San Bernardino County Synthetic Unit Hydrology Method
Manual date - August 1986

Program License Serial Number 6277

2019-185 HCC II
Post-Developed Conditions
Unit Hydrograph Method - 100yr Storm
DMA C

Storm Event Year = 100

Antecedent Moisture Condition = 3

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

English Units used in output format

Area averaged rainfall intensity isohyetal data:

Sub-Area (Ac.)	Duration (hours)	Isohyetal (In)
Rainfall data for year 10		
24.95	1	0.77
Rainfall data for year 2		
24.95	6	1.08
Rainfall data for year 2		
24.95	24	2.03
Rainfall data for year 100		
24.95	1	1.29
Rainfall data for year 100		
24.95	6	2.99
Rainfall data for year 100

San Bernardino County Synthetic Unit Hydrology Method
Manual date - August 1986

Program License Serial Number 6277

2019-185 HCC II
Post-Developed Conditions
Unit Hydrograph Method - 100yr Storm
DMA J

Storm Event Year = 100

Antecedent Moisture Condition = 3

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

English Units used in output format

Area averaged rainfall intensity isohyetal data:

Sub-Area (Ac.)	Duration (hours)	Isohyetal (In)
Rainfall data for year 10		
2.55	1	0.77
Rainfall data for year 2		
2.55	6	1.08
Rainfall data for year 2		
2.55	24	2.03
Rainfall data for year 100		
2.55	1	1.29
Rainfall data for year 100		
2.55	6	2.99
Rainfall data for year 100		

```

San Bernardino County Synthetic Unit Hydrology Method
Manual date - August 1986

Program License Serial Number 6277

2019-185 HCC II
Post-Developed Conditions
Unit Hydrograph Method - 100yr Storm
DMA K

Storm Event Year = 100

Antecedent Moisture Condition = 3

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

English Units used in output format

Area averaged rainfall intensity isohyetal data:

Sub-Area (Ac.)	Duration (hours)	Isohyetal (In)
Rainfall data for year 10		
12.57	1	0.77
Rainfall data for year 2		
12.57	6	1.08
Rainfall data for year 2		
12.57	24	2.03
Rainfall data for year 100		
12.57	1	1.29
Rainfall data for year 100		
12.57	6	2.99
Rainfall data for year 100

CONTECH ENGINEERED SOLUTIONS

Date: 7/18/2021
Project Name: Underground Infiltration CMP #1 - 7614 (7-18-2021 0-14-3

City / County:
State:

Designed By:
Company:
Telephone:

CMP: Underground Detention System
Storage Volume Estimation

=Adjustable Input Cells

Contech Engineered Solutions, LLC is pleased to offer the following estimate of storage volume for the above named project. The results are submitted as an estimate only, without liability on the part of Contech Engineered Solutions, LLC for accuracy or suitability to any particular applicaton and are subject to verification of the Engineer of Record. **This tool is only applicable for rectangular shaped systems.**

Summary of Inputs

System Information		Backfill Information		Pipe & Analysis Information	
Out-to-out length (ft):	1,800.0	Backfill Porosity (%):	40%	System Diameter (in):	144
Out-to-out width (ft):	237.0	Depth Above Pipe (in):	6.0	Pipe Spacing (in):	36
Number of Manifolds (ea):	1.0	Depth Below Pipe (in):	6.0	Incremental Analysis (in):	2
Number of Barrels (ea):	16.0	Width At Ends (ft):	3.0	System Invert (Elevation):	0
		Width At Sides (ft):	3.0

**** RETARDING BASIN ROUTING ****

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 307
Hydrograph time unit = 5.000 (Min.)
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this noise study to determine the potential noise impacts and the necessary noise mitigation measures, if any, for the proposed Hesperia Commerce Center II development ("Project"). The Project is proposed to consist of 2,361,648 square feet of High-Cube Fulfillment Center use and 1,383,781 square feet of General Light Industrial use. At the time this noise analysis was prepared, the future tenants of the proposed Project were unknown, and therefore, this noise study includes a conservative analysis of the proposed Project uses. This study has been prepared to satisfy applicable City of Hesperia standards and thresholds of significance based on guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1)

The results of this Hesperia Commerce Center II Noise Impact Analysis are summarized below based on the significance criteria in Section 4 of this report. Table ES-1 shows the findings of significance for each potential noise and/or vibration impact under CEQA before and after any required mitigation measures.

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings	
		Unmitigated	Mitigated
Off-Site Traffic Noise	7	*Potentially Significant*	*Significant and Unavoidable*

1 INTRODUCTION

This noise analysis has been completed to determine the noise impacts associated with the development of the proposed Hesperia Commerce Center II ("Project"). This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, sets out the local regulatory setting, presents the study methods and procedures for transportation related CNEL traffic noise analysis, and evaluates the future exterior noise environment. In addition, this study includes an analysis of the potential Project-related long-term stationary-source operational noise and short-term construction noise and vibration impacts.

1.1 SITE LOCATION

The proposed project is located north of Phelan Road and west of US Highway 395 in the City of Hesperia. The Project location is shown on Exhibit 1-A. The Project Site is generally located in an undeveloped rural area with some residential homes located to the west and south.

1.2 PROJECT DESCRIPTION

The proposed Project consists of the following uses:

- 2,361,648 square feet of High-Cube Fulfillment Center use (65% of the total square footage of Building 1 and Building 2)
- 1,383,781 square feet of General Light Industrial use; 1,271,656 square feet within Building 1 and Building 2 (35% of the total square footage of Building 1 and Building 2) and 112,125 square feet within Building 3

The Project is anticipated to be developed within a single phase with an anticipated opening year of 2021. Regional access to the Project site is available from the I-15 Freeway at the Main Street interchange. At the time this noise analysis was prepared, the future tenants of the proposed Project were unknown.

The on-site Project-related noise sources are expected to include: loading dock activity, entry gate & truck movements, roof-top air conditioning units, and trash enclosure activity. This noise analysis is intended to describe noise level impacts associated with the expected typical operational activities at the Project site. To present a conservative approach, this report assumes the Project will operate 24-hours daily for seven days per week.

2 FUNDAMENTALS

Noise is simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140	INTOLERABLE OR DEAFENING	HEARING LOSS
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100	VERY NOISY	
GAS LAWN MOWER AT 1m (3 ft)		90		
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		SPEECH INTERFERENCE
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70	LOUD	
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50	MODERATE	SLEEP DISTURBANCE
QUIET URBAN NIGHTTIME	THEATER, LARGE CONFERENCE ROOM (BACKGROUND)	40		
QUIET SUBURBAN NIGHTTIME	LIBRARY	30	FAINT	NO EFFECT
QUIET RURAL NIGHTTIME	BEDROOM AT NIGHT, CONCERT HALL (BACKGROUND)	20		
	BROADCAST/RECORDING STUDIO	10	VERY FAINT	
LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. (2) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA

at approximately 100 feet, which can cause serious discomfort. (3) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 NOISE DESCRIPTORS

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most used figure is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period (typically one hour) and is commonly used to describe the "average" noise levels within the environment.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Community Noise Equivalent Level (CNEL), representing a composite 24-hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are made to account for the noise sensitive time periods during the evening and night hours when sound appears louder. CNEL does not represent the actual sound level heard at any time, but rather represents the total sound exposure. The City of Hesperia relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The way noise reduces with distance depends on the following factors.

2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source. (2)

2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receiver is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually

sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receiver, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receiver such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source. (4)

2.3.3 ATMOSPHERIC EFFECTS

Receivers located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects. (2)

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receiver can substantially attenuate noise levels at the receiver. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an "out of sight, out of mind" effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby residents. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure. (4)

2.3.5 REFLECTION

Field studies conducted by the FHWA have shown that the reflection from barriers and buildings does not substantially increase noise levels. (4) If all the noise striking a structure was reflected back to a given receiving point, the increase would be theoretically limited to 3 dBA. Further, not all the acoustical energy is reflected back to same point. Some of the energy would go over the structure, some is reflected to points other than the given receiving point, some is scattered by ground coverings (e.g., grass and other plants), and some is blocked by intervening structures and/or obstacles (e.g., the noise source itself). Additionally, some of the reflected energy is lost due to the longer path that the noise must travel. FHWA measurements made to quantify reflective increases in traffic noise have not shown an increase of greater than 1-2 dBA; an increase that is not perceptible to the average human ear.

2.4 NOISE CONTROL

Noise control is the process of obtaining an acceptable noise environment for an observation point or receiver by controlling the noise source, transmission path, receiver, or all three. This

concept is known as the source-path-receiver concept. In general, noise control measures can be applied to these three elements.

2.5 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by up to 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receiver. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the path of the noise source. (4)

2.6 LAND USE COMPATIBILITY WITH NOISE

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (5)

2.7 COMMUNITY RESPONSE TO NOISE

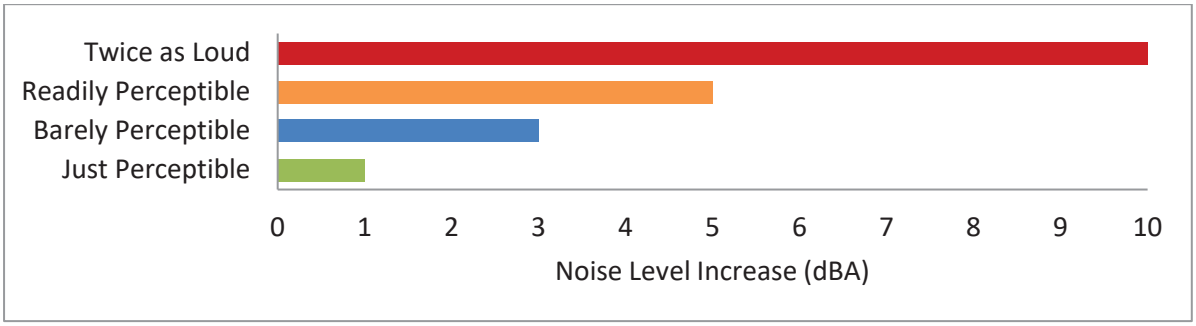
Community responses to noise may range from registering a complaint by telephone or letter, to initiating court action, depending upon everyone's susceptibility to noise and personal attitudes about noise. Several factors are related to the level of community annoyance including:

- Fear associated with noise producing activities;
- Socio-economic status and educational level;
- Perception that those affected are being unfairly treated;
- Attitudes regarding the usefulness of the noise-producing activity;
- Belief that the noise source can be controlled.

Approximately ten percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints will occur. Twenty-five percent of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected from people exposed to any given noise environment. (6) Surveys have shown that about ten percent of the people exposed to traffic noise of 60 dBA will report being highly annoyed with the noise, and each increase of one dBA is associated with approximately two percent more people being highly annoyed. When traffic noise exceeds 60 dBA or aircraft noise exceeds 55 dBA, people may begin to complain. (6) Despite this variability in behavior on an individual level, the population can be expected to exhibit the following responses to changes in noise levels as shown on Exhibit 2-B. A change of

3 dBA are considered *barely perceptible*, and changes of 5 dBA are considered *readily perceptible*. (4)

EXHIBIT 2-B: NOISE LEVEL INCREASE PERCEPTION



2.8 EXPOSURE TO HIGH NOISE LEVELS

The Occupational Safety and Health Administration (OSHA) sets legal limits on noise exposure in the workplace. The permissible exposure limit (PEL) for a worker over an eight-hour day is 90 dBA. The OSHA standard uses a 5 dBA exchange rate. This means that when the noise level is increased by 5 dBA, the amount of time a person can be exposed to a certain noise level to receive the same dose is cut in half. The National Institute for Occupational Safety and Health (NIOSH) has recommended that all worker exposures to noise should be controlled below a level equivalent to 85 dBA for eight hours to minimize occupational noise induced hearing loss. NIOSH also recommends a 3 dBA exchange rate so that every increase by 3 dBA doubles the amount of the noise and halves the recommended amount of exposure time. (7)

OSHA has implemented requirements to protect all workers in general industry (e.g. the manufacturing and the service sectors) for employers to implement a Hearing Conservation Program where workers are exposed to a time weighted average noise level of 85 dBA or higher over an eight-hour work shift. Hearing Conservation Programs require employers to measure noise levels, provide free annual hearing exams and free hearing protection, provide training, and conduct evaluations of the adequacy of the hearing protectors in use unless changes to tools, equipment and schedules are made so that they are less noisy and worker exposure to noise is less than the 85 dBA. This noise study does not evaluate the noise exposure of workers within a project or construction site based on CEQA requirements, and instead, evaluates Project-related operational and construction noise levels at the nearby sensitive receiver locations in the Project study area.

2.9 VIBRATION

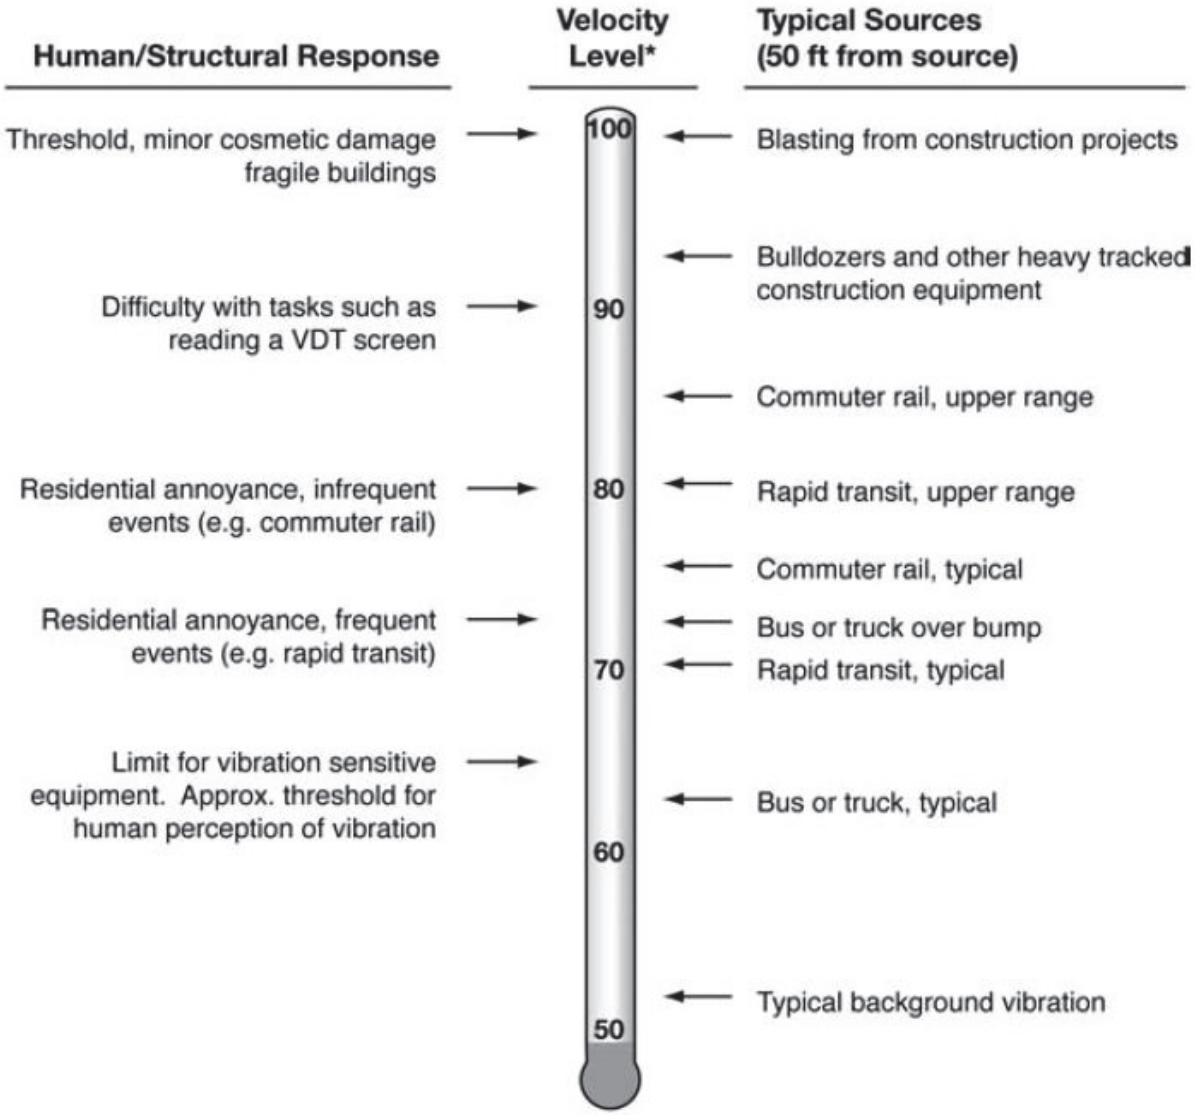
Per the Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual* (8), vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction

equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. Decibel notation (VdB) serves to reduce the range of numbers used to describe human response to vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment and/or activities

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-C illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-C: TYPICAL LEVELS OF GROUND-BORNE VIBRATION



** RMS Vibration Velocity Level in VdB relative to 10^{-6} inches/second*

3 REGULATORY SETTING

To limit population exposure to physically and/or psychologically damaging as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared per guidelines adopted by the Governor's Office of Planning and Research (OPR). (9) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*. In addition, the California Environmental Quality Act (CEQA) requires that all known environmental effects of a project be analyzed, including environmental noise impacts.

3.2 STATE OF CALIFORNIA GREEN BUILDING STANDARDS CODE

The State of California's Green Building Standards Code contains mandatory measures for non-residential building construction in Section 5.507 on Environmental Comfort. (10) These noise standards are applied to new construction in California for controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must be prepared when non-residential structures are developed in areas where the exterior noise levels exceed 65 dBA CNEL, such as within a noise contour of an airport, freeway, railroad, and other areas where noise contours are not readily available. If the development falls within an airport or freeway 65 dBA CNEL noise contour, the combined sound transmission class (STC) rating of the wall and roof-ceiling assemblies must be at least 50. For those developments in areas where noise contours are not readily available and the noise level exceeds 65 dBA L_{eq} for any hour of operation, a wall and roof-ceiling combined STC rating of 45, and exterior windows with a minimum STC rating of 40 are required (Section 5.507.4.1).

3.3 CITY OF HESPERIA GENERAL PLAN NOISE ELEMENT

The City of Hesperia has adopted a Noise Element of the General Plan (11) to control and abate environmental noise, and to protect the citizens of the City of Hesperia from excessive exposure to noise. The General Plan Noise Element specifies the maximum allowable unmitigated exterior noise levels for new developments impacted by transportation noise sources such as arterial roads, freeways, airports, and railroads. In addition, the City of Hesperia General Plan Noise Element identifies several goals and policies to minimize the impacts of excessive noise levels throughout the community and establishes noise level requirements for all land uses. To limit the exposure of City residents to excessive noise, the City of Hesperia General Plan Noise Element contains the following two goals:

NS-1 *To achieve and maintain an environment which is free from excessive or harmful noise through identification, control, and abatement.*

NS-2 *To achieve and maintain an environment which is free from excessive vibration.*

To satisfy these two overarching goals, the General Plan Noise Element identifies the following implementation policies to reduce noise levels associated with the development of the Project.

NS-1.2 *Control and abate undesirable sounds through the use of the land use compatibility criteria shown in Exhibit NS-1, Table NS-3, and the Municipal Code Section 16.20.125(B).*

NS-1.5 *Require the design and construction of commercial, industrial, office and mixed-use structures developments with noise attenuation methods to minimize excessive noise upon noise-sensitive land uses.*

NS-1.9 *Encourage commercial, industrial, office and mixed-use developments to locate loading areas, parking lots, driveways, trash enclosures, mechanical equipment, and other noisier components away from noise-sensitive land uses.*

NS-1.10 *Limit the hours of construction activity in, and around, residential areas in order to reduce the intrusion of noise in the early morning and late evening hours and on weekends and holidays.*

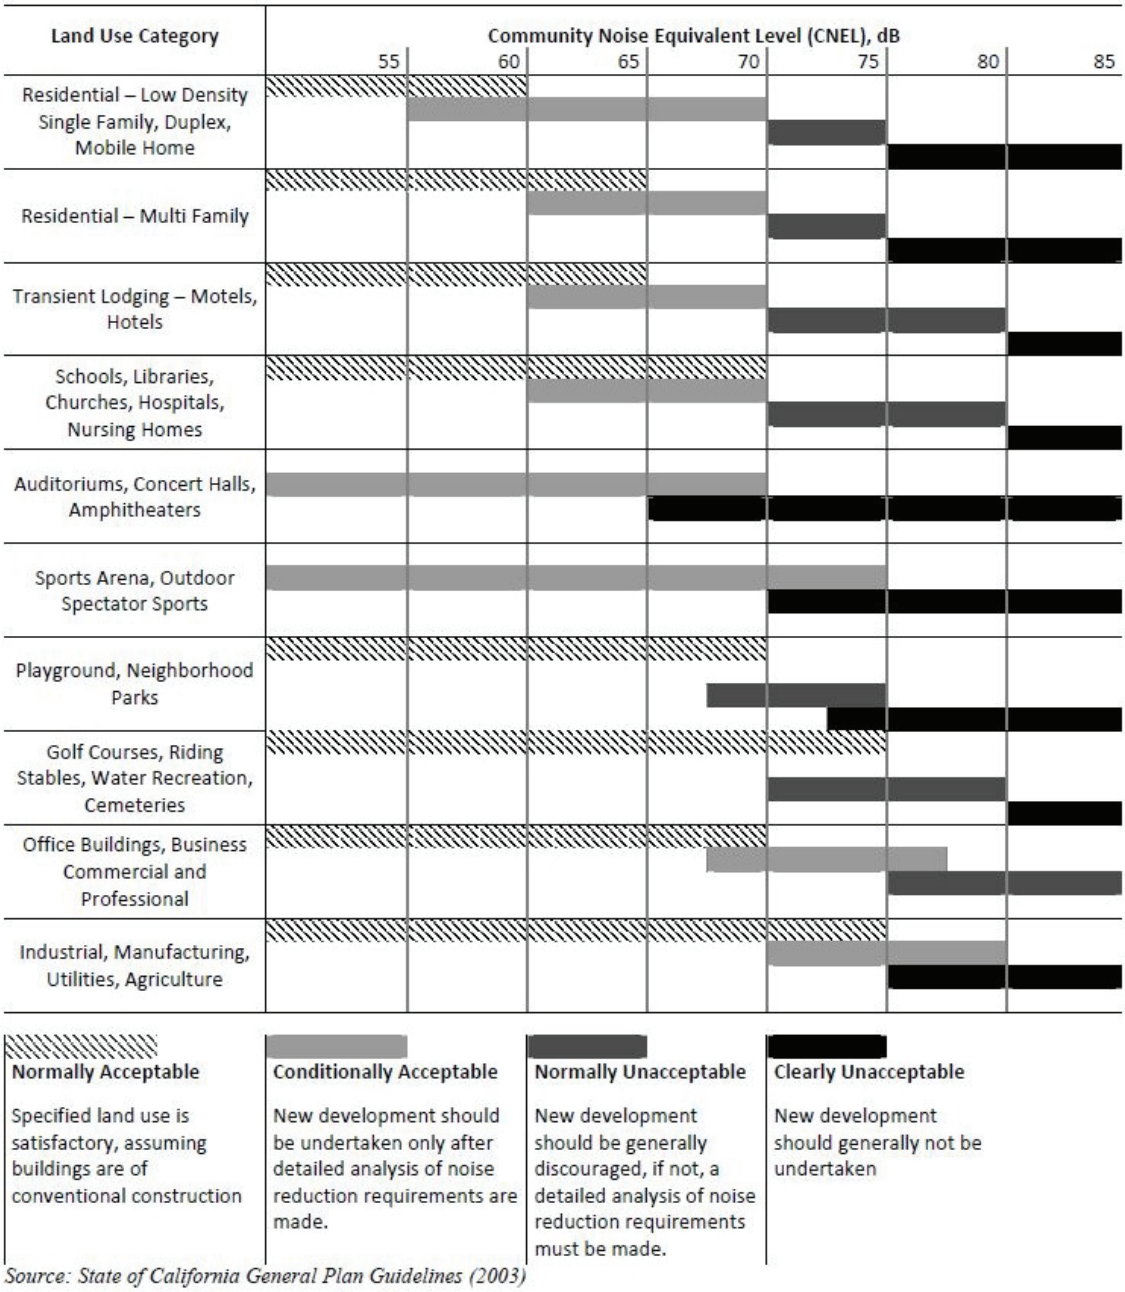
NS-1.11 *Limit delivery hours for businesses with loading areas or docks fronting, siding, or bordering or gaining access on driveways adjacent to noise-sensitive areas.*

NS-1.12 *Implement nighttime and daytime on-site noise level limits to address noise generated by commercial and industrial uses where it affects abutting residential and other noise-sensitive land uses.*

The State of California Land Use Compatibility Plan (Exhibit NS-1) in the City of Hesperia General Plan Noise Element lists land use categories and the acceptable and unacceptable levels of community noise exposure. The compatibility criteria shown on Table NS-1 (and Exhibit 3-A of this report) provides the City with a planning tool to gauge the compatibility of land uses relative to existing and future exterior noise levels.

The State of California Land Use Compatibility Plan describes categories of compatibility, but not specific noise standards. According to these categories of transportation-related noise compatibility, the Hesperia Commerce Center II industrial land uses are considered *normally acceptable* with unmitigated exterior noise levels below 75 dBA CNEL and *conditionally acceptable* with noise levels between 70 and 80 dBA CNEL. For *conditionally acceptable* land use, *"new construction or development should be undertaken only after a detailed analysis of noise reduction requirements are made.* (11)

EXHIBIT 3-A: LAND USE NOISE COMPATIBILITY CRITERIA



Source: State of California General Plan Guidelines (2003)

3.4 OPERATIONAL NOISE STANDARDS

To analyze noise impacts originating from a designated fixed location or private property such as the Hesperia Commerce Center II, stationary-source (operational) noise such as the expected loading dock activity, entry gate & truck movements, roof-top air conditioning units, and trash enclosure activity are typically evaluated against standards established under a jurisdiction's Municipal Code.

Section 16.20.125 of the City of Hesperia Municipal Code included in Appendix 3.1, establishes the noise level standards for stationary noise sources and establishes noise level limits for affected land uses. Since the Project land use will potentially impact a combination of non-noise-sensitive and noise sensitive uses in the Project study area, this noise study relies on the exterior noise level standards for all land uses identified by the City of Hesperia Municipal Code.

For non-noise sensitive industrial uses, the maximum exterior noise level shall not exceed 70 dBA L_{eq} at any time, while the maximum exterior noise level exterior noise levels at non-noise sensitive commercial uses shall not exceed 65 dBA L_{eq} at any time. For noise sensitive residential properties, the maximum exterior noise level shall not exceed 60 dBA L_{eq} during the daytime hours (7:00 a.m. to 10:00 p.m.) and 50 dBA L_{eq} during the nighttime hours (10:00 p.m. to 7:00 a.m.). (12) In addition, except for the nighttime hours from 10:00 p.m. to 7:00 a.m.) the maximum permissible noise levels due to wind noise may be adjusted so that it is no greater than five dB(A) above the ambient noise level. The Municipal Code operational noise level standards are summarized on Table 3-1.

TABLE 3-1: OPERATIONAL NOISE STANDARDS

Jurisdiction	Receiving Land Use	Time Period	Exterior Noise Level Standard (dBA L_{eq})[2]
City of Hesperia[1]	A-1, A-2, R-1, R-3, and RR Zone Districts	Daytime (7:00 a.m. - 10:00 p.m.)	60
		Nighttime (10:00 p.m. - 7:00 a.m.)	55
	C-1, C-2, C-3, C-4, C-R, AP, and P-I Zone Districts	Anytime	65
	I-1 and I-2 Zone	Anytime	70

[1] Source: City of Hesperia Municipal Code, Section 16.20.125 (Appendix 3.1).
L_{eq} represents a steady state sound level containing the same total energy as a time varying signal over a given sample period.

3.5 CONSTRUCTION NOISE STANDARDS

The City of Hesperia Municipal Code, Section 16.20.125.E.3 exempts construction noise from its stationary-source noise level limits between seven a.m. and seven p.m. and at any time on Sundays and federal holidays. (12) In addition, neither the City of Hesperia General Plan or Municipal Code establish numeric maximum acceptable construction source noise levels at potentially affected receivers for CEQA analysis purposes. Therefore, a numerical construction threshold based on Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual* is used for analysis of daytime construction impacts, as discussed below.

According to the FTA, local noise ordinances are typically not very useful in evaluating construction noise. They usually relate to nuisance and hours of allowed activity, and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the impact of a construction project. Project construction noise criteria should account for the existing noise environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land use. Due to the lack of standardized construction noise thresholds, the FTA provides guidelines that can be considered reasonable criteria for construction noise assessment. The FTA considers a daytime exterior construction noise level of 80 dBA L_{eq} as a reasonable threshold for noise sensitive residential land use. (8 p. 179)

3.6 VIBRATION STANDARDS

The City of Hesperia Municipal Code, Section 16.20.130, identifies an operational vibration level threshold of 0.2 in/sec PPV which is used in this report to evaluate potential impacts due to on-site Project related operational vibration level activities at nearby receiver locations. (12) According to Section 16.20.130.C.2, temporary construction, maintenance, or demolition activities are considered exempt provided that construction vibration activity is limited the hours between seven a.m. and seven p.m. including Sundays and federal holidays.

This page intentionally left blank

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on currently adopted guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1) For the purposes of this report, impacts would be potentially significant if the Project results in or causes:

A. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

B. Generation of excessive ground-borne vibration or ground-borne noise levels?

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

While the City of Hesperia General Plan Guidelines provide direction on noise compatibility and establish noise standards by land use type that are sufficient to assess the significance of noise impacts, they do not define the levels at which increases are considered substantial temporary or permanent for use under Guideline A. CEQA Appendix G Guideline C applies to nearest public and private airports, if any, and the Project's land use compatibility.

4.1 CEQA GUIDELINES NOT FURTHER ANALYZED

The Project site is not located within two miles of a public airport or within an airport land use plan. The closest airport is the Hesperia Airport located approximately 6 miles southeast of the Project site. As such, the Project site would not be exposed to excessive noise levels from airport operations, and therefore, impacts are considered *less than significant,* and no further noise analysis is conducted in relation to CEQA Appendix G Guideline C.

4.2 NOISE-SENSITIVE RECEIVERS

Noise level increases resulting from the Project are evaluated based on the Appendix G CEQA Guidelines described above at the nearest sensitive receiver locations. Under CEQA, consideration must be given to the magnitude of the increase, the existing ambient noise levels, and the location of noise-sensitive receivers to determine if a noise level increase represents a significant adverse environmental impact. This approach recognizes *that there is no single noise increase that renders the noise impact significant.* (13) Unfortunately, there is no completely satisfactory way to measure the subjective effects of noise or of the corresponding human reactions of annoyance and dissatisfaction. This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called *ambient* environment. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged.

Since neither the City of Hesperia General Plan Noise Element or Municipal Code identify any noise level increase thresholds, the substantial noise level increase criteria are derived from the Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual.* To describe the amount to which a given noise level increase is considered acceptable, the FTA criteria is used to evaluate the incremental noise level increase and establishes a method for comparing future project noise with existing ambient conditions under CEQA Significance Threshold A. I

In effect, the amount to which a given noise level increase is considered acceptable is reduced based on existing ambient noise conditions. Table 4-1 below provides a summary of the allowable criteria used to identify potentially significant incremental noise level increases.

TABLE 4-1: SIGNIFICANCE OF NOISE LEVEL INCREASES

Without Project Noise Level	Potential Significant Impact (dBA CNEL)
< 55 dBA	5 dBA or more
55 - 60 dBA	3 dBA or more
60 - 65 dBA	2 dBA or more
> 65 dBA	1 dBA or more

FTA Transit Noise and Vibration Impact Assessment Manual, 2018 (Table 4-6).

4.3 NON-NOISE-SENSITIVE RECEIVERS

As previously shown on Exhibit 3-A, the *normally acceptable* exterior noise level for non-noise-sensitive land use, such as office, commercial and professional use 70 dBA CNEL and 75 dBA CNEL for industrial uses. Therefore, noise levels greater than 70 dBA CNEL for office, commercial and professional use or 75 dBA CNEL for industrial uses are considered *conditionally acceptable* according to the *State of California Land Use Compatibility Plan*.

To determine if Project-related traffic noise level increases are significant at off-site non-noise-sensitive land uses, a *barely perceptible* 3 dBA criteria is used. (4) When the without Project noise levels are greater than the *normally acceptable* 70 or 75 dBA CNEL land use compatibility criteria, a *barely perceptible* 3 dBA or greater noise level increase is considered a *significant impact* since the noise level criteria is already exceeded.

4.4 SIGNIFICANCE CRITERIA SUMMARY

Noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development. Table 4-2 shows the significance criteria summary matrix.

TABLE 4-2: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Receiving Land Use	Condition(s)	Significance Criteria	
			Daytime	Nighttime
Off-Site Traffic	Noise-Sensitive[1]	If ambient is < 55 dBA CNEL	≥ 5 dBA CNEL Project increase	
		If ambient is 55 - 60 dBA CNEL	≥ 3 dBA CNEL Project increase	
		If ambient is 60 - 65 dBA CNEL	≥ 2 dBA CNEL Project increase	
		If ambient is > 65 dBA CNEL	≥ 1 dBA CNEL Project increase

5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, 24-hour noise level measurements were taken at six locations in the Project study area. The receiver locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A provides the boundaries of the Project study area and the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Wednesday, May 20th, 2020. Appendix 5.1 includes study area photos.

5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the daytime and nighttime hourly noise levels and calculate the 24-hour CNEL. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (14)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Both Caltrans and the FTA recognize that it is not reasonable to collect noise level measurements that can fully represent every part of a private yard, patio, deck, or balcony normally used for human activity when estimating impacts for new development projects. This is demonstrated in the Caltrans general site location guidelines which indicate that, *sites must be free of noise contamination by sources other than sources of interest. Avoid sites located near sources such as barking dogs, lawnmowers, pool pumps, and air conditioners unless it is the express intent of the analyst to measure these sources*. (2) Further, FTA guidance states, t*hat it is not necessary nor recommended that existing noise exposure be determined by measuring at every noise-sensitive location in the project area. Rather, the recommended approach is to characterize the noise environment for clusters of sites based on measurements or estimates at representative locations in the community*. (8)

