Note that although spectator vehicles do emit toxic organic compounds while driving on streets,
the potential health impacts of those emissions on residences, businesses, schools, etc. near public streets is not assessed herein.

APPENDIX B-2

Spectator On Site Emission Factors

© 2021 Kleinfelder

EMFAC2017 (v1.0.2) Emission Rates **Spectators On-Site:** 5 mph only, ALL FUELS, ALL YEARS ... LD autos and trucks, LHD trucks, MD trucks, Motorcycles, Motor Homes
Region Type: County
Region: SACRAMENTO
Calendar Year: 2021
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for VMT, g/mile for RUNEX, PMBW and PMTW. Note 'day' in the unit is operation day.

	Acetaldehyde	Benzene	Butadiene	Ethylbenzene	Formaldehyde	Naphthalene
Percent TOG	0.28%	2.47%	0.55%	1.05%	1.58%	0.05%

Note that although tow vehicles do emit toxic organic compounds while driving on streets,
the potential health impacts of those emissions on residences, businesses, schools, etc. near public streets is not assessed herein.

APPENDIX B-7

Tow Vehicle On Site Emission Factors

© 2021 Kleinfelder

EMFAC2017 (v1.0.2) Emission Rates **Tow Vehicles On-Site** 15 mph only, DSL only, ALL YEARS ... LHD2 only
Region Type: County
Region: SACRAMENTO
Calendar Year: 2021
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for VMT, g/mile for RUNEX, PMBW and PMTW. Note 'day' in the unit is operation day.

Street Legal Race Vehicle Travel Emission Factors

© 2021 Kleinfelder

EMFAC2017 (v1.0.2) Emission Rates **MDV vehicles, all speeds, gasoline, 1977 through 1999 model years**
Region Type: County
Region: SACRAMENTO
Calendar Year: 2021
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for VMT, g/mile for RUNEX, PMBW and PMTW. Note 'day' in the unit is operation day.

On-Site Racing Area (Tow Vehicles + Non-Trailered Race Vehicles + Racing) Emissions Used for Annual Dispersion Modeling (grams per second) ... Note 4	0.0914				0.00155			0.00404	0.109	0.0000458

NA means that the emissions were not used in the toxics assessment. Although toxic organic compounds are emitted by vehicles traveling on public streets, they are not assessed herein.

Note 1: Number of diesel-fueled vehicles driven by spectators estimated from the ratio of EMFAC VMT/day for diesel-fueled vehicels to all-fueled vehicles for 2019 (11839/32298 = 0.367) x total spectator vehicles.

Note 2: All tow vehicles are diesel fueled.

Note 3: No race vehicles are diesel fueled.

Note 4: For dispersion modeling to assess potential impacts adjacent to the Raceway during Drag Racing; on-site annual emissions (not including travel to/from the Raceway) were totaled and divided by a total of 1,248 hours. The model was turned on for 10 hours each Saturday and Sunday and 4 hours each Wednesday, total 24 hrs/week x 52 weeks = 1,248 hours.

APPENDIX C-2

On-Site Spectator Emissions Used for 8-hour and 24-hour Dispersion Modeling (grams per second) … Note 4	0.0324				0.00309			0.00935	0.0146	
On-Site Racing Area (Tow Vehicles + Racing) Emissions Used for 8-hour and 24-hour Dispersion Modeling (grams per second) … Note 4	0.188				0.00310			0.00783	0.219	

NA means that the emissions were not used in the toxics assessment. Although toxic organic compounds are emitted by vehicles traveling on public streets, they are not assessed herein.

Note 1: Number of diesel-fueled vehicles driven by spectators estimated from the ratio of EMFAC VMT/day for diesel-fueled vehicels to all-fueled vehicles for 2019 (11763/31972 = 0.368) x total spectator vehicles.

Note 2: All tow vehicles assumed diesel-fueled.

Note 3: There are no diesel-fueled race vehicles.

Note 4: For dispersion modeling to assess potential impacts adjacent to the Raceway during Drag Racing; dailly on-site emissions only (no emissions for travel to/from Raceway) were totaled and divided 10 hours per day, same number of hours that the model was turned on for Saturday and Sunday.

Emissions (grams per hour)	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Total Hourly Emissions for Drags (grams/hour)	**709.43**	**797.68**	**5.25**	**4.81**	**10.06**	**5.25**	**19.23**	**24.48**	**867.22**	**0.00**
On-Site Racing Area (Racing only) Emissions Used for 1-hour Dispersion Modeling (grams per second) … Note 4, 5	0.197								0.241	
Total Hourly Emissions for Drags (lb/hour)	**1.56**	**1.76**	**0.01**	**0.01**	**0.02**	**0.01**	**0.04**	**0.05**	**1.91**	**0.00**

NA means that the emissions were not used in the toxics assessment. Hourly emissions are relevant only for on-site speciated toxic organics emissions.

Note 1: Number of diesel-fueled vehicles driven by spectators estimated from the ratio of EMFAC VMT/day for diesel-fueled vehicels to all-fueled vehicles for 2019 (11839/32298 = 0.367) x total spectator vehicles.

Note 2: All tow vehicles are diesel fueled.

Note 3: No race vehicles are diesel fueled.

Note 4: For dispersion modeling to assess potential impacts adjacent to the Raceway during Drag Racing; hourly on-site emissions only (no emissions for travel to/from Raceway) were totaled and divided by 1 hour.

Note 5: For 1-hour dispersion modeling, only the maximum emissions that could occur in the same hour are modeled. Spectator, Tow Vehicle, and Racing do not occur during the same hour.
Thus, only Racing (larger emissions than Spectator or Tow Vehicles) is modeled.

NA means that the emissions were not used in the toxics assessment. Although toxic organic compounds are emitted by vehicles traveling on public streets, they are not assessed herein.

Note 1: Number of diesel-fueled vehicles driven by spectators estimated from the ratio of EMFAC VMT/day for diesel-fueled vehicels to all-fueled vehicles for 2019 (11839/32298 = 0.367) x total spectator vehicles.

Note 2: All tow vehicles are diesel fueled.

Note 3: No motocross vehicles are diesel fueled.

Note 4: For dispersion modeling to assess potential impacts adjacent to the Raceway during Motocross; on-site annual emissions (not including travel to/from the Raceway) were totaled and divided by 208 hours, The model was turned on for 4 hours every Friday, 4 hr/wk x 52 wk/yr = 208 hours.

Note 5: MX1 is 90% of racing on the short track.

Note 6: MX2 is 10% of Racing on the long track.

Note 7: Spectator and Tow Vehicle emissions only.

Note 8: Assumed no diesel-fueled Motocross racing vehicles.

Total Hourly Emissions (grams per hour) for Motocross	**344.70**	**798.00**	**0.59**	**0.00**	**0.59**	**0.59**	**0.00**	**0.59**	**971.40**	**0.00**
On-Site MX1 Emissions Used for 1-hour Dispersion Modeling (grams per second) … Note 4, 5, 8	0.0862								0.243	
On-Site MX2 Emissions Used for 1-hour Dispersion Modeling (grams per second) … Note 4, 6, 8	0.00958								0.0270	
Total Hourly Emissions for Drags (lb/hour)	**0.76**	**1.76**	**0.0013**	**0.00**	**0.0013**	**0.0013**	**0.00**	**0.0013**	**2.14**	**0.00**

NA means that the emissions were not used in the toxics assessment. Although toxic organic compounds are emitted by vehicles traveling on public streets, they are not assessed herein.

Note 1: Number of diesel-fueled vehicles driven by spectators estimated from the ratio of EMFAC VMT/day for diesel-fueled vehicels to all-fueled vehicles for 2019 (11839/32298 = 0.367) x total spectator vehicles.

Note 2: All tow vehicles are diesel fueled.

Note 3: No motocross vehicles are diesel fueled.

Note 4: For dispersion modeling to assess potential impacts adjacent to the Raceway during Motocross; hourly on-site emissions (no emissions for travel to/from Raceway) were totaled and divided by 1 hour.

Note 5: MX1 is 90% of Racing on the short track.

Note 6: MX2 is 10% of Racing on the long track.

Note 7: Spectator and Tow Vehicle emissions only.

Note 8: For 1-hour dispersion modeling, only the maximum emissions that could occur in the same hour are modeled, and Spectator/Tow Vehicle and Racing do not occur during the same hour.
Thus, only Racing (larger emissions than Spectator/Tow) is modeled.

Mortality					
Mortality, Non-Accidental	0 - 99	0.11	0.092	0.00030%	30386

1. Affected age ranges are shown. Other age ranges are available, but the endpoints and age ranges shown here are the ones used by the USEPA in their health assessments. The age ranges are consistent with the epidemiological study that is the basis of the health function.
2. Health effects are shown in terms of incidences of each health endpoint and how it compares to the base (2035 base year health effect incidences, or "background health incidence") values. Health effects are shown for the Reduced Sacramento 4-km Modeling Domain and the 5-Air-District Region.
3. The percent of background health incidence uses the mean incidence. The background health incidence is an estimate of the average number of people that are affected by the health endpoint in a given population over a given period of time. In this case, the background incidence rates cover the 5-Air-District Region (estimated 2035 population of 3,271,451 persons). Health incidence rates and other health data are typically collected by the government as well as the World Health Organization. The background incidence rates used here are obtained from BenMAP.

4. The total number of health incidences across the 5-Air-District Region is calculated based on the modeling data. The information is presented to assist in providing overall health context.

5. The technical specifications and map for the Reduced Sacramento 4-km Modeling Domain are included in Appendix A, Table A-1 and Appendix B, Figure B-2 of the *Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District.*

Sac Metro Air District Strategic Area Project Health Effects Tool, version 2, published September 2020

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
              with a Minimum NO2/NOx Ratio of  0.500
               and a Maximum NO2/NOx Ratio of  0.900

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  NO2

 **Note that special processing requirements apply for the 1-hour NO2 NAAQS - check available guidance.
   Model will process user-specified ranks of daily maximum 1-hour values averaged across the number of years
   modeled.
   For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values can be simulated using the MULTYEAR
   keyword.
   Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option
   with a
   single multi-year meteorological data file using STARTEND keyword.

 **Model Calculates  1 Short Term Average(s) of:   1-HR

 **This Run Includes:      1 Source(s);       2 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      1 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.
```

```
 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
Angle =     0.0
                  Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                  0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.6 MB of RAM.

 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
              with a Minimum NO2/NOx Ratio of  0.500
               and a Maximum NO2/NOx Ratio of  0.900

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  NO2

 **Note that special processing requirements apply for the 1-hour NO2 NAAQS - check available guidance.
   Model will process user-specified ranks of daily maximum 1-hour values averaged across the number of years
   modeled.
   For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values can be simulated using the MULTYEAR
   keyword.
   Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option
   with a
   single multi-year meteorological data file using STARTEND keyword.

 **Model Calculates  1 Short Term Average(s) of:   1-HR

 **This Run Includes:      2 Source(s);       3 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      2 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.
```

```
 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
Angle =     0.0
                  Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                  0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 1-hr NO2 MX
032921_5yrs_NO2.DTA
 **Output Print File:             C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 1-hr NO2 MX
032921_5yrs_NO2.LST

 **File for Summary of Results:   C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 1-hr NO2 MX
032921_5yrs_NO2.SUM

                                          ***     MODEL SETUP OPTIONS SUMMARY       ***
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - -

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses RURAL Dispersion Only.

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
              with a Minimum NO2/NOx Ratio of  0.500
               and a Maximum NO2/NOx Ratio of  0.900

**Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  NO2

**NOTE: Special processing requirements applicable for the 1-hour NO2 NAAQS have been disabled!!!
        User has specified non-standard averaging periods:
        High ranked 1-hour values are NOT averaged across the number of years modeled, and
        complete years of data are NOT required.

**Model Calculates ANNUAL Averages Only

**This Run Includes:      5 Source(s);       6 Source Group(s); and     703 Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     0 VOLUME source(s)
                 and:     5 AREA type source(s)
                 and:     0 LINE source(s)
                 and:     0 RLINE/RLINEXT source(s)
                 and:     0 OPENPIT source(s)
                 and:     0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  19191

**Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
```

```
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
 Angle =     0.0
                  Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                  0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 Ann NO2 DR MX
 033021_5yrs_NO2.DTA
 **Output Print File:             C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 Ann NO2 DR MX
 033021_5yrs_NO2.LST

 **File for Summary of Results:   C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 Ann NO2 DR MX

                                          ***     MODEL SETUP OPTIONS SUMMARY       ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
 - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  OTHER

 **Model Calculates  1 Short Term Average(s) of:  24-HR

 **This Run Includes:      2 Source(s);       3 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     2 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  OTHER

 **Model Calculates  1 Short Term Average(s) of:  24-HR

 **This Run Includes:      3 Source(s);       4 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     3 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0
                Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                0.10000E+07
                Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 24-hr PM25 MX
032921_5yrs_OTHER.DTA
 **Output Print File:             C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 24-hr PM25 MX

                                        ***     MODEL SETUP OPTIONS SUMMARY       ***
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - -

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses RURAL Dispersion Only.

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.

**Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  OTHER

**Model Calculates ANNUAL Averages Only

**This Run Includes:      5 Source(s);       6 Source Group(s); and     703 Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     0 VOLUME source(s)
                 and:     5 AREA type source(s)
                 and:     0 LINE source(s)
                 and:     0 RLINE/RLINEXT source(s)
                 and:     0 OPENPIT source(s)
                 and:     0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  19191

**Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                 0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 Ann PM25 DR MX

 - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  OTHER

 **Model Calculates  1 Short Term Average(s) of:  24-HR

 **This Run Includes:      2 Source(s);       3 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     2 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

 - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  OTHER

 **Model Calculates  1 Short Term Average(s) of:  24-HR

 **This Run Includes:      3 Source(s);       4 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     3 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  OTHER

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:      5 Source(s);       6 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     5 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0
                Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                0.10000E+07
                Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 Ann PM10 DR MX

 - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  TOG

 **Model Calculates  1 Short Term Average(s) of:   1-HR

 **This Run Includes:      1 Source(s);       2 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     1 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                 0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.6 MB of RAM.

 **Input Runstream File:          C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 1-hr TOG DR

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  TOG

 **Model Calculates  1 Short Term Average(s) of:   1-HR

 **This Run Includes:      2 Source(s);       3 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     2 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  TOG

 **Model Calculates  1 Short Term Average(s) of:   8-HR

 **This Run Includes:      2 Source(s);       3 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     2 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  TOG

 **Model Calculates  1 Short Term Average(s) of:   8-HR

 **This Run Includes:      3 Source(s);       4 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     3 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0
                Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                0.10000E+07
                Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 8-hr TOG MX

- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - -

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses RURAL Dispersion Only.

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.

**Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  TOG

**Model Calculates ANNUAL Averages Only

**This Run Includes:      5 Source(s);       6 Source Group(s); and     703 Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     0 VOLUME source(s)
                 and:     5 AREA type source(s)
                 and:     0 LINE source(s)
                 and:     0 RLINE/RLINEXT source(s)
                 and:     0 OPENPIT source(s)
                 and:     0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  19191

**Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                 0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
 - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  TOG

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:      3 Source(s);       4 Source Group(s); and     703 Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                  and:     0 VOLUME source(s)
                  and:     3 AREA type source(s)
                  and:     0 LINE source(s)
                  and:     0 RLINE/RLINEXT source(s)
                  and:     0 OPENPIT source(s)
                  and:     0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  19191

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot.
```

```
 Angle =     0.0
                Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =
                0.10000E+07
                Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.6 MB of RAM.

 **Input Runstream File:          C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 Ann DPM DR MX
033021_5yrs_TOG.DTA
 **Output Print File:             C:\BEEST\Jackson Sac Raceway\Sac Raceway 2014 Ann DPM DR MX

Potential Odors from the Sacramento Rendering Company at the Proposed Jackson Township Development

KLEINFELDER
Bright People. Right Solutions.

TECHNICAL MEMORANDUM

POTENTIAL ODORS FROM THE SACRAMENTO RENDERING COMPANY AT THE PROPOSED JACKSON TOWNSHIP DEVELOPMENT

June 17, 2015

1 EXECUTIVE SUMMARY

The Sacramento Rendering Company (SRC) is located at 11350 Kiefer Boulevard, Sacramento, California. SRC has operated facilities in Sacramento County since 1913 and has been operating at its current location since the 1950s.[1] SRC receives restaurant grease and inedible animal byproduct materials and renders them into products used in the manufacturing of many everyday items such as soaps, cosmetics, candles, and animal feed.[2]

SRC is located approximately 1.5 miles east of the proposed Jackson Township Specific Plan (Jackson Township) and approximately 0.75 miles west of existing homes located on the east side of Sunrise Boulevard (See Figure 1, Attachment A). There have been reports to the Sacramento Metropolitan Air Quality Management District (SMAQMD) of detectable odors in the vicinity associated with SRC[3]. This study evaluates the potential for detectable and recognizable odors from SRC occurring at the proposed Jackson Township. The results of the study are summarized below, while the details are presented in the following sections of this Technical Memorandum.

SRC possesses 10 permits to operate from SMAQMD for potentially emitting devices and emission for control systems at the facility. These emission control systems remove from 69 to 99.7 percent of the potential emissions prior to their being exhausted through elevated stacks to the atmosphere. The emission control equipment and regulatory requirements of SMAQMD significantly reduce the possibility of odors being detected even at existing housing developments located about 0.75 miles east and north of SRC. Prevailing winds in the vicinity of SRC are from the south and west toward the existing homes, with the wind blowing away from the Jackson Township more than 95 percent of the time. Furthermore, experience in other

2 Ada, Suite 250, Irvine, California 92618 p | 949.727.4466 f | 949.727.9242

regions with rendering plants indicates that the vast majority of odor complaints occur less than 0.5 miles from the plants.

A literature review was conducted to identify the nature and intensity of odorous compounds that could be emitted from SRC. Emissions of such compounds are often reported in terms of odor units (OU). An OU is the amount of odor-free air that must be introduced into a given sample to make the odor undetectable. Emissions are also reported in traditional terms of mass per unit time (e.g., tons per year). After obtaining emissions data, the emissions were modeled with an atmospheric dispersion model to evaluate the potential concentrations of the emissions at receptors located at the existing housing and the future Jackson Township. The dispersion modeling indicated that in almost all cases, there is no potential for odor at the nearest point (maximum impact point) of the Jackson Township.

Although detectable odors could occur at the Jackson Township, the likelihood of such an occurrence is very small. This is due to a number of facts, including:

- Extensive emission controls at SRC (some of which were installed in 2010, and subsequently reduced the number of odor complaints associated with SRC by nearly a factor of 10).
- Prevailing wind direction away from the Jackson Township. The wind direction frequency indicates that it is at least 10 times more likely for odors to be detected at the existing housing than at the Jackson Township.
- Distance of the Jackson Township from SRC.

The second section of this Technical Memorandum describes the SRC facility and emission controls, and the third discusses regulations that affect operations and reduce potential odor emissions from the facility. Section 4 summarizes odor complaints that have been received by SMAQMD and complaints at other similar facilities. Section 5 discusses odor perception and thresholds, while Section 6 discusses the potential for detectable and recognizable odors from SRC at the proposed Jackson Township.

2 DESCRIPTION OF SRC

SRC is a privately held rendering facility that accepts and processes (renders) inedible animal byproducts from supermarkets, butcher shops, restaurants, feedlots, ranches, and dairies. SRC takes these materials and recycles them into products that are used in the manufacturing of

Copyright 2015 Kleinfelder

soap, paints, cosmetics, lubricants, candles, animal feed, and biofuel.[4] The facility possesses 10 permits to operate from the SMAQMD. The permits are for devices at the facility with the potential for emissions and devices that control potential emissions from the facility. Detailed information regarding all of the processes at the facility is not available, but the permits to operate indicate that at least the potentially emitting systems shown in Table 2-1 are present at the facility.

Table 2-1
SMAQMD Permits to Operate for SRC[5]

Permit	Issue Date	Device
21357	April 26, 2010	Tower Scrubber venting room air from process building. Outlet to the atmosphere.
21356	April 26, 2010	APC scrubber.
18424	November 8, 2005	Regenerative Thermal Oxidizer (RTO), inlet from the venturi scrubber and outlet to the Spray Tower Scrubber
18423	November 8, 2005	Spray Tower Scrubber venting room air from the loading area and the RTO. Outlet to the atmosphere.
17222	September 23, 2004	Venturi Scrubber. Outlet to the RTO. Inlet is from the two APC condensers.
17221	September 23, 2004	Cross Flow Scrubber. Inlet from room air in the cooking room. Outlet to the atmosphere.
17219	Re-issued September 23, 2004	Two APC Condensers. Inlet is from the process cookers. Outlet to the APC scrubber.
2822	Re-issued December 15, 2004, Issued October 20, 1979	Rendering Plant.
19480	Not Available	Boiler.
19479	Not Available	Boiler.

As Table 1 shows, the facility has a number of air pollution control devices to reduce the potential for emissions and potential odors. These devices can remove well over 90 percent of potential emissions (see Section 6.3).

[5] *List of SMAQMD Permits to Operate*. E-mail from Todd Smith to Jim Wiley dated March 11, 2015.

Copyright 2015 Kleinfelder

Both SRC and the SMAQMD have worked to reduce the potential for emissions and odor complaints from the facility; and the most recent emission control systems installed, the Tower Scrubber and APC scrubber installed in 2010, were as a result of a voluntary commitment to install additional control equipment because of new development in the Sunrise/Douglas area[6].

3 REGULATIONS AFFECTING POTENTIAL EMISSIONS AT SRC

3.1 SMAQMD REGULATIONS

The SMAQMD regulates facilities with the potential to emit any air contaminant and publishes regulations requiring permits to construct and operate any source of emissions and for any type of emission control equipment. SMAQMD also publishes prohibitory rules that apply to specific operations or contaminants. Two of the SMAQMD prohibitory rules that specifically apply to rendering plants such as SRC are Rule 410 – Reduction of Animal Matter and Rule 406 – Specific Contaminants[7]. Rule 410 specifies minimum standards for emission controls on animal rendering plants while Rule 406 specifies maximum emissions of sulfur compounds from any type of facility, including rendering plants. Some sulfur compounds can be odorous (e.g., mercaptans).

In addition to the device-specific prohibitory rules, SMAQMD has a general nuisance rule, Rule 402. Under most scenarios, Rule 402 would apply when a facility operating in compliance with permit conditions is still causing a public odor nuisance. However, California Civil Code Section 3482.6, "The Right to Farm Act", specifically (i) includes rendering plants in the definition of agricultural activity, and (ii) exempts agricultural processing facilities and rendering plants from nuisance rules if the nuisance is due to changed conditions that occur after an agricultural activity has been in continuous operation for more than three years (so long as it was not a nuisance at the time it began operation). This is the case for SRC, and thus the general nuisance rule does not apply to SRC[8].

3.2 OTHER CALIFORNIA REGULATIONS

Potential odors from rendering plants and similar facilities are the subject of regulations in other portions of California as well. For example, the Bay Area Air Quality Management District (BAAQMD) has published Regulation 7, Odorous Substances[9]. This regulation establishes an

[6] *Regulatory Authority*, op.cit.

Copyright 2015 Kleinfelder

ambient odor standard of 4 odor units (see Section 5.0 for discussion of odor units) and establishes maximum emission limits for some odorous compounds, such as mercaptans. However, Regulation 7 does not apply until there are at least 10 odor complaints within 90 days and exempts agricultural operations.

The South Coast Air Quality Management District (SCAQMD) recently proposed a regulation specifically addressing odors from rendering plants. This regulation, Proposed Rule 415, was initially proposed on November 18, 2014 and addresses potential odors through requirements for emission controls rather than an ambient standard[10].

4 ODOR COMPLAINTS

4.1 DISTANCE FROM FACILITIES

One indication of the effectiveness of emission control systems is the frequency of odor complaints associated with a rendering plant and the distance from the plant that odors occur. For example, the SCAQMD reported that nearly all of the odor complaints associated with four rendering plants in Vernon, California, occurred within 1.4 miles of the facilities[11]. Another study of odor complaints found that 20 of 21 odor complaints all occurred within 700 meters (0.4 miles) of the emitting facility[12].

4.2 ODOR COMPLAINTS ASSOCIATED WITH SRC

The SMAQMD provided a report of odor complaints in the vicinity of SRC for the period September 10, 2008 through September 11, 2013[13]. A summary of the number of complaints is shown in Table 4-1.

Table 4-1
SMAQMD Reported Odor Complaints Associated with SRC

Calendar Year	Number of Complaints	Comments
2008	191	There were 27 complaints from September 10 through December 31, 2008. This value was extrapolated to an annual value for 2008 by calculating the ratio of the number of complaints from September 12 - December 31, 2009 to the number of complaints for January 1 - September 11, 2009. This ratio is 7.07 and was multiplied times the 27 complaints recorded from September 10, 2008 – December 31, 2008 to arrive at an estimated value of 191 complaints for all of 2008.
2009	106	Tower Scrubber and APC scrubber installed.
2010	25	
2011	29	
2012	15	
2013	24	There were 20 complaints from January 1, 2013 through September 11, 2013. This value was extrapolated to an annual value for 2013 by calculating the average ratio of the number of complaints from January 1 through September 11 of each of the years 2009, 2010, 2011, and 2012 to the number of complaints for September 12 through December 31 of each year. This ratio is 1.22 and was multiplied times the 20 complaints recorded from January 1 – September 11, 2013 to arrive at an estimated value of 24 complaints for all of 2013.

Table 4-1 shows the dramatic decrease in odor complaints as the result of the new emission control equipment installed at the facility in 2010. Note that the SMAQMD Complaint System did not record the distance from the facility that the odor complaints occurred. If the complaints were from the residences as opposed to persons driving by the facility, the complaints would most likely be from the residences located nearest the facility, about 0.75 miles away.

5 ODOR THRESHOLDS

Different individuals perceive odors differently. There is a wide range of response to an odor stimulant, and the variability in response is a function of the individual's sensitivity to specific compounds. A person can be hypersensitive to one chemical and virtually non-responsive to another. In addition, a person often detects the presence of an odor before he or she

Copyright 2015 Kleinfelder

recognizes an odor quality. Detection and recognition thresholds have been published by several researchers and the American Industrial Hygiene Association (AIHA).[14] These thresholds are in terms of a concentration that can be detected/recognized by approximately 50 percent of the population. There are various studies that attempt to determine odor thresholds, and the range of results is often quite extensive. Table 5-1 shows odor detection and recognition thresholds used in this Technical Memorandum. The information in Table 5-1 came from AIHA[15], SCAQMD[16], and the Environmental Engineer's Handbook[17] publications.

Table 5-1
Odor Detection and Recognition Thresholds of Typical Chemicals Associated with Rendering Plants

Compound	Detection Threshold	Reference (Note 1)	Recognition Threshold	Reference (Note 1)
Butyric Acid	0.5 ppbv	Handbook	1.0 ppbv	Handbook, SCAQMD
Ethyl Mercaptan	0.35 ppbv	AIHA	0.40 – 1.0 ppbv	AIHA, SCAQMD
Methyl Mercaptan	0.54 ppbv	AIHA	1.0 – 2.2 ppbv	AIHA, SCAQMD
Hydrogen Sulfide	1.0 ppbv	AIHA (Note 2)	4.7 ppbv	SCAQMD
Indole	0.1 ppbv	Handbook	1.0 ppbv	SCAQMD

Note 1: See text for explanation of references.
Note 2: AIHA reported the geometric mean detection threshold from the literature for hydrogen sulfide to be 9.4 ppbv, which is greater than the recognition threshold geometric mean. Accordingly, the lowest detection value reported by AIHA was used.

Detection and recognition thresholds can have quite different responses in exposed individuals. For example, when a person is exposed to a very low concentration of hydrogen sulfide, on the order of 1.0 ppbv, the odor is characterized as musty or damp[18]. But if one is exposed to on the order of 30 ppb of hydrogen sulfide, the odor is more like the traditional rotten egg odor associated with hydrogen sulfide[19].

When there is a mix of chemicals, the odor detection and recognition thresholds are not necessarily the same as for an individual chemical (e.g., a chemical with a very strong or unpleasant odor can mask a chemical that has a more pleasing odor). Accordingly, when there is a mix of chemicals the term "odor unit" is used to indicate the odor-causing potential of the chemical mix. An odor unit is the amount of dilution that must occur such that the odor of a given volume of a gas is no longer detectable for 50 percent of the population. For example, if four parts of odor-free air must be mixed with one part of a given gas, that gas has an odor unit of 4.0. As indicated previously, the BAAQMD has established a 4.0 odor unit ambient standard. Other agencies or groups have suggested an ambient odor standard of from 1 to 50 odor units[20].

6 POTENTIAL FOR ODORS FROM SRC AT JACKSON TOWNSHIP

6.1 ATMOSPHERIC DISPERSION MODEL

In order to assess the potential for odors from SRC at the Jackson Township, an atmospheric dispersion model was used. The dispersion model, AERMOD (Version 14134, as provided by BEE-Line Software, Version 10.16), was run with Sacramento Mather Airport meteorological data for the period 2009 to 2013, the most current processed data available. The Mather Airport is only about 3 miles north-northwest of the proposed Jackson Township and represents the meteorological conditions at SRC and vicinity extremely well. The AERMOD dispersion model is approved for use by the US Environmental Protection Agency, California Air Resources Board, and SMAQMD. The model was run with regulatory defaults in urban mode.

Attachment B shows a wind rose for the Mather Airport meteorological data. The spokes on the wind rose indicate the direction and frequency that the wind blows from. For example, approximately 9 percent of the time, the wind is from due south. The colors on the spokes represent the frequency of the wind speed category. For example, the wind speed for winds blowing from due south is less than 3.6 meters per second (8 miles per hour) about 5 percent of the time (the yellow portion of the south spoke in Attachment B). The wind rose shows that the prevailing winds in the vicinity of SRC are from the southern sector, and almost no wind blows from SRC towards the Jackson Township (i.e., easterly to westerly winds occur less than 5 percent of the time).

In order to use an atmospheric dispersion model, an emission rate has to be entered into the model (in terms of grams per second [g/sec] or other emission units per unit of time). If the emitting facility is modeled as a single stack, a normalized (unit) emission rate can be used to model ambient concentrations in terms of the normalized emission rate. For this study, SRC was modeled as a single effective stack. It is recognized that there are several stacks and emitting points at SRC, but data are not available regarding the individual stack characteristics, and as long as one is assessing ambient concentrations at relatively long distances (such as is the case for this study, 0.75 to 1.5 miles or more), a single effective stack representation is a reasonable approximation. The single stack parameters assumed for the model are shown in Table 6-1.

Table 6-1
Modeled Stack Parameters for SRC

Parameter	Value	Comments
Stack Height	35 feet, 10.67 meters	Reported by SRC in the permit application for the Tower Scrubber.
Stack Diameter	6 feet, 1.83 meters	Determined from aerial photos of SRC.
Exhaust Temperature	120 °F, 322.04 °K	Assumed conservatively low value for an exhaust temperature slightly greater than ambient because many of the systems vent both process and room air.
Exit Velocity	17.42 m/sec	SRC reported in the permit application for the Tower Scrubber that the exhaust flow is 92,000 scfm, which equals 97,068 acfm which equates to an exit velocity of 17.42 m/sec for a 1.83 meter diameter stack.
Normalized Emission Rate	1 gram per second	Unit emission rate.
Concentration of Normalized Emission Rate in Stack	23,000 ug/m^3	1 g/sec divided by 43.4 m^3/sec = 0.023 g/m^3 = 23,000 ug/m^3.
Building Dimensions	20 feet, 6.10 meters	Assumed building dimensions based on an aerial photo. Although downwash was included in the model, it will not be important due to the distant (at least 1.2 km) and thus actual building dimensions are not critical.

The dispersion model calculates ambient concentrations at defined geographic locations called receptors. For this study receptors were placed on the eastern side of the Jackson Township where housing or other permanent structures are proposed to be built and at locations of existing housing developments in the area as shown in Figure 1, Attachment A. Since odor

Copyright 2015 Kleinfelder

detection is a short term phenomenon, the dispersion model was run for 1-hour concentrations. The AERMOD model output is provided in Attachment C. The maximum 1-hour ambient concentrations per normalized emission rate are shown in Table 6-2. Table 6-2 also shows the atmospheric dispersion factor, which is the ratio of the modeled in-stack concentration to the ambient concentration. Thus, if one knows the in-stack concentration of a given compound, the in-stack concentration can be multiplied by the atmospheric dilution factor to determine the ambient concentration of that compound.

Table 6-2
Maximum 1-hour Modeled Concentrations

Receptor	Receptor Number (see Figure 1)	Receptor Location	Date and Time	Normalized Concentration	Atmospheric Dilution Factor
Point of Maximum Impact at Existing Housing (PMI)	10	653808 m Easting, 4265626 m Northing	May 24, 2012; 2100	5.07 ug/m^3	0.00022
Point of Maximum Impact at Proposed Jackson Township (Jackson maximum impact point)	29	650708 m Easting, 4264227 m Northing	May 8, 2009; 2000	3.70 ug/m^3	0.00016

The overall PMI is near the housing east of SRC (east of Sunrise Boulevard) and the maximum Jackson impact point is the receptor to the southwest of SRC. This impact point is a proposed Jackson Township Specific Plan agricultural area but there is the possibility for housing development in that area and thus it has been included in the evaluation.

6.2 POTENTIAL EMISSIONS FROM SRC

Traditionally, emitting sources report only emissions of criteria pollutants. The criteria pollutants are sulfur oxides, nitrogen oxides, carbon monoxide, ozone, particulate matter, and lead. The criteria pollutants are not generally associated with adverse odors (unless present in extremely high concentrations). Ozone is not generally emitted, but emissions of reactive organic gases (ROG) can photochemically react in the atmosphere to create excess ozone. At times, facilities report the emissions of total organic gases (TOG) that include ROG plus other non-reactive

Copyright 2015 Kleinfelder

organic compounds, such as methane. Typically, the term volatile organic compounds (VOC) is used interchangeably with ROG. Facilities in California are also required to report emissions of toxic air contaminants and other potentially toxic compounds, but these compounds are not generally associated with odors except in extremely high concentrations. Accordingly, facilities do not routinely report emissions of odor-causing compounds and emission rate data for specific odorous compounds from SRC are not available.

On the other hand, there has been research into emissions of odor causing chemicals at rendering plants. This research reports emissions in terms of a mass emission rate of a specific chemical (e.g., g/sec emissions of mercaptans) or in terms of an odor unit emission rate (e.g., odor units per second). Some of the research reports do not report the emission rate of the odor causing chemicals nor the emission rate of odor units, but rather the in-stack concentration of the compounds of interest.

Since information regarding emissions from SRC was not available, for this study, several research reports were consulted and used to estimate emissions from SRC. Emissions are a function not only of the process that generates the emissions but the nature and effectiveness of emission control systems, such as RTOs and scrubbers. Table 6-3 summarizes the results of the emission estimates found in various research studies. The literature cited for the data in Table 6-3 are noted in the footnotes.

Table 6-3
Typical Emissions from Rendering Plants

Case No.	Emission Source	Emission Controls	Emission Rate or In-Stack Concentration	Comments

mg/m^3 = milligrams per cubic meter. ppbv = parts per billion by volume.

6.3 POTENTIAL AMBIENT CONCENTRATIONS OF ODOR-CAUSING CHEMICALS AT SRC

The emission rates shown in Table 6-3 for typical rendering plants and an assumed control efficiency of the air pollution control devices at SRC can be coupled with the atmospheric dilution factors found in the AERMOD model to calculate an estimated ambient concentration of odor-causing chemicals at the two maximally-exposed receptors: the PMI located at the existing housing east of SRC and the maximum impact point at the proposed Jackson Township to the west of SRC.

When the emission estimates are in terms of concentration (i.e., odor units, concentration of a specific compound in terms of parts per billion by volume [ppbv], or concentration of a specific

Copyright 2015 Kleinfelder

compound in terms of milligrams per cubic meter [mg/m^3]), the ambient concentration at the receptor of interest is calculated as follows:

> Ambient Concentration = Uncontrolled In-Stack Concentration (OU, ppbv, mg/m^3) x [(1 - Air Pollution Control Device Efficiency), percent] x Atmospheric Dilution Factor

When the emission estimates are in terms of tons per year, the ambient concentration is calculated as follows:

> Ambient Concentration = Uncontrolled Emissions (tons per year converted to g/sec) x [(1 - Air Pollution Control Device Efficiency), percent] x Normalized Concentration (ug/m^3 per g/sec)

The emission control effectiveness for scrubbers alone was conservatively assumed to be 69 percent based on a study that evaluated emission controls at rendering plants. (Note that this low efficiency is typically associated with plain water scrubbers. Addition of oxidizing agents to the scrubbing liquid can greatly increase the efficiency of scrubbers; but to be conservative, the 69 percent value was used.) Emission control effectiveness for RTOs was assumed to be 99% based on the same study[35]. The combination of emissions control for scrubbers plus an RTO (as is used for at least some of the emission streams at SRC, see Table 2-1) is, therefore, 99.7 percent [(1-0.69) x (1-0.99) = 0.003 = (1 – 0.997)].

Table 6-4 presents the results of the ambient concentration calculations for the cases in Table 6-3. The calculations in Table 6-4 use the air pollution control equipment that SRC employs. As noted in Table 2-1, some of the emission streams at SRC are controlled by two devices, a scrubber and an RTO, while some of the other emission streams are controlled only by scrubbers. Therefore, ambient concentrations for both types of emission control are shown in Table 6-4.

Example calculations for the values shown in Table 6-4 are as follows:

Example 1: Case 1, Emissions in Terms of Odor Units, Scrubber Alone, PMI

> Ambient Concentration = 3,000 OU Inlet Concentration to Scrubber x (1-0.69) Control Efficiency of a Scrubber x 0.00022 Atmospheric Dilution Factor at PMI = 0.20 OU.

Example 2: Case 3, Emissions in Terms of Tons Per Year, No Additional Control, Jackson Impact Point

> Ambient Concentration = [0.12 tons per year x (1 yr / 8760 hours x (1 hour / 3600 seconds) x 2000 pounds per ton x 453.6 grams per pound] x (1 – 0) Additional Emission Control Efficiency = 0.0034 g/sec x 3.7 ug/m^3 per 1 g/sec emissions = 0.013 ug/m^3.

[35] Sironi, et al., op.cit.

Copyright 2015 Kleinfelder

Example 3: Case 13, Emissions in Terms of Compound Concentration, Scrubber + RTO, PMI

Ambient Concentration = 24,661 ppbv inlet concentration of methyl mercaptan x (1-0.997) Control Efficiency of a Scrubber + RTO x 0.00022 Atmospheric Dilution Factor at PMI = 0.02 ppbv methyl mercaptan.

Table 6-4 (continued)
Potential Ambient Concentration from Odor-Causing Emissions at Receptors of Interest

Case No.	Emission Rate or In-Stack Concentration After Noted Controls from Original Research	Air Pollution Control Systems Assumed for Emission Stream at SRC	Additional Control Efficiency (Note 1)	Ambient Concentration at PMI	Ambient Concentration at Jackson
13	Methyl Mercaptan 24,661 ppbv (no control)	Scrubber + RTO	99.7%	0.02 ppbv	0.01 ppbv
14	Hydrogen Sulfide 114,895 ppbv (no control)	Scrubber + RTO	99.7%	0.08 ppbv	0.06 ppbv

Note 1: When the emissions from the original research for a specific case already include a scrubber (i.e., the emission estimates were after the scrubber), then the additional control efficiency is zero for scrubbers and only 99% for the RTO. When the case has extremely high concentrations of odor-causing chemicals, it is assumed that SRC controls those emission streams with both a scrubber and RTO.

Note 2: Research indicates that less than about 20 percent of the TOG emissions from rendering plants are associated with odors.[36]

Note 3: A conservative assumption was made that all of the odor-causing chemicals have an odor detection and recognition threshold of butyric acid or ethyl Mercaptan. For butyric acid, 1 ug/m^3 is equivalent to 2.7 ppb and for ethyl mercaptan, 1 ug/m^3 is equivalent to 3.8 ppbv.

Note 4: Research indicates that 29.24 percent of VOC emissions from rendering plants are aliphatic hydrocarbons, and 18.32 percent are aromatic hydrocarbons[37]. A conservative assumption was made that half of the aliphatic hydrocarbons are butyric acid and half of the aromatic hydrocarbons are indole. For butyric acid, 1 ug/m^3 is equivalent to 2.7 ppb and for indole, 1 ug/m^3 is equivalent to 2.0 ppbv.

6.4 Interpretation of Model Results

The ambient concentration results for the PMI and the Jackson maximum impact point can be interpreted in terms of odor detection thresholds and odor recognition thresholds. As discussed previously, the BAAQMD established an odor standard of 4 OU. This standard could be used as a recognition threshold. Detection of odors is more complex, but considering the definition of the odor unit, an OU of 1 or less could be considered a detection threshold. For specific chemicals, Table 5-1 shows the applicable detection and recognition thresholds. The ambient concentrations calculated in Table 6-4 are compared to these thresholds as shown in Table 6-5.

There are a total of 18 different emission estimates presented in Table 6-5, and in only one case did the calculations indicated the possibility of a detectable and recognizable odor at the Jackson maximum impact point (Case 9). However, the modeled concentration for that case is only 5 percent greater than the 4.0 OU BAAQMD ambient standard. In 4 more of the 18 cases, the calculations indicated a potential for a detectable, but not recognizable, odor at the Jackson maximum impact point. Note that the results of Table 6-5 do not indicate that an odor would necessarily actually be detected at the Jackson Township, but only that if the assumed emissions and maximum modeled concentration occur at the same time, there is a potential for odor detection.

Table 6-5 also shows that the potential for detectable and recognizable odors at the existing housing to the east of SRC is greater than at Jackson Township, because the atmospheric dilution from SRC to the eastern housing is not as great as for Jackson Township, so the ambient concentrations would be higher. However, for both Jackson and the PMI, the potential for odors appears very small because the emissions from SRC are well controlled and the distance from SRC to the housing is considerable. This result is consistent with the recent dramatic decline in odor complaints associated with SRC recorded by SMAQMD.

Note also that the results shown in Table 6-5 are for the maximum impact points only and the maximum 1-hour concentration out of five years of meteorological data (the maximum single hour out of a total of 43,800 hours). As shown in the wind rose of Attachment B, the wind is more than 10 times more likely to blow from SRC toward the housing to the east and north of SRC than from SRC toward the Jackson Township. The wind rose also shows that for over 95 percent of the time, the wind blows from SRC away from the Jackson Township.

Furthermore, it is important to recognize that the results in Table 6-5 are for the closest point of the Jackson Township to SRC. The Jackson Township extends for another 1.5 miles further west of the Jackson maximum impact point, and since odor detection falls off rapidly with distance, for the vast majority of the Jackson Township, no odors from SRC should be detectable or recognizable.

7 CONCLUSION

This evaluation of the potential for odors at the Jackson Township arising from the SRC facility indicate that although it is possible for detectable odors to occur at the maximum

Copyright 2015 Kleinfelder

impact point at the Jackson Township, the frequency of such odors, if any, will be very low. Any detectable odors at the Jackson Township are at least 10 times less likely than for the existing housing to the north and east of SRC. This conclusion is based on the effectiveness of the emission control systems employed by SRC, the distance from SRC to the Jackson Township, and the documented prevailing wind direction in the vicinity.

8 LIMITATIONS

This work was performed in a manner consistent with that level of care and skill ordinarily exercised by other members of Kleinfelder's profession practicing in the same locality, under similar conditions and at the date the services are provided. Our conclusions, opinions, and recommendations are based on a limited number of observations and data. It is possible that conditions could vary between or beyond the data evaluated. Kleinfelder makes no other representation, guarantee, or warranty, express or implied, regarding the services, communication (oral or written), report, opinion, or instrument of service provided. This report may be used only for the Jackson Township Specific Plan by Tsakopoulos Investments and only for the purposes stated for this specific engagement within a reasonable time from its issuance, but in no event later than two years from the date of the report.

The work performed was based on project information provided by Tsakopoulos Investments. Kleinfelder offers various levels of investigative and engineering services to suit the varying needs of different clients. It should be recognized that definition and evaluation of environmental conditions are a difficult and inexact science. Judgments leading to conclusions and recommendations are generally made with incomplete knowledge of the facility and conditions present due to the limitations of data. Although risk can never be eliminated, more detailed and extensive studies yield more information, which may help understand and manage the level of risk. Since detailed study and analysis involves greater expense, our clients participate in determining levels of service that provide adequate information for their purposes at acceptable levels of risk. More extensive studies should be performed to reduce uncertainties. Acceptance of this report will indicate that Tsakopoulos Investments has reviewed the document and determined that it does not need or want a greater level of service than provided. Tsakopoulos Investments is solely responsible for required notifications, if any, to all regulatory and governmental agencies regarding observations contained in this report.

1.0 EXECUTIVE SUMMARY

The Jackson Township Specific Plan Area (JTSPA or Plan Area) is located central Sacramento County, north of Jackson Highway approximately four miles east of Sacramento City limits. The proposed JTSPA consists of ±1,367 acres of land that is currently utilized for a variety of purposes: livestock grazing, cropland, rural residential, and the Sacramento Raceway. Land uses surrounding the project site include: rangeland, cropland, rural residential and aggregate mining.

Foothill Associates has evaluated the biological resources in the JTSPA. This evaluation included review of relevant natural resource documents and also included field survey of portions of the Specific Plan Area conducted at various times between 2004 and 2013. The purpose of this document is to summarize the general biological resources on the site, to assess the suitability of the site to support special-status species and sensitive habitat types, and to provide recommendations for regulatory permitting or further analysis required prior to development activities occurring within the project site.

This report contains information and analysis for both the participating property (the ±889-acre Excelsior Estates property owned by Tsakopoulos Investments) and non-participating properties (the balance of the JTSPA). Foothill Associates had access to participating properties and therefore specific details about biological resources on that property is included in this document. For non-participating properties information and analysis relies on review of aerial photography, published studies, and visual observations at ground-level from participating properties and from public roadways.

Habitat types occurring on the site include: annual grassland, irrigated pasture and ditch, northern hardpan vernal pool, seasonal wetland, marsh, irrigation pond, and ephemeral drainages. Rural residential properties may contain some of these natural communities, but they also typically support non-native cultivated species typically planted around homes and gardens.

Known or potential biological constraints in the JTSPA include:

- Existing and potential habitat for special-status vernal pool plant and animal species, including state and federally listed species and critical habitat for those species;
- Potential habitat for other special-status aquatic plant and animal species;
- Potential foraging and nesting habitat for Swainson's hawk, a state-listed species;
- Potential foraging and nesting habitat for other special-status birds species;
- Sensitive habitats including: Morrison Creek, vernal pools, marshes, other potential waters of the U.S.; and
- Potential for protected trees.

2.0 INTRODUCTION

This report summarizes the findings of a Biological Resources Assessment (BRA) completed for the ±1,367-acre Jackson Township Specific Plan Area (JTSPA or Plan Area), located within Sacramento County, California (**Figure 1**). This document addresses the onsite physical features, the plant communities present, and the common plant and wildlife species occurring, or potentially occurring on the site. Further, the suitability of habitats to support special-status species and sensitive habitats are analyzed and recommendations for any regulatory permitting or for further analysis required prior to development activities on the project site are included.

This report analyzes natural resource information for the entire JTSPA, but on-the-ground field surveys only occurred on the participating property, in this case the ±889-acre Excelsior Estates property (**Figure 2**). No field survey was conducted on the balance of the JTSPA and review of natural resource documents, soil surveys, aerial photography, and observations made while on participating properties or from public rights-of-way form the basis for analyzing resources on non-participating properties.

2.1 Specific Plan Project Overview

The proposed Jackson Township Specific Plan Area (JTSPA) (Plan Area), approximately 1,367 acres, is located in southeastern Sacramento County, lying south of the Mather Specific Plan Area (MSPA), east of Excelsior Road, north of Jackson Highway and west of Eagles Nest Road in the Vineyard Community (**Figure 1**). The largest landowner, Excelsior Estates LLC, represented by Angelo G. Tsakopoulos, owns and/or controls approximately 889 acres (approximately 65%) within the Plan Area boundaries, referred to as Excelsior Estates. The remaining area is referred to as the "non-participating properties."

The Proposed Project includes a mix of land uses including low density, medium density, and high density residential, commercial and office development, and open space. Proposed open space includes lands along the northern and eastern portions of the site, intended to provide preservation of vernal pool grassland habitat. These preserves are contiguous with similar preserves on lands to the north and east and are consistent with the conservation strategy in the proposed South Sacramento Habitat Conservation Plan (SSHCP).

Additional open-space within the Plan Area includes two drainage corridors, intended to maintain surface drainage across the subject property. These corridors will contain meandering low-flow channels and will be planted with native trees and shrubs, forming two riparian woodland corridors within the Plan Area. The natural open space uses within the Plan Area encompass approximately 300 acres.

3.0 METHODS AND SOURCES OF INFORMATION

Available information pertaining to the natural resources of the region was reviewed. All references reviewed for this assessment are listed in the **References** section of this document. Site-specific information reviewed includes:

- California Department of Fish and Wildlife (CDFW). 2013. *Rarefind California Natural Diversity Database* (CNDDB). July 24, 2013. California Department of Fish and Wildlife, Sacramento, CA.;
- California Native Plant Society. 2013. *Inventory of Rare and Endangered Plants* (online edition, v6-04d). California Native Plant Society. Sacramento, CA;

- Foothill Associates. 2010. *90-Day 2009-2010 Wet-Season Survey for Listed Vernal Pool Branchiopods, Excelsior Estates, Sacramento County, California* (**Appendix E**);
- Foothill Associates. 2014. *Special-Status Plant Surveys on the ±886-Acre Excelsior Estates Site, Sacramento County, California*. August 5, 2014 (**Appendix D**);
- U.S. Fish and Wildlife Service (USFWS). 2013. *Federal Endangered and Threatened Species that may be affected by Projects in the Carmichael 7.5 minute series quadrangle Sacramento, CA*.; and
- U.S. Geological Survey. 1992. *Carmichael, California*. 7.5-minute series topographic quadrangle. United States Department of Interior, U.S. Geological Survey, Reston, Virginia.

Foothill Associates' biologists conducted site visits, a wetland delineation, and various field surveys of the Excelsior Estates site on a variety of dates between 2004 and 2013. These site visits included inspections in all seasons. Some surveys were general in nature, including site visits with resource agency and County personnel. Other surveys were targeted address specific plants or animals. Specific survey dates are listed in the enclosed reports (see **Appendices A through F**).

