up to 20 percent. It is recommended that proper signage be installed at these ramps to prohibit use by pedestrians or bicycles.

Vehicular access to the project site would be provided via one driveway on Terra Bella Avenue and one driveway on Linda Vista Avenue. The proposed driveway widths are acceptable. Given the low traffic volume and low travel speed on Terra Bella Avenue and Linda Vista Avenue, the proposed project driveways are expected to operate acceptably.

The project driveways should be free and clear of any obstructions to optimize sight distance, thereby ensuring that exiting vehicles can see pedestrians on the sidewalk and other vehicles traveling on Terra Bella and Linda Vista Avenues. Any landscaping, parking, and signage should be located in such a way to ensure an unobstructed view for drivers entering and exiting the site.

The width of all drive aisles and parking ramps and the parking space dimensions meet City standards. The site plan shows good circulation in most areas. The condominium parking garage includes dead-end drive aisles where the last two parking stalls would be very close to the garage wall. Parking garage designs should include space at the end of a dead-end aisle for drivers to back into in order to more easily exit the parking stall. We recommend that such “back-up pockets” be provided at the end of each dead-end drive aisle to facilitate backing out of the last parking stalls in those rows.

The ramps in the proposed residential garages are shown to have a maximum slope of 20% with 10% transitions on each side. These dimensions are acceptable since the ramps are covered (i.e. protected from weather) and not used for pedestrian walkways. It should be noted that most ramp users will be residents, and thus, will quickly become accustomed to steeper grades.

Notes:
Bold indicates a substandard level of service.
1. The calculated LOS does not reflect the unmet vehicle demand that cannot get through the intersection during the peak hour. Field observations indicate that the intersection operates at LOS F with 80+ seconds of average delay during one or both peak hours
2. The calculated LOS is based on the overall average traffic delay for all movements. While the intersection currently operates at an acceptable level overall, the northbound through movements during the AM peak hour are affected by queue spillback from downstream intersections. However, observations show that generally the queues clear during each cycle and do not significantly affect the operation of the intersection overall.

1. Introduction

This report presents the results of the transportation impact analysis (TIA) conducted for the proposed residential development at 1001 N. Shoreline Boulevard in Mountain View, California. The project site is bounded by US 101 on the north, Linda Vista Avenue on the east, Terra Bella Avenue on the south, and N. Shoreline Boulevard on the west. The proposed residential project is Phase II of a 7.81-acre mixed-use development. Phase I, which is currently fully occupied, contains a 111,443 square foot (s.f.) office building with surface parking for 371 cars. Phase II is proposed to include 203 apartments in one building and 100 condominiums in a separate building. The proposed Phase II also will include 3,000 s.f. of retail space on the ground level of the apartment building. Both proposed residential buildings would be constructed over two floors of podium parking. In addition, the site will include surface parking and a separate parking garage serving the Phase I office space. The bottom floor of the office parking garage would be available for use by residents and their guests outside of normal business hours. Vehicular access to and from the project site would be provided via one full-access driveway on Terra Bella Avenue and one full-access driveway on Linda Vista Avenue. The project site and the surrounding study area are shown on Figure 1. The project site plan is shown on Figure 2.

Scope of Study

This study was conducted for the purpose of identifying the potential traffic impacts related to the proposed development and to satisfy the requirements of the California Environmental Quality Act (CEQA), the City of Mountain View, and the Santa Clara County Congestion Management Program (CMP). The traffic analysis is based on the AM and PM peak-hour level of service for twelve signalized intersections, three freeway segments, and three freeway ramps in the vicinity of the project site. The study intersections, freeway segments, and freeway ramps are identified below.

11. Whisman Road and Middlefield Road
12. Ellis Street and Middlefield Road

Study Freeway Segments

1. US 101 between Moffett Boulevard and SR 85
2. US 101 between SR 85 and N. Shoreline Boulevard
3. US 101 between N. Shoreline Boulevard and Rengstorff Avenue

Study Freeway Ramps

1. US 101 SB On-Ramp from NB N. Shoreline Boulevard
2. SR 85 SB On-Ramp from NB N. Shoreline Boulevard
3. US 101 SB On-Ramp from NB N. Shoreline Boulevard

In addition, the project's effect on neighborhood traffic conditions were evaluated on the two street segments identified below.

Study Street Segments

1. Linda Vista Avenue south of Terra Bella Avenue
2. Terra Bella Avenue east of Shoreline Boulevard

Analysis Time Periods

Traffic conditions at the study intersections were analyzed for the weekday AM and PM peak hours of adjacent street traffic. In the study area, the AM peak hour is typically between 7:00 AM and 10:00 AM, and the PM peak hour is typically between 4:00 PM and 7:00 PM on a regular weekday. These are the peak commute hours during which most weekday traffic congestion occurs on study area roadways.

Analysis Scenarios

Traffic conditions were evaluated for the following scenarios:

Scenario 1: *Existing Conditions.* Existing AM and PM peak-hour traffic volumes were obtained from new manual turning-movement counts conducted in September 2018. The existing counts include traffic generated by the Phase I office building on the project site. The study intersections were evaluated with a level of service analysis using the TRAFFIX software in accordance with the *2000 Highway Capacity Manual* methodology.

Scenario 2: *Existing Plus Project Conditions*. Existing plus project traffic volumes were estimated by adding to existing traffic volumes the trips associated with the proposed project (Phase II). Existing plus project conditions were evaluated relative to existing conditions in order to determine potential project impacts.

Scenario 3: *Background Conditions*. Background traffic volumes were estimated by adding to existing traffic volumes the projected volumes from approved but not yet constructed developments in the vicinity of the project. Lists of approved but not yet completed developments were provided by the City of Mountain View. The roadway network under background conditions is assumed to include the Shoreline Boulevard bus lane improvement project.

Scenario 4: *Background Plus Project Conditions.* Background plus project traffic volumes were estimated by adding to background traffic volumes the new trips associated with the

proposed project. Background plus project conditions were evaluated relative to background conditions in order to determine potential project impacts.

Scenario 5: *Cumulative No Project Conditions.* Cumulative no project traffic volumes were estimated by applying a two percent annual growth factor for five years to existing (2018) traffic volumes and adding trips associated with approved developments in the project vicinity. The roadway network under cumulative conditions would be the same as the background roadway network.

Scenario 6: *Cumulative Plus Project Conditions.* Cumulative plus project traffic volumes were estimated by adding to cumulative no project traffic volumes the additional traffic generated by the proposed project. Cumulative plus project conditions were evaluated relative to cumulative no project conditions in order to determine potential impacts.

Methodology

This section describes the methods used to determine the traffic conditions for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

Data Requirements

The data required for the analysis were obtained from new traffic counts, the City of Mountain View, VTA, recently published TIA reports for nearby developments, and field observations. The following data were collected from these sources:

- existing traffic volumes,
- lane configurations,
- intersection signal timing and phasing,
- a list of approved but not yet completed projects/improvements, and
- freeway ramp metering rates and queue lengths.

Analysis Methodologies and Level of Service Standards

Traffic conditions were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or forced-flow conditions with extreme delays. The level of service analysis was supplemented with a queuing analysis for selected movements at the study intersections. In addition, a freeway segment analysis and freeway ramp analysis were completed for selected freeway segments and on ramps in the project vicinity. The analysis methods are described further below.

Intersection Level of Service Analysis

The City of Mountain View level of service methodology for signalized intersections is the *2000 Highway Capacity Manual (HCM)* method. This method is applied using the TRAFFIX software. The *2000 HCM* operations method evaluates signalized intersection operations based on average control delay time for all vehicles at the intersection. Since TRAFFIX is also the CMP-designated intersection level of service methodology, the City of Mountain View methodology employs the CMP default values for the analysis parameters. The City of Mountain View level of service standard for signalized intersections is LOS D or better, except for CMP intersections and intersections in the Downtown and the San Antonio Center planning areas, where the standard is LOS E. All the signalized intersections evaluated in this report are subject to the LOS D standard. The correlation between average control delay and level of service is shown in Table 1.

Table 1
Signalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 20.0
C	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though some vehicles may still pass through the intersection without stopping.	20.1 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *2000 Highway Capacity Manual* (Washington, D.C., 2000), p.10-16.

Intersection Vehicle Queuing Analysis

For selected high-demand movements at the study intersections, the estimated maximum vehicle queues were compared to the existing or planned storage capacity. The queuing analysis is used to determine the appropriate storage lengths for the high-demand turn lanes where the project would add a substantial number of trips to these movements. Vehicle queues were estimated using a Poisson probability distribution, which estimates the probability of "n" vehicles for a vehicle movement using the following formula:

$$\text{Probability } (X=n) = \frac{\lambda^n e^{-(\lambda)}}{n!}$$

Where:

Probability (X=n) = probability of "n" vehicles in queue per lane

n = number of vehicles in the queue per lane

λ = Average number of vehicles in queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement.

For signalized intersections, the 95th percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles. Or, a queue length larger than the 95th percentile queue would only occur on 5 percent of the signal cycles (about 3 cycles during the peak hour for a signal with a 60-second cycle length). Therefore, left-turn storage pocket designs based on the 95th percentile queue length would ensure that storage space would be exceeded only 5 percent of the time. The 95th percentile queue length is also known as the "design queue length."

Freeway CMP Guidelines

As prescribed in the CMP technical guidelines, the level of service for freeway segments is estimated based on vehicle density. Density is calculated by the following formula:

$$D = V / (N*S)$$

where:

D= density, in vehicles per mile per lane (vpmpl)

V= peak hour volume, in vehicles per hour (vph)

N= number of travel lanes

S= average travel speed, in miles per hour (mph)

The CMP requires that mixed-flow lanes and auxiliary lanes be analyzed separately from high-occupancy vehicle (HOV) lanes (otherwise known as carpool lanes). The CMP specifies that a capacity of 2,300 vehicles per hour per lane (vphpl) be used for segments three lanes or wider in one direction and a capacity of 2,200 vphpl be used for segments two lanes wide in one direction. HOV lanes are specified as having a capacity of 1,650 vphpl. The CMP defines an acceptable level of service for freeway segments as LOS E or better.

Freeway Ramp Analysis

A freeway ramp analysis was performed in order to verify that the metered freeway on-ramps would have sufficient capacity to serve the expected traffic volumes with and without the project. Ramp operations at the on-ramps were based on field observations and vehicle queue lengths and metering rates measured in the field during the AM and PM peak hours of traffic. It should be noted that the evaluation of freeway ramps is not required based on the VTA's TIA guidelines, nor are there adopted methodologies and impact criteria for the analysis of freeway ramps. Therefore, the freeway on-ramp analysis is presented for informational purposes only.

Significant Impact Criteria

Significance criteria are used to establish what constitutes an impact. For this analysis, the criteria used to determine significant impacts on signalized intersections are based on City of Mountain View level of service standards.

City of Mountain View Definition of Significant Intersection Impact

The project is said to create a significant adverse impact on traffic conditions at a signalized intersection in the City of Mountain View if for either peak hour:

1. The level of service at the intersection drops below its respective level of service standard when project traffic is added, or
2. The intersection is already operating at an unacceptable level of service under background conditions and the addition of project traffic causes both the critical-movement delay at the intersection to increase by four or more seconds and the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

The exception to this threshold is when the addition of project traffic reduces the amount of average control delay for critical movements, i.e., the change in average control delay for critical movements are negative. In this case, the threshold is when the project increases the critical v/c value by 0.01 or more.

A significant impact is said to be satisfactorily mitigated when measures are implemented that would restore intersection conditions to its acceptable level of service or to an average delay that is better than no-project conditions.

Freeway Segments

A development is said to create a significant adverse impact on traffic conditions on a CMP freeway segment if for either peak hour:

1. The level of service on the freeway segment degrades from an acceptable LOS E or better under existing conditions to an unacceptable LOS F under project conditions or,
2. The level of service on the freeway segment is an unacceptable LOS F under project conditions, and the number of project trips on that segment constitutes at least one percent (0.01) of capacity on that segment.

A significant impact by CMP standards is said to be satisfactorily mitigated when measures are implemented that would restore freeway conditions to background conditions or better.

Transit Services

Significant impacts to transit service would occur if the project or any part of the project:

- Disrupts existing transit services or facilities; or
- Conflicts with an existing or planned transit facility; or
- Conflicts with transit policies adopted by the City of Mountain View, VTA, or Caltrans for their respective facilities in the study area.

Bicycle and Pedestrian Facilities

The Mountain View 2030 General Plan (July 2012) describes related policies necessary to ensure pedestrian and bicycle facilities are safe and effective for City residents. Using the General Plan as a guide, significant impacts to these facilities would occur when a project or an element of the project:

- Creates a hazardous condition that does not currently exist for pedestrians and bicyclists, or otherwise interferes with pedestrian accessibility to the site and adjoining areas; or
- Conflicts with an existing or planned pedestrian or bicycle facility; or
- Conflicts with policies related to bicycle and pedestrian activity adopted by the City of Mountain View, VTA, or Caltrans for their respective facilities in the study area.

Report Organization

The remainder of this report is divided into five chapters. Chapter 2 describes existing conditions, including the existing roadway network, transit service, bicycle and pedestrian facilities, and intersection and freeway segment operations. Chapter 3 presents the intersection operations under background conditions. Chapter 4 describes the methods used to estimate the project traffic on the roadway network and presents the intersection and freeway segment operations under existing plus project conditions and background plus project conditions. Chapter 5 presents the intersection operations under cumulative conditions. Chapter 6 provides an evaluation of other transportation-related issues, such as vehicle queuing, freeway ramp operations, effects on bicycle, pedestrian, and transit facilities, site access, and on-site circulation.

2. Existing Conditions

This chapter describes the existing conditions for all the major transportation facilities in the vicinity of the site, including the roadway network, transit service, and bicycle and pedestrian facilities.

Existing Roadway Network

Regional access to the project site is provided by US 101 and SR 85. Local access to the project site is provided via N. Shoreline Boulevard, Middlefield Road, Terra Bella Avenue, and Linda Vista Avenue.

US 101 is a north-south freeway that extends through and beyond the Bay Area, connecting San Francisco to San Jose. US 101 is eight lanes wide (three mixed-flow lanes and one HOV lane in each direction) in the vicinity of the project site. US 101 provides access to the study area via a full interchange at N. Shoreline Boulevard.

SR 85 is a north-south freeway that begins at US 101, east of N. Shoreline Boulevard and extends south towards San Jose and terminates at US 101 east of the Silicon Valley Boulevard/Bernal Road interchange. SR 85 is six lanes wide (two mixed-flow lanes and one HOV lane in each direction) in the vicinity of the project. SR 85 provides access to the project study area via an interchange at Moffett Boulevard.

N. Shoreline Boulevard is a north-south arterial that extends northward from El Camino Real (SR 82) across US 101 to the San Francisco Bay. The City's General Plan classifies N. Shoreline Boulevard as an avenue. The four-lane roadway has a landscaped median with left-turn pockets, bike lanes and sidewalks on both sides of the street north of Terra Bella Avenue. South of Terra Bella Avenue, N. Shoreline Boulevard has a two-way left-turn lane. On-street parking is prohibited on N. Shoreline Boulevard.

Middlefield Road is an east-west four-lane arterial that runs parallel to US 101. It begins at the intersection of Central Expressway in Mountain View and traverses west through Redwood City. Middlefield Road is listed as an avenue in the City's General Plan. The major intersections along Middlefield Road are signalized. Middlefield Road has a landscaped median with left-turn pockets, bike lanes, and sidewalks on both sides of the street. On-street parking is permitted on certain segments of Middlefield Road between the hours of 7:00 PM and 2:00 AM.

Terra Bella Avenue is a two-lane collector street with on-street parking on both sides of the street. It extends eastward from Middlefield Road to east of San Rafael Avenue, at which point it transitions into San Leandro Avenue. Based on the surrounding land uses and function, Terra Bella Avenue is classified as an avenue in the City's General Plan. Sidewalks are present on both sides of the street. Terra Bella Avenue provides direct access to the project site via one full-access driveway. The

unsignalized intersection at Terra Bella Avenue and Linda Vista Avenue is raised similar to a speed hump to reinforce slow speeds and encourage motorists to yield to pedestrians at the crosswalk.

Linda Vista Avenue is a local two-lane street with on-street parking on both sides of the street. It extends northward from Middlefield Road to a dead-end just south of US 101. The City's General Plan classifies Linda Vista Avenue as a flexible street north of Moonbeam Drive and a residential street south of Moonbeam Drive. Sidewalks are present on both sides of the street. Linda Vista Avenue provides direct access to the project site via one full-access driveway. In the fall of 2017, traffic calming measures were implemented including a raised intersection at Terra Bella Avenue and Linda Vista Avenue and speed humps on the segment of Linda Vista Avenue between Terra Bella Avenue and Middlefield Road to

Existing Transit Services

Existing public transit services in the study area are provided by the VTA, the Mountain View Transportation Management Association (TMA), and the City of Mountain View. VTA operates bus and light-rail transit (LRT) services in Santa Clara County, the TMA provides free MVgo shuttle service between the Mountain View Transit Center and corporate campuses in the North Bayshore and Whisman areas, and Mountain View partnering with Google provides free community shuttle service in the City.

The project site is also within easy biking distance (one mile) of the Mountain View Caltrain and LRT stations at the Mountain View Transit Center, which is served by numerous connecting buses.
The VTA bus routes, MVgo shuttle routes, MV community shuttle route, and Caltrain/LRT stations in the project vicinity and the bus/shuttle stops near the project site are shown on Figure 3.

VTA Bus Services

There are four VTA bus routes serving the project vicinity: Routes 32, 40, 185 and 120 with bus stops located at: N. Shoreline Boulevard and Terra Bella Avenue (100 feet from the site), N. Shoreline Boulevard and Middlefield Road (1,000 feet from the site), N. Shoreline Boulevard and La Avenida Street (1,800 feet from the site), and N. Shoreline Boulevard and Pear Avenue (0.5 miles from the site).

The Route 40 bus line operates on N. Shoreline Boulevard, Pear Avenue, Inigo Way, and La Avenida in the project vicinity, providing service between Foothill College and the VTA Maintenance Facility on La Avenida between 6:00 AM and 10:30 PM with 30- to 40-minute headways during the AM and PM peak hours. Within the study area, route 40 stops at the intersection of N. Shoreline Boulevard and La Avenida Street, approximately 1,800 feet north of the project site.

The Route 32 bus line operates on Middlefield Road in the project vicinity, providing service between the San Antonio Shopping Center and the Santa Clara Transit Center. Route 32 operates between 5:45 AM and 8:00 PM with 30-minute headways during the AM and PM peak hours. The bus stops closest to the project site are at the intersection of N. Shoreline Boulevard and Middlefield Road.

The Route 185 bus line operates on N. Shoreline Boulevard in the project vicinity, providing service between the Gilroy Transit Center and Mountain View during commute hours. The line operates three northbound trips during the AM peak period (60-minute headways) and three southbound trips during the PM peak period (60-minute headways). The closest bus stop is located at the intersection of N. Shoreline Boulevard and Terra Bella Avenue, approximately 100 feet south of the project site.

The Route 120 bus line provides express service between the Fremont BART station and the North Bayshore area in Mountain View. Service is limited to five southbound (westbound) trips in the morning and five northbound (eastbound) trips in the afternoon/evening with 30- to 60-minute headways. Within

the project vicinity, the 120 line operates on N. Shoreline Boulevard with a bus stop at Pear Avenue, approximately ½ mile north of the project site.