Based on recommendations of Caltrans and the FTA, it is not necessary to collect measurements at each individual building or residence, because each receiver measurement represents a group of buildings that share acoustical equivalence. (8) In other words, the area represented by the receiver shares similar shielding, terrain, and geometric relationship to the reference noise source. Receivers represent a location of noise sensitive areas and are used to estimate the future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receiver locations allows for a comparison of the before and after Project noise levels

and is necessary to assess potential noise impacts due to the Project's contribution to the ambient noise levels.

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average or equivalent sound levels (L_{eq}). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the hourly daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) noise levels at each noise level measurement location. Appendix 5.2 provides a summary of the existing hourly ambient noise levels described below:

- Location L1 represents the noise levels northwest of the Project site on Yucca Terrace Drive near existing single-family residential home at 10120 Fremontia Road. The noise levels at this location consist primarily of traffic noise from Yucca Terrance Drive and Fremontia Road. The noise level measurements collected show an overall 24-hour exterior noise level of 61.2 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 54.7 dBA L_{eq} with an average nighttime noise level of 54.9 dBA L_{eq}.
- Location L2 represents the noise levels northeast of the Project site on Bolinas Street near existing Vacant Land. The ambient noise levels at this location account for traffic on Bolinas Street and US-395. The noise level measurements collected show an overall 24-hour exterior noise level of 65.2 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 58.8 dBA L_{eq} with an average nighttime noise level of 58.9 dBA L_{eq}.
- Location L3 represents the noise levels east of the Project site on Mesa Linda Street near the West Main Villas multi-family homes. The 24-hour CNEL indicates that the overall exterior noise level is 65.5 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 59.1 dBA L_{eq} with an average nighttime noise level of 59.2 dBA L_{eq}. Background traffic noise from Mesa Linda Street and Main Street represent the primary source of noise at this location.
- Location L4 represents the noise levels south of the Project site on Phelan Road near existing single-family residential home at 9565 Fremontia Road. The noise level measurements collected show an overall 24-hour exterior noise level of 75.4 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 70.6 dBA L_{eq} with an average nighttime noise level of 71.6 dBA L_{eq}. The noise levels at this location consist primarily of traffic noise from Phelan Road.
- Location L5 represents the noise levels west of the Project site on Monta Vista near existing single-family residential home at 9751 Monta Vista. The 24-hour CNEL indicates that the overall exterior noise level is 57.2 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 52.8 dBA L_{eq} with an average nighttime noise level of 54.1 dBA L_{eq}. Traffic on Monte Vista represents the primary source of noise at this location.
- Location L6 represents the noise levels west of the Project site on Monta Vista near existing single-family residential home at 10040 Monta Vista. The 24-hour CNEL indicates that the overall exterior noise level is 55.1 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 50.4 dBA L_{eq} with an average nighttime noise level of 51.5 dBA L_{eq}. Traffic on Monte Vista represents the primary source of noise at this location.

Table 5-1 provides the (energy average) noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all hourly noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides summary worksheets of the noise levels for each hour as well as the minimum, maximum, L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods.

The background ambient noise levels in the Project study area are dominated by the transportation-related noise associated with surface streets and US-395. This includes the auto and heavy truck activities on study area roadway segments near the noise level measurement locations. The 24-hour existing noise level measurement results are shown on Table 5-1.

TABLE 5-1: 24-HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Description	Energy Average Noise Level (dBA L_{eq})[2]		CNEL
		Daytime	Nighttime	
L1	Located northwest of the Project site on Yucca Terrace Drive near existing single-family residential home at 10120 Fremontia Road.	54.7	54.9	61.2
L2	Located northeast of the Project site on Bolinas Street near existing Vacant Land.	58.8	58.9	65.2
L3	Located east of the Project site on Mesa Linda Street near the West Main Villas multi-family homes.	59.1	59.2	65.5
L4	Located south of the Project site on Phelan Road near existing single-family residential home at 9565 Fremontia Road.	70.6	71.6	75.4
L5	Located west of the Project site on Monta Vista near existing single-family residential home at 9751 Monta Vista.	52.8	54.1	57.2
L6	Located west of the Project site on Monta Vista near existing single-family residential home at 10040 Monta Vista.	50.4	51.5	55.1

EXHIBIT 5-A: NOISE MEASUREMENT LOCATIONS

6 TRAFFIC NOISE PREDICTION METHODS AND PROCEDURES

The following section outlines the methods and procedures used to model and analyze the future traffic noise environment. Consistent with the *Land Use Compatibility Criteria*, all transportation related noise levels are presented in terms of the 24-hour CNEL's.

6.1 FHWA TRAFFIC NOISE PREDICTION MODEL

The expected roadway noise level increases from vehicular traffic were calculated by Urban Crossroads, Inc. using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model- FHWA-RD-77-108. (15) The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels. (16) Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period. Research conducted by Caltrans has shown that the use of soft site conditions is appropriate for the application of the FHWA traffic noise prediction model used in this analysis. (17)

6.2 OFF-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

Table 6-1 presents the roadway parameters used to assess the Project's off-site dBA CNEL transportation noise impacts. Table 6-1 identifies the 31 study area roadway segments, the distance from the centerline to adjacent land use based on the functional roadway classifications per the City of Hesperia General Plan Circulation Element, and the posted vehicle speeds. The ADT volumes used in this study area presented on Table 6-2 are based on the *Hesperia Commerce Center II Traffic Impact Analysis*, prepared by Urban Crossroads, Inc. for the following traffic scenarios under both Without and With Project alternatives: Existing (2019), Opening Year Cumulative (2021), and Horizon Year (2040). (18)

The ADT volumes vary for each roadway segment based on the existing traffic volumes and the combination of project traffic distributions. This analysis relies on a comparative evaluation of the off-site traffic noise impacts, without and with project ADT traffic volumes from the Project traffic study.

[1] Hesperia Commerce Center II Traffic Impact Analysis.

To quantify the off-site noise levels, the Project related truck trips were added to the heavy truck category in the FHWA noise prediction model. The addition of the Project related truck trips increases the percentage of heavy trucks in the vehicle mix. This approach recognizes that the FHWA noise prediction model is significantly influenced by the number of heavy trucks in the vehicle mix.

Table 6-3 provides the time of day (daytime, evening, and nighttime) vehicle splits. The daily Project truck trip-ends were assigned to the individual off-site study area roadway segments based on the Project truck trip distribution percentages documented in the *Traffic Impact Analysis*. Using the Project truck trips in combination with the Project trip distribution, Urban Crossroads, Inc. calculated the number of additional Project truck trips and vehicle mix percentages for each of the study area roadway segments. Table 6-4 shows the traffic flow by vehicle type (vehicle mix) used for all without Project traffic scenarios, and Tables 6-5 to 6-7 show the vehicle mixes used for the with Project traffic scenarios.

TABLE 6-3: TIME OF DAY VEHICLE SPLITS

Vehicle Type	Time of Day Splits[1]			Total of Time of Day Splits
	Daytime	Evening	Nighttime	
Autos	62.20%	12.75%	25.05%	100.00%
Medium Trucks	67.85%	9.36%	22.79%	100.00%
Heavy Trucks	63.02%	10.79%	26.19%	100.00%

[1] Based on an existing 24-hour count taken at United Stated Highway 395 and Main Street. (Hesperia Commerce Center II Traffic Impact Analysis, Urban Crossroads, Inc.). Values rounded to the nearest one-hundredth.
"Daytime" = 7:00 a.m. to 7:00 p.m.; "Evening" = 7:00 p.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

TABLE 6-4: WITHOUT PROJECT VEHICLE MIX

Classification	Total % Traffic Flow			Total
	Autos	Medium Trucks	Heavy Trucks	
All Segments	81.35%	6.69%	11.96%	100.00%

Based on an existing vehicle count taken at United States Highway 395 and Main Street (Hesperia Commerce Center II Traffic Impact Analysis, Urban Crossroads, Inc.). Vehicle mix percentage values rounded to the nearest one-hundredth.

Due to the added Project truck trips, the increase in Project traffic volumes and the distributions of trucks on the study area road segments, the percentage of autos, medium trucks and heavy trucks will vary for each of the traffic scenarios. This explains why the existing and future traffic volumes and vehicle mixes vary between seemingly identical study area roadway segments.

7 OFF-SITE TRAFFIC NOISE IMPACTS

To assess the off-site transportation CNEL noise level impacts associated with the proposed Project, noise contours were developed based on the *Hesperia Commerce Center II Traffic Impact Analysis*. (18) Noise contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway.

7.1 TRAFFIC NOISE CONTOURS

Noise contours were used to assess the Project's incremental 24-hour dBA CNEL traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA CNEL noise levels. The noise contours do not consider the effect of any existing noise barriers or topography that may attenuate ambient noise levels. In addition, because the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from the surrounding stationary noise sources within the Project study area.

Tables 7-1 through 7-6 present a summary of the exterior dBA CNEL traffic noise levels without barrier attenuation. Roadway segments are analyzed from the without Project to the with Project conditions in each of the following timeframes: Existing (2019), Opening Year Cumulative (2021), and Horizon Year (2040). Appendix 7.1 includes a summary of the dBA CNEL traffic noise level contours for each of the traffic scenarios.

TABLE 7-1: EXISTING WITHOUT PROJECT NOISE CONTOURS

ID	Road	Segment	Receiving Land Use[1]	CNEL at Receiving Land Use (dBA)[2]	Distance to Contour from Centerline (Feet)

[1] Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses.

[2] The CNEL is calculated at the boundary of the right-of-way of the receiving adjacent land use.

"RW" = Location of the respective noise contour falls within the right-of-way of the road.

7.2 EXISTING PROJECT TRAFFIC NOISE LEVEL INCREASES

An analysis of existing traffic noise levels plus traffic noise generated by the proposed Project has been included in this report to fully analyze all the existing traffic scenarios identified in the *Hesperia Commerce Center II Traffic Impact Analysis*. This condition is provided solely for informational purposes and will not occur, since the Project will not be fully developed and occupied under Existing conditions. Table 7-1 shows the Existing without Project conditions CNEL noise levels. The Existing without Project exterior noise levels are expected to range from 60.7 to 82.4 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-2 shows the Existing with Project conditions will range from 61.0 to 82.4 dBA CNEL. Table 7-7 shows that the Project off-site traffic noise level impacts will range from 0.0 to 2.3 dBA CNEL. Based on the significance criteria for off-site traffic noise presented in Table 4-2, the following two study area roadway segments are shown to experience *potentially significant* off-site traffic noise level increases due to the proposed Project truck trip distribution under Existing with Project conditions. The existing noise-sensitive land uses on these two segments are described below.

- Existing noise-sensitive use (residences) on Main Street west of Mesa Linda Street (Segment #23).
- Existing noise-sensitive use (residences) on Main Street west of Cataba Road (Segment #24).

Section 7.5 describes the off-site traffic noise mitigation measures considered in this analysis. All other roadway segments would not experience noise level increases under Existing with Project conditions that would exceed the established thresholds of significance. In addition, a review of these two study area roadway segments show that they both benefit from existing setbacks and noise barriers that were required to satisfy the General Plan Noise Element exterior noise level standards. These measures are designed to reduce the future long-range exterior noise levels due to future General Plan buildout traffic conditions that include the Project-related off-site traffic noise level impacts.

7.3 OPENING YEAR CUMULATIVE (2021) PROJECT TRAFFIC NOISE LEVEL INCREASES

Table 7-3 presents the Opening Year Cumulative (2021) without Project conditions CNEL noise levels. The Opening Year Cumulative (2021) without Project exterior noise levels are expected to range from 60.9 to 82.9 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-4 shows the Opening Year Cumulative (2021) with Project conditions will range from 61.2 to 83.2 dBA CNEL. Table 7-8 shows that the Project off-site traffic noise level increases will range from 0.0 to 1.7 dBA CNEL. Based on the significance criteria for off-site traffic noise presented in Table 4-2, the following two study area roadway segments are shown to experience *potentially significant* off-site traffic noise level increases due to the proposed Project truck trip distribution under OYC with Project conditions.

- Existing noise-sensitive use (residences) on Main Street west of Mesa Linda Street (Segment #23).
- Existing noise-sensitive use (residences) on Main Street west of Cataba Road (Segment #24).

7.4 HORIZON YEAR (2040) PROJECT TRAFFIC NOISE LEVEL INCREASES

Table 7-5 presents the Horizon Year (2040) without Project conditions CNEL noise levels. The Horizon Year (2040) without Project exterior noise levels are expected to range from 62.2 to 85.1 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-6 shows that the Horizon Year (2040) with Project conditions will range from 62.4 to 85.1 dBA CNEL. Table 7-9 shows that the Project off-site traffic noise level increases will range from 0.0 to 1.7 dBA CNEL. Based on the significance criteria for off-site traffic noise presented in Table 4-2, land uses adjacent to the study area roadway segments would experience *less than significant* noise level impacts due to unmitigated Project-related traffic noise levels. Based on the significance criteria for off-site traffic noise presented in Table 4-2, the following two study area roadway segments are shown to experience *potentially significant* off-site traffic noise level increases due to the proposed Project truck trip distribution under Horizon Year with Project conditions.

- Existing noise-sensitive use (residences) on Main Street west of Mesa Linda Street (Segment #23).
- Existing noise-sensitive use (residences) on Main Street west of Cataba Road (Segment #24).

[2] The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use.

[3] Does the Project create an incremental noise level increase exceeding the significance criteria (Table 4-2)?

7.5 OFF-SITE TRAFFIC NOISE MITIGATION

To reduce the *potentially significant* Project traffic noise level increases on the two study area roadway segments (Segment #23 and Segment #24) for Existing plus Project, Opening Year Cumulative and Horizon Year Project conditions, potential noise mitigation measures are identified in this analysis. Potential mitigation measures discussed below include rubberized asphalt hot mix pavement and off-site noise barriers for the existing non-conforming residential use adjacent to impacted roadway segments.

7.5.1 RUBBERIZED ASPHALT

Due to the potential noise attenuation benefits, rubberized asphalt is considered as a mitigation measure for the Project-related roadway improvements associated with Project construction. To reduce traffic noise levels at the noise source, Caltrans research has shown that rubberized asphalt can provide noise attenuation of approximately 4 dBA for automobile traffic noise levels. (19) Changing the pavement type of a roadway has been shown to reduce the amount of tire/pavement noise produced at the source under both near-term and long-term conditions. Traffic noise is generated primarily by the interaction of the tires and pavement, the engine, and exhaust systems. For automobiles noise, as much as 75 to 90-percent of traffic noise is generated by the interaction of the tires and pavement, especially when traveling at higher and constant speeds. (2) According to research conducted by Caltrans (19) and the Canadian Ministry of Transportation and Highways (20) a 4 dBA reduction in tire/pavement noise is attainable using rubberized asphalt under typical operating conditions.

The effectiveness of reducing traffic noise levels is higher on roadways with low percentages of heavy trucks, since the heavy truck engine and exhaust noise is not affected by rubberized alternative pavement due to the truck engine and exhaust stack height above the pavement itself. (19) Per Caltrans guidance a truck stack height is modeled using a height of 11.5 feet above the road. (4) (21) With the primary off-site traffic noise source consisting of heavy trucks with a stack height of 11.5 feet off the ground, the tire/pavement noise reduction benefits associated rubberized asphalt will be primarily limited to autos.

While the off-site Project-related traffic noise level increases would theoretically be reduced with the 4 dBA reduction provided by rubberized asphalt, the reduction would not provide reliable benefits for the noise levels generated by heavy truck traffic. This is, as previously stated, due to the noise source height difference between automobiles and trucks. While rubberized asphalt will provide some noise reduction, this noise study recognizes that this is only effective for tire-on-pavement noise at higher speeds and would not reduce truck-related off-site traffic noise levels associated with truck engine and exhaust stacks to less than significant impacts. Since the use of rubberized asphalt would not lower the off-site traffic noise levels below a level of significance, rubberized asphalt is not proposed as mitigation for the Project and the off-site Project-related traffic noise level increases at adjacent land uses would remain *significant.*

7.5.2 OFF-SITE NOISE BARRIERS

Since existing and future noise-sensitive receiving land uses are located adjacent to the impacted roadway segments in the Project study area, off-site noise barriers were considered in this analysis as a potential traffic noise mitigation measure to reduce the impacts. Off-site noise barriers are estimated to provide a *readily perceptible* 5 dBA reduction which, according to the FHWA, is *simple* to attain when blocking the line-of-sight from the noise source to the receiver. (4) As previously discussed, Caltrans guidance in the Highway Design Manual, Section 1102.3(3), indicates that for design purposes, *the noise barrier should intercept the line of sight from the exhaust stack of a truck to the receptor*, and an 11.5-foot-high truck stack height is assumed to represent the truck engine and exhaust noise source. (21) Therefore, any exterior noise barriers at receiving noise sensitive land uses experiencing Project-related traffic noise level increases would need to be high enough and long enough to block the line-of-sight from the noise source (at 11.5 feet high per Caltrans) to the receiver (at 5 feet high per FHWA guidance) in order to provide a 5 dBA reduction per FHWA guidance. (21)

In addition, according to FHWA guidance, outdoor living areas are generally limited to outdoor living areas of frequent human use (e.g., backyards of single-family homes). Therefore, front and side yards of residential homes adjacent to off-site roadway segments do not represent noise sensitive areas of frequent human use that require exterior noise mitigation. (4) Exterior noise mitigation in the form of noise barriers is not anticipated to provide the FHWA attainable reduction of 5 dBA required to reduce the off-site traffic noise level increases and would also require potential openings for driveway access to individual residential lots fronting the road. As such, off-site noise barriers would not be feasible and would not lower the off-site traffic noise levels below a level of significance, and therefore, noise barriers are not proposed as mitigation for the Project.

7.5.3 SIGNIFICANT OFF-SITE TRAFFIC NOISE IMPACTS

Both rubberized asphalt and off-site noise barriers are considered as potential noise mitigation measures to reduce the *potentially significant* off-site traffic noise level increases shown on Tables 7-7 to 7-9. However, neither form of mitigation would eliminate the off-site traffic noise level increases at the adjacent land uses to the impacted roadway segments. Therefore, the Project-related off-site traffic noise level increases at adjacent noise-sensitive land are considered a *significant and unavoidable* impact.

8 SENSITIVE RECEIVER LOCATIONS

To assess the potential for long-term operational and short-term construction noise impacts, the following sensitive receiver locations, as shown on Exhibit 8-A, were identified as representative locations for analysis. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

To describe the potential off-site Project noise levels, six receiver locations in the vicinity of the Project site were identified. All distances are measured from the Project site boundary to the outdoor living areas (e.g., private backyards) or at the building façade, whichever is closer to the Project site. The selection of receiver locations is based on FHWA guidelines and is consistent with additional guidance provided by Caltrans and the FTA, as previously described in Section 5.2. Other sensitive land uses in the Project study area that are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures. Distance is measured in a straight line from the project boundary to each receiver location.

R1: Location R1 represents the existing noise sensitive residence at 10120 Fremontia Road, approximately 662 feet northwest of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R1 is placed at the residential building façade. A 24-hour noise measurement was taken near this location, L1, to describe the existing ambient noise environment.

R2: Location R2 represents the existing noise sensitive residence at 10368 US-395 approximately 2,010 feet northeast of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R2 is placed at the residential building façade. A 24-hour noise measurement was taken near this location, L2, to describe the existing ambient noise environment.

R3: Location R3 represents the existing West Main Villas apartments at 9800 Mesa Linda Street, approximately 2,165 feet southeast of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R3 is placed at the residential building façade. A 24-hour noise measurement near this location, L3, is used to describe the existing ambient noise environment.

R4: Location R4 represents the existing noise sensitive residence at 11345 Phelan Road, approximately 217 feet south of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R4 is placed at the residential building

façade. A 24-hour noise measurement near this location, L4, is used to describe the existing ambient noise environment.

R5: Location R5 represents the existing noise sensitive residence at 9883 Monta Vista, approximately 745 feet west of the Project site. R5 is placed at the private outdoor living area (backyard) facing the Project site. A 24-hour noise measurement near this location, L5, is used to describe the existing ambient noise environment.

R6: Location R6 represents the existing noise sensitive residence at 9993 Monta Vista, approximately 1,226 feet west of the Project site. R5 is placed at the private outdoor living area (backyard) facing the Project site. A 24-hour noise measurement near this location, L6, is used to describe the existing ambient noise environment.

9 OPERATIONAL NOISE IMPACTS

This section analyzes the potential stationary-source operational noise impacts at the nearby receiver locations, identified in Section 8, resulting from the operation of the proposed Hesperia Commerce Center II Project. Exhibit 9-A identifies the representative noise source locations used to assess the operational noise levels.

9.1 OPERATIONAL NOISE SOURCES

This operational noise analysis is intended to describe noise level impacts associated with the expected typical of daytime and nighttime activities at the Project site. To present the potential worst-case noise conditions, this analysis assumes the Project would be operational 24 hours per day, seven days per week. Consistent with similar warehouse and light industrial uses, the Project business operations would primarily be conducted within the enclosed buildings, except for traffic movement, parking, as well as loading and unloading of trucks at designated loading bays. The on-site Project-related noise sources are expected to include: loading dock activity, entry gate & truck movements, roof-top air conditioning units, and trash enclosure activity.

9.2 REFERENCE NOISE LEVELS

To estimate the Project operational noise impacts, reference noise level measurements were collected from similar types of activities to represent the noise levels expected with the development of the proposed Project. This section provides a detailed description of the reference noise level measurements shown on Table 9-1 used to estimate the Project operational noise impacts. It is important to note that the following projected noise levels assume the worst-case noise environment with the loading dock activity, entry gate & truck movements, roof-top air conditioning units, and trash enclosure activity all operating continuously. These sources of noise activity will likely vary throughout the day.

9.2.1 MEASUREMENT PROCEDURES

The reference noise level measurements presented in this section were collected using a Larson Davis LxT Type 1 precisions sound level meter (serial number 01146). The LxT sound level meter was calibrated using a Larson-Davis calibrator, Model CAL 200, was programmed in "slow" mode to record noise levels in "A" weighted form and was located at approximately five feet above the ground elevation for each measurement. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (14)

EXHIBIT 9-A: OPERATIONAL NOISE SOURCE LOCATIONS

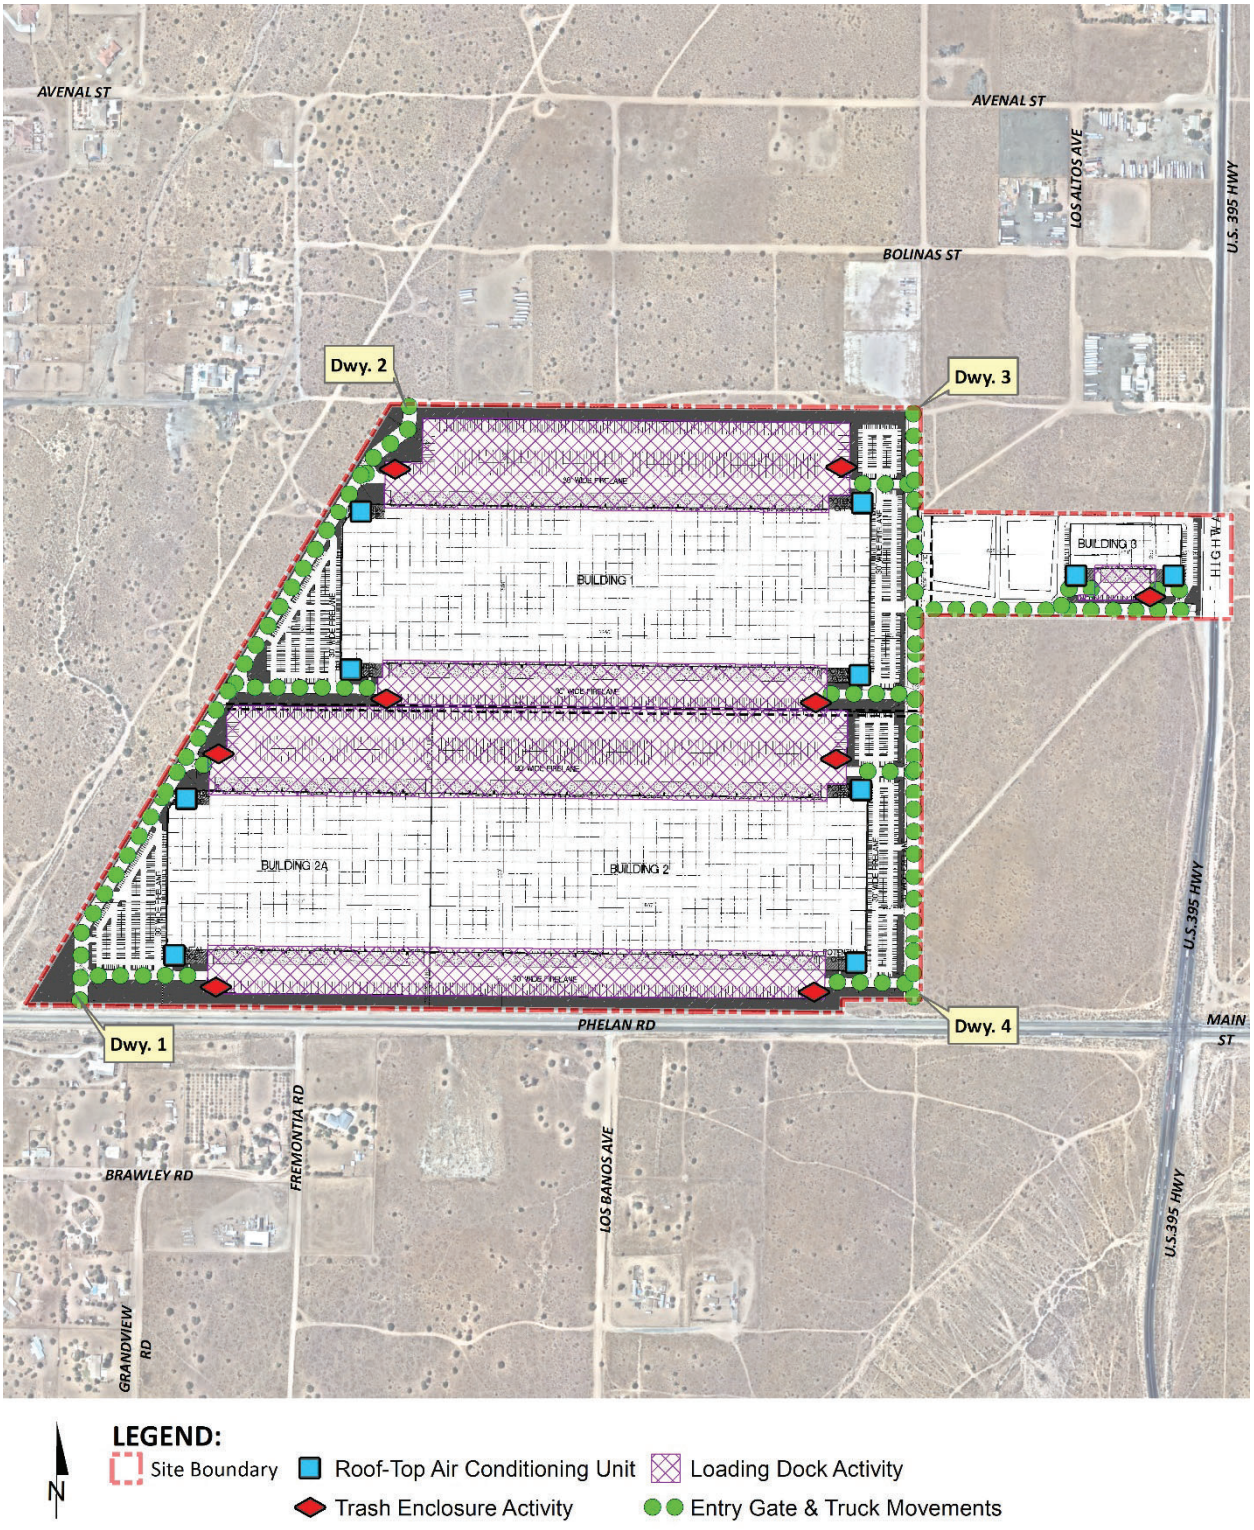

TABLE 9-1: REFERENCE NOISE LEVEL MEASUREMENTS

Noise Source	Duration (hh:mm:ss)	Ref. Distance (Feet)	Noise Source Height (Feet)	Min./Hour[5]		Reference Noise Level (dBA L_{eq})		Sound Power Level (dBA)[6]
				Day	Night	@ Ref. Dist.	@ 50 Feet	
Loading Dock Activity[1]	00:14:00	30'	8'	60	60	70.1	65.7	111.5

[2] As measured by Urban Crossroads, Inc. at the Motivational Fulfillment & Logistics Services distribution facility in the City of Chino.
[3] Lennox SCA120 series 10-ton model packaged air conditioning unit.
[4] As measured by Urban Crossroads, Inc. at a commercial and office park trash enclosure in the City of Costa Mesa.
[5] Anticipated duration (minutes within the hour) of noise activity during typical hourly conditions expected at the Project site. "Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.
[6] Sound power level represents the total amount of acoustical energy (noise level) produced by a sound source independent of distance or surroundings. Sound power levels calculated using the CadnaA noise model at the reference distance to the noise source. Numbers may vary due to size differences between point and area noise sources.
[7] Entry Gate & Truck Movements are calculate based on the number of events by time of day (See Table 9-2).

9.2.2 LOADING DOCK ACTIVITY

To describe the loading dock activities, a reference noise level measurement was collected to represent the truck activities at the Nature's Best distribution facility located at 16081 Fern Avenue in the City of Chino. The reference noise level measurement was taken in the center of the loading dock activity area and represents multiple concurrent noise sources resulting in a combined noise level of 65.7 dBA L_{eq} at a uniform distance of 50 feet. Specifically, the reference noise level measurement represents one truck located approximately 30 feet from the noise level meter with another truck passing by to park roughly 20 feet away, both with their engines idling. Throughout the reference noise level measurement, a separate docked and running reefer truck was located approximately 50 feet east of the measurement location. Additional background noise sources included truck pass-by noise, truck drivers talking to each other next to docked trucks, and air brake release noise when trucks parked.

