Notes:
Data reported prior to January 2007 was provided by ERM.
Only VOCs detected in one or more samples are listed.
< = Not present at or above listed reporting limit.
Bold = Results in excess of MCL.
J = Estimated result between method detection limit and reporting limit.
ID = Due to low levels of the analyte found in the sample, the analyte was qualitatively identified based on the compound's retention time and the presence of a single mass ion.
U = Reported concentration should be considered not detected above the reported sample value.
u = Nondetected, estimated report limit.
A-01 = Sample reanalyzed to confirm the hit
H3 = Sample was received and analyzed past holding time
--- No MCL
NA = Not Analyzed
low-flow = Field duplicate sample collected using low-flow purging and sampling techniques/equipment.
After July 2002, all samples collected using low-flow techniques/equipment.

[1] - BMW-6: Chloroethane also detected at estimated concentration of 1.6 mg/l.
[2] - BMW-6: Chloroethane detected at a concentration of 2.6 mg/l and 2-Butanol at estimate concentration of 11.0 mg/l
[3] - BMW-6 duplicate: Chloroethane detected at a concentration of 2.7 mg/l and 2-Butanol at estimate concentration of 10.0 mg/l.
[4] - BMW-6 duplicate: Chloroethane detected at a concentration of 2.1 ug/l and Tert-amyl methyl ether at a concentration of 2.5 ug/l.
[5] - BMW-9: 1,1,2,2-tetrachloroethane also detected at 0.7 mg/l.
[6] - BMW-15: Dichlorodifluoromethane also detected at 4.7 mg/l.
[7] - BMW-15: Freon-12 also detected at 8.3 mg/l.
[8] - BMW-15: Freon-12 also detected at 3.3 mg/l; Trichlorofluoromethane also detected at 1.1 mg/l.
[9] - Methylene chloride detected at 190J µg/L in this BMW-4 sample.
[10] - Chloroform detected at 1.1 µg/L in this QCTB sample.
[11] - tert-Butanol (TBA) was also detected with a J lab qualifier.
[12] - 2-Butanone was also detected in the equipment blank collected in January 2008. 2-Butanone was not detected in any of the samples collected from the wells.
[13] - January 18, 2008 - BMW-5, BMW-6, and BMW-20 sample collection order after BMW-4 may have influenced analytical results. Wells were resampled on March 7, 2008 and reflect normal well sampling order.

Abbreviations:
ug/l = Micrograms per liter
DCA = Dichloroethane
DCE = Dichloroethene
DIPE = Di-isopropyl ether
dup = Duplicate sample
EB = Equipment blank
FD = Field duplicate
MCL = California Maximum Contaminant Level (California Department of Public Health;CRWQCB 2008)
MtBE = Methyl tert-butyl ether
NA = Not analyzed
NS = Not sampled
p-IPT = p-isopropyl toluene
PCE = Tetrachloroethene
QA/QC = Quality assurance/Quality control
TCE = Trichloroethene
TMB = Trimethylbenzene
USEPA = United States Environmental Protection Agency
VOC = Volatile organic compounds

SUBJECT: Annual Groundwater Monitoring Report - 2013 Certification
Former Cornfield Yard, 1245 North Spring Street, Los Angeles, California
Spills, Leaks, Investigation, and Cleanup (SLIC) Program, Case No. 891

Dear Mr. Bishop,

ARCADIS has prepared the attached Annual Groundwater Monitoring Report - 2013 on behalf of the Union Pacific Railroad Company (UPRR) to summarize the results of the annual groundwater monitoring event performed at the Former Cornfield Yard in Los Angeles, California. The report is due on January 30, 2014.

I, James E. Diel, do hereby declare, under penalty of perjury under the laws of the State of California, that I am the Manager of Environmental Site Remediation for the Union Pacific Railroad Company, that I am authorized to attest to the veracity of the information contained in the report described herein, and that the information contained in the Annual Groundwater Monitoring Report - 2013, dated January 30, 2014, is true and correct, and that this declaration was executed at Roseville, CA, on January 23, 2014

If you have any questions or comments, please contact me at 916-789-5184.

Sincerely,

James E. Diel
Manager of Site Remediation

Dear Mr. Bishop:

ARCADIS U.S., Inc. (ARCADIS) has prepared this report on behalf of the Union Pacific Railroad Company (UPRR) to summarize the results of the annual groundwater monitoring event performed at the Former Cornfield Yard in Los Angeles, California ("the Site"; Figures 1 and 2). The groundwater monitoring program was first implemented beginning in August 2000 at the request of the California Regional Water Quality Control Board, Los Angeles Region (RWQCB).

A request for "no further action" (NFA) and site closure was included in the *Addendum to the Summary of Site Conditions and Request for Closure Report, Former Cornfield Yard*, prepared by ARCADIS and dated January 2010 (ARCADIS 2010a and 2010b), and reiterated in subsequent documents. In response, the RWQCB in correspondence dated May 25, 2010 (RWQCB 2010), requested that additional annual monitoring should occur to document further decreases in benzene concentrations prior to considering a NFA for the Site. Annual groundwater monitoring activities performed in the third quarter of 2013 included the following items as approved by the RWQCB in their June 28, 2013 letter (RWQCB 2013):

- Measurement of groundwater elevations from all accessible groundwater monitoring wells, and collection of groundwater samples from wells BMW-4 and BMW-6.
- Analysis of groundwater samples for volatile organic compounds (VOCs) including fuel oxygenates using United States Environmental Protection Agency (USEPA) Method 8260B and Volatile and Extractable Fuel Hydrocarbons by Method 8015M.
- Collection of field parameters to include temperature, pH, conductivity, and dissolved oxygen (DO).
- Analysis of groundwater samples for biogeochemical data to include methane, iron, manganese, nitrate, and sulfate.

- Preparation of figures including Site Location Map (Figure 1), Site Plan (Figure 2), Groundwater Elevation Contours (Figure 3) showing calculated groundwater hydraulic gradient direction, and an Analyte Concentration Distribution Map (Figure 4).

- Contaminant-specific contour maps (Figures 5 through 9).

- Submittal of a technical report documenting groundwater monitoring activities by January 30, 2013, and annually thereafter.

The 2013 monitoring field activities were performed by Blaine Tech Services, Inc. (BTS). The data were supplied to ARCADIS and are included herein for interpretation and preparation of this report.

Summary of Monitoring Activities

On September 11, 2013, BTS collected depth-to-water measurements from wells BMW-2, BMW-3, BMW-5, BMW-6, and MW-18 through MW-20. BTS also collected a groundwater sample from BMW-6 for laboratory analysis. MW-18 is not required to be monitored as part of the current sampling program and BMW-4 could not be located. On September 24, 2013, United Pumping Services, Inc. (UPS), under oversight by ARCADIS, successfully located and uncovered BMW-4 to allow groundwater sampling. BTS re-mobilized to the Site to gauge and collect groundwater samples from BMW-4 for laboratory analysis on September 25, 2013.

BTS used the low-flow purge and sample methods outlined in Appendix A to collect samples from BMW-4 and BMW-6 BTS collected samples using dedicated tubing in each well attached to a peristaltic pump. Purge characterization and sample logs for the 2013 monitoring event are included as Appendix B.

TestAmerica Analytical Testing Corporation of Irvine, California, a California Department of Health Services-accredited laboratory, performed the laboratory analysis for the following parameters:

- VOCs (including fuel oxygenates) in accordance with USEPA Method 8260B.

- Total volatile petroleum hydrocarbons (TVPH) qualified as hydrocarbon speciation C4-C12 or C6-C12, in accordance with USEPA Method 8015M.

- Total extractable petroleum hydrocarbons in the diesel (TEPH-d) qualified as hydrocarbon speciation C13-C22 and motor oil (TEPH-mo) qualified as hydrocarbon speciation C23-C40, in accordance with USEPA Method 8015M.

- Biogeochemical parameters including methane (RSK-175 mod), iron and manganese (EPA 200.7-DISS), and nitrate and sulfate (EPA 300.0).

Laboratory reports including quality assurance and quality control (QA/QC) sample results are included in Appendix C. Field QA/QC during each monitoring event included the analysis of one field duplicate sample (from well BMW-6) and one field equipment blank after sampling was complete [QCEB1]). Duplicate and/or equipment blank samples were analyzed for the same parameters as the primary groundwater samples. One trip blank was included in the cooler for transportation with the samples during the monitoring event. Method blank, matrix spike, blank spike, and surrogate spike samples were prepared and analyzed by the laboratory.

Purge and decontamination water generated during this sampling event were stored on-site in a labeled 55-gallon drum. UPRR's subcontractor, UPS, completed profiling and disposal of this waste and records are maintained by UPRR.

Results

No free phase hydrocarbon product was observed in the wells monitored during the September 2013 monitoring event, which is consistent with historical monitoring events.

Depth to groundwater measurements collected during the September 2013 monitoring event are summarized in Table 1. A groundwater elevation contour map is presented as Figure 3. Current and historical groundwater analytical data for the Site are summarized on Tables 2 through 4 and select data are shown on Figure 4. Contaminant-specific contour maps are presented as Figures 5 through 9.

Depth to Groundwater

Depth to groundwater at the Site ranged from 28.33 feet below ground surface (ft bgs) in MW-19 to 37.08 ft bgs in BMW-4 within the 32-acre parcel and was 61.89 ft bgs in MW-18 located above the escarpment north of the 10-acre MTA easement. The current groundwater flow direction during this annual monitoring period was towards the south-southwest, which is generally consistent with the historical groundwater flow direction. However, a slight depression in groundwater elevation was observed at MW-20, which is not consistent with prior reported data and may be anomalous.

Analytical Results - VOCs

VOCs were detected in both BMW-4 and BMW-6 (primarily benzene, toluene, ethylbenzene, and xylenes [BTEX]). The following maximum concentrations were detected above their respective California Primary Maximum Contaminant Level (MCL):

- Benzene (5,900 micrograms per liter [µg/L]), toluene (210 µg/l), ethylbenzene (2,400 µg/L), and total xylenes (760 µg/L) in well BMW-4.

- 1,2-dichloroethane (1,2-DCA) was detected at 0.44 J µg/L in well BMW-6 and 0.47 J µg/L in the field duplicate sample (a J qualifier indicates an estimated result between method detection limit and reporting limit).

No other VOCs were detected above their respective MCLs during the September 2013 monitoring event.

Analytical Results – Petroleum Hydrocarbons

The following maximum concentrations were detected:

- TVPH (24 milligrams per liter [mg/L]), TEPH-d (0.51 mg/L), and TEPH-mo (0.15 J mg/L) in well BMW-4.

- TVPH (0.041 J mg/L) in well BMW-6 and 0.040 J mg/L in its field duplicate.

Analytical Results – Biogeochemical

Biodegradation of petroleum compounds can proceed via aerobic or anaerobic microbial processes, with naturally-occurring bacteria using these constituents as sources of carbon and/or energy. Bacteria obtain energy for cell production and maintenance by facilitating reduction-oxidation (redox) reactions involving the transfer of electrons from electron donors (e.g., hydrocarbon constituents) to available electron acceptors. Electron acceptors in groundwater systems include oxygen, nitrate, manganese, ferric iron, sulfate, and carbon dioxide. When sufficient oxygen is present in groundwater, biodegradation is primarily aerobic. When oxygen becomes less available, conditions will become reducing as anaerobic microorganisms consume electron acceptors in the following order of preference: nitrate (nitrate reduction), manganese (manganese (IV) reduction), ferric iron (ferric iron reduction), sulfate (sulfate reduction), and carbon dioxide (methanogenesis).

While stable or decreasing trends in concentrations represent the primary line of evidence for natural attenuation, biogeochemical indicator parameters can provide an additional line of evidence to document favorable groundwater conditions for ongoing attenuation mechanisms and to evaluate the potential biodegradation processes that may be occurring.

The majority of petroleum hydrocarbon and VOC impacts to groundwater are limited to the vicinity of BMW-4. Current and historical groundwater analytical data for the Site are summarized in Tables 2 and 3 and biogeochemical data are summarized in Table 4.

Concentrations of several biogeochemical parameters continue to be consistent throughout the Site. Dissolved Oxygen (DO) concentrations were detected at low concentrations of 1.7 mg/L or less throughout the site, and nitrate concentrations were either less than the reporting limits (<0.11 mg/L) or at low concentrations of 0.75 mg/L or less, indicating low ambient DO and nitrate concentrations. Iron and manganese concentrations were also similar and within the same order of magnitude between the background location (BMW-3) and other locations, with the exception of downgradient well, MW-19, which had iron concentrations two orders of magnitude lower. Levels of pH were within a range conducive to biological activity (between 6 and 7).

Sulfate and methane concentrations detected at BMW-4 as compared to areas without dissolved petroleum hydrocarbon impacts are consistent with ongoing biodegradation of petroleum compounds. Sulfate reduction typically occurs after DO, nitrate, and biologically available manganese and iron have been depleted, and is indicative of a strongly reducing groundwater environment. The sulfate concentrations at BMW-4 were approximately three orders of magnitude lower and methane concentrations at BMW-4 were significantly higher than other areas of the Site. The sulfate concentration detected in groundwater from BMW-4 (0.47 J mg/L) was much lower than that detected at BMW-6 (100 mg/L); suggesting sulfate is being utilized to facilitate anaerobic biodegradation within the core of the plume. Methanogenesis is an anaerobic redox reaction in which bacteria use carbon dioxide as an electron acceptor in the biodegradation of organic compounds, producing methane as a byproduct. Methanogenesis is indicative of a highly reducing groundwater environment. Methane was detected at BMW-4 at a higher concentration (5.4 mg/L) than BMW-6 (0.039 mg/L), indicating highly reducing conditions at BMW-4 consistent with historic and ongoing degradation of petroleum compounds.

Conclusions

The groundwater data collected to date indicate the following:

- Current monitoring of BMW-4 and BMW-6 confirm that the detected BTEX in BMW-4 is limited in extent. The 2013 result of 5,900 µg/L for benzene appears to be part of an overall decreasing trend in this well based on results since 2003 (benzene was 15,000 µg/L at BMW-4 in 2003). However, benzene concentrations detected in BMW-4 since 2009 have been fluctuating in concentration but relatively stable.

- BTEX concentrations in well BMW-6, immediately downgradient of BMW-4, have shown a generally decreasing trend since August 2001. Benzene was not detected in the 2012 sampling events, but was detected at a low concentration of 5.0 µg/L in 2013. The overall prior results from wells downgradient of BMW-4 and BMW-6 suggest that the area of remaining dissolved-phase gasoline-range impacts to groundwater is likely stable or shrinking given the long-term monitoring concentration trends observed at the Site.

- 1,2-DCA was detected in BMW-6 at a concentration of 0.44 J µg/L. 1,2-DCA was previously detected at concentrations up to 140 µg/L in BMW-4 in 2001, but has shown a decreasing trend likely due to natural attenuation as a result of the BTEX in BMW-4 serving as a carbon donor and does not present a significant threat to groundwater.

- Sulfate concentrations are significantly depleted in BMW-4 within the source area compared to the downgradient well BMW-6 and other Site wells, indicating that there is ongoing consumption of petroleum hydrocarbons by sulfate reducing microorganisms.

- Methane was detected at BMW-4 at a higher concentration (5.4 mg/L) than downgradient well BMW-6 (0.039 mg/L) and other Site wells, indicating highly reducing conditions at BMW-4 consistent with historic and ongoing degradation of petroleum compounds.

Based on concentrations observed in BMW-4 and BMW-6, it is apparent that remaining concentrations of dissolved-phase BTEX will continue to attenuate based on groundwater data trends and results of the biogeochemical data that are characteristic of microbial biodegradation of petroleum hydrocarbons. The decreasing trends in BTEX concentrations at BMW-6, downgradient of BMW-4, are indicative of a shrinking plume and evidence of biodegradation is present. As stated in the *Addendum to the Summary of Site Conditions and Request for Closure Report* (ARCADIS 2010a), the following conclusions with respect to groundwater at the Site can be demonstrated:

- Current and future Site use is acceptable for its intended use (on-site soil does not pose unacceptable risk to Site users and the Site's intended use is limited to commercial and/or industrial use) and the Site will remain a recreation park.

- Groundwater has shown plume stability and given the widely known fate and transport characteristics of BTEX, the dissolved petroleum hydrocarbons in groundwater at the Site do not pose a threat to on-site or off-site receptors. Furthermore, there is no groundwater receptor wells located within 1-mile downgradient of the Site.

- ARCADIS performed a regression and trend analysis that showed benzene will achieve its MCL within 32 years within the source area of BMW-4 (ARCADIS, 2010a). Continued collection of VOC or biogeochemical data is no longer necessary to demonstrate that monitored natural attenuation is occurring and to further demonstrate that MCLs will be met in the long term. Biogeochemical data have been consistent since 2009.

Scheduled Activities

ARCADIS recommends continuing the annual groundwater monitoring and reporting activities in 2014 to verify benzene and dissolved petroleum hydrocarbon concentrations continue to exhibit a decreasing trend. ARCADIS recommends formal approval from the RWQCB to eliminate the biogeochemical analysis for the 2014 monitoring program. The next annual groundwater monitoring event at the Site is scheduled for September 2014 and because the plume is contained on-site in the vicinity of BMW-4, ARCADIS will continue to implement the reduced groundwater monitoring program. ARCADIS, or its subcontractor, will gauge wells MW-18 through MW-20 and BMW-2 through BMW-6 and sample wells BMW-4 and BMW-6 for laboratory analysis of VOCs, TVPH, TEPH-d, and TEPH-mo. After evaluation of the results, ARCADIS will request a NFA at that time, if appropriate.

Please contact Kristen Stevens at 562-496-3010 if you have any questions or concerns regarding this report.

Sincerely,

ARCADIS U.S., Inc.

Notes:
Data prior to January 2007 provided by ERM.
Wells originally surveyed on May 18, 2000 by Don Thomas Associates.
Wells re-surveyed on July 2, 2002 by Cal Vada Surveying.
Wells BMW-4 and MW-20 surveyed on August 24, 2006 by Dulin and Boynton.
Wells re-surveyed on January 31, 2007 by Cal Vada Surveying and elevations were based on the National Geodetic Vertical Datum of 1929 (NGVD29).
The September 2009 laboratory report (TestAmerica Identification No. ISI1377) was modified to normalize the hydrocarbon speciation reporting.
1 = Positive change indicates an increase in groundwater elevation whereas a negative change indicates a decrease in groundwater elevation.
*Accuracy of measurement is suspect, due to wellhead damage or modification to surface elevation caused during construction activities.

feet MSL Feet above Mean Sea Level
-- Data not available
NM Not measured

Notes:
Data reported prior to January 2007 was provided by ERM.
Only VOCs detected in one or more samples are listed.
< = Not present at or above listed reporting limit.
Bold = Results in excess of MCL.
J = Estimated result between method detection limit and reporting limit.
ID = Due to low levels of the analyte found in the sample, the analyte was qualitatively identified based on the compound's retention time and the presence of a single mass ion.
U = Reported concentration should be considered not detected above the reported sample value.
u = Nondetected, estimated report limit.
A-01 = Sample reanalyzed to confirm the hit
H3 = Sample was received and analyzed past holding time
--- No MCL
NA = Not Analyzed
low-flow = Field duplicate sample collected using low-flow purging and sampling techniques/equipment.
After July 2002, all samples collected using low-flow techniques/equipment.
[1] - BMW-6: Chloroethane also detected at estimated concentration of 1.6 mg/L.
[2] - BMW-6: Chloroethane detected at a concentration of 2.6 mg/l and 2-Butanol at estimate concentration of 11.0 mg/L
[3] - BMW-6 duplicate: Chloroethane detected at a concentration of 2.7 mg/l and 2-Butanol at estimate concentration of 10.0 mg/L.
[4] - BMW-6 duplicate: Chloroethane detected at a concentration of 2.1 ug/l and Tert-amyl methyl ether at a concentration of 2.5 µg/L.
[5] - BMW-9: 1,1,2,2-tetrachloroethane also detected at 0.7 mg/L.
[6] - BMW-15: Dichlorodifluoromethane also detected at 4.7 mg/L.
[7] - BMW-15: Freon-12 also detected at 8.3 mg/L.
[8] - BMW-15: Freon-12 also detected at 3.3 mg/L; Trichlorofluoromethane also detected at 1.1 mg/L.
[9] - Methylene chloride detected at 190J µg/L in this BMW-4 sample.
[10] - Chloroform detected at 1.1 µg/L in this QCTB sample.
[11] - tert-Butanol (TBA) was also detected with a J lab qualifier.
[12] - 2-Butanone was also detected in the equipment blank collected in January 2008. 2-Butanone was not detected in any of the samples collected from the wells.
[13] - January 18, 2008 - BMW-5, BMW-6, and BMW-20 sample collection order after BMW-4 may have influenced analytical results. Wells were resampled on March 7, 2008 and reflect normal well sampling order.

Abbreviations:
µg/L = micrograms per liter
DCA = dichloroethane
DCE = dichloroethene
DIPE = Di-isopropyl ether
dup = duplicate sample
EB = equipment blank
FD = field duplicate
MCL = California Maximum Contaminant Level (California Department of Public Health;CRWQCB 2008)
mg/L = milligrams per liter
MtBE = Methyl tert-butyl ether
NA = not analyzed
NS = not sampled
p-IPT = p-isopropyl toluene
PCE = tetrachloroethene
QA/QC = quality assurance/quality control
TCE = trichloroethene
TMB = trimethylbenzene
USEPA = United States Environmental Protection Agency
VOC = volatile organic compounds

Notes:
Data prior to January 2007 provided by ERM.
TVPH = carbon chain C4 through C12 (gasoline range)
TEPH-d = carbon chain C13 through C22 (diesel range)
TEPH-mo = carbon chain C23 through C32 (oil range)
* Chromatogram pattern does not show the peaks characteristic of gasoline, even if the carbon range is typical for gasoline.
**Chromatogram pattern does not show the peaks characteristic of diesel, even if the carbon range is typical for diesel.
*** Chromatogram pattern does not show the peaks characteristic of diesel/motor oil, even if the carbon range is typical for diesel/motor oil.

1	TVPH carbon chain C6 through C12
<	Not present at or above listed reporting limit.
--	Not analyzed
J	Estimated result between method detection limit and reporting limit.
Nj	Estimated value - chromatogram did not resemble the standard hydrocarbon pattern.
U	Reported concentration should be considered not detected above the reported sample value.
H-1	Sample analysis performed past the method-specified holding time per the client's approval.
QP1	Hydrocarbon result partly due to individual peak(s) in quantitation range.
low-flow	Field duplicate sample collected using low-flow purging and sampling techniques/equipment. After July 2002, all samples collected using low-flow techniques/equipment.
dup	dup = Duplicate sample
EB	Equipment blank
mg/l	Milligrams per liter
NS	Not sampled
TEPH-d	Total extractable petroleum hydrocarbons in diesel range
TEPH-mo	Total extractable petroleum hydrocarbons in motor oil range
TPH-cc	Total petroleum hydrocarbons measured via carbon chain analysis (C8 - C40).
TVPH	Total Volatile Petroleum Hydrocarbons
USEPA	United States Environmental Protection Agency

Sampling and Decontamination Procedures

Blaine Tech Services, Inc.
Standard Procedure

DECONTAMINATION OF EQUIPMENT

Decontamination of the equipment that is re-used in the process of sample collection is necessary to ensure the validity of the samples collected. Equipment decontamination occurs before, during and after each sampling event.

The nature and extent of decontamination efforts is proportional to the suspected level and volatility of the contamination. That is, it varies. When equipment and cross contamination risk is minimal, so should decontamination efforts. When equipment and cross contamination risk is severe, so should decontamination efforts. When in doubt, err on the side of caution.

All attempts should be made to understand the risk level so that the appropriate effort is applied. Performing superfluous cleaning may raise the confidence level of the Sampling Technician, but does nothing to increase the validity of the sample. Accordingly, superfluous cleaning should be avoided.

Outlined below are equipment decontamination descriptions and guidelines. They should be viewed as minimum standards. Conditions in the field may require greater decontamination efforts. Lesser efforts should not be applied unless first approved by the Project Coordinator.

Decontamination Effort Levels

1. Light. De-ionized or clean water spray rinse with hand held sprayer.
2. Moderate. De-ionized or clean water spray rinse with Pressure Washer.
3. Heavy. De-ionized or clean water spray rinse with Pressure Washer plus non-phosphate soap wash.

The BTS on-board pressure washer system consists of three main components. These are the stainless steel supply tank, Hotsy pressure washer and integrated decontamination sink.

Note: This system uses new water for each decontamination procedure. No rinsate water is ever reused or recycled.

Stainless Steel Supply Tank. All BTS Sampling Vehicles are equipped with custom-built stainless steel supply tanks. These tanks vary in capacity from 80 to 130 gallons and serve as the source for all decontamination activities on the vehicles. The water contained in the tank is routed to both the pressure washer and the integrated decontamination sink.

Hotsy Pressure Washer. An industrial grade Hotsy brand pressure washer/steam cleaner is mounted on all BTS Sampling Vehicles. The wand is located at the rear of the vehicle so that the washer may be used in conjunction with the decontamination sink.

Integrated Decontamination Sink. A custom-built stainless steel decontamination sink is mounted to the rear of all BTS Sampling Vehicles. This deep sink provides an ideal workstation to perform equipment decontamination. All rinsate water is automatically collected in the sink and pumped into the on-board effluent tank(s) thus eliminating potentially hazardous water handling activities.