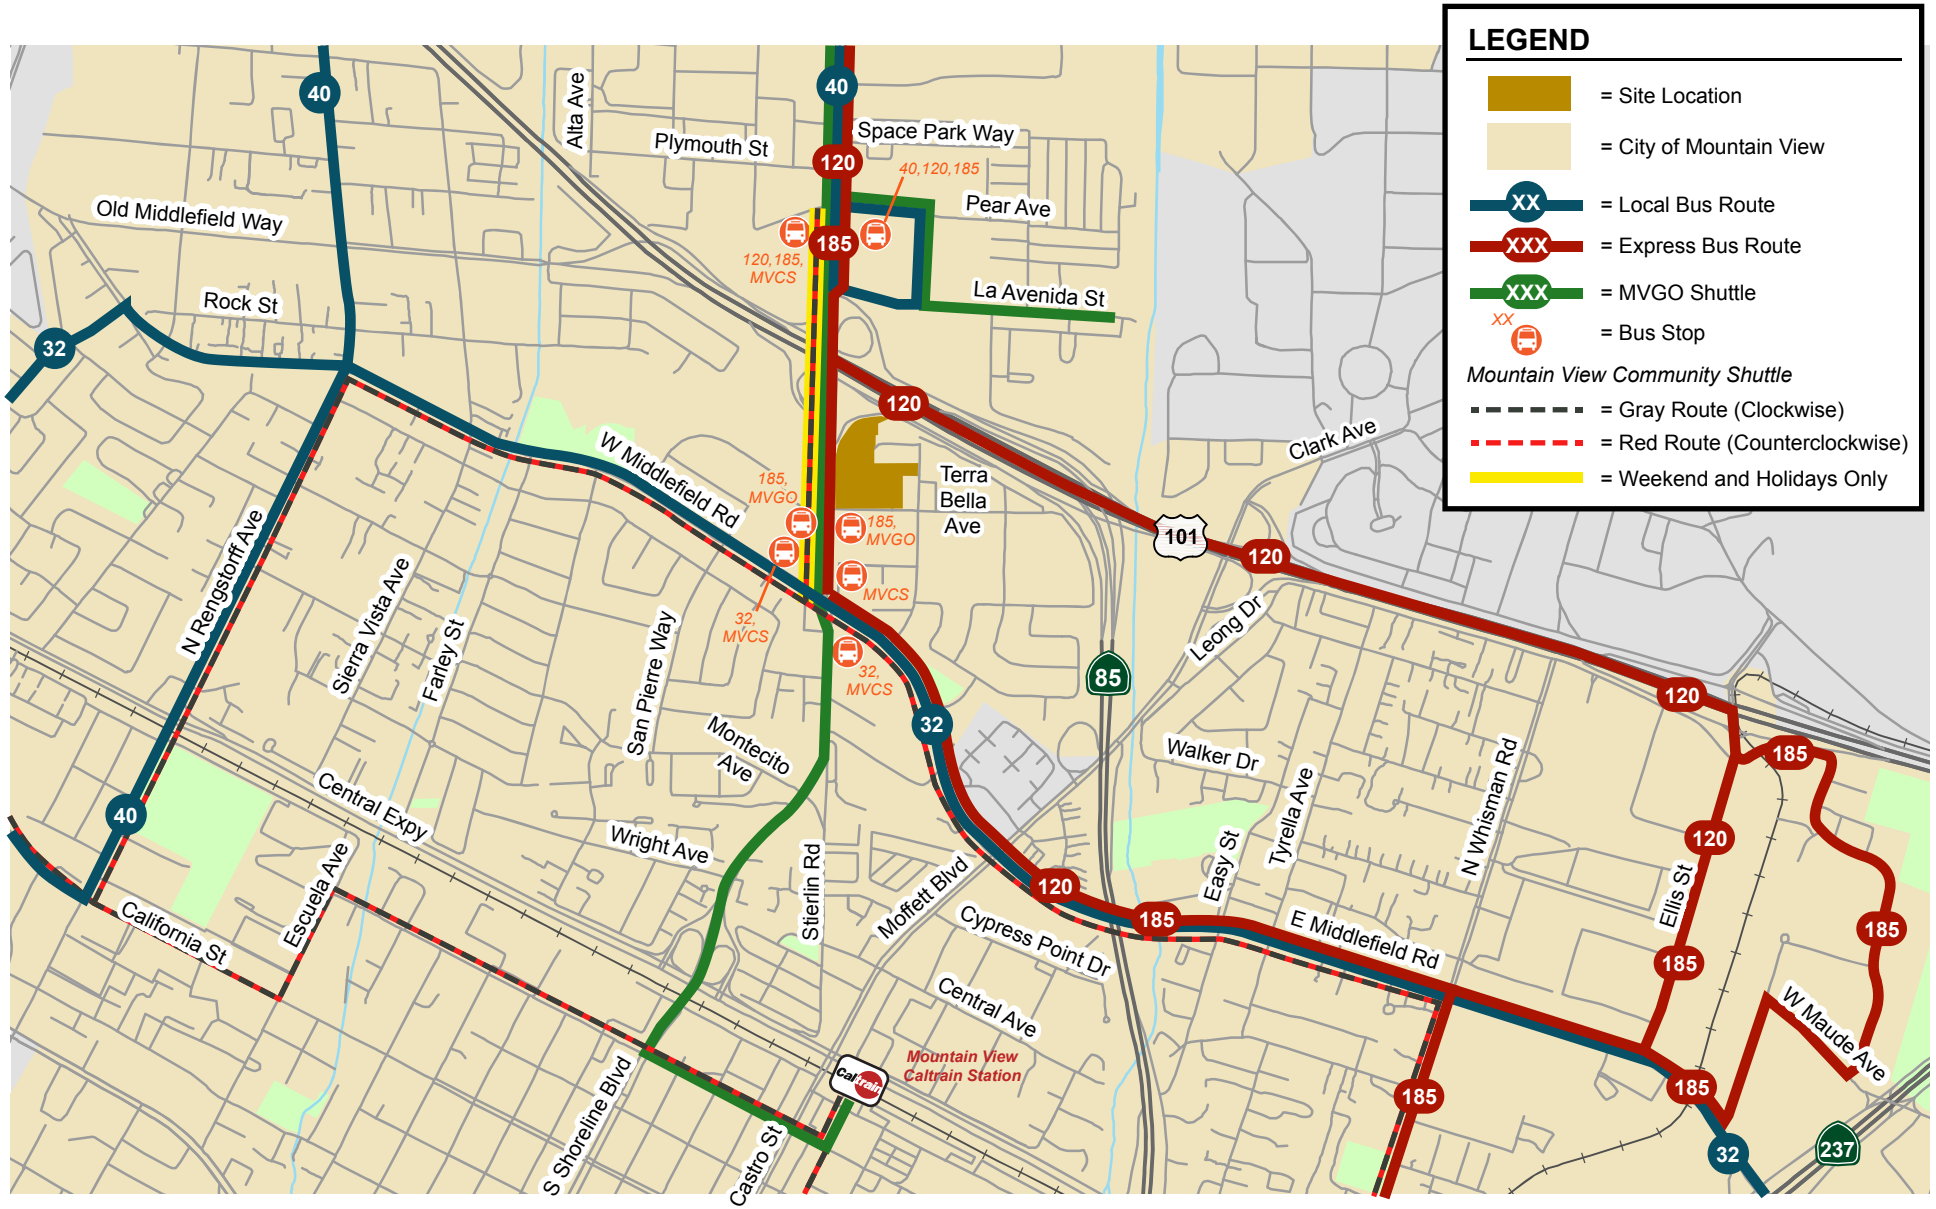

Figure 3
Existing Transit Services

NORTH
Not to Scale

It should be noted that as part of VTA's Next Network 2018-2019 Transit Service Plan, Route 32 would be discontinued and replaced by Route 21, which would not be within walking distance of the project site. In addition, Route 120 would be discontinued due to the extension of BART to Santa Clara County. Route 40 service that currently ends in the North Bayshore area would be extended south on N. Shoreline Boulevard to connect with the Mountain View Transit Center reducing the distance from the project site to the nearest bus stop on this route.

MVgo Shuttles

The TMA currently provides three MVgo shuttle routes that start and end at the Mountain View Transit Center: East Bayshore, West Bayshore, and East Whisman. The shuttle schedule is coordinated with Caltrain arrivals in the morning and departures in the afternoon. The East and West Bayshore Routes serve the project site, with the nearest shuttle stops on N. Shoreline Avenue at Terra Bella Avenue approximately 100 feet south of the project site. The service runs on weekdays, primarily during the peak commute periods with average headways of 15 to 25 minutes.

Mountain View Community Shuttle

The Mountain View Community Shuttle provides free bus service between many residential neighborhoods, senior residences and services, city offices, library, park and recreational facilities, medical offices, shopping centers, and entertainment venues throughout Mountain View. The shuttle service runs from 10 AM to 6 PM with 30-minute headways on weekdays and 60-minute headways on weekends. The shuttle stop closest to the project site is on W. Middlefield Road at N. Shoreline Boulevard, approximately 1,000 feet from the project site.

Altamont Commuter Express (ACE) Orange Shuttle

The Altamont Commuter Express (ACE) Orange Shuttle (Route 824) also serves the project area. ACE provides commuter rail service between Stockton, Tracy, Pleasanton, and San Jose during commute hours. This free shuttle, funded by the Bay Area Air Quality Management District, transports Mountain View passengers to and from the ACE Great America Station in Santa Clara. Service is limited to four westbound trips in the morning and four eastbound trips in the afternoon/evening with headways averaging 60 minutes. The shuttle stop closest to the project site is located at N. Shoreline Boulevard and Pear Avenue, approximately ½ mile north of the project site.

Mountain View Transit Center

The Mountain View Transit Center provides connections to Caltrain, VTA LRT, several VTA bus routes, three MVgo shuttle routes, and the Mountain View Community Shuttle. The transit center is within a reasonable biking distance from the project site (and, as noted below, there are bike lanes and bike routes between the site and the transit center) but is beyond a reasonable walking distance.

Caltrain Commuter Train Service

Caltrain provides frequent commuter train service between San Jose and San Francisco seven days a week, with stops at most cities in between. During the AM peak period between 7:00 and 10:00, There are 10 northbound trains (two baby bullet trains, seven limited-stop trains, and one local train) and 11 southbound trains (five baby bullet trains and six limited-stop trains) serving the Mountain View station.

During the PM peak period between 4:00 and 7:30, there are 13 northbound (five baby bullet trains, seven limited-stop trains, and one local train) and 12 southbound trains (three baby bullet trains, eight limited-stop trains, and one local train) serving the Mountain View station. Bicycles are permitted on Caltrain, and there are bicycle racks and bicycle lockers available at the Mountain View Transit Center.

VTA Light-Rail Transit Service

The VTA operates the 42.2-mile LRT system extending from south San Jose through downtown to the northern areas of San Jose, Santa Clara, Milpitas, Mountain View and Sunnyvale. The service operates nearly 24-hours a day with 15-minute headways during much of the day. The Mountain View-Winchester LRT line (Route 902) operates along Central Expressway within the project vicinity and stops at the Mountain View Transit Center. VTA's Next Network 2018-2019 Transit Service Plan will rename the Route 902 LRT Line as the Green Line and change the northern end to Old Ironsides Light Rail Station. A new LRT route called the Orange Line will be created to connect Downtown Mountain View with the Alum Rock Transit Center.

Existing Bicycle Facilities

The bicycle facilities that exist within one mile of the project site (see Figure 4) include multi-use trails (Class I bikeway), striped bike lanes (Class II bikeway) and shared bike routes/boulevards (Class III bikeway). Bike paths or multi-use trails are shared between pedestrians and bicyclists and separated from motor vehicle traffic. Bike lanes are lanes on roadways designated for use by bicycles with special lane markings, pavement legends, and signage. Bike routes are existing streets that accommodate bicycles but are not separate from the existing travel lanes. Routes are typically designated only with signs. Bike boulevards are modified bike routes offering especially convenient and efficient through-routes for bicyclists of all skill levels.

Within the project area, bike lanes are present along the entirety of Middlefield Road, N. Shoreline Boulevard, Inigo Way, La Avenida Street east of Inigo Way, and Moffett Boulevard north of SR 85. The remainder of Moffett Boulevard is designated as a bike route. Montecito Avenue, Stierlin Road, and Central Avenue are designated as bike boulevards. Although not designated as a bike route, local and collector streets like Linda Vista Avenue and Terra Bella Avenue carry low traffic volumes and are conducive to bicyclists.

Multi-use trails in the project vicinity include the Stevens Creek Trail and the Permanente Creek Trail. The Stevens Creek Trail, located one mile east of the project site, extends from Shoreline at Mountain View Park to Dale Avenue/Heatherstone Way, south of El Camino Real. This paved multi-use path is ideal for bike commuters as it connects to the North Bayshore businesses, the area east of Downtown Mountain View, and residential areas adjacent to the trail. The Stevens Creek Trail provides connections to other bike lanes and routes such as Moffett Boulevard, Middlefield Road and Evelyn Avenue, as well as major bus routes, Caltrain and light rail stations. The trail can be accessed from Middlefield Road and Moffett Boulevard in the project vicinity. Both access points are approximately one mile from the project site. There exist continuous bicycle facilities from both trail access points to the project site. The Permanente Creek Trail extends from the Bay over US 101, under Old Middlefield Road, and ends at W. Middlefield Road, about 0.8 miles from the project site. The availability of these bicycle facilities near the project site could encourage future residents of the proposed project to use an alternative mode of transportation.

Hexagon conducted bicycle counts during the peak commute hours at all study intersections. The bike counts are included in Appendix A. The counts indicate that bike activity within the study area is relatively light. During the AM peak hour, the intersection of Rengstorff Avenue and Middlefield Road received the highest amount of bicycle traffic, with 22 bikes per hour. During the PM peak hour, the intersection of Shoreline Boulevard and Montecito Avenue had the most bikes with 30 bikes per hour. Within the immediate vicinity of the project site, the intersection of N. Shoreline Boulevard and Terra Bella Avenue received less than 10 bikes per hour during both peak hours.

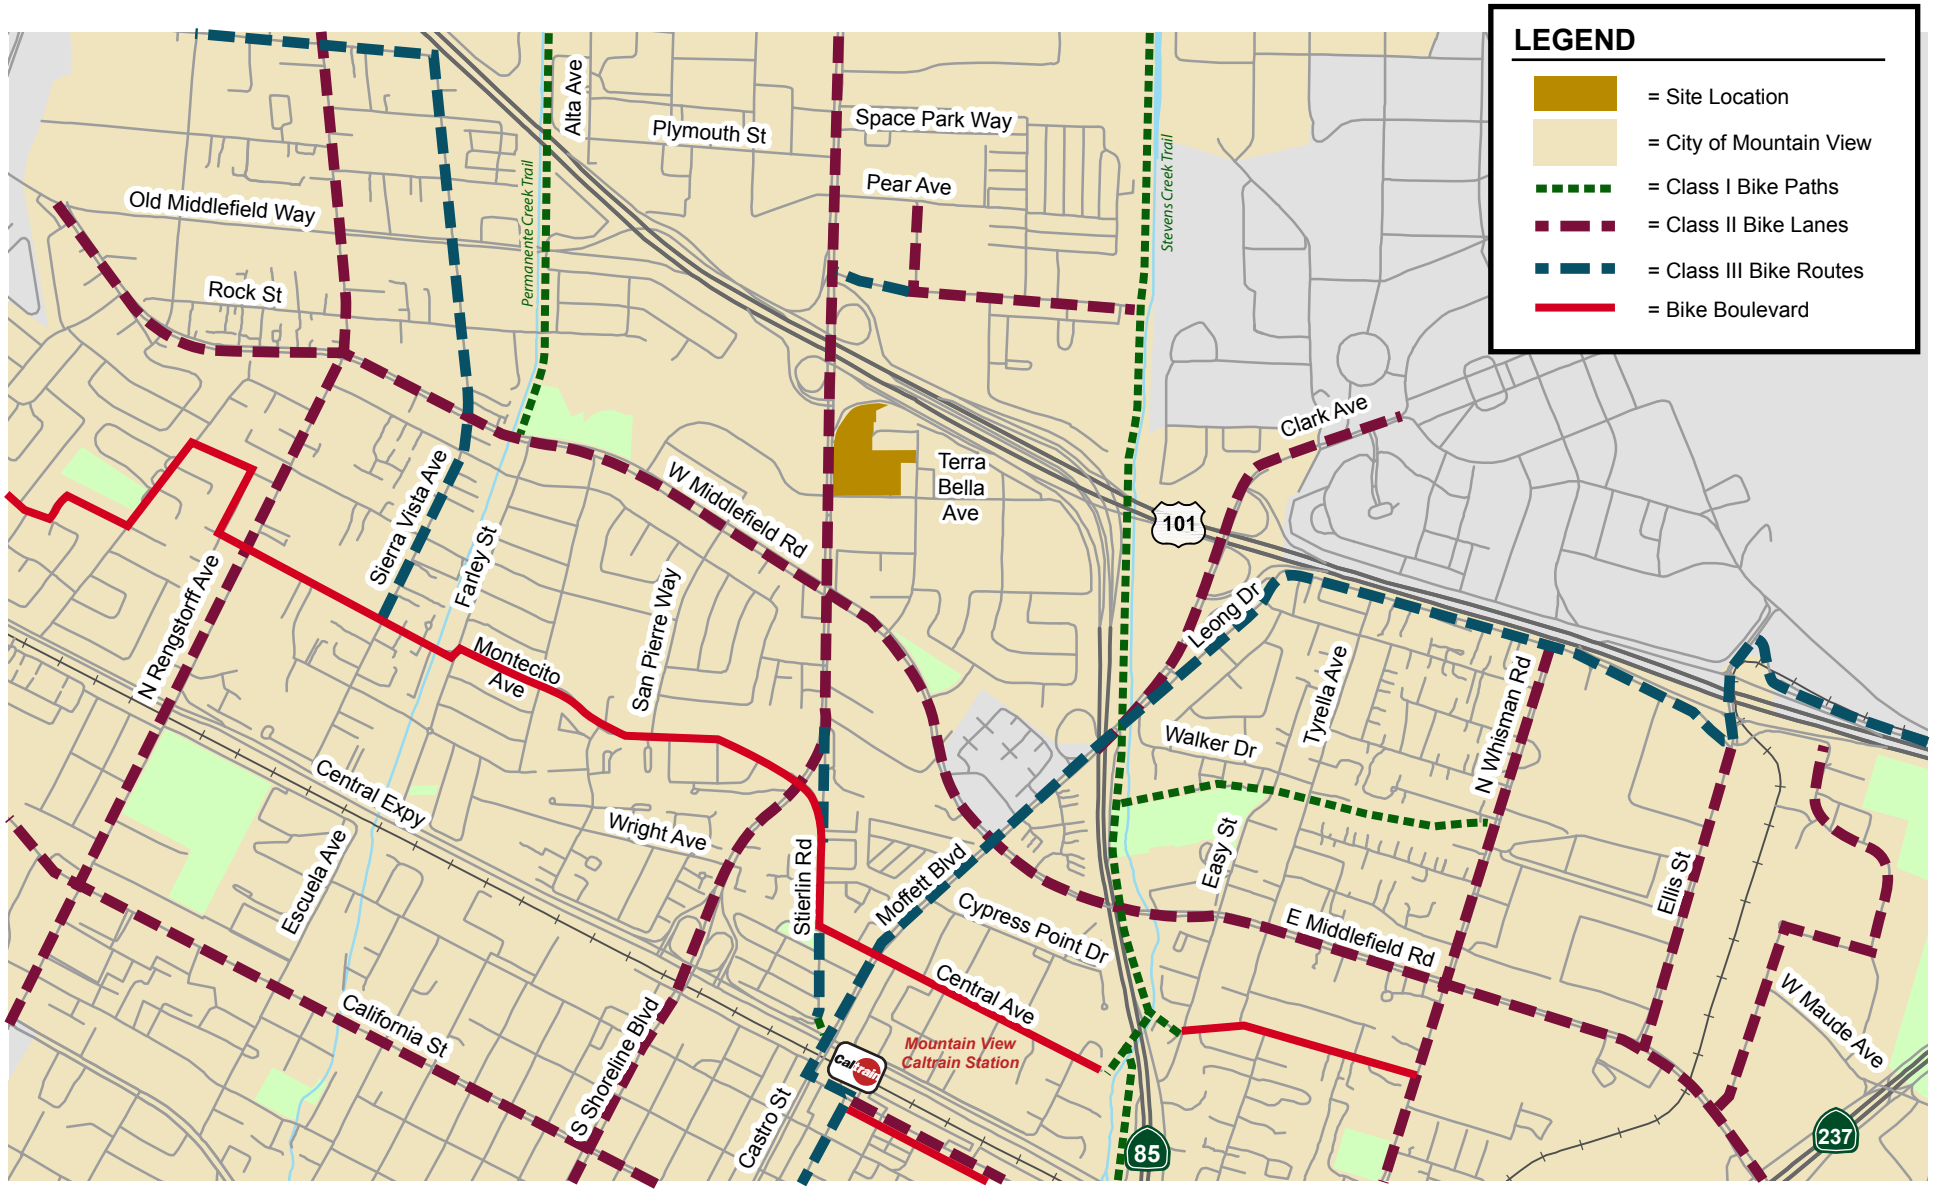

Figure 4
Existing Bicycle Facilities

NORTH
Not to Scale

Existing Pedestrian Facilities

Sidewalks are present along both sides of all study area roadways. The study intersections on N. Shoreline Boulevard at Pear Avenue, Terra Bella Avenue and at Middlefield Road have signalized crosswalks with pedestrian push buttons on all legs. The Shoreline/La Avenida/US 101 Northbound Ramp intersection has crosswalks on all approaches except the south leg, while the Shoreline/US 101/SR 85 Southbound Ramp intersection has crosswalks on only the east and west legs.

Pedestrian traffic is moderate within the study area. During the AM peak hour, the highest pedestrian volume occurred at the intersection of Moffett Boulevard and Middlefield Road where 66 pedestrians crossed the intersection. Within the immediate vicinity of the project site, there were 49 pedestrians crossing the intersection of Shoreline Boulevard and Terra Bella Avenue. During the PM peak hour, the highest pedestrian volume occurred at the intersection of N. Shoreline Boulevard and Pear Avenue where 66 pedestrians crossed the intersection. Within the immediate vicinity of the project site, there were 16 pedestrians crossing the intersection of Shoreline Boulevard and Terra Bella Avenue. The pedestrian counts are included in Appendix A.

Existing Lane Configurations and Traffic Volumes

The existing lane configurations at the study intersections were obtained from field observations (see Figure 5).

Existing traffic volumes were obtained from new manual peak-hour turning-movement counts conducted on September 25, 2018. The existing traffic volumes at the study intersection are shown on Figure 6. All the intersection counts were conducted while nearby colleges were in session. The traffic count data are included in Appendix A. The volumes for all study scenario are included in Appendix B.

Existing Intersection Levels of Service

The results of the intersection level of service analysis and field observations show that most of the study intersections currently are operating at an acceptable LOS D or better (see Table 2). The following two study intersections currently operate at unacceptable level of service during one or both peak hours of traffic:

- N. Shoreline Boulevard and Pear Avenue (AM peak hour)
- N. Shoreline Boulevard and US 101 NB Off-Ramp/La Avenida (AM and PM peak hours)

The intersection levels of service calculation sheets are included in Appendix C.

		PM	09/25/18	21.5	C+

Notes:
Bold indicates a substandard level of service.
[1] The calculated LOS does not reflect the unmet vehicle demand that cannot get through the intersection during the peak hour. Field observations indicate that the intersection operates at LOS F with 80+ seconds of average delay during one or both peak hours.
[2] The calculated LOS is based on the overall average traffic delay for all movements. While the intersection currently operates at an acceptable level overall, the northbound through movements during the AM peak hour are affected by queue spillback from downstream intersections. However, observations show that generally the queues clear during each cycle and do not significantly affect the operation of the intersection overall.

Existing Freeway Levels of Service

Existing traffic volumes and level of service on the study freeway segments were obtained from the *2016 Santa Clara County CMP Annual Monitoring Report*, which contains the most recent data collected for freeway segments located in Santa Clara County. The CMP data shows that the following mixed-flow and HOV freeway segments currently operate at an unacceptable LOS F during at least one peak hour of traffic (see Table 3).

Mixed-Flow Freeway Segments

- US 101 northbound from Moffett Boulevard to SR 85 (AM and PM peak hours)

- US 101 northbound from SR85 to N. Shoreline Boulevard (AM and PM peak hours)
- US 101 northbound from N. Shoreline Boulevard to Rengstorff Avenue (AM and PM peak hours)

Observed Existing Traffic Conditions

Traffic conditions were observed in the field in order to identify existing operational deficiencies and to confirm the accuracy of calculated intersection levels of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to level of service, and (2) to identify any locations where the level of service analysis does not accurately reflect existing traffic conditions.

N. Shoreline Boulevard and Pear Avenue

During the AM peak hour, northbound through traffic is extremely heavy and queues extend to and beyond the US 101 northbound off-ramp impeding northbound through traffic on Shoreline Boulevard and right-turn traffic from the US 101 northbound off-ramp. Observations in the field indicate that this intersection operates at LOS F during the AM peak hour due to the lengthy delays and unmet demand on the northbound approach.

During the PM peak hour, heavy traffic was observed on southbound Shoreline Boulevard. The right-most lane of the three southbound through lanes carries traffic to both northbound and southbound US 101 and southbound SR 85. Vehicles in this lane regularly back up to Plymouth Street. The westbound

left turn from Pear Avenue and the eastbound right turn to southbound Shoreline Boulevard are able to clear the intersection by turning into the two left-most through lanes.

N. Shoreline Boulevard and US101 NB Off-Ramp/La Avenida Street

During the AM peak hour, long queues were observed on the US 101 northbound off-ramp. Northbound traffic at the downstream intersection of Shoreline Blvd/Pear Avenue spillbacks to La Avenida Street and impedes the flow of northbound through traffic on Shoreline Boulevard and right-turn traffic from the US 101 northbound off-ramp. Due to this congestion, it takes multiple green cycles for these movements to clear the intersection. Queues on northbound Shoreline Boulevard extend to the overpass and occasionally extend to the upstream intersection at Shoreline Boulevard/US 101/SR 85 southbound ramps.

During the PM peak hour, a lane imbalance was observed in the southbound through lanes in favor of the far-right lane due to the high volume of traffic turning right onto the US 101/SR 85 southbound loop on-ramp. This lane imbalances causes longer queues and slower travel speeds in the right lane (compared to the adjacent lanes). Traffic turning left from the US101 northbound off-ramp and from La Avenida Street is able to clear within one cycle.

Observations in the field indicate that the intersection of N. Shoreline Boulevard and US 101 northbound off-ramp operates at LOS F during both the AM and PM peak hours due to the lengthy delays and persistent queue spillback in the peak travel direction.

N. Shoreline Boulevard and US 101/SR 85 Southbound Ramps

During the AM peak hour, northbound through queues occasionally extend to Terra Bella Avenue. Generally, the queues are able clear with each cycle and the intersection operates at acceptable levels.

During the PM peak hour, southbound traffic is heavy and occasionally vehicles need two cycles to clear the intersection. At the end of every green phase for southbound Shoreline Boulevard, the southbound queue extends halfway to La Avenida Street. However, vehicles from La Avenida Street and the US 101 northbound off-ramp constantly replenish the southbound queue. Overall, the intersection operates at acceptable levels as the southbound right-turn movement is not controlled by the traffic signal and the traffic volume for movements that conflict with the peak southbound direction is quite light.

N. Shoreline Boulevard and Terra Bella Avenue

During the AM peak hour, the intersection generally operates well without significant operational issues. Occasionally northbound queues spill back from downstream intersections and temporarily impede northbound through traffic and westbound right-turn traffic.

During the PM peak hour, the southbound through queues occasionally extend to the upstream intersection at the US 101 southbound off-ramp and need two signal cycles to get through the intersection. The eastbound approach experiences a somewhat lengthy queue of 10-12 vehicles, however the queue clears each cycle.