9.2.3 ENTRY GATE & TRUCK MOVEMENTS

An entry gate and truck movements reference noise level measurement were taken at the southern entry gate of the Motivational Fulfillment & Logistics Services distribution facility located at 6810 Bickmore Avenue in the City of Chino over a 15-minute period and represents multiple noise sources producing a reference noise level of 58.0 dBA L_{eq} at 50 feet. The noise sources included at this measurement location account for the rattling and squeaking during normal opening and closing operations, the gate closure equipment, truck engines idling outside the entry gate, truck movements through the entry gate, and background truck court activities and forklift backup alarm noise.

Consistent with the *Hesperia Commerce Center II Traffic Impact Analysis*, the Project is expected to generate a total of approximately 11,898 trip-ends per day (actual vehicles) and includes 2,368 truck trip-ends per day. (18) This noise study relies on the actual Project trips (as opposed to the passenger car equivalents) to accurately account for the effect of individual truck trips on the study area roadway network. Using the estimated number of truck trips in combination with time of day vehicle splits, the number of entry gate and truck movements by driveway location were calculated. As shown on Table 9-2, this information is then used to calculate the entry gate and truck movements operational noise source activity based on the number of events by time of day.

TABLE 9-2: ENTRY GATE & TRUCK MOVEMENTS BY LOCATION

Entry Gate & Truck Movement Location[1]	Total Project Truck Trips[2]	Trip Dist.[3]		Truck Trips by Location[4]	Time of Day Vehicle Splits[5]			Truck Movements[6]		
		In	Out		Day	Evening	Night	Day	Evening	Night
Driveway 1	2,368	20%	5%	296	63.02%	10.79%	26.19%	187	32	78

[3] Project truck trip distribution according to Figure 4-1 of the Hesperia Commerce Center II TIA.
[4] Calculated trip trucks per location represents the product of the total (inbound and outbound) project truck trips by and the trip distribution.
[5] Heavy truck time of day vehicle splits as shown on Table 6-3.
[6] Calculated time of day entry gate and truck movements by location.

9.2.4 ROOF-TOP AIR CONDITIONING UNITS

To assess the noise levels created by the roof-top air conditioning units, reference noise level measurements were collected from a Lennox SCA120 series 10-ton model packaged air conditioning unit. At 5 feet from the roof-top air conditioning unit, the exterior noise levels were measured at 77.2 dBA L_{eq}. At the uniform reference distance of 50 feet, the reference noise levels are 57.2 dBA L_{eq}.

Based on the typical operating conditions observed over a four-day measurement period, the roof-top air conditioning units are estimated to operate for and average 39 minutes per hour during the daytime hours, and 28 minutes per hour during the nighttime hours. These operating conditions reflect peak summer cooling requirements with measured temperatures approaching 96 degrees Fahrenheit (°F) with average daytime temperatures of 82°F. For this noise analysis, the air conditioning units are expected to be located on the roof of the Project buildings. This reference noise level describes the expected roof-top air conditioning units located 5 feet above the roof for the planned air conditioning units at the Project site.

9.2.5 TRASH ENCLOSURE ACTIVITY

To describe the noise levels associated with a trash enclosure activity, Urban Crossroads collected a reference noise level measurement at an existing trash enclosure containing two dumpster bins. The trash enclosure noise levels describe metal gates opening and closing, metal scraping against concrete floor sounds, dumpster movement on metal wheels, trash dropping into the metal dumpster. The reference noise levels describe trash enclosure noise activities when trash is dropped into an empty metal dumpster, as would occur at the Project site. The measured reference noise level at the uniform 50-foot reference distance is 56.8 dBA L_{eq} for the trash enclosure activity. The reference noise level describes the expected noise source activities associated with the trash enclosures for each of the Project buildings. Typical trash enclosure activities are estimated to occur for 5 minutes per hour.

9.3 CADNAA NOISE PREDICTION MODEL

To fully describe the exterior operational noise levels from the Project, Urban Crossroads, Inc. developed a noise prediction model using the CadnaA (Computer Aided Noise Abatement) computer program. CadnaA can analyze multiple types of noise sources using the spatially accurate Project site plan, georeferenced Nearmap aerial imagery, topography, buildings, and barriers in its calculations to predict outdoor noise levels.

Using the ISO 9613 protocol, CadnaA will calculate the distance from each noise source to the noise receiver locations, using the ground absorption, distance, and barrier/building attenuation inputs to provide a summary of noise level at each receiver and the partial noise level contributions by noise source. Consistent with the ISO 9613 protocol, the CadnaA noise prediction model relies on the reference sound power level (PWL) to describe individual noise sources. While sound pressure levels (e.g. L_{eq}) quantify in decibels the intensity of given sound sources at a reference distance, sound power levels (PWL) are connected to the sound source and are independent of distance. Sound pressure levels vary substantially with distance from the source and diminish from intervening obstacles and barriers, air absorption, wind, and other factors. Sound power is the acoustical energy emitted by the sound source and is an absolute value that is not affected by the environment. The operational noise level calculations provided in this noise study account for the distance attenuation provided due to geometric spreading, when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. A default ground attenuation factor of 0.0 was used in the CadnaA noise analysis to account for hard site conditions. Appendix 9.1 includes the detailed noise model inputs.

9.4 PROJECT OPERATIONAL NOISE LEVELS

Using the reference noise levels to represent the proposed Project operations that include loading dock activity, entry gate & truck movements, roof-top air conditioning units, and trash enclosure activity, Urban Crossroads, Inc. calculated the operational source noise levels that are expected to be generated at the Project site and the Project-related noise level increases that would be experienced at each of the sensitive receiver locations. Tables 9-3 shows the Project

operational noise levels during the daytime hours of 7:00 a.m. to 10:00 p.m. The daytime hourly noise levels at the off-site receiver locations are expected to range from 50.0 to 53.9 dBA L_{eq}.

TABLE 9-3: DAYTIME PROJECT OPERATIONAL NOISE LEVELS

Noise Source[1]	Operational Noise Levels by Receiver Location (dBA Leq)					
	R1	R2	R3	R4	R5	R6
Loading Dock Activity	52.7	48.9	52.4	49.1	49.7	49.5
Entry Gate & Truck Movements	46.6	43.5	48.4	45.8	44.3	42.3
Roof-Top Air Conditioning Units	31.4	27.5	32.4	30.1	29.1	26.7
Trash Enclosure Activity	26.0	19.8	27.7	23.7	23.6	17.3
Total (All Noise Sources)	**53.7**	**50.0**	**53.9**	**50.8**	**50.8**	**50.3**

[1] See Exhibit 9-A for the noise source locations. CadnaA noise model calculations are included in Appendix 9.1.

Table 9-4 shows the Project operational noise levels during the nighttime hours of 10:00 p.m. to 7:00 a.m. The nighttime hourly noise levels at the off-site receiver locations are expected to range from 49.4 to 53.1 dBA L_{eq}. The differences between the daytime and nighttime noise levels is largely related to the duration of noise activity (Table 9-1).

TABLE 9-4: NIGHTTIME PROJECT OPERATIONAL NOISE LEVELS

Noise Source[1]	Operational Noise Levels by Receiver Location (dBA Leq)					
	R1	R2	R3	R4	R5	R6
Loading Dock Activity	52.7	48.9	52.4	49.1	49.7	49.5
Entry Gate & Truck Movements	42.7	39.7	44.6	42.0	40.5	38.5
Roof-Top Air Conditioning Units	29.0	25.1	30.0	27.7	26.7	24.3
Trash Enclosure Activity	25.0	18.8	26.7	22.8	22.6	16.3
Total (All Noise Sources)	**53.1**	**49.4**	**53.1**	**49.9**	**50.2**	**49.8**

[1] See Exhibit 9-A for the noise source locations. CadnaA noise model calculations are included in Appendix 9.1.

9.5 PROJECT OPERATIONAL NOISE LEVEL COMPLIANCE

To demonstrate compliance with local noise regulations, the Project-only operational noise levels are evaluated against exterior noise level thresholds based on the City of Hesperia exterior noise level standards at nearby noise-sensitive receiver locations. Table 9-5 shows the operational noise levels associated with Hesperia Commerce Center II Project will satisfy the City of Hesperia 60 dBA L_{eq} daytime and 55 dBA L_{eq} nighttime exterior noise level standards at all nearby receiver locations. Therefore, the operational noise impacts are considered *less than significant* at the nearby noise-sensitive receiver locations.

TABLE 9-5: OPERATIONAL NOISE LEVEL COMPLIANCE

Receiver Location[1]	Project Operational Noise Levels (dBA Leq)[2]		Noise Level Standards (dBA Leq)[3]		Noise Level Standards Exceeded?[4]	
	Daytime	Nighttime	Daytime	Nighttime	Daytime	Nighttime
R1	53.7	53.1	60	55	No	No
R2	50.0	49.4	60	55	No	No
R3	53.9	53.1	60	55	No	No
R4	50.8	49.9	60	55	No	No

[2] Proposed Project operational noise levels as shown on Tables 9-3 and 9-4.
[3] Exterior noise level standards for residential land use, as shown on Table 3-1.
[4] Do the estimated Project operational noise source activities exceed the noise level standards? "Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

9.6 PROJECT OPERATIONAL NOISE LEVEL INCREASES

To describe the Project operational noise level increases, the Project operational noise levels are combined with the existing ambient noise levels measurements for the nearby receiver locations potentially impacted by Project operational noise sources. Since the units used to measure noise, decibels (dB), are logarithmic units, the Project-operational and existing ambient noise levels cannot be combined using standard arithmetic equations. (2) Instead, they must be logarithmically added using the following base equation:

$$SPL_{Total} = 10\log_{10}[10^{SPL1/10} + 10^{SPL2/10} + \ldots 10^{SPLn/10}]$$

Where "SPL1," "SPL2," etc. are equal to the sound pressure levels being combined, or in this case, the Project-operational and existing ambient noise levels. The difference between the combined Project and ambient noise levels describe the Project noise level increases to the existing ambient noise environment. As indicated on Tables 9-6 and 9-7, the Project is not expected to generate a measurable daytime and nighttime operational noise level increase dBA L_{eq} at the nearby receiver locations. Project-related operational noise level increases will satisfy the operational noise level increase significance criteria presented on Table 4-2. Therefore, the incremental Project operational noise level increase is considered *less than significant* at all receiver locations.

9.7 OPERATIONAL VIBRATION IMPACTS

The operation of the Project site will include heavy trucks moving on site to and from the loading dock areas. Truck vibration levels are dependent on vehicle characteristics, load, speed, and pavement conditions. According to the FTA *Transit Noise and Vibration Impact Assessment Manual,* (8 p. 113) trucks rarely create vibration that exceeds 70 VdB or 0.004 PPV (in/sec) at 25 feet (unless there are bumps due to frequent potholes in the road). Trucks transiting on site will be travelling at very low speeds so it is expected that delivery truck vibration impacts will satisfy the City of Hesperia 0.2 PPV (in/sec) vibration threshold, and therefore, will be *less than significant*

10 CONSTRUCTION IMPACTS

This section analyzes potential impacts resulting from the short-term construction activities associated with the development of the Project. Exhibit 10-A shows the construction noise source locations in relation to the nearest sensitive receiver locations previously described in Section 8. To prevent high levels of construction noise from impacting noise-sensitive land uses, City of Hesperia Municipal Code Section 16.20.125.E.3, states that construction activities are limited to the hours of 7:00 a.m. to 7:00 p.m. on any day and at any time on Sundays and federal holidays.

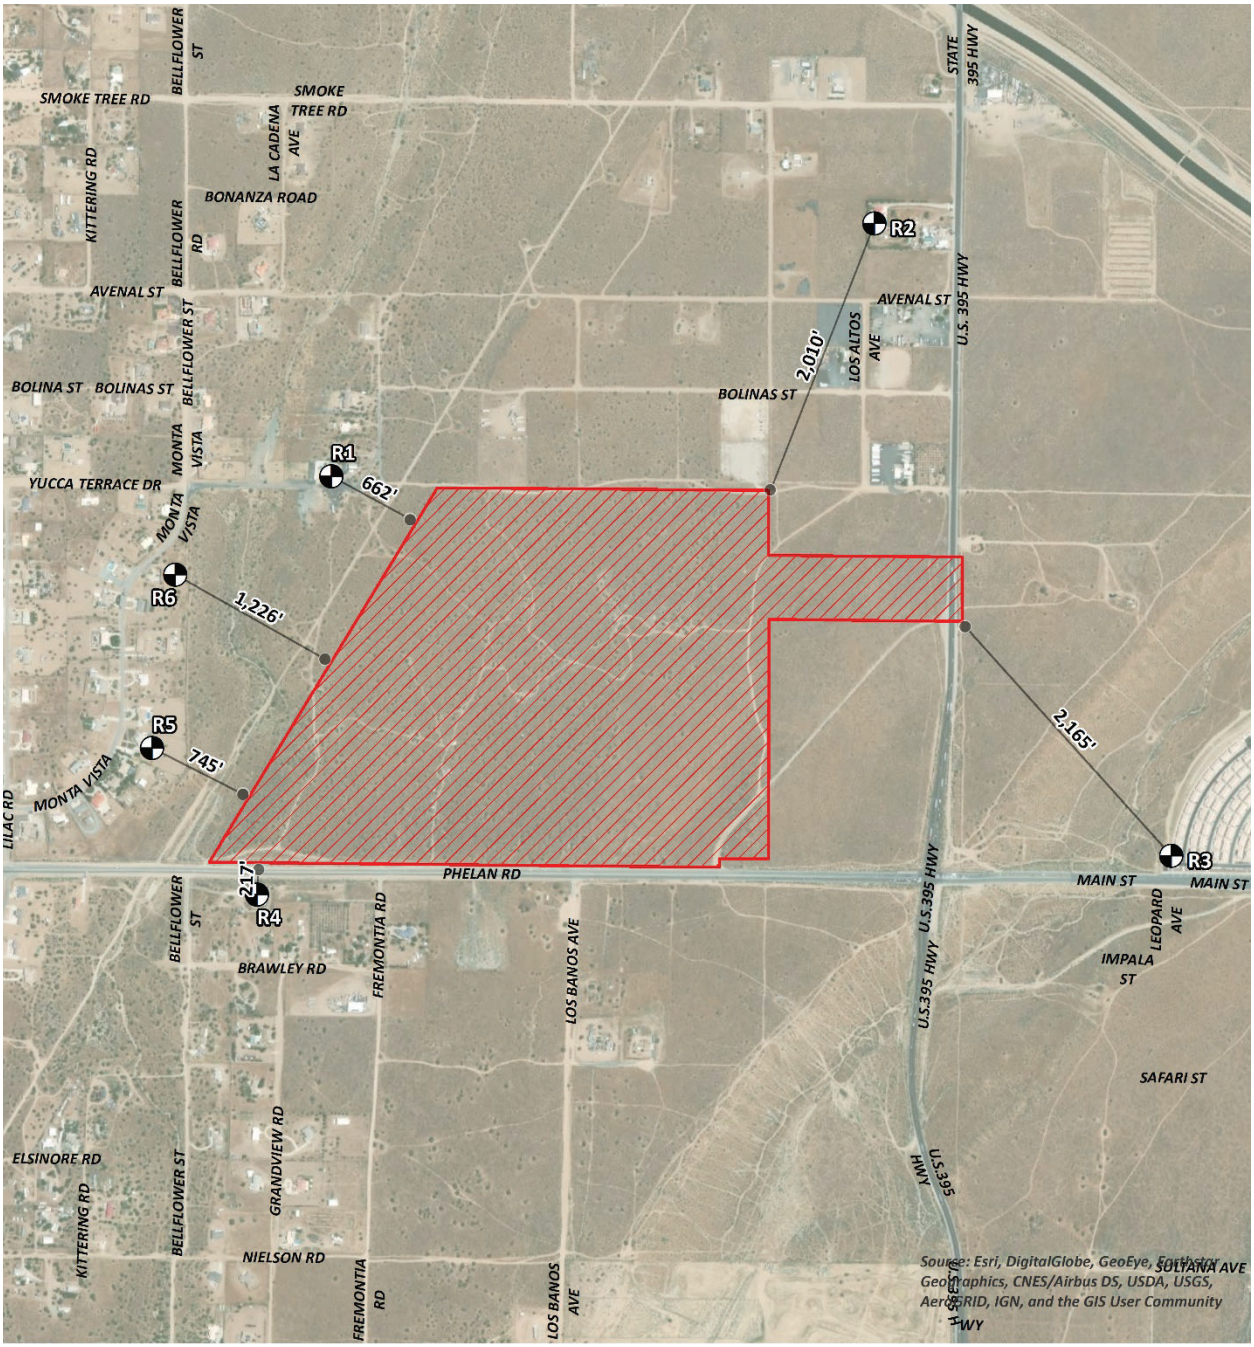
10.1 CONSTRUCTION NOISE LEVELS

Noise generated by the Project construction equipment will include a combination of trucks, power tools, concrete mixers, and portable generators operating simultaneously that when combined can reach high levels. The number and mix of construction equipment are expected to occur in the following stages:

- Demolition
- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating

This construction noise analysis was prepared using reference noise level measurements taken by Urban Crossroads, Inc. to describe the typical construction activity noise levels for each stage of Project construction. The construction reference noise level measurements represent a list of typical construction activity noise levels. Noise levels generated by heavy construction equipment can range from approximately 68 dBA to more than 80 dBA when measured at 50 feet. However, these noise levels diminish with distance from the construction site at a rate of 6 dBA per doubling of distance. For example, a noise level of 80 dBA measured at 50 feet from the noise source to the receiver would be reduced to 74 dBA at 100 feet from the source to the receiver, and would be further reduced to 68 dBA at 200 feet from the source to the receiver.

EXHIBIT 10-A: TYPICAL CONSTRUCTION NOISE SOURCE LOCATIONS



LEGEND:

- Construction Activity
- Receiver Locations
- Distance from receiver to Project site boundary (in feet)

10.2 TYPICAL CONSTRUCTION REFERENCE NOISE LEVELS

To describe the Project typical construction noise levels, measurements were collected for similar activities at several construction sites. Table 10-1 provides a summary of the construction reference noise level measurements. Since the reference noise levels were collected at varying distances of 30 feet and 50 feet, all construction noise level measurements presented on Table 10-1 have been adjusted for consistency to describe a uniform reference distance of 50 feet. Construction noise generated from concrete crushing activities and nighttime concrete pours are addressed separately, below.

TABLE 10-1: TYPICAL CONSTRUCTION REFERENCE NOISE LEVELS

Construction Stage	Reference Construction Activity[1]	Reference Noise Level @ 50 Feet (dBA L_{eq})	Highest Reference Noise Level (dBA L_{eq})
Demolition	Demolition Activity	67.9	71.9
	Backhoe	64.2	
	Water Truck Pass-By & Backup Alarm	71.9	
Site Preparation	Scraper, Water Truck, & Dozer Activity	75.3	75.3
	Backhoe	64.2	
	Water Truck Pass-By & Backup Alarm	71.9	
Grading	Rough Grading Activities	73.5	73.5
	Water Truck Pass-By & Backup Alarm	71.9	
	Construction Vehicle Maintenance Activities	67.5	
Building Construction	Foundation Trenching	68.2	71.6
	Framing	62.3	
	Concrete Mixer Backup Alarms & Air Brakes	71.6	
Paving	Concrete Mixer Truck Movements	71.2	71.2
	Concrete Paver Activities	65.6	
	Concrete Mixer Pour & Paving Activities	65.9	
Architectural Coating	Air Compressors	65.2	65.2
	Generator	64.9	
	Crane	62.3	

[1] Reference construction noise level measurements taken by Urban Crossroads, Inc.

10.3 TYPICAL CONSTRUCTION NOISE ANALYSIS

Using the reference construction equipment noise levels and the CadnaA noise prediction model, calculations of the Project construction noise level impacts with multiple pieces of equipment operating simultaneously at the nearest sensitive receiver locations were completed. This includes the additional noise attenuation provided by the existing intervening building structures and noise barriers located between the Project site and the nearest receiver locations.

To assess the worst-case construction noise levels, the Project construction noise analysis relies on the highest noise level impacts when the equipment with the highest reference noise level is operating at the closest point from the edge of primary construction activity (Project site boundary) to each receiver location. As shown on Table 10-2, the construction noise levels are expected to range from 60.6 to 73.6 dBA L_{eq}, and the highest construction levels are expected to range from 64.7 to 73.6 dBA L_{eq} at the nearby receiver locations. Appendix 10.1 includes the detailed CadnaA construction noise model inputs.

TABLE 10-2: TYPICAL CONSTRUCTION EQUIPMENT NOISE LEVEL SUMMARY

Receiver Location[1]	Construction Noise Levels (dBA L_{eq})						
	Demolition	Site Preparation	Grading	Building Construction	Paving	Architectural Coating	Highest Levels[2]
R1	68.7	72.1	70.3	68.4	68.0	68.0	72.1
R2	61.3	64.7	62.9	61.0	60.6	60.6	64.7
R3	70.2	73.6	71.8	69.9	69.5	69.5	73.6
R4	67.3	70.7	68.9	67.0	66.6	66.6	70.7
R5	66.4	69.8	68.0	66.1	65.7	65.7	69.8
R6	62.7	66.1	64.3	62.4	62.0	62.0	66.1

[1] Noise receiver locations are shown on Exhibit 10-A.
[2] Construction noise level calculations based on distance from the project site boundaries (construction activity area) to nearby receiver locations. CadnaA construction noise model inputs are included in Appendix 10.1.

10.4 TYPICAL CONSTRUCTION NOISE LEVEL COMPLIANCE

To evaluate whether the Project will generate potentially significant short-term noise levels at nearest receiver locations, a construction-related daytime noise level threshold of 80 dBA L_{eq} is used as a reasonable threshold to assess the daytime construction noise level impacts. The construction noise analysis shows that the nearest receiver locations will satisfy the reasonable daytime 80 dBA L_{eq} significance threshold during Project construction activities as shown on Table 10-3. Therefore, the noise impacts due to Project construction noise is considered *less than significant* at all receiver locations.

TABLE 10-3: TYPICAL CONSTRUCTION NOISE LEVEL COMPLIANCE

Receiver Location[1]	Construction Noise Levels (dBA L_{eq})		
	Highest Construction Noise Levels[2]	Threshold[3]	Threshold Exceeded?[4]
R1	72.1	80	No
R2	64.7	80	No
R3	73.6	80	No
R4	70.7	80	No
R5	69.8	80	No
R6	66.1	80	No

[1] Noise receiver locations are shown on Exhibit 10-A.
[2] Highest construction noise level calculations based on distance from the construction noise source activity to nearby receiver locations as shown on Table 10-2.
[3] Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual.
[4] Do the estimated Project construction noise levels exceed the construction noise level threshold?

10.6 TYPICAL CONSTRUCTION VIBRATION IMPACTS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. Ground-borne vibration levels resulting from typical construction activities occurring within the Project site were estimated by data published by the Federal Transit Administration (FTA). (8) However, while vehicular traffic is rarely perceptible, construction has the potential to result in varying degrees of temporary ground vibration, depending on the specific construction activities and equipment used.

Ground vibration levels associated with various types of construction equipment are summarized on Table 10-4. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the potential Project construction vibration levels using the following vibration assessment methods defined by the FTA. To describe the human response (annoyance) associated with vibration impacts the FTA provides the following equation:
$PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$

TABLE 10-4: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	PPV (in/sec) at 25 feet
Small bulldozer	0.003
Jackhammer	0.035
Loaded Trucks	0.076
Large bulldozer	0.089

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual

Table 10-5 presents the expected typical construction equipment vibration levels at the nearest receiver locations. At distances ranging from 217 feet to 2,165 feet from typical Project construction activities (at the Project site boundary), construction vibration velocity levels are estimated at 0.003 PPV (in/sec). Based on the City of Hesperia vibration standards, the unmitigated Project construction vibration levels will satisfy the 0.2 PPV (in/sec) threshold at all the nearby sensitive receiver locations. Therefore, the vibration impacts due to Project construction are considered *less than significant*.

Further, vibration levels at the site of the closest sensitive receiver are unlikely to be sustained during the entire construction period but will occur rather only during the times that heavy construction equipment is operating simultaneously adjacent to the Project site perimeter. Moreover, construction at the Project site will be restricted to daytime hours consistent with City requirements thereby eliminating potential vibration impacts during the sensitive nighttime hours.

TABLE 10-5: TYPICAL CONSTRUCTION EQUIPMENT VIBRATION LEVELS

Receiver[1]	Distance to Const. Activity (Feet)	Receiver PPV Levels (in/sec)[2]					Threshold PPV (in/sec)[3]	Threshold Exceeded?[4]
		Small Bulldozer	Jack-hammer	Loaded Trucks	Large Bulldozer	Peak Vibration		
R1	662'	0.000	0.000	0.001	0.001	0.001	0.2	No

APPENDIX 3.1:

CITY OF HESPERIA MUNICIPAL CODE

This page intentionally left blank

16.20.125 - Noise.

A. Noise Measurement. Noise will be measured with a sound level meter, which meets the standards of the American National Standards Institute (ANSI Section S1.4-1979, Type 1 or Type 2). Noise levels shall be measured using the "A" weighted sound pressure level scale in decibels (ref. pressure = 20 micro-newtons per meter squared). The unit of measure shall be designated as dB(A). The building official shall be the noise control officer.

B. Noise Standards.

1. The following table describes the noise standard for emanations from any source, as it affects adjacent properties:

NOISE STANDARDS

Affected Land Use (Receiving Noise)	Maximum Noise Level	Time Period
A-1, A-2, R-1, R-3 and RR Zone Districts	55 dB(A)	10:00 p.m. - 7:00 a.m.
A-1, A-2, R-1, R-3 and RR Zone Districts	60 dB(A)*	7:00 a.m. - 10:00 p.m.
C-1, C-2, C-3, C-4, C-R, AP, and P-I Zone Districts	65 dB(A)*	Anytime
I-1 and I-2 Zone Districts	70 dB(A)*	Anytime

* Due to wind noise, the maximum permissible noise level may be adjusted so that it is no greater than five dB(A) above the ambient noise level.

2. No person shall operate or cause to be operated any source of sound at any location or allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which causes the noise level, when measured on any other property, either incorporated or unincorporated, to exceed:

a. The noise standard for that receiving land use (as specified in subsection (B)(1) of this section) for a cumulative period of more than thirty (30) minutes in any hour; or

b. The noise standard plus five dB(A) for a cumulative period of more than fifteen (15) minutes in any hour; or

c. The noise standard plus ten dB(A) for a cumulative period of more than five minutes in any hour; or

d. The noise standard plus fifteen (15) dB(A) for a cumulative period of more than one minute in any hour; or

e. The noise standard plus twenty (20) dB(A) for any period of time.

C. If the measured ambient level exceeds any of the first four noise limit categories above, the allowable noise exposure standard shall be increased to reflect the ambient noise level. If the

ambient noise level exceeds the fifth noise limit category, the maximum allowable noise level under this category shall be increased to reflect the maximum ambient noise level.

D. If the alleged offense consists entirely of impact noise or simple tone noise, each of the noise levels in subsection (B)(1) of this section shall be reduced by five dB(A).

E. Exempt Noises. The following sources of noise are exempt:

1. Motor vehicles not under the control of the industrial use;

2. Emergency equipment, vehicles and devices;

3. Temporary construction, repair, or demolition activities between seven a.m. and seven p.m. except Sundays and federal holidays.

(Ord. 2002-07 Exh. A, 2002; Amended during 1997 codification; Ord. 75 § 2 (part), 1990; SBCC § 87.1305)

16.20.130 - Vibration.

A. Vibration Standard. No ground vibration shall be allowed which can be felt without the aid of instruments at or beyond the lot line; nor will any vibration be permitted which produces a particle velocity greater than or equal to 0.2 inches per second measured at or beyond the lot line.

B. Vibration Measurement. Vibration velocity shall be measured with a seismograph or other instrument capable of measuring and recording displacement and frequency, particle velocity or acceleration. Readings are to be made at points of maximum vibration along any lot line next to a residential or commercial district or a community industrial lot.

C. Exempt Vibrations. The following sources of vibration are not regulated by this code:

1. Motor vehicles not under the control of the industrial use;

2. Temporary construction, maintenance or demolition activities between seven a.m. and seven p.m. except Sundays and federal holidays.

(SBCC § 87.1310)

24-Hour CNEL (dBA)

65.5

24-Hour Noise Level Measurement Summary

Date: Wednesday, May 20, 2020
Project: Hesperia Commerce Center II

L4 - Located south of the Project site on Phelan Road near existing single-family residential home at 9565 Fremontia Road.

Meter: Piccolo I

JN: 12780
Analyst: P. Mara

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing (2019) | Project Name: Hesperia Commerce Cent
Road Name: US Hwy. 395 | Job Number: 12780
Road Segment: n/o Luna Rd.

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	23,862 vehicles
Peak Hour Percentage:	9.38%
Peak Hour Volume:	2,238 vehicles
Vehicle Speed:	55 mph
Near/Far Lane Distance:	72 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	62.0 feet
Centerline Dist. to Observer:	62.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	62.2%	12.7%	25.0%	83.81%
Medium Trucks:	67.8%	9.4%	22.8%	7.36%
Heavy Trucks:	63.0%	10.8%	26.2%	8.83%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	50.725
Medium Trucks:	50.550
Heavy Trucks:	50.567

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing + Project
Road Name: US Hwy. 395
Road Segment: s/o Joshua St.
Project Name: Hesperia Commerce Cent
Job Number: 12780

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	25,851 vehicles
Peak Hour Percentage:	9.38%
Peak Hour Volume:	2,425 vehicles
Vehicle Speed:	55 mph
Near/Far Lane Distance:	106 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	65.0 feet
Centerline Dist. to Observer:	65.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	62.2%	12.7%	25.0%	84.77%
Medium Trucks:	67.8%	9.4%	22.8%	6.92%
Heavy Trucks:	63.0%	10.8%	26.2%	8.31%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	37.961
Medium Trucks:	37.727
Heavy Trucks:	37.749

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: OYC (2021) | Project Name: Hesperia Commerce Cent
Road Name: Phelan Rd. | Job Number: 12780
Road Segment: w/o Bellflower St.

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	19,579 vehicles
Peak Hour Percentage:	9.38%
Peak Hour Volume:	1,837 vehicles
Vehicle Speed:	55 mph
Near/Far Lane Distance:	48 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	52.0 feet
Centerline Dist. to Observer:	52.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	62.2%	12.7%	25.0%	83.81%
Medium Trucks:	67.8%	9.4%	22.8%	7.36%
Heavy Trucks:	63.0%	10.8%	26.2%	8.83%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	46.400
Medium Trucks:	46.209
Heavy Trucks:	46.228

FHWA Noise Model Calculations

VehicleType	REMEL	Traffic Flow	Distance	Finite Road	Fresnel	Barrier Atten	Berm Atten

CADNAA CONSTRUCTION NOISE MODEL INPUTS

This page intentionally left blank

12780 - Hesperia Commerce II

CadnaA Noise Prediction Model: 12780_Construction.cna
Date: 15.07.20
Analyst: B. Lawson

Calculation Configuration

Configuration	
Parameter	Value
General	
Country	(user defined)
Max. Error (dB)	0.00
Max. Search Radius (#(Unit,LEN))	2000.01
Min. Dist Src to Rcvr	0.00
Partition	
Raster Factor	0.50
Max. Length of Section (#(Unit,LEN))	999.99
Min. Length of Section (#(Unit,LEN))	1.01
Min. Length of Section (%)	0.00
Proj. Line Sources	On
Proj. Area Sources	On
Ref. Time	
Reference Time Day (min)	960.00
Reference Time Night (min)	480.00
Daytime Penalty (dB)	0.00
Recr. Time Penalty (dB)	5.00
Night-time Penalty (dB)	10.00
DTM	
Standard Height (m)	0.00
Model of Terrain	Triangulation
Reflection	
max. Order of Reflection	2
Search Radius Src	100.00
Search Radius Rcvr	100.00
Max. Distance Source - Rcvr	1000.00 1000.00
Min. Distance Rvcr - Reflector	1.00 1.00
Min. Distance Source - Reflector	0.10
Industrial (ISO 9613)	
Lateral Diffraction	some Obj
Obst. within Area Src do not shield	On
Screening	Incl. Ground Att. over Barrier
	Dz with limit (20/25)
Barrier Coefficients C1,2,3	3.0 20.0 0.0
Temperature (#(Unit,TEMP))	10
rel. Humidity (%)	70
Ground Absorption G	0.00
Wind Speed for Dir. (#(Unit,SPEED))	3.0
Roads (RLS-90)	
Strictly acc. to RLS-90	
Railways (FTA/FRA)	
Aircraft (???)	
Strictly acc. to AzB

1 INTRODUCTION

This report presents the results of the traffic impact analysis (TIA) for the proposed Hesperia Commerce Center II development (referred to as "Project") located north of Phelan Road and west of US Highway 395 in the City of Hesperia, as shown on Exhibit 1-1.

The purpose of this TIA is to evaluate the potential circulation system deficiencies that may result from the development of the proposed Project, and to recommend improvements to achieve acceptable circulation system operational conditions. This traffic study has been prepared in accordance with the San Bernardino County Congestion Management Program (CMP) Guidelines for CMP Traffic Impact Analysis Reports (Appendix B, 2016 Update), the California Department of Transportation (Caltrans) Guide for the Preparation of Traffic Impact Studies, and through consultation with City of Hesperia staff during the scoping process. (1) (2) The approved Project Traffic Study Scoping agreement is provided in Appendix 1.1 of this TIA.