Blaine Tech Services, Inc.
Standard Operating Procedure

WATER LEVEL, SEPARATE PHASE LEVEL AND TOTAL WELL DEPTH MEASUREMENTS (GAUGING)

Routine Water Level Measurements

1. Establish that water or debris will not enter the well box upon removal of the cover.
2. Remove the cover using the appropriate tools.
3. Inspect the wellhead (see Wellhead Inspections).
4. Establish that water or debris will not enter the well upon removal of the well cap.
5. Unlock and remove the well cap lock (if applicable). If lock is not functional cut it off.
6. Loosen and remove the well cap. CAUTION: DO NOT PLACE YOUR FACE OR HEAD DIRECTLY OVER WELLHEAD WHEN REMOVING THE WELL CAP. WELL CAP MAY BE UNDER PRESSURE AND/OR MAY RELEASE ACCUMULATED AND POTENTIALLY HARMFULL VAPORS.
7. Verify and identify survey point as written on S.O.W.
   TOC: If survey point is listed as Top of Casing (TOC), look for the exact survey point in the form of a notch or mark on the top of the casing. If no mark is present, use the north side of the casing as the measuring point.
   TOB: If survey point is listed as Top of Box (TOB), the measuring point will be established manually. Place the inverted wellbox lid halfway across the wellbox opening and directly over the casing. The lower edge of the inverted cover directly over the casing will be the measuring point.
8. Put new Latex or Nitrile gloves on your hands.
9. Slowly lower the Water Level Meter probe into the well until it signals contact with water with a tone and/or flashing a light.
10. Gently raise the probe tip slightly above the water and hold it there. Wait momentarily to see if the meter emits a tone, signaling rising water in the casing. Gently lower the probe tip slightly below the water. Wait momentarily to see if the meter stops emitting a tone, signaling dropping water in the casing. Continue process until water level stabilizes indicating that the well has equilibrated.
11. While holding the probe at first contact with water and the tape against the measuring point, note depth. Repeat twice to verify accuracy. Write down measurement on Well Gauging Sheet under Depth to Water column.
12. Recover probe, replace and tighten well cap, replace lock (if applicable), replace well box cover and tighten hardware (if applicable)

Water Level and Separate Phase Thickness Measurements in Wells Suspected of Containing Separate Phase

1. Establish that water or debris will not enter the well box upon removal of the cover.
2. Remove the cover using the appropriate tools.
3. Inspect the wellhead (see Wellhead Inspections).
4. Establish that water or debris will not enter the well upon removal of the well cap.

5. Unlock and remove the well cap lock (if applicable). If lock is not functional cut it off.
6. Loosen and remove the well cap. CAUTION: DO NOT PLACE YOUR FACE OR HEAD DIRECTLY OVER WELLHEAD WHEN REMOVING THE WELL CAP. WELL CAP MAY BE UNDER PRESSURE AND/OR MAY RELEASE ACCUMULATED AND POTENTIALLY HARMFULL VAPORS.
7. Verify and identify survey point as written on S.O.W.
   TOC: If survey point is listed as Top of Casing (TOC), look for the exact survey point in the form of a notch or mark on the top of the casing. If no mark is present, use the north side of the casing as the measuring point.
   TOB: If survey point is listed as Top of Box (TOB), the measuring point will be established manually. Place the inverted well box lid halfway across the well box opening and directly over the casing. The lower edge of the inverted cover directly over the casing will be the measuring point.
8. Put new Nitrile gloves on your hands.
9. Slowly lower the tip of the Interface Probe into the well until it emits either a solid or broken tone.
   BROKEN TONE: Separate phase layer is not present. Go to Step 8 of Routine Water Level Measurements shown above to complete gauging process using the Interface probe as you would a Water Level Meter.
   SOLID TONE: Separate phase layer is present. Go to the next step.
10. Gently raise the probe tip slightly above the separate phase layer and hold it there. Wait momentarily to see if the meter emits a tone, signaling rising water in the casing. Gently lower the probe tip slightly below the separate phase layer. Wait momentarily to see if the meter stops emitting a tone, signaling dropping water in the casing. Continue process until water level stabilizes indicating that the well has equilibrated.
11. While holding the probe at first contact with the separate phase layer and the tape against the measuring point, note depth. Repeat twice to verify accuracy. Write down measurement on Well Gauging Sheet under Depth to Product column.
12. Gently lower the probe tip until it emits a broken tone signifying contact with water. While holding the probe at first contact with water and the tape against the measuring point, note depth. Repeat twice to verify accuracy. Write down measurement on Well Gauging Sheet under Depth to Water column.
13. Recover probe, replace and tighten well cap, replace lock (if applicable), replace well box cover and tighten hardware (if applicable).

Routine Total Well Depth Measurements

1. Lower the Water Level Meter probe into the well until it lightens in your hands, indicating that the probe is resting at the bottom of well.
2. Gently raise the tape until the weight of the probe increases, indicating that the probe has lifted off the well bottom.
3. While holding the probe at first contact with the well bottom and the tape against the well measuring point, note depth. Repeat twice to verify accuracy. Write down measurement on Well Gauging Sheet under Total Well Depth column.

4. Recover probe, replace and tighten well cap, replace lock (if applicable), replace well box cover and tighten hardware (if applicable).

Blaine Tech Services, Inc.
Standard Operating Procedure

LOW FLOW PURGING AND SAMPLING

The Low-Flow purging and sampling process requires the use of a variable speed pump and a Flow Cell. The Flow Cell (typically YSI 556) consists a flow cell, a sonde, a display unit and various hose lines. The pump must be used to supply the flow of water to the Flow Cell. The most common purge pump used is the Grundfos Redi-Flo II variable speed electric submersible pump. Both peristaltic and pneumatic bladder pumps are common alternatives.

Flow Cell purging provides the user with a constant stream of real time, highly accurate water quality information during the purge process.

As the Low-Flow methodology stipulates sampling through the purge tube (as opposed to a bailer) to minimize disturbance to the water column, dedicated, small-diameter tubing is typically used.

Low-Flow purging and sampling using Flow Cell

1. Plug the display unit into the sonde.
2. Calibrate the sonde for all parameters using the supplied calibration fluids.
3. Connect the flow cell to the sonde.
4. Without disturbing the water column in the well, lower the purge pump carefully into the well until it rests at the middle of the screened interval. Connect the water line from the pump to the lower end of the flow cell. Alternatively, connect the water line from the in-place pump to the lower end of the flow cell.
5. Connect a water discharge line to the upper end of the flow cell.
6. Without disturbing the water column, connect the power source (electricity, compressed air, etc.) to the in-place pump, if required.
7. Lower an electronic water level indicator (sounder) slowly into the well until it hits the water surface.
8. While monitoring the sounder, commence pumping at a rate that does not induce draw-down in the well.
9. Collect parameter measurements from the display unit as per job specifications (ie. every 1 minute, every 3 minutes, etc.).
10. Monitor flow cell to make sure it remains free of air bubbles.
11. Once parameters have stabilized, adjust the pump rate to the lowest technically feasible setting.
12. Disconnect the water line from the lower end of the flow cell.
13. Fill the appropriate sample containers.
14. Remove sounder and power supply or pump from well.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: ARCADIS U.S., Inc.
Project/Site: UPRR-Cornfield

TestAmerica Job ID: 440-56788-1

Laboratory: TestAmerica Irvine

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

Authority	Program	EPA Region	Certification ID	Expiration Date
Alaska	State Program	10	CA01531	06-30-14
Arizona	State Program	9	AZ0671	10-13-13
California	LA Cty Sanitation Districts	9	10256	01-31-14
California	NELAP	9	1108CA	01-31-14
California	State Program	9	2706	06-30-14
Guam	State Program	9	Cert. No. 12.002r	01-28-14 *
Hawaii	State Program	9	N/A	01-31-14
Nevada	State Program	9	CA015312007A	07-31-14
New Mexico	State Program	6	N/A	01-31-14
Northern Mariana Islands	State Program	9	MP0002	01-31-14
USDA	Federal		P330-09-00080	06-06-14
USEPA UCMR	Federal	1	CA01531	01-31-15

* Expired certification is currently pending renewal and is considered valid.

Creator: Avila, Stephanie

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	Not Legible
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 9/25/2013 5:45 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5º C.

GC/MS VOA
Method(s) 8260B: The continuing calibration verification (CCV) for Acetone, Carbon tetrachloride, Chlorodibromomethane, Tetrachloroethane and Trichlorofluoromethane associated with batch 135672 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 135642 were outside control limits.

Method(s) 624, 8260B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for batch 135642 recovered outside control limits for the following analytes: Carbon tetrachloride. The analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

No other analytical or quality issues were noted.

HPLC
No analytical or quality issues were noted.

GC VOA
Method(s) 8015B: Surrogate recovery was outside control limits for the following sample: (LCS 440-134526/2). The GRO standard coeluted with the 4-bromofluorobenzene surrogate. Data not impacted.

Method(s) 8015B: Surrogate recovery was outside control limits for the following sample: (440-57914-5 MS), (440-57914-5 MSD), (CCV 440-135084/13), (CCV 440-135084/25), (CCVRT 440-135084/1), (LCS 440-135084/4). BFB surrogate coeluted with TPH standard. Data not impacted.

No other analytical or quality issues were noted.

GC Semi VOA
Method(s) 8015B: Insufficient sample volume was available to perform batch matrix spike/matrix spike duplicate (MS/MSD) associated with batch 134028. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch. (LCS 440-134028/2-A)

Method(s) 8015B: Insufficient sample volume was available to perform batch matrix spike/matrix spike duplicate (MS/MSD) associated with batch 134402. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch. (LCS 440-134402/2-A)

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

VOA Prep
No analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F	MS/MSD Recovery and/or RPD exceeds the control limits

GC VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

DATE OF INVESTIGATION

February 9, 1991

SUMMARY OF EVENTS

On February 9, 1991 at approximately 0600 hours Deputy Health Officers Walter Uroff, Milo Gonzalez and Michael Lohnes responded to a request for assistance from Los Angeles County Fire Department Captain Dyrck McClellan. Uroff, Gonzalez and Lohnes arrived at Bonnie Beach Place between Medford and Worth Street at a Southern Pacific Transportation Company railroad location where they observed a derailed tanker rail car in a precarious position which contained approximately 20,000 gallons of Aqueous Acrylamide (a toxic suspect carcinogen).

At approximately 1100 hours Deputy Health Officer Alfonso Berumen responded to a request for assistance by Uroff, Gonzalez and Lohnes at the aforementioned location. Gonzalez and Berumen were told by McClellan that the Fire Department received the emergency call at 0515 hours.

Upon arrival at Bonnie Beach Place, Berumen transcribed the following lettering from the derailed tanker rail car;

Aqueous Acrylamide DOW X 70028
CAPY 23782 Gals
CAPY 90015L

At approximately 1140 hours a meeting was held at the derailment site to identify the safety precautions necessary during the SPTC emergency rerailment of the tanker car. The aforementioned Deputy Health Officers and the following individuals signed a roll sheet at the meeting:

Name	Company	Tel.#
David Becker	Environmental Transloading Services (ETS)	(213) 688-7000
Ari Nadelman	ETS	"
Brian Mitchell	ETS	"
Bob Wetzel	ETS	"
Gonzalo Miramontes	ETS	"
Carlos Robalino	ETS	"
Rick Lijana	Rhone Poulenc	(213) 266-0625
Jim Mitchell	Dow Chemical	(213) 533-5378
Gabriel Baltareta	SPTC, Mechanic	(213) 668-4029
Rick Sloan	SPTC	(503) 220-4424
Cpt. Bob Weinberger	Fire Department	(818) 336-2611
Cpt. Dyrek McClellan	Fire Department	(818) 336-2611

Gonzalez and Berumen met Rick Sloan Hazardous Materials Officer for SPTC from Portland Oregon, onsite. Sloan related the following about the derailment:

The derailment of two tanker rail cars occurred at approximately 0030 hours. The SPTC train master on duty at the time was Don Paywall. At approximately 0330 hours leakage of an unknown liquid occurred during an unsuccessful attempt to return the Acrylamide containing tanker rail car back to the track. When the leakage occurred Sloan was called to the location. Rick Sloan arrived onsite at approximately 0900 hours to manage the derailment.

Gonzalez and Berumen then met Gabriel Baltareta, SPTC train master mechanic who related the following about the derailment:

Baltareta was called at home at 0030 hours. At 0300 a SPTC wrecking crew arrived and rerailed the first tanker rail car which contained a mildy caustic solution. At 0330 during an attempt to rerail the second car which contained Aqueous Acrylamide the tanker began to leak an unknown liquid. At 0400 Sloan was notified of the situation. Sloan instructed the SPTC individual onsite to make local emergency notification. At 0430 hours the Fire Department was notified.

The leakage from the derailed tanker was identified by SPTC representatives as a non-hazardous coolant that surrounds the inner Acrylamide tank. At approximately 2200 hours the same day SPTC representatives had completed the emergency project of emptying the derailed aqueous acrylamide tanker railcar and had returned the tanker car to the track.

On February 21, 1991 at approximately 1515 hours Berumen went to Rhone Poulenc located at 4690 Worth Street in Los Angeles, CA where he met Richard M. Lijana, plant manager. Berumen told Lijana the purpose of the visit was to gather information regarding the derailment of an Aqueous Acrylamide containing tanker rail car on February 5, 1991. Lijana stated that Rhone Poulenc purchased the Aqueous Acrylamide from Dow Chemical and that SPTC was the transporter of the material. Berumen requested the shipping papers that corresponded with the material in the derailed tanker car and the materials ultimate storage location. Lijana stated that his shipping personell had all gone home but that he would send everything to Beurmen's office the next day. On February 25, 1991. Berumen received the following papers from Lijana.

1. A letter explaining how the material was transported and stored.

2. A site map of the Rhone-Poulenc facility.

UNO TAKES ACTION ON HAZARDOUS CHEMICAL SPILL IN CITY TERRACE

At UNO's request this morning, Los Angeles County District Attorney Ira Reiner agreed to convene a conference of county and Southern Pacific officials with UNO to develop a coordinated strategy for the safe transportation of hazardous materials near residential areas.

This request for the conference of concerned parties comes from an UNO demand for an immediate response by county officials and the Southern Pacific Company to this mornings hazardous chemical spill in City Terrace.

UNO demands an end to unsafe transportation of hazardous chemicals that threatgen residents, hospitals, schools, and freeways. County enforcement of state law must be firmly enforced to protect the health and lives of residents.

UNO demands:

1. Immediate and full disclosure of health threats in the type of chemical spilled this morning.

2. Immediate assurance by County officials and by Southern Pacific officials that any real threat to public health and safety has been eliminated.

3. That Southern Pacific officials initiate a thorough reevaluation of its safety procedures for transportation of hazardous materials near residential areas.

UNO leader Leila Campos said, "We are preparing for a major assembly Monday evening with both candidates for the Board of Supervisors and law enforcement officials to adopt an emergency plan to deal with gang related violence in City Terrace, and now we are faced with another kind of violence. It's all violence."

CORNFIELD UST REMOVAL REPORT

1. PURPOSE

The purpose of this report is to document the general procedures used during the removal of the underground storage tanks (UST) from Southern Pacific's Cornfield site. The removal of an UST includes the permanent removal of the tank and associated piping (if any), disposal of the tank and piping, and proper closure of the excavation. This report does not include a discussion on any remedial actions anticipated as the result of encountering contaminated soil during excavation activities.

2. PROCEDURES FOR TANK REMOVAL

- The UST was exposed by removing the overlying material (asphalt, concrete, gravel, soil) by means of a backhoe, jackhammer, shovel or other appropriate equipment.

- Any residual liquid was removed from the tank by pumping the material into a vacuum truck or drums. This liquid was transported for either recycling or proper disposal.

- Prior to pulling the tank from the excavation, the tank was rendered inert by purging with carbon dioxide. An explosimeter, or LEL meter was used in the field to determine that the tank was inert. All local regulations governing procedures and inspections were carefully adhered to.

- The tank was removed from the excavation by means of a backhoe and was loaded onto a flatbed truck, and transported under the proper manifests to a site which is certified to receive tanks.

- The tanks were cleaned (if necessary) and cut into scrap metal. A certificate for each tank was obtained after its destruction to document that the tanks will not be re-used for any purpose other than scrap metal.

3. EXCAVATION AND SAMPLING PROCEDURES

3.1 Excavation Procedures

Upon removal of each tank, the tank backfill material was removed from the excavation with the backhoe. The excavation was visually inspected for an indication of soil contamination. If contamination is found to be present, SPEvS procedures dictate that the affected soil be separated from soil which is deemed clean, and either stockpiled on and covered with plastic, or placed in 55-gallon soil drums until receipt of analytical results from soil samples. In this case, contamination was observed on the sidewalls of Tank 1 and Tank 2, however only minor amounts of the contaminated soil were removed in conjunction with the tank removal, and therefore the soils were

not stockpiled separately.

3.2 Sampling Procedures

After tank removal, soil samples were collected from beneath the former location of the tanks. Refer to the Site Plan for tank excavation and sample locations. Upon deciding the sample locations, each sample was obtained by the following procedures:

- Native soil from the desired location was obtained with the backhoe bucket and brought to the ground surface.
- The top portion of the material in the bucket was scraped away with a clean hand trowel to expose "undisturbed" soil.
- To obtain a sample, the field technician drove a clean brass tube into the undisturbed soil with a mallet. (The brass tubes were cleaned prior to use by washing in a solution of tri-sodium phosphate, rinsing in distilled water, and allowing to air dry.)
- The sample tube was removed from the soil and each end was covered with Teflon sheeting and tight fitting plastic end caps.
- Each sample was labeled, logged onto a chain-of-custody, and stored in an iced cooler until delivery to a state certified laboratory.
- Samples of the stockpiled soils were collected to determine if the soil could be used for backfilling.

Because samples numbered 05050-1B and 05050-2C were collected from soil which had fallen from the sides of the excavation into the bottom of the hole and not from native soil (due to access problems), these areas were re-sampled (04/06/90) after the stockpiled soils were moved and the areas could be readily accessed.

4. ANALYTICAL ANALYSIS

As a minimum, two samples from each tank excavation were analyzed for total petroleum hydrocarbons (TPH), and benzene, toluene, ethylbenzene, and xylenes (BTEX). Samples from the initial excavation (02/23/90) and from the stockpiles were analyzed by Enseco, a state certified laboratory, on a standard 2-week turn around time. The additional two samples (04/06/90) were analyzed by American Environmental Laboratory, also a state certified laboratory. All laboratory reports are included as an attachment to this report.

5. EXCAVATION CLOSURE

Prior to backfilling the excavations, the three stockpiles were sampled and analyzed for BTEX and TPH on February 27, 1990. A table of the results is presented as Table 2. This table shows all BTEX results to be below the laboratory detection levels, and all but one sample for TPH were below the laboratory detection levels also. Only sample 2A,B composite indicated 4 ppm TPH. After the results of the stockpiled soil sampling were received, the holes were backfilled with the stockpiled soils and imported fill from an offsite source. The excavations were compacted as required by the City of Los Angeles, Building Department.

6. HEALTH AND SAFETY PROCEDURES

At each tank site, the minimum level of protection required for all personnel on site was:

- steel toe boots
- hard hats
- safety glasses or goggles
- disposable gloves

The level of protection was not upgraded as field observations and TIP readings did not deem it to be necessary.

Safe work practices were followed. The work area was barricaded so as not to allow the public to have access to the work area. In addition, the site was temporarily fenced.

SP ENVIRONMENTAL SYSTEMS, INC.
UNDERGROUND STORAGE TANK REMOVAL PROGRAM

GENERAL SITE INFORMATION

1. SP Tank Number: 05050-1
2. Date On Site: 02/23/90, 04/06/90
3. Facility Name: Cornfield
4. Street Address: 1322 North Broadway
5. City/State/County: Los Angeles/California/Los Angeles County

TANK INFORMATION

1. Tank Capacity (volume): 8,000 gallons
2. Product Type: Gasoline
3. Amount of product in tank (if any): None

   a) Was product pumped?: N/A
   b) If so, destination of product: N/A

4. Condition of Tank/Comments: Tank was in good condition, no holes were observed.

EXCAVATION INFORMATION

1. **Final excavation depth:** Initial excavation depth was approximately 15 feet (02/23/90). Final excavation depth was 17 feet.

2. **Visible Contamination?:** Yes, the southern end of the tank excavation contained strong odors and visible contamination between 10 and 17 feet.

   a) **Describe extent:** At least between 10 and 17 feet below grade. Total depth, unknown.

3. **Soil Description (include type, color, moisture, odor, other):** Soil was a mixture of different types of fill, including pottery, brick, etc.

4. **Excavation Backfilled?:** Yes
   a) **Source of fill material:** The excavation was backfilled with the stolckpiled soil removed from the excavation following analytical results on composite samples from the stockpile, and also with additional imported fill material.

5. **Is there soil stockpiled?:** No.

LABORATORY INFORMATION

1. **Number of samples taken:** Three

Date	Sample ID	Sample Location	Analyses
02/26/90	05050-1A	North end of tank at 15 feet	8015/8020
02/26/90	05050-1B	South end of tank at 15 feet	8015/8020
04/06/90	05050-1C	South end of tank at 17 feet	8015/8020

2. **Performing Laboratory:** Enseco (02/23/90), and American (04/04/90)

3. **Chain-of-Custody Number:** 60355, and L4613

4. **Date Sent to Lab:** 02/26/90, and 04/10/90

5. **Comments:** The stockpiles were sampled on 02/27/90 and analyzed by Enseco Laboratory. Refer to laboratory reports for results.

GENERAL SITE INFORMATION

1. SP Tank Number: 05050-2
2. Date On Site: 02/23/90, 04/06/90
3. Facility Name: Cornfield
4. Street Address: 1322 North Broadway
5. City/State/County: Los Angeles/California/Los Angeles County

TANK INFORMATION

1. Tank Capacity (volume): 6,000 gallons
2. Product Type: Gasoline
3. Amount of product in tank (if any): 50 gallons

   a) Was product pumped?: Yes
   b) If so, destination of product: Product was sent for recycling at Petroleum Recycling Corporation of Signal Hill, CA.

4. Condition of Tank/Comments: Tank was in good condition, no holes were observed. The interior of the tank contained sludge , rocks, and garbage.

EXCAVATION INFORMATION

1. **Final excavation depth:** Initial excavation depth was approximately 15 feet (02/23/90). Final excavation depth was 17 feet.

2. **Visible Contamination?:** Yes, the southwestern end of the tank excavation contained strong odors and visible contamination between 10 and 17 feet.

   a) **Describe extent:** At least between 10 and 17 feet below grade. Total depth, unknown.

3. **Soil Description (include type, color, moisture, odor, other):** Soil was a mixture of different types of fill, including pottery, brick, etc.

4. **Excavation Backfilled?:** Yes

   a) **Source of fill material:** The excavation was backfilled with the stolckpiled soil removed from the excavation following analytical results on composite samples from the stockpile, and also with additional imported fill material.

5. **Is there soil stockpiled?:** No.

SUBSURFACE INVESTIGATION REPORT
SOUTHERN PACIFIC TRANSPORTATION COMPANY
CORNFIELD PROPERTY

1. INTRODUCTION

Four underground storage tanks were removed from the Southern Pacific Transportation Company's (SPTCo) Cornfield property at 1322 North Broadway in Los Angeles, California. The tanks were removed in February, 1990.

The property is bordered on the west by North Broadway Street, on the north by a vacant lot, and on the east and south by a steep cliff. The site location is shown as Figure 1.

The tanks were numbered T1, T2, T3, and T4, from north to south. Soil samples collected at the time of tank removal indicated that tanks T1 and T2 had releases of gasoline into the soil from the south end of each tank. Table 1 is a summary of the analytical results from the tank removal.

The objective of this investigation was to determine the nature and extent of soil contamination at the Cornfield property. The specific objectives of this investigation are to evaluate the type and distribution (vertical and lateral) of petroleum hydrocarbons and volatile organic compounds in the soils in the vicinity where releases have been identified from tanks T1 and T2.

2. SCOPE OF WORK PLAN

The approved work plan called for the installation of four borings, one each at the south end of where tanks T1 and T2 were located, and one each to the west of tanks T1 and T2.

The borings were to be advanced by five foot intervals to a depth where clean soil was encountered or to a maximum depth of 50 feet. Groundwater was not expected to be encountered. Clean soil was defined as having no visible contamination, no odors and readings from a PID (photo-ionization detector) less than 100 mg/kg.

The borings were to be logged continuously and sampled every five feet. Selected samples were to be analyzed for TPH and BTEX.

3. DRILLING AND SAMPLING PROCEDURES

Five borings were installed at this site on July 25 and 26, 1990. Boring locations are shown on Figure 2.

A truck-mounted hollow-stem auger drilling rig was used to install the borings at the site. Brass liners in split-spoon samplers were advanced or driven and samples collected at approximately five foot intervals. The bottom brass liner from the split-spoon sampler was retained for chemical analysis to provide an estimate of the vertical and lateral distribution of affected soils and to quantify the types of compounds present in the soil. Once the brass liners were retrieved, they were then sealed with teflon film underneath end caps, and taped closed. The samples were logged, labeled, and transported in a chilled cooler under chain of custody to a California certified laboratory. Soils encountered during drilling were logged continuously and lithologically described. Boring logs are enclosed as Appendix A.

4. BORING INSTALLATION RESULTS

Borings B-1 and B-2 were installed in the former T1 and T2 tank locations where previous samples indicated the highest levels of contamination. Both borings were drilled through visibly contaminated soils with gasoline odors. A perched water layer was unexpectedly encountered at approximately 34 feet in both borings. B-1 and B-2 were not advanced past 34 feet.

Boring B-4 was installed approximately 10 feet to the southwest of B-1. Slight odors were observed in the soils but no contamination was detected in the samples. The boring was advanced until perched water was reached at 34 feet.

Boring B-3 was the southernmost boring. No visible contamination or odors were noted, therefore the boring was continued through the water zone that was encountered at 34 feet. This zone was less than five inches thick. A second water bearing zone was encountered at 40 feet with a thickness of one foot. As the drilling progressed, the differentiation between the "dry" zones and the water bearing zones could no longer be identified, as water from the upper zones was being carried to the lower depths. The boring was completed to 50 feet.

Boring B-5 was installed in the northeastern corner of the site. Groundwater was encountered at approximately 33 feet for a couple of inches. The upper 30 feet of this boring showed no visible contamination or odors. From 30 to 55 feet, gasoline odors were noted.

A total of eighteen samples were collected from the five borings. The borings were grouted to ground surface.