N. Shoreline Boulevard and Middlefield Road

During the AM peak hour, long queues were observed in the northbound through lanes, however the queue clears with each cycle. The northbound left-turn queue extends out of the dedicated turn pocket into the two-way left-turn lane. Northbound left-turn traffic generally clears within one cycle, however occasionally, some vehicles must wait through two cycles to clear the intersection.

During the PM peak hour, the southbound through traffic consistently extends to and beyond Terra Bella Avenue. Generally, the queue clears with each signal cycle. The southbound left-turn traffic consistently overflows the turn pocket and vehicles wait two to three cycles to clear the intersection. The westbound left-turn queue occasionally spills out of the turn pocket into the through lane, and vehicles need two cycles to clear the intersection.

Rengstorff Avenue and Middlefield Road

During the AM peak hour, the northbound through queue extends beyond the upstream unsignalized cross streets at San Ramon Avenue and Junction Avenue, however the queue clears with each cycle.

During the PM peak hour, the southbound left-turn queue spills out of the turn pocket, however most vehicles clear in a single cycle.

Moffett Boulevard and Middlefield Road

This intersection operates without any significant operational issues during the AM peak hour.

During the PM peak hour, the southbound left-turn queue spills out of the turn pocket. Some southbound left-turn vehicles need two cycles to clear the intersection.

Whisman Road and Middlefield Road

No operational issues were observed at this intersection during either peak hour.

Ellis Street and Middlefield Road

During the AM peak hour, the eastbound left-turn queue on Middlefield Road occasionally spills out of the turn pocket and into the adjacent through lane temporarily blocking westbound vehicles from turning left into the driveway at 487 E. Middlefield Road. Generally, the queue clears with each cycle.

The intersection operates acceptably without any operational issues during the PM peak hour.

3. Background Conditions

This chapter describes the background traffic conditions, which are defined as conditions just prior to completion of the proposed project. Traffic volumes for background conditions comprise volumes from existing traffic counts plus traffic generated by approved projects in the vicinity of the site. This chapter describes the planned roadway network, the procedure used to determine background traffic volumes, and the resulting traffic conditions.

Background Roadway Network

The roadway network under background conditions is assumed to include the Shoreline Boulevard bus lane improvement project. The project would include a reversible transit-only lane on N. Shoreline Boulevard that extends northward from Middlefield Road to Pear Avenue. The single lane would operate northbound on weekday mornings and southbound in the afternoon. On N. Shoreline Boulevard at the intersections with Middlefield Road and Pear Avenue, dedicated transit signals are proposed to facilitate bus transitions in and out of the transit lane. On N. Shoreline Boulevard between Middlefield Road and Terra Bella Avenue, the transit lane would occupy the existing center left-turn lane. All vehicles currently using the center turn lane would perform a U-turn at either the Middlefield Road or Terra Bella Avenue intersections. The left-turn lane that provides access to the southbound SR 85 on-ramp from northbound Shoreline Boulevard would be removed to provide space for the bus lane. Traffic bound for southbound SR 85 is expected to divert to the SR 85/Moffett Boulevard interchange. The Shoreline improvement project will result in the following changes to study intersections:

- N. Shoreline Boulevard and Pear Avenue: The traffic signal would be modified to include an additional transit signal phase in the morning to facilitate the northbound buses getting out of the transit lane. The transit phase would increase the total intersection lost time and the cycle length in the morning.
- N. Shoreline Boulevard and US 101 Southbound Off-Ramp: The northbound left-turn lane onto the southbound SR 85 on-ramp and the associated signal phase would be removed.
- N. Shoreline Boulevard and Terra Bella Avenue: The signal phasing for the eastbound and westbound approaches is expected to be modified from permitted to split phase. Split phase operation would increase the total intersection lost time and the cycle length.
- N. Shoreline Boulevard and Middlefield Road: The traffic signal would be modified to include an additional transit signal phase in the afternoon to facilitate the southbound buses getting out of the transit lane. The transit phase would increase the total intersection lost time and the cycle length in the afternoon. A second left-turn lane would be added to the eastbound and westbound approaches by reducing the width of the existing landscaped medians.

Background Traffic Volume

Background traffic volumes for the study intersections (see Figure 7) were estimated by adding to the existing traffic volumes (1) the trips generated by nearby approved projects that have not been constructed or occupied and (2) the reassigned traffic resulting from the Shoreline Boulevard bus lane improvement project.

Lists of approved projects were obtained from the City of Mountain View. Hexagon considered both the location and size of the approved projects in order to eliminate those that were too far away or too small to affect traffic conditions of the study intersections. The approved projects considered for the study are listed in Appendix D. Vehicle trips from the approved projects were obtained from the project's TIA or environmental document (initial study or EIR), if available. For projects without a traffic study, trip estimates were developed using rates published in the ITE *Trip Generation Manual, 10th Edition*. The estimated trips were assigned to the study intersections according to distributions identified in the development traffic studies, if available, or knowledge of the study area.

The Shoreline Boulevard bus lane improvement project identifies the removal of the northbound left-turn lane at the intersection of N. Shoreline Boulevard and the on-ramp to southbound US 101/SR 85. The closure of this lane would require all vehicles bound for SR 85 to use Middlefield Road to access the Moffett Boulevard/SR 85 interchange. Therefore, all existing vehicles that are utilizing the left-turn lane were rerouted to the Moffett interchange.

The proposed center transit lane would occupy the existing center turn lane on N. Shoreline Boulevard between Middlefield Road and Terra Bella Avenue. All vehicles currently using the center turn lane would perform a U-turn at either the Middlefield Road or Terra Bella Avenue intersections. An additional 50 vehicles were assumed to perform U-turns at both intersections during both the AM and PM peak periods. The additional U-turn volume was estimated based on the type and size of land uses and parking lots that have access to this segment of N. Shoreline Boulevard.

The approved trips and traffic volumes for all components of traffic are tabulated in Appendix B.

Background Intersection Levels of Service

The results of the intersection level of service analysis under background conditions are summarized in Table 4. Most of the study intersections would operate at acceptable levels of service. The intersection of N. Shoreline Boulevard and Pear Avenue would continue to operate at level of service F during the AM peak hour. The intersection of N. Shoreline Boulevard and the US 101 northbound off-ramp/La Avenida would continue to operate at an unacceptable level during the AM and PM peak hours.

It should be noted that, at some intersections, the average delay is shown to be decreased with the addition of traffic associated with approved projects. This occurs because the intersection delay is a weighted average of all intersection movements. When traffic is added to movements with delays lower than the average intersection delay, the average delay for the entire intersection can decrease.

The intersection levels of service calculation sheets are included in Appendix C.

		PM	21.5	C+	21.5	C+

Notes:

Bold indicates a substandard level of service.

[1] The calculated LOS does not reflect the unmet vehicle demand that cannot get through the intersection during the peak hour. Field observations indicate that the intersection operates at LOS F with 80+ seconds of average delay during one or both peak hours.

[2] The calculated LOS is based on the overall average traffic delay for all movements. While the intersection currently operates at an acceptable level overall, the northbound through movements during the AM peak hour are affected by queue spillback from downstream intersections. However, observations show that generally the queues clear during each cycle and do not significantly affect the operation of the intersection overall.

4. Project Conditions

This chapter describes the roadway traffic operations under background plus project conditions and existing plus project conditions, the method by which project traffic is estimated, and any impacts caused by the project. Existing plus project traffic conditions could potentially occur if the project were to be occupied prior to the other approved projects in the area. However, it is unlikely that this traffic condition would occur, since some of the other approved projects expected to add traffic to the study area would likely be built and occupied during the time this project is going through the development review process. Therefore, the Environmental Impact Report (EIR) impact conclusions are based on a comparison of background plus project conditions to background conditions per the methodology established by the City and the VTA.

Transportation Network under Existing Plus Project Conditions

The transportation network and intersection lane configurations under existing plus project conditions is assumed to be the same as that described under existing conditions.

Transportation Network under Background Plus Project Conditions

The transportation network and intersection lane configurations under background plus project conditions is assumed to be the same as that described under background conditions.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: 1) trip generation, 2) trip distribution, and 3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment, the project trips are assigned to specific streets and intersections. These procedures are described below.

Trip Generation

Through empirical research, data have been collected that quantify the amount of traffic produced by common land uses. Thus, for the most common land uses there are standard trip generation rates that can be applied to help predict the future traffic increases that would result from a new development. The magnitude of traffic added to the roadway system by a development is estimated by multiplying the applicable trip generation rates by the size of the development. The trip generation rates published in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual, 10th Edition (*2017) for

Multifamily Family (Mid-Rise) (Land Use Code 221) were used to estimate the trips generated by the residential component for this study. Mid-rise multifamily housing is defined to include residential developments with between three and ten stories. The retail tenant is unknown at this time. For the purpose of this study, the proposed retail component was assumed to be a coffee shop (Land Use Code 936). This is a conservative assumption since a coffee shop would generate more trips than other retail uses that might occupy the space. Based on the ITE rates, the proposed project would generate 413 gross new AM peak-hour trips and 242 gross new PM peak-hour trips.

Trip Reductions

The gross project trip estimates listed above were reduced to account for the mixed-use development and for retail pass-by trips. In addition, the project will implement a Transportation Demand Management Plan with a combination of services, incentives, facilities, and actions that reduce single–occupant vehicle (SOV) trips to help relieve traffic congestion, parking demand, and air pollution problems. The TDM Plan has not yet been finalized so the potential trip reduction achieved by TDM is uncertain. Thus, the traffic analysis does not assume any trip reductions based on TDM. This is a conservative worst-case assumption that may overstate the number of vehicle trips generated by the project.

Mixed-Use Development

Including the Phase I development that is already built and occupied, the project site will incorporate a mix of the following three uses: office, residential, and retail. Mixed-use developments have been shown to generate fewer vehicle trips than a single-use stand-alone development due to the internalization of trips between complementary land uses. For example, some office workers at the project site may live at the proposed new residences on the same site and thus walk rather than drive to work. In addition, site residents may patronize the retail use proposed on the same site thereby reducing the external vehicle trips generated by both the retail and residential uses. As prescribed by the Santa Clara VTA *Transportation Impact Analysis Guidelines (2014)*, a three percent trip reduction was applied for the proposed mixed-use development with housing and employment. The guidelines specify that the mixed-use trip reduction is to be calculated based on the land use that produces the fewest new trips. Based on the *1001 North Shoreline Boulevard Office Development TIA* prepared by Hexagon Transportation Consultants, Inc. in June 2015, the office portion of the project area is estimated to generate 209 AM peak-hour trips and 203 PM peak-hour trips. Therefore, since the residential portion of the project would generate fewer new trips, the three percent reduction was applied to the gross new residential peak-hour trips. To be conservative, no reductions were applied to the trips generated by the existing office space.

The Santa Clara VTA *Transportation Impact Analysis Guidelines (2014)* also allow a 15 percent trip reduction for a mixed-use development that combine retail uses with a housing component. Therefore, a 15 percent trip reduction was applied to the smaller trip generator (residential). The same number of trips with reversed trip directions were then subtracted from the larger trip generator (retail) to account for both ends of the internal trip.

Pass-By Trips

In accordance with the Santa Clara VTA *Transportation Impact Analysis Guidelines (2014)*, a retail pass-by trip reduction of 30 percent was applied to the net peak-hour trip generation estimates for the proposed retail space. Pass-by-trips are trips that would already be on the adjacent roadways (and so are already counted in the background traffic) but would turn into the site while passing by. For example, some of the customers at the proposed retail space may stop in on their way to work. Justification for applying the pass-by-trip reduction is founded on the observation that such retail traffic is not actually generated by the retail development but is already part of the ambient traffic levels.

After applying the mixed-use and pass-by trip reductions, the proposed project is expected to generate 291 net new vehicle trips (123 inbound and 167 outbound) during the AM peak hour and 178 net new vehicle trips (103 inbound and 75 outbound) during the PM peak hour. The project trip generation summary is shown in Table 5.

Table 5
Project Trip Generation Summary

Notes
d.u. = dwelling units
[1] Rate expressed in trips per dwelling unit for residential uses and per 1,000 s.f for retail uses.
[2] Trip generations rate for the proposed Apartments and Condominiums are based on the ITE's *Trip Generation Manual, 10th Edition* rates for Land Use Code 221 "Multifamily Housing (Mid-Rise)."
[3] Trip generation rates for the proposed retail space are based on the ITE's *Trip Generation Manual, 10th Edition* rates for Land Use Code 936 "Coffee/Donut Shop without Drive-Through Window"
[4] As prescribed by the *VTA Transportation Impact Analysis Guidelines, 2014* , a maximum trip reduction of 3% for mixed-use development with housing and employment was applied to the housing trip generation.
[5] As prescribed by the *VTA Transportation Impact Analysis Guidelines, 2014* , a 15% trip reduction was applied to the smaller trip generator. The same number of trips were then subtracted from the larger trip generator to account for both trip ends.
[6] As prescribed by the VTA Transportation Impact Analysis Guidelines, 2014, a 30% pass-by trip reduction was applied to the retail component of the project. The reduction was applied to the net retail trips after applying the mixed-use reduction.

Trip Distribution and Assignment

The trip distribution patterns for the proposed uses were estimated based on existing travel patterns on the surrounding roadway system and the location of complimentary land uses. The trip distribution pattern for the residential component of the project is shown on Figure 8 and the trip distribution pattern for the retail component is shown on Figure 9.

The project trips were assigned to the roadway network based on the direction of approach and departure, roadway network connections, freeway access points, and locations of project driveways. The project trip assignment at the intersection of N. Shoreline Boulevard and Terra Bella Avenue includes the effect of retail pass-by trips that would be subtracted from the through traffic on N. Shoreline Boulevard and added to the turning movements to and from the east leg of Terra Bella Avenue. The net project trip assignment with the existing transportation network is shown on Figure 10. Note that the project trip assignment differs under background conditions due to the elimination of access to southbound SR 85 from N. Shoreline Boulevard. Instead, project trips bound for southbound SR 85 were assigned to use the southbound SR 85 on-ramp at Moffett Boulevard.

Project Condition Intersection Traffic Volumes

Project impacts were evaluated relative to both existing traffic volumes and background traffic volumes. For the existing plus project scenario, the total new trips generated by the project were added to the existing traffic volumes to derive the existing plus project traffic volumes (see Figure 11). For the background plus project scenario, the project trips generated by the project were added to the background traffic volumes to derive the background plus project traffic volumes (see Figure 12). Peak-hour intersection volumes for the study intersections are tabulated in Appendix B.

Existing Plus Project Intersection Level of Service Analysis

The results of the intersection level of service analysis under existing plus project conditions are summarized in Table 6. The results show that most of the study intersections would operate at acceptable levels during both the AM and PM peak hours. Under existing plus project conditions, the N. Shoreline Boulevard/Pear Avenue intersection would continue to operate at LOS F during the AM peak hour and the N. Shoreline Boulevard/US 101 northbound off-ramp intersection would continue to operate at LOS F during both the AM and PM peak hours. However, the project would not result in a significant project impact at either of these two intersections because the project traffic would not cause an increase in critical-movement delay of four or more seconds or an increase in critical v/c of one percent (0.01) or more. The intersection level of service calculation sheets are included in Appendix C.

At the intersection of N. Shoreline Boulevard and Montecito Avenue, the average delay under existing plus project conditions is shown to be less than under existing conditions during the AM peak hour. The average delay can be less under project conditions because the intersection delay is a weighted average of all intersection movements. The addition of project traffic to movements with delays lower than the average intersection delay can reduce the average delay for the entire intersection.

Notes:

Bold indicates a substandard level of service.

[1] The calculated LOS does not reflect the unmet vehicle demand that cannot get through the intersection during the peak hour. Field observations indicate that the intersection operates at LOS F with 80+ seconds of average delay during one or both peak hours.

[2] The calculated LOS is based on the overall average traffic delay for all movements. While the intersection currently operates at an acceptable level overall, the northbound through movements during the AM peak hour are affected by queue spillback from downstream intersections. However, observations show that generally the queues clear during each cycle and do not significantly affect the operation of the intersection overall.

Background Plus Project Intersection Level of Service Analysis

The results of the intersection level of service analysis under background plus project conditions are summarized in Table 7. The results show that most of the study intersections would operate at acceptable levels during both the AM and PM peak hours under background plus project conditions. The N. Shoreline Boulevard/Pear Avenue intersection would continue to operate at LOS F during the AM peak hour and the N. Shoreline Boulevard/US 101 northbound off-ramp intersection would continue to operate at LOS F during both AM and PM peak hours. However, the project would not result in a significant project impact at either of these two intersections because the project traffic would not cause an increase in critical-movement delay of four or more seconds or an increase in critical v/c of one percent (0.01) or more.

The intersection levels of service calculation sheets are included in Appendix C.

Table 7

Notes

Bold indicates a substandard level of service.

[1] The calculated LOS does not reflect the unmet vehicle demand that cannot get through the intersection during the peak hour. Field observations indicate that the intersection operates at LOS F with 80+ seconds of average delay during one or both peak hours.

[2] The calculated LOS is based on the overall average traffic delay for all movements. While the intersection currently operates at an acceptable level overall, the northbound through movements during the AM peak hour are affected by queue spillback from downstream intersections. However, observations show that generally the queues clear during each cycle and do not significantly affect the operation of the intersection overall.

At the intersection of N. Shoreline Boulevard and Montecito Avenue, the average delay under background plus project conditions is shown to be less than under background conditions during the AM and PM peak hours. The average delay can be less under project conditions because the intersection delay is a weighted average of all intersection movements. The addition of project traffic to movements with delays lower than the average intersection delay can reduce the average delay for the entire intersection.

Freeway Segment Evaluation

Traffic volumes on the study freeway segments under project conditions were estimated by adding project trips to the existing volumes obtained from the 2016 CMP Annual Monitoring Report. The results of the freeway segment impact analysis (see Table 8) show that all the study freeway segments currently operating at LOS F would continue operating at an unacceptable LOS F. The project would contribute trips equivalent to less than one percent of the capacity on each of the studied freeway

segments under every scenario. Thus, the project would have an insignificant impact on nearby freeway segments under existing plus project and all future scenarios including background plus project and cumulative conditions.

Table 8
Freeway Level of Service Analysis

Bold indicates unacceptable LOS.
Boxed indicates significant impact.

5. Cumulative Conditions

This chapter describes the roadway traffic operations under cumulative no project conditions and cumulative plus project conditions. Cumulative traffic volumes reflect traffic generated by the approved development projects and traffic growth contributed by the pending developments in the study area. Cumulative plus project conditions were evaluated relative to cumulative no project conditions in order to determine potential project impacts.

Cumulative Transportation Network

The roadway network under cumulative conditions would be the same as the background roadway network as described in Chapter 3.

Cumulative Traffic Volumes

The cumulative no project traffic volumes were estimated by first applying a two percent growth factor per year for five years to existing 2018 traffic volumes. (With compounding, this yields a factor of 1.104.) This growth assumption was furnished by the City of Mountain View Planning Department. The trips generated by the approved projects in the vicinity were then added to obtain cumulative no project traffic volumes (see Figure 13).

The net project trip estimates in Chapter 4 were then added to the cumulative no project traffic volumes to yield cumulative plus project traffic volumes (see Figure 14). Traffic volumes for all components of traffic are tabulated in Appendix B.

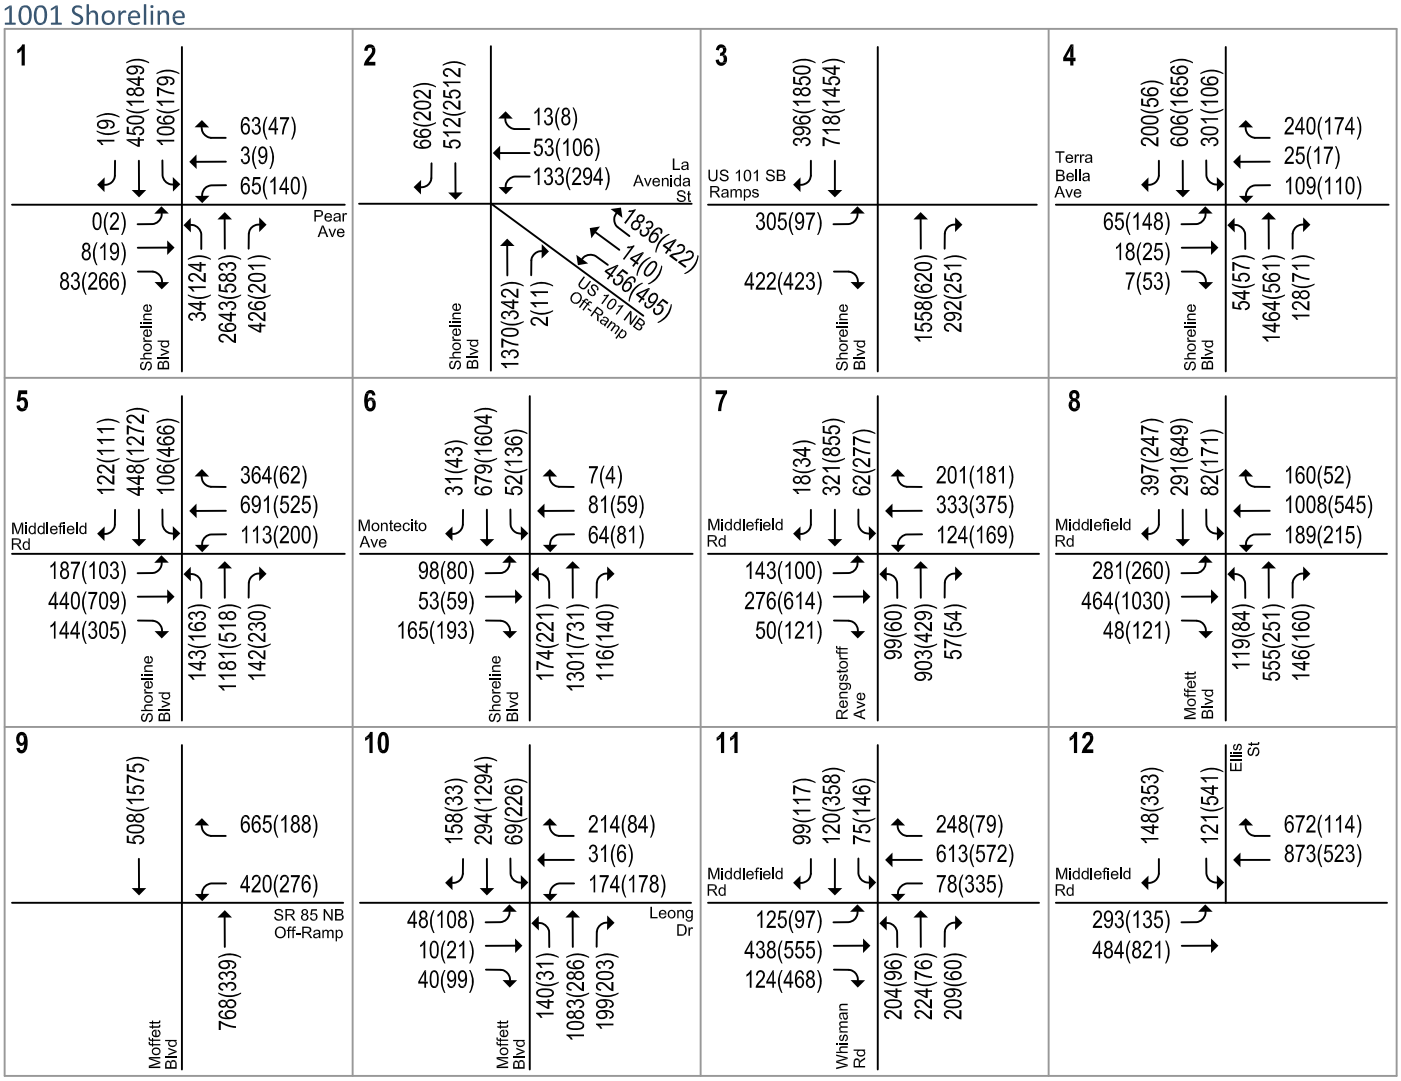
Cumulative No Project Traffic Volumes



LEGEND

XX(XX) = AM(PM) Peak-Hour Traffic Volumes

Figure 14
Cumulative Plus Project Traffic Volumes

Intersection Levels of Service Under Cumulative Conditions

Cumulative plus project conditions were evaluated relative to cumulative no-project conditions in order to determine potential project impacts. The results of the intersection level of service analysis (see Table 9) show that the following study intersections would operate at unacceptable levels of service (LOS E or F) under both cumulative no project conditions and cumulative with project conditions.

