TABLE NOTES:												

A) Average daily traffic (ADT) volumes derived from peak hour traffic volume information provided by Hexagon Transportation Consultants. The highest AM or PM peak hour volume was assumed to be equal to 10% of ADT.

B) Total peak hour vehicles is based on AM and PM peak hour traffic volume information provided by Hexagon Transportation Consultants.

C) Non peak-hour vehicles are derived by subtrating total peak hour traffic from ADT volumes and dividing by 22 (the number of non=peak hours in the day).

D) Vehicles per daytime includes peak hour traffic and non-peak hour traffic (10 hours) multiplied by EMFAC vehicle class distribution percentages.

E) Vehicles per nighttime includes non-peak hour traffic (12 hours) multipled by EMFAC vehicle class distribution percentages.

TABLE NOTES:												
A) Average daily traffic (ADT) volumes derived from peak hour traffic volume information provided by Hexagon Transportation Consultants. The highest AM or PM peak hour volume was assumed to be equal to 10% of ADT.												
B) Total peak hour vehicles is based on AM and PM peak hour traffic volume information provided by Hexagon Transportation Consultants.												
C) Non peak-hour vehicles are derived by subtrating total peak hour traffic from ADT volumes and dividing by 22 (the number of non=peak hours in the day).												
D) Vehicles per daytime includes peak hour traffic and non-peak hour traffic (10 hours) multiplied by EMFAC vehicle class distribution percentages.												
E) Vehicles per nighttime includes non-peak hour traffic (12 hours) multipled by EMFAC vehicle class distribution percentages.

TABLE NOTES:

A) Average daily traffic (ADT) volumes derived from peak hour traffic volume information provided by Hexagon Transportation Consultants. The highest AM or PM peak hour volume was assumed to be equal to 10% of ADT.

B) Total peak hour vehicles is based on AM and PM peak hour traffic volume information provided by Hexagon Transportation Consultants.

C) Non peak-hour vehicles are derived by subtrating total peak hour traffic from ADT volumes and dividing by 22 (the number of non=peak hours in the day).

D) Vehicles per daytime includes peak hour traffic and non-peak hour traffic (10 hours) multiplied by EMFAC vehicle class distribution percentages.

E) Vehicles per nighttime includes non-peak hour traffic (12 hours) multipled by EMFAC vehicle class distribution percentages.

TABLE NOTES:												

A) Average daily traffic (ADT) volumes derived from peak hour traffic volume information provided by Hexagon Transportation Consultants. The highest AM or PM peak hour volume was assumed to be equal to 10% of ADT.

B) Total peak hour vehicles is based on AM and PM peak hour traffic volume information provided by Hexagon Transportation Consultants.

C) Non peak-hour vehicles are derived by subtrating total peak hour traffic from ADT volumes and dividing by 22 (the number of non=peak hours in the day).

D) Vehicles per daytime includes peak hour traffic and non-peak hour traffic (10 hours) multiplied by EMFAC vehicle class distribution percentages.

E) Vehicles per nighttime includes non-peak hour traffic (12 hours) multipled by EMFAC vehicle class distribution percentages.

1. Introduction

This report presents the results of the transportation analysis (TA) conducted for the proposed Patrick Henry Drive Specific Plan in Santa Clara, California (see Figure 1). The Patrick Henry Drive Specific Plan encompasses approximately 73.6 gross acres in an employment-rich area of northern Santa Clara, comprising several moderate-intensity office and industrial parks accompanied by surface parking. The Plan Area is bounded by Sunnyvale and Calabazas Creek to the west, the Hetch Hetchy right-of-way to the north, Great America Parkway to the east, and Mission College to the south. The green and orange light rail lines on Tasman Drive are approximately a ten-minute walk from any portion of the Patrick Henry focus area, and VTA bus service is also available on Great America Parkway.

The Patrick Henry Drive Specific Plan would transform this industrial area into a high-density, mixed-use residential community supported by walkable streets and a range of neighborhood-serving amenities, including parks, trails, ground-floor retail, and new community spaces. This traffic analysis evaluates two development scenarios. In the first scenario, the Plan Area would include approximately 12,000 residential units and 310,000 square feet (s.f.) of non-residential uses, including 150,000 s.f. of retail space, a 45,000 s.f. library, 25,000 s.f. of community/civic uses, and 90,000 s.f. of flex space, which is assumed to be an equal mix of office space, retail space, and residential amenities. The second scenario would be the same as the first but would substitute office for high-density residential in the “High Density Flex” zone along the east edge of the Plan Area, reducing the total residential development within the Plan Area by 1,700 units and adding 785,000 s.f. of office space. Appendix A shows a summary of development by parcel within the Specific Plan area. As illustrated on Figure 2 (Draft Conceptual Land Use Plan), the highest intensity uses are anticipated within the core and along the southern border of the Plan Area, with development intensity scaling down to the west approaching the Sunnyvale border. The proposed uses would replace existing buildings totaling 995,541 s.f. including 432,216 s.f. of office space, 154,467 s.f. of research and development space, 120,900 s.f. of industrial space, a 29,400 s.f. church, a 137,075 s.f. data center, and 121,483 s.f. of vacant space.

The Specific Plan would maintain the existing roadways and vehicle connections from Great America Parkway and Tasman Drive. Slow-speed interior roadways will be added to provide emergency vehicle and resident access, and to increase the walkability of the neighborhood by breaking down large blocks and parcels. One new vehicle connection from Patrick Henry Drive to Mission College Boulevard is proposed in the Specific Plan. Two potential alignments were considered. The western alignment would be located between parcels 6 and 7, while the eastern alignment would be between parcels 7 and 10 (see Figure 2). The new roadway connection would require the consent of Mission College as it would connect to a private roadway controlled by the College. Because is it uncertain if the College will consent to this new roadway connection, the PHDSP was evaluated both with and without this new

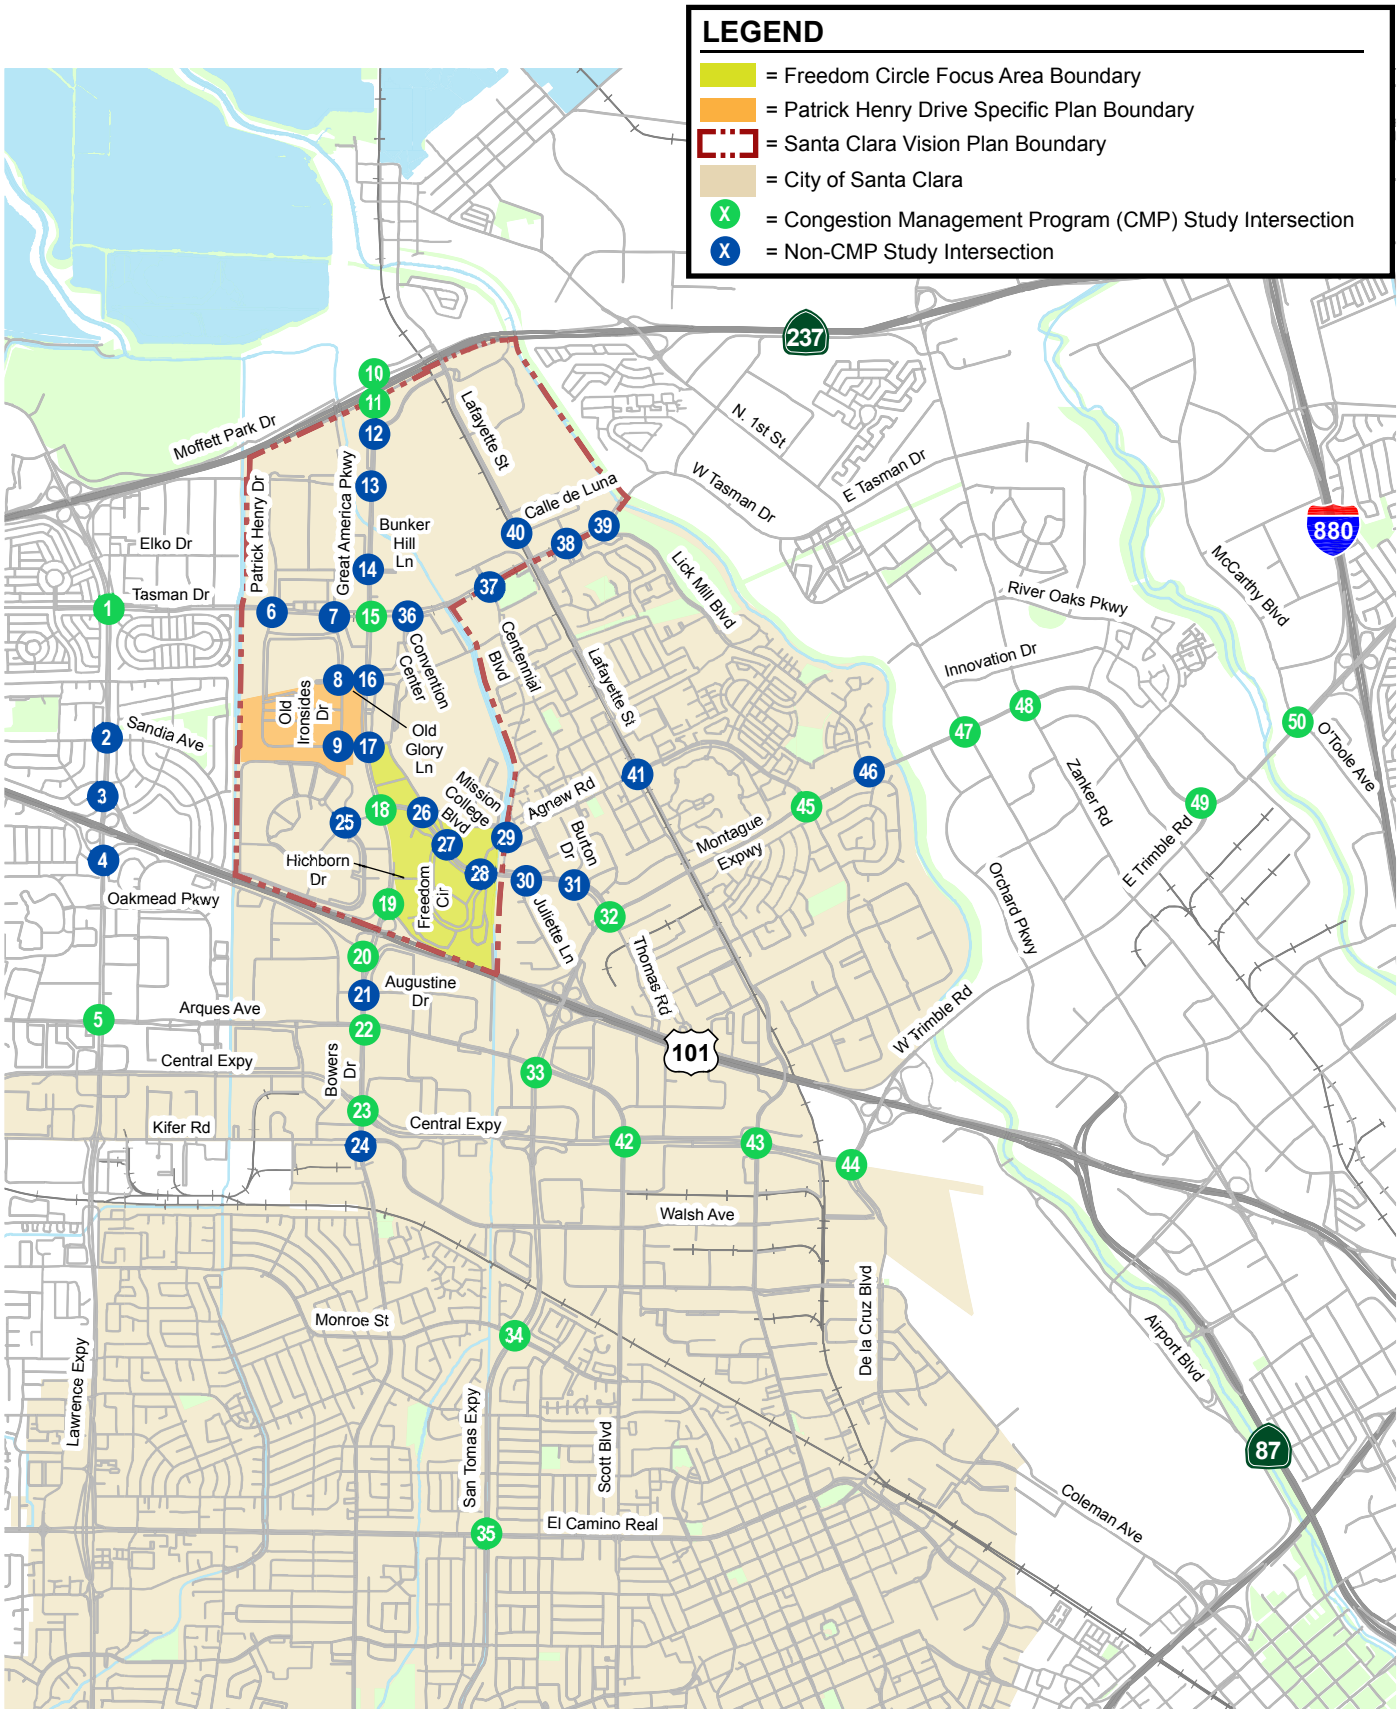

Figure 1
Study Intersections

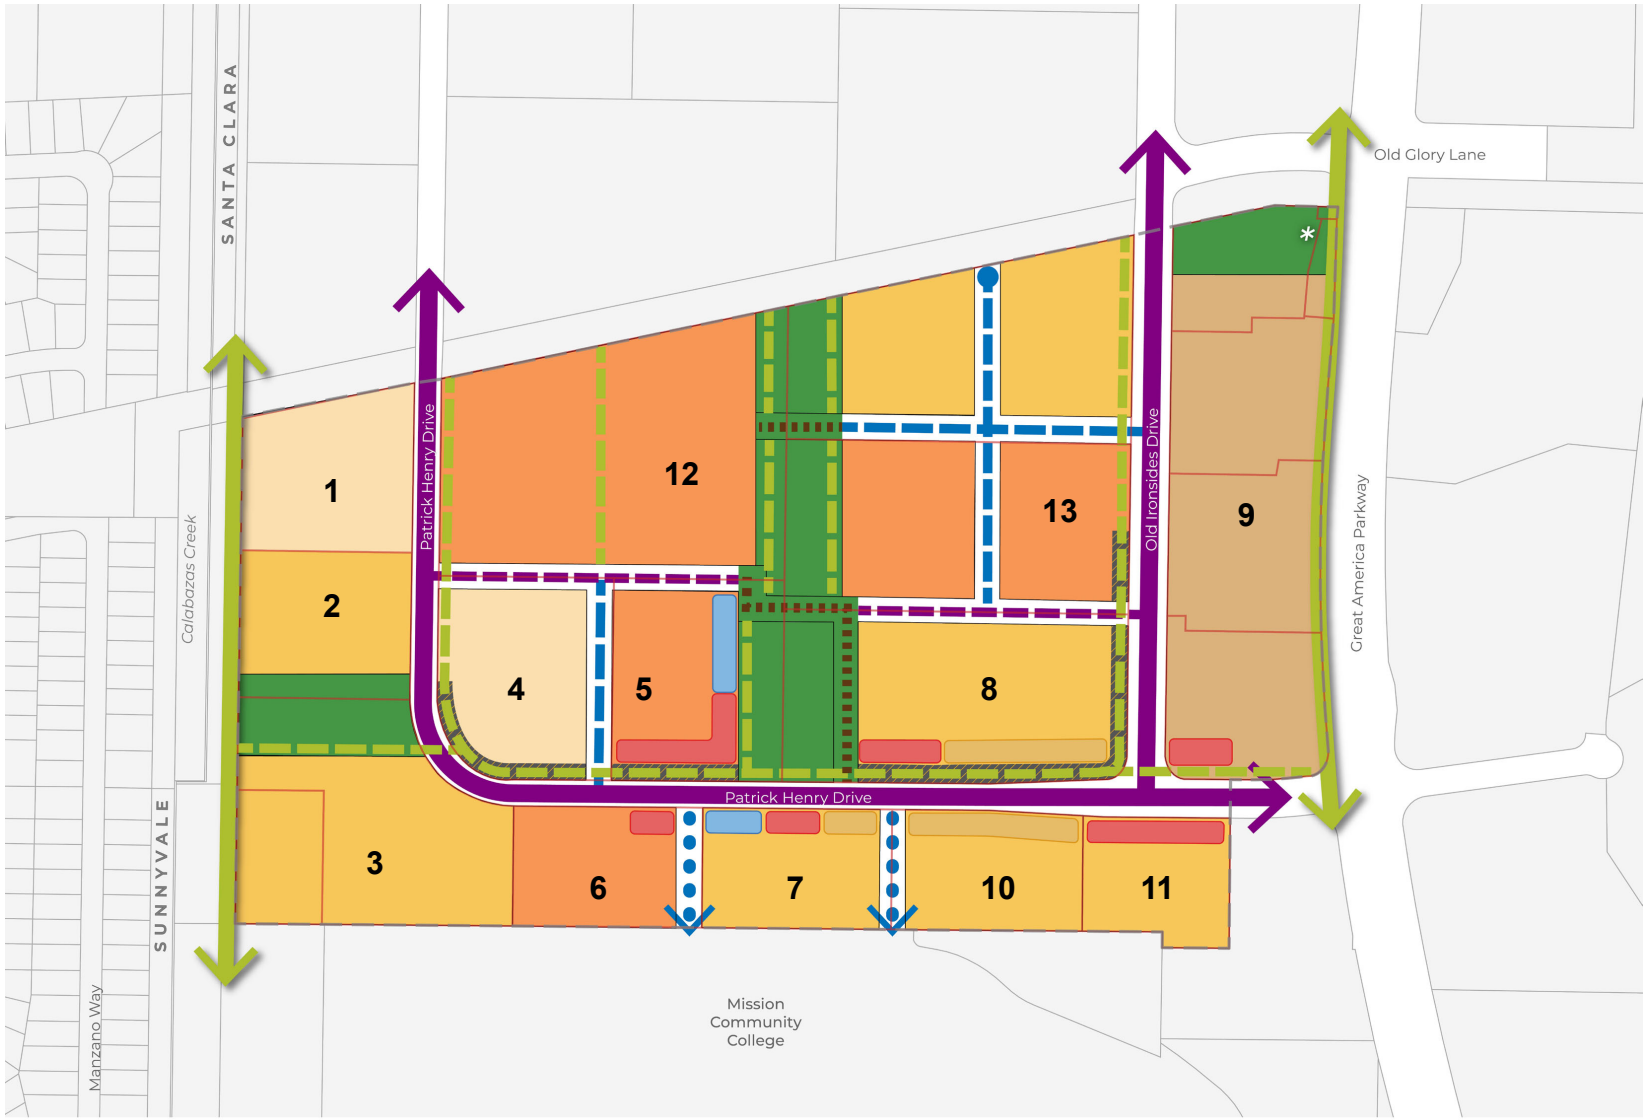

FIGURE 4.X: DEVELOPMENT FRAMEWORK

Figure 2
Draft Conceptual Land Use Plan for Patrick Henry Drive Specific Plan

roadway connection. As explained in Chapter 6, the western alignment is preferable and was assumed in this analysis.

Scope of Study

The purpose of the transportation analysis (TA) is to satisfy the requirements of the City of Santa Clara and the Congestion Management Program (CMP) of the Santa Clara Valley Transportation Authority (VTA) and the California Environmental Quality Act (CEQA).

It should be noted that this transportation analysis is based on existing conditions as of 2018/2019, prior to the recent reductions in traffic volumes and transit services associated with the current pandemic. Since the institution of shelter in place orders went into effect in March 2020 due to COVID-19, most offices and schools are closed, and people are working at home to the extent possible. As a result, current traffic volumes are a fraction of what they were prior to the virus outbreak and transit providers are operating on reduced schedules. It is not known when traffic conditions will return to pre-virus levels, but it is expected that the current reductions in traffic volumes and transit services are only temporary. Since development of the Patrick Henry Drive Specific Plan Area is anticipated to occur over a period of many years or decades, this transportation analysis is based on pre-virus conditions. Furthermore, future year traffic forecasts reflect assumptions regarding land use developments and transportation improvements developed in 2019 without any modifications to reflect the potential long-range economic effects of the current pandemic. Thus, this transportation analysis is considered to be a conservative evaluation of the project's effects since the growth in traffic volumes reflected in this report may not occur until many years after the horizon years evaluated in this report.

Vehicle Miles Traveled

In 2013, Governor Brown signed Senate Bill 743. SB 743 directed the State Office of Planning and Research (OPR) to develop new California Environmental Quality Act (CEQA) guidelines and to replace Level of Service (LOS) as the evaluation measure for transportation impacts under CEQA with another measure such as Vehicle Miles Traveled (VMT). VMT measures the amount of vehicle trip making and trip length and is a direct measurement of greenhouse gas emissions. A reduction in VMT would promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses that reduces the reliance on individual vehicles.

The City of Santa Clara recently adopted a VMT Transportation Analysis Policy for Environmental Review[1]. The Policy sets forth screening criteria that allow various types of developments such as infill developments, small projects, and/or transit supportive projects near major transit corridors to be presumed to have a less than significant impact on VMT. The Patrick Henry Drive Specific Plan would qualify as a transit supportive project since it meets the following criteria:

Proximity to Transit

Transit supportive projects must be located within ½ mile of an existing Major Transit Stop or an existing transit stop along a High-Quality Transit Corridor, as those terms are defined by Public Resources Code sections 21064.3 and 21155. A "Major Transit Stop" is defined as a site containing any of the following: (a) an existing rail or bus rapid transit station; (b) the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and

[1] City of Santa Clara, Resolution No. 20-8861, "A Resolution of the City of Santa Clara, California to Amend Resolution 5713 to Adopt a Transportation Analysis Policy to Comply with the California Environmental Quality Act Pursuant to State Senate Bill 743 (2013) and CEQA Guidelines Section 15064.3," adopted June 23, 2020.

afternoon peak commute periods; or (3) a major transit stop that is included in Plan Bay Area 2040 (Pub. Res. Code §§ 21064.3, 21155(b)). A "High-Quality Transit Corridor" is defined as a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours. (Pub. Res. Code § 21155(b).

Several parcels within the PHDSP area are within ½ mile of the Old Ironsides LRT station, which meets the definition of a Major Transit Stop. In addition, VTA provides the frequent bus service via Route 57, which runs along Great America Parkway with 15-minute headways during the AM and PM peak commute periods. Thus, Great America Parkway is considered a High-Quality Transit Corridor. All of the parcels within the Plan area are within ½ mile of the nearest Route 57 bus stops on Great America Parkway at either Patrick Henry Drive or Old Glory Lane. A map showing these transit facilities and a full description of other nearby transit services are presented in Chapter 2 (see Figure 5).

Density

For office/R&D projects, transit supportive projects must have a minimum floor area ratio (FAR) of 0.75. Likewise, residential projects must have a minimum density of 35 dwelling units per acre. Residential densities within the PHDSP area are proposed to range from a minimum of 65 du/ac to a maximum of 250 du/ac. Under Option 1, a small amount of office space would be permitted as flex space in addition to proposed residential development. Under Option 2, 785,000 s.f. of office space would be built on a 9.86-acre parcel in place of the residential use assumed under Option 1. The office development on this parcel equates to an FAR of approximately 1.83. Thus, the development densities permitted within the PHDSP Area meet the minimum requirements to be considered a transit supportive project.

Multimodal Transportation Networks

The City Policy requires that transit supportive projects promote multimodal transportation networks. The PHDSP Area will provide balanced, multimodal internal circulation as well as easy access to nearby destinations and transit stations. The Plan includes the following policies that support safe, active, and sustainable travel options for residents and visitors:

- Prioritize the comfort and safety for pedestrians and cyclists
- Retrofit the right-of-way to accommodate all travel modes including walking, cycling, driving, micro-mobility, and transit
- Support access to transit stops on Tasman Drive and Great America Parkway
- Improve infrastructure for pedestrians, cyclists, and micro-mobility (e.g., scooters) to mitigate the impact of urban-scale development on traffic congestion
- Improve connections to the Calabazas Creek Trail and other trails and greenways
- Design flexible street environments that allow for innovative transit and ride-share options (e.g., jitneys) as well as emerging technology (e.g., autonomous vehicles)
- Use Transportation Demand Management (TDM) strategies in partnership with area employers and property owners to minimize vehicle miles traveled
- Limit vehicle parking spaces for residences and businesses, and
- Reduce carbon emissions from transportation.

Transit-Oriented Design Elements

Transit supportive projects must include transit-oriented design elements. The PHDSP will include design guidelines and standards to ensure a pedestrian-oriented, mixed-use residential neighborhood that is walkable with convenient connections to high-quality transit. The following urban design principles will ensure the PHD Specific Plan Area is a transit-oriented development:

- Create a human-scaled public realm with a distinctly urban feel
- Enliven the street environment and create multi-use activity nodes

- Prioritize the safety and comfort of pedestrians of all ages and abilities
- Create a fine-grained network of pedestrian paths
- Use landscaping to create a comfortable pedestrian realm and contribute color and depth
- Use signage appropriate in scale and orientation to the primary audience: pedestrians versus motorists

Parking

Transit supportive projects may not include more parking for use by residents, customers, or employees of the project than required by the City Code. No development applications have been submitted for projects within the PHDSP area, thus the proposed on-site parking supply is unknown. The PHDSP does not require parking at a higher rate than the code requirements in effect in other areas. Thus, it is assumed that future developments within the PHDSP Area will not include excess parking and would qualify as transit supportive under this metric. Moving forward, development proposals will undergo review upon submittal and any applications that propose excess parking would not qualify as transit supportive and would be required to evaluate their potential impacts on VMT.

Affordable Housing

Affordable housing has been shown to generate fewer vehicle miles traveled per capita than market rate housing. Accordingly, the City's VMT Policy states that transit supportive projects must not replace affordable residential units with a smaller number of affordable units, and any replacement units must be at the same level of affordability. Currently, the PHDSP Area does not contain any residential dwelling units. The PHDSP will require 15 percent of the proposed new residential dwelling units be affordable to those earning less than 80 percent of the Area Median Income (AMI). Therefore, the project would add new affordable dwelling units and not result in a loss of affordable units.

Findings

Per the State's guidance and the City's VMT Policy, the Patrick Henry Drive Specific Plan qualifies as a transit supportive project and is presumed to have a less than significant impact on VMT.

Local Transportation Analysis

Although the Patrick Henry Drive Specific Plan does not require a VMT analysis, the City still requires all projects to measure intersection efficiency (LOS) as part of an operational analysis and to provide improvements or address project related operational deficiencies. Thus, this report contains a local transportation analysis to evaluate the project's consistency with the level of service standards set forth in the City's General Plan and to identify feasible improvements to remedy any deficiencies.