5. SITE HYDROGEOLOGY

The Cornfield property is located approximately 80 to 100 feet in elevation above the SPTCo Cornfield railyard and the Los Angeles River. The railyard in located in the Los Angeles River floodplain.

The site is 50 feet wide by 180 feet long and has approximately little to zero slope. The Cornfield site is underlain by greater than 150 feet of unconsolidated sediments deposited by the Los Angeles River system. The upper 55 feet, at least, of the soil profile consists primarily of interstratified sand, silty sand, and gravelly sand.

Two perched water zones were encountered beneath the site, at 34 feet and at 40 feet. Groundwater in the area is reported at approximately 35 feet below the railyard. Regional groundwater flow is in a southerly direction roughly parallel to the flow direction of the Los Angeles River.

6. LABORATORY ANALYSIS

The samples were submitted to Coast to Coast Analytical Laboratory in San Luis Obispo, Ca. (a California certified laboratory) for chemical analysis. All of the samples were extracted by EPA Method 5030 and analyzed by EPA method 8240 for benzene, toluene, ethylbenzene, total xylenes (BTEX), and total petroleum purgeable hydrocarbons (TPPH). Laboratory reports are enclosed as Appendix B.

7. ANALYTICAL RESULTS

The analytical sample results from boring B-1 indicate TPPH levels as high as 4,300 mg/kg in the upper 22 feet of the boring. TPPH decreases to less than 2 mg/kg from 23 to 36 feet.

Boring B-2 had the highest TPPH values. At 16 feet depth, TPPH was 7,100 mg/kg but decreased to 1,800 and 2,000 mg/kg from 24 to 30 feet, respectively.

Borings B-3 and B-4 had TPPH values less than 1 mg/kg and all BTEX values less than 0.1 mg/kg.

Boring B-5 indicated TPPH of 0.1 mg/kg with little to no BTEX constituents in the samples from the upper 30 feet of the boring. Samples analyzed from 31 and 41 feet, after perched water was encountered, indicate TPPH of 360 and 180 mg/kg respectively.

BTEX values correspond with TPPH, where high TPPH is noted, high BTEX levels are also present. Table 2 is a summary of analytical results from this investigation.

8. CONCLUSIONS

The subsurface soils underlying the northern half of the Cornfield property are contaminated with gasoline. The levels of contamination decrease with depth and appear to be localized to the tank area.

The substrata consists of more than 150 feet of unconsolidated sediments which include areas of perched groundwater. Depth to an aquifer in this area is well over 100 feet based on regional information. While there is contaminated soil at this property and evidence of contamination in the upper perched zones, there is no evidence of any release to useable groundwater in the area.

Subject: Southern Pacific Transportation Company- UST Remediation at 1322 North Broadway, Los Angeles

Dear Mr. Amparan:

Enclosed you will find a report documenting additional investigation and remedial system design for soil impacted by underground storage tanks removed from the above-referenced location by Southern Pacific Transportation Company (SPTCo). SPTCo is prepared to implement the recommended remedial system as soon as we receive your concurrence. Please contact me at (415)541-2557 with any comments or questions.

Sincerely,

John C. Moe

EXECUTIVE SUMMARY

A detailed site investigation was conducted in April 1991 by Hydrologic Consultants, Inc. (HCI), at property located at 1322 North Broadway, in Los Angeles, California (the Cornfield property). The property was the former location of four underground storage tanks (USTs) that had been removed in February 1990. The USTs were part of a former filling station that had been demolished in 1989; the historical use of the tanks was presumably for storage of petroleum products.

The results of a previous investigation by SP Environmental Systems, Inc. indicated that a release of fuel hydrocarbons to the adjacent soil had occurred from one or more of the tanks. The purposes of the current detailed investigation were to assess the vertical and lateral distribution of fuel constituents in soils on the property, and to assess whether fuel constituents, originating near the former UST locations, had migrated to the shallow ground-water table beneath the property. During the current investigation, five soil borings were drilled and sampled, three shallow monitoring wells were installed and sampled, and a single deeper piezometer was installed.

Volatile fuel constituents (benzene, toluene, ethylbenzene, or xylene isomers) were detected in soil samples collected just above the shallow ground-water table, at depths of about 30 to 35 feet below land surface, in every borehole. Volatile fuel constituents were also detected at shallower depth intervals in some boreholes. This suggested that fuel constituents were present in soils in a restricted area around the former tanks and fueling facilities, and that some fuel constituents had migrated to the local ground-water table. Ground-water samples were collected from the three shallow water-table monitoring wells to assess this possibility. The results of ground-water sampling suggested that fuel constituents were present in ground water beneath the property in concentrations that exceeded regulatory standards; however, extensive migration of fuel constituents in ground water has probably not occurred.

Based on the results of the site investigation, an engineered system was designed to remediate the former UST location. The remediation system that is proposed is based on vapor-extraction technology, and consists of four continuous-service vapor extraction wells and two limited-service vapor extraction wells completed in the vadose zone, together with a regenerative blower, a catalytic thermal oxidation reactor, and associated surface piping and hardware. It is also recommended that an additional monitoring well be installed on the adjacent Cornfield railyard, to be sampled at regular intervals during site remediation to assess any changes

over time in the concentrations of fuel constituents in ground water.

The results of calculations suggest that remediation of soils that contain fuel constituents can be remediated over a period of about one year. It is recommended that a cleanup level for total fuel hydrocarbons (quantitated as gasoline) in soils on the Cornfield property be established prior to the commencement of remediation; the recommended average residual concentration is 100 mg/kg total fuel hydrocarbons (as gasoline) in soils in the vicinity of the former UST location. Following remediation, site closure would be verified by drilling and sampling three soil borings from the land surface to the shallow water table in the affected area. Remediation of ground water as a result of the removal of fuel constituents from soils would be verified by sampling a down-gradient monitoring well.

1.0 INTRODUCTION

Four underground storage tanks (USTs) were removed in February 1990 from property located at 1322 North Broadway, in Los Angeles, California. The tank removal was conducted by SP Environmental Systems, Inc., under contract to the Southern Pacific Transportation Company (SPTCo), the property owner. The USTs were part of a former filling station that had been demolished in 1989; the historical use of the tanks was presumably for storage of petroleum products.

The results of laboratory analyses of soil samples collected during the tank removal and a subsequent site investigation indicated that a release of fuel hydrocarbons to the adjacent soil had occurred from one or more of the tanks. Accordingly, SPTCo decided to conduct a detailed site investigation to assess the vertical and lateral distribution of fuel constituents in soils on the property, and to assess whether fuel constituents, originating near the former UST locations, had migrated to the shallow groundwater table. Following the investigation, a remedial design would be prepared that would enable remediation of the property to be achieved and the UST site to be closed.

The detailed site investigation was conducted in April 1991 by Hydrologic Consultants, Inc. (HCI), under contract to SPTCo. A remedial design for the UST site was subsequently prepared, based on the results of the April 1991 site investigation and on the previous investigations at the site. This report presents summary results of the site investigation, and describes the engineering design that has been developed for remediation of the property. Background information, including a description of the property and a brief chronology of site investigations, is presented in Section 2.0. The procedures that were followed and the results that were

obtained during the April 1991 site investigation are presented and discussed in Section 3.0. A description of the recommended engineering design for site remediation is presented in Section 4.0, while the engineering specifications for the remedial system, an integral part of this report, are included as in Appendix M.

Details of sampling and analysis are not provided in the text, nor are many citations presented. The interested reader is referred to the appendices. The general physiography, local geology, and hydrogeology of the Los Angeles area in the vicinity of the property, together with detailed information specific to the site, are described in Appendix A. Methods of investigation, drilling and sampling procedures, and details of the QA/QC program are presented in Appendix B; Appendix C contains the site safety plan in effect during field investigations. Descriptions of data collected in the field during the investigation are included in Appendices D, E, F, and G. The chemical laboratory analytical results are presented in Appendices H and I, while the geotechnical laboratory analytical results are included in Appendix K. Representative calculations used in the remedial design are presented in Appendix L. All appendices are included in this report.

2.0 BACKGROUND INFORMATION

2.1 SITE LOCATION AND DESCRIPTION

The site is located at 1322 North Broadway, on the southeast side of Broadway south of the intersection of Broadway and Savoy Street, approximately four miles northeast of the center of Los Angeles, California and one-half mile east of Dodger Stadium (Figure 1). The parcel covers approximately 0.2 acres between North Broadway and the edge of a steep escarpment or bluff (Figure 2), adjacent to the Cornfield railyard which is also owned by SPTCo. This small parcel was the subject of the current investigation, and will be referred to as the "Cornfield property".

The Cornfield property is located in the northern edge of Los Angeles' Chinatown; land on the west side of Broadway near the property is urbanized, and is occupied by residential and light-industrial buildings, while land east of Broadway, from the street to the edge of the scarp, is unoccupied. This vacant land forms a bare strip, approximately 50 feet wide along Broadway, from the southeast end of the Cornfield property to a point approximately 100 yards north of Savoy Street, where a private dirt road descends the scarp face into the Cornfield railyard.

The property currently consists of an asphalt-paved lot, level and at grade with Broadway (Figure 2). Two concrete slabs remain on the lot, and the southern one-third of the property is covered with compacted gravel. The excavations that mark the former UST locations have been backfilled to grade with a distinctive, coarse pea gravel. The site is fenced with an industrial-grade chain-link fence, six feet in height, on the western and northwestern sides, adjacent to Broadway, and is bounded on the south and east sides by a steep scarp that overlooks the Cornfield railyard 40 feet below.

The remnants of a fence section that previously bounded the property to the northeast are strewn on the ground between the northern tank excavation and the base of a large billboard. There are no structures currently located on the parcel; however, the property was formerly occupied by a filling station, which was demolished in 1989.

2.2 CHRONOLOGY AND RESULTS OF PREVIOUS INVESTIGATIONS

In 1989, a limited site investigation was conducted on the Cornfield property by ERM-West, Inc. (ERM) as part of a due-diligence site assessment of the entire Cornfield railyard in anticipation of a potential property transfer (ERM-West, 1989). The purpose of the railyard site assessment was to identify areas of potential environmental concern that might adversely affect the eventual sale or valuation of the land. Locations that contained underground storage tanks (including the retail gasoline facility on the Cornfield property) were identified as areas of potential concern, and were selected for more intensive examination.

During subsequent field investigations, several samples of soil gas were collected on the Cornfield property and analyzed for volatile organic compounds. Volatile organic compounds were detected in three of the five samples collected on the property (samples SG-39, SG-40, and SG-42; ERM-West, 1989); however, the concentrations that were detected were not sufficiently elevated above background concentrations to draw attention. Two soil borings were also drilled on the site (borings GS-1 and GS-2; ERM-West, 1989). Soil samples were collected from the borings, and were analyzed for fuel hydrocarbons, volatile organic compounds, and metals (CAM metals listed in California Administrative Code Title 22). Fuel hydrocarbons and volatile organic compounds were not detected in these samples, and CAM metals were detected at

concentrations that were less than concentrations of potential regulatory concern. These results suggested that there might be no environmental concerns associated with the USTs on the Cornfield property.

The retail gasoline facility was subsequently demolished in 1989. Removal of the USTs commenced on February 23, 1990, and was conducted by SP Environmental Systems, Inc. (SPEvS), under contract to SPTCo (SPEvS, 1990a). Four tanks were removed from two separate excavations (Figure 3); the tops of the tanks were approximately 10 feet below land surface. After the tanks had been exposed, residual petroleum product was pumped from two tanks (Tanks 2 and 3), and was shipped to Petroleum Recycling Corporation of Signal Hill, California. The tanks were then removed from the excavations, and were transported off-site for demolition by Metal Recycling, Inc. of Ontario, California. The removal and disposal of the tanks complied with all local, state, and federal regulations applicable to UST removal (SPEvS, 1990a). Excavations were subsequently backfilled with clean pea gravel.

The removed tanks were found to be as follows:

- Two tanks for gasoline storage, 8,000 gallons each (Tanks 1 and 4)
- One tank for gasoline storage, 6,000 gallons (Tank 2)
- One tank for gasoline storage, 1,000 gallons (Tank 3)

The description of tank contents and past use was based on olfactory evidence and readings obtained from a photo-ionization detector (PID).

Ambient air quality and excavated soil were monitored during tank-removal activities with a PID for purposes of respiratory hazard assessment, and to provide an indication of the possible presence of fuel constituents in soils adjacent to the tanks. Elevated PID readings were observed in soils in the tank excavations adjacent to Tanks 1, 2, and 3; in addition, the soils were discolored, and a noticeable odor of gasoline was present during excavation activities. Inspection of the tanks following their removal from the excavations revealed that one tank (Tank 3) contained visible holes.

Representative soil samples were collected from beneath each tank immediately after the USTs had been removed (Table 1). These samples were analyzed for total fuel hydrocarbons (quantitated against a gasoline standard) and for the volatile fuel constituents benzene, toluene, ethylbenzene, and total xylene isomers (BTEX) by ENSECO Laboratories, Inc., a California-certified laboratory.

Laboratory analysis of these soil samples confirmed the presence of fuel constituents in soils beneath the former UST locations. SPTCo therefore decided to conduct an initial site investigation on the Cornfield property, centered around the known UST locations. This initial investigation was conducted by SPEvS in July 1990 (SPEvS, 1990b). Five soil borings were drilled and sampled to assess the vertical and lateral distribution of fuel constituents in soils around the former UST locations (Figure 4). Soil samples were collected at five-foot depth intervals during drilling, from a depth of five feet until ground water was encountered, or to a maximum depth of 50 feet. (Two of the soil borings - B-1 and B-2 - were located within former tank excavations; these were not sampled until the borehole had penetrated the bottom of the excavation, approximately 17 feet below land surface.) Based on the results of an earlier investigation on the

adjacent Cornfield railyard, SPEvS had anticipated that the ground-water table would be located at least 100 feet below land surface (ERM-West, 1989; SPEvS, 1990b). However, ground water was unexpectedly encountered during drilling at a depth of approximately 34 feet below land surface in four of the five soil borings; although this was assumed to be a thin perched ground-water zone, these boreholes were terminated at depths of about 34 feet. A fifth borehole (B-3) was advanced to a total depth of 50 feet below land surface (SPEvS, 1990b).

Some soil samples collected from soil borings were analyzed for fuel hydrocarbons and BTEX by Coast-to-Coast Analytical Services, Inc., of San Luis Obispo, California, a California-certified laboratory. Fuel constituents were detected in soil samples collected from every depth interval in the soil borings (Table 2). The concentrations of fuel constituents were highest in soils immediately beneath the former UST locations; the observed concentrations declined with depth in the boreholes, but increased again in the zone in which shallow ground water was encountered, approximately 34 to 35 feet below land surface.

3.0 CURRENT SITE INVESTIGATION

The results of the initial site investigation (SPEvS, 1990b) suggested that fuel constituents were present in soils near the former UST locations in concentrations that exceeded regulatory standards (DHS, 1988, Table 2-2). Accordingly, SPTCo decided to conduct a more detailed site investigation to better assess the distribution of fuel constituents in soils beneath the property, and to assess whether fuel constituents had migrated to the ground-water table beneath the former UST location. The information obtained during this detailed investigation could then be used to estimate the quantity of soil that would be subject to remedial activities, and to develop an engineering design for remediation.

3.1 CONDUCT OF DETAILED SITE INVESTIGATION

The detailed site investigation was conducted by HCI in April 1991. Five soil borings were drilled and sampled during the detailed investigation to assess the vertical and lateral distribution of fuel constituents in soils around the UST excavations (Figure 5). The first boring drilled was to be advanced to the water table beneath the site, so that the depth to ground water could be measured, and the completion depths of monitoring wells that were to be installed could be determined. (Note: field notes and chain-of-custody records refer to this borehole as "MW-1", although the borehole was not completed as a monitoring well. To avoid confusion with monitoring wells MW-1A and MW-1B, this deep soil boring will be referred to in this report as "WB-1"). It was thought on the basis of previous site investigations (ERM-West, 1989; SPEvS, 1990b) that the ground-water table was deeper than 100 feet below land surface at the site, and that shallow ground water that had been encountered by SPEvS represented a shallow perched interval. For this reason, soil boring WB-1 was advanced through

the "perched" intervals, to a total depth of 160 feet below land surface (Appendix B). A temporary well casing, with 10 feet of well screen on the bottom end, was then placed in the borehole, and the water level in the well was allowed to stabilize for 12 hours. The water level in the temporary well recovered rapidly to a depth of about 34 feet below land surface, indicating that this saturated interval probably represents the local water table beneath the property. Accordingly, all subsequent soil borings were drilled to the water table at a total depth of about 35 feet below land surface, and subsequent monitoring well completions were planned to straddle the shallow water table at about that depth.

The various soil types penetrated by the soil borings were examined and described as the boreholes were advanced (Appendix B); soil samples were also collected during drilling (Table 3), and were subsequently submitted for chemical analysis. Soil samples were collected at five-foot intervals during drilling, from a depth of five feet below land surface to the total depth of drilling (about 160 feet below land surface for soil boring WB-1; and about 35 feet below land surface for soil borings SB-1, SB-2, SB-3, and SB-4). After each soil boring had been drilled and sampled to its total depth, the borehole was terminated, and was abandoned by backfilling to the surface with a commercial grout mixture ("Enviroplug").

Four ground-water monitoring wells were also installed during the April 1991 investigation (Figure 6). These wells were intended to be used to sample the shallow ground water beneath the Cornfield property to assess whether fuel constituents had migrated to the water table. The wells were therefore located around the former UST locations so that samples of ground water could be collected both up-gradient and down-gradient of the suspected source of constituents. A well pair (monitoring wells MW-1A and MW-1B),

consisting of two closely-adjacent wells completed at different depths, was also installed near the northwest corner of the property, so that vertical gradients beneath the shallow water table could be assessed.

The various soil types penetrated by the monitoring-well boreholes were examined and described as the boreholes were advanced (Appendix B); soil samples were collected during drilling (Table 3), and were subsequently submitted for chemical or geotechnical analysis. (No soil samples were collected from the boreholes for wells MW-1A and MW-1B, due to their proximity to soil boring WB-1 which had already been sampled from a depth of 5 feet to a depth of 160 feet below land surface). Soil samples were collected at five-foot intervals during drilling, from a depth of five feet below land surface until the water table was encountered (about 30 to 35 feet below land surface). The boreholes were advanced several feet past the point at which water was first encountered in drilling. The holes were then terminated, and were completed as monitoring wells: wells MW-1A, MW-2, and MW-3 were completed with screened intervals of 20 feet, with some of the screened interval extending above the water table, while well MW-1B was completed with a 5-foot screened interval, 20 feet below the water table (Appendix B). The drilling and sampling procedures used during the drilling of boreholes for soil borings and monitoring wells were in accordance with standard practices, to ensure the quality of the analytical results; details of drilling, sampling, and well completions are presented in Appendix B.

After the four monitoring wells had been installed, the wellhead elevations were surveyed to a common datum, the National Geodetic Vertical Datum of 1929 (NGVD; equivalent to mean sea level) by a licensed surveyor, so that the elevation of the groundwater surface in each well could be calculated (Appendix B). When

the wells had been developed and the water levels had stabilized, the ground-water level was measured in each well (Table 4), and the three water-table wells were sampled.

3.2 RESULTS OF DETAILED SITE INVESTIGATION

The Cornfield property appears to occupy a relict terrace that was cut into Puente formation bedrock on the south flank of the Elysian Park anticline, and then built up by aggradation of sediments transported by the Los Angeles River (Appendix A). This depositional terrace was subsequently leveled with imported fill material. The uppermost zero to 10 feet of material is generally a heterogeneous fill consisting of silty sand that contains a little clay. The fill material overlies approximately 60 feet of silty sands, clayey sands, and gravels deposited on Puente formation bedrock (Appendix A). The stratigraphic relationships among the various units are presented conceptually in Figure 7.

Water-level measurements taken in the monitoring wells (Table 4) indicate that the potentiometric surface is located at a relatively shallow depth below land surface, and is strongly influenced by local topography: equipotential contours are parallel to the scarp face, and the calculated ground-water flow direction is directly downhill beneath the site (Figure 8). Monitoring well MW-3 is thus down-gradient of the former location of Tank #1. Water-level measurements taken in the paired monitoring wells (MW-1A and MW-1B) suggest that there is a slight downward potential gradient below the water table (Table 4).

Certain soil samples collected from soil borings and monitoring-well boreholes were analyzed for fuel hydrocarbons and volatile organic compounds. Extraction and sample analyses followed established protocols (Appendix B). Analyses for total fuel

hydrocarbons in soil samples were conducted according to the protocols of the California Department of Health Services (DHS), as outlined in the California DHS Leaking Underground Fuel Tank (LUFT) manual (DHS, 1988). Analyses for volatile organic compounds in soil samples were conducted according to the protocols of EPA Method 8240 (U.S. EPA, 1986).

Fuel hydrocarbons, quantitated as gasoline, were detected in soil samples collected near the shallow ground-water table (depth interval of 30 to 35 feet below land surface) in boreholes MW-3, SB-1, and SB-3 (Table 5). Hydrocarbons were also detected in a sample collected at a depth of 155 feet below land surface in borehole WB-1; however, no fuel hydrocarbons were detected in other soil samples collected below the shallow water table in this borehole, and the chromatographic result for this sample is not typical of gasoline (Appendix B). It is therefore possible that other hydrocarbons (e.g., methane) could have been detected in this soil boring.

Volatile fuel constituents (BTEX) were detected in soil samples collected near the shallow ground-water table in every borehole (Table 6). Volatile fuel constituents were also detected at shallower depth intervals in some boreholes (WB-1, SB-1, SB-3, and SB-4), but no fuel constituents were detected in soils collected at depths below the shallow ground-water table in samples that were analyzed (WB-1 and MW-3). This suggested that fuel constituents were present in soils in a restricted area around the former tanks and fueling facilities, and that some fuel constituents had migrated to the local ground-water table.

Ground-water samples were collected from the three shallow water-table monitoring wells to assess this latter possibility. The ground-water samples were analyzed for fuel hydrocarbons and

volatile organic compounds; extraction and sample analyses followed established protocols (Appendix B). Analyses for total fuel hydrocarbons in ground-water samples were conducted according to the protocols outlined in the California DHS LUFT manual (DHS, 1988). Analyses for volatile organic compounds in ground-water samples were conducted according to the protocols of EPA Method 8240 (U.S. EPA, 1986).

The results of ground-water sampling (Table 7) suggested that fuel constituents were present in ground water beneath the property in concentrations that exceeded regulatory standards. The highest concentrations of fuel constituents were detected in a water sample collected from well MW-1A, in the immediate vicinity of the former location of Tank 1. The concentrations of volatile organic compounds that were detected in the down-gradient well (well MW-3) were somewhat lower, suggesting that extensive migration of fuel constituents in ground water had not occurred.

3.3 SUBSURFACE DISTRIBUTION OF FUEL CONSTITUENTS AND ORGANIC COMPOUNDS

3.3.1 Distribution of Fuel Constituents in Soils

The results of soil sampling conducted during tank removal activities (Table 1), the initial site investigation conducted by SPEvS (Table 2), and during the current detailed investigation, suggest that elevated concentrations of fuel constituents are restricted to soils in the immediate vicinity of the UST excavations. The maximum concentrations of fuel constituents detected in soils occurred at depths of about 15 to 17 feet below land surface, near the bottoms of the former UST locations. Concentrations of fuel constituents in soils were generally observed to decrease with increasing depth, although an increase in

the concentrations of fuel constituents occurs in the depth interval 30 to 35 feet below land surface, corresponding approximately to the location of the shallow water table.

The maximum concentrations of total fuel hydrocarbons (as gasoline) detected in the depth interval 10 feet to about 32 feet below land surface (corresponding to depths between the former tops of the USTs and the shallow ground-water table) were contoured to enable an estimate to be made of the distribution of fuel hydrocarbons in soils around the UST locations. Concentrations were contoured at intervals of 100 mg/kg, 1,000 mg/kg, and 10,000 mg/kg total fuel hydrocarbons (as gasoline) in soils (Figure 9); the resulting distribution indicates that fuel hydrocarbons are restricted to a relatively small area around the former UST locations. This observation is reinforced by an examination of an isoconcentration contour map of the distribution of benzene in soils on the property (Figure 10).

The total mass of gasoline in soils on the property can be calculated under the following assumptions (Appendix L):

- The contoured distribution of fuel constituents is representative of the distribution of fuel constituents in soils on the property (note that the results of sampling in the excavation for Tank #3 have been neglected during contouring, because the bottom of Tank #3 was at a shallower depth than the other tanks).
- Fuel constituents are present at a uniform concentration in soils within each isoconcentration contour from a depth of 10 feet below land surface (the approximate tops of the tanks) to a depth of 32 feet below land surface (the approximate depth to the water table).

The maximum concentrations detected in soil samples from several boreholes (notably the boreholes down-gradient of the former UST

locations, near the scarp edge) occurred in samples collected near the shallow ground-water table. These concentrations probably are a result of the accumulation of fuel hydrocarbons near the water table - vadose zone interface, and are not truly representative of soil conditions through the entire unsaturated zone in those locations. Additionally, the isoconcentration contours may not encompass an area as large as indicated in Figure 9. For these reasons, the calculation will overpredict the total volume of gasoline constituents in the subsurface, and is therefore "conservative". The estimate of the total volume of gasoline constituents is nevertheless useful, and is necessary if estimates are to be made of the time required for remediation. The results of calculations suggest that approximately 11,000 pounds of gasoline (corresponding to about 2,000 gallons) are present in soils around the former UST location.

