BUSINESS PLAN FOR EMERGENCY RESPONSE
Section II: Evacuation Procedures

1) By which method(s) is the Emergency Coordinator at your facility notified that an emergency (i.e. an actual or threatened hazardous materials release) is taking place? (check applicable items)

[X] Alarms: Name of Manufacturer American District Telegraph
Last Test Date 2-25-87 Test Frequency Monthly

[ ] Horns Last Test Date: Test Frequency:

[X] Emergency Phone Number Phone Number 800-231-0256

[ ] Shouting [X] Other Intercom in Manufacturing Area

2) Once the EC has been notified of an emergency situation what outside agencies does he/she notify?

Agency *Fire Department* Phone 911
Agency *State Office of Emergency Services* Phone 1-800-852-7550
Agency Phone
Agency Phone

These phone numbers should be posted throughout the facility to allow any employee to report the emergency, should the emergency coordinator or his alternate not be available.

3) If the facility must be evacuated, all personnel should know where the nearest emergency exit is located, and should be aware of all evacuation routes. This can best be accomplished by POSTING EVACUATION MAPS throughout the facility showing the location of emergency exits and evacuation routes, and by PRACTICING EVACUATION DRILLS on a routine basis.

4) During the actual evacuation, each facility should have specific individuals assigned to specific tasks.

List the person(s) responsible to do the following tasks. Include the person's name title, and shift number. (Use additional sheets if required).

Inspect Bathrooms Cathi Kelsey/Vic Conti
Inspect Breakroom Cathi Kelsey
Shut Off Gas Supply Vic Conti
Shut Off Water Supply Vic Conti
Shut Off Electricity (circuit breakers): Ray Riley
Provide CPR Ray Riley/Lisa Walter
Provide Emergency First Aid Ray Riley/Lisa Walter
Verify That All Personnel Have Been Evacuated (headcount): Bob Walker

5) Should personnel be injured during the emergency, your facility must have a nearby clinic, hospital available for treatment.

Medical Facility Name El Camino Hospital
Medical Facility Address 2500 Grant Road, Mountain View
Medical Facility Phone Number (24-hour): (415) 940-7055
Approximate Distance To Medical Facility 3 miles

BUSINESS PLAN FOR EMERGENCY RESPONSE
Section III: Spill Control/Mitigation Procedures

1) If the chemical spill/release is considered too large for your facility to handle or if your facility is not equipped with the appropriate clean-up equipment, you should have available a phone number of a hazardous materials clean-up contractor to call. This number will also be used by the fire department during an emergency involving hazardous materials clean-up.

Contractor Name: I. T. Corporation

Contractor Address: 3010 Zankar Road, San Jose, CA

Contractor Phone (24-hour): (415) 372-9100

Contractor EPA ID Number: CAD 980885925

2) If your facility has the ability to mitigate the spill/release, a list of personnel responsible for the use of all specialized protective clothing, chemical spill control and clean-up equipment must be established and maintained.

Name	Title	Specific Responsibilities

3) In addition to personnel, the protective equipment and spill control equipment must be maintained, tested, and inspected on a regular basis.

PLEASE COMPLETE ATTACHMENT 1: EMERGENCY EQUIPMENT

4) Are all Emergency Response Procedures posted on site? [X] Yes [ ] No

If yes, list locations

On file at Safety Manager's Office

Lunchroom

BUSINESS PLAN FOR EMERGENCY RESPONSE
Section IV: Employee Training Records

1. Are all personnel trained and drilled in proper evacuation procedures, and do they understand what additional responsibilities, if any, they may have during an evacuation? YES[X] or NO[ ]

2. Are all personnel familiar with proper means of notifying their manager/ emergency coordinator in the event of an emergency? YES[X] or NO[ ]

3. Are all personnel trained in the safe handling of hazardous materials which they use or may be exposed to in their job? YES[X] or NO[ ]

4. Are new personnel trained in proper notification, evacuation, and hazardous materials handling procedures within 6 months of their date of hire? YES[X] or NO[ ]

5. Are refresher courses in: emergency response (for emergency response personnel only), evacuation, notification, and hazardous materials handling procedures given at least annually? YES[X] or NO[ ]

6. Do in-house emergency response personnel receive specialized hazardous material incident response training as part of their overall job training? YES[ ] or NO[X]

7. Are copies of all Material Safety Data Sheets (MSDS's) included with this packet? YES[X] or NO[ ]

I hereby certify that our plan is in conformance with the requirements of the California Health and Safety Code, Chapter 6.95, as it relates to The Emergency Response Plan subsection of the Business Plan, and understand that I will be required to show proof of compliance (including training documentation) during any facility inspection conducted by local, county, or state authorities.

EMERGENCY EQUIPMENT

INSTRUCTIONS: In the blank form provided describe the safety, spill response, and communication equipment you have in place at your facility for use in emergency situations. If practical, report the equipment according to individual job, shop or work activity area within your facility. If applicable, include the elements listed in legend.

Personal Protective & Safety Equipment

- Aprons
- Gloves
- Coats
- Chemical Suits
- Boots
- Safety Glasses
- Faceshield
- Hard Hats
- Cartridge Respirators
- Self Contained Breathing Apparatus (SCBA)
- First Aid Kits
- Exhaust Hoods/Vapor Scrubbers
- First Aid Stations
- Chemical Antidotes
- Eye Wash/Safety Shower

Spill Control/Monitoring Equipment

- Fire Blankets
- Fire Extinguishers (Type (A, B, C) & D)
- Fire Hoses
- Chemical Vapor Monitoring Equipment (Type)
- Spill Cart
- Chemical Absorbants
- Neutralizers
- Sand
- Leak Repair Kits (Chlorine)
- Underground Tank Leak Detection Monitors one
- Overpak Drums
- Plugging/DIKing Materials
- Pumps

Communications Equipment

- Pager X
- Telephones X
- Intercoms
- Portable Radio(s)
- Verbal X

Re: Hazardous Materials Storage Permit Application
Renewal and Fees for 1986
MESA Technology

Gentlemen:

In accordance with the City of Mountain View's Hazardous Materials Storage Permit Code, MESA Technology is submitting the following:

a) Hazardous Materials Management Plan (Form HM-3)
b) Facility Permit Fee Worksheet (Form HM-3)
c) Fee Payment
d) Storage Facility Permit Quantity Limit (Form HM-3)
e) Hazardous Materials Inventory Statement (Form HM-2)
f) Application for Permit to Operate Underground Storage Tank (Form HSC04-070185)
g) HMMP Questionnaire (Form HM3-5)

If you should have any questions, please feel free to phone me at (415) 961-6372.

Sincerely,

Larry Barber
Manufacturing Manager

June 27, 1989

Dear Chris:

Per our conversation I have enclosed a confidential listing of the Olin Mesa process lines and chemical concentrations.

The location map has been updated to highlight the process lines that correspond to the listing.

I hope that this satisfies your request.

I will be on holiday until July 19th. so if you have any questions or comments, please contact me after that date.

Should you wish to conduct your re-inspection before that date, contact Phil Audet at this address.

Sincerely,

Curt M. Richards

June 8, 1989

Mr. Curt Richards
MESA TECHNOLOGY
1130 Terra Bella
Mountain View, CA 94043

Dear Mr. Richards:

On May 22, 1989, an inspection was conducted at your facility at 1130 Terra Bella to determine compliance with the Hazardous Material Storage Ordinance (Chapter 24, MVMC).

The following items were noted as requiring remedial action for compliance:

Paperwork

1) A recordable spill log shall be kept on site as we discussed.

2) Your closure plan shall be submitted to our office thirty days prior to your departure.

Inside Storage

1) All your process tanks shall be labelled with DOT class, chemical name, and % concentration.

Outside Storage

1) Empty drum storage area shall be labelled as such.

A brief re-inspection of your premises will be conducted during the MONTH OF JULY to confirm that those items not in compliance have been corrected. Failure to correct said items may result in civil penalties of up to $500.00 per day. Further re-inspections will be billed at $40.00 per man hour, one hour minimum. Re-inspections will continue until all items have been corrected.

If you have any questions in this matter, please feel free to contact me at (415) 966-6378.

Sincerely,

Chris Stock

Contingency Plan

Introduction

The Contingency Plan is based on the "Business Plan for Emergency Response (HM 3-5)" which is required by the City of Mountain View. It is attached for reference and supplemented by the following information. The attached HM 3-5 describes arrangements with local authorities, emergency coordinators, emergency equipment, and the evacuation plan. Hazardous wastes are defined and discussed in the Waste Management Plan.

Purpose

The purpose of the contingency plan is to minimize hazards to human health or the environment which results from fires or releases of hazardous wastes into the environment via the storm drains, the sewers or other means.

These provisions should be implemented as soon as possible whenever an incident occurs which threatens to harm human health or the environment by the release of hazardous wastes.

Procedures

Upon the occurrence of an incident serious enough to harm human health or to threaten the environment the following steps shall be implemented immediately by the Emergency Coordinator (EC):

(a) Activate the internal alarm systems.

(b) Stop leak or continuing problem.

(c) Begin clean up.

(d) The EC shall quantify the materials spilled and the threat to the environment.

(e) If help is required call the following as needed:

1) I. T. Corporation (415) 372-9100
3010 Zankor Road, San Jose
Emergency Spill Response/Clean Up

2) Ambulance - Call 911

3) El Camino Hospital (415) 940-7055
2500 Grant Road, Mountain View

4) Mountain View Fire Department - 911 or
(415) 966-6378

5) Mountain View Police Department - 911 or
(415) 966-6344

6) State Office of Emergency Services - 1-800-852-7550
2800 Meadowview Road, Sacramento 95832

7) Polo Alto Wastewater Treatment Plant - (415) 329-2117
2501 Embarcodero Way, P. O. Box 10250, Palo Alto,
CA 94303

(d) Upon the release of hazardous wastes to the environment the EC shall notify the State Office of Emergency Services and give the following information:

1) Name and phone number of reporter.

2) Name and address of facility.

3) Time and type of incident.

4) Name and quantities of materials.

5) Injuries, if any

6) Possible hazards associated with the incident.

(e) During an emergency the EC shall take all necessary steps to ensure that additional fires or releases do not occur, reoccur, or spread. These measures include stopping operations, containing spilled wastes, etc.

(f) The EC shall provide for the clean up of spills or residues either by in-house personnel or by contract personnel, e.g., I. T. Corporation as listed. (Minor spills should be cleaned up according to the waste management plan).

(g) The EC shall provide that no incompatible wastes are handled in the affected area until the clean up is completed and that all emergency equipment is cleaned and readied for future service before operations resume.

(h) The EC or other management personnel shall notify the Office of Emergency Services and others previously notified that the clean up is completed before resuming operations in the affected areas.

(i) Details of the incident including the time and date shall be entered into the operating record by memo and a written report made within 15 days to the State as per HSC 67145 (J) (1-7). The report shall include the following items:

(1) Name, address, and telephone number of Mesa

(2) Date, time and type of incident (e.g. fire, explosion)

(3) Names and quantities of material involved

(4) Extent of injuries, if any

(5) An assessment of hazards, where applicable

(6) Quantity and disposition of recovered materials resulting from the incident.

Mesa Technology

Preparedness and Prevention Plan

for Hazardous Waste Storage Areas

Introduction:

Required Equipment:

(a) An internal communications system exists and is adequate for alerting facility personnel of an emergency situation. The System is comprised of an intercom in the manufacturing area, activated by the receptionist, a telephone system to the lab, and augmented by the ease of vocal communications in the office and manufacturing areas. The inside waste flammables storage area would be covered by most of the above while the outside storage area would be informed vocally.

(b) In addition to the telephone system the fire alarms are wired to a security company which contacts the Mountain View Fire Department. These provide ample emergency notification.

(c) Ample emergency response equipment is located on-site to prevent small occurrences from becoming major occurrences. These are described in Attachment 1.

(d) Water Supply is adequate in volume and pressure to supply the sprinkler system and the on-site fire hose.

Testing and Maintenance of Equipment

(a) It is the policy of Mesa that all safety equipment discussed in the above section and identified in Attachment 1 shall be maintained in proper and workable condition. Also, adequate stock

of expendible items will be maintained. The equipment will be tested as called for in Attachment 2, and a written record maintained on file of the inspections.

Access to Communications Equipment

(a) A telephone is immediately available in the operations area in the event that an incident regarding hazardous waste occurs. This is the area in which the waste handling, pumping pouring, etc., occurs and is the most likely place of an event. A fire alarm is located just inside the back door adjacent to the outside drum storage area.

(b) It is the policy that no hazardous wastes will be handled when only one person is present on-site. A minimum of two persons are required to be on-site at the time waste is being handled.

Aisle Space

Adequate aisle space will be maintained around the waste drums to allow personnel to move freely about and to allow for the handling of leaking drums.

Arrangements with Local Authorities

The Emergency Response Plan (HM 3-5) required by the Mountain View Fire Department is to be provided to the following agencies along with HM 3-2 and 3-3:

1 - Office of Emergency Service

2 - Mountain View Fire Department

3 - Mountain View Police Department

4 - El Camino Hospital

In the cover letter of explanation the Fire Department shall be designated at the lead agency. These agencies shall be notified of subsequent changes in the Plan on an annual basis regarding minor changes, and as soon as practical for major changes.

EMERGENCY EQUIPMENT

INSTRUCTIONS: In the blank form provided describe the safety, spill response, and communication equipment you have in place at your facility for use in emergency situations. If practical, report the equipment according to individual job, shop or work activity area within your facility. If applicable, include the elements listed in legend.

Personal Protective & Safety Equipment

Aprons
Gloves
Coats
Chemical Suits
Boots
Safety Glasses
Faceshield
Hard Hats
Cartridge Respirators
Self Contained Breathing Apparatus (SCBA)
First Aid Kits
Exhaust Hoods/Vapor Scrubbers
First Aid Stations
Chemical Antidotes
Eye Wash/Safety Shower

Spill Control/Monitoring Equipment

Fire Blankets
Fire Extinguishers (Type A, B, C & D)
Fire Hoses
Chemical Vapor Monitoring Equipment (Type)
Spill Cart
Chemical Absorbants
Neutralizers
Sand
Leak Repair Kits (Chlorine)
Underground Tank Leak Detection Monitors one
Overpak Drums
Plugging/Diking Materials
Pumps

RE: Relocation of MHI

Dear Marianne:

Let this serve as formal notice that MHI moved from 1170 Terra Bella Avenue, Mountain View 94043 on October 4, 1986.

Enclosed please find material which is being returned as requested.
Thank you for your advice as to how to handle this matter.

Sincerely,

Judith M. Broyles

HAZARDOUS MATERIALS STORAGE PERMIT CODE--PERMIT APPLICATION

Please Review This Information Thoroughly

No person, firm or corporation shall store any material regulated by the Hazardous Materials Storage Permit Code (MVMC, Chapter 24 et seq.) until a permit or approval has been issued by the City.

THE FORMS AND APPROPRIATE FEES MUST BE SUBMITTED TO
THE MOUNTAIN VIEW FIRE DEPARTMENT BY THE ABOVE STAMPED DATE

1987 HMMP REVISIONS--Due to the passage of State Assembly Bill 2187 (Waters Bill), the mailing of 1987 HMMP forms have been delayed in order to reflect the following revisions:

1) Greater detail is now required on general facility maps;
2) Annual waste throughput must be reported;
3) An emergency response plan must be reported by every facility storing hazardous materials above Quantity Range No. 1.

In addition, Hazardous Materials Storage Permit fees have been increased to reflect the increased cost of processing, enforcement, and clean-up.

PERMIT FEES--Annual fees are paid on a "facility" basis. If you are a tenant and occupy only a portion of a building, you may make a separate payment for the area you occupy. No application shall be accepted unless and until the fees have been paid (MVMC Sec. 24.44.).

LATE CHARGES AND BACK FEES--All permit fees delinquent for thirty (30) days or more shall be subject to double permit fees. The yearly filing deadlines have formerly fallen on December 27th of the previous year, with 1985 as the first year requiring a permit. If hazardous materials were stored in 1985 or 1986, and permits were not obtained, back fees are due for all previous years. Back fees are also required for any errors made in previous submittals affecting the fee calculations. Failure to comply with the ordinance constitutes a violation and is subject to civil penalties of $500 per day per each violation plus the cost incurred by the City for enforcement.

HAZARDOUS MATERIAL STORAGE PERMIT

THIS PERMIT EVIDENCES THAT THE FIRM OR CORPORATION NAMED HEREIN HAS PAID THE APPLICABLE FEES AND IS AUTHORIZED TO STORE HAZARDOUS MATERIALS AT THE FACILITY INDICATED BELOW IN ACCORDANCE WITH CHAPTER 24 OF THE MOUNTAIN VIEW MUNICIPAL CODE

Permitted Facility: Telewave, Inc.
1170 Terra Bella Avenue

Telewave, Inc.
1170 Terra Bella
Mountain View, CA 94043
Attn: Sam Selbert

Date Issued: May 31, 1990
Date Expires: April 1, 1991
Permit ID: 1711

Hazardous Materials Division

POST IN A CONSPICUOUS PLACE

This FULL—TERM permit limits the firm or corporation named herein to store the following maximum quantities of hazardous materials at the Permitted Facility:

Hazard Class	Quantity	Units
CRM-L — City Req. Mats - Liquid	110	Gal
FL — Flammable Liquid	5	Gal

CLOSURE PLAN

Please fill out the following items concerning the closure of your facility. Enter "N/A" for any items that do not apply to your situation.

Business Name: TELEWAVE, INC.

Facility Address: 1170 TERRA BELLA AVENUE, MT. VIEW

Proposed Date of Closure: AS SOON AS POSSIBLE

1) Disposition of all hazardous materials: (excluding waste)

__ Return to supplier/manufacturer (List chemicals & suppliers on back)

X Moved to new location (List chemicals on back)

New Facility Address:

1145 TERRA BELLA AVENUE
MT. VIEW 94043

2) Company removing all hazardous waste:

Name: TELEWAVE, INC.

Address: 1155 TERRA BELLA EPA ID#: ----

TS&D Facility:

EPA ID#: ----

Are all hazardous waste manifests attached? NO

3) If removing Underground Storage Container(s), have you submitted separate "Underground Tank Removal" forms? NONE

I hereby certify that the above information is complete and correct.

CITY OF MOUNTAIN VIEW
FIRE DEPARTMENT

EMERGENCY RESPONSE PLAN
Section I: Evacuation Procedures

This emergency response plan describes the personnel, procedures, and equipment your facility has available to respond to a release or threatened release of the hazardous materials you store or use. This plan is for the protection of your and your employees. For small facilities, this plan may be sufficient to adequately address all your emergency response concerns. For larger or more complex facilities, supplemental and detailed emergency response information should be maintained on site and be available for review by the Fire Department.

1. *By which method(s) is the Emergency Coordinator (EC) at your facility notified that an emergency (i.e., an actual or threatened hazardous materials release) is taking place? (Check applicable items.)*

☐ Alarms: Name of Manufacturer [illegible]
Last Test Date _____ Test Frequency _____

☐ Horns: Last Test Date _____ Test Frequency _____

☐ Emergency Phone Number: Number _____

☑ Shouting

☐ Other _____

2. *Once the EC has been notified of an emergency situation, what outside agencies does he/she notify? (Check applicable items.)*

☒ Agency: *FIRE DEPARTMENT* Phone *9 1 1*

☒ Agency: *State Office of Emergency Services* Phone *1-800-852-7550*

☐ Agency: _____ Phone _____

☐ Agency: _____ Phone _____

3. *Indicate the extent of your evacuation pre-planning. (Check applicable items.)*

☑ Immediate area evacuation routes defined and procedures developed.

☐ Entire building evacuation procedures developed.

☒ Assembly areas pre-planned.

☒ Evacuation maps posted.

☐ Other: _____

4. *Should personnel be injured during the emergency, your facility must have a nearby clinic/hospital available for treatment:*

Medical Facility Name [illegible]
Medical Facility Address [illegible]

EMERGENCY RESPONSE PLAN
Section III: Emergency Response Training Program

1. PERSON RESPONSIBLE FOR EMERGENCY RESPONSE TRAINING PROGRAM:

Name TROYD JOHNSON Title FOREMAN Phone (415) 968-4400

2 TRAINING REQUIREMENTS (Check all applicable items.)

All employees are trained in the following procedures:

- [XX] Notification of emergency response coordinator
- [XX] Notification of external emergency response organizations (e.g. Fire Department)
- [XX] Location and content of emergency response plan
- [XX] Evacuation

Chemical handlers are additionally trained in the following:

- [XX] Safe methods for handling and storage of hazardous materials
- [XX] Proper use of personal protection equipment
- [XX] Locations and proper use of fire and spill control equipment
- [XX] Specific hazards of each chemical to which they may be exposed, including the pathways of exposure (i.e., skin absorption, inhalation, ingestion)

Emergency response team members are additionally trained in the following procedures:

- [XX] Shutdown of operations
- [ ] Use, maintenance, and replacement of emergency response equipment

- [XX] ALL PERSONNEL RECEIVE APPROPRIATE EMERGENCY RESPONSE TRAINING WITHIN SIX MONTHS OF HIRING
- [XX] REFRESHER TRAINING IS PROVIDED AT LEAST ANNUALLY

3. PERSONNEL TRAINING RECORDS

The following training records are maintained for each employee:

- [ ] Type and amount of introductory and continuing training
- [ ] Date that training was completed
- [ ] Description of facility emergency reponse drills
- [ ] Former employees' training records are retained for at least three years

Your Emergency Response Plan must be on-site and available for review by the Fire Department.

Date _____ Building Inspector

III. REMEDIATION:

F. THE SUMP AREA WAS TESTED (ATTACHMENT V), THE SUMP CONCRETE WAS CHIPPED OUT AND DISPOSED. SAMPLES WERE TAKEN OF THE SOIL BENEATH THE SUMP AREA AND TESTED FOR COPPER CONTAMINATION LEVELS. SOIL SAMPLE ANALYSIS SHOWED 340 MG/KG COPPER (ATTACHMENT VIII) AND 2.1 MG/L (ATTACHMENT X). NO FURTHER ACTION IS REQUIRED BASED ON THE SOIL ANALYSIS.

I. FOR WIPE SAMPLES DETECT CONTAMINATION ABOVE ACTION LEVELS, AFTER DECONTAMINATION WIPE SAMPLES WERE OBTAINED TO VERIFY DECONTAMINATION WAS COMPLETE (ATTACHMENT VII & ATTACHMENT IX).

J. ALL CONCRETE AND SOIL WILL BE REMOVED BY TUESDAY NOVEMBER 5, 1989.

IV. CONCLUSIONS

A. THERE ARE NO ENVIRONMENTAL OR HEALTH RISK POSED BY THE FACILITY AFTER COMPLETION OF REMEDIATION. OLIN MESA DID NOT EXPERIENCE ANY REPORTABLE SPILLS IN THE HISTORY OF THE COMPANY. IN SEPTEMBER 1988, A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND GROUNDWATER INVESTIGATION WAS COMPLETED. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE.

THE FINAL WIPE SAMPLE ANALYSIS SHOWED THAT ALL AREA SAMPLES WERE BELOW THE BACKGROUND SAMPLES FOR NICKEL AND COPPER EXCEPT AT AREA #3B WHERE THE FLOOR HAS BEEN RECLEANED AND AND A RETEST WAS CONDUCTED 10/23/89. THE RESULTS ARE SUBMITTED WITH THIS ADDENDUM.

Attention: Peter Brewer

Subject: Analysis of 2 Soil Samples, Received 10/26/89.

The samples were prepared by extraction in a citrate buffer for 48 hours. The resulting extract was filtered and acid digested using EPA Method 3010 and/or 3020 prior to analysis. The extract was then analyzed for requested metals using Inductively Coupled Argon Plasma spectroscopy or Atomic Absorption spectrophotometry. The resulting values are the soluble threshold limit concentrations for the requested metals. The results are presented in Table 1.

If you should have any technical questions, please contact the undersigned at (415)964-0844.

Approved by: Daniel L. Middleton

Subject: Analysis of 2 Soil Samples, Received 11/10/89

The samples were digested using EPA method 3050 prior to analysis. The digestate was analyzed for requested metals using Inductively Coupled Argon Plasma Spectroscopy or Atomic Absorption spectrophotometry following Test Methods for Evaluating Solid Waste (SW-846 3rd. Ed.,1986). The EPA method employed is listed alongside of the parameter. The results are presented in Table 1.

The samples were prepared by extraction in a citrate buffer for 48 hours. The resulting extract was filtered and acid digested using EPA Method 3010 and/or 3020 prior to analysis. The extract was then analyzed for requested metals using Inductively Coupled Argon Plasma spectroscopy or Atomic Absorption spectrophotometry. PERMIT CONDITIONS/PROCEDURES

I. TANK PREPARATION PROCEDURES

1. An inspection must be completed by the Fire Department before the tank(s) may be removed from the excavation. Appointments must be made 48 hours in advance. Call (415) 966-6378 to arrange for an inspection appointment. The Demolition Permit must be displayed at the job site.

2. Arrange for a State Certified laboratory to analyze the required soil sample(s) and for sampling by a qualified independent third party.

3. Tank(s) shall be emptied of all liquid product.

4. Render tank(s) inert with a minimum 15 pounds of dry ice per each 1,000 gallons of tank volume. Tank oxygen level must be reduced to less than 10 percent. Keep the dry ice sales receipts available at the tank site for the Inspector to review.

5. Cap all tank(s) opening(s) except for vent pipe(s) and allow a minimum 2 hours for oxygen displacement. Excavation and pipe removal may proceed during this period, but the tank(s) CANNOT be removed from the excavation.

6. Begin excavation to expose tank and pipelines for removal.

7. Remove all pipelines at the tank and cap or plug each tank opening immediately after the pipeline is disconnected. Leave a 1/8" to 3/8" pressure relief hole at the top of the tank for carbon dioxide venting.

8. After the 2-hour period for oxygen displacement has passed, call (415) 966-6378 for an inspection by the Fire Department.

II. REMOVAL PROCEDURES

1. Tank removal may commence only after the Fire Department Inspector has given his approval.

2. Remove the tank(s) from the excavation and load on a vehicle(s). Position the tank(s) so the pressure relief hole is close to the top of the tank.

3. Check tank(s) for leaks or holes, and if present, seal immediately.

4. Properly transport the tank(s) outside of the City limits to the approved location as follows:

   a. If tanks ARE NOT cleaned on-site, only a licensed Hazardous Waste hauler can transport them away from the

site. Make sure the tank transporter has a Transporter EPA ID Number. The tank must be taken to a licensed Treatment, Storage, and Disposal (TSD) Facility.

b. If tanks ARE cleaned on-site, the cleaning effluent can only be transported by a licensed Hazardous Waste Hauler. Make sure the effluent transporter has a Transporter EPA ID Number. The effluent must be taken to a licensed Treatment, Storage, and Disposal (TSD) Facility. In this case, the tank transporter need not be a Hazardous Waste hauler.

c. In either case, the shipper (i.e. tank owner) must complete a Hazardous Waste Manifest to transport the tank or effluent. The manifest must be used instead of the standard Bill of Lading document.

5. Have the soil sample(s) taken and analyzed as explained below.

6. Secure the area around the tank excavation site until soil analyses are complete. At that time, the FIRE DEPARTMENT will notify you as to whether the excavation may be backfilled or further soil removal will be required.

7. Have the monitoring well(s) destroyed as required. When an abandoned well is destroyed, a permit from SCVWD is required.

8. An additional $40 per hour will be charged for inspection time exceeding the allowable time specified in the Demolition Permit (job card).

III. SOIL SAMPLING PROCEDURES

1. A minimum of __/__ representative soil samples shall be taken from the area beneath the tank(s). (_____per tank). Additional samples:_____
_____.
(To be completed by the Fire Department).

2. All sampling shall be completed by a qualified independent third party to include delivery of the samples to a State Certified laboratory. A MOUNTAIN VIEW CHAIN OF CUSTODY FORM MUST be maintained throughout the sample transfer process. (This form is attached).

3. Soil samples MAY NOT be composited by the laboratory and analyzed together.

4. Sampling protocol shall employ methods acceptable to the RWQCB, SCVWD, and MV Fire Dept. These shall include: soil sample collection in brass or stainless steel tubes, taping, capping, and labeling of tubes, sample storage in ice, and elimination of head space in all water sample containers.

5. Sample analysis shall employ the EPA STANDARD PROCEDURES AND QUANTITATION/REPORTING LIMITS SPECIFIED IN THE ATTACHMENT TO THIS APPLICATION.

6. Laboratory analysis shall test for:

_____ GC scan for Total Petroleum Hydrocarbons (Gasoline), and BTX (analyzed individually)

_____ GC scan for Total Petroleum Hydrocarbons (Diesel), and BTX (analyzed individually)

_____ GC scan for Total Oil and Grease, Total Petroleum Hydrocarbons (High Boiling Hydrocarbons), Volatile Organic Compounds (EPA 8240 or 8010 and 8020 with ten largest peaks identified).

_____ GC scan for Solvents: _____

__X__ pH, Heavy Metals: Copper

_____ _____

(To be completed by Fire Department)

7. A site drawing showing tank locations, sampling locations, and sampling depths must be included in all submitted laboratory analysis.

8. **The applicant shall have a copy of ALL LABORATORY TEST RESULTS, MOUNTAIN VIEW CHAIN OF CUSTODY RECORD, AND SITE DRAWING mailed DIRECTLY to:**

Mountain View Fire Department
Hazardous Materials Division
1000 Villa Street
Mountain View, CA 94041

Underground tank removals are not considered complete unless we receive a hard copy of all items listed above.

UNDERGROUND TANK REMOVAL AUTHORIZATION

When properly validated, this is an authorized permit subject to the conditions indicated above.

****This Permit Expires Sixty (60) Days From Date Of Authorization****

Authorized By

EXPLANATION FOR TABLE #2: MINIMUM VERIFICATION ANALYSIS

1. TOTAL PETROLEUM HYDROCARBONS (TPH) as gasoline (G) and diesel (D) ranges (volatile and extractible, respectively) are to be analyzed and characterized by GC FID with a fused capillary column. They are to be prepared by EPA method 5030 for volatile hydrocarbons, or extracted from soil by sonication using 3550 methodology, or extracted from water by liquid-liquid extraction using methodology 3510 for extractible hydrocarbons.

2. TETRAETHYLLEAD (TEL) may be analyzed as total lead. However, a confirming analysis must be completed using a soil sample at the same soil depth in another borehole, or for water, from an upgradient well that is not contaminated with hydrocarbons.

3. CHLORINATED HYDROCARBONS (CL HC) are analyzed by EPA method 8010 or 601, and requires second column confirmation, or by method 8240 or 624, and requires identification of the ten highest peaks not on the routine list.

4. BENZENE, TOLUENE, XYLENE AND ETHYLBENZENE (BTX&E) are analyzed by EPA method 8020 or 602, and requires second column confirmation, or by method 8240 or 624.

5. OIL AND GREASE (O & G) may be used when heavy, straight chain hydrocarbons may be present. Infrared analysis by method 418.1 may also be acceptable for O & G if proper standards are used.

6. To avoid false positive detection of benzene, benzene-free solvents are to be used. Fused capillary columns are preferred to packed columns; a packed column may be used as a "first cut" with "dirty" samples or once the hydrocarbons have been characterized and proper QA/QC is followed.

7. For DRINKING WATER SOURCES, EPA recommends that the 500 series for volatile organics be used in preference to the 600 series because the detection limits are lower and the QA/QC is better.

8. For all analyses on Table #2, appropriate standards are to be used for the material stored in the tank. For instance, seasonally, there may be five different jet fuel mixtures to be considered.

9. Other methodologies are continually being developed (such as cryogenic focusing), and as they are accepted by EPA and DHS, they may also be used pending Regional Board prior approval.

OLIN MESA CLOSURE PLAN
1130 TERRA BELLA AVENUE
MOUNTAIN VIEW, CA

I. INTRODUCTION:

A. 1130 TERRA BELLA AVENUE, MOUNTAIN VIEW, CA.

B. COMPANY HEADQUARTERS, RESEARCH & DEVELOPMENT, AND MANUFACTURING FACILITY FOR TAB (TAPE AUTOMATED BONDING) TAPE FROM MARCH, 1983 TO SEPTEMBER, 1989.

C. 1. MESA TECHNOLOGY (NOW OLIN MESA CORP.) OCCUPIED THIS BUILDING IN MARCH, 1983 AS A COMPANY HEADQUARTERS, TAB TAPE RESEARCH & DEVELOPMENT AND MANUFACTURING FACILITY. THE BUILDING WAS CONSTRUCTED IN MAY, 1982 BY PEERY AND ARRILAGA AND CALLED "SHARP INDUSTRIAL PARK." FROM AVAILABLE RECORDS, IT APPEARS THAT BETWEEN 1972 AND 1982 THE PROPERTY WAS A PLASTER CONTRACTORS YARD AND PRIVATE RESIDENCE.

2. IN SEPTEMBER 1988, AQUA TERRA TECHNOLOGIES COMPLETED A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND GROUNDWATER INVESTIGATION FOR SNIDER PROPERTIES. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE. A REVIEW OF THE DATA INDICATES TRACE CONCENTRATIONS OF METALS WERE DETECTED DUE TO PRESENCE OF SOIL PARTICLES IN THE SAMPLES. THE "PRELIMINARY ENVIRONMENTAL ASSESSMENT AND GROUNDWATER INVESTIGATION FOR PROPERTY LOCATED AT 1130 TERRA BELLA AVENUE, MOUNTAIN VIEW, CA, ATT PROJECT #859" IS ATTACHED (ATTACHMENT I).

II. FINAL SITE INSPECTION AND ASSESSMENT:

A. ALL HAZARDOUS MATERIALS ON SITE WERE TRANSPORTED TO OLIN MESA'S NEW LOCATION AT 3500 GARRETT DRIVE, SANTA CLARA, CA, BY DEVINCENZI TRUCKING COMPANY, SAN FRANCISCO, CA, ON OCTOBER 3, 1989. THE

SHIPPING LIST IS ATTACHED (ATTACHMENT II). ALL HAZARDOUS WASTES WERE SHIPPED TO CHEMICAL WASTE MANAGEMENT, KETTLEMEN CITY, CA, BY UNIVERSAL ENGINEERING INC., (SPENT LT-26, COPPER CONTAMINATED INERTS, SPENT NICKEL BATH AND WASTE STRIPPER), SOLVENT SERVICES, SAN JOSE, CA, (SPENT SOLVENT), CPI INORGANICS, UNION CITY, CA, BY ADMIRAL TRANSPORTATION, (WASTE AMMONIUM HYDROXIDE) OR AMERICAN CHEMICAL & REFINING, SOUTH EL MONTE, CA, (CYANIDE GOLD SOLUTION). ALL UNIFORM HAZARDOUS WASTE MANIFESTS FOR THOSE SHIPMENTS ARE ATTACHED (ATTACHMENT III).

B. A MAP IDENTIFYING ALL CHEMICAL USE AND STORAGE AREAS IS ATTACHED, AS WELL AS, THE QUANTITIES (ATTACHMENT IV).

C. HAZARDOUS MATERIALS USE AND STORAGE AREAS WERE CLEANED. THE MANUFACTURING CONCRETE FLOOR AND TRENCH WERE SAND OR BEAD BLASTED.

D. ALL HAZARDOUS CHEMICALS WERE MOVED OR PROPERLY DISPOSED PRIOR TO VACATING THE FACILITY. ALL PROCESS EQUIPMENT, EXCEPT SOLVENT AND GOLD CONTAINING EQUIPMENT, WAS CLEANED, FLUSHED AND DRAINED TO THE NEUTRALIZATION SYSTEM. SOLVENT AND GOLD CONTAINING EQUIPMENT WERE FLUSHED AND DRUMMED FOR HAZARDOUS WASTE DISPOSAL.

E. A WIPE SAMPLE ANALYSIS WAS PERFORMED ACCORDING TO THE WIPE SAMPLE PLAN (ATTACHMENT V). THE RESULTS OF THE INITIAL ANALYSIS (ATTACHMENT VI) AND FINAL ANALYSIS (ATTACHMENT VII) ARE THE FOLLOWING:

BACKGROUND SAMPLES

COPPER	53.7	218	121	AVE: 130.9

III. REMEDIATION:

A. ALL ROOF EXHAUST FANS, EXCEPT THE CHEMICAL HOOD EXHAUST FAN IN THE COATING ROOM, WERE REMOVED AND RELOCATED TO THE NEW FACILITY. THE LANDLORD REQUESTED THAT THIS EXHAUST SYSTEM NOT BE REMOVED. ALL PROCESS DUCTS WERE FLUSHED AND DRAINED TO THE NEUTRALIZATION SYSTEM PRIOR TO MOVING OR DISPOSAL. A LITMUS PAPER TEST WAS PERFORMED TO DETERMINE PH. A PH OF 7.0-8.0 WAS CONSIDERED ACCEPTABLE. ALL FLASHINGS FOR REMOVED EQUIPMENT WERE REMOVED AND THE OPENINGS CLOSED AND RENDERED WATERTIGHT.

B. ALL AIR COMPRESSORS WERE REMOVED. ALL PIPING, EXCLUDING CITY WATER, SANITARY AND NITROGEN LINES, WAS REMOVED. ALL PROCESS PIPING WAS FLUSHED IN PLACE AND DRAINED TO THE NEUTRALIZATION SYSTEM PRIOR TO REMOVAL. A LITMUS PAPER TEST WAS PERFORMED TO DETERMINE PH. A PH OF 7.0-8.0 WAS CONSIDERED ACCEPTABLE. THE DI WATER SYSTEM WAS REMOVED BY POLYMETRICS. THE NEUTRALIZATION SYSTEM WAS FLUSHED AND DRAINED TO THE SANITARY SEWER PRIOR TO RELOCATION.

C. ALL PROCESS PIPING WAS FLUSHED IN PLACE AND DRAINED TO THE NEUTRALIZATION SYSTEM PRIOR TO REMOVAL. ALL INTERIOR DUCTS WERE REMOVED, EXCLUDING DUCTS FOR AIR CONDITIONING AND CHEMICAL HOOD EXHAUST IN THE COATING ROOM. . ALL PROCESS DUCTS WERE FLUSHED AND DRAINED TO THE NEUTRALIZATION SYSTEM PRIOR TO MOVING OR DISPOSAL. A LITMUS PAPER TEST WAS PERFORMED TO DETERMINE PH. A PH OF 7.0-8.0 WAS CONSIDERED ACCEPTABLE. ALL PROCESS EQUIPMENT, EXCEPT SOLVENT AND GOLD CONTAINING EQUIPMENT, WAS CLEANED, FLUSHED AND DRAINED TO THE NEUTRALIZATION SYSTEM. SOLVENT AND GOLD CONTAINING EQUIPMENT WERE FLUSHED AND DRUMMED FOR HAZARDOUS WASTE DISPOSAL.

D. THE ONLY EQUIPMENT REMAINING ON SITE IS ELECTRICAL UTILITY EQUIPMENT AND THE CHEMICAL HOOD EXHAUST FAN FOR THE COATING ROOM ALL PROCESS EQUIPMENT WAS RELOCATED TO THE NEW FACILITY.

E. ALL FLOORS WERE CLEANED WITH SOAP AND WATER AFTER THE PROCESSING EQUIPMENT WAS REMOVED. AN ACID AND BASE SOLUTION WAS USED TO CLEAN STAINED AREAS. THE MANUFACTURING CONCRETE FLOOR AND TRENCH WERE SAND OR BEAD BLASTED.

F. THE SUMP AREA WAS TESTED (ATTACHMENT V), THE SUMP CONCRETE WAS CHIPPED OUT AND DISPOSED. SAMPLES WERE TAKEN OF THE SOIL BENEATH THE SUMP AREA AND TESTED FOR COPPER CONTAMINATION LEVELS. SOIL SAMPLE ANALYSIS SHOWED 340 MG/KG COPPER (ATTACHMENT VIII). NO FURTHER ACTION IS REQUIRED BASED ON THE SOIL ANALYSIS.

G. THE HAZARDOUS WASTE CONTAINMENT AREA WAS TESTED FOR CONTAMINATION PER ATTACHMENT V, BROKEN UP AND DISPOSED. SAMPLES WERE TAKEN OF THE SOIL BENEATH THE HAZARDOUS WASTE AREA AND TESTED FOR COPPER CONTAMINATION LEVELS. SOIL SAMPLE ANALYSIS SHOWED 25 MG/KG COPPER. NO FURTHER ACTION IS REQUIRED BASED ON THE SOIL ANALYSIS.

H. ALL HAZARDOUS MATERIALS ON SITE WERE TRANSPORTED TO OLIN MESA'S NEW LOCATION AT 3500 GARRETT DRIVE, SANTA CLARA, CA, BY DEVINCENZI TRUCKING COMPANY, SAN FRANCISCO, CA, ON OCTOBER 3, 1989. THE SHIPPING LIST IS ATTACHED (ATTACHMENT II). ALL HAZARDOUS WASTES WERE SHIPPED TO CHEMICAL WASTE MANAGEMENT (SPENT LT-26, COPPER CONTAMINATED INERTS, SPENT NICKEL BATH AND SPENT STRIPPER), SOLVENT SERVICES (SPENT SOLVENT), CPI INORGANICS (WASTE AMMONIUM HYDROXIDE), OR AMERICAN CHEMICAL & REFINING (CYANIDE GOLD SOLUTION). ALL UNIFORM HAZARDOUS WASTE MANIFESTS FOR THOSE SHIPMENTS ARE ATTACHED (ATTACHMENT III).

I. FOR WIPE SAMPLES DETECT CONTAMINATION ABOVE ACTION LEVELS, AFTER DECONTAMINATION WIPE SAMPLES WERE OBTAINED TO VERIFY DECONTAMINATION WAS COMPLETE (ATTACHMENT VII).

IV. CONCLUSIONS

A. THERE ARE NO ENVIRONMENTAL OR HEALTH RISK POSED BY THE FACILITY AFTER COMPLETION OF REMEDIATION. OLIN MESA DID NOT EXPERIENCE ANY REPORTABLE SPILLS IN THE HISTORY OF THE COMPANY. IN SEPTEMBER 1988, A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND

GROUNDWATER INVESTIGATION WAS COMPLETED. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE.

THE FINAL WIPE SAMPLE ANALYSIS SHOWED THAT ALL AREA SAMPLES WERE BELOW THE BACKGROUND SAMPLES FOR NICKEL AND COPPER EXCEPT AT AREA #3B WHERE THE FLOOR HAS BEEN RECLEANED AND AND A RETEST WAS CONDUCTED 10/23/89. THE RESULTS WILL BE SUBMITTED TO THE CITY WHEN RECEIVED.

Subject: Preliminary Environmental Assessment and Groundwater Investigation for Property Located at 1130 Terra Bella Avenue, Mountain View, CA, ATT Project #859

Dear Mr. Snider:

Aqua Terra Technologies, Inc. (ATT) is pleased to submit our findings of a preliminary environmental site assessment and groundwater investigation of property located at 1130 Terra Bella Avenue, Mountain View, CA.

Aqua Terra Technologies
Consulting Engineers
& Scientists

1950 Buskirk Avenue
Suite 320
Walnut Creek, CA
94596
(415) 934-4884

The preliminary environmental site assessment included a site reconnaissance, a review of appropriate regulatory agency files, a review of historical aerial photographs, monitoring well construction, groundwater sampling and analyses. The objectives were to determine whether contamination to the local soils or groundwater has occurred, and to evaluate whether any previous activities or currently existing conditions could impact the environmental quality of the subject parcel. The objective of the field investigation was to provide a preliminary quantitative assessment of local groundwater conditions.

SITE HISTORY

The subject parcel is located on the north side of Terra Bella Avenue near Linda Vista Avenue, in Mountain View, California. The subject parcel consists of approximately 0.9 acres of land and is occupied by one building surrounded by a parking lot. The subject property is situated among several industrial companies which exist along all four property boundaries. A storage yard is located on the west side of the property; to the south are a weed and pest control business, computer hardware and software facilities, a machine shop, a landscape gardener, a laboratory, and numerous residences. On the eastern side of the building is an engineering contractor's yard, which contains a large amount of debris including rusting drums and pallets, the former Jasco Chemical property, and several auto repair shops. A site location map is presented in Plate A1, Attachment A.

The property has been used for research and development, manufacturing, and as a warehouse for Mesa Technology for the past five years. The building presently on the property was constructed in May, 1982 by Peery and Arrilaga, and called "Sharp Industrial Park". From available records, it appears that the property was a plaster contractors yard and private residence between 1972 and 1982. Aerial photographs confirm storage of wallboard and construction debris on the subject property during this time period. Aerial photographs indicate that the area was agricultural in the 1950s, with a transition to residential/suburban in the 1960s and 1970s.

SITE RECONNAISSANCE

A site reconnaissance of the property was made on August 10, 1988. The purpose of the site visit was to inspect the subject parcel for any evidence of visual contamination and to canvass the area surrounding the subject parcel in order to determine the identity of neighboring facilities and operations or activities which could possibly impact the environmental quality of the subject property.

At the time of the site reconnaissance, several 55-gallon drums containing spent solvents and other chemicals were observed on a paved surface behind a fence at the facility. In general, the drums were labeled, appeared to be in good condition, and were being stored in an enclosed area. Other chemicals were observed in storage in this same area. However, a complete review of chemical management practices was outside the scope of work of this investigation.

HAZARDOUS MATERIALS HANDLING ON-SITE

A "Tenant Environmental Risk Assessment Questionnaire" filled out by Mesa Technology, an alphabetical listing of chemicals used on-site, and a city of Mountain View Hazardous Materials Management Plan (HMMP) Facility Directory are provided in Attachment B. The questionnaire indicates that acids, caustic/alkaline cleaner, cyanide, photo resist stripper, and flammable solvents are stored at the facility. Flammable solvents are the only chemicals stored in 55-gallon drums. All other chemicals are stored in bottles or carboys

less than 30 gallons in volume. Hazardous waste including waste solvents generated on-site are transported off-site. The information provided by Mesa indicates that the wastes were transported offsite to a proper recycling or disposal facility. Industrial wastewater is treated on-site in a neutralization sump, which according to Mr. Curt Richards, Director of Operations for Mesa Technology, is a concrete pit in the ground for neutralization of corrosives and acids under permit by the City of Mountain View. This permit was not available for review by ATT. To his knowledge the treatment system has always met permit requirements which includes periodic sampling and analysis for priority pollutants. The questionnaire indicated that hazardous material spills to the sewer have occurred, but does not provide further detail.

ATT SOIL AND GROUNDWATER INVESTIGATION

The groundwater investigation conducted by ATT included the drilling of groundwater monitoring wells to evaluate subsurface conditions and the collection of groundwater samples for analysis.

Three groundwater monitoring wells, Wells MW-1 through MW-3, were installed at the property at locations shown in Attachment A-2. Wells MW-1 and MW-2 were placed downgradiant of site facilities at Mesa Technology to evaluate the presence or absence of groundwater contamination as a result of site activities. Well MW-3 was placed in an inferred upgradient area away from known site activities in order to establish background groundwater physical and chemical characteristics. The wells were installed under the direct supervision of a California Registered Geologist.

Monitoring Well Construction, Development, and Sampling

Permits obtained from the Santa Clara Valley Water District (SCVWD) for each well installed at the site. Monitoring well construction proceeded according to guidelines and requirements of the SCVWD. A description of drilling procedures and groundwater monitoring well construction and design is presented in Attachment C1. Soil samples were collected every five feet and logged according to the Unified Soil Classification System. Lithologic logs of the borings are presented in

Attachment C2, and well construction details are presented in Attachment C3.

After the well construction was completed, the wells were developed as described in Attachment C1. Wells MW-1 and MW-3 were developed with a centrifugal pump. A total of 80 and 70 gallons, were removed from these wells, respectively, until a moderately turbid to slightly cloudy discharge was obtained. The groundwater in Well MW-2 was thick with mud prior to development and could only be developed with a bailer. After bailing 40 gallons, the water still contained a significant amount of mud.

After the wells were constructed and developed, groundwater samples were collected. Groundwater sample collection and handling protocol are described in Attachment C4. The groundwater samples were transported to a laboratory certified by the California Department of Health Services (DHS) for complete chemical analysis of hazardous waste and drinking water. Proper chain of custody documentation accompanied the samples to the laboratory. Unfiltered groundwater samples were analyzed for purgeable organic compounds using gas chromatography/mass spectroscopy according to EPA Method 624, for semivolatile organic compounds using gas chromatography/mass spectroscopy according to EPA Method 625, and for California Code of Regulations (CCR) priority pollutant metals according to EPA Methods in the 6000/7000 series. The groundwater was analyzed on a normal priority basis. Environmental sample collection and chain of custody records are presented in Attachment C5.

Site Geology and Hydrogeology

The lithologic logs (Attachment C2) indicate that site conditions are characterized by an upper sequence of dry, stiff clay with minor gravel, underlain by fine sand with approximately 15 percent fine gravel. Clay occurs beneath the sand and gravel, at approximately 21 feet. Groundwater was generally first encountered between 11.5 and 13.5 feet. The saturated zone is characterized by well graded fine, loose to moderately dense, unconsolidated sand and gravel. The localized geologic conditions indicated on the boring logs

correlates with observations made at nearby sites. Groundwater occurs under unconfined conditions.