For non-participating properties, Foothill Associates' biologists relied on relevant natural resource studies, soil surveys, aerial photography, and ground-level observations made from participating properties and from public rights-of-way. The extent of aquatic habitat and upland communities within these areas was made through aerial photo interpretation, with aquatic habitats digitized into a Geographic Information System (GIS). "Windshield surveys" provided limited ground-truthing of aerial photo observations.

4.0 REGULATORY SETTING

4.1 Federal Laws and Policies

4.1.1 Federal Endangered Species Act

The United States Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3)(19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

FESA and Clean Water Act (CWA) Section 404 guidelines prohibit the issuance of wetland permits for projects that jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of critical habitat of such species. The U.S. Army Corps of Engineers (Corps) must consult with the U.S. Fish and Wildlife Service (USFWS) and/or the National Marine Fisheries Service (NMFS) when threatened or endangered species under their jurisdiction may be affected by a proposed project. In the context of the proposed project, FESA would be initiated if development resulted in take of a threatened or endangered species or if issuance of a Section 404 permit or other federal agency action could jeopardize the continued existence of an endangered or threatened species or adversely modify critical habitat of such a species.

4.1.2 Migratory Bird Treaty Act

The federal Migratory Bird Treaty Act (MBTA), first enacted in 1916, prohibits any person, unless permitted by regulations, to: "pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird, included in the terms of this Convention . . . for the protection of migratory birds . . . or any part, nest, or egg of any such bird." (16 U.S.C. 703).

The list of migratory birds includes nearly all bird species native to the United States. The Migratory Bird Treaty Reform Act (MBTRA) of 2004 further defined species

protected under the act and excluded all non-native species. The statute was extended in 1974 to include parts of birds, as well as eggs and nests. Thus, it is illegal under MBTA to directly kill, or destroy a nest of, nearly any bird species, not just endangered species. Activities that result in removal or destruction of an active nest (a nest with eggs or young being attended by one or more adults) would violate the MBTA. Removal of unoccupied nests, or bird mortality resulting indirectly from disturbance activities, is not considered a violation of the MBTA.

4.1.3 Clean Water Act, Section 404

The U.S. Army Corps of Engineers (Corps) regulates discharge of dredged or fill material into waters of the United States under Section 404 of the Clean Water Act (CWA). "Discharge of fill material" is defined as the addition of fill material into waters of the U.S., including, but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; fill for intake and outfall pipes and subaqueous utility lines." [33 C.F.R. §328.2(f)]. Section 404 of the Clean Water Act requires that a permit be obtained from the Corps prior to discharging dredged or fill material into the "waters of the United States." Typical activities requiring Section 404 permits are:

- Depositing fill or dredged material in waters of the U.S. or adjacent wetlands to facilitate site development for residential, commercial, or recreational uses. Construction of revetments, groins, breakwaters, levees, dams, dikes, and weirs.
- Placement of riprap and road fills.

A new rule published on June 29, 2015 and which went into effect on August 28, 2015 clarified the extent of the Corps' jurisdiction over wetlands and other, non-navigable waters. The term "waters of the United States" includes (a) traditional navigable waters, (b) interstate waters, (c) territorial seas, (d) impoundments of jurisdictional waters, and (e) their tributaries. Tributaries must have a bed and bank and ordinary high water mark and may have ephemeral, intermittent, or perennial flow. Additionally the rule defines "adjacent waters" as jurisdictional due to their significant nexus with a jurisdictional water in class (a) through (e). Adjacent waters include any waters located in whole or part within 100 feet of a jurisdictional water in class (a) through (e); any waters located within the 100-year floodplain and within 1,500 feet of a jurisdictional water in class (a) through (e); and any waters within 1,500 feet f the ordinary high water mark of a traditionally navigable water, territorial sea, or the Great Lakes. Five classes of waters, prairie potholes, Carolina bays and Delmarva bays, pocosins, western vernal pools, and Texas coastal prairie wetlands, were determined to be jurisdictional due to their nexus with jurisdictional waters when considered in combination with similarly situated waters. Other waters not previously defined as jurisdictional that are located within the 100-year floodplain of a traditionally navigable water, interstate water, or territorial sea or are within 4,000 feet of the ordinary high water mark of a jurisdictional water in class (a) through (e) are evaluated on a case-specific basis. The rule specifically exempts the following types of features from Federal jurisdiction: waste treatment systems, including

ponds or lagoons designed to meet the requirements of the Clean Water Act, prior converted cropland, ditches with ephemeral or intermittent flow that are not a relocated tributary, excavated in a tributary, or drain wetlands, ditches that do not flow directly or indirectly into a jurisdictional water, artificially irrigated areas that would revert to dry land should irrigation cease, artificial constructed lakes, ponds, reflecting pools, or swimming pools constructed in uplands, water filled depressions created in uplands incidental to mining or construction activity, erosional features, puddles, and stormwater control features and wastewater recycling structures constructed in uplands [33 C.F.R. § 328.3].

The new rule was challenged in court and on October 9, 2015 the U.S. Court of Appeals for the Sixth Circuit stayed the new rule nationwide. Until a final ruling is made, the Corps will continue to operate pursuant to the Supreme Court's decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* (126 S. Ct. 2208) and agency guidance subsequent to this decision. Under these rules, the Corps will assert jurisdiction over wetlands adjacent to traditional navigable waters, relatively permanent non-navigable tributaries (i.e., waters that have a continuous flow at least three months out of the year), and wetlands that abut relatively permanent tributaries. The Corps will determine jurisdiction over waters that are non-navigable tributaries that are not relatively permanent, and wetlands adjacent to these tributaries, by making a determination whether such waters "significantly affect the chemical, physical, and biological integrity of other jurisdictional waters more readily understood as "navigable." Finally, the Corps generally does not consider the following to be "waters of the United States": swales or erosional features (e.g., gullies, small washes characterized by low volume, infrequent or short duration flow) and ditches "wholly in and draining only uplands…which do not carry a relatively permanent flow of water."

4.1.4 Clean Water Act, Section 401

Section 401 of the CWA (33 U.S.C. 1341) requires any applicant for a federal license or permit to conduct any activity that may result in a discharge of a pollutant into waters of the United States to obtain a certification that the discharge will comply with the applicable effluent limitations and water quality standards. This program is meant to protect waters of the United States by ensuring that waste discharged into them meets state water quality standards. Because the water quality certification program is triggered by the need for a Section 404 permit, the definition of "waters of the United States" under Section 401 is the same as that used by the Corps under Section 404.

4.2 State of California Laws and Policies

4.2.1 California Environmental Quality Act

The California Environmental Quality Act (CEQA) requires evaluations of project effects on biological resources. Section 15064.7 of the CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study

checklist contained in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these examples, impacts to biological resources would normally be considered significant if the project would result in any of the following:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by California Department of Fish and Wildlife or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by CDFW or USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and
- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant according to CEQA. This is necessary because although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

4.2.2 California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to FESA but pertains to state-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW) when preparing California Environmental Quality Act (CEQA) documents. The purpose is to ensure that the state lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction, or adverse

modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code §2080). The CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows CDFW to authorize exceptions to the state's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (Fish & Game Code § 2081).

4.2.3 California Porter-Cologne Water Quality Control Act

Water quality in California is governed by the Porter-Cologne Water Quality Control Act (Porter Cologne; Ca. Water Code, Div. 7, §13000 et seq.). Under the California Porter-Cologne Water Quality Control Act, discharges to wetlands and other "waters of the state" are subject to state regulation. Under California State law, "waters of the state" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state". Waters of the State may include waters that not considered a Water of the U.S. This law assigns overall responsibility for water rights and water quality protection to the State Water Resource Control Board (SWRCB) and directs the nine statewide Regional Water Quality Control Boards to develop and enforce water quality standards within their boundaries. In general, the Regional Water Quality Control Boards regulate discharges to isolated waters in much the same way as they do for federal-jurisdictional waters, using the Porter-Cologne Act rather than CWA authority.

4.2.4 California Department of Fish and Game Code

Fish and Game Code, Section 1600 *et. sq.* (Streambed and Lakebed Alteration)

CDFW is a trustee agency that has jurisdiction under Section 1600 *et seq.* of the California Fish and Game Code. Under Section 1602, a private party must notify CDFW if a proposed project will "substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds except when the department has been notified pursuant to Section 1601." If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures.

Fish and Game Code, Section 3503.5 (Raptor Nests)

Section 3503.5 of the California Fish and Game Code states that it is "unlawful to take, possess, or destroy any birds in the order Falconiformes or Strigiformes or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto."

4.2.5 CDFW Species of Concern

In addition to formal listing under FESA and CESA, species receive additional consideration by CDFW and local lead agencies during the CEQA process. Species that may be considered for review are included on a list of "Species of Special Concern," developed by CDFW. It tracks species in California whose numbers, reproductive success, or habitat may be threatened.

4.2.6 California Native Plant Society

The California Native Plant Society (CNPS) maintains a list of plant species native to California that has low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Plants of California* (CNPS 2013). Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS rankings:

- Rank 1A: Plants presumed Extinct in California
- Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere
- Rank 2: Plants Rare, Threatened, or Endangered in California, but more numerous elsewhere
- Rank 3: Plants about which we need more information – A Review List
- Rank 4: Plants of limited distribution – A Watch List

4.3 County Laws and Policies

4.3.1 Sacramento County General Plan

In addition to federal and State regulations, the *Sacramento County General Plan* identifies goals, objectives, and policies to provide further protection to biological resources within the County's limits (Sacramento County 2011). The General Plan's Conservation Element sets forth the goal of "preserving and managing natural habitats and their ecological functions throughout Sacramento County." In furtherance of this goal, Policy CO-58 provides that projects should "ensure no net loss of wetlands, riparian woodlands, and oak woodlands," while Policy CO-59 provides that mitigation should occur for impacts to vernal pools, wetlands, riparian habitats, native vegetation habitats and special status species habitat. The General Plan also seeks to protect native trees. Policy CO-138 encourages protection and preservation of native oak trees measuring a minimum of 6 inches in diameter at breast height. Policy CO-139 requires that native trees, other than oaks, which cannot be protected through development, shall be replaced with in-kind species, the combined diameter of which shall equal the combined diameter of the trees removed. Policy CO-145 requires that non-native tree canopy removed for development be replaced with the equivalent acreage of new tree canopy.

4.3.2 Sacramento County Tree Ordinance

Sacramento County has two tree ordinances. The Tree Ordinance (County Code Chapter 19.04) regulates removal and impacts to public trees, heritage trees, and landmark trees. Public trees are defined as any tree or shrub planted or maintained by the County on an easement, planting easement, street, County park, or public premises; heritage trees are any California oak tree with a trunk sixty inches or greater in girth, which equates to a trunk diameter of approximately 19 inches; landmark trees include any especially prominent or stately tree. The Tree Preservation Ordinance (County Code Chapter 19.12) regulates removal and impacts to any native oak tree. Native oak trees are defined as any valley oak (*Quercus lobata*), interior live oak (*Quercus wislizeni*), blue oak (*Quercus douglasii*), or oracle oak (*Quercus x morehus*) with a trunk diameter of at least 6 inches at 4-1/2 feet above the ground (DBH) or an aggregate DBH of at least 10 inches for multi-trunk trees. Tree permits are required prior to the removal or disturbance, including trenching, grading, or fill within the dripline, of a protected tree.

Additionally, native trees that are 4 inches or diameter or larger at breast height are considered in the County's CEQA review process. Tree species considered through the County's CEQA process include valley oak (*Quercus lobata*), interior live oak (*Quercus wislizeni*), blue oak(*Quercus douglasii*), coast live oak (*Quercus agrifolia*) (in the Delta area), oracle oak (*Quercus x morehus*), native oak hybrids, California sycamore (*Platanus racemosa*), Northern California black walnut (*Juglans hindsii*), Oregon ash (*Fraxinus latifolia*), Goodding's black willow (*Salix gooddingii*), box elder (*Acer negundo* v. *californicum*), white alder (*Alnus rhombifolia*), and California buckeye (*Aesculus californica*). Large, healthy non-native trees are considered in the CEQA review.

4.3.3 Swainson's Hawk Ordinance

The Sacramento County and CDFW jointly developed a methodology for determining foraging habitat impacts in unincorporated Sacramento County. The methodology recognizes that Swainson's hawk foraging habitat value is greater in large expansive open spaces and agricultural areas than in areas which have been fragmented by agricultural-residential or urban development. As a baseline, County staff assumes that properties zoned AG-40 and larger have 100% habitat value, AG-20 properties have 75% and AR-10 properties have 25% habitat value. Properties zoned AR-5 and smaller, such as AR-2, AR-1, the urban residential densities (RD-1 through 40), commercial and industrial zonings, retain no habitat value.

If a project will result in impacts to foraging habitat, there are several options to mitigate this impact. The Sacramento County worked with staff of CDFW to develop an ordinance that provides a simplified means for individual development projects to mitigate impacts to Swainson's hawk foraging habitat on a region-wide basis. The ordinance (Chapter 16.130 of the County Code) which was last amended in 2009 requires mitigation of impacts to Swainson's hawk foraging habitat by preserving similar habitat at a 1:1 mitigation ratio. Projects impacting 40 acres of foraging habitat or more must preserve foraging habitat through conservation easements or transfer of title to either the County or an approved conservation entity. Projects impacting less than 40 acres may preserve foraging habitat through conservation easements or transfer of title to the

County or an approved conservation entity or may pay an impact mitigation fee as determined by the County. The current impact mitigation fees, approved on December 15, 2009, are $10,550 per acre for land acquisition and $2,375 per acre for operations and management. Applicants can also mitigate pursuant to CDFW's 1994 *Staff Report Regarding Mitigation for Impacts to Swainson's Hawks* (*Buteo swainsoni*) *in the Central Valley of California*. According to that staff report, projects within ten miles of an active nest but greater five miles from an active nest shall provide ½ acre of managed habitat, protected via a conservation easement, for each acre of suitable habitat impacted.

4.3.4 South Sacramento Habitat Conservation Plan

The anticipated South Sacramento Habitat Conservation Plan (SSHCP) is a regional approach to conserving species and addressing issues related to urban development, habitat conservation, open space preservation, and agricultural protection. The intent of the SSHCP is to provide a mechanism by which Sacramento County and its partners would be authorized to issue permits that allow landowners to engage in specific development activities (covered activities) that could result in the incidental take of listed species (covered species). Sacramento County would adopt a developer-paid fee based on the projected loss of habitat acreage, habitat type and long-term management costs. These fees would then fund the preservation, restoration and management elements of the anticipated SSHCP. As currently envisioned, the SSHCP would consolidate environmental efforts to protect and enhance vernal pool habitat and other aquatic and upland habitats to provide ecologically viable conservation areas in south Sacramento County for numerous species (Sacramento County 2012).

5.1.1 Site History and Overview

The ±1,367-acre site is located east of Excelsior Road, north of Jackson Highway and west of Eagles Nest Road in the Vineyard Community. The site is located within portions of Sections 23, 24, 25, and 26, Township 8 North, Range 6 East, Mount Diablo Baseline and Meridian, found on the USGS 7.5-minute series *Carmichael, California* topographic quadrangle (**Figure 1**). The site is currently being used for a variety of uses including cattle grazing, cropland, rural residential dwellings, and the Sacramento Raceway.

The majority of the site consists of open rangeland and irrigated pasture. The northwestern portion of the site was formerly used as a nursery and koi farm, which is evidenced by the presence of several large man-made impoundments for holding koi. The Sacramento Raceway occupies approximately 180 acres in the west central portion of the Plan Area. The raceway contains a drag strip, dirt track, motocross track, and associated infrastructure (lights, grandstands, parking etc.). The raceway dates from the mid-1960s.

Rural residences and associated out buildings within the site occur along Excelsior Road along Jackson Highway, and along Tree View Lane. Small areas of cropland (strawberry production) occur along Excelsior Road. The unimproved alignment of Kiefer Boulevard occurs along the northern boundary of the site. While the County has attempted to control access to this dirt road, significant trespass and litter dumping has occurred here. In addition, the portion of the Plan Area north of the Kiefer right-of-way receives significant use by off-road vehicles. There is abundant evidence of campfires, target practice, etc. in this area.

Land uses surrounding the site include open rangeland and residential subdivisions to the north, a large gravel pit and rural residential to the west, open rangeland and rural residential to the south and east.

5.1.2 Topography and Drainage

Moderate rolling hills and extensive flatlands characterize the topography of the site and the surrounding area. Slopes are dominantly convex and incised by shallow drainageways and depressions. Elevation ranges from 75 to 140 feet above mean sea level (MSL). Man-made aquatic features include irrigation and farm ponds, irrigation ditches, and abandoned Koi farm impoundments.

The hydrologic regime on the site is dominated by seasonal rainfall and storm water run-off, primarily between November and April. The site drains primarily to the west via four drainage features. These drainage features consist of a tributary to Morrison Creek, which passes through the northeast corner of the site, an ephemeral drainage within the northwest corner of the site that crosses beneath Excelsior Road and is ultimately

tributary to the mining pit west of Excelsior Road, and two riverine features in the southern half of the site that merge together and form a perennial marsh. From here the drainage flows toward the intersection of Jackson Highway and Excelsior Road. This riverine system forms the headwaters of Elder Creek.

The hydrology of the perennial marsh habitat on the site is largely dependent on nearby artificially irrigated pasture. The pastures are flood irrigated via three irrigation ditches. One of these ditches runs north to south and irrigates the pasture area immediately to the west, as well as directing irrigation water to another ditch that runs east-west and irrigates the pasture area to the south. These ditches are fed irrigation water from a pond via a valve gate. The pond is filled periodically with groundwater pumped from a nearby well. Another north-south running ditch occurs to west of the aforementioned ditch. This ditch irrigates pasture areas to the east and the west. Irrigation water for this ditch comes from groundwater pumped from another well located in the vicinity of this ditch.

5.1.3 Soils

The Natural Resources Conservation Service (NRCS) has mapped eight soil units within the Plan Area (**Figure 3**). The soil units that occur on the Plan Area include: **Hedge loam, 0 to 2 percent slopes**; **Hicksville gravelly loam, 0 to 2 percent slopes**, **occasionally flooded**; **Red Bluff loam, 0 to 2 percent slopes**; **Red Bluff loam, 2 to 5 percent slopes**; **Red Bluff-Redding complex, 0 to 5 percent slopes**; **Redding gravelly loam**, **0 to 8 percent slopes**; **San Joaquin silt loam, 0 to 3 percent slopes**; and **Xerarents-Redding Complex, 0 and 2 percent slopes** (NRCS 1993)**.** General characteristics associated with these soils types are described below.

- **Hedge loam, 0 to 2 percent slopes**: Hedge loam is a moderately deep, moderately well drained soil located on low terraces commonly adjacent to drainageways, on flood plains, and on low stream terraces. This soil formed in alluvium derived from granitic rocks. Permeability is moderately slow and available water capacity is low or moderate. Vegetation typically found on this soil unit consists of non-native annual grasses and herbaceous plant species (NRCS 1993). The hydric soils list for Sacramento County identifies one hydric inclusion within this soil type: Columbia, found on low floodplains (NRCS 2015).

- **Hicksville gravelly loam, 0 to 2 percent slopes, occasionally flooded**: Hicksville gravelly loam is a very deep, moderately well drained soil on low stream terraces and the alluvial flats adjacent to drainageways on high terraces and hills. This soil unit formed in alluvium derived from mixed rock sources. Permeability is moderately slow and the available water capacity is high. Vegetation typically found on this soil unit consists of non-native annual grasses and herbaceous plant species (NRCS 1993). The hydric soils list for Sacramento County identifies two hydric inclusions within this soil type: Cosumnes, found on low floodplains and Columbia, found on floodplains (NRCS 2015).

- **Red Bluff loam, 0 to 2 percent slopes**: Red Bluff loam is a very deep, well drained soil located on intermediate terraces. This soil unit formed in alluvium derived from

mixed rock sources. Permeability is moderately slow and available water capacity is high. Vegetation typically found on this soils unit consists of non-native annual grasses and herbaceous plant species (NRCS 1993). The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type (NRCS 2015).

- **Red Bluff loam, 2 to 5 percent slopes**: Red Bluff loam is a very deep, well drained soil located on high terraces. This soil unit formed in alluvium derived from mixed rock sources. Permeability is slow and available water capacity is high. Vegetation typically found on this soil unit consists of non-native annual grasses and herbaceous plant species (NRCS 1993). The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type (NRCS 2015).

- **Red Bluff-Redding complex, 0 to 5 percent slopes**: Red Bluff soil is a very deep and well drained soil formed in alluvium derived from mixed rock sources. Permeability is slow and available water capacity is high. Redding soil is a moderately deep, moderately well drained formed in gravel and cobble alluvium derived from mixed rock sources. Permeability is very slow and available water capacity is low. This complex is found on high terraces, and usually supports annual grasses and forbs (NRCS 1993). The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil complex (NRCS 2015).

- **Redding gravelly loam, 0 to 8 percent slopes**: Redding gravelly loam is a moderately deep, moderately well drained soil located on high terraces and terrace remnants. This soil unit formed in gravel and cobble alluvium derived from mixed rock sources. Permeability is very slow and available water capacity is low. Vegetation typically found on this soil unit consists of non-native annual grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type.

- **San Joaquin silt loam, 0 to 3 percent slopes**: San Joaquin silt loam is a moderately deep, moderately well drained soil located on low terraces. This soil formed in alluvium derived from dominantly granitic rocks. Permeability is very slow and available water capacity is low. Vegetation typically found on this soil unit consists of non-native annual grasses and forbs, and a few scattered native oaks (NRCS 1993). The hydric soils list for Sacramento County identifies one hydric inclusion within this soil type: Galt, found within depressions (NRCS 2015).

- **Xerarents-Redding complex, 0 to 2 percent slopes**: Xerarents is a moderately deep to very deep, well drained and altered soil formed in fill material mixed by leveling activities. This fill material is derived from nearby soils of mixed origin. Permeability is moderate to very slow and available water capacity is moderate or high. Redding soil is moderately deep and moderately well drained soil formed in gravel and cobble alluvium derived from mixed rock sources. Permeability is very slow and available water capacity is low. Vegetation typically found on this soil complex consists of irrigated pasture grasses and legumes (NRCS 1993). The hydric

soils list for Sacramento County identifies one hydric inclusion within this soil complex: Sailboat, found on low floodplains (NRCS 2015).

5.1.4 Habitats

Excelsior Estates

Annual Grassland

The biological community covering the majority of the Excelsior Estates property is annual grassland. Central Valley annual grassland communities are composed largely of non-native annual grasses and forbs. The dominant plant species observed in the annual grassland consists of soft brome (*Bromus hordeaceus*), wild oat *(Avena* sp.), medusa head (*Elymus caput-medusae*), long-beaked filaree (*Erodium botrys*), hawkbit (*Leontodon taraxacoides*), mouse-tail grass *(Vulpia myuros*), Spanish clover (*Acmispon americanus*), tarplant (*Holocarpha virgata*), Fitch's tarweed (*Centromadia fitchii*), barley (*Hordeum murinum* ssp. *leporinum*), and Italian ryegrass (*Festuca perennis*).

Annual grassland typically supports breeding, foraging, and shelter habitat for several species of wildlife including raptors and migratory birds. Wildlife species observed in the grasslands during site surveys include: western kingbird (*Tyrannus verticalis*), European starling (*Sturnus vulgaris*), Brewer's blackbird (*Euphagus cyanocephalus*), western meadowlark (*Sturnella neglecta*), killdeer *(Charadrius vociferous*), northern mockingbird (*Mimus polyglottos*), northern harrier (*Circus cyaneus*), turkey vulture (*Cathartes aura*), savannah sparrow (*Passerculus sandwichensis*), white-tailed kites (*Elanus leucurus*), red-tailed hawks (*Buteo jamaicensis),* California ground squirrel (*Spermophilus beecheyi*), cottontail *(Sylvilagus* sp.), and black-tailed jackrabbit (*Lepus californicus*).

Northern Hardpan Vernal Pools

The vernal pools on the Excelsior Estates property can be best characterized as Northern Hardpan Vernal Pool according to A Manual of California Vegetation (Sawyer and Keeler-Wolf, 1995). These pools occur on old, acidic, iron-silica cemented soils including Corning, Redding, and San Joaquin soils series (Sawyer and Keeler-Wolf, 1995). Northern hardpan vernal pools are seasonally flooded depressions found on soils with an impermeable hardpan layer. The impermeable layer allows the pools to retain water much longer than the surrounding uplands; nonetheless, the pools are shallow enough to dry up each season. Vernal pools are scattered throughout the site, with the highest density of pools occurring in the east – central portion. Some vernal pools on site are inter-connected by riverine seasonal wetland. This typically occurs where one pool overflows into another relatively regularly.

Whereas California grasslands now contain mostly non-native species, vernal pools typically support a predominance of native plants. Plant species observed within the vernal pools throughout the site are typical of species which are adapted to seasonally inundated conditions. Plant species observed within the vernal pool habitat on site include manna grass (*Glyceria declinata*), coyote thistle *(Eryngium vaseyi*), spikerush (*Eleocharis macrostachya*), hedge-hyssop (*Gratiola ebracteata*), white-headed navarretia

(*Navarretia leucocephala*), annual hairgrass (*Deschampsia danthonioides*), woolly marbles (*Psilocarphus* sp.), and popcorn flower (*Plagiobothrys stipitatus*).

Vernal pools play a valuable role in the food chain for a wide array of animals, including birds of prey, migratory waterfowl, shorebirds, frogs, toads, salamanders and pollinating insects. They are also home for listed vernal pool crustaceans.

Seasonal Wetlands

Seasonal wetland habitat is typically associated with shallow drainages and swales (riverine features) or depressions, that inundate long enough to support hydric soils and hydrophytic vegetation, but do not inundate sufficiently to support vernal pool species. Riverine seasonal wetlands are characterized by the seasonal flow of water induced by the onset of heavy rains. A depressional seasonal wetland is characterized by shallow land depressions that remain saturated for extended periods.

Dominant plant species observed within the seasonal wetland habitat on site include quaking grass (*Briza minor*), Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), Italian ryegrass, annual beard grass (*Polypogon monspeliensis*), annual hairgrass, toad rush, and curly dock (*Rumex crispus*).

Marsh

Both perennial and seasonal marsh habitat occur within the Excelsior Estates property. Aside from perennial marshes remaining inundated or saturated throughout the year, both support perennial herbaceous plant species that tolerate high soil moisture and seasonal to permanent soil saturation or inundation. For both aquatic habitat types, inundation/saturation persists well into the warm season.

Plant species observed within the marsh habitat on site include broad-leaved cattail (*T. latifolia*), narrow-leaved cattail (*T. angustifolia*), bulrush (*Scirpus* spp.), water primrose (*Ludwigia peploides*), pennyroyal (*Mentha pulegium*), nutsedge (*Cyperus eragrostis*), creeping spikerush (*Eleocharis macrostachya*), and four angled spikerush (*Eleocharis quadrangulata*). In addition, wildlife species observed within the marsh habitat include: black phoebe (*Sayornis nigricans*), Brewer's blackbird, red-winged blackbird, ring-necked pheasant, and song sparrow (*Melospiza melodia*).

Marshes provide shelter and foraging habitat for several species of wildlife on the site including resident and migratory bird species, amphibians, reptiles, aquatic invertebrates, and foraging mammals. Wildlife expected to occur in the marsh habitat on the site include: egret, heron, waterfowl, bullfrog, pacific tree frog, opossum *(Didelphis virginiana*), and raccoon (*Procyon lotor*). Most of the marsh habitats on site are supported by summer irrigation runoff.

Irrigated Pasture, Ditch, Drainages, and Farm Ponds

Irrigated pasture habitat is found mainly in the south-central portion of the Excelsior Estates property. Irrigated pasture vegetation is typically a mix of warm-season plants dependent on summer irrigation. The abundance of the vegetation can vary, according to

season and livestock stocking levels, from a few inches to a foot or more. Irrigation ditches and drainages occur on site in association with the pastures. Common species observed in this habitat include: Bermuda grass (*Cynodon dactylon*), nutsedge (*Cyperus eragrostis*), dallis grass (*Paspalum dilatatum*), cattails (*Typha* sp.) and canary grass (*Phalaris* sp.).

The irrigated pasture habitat on site supports breeding, foraging, and shelter habitat for species of wildlife similar to annual grassland habitat discussed above. The irrigation ditches also provide suitable foraging habitat for egrets and herons as well as breeding habitat for amphibians such as bullfrog (*Rana catesbiana*) and pacific tree frog (*Hyla regilla*). Species observed in this habitat during the site surveys include ring-necked pheasant (*Phasianus colchicus*), red-winged black bird *(Agelaius phoeniceus*), yellow-billed magpie (*Pica nuttallii*), phainopepla (*Phainopepla nitens*), and American robin (*Turdus migratorius*).

A number of farm ponds and other impoundments are found in the JTSPA, primarily associated with rural residences. These ponds were constructed by excavation, damming a drainage swale, or some combination of the two. Water supply is assumed to be derived from runoff, although groundwater pumping could also play a role in filling these ponds.

Irrigation Ponds

The largest pond in the Plan Area is found on the Excelsior Estates property. This pond serves as the irrigation water supply for irrigated pastures located in the south-central portion of the site. The pond is located at a relatively high elevation and appears to have been excavated solely for the purpose of irrigation supply.

Aquatic plant species observed in this pond habitat include: cattail, spikerush, meadow fescue (*Festuca pratensis*), hairy willow herb (*Epilobium ciliatum*), bird's-foot trefoil (*Lotus conriculatus*), and water primrose. Willow trees (*Salix* spp.) were observed along the banks of the irrigation pond.

Several species of bird and aquatic wildlife were observed using the irrigation pond, such as great egret, great blue heron, double-crested cormorant (*Phalacrocorax auritus*), green heron (*Butorides virescens*), common moorhen (*Gallinula chloropus*), white-tailed kite, Brewer's blackbird, mallard (*Anas platyrhynchos*), bullfrog, ground squirrel (burrows), and raccoon (tracks).

Rural Residential

A section of rural residential is located in the northwest portion of the Excelsior Estates property and several small areas are located throughout the southern portion of the site. This community consists largely of widely scattered residential houses, driveways, outbuildings, and open pasture and annual grassland. This community has been heavily disturbed by past construction activity and is largely limited to ruderal and annual grassland species, such as filaree, soft brome, hawkbit and pineapple weed (*Matricaria discoidea*).

Non-Participating Properties

Industrial/Commercial

The most extensive biological community in the non-participating properties is the industrial/commercial community, which surrounds the Sacramento Raceway, in the northwestern portion of the JTSPA. As mentioned above, this community consists of a drag strip, dirt track, motocross track, and associated infrastructure (lights, grandstands, parking etc.). As a result of these developments, soil disturbance has been extensive and plant species are largely limited to ruderal and annual grassland species, such as filaree, soft brome, hawkbit and pineapple weed. Wetland habitats are found within this community, but will be discussed separately below.

Due to past disturbance and current activities, wildlife in this community is also limited, consisting mostly of species found in the annual grassland habitat, such as European starling, Brewer's blackbird, California ground squirrel, and black-tailed jackrabbit (*Lepus californicus*).

Rural Residential

Most of the rural residential community is found in the non-participating properties, and consists largely of widely scattered residential houses, driveways, outbuildings, and open pasture and annual grassland. This community is also highly disturbed, and therefore plant and wildlife species are similar to those found in the industrial/commercial community.

Annual Grassland

The annual grassland community is commonly found throughout the non-participating properties in upland areas. Although these grasslands may experience more disturbances due to their proximity to residential and commercial development, these areas support most of the plant and animal species listed in the annual grassland description above under the discussion of Excelsior Estates.

Northern Hardpan Vernal Pools

Although not common in non-participating properties, vernal pools were documented at various locations along Jackson Highway and near the Sacramento Raceway. As discussed above, the northern hardpan vernal pool habitat is characterized by seasonally flooded depressions found on soils with an impermeable hardpan layer. Similar plant and animal species found in the Excelsior Estates vernal pools would be expected in non-participating properties as well.

Seasonal Wetlands

Seasonal wetlands are frequently found on non-participating properties, especially in the southwest and southeast corners of the JTSPA. These wetlands differ from vernal pools in that they are shallower drainages and swales or depressions that are inundated for a shorter time. Hence, seasonal wetlands support a different array of plant species, documented above under the discussion of Excelsior Estates, than do vernal pools.

Marsh

Perennial marsh in the non-participating properties is located along Jackson Highway in the lower middle boundary of the JTSPA. Perennial marshes remain inundated or saturated throughout the year, and support perennial herbaceous plant species that tolerate high soil moisture. Plant and wildlife species likely to be present in the marsh community are documented in the Excelsior Estates section above.

Irrigated Pasture, Ditch, Drainages, and Farm Ponds

Farm ponds are found within the non-participating properties south of the Sacramento Raceway and in the southeast corner of the JTSPA. Irrigated pasture, ditches and drainages may be found in various locations in the non-participating properties. Plant and wildlife species are discussed above.

5.1.5 Native and Non-Native Trees

Historically the JTSPA supported few or no trees, due to the presence of hardpan soils and the absence of summer water. Growth of trees within the Plan Area was promoted by the development of irrigation facilities, the establishment of rural residential uses, and tree planting. While the site is still mostly treeless, there are considerable areas of non-native tree species on site, mostly associated with rural residential parcels. Eucalyptus is probably the most common tree species within the Plan Area, but other typical landscape and ornamental species (mulberry, palm, etc.) are found as well. See **Appendix A** for a copy of the Arborist Report prepared specifically for the ±889-acre Excelsior Estates property within the JTSPA and the surrounding non-participating properties.

As detailed in the Arborist Report (**Appendix A**), five native oak trees, which are protected by the Sacramento County Tree Ordinance, were identified in the JTSPA. In addition, there are approximately 95 native trees of other species, most of which are found around the ponds and marsh areas and thus may be considered riparian trees. Approximately 700 landscape trees of various species are located in the JTSPA. Although not protected by the Sacramento County Tree Ordinance, removal of landscape trees is subject to General Plan Policy CO-145, which requires equal replacement of tree canopy.

5.1.6 Special-Status Species

Special-status species are plant and animal species that have been afforded special recognition by federal, State, or local resource agencies or organizations. Special-status species are defined as:

- Listed or proposed for listing under CESA and/or FESA;
- Protected under other regulations (e.g. Migratory Bird Treaty Act);
- Listed by CDFW as a Species of Special Concern;
- Ranked by CNPS as being rare (a ranking of 1A, 1B, or 2); or
- Any other species that would receive consideration according to the CEQA Guidelines.

Special-status species considered for this analysis are based on queries of the CNDDB for the *Carmichael* quadrangle, the USFWS Online Species List for the *Carmichael* quadrangle, and the CNPS Inventory of Rare and Endangered Plants List for the *Carmichael* quadrangle (online version) (**Appendix B**). **Appendix B** includes the common name and scientific name for each species, regulatory status (federal, State, local, CNPS), habitat descriptions, and potential for occurrence on the project site. **Figure 4** depicts the locations of special-status species recorded in the CNDDB within five miles of the Plan Area. The following set of criteria has been used to determine each species potential for occurrence on the site:

- **High**: Species is known to occur on or near the site (based on CNDDB records within 8 km or 5 mi, and/or based on professional expertise specific to the site or species) and there is suitable habitat on site.

- **Medium**: Species is known to occur in the vicinity of the site, and there is marginal habitat on site. -OR- Species is not known to occur in the vicinity of the site; however there is suitable habitat on site.

- **Low**: Species is not known to occur in the vicinity of the site and there is not suitable habitat for the species on site.

- **No**: Species was surveyed for during the appropriate season with negative results for the species occurrence on site. -OR- The site is out of the known range of the species.

Only those species that are known to be present or that have a medium to high to low potential for occurrence will be discussed further in this BRA.

Listed and Special-Status Plants

Excelsior Estates

As indicated in **Appendix B**, seven special-status plant species have a high potential to occur within both the Excelsior Estates and non-participating properties and include: Ahart's dwarf rush, Bogg's Lake hedge-hyssop, Dwarf downingia, Legenere, Sacramento orcutt grass, slender Orcutt grass, and Sanford's arrowhead. Focused surveys were performed only on Excelsior Estates for all of these species, which none of these species have been observed within the Excelsior Estates property (**Appendices C and D**). The special-status plant species that have a potential to occur on the site are discussed further in detail in the following paragraphs.

Ahart's Dwarf Rush

Ahart's dwarf rush is an annual herb that occurs primarily on the margins of vernal pools in areas that are sparsely vegetated. The vernal pools on site represent potential habitat for this species. There are thirteen reported occurrences of this species within California, one within five miles of the site. The nearest occurrence is less than a ¼ mile northeast of the site boundary (**Figure 4**) (CDFW 2013). Based on the presence of suitable habitat

and documented occurrences within the site vicinity, this species has a *medium* to *high* potential to occur on site.

Bogg's Lake Hedge-hyssop

Bogg's Lake hedge-hyssop is and annual herb that occurs in vernal pools primarily on saturated clay (adobe) soils and, at the Bogg's Lake Preserve, on shallow lake margins (CNPS 2013). The vernal pools on site represent potential habitat for this species. There are 93 reported occurrences of this species within California, one of which is within five miles of the site. The nearest occurrence is less than ¼ mile northeast of the site boundary (**Figure 4**) (CDFW 2013). Based on the presence of suitable habitat and documented occurrences within the vicinity, this species has a *high* potential to occur on site.

Dwarf Downingia

Dwarf downingia is an annual herb that occurs in vernal pools and swales. The vernal pools on site represent potential habitat for this species. There are 127 reported occurrences of this species within California, 11 of which are within Sacramento County (CDFW 2013). There are no reported occurrences of this species within five miles of the site, the presence of suitable habitat on site creates a *medium* potential for this species to occur there.

Legenere

Legenere is an annual herb that occurs in vernal pools and swales, seasonal marshes, artificial ponds, floodplains of intermittent streams, and other seasonally inundated habitats (CNPS 2013). The vernal pools and seasonal wetlands on site represent potential habitat for this species. There are 79 reported occurrences of this species within California, six of which are within five miles of the site (**Figure 4**) (CDFW 2013). The nearest occurrence borders the site to the north. Based on the presence of suitable habitat and documented occurrences within the vicinity, this species has a *high* potential to occur on site.

Sacramento and Slender Orcutt Grasses

Though Sacramento and slender Orcutt grasses have been documented within five miles of the site, surveys of the Excelsior Estates property for these species in 2006 and 2007 produced negative results (**Appendix C**). Although a portion of the JTSPA is within critical habitat for these two species, neither of these species has ever been observed with the JTSPA.

Sanford's Arrowhead

Sanford's arrowhead is a perennial herb that occurs in shallow, fresh-water conditions. The seasonal and perennial marshes represent habitat for this species. There are 93 reported occurrences of this species within California, five of which are within five miles

of the site (**Figure 4**) (CDFW 2013). The nearest occurrence is approximately 2 miles west of the site. Based on the presence of suitable habitat and documented occurrences within the vicinity this species has a *high* potential to occur on site.

Non-Participating Properties

As mentioned above, no focused surveys for potential special-status plant species were performed on the non-participating properties. However, because wetland habitat does occur in the non-participating properties, the special-status plant species listed above have the potential to occur within those properties.

Listed and Special-Status Animals

Excelsior Estates

As indicated in **Appendix B**, several special-status animal species have a *medium* to *high* potential to occur on both Excelsior Estates and non-participating properties. The special-status animal species that have a potential to occur on the Excelsior Estates site are discussed further in detail in the following paragraphs.

Listed Vernal Pool Crustaceans

Two species of listed vernal pool crustaceans, vernal pool fairy shrimp and vernal pool tadpole shrimp, occur on the Excelsior Estates property (**Figure 4**) (CDFW 2013). Vernal pools on the Excelsior Estates property represent potential habitat for these species, but marsh habitats and pond habitats do not support these species. Wet-season surveys for vernal pool crustaceans were performed during 2009-2010 on the Excelsior Estates property and are included in **Appendix E** of this report. These surveys indicated that both species exist in the vernal pools on the Excelsior Estates property.

Approximately 648 acres of the Excelsior Estates property is within an area designated as critical habitat for both vernal pool fairy shrimp and vernal pool tadpole shrimp (**Figure 5**).

Northwestern Pond Turtle

Northwestern pond turtle is associated with permanent or nearly permanent water in a variety of habitats. This species requires basking sites such as partially submerged logs, rocks, mats of floating vegetation, or open mud banks (Zeiner *et. al.*, 1990). Nests are built in uplands in a variety of soil types with a relatively high humidity. Though there is suitable habitat on site and there is a reported occurrence in the vicinity, it is believed that there is a *low* potential for this species to occur on site due to the fact that there is no substantial hydrologic connection between the pond and known occupied habitat.

This species has not been observed on the Excelsior Estates property, during any of Foothill Associates' previous visits to that property.

Western Spadefoot Toad

Western spadefoot toad occurs throughout the Central Valley and adjacent foothills. Breeding and egg-laying occur almost exclusively in shallow, temporary pools that fill during winter rains (Zeiner *et. al.*, 1990). This activity occurs primarily from late winter to the end of March. This species spends the majority of the year in burrows that they construct themselves, though mammal burrows may also be used. The nearest CNDDB occurrence for this species is within a ¼ mile northeast of the site (**Figure 4**) (CDFW 2013). The vernal pools onsite represent potential habitat for this species, but the species has not been observed onsite during aquatic invertebrate surveys or spring rare-plant surveys. Based on the presence of suitable habitat and the proximity of a reported occurrence, it is believed that there is a *high* potential for this species to occur onsite.

Non-Participating Properties

No focused surveys for potential special-status wildlife species were performed on the non-participating properties. However, because wetland habitat does occur in the non-participating properties, the special-status animal species listed above have the potential to occur within those properties.

Approximately 131 acres of the non-participating properties are designated as critical habitat for both vernal pool fairy shrimp and vernal pool tadpole shrimp (**Figure 5**).

Listed and Special-Status Nesting Raptors/Other Birds

Excelsior Estates

Several special-status raptors and other bird species have a potential to occur on the Excelsior Estates property as indicated in **Appendix B**. Each of these species is discussed in detail in the following paragraphs. No focused surveys for nesting raptors or other birds were conducted for Excelsior Estates. However, sightings were recorded for various species, as documented below.

Loggerhead Shrike

Loggerhead shrikes are a common resident and winter visitor in lowlands and foothills throughout California. The trees surrounding the pond and the adjacent pasture and annual grassland represent potential nesting and foraging habitat for this species, respectively. Although this species has not been observed on the site, there is a *high* potential for this species to occur on the Excelsior Estates property.

Swainson's Hawk

Swainson's hawk is an uncommon breeding resident and migrant in the Central Valley, Klamath Basin, Northeastern Plateau, Lassen Co., and Mojave Desert (Zeiner *et. al*., 1990). This species is known to occur in the Central Valley from March to September. They are known to breed in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. They forage in adjacent grasslands or suitable grain or alfalfa fields, or livestock pastures. Breeding occurs from late March to late August, peaking in late May through July (Zeiner *et. al*., 1990). Swainson's hawk begin

their migration to their wintering grounds during the months of September and October. The nearest reported CNDDB occurrence is about 2 miles south of the site. According to the CNDDB, there are several active nests within five to 10 miles of the site (**Figure 4**) (CDFW 2013). Nests are considered active when they have been actively used at least once in the preceding five years. The annual grassland areas of the site present potential foraging habitat for this species. The trees surrounding the pond and those adjacent to the site represent potential nesting habitat for this species. Although this species has not been observed on the site, there is a *high* potential for this species to occur on the Excelsior Estates property.

Tricolored Blackbird

Tricolored blackbirds are found throughout the Central Valley and in coastal districts from Sonoma County to the south. This species nests near fresh water, typically in emergent wetlands with tall, dense cattails or tules, and also in thickets of willow, blackberry, and wild rose (Zeiner *et. al*., 1990). They typically feed in flocks in grassland and cropland habitats. The CNDDB shows occurrences of this species within five miles of the site (**Figure 4**) (CDFW 2013). The marsh habitat and pasture and annual grasslands represent potential nesting and foraging habitat for this species, respectively. Although this species has not been observed on the site, there is a *high* potential for this species to occur on the Excelsior Estates property.

Western Burrowing Owl

Western burrowing owls are found primarily in grasslands and agricultural areas throughout California. Burrowing owls utilize mammal burrows for nesting and roosting, but may also use pipes, culverts, and nest boxes where burrows are not available (Zeiner *et. al*., 1990). This species typically nests in small colonies. The nearest reported CNDDB occurrence is approximately ½ mile from the site (**Figure 4**) (CDFW 2013). The annual grasslands represent potential nesting and foraging habitat for this species. Though not in very high densities, ground squirrel burrows were observed throughout the Excelsior Estates site. All burrow colonies observed were surveyed for signs of use by burrowing owls. Typical signs of use include: cast pellets, molted feathers, prey remains, eggshell fragments, or excrement at or near a burrow entrance. None of these indicators were observed in association with the burrow colonies occurring on site. A burrowing owl was observed on the Excelsior Estates property in the winter of 2010, but it was not observed occupying a burrow. Therefore, there is a *high* potential for this species to occur on the Excelsior Estates property.

White-tailed kite

White-tailed kites are found in grasslands and agricultural areas in valley and coastal lowlands. This species builds nest in dense stands of oaks, willows, or other tree species near open foraging areas (Zeiner *et. al*., 1990). The pasture and annual grassland areas of the site present potential foraging habitat for this species. The trees around the ponds and associated with residential uses represent potential nesting habitat for this species. During several site visits to Excelsior Estates, white-tailed kites were observed foraging

in the annual grassland areas of the site; however no nests sites for this species were observed. Therefore, there is a *high* potential for this species to nest on the Excelsior Estates property.

Other Raptor Species

Other raptor species forage and nest in a variety of habitats throughout Sacramento County. Raptor nests are protected under the MBTA and Section 3503.5 of the California Fish and Game Code, which makes it illegal to destroy any active raptor nest. Trees on site and in the vicinity of the site may provide potential nesting habitat for raptor species. In addition, potential foraging for raptors occurs within the pasture and annual grassland habitat on the site. Raptors observed in flight over the Excelsior Estates property include: northern harrier, red-tailed hawk, turkey vulture, and white-tailed kite. Therefore, there is a *high* potential for raptors to nest on the Excelsior Estates property and in the vicinity.

Non-Participating Properties

No focused surveys or sightings of nesting raptors or other birds were documented for the non-participating properties. However, all of the species listed above under the discussion of Excelsior Estates have the potential to occur in the non-participating properties.

Sensitive Habitats

Sensitive habitats are those habitats that are of special concern to resource agencies or those that are protected under CEQA, Section 1600 of the California Fish and Game Code, or Section 404 of the Clean Water Act. Additionally, sensitive habitats are protected under the specific policies outlined in the Sacramento County General Plan.

Excelsior Estates

Sensitive habitats identified on Excelsior Estates include: native tree stands, Morrison Creek, vernal pools, marshes, and other potential waters of the U.S. (**Figure 6**). These sensitive resources represent potential habitat for several of the special-status species discussed above.

Potential Jurisdictional Waters

As described above in **Section 4.0**, **Regulatory Setting**, the term "waters of the United States" includes a variety of waters including navigable rivers, some tributaries to these rivers and certain wetlands adjacent to such navigable and non-navigable tributaries. Wetlands are defined as "those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (Environmental Laboratories 1987). The majority of jurisdictional wetlands in the United States meet three wetland assessment criteria: hydrophytic vegetation, hydric soils, and wetland hydrology. Jurisdictional waters can also be defined by exhibiting a defined bed and bank and ordinary high water mark (OHWM). As discussed

in **Section 4.1.3**, jurisdictional waters of the U.S. are subject to Section 404 of CWA and are regulated by the Corps. Waters of the State, which may include waters not subject to federal jurisdiction, are regulated under Section 401 if the CWA and the Porter-Cologne Water Quality Control Act (see Sections 4.1.4 and 4.2.3). Taken together waters of the U.S. and state are considered jurisdictional waters.

Foothill Associates delineated jurisdictional waters on the Excelsior Estates property. The Corps concurred with Foothill's delineation and issued a Preliminary Jurisdictional Determination (PJD) for the Excelsior Estates property on November 6, 2015. A copy of this PJD is enclosed as **Appendix F** of this report. There are no waters that are subject to State jurisdiction which are not also subject to Federal jurisdiction. The acreages of potential jurisdictional waters are depicted on **Figure 7** and summarized in **Table 1** below.

Table 1 — Summary of Aquatic Features

Classification	Jurisdictional Waters (acres)	
	Excelsior Estates	Non-Participating Properties
Depressional Wetlands		
Seasonal Wetlands	4.41	0.44
Perennial Marsh	1.03	0.06
Vernal Pool	27.85	4.71
Riverine Wetlands		
Seasonal Wetland	3.70	7.06
Perennial Marsh	10.05	1.19
Other Waters of the U.S.		
Intermittent Drainage	1.19	0.30
Ephemeral Drainage	0.23	0.04
Pond	5.04	1.55
Ditch/Canal	0.31	0.00
TOTAL	**53.80**	**15.35**

Trees

The trees on the Excelsior Estates property were surveyed in 2015 as documented in the Arborist Report (**Appendix A**). There are 28 native trees and 147 landscape trees on the Excelsior Estates property (**Figure 6**). None of the trees on the Excelsior Estates property are Heritage trees or recommended for preservation as Landmark Trees.

Non-Participating Properties

Potential Jurisdictional Waters

Potential jurisdictional waters for non-participating properties were estimated through a combination of aerial photo interpretation and limited ground-truthing. The estimated extent of wetlands and other aquatic habitat were digitally mapped by observing aerial

photographs in different years/seasons, noting standing water, changes in vegetation patterns, and other markers of periodically inundated areas. Ground-truthing, consisting of observations conducted from participating properties and from public right-of-ways, was used to supplement and confirm aerial photo interpretation. Sensitive habitats identified on the non-participating properties include: vernal pools, marshes, and other potential waters of the U.S. (**Figure 7**). These sensitive resources represent potential habitat for several of the special-status species discussed above. The acreages of potential jurisdictional waters are summarized in **Table 1** above. Potential jurisdictional waters within the non-participating properties were digitized from existing aerial photography and total approximately 15.35 acres.