The study area was determined using the City of Santa Clara's (CSC) travel demand forecast model. The study analyzes the effects of the project on the key intersections, freeway segments, and freeway ramps in the study area during the weekday AM and PM peak hours of traffic. Locally, the AM peak hour of traffic is usually between 7:00 and 9:00 AM, and the PM peak hour is typically between 4:00 and 6:00 PM. It is during these periods that the most congested traffic conditions occur on an average weekday.

The Santa Clara County VTA CMP guidelines require that the CMP freeway segments be evaluated to determine the impact of added traffic for projects that generate trips equal to or greater than one percent of the freeway segment's capacity. Implementation of the Specific Plan is expected to generate added traffic volume on multiple freeway segments along US 101, SR 237, and SR 87. The traffic analysis also includes a capacity analysis for 16 freeway ramps.

Study Intersections

Fifty study intersections were selected in accordance with VTA's *Transportation Impact Analysis Guidelines* (October 2014) and in consultation with Santa Clara staff. The study includes those intersections that provide primary access to the project areas and intersections that would experience a substantial increase in traffic volumes. The study intersections are listed below and shown on Figure 1. Twenty-two study intersections are designated as CMP intersections. Five of the study intersections are located in the City of Sunnyvale, six of the study intersections are located in the City of San José, and the remaining intersections are in Santa Clara. All study intersections were evaluated against the standards of the applicable municipality, while the CMP intersections also were evaluated against the standards of the Santa Clara County CMP.

Other Transportation Issues

The study includes an evaluation of the project's impacts on transit services and pedestrian and bicycle facilities, and a review of internal vehicular circulation, hazards, and emergency access. In addition, vehicle queuing was evaluated at selected locations where the Plan Area would add a significant number of left-turning vehicles. Lastly, a signal warrant analysis was conducted for the unsignalized study intersections.

Traffic conditions at the study intersections were evaluated for the following scenarios:

- ***Existing Conditions.*** Existing AM and PM peak-hour traffic volumes were obtained from new turning-movement counts conducted in May 2019, previously completed traffic studies, and the latest available CMP database.
- ***Background (Year 2030) Conditions*****.** Background traffic volumes were developed using the CSC travel demand forecasting model. In most locations, the model reflects anticipated growth according to ABAG 2030 land use projections. In the vicinity of the Plan Area, the model assumes completion of City Place Phases 1-3 and buildout of the Tasman East Specific Plan. The existing land uses are assumed to remain unchanged within the Patrick Henry Specific Plan Area. The analysis reflects planned transportation improvements anticipated to occur by the Year 2030. Intersection levels of service under background conditions were evaluated using the City methodology.
- ***Background Plus Project Conditions.*** The Institute of Transportation Engineers (ITE) *Trip Generation Manual, 10th Edition* and the CSC travel demand forecasting model were used to develop traffic forecasts for background plus project conditions under two development scenarios. Intersection level of service calculations were conducted to evaluate background plus project traffic conditions during the AM and PM peak hours. Adverse effects on intersection levels of service associated with the buildout of the Plan Area were evaluated relative to background conditions.
- ***Cumulative (Year 2040) No Project Conditions.*** Cumulative no project traffic volumes were developed using the CSC travel demand model. Cumulative conditions reflect future development and planned transportation improvements anticipated to occur by the year 2040. The model land use assumptions reflect ABAG land uses in most locations. Within the vicinity of the Plan Area, the model assumes buildout of City Place, buildout of the proposed Kylli project and the Freedom Circle Focus Area as well as development of an additional 1,500 dwelling units per a proposed Amendment to the Tasman East Specific Plan. Cumulative no project conditions assume no growth within the Patrick Henry Drive Specific Plan Area. Intersection level of service calculations under cumulative no project conditions were evaluated using the City methodology.
- ***Cumulative Plus Project Conditions.*** Cumulative plus project traffic volumes were developed using ITE trip rates and the CSC travel demand model and reflect trips generated by buildout of the Patrick Henry Drive Specific Plan under two development scenarios. Intersection levels of service under cumulative plus project conditions were evaluated using the City methodology.

Methodology

This section presents the methods used to determine traffic conditions on study roadways and effects on traffic operations caused by the project. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

Data Requirements

The data required for the analysis were obtained from new traffic counts, the City of Santa Clara, City of San José, City of Sunnyvale, the CMP, and field observations. The following data were collected from these sources:

- Existing traffic volumes,
- Lane geometries,
- Signal timing and phasing, and
- Lists of approved and pending developments.

Intersection Level of Service Methodologies and Standards

Traffic conditions at the study intersections were evaluated using level of service (LOS). Level of service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays.

Signalized Intersections

The Cities of Santa Clara, San José, and Sunnyvale evaluate level of service at signalized intersections based on the 2000 *Highway Capacity Manual (HCM)* level of service methodology. This HCM method evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. This average delay can then be correlated to a level of service. Table 1 presents the level of service definitions for signalized intersections.

This study utilizes TRAFFIX software to determine intersection levels of service based on the HCM method. Since TRAFFIX is approved by VTA as the level of service analysis software for CMP signalized intersections, the Cities of Santa Clara, San José, and Sunnyvale employ the CMP defaults values for the analysis parameters. TRAFFIX software was used to analyze intersection operations and to identify adverse effects based on the increases in critical-movement delay and the volume-to-capacity ratio (v/c) between no-project and project scenarios.

The Cities of Santa Clara, San José, and Sunnyvale have set forth LOS D as the minimum standard, except on CMP and expressway facilities within Santa Clara and roadways considered “regionally significant” within Sunnyvale, which have a standard of LOS E. Study intersections within Sunnyvale along Lawrence Expressway are considered regionally significant.

Unsignalized Intersections

The study includes the analysis of two unsignalized intersections located in the City of Santa Clara. The City of Santa Clara does not have a level of service standard for unsignalized intersections. The two unsignalized study intersections were analyzed for operational purposes.

Level of service analysis at unsignalized intersections is generally used to determine the need for modification in the type of intersection control (i.e., all-way stop or signalization). As part of the evaluation, traffic volumes and delays are evaluated to determine if the existing intersection control is appropriate.

For unsignalized intersections, the level of service is reported based on the average delay for all movements. The level of service definitions for unsignalized intersections is shown in Table 2. This study utilizes TRAFFIX software to determine intersection levels of service based on the 2000 HCM methodology for unsignalized intersections.

Table 1
Signalized Intersection Level of Service Definitions Based on Average Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 20.0
C	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though some vehicles may still pass through the intersection without stopping.	20.1 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *2000 Highway Capacity Manual* (Washington, D.C., 2000), p.10-16.

Table 2
Unsignalized Intersection Level of Service Definitions Based on Average Delay

Level of Service	Description	Average Delay Per Vehicle (Sec.)
A	Little or no traffic delay	10.0 or less
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Source: Transportation Research Board, *2000 Highway Capacity Manual* (Washington, D.C., 2000) p17-2.

Traffic Signal Warrant Analysis

An assessment of the need for signalization was conducted for unsignalized study intersections. For this study, the need for signalization was assessed on the basis of the peak hour volume signal warrant (Warrant #3) described in the *2014 California Manual on Uniform Traffic Control Devices* (CA MUTCD). This method provides an indication of whether traffic conditions and peak-hour traffic levels are, or would be, sufficient to justify the installation of a traffic signal. It should be noted that it is just one of the factors/warrants used to indicate whether installation of a traffic control signal is justified.

Freeway Segments

Within Santa Clara County, freeway segments are analyzed as prescribed in the Santa Clara County CMP technical guideline. The level of service for freeway segments is estimated based on vehicle density. Density is calculated by the following formula:

$$D = V / (N*S)$$

Where:

D = density, in vehicles per mile per lane (vpmpl)

V = peak hour volume, in vehicle per hour (vph)

N = number of travel lanes

S = average travel speed, in miles per hour (mph)

The vehicle density on a segment is correlated to level of service as shown in Table 3. The CMP requires that mixed-flow lanes and auxiliary lanes be analyzed separately from high-occupancy vehicle (HOV) lanes (otherwise known as carpool lanes). The CMP specifies that a capacity of 2,300 vehicles per hour per lane (vphpl) be used for segments three lanes or wider in one direction, and a capacity of 2,200 vphpl be used for segments two lanes wide in one direction. HOV lanes are specified as having a capacity of 1,650 vphpl.

Table 3
Freeway Segment Level of Service Definitions

Level of Service	Description	Density (vehicles/mile/lane)
A	Average operating speeds at the free-flow speed generally prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	11.0 or less
B	Speeds at the free-flow speed are generally maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high.	11.0 to 18.0
C	Speeds at or near the free-flow speed of the freeway prevail. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more vigilance on the part of the driver.	18.0 to 26.0
D	Speeds begin to decline slightly with increased flows at this level. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels.	26.0 to 46.0
E	At this level, the freeway operates at or near capacity. Operations in this level are volatile, because there are virtually no usable gaps in the traffic stream, leaving little room to maneuver within the traffic stream.	46.0 to 58.0
F	Vehicular flow breakdowns occurs. Large queues form behind breakdown points.	greater than 58.0

Source: Santa Clara County Valley Transportation Authority, Transportation Impact Analysis Guidelines, Updated March 2009 (Based on the *Highway Capacity Manual (2000), Washington, D.C.)*

Freeway Ramps

A freeway ramp analysis was performed in order to verify that the freeway ramps have sufficient capacity to serve the projected traffic volumes with the development of the Patrick Henry Drive Specific Plan Area. This analysis consisted of a volume-to-capacity ratio evaluation of the freeway ramps at the study interchanges. The ramp capacities were obtained from the *Highway Capacity Manual 2000*, and considered the free-flow speed, number of lanes on the ramp, and ramp metering.

Intersection Vehicle Queuing Analysis

The analysis of intersection operations was supplemented with a vehicle queuing analysis at study intersections where the Plan Area would add a substantial number of vehicle trips to the left-turn movements. The analysis provides a basis for estimating future left-turn pocket storage requirements at the study intersections and is presented for informational purposes only, since the City of Santa Clara has not defined a policy related to queuing. Vehicle queues were estimated using a Poisson probability distribution, which estimates the probability of "n" vehicles for a vehicle movement using the following formula:

$$P(x=n) = \frac{\lambda^n e^{-(\lambda)}}{n!}$$

Where:

P (x=n) = probability of "n" vehicles in queue per lane
n = number of vehicles in the queue per lane

λ = average # of vehicles in the queue per lane (vehicles per hr per lane/signal cycles per hr)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95th percentile maximum number of queued vehicles for a particular left-turn movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the left-turn movement. This analysis thus provides a basis for estimating future turn pocket storage requirements at intersections.

For signalized intersections, the 95th percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles or a queue length larger than the 95th percentile queue would only occur on 5 percent of the signal cycles (about 3 cycles during the peak hour for a signal with a 60-second cycle length). Thus, turn pocket storage designs based on the 95th percentile queue length would ensure that storage space would be exceeded only 5 percent of the time for a signalized movement. Vehicle queuing at unsignalized intersections are evaluated based on the delay experienced by the turn movement.

Definition of Adverse Effects

Although measures of congestion such as delay and level of service are no longer used to identify significant impacts under CEQA, a local transportation analysis was conducted to evaluate the project's consistency with the level of service standards set forth in the City's General Plan and to identify feasible improvements to remedy any deficiencies. Deficiencies in intersection operations that meet specific criteria are labeled as an "adverse effect" of the project. Such adverse effects on intersection operations do not constitute significant impacts under CEQA.

Signalized Intersections

According to the Cities of Santa Clara, Sunnyvale, and San José, a project is said to create an adverse effect at a signalized intersection if for either peak hour, either of the following conditions occurs:

1. The level of service at the intersection drops below its respective level of service standard (LOS D or better for all San José intersections and local intersections in Santa Clara and Sunnyvale and LOS E or better for CMP and regionally significant intersections in Santa Clara and Sunnyvale) when project traffic is added, or
2. An intersection that operates below its level of service standard under no-project conditions experiences an increase in critical-movement delay of four (4) or more seconds, and an increase in critical volume-to-capacity ratio (v/c) of one percent (0.01) or more when project traffic is added.

The exception to this criterion is when the addition of project traffic reduces the amount of average control delay for critical movements, i.e., the change in average control delay for critical movements are negative. In this case, the criterion is when the project increases the critical v/c value by 0.01 or more.

Although adverse effects on intersection operations do not constitute significant impacts under CEQA, the City may require developers to implement improvements to address deficiencies in the local transportation network. Adverse effects at signalized intersections can be addressed by one of the following approaches:

- Construct or pay a fair share towards improvements to the subject intersection or proximate to the intersection to increase overall capacity (e.g., traffic signal modifications, construction of additional turn lanes), or

- Construct or pay a fair share towards improvements to the pedestrian or bicycle facilities within the intersection or proximate to the intersection, or
- Construct or pay a fair share towards improved access to transit or transit facility proximate to the intersection, or
- Implement transportation demand management (TDM) measures that will reduce the project traffic at the intersection and improve the deficiency.

Unsignalized Intersections

The City of Santa Clara has not established criteria to define adverse effects for unsignalized intersections. The determination of appropriate improvements to unsignalized intersections typically includes a qualitative and quantitative analysis of movement delay, movement traffic volumes, intersection safety, and need for signalization. For this reason, adverse effects, and the associated improvements to unsignalized intersections are frequently determined on the basis of professional judgment. Like at signalized intersections, adverse effects at unsignalized intersections do not constitute significant impacts under CEQA.

For this study, the following criteria were used to determine if the project would create an adverse effect on traffic conditions at an unsignalized intersection:

1. The addition of project traffic causes the average intersection delay to degrade to LOS E or worse, and
2. The intersection satisfies the California Manual of Uniform Traffic Control Devices (CA MUTCD) peak-hour volume signal warrant.

Freeway Segments and Ramps

In Santa Clara County, a development is said to create a deficiency at a CMP freeway segment if for either peak hour:

1. The level of service on the freeway segment degrades from an acceptable LOS E or better under existing conditions to an unacceptable LOS F under project conditions or,
2. The level of service on the freeway segment is an unacceptable LOS F under project conditions, and the number of project trips on that segment constitutes at least one percent (0.01) of capacity on that segment.

The VTA does not provide thresholds for acceptable freeway ramp operations; however, the City of Santa Clara considers ramps operating at less than their capacity (less than a volume capacity ratio of 1.00) to be acceptable. For the purpose of this study, the project is said to create a deficiency at a freeway ramp if its implementation:

1. Causes the volume-to-capacity (V/C) ratio of the freeway ramp to exceed 1.0; or
2. Increases the amount of traffic on a freeway ramp that is already exceeding its capacity by more than one percent (1%) of the ramp's capacity.

Report Organization

This report has a total of six chapters. Chapter 2 describes the existing roadway network, transit service, bicycle and pedestrian facilities, and intersection levels of service. Chapter 3 presents the intersection levels of service under background conditions with the addition of traffic from future development and planned transportation improvements anticipated to occur by the year 2030. Chapter

4 describes the method used to forecast 2030 traffic volumes with the proposed Patrick Henry Drive Specific Plan, the resulting intersection levels of service, and potential improvements recommended to address deficiencies identified under background plus project conditions both with and without the proposed new roadway connection to Mission College Boulevard. Chapter 5 presents the traffic conditions in the study area under cumulative conditions with the addition of traffic from future development and planned transportation improvements anticipated to occur by the year 2040. Cumulative conditions were evaluated both without and with the Patrick Henry Drive Specific Plan development. Cumulative plus project conditions were analyzed both with and without the proposed new roadway connection between Patrick Henry Drive and Mission College Boulevard. Chapter 6 presents the analysis of other transportation-related issues, including freeway segment analysis, freeway ramp analysis, vehicle queuing, signal warrants, internal vehicular circulation, hazards, emergency access, and impacts on bicycle, pedestrian, and transit facilities.

2. Existing Conditions

This chapter describes the existing conditions for transportation facilities in the vicinity of the site, including the roadway network, transit services, pedestrian and bicycle facilities, and traffic operations at the study intersections. It should be noted that existing conditions presented in this chapter reflect traffic conditions in 2018/2019, prior to the recent reductions in traffic volumes and transit services associated with the current pandemic.

Existing Roadway Network

Regional access to the project area is provided via US 101 and SR 237. These roads are described below.

US 101 is an eight-lane freeway with three mixed-flow lanes and one high-occupancy vehicle (HOV) lane in each direction in the vicinity of the site. It extends north through San Francisco and south through Gilroy. Regional access to the project site is provided via its interchanges with Great America Parkway and Lawrence Expressway.

SR 237 is a four-lane to six-lane freeway within the vicinity of the study area that extends west to El Camino Real and east to I-880 in Milpitas. East of Mathilda Avenue, SR 237 has two mixed-flow lanes and one HOV lane in each direction. West of Mathilda Avenue, SR 237 has two mixed-flow lanes in each direction. SR 237 provides access to the study area via its interchanges at Great America Parkway and Lawrence Expressway.

Major roadways serving the Plan Area include Lawrence Expressway, Montague Expressway, Great America Parkway, Bowers Avenue, Mission College Boulevard, and Tasman Drive. Local roads serving the Plan Area include Patrick Henry Drive, Old Ironside Drive, and Old Glory Lane.

Lawrence Expressway is a north-south, eight-lane expressway with a raised median and a posted speed limit of 50 mph. It begins at Saratoga Avenue in the south, crosses through Sunnyvale, and extends northward where it transitions into Caribbean Drive at SR 237. HOV lanes are present on Lawrence Expressway between Stevens Creek Boulevard and Arques Avenue. Lawrence Expressway connects with US 101 and SR 237 via full-access freeway interchanges. Lawrence Expressway includes sidewalks along both sides on most segments and crosswalks at signalized intersections. There are no bike lanes on Lawrence Expressway, but bikes are allowed to ride on the shoulders. On-street parking is not permitted.

Montague Expressway is an east-west expressway that begins at US 101 and extends northeastward to Milpitas where it transitions into Landess Avenue at I-680. Full interchanges are located at I-680, I-880, and US 101. Montague Expressway transitions to San Tomas Expressway at US 101. West of McCarthy Boulevard, Montague Expressway has carpool lanes (also known as high-occupancy vehicle

(HOV) lanes). The HOV lane designation is in effect in both directions of travel during both the AM and PM peak commute hours. During other times, the lane is open to all users.

Central Expressway is a six-lane east-west expressway that begins at De La Cruz Boulevard and extends westward to San Antonio Road where it transitions into Alma Street in Mountain View. East of San Tomas Expressway, Central Expressway has HOV lanes. It has a posted speed limit of 50 miles per hour (mph).

Great America Parkway is a north-south thoroughfare that begins at US 101 and extends northward to SR 237. Full interchanges are located at both US 101 and SR 237. Great America Parkway is primarily a six-lane roadway with a raised median and a posted speed limit of 40 mph. There is an additional northbound lane between Tasman Drive and US 101. Bike lanes are present along both directions of the roadway and on-street parking is not permitted. There are sidewalks on both sides of the street for the whole length of the roadway. Great America Parkway serves the east boundary of the Patrick Henry Drive Specific Plan Area and provides access to and from the project site via its intersections with Patrick Henry Drive and Old Glory Lane.

Bowers Avenue is a six-lane north-south street north of Kifer Road, and a four-lane street south of Kifer Road. It transitions from Great America Parkway north of US 101 and extends southerly to El Camino Real, where it transitions to Kiely Boulevard. Bowers Avenue has a speed limit of 35 mph. Bike lanes exist along most of Bowers Avenue except between Central Expressway and Kifer Road.

Tasman Drive is an east-west, two-lane to four-lane roadway with a posted speed limit of 40 mph in the project vicinity. Tasman Drive begins at Morse Avenue in the west and extends east past I-880 and transitions into Great Mall Parkway. The VTA Light Rail tracks are present in the middle of Tasman Drive east of Fair Oaks Avenue. Tasman Drive includes sidewalks along most segments and crosswalks at signalized intersections. Bike routes or lanes are provided, and on-street parking is prohibited within the project vicinity.

Mission College Boulevard to the west of Great America Parkway is a loop road circumnavigating Mission College and the Mercado Shopping Center. The eastern portion of Mission College Boulevard is a four-lane east-west thoroughfare, running between Great America Parkway and Montague Expressway.

Old Glory Lane serves as the primary entrance to the Great America Amusement Park east of Great America Parkway. West of Great America Parkway, Old Glory Lane is a two-lane roadway with a raised center median that connects to Old Ironsides Drive. Old Glory Lane and the Hetch Hetchy right-of-way form the northern boundary of the Plan Area.

Old Ironsides Drive is a two-lane roadway with a center two-way left-turn lane that runs between Tasman Drive and Patrick Henry Drive. Old Ironsides Drive provides direct access to and from the Plan Area. On-street parking is prohibited along Old Ironsides Drive. The speed limit on Old Ironsides Drive is 25 mph.

Patrick Henry Drive is a two-lane roadway with center two-way left-turn lane that runs between Tasman Drive and Great America Parkway. The speed limit on Patrick Henry Drive is 25 mph. On-street parking is prohibited. Between Great America Parkway and Old Ironsides Drive, sidewalks are available on both sides of Patrick Henry Drive. West of Old Ironsides Drive, Sidewalks are available on the west and south sides of the roadway and only a small section on the north side of the road. Patrick Henry Drive runs through the Plan Area and provides direct access to and from the development in the Plan Area.

Existing Pedestrian Facilities

Pedestrian facilities consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections (Figure 3). In the project vicinity, sidewalks and separated pedestrian walkways are provided on the following roadways:

- Both sides of Patrick Henry Drive between Great America Parkway and Old Ironsides Drive
- South and west sides of Patrick Henry Drive between Old Ironsides Drive and Democracy Way
- Both sides of Patrick Henry Drive between Democracy Way and Tasman Drive
- North side of Patrick Henry Drive for a small section west of Old Ironsides Drive
- East side of Old Ironsides Drive between Patrick Henry Drive and Tasman Drive
- West side of Old Ironsides Drive, north of Patrick Henry Drive for approximately 700 feet
- Both sides of Old Glory Lane between Great America Parkway and Old Ironsides Drive
- Both sides of Mission College Boulevard
- One or both sides of the Mission College Boulevard Loop (see Figure 3 for details)
- Both sides of Great America Parkway
- Both sides of Tasman Drive
- Both sides of Freedom Circle

Crosswalks are provided at the following intersections in the immediate vicinity of the project site:

- Old Ironsides Drive and Patrick Henry Drive
- Great America Parkway and Patrick Henry Drive
- Old Ironsides Drive and Old Glory Lane
- Great America Parkway and Old Glory Lane
- Old Ironsides Drive and Democracy Way
- Old Ironsides Drive and Tasman Drive
- Patrick Henry Drive and Tasman Drive
- Patrick Henry Drive and Democracy Way
- Midblock on Patrick Henry Drive

All of the crosswalks at the signalized study intersections include pedestrian signal heads and push buttons. However, the existing pedestrian transition at some intersections as shown on Figure 3 does not comply with Americans with Disabilities Act (ADA) guidelines.

Pedestrians are permitted to use the shared-use paths such as the Calabazas Creek Trail, which is immediately adjacent to the western edge of the Plan Area, as well as other trails described below.

Existing Bicycle Facilities

The bicycle facilities that exist in the project vicinity (see Figure 4) include multi-use trails/paths (Class I bikeway), striped bike lanes (Class II bikeway), and shared bike routes (Class III bikeway).

Class I Trail or Path is an off-street path with exclusive right-of-way for non-motorized transportation used for commuting as well as recreation.

The San Tomas Aquino Creek trail extends from Sunnyvale Baylands Park, north of SR 237, southward to San Tomas Expressway, where it connects to a bike path along the west side of San Tomas Expressway north of Cabrillo Avenue and extends southward to Homestead Road. The trail connects to bike lanes on Great America Parkway, Tasman Drive and Mission College Boulevard.

The Calabazas Creek Trail connects Mountain View-Alviso Road to Mission College and passes near Levi's Stadium. This trail can be accessed via Tasman Drive or Mission College Boulevard. A pedestrian/bike bridge connects the Calabazas Creek Trail with the John W. Christian Greenbelt near the northwestern corner of the Patrick Henry Drive Specific Plan Area.

The John W. Christian Greenbelt is a shared-use path that extends from the Calabazas Creek Trail westward into Sunnyvale to Blazingwood Drive near the Lawrence Expressway/Lakehaven Drive/Sandia Avenue intersection.

The Guadalupe River Trail is located approximately 2.0 miles east of the Plan Area. The northern segment of this trail begins at Gold Street in Alviso and connects to the SR 237 Bikeway. Continuing south, the trail passes beneath most roadways, including SR 237, US 101 and I-880 and connects to downtown San José. The trail can be accessed via the bike lanes on Tasman Drive, a pathway from Lick Mill Boulevard through Thamien Park, and from Montague Expressway.

The Baylands Park Trail is located north of the specific Plan Area and runs from the Baylands Park in Sunnyvale and tracks parallel to Hwy 237. It serves as the northern trailhead for some of the South Bay's major north to south trails including the Calabazas Creek Trail, the San Tomas Aquino Creek Trail, and the Guadalupe River Trail.

Class II Bike Lanes are lanes on roadways designated for use by bicycles with special lane markings. Within a one-mile radius of the project site, striped bike lanes are present along the following roadway segments:

- Great America Parkway, south of Great America Way (except for a small segment just north and south of Mission College Boulevard)
- Tasman Drive, east of Patrick Henry Drive and west of Calabazas Creek Trail
- Mission College Boulevard, from Montague Expressway to west of Great America Parkway at Marriott Driveway
- Mission College Boulevard Loop south of the intersection at Mission College Blvd
- Bowers Avenue, from Chromite Drive extending onto Great America Parkway
- Lafayette Street, from Gold Street Connector to Agnew Road
- Old Mountain View-Alviso/Lawrence Station Road, from Elko Drive to Great America Parkway
- Agnew Road, from San Tomas Aquino Creek Trail to Montague Expressway
- Elko Drive, from Reamwood Avenue to Lawrence Expressway
- Reamwood Avenue, from Tasman Drive to Elko Drive
- Scott Boulevard, from Monroe Street to Arques Avenue
- Lakeside Drive, from Scott Boulevard to Arques Avenue
- Oakmead Parkway, from Central Expressway to Lawrence Expressway
- Octavius Drive, from Scott Boulevard to Montgomery Drive
- Hope Drive, from Lafayette Street to Lick Mill Boulevard
- N. First Street, from Liberty Street to Charcot Avenue
- River Oaks Parkway, from Guadalupe River Trail to Montague Expressway

Class III Bike Routes are streets designated for bike travel and shared with motor vehicles. Within a one-mile radius of the project site, bike routes are present along the following roadway segments:

- Great America Way, from Great America Parkway to Lafayette Street

Bicycles are also permitted on Central Expressway, Lawrence Expressway, and Montague Expressway. However, due to high speeds and traffic volumes, the expressways are recommended for use only by bicyclists of intermediate to advanced skills.