Groundwater Flow Direction, Gradient, and Velocity

A level and traverse survey was conducted to estimate groundwater gradient and flow direction. The survey was conducted within one week after completion of the monitoring wells. To estimate the gradient and flow direction, depths of groundwater were measured relative to an arbitrarily established level of 100.00 feet at the well casing on Well MW-1. A groundwater contour map developed from the survey is shown in Plate A2, Attachment A.

Groundwater levels occurred at depths between 11.5 and 13.5 feet below grade. Groundwater appears to flow north-northwest under an approximate gradient of 0.012 feet per foot. The localized groundwater conditions indicated on the map corroborate the groundwater flow direction estimated from data at nearby sites.

Based on the lithology encountered in the groundwater monitoring wells and the results of groundwater pump tests in this aquifer less than one-fourth mile from the site, the magnitude of hydraulic conductivity is estimated to range from 10.0 to 100.0 meters per day (m/d) ("Groundwater Assessment-Spectra Physics Facility, Mountain View, California, Levine-Fricke, 22 July, 1985). This range is also consistent with published estimates for sand and fine gravel ("Summary of Hydrologic and Physical Properties of Rock and Soil Materials", United States Geological Survey Water Supply Paper, 1839-D, 1967). Using an average hydraulic gradient of 0.012 and an average effective porosity of 0.40, groundwater velocities are estimated to range from approximately 0.3 m/d to 3 m/d, or about 350 to 3500 feet per year. A more reliable estimate for site-specific hydraulic conductivity and other aquifer parameters requires performing an aquifer pumping test.

Site Chemical Conditions

Organic and metal analyses were performed on all groundwater samples. The results of these analyses are discussed below.

Organics

A compilation of laboratory data for organics is provided in Table D-1 of Attachment D. Complete laboratory data for organics is provided in the remainder of Attachment D. No detectable concentrations of semivolatile organic compounds were reported. Trichloroethylene (TCE) was detected at 13, 240, and 33 ug/L in Wells MW-1, MW-2, and MW-3, respectively and trans-1,2-Dichloroethylene (t-1,2-DCE) was detected at 22 and 6 ug/L in wells MW-2 and MW-3. In all three wells the level of TCE exceeded the California Department of Health Services (DHS) action level for drinking water of 5 ug/L which is accepted as a guideline for groundwater clean-up, although the contaminated groundwater is not considered potable. The DHS action level for t-1,2-DCE of 16 ug/L was exceeded in Well MW-2.

These concentrations will likely produce a regulatory response due to the State Water Resource Control Board's (SWRCB) non-degradation policy for groundwater resources which do apply to shallow water-bearing zones not commonly used for drinking water or specifically designated for a beneficial use. In most groundwater remediation programs, water quality goals are, therefore based upon background or natural concentrations of constituents.

Because TCE and t-1,2-DCE were detected in the upgradient well, Well MW-3, it appears that these compounds may have originated from an offsite source. However, higher concentrations of TCE and t-1,2-DCE occurred in Well MW-2, which is directly downgradient of Well MW-3. At this time it cannot be conclusively determined whether the compounds are present as the result of an onsite or an offsite source.

Metals

Analyses for seventeen metals listed in Section 66699 of the CCR, Title 22, were performed for groundwater samples collected from these wells to assess general groundwater quality. The results of these analyses are presented in Attachment D. A review of the data indicates that trace concentrations of metals were detected in all three groundwater samples due to

presence of soil particles in the samples. Higher concentrations of all metals in Wells MW-1 and MW-2 are likely due to the sorption of metals to soil particles in the groundwater. The concentrations of arsenic, barium, chromium, and mercury in all three wells exceed the corresponding Maximum Contaminant Levels (MCLs) established by the U.S. Environmental Protection Agency (EPA) Drinking Water Standards. However, this water is not a drinking water source.

ENVIRONMENTAL BACKGROUND SURVEY

Appropriate regulatory agency files were reviewed to identify any previous site usage or activities involving the subject parcel or neighboring properties which may have impacted the environmental quality of the subject parcel. This activity included a review of the public record at: the State of California Regional Water Quality Control Board-San Francisco Bay Region (RWQCB), the State of California Department of Health Services (DHS), and the City of Mountain View Fire Department.

State of California Regional Water Quality Control Board (RWQCB)

The offices of the RWQCB maintains a list of files of all reported toxics releases and fuel tank leaks. ATT reviewed each list and files associated with investigations or remediation which has occurred at sites located within approximately one-half mile from the subject parcel. The following cases, divided into toxics and fuel leaks cases were reviewed:

Toxics Case Investigations

SPECTRA PHYSICS, INC., 1250 West Middlefield Road, and TELEDYNE SEMICONDUCTOR, 1300 Terra Bella Avenue. These sites are directly adjacent to one another, and are being evaluated together by the RWQCB. They are situated approximately one-quarter mile to the west of the subject site (cross-gradient). Chemicals detected in the groundwater at these locations have included the chlorinated organic compounds TCE, trans-1,2-DCE, tetrachloroethylene (PCE), trichloroethane (TCA) 1,1-dichloroethane (DCA), 1,1-dichloroethene (DCE), and Freon-113. The contamination was initially

detected in shallow groundwater at Teledyne in 1982 and at Spectra Physics in 1984. Both properties are the source of these constituents in shallow groundwater; the RWQCB has required extensive remedial action in the form of removal of underground tanks and sumps, and extraction and treatment of groundwater. Water level data collected from groundwater monitoring wells installed for these investigations indicate that the shallow groundwater and associated contaminant flow direction is towards the northwest, away from the subject site. Groundwater at these sites has historically exhibited up to 2,000 ug/L TCE. However, one well associated with the Spectra Physics/Teledyne investigation which is located approximately 500 feet west of the subject property does not contain detectable chlorinated organic compounds. Because current data shows that these organics were not in the southeastern edge of the Teledyne/Spectra Physics plume, this does not preclude the possibility that the contaminants are coming from that area.

JASCO CHEMICAL, INC., 1090 Terra Bella Avenue (at Linda Vista). Approximately 0.1 mile east of the subject site, TCE and TCA were detected in groundwater beneath this property in concentrations of 40 ug/L and 3 ug/L, respectively. Although Jasco has indicated to the RWQCB that neither of these chemicals were ever used or stored on the property, Jasco did maintain 10 underground storage tanks used for the storage of lacquer thinner, kerosene, and paint thinner. The tanks have been removed along with contaminated soil. The RWQCB files recommend "no further action" at the site.

CALIFORNIA FIRST BANK, 327 Moffett Boulevard (at Middlefield Road). This site is located approximately one-half mile south of the subject site. Preliminary studies indicate that TCE, DCE, DCA, and methylene chloride occur in groundwater at maximum concentrations of 300, 1,700, 3,500, and 100 ug/L, respectively and that underground sumps may have been the source of some or all of these compounds to soil and groundwater. Groundwater flow for this site has been estimated to be in a north-northwesterly direction, indicating that it

is upgradient of the subject property. James M. Montgomery Engineers performed the subsurface investigations, which to date have not extended offsite. Additional monitoring wells and soil borings have been proposed, but it is not known when this information will become available for evaluation.

Fuel Leak Investigations

ARCO SERVICE STATION, 790 Stierlin Road (at Middlefield). Floating petroleum product was reported in July 1987, with total petroleum hydrocarbon concentrations up to 7,800 mg/L (milligrams per liter or parts per million - ppm). Information in the files does not contain sufficient detail to indicate whether the hydrocarbon consisted of gasoline or diesel fuel. The lateral extent of this occurrence or further investigation details are not documented in the file.

ROBB JACK CORPORATION, 1080 Linda Vista Avenue (at San Leandro Avenue). According to the files, one 1,000 gasoline tank was removed from this property in 1986. Soil removed from the excavation contained up to 2,?00 ppm gasoline. A groundwater sample collected from a monitoring well on this property indicated that gasoline components, including benzene, toluene, and xylene were not detected. The specific laboratory detection limits are not known, however. Although soil and/or groundwater contamination have been detected upgradient and cross-gradient from the subject parcel, there is no evidence that significant offsite migration has occurred or that the environmental quality of the subject property has been adversely impacted by reported upgradient conditions.

State of California Department of Health Services

Several databases containing lists of State and Federal Superfund cases were evaluated to determine if hazardous waste or toxic substance activities in the area may impact the site. The EPA CERCLIS (Superfund) database which lists potential uncontrolled hazardous waste sites

that have been brought to the attention of the EPA included Spectra Physics, Teledyne, and Jasco Chemical, sites discussed in the above section. No additional information was provided.

A review of the DHS "Expenditure Plan for Hazardous Substances Cleanup Bond Act of 1984", Revision 3, January 1988 indicates that there are no sites with known contamination in on-site soil or underlying groundwater upgradient of the subject property.

Review of City of Mountain View Records

The Mountain View Fire Department was contacted by ATT regarding the present or former existence of underground storage tanks and hazardous materials storage at the subject property and at adjacent properties. The Fire Department has a Hazardous Materials Management Plan (HMMP) dated March 23, 1988 for Mesa Technology and records indicate that the Fire Department located a wastewater sump at the property in 1983. The HMMP (Attachment B), lists chemicals stored both inside and outside of the building.

There are numerous facilities throughout this area which may be storing hazardous materials or have underground storage tanks or sumps. It will take several more weeks for the City of Mountain View to research adjacent properties. ATT will evaluate this information as soon as it is available.

CONCLUSIONS

A preliminary environmental site assessment and groundwater investigation consisting of a site reconnaissance, a review of appropriate regulatory agency files, a review of historical aerial photographs, monitoring well construction, groundwater sampling and analyses has been conducted. The purpose of the investigation was to determine whether contamination to the local soils or groundwater existed, and to evaluate whether any previous activities or currently existing conditions could impact the environmental quality of the subject parcel.

The site investigation indicates that two chlorinated hydrocarbons, TCE and t-1,2-DCE occur in shallow groundwater at the subject property. Both chemicals occur in both the upgradient well, Well MW-3 and in higher concentrations in one of the downgradient wells, Well MW-2, indicating that the source may be on-site or off-site. If the source is off-site it may be from either an adjacent property or from a plume with a source some unknown distance upgradient.

RECOMMENDATIONS

The following specific activities are recommended to determine the source of TCE in groundwater at the subject property:

- A review of records maintained by Mesa Technology pertaining to the purchase, storage, use, and disposal of hazardous materials is recommended. Specifically, this should include a review of the use of solvents in industrial processes beginning with the initial occupancy of the building. Records and manifests should be reviewed, and former personnel interviewed to determine their knowledge of any historical TCE use. MSDS sheets for chemicals historically and presently used at the facility should be reviewed to determine the chemical content of proprietary chemicals listed in usage at the facility. The wastewater sump should also be inspected to determine its intregity.

- A review of the records provided by the City of Mountain View on hazardous materials storage for the industrial area directly upgradient of the subject parcel is recommended. These records will be available within two weeks.

- A thorough review should be made of files pertaining to the California First Bank property to evaluate this site as a potential source of contamination. A review of agency files for sites located up to one and one-half miles upgradient should also be made.

- The outer boundaries of TCE and t-1,2-DCE in the groundwater on the property should be defined. In order to conclude where the outer boundaries exist,

grab groundwater samples should be collected and mobile analytical laboratory facilities utilized. This technique allows a same-day sampling and analytical response for a total of up to 15 sampling locations. Because response time will be rapid, sampling locations will be selected as analytical data becomes available. Therefore, each sampling location represents a refinement to defining the boundaries of chemical contamination.

A California Registered Geologist will supervise all drilling operations. Duplicate samples of every fourth sample will be submitted to a DHS certified analytical laboratory for confirmation analyses. Prior to drilling, a private utility locator will mark all utility lines. Snider Properties will be responsible for approving all boring locations prior to drilling.

PROPOSED BUDGET

ATT proposes that compensation for consulting services performed by ATT not to exceed $16,400.00 for work defined in the above recommendatins. If it is necessary to perform the field activities on a weekend, the compensation will not exceed $19,500.00 for work defined herein. Personnel time shall be reimbursed according to the attached Schedule of Charges and direct job related costs shall be reimbursed cost plus 15 percent. The Schedule of Charges (Attachment E) includes all overhead costs. Expenses include travel by public and commercial transportation, meals and lodging while traveling, materials other than normal office supplies, reproduction, printing, services of subconsultants and subcontractors, and other definable job expenses. The use of ATT vehicles for travel shall be paid at the rate of $0.25 per mile.

To assure a clear understanding of all matters related to our mutual responsibilities, the attached Standard Conditions are made a part of our agreement. These terms are appropriate for use with agreement of the provision of consulting services and, accordingly, should any conflict exist between the attached terms and the form of any purchase order or confirmation issued, these terms shall prevail. Our written agreement precedes and supercedes any verbal agreement.

If the recommendations and budget estimate meets with your agreement, please sign where noted below and return a copy to our office to act as our authorization. We look forward to working with you on this project.

Very truly yours,

AQUA TERRA TECHNOLOGIES, INC.

Age of Facility: 5

Length of Occupancy: 5

Major products manufactured and/or activities conducted on the property:
TAB (TAPE AUTOMATED BONDED) TAPE

Type of business activity(ies):
(Check all that apply)

- ___ Machine shop
- ___ Light assembly
- X Research and development
- ___ Product service or repair
- ___ Photo processing
- ___ Automotive service and repair
- X Manufacturing
- X Warehouse
- ___ Integrated circuit
- ___ Chemical/pharmaceutical prod.
- ___ Printed circuit

Hazardous materials activities:
(Check all that apply)

- ___ degreasing
- X chemical etching/milling
- X wastewater treatment
- ___ painting
- X stripping
- X cleaning
- ___ printing
- X analytical lab
- X plating
- ___ chemical mixing/synthesis
- ___ silkscreen
- ___ lathe/mill machining
- X deionized water prod.
- ___ photo masking
- ___ wave solder
- ___ metal finishing

2. HAZARDOUS MATERIALS/WASTE HANDLING AND STORAGE

a. Are hazardous materials handled on any of your shipping and receiving docks in container quantities greater than one gallon? (yes) or no

b. If hazardous materials or waste are stored on the premises, please check off the nature of the storage and type(s) of materials be1 w:

Type of hazardous materials and/or waste stored		
1-2	X	acid
1-2	X	caustic/alkaline cleaner
1-2	X	cyanide
2	X	photo resist stripper
	___	paint
	___	phenol
1-2-3	X	flammable solvent
	___	gasoline/diesel fuel
	___	nonflam./chlorinated solvent
	___	metallic solutions
	___	oil/cutting fluid

Type of Storage Container
(List above ground storage only)

Indicate storage container type from key below, i.e. 1 - 4, next to hazardous materials you store onsite.

1. 1 gal or 3 liter bottles
2. 5 to 30 gallon carboys
3. 55 gallon drums
4. tanks

c. Do you accumulate hazardous waste onsite? (yes) or no

If yes, how is it being handled?

___ onsite treatment or recovery
___ discharged to sewer
X hauled offsite
___ incineration

d. Indicate your hazardous waste storage status with DOHS:

X Generator
___ Interim Status Facility
___ Permitted TSDF
___ None of the above

3. INDUSTRIAL WASTEWATER TREATMENT/DISCHARGE

a. Do you discharge industrial wastewater to:

X sewer? POTW
___ storm drain?
___ surface water?
___ no industrial discharge

b. Is your industrial wastewater treated before discharge? (yes) or no

If yes, what type of treatment is being conducted?

- X Neutralization
- ___ Metal hydroxide formation
- ___ Closed loop treatment
- ___ Cyanide destruct
- ___ HF treatment
- ___ Other

4. SUBSURFACE CONTAINMENT OF HAZARDOUS MATERIALS/WASTES

a. Are underground ~~tanks~~/sumps being used for any of the following?

- ___ Hazardous waste storage
- ___ Chemical storage
- ___ Gasoline/diesel fuel storage
- ___ Waste treatment
- ___ Wastewater neutralization
- ___ Industrial wastewater treatment
- ___ None of the above
- X Wastewater collection

b. If underground ~~tanks~~ Sump are located onsite, indicate their construction:

- ___ steel
- ___ fiberglass
- X concrete
- ___ inside open vault
- ___ double walled

c. Are hazardous materials or untreated industrial wastewater transported via buried piping to tanks, process areas, or treatment areas? yes or (no)

d. Do you have wet floors in your process areas? yes or (no)

If yes, name processes: _____

e. Are abandoned underground tanks or sumps located on the property? yes or (no)

5. HAZARDOUS MATERIALS SPILLS

a. Have hazardous materials ever spilled to:
- X the sewer?
- ___ the storm drain?
- ___ onto the property?
- ___ no spills have occurred.

b. Have you experienced any leaking underground tanks or sumps? yes or (no)

c. If spills have occurred, were they reported? (yes) or no

Check off the government agencies that you have contacted regarding the spill(s):

- ___ Dept. of Health Services, Berkeley
- ___ Fish and Game
- ___ EPA, Region 9, San Francisco
- ___ S.F. Regional Water Quality Control Board (RWQCB)
- X Fire Department
- X POTW

d. Have you been contacted by a government agency regarding soil or groundwater contamination on your site? yes or (no)

6. WELLS

a. Do you have exploratory wells onsite? yes or (no)

If yes, indicate the following:

Number of Wells: _____
Approximate Depth of Wells: _____
Well diameters: _____

PLEASE ATTACH ENVIRONMENTAL REGULATORY PERMITS AND AGENCY REPORTS THAT APPLY TO YOUR OPERATION.

Check off those enclosed:

- Hazardous Materials Inventory Statement, HMIS
- Hazardous Materials Management Plan, HMMP
- Department of Health Services, Generator Inspection Report
- Underground Tank Registrations
- Industrial Wastewater Discharge Permit

Drilling Procedures and Groundwater Monitoring Well Construction/Design

ATTACHMENT C-1

DRILLING PROCEDURES & GROUNDWATER MONITORING WELL CONSTRUCTION/DESIGN

DRILLING AND SAMPLING PROCEDURES

All borings for well construction were drilled using eight-inch diameter or larger hollow stem auger equipment. A California Registered Geologist directed the collection of undisturbed samples of the soils encountered and the preparation of detailed logs of each boring.

Soil sampling was conducted using a modified California drive sampler, a standard penetration sampler, or a five-foot continuous sampler. Representative samples of each soil type were retained in either Ziploc bags or two-inch to three-inch diameter, six-inch long, clean, brass tubes. The samples were retained for verification of soil classification and for chemical laboratory analytical testing, as appropriate. Teflon sheeting was placed between the soil sample and the cap, and the cap was sealed with PVC tape.

When access limitations do not allow drilling with truck mounted equipment, either a trailer mounted drilling rig, portable power driven, or manually operated soil sampling equipment is utilized. If soil samples are to be retained for analysis, they were collected in clean brass tubes fitted within a thin walled drive sampler. The soil samples would be capped and sealed as described above.

All down hole sampling, drilling, and well construction equipment and materials, including augers, casing, and screens were steam cleaned prior to their initial use. The sampling equipment was cleaned prior to each assembly by washing with a trisodium phosphate solution, rinsing with distilled water, and allowing to air dry. The auger flights, drill bit, and sampler were steam cleaned at each boring location.

MONITORING WELL CONSTRUCTION

Monitoring wells were constructed in accordance with applicable local water district or California Department of Water Resources guidelines. The specific completion details for each well were determined in the field at the time of drilling by a California Registered

Geologist experienced in groundwater monitoring system

design and installation.

Monitoring wells consist of two or four-inch diameter, Schedule 40 PVC casing and screens with flush, threaded joints. No PVC glue is used. The screened sections are machine slotted with either 0.010-inch (0.255 mm) 0.020-inch (0.51 mm) openings. The smaller slot size is used where the wells are screened within fine-grained sandy soils, and the larger slots are used where coarse sand or gravels are encountered. The slotted sections are fitted with a slip-on cap and placed opposite the water-bearing strata in the boring. The blank pipe is connected to the perforated pipe and extends to just below the ground surface.

The annulus between the side of the borehole and the slotted section are filled with a clean sand pack to variable depths, but not less than one or two feet above the perforated pipe. The annulus is packed with either Lonestar No. 1/20 (where 0.010-inch slotted pipe is used) or No. 3 (where 0.020-inch slotted pipe is used) washed sand filter material. The gradation of the filter material is summarized below:

U.S. Sieve No.	Opening (mm)	Percent Passing (No. 3)	Percent Passing (No. 1/20)
6	3.35	100	
8	2.36	99 - 100	
12	1.70	62 - 78	
16	1.18	15 - 33	100
20	0.85	0 - 8	90 - 100
30	0.60	0 - 4	14 - 40
40	0.425		0 - 5

A seal of bentonite pellets approximately 24-inches thick was placed above the sand pack to reduce the risk of grout penetration into the sand. The bentonite pellets were hydrated with distilled water to form a tight plug. A cement/bentonite grout was be placed above the bentonite plug to a depth of approximately two feet below the ground surface. The grout was pumped into the boreholes using a tremie pipe. Concrete was be placed from the top of the cement/bentonite mixture to the ground surface.

At most sites in sedimentary formations, it is not practical to "rationally design" a filter pack based on sieve analyses. From experience, Lonestar No. 1/20 or No. 3 washed sand as a filter material has been selected for use in the proposed wells. The 0.010-inch and 0.020-inch slot sizes were selected to retain 100 percent of the filter material.

The completed wells are enclosed in a traffic rated enclosure placed flush with grade or in an above-ground metal enclosure, and are fitted with a locking cap. If a groundwater level contour map was prepared, well head elevations were determined by a level survey, and well coordinates were determined by a traverse survey. The level/traverse survey was referenced to a bench mark of known or assumed elevation and coordinates. Once water levels have stabilized, water levels in all wells will be measured.

After the wells were completed, they were developed by pumping and surging to clean and stabilize the soils around the screens. A manually operated, positive displacement surge pump and Teflon bailer, surge block, and/or centrifugal pump was used for development. A minimum of 10 well casing volumes of water was removed during development; however, development continued until water flowed clear and pH, temperature, and conductivity stabilized. All development equipment was steam cleaned prior to its initial use in each well. A well development log was be maintained which will include 1) a record of development water parameters at frequent intervals, 2) the quantity of water removed during development, and 3) flow rates during development.

Soil cuttings generated during drilling were wrapped in plastic sheeting, and water generated during well development was retained in secured 55-gallon drums until chemical analytical data from samples were received.

Soil & Groundwater Sample Collection & Handling Protocol

ATTACHMENT C-4

SOIL & GROUNDWATER SAMPLE COLLECTION & HANDLING PROTOCOL

INTRODUCTION & PURPOSE

Because reliable and representative test results must be generated from soil and groundwater samples, it is essential to establish a sampling procedure which assures that all samples are:

- Collected by approved and repeatable methods
- Representative of the materials(s) at the desired location and depth
- Uncontaminated by container and sampling equipment

The following sampling protocol is designed to be a guide to the sampling and handling procedures for soil and groundwater samples to be collected. Based on conditions which may be encountered in the field, some modifications to this protocol may be required to fit the needs of an individual site.

SAMPLING PROCEDURES

Groundwater Sampling

Prior to collecting groundwater samples, monitoring wells were purged by bailing until pH, conductivity, and temperature levels stabilize. Wells were purged and groundwater samples were obtained using a Teflon bailer and nylon rope. New nylon rope is used for each well.

The appropriate number of sample containers and type will be used for each sample collected, in accordance with the analytical laboratory requirements and EPA protocol. The bottles will be filled using the bailer. All sample bottles will be pre-cleaned by the supplier according to EPA protocols.

To prevent cross contamination of groundwater samples by the sampling equipment, all equipment used in sampling was washed with a trisodium phosphate solution, triple rinsed with distilled water, and allowed to air dry prior to each use. A sample of the distilled water used

in the final rinse was retained for analysis as part of sample quality assurance.

Soil Sampling

After the soil sampler is driven to the desired depth and the samples are retrieved, each end of the ring containing the soil sample is retained for laboratory analysis will be sealed with Teflon sheeting, covered with plastic end caps, and sealed with PVC tape. All sample containers (tubes and end caps) are steamed cleaned and air dried prior to use. The soil sample recovered in the ring just above the sample retained for chemical analysis is examined in the field for visual and olfactory indications of chemical contamination and used for lithologic description.

The Unified Soil Classification System (USCS) is used to log and describe the soil by the on-site geologist. These logs also include details of the sampling process such as depth, apparent odors, discoloration, and any other factors which may be required to evaluate the presence of contamination at the site.

POST SAMPLING PROCEDURES

One field/travel blank consisting of one sample bottle filled with distilled water accompanies soil and groundwater sample containers at all times, including during transport to and from the site. Distilled water field/travel blanks were analyzed according to the appropriate EPA Methods corresponding to the soil/groundwater sample analyses.

Sample containers were labeled with sample number, project number, date, and the initials of the person collecting the sample. A separate sample collection record was maintained for each groundwater sample collected.

Soil and groundwater samples collected were analyzed by an analytical laboratory certified by the California Department of Health Services (DHS) for complete chemical analysis of hazardous waste as well as drinking water samples. Quality assurance documentation accompanied all analytical reports generated by the laboratory.

The samples were placed in an ice cooler immediately following collection, and remained in the ice cooler until refrigerated at the analytical laboratory. The samples were delivered to the laboratory direct by courier or overnight freight within 48 hours of time of collection. Appropriate chain of custody forms were used for all samples.

Summary Table

ATT

Table D-1. Groundwater Analytical Organics Data Summary[a], 1130 Terra Bella Avenue Mountain View, CA

Sample	EPA Method 625 Compounds	EPA Method 624 Compounds	
		TCA[c]	1,2-DCE[d]
MW-1	N.D.[b]	13	N.D.
MW-2	N.D.	240	22
MW-3	N.D.	33	6
DHS Action Level[e]	---	5	16
EPA MCL[f]	---	5	---
EPA RMCL[f]	---	Zero	---

a. Concentrations expressed as micrograms per liter (ug/L) or parts per billion (ppb).
b. N.D. = Below analytical detection limit.
c. TCE = trichloroethylene
d. 1,2-DCE= trans-1,2-dichlorethylene
e. California Department of Health Services (DHS) State Action Level for drinking water, June 1986.
f. United State Environmental Protection Agency (EPA) Maximum Contaminant Level (MCL) or Recommended Maximum Contaminant Level (RMCL).

ATTACHMENT E

Standard Conditions and
Schedule of Charges

ATT

STANDARD CONDITIONS

1. Invoices

Consultant will submit invoices to Client monthly and a final bill upon completion of services. Billings are payable upon receipt unless other arrangements, confirmed in writing by Consultant, have been made. A finance charge of 1-1/2% per month will be payable on accounts not paid within 30 days. Any attorneys' fees or other costs incurred collecting any delinquent amount shall be paid by the Client.

2. Services by Client

Client will provide work site access, obtain all permits, provide all legal services in connection with projects, and provide environmental impact reports and energy assessments unless specifically included in work scope. Client shall pay costs of checking and inspection, soil engineering, testing, surveying, and all other fees not specifically covered by terms of this agreement.

3. Services During Construction

Any construction inspection or testing provided by Consultant is for determining contractor's compliance with functional provisions of project specifications only. Consultant in no way guarantees or insures contractor's work nor assumes responsibility for methods or appliances used by contractor, for jobsite safety or for contractor's compliance with laws and regulations. Client agrees that in accordance with generally accepted construction practices, contractor will be required to assume sole and complete responsibility for jobsite conditions during the course of project related construction, including safety of all persons and property and that this responsibility shall be continuous and not limited to normal working hours.

4. Cost Estimates

Any statements of cost furnished by Consultant are predicted costs and are based on professional opinions and judgement. Consultants are not responsible for construction cost fluctuations due to bidding conditions and other factors not anticipated at the time a particular cost estimate was prepared.

5. Standard of Care

Services performed by Consultant will be conducted in a manner consistent with that level of care and skill ordinarily exercised by other members of the environmental consulting profession currently practicing under similar conditions. No other warranty, expressed or implied, is made.

6. Limitation of Liability

Consultant's liability for damages, loss, or injury due to professional negligence will be limited to a sum not to exceed $50,000 or the Consultant's fee, whichever is lesser.

ATT

SCHEDULE OF CHARGES

Services	Hourly Rate
Principal Scientist/Engineer	$110
Senior Scientist/Engineer	$100
Engineer-Scientist, Grade 1	$ 80
Engineer-Scientist, Grade 2	$ 70
Engineer-Scientist, Grade 3	$ 60
Technician, Grade 1	$ 50
Technician, Grade 2	$ 35
Drafter	$ 35
Word Processor	$ 35
Clerical	$ 25
Computer Time	$ 20

Direct Expenses

Reimbursement for expenses directly resulting from services provided will be based on actual cost plus fifteen percent for administration and management.

Representative direct expenses include:

* Costs of subconsultants
* Laboratory costs
* Costs of special fees (insurance, permits, etc.)
* Costs and/or rental fees of special equipment
* Costs of long distance telephone calls
* Costs for authorized travel, including subsistence, outside the Bay Area
* Costs for photocopying
* Other expenses:

  Fax @ $1.00/page
  In-house copying @ $0.20/page
  Direct automobile mileage $0.25/mile

Rev. 9/1/88

Client PO: 9424.011
Page 1 of 10

Attention: Peter Brewer

Subject: Analysis of 21 Wipe Samples, Received 9/29/89.

The samples were analyzed for purgeable organic compounds according to U.S. EPA Method 624 (Federal Register, Volume 49 No. 209, Oct. 26, 1984; Page 141). Results are presented in Table 1. The method can be summarized as follows:

> Helium is bubbled through an aliquot of sample contained in a specially designed purging chamber. The purgeable volatile organic compounds are efficiently transferred from the aqueous phase to the vapor phase. The vapor is swept through a sorbent column where the purgeables are trapped. After purging is completed, the trap is heated and back flushed with helium to desorb the purgeables onto a gas chromatographic column. The gas chromatograph is temperature programmed to separate the purgeables that are then detected with a mass spectrometer.

Qualitative identification of the priority pollutants is performed initially using the relative retention times and the relative abundance of three unique ions. The entire mass spectrum is checked before any final identifications are recorded. Quantitative analysis is performed by the internal standard method using a single characteristic ion and response factors obtained from a daily calibration standard. In the tables, an entry such as "<5" means that the compound was not found at a level above the laboratory's reporting limit. The reporting limit, which is based on EPA reporting levels, has been corrected for any sample dilution.

Prior to analysis, every sample is spiked with surrogate compounds as part of Acurex's Quality Control Program. These compounds simulate the behavior of compounds of interest and confirm that acceptable recoveries are being achieved on every sample. The results of surrogate recoveries are reported with the sample results.

485 Clyde Avenue, P.O. Box 7044, Mountain View, CA 94039 (415) 961-5700 Telex: 325961 FAX: (415) 964-5148

The samples were analyzed for requested metals using Inductively Coupled Argon Plasma spectroscopy or Atomic Absorption spectrophotometry following Methods for Chemical Analysis of Water and Wastes (EPA 1983). The EPA method employed is listed alongside of the parameter. Samples were digested using EPA Method 3010 and/or 3020 prior to analysis. The results are presented in Table 2.

The samples were analyzed for requested general chemical parameters following Test Methods for Evaluating Solid Wastes (SW-846, 3rd Ed.,1986). EPA methods employed are listed next to the parameters in Table 3.

If you should have any technical questions, please contact the undersigned at (415)964-0844.

ACUREX Corporation

Environmental Systems Division

October 20, 1989

Mr. Amar Chunder
Olin Mesa Corporation
3500 Garnett Drive
Santa Clara, California 95054

Subject: Building Decontamination Verification, Wipe Test

Reference: Olin Mesa P.O. 10779, Acurex Project 9424

Dear Mr. Chunder:

This letter report outlines the results of the wipe tests conducted on October 16, 1989, at the 1130 Terrabella, Mountain View facility. Seven wipe tests and a field blank were analyzed as follows:

WIPE TEST RESULTS

Location	Area sq.ft	COPPER Initial ug/wipe	COPPER Final (a) ug/sq ft	NICKEL Initial ug/wipe	NICKEL Final ug/sq ft
Area 1	1	23	19	NA	NA
Area 3A	1	7.2	3.3	ND	ND
Area 3B	1	55	51	76	63
Area 3C	0.11	24	185	ND	ND
Area 5	0.11	22	169	NA	NA
Area 7	0.11	32	259	NA	NA
Area 9	0.11	86	759	NA	NA
Field Blank		3.9	---	13	---

Notes: a - Final values have been blank corrected. The blank result has been subtracted from the initial value before calculating the ug/sq.ft.
NA - Not analyzed.
ND - Not detected.

The laboratory report and Chain of Custody for this effort is enclosed. If you have any questions or need further assistance with your environmental concerns, please contact me at 415 961-5700, extension 3399.

Sincerely,
Acurex Corporation

Subject: Analysis of 11 Water Samples, Received 10/16/89.

Aqueous samples were analyzed for requested metals using Inductively Coupled Argon Plasma spectroscopy or Atomic Absorption spectrophotometry following Methods for Chemical Analysis of Water and Wastes (EPA 1983). The EPA method employed is listed alongside of the parameter. Samples were digested using EPA Method 3010 and/or 3020 prior to analysis. The results are presented in Table 1.

If you should have any technical questions, please contact the undersigned at (415)964-0844.

Subject: Building Decontamination Verification, pH and Soil Results

Reference: Olin Mesa P.O. No.'s 10728, 10779, Acurex Project 9424

Dear Mr. Chunder:

This letter report outlines the results of the pH tests conducted on September 29, 1989 and the Soil tests conducted on October 10, 1989 at the 1130 Terrabella facility.

PH Results

Area #10 PH =7

Area #11 PH =7

The values reported represent the average of three pH tests. All six individual tests showed a pH of 7. The original matrix of the wipe testing is enclosed as Exhibit A.

Soil Sample Results

Site #1 (Well) 240 mg/kg Copper

Site #2 (Pad) 25 mg/kg Copper

The laboratory report for the soil sample analysis and the California Department of Health Services (DHS) Laboratory Certification for Hazardous Waste Testing and Water Testing is enclosed.

Please contact me at (415) 961-5700 extension 3399 if you have any questions.

Mr. Curt Danzinger
Mountain View Fire Department
City of Mountain View

October 23, 1989

Dear Curt:

Attached is the Olin Mesa Closure Plan for 1130 Terra Bella Avenue.

The final sample for nickel at #3B will be obtained today to complete the Closure Plan.

As I leave for Japan tomorrow, I will have the results sent to you when received. No problem is expected based on the internal sampling.

If I can be of assistance or answer any questions, please don't hesitate to contact me at (408)982-2234.

Sincerely,

Curt M. Richards

Curt M. Richards
Director of Operations
Olin Mesa Corp.

Addendum to

OLIN MESA CLOSURE PLAN

1130 TERRA BELLA AVENUE

MOUNTAIN VIEW, CA

II. FINAL SITE INSPECTION AND ASSESSMENT:

E. A WIPE SAMPLE ANALYSIS WAS PERFORMED ACCORDING TO THE WIPE SAMPLE PLAN (ATTACHMENT V). THE RESULTS OF THE INITIAL ANALYSIS (ATTACHMENT VI) AND FINAL ANALYSIS (ATTACHMENT VII) AND RETEST (ATTACHMENT IX) ARE THE FOLLOWING:

BACKGROUND SAMPLES

COPPER	53.7 218 121	AVE: 130.9
ARSENIC	<0.5	
NICKEL	5.8	
CYANIDES, TOTAL	<2.0	
VOA	SEE ATTACHMENT VI	

AREA SAMPLES

	INITIAL	FINAL
AREA #1		
COPPER	149	23
NICKEL	5.7	NO RETEST
AREA #2		
COPPER	739	CONCRETE REMOVED
NICKEL	50.2	CONCRETE REMOVED
AREA #3A		
COPPER	297	7.2
CYANIDE	<2.0	NO RETEST
NICKEL	239	ND
ARSENIC	<0.5	NO RETEST

AREA #3B		
COPPER	228	55
CYANIDE	<2.0	NO RETEST
NICKEL	373	7.6 RETEST 12.3
ARSENIC	<0.5	NO RETEST
AREA #3C		
COPPER	86.1	24
CYANIDE	<2.0	NO RETEST
NICKEL	21.6	ND
ARSENIC	<0.5	NO RETEST
AREA #5		
COPPER	507	22
AREA #6		
VOA	SEE ATTACHMENT VI	NO RETEST
AREA #7		
COPPER	2960	32
AREA #8		
COPPER	1370	CONCRETE REMOVED
AREA #9		
COPPER	306	86
AREA #10		
pH	7 ATTACHMENT VIII	NO RETEST
AREA #11		
pH	7 ATTACHMENT VIII	NO RETEST

III. REMEDIATION:

F. THE SUMP AREA WAS TESTED (ATTACHMENT V), THE SUMP CONCRETE WAS CHIPPED OUT AND DISPOSED. SAMPLES WERE TAKEN OF THE SOIL BENEATH THE SUMP AREA AND TESTED FOR COPPER CONTAMINATION LEVELS. SOIL SAMPLE ANALYSIS SHOWED 340 MG/KG COPPER (ATTACHMENT VIII) AND 2.1 MG/L (ATTACHMENT X). NO FURTHER ACTION IS REQUIRED BASED ON THE SOIL ANALYSIS.

I. FOR WIPE SAMPLES DETECT CONTAMINATION ABOVE ACTION LEVELS, AFTER DECONTAMINATION WIPE SAMPLES WERE OBTAINED TO VERIFY DECONTAMINATION WAS COMPLETE (ATTACHMENT VII & ATTACHMENT IX).

J. ALL CONCRETE AND SOIL WILL BE REMOVED BY TUESDAY NOVEMBER 5, 1989.

IV. CONCLUSIONS

A. THERE ARE NO ENVIRONMENTAL OR HEALTH RISK POSED BY THE FACILITY AFTER COMPLETION OF REMEDIATION. OLIN MESA DID NOT EXPERIENCE ANY REPORTABLE SPILLS IN THE HISTORY OF THE COMPANY. IN SEPTEMBER 1988, A PRELIMINARY ENVIRONMENTAL SITE ASSESSMENT AND GROUNDWATER INVESTIGATION WAS COMPLETED. NO DETECTABLE CONCENTRATIONS OF SEMIVOLATILE ORGANIC COMPOUNDS WERE REPORTED. TRICHLOROETHYLENE (TCE) AND TRANS-1,2-DICHLOROETHYLENE (T-1,2-DCE) WERE DETECTED. OLIN MESA USES RESEARCH QUANTITIES OF TCE AND HAS NEVER USED DCE. BECAUSE TCE AND DCE WERE DETECTED IN THE UPGRADIENT WELL, IT APPEARS THESE COMPOUNDS ORIGINATED FROM AN OFFSITE SOURCE.

THE FINAL WIPE SAMPLE ANALYSIS SHOWED THAT ALL AREA SAMPLES WERE BELOW THE BACKGROUND SAMPLES FOR NICKEL AND COPPER EXCEPT AT AREA #3B WHERE THE FLOOR HAS BEEN RECLEANED AND AND A RETEST WAS CONDUCTED 10/23/89. THE RESULTS ARE SUBMITTED WITH THIS ADDENDUM.

Mountain View, California

RE: SUSPENSION OF INDUSTRIAL WASTE DISCHARGE PERMIT DUE TO FIRE

Dear Mr. Richards,

On October 26, 1987, at 0200 hours, a fire occurred at Mesa Technology. A preliminary investigation has suggested that the fire was caused by a malfunctioning immersion heater used to heat a deionized rinse water. The fire ruptured a container holding acid (NCl), which in turn resulted in an acid spill reaching an outside storm water drain inlet. This spill was successfully contained by the Fire Department and cleaned up by the Maintenance Department.

On December 18, 1985, Mesa Technology was issued an Industrial Waste Discharge Permit in accordance with the City of Mountain View Municipal Code (MVMC), section 35.32.1 (Industrial Waste Ordinance). Due to the fire, this permit is herewith suspended for a period not to exceed forty-five (45) days in accordance with MVMC 35.32.3. Mesa Technology shall immediately cease and desist all discharges of industrial wastes into the City of Mountain View sanitary sewer collection system (MVMC 35.32.3b). This includes all discharges except domestic sewage (restrooms, drinking water, etc.).

Mesa Technology is entitled to, upon request, an informal hearing before the City Manager, or his delegate, to discuss this suspension. If so desired, Mesa Technology must submit in writing to the Maintenance Director a request for an informal hearing within ten (10) calender days from the date of this letter (MVMC 35.32.4b). An informal hearing will be scheduled within five (5) working days from receipt of the request. All parties involved have the right to be represented by counsel (MVMC 35.32.4c).

Dear Mr. Gold:

On August 13, 2015 the Department of Toxic Substances Control received your facsimile dated August 13, 2015 requesting records under the Public Records Act. After a thorough review of our files, we have found that we have records pertaining to some of the sites/facilities referenced in your request but not all of them. Please see below.

We have records for:

- 1130 Terra Bella Avenue, Mountain View

We do not have records for:

- 1150, 1160, 1170 Terra Bella Avenue, Mountain View
- 1001, 1005, 1015, 1023, 1043, 1091 N. Shoreline Boulevard, Mountain View
- 1001, 1005, 1015, 1023, 1043, 1091 Stierlin Road, Mountain View
- 1062 Linda Vista Avenue, Mountain View

The records that are on EnviroStor are ready for public review and can be accessed at: http://www.envirostor.dtsc.ca.gov/public. EnviroStor is a database that provides information and documents on over 5,000 DTSC cleanup sites. A computer is available in the Central Files of each DTSC Regional Office for use by community members to view Envirostor.

Those records we do have are ready for your review. Please contact me at (510) 540-3800 to arrange for an appointment to review the records.

DTSC No Action Site Form

Site Name: Olin Corporation, Morgan Hill Plant

Site Address: 425 Tennant Avenue
Morgan Hill, California 95037

Date of Recommendation(s): 9/28/1995

Recommendation(s): No Further Action based on available information at this time.

Comments(s):

Olin Corporation, Morgan Hill Plant site located at 425 Tenant Avenue in Morgan Hill, bought the site in 1956 and occupied it until 1987 during which they manufactured highway and railroad flares, clay pigeons, and pool chemical tablets. Standard Fusee leased the site from Olin in March 1988 and since Standard Fusee bought the facility has been manufacturing railroad and highway flares. CERCLA Screening Site Inspection report determined no further action at the site because the total waste quantity on-site is unknown but appears to be small; the likelihood of a release of contaminants to groundwater appears to be low: there is no contamination in the nearby municipal well attributable to the site; and a release of contaminants to the air appears to be unlikely. The Regional Water Quality Control Board (Board) inspected the site on November 21, 1979 and the Preliminary Assessment of the site in December 1981 and stated that there was no hazard to human health at the site. No information available from the Santa Clara county as of today (9/28/95). The Board does have any record of this site in their active list. Therefore, based on the available information it is determined that no further action is required

DENIAL OF VARIANCE APPLICATION

Dear Mr. Richards:

On October 8, 1987, the Department of Health Services, Toxic Substances Control Division received your request for a variance from the hazardous waste facility permit requirements in Chapter 30, Division 4, California Code of Regulations (CCR).

The Department has reviewed your application and denies your request for a variance.

The application requests a variance to legally allow your facility to meter its highly concentrated hazardous waste into its wastewater effluent. This would, in effect, allow your facility to dilute these concentrated solutions and dispose of them into the sewer as non-hazardous waste.

Section 66300, Title 22, CCR states the following:

> "...all provisions of this chapter shall apply to the management of any liquid, semisolid, solid, or gaseous waste which conforms to the definition of hazardous waste in Section 25117 of the Health and Safety Code including but not limited to the following:
>
> A waste mixture formed by mixing any waste or substance with a hazardous waste."

The Department does not recognize dilution as an appropriate method of waste disposal.

In addition, your variance request mentions a wastewater pretreatment unit. The Department has no record of a permit or variance for this unit. If this unit treats hazardous waste, either a variance or a permit is required.

If you have any questions regarding this letter, please contact Karen Toth at (415) 540-3395.

Sincerely,

Michael R. James

Gentlemen:

Enclosed is a variance request for three waste streams at our facility. This request is based on your authority, as defined by Section 66310(a)(2), for waste disposed of pursuant to the regulations of another governmental agency. The nature of the request is to allow the discharge of copper bearing waste streams which are greater than 25 mg/l, so as not to exceed the POTW discharge limits of 2 mg/l of copper.

If you have any questions or need additional information please contact me or Mr. David Booth of our Environmental Affairs Department at (318) 491-3157.

Very truly yours,

Curt M. Richards

DEPARTMENT OF TOXIC SUBSTANCES CONTROL
"OFFICIAL FILE COPY"

REQUEST FOR HAZARDOUS WASTE FACILITY PERMIT VARIANCE

California Department of Health Services

Hazardous Waste Management Branch

I would like to request a variance from the Hazardous Waste Facility Permit requirements of the California State Department of Health Services.

I am requesting a variance for the following type of facility:

( ) Container storage

( ) Tank storage

( ) located above ground

( ) located below ground

( ) A totally enclosed treatment facility.

( ) An elementary neutralization unit.

(X) A facility that discharges directly to a POTW.

( ) Other (specify) _____.

This facility is owned/operated by Mesa Technology, a wholly owned subsidiary of Olin Corporation.,

and is located at 1130 Terra Bella Avenue, Mountain View, CA 94043.

I am basing my request for a variance on the following checked (X) sections of Title 22, California Administrative Code:

( ) 66310(a)(1) The hazardous waste at my facility is insignificant as a potential hazard to humans, domestic livestock or wildlife because of its:

( ) small quantity;

( ) low concentration; and/or

( ) physical or chemical characteristics.

( ) 66310(a)(2) The hazardous waste at my facility is handled, processed or disposed of pursuant to regulations of another governmental agency:

My firm is regulated by the following agency: City of Mountain View, and the Palo Alto P.O.T.W.

A copy of the applicable permit is attached. A permit has been applied for and is pending. The allowable discharge limits are attached.

I am attaching information and drawings as outlined in Attachment A in support of this variance request. For any facilities involving underground tanks, I have attached information on a proposed groundwater monitoring program as outlined in Attachment B.

I understand that any variance from the Hazardous Waste Facility Permit requirements of the Department of Health Services, if granted, does not exempt my firm from any other applicable laws and regulations governing the management of hazardous wastes.

I certify that all information submitted with regards to this variance request is true, accurate and complete.

MESA TECHNOLOGY

GENERAL FACILITY DESCRIPTION

DEPARTMENT OF TOXIC
SUBSTANCES CONTROL
"OFFICIAL FILE COPY"

INDUSTRY

Mesa Technology is a subsidiary of Olin Corporation, Stamford, CT., incorporated in the State of California, and located at 1130 Terra Bella Avenue, Mountain View, California. Mesa Technology develops, manufactures and sells materials and equipment for semiconductor packaging and assembly in the electronics and semiconductor industry sector.

PRODUCTS

Mesa Technology manufactures microinterconnect tape which is comprised of copper foil either by itself or as a laminate with polymide film backing. This microinterconnect tape is used to interconnect semiconductor devices to packages in microelectronic assembly operations.

The manufacturing process to fabricate microinterconnect tape involves the cleaning of copper foil, coating the foil on both sides with a positive acting photoresist, exposing a pattern, chemically etching or plating the copper foil to define a pattern, stripping the photoresist from both sides of the foil, cleaning the patterned copper foil and plating the patterned foil with tin, nickel, gold, or solder. This process is performed in a continuous manner using reel-to-reel feeding of copper coils up to 70 mm in width. The process is currently operated on a one shift per day basis but will be capable of three shifts in the future.

GENERAL FACILITY LAYOUT

Attached is an area layout and a facility layout. On the facility layout are the locations of the safety equipment, fencing, utility cutoff's, hazardous material storage and the neutralization system. All facilities are secured within either locked gates or the building which is monitored by an electronic system.

WASTESTREAMS

During the manufacturing process there are various steps which utilize certain specialty chemicals and cleansers to clean, coat, etch, and plate the copper foil. Some of these chemicals build up concentrations of copper, and must be replenished or replaced. The solutions commonly discarded are described below.

It is requested that a variance be granted to allow the materials to be routed to the wastewater pretreatment unit, and to be discharge to the Palo Alto POTW, under their discharge limits of 2 mg/l for copper. Because such small volumes are generated, it is possible to meter this solution to the wastewater pretreatment system and maintain compliance with the copper effluent limits of 2 mg/l.

A. Ammonium Persulfate Wastestream

This material is used in the pre-clean line, to help prepare the copper foil for the coating and etching process. A 20 gallon reservoir supplies a spray wash which applies the solution to the copper foil. The solution is recycled to the reservoir and used until the copper concentration builds up to unacceptable limits. A small portion of the solution is replaced daily with fresh material. About three gallons per shift are generated on about seven working days out of the month. The copper concentration has been determined to range between 1,000 and 7,000 mg/l.