Trees

The trees on the non-participating properties were inventoried from participating properties and from public right-of-ways in 2015 as documented in the Arborist Report (**Appendix A**). There are estimated to be 628 trees on the non-participating properties, of which approximately 50 are native species (**Figure 6**). None of the trees on the non-participating properties are Heritage trees or recommended for preservation as Landmark Trees.

5.1.7 Existing Land Use Effects on Biological Resources

While the JTSPA is largely open rangeland, this rangeland shares considerable edge with various existing land uses that may impact the habitat and habitat quality of the biological resources occupying the site.

Rural Residences

Rural residences (non-participating properties) are common along the southern (Jackson Highway) and western (Excelsior Road) portions of the Plan Area. The density of houses in these areas is fairly low, but there are other elements present that reduce the biological resource value on and around these parcels.

While these parcels typically support natural plant communities and often contain aquatic habitat many residential parcels have tracts of cultivated plants, irrigated areas, outbuildings, livestock enclosures, paving and grading, and other improvements that reduce or alter biological communities.

Sacramento Raceway

The Sacramento Raceway property (non-participating) contains some aquatic habitat, including vernal pools. While the eastern end of the property is relatively undisturbed, the western 75% contains various improvements to support raceway activities including a drag strip, dirt track, motocross track, and associated infrastructure (lights, grandstands, parking etc.).

The northern tributary to Elder Creek flows across and through the raceway property. Various ditches and culverts are used to move water around and beneath the drag strip,

and periodic grading of firebreaks introduces sediment into the drainage ways and downstream wetlands.

Kiefer Boulevard

Kiefer Boulevard runs along the northern portion of the JTSPA. This right-of-way is currently unimproved and consists of a bare dirt track with numerous stretches of deep tire ruts. Vehicles drive across the Morrison Creek tributary at-grade, through the streambed.

There is typically open access on both ends of the right-of-way, although the County has attempted periodically to block off access. There is significant trash dumping occurring along this stretch of Kiefer Boulevard including construction rubble, electronics, furniture, etc. Dump sites are scattered along the right-of-way, including into the bed of the Morrison Creek tributary.

The frequent vehicle travel, especially in wet weather, has resulted in noticeable turbidity in downstream vernal pools within the JTSPA. **Figure 8** illustrates the extent of this turbidity.

6.0 DISCUSSION AND RECOMMENDATIONS

6.1 Summary

This BRA has documented the Jackson Township Specific Plan Area's physical features, biological communities, and sensitive habitats, and its potential to support special-status species. Known or potential biological constraints on the site include:

- Existing and potential habitat for special-status vernal pool plant and animal species, including federally-listed vernal pool species and their critical habitat;
- Potential habitat for other special-status aquatic plant and animal species;
- Potential foraging and nesting habitat for Swainson's hawk, a state-listed species;
- Potential foraging and nesting habitat for other special-status birds species;
- Sensitive habitats including: Morrison Creek, vernal pools, marshes, other potential waters of the U.S.; and
- Potential for protected trees.

6.2 Recommendations

If any future activity on the site would result in significant effects to the sensitive resources identified on site, measures should be taken to avoid, minimize, and/or mitigate for these effects. Section 15382 of the CEQA Guidelines define a significant effect on the environment as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, …." (CELSOC, 2004). As referenced in **Section 4.2.1** of this BRA, a project would result in potential significant impacts to biological resources if it would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or

- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

6.2.1 Impacts to Special-Status Plants

Excelsior Estates

Impacts to Vernal Pool Plants

As discussed, several special-status vernal pool plants have the potential to occur on site (See **Section 5.1.6**). Botanical surveys for these species were conducted in May of 2014 in accordance with applicable protocols during the appropriate flowering periods for these species (**Appendix D**). No populations of any special-status plants were observed. The results of these surveys are typically valid for two years. If future surveys are conducted and populations of any of these species are identified on site, then the project proponent shall either avoid these plants or, if avoidance is not feasible, shall mitigate for potential impacts to these species. Mitigation of non-listed species could include propagation of special-status plants to suitable areas within the proposed on-site wetland preserve through seed or seedbank collection. If mitigation is required, a mitigation plan should be prepared that identifies avoidance and preservation measures, seed or plant harvesting procedures, locations where the plants will be transplanted in the on-site preserve, success criteria, and monitoring protocols. Additionally, since mitigation for impacts to vernal pool habitat (discussed in **Section 6.2.2** below) will also preserve and create potential habitat for rare vernal pool plant species, coordination between habitat and species mitigation is possible. Alternatively, if the SSHCP is adopted and the SSHCP covers the proposed project, then the project proponent may elect to compensate for unavoidable impacts through participation in the SSHCP.

If State or federally-listed plants (Bogg's Lake hedge hyssop, Sacramento Orcutt grass, slender Orcutt grass) are identified on site, then additional mitigation measures may be required by CDFW and the USFWS. These measures may include avoidance and minimization through the establishment of an on-site preserve managed in perpetuity and protected by a conservation easement, the salvage of a seed bank from vernal pools to be impacted for the re-establishment of the population at a nearby location (preferably on site), or the enhancement/restoration of habitat at known locations of populations of these species. Coordination with the appropriate agencies should be completed, if listed plants are found.

Impacts to Sanford's Arrowhead

Botanical surveys for Sanford's Arrowhead were conducted in June 2014 (**Appendix D**). No populations of Sanford's Arrowhead were observed. The results of this survey are valid for two years. If future botanical surveys for this species are conducted and populations of this species are identified on site, the project proponent shall either avoid these plants or, if avoidance is not feasible, the project proponent shall mitigate for potential impacts to these species. If mitigation is required, a mitigation plan should be prepared that identifies avoidance and preservation measures, seed or plant harvesting procedures, locations where the plants will be transplanted in the on-site preserve, success criteria, and monitoring protocols. Alternatively, if the SSHCP is adopted and the SSHCP covers the proposed project, then the project proponent may elect to compensate for unavoidable impacts through participation in the SSHCP.

Non-Participating Properties

As previously mentioned, the non-participating properties have vernal pool and marsh habitat, and therefore have the potential to contain special-status plants. Since Foothill Associates did not have authorization to access the non-participant properties, botanical surveys of these properties have not yet been conducted. Prior to the commencement of ground-disturbing activities within the non-participating properties, botanical surveys will be conducted within the appropriate flowering periods for these species. If special-status plant species are identified, the project proponent shall either avoid these plants or, if avoidance is not feasible, the project proponent shall mitigate for potential impacts to these species as described above.

6.2.2 Impacts to Special-Status Animals

Impacts to Vernal Pool Crustaceans

Excelsior Estates

As discussed, vernal pools and other wetlands on the site represent known and potential habitat for special-status crustacean species including vernal pool fairy shrimp and vernal pool tadpole shrimp. The USFWS typically considers vernal pool invertebrate habitat to be indirectly impacted by fill or development activities within 250 feet of the habitat. However, the 250 foot indirect impact area may be reduced based on site-specific information such as topography or hydrologic data indicating that activities can encroach closer than 250 feet without impacting those habitats.

For the Excelsior Estates portion of the JTSPA, the acreage of listed vernal pool crustacean habitat is shown in **Table 2**. This estimate generally excludes aquatic habitat that either has inappropriate hydrology (e.g. warm-season inundation), significant disturbance, or other factors that reduce or minimize habitat value for vernal pool crustaceans.

Table 2 — Vernal Pool Crustacean Habitat within Excelsior Estates

Classification	Acreage
Depressional Seasonal Wetland	4.41
Vernal Pool	27.85
Riverine Seasonal Wetland	3.70
Total	**35.96**

The development of Excelsior Estates, as proposed, will result in direct impacts to approximately 29.95 acres and preservation of ±6.02 acres of vernal pool crustacean habitat.

As mentioned above, listed vernal pool crustaceans (vernal pool fairy shrimp and vernal pool tadpole shrimp) have been found within several pools on the Excelsior Estates property. Accordingly, the project proponent will implement one or a combination of both of the following mitigation measures to address these impacts:

1. Total Avoidance: Unless a smaller buffer is approved through formal consultation with the USFWS, the project proponent will maintain a minimum 250 foot no disturbance buffer from all delineated vernal pools. If total avoidance is implemented for a pool, no further action is required for that pool.

2. Compensation: The project proponent will consult with the USFWS regarding any impacts to potential vernal pool crustacean habitat which cannot be avoided. The project proponent will compensate for unavoidable impacts in accordance with the Biological Opinion issued by USFWS and the Clean Water Act Section 404 Permit and/or RWQCB Waste Discharge Requirements obtained for the project. Typically, the USFWS requires compensatory mitigation for direct impacts to these species at a 3:1 ratio (2:1 preservation and 1:1 creation). Possible mitigation opportunities include on-site or off-site preservation and creation of vernal pools or purchase of vernal pool credits at a qualified mitigation bank. Alternatively, if the SSHCP is adopted and the SSHCP covers the proposed project, then the project proponent may elect to compensate for unavoidable impacts through participation in the SSHCP.

Non-Participating Properties

The non-participating properties contain wetlands which may represent habitat for vernal pool crustaceans. Since Foothill Associates was not able to access these properties, no focused surveys have been conducted in these areas. Prior to commencing work within suitable habitat, the non-participating property owners will conduct surveys to determine whether the wetlands contain protected vernal pool crustaceans. The owners may choose to assume that special-status crustaceans are present in-lieu of conducting these surveys. The owners will then address any impacts to protected species through the mitigation measures described above in the discussion of Excelsior Estates vernal pool crustacean impacts.

Impacts to Critical Habitat for Vernal Pool Species

Excelsior Estates

The JTPSA includes a portion of Vernal Pool Critical Habitat Subunit 11E. This subunit includes critical habitat for vernal pool fairy shrimp, vernal pool tadpole shrimp, Sacramento orcutt grass, and slender orcutt grass (multiple surveys for the latter two species on the Excelsior Estates property were negative). Approximately 779 acres (57%) of this subunit occurs within the JTSPA, 648 acres of which exist on the Excelsior Estates property. Approximately 258 acres of this critical habitat unit will be preserved as part of the JTSPA development.

As mentioned above, for projects where the Corps or another federal agency is issuing a federal permit or license, that agency must ensure that the effects of its permit do not "adversely modify" the critical habitat of a species protected by the FESA. The term "adverse modification" is defined as "a direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of a listed species." (50 C.F.R., § 402.02.) Guidance issued by USFWS provides that the adverse modification threshold is exceeded "when the proposed action will adversely affect the critical habitat's constituent elements or their management in a manner likely to appreciably diminish or preclude the role of that habitat in both the survival and recovery of the species" (USFWS, Section 7 Handbook at 4-39.), An analysis of adverse modification of critical habitat normally focuses on the entire critical habitat area designated and not just discrete units of critical habitat (*Id*.).

Development of the JTSPA is not expected to result in adverse modification of this Critical Habitat subunit for the following reasons:

1) Both Orcutt grass species have never been found in this subunit, and surveys covering a large portion of the subunit have not found these species. Additionally, the dense vegetation in the larger pools makes them unsuitable for both species of Orcutt grass.

2) Past and current disturbances (dry-season irrigation, erosion and sedimentation, contamination from certain land uses, adjacent land uses, etc.) impact portions of the critical habitat unit, primarily in the westernmost portions. Primary constituent elements (PCEs), while present in the overall subunit, are compromised in portions of the subunit affected by these existing conditions.

3) Protection of a significant portion of the critical habitat unit where all PCEs are present provides protection for the species and maintains a contiguous critical habitat unit that coordinates with potential future preserves on adjacent properties.

For impacts to designated critical habitat on the Excelsior Estates property, the project proponent will consult with the USFWS to ensure that its proposed development does not adversely modify critical habitat. The mitigation measures identified above for impacts to vernal pool crustaceans will ensure that adverse modification will not occur. Alternatively, if the SSHCP is adopted and the SSHCP covers the proposed project, then

the project proponent may elect to compensate for unavoidable impacts to critical habitat through participation in the SSHCP.

Non-Participating Properties

As mentioned previously, approximately 131 acres of the non-participating properties have been designated as critical habitat for vernal pool species. To ensure that development of these properties will not result in adverse modification of critical habitat, where a 404 permit is required for development of a property, the owner(s) of that property will consult with USFWS pursuant to Section 7 of the Endangered Species Act. The mitigation measures identified above in the discussion of mitigation for impacts to vernal pool crustaceans on Excelsior Estates will ensure that adverse modification will not occur.

Impacts to Northwestern Pond Turtle

Excelsior Estates

As discussed in **Section 6.2.2**, the pond on the Excelsior Estates property represents potential habitat for northwestern pond turtle and the surrounding uplands provide potential overwintering and breeding habitat. If the pond or surrounding uplands within 300 feet are to be impacted by any future activity it is recommended that surveys be conducted for this species no more than 30 days prior to construction. If western pond turtles are found, then the project biologist should conduct a pre-construction worker awareness training and be on-site to monitor construction during initial vegetation clearing and ground disturbance. If any western pond turtles or eggs must be relocated during the project, a relocation plan should be submitted to CDFW for approval prior to relocation. The relocation plan should establish western pond turtle handling procedures and identify suitable habitat where the western pond turtles will be released. Release sites should be suitable habitat located as close as possible to the project site. Alternatively, if the SSHCP is adopted and the SSHCP covers the proposed project, then the project proponent may elect to compensate for unavoidable impacts through participation in the SSHCP.

Non-Participating Properties

Ponds and the surrounding uplands on the non-participating properties may also provide habitat for the northwestern pond turtle. To ensure that development of these properties does not have an adverse effect on this species, the owner(s) will conduct preconstruction surveys and, if western pond turtles are found, implement mitigation as discussed above with respect to Excelsior Estates.

Impacts to Western Spadefoot

Excelsior Estates

Any impacts to vernal pools within the Excelsior Estates property could potentially impact western spadefoots. Prior to construction in or around vernal pools it is recommended that surveys be conducted for this species no more than 30 days prior to construction. If western spadefoots are found, then the project biologist should conduct a

pre-construction worker awareness training and be on-site to monitor construction during initial vegetation clearing and ground disturbance. If any western spadefoots must be relocated during the project, a relocation plan should be submitted to CDFW for approval prior to relocation. The relocation plan should establish western spadefoot handling procedures and identify suitable habitat where the western spadefoot will be released. Release sites should be suitable habitat located as close as possible to the project site.

Non-Participating Properties

Vernal pools and the surrounding uplands on the non-participating properties may also provide habitat for the western spadefoot. To ensure that development of these properties does not have an adverse effect on this species, the owner(s) will conduct preconstruction surveys and, if western spadefoots are found, implement mitigation as discussed above with respect to Excelsior Estates.

Impacts to Swainson's Hawk Foraging and Nesting Habitat

Excelsior Estates

At the time of preparation of this BRA there were no active Swainson's hawk nests within five miles of the site, however there are several within five to 10 miles of the site. Any impacts to the pasture and grasslands on site could impact potential foraging habitat for Swainson's hawk. If Sacramento County, in conjunction with CDFW, determines that impacts to Swainson's hawk foraging habitat will occur as a result of the project, these impacts can be mitigated through participation in the Sacramento County's Swainson's Hawk Mitigation Program or pursuant to CDFW's 1994 *Staff Report Regarding Mitigation for Impacts to Swainson's Hawks* (*Buteo swainsoni*) *in the Central Valley of California* as described above in **Section 4.3.3**.

In addition, trees on and adjacent to the site represent potential nesting habitat for this species. All trees on site and within a ½ mile of the site should be surveyed for nesting Swainson's hawks. These surveys should be conducted prior to any intensive new disturbances associated with construction or other project-related activities that may cause nest abandonment or forced fledging between March 1 and September 15. If project related activities may cause nest abandonment or forced fledging, the nest site should be monitored by a qualified biologist.

If the SSHCP is adopted and the SSHCP covers the proposed project, then the project proponent may elect to compensate for unavoidable impacts to Swainson's hawk nesting and foraging habitat through participation in the SSHCP.

Non-Participating Properties

The annual grassland and trees on the non-participating properties also provides suitable Swainson's hawk foraging and nesting habitat. Prior to development of these properties, the owner(s) will consult with the County to determine whether impacts to Swainson's hawk foraging habitat will occur as a result of construction activities. With respect to the trees on the non-participating properties, the owners will conduct preconstruction surveys

and, if Swainson's hawks are found, implement mitigation as discussed above with respect to Excelsior Estates.

Impacts to Western Burrowing Owl

Excelsior Estates

Any impacts to the grasslands and associated ground squirrel burrow colonies could potentially impact western burrowing owls. Since burrowing owls have been observed on the site, but are not known to nest on the site, a protocol nesting survey is recommended during the nesting season prior to construction. Currently, CDFW's 2012 *Staff Report on Burrowing Owl Mitigation* recommends conducting four surveys of the project site and surrounding 500 feet, where accessible, during the breeding season: one survey between February 15 and April 15 and three between April 15 and July 15. If an active burrowing owl nest is determined to be present within 500 feet of the project site during the surveys, then an avoidance plan should be developed and approved by CDFW. The avoidance plan should identify measures to minimize impacts to burrowing owls, such as worker awareness training, buffer zones, work scheduling, and biological monitoring.

If no burrowing owls are identified during the breeding season surveys, a pre-construction survey for burrowing owls is recommended within 24 hours prior to the start of ground disturbance. If burrowing owls are found during the pre-construction survey, CDFW should be contacted to develop an avoidance plan, as described above.

Alternatively, if the SSHCP is adopted and the SSHCP covers the proposed project, then the project proponent may elect to compensate for unavoidable impacts to western burrowing owl through participation in the SSHCP.

Non-Participating Properties

The annual grassland on the non-participating properties also provides suitable burrowing owl habitat. To ensure that development of these properties does not have an adverse effect on this species, the owner(s) will conduct preconstruction surveys and, if western burrowing owls are found, implement mitigation as discussed above with respect to Excelsior Estates.

Impacts to Other Raptors and Migratory Birds

Excelsior Estates

As discussed earlier, the Excelsior Estates property represents potential foraging and nesting habitat for raptors. Raptors with a *high* potential to occur on site include: northern harrier, red-tailed hawk, and white-tailed kite. Additionally, suitable nesting habitat for migratory birds such as loggerhead shrike and tri-colored blackbird occurs on site. Active raptor nests are protected by the California Fish and Game Code Section 3503.5 and the MBTA. For this reason, if any project related activity or other disturbance is expected to occur during the nesting season (February through August), a pre-construction raptor survey is recommended to determine whether raptors are actively nesting on or within 500 feet of the site. The survey should be conducted by a qualified

biologist no more than 30 days from the onset of disturbance to the site. If the nests are found and considered to be active, project related disturbance should not occur within 500 feet of the nests until the young have fledged. If active migratory bird nests are found the CDFW should be consulted for mitigation measures that may be required. If construction activities are proposed to occur during non-breeding season (September through January), a pre-construction survey is not required and no further studies are necessary. Alternatively, if the SSHCP is adopted and the SSHCP covers the proposed project, then the project proponent may elect to compensate for unavoidable impacts to nesting and foraging habitat of raptors and migratory birds through participation in the SSHCP.

Non-Participating Properties

The non-participating properties have the potential to contain nesting raptors and other birds. Accordingly, prior to commencing ground disturbance or construction during the nesting season, the non-participating owner(s) shall conduct pre-construction surveys and implement mitigation, if needed, as described above.

6.2.3 Impacts to Sensitive Habitats

Impacts to Jurisdictional Waters

Excelsior Estates

Sensitive habitats identified include: Morrison Creek, vernal pools, marshes, and other potential jurisdictional waters. The site supports approximately 53.80 acres of jurisdictional waters (**Table 1 and Figure 7**). These areas are subject to regulation by the Corps pursuant to Section 404 of the Clean Water Act and the RWQCB pursuant to Section 401 of the Clean Water Act. Additionally, these areas are protected under the *Sacramento County General Plan*. Prior to discharging into waters of the U.S., the project proponent shall comply with Sections 401 and 404 of the Clean Water Act. Any waters of the U.S. that would be lost or disturbed should be replaced or restored on a "no-net-loss" basis in accordance with the Corps' current mitigation guidelines.

Non-Participating Properties

The non-participating properties support approximately 15.35 acres of wetlands and other potential jurisdictional waters. Prior to impacting the wetland resources on the non-participating properties, the non-participating owner(s) shall obtain a wetland delineation to determine whether the wetlands are subject to the jurisdiction of the Corps and/or the RWQCB. Depending on the results of the delineation, the non-participating owner(s) shall consult with the Corps and/or RWQCB, as appropriate, to determine whether permits are required for their proposed activities.

Impacts to Riparian Habitats

Excelsior Estates

The intermittent drainage on the northeastern corner of the Excelsior Estates property is expected to be subject to CDFW jurisdiction. Additionally, CDFW may exert

jurisdiction over the riverine seasonal marsh and wetlands. If project activities will affect the bed, bank or associated riparian vegetation of a stream or lake, the applicant shall notify the CDFW pursuant to Section 1600 of the Fish and Game Code before engaging in such activities. If appropriate, the project applicant shall enter into a Streambed Alteration Agreement with CDFW and coordinate with CDFW in developing appropriate mitigation, and should abide by the conditions of any executed agreements.

Non-Participating Properties

While it is unlikely that the riverine seasonal wetlands on the non-participating properties would be subject to CDFW jurisdiction, CDFW recommends that a 1600 Streambed Alteration Notification be submitted for all projects. If CDFW determines that they do not have jurisdiction, then the application fee will be refunded. Prior to impacting potential riparian habitat, the property owners will consult with CDFW to determine if a 1600 Streambed Alteration Agreement is required.

Impacts to Protected Trees

Excelsior Estates

A Tree Permit is required prior to removal of any native oak tree. Other native trees and landscape trees are protected by General Plan Policies CO-139 and CO-145, which require replacement of trees removed based on trunk diameter and canopy cover, respectively. Although on-site mitigation planting is preferred, other mitigation options, including off-site planting or payment to the County's Tree Preservation Fund, may be considered. A total of 175, consisting of 28 native trees and 147 landscape trees were mapped on the Excelsior Estates site. There is one native oak tree located in the northwest corner of the property, which will require a Tree Permit prior to removal or pruning. The trunk diameter of the native trees totals 1,004 inches. Per Policy CO-139, these trees should be replaced with like species. There is approximately 1.75 total acres of tree canopy on the Excelsior Estates site, which would need to be replaced in accordance with the General Plan Policy CO-145.

Once construction documents are prepared, impacts to protected trees should be evaluated and mitigation requirements calculated in accordance with applicable Sacramento County policies. The construction documents should be reviewed during the approval process to ensure that required mitigation measures are being met.

Non-Participating Properties

Prior to development on the non-participating properties, a tree survey should be completed by an ISA-Certified Arborist to identify the species and size of trees located on these properties. Removal of any trees must comply with the Sacramento County Tree Ordinance and General Plan.

1.0 INTRODUCTION

This report presents the results of a tree survey conducted for the approximately 1,391 acre Jackson Township Specific Plan Area (JTSPA) (Plan Area) (**Figure 1**). The largest owner within the JTSPA, Excelsior Estates LLC (Excelsior Estates), owns and/or controls approximately 866 acres (approximately 62%) within the Plan Area boundaries. The remainder of the JTSPA is owned by other, non-participating property owners.

The survey area is located within Sacramento County, north of Jackson Highway approximately four miles east of Sacramento City limits. The Excelsior Estates property is currently used for livestock grazing and includes two residences. The non-participating properties are mostly rural residential rangeland as well as a racetrack. Land uses surrounding the study area include rangeland, rural residential, and cropland. Habitat types occurring on Excelsior Estates property include annual grasslands, irrigated pasture and ditches, northern hardpan vernal pools, seasonal wetlands, marsh, irrigation ponds, and ephemeral drainages. The purpose of this report is to present information on the species, size, and condition of the trees located on the Excelsior Estates property and an estimate of protected trees occurring on the non-participating properties.

The County of Sacramento regulates removal and impacts of protected trees under the Tree Preservation Ordinance, Chapter 19.12 of the County Code. Under the Ordinance, all native oak trees, defined as valley oak (*Quercus lobata*), interior live oak (*Quercus wislizeni*), blue oak (*Quercus douglasii*), or oracle oak (*Quercus morehus*), with at least one trunk of six inches or more in diameter at breast height or an aggregate diameter of ten inches or more for multi-trunk trees, are protected. The Ordinance also gives special consideration to Landmark Trees, which are prominent or stately trees of any species that are in good health and structural condition, and Heritage Trees, which are any native oak with a trunk diameter of 19 inches or larger.

In addition, as part of the environmental review process, the Sacramento County Community Development Department, Planning and Environmental Review considers both the removal of certain native and non-native trees and the encroachment of construction activities into the protected zones of these trees. Native trees are defined as native oaks Northern California black walnut (*Juglans hindsii*), California sycamore (*Platanus racemosa*), Oregon ash (*Fraxinus latifolia*), Goodding's black willow (*Salix gooddingii*), California box elder (*Acer negundo* var. *californicum*), California buckeye (*Aesculus californica*), and white alder (*Alnus rhombifolia*) with a trunk diameter of four inches or greater. The County's General Plan establishes a goal of protecting both oaks and other non-oak native species. Policy CO-139 provides that non-oak native trees which cannot be protected through preservation should be replaced with in-kind species in accordance with established tree planting specifications, the combined diameter of which shall equal the combined diameter of the trees removed. For impacts to non-native trees, Policy CO-145 requires that removal of non-native tree canopy shall be mitigated by creating equivalent canopy on-site.

2.0 METHODS

The methods utilized by Foothill Associates' arborists in this survey vary depending on the property. Access was granted to the Excelsior Estates property, which was surveyed on foot. Non-participating properties were surveyed remotely, as described below.

2.1 Excelsior Estates Property

The Excelsior Estates property was surveyed by an International Society of Arboriculture (ISA) Certified Arborist on March 5 and 6, 2014. All existing trees were closely examined to determine their species type and diameter at breast height (DBH). A diameter tape or calipers was used to verify each trunk diameter at the industry standard of 54 inches above grade. All trees with trunks greater than four inches in diameter were inventoried, or otherwise described. The measurement from the trunk to the end of the longest lateral limb was used as the dripline radius (DLR). All of the inventoried trees have been numbered in the field with an aluminum tag, which corresponds to the numbering in **Appendix A**.

The health and structural condition of each tree was rated according to **Table 1** below. The health rating considers factors such as the size, color, and density of the foliage; the amount of deadwood within the canopy; bud viability; evidence of wound closure; and the presence or evidence of stress, disease, nutrient deficiency, and insect infestation. The structural rating reflects the trunk and branch configuration; canopy balance; the presence of included bark and other structural defects such as decay; and the potential for structural failure. In cases where conditions fall between the Good, Fair, and Poor ratings, intermediate ratings Fair-Good and Poor-Fair were used.

2.2 Non-Participating Properties

The non-participating properties were visually surveyed from public roads by an International Society of Arboriculture (ISA) Certified Arborist on April 14, 2014. The non-participatory properties were subdivided into 21 areas (**Figure 2**). Trees in each area were identified by species and approximate size, as shown in **Appendix B**.

Table 1 — Tree Rating System

Rating	Tree Health
Good	There is an average or below-average amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density are typical for the species; buds are normal size, viable, abundant, and uniform throughout the canopy; current and past growth increments are generally average or better; any callusing is vigorous. This health rating indicates that there is very little, if any, evidence of stress, disease, nutrient deficiency, and/or insect infestation.
Fair	There is an above-average amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density may be below what is typically expected for the species; buds are normal size and viable, but slightly sparse throughout the canopy; current and past growth increments may be below average; tree may be slow to callus around old wounds. This health rating indicates that there is moderate evidence of stress, disease, nutrient deficiency, and/or insect infestation.
Poor	There is an extreme amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density are clearly compromised; very few viable buds are present throughout the canopy; current and past growth increments are meager; no evidence of callusing around old wounds. This health rating indicates that there is widespread evidence of stress, disease, nutrient deficiency, and/or insect infestation.
	Tree Structure
Good	No wounds, cavities, decay, or indication of hollowness are evident in the root crown, trunk, or primary and secondary limbs; no anchor roots are exposed; no codominant branching or multiple trunk attachments are present; very little included bark at branch attachments exists; no dead primary or secondary limbs are present in canopy; there have been no major limb failures; limbs are not overburdened; branching structure is appropriate for species; any decay is limited to small dead branches/stubs. This structure rating represents a low potential for failure.
Fair	With respect to the size of the tree, small to moderate wounds, cavities, decay, and indication of hollowness may be evident in the root crown, trunk, and/or primary and secondary limbs; some anchor roots may be exposed; codominant branching or multiple trunk attachments may be present, but included bark does not exist or is not well developed; minor to moderate amounts of included bark at branch attachments may exist; there may be small to moderate amounts of large dead limbs in canopy, but there is no evidence of large limb failures; limbs may be slightly overburdened; branching structure and/or canopy balance may be moderately altered by the tree's growing environment. This structure rating represents a moderate potential for failure.
Poor	With respect to the size of the tree, significant wounds, cavities, decay, and/or indication of hollowness may be evident in the root crown, trunk, and/or primary and secondary limbs; anchor roots may be exposed and/or the tree may have lost anchorage; codominant branching or multiple trunk attachments may be present; significant amounts of included bark may exist in trunk and branch attachments; there may be significant amounts of large dead limbs in the canopy; there may be evidence of trunk or large limb failures; limbs may be severely overburdened; branching structure and/or canopy balance may be drastically altered by the tree's growing environment. This structure rating represents a high potential for failure.

3.0 RESULTS AND DISCUSSION

3.1 Excelsior Estates Property

A total of 175 trees were inventoried on the Excelsior Estates property. Most trees were non-native trees planted near existing residences. Native willows and cottonwoods were observed in mesic sites. Native trees included: 25 black willow (*Salix gooddingii*), 13 black walnut (*Juglans hindsii*), 3 California sycamore (*Platanus racemosa*), 6 Fremont cottonwoods (*Populus fremontii*), and 1 interior live oak (*Quercus wislizeni*). Non-native trees inventoried on the site included 45 eucalyptus (*Eucalyptus* spp.), 8 pine (*Pinus* spp.), 24 black locust (*Robinia pseudoacacia*), 18 tree of heaven (*Ailanthus altissima*), 8 elm (*Ulmus* sp.), 3 plum (*Prunus* sp.), 1 Chinese pistache (*Pistacia chinensis*), 1 cork oak (*Quercus suber*), 3 edible fig (*Ficus carica*), 1 sweetgum (*Liquidambar styraciflua*), 1 southern magnolia (*Magnolia grandiflora*), 10 white mulberry (*Morus alba*), 3 willow (*Salix* spp.), and 1 Lombardy poplar (*Populus nigra*) (**Figure 2**). There are no Heritage Trees on the Excelsior Estates property and no trees are recommended for preservation as Landmark Trees.

Table 2 summarizes the surveyed trees by their health and structure ratings. **Appendix A** shows detailed tree data for all surveyed trees.

Table 2 — Excelsior Estates Protected Trees by Health and Structure Ratings

		Structure					
		Good	**Fair-Good**	**Fair**	**Poor-Fair**	**Poor**	**Total Trees**
Health	**Good**	40	23				63
	Fair-Good	7	15	3			25
	Fair	4	15	19	6		44
	Poor-Fair			9	13		22
	Poor			2	3	16	21
	Total Trees	**51**	**53**	**33**	**22**	**16**	**175**

As a whole, most of the trees are in relatively good condition. Seventy-five percent (132 out of 175) of all inventoried trees rated Fair or better in health, and 59 percent (104 out of 175) rated Fair or better in structure. Many of the black willows surrounding the large pond in the center of the site are old trees that are in Poor condition.

3.2 Non-Participating Properties

A total of 628 trees were recorded on the non-participating properties. Forty-eight native trees were identified, including 5 black walnut, 31 Fremont cottonwood, 2 interior live oak, 3 red willow (*Salix laevigata*), 5 California sycamore, and 2 valley oak (*Quercus lobata*). Non-native species identified on the non-participating properties included tree of

heaven, black locust, catalpa (*Catalpa* sp.), coast redwood (*Sequoia sempervirens*), cork oak, deodar cedar (*Cedrus deodara*), domestic almond (*Prunus dulcis*), elm, eucalyptus, Italian cypress (*Cupressus sempervirens*), sweetgum, Lombardy poplar, maple (*Acer* sp.), white mulberry, olive (*Olea europaea*), pine, plum, privet (*Ligustrum* sp.), red maple (*Acer rubrum*), silver wattle (*Acacia dealbata*), and willows. Most of these trees were planted as landscape trees around existing residences and appeared to be in Fair or better health. None of the native oaks appear large enough to be considered Heritage Trees. No trees are recommended for preservation as Landmark Trees. **Appendix B** includes estimated data for trees observed on the non-participating properties.

3.3 Environmental Review and Mitigation

In accordance with the Tree Preservation Ordinance, removal of the 3 interior live oaks and 2 valley oaks must be authorized as a condition of approval of the JTSPA entitlements (Sacramento County Code, Section 19.12.060). In addition, the impact of removing other native trees will be considered during the environmental review of the project during the California Environmental Quality Act (CEQA) process. As previously discussed, any native trees removed during development must be mitigated in-kind on an inch per inch basis as required by Policy CO-139. Policy CO-140 specifies the various methods for mitigating such impacts, including planting replacement trees on-site or off-site, or the payment of a sum equivalent to the replacement cost of the impacted trees into the County's Tree Preservation Fund or another appropriate tree preservation fund. Additionally, according to General Plan Policy CO-145, mitigation for the loss of non-native tree canopy may be required by the County as part of the project review and approval process. This mitigation would include creation of new tree canopy equivalent to the acreage of non-native tree canopy removed. Although on-site mitigation is generally preferred, payment of in-lieu fees to the County's Tree Preservation Fund or the Greenprint Initiative may be considered (See Policy CO-146).

Appendix B — Special-Status Species Table Potentially Occurring on or in the Vicinity of the Jackson Township Specific Plan Area

Special-Status Species	Regulatory Status (Federal; State; Local; CNPS)	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Ahart's (dwarf) rush *Juncus leiospermus* var. *ahartii*	--; --; --; 1B.2	Ahart's dwarf rush is known to occur on vernal pool margins and mesic valley and foothill grassland areas at elevations of 100–330 feet above MSL.	Blooming period: March – May.	**High**; suitable habitat on the site.
Boggs Lake hedge-hyssop *Gratiola heterosepala*	--; CE; --; 1B.2	Clay soils around the margins of marshes and swamps and in vernal pools.	Blooming period: April – August.	**High**; suitable habitat on the site.
Dwarf downingia *Downingia pusilla*	--; --; --; 2.2	Dwarf downingia is known to occur in vernal pools and mesic valley and foothill grassland areas at elevations of 3-1500 feet above MSL.	Blooming period: March – May.	**Medium**; there is marginal habitat on the site.
Legenere *Legenere limosa*	--; CT; --; 1B.1	Legenere is known to occur in vernal pools at elevations of 3- 3,000 feet above mean sea level.	Blooming period: April – June.	**High**; suitable habitat on the site.
Sacramento Orcutt grass *Orcuttia viscicla*	FE; CE; --; 1B.1	Sacramento Orcutt grass is known to occur in large, relatively deep vernal pools within Sacramento county. This species will occur at elevations of 100-330 feet above MSL.	Blooming period: April – July.	**No**; focused survey conducted in 2006 and 2007 found no Sacramento Orcutt grass present on site. Critical habitat on the site.
Slender Orcutt grass *Orcuttia tenuis*	FT; CE; --; 1B.1	Slender Orcutt grass is known to occur in large, relatively deep vernal pools and the margins of stock ponds in elevations of 115 -5,700 feet above MSL.	Blooming period: May – July.	**No**; focused survey conducted in 2006 and 2007 found no slender Orcutt grass present on site. Critical habitat on the site.
Sanford's arrowhead *Sagittaria sanfordii*	--; --; --; 1B.2	Sanford's arrowhead is known to occur in shallow, standing, fresh water and sluggish waterways within marshes, ponds, vernal pools, ditches, canals, and streams. This species will occur in elevations of 0-2200 feet above MSL.	Blooming period: May – October.	**High**; suitable habitat on the site.
Wildlife				
Invertebrates				
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT; --; --; --	Complete life cycle associated with its host plant, elderberry shrubs (*Sambucus* sp.).	Adults emerge in spring until June. Exit holes visible year-round.	**Low**; no elderberry shrubs were observed on Excelsior Estates, potential in balance of Plan Area.
Vernal pool fairy shrimp *Branchinecta lynchi*	FT; --; --; --	Vernal pools, swales, and ephemeral freshwater habitat.	Wet season.	**High**; found on site. Critical habitat on the site.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE; --; --; --	Vernal pools, swales, and ephemeral freshwater habitat.	Wet season.	**High**; found on site. Critical habitat on the site.
Fish				
Delta smelt *Hypomesus transpacificus*	FT; CE; --; --	Lower and middle reaches of Sacramento-San Joaquin Delta. Spawning takes place within side channels and sloughs in the middle reaches of the Delta.	Year-round.	**No**; no suitable habitat on the site.
Central Valley steelhead *Oncorhynchus mykiss*	FT; --; --; --	Sacramento and San Joaquin Rivers and their tributaries.	Year-round.	**No**; no suitable habitat on the site.
Central Valley fall/late fall-run chinook salmon *Oncorhynchus tshawytscha*	FE; CE; --; --	Sacramento and San Joaquin Rivers and their tributaries.	Year-round.	**No**; no suitable habitat on the site.
Central Valley spring-run Chinook salmon *Oncorhynchus tshawytscha*	FT; CT; --; --	Sacramento and San Joaquin Rivers and their tributaries.	Year-round.	**No**; no suitable habitat on the site.
Winter-run Chinook salmon *Oncorhynchus tshawytscha*	FE; CE; --; --	Sacramento and San Joaquin Rivers and their tributaries.	Year-round.	**No**; no suitable habitat on the site.
Amphibians/Reptiles				
California red-legged frog *Rana aurara draytonii*	FT; CSC; --; --	Requires a permanent water source and is typically found in deep pools (greater than 2½ feet) along quiet slow moving streams, ponds, or marsh communities with emergent vegetation.	Aquatic surveys of breeding sites: February 25 – April 30.	**No**; no substantiated historic records for the Sacramento Valley exist. In addition, the high density of bull frogs in the on site pond would make it less likely that this species occurs there.
California tiger salamander *Ambystoma californiense*	FT; CT; --; --	Breeds in temporary rain pools and permanent waters of grassland and open woodland of low hills and valleys. Require mammal burrows within the adjacent uplands for summer refugia.	Drift fence studies during fall and winter for upland habitats.	**No**; no substantiated historic records for the project vicinity exist. In addition, the high density of bull frogs in the on site pond would make it less likely that this species occurs there.
Giant garter snake *Thamnophis gigas*	FT; CT; --; --	Agricultural wetlands and other wetlands such as irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and their associated uplands.	Optimal detection early spring through mid fall (about mid March-early November) during their active period.	**No**; outside of historic range.
Northwestern western pond turtle *Actinemys marmorata*	--; CSC; --; --	Found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches, with abundant vegetation, and either rocky or muddy bottoms, in woodland, forest, and grassland.	Active outside of dormancy period November – February	**Low**; there is suitable habitat for this species on site but no known occurrences within 5 miles of the site.
Western spadefoot toad *Spea hammondii*	--; CSC; --; --	Open grasslands and woodlands. Requires vernal pools or seasonal wetlands for breeding.	Year-round.	**High**; suitable habitat on the site.
Birds				
Bank swallow *Riparia riparia*	--; CT; --; -- (Nesting)	Nests in large colonies, excavating nest burrows in steep riverbank cliffs, gravel pits, and highway cuts.	Spring - Fall	**No**; no suitable nesting habitat occurs on the site.

Special-Status Species	Regulatory Status (Federal; State; Local; CNPS)	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Loggerhead shrike *Lanius ludovicianus*	--; CSC; --; -- (Nesting)	Open habitats with scattered shrubs, trees, posts, fences and utility lines for perches. Nests in densely foliaged tree or shrub.	Spring - Fall	**High**; suitable habitat on the site.
Swainson's hawk *Buteo swainsoni*	--; CT; --; -- (nesting)	Breeding resident in the Central Valley. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah. Forage in adjacent grasslands or suitable grain fields and pastures.	Nesting: early March-early September.	**High**; suitable habitat on the site.
Tricolored blackbird *Agelaius tricolor*	--; CSC; --; -- (nesting colony)	Nests in dense thickets of blackberry, cattails, willow, or wild rose within emergent wetland habitats within the Central Valley and surrounding foothills.	Nesting: mid-April - late July.	**High**; suitable habitat on the site.
Western burrowing owl *Athene cunicularia hypugaea*	--; CSC; --; -- (burrow sites and some wintering sites)	Nests in burrows in the ground, often in old ground squirrel burrows or badger, within open dry grassland and desert habitat.	Year-round.	**High**; ground-squirrel burrows found on site.
White-tailed kite *Elanus leucurus*	--; CFP; --; -- (nesting)	Nests in isolated trees or woodland areas with suitable open foraging habitat.	Year-round.	**High**; observed foraging and roosting, no nests were observed.
Other Raptors (Hawks, Owls and Vultures)	MBTA and §3503.5 Department of Fish and Game Code	Nests in a variety of communities including oak woodland, mixed coniferous forest, chaparral, montane meadow, riparian, and urban.	February – September.	**High**; raptors observed foraging and roosting, no nests were observed.
Mammals				
American Badger *Taxidea taxus*	--; CSC; --; --	Occurs primarily in grasslands, parklands, farms, and other treeless areas with friable soils and a supply of rodent prey. Also found in meadows, marshes, and brushy areas at elevations ranging up to 12,00o feet above MSL.	Year-round.	**Low**; potential habitat but no known occurrences.
Special-status bat species	--; CSC; --; --	Typically roost in crevices in rocks, caves, or manmade structures. Occasionally roost in hollow trees or shrubs.	Year-round.	**Low**; there is limited suitable habitat for some species and no known occurrences within 5 miles of the project site.

Federally Listed Species:

FE = federal endangered

FT = federal threatened

FC = candidate

PT = proposed threatened

FPD = proposed for delisting

FD = delisted

California State Listed Species:

CE = California state endangered

CT = California state threatened

CR = California state rare

CSC = California Species of Special Concern

CSC = California Species of Special Concern

CFP = California Fully Protected

CNPS* Rank Categories:

1A = plants presumed extinct in California

1B = plants rare, threatened, or endangered in California and elsewhere

2 = plants rare, threatened, or endangered in California, but common elsewhere

3 = plants about which we need more information

4 = plants of limited distribution

Other Special-Status Listing:

SLC = species of local or regional concern or conservation significance

Appendix C — 2006 and 2007 Orcutt Grass Survey on the ±866- Acre Excelsior Estates Site, Sacramento County, California

July 20, 2006

Angelo Tsakopoulos
Tsakopoulos Real Estate Investments
7423 Fair Oaks Boulevard, Suite 10
Carmichael, CA 95608

Subject: Results of a Focused Survey for Sacramento Orcutt grass (*Orcuttia viscida*) and Slender Orcutt grass (*Orcuttia tenuis*) on the Excelsior Estates ±866.3-Acre Site.

Dear Angelo:

This report summarizes the results of a focused survey for Sacramento Orcutt grass (*Orcuttia viscida*) and slender Orcutt grass (*Orcuttia tenuis*). The purpose of this focused survey was to determine the presence or absence of these federally listed Orcutt grass species on the Excelsior Estates site located in Sacramento County, California. The ±866.3 site is located in an unincorporated area of Sacramento County immediately south of the City of Rancho Cordova, north of Jackson Highway (Highway 16), east of Excelsior Road, and bound on the north by the undeveloped Kiefer Boulevard right-of-way. The site is located within portions of Sections 23, 24, 25, and 26, Township 8 North, Range 6 East, Mount Diablo Baseline and Meridian, on the USGS 7.5-minute series "Carmichael, CA" topographic quadrangle (**Figure 1**).

The site is currently being used for cattle grazing and is occupied by two rural residences. The majority of the site consists of open rangeland. A small area in the southwestern portion of the site is composed of irrigated pasture. The northwestern portion of the site was formerly used as a nursery and Koi farm, which is evidenced by the presence of several large man-made ponds that saturate seasonally. Two rural residences and associated out buildings occur within the site along Excelsior Boulevard near the northwest corner of the site and at the terminus of Tree View Road in the southern-central portion of the site. These two sites are artificially irrigated and vegetated with large ornamental trees and shrubs. Additionally, the ±175-acre Sacramento Raceway Park occurs along the central-western boundary. This facility hosts vehicle and motorcycle races throughout the year.

Land uses surrounding the site include open rangeland and residential subdivisions to the north, a large gravel pit and rural residential developments to the west, as well as open rangeland and rural residential developments to the south and east.

Regulatory Framework

Federal Endangered Species Act

The United States Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA)

to help protect the ecosystems upon which endangered and threatened species depend. FESA prohibits the "take" of endangered or threatened wildlife species. "The term "take" means to harass, harm, pursue, hunt, shoot, kill, trap, capture, or collect, or to attempt to engage in any such conduct" (FESA Section 3 [(3)(19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3).

California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to FESA but pertains to state-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Game (CDFG) when preparing CEQA documents. The purpose is to ensure that the lead agency's actions do not jeopardize the continued existence of a listed species or result in the destruction, or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code §2080). CESA directs agencies to consult with CDFG on projects or actions that could affect listed species, directs CDFG to determine whether jeopardy would occur and allows CDFG to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows CDFG to authorize exceptions to the state's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (Fish & Game Code § 2081).

California Native Plant Society

The California Native Plant Society (CNPS) maintains a list of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the Inventory of Rare and Endangered Vascular Plants of California. Potential impacts to populations of CNPS-listed plants receive consideration under CEQA review. The following identifies the definitions of the CNPS listings:

- List 1A: Plants presumed Extinct in California
- List 1B: Plants Rare, Threatened, or Endangered in California and elsewhere
- List 2: Plants Rare, Threatened, or Endangered in California, but more numerous elsewhere
- List 3: Plants about which we need more information – A Review List
- List 4: Plants of limited distribution – A Watch List

Species Description, Distribution and Habitat

Sacramento Orcutt Grass

Sacramento Orcutt grass (endangered (FE), state endangered (SE), CNPS list 1B) is endemic to southeastern Sacramento Valley and has always been restricted to Sacramento County. Sacramento Orcutt grass occurs in Northern Hardpan and Northern Volcanic Mudflow vernal pools within blue oak woodland and annual grassland. Occupied pools

are located on high terrace sites at elevations between 150 to 270 feet above mean sea level (MSL). Prior to 1998 and through examination of the known occurrences of Sacramento Orcutt grass at that time, it has been determined that this species occurs in pools that range from 0.25 to 2.03 acres in size, with a median size of 0.69 acre.

Sacramento Orcutt grass is an annual species that typically blooms between May and July. Like all members of the grass tribe Orcuttieae, this species is sticky and aromatic. This species is densely tufted, bluish green in color and densely hairy-glandular. Stems are erect or spreading and do not branch. The inflorescence occupies the upper one-third to one-half of the stem and consists of 5-15 spikelets. The spikelets are closely spaced and arranged in two opposing rows oriented towards one side of the inflorescence.

Slender Orcutt Grass

Slender Orcutt grass (FE, SE, CNPS list 1B) is found in Lake, Lassen, Plumas, Sacramento, Shasta, Siskiyou and Tehama counties. Slender Orcutt grass is typically found in vernal pools on remnant alluvial fans and high stream terraces and recent basalt flows that occur in valley grassland and blue oak woodland habitats, ranging in elevations from approximately 115 to 5,774 feet above MSL.

Slender Orcutt grass is a slender annual grass, which typically blooms between May and July. This species has branches that extend from the upper nodes and generally has several stems 2-6 inches tall, that end in a elongated inflorescence of relatively evenly spaced spikelets. Like all members of the grass tribe Orcuttieae, this species is sticky and aromatic. The foliage is grayish with sparse hairs. The lemmas are deeply cleft, of equal length, and have distinct teeth that are sharp-pointed or short-awned.

Methods

Foothill Associates' biologists conducted a focused survey for Orcutt grasses on June 28, 2006. Prior to the survey, soil data describing types of soils occurring on the site (**Figure 2**) was reviewed, as well as, a CNDDB records search for Orcutt grasses within five miles of the site (**Figure 3**). The survey was conducted during June when these species are flowering, for optimal identification. Prior to surveying for the Orcutt grasses, Sacramento Orcutt grass was observed immediately prior to the survey at the *Phoenix Field Ecological Preserve* located in Sacramento County, in order to review the condition and flowering status of this target species. This reference population of Sacramento Orcutt grass was photographed on June 28, 2006 and was in good condition and readily identifiable (**Figure 4**).

In accordance with the CNPS Botanical Survey Guidelines, the survey was conducted by personnel with the following qualifications: experience with conducting floristic surveys; intimate knowledge of plant taxonomy and plant community ecology and classification; familiarity with the plants of the area, including special-status and locally significant plants; familiarity with the appropriate state and federal statutes related to plants and plant collecting, and experience with analyzing impacts of project activities on native plants and plant communities.

The following available information pertaining to the natural resources of the region was reviewed for the survey and preparation of this report.

- Hickman, James C. (Ed). 1993. *The Jepson Manual: Higher Plants of California*. University of California Press, Berkeley California;
- Mason, Herbert L. 1957. *A Flora of the Marshes of California*. University of California Press, Berkeley, CA;
- Nakamura, G. and Nelson, J. Eds). 2001. *Selected Rare Plants of Northern California*. University of California Agricultural and Natural Resources, Oakland, CA; and
- U.S. Geological Survey. 1992. *Carmichael, California 7.5-minute series topographic quadrangle*. United States Department of the Interior.

The site was surveyed on foot to provide 100% search coverage. Particular attention was given to the vernal pools and depressional seasonal wetlands on the site which represent potential habitat for the special-status plant species of concern. While conducting the survey, a comprehensive botanical survey species list of all plant species observed on the site was compiled (**Appendix A**).

Results

The site was thoroughly searched for Sacramento Orcutt grass and slender Orcutt grass. These species were not found during this focused survey.