- N. Shoreline Boulevard/Pear Avenue (AM peak hour)
- N. Shoreline Boulevard/US 101 Northbound Off-Ramp (AM and PM peak hours)
- N. Shoreline Boulevard/W. Middlefield Road (PM peak hour)

However, the added project traffic would not result in a significant project impact at these intersections because the project traffic would not cause an increase in critical-movement delay of four or more seconds or an increase in critical v/c of one percent (0.01) or more.

		PM	21.9	C+	22.0	C+	0.0	0.003

Notes:

Bold indicates a substandard level of service.

[1] The calculated LOS does not reflect the unmet vehicle demand that cannot get through the intersection during the peak hour. Field observations indicate that the intersection operates at LOS F with 80+ seconds of average delay during one or both peak hours.

[2] The calculated LOS is based on the overall average traffic delay for all movements. While the intersection currently operates at an acceptable level overall, the northbound through movements during the AM peak hour are affected by queue spillback from downstream intersections. However, observations show that generally the queues clear during each cycle and do not significantly affect the operation of the intersection overall.

6. Other Transportation Issues

This chapter presents an analysis of other transportation issues associated with the project, including:

- Effects on pedestrian, bicycle, and transit facilities
- Vehicle miles travelled
- Neighborhood traffic conditions
- Freeway on-ramp traffic operations
- Queuing analysis at selected intersections
- Site access and circulation

Unlike the level of service impact methodology, which is adopted by the City Council, the analyses in this chapter are based on professional judgment in accordance with the standards and methods employed by the traffic engineering community. Although operational issues are not considered CEQA impacts, they do describe traffic conditions that are relevant to describing the project environment.

Effects on Pedestrians, Bicycles and Transit Facilities

Overall, the project is well served by the existing pedestrian and bicycle facilities. Sidewalks are found along virtually all previously-described local roadways in the study area. The project would provide sidewalks along the entire project frontage and enhance the pedestrian and bicycle network within the project site.

Pedestrian and Bicycle Facilities

Pedestrian facilities in the study area consist of sidewalks along all the surrounding streets. The study intersections on N. Shoreline Boulevard at Pear Avenue, Terra Bella Avenue and at Middlefield Road have signalized crosswalks with pedestrian push buttons on all legs. The Shoreline/La Avenida/US 101 Northbound Ramp intersection has crosswalks on all approaches except the south leg, while the Shoreline/US 101/SR 85 Southbound Ramp intersection has crosswalks on only the east and west legs. Overall, the existing sidewalks and pedestrian paths have good connectivity and would provide pedestrians with safe routes to surrounding land uses including Downtown Mountain View, the Mountain View Transit Center, and nearby schools and bus stops. The project would enhance pedestrian circulation with a public pedestrian/bicycle pathway through the site connecting Shoreline Boulevard and Linda Vista Avenue.

The project site is adjacent to bike lanes along N. Shoreline Boulevard and would provide a public pedestrian/bicycle pathway through the site connecting Shoreline Boulevard and Linda Vista Avenue.

Although not designated as a bike route, Linda Vista Avenue and Terra Bella Avenue carry low traffic volumes and are conducive to bicyclists. In addition, the project is located about one mile from the Stevens Creek Trail and about 0.8 mile from the Permanente Creek Trail. It is expected that the project would generate some bicycle trips because of its proximity to the bike lanes and complementary land uses, including the Mountain View Transit Center, and corporate campuses in the North Bayshore and Whisman areas.

Pedestrian and Bicycle Access to Schools

The project site is located within the boundary of Theuerkauf Elementary School, Crittenden Middle School, and Mountain View High School, which are about 0.8 miles southwest, 0.8 miles west, and 4.9 miles south of the project site, respectively. While Theuerkauf Elementary School and Crittenden Middle School are more than one-half mile away and not normally considered within walking distance, some students may choose to walk or bike to these schools from the project site. Mountain View High School is considered too far to walk or even bike to or from the project site. Students who choose to walk to Theuerkauf Elementary School would use N. Shoreline Boulevard, W. Middlefield Road, San Pierre Way, and San Luis Avenue. This pedestrian route has adequate sidewalks with crosswalks provided at the N. Shoreline Boulevard/W. Middlefield Road and San Pierre Way /W. Middlefield Road intersections. It is unlikely that students would bike to Theuerkauf Elementary School due to the young ages. Students who choose to walk to Crittenden Middle School would use Terra Bella Avenue, Middlefield Road, and the Permanente Creek Trail. This pedestrian route has adequate sidewalks/pedestrian pathways with a signalized crosswalk at the N. Shoreline Boulevard/Terra Bella Avenue intersection. Students that choose to bike to Crittenden Middle School could follow the same route or could utilize the bike lanes on N. Shoreline Boulevard and W. Middlefield Road.

Transit Services

The project site is served by VTA bus routes 32, 40, 120, and 185, two MVgo Shuttles (East and West Bayshore routes), the Mountain View Community Shuttle, and an ACE shuttle. The nearest transit stops are located at: N. Shoreline Boulevard and Terra Bella Avenue (500 feet from the site), N. Shoreline Boulevard and Middlefield Road (1,000 feet from the site), N. Shoreline Boulevard and La Avenida Street (1,800 feet from the site), and N. Shoreline Boulevard and Pear Avenue (0.5 miles from the site). Sidewalks are present to facilitate pedestrian movements between the project site and the nearest transit stops. However, VTA will discontinue routes 32 and 120, and extend route 40 as part of VTA's Next Network 2018-2019 Transit Service Plan. With the changes, the project would be served by VTA Routes 40 and 185. In addition, a new MVgo bus stop will be located immediately adjacent to the project site at the northeast corner of N. Shoreline Boulevard and Terra Bella Avenue.

Because of the local VTA buses serving the project site and the project's location near the Mountain View Transit Center and the North Bayshore area, it is expected that the project would generate some commuter transit trips that utilize the MVgo shuttles or VTA Routes 40 and 185 on N. Shoreline Boulevard to get to the North Bayshore area or the VTA Light Rail/Caltrain at the Mountain View Transit Center to get to other destinations. The transit center is approximately one mile from the project site and could be easily accessed by bicycle. Residents who choose to take buses to the transit center could utilize the MVgo shuttles or VTA Routes 40 or 185 on N. Shoreline Boulevard. Based on the 2012-2016 American Community Survey 5-Year Estimates for 2016, an average of approximately six percent of Mountain View residents use transit to commute to and from work. Assuming a 6 percent transit mode share, the project would generate approximately 17 new transit riders during the AM peak hour and 11 riders during the PM peak hour. This new ridership generated by the project could be accommodated by these existing and planned transit services.

To assess the project's effect on transit vehicle delay, the delay experienced by each route running through the study intersections was estimated based on the average vehicle delay that is calculated as

part of the intersection level of service analysis. Table 11 summarizes the bus travel times through the study area and the increase in transit vehicle delay with the addition of the project traffic. VTA does not have significance thresholds to determine impacts on transit vehicle delay. Therefore, this analysis is presented for information purposes only. The results show that the project would result in minimal increases in transit travel time (from 0.1 to 1.3 percent) for the bus routes in the study area. Thus, it can be concluded that the addition of project-generated traffic is so minor that the delay increases experienced by the bus routes that operate within the study area would be imperceptible.

Table 10
Transit Vehicle Delay in Study Area

			Existing			Background	Background+Project

		PM	15	900	126.8	133.1	136.4	3.3	0.4%

Note:
1. Travel time based on the VTA's bus schedule for two timepoints closest to each end of the study area.
2. The total movement delay of all relevant study intersections added together.
3. Increase in delay/travel time over background conditions.
4. The delay and travel time for Route 40 under existing and background conditions reflect the the total movement delay of all relevant study intersections along the extended Route 40 as described as part of VTA's Next Network.

Vehicle Miles Travelled (VMT) Analysis

Pursuant of SB 743, the Governor's Office of Planning and Research (OPR) published the finalized *Updates to the CEQA Guidelines* in November 2017. The guidelines state that level of service will no longer be an environmental impact under CEQA, and that vehicle-miles-travelled (VMT) is considered the most appropriate measure of transportation impact. Cities have until July 2020 to adopt the new procedures. The City of Mountain View has not yet adopted any standards or guidelines related to VMT. Therefore, the qualitative analysis of VMT presented in this report is for information only. It is not intended to provide any indication of the transportation impacts of the project under SB 743.

Compared to other locations in the City, the project site is expected to have a lower than average VMT per resident due to its proximity to the North Bayshore employment area, its location immediately adjacent to multiple transit routes and bike lanes on N. Shoreline Boulevard, and its proximity to multiple pedestrian/bike trails and to Caltrain and light rail service at the Mountain View Transit Center. In addition, the project will implement a Transportation Demand Management Plan with a combination of services, incentives, facilities, and actions that reduce single–occupant vehicle trips to help relieve traffic congestion, parking demand, and air pollution problems. Thus, for these reasons, the project is expected to help the City reduce the citywide average VMT per capita.

Neighborhood Traffic Conditions

Mechanical tube counts were conducted over a two-day period (Wednesday and Thursday, September 26 – 27, 2018) on the following street segments:

- Terra Bella Avenue between N. Shoreline Boulevard and Linda Vista Avenue, and
- Linda Vista Avenue between Terra Bella Avenue and Moonbeam Drive.

According to the City of Mountain View's General Plan, Terra Bella Avenue is classified as an avenue, which is described as a tree-lined arterial or collector with mixed residential and commercial frontage. Linda Vista Avenue is classified as a flexible street north of Moonbeam Drive and a residential street south of Moonbeam Drive. A flexible street is a street in an area of potential transition while a residential street is generally a low volume street. The average daily traffic volumes on these roadway segments under existing conditions are shown in Table 10. The City's General Plan does not provide any standards for desired or maximum traffic volume on various street classifications. However, the City's Neighborhood Traffic Management Program (NTMP) states that local residential and collector streets with cut-through traffic equal to 25 percent or more may be eligible for the installation of traffic calming devices.

Observations indicate that these streets currently experience substantial cut through traffic, primarily during the morning commute hours when traffic diverts from Middlefield Road to northbound Linda Vista Avenue and then turns left onto westbound Terra Bella Avenue and then right onto northbound Shoreline Boulevard. Based on a review of the hourly traffic volumes by direction, it is estimated that cut through traffic comprises approximately 455 vehicles per day, which is less than 25 percent of the total daily traffic volume on Terra Bella Avenue. However, the existing cut-through traffic represents more than 25 percent of the total daily traffic volume on Linda Vista Avenue.

The proposed project is expected to add trips to both street segments (see Table 11). The greatest increase in project trips is expected to occur on Terra Bella Avenue between Shoreline Boulevard and the project driveway. Including pass-by trips diverted from N. Shoreline Boulevard, the project is expected to add approximately 2,575 vehicle trips per day to this segment of Terra Bella Avenue, which represents a 52 percent increase in the existing traffic volume on this street. The addition of project trips would increase the percentage of cut through traffic on Terra Bella Avenue from 12 to 48 percent. Note that the cut-through trips on Terra Bella Avenue include pass-by trips that are expected to divert from their existing route on N. Shoreline Boulevard to Terra Bella Avenue to access the proposed retail use(s) as an intermediate stop while en route to another destination elsewhere.

On Linda Vista Avenue, the project is estimated to add 611 vehicle trips per day, which represents a 41 percent increase in the existing traffic volume on this street. The percentage of cut-through traffic on Linda Vista Avenue is expected to increase from 31 to 51 percent as a result of the project.

According to the NTMP, traffic-calming measures may be implemented to eliminate the perceived time savings incentive to use these streets and reduce the volume of cut through traffic. Installation of traffic-calming devices is conducted following a multi-step process that includes neighborhood meetings and a

post-card survey of affected residents and property owners. Some traffic-calming measures require approval of the Council Transportation Committee and the full City Council.

The proposed project is expected to add the same number trips to both study street segments under background plus project and cumulative conditions.

Table 11
Average Daily Traffic Volumes on Neighborhood Streets

	Existing (2018)[1]			Existing + Project			
Street Segment	Total Volume	Cut Through Volume	Cut Through %	Project Trips	Total Volume	Cut Through Volume	Cut Through %
Linda Vista Avenue (between Terra Bella Avenue and Moorbeam Drive)	1,477	455	31%	611	2,088	1,066	51%
Terra Bella Avenue (between Linda Vista Avenue and N. Shoreline Boulevard)	3,712	455	12%	2,575	6,287	3,030	48%

Notes
[1] Existing traffic counts were collected in September 2018.

Freeway On-Ramp Traffic Operations

An analysis of freeway on-ramps providing access to US 101 and SR 85 from the project site was performed to identify the effect of the addition of project traffic on the vehicle queues at the metered on-ramps (see Table 12). It should be noted that the evaluation of freeway ramps is not required by the City's TIA guidelines, nor are there adopted methodologies and impact criteria for the analysis of freeway ramps. Thus, the analysis of freeway on-ramps was conducted only for existing and existing plus project conditions.

The US 101/SR 85/Shoreline Boulevard interchange provides direct access to US 101 and SR 85 from the project site. In the project vicinity, the peak direction on both US 101 and SR 85 is northbound during the AM peak commute period and southbound during the PM peak commute period. The US 101 northbound loop on-ramp from Shoreline Boulevard is not metered during the AM or PM peak commute hours. The on-ramps from Shoreline Boulevard to southbound US 101 and southbound SR 85 are metered only during the PM peak commute period. Ramp operations on the northbound US 101 on-ramp were evaluated based on the number of lanes and free-flow capacity of the loop ramp while the southbound on-ramps were evaluated based on vehicle queue lengths and metering rates observed in the field during the PM peak hour of traffic.

The on-ramp to southbound SR 85 widens from one to two lanes approaching the meter and is about 725 feet long in the one-lane section and 475 feet long in the two-lane section, which can accommodate a queue of about 67 vehicles in all. The maximum existing queue on the southbound SR 85 on-ramp is about eight vehicles per lane with a metering rate of about 9 seconds per vehicle per lane (or 800 vehicles per hour) during the PM peak period. The existing PM peak-hour traffic volume on this ramp is substantially less than the metered capacity of the ramp. Accordingly, the observed on-ramp queue is much shorter than the length of the ramp. The addition of project traffic to the on-ramp would slightly increase the ramp traffic (1%) and would not noticeably increase the queue length or wait times at the ramp.

Table 12
Freeway On-Ramp Analysis

Freeway On-Ramp	Peak Hour	Lanes	On-Ramp Storage (veh)	Existing[1] Volume[2] (veh/hr)	Existing[1] Metering Rate (sec/veh/ln)	Existing[1] On-Ramp Capacity (veh/hr)	Existing[1] Queue Length (veh)	Existing[1] Wait Time[3] (sec)	Existing Plus Project Project Trips (veh/hr)	Existing Plus Project Volume (veh/hr)	Existing Plus Project %Increase	Existing Plus Project Queue Length[4] (veh)	Existing Plus Project Wait Time[3] (sec)
from Shoreline Boulevard Eastbound													
- to southbound SR 85 [5]	PM	2	67	467	9	800	16	72	6	473	1%	16	72
- to southbound US 101 [5]	PM	2	118	1,149	6	1,200	70	210	10	1,159	1%	71	213
- to northbound US 101 [6]	AM	1	134	371	n/a	1,800	0	0	18	389	5%	0	0
	PM	1	134	320	n/a	1,800	0	0	10	330	3%	0	0

Notes:
1. Existing queue length and existing metering rate were measured during the PM peak hour in October 2017.
2. The existing on-ramp traffic volumes were based on counts conducted in October 2018.
3. Wait time was estimated based on the queue length and measured metering rate.
4. Queue lengths for existing plus project conditions were estimated based on the ratio of existing plus project volume to existing volume.
5. Ramp meter on these two ramps operates only during the PM peak hour.
6. Ramp meter is not turned on during either the AM or PM peak hours at this ramp.

The on-ramp to southbound US 101 widens from one to two lanes approaching the meter and is about 1,800 feet long in the one-lane section (queue space for 72 vehicles) and 575 feet long in the two-lane section (queue space for 23 vehicles per lane), for a total queueing capacity of about 118 vehicles. The maximum existing queue on the southbound US 101 on-ramp fully occupies the two-lane portion of the ramp and about 1/3 of the one-lane portion of the ramp (about 70 vehicles total) with a metering rate of about 6 seconds per vehicle per lane (or 1,200 vehicles per hour) during the PM peak period. The existing PM peak-hour traffic volume on this ramp is near the metered ramp capacity, however the observed maximum ramp queue length does not exceed the available ramp storage. The addition of project traffic to the on-ramp would slightly increase the ramp traffic (1%) and would increase the on-ramp queue length by only one vehicle and increase wait times by only 3 seconds. The maximum vehicle queue under existing plus project conditions is expected to be contained within the existing on-ramp storage.

The addition of project traffic to the US 101 northbound on-ramp would slightly increase the ramp volume (5% during the AM peak hour and 3% during the PM peak hour). However, the ramp volume would still be well below the ramp capacity under the existing plus project conditions. Therefore, the project would not affect traffic operations on this ramp. Based on the on-ramp traffic operations analysis, the existing on-ramp storage is adequate to serve the vehicle queues that would develop with the addition of project-generated traffic.

Intersection Vehicle Queuing

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for intersection turning movements where the project would add a substantial number of trips. This analysis provides a basis for estimating future storage requirements at the intersections. Vehicle queues were estimated using a Poisson probability distribution, described in Chapter 1. The following turn movements were selected for evaluation:

- Westbound left turn at N. Shoreline Boulevard and US 101 NB Ramps/La Avenida Street
- Northbound left-turn at N. Shoreline Boulevard and US 101/SR 85 SB Ramps
- Southbound left-turn at N. Shoreline Boulevard and Terra Bella Avenue
- Eastbound left-turn at N. Shoreline Boulevard and Middlefield Road

As mentioned previously, unlike the level of service impact methodology, which is adopted by the City Council, the intersection vehicle queuing issues are not considered CEQA impacts and only analyzed under existing and background conditions. The queuing analysis at each of the selected location is discussed further below and summarized in Table 13. Because vehicle queuing is considered an operational issue not subject to CEQA significance thresholds, the queuing analysis was conducted for existing and background conditions without and with the proposed project and not under cumulative conditions.

Shoreline Boulevard and US 101 NB Ramps/La Avenida Street

Under all scenarios, the westbound left-turn queues on the US 101 northbound off-ramp at Shoreline Boulevard are projected to be less than the available storage capacity during the AM and PM peak hours. No improvements are needed.

Notes:
[1] Vehicle queue calculations based on cycle length for signalized intersections.
[2] Assumes 25 feet per vehicle queued.
[3] The northbound left-turn movement will be eliminated as part of the planned Shoreline Boulevard Transportation Corridor improvements under background and backgound plus project conditions.
[4] The Shoreline Boulevard Transportation Corridor improvements include the addition of a second EB LT lane at Shoreline/Middlefield under background and background plus project conditions.

Shoreline Boulevard and US101/SR 85 SB Ramps

At this intersection, the existing northbound left-turn pocket provides 175 feet of storage, which can accommodate about seven vehicles. The estimated 95th percentile queue is less than the existing vehicle storage capacity during both AM and PM peak hours under existing conditions. The addition of project traffic would only increase the 95th percentile queue by one vehicle during the AM and would not increase the vehicle queue during the PM peak hour. Under the existing plus project scenario, the northbound left-turn queues are projected to be less than the available storage capacity during the AM and PM peak hours.

Under background conditions, the northbound left-turn lane onto the southbound SR 85 would be removed as part of the Shoreline Boulevard Transportation Corridor improvements.

Shoreline Boulevard and Terra Bella Avenue

Currently, the left turn pocket on southbound Shoreline Boulevard is only about 175 feet long, which provides enough storage for about seven vehicles. The estimated maximum vehicle queue for the southbound left-turn movement exceeds the existing vehicle storage capacity under all scenarios during the AM peak hour. During the PM peak hour, the southbound left-turn queue is less than the storage capacity at the intersection under existing and background conditions. The project is expected to increase this queue by three vehicles during the PM peak hour and would result in the queue exceeding the vehicle storage capacity. It may be possible to extend the left-turn pocket beyond the current length; however, it is not possible to accommodate the projected maximum queue length of 450 feet due to the planned bus lane that will run in the median.

The queue storage deficiency at this intersection is partly due to the existing congestion on the northbound US 101 off ramp to Shoreline Boulevard during the peak morning commute period. To avoid the lengthy queue in the right-turn lanes, some off-ramp traffic turns left onto southbound Shoreline and then makes a U-turn at Terra Bella Avenue. Counts show that 135 vehicles per hour conduct a U-turn at this location. The North Bayshore Precise Plan identifies improvements to the northbound US 101 off ramp to Shoreline Boulevard that would alleviate the existing congestion at the off ramp eliminating the perceived travel time savings gained by making a U-turn at Terra Bella Avenue. These planned improvements are not expected to be completed within the next five years, thus they were not assumed as part of the background or cumulative transportation network. Without the U-turn traffic, the 95th percentile queue at Terra Bella would be 275 feet. Thus, after the planned gateway transportation improvements are completed, the need for additional turn pocket storage would wane as queues would overflow the existing turn pocket storage in about one of every three signal cycles during the AM peak hour and only about one out of ten signal cycles during the PM peak hour.

Shoreline Boulevard and Middlefield Road

The queuing analysis indicates that the maximum queue for the eastbound left-turn movement on Middlefield Road currently exceeds the existing vehicle storage capacity during the AM peak hour. The project would not cause a noticeable increase in queue length for this movement. As shown in Table 14, the project would only increase the eastbound left-turn queue by one vehicle during the AM peak hour.

With the Shoreline bus lane project, a second left-turn lane would be added to the eastbound and westbound approaches under background conditions. The improvement is expected to reduce the demand for green time for the eastbound and westbound left-turn movements and yield more green time for the northbound and southbound movements. The queuing analysis shows that with the improvement, the maximum eastbound left-turn vehicle queues would be contained within the turn pocket under background and project conditions.

Vehicular Site Access and Circulation

The evaluation of site access and circulation is based on the project site plan prepared by Studio T Square dated July 17, 2018. On-site circulation was reviewed in accordance with generally accepted traffic engineering standards.

Pedestrian and Bicycle Access and Circulation

Pedestrian access to the project site is provided via sidewalks on N. Shoreline Boulevard, Terra Bella Avenue and Linda Vista Avenue. Pedestrian walkways would be provided through and around the site that provide pedestrian access from the surrounding streets to elevators and stairways at each residential building, the leasing office, and retail spaces within the site. Pedestrian access to parking garage level two in both Block A and Block B would be provided by elevators and stairways. Pedestrian pathways within the parking structures are adequate and comply with ADA guidelines. Ramps used by vehicles to travel between different levels would have slopes up to 20 percent. It is recommended that proper signage be installed at these ramps to prohibit use by pedestrians or bicycles.