Existing Transit Services

Existing transit services within the study area are provided by the VTA, the San Joaquin Regional Rail Commission (SJRRC), and the Capitol Corridor Joint Powers Authority. The following discussion of the project's accessibility via transit is based on transit service as of February 2020, prior to the temporary reductions in transit service that have been implemented in response to the COVID-19 pandemic.

The VTA provides scheduled bus and light rail transit (LRT) routes through Santa Clara County. In the vicinity of the Patrick Henry Drive Specific Plan (PHDSP) Area, VTA provides rapid and local bus services as well as LRT service. VTA bus service near the PHDSP Area is provided along Tasman Drive, Great America Parkway, Lawrence Expressway, Mission College Boulevard, and Agnew Road with the closest VTA bus stops located on Tasman Drive, Great America Parkway, and Mission College Boulevard. VTA LRT service includes the Mountain View-Alum Rock (Orange) LRT line and the Winchester-Old Ironsides (Green) LRT line, which run along Tasman Drive in the project vicinity. Old Ironsides and Great America Stations are the nearest LRT stops to the PHDSP Area.

The SJRRC manages the Altamont Corridor Express (ACE) commuter rail service between the Central Valley and Silicon Valley with a shuttle that connects the PHDSP Area to the Great America Transit Station. There are several bus stops served by ACE shuttle along Patrick Henry Drive, Old Ironsides Drive, Tasman Drive, and Great America Parkway in the immediate vicinity of the PHDSP Area. The Capitol Corridor Joint Powers Authority also operates passenger train service operated by Amtrak between San José and Sacramento and the foothills of the Sierra Nevada with stops at the Great America Transit Station.

Although not within walking distance of the PHDSP Area, commuters to the Plan Area also use Caltrain, which provides commuter rail service from San Francisco in the north through San Mateo County to Santa Clara County in the south. Commuters to the study area can access the Sunnyvale and Santa Clara Caltrain Stations, which are located approximately five miles from the PHDSP Area, via VTA bus routes or a Caltrain shuttle.

Transit services within walking distance (½ mile) of the PHDSP Area are described below and illustrated on Figure 5.

Mountain View-Alum Rock (Orange) LRT line provides service with headways of 10-20 minutes during peak hours between Mountain View station and Alum Rock station.

Winchester-Old Ironsides (Green) LRT line provides service with headways of 10-20 minutes during peak hours between Winchester Station and Old Ironsides Station.

VTA Route 20 is a local route, which provides service with headways of 15 minutes during peak hours and 30 minutes during non-peak hours between Milpitas BART station and Sunnyvale Transit Center via Agnew Road near the project site.

VTA Route 55 is a local route, which provides service with headways of 30 minutes between Old Ironsides Station and De Anza College via Lawrence Expressway near the project site.

VTA Route 57 is a rapid route, which provides service with headways of 15 minutes between Old Ironsides Station and West Valley College via Great America Parkway near the project site.

VTA Route 59 is a local route, which provides service with headways of 30 minutes between Valley Fair and Baypointe station via Great America Parkway near the project site.

Figure 5
Existing Transit Services

Existing Lane Configurations and Traffic Volumes

The existing lane configurations at the study intersections were obtained from field observations (see Figure 6).

Existing traffic volumes were obtained from new turning movement counts collected in May 2019, between 7:00 and 9:00 AM and between 4:00 and 6:00 PM, and previously completed traffic studies. PM peak-hour counts for CMP intersections were obtained from the latest available CMP database for the 2018 CMP Annual Monitoring Report. Traffic counts for PM peak hours at Great America Parkway and Patrick Henry Drive from 2018/2019 are lower than 2016 counts. Thus, 2020 traffic volumes were estimated by applying a 2 percent annual growth factor to 2016 PM counts at this intersection. Traffic counts from 2018/2019 are not available for Lafayette Street and Calle De Luna. Thus, 2020 traffic volumes were estimated by applying a 2 percent annual growth factor to 2014 counts. The existing peak-hour intersection volumes are shown on Figure 7. The intersection turning-movement counts conducted for this analysis are presented in Appendix B.

Existing Intersection Levels of Service

The results of the intersection level of service analysis show that most of the study intersections currently are operating at acceptable levels of service (see Table 4). The following intersections operate below the level of service standard:

- 44. De la Cruz Boulevard and Central Expressway (AM peak hour)
- 47. N. 1st Street and Montague Expressway (AM and PM peak hours)
- 50. McCarthy Boulevard/O'Toole Avenue and Montague Expressway (PM peak hour)

Notes:
SCC = Santa Clara County, SC = Santa Clara, SJ = San Jose, SV = Sunnyvale
Bold indicates a substandard level of service.
1. Traffic counts from 2018/2019 are lower than 2016 counts. Thus, 2020 traffic volumes were estimated by applying a 2% annual growth factor to 2016 counts.
2. Traffic counts from 2018/2019 are not available. Thus, 2020 traffic volumes were estimated by applying a 2% annual growth factor to 2014 counts.

3. Background Conditions

Background conditions reflect Year 2030 traffic conditions without the land use development and transportation network changes envisioned under the proposed Patrick Henry Drive Specific Plan. This chapter describes background improvements assumed in the Year 2030 transportation network, the procedure used to forecast background traffic volumes, and the resulting traffic conditions.

Roadway Network Under Background Conditions

The Year 2030 forecasts produced using the CSC model reflect planned transportation improvements anticipated to occur by the Year 2030. Most notable is the planned BART extension into Silicon Valley. The base year (2018) CSC model reflects BART service that terminated at the Warm Springs/South Fremont Station. In June 2020, BART service commenced on the Phase I extension from Warm Springs to Milpitas and Berryessa/North San José. The Phase II BART extension into downtown San José and Santa Clara is assumed to be complete by 2030.

VTA light rail service also was modified at the end of 2019. While the base year (2018) model assumed that LRT service between Old Ironsides Station and Milpitas would require a transfer, the 2030 model reflects the current LRT lines. The Orange Line now offers direct LRT service with 15-minute headways from the PHDSP Area via the Old Ironsides Station to the Milpitas BART station as well as to the Moffett Park business park in Sunnyvale, Mountain View, and the Alum Rock area of San José. Similarly, the PHDSP Area will benefit from the Green Line, which provides direct LRT service with 15-minute headways from the Old Ironsides Station to downtown San José and Campbell. LRT service between the PHDSP Area and South San José would require a transfer to the Blue Line.

In addition, the 2030 model assumes the existing carpool (HOV) lanes on US 101 will be converted to express lanes. Carpools with three or more occupants will be permitted to use the express lane free of charge, while vehicles with two or fewer occupants must pay a fee to access the express lane.

The transportation network under background conditions is assumed to include the following improvements at study intersections. The intersection improvements are planned CIP projects or improvements that will be fully funded by Tasman East Specific Plan and City Place Phases 1, 2, and 3 developments. Figure 8 shows the lane configurations at the study intersections under background conditions.

10. Great America Parkway and SR 237 Westbound Ramps: restripe the southbound approach as one through/right-turn lane and one right-turn lane, add a second westbound right-turn lane and a third westbound left-turn lane and associated receiving lane under underpass.

Figure 8
Background No Project Lane Configurations

11. Great America Parkway and SR 237 Eastbound Ramps: add a third southbound through lane and a second eastbound right-turn lane.

12. Great America Parkway and Great America Way: add a second westbound right-turn lane with an overlap phase and a second southbound left-turn lane.

13. Great America Parkway and Old Mountain View-Alviso Road: add a second eastbound left-turn lane.

15. Great America Parkway and Tasman Drive: add a southbound right-turn lane and a third westbound left-turn lane.

18. Great America Parkway and Mission College Boulevard: add a third northbound left-turn lane, a third westbound left-turn lane, a second eastbound left-turn lane, and a westbound right-turn pocket.

39. Lick Mill Boulevard and Tasman Drive: reconfigure northbound and southbound approaches to include two left-turn lanes, one through lane, and one right-turn lane; change the northbound/southbound phasing from split to protected phasing; add a second westbound left-turn lane.

40. Lafayette Street and Calle De Luna: restripe the westbound approach to include one left-turn lane and one right-turn lane.

44. De la Cruz Boulevard and Central Expressway: add a third southbound through lane and a second southbound right-turn lane; add a second eastbound right-turn lane; add a third northbound left-turn lane and remove one northbound through lane.

45. Agnew Road/De La Cruz Boulevard and Montague Expressway: add a second northbound left-turn lane.

49. Trimble Road and Montague Expressway: construction of a flyover to serve westbound left turn traffic from Montague Expressway to southbound Trimble Road.

Background Traffic Volumes

Background traffic volumes were developed using the CSC travel demand forecasting model. In most locations, the model reflects anticipated growth according to ABAG 2030 land use projections. In the vicinity of the Plan Area, the model assumes completion of City Place Phases 1-3 and buildout of the Tasman East Specific Plan. For consistency, the trip estimates reported in the EIR for each of these developments was hard coded into the model. The proposed Kylli development is not assumed in 2030.

While the ABAG land use data do not reflect any growth in enrollment at Mission College from 2018 to 2030, the forecasts were modified to reflect a five percent increase in enrollment by the Year 2030 based on historic data obtained from the California Community Colleges Chancellor's Office.[2]

The existing land uses are assumed to remain unchanged within the Patrick Henry Drive Specific Plan Area. The trip generation estimates for the PHDSP Area under Background (2030) conditions were developed based on the land use type and size of existing uses and account for the current vacancy rate and trip reductions for transit use. 2030 ABAG employment data for the traffic analysis zones that

[2] https://datamart.cccco.edu/Students/Enrollment_Status.aspx

represent the PHDSP Area were modified to match more closely the ITE trip estimates for the existing uses. Table 5 presents the CSC model trip estimates for the existing uses within the PHDSP Area.

Table 5
Trip Generation Estimates for Existing Uses in the PHDSP Area

		Daily			AM Peak Hour					PM Peak Hour				
				Mode		Vehicle Trips			Mode		Vehicle Trips			Mode
		Rate	Trips	Share	Rate	In	Out	Total	Share	Rate	In	Out	Total	Share
Total Project Trips [1]														
Employment[2]	2,592 jobs	2.81	**7,276**	100.0%	0.25	535	115	**650**	100.0%	0.31	221	589	**810**	100.0%
Less External Public Transit Trips			(313)	4.3%		(39)	(8)	(47)	7.2%		(13)	(35)	(48)	5.9%
External Vehicle Trips			**6,963**	95.7%		**496**	**107**	**603**	92.8%		**208**	**554**	**762**	94.1%

[1] For comparison purposes, project trip estimates listed above do not include external bike/walk trips forecast by the CSC model since ITE trip rates reflect only vehicle trips.

[2] Existing uses occupy approximately 874,000 s.f. including a mix of office, research & development, industrial, data center, and church uses (excluding vacant space). Existing employment in the CSC model was adjusted so that the CSC model trip estimates would match ITE trip generation estimates.

Figure 9 shows the traffic volumes at the study intersections under background conditions.

Background Intersection Levels of Service

The results of the intersection level of service analysis show that the following 14 study intersections would operate at an unacceptable level of service (LOS E or worse for any San José intersection and locally controlled Santa Clara and Sunnyvale intersections and LOS F for CMP and expressway intersections in Santa Clara and Sunnyvale) during at least one peak hour under background conditions (see Table 6).

4. Lawrence Expressway and US101 Southbound Ramps (PM peak hour)
5. Lawrence Expressway and E. Arques Avenue (PM peak hour)
17. Great America Parkway and Patrick Henry Drive (PM peak hour)
23. Bowers Avenue and Central Expressway (AM and PM peak hours)
32. Mission College Boulevard and Montague Expressway (AM peak hour)
35. San Tomas Expressway and El Camino Real (AM peak hour)
39. Lick Mill Boulevard and Tasman Drive (PM Peak Hour)
42. Scott Street and Central Expressway (PM peak hour)
44. De La Cruz Boulevard and Central Expressway (AM peak hour)
45. Agnew Road/De La Cruz Boulevard and Montague Expressway (AM and PM peak hours)
47. N. 1st Street and Montague Expressway (AM and PM peak hours)
48. Zanker Road and Montague Expressway (AM and PM Peak hours)
49. Trimble Rd and Montague Expressway (PM peak hour)
50. McCarthy Boulevard/O'Toole Avenue and Montague Expressway (AM and PM peak hours)

All other study intersections would operate at acceptable levels during both the AM and PM peak hours of traffic. The intersection levels of service calculation sheets are included in Appendix B.

4.
Background Plus Project Conditions

This chapter describes background plus project traffic conditions. Background plus project conditions were evaluated relative to background conditions in order to determine potential project impacts.

Roadway Network Under Background Plus Project Conditions

The Patrick Henry Drive Specific Plan proposes a new roadway connection between Patrick Henry Drive and Mission College Boulevard Loop. This new roadway would provide a direct link between the Plan Area and Mission College and the Mercado shopping center located at the southwest quadrant of the Mission College Boulevard Loop. In addition, the roadway would provide a new connection between the Plan Area and Lawrence Expressway via Wildwood Avenue and a new access route for traffic traveling to and from the south on Great America Parkway. Lastly, the new roadway may be used by PHDSP Area residents traveling to and from Montague Expressway via Mission College Boulevard. In addition to serving traffic associated with the PHDSP Area development, the proposed roadway connection is expected to be used by other travelers to and from other developments in the vicinity. Because it is uncertain if Mission College District will consent to this new roadway connection, background plus project traffic conditions were analyzed both with and without this new roadway connection.

The roadway network under background plus project conditions would be the same as the background roadway network as described in Chapter 3 at all study intersections.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear were estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment, the project trips are assigned to specific streets and intersections. These procedures are described below.

Trip Generation

Vehicle trips generated by development of the Patrick Henry Drive Specific Plan Area were estimated using the trip rates for a general Urban/Suburban area published in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual, 10th Edition (2017).* For residential land uses, trips rates for "Multi-family Housing Mid-Rise" (Land Use 221) and "Multi-family Housing High-Rise" (Land Use 222) were used. As defined by the ITE, "mid-rise" multifamily housing are buildings that have between 3 and

10 floors, and "high-rise" multifamily housing are buildings that have more than 10 floors. ITE trip rates for "General Office Building" (Land Use 710) were used for office uses, "Shopping Center" (Land Use 820) trip rates were used for retail uses, "Library" (Land Use 590) trip rates were used for the library, and "Recreational Community Center" (Land Use 495) trip rates were used for the community center.

This report analyzes two mixed-use development options for the PHDSP Area. The first option would include approximately 12,000 residential units, 310,000 square feet (s.f.) of non-residential uses, including 150,000 s.f. of retail space, a 45,000 s.f. library, a 25,000 s.f. community center, and 90,000 s.f. of flex space, which is assumed to be an equal mix of office space, retail space, and residential amenity space, which is assumed to serve residents only and thus generate no external vehicle trips. The second option would be the same as the first but would substitute office for high-density residential in the "High Density Flex" zone along the east edge of the Plan Area, reducing the total residential development within the Plan Area by 1,700 units and adding 785,000 s.f. of office space.

As shown in Table 7, development of PHDSP option 1 is estimated to generate 71,303 gross daily vehicle trips, 4,359 (1,221 inbound and 3,138 outbound) gross AM peak hour trips, and 6,020 (3,511 inbound and 2,509 outbound) gross PM peak hour trips. As shown in Table 8, development of PHDSP option 2 is estimated to generate 69,701 gross daily vehicle trips, 4,657 (1,845 inbound and 2,812 outbound) gross AM peak hour trips, and 6,174 (3,199 inbound and 2,975 outbound) gross PM peak hour trips.

Source: Trip rates from ITE *Trip Generation Manual, 10th Edition,* 2017. Internal and transit trip reductions derived from CSC travel demand model.
[1]Residential amenities are assumed to serve residents only and thus generate no external vehicle trips.

Since this PHDSP would include a mix of land uses, a portion of the trips generated by Plan Area developments will both begin and end within the PHDSP Area, also known as internal trips. Some trips to and from the Plan Area will also occur using alternative modes of travel like public transit. The Year 2030 CSC travel demand forecasting model was used to estimate trip reductions for internalization and transit usage under background conditions. The model estimates that approximately 10 percent of the daily trips and 4 percent of the AM and PM peak hour trips would be internal within the PHDSP. Internal trips are assumed to be made via an alternative mode such as walking or bicycling. Transit trips are estimated to comprise roughly 14 to 19 percent of all trips.

The project also includes retail uses, which attract some of their customers from people who are passing by the site as they head to their destination. These customers do not need to make a separate vehicle trip to come to the project site. Such vehicle trips are categorized as pass-by trips as they are not new trips generated on the roadway network and are credited from the project trip generation. The pass-by trip reduction for the retail land uses is assumed to be 25 percent for daily, AM and PM peak hours.

After applying the internal capture, transit, and pass-by reductions, the development of PHDSP option 1 is expected to generate 51,700 net daily vehicle trips, 3,318 (898 inbound and 2,420 outbound) net AM peak hour trips, and 4,764 (2,801 inbound and 1,963 outbound) net PM peak hour trips under background plus project conditions. The development of PHDSP option 2 is expected to generate 50,500 net daily vehicle trips, 3,540 (1,351 inbound and 2,189 outbound) net AM peak hour trips, and 4,810 (2,517 inbound and 2,293 outbound) net PM peak hour trips under background plus project conditions.

Trip Distribution and Assignment

The net project trip estimates were hard coded into the CSC model, which was then used to determine the distribution and assignment of project trips. Note that the trip estimates presented in Tables 7 and 8 do not include any credits for existing use trips because the CSC model inputs need to reflect the total vehicle trips generated by the Plan Area rather than the incremental increase in trips beyond the existing trip generation.

The CSC model represents the entire PHDSP Area in a single traffic analysis zone (TAZ) with only a few connectors to the adjacent roadways. While the model is capable of estimating gross traffic patterns, it does not accurately model trip patterns at study intersections within and immediately adjacent to the Plan Area. Thus, a more detailed model of the PHDSP Area was created using the TRAFFIX software to refine the traffic forecasts for nearby study intersections on Tasman Drive, Great America Parkway, and Mission College Boulevard and study intersections within the Plan Area on Patrick Henry Drive and Old Ironsides Drive. The TRAFFIX model represents the future land uses anticipated within the PHDSP Area on a parcel level and includes the proposed new internal roadways within the Plan Area as well as the proposed new roadway connection between Patrick Henry Drive and Mission College Boulevard Loop.

In addition, while pass-by trips are not new trips to the study area, they are new to roadways within the PHDSP Area. Pass-by trips result in a reduction in through trips along Tasman Drive and Great America Parkway and an increase in turning movements to and from these roadways. Thus, pass-by trips were estimated manually and added to the affected intersections.

Background Plus Project Traffic Volumes

In addition to the new vehicle trips associated with developments within the PHDSP Area, model forecasts under background plus project conditions also reflect changes in background no project trips not associated with the Plan Area. For example, the introduction of a large number of residential units in an employment-rich area of northern Santa Clara is expected to cause changes in trip distribution patterns for background traffic, changes in the mode split choices of other travelers, and a diversion of some vehicles from one route to another in order to avoid the most congested routes and reduce travel time. In addition, the CSC model shows changes in background traffic patterns due to the proposed new roadway connection between Patrick Henry Drive and Mission College Boulevard Loop.

Figures 10 and 11 show the traffic volumes forecast under background plus project conditions with the proposed new roadway connection to Mission College Boulevard for PHDSP Options 1 and 2, respectively.

Background Plus Project Intersection Levels of Service with Mission College Boulevard Connection – Option 1

The results of the intersection level of service analysis (see Table 9) show that development of the PHDSP Area under Option 1 with the proposed new roadway connection to Mission College Boulevard would cause adverse effects at the following five intersections:

9. Old Ironsides Drive and Patrick Henry Drive (AM and PM peak hours)
17. Great America Parkway and Patrick Henry Drive (AM and PM peak hours)
23. Bowers Avenue and Central Expressway (AM and PM peak hours)
47. N. 1st Street and Montague Expressway (PM peak hour)
48. Zanker Road and Montague Expressway (PM peak hour)

The adverse effects and proposed improvements to alleviate the deficiencies are described below.

Notes:
Bold indicates a substandard level of service.
Bold indicates an adverse effect caused by the project.
OVFL indicates that the result is out of software calculation limits.

The following study intersections also would operate at unacceptable levels of service under background plus project conditions.

4. Lawrence Expressway and US 101 SB Ramps (PM peak hour)
32. Mission College Boulevard and Montague Expressway (AM peak hour)
35. San Tomas Expressway and El Camino Real (AM peak hour)
42. Scott Boulevard and Central Expressway (PM peak hour)
44. De la Cruz Boulevard and Central Expressway (AM peak hour)
45. Agnew Road/De la Cruz Boulevard and Montague Expressway (AM and PM peak hours)
49. Trimble Road and Montague Expressway (PM peak hour)
50. McCarthy Boulevard/O'Toole Avenue and Montague Expressway (AM and PM peak hours)

However, since the development of the PHDSP Area under Option 1 would not cause the critical-movement delay at the signalized intersections listed above to increase by four or more seconds and the V/C to increase by one percent (0.01) or more compared to background conditions, the project would not have an adverse effect on the operation of those intersections. The level of service calculation sheets are included in Appendix B.

Adverse Effects and Recommended Improvements – Option 1

This section discusses the adverse effects identified under background plus project conditions with the proposed new roadway connection to Mission College Boulevard and proposed improvements to address the deficiencies under Option 1. Adverse effects on intersection operations do not constitute significant impacts under CEQA.

In addition to physical improvements recommended to resolve deficiencies at affected intersections, the PHDSP will include travel demand management (TDM) measures that could reduce the vehicle trips below the level documented in this report. The City of Santa Clara's Climate Action Plan requires a 20 percent reduction in vehicle miles traveled for high density residential developments and high intensity office/R&D developments north of Caltrain, of which 10 percent must come from TDM. A sensitivity analysis was conducted to determine if a reduction in project vehicle trips due to TDM would avoid any of the adverse effects at study intersections.

9. Old Ironsides Drive and Patrick Henry Drive

This unsignalized intersection in the City of Santa Clara would operate at an acceptable LOS A under background conditions during the AM and PM peak hours. The development of the PHDSP under Option 1 would cause the intersection to degrade to an unacceptable LOS F during the AM and PM peak hours. Furthermore, the intersection is expected to satisfy the peak-hour signal warrant. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by installing a traffic signal. In addition, when the adjacent property on the south side of Patrick Henry Drive redevelops, it is assumed that the site driveway would be relocated to align with Old Ironsides Drive and a westbound left-turn pocket would be added leading to a relocated driveway. With these improvements and a 10 percent TDM reduction, the intersection is expected to operate at an acceptable LOS C during the AM and PM peak hours under background plus project conditions. These improvements should be fully funded by the PHDSP Area developments.

17. Great America Parkway and Patrick Henry Drive

This City of Santa Clara intersection would operate at an acceptable LOS C during the AM peak hour and an unacceptable LOS E during the PM peak hour under background conditions. The development of the PHDSP under Option 1 would cause the intersection to degrade to LOS F during the AM peak

hour and cause average critical movement delay to increase by 283.9 seconds and the critical v/c to increase by 0.669 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by constructing a second northbound left-turn lane and implementing TDM measures to reduce the vehicle trips associated with the PHDSP Area. With the recommended improvement and a 10 percent TDM reduction, the intersection is expected to operate at an acceptable LOS D during both peak hours under background plus project conditions. The cost of this improvement will be fully funded by PHDSP Area developments.

23. Bowers Avenue and Central Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under background conditions during the AM and PM peak hours. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by 5.4 and 5.0 seconds and the critical v/c to increase by 0.040 and 0.012 during the AM and PM peak hours, respectively. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The County identified the need for a grade-separated interchange at this location as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

47. N. 1st Street and Montague Expressway

This CMP intersection in the City of San José would operate at an unacceptable LOS F under background conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by 12.1 seconds and the critical v/c to increase by 0.021 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development and lessen the adverse effect. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The County identified the need for a grade-separated interchange at this location as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

48. Zanker Road and Montague Expressway

This CMP intersection in the City of San José would operate at an unacceptable LOS E under background conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by 9.0 seconds and the critical v/c to increase by 0.030 during the PM peak hour. This constitutes an adverse effect on intersection operations.

The City of San José plans to widen Zanker Road to three lanes in each direction from River Oaks Parkway to Trimble Road and to add a second left-turn lane on both the northbound and southbound approaches. This improvement is anticipated to be complete sometime between the Year 2030 and 2040. Thus, this improvement is assumed under cumulative conditions but not background conditions. This planned improvement and a 10 percent TDM reduction would cause the increase in critical movement delay to be less than four seconds such that the project would not be considered to have an

adverse effect on intersection operations. The PHDSP Area developments should either pay the North San José fee, or a fair-share contribution for the improvement, or a fair-share contribution for off-setting multimodal improvements based on the amount of Project's percent contribution of the traffic volume growth at the intersection.

Background Plus Project Intersection Levels of Service with Mission College Boulevard Connection – Option 2

The results of the intersection level of service analysis (see Table 10) show that development of the PHDSP Area under Option 2 with the proposed new roadway connection to Mission College Boulevard would cause adverse effects at the following five intersections:

9. Old Ironsides Drive and Patrick Henry Drive (AM and PM peak hours)
17. Great America Parkway and Patrick Henry Drive (AM and PM peak hours)
32. Mission College Boulevard/Thomas Road and Montague Expressway (PM peak hour)
47. N. 1st Street and Montague Expressway (PM peak hour)
48. Zanker Road and Montague Expressway (PM peak hour)

The adverse effects and proposed improvements to alleviate the deficiencies are described below.

The following study intersections also would operate at unacceptable levels of service under background plus project conditions.

4. Lawrence Expressway and US 101 SB Ramps (PM peak hour)
5. Lawrence Expressway and E. Arques Avenue (PM peak hour)
23. Bowers Avenue and Central Expressway (AM and PM peak hours)
33. San Tomas Expressway and Scott Boulevard (AM peak hour)
35. San Tomas Expressway and El Camino Real (AM peak hour)
42. Scott Boulevard and Central Expressway (PM peak hour)
44. De la Cruz Boulevard and Central Expressway (AM peak hour)
45. Agnew Road/De la Cruz Boulevard and Montague Expressway (AM and PM peak hours)

Notes:
Bold indicates a substandard level of service.
Bold indicates an adverse effect caused by the project.
OVFL indicates that the result is out of software calculation limits.

49. Trimble Road and Montague Expressway (PM peak hour)
50. McCarthy Boulevard/O'Toole Avenue and Montague Expressway (AM and PM peak hours)

However, since the development of the PHDSP Area under Option 2 would not cause the critical-movement delay at the above signalized intersections to increase by four or more seconds and the V/C to increase by one percent (0.01) or more compared to background conditions, the project would not have an adverse effect on the operation of those intersections. The level of service calculation sheets are included in Appendix C.