Sincerely,

Carie Sears
Biologist

Subject: **Orcutt Grass Survey on the ±866-Acre Excelsior Estates Site, Sacramento County, California**

Dear Angelo:

This report summarizes the results of a focused survey for Sacramento Orcutt grass (*Orcuttia viscida*) and slender Orcutt grass (*Orcuttia tenuis*). The purpose of this focused survey was to determine the presence or absence of these federally listed Orcutt grass species on the site.

The ±866-acre site is located in an unincorporated area of Sacramento County, just south of the City of Rancho Cordova. The site is irregularly shaped and bounded partially on the south by Jackson Road (Highway 16), on the west by Excelsior Road, and on the north by the unimproved Kiefer Boulevard right-of-way. The site occupies portions of Sections 23, 24, 25, and 26, Township 8 North, Range 6 East, Mount Diablo Baseline and Meridian, on the USGS 7.5-minute series *Carmichael, CA* topographic quadrangle (**Figure 1**).

The site is predominantly composed of open rangeland and is currently being used for cattle grazing. A small area in the southwestern portion of the site is composed of irrigated pasture. The northwestern portion of the site was formerly used as a nursery and Koi farm, and still supports several large man-made ponds that saturate seasonally. Two rural residences and associated outbuildings occur within the site along Excelsior Road near the northwest corner of the site and at the terminus of Tree View Road in the southern-central portion of the site. These two areas are artificially irrigated and vegetated with ornamental trees and shrubs. Additionally, the ±175-acre Sacramento Raceway Park occurs along the western-central boundary. This facility hosts vehicle races throughout the year.

Species Description, Distribution and Habitat

Sacramento Orcutt Grass

Sacramento Orcutt grass (endangered (FE), state endangered (SE), CNPS list 1B) is endemic to southeastern Sacramento Valley and has always been restricted to Sacramento

County. Sacramento Orcutt grass occurs in Northern Hardpan and Northern Volcanic Mudflow vernal pools within blue oak woodland and annual grassland. Occupied pools are located on high terrace sites at elevations between 150 to 270 feet above mean sea level (MSL). Prior to 1998 and through examination of the known occurrences of Sacramento Orcutt grass at that time, it has been determined that this species occurs in pools that range from 0.25 to 2.03 acres in size, with a median size of 0.69 acre.

Sacramento Orcutt grass is an annual species that typically blooms between May and July. Like all members of the grass tribe Orcuttieae, this species is sticky and aromatic. This species is densely tufted, bluish green in color and densely hairy-glandular. Stems are erect or spreading and do not branch. The inflorescence occupies the upper one-third to one-half of the stem and consists of 5-15 spikelets. The spikelets are closely spaced and arranged in two opposing rows oriented towards one side of the inflorescence.

Slender Orcutt Grass

Slender Orcutt grass (FE, SE, CNPS list 1B) is found in Butte, Lake, Lassen, Modoc, Plumas, Sacramento, Shasta, Siskiyou and Tehama counties. Slender Orcutt grass is typically found in vernal pools on remnant alluvial fans and high stream terraces and recent basalt flows that occur in valley grassland and blue oak woodland habitats, ranging in elevations from approximately 115 to 5,774 feet above MSL.

Slender Orcutt grass is a slender annual grass, which typically blooms between May and July. This species has branches that extend from the upper nodes and generally has several stems 2-6 inches tall, that end in a elongated inflorescence of relatively evenly spaced spikelets. Like all members of the grass tribe Orcuttieae, this species is sticky and aromatic. The foliage is grayish with sparse hairs. The lemmas are deeply cleft, of equal length, and have distinct teeth that are sharp-pointed or short-awned.

Methods

The focused survey for Orcutt grasses was conducted by Foothill Associates biologists on July 18, 2007. Immediately prior to surveying for the Orcutt grasses, Sacramento Orcutt grass was observed at the *Phoenix Field Ecological Preserve* and *Anatolia Preserve* located in Sacramento County, in order to review the condition and flowering status of this target species. Both reference populations of Sacramento Orcutt grass were photographed on July 18, 2007 and were in good condition and readily identifiable (**Figure 2**). It should be noted that this survey followed a June 8, 2007 site visit with Justin Cutler of the U.S. Fish and Wildlife Service, where the large vernal pools on the site were inspected for Orcutt grasses.

In accordance with the CNPS Botanical Survey Guidelines, the survey was conducted by personnel with the following qualifications: experience with conducting floristic surveys; intimate knowledge of plant taxonomy and plant community ecology and classification; familiarity with the plants of the area, including special-status and locally significant plants; familiarity with the appropriate state and federal statutes related to plants and plant collecting, and experience with analyzing impacts of project activities on native plants and plant communities.

The following available information pertaining to the natural resources of the region was reviewed for the survey and preparation of this report.

- Hickman, James C. (Ed). 1993. *The Jepson Manual: Higher Plants of California*. University of California Press, Berkeley California.

- Mason, Herbert L. 1957. *A Flora of the Marshes of California*. University of California Press, Berkeley, CA.

The site was surveyed on foot to provide total search coverage. Particular attention was given to the vernal pools and other seasonal wetland habitats, which represent potential habitat for *Orcuttia* species. While conducting the survey, a comprehensive botanical survey species list of all plant species observed was compiled (**Appendix A**).

Results

The site was thoroughly searched for Sacramento Orcutt grass and slender Orcutt grass. These species were not found during this focused survey.

Feel free to contact me if you have any questions or require additional information.

Sincerely,

Michael J. Farmer
Senior Biologist

7423 Fair Oaks Boulevard, Suite 10
Carmichael, CA 95608

RE: Special-Status Plant Surveys on the ±886-Acre Excelsior Estates Site, Sacramento County, California

Dear Mr. Tsakopoulos:

This report summarizes the results of two special-status plant surveys. The first survey focused on species blooming between March and June including: Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), Bogg's Lake hedgehyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii* ssp. *myersii*), and Sanford's arrowhead (*Sagittaria sanfordii*). The second survey focused on later blooming species, specifically Sacramento Orcutt grass (*Orcuttia viscida*) and slender Orcutt grass (*Orcuttia tenuis*). Sanford's arrowhead was also included in the second survey, as it blooms in late spring through late summer. The purpose of this survey was to determine the presence or absence of these listed species on the project site.

The ±866-acre project site is located in an unincorporated area of Sacramento County, just south of the City of Rancho Cordova. The site is irregularly shaped and bounded partially on the south by Jackson Road (Highway 16), on the west by Excelsior Road, and on the north by the unimproved Kiefer Boulevard right-of-way. The site occupies portions of Sections 23, 24, 25, and 26, Township 8 North, Range 6 East, Mount Diablo Baseline and Meridian, on the USGS 7.5-minute series *Carmichael, CA* topographic quadrangle (**Figure 1**).

The site is predominantly composed of open rangeland and is currently being used for cattle grazing. A small area in the southwestern portion of the site is composed of irrigated pasture. The northwestern portion of the site was formerly used as a nursery and koi farm, and still supports several large man-made ponds that saturate seasonally. Two rural residences and associated outbuildings occur within the site along Excelsior Road near the northwest corner of the site and at the terminus of Tree View Road in the southern-central portion of the site. These two areas are artificially irrigated and vegetated with ornamental trees and shrubs. Additionally, the ±175-acre Sacramento Raceway Park is located along the western-central boundary. This facility hosts vehicle races throughout the year.

The surveys were conducted by a Foothill Associate's biologist on May 2, 5 and 6, and June 5 and 6, 2014. The survey was conducted by personnel with the following qualifications:

experience with conducting floristic surveys; intimate knowledge of plant taxonomy and plant community ecology and classification; familiarity with the plants of the area, including special-status and locally significant plants; familiarity with the appropriate state and federal statutes related to plants and plant collecting, and experience with analyzing impacts of project activities on native plants and plant communities.

The site was surveyed on foot to provide total search coverage. All species occur in vernal pool and other seasonal wetland habitats. Therefore, all surveys were focused within these habitats. The June surveys were focused on the larger, deeper vernal pool and marshy habitats. While conducting the surveys, a comprehensive botanical survey species list of all plant species observed was compiled (Appendix A).

Although the site has potential habitat for several of these special-status plant species, no special-status plant species were observed.

If you have any questions please contact me at your earliest convenience at (916) 435-1202 or email kvail@foothill.com.

Sincerely,

Kirk Vail
Biologist

Appendix A — Plant Species Observed on the Project Site

Scientific Name	Common Name
Agoseris heterophylla	Annual false dandelion
Amsinkia menziesii var. intermedia	Fiddleneck
Avena sp.	Wild oats
Brassica nigra	Black mustard
Briza minor	Rattlesnake grass
Bromus diandrus	Ripgut brome
B. hordeaceus	Soft chess
Calamagrostis sp.	Reed grass
Carduus pycnocephalus	Italian thistle
Castilleja attenuata	Valley tassels
Centaurea solstitialis	Yellow star-thistle
Centromadia fitchii	Fitch's tarplant
Cichorium intybus	Chicory
Convolvulus arvensis	Bindweed
Conyza canadensis	Horseweed
Croton setigerus	Dove weed
Cotula coronopifolia	Brass buttons
Cuscuta sp.	Dodder
Cynodon dactylon	Bermudagrass
Cyperus eragrostis	Nutsedge
Deschampsia danthonioides	Annual hairgrass
Dianthus sp.	Pink
Digitaria ischaemum	Smooth crabgrass
Downingia bicornuta	Downingia
Echinochloa crus-galli	Barnyard grass
Eleocharis macrostachya	Spikerush
Elymus caput-medusae	Medusa head grass
Eryngium vaseyi	Coyote thistle
Eucalyptus camaldulensis	Red gum
Festuca perennis	Italian ryegrass
Glyceria occidentalis	Western mannagrass
Holocarpha virgata	Sticky tarweed
Holcus lanatus	Velvet grass

Scientific Name	Common Name
Hordeum marinum ssp. gussoneanum	Mediterranean barley
H. murinum	Barley
Hypochaeris glabra	Smooth cat's ear
H. radicata	Rough cat's ear
Juncus bufonius	Common toad rush
J. effusus	Common rush
J. mexicanus	Mexican spikerush
Juglans hindsii	Northern California black walnut
Lactuca serriola	Prickly lettuce
Lasthenia fremontii	Goldfields
Leontodon taraxacoides	Hawkbit
Lepidium sp.	Peppergrass
Lotus corniculatus	Bird's foot trefoil
Ludwigia peploides	Water primrose
Lythrum hyssopifolia	Loosestrife
Maclura pomifera	Osage orange
Mentha pulegium	Pennyroyal
Morus alba	Mulberry
Navarretia leucocephala	White-headed navarretia
Paspalum dilatatum	Dallis grass
Paspalum distichum	Knotgrass
Pistachia sp.	Pistache
Plagiobothrys stipitatus	Vernal pool allocarya
Plantago lanceolata	English plantain
Pogogyne zizyphoroides	Mesamint
Polygonum sp.	Smartweed
P. monspeliensis	Rabbitsfoot grass
Populus fremontii	Fremont's cottonwood
Psilocarphus brevissimus	Wooly marbles
Pyracantha sp.	Firethorn
Ranunculus bonariensis	Vernal pool buttercup
Raphanus sativus	Field mustard
Rubus armeniacus	Himalayan blackberry
Rumex crispus	Curly dock
R. pulcher	Fiddle dock
Salix gooddingii	Black willow

1.0 EXECUTIVE SUMMARY

This report presents the results of the 2009-2010 wet-season survey for listed vernal pool branchiopods conducted on the Excelsior Estates site located in Sacramento County, California. The purpose of this survey was to determine the presence of listed vernal pool branchiopods within historic pools on the site. Surveys focused on pools in the potential preserve area, although pools from throughout the site were randomly sampled.

A total of 290 wetlands on the site were surveyed between December 2009 and March 2010. Monitoring occurred on December 21, 2009, January 7, January 8, January 20, January 21, January 22, January 25, February 3, February 18, February 19, March 4, and March 5, 2010. Populations of vernal pool branchiopods were found in 137 of the sampled pools. The federally listed vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*) were observed throughout the site in 36 and 81 wetlands respectively. California linderiella (*Linderiella occidentalis*), a former federal species of concern, was also observed in 125 wetlands. All three species coexisted in 26 of the sampled pools. Forty-four pools had populations of tadpole shrimp and California linderiella only. Vernal pool fairy shrimp and California linderiella were found together without tadpole shrimp in nine pools.

2.0 INTRODUCTION

This report presents the results of the 2009-2010 wet-season survey for listed vernal pool branchiopods conducted on the Excelsior Estates site (site). The site is located north of Jackson Highway, State Route 16, approximately four miles east of the Sacramento city limits within Township 8 North, Range 6 East, Sections 23, 24, 25 and 26 of the *Carmichael* 7.5 minute USGS Quadrangle (**Figure 1**). A total of 286 vernal pools and 140 depressional seasonal wetlands occur on the site (**Figure 2**).

3.0 METHODS

Wet-season surveys for listed vernal pool branchiopods were conducted on the site on December 21, 2009, January 7, January 8, January 20, January 21, January 22, January 25, February 3, February 4, February 18, February 19, March 4, and March 5, 2010. Pools in the proposed preserve area were sampled, if inundated, on every site visit. A minimum of ten randomly chosen pools outside of the proposed preserve are were sampled during each survey.

The surveys were conducted in accordance with the U.S. Fish and Wildlife Service (USFWS) protocol survey for listed vernal pool branchiopods, as outlined in 1996 *Interim Survey Guidelines to Permittees for Recovery Permits under Section 10(a)(1)(A) of the Endangered Species Act for the Listed Vernal Pool Branchiopods*. Wetlands were sampled by pulling a D-frame, 150-micron aquatic dip-net through the water column. The dip-net was undulated up and down through the water column to ensure a representative sample from each wetland sampled. A minimum of three, five-foot passes were made with the dip-net per wetland sampled.

The number of listed branchiopods was estimated to be in the 10s, 100s, and 1,000s depending on the number of shrimp that were netted and the amount of inundation within the wetland during the survey. This estimated population data along with the presence of common invertebrates, insects, and other wildlife species within the wetland were indicated on the data sheets. In sampling some pools, only female vernal pool fairy shrimp were observed and no males were found. In such situations, female vernal pool fairy shrimp were identified as such based on the morphology of the brood sac and overall body size compared to identified males of the same species in other wetlands. If vernal pool fairy shrimp were identified from female individuals only in a pool, it was noted on the field survey data sheets by the presence of a female sign (♀) following the number of individuals estimated to be in the wetland. In pools where vernal pool tadpole shrimp carapaces were observed but no live shrimp were captured in the net the population was assumed to be in the 10s and 'carapace only' was noted on the data sheets. Other data collected during each sampling included the wetland number, water depth, estimated maximum depth, surface area of each wetland at time of sampling, estimated maximum surface area of wetland, water temperature, if a voucher specimen was collected, and habitat and weather conditions. The species were easily identifiable in the field; therefore no voucher specimens were collected. Representative site photographs were taken with a digital camera during the surveys.

4.0 RESULTS

4.1 Biological Community Description

The vernal pools on the site are surrounded by annual grassland habitat that supports numerous grasses and herbaceous species. Dominants include soft brome (*Bromus hordeaceus*), wild oat (*Avena* sp.), medusa head (*Taeniatherum caput-medusae*), long-beaked filaree (*Erodium botrys*), hawkbit (*Leontodon taraxacoides*), foxtail grass (*Vulpia myuros*), Spanish clover (*Lotus purshianus*), tarplant (*Holocarpha virgata*), Fitch's tarweed (*Centromadia fitchii*), foxtail barley (*Hordeum murinum*), and Italian ryegrass (*Lolium multiflorum*).

Dominant plant species observed in vernal pool habitat included waxy manna grass (*Glyceria declinata*), coyote thistle (*Eryngium vaseyi*), spikerush (*Eleocharis macrostachya*), and vernal pool buttercup (*Ranunculus bonariensis*).

4.2 Sampling Results

Invertebrate data were collected from 290 wetlands on the site. As shown in **Table 1**, vernal pool branchiopods were present in approximately half of the sampled pools. Populations of vernal pool fairy shrimp were identified in a total of 36 individual pools. Populations of vernal pool tadpole shrimp were identified in 81 separate pools. California linderiella was found in 125 pools. Vernal pool tadpole shrimp and California linderiella were found together in a total of 70 pools. Vernal pool fairy shrimp and California linderiella were found together in a total of 35 pools. The three species co-existed in 26 pools. Vernal pool tadpole shrimp and vernal pool fairy shrimp were never found in the same feature without California linderiella also being present. The number of pools with populations of branchiopods on each sampling date is shown in **Table 2**. **Figure 3** shows the locations of all populations of vernal pool fairy shrimp and vernal pool tadpole shrimp identified on the site. CNDDB reports have been submitted to the California Department of Fish and Game and are included as **Appendix C** of this report.

Table 1 — Frequency of Populations of Vernal Pool Branchiopods

Branchiopod Species Found (exclusive of other categories)	Number of Pools	Percent of Total Pools Sampled
All Three Species	26	9.0%
Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp	0	0%
Vernal Pool Tadpole Shrimp and California Linderiella	44	15.2%
Vernal Pool Fairy Shrimp and California Linderiella	9	3.1%
Vernal Pool Fairy Shrimp Only	1	0.3%
Vernal Pool Tadpole Shrimp Only	11	3.8%
California Linderiella Only	46	15.9%
No Branchiopod Species	153	52.7%

Table 2 — Populations of Vernal Pool Branchiopods by Sampling Date

Sampling Date	Number of Pools Sampled	Number of Pools with Populations		
		Branchinecta lynchi	***Lepidurus packardi***	***Linderiella occidentalis***
12/21/2009	13	0	0	2
1/7/2010	21	3	1	9
1/8/2010	14	1	0	9
1/20/2010	6	0	0	4
1/21/2010	73	4	2	9
1/22/2010	85	0	0	1
1/25/2010	92	0	0	1
2/3/2010	50	13	30	19
2/4/2010	46	14	28	33
2/18/2010	63	13	39	44
2/19/2010	48	9	23	33
3/4/2010	74	0	37	30
3/5/2010	70	2	21	29

Other non-listed aquatic invertebrates found during the survey included water fleas (cladocera), copepods (copepoda), seed shrimp (ostracoda), and flatworms (planaria), diving water beetles (dytiscidae), crawling water beetles (haliplidae), midges (chironomidae), and backswimmers (notonectidae). Bullfrog larvae (*Rana catesbiana*) and both larval and adult pacific tree frogs (*Hyla regilla*) were also found in the sampled

wetlands on the site. Ground-level photographs of the site and the field survey data sheets are included in **Appendix A** and **Appendix B**, respectively.

4.3 Site Conditions

During our survey, the site was found to be in good condition. There were cattle tracks and bovine fecal matter in many of the vernal pools and surrounding landscape, resulting in high variability of conditions between individual vernal pools. Some pools had little or no evidence of cattle presence and exhibited relatively clear water, while other pools had obvious signs of high cattle traffic and typically had turbid, foul-smelling water. Overall, there were no significant problems with trash dumping, off-road vehicle use, or other signs of disturbance on the majority of the site. Trash dumping and off-road vehicle damage was observed in portions of the site within and north of the decommissioned section of Kiefer Boulevard. Additionally, small pieces of trash that had likely been blown onto the site from the nearby road littered the southern edge of the site.

5.0 CONCLUSIONS

As discussed, populations of the federally listed vernal pool fairy shrimp and vernal pool tadpole shrimp were observed in approximately 12% (36) and 28% (81) of the total wetland features sampled, respectively. Many of the wetlands on the site provide suitable habitat for listed vernal pool branchiopods.

Appendix F — Corps Jurisdictional Determination for the Jackson Township Project (formerly Excelsior Estates), November 6, 2015

DEPARTMENT OF THE ARMY
U.S. ARMY CORPS OF ENGINEERS, SACRAMENTO DISTRICT
1325 J STREET
SACRAMENTO CA 95814-2922

REPLY TO
ATTENTION OF

November 6, 2015

Regulatory Division SPK-2004-00791

Tsakopoulos Investments
Attn: Mr. Angelo G. Tsakopoulos
7423 Fair Oaks Boulevard, Suite 10
Carmichael, California 95608

Dear Mr. Tsakopoulos:

We are writing in regards to the revised delineation of aquatic resources on the Jackson Township 900 (formerly Excelsior Estates) site. The approximately 862-acre site is located in unincorporated eastern Sacramento County, and is bordered on the north by Keifer Boulevard, on the south by Jackson Highway and on the west by Excelsior Road, Latitude 38.52393° North, Longitude 121.27833° West.

Based on available information, **we concur with the amount and location of aquatic resources on the site as depicted on the enclosed revised October 29, 2015, *Delineated Waters of the U.S. Excelsior Estates Specific Plan Area, Figure 1*, prepared by Foothill Associates**. The approximately 53.81 acres of aquatic resources, consisting of 4.41 acre of depressional seasonal wetlands, 1.03 acres of depressional perennial marsh, 27.85 acres of vernal pools, 3.70 acres of riverine seasonal wetlands, 10.05 acres of riverine perennial marsh, 1.19 acres of intermittent drainage, 0.23 acre of ephemeral drainage, 5.04 acres of ponds, and 0.31 acre of ditch canal, present within the survey area are potential waters of the United States regulated under Section 404 of the Clean Water. This preliminary jurisdictional determination supersedes our August 27, 2015, preliminary jurisdictional determination.

We have enclosed a copy of the *Preliminary Jurisdictional Determination Form* for this site. Please sign and return a copy of the completed form to this office. Once we receive a copy of the form with your signature we can accept and process a Pre-Construction Notification or permit application for your proposed project.

You should not start any work in potentially jurisdictional waters of the United States unless you have Department of the Army permit authorization for the activity. You may request an approved JD for this site at any time prior to starting work within waters. In certain circumstances, as described in RGL 08-02, an approved JD may later be necessary.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This preliminary determination has been conducted to identify the potential limits of wetlands and other water bodies which may be subject to Corps of Engineers' jurisdiction for the particular site identified in this request. A Notification of Appeal Process and Request for Appeal form is enclosed to notify you of your options with this determination. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are U.S. Department of Agriculture (USDA) program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

We appreciate your feedback. At your earliest convenience, please tell us how we are doing by completing the customer survey on our website under *Customer Service Survey*.

Please refer to identification number SPK-2004-00791 in any correspondence concerning this project. If you have any questions, please contact me at 1325 J Street, Room 1350, Sacramento, California 95814, by email at *Lisa.M.Gibson2@usace.army.mil*, or telephone at 916-557-5288. For more information regarding our program, please visit our website at *www.spk.usace.army.mil/Missions/Regulatory.aspx*.

Sincerely,

Lisa M Gibson

PRELIMINARY JURISDICTIONAL DETERMINATION FORM
Sacramento District

This preliminary JD finds that there *"may be"* waters of the United States on the subject project site, and identifies all aquatic features on the site that could be affected by the proposed activity, based on the following information:

Regulatory Branch: **Sacramento District** File/ORM #: **SPK-2004-00791** PJD Date: **November 6, 2015**

State: **CA** City/County: **Sacramento County**
Nearest Waterbody: **Elder Creek, Morrison Creek**
Location (Lat/Long): **38.52509° North, 121.28180° West**
Size of Review Area: **862** acres

Name/Address Of Property Owner/ Potential Applicant: **Tsakopoulos Investments**
Attn: Mr. Angelo G. Tsakopoulos
7423 Fair Oaks Boulevard, Suite 10
Carmichael, California 95608

Identify (Estimate) Amount of Waters in the Review Area
Non-Wetland Waters:
linear feet ft wide **6.77** acre(s)
Stream Flow: **Mixed**

Wetlands: **47.04** acre(s)
Cowardin Class: **Palustrine, emergent**

Name of any Water Bodies on the site identified as Section 10 Waters: Tidal: Non-Tidal:

☐ Other information (please specify):

IMPORTANT NOTE: The information recorded on this form has not necessarily been verified by the Corps and should not be relied upon for later jurisdictional determinations.

Noam Gibson 11/6/15
Signature and Date of Regulatory Project Manager (REQUIRED)

Signature and Date of Person Requesting Preliminary JD (REQUIRED, unless obtaining the signature is impracticable)

EXPLANATION OF PRELIMINARY AND APPROVED JURISDICTIONAL DETERMINATIONS:

1. The Corps of Engineers believes that there may be jurisdictional waters of the United States on the subject site, and the permit applicant or other affected party who requested this preliminary JD is hereby advised of his or her option to request and obtain an approved jurisdictional determination (JD) for that site. Nevertheless, the permit applicant or other person who requested this preliminary JD has declined to exercise the option to obtain an approved JD in this instance and at this time.

2. In any circumstance where a permit applicant obtains an individual permit, or a Nationwide General Permit (NWP) or other general permit verification requiring "preconstruction notification" (PCN), or requests verification for a non-reporting NWP or other general permit, and the permit applicant has not requested an approved JD for the activity, the permit applicant is hereby made aware of the following: (1) the permit applicant has elected to seek a permit authorization based on a preliminary JD, which does not make an official determination of jurisdictional waters; (2) that the applicant has the option to request an approved JD before accepting the terms and conditions of the permit authorization, and that basing a permit authorization on an approved JD could possibly result in less compensatory mitigation being required or different special conditions; (3) that the applicant has the right to request an individual permit rather than accepting the terms and conditions of the NWP or other general permit authorization; (4) that the applicant can accept a permit authorization and thereby agree to comply with all the terms and conditions of that permit, including whatever mitigation requirements the Corps has determined to be necessary; (5) that undertaking any activity in reliance upon the subject permit authorization without requesting an approved JD constitutes the applicant's acceptance of the use of the preliminary JD, but that either form of JD will be processed as soon as is practicable; (6) accepting a permit authorization (e.g., signing a proffered individual permit) or undertaking any activity in reliance on any form of Corps permit authorization based on a preliminary JD constitutes agreement that all wetlands and other water bodies on the site affected in any way by that activity are jurisdictional waters of the United States, and precludes any challenge to such jurisdiction in any administrative or judicial compliance or enforcement action, or in any administrative appeal or in any Federal court; and (7) whether the applicant elects to use either an approved JD or a preliminary JD, that JD will be processed as soon as is practicable. Further, an approved JD, a proffered individual permit (and all terms and conditions contained therein), or individual permit denial can be administratively appealed pursuant to 33 C.F.R. Part 331, and that in any administrative appeal, jurisdictional issues can be raised (see 33 C.F.R. 331.5(a)(2)). If, during that administrative appeal, it becomes necessary to make an official determination whether CWA jurisdiction exists over a site, or to provide an official delineation of jurisdictional waters on the site, the Corps will provide an approved JD to accomplish that result, as soon as is practicable.

Appendix BR-2

Special-Status Species Descriptions

Special-Status Species Descriptions

Special-Status Plants

[County- For brevity and ease of reading, it may be better to compile the following descriptions into Appendix B. Please advise if this is acceptable]

Based on the species table found in Appendix B of the Biological Resources Assessment (Appendix BR-1), the following seven special-status plant species have potential to occur in the Plan Area: Ahart's dwarf rush (*Juncus leiospermus var. ahartii*), Bogg's Lake hedge-hyssop (*Gratiola heterosepala*), legenere (*Legenere limosa*), Sacramento Orcutt grass, slender Orcutt grass, dwarf downingia (*Downingia pusilla)* and Sanford's arrowhead (*Sagittaria sanfordii*). Botanical surveys for special-status plant species were conducted on the Applicant-owned properties in May and June of 2014, and no populations of any special-status plant species were observed. However, because protocol-level surveys were not conducted over the entire Plan Area, the most recent surveys were conducted during a drought year and reference sites were not visited to confirm successful establishment of target species that year, and the surveys are outdated according to agency standards, the potential for these species to occur cannot be ruled out. Legenere has been documented previously on the non-participating properties at the border of the Mather Preserve (CNDDB 2018). Also, most of the Plan Area is within the Mather Core Area and is designated by the USFWS as critical habitat for slender orcutt grass and Sacramento orcutt grass.

Ahart's Dwarf Rush

Ahart's dwarf rush is an annual herb that occurs primarily on the margins of vernal pools in areas that are sparsely vegetated. The vernal pools onsite represent potential habitat for this species. There are 13 reported occurrences of this species within California, one within 5 miles of the site. There are several occurrences of this species in the vicinity including at the Mather Preserve. Based on the presence of suitable habitat and documented occurrences in the vicinity, this species has potential to occur in the Plan Area.

Bogg's Lake Hedge-hyssop

Bogg's Lake hedge-hyssop is and annual herb that occurs in vernal pools primarily on saturated clay (adobe) soils and, at the Bogg's Lake Preserve, on shallow lake margins (CNPS 2013). The vernal pools onsite represent potential habitat for this species. There are 93 reported occurrences of this species within California, one of which is within 5 miles of the site. The nearest occurrence is less than 0.25-mile northeast of the site boundary on the Mather Preserve. Based on the presence of suitable habitat and documented occurrences in the vicinity, this species has potential to occur onsite.

Dwarf Downingia

Dwarf downingia is an annual herb that occurs in vernal pools and swales. The vernal pools onsite represent potential habitat for this species. There are 127 reported

occurrences of this species within California, 11 of which are within Sacramento County and nine of which are within the nine-quad area containing and surrounding the Plan Area (CDFW 2018). There are no reported occurrences of this species within 5 miles of the site; however, the Plan Area is within the species' known range and the presence of suitable habitat creates potential for this species to occur.

LEGENERE

Legenere is an annual herb that occurs in vernal pools and swales, seasonal marshes, artificial ponds, floodplains of intermittent streams, and other seasonally inundated habitats (CNPS 2013). The vernal pools and seasonal wetlands on site represent potential habitat for this species. There are 79 reported occurrences of this species within California, six of which are within 5 miles of the Plan Area. The nearest occurrence borders the Plan Area to the north, at the Mather Preserve. Based on the presence of suitable habitat and documented occurrences in the vicinity, this species has potential to occur on site.

SACRAMENTO AND SLENDER ORCUTT GRASSES

Though Sacramento and slender Orcutt grasses have been documented within 5 miles of the Plan Area, surveys for these species in 2006 and 2007 produced negative results. Although a portion of the Plan Area is within critical habitat for these two species, neither of these species has ever been observed within the Plan Area.

SANFORD'S ARROWHEAD

Sanford's arrowhead occurs in emergent marsh habitats, including habitats which are modified or human-made. Sanford's arrowhead is designated as a federal species of special concern and is listed by the California Native Plant Society's Inventory of Rare and Endangered Plants as category 1B.2 (i.e., rare throughout its range in California with a moderate probability of going extinct). Sanford's arrowhead is fairly common in the Sacramento area. The nearest occurrence is approximately 2 miles west of the Plan Area. Potential suitable marsh habitats include the margins of rivers, streams, ponds, reservoirs, irrigation and drainage canals and ditches, and stock-ponds. Based on the presence of suitable habitat and documented occurrences in the vicinity, this species has a high potential to occur on site.

SPECIAL-STATUS ANIMALS

BIRDS

Based on the species table found in Appendix B of the Biological Resources Assessment (Appendix BR-1), the following special-status avian species are identified as having potential to occur on or near the Plan Area: Western burrowing owl (*Athene cunicularia*), tricolored blackbird (*Agelaius tricolor*), Swainson's hawk (*Buteo swainsoni*), loggerhead shrike (*Lanius ludovicianus)*, white-tailed kite (*Elanus leucurus*), grasshopper sparrow (*Ammodramus savannarum*), Cooper's Hawk (Accipiter cooperi), and song sparrow (*Melospiza melodia*)(Modesto population). The section also addresses nesting raptors in general, which are afforded minimum protections pursuant to the Fish and Game code regardless of status.

SWAINSON'S HAWK

The Swainson's hawk is listed as a Threatened species by the State of California and is a candidate for federal listing as threatened or endangered. It is a migratory raptor typically nesting in or near valley floor riparian habitats during spring and summer months. Swainson's hawks were once common throughout the state, but various habitat changes, including the loss of nesting habitat (trees) and the loss of foraging habitat through the conversion of native Central Valley grasslands to certain incompatible agricultural and urban uses has caused an estimated 90 percent decline in their population.

Swainson's hawks feed primarily upon small mammals, birds, and insects. Their typical foraging habitat includes native grasslands, alfalfa and other hay crops that provide suitable habitat for small mammals. Certain other row crops and open habitats also provide some foraging habitat. The availability of productive foraging habitat near a Swainson's hawk's nest site is a critical requirement for nesting and fledgling success. In central California, about 85 percent of Swainson's hawk nests are within riparian forest or remnant riparian trees. CEQA analysis of impacts to Swainson's hawks consists of separate analyses of impacts to nesting habitat and foraging habitat.

Swainson's hawks are known to forage up to 18 miles from their nest site; however, that is the extreme range of one individual bird's daily movement. It is more common for a Swainson's hawk to forage within 10 miles of its nest site. Therefore, it is generally accepted and CDFW recommends evaluating projects for foraging habitat impacts when they are within 10 miles of a known nest site.

Although this species has not been observed onsite, there is a high potential for it to occur in the Plan Area. According to the most recent data available on CNDDB, there are several active nests within 5 to 10 miles of the site and the closest occurrence is within 2 miles. The trees that surround the irrigation pond and are adjacent to the Plan Area represent potential nesting habitat, while the Plan Area also provides foraging habitat for the hawk.

TRICOLORED BLACKBIRD

The Fish and Game Commission voted to list the tricolored blackbird as threatened on April 19, 2018 and the official Notice of Findings was published on September 14, 2018 (OAL 2018); however, the species remains as a candidate until it is added to Title 14 Section 670.5b. According to CDFW's life history account for the tricolored blackbird, the species is mostly a resident in California, and common locally throughout the Central Valley. The species is a colonial nester that breeds near fresh water, preferably in emergent wetland with tall, dense cattails or tules, but also in thickets of willow, blackberry, wild rose, and tall herbs. Nesting colonies usually support a minimum of 50 pairs. The species feeds in grassland and cropland habitats. The usual breeding season is mid-April into late-July.

According to the CNDDB, there is a record of this species in the Plan Area. The occurrence record states there were 15 adults observed in the colony, which is small, but the colony was successfully breeding amongst blackberry bushes on the site in 1994. Foraging tricolored blackbirds were also observed during the June 22, 2017 site

visit to the Plan Area. The site includes a variety of wetland habitats, including habitats that support reeds, blackberries, and other plants that provide suitable nesting habitat. The entire Plan Area provides suitable foraging habitat.

WHITE-TAILED KITE

According to the CDFW life history account for the white-tailed kite, the species is a resident in coastal and valley lowlands and is rarely found away from agricultural areas. The species forages in undisturbed grasslands, meadows, farmlands, and emergent wetlands. Groves of dense, broad-leafed deciduous trees are used for nesting and roosting. The species is listed as fully protected due to nesting impacts. The grassland habitat provides foraging habitat to the white-tailed Kite. During several site visits to the Plan Area, white-tailed kites were observed foraging in the annual grassland areas; however, no nest sites for this species were observed. There is high potential for this species to nest in the Plan Area.

WESTERN BURROWING OWL

Western burrowing owl is a California species of special concern that can be found in annual and perennial grasslands, deserts, and arid scrublands characterized by low-growing vegetation (Zarn 1974). Suitable owl habitat may also include trees and shrubs if the canopy covers less than 30 percent of the ground surface. Burrows are the essential component of burrowing owl habitat. Both natural and artificial burrows provide protection, shelter, and nesting habitat for burrowing owls (Henny and Blus 1981). Burrowing owls typically use burrows made by fossorial mammals, such as ground squirrels or badgers, but also use artificial structures such as cement culverts; wood debris piles; or openings beneath cement or asphalt pavement.

Burrowing owls may use a site for breeding, wintering, foraging, and/or migration stopovers. Breeding takes place from February 1 to August 31 and wintering takes place from September 1 to January 31. Occupancy of suitable burrowing owl habitat can be verified at a site by detecting a burrowing owl, its molted feathers, cast pellets, prey remains, eggshell fragments, or excrement at or near a burrow entrance. Burrowing owls exhibit high site fidelity, reusing burrows year after year or year-round (Rich 1984, Feeney 1992).

The CNDDB documents burrowing owl sightings outside of the Plan Area, but within 0.5 mile. The occurrence record details multiple site visits which documented 16 active burrows in 1991. Given that burrowing owls tend to display high nest fidelity, it should be assumed that this burrow area is still active. The Plan Area contains many rodent and other burrows that could be suitable for nesting or wintering.

GRASSHOPPER SPARROW

Grasshopper sparrow is a California species of special concern and, according to the CDFW life history account, the species is an uncommon and local summer resident and breeder in foothills and lowlands, arriving in California from March to May and migrating south in August or September. The species occurs in dry, dense grasslands, especially those with a variety of grasses and tall forbs and scattered shrubs for singing perches.

Nests are built of grasses and forbs in a slight depression on the ground, hidden at the base of an overhanging clump of grasses or forbs.

Grasshopper sparrow is known to occur in southern half of Sacramento County. The CNDDB documents one occurrence of this species between 5 and 10 miles from the Plan Area. In 2007, two adults were documented north of Latrobe Road and east of Scott Road in the Deer Creek Hills Unit of the Prairie City State Vehicle Restoration Area.

LOGGERHEAD SHRIKE

According to the CDFW life history account for the loggerhead shrike*,* the species breeds mainly in shrublands or open woodlands with a fair amount of grass cover and areas of bare ground. They require tall shrubs or trees (they also use fences or power lines) for hunting perches, territorial advertisement, and pair maintenance; open areas of short grasses, forbs, or bare ground for hunting; and large shrubs or trees for nest placement. They also need impaling sites for prey manipulation or storage, which can include sharp, thorny, or multi-stemmed plants and barbed-wire fences. The breeding season for this species begins in mid-March to early-April and extends to July. The species is listed as a California species of special concern due to loss of nesting habitat. Although the loggerhead shrike has not been observed on site, the trees surrounding the pond, the adjacent pasture, and annual grassland all provide potential nesting and foraging habitat.

SONG SPARROW MODESTO POPULATION

Modesto song sparrow is endemic to California, where it resides only in the north-central portion of the Central Valley. Highest densities occur in the Butte Sink area of the Sacramento Valley and in the Sacramento-San Joaquin River Delta. It is a year-round resident that breeds from mid-March to early-August. The ecological requirements for this species are largely undescribed. Grinnell and Miller noted this population's affinity for emergent freshwater marshes dominated by tules and cattails, as well as riparian willow tickets. These song sparrows also nest in riparian forest of valley oak with a sufficient understory of blackberry along vegetated irrigation canals and levees, and in recently planted valley oak restoration sties. Modesto song sparrow is listed as a California species of special concern due to habitat loss, fragmentation, and degradation. Modesto song sparrow has been observed onsite (Foothill Associates 2015) and the freshwater emergent vegetation within the Plan Area provides potential nesting habitat for this species.

COOPER'S HAWK

Cooper's hawk is a resident of the Central Valley and nests in a in a variety of woodland habitats but is most often found nesting in oak woodlands (County of Sacramento et al. 2018). Cooper's hawk is listed as a watch list species by CDFW and is covered by the SSHCP. The CNDDB records Cooper's hawk occurrences within 5 miles of the Plan Area; however, the species is not known to occur within the Plan Area.

OTHER RAPTORS

Raptors observed in flight over the Plan Area included American kestrel (*Falco sparverius*), northern harrier (*Circus cyaneus*), red-tailed hawk (*Buteo jamaicensis*),

turkey vulture (*Cathartes aura*), great-horned owl (*Bubo virginianus*), and barn owl (*Tyto alba*). Raptors, in general, build nests in large mature trees; though there are some ground-nesting species such as northern harrier and burrowing owl (refer to species-specific discussions above). Although no nests were observed, raptors were observed foraging and roosting onsite and there are many large trees on the site that are suitable for nesting raptors.

MAMMALS

PALLID BAT

Pallid bats, a California species of special concern, are not known to occur within the Plan Area but are known to occur in southern Sacramento County. The species typically uses caves, mines, rock crevices, hollow trees and buildings for roost sites (CWHR 2000). Foraging habitat for pallid bats consists of grasslands and open woodlands, and such habitats are found within the Plan Area.

WESTERN RED BAT

Western Red Bat is known to roost in the leaves of large shrubs and trees. Roosts are most often located in trees that are located near streams, grasslands, pastures, or agricultural areas. The species may also roost in mature trees within urban settings. The species is not known to occur within the Plan Area but is known to occur in southern Sacramento County (County of Sacramento et al. 2018).

AMERICAN BADGER

According to the CDFW life history account for the species, the American badger (*Taxidea taxus*) is an uncommon, permanent resident which is most often found in drier open stages of shrub, forest, and herbaceous habitats. Badgers dig burrows in soils which are easily crumbled and broken down, and regularly dig new burrows to use for cover during the night. Badgers may exhibit some torpor in winter, but do not hibernate. Home ranges vary by geography and season but are generally quite large (up to 1,500 acres for males). Badgers mate in the early summer and fall, and young are born in March and April; females bear and rear young within burrows. Badgers prey on small mammals, reptiles, and insects. The conversion of suitable habitat to either urban or agricultural uses has contributed to the decline of the species, as has the usage of rodenticides and other “pest” control mechanisms – which has resulted in direct mortality due to ingestion and also a substantial reduction in the prey base. The American badger is state-listed as a Species of Special Concern. There is no published regulatory guidance for the treatment of this species.

Although no American badgers have been observed on the Plan Area, they have historically been observed in the general area, which indicates that the area contains suitable soils for the creation of dens.

REPTILES AND AMPHIBIANS

WESTERN POND TURTLE

According to the CDFW life history account for the species, the western pond turtle (*Emys marmorata*), is an aquatic turtle that usually leaves the aquatic site to reproduce, to aestivate, or to overwinter. Western pond turtles require some slack- or slow-water

aquatic habitat. High-gradient streams with minimal cover or basking habitat are not suitable. In pond environments, the species typically only leaves the water to reproduce, whereas in stream environments, the turtles more commonly leave the water to aestivate or overwinter, in addition to leaving for reproduction. Turtles leave the water to overwinter in October or November, and typically become active in March or April. Mating typically occurs in late April or early May but may occur year-round. Most egg-laying occurs in May or June but may occur as early as April or as late as August. The hatchlings remain in the nest over the winter and emerge in the spring. Suitable nesting locations have dry soils (usually in a substrate with a high clay or silt fraction) on a slope that is unshaded and may be at least partially south-facing. The nest site can be up to 1,300 feet from the aquatic habitat, but it is more typical for the nest to be within 650 feet of aquatic habitat. The life history account conservatively recommends a buffer of 1,650 feet to ensure that neither adults nor nests will be disturbed.

This species has not been observed on the Applicant-owned properties during any of Foothill Associates' previous visits. Many of the wetlands on the site dry out seasonally and are not suitable for the species. The primary suitable habitat areas include the perennial marsh areas and the pond on the southern side of the Plan Area, but the species could nest in upland habitats up to several hundred feet from these aquatic habitats; therefore, this species could be present in the Plan Area.

WESTERN SPADEFOOT

The western spadefoot (*Spea hammondii)* breeds in shallow, seasonal wetlands in valley and foothill habitats such as grasslands, open chaparral, sage scrubland, short-grass plains, and pine woodlands. Spadefoot occur in both grazed and ungrazed habitat. Adult spadefoot occupy burrows up to 3 feet in depth in upland habitat during dry periods to avoid desiccation. Individuals may remain in these burrows for eight to nine months. Most surface activity is nocturnal. Spadefoot leave their upland burrows for wetlands during the breeding season, which lasts from January to August, depending on rainfall. It appears that vernal pools and other temporary wetlands may be optimal for breeding due to the absence or reduced abundance of both native and nonnative predators (e.g., bullfrogs, fish, and crawfish), many of which require more permanent water sources. Current research on amphibian conservation suggests that typical upland habitat utilization falls within 1,200 feet of aquatic habitats (USFWS 2005).

The Plan Area contains vernal pools; therefore, suitable habitat for western spadefoot is present in the Plan Area.

INVERTEBRATES

VERNAL POOL INVERTEBRATES

There are a variety of invertebrate species that rely on vernal pools and similar seasonal wetland habitat. Special-status invertebrate species associated with vernal pools in the region include midvalley fairy shrimp (*Branchinecta mesovallensis*), vernal pool fairy shrimp, vernal pool tadpole shrimp, and Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i). All of these species spend their life cycle within vernal pools. None of these species are readily observed through casual observation. Thus, lack of recorded sightings is not evidence to conclude that the species is absent. Where

suitable habitat is present, these species should be assumed present unless protocol-level surveys have found them to be absent.

According to the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (vernal pool recovery plan) (USFWS 2005), midvalley fairy shrimp, vernal pool fairy shrimp, and vernal pool tadpole shrimp use the same habitat types. These species feed on algae, bacteria, protozoa, rotifers and bits of detritus. The females carry their eggs in a ventral brood sac until they are dropped to the bottom of the pool, or the mother dies and sinks. At the end of the rainy season, as occupied vernal pools dry up, the eggs, referred to as cysts, remain in a dormant stage in the dried pool until the rains of the next season, or other environmental stimuli cause them to hatch. Cysts will hatch when the pool refills, although not all cysts present will hatch during the following rainy season and they may remain dormant in the soil for multiple seasons.

The majority of the Plan Area is located within designated critical habitat for both vernal pool fairly shrimp and vernal pool tadpole shrimp. The Plan Area contains vernal pools; which represent potential habitat for these species. Wet season surveys were performed during 2009-2010 on the Applicant-owned property of the Plan Area (Appendix E of Appendix BR-1) and indicated that both species are present in the Plan Area.

VALLEY ELDERBERRY LONGHORN BEETLE

The valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) is completely dependent on its host plant, elderberry (*Sambucus* spp.), which is a common component of the remaining riparian forests and adjacent upland habitats of the Central Valley. The adult-stage of the species is short-lived, so the majority of the species' life is spent in larval form within the stem of an elderberry plant. Adults emerge from late-March through June, at around the same time as the elderberry produces flowers, producing an exit hole in the stem of the plant, which is often the only exterior evidence of the plant's use by the beetle. The species is federally-listed as threatened.

Although no elderberry shrubs were observed on the Applicant-owned property, there is potential for them to occur on the non-participating properties.

Appendix BR-3

South Sacramento Habitat Conservation Plan Conditions Avoidance and Minimization Measures

5.4.1 General Avoidance and Minimization Measures

General AMMs are designed to avoid or minimize effects of Covered Activities on SSHCP land cover types and Covered Species.

Condition 1. Avoid and Minimize Urban Development Impacts to Watershed Hydrology and Water Quality

National Pollution Discharge Elimination System permits are issued by the Regional Water Quality Control Board to jurisdictions in the region, including the jurisdictions that are also SSHCP Land Use Authority Permittees (i.e., County of Sacramento, and Cities of Rancho

---

[16] In a situation like this, the Local Land Use Authority Permittee will suspend one or more local permits (e.g., grading permit, building permit) until compliance with terms of all SSHCP requirements is demonstrated.

[17] Post-construction monitoring by the Land Use Authority Permittee could continue for several years.

Cordova and Galt). The National Pollution Discharge Elimination System permit is issued to each of the Land Use Authority Permittees every 5 years, and is referred to as the Municipal Separate Storm Sewer System (MS4) permit. MS4 permits contain specific design measures required for all projects constructed within the region. The Stormwater Quality Design Manual for the Sacramento and South Placer Regions (Stormwater Manual) outlines planning tools and requirements to reduce urban runoff from new development and redevelopment projects within the region (Sacramento Stormwater Quality Partnership 2007). The Stormwater Manual is used as a general guidance document to aid with the selection, siting, design, operation, and long-term maintenance of stormwater quality control measures. The Stormwater Manual contains control measures intended to meet the standard of "reducing pollutants in urban runoff to the maximum extent practicable" set forth in the local agencies' MS4 permits issued by the Central Valley Regional Water Quality Control Board. AMM LID-1 (see below) is designed to ensure compliance with MS4 requirements by requiring Third-Party Project Proponents to minimize increases of peak discharge of stormwater and to eliminate or reduce runoff of pollutants.

Development Covered Activities may adversely alter watershed hydrology and degrade water quality, which, in turn, could diminish or eliminate the conservation benefits provided by the SSHCP Preserve System. Condition 1 is designed to conserve and/or rehabilitate on-site natural creeks and streams. This condition will require the provision of BMPs and low-impact development (LID) drainage control measures to ensure that runoff from developed lands will closely mimic the pre-development hydrograph and retain most pre-development hydrologic functions. Condition 1 will accomplish the hydrograph and hydrologic objectives through application of the listed AMMs to all UDA Covered Activities that occur at the parcel, subdivision, or master plan scale.

LID-1 (Stormwater Quality): When the size of a Covered Activity project exceeds the thresholds established by the State Water Resources Control Board (SWRCB) (see the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions, or future SWRCB-approved design manuals applicable to the Plan Area), incorporate stormwater management into site design to satisfy the requirements outlined in the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions. Stormwater management may include groundwater recharge (LID-2) and natural site features (LID-3).

LID-2 (Groundwater Recharge): When siting SSHCP Preserves containing Riparian, Open Water, or Freshwater Marsh SSHCP land cover types, the Implementing Entity will prioritize locations that are suitable for groundwater recharge.

LID-3 (Natural Site Features): Incorporate preservation of a site's natural aquatic features (such as creeks and streams) into project design to retain natural hydrologic patterns and to retain habitat that might be used by Covered Species.