3.3.2 Distribution of Volatile Organic Compounds in Soils

The volatile organic compounds acetone and 2-butanone (methyl ethyl ketone, or MEK) were also detected in soil samples collected from soil borings SB-2, SB-3, and SB-4 (Table 6). These compounds are not typically found as constituents of petroleum-based fuels, but rather are commonly-used industrial solvents (Howard, 1990b). After HCI had reviewed the laboratory analytical data, we suspected that these compounds could have been introduced into the field samples or aliquots during sample collection or laboratory processing. Accordingly, HCI contracted Environmental Quality Consultants, Inc. (EQC), of Evergreen, Colorado to conduct a review of the analytical results obtained during the identification and quantitation of acetone and MEK in soil samples that were collected on April 12, 1991 and analyzed on April 17 - April 18, 1991. As a result of the data review ("data validation"; Appendix J) EQC concluded that the laboratory analytical data were valid and

quantitative, and that there was no evidence in the data package indicating that the analytical results for acetone or MEK should be rejected. The occurrence of these compounds in soils on the Cornfield property cannot currently be explained.

3.3.3 Distribution of Fuel Constituents and Volatile Organic Compounds in Ground Water

The highest concentrations of fuel constituents in ground water beneath the property were observed in samples collected near the former location of Tank #1 (Table 7). However, the maximum concentrations of BTEX constituents observed were far lower than the total solubility of these compounds in water (the solubility of benzene, for example, is about 1780 mg/l; Montgomery and Welkom, 1990), and no free product was observed during sampling. This suggests that little of the residual fuel has infiltrated to the water table. The concentrations of fuel constituents in ground water were observed to decline with increasing distance down-gradient from the former UST locations (c.f. well MW-3), suggesting that their distribution in ground water is areally restricted. The calculated ground-water flow direction is to the southeast, towards the adjacent SPTCo Cornfield railyard. Fuel constituents have not been observed in nearby monitoring wells installed in the railyard (ERM-West, 1989), suggesting that the concentrations of these compounds are rapidly reduced to levels below detection by natural attenuation processes (dispersion, volatilization, biodegradation).

Carbon disulfide was also detected at low concentrations in a single monitoring well (Table 7). This volatile compound is a natural byproduct of the anaerobic biodegradation of organic compounds (Howard, 1990b); its appearance in well MW-3, down-gradient of the former UST location may suggest that degradation of

fuel constituents is currently occurring in the subsurface beneath the property.

4.0 PROPOSED REMEDIATION SYSTEM

The results of soil and ground-water sampling have indicated that fuel constituents are present on the Cornfield property in concentrations that exceed regulatory standards (DHS, 1988). An engineered system was therefore designed to remediate the former UST location.

4.1 SITE CLOSURE CRITERIA

Prior to undertaking remediation system design or site remediation, it is first necessary to establish criteria for achieving site closure. Closure criteria can then be used as a standard against which the effectiveness of a remediation system can be measured.

A methodology to assess the applicable regulatory standards for concentrations of fuel constituents in soils has been established by DHS (DHS, 1988). According to this methodology, the maximum allowable concentration of total fuel hydrocarbons (as gasoline) in soils on the Cornfield property would be 100 mg/kg (DHS, 1988, Table 2-1). The current average concentration of fuel hydrocarbons in the vicinity of the former UST location is calculated to be about 2,100 mg/kg (Appendix L). If an average concentration of 100 mg/kg total fuel hydrocarbons is achieved by site remediation, then it is calculated that approximately 500 pounds of fuel hydrocarbons (the equivalent of about ninety gallons of gasoline) will remain in the affected area defined by Figure 9.

HCI proposes that the cleanup level for the Cornfield property be established at an average concentration of 100 mg/kg total fuel hydrocarbons (as gasoline) in soils in the vicinity of the former UST location. The concentrations of fuel hydrocarbons remaining in

soils following remediation would be assessed by drilling and sampling three soil borings from the land surface to the shallow water table in the affected area. The three samples from each soil boring that contain the highest concentrations of fuel hydrocarbons, based on the results of field screening, would be submitted to a laboratory for chemical analysis. Following laboratory analysis, the geometric mean concentration of total fuel hydrocarbons would be calculated for the nine analyzed soil samples, and would be used to confirm site remediation (geometric mean concentration for nine samples should be less than 100 mg/kg). If this remediation goal is achieved, then it is calculated that less than 500 pounds of fuel hydrocarbons (the equivalent of ninety gallons of gasoline) would remain in the affected area defined by Figure 9.

Removal of fuel constituents from soils in the unsaturated zone should be sufficient to remediate ground water beneath the property. Once fuel constituents are not infiltrating to the water table from soils in the vadose zone, natural attentuation processes such as biodegradation and volatilization should be sufficient to remove the current low concentrations of fuel constituents from shallow ground water (Hinchee and others, 1987; Howard, 1990b). Ground-water remediation resulting from the removal of fuel constituents from soils would be verified by sampling monitoring well MW-3. Ground-water samples would be collected quarterly for two quarters following the termination of remedial activities, and would be analyzed for total fuel hydrocarbons (as gasoline) and BTEX. Remediation and closure would be achieved if the concentrations of total fuel hydrocarbons and BTEX in both quarterly ground-water samples were below detection limits.

4.2 DESIGN CONSIDERATIONS

All of the following factors should be considered during the design of a remediation system (Nyer and Skladany, 1989):

- the physical and chemical properties of the compounds of potential environmental concern;
- the physical characteristics of the site to be remediated;
- the economics of various remedial alternatives; and
- the regulatory goals that must be met.

If any of these factors is neglected, the selected remedial design may be ineffective, inefficient, or may fail to meet regulatory requirements.

The compounds of potential environmental concern on the property are constituents of gasoline. Because the gasoline has been incorporated in soils on the property for a minimum period of two years, it is considered to be "weathered gasoline" (Johnson and others, 1990a). Weathered gasoline differs from fresh gasoline in that weathered gasoline contains lower fractions of volatile constituents than does fresh gasoline.

The BTEX constituents are the compounds of principal concern in gasoline (DHS, 1988). These compounds are distinguished by their low density, relatively high solubility, high volatility, and susceptibility to microbial degradation (Nyer and Skladany, 1989; Freeman and Anthony, 1991), and can occur in any of three phases: adsorbed to soil particles, dissolved in soil moisture or ground water, or volatilized in soil gas. The sampling data collected on the property indicates that the greatest proportion of fuel

constituents is present in soils, and a relatively small mass of fuel constituents has migrated to the shallow ground water. Furthermore, most of the fuel constituents occur in the immediate vicinity of the former UST location, in a depth interval that closely corresponds to the original depth of the tanks (about 15 to 25 feet below land surface). Remediation of the Cornfield property must therefore address primarily the removal of gasoline constituents from soils in the unsaturated zone within a relatively limited area. Because the apparently limited distribution of acetone and MEK in soils is similar to the distribution of fuel constituents, remediation of soils that contain fuel constituents should also serve to remove the other organic compounds that were detected.

Excavation and treatment or disposal of fuel-affected soil, and soil venting, or "vapor extraction", are two commonly-implemented technologies used for remediation of soils in the unsaturated zone that contain fuel constituents (U.S. EPA, 1988). Excavation of fuel-affected soils is not considered to be a feasible remedial alternative at the Cornfield property for the following reasons:

- Fuel constituents have been detected in soils at concentrations that exceed regulatory standards at depths of about 30 to 35 feet below land surface. The practical operating depth limit of excavation is about 25 feet. Excavation would leave some fuel-affected soils in place near the water table.

- On-site treatment of fuel-affected soils would probably be disallowed under Rule 1166 of the South Coast Air Quality Management District (SCAQMD). The SCAQMD maintains strict regulatory control of the release of volatile organic compounds during remedial activities; on-site remediation of excavated soils is probably not possible in the current regulatory environment (SCAQMD, 1990).

- The potentially large volume of soils to be excavated implies that disposal costs would be prohibitive (on the order of $300,000.00).
- Excavation alone may not address the remediation of ground water that contains fuel constituents.

These disadvantages do not apply to vapor-extraction technology. Vapor-extraction systems involve the generation of a low-pressure area in the soil unsaturated zone in the vicinity of volatile chemicals to induce vapor flow through the soils, attracting and extracting the chemicals (Hinchee and others, 1987). The system typically consists of point collectors, such as vadose-zone wells; collection pipes and manifolds at the land surface, connecting the wells to blower; and a treatment system to abate the extracted vapor. Relative advantages of a vapor-extraction system in the present application include the following:

- Given sufficient time, a vapor-extraction system is capable of remediating soils through the full depth of the unsaturated zone, from land surface to the shallow water table.
- The technology is readily available, and easily implemented.
- Permits for construction and operation of vapor-extraction systems can be obtained from SCAQMD, if abatement of extracted vapors to levels within regulatory requirements can be demonstrated (SCAQMD, 1990).
- Vapor-extraction technology is relatively cost-competitive (Hinchee and others, 1987; U.S. EPA, 1988).
- Vapor-extraction systems are capable of developing large concentration gradients at the vadose zone - water table interface, thereby inducing volatilization of dissolved constituents from ground water. Sufficient volatilization will reduce the concentrations of fuel constituents in shallow ground water, resulting in ground-water remediation (U.S. EPA, 1988).

For these reasons, a vapor-extraction system design was developed to address the remediation of soils and shallow ground water at the Cornfield property that contain gasoline constituents and organic compounds (Appendix M).

It was necessary for the design to address certain systemic and site-specific characteristics of vapor-extraction technology. These include:

- Vapor extraction systems are effective only if they induce vapor flow through the soil zones that contain fuel constituents. Most of the fuel constituents on the site occur in a limited area in the vicinity of the tank excavations, which have been backfilled with clean pea gravel - a material that is considerably more permeable than the native soils. Unless measures are taken to control the direction of air flow, most soil gas will be drawn through the clean pea gravel.

- Because of the location of the property adjacent to an exposed scarp face, much of the air that is induced to flow through the vadose zone will be drawn into the soils at the scarp.

- The pressure drop induced near a vapor-extraction well causes a concomitant rise in the water table beneath the well. Vapor-extraction wells should not be completed to a depth near the water table, to avoid drawing water into the well.

- The extracted vapors must be treated so that constituent concentrations in stack emissions are within applicable regulatory limits.

4.3 DESCRIPTION OF REMEDIATION SYSTEM

A vapor-extraction design was identified as a feasible remediation system to remove gasoline constituents from soils and shallow ground water on the Cornfield property (Appendix M). Specifications for individual system components were developed

using analytical methods outlined by Johnson and others (1990a; 1990b). The anticipated performance of individual wells was calculated, and system performance and the time required for remediation were estimated using analytical techniques (Appendix L). The performance of system components and the relative effectiveness of selected vapor-extraction well locations were then assessed, based on the calculated subsurface pressure distribution beneath the property, using a numerical model of vapor flow in the unsaturated zone.

4.3.1 Remediation System Design

The remediation system that was designed for the Cornfield property incorporates the following elements:

- The subsurface extraction points will consist of four continuous-service vapor extraction wells (wells VE-1 through VE-4), completed in the unsaturated zone, to a depth of about 28 feet below land surface (about 4 feet above the water table). Each well will be pumped at a rate of about 20 standard cubic feet per minute (scfm), for a total continuous extraction rate of 80 scfm.

- Two other vapor extraction wells (wells VE-5 and VE-6) will be installed, and pumped at irregular intervals at a rate of about 20 scfm per well. These wells will be pumped at irregular intervals to eliminate vapor-transport "stagnation points" when and if they develop in the subsurface pressure regime. The total system capacity will therefore be approximately 120 scfm (6 wells at 20 scfm each).

- Each vapor-extraction well will be connected to a manifold using ABS plastic pipe, buried in a shallow trench below land surface. The manifold will be equipped with a moisture separator and in-line filter.

- The manifold will connect all vapor-extraction wells to a regenerative blower in an explosion-proof housing. The blower should be rated to produce not less than 120 scfm

against a suction head equivalent to 40 inches of water (0.1 atmospheres).

- The blower will discharge extracted vapor directly into a forced-draft, low-temperature catalytic thermal oxidation reactor, rated at a destruction efficiency of not less than 99 percent. The catalytic thermal oxidation reactor will discharge the treated vapor stream to the atmosphere.

- The manifold, regenerative blower, and catalytic thermal oxidation reactor will be mounted on an existing concrete pad. The manifold, regenerative blower, and thermal oxidation reactor will be enclosed in a light-duty utility shed, equipped with a lock, to restrict unauthorized access to above-ground equipment.

- The surface of the property, from the perimeter fence adjacent to North Broadway to the edge of the bluff, and from the maximum northeastern extent of the excavation for Tank #1 to the maximum southwestern extent of the excavation for Tank #4 (approximately), will be covered with a layer of 12-mil polyethylene sheeting, to inhibit the flow of air downward from the land surface through the pea gravel in the tank excavations. The polyethylene sheeting shall be covered with a 4-inch layer of pea gravel to protect it from wear.

The locations of the remediation-system components are shown schematically in Figure 11. It is recommended that an additional monitoring well (well MW-4) also be installed in the adjacent Cornfield railyard at the base of the property scarp. This well should be sampled to assess whether fuel constituents have migrated from the former UST location to the ground water beneath the railyard. The monitoring well should also be sampled at regular intervals (quarterly intervals are recommended) during site remediation, so that changes over time in the concentrations of fuel constituents in ground water, if they are present, can be assessed.

4.3.2 Remediation System Design Performance Assessment

The performance of individual components of the proposed remediation system can be calculated using analytical solutions based on the flow of an idealized vapor through a porous medium (Johnson and others, 1990a; ibid., 1990b). The calculations were based on physical properties of the soil at the site that have been measured or estimated, and were conducted assuming that approximately 2,000 gallons of weathered gasoline are present in the unsaturated zone beneath the property (Appendix L).

The initial concentration of fuel constituents in the vapor extracted by the proposed system is calculated to be approximately 245 milligrams per liter of the extracted vapor (mg/l vapor); however, this concentration is expected to decline rapidly as site remediation proceeds (Johnson and others, 1990b). Vapor flow velocities resulting from extraction in a single well are calculated to be approximately 0.3 centimeters per second (cm/s) at the well radius, and about 0.003 cm/s at a radius of 30 feet from the extraction well. (Vapor flow velocities should generally be in the range of 0.001 cm/s to 1.0 cm/s for optimum system performance; Johnson and others, 1990a.)

At these flow rates and concentrations, fuel constituents are calculated to be extracted from soils at the initial rate of approximately 105 pounds of constituents per day; however, the rate of extraction of constituents will decline as the more volatile constituents are removed from soils and constituent removal rates become limited by diffusive processes (Johnson and others, 1990b). As the extraction of fuel constituents becomes diffusion-limited, extraction efficiency (defined as the ratio between actual constituent removal and the theoretical maximum removal rate) is calculated to decline to about 6 percent. At the maximum theoreti-

cal extraction rate, about 1,900 gallons of gasoline (97 percent of the estimated spill volume) could be removed in a period of about three months. However, because of extraction limitations imposed by diffusive processes, remediation of the property using vapor-extraction technology will probably require a period of approximately one year.

Representative calculations that illustrate these system performance predictions are presented in Appendix L.

After the individual well designs had been established and well performance had been estimated, it was decided to assess the optimal extraction well locations and the relative performance of a four-well system, based on the calculated resulting subsurface pressure distribution in the unsaturated zone, using a numerical model of vapor flow. A numerical model was used in the assessment because subsurface conditions (the backfilled tank excavations) and the unusual boundary conditions at the site (exposed scarp face east of the property, and relatively impermeable bedrock backslope west of North Broadway) rendered the evaluation of the system using analytical techniques uncertain. A four-well system was evaluated because only four of the wells proposed for the six-well installation are intended to be used as continuous-service withdrawal points.

Because the density of a gas depends on gas pressure, the mathematical description of true vapor flow in porous media is nonlinear. Under suitably restrictive conditions of temperature, pressure, and flow rate (which are generally met in a typical application of vapor-extraction technology), the equations that describe vapor flow can be linearized (McWhorter, 1990; Wilson and others, 1988). Linearization of the vapor-flow equations results in predictive errors of less than 5 percent under the conditions of

vacuum pressure used in most vapor-extraction systems (0.5 - 0.95 atm), so that the error introduced into calculations by this approximation is negligible in most practical applications (McWhorter, 1990).

If the vapor-flow equations are suitably linearized, they can be solved using an adaptation of a numerical ground-water flow model, to give predictions of pressure distributions or flow rates across an area to be remediated (Massman, 1989). The only limitation to the use of ground-water flow models in vapor-extraction applications is that the input data that describe the physical characteristics of the subsurface earth materials must be corrected to account for vapor properties (rather than hydraulic properties).

The code that was used in the numerical model solves the flow equations using the finite-element method (Durbin and Berenbrock, 1985). The model was designed to simulate, as closely as possible, the physical conditions of the unsaturated zone in the subsurface on the Cornfield property. The physical properties of subsurface soils were determined by laboratory analyses, or were estimated (Appendix L, Table L-4). The intrinsic permeability of soil in the unsaturated zone was estimated from the results of grain-size analyses using the Fair-Hatch formula (McWhorter and Sunada, 1977; Appendix L) and from the results of soil-moisture retention analyses (Appendix K) using the method of van Genuchten (1978). The boundaries of the vapor extraction model were established based on physical characteristics of the site. The southeastern edge of the model was defined as a constant-pressure boundary to represent the free-air surface on the bluff face overlooking the railyard. The northern and eastern boundaries of the site were assumed to coincide with vapor flow lines, and were defined as zero flux boundaries. The southwestern boundary of the model coincides with

the bedrock surface west of North Broadway, and was also assumed to represent a zero flux boundary. The base of the model was assumed to coincide with the lower contact of the silty sand unit, at the vadose zone - water-table interface. A plan view of the finite-element mesh, and the model boundaries, is presented in Figure 12.

The maximum required vapor-extraction flow rate was estimated to be 100 to 140 scfm, based on the estimated total mass of hydrocarbons in the subsurface, and assuming a remediation period of one year. The continuous-service vapor-extraction wells were simulated using specified pressures equivalent to the well operating pressures (0.9 atmospheres) at model nodes corresponding to well locations. Several model simulations were then conducted to select optimal well locations and minimize the total flow rate, while obtaining vapor flow through the unsaturated zone at a rate sufficient to remediate the soil. The results of these simulations indicate that a total of four wells, each operating a pressure of 0.9 atmospheres (equivalent to a vapor-extraction rate of about 20 scfm), are capable of establishing a pressure distribution across the property sufficient to induce vapor flow at a rate that can achieve site remediation (Figure 13).

4.3.3 Achievement of Remedial Goals

The extracted vapor stream would be monitored at regular intervals to assess the performance of the remediation system through time. If vapor-stream concentrations are analyzed regularly and flow-rate records are kept, then it is possible to calculate the cumulative removal of constituent mass from the subsurface. The proposed vapor-extraction remediation system would be operated until one of the following conditions is observed:

- The calculated cumulative mass removed by the remediation system exceeds 10,500 pounds of constituents; **or**
- The concentrations of fuel constituents in extracted vapor is less than 1 ppm vapor continuously for a period of three months; **or**
- The concentrations of fuel constituents in extracted vapor is less than 0.010 ppm vapor continuously for a period of four weeks.

If any of these conditions occurs, the system would be shut down, and closure verification activities, consisting of drilling and sampling of soil borings and collection of ground-water samples, as outlined in Section 4.1, would commence.

5.0 CONCLUSIONS

A detailed site investigation was conducted in April 1991 at the SPTCo Cornfield property in Los Angeles, California, to assess the distribution of gasoline constituents in soils and ground water beneath the property. The results of a previous site investigation had suggested that fuel constituents were present in soils near former UST locations in concentrations that exceeded regulatory standards. During the current investigation, five soil borings were drilled and sampled, three shallow monitoring wells were installed and sampled, and a single deeper piezometer was installed.

The results of soil sampling suggest that elevated concentrations of fuel constituents are restricted to soils in the immediate vicinity of the UST excavations. It is estimated that approximately 11,000 pounds of fuel constituents (equivalent to about 2,000 gallons of gasoline) might be present in soils around the excavations. Low concentrations of volatile fuel constituents (BTEX) were also detected in ground-water samples collected from shallow monitoring wells. The concentrations of fuel constituents in ground water decline with increasing distance down-gradient from the former UST locations, suggesting that their distribution in ground water is areally restricted, or that the concentrations of these compounds are rapidly reduced to levels below detection by natural attenuation processes.

Because the concentrations of fuel constituents in soils on the Cornfield property are present in concentrations that exceed regulatory standards, an engineered system was designed to remediate the former UST location. The remediation system that is proposed is based on vapor-extraction technology, and consists of four vapor-extraction wells completed in the vadose zone, together

with a regenerative blower, a catalytic thermal oxidation reactor, and associated surface piping and hardware. It is also recommended that an additional monitoring well be installed on the adjacent Cornfield railyard, and should be sampled at regular intervals during site remediation to assess any changes over time in the concentrations of fuel constituents in ground water.

The results of calculations suggest that remediation of soils that contain fuel constituents can be remediated over a period of about one year. It is recommended that the cleanup level for the Cornfield property be established at an average concentration of 100 mg/kg total fuel hydrocarbons (as gasoline) in soils in the vicinity of the former UST location. Following remediation, site closure would be verified by drilling and sampling three soil borings from the land surface to the shallow water table in the affected area. Remediation of ground water as a result of the removal of fuel constituents from soils would be verified by sampling monitoring well MW-3.

UNDERGROUND STORAGE TANK CASE CLOSURE
UNION PACIFIC RAILROAD COMPANY
1322 NORTH BROADWAY, LOS ANGELES (ID #900120143)

Dear Mr. Moe:

This letter confirms the completion of the site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tanks is greatly appreciated.

Based on the available information and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

Please contact Ms. Gay Norris at (213) 266-7573, if you have any questions regarding this matter.

Sincerely,

DENNIS A. DICKERSON

Dear Mr. Moe:

ATC Associates Inc. (ATC) in cooperation with Weck Laboratories, is pleased to submit this report of Ground Water Monitoring at the above-referenced property, as well as the items requested in the letter from the Los Angeles Regional Water Quality Control Board (Regional Board) dated June 10, 1997 (Attached). The objective of the assessment was to further evaluate the extent of fuel-hydrocarbon-impacted ground water beneath the site and to determine whether additional cleanup is required. The scope of work included the following activities:

- Sampling of five ground water wells previously installed at the site
- Re-surveying wellheads
- Laboratory analysis of five ground water samples
- Data evaluation
- Report preparation

SITE DESCRIPTION

The subject site is currently vacant. It consists of a partially asphalt-paved lot approximately 50 feet along Broadway, where a private dirt road descends into the Cornfield railroad yard. Two concrete slabs remain on the lot and the southern third of the property is covered with gravel.

50 E. Foothill Blvd. • Arcadia, CA 91006 • (626) 447-5216 • FAX (626) 447-7593

Union Pacific Railroad Company

BACKGROUND

According to a report prepared by Hydrologic Consultants Inc. (HCI), four underground gasoline storage tanks (USTs) were removed from the site in February 1990. Laboratory analysis of soil samples collected during the tank removal and as part of a subsequent site investigation indicated that a release of fuel hydrocarbons had occurred. In 1991, HCI performed a site investigation at the subject site in the area of the former USTs and dispenser island. Several soil borings and four ground water monitoring wells were drilled to assess subsurface conditions. Based on the results of the HCI investigation, an additional well was proposed downgradient from the subject site on the Cornfield railroad property.

On April 5, 1993, Industrial Compliance (IC) installed the ground water monitoring well proposed by HCI. Analysis of ground water samples obtained from all five wells indicated that only ground water from well MW-3 had elevated aromatic and fuel hydrocarbons.

On June 10, 1997 the Regional Board issued their review of the IC report. The Regional Board requested that one more round of sampling be conducted and the wells be re-surveyed to a known benchmark. This report summarizes the results of that requested work.

FIELD WORK

Survey

Ledco Survey performed an elevation survey on September 22, 1997. A known benchmark located on Savoy Street was used as the know elevation. The certified survey is shown as Attachment C.

Ground Water Sampling and Measurement

On September 22, 1997, the wells were purged using a two-inch submersible pump. Approximately five well volumes of ground water were extracted from each well. After eighty percent of the well volume was allowed to recharge, each well was sampled using a disposable bailer. The ground water was retained in clean glass vials, labeled, and placed in a chilled ice chest prior to delivery to Weck

Laboratories, a state-certified laboratory, for chemical analysis. Prior to sampling, the depth to ground water was measured in each well using an electronic sounder.

Laboratory Analysis

All three water samples were labeled, refrigerated, and delivered under chain-of-custody protocol to Weck Laboratories in the City of Industry, California. The samples were analyzed for total petroleum hydrocarbons (TPH) as gasoline by EPA Method 8015M, aromatic hydrocarbons (benzene, toluene, ethylbenzene, and xylenes [BTEX]) and methyl tertiary butyl ether (MTBE) by EPA Method 8020. The presence of MTBE was confirmed by EPA Method 8260, but no quantification was performed.

FINDINGS

TPH was not detected in ground water from any of the wells. Benzene was detected in low concentrations ranging from non-detect in wells MW-1B and MW-4 to 7.73 micrograms per liter (µg/L) in well MW-3.

MTBE was detected in three of the five wells. The concentrations of MTBE were 25 µg/L in well MW-1A, 15 µg/L in well MW-2 and 53 µg/L in well MW-3. The ground water gradient was evaluated to be to the south east which conforms to the previous investigations.

A summary of the laboratory results is included in Table 1. Laboratory reports are included in Appendix A. A summary of the September 1991 and May 1993 laboratory results is also included in Table 1.

CONCLUSIONS

Occurrence

The current monitoring well sampling results show a significant decrease of gasoline constituents in the ground water since the wells were installed in 1991. The laboratory did not quantify the MTBE concentrations, but verified their presence by EPA Method 8260.

The underlying ground water is affected by low concentrations of aromatic compounds. Benzene is present at a concentration of 7.73 µg/L, which exceeds the maximum contaminant level (MCL) of 1.0 µg/L for drinking water. Although MTBE is present, no MCL has been established for MTBE.

Based upon the removal of the contamination source (the USTs) and the low contaminant concentrations which are currently present in ground water, the site should be considered a low risk site. Such low risk sites may not require any additional remediation according to the May 1996 California Regional Water Quality Control Board Interim Assessment and Cleanup Guidebook.