Adverse Effects and Recommended Improvements – Option 2

This section discusses the adverse effects identified under background plus project conditions with the proposed new roadway connection to Mission College Boulevard and proposed improvements to address the deficiencies under Option 2. As previously stated, adverse effects on intersection operations do not constitute significant impacts under CEQA.

In addition to physical improvements recommended to resolve deficiencies at affected intersections, the PHDSP will include TDM measures to achieve a 10 percent reduction in VMT per the City's Climate Action Plan. A sensitivity analysis was conducted to determine if a reduction in project vehicle trips due to TDM would avoid any of the adverse effects at any study intersections.

9. Old Ironsides Drive and Patrick Henry Drive

This unsignalized intersection in the City of Santa Clara would operate at an acceptable LOS A under background conditions during the both peak hours. The development of the PHDSP under Option 2 would cause the intersection to degrade to an unacceptable LOS F during the both peak hours. Furthermore, the intersection is expected to satisfy the peak-hour signal warrant. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by installing a traffic signal. In addition, when the adjacent property on the south side of Patrick Henry Drive redevelops, it is assumed that the site driveway would be relocated to align with Old Ironsides Drive and a westbound left-turn pocket would be added leading to a relocated driveway. With these improvements and a 10 percent TDM reduction, the intersection is expected to operate at an acceptable LOS C and LOS D during the AM and PM peak hours, respectively, under background plus project conditions. These improvements should be fully funded by the PHDSP Area developments.

17. Great America Parkway and Patrick Henry Drive

This City of Santa Clara intersection would operate at an acceptable LOS C during the AM peak hour and an unacceptable LOS E during the PM peak hour under background conditions. The development of the PHDSP under Option 2 would cause the intersection to degrade to LOS F during the AM peak hour and cause the average critical movement delay to increase by 307.5 seconds and the critical v/c to increase by 0.723 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by constructing a second northbound left-turn lane and a second eastbound right-turn lane. Although intersection widening for dual right-turn lanes may improve vehicle operations, this improvement conflicts with bicycle and pedestrian policies within the City's *2010-2035 General Plan* (GP), *2018 Bicycle Master Plan* (BMP), and *2019 Pedestrian Master Plan* (PMP). Intersection widening is discouraged by GP Policy 5.8.2-P2 and PMP Policies 1.A.3, 2.A.1, and 2.A.4. Dual right-turn lanes result in challenges with visibility between turning vehicles and pedestrians (*Caltrans Highway Design Manual* 403.6(1)) and this conflicts with GP Policy 5.8.4-P13, BMP Policy 1.A.2 and PMP Policies 1.A.3 and 2.A.5. Furthermore, intersection widening reduces the width of

sidewalks and conflicts with GP Policy 5.8.2-P1 and the PMP Pedestrian Recommendation Toolbox. Therefore, intersection widening for dual right-turn lanes is not recommended. With only the recommended dual northbound left-turn lanes and a 10 percent TDM reduction, the intersection is expected to operate at an acceptable LOS D during the AM peak hour and an unacceptable LOS E during the PM peak hour under background plus project conditions. The cost of this improvement will be fully funded by PHDSP Area developments.

Developments within the PHDSP Area also will be responsible for construction of a Class IV separated bikeway on Patrick Henry Drive. This multimodal improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would encourage residents and employees to leave their vehicles at home by adding a physical barrier between the existing bike lane and the vehicular travel lane, thereby increasing the comfort level for cyclists. Within the Specific Plan area, the bikeway improvement will be constructed as part of the Plan. Outside the Specific Plan area, PHDSP area stakeholders will pay a fair share fee for future construction of the bikeway on the Patrick Henry Drive segment between the Plan Area and Tasman Drive.

32. Mission College Boulevard/Thomas Road and Montague Expressway

This CMP intersection in the City of Santa Clara would operate at an acceptable LOS E under background conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection to degrade to an unacceptable LOS F during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. A sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would reduce the average delay to 78.9 seconds per vehicle, which corresponds to an acceptable LOS E. Thus, TDM measures are expected to be sufficient to avoid the adverse effect without any physical improvements at this intersection.

47. N. 1st Street and Montague Expressway

This CMP intersection in the City of San José would operate at an unacceptable LOS F under background conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by 9.0 seconds and the critical v/c to increase by 0.018 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development and lessen the adverse effect. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The County identified the need for a grade-separated interchange at this location as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

48. Zanker Road and Montague Expressway

This CMP intersection in the City of San José would operate at an unacceptable LOS E under background conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by 5.8 seconds and the critical v/c to increase by 0.018 during the PM peak hour. This constitutes an adverse effect on intersection operations.

The City of San José plans to widen Zanker Road to three lanes in each direction from River Oaks Parkway to Trimble Road and to add a second left-turn lane on both the northbound and southbound

approaches. This improvement is anticipated to be complete sometime between the Year 2030 and 2040. Thus, this improvement is assumed under cumulative conditions but not background conditions. This planned improvement and a 10 percent TDM reduction would cause the increase in critical movement delay to be less than four seconds such that the project would not be considered to have an adverse effect on intersection operations. The PHDSP Area developments should either pay the North San José fee, or a fair-share contribution for the improvement, or a fair-share contribution for off-setting multimodal improvements based on the amount of Project's percent contribution of the traffic volume growth at the intersection.

Summary of Background Plus Project Conditions with Mission College Boulevard Connection

Table 11 presents a summary of the intersections that would be adversely affected under each project option and the improvements recommended under background plus project conditions with the proposed new roadway connection to Mission College Boulevard. The table also shows the development level triggering the need for each improvement both as a percentage of the PHDSP area buildout and as the total daily vehicle trips generated by all parcels within the PHDSP area. With the exception of planned improvements to intersections on County Expressways, to which the project would pay a fair-share contribution, the project will fully fund the improvements required to offset adverse effects identified under background plus project conditions. Funding commitments of individual stakeholders within the PHDSP area will be determined through an infrastructure fee.

Table 11
Summary of Affected Intersections under Background Plus Project Conditions with Mission College Boulevard Connection

#	Intersection	Jurisdiction	With Mission College Boulevard Connection Affected Scenario		Development Level Triggering Need for Improvement % (daily trips)		Recommended Improvements	Project Responsibility[1]
			Option 1	Option 2	Option 1	Option 2		
9	Old Ironsides Drive and Patrick Henry Drive *(Unsignalized)*	SC	**YES**	**YES**	1% (628)	2% (814)	Install a traffic signal Install WB LT lane when adjacent property develops	100% 100%
17	Great America Parkway and Patrick Henry Drive	SC	**YES**	**YES**	1% (773)	1% (698)	Opt. 1 & 2: Add a second northbound left-turn lane Opt. 2 only: Construct Class IV separated bikeway on Patrick Henry Drive within Plan area and from Plan area to Tasman Dr. (Bicycle Master Plan Update 2018)	100% 100% within Plan area fair share outside Plan area
23	Bowers Avenue and Central Expressway (CMP)	SCC	**YES**	NO	74% (38,296)	n/a	Construct grade separated interchange (2040 Expressway Plan)	% of Total Traffic
32	Mission College Blvd and Montague Expwy *(CMP)*	SCC	NO	**YES**	n/a	95% (47,877)	TDM Measures with 10% Trip Reduction	100%
47	N. 1st Street and Montague Expressway *(CMP)*	SCC	**YES**	**YES**	48% (24,619)	56% (28,056)	Construct grade separated interchange (2040 Expressway Plan)	% of Total Traffic
48	Zanker Road and Montague Expressway *(CMP)*	SCC	**YES**	**YES**	44% (22,978)	69% (34,828)	Widen Zanker Rd to 3 lanes in each direction from River Oaks Parkway to Trimble Rd and add a 2nd left-turn lane on both the NB and SB approaches (North San José Deficiency Plan)	Pay North San José fee or % of Total Traffic

Notes:

SCC = Santa Clara County, SC = Santa Clara, SJ = San Jose, SV = Sunnyvale

[1] "100%" = The cost and construction of the recommended improvement is the full responsibility of PHDSP area developements. These are discrete improvements that counter adverse effects caused by the project. "% of Total Traffic" = PHDSP area developements shall pay a fair-share contribution to the recommended improvement, which is typically a larger transportation improvement, such as an expressway interchange or bike lanes along a corridor, that has been identified in an adopted plan. "Pay North San José fee or % of Total Traffic" = PHDSP area developements can pay the North San José fee, or a fair-share contribution for the improvement, or a fair-share contribution for off-setting multimodal improvements based on the amount of Project's percent contribution of the traffic volume growth at the intersection.

Background Plus Project Intersection Levels of Service - without Mission College Boulevard Connection

The intersection operations analyses presented in the previous section assume that the Patrick Henry Drive Specific Plan would construct a new roadway connecting Patrick Henry Drive with the Mission College Boulevard loop. The new roadway connection would require the consent of Mission College as it would connect to a private roadway controlled by the College. Because it is uncertain if the College will consent to this new roadway connection, background traffic conditions also were analyzed without this new roadway connection.

As presented above, the analysis without the new roadway connection also covers two development options within the PHDSP Area. The analysis was limited to 10 key study intersections that would be substantially affected by the elimination of the proposed new roadway connection.

The elimination of this short roadway segment between Patrick Henry Drive and Mission College Boulevard is not expected to have an appreciable effect on the mode split or project trip distribution. Thus, traffic forecasts were developed for the new background scenarios by manually reassigning trips that had been forecast to use the new roadway connection to alternative routes. The following roadway segments are expected to experience an increase in traffic without the new roadway connection:

- Lawrence Expressway between Lakewood Drive/Bridgewood Way and Tasman Drive
- Tasman Drive between Lawrence Expressway and Old Ironsides Drive
- Mission College Boulevard between Wildwood Avenue and Great America Parkway (south side of the Mission College Boulevard loop)
- Great America Parkway between Mission College Boulevard and Old Glory Lane

Thus, the analysis was limited to the following 10 key study intersections that would be substantially affected by the elimination of the proposed new roadway connection:

1. Lawrence Expressway and Tasman Drive
2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive
6. Patrick Henry Drive and Tasman Drive
7. Old Ironsides Drive and Tasman Drive
8. Old Ironsides Drive and Old Glory Lane
9. Old Ironsides Drive and Patrick Henry Drive
16. Great America Parkway and Old Glory Lane
17. Great America Parkway and Patrick Henry Drive
18. Great America Parkway and Mission College Boulevard
25. Mission College Loop and Mission College Boulevard

The traffic volumes and level of service at the other 40 study intersections would be the same with or without the new roadway connection. The resulting background plus project traffic volume forecasts without the new roadway connection to Mission College Boulevard under PHDSP Options 1 and 2 are presented in Figures 12 and 13, respectively.

Background Plus Project Intersection Levels of Service without Mission College Boulevard Connection

The results of the intersection level of service analysis without the new roadway connection to Mission College Boulevard under PHDSP Options 1 and 2 are presented in Tables 12 and 13, respectively. Compared to the results of similar background plus project scenarios with the new roadway connection (see Tables 9 and 10), the elimination of the proposed new roadway connection would exacerbate traffic operations at many intersections and result in adverse effects at additional intersections.

Notes:
Bold indicates a substandard level of service.
Bold indicates an adverse effect caused by the project.
OVFL indicates that the result is out of software calculation limits.

Of the 10 study intersections evaluated without the proposed new roadway connection, the following 4 intersections would be adversely affected by development of the PHDSP Area under Option 1:

8. Old Ironsides Drive and Old Glory Lane (PM peak hour)
9. Old Ironsides Drive and Patrick Henry Drive (AM and PM peak hours)
16. Great America Parkway and Old Glory Lane (PM peak hour)
17. Great America Parkway and Patrick Henry Drive (AM and PM peak hours)

Under the development of the PHDSP Area under Option 2, the following 4 study intersections evaluated without the proposed new roadway connection would be adversely affected:

8. Old Ironsides Drive and Old Glory Lane (AM and PM peak hours)
9. Old Ironsides Drive and Patrick Henry Drive (AM and PM peak hours)
16. Great America Parkway and Old Glory Lane (PM peak hour)
17. Great America Parkway and Patrick Henry Drive (AM and PM peak hours)

The adverse effects identified in this analysis do not constitute significant impacts under CEQA. The intersection level of service calculation sheets are included in Appendix C.

Recommended Improvements Without Mission College Boulevard Connection

While the traffic volume forecasts would be higher without the new roadway connection to Mission College Boulevard exacerbating congestion at many study intersections, additional intersection improvements beyond those recommended in the previous chapters are not feasible at many locations. Thus, at most study intersections, the recommended improvements for adverse effects on intersection operations would be the same with or without the proposed new roadway connection (see Table 14). The following two intersections would require additional improvements without the roadway connection that were not identified in the previous section. The recommended improvements would be the same under PHDSP Option 1 and Option 2 unless stated otherwise.

8. Old Ironsides Drive and Old Glory Lane

With the proposed new roadway connection to Mission College Boulevard, this unsignalized intersection is expected to operate at an acceptable level of service and would not meet the peak-hour signal warrant under background plus project conditions. However, without the proposed roadway connection, the intersection would operate at an unacceptable level of service and would satisfy the peak-hour signal warrant during one or both peak hours under both PHDSP development options. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP development and lessen the adverse effect. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. Intersection operations could be improved to an acceptable LOS B during the peak hours by installing a traffic signal and achieving a 10 percent TDM reduction. The PHDSP Area developments should provide full funding for this new signal.

16. Great America Parkway and Old Glory Lane

This City of Santa Clara intersection is expected to operate at an acceptable LOS B or C during the PM peak hour under background plus project conditions with the proposed new roadway connection. However, without the proposed roadway connection, the intersection would degrade to an unacceptable LOS E and LOS F under PHDSP Option 1 and Option 2, respectively. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP development and lessen the adverse effect. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. Intersection operations could be improved to an acceptable LOS D by adding a second northbound left-turn lane and achieving a 10 percent TDM reduction. The PHDSP Area developments should provide full funding for this improvement.

Table 14
Summary of Affected Intersections under Background Plus Project Conditions without Mission College Blvd. Connection

#	Intersection	Jurisdiction	Without Mission College Boulevard Connection Affected Scenario		Development Level Triggering Need for Improvement % (daily trips)		Recommended Improvements	Project Responsibility[1]
			Option 1	Option 2	Option 1	Option 2

16	Great America Parkway and Old Glory Lane	SC	**YES**	**YES**	70% (36,294)	54% (28,145)	Add a second northbound left-turn lane	100%
17	Great America Parkway and Patrick Henry Drive	SC	**YES**	**YES**	1% (728)	1% (657)	Add a second northbound left-turn lane and Construct Class IV separated bikeway on Patrick Henry Drive within Plan area and from Plan area to Tasman Dr. (Bicycle Master Plan Update 2018)	100% 100% within Plan area fair share outside Plan area
23	Bowers Avenue and Central Expressway (CMP)	SCC	**YES**	NO	74% (38,296)	n/a	Construct grade separated interchange (2040 Expressway Plan)	% of Total Traffic
32	Mission College Blvd and Montague Expwy *(CMP)*	SCC	NO	**YES**	n/a	95% (47,877)	TDM Measures with 10% Trip Reduction	100%
47	N. 1st Street and Montague Expressway *(CMP)*	SCC	**YES**	**YES**	48% (24,619)	56% (28,056)	Construct grade separated interchange (2040 Expressway Plan)	% of Total Traffic
48	Zanker Road and Montague Expressway *(CMP)*	SCC	**YES**	**YES**	44% (22,978)	69% (34,828)	Widen Zanker Rd to 3 lanes in each direction from River Oaks Parkway to Trimble Rd and add a 2nd left-turn lane on both the NB and SB approaches (North San José Deficiency Plan)	Pay North San José fee or % of Total Traffic

Notes:
SCC = Santa Clara County, SC = Santa Clara, SJ = San Jose, SV = Sunnyvale

[1] "100%" = The cost and construction of the recommended improvement is the full responsibility of PHDSP area developements. These are discrete improvements that counter adverse effects caused by the project. "% of Total Traffic" = PHDSP area developements shall pay a fair-share contribution to the recommended improvement, which is typically a larger transportation improvement, such as an expressway interchange or bike lanes along a corridor, that has been identified in an adopted plan. "Pay North San José fee or % of Total Traffic" = PHDSP area developements can pay the North San José fee, or a fair-share contribution for the improvement, or a fair-share contribution for off-setting multimodal improvements based on the amount of Project's percent contribution of the traffic volume growth at the intersection.

5. Cumulative Conditions

This chapter describes the roadway traffic operations under cumulative no project conditions and cumulative plus project conditions. Cumulative conditions represent the Year 2040. Cumulative no project conditions include all anticipated developments in the area including the Freedom Circle Focus Area, except development of the Patrick Henry Drive Specific Plan Area. Cumulative plus project conditions were evaluated relative to cumulative no project conditions to identify adverse effects of the PHDSP Area development. As in the previous chapter, this report evaluates two development options in the PHDSP Area both with and without the proposed new vehicle connection from Patrick Henry Drive to Mission College Boulevard. This chapter describes cumulative improvements assumed in the Year 2040 transportation network, the procedure used to forecast cumulative traffic volumes, the resulting traffic conditions, and improvements recommended to alleviate adverse effects of the PHDSP Area development.

Roadway Network under Cumulative Conditions

The transportation network under cumulative conditions is assumed to include all of the background transportation improvements described in Chapter 3 plus the following additional improvements at study intersections. The intersection improvements are planned CIP projects and improvements that will be funded by City Place as mitigation for buildout of the project. Figure 14 shows the lane configurations at the study intersections under cumulative conditions.

38. Calle Del Sol and Tasman Drive: reconfigure southbound approach to include two left-turn lanes and one right-turn lane with overlap phase.

40. Lafayette Street and Calle De Luna: reconstruct the westbound approach to include two left-turn lanes and one right-turn lane.

41. Lafayette Street and Agnew Road: add a second eastbound left-turn lane and a second southbound left-turn lane.

42. Scott Boulevard and Central Expressway: convert Central Expressway HOV lane to mixed-flow lane, resulting in 3 mixed-flow lanes in each direction (eastbound and westbound).

43. Lafayette Street and Central Expressway: convert Central Expressway HOV lane to mixed-flow lane, resulting in 3 mixed-flow lanes in each direction (eastbound and westbound).

44. De la Cruz Boulevard and Central Expressway: convert Central Expressway HOV lane to mixed-flow lane, resulting in 3 mixed-flow lanes in eastbound direction.

46. Lick Mill Boulevard and Montague Expressway: add a third southbound left-turn lane.

Figure 14
Cumulative No Project Lane Configurations

48. Zanker Road and Montague Expressway: widen Zanker Road to three lanes in northbound and southbound directions from River Oaks Parkway to Trimble Road; Add a second northbound left-turn lane and a second southbound left-turn lane.

50. McCarthy Boulevard/O'Toole Avenue and Montague Expressway: construction of a "square-loop" interchange to replace the at-grade intersection.

Cumulative conditions with the project assume the above transportation improvements plus those described in Chapter 4 including the proposed new roadway connection between Patrick Henry Drive and Mission College Boulevard Loop and a change in the lane configuration at the intersection of Patrick Henry Drive and Old Ironsides Drive.

Cumulative Traffic Volumes

Cumulative No Project Traffic Volumes

Traffic volumes under cumulative no project conditions (see Figure 15) were estimated using the CSC travel demand forecast model. The model land use assumptions reflect ABAG 2040 land use projections in most locations. In the vicinity of the Plan Area, the model assumes buildout of City Place and the Tasman East Specific Plan Area as well as development of an additional 1,500 dwelling units per a proposed Amendment to the Tasman East Specific Plan.

Cumulative no project conditions also assume buildout of the proposed Kylli site located immediately north of the PHDSP Area and the Freedom Circle Focus Area located southeast of the PHDSP Area. As originally proposed, the Kylli mixed-use development totaled 10.61 million gross square feet. The application is currently on hold as Kylli works to prepare a reduced-density plan with reduced heights based on feedback from the FAA. While the reduced density plan has not yet been finalized, for the purpose of this analysis, the Kylli site is assumed to contain 3,170 residential dwelling units, 3,060,000 s.f. of office space, approximately 250,000 s.f. of retail/restaurant space, a 300-room hotel, a 600-student elementary school and a 160-student day care.

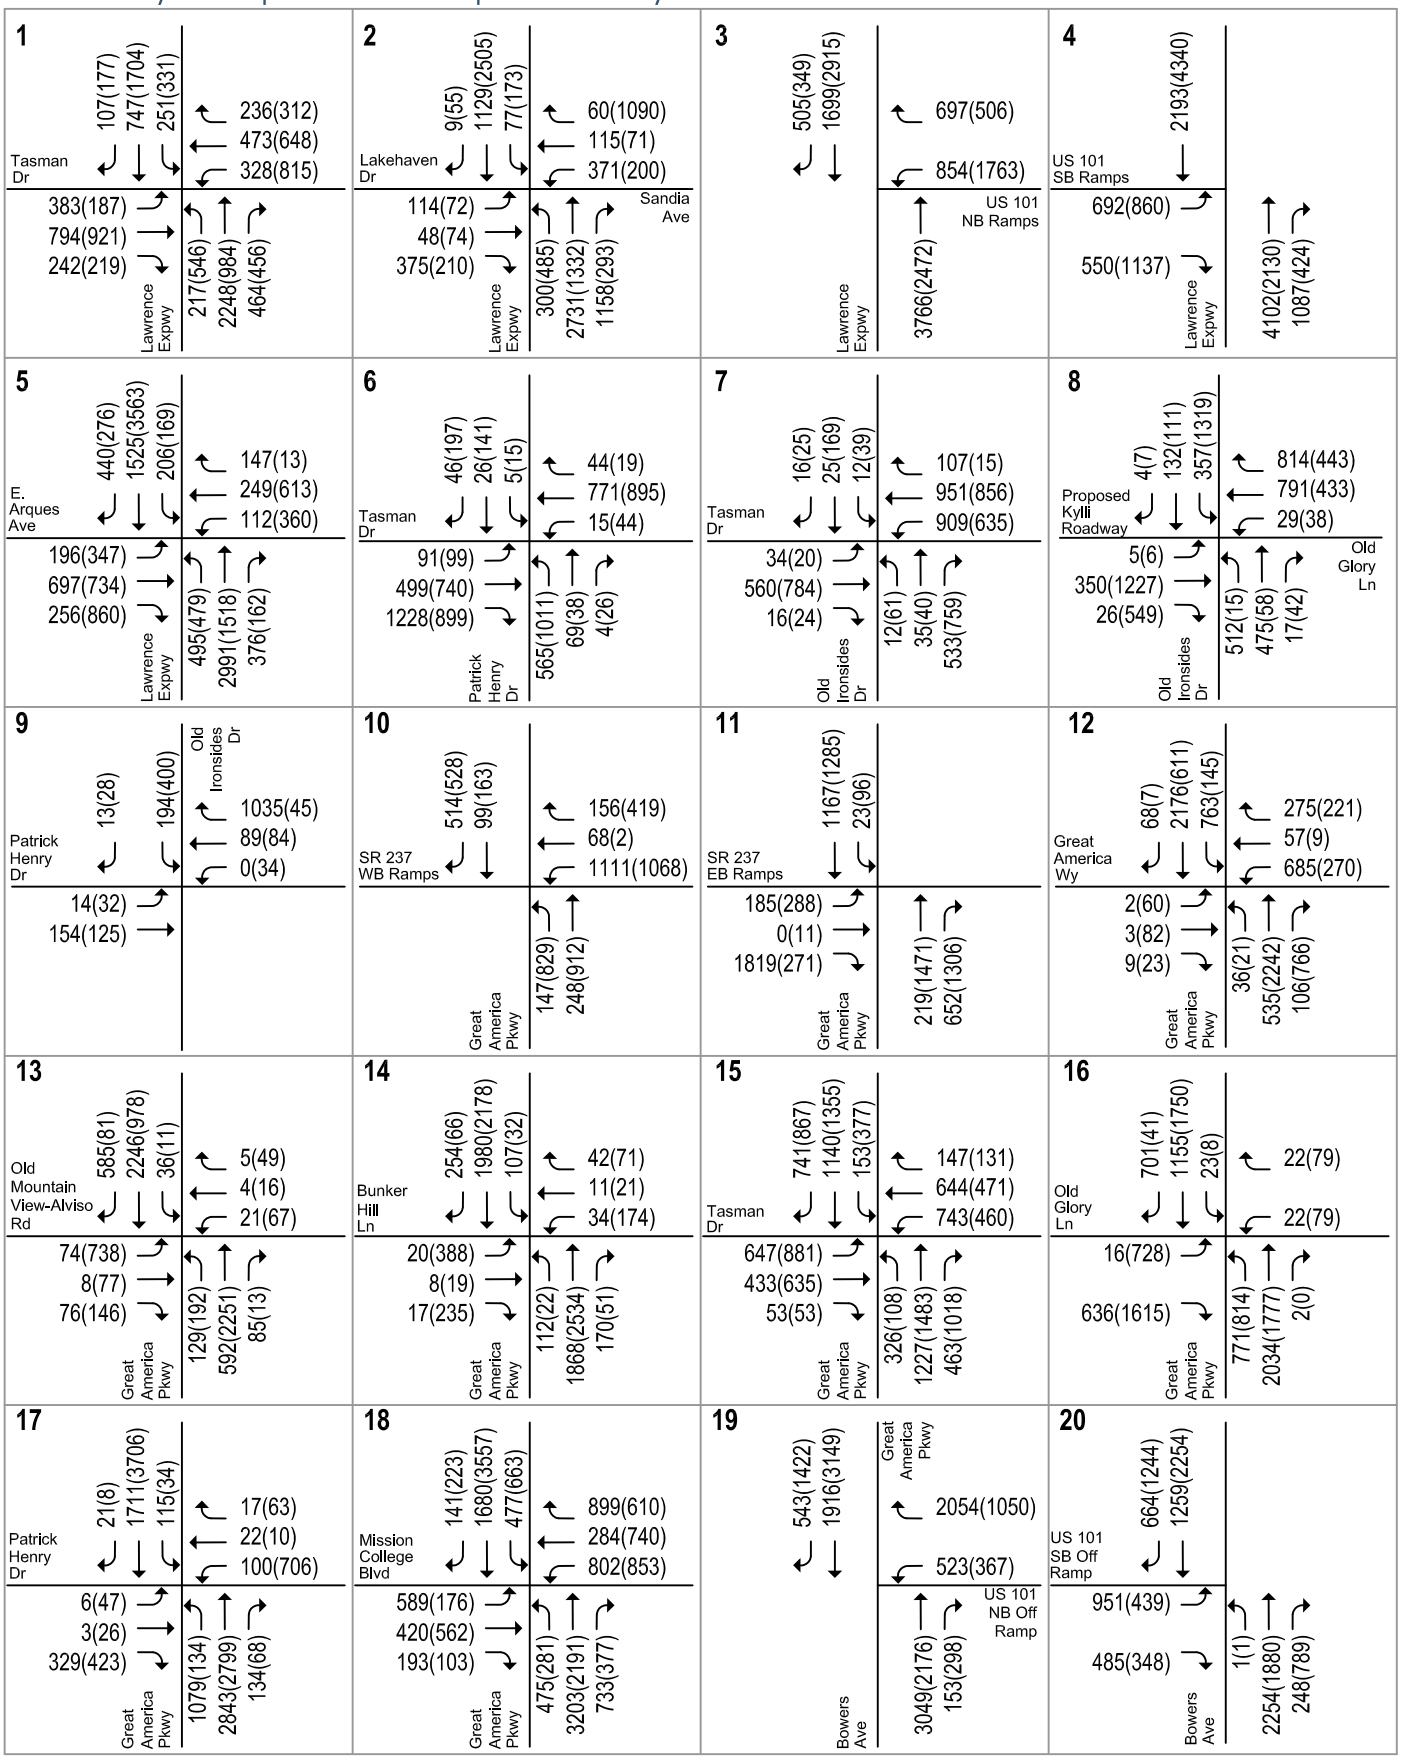
The Freedom Circle Focus Area land uses under this cumulative scenario are assumed to include existing employment plus ABAG projected employment growth (from 3,906 jobs under the Year 2018 baseline to 4,409 jobs in the Year 2040, an increase of approximately 13 percent), the completion of the approved 718,000 s.f. office development at 4301, 4401, 4551 Great America Parkway, and the construction of 2,000,000 s.f. of additional office space, 3,600 residential dwelling units (1,100 units on the Greystar site and the 2,500 units on the Irvine property), and 2,000 s.f. of retail space as permitted under the proposed Freedom Circle Focus Area Plan. The existing Marriott hotel is assumed to remain unchanged under cumulative conditions with the Focus Area employment growth divided among the other non-residential parcels.