B. Hydrochloric Acid Waste Stream

This material is a 30% solution of hydrochloric acid. It is used in several parts of the overall process, e.g., the pre-cleaning line and the final cleaning line. It is used in a similar manner as the ammonium persulfate described above. About three gallons per shift are generated; about seven working days per month. A typical concentration would be expected to be in the same range as the persulfate waste, i.e., 1,000 - 7,000 mg/l. This material is also a characteristic corrosive hazardous waste which is easily neutralized in the pretreatment system.

C. Stripper Waste Stream

In the final cleaning line an organic stripper solution is used. This solution is a cellosolve based mixture, which is used in a three stage, three tank recirculating system. About six gallons per shift are generated from this system, about seven working days per month. The copper concentration has been determined to range from 700 to 14,000 mg/l.

WASTE TREATMENT FACILITIES

The waste treatment system is a prepackaged two chamber "Port-A-Just 15" acid neutralization unit built and installed by Ecology Protection Systems, San Jose, California. The system is designed to accommodate a peak flow of 15 gallons per minute and will maintain a pH range of 6.5 to 9.0. The system consists of the following:

PORT-A-JUST

DEPARTMENT OF TOXIC SUBSTANCES CONTROL
"OFFICIAL FILE COPY"

Size: 5' X 5' X 5'
2 Chambers
2 Agitators
2 pH Controllers
2 Chemical Feed Pumps, Acid
2 Chemical Feed Pumps, Caustic
1 Control Panel with alarms for out of spec pH and low chemicals

LIFT STATION, 15 GPM

2 Pumps, Duplexed
1 Control Panel with starters and sump level control
1 Sump tank liner (Provides double containment)
Associated piping and valves

The Port-A-Just chemicals are supplied in 30 gallon drums.

Waste effluent from the process stations is conveyed to the sump in polypropylene drain lines mounted to the sidewall of a sealed and coated in-ground concrete trench. The trench extends from inside the building to a sump outside the building on the rear facilities support pad. The effluent is pumped from the sump into the neutralization unit. Following pH adjustment, the effluent is gravity fed into the building sewer drain line through a conventional vented P-trap arrangement and then flows to the Polo Alto Wastewater Treatment Plant.

A schematic diagram of the waste treatment system is included herein.

Log 9/29/87

August 7, 1987

Mr. Dwight Hoenig
CA Department of Health Services
Toxic Substances Control Division
2151 Berkeley Way, Annex 7
Berkeley, CA 94704

Gentlemen:

Enclosed is a variance request for three separate waste streams at our facility. These requests are based on your authority, as defined by Section 66310(a)(1) for very small quantities of hazardous wastes. In two cases a lead and a solvent waste stream take more than 90 days to fill a container for the recycler/disposal company. In the third case an elementary neutralization unit treats a small wastewater stream prior to discharge to a local POTW.

We specifically request that a variance be granted to store the lead and solvent waste streams for up to one year to facilitate the transportation of full containers, and that a variance for the elementary neutralization unit be granted.

If you have any questions or need additional information please contact Mr. Ray Riley our Facilities Manager at (415) 961-6372 or Mr. David Booth our Environmental Specialist at (318) 491-3157.

Very truly yours,

Scott Voss

Scott Voss

Enclosure

REQUEST FC HAZARDOUS WASTE FACILITY PERM VARIANCE

California Department of Health Services
Toxic Substances Control Division

I would like to request a variance from the Hazardous Waste Facility Permit requirements of the California State Department of Health Services.

I am requesting a variance for the following type of facility:

(X) Container storage

( ) Tank storage

( ) located above ground

( ) located below ground

DEPARTMENT OF TOXIC SUBSTANCES CONTROL "OFFICIAL FILE COPY"

( ) A totally enclosed treatment facility

(X) An elementary neutralization unit

(X) A facility that discharges directly to a POTW

( ) Other (specify) _____.

This facility is owned/operated by Mesa Technology a wholly owned subsidiary of Olin Corporation.

and is located at 1130 Terra Bella Avenue, Mountain View, CA 94043

I am basing my request for a variance on the following checked (X) Sections of Title 22, California Administrative Code:

(X) 66310(a)(1) The hazardous waste at my facility is insignificant as a potential hazard to humans, domestic livestock or wildlife because of its:

(X) small quantity;

( ) low concentration; and/or

( ) physical or chemical characteristics

( ) 66310(a)(2) The hazardous waste at my facility is handled, processed or disposed of pursuant to regulations of another governmental agency.

My firm is regulated by the following agency: City of Mountain View, and Palo Alto Water Quality Department

A copy of the applicable permit is attached. Permit is currently pending.

I am attaching information and drawings as outlined in Attachment A in support of this variance request. For any facilities involving underground tanks, I have attached information on a proposed groundwater monitoring program as outlined in Attachment B.

I understand that any variance from the Hazardous Waste Facility Permit requirements of the Department of Health Services, if granted, does not exempt my firm from any other applicable laws and regulations governing the management of hazardous wastes.

I certify that all information submitted with regards to this variance request is true, accurate and complete.

MESA TECHNOLOGY

GENERAL FACILITY DESCRIPTION

INDUSTRY

Mesa Technology is a subsidiary of Olin Corporation, Stamford, CT., incorporated in the State of California, and located at 1130 Terra Bella Avenue, Mountain View, California. Mesa Technology develops, manufactures and sells materials and equipment for semiconductor packaging and assembly in the electronics and semiconductor industry sector.

PRODUCTS

Mesa Technology manufactures microinterconnect tape which is comprised of copper foil either by itself or as a laminate with polymide film backing. This microinterconnect tape is used to interconnect semiconductor devices to packages in microelectronic assembly operations.

The manufacturing process to fabricate microinterconnect tape involves the cleaning of copper foil, coating the foil on both sides with a positive acting photoresist, exposing a pattern, chemically etching or plating the copper foil to define a pattern, stripping the photoresist from both sides of the foil, cleaning the patterned copper foil and plating the patterned foil with tin, nickel, gold, or solder. This process is performed in a continuous manner using reel-to-reel feeding of copper coils up to 70 mm in width.

GENERAL FACILITY LAYOUT

Attached is an area layout and a facility layout. On the facility layout are the locations of the safety equipment, fencing, utility cutoff's, hazardous material storage and the neutralization system. All facilities are secured within either locked gates or the building which is monitored by an electronic system.

WASTESTREAMS

A. In the reel-to-reel system, water sprays wash residual process acids from the copper foil and generate a wastewater stream. This stream is maintained between 2.0 and 12.5 standard pH units. It is then treated in our elementary neutralization system to enable compliance with the POTW requirements of 5.5 to 10.0 standard units. While this stream is managed as a non hazardous stream, there exists some vulnerability in the event an upset or spill would cause water less than a pH of 2 to enter the neutralization system. We are unsure if

the Department of Health Services would consider this a hazardous waste treatment system, in that event. Therefore to settle this issue we are requesting a variance as an elementary neutralization system.

A description of the neutralization system is at Attachment A. The location of the system may be seen on the attached Facility Plan.

B. Solvents are used in a minor way for spot cleaning equipment and materials. They are not used as process chemicals. The waste solvents are collected into a steel drum and maintained in a flammable storage cabinet inside the production area. It's approximate location may be seen on the attached Facility Plan. They are generated in very small quantities over a long period of time. It takes between six months to 1 year to collect a full 30 to 55 gallon drum of solvents.

These solvents are designated by California waste code No. 214 as waste and comprised by acetone, isopropyl alcohol and 1,1,1 trichloroethane. They are sent to a recycle for recovery into a commercial product.

The need to have a transporter come in every 90 days rather than once in 9 months for a single container, increases the cost of this recycling considerably. This is due to the transportation cost premium for handling only one drum. A variance is requested to allow the accumulation of these materials for up to one year prior to shipment for recycle or disposal.

C. The third waste stream for which a variance is requested is for waste solder. About three to four pounds are generated monthly from solder coating equipment which treats certain copper foil products. This waste solder is hazardous by virtue of the lead content. It is accumulated at the point of generation in a sealed container. arrangements are being made for recycle of the material. If this is not possible, it will be disposed of as a hazardous waste in a secure landfill.

This material also is generated in very small quantities, and a variance is requested to accumulate the material until full containers of 5 to 15 gallon size may be shipped more economically. A variance is requested to accumulate these materials for up to one year prior to shipment for recycle or diposal.

SUBJECT: 30 DAY EXTENSION ACCUMULATION TIME FOR THE GENERATOR

DEAR SIR:

A 30 DAY EXTENSION FOR THREE DRUMS OF WASTE CORROSIVE LIQUID N.O.S. (UN1760) HAZARDOUS WASTE STORED OVER 90 DAYS IS REQUESTED.

DUE TO THE INABILITY TO TREAT THE HAZARDOUS WASTE IN THE STATE OF CALIFORNIA, THE DRUMS ARE WAIT LISTED FOR A COMBINED SHIPMENT TO CHEMICAL WASTE MANAGEMENT IN CARLYSS, LA. THE DRUMS ARE EXPECTED TO SHIP BEFORE JANUARY 30, 1989.

YOUR APPROVAL IS REQUESTED.

IF ADDITIONAL INFORMATION IS REQUIRED PLEASE CONTACT ME AT (415) 961-6372.

Subject: Olin Mesa

SUMMARY:

On 1/26 I spoke with Curt Richards regarding a 30 day extension to the generator storage limits.

I told him that there was not time or resources to process his request. We discussed the fact that he would be in violation until he got the drums of the facility. He said that the drums are scheduled to be shipped February 6, 1989.

12/11/81
From: Dave Reth
Re: OLIN and PACIFIC RAILWAY SIGNALS/COLUMBIA POWDER SUSPECT SITES

Conclusion: NO PROBLEM

8/20/81: Sites identified from Superfund notification

9/16/81: Pacific R.R. site could not be identified from drive-by

11/16/81: Questionnaires sent

12/9/81: I telephoned Mr. Knowles, the Director of Environmental and Energy Affairs for Olin Corp.

Columbia Powder first established the site in Los Gatos for the production of fireworks around the turn of the century. Pacific Railway Signals bought it around 1940, and manufactured signal flares. The site was purchased by Olin Corp. around 1949. The plant was damaged by a fire in 1955. As there was also pressure from the town of Los Gatos, who were trying to discourage Industrial development, Olin moved the operation to their Morgan Hill facility.

Wastes were disposed of, until 1975, by puting the solid wastes into a trench and burning them. The wastes are now hauled by a registered hauler to a class I site. The wastes formerly burned were:

strontium nitrate
potassium purchlorate
sawdust
starch
sulfer

According to a qualified physical chemist with whom I inquired, Dr. Julius Roth, Ph.D., these substances would almost entirely burn off. Any residue remaining would consist primarily of potassium chloride, a fertilizer, and sodium chloride, table salt. These would not be environmental or health hazards.

CONCLUSION: The sites should be classified as NO PROBLEM.

ABANDONED INDUSTRIAL WASTE DISPOSAL SITE SURVEY

Your cooperation in completing this form is appreciated. If you are completing this form for several plants, please use a separate form for each plant your company has operated and/or currently operates in California. If you do not have adequate space, please use another sheet of paper and identify responses by the question number.

From: Dave Reth
Re: OLIN and PACIFIC RAILWAY SIGNALS/COLUMBIA POWDER SUSPECT SITES

Conclusion: NO PROBLEM

8/20/81: Sites identified from Superfund notification

9/16/81: Pacific R.R. site could not be identified from drive-by

11/16/81: Questionnaires sent

12/9/81: I telephoned Mr. Knowles, the Director of Environmental and Energy Affairs for Olin Corp.

Columbia Powder first established the site in Los Gatos for the production of fireworks around the turn of the century. Pacific Railway Signals bought it around 1940, and manufactured signal flares. The site was purchased by Olin Corp. around 1949. The plant was damaged by a fire in 1955. As there was also pressure from the town of Los Gatos, who were trying to discourage Industrial development, Olin moved the operation to their Morgan Hill facility.

Wastes were disposed of, until 1975, by puting the solid wastes into a trench and burning them. The wastes are now hauled by a registered hauler to a class I site. The wastes formerly burned were:

strontium nitrate
potassium purchlorate
sawdust
starch
sulfer

According to a qualified physical chemist with whom I inquired, Dr. Julius Roth, Ph.D., these substances would almost entirely burn off. Any residue remaining would consist primarily of potassium chloride, a fertilizer, and sodium chloride, table salt. These would not be environmental or health hazards.

CONCLUSION: The sites should be classified as NO PROBLEM.

APPENDIX A – HEALTH AND SAFETY PLAN

Type of Services	**Site Management Plan**
Location	**1001 North Shoreline Boulevard** **Mountain View, CA 94043**

SECTION 1: INTRODUCTION

On behalf of Calvano/CRP Mountain View Venture LLC, Cornerstone Earth Group (Cornerstone) prepared this Site Management Plan (SMP) for the planned commercial development at 1001 North Shoreline Boulevard in Mountain View, California (Site) as shown on Figures 1 and 2. This work was performed in reliance with the following documents:

- Cornerstone Earth Group, September 4, 2015. Project Health and Safety Plan (HSP), 1001 North Shoreline Boulevard, Mountain View, CA, Cornerstone.
- Cornerstone Earth Group, June 16, 2015. Preliminary Soil Vapor Quality Evaluation, 1001 North Shoreline Boulevard, Mountain View, California.
- Applied Water Resources, September 9, 2015. Monitoring Well Destruction Completion, 1130 Terra Bella, Mountain View, California.
- Applied Water Resources, April 25, 2014. Phase I Environmental Site Assessment, 1091 Shoreline Blvd., Mountain View, California.
- Applied Water Resources, January 10, 2014. Phase I Environmental Site Assessment, 1130 Terra Bella, Mountain View, California.
- Applied Water Resources, January 10, 2014. Phase I Environmental Site Assessment, 1160-1170 Terra Bella, Mountain View, California.
- Applied Water Resources, October 10, 2013. Phase I Environmental Site Assessment, 1023 Shoreline Blvd., Mountain View, California.
- Applied Water Resources, October 10, 2013. Phase I Environmental Site Assessment, 1043 Shoreline Blvd., Mountain View, California.
- Applied Water Resources, October 10, 2013. Phase I Environmental Site Assessment, 1062 Linda Vista, Mountain View, California.
- Applied Water Resources, March 16, 2011. Phase I Environmental Site Assessment, 1005 and 1015 North Shoreline, Blvd. and 1150 Terra Bella Ave., Mountain View, California.

The SMP meets the following corrective action standards:

- Be protective of human health and the environment;
- Describes contingency measures intended to control the known ground water contamination that has migrated onto the Site and reduce or eliminate further releases of hazardous constituents that may pose a threat to human health and the environment;
- Comply with applicable federal, state and local standards for management of wastes; and
- Implement applicable risk management controls.

The SMP provides technical and operational protocols for handling known and unknown impacted soil, soil vapor and ground water that may be encountered during redevelopment of the Site. It contains the following:

- A description of environmental conditions identified at the Site and surrounding areas;
- A general description of the planned development of the Site; and
- General soil, soil vapor and ground water management protocols to be implemented during construction of the planned development.

It is the General Contractor's responsibility to incorporate the provisions of this SMP into their design documents and HSP; applicable worker health and safety procedures are to be applied by the General Contractor and its subcontractors conducting the work.

SECTION 2: SITE DESCRIPTION

The location of the Site is shown on Figures 1 and 2. Tables 1 through 3 summarize general characteristics of the Site and adjoining properties.

2.1 LOCATION AND OWNERSHIP

Table 1 describes the physical location and current use of the property, based on information provided by Calvano/CRP Mountain View Venture LLC.

Table 1. Location and Current Use

Address	APN	Size (Acres)	Current Use	Square Footage	Approximate Construction Date
1091 North Shoreline	153-15-028	1.85	Two-story multiple tenant office building	36,054	1980
1043 North Shoreline	153-15-018	0.75	Two-story office building	13,000	1970
1062 Linda Vista	153-15-24	0.85	Warehouse	5,640	Early 1960s
1005 North Shoreline	153-15-015	2	Fiesta Del Mar Restaurant	---	Since at least 1974
1015 North Shoreline	153-15-016	0.76	Former residence that is used by Fiesta Del Mar for storage	---	Since at least 1956

Table 1 (Continued). Location and Current Use

1150 Terra Bella	153-15-022	0.86	Residence, garage, greenhouse, storage sheds, and open areas formerly used for storage	1,356	1947
1160-1170 Terra Bella	153-15-014	½	Single story office and light industrial building	7,840	1960
1130 Terra Bella	153-15-026	0.86	Single story office and warehouse building	12,300	1983
1023 North Shoreline	153-15-017	¾	Two-story office building	13,000	1974

2.2 SITE SETTING

Land use in the general Site vicinity appears to be primarily commercial and light industrial.

2.3 REDEVELOPMENT PLANS

The project will consist of redeveloping the Site for a new Class A office complex (Figure 2). The planned four-story office building will have a footprint of approximately 30,000 square feet. The building will be steel-frame construction. The remainder of the Site will be covered with at-grade asphalt concrete pavement and associated flatwork improvements.

SECTION 3: BACKGROUND

3.1 SITE BACKGROUND

The Site and surrounding area generally were used for agricultural purposes beginning in the late 1930s. Subsequent Site uses have included residences, warehouses, office space and light industrial activities. The surrounding area was used primarily as agricultural fields until it was developed with light industrial facilities in the 1960s and early 1970s.

According to the Applied Water Resources Phase I ESA for the property located at 1130 Terra Bella, the property was agricultural in 1939 and then used by Pennell Plastering and a residence from 1948 until the late 1970s. The existing building was constructed in 1983. Mesa Technologies operated a portion of the Site until 1989 as an instrument and electronics company and warehouse.

Based on a Preliminary Environmental Assessment and Ground Water Investigation completed by Aqua Terra Technologies in 1988 (ATT, 1988), Mesa Technology stored acids, caustic/alkaline cleaner, cyanide, photo resist stripper and flammable solvents at the facility. Flammable solvents also reportedly were stored in 55-gallon drums, and industrial waste water was treated on-Site in a neutralization sump, which reportedly was a concrete pit in the ground permitted by the City of Mountain View for neutralization of corrosives and acids. This pit reportedly was removed in 1989 under Mountain View Fire Department oversight. Sampling completed at the time of removal reportedly did not identify any releases of hazardous materials. The 2014 Phase I report completed by Applied Water Resources stated, "*Based on the analytical results of soil sampling, wipe sampling of the hazardous materials storage, site*

walk-through and the proper manifest documentation for the removal of the concrete and soil, the City of Mountain View Fire Department, Hazardous Materials Division granted closure for the facility on December 20, 1989."

Numerous investigations within the City of Mountain View have identified ground water impacts to the general Site area. Although none of the environmental reports have identified the Site as being an agency listed site and none identified a release of hazardous materials on-Site, based on the storage of hazardous materials, three monitoring wells were installed at the Site in August 1988 to evaluate its potential to have contributed to impairment of ground water quality (MW-1 and MW-2) and to establish background ground water chemical characteristics (MW-3) (Figure 3). Trichloroethene (TCE) reportedly was detected at 13, 240 and 33 micrograms per liter (µg/L) in wells MW-1, MW-2 and MW-3, respectively (ATT, 1988). It was concluded that, because TCE and trans 1,2-dichloroethene (tDCE) were detected in the up-gradient well MW-3, it appeared that these compounds were from an off-Site source. In addition, Applied Water Resources noted that, in granting closure for the hazardous materials storage area, "*the Mountain View Fire Department concluded that, because DCE was never used by the site occupant, only research quantities of TCE were used at the site, and both chemicals were detected in an up-gradient well, these chemicals were from an off-site source"*. The most recent sampling was performed at the Site on July 27, 2005. TCE reportedly was detected in all three wells at similar concentrations (33 to 46 µg/L) with the up-gradient monitoring well displaying the greatest concentrations of chemicals of concern (Figure 3). tDCE only was detected in the up-gradient well (MW-3 at 0.64 µg/L). No total petroleum hydrocarbons (TPH) as gasoline or diesel were detected in the water sampled.

Note that three ground water monitoring wells installed on-Site in 1988 were recently destroyed by Applied Water Resources (September 2015) under permit from the Santa Clara Valley Water District (Water District).

3.2 ADJACENT PROPERTIES

According to historical sources, properties surrounding the Site were primarily agricultural land prior to being developed with light industrial and commercial facilities in the 1960s and early 1970s. Ground water contamination from multiple sources has migrated beneath the Site. Those releases are summarized below.

3.2.1 Former Texaco Station, 975 north Shoreline Boulevard

A Texaco-branded service station previously was located at the southeastern corner of the intersection of North Shoreline Boulevard and Terra Bella Avenue. The former station included one 6,000-gallon gasoline underground storage tank (UST), four 4,000-gallon gasoline USTs, and one waste oil UST. In 1992, the six USTs, associated product piping, and dispensers were removed, and the property was redeveloped as a fast food restaurant. Following removal of the former USTs, approximately 1,520 cubic yards of petroleum hydrocarbon-impacted soil and approximately 1,000 gallons of petroleum hydrocarbon-impacted ground water were removed from the former UST area.

From January 13 to February 9, 1994, ENTRIX, Inc. (ENTRIX) operated a soil vapor extraction (SVE) system. The SVE system was shut down for rebound evaluation from February 9 to 24, 1994. On February 24, 1994, ENTRIX restarted and sampled the SVE system and concluded that no rebound had occurred. ENTRIX concluded that the SVE system appeared to

achieve remedial objectives. The SVE system was decommissioned following the rebound test to facilitate property redevelopment.

Twelve ground water monitoring wells were installed on or near the services station property, with four wells installed on the property (Figure 3). In the most recent ground water monitoring report (2010), contamination was detected in MW-22E, which is located on-Site south of the building at 1015 North Shoreline. TPH as gasoline was detected at 9,900 µg/L; benzene was detected at a concentration of 130 µg/L; toluene was detected at a concentration of 4.2 µg/L; ethyl benzene was detected at a concentration of 11 µg/L and Methyl tert-Butyl Ether (MtBE) was detected at a concentration of 1 µg/L.

On July 1, 2011, the County of Santa Clara County Department of Environmental Health (County Health) issued fuel leak site case closure. The ground water monitoring wells reportedly were destroyed under permit from the Water District (Stantec, June 2011).

3.2.2 The Shippen Property, 1175 Terra Bella

A 500 gallon gasoline UST was removed from 1175 Terra Bella in August 1998. During the removal of the UST, numerous holes were noted. Soil samples were collected in the excavation. The maximum contamination was reported at 1,900 milligrams per kilogram (mg/kg) for TPH as gasoline and 1.7 mg/kg for benzene; MtBE was not detected. In September 1998, one ground water sample was collected from the excavation, and TPH as gasoline was detected at 42,000 µg/L; benzene was detected at 1,400 µg/L; and MtBE was not detected. In November 2000, one boring was advanced to a depth of approximately 16 feet in an area off-site of 1175 Terra Bella. Three additional borings were advanced at 1175 Terra Bella. Soil and ground water samples were collected. TPH as gasoline, benzene and MtBe were not detected above laboratory detection limits in any of the sampling locations. The Water District granted fuel leak case closure on July 17, 2001.

3.2.3 Teledyne-Spectra Physics National Priority List (NPL) site

Volatile Organic Compound (VOC) impacted ground water and soil has been identified at the nearby Teledyne-SpectraPhysics National Priority List (NPL) site (Figure 1), from which a regional ground water plume (known as the North Bayshore Area plume) extends approximately 1 mile long and in some areas extends approximately 2,000 feet in width. The Project Site does not appear to be impacted by this ground water plume.

3.3 VAPOR INTRUSION

3.3.1 Texaco's Indoor Air Evaluation at 1015 North Shoreline

Stantec (December 2010), on behalf of Chevron and Texaco, evaluated the indoor air, crawl space air and outdoor ambient air of the vacant single-story residence at 1015 North Shoreline for vapor intrusion evaluation purposes due to the close proximity of the former Texaco Service Station located 975 North Shoreline Boulevard. MtBE and naphthalene were not detected above laboratory reporting limits in any of the air samples collected during this assessment. Benzene, toluene, ethylbenzene and xylene (BTEX) compounds were detected in all indoor air, crawl space air, and outdoor ambient air samples. Screening levels established for indoor air for residential use were exceeded for benzene and ethylbenzene; however, concentrations of these compounds in outdoor air were essentially the same as detected in indoor air. The presence of compounds in outdoor ambient air at concentrations exceeding

screening levels is reported in literature (Weisel, 2005; McHugh, 2004). BTEX compounds detected in outdoor ambient air are at or below median concentrations reported for urban environments across the United States (US EPA, 1999).

Crawl space air should be less affected by household chemical use or lifestyle choices such as smoking and is often used as a substitute for sub-slab sampling and indoor air sampling. For screening of possible human health risk, the US EPA applies an attenuation factor of 1.0 to detected chemicals in crawl space samples (US EPA, 2002). Thus, the indoor air quality is assumed to be equal to the crawl space air for evaluation purposes. The results of crawl space sampling indicated similar and same order of magnitude concentrations of the BTEX compounds as detected in both indoor air and outdoor ambient air.

Stantec concluded, "*Air sampling has not identified a complete vapor intrusion pathway at the vacant single-story residence, and no further vapor intrusion evaluation is warranted*".

3.3.2 Cornerstone's Soil Vapor Evaluation

Based on comments provided by the staff at the San Francisco Bay Regional Water Quality Control Board (Water Board) and the City of Mountain View (City), the Site is in close proximity to the Teledyne Spectra Physics and Texaco ground water plumes (Figure 1). To evaluate the potential for contaminated soil vapor to have migrated from these areas to the Site, Cornerstone (June 2015) performed a Preliminary Soil Vapor Quality Evaluation. Results from one sampling event (seven soil vapor samples) were compared to the residential and commercial regional screening levels (RSLs, US EPA, 2015) and the environmental screening levels (ESLs, Water Board, 2013) for soil gas. The detected soil vapor concentrations of PCE were compared to the California-modified indoor air screening levels of 0.4 micrograms per cubic meter ($\mu g/m^3$) for residential exposure and 2 $\mu g/m^3$ for commercial exposure (EPA, 2013). The TCE detected concentrations were compared to calculated screening levels based on the residential and commercial RSLs of 0.21 $\mu g/m^3$ and 0.88 $\mu g/m^3$, respectively, and the TCE indoor air short-term response action levels of 2 $\mu g/m^3$ for residential exposure and 9 $\mu g/m^3$ for commercial exposure (EPA, 2013). The PCE and TCE soil vapor screening levels were calculated by dividing these residential and commercial indoor air screening levels by the same Attenuation Factors (AF=0.001 [residential] or AF=0.0005 [commercial]). The residential and commercial soil vapor ESLs were used for comparison for compounds where no indoor air RSLs are established.

Benzene was detected above laboratory reporting limits in 5 of 7 vapor samples analyzed (including one replicate sample) and exceeded its residential ESL (42 $\mu g/m^3$) in 2 of 7 vapor samples analyzed (SV-2, 9 feet [69 $\mu g/m^3$] and SV-4, 4.75 feet [99 $\mu g/m^3$]). The benzene concentrations reported did not exceed the commercial ESL (420 $\mu g/m^3$), the residential RSL (360 $\mu g/m^3$), or the commercial RSL (3,200 $\mu g/m^3$). Tetrachloroethene (PCE) was detected above its residential ESL (210 $\mu g/m^3$) and its residential Modified California Indoor Air Screening Level (400 $\mu g/m^3$) in 2 of 7 soil vapor samples analyzed (720 $\mu g/m^3$ [SV-1, 4½ feet] and 740 $\mu g/m^3$ [SV-1 replicate, 4½ feet]). Note that these two PCE detections were detected from one soil vapor probe (SV-1), with one of the detections occurring in the replicate sample. The detected PCE concentrations did not exceed the commercial ESL (2,100 $\mu g/m^3$) or the commercial Modified California Indoor Air Screening Level (4,000 $\mu g/m^3$). PCE was not detected in the other soil vapor samples analyzed. TPH as gasoline and other VOCs were detected but at concentrations below the respective residential and commercial screening levels.

SECTION 4: HYDROGEOLOGY

4.1 HYDROGEOLOGY

Ground water appears present under confined conditions in a sand and gravel layer that extends from approximately 10 feet to 26 feet below ground surface (bgs). The ground water flow direction in this water yielding zone is toward the north. During the Geotechnical Investigation (Cornerstone, May 2014), ground water was encountered at an approximate depth of 10½ feet bgs.

SECTION 5: SITE MANAGEMENT APPROACH

5.1 APPLICABILITY OF THE CONSTRUCTION MANAGEMENT PLAN

Soil, soil vapor and ground water with residual concentrations of contaminants of concern (COC) may be present at various locations beneath the Site. This SMP presents protocol for the following construction activities that may encounter residual COC:

- Building demolition;
- Utility removal;
- Trenching, excavating and grading;
- Subsurface utility installation;
- Building foundation construction;
- Hardscapes; and
- Landscapes.

5.2 GENERAL RISK MANAGEMENT CONSTRUCTION PROTOCOLS

During construction activities, measures will be taken by the General Contractor to minimize dust generation, storm water runoff and tracking of soil off-Site. In addition, measures will be taken to reduce the potential for the creation of preferential pathways (vertical or horizontal) for COCs detected in ground water beneath the Site. The general risk management construction protocols are described below.

5.2.1 Pre-Construction Planning and Notification

Prior to the start of any construction activity that involves below ground work (e.g. mass grading, foundation construction, excavating or utility trenching), information regarding Site risk management procedures (*e.g.*, a copy of this SMP) will be provided to the General Contractor and each of its subcontractor for incorporation into their HSPs.

5.2.2 Site-Specific Health and Safety Worker Requirements

A Site-specific HSP is attached as Appendix A. It was prepared to establish health and safety protocols for personnel working at the Site. This HSP meets federal and State of California (OSHA) standards for hazardous waste operations (29 CFR 1910.120 and 8 CCR 5192).

The General Contractor will be responsible for following the protocols presented in the Site-specific HSP. The Contractor also will prepare their own HSP and Injury and Illness Prevention Plan (IIPP) and will maintain the responsibility for the health and safety of their workers. The General Contractor's HSP will follow the protocols in the Site-specific HSP and will establish health and safety protocols for their personnel and their subcontractors and their personnel in accordance with federal and State of California OSHA standards. The General Contractor's HSP will contain provisions for limiting chemical exposure to construction workers, chemical and non-chemical hazards, emergency procedures, and standard safety protocols. Contractors are required to implement their specific requirements for worker training, based on the level of expected contact to soil, soil vapor, and ground water associated with their workers' activities.

5.2.2.1 Personal Protection Equipment (PPE)

Work activities will be conducted with Level D protection:

- Chemical-resistant steel-toed boots when in contact with ground water or contaminated materials;
- Work boots;
- Work gloves as required; nitrile gloves when in contact with ground water or contaminated materials;
- Safety glasses when risk of contact with ground water;
- Hard hat; and
- Hearing protection (if noise levels exceed 85 dBA).

Coveralls and nitrile gloves are needed only as required to help reduce soiling by contaminated materials.

5.2.3 Site Control

The Site will be fenced and gated with lock. Access to the Site will be limited by the General Contractor to authorized personnel. Site control procedures will be implemented by the Contractor to control the flow of personnel, vehicles and materials in and out of the Site. Signs will be posted by the Contractor instructing visitors to sign in at the project support areas at all Site entrances.

5.2.4 Access Controls

The General Contractor will establish the physical boundaries the Site and shall instruct all workers and visitors on the limits of the restricted areas. No one shall be allowed to enter a restricted area without the required protective equipment for that area. The General Contractor's Site Safety Officer (SSO) shall ensure compliance with all restricted area entry and exit procedures.

Visitors should check in with the General Contractor's SSO immediately upon arrival. Only authorized visitors will be allowed access to active work areas. Each visitor will be required to

provide and wear the necessary protective equipment for use during site visits and shall be escorted by the General Contractor while on site. All visitors, subcontractors and other personnel will be required to sign a safety plan acknowledgement sheet to certify that they have read and will comply with the Site HSP. Failure to comply with this Site entry procedure may result in expulsion from the Site.

5.2.5 Traffic Control

To reduce the potential impacts of construction traffic at the Site, the General Contractor shall employ traffic management measures at the Site: 1) to provide for the safety of on-Site personnel; 2) to reduce the potential for spillage or tracking of soil on or off-Site; 3) to help facilitate concurrent construction activities with remediation activities so that they do not adversely impact or compromise safe traffic flow within the Site; and 4) to limit the disruption of existing traffic flows on local roadways.

Traffic management protocols include:

- Visual monitoring of traffic movements on the Site will be performed by the General Contractor to ensure safe movement of traffic and protection of persons and property around the Site.
- Construction roads will be observed by the General Contractor to confirm road conditions support safe working and driving.
- Each sub-contractor is responsible for compliance with this plan for vehicle and transport safety of personnel and vehicles under their control.
- Drivers of vehicles are responsible for driving safely and exercising care.
- Any track-out on a paved public road at any location where vehicles exit the work Site will be cleaned by using wet sweeping or a HEPA filter equipped vacuum device by the end of each work day. Dry sweeping of paved roadways will be prohibited.
- A maximum vehicle speed limit of approximately 15 miles per hour or less.
- Water applied approximately every 2 hours of active operations or sufficiently often to keep the area adequately wetted.
- Vehicles maintained by covering holes or other openings in cargo compartments such that no spillage can occur.
- Loads wetted and either:
    - Covered with tarps; or
    - Loaded such that the material does not contact the front, back, or sides of the cargo compartment at any point less than ½ foot from the top and that no point of the load extends above the top of the cargo compartment.
- Spills immediately cleared by engaging appropriate safety and response standards as relevant to the event.

5.2.6 Dust Control

The General Contractor will utilize effective means of dust and erosion control to minimize the generation of dust and erosion associated with excavation activities, truck and vehicle traffic onto and off the Site, and the effects of ambient wind traversing exposed soil.

Work activities, such as clearing, demolition, excavation and grading operations, construction vehicle traffic on unpaved ground, and wind blowing over disturbed soil surfaces may generate dust and particulate matter whenever exposed soil surfaces are dry. The General Contractor will minimize dust emissions to the maximum extent possible. To accomplish minimal dust emissions, the General Contractor will implement dust control measures in accordance with Air District rules and regulations.

An effective means of dust control will be utilized to minimize the generation of dust associated with the earthwork activities, truck traffic onto and off the Site, and the effects of ambient wind traversing exposed soil. Dust control measures utilized at the Site will include several or more of the following on an as needed basis:

- Providing equipment and staffing during normal working hours for watering of all exposed or disturbed soil surfaces sufficient to suppress dust plumes.
- Using dust suppressant additives in the water, which can be a small amount of ordinary liquid detergent.
- Covering or wetting of stockpiles of debris, soil, sand or other materials that can be blown by the wind.
- Misting or spraying water while excavating soil and loading transportation vehicles.
- Minimizing drop heights while loading/unloading excavated soil.
- Sweeping adjacent streets of all soil and debris generated from the Site work activities.
- Wetting inactive portions of the Site that have exposed soil surfaces or treating these areas with an approved dust suppressant.
- Suspending earth moving or other dust producing activities during periods of high winds whenever dust control measures are unable to prevent visible dust plumes.
- Watering to control dust will not result in ponded water or runoff. If runoff occurs, it will be contained on-Site.

5.2.7 Perimeter Air Monitoring

If required by the City and/or the Owner/Developer, perimeter air monitoring will be conducted at the Site by either the General Contractor or the Environmental Consultant to document the effectiveness of dust control measures. Prior to the beginning of excavation or grading activities, a windsock or anemometer will be used to monitor the wind direction at the Site and to help determine the location of monitors along the fence lines. Fence line monitoring will be conducted at three locations. Each dust monitor will be positioned within the breathing zone at approximately 5 feet above the ground level. Perimeter monitoring will include the collection of

air samples at one upwind location and two downwind locations. Dust monitoring will conducted daily during demolition, excavation, trenching and grading activities.

5.2.7.1 Dust

- Real time monitoring of total dust (<10 µm diameter) will be conducted daily throughout the duration of the project during activities that may significantly disturb impacted soil. The monitoring will be performed using three DataRAM PDR-1000 particulate monitors. These meters log the detected airborne dust concentrations.

- The particulate meters will be monitored to evaluate if excessive dust is migrating off-Site. Each time the meters are checked, the differences between the average upwind dust concentration and the average downwind concentration will be compared to the ambient air quality standard of 150 µg/m³ (8-hour average) for respirable dust. If this standard is exceeded, increased dust control measures will be implemented. The California Ambient Air Quality Standard for respirable particulate matter (PM10) is 50 µg/m^3 over an averaging time of 24 hours. Based on an 8-hour construction work day, 150 µg/m^3 over an averaging time of 8 hours will average 50 µg/m^3 over 24 hours (16 hours of non-activity). Significant concentrations are defined as exceeding 150 µg/m^3 over an averaging time of 8 hours.

5.2.8 Storm Water Pollution Prevention Plan (SWPPP)

The Clean Water Act and associated federal regulations (Title 40 of the Code of Federal Regulations [CFR] 123.25(a)(9), 122.26(a), 122.26(b)(14)(x) and 122.26(b)(15)) require nearly all sites engaged in clearing, grading, and excavating activities that disturb one acre or more, to obtain coverage under a National Pollutant Discharge Elimination System (NPDES) permit for storm water discharges. A Site-specific Storm Water Pollution Prevention Plan (SWPPP) and Erosion Control Plan covering the activities of Site redevelopment will be prepared by the Civil Engineer (QSD). Contractors and their Subcontractors shall comply with the provisions and protocols of this plan. A copy of the SWPPP shall remain on-Site throughout construction. Storm water pollution controls will be based on best management practices (BMPs), such as those described in “Information on Erosion and Sediment Control for Construction Projects: A Guidebook” (Water Board 1998) and “Erosion and Sediment Control Field Manual, Third Edition (Water Board 1999). The California Stormwater Best Management Practice Handbooks published by the California Stormwater Quality Association (CASQA) (http://www.casqa.org) also reflect current practices and storm water management standards. Sediment and erosion control procedures include, but are not limited to the following:

- Construct temporary berms or erecting silt fences around exposed soil;

- Place straw bale barriers or sediment traps around catch basins or other entrances to storm drains;

- Cover soil stockpiles with plastic sheeting or tarps during rainfall events;

- Thoroughly sweep paved areas exposed to soil excavation/grading activities;

- During storm events, prevent stockpiled soil from entering the storm drain system;

- Provide water for truck cleaning and dust control; and
- Implement other appropriate BMPs.

Maintenance, monitoring and inspection shall be conducted according to the BMPs. Erosion control measures shall be maintained until disturbed areas are stabilized. Changes to this erosion control plan shall be made to meet field conditions only with the approval or at the direction of the Civil Engineer.

5.2.9 Stockpiling

Soil may require temporary stockpiling as needed by the Contractor. The stockpile area will be constructed in accordance with the approved SWPPP.

5.2.9.1 "Clean" Soil

In general, the stockpile area will be clean and free of debris. The stockpile shall be covered with heavy duty plastic (minimum of 10 mil), or watered twice daily, or sprayed with a non-toxic soil binder. All stockpiles will include berms for containment of any water that drains from the soil. Stockpiles will be inspected at least daily. All stockpiles will be handled as to prevent and/or reduce potential dust generation. Additional water spray will be utilized for dust suppression and foam or surfactant will be utilized for stabilization of stockpiles, if necessary.

5.2.9.2 Soil Suspected as Contaminated

Excavated soil suspected to be impacted with unknown contaminants (e.g., soil contaminated from a newly encountered leaking drum or tank) or excavated soil that was in contact with contaminated ground water will require additional stockpiling measures. In general, the stockpile area will be clean and free of debris prior to the placement of the bottom liner. The liners will consist of heavy duty plastic (minimum of 10-mil) as the bottom and top liners. All stockpiles will include berms for containment of any water that drains from the soil. Stockpiles will be inspected at least twice daily and repaired as needed. At the end of each shift or when the stockpile is not in use for two hours or longer, the pile(s) will be securely covered with the heavy duty plastic liner. All stockpiles will be handled as to prevent and/or reduce potential dust generation. Additional water spray will be utilized for dust suppression and foam or surfactant will be utilized for stabilization of stockpiles, if necessary.

5.2.9.3 Stockpile Sampling

The quality of stockpiled soil may require analytical testing so that appropriate disposal alternatives can be determined. Soil samples will be collected from the stockpile in random areas and depths and analyzed for contaminants of concern (COC) in accordance with the following protocols:

- Up to 1,000 cubic yards (cy): One sample per every 250 cy
- 1,000 to 5,000 cy: Four samples for the first 1,000 cy and one sample for each additional 500 cy
- Greater than 5,000 cy: 12 samples for the first 5,000 cy and one sample for each additional 1,000 cy

If COC are detected below DTSC-Recommended Screening Levels for residential use or at ambient/background concentrations for metals, then re-use of the soil will be appropriate. If DTSC-Recommended Screening Levels are not available for a specific COC, residential RSLs and ESLs may be used. If COC are detected above these levels, then County Health staff will be contacted for approval to use the soil on-Site or the soil will be disposed off-Site at a permitted facility. Prior to off-Site disposal at an appropriately permitted facility, soil samples will be collected and analyzed in accordance with the disposal facility requirements.

5.3 GROUND WATER MANAGEMENT PROTOCOLS

5.3.1 Utility Trenches

If utility trenches that extend to an approximate depth of 10 feet or more (or encounter ground water), measures will be implemented to reduce the potential for vapor and ground water migration through trench backfill and utility conduits. Such measures shall include placement of low-permeability backfill "plugs" at selected intervals on-Site and at all locations where the utility trenches extend off-Site. In addition, utility conduits that are placed below ground water will be installed with water-tight fittings to reduce the potential for ground water to migrate into the conduits. The Civil Engineer shall survey and record all '*plug'* placement locations.

Soil in contact with ground water shall be assumed contaminated. If excavated, this soil shall be handled as described in Section 5.2.9.2 and 5.2.9.3.

5.3.2 Excavation Dewatering

Ground water is assumed to be potentially contaminated on-Site; note that ground water contamination may be more widespread than shown on Figure 3. If excavation de-watering is required, the ponded water will be sampled and analyzed prior to pumping to evaluate discharge alternatives. If subsurface parking is planned, pre-excavation ground water sampling should be considered to prepare a dewatering plan. The Developer's environmental consultant will collect a sample of the ground water for laboratory analyses for the COC; other analyses may be required, based on the intended use of the water. Pursuant to Water Board resolution 88-160, the preferred use of the ponded water is recycling or on-Site re-use. If recycling or re-use is not appropriate, based on analytical data or Site circumstances (i.e. more ponded water than is necessary for dust control), the next alternative is discharge to publicly owned treatment works. If recycling/on-Site reuse or discharged to publicly owned treatment works is not appropriate, then treatment and discharge to the local receiving waters (i.e. storm drain) will be evaluated. If the pumped water is to be used for on-Site dust control, concentrations of chemicals of concern will be compared to the lower of the San Francisco Bay Regional Water Quality Control Board's (Water Board's) Environmental Screening Levels (ESLs, December 2014) for fresh or estuarine surface water. If the concentrations detected exceed the ESLs, then County Health staff will be consulted prior to using pumped water for on-Site dust control. Discharge to the sanitary sewer or storm sewer, if any, will be performed under an approved permit from the City of Mountain View or Water Board, respectively. If required, water will be treated prior to discharge.

Alternatively, extracted ground water also may be used as dust control on contaminated stockpiles (if any), provided that no water is allowed to run off the stockpile surface.

5.3.3 Ground Water Wells

The seven ground water monitoring wells installed on-Site reportedly have been destroyed under permit from the Water District. In addition, there is an active potable well at the 1150 Terra Bella. This well reportedly is in process to be destroyed by a licensed well driller under permit with Water District.

5.4 SOIL MANAGEMENT PROTOCOLS

5.4.1 Management of Unanticipated Contamination or Hazardous Debris

During construction activities, if unanticipated contamination (*e.g.*, if soil discoloration or odors are noted), buried structures (*e.g.*, sumps or tanks), or hazardous debris are encountered that may pose a risk to human health or the environment, earthwork in the suspect area will be immediately stopped and worker access to the suspect area will be restricted. The area will be cordoned off using delineators and caution tape, or similar materials by the Contractor. Subsequently, the Environmental Consultant will be immediately notified. The County of Santa Clara Department of Environmental Health (County Health) will be notified within five business days.

Excavated soil will be observed for discoloration or readily apparent chemical odors. If observed, these soils will be designated as potentially contaminated. This potentially contaminated soil will be evaluated through analytical testing by the Environmental Consultant so that appropriate handling and disposal alternatives can be determined.

Soil samples shall be collected from the stockpile or in place soil and analyzed for full list VOCs. If VOCs are detected below their respective residential Environmental Screening Level (ESL, 2013), then re-use of the soil would be appropriate. If COCs are detected above these levels, then regulatory agency staff shall be contacted for approval to use the soil on-Site, or it should be disposed off-Site. Prior to off-Site disposal, additional analytical testing may be required in accordance with the requirements of the selected disposal facility. Any cleanup/remediation of the Site will be required to meet applicable state and local requirements.

If unanticipated contamination is encountered (e.g., leaking drum) that may pose a risk to human health or the environment, earthwork activities in these contaminated materials will be performed by licensed hazardous materials contractors and personnel trained in hazardous waste operations (40-hour OSHA training), if warranted based on COC concentrations. The soil management procedures described in this document will be followed. Soil suspected of being contaminated that is excavated during construction shall be stockpiled separately from “clean” soil. Stockpiled soil that is suspected to be contaminated shall be stockpiled on-Site per the protocols of Section 5.2.9.2.

5.4.1.1 Laboratory Analyses of Confirmation Soil Samples

Collected soil samples will be submitted to a state certified laboratory (dry weight basis) and selectively analyzed for COC identified for the Site:

- Full list Volatile Organic Compounds (VOCs) (EPA Test Method 8260); and
- TPH as diesel and oil (EPA Test Method 8015)

Other analytical test methods may be recommended by the Environmental Consultant and/or required by the Water Board, County Health or landfill (if off-Site disposal is required).

5.4.1.2 Sampling Protocol

Soil samples for laboratory analyses will be collected in new (unused) or pre-cleaned, stainless steel liners. Soil samples for VOC analysis will be collected in 5-gram Core N' One™ capsules following DTSC guidance. The ends of the liners will be covered in a Teflon film, fitted with plastic end caps, taped, and labeled with a sample identification number. Each sample will be assigned a unique sample number. The assigned number will provide a tracking procedure to allow ease of data retrieval, data reduction, and evaluation. The sample identification numbers will be maintained by Cornerstone's field staff on the Daily Field Reports and on the chain-of-custody records. The sample label or tags will be affixed to each sample container. The samples will then be placed in an ice-chilled cooler and transported to a state-certified laboratory with chain of custody documentation.

5.4.1.3 Field Documentation

The Environmental Consultant will be present on-Site during the removal of impacted soil and will be responsible for observing soil conditions, air monitoring, and Contractor's activities. As part of this process, daily field reports documenting Site activities will be completed and made available for inspection by authorized oversight personnel for the duration of the project.

5.4.1.4 Daily Field Reports

Daily field reports will document where, when, how, and from whom project information was obtained. Entries will be complete and accurate enough to permit reconstruction of field activities. Each page will be dated and the time of entry noted. Entries in the daily field reports will include:

- Site name and address
- Recorder's name
- Time of Site arrival/entry and time of Site departure
- A summary of any on-Site meetings
- Quantity of impacted soils excavated
- Quantity of impacted soils temporarily stored on-Site
- Quantity of excavated soils in truckloads transported off-Site
- Names of waste transporters and proposed disposal facilities
- Quantity of import fill material in truckloads
- Deviations from this SMP
- Calibration readings and equipment model for any equipment used

The following information will be recorded during the collection of each sample:

- Sample identification number
- Sample location and description
- Site sketch showing sample location and measured distances
- Sampler's name(s)
- Date and time of sample collection
- Designation of sample as composite or grab

- Type of sample (i.e., matrix)
- Type of preservation
- Type of sampling equipment used
- Field observations and details important to analysis or integrity of samples (e.g., heavy rains, odors, colors, etc.)
- Instrument readings (e.g., photoionization detector [PID], etc.)
- Chain-of-custody form numbers and chain-of-custody seal numbers
- Transport arrangements (courier delivery, lab pickup, etc.)
- Recipient laboratory(ies)

5.4.1.5 Chain of Custody Records

Chain-of-custody records are used to document sample collection and shipment to the laboratory for analysis. All sample shipments for analyses will be accompanied by a chain-of-custody record. Form(s) will be completed and sent with the samples for each laboratory and each shipment. If multiple coolers are sent to a single laboratory on a single day, chain-of-custody form(s) will be completed and sent with the samples for each cooler. The chain-of-custody record will identify the contents of each shipment and maintain the custodial integrity of the samples. Generally, a sample is considered to be in someone's custody if it is either in someone's physical possession, in someone's view, locked up, or kept in a secured area that is restricted to authorized personnel. Until receipt by the laboratory, the custody of the samples will be the responsibility of the sample collector.