RECOMMENDATIONS

Based on the removal of the contamination source and the low concentrations of contaminants detected in the ground water at the site, ATC recommends that this site be granted closure.

If you have any questions concerning the information contained in this report, please contact our office at 626-447-5216.

Sincerely,

Timothy J. Lane

Ramboll US Consulting, Inc. (Ramboll) is submitting this report to S&R Partners, LLC (Project Applicant) regarding the results of the methane assessment conducted at the property referred to as the Buena Vista Project (the "Project") and located at 1251 North Spring Street, and 1030 through 1380 North Broadway, Los Angeles, California ("site"). The methane assessment was conducted in 2017 and 2018 in accordance with the City of Los Angeles Department of Building and Safety (LADBS) Bulletin No. P/BC 2017-101[1] (reference no. LABC 7104.1 – the "bulletin"). The testing results are used to evaluate whether a methane mitigation system is necessary for any new buildings and paved areas at the site, as it is located within a methane zone as defined by the LADBS and the California Department of Conservation Division of Geologic Energy Management (CalGEM), formerly the Department of Oil, Gas, & Geothermal Resources (DOGGR).

BACKGROUND

There are several addresses associated with the site (Figure 1), including 1030 through 1380 North Broadway (even numbers), and it appears as 1251 North Spring Street on the Los Angeles County Assessor's map as Parcel Number 5414-016-002. As a part of the Project, the site will be subdivided into two master lots: the "South Parcel" (Figure 2a), which until recently was occupied by the Los Angeles County Metropolitan Transportation Authority, and the "North Parcel" (Figure 2b), which is currently occupied by a construction company as a staging area.

The property is located in an area designated as the "methane zone" and is subject to Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code. This division sets forth the minimum requirements of the City of Los Angeles for control of methane intrusion emanating from geologic formations. Division 71 requires that testing be performed in accordance with the "bulletin" to determine the minimum methane mitigation requirements. Division 71 requirements are provided in Attachment A.

SCOPE OF WORK

The proposed scope of work included (1) pre-field activities and mobilization; (2) a methane investigation; and, (3) preparation of this report. All drilling and sampling

[1] Currently Bulletin No. P/BC 2020-101

activities were supervised by Ramboll field personnel working under the supervision of a California Registered Professional Engineer. Field work was conducted from December 14, 2017 and May 17, 2018.

Task 1–Pre-Field Activities and Mobilization

Prior to initiation of drilling activities, Ramboll contacted Underground Service Alert (USA) to mark the locations of all major utilities near the proposed boring locations. In addition to the services provided by USA, Ramboll contracted with a private utility locating company to conduct a geophysical survey in the immediate vicinity of each proposed boring location to identify subsurface structures or underground obstructions. Ramboll also prepared a Site-specific Health and Safety Plan (HASP). The HASP is designed to minimize exposure of Ramboll field personnel to potentially hazardous materials. All field personnel involved in the project were required to implement the procedures presented in the HASP while conducting the field work.

Task 2–Methane Gas Investigation

On December 14, 2017, Ramboll retained a direct-push drilling contractor to conduct a shallow soil gas test as defined in the bulletin. One soil gas sample was collected per approximately 10,000 square feet of site area at a depth of approximately 5 feet below ground surface (bgs). In total, 10 temporary soil gas probes were installed in the South Parcel, and 9 temporary soil gas probes were installed in the North Parcel (Borings SV-1 through SV-19; see Figure 1) for collection of soil gas samples. Ramboll retained H&P Mobile Geochemistry Inc. (H&P), a contractor certified by the LADBS, to assist with probe installation and sample collection and analysis. On December 14 and December 15, 2017, soil gas samples were collected in syringes and analyzed in an on-site mobile laboratory for methane in accordance with United States Environmental Protection Agency (EPA) Method 8015 Modified. Barometric pressure measurements also were recorded at each of the sampling points using calibrated pressure gauges.

The second phase of the methane gas investigation involved the installation of 10 nested soil gas probes (one per approximately 20,000 square feet) by Gregg Drilling and Testing, Inc. of Signal Hill, California using a hollow stem auger drill rig near where the highest concentration of methane was found based on the data from the shallow soil gas test. Each gas probe set consisted of three multi-depth probes, including the 5-foot probes installed in December 2017. The deepest soil gas probes were installed where the soil matrix was observed to be slightly moist because groundwater is estimated to be above the deepest extent of planned excavation. The intermediate probes were installed approximately 10 feet above the deepest probes at each location (Figures 2a and 2b). The probes were installed from April 23, 2018 to May 10, 2018, by H&P and according to the specifications described on page 8 of the bulletin.

On May 14, 2018 and May 15, 2018, a minimum of 24 hours after the five soil gas probe sets were installed, all probes were sampled; methane gas concentrations and pressure measurements at each probe were measured. Barometric pressure was measured and recorded at the start of each sample collection. Samples were collected in syringes and analyzed in an on-site mobile laboratory for methane in accordance with EPA Method 8015 Modified.

On May 17, 2018, the soil gas probe sets were sampled for methane a second time; procedures were followed as described for the May 14 and May 15, 2018 sampling event.

FINDINGS

As required by the bulletin, the testing results are compiled on Form 1 which is provided in Attachment B of this letter.

First Phase - Shallow Soil Gas Test

Methane was detected above the laboratory reporting limit (RL) of 10 parts per million by volume (ppmv) in samples at one location in the North Parcel, with a concentration of 74 ppmv at Boring SV-19.

Based on the shallow soil gas test results, soil gas probe sets were installed near probes where methane was previously reported (SV-19). In addition, nested soil gas probes were installed at locations throughout the site (SV-2, SV-4, SV-6, SV-7, SV-9, SV-12, SV-14, SV-16, and SV-18) in accordance with the bulletin.

Second Phase - Nested Gas Probe Test

Shallow probes:

Methane was detected on neither the North nor South Parcels above the RL at any location at the 5-foot depth, including SV-19, where methane was detected during the shallow soil gas test.

Intermediate probes:

On May 14, 2018, methane was not detected above the RL in samples at any location.

On May 17, 2018, methane was detected above the RL on the North Parcel at Boring SV-14-20' with a concentration of 620 ppmv.

Deep probes:

On May 14, 2018, methane was detected above the RL on the North Parcel at Boring SV-14-30' with a concentration of 190 ppmv. On May 17, 2018, methane was detected above the RL also at Boring SV-14-30' with a concentration of 3,400 ppmv. Methane also was detected at a concentration of 4,000 ppmv in the replicate sample at Boring SV-14-30'.

A summary of the analytical results for methane in the soil gas samples is presented in Table 1, LADBS Form 1 is included as Attachment B, and complete analytical laboratory reports and data validation are included as Attachment C.

CONCLUSIONS AND RECOMMENDATIONS

South Parcel

Based on analytical results of shallow, intermediate and deep samples collected from SV-1 through SV-10, no methane concentrations above the analytical RL were detected. Accordingly, no further methane assessment is recommended for the South Parcel. However, since the property is located in the methane zone, Article 71 requires methane mitigation depending on the concentration of methane detected during the testing performed per the bulletin.

As summarized in Table 71 of Attachment A, for concentrations of methane less than 100 ppmv and methane pressures less than 2-inches of water, a Level I Passive Design Level is required. The passive Level I Design Level requires a sub-slab venting system, an impervious membrane, utility trench dams, and conduit or cable seal fittings. The sub-slab venting system shall consist of perforated horizontal piping, a 2-inch gravel blanket thickness under the impervious membrane, a 2-inch gravel thickness surrounding the perforated horizontal piping, and vent risers.

North Parcel

Two sample locations in the central and northern portions of the North Parcel, SV-14 and SV-19, yielded detections of methane above the laboratory RL. The SV-19 location produced a methane detection of 74 ppmv during the December 14, 2017 sample event, although resampling in May 2018 yielded a result below laboratory RLs. Methane detections at SV-14, however, were replicated during the May 14,

and May 17, 2018 sampling events with concentrations ranging from 190 to 4,000 ppmv in the 20- to 30-foot depth range.

Methane can be attributed to various sources, including leaking natural gas lines, decomposing organic matter, and nearby activities related to oil drilling. Due to the proximity of a catalogued abandoned oil well (API: 0403716588) close to SV-14 (see Figure 2b), it is possible that the abandoned oil well is a source of the methane detections observed at SV-14.

In the vicinity of SV-14, the presence of elevated methane concentrations may trigger concern for potentially explosive methane accumulations in the current conditions on the site. Because the proposed Project would develop residential land uses on the site, this existing accumulation of methane may trigger, at a minimum, a CalGEM requirement to expose the nearby abandoned oil well, and to perform leak testing. If the abandoned oil well is determined to be the source of elevated methane, re-abandonment of the well is anticipated to be required, especially if the well must be recompleted to fit beneath the planned subterranean parking structure. If the abandoned oil well is determined to be the source of the methane and if properly re-abandoned, then it is possible that the methane concentrations may decrease, potentially lessening the mitigation design requirements discussed below. Since methane concentrations in the vicinity of SV-14 were as high as 4,000 ppmv, under Article 71, without the steps associated with the re-abandonment of the oil well and follow-up testing and confirmation, buildings in the vicinity of SV-14 would be otherwise required to achieve a Level III design. As summarized in Table 71 of Attachment A, Level III Design requires both passive and active systems, trench dams, and conduit or cable seal fittings. The passive Level III Design requires a sub-slab venting system, an impervious membrane, utility trench dams, and conduit or cable seal fittings. The active venting system requires a gas detection system, mechanical ventilation, and an alarm system on the lowest occupied space, as well as a control panel.

CLOSING

Ramboll will contact CalGEM to address the abandoned oil wells that potentially are present at the site according to CalGEM records. If either of the abandoned wells on the North Parcel of the site is determined to be the source of the methane, and are ultimately re-abandoned and sealed, then it is recommended that re-testing in accordance with the bulletin be performed.

Methane mitigation measures will need to be implemented in accordance with Article 71 (Attachment A) based on the current (or post oil well abandonment) results.

Very truly yours,

PROJECT: 1690005894 | DATED: 11/11/2021 | DESIGNER: MKNEALE

ATTACHMENT A
DIVISION 71 METHANE MITIGATION REQUIREMENTS

ORDINANCE NO. 175790

An ordinance amending Section 91.106.4.1 and Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code to establish citywide methane mitigation requirements and include more current construction standards to control methane intrusion into buildings.

WHEREAS, there was a fire in the Fairfax Area of the City of Los Angeles in 1985, due to high volume of methane gas seepage through cracks in the concrete floor of a building;

WHEREAS, the City of Los Angeles adopted an Ordinance, (Ord. No. 161,552, Eff. 8-31-86) which required mitigation for methane gas intrusion into buildings located in the Fairfax area of Los Angeles;

WHEREAS, methane gas which percolates from subsurface geological formations to the atmosphere is a natural phenomenon;

WHEREAS, in 1999, large pockets of methane gas in subsurface geological formations were discovered at the Playa Vista project area of West Los Angeles;

WHEREAS, in 2001, new methane mitigating systems were developed and used in the Playa Vista Project;

WHEREAS, in Council File No. 01-1305, the City Council directed the City=s Departments of Building and Safety, Engineering, and Planning, as well as, the Chief Legislative Analyst and Office of Administrative and Research Services, to form a work group and recommend uniform safety requirements regarding methane, for all future development throughout the City;

WHEREAS, a study by the work group was conducted regarding areas throughout the City of Los Angeles to identify areas where subsurface methane gas may be found;

WHEREAS, from the information and data provided by the Division of Oil, Gas and Geothermal Resources, Department of Conservation, State of California, City of Los Angeles Department of Environmental Affairs, Department of Building and Safety and the Fire Department a map was plotted by the Department of Public Works to show other areas within the City of Los Angeles, where there exists a possible potential hazard of methane gas;

WHEREAS, modern construction standards were successfully used as methane mitigation systems for many projects in Playa Vista;

WHEREAS, the work group utilized the research and knowledge gained through the development of the Playa Vista methane mitigation systems;

WHEREAS, many of the modern construction standards to mitigate potential hazard of methane gas intrusion into building were incorporated into the Los Angeles Municipal Code as more restrictive provisions than found in the 2001 edition of the California Building Code based on local geological conditions;

NOW, THEREFORE,

THE PEOPLE OF THE CITY OF LOS ANGELES
DO ORDAIN AS FOLLOWS:

Section 1. Exception 6 of Section 91.106.4.1 of the Los Angeles Municipal Code is amended to read:

6. The Department shall have the authority to withhold permits on projects located within a Methane Zone or Methane Buffer Zone established under Sections 91.7101 *et seq.* of this Code. Permits may be issued upon submittal of detailed plans that show adequate protection against flammable gas incursion by providing the installation of suitable methane mitigation systems.

Sec. 2. Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code is amended to read:

DIVISION 71
METHANE SEEPAGE REGULATIONS

SEC. 91.7101. PURPOSE.

This division sets forth the minimum requirements of the City of Los Angeles for control of methane intrusion emanating from geologic formations. The requirements do not regulate flammable vapor that may originate in and propagate from other sources, which include, but are not limited to, ruptured hazardous material transmission lines, underground atmospheric tanks, or similar installations.

SEC. 91.7102. DEFINITIONS.

For the purpose of this division, certain words and phrases are defined as follows:

Alarm System shall mean a group of interacting elements consisting of components and circuits arranged to monitor and annunciate the status of gas concentration levels or supervisory signal-initiating devices and to initiate the appropriate response to those signals.

Buildings with Raised Floor Construction shall mean a building with the bottom of the floor system raised above grade where the clearance for each of the following items shall be at least: 12 inches for the girder, 18 inches for the floor joist and 24 inches for the structural floors.

Cable or Conduit Seal Fitting shall mean an approved fitting provided in a cable or conduit system to prevent the passage of gases, vapors, or flames through electrical cable or conduit.

Design Methane Concentration shall mean the highest concentration of methane gas found during site testing.

Design Methane Pressure shall mean the highest pressure of methane gas found during site testing.

De-watering System shall mean a permanent water removal system, consisting of perforated pipes, gravel, sump pumps and pits, designed to permanently maintain the ground water level one foot below the sub-slab vent system.

Gas Detection System shall mean one or more electrical devices that measure the methane gas concentration and communicate the information to the occupants, building management, central station or alarm company with audible or visual signals.

Gravel Blanket shall mean a layer of gravel, sand, or approved material designed to transmit gas to the vent riser without obstructing the venting system.

Impervious Membrane shall mean a continuous gas barrier made of material approved by the Department and installed beneath a building for the purpose of impeding methane migration to the interior of the building.

Mechanical Extraction System shall mean a system operated by a machine which is designed to remove methane gas from below the impervious membrane through the use of fans, blowers, or other powered devices.

Mechanical Ventilation shall mean a fan, blower or other similar group of interacting elements operated by a machine within the building, which introduce and/or remove air from an enclosed space.

Narrow Building shall mean a building that has a width less than 50 feet, a footprint of less than 50,000 square feet and having a minimum 2-foot wide landscaped area immediately adjacent to the exterior wall for at least 50 percent of the perimeter of the building.

Oil Well shall mean a deep hole or shaft sunk into the earth for the exploration of oil or gas; or which is on lands producing or reasonably presumed to contain oil or gas; or which is drilled for the purpose of injecting fluids or gas for stimulating oil recovery, re-pressurizing or pressure maintenance of oil or gas, or disposing of waste fluids from an oil or gas field.

Perforated Horizontal Pipe shall mean an approved pipe which contains a series of small holes or narrow openings placed equidistant along the length of the approved pipe, which is placed horizontally beneath the foundation of a building, for the purpose of venting accumulated methane gas and preventing the development of elevated gas pressures, or for drainage of ground water to an approved location.

PPMV shall mean Parts per Million by Volume.

Pressure Sensor shall mean a device that measures and communicates surrounding gas pressure to an alarm or control system.

Single Station Gas Detector shall mean a device consisting of electrical components capable of measuring methane gas concentration and initiating an alarm.

Trench Dam shall mean an approved subsurface barrier installed within a furrow or ditch adjacent to the foundation of a building, for the purpose of preventing the migration of methane gas beneath that foundation.

Unobstructed Opening shall mean a permanent clearing or gap in the walls, floors or roof-ceiling assemblies without windows, doors, skylights or other solid barriers that may restrict the flow of air.

Vent Riser shall mean an approved pipe which is placed vertically with joints and fittings connected to Perforated Horizontal Pipes to convey and discharge the gas to the atmosphere.

SEC. 91.7103. GENERAL METHANE MITIGATION REQUIREMENTS.

All new buildings and paved areas located in a Methane Zone or Methane Buffer Zone shall comply with these requirements and the Methane Mitigation Standards established by the Superintendent of Building. The Methane Mitigation Standards provide information describing the installation procedures, design parameters and test protocols for the methane gas mitigation system, which are not set forth in the provisions of this division.

Boundaries of the Methane Zones and Methane Buffer Zones are shown on the AMethane and Methane Buffer Zones Map@ designated as Map number A-20960, dated September 21, 2003, which is attached to Council File No. 01-1305.

SEC. 91.7104. GENERAL METHANE REQUIREMENTS.

91.7104.1. Site Testing. Site testing of subsurface geological formations shall be conducted in accordance with the Methane Mitigation Standards. The site testing shall be conducted under the supervision of a licensed Architect or registered Engineer or Geologist and shall be performed by a testing agency approved by the Department.

The licensed Architect, registered Engineer or Geologist shall indicate in a report to the Department, the testing procedure, the testing instruments used to measure the concentration and pressure of the methane gas. The measurements of the concentration and pressure of the methane gas shall be used to determine the Design Methane Concentration and the Design Methane Pressure. The Design Methane Concentration and the Design Methane Pressure shall determine the Site Design Level of Table 71.

EXCEPTION: Site testing is not required for buildings designed to the requirements of Site Design Level V as described in Table 71, or for buildings designed using the exceptions set forth in Sections 91.7104.3.2 or 91.7104.3.3.

91.7104.2. Methane Mitigation Systems. All buildings located in the Methane Zone and Methane Buffer Zone shall provide a methane mitigation system as required by Table 71 based on the appropriate Site Design Level. The Superintendent of Building may approve an equivalent methane mitigation system designed by an Architect, Engineer or Geologist.

Table 71 prescribes the minimum methane mitigation systems, such as, the passive,

active and miscellaneous systems, depending on the concentration and pressure of the methane present at the site. Each component of the passive, active and miscellaneous systems shall be constructed of an approved material and shall be installed in accordance with the Methane Mitigation Standards.

91.7104.2.1. Passive System. The passive system is a methane mitigation system installed beneath or near the building. The components of the passive system may consist of a de-watering system, the sub-slab vent system, and impervious membrane. The sub-slab vent system shall consist of Perforated Horizontal Pipes, Vent Risers, and Gravel Blankets for the purpose of collecting and conveying methane from the soil underneath the building to the atmosphere.

91.7104.2.1.1. De-watering System. The de-watering system is used to lower the ground water table to a level more than 12 inches below the bottom of the Perforated Horizontal Pipes. The de-watering system shall conduct ground water to an approved location.

91.7104.2.2. Active System. The components of the active system shall consist of one or more of the following, sub-slab system, gas detection system, mechanical ventilation, alarm system and control panel. All components shall be constructed of an approved material, installed in accordance with the Methane Mitigation Standards.

91.7104.2.3. Miscellaneous System. The components of the miscellaneous system may consist of Trench Dam, Cable or Conduit Seal Fitting, or Additional Vent Risers. The component of the miscellaneous system shall be a material approved by the Department and shall be installed in accordance with the Methane Mitigation Standards.

91.7104.3. Exceptions to Table 71. The provisions of this section are exceptions to the construction requirements of Table 71.

91.7104.3.1. Narrow Buildings. Narrow Buildings may substitute Pressure Sensors below the Impervious Membrane in lieu of the Gas Detection System and Mechanical Ventilation, if the installation of the Pressure Sensors below the Impervious Membrane is not required per Table 71 and the Narrow Building is constructed with a minimum two feet wide landscaped area covering at least 50 percent of the ground immediately adjacent to the exterior building walls.

91.7104.3.2. Buildings with Raised Floor Construction. If a Building with Raised Floor Construction has underfloor ventilation construction in accordance with the standards below, then the utilities shall be installed with Trench Dams and Cable or Conduit Seal Fittings and a four inch thick gravel blanket shall be installed under and around the elevator pits.

Underfloor ventilation shall be provided by an approved mechanical ventilation system capable of exhausting underfloor air an equivalent of every 20 minutes, or by openings in the underfloor area complying with the following:

A. The top of the openings shall be located not more than 12 inches below the bottom of the floor joists.

B. The openings shall be distributed approximately equally and located to provide cross ventilation, for example, by locating the opening along the length of at least two opposite sides of the building.

C. The openings shall be the larger of:

1. Openings of not less than 1.5 square feet for each 25 linear feet or fraction of exterior wall; or

2. Openings shall be equal to 1 percent of underfloor area.

D. The openings may be covered with corrosion-resistant wire mesh with mesh openings of greater than **3** inch and less than **2** inch in dimension.

91.7104.3.3. Buildings with Natural Ventilation. A building with natural ventilation is a building constructed with the following:

A. The Unobstructed Openings shall exchange outside air.

B. The size of the Unobstructed Opening shall be the larger of:

1. Opening equal to at least 25 percent of the total perimeter wall area of the lowest level of the building, or

2. Opening equal to at least 25 percent of the floor area of the lowest level of the building.

C. The Unobstructed Openings shall be evenly distributed and located within the upper portion of at least two opposite exterior walls of the lowest level of the building.

Buildings with natural ventilation that are constructed as described above, shall have the utilities constructed with Trench Dams and Cable or Conduit Seal Fittings. If there is an enclosed room or space less than 150 square feet within the building, then the enclosed room or space shall be constructed with vent openings

that comply with the requirements of Section 91.7104.3.4.

91.7104.3.4. Enclosed Room or Space within Building. Individual enclosed rooms or enclosed spaces with floor area less than 2,000 square feet may be exempt from providing the Active System as required by Table 71, provided the vent openings comply with all of the following:

1. Vent openings are Unobstructed Openings, except screens made with at least **3** inch mesh or wind driven turbines on the roof shall be permitted.

2. The aggregate size of vent openings shall be the larger of either five percent of the total floor area of the room or the area of enclosed space, or ten percent of the area of walls on the perimeter of the room or enclosed space.

3. The vent openings shall be located to prevent the accumulation of methane gases within the room or enclosed space.

4. The top of the vent opening shall be located not more than 12 inches below roof joists or ceiling joists if located in a wall of a building.

5. The vent openings shall be located on either two opposite walls or two adjacent walls of the room or enclosed space if located in a wall of a building.

6. The vent openings shall be located no more than 50 feet from any point within the room or enclosed space.

7. When using wind driven turbine, the area of the vent opening shall be calculated by the area of the opening at the attachment of the wind driven turbine at the roof.

8. When the vent opening is located in a wall of an adjoining room, then the adjoining room shall be constructed of either an Active System, or have Natural Ventilation as described in Section 91.7104.3.3.

91.7104.3.5. Single Family Dwelling. Single Family Dwellings and buildings accessory to single family dwellings shall comply with all the Methane Mitigation requirements of Table 71, except that the following mitigation system may be substituted:

A. Pressure Sensors below Impervious Membrane may be installed in lieu of

Gas Detection System when Pressure Sensors below Impervious Membrane is not required; or

B. Single Station Gas Detectors with battery back-up may be installed in lieu of Alarm System and Gas Detection System; or

C. 6 mil thick Visquene may be used in lieu of Impervious Membrane, when the Site Design Levels are I or II; or

D. Additional Vent Risers or Mechanical Ventilation may be omitted for buildings with width less than 50 feet and footprint less than 6,000 square feet in area; or

E. Vent Risers may be substituted in lieu of Mechanical Extraction System, provided the Vent Risers are designed at a rate twice that established by the Methane Mitigation Standards.

91.7104.3.6. Buildings Located in the Methane Buffer Zone. A building, located entirely or partially in the Methane Buffer Zone, shall be designed to the requirements of the Methane Buffer Zone. Buildings located in the Methane Buffer Zone shall not be required to provide any methane mitigation system, if the Design Methane Pressure is less than or equal to two inches of water pressure and is either of the following:

A. Areas which qualify as Site Design Level I or II; or

B. Areas which qualify as Site Design Level III and the utilities are installed with Trench Dams and Cable or Conduit Seal Fitting.

91.7104.3.7. De-watering System. A De-watering system is not required for either of the following:

A. If during the site testing, the groundwater level is deeper than 10 feet below the Perforated Horizontal Pipes, or

B. If the soil investigation or analysis, as approved by the Department, reveals the groundwater level is more than 12 inches below the bottom of the Perforated Horizontal Pipes.

91.7104.3.8. Buildings Located in the First Phase Playa Vista Project. The First Phase Playa Vista project, as approved by the City on September 21, 1993 and December 8, 1995, shall comply with the methane mitigation program as required by the Department pursuant to the Methane Prevention, Detection and Monitoring Program approved by the Department on January 31, 2001, in lieu of the requirements of this

division.

91.7104.4. Paved Areas. Paved areas that are over 5,000 square feet in area and within 15 feet of the exterior wall of a commercial, industrial, institutional or residential building, shall be vented in accordance with the Methane Mitigation Standards.

EXCEPTION: Paved areas located in the Methane Buffer Zone and which qualify for Site Design Levels I, II or III.

SEC. 91.7105. EXISTING BUILDINGS.

Additions, alterations, repairs, changes of use or changes of occupancy to existing buildings shall comply with the methane mitigation requirements of Sections 91.7104.1 and 91.7104.2, when required by Divisions 34, 81 or 82 of this Code.

Approved methane mitigation systems in existing buildings shall be maintained in accordance with Section 91.7106.

SEC. 91.7106. TESTING, MAINTENANCE AND SERVICE OF GAS- DETECTION AND MECHANICAL VENTILATION SYSTEMS.