Like under background no project conditions, cumulative no project conditions assume no growth in the existing employment within the Patrick Henry Drive Specific Plan Area.

While the ABAG land use data do not reflect any growth in enrollment at Mission College from 2018 to 2040, the forecasts were modified to reflect a ten percent increase in enrollment by the Year 2040 based on historic data obtained from the California Community Colleges Chancellor’s Office.

Cumulative Plus Project Traffic Volumes

Traffic volumes under cumulative plus project conditions with the proposed new roadway connection to Mission College Boulevard were estimated for both PHDSP Option 1 and Option 2 using the CSC travel demand forecast model. The land use assumptions outside the PHDSP Area are unchanged from the above cumulative no project scenario. The land uses assumptions within the PHDSP Area are



LEGEND

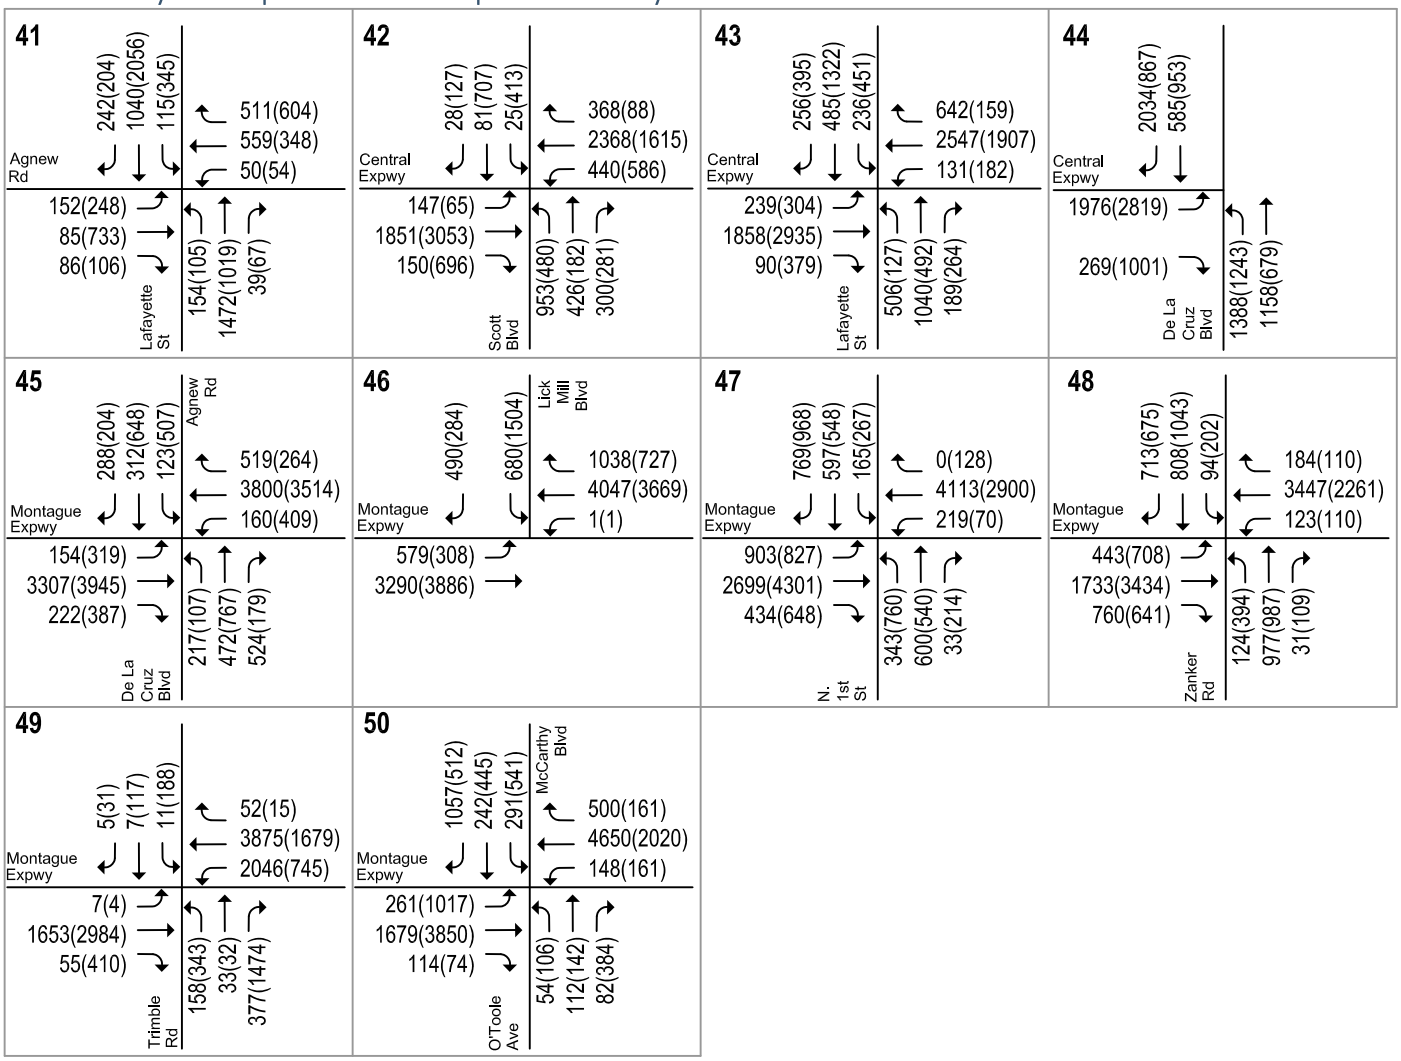
LEGEND

XX(XX) = AM(PM) Peak-Hour Traffic Volumes

Figure 15
Cumulative No Project Traffic Volumes



LEGEND

XX(XX) = AM(PM) Peak-Hour Traffic Volumes

Figure 15
Cumulative No Project Traffic Volumes

unchanged from those presented in Chapter 4. Like under background plus project conditions, the trips generated by the PHDSP Area development were estimated based on ITE trip rates, a 25-percent pass-by trip reduction for retail uses, and reductions for internal trips and transit usage based on CSC model estimates.

The gross project trips generated by the development of PHDSP Option 1 and Option 2 remain the same as described in Chapter 4. After applying the trip reductions, the PHDSP option 1 development is expected to generate 51,666 net daily vehicle trips, 3,253 (881 inbound and 2,372 outbound) net AM peak hour trips, and 4,698 (2,760 inbound and 1,938 outbound) net PM peak hour trips under cumulative conditions (see Table 15). PHDSP Option 2 development is expected to generate 50,157 net new daily vehicle trips, 3,420 (1,269 inbound and 2,151 outbound) net new AM peak hour trips, and 4,763 (2,494 inbound and 2,269 outbound) net new PM peak hour trips under cumulative conditions (see Table 16). See Figures 16 and 17 for traffic volumes under cumulative plus project conditions with the proposed new roadway connection to Mission College Boulevard.

Compared to the project trip estimates in the Year 2030 (see Tables 7 and 8 in the previous chapter), the Year 2040 project trip estimates reflect a slightly lower reduction for internal trips because nearby large developments assumed in the Year 2040 that were not included in the Year 2030 (e.g. the Kylli mixed-use project and the Freedom Circle Focus Area), attract some vehicle trips from the proposed project that would have been internal bike/walk trips in 2030. Conversely, the 2040 forecasts show a greater percentage of project trips would use transit than in 2030. This is due to the generally higher traffic volumes on area roadways in 2040, which cause increasing levels of roadway congestion and in turn make transit a relatively more attractive alternative in 2040 than in 2030.

Cumulative No Project Intersection Levels of Service

The results of the intersection level of service analysis show that the following 25 study intersections would operate at an unacceptable level during at least one peak hour under cumulative no project conditions (see Table 17).

1. Lawrence Expressway and Tasman Drive (PM peak hour)
2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive (AM and PM peak hours)
5. Lawrence Expressway and E. Arques Ave (PM peak hour)
8. Old Ironsides Drive and Old Glory Lane (AM and PM peak hours)
12. Great America Parkway and Great America Way (AM and PM peak hours)
16. Great America Parkway and Old Glory Lane (AM and PM peak hours)
17. Great America Parkway and Patrick Henry Drive (AM and PM peak hours)
18. Great America Parkway and Mission College Boulevard (AM and PM peak hours)
23. Bowers Avenue and Central Expressway (AM and PM peak hours)
27. Freedom Circle (W) and Mission College Boulevard (AM and PM peak hours)
28. Agnew Road/Freedom Circle (E) and Mission College Boulevard (PM peak hour)
32. Mission College Boulevard and Montague Expressway (AM and PM peak hours)
33. San Tomas Expressway and Scott Boulevard (AM peak hour)
35. San Tomas Expressway and El Camino Real (AM and PM peak hours)
37. Centennial Boulevard and Tasman Drive (AM peak hour)
39. Lick Mill Boulevard and Tasman Drive (AM and PM peak hours)
41. Lafayette Street and Agnew Road (AM and PM peak hour)
42. Scott Boulevard and Central Expressway (PM peak hour)
43. Lafayette Street and Central Expressway (PM peak hour)
44. De La Cruz Boulevard and Central Expressway (AM and PM peak hours)
45. Agnew Road/De La Cruz Boulevard and Montague Expressway (AM and PM peak hours)
46. Lick Mill Boulevard and Montague Expressway (PM peak hour)
47. N. 1st Street and Montague Expressway (AM and PM peak hours)
48. Zanker Road and Montague Expressway (AM and PM peak hours)
49. Trimble Road and Montague Expressway (PM peak hour)

All other study intersections would operate at acceptable levels during both the AM and PM peak hours of traffic. The intersection level of service calculation sheets are included in Appendix C.

Cumulative Plus Project Intersection Levels of Service with Mission College Boulevard Connection – Option 1

The results of the intersection level of service analysis under cumulative plus project conditions with the proposed new connection to Mission College Boulevard show that development of the PHDSP Area under Option 1 would cause adverse effects at the following 17 intersections (see Table 17):

1. Lawrence Expressway and Tasman Drive (PM peak hour)
2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive (PM peak hour)
5. Lawrence Expressway and E. Arques Avenue (PM peak hour)
8. Old Ironsides Drive and Old Glory Lane (AM and PM peak hours)
9. Old Ironsides Drive and Patrick Henry Drive (AM and PM peak hours)
12. Great America Parkway and Great America Way (PM peak hour)
17. Great America Parkway and Patrick Henry Drive (PM peak hour)
18. Great America Parkway and Mission College Boulevard (PM peak hour)
23. Bowers Avenue and Central Expressway (AM and PM peak hours)

Notes:
Bold indicates a substandard level of service.
Bold indicates an adverse effect caused by the project.
OVFL indicates that the result is out of software calculation limits.

27. Freedom Circle (W) and Mission College Boulevard (PM peak hour)
28. Agnew Road/Freedom Circle (E) and Mission College Boulevard (PM peak hour)
32. Mission College Boulevard and Montague Expressway (AM and PM peak hours)
42. Scott Boulevard and Central Expressway (PM peak hour)
44. De La Cruz Boulevard and Central Expressway (PM peak hour)
45. Agnew Road/De La Cruz Boulevard and Montague Expressway (PM peak hour)
46. Lick Mill Boulevard and Montague Expressway (PM peak hour)
48. Zanker Road and Montague Expressway (PM peak hour)
49. Trimble Road and Montague Expressway (PM peak hour)

The adverse effects and proposed improvements to alleviate the deficiencies are described below.

The following study intersections also would operate at unacceptable levels of service under cumulative plus project conditions.

16. Great America Parkway and Old Glory Lane (AM and PM peak hours)
33. San Tomas Expressway and Scott Boulevard (AM peak hour)
35. San Tomas Expressway and El Camino Real (AM and PM peak hours)
37. Centennial Boulevard and Tasman Drive (AM peak hour)
39. Lick Mill Boulevard and Tasman Drive (AM and PM peak hours)
41. Lafayette Street and Agnew Road (AM and PM peak hours)
43. Lafayette Street and Central Expressway (PM peak hour)
47. N. 1st Street and Montague Expressway (AM and PM peak hours)

However, since the development of the PHDSP Area under Option 1 would not cause the critical-movement delay at these intersections to increase by four or more seconds and the V/C to increase by one percent (0.01) or more compared to cumulative no project conditions, the project would not have an adverse effect on the operation of those intersections. The intersection level of service calculation sheets are included in Appendix C.

Adverse Effects and Recommended Improvements – Option 1

This section discusses the adverse effects identified under cumulative plus project conditions with the proposed new Mission College Boulevard connection and proposed improvements to address the deficiencies. It should be noted that adverse effects on intersection operations do not constitute significant impacts under CEQA.

The PHDSP will include TDM measures to achieve a 10 percent reduction in VMT per the City's Climate Action Plan. A sensitivity analysis was conducted to determine if a reduction in project vehicle trips due to TDM would avoid any of the adverse effects at any study intersections.

1. Lawrence Expressway and Tasman Drive

This CMP intersection in the City of Sunnyvale would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

As described in Chapter 4, improvements of the at-grade intersection are not feasible due to right of way constraints and impacts on adjacent properties. Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The County identified an improvement that would depress the light rail transit (LRT) line under this intersection as part of the 2040 Expressway Plan. Depressing the LRT would reduce delay for both trains and vehicle traffic. The PHDSP Area developments should provide fair-share funding towards this improvement.

2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive

This City of Sunnyvale intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by widening Lawrence Expressway to add a fifth through lane on the northbound and southbound approaches. However, this improvement is not feasible because it would require acquisition of additional right of way and negatively impact adjacent properties. Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The Long-Range Transportation Plan for Santa Clara County (VTP2040) lists a project (VTP ID# R39) that would realign Wildwood Avenue to connect directly with Lawrence Expressway, and create a new signalized intersection at Lawrence Expressway and Wildwood Avenue. This improvement would have a beneficial effect on traffic operations at the Lawrence/Sandia/Lakehaven intersection. The PHDSP Area developments should provide fair-share funding towards this improvement.

5. Lawrence Expressway and E. Arques Avenue

This CMP intersection in the City of Sunnyvale would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by 4.3 seconds and the critical v/c to increase by 0.018 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. A sensitivity analysis shows that the study intersection would continue to operate at LOS F with a 10 percent TDM trip reduction within the Plan Area. However, the TDM trip reduction would cause the average critical movement delay to increase by less than 4 seconds, thus TDM measures would be sufficient to avoid the adverse effect on intersection operations.

8. Old Ironsides Drive and Old Glory Lane

This unsignalized intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the AM and PM peak hours. Currently, the west leg at this intersection provides access to a parking lot that is used only for events at Levi's Stadium. The analysis presented in this report reflects typical conditions without an event at the stadium. The poor operations

forecast at this intersection under cumulative no project conditions are in large part due to the trips associated with the proposed Kylli mixed-use development, which would have access via the west leg at this intersection. The development of the PHDSP under Option 1 would exacerbate the deficiency at this intersection. Furthermore, the intersection is expected to satisfy the peak-hour signal warrant. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved to an acceptable LOS D during the AM peak hour by installing a traffic signal and applying a 10 percent TDM reduction. While the intersection would continue to operate at LOS F during the PM peak hour with signal control and a 10 percent TDM reduction, the delay would be less than under no project conditions. The PHDSP Area developments should provide fair-share funding for this new signal.

9. Old Ironsides Drive and Patrick Henry Drive

This unsignalized intersection in the City of Santa Clara would operate at an acceptable LOS A and LOS B under cumulative no project conditions during the AM and PM peak hours, respectively. The development of the PHDSP under Option 1 would cause the intersection to degrade to an unacceptable LOS F during both peak hours. Furthermore, the intersection is expected to satisfy the peak-hour signal warrant. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by installing a traffic signal, adding a second southbound left-turn lane, a westbound right-turn lane, and a westbound left-turn lane. With the recommended improvement and a 10 percent TDM reduction, the intersection would operate at an acceptable LOS C or better during the peak hours. These improvements should be fully funded by the PHDSP Area developments.

12. Great America Parkway and Great America Way

This City of Santa Clara intersection would operate at an unacceptable LOS E under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by 24.6 seconds and the critical v/c to increase by 0.048 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The adverse effect could be partially addressed by adding a northbound right-turn lane. This improvement is not considered feasible as it would require acquisition of additional right-of-way outside the PHDSP Area. Intersection operations could be improved by the construction of a Class IV separated bikeway on Great America Parkway. This multimodal improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would encourage residents and employees to leave their vehicles at home by adding a physical barrier between the existing bike lane and the vehicular travel lane, thereby increasing the comfort level for cyclists. The PHDSP Area development should provide fair-share funding towards this multimodal improvement.

17. Great America Parkway and Patrick Henry Drive

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by constructing a second northbound left-turn lane. With the recommended improvement and a 10 percent TDM reduction, the intersection would continue to operate at an unacceptable LOS F during the PM peak hour, however the delay would be less than under cumulative no project conditions. The cost of this improvement will be fully funded by PHDSP Area developments.

18. Great America Parkway and Mission College Boulevard

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by 53.5 seconds and the critical v/c to increase by 0.109 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by adding a fourth southbound through lane and a second eastbound right-turn lane. These improvements are not feasible because they would require acquisition of additional right of way and negatively impact adjacent properties. Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on Great America Parkway. This improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would encourage cycling by adding a physical barrier between the existing bike lane and the vehicular travel lane, thereby increasing the comfort level for cyclists. This intersection is also included in the City of Santa Clara *Multimodal Improvement Plan* (MIP). MIP Actions intended to address the LOS deficiency at this intersection include installation of transit signal priority, crosswalk motion sensors, upgraded safety lighting at intersections along Mission College Boulevard, and adaptive traffic signals along Great America Parkway. The PHDSP Area developments should provide fair-share funding towards the Class IV bikeway on Great America Parkway and MIP improvements.

23. Bowers Avenue and Central Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the AM and PM peak hours. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the AM peak hour. During the PM peak hour, the project would cause the critical movement delay to decrease slightly and the critical v/c to increase by more than 0.01. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The County identified the need for a grade-separated interchange at this location as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

27. Freedom Circle (W) and Mission College Boulevard

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the

critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by adding a second northbound left-turn lane and an eastbound right-turn lane and restriping the southbound approach for one right-turn lane, one shared through/right-turn lane and one left-turn lane. The construction of these improvements along with the planned Class IV separated bike lanes on Mission College Boulevard would require widening Mission College Boulevard but would not require the dedication of additional right of way. The existing curb-to-curb width on Freedom Circle is sufficient to accommodate the recommended dual northbound left-turn lanes. Although restriping the southbound approach for dual right-turn lanes may improve vehicle operations, this improvement conflicts with bicycle and pedestrian policies within the City's *2010-2035 General Plan, 2018 Bicycle Master Plan*, and *2019 Pedestrian Master Plan*. As described in the previous chapter, intersection widening for dual right-turn lanes is not recommended. With the recommended improvements on the northbound and eastbound approaches and a 10 percent TDM reduction, the intersection is expected to continue to operate an unacceptable LOS F during the PM peak hour, however the delay would be less than under cumulative no project conditions. Thus, the recommended improvement would be sufficient to fully offset the adverse effect on intersection operations. Funding for these improvements should be shared between developments in both the PHDSP Area and the Freedom Circle Focus Area.

28. Agnew Road/Freedom Circle (E) and Mission College Boulevard

This City of Santa Clara intersection would operate at an unacceptable LOS F during the PM peak hour under cumulative no project conditions. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by adding a second eastbound left-turn lane and widening the northbound approach to include one left-turn lane, one through lane, and two right-turn lanes. The addition of a second lane on the north leg (Agnew Road) to receive the dual eastbound left-turn lanes would require the dedication of additional right of way from adjacent properties within the Freedom Circle Focus Area and/or narrowing the sidewalk and thus is considered to be infeasible. Furthermore, as described above, dual right-turn lanes are not recommended as they would adversely affect cyclists and pedestrians and conflict with City of Santa Clara policies. Thus, only the addition of a single northbound right-turn lane is recommended. While the intersection is expected to continue to operate at LOS F with the recommended improvement and a 10 percent TDM reduction, it would reduce the intersection delay below that expected under cumulative no project conditions. Thus, the recommended improvement would be sufficient to fully offset the adverse effect on intersection operations. Funding for this improvement should be shared between developments in both the PHDSP Area and the Freedom Circle Focus Area.

32. Mission College Boulevard and Montague Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the AM and PM peak hours. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during both peak hours. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. A sensitivity analysis shows that a 10 percent TDM trip

reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. Intersection operations could be improved by constructing a partial grade separation with a flyover from eastbound Montague Expressway to northbound Mission College Boulevard. This improvement was identified as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

42. Scott Boulevard and Central Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicles trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The County identified the need for a grade-separated interchange at this location as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

44. De La Cruz Boulevard and Central Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

The analysis of cumulative conditions at this intersection assumes the following planned improvements: a third southbound through lane and a second southbound right-turn lane; a second eastbound right-turn lane; a third northbound left-turn lane and removal of one northbound through lane. In addition, cumulative conditions include the planned conversion of the existing HOV lanes on Central Expressway to mixed-flow lanes. Further improvements are not considered feasible since it would require extensive widening to add additional through lanes on both roadways that would entail acquisition of additional right of way adversely affecting adjacent properties as well as reconstruction of the railroad bridge over Central Expressway just west of the intersection. Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on De La Cruz Boulevard. This improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would provide an important link for cyclists between the southern and northern portions of Santa Clara and connect to buffered bike lanes on Trimble Road in San José. This intersection is also included in the City of Santa Clara *Multimodal Improvement Plan* (MIP). MIP Actions intended to address the LOS deficiency at this intersection include installation of crosswalk motion sensors, accessible pedestrian signals, upgraded safety lighting, travel time data collection systems, traffic monitoring cameras, and periodic retiming of signal coordination at intersections along De La Cruz Boulevard. The PHDSP Area developments should provide fair-share funding towards these multimodal improvements.

45. Agnew Road/De La Cruz Boulevard and Montague Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. This intersection is included in the City of Santa Clara *Multimodal Improvement Plan* (MIP). MIP Actions intended to address the LOS deficiency at this intersection include installation of crosswalk motion sensors, accessible pedestrian signals, upgraded safety lighting, travel time data collection systems, traffic monitoring cameras, and periodic retiming of signal coordination at intersections along Agnew Road/De La Cruz Boulevard. The PHDSP Area developments should provide fair-share funding towards these multimodal improvements.

46. Lick Mill Boulevard and Montague Expressway

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Cumulative no project conditions assume the addition of a third southbound left-turn lane. Implementation of TDM measures could reduce the vehicle trips associated with the PHDSP Option 1. However, a sensitivity analysis shows that a 10 percent TDM trip reduction would not be sufficient to avoid the adverse effect on intersection operations.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on Lick Mill Boulevard, which is identified in the City's *Bicycle Master Plan Update 2018*. This multimodal improvement would add to the bicycle network in northern Santa Clara encouraging commuters and residents to cycle instead of traveling by motor vehicle. The PHDSP Area developments should provide fair-share funding towards this multimodal improvement.

48. Zanker Road and Montague Expressway

This CMP intersection in the City of San José would operate at an unacceptable LOS E under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Further lane additions beyond the planned widening of Zanker Road that is assumed under cumulative no project conditions are not feasible. Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the PHDSP Area would not be sufficient to avoid the adverse effect on intersection operations.

The North San José Deficiency Plan identifies HOV-type signal improvements on Montague Expressway that could support future Bus Rapid Transit facilities. This improvement would partially

offset the adverse effect at this intersection. The PHDSP Area developments should provide fair-share funding towards this improvement.

49. Trimble Road and Montague Expressway

This CMP intersection in the City of San José would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 1 would cause the intersection's average critical movement delay to increase by more than four seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

There are no feasible capacity improvements beyond the planned flyover from westbound Montague Expressway to southbound Trimble Road that is assumed under cumulative no project conditions. Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the PHDSP Area would not be sufficient to avoid the adverse effect on intersection operations.

The North San José Deficiency Plan identifies HOV-type signal improvements on Montague Expressway that could support future Bus Rapid Transit facilities. This improvement would partially offset the adverse effect at this intersection. The PHDSP Area developments should provide fair-share funding towards this improvement.