Bicycle access to the project site is via N. Shoreline Boulevard. In addition, although not designated as a bike route, Terra Bella Avenue and Linda Vista Avenue are conducive to bicycle travel. The existing bike lanes on N. Shoreline Boulevard connect cyclists from the project site to the surrounding areas. The project would provide a public pedestrian/bicycle path through the middle of the site to connect N. Shoreline Boulevard with Linda Vista Avenue. The project would provide secure bicycle storage for residents on the ground level of the parking garage in Block B and on both the ground level and the upper level of the parking garage in Block A. For ease of access and to avoid residents riding down the garage ramp or bringing bicycles into elevators, it is recommended the project applicant locate all bicycle storage at the ground level.

Vehicle Site Access

Vehicular access to the project site would be provided via one driveway on Terra Bella Avenue and one driveway on Linda Vista Avenue. The Terra Bella Avenue driveway would be 30 feet wide, measured at the throat, and would allow full access. The Linda Vista Avenue driveway would be 26 feet wide, measured at the throat, and would allow full access. The proposed driveway widths are acceptable.

On-site parking for the proposed project would be provided via surface parking and parking garages. There would be 90-degree parking spaces located along the two main project drive aisles. The Terra Bell Avenue driveway would lead to the north-south 30-foot wide drive aisle (On-Site Road # 2) and the Linda Vista driveway would lead to the east-west 26-foot wide drive aisle (On-Site Road #1). The proposed aisle widths would be adequate for two-way traffic and to allow maneuvering in and out of the adjacent parking spaces. The project would include three separate parking garages, one each for the office, apartments, and condominiums. The apartment garage would have two gated entry/exit points located along On-Site Road #2 (north-south). The office garage would include a single entry/exit point close to the Linda Vista Avenue driveway, and the condominium garage would include a single entry/exit point close to the Terra Bella Avenue driveway. All the garages would have two-way drive aisles, 90-degree parking spaces, and a minimum drive aisle width of 24 feet, which would be adequate for two-way traffic and to allow maneuvering in and out of the parking spaces.

Including pass-by trips diverted from N. Shoreline Boulevard, the total volume estimated to use the Terra Bella driveway upon the completion of both Phase I and II is 412 vehicles (235 inbound and 177 outbound) during the AM peak hour, which would be about 4 vehicles entering and 3 vehicles exiting every minute. During the PM peak hour, the driveway on Terra Bella Avenue is estimated to serve 282 vehicles (113 inbound and 169 outbound). The Linda Vista driveway would serve a total of 174 trips

(115 inbound and 59 outbound) during the AM peak hour and a total of 127 trips (39 inbound and 88 outbound) during the PM peak hour.

Of the two project driveways, the driveway on Terra Bella Avenue is expected to serve the most traffic. Likewise, the background (non-project) traffic is greater on the segment of Terra Bella Avenue adjacent the project site than on the segment of Linda Vista Avenue adjacent the project site. Thus, an analysis of traffic operations was conducted for the Terra Bella Avenue driveway during the AM peak hour. The AM peak hour reflects the worst time period since traffic volumes at the Terra Bella Avenue driveway are expected to be lower during the PM peak hour. The most heavily used movements to and from the Terra Bella Avenue driveway are expected to be the eastbound left turn into the project site and the southbound right-turn out of the project site. The conflicting volume on the westbound through movement is expected to be approximately 205 vehicles during the AM peak hour. Vehicles turning left into the project site from eastbound Terra Bella Avenue would turn from the through lane as there is no left-turn pocket or median. While left-turns into the site may occasionally cause delays for eastbound through traffic while left-turn vehicles wait for a gap in oncoming traffic, the eastbound Terra Bella Avenue approach is estimated to have an average delay of only 8.1 seconds per vehicle and result in a 95% queue length of only three vehicles during the AM peak hour. Given this intersection and time period represents the worst case and traffic volumes during other time periods and at the Linda Vista Avenue driveway would be less, the proposed project driveways are expected to operate acceptably.

The project driveways should be free and clear of any obstructions to optimize sight distance, thereby ensuring that exiting vehicles can see pedestrians on the sidewalk and other vehicles traveling on Terra Bella and Linda Vista Avenues. Any landscaping, parking, and signage should be located in such a way to ensure an unobstructed view for drivers entering and exiting the site.

Vehicular On-Site Circulation

Residential Parking Garages

All parking spaces in the residential parking garages are oriented at a 90-degree angle from the drive aisles. The width of all drive aisles meets the City of Mountain View minimum requirement (24 feet) for 90-degree parking spaces on double-loaded drive aisles with two-way traffic. The parking space dimensions (8.5 feet wide by 18 feet long) meet City standards. The site plan shows good circulation through the two-level apartment garage without any dead-end aisles. The condominium parking garage includes one dead-end drive aisle on the ground level and two dead-end drive aisles on the upper level. The last two parking stalls in the dead-end aisles (one on each side of the drive aisle) are zero to three feet from the garage wall. It would be difficult for drivers who park in those last stalls to back out of the stall, complete a three-point turn, and then drive forward out of the drive aisle. Parking garage designs should include space at the end of a dead-end aisle for drivers to back into in order to more easily exit the parking stall. We recommend that such “back-up pockets” be provided at the end of each dead-end drive aisle to facilitate backing out of the last parking stalls in those rows.

The proposed garage ramps would be 24 feet wide, which meets the minimum width for a two-way drive aisle set forth by the City of Mountain View Zoning Code (36.32.80). The ramps in the proposed residential garages are shown to have a maximum slope of 20% with 10% transitions on each side. These dimensions are acceptable. Commonly cited parking publications recommend grades of up to 16% on ramps where no parking is permitted, but grades of up to 20% are cited as acceptable when ramps are covered (i.e. protected from weather) and not used for pedestrian walkways. It should be noted that most ramp users will be residents, and thus, will quickly become accustomed to steeper grades.

A loading zone is shown at the southwest corner of the apartment building. At the end of the onsite Road #1, there is sufficient space on site to allow trucks and emergency vehicles to conduct a three-point turn in order to turn around on site. Thus, trucks will not have to back into or out of the site

driveway. A trash staging area would be located within the parking lot. Trash trucks would enter via the Terra Bella Avenue driveway and exit via the Linda Vista Avenue driveway. Delivery trucks would enter the site via Terra Bella Avenue, turn left at the first cross aisle, and then back into the loading space.

Office Parking Garage

The office parking garage features park on ramps with 90-degree parking throughout the site and 24-foot-wide drive aisles, which are adequate for two-way circulation. The site plan shows good circulation through garage levels one through five. There is a dead-end aisle on the sixth level of the parking garage. Although dead-end aisles are generally undesirable, extra space has been provided to allow a vehicle to turn around, which is acceptable.

Approved Project List

1001 N. Shoreline Blvd. Project

Background Projects for Traffic Analysis (Unoccupied Entitled Projects)

Address	Applicant	Project Description	Status
500 FERGUSON DRIVE	EFL Development	394 apartments; 3,000 square feet or commercial	Under Construction
100 AND 420-430 FERGUSON DRIVE	Pulte Homes	198-unit rowhouse development	Approximately 75% occupied
PACIFIC DR.	Summer Hill Homes	16 small-lot single-family homes	Occupied
580 – 620 CLYDE AVENUE	Renault & Handley	Rezone; 178,477 square feet of office	Building Permit Application under review
369 N. WHISMAN RD.	Whisman Associates, LLC	180,773 square feet of office	On hold; entitlements vested through September 2021
450 N. WHISMAN DR., MOUNTAIN VIEW	Summer Hill Homes	37-unit rowhouse development	Under Construction
277 FAIRCHILD DR.	Warmington Residential	22-unit rowhouse development	Building Permit Application under review
186 EAST MIDDLEFIELD RD.	DeNardi Homes	8-unit condominium project	Building Permit Application under review
133-149 FAIRCHILD DR.	Dividend Homes	35-unit rowhouse development	Occupied
660 TYRELLA AVENUE	Taylor Morrison Homes	37-unit rowhouse development	Under Construction
750 MOFFETT BOULEVARD	Broadreach Capital Partners	255-room hotel and 200,000 square feet of office	Under Construction
1001 N. SHORELINE BOULEVARD (same as project site)	Calvano/CPR Mountain View Venture	111,443 square feet of office	Occupied
647 Sierra Vista Ave	Classic Communities	29-unit rowhouse development	Under Construction
410-414 SIERRA VISTA AVENUE	The DeNardi Group	14-unit rowhouse development	Approved/Entitled
1968 HACKETT AVENUE & 208-210 SIERRA VISTA AVENUE	Dividend Homes	24-unit rowhouse development	Under Construction
1998-2024 MONTECITO AVENUE	Stuart Welte (Architect)	17-unit condominium development	Under Construction

Updated 8/30/2018

2025 AND 2065 SAN LUIS AVENUE	California Communities/Peninsula Communities	33-unit rowhouse development	Under Construction
333 North Rengstorff Avenue	Summer Hill Homes	31-unit rowhouse development	Approved and Under Building Permit Review
908 N. RENGSTORFF AVE	Windsor Academy	8,088-square-foot, 84 child daycare center	Occupied
1045-1085 LA AVENIDA STREET	Microsoft	128,000 square foot addition to the existing 515,000 square feet of office	Under Construction
1625 NORTH SHORELINE BOULEVARD	Shashi Hotel	104,750 square foot, 200-room hotel	Under Construction
1625 PLYMOUTH STREET	Broadreach Capital Partners	224,505 square feet of office	Occupied
2000 NORTH SHORELINE BOULEVARD	Google Inc.	595,000 square feet of office	Under Construction
870 LEONG DR.	Temple Hospitality	41,039 square foot, 78-room hotel	Approved
1075 TERRA BELLA	Calvano Development	19,301 square feet of office	Approved
1185 Terra Bella Avenue	Terra Bella, LLC	9,700 square feet of office	Approved
NASA Research Park	Google Inc.	1.1 million square feet of office	Approved and Under Construction
460 NORTH SHORELINE BOULEVARD	Mid-Pen Housing	demolish 12 affordable townhouse units and replace them with 62 affordable units	Approved/Building Permits Under Review
2044 AND 2054 MONTECITO AVENUE	Summer Hill Homes	52-unit rowhouse development	Approved. Under Building Permit Review
2019 LEGHORN STREET	McKim Design Group	12,050 square-feet of office	Approved/Entitled
535 & 555 Walker Drive	SummerHill Homes	Demolition of 2 units and construction of 58-unit rowhouse development	Approved
257-265 Calderon Ave.	SummerHill Homes	Demolition of 7 existing units and construction of 16-unit rowhouse development	Approved

Cumulative Project List for Traffic Analysis (Entitlement Under Review)

Address	Applicant	Project Description	Status
700 AND 800 E. MIDDLEFIELD ROAD AND 1100 W. MAUDE AVENUE	LinkedIn	Rezone; 1.08 million square feet office [468Ksf = existing bldgs. that are occupied and will remain; 612Ksf = cumulative pending project (EIR being prepared now)]	Planning Review
555 WEST MIDDLEFIELD ROAD	AvalonBay Communities	Rezone; 341-unit addition to an existing 402-unit residential development	Planning Review
777 WEST MIDDLEFIELD ROAD	Fortbay	Rezone; demolition of 208 existing apartment units and construction of 711 new apartment units	Planning Review
1255 PEAR AVENUE,	The Sobrato Organization	650 residential units; 234,247 square feet of new office uses, demolish a total of 103,513 square foot of industrial-office buildings across the site	Planning Review
828 and 836 Sierra Vista Ave.	D&C Development	20-unit rowhouse development	Planning Review
315 & 319 Sierra Vista Ave.	Classic Communities	Demolition of 7 units and construction of 15-unit rowhouse development	Planning Review
2005 Rock Street	Dividend Homes	15 units	Planning Review
759 W. Middlefield Ave.	Prometheus	75 apartment units	Planning Review
1696-1758 Villa Street	Prometheus	Demolition of 16 existing units and construction of 226 apartment units	Planning Review
360 S. Shoreline Blvd.	Mountain View Academy	7 staff apartment units	Planning Review
303 Ravendale Drive	Sand Hill Property	181,000 square foot office	Informal Planning Review

Updated 8/30/2018

355-415 East Middlefield Road	SummerHill Homes	448 new housing units	Informal Planning Review
189 N Bernardo Avenue	Sand Hill Property	86,160 square foot office building to replace an existing 58,400 square foot office building	Informal Planning Review
465 Fairchild Drive	The Sobrato Organization	259,595 square foot office building	Informal Planning Review

HEXAGON TRANSPORTATION CONSULTANTS, INC.

July 10, 2019

Ms. Elizabeth Kanner
Environmental Science Associates
180 Grand Avenue, Suite 1050
Oakland, CA 94612

Re: Analysis of Vehicle Miles Travelled (VMT) for the Proposed Residential Development at 1001 North Shoreline Boulevard in Mountain View, California

Dear Ms. Kanner,

Hexagon Transportation Consultants, Inc. has completed an analysis of vehicle miles travelled (VMT) for the proposed residential development at 1001 North Shoreline Boulevard in Mountain View, California. The proposed residential project is Phase II of a 7.81-acre mixed-use development. Phase I, which is currently fully occupied, contains a 111,443 square foot (s.f.) office building. Phase II would construct 203 apartments, 100 condominiums and 3,000 s.f. of ground-floor retail space. This memorandum presents background information about the new California Environmental Quality Act (CEQA) guidelines regarding VMT and a comparison of the average VMT per capita in the project vicinity versus the average VMT per capita for the City of Mountain View and for Santa Clara County.

Background

Per California Senate Bill 743, the California Natural Resources Agency, with assistance from the Governor's Office of Planning and Research (OPR), adopted new CEQA guidelines in December 2018. The new guidelines state that automobile delay as described solely by level of service (or similar measures of vehicular capacity or traffic congestion) will no longer be an environmental impact under CEQA, and that vehicle-miles-travelled (VMT) is considered the most appropriate measure of transportation impact. The legislation is intended to promote infill development, a diversity of land uses, transit, active transportation modes while reducing greenhouse gas emissions. OPR recommends the following threshold for residential projects:

> *"A proposed project exceeding a level of 15 percent below existing VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita or a city VMT per capita."*

Notwithstanding OPR's recommended threshold, lead agencies have the discretion to choose the VMT analysis methodology and to set or apply their own thresholds of significance. Cities have until July 2020 to adopt the new procedures and thresholds related to VMT. The City of Mountain View has not yet adopted any analysis procedures, standards, or guidelines related to VMT. Therefore, the DEIR for the proposed residential development at 1001 North Shoreline Boulevard evaluates traffic impacts based on level of service. However, an analysis of VMT for this project is presented for informational purposes only to aid decision makers during this transition period from LOS to VMT. It is not intended to provide any indication of the transportation impacts of the project under SB 743.

The City of Mountain View recently published the *East Whisman Precise Plan DEIR*, which used the Mountain View model to evaluate the Precise Plan's effect on VMT within the Plan Area and citywide. However, the Mountain View model is not intended to evaluate VMT associated with specific development projects. While the Santa Clara Valley Transportation Authority (VTA) is in the process of developing a VMT analysis tool and in anticipation of the City potentially developing their own tool to estimate VMT for development projects, the Metropolitan Transportation Commission (MTC) is currently the best source to obtain VMT data for areas within the nine counties of the San Francisco Bay Area.

MTC Simulated VMT by Place of Residence

The simulated VMT by place of residence for the Year 2020 was obtained from MTC's website[1] and was used to calculate the average VMT per capita for (a) the traffic analysis zone (TAZ) in which the project is located, (b) the City of Mountain View, and (c) Santa Clara County. Figure 1 (attached) visually depicts the average VMT per capita in Santa Clara County by TAZ. Table 1 (attached) presents the same information in tabular format.

The VMT per capita for the project area was compared with the City and the County average VMT per capita. As stated previously, the City of Mountain View has not adopted any impact thresholds related to VMT, so this comparison is provided for informational purposes only. The TAZ containing the proposed project (TAZ 377) is estimated to have an average VMT per capita of 16.13, which is greater than the average VMT per capita for both the City of Mountain View (14.37) and Santa Clara County (15.11). As shown on Figure 1, the lowest VMT areas in Santa Clara County are located in downtown San Jose, while the North Bayshore, Crossings, and Shoreline West neighborhoods have the lowest VMT in the City of Mountain View.

While the MTC model provides the average VMT per capita for the project's zone, that does not mean that the project's VMT per capita would match that of the project's zone. VMT for a specific project is affected by a number of factors including location, development density, land use diversity, multimodal infrastructure, parking policies/pricing, and TDM programs. It should be noted that the VMT data obtained from MTC reflects the average VMT per capita for the TAZ in which the project is located but does not reflect the precise location of the proposed project.

Project VMT Estimates

The project is located immediately south of US 101, which is the boundary between TAZ 377 and TAZ 401. TAZ 401 represents the portion of Mountain View north of US 101, otherwise known as the North Bayshore area. The average VMT per capita in the North Bayshore area (12.82) is substantially less than the average VMT per capita for TAZ 377 (16.13). Thus, compared to other parcels within TAZ 377, the project is expected to have a lower than average VMT per resident due to its proximity to the North Bayshore employment area. Furthermore, the project is located immediately adjacent to multiple transit routes and bike lanes on N. Shoreline Boulevard. The

[1] https://mtc.maps.arcgis.com/home/webmap/viewer.html?webmap=0a94dfbf14824945a84bbd130475d262 accessed on June 25, 2019. Simulated vehicle miles traveled, per capita, by place of residence for Year 2020. Simulation was conducted as part of the planning process related to Plan Bay Area 2040 and the associated Regional Transportation Plan, both of which were produced in 2017.

project site's accessibility via transit and bike would also result in a lower than average VMT compared to other parcels within TAZ 377.

The City of San Jose has developed a VMT evaluation tool to quantify the average VMT per capita for specific development projects. San Jose's VMT tool uses data from the VTA model to estimate the average VMT per capita for the project site and then estimates the effect of specific characteristics of the proposed project on VMT. Currently, the City of Mountain View does not have any tools available to estimate the average VMT by parcel within a TAZ. However, the San Jose VMT tool was used to estimate the effect of the project's density on VMT. The project is expected to increase the residential density of TAZ 377 by approximately 12 percent. The increase in development density is estimated to result in a five percent reduction in VMT. [2]

Reductions in vehicle trips and VMT are also expected due to the mixed-use nature of the project. The project will add residential and retail uses on a site that is currently occupied entirely by office use. Based on VTA's *Transportation Impact Analysis Guidelines*, 2014, a mixed-use site containing housing and employment could reduce residential trips by up to three percent. Likewise, a mixed-use site containing housing and retail could reduce residential trips by up to 15 percent. The retail trip reductions may vary depending upon the specific tenant. Reductions in VMT may not equal the trip reductions because trip lengths vary by purpose. Nevertheless, internal (captured) trips are expected to result in a reduction in the project's VMT.

Furthermore, the project will implement a Transportation Demand Management Plan with a combination of services, incentives, facilities, and actions that reduce single–occupant vehicle trips to help relieve traffic congestion, parking demand, and air pollution problems. The TDM Plan has not yet been finalized so the potential reduction in VMT due to TDM is uncertain and has not been quantified.

Due to the project's proximity to the North Bayshore employment area, the transit routes and bike lanes immediately adjacent the project site on N. Shoreline Boulevard, the project's development density, and the mix of land uses on the project site, the project is expected to result in an average VMT per capita between 11.9 and 14.0, which is lower than the citywide average VMT per capita (14.37). Thus, the project would help the City reduce the citywide average VMT per capita.

Please feel free to contact me if there are any questions.

Sincerely,

HEXAGON TRANSPORTATION CONSULTANTS, INC.

Executive Summary

Schaaf & Wheeler has been retained by Environmental Science Associates to determine impacts from The Residences @ Shoreline Gateway (Project) on the City of Mountain View's (City) potable water and sanitary sewer systems. The Project is the second phase of the mixed-used development located at 1001 North Shoreline Boulevard. The first phase approved in 2015 includes 111,443 square feet of office space and surface parking and was completed in 2018.

The Project site is located south of U.S. Highway 101 and bounded by North Shoreline Boulevard to the west, Linda Vista Avenue to the east, and Terra Bella Avenue to the south (Figure B-1). The Project proposes to construct two residential buildings and one parking structure for the office building built during the first phase of the mixed use development project.

Project impacts are analyzed for Existing (2010), Existing with Shoreline/101 CIP (2010), and Future Cumulative (2030) Conditions for the water system. Hydraulic models simulating pre- and post-Project development scenarios are performed to examine hydraulic deficiencies. The Existing Condition is based on the *2010 Water Master Plan* (WMP). The Existing with Shoreline/101 CIP Condition is also based on the 2010 WMP, but it includes a proposed Capital Improvement Project (CIP) crossing State Highway 101 near North Shoreline Boulevard based on City-provided plans from January 2018. The Future Cumulative Condition model is created from the *2030 General Plan – Updated Water System Modeling Alternative 1* (GP-UWSM Alt 1; Schaaf & Wheeler, November 2014) model. Within the North Bayshore Precise Plan boundary, the Future Cumulative Condition model is further updated based on the *North Bayshore Precise Plan Phase II Utility Impact Study* (NBPPII UIS; Schaaf & Wheeler, October 2016) model. The Future Cumulative Condition model includes CIPs from the NBPPII UIS and recent City approved projects not accounted for or in exceedance of the 2030 GPUUIS and GP-UWSM projections.

Project impacts to the sewer system are analyzed for Existing (2010), Existing with Shoreline/101 CIP (2010), and Future Cumulative (2030) Conditions. Hydraulic models simulating pre- and post-Project development scenarios are performed to examine hydraulic deficiencies. The Existing Condition is based on the *2010 Sewer Master Plan* (SMP). The Existing with Shoreline/101 CIP Condition is also based on the 2010 SMP, but it includes a proposed CIP crossing State Highway 101 near North Shoreline Boulevard based on City-provided plans from January 2018. The Future Cumulative Condition sewer model is created from the *General Plan Update Utility Impact Study* (GPUUIS; IEC, October 2011) model and includes all sewer system CIPs recommended in the GPUUIS. The Future Cumulative Condition includes recent City approved projects not accounted for or in exceedance of the 2030 GPUUIS projections.

Water System Project Impacts

The Project development does not significantly impact the water system at Existing or Existing with Shoreline/101 CIP Conditions. The Project also does not significantly impact the water system during Future Cumulative Condition assuming all the recommended CIPs in the GP-UWSM Alt 1 and NBPPII UIS have been constructed. The assumed Project-specific fire flow requirement of 3,500 gpm is met during Existing, Existing with Shoreline/101 CIP, and Future Cumulative Conditions. The Project fire flow requirement used in this analysis assumes a 50% reduction of the required fire flow will be approved by the City Fire Marshal based on

the installation of an approved automatic fire sprinkler system. This is a conservative reduction assumption, as buildings have the potential for a 75% reduction of the required fire flow according to the California Fire Code (2016), if approved. The actual fire flow requirement may change as the planning process continues and Project specific requirements are determined by the City Fire Marshal. If Project conditions require higher fire flow than what is analyzed, revised modeling should be conducted.

Sewer System Project Impacts

The sewer system has sufficient capacity in the Existing, Existing with Shoreline/101 CIP Condition, and Future Cumulative Conditions with the estimated increase in incremental flow. In the Future Cumulative Condition, three CIPs recommended in the 2030 GPUUIS are required to meet maximum flow depth to pipe diameter (d/D) performance criteria both pre- and post-Project. Project contribution to the recommended CIPs are determined and may be used to estimate developer impact fees for fair share impact to the system.