1.1 SUMMARY OF FINDINGS

The Project is proposing to construct the following improvements as design features in conjunction with development of the site.

Recommendation 1.1 – Driveway 1 & Phelan Road (#4) – The following improvements are necessary to accommodate site access:

- Project to install a stop control on the southbound approach and construct southbound shared left-right turn lane, and westbound right turn lane.

Recommendation 2.1 – Driveway 2 & Yucca Terrace Drive (#5) – The following improvements are necessary to accommodate site access:

- Project to install a stop control on the northbound approach and construct northbound shared left-right turn lane, eastbound shared through-right turn lane, westbound left turn lane within a two-way turn lane and a westbound through lane.

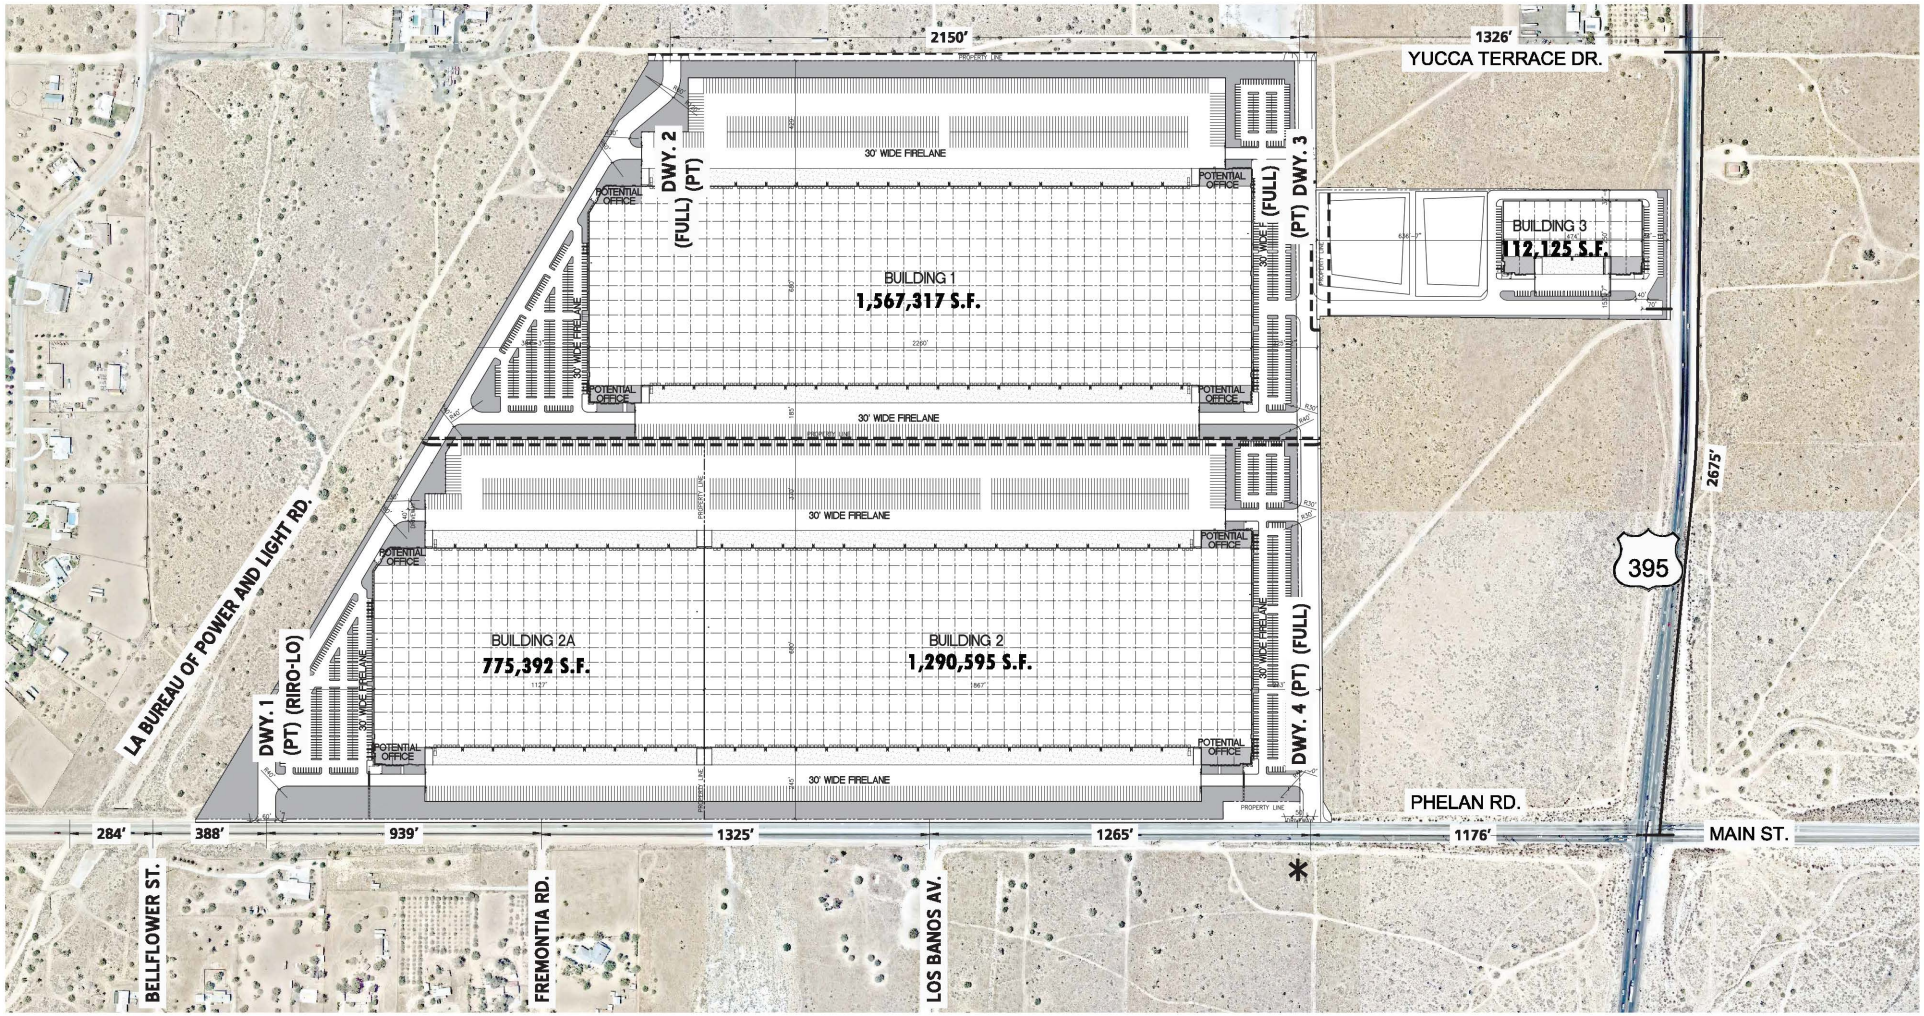
Recommendation 3.1 – Driveway 3 & Yucca Terrace Drive (#6) – The following improvements are necessary to accommodate site access:

- Project to install a stop control on the northbound approach and construct northbound shared left-right turn lane, eastbound shared through-right turn lane, westbound left turn lane within a two-way turn lane and a westbound through lane.

Recommendation 4.1 – Driveway 4 & Phelan Road (#7) – The following improvements are necessary to accommodate site access:

- Project to install a traffic signal and construct southbound shared left-right turn lane and eastbound left turn lane with a minimum of 150-feet of storage. Driveway 4 is proposed to provide reciprocal access with the adjacent (not-a-part) use to the east.

EXHIBIT 1-1 PRELIMINARY SITE PLAN



LEGEND:

RIRO	= RIGHT-IN/RIGHT-OUT ONLY ACCESS
FULL	= FULL ACCESS
PT	= PASSENGER CARS AND TRUCKS
LO	= LEFT OUT

*** NOTE: DRIVEWAY 4 IS A PROPOSED SIGNALIZED DRIVEWAY THAT WILL PROVIDE RECIPROCAL ACCESS WITH THE ADJACENT USE. A SIGNAL MODIFICATION WILL BE NECESSARY AT THIS LOCATION.**

N

Recommendation 5.1 – US Highway 395 & Yucca Terrace Drive (#11) – The following improvements are necessary to accommodate site access:

- Project to install a traffic signal and construct northbound left turn lane with a minimum of 260-feet of storage, eastbound left turn lane with a minimum of 200-feet of storage and an eastbound right turn lane.

Recommendation 6.1 – US Highway 395 & Phelan Road/Main Street (#12) – The following improvements are necessary to accommodate site access:

- Project to construct a 2nd northbound left turn lane.
- Project to construct a 2nd southbound left turn lane.

Recommendation 7.1 – Phelan Road – Project to construct Phelan Road from the western Project boundary to the eastern Project boundary at its ultimate half-section width as a Major Arterial (ultimate 120-foot right-of-way) in compliance with the circulation recommendations found in the City of Hesperia's General Plan. The additional westbound through lanes may not be striped until such time in the future when Phelan Road is widened to the west with additional receiving lanes.

Recommendation 8.1 – Yucca Terrace Drive – Project to construct Yucca Terrace Drive from the western Project boundary to the eastern Project boundary at its ultimate half-section width as an Industrial Collector (ultimate 70-foot right-of-way) in compliance with the circulation recommendations found in the City of Hesperia's General Plan. The project will provide an additional 12-feet of pavement width to accommodate one westbound lane from the western Project boundary to US Highway 395 and an additional 12-feet of pavement width to accommodate one eastbound lane from the eastern Project boundary to US Highway 395 in order to facilitate site access.

Recommendation 9.1 – US Highway 395 – Project to construct US Highway 395 from the northern Project boundary of Building 3 to the southern Project boundary of Building 3 at its ultimate half-section width (ultimate 130-foot right-of-way) in compliance with Caltrans standards and the circulation recommendations found in the City of Hesperia's General Plan. The additional southbound through lanes may not be striped until such time in the future when US Highway 395 is widened to the south with additional receiving lanes.

The Project Applicant's responsibility for the Project's contributions towards off-site deficient intersections is fulfilled through payment of fair share and/or payment into pre-existing fee programs (if applicable) that would be assigned to construction of the identified recommended improvements. The Project Applicant would be required to pay requisite fees and/or fair share contributions consistent with the City's requirements (see Section 8 *Local and Regional Funding Mechanisms*).

Recommendation 10.1 – Prior to the issuance of building permits, the Project Applicant shall pay the Project's fair share amount of $324,443 for the improvements identified in Table 1-3 at intersections located within the City of Hesperia, or as agreed to by the City and Project Applicant.

Recommendation 11.1 – The Developer's fair-share amount for the intersections that either share a mutual border with or are wholly located within the jurisdiction of Caltrans that have recommended improvements which are not covered by a pre-existing fee program is $893,156. Developer shall be required to pay the amount shown above to the City of Hesperia prior to the issuance of building permits. The City of Hesperia shall hold Developer's Fair Share contribution in trust and shall apply Developer's Fair Share Contribution to any fee program adopted or agreed upon with Caltrans.

1.2 PROJECT OVERVIEW

The proposed Project consists of the following uses:

- 2,361,648 square feet of High-Cube Fulfillment Center use (65% of the total square footage of Building 1 and Building 2)
- 1,383,781 square feet of General Light Industrial use; 1,271,656 square feet within Building 1 and Building 2 (35% of the total square footage of Building 1 and Building 2) and 112,125 square feet within Building 3

The Project is anticipated to be developed within a single phase with an anticipated opening year of 2021. Regional access to the Project site is available from the I-15 Freeway at the Main Street interchange. The Project is located north of Phelan Road and west of US Highway 395 in the City of Hesperia. Vehicular and truck traffic access will be provided via the following driveways:

- Driveway 1 via Phelan Road – Right-In/Right-Out/Left-Out access for both passenger cars and trucks (no left-in access)
- Driveway 2 via Yucca Terrace Drive – Full access for both passenger cars and trucks
- Driveway 3 via Yucca Terrace Drive – Full access for both passenger cars and trucks
- Driveway 4 via Phelan Road – Full access for both passenger cars and trucks

Trips generated by the Project's proposed land uses have been estimated based on trip generation rates published by the Institute of Transportation Engineers (ITE) as provided in their Trip Generation Manual, 10th Edition, 2017 and the High-Cube Warehouse Trip Generation Study (WSP, January 29, 2019). (3) (4) The Project is estimated to generate a total of 11,898 trip-ends per day on a typical weekday with 1,258 AM peak hour trips and 1,261 PM peak hour trips. The

assumptions and methods used to estimate the Project's trip generation characteristics are discussed in greater detail in Section 4.1 *Project Trip Generation* of this report.

1.3 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential deficiencies to traffic and circulation have been assessed for each of the following conditions:

- Existing (2019)
- Existing Plus Project (E+P)
- Opening Year Cumulative (2021) Without Project
- Opening Year Cumulative (2021) With Project
- Horizon Year (2040) Without Project
- Horizon Year (2040) With Project

1.3.1 EXISTING (2019) CONDITIONS

Existing (2019) conditions represents the baseline traffic conditions as they existed at the time this report was prepared.

1.3.2 EXISTING PLUS PROJECT CONDITIONS

The E+P analysis determines circulation system deficiencies that would occur on the existing roadway system in the scenario of the Project being placed upon Existing conditions. The E+P analysis is intended to identify the project-specific traffic deficiencies associated solely with the development of the proposed Project based on a comparison of the E+P traffic conditions to Existing (2019) conditions.

1.3.3 OPENING YEAR CUMULATIVE (2021) CONDITIONS

The Opening Year Cumulative (2021) conditions analysis determines the potential near-term cumulative circulation system deficiencies. To account for growth in traffic between Existing (2019) traffic conditions and the Project Opening Year Cumulative (2021), a growth rate of 4.04 percent was assumed (2.0 percent per year, compounded annually over 2 years).

1.3.4 HORIZON YEAR (2040) CONDITIONS

Traffic projections for Horizon Year (2040) with Project conditions were derived from the San Bernardino Transportation Analysis Model (SBTAM). The Horizon Year (2040) conditions analysis will be utilized to determine if improvements funded through regional transportation mitigation fee programs, such as the City's Development Impact Fee (DIF) program or other approved funding mechanisms, can accommodate the long-range cumulative traffic at the target level of service (LOS) identified by the City of Hesperia (lead agency). If the planned and funded improvements can provide the target LOS, then the Project's payment into established fee programs will be considered as cumulative improvements. Other improvements needed beyond the "funded" improvements (such as localized improvements to non-DIF facilities) are identified as such.

1.4 STUDY AREA

1.4.1 INTERSECTIONS

The following 25 study area intersections listed in Table 1-1 and shown on Exhibit 1-2 were selected for this TIA based on where the Project is anticipated to contribute 50 or more peak hour trips, or if the intersection provides access to the proposed Project.

TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

ID	Intersection Location	Jurisdiction	CMP?
1	Baldy Mesa Rd. & Phelan Rd.	County of San Bernardino	No
2	Verbena Rd. & Phelan Rd.	County of San Bernardino	No
3	Bellflower St. & Phelan Rd.	County of San Bernardino	No
4	Driveway 1 & Phelan Rd. – Future Intersection	City of Hesperia, County of San Bernardino	No
5	Driveway 2 & Yucca Terrace Dr. – Future Intersection	City of Hesperia	No
6	Driveway 3 & Yucca Terrace Dr. – Future Intersection	City of Hesperia	No

12778 - locmap-d.dwg

URBAN CROSSROADS

The "50 peak hour trip" criterion utilized by the City of Hesperia is consistent with the methodology employed by the County of San Bernardino, and generally represents a minimum number of trips at which a typical intersection would have the potential to be affected by a given development proposal. Although each intersection may have unique operating characteristics, this traffic engineering rule of thumb is a widely-utilized tool for estimating a study area.

The intent of a CMP is to more directly link land use, transportation, and air quality, thereby prompting reasonable growth management programs that will effectively utilize new transportation funds, alleviate traffic congestion and related deficiencies, and improve air quality. Counties within California have developed CMPs with varying methods and strategies to meet the intent of the CMP legislation. The intersection of US Highway 395 & Phelan Road/Main Street is identified as a San Bernardino County Transportation Authority (SBCTA) CMP intersection.

1.4.2 FREEWAY MAINLINE AND RAMP JUNCTION ANALYSIS

Study area freeway mainline analysis locations were selected based on Caltrans traffic study guidelines, which may require the analysis of State highway facilities. (2) Consistent with recent Caltrans guidance, and because deficiencies to freeway segments tend to dissipate with distance from the point of State Highway System (SHS) entry, quantitative study of freeway segments beyond those immediately adjacent to the point of entry typically is not required. This study evaluates the following freeway facilities adjacent to the point of entry to the SHS at the I-15 Freeway and Main Street, and the I-15 Freeway and US Highway 395 (see Table 1-2):

TABLE 1-2: FREEWAY FACILITY ANALYSIS LOCATIONS

ID	Freeway Facilities
1	I-15 Freeway Southbound, North of Main St. (mainline segment)
2	I-15 Freeway Southbound, Off-Ramp at Main St. (diverge ramp junction)
3	I-15 Freeway Southbound, Loop On-Ramp at Main St. (merge ramp junction)
4	I-15 Freeway Southbound, On-Ramp at Main St. (merge ramp junction)
5	I-15 Freeway Southbound, South of Main St. (mainline segment)
6	I-15 Freeway Southbound, North of US Highway 395 (mainline segment)
7	I-15 Freeway Southbound, On-Ramp at US Highway 395 (merge ramp junction)
8	I-15 Freeway Southbound, South of US Highway 395 (mainline segment)
9	I-15 Freeway Northbound, North of Main St. (mainline segment)
10	I-15 Freeway Northbound, On-Ramp at Main St. (merge ramp junction)
11	I-15 Freeway Northbound, Loop On-Ramp at Main St. (merge ramp junction)
12	I-15 Freeway Northbound, Off-Ramp at Main St. (diverge ramp junction)
13	I-15 Freeway Northbound, South of Main St. (mainline segment)
14	I-15 Freeway Northbound, North of US Highway 395 (mainline segment)
15	I-15 Freeway Northbound, Off-Ramp at US Highway 395 (diverge ramp junction)
16	I-15 Freeway Northbound, South of US Highway 395 (mainline segment)

1.5 SENATE BILL 743 – VEHICLE MILES TRAVELED (VMT)

Senate Bill 743 (SB 743), approved in 2013, endeavors to change the way transportation impacts will be determined according to the California Environmental Quality Act (CEQA). The Office of Planning and Research (OPR) has recommended the use of vehicle miles traveled (VMT) as the replacement for automobile delay-based LOS. In December 2018, the Natural Resources Agency finalized updates to CEQA Guidelines to incorporate SB 743 (i.e., VMT). While a lead agency has the option to immediately apply the new VMT based analysis methodology and thresholds for the purposes of evaluating transportation impacts, statewide application of the new guidelines is required July 1, 2020. VMT analysis for the proposed Project has been prepared under separate cover.

It is our understanding that the City of Hesperia has not currently adopted VMT thresholds. In July 2019, the County of San Bernardino adopted new Traffic Impact Study Guidelines which includes a set of procedures and thresholds for conducting VMT analyses in the County. The County has concluded that County projects will be required to complete a TIA, in conjunction with a VMT assessment, in order to demonstrate consistency with the General Plan. For purposes of SB 743 compliance, VMT analysis should be conducted for land use projects as deemed necessary by the lead agency and would apply to projects that have the potential to increase the average VMT per person or employee. The County recommends VMT be estimated by multiplying average trip length by the trip generation for the project and that average trip length information be obtained for each trip purpose from the SBTAM traffic model. Using SBTAM to determine both trip generation and trip lengths allows the user to use an identical methodology when comparing project VMT per person/employee to the regional VMT per person/employee. The San Bernardino County Transportation Authority (SBCTA) is also currently conducting a multi-jurisdictional study to develop a set of procedures and provide local jurisdictions with sufficient information to adopt VMT baselines and thresholds of significance at or around the July 2020 required implementation date.

Caltrans has yet to formally adopted VMT thresholds of significance for purposes of determining transportation impacts under CEQA. The guidelines are set to be available in Spring/Summer 2020, however, Caltrans acknowledges automobile delay will no longer be considered a CEQA impact for development projects and will use VMT for projects on the SHS. As such, the LOS operations included in this TIA for intersections and freeway facilities are informational and are not anticipated to support the environmental document.

1.6 DEFICIENCIES

This section provides a summary of Project deficiencies. Section 2 *Methodologies* provides information on the methodologies used in the analysis and Section 5 *E+P Traffic Conditions*, Section 6 *Opening Year Cumulative (2021) Traffic Conditions*, and Section 7 *Horizon Year (2040) Traffic Conditions* includes the detailed analysis. A summary of LOS results for all analysis scenarios is presented on Exhibit 1-3.

1.6.1 E+P CONDITIONS

Intersections

US Highway 395 & Yucca Terrace Drive (#11) – This intersection was found to operate at an unacceptable LOS (LOS E or worse) during the PM peak hour under Existing traffic conditions and is anticipated to continue to operate at an unacceptable LOS during one or more peak hours with the addition of Project traffic resulting in a cumulative deficiency.

US Highway 395 & Phelan Road/Main Street (#12) – This intersection was found to operate at an acceptable LOS (LOS D or better) during the peak hours under Existing traffic conditions. However, the intersection is anticipated to operate at an unacceptable LOS (LOS E or worse) during the peak hours with the addition of Project traffic for E+P traffic conditions.

US Highway 395 & Poplar Street (#13) – This intersection was found to operate at an unacceptable LOS (LOS E or worse) during the peak hours under Existing traffic conditions and is anticipated to continue to operate at an unacceptable LOS during one or more peak hours with the addition of Project traffic resulting in a cumulative deficiency.

Queuing

The following turning movement is anticipated to experience periodic queuing issues during the peak hours based on the 95th percentile peak hour traffic flows under E+P traffic conditions:

- US Highway 395 & Phelan Road/Main Street (#12) Southbound Left – AM and PM peak hours

Consistent with Existing (2019) traffic conditions, there are no off-ramp movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows.

Freeway Facilities

Consistent with Existing (2019) traffic conditions, the following study area freeway segments and merge/diverge ramp junctions analyzed for this study are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours for E+P traffic conditions:

- I-15 Freeway Northbound, North of Main Street (#9) – LOS E PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at Main Street (#12) – LOS E PM peak hour only
- I-15 Freeway Northbound, South of Main Street (#13) – LOS E PM peak hour only

EXHIBIT 1-3: SUMMARY OF DEFICIENT INTERSECTIONS BY ANALYSIS SCENARIO

1.6.2 OPENING YEAR CUMULATIVE (2021) CONDITIONS

Intersections

The following intersections are anticipated to operate at an unacceptable LOS during the peak hours for Opening Year Cumulative (2021) Without Project traffic conditions:

- Verbena Road & Phelan Road (#2) – LOS D AM and PM peak hours
- US Highway 395 & Yucca Terrace Drive (#11) – LOS F AM and PM peak hours
- US Highway 395 & Phelan Road/Main Street (#12) – LOS E PM peak hour only
- US Highway 395 & Poplar Street (#13) – LOS F AM and PM peak hours
- Escondido Avenue & Main Street (#23) – LOS E PM peak hour only

Queuing

The following intersection turning movements are anticipated to experience periodic queuing issues during the peak hours based on the 95th percentile peak hour traffic flows for Opening Year Cumulative (2021) Without Project traffic conditions:

- US Highway 395 & Phelan Road/Main Street (#12) Southbound Left – AM and PM peak hours
- US Highway 395 & Three Flags Road (#14) Northbound Left – AM and PM peak hours

The following additional intersection turning movement is anticipated to experience queuing issues during the peak hours based on the 95th percentile peak hour traffic flows for Opening Year Cumulative (2021) With Project traffic conditions:

- US Highway 395 & Phelan Road/Main Street (#12) Northbound Left – AM and PM peak hours

Consistent with Existing (2019) traffic conditions, there are no off-ramp movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under Opening Year Cumulative (2021) Without Project and With Project traffic conditions.

Freeway Facilities

The following study area freeway segments and merge/diverge ramp junctions analyzed for this study are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours for Opening Year Cumulative (2021) Without Project traffic conditions:

- I-15 Freeway Northbound, North of Main Street (#9) – LOS E PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at Main Street (#12) – LOS E PM peak hour only
- I-15 Freeway Northbound, South of Main Street (#13) – LOS E PM peak hour only

The following additional study area ramp junction is anticipated to operate at an unacceptable LOS under Horizon Year (2040) With Project traffic conditions, resulting in a cumulative deficiency:

- I-15 Freeway Northbound, On-Ramp at Main Street (#10) – LOS E PM peak hour only

1.6.3 HORIZON YEAR (2040) CONDITIONS

Intersections

The following study area intersections are anticipated to operate at an unacceptable LOS during the peak hours under Horizon Year (2040) Without Project conditions:

- Verbena Road & Phelan Road (#2) – LOS E AM peak hour; LOS D PM peak hour
- Bellflower Street & Phelan Road (#3) – LOS D AM and PM peak hours
- US Highway 395 & Luna Road (#8) – LOS E AM peak hour; LOS F PM peak hour
- US Highway 395 & Bear Valley Road (#9) – LOS E AM peak hour; LOS F PM peak hour
- US Highway 395 & Eucalyptus Road (#10) – LOS E AM and PM peak hours
- US Highway 395 & Yucca Terrace Drive (#11) – LOS F AM and PM peak hours
- US Highway 395 & Phelan Road/Main Street (#12) – LOS F AM and PM peak hours
- US Highway 395 & Poplar Street (#13) – LOS F AM and PM peak hours
- US Highway 395 & Three Flags Road (#14) – LOS F AM peak hour only
- US Highway 395 & Joshua Street (#15) – LOS F PM peak hour only
- Escondido Avenue & Main Street (#23) – LOS E AM and PM peak hours
- Escondido Avenue & Sultana Street (#24) – LOS E AM peak hour; LOS F PM peak hour
- Topaz Avenue & Main Street (#25) – LOS E PM peak hour only

Queuing

The following intersection turning movements are anticipated to experience periodic queuing issues during the peak hours based on the 95th percentile peak hour traffic flows for Horizon Year (2040) Without Project traffic conditions:

- US Highway 395 & Bear Valley Road (#9) Northbound Left – AM and PM peak hours
- US Highway 395 & Bear Valley Road (#9) Southbound Left – AM and PM peak hours
- US Highway 395 & Phelan Road/Main Street (#12) Northbound Left – PM peak hour only
- US Highway 395 & Phelan Road/Main Street (#12) Southbound Left – AM and PM peak hours
- US Highway 395 & Poplar Street (#13) Southbound Left – AM and PM peak hours
- US Highway 395 & Three Flags Road (#14) Northbound Left – AM and PM peak hours
- US Highway 395 & Joshua Street (#15) Southbound Left – AM and PM peak hours

With the addition of Project traffic, there are no additional intersection turning movements that are anticipated to experience queuing issues during the peak hours based on the 95th percentile peak hour traffic flows for Horizon Year (2040) With Project traffic conditions, in addition to the movements identified under Horizon Year (2040) Without Project traffic conditions.

Consistent with Existing (2019) traffic conditions, there are no off-ramp movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under Horizon Year (2040) Without Project and With Project traffic conditions.

Freeway Facilities

The following study area freeway segments and merge/diverge ramp junctions analyzed for this study are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours for Horizon Year (2040) Without Project traffic conditions:

- I-15 Freeway Southbound, North of Main Street (#1) – LOS E AM and PM peak hours
- I-15 Freeway Southbound, Off-Ramp at Main Street (#2) – LOS E AM and PM peak hours
- I-15 Freeway Southbound, South of Main Street (#5) – LOS E AM peak hour only
- I-15 Freeway Southbound, North of US Highway 395 (#6) – LOS F AM peak hour; LOS E PM peak hour
- I-15 Freeway Southbound, On-Ramp at US Highway 395 (#7) – LOS F AM peak hour only
- I-15 Freeway Southbound, South of US Highway 395 (#8) – LOS F AM peak hour; LOS E PM peak hour
- I-15 Freeway Northbound, North of Main Street (#9) – LOS F PM peak hour only
- I-15 Freeway Northbound, On-Ramp at Main Street (#10) – LOS F PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at Main Street (#12) – LOS F PM peak hour only
- I-15 Freeway Northbound, South of Main Street (#13) – LOS F PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at US Highway 395 (#15) – LOS F PM peak hour only
- I-15 Freeway Northbound, South of US Highway 395 (#16) – LOS F PM peak hour only

The following additional study area ramp junctions are anticipated to operate at an unacceptable LOS under Horizon Year (2040) With Project traffic conditions, resulting in a cumulative deficiency:

- I-15 Freeway Southbound, On-Ramp at Main Street (#4) – LOS E AM peak hour only
- I-15 Freeway Northbound, Loop On-Ramp at Main Street (#11) – LOS E PM peak hour only

1.7 RECOMMENDATIONS

The following recommendations are based on the improvements needed to accommodate site access. Exhibit 1-4 shows the site adjacent recommendations.

Recommendation 1.1 – Driveway 1 & Phelan Road (#4) – The following improvements are necessary to accommodate site access:

- Project to install a stop control on the southbound approach and a southbound shared left-right turn lane.
- Project to construct a westbound right turn lane.

Recommendation 2.1 – Driveway 2 & Yucca Terrace Drive (#5) – The following improvements are necessary to accommodate site access:

- Project to install a stop control on the northbound approach and a northbound shared left-right turn lane.
- Project to construct an eastbound shared through-right turn lane.
- Project to construct a westbound left turn lane within a two-way turn lane and a westbound through lane.

Recommendation 3.1 – Driveway 3 & Yucca Terrace Drive (#6) – The following improvements are necessary to accommodate site access:

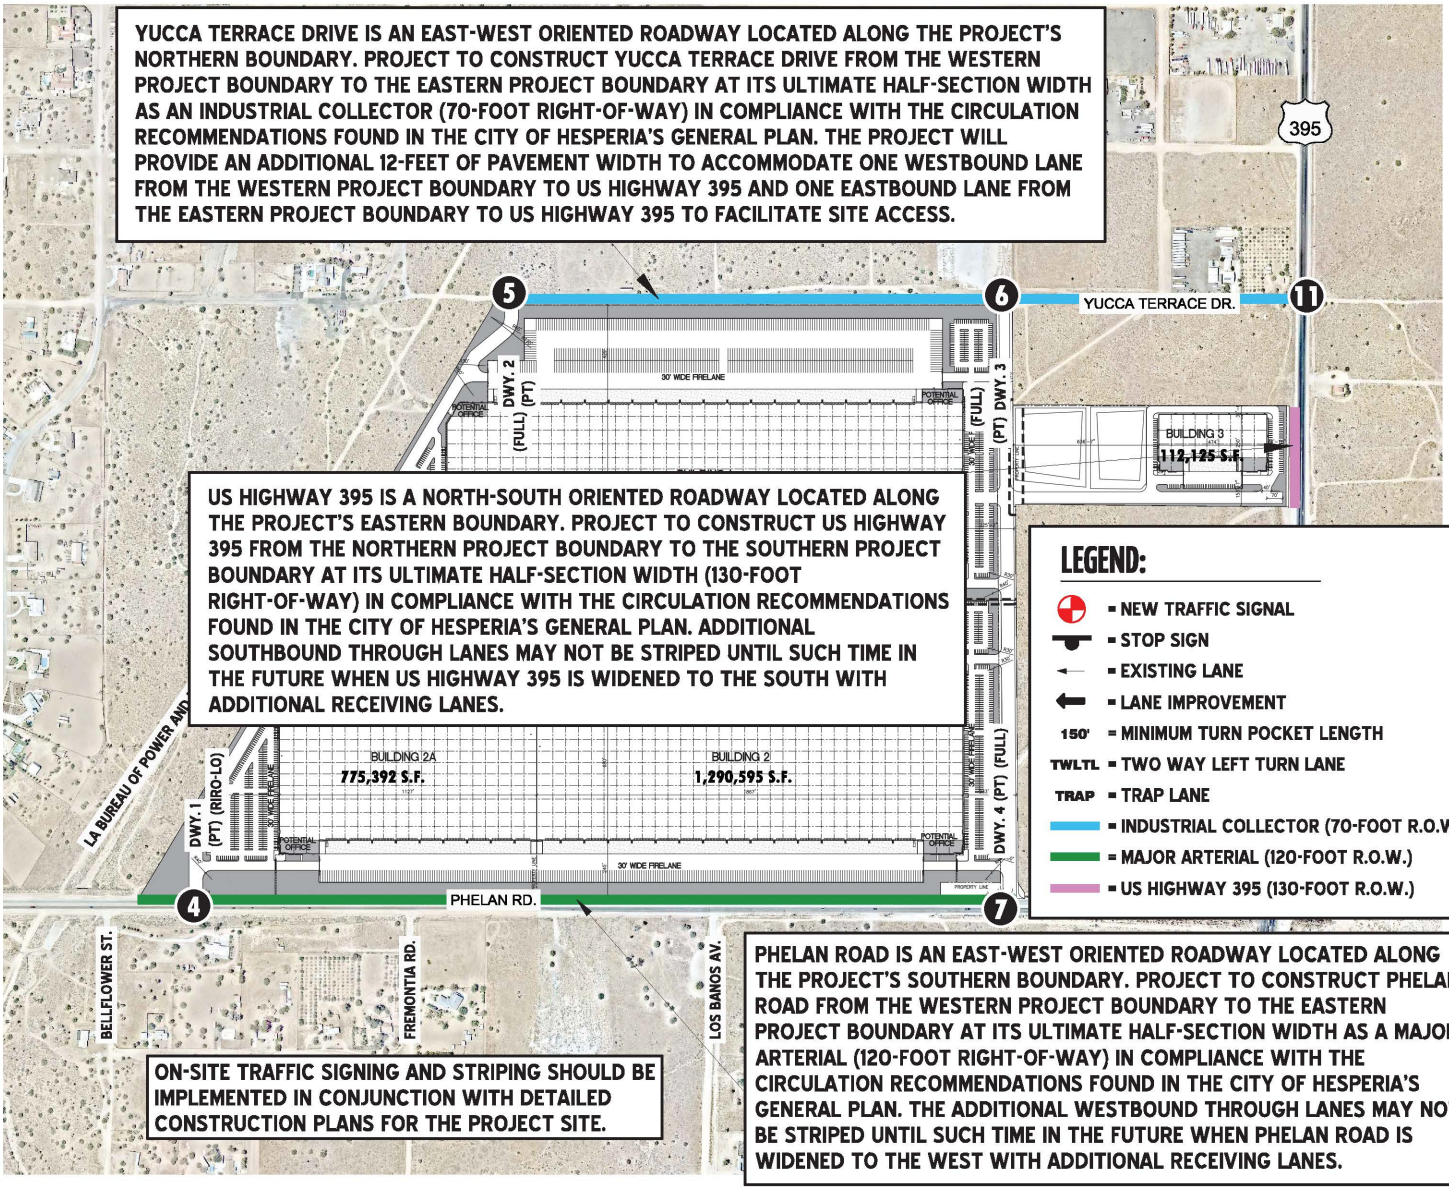
- Project to install a stop control on the northbound approach and a northbound shared left-right turn lane.
- Project to construct an eastbound shared through-right turn lane.
- Project to construct a westbound left turn lane within a two-way turn lane and a westbound through lane.

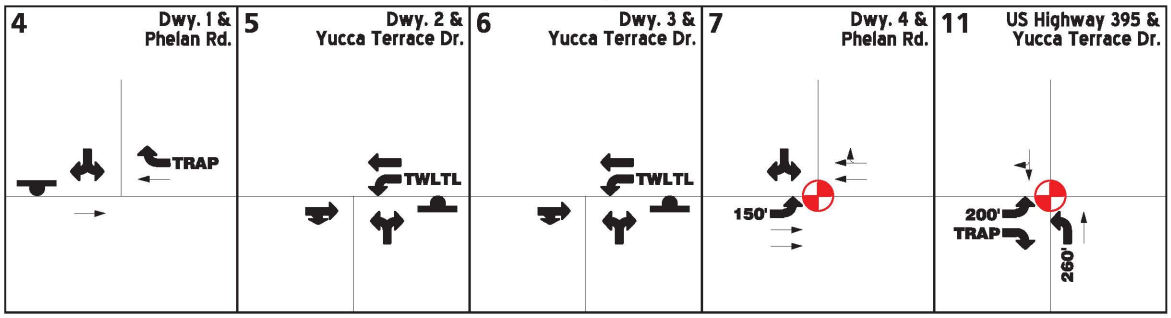
Recommendation 4.1 – Driveway 4 & Phelan Road (#7) – The following improvements are necessary to accommodate site access:

- Project to install a traffic signal.
- Project to construct a southbound shared left-right turn lane.
- Project to construct an eastbound left turn lane with a minimum of 150-feet of storage.

Driveway 4 is proposed to provide reciprocal access to the adjacent (not-a-part) use to the east.

EXHIBIT 1-4: SITE ADJACENT ROADWAY AND SITE ACCESS RECOMMENDATIONS





N

SIGHT DISTANCE AT EACH PROJECT ACCESS POINT SHOULD BE REVIEWED WITH RESPECT TO STANDARD CALTRANS AND CITY OF HESPERIA SIGHT DISTANCE STANDARDS AT THE TIME OF PREPARATION OF FINAL GRADING, LANDSCAPE AND STREET IMPROVEMENT PLANS.

DRIVEWAY 4 IS A PROPOSED SIGNALIZED DRIVEWAY THAT WILL PROVIDE RECIPROCAL ACCESS WITH THE ADJACENT USE. A SIGNAL MODIFICATION WILL BE NECESSARY AT THIS LOCATION.

12778 - recs.dwg

URBAN CROSSROADS

Recommendation 5.1 – US Highway 395 & Yucca Terrace Drive (#11) – The following improvements are necessary to accommodate site access:

- Project to install a traffic signal.
- Project to construct a northbound left turn lane with a minimum of 260-feet of storage.
- Project to construct an eastbound left turn lane with a minimum of 200-feet of storage and an eastbound right turn lane.

Recommendation 6.1 – US Highway 395 & Phelan Road/Main Street (#12) – The following improvements are necessary to accommodate site access:

- Project to construct a 2nd northbound left turn lane.
- Project to construct a 2nd southbound left turn lane.

Recommendation 7.1 – Phelan Road – Phelan Road is an east-west oriented roadway located along the Project's southern boundary. Project to construct Phelan Road from the western Project boundary to the eastern Project boundary at its ultimate half-section width as a Major Arterial (ultimate 120-foot right-of-way) in compliance with the circulation recommendations found in the City of Hesperia's General Plan. The additional westbound through lanes may not be striped until such time in the future when Phelan Road is widened to the west with additional receiving lanes.

Recommendation 8.1 – Yucca Terrace Drive – Yucca Terrace Drive is an east-west oriented roadway located along the Project's northern boundary. Project to construct Yucca Terrace Drive from the western Project boundary to the eastern Project boundary at its ultimate half-section width as an Industrial Collector (ultimate 70-foot right-of-way) in compliance with the circulation recommendations found in the City of Hesperia's General Plan. The project will provide an additional 12-feet of pavement width to accommodate one westbound lane from the western Project boundary to US Highway 395 and an additional 12-feet of pavement width to accommodate one eastbound lane from the eastern Project boundary to US Highway 395 to facilitate site access.

Recommendation 9.1 – US Highway 395 – US Highway 395 is a north-south oriented roadway located along the Project's eastern boundary. Project to construct US Highway 395 from the northern Project boundary of Building 3 to the southern Project boundary of Building 3 at its ultimate half-section width (ultimate 130-foot right-of-way) in compliance with Caltrans standards and the circulation recommendations found in the City of Hesperia's General Plan. The additional southbound through lanes may not be striped until such time in the future when US Highway 395 is widened to the south with additional receiving lanes.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the Project site.