All gas detection and mechanical ventilation systems shall be maintained and serviced in proper working condition and meet all requirements of the Electrical and Mechanical Code. The testing, maintenance and service procedure for each gas-detection and mechanical ventilation systems shall be performed in accordance with the manufacturer=s current written instructions and the following:

A. Fire Department. The manufacturer=s instructions shall be approved by the Fire Department. Testing and servicing of each system shall be performed by a person certified by the Fire Department.

B. Notification Placard. A permanent notification placard shall be posted and maintained at the front entrance of a building that is constructed with Impervious Membrane, except in residential buildings. The placard shall indicate the presence of the Impervious Membrane.

SEC. 91.7107. EMERGENCY PROCEDURES.

With the exception of single-family dwellings, all buildings required by this division to have a gas-detection system or sub-slab vent system shall, subject to Fire Department approval, have established emergency procedures that include, but are not limited to, the following:

A. Assignment of a responsible person as safety director to work with the Fire Department in the establishment, implementation and maintenance of an emergency plan.

B. Conspicuous posting of the Fire Department=s telephone number in areas designated by the Fire Department.

C. Conspicuous posting of emergency plan procedures approved by the Fire Department.

SEC. 91.7108. APPLICATION OF METHANE SEEPAGE REGULATIONS TO LOCATIONS OR AREAS OUTSIDE THE METHANE ZONE AND METHANE BUFFER ZONE BOUNDARIES.

Upon a determination by the Department of Building and Safety that a hazard may exist from methane intrusion at a geographical location or in an area outside the boundaries established in Section 91.7103 of this Code, the Department of Building and Safety and the Fire Department may enforce any or all of the requirements of Division 71 of this Code as required to preclude potential fire or explosion from methane concentration.

SEC. 91.7109. ADDITIONAL REMEDIAL MEASURES.

91.7109.1. General Remedial Measures. In the event the concentration of methane gas in any building located in a Methane Zone or Methane Buffer Zone reaches or exceeds 25 percent of the minimum concentration of gas that will form an ignitable mixture with air at ambient temperature and pressure, the owner shall hire an engineer to investigate, recommend and implement mitigating measures. These measures shall be subject to approval of this Department and the Fire Department.

91.7109.2. Abandoned Oil Well. Any abandoned oil well encountered during construction shall be evaluated by the Fire Department and may be required to be re-abandoned in accordance with applicable rules and regulations of the Division of Oil, Gas and Geothermal Resources of the State of California. Buildings shall comply with these provisions and the requirements of Section 91.6105 of this Code, whichever is more restrictive.

TABLE 71. MINIMUM METHANE MITIGATION REQUIREMENTS.

Site Design Level			LEVEL I		LEVEL II		LEVEL III		LEVEL IV		LEVEL V
Design Methane Concentration (ppmv)			0-100		101-1,000		1,001-5,000		5,001-12,500		>12,500

	Additional Vent Risers [6]										X

X = Indicates a Required Mitigation Component

1. See Section 91.7104.3.7 for exception.
2. The Mechanical Extraction System shall be capable of providing an equivalent of a complete change of air every 20 minutes of the total volume of the Gravel Blanket.
3. See Section 91.7104.3.1 for Narrow Buildings.

4. The Mechanical Ventilation systems shall be capable of providing an equivalent of one complete change of the lowest occupied space air every 15 minutes.
5. Vent opening complying with Section 91.7104.3.4 may be used in lieu of mechanical ventilation.
6. The total quantity of installed Vent Risers shall be increased to double the rate for the Passive System.

Sec. 3. The City Clerk shall certify to the passage of this ordinance and have it published in accordance with Council policy, either in a daily newspaper circulated in the City of Los Angeles or by posting for ten days in three public places in the City of Los Angeles: one copy on the bulletin board located in the Main Street lobby to the City Hall; one copy on the bulletin board located at the ground level at the Los Angeles Street entrance to the Los Angeles Police Department; and one copy on the bulletin board located at the Temple Street entrance to the Los Angeles County Hall of Records.

I hereby certify that this ordinance was passed by the Council of the City of Los Angeles, at its meeting of February 12, 2004.

J. MICHAEL CAREY, City Clerk

H&P REPORTS

H&P Mobile Geochemistry Inc.

25 May 2018

Ms. Seema Sutarwala Turner
Ramboll Environ - Los Angeles
350 South Grand Avenue, Suite 2800
Los Angeles, CA 90071

H&P Project: RAM051418-L6
Client Project: 1690005894 / 1251 N. Broadway

Dear Ms. Seema Sutarwala Turner:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 5/14/2018 -5/17/2018 which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody
- Sampling Logs (if applicable)

Unless otherwise noted, I certify that all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Janis La Roux
Laboratory Director

H&P Mobile Geochemistry, Inc. is certified under the California ELAP and the National Environmental Laboratory Accreditation Conference (NELAC). H&P is approved as an Environmental Testing Laboratory and Mobile Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs, accreditation number 69070 for EPA Method TO-15, H&P Method TO-15, EPA Method 8260B and H&P 8260SV.

Notes and Definitions

LCC	Leak Check Compound
ND	Analyte NOT DETECTED at or above the reporting limit
MDL	Method Detection Limit
%REC	Percent Recovery
RPD	Relative Percent Difference

All soil results are reported in wet weight.

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Testing Laboratory and Mobile Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs through PJLA, accreditation number 69070 for EPA Method TO-15, H&P Method TO-15, EPA Method 8260B and H&P 8260SV.

H&P is approved by the State of Arizona as an Environmental Testing Laboratory and Mobile Laboratory, certification numbers AZM758 and AZ0779.

H&P is approved by the State of California as an Environmental Laboratory and Mobile Laboratory in conformance with the Environmental Laboratory Accreditation Program (ELAP) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste, certification numbers 2740, 2741, 2743, 2744, 2745, 2754 & 2930.

H&P is approved by the State of Florida Department of Health under the National Environmental Laboratory Accreditation Conference (NELAC) certification number E871100.

The complete list of stationary and mobile laboratory certifications along with the fields of testing (FOTs) and analyte lists are available at www.handpmg.com/about/certifications.

Site Notes such as weather, visitors, scope deviations, health & safety issues, etc. (When making sample specific notes, reference the line number above):
*Replaced all valves on probes w/ 1-way valves *Probe & Barometric pressure recorded in margins
*A: Low flow; Purged +/- 5L: client consented to collecting sample at 5L. Due to vac, 20 ml collected per T.C.
*B: No flow; Vac spiked after 4-5 seconds of purging; P.P. = -60"+
*C: Low flow; High vac: Client consented to 1 TV after standard low flow conditions protocols were tried.
*D: On 5.17.18, I noticed that soil vapor construction matrix did not match tags on probes. With client present, I used 1/8" Nylaflow to confirm probe depths. SV-16-5 ✓; middle depth is 20'; deep probe is 30'

Purge Volume Information
PV Amount: 3PV
PV Includes: ☐ Tubing ☐ Sand 40% ☐ Dry Bent 50%

Leak Check Compound
A cloth saturated with LCC is placed around tubing connections and probe seal. This is done for all samples unless otherwise noted.
☐ 1,1-DFA ☐ 1,1,1,2-TFA ☐ IPA ☒ Other: Hexane

Resample Key
RS = Resample
RD = for Dilution
RL = for LCC Fail

H&P Mobile Geochemistry Inc.

20 December 2017

Ms. Seema Sutarwala
Ramboll Environ
18100 Von Karman Ave, Suite 600
Irvine, CA 92612

H&P Project: RAM121417-L6
Client Project: 1690003806 / 1251 N Spring St

Dear Ms. Seema Sutarwala:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 12/14/2017-12/15/2017which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody
- Sampling Logs (if applicable)

Unless otherwise noted, I certify that all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Janis La Roux
Laboratory Director

H&P Mobile Geochemistry, Inc. is certified under the California ELAP and the National Environmental Laboratory Accreditation Conference (NELAC). H&P is approved as an Environmental Testing Laboratory and Mobile Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs, accreditation number 69070 for EPA Method TO-15, H&P Method TO-15, EPA Method 8260B and H&P 8260SV.

Notes and Definitions

LCC	Leak Check Compound
ND	Analyte NOT DETECTED at or above the reporting limit
MDL	Method Detection Limit
%REC	Percent Recovery
RPD	Relative Percent Difference

All soil results are reported in wet weight.

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Testing Laboratory and Mobile Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs, accreditation number 69070 for EPA Method TO-15, H&P Method TO-15, EPA Method 8260B and H&P 8260SV.

H&P is approved by the State of Arizona as an Environmental Testing Laboratory and Mobile Laboratory, certification numbers AZM758 and AZ0779.

H&P is approved by the State of California as an Environmental Laboratory and Mobile Laboratory in conformance with the Environmental Laboratory Accreditation Program (ELAP) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste, certification numbers 2740, 2741, 2743, 2744, 2745, 2754 & 2930.

H&P is approved by the State of Florida Department of Health under the National Environmental Laboratory Accreditation Conference (NELAC) certification number E871100.

The complete list of stationary and mobile laboratory certifications along with the fields of testing (FOTs) and analyte lists are available at www.handpmg.com/about/certifications.

SITE TESTING STANDARDS FOR METHANE

This Information Bulletin establishes the standard protocol for Site Testing that provides design input data for methane mitigation systems required by Division 71 of the Los Angeles Building Code.

The work plan for site testing is summarized in three primary steps:

Step 1 - Schedule Site Testing

Step 2 - Conduct Shallow Soil Gas Test

Step 3 - Conduct Gas Probe Test

The site testing results from these steps are to be organized in a report and included with the building permit application.

I. SITE TESTING FOR METHANE

Site testing shall be conducted using the following three-step testing protocol described in this Bulletin to determine the concentration and pressure of the subsurface methane gas for the design of methane hazard mitigation systems.

STEP 1- SCHEDULE SITE TESTING

1. Site Testing should be scheduled before any site grading. If Site Testing after site grading is unavoidable, then Site Testing shall be conducted at least 30 days after any site grading.

STEP 2- CONDUCT SHALLOW SOIL GAS TEST

1. Methane gas concentration measurements for the Shallow Soil Gas Test (See page 7 for the Shallow Soil Gas Test Equipment Set-Up) shall be taken as follows:

    a. A minimum of two per project site, and at a rate of one sample per 10,000 square feet of site area, or portion thereof. The site area of very large sites may be calculated as the area of the building footprint plus the area within 100 feet of the building perimeter.

    b. At a depth of not less than 4 feet below ground surface, or

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities.

c. If ground water is found less than 4 feet below ground surface, then the depth of the Shallow Soil Gas Sample shall be taken above the ground water level.

2. Review the methane gas concentration data from the Shallow Soil Gas Test and site observations to identify locations where high gas concentrations of methane gas may be found.

3. Shallow Soil Gas measurements shall be made at least once and may be taken at anytime before the installation of Gas Probe Sets.

STEP 3 - CONDUCT GAS PROBE TEST

1. The location of Gas Probe Sets shall be based on the information from the Shallow Soil Gas Test where the highest concentration of soil gas may be found.

2. Methane gas concentration and pressure measurements for the Gas Probe Tests (See page 8 for the Gas Probe Set Equipment Set-Up) shall be taken as follows:

   a. There shall be at least one gas probe set for every 20,000 square feet or portion thereof of site area. Regardless of area, all sites shall install a minimum of two gas probe sets.

   b. The site area of very large sites may be calculated as the area of the building footprint plus the area within 100 feet of the building perimeter.

   c. Each Gas Probe Set shall consist of three probes, installed at approximate sampling depths of 5 feet, 10 feet and 20 feet below the elevation of the lowest building slab or footing.

   d. Gas Probe Sets shall be installed a minimum of 12 inches above ground water table.

   e. Gas Probe Sets are not required to be installed below the ground water level.

   f. Shallow Soil Gas data, collected as described in Step 2, may be used in lieu of Gas Probe Set data when ground water is found less than 5 feet below the ground surface.

3. Record data from the Gas Probe Sets as follows:

   a. Two sequential measurements shall be taken, with a minimum 24-hour interval following placement of the Gas Probe Sets. Samples shall not be collected during increasing barometric pressure from a pre-frontal weather condition.

   b. Site testing data shall be recorded on Form 1, Certificate of Compliance for Methane Test Data and certified by the engineer (see pages 4 and 5).

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities.

II. REPORTING SITE TESTING RESULTS

The methane site testing data shall be organized as described below:

1. The Certificate of Compliance for Methane Test Data, Form 1, shall be completed, stamped and signed by an engineer, geologist or architect. This form shall be attached to the methane mitigation construction plans.

2. Site Testing Plan showing:

    a. Locations of Shallow Soil Gas Samples and Gas Probe Sets.

    b. Locations and dimensions of the proposed and existing building footprints.

III. CERTIFICATE OF COMPLIANCE AND GAS COLLECTION EQUIPMENT

Form 1- Certificate of Compliance for Methane Test Data
Table I - Gas Collection Equipment
Shallow Sample Equipment Set-Up
Gas Probe Set Equipment Set-Up

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities.

FORM 1 - CERTIFICATE OF COMPLIANCE FOR METHANE TEST DATA

Part 1: Certification Sheet

Site Address:

Legal Description: Tract: Lot: Block:

Building Use: _____

Name of Architect, Engineer, or Geologist: Mailing Address: Telephone:	Architect=s, Engineer=s or Geologist=s Stamp:
Name of Testing Laboratory: City Test Lab License #:_____ Telephone:	

I hereby certify that I have tested the above site for the purpose of methane mitigation and that all procedures were conducted by a City of Los Angeles licensed testing agency in conformity with the requirements of the LADBS Information Bulletin P/BC 2020-101. Where the inspection and testing of all or part of the work above is delegated, full responsibility shall be assumed by the architect, engineer or geologist whose signature is affixed thereon.

Signed: _____ date _____

Required Data:

_ Project is in the (Methane Zone) or (Methane Buffer Zone).

_ Depth of ground water observed during testing: _____ feet below the Impervious Membrane.

_ Depth of Historical High Ground Water Table Elevation*: _____ feet below the Impervious Membrane.

_ Design Methane Concentration**: _____ parts per million in volume (ppmv).

_ Design Methane Pressure***: _____ inches of water column.

_ Site Design Level: (Level I, Level II, Level III, Level IV, Level V) with _____ inches of water column.

De-watering:

_ De-watering (is) (is not) required per Section 7104.3.7.

_ Pump discharge rate _____ cubic feet per minute per reference geology or soil report: _____ dated _____.

Additional Investigation:

_ Additional investigation (was) (was not) conducted.

Latest Grading on Site:

_ Date of last grading on site (was) (was not) more than 30 days before Site Testing.

_ See Attached explanation of the effect on soil gas survey results by grading operations.

Notes:

* Historical High Ground Water Table Elevation shall mean the highest recorded elevation of ground water table based on historical records and field investigations as determined by the engineer for the methane mitigation system.

** Design Methane Concentration shall mean the highest recorded measured methane concentration from either Shallow Soil Gas Test or any Gas Probe Set on the site.

*** Design Methane Pressure shall mean the highest total pressure measured from any Gas Probe Set on the site.

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities.

FORM 1 (CONTINUED) - CERTIFICATE OF COMPLIANCE FOR METHANE TEST DATA

Part 2: Test Data - Shallow Soil Gas Test and Gas Probe Test

Site Address: _____

Description of Gas Analysis Instrument(s):

Instrument Name and Model: _____ Instrument Accuracy: ± _____ ppmv.

City of Los Angeles Testing License #:

Date	Time	Probe Set #	Concentration (ppmv)	Pressure (inches water column)	Probe Depth (feet)	Description / Probe Location

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities.

TABLE 1 - DATA COLLECTION EQUIPMENT

Parameter	Equipment or Procedure	Detection Limit
Barometric Pressure	Barometer or GA-90	0.1" of Hg
Gas Probe Pressure	Pressure Gauge	0.1" of H_2O
Methane Concentration	Landtec GA-90 (Field) or EPA 8015 (Lab)	0.1% or 1,000 ppm
Combustible Gas Concentration	LTX-310 (Field) or EPA 8015 (Lab)	0.1% or 1,000 ppm

Notes for Table 1:

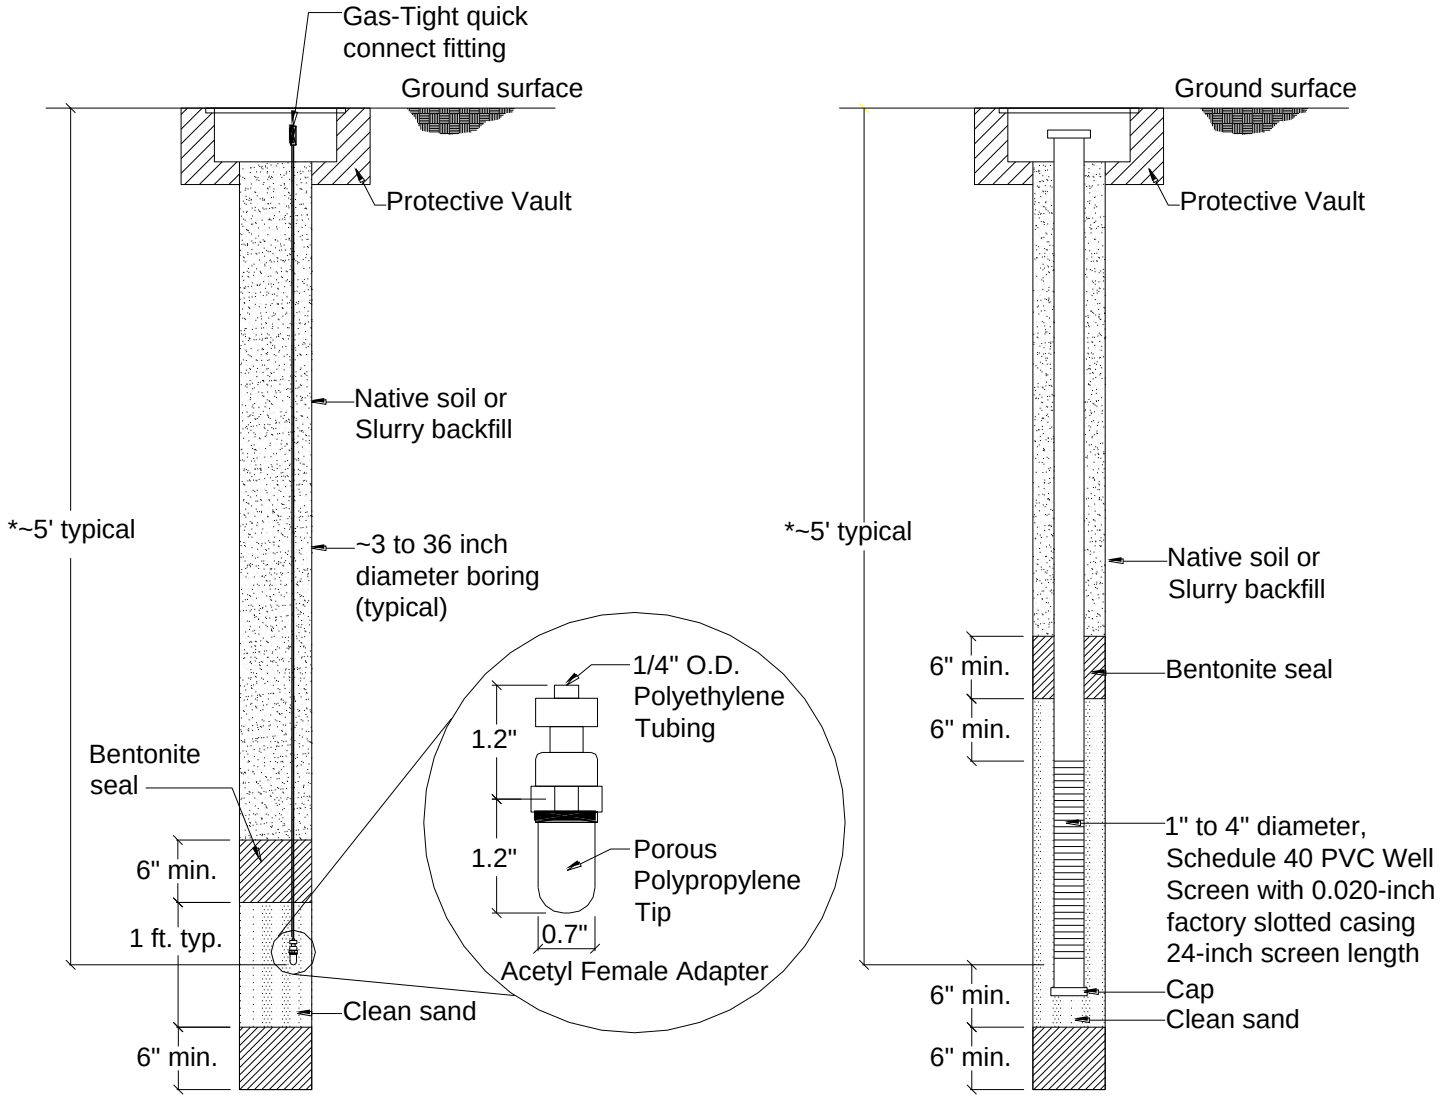
1. Gas Probe Sets shall be capable of collecting data for both soil gas pressure and methane concentration.

2. Instruments and test procedures used to determine gas pressure and concentrations shall be in accordance with the test equipment manufacturer=s instructions and the listed Detection Limits.

3. Portable Gas Sampling Instruments shall consist of infrared gas analyzer or other combustible gas analyzers. Photo Ionization Detectors (PIDs) shall not be used to measure methane concentrations. Flame Ionization Detectors (FID=s) may be used as the primary detector for gas probe monitoring. All portable gas sampling instruments shall be calibrated daily using a laboratory certified methane calibration gas.

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities.

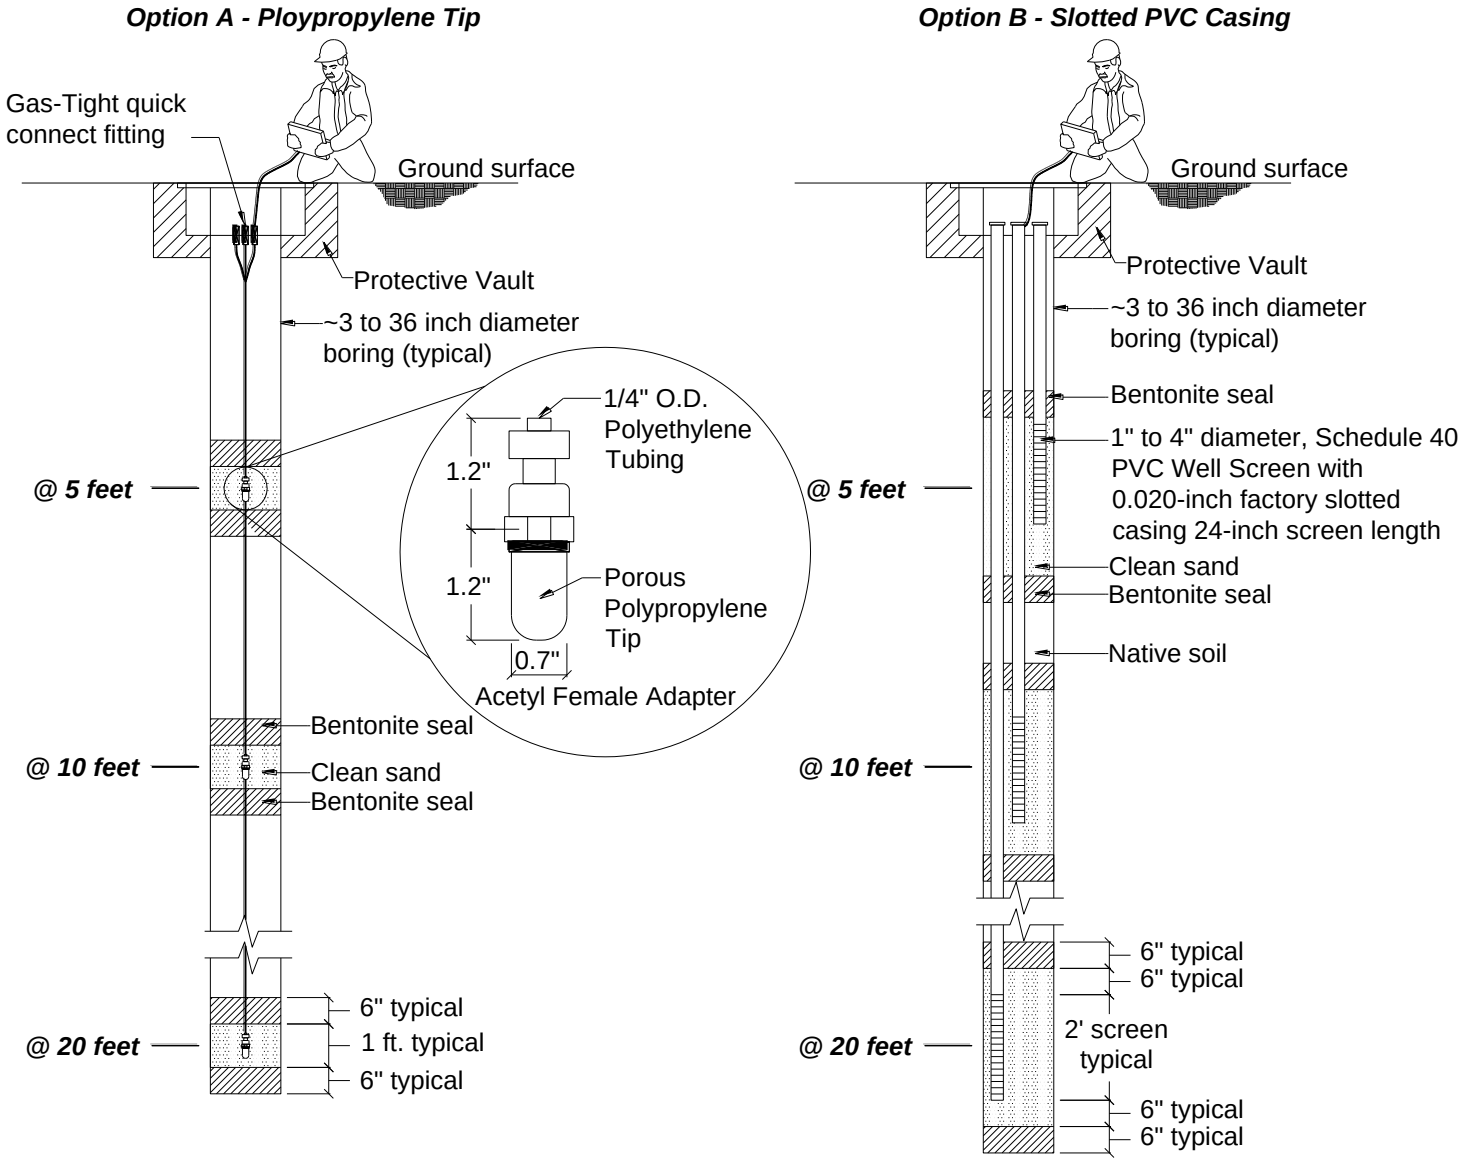
SHALLOW SOIL GAS TEST EQUIPMENT SET-UP



*Note: Measurement from Shallow Soil Gas Test shall be taken above ground water level.