Cumulative Plus Project Intersection Levels of Service with Mission College Boulevard Connection – Option 2

The results of the intersection level of service analysis under cumulative plus project conditions with the proposed new connection to Mission College Boulevard (see Table 18) show that development of the PHDSP Area under Option 2 would cause adverse effects at the following 25 intersections:

1. Lawrence Expressway and Tasman Drive (PM peak hour)
2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive (AM and PM peak hours)
7. Old Ironsides Drive and Tasman Drive (PM peak hour)
8. Old Ironsides Drive and Old Glory Lane (AM and PM peak hours)
9. Old Ironsides Drive and Patrick Henry Drive (AM and PM peak hours)
12. Great America Parkway and Great America Way (PM peak hour)
17. Great America Parkway and Patrick Henry Drive (PM peak hour)
18. Great America Parkway and Mission College Boulevard (PM peak hour)
23. Bowers Avenue and Central Expressway (AM and PM peak hours)
27. Freedom Circle (W) and Mission College Boulevard (PM peak hour)
28. Agnew Road/Freedom Circle (E) and Mission College Boulevard (PM peak hour)
32. Mission College Boulevard and Montague Expressway (PM peak hour)
37. Centennial Boulevard and Tasman Drive (AM peak hour)
39. Lick Mill Boulevard and Tasman Drive (PM peak hour)
42. Scott Boulevard and Central Expressway (PM peak hour)
44. De La Cruz Boulevard and Central Expressway (PM peak hour)
46. Lick Mill Boulevard and Montague Expressway (PM peak hour)
48. Zanker Road and Montague Expressway (PM peak hour)

The adverse effects and proposed improvements to alleviate the deficiencies are described below.

Table 18
Cumulative Intersection Levels of Service with Mission College Blvd Connection – Option 2

			2040 Conditions

	(CMP)	PM	--	--	--	--	--	--		

Notes:
Bold indicates a substandard level of service.
Bold indicates an adverse effect caused by the project.
OVFL indicates that the result is out of software calculation limits.

The following study intersections also would operate at unacceptable levels of service under cumulative plus project conditions.

5. Lawrence Expressway and E. Arques Avenue (PM peak hour)
16. Great America Parkway and Old Glory Lane (AM and PM peak hours)
33. Mission College Boulevard and Scott Boulevard (AM peak hour)
34. San Tomas Expressway and Monroe Street (AM peak hour)
35. San Tomas Expressway and El Camino Real (AM and PM peak hours)
41. Lafayette Street and Agnew Road (AM and PM peak hours)
43. Lafayette Street and Central Expressway (PM peak hour)
45. Agnew Road/De La Cruz Boulevard and Montague Expressway (AM and PM peak hours)
47. N. 1st Street and Montague Expressway (AM and PM peak hours)
49. Trimble Road and Montague Expressway (PM peak hour)

However, since the development of the PHDSP Area under Option 2 would not cause the critical-movement delay at these intersections to increase by four or more seconds and the V/C to increase by one percent (0.01) or more compared to cumulative no project conditions, the project would not have an adverse effect on the operation of those intersections. The intersection level of service calculation sheets are included in Appendix C.

Adverse Effects and Recommended Improvements – Option 2

This section discusses the adverse effects identified under cumulative plus project conditions with the proposed new Mission College Boulevard connection and proposed improvements to address the deficiencies. As noted above, adverse effects on intersection operations do not constitute significant impacts under CEQA.

The PHDSP will include TDM measures to achieve a 10 percent reduction in VMT per the City's Climate Action Plan. A sensitivity analysis was conducted to determine if a reduction in project vehicle trips due to TDM would avoid any of the adverse effects at any study intersections.

1. Lawrence Expressway and Tasman Drive

This CMP intersection in the City of Sunnyvale would operate at an unacceptable at LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01. This constitutes an adverse effect on intersection operations.

As described in Chapter 4, intersection improvements are not feasible due to right of way constraints and impacts on adjacent properties. Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The County identified an improvement that would depress the LRT line under this intersection as part of the 2040 Expressway Plan. Depressing the LRT would reduce delay for both trains and vehicle traffic. The PHDSP Area developments should provide fair-share funding towards this improvement.

2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive

This City of Sunnyvale intersection would operate at an acceptable LOS F under cumulative no project conditions during the AM and PM peak hours. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01. This constitutes an adverse effect on intersection operations.

As described above, intersection improvements are not feasible because it would require acquisition of additional right of way and negatively impact adjacent properties. Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The Long-Range Transportation Plan for Santa Clara County (VTP2040) lists a project (VTP ID# R39) that would realign Wildwood Avenue to connect directly with Lawrence Expressway, and create a new signalized intersection at Lawrence Expressway and Wildwood Avenue. This improvement would have a beneficial effect on traffic operations at the Lawrence/Sandia/Lakehaven intersection. The PHDSP Area developments should provide fair-share funding towards this improvement.

7. Old Ironsides Drive and Tasman Drive

This City of Santa Clara intersection would operate at an acceptable LOS C under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection to degrade to an unacceptable LOS E during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by installing a second westbound left-turn lane and a second northbound right-turn lane. The addition of a second westbound left-turn lane is considered to be infeasible as it would require the acquisition of additional right of way on the northeast quadrant of the intersection. Furthermore, as described above, dual northbound right-turn lanes are not recommended because they would adversely affect cyclists and pedestrians and conflict with City policies.

Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. A sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would reduce the average delay to 54.3 seconds per vehicle, which corresponds to an acceptable LOS D. Thus, TDM measures are expected to be sufficient to avoid the adverse effect without any physical improvements at this intersection.

8. Old Ironsides Drive and Old Glory Lane

This unsignalized intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the AM and PM peak hours. The poor level of service is due to the trips associated with the proposed Kylli mixed-use development, which would have access via the west leg at this intersection. The development of the PHDSP under Option 2 would exacerbate the deficiency at this intersection. Furthermore, the intersection is expected to satisfy the peak-hour signal warrant. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved to an acceptable LOS C during the AM peak hour by installing a traffic signal and applying a 10 percent TDM reduction While the intersection would continue to operate at LOS F during the PM peak hour with signal control and a 10 percent TDM reduction, the intersection would operate better than that expected under cumulative no project conditions. The PHDSP Area developments should provide fair-share funding for this new signal.

9. Old Ironsides Drive and Patrick Henry Drive

This unsignalized intersection in the City of Santa Clara would operate at an acceptable LOS A and LOS B under cumulative no project conditions during the AM and PM peak hours, respectively. The development of the PHDSP under Option 2 would cause the intersection to degrade to an unacceptable

LOS F during both peak hours. Furthermore, the intersection is expected to satisfy the peak-hour signal warrant. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by installing a traffic signal and adding a second southbound left-turn lane, a westbound right-turn lane, and a westbound left-turn lane. With the recommended improvements and a 10 percent TDM reduction, the intersection is expected to operate at an acceptable LOS C or better during both peak hours. These improvements should be fully funded by the PHDSP Area developments.

12. Great America Parkway and Great America Way

This City of Santa Clara intersection would operate at an unacceptable LOS E under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by adding a northbound right-turn lane. This improvement is not considered feasible as it would require acquisition of additional right-of-way outside the PHDSP Area. Intersection operations could be improved by the construction of a Class IV separated bikeway on Great America Parkway. This multimodal improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would encourage residents and employees to leave their vehicles at home by adding a physical barrier between the existing bike lane and the vehicular travel lane, thereby increasing the comfort level for cyclists. The PHDSP Area developments should provide fair-share funding towards this multimodal improvement.

17. Great America Parkway and Patrick Henry Drive

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 is expected to cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by constructing a second northbound left-turn lane. With the recommended improvement and a 10 percent TDM reduction, the intersection would continue to operate at an unacceptable LOS F during the PM peak hour, however the delay would be less than under cumulative no project conditions. The cost of this improvement will be fully funded by PHDSP Area developments.

18. Great America Parkway and Mission College Boulevard

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

As described above, intersection improvements are not feasible because it would require acquisition of additional right of way and negatively impact adjacent properties. Implementation of travel demand management (TDM) measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on Great America Parkway. This improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would encourage cycling by adding a physical barrier between the existing bike lane and the vehicular travel lane, thereby increasing the comfort level for cyclists. This intersection is also included in the City of Santa Clara *Multimodal Improvement Plan* (MIP). MIP Actions intended to address the LOS deficiency at this intersection include installation of transit signal priority, crosswalk motion sensors, upgraded safety lighting at intersections along Mission College Boulevard, and adaptive traffic signals along Great America Parkway. The PHDSP Area developments should provide fair-share funding towards the Class IV bikeway on Great America Parkway and MIP improvements.

23. Bowers Avenue and Central Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the AM and PM peak hours. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the AM peak hour. During the PM peak hour, the project would cause the average critical movement delay to decrease while the critical v/c would increase by more than 0.01. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The County identified the need for a grade-separated interchange at this location as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

27. Freedom Circle (W) and Mission College Boulevard

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by adding a second northbound left-turn lane and an eastbound right-turn lane and restriping the southbound approach for one right-turn lane, one shared through/right-turn lane and one left-turn lane. The construction of these improvements along with the planned Class IV separated bike lanes on Mission College Boulevard would require widening Mission College Boulevard but would not require the dedication of additional right of way. The existing curb-to-curb width on Freedom Circle is sufficient to accommodate the recommended dual northbound left-turn lanes. Although restriping the southbound approach for dual right-turn lanes may improve vehicle operations, dual right-turn lanes are not recommended because it would adversely affect cyclists and pedestrians and conflict with City policies. With the recommended improvements on the northbound and eastbound approaches and a 10 percent TDM reduction, the intersection would continue to operate at an unacceptable LOS F during the PM peak hour , however the average delay would be less than that under cumulative no project conditions. Funding for these improvements should be shared between developments in both the PHDSP Area and the Freedom Circle Focus Area.

28. Agnew Road/Freedom Circle (E) and Mission College Boulevard

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by adding a second eastbound left-turn lane and widening the northbound approach to include one left-turn lane, one through lane, and two right-turn lanes. The addition of a second lane on the north leg (Agnew Road) to receive the dual eastbound left-turn lanes would require the dedication of right of way from adjacent properties within the Freedom Circle Focus Area and/or narrowing the sidewalk and thus is considered to be infeasible. Furthermore, as described above, dual right-turn lanes are not recommended as they would adversely affect cyclists and pedestrians and conflict with City of Santa Clara policies. Thus, only the addition of a single northbound right-turn lane is recommended. With the recommended improvement on the northbound approach and a 10 percent TDM reduction, the intersection would continue to operate at LOS F during the PM peak hour, however the average delay would be less than that under cumulative no project conditions. Funding for this improvement should be shared between developments in both the PHDSP Area and the Freedom Circle Focus Area.

32. Mission College Boulevard and Montague Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more the 0.010 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that even a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. Intersection operations could be improved by constructing a partial grade separation with a flyover from eastbound Montague Expressway to northbound Mission College Boulevard. This improvement was identified as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

37. Centennial Boulevard and Tasman Drive

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the AM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the AM peak hour. This constitutes an adverse effect on intersection operations.

Improving the intersection's operations to an acceptable level of service would require widening Tasman Drive to add a third westbound through lane. However, the existing right-of-way is not sufficient to add a lane. Furthermore, the westbound approach is elevated due to its proximity to the overcrossing of the ACE rail line, which would further complicate efforts to widen Tasman Drive. Lastly, widening Tasman Drive would adversely affect pedestrian traffic at this intersection, which experiences heavy pedestrian flows before and after events at the adjacent Levi's Stadium. For all of these reasons, intersection capacity improvements are considered infeasible. Implementation of TDM measures could reduce the vehicle trips associated with the PHDSP Option 2 development. A sensitivity analysis shows

that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on Lafayette Street. This multimodal improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would connect with the existing Class II bike lanes on Tasman Drive and the planned Class I shared-use path along the Hetch Hetchy right of way and encourage area residents and employees to use active transportation modes in place of driving. The PHDSP Area developments should provide fair-share funding towards the Lafayette Street bikeway.

39. Lick Mill Boulevard and Tasman Drive

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c would increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Planned improvements associated with City Place that are assumed under cumulative no project conditions include reconfiguring the northbound and southbound approaches to two left-turn lanes, one through lane, and one right-turn lane. In addition, the signal phasing would be changed from split phase to protected left-turns for the northbound and southbound approaches. Lastly, a second westbound left-turn lane is planned. Intersection operations could be further improved by converting the right-turn lane to a free right-turn lane. This improvement is not recommended because it would have an adverse effect on pedestrians and bicyclists. Implementation of TDM measures could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on Lick Mill Boulevard, which is identified in the City's *Bicycle Master Plan Update 2018*. This multimodal improvement would add to the bicycle network in northern Santa Clara encouraging commuters and residents to cycle instead of traveling by motor vehicle. The PHDSP Area developments should provide fair-share funding towards this multimodal improvement.

42. Scott Boulevard and Central Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Implementation of TDM measures within the PHDSP Area could reduce the vehicles trips associated with the PHDSP Option 1 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations. The County identified the need for a grade-separated interchange at this location as part of the 2040 Expressway Plan. The PHDSP Area developments should provide fair-share funding towards this improvement.

44. De La Cruz Boulevard and Central Expressway

This CMP intersection in the City of Santa Clara would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

The analysis of cumulative conditions at this intersection assumes the following planned improvements: a third southbound through lane and a second southbound right-turn lane; a second eastbound right-turn lane; a third northbound left-turn lane and removal of one northbound through lane. In addition, cumulative conditions include the planned conversion of the existing HOV lanes on Central Expressway to mixed-flow lanes. Further improvements are not considered feasible since it would require extensive widening to add additional through lanes on both roadways that would entail acquisition of additional right of way adversely affecting adjacent properties as well as reconstruction of the railroad bridge over Central Expressway just west of the intersection. Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on De La Cruz Boulevard. This improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would provide an important link for cyclists between the southern and northern portions of Santa Clara and connect to buffered bike lanes on Trimble Road in San José. This intersection is also included in the City of Santa Clara *Multimodal Improvement Plan* (MIP). MIP Actions intended to address the LOS deficiency at this intersection include installation of crosswalk motion sensors, accessible pedestrian signals, upgraded safety lighting, travel time data collection systems, traffic monitoring cameras, and periodic retiming of signal coordination at intersections along De La Cruz Boulevard. The PHDSP Area developments should provide fair-share funding towards these multimodal improvements.

46. Lick Mill Boulevard and Montague Expressway

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the PM peak hour. The development of the PHDSP under Option 2 would cause the intersection's average critical delay to increase by more than 4.0 seconds and the critical v/c ratio to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Cumulative no project conditions assume the addition of a third southbound left-turn lane. Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the PHDSP Area would not be sufficient to avoid the adverse effect on intersection operations. The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on Lick Mill Boulevard, which is identified in the City's *Bicycle Master Plan Update 2018*. This multimodal improvement would add to the bicycle network in northern Santa Clara encouraging commuters and residents to cycle instead of traveling by motor vehicle. The PHDSP Area developments should provide fair-share funding towards this multimodal improvement.

48. Zanker Road and Montague Expressway

This CMP intersection in the City of San José would operate at an unacceptable LOS E under cumulative no project conditions during the PM peak hours. The development of the PHDSP under

Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during the PM peak hour. This constitutes an adverse effect on intersection operations.

Further lane additions beyond the planned widening of Zanker Road that is assumed under cumulative no project conditions are not feasible. Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP Option 2 development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The North San José Deficiency Plan identifies HOV-type signal improvements on Montague Expressway that could support future Bus Rapid Transit facilities. This improvement would partially offset the adverse effect at this intersection. The PHDSP Area developments should provide fair-share funding towards this improvement.

Summary of Cumulative Plus Project Conditions with Mission College Boulevard Connection

A summary of the adverse effects associated with the project under cumulative conditions with the proposed new roadway connection to Mission College Boulevard, the recommended improvements, and funding responsibilities are provided in Table 19.

Table 19
Summary of Affected Intersections under Cumulative Plus Project Conditions with Mission College Boulevard Connection

#	Intersection	Jurisdiction	With Mission College Boulevard Connection Affected Scenarios		Recommended Improvements	Project Responsibility[1]
			Option 1	Option 2		
1	Lawrence Expressway and Tasman Drive *(CMP)*	SCC	**YES**	**YES**	Depress LRT under the intersection (2040 Expressway Plan)	% of Total Traffic
2	Lawrence Expwy and Sandia Av/Lakehaven Dr	SCC	**YES**	**YES**	Realign Wildwood Avenue to connect with Lawrence Expressway and create a new signalized intersection (VTP 2040)	% of Total Traffic
5	Lawrence Expressway and E. Arques Ave. *(CMP)*	SCC	**YES**	NO	TDM Measures with 10% Trip Reduction	100%
7	Old Ironsides Drive and Tasman Drive	SC	NO	**YES**	TDM Measures with 10% Trip Reduction	100%
8	Old Ironsides Drive and Old Glory Lane *(Unsignalized)*	SC	**YES**	**YES**	Install a traffic signal	% of Total Traffic
9	Old Ironsides Drive and Patrick Henry Drive *(Unsignalized)*	SC	**YES**	**YES**	Install a traffic signal and add a 2nd SB left-turn lane, a WB RT lane, and a WB LT lane	100%
12	Great America Parkway and Great America Way	SC	**YES**	**YES**	Construct Class IV bikeway on Great America Pkwy	% of Total Traffic
17	Great America Parkway and Patrick Henry Drive	SC	**YES**	**YES**	Add a second northbound left-turn lane	100%
18	Great America Pkwy and Mission College Blvd *(CMP)*	SC	**YES**	**YES**	Construct Class IV bikeway on Great America Parkway (Bicycle Master Plan Update 2018) and Multimodal Improvement Plan measures	% of Total Traffic
23	Bowers Avenue and Central Expressway (CMP)	SCC	**YES**	**YES**	Construct grade separated interchange (2040 Expressway Plan)	% of Total Traffic
27	Freedom Circle W and Mission College Blvd	SC	**YES**	**YES**	Add a second northbound left-turn lane and an eastbound right-turn lane	% of Total Traffic
28	Agnew/Freedom Circle E & Mission College Blvd	SC	**YES**	**YES**	Add a northbound right-turn lane	% of Total Traffic
32	Mission College Blvd and Montague Expwy *(CMP)*	SCC	**YES**	**YES**	Construct partial grade separation (2040 Expressway Plan)	% of Total Traffic
37	Centennial Boulevard and Tasman Drive	SC	NO	**YES**	Construct Class IV separated bikeway on Lafayette Street (Bicycle Master Plan Update 2018)	% of Total Traffic

Table 19 (continued)
Summary of Affected Intersections under Cumulative Plus Project Conditions with Mission College Boulevard Connection

#	Intersection	Jurisdiction	With Mission College Boulevard Connection Affected Scenario		Recommended Improvements	Project Responsibility[1]
			Option 1	Option 2		
39	Lick Mill Boulevard and Tasman Drive	SC	NO	**YES**	Construct a Class IV separated bikeway on Lick Mill Boulevard (Bicycle Master Plan Update 2018)	% of Total Traffic
42	Scott Boulevard and Central Expressway *(CMP)*	SCC	**YES**	**YES**	Construct grade separated interchange (2040 Expressway Plan)	% of Total Traffic
44	De la Cruz Boulevard and Central Expressway *(CMP)*	SCC	**YES**	**YES**	Construct Class IV separated bikeway on De La Cruz Boulevard (Bicycle Master Plan Update 2018) and Multimodal Improvement Plan measures	% of Total Traffic
45	Agnew Rd/De La Cruz Blvd and Montague Expwy *(CMP)*	SCC	**YES**	NO	Implement measures identified in Multimodal Improvement Plan	% of Total Traffic
46	Lick Mill Boulevard and Montague Expressway	SCC	**YES**	**YES**	Construct Class IV separated bikeway on Lick Mill Boulevard (Bicycle Master Plan Update 2018)	% of Total Traffic
48	Zanker Road and Montague Expressway *(CMP)*	SCC	**YES**	**YES**	HOV-type signal improvements that could support future Bus Rapid Transit facilites (North San José Deficiency Plan)	Pay North San José fee or % of Total Traffic
49	Trimble Road and Montague Expressway *(CMP)*	SCC	**YES**	NO	HOV-type signal improvements that could support future Bus Rapid Transit facilites (North San José Deficiency Plan)	Pay North San José fee or % of Total Traffic

Notes:
SCC = Santa Clara County, SC = Santa Clara, SJ = San Jose, SV = Sunnyvale
1 "100%" = The cost and construction of the recommended improvement is the full responsibility of PHDSP area developements. These are discrete improvements that counter adverse effects caused by the project. "% of Total Traffic" = PHDSP area developements shall pay a fair-share contribution to the recommended improvement, which is typically a larger transportation improvement, such as an expressway interchange or bike lanes along a corridor, that has been identified in an adopted plan. "Pay North San José fee or % of Total Traffic" = PHDSP area developements can pay the North San José fee, or a fair-share contribution for the improvement, or a fair-share contribution for off-setting multimodal improvements based on the amount of Project's percent contribution of the traffic volume growth at the intersection.

Cumulative Plus Project Conditions without Mission College Boulevard Connection

Cumulative plus project traffic conditions also were analyzed without the proposed new roadway connecting Patrick Henry Drive with the Mission College Boulevard loop. This analysis reflects a worst-case scenario with all future developments anticipated in the area including the proposed development of both Patrick Henry Drive Specific Plan and Freedom Circle Focus Areas, the proposed Kylli mixed-use project, the approved City Place project, and approved Tasman East Specific Plan developments and the proposed Amendment to the Tasman East Specific Plan. As presented in the previous section, the analysis covers two development options within the PHDSP Area.

The elimination of this short roadway segment between Patrick Henry Drive and the Mission College Boulevard loop is not expected to have an appreciable effect on the mode split or project trip distribution. Thus, traffic forecasts were developed for the new cumulative scenarios by starting with the previous cumulative plus project forecasts and manually reassigning trips that had been forecast to use the new roadway connection to alternative routes. Note that under cumulative conditions, the new roadway connection would be used by trips generated by the Patrick Henry Drive Specific Plan as well as trips generated by the proposed Kylli mixed-use project immediately north of the PHDSP Area. The following roadway segments are expected to experience an increase in traffic without the new roadway connection:

- Lawrence Expressway between Lakewood Drive/Bridgewood Way and Tasman Drive
- Tasman Drive between Lawrence Expressway and Old Ironsides Drive
- Mission College Boulevard between Wildwood Avenue and Great America Parkway (south side of the Mission College Boulevard loop)
- Great America Parkway between Mission College Boulevard and Old Glory Lane

Thus, the analysis was limited to the following 10 key study intersections that would be substantially affected by the elimination of the proposed new roadway connection:

1. Lawrence Expressway and Tasman Drive
2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive
6. Patrick Henry Drive and Tasman Drive
7. Old Ironsides Drive and Tasman Drive
8. Old Ironsides Drive and Old Glory Lane
9. Old Ironsides Drive and Patrick Henry Drive
16. Great America Parkway and Old Glory Lane
17. Great America Parkway and Patrick Henry Drive
18. Great America Parkway and Mission College Boulevard
25. Mission College Loop and Mission College Boulevard

The traffic volumes and level of service at the other 40 study intersections would be the same with or without the new roadway connection. The resulting cumulative plus project traffic volume forecasts without the new roadway connection to Mission College Boulevard under PHDSP Options 1 and 2 are presented in Figures 18 and 19, respectively.

Cumulative Plus Project Intersection Levels of Service without Mission College Boulevard Connection

The results of the intersection level of service analysis without the new roadway connection to Mission College Boulevard under PHDSP Options 1 and 2 are presented in Tables 20 and 21, respectively. Compared to the results of similar cumulative plus project scenarios with the new roadway connection (see Tables 17 and 18), the elimination of the proposed new roadway connection would exacerbate

Notes:
Bold indicates a substandard level of service.
Bold indicates an adverse effect caused by the project.
OVFL indicates that the result is out of software calculation limits.

traffic operations at many intersections and result in adverse effects at additional intersections. The adverse effects identified in this analysis do not constitute significant impacts under the California Environmental Quality Act (CEQA). Of the 10 study intersections evaluated without the proposed new roadway connection, the following 9 intersections would be adversely affected by development of the PHDSP Area under Option 1:

1. Lawrence Expressway and Tasman Drive (PM peak hour)
2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive (PM peak hour)
6. Patrick Henry Drive and Tasman Drive (AM and PM peak hours)
7. Old Ironsides Drive and Tasman Drive (PM peak hour)
8. Old Ironsides Drive and Old Glory Lane (AM and PM peak hours)
9. Old Ironsides Drive and Patrick Henry Drive (AM and PM peak hours)
16. Great America Parkway and Old Glory Lane (AM and PM peak hours)
17. Great America Parkway and Patrick Henry Drive (AM and PM peak hours)
18. Great America Parkway and Mission College Boulevard (PM peak hour)

The same study intersections would be adversely affected without the proposed new roadway connection under the development of the PHDSP Area under Option 2. However, the time periods differ slightly:

1. Lawrence Expressway and Tasman Drive (PM peak hour)
2. Lawrence Expressway and Sandia Avenue/Lakehaven Drive (AM and PM peak hours)
6. Patrick Henry Drive and Tasman Drive (AM and PM peak hours)
7. Old Ironsides Drive and Tasman Drive (PM peak hour)
8. Old Ironsides Drive and Old Glory Lane (AM and PM peak hours)
9. Old Ironsides Drive and Patrick Henry Drive (AM and PM peak hours)
16. Great America Parkway and Old Glory Lane (AM and PM peak hours)
17. Great America Parkway and Patrick Henry Drive (AM and PM peak hours)
18. Great America Parkway and Mission College Boulevard (AM and PM peak hours)

The intersection level of service calculation sheets are included in Appendix C.

Recommended Improvements Without Mission College Boulevard Connection

While the traffic volume forecasts would be higher without the new roadway connection to Mission College Boulevard exacerbating congestion at many study intersections, additional intersection improvements beyond those recommended in the previous chapters are not feasible at many locations. Thus, at most study intersections, the recommended improvements for adverse effects on intersection operations would be the same with or without the proposed new roadway connection (see Table 22). The following three intersections would require additional improvements without the roadway connection that were not identified in the previous section. The recommended improvements would be the same under PHDSP Option 1 and Option 2 unless stated otherwise.

6. Patrick Henry Drive and Tasman Drive

This City of Santa Clara intersection is expected to operate at an acceptable LOS D under cumulative plus project conditions with the proposed new roadway connection to Mission College Boulevard. However, without the roadway connection, the intersection would serve substantially higher traffic volumes causing the intersection to degrade to an unacceptable LOS F and LOS E during the AM and PM peak hours, respectively. This constitutes an adverse effect on intersection operations.

Vehicle delay at this intersection could be reduced by installing a second eastbound right-turn lane. However, as stated previously, dual right-turn lanes are not recommended because they would adversely affect cyclists and pedestrians and conflict with City policies.

Implementation of TDM measures within the PHDSP Area could reduce the vehicle trips associated with the PHDSP development. However, a sensitivity analysis shows that a 10 percent TDM trip reduction within the Plan Area would not be sufficient to avoid the adverse effect on intersection operations.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on Patrick Henry Drive. This improvement, which is identified in the City's *Bicycle Master Plan Update 2018*, would provide direct access to the PHDSP Area. Within the Specific Plan area, the bikeway improvement will be constructed as part of the Plan. Outside the Specific Plan area, PHDSP area stakeholders will pay a fair share fee for future construction of the bikeway on the Patrick Henry Drive segment between the Plan area and Tasman Drive. PHDSP Area developments shall also pay a fair share to build the Calabazas Creek Trail, and certain properties within the PHDSP area may be required to dedicate right of way to implement the proposed trail connections. Appendix F presents the details of the preliminary trail alignment plan for the Calabazas Creek Trail.