Sight distance at each project access point should be reviewed with respect to standard City of Hesperia sight distance standards at the time of preparation of final grading, landscape and street improvement plans.

The recommended improvements needed to address the cumulative deficiencies identified under E+P, Opening Year Cumulative (2021), and Horizon Year (2040) traffic conditions are shown in Table 1-3. For those improvements listed in Table 1-3 and not constructed as part of the Project, the Applicant's responsibility for the Project's contributions towards deficient intersections is fulfilled through payment of fair share that would be assigned to construction of the identified recommended improvements. Preliminary cost estimates and fee assessments for these improvements are summarized in Table 1-3. The Project Applicant would be required to pay fair share fees consistent with the City's requirements (see Section 8 *Local and Regional Funding Mechanisms*).

Recommendation 10.1 – Prior to the issuance of building permits, the Project Applicant shall pay the Project's fair share amount of $321,301 for the improvements identified in Table 1-3 at intersections located within the City of Hesperia, or as agreed to by the City and Project Applicant.

Recommendation 11.1 – The Developer's fair-share amount for the intersections that either share a mutual border with or are wholly located within the jurisdiction of Caltrans that have recommended improvements which are not covered by a pre-existing fee program is $680,227. Developer shall be required to pay the amount shown above to the City of Hesperia prior to the issuance of building permits. The City of Hesperia shall hold Developer's Fair Share contribution in trust and shall apply Developer's Fair Share Contribution to any fee program adopted or agreed upon by the City of Hesperia and other agencies.

1.8 TRUCK ACCESS

Due to the typical wide turning radius of large trucks, a truck turning template has been overlaid on the site plan at each applicable Project driveway and site adjacent intersection anticipated to be utilized by heavy trucks in order to determine appropriate curb radii and to verify that trucks will have sufficient space to execute turning maneuvers (see Exhibit 1-5). A WB-67 truck (53-foot trailer) has been utilized for the purposes of this analysis. As shown on Exhibit 1-5, the Project driveways are anticipated to accommodate the wide turning radius of trucks as currently designed.

Table 1-3

										Total Costs for Horizon Year (2040) Improvements	**$7,017,280**		**$1,001,527**
										Total Project Fair Share Contribution to the City of Hesperia (non-DIF)[6]		**$321,301**	
										Total Project Fair Share Contribution to the City of Victorville[7]		**$0**	
										Total Project Fair Share Contribution to Caltrans[8]		**$680,227**	

[1] Improvements included in City of Hesperia Development Impact Fee (DIF) or the San Bernardino County Transportation Authority (SBCTA) Congestion Management Program (CMP) fee programs.
[2] Identifies the Project's responsibility to construct an improvement, contribute fair share, or contribute a fee payment towards the implementation of the improvements shown.
[3] Costs have been estimated using the data provided in Appendix "G" of the CMP (2016 Update) for preliminary construction costs.
[4] Program improvements constructed by project may be eligible for fee credit, at discretion of the City. See Table 8-1 for Fair Share Calculations.
[5] Rough order of magnitude cost estimate.
[6] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Hesperia.
[7] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Victorville.
[8] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within Caltrans' jurisdiction.
[9] Project will construct the improvement in order to facilitate site access.

2 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are generally consistent with the SBCTA CMP and Caltrans traffic study guidelines. (1) (2)

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (LOS). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The Transportation Research Board's Highway Capacity Manual (HCM) 6th Edition methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (5) The HCM uses different procedures depending on the type of intersection control.

2.2.1 SIGNALIZED INTERSECTIONS

The City of Hesperia, City of Victorville, County of San Bernardino, and Caltrans require signalized intersection operations analysis based on the methodology described in the HCM 6th Edition. Intersection LOS operations are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections, LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 2-1. Study area intersections have been evaluated using the Synchro (Version 10) analysis software package.

TABLE 2-1: SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A	F
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B	F

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C	F
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D	F
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E	F
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.	80.01 and up	F	F

Source: HCM, 6th Edition

Consistent with Appendix B of the SBCTA CMP, the following saturation flow rates, in vehicles per hour green per lane (vphgpl), will be utilized in the traffic analysis for signalized intersections:

Existing and Opening Year Cumulative (2021) Traffic Conditions:

- Exclusive through: 1800 vphgpl
- Exclusive left: 1700 vphgpl
- Exclusive right: 1800 vphgpl
- Exclusive dual left: 1600 vphgpl
- Exclusive triple left: 1500 vphgpl

Horizon Year (2040) Traffic Conditions:

- Exclusive through: 1900 vphgpl
- Exclusive left: 1800 vphgpl
- Exclusive right: 1900 vphgpl
- Exclusive dual left: 1700 vphgpl
- Exclusive triple left: 1600 vphgpl

Synchro is a macroscopic traffic software program that is based on the signalized intersection capacity analysis as specified in the HCM. Macroscopic level models represent traffic in terms of aggregate measures for each movement at the study intersections. Equations are used to determine measures of effectiveness such as delay and queue length. The level of service and capacity analysis performed by Synchro takes into consideration optimization and coordination of signalized intersections within a network.

The peak hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15-minute volumes. Common practice for LOS analysis is to use a peak 15-minute rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g. PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for all analysis scenarios. Per the HCM, PHF values over 0.95 often are indicative of high traffic volumes with capacity constraints on peak hour flows while lower PHF values are indicative of greater variability of flow during the peak hour. (5)

2.2.2 UNSIGNALIZED INTERSECTIONS

The City of Hesperia, City of Victorville, County of San Bernardino, and Caltrans require the operations of unsignalized intersections be evaluated using the methodology described the HCM 6th Edition. (5) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2).

TABLE 2-2: UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay Per Vehicle (Seconds)	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Little or no delays.	0 to 10.00	A	F
Short traffic delays.	10.01 to 15.00	B	F
Average traffic delays.	15.01 to 25.00	C	F
Long traffic delays.	25.01 to 35.00	D	F
Very long traffic delays.	35.01 to 50.00	E	F
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F	F

Source: HCM, 6th Edition

At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. For all-way stop controlled intersections, LOS is computed for the intersection as a whole.

2.3 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TIA uses the signal warrant criteria presented in the latest edition of the Caltrans California Manual on Uniform Traffic Control Devices (CA MUTCD) for all unsignalized study area intersections. (6)

The signal warrant criteria for Existing study area intersections are based upon several factors, including volume of vehicular and pedestrian traffic, frequency of accidents, and location of school areas. The CA MUTCD indicate that the installation of a traffic signal should be considered if one or more of the signal warrants are met. (6) Specifically, this TIA utilizes the Peak Hour

Volume-based Warrant 3 as the appropriate representative traffic signal warrant analysis for existing traffic conditions. Warrant 3 is appropriate to use for this TIA because it provides specialized warrant criteria for intersections with rural characteristics (e.g. located in communities with populations of less than 10,000 persons or with adjacent major streets operating above 40 miles per hour). For the purposes of this study, the speed limit was the basis for determining whether Urban or Rural warrants were used for a given intersection.

Future unsignalized intersections, that currently do not exist, have been assessed regarding the potential need for new traffic signals based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets.

As shown in Table 2-3, traffic signal warrant analyses were performed for the following unsignalized study area intersections during the peak weekday conditions wherein the Project is anticipated to contribute the highest trips:

TABLE 2-3: TRAFFIC SIGNAL WARRANT ANALYSIS LOCATIONS

ID	Intersection Location	Jurisdiction
2	Verbena Rd. & Phelan Rd.	County of San Bernardino
3	Bellflower St. & Phelan Rd.	County of San Bernardino
5	Driveway 2 & Yucca Terrace Dr. – Future Intersection	City of Hesperia
6	Driveway 3 & Yucca Terrace Dr. – Future Intersection	City of Hesperia
7	Driveway 4 & Phelan Rd. – Future Intersection	City of Hesperia
11	US Highway 395 & Yucca Terrace Dr.	City of Hesperia, Caltrans
13	US Highway 395 & Poplar St.	City of Hesperia, Caltrans
24	Escondido Av. & Sultana St.	City of Hesperia

The Existing conditions traffic signal warrant analysis is presented in the subsequent section, Section 3 *Area Conditions* of this report. The traffic signal warrant analyses for future conditions are presented in Section 5 *E+P Traffic Analysis,* Section 6 *Opening Year Cumulative (2021) Traffic Analysis,* and Section 7 *Horizon Year (2040) Traffic Analysis* of this report.

It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

2.4 FREEWAY OFF-RAMP QUEUING ANALYSIS

Consistent with Caltrans requirements, the 95th percentile queuing of vehicles has been assessed at the off-ramps to determine potential queuing deficiencies at the freeway ramp intersections at the I-15 Freeway and Main Street interchange. Specifically, the queuing analysis is utilized to identify any potential queuing and "spill back" onto the I-15 Freeway mainline from the off-ramps.

The traffic progression analysis tool and HCM intersection analysis program, Synchro, has been used to assess the potential deficiencies/needs of the intersections with traffic added from the proposed Project. Storage (turn-pocket) length recommendations at the ramps have been based upon the 95th percentile queue resulting from the Synchro progression analysis. The footnote from the Synchro output sheets indicates if the 95th percentile cycle exceeds capacity. Traffic is simulated for two complete cycles of the 95th percentile traffic in Synchro in order to account for the effects of spillover between cycles. A vehicle is considered queued whenever it is traveling at less than 10 feet/second. A vehicle will only become queued when it is either at the stop bar or behind another queued vehicle. In practice, the 95th percentile queue shown will rarely be exceeded and the queues shown with the footnote are acceptable for the design of storage bays. The 95th percentile queue is derived from the average queue plus 1.65 standard deviations. The 95th percentile queue is not necessarily ever observed it is simply based on statistical calculations.

2.5 FREEWAY MAINLINE SEGMENT ANALYSIS METHODOLOGY

Consistent with recent Caltrans guidance, the traffic study has evaluated all freeway segments where the Project is anticipated to contribute 50 or more peak hour one-way trips, in an effort to conduct a conservative analysis and overstate as opposed to understand potential deficiencies.

The freeway system in the study area has been broken into segments defined by the freeway-to-arterial interchange locations. The freeway segments have been evaluated in this TIA based upon peak hour directional volumes. The freeway segment analysis is based on the methodology described in the HCM and performed using Highway Capacity Software (HCS) 7. The performance measure preferred by Caltrans to calculate LOS is density. Density is expressed in terms of passenger cars per mile per lane. Table 2-4 illustrates the freeway segment LOS descriptions for each density range utilized for this analysis.

TABLE 2-4: DESCRIPTION OF FREEWAY MAINLINE LOS

Level of Service	Description	Density Range (pc/mi/ln)[1]
A	Free-flow operations in which vehicles are relatively unimpeded in their ability to maneuver within the traffic stream. Effects of incidents are easily absorbed.	0.0 – 11.0
B	Relative free-flow operations in which vehicle maneuvers within the traffic stream are slightly restricted. Effects of minor incidents are easily absorbed.	11.1 – 18.0
C	Travel is still at relative free-flow speeds, but freedom to maneuver within the traffic stream is noticeably restricted. Minor incidents may be absorbed, but local deterioration in service will be substantial. Queues begin to form behind significant blockages.	18.1 – 26.0
D	Speeds begin to decline slightly, and flows and densities begin to increase more quickly. Freedom to maneuver is noticeably limited. Minor incidents can be expected to create queuing as the traffic stream has little space to absorb disruptions.	26.1 – 35.0
E	Operation at capacity. Vehicles are closely spaced with little room to maneuver. Any disruption in the traffic stream can establish a disruption wave that propagates throughout the upstream traffic flow. Any incident can be expected to produce a serious disruption in traffic flow and extensive queuing.	35.1 – 45.0
F	Breakdown in vehicle flow.	>45.0

[1] pc/mi/ln = passenger cars per mile per lane. Source: HCM, 6th Edition

The number of lanes for existing baseline conditions has been obtained from field observations conducted by Urban Crossroads in October 2019. These existing freeway geometrics have been utilized for Existing, E+P, Opening Year Cumulative (2021), and Horizon Year (2040) conditions.

The I-15 Freeway mainline volume data was obtained from the Caltrans Performance Measurement System (PeMS) website for the segments of the I-15 Freeway interchanges at Main Street. The data was obtained from September 2019. In an effort to conduct a conservative analysis, the maximum value observed within the 3-day period was utilized for the weekday morning (AM) and weekday evening (PM) peak hours. In addition, truck traffic, represented as a percentage of total traffic and actual vehicles (as opposed to PCE volumes) have been utilized for the purposes of the basic freeway segment analysis. (7)

2.6 FREEWAY MERGE/DIVERGE RAMP JUNCTION ANALYSIS

The freeway system in the study area has been broken into segments defined by freeway-to-arterial interchange locations resulting in 4 existing on and off ramp locations where the Project is anticipated to contribute 50 or more peak hour trips (see Table 1-2). Although the HCM indicates the influence area for a merge/diverge junction is 1,500 feet, the analysis presented in this traffic study has been performed at all ramp locations with respect to the nearest on or off ramp at each interchange in an effort to be consistent with Caltrans guidance/comments on other projects Urban Crossroads has worked on in the region.

The merge/diverge analysis is based on the HCM Ramps and Ramp Junctions analysis method and performed using HCS7 software. The measure of effectiveness (reported in passenger car/mile/lane) are calculated based on the existing number of travel lanes, number of lanes at the on and off ramps both at the analysis junction and at upstream and downstream locations (if applicable) and acceleration/deceleration lengths at each merge/diverge point. Table 2-5 presents the merge/diverge area level of service descriptions for each density range utilized for this analysis.

TABLE 2-5: DESCRIPTION OF FREEWAY MERGE AND DIVERGE LOS

Level of Service	Density Range (pc/mi/ln)[1]
A	≤10.0
B	10.0 – 20.0
C	20.0 – 28.0
D	28.0 – 35.0
E	>35.0
F	Demand Exceeds Capacity

[1] pc/mi/ln = passenger cars per mile per lane. Source: HCM, 6th Edition

Similar to the basic freeway segment analysis, the I-15 Freeway mainline volume data were obtained from the Caltrans maintained PeMS website for the segments of the I-15 Freeway interchanges at Joshua Street and Ranchero Road. The ramp data (per the count data presented in Appendix 3.1) were then utilized to flow conserve the mainline volumes to determine the remaining I-15 Freeway mainline segment volumes. Flow conservation checks ensure that traffic flows from north to south (and vice versa) of the interchange area with no unexplained loss of vehicles. The data was obtained from September 2019. In an effort to conduct a conservative analysis, the maximum value observed within the 3-day period was utilized for the weekday morning (AM) and weekday evening (PM) peak hours. In addition, truck traffic, represented as a percentage of total traffic and actual vehicles (as opposed to PCE volumes) have been utilized for the purposes of the freeway ramp junction (merge/diverge) analysis. (7)

2.7 Minimum Acceptable Levels of Service (LOS)

2.7.1 City of Hesperia

For the purposes of this traffic analysis, and consistent with the City of Hesperia General Plan Circulation Element, LOS D is considered acceptable for circulation element intersections.

2.7.2 City of Victorville

For the purposes of this traffic analysis, and consistent with the City of Victorville General Plan Circulation Element, LOS D is considered acceptable for circulation element intersections.

2.7.3 County of San Bernardino

The definition of an intersection deficiency in the County of San Bernardino is based on the County's General Plan Circulation Element. The County of San Bernardino's General Plan states

that target LOS C be maintained at County intersections and roadway segments wherever possible within the Desert region.

2.7.4 SAN BERNARDINO COUNTY CMP

The CMP definition of deficiency is based on maintaining a level of service standard of LOS E or better, where feasible, except where an existing LOS F condition is identified in the CMP document. However, for the purposes of this analysis, LOS D (or LOS C in County of San Bernardino) has been utilized for all study area intersections.

2.7.5 CALTRANS

Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on the SHS facilities; however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing State highway facility is operating at less than this target LOS, the existing LOS should be maintained. Caltrans acknowledges that the region-wide goal for an acceptable LOS on all freeways, roadway segments, and intersections is LOS D. Consistent with the Caltrans LOS threshold of LOS D and in excess of the CMP stated LOS threshold of LOS E, LOS D will be used as the target LOS for freeway ramps, freeway segments, and freeway merge/diverge ramp junctions.

2.8 INTERSECTION DEFICIENCY CRITERIA

City of Hesperia, City of Victorville

To determine whether the addition of project traffic (as defined through the comparison of Existing traffic conditions to E+P traffic conditions) at a study intersection, which would result in a direct project-specific traffic deficiency, the following will be utilized:

- When the pre-Project condition is at or better than LOS D (i.e., acceptable LOS), and project-generated traffic, as measured by 50 or more peak hour trips, causes deterioration below LOS D (i.e., unacceptable LOS), a deficiency is deemed to occur.

However, when the pre-Project condition is already below LOS D (i.e., unacceptable LOS), the Project will be responsible for improving its contribution to a deficiency to a level of service equal to or better than it was without the Project for intersections that receive 50 or more peak hour project-related trips.

Cumulative traffic deficiencies are created as a result of a combination of the proposed Project together with other future developments contributing to the overall traffic deficiencies requiring additional improvements to maintain acceptable level of service operations with or without the Project. A Project's contribution to a cumulative deficiency can be reduced if the Project is required to implement or fund its fair share of improvements designed to alleviate its contribution to the deficiency. A cumulative deficiency is identified when the Project contributes 50 or more peak hour trips, and all facilities that would receive 50 or more peak hour trips from the Project are evaluated in this report.

County of San Bernardino

Consistent with the County of San Bernardino traffic study guidelines and the acceptable LOS for the Desert, Valley, and Mountain regions as described in the General Plan, the County will consider the following signalized intersection criteria when identifying operational deficiencies in a traffic study to demonstrate consistency with the General Plan: (8)

- Any signalized study intersection in the Valley or Mountain regions that is operating at an acceptable LOS D or better without project traffic in which the addition of project traffic causes the intersection to degrade to an LOS E or F shall identify improvements to improve operations to LOS D or better.
- Any signalized study intersection in the Desert region that is operating at an LOS C or better without project traffic in which the addition of project traffic causes the intersection to degrade to an LOS D, E, or F shall identify improvements to improve operations to LOS C.
- Any signalized study intersection in the Valley or Mountain regions that is operating at LOS E or F without project traffic where the project increases delay by 5.0 or more seconds shall identify improvements to offset the increase in delay.
- Any signalized study intersection in the Desert region that is operating at LOS D, E, or F without project traffic where the project increases delay by 5.0 or more seconds shall identify improvements to offset the increase in delay.

Consistent with the County of San Bernardino traffic study guidelines and the acceptable LOS for the Desert, Valley, and Mountain regions as described in the General Plan, the County will consider the following unsignalized intersection criteria when identifying operational deficiencies in a traffic study to demonstrate consistency with the General Plan:

- The addition of project related traffic causes the intersection to move from a LOS D or better to a LOS E or worse in the Valley and Mountain regions or from an LOS C or better to an LOS D or worse in the Desert region.

  OR

- The project contributes additional traffic to an intersection that is already projected to operate at an LOS E or F in the Valley and Mountain regions or at an LOS D, E, or F in the Desert region (per Section 10.5.2 b))

  AND

- One or both of the following conditions are met:
  - The project adds ten (10) or more trips to any approach
  - The intersection meets the peak hour traffic signal warrant after the addition of project traffic (per Section 10.5.2 c)).

If the conditions above are satisfied, improvements should be identified that achieve the following:

- In the Valley and Mountain regions, improvements should be identified that would achieve LOS D or better for case a) above or to pre-project LOS and delay for case b) above.
- In the Desert region, improvements should be identified that would achieve LOS C or better for case a) above or to pre-project LOS and delay for case b) above.

Improvements for project level deficiencies should focus on providing operations that offset the project deficiency (e.g. achieve a "no project" LOS). Improvements could consist of signal timing improvements, lane restriping, or new lanes to study facilities. Cumulative deficiencies should include a fair-share contribution toward achieving acceptable levels of service as noted below. Alternatively, if a cumulative location is included in an existing traffic impact fee program, payment of those fees would constitute an appropriate contribution. A key element of SB 743 is the elimination of automobile delay and level of service as the sole basis of determining CEQA impacts. The most recent CEQA guidelines, released in December 2018, recommend VMT as the most appropriate measure of project transportation impacts. However, SB 743 does not prevent a city or county from continuing to analyze delay or LOS as part of other plans (i.e., the general plan), studies, or ongoing network monitoring. VMT thresholds, methodology, analysis, and findings are discussed under separate cover.

2.9 PROJECT FAIR SHARE CALCULATION METHODOLOGY

Improvements found to be included in the City's DIF will be identified as such. For improvements that do not appear to be in any pre-existing fee programs, a fair share financial contribution based on the Project's proportional share may be imposed in order to improve the Project's share of deficiencies in lieu of construction. It should be noted that fair share calculations are for informational purposes only and the City Engineer will determine the appropriate improvements to be implemented by a project (to be identified in the conditions of approval).

The Project's fair share cost of improvements have been determined based on the following equation, which is the ratio of Project traffic to new traffic, where new traffic is total future traffic less existing baseline traffic:

Project Fair Share % = Project Traffic / (2040 With Project Total Traffic – Existing 2019 Traffic)

3 AREA CONDITIONS

This section provides a summary of the existing circulation network, the City of Hesperia General Plan Circulation Network, and a review of existing peak hour intersection operations, traffic signal warrant, queuing, and freeway facility operations analyses.

3.1 EXISTING CIRCULATION NETWORK

Pursuant to the scoping agreement with City of Hesperia staff (Appendix 1.1), the study area includes a total of 25 existing and future intersections as shown previously on Exhibit 1-2 where the Project is anticipated to contribute 50 or more peak hour trips. Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

3.2 CITY OF HESPERIA GENERAL PLAN CIRCULATION ELEMENT

As previously noted, the Project site is located within the City of Hesperia. Exhibit 3-2 shows the City of Hesperia General Plan Circulation Element, and Exhibit 3-3 illustrates the City of Hesperia General Plan roadway cross-sections. The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the City of Hesperia in the vicinity of the proposed Project as identified on the City's General Plan Circulation Element are described subsequently.

Major Arterials can accommodate six travel lanes and may have raised medians. These roadways experience the most traffic within the city. Examples of a Major Arterial within the study area include:

- Phelan Road
- Main Street, west of I-15 Freeway

Major Arterials with Bike Lanes can accommodate six travel lanes with bike lanes on each side and may have raised medians. These roadways experience the most traffic within the city. An example of a Major Arterial with Bike Lanes within the study area includes:

- Escondido Avenue, north of Main Street

Arterials can accommodate four travel lanes. Arterials may have two-way left-turn lanes. Examples of Arterials within the study area include:

- Mesa Linda Street
- Escondido Avenue, south of Main Street

Secondary Arterials can accommodate two travel lanes and provide connection between collectors and arterials. Secondary Arterials may have two-way left-turn lanes. Examples of Secondary Arterials within the study area include:

- Poplar Street, west of Lassen Road
- Joshua Street

EXHIBIT 3-1 (1OF2): EXISTING NUMBER OF THROUGH LANES AND INTERSECTION CONTROLS

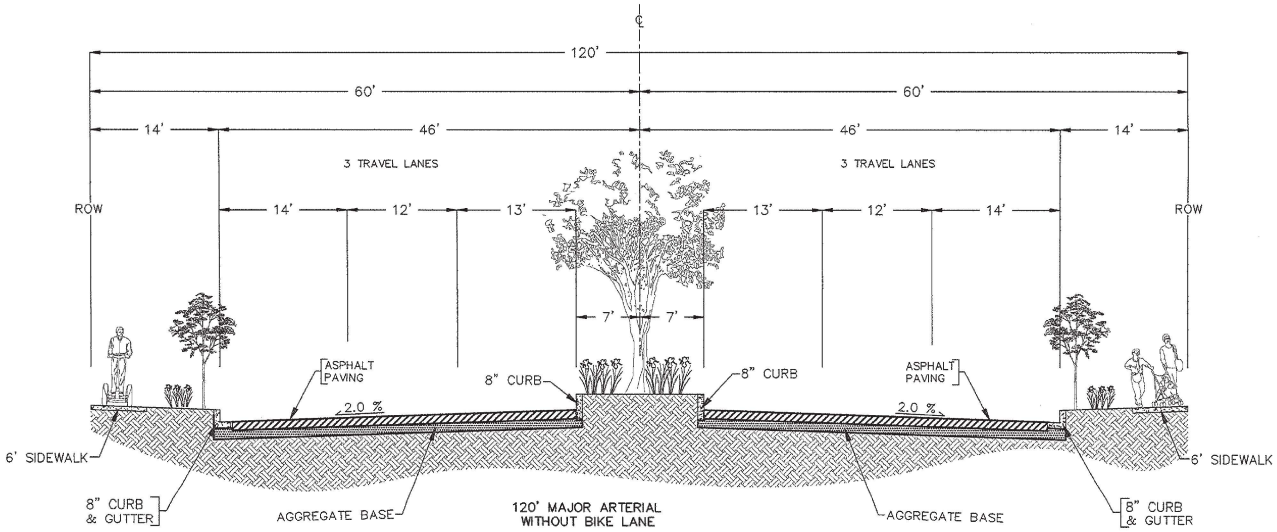

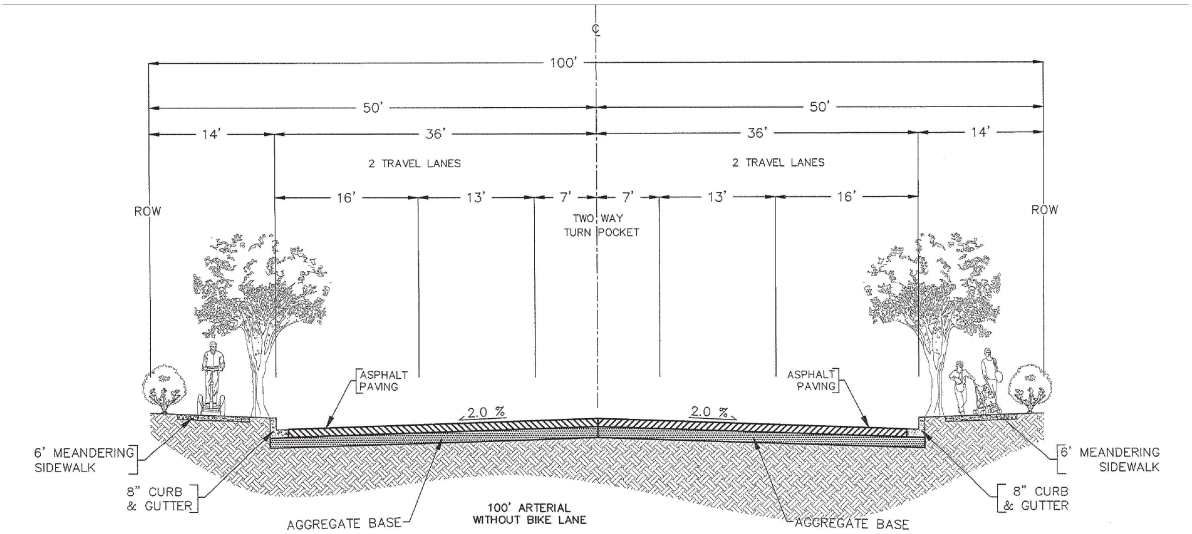

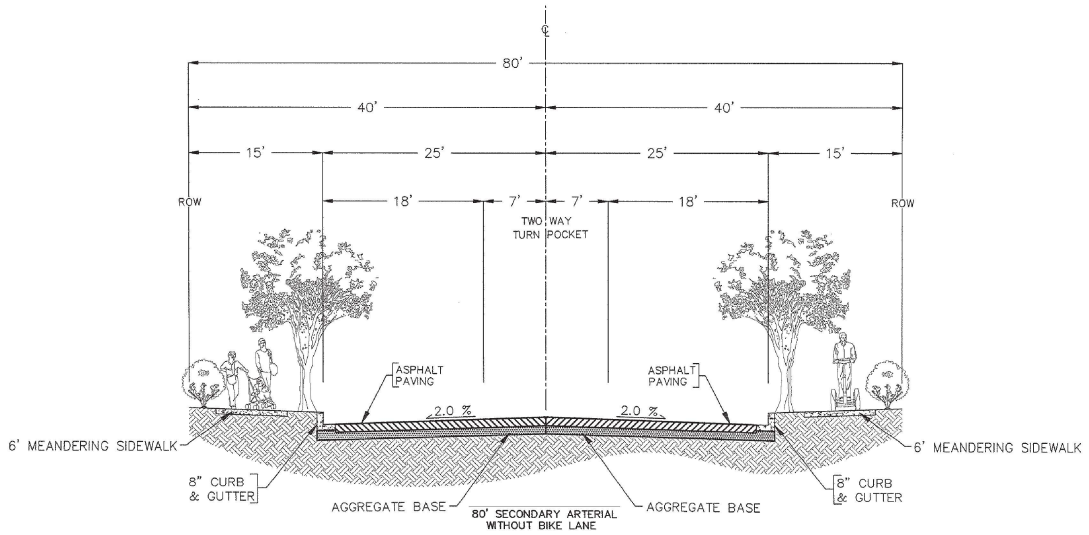

EXHIBIT 3-3 (2OF3): CITY OF HESPERIA GENERAL PLAN ROADWAY CROSS-SECTIONS

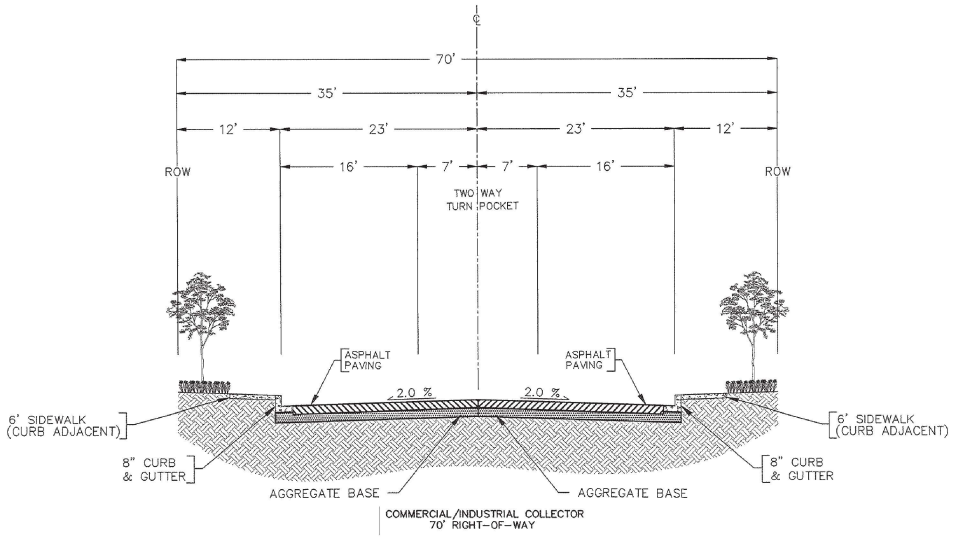

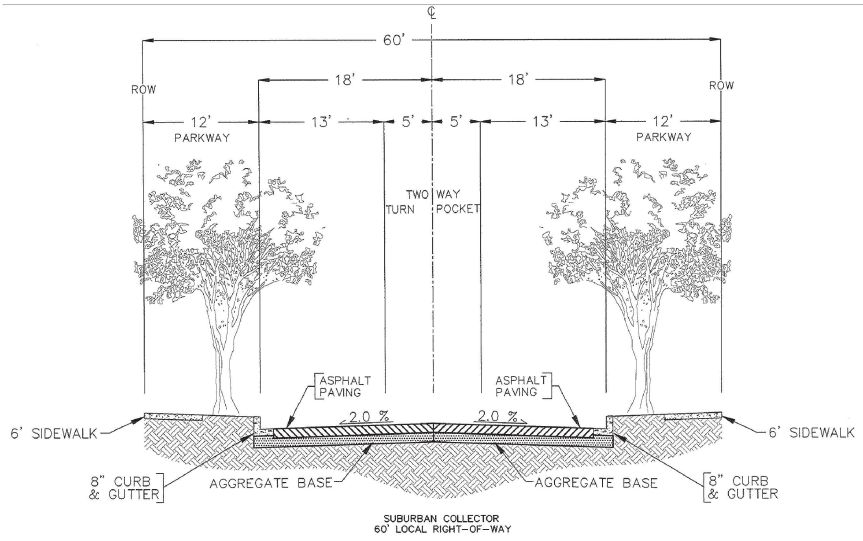

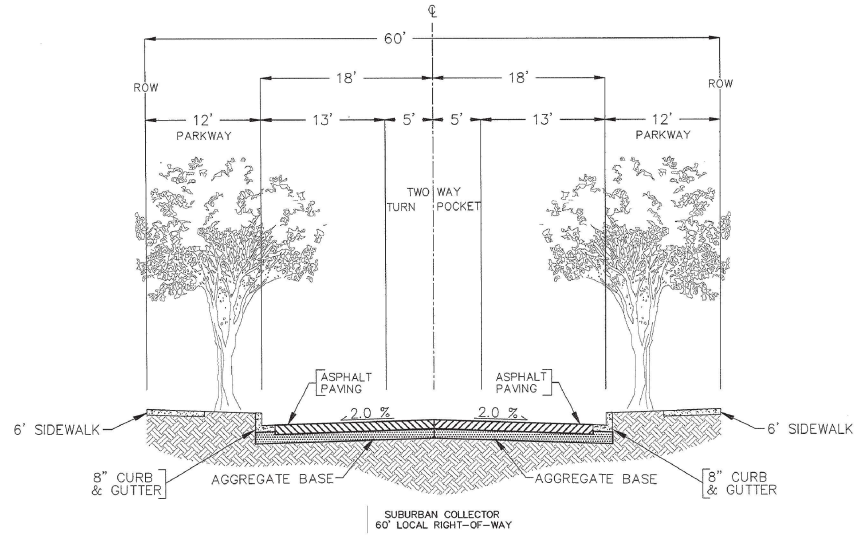

EXHIBIT 3-3 (3OF3): CITY OF HESPERIA GENERAL PLAN ROADWAY CROSS-SECTIONS

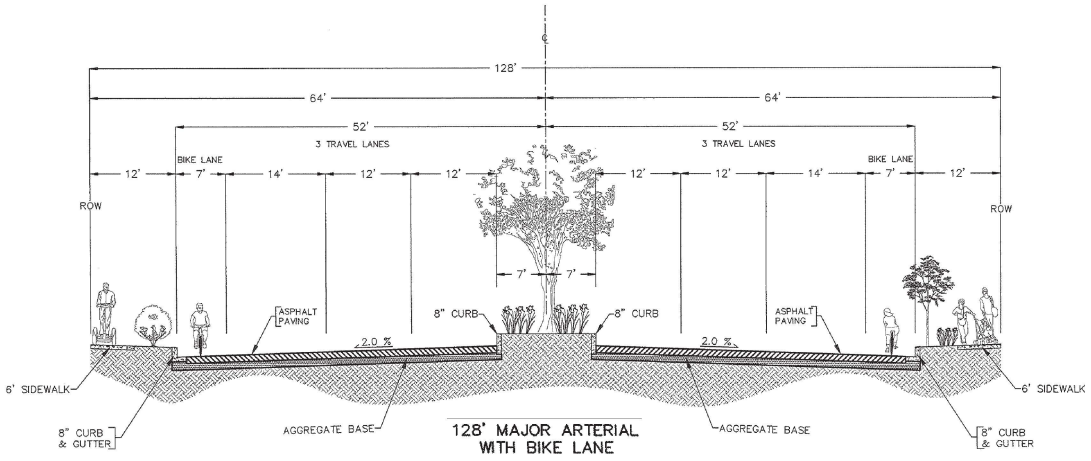

Main Street Corridor 'A' is the segment of Main Street from the I-15 Freeway to Ninth Avenue. This segment of Main Street can accommodate six travel lanes and includes a landscape median. This segment does not include bike lanes.

3.3 COUNTY OF SAN BERNARDINO AND CITY OF VICTORVILLE GENERAL PLAN CIRCULATION ELEMENT

Exhibits 3-4 and 3-5 show the County of San Bernardino's General Plan Circulation Element and roadway cross-sections, respectively. Exhibits 3-6 and 3-7 show the City of Victorville's General Plan Circulation Element and roadway cross-sections, respectively.

3.4 BICYCLE & PEDESTRIAN FACILITIES

In an effort to promote alternative modes of transportation, the City of Hesperia General Plan also includes a bike plan. The City of Hesperia bike plan is shown on Exhibit 3-8. Within the study area, there are existing Class II bike paths along Escondido Avenue. Within the study area, there are proposed Class I bike paths along Main Street, east of I-15 Freeway, proposed Class II bike facilities along Topaz Avenue and Mariposa Avenue, and a proposed Class III bike facility along Joshua Street.

Field observations conducted in October 2019 indicates nominal pedestrian and bicycle activity within the study area. Exhibit 3-9 illustrates the existing pedestrian facilities, including sidewalks and crosswalks. As shown on Exhibit 3-9, there are existing sidewalks along portions of Luna Road, Main Street, and Escondido Avenue within the study area.

3.5 TRANSIT SERVICE