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities.

GAS PROBE TEST EQUIPMENT SET-UP



*Note: Gas Probe Test shall not be install below ground water level.

As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and, upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities.

NO FURTHER REQUIREMENT FOR SOILS ONLY: FORMER TEXACO GASOLINE STATION PARCEL – CORNFIELD PROPERTY, 1322 NORTH BROADWAY, LOS ANGELES, CALIFORNIA (SLIC ID. 2047T00; SLIC NO. 891)

Dear: Mr. Levy

The Los Angeles Regional Water Quality Control Board (Regional Board) staff have received the document entitled *Soil Vapor Extraction Update, dated February 9, 2006* (Report), submitted on behalf of the Union Pacific Railroad Company (UPRR) by Environmental Resources Management-West, Inc. (ERM) to support your no further action request for soils at the former Texaco Station site (Site) located historically at 1322 North Broadway in Los Angeles. Regional Board staff has reviewed the Report and other related information regarding the subject site, including the *Annual Groundwater Monitoring Report, dated January 2006* (Groundwater Report).

BACKGROUND

The former Cornfield site is a 50-acre property (Property) located between North Broadway and North Spring Street in an industrial area east of downtown Los Angeles, as shown in Figure 1 (enclosed). Historically, the Southern Pacific Railroad solely operated the Property, and five parcels were leased to various commercial businesses over time, including the former Texaco station site. The Property is currently divided into three parcels: 1) a 32-acre Parcel which includes most of the flat portion; 2) the 10-acre Metropolitan Transit Authority (MTA) easement which transverses the Property along the northwest side of the 32-acre Parcel; and 3) an 8-acre Parcel that includes the former Texaco station, and the escarpment and flat area at the south end of the Property (Figure 1).

The 8-arce Parcel was occupied by a restaurant from around 1950 to 1955. From 1955 to 1989, the former Texaco gasoline station occupied a portion (0.2 acres between North Broadway and the edge of a steep escarpment or bluff) of the current 8-acre Parcel. A portion of the Site was also leased for parking starting around 1983. The Site had four underground gasoline tanks (USTs) including the associated dispensing hardware, a hydraulic lift, and a small office building. The USTs consisted of two at 8,000 gallons each, one at 6,000 gallons, and one at 1,000 gallons. The retail gasoline station was reportedly demolished in 1989, and the USTs were removed in 1990.

SOIL INVESTIGATION AND REMEDIATION

During the tank removal in 1990, soil samples collected from the base of the UST excavation pits (between 7 and 16 feet below surface grade [ft bgs]) indicated a maximum concentration of total petroleum hydrocarbons as gasoline (TPH-g) at 25,000 milligrams per kilogram (mg/kg), and a maximum concentration of TPH as diesel at 2,000 mg/kg. Benzene, toluene, ethylbenzene and xylenes (BTEX) constituents were detected at maximum concentrations of 120 mg/kg for benzene, 710 mg/kg for toluene, 290 mg/kg for ethylbenzene, and 1,400 mg/kg for xylenes.

Site investigations between 1999 and 2001 indicate that soil and groundwater were impacted by TPH-g, BTEX, and methyl-tert-butyl-ether (MTBE) beneath a limited portion of the 32-acre parcel down-gradient of and attributable to the former Texaco station site. In June 2001, during construction activities along the MTA easement, hydrocarbon-impacted soil was encountered at the base of the escarpment, next to the retaining wall below the former Texaco station location. Approximately 300 cubic yards of impacted soil in this area were excavated.

From March 2001 to June 2002, a soil vapor extraction (SVE) system was operated to remediate a thin (0.2 feet or less) layer of free-phase gasoline within the capillary fringe near the escarpment of the Site. Another SVE system was installed in 2003 to remediate soil impacted by gasoline releases from USTs at the former Texaco service station on the current upper 8-acre Parcel. The SVE system began operation in October 2003. Confirmation soil boring samples were collected in May of 2005. Soil samples from these borings were non-detect for TPH-g, BTEX, and MTBE, and were well below the USEPA's residential Preliminary Remediation Goals (PRGs) for any detected compound. As of June of 2005, the SVE system had removed 365 pounds of volatile organic compounds (VOCs). Rebound testing was conducted from July through September 2005, and indicated that the SVE system had achieved the soil cleanup goals.

GROUNDWATER INVESTIGATION

Since 2000, twenty groundwater wells have been installed at the Site, and six have been decommissioned. Depth to groundwater ranges from 30 to 35 feet below ground surface (bgs). Historical groundwater elevations across the Site have indicated a flow direction generally to the southwest. The hydraulic gradient is approximately 0.009 feet per foot and 0.001 feet per foot, respectively in the northeastern and southwestern portions of the Site. The nearest municipal groundwater well is located 4 miles to the southwest.

Based upon the Groundwater Report, maximum BTEX concentrations in groundwater are 14,000 micrograms per Liter (ug/L), 31,000 ug/L, 3,000 ug/L, and 18,000 ug/L, respectively. MTBE was detected up to 27 ug/L; tetrachloroethylene (PCE) less than one ug/L; trichloroethylene (TCE) up to 3.7 ug/L; 1,2-dichloroethane (1,2-DCA) up to 120 ug/L; and cis-1,2-dichloroethene (cis-1,2-DCE) up to 2.8 ug/L. Free product has not been detected since June 2002. Due to the high BTEX concentrations present in groundwater, sampling and monitoring are still required, along with the possibility of groundwater remediation.

CONCLUSION

Based upon the soil and groundwater data, and other information in our case file, Regional Board staff concludes that the SVE system achieved the cleanup targets for soils, and very low concentrations of TPH remain in soil. These low concentrations do not appear to pose a significant threat to human health and groundwater quality. However, high BTEX constituents concentrations remain groundwater. Therefore, groundwater assessment, sampling, monitoring and remediation are still required by this Regional Board.

The "No Further Requirements" (NFR) determination for soils at this site is made at this time based upon the most current information/data contained in the subject file. The NFR applies only to the known chemicals of concern which have been tested during the site assessment, monitoring, and mitigation phases, and with the provision that the information provided to Regional Board staff is accurate and representative of site conditions. If new contamination is encountered during future site construction or redevelopment activities, you are required to provide verbal notification to this Regional Board immediately and submit a follow-up written report within 72 hours. In addition, appropriate health and safety measures must be fully implemented if conditions change.

In addition, the jurisdiction requirements of other agencies, such as the United States Environmental Protection Agency (USEPA), and Cal EPA-Department of Toxic Substances Control (DTSC), are not affected by this Regional Board's decision regarding the Site. Such agencies may choose to make their own determination concerning the Site.

Please notify this Regional Board of any change in operations, regarding storage and handling of chemicals, or the processing and disposal of wastes. If this property is sold to another party, we must be informed by the new owners of any change in facility operations, such as storage and handling of chemicals, or the processing and disposal of wastes.

If you have any questions, please contact Dr. Arthur G. Heath at (213) 576-6725.

Sincerely,

Jonathan S. Bishop
Executive Officer

1.0 INTRODUCTION

On June 3rd, 2019 Spectrum Geophysics conducted a geophysical investigation at two properties in Los Angeles, California. The purpose of the investigation was to delineate the surface trace of detectable abandoned steel-cased oil wells at these properties.

The first property was a storage yard located at 1380 North Broadway (designated as "North Parcel") and the second property was located southeast of the first property along a narrow strip of ground between a building and a concrete wall on a portion of an active Metro facility; this second property was designated as "South Parcel", and both areas of investigataion were established by Denise Lopez of Ramboll. The North Parcel measured approximately 180 feet by 60 feet in size and was soil covered. The South Parcel measured approximately 150 feet by 10 feet in size and was soil covered.

Site interferences were numerous. As the North Parcel area was an active storage yard, the interferences included chainlink fencing, parked personal and construction vehicles, large steel truck trailers, a portable work trailer, mounds of construction debris, a large metallic sign and 5-foot tall spools of cable (Figure 1). Because of these sources of interference the original intended 200 X 120-foot area of investigation at the North Parcel was reduced to approximately 180 feet by 60 feet. Interferences at the South Parcel area were a steel walled building to the southeast and a reinforced concrete wall ot the northwest – both of which formed the boundary to the accessible portion of the investigation area – and a heavily vegetated slope directly adjacent and northwest of the concrete wall about 10 feet higer in elevation than the accessible portion of the South Parcel (Figure 3).

A discussion of the equipment used during this investigation is presented in Section 2.0, the methods and field procedures are discussed in Section 3.0, results are presented in Section 4.0, and limitations are presented in Section 5.0.

2.0 EQUIPMENT

The equipment used in this investigation consisted of a Geometrics G-858G cesium-vapor magnetometer/gradiometer (G-858G), a NavCom submeter GPS unit (used for positional navigation during data collection) and a shallow-focus metal detector (M-scope).

3.0 METHODS AND FIELD PROCEDURES

3.1 Total Field Magnetics

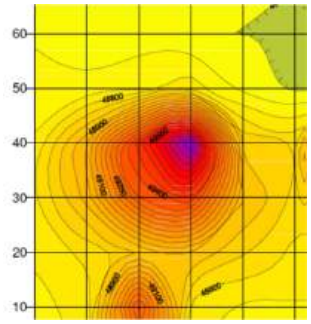
A Geometrics G-858G Cesium Vapor Magnetometer/Gradiometer was used in an effort to identify significant magnetic anomalies that might be associated with massive buried ferromagnetic features, such as the steel casing from an abandoned oil well. The magnetometer used for this survey measures the earth's magnetic field intensity in nanoteslas (nT). A very gradual change in the natural magnetic field is usually observed over background materials in small areas unless there are massive ferrous objects with high

Cesium Vapor Gradiometer – North Parcel
(View to the Northeast)

magnetic susceptibilities present. The shape and amplitude of a magnetic anomaly over a ferromagnetic object is dependent upon the geometry, mass, magnetic susceptibility of the object; depth to the object; and the inclination of the earth's magnetic field in the survey area. Most magnetic anomalies from buried ferrous infrastructure like underground storage tanks (USTs) or pipes are dipolar with the positive portion of the dipole centered over the southern extent of the ferrous metal and the negative portion located to the north of the object. Vertical structures like metallic well casing generally produce broad monopolar anomalies – where there is typically just a large positive anomaly – similar to a "bullseye" in the ideal case. In the presence of metallic interference these predictable signatures of buried ferrous materials change and become quite a bit more complex to interpret – especially in the total magnetic field data.

Because it was known that there would be significant sources of metallic interference present during the data acquisition for both properties during this survey, and because based on Spectrum's extensive experience in downtown Los Angeles it is known that the signature of early 1900's-vintage wells (such as are known to exist in the Elysian Park Oil Field) can be tricky to identify, a second cesium vapor magnetic sensor was utilized during this survey. This second sensor allowed us to collect vertical magnetic gradient data – which typically allows the user to discriminate between surface metallic features and buried metallic features more easily.

During this investigation, readings of the earth's total magnetic field (and/or vertical magnetic gradient) were collected and stored in the G-858G console at 0.3 second intervals. Survey lines were spaced 5 feet apart at the North Parcel and were acquired northwest to southeast (approximately perpendicular to North Broadway). GPS positions were streamed into the G-858G console at one second intervals during data acquisition. Magnetics measurements were interpolated between GPS positions which resulted in a 1.5 foot station spacing on average. These data were processed in the field and used to generate a contour map to assist in identifying anomalous areas that may be caused by buried ferromagnetic features of interest. Where possible, anomalies observed in the contour maps were relocated usingthe G-858G in search mode. A discussion of procedures used at each property is contained in Section 4.0.



Typical anomaly associated with a buried steel-cased well.

In the absence of interference total magnetic field anomalies typical of steel-cased wells are characterized by a regional monopolar magnetic high with a magnitude ranging from 100's to 1000's of nanoteslas above the background magnetic field. These circular monopoles can have a radius of 10 to 30 feet or more depending on several factors like vintage of the well, total

mass of the casing and depth to the well head. It should be noted that, based on our experience, oil wells drilled in the early 1900's may not always produce typical magnetic anomalies due to casing that has been corroded.

4.0 RESULTS

The geophysical interpretation map for the North Parcel is presented in Figure 1. A contour map of vertical magnetic gradient data for the North Parcel is presented in Figure 2. The geophysical interpretation map for the South Parcel is presented in Figure 3. A contour map of total magnetic field data for the South Parcel is presented in Figure 4. A discussion of results on a site by site basis is provided below.

4.1 North Parcel

Anomaly A (pink cross) beneath truck trailer
View to the southeast

Based on DOGGR information provided by Ramboll, one steel cased well was expected to be found within the North Parcel area of investigation. While the area of investigation originally designated by Ramboll contained the anticipated location of this well, it must be stated that Spectrum *could not collect data everywhere* within the 200-foot by 120-foot area. While Ramboll personnel had arranged for the vehicles and site interferences to be removed as much as possible by the current tenant of the property, it was not possible for the tenant to move many of the vehicles and in particular, *two large metallic truck trailers* that happened to be situated directly on top of the expected location of the oil well in question. As a result, the actual data collection area was reduced to 180 feet in the northeast-southwest direction and about 60 feet in the northwest-southeast direction (Figure 1) and in some cases Spectrum had to walk paths in between surface features such as parked trucks and construction vehicles – which limited our ability to discern buried features beneath the walking paths.

To provide the best quality data possible in this situation Spectrum collected vertical magnetic gradient data (linked to GPS for positioning) within the accessible areas of the North Parcel. The resultant contour of vertical magnetic gradient data is provided in Figure 2.

4.1.1 Anomalies Identified

A total of five anomalies were identified in the vertical magnetic gradient data that could not be explained by surface features; the peak (or apparent peak) of each of these anomalies is indicated with a cross symbol in Figure 2. These anomalies are designated as ***Anomalies A through E*** and are discussed below. The location of each of these anomalies is indicated with a colored circle in Figure 1, and they are discussed below.

Anomaly A

Anomaly A is a high-amplitude positve monopole anomaly, appears to be 20 feet in diameter, and has a peak magnetic gradient value of 33,000 nT/m at CA State Plane East 6492191, CA State Plane North 1848267. The peak of this anomaly is identified with a light blue cross in Figure 2, and the anomaly location is indicated with a green circle in Figure 1. It should be noted that the actual ground-verified position of this anomaly (not the apparent peak to the west of this anomaly in Figure 2) is identified in Figures 1 and 2; this is because during data acquisition a large metallic truck trailer was located directly on top of ***Anomaly A***, and it was not possible to exactly locate the peak of this anomaly while walking parallel lines. Once the approximate area of this anomaly was determined from the data, its location was reoccupied with the gradiometer in search mode in order to verify its peak. It should be noted that because the truck trailer could not be moved during the survey the source of this anomaly could not be fully verified; in addition, it is possible that the peak indicated in the figures may not be the *exact location* of the true peak, because it was not possible acquire data beneath the truck trailer. Nevertheless, based on Spectrum's extensive experience in identifying abandoned wells this anomaly exhibits the typical strong monopole signature of a buried steel cased well, and it is likely that the source of ***Anomaly A*** is within 10 feet of the peak marked in Figure 2. This anomaly was painted in pink with a white whisker placed in the center of it during the investigation.

It should be noted that, because of metallic interference, a limited utilities investigation was done in the vicinity of ***Anomaly A***, and because of current tenant activities during the investigation it was not possible to explore for the presence of utilities in the vicinity of ***Anomalies B through E***. As a result Spectrum cannot guarantee that all utilities present within the area of investigation have been identified. In the event of further excavation/exploration we recommend a full utilities survey.

Anomaly B

Anomaly B is a high-amplitude positive gradient anomaly, appears to be 10 feet in diameter, and has a peak magnetic gradient value of 6,800 nT/m at CA State Plane East 6492208, CA State Plane North 1848278. This anomaly was identified subsequent to the field investigation. The apparent peak of this anomaly is identified with a green cross in Figure 2, and the anomaly location is indicated with a red circle in Figure 1. It should be noted that this anomaly is not fully exhibited in the data because of the limited area to collect data in this location; this is because during data acquisition a large metallic truck trailer was located directly southeast of ***Anomaly B***, and it was not possible to collect data further to the southeast of the peak marked in Figure 2. As a result, it is possible that the peak/location for this anomaly indicated in Figures 1 and 2 may not be the *exact location* of the true peak, because it was not possible acquire data beneath the truck trailer or further to the southeast. As ***Anomaly B*** appears to be significant in the gradient data it is likely associated with a buried ferrous object, and could possibly be associated with a steel cased well. Because this anomaly was identified subsequent to the investigation it was not further investigated with utility locating methods.

Anomaly C

Anomaly C is a high-amplitude positive monopole anomaly, appears to be 20 feet in diameter, and has a peak magnetic gradient value of 9,500 nT/m at CA State Plane East 6492226, CA State Plane North 1848289. This anomaly was identified subsequent to the field investigation. The apparent peak of this anomaly is identified with a green cross in Figure 2, and the anomaly location is indicated with a red circle in Figure 1. It should be noted that ***Anomaly C*** is not fully exhibited in the data because of the limited area to collect data in this location; this is because during data acquisition a large metallic truck trailer was located directly west of the anomaly and large metallic spools of cable were located directly southeast of the anomaly; therefore it was not possible to collect data further to the southeast of the peak marked in Figure 2. As a result, it is possible that the peak/location for this anomaly indicated in Figures 1 and 2 may not be the *exact location* of the true peak, because it was not possible acquire data further to the southeast. Because ***Anomaly C*** appears to be 20 feet in diameter and is also monopololar in the gradient data, it could be associated with a steel cased well or other buried ferrous object. Because this anomaly was identified subsequent to the investigation it was not further investigated with utility locating methods.

Anomaly D

Anomaly D is a high-amplitude positive gradient anomaly, appears to be at least 10 feet in diameter, has a peak magnetic gradient value of 5,500 nT/m, a strong positive total field value of about 5,000 nT (bottom sensor) above background, and is located at CA State Plane East 6492272, CA State Plane North 1848330. This anomaly was identified subsequent to the field investigation. The apparent peak of this anomaly is identified with a green cross in Figure 2, and the anomaly location is indicated with a red circle in Figure 1. It should be noted that ***Anomaly D*** is not fully exhibited in the data because of the limited area to collect data in this location; this is because during data acquisition a large metallic construction vehicle was located directly southeast of the anomaly and large piles of construction debris/concrete rubble were located directly northeast of the anomaly; therefore it was not possible to collect data to further characterize this anomaly. As a result, it is possible that the peak/location for this anomaly indicated in Figures 1 and 2 may not be the *exact location* of the true peak, because it was not possible acquire data further to the southeast or northeast of it. Because ***Anomaly D*** appears to be at least 10 feet in diameter and exhibits a strong monopololar signature in both the magnetic gradient and the total field data, it could be associated with a steel cased well or other buried ferrous object. Because this anomaly was identified subsequent to the investigation it was not further investigated with utility locating methods.

Anomaly E

Anomaly E is a high-amplitude positive monopole anomaly, appears to be 15 feet in diameter, and has a peak magnetic gradient value of 5,600 nT/m at CA State Plane East 6492256, CA State Plane North 1848352. This anomaly was identified subsequent to the field investigation. The apparent peak of this anomaly is identified with a green cross in Figure 2, and the anomaly location is indicated with a red circle in Figure 1. It should be

noted that ***Anomaly E*** is not fully exhibited in the data because of the limited area to collect data in this location; this is because during data acquisition large construction vehicles were located directly northwest of the anomaly; therefore it was not possible to collect data further to the northwest of the peak marked in Figure 2. As a result, it is possible that the peak/location for this anomaly as indicated in Figures 1 and 2 may not be the *exact location* of the true peak, because it was not possible acquire data further to the northwest. Because ***Anomaly E*** appears to be 15 feet in diameter and is also monopololar in the gradient data, it could be associated with a steel cased well or other buried ferrous object. Because this anomaly was identified subsequent to the investigation it was not further investigated with utility locating methods.

Area of Investigation – South Parcel
(View to the southwest)

4.2 South Parcel

The geophysical interpretation map for the South Parcel is presented in Figure 3, and a contour map of total magnetic field data for the South Parcel is presented in Figure 4.

Based on DOGGR information provided by Ramboll, one steel cased well was expected to be found within the South Parcel area of investigation. While the area of investigation originally designated by Ramboll contained the anticipated location of this well, it must be stated that Spectrum *could not collect data* within a large portion of the originally designated 150-foot by 45-foot area. While Ramboll personnel had originally intended for Spectrum to investigate within what appeared to be a vacant strip of land directly east of a building, where the anticipated well location was right along the southeast edge of that building, in fact that strip of land turned out to be heavily vegetated and unsafe for Spectrum personnel to occupy. As a result, the actual data collection area for South Parcel was reduced to a 10-foot-wide strip of land measuring approximately 150 feet in the northeast-southwest direction between a metallic building and a reinforced concrete wall (Figure 3).

Because this narrow strip of land was also sloped, for safety concerns vertical magnetic gradient data acquisition was not attempted at the South Parcel. Instead, Spectrum collected total magnetic field data using a rectangular grid for positioning, with parallel lines spaced 2.5 feet apart. It must be stated that magnetics data quality within such a narrow area surrounded by continuous ferrous/metallic features would be expected to poor at best. The South Parcel area of investigation is indicated in blue in Figure 3. The resultant contour map of total magnetic field data is provided in Figure 4.

4.2.1 Anomalies Identified

One anomaly was identified in the total magnetic field data that could not be explained by surface features; the peak (or apparent peak) of this anomaly is indicated with a cross symbol in Figure 4. This anomaly is designated as ***Anomaly F*** and is discussed below. The location of this anomaly is indicated with a red circle in Figure 3, and it is discussed below.

Anomaly F

Anomaly F is a high-amplitude positve peak anomaly that was identified directly adjacent to the reinforced concrete wall, approximately 95 feet southwest of the northeast corner of the metallic building, as measured along the long axis of the geophysical grid. This anomaly had a peak total magnetic field value of 60,000 nT, and has corresponding GPS coordinates of 6490258 CA State Plane East and 1846393 CA State Plane North. It should be noted that the actual ground-verified position of this anomaly (not the apparent peak in the contour map in Figure 4) is identified in Figures 3 and 4; this is because during data acquisition the reinforced concrete wall was essentially directly on top of ***Anomaly F***, and it was not possible to exactly locate the peak of this anomaly while walking parallel lines. Once the approximate area of this anomaly was determined from the data, its location was reoccupied with the magnetometer in search mode in order to verify its peak. It should be noted that, while a peak in the total field data has been identified, it is likely that the *actual peak* in reality for this anomaly could be *35 feet or more northwest of the marked location* for ***Anomaly F***, because it was not safe to acquire data on the vegetated slope directly northwest of ***Anomaly F.*** Nevertheless, based on Spectrum's extensive experience in identifying abandoned wells this anomaly exhibits the typical strong positive signature exhibited in the vicinity of a buried steel cased well – especially in the presence of metallic interference. This anomaly was marked with a pink whisker and painted with pink spray chalk on the side of the metallic building during the investigation.

5.0 LIMITATIONS

5.1 Magnetometry/Gradiometry

In the absence of cultural interference, provided the abandoned well is steel cased and depending on the vintage of the well, most abandoned wells are detectable with the magnetic method to depths of 10 feet or more. Magnetometry/gradiometry surveys for abandoned wells are subject to interference by induced magnetic fields associated with surface and subsurface cultural features that contain ferrous materials. These features may be located within the survey area or along the survey perimeter. Such features include metallic trailers, buildings, reinforcing steel bars in concrete, vehicles, chain link fences and underground utilities. In addition, there were numerous sources of removable surface metallic interference present in the North Parcel area of investigation, and at least two sources of permanent surface metallic interference present in the South Parcel area of investigation. As a result, Spectrum cannot guarantee that all abandoned wells, utilities, or other buried metallic objects have been identified within 10 feet of surface metallic features present during this investigation (Figures 1 and 3).

5.2 Utilities

It should be understood that utility locating methods were primarily used during this investigation for exploration of ***Anomaly A***, and because of the presence of the metallic truck

trailer these methods were not highly useful: although no utilities were identified in the vicinity of ***Anomaly A***, it is possible that some utilities are present in this location. Because of current tenant activities during the investigation it was not possible to explore for the presence of utilities in the vicinity of ***Anomalies B through E***. Because of excessive metallic interference in the area of exploration for ***Anomaly F*** in the South Parcel, no attempt was made to locate utilities in the vicinity of ***Anomaly F***. As a result, Spectrum cannot guarantee that all utilities present within the areas of investigation at the North Parcel or the South Parcel have been identified. In the event of further excavation/exploration of ***Anomalies A through F*** we recommend a full utilities survey.