Condition 2. Avoid and Minimize Urban Development Direct and Indirect Impacts to Existing Preserves and SSHCP Preserves

Development Covered Activities adjacent to Preserves may adversely impact species that use the Preserve, and erode or eliminate the conservation benefits provided by the Preserve. Condition 2 seeks to avoid or minimize the following Covered Activity environmental stressors that may result in direct and indirect impacts to the SSHCP Preserve System:

- Alterations to landscape hydrology from new impervious surfaces may adversely affect natural communities in the lower watershed, the ecology of a Preserve, and/or downstream aquatic resources.
- Water runoff from development or from roadways directed into Preserves may introduce harmful substances into Preserves. Unseasonal and/or additional water entering a Preserve may eliminate vernal pools and other seasonal wetlands native to the region by converting them to low-functioning perennial wetlands.
- Development adjacent to Preserves may partially to fully remove the soil's "perched aquifer" (see Chapter 3) and reduce or eliminate the micro-watersheds that support the hydrology of vernal pools within the Preserve boundary. These changes may adversely affect the existing hydrologic regime of vernal pools by changing the timing, depth, and/or duration of vernal pool saturation and/or ponding, causing long-term changes to a suite of vernal pool functions. For example, changes to water chemistry could adversely affect species habitat. Although the vernal pools remain, the environmental conditions of the pools may no longer provide habitat for vernal pool Covered Species, or provide the benefit of other wetland functions (e.g., stormwater attenuation) compared to pre-project conditions.
- Introduction or proliferation of non-native or invasive plant and wildlife species may displace native species.
- Landscaping in the interface of a development and a Vernal Pool–Grassland Preserve often includes native or non-native trees and other plant species that are not found in California grasslands and, therefore, cannot survive on the Vernal Pool–Grassland Preserve border without intensive irrigation and cultivation. In addition to adverse effects from irrigation and landscape maintenance, adult trees may become landscape barriers that inhibit species movement and may act to isolate individual Preserves from the larger SSHCP Preserve System.
- Recreational use of Preserves near developed areas may compact soils, eliminate vegetation, impair hydrologic functions, introduce weeds or invasive plant species, and disturb plants and wildlife.

- Introduction of light, noise, or vibrations may disrupt normal nocturnal and diurnal cycles of native species.

AMMs associated with Condition 2 must be applied to all UDA Covered Activities that border an existing Preserve or planned SSHCP Preserve.

EDGE-1 (Compatible Land Uses): To the maximum extent practicable, development project Covered Activities will locate compatible land uses (e.g., designated open space such as parks and ball fields, detention basins, and other land uses with less-intensive human activity) in areas immediately adjacent to existing or planned Preserve boundaries. The compatible land use will provide additional buffering of Preserves from potential indirect effects of adjacent urban development. The soil surfaces in a compatible land use area may be re-contoured provided that the soil restrictive layer remains undamaged and most of the soil profile above the restrictive layer remains intact. The Land Use Authority will determine when it is not practicable to locate a compatible land use adjacent to existing or planned Preserve boundaries.

EDGE-2 (Single-Loaded Streets): To the maximum extent practicable, the design of Urban Development Covered Activities will locate single-loaded streets adjacent to existing or planned Preserve. The Land Use Authority will determine when single-loaded streets are not practicable.

EDGE-3 (Preserve Setbacks): Urban Development Covered Activities constructed adjacent to existing or planned Preserves must establish a minimum 50-foot-wide setback outward from the boundary of any existing Preserve or planned SSHCP Preserve. This minimum 50-foot-wide setback will function as a transition between Urban Development and the Preserve, and must be managed to maintain the natural community of vegetation present in the adjacent Preserve. As much of the setback as possible should remain in the same natural habitat as the Preserve.

However, as discussed in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA, where an existing or planned Preserve is adjacent to an existing roadway (e.g., collectors, arterials, thoroughfares), the 50-foot Preserve Setback will not be required, and any bicycle or pedestrian trail will be established in the road right-of-way. In addition, where a planned roadway crosses an existing or planned Preserve, no Preserve Setback will be required, and any bicycle or pedestrian trail will be established in the road right-of-way.

EDGE-3a (Setback Recreational Trails): Trails are best suited outside of the setback; however, certain types of recreational trails or facilities (e.g., benches, trash receptacles, shade structures, fencing) that can be constructed with minimum ground disturbance and in compliance with EDGE-7 may be allowed within a Preserve Setback, as specified in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA. Preserve Setback design must locate trails on the side nearest development, away from the Preserve boundary. Trails may be permeable or semi-permeable hiking trails or paved community trials. The maximum trail width will be 16 feet total, including 2-foot-wide shoulders. Post and cable fencing, split rail, or other open fencing will be installed adjacent to recreation trails to keep pedestrians on the trail.

EDGE-3b (Setback Firebreaks): If approved by the local authorities, the Preserve Setback trail may also be used as a firebreak. In instances where a trail cannot act as a firebreak, the firebreak will be located between the trail and the Preserve boundary (see Section 5.2.7). Firebreaks allowed inside the setbacks must be created by methods that will not disturb the soil's restrictive layer, such as mowing, minor scraping of surface vegetation, or shallow tilling, to comply with EDGE-7. Firebreak width within Preserve Setbacks is the minimum width needed to comply with applicable local codes.

EDGE-3c (Setback Shade Trees and Landscaping): To prevent potential impacts from irrigation water or from accumulation of leaf litter onto the grasslands or vernal pools of a Preserve, planting of shade trees or landscaping vegetation will be limited to the area of the Preserve Setback located between the recreation trail and the adjacent urban development (i.e., away from Preserves).

- Only drought-tolerant plant species will be planted. The planting pallet used for Preserve Setback landscaping will not include invasive plant species listed in the California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory Database or listed in the Cal-IPC California Invasive Plant Watch List (see http://www.cal-ipc.org/paf/). Any shade trees planted along Preserve Setback trails will be native species that are found in California grasslands and that can survive in the Vernal Pool–Grassland border without long-term irrigation or fertilization (e.g., valley oak, black oak, blue oak, oracle oak). In general, no more than 30% of any 1,000-foot-long segment of a Preserve Setback trail will have canopy cover from tree plantings (to be consistent with maximum tree densities naturally found within native California grasslands and savanna).

- Drip irrigation will be allowed for a maximum of 5 years to establish shade trees or landscape vegetation between the recreation trail and adjacent urban development. The Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation will not affect the Preserve. Any irrigation systems located within Preserve Setbacks will be inspected quarterly to determine if such systems are affecting soils or vegetation not part of the intended plantings. Irrigation system repairs will be completed immediately if it is determined that the irrigation system is affecting vegetation or soil moisture not part of the intended tree planting.
- If, during annual monitoring of the adjacent Preserve (see Chapter 8), adverse indirect effects (e.g., leaf litter accumulation, irrigation runoff, plant encroachment) of the Preserve Setback's planted vegetation are detected, then the SSHCP Implementing Entity, the Preserve Manager, and the entity responsible for the Preserve Setback will identify appropriate adaptive management of the Preserve Setback tree or landscape plantings in accordance with the Preserve Setback Easement (see Section 5.2.5 and Chapter 9).

EDGE-4 (Locate Stormwater Control Outside Preserves): Roads, sidewalks, and other impermeable surfaces of Urban Development Covered Activities adjacent to existing or planned Preserves will slope away from Preserves and Preserve Setbacks or intercept drainage with swales or curbs and gutters to preclude drainage from entering Preserves and Preserve Setbacks. Stormwater flows must be directed away from Preserves and Preserve Setbacks and directed into stormwater control facilities inside the development (outside Preserves and Preserve Setbacks)[18] (see EDGE-6 for exception to EDGE-4 in certain SSHCP Linkage Preserves).

EDGE-5 (Stormwater Control in Preserve Setbacks): If trails are established in any Preserve Setback in compliance with EDGE-3, the trail must be sloped away from the Preserve, and rainwater leaving the trail surface must flow into an adjacent low-velocity bio-retention swale or cell to keep rainwater runoff and trail contaminants from entering the Preserve. Low-velocity bio-retention swales or cells are typically small linear features placed on one or both sides of a trail. As required by EDGE-3, trails and their adjacent bio-retention swales or cells must be located on the side of the Preserve Setback nearest development.

[18] Detention basins are allowed in some Linkage Preserves consistent with the requirements of EDGE-6. At the time of SSHCP preparation, seven Linkage Preserves with drainages are planned SSHCP Preserves: L1, L2, L4, L7, L8, L9, and L10 (see Section 5.2.7 and Section 7.5). Also see project-specific measures in Section 5.5.1.

EDGE-6 (Detention Basins in Linkage Preserves): Because planned SSHCP Linkage Preserves L1, L2, L4, L7, L8, L9, and L10 (see Section 7.5) surround natural creeks or streams that must receive stormwater from planned adjacent Urban Development Covered Activities, a limited number of stormwater detention basins will be allowed on those Linkage Preserves. Detention basins within Linkage Preserves (see Section 5.2.7) will be designed and constructed with fill material to build up the perimeter of the detention basin so as not to impact the soil restrictive layer (duripan or hardpan) and function of the soil perched aquifer. Detention basins within Linkage Preserves will capture stormwater flows and runoff, and will discharge water to the stream/creek or percolate collected water to the soil perched aquifer. Detention basin structures that collect stormwater entering the basin or convey stormwater leaving the basin must be designed to avoid and minimize effects to Covered Species habitat in the Linkage Preserve.

EDGE-7 (Hardpan/Duripan Protection): To protect the soil perched aquifer and the micro-watersheds supporting existing vernal pool hydrology, activities that have the potential to cut into, disrupt, or remove the soil's restrictive layer (hardpan or duripan) will not occur within Preserves or Preserve Setbacks. However, in certain circumstances, the Covered Activities defined in Section 5.2.6, Covered Activities in Stream Setbacks in the UDA, and Section 5.2.8, Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System, may result in punctures[19] or other minor disruptions of the soil hardpan or duripan if approved by the Implementing Entity and the Technical Advisory Committee according to the process described in Chapter 9 of the SSHCP. If a Covered Activity on a Preserve or Preserve Setback results in a puncture or other disruption to the soil hardpan or duripan, the puncture will be sealed using bentonite clay or other material that maintains the functionality of the soil's restrictive layer and associated perched aquifer.

EDGE-8 (Outdoor Lighting): All outdoor lighting in Urban Development Covered Activity projects will be designed to minimize light pollution into existing and planned Preserves, except where a Land Use Authority Permittee determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g., shielding, low glare, or no lighting), directing light away from Preserves, or other means to avoid or minimize light pollution. The Third-Party Project Proponent will use the best information available at the time of project design to minimize effects of light pollution on target SSHCP Covered Species (e.g., western spadefoot (*Spea*

[19] Punctures may include small holes that penetrate the soil hardpan or duripan such as might occur when digging or drilling holes for the installation of fence posts, sign posts, or trees.

hammondii), Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), and Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*)).

EDGE-9 (Livestock Access to Preserves): Urban Development Covered Activity projects that include on-site Preserves will include in their design an adequate number of access points and facilities for delivery and pick up of grazing animals (livestock), such that these activities will not significantly alter the Preserve's habitat and are consistent with the protection of livestock and protection of adjacent public property, and include adequate public safety measures.

EDGE-10 (Prevent Invasive Species Spread): Completed Covered Activities (including roads) will be maintained in a manner that avoids the spread of invasive species into Preserve and Open Space areas. Such maintenance measures will include the following:

- To prevent the transport of non-native invasive species onto Preserves, before bringing any equipment onto an SSHCP Preserve or Preserve Setback, equipment must be cleaned of mud, dirt, and plant material. Cleaning will occur in the infested area or another appropriate location as approved by a Plan Permittee.
- Mowing rotation will start in un-infested areas and move to infested areas.
- Invasive plant prevention techniques will be incorporated into maintenance plans.
- The SSHCP Implementing Entity will survey road shoulders, ditches, and rights-of-way that border SSHCP Preserves for invasive weeds or other exotic plant species. Where roadside weed infestations have reached a critical control point, the Implementing Entity or Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment.

Condition 3. Implement Construction Best Management Practices

AMMs associated with Condition 3 must be applied to all UDA Covered Activities.

BMP-1 (Construction Fencing): Orange construction fencing will be installed to ensure that ground disturbance does not extend beyond the allowed construction footprint (i.e., the limit of project construction plus equipment staging areas and access roads). Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will mark the outer boundary of any Preserve Setback or Stream Setback adjacent to or within the project site with orange construction fencing prior to ground disturbance. This fencing will remain in place until project completion, as identified by the Plan Permittee.

BMP-2 (Erosion Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will install temporary control measures for sediment, stormwater, and pollutant runoff as required by the Plan Permittee to protect water quality and species habitat. Silt fencing or other appropriate sediment control device(s) will be installed downslope of any Covered Activity that disturbs soils.

Fiber rolls and seed mixtures used for erosion control will be certified as free of viable noxious weed seed. As discussed in Section 5.4.2, Covered Species Take Avoidance and Minimization Measures, erosion controls installed in or adjacent to Plan Area modeled habitat for giant gartersnake (*Thamnophis gigas*), western pond turtle (*Actinemys marmorata*), California tiger salamander (*California tiger salamander*), or western spadefoot (see Chapter 3) must be of appropriate design and materials that will not entrap the species (e.g., not contain mesh netting). Regular monitoring and maintenance of the project's erosion control measures will be conducted until project completion to ensure effective operation of erosion control measures.

BMP-3 (Equipment Storage and Fueling): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will ensure that equipment storage and staging will occur in the development footprint only (not sited in any existing on-site Preserve, planned on-site Preserve, Preserve Setback, Stream Setback, or aquatic land cover type). Fuel storage and equipment fueling will occur away from waterways, stream channels, stream banks, and other environmentally sensitive areas within the development footprint.

However, certain equipment storage and fueling activities can be allowed on Preserves within habitat re-establishment/establishment sites (refer to Section 5.2.7) if no location outside of the site is available. If a Covered Activity results in a spill of fuel, hydraulic fluid, lubricants, or other petroleum products, the spill will be absorbed and waste disposed of in a manner to prevent pollutants from entering a waterway, Preserve, Preserve Setback, or Stream Setback.

BMP-4 (Erodible Materials): Plan Permittees and Third-Party Project Proponents implementing Covered Activities must not deposit erodible materials into waterways. Vegetation clippings, brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks. Erodible material must be disposed of such that it cannot enter a waterway, Preserve, Preserve Setback, Stream Setback, or aquatic land cover type. If water and sludge must be pumped from a subdrain or other structure, the material will be conveyed to a temporary settling basin to prevent sediment from entering a waterway.

BMP-5 (Dust Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will water active construction sites regularly, if warranted, to avoid or minimize impacts from construction dust on adjacent vegetation and wildlife habitats. No surface water will be used from aquatic land covers; water will be obtained from a municipal source or existing groundwater well.

BMP-6 (Construction Lighting): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will direct all temporary construction lighting (e.g., lighting used for security or nighttime equipment maintenance) away from adjacent natural habitats, and particularly Riparian and Wetland habitats and wildlife movement areas.

BMP-7 (Biological Monitor): If a Covered Activity includes ground disturbance within Covered Species modeled habitat, an approved biologist will be on site during the period of ground disturbance, and may need to be on site during other construction activities depending on the Covered Species affected. After ground-disturbing project activities are complete, the approved biologist will train an individual to act as the on-site construction monitor for the remainder of construction, with the concurrence of the Permitting Agencies. The on-site monitor will attend the training described in BMP-8. The approved biologist and the on-site monitor will have oversight over implementation of Avoidance and Minimization Measures, and will have the authority to stop activities if any of the requirements associated with those measures are not met. If the monitor requests that work be stopped, the Wildlife Agencies will be notified within one working day by email. The approved biologist and/or on-site monitor will record all observations of listed species on California Natural Diversity Database field sheets and submit them to the California Department of Fish and Wildlife. The approved biologist or on-site monitor will be the contact source for any employee or contractor who might inadvertently kill or injure a Covered Species or who finds a dead, injured or entrapped individual. The approved biologist and on-site monitor's names and telephone numbers will be provided to the Wildlife Agencies prior to the initiation of ground-disturbing activities. Refer to species-specific measures for details on requirements for biological monitors.

BMP-8 (Training of Construction Staff): A mandatory Worker Environmental Awareness Program will be conducted by an approved biologist for all construction workers, including contractors, prior to the commencement of construction activities. The training will include how to identify Covered Species that might enter the construction site, relevant life history information and habitats, SSHCP and

statutory requirements and the consequences of non-compliance, the boundaries of the construction area and permitted disturbance zones, litter control training (SPECIES-2), and appropriate protocols if a Covered Species is encountered. Supporting materials containing training information will be prepared and distributed by the approved biologist. When necessary, training and supporting materials will also be provided in Spanish. Upon completion of training, construction personnel will sign a form stating that they attended the training and understand all of the Avoidance and Minimization Measures. Written documentation of the training must be submitted to the Implementing Entity within 30 days of completion of the training, and the Implementing Entity will provide this information to the Wildlife Agencies.

BMP-9 (Soil Compaction): After construction is complete, all temporarily disturbed areas will be restored similar to pre-project conditions, including impacts relating to soil compaction, water infiltration capacity, and soil hydrologic characteristics.

BMP-10 (Revegetation): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will revegetate any cut-and-fill slopes with native or existing non-invasive, non-native plants (e.g., non-native grasses) suitable for the altered soil conditions and in compliance with EDGE-2 and EDGE-8, if applicable.

BMP-11 (Speed Limit): Project-related vehicles will observe the posted speed limits on paved roads and a 10-mile-per-hour speed limit on unpaved roads and during travel in project areas. Construction crews will be given weekly tailgate instruction to travel only on designated and marked existing, cross-country, and project-only roads.

Condition 4. Avoid and Minimize Impacts that May Result from Implementation of Covered Transportation Projects

Urban Development transportation project and Rural Transportation Project Covered Activities, including bridge projects, can affect Covered Species. AMMs included for Condition 4 seek to avoid or minimize direct and indirect impacts that may result from construction of roadways or roadway improvements. Condition 4 applies to all transportation-related Covered Activities (see Sections 5.2.1 and 5.2.3).

Plan Permittees and Third-Party Project Proponents implementing Urban Development transportation or Rural Transportation Project Covered Activities must comply with the roadway siting, design, and construction AMMs described below.

ROAD-1 (Road Project Location): Road projects will be located in the least environmentally sensitive area to avoid, to the maximum extent practicable, impacts on Covered Species, Covered Species habitat, and waters of the United States. Road project alignments will follow existing roads, road easements, and rights-of-way, or be sited in disturbed areas to minimize habitat loss and additional habitat fragmentation.

ROAD-2 (Wildlife Crossing Structures): Road projects that are Urban Development Covered Activities (see Section 5.2.1) (including the Capital Southeast Connector, see Section 5.2.1.1) or are Rural Transportation Covered Activities (see Section 5.2.3) will include an adequate number of wildlife crossing structures, as depicted in Figure 5-10. An adequate number of wildlife crossing structures within the Urban Development Area (UDA) and outside the UDA will provide for continued dispersal and movement of native wildlife throughout the SSHCP Plan Area, as required by the SSHCP Biological Goals and Objectives (see Chapter 7).

The Plan defines "wildlife crossing structure" as a physical structure specifically designed or retrofitted to facilitate undercrossing for target wildlife species. The Plan further classifies wildlife crossings as hydrologic crossings and dry crossings. Hydrologic crossings are built where there is an existing stream, creek, or intermittent drainage to maintain existing hydrologic connectivity within the Plan Area. As described below, hydrologic crossings require specialized features to be built into the crossing structure, such as elevated platforms to allow wildlife to pass under a crossing structure when it is inundated with water. Dry wildlife crossings are built where there is no hydrologic feature but where a crossing is needed to provide for overland connectivity. SSHCP wildlife crossing structures may include structures such as bridges, arches, or box and pipe culverts.

Plan Permittees expect that future wildlife movement and dispersal within the UDA will occur almost entirely within the boundaries of the future interconnected SSHCP Preserve System (see Section 7.5). Therefore, wildlife crossings are needed wherever a roadway crosses (bisects) the conceptual SSHCP Preserve System (see Figure 5-10). Wildlife crossing structures inside the UDA will be sized to accommodate movement of a highly mobile native indicator species (i.e., coyote (*Canis latrans*)). By designing UDA wildlife crossing structures to meet the movement and dispersal requirements of coyote, the Plan Permittees anticipate that the crossing structure will also accommodate most native wildlife species that currently occupy the UDA (see Chapter 3).

The Plan Permittees expect that most of the Plan Area outside of the UDA will remain as Open Space over the 50-year Permit Term (see Chapter 4). Therefore,

the Plan Permittees expect that the Rural Transportation Project Covered Activities proposed outside the UDA will have a relatively small effect on the movement and dispersal of larger or more mobile native wildlife species, including coyote. Consequently, the Plan Permittees anticipate that the design of Rural Transportation Project Covered Activities outside the UDA will need to include wildlife crossing structures primarily where the Rural Transportation Project Covered Activities occur within California tiger salamander modeled habitat (see CTS-3 and also Chapter 3, Figure 3-16).

The design and location of wildlife crossing structures both inside the UDA and outside the UDA will be determined by collaboration between the Third-Party Project Proponent, the Land Use Authority, and the Implementing Entity. Crossing design will use the best available scientific and commercial information for the target species. The design of crossing structures will be based on demonstrated effectiveness of design for the target species when such information is available, or will be designed with a high level of certainty of success based on studies of similar taxa in similar environmental settings. The proposed wildlife crossing structures designs will be reviewed and approved by the Implementing Entity prior to final design.

The Implementing Entity will develop a Wildlife Crossing Maintenance Manual to be provided to the entity responsible for maintaining the wildlife crossing. The Wildlife Crossing Maintenance Manual will identify vegetation management, clearing of obstructions, and other techniques to maintain the desired movement and hydrologic connectivity, and to avoid effects to adjacent Preserves.

All SSHCP wildlife crossing structures in the UDA will include the following design elements:

- Open-bottom bridges or arches where the roadway crosses a river or stream. Where an open-bottom bridge or arch is used, the span of the crossing will be at least 1.2 times the bankfull width of the stream and span the banks to allow for dry wildlife passage along each side of the stream and to avoid or minimize piers or footings within the stream. (Bankfull width refers to the width of a stream channel at the point where over-bank flow begins during a flood event.)
- Any wildlife crossing structure that also maintains hydrologic connectivity will be designed to maintain pre-construction water capacity, depth, and velocity. The crossing structure will not restrict or impede normal flows or flood flows, unless a primary purpose of the structure is to manage such

flow(s). Wildlife crossing structures must be designed to provide a dry passage (e.g., a platform ledge) higher than flows for a 10-year storm event to allow wildlife to pass through an inundated crossing structure.

- Wildlife crossing structures in the UDA will be designed and sized to accommodate movement of at least medium-sized mammals (e.g., coyote). The opening must be at least 3 feet high and the crossing structure must have a minimum openness ratio of at least 0.4.
- Vegetation leading up to the entrance of a crossing structure and the substrate leading into and within the crossing structure will be natural and appropriate to provide for continuity of habitat, attract the target animal species for which the crossing is designed, and facilitate use of the crossing structure.
- A wildlife crossing under six-lane roads or larger will be designed to provide ambient light and temperature in the longer crossing structures (e.g., either by providing a larger opening or a grate at the top of the structure to improve the attractiveness of the crossing to certain Covered Species and wildlife that may hesitate to cross through dark, confined structures or one with a temperature gradient (Jackson and Griffin 2000)). If a road is less than six lanes in width, these designs will be optional.
- Lighting will not be placed at or near the entrance of a wildlife crossing structure to maintain natural ambient light conditions at night and to increase chances of wildlife use. However, a Land Use Authority Permittees may allow lighting if necessary for human health or safety.

Outside the UDA, wildlife crossing structures may be required for California tiger salamander (refer to CTS-1), and could also be required for other native species.

ROAD-3 (Roadside Pesticide Use[20]): If pesticide use is necessary along roadsides, the appropriate SSHCP Permittee will ensure that the pesticide application strictly complies with the pesticide label and all other applicable federal, state, and local authorities pertaining to the use, safety, storage, disposal, and reporting of the pesticide. Where roadside weed infestations have reached a critical control point, the Implementing Entity or a Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment. In addition, the Implementing Entity or appropriate Land Use Authority Permittee will post signs along road shoulders adjacent to sensitive areas that are within the SSHCP

[20] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and conforms to all conditions in Section 5.4.

Preserve System (e.g., California tiger salamander breeding ponds, endemic plant populations, vertebrates that rely on insects for part of their diet). The signs will identify pesticide use restrictions or other roadside maintenance restrictions.

Condition 5. Avoid and Minimize Impacts that Result from Public Use of Low-Impact Nature Trails in Preserves

Preserves within the UDA are likely to be surrounded by urban development. As discussed in Section 5.2.7, allowing limited use of SSHCP Preserves will help to foster a sense of community ownership and will provide an opportunity to educate the community about the natural resources to be protected within the SSHCP Preserve System.

Low-impact nature trails will be designed following the AMMs outlined below.

NATURE TRAIL-1 (Nature Trail Plan): A nature trail plan must be prepared for each Preserve where a trail is allowed by the Preserve Management Plan. Nature trails will be unpaved trails that vary in width depending on terrain and existing constraints, but will never exceed 4 feet in width. Where a trail crosses a swale, wooden walkways elevated to a height no greater than 2 feet will be installed. Trail improvements may include mowing vegetation to create or maintain a trail, minor grading to remove trip hazards, and signs providing directional and educational information. Public access to land acquired for preservation will be prohibited until a trail plan can be prepared by the Implementing Entity and approved by the Permitting Agencies. A trail plan will include the following:

- Maps identifying areas that contain sensitive habitats or species occurrences.
- Maps that show the location and footprint of proposed trails.
- Methods used to control public access.
- Trail and use monitoring methods, schedules, and responsibilities.
- Trail operation and maintenance guidelines and responsibilities.
- Clear triggers for use restrictions or closure based on sensitive biological indicators (e.g., seasonal closures of some trails on the basis of activity periods of Covered Species or sensitive species).

NATURE TRAIL-2 (Nature Trail Protection of Duripan): Nature trails will be sited and constructed so as not to interfere with existing soil duripan and the perched aquifer that support the existing hydrologic regime of the Vernal Pool–Grassland, and will not interfere with existing pool hydrology. Trails within Preserves will not be paved.

SOURCE: ESRI, County of Sacramento 2014, USFWS 2015

FIGURE 5-10

Wildlife Crossings

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

INTENTIONALLY LEFT BLANK

NATURE TRAIL-3 (Nature Trail Location): Nature trails will be located away from sensitive natural resources (e.g., vernal pools, riparian habitat, woodland habitat, Covered Species occurrences, raptor nesting sites, tricolored blackbird (*Agelaius tricolor*) colony sites). The Wildlife Agencies will determine the distance necessary to avoid impacts to sensitive natural resources.

NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design): Biological studies will be conducted within the area being considered for nature trail construction prior to project design. The studies will include land cover type mapping and focused species surveys and/or wetland delineations. The biological studies will include assessments of potential effects of trail construction on Preserve System resources, and recommendations for avoidance and minimization that may be incorporated into project siting, design, construction, and operation.

NATURE TRAIL-5 (Monitoring of Nature Trail Impacts): Impacts that could result from use of a nature trail within a Preserve will be monitored according to the Preserve Management Plan (Chapter 8) to ensure that uses do not conflict with the individual Preserve Management Plan. If use of a trail is found to conflict with the individual Preserve Management Plan, use of that trail will be discontinued until adjustments in the use can be made to reduce or eliminate conflicts. The Implementing Entity will make decisions about discontinuing or modifying use of a trail in consultation with the Preserve Manager or other applicable Preserve management agency or organization.

Condition 6. Avoid and Minimize Impacts When Re-Establishing or Establishing Wetlands

As discussed in Chapter 7, the Plan Permittees anticipate that 389 acres of Vernal Pool habitat will be re-established or established[21] within the Plan Area as part of the SSHCP Conservation Strategy. Although re-establishment or establishment of vernal pools is a Measurable Objective under this Plan, if not done correctly, the action could have an adverse impact on existing vernal pools.

RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool): Re-establish or establish Vernal Pool Wetland according to the following guidelines:

- Re-establishment will always take priority over establishment of vernal pools. Establishment will be permitted only after it has been determined that sites with the potential to re-establish vernal pools no longer exist in the Plan Area or cannot be acquired through a willing seller/buyer agreement.

[21] In the context of this Plan, "establish" is synonymous with "create."

- When possible, re-established or established sites will be located adjacent to an existing Preserve(s) to maximize connectivity and Preserve area.
- Re-establishment or establishment will not result in direct or indirect adverse impacts to the hydrologic regime of existing vernal pools. Vernal pool re-establishment or establishment actions will not remove more than 10% of any existing vernal pool watershed, as defined by the SSHCP LIDAR analysis (see Section 3.3 and Conservation Action VPI1.2 in Table 7.1).
- Vernal pool re-establishment will attempt to restore the historical density and range of vernal pool sizes to the maximum extent feasible using historical aerial photography of the site, if available. Where aerial photography of the site's historical conditions is not available, vernal pool re-establishment will include a range of pool sizes (area and depth) to accommodate the different habitat needs and life history characteristics of the vernal pool invertebrate Covered Species.
- Established vernal pools must be located on sites with vernal pool soils, defined as any Plan Area soil type where vernal pools currently exist.
- Established vernal pool sites will include a range of pool sizes to accommodate the different habitat needs and life history characteristics of the three vernal pool invertebrate Covered Species.
- The total density of vernal pools will not exceed 10% of the suitable soil areas in any vernal pool re-establishment and/or establishment site, unless it can be shown that the suitable areas of that site historically supported greater densities.
- Re-establishment or establishment may include inoculation when it is likely that no seed or cyst bank of vernal pool species remains at a site. Vernal Pool inocula will come from nearby vernal pools that are on the same geologic formation and soil type.

RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank): Vernal pool re-establishment or establishment may include "soil inoculation" when it is likely that no seed or cyst bank of vernal pool species remains at a re-establishment or establishment site.

- During conversion of Urban Development Area vernal pools to a developed land cover type, project proponents will excavate and retain soil from vernal pools following protocols developed by the SSHCP Technical Advisory Committee (Chapter 9).

- Inocula applied in re-established or established vernal pools must be harvested from a vernal pool that is on the same geologic formation and soil type shown on the County General Soil Map as the re-establishment/establishment site. Geologic formations and soil types will follow U.S. Department of Agriculture Soil Conservation Service's 1993 Soil Survey of Sacramento County, California. Proposed off-site inocula sources must be approved by the Wildlife Agencies.

RE-ESTABLISHMENT/ESTABLISHMENT-3 (Re-Establishment/Establishment of Freshwater Marsh or Open Water Near Airports): During review of proposed re-establishment/establishment projects for freshwater marsh or open water on SSHCP Preserves, the Implementing Entity shall consider the potential for the location of the re-establishment/establishment projects to increase the risk of wildlife strikes or generation of ground fog at airports. If a re-establishment/ establishment project would result in (1) a net increase in open water or freshwater marsh acreage over baseline conditions[22] within 5 miles of Mather Field, Sacramento Executive Airport, or Franklin Field; or (2) replacement of open water/freshwater marsh habitat that is located 2 or more miles from Mather Field or Sacramento Executive Airport with open water/freshwater marsh habitat that is located less than 2 miles from those airports, a qualified biologist shall prepare a concise letter report. The letter report shall summarize the biologist's findings regarding (1) the species likely to use the re-established/established habitat, (2) a rough order of magnitude estimate on the peak number of birds that might use the re-established/established habitat, and (3) potential movement patterns for birds using the re-established/established habitat and whether they might cross through the airport safety zones (e.g., to reach foraging habitat or another wildlife attractant). The letter report will also provide recommendations to the Implementing Entity on how they could reduce any of the identified wildlife hazards if there are any feasible means to do so that would not conflict with the biological goals and measurable objectives of the Conservation Plan.

Condition 7. Avoid and Minimize Impacts to Streams and Creeks

AMMs associated with Condition 7 must be applied to all Covered Activities where a stream or creek is located within a project footprint.

[22] For purposes of establishing baseline conditions, Freshwater Marsh and Open Water acreages will be calculated using that version of the SSHCP Land Cover Type Map in existence as of the date that the SSHCP permit was issued to the Plan Permittees by the USFWS.

STREAM-1 (Laguna Creek Wildlife Corridor): A 150-foot setback measured from the top of the bank on both sides of the stream will be applied to Laguna Creek within the Urban Development Area (minimum 300-foot corridor width). If trails are located within the Laguna Creek Wildlife Corridor, the nearest edge of the trail will be located at least 80 feet from the top of the bank.

STREAM-2 (UDA Stream Setbacks): A 100-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all streams listed in Table 5-1 (see also Figure 2-4). If a stream reach supports woody riparian vegetation, the setback will be equal to the riparian edge plus 25 feet or will be the setback defined above, whichever is greater. If trails are located within the Stream Setback, the nearest edge of the trail will be located at least 50 feet from the top of the bank.

Table 5-1
Stream Setback Minimum Requirements in the Urban Development Area

Stream	Minimum Setback (from the Top of Bank Measured in Aerial Perspective) on Both Sides of the Stream
Elder Creek	100 feet
Frye Creek	100 feet or as depicted as part of the NewBridge development project hardline Preserve (see Appendix K)
Gerber Creek	100 feet
Morrison Creek	100 feet
Central Paseo	100 feet or as depicted as part of the Cordova Hills development project hardline Preserve (Appendix K)
Sun Creek	100 feet or as depicted as part of the Sun Creek development project hardline Preserve (see Appendix K)

STREAM-3 (Minor Tributaries to UDA Streams): A 25-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all avoided first and second order tributaries to the streams listed in Table 5-1 and Laguna Creek. Refer to Objective W6 in Chapter 7 (Table 7-1) regarding avoided first and second order tributaries. Trails are not permitted within headwater ephemeral Stream Setbacks.

STREAM-4 (Minimize Effects from Temporary Channel Re-Routing): When an Urban Development Covered Activity temporarily re-routes a stream, creek, or drainage, the re-routing will be completed in a manner that minimizes impacts to beneficial uses and habitat. The following measures will be employed to minimize disturbances that will adversely impact water quality:

- No equipment will be operated in areas of flowing or standing water.
- Construction materials and heavy equipment must be stored outside of the active flow of any waters.

- When work within waters is necessary, the entire stream flow will be diverted around the work area.
- In the event of rain, the disturbed in-water work area will be temporarily stabilized before water body flow exceeds the capacity of the diversion structure. The disturbed water body will be stabilized so that the disturbed areas will not come in contact with the flow.
- Once construction is complete, all project-introduced material (e.g., pipes, gravel, cofferdam, sandbags) must be removed, leaving the water as it was before construction. Excess materials will be disposed of at an appropriate disposal site.
- All work areas will be effectively isolated from stream flows using suitable control measures before commencement of any in-water work. The diverted stream flow will not be contaminated by construction activities. Structures for isolating the in-water work area and/or diverting the stream flow (e.g., cofferdam, geo-textile silt curtain) will not be removed until all disturbed areas are cleaned and stabilized.
- Any flow diversion used during construction will be designed in a manner to prevent pollution and minimize siltation, and will provide flows to downstream reaches. Flows will be maintained to support existing aquatic life, riparian wetlands, and habitat that may be located upstream and downstream from any temporary diversion.
- All surface waters, including ponded waters, will be diverted away from areas undergoing grading, construction, excavation, vegetation removal, and/or any other activity that may result in a discharge to waters.
- All temporary dewatering methods will be designed to have the minimum necessary impacts to waters to isolate the immediate work area. All dewatering methods will be installed such that natural flow is maintained upstream and downstream of the diversion area. Any temporary dams and diversions will be installed such that the diversion does not cause sedimentation, siltation, or erosion upstream or downstream of the diversion area. All dewatering methods will be removed immediately upon completion of diversion activities.
- A method of containment must be used below any bridge, boardwalk, and/or temporary crossing to prevent debris from falling into the waters through the entire duration of a project.

- If temporary surface water diversions and/or dewatering are anticipated, the Third-Party Project Proponent will develop and maintain on site a surface water diversion and/or dewatering plan. The plan(s) must be developed prior to initiation of any water diversions and will include the proposed method and duration of diversion activities. The plan(s) must be made available to Central Valley Water Board staff upon request.
- When work in a flowing stream is unavoidable and any dam or other artificial obstruction is being constructed, maintained, or placed in operation, sufficient water will be allowed at all times to pass downstream to maintain beneficial uses of waters below the dam. Construction, dewatering, and removal of temporary cofferdams will not violate the turbidity, settle-able matter, pH, temperature, or dissolved oxygen requirements of any Water Quality Control Plan.
- Any temporary dam or other artificial obstruction will only be built from clean materials such as sandbags, gravel bags, water dams, or clean/washed gravel that will cause little or no siltation. Stream flow will be temporarily diverted using gravity flow through temporary culverts or pipes, or pumped around the work site with the use of hoses.

STREAM-5 (Design for Stream Channel Re-Routing, Widening, or Deepening): When an Urban Development Covered Activity alters a stream, creek, or drainage by re-routing, widening, or deepening a channel, the project design will include the following:

- The main channel of a re-routed channel will be free to migrate laterally over its active and terrace floodplain.
- Channel geometry (plan, profile, and cross-section) of the site will be appropriate for the watershed location and physical/hydrologic condition.
- Local, native materials will be used as fill material to the extent practicable.
- Bioengineering techniques will be used for construction and maintenance of bank stabilization. Bioengineered bank stabilization structures will use vegetation in combination with bank reshaping; biodegradeable geotextile materials; and, in some cases, a minimal amount of rock or wood to the extent practicable to dissipate erosive energy. Third-Party Project Proponents will consult a professional engineer when considering using bioengineering techniques.
- All re-routed, widened, or deepened streams are required to establish Stream Setbacks with minimum widths required under STREAM-1, STREAM-2, or STREAM-3. All re-routed, widened, or deepened streams must re-establish/

establish and maintain native Woody Riparian land cover and/or native Grassland Riparian land cover in the entire Stream Setback.

Condition 8. Avoid and Minimize Impacts to Covered Species from Utility and Utility Maintenance Covered Activities

AMMs associated with Condition 8 must be applied to all Covered Activities associated with construction and maintenance of infrastructure projects.

UTILITY-1 (Avian Collision Avoidance): Installation of new, or relocation of existing, utility poles, lines, and cell towers located within the Preserve System or within 1,000 feet of a Preserve boundary will be coordinated with the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife. The applicant or relevant utility/service provider will install utility poles, lines, and cell towers in conformance with Avian Powerline Interaction Committee (APLIC) standards for collision-reducing techniques, as outlined in Reducing Avian Collisions with Power Lines: State of the Art in 2012 (APLIC 2012), or any superseding document issued by the APLIC.

UTILITY-2 (Utility Maintenance on Preserves): Utility maintenance inside SSHCP Preserves and SSHCP Preserve Setbacks containing vernal pools will occur only when vernal pools have been dry for 30 days, except in emergency situations related to human health and safety.

UTILITY-3 (Trenchless Construction Methods): Where a pipeline or conduit crosses an existing or planned Preserve or will be located between adjacent Preserves (e.g., under a roadway that has a Preserve on both sides), trenchless construction methods will be used to minimize impacts to the existing soil profile (including impacts to a hardpan or duripan) to maintain the perched aquifer in Vernal Pool Grassland land cover type.

UTILITY-4 (Siting of Entry and Exit Location): The entry and exit locations for the trenchless construction method (see Utility-3) will be sited to avoid impacts to vernal pools and Riparian Woodland, and to avoid direct take of SSHCP Covered Species.

Condition 9. Avoid and Minimize Impacts That Might Result From Removing or Breaching Levees to Establish or Re-establish Riparian Habitat

LEVEE-1 (Preparation of Hydrologic Analysis): Prior to approving a draft Preserve Management Plan that includes (1) modifying or breaching an existing levee, or (2) would place a potential impedance to high-water event flood-flows on the water side of an existing levee (including new riparian vegetation plantings or

other new Preserve facilities), a hydrologic analysis will be conducted. The Preserve activity will only be implemented if the hydrologic analysis concludes that the activity will not result in a substantial increase in flood stage elevations or flood risk on lands outside the Preserve.

Condition 10. Avoid and Minimize Impacts That Might Result From Potential Residual Contamination of Preserves and Related Exposure of People to Such Hazardous Materials

HAZARDOUS MATERIALS-1 (Preparation of Phase I Environmental Site Assessment): Prior to the acquisition of a preserve site or implementation of a stream or riparian restoration project, a Phase I Environmental Site Assessment shall be conducted in general accordance with the American Society for Testing and Materials Standard Practice E1527-05. The purpose of this Environmental Site Assessment is to identify, to the extent feasible pursuant to the American Society for Testing and Materials Standard, recognized environmental conditions in connection with the potential site. The term "recognized environmental condition" means the presence or likely presence of hazardous substances or petroleum products on the property under conditions that may indicate an existing release, a past release, or a material threat of release of these substances to the property. If the Phase 1 Environmental Site Assessment indicates the presence of a recognized environmental condition, the Implementing Entity shall consider the following options.

- Determine that the acquisition/project can proceed on the basis that the Habitat Plan goals and objectives can be met on the site even with the presence of a recognized environmental condition.
- Conduct a Phase II Environmental Site Assessment, including soil and groundwater testing, to further study the potential for contamination to limit the Implementing Entity's management activities.
- If the results of the Phase I (or Phase II) Environmental Site Assessment indicate that the Habitat Plan goals and objectives cannot be met on the site, the Implementing Entity should not acquire the site.

HAZARDOUS MATERIALS-2 (Contingency Plan): As part of each Preserve Management Plan or site restoration plan, a Contingency Plan shall be prepared to address the actions that would be taken during construction in the event that unexpected contaminated soil or groundwater is discovered. The Contingency Plan shall include health and safety considerations, handling and disposal of wastes, reporting requirements, and emergency procedures. The Contingency Plan shall include a requirement that if evidence of contaminated materials is encountered

during construction, construction would cease immediately and applicable requirements of the Comprehensive Environmental Release Compensation and Liability Act and the California Code of Regulations Title 22 regarding the disposal of waste would be implemented.

5.4.2 Covered Species Take Avoidance and Minimization Measures

The following section describes measures to avoid or minimize effects of Covered Activities on specific SSHCP Covered Species. Species-specific AMMs include species surveys, pre-construction surveys, and construction monitoring. Most species-specific AMMs require that species surveys be conducted if Covered Species modeled habitat is within the proposed Covered Activity footprint or within a specified distance of the proposed Covered Activity. Section 3.4 provides maps and descriptions of modeled habitat for each Covered Species. The AMMs described below apply to Covered Activities when Covered Species modeled habitat or a Covered Species occurrence are at a project site. The Implementing Entity and Wildlife Agencies may update specific SSHCP AMMs over the Permit Term to provide the best and most appropriate protective measures for a Covered Species.

General Covered Species Take Avoidance and Minimization Measures

The following AMMs will apply to all Covered Activities that are required to implement Covered Species take AMMs.

SPECIES-1 (Litter Removal Program): A litter control program will be instituted for the entire project site. All workers will ensure that their food scraps, paper wrappers, food containers, cans, bottles, and other trash are deposited in covered or closed trash containers. All garbage will be removed from the project site at the end of each work day, and construction personnel will not feed or otherwise attract wildlife to the area where construction activities are taking place.

SPECIES-2 (No Pets in Construction Areas): To avoid harm and harassment of native species, workers and visitors will not bring pets onto a project site.

SPECIES-3 (Take Report): If accidental injury or death of any Covered Species occurs, workers will immediately inform the approved biologist or on-site monitor and site supervisor. The approved biologist or on-site monitor will phone the appropriate contact person at the Implementing Entity. The Implementing Entity will immediately contact the Wildlife Agencies by telephone. A memorandum will be provided to the Implementing Entity and Wildlife Agencies within 1 working day of the incident. The report will provide the date and location of the incident, number of individuals taken,

the circumstances resulting in the take, and any corrective measures taken to prevent additional take.

SPECIES-4 (Post-Construction Compliance Report): A post-construction compliance report will be submitted to the SSHCP Implementing Entity within 30 calendar days of completion of construction activities or within 30 calendar days of any break in construction activity that lasts more than 30 days. The report will detail the construction start and completion dates, any information about meeting or failing to meet species take Avoidance and Minimization Measures (AMM), effectiveness of each AMM that was applied at the project site, and any known project effects to Covered Species.

Rare Plants

PLANT-1 (Rare Plant Surveys): If a Covered Activity project site contains modeled habitat for Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii)*, Bogg's Lake hedge-hyssop (*Gratiola heterosepala)*, dwarf downingia (*Downingia pusilla)*, Legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii)*, or Sanford's arrowhead (*Sagittaria sanfordii*), the Covered Activity project site will be surveyed for the rare plant by an approved biologist and following the California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or the most recent CDFW rare plant survey protocols. An approved biologist will conduct the field surveys and will identify and map plant species occurrences according to the protocols. See Chapter 10 for the process to submit survey information to the Plan Permittee and the Permitting Agencies.

PLANT-2 (Rare Plant Protection): If a rare plant listed in AMM PLANT-1 is detected within an area proposed to be disturbed by a Covered Activity or is detected within 250 feet of the area proposed to be disturbed by a Covered Activity, the Implementing Entity will assure one unprotected occurrence of the species is protected within a SSHCP Preserve before any ground disturbance occurs a the project site.

Sacramento and Slender Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is a federally and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Slender Orcutt grass (*Orcuttia tenuis*) is a federally threatened and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Both Orcutt grasses are very rare, and the likelihood of finding new occurrences within the Plan Area is low. Due to their rarity, take of either of these species is not permitted under the SSHCP, with the exception of take related to Preserve management and monitoring (see Section 5.2.7, SSHCP Preserve System Covered Activities).

ORCUTT-1 (Orcutt Grass Surveys): If a Covered Activity project site is located within 1 mile of the Mather Core Recovery Area and contains the Vernal Pool land cover type, the project site will be surveyed for Sacramento and slender Orcutt grass by an approved biologist following California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or most recent CDFW guidelines to determine if Sacramento and/or slender Orcutt grass is present. An approved biologist will conduct the field investigation to identify and map occurrences. See Chapter 10 for the process to conduct and submit survey information.

ORCUTT-2 (Orcutt Grass Protection): Where known or new Sacramento or slender Orcutt grass occurrences are found, they will be protected within an SSHCP Preserve that is at least 50 acres. The occurrence will be located interior to the Preserve at a distance of no less than 300 feet from the edge of the Preserve boundary. If a Third-Party Project Proponent encounters a previously undiscovered occurrence of Sacramento or slender Orcutt grass on a Covered Activity project site, the Third-Party Project Proponent will contact the Implementing Entity or Land Use Authority Permittee with authority over the project, who will coordinate with the Wildlife Agencies for written concurrence of avoidance to ensure that the project does not cause take of the species.

California Tiger Salamander

To avoid direct and indirect effects of Covered Activities on California tiger salamander (*Ambystoma californiense*), the following AMMs will be implemented.

CTS-1 (California Tiger Salamander Daily Construction Schedule): Ground-disturbing Covered Activities within California tiger salamander modeled habitat (Figure 3-16) will occur outside the breeding and dispersal season (occur after July 31 and before October 15), to the maximum extent practicable. If Covered Activities must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), construction activities will not start until 30 minutes after sunrise and must be complete 30 minutes prior to sunset.

CTS-2 (California Tiger Salamander Exclusion Fencing): If a Covered Activity must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), exclusion fencing will be installed around the project footprint before October 15. Temporary high-visibility construction fencing will be installed along the edge of work areas, and exclusion fencing will be installed immediately outside of the temporary high-visibility construction fencing to exclude California tiger salamanders from entering the construction area or becoming entangled in the construction fencing. Exclusion fencing will be at least 1 foot tall and be buried

at least 6 inches below the ground to prevent salamanders from going under the fencing. Fencing will remain in place until all construction activities within the construction area are complete. No project activities will occur outside the delineated project footprint. An approved biologist must inspect the exclusion fencing and project site every morning before 7:00 a.m. for integrity and for any entrapped California tiger salamanders. If a California tiger salamander is encountered, refer to CTS-5, below. (However, the Implementing Entity may, with approval of the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), determine that it is appropriate for a Covered Activity project to not implement CTS-2 for certain long and linear roadway Covered Activity projects if it appears that the exclusion fencing will likely trap individuals or cause more take of California tiger salamander than it would prevent.)

CTS-3 (California Tiger Salamander Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-16), an approved biologist experienced with California tiger salamander identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site for California tiger salamander every morning before 7:00 a.m., or prior to construction activities. As required by BMP-8 (Training of Construction Staff), the approved biologist will also train construction personnel on the required California tiger salamander avoidance procedures, exclusion fencing, and correct protocols in the event that a California tiger salamander enters an active construction zone. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-4 (Avoid California Tiger Salamander Entrapment): If Covered Activities must be implemented in modeled habitat, all excavated steep-walled holes or trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes or trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within California tiger salamander modeled habitat will be inspected for California tiger salamanders by the approved biologist prior to being moved. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-5 (California Tiger Salamander Encounter Protocol): If a California tiger salamander is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately (California Department of Fish and Wildlife (CDFW)

and U.S. Fish and Wildlife Service (USFWS)). Construction activities will be suspended in a 100-foot radius of the animal until the animal is relocated by an approved biologist with appropriate handling permits from the Wildlife Agencies. Prior to relocation, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the salamander, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to USFWS and CDFW immediately. Any worker who inadvertently injures or kills a California tiger salamander or who finds dead, injured, or entrapped California tiger salamander(s) must immediately report the incident to the approved biologist.

CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat): If erosion control (BMP-2) is implemented within California tiger salamander modeled habitat (Figure 3-16), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that salamanders are not trapped (no monofilament). Coconut coir matting and fiber rolls with burlap are examples of acceptable erosion control materials. This limitation will be communicated to the contractor through use of special provisions included in the bid solicitation package.

CTS-7 (Rodent Control): CTS-7 only applies to projects that are within California tiger salamander modeled habitat (Figure 3-16) and on Covered Activities. Rodent control will be allowed only in developed portions of a Covered Activity project site. Where rodent control is allowed, the method of rodent control will comply with the methods of rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Western Spadefoot

To avoid direct and indirect effects of Covered Activities on western spadefoot (*Spea hammondii*), the following AMMs will be implemented.

WS-1 (Western Spadefoot Work Window): Ground-disturbing Covered Activities within western spadefoot modeled habitat (Figure 3-17) will occur outside the breeding and dispersal season (after May 15 and before October 15), to the maximum extent practicable.

WS-2 (Western Spadefoot Exclusion Fencing): If Covered Activities must be implemented in modeled habitat (Figure 3-17) after October 15 and before May 15, exclusion fencing

will be installed around the project footprint before October 15, and the project site must be monitored by an approved biologist following rain events. Temporary high-visibility construction fencing will be installed along the edge of work areas, and silt fencing will be installed immediately behind the temporary high-visibility construction fencing to exclude western spadefoot from entering the construction area. Fencing will remain in place until all construction activities within the construction area are completed. No project activities will occur outside the delineated project footprint. If a western spadefoot is encountered, refer to WS-6, below.