Chapter 1. Introduction

1.1. Project Description

The Residences at Shoreline Gateway (Project) is the second phase of a 7.81 acre mixed-use development at 1001 North Shoreline Boulevard. Phase I included 111,443 square feet of office space and surface parking and has been constructed.

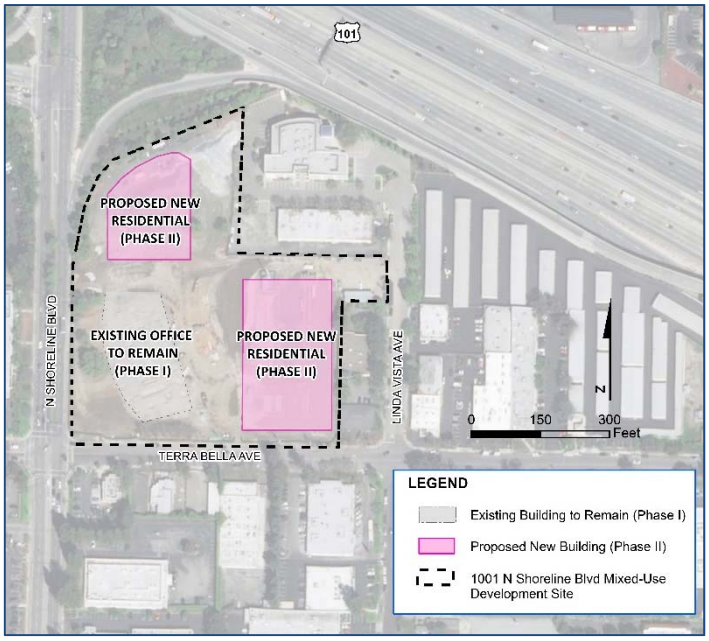

Figure 1: Proposed Site Layout (July 2018)

Phase II proposes two new residential buildings: a seven-story apartment building on the northwest corner of the Project lot containing 203 rental units and a seven-story building on the southeast corner of the lot with 100 condominimums (Figure 1). Both residential buildings will have two floors of podium parking below five stories of apartments or condominiums, respectively. The building with 203 apartment rental units will also have 3,000 square feet of retail. Additionally, the Project includes constructing a new 130,820 square foot parking structure for the office building constructed for Phase I.

The Project is currently zoned as limited industrial (ML) and general industrial (MM) and has a General Plan Designation of General Industrial. The Project is requesting a Zoning Map Amendment to change the existing zoning to P (Planned Community) and a General Plan Amendment to change the land use designation to Mixed-Use Center.

1.2. Water System Analysis Approach

Project impacts are analyzed using the City's water models for three conditions: Existing (2010), Existing with Shoreline/101 CIP (2010), and Future Cumulative (2030). As a baseline for system performance, each condition is evaluated pre-Project for existing hydraulic deficiencies. The estimated incremental water demand resulting from Project development is added to the model and post-Project deficiencies are examined. In total, six model simulations of the water system are performed, as shown in Figure 2.

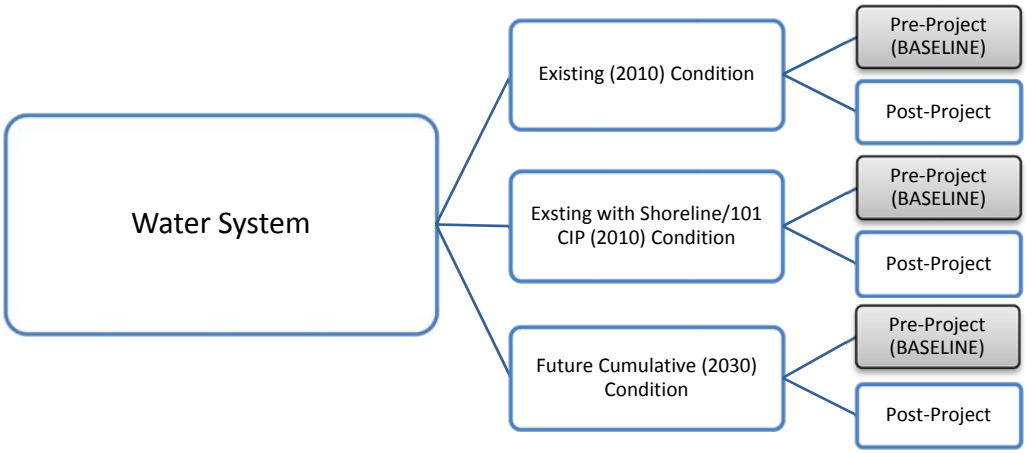

Figure 2. Water System Model Simulations

The Existing Condition model consists of the existing distribution system and operating parameters along with water demands based on existing land use from the *2010 Water Master Plan* (WMP). The Existing with Shoreline/101 CIP Condition also consists of the existing distribution system, operating parameters, and water demands from the 2010 WMP, but it includes a proposed Capital Improvement Project (CIP) crossing State Highway 101 near North Shoreline Boulevard (Figure 3). This CIP proposes a 16-inch diameter pipe from North Shoreline Boulevard through the Project site and across State Highway 101 as well as a 12-inch diameter pipe along La Avenida, Inigo Way, and Pear Avenue to North Shoreline Boulevard. This CIP is in the design stage but, based on discussions with the City, construction of the CIP may not coincide with Project construction.

The Future Cumulative Condition water demand is based on the 2030 General Plan Update (GPU) land use and has since been revised to include recent City approved projects not accounted for or in exceedance of the 2030 GPU projections. Table A-1 in Appendix A provides a list of the considered development projects for the Future Cumulative Condition. The Future Cumulative Condition model is based on the *2030 General Plan – Updated Water System Modeling Alternative 1* (GP-UWSM Alt 1; Schaaf & Wheeler, November 2014) model and assumes all of the recommended CIPs in the *North Bayshore Precise Plan Phase II Utility Impact Study* (NBPPII UIS; Schaaf & Wheeler, October 2016) have been constructed. The Future Cumulative Condition model also includes the CIP crossing State Highway 101 near North Shoreline Boulevard (Figure 3). The GP-UWSM Alt 1 updates the *General Plan Update Utility Impact Study* (GPUUIS; IEC, October 2011) with revisions to demands, network components, boundary conditions, fire flow requirements, and recommended CIPs. The NBPPII UIS updates some CIPs recommended in the GP-UWSM Alt 1 based on revised demand and fire flow requirements within the North Bayshore Precise Plan boundary.

It should be noted that should construction of the Shoreline/101 CIP occur after construction of the Project, the City will require adequate space for trenchless installation under State Highway 101. The Project Plan Set dated July 17, 2018, shows the pit for trenchless installation on Caltrans right-of-way, which may not be feasible. The City and the Project will need to address space requirements and site impacts should timing of the Project and the CIP not coincide.

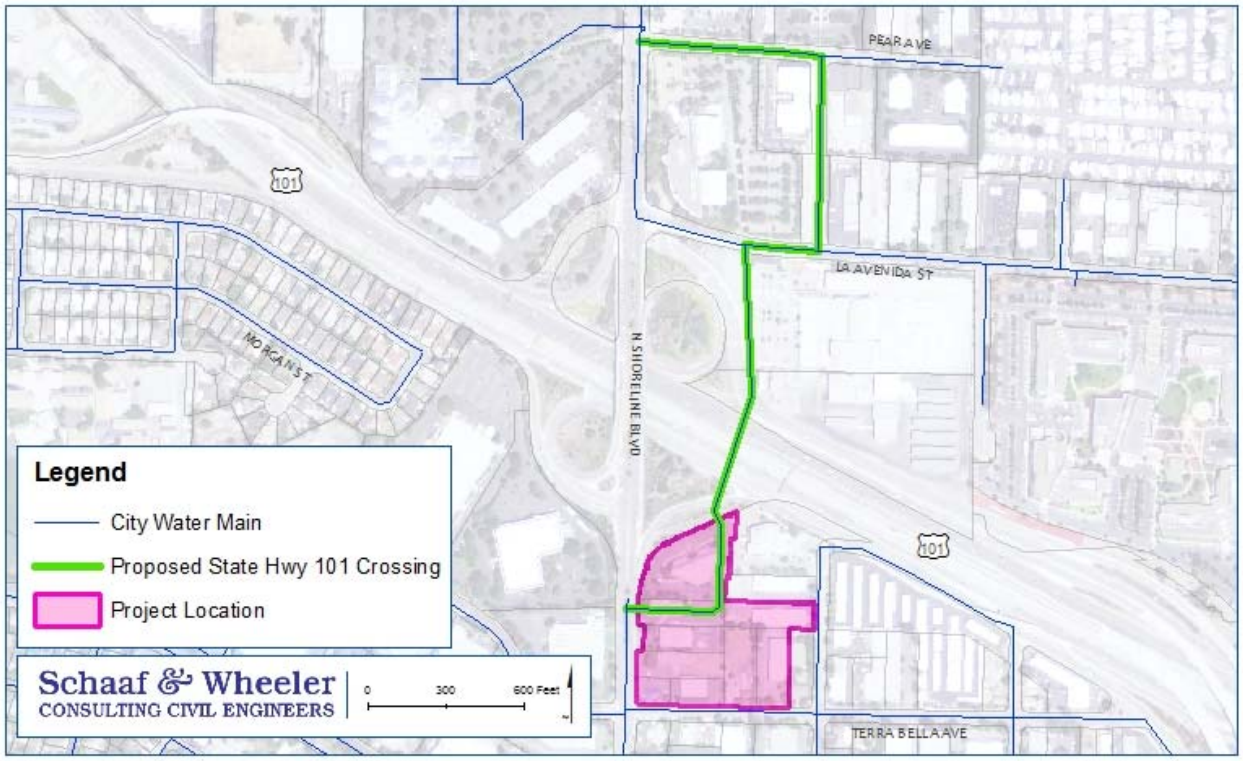

Figure 3: Proposed Hwy 101 Water Main Crossing

1.3. Sewer System Analysis Approach

Project impacts to the sewer system are analyzed using the City's sewer models for three conditions: Existing (2010), Existing with Shoreline/101 CIP (2010), and Future Cumulative (2030). As a baseline for system performance, each condition is evaluated pre-Project for existing hydraulic deficiencies. The estimated sewer flow resulting from Project development is added to the model and post-Project deficiencies are examined. In total, six model simulations of the sewer system are performed, as shown in Figure 4.

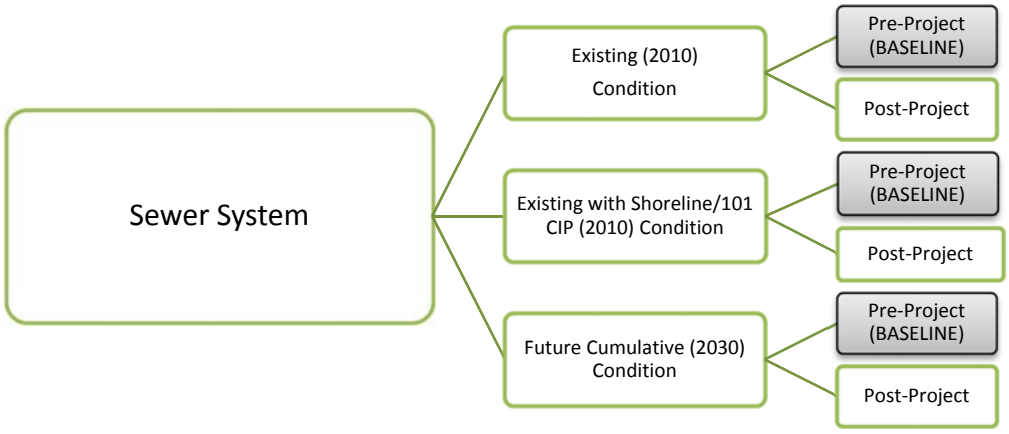

Figure 4. Sewer System Model Simulations

The Existing Condition model consists of the existing collection system and operating parameters along with from the *2010 Sewer Master Plan* (SMP). For this analysis, the Existing with Shoreline/101 CIP Condition consists of the Existing Condition model with one CIP added to the model that crosses State Highway 101 near North Shoreline Boulevard (Figure 5). This CIP proposes a 21-inch diameter from North Shoreline Boulevard through the Project site, across State Highway 101, and along La Avenida, Inigo Way, and Pear Avenue. This CIP is in the design stage but, based on discussions with the City, construction of the CIP may not coincide with Project construction.

The Future Cumulative Condition sewer flows are based on the 2030 GPU land use and have since been revised to include recent City approved projects not accounted for or in exceedance of the 2030 GPU projections. Table A-1 in Appendix A provides a list of the considered development projects for the Future Cumulative Condition. The Future Cumulative Condition includes the operating parameters in the 2030 GPUUIS model and assumes that all sewer system CIPs in the 2030 GPUUIS have been constructed.

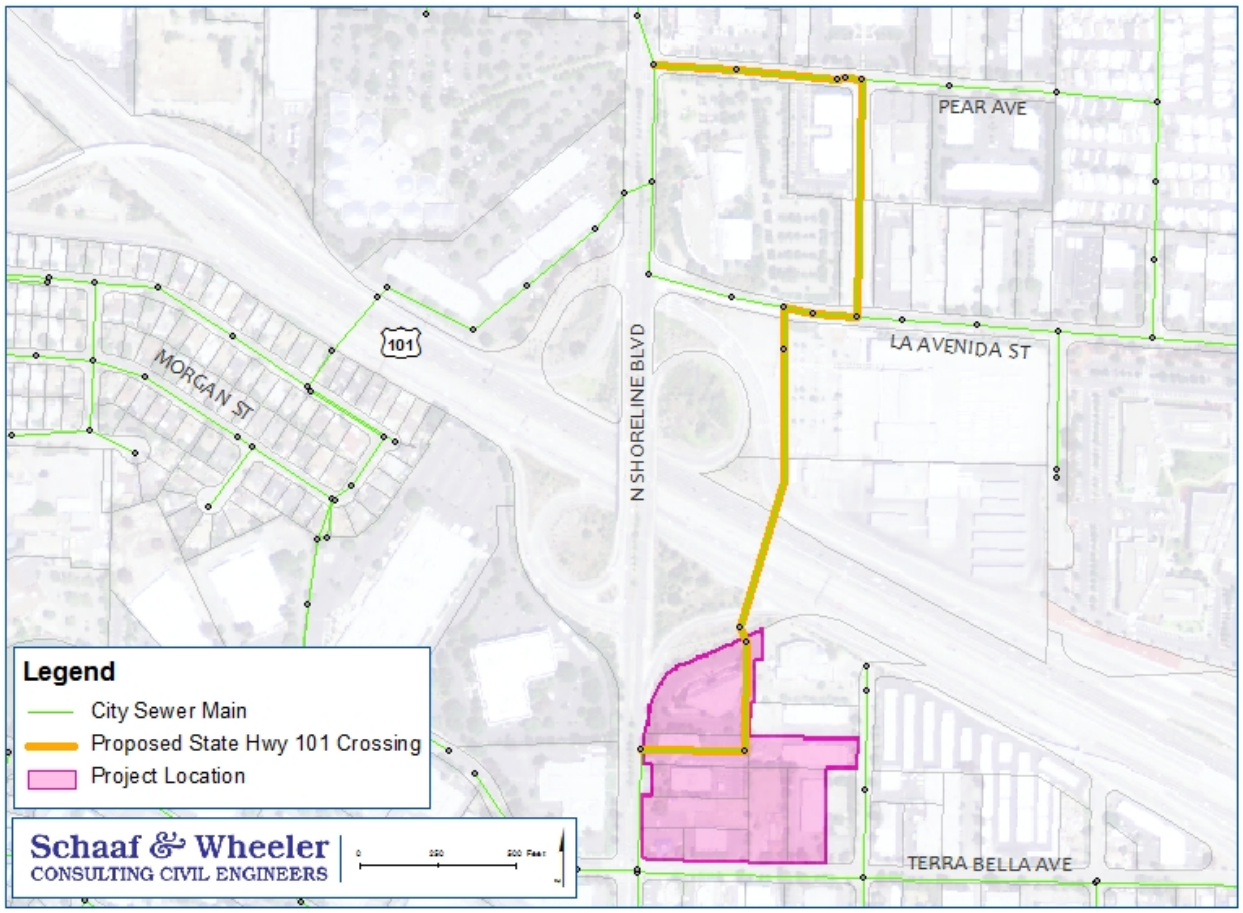

Figure 5. Proposed Hwy 101 Sewer Main Crossing

1.4. Report Organization

This report is organized into the following five sections. Chapter 2 discusses the water demand estimates for the Project. Chapter 3 covers the impacts and capital improvement recommendations for the water system. Chapter 4 discusses the sewer flow estimates. Chapter 5 covers the capital improvements recommendations for the sewer system.

Chapter 2. Demand Projections

This chapter discusses the estimated water demand and required fire flow for the Project development. Water demand in this section represents Average Daily Demand (ADD). The ADD is an estimated daily average of water use patterns that varies by season and customer type.

Because the Project is the second phase of the multi-use development project at 1001 North Shoreline Boulevard, Project impact is evaluated by adding the estimated Project demand to the pre-Project baseline demand. The pre-Project baseline demand at the Project parcels is taken as the Phase I office building demand based on the *1001 North Shoreline Utility Impact Study* (NS UIS; Schaaf & Wheeler, April 2015).

The water unit duty factor for estimating Project demand is taken from previous technical studies to remain consistent with the City-wide demand projections used in the hydraulic models.

2.1. Project Water Demand

Project water demand is estimated from the proposed number of residential units the retail square footage provided in Project Plan Set dated July 17, 2018, and water unit duty factors developed for the City as part of the *North Bayshore Precise Plan Phase II Utility Impact Study* (NBPPII UIS; Schaaf & Wheeler, October 2016). These duty factors are based on recent water meter data, collected between 2005 and 2015, of recent developments throughout the City. Table 2-1 provides the demand estimation for each building.

Table 2-1: Project Water Demand

Building	Units	Area (sf)	Land Use Type	Water Duty Factor (gpd/unit or gpd/1000 sf)	Water Demand (gpd)
Apartments	203		Multi-Family Residential	100	20,300
Apartments		3,000	Retail	130	390
Apartments Subtotal	*203*	*3,000*	-	-	*20,690*
Condominiums	100		Multi-Family Residential	100	10,000
Total	***303***	***3,000***	**-**	**-**	***30,690***

2.1.1. Project Required Fire Flow

The anticipated fire flow requirement at the site is based on the 2016 California Fire Code (CFC) Appendix B, which gives the minimum fire flow requirement based on fire-flow area and building construction type. Building specific fire flow requirements based on the CFC are presented in Table 2-2. Based on the California State Fire Marshal Code Interpretation 11-015 for mixed use construction, the fire flow requirement for the apartment and condominium buildings is estimated using a percentage approach between the Type III-A construction proposed for the multi-family levels and the Type I-A construction proposed for the podium parking garage. The fire flow requirement for the new office garage is based on the area of the three largest floors of the garage per CFC Section B104.3.

The highest fire flow in Table 2-2 is considered as the controlling fire flow rate at the site and includes the Phase I office building on the Project lot. A 50 percent reduction of the identified controlling fire flow rate is used as the project-specific fire flow requirement in this evaluation. This is a conservative assumption since a 75 percent reduction is allowed upon approval of an approved automatic sprinkler system according to CFC Section B105.2. The actual fire flow requirement may change as the planning process continues and Project specific requirements are determined by the City Fire Marshal.

Table 2-2 – Anticipated Project Fire Flow (FF) Requirement

Building	Occupancy Use	Fire-Flow Calculation Area (Square Feet)	Building Construction Type	CFC Required FF (gpm)	FF with 50% Reduction (gpm)	FF with 75% Reduction (gpm)
Office[1]	Office	111,443	II-B	7,000	3,500	1,750
Apartments	Residential	390,620	III-A/I-A	6,000	3,000	1,500
Condominiums	Residential	203,150	III-A/I-A	5,690	2,845	1,500[2]
Office Garage	Garage	69,300	I-A	2,750	1,500[2]	1,500[2]

[1]Based on 1001 North Shoreline Utility Impact Study (Schaaf & Wheeler, April 2015)

[2]Minimum allowed reduction is 1,500 gpm per 2016 CFC

2.2. Existing Condition (2010)

2.2.1. Pre-Project (Baseline) Land Use and Demand

The pre-Project (baseline) condition for the Project parcels represents the demand from the office building constructed as part of Phase I. Outside of the Project area, the pre-Project condition includes parcel-level demand adopted from the City's InfoWATER model, developed as part of the 2010 WMP. The demand in the model is calibrated against water billing records from 2005 and 2006, as further explained in the 2010 WMP. Table 2-3 details the model demand at the parcels.

Table 2-3: Baseline Demand for Existing Condition

Address	APN	Current Land Use	Acreage	Water Demand (gpd)
1001 N Shoreline Blvd	-	High-Intensity Office/R&D	7.81	23,400
Total	**-**	**-**	***7.81***	***23,400***

2.2.2. Post-Project Demand

For the Project impact analysis, Project demand is added to the Existing Condition model. Because the office constructed as Phase I of the mixed-use development is not going to be removed as part of the Project, pre-Project demands are assumed to remain and Project demands are added to the pre-Project demands. The total post-Project demand in the Existing Condition is given in Table 2-4.

Table 2-4: Post-Project Demand for Existing Condition

	Water Demand (gpd)
Pre-Project (Baseline) Demand	23,400
Project Demand	30,690
Total Post-Project Demand	***54,090***

2.3. Existing with Shoreline/101 CIP Condition (2010)

2.3.1. Pre-Project (Baseline) Land Use and Demand

As with the Existing Condition, the pre-Project (baseline) condition for the Project parcels represents the demand from the office building constructed as part of Phase I. Outside of the Project area, the pre-Project condition includes parcel-level demand adopted from the City's InfoWATER model, developed as part of the 2010 WMP. The demand in the model is calibrated against water billing records from 2005 and 2006, as further explained in the 2010 WMP. Table 2-5 details the model demand at the parcels.

Table 2-5: Baseline Demand for Existing with Shoreline/101 CIP Condition

Address	APN	Current Land Use	Acreage	Water Demand (gpd)
1001 N Shoreline Blvd	-	High-Intensity Office/R&D	7.81	23,400
Total	**-**	**-**	***7.81***	***23,400***

2.3.2. Post-Project Demand

For the Project impact analysis, Project demand is added to the Existing with Shoreline/101 CIP Condition model. Because the office constructed as Phase I of the mixed-use development is not going to be removed as part of the Project, pre-Project demands are assumed to remain and Project demands are added to the pre-Project demands. The total post-Project demand in the Existing with Shoreline/101 CIP Condition is given in Table 2-6.

Table 2-6: Post-Project Demand for Existing with Shoreline/101 CIP Condition

	Water Demand (gpd)
Pre-Project (Baseline) Demand	23,400
Project Demand	30,690
Total Post-Project Demand	***54,090***

2.4. Future Cumulative Condition (2030)

2.4.1. Pre-Project (Baseline) Land Use and Demand

The pre-Project (baseline) condition for the Project parcels represents the demand from the office building constructed as part of Phase I. Outside of the Project parcels, Future Cumulative (baseline) demand is adopted from the City's InfoWater model, developed as part of the 2030 GPUUIS and has since been updated to include recent City approved projects outlined in Table A-1 in Appendix A. Table 2-7 presents the pre-project demand based on the NS UIS.

Table 2-7: Baseline Demand for Future Cumulative Condition

Address	APN	Current Land Use	Acreage	Water Demand (gpd)
1001 N Shoreline Blvd	-	High-Intensity Office/R&D	7.81	23,400
Total	**-**	**-**	***7.81***	***23,400***

2.4.2. Post-Project Demand

Because the office constructed as Phase I of the mixed-use development is not going to be removed as part of the Project, pre-Project demands are assumed to remain and Project demands are added to the pre-Project demands. The total post-Project demand in the Future Cumulative Condition is given in Table 2-8.