5.4.1.6 Photographs

Photographs will be taken by the Environmental Consultant to help document information entered in the daily field report. When a photograph is taken, the following information will be written in the daily field report:

- Time, date, location, and, if appropriate, weather conditions
- Description of the subject photographed
  Name of person taking the photograph

5.4.2 Designated Work Zones

To help prevent the migration of contamination by personnel or equipment, work areas will be divided into three zones: an exclusion zone (EZ), a contamination reduction zone (CRZ) and a support zone. The General Contractor and its subcontractors are responsible for establishing these work zones. The zones are summarized below:

5.4.2.1 Exclusion Zone

The exclusion zones will consist of areas where inhalation, oral contact, or dermal contact with contaminants is considered to be possible. The size and configuration of each area may vary. Each exclusion zone boundary will be clearly and conspicuously marked. A single entry and exit point will be established at each zone. Entry shall be limited to essential personnel or pre-approved visitors.

5.4.2.2 Contamination Reduction Zone

The CRZ will be established between the exclusion zone and support zone. In this area, personnel will begin the sequential decontamination process required to exit the exclusion zone. To prevent off-Site migration of contamination and to facilitate personnel accountability, all personnel will enter and exit the exclusion zone through the CRZ. All vehicles and equipment exiting an EZ will traverse a track-out prevention area consisting of rumble strips or a 20-foot pad of 6-inch minus rock to dislodge materials from wheels and undercarriage. In no event will visible track-out to public roadways be permitted. Potentially contaminated material that is removed will be added to stockpile area, and rinsate generated by decontamination activities will be used for dust control on the contaminated stockpiles (see Section 5.2.9.2), which will be located in lined and bermed areas.

5.4.2.3 Support Zone

The support zone will consist of a clearly marked area where the administrative area, break areas, and changing facilities are located. Smoking, drinking, and eating will be allowed only in designated areas. Sanitation facilities (with hand wash) will be provided in the support zone.

5.4.2.4 Access Controls

The General Contractor will establish the physical boundaries of each zone and shall instruct all workers and visitors on the limits of the restricted areas. No one shall be allowed to enter a restricted area without the required protective equipment for that area. The General Contractor's Site Safety Officer (SSO) shall ensure compliance with all restricted area entry and exit procedures. The General Contractor's SSO also shall designate a decontamination corridor through which personnel may exit from a contaminated area and enter into adjacent clean break areas. Additional responsibilities of the SSO are summarized in the HSP.

5.4.3 Equipment Decontamination

Decontamination procedures shall be established and implemented by the General Contractor to reduce the potential for construction equipment and vehicles to release contaminated soil onto public roadways or other off-Site transfer. A separate decontamination pad will be established for the decontamination of all equipment leaving the EZs. The following will apply:

- Gross soil deposits will be removed manually from tracks, tires, drives, etc. using digging bars, scrapers, etc. before moving to the decontamination pad.
- All surfaces that cannot be sufficiently decontaminated manually will be pressure washed with surfacted water to remove remaining adhering contamination.
- A final rinse will be performed to remove dissolved contaminant, water and surfactant residues.
- Rinsates and dislodged soil and other contaminated material will be added to the impacted stockpiles or directly hauled by trucks for appropriate off-Site disposal.

5.4.4 Monitoring of Soil Vapor in Trenches and Excavations

To evaluate potential risks to construction workers, daily monitoring of soil vapors with an Organic Vapor Monitor (OVM) or similar monitor will be required in all excavations and trenches that are 4 feet or deeper.

5.4.5 General Protective Measures

- All excavating, trenching and grading activities shall be conducted according to Cal OSHA regulations.
- Trenches/excavations 5 feet or deeper shall be sloped, shored or benched.
- Trenches/excavations shall be screened daily with an OVM or similar meter.
- Open trenches/excavations shall be observed daily for readily observable indications of possible cave-ins, hazardous atmosphere or other hazardous conditions.
- If readily observable conditions are noted that could result in cave-in, hazardous atmosphere or other hazardous condition, exposed workers shall be removed from the area until the necessary precautions have been taken to address the concern.
- Trenches/excavations shall be protected with adequate barriers or physical protection.
- Stockpiles of soil shall not be stored within 2 feet of a trench/excavation.
- Where oxygen deficiency (atmospheres containing less than 19.5 percent oxygen) or a hazardous atmosphere exists or could reasonably be expected to exist, the atmosphere shall be tested before workers enter the work area (see HSP in Appendix A).
- Adequate precautions shall be taken to prevent exposures to atmospheres containing less than 19.5 percent oxygen and or hazardous atmospheres, including proper respiratory protection or ventilation.
- Workers shall not work in excavations/trenches in which there is accumulated water or in trenches/excavations in which water is accumulating, unless adequate precautions have been taken against the hazards posed by the accumulation. These measures can include PPE, shoring or water removal.
- Workers shall wash hands thoroughly after handling Site soil or ground water even if they were wearing protective gloves.

5.4.6 Import Fill

5.4.6.1 Geotechnical Engineering Parameters

Imported fill shall be non-expansive inorganic material with a Plasticity Index (PI) of 15 or less. For the backfilling of deeper excavations, a higher PI may be allowable if approved by the Geotechnical Engineer. To help prevent significant caving during excavation activities, imported material should have sufficient fines. Samples of potential import sources should be delivered to the Geotechnical Engineer's office at least 10 days prior to the desired import start date.

Information regarding the import source should be provided, such as any site geotechnical reports. If the material will be derived from an excavation rather than a stockpile, potholes will likely be required to collect samples from throughout the depth of the planned cut that will be imported. At a minimum, laboratory testing will include PI tests. Material data sheets for select fill materials (Class 2 aggregate base, ¾- inch crushed rock, quarry fines, etc.) listing current laboratory testing data (not older than 6 months from the import date) may be provided for our review without providing a sample. If current data is not available, specification testing will need to be completed prior to approval.

Soil corrosion characterization must also be evaluated prior to acceptance. The potential import source should not be more corrosive than the on-Site soils, based on pH, saturated resistivity, and soluble sulfate and chloride testing.

5.4.6.2 Environmental Parameters

To limit the potential introduction of contaminated fill onto the Site, possible sources of import fill to backfill the excavations will be evaluated. Adequate documentation will be required so it can be verified that the fill source is appropriate for the Site by the Environmental Consultant. The documentation will include detailed information on previous land use of the fill source, any environmental site assessments performed and the findings, and the results of any analytical testing performed. If no documentation is available or the documentation is inadequate, or if no analytical testing has been performed, samples of the potential fill material will be collected and analyzed per the protocols established by DTSC. The analyses performed will be based on the fill source and knowledge of the previous land use. The sample frequency for potential fill material will be in accordance with that outlined in the technical document titled, "*Information Advisory on Clean Imported Fill Material*" (DTSC, October 2001).

5.5 SOIL VAPOR MANAGEMENT DURING CONSTRUCTION ACTIVITIES

This section provides the guidance for subsurface construction activities in consideration of the VOC contamination detected in on-Site soil vapor and ground water. Field oversight activities by the Environmental Consultant include:

- Perimeter monitoring of excavations; and
- Soil headspace screening.

5.5.1 Excavation Perimeter Monitoring

Air sampling (breathing-zone) of excavation areas (i.e., trench or other excavation) will be performed in the field for the presence of VOCs using direct-read (real-time) monitors and methods described in this section.

5.5.1.1 Calibration

The direct-read monitor will be calibrated in accordance with the manufacturer's manual. If the instrument readings are irregular and the meter cannot be recalibrated, the meter shall be removed from the field and replaced with a different unit that is capable of being calibrated and used with reliability.

5.5.1.2 Sampling Approach and Frequency

A photo-ionization detector (PID) capable of measuring to at least 10 parts per billion by volume (ppb_v), such as the ppbRAE 3000, will be used to monitor trench and excavation perimeters to evaluate if areas outside the excavation areas are potentially impacted by excavation activities. Samples will be collected over approximately 1 to 5 minute durations every hour around the perimeter of the excavation. Baseline PID samples will be collected for comparison each day, prior to excavation activities and in the ambient air at least 100 feet from the excavation area.

5.5.1.3 Screening and Action Levels

A vapor level will be considered as possibly elevated if the PID reading is 500 pbb_v above background for greater for 10 seconds or more. Respiratory protection will be require if total VOCs are detected at a sustained (approximately 5 minutes) Action Level of 10 parts per million by volume (ppm_v).

5.5.1.4 Response Actions

If PID readings are measured at 500 ppb_v or greater above background for 10 seconds or more in the breathing zone, a representative air canister sample (8-hour) will be collected from this air space and analyzed by the analytical laboratory for TO-15 SIM on a 24 hours response time. Should the TCE results exceed the Urgent Response Action Level (21 micrograms per cubic meter [$\mu g/m^3$] above background), the General Contractor's SSO and the Project C.I.H. (Earth Safety Dynamics) will be notified. If the levels do not recede, engineering controls, such as fans to increase ventilation or application of foam suppressant to disturbed surface areas, may be implemented. Daily 8-hour canister sampling will continue until TCE concentrations are less than 5 $\mu g/m^3$ above background.

Total VOCs at a sustainable concentration of 5 ppm_v above background will require Site personnel to stop work and move upwind 25 feet from the source. After 5 minutes, the location will be monitored. Work can proceed if concentrations decrease to background.

If in the unlikely event PID readings are measured at 10 ppm_v or greater in the breathing zone and concentrations do not recede, the trench/excavation shall be barricaded and the Environmental Consultant and the General Contractor's SSO will be notified to implement appropriate respiratory protection (NIOSH/MSHA-approved respirators equipped with combination organic vapor and P-100 HEPA air purifying cartridges). Daily 8-hour canister sampling will be performed; respiratory projection will be required until approved to be removed by the SSO.

5.5.2 Soil Headspace Screening

Soils suspected as contaminated will be field-screened for the presence of VOCs. Field screening will occur using a PID that measures to at least 10 ppbv. Soil that is field-screened and "cleared" using the field head space method with the PID (discussed below) can be considered "clean" and can be reused for on-Site fill.

5.5.2.1 Calibration

The direct-read monitor will be calibrated in accordance with the manufacturer's manual. If the instrument readings are irregular and the meter cannot be recalibrated, the meter shall be removed from the field and replaced with a different unit that is capable of being calibrated and used with reliability.

5.5.2.2 Soil Screening Procedure

Soil screening will be performed as follows:

- A representative soil sample will be placed into an unused resealable Ziploc plastic bag with a minimum volume of one quart until the bag is approximately half full;
- The bag will be sealed and the soil crumbled by hand while inside the bag;
- After a minimum of 2 minutes, the bag slightly opened to allow the PID probe into its headspace; and
- The sample will be considered as possibly contaminated if the PID reading is 500 ppbv or higher for approximately 10 seconds or more.

5.5.2.3 Potentially Contaminated Soil

Potentially contaminated soil will be segregated and stockpiled as described by Section 5.2.9.2 at a designated, plastic-lined stockpile area.

5.6 VAPOR BARRIER

On a voluntary basis and to provide a higher degree of confidence that the future commercial occupants of the Site will be protected from the potential off-gassing of VOCs, the Developer/Owner shall install a vapor barrier system to effectively eliminate vapor intrusions into the proposed structures. The Developer/Owner's licensed professional engineer shall prepare engineering drawings and specifications for the vapor barrier system. The vapor barrier shall consist of a 60 mil, spray-applied, seamless, solvent free membrane. The membrane shall be applied over a non-woven geotextile that will protect it from puncture from the subgrade. A geotextile constructed of polypropylene fibers also shall be placed over the 60 mil membrane to help protect it from damage during installation of the overlying concrete slab. The general specification package shall at a minimum include the following:

- Material specifications and cut sheets for the vapor barrier including substrate and protective layers;
- Construction specifications for vapor barrier system, including inspection and leak testing procedures for the vapor barrier; and
- Design drawings including foundation plans and typical details showing location and dimensions of the vapor membrane for each of the individual building layouts.
- If the vapor membrane system requires maintenance or repairs due to future construction activities, an appropriately trained contractor shall be retained to perform

this work. A pre-installation conference shall be held with the Developer/Owner prior to any repair to assure proper substrate and installation conditions.

5.7 VEGETATED SWALES AND WATER FEATURES

A vegetated swale is a shallow channel with a dense stand of vegetation covering the side slopes and bottom. Swales are designed to trap particulate pollutants (suspended solids) and reduce the flow velocity of storm water runoff. Runoff ultimately will be captured by PVC pipe and transported to the storm sewer system. Because the Site is known to have pollutants with the potential for mobilization, the Civil Engineer will designed the bottom and sides of the vegetated swales and water features (if incorporated into the design) to be lined with a minimum 10-mil heavy duty plastic to help prevent water infiltration.

SECTION 6: KEY SITE CONTACTS

Key Site contacts are presented below:

Table 4. Key Site Contacts

Type of Services	Site Specific Health and Safety Plan
Location	1001 North Shoreline Boulevard Mountain View, CA 94043

SECTION 1: INTRODUCTION

Cornerstone Earth Group (Cornerstone) has prepared this Health and Safety Plan (HSP) to inform its personnel of potential hazards associated with construction activities for the approximately 9.18-acre property located at 1001 North Shoreline Boulevard (Site), as shown on Figures 1 and 2 of the Site Management Plan (SMP) of which this document is an Appendix.

The project will consist of redeveloping the Site for a new Class A office complex (Figure 2 of the SMP). The new four-story office building will have a footprint of approximately 30,000 square feet. The building will be steel-frame construction. The remainder of the Site will be covered with at-grade asphalt concrete pavement and associated flatwork improvements. This HSP was prepared with the assumption that impacted soil vapor and ground water will be encountered during construction activities.

This HSP is intended to supplement the SMP prepared by Cornerstone for the Site and was developed to provide general health and safety guidance such that field activities can be conducted in a safe manner. Contractors will be responsible for the health and safety of their employees during construction activities, and this HSP (as well as the SMP) will be kept on-Site during construction activities involving soil and ground water.

Employees conducting Site activities that may encounter ground water or contaminated materials shall complete a 40-hour HAZWOPER training course (29 CFR 1910.120 (e)), including respirator and personal protective equipment training.

Tables 1, 2, and 3 (below) identify the chemicals of concern (COC) and their greatest concentrations previously reported in soil (Table 1), ground water (Table 2), and soil vapor (Table 3) at the Site.

Table 1. Primary Chemicals of Concern (COC) In Soil

Chemical	Maximum Soil Concentration Reported in 2010	Location
TPH as gasoline	70 mg/kg	Boring B-4
Benzene	0.079 mg/kg	Boring B-4

Table 2. Primary Chemicals of Concern (COC) In Ground Water

Chemical	Maximum Ground Water Concentration Versus Most Recent Concentration as Reported in On-Site Monitoring Wells	Location
TPH as gasoline	MW-22E: 420,000 µg/L (1992) MW-22E: 7,700 µg/L (2010)	South side of building at 1015 North Shoreline 1175 Terra Bella
Benzene	MW-22E: 39,000 µg/L (1989) MW-22E: 58 µg/L (2010)	South side of building at 1015 North Shoreline 1175 Terra Bella
Toluene	MW-22E: 40,000 ug/L (1989) MW-22E: 1 µg/L (2010)	South side of building at 1015 North Shoreline
Ethylbenzene	MW-22E: 6,200 µg/L (1992) MW-22E: 8 µg/L (2010)	South side of building at 1015 North Shoreline
Methyl tert-butyl ether (MtBE)	MW-22E: 340 µg/L (1998) MW-2E: 1 µg/L (2010)	South side of building at 1015 North Shoreline
Trichloroethene (TCE)	MW-1: 13 µg/L (1988) MW-2: 240 µg/L (1988) MW-3: 33 µg/L (1988) 33 to 46 µg/L (2005)	1130 Terra Bella
trans 1,2- dichloroethene (tDCE)	MW-3: 0.64 µg/L (2005)	1130 Terra Bella

Table 3. Primary Chemicals of Concern (COC) In Soil Vapor

Chemical	Maximum Soil Vapor Concentration	Location
Benzene	69 µg/m^3 99 µg/m^3	SV-2 at 9 feet SV-4 at 4.75 feet
Tetrachloroethene (PCE)	740 µg/m^3	SV-1 (replicate sample) at 4½ feet

This HSP addresses the potential hazards posed by the proposed additional site characterization activities and identifies the controls to be implemented for these activities.

SECTION 2: PROJECT SAFETY AUTHORITY

2.1 HEALTH AND SAFETY PERSONNEL

2.1.1 Cornerstone Earth Group and Site Safety Officer (SSO)

The Owner/Developer will provide this HSP to the General Contractor. The General Contractor will appoint an on-Site Site Safety Officer (SSO) for their on-Site personnel. Each subcontractor to the General Contractor also will develop their own Site-specific Health and Safety Plan unique to their assigned tasks. The SSO is an individual who is responsible to the employer and has the authority, training, experience, and knowledge necessary to implement the HSP and verify compliance with applicable safety and health requirements. Each subcontractor will be solely responsible for the health and safety of their employees as well as for compliance with all applicable federal, state, and local laws and guidelines.

The SSO must verify that all on-Site personnel are qualified, trained, and prepared to implement the HSP and safely perform the planned Site work. Field personnel should be required to indicate in writing that they have read and understand the provisions of the HSP.

Safe work practices should be emphasized during safety meetings to be conducted by the SSO and implemented throughout the project.

2.1.2 EXPOSURE MONITORING

Exposure monitoring (if any) and other monitoring will be performed under the supervision of the General Contractor's SSO and/or Health and Safety Manager. The SSO will make recommendations relative to personal protective equipment. The SSO also will conduct additional hazard assessments as necessary and/or as requested.

2.2 ENFORCEMENT OF THE HSP

Enforcement of the policies and practices of the HSP will be the responsibility of the SSO(s). The SSO has the authority to suspend work in the area of the Site where the provisions of the HSP are not being met.

2.3 EVALUATION OF EFFECTIVENESS

The SSO shall evaluate the effectiveness of the HSP. As applicable, deficiencies and associated corrective actions must be documented and a written summary evaluation prepared and maintained on-Site.

SECTION 3: CHEMICAL HAZARD ASSESSMENT AND CONTROL MEASURES

This HSP provides standard operating procedures for personnel involved in activities that may expose them to COCs during remediation and additional Site investigation activities that disturb impacted soil and ground water. Physical hazards also exist. For example, excavating equipment presents a high potential for physical hazards.

Field personnel are required to control chemical exposure primarily through the use of safe work practices and engineering controls (Sections 5.0 to 8.0). The working conditions will be assessed using air monitoring instruments and/or visual observations (Section 6.0).

3.1 EXPOSURE PATHWAYS

The primary exposure pathways for the COC in soil include incidental ingestion, dermal contact, and inhalation of windblown dust during the field activities. The windblown dust potential exposure pathway must be mitigated by appropriate dust removal measures (Section 7.0) implemented during Site remediation and Site construction activities. The ingestion and dermal exposure pathways will be mitigated by personal protective gear and safe work practices.

3.2 ACTIVITIES THAT COULD GENERATE CHEMICAL DUSTS

The following activities that will be performed during the course of activities at the Site could locally release COC-bearing vapors and dusts if control measures described in this plan are not stringently implemented:

- Excavation and stockpiling of potentially impacted soils
- Loading of potentially impacted soils into dump trucks
- Demolition of subsurface structures within potentially impacted soil, ground water, and soil vapor
- Construction of a single-story below grade parking garage within potentially impacted soil, ground water, and soil vapor

Mitigation measures to address the potential release of airborne COC during these activities are described in the following sections of this plan.

3.3 HAZARDOUS SUBSTANCE INFORMATION

Table 4 summarizes the hazardous substance information for the designated COCs.

Table 4. Hazardous Substance Information

COC	Most Recent Concentration as Reported for Ground Water (MW-22E) and Soil (B-4)	TLV or PEL	IDLH	Routes of Exposure	Potential Effects of Overexposure
TPH as gasoline	70 mg/kg (soil) 7,700 µg/L (water)	300 ppm (900 mg/ m^3)	NE	Inhalation, ingestion, skin and/or eye contact	Irritation eyes, skin, mucous membranes; dermatitis; headache, lassitude (weakness, exhaustion), blurred vision, dizziness, slurred speech, confusion, convulsions; chemical pneumonitis (aspiration liquid); possible liver, kidney damage
Benzene	0.79 mg/kg (soil) 130 µg/L (water)	1 ppm (3.19 mg/m^3)	NE	Inhalation, skin absorption, ingestion, skin and/or eye contact	Irritation eyes, skin, nose, respiratory system; dizziness; headache, nausea, staggered gait; anorexia, lassitude (weakness, exhaustion); dermatitis; bone marrow depression
Toluene	0.071 mg/kg (soil) 1.0 µg/L (water)	200 ppm (754 mg/ m^3)	500 ppm	Inhalation, skin absorption, ingestion, skin and/or eye contact	Irritation eyes, nose; lassitude (weakness, exhaustion), confusion, euphoria, dizziness, headache; dilated pupils, lacrimation (discharge of tears); anxiety, muscle fatigue, insomnia; paresthesia; dermatitis, liver, kidney damage
Ethylbenzene	0.01 mg/kg (soil) 8.0 ug/L (water)	100 ppm (435 mg/ m^3)	800 ppm (10% LEL)	Inhalation, ingestion, skin and/or eye contact	Irritation eyes, skin, mucous membrane; headache; dermatitis; narcosis, coma

Table 4 (Continued). Hazardous Substance Information

COC	Most Recent Reported Concentration	TLV or PEL	IDLH	Routes of Exposure	Potential Effects of Overexposure
Methyl tert-butyl ether (MtBE) [CDC & ATSDR fact sheets]	<0.0005 mg/kg (soil) 1 µg/L (water)	40 – 50 ppm (144-180 mg/m^3)	NE	Inhalation, ingestion	Irritation skin; chemical pneumonitis; lowering of consciousness
Trichloroethene (TCE)	46 µg/L (water)	100 ppm (537 mg/m^3) (5 minute maximum peak of 300 ppm [1,611 mg/m^3] in any 2 hours)	1,000 ppm	Inhalation, skin absorption, ingestion, skin and/or eye contact	Irritation eyes, skin; headache, visual disturbance, lassitude (weakness, exhaustion), dizziness, tremor, drowsiness, nausea, vomiting; dermatitis; cardiac arrhythmias, paresthesia; liver injury
Trans 1,2 - dichloroethene (tDCE)	0.64 µg/L (water)	200 ppm (790 mg/m^3)	1,000 ppm	Inhalation ingestion, skin and/or eye contact	Irritation eyes, respiratory system; central nervous system depression
Tetrachloroethene (PCE)	740 ug/m^3 [0.74mg/m^3] (soil vapor)	100 ppm (678 mg/m^3) (200 ppm [1,356 mg/m^3] for 5 minutes in any 3-hour period, with a maximum of 300 ppm [2,034 mg/m^3])	150 ppm	Inhalation, skin absorption, ingestion, skin and/or eye contact	Irritation eyes, skin, nose, throat, respiratory system; nausea; flush face, neck; dizziness, incoordination; headache, drowsiness; skin erythema (redness); liver damage

PEL = Permissible Exposure Limit given in Title 8, CCR, Section 5155, or Threshold Limit Value from ACGIH 2011.
NE= not established.
mg/m^3 = milligrams per cubic meter.
IDLH = Immediately Dangerous to Life and Health.
Routes of entry and acute exposure to symptoms given in NIOSH *Pocket Guide to Chemical Hazards* (U.S. Department of Health and Human Services, September 2007)

3.4 HAZARD EVALUATION

3.4.1 Inhalation

Potential inhalation exposures were conservatively evaluated by assuming that the maximum concentration of COCs in site soil is proportional in a total dust concentration of 5 mg/m^3. This is conservative since total dust at 5 mg/m^3 is visible in air and is the threshold limit value (ACGIH TLV) for nuisance dust and the OSHA PEL for the respirable fraction of nuisance dust particulates, not otherwise regulated (OSHA, 1989).

Alternatively, if the fraction of TPHg concentration in soil (1,700 ppm or 0.0017%) is assumed to be the same as that in the air, then 0.0017 x 5 mg/m^3 = 0.085 mg/m^3, which is below the PEL of 300 mg/m^3.

For all COC reviewed, sampling activities will not likely generate occupationally significant airborne chemical exposures.

3.4.2 Ingestion and Dermal Exposure Pathway Risks

Ingestion and dermal exposure pathways shall be controlled using hygienic measures and protective clothing (Section 5.1).

SECTION 4: PHYSICAL HAZARDS

Physical hazards associated with field sampling activities, such as occupational noise, sampling equipment, heat-related disorders, slips, trips, falls, and falling objects, may be present on-Site and can present a greater risk of injury than the COC in soil at the Site. All activities within the scope of this project must comply with all applicable regulations, including Cal/OSHA standards.

4.1 NOISE HAZARDS

Noise-generating equipment will be used during field activities. The noise levels near this type of equipment may exceed 85 dBA. Elevated noise levels could constitute a hearing hazard and interfere with communication. Employers must protect their field personnel from noise levels exceeding 85 dBA and provide appropriate PPE.

4.2 HEAVY EQUIPMENT HAZARDS

Heavy equipment can pose significant hazards to on-Site employees. Contractors working on-Site must ensure that their motor vehicles and material handling equipment meet the requirements specified in the Department of Industrial Relations, General Industry Safety Orders and Construction Safety Orders (8 CCR Division 1, Chapter 4, Subchapters 4 and 7). The following safe work practices are to be followed during work around heavy equipment:

- Never walk directly behind or to the side of heavy equipment without the operator's knowledge. Be aware of the location and operation of heavy equipment; do not assume that the operator is aware of keeping track of your presence.
- While working on-Site, wear reflective/visible safety vests, maintain visual contact with the operator at all times, and remain alert.
- All heavy equipment must be fitted with audible reversing signals as mandated by OSHA.
- Unless a spotter is present to guide the operator, equipment with an obstructed rear view will have an audible alarm that sounds when moving in the reverse direction.

- Establish hand signals with the operator when verbal communication is not possible.
- Whenever drilling or other operations are conducted in tight quarters, the equipment contractor should make provisions for another person to help guide the operator's movements.
- Hydraulic systems will be fully lowered and parking brakes engaged whenever equipment is not in use.
- All non-essential personnel will be kept out of work areas.
- Deep excavation may require shoring to prevent cave-ins or ground failures.

All heavy equipment used at COC-impacted portions of the Site will remain there until construction activities are completed. Each contractor will be responsible for completely decontaminating equipment in designated decontamination areas.

4.3 HEAT OR COLD-RELATED DISORDERS

Heat (or cold) related disorders could be a significant issue depending upon the temperatures encountered during construction activities. Each contractor is responsible for monitoring their workers for signs and symptoms of heat stress or cold stress. Water must be provided on-Site and the Site supervisor should have first aid/CPR training and be familiar with the early signs of heat related disorders, and appropriate treatment procedures per Cal/OSHA Title 8 CCR 1524 and Title 8 CCR 1512. Accommodations for reduction of cold stress should additionally be provided, as necessary.

4.4 SLIPS, TRIPS, AND FALLS

Slipping, tripping, and falling are the most common sources of injuries at these types of sites. These injuries can be prevented by proper Site control measures, safe work practices, and by keeping the work area free from obstructions. Tailgate safety briefings should be held prior to each day's field activities to identify specific Site locations of concern (slippery surfaces or uneven terrain), and to specify work practices and controls necessary to avoid or eliminate the hazards in those areas.

4.5 BURIED UTILITIES

The buried utilities at the Site (if any) must be identified through Underground Service Alert (USA). If buried utilities, such as natural gas piping, are damaged during construction-related activities, the area should be immediately evacuated and Emergency 911 should be immediately notified. The SSOs should notify all on-Site employees of the rupture and the area of the release should be evacuated.

4.6 MUSCULAR-SKELETON INJURY HAZARDS

Field activities may require some lifting of heavy objects. No one should attempt to lift large, heavy (greater than 50 pounds), or cumbersome objects without assistance. All

on-Site employees who are generally called upon to do frequent lifting are to be instructed in proper lifting procedures.

4.7 BIOLOGICAL HAZARDS

The biological hazards that may be encountered include spiders and bees. A first aid kit to treat minor skin irritations, stings, and bites must be maintained at the Site.

4.8 OTHER HAZARDS

Although not supported by site investigations to date, other unforeseen hazards may be of potential concern. If unusual odors, smoke, and/or unusual signs and symptoms of exposure (upper respiratory tract, eye irritation, behavioral/mood changes) are noticed, work should be stopped at the particular location and workers be directed away from the potential sources of exposure. Cornerstone Earth Group and the SSO(s) will make a determination of hazard and/or determine if outside emergency services are required, prior to allowing work to proceed. Cornerstone Earth Group and/or the SSO(s) will determine if additional investigation and other notifications are required.

SECTION 5: SAFETY EQUIPMENT, PERSONAL HYGIENE

5.1 PERSONAL PROTECTIVE EQUIPMENT (PPE)

Work activities will be conducted with Level D protection:

- Chemical-resistant steel-toed boots when in contact with ground water or contaminated materials;
- Work boots;
- Work gloves as required; nitrile gloves when in contact with ground water or contaminated materials;
- Safety glasses when risk of contact with ground water;
- Hard hat; and
- Hearing protection (if noise levels exceed 85 dBA).

Coveralls and nitrile gloves are needed only as required to help reduce soiling by contaminated materials.

5.2 SANITATION

The Contractor, in accordance with Title 8 CCR 5192, must provide potable water, toilet, and washing facilities at the Site in the support area. Before any eating, smoking, or drinking, personnel will exit exclusion zones (as described in Section 6.1) and wash hands, arms, neck, and face.

SECTION 6: SOIL VAPOR MANAGEMENT DURING CONSTRUCTION ACTIVITIES

This section provides the guidance for construction activities in consideration of the VOC contamination detected in on-Site soil vapor and ground water. Field oversight activities by the Environmental Consultant include:

- Perimeter monitoring of excavations; and
- Soil headspace screening.

6.1 EXCAVATION PERIMETER MONITORING

Air sampling (breathing-zone) of excavation areas (i.e., trench or other excavation) will be performed in the field for the presence of VOCs using direct-read (real-time) monitors and methods described in this section.

6.1.1 Calibration

The direct-read monitor will be calibrated in accordance with the manufacturer's manual. If the instrument readings are irregular and the meter cannot be recalibrated, the meter shall be removed from the field and replaced with a different unit that is capable of being calibrated and used with reliability.

6.1.2 Sampling Approach and Frequency

A photo-ionization detector (PID) capable of measuring to at least 10 parts per billion by volume (ppbv), such as the ppbRAE 3000, will be used to monitor trench and excavation perimeters to evaluate if areas outside the excavation areas are potentially impacted by excavation activities. Samples will be collected over approximately 1 to 5 minute durations every hour around the perimeter of the excavation. Baseline PID samples will be collected for comparison each day, prior to excavation activities and in the ambient air at least 100 feet from the excavation area.

6.1.3 Screening and Action Levels

A vapor level will be considered as possibly elevated if the PID reading is 500 pbbv above background for greater for 10 seconds or more. Respiratory protection will be require if total VOCs are detected at a sustained (approximately 5 minutes) Action Level of 10 parts per million by volume (ppmv).

6.1.4 Response Actions

If PID readings are measured at 500 ppbv or greater above background for 10 seconds or more in the breathing zone, a representative air canister sample (8-hour) will be collected from this air space and analyzed by the analytical laboratory for TO-15 SIM on a 24 hours response time. Should the TCE results exceed the Urgent Response Action Level (21 micrograms per cubic meter [$\mu g/m^{3]}$ above background), the General Contractor's SSO and the Project C.I.H. (Earth Safety Dynamics) will be notified. If the levels do not recede, engineering controls, such as fans to increase ventilation or application of foam suppressant to disturbed surface areas, may be implemented. Daily 8-hour canister sampling will continue until TCE concentrations are less than 5 $\mu g/m^3$ above background.

Total VOCs at a sustainable concentration of 5 ppmv above background will require Site personnel to stop work and move upwind 25 feet from the source. After 5 minutes, the location will be monitored. Work can proceed if concentrations decrease to background.

If in the unlikely event PID readings are measured at 10 ppmv or greater in the breathing zone and concentrations do not recede, the trench/excavation shall be barricaded and the Environmental Consultant and the General Contractor's SSO will be notified to implement appropriate respiratory protection (NIOSH/MSHA-approved respirators equipped with combination organic vapor and P-100 HEPA air purifying cartridges). Daily 8-hour canister sampling will be performed; respiratory projection will be required until approved to be removed by the SSO.

SECTION 7: SITE CONTROL

7.1 SITE CONTROL PROCEDURES

Site control procedures are established to control the potential spread of encountered contamination from the Site. An Exclusion Zone will be established along the perimeter of the areas of contamination that may pose a risk to human health or the environement (or the perimeter of the Site, if desired).

Support Zone
The Support Zone will include administrative and support facilities including, onsite superintendent and administrative offices, supply storage, staging areas, and a maintenance yard where excavating equipment can be mechanically maintained.

Contaminant Reduction Zone (CRZ)
The CRZ will provide a corridor into and out of Exclusion Zones. At this location a tool drop and decontamination area will be established. The tool drop and decontamination area are facilities used to prevent off-Site migration of Site contaminants.

Tool Drop
Miscellaneous hand tools not left in the Restricted Zone will be stored at this location. This part of the facility is to provide a location for miscellaneous tools/equipment storage that may have come in contact with COC bearing soils, but does not require immediate decontamination.

Vehicle Decontamination
Brushing of vehicles and establishment of a 50-foot track-out zone will suffice for decontamination of vehicles. No visible trackout will be permitted onto public roadways, and any visible tracked material must be removed at least daily through wet sweeping or use of a HEPA- filtered vacuum system. A separate decontamination pad will be established for the decontamination of all equipment leaving hazardous waste exclusion zones. The following steps will be performed sequentially:

Step 1: Gross Contamination Removal
Gross soil deposits will be removed manually from tracks, tires, drives, etc. using digging bars, scrapers, etc. before moving onto decontamination pad.

Step 2: Pressure Wash
All surfaces that cannot be sufficiently decontaminated manually and by track out buffer will be pressure washed with surfacted water to remove any remaining adhering contamination.

Step 3: Final water rinse
A final rinse is performed to remove dissolved contaminant, water, and surfactant residues.

Worker Decontamination
Prior to Workers entering the Contaminant Reduction Zone from Restricted areas of the Site, at their work area location, workers will first remove gross accumulations of soil from the boots. All workers and vehicles exiting from restricted areas will require decontamination. This will include facilities consisting of wet methods to allow for the removal of potentially COC impacted soils on exterior surfaces of workers and vehicles.

Upon entering the CRZ, workers will first drop hand tools, miscellaneous tools, tool belts, etc., then proceed to the boot brush area. After wet boot brushing (or washing), workers will proceed with the vacuuming of exterior clothing such as work vests and gloves. After vest/gloves, workers will wet wipe hard hat exterior, interior, and exterior of respirator (if used). Next, Tyvek coveralls (if used) will be removed and placed into a disposal container, than the respirator (if used) may be removed, interior face piece wiped, then bagged.

Water from decontamination operations will be drummed for offsite disposal and/or treatment.

Exclusion Zone
The Exclusion Zone will be clearly demarcated with appropriate signage and barriers. In this zone remedial activities will take place and is therefore restricted to all personnel unless they are properly trained, properly garbed (PPE) and authorized to work in the Exclusion Zone.

7.2 VISITORS

Visitors will not be allowed access to the Exclusion Zone or Contamination Reduction Zone areas of the Site. If the Exclusion Zone is established to encompass the entire Site, visitors will not be allowed on-Site. Visitors failing to adhere to this provision of this HSP will be escorted from the Site.

SECTION 8: DUST REMOVAL PROCEDURES

8.1 EQUIPMENT DUST REMOVAL

Before being removed from the Site and between sampling locations, all equipment and tools (shovel, hand auger, or other sampling equipment) in contact with COC impacted soil must be thoroughly washed to remove residual soil and prevent the transfer of impacted soil to other areas of the Site.

8.2 PERSONNEL DUST REMOVAL

Personnel dust removal includes boot cleansing and removal of soil residues from clothing, hard hat, gloves and brushing off coveralls (if used), removing work gloves and washing hands and face prior to eating, drinking, smoking, or leaving the Site. Workers should minimize the amount of dirt or dust on their hands, face, clothing, and shoes. If any of these are visibly soiled, they should be brushed off and left at the Site. Prior to leaving the Work Area, workers must thoroughly wash hands and face.

SECTION 9: TRAINING AND MEDICAL SURVEILLANCE

Health and safety training and hazard communication must be implemented as addressed below. All on-Site personnel must be familiar with the provisions of this HSP and verify in writing that they have read it and understand it.

Employees conducting construction activities at the site that may encounter contaminated materials shall complete a 40-hour HAZWOPER training course (29 CFR 1910.120 (e)), including respirator and personal protective equipment training. The 8 hour refresher training is required where applicable. The SSO will verify that each and every applicable worker possesses this training.

9.1 SITE-SPECIFIC TRAINING PROGRAM

A Site-specific training program must be instituted prior to Site work. Attendees at all meetings should be documented by signature. The Site-specific training should include a discussion of the following.

1. The health effects (acute and chronic) of the chemical and physical hazards that may be encountered at the Site
2. Proper control measures for the chemical and physical hazards that may be encountered
3. The importance of dust control at the Site
4. Proper personal hygiene procedures
5. Dust removal on equipment and personnel
6. Emergency procedures
7. Proper management of impacted soil
8. Potential physical hazards at the Site

9.2 MEDICAL MONITORING

Periodic medical monitoring is not required for this project. Employees conducting construction activities should be medically cleared to perform their duties for this project, including wearing air purifying respirators, if respirator use is needed.

SECTION 10: EMERGENCY AND CONTINGENCY PLANNING

10.1 RELEVANT FIRST AID PROCEDURES

Minor injuries, including minor cuts, scrapes, and abrasions should be treated on-Site. If an injured individual requires further attention, the individual should be immediately transported to the nearest hospital. Attachment 1 illustrates the route to the nearest emergency medical facility. All accidents, without regard to severity, must be reported in writing to the SSO within 24 hours.

10.2 EVACUATION PROCEDURES

Various emergencies may warrant a Site evacuation. Although these conditions are not anticipated, they may include fire, explosion, chemical release, or other event that could cause personal injury. Emergency evacuation procedures must be discussed in advance of site activities.

10.3 EMERGENCY SERVICES AND CONTACT TELEPHONE NUMBERS

The emergency medical facility designated for this project is El Camino Hospital at 2500 Grant Road**,** approximately 3.6 miles south of the Site (Attachment A). If an injury is serious enough to require ambulance medical transport or the fire department, immediately call 911.

El Camino Hospital
2500 Grant Road
Mountain View, California

Phone: (650) 940-7055

SECTION 11: INJURY AND ILLNESS PREVENTION PROGRAM

All contractors are required to have an Injury and Illness Prevention Program (IIPP) in accordance with Cal OSHA regulations in Title 8 of the California Code of Regulations. Each IIPP must include a discussion of safety measures that are implemented, including the measures presented in this HSP, to help prevent illness and injury to their employees. Investigation and reporting procedures in case of an accident or injury also should be discussed in the IIPP.

SECTION 12: INTERNAL AND EXTERNAL COMMUNICATIONS

All personnel will have a cell phone and/or radio for communication between personnel. Due to the relatively small Site size, verbal commands, radios, and cellular telephones should be adequate means of communication.

12.1 EMERGENCY CONTACT LIST

The list below provides names and telephone numbers for emergency contact personnel. In the event of a medical emergency, personnel will take direction from the SSO or Cornerstone Earth Group's project manager. The SSO or designee will notify the appropriate outside emergency organization.

Table 5. Emergency Contact List

ORGANIZATION	TELEPHONE
Ambulance	911
Police	911
Fire	911
Hospital El Camino Hospital	650-940-7055
Bay Area Air Quality Management District	415-771-6000

Mr. David Kingery (dave.kingery@carlyle.com)
3675 Mt. Diablo Blvd. Suite 310
Lafayette, CA 94549

Subject: Voluntary Cleanup Program: Calvano/CRP Mountain View, 1001 N Shoreline Blvd., Mountain View, CA; SCCo Case No. 06S2W15M04s

Dear Mr. Kingery:

Thank you for submitting the Site Management Plan (SMP) prepared by your consultant Cornerstone Earth Group (Cornerstone) and dated September 15, 2015. The SMP sets forth a strategy to manage soil, groundwater, and soil vapor containing residual levels of Petroleum Hydrocarbons, Tetrachloroethane (PCE), Trichloroethene (TCE), trans 1,2-dichloroehtene (tDCE), Benzene, Toluene, Ethylbenzene, Xylenes, Methyl Tertiary Butyl Ether (MTBE) and other contaminants. The Department of Environmental Health (DEH) conditionally approves the SMP with the following conditions:

APPROVAL CONDITIONS

1. A copy of the SMP must be kept on-site and available to workers at all times.

2. If unexpected contamination is encountered notification to the DEH is required within 48 hours.

3. If the respirable dust air quality standard (150 $\mu g/m^3$ for 8-hour average) is exceeded (through perimeter air monitoring), additional dust suppression should be implemented and a notification to the DEH is required within 48 hours.

4. A copy of the Storm Water Pollution Prevention Plan (SWPPP) should be submitted to the DEH and a copy shall be kept on-site at all times.

5. You must obtain prior approval from the DEH for any soil re-use. The DEH will not allow re-use of soil that has been screened in the field with handheld instruments.

6. You must obtain prior approval from the DEH for any use of contaminated groundwater for dust control or any other groundwater re-use.

7. A well destruction report documenting the destruction of the potable water well at 1150 Terra Bella must be submitted to the DEH within 45 days after destruction.

Board of Supervisors: Mike Wasserman, Cindy Chavez, Dave Cortese, Ken Yeager, S. Joseph Simitian
County Executive: Jeffrey V. Smith

8. The final vapor barrier system design must be submitted to the DEH prior to installation. Documentation of the vapor barrier system installation will also be required.

Please prepare and submit a schedule of the redevelopment work. We may wish to be onsite to observe ongoing activities.

TECHNICAL REPORT REQUEST

Please submit the following technical report to DEH (Attention: Mr. Aaron Costa), according to the following schedule:

Redevelopment Schedule **December 4, 2015**

This technical report is being requested pursuant to our authority under Section 101480 of the California Health and Safety Code. Each report shall include conclusions and recommendations for the next phases of work required to protect water resources, human health and safety, and the environment at the site. We request that all required work be performed in a prompt and timely manner. Revisions to the schedule shall be requested at least two weeks prior to the due date in writing with appropriate justification for the anticipated delays and a proposed revised schedule.

The California Business and Professions Code (Sections 6735, 7835, and 7835.1) require that work plans and technical or implementation reports containing geologic or engineering evaluations and/or judgments must be performed under the direction of an appropriately registered or certified professional.

PERJURY STATEMENT

All proposals and reports submitted to this office must be accompanied by a cover letter from the responsible party which states, at a minimum, the following:

> "I declare, under penalty of perjury, that the information and/or recommendations contained in the attached proposal or report is true and correct to the best of my knowledge."

This letter must be signed by an officer or legally authorized representative of your company. Future submittals made without the perjury statement may be returned as insufficient.

If you have any questions, please feel free to contact me at (408) 918-1954 or via email.

Sincerely,

Aaron Costa

Subject: Limited Phase II Grab Groundwater Sampling Activities and Conceptual Site Model, 1066 and 1080 Linda Vista Avenue, Mountain View, California SCCDEH Voluntary Cleanup Program Case 06S2W15M05s

Dear Mr. Costa:

SCS Engineers (SCS) is pleased to present this Report for Limited Grab Groundwater Sampling Activities and Conceptual Site Model (CSM) Preparation (Report) on behalf of our Client, the Church of Scientology, for the properties located at 1066 and 1080 Linda Vista Avenue in Mountain View, California (Site). We have prepared this Report at your request, to better evaluate the environmental conditions at the Site. The Site location is shown on **Figure 1**.

BACKGROUND

On September 1, 2015, SCS submitted a Phase I Environmental Site Assessment (ESA) Report for the properties addressed as 1066 and 1080 Linda Vista Avenue, Mountain View, California (Assessor's Parcel Numbers – 153-015-025 and 153-025-030) in the City of Mountain View (City), Santa Clara County, California. The ESA Report described the Site history and environmental conditions, which are briefly summarized below.

The Site consists of approximately 2.53 acres of land. The Site vicinity currently consists of vacant commercial businesses. The Site is developed with two buildings with a combined footprint of 31,074 square feet, divided between two structures. An irregular rectangular structure addressed as 1080 Linda Vista Avenue (1080 building) is located on the northern portion of the Site. A smaller, east-west rectangular structure addressed as 1066 Linda Vista Avenue (1066 building) is located on the southern portion of the Site. The buildings exist at the northern extent of Linda Vista Avenue, bounded by Highway 101 to the north. Paved parking and landscaping surround both structures on all sides.

Records dating back to 1939 depict the Site as undeveloped and agricultural land until the 1950s, at which time commercial structures were built. The Site was subsequently used for light

industrial purposes including computer parts and tool manufacturing which resulted in the categorization of a business as a small quantity generator of Resource Conservation and Recovery Act (RCRA) waste. It should be noted that being included on the RCRA small quantity generator database does not imply the improper use, storage or release of such chemicals. The Site has been owned by the Church of Scientology Mountain View since 2008. It is SCS's understanding that previous investigations were performed to address geotechnical issues at the Site, including cone penetrometer testing (CPT) around the building exteriors.

An underground storage tank (UST) was reportedly located near and exterior to the southwestern corner of the 1080 building. Available records indicated that an unauthorized release of gasoline occurred and the UST was removed in 1986. Following UST and piping removal, soils removal and disposal, and groundwater monitoring, the regulatory case was closed by the Santa Clara County Local Oversight Program in 1996. Petroleum hydrocarbons were detected in groundwater monitoring wells just prior to case closure at concentrations below regulatory action levels.

Phase II testing performed at the Site by others in 2008 reportedly identified volatile organic compounds (VOCs) in soil and groundwater beneath the Site. Based on SCS' review of available documents and the preliminary findings of the SCS Phase I ESA for the Site, it appeared that the Site subsurface was impacted by the presence of VOCs, including trichloroethylene (TCE), tetrachloroethylene (PCE), possible breakdown products, and petroleum hydrocarbons.

In a communication to the Church of Scientology Mountain View, the City of Mountain View requested that an assessment of the potential for intrusion of VOC-containing vapors into indoor air be performed to ensure that redevelopment of the on-Site structures adequately addressed the potential vapor intrusion concern. Therefore, SCS performed a phased sequence of investigations, including a limited soil vapor survey, followed by an indoor air survey and limited soil sampling program. The methods for and results of these investigations were presented in reports submitted to the Santa Clara County Department of Environmental Health (SCCDEH).

In July and August 2015, SCS collected soil, soil vapor, and indoor air samples from the Site and surrounding area. Soil vapor samples collected from approximately five feet below ground surface (bgs) in the eastern and central portions of the 1066 Linda Vista Avenue property showed concentrations of PCE and TCE in excess of their respective Environmental Screening Levels (ESLs) published by the San Francisco Bay Regional Water Quality Control Board (RWQCB, 2013). Indoor air samples collected in the central portion of the 1066 Linda Vista Avenue property showed concentrations of benzene, ethylbenzene, and 1,2-dichloroethane (1,2-DCA) above their respective ESLs; however, it should be noted that various chemicals, including a gasoline container, were being stored in this area.

The soil vapor, sub-slab vapor, and indoor air sample results previously obtained by SCS were included in a Summary Report dated August 31, 2015 which was submitted to the SCCDEH. On October 26, 2015, Mr. Jeffrey Smith (Hill), Mr. Tom Graf (GrafCon) and Mr. James Ritchie

(SCS) met with Mr. Aaron Costa (SCCDEH) to discuss the Summary Report and those additional steps needed to enable SCCDEH to approve Site redevelopment activities. Mr. Costa requested submittal of a Workplan for additional assessment soil vapor and sub-slab vapor conditions. SCS and Hill prepared and presented the Workplan on October 28, 2015, and following SCCDEH tentative approval on November 25, 2015, proceeded with implementation.

In January 2016, SCS collected three indoor air samples from the 1066 Linda Vista Avenue building, and two outdoor background ambient air samples from the surrounding area. Results of the January 2016 indoor and ambient air sampling event showed that Site constituents of potential concern (COPCs) were not present above their respective commercial/industrial ESL values inside the 1066 Linda Vista Avenue building when background concentrations of Site COPCs were taken into consideration. Also in January, 2016, SCS collected two soil vapor samples and four sub-slab vapor samples from beneath the 1066 Linda Vista Avenue building interior. Results of the soil vapor and sub-slab vapor sampling showed concentrations of select Site COPCs above their respective commercial/industrial ESL values. Additionally, elevated concentrations of the leak check compound were detected in select sub-slab vapor samples and warranted additional investigation.