WS-3 (Western Spadefoot Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-17) in the breeding and dispersal season (after October 15 and before May 15), an approved biologist experienced with western spadefoot identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site daily for western spadefoot prior to construction activities. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western spadefoot enters an active construction zone (i.e., outside the buffer zone). If a western spadefoot is encountered, refer to WS-6, below.

WS-4 (Avoid Western Spadefoot Entrapment): If a Covered Activity occurs in western spadefoot modeled habitat (Figure 3-17), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western spadefoot modeled habitat will be inspected for western spadefoot by the approved biologist prior to being moved. If a western spadefoot is encountered, refer to WS-6, below.

WS-5 (Erosion Control Materials in Western Spadefoot Habitat): If erosion control (BMP-2) is implemented within western spadefoot modeled habitat (Figure 3-17), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that western spadefoots are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WS-6 (Western Spadefoot Encounter Protocol): If Covered Activities must be implemented in modeled habitat (Figure 3-17) during the breeding and dispersal season (after October 15 and before May 15), and a western spadefoot is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the western spadefoot within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife immediately. Any worker who inadvertently injures or kills a western spadefoot or who finds dead, injured, or entrapped western spadefoot(s) must immediately report the incident to the approved biologist.

Giant Gartersnake

To avoid direct and indirect effects of Covered Activities on giant gartersnake (*Thamnophis gigas*), the following AMMs will be implemented.

GGS-1 (Giant Gartersnake Surveys): If the SSHCP giant gartersnake modeled habitat maps (Figure 3-18) show that modeled habitat for giant gartersnake is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate giant gartersnake aquatic habitat within the project footprint and adjacent areas within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-18, giant gartersnake aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, agricultural ditches, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide these maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated giant gartersnake habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as giant gartersnake habitat is identified and fully avoided. Otherwise, Covered Activities must comply with GGS-2 through GGS-8, below. See Chapter 10 for the process to conduct and submit survey information.

GGS-2 (Giant Gartersnake Work Window): Covered Activities that do not fully avoid giant gartersnake modeled habitat (Figure 3-18) will be conducted during the snake's active

season. Construction and ground-disturbing activities will be initiated after May 1 and will end prior to September 15. If it appears that construction activities may go beyond September 15, the Third-Party Project Proponent or Plan Permittee will contact the Local Land Use Permittee and the Implementing Entity as soon as possible, but not later than September 1. The Local Land Use Permittee and the Implementing Entity will discuss with the Wildlife Agencies additional measures necessary to minimize take.

GGS-3 (Giant Gartersnake Monitoring): If a Covered Activity is occurring in giant gartersnake modeled habitat (Figure 3-18), an approved biologist experienced with giant gartersnake identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for giant gartersnake prior to construction activities. If a giant gartersnake is encountered, refer to GGS-7. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a giant gartersnake enters an active construction zone (i.e., outside the buffer zone).

GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion): If construction activities will occur in giant gartersnake aquatic habitat, aquatic habitat will be dewatered and then remain dry and absent of aquatic prey (e.g., fish and tadpoles) for 15 days prior to initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to giant gartersnake. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent snakes from attempting to move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify the construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Giant gartersnake habitat outside construction fencing will be avoided by all construction personnel. The fencing and the work area will be inspected by the approved biologist to ensure that the fencing is intact and that no snakes have entered the work area before the start of each work day. The fencing will be maintained by the contractor until completion of the project. If giant gartersnake is encountered, refer to GGS-7, below.

GGS-5 (Avoid Giant Gartersnake Entrapment): If a Covered Activity occurs in giant gartersnake modeled habitat (Figure 3-18), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or

provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within giant gartersnake modeled habitat will be inspected for giant gartersnake by the approved biologist prior to being moved. If a giant gartersnake is encountered, refer to GGS-7.

GGS-6 (Erosion Control Materials in Giant Gartersnake Habitat): If erosion control (BMP-2) is implemented within giant gartersnake modeled habitat (Figure 3-18), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure snakes are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

GGS-7 (Giant Gartersnake Encounter Protocol): If a giant gartersnake is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the giant gartersnake within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a giant gartersnake or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

GGS-8 (Giant Gartersnake Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation. Refer to the U.S. Fish and Wildlife Service's (USFWS) Guidelines for the Restoration and/or Replacement of Giant Gartersnake Habitat (USFWS 1997), or the most current USFWS guidelines at the time of the

activity. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration.

Western Pond Turtle

To avoid direct and indirect effects of Covered Activities on western pond turtle (*Actinemys marmorata*), the following AMMs will be implemented.

WPT-1 (Western Pond Turtle Surveys): If the SSHCP western pond turtle modeled habitat maps (Figure 3-19) show that modeled habitat for western pond turtle is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate western pond turtle aquatic habitat within the project footprint and within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-19, western pond turtle aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide those maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated western pond turtle habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as western pond turtle habitat is identified and fully avoided. Otherwise, Covered Activities must comply with WPT-2 through WPT-9. See Chapter 10 for the process to conduct and submit survey information.

WPT-2 (Western Pond Turtle Work Window): Maintenance and improvements to existing structures may occur throughout the year as long as western pond turtle habitat is identified and avoided, and movement of equipment is confined to existing roads. Otherwise, construction and ground-disturbing Covered Activities must be conducted outside of western pond turtle's active season. Construction and ground-disturbing activities will be initiated after May 1 and will commence prior to September 15. If it appears that construction activities may go beyond September 15, the appropriate Plan Permittee will contact the Local Land Use Permittee and the Implementing Entity as soon as possible, but not later than September 1, to determine if additional measures are necessary to minimize take.

WPT-3 (Western Pond Turtle Monitoring): If a Covered Activity is occurring in western pond turtle modeled habitat (Figure 3-19), an approved biologist experienced with western pond turtle identification and behavior will monitor the project site, including the

integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for western pond turtle prior to construction activities. The approved biologist will also training construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western pond turtle enters an active construction zone (i.e., outside the buffer zone).

WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion): If construction activities will occur in western pond turtle aquatic habitat, aquatic habitat for the turtle will be dewatered and then remain dry and absent of aquatic prey (e.g., crustaceans and other aquatic invertebrates) for 15 days prior to the initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to western pond turtle. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent turtles from attempting to burrow or move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Western pond turtle habitat outside construction fencing will be avoided by all construction personnel. The fencing and work area will be inspected by the approved biologist to ensure that the fencing is intact and that no turtles have entered the work area before the start of each work day. Fencing will be maintained by the contractor until completion of the project. If, after exclusion fencing and dewatering, western pond turtles are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will discuss the next best steps with the Implementing Entity and Wildlife Agencies.

WPT-5 (Avoid Western Pond Turtle Entrapment): If a Covered Activity occurs within western pond turtle modeled habitat (Figure 3-19), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western pond turtle modeled habitat will be inspected for western pond turtle by the approved biologist prior to being moved.

WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat): If erosion control (BMP-2) is implemented within western pond turtle modeled habitat (Figure 3-19), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that turtles are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit): Covered Activity construction and maintenance vehicles will observe a 20-mile-per-hour speed limit within western pond turtle modeled upland habitat (Figure 3-19).

WPT-8 (Western Pond Turtle Encounter Protocol): If a western pond turtle is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the turtle, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a western pond turtle or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

WPT-9 (Western Pond Turtle Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation and placing appropriate artificial or natural basking areas in waterways and wetlands. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration.

Tricolored Blackbird

To avoid direct and indirect effects of Covered Activities on tricolored blackbird (*Agelaius tricolor*), the following AMMs will be implemented.

TCB-1 (Tricolored Blackbird Surveys): If modeled habitat for tricolored blackbird is present within a Covered Activity's project footprint or within 500 feet of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting or foraging sites are present within the project footprint and adjacent areas within 500 feet of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Within the Plan Area, potential tricolor blackbird nest sites are often associated with freshwater marsh and seasonal wetlands, or in thickets of willow, blackberry, wild rose, thistle, and other thorny vegetation. Tricolored blackbirds are also known to nest in crops associated with dairy farms. Foraging habitat is associated with annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields (such as large tracts of alfalfa and pastures with continuous haying schedules and recently tilled fields), cattle feedlots, and dairies. The Third-Party Project Proponent will map all existing or potential nesting or foraging sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

TCB-2 (Tricolored Blackbird Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 500 feet of a project footprint if existing or potential nest sites were found during design surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and within 3 days of ground-disturbing activities, and within the proposed project footprint and 500 feet of the proposed project footprint to determine the presence of nesting tricolored blackbird. Pre-construction surveys will be conducted during the breeding season (March 1 through August 31). Surveys conducted in February (to meet pre-construction survey requirements for work starting in March) must be conducted within 14 days and 3 days in advance of ground-disturbing activities. If a nest is present, then TCB-3 and TCB-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and the Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

TCB-3 (Tricolored Blackbird Nest Buffer): If active nests are found within the project footprint or within 500 feet of any project-related Covered Activity, the Third-Party Project Proponent will establish a 500-foot temporary buffer around the active nest until the young have fledged.

TCB-4 (Tricolored Blackbird Nest Buffer Monitoring): If nesting tricolored blackbirds are present within the project footprint or within 500 feet of any project-related Covered

Activity, then an approved biologist experienced with tricolored blackbird behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place near the disturbance buffer. Work within the nest disturbance buffer will not be permitted. If the approved biologist determines that tricolored blackbirds are exhibiting agitated behavior, construction will cease until the buffer size is increased to a distance necessary to result in no harm or harassment to the nesting tricolored blackbirds. If the biologist determines that the colonies are at risk, a meeting with the Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will be held to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a tricolored blackbird flies into an active construction zone (i.e., outside the buffer zone).

TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves): On SSHCP Agricultural Preserves, pesticides (including herbicides) will not be applied from January 1 through July 15.

Swainson's Hawk

To avoid direct and indirect effects of Covered Activities on Swainson's hawk (*Buteo swainsoni*), the following AMMs will be implemented.

SWHA-1 (Swainson's Hawk Surveys): If modeled habitat for Swainson's hawk (Figure 3-25) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a survey to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Nest sites are often associated with Riparian land cover, but also include lone trees in fields, trees along roadways, and trees around structures. Nest trees may include, but are not limited to, Fremont's cottonwood (*Populus fremontii*), oaks (*Quercus* spp.), willows (*Salix* spp.), walnuts (*Juglans* spp.), eucalyptus (*Eucalyptus* spp.), pines (*Pinus* spp.), and Deodar cedar (*Cedrus deodara*). The Third-Party Project Proponent will map all existing and potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

SWHA-2 (Swainson's Hawk Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites were found during initial surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities to determine presence of nesting Swainson's hawk. Pre-construction surveys will be conducted during the breeding season (March 1 through September 15). If a nest is present, then SWHA-3 and SWHA-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

SWHA-3 (Swainson's Hawk Nest Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.25 mile disturbance buffer around the active nest until the young have fledged, with concurrence from the Wildlife Agencies.

SWHA-4 (Swainson's Hawk Nest Buffer Monitoring): If nesting Swainson's hawks are present within the project footprint or within 0.25 mile of any project-related Covered Activity, then an approved biologist experienced with Swainson's hawk behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting Swainson's hawks begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a Swainson's hawk flies into an active construction zone (i.e., outside the buffer zone).

Greater Sandhill Crane

To avoid direct and indirect effects of Covered Activities on greater sandhill crane (*Grus canadensis*), the following AMMs will be implemented.

GSC-1 (Greater Sandhill Crane Surveys): If modeled habitat for greater sandhill crane (Figure 3-22) is present within a Covered Activity's project footprint or within 0.5 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential roosting sites are present within the project footprint and adjacent areas within 0.5 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Roosting sites within the Plan Area are often associated with flooded fields, seasonal wetlands, and freshwater marsh. The Third-Party Project Proponent will map all existing or potential roosting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Roosting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

GSC-2 (Greater Sandhill Crane Pre-Construction Surveys): Pre-construction surveys will be required to determine if active roosting sites are present within a project footprint or within 0.5 mile of a project footprint if existing or potential roosting sites were found during initial surveys and construction activities will occur when wintering flocks are present within the Plan Area (September 1 through March 15). An approved biologist will conduct pre-construction surveys within 15 days of ground-disturbing activities, and within 0.5 mile of a project footprint, to determine presence of roosting greater sandhill cranes. Pre-construction surveys will be conducted September 1 through March 15, when wintering flocks are present within the Plan Area. If birds are present, then GSC-3, GSC-4, and GSC-5 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

GSC-3 (Greater Sandhill Crane Roosting Buffer): If active roosting sites are found within the project footprint or within 0.5 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.5 mile temporary roosting disturbance buffer around the roosting site until the cranes have left.

GSC-4 (Greater Sandhill Crane Visual Barrier): Greater sandhill cranes have low tolerance for human disturbance, and such disturbance has caused cranes to abandon foraging and roosting sites. Repeat disturbance affects their ability to feed and store energy needed for survival. If project-related activities occur within 0.5 mile of a known roosting site as identified by surveys conducted during implementation of GSC-1 or GSC-2, a visual barrier will be constructed.

GSC-5 (Greater Sandhill Crane Roosting Buffer Monitoring): If roosting sites are found within the project footprint or within 0.50 mile of any project-related Covered Activity, an

approved biologist experienced with greater sandhill crane behavior will be retained by the Third-Party Project Proponent to monitor the roosting site throughout the roosting season and to determine when the birds have left. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary disturbance buffer can only occur with the written permission of the Implementing Entity and Wildlife Agencies. If greater sandhill cranes are abandoning their roosting and/or forage sites, the approved biologist will have the authority to shut down construction activities. If roost abandonment occurs, the approved biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid harm and harassment of individuals. The approved biologist will also train construction personnel on the avoidance procedures, buffer zones, and protocols in the event that greater sandhill cranes move into an active construction zone (i.e., outside the buffer zone).

Western Burrowing Owl

To avoid direct and indirect effects of Covered Activities on western burrowing owl (*Athene cunicularia*), the following AMMs will be implemented.

WBO-1 (Western Burrowing Owl Surveys): Surveys within modeled habitat are required for both the breeding and non-breeding season. If the project site falls within modeled habitat, an approved biologist will survey the project site and map all burrows, noting any burrows that may be occupied. Occupied burrows are often (but not always) indicated by tracks, feathers, egg shell fragments, pellets, prey remains, and/or excrement. Surveying and mapping will be conducted by the approved biologist while walking transects throughout the entire project site plus all accessible areas within a 250-foot radius from the project site. The centerline of these transects will be no more than 50 feet apart and will vary in width to account for changes in terrain and vegetation that can preclude complete visual coverage of the area. For example, in hilly terrain with patches of tall grass, transects will be closer together, and in open areas with little vegetation, they can be 50 feet apart. This methodology is consistent with current survey protocols for this species (California Burrowing Owl Consortium 1993). Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If suitable habitat is identified during the initial survey, and if the project does not fully avoid the habitat, pre-construction surveys will be required. Burrowing owl habitat is fully avoided if project-related activities do not impinge on a 250-foot buffer established by the approved biologist around suitable burrows. See Chapter 10 for the process to conduct and submit survey information.

WBO-2 (Western Burrowing Owl Pre-Construction Surveys): Prior to any Covered Activity ground disturbance, an approved biologist will conduct pre-construction surveys in all areas that were identified as suitable habitat during the initial surveys. The purpose of the pre-construction surveys is to document the presence or absence of burrowing owls on the project site, particularly in areas within 250 feet of construction activities. To maximize the likelihood of detecting owls, the pre-construction survey will last a minimum of 3 hours. The survey will begin 1 hour before sunrise and continue until 2 hours after sunrise (3 hours total), or begin 2 hours before sunset and continue until 1 hour after sunset. Additional time may be required for large project sites. A minimum of two pre-construction surveys will be conducted (if owls are detected on the first survey, a second survey is not needed). All owls observed will be counted and their location will be mapped. Surveys will conclude no more than 2 calendar days prior to construction. Therefore, the Third-Party Project Proponent must begin surveys no more than 4 days prior to construction (2 days of surveying plus up to 2 days between surveys and construction). To avoid last-minute changes in schedule or contracting that may occur if burrowing owls are found, the Third-Party Project Proponent may also conduct a preliminary survey up to 15 days before construction. This preliminary survey may count as the first of the two required surveys as long as the second survey concludes no more than 2 calendar days in advance of construction.

WBO-3 (Burrowing Owl Avoidance): If western burrowing owl or evidence of western burrowing owl is observed on the project site or within 250 feet of the project site during pre-construction surveys, then the following will occur:

During Breeding Season: If the approved biologist finds evidence of western burrowing owls within a project site during the breeding season (February 1 through August 31), all project-related activities will avoid nest sites during the remainder of the breeding season or while the nest remains occupied by adults or young (nest occupation includes individuals or family groups foraging on or near the site following fledging). Avoidance is establishment of a minimum 250-foot buffer zone around nests. Construction and other project-related activities may occur outside of the 250-foot buffer zone. Construction and other project-related activities may be allowed inside of the 250-foot non-disturbance buffer during the breeding season if the nest is not disturbed, and the Third-Party Project Proponent develops an avoidance, minimization, and monitoring plan that is approved by the Implementing Entity and Wildlife Agencies prior to project construction based on the following criteria:

- The Implementing Entity and Wildlife Agencies approve of the avoidance and minimization plan provided by the project applicant.

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline nesting and foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl nesting and foraging behavior in response to construction activities.

If there is any change in owl nesting and foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer. Construction cannot resume within the 250-foot buffer until any owls present are no longer affected by nearby construction activities, and with written concurrence from the Wildlife Agencies.

If monitoring by the approved biologist indicates that the nest is abandoned prior to the end of nesting season and the burrow is no longer in use, the non-disturbance buffer zone may be removed if approved by the Wildlife Agencies. The approved biologist will excavate the burrow in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl to prevent reoccupation after receiving approval from the Wildlife Agencies.

The Implementing Entity and Wildlife Agencies will respond to a request from the Third-Party Project Proponent to review the proposed construction monitoring plan within 21 days.

During Non-Breeding Season: During the non-breeding season (September 1 through January 31), the approved biologist will establish a minimum 250-foot non-disturbance buffer around occupied burrows. Construction activities outside of this 250-foot buffer will be allowed. Construction activities within the non-disturbance buffer will be allowed if the following criteria are met to prevent owls from abandoning over-wintering sites:

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl foraging behavior in response to construction activities.
- If there is any change in owl foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer.
- If the owls are gone for at least 1 week, the Third-Party Project Proponent may request approval from the Implementing Entity and Wildlife Agencies that an approved biologist excavate usable burrows and install one-way exclusionary

devices to prevent owls from re-occupying the site. After all usable burrows are excavated, the buffer zone will be removed and construction may continue.

Monitoring must continue as described above for the non-breeding season as long as the burrow remains active.

WBO-4 (Burrowing Owl Construction Monitoring): During construction of Covered Activities, 250-foot construction buffer zones will be established and maintained around any occupied burrow. An approved biologist will monitor the site to ensure that buffers are enforced and owls are not disturbed. The approved biologist will also train construction personnel on avoidance procedures, buffer zones, and protocols in the event that a burrowing owl flies into an active construction zone.

WBO-5 (Burrowing Owl Passive Relocation): Passive relocation is not allowed without the express written approval of the Wildlife Agencies. Passive owl relocation may be allowed on a case-by-case basis on project sites during the non-breeding season (September 1 through January 31) with the written approval of the Wildlife Agencies if the other measures described in this condition preclude work from continuing. Passive relocation must be done in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl. Passive relocation will only be proposed if the burrow needing to be removed or with the potential to collapse from construction activities is the result of a Covered Activity. If passive relocation is approved by the Wildlife Agencies, an approved biologist can passively exclude birds from their burrows during the non-breeding season by installing one-way doors in burrow entrances. These doors will be in place for 48 hours to ensure that owls have left the burrow, and then the biologist will excavate the burrow to prevent reoccupation. Burrows will be excavated using hand tools only. During excavation, an escape route will be maintained at all times. This may include inserting an artificial structure into the burrow to avoid having materials collapse into the burrow and trap owls inside. Other methods of passive relocation, based on best available science, may be approved by the Wildlife Agencies over the 50-year Permit Term.

WBO-6 (Burrowing Owl Timing of Maintenance Activities): All activities adjacent to existing or planned Preserves, Preserve Setbacks, or Stream Setback areas will be seasonally timed, when safety permits, to avoid or minimize adverse effects on occupied burrows.

WBO-7 (Rodent Control): Rodent control will be allowed only in developed portions of a Covered Activity project site within western burrowing owl modeled habitat. Where rodent control is allowed, the method of rodent control will comply with the methods of

rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Covered Raptor Species

To avoid direct and indirect effects of Covered Activities on covered raptor species, the following AMMs will be implemented. This measure applies to Cooper's hawk (*Accipiter cooperii*), loggerhead shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), and white-tailed kite (*Elanus leucurus*). The following AMMs do not apply to ferruginous hawk (*Buteo regalis*), as they do not nest in the Plan Area. The following AMMs also do not apply to Swainson's hawk or burrowing owl, as specific AMMs have been developed for these covered raptor species.

RAPTOR-1 (Raptor Surveys): If modeled habitat for a covered raptor species (Figures 3-20, 3-23, 3-24, or 3-28) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

RAPTOR-2 (Raptor Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present with a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites are found during initial surveys and construction activities will occur during the raptor breeding season. An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities within the proposed project footprint and within 0.25 mile of the proposed project footprint to determine presence of nesting covered raptor species. Pre-construction surveys will be conducted during the raptor breeding season. If a nest is present, then RAPTOR-3 and RAPTOR-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

RAPTOR-3 (Raptor Nest/Roost Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project

Proponent will establish a 0.25 mile temporary nest disturbance buffer around the active nest until the young have fledged.

RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring): If project-related Covered Activities within the temporary nest disturbance buffer are determined to be necessary during the nesting season, then an approved biologist experienced with raptor behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting raptors begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist/monitor will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a covered raptor species flies into an active construction zone (i.e., outside the buffer zone).

Western Red Bat

To avoid direct and indirect effects of Covered Activities on western red bat (*Lasiurus blossevillii*), the following AMMs will be implemented.

BAT-1 (Winter Hibernaculum Surveys): If modeled habitat (Figure 3-30) for western red bat is present within 300 feet of a Covered Activity's project footprint, then an approved biologist will conduct a field investigation of the project footprint and adjacent areas within 300 feet of a project footprint to determine if a potential winter hibernaculum is present, and to identify and map potential hibernaculum sites. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If potential hibernaculum sites are found, the Third-Party Project Proponent will note their locations on project designs and will design the project to avoid all areas within a 300-foot buffer around the potential hibernaculum sites. Winter hibernaculum habitat is fully avoided if project-related activities do not impinge on a 300-foot buffer established by the approved biologist around an existing or potential winter hibernaculum site. See Chapter 10 for the process to conduct and submit survey information.

BAT-2 (Winter Hibernaculum Pre-Construction Surveys): If the Third-Party Project Proponent elects not to avoid potential winter hibernaculum sites within the project footprint plus a 300-foot buffer, additional surveys are required. Prior to any ground disturbance related to Covered Activities, an approved biologist will conduct a pre-construction survey within 3 days of ground-disturbing activities within the project footprint and 300 feet of the project footprint to determine the presence of winter hibernaculum sites. Pre-construction surveys will be conducted during the winter hibernaculum season (November 1 through March 31). If a winter hibernaculum is present, then BAT-3 and BAT-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

BAT-3 (Winter Hibernaculum Buffer): If active winter hibernaculum sites are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will establish a 300-foot temporary disturbance buffer around the active winter hibernaculum site until bats have vacated the hibernaculum and the Implementing Entity and Wildlife Agencies concur.

BAT-4 (Bat Eviction Methods): An approved biologist will determine if non-maternity and non-hibernaculum day and night roosts are present on the project site. If necessary, an approved biologist will use safe eviction methods to remove bats if direct impacts to non-maternity and non-hibernaculum day and night roosts cannot be avoided. If a winter hibernaculum site is present, Covered Activities will not occur until the hibernaculum is vacated, or, if necessary, safely evicted using methods acceptable to the Wildlife Agencies.

Appendix CC-1

GHG Emissions from the Existing Sacramento Raceway

KLEINFELDER
Bright People. Right Solutions.

April 19, 2021

Mr. Angelo Tsakopoulos
Tsakopoulos Investments
1435 River Park Drive, Suite 500
Sacramento, CA 95815

SUBJECT: GHG Emissions from the Existing Sacramento Raceway Operations

Dear Mr. Tsakopoulos:

This letter summarizes the greenhouse gas (GHG) emissions from the existing Sacramento Raceway (Raceway) operations. The emission estimates herein are provided as a point of information because they were not addressed in the previously prepared Air Quality Management Plan[1] (AQMP) or Greenhouse Gas Reduction Plan[2] (GHGRP). These emissions were not subtracted or credited in the AQMP or GHGRP, even though when the housing, schools, and parks that are included on the Raceway property as part of the Jackson Township Specific Plan (Jackson Township) are built, Raceway operations will cease and the emissions reported herein would be eliminated.

Attachment 1 shows the potential GHG emissions from the operation of the Raceway. The emissions were calculated for future calendar year 2035 to be consistent with the AQMP and GHGRP. The vehicle miles traveled (VMT) and GHG emission factors used in Attachment 1 were calculated consistent with the Sacramento Raceway health effects report[3], but with the emission factors updated to calendar year 2035. Table 1 shows the total annual GHG emissions in terms of metric tons per year (MT/yr). The VMT and Raceway operation assumptions were based on estimated actual operations in calendar year 2019 as explained in the health effects report.

Table 1

Estimated Sacramento Raceway GHG Emissions

Description	Annual GHG Emissions (MT/yr)
Drag Racing	1,586
Motocross	24

Net CO2e Emissions Saved		**2,501**	MT/yr		

Note 1: Drive Clean California states that it takes 4 to 6 hours to fully charge an EV. But one would not typically allow the vehicle to be empty before charging, thus assumed 3 hrs/charge.

Note 2: Drive Clean California states that EVs have battery capacities of 24 to 36 kWh and fully charge in 4 to 6 hours, so 6 kWh/hr.

Note 3: Average effeciency of 24 model year 2019 electric vehicles, per USDOE. Used only model year 2019 because vehicles will be more efficient in 2035 than in the past.

Note 4: From SMUD for calendar year 2030, per Memo dated January 11, 2019 from Mr. Todd Smith, Sacramento County PER.

Note 5: From EMFAC 2017 for gasoline engines, all models and model years; calendar year 2035.

EXECUTIVE SUMMARY

BSK Associates (BSK) performed a Phase I Environmental Site Assessment (ESA) in general accordance with the scope and limitations of ASTM Practice E 1527-05 of the approximately 1,400 acres comprised of 39 parcels, generally bordered by Jackson Road to the south, Excelsior Road to the west, Keifer Boulevard to the north and just west of Eagles Nest Road to the east (the Site). Sacramento County's APN's and associated acres are provided in Table 1: Property Information.

The Site consists of generally vacant, undeveloped land, with single family agricultural residences located primarily along Excelsior Road and Jackson Highway in an area designated for agriculture, and industrial land uses. The properties appear through historical aerial photos to have been used primarily for agricultural, residential and industrial purposes.

RECOGNIZED ENVIRONMENTAL CONDITIONS

The goal of the ASTM E 1527-05 Standard practice is to identify Recognized Environmental Conditions (RECs), as defined in the Standard and in Section 1 of this Report. This assessment has revealed evidence of RECs in connection with the subject Site as defined in the Standard. The RECs are associated with disposal piles on several parcels and potential soil and groundwater contamination associated with Sacramento Raceway activities.

HISTORICAL RECS AND KNOWN OR SUSPECT ENVIRONMENTAL CONDITIONS

The ASTM E 1527-05 Standard also requires identification of historical RECs (HRECs) and other known or suspect environmental conditions, as defined in the Standard and in Section 1 of this Report. The assessment has revealed evidence of HRECs or known environmental conditions in connection with the subject Site, specifically with the Sacramento Raceway.

PHASE I ENVIRONMENTAL SITE ASSESSMENT
PROPOSED JACKSON TOWNSHIP SPECIFIC PLAN – EXCELSIOR ESTATES, LLC
1,400 ACRES, UNINCORPORATED SACRAMENTO COUNTY, CALIFORNIA

1. INTRODUCTION

BSK Associates (BSK) has performed a Phase I Environmental Site Assessment (ESA) for the property identified as the proposed Jackson Township Specific Plan located in unincorporated Sacramento County, see Figure 1: Vicinity Map. The Site is generally bordered by Jackson Road to the south, Excelsior Road to the west, Keifer Boulevard to the north, and just west of Eagles Nest Road to the east (the Site), see Figure 2: Site Location Map. The former Mather Air Force Base, which has been converted to Mather Air Park, is located north of the Site. Sacramento County's APN's and associated acres and land uses are provided in Table 1: Property Information. This ESA was conducted as authorized by Excelsior Estates, LLC.

1.1 Purpose

The purpose of this Phase I ESA is to identify, to the extent feasible, recognized environmental conditions (RECs) in connection with the property. Typical RECs include the possible presence of hazardous substances or petroleum products on the Site (or adjoining properties) under conditions that indicate an existing release, a past release, or a material threat of a release of the substance/product into structures, the ground, groundwater, or surface water of the property. An additional use of the Phase I ESA is to permit the user to satisfy one of the requirements to qualify for what is commonly known as the "innocent landowner" defense to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) liability as described by 42 U.S.C. Section 9601 (35)(B).

1.2 Scope of Services

BSK conducted this Phase I ESA in accordance with the methods described in the American Society for Testing and Materials (ASTM) Standard E1527-05, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. The scope of services provided for this ESA included:

- A general description of the property;
- Review of the property's history using aerial photography, USGS topographic maps, directories, and other readily available information;
- Review of the reasonably ascertainable regulatory information published by local, state, and federal agencies;
- Site reconnaissance;
- Interviews with the current owner of the property; and
- Preparation of this Report.

1.3 Non-Scope Issues

Non-scope issues are those conditions and concerns that are beyond the scope of services of this Phase I ESA and include, but are not limited to: asbestos containing materials, radon, lead-based paint, lead in drinking water, wetlands delineation or identification, regulatory compliance, cultural concerns, industrial hygiene, ecological resources, endangered species, indoor air quality, and high voltage power lines. Sampling and analytical testing of soil, groundwater, air, radon gas, radioactive materials, urea-formaldehyde, mold, pesticides or polychlorinated biphenyls (PCBs) are also considered non-scope issues.

1.4 Significant Assumptions

No significant assumptions were made regarding this Phase I ESA.

1.5 Limitations

The findings presented in this Report were based upon field observations during a Site reconnaissance and discussions with local regulatory agencies and persons knowledgeable of the property. Observations describe only the conditions present at the time of this investigation. The data reviewed and observations made are limited to accessible areas and available records searched during the course of this investigation. BSK cannot guarantee the completeness or accuracy of the regulatory agency records reviewed. Unless BSK otherwise expressly agrees in writing, no other party is entitled to rely upon the observations, research information, or conclusions presented in this report or in any other material obtained by BSK from the sources identified in this Report. Additionally, in evaluating the property, BSK has relied in good faith upon information provided by the interview sources noted in the report with respect to existing property conditions, and the historic uses of the property. It must also be understood that changing circumstances in the property usage, proposed property usage, property zoning, and changes in the environmental status of the other nearby properties can alter the validity of conclusions and information contained in this Report. Therefore, the data obtained are clear and accurate only to the degree implied by the sources and methods used.

This Phase I ESA report provides neither certification nor guarantee that the property is free of hazardous-material and/or petroleum-product contamination or that there are no recognized environmental conditions associated with the property that potentially pose an environmental risk/liability or that the property is in compliance with current applicable federal, state, or local regulations. Findings of this Phase I ESA may have a potential for negative impact on the value or suitability of the property for the purpose intended. BSK cannot assume liability for such negative impact. No warranties, expressed or implied, are made as to the findings or conclusions presented in this report. Sampling and analytical testing of soil, groundwater, air, radon gas, biological agents and/or construction/building materials was not part of the scope of services for this Phase I ESA. This assessment did not include non-scope issues identified in Section 1.3 of this Report.

1.6 Exceptions

Exceptions to this Report include: title reports for the past 50 years were not provided or reviewed and site visits were not conducted on properties not owned by Excelsior Estates, LLC, however visual examinations were completed from the fence line. Excelsior Estates, LLC is aware of these exceptions and requested BSK to provide our opinions and conclusions understanding there would be data gaps.

1.7 Special Terms and Conditions

Excelsior Estates, LLC requested BSK to not access properties that were not owned by them, which is limited to 27 parcels of mostly private residences and the Sacramento Raceway (see Table 1: Property Information).

1.8 User Reliance

This Report may be distributed and relied upon by Excelsior Estates, LLC and Sacramento County for environmental review purposes. Reliance on the information and conclusions in this Report by any other person or entity is not authorized without the written consent of BSK Associates.

2. PROPERTY DESCRIPTION

2.1 Location and Legal Description

The Site is comprised of the property identified as the proposed Jackson Township Specific Plan that is approximately 1,400 acres and comprised of at least 39 parcels, in the unincorporated area of Sacramento County. Individual Title Reports or detailed legal descriptions for properties were not provided as part of the Phase I. Thirty-nine separate parcels encompass the project area. Table 1: Property Information provides the assessor's parcel number (APN), address, estimated number of acres, land use and zoning, and general site description for each parcel. The study did not evaluate the potential presence of environmental liens or indebtedness for properties not owned by Excelsior Estates, LLC.

Table 1: Property Information

No	APN/ Address	Acres	Land Use Activities (*Zoning)*	E. E. LLC owns	General Site Description andProperty Improvements
1	067-0050-002 5051 Excelsior Rd	143.5	Agricultural dry pasture *AG 80*	Yes	Residential home and abandoned fenced area. Piles of clay-like material. Contains remnants of aquiculture production.

Table 1: Property Information					
2	067-0050-004 Keifer Blvd	34.6	Agricultural dry pasture *AG 80*	Yes	Vacant undeveloped land. Public utilities run along Keifer Blvd.
3	067-0050-045 Keifer Blvd	84	Agricultural dry pasture *M1*	No	Vacant undeveloped land. Trails created from off road vehicles; debris piles.
4	067-0050-022 Keifer Blvd	6	Agricultural dry pasture *IR*	Yes	Vacant undeveloped land. Trails created from off road vehicles. Debris piles along Keifer Rd.
5	067-0050-021 Keifer Blvd	17	Agricultural dry pasture *IR*	Yes	Vacant undeveloped land. Trails created from off road vehicles, significant number of debris and burn piles.
6	067-0050-005 5305 Excelsior Rd	191.3	Recreational Sacramento Raceway *M1*	No	Paved and dirt race tracks, paved parking lots, fencing surrounds the parcel, several structures, hazardous materials storage, and propane gas storage.
7	067-0050-019 Keifer Blvd	71.5	Agricultural dry pasture *M1*	Yes	Vacant, undeveloped grazing land with variable topography.
8	067-0050-020 Keifer Blvd	60.5	Agricultural dry pasture *M1*	Yes	Vacant, undeveloped grazing land with variable topography.
9	067-0060-007 Excelsior Rd	13	Residential *AG 80*	No	Vacant property.
10	067-0060-008 5751 Excelsior Rd	9.7	Residential *AG 80*	No	Single family rural home with at least three large structures and multiple smaller sheds; dirt tracks in rear of property.
11	067-0060-010 5777 Excelsior Rd	7.3	Residential *AG 80*	No	Single family rural home with at least three large structures and multiple smaller sheds; apparent dirt piles in rear of property.
12	067-0060-012 5801 Excelsior Rd	1.9	Residential *AG 80*	No	Two single family units with several smaller sheds.
13	067-0060-011 5809 Excelsior Rd	5.3	Residential *AG 80*	No	Single family rural home.
14	067-0060-013 5817 Excelsior Rd	5	Residential *AG 80*	No	Single family rural home. Elder Creek is located on the eastern portion of property.
15	067-0060-014 Excelsior Rd	18.3	Residential *AG 80*	No	Vacant undeveloped land. Elder Creek runs through property. Small fruit stand with cash crops grown on property.
16	067-0060-016 10591 Jackson Rd	4.8	Residential *AG 80*	No	Single family rural home. Some dirt piles in rear of the property.
17	067-0050-058 Jackson Rd	76.6	Agricultural *AG 80*	Yes	Large vacant property - dry pasture. Elder Creek and variable topography runs through

Table 1: Property Information					
					the property; Sacramento Raceway on north border.
18	067-0050-028 Jackson Rd	10.4	Residential *AG 80*	No	Vacant land with variable topography.
19	067-0050-029 10685 Jackson Rd	10	Residential *AG 80*	No	Single family rural home with at least three structures.
20	067-0050-051 10891 Jackson Rd	213.4	Agricultural *AG 80*	Yes	Irrigated and dry pastures. Residential dwelling on the eastern border. Pond fed by water supply on approximately two acres. Overhead electrical transmission line.
21	067-0070-002 10775 Jackson Rd	10	Residential *AG 80*	No	Single family with several structures. Overhead electrical transmission line. Man-made ditch traverses property.
22	067-0050-047 Keifer Blvd	199.3	Agricultural *M1*	Yes	Vacant unimproved land, as dry pasture; variable topography throughout property.
23	067-0080-031 6001 Tree View Rd	15.6	Residential *AG 80*	No	Single family residence, at least two structures. Overhead electrical transmission line.
24	067-0080-023 6031 Tree View Rd	1.8	Residential *AG 80*	No	Single family residence with at least one structure.
25	067-0080-028 6101 Tree View Rd	5	Residential *AG 80*	No	Single family rural home with at least four structures and paved driveway.
26	067-0080-033 6161 Tree View Rd	4.7	Residential *AG 80*	No	Single family rural home with at least one structure.
27	067-0080-061 10917 Jackson Rd	5.6	Residential *AG 80*	No	Single family rural home with at least one structure.
28	067-0080-032 10951 Jackson Rd	6.6	Residential *AG 80*	No	Single family rural home.
29	067-0080-048 10961 Jackson Rd	0.48	Residential *AG 80*	No	Single family residence.
30	067-0080-049 Jackson Rd	0.6	Residential *AG 80*	No	Single family residence.
31	067-0080-050 Jackson Rd	4.5	Residential *AG 80*	Yes	Undeveloped, vacant land.

Table 1: Property Information					
32	067-0080-051 Jackson Rd.	5.5	Residential *AG 80*	Yes	Undeveloped, vacant land.
33	067-0080-059 11013 Jackson Rd	5.9	Residential *AG 80*	No	Single family rural home.
34	067-0080-039 11027 Jackson Rd	4.4	Residential *AG 80*	No	Single family rural home.
35	067-0080-004 Jackson Rd	10	Agricultural *AG 80*	Yes	Dry pasture.
36	067-0080-040 11151 Jackson Rd	24	Residential *AG 80*	No	Single family rural home.
37	067-0080-057 11075 Jackson Rd	19.5	Residential *AG 80*	No	Two single family units.
38	067-0080-042 11101 Jackson Rd	35	Residential *AG 80*	No	Single family rural home with at least one structure; variable topography.
39	067-0080-045 11169 Jackson Rd	19.9	Residential *AG 80*	No	Single family rural home. Variable topography with detention basin.

AG 80 – Agricultural M1 – Light Industrial IR – Industrial Reserve

2.2 Property Vicinity and General Characteristics

The properties are zoned as agricultural (AG 80), light industrial (M1) and industrial Reserve (IR) as designated by the County of Sacramento. Table 1: Property Information provides the specific land use designation for each property. Table 2: Surrounding Property Designated Land Uses provides the designated Sacramento County zoning and land uses for surrounding properties (Sacramento County Planning Department, 2013).

Table 2: Surrounding Property Designated Land Uses		
Direction from Site	**County Zoning**	**Observed Adjoining Property Uses**
North	SPA	Site bordered by Keifer Blvd. Single family residential and rural residential vacant, undeveloped pasture land; agricultural land; and wetland preserves. The town of Mather and Mather Air Park and airport are located north of the Site.
East	M-1 M-2 & AG 80	Single family rural residential homes, vacant, undeveloped grazing land, agricultural land, Greater Sacramento Muslim Cemetery, and a pet cemetery.

South	AG 160	Jackson Road borders the property to the south and includes single family rural residential homes, an equestrian center, aggregate quarries, and wetland preserves.
West	M-1, AG 80, IR , SM	Rock and garden center, single family rural residential homes, vacant undeveloped grazing land, and aggregate quarries.

SPA – Special Planning Area; M-1 – Light Industrial; M-2 – Heavy Industrial; AG 80 - Agricultural 80 acres IR – Industrial Reserve SM- Surface Mining

2.3 Current Use of the Property

The properties consist of several land use activities including:

- Vacant undeveloped grazing land
- Irrigated pasture land
- Agricultural – strawberries and other cash crops
- Grazing – cattle, sheep
- Commercial (Sacramento Raceway)
- Residential - single family rural
- Open space including creeks, vernal pools and wetland features

2.4 Property Improvements

General property improvements include:

- For residential properties: building structures, water wells, septic system, paved driveways, lighting, fencing
- Farmsteads: barns and other structures, irrigation wells, ponds and water features, fencing
- Sacramento Raceway: paved driveway, dirt track and raceway, structures to store oil and hazardous materials, waste storage location, fencing, lighting, concession stand, propane tank, structures; water well and septic system
- Agriculture: fencing and paved and unpaved roads

For specific permits associated with property improvements see Table 3.

2.5 Current Uses of Adjoining Properties

Based on observations by BSK during the site and vicinity reconnaissance, Table 2: Surrounding Property Designated Land Use summarizes the current use of properties immediately adjacent to the property.

2.6 Physical Setting

2.6.1 Topography

The property is located in the California Central Valley at an approximate elevation of 132 feet above mean sea level. The Site is located in Section 23, 24, 25, and 26 of Township 8 North, Range 6 East of the Mount Diablo Base Line and Meridian (Google Earth, 2013). The geographic coordinates at the estimated center of the Site is 38.522654/-121.276071 (Google Earth, 2013).

2.6.2 Geologic Information

To the east are the foothills of the Sierra Nevada, and to the west is the California Coast Range. The project area is located in the Sacramento Valley within the Great Valley Geomorphic Province. The Great Valley Province is a long, narrow northwest-trending alluvial valley that lies between the Sierra Nevada Range to the east and the Coast Ranges to the west. The Sacramento Valley sediments range from Jurassic to Holocene in age and record a history of alternating marine and terrestrial depositional environments (The Planning Center, 2012).

The soils are composed of San Joaquin Class D and are characteristic of very slow infiltration, clayey and have a high water table, or are shallow to an impervious layer. The soil drainage class is moderately well drained.

2.6.3 Ground Water and Surface Water Information

The subject Site is located in the South American subbasin of the Sacramento Valley Groundwater Basin. While local groundwater flow is influenced by production well pumping, regional flow in the basin is predominately directed toward the Sacramento River Delta to the southwest. Based on a groundwater contour map, groundwater is expected to be located about 150 feet below ground surface on the site (SCGA, 2012).

According to the USGS 1992 topographic map, the nearest surface water (Elder Creek) is located onsite with it headwaters on the eastern portion of the Site. Morrison Creek traverses across the northeastern portion of the Site. Based on surface topography, the surface water flows generally from a north east to a south west direction.

3. USER-PROVIDED INFORMATION

As part of the AAI requirements, Excelsior Estates, LLC provided BSK with a completed user's questionnaire dated July 22, 2013. A copy of the questionnaire is included in Appendix A .

4. RECORDS REVIEW

The purpose of the records review is to obtain and review records to identify properties, including the subject property, having potential recognized conditions.

4.1 Standard Environmental Record Sources

Federal, State, and local regulatory agencies maintain databases of businesses and properties that handle, store, and dispose of hazardous materials and/or wastes, and locations known to have had unauthorized releases of hazardous substances to soil and/or groundwater. These databases are available for review at the various regulatory agencies, or the information may be obtained from commercial data collection services. BSK Associates retained Environmental Data Resources (EDR) to perform the regulatory agency database search. The record search meets the government records search requirements of ASTM E 1527-05. EDR's findings are documented in The EDR-DataMap™ Area Study dated June 14, 2013, which is included in Appendix B.

4.2 Database Search Findings

The subject property was identified in the regulatory databases as identified in the EDR-DataMap™ Area Study Report.

Sacramento Raceway: 5305 Excelsior Road. Track was built in 1965 and has operated for 40 years. Water wells were drilled in 1966 and in November 1977, the facility applied for a water supply system (small water supply) with the County of Sacramento Department of Community Health. As an emergency provision for fire protection, a 100,000 gallon water storage pond was installed and permitted in 1990. The Sacramento County Environmental Management Department (SCEMD) has issued Notice to Comply for violations related to storage issues and mishandling of hazardous substances and waste on multiple occasions including but not limited to:

- October 30, 1991 - noted over 134 drums onsite that did not appear to be handled properly, drums were turned upside that caused surface contamination (SCEMD, 1991);
- April 21, 1993 - soil contamination around several drums from spillage of waste oil (SCEMD, 1993);
- June 12, 1997 - leaking oil containers that contaminated the soil; soil contamination between two above ground storage tanks; batteries stored on the ground; steam cleaning engines without containing waste water; and numerous stained and discolored soil areas around the property (SCEMD, 1997);
- November 6, 2002 - leaking waste oil containers and punching holes in oil drums (SCEM, 2002);
- April 9, 2006 - extensive spillage of diesel fuel from tank and nozzle located at motor-cross area and saturated soil; oil contaminated soil in the storage yard area; oil spills in the area of the 500 gallon fuel tank; and used batteries inappropriately stored (SCEMD, 2006);
- December 3 and 4, 2008 - waste oil spills that contaminated soil (SCEHD, 2008); and

- March 30, 2012 – spills of Track Bite and oil stains under the tractor; 94-55 gallon drums of waste accumulated and many drums had related spills. No records for proper waste oil disposal in three years (SCEHD, 2012).

Additionally, in September 2008, a natural gas leak was reported to the Sacramento County Fire Department that reportedly was caused when an earth mover ruptured the 12-inch steel line. The line supposedly was repaired. The Site represents a recognized environmental condition for historic and ongoing releases.

Adjacent facilities of interest identified in the EDR-DataMap™ Area Study Report as discussed below.

Mather Air Force Base: Is identified under multiple databases including but not limited to CERCLIS, DOD, UST and CORRACTS. Mather was constructed in 1918 and its primary mission was a flight school and operated as a military base as an air training command to provide support for the Strategic Air Command.

In 1989, the entire site, consisting of over 5,700 acres, was listed as a federal Superfund site for significant soil and groundwater contamination from the release of volatile organic compounds (VOCs), mainly trichloroethylene (TCE) and tetrachloroethylene (PCE), and hydrocarbons associated with fuels. The Site has been divided into approximately six multiple operating units with a total of 89 potential sites. Mather AFB was officially closed in 1993. In October 1989, the U.S. Air Force, EPA and DTSC entered into a Federal Facilities Agreement (FFA) for Mather AFB. The FFA allows for state oversight at contaminated sites. Since the closure of Mather in 1993, approximately 1,300 acres have been transferred for realignment (DTSC, 2013). This facility is considered a historical REC and a current REC.

PG&E: 5400 Excelsior Road. The site was listed under the Emergency Response Notification System for a steel tank rupture incident in 2006 that released two gallons of crude oil. The incident appeared to have occurred on the Teichert Property. This is not considered a REC.

Teichert Aggregate: 5400 Excelsior Road. An incident in 2003 resulted in 50 gallons of hydraulic fluid. This is not considered a REC.

Round Tree Rock and Gardening: 5300 Excelsior Road. The site was identified for generating small quantities of oil containing waste, organic solids. This is not considered a REC.

Barlow Trucking: 10960 Jackson Road, The facility historically had two underground storage tanks (a 500 gallon tank and a 4,000 gallon diesel tank), however no leaks were ever reported. This is not considered a REC.

Samuel D Tarpin Trust: 11118 Jackson Road. The site was listed for a former underground gasoline storage tank. The case was closed in in March 1996. This is not considered a REC.

4.3 Other Records Reviewed

BSK contacted the following regulatory agencies either in person or by visiting their web sites to review reasonably ascertainable and practically reviewable documentation regarding RECs present at the subject property and adjacent facilities:

- *Sacramento County Environmental Management Department (SCEMD)*

Table 3: Information Obtained from SCEMD Database provide highlights of records obtained through the Sacramento County public records for a 50 year period from June 26, 1963 to June 26, 2013. Information below does not reflect permits that may have been issued before June 26, 1963, and is not intended to identify all wells and septic tanks for all properties located in the project area. Additionally, properties without an address were not searchable under the Sacramento County Environmental Management Records Search since the records can only be searched by Business or address and not APN number.