The study area is currently served by the Victor Valley Transit Authority (VVTA), a public transit agency serving the Victor Valley area within San Bernardino County, with bus service along Mariposa Road, Main Street, Phelan Road, Bear Valley Road, and Escondido Avenue. Existing bus routes provided within the area by VVTA are shown on Exhibit 3-10. VVTA Route 21W could potentially serve the Project in the future. Transit service is reviewed and updated by VVTA periodically to address ridership, budget and community demand needs. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate. As such, it is recommended that the Project Applicant work in conjunction with VVTA to potentially provide bus service to the site.

3.6 TRUCK ROUTES

The City of Hesperia's General Plan does not provide designated truck routes. The City of Victorville truck routes are shown on Exhibit 3-11. Truck routes for the proposed Project have been determined based on discussions with City staff. These truck routes serve both the proposed Project and future cumulative development projects throughout the study area.

3.7 EXISTING TRAFFIC COUNTS

The intersection LOS analysis is based on the traffic volumes observed during the peak hour conditions using traffic count data collected in September 2019 and January 2020, while schools were in session. Consistent with standard engineering practice, these traffic counts were conducted either on Tuesday, Wednesday, or Thursday due to potential fluctuations in traffic that typically occur on Mondays, Fridays, Holidays, or weekends. The following peak hours were selected for analysis:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 9:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 6:00 PM)

The weekday AM and weekday PM peak hour count data are representative of typical weekday peak hour traffic conditions in the study area, which are based on the traffic conditions in September 2019 and January 2020. There were no observations made in the field that would indicate atypical traffic conditions on the count dates, such as construction activity or detour routes and near-by schools were in session and operating on normal schedules.

The raw manual peak hour turning movement traffic count data sheets are included in Appendix 3.1. These raw turning volumes have been flow conserved between intersections with limited access, no access, and where there are currently no uses generating traffic. The traffic counts collected in September 2019 and January 2020 include the vehicle classifications as shown below:

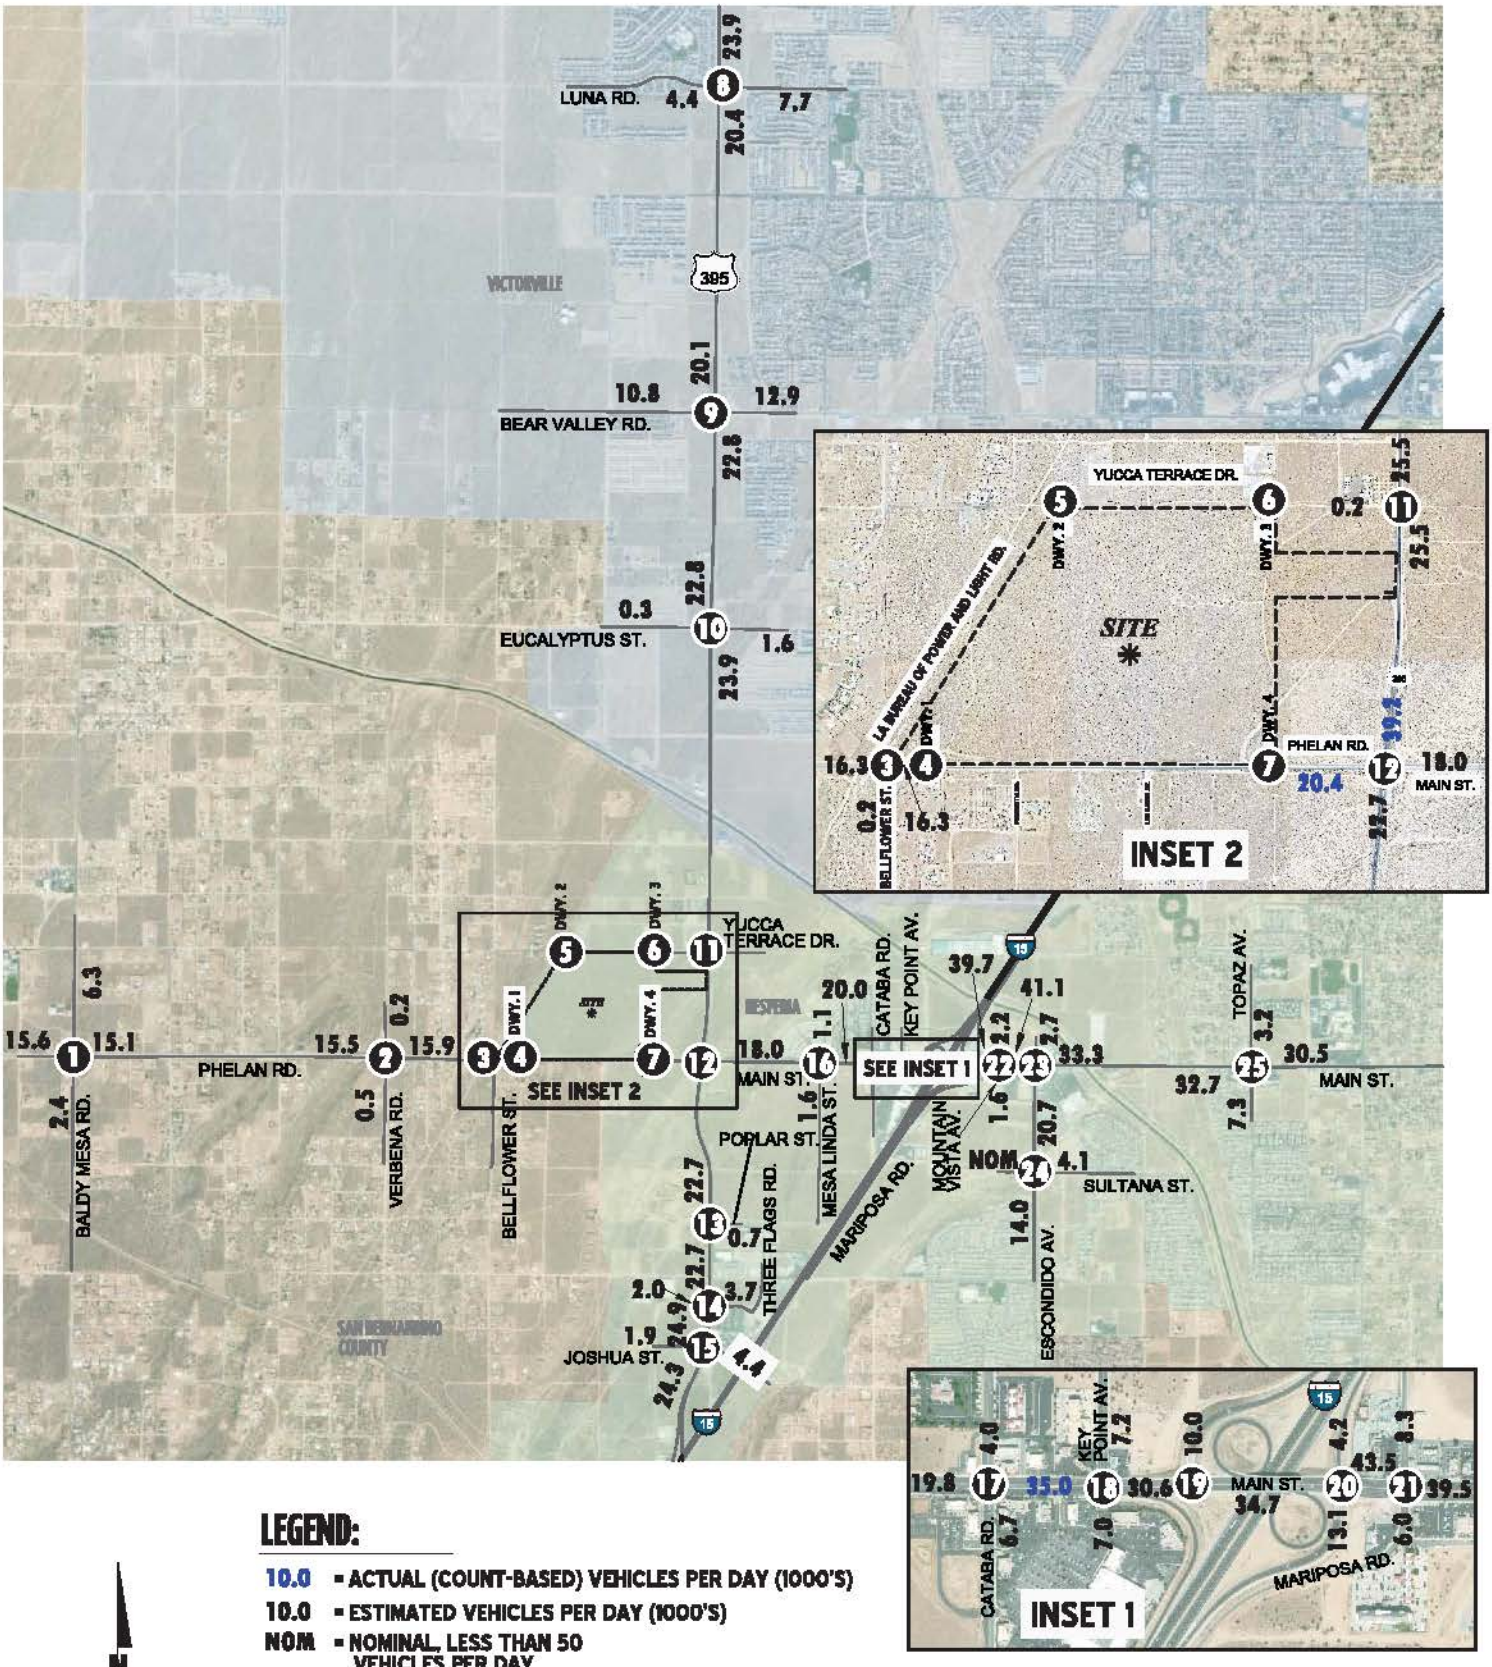
- Passenger Cars
- 2-Axle Trucks
- 3-Axle Trucks
- 4 or More Axle Trucks

To represent the effect of large trucks, buses, and recreational vehicles have on traffic flow, all trucks were converted into PCEs. By their size alone, these vehicles occupy the same space as two or more passenger cars. In addition, the time it takes for them to accelerate and slow-down is also much longer than for passenger cars and varies depending on the type of vehicle and number of axles. For this analysis, a PCE factor of 1.5 has been applied to 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for 4+-axle trucks to estimate each turning movement. These factors are consistent with the values recommended for use in the SBCTA CMP. (9)

Existing weekday ADT volumes on arterial highways throughout the study area are shown on Exhibit 3-12. Where actual 24-hour tube count data was not available, Existing ADT volumes were based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

Weekday PM Peak Hour (Approach Volume + Exit Volume) x 10.66 = Leg Volume

EXHIBIT 3-12: EXISTING (2019) AVERAGE DAILY TRAFFIC (ADT) (IN PCE)



LEGEND:

- **10.0** = ACTUAL (COUNT-BASED) VEHICLES PER DAY (1000'S)
- **10.0** = ESTIMATED VEHICLES PER DAY (1000'S)
- **NOM** = NOMINAL, LESS THAN 50 VEHICLES PER DAY

12778 - adt-a.dwg

A comparison of the PM peak hour and daily traffic volumes of various roadway segments within the study area indicated that the peak-to-daily relationship is approximately 9.38 percent. As such, the above equation utilizing a factor of 10.66 estimates the ADT volumes on the study area roadway segments assuming a peak-to-daily relationship of approximately 9.38 percent (i.e., 1/0.0938 = 10.66) and was assumed to sufficiently estimate average daily traffic (ADT) volumes for planning-level analyses. Existing weekday AM and weekday PM peak hour intersection volumes (in PCE) are shown on Exhibit 3-13.

3.8 INTERSECTION OPERATIONS ANALYSIS

Existing peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results are summarized in Table 3-1, which indicates that the following study area intersections are currently operating at an unacceptable LOS during the peak hours (i.e., LOS E or worse):

- US Highway 395 & Yucca Terrace Drive (#11) – LOS F PM peak hour only
- US Highway 395 & Poplar Street (#13) – LOS F AM and PM peak hours

Consistent with Table 3-1, a summary of the peak hour intersection LOS for Existing conditions is shown on Exhibit 3-14. The intersection operations analysis worksheets are included in Appendix 3.2 of this TIA.

3.9 TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for Existing (2019) traffic conditions are based on existing peak hour intersection turning volumes. The following study area intersection currently warrants a traffic signal under Existing (2019) traffic conditions:

- Escondido Avenue & Sultana Street (#24)

Existing (2019) traffic conditions traffic signal warrant analysis worksheets are provided in Appendix 3.3.

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free-Right Turn Lane; d= Defacto Right Turn Lane

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown. HCM delay reported in seconds.

[3] CSS = Cross-street Stop; TS = Traffic Signal

3.10 QUEUING ANALYSIS

3.10.1 ARTERIAL ANALYSIS

A queuing analysis was performed for US Highway 395 from Luna Road to Joshua Street to assess vehicle queues along the roadways. Queuing analysis findings are presented in Table 3-2. It is important to note that the available stacking distances are consistent with the measured turn pocket lengths. As shown in Table 3-2, there are no intersection turning movements that currently experience periodic queuing issues during the peak hours based on the 95th percentile peak hour traffic flows. Worksheets for Existing (2019) traffic conditions queuing analysis are provided in Appendix 3.4.

3.10.2 FREEWAY OFF-RAMP ANALYSIS

A queuing analysis was performed for the off-ramps at the I-15 Freeway and Main Street interchange to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the I-15 Freeway mainline. Queuing analysis findings are presented in Table 3-2. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown in Table 3-2, there are no off-ramp movements that are currently experiencing queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows. Worksheets for Existing (2019) traffic conditions queuing analysis are provided in Appendix 3.4.

3.11 FREEWAY FACILITY ANALYSIS

Existing (2019) mainline directional volumes for the AM and PM peak hours are provided on Exhibit 3-15. As shown in Table 3-3, the following study area freeway segments and merge/diverge ramp junctions analyzed for this study are currently operating at an unacceptable LOS (i.e., LOS E or worse) during the peak hours for Existing (2019) traffic conditions:

- I-15 Freeway Northbound, North of Main Street (#9) – LOS E PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at Main Street (#12) – LOS E PM peak hour only
- I-15 Freeway Northbound, South of Main Street (#13) – LOS E PM peak hour only

Existing (2019) freeway facility analysis worksheets are provided in Appendix 3.5.

Table 3-2

Peak Hour Queuing Summary for Existing (2019) Conditions

Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet)		Acceptable? [1]	
			AM Peak Hour	PM Peak Hour	AM	PM

		South of US Highway 395	4	14.4	23.6	B	C

[1] NB = Northbound; SB = Southbound

[2] Number of lanes are in the specified direction and is based on existing conditions.

[3] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[4] LOS = Level of Service

EXHIBIT 3-15: EXISTING (2019) FREEWAY MAINLINE VOLUMES

3.12 DEFICIENCIES AND RECOMMENDED IMPROVEMENTS

This section provides a summary of existing deficiencies and recommended improvements. Based on the City of Hesperia deficiency criteria discussed in Section 2.7 *Minimum Acceptable Levels of Service (LOS) and Intersection Deficiency Criteria*, the following intersections were found to be deficient. Improvements necessary to improve traffic deficiencies back to acceptable levels are also discussed below.

3.12.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the proposed recommended improvements is presented in Table 3-4 for Existing (2019) traffic conditions. The intersection operations analysis worksheets for Existing (2019) traffic conditions, with improvements, are included in Appendix 3.6 of this TIA.

Recommended Improvement – US Highway 395 & Yucca Terrace Drive (#11) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound through lane.
- Add a 2nd southbound through lane.

Recommended Improvement – US Highway 395 & Poplar Street (#13) – The following improvement is necessary to bring the LOS back to acceptable levels:

- Add a 2nd southbound through lane.

3.12.2 RECOMMENDED IMPROVEMENTS TO ADDRESS QUEUING DEFICIENCIES

As shown previously in Table 3-2, there are currently no peak hour queuing issues for Existing (2019) traffic conditions. As such, no improvements have been recommended.

3.12.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

As shown previously in Table 3-3, there are study area freeway mainline segments and ramp junctions that currently operate at an unacceptable LOS for Existing (2019) traffic conditions. At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the City of Hesperia (or other neighboring jurisdictions) on the SHS roadway segments. As such, no improvements have been recommended to address the Existing (2019) deficiencies on the SHS.

Table 3-4

Intersection Analysis for Existing (2019) Conditions With Improvements

#	Intersection	Traffic Control[3]	Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
			Northbound			Southbound			Eastbound			Westbound						
			L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
11	US Highway 395 & Yucca Terrace Dr.																	
	- Without Improvements	CSS	0	1	0	0	1	0	0	1	0	0	1	0	22.7	**77.2**	C	**F**
	- With Improvements	CSS	0	**2**	0	0	**2**	0	0	1	0	0	1	0	13.5	32.5	B	D
13	US Highway 395 & Poplar St.																	
	- Without Improvements	CSS	0	2	0	1	1	0	0	0	0	1	0	1	**69.6**	**85.0**	**F**	**F**
	- With Improvements	CSS	0	2	0	1	**2**	0	0	0	0	1	0	1	19.4	24.3	C	C

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] CSS = Cross-street Stop

4 PROJECTED FUTURE TRAFFIC

This section presents the traffic volumes estimated to be generated by the Project, as well as the Project's trip assignment, onto the study area roadway network. The proposed Project consists of the following uses:

- 2,361,648 square feet of High-Cube Fulfillment Center use (65% of the total square footage of Building 1 and Building 2)
- 1,383,781 square feet of General Light Industrial use; 1,271,656 square feet within Building 1 and Building 2 (35% of the total square footage of Building 1 and Building 2) and 112,125 square feet within Building 3

The Project is anticipated to be developed within a single phase with an anticipated opening year of 2021. Regional access to the Project site is available from the I-15 Freeway at Main Street interchange. The Project is located north of Phelan Road and west of US Highway 395 in the City of Hesperia. Vehicular and truck traffic access will be provided via the following driveways:

- Driveway 1 via Phelan Road – Right-In/Right-Out/Left-Out access for both passenger cars and trucks
- Driveway 2 via Yucca Terrace Drive – Full access for both passenger cars and trucks
- Driveway 3 via Yucca Terrace Drive – Full access for both passenger cars and trucks
- Driveway 4 via Phelan Road – Full access for both passenger cars and trucks

4.1 PROJECT TRIP GENERATION

Trip generation represents the amount of traffic that is attracted and produced by a development, and is based upon the specific land uses planned for a given project. In order to develop the traffic characteristics of the proposed project, the trip generation rates used for this analysis are based upon information collected by the ITE as provided in their Trip Generation Manual, 10th Edition, 2017 and the High-Cube Warehouse Trip Generation Study (WSP, January 29, 2019). (3) (4) Trip generation rates for the Project are shown in Table 4-1. The trip generation summary illustrating daily, and peak hour trip generation estimates for the proposed Project in actual vehicles and PCE are shown in Table 4-2.

Table 4-1

[1] TSF = thousand square feet

[2] TOTAL NET TRIPS = Passenger Cars + Net Truck Trips.

For purposes of this analysis, the following ITE land use codes and vehicle mixes have been utilized for the proposed Project:

- High-Cube Fulfillment Center Warehouse has been used to derive site specific trip generation estimates for up to 2,361,648 square feet of the proposed Project. The ITE Trip Generation Manual (2017) has trip generation rates for high-cube fulfillment center use (ITE land use code 155), however, these rates are unreliable because they are based on limited data (i.e., one to two surveyed sites) and the ITE Trip Generation Manual recommends the use of local data sources where available. As such, the trip-generation statistics published in the High-Cube Warehouse Trip Generation Study (WSP, January 29, 2019) which was commissioned by the Western Riverside Council of Governments (WRCOG) in support of the Transportation Uniform Mitigation Fee (TUMF) update, has been utilized for the high-cube fulfillment center use. The WSP trip generation rates were published in January 2019 and are based on data collected at 11 local high-cube fulfillment center sites. However, the WSP study does not include a split for inbound and outbound vehicles, as such, the inbound and outbound splits per the ITE High-Cube Warehouse Vehicle Trip Generation Analysis (October 2016) have been utilized. (10)
- ITE land use code 110 (General Light Industrial) has been used to derive site specific trip generation estimates for up to 1,383,781 square feet of the proposed Project. The ITE Trip Generation Manual includes very limited data regarding the types of vehicles that are generated for general light industrial uses (passenger cars and various sizes of trucks). As such, data regarding the vehicle mix has been obtained from a separate report; the City of Fontana's Truck Trip Generation Study (August 2003) for the general light industrial uses proposed as part of the Project. The "Light Industrial" vehicle mix data has been utilized: 8.0% 2-axle trucks, 3.9% 3-axle trucks, and 9.5% 4+-axle trucks (total of 21.4% trucks). (11)

As shown in Table 4-1, refinements to the raw trip generation estimates have been made to provide a more detailed breakdown of trips between passenger cars and trucks. Trip generation for heavy trucks was further broken down by truck type (or axle type). The total truck percentage is comprised of 3 different truck types: 2-axle, 3-axle, and 4+-axle trucks for General Light Industrial and 2 different truck types: 2-4-axle and 5+-axle for High-Cube Fulfillment Center Warehouse use. PCE factors were applied to the trip generation rates for heavy trucks (large 2-axles, 3-axles, 4+-axles). PCEs allow the typical "real-world" mix of vehicle types to be represented as a single, standardized unit, such as the passenger car, to be used for the purposes of capacity and level of service analyses. The PCE factors are consistent with the recommended PCE factors in Appendix B of the San Bernardino County Congestion Management Program (CMP) (2016 Update). (9)

As shown in Table 4-2, the proposed Project is anticipated to generate a total of 11,898 actual vehicle trip-ends per day, with 1,258 AM peak hour trips and 1,261 PM peak hour trips. Consistent with the City's traffic study guidelines, the peak hour operations analysis has been conducted using PCE volumes. The proposed Project is anticipated to generate a total of 15,152 PCE trip-ends per day, 1,587 PCE AM peak hour trips and 1,570 PCE PM peak hour trips, as shown in Table 4-2.

4.2 PROJECT TRIP DISTRIBUTION

Trip distribution is the process of identifying the probable destinations, directions, or traffic routes that will be utilized by Project traffic. The potential interaction between the planned land uses and surrounding regional access routes are considered to identify the route where the Project traffic would distribute.

The Project trip distribution was developed based on anticipated travel patterns to and from the Project site for both passenger cars and truck traffic. The Project trip distribution patterns have been developed based on the anticipated travel patterns for the warehousing trucks. For both passenger cars and trucks, the Project trip distribution was developed based on an understanding of existing travel patterns in the area, the geographical location of the site, and the site's proximity to the regional arterial and state highway system.

The Project truck trip distribution pattern is graphically depicted on Exhibit 4-1. The Project passenger car trip distribution pattern is graphically depicted on Exhibit 4-2. Each of these distribution patterns was reviewed by the City of Hesperia as part of the traffic study scoping process (see Appendix 1.1).

4.3 MODAL SPLIT

The traffic reducing potential of public transit, walking, or bicycling have not been considered in this TIA. Essentially, the traffic projections are "conservative" in that these alternative travel modes might be able to reduce the forecasted traffic volumes (employee trips only).

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project ADT and peak hour intersection turning movement volumes in PCE are shown on Exhibits 4-3 and 4-4, respectively.

4.5 BACKGROUND TRAFFIC

Future year traffic forecasts have been based upon two years of background (ambient) growth at 2% per year for 2021 traffic conditions. The total ambient growth is 4.04% for 2021 traffic conditions (growth of 2 percent per year, compounded over two years or $1.02^{2\ years}$). This ambient growth factor is added to existing traffic volumes to account for area-wide growth not reflected by cumulative development projects. Ambient growth has been added to daily and peak hour traffic volumes on surrounding roadways. Ambient growth has been added to daily and peak hour traffic volumes on surrounding roadways, in addition to traffic generated by the development of future projects that have been approved but not yet built and/or for which development applications have been filed and are under consideration by governing agencies.

N

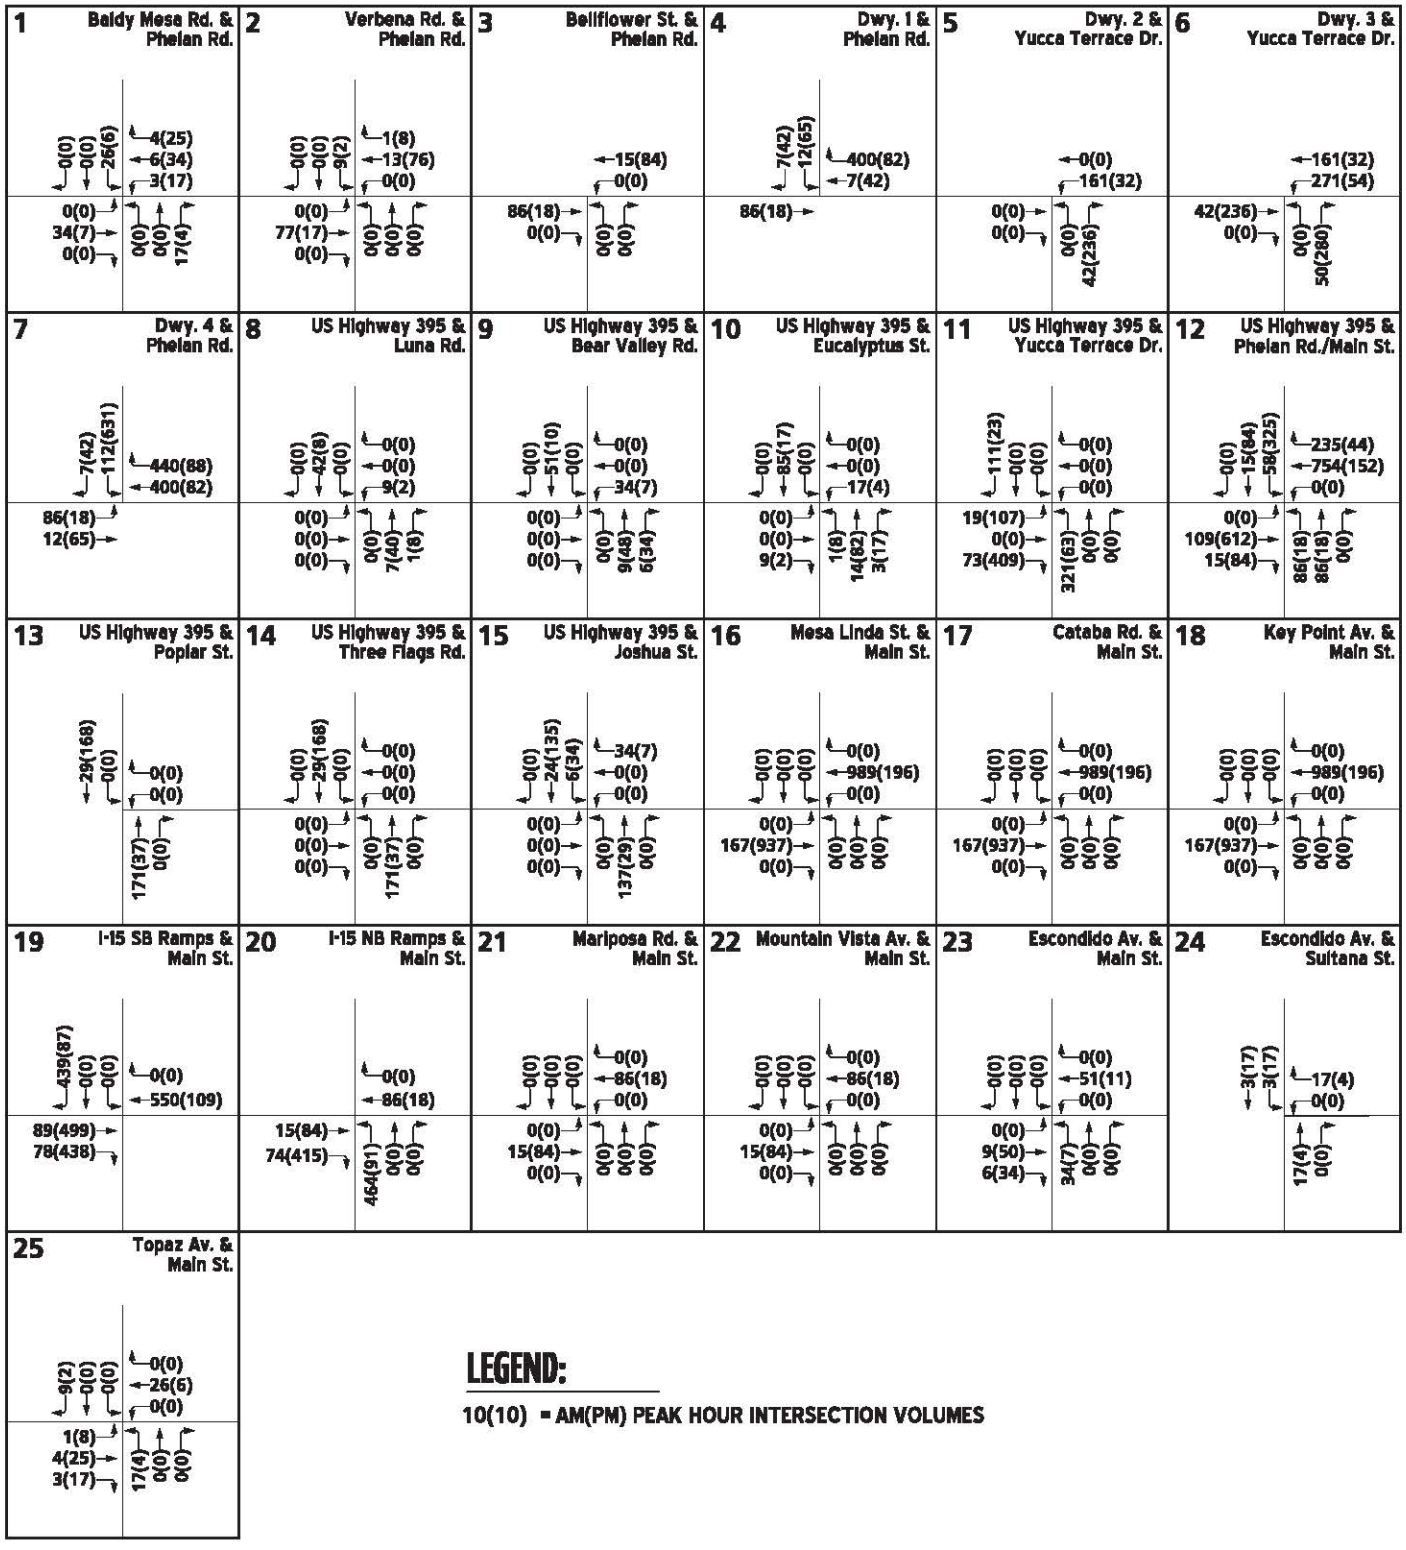
12778 - adt-a.dwg

EXHIBIT 4-4: PROJECT ONLY TRAFFIC VOLUMES (IN PCE)



The 2.0 percent annual growth rate is intended to capture non-specific ambient traffic growth. Conservatively, the TIA estimates area-wide traffic growth, then adds traffic generated by other known or probable related projects. These related projects are at least in part already accounted for in the assumed annual 2.0 percent ambient growth in traffic noted above; and in some instances, these related projects would likely not be implemented and operational within the 2021 Opening Year Cumulative time frame assumed for the Project. The resulting traffic growth rate used in the TIA (2.0 percent compounded annual ambient growth plus traffic generated by related projects) would therefore tend to overstate rather than understate background cumulative traffic deficiencies under 2021 traffic conditions.

The currently adopted Southern California Association of Governments (SCAG) 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (April 2016) growth forecasts for the City of Hesperia identifies projected growth in population of 91,5100 in 2012 to 129,100 in 2040, or a 41.7 percent increase over the 28-year period. The change in population equates to roughly a 1.25 percent growth rate, compounded annually. Similarly, growth over the same 28-year period in households is projected to increase by 48.1 percent, or 1.41 percent annual growth rate. Finally, growth in employment over the same 28-year period is projected to increase by 89.9 percent, or a 2.32 percent annual growth rate.

Therefore, the use of an annual growth rate of 2.0 percent would appear to conservatively approximate the anticipated regional growth in traffic volumes in the City of Hesperia, especially when considered along with the addition of Project-related traffic and traffic generated by other known development projects. As such, the growth in traffic volumes assumed in this TIA would tend to overstate as opposed to understate the potential deficiencies to traffic and circulation.

4.6 CUMULATIVE DEVELOPMENT TRAFFIC

California Environmental Quality Act (CEQA) guidelines require that other reasonably foreseeable development projects which are either approved or being processed concurrently in the study area also be included as part of a cumulative analysis scenario. A cumulative project list was developed for the purposes of this analysis through consultation with planning and engineering staff from the City of Hesperia, City of Victorville, and County of San Bernardino. The cumulative project list includes known and foreseeable projects that are anticipated to contribute traffic to the study area intersections.

Where applicable, cumulative projects anticipated to contribute measurable traffic (i.e. 50 or more peak hour trips) to study area intersections have been manually added to the study area network to generate Opening Year Cumulative (2021) forecasts. In other words, this list of cumulative development projects has been reviewed to determine which projects would likely contribute measurable traffic through the study area intersections (e.g., those cumulative projects in close proximity to the proposed Project). For the purposes of this analysis, the cumulative projects that were determined to affect one or more of the study area intersections are shown on Exhibit 4-5, listed in Table 4-3, and have been considered for inclusion.

[1] TSF = Thousand Square Feet; VFP = Vehicle Fueling Positions; RM = Room; DU = Dwelling Units

Any other cumulative projects located beyond the study area that are not expected to contribute measurable traffic to study area intersections have not been included since the traffic would dissipate due to the distance from the Project site and study area intersections. Any additional traffic generated by other projects not on the cumulative projects list is accounted for through background ambient growth factors that have been applied to the peak hour volumes at study area intersections as discussed in Section 4.5 *Background Traffic*. Cumulative only ADT and peak hour traffic volumes are shown on Exhibits 4-6 and 4-7, respectively.

4.7 TRAFFIC FORECASTS

To provide a comprehensive assessment of the deficiencies, two types of analyses, "buildup" and "buildout", were performed in support of this work effort. The "buildup" method was used to approximate E+P and Opening Year Cumulative (2021) traffic conditions and is intended to identify the near-term deficiencies on both the existing and planned near-term circulation system. The Opening Year Cumulative (2021) traffic conditions includes background traffic, traffic generated by other cumulative development projects within the study area, and traffic generated by the proposed Project. The "buildout" method was utilized for Horizon Year traffic conditions and is based on the regional traffic model for 2040 traffic conditions.

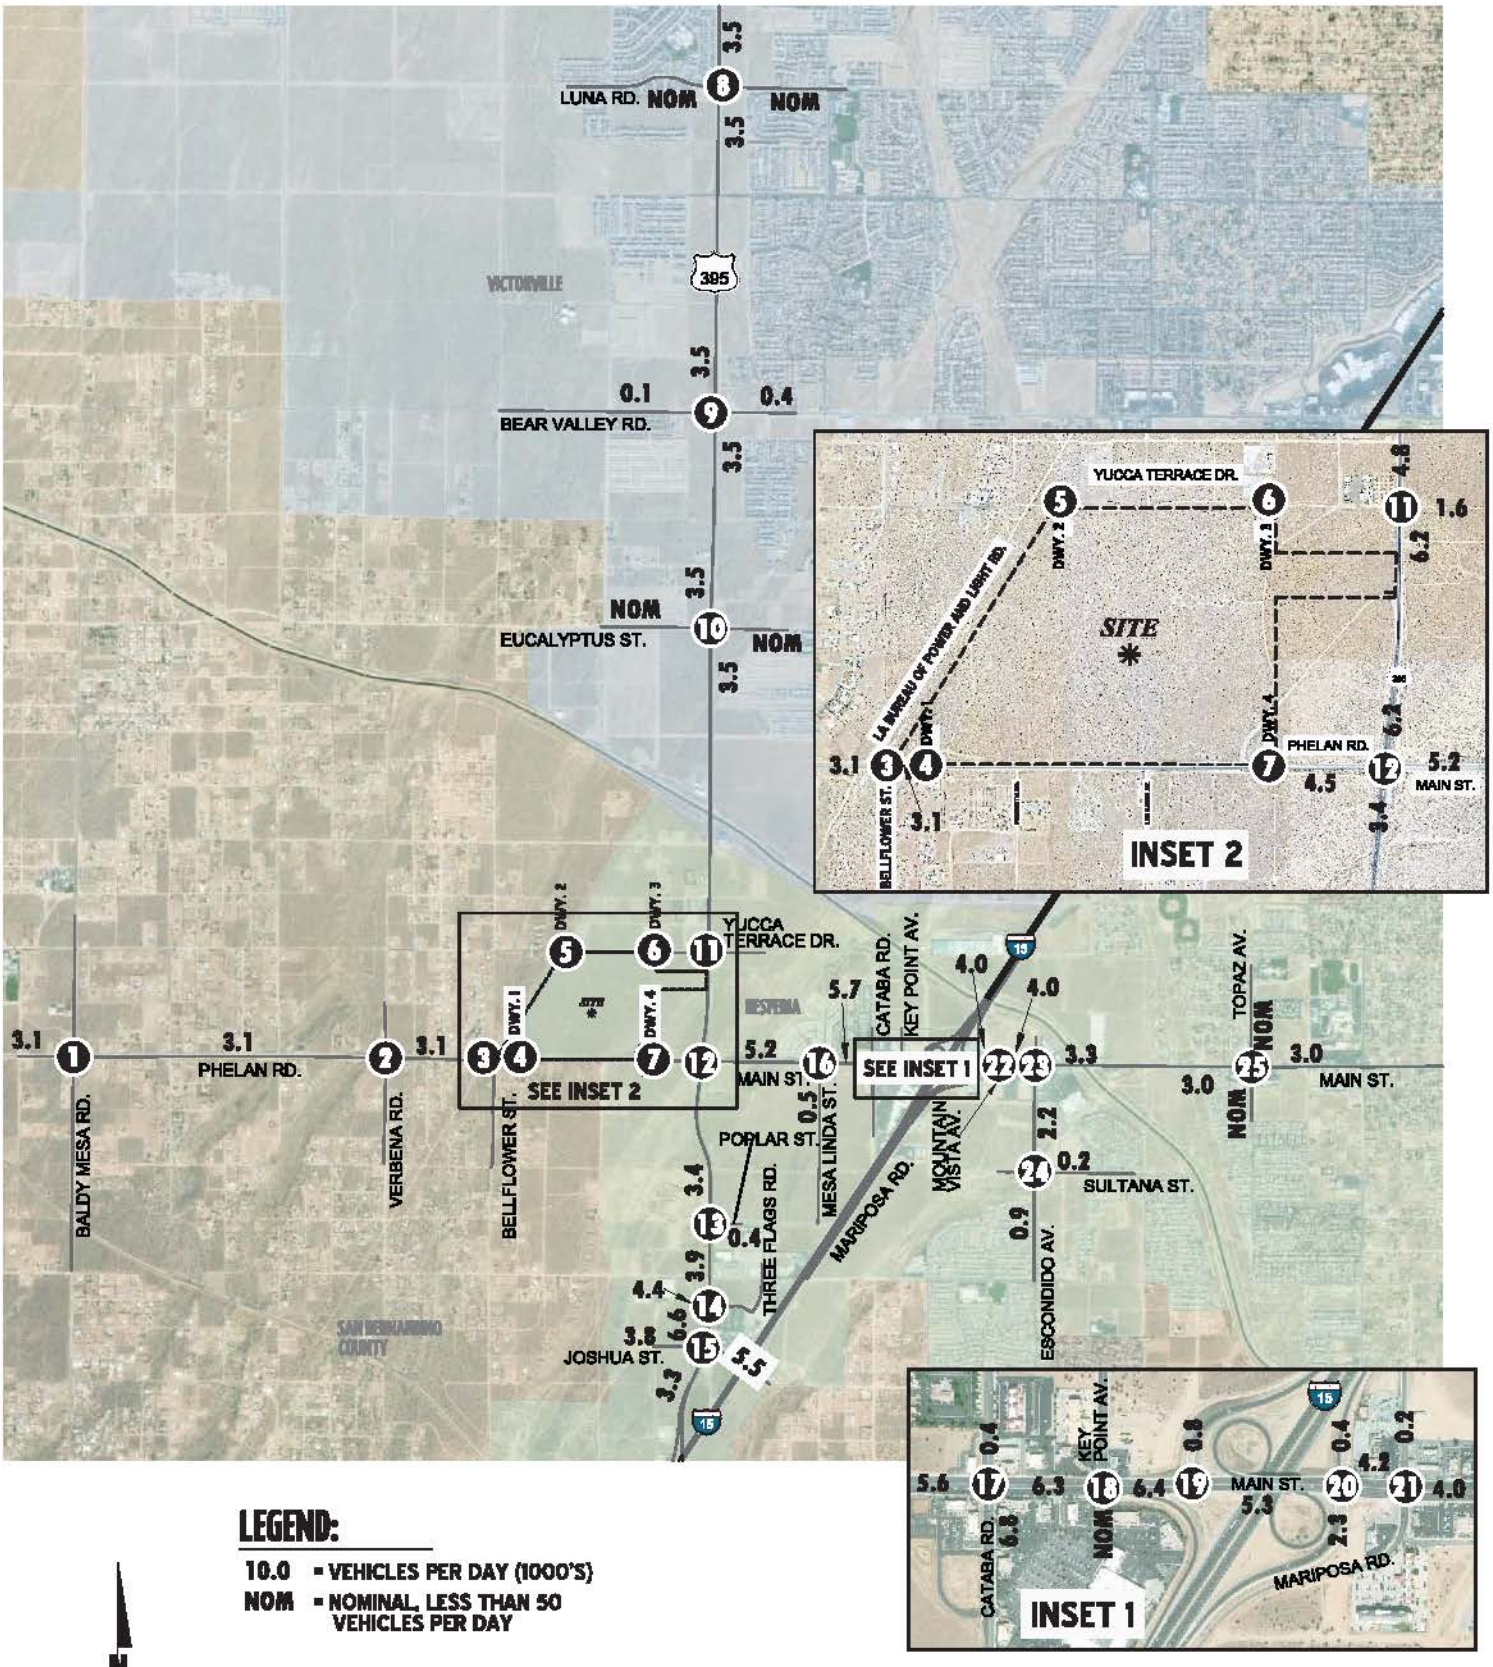
4.8 NEAR-TERM TRAFFIC CONDITIONS

The "buildup" approach combines existing traffic counts with a background ambient growth factor to forecast Opening Year Cumulative (2021) traffic conditions. An ambient growth factor of 2.0% per year has been used to account for background (area-wide) traffic increases that occur over time up to the year 2021 from the year 2019 (2.0 percent per year growth rate, compounded annually over a 2-year period). Traffic volumes generated by the Project are then added to assess the near-term traffic conditions. The 2021 roadway networks are similar to the Existing conditions roadway network, with the exception of future driveways proposed to be developed by the Project.

The near-term traffic analyses include the following traffic conditions, with the various traffic components:

- Opening Year Cumulative (2021) Without Project
    - Existing 2019 counts
    - Ambient growth (4.04%)
    - Cumulative Development traffic
- Opening Year Cumulative (2021) With Project
    - Existing 2019 counts
    - Ambient growth (4.04%)
    - Cumulative Development traffic
    - Project traffic

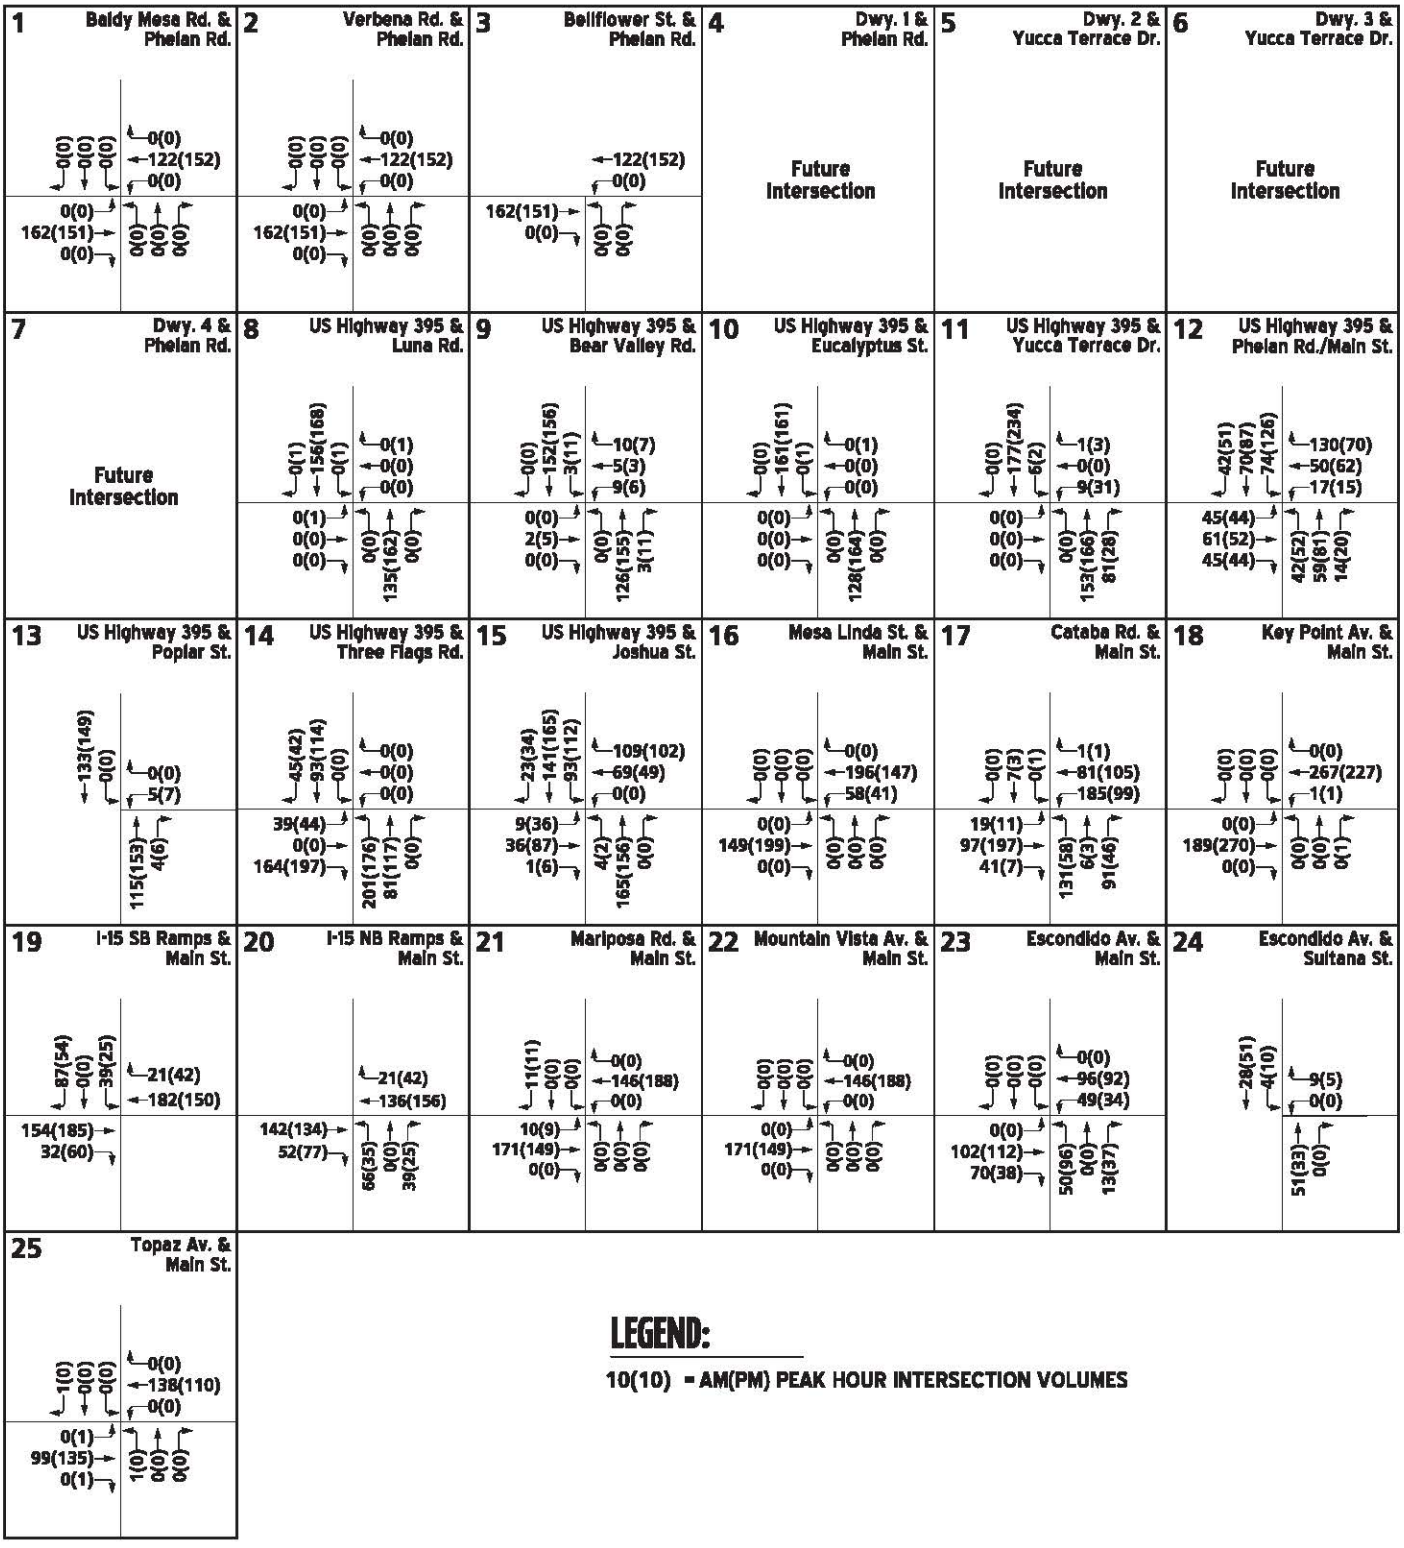
EXHIBIT 4-6: CUMULATIVE ONLY AVERAGE DAILY TRAFFIC (ADT) (IN PCE)



12778 - adt-a.dwg

URBAN CROSSROADS

EXHIBIT 4-7: CUMULATIVE ONLY TRAFFIC VOLUMES (IN PCE)



4.9 HORIZON YEAR (2040) CONDITIONS

Traffic projections for Horizon Year (2040) with Project conditions were derived from the SBTAM modified to represent buildout of the City of Hesperia. The SBTAM uses an AM peak period-to-peak hour factor of 0.35 and a PM peak period-to-peak hour factor of 0.27. These factors represent the relationship of the highest single AM peak hour to the modeled 3-hour AM peak period (an even distribution would result in a factor of 0.33) and the highest single PM peak hour to the modeled 4-hour PM peak period (an even distribution would result in a factor of 0.25).

In some instances, the traffic model zone structure is not designed to provide accurate turning movements along arterial roadways unless refinement and reasonableness checking is performed. Horizon Year (2040) turning volumes were compared to Opening Year Cumulative (2021) volumes in order to ensure a minimum growth as a part of the refinement process, where applicable. The minimum growth includes any additional growth between Opening Year Cumulative (2021) and Horizon Year traffic conditions that is not accounted for by the traffic generated by cumulative development projects and the ambient growth between Existing and Opening Year Cumulative (2021) traffic conditions. The initial estimate of the future Horizon Year (2040) peak hour turning movements were then reviewed by Urban Crossroads for reasonableness at intersections where model results showed unreasonable turning movements. The initial raw model estimates were adjusted to achieve flow conservation (where applicable), reasonable growth, and reasonable diversion between parallel routes. Post-processing worksheets for Horizon Year with Project traffic conditions are provided in Appendix 4.1.

The Horizon Year (2040) conditions analysis will be utilized to determine if improvements funded through regional transportation mitigation fee programs, such as the City's DIF program or other approved funding mechanisms, can accommodate the long-range cumulative traffic at the target LOS identified by the City of Hesperia (lead agency). If the planned and funded improvements can provide the target LOS, then the Project's payment into established fee programs will be considered as cumulative improvements. Other improvements needed beyond the "funded" improvements (such as localized improvements to non-DIF facilities) are identified as such.

This Page Intentionally Left Blank

5 E+P TRAFFIC ANALYSIS

This section discusses the traffic forecasts for Existing plus Project (E+P) conditions and the resulting peak hour intersection operations, traffic signal warrant, queuing, and freeway facility operations analyses.

5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for E+P conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for E+P conditions only (e.g., intersection and roadway improvements at the Project's frontage and driveways).

5.2 E+P TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus Project traffic. The ADT volumes and weekday AM and PM peak hour intersection turning movement volumes which can be expected for E+P traffic conditions are shown on Exhibits 5-1 and 5-2, respectively.

5.3 INTERSECTION OPERATIONS ANALYSIS

E+P peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TIA. The intersection analysis results are summarized in Table 5-1, which indicates that with the addition of Project traffic, the following additional study area intersection is anticipated to operate at unacceptable LOS for E+P traffic conditions, in addition to the intersections previously identified under Existing (2019) traffic conditions:

- US Highway 395 & Phelan Road/Main Street (#12) – LOS F AM and PM peak hours

A summary of the peak hour intersection LOS for E+P traffic conditions is shown on Exhibit 5-3. The intersection operations analysis worksheets for E+P traffic conditions are included in Appendix 5.1.

5.4 TRAFFIC SIGNAL WARRANTS ANALYSIS

The following study area intersection is anticipated to meet a traffic signal warrant for E+P traffic conditions:

- Driveway 4 & Phelan Road (#7)

A traffic signal will be constructed by the Project at the intersection of Driveway 4 & Phelan Road as part of the site adjacent Project design features. For all Project design features, see Section 1.7 *Recommendations* of this report. Driveway 4 is proposed to provide reciprocal access to both the proposed Project and future adjacent not-a-part development.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown. HCM delay reported in seconds.

[2] CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

[3] The Project will construct a traffic signal as part of the Project design features.

E+P traffic conditions traffic signal warrant analysis worksheets are provided in Appendix 5.2.

5.5 QUEUING ANALYSIS

5.5.1 ARTERIAL ANALYSIS