SCS returned to the Site in March 2016 to re-sample the four sub-slab vapor locations using vapor pin locks and a helium shroud sample collection apparatus in an effort to limit potential leaks in sampling components. Results of the March 2016 sub-slab vapor sampling showed select Site COPCs present at concentrations exceeding their respective commercial/industrial ESL values.

On April 27, 2016 SCS personnel met with representatives of the SCCDEH to discuss work completed at the Site and tasks which will complete Site characterization and mitigation, thereby enabling SCCDEH to grant case closure. Limited groundwater analytical data exist for the Site, and those data do not sufficiently represent groundwater conditions across the Site. Therefore, the SCCDEH requested that a round of groundwater sampling be performed for assessment of the distribution of petroleum hydrocarbons and VOCs in shallow groundwater across the Site. Furthermore, the SCCDEH requested that Site environmental data be incorporated into a CSM to facilitate evaluation of the Site for closure.

On May 11, 2016, SCS submitted a Work Plan for Limited Phase II Grab Groundwater Sampling to the SCCDEH, and on May 19, 2016, the SCCDEH issued a letter approving the Work Plan and requested submittal of the CSM and groundwater sampling results on or before July 29, 2016.

SCOPE OF WORK

In accordance with the Work Plan, SCS implemenated the tasks described below.

Preliminary Fieldwork

SCS obtained Site access with the property owner, and cleared the proposed grab groundwater sampling locations of utilities. The utility clearance consisted of contacting Underground Service Alert (USA) at least 48 hours in advance of drilling. SCS also retained a private utility locator to identify potential subsurface obstructions near the proposed grab groundwater sampling locations prior to drilling.

Grab Groundwater Sample Collection

SCS collected ten grab groundwater samples, GW-1 through GW-10, from the locations shown on **Figure 2**. SCS utilized a C-57 licensed contractor to perform direct push drilling to approximately 12 feet bgs, the anticipated depth of groundwater based on previous investigations performed at the Site.

The driller installed temporary well screen in each borehole to facilitate groundwater sample collection using small diameter tubing connected to a check valve at the bottom of the temporary well screen. The collected water was decanted into clean laboratory supplied containers. After advancing the soil boring and collecting the grab groundwater samples, the driller decommissioned each boring by backfilling with cement grout to ground surface.

Grab groundwater samples were analyzed for TPHg and VOCs by Environmental Protection Agency (EPA) Method 8260. A soil sample was collected for disposal purposes and was analyzed for TPHg and VOCs by EPA Method 8260. Soil generated during drilling activities was properly disposed of by Instrat, Inc. A copy of the laboratory analytical report for the soil sample collected for disposal purposes is included as Attachment A.

The collected grab groundwater samples were labeled, recorded on a chain-of-custody (COC) form and placed in and ice-chilled cooler for preservation during transport to a California Department of Public Health certified analytical laboratory for the requested analyses.

Grab Groundwater Analytical Results

The results of the grab groundwater sampling activities completed by SCS on May 31 and June 1, 2016 are presented in Table 1. The grab groundwater sampling locations are shown on Figure 2. A copy of the laboratory analytical report is included as Attachment A.

During the grab groundwater sampling event, select Site COPCs were detected above laboratory reporting limits (RLs) in each of the borings. The grab groundwater sample analysis yielded the following results:

- TPHg was reported in five samples at concentrations ranging from 90 to 250 micrograms per liter (µg/L);
- Methyl tertiary butyl ether (MTBE) was reported in three samples at concentrations ranging from 0.58 to 2.1 µg/L;
- Tertiary butyl alcohol (TBA) was reported in one sample at a concentration of 4.1µg/L;

- PCE was reported in six samples at concentrations ranging from 0.63 to 76 µg/L;
- TCE was reported in each of the ten samples at concentrations ranging from 1.3 to 180 µg/L;
- 1,1-dichlorethane (1,1-DCA) was reported in four samples at concentrations ranging from 0.63 to 1.7 µg/L;
- cis-1,2-dichloroethene (cis-1,2-DCE) was reported in each of the ten samples at concentrations ranging from 0.99 to 79 µg/L;
- trans-1,2-DCE was reported in one sample at a concentration of 3.0 µg/L;
- Freon 113 was reported in one sample at a concentration of 7.7 µg/L; and,
- Vinyl Chloride was reported in one sample at a concentration of 0.60 µg/L.

CONCEPTUAL SITE MODEL

In response to the May 19, 2016 letter from SCCDEH, SCS prepared this CSM using available data for the Site and vicinity. The CSM represents Site conditions and explains where pollutants are in the environment and the potential threats that these pollutants pose to human and ecological health, water resources, and the environment. The CSM is used to assess risks and threats to human and ecological receptors and water resources. Our analysis followed guidelines prepared by the RWQCB, San Francisco Bay Region as presented in their Draft Final document, *Assessment Tool for Closure of Low Threat Chlorinated Solvent Sites*, dated July 31, 2009.

The RWQCB (2009) guidance identifies the necessary elements of a CSM, which are as follows:

- Hydrogeologic conditions and framework
- Sources of pollution
- Pollutant distribution within the environment (i.e., nature and extent)
- Actual and potential migration pathways
- Actual and potential exposure pathways and receptors

Each element is further described for the Site below.

Hydrogeologic Conditions and Framework

The Site is located in Mountain View in an area which is generally characterized by a mix of commercial and industrial development. Historically, the area was used for agricultural purposes beginning in the 1930s, until development for commercial and light industrial purposes occurred in the 1960s and 1970s. More recently, the area has been subject to redevelopment, primarily for commercial and mixed use purposes.

The Site is currently owned by the Church of Scientology of Mountain View. The 1066 Linda Vista Avenue building is predominantly used for storage. The 1080 Linda Vista Avenue building is predominantly used for assembly meeting for the Church of Scientology of Mountain View. The surface topography in the area of the Site is relatively flat, gently sloping toward the southern portion of San Francisco Bay located approximately 2.5 miles north of the Site. The

Site is bordered by a property redevelopment project to the west and south, Linda Vista Avenue to the east, and Highway 101 to the north.

The water-bearing formations of the Santa Clara subbasin include Pliocene to Holocene age continental deposits of unconsolidated to semi-consolidated gravel, sand, silt and clay. Two members form this group, the Santa Clara Formation of Plio-Pleistocene age and the younger alluvium of Pleistocene to Holocene age (DWR 1975). Lithologic similarities make distinction between these two units difficult based on available well data. The combined thickness of these two units probably exceeds 1500 feet (DWR 1967).

The Santa Clara Formation is of Plio-Pleistocene age and rests unconformably on impermeable rocks that mark the bottom of the groundwater subbasin (DWR 1975). The Santa Clara Formation is exposed only on the west and east sides of the Santa Clara Valley. Where exposed, it is composed of poorly sorted deposits ranging in grain size from boulders to silt (DWR 1975). Well logs indicate that permeability increases from west to east and that in the central part of the valley permeability and grain size decrease with depth (DWR 1975). Review of groundwater flow information on Geotracker from this Site (1080 Linda Vista Avenue – Robb – Jack) and another upgradient site (924 San Rafael Avenue) indicate groundwater flow is to the northwest.

Site specific geologic data are limited to soil samples collected for lithologic description during the recent grab groundwater sampling event performed on May 31 and June 1, 2016. Generally, Site specific geology consists of a silty clay material. In some portions of the Site, the uppermost two feet consist of soil types ranging from well-graded sands to gravelly sands, and intermixed sands, gravels, and silts. Additionally, some portions of the Site in the greatest depth explored of 12 bgs, consist of sandy gravels and gravelly sands. Groundwater encountered during the recent grab groundwater sampling event was present at depths ranging from 6.43 to 8.41 feet bgs.

Groundwater has also been encountered beneath the adjacent property located 1001 North Shoreline Boulevard (Cornerstone, 2015) at an approximate depth of 10.5 feet within a sand and gravel layer that reportedly extends from approximately 10 to 26 feet bgs.

Source(s) of Pollution

The primary COPC at the Site are PCE, TCE and associated breakdown products, with TPHg considered a lesser COPC. Based on investigations completed by SCS, there do not appear to be current or historic on-Site sources for the VOCs. As noted in a Phase I ESA Report for the Site (SCS, 2015), the 1080 building was listed on the following databases:

- California Leaking Underground Storage Tanks (LUST) – Listed as Robb-Jack Corp;
- CORTESE Database and CORTESE Hist Sites – Listed as Robb-Jack Corp;
- Historic UST Registered – Listed as Comm Bldg, Robb-Jack Corp;
- SWEEPS UST List – Listed as Comm Bldg; and,
- HazNet – Listed as Robert Eitreim.

The 1066 building was listed on the following database:

- RCRA Generators (RCRA GEN) –Main-Champ Co. and Gard-More Circuits listed as small quantity generators of RCRA waste.

The HazNet listing for Robert Eitreim pertained to disposal of an unspecified organic liquid mixture waste (1.6054 tons) at an unnamed disposal facility in Santa Clara County. The SWEEPS UST and Historic UST Registered databases identify a UST as being registered to Robert Eitreim, while the California LUST and CORTESE listings pertain to records associated with the discovery of a gasoline leak from a 1,000 gallon capacity UST, and subsequent assessment and case closure from the Santa Clara County Local Oversight Program (LOP) and the RWQCB. The case was opened in 1986 and closed in 1996 by the SCVWD and approved by the RWQCB, with case records listed to 2012.

A Phase I ESA Report prepared by The EI Consulting Group, Inc. (EI), dated May 30, 2008, also identified the historic Site land use and releases from up-gradient properties as RECs. Regarding the historic Site land use, EI identified past Site tenants of concern that included a snow machine manufacturer, an electronic circuit manufacturer, and a missile company. Specifically, EI noted the potential for petroleum hydrocarbon and/or VOC contamination from the past use of the 1,000 gallon UST and the potential for heavy metal and chlorinated solvent contamination associated with a former circuit board plating operation.

EI identified floor drains inside the 1066 building as possible pathways for chemicals to leak into the soil below. United Soils Engineering (USE) completed a Phase I ESA Update Report in 2002 in which high concentrations of copper were reportedly detected in soil samples collected at the Site. The location of the soil samples were not provided.

It should be noted that the UST has been removed and the UST release case was closed by the SCVWD and RWQCB. The floor drains identified by EI were subsequently inspected by SCS and sealed, and soil samples were collected from underlying soils for chemical analysis. Current Site use does not include any of the noted chemicals or practices of concern identified in the Phase I ESA reports.

The SCS Phase I ESA, the EI Phase I ESA, and the Cornerstone Site Management Plan (SMP) each identified chemical release cases in the Site vicinity, including the Teledyne-Spectra Physics National Priority List (NPL) VOC case, several petroleum hydrocarbon release locations, and hydraulically-upgradient VOC release cases. The Teledyne case, located at 1300 Terra Bella Avenue, approximately 1,200 feet to the west, has been in open remediation to address chlorinated solvents since 1986, including the same types found in the soil and groundwater beneath the Site. Based upon these reports, it appears that VOCs are present in shallow groundwater on a regional basis, sourced from off-Site locations.

Pollutant Distribution within the Environment

The previously noted Site investigations have revealed COPC in limited concentration and extent at the Site as follows:

Indoor Air

On behalf of the Client, SCS conducted indoor air and ambient air (background) sampling during two events, including August 2015 and January 2016. The indoor air sampling results are presented on Table 2, and may be summarized as follows for the August 2015 event:

- Benzene was reported in each sample at concentrations ranging from 0.61 to 8.6 micrograms per cubic meter (µg/m^3);
- Toluene was reported in each sample at concentrations ranging from 2.0 to 53 µg/m^3;
- Ethylbenzene was reported in each sample at concentrations ranging from 0.35 to 8.1 µg/m^3;
- Xylenes were reported in each sample at concentrations ranging from 1.16 to 40 µg/m^3;
- Carbon tetrachloride was reported in each sample at concentrations ranging from 0.55 to 0.58 µg/m^3;
- Chloroform was reported in each sample at concentrations ranging from 0.16 to 1.8 µg/m^3;
- Chloromethane was reported in each sample at concentrations ranging from 1.0 to 1.4 µg/m^3;
- Acetone was reported in each sample at concentrations ranging from 16 to 35 µg/m^3;
- Methylene chloride was reported in each sample at concentrations ranging from 7.8 to 11 µg/m^3;
- Styrene was reported in one sample at a concentration of 4.6 µg/m^3;
- 1,2-DCA was reported in each sample at concentrations ranging from 0.18 to 4.0 µg/m^3;
- 1,1,1-TCA was reported in one sample at a concentration of 0.28 µg/m^3;
- PCE was reported in each sample at concentrations ranging from 0.26 to 1.2 µg/m^3; and,
- TCE was reported in one sample at a concentration of 0.6 µg/m^3.

The outdoor ambient air samples yielded the following results (for samples BG-1 and BG-2, respectively):

- Benzene was reported in both samples at concentrations of 0.40 and 0.44 µg/m^3;
- Toluene was reported in both samples at concentrations of 0.81 and 0.87 µg/m^3;
- Ethylbenzene was reported in both samples at concentrations of 0.16 and 0.17 µg/m^3;
- Xylenes were reported in both samples at concentrations of 0.77 and 1.71 µg/m^3;
- Carbon tetrachloride was reported in both samples at concentrations of 0.54 and 0.56 µg/m^3;
- Chloromethane was reported in both samples at concentrations of 1.0 and 1.1 µg/m^3;

- Acetone was reported in both samples at concentrations of 6.9 and 7.1 µg/m^3; and,
- Methylene chloride was reported in one sample at a concentration of 1.3 µg/m^3.

Benzene, ethylbenzene, carbon tetrachloride, and 1,2-DCA were detected in indoor air samples above the respective ESLs for commercial land use. A second round of indoor and background air samples were subsequently collected at the Site in January 2016 after the building interior was cleaned and previously stored chemicals were removed.

- Benzene was reported in each sample at concentrations ranging from 0.77 to 0.78 µg/m^3;
- Toluene was reported in each sample at concentrations ranging from 1.8 to 3.1 µg/m^3;
- Ethylbenzene was reported in each sample at concentrations ranging from 1.70 to 3.13 µg/m^3;
- Xylenes were reported in each sample at concentrations ranging from 1.70 to 3.13 µg/m^3;
- Carbon tetrachloride was reported in each sample at concentrations ranging from 0.38 to 0.40 µg/m^3;
- Chloroform was reported in one sample at a concentration of 0.16 µg/m^3;
- Chloromethane was reported in each sample at concentrations ranging from 1.0 to 1.1 µg/m^3;
- Acetone was reported in each sample at a concentration of 14 µg/m^3;
- Methylene chloride was reported in each sample at concentrations ranging from 7.1 to 13 µg/m^3;
- 1,2-DCA was reported in two samples at concentrations ranging from 0.13 to 0.16 µg/m^3;
- PCE was reported in each sample at concentrations ranging from 0.38 to 0.58 µg/m^3; and,
- TCE was reported in one sample at a concentration of 0.22 µg/m^3.

The outdoor ambient air samples yielded the following results (for samples BG-1 and BG-2, respectively):

- Benzene was reported in both samples at concentrations of 1.1 and 0.94 µg/m^3;
- Toluene was reported in both samples at concentrations of 5.5 and 2.4 µg/m^3;
- Ethylbenzene was reported in both samples at concentrations of 1.4 and 0.52 µg/m^3;
- Xylenes were reported in both samples at concentrations of 5.9 and 2.22 µg/m^3;
- Carbon tetrachloride was reported in both samples at concentrations of 0.36 and 0.39 µg/m^3;
- Chloroform was reported in sample BG-1 at a concentration of 0.16 µg/m^3;
- Chloromethane was reported in both samples at concentrations of 1.2 and 0.93 µg/m^3;
- Acetone was reported in both samples at concentrations of 30 and 6.6 µg/m^3;
- Methylene chloride was reported in sample BG-1 at a concentration of 1.3 µg/m^3;
- 1,2-DCA was reported in sample BG-1 at a concentration of 0.22 µg/m^3; and,
- PCE was reported in sample BG-1 at a concentration of 0.73 µg/m^3.

The second indoor air sampling event demonstrated the lack of benzene in indoor air above ambient background concentrations, indicating that the elevated detection in August 2015 was

likely due to materials stored in the building. Consistent with the August 2015 sampling event, the January 2016 event yielded benzene and carbon tetrachloride in air samples collected outside of the building (background or ambient air samples) at concentrations higher than or equal to concentrations detected within the 1066 building (indoor air samples). These concentrations are above the respective ESLs for commercial land use.

Based upon the historic indoor air and ambient air sampling results, SCS concluded that indoor air within the on-Site building has not been deleteriously affected by intrusion of VOC-containing vapors from the subsurface.

Soil Vapor and Sub-Slab Vapor

Soil vapor was investigated at the Site during two events including July 2015 at locations SV-1 through SV-10 across the Site and a second event in January 2016 at locations SV-5 and SV-6 beneath the 1066 building slab. Tables 3 and 4 provide the soil vapor and sub-slab vapor analytical results, and Figure 3 provides the sample locations.

The Site-wide soil vapor survey indentified COPC as follows:

- TPHg was reported in four samples at concentrations ranging from 1,300 to 6,100 µg/m^3;
- Benzene was reported in five samples at concentrations ranging from 8.5 to 31 µg/m^3;
- Toluene was reported in eight samples at concentrations ranging from 7.1 to 230 µg/m^3;
- Ethylbenzene was reported in four samples at concentrations ranging from 5.4 to 23 µg/m^3;
- Xylenes (m,p) were reported in seven samples at concentrations ranging from 9.2 to 81 µg/m^3;
- Xylene (o) was reported in five samples at concentrations ranging from 6.4 to 25 µg/m^3;
- PCE was reported in seven samples at concentrations ranging from 16 to 2,500 µg/m^3;
- TCE was reported in seven samples at concentrations ranging from 36 to 4,300 µg/m^3;
- 1,1-DCA was reported in two samples at concentrations of 5.8 and 21 µg/m^3;
- 1,1-DCE was reported in one sample at a concentration of 32 µg/m^3;
- Cis-1,2-DCE was reported in four samples at concentrations ranging from 8 to 28 µg/m^3;
- Trans-1,2-DCE was reported in one sample at a concentration of 28 µg/m^3;
- 1,1,1-trichloroethane (TCA) was reported in four samples at concentrations ranging from 24 to 340 µg/m^3;
- Acetone was reported in seven samples at concentrations ranging from 37 to 120 µg/m^3; and,
- Methyl ethyl ketone (MEK) was reported in two samples at concentrations of 20 and 24 µg/m^3.

Chloroform was detected in the soil vapor sample collected from probe SV-2 above the laboratory RL; however, this is not considered to be a Site COPC and may be due to laboratory analytical method interference. 1,1-difluoroethane, used as a leak checking compound, was detected in two of the soil vapor samples, SV-8 and SV-10, collected and submitted for analysis to

Eurofins. Only two locations, SV-5 (PCE) and SV-6 (PCE and TCE) yielded one or more COPC above a corresponding ESL value for commercial land use.

Based on these results, SCS performed a second soil vapor survey in January 2016, focusing upon locations SV-5 and SV-6. The soil vapor sample analysis yielded the following results:

- TPHg was reported in SV-5 at a concentration of 4,800 µg/m^3;
- Toluene was reported in SV-5 at a concentration of 12 µg/m^3;
- Ethylbenzene was reported in SV-5 at a concentration of 5.8 µg/m^3;
- Xylenes (m,p) were reported in SV-5 at a concentration of 17 µg/m^3;
- Xylene (o) was reported in SV-5 at a concentration of 9.0 µg/m^3;
- PCE was reported in SV-5 and SV-6 at concentrations of 220 and 2,200 µg/m^3, respectively;
- TCE was reported in SV-5 and SV-6 at concentrations of 110 and 2,700 µg/m^3, respectively;
- 1,1-DCA was reported in SV-6 at a concentration of 26 µg/m^3;
- 1,1-DCE was reported in SV-6 at a concentration of 190 µg/m^3;
- cis-1,2-DCE was reported in SV-6 at a concentration of 84 µg/m^3;
- trans-1,2-DCE was reported in SV-6 at a concentration of 9.6 µg/m^3; and,
- 1,1,1-TCA was reported in SV-6 at a concentration of 400 µg/m^3.

Chloroform was detected in the soil vapor sample collected from probe SV-5 above the laboratory RL; however, this is not considered to be a Site COPC and may be due to laboratory analytical method interference. Chloroform was not detected above the commercial ESL value. The leak check compound, 1,1-difluoroethane, was detected in soil vapor sample SV-5 at a concentration of 71 parts per billion by volume (ppbv), but was not detected above the laboratory RL in the sample collected from probe SV-6.

During the second event, only PCE was detected above the commercial ESL value in soil vapor sample SV-6. No other Site COPCs were detected above corresponding commercial ESL values. Based upon these results, the extent of residual COPC (PCE and TCE) in soil vapor appears to be limited to a portion of the area beneath the building 1066 slab.

In January 2016, coincident with the second, focused soil vapor sampling event, SCS also conducted a sub-slab vapor survey at four locations in proximity to vapor probes SV-5 and SV-6. Sub-slab vapor probes SS-5A, SS-5B, SS-6A, and SS-6B yielded the following results:

- TPHg was reported in two samples at concentrations ranging from 18 to 51 µg/m^3;
- Toluene was reported in two samples at concentrations ranging from 6.4 to 17 µg/m^3;
- PCE was reported in each sample at concentrations ranging from 120 to 1,700 µg/m^3;
- TCE was reported in three samples at concentrations ranging from 120 to 420 µg/m^3;
- 1,1-DCE was reported in one sample at a concentration of 68 µg/m^3;

- 1,1,1-TCA was reported in two samples at concentrations ranging from 13 to 160 µg/m^3; and,
- Acetone was reported in two samples at concentrations ranging from 56 to 240 µg/m^3.

None of the results exceeded a corresponding ESL value for commercial land use. However, due to detections of elevated concentrations of the leak check compound 1,1-difluoroethane in samples SS-5A and -5B, the analytical results for these samples was considered to be suspect. Therefore, SCS performed a second sub-slab soil vapor sampling event in March 2016 using vapor pins and a helium shroud to minimize the potential for sample train compromise.

During the sub-slab vapor re-sampling event, select COPC were detected as follows:

- TPHg was reported in each sample at concentrations ranging from 1,200 to 11,000 µg/m^3;
- Benzene was reported in each sample at concentrations ranging from 2.7 to 500 µg/m^3;
- Toluene were reported in each sample at concentrations ranging from 2.8 to 43 µg/m^3;
- Ethylbenzene was reported in each sample at concentrations ranging from 2.4 to 44 µg/m^3;
- Xylenes were reported in three samples at concentrations ranging from 9.9 to 35 µg/m^3;
- PCE was reported in each sample at concentrations ranging from 710 to 2,900 µg/m^3;
- TCE was reported in each sample at concentrations ranging from 140 to 330 µg/m^3;
- 1,1-DCE was reported in three samples at concentrations ranging from 7 to 14 µg/m^3;
- 1,1,1-TCA was reported in each sample at concentrations ranging from 16 to 210 µg/m^3;
- Acetone was reported in each sample at concentrations ranging from 110 to 350 µg/m^3; and,
- MEK was reported in two samples at concentrations of 110 and 170 µg/m^3.

The leak check compound helium, was detected in each sub-slab vapor sample, at percentage concentrations ranging from 0.074 to 3.8, below the 5% threshold established by the DTSC. Based on this finding, the sub-slab re-sampling data were considered valid and reliable.

Sub-slab vapor results from the March 2016 event were generally consistent with to slightly higher than results from the January 2016 event. Two samples (SS-5A and SS-5B) yielded PCE slightly in excess of the corresponding ESL value for commercial land use, and one sample (SS-6A) yielded benezene slightly above the corresponding ESL value for commercial land use. No other results exceeded corresponding commercial ESL values.

Sub-slab vapor results were generally lower in concentration than the five foot bgs soil vapor results described above. The soil vapor and sub-slab vapor results indicate that concentrations of Site COPCs decrease vertically as they approach the building sub-slab foundation.

Shallow Soil

Shallow soil has been investigated by EI (2008) and SCS (2015). SCS was unable to locate a complete copy of the EI report, and we therefore could not accurately identify sample locations. However, the reported data, as well as the SCS soils data may be summarized as follows. Seven soil samples were analyzed for VOCs, with reported detections of TCE in three samples at concentrations ranging from 7.5 to 12 micrograms per kilogram (µg/kg) or parts per billion (ppb) and PCE in one sample (6.9 ppb), each at concentrations well below corresponding ESL values for commercial or residential land use.

Arsenic, copper, lead, and nickel were detected above the commercial/industrial land use ESL in soil sample Soil4 collected from approximately two feet bgs beneath the 1066 building slab. Additionally, arsenic was detected above the commercial/industrial land use ESL in the soil samples collected from Soil1 at approximately five feet bgs and Soil2 at approximately two feet bgs. Arsenic concentrations detected above the commercial/industrial land use ESL ranged from 3.3 to 5.0 milligrams per kilogram (mg/kg). Table 5 provides the soil analytical results, and Figure 3 presents the SCS soil sample locations.

Arsenic concentrations detected in select soil samples collected from the Site were well within what are considered to be background concentrations for the San Francisco Bay area (Bradford et. al., March 1996; City of Oakland, January 1, 2001; and Duverge, December 2011) although in excess of the corresponding ESL value (RWQCB, 2016). The RWQCB considers an arsenic value of 11 mg/kg to be a background value, and the concentrations of arsenic in Site soils ranged from 0.93 to 5 mg/kg. California regulatory agencies generally do not require remediation/mitigation of metals to below background concentrations. The presence of residual metals concentrations above commercial ESL values at one location beneath the 1066 building slab does not appear to be a pathway by which on-Site workers (employees) would be exposed to the soils.

None of these residual concentrations of COPC in soils appear to represent a source requiring further assessment or mitigation.

Shallow Groundwater

Shallow groundwater conditions were previously assessed during a limited investigation by EI (2008); however, SCS was provided with only a partial copy of the report, and we were unable to accurately locate the sample collection points. As described above, the grab groundwater sampling activities completed by SCS on May 31 and June 1, 2016 yielded the following results:

- TPHg was reported in five samples at concentrations ranging from 90 to 250 µg/L;
- MTBE was reported in three samples at concentrations ranging from 0.58 to 2.1 µg/L;
- Tertiary butyl alcohol (TBA) was reported in one sample at a concentration of 4.1µg/L;
- PCE was reported in six samples at concentrations ranging from 0.63 to 76 µg/L;

- TCE was reported in each of the ten samples at concentrations ranging from 1.3 to 180 µg/L;
- 1,1-DCA was reported in four samples at concentrations ranging from 0.63 to 1.7 µg/L;
- cis-1,2-DCE was reported in each of the ten samples at concentrations ranging from 0.99 to 79 µg/L;
- trans-1,2-DCE was reported in one sample at a concentration of 3.0 µg/L;
- Freon 113 was reported in one sample at a concentration of 7.7 µg/L; and,
- Vinyl Chloride was reported in one sample at a concentration of 0.60 µg/L.

Analytical results from the recent grab groundwater sampling event (Table 1) were compared to the Groundwater ESLs – Groundwater Vapor Intrusion Human Health Risk Levels – Shallow Groundwater – Commercial/Industrial (RWQCB, 2016).

Results of the recent grab groundwater sampling event show that PCE was detected in two samples, GW-1 and GW-2, at concentations above the ESL, TCE was detected in three samples, GW-6 through GW-8, at concentrations above the ESL and vinyl chloride was detected in one sample, GW-5, at a concentration above the ESL. The most elevated PCE concentrations were reported in the samples collected near the southern Site boundary, in the apparent upgradient-most locations. More elevated concentrations of TCE, and PCE breakdown products, were detected in grab groundwater samples collected along the eastern, upgradient boundary of the Site.

The recent grab groundwater analytical results appear to indicate that PCE is migrating onto the Site from the adjacent property to the southeast. The highest concentrations of PCE were detected in samples collected along the fenceline with the southern property. The highest concentrations of TCE, a breakdown product of PCE, were detected in the upgradient eastern to northeastern portions of the Site. Additionally, the highest concentrations of further breakdown products such as 1,1-DCA, cis-1,2-DCE, and trans-1,2-DCE were detected in the eastern to northeastern portions of the Site.

Actual and Potential Migration Pathways

Residual primary COPC, namely TCE and PCE are present above corresponding ESL values in shallow groundwater and soil vapor/sub-slab vapor. The metals copper, lead and nickel are present at one shallow location beneath the 1066 building slab above corresponding ESL values, along with arsenic above ESL values but within background ranges for the area. Benzene and carbon tetrachloride are present above corresponding ESL values in indoor and outdoor air; however the distribution of these volatile compounds in air across the Site indicates their presence is likely due to a regional or ambient condition, rather than due to a Site-related source.

Based upon these data, the actual and potential migration pathways for Site COPC are considered to be as follows:

- Soil Vapor and Sub-Slab Vapor as a pathway for migration of VOC-containing vapors, either upward into overlying structures, or downward via leaching to groundwater;
- Soil as a pathway for migration of metals, downward via leaching to groundwater; and,
- Shallow groundwater as a pathway for migration of dissolved VOCs, laterally, with possible volatilization of VOCs into the vadose zone and/or overlying structures.

Each actual/potential pathway is further discussed below.

Soil Vapor and Sub-Slab Vapor

Soil vapor beneath the 1066 building contains PCE and TCE at concentrations in excess of commercial land use ESL values. VOC-containing vapors may move within the vadose zone through diffusion from an area of higher concentration (source) and/or by advection (pressure differential) into overlying structures or along preferential pathways such as utility corridors.

Site subsurface data demonstrate the lack of a VOC source area, and therefore, while diffusion may occur, there is no driving force to cause significant migration of VOC-containing vapors away from the locations of most elevated concentration. Indoor air concentrations do not indicate that vapor intrusion through the building slab is occurring. The elevated sub-slab concentrations of PCE follow the pattern measured for vapors where concentrations of vapor typically increase under confined building areas.

In addition, because the presence of vapors is due to off-gassing from groundwater, the potential for downward vertical migration of VOCs from soil vapor to underlying shallow groundwater is limited.

Shallow Soil

Soil in one location beneath the 1066 building contains concentrations of metals (arsenic, copper, lead, and nickel) at concentrations in excess of commercial land use ESL values. Due to the low mobility of metals in soils, the primary potential for migration is limited to vertical migration to shallow groundwater due to infiltration of low pH water, which has not been measured on-Site. This possibility is further limited by the presence of an overlying structure and intact building slab.

Shallow Groundwater

Shallow groundwater beneath the Site, primarily the central and eastern portions, contains dissolved COPC, including PCE, TCE and vinyl chloride in concentrations above ESLs in one or more samples. The concentrations of these constituents attenuate laterally from the upgradient locations where they are measured.

Actual and Potential Exposure Pathways and Receptors

The potential exposure pathways for Site COPC are as follows:

- Exposure to VOC-containing soil vapor and sub-slab vapor (inhalation);
- Exposure to metals-impacted soil (dermal contact/ingestion); and,
- Exposure to VOC-containing groundwater (ingestion).

Exposure to VOC-Containing Soil Vapor and Sub-Slab Vapor (Inhalation)

Soil vapor beneath the 1066 building contains PCE and TCE at concentrations in excess of commercial land use ESL values. The potential exists for intrusion of VOC-containing vapors into indoor air at the Site, particularly the 1066 building. However, the concentrations of VOCs in soil vapor beneath the 1066 building attenuate vertically from soil vapor sample locations to the sub-slab vapor locations. Furthermore, the COPC detected at elevated concentrations in soil vapor and sub-slab vapor beneath the 1066 building were not detected at elevated concentrations in indoor air within the 1066 building. Therefore, the potential for a complete exposure pathway for inhalation of COPC-containing vapors via vapor intrusion is low, and is considered an incomplete pathway.

Exposure to Metals-Impacted Soil (Dermal Contact/Ingestion)

Soil in one location beneath the 1066 building contains concentrations of metals (arsenic, copper, lead, and nickel) at concentrations in excess of commercial land use ESL values. The potential exposure pathway to these soils is through dermal contact during construction work. This potential exposure pathway can be rendered incomplete through implementation of an SMP. Therefore, the potential for a complete exposure pathway for dermal contact or ingestion of COPC-containing soils via direct contact is low, and is considered an incomplete pathway.

Exposure to VOC-Containing Groundwater (Ingestion)

Shallow groundwater beneath the Site, primarily the southern and eastern portion, contains dissolved COPC, including PCE, TCE and vinyl chloride in concentrations above ESL in one or more samples. The potential exposure pathway to COPC affected groundwater would be via use of groundwater for irrigation, domestic supply or other uses in conjunction with one or more water supply wells. There are no wells present on the Site, and the potential for future use of shallow groundwater for irrigation, domestic supply or otherwise is considered extremely low. This pathway is therefore considered incomplete.

SUMMARY AND CONCLUSIONS

Investigation of Site media by SCS has documented that COPC are present above commercial land use ESLs in limited extent in shallow groundwater and soil vapor beneath the Site. Ambient air across the Site contains benzene and carbon tetrachloride at concentrations above

ESLs for commercial land use. Shallow soil in one location beneath the 1066 building slab also contains select metals above the commercial land use ESL.

Based on results of investigations performed at the Site and in surrounding areas, SCS believes that:

- There does not appear to be an on-Site source of PCE or TCE in the Site subsurface;
- There does not appear to be a significant residual source of VOCs or other constituents in the Site subsurface; and,
- The concrete slab foundation for the 1066 Linda Vista building appears to provide adequate protection to on-Site workers (employees) from being exposed to Site COPCs above the established ESL values relevant to the Site.

The analysis presented in the CSM demonstrates a lack of existing source for the COPCs, incomplete exposure pathways, and a lack of threatened receptors.

These conclusions assume the following:

- Continued (future) land use will be consistent with current practices;
- Groundwater will not be used for irrigation or drinking supply purposes;
- Earthwork performed at the Site will follow procedures described in a SMP; and,
- Any disturbance of the building slab for the 1066 building will be followed by indoor air sampling within the 1066 building to document satisfactory indoor air quality.

Based upon the foregoing, SCS requests that the SCCDEH agree to close the case for the Site, with the understanding that the above listed items will be conducted by the Church of Scientology within an agreed-upon period.

CLOSING

SCS appreciates the opportunity to work with you on this important project. Should you have any questions, please call us at (925) 426-0080.

Sincerely,

Notes:

VOCs = volatile organic compounds; analyzed using Method TO-15.

NE = ESL Not Established

NA = Not Analyzed

ND = Not Detected

µg/m^3 = micrograms per cubic meter

µL/L = microliters per liter (also referred to as ppm)

ppm = parts per million

Commercial/Industrial ESL = Table E-3. Ambient and Indoor Air Screening Levels (Commercial/Industrial Exposure). - San Francisco Bay Regional Water Quality Control Board, December 2013

Bold = Exceeds Commercial/Industrial ESL

J = Estimated Value

Note - Other detected VOCs included Freon 11, Freon 12, Freon 113, Ethanol, 2-Propanol, Hexane, Heptane, 1,2,4-Trimethylbenzene, Cyclohexane, 4-Ethyltoluene, 2,2,4-Trimethylpentane, with no associated ESL values. Please see laboratory analytical report for full results.

1,4-Dichlorobenzene was detected in sample BG-2 at a concentration of 0.24 µg/m^3 on 1/15/16. Although this sample was collected from a background location, it should be noted that the result is below the ESL value of 1.1 µg/m3.

Indoor air concentration does not exceed ESL when subtracted from background ambient air concentration.

Notes:

Metals analyzed using either EPA Methods 6010B, 6020, or 7471A

mg/kg = milligrams per kilogram (or parts per million; ppm)

TTLC = Total Threshold Limit Concentration (CCR Title 22, Section 66261.24)

Commercial/Industrial ESL (Drinking Water) = Environmental Screening Level for commercial shallow soil (less than or equal to 3 meters below ground surface) where groundwater is a current or potential source of drinking water - San Francisco Bay Regional Water Quality Control Board, December 2013

Commercial/Industrial ESL (non-Drinking Water) = Environmental Screening Level for commercial shallow soil (less than or equal to 3 meters below ground surface) where groundwater is not a current or potential source of drinking water - San Francisco Bay Regional Water Quality Control Board, December 2013

ft bgs = feet below ground surface

a = value for Trivalent Chromium

Bold = Exceeds Commercial/Industrial ESL (Current of Future Drinking Water)

* =Arsenic concentrations detected at the Site are generally within background ranges reported for California soils (11/mg/kg). Regulatory agencies generally do not require remediation/mitigation of metals to below background concentrations.

** = Sample 4@2 only yielded PCE and TCE. Neither 2@2 nor 4@2 yielded any other VOC or TPHg by EPA Method 8260B.

DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Analytical Qualifiers

c8	sample pH is greater than 2

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

Glossary of Terms & Qualifier Definitions

Client: SCS Engineers
Project: 01215172.04; Scientology
WorkOrder: 1606117

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Subject: Voluntary Cleanup Program: Church of Scientology of Mountain View
1066 & 1080 Linda Vista Ave., Mountain View, CA
Case No. 06S2W15M05s

Dear Ms. Hamilton:

The Department of Environmental Health (DEH) has reviewed the *Limited Phase II Grab Groundwater Sampling Activities and Conceptual Site Model* (The Report) submitted by SCS Engineers. Based on the results of the recent sampling activities documented in The Report and the understanding of the Conceptual Site Model, the DEH has determined that no further action is required at this time while the case is prepared for closure.

The Report documents groundwater contamination beneath the properties that appears to be related to an off-site chlorinated solvent release. Both tetracholoroethene (PCE) and trichloroethene (TCE) was reported in groundwater above environmental screening levels, however the soil vapor and indoor air data collected to date indicate that vapor intrusion is not occurring at the site. Should construction or site development activities penetrate the current building foundation, the appropriate steps should be taken to repair the foundation in such a way that it does not allow vapors from the subsurface into the building.

If you have any questions, please feel free to contact me at (408) 918-1954 or via email.

Sincerely,

1.0 EXECUTIVE SUMMARY

The following *Work Plan for Additional Site Assessment* (*Work Plan*) describes additional soil, soil vapor and groundwater investigation tasks designed to further characterize previously confirmed chemical impacts to the subsurface [i.e., chlorinated solvents - trichloroethylene (TCE) and associated degradation daughter products] that was discovered at the Former Telewave Property (1155 Terrabella Avenue, Mountain View, CA – see Figure 1) during a previously completed *Phase II Environmental Site Assessment*[1]. Two (2) separate parties that were interviewed during previous Phase I research had independently confirmed knowledge of an underground chemical storage tank (UST), that was removed from the site without permit sometime during the previous decade. Elevated concentrations of chlorinated solvents detected in soil and groundwater beneath the location of the reported chemical UST suggest that it is the likely source of the release.

Old Trace Partners, LLC (the current property owner and responsible party) have recently entered in to Santa Clara County Department of Environmental Health's (SCCDEH) Voluntary Cleanup Program (VCP), which allows the SCCDEH to assume lead regulatory oversight for site characterization and remediation activities and certify that site cleanup goals have been met. The owner, who purchased the property in late 2016, has plans to redevelop the site for residential use. The existing, on-site commercial building is currently vacant, and the owner has no plans to lease the space prior to redevelopment. We note that the building will need to be razed to facilitate the majority of investigation tasks described in this *Work Plan,* including subsequent primary source removal tasks, as proposed investigation locations situated within the building footprint cannot currently be accessed with the necessary drilling equipment.

The proposed additional soil, soil vapor and groundwater investigation tasks described in this *Work Plan* will be completed with the goal of generating a *Conceptual Site Model* that will be used to identify potential data gaps and evaluate remediation and/or mitigation approaches to move the site towards regulatory case closure for the proposed transition to residential use. Specifically, the proposed scope of work includes:

"Source Area" Soil Characterization (see Figure 6)

Investigate the area at, and around the immediate vicinity of the former chemical UST to determine the vertical and lateral extent of soil impacts. This proposed, two-part investigation will first involve advancing at least four (4) cone penetrometer test / membrane interface probe (CPT/MIP) borings to qualitatively gauge the point source location and extent of soil impacts, followed by the collection and laboratory analysis of discrete soil samples to quantify the magnitude and extent of soil impacts beneath the site. The goal of this investigation is to gauge potential soil source removal efforts and/or other potential soil remediation alternatives.

Preliminary Evaluation of Persistent Pesticides in Shallow Soil (see Figure 6)

Because the site was historically used to grow orchard crops (i.e., circa 1950s through the mid-1960s), there is a potential for residual, persistent pesticides to be present in shallow soils at concentrations that may pose a heath risk if encountered; therefore, in order to facilitate the proposed residential land use transition and provide clearance for this *Recognized Environmental Condition* we propose to conduct a standard of care sampling and laboratory analysis of first encountered native soils beneath site to determine whether persistent pesticides are present at levels that may exceed risk based thresholds.

Soil Vapor Characterization (see Figure 7)

Obtain additional data on the extent of shallow soil vapor concentrations via the installation of three (3) dual depth soil vapor wells (approximately 5 and 12 feet bgs) near, and downgradient of the apparent chemical UST source. One (1) soil vapor well is also proposed for installation at the southern property line, adjacent to a former off-site hazardous waste sump to provide data on the potential presence of an off-site solvent source.

Ambient Indoor Air Sampling (see Figure 7)

While the existing building remains unoccupied and will be razed to facilitate proposed residential development, we propose collecting two (2) ambient indoor air samples (24-hour sampling period). We acknowledge that the samples may not be representative of indoor air quality for future buildings due to

[1] Weber, Hayes & Associates: *Phase I/II Environmental Site Assessment, Telewave Property*, dated November 15, 2016.

likely differences in building size, foundation construction and heating, ventilation and air conditioning (HVAC) configurations. However, it is our opinion that the data will be useful in providing some information as to whether the subsurface soil gas to indoor air pathway is complete.

Additional Groundwater Characterization (see Figure 8)

We propose a phased approach to further characterize impacts to groundwater which include:

1. Advancing a CPT sounding to depths of approximately 70 to 80 feet bgs (or deeper if possible and necessary) on the north side of Terra Bella Avenue (off-site, downgradient) to determine if a third water bearing zone (C-Zone) occurs at these deeper, unexplored depths, and if confirmed obtain a grab groundwater sample for laboratory analysis to determine if impacts have migrated to the deeper water bearing zone.

2. Advancing a transect of three (3) off-site, downgradient borings on the north side of Terra Bella Avenue for the collection of grab groundwater samples from the previously identified shallow, A-Zone (i.e., ~15-30 feet bgs) and deeper, B-Zone (i.e., ~40-50 feet bgs) to determine the extent of downgradient, off-site impacts in these water bearing zones.

3. Install four (4) paired groundwater monitoring wells to obtain seasonal data on solvent concentrations and groundwater gradient in the A- and B-Zones. The proposed wells will be positioned near, and downgradient of the apparent chemical UST source. One (1) paired well is also proposed for installation at the southern property line, adjacent to an off-site, former hazardous waste sump to provide data on the potential presence of an off-site solvent source. In addition to these proposed well pairs, based on the results of grab groundwater sample analytical data obtained from the downgradient, off-site boring transect described above, we will make appropriate recommendations to Santa Clara County Department of Environmental Health (SCCDEH) for including the installation of an off-site well pair to monitor the downgradient extent of the potential off-site impacts.

We also propose completing a half mile radius well search to locate any nearby water supply wells that could potentially be impacted by the release.

2.0 SITE DESCRIPTION AND BACKGROUND

2.1 SITE SETTING & BACKGROUND

The approximate 0.85 acre subject property (the "site") consists of a single, parcel at 1155 Terra Bella Avenue, in Mountain View, California, and is situated in mixed commercial and residential area. The current Site layout has been the same since at least the mid-1960s.

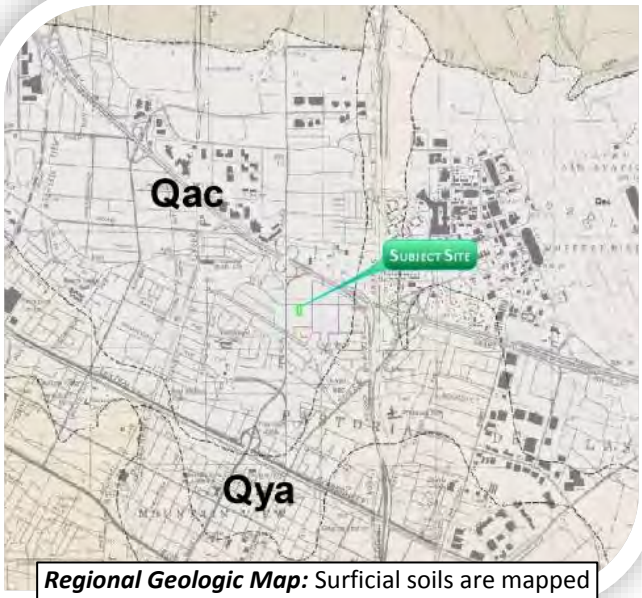
- *Santa Clara County Assessor's Parcel Number (APN):* 153-160-12.
- The property spans a total area of approximately 36,810-ft^2.
- There is a large, commercial warehouse structure on-site along with a smaller storage shed.

The earliest available records (from aerial images dating back to 1939) show the subject Site was largely undeveloped through at least 1950. Agricultural land use (i.e., orchards) were first observed in 1956, and continued until sometime before 1968. The existing site structure and property layout was first observed in 1968, and the layout has remained unchanged thought the current day. The most recent manufacturing operations included the fabrication of radio equipment (Telewave) from the early 1980s through 2008, when operations were moved to a new facility in San Jose. Manufacturing operations included working of raw metals using acid etching, painting, assembly and shipping. Between 2008 and 2016, the site was used for storage and a portion of the building leased to a dog day-care business (Doggie-Ville). The property was acquired by the current owner in late 2016 and has remained unoccupied since that time. The current owner is planning to transition the site to residential.

The adjoining parcels are commercial-industrial, and the surrounding areas contain a mixture of commercial and residential land use (see *Vicinity Aerial Map,* Figure 2). Many of the industrial businesses that operate in this area of Mountain View are involved in the production of electronic and computer components, which often involves the bulk chemical storage and use.

2.2 GEOLOGICAL & HYDROGEOLOGICAL CONDITIONS

Regional geologic maps and reports indicate that surface soils underlying site and the vicinity area generally consist of Holocene-aged surficial sediments consisting of silty clay and organic clay ('Qac', see *regional geologic map*[2], right). This formation generally represents intra-fan areas. To the south and east of the site, there are other surficial sediment formations that consist of alluvial sand, fine-grained silt, and clay (Qya) and area typically associated with the outer edges of depositional fans.



Regional Geologic Map: Surficial soils are mapped as unconsolidated alluvial deposits (Qac) that consist primarily of silty clay, and clays.

Groundwater depth and flow data was gathered from a nearby monitoring network of twelve (12) wells. A quarterly groundwater monitoring report[3] for this nearby leaking underground storage tank site (a Texaco gas station on Shoreline Blvd) indicated shallow groundwater flows in a northernly direction and has a depth to groundwater of around 17 to 24 feet below ground surface (bgs).

As described in the subsection below, a Phase I/II Environmental Site Assessment (ESA) was complete for the site during the summer of 2016, which included the installation of a number of continuously cored soil borings to depths up to 50 feet below the ground surface (bgs). Geologic logs constructed for these borings are included as Appendix A for reference. Generalized observations of on-site subsurface lithology include:

- Lower permeability silts and silty clays are encountered below surface improvements to depths of approximately 11 to 12 feet bgs.

---

[2] *Geologic Map of Santa Clara County, California*, Dibble T.W., dated 2007.

[3] Stantec Consulting Corp, *1st quarter 2010 Semi-Annual Groundwater Monitoring Report, Former Texaco Service Station, dated April 30, 2010*

- Moderate permeability clayey sands to silty sands extend to depths of approximately 24 to 26 feet bgs.
    - **Shallow Groundwater (A-Zone):** Relatively thin water bearing zones (ranging from approximately 0.5 feet to 4.5 feet in thickness) are encountered between depths of approximately 12 and 26 feet bgs within localized sand or gravel lenses. Exception: one boring (DGW-4 encounter a saturated zone between approximately 34 to 37 feet bgs)
- Lithology below depths of approximately 26 feet bgs to depths of approximately 41 feet bgs is somewhat variable ranging from lower permeability silty clays to moderate permeability silty sands and clayey sands.
- **Deeper Groundwater (B-Zone):** a second, deeper water bearing zone was encountered within a well graded gravel deposit at depths below approximately 41 feet bgs, which extends to depths of at least 50 feet bgs.

2.3 PHASE I/II ENVIRONMENTAL SITE ASSESSMENT

A Phase I/II ESA was completed for the property in 2016[4]. The following subsections provide a brief synopsis of the investigation findings.

2.3.1.1 Summary of Phase I Research

A Site inspection, review of local, state and federal regulatory records, and communications with persons knowledgeable about the Site identified two (2) on-site, ***Recognized Environmental Conditions[5],*** which are summarized below.