Table 3: Information Obtained From SCEMD Database

Address	Date(s)	Comments
5777 Excelsior Road	9/24/1987 4/17/1979	Groundwater studies associated with Mather AFB; shallow well evaluation for VOC compounds Permit to repair of septic system
5751 Excelsior Road	10/27/1983 4/23/1992	Permit to repair of septic system Permit for new 1500 gallon septic tank septic tank - old system to be abandoned and old tank pumped out and cleaned and filled.
5801 Excelsior Road	7/30/1969 3/1/1984 9/24/1987 6/30/03	Permit for domestic water well – 150' deep Permit to repair of septic system Groundwater studies associated with Mather AFB; shallow well evaluation for VOC compounds Permit for new septic system
5817 Excelsior Road	11/18/1980 12/1 /1980 10/15/93	Permit for new sewage disposal system Permit for new domestic well – 160' deep Permit for new sewage disposal system: 1500 gallon septic tank
5809 Excelsior Road	6/16/1980 10/12/1983	Permit for new septic system Permit for new irrigation well – 250' deep
5305 Excelsior Road Sacramento Raceway	8/7/1972 6/21/90 to 5/90/13	Permit for septic system Permit to repair septic system Hazardous waste management and concession stand. Multiple violations and permits (see description below)
6001 Tree View Road	7/31/1980	Permit to repair and install new septic system

Table 3: Information Obtained From SCEMD Database

Address	Date(s)	Comments
6031 Tree View Road	10/20/1992	Permit to repair water well to add 270'
6101 Tree View Road	6/23/2000	Permit for new septic tank
6161 Tree View Road	2/7/1986 3/9/1993	Permit to repair septic system Permit to repair and expand septic system
11031 Jackson Road	5/27/98	Permit to repair existing septic system
11027 Jackson Road	4/8/1991 5/7/2012	Permit to repair existing septic system Permit (not identified but assumed for the existing septic system)
10591 Jackson Road	5/20/1975 9/3/1976 9/10/1986	Permit for new domestic well – 150' deep Permit to repair well to deepened to 200' Permit to repair septic system
10685 Jackson Road	11/9/1977 7/10/2002	Permit for new septic system Permit to repair septic system
10891 Jackson Road	6/25/1984	Permit for new irrigation well – 200' deep
10775 Jackson Road	12/27/2006	Permit to repair septic system – new tank replaces old cracked
10917 Jackson Road	10/20/1972 7/30/1980 8/29/1988	Permit for new domestic well – 200' deep Permit for new septic system Permit for new well for "windmill" – 250' deep Permit for new well for "windmill" – 250' deep
10951 Jackson Road	11/1/1976	Permit for new domestic well -225' deep
11013 Jackson Road	5/27/1998	Permit to repair septic system
11027 Jackson Road	12/17/1976 8/1/1980 2/29/1984 4/2/1984 1/20/1987 4/8/1991 5/7/2012	Permit for new septic system Permit for new domestic well -250' deep Permit for new domestic well -275' deep Permit for new septic system Permit for new septic system Permit to repair septic system Liquid Waste Permit for system repair
11075 Jackson	3/27/1979	Permit for new domestic well -200' deep

In addition to the information provided above, the following information regards activities at 5305 Excelsior Road for the Sacramento Raceway:

- State Water Resources Control Board (SWRCB), GeoTracker Web Site
- Department of Toxic Substances Control (DTSC), EnviroStor Web Site

No sites were identified on either SWRCB or DTSC databases within the project area. However the following sites were identified within 1mile of the property boundary:

- Camellia Memorial Lawn, 10221 Jackson Road – LUST Cleanup Site, Case Closed
- Samuel D. Tarpin Trust, 11118 Jackson Road – LUST Cleanup Site, Case Closed
- Mather Air Force Base, 10503 Armstrong Avenue Mather CA – Multiple targets as separate operable units. Several sites remain open and are under investigation and remediation (GeoTracker, 2013).

5. HISTORICAL RECORDS REVIEW

BSK researched, historical topographic maps, historical aerial photographs, and an environmental lien report to assess the history of the property. No Sanborn Fire Insurance maps were available for this area. The following sections summarize the findings.

5.1 Historical Sanborn Fire Insurance Maps

BSK consulted with Environmental Data Resources, Inc. (EDR) regarding a search of available historical Sanborn Fire Insurance maps to obtain information regarding the former uses of the property. No specific search was conducted since similar projects in the area did not result in the findings of EDR's Sanborn® Maps. Sandborn maps are fire insurance maps covering primarily urban area and would not have been conducted for the target area.

5.2 Historical Topographic Maps

BSK reviewed available historical topographic maps obtained from EDR for the years 1893, 1902, 1911, 1954, 1967, 1975, 1980, and 1992 to gather information regarding the developmental history and land use of the property and immediate vicinity. Appendix B includes a copy of the Historical Topographic Map Report dated June 11, 2013. Table 4: Review of Historical Topographic Maps summarizes information obtained from the review of the subject topographic maps.

Table 4: Review of Historical Topographic Maps

Year	Property and Adjoining Property Observations
1893	Information on the 1893 map does not indicate any site use on or surrounding the area. Sacramento Placerville Railroad, Jackson Road, Excelsior Road and Keifer Blvd are visible. Morrison and Elder Creeks are identified. A few scattered dwellings are identified in and around the project area. *Walsh* and *12 mile house* are identified.
1902	The American River is identified. Small communities are identified including Manlove, Mayhews, Mills along the Southern Pacific RR north of the Site and Walsh Station on the corner of Jackson Road and Excelsior Road. Morrison and Elder Creeks are identified on the Site.

Table 4: Review of Historical Topographic Maps	
Year	**Property and Adjoining Property Observations**
1911	No significant change from 1901. A dirt road appears in the project area on the south east quadrant. Information does not indicate any development on the Site.
1954	Mather Air Force Base is visible to the north along with the notation of Mather Field Housing Authority, likely used as base housing. Dredge tailings are visible northeast of the project area. A landing strip and small reservoir are located west of the property. A reservoir appears in the center area of the sSite with several ponds along Elder Creek and its tributaries. At least 14 dwellings are located on Site with at least eight of these dwellings along Jackson Road.
1967	Overhead electrical lines are visible along the south end of the Site. A Drag Strip is identified on the west side of the Site. To the north is an embarkation of Military Reservation Boundary along Keifer Blvd. Gravel pits are seen west of the Site, south of Mather Air Force Base.
1975	A new dwelling is visible in the area identified as Property 1. Several new roads and connecting dwellings are identified along Excelsior Road. New dwellings are visible in the area of the drag strip.
1980	No significant changes from 1975 with the exception of half dozen or more dwelling in the project area. The Camellia Memorial Lawn Cemetery is visible west of Excelsior Road.
1992	No significant changes from 1980.

5.3 Historical Aerial Photographs

BSK reviewed available historical aerial photographs obtained from EDR for the years 1937, 1947, 1952, 1961, 1971, 1981, 1993, and 1998 to gather information regarding the developmental history and land use of the property and vicinity. Appendix B includes a copy of EDR's Aerial Photo Decade Package. Additionally, aerial views from 2005, 2012 and 2013 available through Google Earth were reviewed. Table 5: Review of Historical Aerial Photographs summarizes information obtained from the review of the subject aerial photographs:

Table 5: Review of Historical Aerial Photographs		
Year	**Observed Property Use**	**Property and Adjoining Property Observations**
1937	Undeveloped	The Site appears largely undeveloped and likely has been cultivated. A few dwelling are visible along Jackson Road.

Table 5: Review of Historical Aerial Photographs		
Year	**Observed Property Use**	**Property and Adjoining Property Observations**
1947	Undeveloped	Soil disturbance is visible in the area of Mather AFB and may be related to firing ranges. The properties are used for pasture land; several ponds are visible.
1952	Undeveloped	A reservoir is visible in the center of the Site. The properties are used for pasture land; several ponds are visible.
1961	Developed	Housing developments are visible north of the property boundary. A reservoir is visible in the center of the Site. The properties are used for pasture; several wetted drainages are visible.
1971	Developed	The Sacramento Raceway is visible. Several additional homes are visible along Excelsior Road.
1981	Developed	A significant unidentified operation appears on Property 1 on the corner of Excelsior Road and Keifer Blvd. Debris piles are evident east of this operation. Several acres on this property encompass a series of pond-like features, typically used for fish aquiculture.
1993	Developed	Unknown features and operations on the northwest portion of Site on Property 1 including debris piles and large undulations likely associated with the fish aquiculture. Debris piles seen in 1981 appears to have been naturalized and likely the material still present. Rural residential development is visible along Jackson Road.
1998	Developed	The *tree and rock* commercial operations appear just west of the race track.
2005	Developed	Property 1 contains an apparent vehicle storage or salvage yard. Debris piles are visible along Keifer Blvd .
2009	Developed	The vehicle storage or salvage yard is no longer present. The remains of the fisheries are visible. Debris piles are visible on Properties 4 and 5, which are also apparently used for off-road recreational uses.
2012	Developed	Significantly more soil disturbance is visible on Properties 4 and 5. Debris piles are seen along Keifer Blvd, which has been somewhat naturalized.

5.4 Historical Directories

Since the land use activities have not changed significantly, BSK did not order a directory reports from EDR that potentially would provide former property occupants.

6. SITE RECONNAISSANCE

A site reconnaissance, which included an observation of the property and adjacent properties, was conducted by Ms. Megan Cambridge and Mr. Kurt Balasek of BSK on June 14, 19 and 20, 2013. The parcels were accessed when possible either on foot or from a vehicle. No site was accessed that was not owned by Excelsior Estates, LLC . A general survey was conducted to get an overall condition of the environment and was comprehensive of all environmental concerns. Site photographs are included in Appendix C that highlight the activities noted on Site. The objective of the site reconnaissance was to obtain information indicating the likelihood of identifying RECs, including hazardous substances and petroleum products, in connection with the property and/or adjacent properties (including soils, surface waters, and groundwater).

The site reconnaissance included observations of the property including the exterior periphery, and immediately adjacent properties. In addition, BSK personnel conducted a windshield survey of nearby properties to determine if any adverse impacts to the property from these properties could be ascertained. Limiting conditions to the property reconnaissance were encountered when properties could not be accessed, however field observations were made with field glasses. Table 6: Site Observations, summarizes structures and conditions that were observed on the property during the reconnaissance.

Table 6: Site Observations

Observations or environmental conditions that may involve the use, storage, disposal or generation of hazardous substances or petroleum products	Observed	Not Observed	Description
Aboveground storage tank (AST)	X		Property 6 - associated with the Sacramento Raceway
Air Emissions		X	
Below grade vaults		X	
Burned or buried debris	X		Several burn piles of domestic waste on Properties 4 and 5
Chemical storage	X		Property 6 - oil and propane tanks
Chemical mixing areas		X	
Discolored soil or water		X	
Ditches, streams	X		Properties along Jackson Road and Tree View Road

Table 6: Site Observations			
Observations or environmental conditions that may involve the use, storage, disposal or generation of hazardous substances or petroleum products	**Observed**	**Not Observed**	**Description**
Drains and piping (e.g. floor drains, floor trenches, bay drains, sand traps, grease traps)		X	
Drums	X		Property 6 - on north border along fence
Electrical or hydraulic equipment (Polychlorinated biphenyls [PCBs])	X		Electrical poles and overhead high tension power lines. No indication of potential for hydraulic equipment
Fill dirt from unknown source	X		On Property 1 - multiple piles 4' high of gray clay like material, and Properties 1 – 5 along Keifer Blvd
Fill dirt from known source		X	
Hazardous chemical and petroleum products in connection with unknown use		X	
Non-hazardous containers with contents		X	
Hazardous Waste Storage		X	
Heating and cooling system and fuel source		X	
Industrial waste treatment equipment		X	
Loading and unloading areas		X	
Odors		X	
Pits, Ponds, or Lagoons		X	
Pools of Liquid		X	
Process waste water		X	
Sanitary Sewer System		X	
Septic system (e.g. tank and leach fields)	X		Assumed with all residential properties and Property 6.

Table 6: Site Observations			
Observations or environmental conditions that may involve the use, storage, disposal or generation of hazardous substances or petroleum products	**Observed**	**Not Observed**	**Description**
Soil piles	X		On Property 1 - multiple piles, 4' high of gray clay- like material. Soil piles on properties 1 – 5 along Keifer Blvd.
Solid Waste/Evidence of Unauthorized Dumping	X		Car battery on Property 2; Several burn piles of domestic waste, spa carcass, tires and metal objects, the approximate six of 50' by 150 ' on Properties 4 and 5; Properties 1 – 5 along Keifer Blvd large piles of domestic waste, tires, scrap wood, mattresses.
Stained pavement, soil or concrete		X	None observed
Stains or corrosion (interior, non-water)		X	
Storm drains/catch basins		X	None observed
Stressed vegetation		X	
Sumps and clarifiers		X	
Surface Water	X		Elder Creek and Morrison Creek and tributaries, and reservoir on Property 20
Underground storage tank(s) including heating oil tanks and oil/water separators		X	No evidence
Unidentified substance containers	X		Observed various small containers in areas of dumping
Utilities	X		Electrical services
Waste Water Discharge		X	
Water supplies (potable and process)		X	Assumed to be private wells

Table 6: Site Observations			
Observations or environmental conditions that may involve the use, storage, disposal or generation of hazardous substances or petroleum products	**Observed**	**Not Observed**	**Description**
Wells (irrigation, monitoring, or domestic)		X	No wells were observed however small water tanks commonly used to store water from private wells were observed on many private residences.
Wells (dry)		X	Unknown but likely
Wells (Oil and Gas)		X	Unknown

7. INTERVIEWS

On July 19, 2013, Ms. Megan Cambridge of BSK Associates conducted an interview with Mr. Gregg Jones and Mr. Pete Dwelley of Excelsior Estates, LLC, the current property management company, in order to gain a better understanding of the past and current site uses. According to the questionnaire, a portion of the Site is owned as Excelsior Estates, LLC. Properties had been purchased over the past 50 years. A copy of the Owner/Occupant Questionnaire was completed by Gregg Jones of Excelsior Estates, LLC and is attached as Appendix D.

8. FINDINGS

BSK Associates (BSK) has performed a Phase I Environmental Site Assessment (ESA) for the property identified as the Proposed Jackson Township Specific Plan located in unincorporated Sacramento County. The Site is generally bordered by Jackson Road to the south, Excelsior Road to the west, Keifer Boulevard to the north, and just west of Eagles Nest Road to the east. The former Mather Air Force Base, located north of the Study Area, was recently converted to Mather Air Park.

Environmental Data Resources Inc. (EDR) conducted a search of available environmental records. Available local, state, and federal databases were searched and significant findings were summarized in this Report as well as included in the Appendices. Online regulatory records were reviewed including SCEHD, DTSC's EnviroStor and SWRCB's GeoTracker. No properties were identified for current environmental concerns. However the Sacramento Raceway was identified in the SCEHD for having previous environmental concerns and violations. It is assumed the rural residents have private well and septic systems.

9. OPINION

The project area consists of 39 parcels. Land uses include rural residential, agricultural, grazing, commercial (Sacramento Raceway and cash crops), and open space. Debris piles were observed on Properties 1 to 5 along Keifer Road that may contain hazardous substances. The Sacramento Raceway is considered a current and historic REC for previous activities including numerous oil spills and soil contamination, and non-compliance that may not have been fully addressed. Additionally, uncertain activities occurred historically on Property 1 and along Keifer Blvd. Mather AFB was listed as a Federal Superfund site; however significant progress has been made to remediate environmental conditions. Groundwater was significantly contaminated; it is unknown if the groundwater beneath the Site has been impacted. Based on historic uses of the Site and features observed, a limited Phase II is recommended to further evaluate features associated with the Sacramento Raceway and various debris piles along Keifer Road and Property 1. The Phase II would include soil and possibly groundwater investigation

10. CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM practice E 1527 of the property located in the unincorporated area of Sacramento County as described above. Any exceptions to, or deletions from, this practice are described in Section 1.5 of this Report. This assessment has revealed evidence of recognized environmental conditions and historical recognized environmental condition in connection with the Site. While no information indicates that underground fuel tanks were part of the historic property use, BSK cannot rule out that these types of features could be identified during future excavations or site clearings.

11. DATA GAPS AND DEVIATIONS

No significant exceptions or data gaps that would raise reasonable concerns regarding our opinions and conclusions in the Report were made or noted.

13. ENVIRONMENTAL PROFESSIONAL STATEMENT AND SIGNATURES

We declare that to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in general conformance with the standards and practices set forth in 40 CFR Part 312.

PROJECT PLAN SUMMARY

The Jackson Township Master Plan (JTMP) area is a sparsely populated area encompassing roughly 1,379 acres located to the south and west of the City of Rancho Cordova, in the middle portion of Sacramento County.

The area is designated Extensive Industrial and 20 Acre Agricultural on the Sacramento County November 9, 2011.General Plan Land Use Diagram. The JTMP proposes a diversity of land uses from parks and schools through residential and commercial while retaining areas of wetlands and agricultural designation.

The JTMP is roughly bounded by Kiefer Blvd. on the north, Wetland Preserve to the east, Jackson Road (State Hwy. 16) on the south and Excelsior Road on the west. The proposed development area is currently tributary to Morrison Creek and Elder Creek with 450 acres draining north and/or west into Morrison Creek while 929 acres drains to Elder Creek. The proposed development would drain 462 acres to Morrison Creek, a 12 acre increase, and 917 acres to Elder Creek, a 12 acre reduction.

This plan analyzes the following:-

- Pre-project conditions based on 2004 land use;
- JTMP Post-Project Total Project Conditions.
- JTMP Post-Project Phase 1 Project Alternative 1 Conditions.
- JTMP Post-Project Total Project Alternative 1 Conditions.

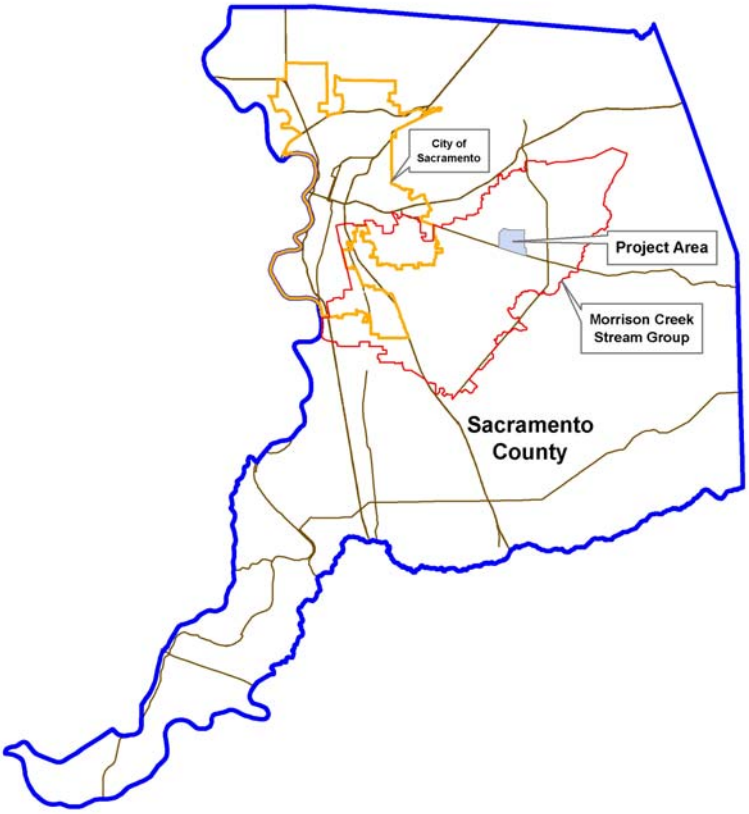
Alternative 1 would construct the same land use plan as the Total Project alternative, but will allow for phasing of the major drainage improvements in the elder Creek watershed. The Detention 1 basin would be enlarged to accommodate all peak flow, Water Quality and hydrograph modification impacts of the Phase 1 development area. Detention 2 in Elder Creek would be built with a later phase and provide the remaining mitigation for the remaining development areas.

Overall increases in runoff volumes and peak flow increases from the proposed project development areas will be mitigated through the implementation of detention facilities. Potential water quality impacts will be mitigated through the implementation of Low Impact Development (LID) measures and water quality treatment features. Improvements to mitigate Hydrograph Modification consistent with the Sacramento County HMP will also be implemented with this plan. Oversize exhibit DF-1 shows the drainage facilities that need to be developed with each watershed area. For stormwater quality analysis, the point of connection will be considered the point at which waters leave the project site.

The improvements needed to accomplish the development concept analyzed in this report are as follows:

- Realign and excavate Elder Creek and a tributary of Morrison Creek within the project area.
- Provide flood control and water quality detention basins along the new channels.
- Construct storm drain pipes for the project area

In the pre-project condition, flows to the Morrison Creek watersheds exit the site at six locations. Four locations cross Excelsior Road, one crosses Kiefer Road and one leaves at the northwest corner of the project area near the intersection of Excelsior and Kiefer. The JTMP would consolidate three of the existing Excelsior Road crossings into a single outlet with only minor roadside drainage being collected and conveyed at the remaining location. Storm drain pipe systems would be added for minor road runoff collection at the northeast corner and the Kiefer Road crossing locations.



There are seven locations where flows in the Elder Creek watershed portion of the project cross Jackson Road, the largest crossing diagonally at the intersection of Jackson and Excelsior.

With the implementation of the various channel improvements, detention and water quality facilities identified in the report, the JTMP would build out at the designated land use densities with the proposed mitigation measures identified in this report, to reduce impacts to downstream hydraulic conditions and stormwater quality.

1.1 ASSUMED PRINCIPLES OF THIS PLAN

This drainage master plan assumes certain principles of the project plan will remain static and are attainable. If in the future these aspects of the plan change, this would necessitate a revision of the drainage master plan for those changes, and a new review of the plan by Sacramento County.

- **LAND USE PLAN:** The analysis is based on the Land Use Plan for the project revised in JUNE 2017. (these revisions pertained to park locations and were provided right before submittal of this version of the document. The exhibits have been updated but some calculations may not be fully revised)

- **RECONSTRUCTION OF STREAM CORRIDORS:** It is assumed that the reconstruction of the stream corridors proposed in this plan will be performed with the project, and that no permitting issues will arise.

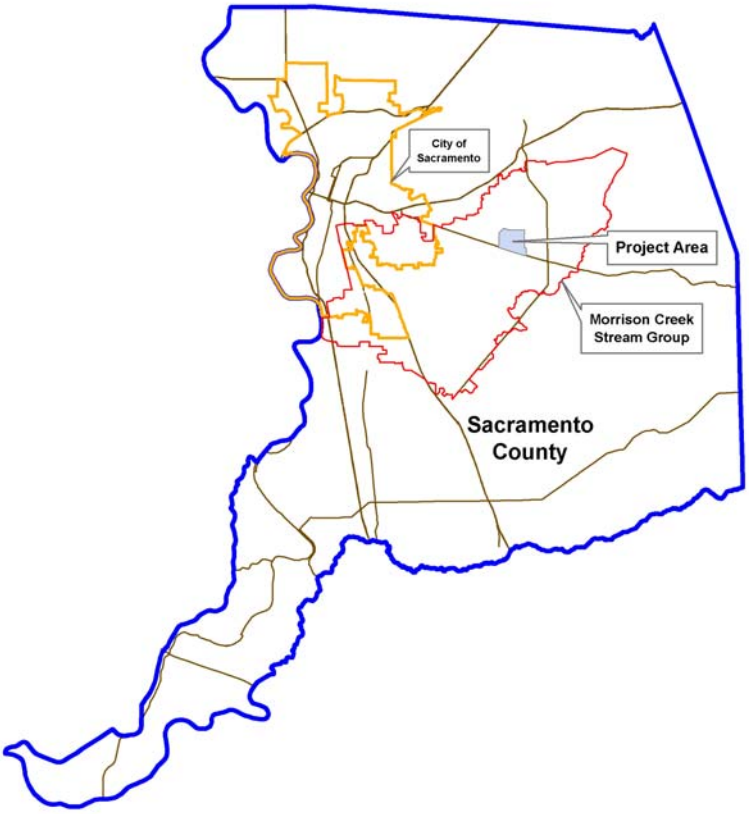
- **RECONSTRUCTED STREAMS ARE NOT WATERS OF THE STATE:** It is assumed that the reconstructed streams will not be considered waters of the State, and that stormwater quality treatment and County maintenance activities will be allowed occur within these streams.

- **MORRISON CREEK COOPERATIVE OUTFALL:** The project intends to combine all Morrison Creek discharges into a single outfall location. In order for this water to be conveyed safely to the existing Quarry, the Jackson Township and adjacent downstream property owners will need to reach an agreement on a new outfall channel.

2.0 DRAINAGE PLAN SUMMARY

2.1 PURPOSE

This drainage master plan is a part of the planning process to be used as a tool by community planners, engineers, and interested parties to evaluate drainage needs in the proposed Jackson Township Master Plan (JTMP) area. The drainage master plan analyzes the potential impacts of the proposed developments, and identifies the improvements necessary to mitigate those impacts.



This plan analyzes the following conditions:-

- Pre-project conditions based 2004 land use conditions.;
- JTMP post-project conditions, including detention basins, water quality treatment facilities, trunk storm drainage, and flood control channels. The incorporation of the recommended improvements into the JTMP will provide flood control and protection to the plan area, and ensure that impacts to peak 100-year flow rates are mitigated to less than the pre-project rates, and that stormwater will be properly treated prior to discharge. Improvements within JTMP will be constructed by the developers and maintained by Sacramento County.
- The included hydraulic and hydrologic analysis were performed for the 10-year, 100-year and 200-year events (500-year event was calculated but not reported in the results).

2.2 BACKGROUND

The area included in the JTMP is a sparsely populated area encompassing roughly 1,379 acres located in the middle portion of Sacramento County. About 1,060 acres of this is proposed for development while the balance would remain as agricultural and wetlands. Each applicant will be required to demonstrate compliance with the master drainage plan prior to improvement plan approval.

2.3 PLANNING AND DESIGN CRITERIA

The parameters of the watersheds for the pre-project conditions come from the existing Sacramento County land use as shown in 2004 aerial photographs, and hydrologic soils shown in exhibit SOIL-1. The parameters for JTMP post-project conditions were determined from the proposed land use plan. The following list briefly describes some critical design criteria implemented with this project and analysis.

1. Refinement of drainage sub shed boundaries as they relate to proposed tentative map development and lot configurations.

2. Sizing and alignment of stormwater conveyance systems, including routing of overland release to natural or improved drainage ways.

3. Functionality of detention basins to maintain pre-project peak 100-year runoff rates downstream of those basins

4. The ability to provide treatment to stormwater runoff prior to discharge into the jurisdictional drainage ways.

5. Incorporation of Low Impact Development measures into design assumptions for stormwater quality treatment and hydrograph modification mitigation.

6. Development of preliminary sizing for hydrograph modification mitigation facilities using SAHM software.

7. The lands of the entire specific plan area are not owned by participating property owners. As a result this plan will demonstrate an alternative drainage plan in which phase facilities could serve the participating properties in Phase 1 (Phase 1 Alternative 1), and the remaining properties in Phase II (Total Project Alternative 1)

Each watershed is described by its hydrologic and hydraulic characteristics for pre-project and proposed development. Hydrology quantifies the rainfall runoff generated from the land surface within the JTMP and is a function of the land surface imperviousness, infiltration rate and capacity, slope, soils characteristics, vegetation and rainfall distribution. Runoff will be collected in storm drainage systems and

conveyed to the regional trunk facilities. The runoff will be conveyed through trunk facilities consisting of open channels, piped storm drainage systems, swales and flood control channels. Hydraulic analysis identifies limitations or constraints within existing systems and provides a tool to size proposed conveyance systems to adequately and safely convey flood event runoff to the receiving streams.

The JTMP project sits at the ridge of three major watersheds for south Sacramento County. Significant areas of the project drain to portions of Morrison Creek (north area of project), and Elder Creek (south area of project) and a portion (southeast corner) of the project drains to a tributary of Laguna Creek.

2.4 SCOPE OF WORK

The low-lying areas of Sacramento County are susceptible to local and regional flooding due to prolonged heavy rains characterized by high peak flows and large volumes of runoff that occur during the winter and early spring. The potential for local flooding also occurs from short duration, high intensity cloudbursts. As urban growth expands into rural areas and increased impervious surfaces accelerate runoff and generate additional runoff volumes, the potential for increased flooding occurs. This report will document computer models which estimate the system response to the predicted flood events. The computer models also can estimate the impacts which the proposed development would have on the existing watershed, downstream and upstream of the project.

Stormwater detention facilities ensure that the increased future peak flow rates do not exceed the receiving creek's pre-project peak flow. To comply with regulatory and clean water issues, water quality treatment facilities are to be provided within the regional stormwater detention facilities of the plan.

Guidelines established as drainage goals within the proposed JTMP include enhancement of the channel flow characteristics of existing creek channels and providing 100-year flood protection within the channel open space corridors.

Hydrologic models are used to determine a quantitative estimate of the runoff flow rates that the JTMP area will discharge for the design storm events (100-year for regional hydrology). Impacts resulting from the proposed changed land use conditions are also evaluated. These models provide a tool to determine and evaluate potential areas of flooding, increased peak flow rates, increased water surface elevations, and provide the engineer a basis upon which to recommend improvements to mitigate and attenuate that flooding to meet Sacramento County Municipal Services Agency Department of Water Resources (MSA-DWR) criteria.

The JTMP is subject to the jurisdiction of the County of Sacramento. The drainage and surface water runoff analysis will be reviewed by MSA-DWR. All new developments and drainage improvements within the County are required to follow

specific guidelines in design, rehabilitation, and maintenance of drainage facilities and natural waters as set forth by MSA-DWR. The County's General Plan and Drainage Master Plan Program require that no adverse downstream impact shall occur due to development. This is achieved by ensuring that the proposed improvements result in no water surface increases outside of the plan area upstream and downstream, and no peak flow increases downstream. Other elements for consideration revolve around public health and safety issues, maintaining compliance with regulatory agencies, and providing the public with aesthetic natural appearing features. Additionally, dual use facilities including parks (active and passive) and trails are encouraged. The JTMP drainage master plan is an integrated part of an overall regional plan.

Stormwater runoff from developing areas is a major focus, especially where historical flooding is known to occur. In most cases, additional flood control facilities are added with modifications to the areas around existing creeks to add attenuation and treatment facilities. In still other circumstances, where there is no intrinsic value to the creek or it is impractical to leave the creek channel intact, a new flood control channel may be proposed to increase flood control capacity. In addition the new drainage corridors help enhance and benefit the environmental and esthetic values.

Within development areas flow events such as the "Nolte" design event will be piped, while major flows will be conveyed via overland release, primarily in streets or along other designated overland or channel release paths.

2.5 DESIGN CRITERIA

All criteria used and the analysis performed for this master plan are in accordance with the "Hydrology Standards, Volume 2 of the Sacramento City/County Drainage Manual", dated December 1996, the Drainage Study Requirements dated June 12, 2008, and "Section 9 Storm Drainage Design" of the Improvement Standards.

2.6 DESIGN EVENTS

A design event of a 100-year recurrence interval was used to evaluate the watershed impacts, regional hydrology and stream flow hydraulics. In addition, hydrologic and Hydraulic analysis of the proposed channel and stream improvements was performed for the 10-year event, 200-year event and 500-year event. All hydrology was performed for the 24-hour storm event, unless noted otherwise herein.

For Trunk Storm Drainage System evaluations, the "Nolte" flow was used to size facilities. (XPSWMM)

For the systems which were analyzed using the XPSWMM software, required parameters including composite percent impervious and infiltration rates were

computed for input into the XPSWMM models. The XPSWMM software then computes and routes the resulting flows.

2.7 STUDY TEAM

Civil Engineering Solutions, Inc. (CESI) was requested to prepare this document in 2013. In 2016 CESI completed this edition of the Master Drainage Plan, which responds to Sacramento County's comments, adds Alternative 1, and responds to project ownership comments.

The hydrologic and hydraulic analyses for the JTMP study (this document) were prepared by Civil Engineering Solutions, Inc. (CESI). Engineering and Grading design for the project were performed by Au Clair Consulting, Inc.

3.0 STUDY AREA CONDITIONS

3.1 STUDY AREA CONDITIONS

The JTMP area boundary includes approximately 1,379 acres roughly bounded by Kiefer Blvd. on the north, Wetland Preserve on the east, the Jackson Road/Highway 16 on the south and Excelsior Road on the west. The project area is a portion of the Morrison Creek Stream Group (MCSG) as shown in Figure 3.1 with 929 acres draining to Elder Creek and 450 acres draining into Morrison Creek.

The drainage master plan is organized to give the reader an overview of the JTMP study area, then develops the hydrology and hydraulic components, including land use changes, adjustments of sub-shed boundaries, and drainage improvements for the individual creek watersheds. This is accomplished by describing the drainage

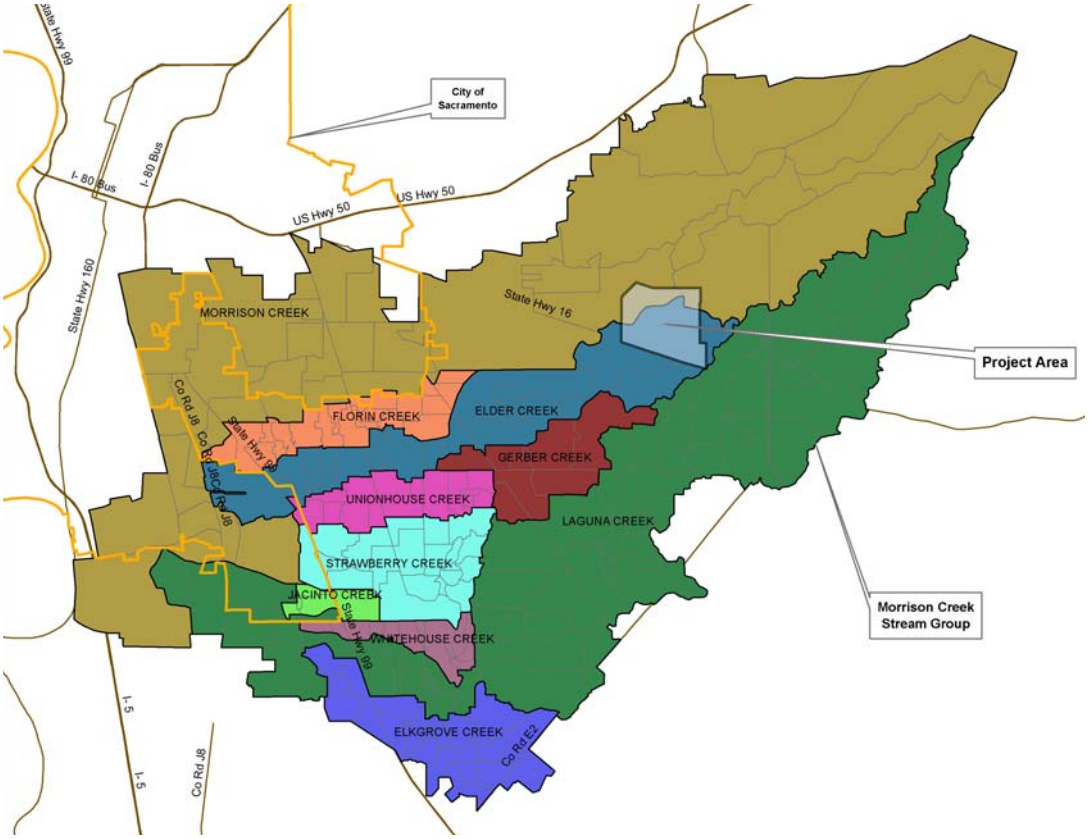


Figure 3.1 Watershed Boundaries

characteristics and proposed improvements within the individual watersheds for Elder Creek, tributaries to Morrison Creek, and the southeast area tributary to Laguna Creek.

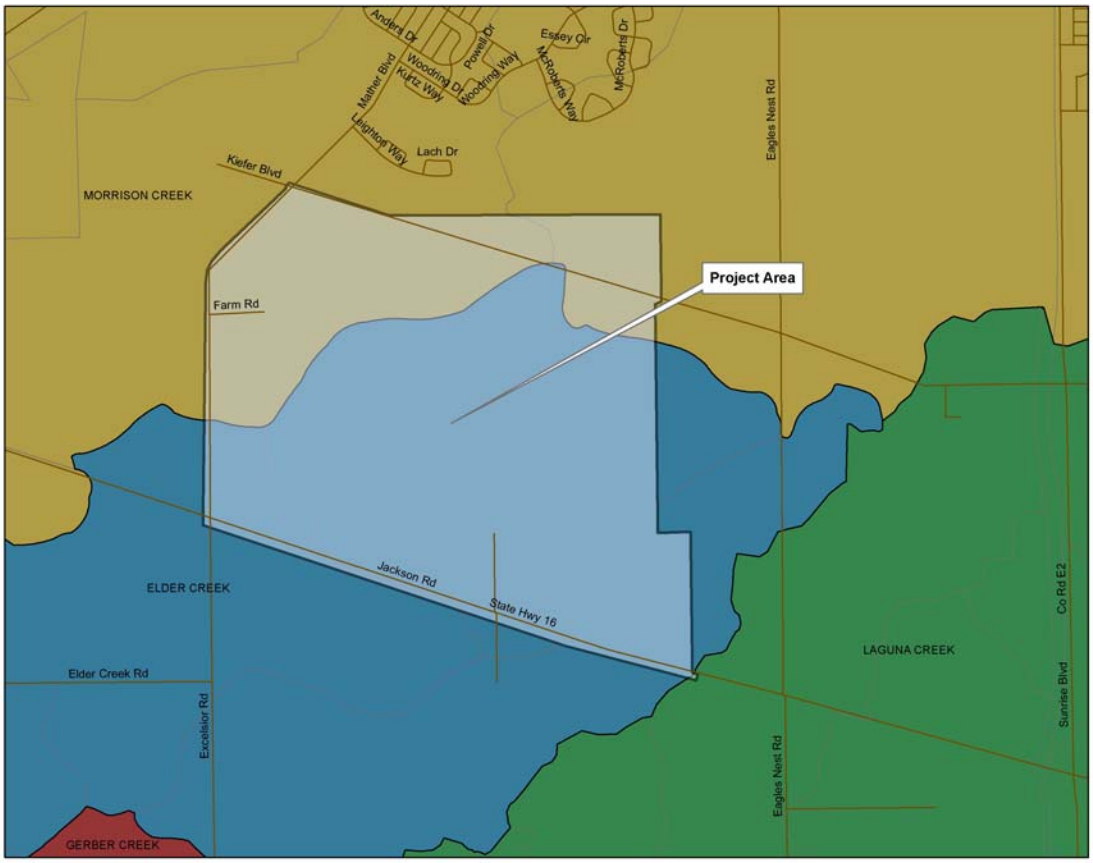

Figure 3.2.1 – Plan Area Boundary

3.2 PRE-PROJECT CONDITIONS AND FACILITIES

The JTMP is primarily located within the watershed boundaries of Elder and Morrison Creeks in Figure 3.2.1. These creeks are tributary to the Morrison Creek Stream Group (MCSG) (see Figure 3.1).

- **Elder Creek**

Elder Creek, with a total watershed area of 7,636 acres, has the largest area within the area of the JTMP. The contributing area within the JTMP is approximately 967 acres and is roughly 13 percent of the Elder Creek total watershed.

Figure 2.2.6 Elder Creek Upstream of Jackson Highway

Elder Creek within the plan area is subdivided into three sub-reaches. Runoff from each of these three sub-reaches makes its way to the south side of Jackson Road through a separate culvert. Portions of two of these sub-reaches

originate outside the proposed development area and will be collected and conveyed through the JTMP. The existing flows are conveyed within natural swales and

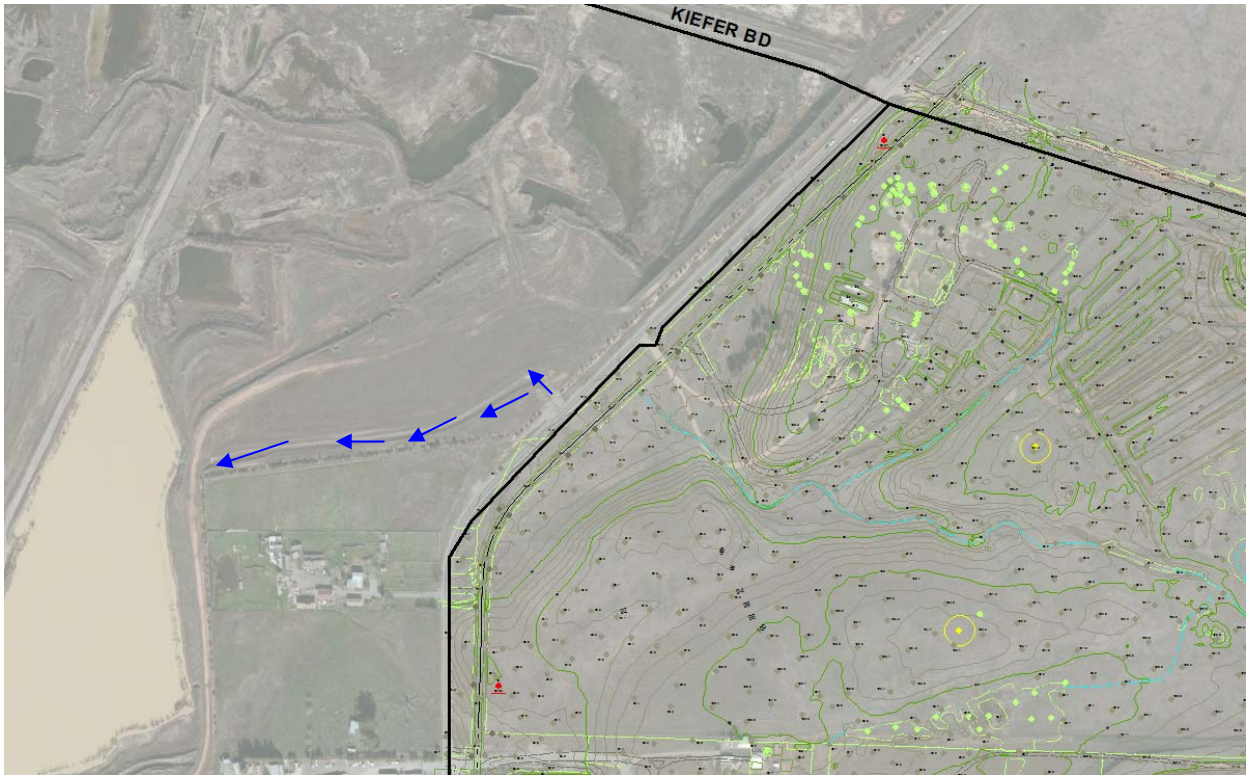

Figure 3.3 Morrison Creek Tributary Main Discharge Location

existing channels. Flow then continues in a southwesterly direction through natural channels with a broad and shallow flood plain for the next two to three miles. Elder Creek eventually discharges into Morrison Creek near Brookfield Drive in the City of Sacramento, approximately ten miles west of the Plan Area.

- **Morrison Creek Tributaries**

Morrison Creek, with a total watershed area of about 40,714 acres, has the largest single area within the Morrison Creek Stream Group. The area contributing to Morrison Creek within the JTMP is approximately 450 acres or roughly 1 percent of the total watershed.

Morrison Creek within the plan area is also subdivided into three sub-reaches, all draining across Excelsior road toward the west through individual culverts. These reaches converge with the main channel of Morrison Creek slightly over two miles downstream.

The main discharge location for the Morrison Creek tributaries leaving the JTMP site crosses Excelsior Road to a channelized swale which conveys the drainage to aggregate quarries west of Excelsior Road and south of Morrison Creek.

3.3 TOPOGRAPHY AND GEOGRAPHICAL SETTING

The Morrison Creek Streams Group (MCSG) area is a fairly gently sloping region located south of the American River roughly between Folsom Lake and the Sacramento River. These streams flow in a generally west-southwest direction, from their beginning near the base of the Sierra Nevada foothills to nearly the Sacramento River. The MCSG is contained east of the Sacramento River Levee system, and conveys flows south to the discharge into the Cosumnes River.

Stream slopes in the two main streams flowing through the area of the JTMP range from 0.2% to 0.8%. This results in somewhat faster moving flow.

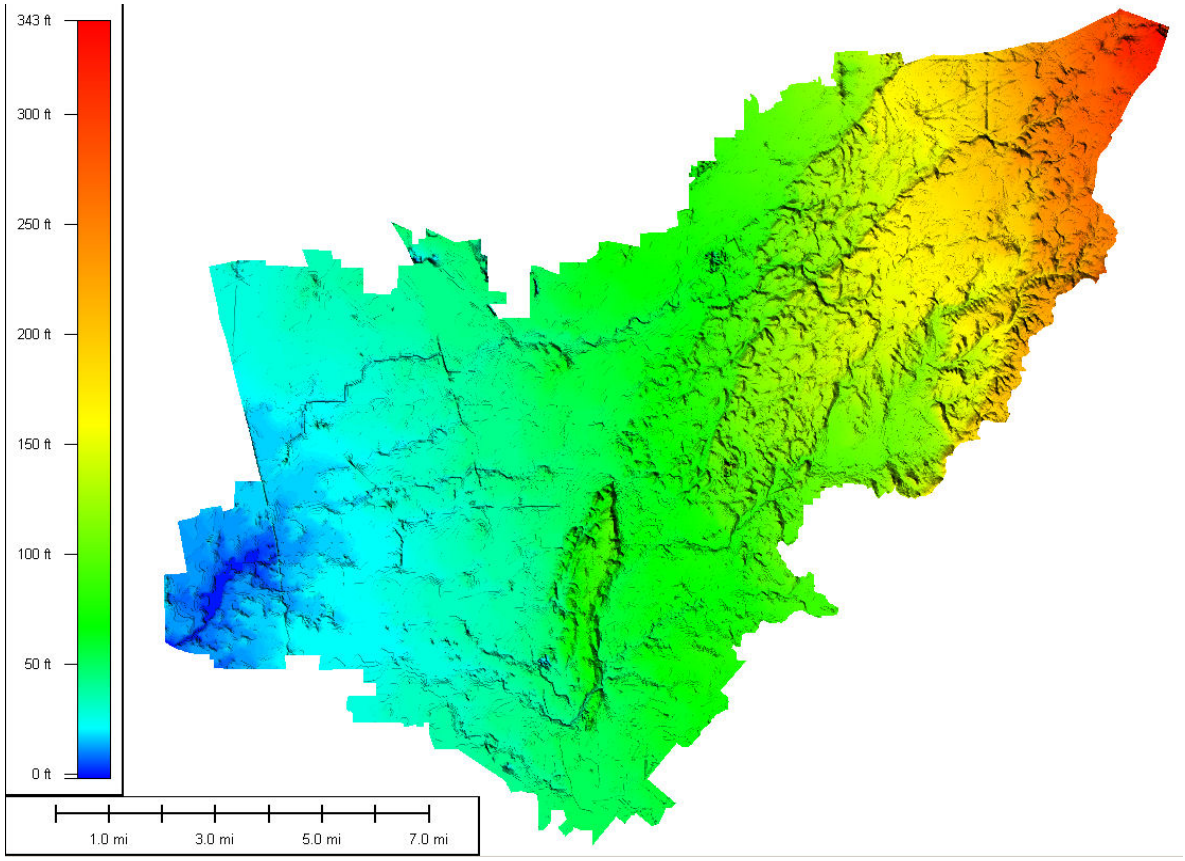

Figure 3.4 Morrison Creek Stream Group Color Shaded Topography

4.0 DEVELOPMENT OF RUNOFF MODEL

4.1 METHODOLOGY

The current standard application in Sacramento County for creating U.S Army Corps of Engineers (USACE) HEC-1 (Hydrologic Engineering Center) hydrologic models is the SACCALC preprocessor program software. The FEMA basis analysis for Elder Creek from the Letter of Map Revision (LOMR) prepared by CESI for the Elder/Gerber stream group hydrology was based on this software. Similarly current base analysis for the Morrison Creek stream group use equivalent methodologies.

For each watershed, the area of each land use type in each hydrologic soil type was determined and input into the SACCALC pre-processor software to generate the HEC-1 hydrologic models. This data was developed using GIS based land use mapping generated from the existing General Plan data and newly created post-project land use mapping for the project area. Soils maps were obtained from the United States Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS, previously the Soils Conservation Service or SCS).

Hydrographs representing the flows generated by each watershed are transferred to the hydraulic un-steady state modeling which now performs the tasks of combining and routing the hydrographs through the various systems. HEC-RAS is used for the unsteady state modeling of creeks and open channels, and XP-SWMM is used for the unsteady state modeling of systems with pipe networks.

4.2 WATERSHEDS

The proposed development area is contained primarily within one existing Morrison Creek shed and three existing Elder Creek sheds. For the onsite pre-project existing conditions model these sheds were broken out into twenty-two Morrison Creek sheds and thirty-eight Elder Creek sheds for a total of sixty onsite sheds. See oversized Exhibit SH-1 for project area drainage shed locations.

4.3 LAND USE CLASSIFICATIONS

Sacramento County Hydrology Standards specify the use and/or computation of various hydrologic parameters based on a set of 18 land use classifications. The mapping for the land use in Geographic Information System (GIS) was coded with a numeric designation for each land use based on these 18 classifications. In many cases the planning land uses specified had no direct correlation to the hydrologic land use. Where this occurred the planning land use was mapped to the closest corresponding hydrologic land use. The table on page 13-12 of the Hydrology

Standards, which describes each index, is reproduced here in Table 4.3. These land use index numbers are used in all further references to land use.

4.4 PRE-PROJECT CONDITIONS LAND USE FACTORS

New pre-project condition land use mapping was created for the area of Elder and Morrison Creeks affected by the proposed JTMP development.

Oversized Exhibit SH-1 shows the pre-project land use mapping. Table 4.4 summarizes the pre-project land use acreage for each of the sheds affected by the JTMP.

Existing Topography for the site is included on the TOPO-1, TOPO-2, TOPO-3 and TOPO-4 oversized exhibits requested by the County.

Table - 4.4 Pre-Project Land Use (acres)

	Land Use Index							Total Acres

4.6 SOILS

Soils information was obtained from the NRCS. Hydrologic soils groups were mapped using GIS and used together with the land use mapping to develop the shed characteristics for the hydrologic models. Figure 4.6.1 shows the soils distribution for the pre-project sheds. These Soil Types can be reviewed for the project area on the oversized exhibit SOIL-1.