A queuing analysis was performed for US Highway 395 from Luna Road to Joshua Street to assess vehicle queues along the roadways. Queuing analysis findings are presented in Table 5-2. It is important to note that the available stacking distances are consistent with the measured turn pocket lengths. As shown in Table 5-2, the following intersection turning movement is anticipated to experience periodic queuing issues during the peak hours based on the 95th percentile peak hour traffic flows with the addition of Project traffic under E+P traffic conditions:

- US Highway 395 & Phelan Road/Main Street (#12) Southbound Left – AM and PM peak hours

Worksheets for E+P traffic conditions queuing analysis are provided in Appendix 5.3.

5.5.2 FREEWAY OFF-RAMP ANALYSIS

A queuing analysis was performed for the off-ramps at the I-15 Freeway and Main Street interchange to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the I-15 Freeway mainline. Queuing analysis findings are presented in Table 5-2. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown in Table 5-2 and consistent with Existing (2019) traffic conditions, there are no off-ramp movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows. Worksheets for E+P traffic conditions queuing analysis are provided in Appendix 5.3.

5.6 FREEWAY FACILITY ANALYSIS

E+P mainline directional volumes for the AM and PM peak hours are provided on Exhibit 5-4. As shown in Table 5-3, there are no additional study area freeway segments and merge/diverge ramp junctions analyzed for this study that are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours with the addition of Project traffic for E+P traffic conditions in addition to the deficient locations identified under Existing traffic conditions. E+P freeway facility analysis worksheets are provided in Appendix 5.4.

Table 5-2

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table.

Table 5-3

Freeway Facility Analysis for E+P Conditions

5.7 RECOMMENDED IMPROVEMENTS

This section provides a summary of E+P deficiencies and recommended improvements. Based on the deficiency criteria discussed in Section 2.7 *Minimum Acceptable Levels of Service (LOS) and Intersection Deficiency Criteria*, the following intersections were found to be deficient. Improvements necessary to improve traffic deficiencies back to acceptable levels are also discussed below.

5.7.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the proposed recommended improvements is presented in Table 5-4 for E+P traffic conditions. The intersection operations analysis worksheets for E+P traffic conditions, with improvements, are included in Appendix 5.5 of this TIA.

Recommended Improvement – US Highway 395 & Yucca Terrace Drive (#11) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound through lane.
- Add a 2nd southbound through lane.
- Install a traffic signal (Project design feature).
- Add a northbound left turn lane (Project design feature).
- Add an eastbound left turn lane (Project design feature).

Recommended Improvement – US Highway 395 & Phelan Road/Main Street (#12) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound left turn lane.
- Add a 2nd southbound left turn lane.

Recommended Improvement – US Highway 395 & Poplar Street (#13) – The following improvement is necessary to bring the LOS back to acceptable levels:

- Add a 2nd southbound through lane.

5.7.2 RECOMMENDED IMPROVEMENTS TO ADDRESS QUEUING DEFICIENCIES

As shown previously in Table 5-2, there is one peak hour queuing issue at the intersection of US Highway 395 & Phelan Road/Main Street. Recommended improvements to address queuing issues for E+P traffic conditions are shown in Table 5-5 and reflect the recommended improvements to address intersection deficiencies, as previously described in Section 5.8.1 *Recommended Improvements to Address Deficiencies at Intersections*. In order to accommodate the 95th percentile peak hour queues for E+P traffic conditions, a 475-foot southbound left turn pocket is recommended at the intersection of US Highway 395 & Phelan Road/Main Street. Worksheets for E+P traffic conditions off-ramp queuing analysis, with improvements, are provided in Appendix 5.6.

Table 5-4

Intersection Analysis for E+P Conditions With Improvements

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] CSS = Cross-street Stop; TS = Traffic Signal; **TS** = Improvement

Table 5-5

Peak Hour Queuing Summary for E+P Conditions With Improvements

Intersection	Movement	Available Stacking Distance (Feet)	Existing (2019)				E+P			
			95th Percentile Queue (Feet)		Acceptable? [1]		95th Percentile Queue (Feet)		Acceptable? [1]	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM
US Highway 95 & Phelan Rd./Main St.	NBL	280	Not Applicable				145 [2]	109	Yes	Yes
	SBL	**475**					196 [2]	312 [2]	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

5.7.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

As shown previously in Table 5-3, there are study area freeway mainline segments and ramp junctions that are anticipated to operate at an unacceptable LOS for E+P traffic conditions. At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the City of Hesperia (or other neighboring jurisdictions) on the SHS roadway segments. As such, no improvements have been recommended to address the E+P deficiencies on the SHS.

6 OPENING YEAR CUMULATIVE (2021) TRAFFIC ANALYSIS

This section discusses the traffic forecasts for Opening Year Cumulative (2021) conditions and the resulting peak hour intersection operations, traffic signal warrant, queuing, and freeway facility operations analyses.

6.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Opening Year Cumulative (2021) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by cumulative developments to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the cumulative development's frontages and driveways).

6.2 OPENING YEAR CUMULATIVE (2021) WITHOUT PROJECT VOLUME FORECASTS

To account for background traffic, other known cumulative development projects in the study area were included in addition to 4.04% of ambient growth for Opening Year Cumulative traffic conditions. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2021) Without Project traffic conditions are shown on Exhibits 6-1 and 6-2, respectively.

6.3 OPENING YEAR CUMULATIVE (2021) WITH PROJECT VOLUME FORECASTS

To account for background traffic, other known cumulative development projects in the study area were included in addition to 4.04% of ambient growth for Opening Year Cumulative traffic conditions in conjunction with traffic associated with the proposed Project. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2021) With Project traffic conditions are shown on Exhibits 6-3 and 6-4, respectively.

6.4 INTERSECTION OPERATIONS ANALYSIS

Opening Year Cumulative (2021) Without and With Project peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TIA. The intersection analysis results are summarized in Table 6-1 for both Opening Year Cumulative (2021) Without and With Project traffic conditions.

For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown. HCM delay reported in seconds.

[2] CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

6.4.1 OPENING YEAR CUMULATIVE (2021) WITHOUT PROJECT CONDITIONS

Opening Year Cumulative (2021) peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TIA. The intersection analysis results are summarized in Table 6-1 and shown on Exhibit 6-5, which indicates that the following intersections are anticipated to operate at an unacceptable LOS during the peak hours:

- Verbena Road & Phelan Road (#2) – LOS D AM and PM peak hours
- US Highway 395 & Yucca Terrace Drive (#11) – LOS F AM and PM peak hours
- US Highway 395 & Phelan Road/Main Street (#12) – LOS E PM peak hour only
- US Highway 395 & Poplar Street (#13) – LOS F AM and PM peak hours
- Escondido Avenue & Main Street (#23) – LOS E PM peak hour only

The intersection operations analysis worksheets for Opening Year Cumulative (2021) Without Project traffic conditions are included in Appendix 6.1 of this TIA.

6.4.2 OPENING YEAR CUMULATIVE (2021) WITH PROJECT CONDITIONS

With the addition of Project traffic, there are no additional study area intersections that are anticipated to operate at an unacceptable LOS during the peak hours. Consistent with Table 6-1, a summary of the peak hour intersection LOS for Opening Year Cumulative (2021) With Project conditions are shown on Exhibit 6-6. The intersection operations analysis worksheets for Opening Year Cumulative (2021) With Project traffic conditions are included in Appendix 6.2 of this TIA.

6.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

There are no additional intersections anticipated to meet traffic signal warrants for Opening Year Cumulative (2021) Without Project. The following intersection is anticipated to meet traffic signal warrants with the addition of Project traffic for Opening Year Cumulative (2021) With Project:

- US Highway 395 & Yucca Terrace Drive (#11)

A traffic signal will be constructed by the Project at the intersection of US Highway 395 & Yucca Terrace Drive as part of the site adjacent Project design features. For all Project design features, see Section 1.7 *Recommendations* of this report. Worksheets for Opening Year Cumulative (2021) Without and With Project traffic conditions signal warrants are provided in Appendices 6.3 and 6.4, respectively.

EXHIBIT 6-5: OPENING YEAR CUMULATIVE (2021) WITHOUT PROJECT SUMMARY OF LOS

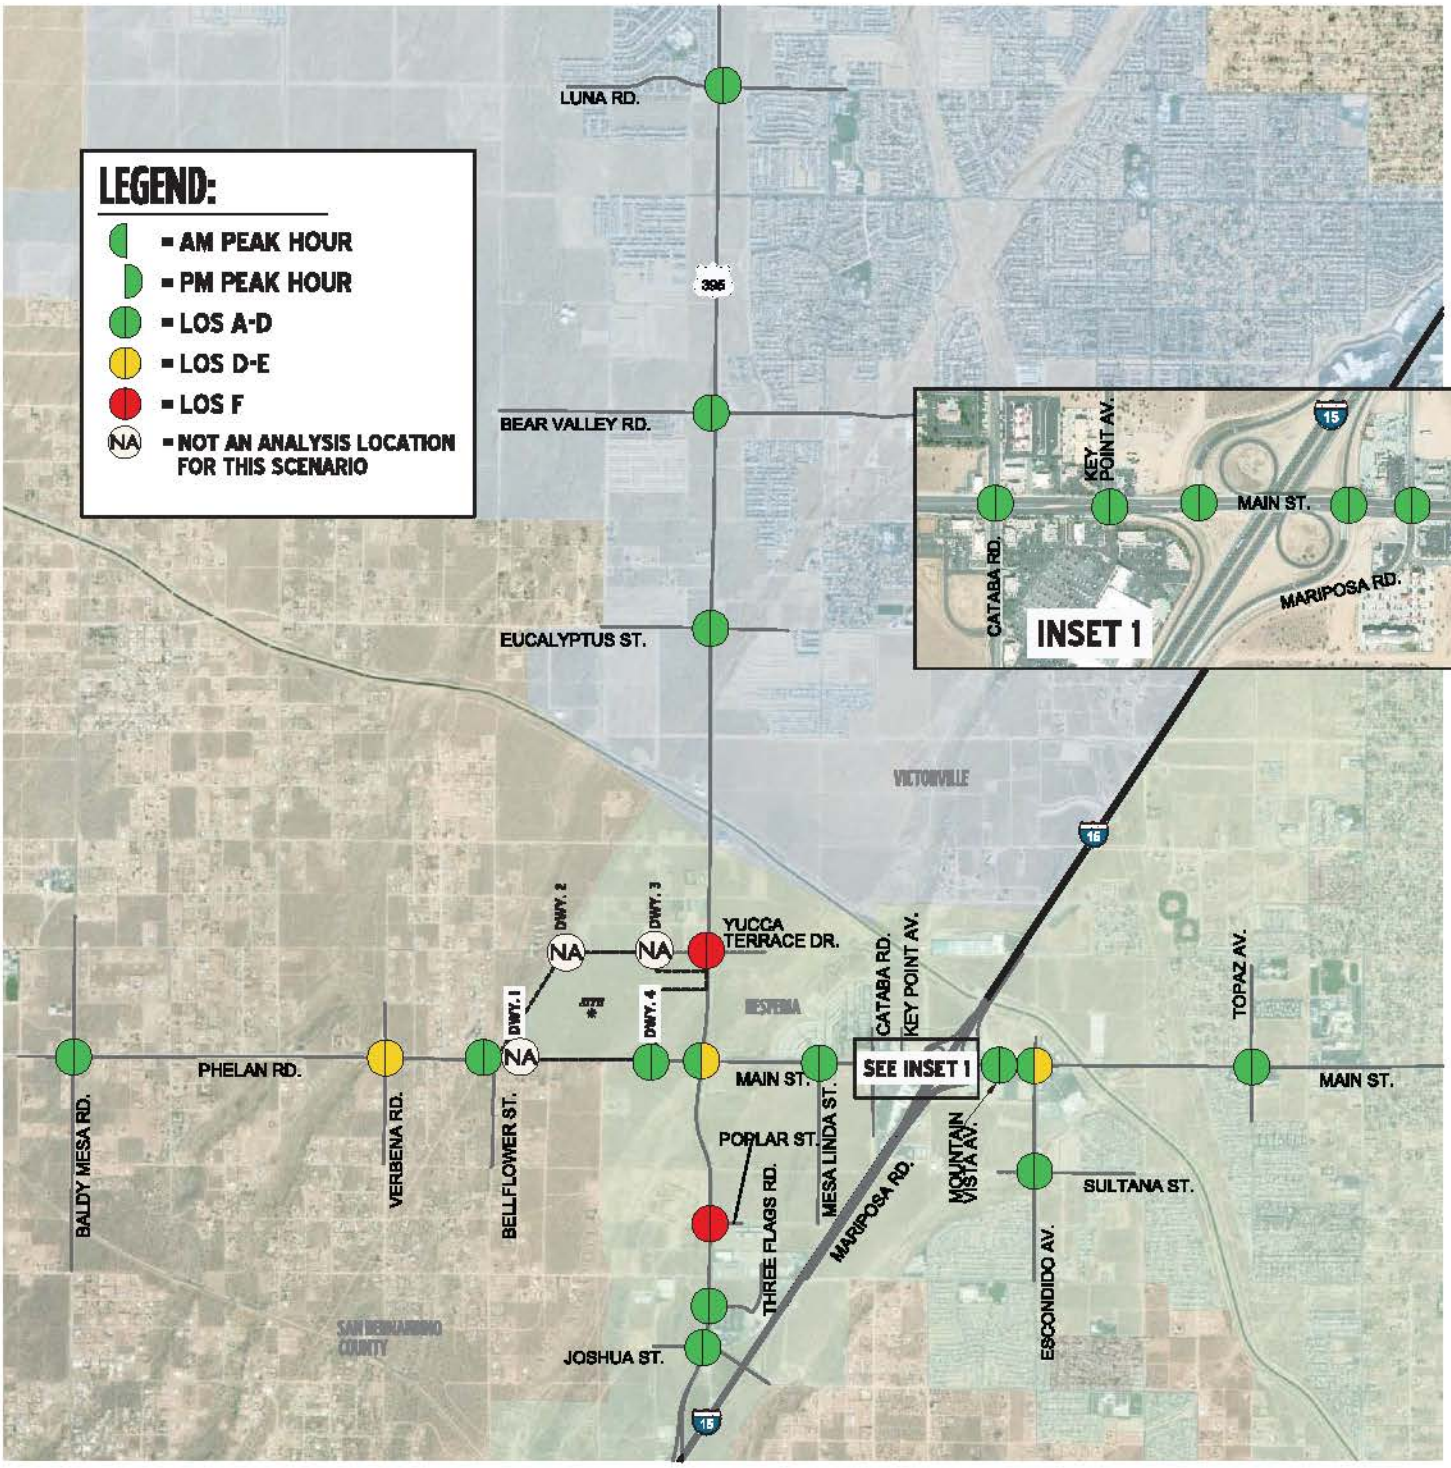

EXHIBIT 6-6: OPENING YEAR CUMULATIVE (2021) WITH PROJECT SUMMARY OF LOS

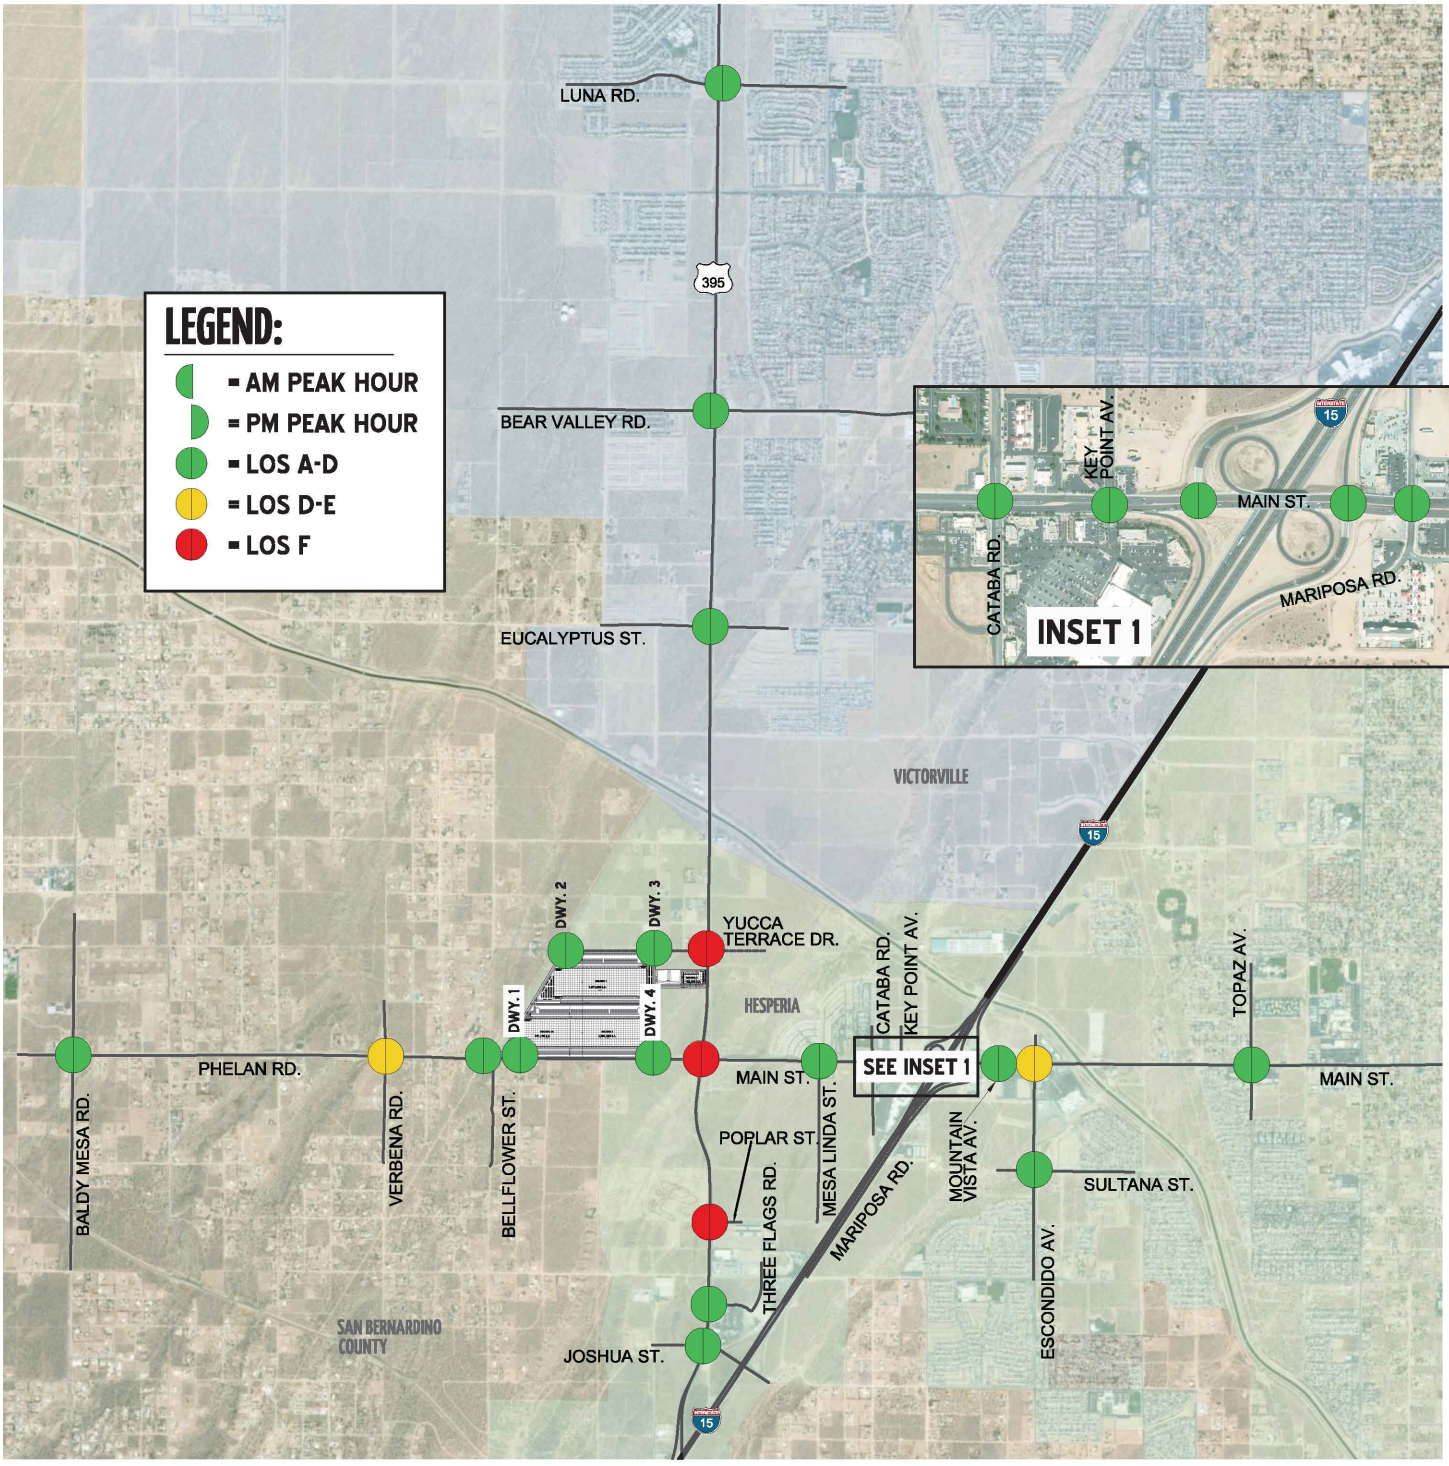

6.6 QUEUING ANALYSIS

6.6.1 ARTERIAL ANALYSIS

A queuing analysis was performed for US Highway 395 from Luna Road to Joshua Street to assess vehicle queues along the roadways. Queuing analysis findings are presented in Table 6-2. It is important to note that the available stacking distances are consistent with the measured turn pocket lengths. As shown in Table 6-2, the following intersection turning movements are anticipated to experience periodic queuing issues during the peak hours based on the 95th percentile peak hour traffic flows for Opening Year Cumulative (2021) Without Project traffic conditions:

- US Highway 395 & Phelan Road/Main Street (#12) Southbound Left – AM and PM peak hours
- US Highway 395 & Three Flags Road (#14) Northbound Left – AM and PM peak hours

Worksheets for Opening Year Cumulative (2021) Without Project traffic conditions queuing analysis are provided in Appendix 6.5.

The following additional intersection turning movement is anticipated to experience queuing issues during the peak hours based on the 95th percentile peak hour traffic flows with the addition of Project traffic for Opening Year Cumulative (2021) With Project traffic conditions:

- US Highway 395 & Phelan Road/Main Street (#12) Northbound Left – AM and PM peak hours

Worksheets for Opening Year Cumulative (2021) With Project traffic conditions queuing analysis are provided in Appendix 6.6.

6.6.2 FREEWAY OFF-RAMP ANALYSIS

A queuing analysis was performed for the off-ramps at the I-15 Freeway and Main Street interchange to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the I-15 Freeway mainline. Queuing analysis findings are presented in Table 6-2. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown in Table 6-2 and consistent with Existing (2019) traffic conditions, there are no off-ramp movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under Opening Year Cumulative (2021) Without Project traffic conditions. Worksheets for Opening Year Cumulative (2021) Without Project traffic conditions off-ramp queuing analysis are provided in Appendix 6.5.

There are no off-ramp movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under Opening Year Cumulative (2021) With Project traffic conditions. Worksheets for Opening Year Cumulative (2021) With Project traffic conditions off-ramp queuing analysis are provided in Appendix 6.6.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table.

6.7 FREEWAY FACILITY ANALYSIS

Opening Year Cumulative (2021) Without Project mainline directional volumes for the AM and PM peak hours are provided on Exhibit 6-7. As shown in Table 6-3, the following study area freeway segments and merge/diverge ramp junctions analyzed for this study are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours for Opening Year Cumulative (2021) Without Project traffic conditions:

- I-15 Freeway Northbound, North of Main Street (#9) – LOS E PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at Main Street (#12) – LOS E PM peak hour only
- I-15 Freeway Northbound, South of Main Street (#13) – LOS E PM peak hour only

Opening Year Cumulative (2021) Without Project freeway facility analysis worksheets are provided in Appendix 6.7.

Opening Year Cumulative (2021) With Project mainline directional volumes for the AM and PM peak hours are provided on Exhibit 6-8. The following additional study area ramp junction is anticipated to operate at an unacceptable LOS with the addition of Project traffic under Horizon Year (2040) With Project traffic conditions, resulting in a cumulative deficiency:

- I-15 Freeway Northbound, On-Ramp at Main Street (#10) – LOS E PM peak hour only

Opening Year Cumulative (2021) With Project freeway facility analysis worksheets are provided in Appendix 6.8.

6.8 RECOMMENDED IMPROVEMENTS

This section provides a summary of Opening Year Cumulative (2021) deficiencies and recommended improvements. Based on the deficiency criteria discussed in Section 2.7 *Minimum Acceptable Levels of Service (LOS) and Intersection Deficiency Criteria*, the following intersections were found to be deficient. Improvements necessary to improve traffic deficiencies back to acceptable levels are also discussed below.

6.8.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the proposed recommended improvements is presented in Table 6-4 for Opening Year Cumulative (2021) traffic conditions. The intersection operations analysis worksheets for Opening Year Cumulative (2021) Without Project and With Project traffic conditions, with improvements, are included in Appendices 6.9 and 6.10, respectively.

	- Without Project	CSS	0	2	0	1	**2**	0	0	0	0	1	0	1	23.9	32.5	C	D
	- With Project	CSS	0	2	0	1	**2**	0	0	0	0	1	0	1	27.9	34.8	D	D
23	Escondido Av. & Main St.																	
	- Without Project	TS	2	1	1>	1	1	0	1	3	1>	2	**3**	1	47.6	51.7	D	D
	- With Project	TS	2	1	1>	1	1	0	1	3	1>	2	**3**	1	52.5	53.0	D	D

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] CSS = Cross-street Stop; TS = Traffic Signal; **TS** = Improvement

Recommended Improvement – US Highway 395 & Yucca Terrace Drive (#11) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound through lane.
- Add a 2nd southbound through lane.

Recommended Improvement – US Highway 395 & Phelan Road/Main Street (#12) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound left turn lane.
- Add a 2nd southbound left turn lane.
- Add a 3rd eastbound through lane.
- Add a 3rd westbound through lane.
- Add a westbound right turn lane.
- Modify the traffic signal to implement overlap phasing for the westbound right turn lane.

Recommended Improvement – US Highway 395 & Poplar Street (#13) – The following improvement is necessary to bring the LOS back to acceptable levels:

- Add a 2nd southbound through lane.

Recommended Improvement – Escondido Avenue & Main Street (#23) – The following improvement is necessary to bring the LOS back to acceptable levels:

- Add a 3rd westbound through lane.

Although the intersection of Verbena Road and Phelan Road is anticipated to operate at an unacceptable LOS (i.e., LOS D or worse) during the peak hours for Opening Year Cumulative (2021) traffic conditions, the Project does not contribute 10 or more peak hour trips to the minor street and the addition of Project traffic does not cause the intersection to meet a traffic signal warrant. As such, according to the County of San Bernardino deficiency criteria, the deficiency at this location does not require improvements.

The following additional improvements are required for Opening Year Cumulative (2021) With Project traffic conditions:

Recommended Improvement – US Highway 395 & Yucca Terrace Drive (#11) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound through lane.
- Add a 2nd southbound through lane.
- Install a traffic signal (Project design feature).
- Add a northbound left turn lane (Project design feature).
- Add an eastbound left turn lane (Project design feature).

6.8.2 RECOMMENDED IMPROVEMENTS TO ADDRESS QUEUING DEFICIENCIES

As shown previously in Table 6-2, there are peak hour queuing issues at three intersection turning movements. Recommended improvements to address queuing issues for Opening Year Cumulative (2021) traffic conditions are shown in Table 6-5 and reflect the recommended improvements to address intersection deficiencies, as previously described in Section 6.8.1 *Recommended Improvements to Address Deficiencies at Intersections*. In order to accommodate the 95th percentile peak hour queues for Opening Year Cumulative (2021) traffic conditions, a 475-foot southbound left turn pocket is recommended at the intersection of US Highway 395 & Phelan Road/Main Street, and a 275-foot northbound left turn pocket is recommended at the intersection of US Highway 395 & Three Flags Road. The turn pocket recommendation at US Highway 395 & Three Flags Road only requires restriping of existing pavement. Opening Year Cumulative (2021) Without Project and With Project traffic conditions with improvements queuing analysis worksheets are provided in Appendices 6.11 and 6.12, respectively.

6.8.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

As shown previously in Table 6-3, there are study area freeway mainline segments and ramp junctions that are anticipated to operate at an unacceptable LOS for Opening Year Cumulative (2021) traffic conditions. At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the City of Hesperia (or other neighboring jurisdictions) on the SHS roadway segments. As such, no improvements have been recommended to address the Opening Year Cumulative (2021) deficiencies on the SHS.

Table 6-5

Peak Hour Queuing Summary for Opening Year Cumulative (2021) Conditions With Improvements

Intersection	Movement	Available Stacking Distance (Feet)	2021 Without Project				2021 With Project			
			95th Percentile Queue (Feet)		Acceptable? [1]		95th Percentile Queue (Feet)		Acceptable? [1]	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM
US Highway 95 & Phelan Rd./Main St.	NBL	280	80	132	Yes	Yes	163 [2]	142	Yes	Yes
	SBL	**475**	142	173	Yes	Yes	194	429 [2]	Yes	Yes
US Highway 395 & Three Flags Rd.	NBL	**275**	263	241	Yes	Yes	263	241	Yes	Yes
	NBR	190	28	35	Yes	Yes	28	37	Yes	Yes
	SBL	225	46	66 [2]	Yes	Yes	46	66 [2]	Yes	Yes
	SBR	225	50	28	Yes	Yes	50	28	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table.

[4] **100** = Improvement

7 HORIZON YEAR (2040) TRAFFIC ANALYSIS

This section discusses the methods used to develop Horizon Year (2040) Without and With Project traffic forecasts and the resulting peak hour intersection operations, traffic signal warrant, queuing, freeway facility operations analyses.

7.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Horizon Year (2040) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Horizon Year (2040) traffic conditions only (e.g., intersection and roadway improvements along the Project's frontage and driveways).
- Other parallel facilities, that although not evaluated for the purposes of this analysis, are anticipated to be in place for Horizon Year traffic conditions and would affect the travel patterns within the study area.
- The future I-15 Freeway and Muscatel interchange is assumed to be constructed. Although the interchange is not included as part of this analysis, the shift in traffic patterns due to the future Muscatel Interchange has been assumed.

7.2 HORIZON YEAR (2040) WITHOUT PROJECT VOLUME FORECASTS

The Horizon Year (2040) Without Project analysis scenario includes the refined post-process volumes obtained from the SBTAM (see Section 4.9 *Horizon Year (2040) Conditions* of this TIA for a detailed discussion on the post-processing methodology). The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) Without Project traffic conditions are shown on Exhibits 7-1 and 7-2, respectively.

7.3 HORIZON YEAR (2040) WITH PROJECT VOLUME FORECASTS

The Horizon Year (2040) Without Project analysis scenario includes the refined post-process volumes obtained from the SBTAM, plus the traffic generated by the buildout of the proposed Project (see Section 4.9 *Horizon Year (2040) Conditions* of this TIA for a detailed discussion on the post-processing methodology). The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) With Project traffic conditions are shown on Exhibits 7-3 and 7-4, respectively.

7.4 INTERSECTION OPERATIONS ANALYSIS

Horizon Year (2040) Without and With Project peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TIA. The intersection analysis results are summarized in Table 7-1 for both Horizon Year (2040) Without and With Project traffic conditions.

7.4.1 HORIZON YEAR (2040) WITHOUT PROJECT CONDITIONS

As shown in Table 7-1, the following study area intersections are anticipated to operate at an unacceptable LOS during the peak hours under Horizon Year (2040) Without Project conditions:

- Verbena Road & Phelan Road (#2) – LOS E AM peak hour; LOS D PM peak hour
- Bellflower Street & Phelan Road (#3) – LOS D AM and PM peak hours
- US Highway 395 & Luna Road (#8) – LOS E AM peak hour; LOS F PM peak hour
- US Highway 395 & Bear Valley Road (#9) – LOS E AM peak hour; LOS F PM peak hour
- US Highway 395 & Eucalyptus Road (#10) – LOS E AM and PM peak hours
- US Highway 395 & Yucca Terrace Drive (#11) – LOS F AM and PM peak hours
- US Highway 395 & Phelan Road/Main Street (#12) – LOS F AM and PM peak hours
- US Highway 395 & Poplar Street (#13) – LOS F AM and PM peak hours
- US Highway 395 & Three Flags Road (#14) – LOS F AM peak hour only
- US Highway 395 & Joshua Street (#15) – LOS F PM peak hour only
- Escondido Avenue & Main Street (#23) – LOS E AM and PM peak hours
- Escondido Avenue & Sultana Street (#24) – LOS E AM peak hour; LOS F PM peak hour
- Topaz Avenue & Main Street (#25) – LOS E PM peak hour only

A summary of the peak hour intersection LOS for Horizon Year Without Project conditions are shown on Exhibit 7-5. The intersection operations analysis worksheets for Horizon Year Without Project traffic conditions are included in Appendix 7.1 of this TIA.

7.4.2 HORIZON YEAR (2040) WITH PROJECT CONDITIONS

With the addition of Project traffic, there are no additional study area intersections that are anticipated to operate at an unacceptable LOS during the peak hours. A summary of the peak hour intersection LOS for Horizon Year With Project conditions are shown on Exhibit 7-6. The intersection operations analysis worksheets for Horizon Year (2040) With Project traffic conditions are included in Appendix 7.2 of this TIA.

Table 7-1

Intersection Analysis for Horizon Year (2040) Conditions

#	Intersection	Traffic Control[2]	2040 Without Project				2040 With Project				Acceptable LOS

[1] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown. HCM delay reported in seconds.

[2] CSS = Cross-street Stop; TS = Traffic Signal; **CSS** = Improvement

EXHIBIT 7-5: HORIZON YEAR (2040) WITHOUT PROJECT SUMMARY OF LOS

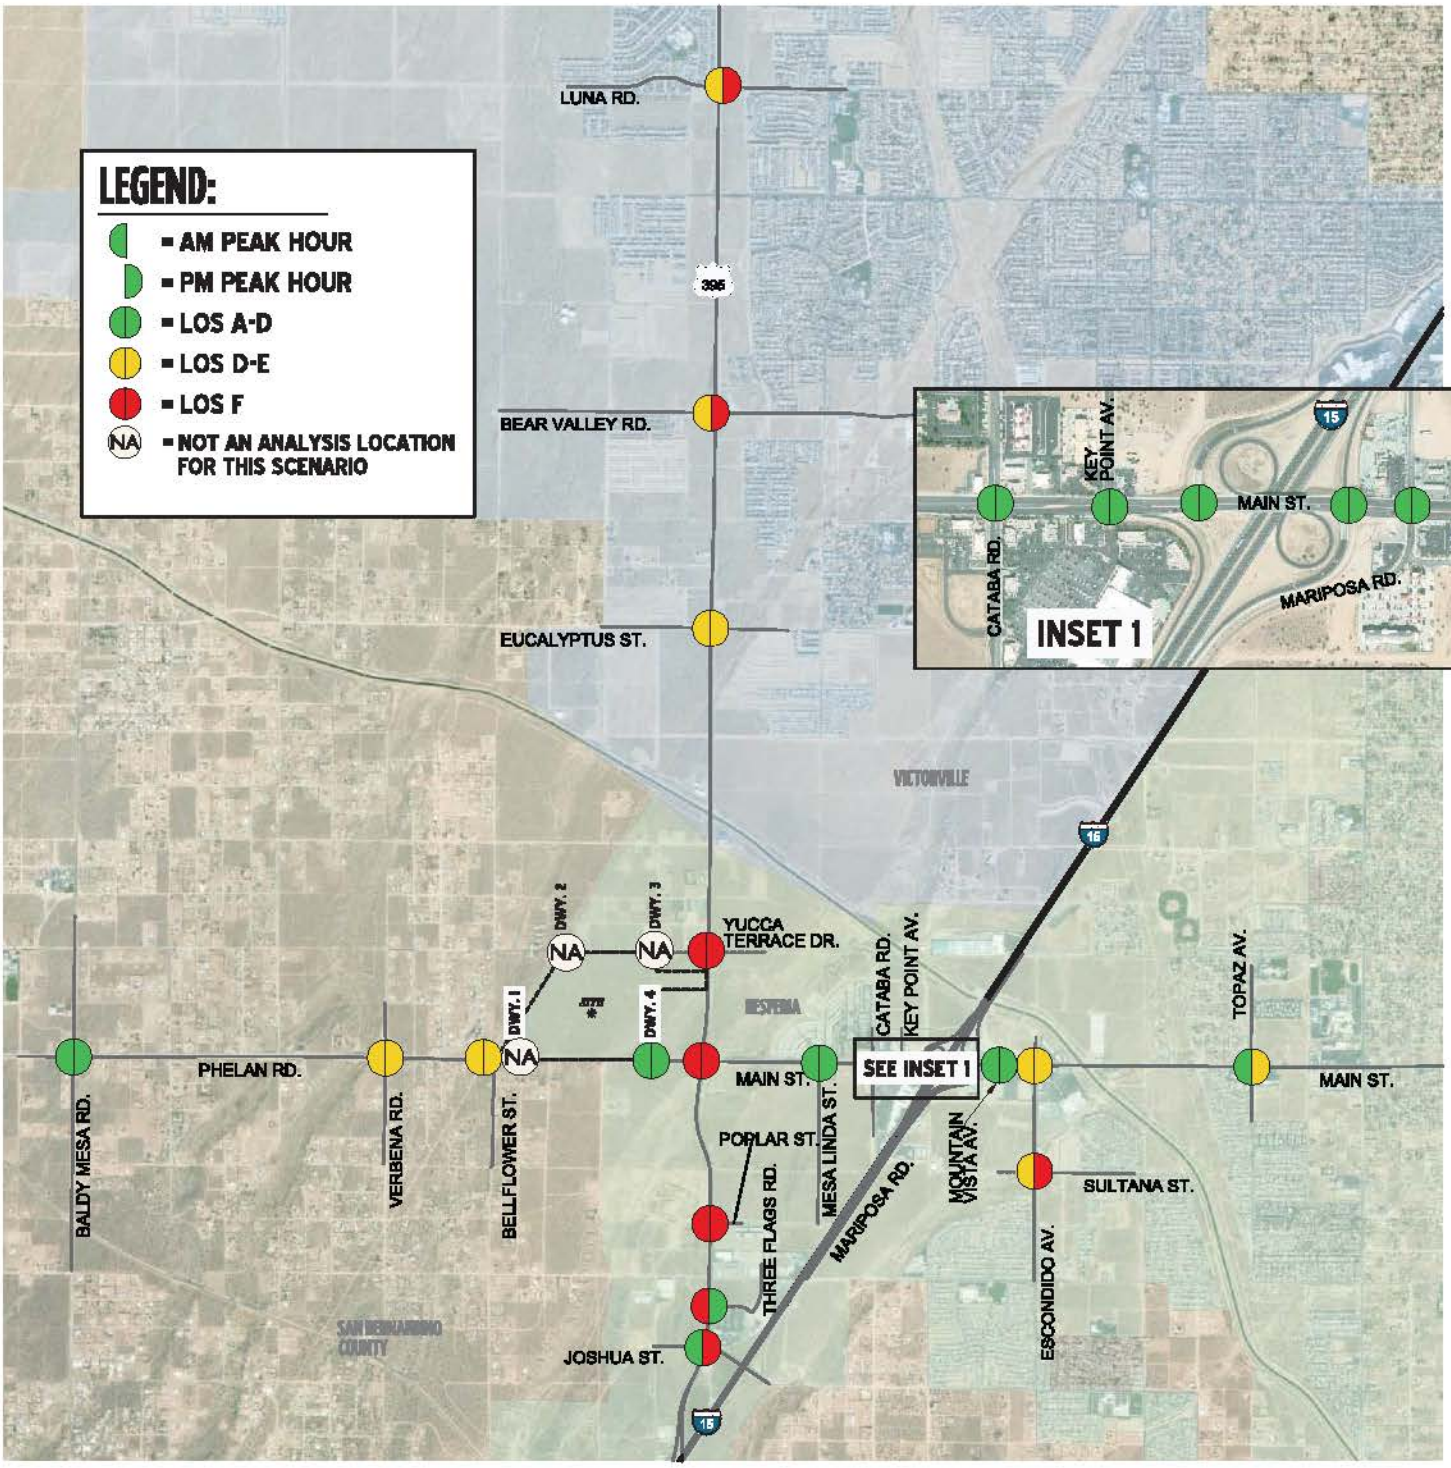

EXHIBIT 7-6: HORIZON YEAR (2040) WITH PROJECT SUMMARY OF LOS

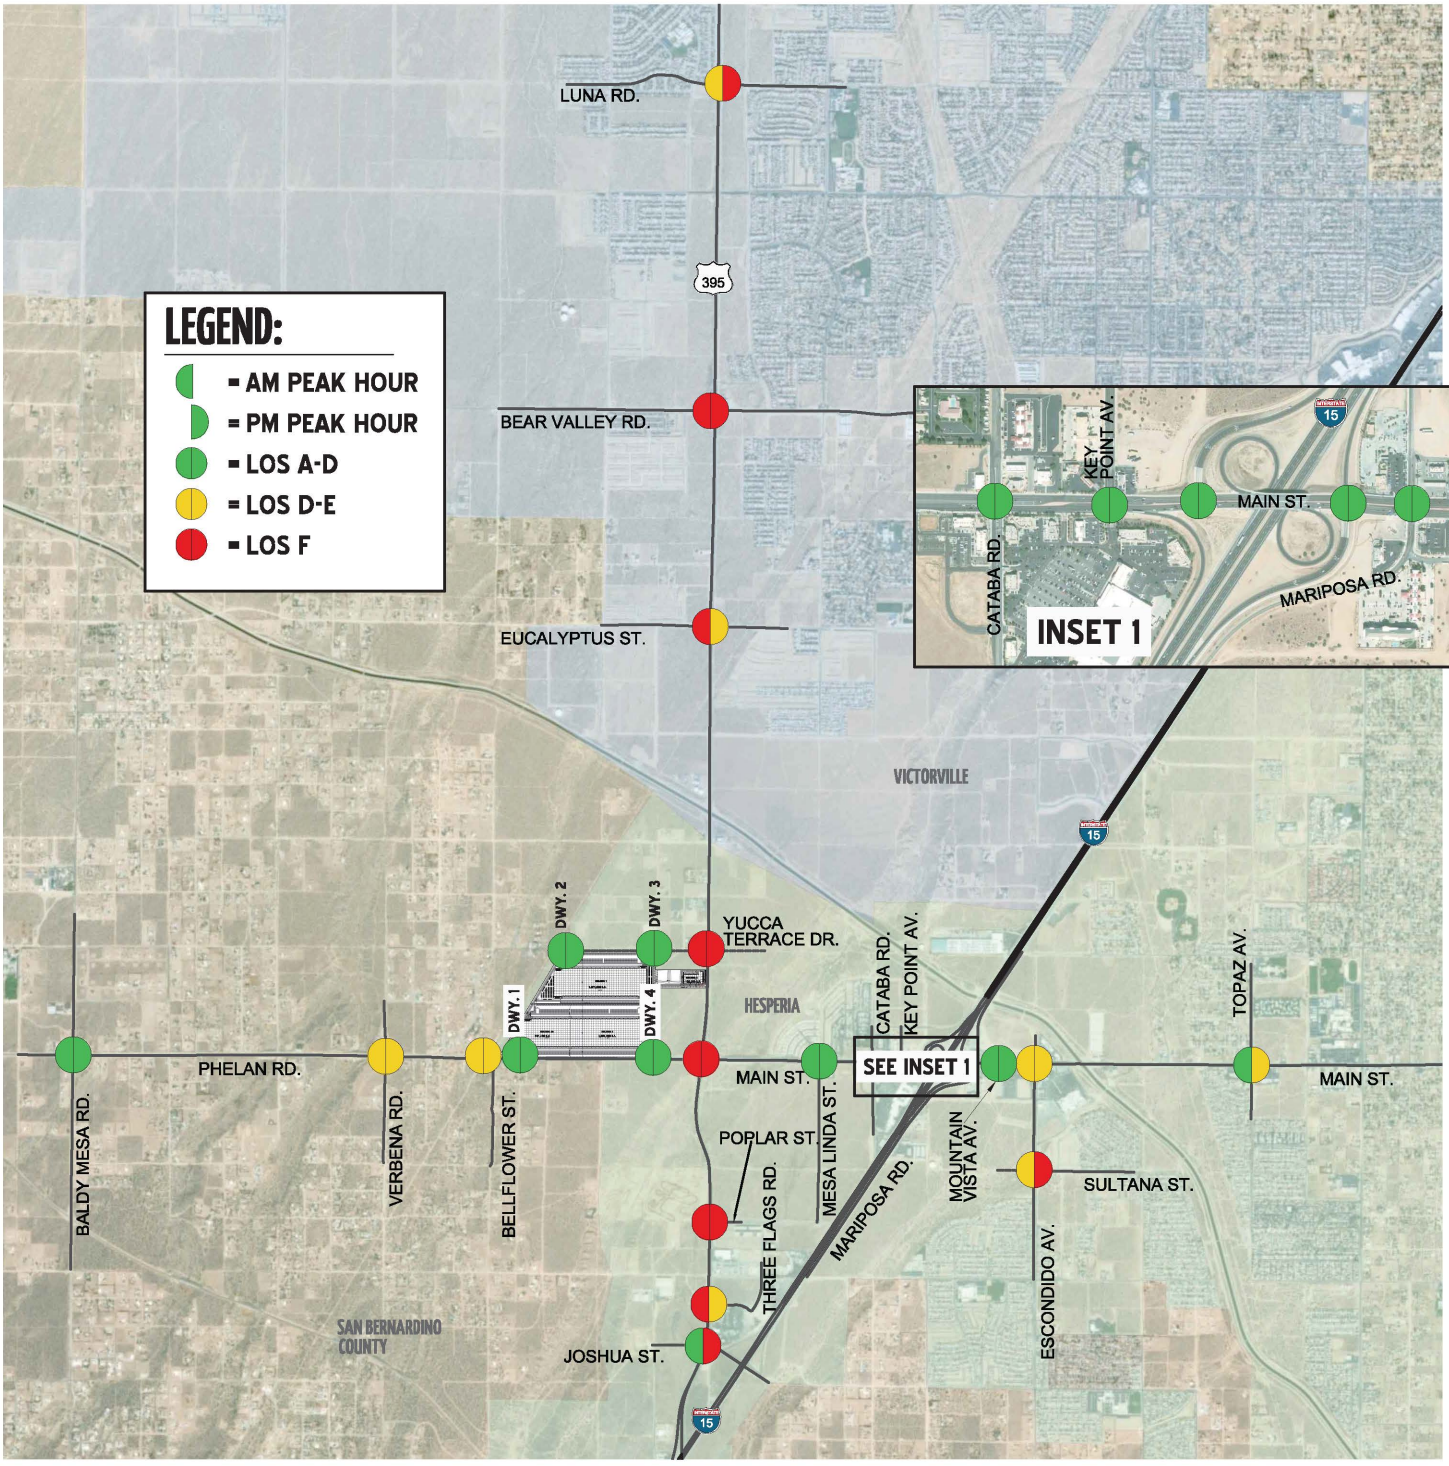

7.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

In addition to the locations previously warranted under Existing (2019), E+P, and Opening Year Cumulative (2021) traffic conditions, the following study area intersection is anticipated to meet a traffic signal warrant for Horizon Year (2040) Without Project traffic conditions:

- US Highway 395 & Poplar Street (#13)

There are no additional study area intersections that are anticipated to meet a traffic signal warrant for Horizon Year (2040) With Project traffic conditions. Worksheets for Horizon Year (2040) Without and With Project traffic conditions signal warrants are provided in Appendices 7.3 and 7.4, respectively.

7.6 QUEUING ANALYSIS

7.6.1 ARTERIAL ANALYSIS

A queuing analysis was performed for US Highway 395 from Luna Road to Joshua Street to assess vehicle queues along the roadways. Queuing analysis findings are presented in Table 7-2. It is important to note that the available stacking distances are consistent with the measured turn pocket lengths. As shown in Table 7-2, the following intersection turning movements are anticipated to experience periodic queuing issues during the peak hours based on the 95th percentile peak hour traffic flows for Horizon Year (2040) Without Project traffic conditions:

- US Highway 395 & Bear Valley Road (#9) Northbound Left – AM and PM peak hours
- US Highway 395 & Bear Valley Road (#9) Southbound Left – AM and PM peak hours
- US Highway 395 & Phelan Road/Main Street (#12) Northbound Left – PM peak hour only
- US Highway 395 & Phelan Road/Main Street (#12) Southbound Left – AM and PM peak hours
- US Highway 395 & Poplar Street (#13) Southbound Left – AM and PM peak hours
- US Highway 395 & Three Flags Road (#14) Northbound Left – AM and PM peak hours
- US Highway 395 & Joshua Street (#15) Southbound Left – AM and PM peak hours

There are no additional intersection turning movements that are anticipated to experience queuing issues during the peak hours based on the 95th percentile peak hour traffic flows for Horizon Year (2040) With Project traffic conditions, in addition to the movements identified under Horizon Year (2040) Without Project traffic conditions.

Table 7-2

	NBT/R	1,200	253	648 [2]	Yes	Yes	254	648 [2]	Yes	Yes
	NBR	700	258	648 [2]	Yes	Yes	258	648 [2]	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table.

7.6.2 FREEWAY OFF-RAMP ANALYSIS

A queuing analysis was performed for the off-ramps at the I-15 Freeway and Main Street interchange to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the I-15 Freeway mainline. Queuing analysis findings are presented in Table 7-2. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown in Table 7-2 and consistent with Existing (2019) traffic conditions, there are no off-ramp movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under Horizon Year (2040) Without Project traffic conditions. Worksheets for Horizon Year (2040) Without Project traffic conditions off-ramp queuing analysis are provided in Appendix 7.5.

There are no off-ramp movements that are anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows with the addition of Project traffic under Horizon Year (2040) With Project traffic conditions. Worksheets for Horizon Year (2040) Without Project traffic conditions off-ramp queuing analysis are provided in Appendix 7.6.

7.7 FREEWAY FACILITY ANALYSIS

Horizon Year (2040) Without Project mainline directional volumes for the AM and PM peak hours are provided on Exhibit 7-7. As shown in Table 7-3, the following study area freeway segments and merge/diverge ramp junctions analyzed for this study are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours for Horizon Year (2040) Without Project traffic conditions:

- I-15 Freeway Southbound, North of Main Street (#1) – LOS E AM and PM peak hours
- I-15 Freeway Southbound, Off-Ramp at Main Street (#2) – LOS E AM and PM peak hours
- I-15 Freeway Southbound, South of Main Street (#5) – LOS E AM peak hour only
- I-15 Freeway Southbound, North of US Highway 395 (#6) – LOS F AM peak hour; LOS E PM peak hour
- I-15 Freeway Southbound, On-Ramp at US Highway 395 (#7) – LOS F AM peak hour only
- I-15 Freeway Southbound, South of US Highway 395 (#8) – LOS F AM peak hour; LOS E PM peak hour
- I-15 Freeway Northbound, North of Main Street (#9) – LOS F PM peak hour only
- I-15 Freeway Northbound, On-Ramp at Main Street (#10) – LOS F PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at Main Street (#12) – LOS F PM peak hour only
- I-15 Freeway Northbound, South of Main Street (#13) – LOS F PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at US Highway 395 (#15) – LOS F PM peak hour only
- I-15 Freeway Northbound, South of US Highway 395 (#16) – LOS F PM peak hour only

[1] NB = Northbound; SB = Southbound

[2] Number of lanes are in the specified direction and is based on existing conditions.

[3] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[4] LOS = Level of Service

Horizon Year (2040) Without Project freeway facility analysis worksheets are provided in Appendix 7.7.

Horizon Year (2040) With Project mainline directional volumes for the AM and PM peak hours are provided on Exhibit 7-8. The following additional study area ramp junctions are anticipated to operate at an unacceptable LOS with the addition of Project traffic under Horizon Year (2040) With Project traffic conditions, resulting in a cumulative deficiency:

- I-15 Freeway Southbound, On-Ramp at Main Street (#4) – LOS E AM peak hour only
- I-15 Freeway Northbound, Loop On-Ramp at Main Street (#11) – LOS E PM peak hour only

Horizon Year (2040) With Project freeway facility analysis worksheets are provided in Appendix 7.8.

7.8 RECOMMENDED IMPROVEMENTS

This section provides a summary of Horizon Year (2040) deficiencies and recommended improvements. Based on the City of Hesperia deficiency criteria discussed in Section 2.7 *Minimum Acceptable Levels of Service (LOS) and Intersection Deficiency Criteria*, the following intersections were found to be deficient. Improvements necessary to improve traffic deficiencies back to acceptable levels are also discussed below.

7.8.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the proposed recommended improvements is presented in Table 7-4 for Horizon Year (2040) traffic conditions. The intersection operations analysis worksheets for Horizon Year (2040) Without Project and With Project traffic conditions, with improvements, are included in Appendices 7.9 and 7.10, respectively.

Recommended Improvement – US Highway 395 & Luna Road (#8) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 3rd northbound through lane.
- Restripe the southbound right turn lane to a 3rd southbound through lane.

Recommended Improvement – US Highway 395 & Bear Valley Road (#9) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound left turn lane.