- Reported Presence of Former Underground Chemical Storage Tank (UST): Interviews with two (2) separate parties have independently confirmed knowledge of an underground chemical storage tank (UST), that was removed sometime during the previous decade. It is likely that the

[4] Weber, Hayes & Associates: *Phase I/II Environmental Site Assessment, Telewave Property*, dated November 15, 2016.

[5] **'REC' - Recognized Environmental Condition:** the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.

suspected underground chemical storage tank was used to store chemicals such as virgin/waste solvents, as suggested in a User Questionnaire. Should a leak have been the reason for its unpermitted removal, there is a strong potential for it to negatively impact the quality of soils and/or groundwater beneath the Site.

- Long-Term Manufacturing: The on-site facility maintained manufacturing operations for over 40 years that reportedly include the manufacture of radio equipment (Telewave) and some sort of computer chip/circuit board fabrication (Circo, Inc). Due to the lack of reviewable records regarding chemical use, storage and disposal, it is not clear how chemicals and wastes were maintained.

  In addition, **one (1) *de minimis* condition**[6] was also identified at the Site.

- Historical Agricultural Land Use (Orchards): Historic aerial photos indicate the property was used for agriculture purposes during the 1950s and early 1960s. Historical agricultural operations in California are documented to include the use of persistent pesticides, which can persist in the environment and create an unacceptable health risk for certain land use scenarios (e.g., residential). However, at the time the ESA was conducted, land use for the subject Site was intended to stay as commercial and encapsulated with paved surfaces, and the potential ingestion/inhalation impacts were considered a *de minimis* condition. **It was recommended that pesticides screening in shallow soils be completed should land use transition to residential.**

  Our review of local, state and federal regulatory records **identified one (1) Recognized Environmental Condition** near the Site, which is described below**.**

- Potential Offsite Contaminant Migration onto the Subject Site: Building records obtained from the City of Mountain View for an adjoining, upgradient property, showed that a manufacturing sump was removed from that property in 1986.[7] Due to the nature of the sump, two closure soil

[6] **De minimis Condition:** a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis conditions are not recognized environmental conditions nor controlled recognized environmental conditions.

[7]: Harris Corp, *Underground Tank Removal Permit Application*, 960 Linda Vista Drive, Mountain View, dated 4/1/1986.

samples were required and analyzed for metals and solvent compounds. The results contained detections of both PCE and TCE indicating some leakage into underlying-soils. However, no further actions were documented.

In addition, there are two other significant and well-defined chlorinated solvent releases (TCE and PCE) that are being actively remediated 2 blocks west of the subject Site (Teledyne and Spectra-Physics plumes). The subject Site is not situated within the lateral limits of the well-defined, groundwater plumes of those two releases. However, two closer properties (located northwest of the subject Site) detected soil vapor contaminants (TCE and PCE) that are attributed, in part, to the Teledyne solvent release, despite not being in direct path of that release plume.

Opinion: The upgradient release of solvents along the adjoining southern property line (upgradient), as documented in 1986 sump closure sampling documents, has the potential to migrate into shallow groundwater beneath the Site, and is considered a ***Recognized Environmental Condition.***

In addition, a *Vapor Encroachment Condition* (VEC) review, indicates there is some potential for vapor encroachment from both: 1) the documented release at the upgradient, property line sump; and 2) the vicinity solvent releases at the Teledyne/Spectra-Physics properties. This potential for vapor (soil gas) encroachment is considered ***Recognized Environmental Condition***.

2.3.1.2 Summary of Phase II Soil and Groundwater Sampling

A completed soil, soil vapor and groundwater sampling and laboratory-testing program was designed to address the *Recognized Environmental Conditions* identified as an outcome of the collected Phase I research described above. The soil, soil vapor and groundwater sampling program targeted areas of concern (infrastructure, chemical storage, etc.). Fieldwork and results are summarized below:

- **Shallow Groundwater Sampling (see Figure 3, Table 1):** On August 10, 2016, first encountered groundwater samples were collected from across the property as a preliminary gauge of site wide, environmental quality. Initially, first encountered groundwater samples were collected and laboratory-tested from eight (8) boring locations that extended to depths of 32 to 36 feet bgs, including three (3) upgradient soil core locations (GW-5, -7, and -8), three (3) mid-property locations (GW-3, -4, and -6), two (2) downgradient property line locations (GW-1, and -2).

All grab groundwater samples were submitted to a State-certified laboratory and analyzed for, *Volatile Organic Solvent Compounds* (VOCs, full list, by EPA Method 8260B) *and Fuel Fingerprint* (includes diesel, gasoline, motor oil), by LUFT/8015B for two locations (GW-1 & GW-4 only).

Results of groundwater analysis confirmed that there is a source of solvent (TCE) contamination centered beneath the suspected, historic chemical UST location. Specifically, a relatively high solvent concentration of TCE (6,600 µg/L, or parts per billion) was detected in first encountered groundwater beneath the tank (GW-4), while concentrations dropped off by two orders of magnitude within 80 feet from the source (GW-6 TCE @ 36 µg/L). An isocontour concentration map of the TCE in the shallow groundwater zone is presented as Figure 3.

- **Deeper Groundwater Sampling (see Figure 4, Table 1):** Due to the impacts in the shallow water bearing zone (discussed above), a follow-up drilling mobilization was completed on September 15 and 16, 2016 in order to evaluate potential impacts to the next (deeper) water-bearing zone, documented to be encountered at approximately depths of 40 feet bgs at nearby chemical release investigation sites[8]. Five (5), deeper groundwater sample (DGW) locations were positioned at upgradient, mid-property, and downgradient locations and grab groundwater samples were collected and submitted to a State-certified laboratory for VOC solvent analysis, specifically one (1) at the upgradient property line (DGW-5), three (3) exploratory borings at mid-property locations (DGW-4, DGW-3, and DGW-2), and one (1) borings at the downgradient property line (DGW-1).

  Results of deeper groundwater analysis confirm that concentrations of solvent VOCs significantly decrease with depth (see Figure 4 and Table 1). As shown on the isocontour map of TCE concentrations in the deeper water bearing zone (Figure 4):

  - The maximum TCE concentrations were again detected beneath the suspected UST source (360 µg/L, at DGW-3), which is more than an order of magnitude decrease in concentration relative to the max concentrations detected in the shallow zone (i.e., 6,600 µg/L in shallow grab sample GW-4; and

[8]: USEPA and Regional Water Quality Control Board, Solvent Release Case, Teledyne Semiconductor (SL721281224, 1300 Terra Bella Ave), and the Spectra Physics Lasers Property (SL721201221, 1250 West Middlefield Road), Mountain View:
- http://geotracker.waterboards.ca.gov/profile_report.asp?global_id=SL721281224

- The dissolved TCE plume appears limited laterally to approximately 110 feet from the suspected source location (the UST).
- However, cis-1,2-DCE, a degradation "daughter product" of TCE, was detected at elevated concentrations at the downgradient sample location (48 µg/L, DGW-1) that exceed its MCL of 6 µg/L. This elevated detection of cis-1,2-DCE suggests natural attenuation of the plume is occurring and the release is limited.

- **Soil Sampling (see Figure 5, Table 3):** Twelve (12) soil samples were collected from depths of approximately 4 to 32 feet bgs at continuously-cored borings DP-3 and DP-4 and submitted for laboratory analysis in order to vertically profile the soils in the vicinity of the former UST. In addition, and as per soil vapor sampling protocols, additional soil samples obtained from a depth of 5 feet bgs at two soil vapor sample locations (SV-1 and SV-2), where vapor sampling was not possible due to low-permeability soils (i.e., high vacuum conditions – see discussion below). The soil samples were submitted to a State-certified laboratory and analyzed for the following:
  - *Volatile Organic (solvent) Compounds* (VOCs) by EPA Method 8260B [all samples]
  - *Fuel Fingerprint* by LUFT/8015B (includes diesel, gasoline, motor oil) [DP-4 only at depths 24, 27 and 31 feet]
  - *Metals* by EPA Method 6010B [DP-4]

  The laboratory results confirmed field observations: elevated concentrations of TCE, and to a much lesser extent cis, 1-2 DCE, were limited to soils beneath the suspected source location (i.e., DP-4), where strong solvent odors were observed in the soil core at depths of 31 feet bgs. Contaminant solvent concentration in all other soil samples contained concentrations below risk-based agency thresholds (*Environmental Screening Levels,* ESLs)[9].

- http://geotracker.waterboards.ca.gov/profile_report.asp?global_id=SL721201221

[9]: **Environmental Screening Levels** (ESLs): from *User's Guide: Screening for Environmental Concerns at Sites With Contaminated Soil and Groundwater,* set by the San Francisco Bay Regional Water Quality Control Board (updated May 2016). The ESLs are intended to provide quantitative risk-based guidance on whether further assessment or remediation of contamination is warranted.

TPH was not detected in soil samples collected at boring DP-4, with the exception of a trace concentration of TPH-diesel detected at 24 feet bgs.

Vertical soil profiling during the second deeper coring mobilization included the collection of soil samples from continuously cored boring DGW-4, situated approximately 20 feet upgradient of the reported UST. Field observations did not note any obvious soil impacts in this boring which was confirmed by laboratory analysis that revealed a single, relatively low-level concentration of cis-1,2-DCE at 32 feet bgs (water bearing soil zone) that marginally exceeded its commercial ESL.

- **Soil Vapor Sampling (see Figure 6, Table 4):** Three (3) temporary, soil vapor-sampling points were installed at the suspected UST location (SV-3), and at two locations along the sanitary sewer lateral (SV-1 and SV-2) where facility process waters were historically discharged. SV-3 was installed in permeable backfill material at the reported UST location and a soil gas sample was easily obtainable. Native soils at the two other soil vapor points (SV-1 and SV-2) consisted of low-permeability silts and clays where *no flow conditions* were encountered during sampling (i.e., high vacuum in the low permeability silts/clays where "stripping" could potentially create a biased high result). As per State DTSC sampling protocols, since soil gas samples could not be obtained due to no flow conditions, a soil sample from the intended soil vapor sample depth (i.e., 5 feet bgs) was laboratory tested to evaluate for the potential presence of solvent VOCs in the low permeability soils.

  The UST backfill vapor sample SV-3, the only soil gas sample obtained due to native soil no-flow conditions, was submitted to a State-certified laboratory and analyzed for *Volatile Organic Compounds* (VOCs) by EPA Method TO-15. Results of laboratory analysis confirmed an elevated concentration **of TCE vapor in the preamble backfill material (25,000 µg/m^3) that exceeds its commercial ESL threshold of 3,000 µg/m^3. In addition, there is an elevated detection of TPH-gasoline but no detections of gasoline's volatile constituent compounds, which suggests "aged-gas".** This may suggest the former UST contained gasoline at one time.

- http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/ESL/ESL%20Workbook_ESLs_Interim%20Final_22Feb16_Rev3_PDF.pdf >

The soil vapor sampling results, including the no flow conditions in native soils, suggests that soil vapor intrusion concerns could be limited to the tank backfill footprint.

3.0 SCOPE OF PROPOSED WORK

This *Work Plan for Additional Site Assessment* (*ASA*) describes additional soil, soil vapor and groundwater investigation tasks designed to further characterize previously confirmed chemical impacts to the subsurface with the goal of generating a *Conceptual Site Model* that will be used to identify potential data gaps and evaluate remediation and/or mitigation approaches to move the site towards regulatory case closure for the proposed transition to residential use. Specifically, the proposed scope of work includes:

"Source Area" Soil Characterization

Investigate the area at, and around the immediate vicinity of the former chemical UST and sanitary sewer lateral to determine the vertical and lateral extent of soil impacts. This proposed, two-part investigation will first involve advancing at least four (4) cone penetrometer test / membrane interface probe (CPT / MIP) borings to qualitatively gauge the extent of soil impacts followed by the collection and laboratory analysis of discrete soil samples to quantify the magnitude and extent of soil impacts beneath the site. The goal of this investigation is to gauge potential soil source removal efforts and/or other potential soil remediation alternatives.

Preliminary Evaluation of Persistent Pesticides in Shallow Soil

Because the site was historically used to grow orchard crops (i.e., circa 1950s through the mid-1960s), there is a potential for residual, persistent pesticides to be present in shallow soils at concentrations that may pose a heath risk if encountered; therefore, in order to facilitate the proposed residential land use transition and provide clearance for this *Recognized Environmental Condition* we propose to conduct a standard of care sampling and laboratory analysis of first encountered native soils beneath site to determine whether persistent pesticides are present at levels that may exceed risk based thresholds.

Soil Vapor Characterization

Obtain additional data on the extent of shallow soil vapor concentrations via the installation of three (3) dual depth soil vapor wells (approximately 5 and 12 feet bgs) near, and downgradient of the apparent

chemical UST source. One (1) soil vapor well is also proposed for installation at the southern property line, adjacent to a former hazardous waste sump to provide data on the potential presence of an off-site solvent source.

Ambient Indoor Air Sampling

While the existing building remains unoccupied and will be razed to facilitate proposed residential development, we propose collecting two (2) ambient indoor air samples (24-hour sampling period) to provide an additional line of evidence on whether vapor intrusion may be risk.

Additional Groundwater Characterization

We propose a phased approach to further characterizing impacts to groundwater which include:

1. Advancing a CPT sounding to depths of approximately 70 to 80 feet bgs on the north side of Terra Bella Avenue (off-site, downgradient) to determine if a third water bearing zone (C-Zone) occurs at these deeper, unexplored depths, and if confirmed obtain a grab groundwater sample for laboratory analysis to determine if impacts have migrated to the deeper water bearing zone.
2. Advancing a transect of three (3) off-site, downgradient borings on the north side of Terra Bella Avenue for the collection of grab groundwater samples from the previously identified shallow, A-Zone (i.e., ~15-30 feet bgs) and deeper, B-Zone (i.e., ~40-50 feet bgs) to determine the extent of downgradient, off-site impacts in these water bearing zones.
3. Install four (4) paired groundwater monitoring wells to obtain seasonal data on solvent concentrations and groundwater gradient in the A- and B-Zones. The proposed wells will be positioned near, and downgradient of the apparent chemical UST source. One (1) paired well is also proposed for installation at the southern property line, adjacent to an off-site, former hazardous waste sump to provide data on the potential presence of an off-site solvent source. In addition to these proposed well pairs, based on the results of grab groundwater sample analytical data obtained from the downgradient, off-site boring transect described above, we will make appropriate recommendations to Santa Clara County Department of Environmental Health (SCCDEH) for including the installation of an off-site well pair to monitor the downgradient extent of the potential off-site impacts.

We also propose completing a half mile radius well search to locate any nearby water supply wells that could potentially be affected by the release.

Additional details on the proposed Scope of Work are presented below.

3.1 PRE-FIELDWORK TASKS

In order to access proposed soil boring investigation locations that are situated within the footprint of the existing, vacant building, the building must be razed. As the property owner/responsible party plans to redevelop the property and does not intend to lease the existing building in the interim, removal of the current site improvements is planned pending approval of demolition permits. Building demolition/removal will also be necessary for subsequent primary source removal efforts. A survey will be completed prior to building demolition in order to accurately preserve the location of key site features such as the former chemical UST and sanitary sewer lateral such that they can be subsequently located with accuracy.

Other tasks that will be completed prior to the investigation mobilization will include:

- Obtaining regulatory concurrence and approval of this *Work Plan* from the SCCDEH and providing at least five (5) days notification prior to the start of any fieldwork.
- Preparation of a Site Health & Safety Plan in accordance with State and Federal hazardous waste operations regulations (California Code of Regulations, Title 8, Section 5192 and 29 Code of Federal Regulations 1910.120) (included in Appendix B).
- Procuring a soil boring permit through the Santa Clara Valley Water District for borings that will extend deeper than 45 feet below the ground surface (bgs).
- Procuring monitoring well installation permits through the Santa Clara Valley Water District.
- Procuring encroachment permits through the City of Mountain View Public Works Department for the installation of borings and monitoring wells in the city right of way along Terra Bella Avenue.
- Retaining the appropriate contractors (i.e., drilling, down-hole screening, and traffic control) to complete the field investigation.
- Prior to drilling activities, Underground Service Alert (USA) will be contacted at least 48 hours in advance to identify the location of utilities that enter the property. All proposed boring locations will be clearly marked with white paint as required by USA. USA will contact all utility owners of record within the Site vicinity and notify them of the intent to drill. All utility owners

of record will be expected to clearly mark the position of their utilities on the ground surface throughout the designated area. In addition, a private utility locating firm will be retained to examine the Site with geophysical tools to locate on-Site, privately owned utilities.

3.2 "SOURCE AREA" SOIL CHARACTERIZATION

Soil analytical results from the previous investigation revealed an elevated concentration of TCE at a depth of 31 feet bgs immediately adjacent to the former chemical UST location (boring DP-4; see Figure 5 and Table 2), with only low-level concentrations detected at shallower depths (below residential screening thresholds). Soil borings installed approximately 15 feet north (DGW-4) and 30 feet southeast (DP-3) of boring DP-4 also did not reveal elevated concentrations of VOCs above residential screening thresholds, with the exception of cis-1,2 DCE detected slightly above the residential screening threshed at a depth of 32 feet bgs in boring DGW-4 (see Figure 5, Table 2). **Although near surface soil impacts were not identified during the previous Phase II Investigation, results of grab groundwater samples suggest that that the source of the TCE release originates at the former chemical UST or possibly the adjacent sanitary sewer lateral and associated former sink drain.** In order to locate the point source of the release and obtain data on the vertical and lateral extent of soil impacts we propose completing a two-part investigation that will include:

1. **Initial Mobilization:** Advancing at least four (4) cone penetrometer test / membrane interface probe borings (CPT/MIP-1 through -4; see Figure 6) to depths of approximately 40 feet bgs (i.e., to depths just above B-Zone groundwater) in an attempt to qualitatively identify the location of the point source release and the approximate vertical and lateral extent of soil impacts. The CPT takes measurements of cone bearing, sleeve friction and dynamic pore water pressure at 5-centimeter intervals during penetration to provide a nearly continuous hydrogeologic log. CPT data reduction and interpretation is performed in real time. The MIP is a multipurpose, semi-qualitative tool for real-time mapping of subsurface soil and groundwater contamination, specifically volatile organic compounds (VOCs) such as halogenated solvents / chlorinated VOCs (cVOCs) and petroleum compounds. If review of the real time MIP data indicates that the installation of additional CPT/MIP borings would be beneficial to the investigation (i.e., step-out borings), additional borings may be advanced during the field mobilization.

2. **Follow-up Mobilization:** Based on the results and interpretation of the CPT/MIP screening investigation, we will propose the installation of soil borings for obtaining discrete soil samples

for laboratory analysis to quantitatively determine the magnitude and extent of soil impacts observed in the MIP data. These soil borings will be installed via conventional direct push drilling techniques. **Specific plans for this follow-up soil sampling scope will be communicated via email to SCCDEH staff for their concurrence and approval prior to mobilization.**

All soil borings will be advanced by a licensed C-57 driller under the direct supervision of experienced Weber, Hayes and Associates (WHA) personnel. The CPT and MIP soundings will be performed by an experienced contractor that specializes in this technology. Proposed boring locations are depicted on Figure 2. Fieldwork will follow our standard *Field Methodology for Cone Penetrometer Testing / Membrane Interface Probe (CPT/MIP) Screening*, which is presented in Appendix C. Fieldwork for follow-up soil sampling will follow our standard *Field Methodology for Hydraulic Driven Probes*, which is also presented in Appendix C.

During follow-up soil sampling, the soil cores from each boring will be carefully examined by an experienced WHA field geologist to produce a boring log, using visual observations and a hand-held photoionization detector (PID) meter to screen for VOCs. Collected soil samples selected for laboratory analysis will be immediately preserved in the field by employing EPA Method 5035 field preservation techniques. The soil samples will be submitted to a State-certified laboratory under chain of custody procedures for the following analysis:

- VOCs by EPA Method 8260B

Analytical results will be compared with residential screening thresholds established in the San Francisco Bay Region - Regional Water Quality Control Board's Environmental Screening Levels (ESLs) and the State DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment "Note 3" screening values (DTSC Note 3)].

3.3 PRELIMINARY EVALUATION OF PERSISTENT PESTICIDES IN SHALLOW SOIL

Because the site was historically used to grow orchard crops (i.e., circa 1950s through the mid-1960s), there is a potential for residual, persistent pesticides to be present in shallow soils at concentrations that may pose a heath risk for the proposed residential land use transition. In order to provide clearance for potential contaminants we propose completing standard of care sampling and laboratory analysis of first encounter native soils beneath site to determine whether persistent pesticides are

present at levels that may exceed risk-based thresholds. Specifically, the proposed sampling will follow the Department of Toxic Substances Control (DTSC) *Interim Guidance for Sampling Agricultural Properties (Third Revision)*, dated August 7, 2008, which provides an approach for evaluating former agricultural properties where pesticides may have been applied. The guidance recommends collecting and analyzing four (4) discrete samples across areas less than three (3) acres. The approximate site acreage is 0.85 acres. The guidance document recommends collecting surface samples (i.e., first encountered soil beneath extraneous materials such as vegetation or other site coverings such as pavement, imported fill, etc.). Recommended laboratory analysis includes the standard suite of organochlorine pesticides and arsenic.

Based on the guidance provided by DTSC, we propose collecting four (4) discrete shallow soil samples (SP-1 through SP-4) from approximate equidistant locations across the site to provide a relatively even distribution of coverage (see Figure 6). Soil samples will be collected from first encountered native soils (i.e., beneath extraneous material). Deeper, backup samples collected from a depth of 6-9 inches below first encountered native soils and placed on hold at the testing laboratory for potential analysis pending the results of the shallow counterpart sample. Soil sampling will be conducted by WHA personnel in accordance with our standard *Field Methodology for Shallow Soil Sampling*, which is presented in Appendix C. Samples will be submitted to a State-certified laboratory under chain of custody procedures for the following DTSC recommended suite of analysis:

- Organochlorine Pesticides by EPA Method 8081
- Arsenic by EPA Method 6010B

Analytical results will be compared with residential ESLs and DTSC Note 3 values. We note that arsenic has very low toxicological screening threshold, well below typical naturally occurring background concentrations. A 2011 study[10] confirms naturally background concentrations (99th percentile) of arsenic in the San Francisco Bay Region (which includes Santa Clara County in the study area) to be 11 mg/kg. Therefore, we propose evaluating the potential risk of any on-site detections of arsenic with respect to this established naturally occurring background concentration.

[10] Duvergé, 2011: Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region

If results for any sample exceed the established residential screening thresholds or background arsenic concentrations, then we will contact the lab to analysis the deeper counterpart sample and will subsequently provide a plan to SCCDEH to conduct "step-out" soil sampling to define the lateral and vertical extent of residual soil impacts.

3.4 ADDITIONAL SOIL VAPOR CHARACTERIZATION

During the 2016 Phase II ESA, three (3) shallow (5-foot deep) temporary soil vapor wells were installed at: 1) the former chemical UST location (SV-3; in the permeable backfill material), and 2) at two (2) locations along the sanitary sewer lateral (SV-1 and -2; see Figure 5). Results of laboratory analysis confirmed an elevated concentration of TCE vapor in the permeable UST backfill material (25,000 µg/m^3) which significantly exceeds the residential ESL/DTSC Note 3 threshold of 240 µg/m^3. Samples were not obtainable from temporary wells SV-1 and 2 due to no-flow conditions, which is attributed to the low permeability soil (i.e., silt to silty clay) encountered at the 5 foot sample depth.

In order to obtain additional data on the vertical and lateral distribution of shallow soil vapor concentrations, we propose to install three (3) dual depth soil vapor wells (approximately 5 and 12 feet bgs) near, and downgradient of the apparent chemical UST source (V-2 through V-4). The dual depth wells (i.e., sample tubing & filter tip) will be installed within the same borehole. We note that low permeability soils were encountered to depths of approximately 11 feet bgs in all previous on-site borings and acknowledge that it may not be possible to obtain samples from the shallow, 5-foot sample depth. The deeper soil vapor well is intended to sample soil vapor within a more permeable soil encountered below approximately 11-12 feet bgs, but above first groundwater which was routinely encountered in a thin, saturated lens between approximately 12-15 feet bgs (see boring logs; Appendix A). The final depth of the deeper soil vapor well will be determined in the field based on soil core observations. The soil vapor wells are expected to provide reasonable coverage to assess the potential vapor intrusion pathway.

One (1) dual depth soil vapor well (V-1) is also proposed for installation at the southern property line, adjacent to a documented, former hazardous waste sump to provide data on the potential presence of an off-site solvent source. Proposed soil vapor well locations are shown on Figure 7.

We will contract with a licensed C-57 driller to install the proposed permanent soil vapor wells. Installation and subsequent sampling will follow our *Field Methodology for Active Soil Gas Sampling*, which is in general accordance with protocols established in DTSC's 2015 *Advisory for Active Soil Gas*

Investigations, and is presented in Appendix C. Collected samples will be submitted to a State-certified laboratory under chain of custody procedures for the following analysis:

- VOCs by EPA Method TO-15

Analytical results will be compared with residential ESLs and the DTSC Note 3 values.

3.5 AMBIENT INDOOR AIR EVALUATION

While the existing building remains unoccupied and will be razed to facilitate proposed residential development, we propose collecting two (2) ambient indoor air samples (IA-1 and IA-2) to provide some insight as to whether vapor intrusion is currently occurring. We acknowledge that the samples may not be representative of indoor air quality for future buildings due to likely differences in building size, foundation construction and heating, ventilation and air conditioning (HVAC) configurations. However, it is our opinion that the data will be useful in providing some information as to whether the subsurface soil gas to indoor air pathway is complete.

The proposed sample locations will be placed at potential worst-case locations which include a former sink drain adjacent to the former chemical UST (IA-1) and a floor drain within a former wash room situated approximately 60 feet north of the former chemical UST (IA-2), and adjacent to the sewer lateral.

Sampling will follow our *Field Methodology for Ambient Air Sampling*, which is in general accordance with protocols established in DTSC's 2011 *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* and is presented in Appendix C. Per the DTSC guidance, we will complete a limited building survey to document conditions prior to sample collection and document any building inventory that may have the potential to skew the results (e.g., chemicals or materials that may contain VOCs). The DTSC guidance also recommends concurrently sampling outdoor ambient air to provide information regarding outside influences on indoor air quality. However, we do not propose collecting outdoor ambient air samples for two (2) reasons: 1) the building is currently non-operational (i.e., no active HVAC system exchanging indoor / outdoor air), and 2) we are specifically sampling for the presence TCE (and daughter products), which is not a common urban air pollutant.

Collected samples will be submitted to a State-certified laboratory under chain of custody procedures for the following analysis:

- VOCs by EPA Method TO-15 Modified SIM (low level detection limits)

Analytical results will be compared with residential ESLs and the DTSC Note 3 values.

3.6 ADDITIONAL GROUNDWATER CHARACTERIZATION

Results of groundwater sampling and analysis completed during the 2016 Phase II ESA confirmed that there is a source of solvent (TCE) contamination centered beneath the suspected, former chemical UST location. Specifically, a relatively high solvent concentration of TCE (6,600 µg/L, or parts per billion) was detected in first encountered groundwater (i.e., A-Zone encountered between approximately 15-30 feet bgs) beneath the tank (GW-4), while concentrations dropped off by two (2) orders of magnitude within 80 feet from the suspected source (GW-6 TCE @ 36 µg/L), as shown on Figure 3.

Results of follow-up, deeper groundwater sampling and analysis (i.e., B-Zone encountered between approximately 40-50 feet bgs) confirm that concentrations of solvent VOCs significantly decrease with depth (see Figure 4 and Table 1). As shown on the isoconcentration map of TCE concentrations in the deeper water bearing zone (Figure 4), the maximum TCE concentrations were again detected beneath the suspected UST source (360 µg/L, at DGW-3), which is more than an order of magnitude decrease in concentration relative to the max concentrations detected in the shallow zone (i.e., 6,600 µg/L in shallow grab sample GW-4. The dissolved TCE plume appears limited laterally to approximately 110 feet from the suspected source location (the UST).

In order to further characterize groundwater impacts beneath the site, we propose the following phased investigation approach:

3.6.1.1 Initial Mobilization – Downgradient Grab Groundwater Sampling

In order to determine if significant solvent impacts have migrated to an even deeper water bearing zone (i.e., below the B-Zone) we propose advancing a CPT sounding (HP/CPT-2; see Figure 8) to depths of approximately 70 to 80 feet bgs (or deeper if necessary and possible) on the north side of Terra Bella Avenue (off-site, downgradient). If a third water bearing zone (C-Zone) is confirmed at these deeper, unexplored depths, then we will obtain a grab groundwater sample for laboratory analysis to determine if impacts have migrated to the deeper water bearing zone.

During the same mobilization we propose to advance a transect of three (3) off-site, downgradient borings (HP-1 through HP-3) on the north side of Terra Bella Avenue (including HP/CPT-2 described above) for the collection of grab groundwater samples from the previously identified shallow, A-Zone (i.e., ~15-30 feet bgs) and deeper, B-Zone (i.e., ~40-50 feet bgs) to determine the extent of

downgradient, off-site impacts in these water bearing zones. These proposed boring are shown on Figure 8.

We will contract with a licensed C-57 driller to install the proposed soil borings and CPT sounding. Fieldwork will follow our standard *Field Methodology for Cone Penetrometer Testing* and *Hydraulic Driven Probes*, which are presented in Appendix C.

We acknowledge that there is some limited risk in advancing CPT soundings through multiple water bearing zones do to the risk of cross-contaminating deeper water bearing zones once the tools is retracted from the subsurface and the borehole is left open for a brief period of time prior to borehole sealing. However, the proposed deeper CPT sounding (i.e., HP/CPT-2) is being installed at a downgradient location from the site where shallow groundwater impacts are expected to be much less significant based on previously collected on-site data. Furthermore, boring advancement into the deeper B-Zone and possible C-Zone water bearing zones (if encountered) will be conducted in separate boreholes using a disposable PVC "drop-screen" such that following grab groundwater sample collection, the screen section (5-foot length) will be abandoned at the base of the borehole and the borehole can be sealed from the bottom upwards by introducing grout through the drill rods as they are being retracted, thus eliminating vertical migration of groundwater. Additional protocols for sealing boreholes are included in the Appendix C *Field Methodologies*.

Collected samples will be submitted to a State-certified laboratory under chain of custody procedures for the following analysis:

- VOCs by EPA 80260B

Analytical results will be compared with State Maximum Contaminant Levels (MCLs).

3.6.1.2 Subsequent Mobilization – Monitoring Well Installation, Development & Post Development Sampling

We propose to install four (4) paired groundwater monitoring wells to obtain seasonal data on solvent concentrations and groundwater gradient in the A-Zone and B-Zones (MW-1A/B through MW-2A/B; see Figure 8). The proposed wells will be positioned near, and downgradient of the apparent chemical UST source (MW-2A/B, and MW-3A/B and -4A/B, respectively; see Figure 8). One (1) paired well is also proposed for installation at the southern property line, adjacent to a former, off-site hazardous waste sump to provide data on the potential presence of an off-site solvent source (MW-1A/B). In addition to

these proposed well pairs, based on the results of grab groundwater sample analytical data obtained from the downgradient, off-site boring transect (i.e., HP-1 through HP-3), we will make appropriate recommendations to SCCDEH for including the installation of an off-site well pair to monitor the downgradient extent of the potential off-site impacts. **Proposed plans for this additional, downgradient well will be communicated to SCCDEH via email for their review and approval prior to initiating the well installation mobilization.**

3.6.1.3 Proposed Groundwater Monitoring Well Design – A-Zone & B-Zone Wells

As discussed in previous sections of this *Work Plan*, shallow, A-Zone groundwater is generally encountered in relatively thin, saturated lenses between 15 and 30 feet bgs. Deeper, B-Zone groundwater is encountered in a gravelly zone between approximately 40 and 50 feet bgs. Based on these hydrogeologic conditions we proposed the following well construction design:

- Paired A/B-Zone wells will be situated within approximately 5 feet from one another and installed in sperate boreholes
- Total Depth: The total well depth will extend to:
    - A-Zone: 30 feet bgs
    - B-Zone: 50 feet bgs
- Well Material: The wells will be constructed of 2-inch diameter, threaded schedule 40 Polyvinyl Chloride (PVC)
- Wells Screens: The wells screens will consist of 0.01-inch factory slotted schedule 40 PVC installed at the base of the well borehole:
    - A-Zone: 15 to 30 feet bgs
    - B-Zone: 40 to 50 feet bgs
- Filter Pack: The filter pack will consist of #2/12 or #3 sand and extend from the base of the borehole to approximately 2 feet above the screened interval
- Annual Seal: The annular seal will consist of approximately 2 feet of hydrated bentonite above the sand filter pack followed by neat cement grout to approximately 6-inches bgs (i.e., 0.5 to 6 feet bgs).

- Surface Completion: Each well will be secured with an 8- or 12-inch diameter traffic rated monitoring well vault set in concrete. The top of well casing will be secured inside the well vault with a locking well cap.

3.6.1.4 Monitoring Well Installation

Monitoring wells will be installed by a licensed C-57 well drilling contractor with specific experience installing groundwater monitoring wells, in accordance with our *Field Methodology for Monitoring / Remediation Well Installation*, which is included in Appendix C. Well bores will be drilled via a hollow stem auger drill rig equipped with 8-inch diameter hollow stem augers. Wells will be constructed, as described above, through the hollow stem augers.

A limited number of soil samples will be collected from the well bores at the discretion of an experienced WHA field geologist in order to confirm lithology and geologic contacts. Well boreholes will be logged by an experienced geologist using the Unified Soil Classification System (USCS) and be recorded in the field on geologic logs. No soils will be retained for laboratory analysis unless chemical impacts are observed, in which case soil samples will be selected for laboratory analysis to determine the vertical extent of soil impacts. Sample handling and preservation will be conducted in accordance with *Field Methodologies* presented in Appendix C, and samples will be laboratory analyzed for VOCs by EPA Method 8260B.

3.6.1.5 Monitoring Well Development & Post Development Sampling

Well development operations will occur no sooner than 48 hours following well installation in accordance with our *Field Methodology for Well Development and Post Development Sampling*, which is included in Appendix C. Well development will promote good hydraulic communication between the well filter pack and surrounding formation and will remove fines from the filter pack. Prior to development a depth to water measurement will be collected from each well to the nearest hundredth (0.01) of a foot with an electric sounder. After the depth to water is measured, each well will be checked for the presence of dense nonaqueous phase liquid (DNAPL) with an electronic oil/water interface probe. If DNAPL is present, the thickness of the layer will be recorded.

After measuring the depth-to-groundwater, a surge block will be used to physically swab the wells entire screened interval a minimum of 50 strokes in order to remove fines from the sand pack and promote gradation between the surrounding formation and the sand pack. Following well swabbing the well will

be purged with a low flow submersible electric pump until visually free of turbidity. It may be necessary to repeat the well swabbing and purging steps if the turbidity of the discharge water does not decrease during the well purge. During purging the physical parameters of temperature, conductivity, pH, dissolved oxygen (D.O.) concentration, and Oxidation-Reduction Potential (ORP) of the purge water will be monitored with a Flow-Through Cell equipped multi-meter to ensure that these parameters have stabilized. Purging will be determined to be complete (stabilized aquifer conditions reached) after the removal of at least three well casing volumes of water, when the discharge water is observed to be free of turbidity, and when the physical parameters have stabilized.

After purging, the water level in the well will be allowed to recover to approximately 80 percent of its original depth before a sample is collected. After water level recovery, a post-development groundwater sample will be collected from each well with a new, disposable bailer, and decanted into the appropriate laboratory-supplied sample container (i.e., 40 mL VOAs). All samples will be labeled in the field and transported in insulated containers cooled with blue ice to State-certified laboratory under proper chain of custody procedures for the following analysis:

Analytical results will be compared with State MCLs.

3.7 SURVEY

Prior to demolition of exiting site improvements, which will need to occur prior to the installation of borings / wells proposed within the foot print of the existing building, we will retain a California-Licensed Land Survey to complete a survey of key site features that will include the location of the former chemical UST and the sanitary sewer lateral. This survey data will be relied upon for accurately positioning the proposed borings following building demolition.

Following the installation of the proposed soil vapor and groundwater monitoring wells, horizontal and vertical locations (top of well casing elevation) will also be surveyed by California-Licensed Land Survey to satisfy State GeoTracker field point data documentation. The survey data will also be used to calculate groundwater elevations across the groundwater monitoring well network in order to accurately determine groundwater gradient and flow direction.

3.8 INVESTIGATIVE DERIVED WASTE

All investigative derived waste (IDW) generated during subsurface investigation activities, including soil cuttings, decontamination water and purged groundwater will be containerized on site in labeled 55-

gallon drums or other appropriate containers (e.g., soil roll-off bins) and will be subsequently properly disposed of by a licensed waste hauling contractor. Documentation of proper IDW disposal will be provided in the subsequent technical report documenting the related investigation activities.

3.9 HALF MILE RADIUS WELL SEARCH

We propose completing a record search through the Department of Water Resources to locate any potential active groundwater supply wells within a half mile radius of the Site to confirm whether there are any nearby drinking water supply wells that could potentially become impacted by the site release. Any wells identified within the radius search (with the exception of chemical release monitoring wells, cathodic protection wells and/or destroyed wells) will be plotted on a plan view location map and pertinent well construction information (i.e., installation date, total depth and screened interval), use details (i.e., domestic, municipal, irrigation) and distance from the site will be summarized in a spreadsheet which will be incorporated into the subsequent technical report documenting the related investigation activities. Pending the results, we will provide recommendations for sampling off-site wells if appropriate.

3.10 SUMMARY REPORTING

Following the completion of all proposed investigation tasks we will prepare a technical report presenting the investigative methods, figures depicting sample locations and analytical results, grologic cross sections, tabulated analytical results, laboratory analytical reports, a summary of our interpretation of the data, and recommendations for appropriate next steps based on the data. The report will be submitted to SCCDEH for their review and comment. All work will be conducted under the supervision of a California Registered Professional Geologist.

Concurrently, we will prepare a *Conceptual Site Model* (CSM) that will incorporate all investigative data obtained during the previous Phase II ESA and results of the currently proposed investigative tasks. The CSM is a progressive assemblage of information regarding the distribution of chemicals of concern and the hydrologic setting of the site. The CSM describes the regional and local geology and hydrogeology, surrounding land use, sensitive receptors, conduits, preferential pathways, and the likely distribution of chemicals of concern and any other factors relevant to the release. The CSM serves as the framework for the investigation, remediation and ultimately the closure of the chemical release site. The CSM is

dynamic and is continually updated as more information is gathered. Subsequent investigations provide data to accurately define the conditions at the site and close data gaps.

4.0 SCHEDULE

Following regulatory approval of this *Work Plan* we will begin procuring the necessary permits (i.e., soil borings and city encroachment). Following permit approval, we will contact SCCDEH with a proposed schedule. As described in this *Work Plan*, the site building will need to be razed prior to installing proposed boring as the necessary drilling equipment will not be able to access the locations within the footprint of the building. The time-frame for the property owner to obtain demolition permits and complete site demolition activities is uncertain. Therefore, some investigation activities will need to be scheduled with the SCCDEH following site demolition. However, prior to building demolition/removal the proposed ambient indoor air sampling will be completed and can be scheduled soon after *Work Plan* approval. The following provides a possible sequencing of the proposed assessment tasks:

Before Site Improvements are Removed

- Complete ambient indoor air sampling (proposed IA-1 & IA-2)
- Complete downgradient, off-site grab groundwater sampling (proposed HP-1, HP/CPT-2 & HP-3)

After Site Improvements are Removed (time-frame currently uncertain)

- Complete source zone investigation (proposed CPT/MIP-1 through -4) and subsequent direct push soil sampling based on results of the CPT/MIP investigationComplete shallow soil sampling for persistent pesticides clearance (proposed SP-1 through -4)
- Complete the installation and initial sampling of dual depth soil vapor monitoring wells (proposed V-1 through V-4) and paired A/B-Zone groundwater monitoring wells (proposed MW-1A/B through -4A/B, including the likely recommendation and approval of an additional off-site, downgradient well pair pending results of off-site grab groundwater samples collected from proposed HP-1 through HP-3).

A technical report documenting all completed tasks will be prepared and submitted within sixty (60) days following the completion of all proposed investigative tasks and receipt of all laboratory analytical

results. A CSM will also be concurrently submitted under separate cover within this proposed time-frame.

5.0 LIMITATIONS

Our service consists of professional opinions and recommendations made in accordance with generally accepted geologic and engineering principles and practices. This warranty is in lieu of all others, either express or implied. The analysis and conclusions in this report are based on sampling and testing which are necessarily limited. Additional data from future work may lead to modification of the opinions expressed herein.

All work related to this investigation and remediation at this Site is done under the direct supervision of a Professional Geologist or Engineer, registered in California, and experienced in environmental assessment and remediation.

Thank you for the opportunity to participate in the assessment of this site. If you have any questions regarding this report, or any aspect of this project, please contact us at (831) 722-3580.

Sincerely yours,

WEBER, HAYES AND ASSOCIATES

A California Corporation

NOTES:

GW = Groundwater **DGW =** Deeper Groundwater Sample

1 = Water Quality Goals: Goals establised by the CRWQCB Central Coast Region based on State *Maximum Contaminant Levels* (Department of Health Services) or taste & odor threshold limits.

2 = Depths shown are not necessarily stabilized depth to groundwater. Boring logs show damp to moist, interbedded fine grained silts, clays and clayey sands to depths of 32 feet, with no saturated water bearing zones. Cased borings slowly porduce water.

3 = No MCL established for TPH as diesel or TPH as motor oil, instead, the ESL thresholds are listed in place of the MCLs.

BOLD = Indicates contaminant compound detected. **BOLD =** Indicates concentration exceeds Water Quality Goal.

J = Laboratory indicates a value between Method MDL and PQL and that the reported concentration should be considered as estimated rather the quantitative.

< # = Reporting limit elevated due to sample dilution and compound not detected at or above the Method Detection Limit (MDL),

ND = Not Detected **NE =** Not Established **bgs =** below ground surface

PCE = Tetrachloroethene **cis 1,2-DCE =** cis-1,2-Dichloroethene **1,1-DCE =** 1,1-Dichloroethene **1,1,1-TCA =** 1,1,1-Trichloroethane

TCE = Trichloroethene **trans 1,2-DCE =** trans 1,2-Dichloroethene **1,1-DCA =** 1,1-Dichloroethane

Notes

1 = **Environmental Screening Levels (ESLs):** from *User's Guide: Screening for Environmental Concerns at Sites With Contaminated Soil and Groundwater,* set by the San Francisco Bay Regional Water Quality Control Board (updated May 2016). <http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/ESL/ESL%20Workbook_ESLs_Interim%20Final_22Feb16_Rev3_PDF.pdf > The ESLs are intended to provide quantitative risk-based guidance on whether further assessment or remediation of contamination is warranted. The ESLs used in this table were obtained from the above referenced document.

2= **CA DTSC Modified Soil Screening Levels:** From the California Department of Toxic Substances Control (DTSC), Office of Human and Ecological Risk (HERO), *Human Health Risk Assessment (HHRA) Note Number 3, Table 3* , Jan 2016 < https://www.dtsc.ca.gov/AssessingRisk/upload/HHRA-Note-3-2016-01.pdf >.

A = No established DTSC HERO Note 3 threshold value for the analyte. The Regional Screening Levels are referenced when no DTSC value is provided (see below for reference).
NOTE: The USEPA Regional Screening Levels (RSLs): from the *USEPA Region 9 RSL Tables* (updated November 2015) <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables-november-2015, revised Nov 2015>. The RSLs are risk-based screening levels used for screening sites, calculating risk factors and potentially as cleanup goals once a site has been characterized.

<X or ND = Analyte not detected at or above the laboratory Method Detection Limit (MDL), X.

NE = Not Established

J = Analyte Detected above Method Detection Limit (MDL) but below the PQL.

BOLD = Analytical result above Residential ESL or DTSC HERO Note 3 value.

BOLD = Analyte Detected

*= Soil sample collected and anlyzed due to low flow vapor condtions (refusal) at this location originally targeted for soil vapor sampling.

Table 3

Soil Sample Analytical Results - Metals

Former Telewave Property - 1155 Terra Bella Avenue, Mountain View

Notes

1 = **Environmental Screening Levels (ESLs):** from *User's Guide: Screening for Environmental Concerns at Sites With Contaminated Soil and Groundwater,* set by the San Francisco Bay Regional Water Quality Control Board (Final version, 2016). The ESLs are intended to provide quantitative risk-based guidance on whether further assessment or remediation of contamination is warranted.

2 = **Naturally Occuring Arsenic:** Note that Arsenic concentrations (and other metals) do occur naturally in the environment. Arsenic is a unique metal that can be present at naturally-occuring levels but still exceed the extremely low, agency thresholds for risk (threshold limit generated from toxicity studies). Naturally-occurring Arsenic concentrations in the Bay Area have been established at 11 mg/kg (Duvergé, 2011).

ND = Analyte not detected above the laboratory Method Detection Limit (MDL).

BOLD = Analytical result above Residential ESL.

- = Sample was not analyzed for this constituent

PCB = Polychlorinated biphenyl

MDL = Laboratory's mimimum detection level (lowest achievable concentration, based on high confidence level).

J = Laboratory reports that the detection value is between MDL and PQL, and should be considered to be an estimate with a high level of confidence.

Table 4

Soil Vapor Sample Analytical Results

Volatile Organic Compounds

Former Telewave Property - 1155 Terra Bella Ave, Mountain View

All soil vapor results are in microgram per cubic meter (ug/m ^{3})

Investigation Date	Sample Information		TPH as Gasoline	Volatile Organic Compounds (VOCs) — Laboratory Analysis by EPA Method TO-15 at STP											Leak Check Monitoring (Isopropyl Alcohol)		
	Sample ID	Depth (feet below ground surface)		Benzene	Toluene	Ethylbenzene	Xylene	PCE	TCE	cis- 1,2 DCE	trans- 1,2 DCE	Vinyl Chloride	1,1,1- Trichloroethane	Other VOCs	Field Shroud Concentration (avg., in ppm)	Laboratory Results (in ug/m^3)	Calculated Leakage (percent)
Soil Vapor Sampling (August 9, 2016)	SV-1	5	SAMPLE REFUSAL (No soil gas flow at these two vapor well locations due to low permability clays) As per State DTSC protocol for no-flow conditions, a backup soil sample was collected at the base of each boring and laboratory tested (See TABLE 3 for these Soil Test Results)												--	--	--

Notes

1 = **Environmental Screening Levels (ESLs):** from *User's Guide: Screening for Environmental Concerns at Sites With Contaminated Soil and Groundwater,* set by the San Francisco Bay Regional Water Quality Control Board (Interim Final, Feb 2016) < **http://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/ESL/ESL%20Workbook_ESLs_PDF_Rev2.pdf** >. The ESLs are intended to provide quantitative risk-based guidance on whether further assessment or remediation of contamination is warranted. The ESLs used in this table were obtained from the above referenced document,"Tier 1 ESLs", based on shallow soils (<3m), groundwater is a current or potential source of drinking water.

2 = **US EPA Region 9 Indoor Air Regional Screening Levels (RSLs):** From *US EPA Regional Screening Levels for Indoor Air* (**https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables-november-2015,** revised Nov 2015) . The Indoor Air RSLs are divided by the US EPA's Recommended Vapor Attenuation Factor (from the US EPA's Recommended Vapor Attenuation Factor for Risk Based Screening of sub-slab soil gas [Table 6-1 in Final Guidance for Assessing and Mitigating the Vapor Intrusion Pathway From Subsurface Sources to Indoor Air, June 2015]) to calculate the Risk Level concentration appropriate for the specific sample collected (i.e., Sub-slab soil gas, "Near-source" exterior soil gas, Crawl space air, etc.).

3 = **CA DTSC Modified Air Screening Levels:** From the California Department of Toxic Substances Control (DTSC), Office of Human and Ecological Risk (HERO), *Human Health Risk Assessment (HHRA) Note Number 3, Table 3* , Jan 2016 < **https://www.dtsc.ca.gov/AssessingRisk/upload/HHRA-Note-3-2016-01.pdf** >. The Modified Air Screening Levels are divided by the DTSC's Recommended Vapor Attenuation Factor (0.05) to calculate the Risk Level concentration appropriate for the specific sample collected. Where Modified Air Screening Levels are not available, US EPA RSLs (see Note 2 above) are used with the DTSC attenuation factor.

ND = Analyte not detected above the laboratory Method Detection Limit (MDL).

PCE = Tetrachloroethene

cis- 1,2 DCE = cis-1,2 Dichloroethene

< # = Compound not detected at or above the elevated detection limit, X.

^ = PQL and MDL are elevated due to sample dilution

J = Value falls below the PQL and is therefore an estimated value

NE = Not Established

TCE = Trichloroethene

trans- 1,2 DCE = trans-1,2-Dichloroethene

-- = Sample was not analyzed for this constituent

TPH = Total Petroleum Hydrocarbons

BOLD = Analytical result above CA DTSC-Modified COMMERCIAL "Near Source" Threshold Limit.

BOLD = Analytical result above CA DTSC-Modified RESIDENTIAL "Near Source" Threshold Limit.