7. Old Ironsides Drive and Tasman Drive

This City of Santa Clara intersection is expected to operate at an acceptable LOS D under cumulative plus project conditions with the proposed new roadway connection to Mission College Boulevard and a 10 percent TDM reduction. However, without the roadway connection, a 10 percent TDM reduction would not be sufficient to maintain an acceptable level of service and the intersection would degrade to an unacceptable LOS E during the PM peak hours. This constitutes an adverse effect on intersection operations.

Vehicle delay at this intersection could be reduced by installing a second westbound left-turn lane and a second northbound right-turn lane. However, as stated previously, dual right-turn lanes are not recommended because they would require acquisition of additional right of way, adversely affect cyclists and pedestrians, and conflict with City policies.

The adverse effect at this intersection could be lessened by the construction of a Class IV separated bikeway on Old Ironsides Drive. This improvement, which is identified in the City's Bicycle Master Plan Update 2018, would provide direct access to the PHDSP Area. Furthermore, the Bicycle Master Plan lists a spot improvement at this intersection that would tighten the curb radius on the northeast corner. Within the Specific Plan area, the bikeway improvement will be constructed as part of the Plan. Outside the Specific Plan area, PHDSP area stakeholders will pay a fair share fee for future construction of the bikeway on the Old Ironsides Drive segment between the Plan area and Tasman Drive. The PHDSP Area developments should provide fair-share funding towards these improvements. PHDSP Area developments shall also pay a fair share to build the Hetch Hetchy Trail, and certain properties within the PHDSP area may be required to dedicate right of way to implement the proposed trail connections. Appendix F presents the details of the preliminary trail alignment plan for the Hetch Hetchy Trail.

8. Old Ironsides Drive and Old Glory Lane

Signalization of this City of Santa Clara intersection is required to offset the adverse effect of the PHDSP developments under background plus project conditions both with and without the proposed new roadway connection to Mission College Boulevard. The cost of signalization will be fully funded by PHDSP Area developments. Signalization also would be sufficient offset the adverse effect of the project under cumulative plus project conditions with the proposed new roadway connection. However, the intersection would serve substantially more traffic under cumulative plus project conditions without the new roadway connection. Additional improvements recommended under this scenario include the addition of a second southbound left-turn lane, a second eastbound through lane, an exclusive northbound right-turn lane, an exclusive eastbound right-turn lane, and an exclusive westbound left-turn

lane. With the recommended improvements and a 10 percent TDM reduction, the intersection would continue to operate at an unacceptable LOS E or LOS F, however the delay would be less than that under cumulative no project conditions. The PHDSP Area developments should provide fair-share funding towards these improvements.

16. Great America Parkway and Old Glory Lane

While this City of Santa Clara intersection is expected to operate at an unacceptable LOS F under cumulative plus project conditions with the proposed new roadway connection, the development of the PHDSP under Option 1 or 2 would have a negligible effect on intersection operations. However, without the new roadway connection, the development of the PHDSP under both Option 1 and Option 2 would cause the intersection's average critical movement delay to increase by more than 4.0 seconds and the critical v/c to increase by more than 0.01 during both peak hours. This constitutes an adverse effect on intersection operations.

Intersection operations could be improved by adding a second northbound left-turn lane. With this improvement and a 10 percent TDM reduction, the intersection is expected to operate at an acceptable LOS D during the AM peak hour. During the PM peak hour, the intersection would continue to operate at LOS F, however the average delay would be less than that under cumulative no project conditions. The PHDSP Area developments should provide full funding towards this improvement.

17. Great America Parkway and Patrick Henry Drive

This City of Santa Clara intersection would operate at an unacceptable LOS F under cumulative no project conditions during the AM and PM peak hours. With the proposed new roadway connection, the development of the PHDSP under Option 1 or 2 would cause an adverse effect on this intersection during the PM peak hour. The PHDSP Area development would be required to fully fund the addition of a second northbound left-turn lane. However, without the new roadway connection, this roadway capacity improvement and a 10 percent TDM reduction would not be sufficient to fully offset the adverse effect of the project.

Developments within the PHDSP Area also will be responsible for construction of a Class IV separated bikeway on Patrick Henry Drive. This multimodal improvement, which is identified in the *City's Bicycle Master Plan Update 2018*, would encourage residents and employees to leave their vehicles at home by adding a physical barrier between the existing bike lane and the vehicular travel lane, thereby increasing the comfort level for cyclists. Within the Specific Plan area, the bikeway improvement will be constructed as part of the Plan. Outside the Specific Plan area, PHDSP area stakeholders will pay a fair share fee for future construction of the bikeway on the Patrick Henry Drive segment between the Plan area and Tasman Drive.

Table 22
Summary of Affected Intersections under Cumulative Plus Project Conditions without Mission College Blvd. Connection

#	Intersection	Jurisdiction	Without Mission College Boulevard Connection Affected Scenarios Option 1	Option 2	Recommended Improvements	Project Responsibility[1]
1	Lawrence Expressway and Tasman Drive *(CMP)*	SCC	**YES**	**YES**	Depress LRT under the intersection (2040 Expressway Plan)	% of Total Traffic
2	Lawrence Expwy and Sandia Av/Lakehaven Dr	SCC	**YES**	**YES**	Realign Wildwood Avenue to connect with Lawrence Expressway and create a new signalized intersection (VTP 2040)	% of Total Traffic
5	Lawrence Expressway and E. Arques Ave. *(CMP)*	SCC	**YES**	NO	TDM Measures with 10% Trip Reduction	100%
6	Patrick Henry Drive and Tasman Drive	SC	**YES**	**YES**	Construct Class IV bikeway on Patrick Henry Drive within Plan area and from Plan area to Tasman Dr. (Bicycle Master Plan Update 2018) and construct Calabazas Creek Trail (Creek Trail Network Expansion Master Plan)	100% within Plan area fair share outside Plan area % of Total Traffic
7	Old Ironsides Drive and Tasman Drive	SC	**YES**	**YES**	Construct Class IV bikeway on Old Ironsides Drive within Plan area and from Plan area to Tasman Dr., tighten curb radius on northeast corner (Bicycle Master Plan Update 2018), and construct Hetch Hetchy Trail (Creek Trail Network Expansion Master Plan)	100% within Plan area fair share outside Plan area % of Total Traffic
8	Old Ironsides Drive and Old Glory Lane *(Unsignalized)*	SC	**YES**	**YES**	Install a traffic signal Add a 2nd SB LT lane, a 2nd EB TH lane, a NB RT lane, an EB RT lane, and a WB LT lane	100% % of Total Traffic

Notes:
SCC = Santa Clara County, SC = Santa Clara, SJ = San Jose, SV = Sunnyvale
1 "100%" = The cost and construction of the recommended improvement is the full responsibility of PHDSP area developements. These are discrete improvements that counter adverse effects caused by the project. "% of Total Traffic" = PHDSP area developements shall pay a fair-share contribution to the recommended improvement, which is typically a larger transportation improvement, such as an expressway interchange or bike lanes along a corridor, that has been identified in an adopted plan. "Pay North San José fee or % of Total Traffic" = PHDSP area developements can pay the North San José fee, or a fair-share contribution for the improvement, or a fair-share contribution for off-setting multimodal improvements based on the amount of Project's percent contribution of the traffic volume growth at the intersection.

6. Other Transportation Issues

This chapter presents other transportation issues associated with the project, including:

- Freeway segment traffic operations
- Freeway ramp traffic operations
- Vehicle queuing analysis
- Signal warrant analysis at unsignalized study intersections
- Internal vehicular circulation within the PHDSP Area
- Hazards and emergency access
- Impacts on pedestrians, bicycles, and transit facilities

Unlike the level of service analysis, which is based on level of service standards adopted by the Cities of Santa Clara, Sunnyvale, and San José and the Valley Transportation Authority, many topics contained in this chapter are based on professional judgment in accordance with the standards and methods employed by the traffic engineering community. Although intersection level of service deficiencies identified in the previous chapters and operational issues described in this chapter are not considered CEQA impacts, they do describe traffic conditions that are relevant to describing the transportation environment with the proposed Patrick Henry Drive Specific Plan. In contrast, impacts on pedestrians, bicycle, and transit facilities were evaluated according to the CEQA checklist.

Freeway Segment Traffic Operations

Traffic volumes for the study freeway segments were obtained from the 2018 CMP Annual Monitoring Report. The results show that the following study freeway segments currently operate at LOS F in at least one direction during at least one peak hour:

- US 101, northbound between McKee Road and Oakland Road (AM Peak Hour)
- US 101, northbound between Oakland Road and I-880 (AM Peak Hour)
- US 101, northbound between I-880 and Old Bayshore Highway (AM Peak Hour)
- US 101, northbound between Old Bayshore Highway and N. First Street (AM Peak Hour)
- US 101, northbound between N. First Street and Guadalupe Parkway (AM Peak Hour)
- US 101, northbound between Guadalupe Parkway and De La Cruz Boulevard (AM Peak Hour)
- US 101, northbound between De La Cruz Boulevard and Montague Expressway/San Tomas Expressway (AM Peak Hour)
- US 101, northbound between Montague Expressway/San Tomas Expressway and Bowers Avenue/Great America Parkway (AM Peak Hour)

- US 101, northbound between Bowers Avenue/Great America Parkway and Lawrence Expressway (AM Peak Hour)
- US 101, northbound between Lawrence Expressway and N. Fair Oaks Avenue (AM Peak Hour)
- US 101, northbound between N. Fair Oaks Avenue and N. Mathilda Avenue (AM Peak Hour)
- US 101, northbound between SR 237 and Moffett Boulevard (AM Peak Hour)
- US 101, northbound between Moffett Boulevard and SR 85 (Both Peak Hours)
- US 101, northbound between SR 85 and to N. Shoreline Boulevard (Both Peak Hours)
- US 101, northbound between N. Shoreline Boulevard and Rengstorff Avenue (Both Peak Hours)
- US 101, northbound between Rengstorff Avenue and San Antonio Avenue (PM Peak Hour)
- US 101, northbound between San Antonio Avenue and Oregon Expressway (PM Peak Hour)
- US 101, northbound between Oregon Expressway and Embarcadero Road (Both Peak Hours)
- US 101, southbound between Embarcadero Road and Oregon Expressway (PM Peak Hour)
- US 101, southbound between Oregon Expressway and San Antonio Avenue (PM Peak Hour)
- US 101, southbound between San Antonio Avenue and Rengstorff Avenue (PM Peak Hour)
- US 101, southbound between Rengstorff Avenue and N. Shoreline Boulevard (PM Peak Hour)
- US 101, southbound between N. Shoreline Boulevard and SR 85 (PM Peak Hour)
- US 101, southbound between SR 85 and Moffett Boulevard (PM Peak Hour)
- US 101, southbound between Moffett Boulevard and SR 237 (PM Peak Hour)
- US 101, southbound between SR 237 and N. Mathilda Avenue (PM Peak Hour)
- US 101, southbound between N. Mathilda Avenue and N. Fair Oaks Avenue (PM Peak Hour)
- US 101, southbound between N. Fair Oaks Avenue and Lawrence Expressway (PM Peak Hour)
- US 101, southbound between Lawrence Expressway and Bowers Avenue/Great America Parkway (PM Peak Hour)
- US 101, southbound between Bowers Avenue/Great America Parkway and Montague Expressway/San Tomas Expressway (PM Peak Hour)
- US 101, southbound between Montague Expressway/San Tomas Expressway and De La Cruz Boulevard (PM Peak Hour)
- US 101, southbound between Guadalupe Parkway and N. First Street (PM Peak Hour)
- US 101, southbound between N. First Street and Old Bayshore Highway (PM Peak Hour)
- US101, southbound between Old Bayshore Highway and I-880 (PM Peak Hour)
- US 101, southbound between I-880 and Oakland Road (PM Peak Hour)
- SR 237, eastbound between SR 85 and Central Parkway (AM Peak Hour)
- SR 237, eastbound between Maude Avenue and US 101 (PM Peak Hour)
- SR 237, eastbound between US 101 and Mathilda Avenue (PM Peak Hour)
- SR 237, eastbound between Mathilda Avenue and N. Fair Oaks Avenue (PM Peak Hour)
- SR 237, eastbound between N. Fair Oaks Avenue and Lawrence Expressway (PM Peak Hour)
- SR 237, eastbound between Great America Parkway and N. First Street (PM Peak Hour)
- SR 237, eastbound between N. First Street and Zanker Road (PM Peak Hour)
- SR 237, westbound between I-880 and McCarthy Boulevard (AM Peak Hour)
- SR 237, westbound between McCarthy Boulevard and Zanker Road (AM Peak Hour)
- SR 237, westbound between Zanker Road and N. First Street (AM Peak Hour)
- SR 237, westbound between N. First Street and Great America Parkway (AM Peak Hour)
- SR 237, westbound between Great America Parkway and Lawrence Expressway (AM Peak Hour)
- SR 237, westbound between Lawrence Expressway and N. Fair Oaks Avenue (Both Peak Hours)
- SR 237, westbound between N. Fair Oaks Avenue and Mathilda Avenue (Both Peak Hours)
- SR 237, westbound between Mathilda Avenue and US 101 (PM Peak Hour)

- SR 237, westbound between US 101 and Maude Avenue (PM Peak Hour)
- SR 237, westbound between Maude Avenue and Central Parkway (PM Peak Hour)
- SR 237, westbound between Central Parkway and SR 85 (PM Peak Hour)
- SR 237, westbound between SR 85 and to El Camino Real (AM Peak Hour)
- SR 87, northbound between Julian Street and Coleman Avenue (AM Peak Hour)
- SR 87, northbound between Taylor Street and Skyport Drive (AM Peak Hour)
- SR 87, northbound between Skyport Drive and US 101 (AM Peak Hour)
- SR 87, southbound between US 101 and Skyport Drive (PM Peak Hour)
- SR 87, southbound between Skyport Drive and Taylor Street (PM Peak Hour)
- SR 87, southbound between Taylor Street and Coleman Street (PM Peak Hour)
- SR 87, southbound between Julian Street and I-280 (PM Peak Hour)

Per the CMP guidelines, the analysis of freeway segments with development of the Patrick Henry Drive Specific Plan Area was evaluated under existing (2018) plus project conditions. As described previously, Plan Area trips in the Year 2018 were estimated using ITE trip rates, a 25-percent pass-by trip reduction, and reductions for internalization and transit usage based on CSC model estimates. The gross project trips generated by the project option 1 and option 2 remain the same as described in Chapter 4.

After applying reductions for internal capture, transit use, and pass-by trips, the PHDSP Option 1 development is expected to generate 53,482 net daily vehicle trips, 3,403 (879 inbound and 2,524 outbound) net AM peak hour trips, and 4,650 (2,766 inbound and 1,884 outbound) net PM peak hour trips under existing conditions (See Table 23). The PHDSP option 2 is expected to generate 52,345 net daily vehicle trips, 3,543 (1,343 inbound and 2,200 outbound) net AM peak hour trips, and 4,746 (2,482 inbound and 2,264 outbound) net PM peak hour trips under existing conditions (See Table 24).

Source: Trip rates from ITE *Trip Generation Manual, 10th Edition,* 2017. Internal and transit trip reductions derived from CSC travel demand model.

The freeway analysis results (see Tables 25 and 26) reflect the net increase in freeway trips above that generated by the existing Plan Area uses. Due to the existing freeway congestion in the vicinity of the PHDSP Area, the model shows that freeway traffic volumes would increase very little under existing plus project conditions compared to existing conditions. To ensure that the transportation analysis does not under report potential adverse effects on freeway segments, the freeway analysis was conducted based on the difference in the CSC model project trip assignment on each freeway segment for the proposed uses compared to the existing uses. The analysis shows a decrease in traffic volume on some freeway segments (e.g., northbound US 101 and westbound SR 237 in the AM) where the proposed predominantly residential uses would generate fewer vehicle trips than the existing employment uses. At the same time, the model forecasts on local roadways presented in previous chapters include traffic that is expected to divert from the freeway due to the addition of project-generated traffic. Thus, the transportation analysis reflects a conservative, worst-case evaluation of the project's effects on both freeways and local streets.

The mixed-flow lanes on the following freeway segments would be adversely affected under existing plus project conditions under both PHDSP Option 1 and Option 2:

- US 101, northbound between SR 237 and Moffett Boulevard (AM Peak Hour)
- US 101, northbound between Moffett Boulevard and SR 85 (AM Peak Hour)
- US 101, northbound between N. Shoreline Boulevard and Rengstorff Avenue (AM Peak Hour)
- US 101, northbound between San Antonio Avenue and Oregon Expressway (AM Peak Hour)
- US 101, northbound between Oregon Expressway and Embarcadero Road (AM Peak Hour)
- US 101, southbound between Rengstorff Avenue and Shoreline Boulevard (PM Peak Hour)
- US 101, southbound between N. Shoreline Boulevard and SR 85 (PM Peak Hour)
- US 101, southbound between SR 85 and Moffett Boulevard (PM Peak Hour)
- US 101, southbound between Moffett Boulevard and SR 237 (PM Peak Hour)
- US 101, southbound between Bowers Avenue/Great America Parkway and Montague Expressway/San Tomas Expressway (PM Peak Hour)
- US 101, southbound between Montague Expressway/San Tomas Expressway and De La Cruz Boulevard (PM Peak Hour)
- SR 237, eastbound between Maude Avenue and US 101 (PM Peak Hour)

Notes:
HOV = high-occupancy vehicle; LOS = level of service.
1. Number of lanes and level of service (LOS) on each segment are taken from VTA's *2018 Congestion Management Program Monitoring Report*.
2. Capacity is based on the capacities cited in VTA's *Transportation Impact Analysis Guidelines* (2014).
Bold indicates a substandard level of service.
Outline indicates an adverse effect associated with the PHDSP development.

Notes:
HOV = high-occupancy vehicle; LOS = level of service.
1. Number of lanes and level of service (LOS) on each segment are taken from VTA's *2018 Congestion Management Program Monitoring Report*.
2. Capacity is based on the capacities cited in VTA's *Transportation Impact Analysis Guidelines* (2014).
Bold indicates a substandard level of service.
Outline indicates an adverse effect associated with the PHDSP development.

- SR 237, eastbound between US 101 and Mathilda Avenue (PM Peak Hour)
- SR 237, eastbound between Mathilda Avenue and North Fair Oaks Avenue (PM Peak Hour)
- SR 237, eastbound between North Fair Oaks Avenue and Lawrence Expressway (PM Peak Hour)
- SR 237, eastbound between Great America Parkway and N. First Street (PM Peak Hour)
- SR 237, westbound between Lawrence Expressway and N. Fair Oaks Avenue (Both Peak Hours)
- SR 237, westbound between N. Fair Oaks Avenue and Mathilda Avenue (Both Peak Hours)
- SR 237, westbound between Mathilda Avenue and US 101 (PM Peak Hour)
- SR 237, westbound between US 101 and Maude Avenue (PM Peak Hour)
- SR 237, westbound between Maude Avenue and Central Parkway (PM Peak Hour)
- SR 237, westbound between Central Parkway (PM Peak Hour)
- SR 237, westbound between SR 85 and El Camino Real (AM Peak Hour)

The mixed-flow lanes on the following freeway segments would be adversely affected under existing plus project conditions only under PHDSP Option 1:

- US 101, northbound between SR 85 and N. Shoreline Boulevard (AM Peak Hour)
- US 101, southbound between Embarcadero Road and Oregon Expressway (PM Peak Hour)
- US 101, southbound between Oregon Expressway and San Antonio Avenue (PM Peak Hour)
- US 101, southbound between San Antonio Avenue and Rengstorff Avenue (PM Peak Hour)

In addition, the mixed-flow lanes on the following freeway segments would be adversely affected under existing plus project conditions under PHDSP Option 2:

- US 101, northbound between Guadalupe Parkway and De La Cruz Boulevard (AM Peak Hour)
- US 101, northbound between De La Cruz Boulevard and San Tomas Expressway (AM Peak Hour)
- US 101, northbound between San Tomas Expressway and Great America Parkway (AM Peak Hour)
- US 101, southbound between Guadalupe Parkway and N. First Street (PM Peak Hour)
- US 101, southbound between Old Bayshore Highway and I-880 (PM Peak Hour)
- SR 237, eastbound between N. First Street and Zanker Road (PM Peak Hour)
- SR 87, southbound between US 101 and Skyport Drive (PM Peak Hour)
- SR 87, southbound between Skyport Drive and Taylor Street (PM Peak Hour)

Furthermore, the development of the PHDSP Area also would adversely affect 17 HOV lane segments under Option 1 and 29 HOV lane segments under Option 2.

The VTA's Valley Transportation Plan (VTP) 2040 identifies freeway express lane projects along US 101 between Cochrane Road and Whipple Avenue. The planned conversion of the existing HOV lane to an express lane and the construction of a second express lane in each direction would increase the capacity of the freeway and help to address the deficiency in freeway operations to which the project would contribute. The Phase 3 portion of the Silicon Valley Express Lanes Project, which extends along US 101 from SR 237 to San Mateo County, is currently under construction and is anticipated to open in 2021. Phase 5, which will extend the US 101 express lanes south from SR 237 to I-880, is expected to be completed in 2025. The San Mateo 101 Express Lanes Project is currently under construction and is expected to be completed in 2022.

The Phase 2 portion of the Silicon Valley Express Lane Project, which extends along SR 237 from N. First Street to Mathilda Avenue, opened in November 2019. The level of service listed in the above table are taken from VTA's 2018 Congestion Management Program Monitoring Report, and thus do not

reflect the newly opened express lane. Additional freeway improvements such as the addition of mixed-flow lanes are generally not feasible due to right of way constraints and secondary impacts associated with induced travel.

While the SR 87 Corridor Study, dated October 2018, stated that there is no room to expand the freeway, it identified technology-based improvements and innovative solutions to maximize use of the existing infrastructure and lead to lower levels of solo driving and higher use of other available modes of travel along the corridor. Potential improvements identified in the study include converting the southbound ramp from US 101 southbound to SR 87 southbound from one to two lanes, use of shoulders as part-time lanes, converting HOV lanes to express lanes, technology-based improvements, and multimodal improvements. Implementation of TDM measures would reduce vehicle trips generated by the PHDSP Area, lessening the project's effect on nearby freeways. However, even with an aggressive TDM program, the project would have an adverse effect on many freeway segments.

Developments within the PHDSP area should be required to provide fair share funding for the above-listed freeway improvements as they come along if full funding is not secured by then.

Freeway Ramp Traffic Operations

A freeway ramp operations analysis was performed to verify that the freeway ramps have sufficient capacity to serve the projected traffic volumes with the development of the Patrick Henry Drive Specific Plan Area. This analysis consisted of a volume-to-capacity (v/c) ratio evaluation of the freeway ramps at the study interchanges. The ramp capacities were obtained from the *Highway Capacity Manual 2000*, and consider the free-flow speed, number of lanes on the ramp, and ramp metering. It should be noted that the evaluation of freeway ramps is not required based on the VTA's *Transportation Impact Analysis Guidelines*, nor are there adopted methodologies and impact criteria for the analysis of freeway ramps.

Freeway ramp traffic operations analysis was conducted for the ramps at the following interchanges:

- US 101/Great America Parkway
- SR 237/Great America Parkway
- US 101/Lawrence Expressway
- SR 237/Lawrence Expressway

Table 27 presents the existing freeway ramp parameters (ramp type, number of lanes, ramp meter locations, and peak-hour traffic volumes) as well as the existing v/c ratio. The existing traffic volume is well below the capacity on all study freeway ramps.

Table 28 presents an analysis of freeway ramps with the trips added by the Patrick Henry Drive Specific Plan under each of the two development options. Under existing plus project conditions with either development option, all study ramps are expected to have sufficient capacity (v/c < 1.0) during both peak hours.

Vehicle Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis for left-turn lanes at intersections where the project would add a substantial number of left turns. This analysis provides a basis for estimating future storage requirements at the intersections under existing and cumulative plus project conditions, which includes development of both the PHDSP Area and the Freedom Circle Focus Area along with other nearby planned and proposed developments including the Kylli project, City Place, and the Tasman East Specific Plan. Vehicle queues were estimated using a

Notes:
NB=northbound, SB=southbound, EB=eastbound, WB=westbound, v/c = volume-to-capacity ratio

[1] As a conservative approach, if an on-ramp has meter equipment present, the ramp is analyzed assuming it is metered.
[2] Ramp capacities were obtained from the Highway Capacity Manual, 2000 (pg 25-4), and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
[3] Peak-hour volumes are obtained through intersection counts or the Caltrans Performance Measurement System (PeMS) database.

Notes:
NB=northbound, SB=southbound, EB=eastbound, WB=westbound, v/c = volume-to-capacity ratio

[1] Ramp capacities were obtained from the Highway Capacity Manual, 2000 (pg 25-4), and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.

[2] Peak-hour volumes are obtained through intersection counts or the Caltrans Performance Measurement System (PeMS) database.

[3] As a conservative approach, if an on-ramp has meter equipment present, the ramp is analyzed assuming it is metered.

Poisson probability distribution, described in Chapter 1. The following left-turn movements were selected for evaluation:

- Bowers Avenue and US 101 SB Off-Ramp – Eastbound left turn
- Great America Parkway and Mission College Boulevard – Northbound and southbound left turn
- Great America Parkway and Patrick Henry Drive – Northbound and eastbound left turn
- Great America Parkway and Old Glory Lane – Northbound and eastbound left turn
- Great America Parkway and Tasman Drive – Northbound, eastbound, and westbound left turn
- Tasman Drive and Patrick Henry Drive – Westbound and northbound left turn
- Tasman Drive and Old Ironsides Drive – Westbound and northbound left turn
- Great America Parkway and SR 237 Westbound Ramps – Northbound and westbound left turn

The queuing analysis was conducted both with and without the proposed new roadway connection to Mission College Boulevard (see Table 29 and 30, respectively). The traffic volumes at three of the intersections listed above are expected to be the same with and without the proposed new roadway connection; thus, those intersections are not repeated in Table 30. The results show that seven of the eight intersections studied are expected to have insufficient turn lane storage to accommodate the anticipated traffic volumes in the Year 2040 both with and without the new roadway connection. The feasibility of potential improvements to address the queue storage deficiencies is discussed below. It should be noted that this analysis is conservative since the queue storage requirements could be reduced somewhat (up to 10 percent) through the implementation of TDM measures.