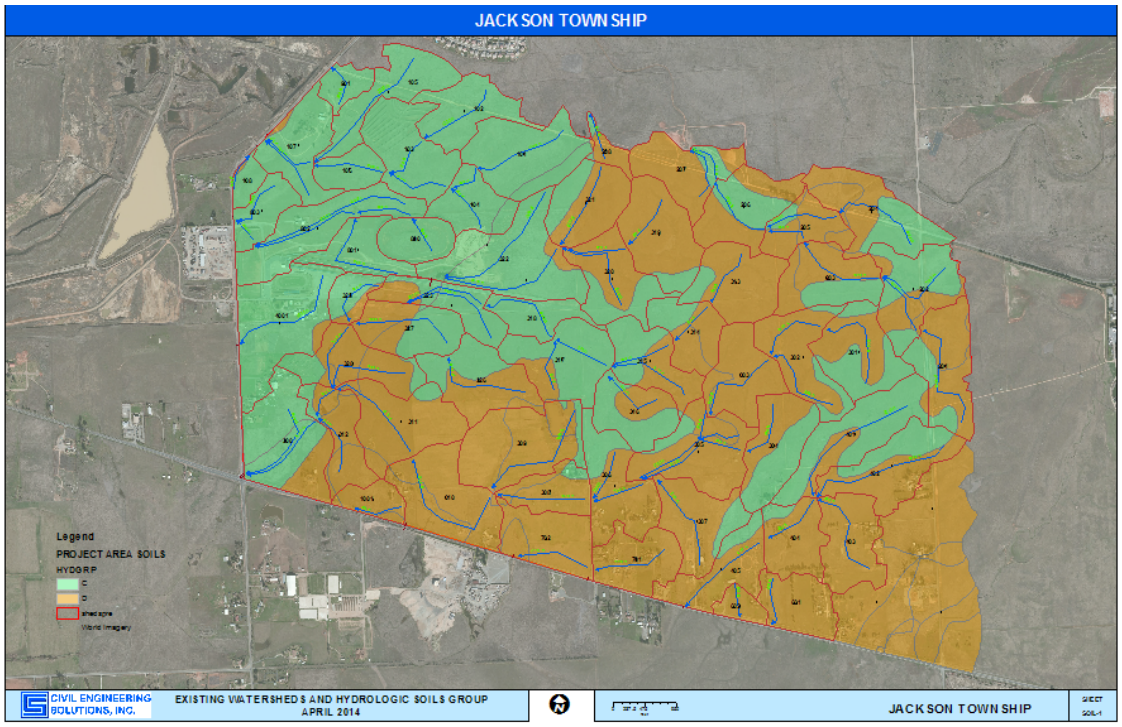

Figure 4.6.1 – Pre-Project Soils and Sheds

5.0 HYDRAULIC MODEL DEVELOPMENT

5.1 HYDRAULIC MODEL DEVELOPMENT

The hydrologic modeling provides runoff hydrographs for the various watersheds in the JTMP study area. The hydrographs developed in these models are used as input in the unsteady state (dynamic) hydraulic routing modeling using HEC-RAS and XPSWMM. For the pre-project conditions, a 3-D surface is built from the existing topography for the project (project topography and County LiDAR). Cross section transects are identified along stream corridors, perpendicular to the estimated direction of flow, and hydraulic model cross sections are developed from the 3-D terrain model at these transect locations. N-value (friction) parameters are developed based on review of the existing conditions aerial photographs and field visits.

For the post-project conditions model, a 3-D terrain model is built from the proposed grading plan received from Au Clair Consulting. CESI performed additional grading refinements for mitigation facilities within the proposed stream corridors. Similar to the pre-project model development, transects are located along the streams, perpendicular to the direction of flow, and model cross sections are developed at these transect locations, from the 3-D terrain model. N-values are estimated based on the long term vegetation outlook for the channels and detention areas assuming only minimal maintenance would occur. N-Values are increased where water will have longer residence times at shallow depths for stormwater quality treatment areas and hydrograph modification mitigation areas, to account for the likely vegetation growth that would occur in these areas.

For Elder Creek downstream of the project, the regional model developed for Sacramento County for The Elder Creek and Gerber Creek Watersheds, ultimate conditions scenario was imported. Some minor stability issues occurred when calculating this extended model with the Jackson Township model, and some interpolated sections, and minor invert modifications were made to the imported portion for model stability.

5.2 VERTICAL DATUM

The vertical datum used for all mapping and calculations with this project is NAVD 88.

5.3 METHODOLOGY

Dynamic Hydraulic modeling for the open channel and creek systems was performed with the USACE HEC-RAS (River Analysis System) modeling software (referred to hereafter as HEC-RAS). This allows for unsteady flow conditions modeling using the flow hydrographs generated by the SACCALC and HEC-1 hydrologic modeling software as direct input to the program (via the DSS interface). Sacramento County uses unsteady flow modeling to evaluate the flow and water surface attenuation characteristics of the open channel systems and the effect of any associated structures including bridges and culverts.

The overall approach for the hydraulic analysis was to apply the proposed land use for the JTMP to the affected sheds, calculate the resulting outflow hydrographs using HEC-1 for each shed, and use the computed flow data as input to the unsteady flow RAS model for each stream. Each of the three streams/stream groups was modeled for both pre-project and proposed post-project conditions.

The HEC-RAS Analysis Plans are summarized below:

EG ULT _ JT PRE_ 100y10d no laguna split : PRE-PROJECT 100-year 10-day

EG ULT _ JT Post_ 100y10d : POST-PROJECT (total) 100-year 10-day

Trunk storm drainage systems were prepared and analyzed for the various areas of the JTMP. For Trunk Storm Drainage System evaluations, the “Nolte” flow was used to size facilities. Simple pipe systems and pipe/open channel systems where attenuation (detention) was not a factor were modeled using the XPSWMM software. The XPSWMM pipe systems analysis results are included in Appendix D XPSWMM Storm Drainage System Analysis. For trunk systems where attenuation and/or detention were a factor the XP-SWMM software was used to evaluate the trunk facilities.

Appendix D Oversized Exhibits contains larger scale presentations of the JTMP area proposed drainage facilities including pipe and drainage channel layouts (“SD-“ Exhibits), SWMM model pipes and channels and the major stream channel alignments.

- **Elder Creek**

For the Elder Creek project areas, a new unsteady flow HEC-RAS model was constructed for the pre-project conditions which terminates a few hundred feet offsite at the downstream end near the intersection of Excelsior and Jackson Highway. Most streams estimated to have flooding more than a couple feet deep within the project were modeled with this analysis, and pre-project 100-year onsite floodplains are shown on Exhibit FP-1.

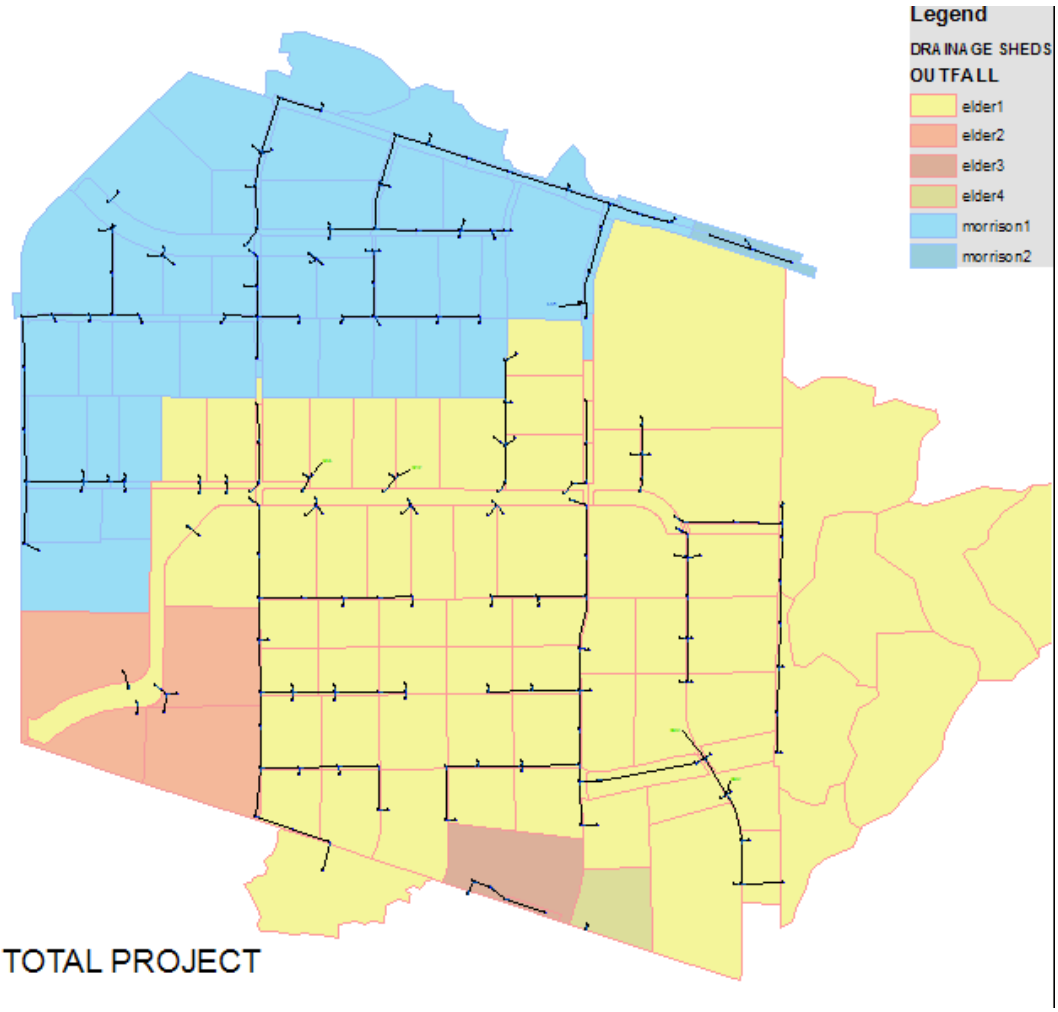

Figure 4.1.1 - Storm Drain Layout and Watersheds by Outfall Location:

The project proposes to completely reconstruct Elder Creek Onsite as a drainage corridor system with inline stormwater quality treatment and hydrograph modification attenuation at the downstream end of the creek within the onsite portion of the project drainage corridor improvements. The attenuation at the downstream area within the proposed drainage corridor will provide a significant part of the 100-year peak flow mitigation due to the project impacts resulting from conversion of ground to a higher level of imperviousness.

Elder Creek will include two detention basin areas in the southwest area of the project. Detention 1 is the upstream basin which occurs in the new alignment of the channel where it widens at a bend. Detention 2 occurs in the widened channel upstream of the Jackson Highway crossing.

For the Total Project, Detention 1 will store up to 47.2 acre feet in the 100-year event. Within that volume, 13.7 acre feet of stormwater quality treatment volume, and 14

acre feet of hydrograph modification volume are proposed. Detention 2 will store up to 110.6 acre feet in the 100-year event. Within that volume, 7.2 acre feet of stormwater quality treatment volume, and 55.1 acre feet of hydrograph modification volume are proposed.

In Phase 1 of Alternative 1, only Detention 1 will be constructed. Detention 1 will store up to 76.0 acre feet in the 100-year event. Within that volume, 14.2 acre feet of stormwater quality treatment volume, and 44.3 acre feet of hydrograph modification volume are proposed.

In Phase II of Alternative 1, Detention 2 is added. Detention 2 will store up to 129.6 acre feet in the 100-year event. Within that volume, 1.12 acre feet of stormwater quality treatment volume, and 67.9 acre feet of hydrograph modification volume are proposed.

The Point of Connection for Elder Creek will be considered to be at the downstream end of the proposed drainage corridor at Jackson Highway crossing, and all treatment, hydrograph modification, and stormwater quality treatment will occur within the project channel, upstream of this location.

- **Morrison Creek:**

The other main system being reconstructed through the project is for a large area that is tributary to Morrison Creek through the western boundary of the project. Identified as Point of Connection Area 107, the swale for this area will be reconstructed into a channel system which also will include volumes for attenuation, hydrograph modification, and stormwater quality treatment mitigations.

Within the segments of the proposed Morrison Creek tributary drainage corridor where attenuation is proposed the combined 100-year floodplain volume would be about 38.7 Acre feet. This includes 7.4 AF of stormwater quality treatment volume for the Dry Basin methodology of treatment. Hydrograph Modification storage at this location has been removed per Sacramento County comments, as these discharges will flow to an existing aggregate quarry with limited discharge.

Since the entire onsite drainage corridor for the proposed tributary to Morrison Creek will be reconstructed, the Point of Connection for Morrison Creek will be considered to be at the downstream end of the proposed corridor at Excelsior Road, and all treatment, hydrograph modification, and stormwater quality treatment will occur within the project drainage corridor, upstream of this location.

5.4 ELDER CREEK MODELING RESULTS

The Elder Creek proposed condition proposes reconstruction of the stream drainage corridors. As previously noted, improvements would include excavation of an enhanced drainage corridor. Drainage Corridor improvements include deepening and widening of the main channel as well as the overbank areas, and creating peak flow mitigation attenuation, hydrograph modification attenuation, and stormwater quality treatment areas. Figure 4.2 shows an illustration of a representative improved channel cross-section. Proposed channel cross sections are shown in Appendix E.

The model results indicate that the peak 100-year water surface elevations for Elder Creek would be higher than the existing condition in the downstream reaches and lower than the existing conditions in the upstream reaches.

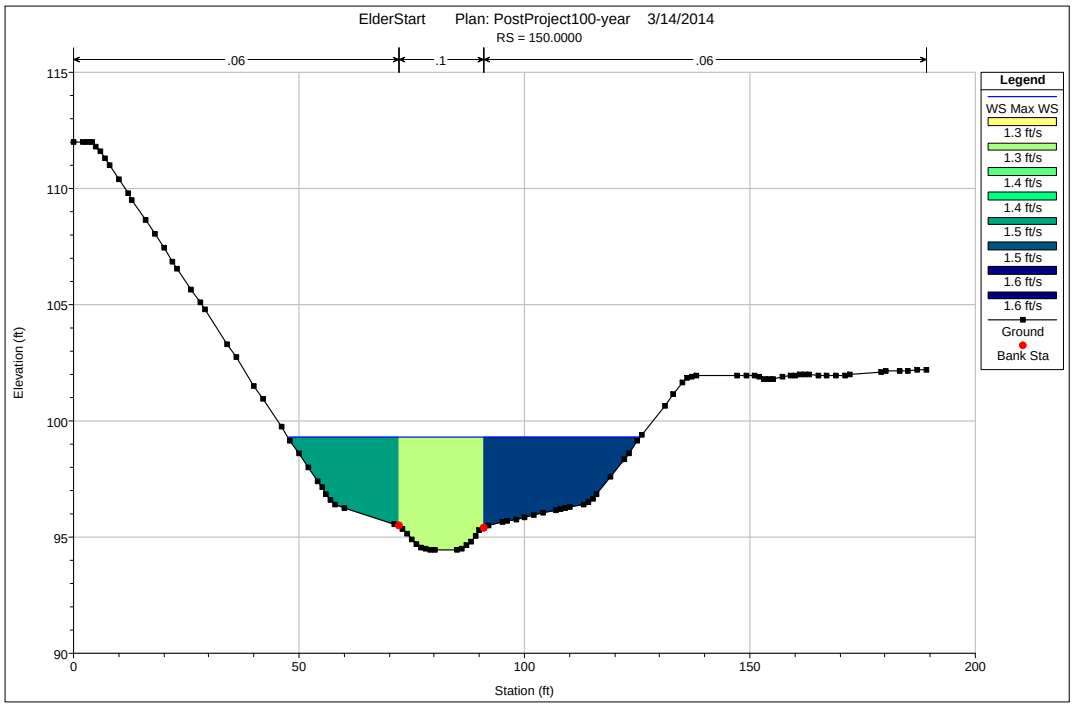

FIGURE 4.2 Sample Proposed Improved Channel Cross-Section Elder Creek (Upstream of Detention 1)

The analysis results demonstrate that the Peak Flow rates will be reduced at the site boundary and downstream of that location. Runoff hydrographs at the Point of Connection are compared in Figure 4.3 for the 10-year, 100-year and 200-year pre-development and post-development conditions.

Exhibit SH-2 in Appendix D identifies the approximate proposed locations and sizes of the storm Drain facilities, and shows the proposed watershed boundaries..

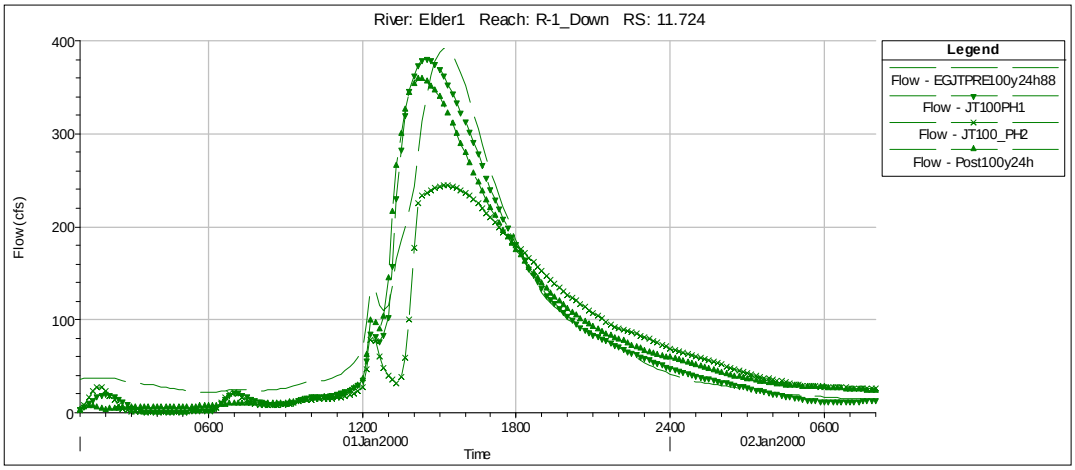

FIGURE 4.3 Comparison of 100-year Hydrograph at Elder Creek POC

5.5 MORRISON CREEK MODELING RESULTS

The Morrison Creek tributary proposed condition proposes reconstruction of the stream drainage corridors. As previously noted, improvements would include

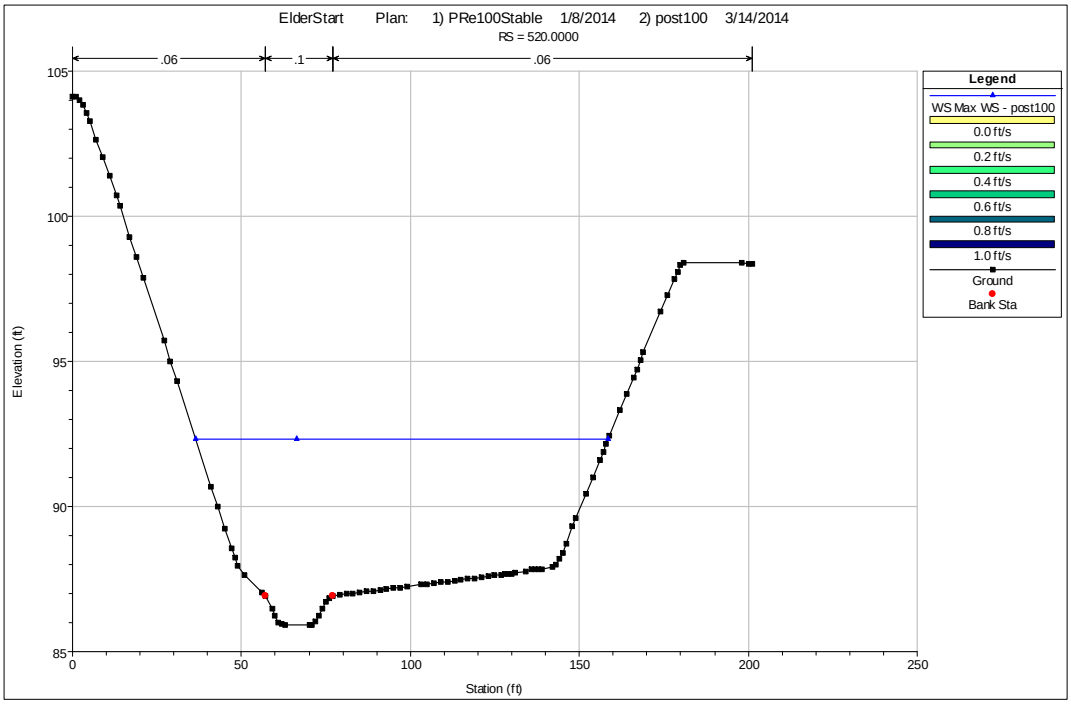

FIGURE 4.4 Sample Proposed Improved Channel Cross-Section Morrison Creek Tributary (Upstream of Excelsior Road)

excavation of enhanced channel. Drainage corridor improvements include deepening and widening of the main channel as well as the overbank areas, and creating peak flow mitigation attenuation, hydrograph modification attenuation, and stormwater quality treatment areas. Figure 4.4 shows an illustration of a representative improved channel cross-section. Proposed drainage corridor cross sections are shown in Appendix E.

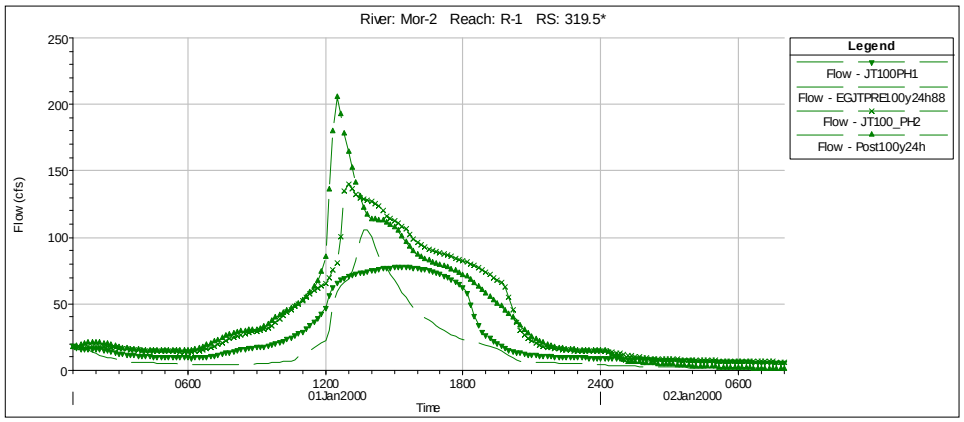

FIGURE 4.5 Comparison of 100-year Hydrograph at Morrison Creek POC (At Downstream limit of project)

The model results indicate that the peak 100-year peak flow rates and water surface elevations for the discharge tributary to Morrison Creek (actually discharges into a Quarry), at the point of discharge would increase. The combined discharges to Morrison Creek would decrease, however, the project proposes to combine the different discharges into a single location. As a result of the increase, the project is coordinating with the adjacent property owner for the future construction of a channel outfall system. See figure 4.5 for comparison of pre-project to post-project runoff hydrographs for the 100-year event.

Exhibit SD-1 in Appendix D identifies the approximate proposed locations and sizes of the storm Drain facilities, and shows the proposed watershed boundaries.

5.5.1. MORRISON CREEK ALTERNATIVE FOR NO DETENTION ANALYSIS

The County of Sacramento has requested that the project consider an alternative to eliminate onsite channelized peak flow mitigation and stormwater quality improvements onsite at the Morrison Creek Tributary discharge location.

An analysis was performed which narrowed the project's proposed channels in Morrison Creek. The removal of onsite attenuation volume areas in the

channels has the results of increasing peak flow rates. For example; The Culverts at the onsite crossing would need to become 2-54 inch pipe culverts instead of the single 48 inch pipe culvert proposed in the plan. Upstream of this location flow rates are less than 200 cfs in the 100-year event and could be feasibly piped, eliminating the proposed channel for this condition.

For the reach in the analysis between the onsite crossing and Excelsior Road, the 200-feet wide open space buffer for the channel was narrowed to 100 feet, and the channel was narrowed similarly.

The proposed channel between the onsite crossing and Excelsior Road cannot be piped and peak flow rates in the 100-year event would become approximately 500 cfs (see figure 4.5.2) without onsite peak flow mitigation. Comparing this to the approximately 200 cfs peak 100-year flow rate shown in figure 4.5 we see that flow rates crossing Excelsior Road could increase by 300 cfs in the 100-year event.

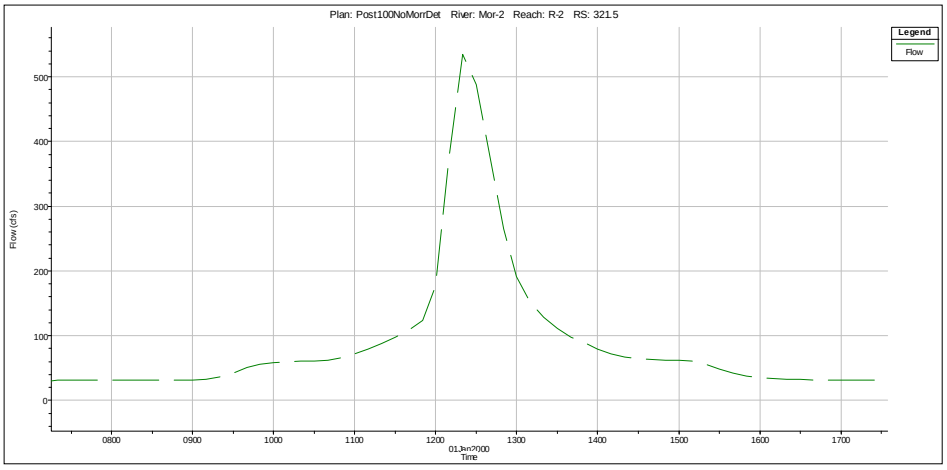

FIGURE 4.5.2 100-year Hydrograph at Morrison Creek POC for non-mitigated condition

The proposed culvert at Excelsior Road would need to be revised to become a 12' wide by 6' tall box culvert to convey this much flow. And the roadway would need to be raised to elevation 83. Downstream of the crossing the existing channel would need to be reconstructed to accept the higher flow rates to the discharge point at the ultimate Quarry Detention Basin. There is significant vertical fall between Excelsior Road and the invert of the quarry, and the channel would like need to use drop structures to step the flows down to the quarry bottom. Currently sheet flows overtop the quarry banks, and the flood waters flow down the banks in an erosive manner. It is the desire of the Jackson Township developer to work with the adjacent property owner to find an equitable solution for the offsite outfall downstream of Excelsior Road.

5.5.2. MORRISON CREEK OUTFALL VOLUMETRIC IMPACTS

To determine the Volumetric Impacts of the Jackson Township Project to the downstream properties at the Morrison Creek Outfall location, the Unsteady State HEC-RAS model (v4.1) was converted to an extended duration 10-day analysis for the 100-year. The Combined volume of outflow for the 10-day 100-year event in the pre-project condition is 179.8 AF. In the post project condition it is 245.8 AF providing a difference of 66 Acre Feet.

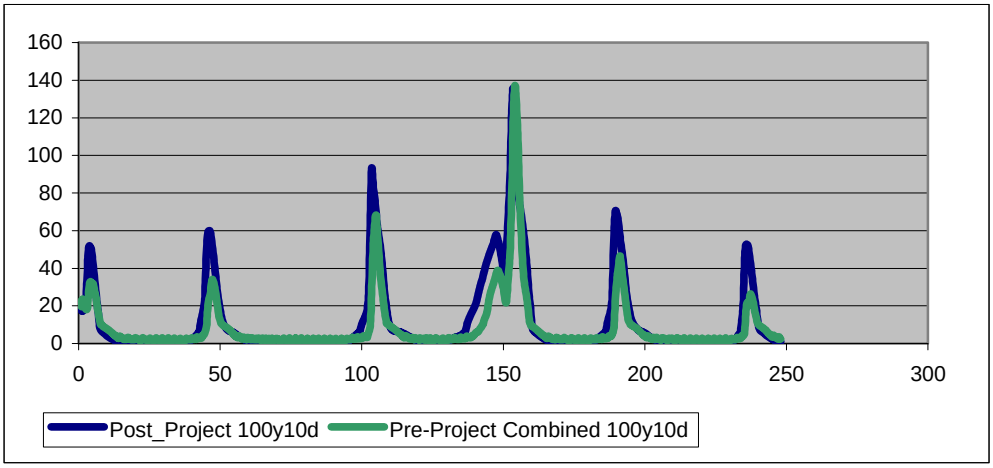

FIGURE 4.5.3 10-day 100-year Hydrograph Comparison at Morrison Creek POC

Figure 4.5.3 Compares the pre-project combined discharges across Excelsior Road, to the Post Project discharges for the 10-day 100-year event.

5.6 FLOOD CONTROL DETENTION BASINS

Three flood control detention basins are to be constructed with the JTMP along Elder Creek and the Morrison Creek Tributary. The detention basins will function inline within the drainage corridors and will contain components for stormwater Quality Treatment and Hydrograph Modification mitigation storage. Oversize exhibit DR-1 shows the detention basins that need to be constructed with the different areas in the JTMP project.

5.7 BRIDGES AND CULVERTS

Table 4.5.3 shows the recommended culvert sizes at proposed channel crossing locations.

Table 4.5.3 – Crossing Culvert Sizes

Location	Recommended Culvert Size	Section in HEC-RAS
Morrison Creek – Road Crossing	1-48” Pipe Culvert	Morrison Creek – Excelsior Road Crossing	3-42” Pipe Culvert	Elder Creek – Western Road Crossing	2-66” Pipe Culverts	
Elder Creek – Middle Road Crossing	1-60” Pipe Culvert	Elder Creek – East Road Crossing	1-48” Pipe Culvert	

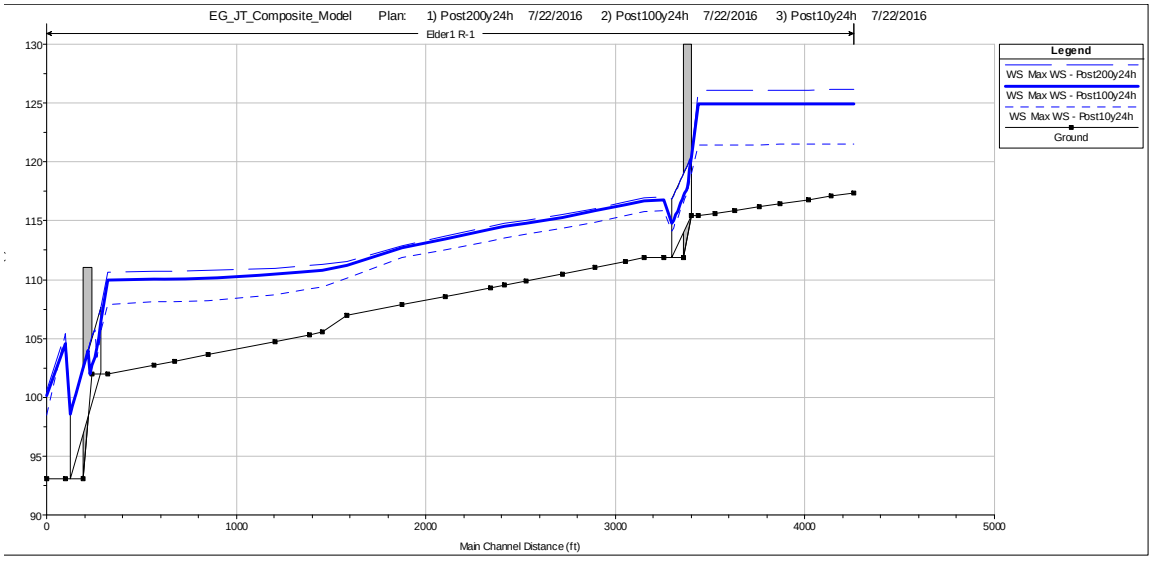

Figure 4.5.1 Elder Creek Max W.S

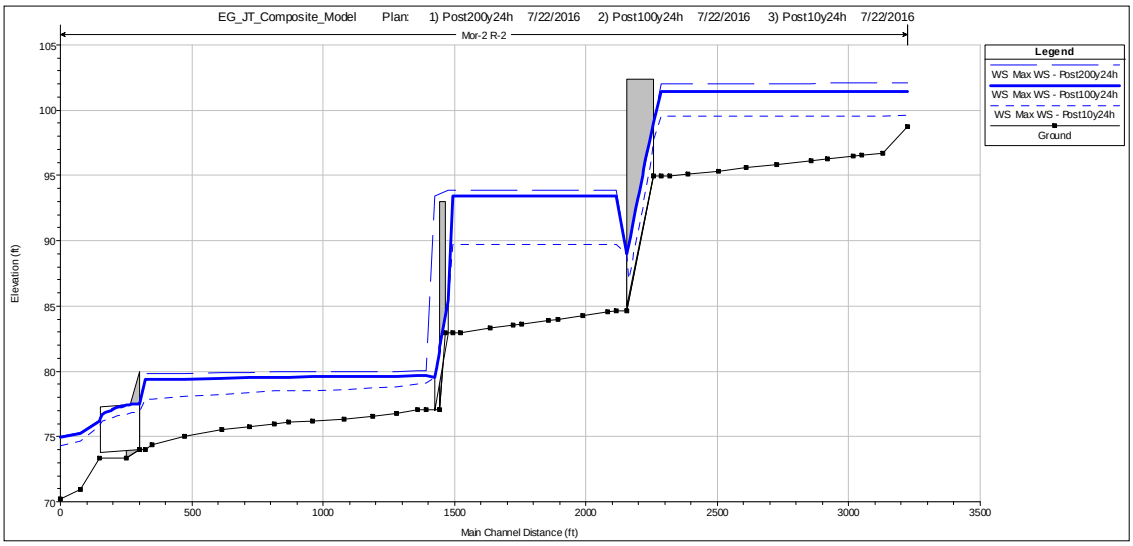

Figure 4.5.2 Morrison Creek Max W.S

5.8 FUTURE BUILDOUT CONDITIONS

Future combined build-out analysis modeling outside of the JTMP for the combined watershed impacts at Elder Creek and Morrison Creek has not been performed for this master plan. Future development in watersheds EL301, EL302, EL303, EL304, EL305, N376 and N462 upstream of the JTMP will be required to mitigate their impacts to existing conditions as shown in this plan.

5.9 TRUNK PIPES AND PIPE SHED GROUPS

A preliminary evaluation was undertaken to determine possible alignments and feasibility of trunk pipe drainage (serving 30 acres or more) for the various portions of the JTMP area. The XP-SWMM model was used for this analysis. Nodes and Pipe linkages are shown in Exhibit SD-1. The results of this analysis are included in the swmm section Appendix C and shown on the oversize exhibits in Appendix D. The results of these analyses are presented in Appendix D.

5.10 FEMA FLOODPLAIN

Existing FIRM Panels show Zone AE floodplain in the south western corner of the site (see Exhibit FP-1). A CLOMR will be required for any necessary mapping changes to this floodzone required for the proposed development, and for proposed improvements such as fill to be placed within this floodzone.

6.0 POST CONSTRUCTION STORM WATER QUALITY MEASURES

6.1 METHODOLOGY AND RESULTS

The volume for each of the water quality basins was computed in accordance with the WEF method as described in the stormwater quality manual. Each shed was assigned to a group. A composite land use percent impervious was calculated for each group and the WEF water quality volume was computed for each discharge point from the project. The Dry Basin Design Criteria will be applied to the SWQ treatment in this project. The required volume for the basins is summarized in the Table 5.1. Calculation of outflow from the detention basins is based on the “March 2007 Draft Stormwater Quality Design Manual”.

The included water quality treatment measures of the JTMP do not include treatment capacity for areas which are outside the JTMP boundary. If/When these areas develop, additional measures may be needed within those projects, or supplemental capacity added to the JTMP facilities such that treatment of the runoff from these additional areas can be accomplished. Areas that cannot drain directly into water quality treatment basins as shown on Oversize Sheet SD-1 will need to be provided with local water quality treatment facilities.

Where water quality treatment is to take place within a detention basin a portion of the basin volume was reserved by including a downstream structure in the hydraulic model which will emulate the release characteristics of the Stormwater Quality Basin outlet. All water quality in the plan is assumed to be sized and configured per the “Dry Design Criteria” BMP alternative.

Tables 6.1.1, 6.1.2 and 6.1.3 demonstrate how the WEF Water Quality volumes were calculated for each watershed, for the Total Project, Alternative 1 Phase 1 Project, and Alternative 1 Total Project scenarios. Refer to Figure 4.1.1 for watershed identification.

The stormwater quality and hydrograph modification analysis include Low Impact Development credit reductions to imperviousness of each watershed, based on the credit system established in the “LID_CREDITS” Spreadsheets for commercial and residential (included in the Appendix).

The regional stormwater quality treatment facilities identified in this section include reductions for possible “Low Impact Development” (LID) measures as may ultimately

be required by Sacramento County. Implementing LID measures with these projects effectively reduces the amount of stormwater which would runoff from the project development areas by reducing the effective imperviousness of the project, and promoting infiltration and pre-treatment. For example, LID measures may include features such as disconnected roof drains, planting of trees, and Hollywood driveways at residential areas.

Drawdown calculations for the outfall structures at the main Elder Creek and Morrison Creek Outfalls are provided in the "\Models\SWQ_LID" directory of the data files provided with this report. The drawdown is calculated such that no more than 75% of the design basin volume occurs in the 1st 24 hours, with most of the water draining in 48 hours.

6.2 LOW IMPACT DEVELOPMENT

The Sacramento Hydrograph Management Plan (HMP) requires the use of Low Impact Development Measures, which will be utilized within this plan. With the development of the HMP, a credit system has been developed to determine the amount of LID that is necessary with any individual project. At the time of development, individual project will be required to perform the credit system calculations. Table 5.2.1 demonstrates the imperviousness adjustment applied for LID improvements within each land use type of the project.

To determine the credits to apply to land uses, a sample area for each land use type was calculated using the Residential and Commercial LID calculators. Sample LID was assumed here to meet the 100 criteria, however, at final development the engineer may choose a different set of LID practices which also meet the 100% criteria for each land use.

For Residential Low Density Land Use, the following LID was included:

1. Disconnected roof drains (assumed 80%)
2. Separated pavement areas (30% divided sidewalks)
3. Interceptor trees (1 evergreen, 1 deciduous per lot)
4. Alternative Driveways (50%)
5. Amended Soils (500 sf per lot)

For Residential Medium Density Land Use, the following LID was included:

1. Disconnected roof drains (assumed 80%)
2. Separated pavement areas (25% divided sidewalks)
3. Interceptor trees (1 evergreen, 1 deciduous per lot)
4. Alternative Driveways (50%)
5. Amended Soils (285 sf per lot)

For Residential High Density Land Use, the following LID was included:

1. Disconnected roof drains (assumed 80%)
2. Separated pavement areas (50% divided sidewalks includes onsite)
3. Interceptor trees (10 evergreen, 10 deciduous per acre)
4. Alternative Driveways (25% of some paving areas)
5. Amended Soils (144 sf per unit)

For PQP and School Land Use, the following LID was included:

1. Disconnected pavement (assumed 20%)
2. Disconnected roof drains (75%)
3. Interceptor trees (10 evergreen, 10 deciduous per acre)

4. Alternative Pavement (25% of some paving areas)

For Roadway Land Use, the following LID was included:

1. Disconnected pavement (assumed 17%)
2. Interceptor trees (10 evergreen, 10 deciduous per acre)
3. Alternative Pavement (25% of some paving areas)
4. Amended Soils (385 sf per acre)

For Commercial Land Use, the following LID was included:

5. Disconnected pavement (assumed 20%)
6. Disconnected roof drains (75%)
7. Interceptor trees (10 evergreen, 10 deciduous per acre)
8. Amended Soils (335 sf per acre)

TABLE 6.2.1 – Impervious Area Reductions For LID by Land Use

Sacramento County Hydrologic Land Use Table			
Index	Description	Percent Impervious	LID Frac
1	Highways, Parking	95	0.48
2	Commercial, Offices	90	0.43
3	Intensive Industrial	85	0.43
4	Apartments, High Density Res.	80	0.24
5	Mobil Home Park	75	0.2
6	Condominiums, Medium Density Res.	70	0.157
7	Residential: 8-10 du/ac (20-25 du/ha), Ext. Indust.	60	0.12
8	Residential: 6-8 du/ac (15-20 du/ha), Low Dens. Res., School	50	0.077
9	Residential: 4-6 du/ac (10-15 du/ha)	40	0.07
10	Residential: 3-4 du/ac (7.5-10 du/ha)	30	0.065
11	Residential: 2-3 du/ac (5-7.5 du/ha)	25	0.06
12	Residential: 1-2 du/ac (2.5-5 du/ha)	20	0.055
13	Residential: 0.5-1 du/ac (1-2.5 du/ha)	15	0.05
14	Residential: 0.2-0.5 du/ac (0.5-1 du/ha), Ag Res	10	0.05
15	Residential: <0.2 du/ac (0.5 du/ha), Recreation	5	0

For the remaining Stormwater Quality and Hydrograph modification calculations performed in this plan, it was assumed the imperviousness changes shown in Table 5.2.1 were made for each type of development.

6.3 HYDROGRAPH MODIFICATION ATTENUATION SIZING

The SAHM program was used to perform continuous simulation analysis of the project drainage system and discharges to develop estimated Hydrograph Modification Attenuation sizing requirements for each discharge location within the project. Along the main creek areas of Elder Creek and Morrison Creek these will occur in the creek areas, regulated by outflow control devices as described here, and by the supplemental detention basins proposed for the Racetrack areas. For the remaining areas, detention basins could be built per the parameters described herein

or other practices, such as additional LID or best management practices could be used to mitigate the impacts.

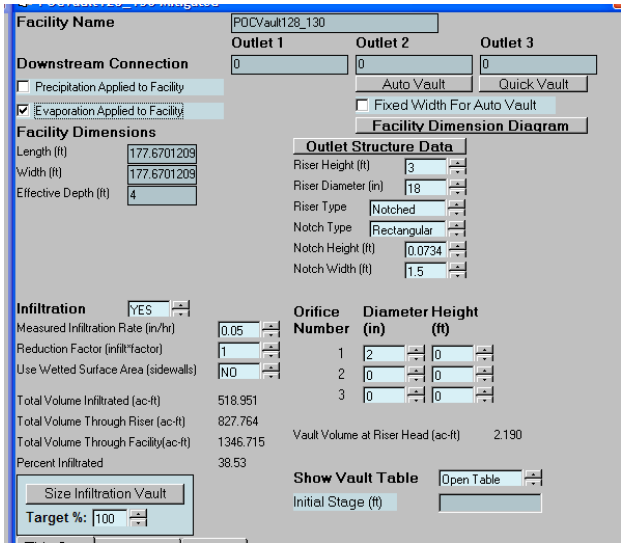
A pre-project watershed analysis was built from parameters used in the SACCALC model for the pre-project. For input to the SAHM analysis for post project conditions, each storm drain watershed was input using three input watersheds… One impervious shed for the Impervious area that would not be mitigated by LID, one Impervious shed for the area that would pass through LID measures, and one Non-impervious shed for the non-impervious areas. The impervious shed that would pass through LID was allowed to pass through the non-impervious shed to simulate the LID actions.

Models were built for each discharge location and attenuation mitigation volumes and control devises were computed as follows:

morrison 1 – No HMP features are required due to discharge to an existing quarry pit. (per county)

morrison 2 – No HMP Features are required (reduced area)

elder3 & elder 4 –Per table below:



TOTAL PROJECT SCENARIO for elder1 and elder2:

elder1 – Figure 6.3.1 shows the stage-storage and discharge relationships for the detention facility of the Total Project detention basin 1 location. Figure 6.3.2 graphically shows the discharge structure which includes a 10 inch low flow pipe, and 35 foot long overtopping weir at elevation 95.10.

7.0 Conclusion

The included master drainage study identifies improvements that the Jackson Township Master Plan will be required to install in order to collect, convey and discharge rain event's runoff per the County's requirements. The Total Project Plan and an Alternative for a Phased Plan are included. The project drainage improvements include:

- Drainage collection and pipe systems
- Drainage Corridors to convey runoff in open channels, and for detention of peak flow impact volumes.
- Drainage Corridors to perform treatment of stormwater quality prior to discharge.
- Drainage Corridors to perform hydrograph modification storage of runoff volumes, to mitigate potential impacts to the downstream geomorphology at all points of discharge.

Jackson Township

Full Development Conditions

SacCalc Report

Sacramento Hydrologic Calculator Report

December 13, 2017 15:40

Project Title: Elder Gerber - Jackson Township Post-Project

Method: Sacramento County HEC-1 method

Comments: Elder and Gerber Creek basins. Ultimate/Future Conditions with current Wildhawk Proposed conditions Revised sheds composited from several different models/studies. Includes preserves areas and subdivided shed E3. Includes Jackson Township portion of Morrison Creek. Also includes Vineyard Point as developed. Most routing removed as not required for RAS modeling.

Date:

Prepared by: TSP

Watershed Hydrologic Summary Data

Jackson Township

Phased Development Conditions
Phase1

SacCalc Report

Sacramento Hydrologic Calculator Report

December 13, 2017 15:41

Project Title: Elder Gerber - Jackson Township Post-Project

Method: Sacramento County HEC-1 method

Comments: Elder and Gerber Creek basins. Ultimate/Future Conditions with current Wildhawk Proposed conditions Revised sheds composited from several different models/studies. Includes preserves areas and subdivided shed E3. Includes Jackson Township portion of Morrison Creek. Also includes Vineyard Point as developed. Most routing removed as not required for RAS modeling. This version Alt1Ph1 for JT Development.

Date:

Prepared by: jdh

Jackson Township

Phased Development Conditions
Phase2

SacCalc Report

Sacramento Hydrologic Calculator Report

December 13, 2017 15:41

Project Title: Elder Gerber - Jackson Township Post-Project

Method: Sacramento County HEC-1 method

Comments: Elder and Gerber Creek basins. Ultimate/Future Conditions with current Wildhawk Proposed conditions Revised sheds composited from several different models/studies. Includes preserves areas and subdivided shed E3. Includes Jackson Township portion of Morrison Creek. Also includes Vineyard Point as developed. Most routing removed as not required for RAS modeling.

Date:

Prepared by: jdh

Watershed Hydrologic Summary Data

Watershed	Area (acres)	Mean Elevation (ft)	Lag Times		Basin "n"		Loss Rates		Percent Impervious	
			Method	Lag Time (min)	Method	Basin "n"	Method	Loss Rate (in/hr)	Method	Impervious Area (%)

|                Configuration Parameters                    |
|  Configuration Parameters, both those that are hardwired   |
|  and those added to the simulation are listed below.       |
|  Configuration Parameters that start with a $ are set in   |
|  the engine as defaults.  The remaining in UPPERCASE       |
|  have been added to the simulation in the Configuration->  |
|  Configuration Parameters dialog or as Engine Defaults in  |
|  the SWMXP.INI file.                                       |
|                                                            |
|  Consult the Help File for the specific meaning/purpose    |
|  of any particular parameter.                              |
|                                                            |
|  Note:                                                     |
|  The second column denotes the value of the parameter.     |

#    Last Updated in June, 2014 by XP Solutions       #

*============================================================*
|        HYDRAULICS TABLES IN THE OUTPUT FILE                |
|  These are the more important tables in the output file.   |
|  You can use your editor to find the table numbers,        |
|  for example: search for Table E20 to check continuity.    |
|  This output file can be imported into a Word Processor    |
|  and printed on US letter or A4 paper using portrait       |
|  mode, courier font, a size of 8 pt. and margins of 0.75   |
|                                                            |
| Table E1   - Basic Conduit Data                            |
| Table E2   - Conduit Factor Data                           |
| Table E3a  - Junction Data                                 |
| Table E3b  - Junction Data                                 |
| Table E4   - Conduit Connectivity Data                     |
| Table E4a  - Dry Weather Flow Data                         |
| Table E4b  - Real Time Control Data                        |
| Table E5   - Junction Time Step Limitation Summary         |
| Table E5a  - Conduit Explicit Condition Summary            |
| Table E6   - Final Model Condition                         |
| Table E7   - Iteration Summary                             |
| Table E8   - Junction Time Step Limitation Summary         |
| Table E9   - Junction  Summary  Statistics                 |
| Table E10  - Conduit   Summary  Statistics                 |
| Table E11  - Area assumptions used in the analysis         |
| Table E12  - Mean conduit information                      |
| Table E13  - Channel losses(H) and culvert info            |
| Table E13a - Culvert Analysis Classification               |
| Table E14  - Natural Channel Overbank Flow Information     |
| Table E14a - Natural Channel Encroachment Information      |
| Table E14b - Floodplain Mapping                            |
| Table E15  - Spreadsheet Info List                         |
| Table E15a - Spreadsheet Reach List                        |
| Table E16  - New Conduit Output Section                    |
| Table E17  - Pump Operation                                |
| Table E18  - Junction Continuity Error                     |
| Table E19  - Junction Inflow & Outflow Listing             |
| Table E20  - Junction Flooding and Volume List             |
| Table E21  - Continuity balance at simulation end          |
| Table E22  - Model Judgement Section                       |

Time Control from Hydraulics Job Control
Year.........    1995 Month.......       1
Day..........       1 Hour........       0
```

```
 Minute.......       0 Second......       0

 Control information for simulation
 ----------------------------------

 Integration cycles.................       360
 Length of integration step is......     60.00 seconds
 Simulation length..................      6.00 hours
 Do not create equiv. pipes(NEQUAL).         0
 Use U.S. customary units for I/O...         0
 Printing starts in cycle...........         1
 Intermediate printout intervals of.       500 cycles
 Intermediate printout intervals of.    500.00 minutes
 Summary printout intervals of......       500 cycles
 Summary printout time interval of..    500.00 minutes
 Hot start file parameter (REDO)....         0
 Initial time.......................      0.00 hours

 Iteration variables: Flow Tolerance.   0.00010
                      Head Tolerance.   0.00050
     Minimum depth (m or ft).........   0.00001
     Underrelaxation parameter.......   0.85000
     Time weighting parameter........   0.85000
     Conduit roughness factor........   1.00000
     Flow adjustment factor..........   1.00000
     Initial Condition Smoothing.....         0
     Courant Time Step Factor........   1.00000
     Default Expansion/Contraction K.   0.00000
     Default Entrance/Exit K.........   0.00000
     Routing Method..................   Dynamic Wave
 Default surface area of junctions...     12.57 square feet.
 Minimum Junction/Conduit Depth......   0.00001 feet.
 Ponding Area Coefficient............   5000.00
 Ponding Area Exponent...............    1.0000
 Minimum Orifice Length..............   1000.00 feet.
 NJSW input hydrograph junctions.....   268
      or user defined hydrographs....

Total length of all conduits .... 53789.0000 feet

==========
| Table E2 - Conduit Factor Data |
==========

Conduit Name	Number of Barrels	Entrance Loss Coef	Exit Loss Coef	Exp/Contc Coefficnt	Time Weighting Parameter	Low Flow Roughness Factor	Depth at Which n Changes	Sediment Depth	Flow Routing
L376	1.0000	0.0000	1.0000	0.0000	0.8500	1.0000	0.0000	0.0000	Standard - Dynamic Wave

==========
| If there are messages about (sqrt(g*d)*dt/dx), or |
| the sqrt(wave celerity)*time step/conduit length |
| in the output file all it means is that the |
| program will lower the internal time step to |
| satisfy this condition (explicit condition). |
| You control the actual internal time step by |
| using the minimum courant time step factor in the |
| HYDRAULICS job control. The message put in words |
| states that the smallest conduit with the fastest |
| velocity will control the time step selection. |
| You have further control by using the modify |
| conduit option in the HYDRAULICS Job Control. |
==========

Conduit Name	Courant Ratio