APPENDIX A

GEOLOGIC LOGS

Geologic Symbols and Terms

	Major Divisions	Symbols	Descriptions
Coarse Grained Soils	Gravels (More than 1/2 of coarse fraction > no. 4 sieve size)	GW	Well Graded Gravels, little or no fines
		GP	Poorly Graded Gravels, little or no fines
		GM	Silty Gravels, gravel-silt mixtures
		GC	Clayey Gravels, gravel-clay mixtures
	Sands (More than 1/2 of coarse fraction < no. 4 sieve size)	SW	Well Graded Sand, little to no fines
		SP	Poorly Graded Sand
		SM	Silty Sand, sand-silt mixtures
		SC	Clayey Sand, sand-clay mixtures
Fine Grained Soils	Silts and Clays Liquid Limit < 50%	ML	Silt or Very Fine Sands, rock flour, with slight plasticity
		CL	Inorganic Clay with high plasticity, lean clay
	Silts and Clays Liquid Limit > 50%	MH	Inorganic Sandy Clay or Silt, elastic silts
		CH	Inorganic Sandy Clay or Silt, with high plasticity, fat clays

Symbols and Terms

- First encountered groundwater
- Stabilized groundwater
- Sample interval
- Soil sample sent to laboratory for targeted analysis
- Water sample sent to laboratory for targeted analysis

Trace = < 5%
Few = 5 - 10%
Little = 15 - 20%
Some = 30 - 45%
Dominantly = > 50%

SOIL DENSITY/CONSISTENCY			
SANDS & GRAVELS	BLOWS/FT.	SILTS & CLAYS	BLOWS/FT.
VERY LOOSE	0 - 4	VERY SOFT	0 - 2
LOOSE	4 - 10	SOFT	2 - 4
MED. DENSE	10 - 30	FIRM	4 - 8
DENSE	30 - 50	STIFF	8 - 16
VERY DENSE	> 50	VERY STIFF	16 - 32
		HARD	> 32

Blow count is the number of blows required to drive a 2-inch diameter California Modified Split-Spoon Sampler the last 12 inches of an 18 inch sample interval by a 140-pound hammer free-falling 30 inches.

Well Construction Details:

- Bentonite Seal
- Cement Seal
- Filter Pack
- Screened Interval

ags = above ground surface bgs = below ground surface
PID = Photo-Ionization Detector ppmv = parts per million by volume
USCS = Unified Soil Classification System

APPENDIX B

SITE HEALTH & SAFETY PLAN

WEBER, HAYES & ASSOCIATES
Hydrogeology and Environmental Engineering
120 Westgate Drive, Watsonville, CA 95076
(831) 722-3580 // www.weber-hayes.com

SITE HEALTH & SAFETY PLAN (SSP)

Drilling, Well Installation & Sampling

This Site Health and Safety Plan has been prepared pursuant to the California Occupational Health and Safety Administration Title 8, Section 5192 *Hazardous Waste Operations and Emergency Response* and the U.S. Occupational Health and Safety Administration 29 CRF 1910.120, *Hazardous Waste Operations and Emergency Response*

Job Name and Job Number: Former Telewave Property – 2X834
Client: Sean Corrigan, Old Trace Partners, LLC
Site Location*:* 1155 Terra Bella Avenue, Mountain View, CA
Type of Facility/Current Usage of Property: Currently vacant – former radio equipment manufacturing & chip/circuit board manufacturer

Subcontractors On-Site

Driven Probe Drilling Contractor (TBD)

*Name:*_____

*Contact:*_____

_____

CPT/MIP Drilling Contractor (TBD)

*Name:*_____

*Contact:*_____

_____

Hollow Stem Auger Drilling Contractor (TBD)

*Name:*_____

*Contact:*_____

_____

Regulatory Agencies

Lead Regulatory Agency
County of Santa Clara
Department of Environmental Health
Case Officer: Travis Flora
1555 Berger Drive, Suite 300
San Jose, CA 95112
Phone Number: (408) 918-3400

SCOPE OF WORK

Additional Site Assessment: Soil, Soil Vapor and Groundwater Sampling

- Advancing up to ten (14) direct push borings to depths of 40 to ~80 feet deep for soil and groundwater sampling.
- Installation and sampling of four (4) soil vapor wells to depths of approximately 14 feet bgs.
- Installation, development and sampling of approximately ten (10) groundwater monitoring wells to depths of approximately 30 and 50 feet bgs.
- Collect two (2) indoor ambient air samples.
- Collect four (4) shallow soil samples (surface and 1 foot bgs)

Key Field Personnel

(OSHA training for Hazardous Waste Operations is required on this job)

Jered Chaney – *Weber, Hayes and Associates*	Environmental Geologist & Site Safety Officer	Office: (831) 722-3580 Cell: (831) 254-1747
TBD Name:_____	Driven Probe Drilling Operator	Cell:_____
TBD Name:_____	CPT/MIP Drilling Operator	Cell:_____
TBD Name:_____	Hollow Stem Auger Drilling Operator	Cell:_____

Anticipated Physical Hazards

- **Noise**: Drill rig (hearing protection required over 85 dBA)
- **Heavy Equipment**: Drill Rigs & Support Trucks
- **Traffic**: Terra Bella right of way (traffic control required)
- **Overhead Hazards**: to be avoided
- **Excavation/Trenches**: none
- **Underground Hazards**: To be located by private utility locator / USA alert
- **Level Of Protection** - Is OSHA training for Hazardous Waste Operations required on this job? No ☒ Yes
- **Hazardous/Regulated Substances Anticipated?** ☐ No; ☒ Yes; (VOCs)

Anticipated Chemical Hazards:

Name (CAS # if applicable)	EXPECTED CONCENTRATION ☒ Soil ☒ Water ☐ Air	HEALTH EFFECTS
▸ Trichloroethylene (TCE) - CAS # 79-01-6 ▸ and breakdown halogenated VOC products (low-level)	▸ Up to 6,600 ppb in groundwater ▸ Up to 72 ppm or lower in soil ▸ Up to 25,000 ppt or lower in soil vapor	See attached NIOSH chemical information sheet

Medical Surveillance

Medical surveillance practices for all on-site employees will be maintained in accordance with Title 8 California Code of Regulations, Section 5192(c)(4)(B). **No personnel will be exposed to potential chemical hazards for more than 30 days at the project site, so no medical surveillance is required.**

Site Control Measures

- General public excluded from all work areas by establishing exclusion zones (i.e., cones and/or barricades with caution tape in work areas).
- Traffic control for work in roadway
- Containment of investigative waste.

Decontamination Procedures: Liquinox solution/ fresh water / D.I. water rinse. Containment of wastewater.

PERSONAL PROTECTIVE EQUIPMENT AND SITE MONITORING

Personal Protective Equipment

(see required Personal Protective Equipment below)

Based on the scope and nature of this field program the following aappropriate level of personal protective equipment is required A: ☐ B: ☐ C: ☐ D ☒

R = required, A = As needed

Hard Hat **A**	Eyewear (type) **A**
Safety Boots **A**	Respirator (type) **A** *(½-face minimum)*
Orange Vest **A**	Filter (type) **A** (organic vapor & particulate)
Hearing Protection **A**	Gloves (type) **A** nitrile
Tyvek Coveralls **A**	

Monitoring Equipment On Site (check those that apply)

Organic Vapor Analyzer HNu	PID with lamp of 10.2 ev X
LEL/Oxygen Meter	Draeger Tube

Confined Space Entry Procedures

Confined space entry is not a component of this field investigation.

PERSONELL TRAINING REQUIREMENTS

All personnel performing on-Site activities who may be exposed to chemical hazards are required to be trained in accordance with CCR, Title 8, Section 5192. As a minimum, all Site personnel will have completed 40-Hour Hazardous Waste Operations (HAZWOPER) training; 24 hours of supervised on the job training; have an eight-hour HAZWOPER refresher course if in initial HAZWOPER 40 hour training course was completed more than one year prior to the start date of Site operations.

Personnel who are only on-Site occasionally for a specific limited task (such as plan review, meetings, land surveying, geographic surveying, asphalt paving electrical work, etc.) and who are unlikely to be exposed over permissible and published exposure limits, shall be informed of the Site hazards in a tail gate safety meeting.

Tailgate Meetings

The Field Superintendent will conduct an initial Tailgate Safety Meeting prior to commencing work at the Site. In addition, the following information will be provided to all Site personnel involved with the project, as applicable:

- Name of personnel and alternate responsible for Site safety and health
- Safety, health, and other hazards present at the Site
- Hospital directions
- General safety procedures and practices to minimize risks from hazards at the Site
- Task specific procedures and practices
- Instructions for safe use of equipment
- Instructions for safe use of personnel protective equipment
- Recognition of symptoms and signs, which might indicate overexposure to hazards
- Site control measures
- Emergency/Contingency procedures

EMERGENCY RESPONSE

In the event of minor physical injury, appropriate first aid will be administered and worker transport to the urgent care/emergency room, if necessary. In the event of significant physical injury beyond the level of first aid response, emergency response personnel will be contacted immediately by calling 911 from the nearest land-line or via cell phone.

Hospital/Clinic: Kaiser Permanente
Santa Clara Medical Center
700 Lawrence Expressway
Santa Clara, CA 95051
Emergency Phone: (408) 851-1000

Fire Department Phone Number: 911

Paramedic Phone Number: 911
Police Department Phone Number: 911

Hospital Directions: See attached directions and accompanying map

Emergency/Contingency Plans and Procedures: Mobile Phone contact with emergency personnel. (831)254-1747

DISCLAIMER AND SIGNATURES

Site Hazard Information Provided By: *Jered Chaney – Site Safety Officer*

Date: September 17, 2018

Jered Chaney, Site Safety Officer

Note: All contractors and authorized visitors to the site are responsible for maintaining their safety using standard of care construction site safety procedures. This site safety plan is designed to provide worker right to know information on site contaminants of concern and a generic due diligence overview of safety issues. Neither the professional activities of Weber, Hayes and Associates, nor the presence of Weber, Hayes and Associates employees and subcontractors, shall be construed to imply Weber, Hayes and Associates has any responsibility for methods of work performance, superintendence, sequencing of construction, or safety in on or about the job site.

Trichloroethylene

Synonyms & Trade Names Ethylene trichloride, TCE, Trichloroethene, Trilene		
CAS No. 79-01-6	**RTECS No.** KX4550000 (../rtecs/kx456d70.html)	**DOT ID & Guide** 1710 160 (../erg/erg2008/g160.pdf)
Formula $ClCH=CCl_2$	**Conversion** 1 ppm = 5.37 mg/m3	**IDLH** Ca [1000 ppm] See: 79016 (../idlh/79016.html)
Exposure Limits **NIOSH REL** : Ca See Appendix A (nengapdxa.html) See Appendix C (nengapdxc.html) **OSHA PEL** † (nengapdxg.html) : TWA 100 ppm C 200 ppm 300 ppm (5-minute maximum peak in any 2 hours)		**Measurement Methods** **NIOSH** 1022 (../docs/2003-154/pdfs/1022.pdf) , 3800 (../docs/2003-154/pdfs/3800.pdf) ; **OSHA** 1001 (../docs/2003-154/pdfs/1001.pdf) See: NMAM (../docs/2003-154/default.html) or OSHA Methods (../oshamethods/oshameth.htm)

Physical Description Colorless liquid (unless dyed blue) with a chloroform-like odor.

MW: 131.4	**BP:** 189°F	**FRZ:** -99°F	**Sol:** 0.1%	**VP:** 58 mmHg	**IP:** 9.45 eV
Sp.Gr: 1.46	**Fl.P:** ?	UEL(77°F): 10.5%	LEL(77°F): 8%		

Combustible Liquid, but burns with difficulty.

Incompatibilities & Reactivities Strong caustics & alkalis; chemically-active metals (such as barium, lithium, sodium, magnesium, titanium & beryllium)

Exposure Routes inhalation, skin absorption, ingestion, skin and/or eye contact

Symptoms irritation eyes, skin; headache, visual disturbance, lassitude (weakness, exhaustion), dizziness, tremor, drowsiness, nausea, vomiting; dermatitis; cardiac arrhythmias, paresthesia; liver injury; [potential occupational carcinogen]

Target Organs Eyes, skin, respiratory system, heart, liver, kidneys, central nervous system

Cancer Site [in animals: liver & kidney cancer]

Personal Protection/Sanitation (See protection codes (protect.html))
Skin: Prevent skin contact
Eyes: Prevent eye contact
Wash skin: When contaminated
Remove: When wet or contaminated
Change: No recommendation
Provide: Eyewash, Quick drench

First Aid (See procedures (firstaid.html))
Eye: Irrigate immediately
Skin: Soap wash promptly
Breathing: Respiratory support
Swallow: Medical attention immediately

Respirator Recommendations

NIOSH

At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:
(APF = 10,000) Any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode
(APF = 10,000) Any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus

Escape:
(APF = 50) Any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister
Any appropriate escape-type, self-contained breathing apparatus

Important additional information about respirator selection (pgintrod.html#mustread)

Field Methodology for Cone Penetrometer Testing / Membrane Interface Probe (CPT/MIP) Screening

Field Methodology for Cone Penetrometer Testing / Membrane Interface Probe (CPT/MIP) Screening

This Appendix describes field methodologies for conducting soil and/or groundwater screening using cone penetrometer testing (CPT) and membrane interface probe techniques. For the purpose of this investigation we will be conducting both CPT and MIP screening simultaneously at each prescribed screening investigation location described in this *Work Plan*. The CPT/MIP can be deployed from any type of hydraulic driven direct push drill rig (ranging from all-terrain track rigs to confined-space dolly mounts). The CPT/MIP tool is threaded onto the lead drill rod of the drill rig and is advanced via the drill rig at the rate of approximately 2 feet per minute.

This Appendix includes the following procedures/references for conducting CPT/MIP screening that will be employed during this field sampling program:

1. Cone Penetration Testing Procedure
2. Cone Penetration Test Data and Interpretation
3. Pore Pressure Dissipation Tests
4. Membrane Interface Probe Procedures
5. GeoProbe® Membrane Interface Probe (MIP) Standard Operating Procedure

Following borehole screening, the CPT/MIP instruments are retracted from the borehole and the subsequent borehole is completely sealed with neat cement grout from the bottom of the borehole upward via a tremi-pipe to ensure no voids or bridging of the sealing material. If the borehole remains open to within 2 feet of the total exploration depth following retraction of the CPT/MIP instruments, then a PVC tremi-pipe will be inserted to the total borehole depth and neat cement grout will be added through the tremi-pipe as it is slowly retracted from the borehole. If the borehole collapses to depths greater than 2 feet above the base of the total borehole depth following retraction of the CPT/MIP tooling, then a hollow drill pipe equipped with an expendable “knock-out” point will be advanced to the original borehole depth and neat cement grout will be added through the drill pipe as it is slowly retracted from the borehole.

Cone Penetration Testing Procedure

(CPT)

Gregg Drilling & Testing, Inc. carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, Figure CPT. The soundings are conducted using a 20 ton capacity cone with a tip area of 15 cm^2 and a friction sleeve area of 225 cm^2. The cone is designed with an equal end area friction sleeve and a tip end area ratio of 0.80.

The cone takes measurements of cone bearing (q_c), sleeve friction (f_s) and dynamic pore water pressure (u_2) at 5-cm intervals during penetration to provide a nearly continuous hydrogeologic log. CPT data reduction and interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored on disk for further analysis and reference. All CPT soundings are performed in accordance with revised (2002) ASTM standards (D 5778-95).

The cone also contains a porous filter element located directly behind the cone tip (u_2), Figure CPT. It consists of porous plastic and is 5.0mm thick. The filter element is used to obtain dynamic pore pressure as the cone is advanced as well as Pore Pressure Dissipation Tests (PPDT's) during appropriate pauses in penetration. It should be noted that prior to penetration, the element is fully saturated with silicon oil under vacuum pressure to ensure accurate and fast dissipation.

When the soundings are complete, the test holes are grouted using a Gregg Drilling support rig. The grouting procedure consists of pushing a hollow CPT rod with a "knock out" plug to the termination depth of the test hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected from your site are presented in graphical form in the attached report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings extending greater than 50 feet, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg InSitu and Gregg Drilling & Testing Inc. do not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and do not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

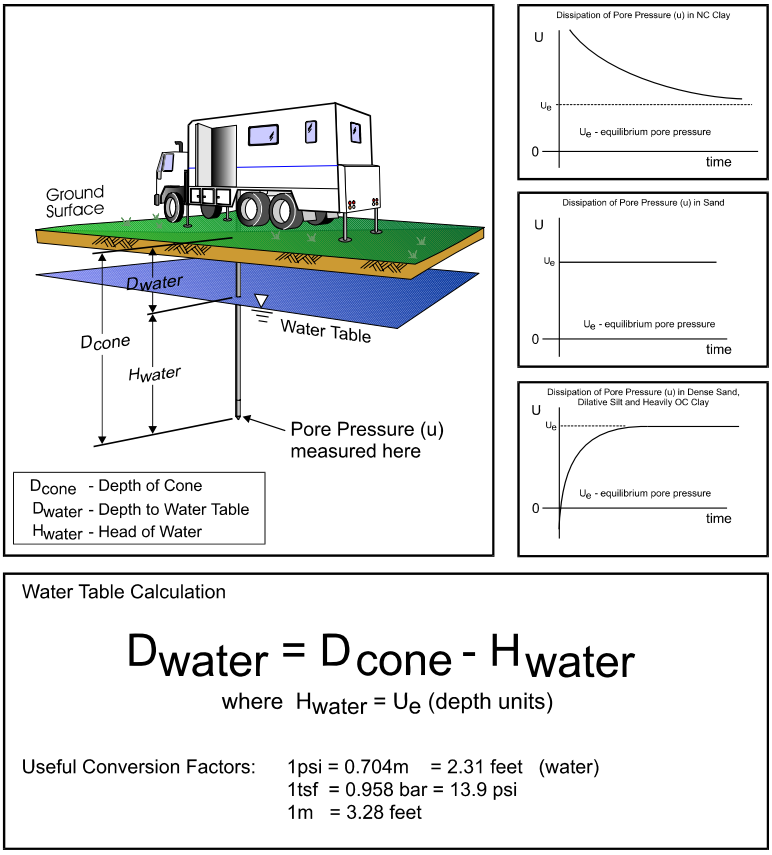
Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals measured hydrostatic water pressures and determined the approximate depth of the ground water table. A PPDT is conducted when the cone is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (*u)* with time is measured behind the tip of the cone and recorded by a computer system.
Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation (c_h)
- In situ horizontal coefficient of permability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until such time as there is no variation in pore pressure with time, *Figure PPDT*. This time is commonly referred to as t_{100}, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1991.



Water Table Calculation

$$D_{water} = D_{cone} - H_{water}$$

where $H_{water} = U_e$ (depth units)

Useful Conversion Factors: 1psi = 0.704m = 2.31 feet (water)
1tsf = 0.958 bar = 13.9 psi
1m = 3.28 feet

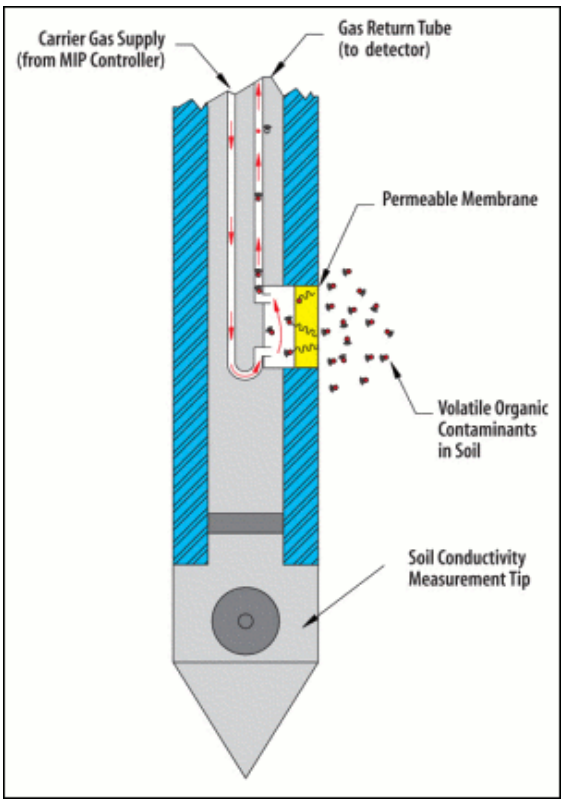
Field Methodology for Membrane Interface Probes (MIP)

Using Hydraulic Driven Direct Push Drilling Techniques

THE INFORMATION PROVIDED IN THIS FIELD METHODOLOGY HAS BEEN GLEANED IN PART FROM THE MANUFACTURER OF THE MIP, GEOPROBE ®

The Membrane Interface Probe (MIP) is a multipurpose tool for mapping soil and groundwater contamination, specifically volatile organic compounds (VOCs) such as halogenated solvents / chlorinated VOCs (cVOCs) and petroleum compounds. The MIP can be deployed from any type of hydraulic driven direct push drill rig (ranging from all-terrain track rigs to confined-space dolly mounts). The MIP tool is threaded onto the lead drill rod of the drill rig and the heating element and gas carrier and return line are run through the center of the hollow drill rods to the surface (trunkline system) where they are connected to the sensor detection system. The MIP is advanced via the drill rig at the rate of approximately 2 feet per minute and can collect approximately 20 sample readings per foot.



The MIP Principle of Operation. The downhole, permeable membrane serves as an interface to a detector at the surface. Volatiles in the subsurface diffuse across the membrane and partition into a stream of carrier gas where they can be swept to the detector. The membrane is heated so that travel by VOCs across this thin film is almost instantaneous. MIP acquisition software logs detector signal with depth.

The MIP is a screening tool with semi-quantitative capabilities acting as an interface between the contaminants in the subsurface and gas phase detectors at the surface (see Figure at right). The membrane is semi-permeable and is comprised of a thin film polymer impregnated into a stainless steel screen for support. The membrane is approximately 6.35mm. The membrane is placed in a heated block attached to the probe. This block is heated to approximately 100-120 degrees Celsius and is raised at the leading edge to protect the membrane. Heating the block helps accelerate diffusion of the contaminant through the membrane.

Diffusion occurs because of a concentration gradient between the contaminated soil/groundwater and the clean carrier gas behind the membrane. The VOC mass is extracted across a semi-permeable membrane and carried to the surface by an inert purge gas at a constant flow of 35-45 milliliters per minute (mL/min) via small diameter inert tubing which carries the contaminants to the gas phase detectors at the surface. Travel time from the membrane interface to the detector(s) is approximately 30-45 seconds (depending on the length of trunkline and flow rate). Once the compounds reach the surface they are analyzed by a suite of three laboratory grade detectors.

The sensor detection system includes:

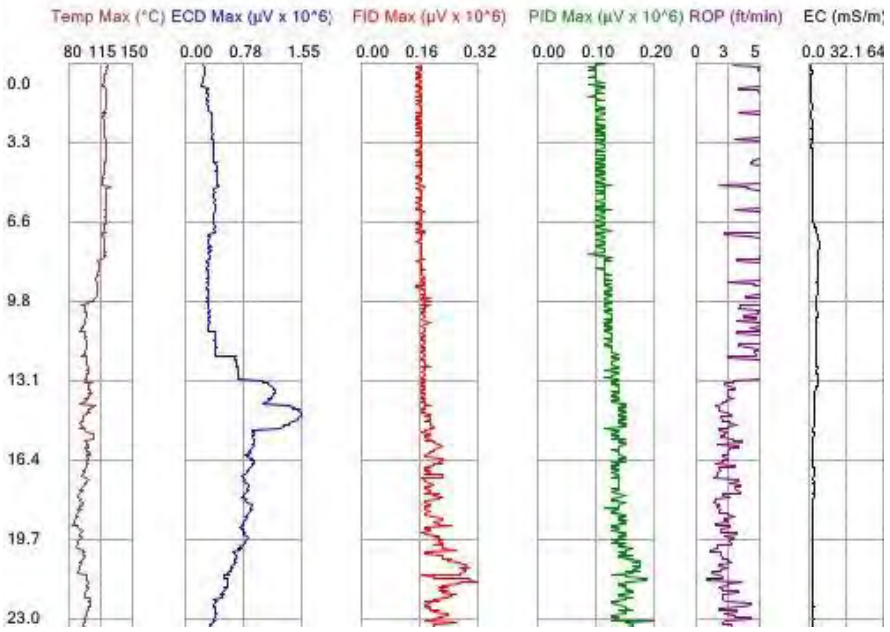
- Photo Ionization Detector (PID)
- Flame Ionization Detector (FID)
- Electron Capture Detector (ECD)

Together, these three detectors offer a range of sensitivities and a means of discriminating different classes of compounds – anything from chlorinated solvents to gasoline hydrocarbons to methane soil gas. The use of multiple detectors is important for separating different types of contamination such as petroleum (e.g., retail gasoline station) from chlorinated solvents (e.g., dry cleaner facility). The ECD is used for chlorinated (e.g., TCE, PCE) contaminant detection, PID is best used for the detection of aromatic hydrocarbons (e.g., BTEX compounds), and the FID is best used for straight chained hydrocarbons (e.g., methane, butane). These detectors may be used in series with the least destructive detector being first and the most destructive detector coming last. The MIP system can process four detector signals at one time. The complementary range of performance of the different detectors enables the system to function from low contaminant levels to near NAPL levels. The detectors have a minimum detection resolution of approximately 0.1 milligram per kilogram (mg/kg) or 100 micrograms per liter (µg/L) for VOCs in soil and groundwater, respectively.

The MIP also includes an integrated Electrical Conductivity (EC) probe to provide indication of general soil particle size which can help determine zones of sands, silts, and clays. The EC logs

can help define zones of lower conductivity (i.e., higher permeability), which may correlate with movement and distribution of contaminants into the subsurface.

The detector information and the electrical conductivity of the soil are graphed via GeoProbe ® FC4000 field instrument (see example graph at right). This instrument allows the operator to determine the location of the contaminant, the relative concentration of the contaminant and the soil/groundwater zone in which the contaminant is located. The MIP log can be used to help determine contaminant "hot spot" zones in the subsurface and generally characterize the vertical and lateral distribution of contaminants in the subsurface.

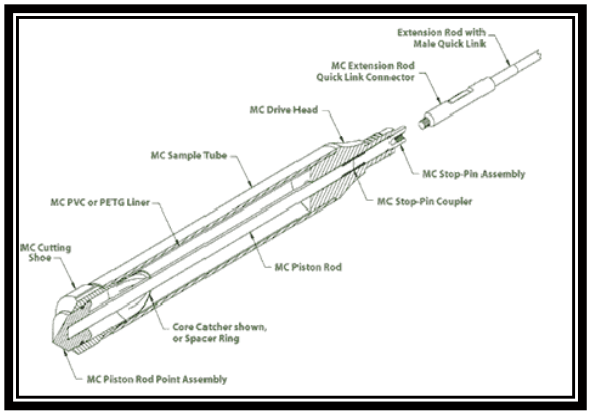


Field Methodology for Hydraulic Driven Probe Sampling

Field Methodology for Hydraulic Driven Probes

Using Macro-Core®, Large Bore® or Dual Tube® Hydraulic Driven Probes

Direct push exploratory borings are "drilled" with a Hydraulic Driven Probe drill rig, which hydraulically vibrates and drives steel probes into the soil. This sampling technology has the ability for either continuous or discrete sampling using a 4-foot long nickel-plated sampling probes fitted with clear acetate liners. During coring operations, the sampler remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval.



The soil cores are logged by an experienced geologist using the Unified Soil Classification System (USCS), noting in particular, the lithology of the soils, moisture content, and any unusual odor or discoloration. Relatively undisturbed soil samples are obtained for both lithologic logging and laboratory analysis. A portion of individual soil cores are stored in sealed plastic bags for field screening of hydrocarbons and/or volatile organic compounds by a Photoionization Detector (PID). Vapor readings in parts per million (ppm) are recorded on the boring logs. The PID is also used during drilling for monitoring the work area for site safety.

All drilling equipment is decontaminated prior to arriving on-site to prevent possible transfer of contamination from another site. The sampling probe and all other soil sampling equipment are thoroughly cleaned between each borehole by washing in a Liqui-Nox or Alconox solution followed by a double rinsing with distilled water to prevent the transfer of contamination.

Following sample collection the borehole borehole is completely sealed with neat cement grout from the bottom of the borehole upward via a tremi-pipe to ensure no voids or bridging of the sealing material. If the borehole remains open to within 2 feet of the total exploration depth following retraction of the sample barrel, then a PVC tremi-pipe will be inserted to the total borehole depth and neat cement grout will be added through the tremi-pipe as it is slowly

retracted from the borehole. If the borehole collapses to depths greater than 2 feet above the base of the total borehole depth following retraction of the sample barrel, then a hollow drill pipe equipped with an expendable "knock-out" point will be advanced to the original borehole depth and neat cement grout will be added through the drill pipe as it is slowly retracted from the borehole.

Samples Targeted for Laboratory Analysis:

Soil samples targeted for laboratory analysis are immediately cut from the acetate sample liner and protected at both ends with Teflon tape, sealed with non-reactive caps, taped, labeled, placed in a plastic Ziploc baggie, and immediately stored in an insulated container chilled to a temperature of 4 degree Celsius. Soil samples selected for Volatile Organic Compound (VOC) analysis will follow field preservation protocols according to EPA Method 5035, as described in DTSC's *Guidance Document for the Implementation of United States Environmental Protection Agency Method 5035: Methodologies for Collection, Preservation, Storage, and Preparation of Soils to be Analyzed for Volatile Organic Compounds*, dated November 2004.

Discrete groundwater samples are collected after temporary PVC casing is placed in the hole and at least one borehole volume of groundwater in the PVC casing is purged and groundwater is visually observed to be free of sediment. Relatively representative groundwater samples are either: 1) collected with a peristaltic pump and dedicated polyethylene tubing and dispensed directly into containers specifically prepared for the analyses (groundwater encountered at depths of less than 27 feet bgs) or 2) collected by mechanically lifting groundwater through a clean stainless steel foot valve and dedicated polyethylene and dispensed directly into containers specifically prepared for the analyses (groundwater encountered at depths greater than 27 feet bgs where a peristaltic pump cannot be used). Samples being analyzed for dissolved metals will be preserved and acidified by the testing laboratory following their receipt of samples. Once collected, groundwater sample containers are placed in Ziploc bags and are stored in an insulated container chilled to a temperature of 4 degree Celsius.

All samples are transported in chilled coolers to a State-certified laboratory under appropriate chain-of-custody documents. Soil samples that may be put on "hold" for potential future analysis will be stored in a dedicated sample freezer, be frozen, and stored under chain-of-custody documentation. Hold times will be confirmed with the testing laboratory to ensure that potential analysis of any "hold" samples will be analyzed within the laboratory hold times.

Field Methodology for Shallow Soil Sampling

Field Methodology for Shallow Soil Sampling

This following provides detailed descriptions of methods used during shallow soil sampling investigations. Included are specifications for shallow soil sampling with a slide hammer, and decontamination procedures.

Shallow Soil Sampling Procedures: A backhoe, two person power auger, or a hand auger is used to get to a point immediately above the sampling depth.

Once at the desired sampling depth, a slide hammer is used to drive a clean stainless steel liner encased in the slide hammer sampling shoe to obtain a relatively undisturbed sample. The slide hammer consists of a metal rod with one end containing a threaded sampling shoe containing a beveled cutting head. A pre-cleaned brass or stainless steel sample liner is installed within the sampling shoe prior to sampling. The slide hammer consists of a weighted sliding handle which slides up and down a connecting rod, and which is used to drive the sampling shoe into undisturbed, native soils. The handle is manually slid up and down the slide rod which in turn forces the sampling shoe (with liner) into native soils.

Materials retrieved from the sampler is be logged on an as-needed basis by the experienced field geologist using the Unified Soil Classification System (USCS), noting in particular, the lithology of the soils, moisture content, and any unusual odor or discoloration. The liner and relatively undisturbed soils is then be removed from the sampling shoe, protected at both ends with Teflon tape, sealed with non-reactive caps, taped, and immediately stored in an insulated container cooled with blue ice at a temperature of 4 degree Celsius or less. Samples targeted for analysis are transported under appropriate chain-of-custody documentation to a State-certified laboratory performing the targeted analysis.

Upon completion of sampling at the designated location, the location will be backfilled and compacted with the materials that were removed prior to sampling, supplemented by clean imported fill as necessary.

Soil samples selected for Volatile Organic Compound (VOC) analysis will follow field preservation protocols according to EPA Method 5035, as described in DTSC's *Guidance Document for the Implementation of United States Environmental Protection Agency Method 5035: Methodologies for Collection, Preservation, Storage, and Preparation of Soils to be Analyzed for Volatile Organic Compounds*, dated November 2004.

Equipment Decontamination and Containerization Procedures: All sampling equipment is cleaned prior to arriving on site to prevent possible transfer of contamination from another site. In areas suspected of having contamination, sampling equipment is thoroughly cleaned between each sampling runs with Alconox ® solution (or equivalent) followed by a double rinsing with distilled water to prevent the vertical transfer of contamination, and/or contamination from location to location onsite. Accordingly, all sampling equipment will be cleaned following sampling operations to prevent the possible transfer of contamination. All cleaning rinsate, and wash water produced during the shallow soil sampling and decontamination process will be containerized on site in pails or approved DOT drums until profiling determines appropriate disposal options.

Field Methodology for Active Soil Gas Sampling

Field Methodology for Active Soil Gas Sampling

The active soil gas / soil vapor (we use the terms interchangeably) sampling field methodology is conducted in general accordance with the procedures outlined in the CalEPA's/DTSC/LARWQCB/SFRWQCB *Advisory – Active Soil Gas Investigations* (July 2015), and the DTSC/CalEPA's final *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (October 2011). We use the terms soil gas and soil vapor interchangeably. The field methodology for soil vapor sampling entails:

- Constructing Soil Vapor Sample Points and Purge Test Points (if necessary);
- Purge volume testing at the Purge Test Point(s);
- Setting up the sampling and leak testing equipment; and
- Soil Vapor Sampling

Constructing & Decommissioning Soil Vapor Sample and Purge Test Probes

Soil vapor sample probes can be either semi-permanent or temporary. A semi-permanent sample probe is constructed with a secure surface completion consisting of bolt-down flush-mounted well vault so it can be reused. A field geologist or engineer logs the soils encountered using the Unified Soil Classification System (USCS), unless the site is already well characterized geologically.

Shallow soil vapor probe installation via GeoProbe drill rig

Shallow Soil Vapor Probe: The soil vapor/gas probe is installed to the target sampling depth via a Geo-Probe drill rig, which hydraulically drives and vibrates steel probes into the soil. The soil is cored out using a 4-foot long nickel-plated sampling barrel fitted with a clear acetate liner. During coring operations, the sample barrel remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval. Alternatively, the soil gas probe borehole can be created via a hollow stem auger or hand auger. Shallow soil gas / soil vapor sample depths will be no less than 5 feet deep (if possible) in order to avoid breakthrough of ambient air from the surface. Shallow and deeper soil gas probes are constructed in a similar manner. Once the probe hole is cored to the desired sample depth, a length of 3/16–inch inner diameter Teflon or Nylaflo tubing having a porous media tip (i.e., ceramic filter stone) attached at the down-hole end of the tubing is inserted through a 1-inch diameter tremi-pipe that runs the entire length of the borehole. This sample tubing is placed approximately 6-inches above the base of the

borehole. A minimum of a one-foot sand pack is emplaced at the base of the borehole (the grain size of the sand pack is larger than the grain size of the adjacent formation), followed by at least one foot of dry granular bentonite. The probe tip is emplaced midway within the sand pack. The tremi-pipe is used to insert the sand pack and granular bentonite to ensure that no bridging occurs. The remainder of the borehole is sealed to the ground surface with hydrated bentonite gel for temporary probes or neat cement mixed with 1% – 5% bentonite, which are both pre-mixed at the ground surface; this ensures a sound surface seal and/or seal between multi-depth nested probe sample intervals.

Decommissioning Shallow Soil Vapor Probes: Following sample collection the vapor probe is properly decommissioned by one of the following regulatory approved techniques:

- The sample tubing is completely removed from the ground surface (if possible) allowing the bentonite gel slurry to flow into the small vertical void thereby sealing the borehole. Subsequently, approximately 6-inches of bentonite slurry is removed below the ground surface and the surface is patched to match the existing grade.
- The sample tubing is properly destroyed by injecting neat cement grout into the tubing via a syringe. The volume of grout injected into the tubing is monitored to ensure that the entire tubing is completely sealed. Subsequently, the tubing is cut off approximately 6-inches below the ground surface and the surface is patched to match the existing grade.
- The vapor probe is properly destroyed by over-drilling the sample tubing and annular seal material. Once the material has been removed, the subsequent borehole is filled with neat cement grout to within about 6-inches of the ground surface and the surface is patched to match the existing grade.

Sub-Slab Soil Vapor Probe: The emplacement of the sub-slab soil vapor sampling probe is conducted by coring a 1 to 1-1/4-inch diameter hole via an electric hand rotary hammer drill through the slab foundation. The sub-slab borehole is advanced approximately 3 to 4-inches below the base of the slab and into the sub-slab material. Once the probe hole is cored to the desired sample depth a length of 3/16–inch inner diameter Teflon or Nylaflo or inert, cleaned metal tubing with a porous media tip (i.e., ceramic filter stone) attached at the down-hole end of the tubing is inserted into the borehole. The probe tip is emplaced 1 to 2-inches above the base of the bore hole. A minimum of 2 to 4-inches of sand pack is emplaced at the base of the borehole followed by at least 1 to 2-inches of dry granular bentonite to above the base of the slab. The probe tip is emplaced midway within the sand pack. The remainder of the borehole is sealed to the ground surface with hydrated bentonite for temporary probes or hydrated bentonite followed by neat cement for permanent probes to ensure a sound surface seal. Permanent probes have a flush-mount inert metal fitting for providing a good seal when

connecting the above-ground sample tubing and for plugging between sampling events. Following sample collection from a temporary probe the sample tubing is removed and the subsequent void is sealed with hydrated bentonite and the surface is patched with concrete.

Purging

Prior to soil gas sample collection, a purge volume or "dead space volume" will be calculated in order to purge ambient or stagnant air from the sampling system to ensure that collected samples are representative.

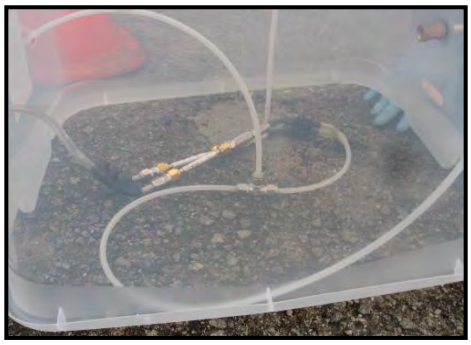
Per the procedures outlined in the CalEPA's Advisory, a default of three purge volumes will be extracted prior to sampling. The purge volume consists of approximately three system volumes (i.e. tubing and annular space) of soil gas, while capturing the purge effluent. One system volume is calculated by summing the inner diameter (id) tubing volume (i.e., id area times the length of tubing) and the annular pore space volume (i.e., area of the borehole times the length of sand pack and granular bentonite surrounding the ceramic filter stone tip times an estimated sand-pack pore space volume of 33.8%). The purge rate will be conducted at the same rate soil gas is sampled (approximately 200-mL/min flow). We note that Cal-EPA guidance recommends purging or sampling at rates between 100 to 200-mL/min for soil vapor probes at all depths, including sub-slab vapor probes, to limit air stripping and to prevent ambient air form diluting the sample. After the specific pre-determined purge volume is removed, a soil vapor/gas sample is collected for laboratory analyses for the site specific target compounds as discussed below.

Sample Collection

Before purging the appropriate "dead space volume" from the soil vapor/gas probe, the probe seal is allowed to cure and the subsurface is allowed to equilibrate for the appropriate amount of time per the procedures outlined in the CalEPA's Advisory. We note that an equilibration time of 2-hours is required for soil vapor/gas probes installed via a direct push drill rig and 48-hours for soil vapor/gas probes installed via a hollow stem auger drill rig, hand-auger, or an electric hand rotary hammer drill. Once the appropriate "dead space volume" has been purged, the sample tubing will be attached to a laboratory prepared soil vapor manifold and 1 or 6-liter Summa canister or sorbent sampling media depending on required laboratory analysis. We note that the choice between using a 1-L or 6-L canister is typically dependent on the purpose of the site investigation. However, for soil vapor/gas samples collected at a depth less than 5-feet, including sub-slab vapor probes, a 1-L canister should be used to avoid excessive air removal and to prevent ambient air from entering the sub-surface and sample. When sampling for ambient indoor air, a 6-L canister is nearly always required because of the extremely low detection limits required to meet Indoor Air ESLs. For soil vapor collection, a 1-L

canister may be all that is necessary if the site is known to contain high concentrations of contaminants of interest that make achieving low detection limits a secondary concern. In those cases, only a small volume of the 1-L collected is necessary for analysis of both the TO-15 and the TO-3 compounds. However, if a site does not have historical data indicating that it is significantly contaminated, or if multiple analytical runs become necessary to achieve reporting limit/CHHSL/ESL goals, it becomes critical to have a larger initial volume of collected sample. A 6-L volume allows the laboratory to provide the lowest possible detection for the compounds of interest for full list TO-15 while providing enough volume for the additional analysis of individual compounds that may require dilution to bring them within the instrument calibration range. The 6-L volume will provide enough residual sample to analyze for additional contaminants (e.g., EPA Method TO-3) and/or fixed Gases (ASTM D1946) including Helium, which may be used as a tracer or leak check compound in the investigation. A consultation with the selected testing laboratory will be conducted for each investigation to ensure that appropriate sample volumes are obtained.

Sample collection with Summa canisters



Sample collection with sorbent tube

The following sample collection procedures are followed for each sample collection media:

- The Summa canisters will be supplied by the analytical laboratory with a vacuum of approximately 30-inches of mercury and outfitted with a 200-mL/min flow control valve. The tubing will be connected to the soil vapor manifold and Summa canister using airtight stainless-steel or brass fittings. The flow control valve will then be opened slowly to draw the vapor sample from the target depth.
- Laboratory sorbent media and canister with a vacuum of approximately 30-inches of mercury and outfitted with a 200- mL/min flow control valve or sampling pump (10 to 200 mL/min) will be supplied by the analytical laboratory. The tubing will be connected to the sorbent media sample tube, upstream of the vacuum canister/sample pump/syringe using airtight stainless-steel or brass fittings. The sample vacuum canister/ pump/syringe will then be activated to draw approximately 1 to 3-L of sample volume for TO-17 analysis from the target depth at a flow rate of 200- mL/min or less per sorbent media sample tube manufacturer and/or laboratory guidelines.

Schematic diagrams of sample configurations for the different sampling media (i.e., Summa canister and sorbent media) and probe construction (i.e., shallow soil and sub-slab) are included as attachments 1, 2, and 3 of this field methodology.

Leak Detection Monitoring

Monitoring leak check compound within shroud during sample collection

Leak detection monitoring will be conducted during soil gas sampling by applying a tracer compound (i.e., isopropyl alcohol [isopropanol, IPA] or helium) to the sample system connections and bentonite seal. Specifically, a shroud will be used to encapsulate the entire system (i.e., the sample canister and surface bentonite seal) so as to trap the applied tracer compound. The leak detection monitoring configuration is graphically depicted on attachments 1, 2, and 3 of this field methodology. The concentration of the leak check compound within the shroud will be monitored periodically throughout the sample collection period with a PID calibrated to the specific tracer gas compound and these values will be recorded into the field notes. The tracer compound (i.e., IPA or helium) is maintained within the shroud at a concentration of approximately two (2) orders of magnitude higher than the detection limit of the field meter used throughout the duration of sample collection. The testing laboratory will screen for this compound in all analyzed air samples when IPA is used. If helium is used the laboratory can screen for this compound if collected in Summa canisters, or the sample effluent after passing through the sorbent media will be field screened for the presence of the helium.

Prior to purging and sample collection, a “shut-in test” is performed to check the above-ground sample system connections downstream from the top of the soil vapor/gas probe, including the laboratory provided sample manifold (“sample train”). The “shut-in test” is completed in the field by closing off all valves to the laboratory provided soil vapor manifold and the soil vapor/gas probe tubing, and subsequently opening the valve to the connected “purge” Summa canister to increase the vacuum in the sample train to a minimum of 100-inches of water, at which point the purge canister is closed. Then the vacuum gauge on the sample train is observed for at least 1-minute to confirm it remains stable.

Low Flow Sampling Conditions

A low flow sampling condition is characterized as a condition where the sample probe cannot sustain a flow rate of 100-mL/min for more than three minutes while maintaining an applied vacuum of less than 100-inches of water (or 7.4-inches of mercury). The vacuum applied to the

sample probe will be measured and monitored via a vacuum gauge installed between the sample probe and the sample collection flow regulator. If the vacuum measured within the sample probe exceeds 100-inches of water during dead space volume purging, then one of the following sample collection procedures will be employed:

- If the lithology observed during sample probe installation indicates potential for low permeability / low flow conditions a representative soil sample at the soil vapor sample depth will be collected and put on ice for possible laboratory analysis.
- If extreme low flow conditions are observed during purging, specifically excessive time will be required to purge and collect a sample, we will contact the regulating agency to confirm collecting a purge volume approximating one dead space volume (i.e., volume of the sample tube plus the volume of the sand pack pore space and granular bentonite pore space surrounding the probe tip) will be evacuated prior to sample collection. Sample collection will proceed until the sample probe vacuum equals 100-inches of water. The sample system will then be closed off to allow the probe to relax and equilibrate. Over time the vacuum will eventually dissipate, the rate of which can be monitored via an in-line vacuum gauge installed as described above. Once the vacuum in the sample probe has dissipated, sampling will resume as described above. This process will be repeated until an adequate sample volume has been obtained for the required laboratory analysis.
- If during low flow sampling as stated above, the sample system when closed off to allow the probe to relax and equilibrate the probe vacuum does not reduce by 13.5 inches of water (1 inch of mercury) in 3-minutes, soil vapor sampling will cease and the previously collected soil sample will be submitted to the laboratory for potential analysis for site specific constituents.

Sample Storage and Transport

Once collected, the soil gas samples are then transported to a State-certified laboratory under appropriate chain-of-custody documentation. Sorbent media are wrapped in foil and placed in individual zip-lock type bags and immediately placed in a chilled cooler (chilled to 4 degrees Celsius) for storage and transport to the testing laboratory. Summa canisters are placed in laboratory provided cardboard boxes and stored at ambient temperature for transport to the testing laboratory.

Temporary Soil Vapor Probe Construction Details

Figure B

Field Methodology for Indoor and Outdoor Air Sampling

Field Methodology for Indoor and Outdoor Air Sampling

This indoor and outdoor air sampling field methodology was designed in general accordance with the procedures outlined in the DTSC/CalEPA's final *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (October 2011 and 2012a).

1.0 SCOPE AND APPLICATION

This field methodology describes the method for collecting indoor, outdoor, and crawl space air samples for volatile organic compounds (VOCs) of target *chemicals of concern*. Reporting limits for these samples are typically very low and extremely prone to positive bias from interfering, aboveground VOC sources. A Building Survey will be performed before sample collection. The methods presented here are based on "clean" sampling techniques. The requirements of clean sampling dictate that sampling and sample handling are done by trained personnel and are designed to satisfy applicable regulatory standards.

2.0 GENERAL GUIDELINES

If other media sampling (i.e., soil, groundwater, soil vapor) are included for the site-specific assessment, typically this sampling will be collected concurrently with the indoor and outdoor air sampling (i.e., soil and groundwater sampling are not generally collected on the same day but are collected on the same phase of work mobilization in order to assess all media samples within a reasonable timeframe).

Indoor Air Sampling: Sampling for indoor air is generally conducted based on conservative (worst case) conditions and/or potential variation in seasonal results. Initial sampling for conservative conditions typically includes closed windows and doors and limiting drafts due to entering/exiting. Heating, ventilation, and air condition (HVAC) systems should be operated normally for the season and time of day. If testing during the cold season, the heating system should be run for at least 24 hours prior to sampling and the temperature should be maintained at, or above, 65ºF to address the potential of enhanced vapor intrusion conditions.

Multiple lines of evidence sampling assessment should be used to evaluate the need for seasonal evaluation of potential vapor intrusion. Lines of evidence can include soil & groundwater results, known contaminant sources, and initial subgrade vapor and indoor air results. Ideally, a minimum of two sampling events should be completed to address the potential for seasonal variation (i.e., a late summer/early autumn and a later winter/early spring). However, number of sampling events can be revised to be more or less based on site-specific conditions.

Outdoor Air Sampling: The collection of outdoor air samples, if deemed necessary to satisfy project goals to assess anthropogenic conditions that may impact indoor air conditions should be collected concurrently with indoor air sampling. The site-specific *Workplan* should define whether outdoor air sampling is to be conducted based on potential target chemical(s) contribution from surrounding area activities/processes. If outdoor air is appropriate, then three outdoor air samples will be collected during each indoor air sampling event.