- Add a 3rd northbound through lane.
- Add a northbound right turn lane.
- Add a 2nd southbound left turn lane.
- Add a 3rd southbound through lane.
- Add a southbound right turn lane.

	- With Project	TS	1	1	0	1	1	0	1	**3**	**0**	1	**3**	0	23.3	28.3	C	C

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; **1** = Improvement

[2] Per the Highway Capacity Manual (6th Edition), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] CSS = Cross-street Stop; TS = Traffic Signal; **TS** = Improvement

Recommended Improvement – US Highway 395 & Eucalyptus Street (#10) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 3rd northbound through lane.
- Add a 3rd southbound through lane.

Recommended Improvement – US Highway 395 & Yucca Terrace Drive (#11) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound through lane.
- Add a 2nd southbound through lane.
- Install a traffic signal (Project design feature).
- Add a northbound left turn lane (Project design feature).
- Add an eastbound left turn lane (Project design feature).
- Add a 3rd northbound through lane.
- Add a 3rd southbound through lane.

Recommended Improvement – US Highway 395 & Phelan Road/Main Street (#12) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 2nd northbound left turn lane.
- Add a 2nd southbound left turn lane.
- Add a 3rd eastbound through lane.
- Add a 3rd westbound through lane.
- Add a westbound right turn lane.
- Modify the traffic signal to implement overlap phasing for the westbound right turn lane.
- Add a 3rd northbound through lane.
- Add a northbound right turn lane.
- Add a 3rd southbound through lane.
- Add a southbound right turn lane.
- Add an eastbound right turn lane.

Recommended Improvement – US Highway 395 & Poplar Street (#13) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Install a traffic signal.
- Add a 3rd northbound through lane.
- Add a northbound right turn lane.
- Add a 2nd southbound left turn lane.
- Add a 2nd southbound through lane.
- Add a 3rd southbound through lane.

Recommended Improvement – US Highway 395 & Three Flags Road (#14) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 3rd northbound through lane.
- Add a 3rd southbound through lane.

Recommended Improvement – US Highway 395 & Joshua Street (#15) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Add a 3rd northbound through lane.
- Add a 3rd southbound through lane.
- Add a southbound right turn lane.

Recommended Improvement – Escondido Avenue & Main Street (#23) – The following improvement is necessary to bring the LOS back to acceptable levels:

- Add a 3rd westbound through lane.

Recommended Improvement – Escondido Avenue & Sultana Street (#24) – The following improvement is necessary to bring the LOS back to acceptable levels:

- Install a traffic signal.

Recommended Improvement – Topaz Avenue & Main Street (#25) – The following improvements are necessary to bring the LOS back to acceptable levels:

- Restripe the eastbound right turn lane to a 3rd eastbound through lane.
- Add a 3rd westbound through lane.

Although the intersections of Verbena Road at Phelan Road (#2) and Bellflower Street at Phelan Road (#3) are anticipated to operate at an unacceptable LOS (i.e., LOS D or worse) during the peak hours for Horizon Year (2040) traffic conditions, the Project does not contribute 10 or more peak hour trips to the minor street and the addition of Project traffic does not cause the intersection to meet a traffic signal warrant. As such, according to the County of San Bernardino deficiency criteria, the deficiency at this location does not require improvements.

7.8.2 RECOMMENDED IMPROVEMENTS TO ADDRESS QUEUING DEFICIENCIES

As shown previously in Table 7-2, there are peak hour queuing issues at seven intersection turning movements. Recommended improvements to address queuing issues for Horizon Year (2040) traffic conditions are shown in Table 7-5 and reflect the recommended improvements to address intersection deficiencies, as previously described in Section 7.8.1 *Recommended Improvements to Address Deficiencies at Intersections*.

In order to accommodate the 95th percentile peak hour queues for Horizon Year (2040) traffic conditions, the following improvements are necessary:

- US Highway 395 & Bear Valley Road (#9) – 150-foot northbound right turn pocket
- US Highway 395 & Bear Valley Road (#9) – 100-foot southbound right turn pocket
- US Highway 395 & Phelan Road/Main Street (#12) – 325-foot northbound right turn pocket
- US Highway 395 & Phelan Road/Main Street (#12) – 475-foot southbound left turn pocket
- US Highway 395 & Phelan Road/Main Street (#12) – 100-foot southbound right turn pocket
- US Highway 395 & Poplar Street (#13) – 100-foot northbound right turn pocket
- US Highway 395 & Three Flags Road (#14) – 275-foot northbound left turn pocket (restriping of existing pavement)
- US Highway 395 & Joshua Street (#15) – 300-foot southbound left turn pocket (restriping of existing pavement)
- US Highway 395 & Joshua Street (#15) – 100-foot southbound right turn pocket

Table 7-5

Peak Hour Queuing Summary for Horizon Year (2040) Conditions With Improvements

Intersection	Movement[4]	Available Stacking Distance (Feet)[5]	2040 Without Project				2040 With Project			
			95th Percentile Queue (Feet)		Acceptable?[1]		95th Percentile Queue (Feet)		Acceptable?[1]	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table.

[4] **NBR** = Improvement

[5] **100** = Improvement

7.8.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

According to the Caltrans I-15 Transportation Concept Report (TCR), the I-15 Freeway is anticipated to be constructed to include the addition of a carpool or High Occupancy Vehicle (HOV) lane. (12) For the purposes of this TIA, this improvement has been analyzed. Caltrans typically assumes a reduction of 14 percent to the freeway mainline through volumes in this region to account for vehicles utilizing the HOV lanes. The reduction to the I-15 Freeway mainline volumes has been applied to account for the proposed HOV lanes. The analysis has been performed assuming the same on and off-ramp configurations as existing baseline conditions at the I-15 Freeway and Main Street interchange.

As shown in Table 7-6, the I-15 Freeway mainline segment operations are anticipated to improve operations with the proposed Caltrans HOV lanes. Although the freeway facilities are anticipated to improve operations with the improvements, the following freeway segments and merge/diverge ramp junctions are anticipated to continue to operate at an unacceptable LOS during the weekday AM or PM peak hours with the improvements to the I-15 Freeway:

- I-15 Freeway Southbound, Off-Ramp at Main Street (#2) – LOS E AM and PM peak hours
- I-15 Freeway Southbound, North of US Highway 395 (#6) – LOS E AM and PM peak hours
- I-15 Freeway Southbound, South of US Highway 395 (#8) – LOS E AM and PM peak hours
- I-15 Freeway Northbound, North of Main Street (#9) – LOS E PM peak hour only
- I-15 Freeway Northbound, On-Ramp at Main Street (#10) – LOS E PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at Main Street (#12) – LOS F PM peak hour only
- I-15 Freeway Northbound, South of Main Street (#13) – LOS F PM peak hour only
- I-15 Freeway Northbound, Off-Ramp at US Highway 395 (#15) – LOS F PM peak hour only
- I-15 Freeway Northbound, South of US Highway 395 (#16) – LOS F PM peak hour only

The Project is anticipated to have a cumulative deficiency to the identified freeway mainline segments and merge/diverge ramp junctions; however, no improvements have been identified as no other improvements beyond those planned by the I-15 Freeway Project have been evaluated. Worksheets for Horizon Year (2040) With Project conditions freeway facility level of service analysis, with improvements, are provided in Appendix 7.13.

Neither Caltrans nor the State have adopted a fee program that can ensure that locally-contributed impact fees will be tied to improvements to freeway mainlines, and only Caltrans has the jurisdiction over mainline improvements. Because Caltrans has exclusive control over state highway improvements, ensuring that fair share contributions to mainline improvements are actually part of a program tied to implementation is within the jurisdiction of Caltrans.

Table 7-6

Freeway Facility Analysis for Horizon Year (2040) Conditions With Improvements

Freeway	Direction	Ramp or Segment	Lanes on Freeway[1]	2040 With Project			
				AM Peak Hour		PM Peak Hour	
				Density[2]	LOS[3]	Density[2]	LOS[3]
I-15	Southbound	North of Main St.	3	31.7	D	31.3	D
		Off-Ramp at Main St.	3	**36.2**	**E**	**36.5**	**E**
		Loop On-Ramp at Main St.	3	30.3	D	25.6	C
		On-Ramp at Main St.	3	27.9	D	27.9	D
		South of Main St.	3	32.2	D	26.5	D
		North of US Highway 395	3	**42.2**	**E**	**36.4**	**E**
		Southbound On-Ramp at US Highway 395	4	26.2	D	23.8	C
		South of US Highway 395	4	**43.5**	**E**	**35.4**	**E**
	Northbound	North of Main St.	3	22.4	C	**39.9**	**E**
		Northbound On-Ramp at Main St.	3	26.1	C	**36.0**	**E**
		Northbound Loop On-Ramp at Main St.	3	21.4	C	33.0	D
		Northbound Off-Ramp at Main St.	3	30.7	D	**41.3**	**F**
		South of Main St.	3	22.7	C	**45.0**	**F**
		North of US Highway 395	4	18.2	C	27.3	D
		Northbound Off-Ramp at US Highway 395	4	33.8	D	**46.5**	**F**
		South of US Highway 395	4	25.9	C	**45.0**	**F**

* **BOLD** = Unacceptable Level of Service

[1] Number of lanes are in the specified direction and is based on planned toll lanes (2 toll lanes in each direction).

[2] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[3] LOS = Level of Service

8 LOCAL AND REGIONAL FUNDING MECHANISMS

Transportation improvements within the City of Hesperia are funded through a combination of construction of off-site improvements by the Project, development impact fee programs or fair share contributions, such as the City of Hesperia Development Impact Fee (DIF) program. Identification and timing of needed improvements is generally determined through local jurisdictions based upon a variety of factors.

8.1 MEASURE "I" FUNDS

In 2004, the voters of San Bernardino County approved the 30-year extension of Measure "I", a one-half of one percent sales tax on retail transactions, through the year 2040, for transportation projects including, but not limited to, infrastructure improvements, commuter rail, public transit, and other identified improvements. The Measure "I" extension requires that a regional traffic impact fee be created to ensure development is paying its fair share. A regional Nexus study was prepared by SBCTA and concluded that each jurisdiction should include a regional fee component in their local programs to meet the Measure "I" requirement. The regional component assigns specific facilities and cost sharing formulas to each jurisdiction and was most recently updated in September 2017. Revenues collected through these programs are used in tandem with Measure "I" funds to deliver projects identified in the Nexus Study.

While Measure "I" is a self-executing sales tax administered by SBCTA, it bears discussion here because the funds raised through Measure "I" have funded in the past, and will continue to fund, new transportation facilities in San Bernardino County, including within the City of Hesperia.

8.2 CITY OF HESPERIA DEVELOPMENT IMPACT FEE PROGRAM

The City of Hesperia has created its own local DIF program to impose and collect fees from new residential, commercial and industrial development for the purpose of funding roadways and intersections necessary to accommodate City growth as identified in the City's General Plan Circulation Element. The City's DIF includes a Regional Circulation System Fee to comply with Measure "I" and a Local Circulation System Fee to address transportation improvements which are locally noteworthy. The City of Hesperia DIF facilities list has been provided by City staff.

Under the City's DIF program, the City may grant to developers a credit against specific components of fees when those developers construct certain facilities and landscaped medians identified in the list of improvements funded by the DIF program. The timing to use the DIF fees is established through periodic capital improvement programs which are overseen by the City's Public Works Department. Periodic traffic counts, review of traffic accidents, and a review of traffic trends throughout the City are also periodically performed by City staff and consultants. The City uses this data to determine the timing of implementing the improvements listed in its facilities list. The City also uses this data to ensure that the improvements listed on the facilities list are constructed before the LOS falls below the LOS performance standards adopted by the City. In this way, the improvements are constructed before the LOS falls below the City's LOS performance thresholds.

The Project Applicant will be subject to the City's DIF fee program and will pay the requisite City DIF fees at the rates then in effect. The Project Applicant's payment of the requisite DIF fees at the rates then in effect pursuant to the DIF Program will reduce its deficiencies to DIF-funded facilities. After the City's DIF fees are collected, they are placed in a separate interest-bearing account pursuant to the requirements of Government Code § 66000 *et seq*. The timing to use the DIF fees is established through periodic capital improvement programs which are overseen by the City's Public Works Department.

8.3 FAIR SHARE CONTRIBUTION

Project improvements may include a combination of fee payments to established programs (e.g., DIF), construction of specific improvements, payment of a fair share contribution toward future improvements or a combination of these approaches. Improvements constructed by development may be eligible for a fee credit or reimbursement through the program where appropriate (to be determined at the City of Hesperia's discretion).

When off-site improvements are identified with a minor share of responsibility assigned to proposed development, the approving jurisdiction may elect to collect a fair share contribution or require the development to construct improvements. Detailed fair share calculations, for each peak hour, have been provided in Table 8-1 for the applicable deficient intersections shown previously in Table 1-3. Improvements included in a defined program and constructed by development may be eligible for a fee credit or reimbursement through the program where appropriate.

Table 8-1

Project Fair Share Calculations

#	Intersection		Existing	Project Only	Horizon Year (2040) With Project	Net New Traffic	Project % of New Traffic
9	US Highway 395 & Bear Valley Rd.

SCOPING AGREEMENT FOR TRAFFIC IMPACT STUDY

This letter acknowledges the City of Hesperia requirements for Traffic impact analysis of the following project. The analysis must follow either the Riverside County Transportation Department Traffic Study Guidelines dated **April 2008**; or San Bernardino County Transportation Authority (SBCTA) congestion management plan (CMP) guidelines as applicable.

Mr. Mike Thornton
City of Hesperia
9700 Seventh Avenue
Hesperia, CA 92345

SUBJECT: HESPERIA COMMERCE CENTER II TRAFFIC IMPACT ANALYSIS SCOPING AGREEMENT (REVISED)

Dear Mr. Mike Thornton:

Urban Crossroads, Inc. is pleased to submit this scoping letter regarding the traffic impact analysis for Hesperia Commerce Center II ("Project"), which is located northwest of U.S. Highway 395 and Main Street/Phelan Road in the City of Hesperia. This letter describes the proposed Project trip generation, trip distribution, and analysis methodology, which have been used to establish the draft proposed Project study area and analysis locations.

PROJECT DESCRIPTION

A preliminary site use plan for the proposed Project is shown on Exhibit 1. Exhibit 2 depicts the location of the proposed project in relation to the existing roadway network. The Project is anticipated to have an Opening Year of 2021. Access to the Project site will be provided via 2 driveways on Phelan Road, 2 driveways on the future Yucca Terrace Drive, and 1 proposed driveway on US Highway 395. The access on US Highway 395 is subject to Caltrans approval and Driveway 1 on Phelan Road is subject to County of San Bernardino approval. Both Caltrans and the County have reviewed the proposed access as shown. Driveway 4 shall be a shared driveway that will provide reciprocal access to the parcel on the southwest corner of US Highway 395 and Phelan Road. Signal modification will be required and coordination with the adjacent development to accommodate the reciprocal access agreement. It is our understanding that the Project is to consist of 2,361,648 square feet (sf) of High-Cube Fulfillment Center Warehouse use (65% of the total sf of buildings 1 and 2), 1,271,656 sf of General Light Industrial use (35% of the total sf of buildings 1 and 2), and 112,125 sf of General Light Industrial use within building 3. The Project will be evaluated in a single phase.

TRIP GENERATION

Trip generation represents the amount of traffic that is attracted and produced by a development and is based upon the specific land uses planned for a given project. In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published in the High-Cube Warehouse Trip Generation Study (WSP, January 29, 2019) for the High-Cube Fulfillment Center Warehouse use and in the Institute of Transportation Engineers (ITE) Trip Generation Manual (10th Edition, 2017) for the General Light Industrial use were utilized. Trip generation rates for the Project are shown in Table 1 for

both passenger car equivalent (PCE) and actual vehicles. The trip generation summary show in Table 2 indicates the daily and peak hour trip generation estimates for the proposed Project in actual vehicles and PCE. For purposes of this analysis, the following land use and vehicle mix has been utilized:

- High-Cube Fulfillment Center Warehouse has been used to derive site specific trip generation estimates for buildings 1 and 2 of the proposed Project. The Institute of Transportation Engineers Trip Generation Manual (10th Edition, 2017) has trip generation rates for high-cube fulfillment center use (ITE land use code 155), however, these rates are unreliable because they are based on limited data (i.e., one to two surveyed sites) and the ITE Trip Generation Manual recommends the use of local data sources where available. As such, the trip-generation statistics published in the High-Cube Warehouse Trip Generation Study (WSP, January 29, 2019) which was commissioned by the Western Riverside Council of Governments (WRCOG) in support of the Transportation Uniform Mitigation Fee (TUMF) update, has been utilized for the high-cube fulfillment center use. The WSP trip generation rates were published in January 2019 and are based on data collected at 11 local high-cube fulfillment center sites. However, the WSP study does not include a split for inbound and outbound vehicles, as such, the inbound and outbound splits per the ITE High-Cube Warehouse Vehicle Trip Generation Analysis (October 2016) have been utilized.
- General Light Industrial (ITE 110): A light industrial facility is a free-standing facility devoted to a single use. The facility has an emphasis on activities other than manufacturing and typically has minimal office space. The ITE Trip Generation Manual and the ITE Trip Generation Handbook does not provide a vehicle mix for the General Light Industrial (ITE land use code 110) land use. As such, the vehicle mix identified in the City of Fontana Truck Trip Generation Study has been utilized for the General Light Industrial land use.

Finally, PCE factors were applied to the trip generation rates to convert trips made by heavy trucks (large 2-axles, 3-axles, 4+-axles) to PCE values. PCEs allow the typical "real-world" mix of vehicle types to be represented as a single, standardized unit, such as the passenger car, to be used for the purposes of capacity and level of service analyses. The PCE factors are consistent with the recommended PCE factors in Appendix B of the San Bernardino County Congestion Management Program (CMP) (2016 Update).

As shown on Table 2, the proposed Project is anticipated to generate a total of 11,898 actual vehicle trip-ends per day with 1,258 AM peak hour trips and 1,261 PM peak hour trips. In comparison, the proposed Project is anticipated to generate a total of 15,152 PCE trip-ends per day, 1,587 PCE AM peak hour trips and 1,570 PCE PM peak hour trips (see Table 2).

TRIP DISTRIBUTION

The Project trip distribution represents the directional orientation of traffic to and from the Project site. Trip distribution is the process of identifying the probable destinations, directions or traffic routes that

will be utilized by Project traffic. The potential interaction between the planned land uses and surrounding regional access routes are considered to identify the route where the Project traffic would distribute. Truck distribution patterns will be based on truck routes, the site's proximity to the regional freeway system and likely distribution of traffic if a future tenant is known. Passenger car distribution patterns will be based on existing and planned land uses in the area along with the planned circulation system. Exhibit 3 illustrates the truck trip distribution patterns for the Project and Exhibit 4 illustrates the passenger car trip distribution patterns.

ANALYSIS SCENARIOS

Consistent with the County's TIA guidelines, intersection analysis will be provided for the following analysis scenarios:

- Existing (2019) Conditions
- Existing plus Project (E+P) Conditions
- Opening Year Cumulative (2021) Without Project Conditions
- Opening Year Cumulative (2021) With Project Conditions (Project Buildout)
- Horizon Year (2040) Without Project Conditions
- Horizon Year (2040) With Project Conditions (Project Buildout)

* Ambient growth assumptions are included for Opening Year Cumulative traffic conditions.

All study area intersections will be evaluated using the Highway Capacity Manual (HCM) 6th Edition analysis methodology. The following study intersections will be evaluated:

1. Baldy Mesa Rd. & Phelan Rd.
2. Verbena Rd. & Phelan Rd.
3. Bellflower St. & Phelan Rd.
4. Driveway 1 & Phelan Rd.
5. Driveway 2 & Yucca Terrace Dr.
6. Driveway 3 & Yucca Terrace Dr.
7. Driveway 4 & Phelan Rd.
8. US Highway 395 & Luna Rd.
9. US Highway 395 & Bear Valley Rd.
10. US Highway 395 & Eucalyptus St.
11. US Highway 395 & Yucca Terrace Dr.
12. US Highway 395 & Driveway 5
13. US Highway 395 & Main St./Phelan Rd.

14. US Highway 395 & Poplar St.
15. US Highway 395 & Three Flags Rd.
16. US Highway 395 & Joshua St.
17. Mesa Linda St. & Main St.
18. Catawba Rd. & Main St.
19. Key Point Av. & Main St.
20. I-15 SB Ramps & Main St.
21. I-15 NB Ramps & Main St.
22. Mariposa Rd. & Main St.
23. Mountain Vista Av. & Main St.
24. Escondido Av. & Main St.
25. Escondido Av. & Sultana St.
26. Topaz Av. & Main St.

Pursuant to discussions with County of San Bernardino staff, Driveway 1 on Phelan Road will be restricted to right-in/right-out access only. Note that Driveway 4 on Phelan Road is proposed to provide reciprocal access to the adjacent parcel. The access at Driveway 5 on US Highway 395 is subject to Caltrans District 8 approval.

CUMULATIVE PROJECTS

Exhibit 5 and Table 3 show the locations and list of proposed cumulative projects within the study area. These cumulative projects have been provided by the City of Hesperia and County of San Bernardino.

TRAFFIC COUNTS

Traffic counts are to be conducted once the scoping agreement has been approved. Counts will be conducted on a Tuesday, Wednesday, or Thursday when schools are in session and operating on normal bell schedules.

CALTRANS FACILITIES

The following Caltrans facilities will also be evaluated as part of the traffic study:

- Conduct freeway segment analysis for the following mainline freeway segments based on the currently accepted Highway Capacity Manual (HCM) Freeway Facilities Analysis methodology for each analysis scenario for the following freeway segments, in each direction of travel:
    - I-15 Freeway Southbound, north of Main Street
    - I-15 Freeway Southbound, south of US Highway 395
    - I-15 Freeway Northbound, south of Main Street
    - I-15 Freeway Northbound, south of US Highway 395
- Perform Merge/Diverge analysis for the following ramp junctions for each analysis scenario using the HCM Freeway Facilities Analysis methodology:
    - I-15 Freeway Southbound, Off-Ramp at Main Street
    - I-15 Freeway Southbound, On-Ramp at Main Street
    - I-15 Freeway Southbound, On-Ramp at US Highway 395
    - I-15 Freeway Northbound, Loop On-Ramp at Main Street
    - I-15 Freeway Northbound, Off-Ramp at Main Street
    - I-15 Freeway Northbound, Off-Ramp at US Highway 395
- Conduct queuing analysis to identify the storage necessary to accommodate 95th percentile queues during peak hour traffic flows for each analysis scenario, at the following locations:
    - US Highway 395 & Luna Road
    - US Highway 395 & Bear Valley Road
    - US Highway 395 & Eucalyptus Street
    - US Highway 395 & Main Street/Phelan Road
    - US Highway 395 & Poplar Street
    - US Highway 395 & Three Flags Road
    - US Highway 395 & Joshua Street
    - I-15 Southbound Off-Ramp & Main Street
    - I-15 Northbound Off-Ramp & Main Street

SPECIAL ISSUES

The following special issues will be addressed in the traffic study:

- Truck turning templates will be used to address how Project truck traffic (e.g., large trucks such as a WB-67) would enter and exit the Project site to determine radii at curb returns, radii of streets per Highway Design Manual, and widths/radii required for on-site maneuvering for two-way truck traffic.
- Traffic signal warrant analysis will be conducted for all unsignalized study area intersections, as applicable.
- "Fair-share" contributions for improvements within the City's DIF program and within in other jurisdictions will be included in the TIA. It is recommended that the City provide a list of facilities and improvements that are included in the City's DIF and/or CIP programs.
- Caltrans signal timing has been obtained from District 8 and will be utilized for Caltrans ramp locations. The scoping agreement has also been shared with Caltrans District 8 to obtain comments with respect to analysis methodology for Caltrans facilities and on the proposed driveway on US Highway 395.
- Review the initial estimates of the raw peak hour turning movement volumes for reasonableness, including the review of traffic flow conservation and peak-to-daily volume ratios.
- Adjust the initial raw model estimates to achieve flow conservation, reasonable growth, and plausible diversion between parallel routes through post-processing.
- Conduct a queuing analysis for all Project driveways and site adjacent intersections, including Driveway 4 on Phelan Road (planned shared driveway with the adjacent development).

CONCLUSION

Urban Crossroads, Inc. is pleased to submit this letter documenting the Project trip generation, trip distribution, and the recommended intersection analysis locations for the Hesperia Commerce Center II Traffic Impact Study. We will continue to move forward towards completing the traffic study after receiving jurisdiction approval or comments finalizing the study area.

If you have any questions, please contact me directly at (949) 336-5982.

Respectfully submitted,

URBAN CROSSROADS, INC.

EXISTING (2019) CONDITIONS TRAFFIC SIGNAL WARRANT ANALYSIS WORKSHEETS

This Page Intentionally Left Blank

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

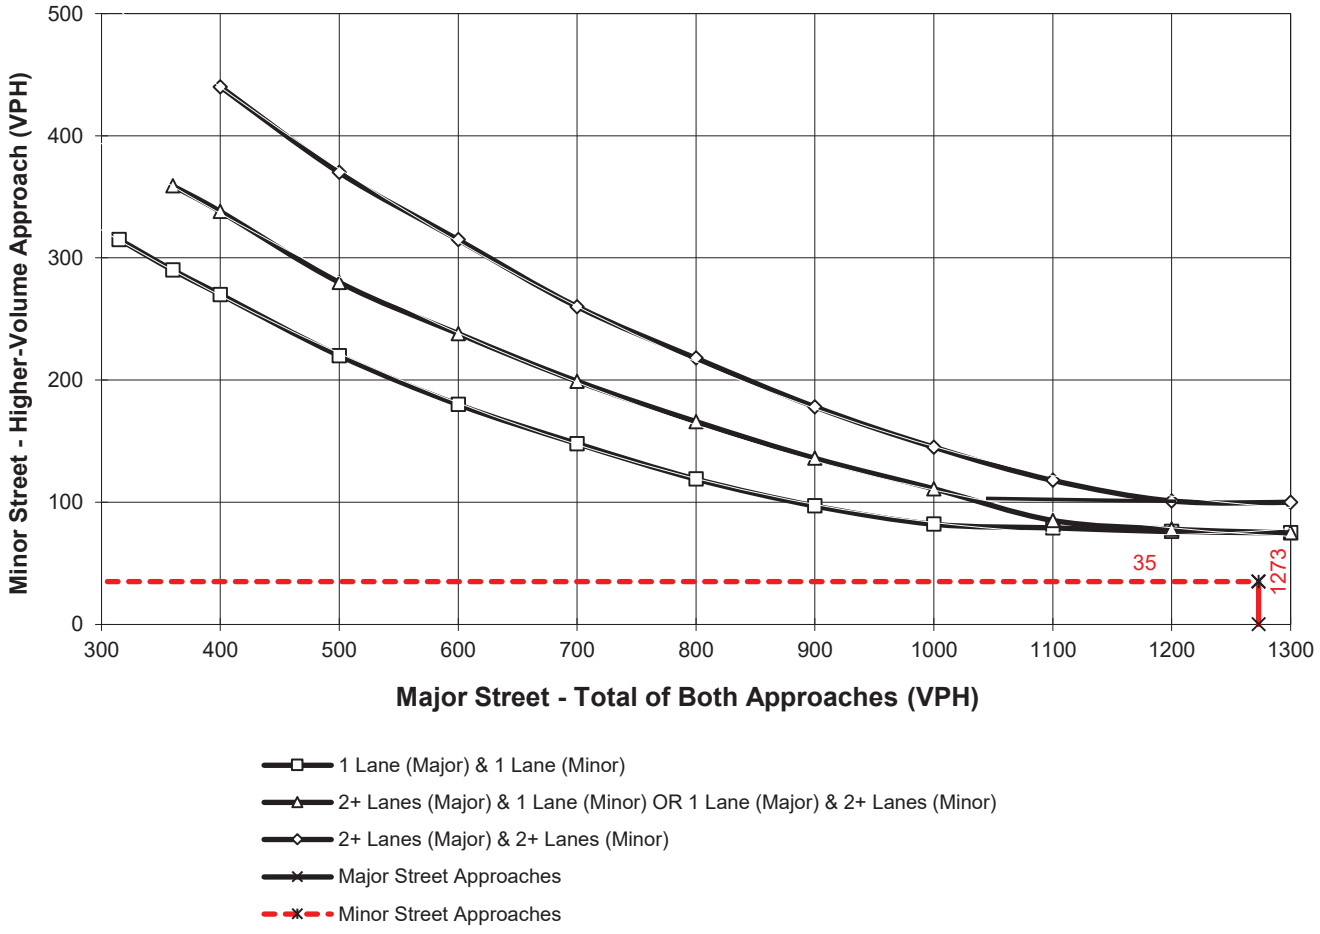
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **Existing (2019) Conditions - Weekday AM Peak Hour**

Major Street Name = **Phelan Road** — Total of Both Approaches (VPH) = **1273**
Number of Approach Lanes Major Street = **1**

Minor Street Name = **Verbena Road** — High Volume Approach (VPH) = **35**
Number of Approach Lanes Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED



*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

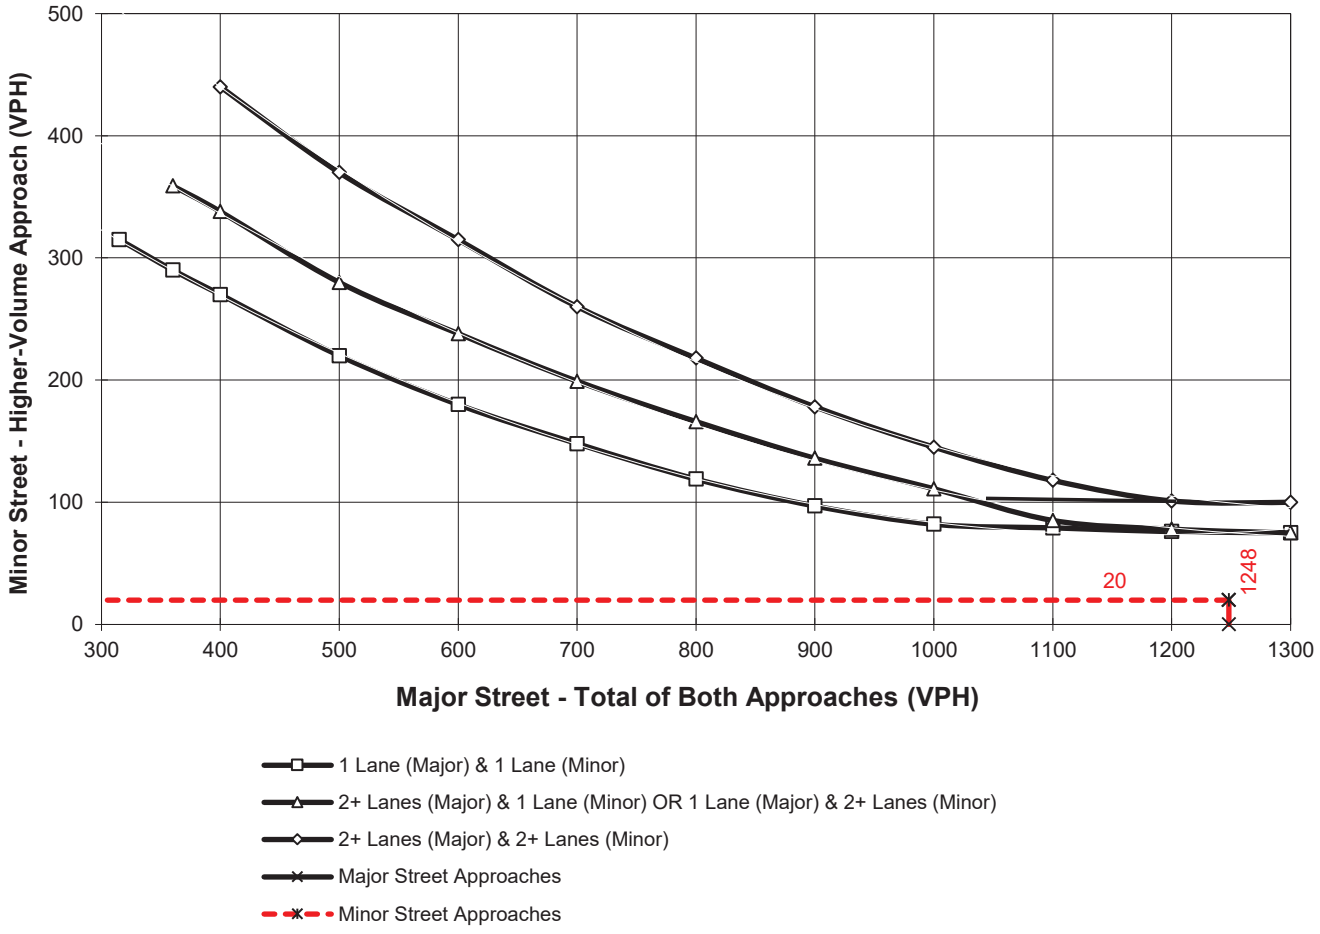
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **Existing (2019) Conditions - Weekday AM Peak Hour**

Major Street Name = **Phelan Road** Total of Both Approaches (VPH) = **1248**
Number of Approach Lanes Major Street = **1**

Minor Street Name = **Bellflower Street** High Volume Approach (VPH) = **20**
Number of Approach Lanes Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED



*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

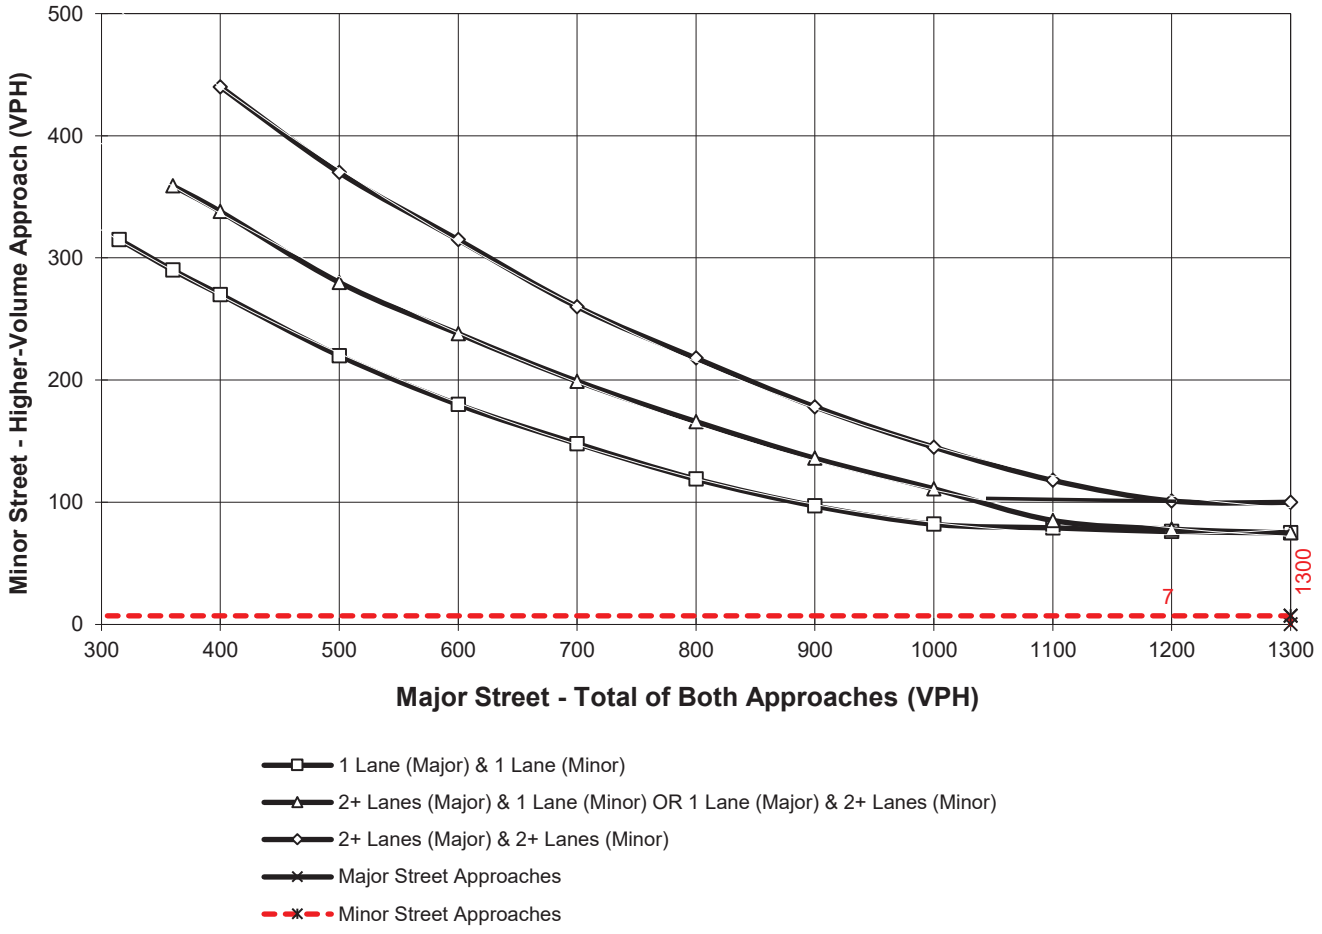
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **Existing (2019) Conditions - Weekday PM Peak Hour**

Major Street Name = **US Highway 395** Total of Both Approaches (VPH) = **2395**
Number of Approach Lanes Major Street = **1**

Minor Street Name = **Yucca Terrace Drive** High Volume Approach (VPH) = **7**
Number of Approach Lanes Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED



*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

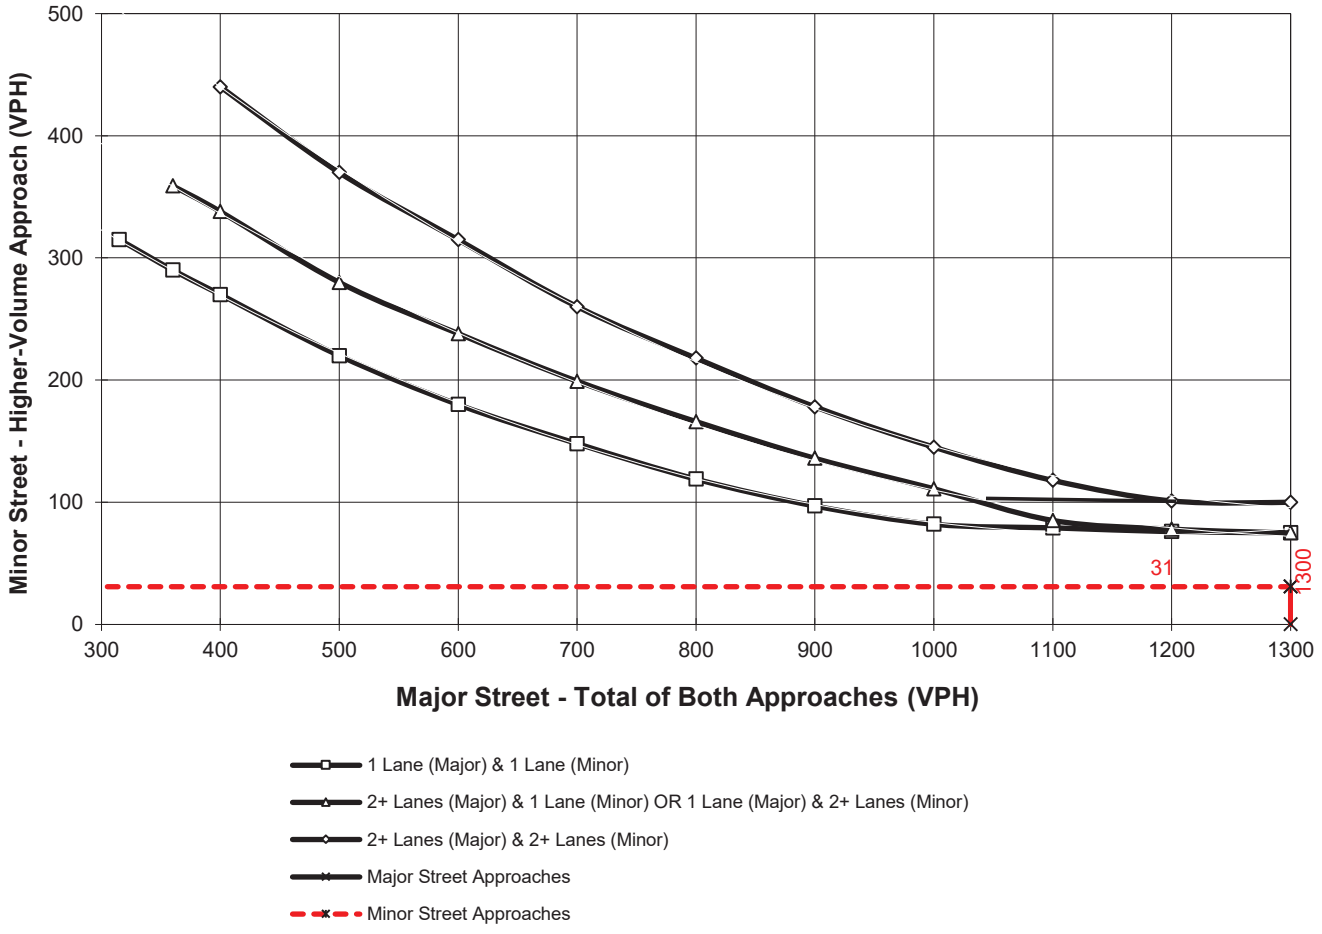
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **Existing (2019) Conditions - Weekday PM Peak Hour**

Major Street Name = **US Highway 395**
Total of Both Approaches (VPH) = **2129**
Number of Approach Lanes Major Street = **2**

Minor Street Name = **Poplar Street**
High Volume Approach (VPH) = **31**
Number of Approach Lanes Minor Street = **2**

SIGNAL WARRANT NOT SATISFIED



*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

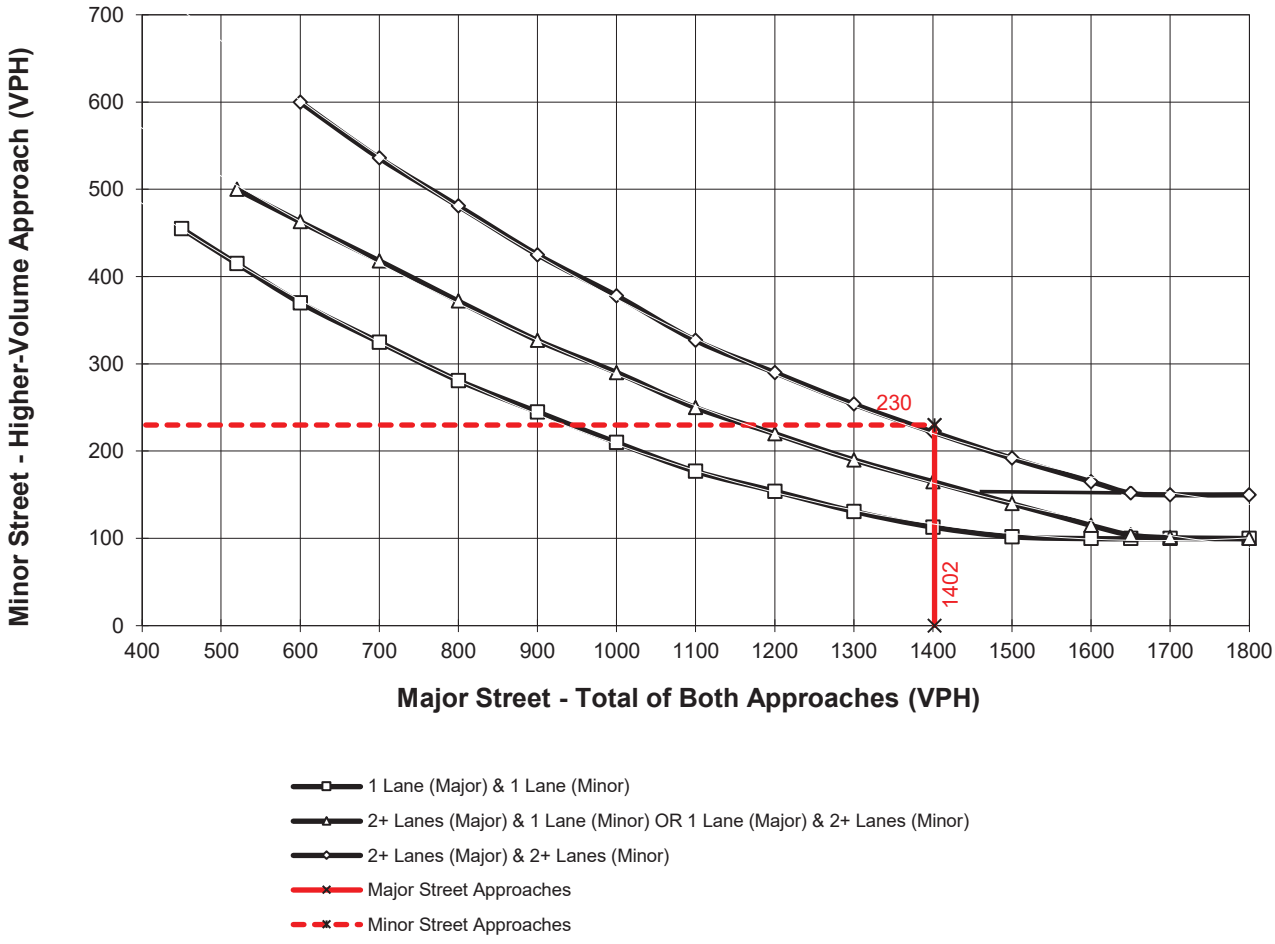
Figure 4C-3. Warrant 3, Peak Hour

Traffic Conditions = **Existing (2019) Conditions - Weekday AM Peak Hour**

Major Street Name = **Escondido Avenue**
Total of Both Approaches (VPH) = **1402**
Number of Approach Lanes on Major Street = **2**

Minor Street Name = **Sultana Street**
High Volume Approach (VPH) = **230**
Number of Approach Lanes On Minor Street = **1**

WARRANTED FOR A SIGNAL



*Note: 150 vph applies as the lower threshold for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold for a minor-street approach with one lane