Table 2-8: Post-Project Demand for Future Cumulative Condition

	Water Demand (gpd)
Pre-Project (Baseline) Demand	23,400
Project Demand	30,690
Total Post-Project Demand	***54,090***

Chapter 3. Water System Impact

Project impacts to water supply, water storage, hydraulic conveyance, and fire flow requirements are evaluated in this chapter to ensure the Project demand can be adequately met. Hydraulic conveyance and available fire flow are assessed for Existing (2010), Existing with Shoreline/101 CIP (2010), and Future Cumulative (2030) Conditions. Water supply and water storage are evaluated for the Future Cumulative Condition.

3.1. Demand Scenarios and Performance Criteria

Hydraulic deficiencies within the water system are evaluated under two demand scenarios: Peak Hour Demand (PHD) and Maximum Day Demand with Fire Flow (MDD + FF). The MDD and PHD peaking factors from the 2010 *Water Mater Plan* (WMP) are used for this analysis. As detailed in the 2010 WMP, MDD and PHD peaking factors are developed using SCADA data from peak usage months in 2006 and 2007. The peak hour occurred on the day with the largest daily demand, which was observed to be August 8, 2007. The calculated peaking factors, presented in Table 3-1, are applied to Average Day Demand (ADD).

Table 3-1: Peaking Factors

Category	Peaking Factor
Maximum Day	1.71
Peak Hour	2.79

Established design criteria used to evaluate the Project impact for all scenarios are summarized in Table 3-2.

Table 3-2: Water System Performance Criteria

Criteria	PHD	MDD + FF
Minimum Allowable Pressure (psi)	40	20

3.2. Water Supply Analysis

The increased water demand from Project development in the Future Cumulative Condition is compared with the City's supply turnouts and groundwater well capacities to ensure demand can be met. The Mountain View water system is divided into three pressure zones to maintain reasonable pressures throughout the City's rising topography moving south, further from the Bay. The Project is located in Pressure Zone 1, which is, at this time, supplied by only one San Francisco Public Utilities Commission (SFPUC) turnout (Turnout #5).

Water demand versus supply capacity by Pressure Zone is given in Table 3-3. Total capacity for Pressure Zone 1 includes peak hour turnout capacity from SFPUC Turnout #5 and additional supply supplemented from Wells #22 and 23. Demand in Pressure Zone 1 cannot be sufficiently supplied by the current supply operation; however, as discussed in the *2030 General Plan Update Utility Impact Study* (IEC, 2011), surplus supply in Pressure Zone 2 could be routed to Pressure Zone 1 to make up the supply deficiency in Pressure Zone 1. A pressure reducing valve (PRV) moving water from Pressure Zone 2 to Pressure Zone 1 at North Whisman Road, between Walker Drive and Whisman Court, is included in the *North Bayshore Precise Plan Phase II Utility Impact*

Study (NBPPII UIS; Schaaf & Wheeler, October 2016). The ability of the system to meet Project demand and the fire flow requirement at Future Cumulative Condition assumes this CIP has been constructed. The additional Project demand does not impact the City's ability to meet total system demand.

Table 3-3: Future Cumulative Condition Demand Versus Supply

Pressure Zone	2030 Future Cumulative Demand			Total Capacity (mgd)*
	Pre-Project		Post-Project	
	ADD (mgd)	PHD (mgd)	PHD (mgd)	
1	7.11	19.84	19.92	16.56
2	8.37	23.35	23.35	30.53
3	1.60	4.47	4.47	5.10
Total	**18.01**	**50.25**	**50.52**	**52.19**

** Total Capacity from Table 3-8 in the General Plan Update Utility Impact Study (IEC, 2011)*

3.3. Water Storage Analysis

Project impact to water storage volume requirements is evaluated according to the State Water Resources Control Board Division of Drinking Water (DDW). DDW requires storage equal to 8 hours of Maximum Day Demand (MDD) plus fire flow storage in each pressure zone. The required storage versus active storage in the City is detailed in Table 3-4 pre- and post-Project. The maximum active storage in the City is 17 MG. However, the City currently operates with only the operational active storage of 14.3 MG.

The fire flow volume in Table 3-4 revises the requirement in the 2010 WMP and is estimated from the largest fire flow requirement in each pressure zone. Based on California Fire Code (CFC) requirements the fire flow volume is calculated as 5,000 gpm for 4 hours. Pressure Zone 3 has the potential for a reduction in required fire flow volume since the controlling fire flow requirement is the hospital along Grant Rd, which has a planning-level fire flow requirement of 3,500 for 4 hours.

Since the City has the storage volume available to meet DDW requirements in the Future Cumulative Condition pre- and post-Project, no additional storage improvements are recommended. In the future, when City demand and storage requirements exceed the current operating storage, the City may need to alter reservoir operation schemes.

Table 3-4: DDW Storage Requirements

Pressure Zone	Maximum Active Storage* (MG)	Operational Active Storage (MG)	Fire Flow (MG)	Future Cumulative Condition Demand					
				Pre-Project			Post-Project		
				ADD (mgd)	8 Hours of MDD (MG)	DDW Requirement (MG)	ADD (mgd)	8 Hours of MDD (MG)	DDW Requirement (MG)
1	6.00	5.1	1.2	7.11	4.05	5.25	7.14	4.07	5.27
2	8.00	6.5	1.2	8.37	4.77	5.97	8.37	4.77	5.97
3	3.00	2.7	1.2	1.60	0.91	2.11	1.60	0.91	2.11
Total	**17.00**	**14.3**	**3.6**	**17.08**	**9.73**	**13.33**	**17.11**	**9.75**	**13.35**

** Maximum Active Storage from Table 4-2 in the General Plan Update Utility Impact Study (IEC, 2011)*

3.4. Existing Condition (2010) Results

3.4.1. Hydraulic Model Information

Existing water system performance is analyzed with the demands and land use type in the City's InfoWATER model developed for the City's 2010 WMP. Demand is added to the model split amongst the model nodes to reflect demands at the separate buildings.

Domestic and fire services for the Project will connect to the existing 12-inch water main in Terra Bella Avenue, the existing 12-inch water main in North Shoreline Boulevard, and the existing 8-inch water main in Linda Vista Avenue according to the Project Plan Set dated July 17, 2018. The existing hydrants on North Shoreline Boulevard, Terra Bella Avenue, and Linda Vista Avenue near the Project will remain. One new hydrant along Terra Bella Avenue is proposed near the southwest corner of the Project parcel. On-site private fire mains are proposed to connect existing water mains in Terra Bella Avenue and Linda Vista Avenue to four hydrants interior to the site. These private fire mains have double check detector assemblies at connection points to the public system and do not provide any conveyance benefits for the City.

The Existing Condition pre-Project fire flow requirement at the Project site is taken from the *1001 North Shoreline Utility Impact Study* (NS UIS; Schaaf & Wheeler, April 2015). The fire flow requirement for the pre-Project condition is 3,500 gpm based on building size and material for Phase I of the multi-use development. After Project development, the Project specific required fire flow at the site is anticipated to be 3,500 gpm with an applied 50% reduction for the assumed approval of an installed fire sprinkler system.

3.4.2. Peak Hour Demand (PHD) – Pre and Post Project

System pressures are evaluated under Peak Hour Demand (PHD) pre-Project (Figure B-2) and post-Project (Figure B-3). At Existing Condition the system meets performance criteria system-wide. The Project development does not impact the system hydraulic performance under PHD.

3.4.3. Maximum Day Demand with Fire Flow (MDD+FF) – Pre and Post Project

The pre-Project required fire flow of 3,500 gpm is met at the existing hydrant locations at the proposed Project site, as shown on Figure B-4.

After Project development, the anticipated project-specific fire flow requirement of 3,500 gpm can be met at the evaluated locations at the site as illustrated in Figure B-5 and detailed in Table 3-5. The existing deficiencies in Pressure Zone 1 shown on Figures B-4 and B-5 are not near the Project site and are independent of the Project. These deficiencies may be due to higher planning level fire flow requirements and should be reviewed with the City Fire Marshal.

Table 3-5: Existing Condition Evaluated Project Fire Flow Nodes

Model Node ID	Location	Required Fire Flow Rate (gpm)	Available Flow Pre-Project (gpm)	Available Flow Post-Project (gpm)
J-2862	Project Location – N Shoreline Blvd near HWY 101	Pre-Project: 3,500 Post-Project: 3,500	8,088	8,080
J-2850	Project Location – N Shoreline Blvd	Pre-Project: 3,500 Post-Project: 3,500	8,847	8,814
J-2839	Project Location – N Shoreline Blvd and Terra Bella Ave	Pre-Project: 3,500 Post-Project: 3,500	9,858	9,824
J-2837	Project Location – Terra Bella Ave	Pre-Project: 3,500 Post-Project: 3,500	8,371	8,341
J-2834	Project Location – Terra Bella Ave and Linda Vista Ave	Pre-Project: 3,500 Post-Project: 3,500	7,988	7,791
J-2855	Project Location – Linda Vista Ave	Pre-Project: 3,500 Post-Project: 3,500	5,801	5,479
J-2835	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	7,815
HY-1	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	5,350
HY-2	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	5,249
HY-3	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	4,344
HY-4	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	4,765

3.4.4. Deficiencies – Pre and Post Project

With Existing Condition demand, the water system meets system design criteria at PHD and is able to adequately supply the increased Project demand. Existing fire flow deficient nodes are evaluated within the Project Pressure Zone (Zone 1) for Project impact. Available fire flow pre- and post-Project at selected deficient nodes is presented in Table 3-6 showing minimal impact (<1%) due to Project development.

Table 3-6: Selected Existing Condition Fire Flow Deficient Nodes Pre- and Post-Project

Node ID	Location	Required Fire Flow Rate (gpm)	Available Flow Pre-Project (gpm)	Available Flow Post-Project (gpm)
J-4194	Macon Ave	5,000	3,747	3,741
J-4185	San Leandro St	3,500	3,443	3,410
J-2624	Jackson St	2,500	2,382	2,381
J-2883	Rock St and Camp St	2,500	2,284	2,282
J-4208	Off La Avenida	3,500	2,554	2,550

3.5. Existing with Shoreline/101 CIP Condition (2010) Results

3.5.1. Hydraulic Model Information

Water system performance is analyzed with the demands and land use type in the City's InfoWATER model developed for the City's 2010 WMP. One Capital Improvement Project (CIP) is added in the Existing with Shoreline/101 CIP Condition model crossing State Highway 101 near North Shoreline Boulevard. This CIP proposes a 16-inch diameter pipe from North Shoreline Boulevard through the Project site and across State Highway 101 as well as a 12-inch diameter pipe along La Avenida, Inigo Way, and Pear Avenue to North Shoreline Boulevard. This CIP is in the design phase but may not be under construction at the time the Project is under construction. Demand is added to the model split amongst the model nodes to reflect demands at the separate buildings.

Domestic and fire services for the Project will connect to the existing 12-inch water main in Terra Bella Avenue, the existing 12-inch water main in North Shoreline Boulevard, and the existing 8-inch water main in Linda Vista Avenue according to the Project Plan Set dated July 17, 2018. The existing hydrants on North Shoreline Boulevard, Terra Bella Avenue, and Linda Vista Avenue near the Project will remain. One new hydrant along Terra Bella Avenue is proposed near the southwest corner of the Project parcel. On-site private fire mains are proposed to connect existing water mains in Terra Bella Avenue and Linda Vista Avenue to four hydrants interior to the site. These private fire mains have double check detector assemblies at connection points to the public system and do not provide any conveyance benefits for the City.

The Existing Condition pre-Project fire flow requirement at the Project site is taken from the *1001 North Shoreline Utility Impact Study* (NS UIS; Schaaf & Wheeler, April 2015). The fire flow requirement for the pre-Project condition is 3,500 gpm based on building size and material for Phase I of the multi-use development. After Project development, the Project specific required fire flow at the site is anticipated to be 3,500 gpm with an applied 50% reduction for the assumed approval of an installed fire sprinkler system.

3.5.2. Peak Hour Demand (PHD) – Pre and Post Project

System pressures are evaluated under Peak Hour Demand (PHD) pre-Project (Figure B-6) and post-Project (Figure B-7). Under Existing with Shoreline/101 CIP Condition, the system meets performance criteria system-wide. The Project development does not impact the system hydraulic performance under PHD.

3.5.3. Maximum Day Demand with Fire Flow (MDD+FF) – Pre and Post Project

The pre-Project required fire flow of 3,500 gpm is met at the existing hydrant locations at the proposed Project site, as shown on Figure B-8.

After Project development, the anticipated project-specific fire flow requirement of 3,500 gpm can be met at the evaluated locations at the site as illustrated in Figure B-9 and detailed in Table 3-7. The existing deficiencies in Pressure Zone 1 shown on Figures B-8 and B-9 are not near the Project site and are independent of the Project. These deficiencies may be due to higher planning level fire flow requirements and should be reviewed with the City Fire Marshal.

Table 3-7: Existing with Shoreline/101 CIP Condition Evaluated Project Fire Flow Nodes

Model Node ID	Location	Required Fire Flow Rate (gpm)	Available Flow Pre-Project (gpm)	Available Flow Post-Project (gpm)
J-2862	Project Location – N Shoreline Blvd near HWY 101	Pre-Project: 3,500 Post-Project: 3,500	8,116	8,122
J-2850	Project Location – N Shoreline Blvd	Pre-Project: 3,500 Post-Project: 3,500	9,048	9,036
J-2839	Project Location – N Shoreline Blvd and Terra Bella Ave	Pre-Project: 3,500 Post-Project: 3,500	10,020	10,016
J-2837	Project Location – Terra Bella Ave	Pre-Project: 3,500 Post-Project: 3,500	8,431	8,404
J-2834	Project Location – Terra Bella Ave and Linda Vista Ave	Pre-Project: 3,500 Post-Project: 3,500	8,030	8,005
J-2855	Project Location – Linda Vista Ave	Pre-Project: 3,500 Post-Project: 3,500	5,809	5,795
J-2835	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	8,030
HY-1	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	5,980
HY-2	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	5,750
HY-3	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	4,671
HY-4	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	5,111

3.5.4. Deficiencies – Pre and Post Project

With Existing with Shoreline/101 CIP Condition demand, the water system meets system design criteria at PHD and is able to adequately supply the increased Project demand. Existing fire flow deficient nodes are evaluated

within the Project Pressure Zone (Zone 1) for Project impact. Available fire flow pre- and post-Project at selected deficient nodes is presented in Table 3-8 showing minimal impact (<1%) due to Project development.

Table 3-8: Selected Existing with Shoreline/101 CIP Condition Fire Flow Deficient Nodes Pre- and Post-Project

Node ID	Location	Required Fire Flow Rate (gpm)	Available Flow Pre-Project (gpm)	Available Flow Post-Project (gpm)
J-4194	Macon Ave	5,000	4,528	4,518
J-4185	San Leandro St	3,500	3,440	3,385
J-2624	Jackson St	2,500	2,381	2,380
J-2883	Rock St and Camp St	2,500	2,294	2,293
J-4208	Off La Avenida	3,500	2,784	2,780

3.6. Future Cumulative Condition (2030) Results

3.6.1. Hydraulic Model Information

Outside of the North Bayshore Precise Plan boundary, the Future Cumulative Condition model is created using water demand based on the 2030 General Plan Update (GPU) land use and includes the additional projects listed in Table A-1 in Appendix A, which were not accounted for or were in exceedance of the 2030 GPU projections. Within the North Bayshore Precise Plan Boundary, demands in the Future Cumulative Condition model are based on demands developed as part of the *North Bayshore Precise Plan Phase II Utility Impact Study* (NBPPII UIS; Schaaf & Wheeler, October 2016). System performance is analyzed under the assumption that all recommended CIPs in the NBPPII UIS and the Shoreline/101 CIP have been constructed.

Domestic and fire services for the Project will connect to the existing 12-inch water main in Terra Bella, the proposed 18-inch water main in North Shoreline Boulevard, and the existing 8-inch diameter water main in Linda Vista Avenue. The existing hydrants on North Shoreline Boulevard, Terra Bella Avenue, and Linda Vista Avenue near the Project will remain. One new hydrant along Terra Bella Avenue is proposed near the southwest corner of the Project parcel. On-site private fire mains are proposed to connect existing water mains in Terra Bella Avenue and Linda Vista Avenue to four hydrants interior to the site. These private fire mains have double check detector assemblies at connection points to the public system and do not provide any conveyance benefits for the City.

The Future Cumulative Condition pre-Project fire flow requirement is not changed from the Existing Condition. The fire flow requirement for the pre-Project land use is 3,500 gpm based on building size and material for Phase I of the multi-use development as described in the NS UIS. After Project development, the Project specific required fire flow at the site is anticipated to be 3,500 gpm with an applied 50% reduction for the assumed approval of an installed fire sprinkler system.

3.6.2. Peak Hour Demand (PHD) – Pre and Post Project

The system generally has adequate pressures pre-Project (Figure B-10). Pressures near Shoreline Golf Links are close to the performance criteria of 40 psi, with one node falling just below the performance criteria.

With the post-Project demands, pressure at the same node falls slightly, but no additional nodes fall below the performance criteria (Figure B-11). Otherwise, the system meets design criteria with post-Project demands.

3.6.3. Maximum Day Demand with Fire Flow (MDD+FF) – Pre and Post Project

In the Future Cumulative Condition, the system is able to meet the fire flow requirements at the site pre- and post-Project as shown on Figures B-12 and B-13 and as detailed in Table 3-9. Within Pressure Zone 1, there is one deficient node, but it is far from and independent of the Project.

Table 3-9: Future Cumulative Condition Evaluated Project Fire Flow (FF) Nodes

Model Node ID	Location	Required Fire Flow Rate (gpm)	Available Flow Pre-Project (gpm)	Available Flow Post-Project (gpm)
J-2862	Project Location – N Shoreline Blvd near HWY 101	Pre-Project: 3,500 Post-Project: 3,500	7,650	7,640
J-2850	Project Location – N Shoreline Blvd	Pre-Project: 3,500 Post-Project: 3,500	7,910	7,875
J-2839	Project Location – N Shoreline Blvd and Terra Bella Ave	Pre-Project: 3,500 Post-Project: 3,500	7,992	7,957
J-2837	Project Location – Terra Bella Ave	Pre-Project: 3,500 Post-Project: 3,500	7,233	7,203
J-2834	Project Location – Terra Bella Ave and Linda Vista Ave	Pre-Project: 3,500 Post-Project: 3,500	7,043	7,014
J-2855	Project Location – Linda Vista Ave	Pre-Project: 3,500 Post-Project: 3,500	3,968	3,958
J-2835	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	7,029
HY-1	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	4,855
HY-2	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	4,784
HY-3	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	4,019
HY-4	Project Location – New Hydrant	Pre-Project: N/A Post-Project: 3,500	N/A	4,378

3.6.4. Deficiencies – Pre and Post Project

With Future Cumulative Condition demand, one node near Shoreline Golf Links falls below the performance criteria of 40 psi during PHD. With post-Project demand, pressure at the same node falls slightly, but no additional nodes fall below the performance criteria. All other nodes in Pressure Zone 1 meet the performance criteria pre- and post-Project.

The fire flow deficient node within Pressure Zone 1 is evaluated for Project impact. Table 3-10 compares the available fire flow before and after Project development, showing minimal (<1%) impact to the fire flow deficiency in Pressure Zone 1.

Table 3-10: Future Cumulative Condition Fire Flow Deficient Nodes Pre- and Post-Project

Node ID	Location	Required Fire Flow Rate (gpm)	Available Flow Pre-Project (gpm)	Available Flow Post-Project (gpm)
J-4185	San Leandro St	3,500	3,269	3,261

3.7. Recommended CIPs

Table 3-11 shows the existing and proposed diameters of some of the recommended CIPs within Pressure Zone 1. This CIP list does not include all of the CIPs within Pressure Zone 1, but represent the CIPs most likely to mitigate fire flow deficiencies that are impacted by the Project.

Table 3-11: Selected Recommended CIPs in Pressure Zone 1

CIP #	Source	Length (ft)	Existing Diameter (in)	Proposed Diameter (in)
47	GP-UWSM Alt 1	700	8	12
52	GP-UWSM Alt 1, City Design Drawings	2,157	12 (along N Shoreline Blvd)	16
MV-1	City Design Drawings	1,716	12 (along La Avenida), 8 (along Inigo Way and Pear Ave)	12
54	GP-UWSM Alt 1, City Design Drawings	1,181	-	16
57A	NBPPII UIS	700	-	8
58A	NBPPII UIS	645	-	8

Chapter 4. Sewer Flow Projections

This chapter discusses the sewer flow estimate for Project development and provides a comparison to pre-Project baseline condition. Because the Project is the second phase of the multi-use development at 1001 North Shoreline Boulevard, Project impact is evaluated by adding the estimated Project flow to the pre-Project flow at the Project site. The pre-Project baseline sewer flow at the Project site is taken as the Phase I office building flow based on the *1001 North Shoreline Utility Impact Study* (NS UIS; Schaaf & Wheeler, April 2015). Outside of the Project, pre-Project sewer flow in the Existing and Future Cumulative Condition follows the methodology described in the 2010 *Sewer Master Plan* (SMP) and 2030 *General Plan Update Utility Impact Study* (GPUUIS; IEC, October 2011). The sewer generation factor for estimating Project sewer flow is taken from previous technical studies (2010 SMP, 2030 GPUUIS, and *North Bayshore Precise Plan Phase II Utility Impact Study*) to remain consistent with the City-wide flow projections used in the hydraulic models.

Three types of sewer flow loading are used to model the sewer system: base wastewater flow, groundwater infiltration (GWI), and rainfall-dependent infiltration/inflow (RDI/I). GWI includes base infiltration (BI) and pumped groundwater discharged to the sewer system. RDI/I is stormwater that enters the sewer system. GWI and RDI/I values are modeled as constant flows.

Base wastewater flow (BWF) is from residential, commercial, institutional, office, and industrial sources. As described in the 2010 SMP, BWF is developed on an individual parcel level using the 2005 and 2006 water billing records and applying a return-to-sewer (RTS) ratio calculated for land use type. Change in BWF throughout the day due to daily use patterns is known as diurnal variation and is accounted for by applying residential and non-residential diurnal curves. BWF and diurnal curves used in this analysis are taken from the 2010 SMP to remain consistent with previous City-wide modeling. The sewer flows discussed in this section are the BWF values representing average flows and are not peaked.

4.1. Project Sewer Flow

Project generated sewer flow is estimated from the proposed number of residential units and the retail square footage provided in the Project Plan Set dated July 17, 2018. A return to sewer (RTS) ratio is applied to the water duty factors from Table 2-1 to estimate sewer flow for each land use type. For the Project's multi-family residential land use, an RTS ratio of 0.9 was used based on the 2010 SMP RTS ratio for multi-family residential land use. For the Project's retail land use, an RTS ratio of 0.7 was used based on the 2010 SMP RTS ratio for service commercial land use. Table 4-1 provides the estimated Project sewer flow.

Table 4-1: Project Sewer Flow

Building	Units	Area (sf)	Land Use Type	Sewer Duty Factor (gpd/unit)	Water Demand (gpd)
Apartments	203		Multi-Family Residential	90	18,270
Apartments		3,000	Retail	91	273
Apartments Subtotal	*203*	*3,000*	-	-	*18,543*
Condominiums	100		Multi-Family Residential	90	9,000

4.2. Existing Condition (2010)

4.2.1. Pre-Project (Baseline)

The pre-Project (baseline) condition for the Project parcels represents the flow from the office building constructed as part of Phase I. Outside of the Project area, the pre-Project condition includes parcel-level sewer flow adopted from the City's InfoSWMM model, developed as part of the 2010 SMP. Table 4-2 details the sewer flow in the model for the Project parcels, which was is taken from the NS UIS.