3.0 SAMPLE LOCATION SELECTION & SETUP

Selection of sample locations: The selection of indoor, outdoor, and crawl space air sample locations will be based on a survey of building conditions, and in consultation with the building owner/occupant and local agency oversight staff. A *Building Survey for Indoor Air Sampling & Vapor Intrusion Investigation* form (copy attached) outlines the procedures/guidelines for performing a pre-sampling building survey (Following *DTSC Vapor Intrusion Guidance,* 2011 Appendix L). The

sample locations will be selected to meet the project-specific data quality objectives and will identify potential entry points of contaminated soil gas into the structure. The building survey observations will better inform appropriate indoor/ambient air sampling locations. Guidelines for selecting indoor, outdoor, and crawl space air sample locations are as follows:

- ***Indoor Air Sample Locations*:**
  - Indoor air samples are typically collected from segregated (walled off) compartments or HVAC zones within a building.
  - Indoor air samples are to be located in the areas of the building that are generally occupied most frequently and by the most amounts of people (i.e., for residential – primary living area; and for commercial – in the primary working zones) and/or at locations having the highest potential vapor intrusion (i.e., residential – bathroom and kitchen; and for commercial – near sumps, elevator shafts, floor drains, etc.).
  - Typically, indoor air samples will be collected on the lowest floor of the building at breathing zone height (approximately 3 to 5 feet) toward the center of the building away from windows and doors.
    - Site-specific considerations will be given to those situations where a different sampling height may also be appropriate to evaluate a unique setting or population (i.e., a daycare facility).
  - If there is more than one floor within a structure, additional indoor air samples will be considered in consultation with the overseeing agency staff, to address the potential for variable risk exposures and/or to distinguish contaminant contribution from background sources. The location and position of the indoor air sampling container will vary depending on the floor layout and facility infrastructure.
  - If there is a basement, any indoor air sample locations will be positioned to investigate worst-case situations within a structure (i.e., sumps or major cracks in the foundation).
- ***Outdoor Air Sample Locations*:**
  - Typically, outdoor air samples are collected upwind of subsurface contaminant plumes, upwind and/or downwind of the building or site being investigated, and at HVAC intakes. Outdoor air samples should be collected at breathing zone height (approximately 6 feet).
  - An effort will be made to place the canister away from obvious potential outdoor VOC sources (i.e., busy roads, gas stations, chemical storage, dry cleaners, etc.) in order to avoid biasing the sample results.
  - Outdoor air samples are collected on the upwind side of the building should be placed at a distance equal to twice the height of the building. However, the outdoor air canister may be placed near the outdoor air intake for the HVAC system for the building.
  - An effort will be made to secure outdoor air sample canisters to an immovable structure to ensure security and prevent tampering in public areas. If the canister is not in a secured location, the canister will be labeled as an environmental sample with warnings not to tamper, and will include contact information. A bicycle lock or piece of chain and padlock will be used.
  - Sampling should be conducted at least 10 feet beyond a tree's drip line. Placing canisters on

or near to a tree should be avoided as studies have suggested tree evapotranspiration processes can potentially capture and release VOCs from groundwater plumes.

- ***Crawl Space Air Sample Locations*:**
  - Crawl Space air samples are typically collected in locations selected to achieve adequate spatial coverage of the building's crawl space. However, the selected sample location may be limited by accessibility.
  - Crawl Space air sample inlets should be located several feet from the opening or access point to avoid dilution by outdoor air. In cases where the crawl space is most conveniently sampled by access through crawl space vents, a sampling probe (sample delivery line made of Teflon® or stainless steel) of sufficient length is attached to the inlet of the flow controller.

Selection of Sample Duration: Generally, 6-liter canisters are used for air sampling. An initial indoor air sample should be collected over a 24-hour sample period for a worst case scenario. If the initial sample indicates there is NO presence of VOCs, and additional lines of evidence indicate there is no significant source of source material capable of creating significant off-gassing (i.e., no significance source of residual soil contamination or elevated dissolved concentrations in a contaminant plume), then a second round of follow-up samples may not be necessary.

After initial samples are collected, follow-up sampling may be warranted based on any significant detections and any additionally collected multiple lines of evidence. Follow-up sampling durations are usually selected to mimic the building occupants daily exposure period. Residential air sampling durations are typically 24 hours and commercial/industrial durations are typically 8-hours (note: depending on schedule shifts, the duration may be adjusted).

Sample collection can be integrated over time by adjusting the flow controller. Project-specific sample periods as short as 10 minutes to as long as 24 hours can be achieved based on the size of canister used and the sampling rate selected (see Table below).

Typical Air Sampling Rates:

Canister Size	Sample Duration	Sampling Flow Rate (mL/min)
6-Liter	1-hour	90
6-Liter	8-hours	11.25
6-Liter	24-hours	3.75
1-Liter	5-minutes	180
1-Liter	1-hour	15
850-mL	5-minutes	150
850-mL	1-hour	12

Selection of Sampling Schedule: Sample collection that is less than 24-hous should ideally occur during typical operating conditions (i.e., when workers occupy the building). However, building owners/occupants may request that sampling take place when the building is not in use. In the case

of commercial operations, the HVAC system is set to typical operating conditions and an additional sampling event may be required to further refine assessment of conditions when the HVAC system is off. If additional sampling is warranted, the schedule and location will be selected only after conferencing with agency staff.

4.0 SAMPLING EQUIPMENT & MATERIALS

Indoor and outdoor air samples are typically collected in stainless steel, polished, certified clean canisters that have been evacuated to a vacuum of approximately 30 inch of mercury. Laboratory provided flow controllers are also certified clean and set at the desired sampling rate by the laboratory. Laboratory sampling equipment/hardware is typically shipped in containers suitable for protection during transit with general package shipping companies (i.e., FedEx or UPS).

Vacuum gauges used to check canister vacuum should be oil-free and clean (gauges are typically provided by the laboratory). The laboratory may either provide one vacuum gauge to be used with all of the canisters, or a vacuum gauge for each canister to be left on during sample collection. Sometimes the canisters are fitted with built-in vacuum gauges that are not removable. These gauges are for field use only, and are an approximate measure of the actual vacuum. Regularly calibrated – and less rugged – vacuum gauges are used at the laboratory to measure vacuum before shipment and again after sample receipt. All tools (i.e., wrenches and screwdrivers) used for connecting fittings and making adjustment to the flow controller should be clean and free of contaminants.

For crawl space samples, typical sample probe material may include new Teflon®, Nylaflo® or stainless steel tubing, fitted with compression fittings.

A sampling desiccant filter or similar device may be used for outdoor air sampling to prevent water from entering canister during sampling.

SAMPLE COLLECTION PROCEDURES

Clean sampling protocols must be followed when handling and collecting air samples, including:

- Care in the shipping, storage, and use of sampling equipment.
- Cleanliness of personnel who come in contact with the sampling equipment is also important:
    - NO smoking, eating, drinking, perfumes, deodorants, dry cleaned clothing, etc.
- Canisters should not be transported in vehicles with gas-powered equipment or fuel cans.
- Sharpie®- type markers should not be used for labeling or note-taking during sampling.

As noted above, a building survey to evaluate vapor intrusion should be completed prior to taking air samples, (see *Building Survey for Indoor Air Sampling & Vapor Intrusion Investigation* form). The form should be referenced and any changes in building conditions since the building survey was completed should be noted (i.e., changes in chemical storage location/quantities).

The canister should be carefully inspected for damage (canisters having visible damage should not be used). The canister's initial vacuum should be recorded and sufficient vacuum should be available for sampling. Canister having less vacuums than registered by the certified laboratory (~29 to 30 inches Hg) are a potential indication of leakage which could affect the accuracy of analytical results. The initial canister vacuum will be measured using an external vacuum gauge, as described below:

- Remove protective cap from the canister (make sure the canister valve is closed before doing

this.

- If there is not a vacuum gauge already attached to the canister, attach an external vacuum gauge to the canister and open the valve. If the vacuum gauge has two openings, make sure that the other opening is closed; the canister cap can be used for this. After taking the reading, record the initial vacuum, close the canister valve and remove the gauge.
- Measure the initial canister vacuum using a vacuum gauge with 0.25% accuracy at the -30 to 0 inches Hg range and NIST-traceable calibration for vacuum measurements.
- Do not sample using a canister without sufficient initial vacuum. Sampling data may be flagged or rejected for canisters having low initial vacuum (less than 28 inches Hg) as low initial vacuum can create a low bias in analytical results due to air leakage. While there is also a smaller risk that air leakage could introduce contaminants into the canister, the primary concern is the low bias to analytical results; this bias is within the range of analytical variability allowed with the EPA Method TO-15 (±30%) for initial vacuums >24 inches Hg. The table presented in below identifies the field person's response based on the initial vacuum reading for a canister. In addition, this table also identifies the potential bias to results at different initial canister vacuums. Use the following table to determine when to use canisters based on initial vacuum readings:

Initial Vacuum Reading (inches of Hg)	Potential Percent Error in Analytical Results (from vacuum leakage)	Recommended Course of Action
>30 to 28	Up to -10%	Use canister for sampling – no limitations on use.
>26 to 28	Up to -21%	Use canister for sampling if necessary; replace canister with a spare if spares are available.
>24 to 26	Up to -30%	Sampling with canister is not advisable. Contact project manager and obtain direction before sampling with this canister. (Lab qualifiers may be applied to analytical results sampled with canisters with vacuums less than 26 inches Hg).
<24	> -30%	Do not use (analytical results will be rejected).

Flow controllers should come pre-set by the laboratory to sample at a pre-determined rate based on specific project requirements (see Table on page 4, under *Selection of Sample Duration* for the most common options). In some cases (i.e., project-specific quality assurance [QA]), the flow rate will need to be verified in the field prior to use. This is accomplished with a bubble meter, vacuum source, and instructions supplied by the laboratory.

5.0 SAMPLE EQUIPMENT SETUP, SAMPLE COLLECTION & BREAKDOWN

- Connect the flow controller to the sample canister.
- For outdoor samples, be sure that the inlet to the flow controller is protected from precipitation. Place the canister and flow controller under a shelter/enclosure, use a sampling desiccant filter provided by the laboratory, or use a clean piece of aluminum foil to build a tent over the flow controller inlet.
- If crawl spaces are being sampled remotely through a crawl space vent, adjust the length of the

sampling probe to achieve the desired sampling location and place an inert spacer/support (wire clothes hanger) near the end of the probe to keep the probe tip opening suspended ~3 inches above the ground level. Then connect the sampling probe to the inlet of the flow controller.

- Remove all work articles from the sampling area.
- BEGIN SAMPLING by slowly opening the canister valve one full turn. For canisters with built-in or assigned vacuum gauges, monitor the vacuum change several times during the course of the selected sample period to ensure the canister is filling at the desired rate.
- AT THE END OF THE SAMPLE PERIOD, record the final canister vacuum and close the canister valve finger tight.
- Remove the flow controller and replace the protective cap on the canister valve fitting.
- If necessary, measure the final canister vacuum with a separate vacuum gauge. Open the canister valve and record the final vacuum. Close the valve, remove the gauge, and replace and tighten the cap on the canister.
    - Appropriate final vacuum in the canister is between 2 and 10 inches Hg. More than 10 inches Hg indicates that a smaller than expected sample volume has been collected, which can increase laboratory reporting limits.
- Canisters with no vacuum left (i.e., 0 inches Hg) should not be analyzed as sample bias could occur. It may be possible to have the lab verify if there is vacuum (i.e., the tank gauge is faulty). If the laboratory vacuum gauge indicates vacuum remains in the canister, then the sample is still considered acceptable and may be analyzed. The analytical laboratory will be directed to not analyze any sample showing a final vacuum of 0 inches Hg (as measured by the laboratory).
- If the flow controller is going to be used for more than one sample collection, a purge volume should run through the apparatus. To do this, attach the flow controller to a vacuum source and draw clean air or gas (ultra-high purity) through it for several minutes before attaching it to the canister.

6.0 QUALITY ASSURANCE/QUALITY CONTROL

One duplicate sample will be collected for each sampling event, and for each laboratory used, if more than on laboratory is needed. Trip blanks are considered unnecessary when passivated steel canisters are used for sample collection. Collected samples will be delivered to the analyzing laboratory as soon as possible and will be analyzed within the recommended holding times (30 days for passivated steel canisters).

7.0 SAMPLE STORAGE AND TRANSPORT

Once collected, the air samples are then transported to a State-certified laboratory under appropriate chain-of-custody documentation. Sticky labels should NOT be affixed to the sample canisters. Summa canisters are placed in cardboard boxes and stored at ambient temperature for transport to the testing laboratory.

8.0 ALTITUDE CORRECTION

Air pressure decreases with elevation. Therefore, a canister evacuated at a laboratory located at sea level will show a lower vacuum measurement at a higher altitude. Generally, a 1,000 foot rise in

elevation corresponds to a 1 inch Hg drop in pressure OR a 1 inch Hg decrease in measured vacuum. For example, a canister evacuated to 30 inches at sea level and used at 3,000 feet would show an initial vacuum of 27 inches Hg.

For samples collected at altitude, the laboratory will be informed ahead of time so they adjust the flow controllers accordingly. If sampling is being conducted at higher elevations, verify the elevation difference between the analytical laboratory and field location and determine the associated decrease in measured vacuum using the following formula:

- Calculate the pressure difference between the laboratory and field location as follows:
    - Difference from Sea Level (field) – Difference from Sea Level (laboratory). Use the Altitude Correction Table attached.
- Subtract the pressure difference determined directly above from allowable initial vacuum levels (pre-sample collection) and final vacuum levels (post-sample collection) to determine appropriate initial and final vacuum levels.

Field Methodology for Monitoring / Remediation Well Installation & Well Development and Post Development Sampling

Field Methodology for Monitoring / Remediation Well Installation
and
Well Development & Post Development Sampling

This appendix describes the methods employed in hollow stem auger drilling for soil and groundwater investigations and/or monitoring and/or remediation well installations. Included are specifications for borehole drilling and soil sampling procedures, and the conversion of boreholes into monitoring wells, piezometers, sparge wells, vapor monitoring, and /or vapor extraction wells. Fieldwork tasks and well construction generally follow the guidelines outlined in the California EPA's *Guidance Manual for Groundwater Investigations – Monitoring Well Design and Construction for Hydrogeologic Investigations,* dated July 1995.

Borehole Drilling and Soil Sampling Procedures: Exploratory borehole(s) locations are determined based on data from previous investigation(s), local and regional groundwater flow direction, surface topography, underground utilities, overhead utilities and obstructions, property lines, and structures.

The exploratory boreholes are drilled using a truck-mounted drill rig equipped with eight-inch or twelve-inch diameter hollow-stem augers. Soil samples are obtained for lithologic logging of native materials and laboratory analysis. The retrieved soil is logged by an experienced geologist using the Unified Soil Classification System (USCS). A Photoionization Detector (PID) is used during drilling operations for site safety purposes and for on-site interpretation of potential "hot-spots". Vapor readings in parts per million (ppm) are recorded on the boring logs.

The samples are collected by advancing the boring to a point immediately above the sampling depth and driving a modified-California split-spoon sampler into relatively undisturbed soil through the center of the drill augers. The sampler contains three separate six-inch brass or stainless steel sleeves that are driven into undisturbed soils by a standard 140-pound hammer that is repeatedly dropped from a height of 30 inches. The number of blows required to drive the sampler each successive 6-inches is recorded on geologic logs to evaluate the relative consistency of the soil. When driving the split-spoon sampler is complete, the driller advances the auger flight over the split-spoon sampler, thus freeing the sampler to be retrieved. Drilling cuttings are continuously observed and materials retrieved from the sampler are logged by the field geologist. Three brass sleeves are retained from the modified-California split-spoon sampler at project specific sampling intervals. The soil sleeves are retained for the following purposes:

- One sleeve is protected at both ends with Teflon tape, sealed with non-reactive caps, taped, labeled, and immediately stored in an insulated container cooled chilled to a temperature of 4 degree Celsius. Selected samples (generally at least one per borehole,

though soil samples may not be analyzed from borings for remediation wells at well characterized sites) are transported under appropriate chain-of-custody documentation to a State Certified laboratory for analysis specific to the investigation.

- The second sample is extracted from its sleeve and stored in a sealed plastic bag so that it may be screened by the portable PID for hydrocarbon odors and/or volatile organic compounds.
- The third sample is also extracted from its sleeve and used to describe the subsurface lithology at the specific sampling depth. The retrieved soil is logged by an experienced geologist using the USCS criteria for soil description.

Alternatively, some hollow stem auger drill rigs are equipped with pneumatic samplers rather than the aforementioned free falling hammer sampling technique. The pneumatic sampler vibrates and drives steel probes into the soil. This sampling technology has the ability for either continuous or discrete sampling using a 4-foot long nickel-plated sampling probes fitted with clear acetate liners. During coring operations, the sampler remains open as it is driven into undisturbed soil over its entire 4-foot sampling interval. Soil samples targeted for laboratory analysis are immediately cut from the acetate sample liner and protected at both ends with Teflon tape, sealed with non-reactive caps, taped, labeled, placed in a plastic ZipLock baggie, and immediately stored in an insulated container chilled to a temperature of 4 degree Celsius for transportation under to a State Certified laboratory for analysis specific to the investigation appropriate chain-of-custody documentation.

Soil cuttings are either (1) stockpiled on, and covered with, plastic sheeting to eliminate aeration of potentially contaminated soil, or (2) containerized in 55-gallon steel drums. Soil cuttings from drilling operations are disposed of under proper hazardous waste manifest(s) in landfills capable of accepting the appropriate waste type and contaminant concentration.

Conversion of Borehole(s) into Well(s): The boreholes are converted into groundwater monitoring wells, piezometers, sparge wells, vapor monitoring, and /or vapor extraction wells by installing threaded schedule 40 PVC well casing of the appropriate diameter (dependant upon well type). A predetermined portion of the well casing is constructed of machine-slotted sections, which allow for the flow of groundwater and/or soil vapor/air into and out of the well casing. The size of the machined slots (measured in 100ths of inches) is determined by the grain size of the native materials encountered during drilling and by the well's intended use. For groundwater monitoring wells the screened section is generally no more than 10 feet long. The well casing is lowered into the borehole through the hollow stem augers and the annular space adjacent to the screened interval is slowly backfilled with sand (sand size is determined by the slot size noted above). The annular space between the well casing and the borehole wall will be a minimum of 2.5 inches and no more than 5-inches. A weighted measuring tape with the

appropriate graduations (feet and 10ths of feet) is used to prevent bridging of the annular material and to insure that the well is constructed according to the predetermined construction specifications. The annular sand (or filter pack) is extended one to two feet above the top of the screened interval. A two-foot thick hydrated bentonite seal is placed above the sand and the remaining annular space is back filled with cement slurry to prevent the inflow of surface water. The wellhead is fitted with a locking watertight plug and is encased in a traffic-rated bolt-down vault to protect against damage and unauthorized access.

Well Development and Groundwater Sample Collection: Weber, Hayes and Associates' groundwater monitoring field methodology is generally based guidelines outlined in California EPA's *Guidance Manual for Groundwater Investigations – Monitoring Well Design and Construction for Hydrogeologic Investigations,* dated July 1995. Well development operations will occur no sooner than 48 hours following well installation. The first step in groundwater well development is for Weber, Hayes and Associates field personnel to measure the depth-to-groundwater to the nearest hundredth (0.01) of a foot with an electric sounder. If the well appears to be pressurized, or the groundwater level is fluctuating, measurements are made until the groundwater levels stabilize, and a final depth-to-groundwater measurement is taken and recorded. After the depth-to-groundwater is measured, the well is then checked for the presence of free product with an oil/water interface probe. If free product is present, the thickness of the layer is recorded, and the product is removed. All field data (depth-to-groundwater, well purge volume, physical parameters, and sampling method) is recorded on field data sheets. Because removing free product may skew the data, wells that contain free product are generally not used in groundwater elevation and gradient calculations.

After measuring the depth-to-groundwater, a surge block is used to physically swab the wells entire screened interval a minimum of 50 strokes in order to remove fines for the sand pack and promote gradation between the surrounding formation and the sand pack. Following well swabbing the well is purged with a low flow submersible electric pump until visually free of turbidity. It may be necessary to repeat the well swabbing and purging steps if the turbidity of the discharge water does not decrease during the well purge. During purging the physical parameters of temperature, conductivity, pH, dissolved oxygen (D.O.) concentration, and Oxidation-Reduction Potential (ORP) of the purge water are monitored with a YSI ProPlus Flow Through Cell equipped meter to ensure that these parameters have stabilized. The YSI ProPlus meter is calibrated on site prior to each sampling event. Purging is determined to be complete (stabilized aquifer conditions reached) after the removal of at least one well casing volume of water and when the physical parameters have stabilized as follows:

Parameter	Stabilization Criteria
Temperature	+/- 3% of the reading (minimum of +/- 0.2° C)
pH	+/- 0.1
Electrical Conductance (EC)	+/- 3%
Oxidation-reduction Potential	+/- 10 millivolts
Dissolved Oxygen	+/- 0.3 milligrams per liter

The stabilization criteria should hold for at least three consecutive readings at a recording interval of approximately 1 reading per minute.

All purge water is stored on site in DOT-approved, 55-gallon drums for disposal by a state-licensed contractor pending laboratory analysis for fuel hydrocarbons.

After purging, the water level in the well is allowed to recover to 80 percent of its original depth before a sample is collected. After water level recovery, a post-development groundwater sample is collected from each well with a new, disposable bailer, and decanted into the appropriate laboratory-supplied sample container(s). All samples are labeled in the field and transported in insulated containers cooled with blue ice to state-certified laboratories under proper chain of custody procedures.

All field and sampling equipment is decontaminated before, between, and after measurements or sampling by washing in a Liqui-Nox and tap water solution, rinsing with tap water, and rinsing with distilled water.

Equipment Decontamination and Decontamination Fluid Containerization Procedures: All drilling equipment is steam cleaned prior to arriving on-site to prevent the transfer of contamination from another site. Accordingly, all drilling equipment is steam cleaned between boreholes (if applicable) and at the end of drilling operations to prevent the transfer of contamination to another site. The drill augers, all soil sampling equipment, and groundwater sampling and/or measurement equipment is thoroughly cleaned between each sampling run with a Liqui-Nox® or Alconox® solution followed by a double rinsing with distilled water to prevent transferring contamination vertically.

All cleaning rinsate, wash water, and other fluids or solids produced during the drilling process are containerized on-site in 55-gallon steel drum(s), and/or are disposed of under proper hazardous waste manifest(s) to an appropriate recycling facility with the capacity to accept the type and concentration of contaminant(s).

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

1001-1091 N SHORELINE BLVD & 1062 LINDA VISTA AVE
MOUNTAIN VIEW, CA 94043

COORDINATES

Latitude (North):	37.4092510 - 37° 24' 33.30''
Longitude (West):	122.0773120 - 122° 4' 38.32''

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 12/12/2018 has revealed that there are 6 NPL sites within approximately 1 mile of the target property.

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 12/12/2018 has revealed that there are 3 SEMS sites within approximately 0.5 miles of the target property.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 12/13/2018 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 19 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there is

1 RCRA-CESQG site within approximately 0.25 miles of the target property.

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State

Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 01/28/2019 has revealed that there are 18 CA ENVIROSTOR sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

CA CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CA CPS-SLIC list, as provided by EDR, has revealed that there are 22 CA CPS-SLIC sites within approximately 0.5 miles of the target property.

Local Lists of Registered Storage Tanks

CA SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the CA SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 10 CA SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there are 7 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

Site name: OLIN MESA CORPORATION
Classification: Small Quantity Generator

Violation Status: No violations found

FINDS:

Registry ID: 110002692676

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Summary Details:

Conditions at proposal April 10, 1985): Moffett Naval Air Station covers 8,700 acres in Sunnyvale, Santa Clara County, California. In the past, various solvents and sludges were disposed on-site into ponds and landfills and onto the ground.As a result, soil and ground water on-site are contaminated. The major contaminants in ground water are volatile organic compounds. About 272,000 people depend on wells within 3 miles of the station as a source of drinking water. Moffett Naval Air Station is participating in the Installation Restoration Program IRP), established in 1978. Under this program, the Department of Defense seeks to identify, investigate, and clean up contamination from ha ardous materials. The Navy has completed Phase I records search) of the program and is beginning Phase II remedial investigation). Moffett Naval Air Station is in the South Bay Area of San Francisco. In October 1984, 19 non-Federal sites in the area were proposed for the NPL. Facilities at these sites have used a variety of toxic chemicals, primarily chlorinated organic solvents, which contaminate a common ground water basin. Although these sites are listed separately, EPA intends to apply an area-wide approach to the problem as well as take site-specific action as necessary. Status July 22, 1987): In May 1985, the California Regional Water Quality Control Board adopted Waste Discharge Requirements for Moffett Naval Air Station.The requirements outline specific tasks and compliance dates Moffett must follow to define the full extent of contamination in soils and ground water. In April 1986, the Navy released the final report for the verification step of Phase II.Moffett is revising the quality assurance project plan and sample plan for the characteri ation step of Phase II. Within the boundaries of this Federal facility, including this specific site, there are no areas subject to the Subtitle C corrective action authorities of the Resource Conservation and Recovery Act. Therefore, this Federal facility site is being placed on the Federal section of the NPL.

Summary Details:

Conditions at proposal October 15, 1984): Intel Corp. manufactured semiconductors at a plant in Mountain View, Santa Clara County, California, between 1968 and 1981. At that time, the facility occupied 2 acres and was surrounded by residential areas, office buildings, and other semiconductor-manufacturing plants. Monitoring wells on the site are contaminated with trichloroethylene, xylene, vinyl chloride, and 1,1- and trans-1,2-dichloroethylene, according to analyses conducted by a consultant to Intel. Contamination is believed to have resulted from leaking underground solvent tanks. About 270,000 people depend on wells within 3 miles of the site as a source of drinking water. Since early 1982, Intel hasbeen pumping ground water and treating it by carbon adsorption. The company intends to implement additional cleanup activities, including the installation of a system to pump and treat contaminated ground water and excavation of soil beneath the underground storage tanks, which were previously removed. The company is working with the California Regional Water Quality Control Board CRWQCB) to determine the full extent of the contamination. This is one of 19 sites in the SouthBay Area of San Francisco. Facilities at these sites have used a variety of toxic chemicals, primarily chlorinated organic solvents, which contaminate a common ground water basin. Although these sites are listed separately, EPA intends to apply an area-wide approach to the problem as well as take specific action as necessary. Status June 10, 1986): Intel has removed approximately 4,600 cubic yards of contaminated soil and has installed four wells to pump and treat contaminated ground water. CRWQCB has issued Waste Discharge Requirements to the company. The requirements are the board s legal mechanism for regulating activities at facilities under its jurisdiction. On August 15, 1985, EPA issued a CERCLA Administrative Order on Consent to Intel Corp. s Mountain View Plant, as well as to Fairchild Camera s and Raytheon Corp. s Mountain View Plants. The order calls for the three companies to conduct a joint remedial

INTEL CORPORATION (Continued) **1000203455**

investigation/feasibilitystudy of the area to determine the type and extent of contamination and identify alternatives for remedial action.

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

SUPERFUND NPL

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Summary Details:

Conditions at proposal October 15, 1984): Teledyne Semiconductor has manufactured semiconductors on a 1-acre site in Mountain View, Santa Clara County, California, since 1962. In December l982, Teledyne reported to the California Regional Water Quality Control Board CRWQCB) that soil and ground water near an underground storage tank were contaminated with solvents, including trichloroethylene. An investigation in June 1984 revealed that the contaminants had migrated to the northand affected approximately 50 private domestic wells. Local agencies and the company have provided alternative sources of drinking water for the affected residences. About 116,000 people depend on wells within 3 miles of the site as a source of drinking water. The company is working with CRWQCB to determine the extent of the contamination and to develop interim hydraulic controls to prevent further migration of the contaminants. The facility received Interim Status underSubtitle C of the Resource Conservation and Recovery Act RCRA) when the company filed Part A of a permit application. This is one of 19 sites in the South Bay Area of San Francisco. Facilities at these sites have used a variety of toxicchemicals, primarily chlorinated organic solvents, which contaminate a common ground water basin. Although these sites are listed separately, EPA intends to apply an area-wide approach to the problem as well as take specific action as necessary. Status February 1986): CRWQCB, in conjunction with EPA and the California Department of Health Services, is considering various response actions at the site. This site remains in proposed status until EPA implements the appropriate elements of its final policy for placing RCRA-related sites on the NPL and then applies the policy to this site. Status July 22, 1987): Subsequent investigation revealed that this site is not subject to the Subtitle C permitting requirements of RCRA. Its score on the Ha ard Ranking System, which EPA uses to evaluate sites for the NPL, is above the cutoff point of 28.50, and EPA received no information that prevents placing the site on the NPL. Therefore, it is being placed on the NPL. Teledyne is planning on pumping the contaminated ground water in the upper aquifer to the surface for

EMBARCADERO REALTY SERVICES LP (Continued) **1000201854**

subsequent treatment.

Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D007

EMBARCADERO REALTY SERVICES LP (Continued) **1000201854**

. Waste name: CHROMIUM

. Waste code: D008
. Waste name: LEAD

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Pathway: GROUND WATER PATHWAY
Scoring: 2

Summary Details:

Conditions at proposal June 24, 1988): Spectra-Physics, Inc. SP) has manufactured electronic equipment and gas lasers on Terra Bella Boulevard and Middlefield Roads in Mountain View, Santa Clara County, California, since 1961. The 11.5-acre site consists of nine buildings in a light industrial complex. SP uses a variety of cleansers, degreasers, and lubricants in its manufacturing processes, including isopropyl alcohol, acetone, methyl alcohol, trichloroethylene TCE), Freon, 1,1,1-trichloroethane TCA), and Solvasol Solvent 360. In an inspection conducted in 1981, the California Regional Water Quality Control Board CRWQCB) found that areas where ha ardous wastes were stored had no dikes or systems to collect leachate; rusty barrels were also found on-site. Ground water investigations began at the SP facility in September 1984 after tests at Teledyne Semiconductor adjacent and downgradient of SP) indicated possible upgradient sources of contamination. The Teledyne site was placed on the NPL in July 1987.) Soil and ground water collected at SP contained TCE, TCA, and 1,2-dichloroethylene. SP s plume of contaminated ground water has merged with Teledyne s and migrated off-site. More than 200 private drinking water wells had been drilled into the 1-square-mile plume. Most wells have been closed; 47 were found contaminated above State Action Levels. The owners now obtain water from municipal water supplies. An estimated 189,000 people obtain drinking water from public and private wells within 3 miles of the site. Teledyne is operating two extraction wells on-site -- one in the shallow one and one in the intermediate one. The wells pump the water to the surface and discharge it to the sanitary sewer; the ground water is not treated before discharge. SP will evaluate the effectiveness of this system in preventing its on-site plume from migrating off-site. Both companies are jointly designing an off-site extraction system. San Francisco Bay 2.5 miles downstream of the site) is used for recreational activities. Permanente Creek is tidally influenced within 1 mile of the site. Several species of birds designated as endangered species by the U.S. Fish and Wildlife Service are found within the area of tidal influence. Status February 11, 1991): In February 1990, SP installed a vapor extraction system to reduce concentrations of contaminants in soil. Underan order issued by CRWQCB, SP conducted a remedial investigation/feasibility study RI/FS) to determine the type and extent of contamination at the site and identify alternatives for remedial action. The RI/FS was completed in December 1990. In February 1991, CRWQCB will adopt a final cleanup and abatement order requiring SP to implement the best remedial alternative evaluated in the RI/FS. This alternative will include expanding the existing soil vapor extraction system and the ground water extraction system. In April 1991, EPA will complete a Record of Decision describing the selected remedy.

Pathway: SURFACE WATER PATHWAY
Scoring: 3

Summary Details:

Conditions at proposal June 24, 1988): Jasco Chemical Corp. has formulated chemical products on a 2.05-acre site in Mountain View, Santa Clara County, California, since 1976. The site is bordered on the northeast by the Central Expressway and the Southern Pacific Railroad, and on the remaining sides by residential neighborhoods. In January 1983, a citi en complained to the California Regional Water Quality Control Board CRWQCB) that the facility was dumping solvents at therear of the site on a daily basis. CRWQCB requested Jasco to install a monitoring well at the site to determine if ground water was contaminated. Both ground water and soil are contaminated at the site, according to analyses conducted byconsultants to Jasco. Methylene chloride concentrations are as high as 142,000 parts per million in ground water, and soil is highly contaminated with pentachlorophenol to depths of 20 feet. Contamination is believed to have resulted from anyof the following sources: an underground tank farm, two dry wells used for disposal of storm water run-off from the roof and paved portion of the site, and a drain that discharges surface run-off at the rear of the site. The company is working with CRWQCB to determine the extent of the contamination and to prevent further migration of the contaminants. In addition, the City of Mountain View closed nearby Municipal Well 17 in 1987, until the lateral and vertical extent of the pollution has been defined. About 333,000 people obtain drinking water from wells within 3 miles of the site. Status October 4, 1989): Jasco is pumping and treating ground water to remove contamination. In July 1988, Municipal Well 17was returned to service. In November 1988, Jasco excavated 550 cubic feet of contaminated soil and transported it to a ha ardous waste facility regulated under Subtitle C of the Resource Conservation and Recovery Act.

Summary Details:

Conditions at proposal June 24, 1988): CTS Printex, Inc., manufactured printed circuit boards on 5.6 acres in Mountain View, Santa Clara County, California, during 1966-85. Printex was incorporated in 1966 and acquired by CTS Corp. in 1981.In the wet-floor building at 1911 Plymouth Street, acid waste water containing copper, lead, and organic wastes containing trichloroethylene TCE) and other solvents drained to the floor, collected in a sump where they were neutrali ed withammonia, and discharged to the Mountain View sanitary sewer. Early in 1985, a consultant to CTS Corp. found high levels of copper and lead in soil near the wet-floor building and high levels of TCE, 1,1,1-trichloroethane, and 1,1-dichloroethylene in

CTS PRINTEX, INC. (Continued) **1000128432**

monitoring wells downgradient of the site. An estimated 189,000 people obtain drinking water from municipal wells within 3 miles of the site. Permanente Creek borders the site. Surface water drainage eventually discharges to San Francisco Bay 2.5 miles to the north. Late in 1985, the company excavated the sump area and filled it in, decontaminated the building, and transported waste materials to a ha ardous waste facility regulated under Subtitle C of the Resource Conservation and Recovery Act RCRA). In October 1986, the California Department of Health Services certified closure of the facility. In an attempt to stop migration of contaminated ground water off-site, the company is pumping the water and discharging it to Mountain View s sanitary sewer system under a city permit. The company continues to monitor to define the plume of contaminated ground water. In March 1987, the California Regional Water Quality Control BoardCRWQCB) issued a Cleanup and Abatement Order requiring the company to be more expeditious and thorough in its cleanup and set a schedule for various on- and off-site tasks. Status February 21, 1990): CTS Printex is conducting a remedialinvestigation/feasibility study RI/FS) to determine the type and extent of contamination at the site and identify alternatives for remedial action. In November 1989, CRWQCB received the first draft of the RI/FS for review. The final draft isscheduled to be submitted in late 1990.

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

SUPERFUND NPL

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

RB Case Number:	20-017
Local Agency:	Not reported
File Location:	All Files are on GeoTracker or in the Local Agency Database
Local Case Number:	06S2W15M02f
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	MTBE / TBA / Other Fuel Oxygenates, Gasoline
Site History:	The Site is a former Texaco-branded service station located at the intersection of North Shoreline Boulevard and Terra Bella Avenue in Mountain View, California. Former station features include one 6,000-gallon gasoline underground storage tank (UST), four 4,000-gallon gasoline USTs, and one waste oil UST. In 1992, the six USTs, associated product piping, and dispensers were removed, and the Site was redeveloped as a restaurant. Twelve groundwater monitoring wells have been installed on or near the Site to-date. Eight groundwater monitoring wells (MW-22A, MW-22B, MW-22D, and MW-22L through MW-22P) were installed on-site, and four groundwater monitoring wells (MW-22E through MW-22H) were installed at off-site locations to assess the lateral extent of petroleum hydrocarbons in groundwater. Groundwater monitoring has been performed at the Site since 1988. Historically, groundwater flow at the Site has been towards the north.

FINDS:

Registry ID: 110002683061

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System
STATE MASTER

Registry ID: 110009540791

Environmental Interest/Information System
US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

WDS:

Facility ID:	San Francisco Bay 43I006649
Facility Type:	Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number:	CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board
Subregion:	2
Facility Telephone:	6509626572
Facility Contact:	DENNIS MARSHALL
Agency Name:	TELEDYNE IND
Agency Address:	1274 Terra Bella Ave

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

FINDS:

Registry ID: 110002411854

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Description: Failure to complete and electronically submit a site map with all required content.
Violation Notes: Update site map with accurate locations of all chemicals
Violation Division: Mountain View Fire Department
Violation Program: HMRRP
Violation Source: CERS

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 08-16-2016
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: Onsite today for routine hazardous waste inspection, noted the following: -Met with facility manager Darin Clarke and Al Batakjih today, toured facility. -Labs perform soldering and work also with some solvents including toluene and MEK for process and production work of parts. -Each lab bench worker has an independent satellite container for hazardous waste solid debris, each has a completed hazardous waste label. -Emergency Procedures were updated today and posted in the facility. -Outside there are approximately 8 hazardous waste storage rooms for segregation of wastes for compatibility purposes; Chemical shed #1 had 1 x 55 gallon vapor degreaser drum, label accumulation start date was updated today (label was mis-labeled for 2014). -Discussed training details and universal waste handling; the universal waste batteries, fluorescent tubes and aerosol cans were labeled and stored appropriately. -Manifests are maintained onsite and were reviewed today. No were [Truncated]

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CPS-SLIC:

Region:	STATE
Facility Status:	**Open - Remediation**
Status Date:	01/04/1990
Global Id:	SL721201221
Lead Agency:	SAN FRANCISCO BAY RWQCB (REGION 2)
Lead Agency Case Number:	Not reported
Latitude:	37.407804
Longitude:	-122.079986
Case Type:	Cleanup Program Site
Case Worker:	RWP
Local Agency:	SANTA CLARA VALLEY WATER DISTRICT
RB Case Number:	43S0120
File Location:	Regional Board
Potential Media Affected:	Other Groundwater (uses other than drinking water), Soil, Soil Vapor
Potential Contaminants of Concern:	Other Chlorinated Hydrocarbons, Trichloroethylene (TCE)
Site History:	The former Spectraphysics property is part of a 2-property Federal Superfund site along with the adjacent Teledyne property. Within the last ten years, Responsible Parties (RPs) for the Teledyne/Spectra-Physics site completed a Monitored Natural Attenuation (MNA) study in the off-property area north of and downgradient of the site. The MNA study concluded that natural breakdown of the chlorinated volatile organic compounds of concern is occurring naturally and at the same rate as groundwater extraction. As a result, only a few of the off-property downgradient extraction wells are operating mainly to maintain hydraulic control of the plume. The RPs completed an extended pilot study to test the feasiblity of enhanced reductive dechlorination (ERD) and concluded

SPECTRA-PHYSICS LASERS (Continued) **S103980880**

that ERD is feasible with bioaugmentation of the Shallow Zone. Within the last several years, the RPs detected on-property groundwater-CVOCs and higher than expected levels but under 1,000 parts per billion and are about to impelment an on-property ERD treatability study with the same recirculation technology as the the neighboring Teledyne property. When sub-slab depressurizationv (SSD) systems have been installed under the potentially impacted buildings, the RPs will move forward on the ERD treatability study. Within the last seven years however, IA VI was evaluated in several of the on-property commercial buildings to find that IA-CVOCs were over ESLs. The RPs installed SSD systems at several of the buildings. The RPs also assertiively evaluated potential IA VI in the off-property commercial North Bayshore and residential Spring Street areas to conclude that IA VI is occurring in one of the off-property commercial area buildings and in several homes in the residential area. The RPs were in the process of installing a sub-slab depressurization system in the commercial building and offered the affected residents crawl space fans to address the issue.

- Used oil fuel marketer to burner: No
- Used oil Specification marketer: No
- Used oil transfer facility: No
- Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D018
. Waste name: BENZENE

Violation Status: No violations found

Environmental Interest/Information System

CHEVRON STATION NO 96377 (Continued) **1006804980**

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: 181

. Waste code: 211
. Waste name: Halogenated solvents (chloroform, methyl chloride, perchloroethylene, etc.)

. Waste code: 331
. Waste name: Off-specification, aged, or surplus organics

. Waste code: 352
. Waste name: Other organic solids

. Waste code: 541
. Waste name: Photochemicals / photo processing waste

TAKARA BIO USA, INC. (Continued) **1012176398**

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D003
. Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D003
. Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

. Waste code: D011
. Waste name: SILVER

. Waste code: D018
. Waste name: BENZENE

. Waste code: D022
. Waste name: CHLOROFORM

. Waste code: D038
. Waste name: PYRIDINE

. Waste code: F002
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE,

CLONTECH LABORATORIES (Continued) **1012175746**

ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F005
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Universal Waste Summary:
Waste type: Batteries
Accumulated waste on-site: Yes
Generated waste on-site: Yes

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D008
. Waste name: LEAD

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Case Type:	Cleanup Program Site
Case Worker:	UUU
Local Agency:	Not reported
RB Case Number:	43S0633
File Location:	Regional Board
Potential Media Affected:	Other Groundwater (uses other than drinking water), Soil, Soil Vapor
Potential Contaminants of Concern:	* Solvents
Site History:	Digital Equipment Corporation (DEC) operated a manufacturing facility at the subject site between 1969 and 1983. The facility performed nickel and copper plating of discs. As part of this operation, DEC stored and used hazardous materials including TCA and acetone, and operated an acid neutralization tank whose effluent discharged to the sanitary sewer. After operations were discontinued, DEC removed the acid neutralization tank and received regulatory closure from the Mountain View Fire Department. The Department approved final facility closure for chemical storage in 1990. DEC was acquired by Compaq in 1998; Compaq in turn was acquired by Hewlett Packard in 2002. DEC voluntarily reported a possible release of chlorinated solvents in 1984. This report was based on onsite groundwater monitoring that appeared to show chlorinated solvents in groundwater above drinking water levels. DEC later concluded that these results were false positives, due to laboratory contamination, and that no release of chlorinated solvents to soil or groundwater had occurred. Terra Bella Office Partners, LLC, the landowner, performed a comprehensive soil, soil vapor, and groundwater investigation in 2010. VOCs were either non-detect or in a few cases detected below regulatory standards (e.g., MCLs). Metals were detected but at concentrations consistent with background conditions. Water Board staff concludes that no condition of pollution exists at the site and the case should be closed.

1300 TERRA BELLA TELEDYNE (Continued) **1001433386**

Treat To Water: Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.

Complexity: Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.

CPS-SLIC:
Region: STATE
Facility Status: **Open - Remediation**
Status Date: 10/01/1986
Global Id: SL721281224
Lead Agency: SAN FRANCISCO BAY RWQCB (REGION 2)
Lead Agency Case Number: Not reported
Latitude: 37.4106132140258
Longitude: -122.080657482147
Case Type: Cleanup Program Site
Case Worker: RWP
Local Agency: SANTA CLARA VALLEY WATER DISTRICT
RB Case Number: 43S0128
File Location: Regional Board
Potential Media Affected: Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern: Other Chlorinated Hydrocarbons, Tetrachloroethylene (PCE), Trichloroethylene (TCE), Vinyl chloride
Site History: The Teledyne property is part of a two-property Superfund site along with the adjacent Spectra-Physics property. The responsible parties (RPs) for the Teledyne/Spectra-Physics site completed a Monitored Natural Attenuation (MNA) study in the off-property area north of and downgradient of the site. The MNA study concluded that natural breakdown of the chlorinated volatile organic compounds of concern is occuring naturally and at the same rate as groundwater extraction. As a result, only a few of the off-property downgradient extraction wells were operating mainly to maintain hydraulic control of the plume. The RPs completed a pilot study to test the feasibility of enhanced reductive dechlorination (ERD) and concluded that ERD is feasible with bioaugmentation of the Shallow Zone. Within the last five years, the RPs detected elevated source areas at the Teledyne property using high resolution technology and continuously logged and screened ERD injection well boreholes. Implementing a full-scale ERD treatability study, they have been and are currently remediating the property with groundwater-CVOC levels dropping from as much as over 80,000 ug/l to low multiples of MCLs. Several rounds of ERD injections successfully cleaned up most of the Shallow Zone at the Teledyne property and the adjacent Spring Street residential area to drinking water standards and the treatability study was even more successful in the underlying Upper and Lower Intermediate Zones. An

TDY INDUSTRIES, INC (Continued) **S100833421**

on-property IA VI evaluation at a SpectraPhysics property in 2004 indicated no IA-CVOC contamination above the Regional Water Board's 2008 ESLs. More recently, the RPs also assertively evaluated potential IA VI in the off-property commercial North Bayshore and residential Spring Street areas to conclude that IA VI is not occurring in most of the commercial area and is occasionally occurring in several homes in the residential area. The RPs installed sub-slab depressurization systems in the impacted on-property commercial buildings and offered the affected residents crawl space fans to address the issue.

Background Info:	Teledyne Semiconductor has operated a semiconductor manufacturing facility at this one-acre site since 1962. Chemicals

TDY INDUSTRIES, INC (Continued) **S100833421**

used in the manufacturing process and wastes generated by the process are handled and stored onsite.
In 1982, Teledyne notified the RWQCB that soil and groundwater near underground solvent storage tanks was contaminated. Further study revealed that a groundwater contaminant plume had migrated northward and contaminated forty private domestic wells. The contaminants identified in soil and groundwater include trichloroethylene (TCE), dichloroethylene (DCE), Freon-113, dichlorobenzene (DCB), perchloroethylene (PCE), and xylene.
About 270,000 people residing within three miles of the site depend on groundwater as a source of drinking water. The groundwater contamination represents a potential threat to municipal and other wells.

CA BOND EXP. PLAN:
Reponsible Party: NPL SITE CLEANUP WORKPLAN
Project Revenue Source Company: Not reported
Project Revenue Source Addr: Not reported
Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: Teledyne, the responsible party, has been conducting remedial activities under and order issued by the RWQCB. DHS has budgeted $50,000 for development, review and approval of a RAP and will seek to recover all actual costs from the responsible parties.
Site Description: Teledyne Semiconductor has operated a semiconductor manufacturing facility at this one-acre site since 1962. Chemicals used in the manufacturing process and wastes generated by this process are handled and stored onsite.
Hazardous Waste Desc: In 1982, Teledyne notified the RWQCB that soil and ground water near underground solvent storage tanks was contaminated. Further study revealed that a ground water contaminant plume and migrated northward and contaminated 40 private domestic wells. The contaminants identified in soil and ground water are trichloroethylene (TCE), dichloroethylene (DCE), Freon-113, dichlorobenzene (DCB), perchloroethylene (PCE) and xylene.
Threat To Public Health & Env: About 270,000 people residing within 3 miles of the site depend on ground water as a source of drinking water. The ground water contamination represents a potential threat to municipal and other wells.
Site Activity Status: An investigation conducted in June, 1984, revealed that solvents had contaminated private wells to the north of the site. Contaminated wells were closed and an alternate drinking water supply was provided to affected residents. A ground water extraction system was installed onsite and began operating in October, 1986. Characterization of soil and ground water contamination is continuing.

FINDS:

Registry ID: 110002828389

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource

AUTOMOTIVE SERVICE CENTER (Continued) **1000335067**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002901003

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Teledyne-Spectraphysics (T-S) plume with underlying groundwater probably impacted by the upgradient T-S source properties. The developer plans to construct the building wiht a vapor intrusion mitigation system (VIMS) and water barrier. Indoor air testing will be conducted to verify that the VIMS is working as designed.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Completion Report
Completed Date:	01/06/1984
Comments:	In February of 1983, DHS directed LGM to remove the contaminated soil from on and off its property. Several months later, LGM declared bankruptcy and went out of business. In the latter part of 1983 and early 1984, chemicals and contaminated soil were removed from the LGM storage area and an adjacent condominium complex. Post-excavation confirmation samples were taken for fluoride and copper. Detected levels were below health-based risk goals considered safe for residential use.

Background Info:	LGM Manufacturing (LGM) manufactured printed circuit boards from 1969 to 1983. Chemicals used at the Site included ammonia, etch acids, brighteners, fusing oil, trichloroethylene, copper with formaldehyde, and methylene chloride. Chemical wastes were stored in drums and containers in a yard behind the LGM warehouse.

Case Worker:	RWP
Local Agency:	Not reported
RB Case Number:	43S1173
File Location:	Regional Board
Potential Media Affected:	Soil, Soil Vapor
Potential Contaminants of Concern:	Trichloroethylene (TCE)
Site History:	The project is a redevelopment property within the Teledyne-Spectraphysics (T-S) plume with underlying groundwater probably impacted by the upgradient T-S source properties. The developer plans to construct the building wiht a vapor intrusion mitigation system (VIMS) and water barrier. Indoor air testing will be conducted to verify that the VIMS is working as designed.