Great America Parkway and Mission College Boulevard – Southbound Left Turn

The existing storage capacity for the southbound left-turn on Great America Parkway is approximately 200 feet in the inner lane and 600 feet in the outer left-turn lane for an average of 400 feet per lane. Under existing conditions, the available storage is sufficient to accommodate the 95th percentile queue. Under cumulative conditions, this movement is expected to exceed the available storage during both the AM and PM peak hours, with a maximum queue of 625 to 775 feet per lane with and without the new roadway connection, respectively. The turn lanes could be extended by modifying the existing landscaped median. However, there is not sufficient space to accommodate the 95th percentile queue for both the southbound left turn at the Great America/ Mission College intersection as well as the northbound left turn at the Great America/Patrick Henry intersection even if the turn pockets are extended so that they are end to end.

Great America Parkway and Patrick Henry Drive – Northbound and Eastbound Left Turn

Under existing conditions, the 95th percentile queue for the northbound left-turn exceeds the available storage (230 feet) by about 350 feet during the AM peak hour. The addition of a second northbound left-turn lane is recommended to address the adverse effect of PHDSP Area development. Even with the added lane, the 95th percentile queue is expected to exceed the available storage during one or both peak hours with a maximum queue of 575 to 700 feet per lane under cumulative conditions with and without the new roadway connection, respectively. The length of the turn lanes could be extended by modifying the existing landscaped median. However, as previously stated, it is not feasible to accommodate the 95th percentile queue for the northbound left-turn at the Great America/Patrick Henry intersection as well as the southbound left-turn at the Great America/Mission College intersection.

[1] Vehicle queue calculations based on cycle length for signalized intersections, and movement delay for unsignalized intersections.
[2] Assumes 25 Feet Per Vehicle Queued

The trips associated with the PHDSP Area development and other proposed projects such as the Kylli development are expected to cause the left-turn queue on eastbound Patrick Henry Drive to extend beyond the upstream intersection at Old Ironsides Drive during both the AM and PM peak hour. The queue length would be the same with or without the proposed new roadway connection to Mission College Boulevard. As described in Chapters 4 and 6, installation of a new traffic signal is recommended at the Old Ironsides/Patrick Henry intersection. The new signal should be closely coordinated with the existing signal at the Great America/Patrick Henry intersection to manage the vehicle queues.

Great America Parkway and Old Glory Lane – Northbound and Eastbound Left Turn

The existing storage capacity in the northbound left-turn lane (240 feet) is sufficient to accommodate the 95th percentile queue during the AM and PM peak hours. However, the addition of trips associated with the PHDSP Area development would cause the queue to overflow the existing turn lane storage during both development scenarios with and without the proposed new roadway connection to Mission College Boulevard. The addition of a second northbound left-turn lane is recommended at this intersection to offset the adverse effect of PHDSP Area development under cumulative plus project conditions without the proposed new roadway connection to Mission College Boulevard. Even with the added lane, the 95th percentile queue is expected to exceed the available storage during both peak hours with a maximum queue of 775 feet per lane under cumulative plus project conditions without the new roadway connection. The dual left-turn lanes could be extended to accommodate the 95th percentile queue by modifying the existing landscaped median. A second northbound left-turn lane is not required to address the projects effects on level of service under cumulative plus project conditions with the new roadway connection to Mission College Boulevard. Nevertheless, it is recommended under this scenario as well to prevent operational issues associated with queues overflowing the left-turn pocket and impeding traffic in the adjacent through lane.

Under existing conditions, the eastbound approach has only a single lane that is shared by all movements. Thus, the queuing analysis is based on the total eastbound approach volume including all turn movements. The trips associated with the PHDSP Area development are expected to cause the queue on eastbound Old Glory Lane to extend beyond the upstream intersection at Old Ironsides Drive both with and without the proposed new roadway connection to Mission College Boulevard. The addition of a separate eastbound right-turn lane is recommended to help alleviate the queueing issue on Old Glory Lane. Furthermore, as described in the previous chapters, installation of a new traffic signal is recommended at the Old Ironsides/Old Glory intersection. The new signal should be closely coordinated with the existing signal at the Great America/Old Glory intersection to avoid gridlock.

Great America Parkway and Tasman Drive – Northbound, Eastbound and Westbound Left Turn

The traffic volumes for all movements at this intersection are expected to be the same with or without the proposed new roadway connection to Mission College Boulevard. Thus, the queuing analysis results for this intersection presented in Table 29 would apply both with and without the roadway connection and are not repeated in Table 30.

While the 95th percentile queue at the northbound left-turn movement currently exceeds the available storage, the 2040 traffic volumes do not expect an increase in the traffic volume making this movement. The left-turn lanes could be extended to accommodate the existing queue length if the northbound left-turn queues cause operational issues.

The existing storage capacity for the eastbound dual left-turn lanes on Tasman Drive (290 feet per lane) is sufficient under existing conditions. The proposed development of the PHDSP Area and the

Kylli project are expected to cause maximum queues of up to 625 feet per lane. The turn lanes cannot be extended due to presence of light rail in the median and right-of-way constraints.

The westbound left-turn queue is expected to grow from 300 feet per lane in two lanes under existing conditions to as much as 400 feet per lane in three lanes in the Year 2040 during the AM peak hour. The left-turn pocket could be extended from the existing length of 270 feet to 425 feet by modifying the existing landscaped median.

Tasman Drive and Patrick Henry Drive – Westbound and Northbound Left Turn

Under existing conditions, the westbound left-turn queue can be accommodated within the existing turn pocket storage. However, in the Year 2040, the trips associated with the PHDSP Area and other nearby developments are expected to cause the left-turn queue on westbound Tasman Drive to extend up to 250 feet, which would exceed the existing turn pocket length by 20 feet, which is approximately one vehicle length. Thus, queuing issues at this location would occur only rarely and do not warrant the expense of extending the turn pocket. The queuing analysis results for this turning movement are the same with or without the proposed new roadway connection to Mission College Boulevard.

The northbound left-turn lanes are each only about 140 feet long, which is sufficient for the maximum queue of 75 feet under existing conditions. The projected 2040 traffic volumes are expected to result in 95th percentile queues of up to 550 feet with the new roadway connection and 725 feet without the connection. Extending the existing turn lanes may require right of way dedication when the Kylli site is developed. Furthermore, the Kylli development should avoid locating driveways or internal roadways in close proximity to the Tasman/Patrick Henry intersection to avoid issues with queue spillback.

Tasman Drive and Old Ironsides Drive – Northbound and Westbound Left Turn

Currently, there is only a single left-turn lane approximately 150 feet long on westbound Tasman Drive at Old Ironsides Drive. Over 1,000 vehicles are expected to make this left turn by the Year 2040 in the AM peak hour due to the development of the PHDSP Area and the Kylli project resulting in a 95th percentile queue over 1,000 feet in the AM peak hour both with or without the proposed new roadway connection to Mission College Boulevard. Adding a second westbound left-turn lane is not feasible because it would require the acquisition of additional right of way along the north side of Tasman Drive. However, the existing left-turn lane could be extended by modifying the landscaped median. Due to the proximity of the Great America/Tasman intersection, the westbound left-turn lane could not be extended to a length of more than 450 feet per lane.

In the Year 2040, the trips associated with the PHDSP Area and other nearby developments are expected to cause the left-turn queue on northbound Old Ironsides Drive to extend beyond the dedicated turn lane striping, which is only about 100 feet in length. Beyond this point, the median is striped as a two-way left-turn lane, and also serves southbound left-turn traffic turning into an adjacent parcel. With the proposed new roadway connection to Mission College Boulevard, the projected 95th percentile queue length is estimated to be 225 feet, which would not leave any space for southbound vehicles to queue in the median while waiting to turn into the nearby driveway. The driveway could be restricted to right turns only if significant operational issues develop. Without the proposed new roadway connection, the 95th percentile queue length would be even longer (approximately 300 feet), which would extend to the upstream driveway.

Great America Parkway and SR 237 Westbound Ramps – Northbound Left Turn

The traffic volumes for all movements at this intersection are expected to be the same with or without the proposed new roadway connection to Mission College Boulevard. Thus, the queuing analysis results for this intersection presented in Table 29 would apply both with and without the roadway connection and are not repeated in Table 30.

The existing storage capacity for the northbound left-turn lane on Great America Parkway is approximately 210 feet, or 8 vehicles per lane. The traffic growth expected by the Year 2040 is estimated to result in a 95th percentile queue length of 325 feet per lane. The left-turn storage cannot be increased because the turn lanes extend to the upstream intersection at the SR 237 Eastbound Ramps.

Signal Warrant Analysis

The study evaluated two unsignalized T-intersections: Old Ironsides Drive/Old Glory Lane and Old Ironsides Drive/Patrick Henry Drive. The Old Ironsides Drive/Old Glory Lane intersection is stop controlled for the westbound Old Glory Lane approach. The Old Ironsides Drive/Patrick Henry Drive intersection is stop controlled on the southbound Old Ironsides Drive approach. Under project conditions, the parcel on the south side of Patrick Henry Drive, opposite to Old Ironsides Drive, is assumed to redevelop and have a driveway that will create a new south leg so that the intersection will have four legs with the proposed project and only three legs without the project. It was assumed that the intersection would include a single shared approach lane on the south leg. The north leg will be re-striped with one left-turn lane and one shared through/right-turn lane.

The level of service analysis (see Chapters 2 to 5) shows that both intersections would operate at unacceptable levels (LOS E or F) during at least one peak hour with development of the PHDSP Area under both Options 1 and 2 in 2030 and in 2040. In the year 2030, the intersection of Old Ironsides Drive and Old Glory Lane would not meet the signal warrant with either PHDSP development option under the scenarios with the new roadway connection to Mission College Boulevard and would meet the signal warrant with either PHDSP development option under the scenarios without the new roadway connection to Mission College Boulevard. In the Year 2040, this intersection would satisfy the signal warrant under every scenario including the No Project scenario both with and without the proposed roadway connection to Mission College Boulevard. The intersection of Old Ironsides Drive and Patrick Henry Drive is expected to meet the peak hour signal warrant with development of the PHDSP Area under all project scenarios (under both Options 1 and 2, in the Year 2030 and 2040, with and without the new roadway connection). The signal warrant calculations are included in Appendix D. Ultimately, it is expected that signalization will be required at both intersections to accommodate the traffic associated with the Patrick Henry Drive Specific Plan Area and other nearby developments such as the Kylli project.

Internal Vehicular Circulation

A grid system of new streets will be implemented within the PHDSP Plan Area to provide vehicular connections between parking garages in the Plan Area and Patrick Henry Drive and Old Ironsides Drive. Three new street connections (A Street, B Street, and C Street) are planned on Patrick Henry Drive and two new street connections (A Street and E Street) are planned on Old Ironsides Drive as shown on Figure 18. A new street connection (F Street) is also proposed between Patrick Henry Drive and Mission College Boulevard.

Two potential alignments of F Street that coincide with existing parcel boundaries were considered. The western alignment would be located approximately 200 feet east of B Street and 400 feet west of C Street, while the eastern alignment would be roughly 100 feet east of C Street and 550 feet west of Old Ironsides Drive. The proximity between C Street and the eastern alignment of F Street would cause operational issues as the spacing is too close to allow the two intersections to operate independently, yet the offset would preclude simultaneous left turns on the north and south legs necessitating split-phase operation, which is generally less efficient. Furthermore, the traffic volumes on Patrick Henry Drive and on Mission College Boulevard increase as you move east resulting in a higher volume of

conflicting movements for intersections at the eastern alignment. Thus, the western alignment is preferable and was assumed in this analysis.

The new roadway connection would require the consent of Mission College as it would connect to a private roadway controlled by the College. Because it is uncertain if the College will consent to this new roadway connection, cumulative traffic conditions also were analyzed without this new roadway connection.

Intersection Operations with the Connection to Mission College Boulevard

Figure 20 presents the recommended lane configurations and traffic control for the new intersections with the proposed new roadway connection to Mission College Boulevard. With the exception of F Street, the new streets internal to the Plan Area would be used only by trips to and from PHDSP parcels. Thus, the traffic volumes on the new internal streets are anticipated to be low. Therefore, new intersections internal to the PHDSP Plan Area will be stop controlled and have one lane on each approach.

The new intersections on Patrick Henry Drive, Old Ironsides Drive, and Mission College Boulevard will have traffic associated with the PHDSP Plan Area and other nearby developments such as the Kylli project as described in the previous chapters. The analysis of traffic operations with the proposed new Mission College Boulevard Connection shows that the intersections of F Street and Patrick Henry Drive, F Street and Mission College Boulevard, Patrick Henry Drive and A Street, and Old Ironsides Drive and E Street would meet signal warrants under cumulative plus project conditions under both PHDSP Option 1 and Option 2. These intersections would operate at an unacceptable level of service as single lane roundabouts and are recommended to be signalized. Exclusive left-turn pockets are recommended on the collector street approaches (on Patrick Henry Drive and on Old Ironsides Drive) while shared turn lanes are recommended at most new local street approaches at these intersections. A separate left-turn lane is recommended at the westbound approach of Old Ironsides Drive and E Street. A dual westbound left turn is recommended at the intersection of F Street and Patrick Henry Drive for it to operate acceptably. This will require widening of a short segment of Patrick Henry Drive. Additionally, due to the proximity of B Street to F Street, it is recommended that turns to and from B Street at Patrick Henry Drive be limited to right turns only. This turn restriction is expected to divert traffic from southbound B Street to either the westbound left turn at the intersection of Patrick Henry Drive and A Street or the southbound right and left-turn movements at the intersection of C Street and Patrick Henry Drive.

The traffic volumes forecast under cumulative plus project conditions for PHDSP Option 1 and Option 2 are shown on Figures 21 and 22, respectively. The forecasts reflect the recommended turn restriction at B Street and the resulting traffic diversions. The forecasts show that in the Year 2040, the new street connection between Patrick Henry Drive and Mission College Boulevard would serve approximately 1,800-1,900 vehicles (60 percent northbound and 40 percent southbound) in the AM peak hour and 2,900-3,000 vehicles (35 percent northbound and 65 percent southbound) in the PM peak hour. The heavy traffic volume forecast on this new roadway reflects broad usage by trips to both the PHDSP Area and the proposed Kylli development as well as a diversion of cumulative no project traffic from other routes.

Table 31 presents the results of the level of service analysis for the proposed new intersections on Patrick Henry Drive, Old Ironsides Drive, and Mission College Boulevard. Unlike the level of service results in the previous chapter and the volumes shown on Figures 21 and 22, which do not reflect any trip reductions for TDM, the level of service analysis of internal intersections reflects a 10 percent reduction in trips due to TDM, as required by the City's Climate Action Plan. All of the proposed new internal intersections, both signalized and stop-controlled, would operate at an acceptable LOS D or better during both the AM and PM peak hours. While delays for some stop-controlled movements on

the minor street approaches would exceed 35 seconds, which is the LOS D/E threshold, the planned grid network would allow residents to use the internal street connections to travel to one of the signalized access points to avoid waiting at a stop-controlled approach during peak periods. Furthermore, the proposed new signals would create gaps in the traffic flow on Patrick Henry Drive and on Old Ironsides Drive facilitating turns to and from unsignalized driveways.

Signal warrant and level of service calculations are provided in Appendix E.

Hazards and Emergency Access

Detailed site plans are not yet available to allow for the review of design details to assess if any design features pose a hazard or affect emergency access. All internal streets, sidewalks, driveways, traffic control devices, and other transportation infrastructure should be designed to meet applicable standards for safety. All driveway and drive aisles on-site should comply with the City requirement for emergency vehicle access. Future development applications within the PHDSP area would be subject to the City of Santa Clara process for site plan review to ensure the adequacy of circulation patterns.

Effects on Pedestrians, Bicycles, and Transit Facilities

The following sections describe the potential impact of the project on pedestrian, bicycle, and transit facilities and services. Impacts are identified based on the significance criteria as described below.

Significance Criteria

Significant impacts to pedestrian or bicycle facilities would occur when a project or an element of the project:

1. Creates a hazardous condition that does not currently exist for pedestrians and bicyclists, or otherwise interferes with pedestrian accessibility to the site and adjoining areas; or
2. Conflicts with an existing or planned pedestrian or bicycle facility; or
3. Conflicts with policies related to bicycle and pedestrian activity adopted by the City of Santa Clara.

Significant impacts to transit service would occur if the project:

1. Disrupts existing transit services or facilities; or
2. Conflicts with an existing or planned transit facility; or
3. Conflicts with transit policies adopted by the City of Santa Clara or VTA.

Pedestrian Facilities

The project would result in a substantial improvement to pedestrian facilities. Currently portions of Patrick Henry Drive and Old Ironsides Drive lack sidewalks. Sidewalks would be added in these sections and would be improved at sections where they are currently present. The intersections of Old Ironsides Drive with Old Glory Lane and with Patrick Henry Drive lack current ADA compliant crosswalks. The same is true at the intersections of Old Glory Lane and Patrick Henry Drive with Great America Parkway. All of these intersections would be upgraded to current ADA standards as part of the project.

The Plan Area currently comprises very large parcels that make walking distances excessive between properties. The plan would implement a grid system of streets that would significantly shorten block lengths and walking distances. All new streets would be designed to comfortably accommodate pedestrians with new continuous sidewalk facilities and high visibility crosswalks at intersections. Some of the new streets would not allow motor vehicles and would be designed only for pedestrians and bicycles.

One of the planned new streets would provide a connection to Mission College, directly to the south of the project. Currently, the only connection to the College from the Plan Area is via Great America Parkway. Continuous sidewalk facilities will be provided along this new street providing easy walking access to the College. Consent will be required from Mission College to build the new connection, and thus, this roadway may not come to fruition.

The Calabazas Creek Trail, which runs directly adjacent to the western edge of the Plan Area also provides access to the College, however, the Plan Area currently does not have any direct connections to the trail. The City of Santa Clara is currently preparing the *Creek Trail Network Expansion Master Plan (Trail Master Plan),* which addresses Saratoga Creek, Hetch Hetchy and Calabazas Creek corridors. The *Trail Master Plan* has identified two locations to access the Calabazas Creek Trail. The first access point is located at the southwest corner of the Plan Area where Mission College Boulevard turns east away from the creek (see Figure 26). The second access point is located in the northwest corner of the Plan Area where the proposed Hetch Hetchy Trail intersects the Calabazas Creek Trail (see Figure 27). The Hetch Hetchy Connector Trail is an off-street east-west trail, which is proposed to run along the northern edge of the Plan Area and to connect north-south trails in Santa Clara County including the Calabazas Creek Trail, San Tomas Aquino Creek Trail, and Guadalupe River Trail. Trail access should be integrated into the Patrick Henry Specific Plans at both of these locations. PHDSP Area developments shall pay a fair share to build both the Hetch Hetchy Trail and Calabazas Creek Trail in order to offset the adverse effects associated with the project at adjacent study intersections as identified in the previous chapter. Furthermore, certain properties within the PHDSP area may be required to dedicate right of way to implement the proposed trail connections. Appendix F presents the details of the preliminary trail alignment plan for both the Hetch Hetchy and Calabazas Creek Trails.

The PHDSP includes a new greenway west of Patrick Henry Drive to connect the Plan Area to the Calabazas Creek Trail. Greenways are also planned along the entire length of Patrick Henry Drive, Old Ironsides Drive, and along the proposed park in the middle of the Plan Area. The north-south greenways and internal streets in the plan area will connect to the Hetch Hetchy Connector Trail along the northern edge of the Plan Area.

The typical destinations for pedestrians are schools, parks, shopping areas, and transit stops. The existing and planned pedestrian network would allow access to all nearby facilities. Parks are planned within the PHDSP area. Additional parks are planned within the Kylli development directly north of the PHDSP area. Retail stores and restaurants are included in the PHDSP and also in the planned Kylli project. The Mercado shopping center is located just over one-half mile south of the PHDSP area and includes movie theaters, restaurants, and some larger stores. Bus stops are currently located within the Plan Area on Patrick Henry Drive and Old Ironsides Drive. Additional bus stops are located on Great America Parkway and Mission College Boulevard. Light rail service is provided along Tasman Drive with the closest station being about ½ mile north of the Plan Area. Thus, most of the daily needs of future residents could be met within walking distance of the planned homes. School access is discussed below.

In summary, the project would have a beneficial impact on pedestrian facilities. It would build several new pedestrian connections, and it is located in an area that is near existing and planned services.

Bicycle Facilities

The area surrounding the PHDSP area has numerous bicycle facilities, including trails and bike lanes. There are north-south trails along Calabazas Creek, San Tomas Aquino Creek, and the Guadalupe River. These trails connect to the Bay Trail on the north edge of Santa Clara. There are east-west bike lanes on Tasman Drive, Mission College Boulevard, and several other streets. There is also a bike and pedestrian bridge over Calabazas Creek on the western edge of the PHSP area that connects to the John W. Christian trail in Sunnyvale.

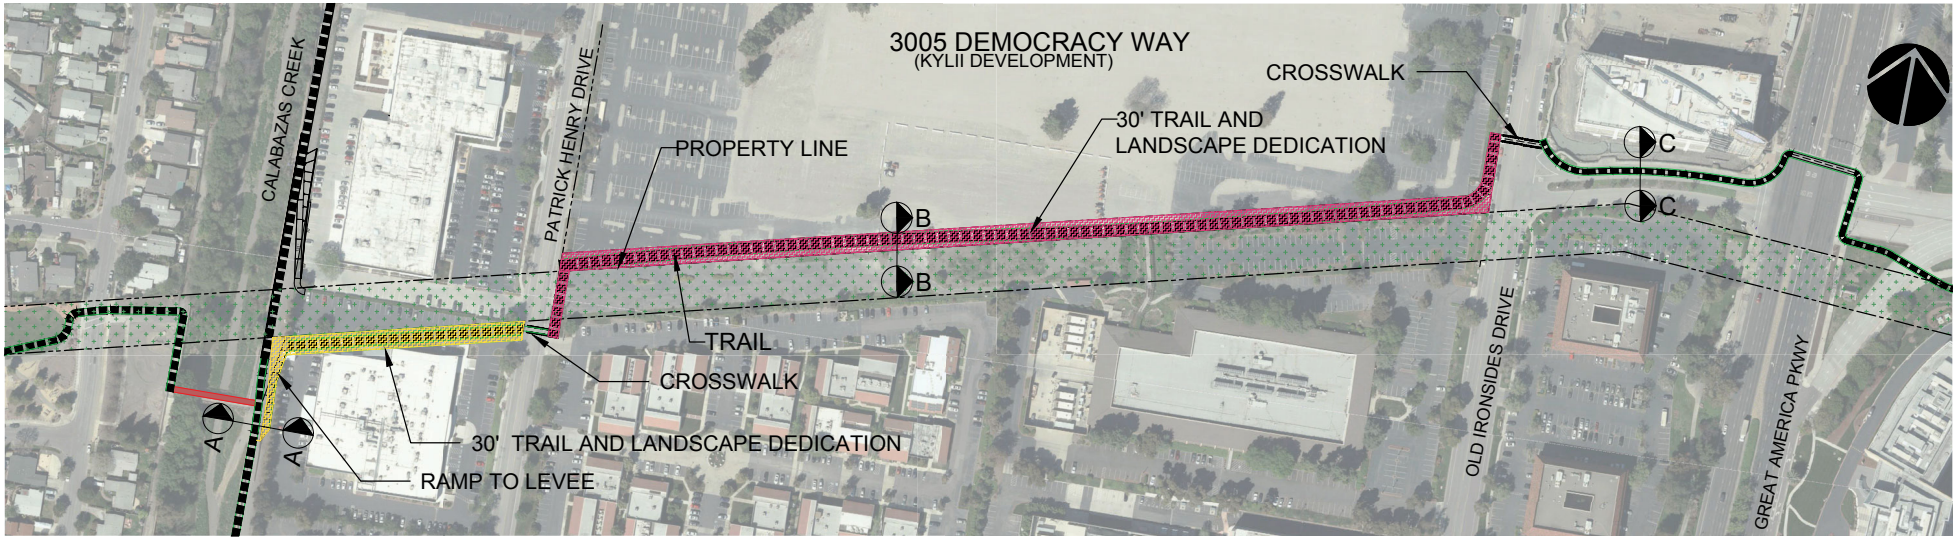

Figure 27
Hetch Hetchy ROW Preliminary Trail Alignment Plan

NORTH
Not to Scale

In addition to recreational riding, there would likely be many future residents of the PHDSP area who would ride to work. There are bike lane and bike trail connections to most surrounding employment areas. Existing employment zones to the north of the project could be reached via bike lanes on Great America Parkway or via the Calabazas Creek trail. Planned employment in the Kylli development is within walking distance. There also is a large amount of employment planned as part of the City Place development. This area could be reached via the bike lanes on Tasman Drive. The same bike lanes on Tasman Drive could be used to reach the employment area in North San José. The Guadalupe River trail could be used to reach downtown San José. Employment areas south of the project site could be reached via the San Tomas Aquino Creek trail or bike lanes on Great America Parkway/Bowers Avenue.

As described above, the PHDSP would add a grid system of streets to the Plan Area, which would enhance bicycle access as well as pedestrian access. Consistent with the City's *Bicycle Master Plan Update 2018*, Class IV protected bike lanes will be provided on Patrick Henry Drive and Old Ironsides Drive within the Plan Area. In addition, the internal streets within the plan area would be designated as Class III bike routes. In summary, the project would have a beneficial impact to bicycle facilities. Also, the PHDSP Area is well situated to take advantage of numerous existing bicycle facilities that provide connections to all likely destinations.

Access to Schools

The PHDSP project would generate an increase in school attendance. The Kylli development also would generate school students and is planning to build an elementary school as part of the project. This school would be within walking distance of the PHDSP residents, and various sidewalks and paths would be provided to get to the school.

The Santa Clara Unified School District does not provide any middle schools or high schools in the close proximity to the PHDSP Area. The nearest schools are several miles away. Given the distance of the schools, no middle school or high school students would be expected to walk, and few students would bicycle. Therefore, students would need to get to school by transit or car.

Transit Services

Existing bus services to the PHDSP Area include an ACE shuttle, which travels on Patrick Henry Drive and Old Ironsides Drive, and three VTA routes along Great America Parkway once regular services resumes. Service is currently limited due to COVID-19. The PHDSP Area is located about one-half mile south of the Old Ironsides light rail station on Tasman Drive, which is about a 10-minute walk. The Plan Area is not served by a Caltrain shuttle. However, VTA route 59 connects to the Santa Clara Caltrain station, and light rail connects to the Mountain View Caltrain station. Both connections are indirect.

The project would not interfere or conflict with existing or planned transit facilities. To the contrary, the project would contribute to grade separation projects at intersections with light rail in the median, HOV type signal improvements that could support future bus rapid transit facilities, and transit signal priority at signalized intersections. While VTA's New Transit Service Plan (2019) does not call for transit service within the PHDSP Area, the Specific Plan would include bus stops along Patrick Henry Drive and Old Ironsides Drive that would allow for shuttle or other micro transit services provided by VTA, a Transportation Management Agency (TMA), or private provider. Thus, the project is expected to have a positive effect on transit services.

Patrick Henry Drive Specific Plan TA