Table 4-2: Baseline Flow for Existing Condition

Address	APN	Current Land Use	Acreage	Sewer Flow (gpd)
1001 N Shoreline Blvd	-	High-Intensity Office/R&D	7.81	16,718
Total	**-**	**-**	***7.81***	***16,718***

4.2.2. Post-Project Flow

For the Project impact analysis, Project sewer flow is added to the Existing Condition model. Because the office constructed as Phase I of the mixed-use development is not going to be removed as part of the Project, pre-Project flows are assumed to remain and Project flows are added to the pre-Project flows. The total post-Project flow in the Existing Condition is given in Table 4-3.

Table 4-3: Post-Project Project Flow for Existing Condition

	Sewer Flow (gpd)
Pre-Project (Baseline) Flow	16,718
Project Flow	27,543
Total Post-Project Flow	***44,261***

4.3. Existing with Shoreline/101 CIP Condition (2010)

4.3.1. Pre-Project (Baseline)

As with the Existing Condition, the pre-Project (baseline) condition for the Project parcels represents the flow from the office building constructed as part of Phase I. Outside of the Project area, the pre-Project condition includes parcel-level sewer flow adopted from the City's InfoSWMM model, developed as part of the 2010 SMP. Table 4-4 details the sewer flow in the model for the Project parcels, which was is taken from the NS UIS.

Table 4-4: Baseline Flow for Existing with Shoreline/101 CIP Condition

Address	APN	Current Land Use	Acreage	Sewer Flow (gpd)
1001 N Shoreline Blvd	-	High-Intensity Office/R&D	7.81	16,718
Total	**-**	**-**	***7.81***	***16,718***

4.3.2. Post-Project Flow

For the Project impact analysis, Project sewer flow is added to the Existing with Shoreline/101 CIP Condition model. Because the office constructed as Phase I of the mixed-use development is not going to be removed as part of the Project, pre-Project flows are assumed to remain and Project flows are added to the pre-Project flows. The total post-Project flow in the Existing with Shoreline/101 CIP Condition is given in Table 4-5.

Table 4-5: Post-Project Project Flow for Existing with Shoreline/101 CIP Condition

	Sewer Flow (gpd)
Pre-Project (Baseline) Flow	16,718
Project Flow	27,543
Total Post-Project Flow	***44,261***

4.4. Future Cumulative Condition (2030)

4.4.1. Pre-Project (Baseline)

The pre-Project (baseline) condition for the Project parcels represents the demand from the office building constructed as part of Phase I. Outside of the Project parcels, Future Cumulative (baseline) flow is adopted from the City's InfoSWMM model, developed as part of the 2030 GPUUIS updated to include and has since been recent City approved projects outlined in Table A-1 in Appendix A. Table 4-6 presents the parcel-level pre-project flow.

Table 4-6: Baseline Flow for Future Cumulative Condition

Address	APN	Current Land Use	Acreage	Sewer Flow (gpd)
1001 N Shoreline Blvd	-	High-Intensity Office/R&D	7.81	16,718
Total	**-**	**-**	***7.81***	***16,718***

4.4.2. Post-Project Flow

Because the office constructed as Phase I of the mixed-use development is not going to be removed as part of the Project, pre-Project flows are assumed to remain and Project flows are added to the pre-Project flows. The total post-Project flow in the Future Cumulative Condition is given in Table 4-7.

Table 4-7: Post-Project Flow for Future Cumulative Condition

	Sewer Flow (gpd)
Pre-Project (Baseline) Flow	16,718
Project Flow	27,543
Total Post-Project Flow	***44,261***

Chapter 5. System Impact

The impact of Project development on the sewer system is analyzed under both Existing (2010) and Future Cumulative (2030) Condition. The specific affected area of the gravity system evaluated for Project impact begins at the Project site at the intersection of Terra Bella Avenue and Linda Vista Avenue and flows north to the Shoreline Sewage Pump Station via the Central Trunk.

5.1. Scenarios and Performance Criteria

Sewer capacity is analyzed under Peak Wet Weather Flow (PWWF) and Average Dry Weather Flow (ADWF). PWWF is used to determine hydraulic deficiencies according to the performance criteria in Table 5-1. ADWF is used to determine adequacy of treatment capacity.

The ADWF scenario is developed in the model by adding BWF and GWI. Since the ADWF scenario models average daily flows, BWF and GWI are not peaked. The PWWF scenario applies the diurnal peaking curves for residential and non-residential flows and simulates system response to rainfall dependent inflow and infiltration. The diurnal peaking curves are adopted from the City's 2010 *Sewer Master Plan* (SMP). Groundwater Infiltration (GWI) and rainfall-dependent infiltration/inflow (RDI/I) are included, but are not peaked.

Table 5-1: Sewer System Performance Criteria

Criteria	Pipe Diameter ≤ 12 inch	Pipe Diameter > 12 inch
Maximum Flow Depth/Pipe Diameter (d/D)	0.50	0.75

5.2. Sewer Treatment, Joint Interceptor, and San Antonio Interceptor Capacity

Sewage generated within the City is treated at the Regional Water Quality Control Plant (RWQCP) in Palo Alto. The sewer collection system is a gravity system with the majority of flow discharging into three main trunk lines that convey flow from the south to the north and terminate at the Shoreline Sewage Pump Station (SPS) located within the City's Shoreline Park. Flow is then pumped to the gravity Joint Interceptor Sewer that conveys flow to the RWQCP. The remaining flow not received at the SPS is discharged to the Los Altos' San Antonio Interceptor that also conveys flow into the Joint Interceptor.

The City entered into a joint agreement, referred to as the Basic Agreement, with the cities of Palo Alto and Los Altos in 1968 for the construction and maintenance of the joint sewer system addressing the need for conveyance, treatment, and disposal of wastewater to meet Regional Board requirements. In accordance with the Basic Agreement, Palo Alto owns the RWQCP and administers the Basic Agreement with the partnering agencies purchasing individual capacity rights in terms of an average annual flow that can be discharged to the RWQCP. Capacity rights of the three cities can be rented or purchased from other neighboring agencies and each partnering agency can sell their capacity to others. Contractual capacity is based upon the 1985 Addendum No. 3 of the 1968 Joint Sewer System agreement that revised capacity rates in relationship to facility expansion and is based upon Average Annual Flow (defined as 1.05 times Average Dry Weather Flow). Separate service

agreements with the RWQCP have since reallocated current capacity rights to include six partnering agencies. Table 5-2 presents the current capacity rights for each agency.

Table 5-2: RWQCP Joint Facilities Capacity Rights

Partner Agency	Treatment Capacity	72-inch Joint Interceptor Capacity
	Average Annual Flow (MGD)	Peak Wet Weather Flow (MGD)
Palo Alto	15.3	14.59
East Palo Alto Sanitary District	3.06	0
Los Altos Hills	0.63	3.41
Stanford University	2.11	0
Mountain View	15.1	50
Los Altos	3.8	12
Total	***40***	***80***

Source: Long Range Facilities Plan for the Regional Water Quality Control Plant (Carollo, May 2012)

The City's total capacity rights include flow leaving the City through the SPS and the amount of flow that the City discharges into the Los Altos' San Antonio Interceptor, per the 1970 Los Altos San Antonio Trunk Sewer Capacity Agreement between the two cities. The total system-wide contractual capacity for Mountain View is evaluated in the Existing and Future Cumulative Conditions with increased Project flow. Table 5-3 shows the City's projected flows compared to the RWQCP Joint Facilities capacity rights.

Per the Basic Agreement, the partnering agencies agree to conduct an engineering study when their respective service area reaches 80% of their contractual capacity rights. The Future Cumulative Condition estimates that the projected demand pre-Project and post-Project will exceed the 80% capacity threshold. The required engineering study when the City reaches 80% of their capacity shall redefine the anticipated future needs of the treatment plant.

Table 5-3: Capacity Rights Comparison

RWQCP Joint Facility	Mountain View Contractual Capacity (MGD)	Pre-Project		Post-Project	
		2010 Existing (MGD)	2030 Future Cumulative (MGD)	2010 Existing (MGD)	2030 Future Cumulative (MGD)
Treatment	15.1	10.19	14.35	10.22	14.38
Joint Interceptor	50.0	16.82	21.78	16.91	21.88

** Treatment = Average Annual Flow (AAF), Joint Interceptor = PWWF*

5.3. Existing Condition (2010) Results

5.3.1. Hydraulic Model Information

The Existing Condition sewer system is modeled using the City's InfoSWMM model developed as part of the 2010 SMP. Project sewer flow is assumed to discharge into the 15-inch diameter public main in Terra Bella

Avenue and to the existing 18-inch diameter main along North Shoreline Boulevard. Flow is divided and added to the proposed manholes to reflect flow generated at the separate buildings.

5.3.2. Peak Wet Weather Flow (PWWF) Scenario – Pre and Post Project

The sewer system has sufficient capacity downstream of the Project with both the pre-Project and post-Project flows in the Existing Condition as shown in Figures B-14a, B-14b, B-15a, and B-15b.

5.3.3. Deficiencies – Pre and Post Project

Existing Condition model results comparing pre- and post-Project d/D are presented in Table 5-4. The system meets d/D performance criteria in all pipes downstream of the Project.

5.4. Existing with Shoreline/101 CIP Condition (2010) Results

5.4.1. Hydraulic Model Information

The Existing with Shoreline/101 CIP Condition sewer system is modeled using the City's InfoSWMM model developed as part of the 2010 SMP. One Capital Improvement Project (CIP) is added to the Existing Condition model for a sewer main crossing State Highway 101 near North Shoreline Boulevard. This CIP proposes a 21-inch diameter from North Shoreline Boulevard through the Project site, across State Highway 101, and along La Avenida, Inigo Way, and Pear Avenue. This CIP is in the design stage but construction of the CIP may not coincide with Project construction. Project sewer flow is assumed to discharge into the 15-inch diameter public main in Terra Bella Avenue and to the new 21-inch diameter main through the Project site. Flow is divided and added to the proposed manholes to reflect flow generated at the separate buildings.

5.4.2. Peak Wet Weather Flow (PWWF) Scenario – Pre and Post Project

The sewer system has sufficient capacity downstream of the Project with both the pre-Project and post-Project flows in the Existing Condition as shown in Figures B-16a, B-16b, B-17a, and B-17b.

5.4.3. Deficiencies – Pre and Post Project

Existing Condition model results comparing pre- and post-Project d/D are presented in Table 5-5. The system meets d/D performance criteria in all pipes downstream of the Project.

5.5. Future Cumulative Condition (2030) Results

5.5.1. Hydraulic Model Information

The Future Cumulative Condition model is created using sewer flows based on the 2030 General Plan Update (GPU) land uses and includes additional projects listed in Table A-1 in Appendix A, which were not accounted for or were in exceedance of the 2030 GPU projections. System performance is analyzed under the assumption that all recommended CIPs in the 2030 *General Plan Update Utility Impact Study* (GPUUIS; IEC, October 2011) and the Shoreline/101 CIP have been constructed. Project sewer flow is assumed to discharge into the 15-inch diameter public main in Terra Bella Avenue and the new 21-inch diameter main through the Project site. Flow is divided and added to the proposed manholes to reflect flow generated at the separate buildings.

Three recommended CIPs in the 2030 GPUUIS are downstream of the Project, CIPs #97, #100, and #108. CIP #97 recommends upsizing 190 feet of 8-inch diameter pipe to 15-inch diameter pipe and 2,028 feet of 6- and 15-inch diameter pipe to 18-inch diameter pipe. CIP #100 in the 2030 GPUUIS includes upsizing 4,419 feet of existing 18-inch diameter pipe to 21-inch diameter pipe along North Shoreline Boulevard from Terra Bella Avenue to Crittenden Lane. For this analysis, however, the alignment for CIP #100 conforms to City-provided plans from January 2018 for crossing State Highway 101 such that approximately 5,800 feet of pipe is upsized to 21-inch diameter pipe. CIP #108 recommends upsizing 241 feet of 21-inch diameter pipe to 24-inch diameter pipe along North Shoreline Boulevard north of Crittenden Lane.

5.5.2. Peak Wet Weather Flow (PWWF) Scenario – Pre and Post Project

The system meets d/D performance criteria downstream of the Project in the Future Cumulative Condition both pre- and post-Project as shown in Figures B-18a, B-18b, B-19a, and B-19b.

5.5.3. Deficiencies – Pre and Post Project

Table 5-5 presents the comparison of d/D criteria pre- and post-Project for pipes downstream of the Project development. The system meets d/D performance criteria in all pipes downstream of the Project in the pre- and post-Project condition. Recommended CIP diameters from the 2030 GPUUIS in Table 5-6 are indicated by bold green font. CIP diameters from City-provided plans (January 2018) for crossing State Highway 101 near North Shoreline Boulevard are indicated by bold orange font.

5.6. Project Contribution to Deficient Sewer Pipes

Approximately 4,660 feet of sewer mains along North Shoreline Boulevard downstream of the Project site was identified as deficient in the 2030 GPUUIS based on d/D performance criteria. The 2030 GPUUIS recommends upsizing these pipes from 18-inch diameter to 21-inch diameter and from 21-inch diameter to 24-inch diameter. Given the alignment provided by the City for crossing State Highway 101, the length of pipe recommended to be upsized increases to approximately 6,042 feet from Terra Bella to north of Crittenden Lane. These improvements are assumed to be constructed in the model results presented in this report.

Of that 6,042 feet, approximately 738 feet are planned to be installed as part of the Project development as the improved pipeline crosses through the Project site. Another 2,731 feet from the Project site crossing State Highway 101 to North Shoreline Boulevard is currently in design phase as City Capital Improvement Project 16-61. The remaining 2,573 feet were recommended for replacement in the 2030 GPUUIS but are not yet in the design phase.

In addition, approximately 725 feet of sewer pipe downstream of the Project along Terra Bella Avenue was identified as deficient in the 2030 GPUUIS and was recommended to be upsized from 15-inch diameter to 18-inch diameter. However, City Capital Improvement Projects 16-21 and 16-22 will divert flow from the Central Trunk to the East Trunk, decreasing the amount of flow through pipes in Terra Bella Avenue. With these Capital Projects, assumed to be constructed in the Future Cumulative Condition for this analysis, model results show that the 725 feet of pipe on Terra Bella Avenue downstream of the Project does not need to be upsized. This pipe can remain as a 15-inch diameter pipe without exceeding the d/D performance criteria.

Table 5-8 provides a comparison of ADWF in order to determine the Project contribution for the recommended pipe improvement projects and may be used to estimate developer impact fees for fair share impact to the system. Flow contribution is based upon Future Cumulative Condition ADWF. This Utility Impact Study shows that the proposed development will contribute flows that would cause performance and capacity deficiencies in downstream segments of the sanitary sewer system. The applicant shall pay their fair share contribution, as determined by the Public Works Department, to implement these sewer system improvements.

Table 5-4: Existing Condition Model Results – Pre and Post Project

Sewer Main ID	Upstream MH ID	Downstream MH ID	Existing Diameter (in)	Length (ft)	Slope (%)	ADWF				PWWF

APPENDIX A:

Additional Considered Projects

Table A-1: Additional Considered Projects for Future Cumulative Condition (Last Updated May 2018)

	Project	Change Area/Planning Area	Address	Status
1	Mountain View Co-Housing Community	Central Neighborhood	445 Calderon Ave	Completed
2	Hope Street Investors	Downtown/Evelyn Corridor	231-235 Hope St	Under Construction
3	Downtown Mixed Use Building	Downtown/Evelyn Corridor	605 Castro St	Completed
4	Residential Condominium Project	Downtown/Evelyn Corridor	325, 333, 339 Franklin St	Under Review
5	St Joseph's Church	Downtown/Evelyn Corridor	582 Hope Street	Under Construction
6	Fairmont Mixed Use	Downtown/Evelyn Corridor	881 Castro Street	Approved
7	Bryant/Dana Office	Downtown/Evelyn Corridor	250 Bryant St	Completed
8	Quad/Lovewell	East Whisman	369 N Whisman Rd	Approved but Inactive
9	Renault & Handley	East Whisman	625-685 Clyde Ave	Completed
10	Symantec	East Whisman	575 E Middlefield Rd	On Hold
11	LinkedIn	East Whisman	700 E Middlefield Rd & 1100 W Maude Ave	Under Review
12	National Avenue Partners	East Whisman	600 National Ave	Completed
13	2700 West El Camino Real	El Camino Real	2700 El Camino Real W	Approved
14	SummerHill Apt	El Camino Real	2650 El Camino Real W	Completed
15	Hotel Expansion	El Camino Real	2300 W El Camino Real	Approved
16	Lennar Multi-Family Communities	El Camino Real	2268 El Camino Real W	Under Construction
17	UDR	El Camino Real	1984 El Camino Real W	Completed
18	Residence Inn Gatehouse	El Camino Real	1854 El Camino Real W	Under Building Review
19	Residence Inn	El Camino Real	1740 El Camino Real W	Completed
20	Tropicana Lodge - Prometheus	El Camino Real	1720 El Camino Real W	Completed
21	Austin's - Prometheus	El Camino Real	1616 El Camino Real W	Completed
22	1701 W El Camino Real	El Camino Real	1701 El Camino Real W	Under Construction
23	First Community Housing	El Camino Real	1585 El Camino Real W	Completed
24	Harv's Car Wash - Regis House	El Camino Real	1101 El Camino Real W	Completed
25	Greystar	El Camino Real	801 El Camino Real W	Under Construction
26	Medical Building	El Camino Real	412 El Camino Real W	Completed
27	Lennar Apartments	El Camino Real	865 El Camino Real E	Completed
28	Wonder Years Preschool	El Camino Real	86 El Camino Real	Under Construction

Table A-1: Additional Considered Projects for Future Cumulative Condition (Last Updated May 2018)

	Project	Change Area	Address	Status
29	Evelyn Family Apartments	Grant/Sylvan	779 East Evelyn Ave	Under Construction
30	334 Bryant Ave	Grant/Sylvan	334 Bryant Ave	Under Building Review
31	Adachi Project	Grant/Sylvan	1991 Sun Mor Ave	Under Construction
32	840 E El Camino Real	Grant/Sylvan	840 El Camino Real E	Approved
33	Loop Convenience Store	Grant/Sylvan	790 El Camino Real E	Completed
34	El Camino Real Hospital Campus	Miramonte/Springer	2500 Grant Ave	Under Construction
35	City Sports	Miramonte/Springer	1040 Grant Ave	Completed
36	Prometheus	Moffett/Whisman	100 Moffett Blvd	Completed
37	Hampton Inn Addition	Moffett/Whisman	390 Moffett Blvd	Completed
38	Calvano Development	Moffett/Whisman	1075 Terra Bella Avenue	Approved
39	Moffett Gateway	Moffett/Whisman	750 Moffett Blvd	Under Construction
40	Holiday Inn Express	Moffett/Whisman	870 Leong Dr	Approved
41	Warmington Residential	Moffett/Whisman	660 Tyrella Avenue	Under Construction
42	Dividend Homes	Moffett/Whisman	111 and 123 Fairchild Dr	Completed
43	133-149 Fairchild Dr	Moffett/Whisman	133-149 Fairchild Dr	Completed
44	Warmington Residential	Moffett/Whisman	277 Fairchild Dr	Under Building Review
45	Hetch-Hetchy Property	Moffett/Whisman	450 N Whisman Dr	Under Construction
46	DeNardi Homes	Moffett/Whisman	186 East Middlefield Road	Under Building Review
47	Tripointe Homes	Moffett/Whisman	135 Ada Ave	Completed
48	Tripointe Homes	Moffett/Whisman	129 Ada Ave	Completed
49	Robson Homes	Moffett/Whisman	137 Easy St	Completed
50	167 N Whisman Rd	Moffett/Whisman	167 N Whisman Rd	Approved
51	Antenna Farm (Pacific Dr)	Moffett/Whisman	Pacific Dr	Under Construction
52	Pulte Homes	Moffett/Whisman	100, 420-430 Ferguson Dr	Under Construction
53	EFL Development	Moffett/Whisman	500 Ferguson Dr	Under Construction
54	Shenandoah Square Precise Plan	Moffett/Whisman	500 Moffett Blvd	On Hold
55	1185 Terra Bella Ave	Moffett/Whisman	1185 Terra Bella Ave	Approved

Table A-1: Additional Considered Projects for Future Cumulative Condition (Last Updated May 2018)

	Project	Change Area	Address	Status
56	Linde Hydrogen Fueling Station	Moffett/Whisman	830 Leong Dr	Completed
57	Windsor Academy	Monta Loma/Farley/Rock	908 N Rengstorff Ave	Completed
58	D.R. Horton	Monta Loma/Farley/Rock	827 N Rengstorff Ave	Completed
59	ROEM/Eden	Monta Loma/Farley/Rock	819 N Rengstorff Ave	Completed
60	Paul Ryan	Monta Loma/Farley/Rock	858 Sierra Vista Ave	Under Building Review
61	William Lyon Homes	Monta Loma/Farley/Rock	1951 Colony St	Completed
62	Dividend Homes	Monta Loma/Farley/Rock	1958 Rock St	Completed
63	Paul Ryan	Monta Loma/Farley/Rock	2392 Rock St	Completed
64	San Antonio Station	Monta Loma/Farley/Rock	100 & 250 Mayfield Ave	Completed
65	Northpark Apartments	Monta Loma/Farley/Rock	111 N Rengstorff Ave	Completed
66	333 N Rengstorff Ave	Monta Loma/Farley/Rock	333 N Rengstorff Ave	Under Building Review
67	Classic Communities	Monta Loma/Farley/Rock	1946 San Luis Ave	Completed
68	1998-2024 Montecitio Ave	Monta Loma/Farley/Rock	1998-2024 Montecito Ave	Under Construction
69	Classic Communities	Monta Loma/Farley/Rock	647 Sierra Vista Ave	Under Construction
70	Dividend Homes	Monta Loma/Farley/Rock	1968 Hackett Ave & 208-210 Sierra Vista Ave	Under Construction
71	California Communities	Monta Loma/Farley/Rock	2025 & 2065 San Luis Ave	Under Construction
72	2044 and 2054 Montecito Ave	Monta Loma/Farley/Rock	2044 & 2054 Montecito Ave	Under Review
73	Shorebreeze Apartments	Monta Loma/Farley/Rock	460 North Shoreline Blvd	Approved
74	Intuit	North Bayshore	2600 Marine Way	Completed
75	Sobrato Organization	North Bayshore	1255 Pear Ave	Under Review
76	Charleston East	North Bayshore	2000 North Shoreline Blvd	Under Construction
77	LinkedIn and Sywest	North Bayshore	1400 North Shoreline Blvd	On Hold
78	Broadreach	North Bayshore	1625 Plymouth Street	Under Construction
79	Microsoft	North Bayshore	1045-1085 La Avenida St	Under Building Review
80	Shashi Hotel	North Bayshore	1625 North Shoreline Blvd	Under Construction
81	Community School of Music and Art	San Antonio	250 San Antonio Circle	Approved
82	Prometheus	San Antonio	400 San Antonio Rd	Under Construction
83	Octane Fayette	San Antonio	2645 & 2655 Fayette Dr	Under Review

Table A-1: Additional Considered Projects for Future Cumulative Condition (Last Updated May 2018)

	Project	Change Area	Address	Status
84	Merlone Geier Partners (MGP)	San Antonio	405 San Antonio Rd	Under Construction
85	Anton Calega	San Antonio/Rengstorff/ Del Medio	394 Ortega Ave	Under Construction
86	Barry Swenson Builder	San Antonio/Rengstorff/ Del Medio	1958 Latham St	Under Building Review
87	2296 Mora Drive	San Antonio/Rengstorff/ Del Medio	2296 Mora Dr	Under Construction