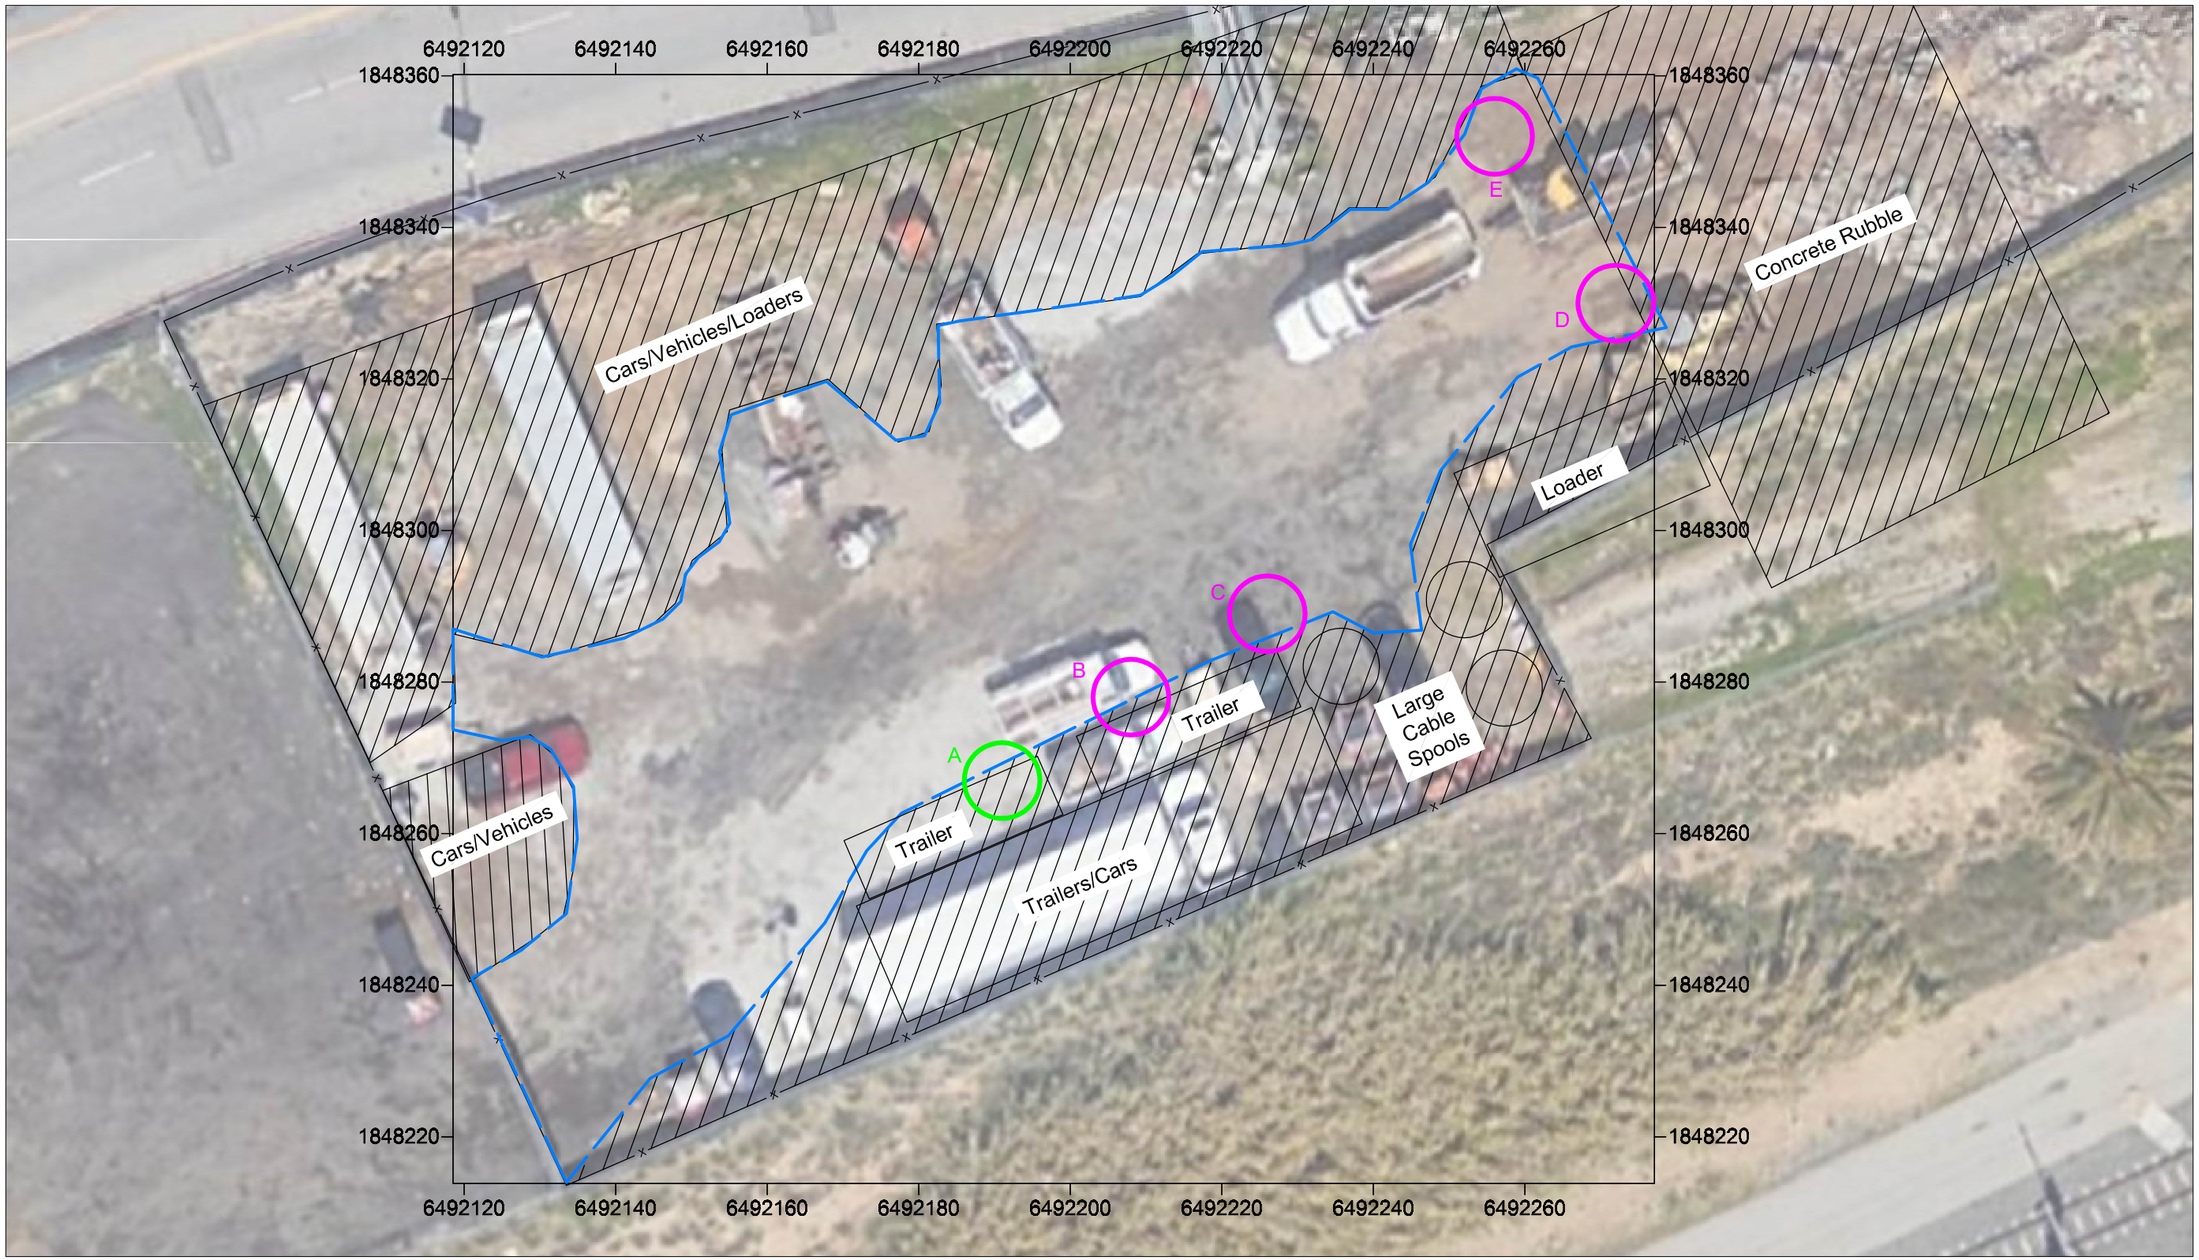
5.3 Positions

The GPS positions for ***Anomalies A through F***, as identified during this investigation, are subject to the accuracy of the GPS unit used for navigation during this survey. As a result, positions can be regarded as correct to +/- 5 feet of their true geographic location.

5.4 General

Spectrum is not responsible for subsurface features, such as abandoned wells, utilities and USTs, situated outside of the boundaries of the Area of Investigation at the North Parcel and South Parcel properties.

It should be understood that the location of subsurface objects and utilities is dependent upon the recognition of physical phenomena at the ground surface. These phenomena can be magnetic fields or electro-magnetic waves that give rise to a surface expression which in turn is interpreted as representative of subsurface objects. These waves, however, may be attenuated and/or distorted by a number of factors including soil moisture, corrosion, and proximity to other surface and subsurface facilities.



*Due to metallic interference, Spectrum cannot guarantee that all abandoned wells, utilities or other buried metallic objects have been identified within 10 feet of surface metallic features present during the investigation.

ATTACHMENT E
REPORT BRIEF-GEOPHYSICAL INVESTIGATION, ABANDONED OIL WELL, VACANT LOT, 1380 N. BROADWAY LOS ANGELES, CALIFORNIA, PREPARED BY SPECTRUM GEOPHYSICS (JULY 18, 2023)

LETTER REPORT

SPECTRUM GEOPHYSICS, 8216 LANKERSHIM BLVD. #12, NORTH HOLLYWOOD, CA 91605

July 18, 2023

Mr. Alex Marr
Ramboll
350 South Grand Avenue, Suite 2800
Los Angeles, California 90071

RE: Report Brief-Geophysical Investigation
Abandoned Oil Well
Vacant Lot
1380 N. Broadway
Los Angeles, California

Dear Mr. Marr:

Spectrum Geophysics (Spectrum) conducted a geophysical investigation on July 5th, 2023 on a portion of a vacant lot located at 1380 N. Broadway in Los Angeles, California – hereinafter referred to as the Property (Figure 1). The purpose of the investigation was to locate an abandoned steel-cased oil well; information from Ramboll and CalGEM indicated that the well in question is referred to as " Freight Depot #1" with API # 0403716588. The area of investigation, as designated by Larson Henderson of Ramboll, was approximately 48,000 square feet in size and was soil and gravel covered; the investigation area included a previously identified/verified well known as "Southern Pacific Corehole No. 1" with API # 0403700510. Site interferences included scattered surface debris, chain link fencing, steel posts, 3 billboards, a temporary power pole and a steel plate.

EQUIPMENT AND PROCEDURES

A Geometrics G-858G cesium vapor magnetic gradiometer (G-858G) was used during this investigation in an effort to identify significant magnetic anomalies that might be associated with massive buried ferromagnetic features at the Property, such as the steel casing from an abandoned oil well. Additional equipment consisted of a Trimble Pro 6H submeter GPS unit (used for both navigation during magnetics data collection and for mapping site features), a Schonstedt magnetic gradiometer, a RadioDetection RD4000 electromagnetic utility locator (RD4000), a Fisher TW-6 M-Scope shallow-focus metal detector (M-Scope) and an Archer field computer.

SPECTRUM GEOPHYSICS, 8216 LANKERSHIM BLVD. #12, NORTH HOLLYWOOD, CA 91605

The following QA/QC measures were taken to ensure the equipment was working properly:

- The G-858G was allowed to warm up for approximately ten minutes while a manufacturer system test was run and the sensor gained sufficient signal strength
- The battery level and memory space of the G-858G were checked and found to be within acceptable levels.

Once the G-858G was found to be operating in proper working order, readings of the earth's total magnetic field and vertical magnetic gradient were collected (using GPS for navigation) and stored in the G-858G console at approximate 1-foot intervals along parallel traverses spaced approximately 5 feet apart within the area of investigation. These data were processed in the field and used to generate contour maps to assist in identifying anomalous areas that may be caused by buried ferromagnetic features of interest. A discussion of the magnetics method for abandoned well detection may be found in the attached methods section.

PROJECT RESULTS

A geophysical interpretation map is presented in Figure 1. Contour maps of total magnetic field and vertical magnetic gradient are presented in Figures 2 and 3, respectively. The geophysical interpretation map in Figure 1 provides a map of key surface cultural features, as well as detected utilities and identified anomalies within the boundaries of the Area of Investigation (dashed blue boundary line in Figure 1). This map was used as the detailed cultural feature map for the survey area, which was compared with the contour maps of magnetics data to determine which anomalies were likely caused by surface cultural features or utilities, and which might be associated with a steel cased well. Based on this process three anomalies were identified in the data that cannot be explained by surface cultural features or detected utilities. These anomalies were desigated as ***Anomaly A, Anomaly B*** and ***Anomaly C,*** are indicated with a red box in Figure 1. The location where a buried ferromagnetic object was detected within the bounds of each anomaly during the field survey is indicated with a red cross symbol in Figure 1. These anomalies are discussed below.

Anomaly A

Anomaly A was identified in a previous investigation. ***Anomaly A*** is a strong magnetic monopolar high, extending from Eastings 6491908 to 6491936 and between Northings 1848187 and 1849158 with the peak of the anomaly centered at Easting 6491922 and Northing 1848173. ***Anomaly A*** is a complete "textbook" broad magnetic monopole whose peak is approximately 10,000 gammas above background values. This location was marked on the ground with an orange box (orange cross at the peak location) during the field investigation. Based on our records and maps provided by Ramboll, ***Anomaly A*** appears to be associated with the well known as "Southern Pacific Corehole No. 1."

SPECTRUM GEOPHYSICS, 8216 LANKERSHIM BLVD. #12, NORTH HOLLYWOOD, CA 91605

Anomaly B

Anomaly B is a moderate positive magnetic monopolar high, is roughly 27 X 30 feet in size, and extends from Eastings 6492086 to 6492122 and between Northings 1848274 and 1848235. The peak of the anomaly is centered at Easting 6492105 and Northing 1848251. Follow up using a Schonstedt magnetic locator detectected a ferromagnetic object within the bounds of the anomaly; however, a source could not be determined. EM-Utility locating methods provided no further information. This location was marked on the ground with an orange box (orange cross at the peak location) during during the field investigation. Based on a review of the map provided by Ramboll and the CalGEM well records, ***Anomaly B*** may be associated with the well kown as " Freight Depot #1"; although, this anomaly is relatively low amplitude and not fully monopolar. Alternatively, ***Anomaly B*** may be associated with an unknown buried ferromagnetic object.

Anomaly B *with Orange Cross (View to NW)*

Anomaly C

Anomaly C is a moderate magnetic monopolar low in both the total field and the vertical gradient data, is roughly 22 X 20 feet in size, and extends from Eastings 6492107 to 6492129 and between Northings 1848330 and 1848310. Follow up with the Schonstedt and EM-Utility locating methods provided no further information. This location was marked on the ground with and orange box during the field investigation. It should be understood that ***Anomaly C*** does not exhibit the positive monopole that would be expected of a steel cased well. However, the exact source of this anomaly was not clear during the field survey, and while it likely is associated with the power pole/low hanging power lines that lie about 10 feet to the west of it, it could be associated with a ferromagnetic source.

LETTER REPORT

We appreciate the opportunity to provide these results to Ramboll. Please let us know if there are any questions regarding these results.

Sincerely,

SPECTRUM GEOPHYSICS

METHODS

CESIUM VAPOR MAGNETICS – OIL WELL SEARCH

During this investigation a Geometrics G-858/G-858G cesium vapor magnetometer/gradiometer (G-858/G-858G) was used in an effort to identify anomalies indicating high concentrations of buried ferromagnetic material that may be associated with former steel cased wells. A magnetometer measures the intensity of the earth's magnetic field in nanoteslas (nT); a gradiometer measures the change in the intensity of that field over a short distance (in this case vertical distance). The earth's background magnetic field generally varies from 30,000 nT at the magnetic equator to 65,000 nT at the magnetic poles.

Total Field Magnetics Survey

The G-858/G-858G operates on the principal of optical pumping to measure the earth's magnetic field intensity in nanoteslas (nT), as well as the vertical gradient of the earth's magnetic field (change in the total magnetic field over a short vertical distance) in nanoteslas/meter (nT/m). The benefits of optically pumped magnetometers and gradiometers are the ability for continuous measurement of the earth's magnetic field intensity, high precision data, and near-ground readings where the response to small near-surface objects is maximized.

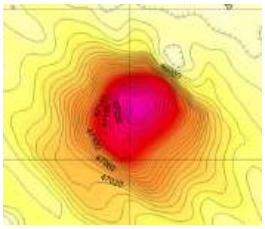
A very gradual change in the natural magnetic field is usually observed over background near surface materials over short distances unless there are massive ferrous objects with high magnetic susceptibilities present. The shape and amplitude of a magnetic anomaly over a ferromagnetic object is dependent upon the geometry, mass, and magnetic susceptibility of the object; depth to the object; and the inclination of the earth's magnetic field in the survey area. In the northern hemisphere, magnetic anomalies over buried or surface objects such as drums, pipes, and buried metallic debris are dipolar and generally exhibit an asymmetrical, south up, north down signature in the data (maximum – red – on the south side and minimum – blue – on the north side). However, long vertical ferrous structures like steel well casings generally produce broad monopolar anomalies (particularly in the total magnetic field data) – where there is typically just a large positive anomaly surrounding the feature – similar to a "bullseye" in the ideal case. In the presence of metallic interference these predictable signatures of buried ferrous materials change and become quite a bit more complex to interpret – especially in the total field data.

The G-858 instrument may be operated in vertical gradiometer mode (G-858G) to better identify buried steel cased wells in areas where severe surface or subsurface cultural interference (such as in areas with piping, fences, buildings or high voltage) is anticipated. In vertical gradiometer mode, two cesium vapor sensors are mounted vertically at either end of a short aluminum pole, where the change in magnetic field is recorded as the vertical magnetic gradient in nanoTeslas/meter.

G-858G Gradiometer Survey

During magnetics data acquisition readings of the earth's total magnetic field and vertical magnetic gradient are displayed and recorded on a console that is held at the operator's waist. Parallel lines of magnetics readings (both total field and vertical magnetic gradient) spaced approximately 5 feet apart are collected within the entire survey area, and then contoured and color enhanced to generate plan

view maps of the magnetic field in the survey area. These maps are then used to facilitate anomaly recognition.



Typical Regional Oil Well Anomaly

In the absence of interference, total magnetic field anomalies typical of steel-cased wells are characterized by a regional monopolar magnetic high with a magnitude ranging from 100's to 1000's of nanoteslas above the background magnetic field. These circular monopoles can have a radius of 10 to 30 feet or more depending on several factors such as vintage of the well, thickness of the casing, total mass of the casing and depth to the well head. It should be noted that, based on our experience, *oil wells drilled in the early 1900's may not always produce typical magnetic anomalies* due to several factors, such as how the well was abandoned/ what it was filled with when abandoned, the magnetic properties of the steel, how many strings of casing were used, and whether the casing has been corroded

The precise location of a well is typically offset a short distance northerly of the monopolar anomaly peak due to the inclination of the earth's magnetic field. This offset distance varies from a few feet to 5 feet or more, depending on the depth to the well head.

Procedures

During this investigation the geophysics crew established a grid and collected magnetics data along lines approximately 5 feet apart (where possible); these data were recorded and stored in a digital console, and then downloaded to a laptop computer and processed in the field. Contour maps were generated to assist in identifying anomalous areas that may represent the location of buried ferromagnetic well casings.

Hand-held Magnetic Locator

Identified anomalies were further investigated using a Schonstedt Mac 51 hand-held magnetometer in an effort to pinpoint the possible well locations. Electromagnetic utility-locating equipment was also used to identify possible sources of identified anomalies, such as utilities.

Limitations

Provided the abandoned well is steel cased and is 1940s vintage or later, most vertically oriented abandoned wells are detectable with the magnetic method to depths of 10 feet or more. It should be understood that although utilities were identified during the course of this survey this was not a full-site utility locating survey.

It should be understood that the location of subsurface objects and utilities is dependent upon the recognition of physical phenomena at the ground surface. These phenomena can be magnetic fields or electromagnetic waves that give rise to a surface expression which in turn is interpreted as representative of subsurface objects. These waves, however, may be attenuated and/or distorted by a number of factors including soil moisture, corrosion, and proximity to other surface and subsurface features.

Dear Mr. Carrasco:

On behalf of Union Pacific Railroad (UPRR), Arcadis U.S., Inc. (Arcadis) prepared this 2023 Annual Groundwater Monitoring Report and Request for No Further Action (2023 Report) to summarize the 2023 annual groundwater monitoring and sampling event performed at the former Cornfield Yard located at 1245 North Spring Street, Los Angeles, California (Site; Figures 1 and 2).

This 2023 Report presents updated information and multiple lines of evidence to provide a basis for closure. The additional information presented in this 2023 Report supplements the closure requests that are documented in the Summary of Site Conditions and Request for Closure Report (Request for Closure; Arcadis 2009), Addendum to the Summary of Site Conditions and Request for Closure Report (Request Addendum; Arcadis 2010), and 2018, 2019, 2020, 2021, and 2022 Annual Groundwater Monitoring Reports and Request for No Further Action submitted since 2018 (Arcadis 2019, 2020, 2021, 2022, 2023).

SITE DESCRIPTION

The Site consists of a 50-acre former railroad transfer station and storage yard and is currently used by multiple parcel owners, as summarized below:

- A 32-acre parcel located in the lower flat portion of the Site that has been redeveloped as a park.
- A 10-acre easement consisting of an active Metropolitan Transportation Authority (MTA) rail line.
- An 8-acre parcel along the 40-foot-high escarpment that is planned for redevelopment as residential dwellings.

SITE BACKGROUND

Site background and history details are provided in the Request for Closure (Arcadis 2009).

The groundwater monitoring program was first implemented in August 2000 at the request of the California Regional Water Quality Control Board, Los Angeles Region (RWQCB). A request for no further action (NFA) was included in the Request for Closure and the Request Addendum (Arcadis 2009, 2010). In a letter to UPRR, the RWQCB requested that additional annual monitoring be conducted to monitor benzene concentrations before considering a NFA determination for the Site (RWQCB 2010). Additional monitoring was performed annually starting in 2010.

SCOPE OF WORK PERFORMED

Annual groundwater monitoring activities performed during the fourth quarter of 2023 included the following tasks, as approved by the RWQCB in a letter dated June 28, 2013 (RWQCB 2013):

- Measured depth to groundwater for accessible groundwater monitoring wells and calculated groundwater elevations and gradient.
- Collected groundwater samples from wells BMW-4 and BMW-6.
- Analyzed groundwater samples for volatile organic compounds (VOCs), including fuel oxygenates using United States Environmental Protection Agency (USEPA) Method 8260B and for total volatile and extractable fuel hydrocarbons by USEPA Method 8015M.
- Measured groundwater field parameters (temperature, pH, conductivity, and dissolved oxygen [DO]).
- Analyzed groundwater samples for biogeochemical data, including methane, iron, manganese, nitrate, and sulfate.
- Prepared figures, including a Site Location Map (Figure 1), Site Plan (Figure 2), Groundwater Elevation Contours – October 2023 (Figure 3) showing calculated groundwater hydraulic gradient direction, and an Analyte Concentration Distribution Map – October 2023 (Figure 4).
- Prepared analyte-specific isoconcentration contour maps (Figures 5 through 9).
- Prepared this 2023 Report to document groundwater monitoring activities.

Arcadis' subcontractor, Blaine Tech Services, Inc. (BTS), monitored the wells and collected groundwater samples during the 2023 monitoring and sampling event.

SUMMARY OF MONITORING ACTIVITIES

On October 2, 2023, BTS measured depth to groundwater and collected groundwater samples for laboratory analysis at wells BMW-4 and BMW-6. BTS was unable to locate wells BMW-3, BMW-5, MW-18, MW-19, and MW-20 during the initial mobilization. BTS returned on October 6, 2023, to locate and measure depth to groundwater from the remaining wells. BTS also collected GPS coordinates of all wells to avoid the need for multiple mobilizations in the future. Free-phase hydrocarbons were not detected during the monitoring event.

BTS collected groundwater samples from wells BMW-4 and BMW-6 using low-flow purge and sampling methods as outlined in Appendix A. BTS collected samples using a peristaltic pump and dedicated tubing at each well. Groundwater monitoring logs for the 2023 monitoring event are included in Appendix B.

Pace Analytical, located in Mount Juliet, Tennessee, a California Department of Health Services accredited laboratory, performed laboratory analyses for the following parameters:

- VOCs (including fuel oxygenates) in accordance with USEPA Method 8260B
- Total volatile petroleum hydrocarbons (TVPH), quantified in the hydrocarbon range of C5-C12, in accordance with USEPA Method 8015
- Total extractable petroleum hydrocarbons in the diesel range (TEPH-d), quantified in the hydrocarbon range of C10-C28, and total extractable petroleum hydrocarbons as motor oil (TEPH-mo), quantified in the hydrocarbon range of C28-C40, in accordance with USEPA Method 8015
- Biogeochemical parameters, including methane (RSK-175 mod), iron and manganese (USEPA Method 6010B), nitrate (USEPA Method 353.2), and sulfate (USEPA Method 9056A).

Data Quality Control and Validation

Laboratory reports, including quality assurance and quality control sample results, are presented in Appendix C. Field quality assurance/quality control procedures included collecting and analyzing one field duplicate sample (from well BMW-6) and three field equipment blanks (QCEB1, QCEB2 and QCEB3). The field duplicate was analyzed for the same parameters as the primary groundwater samples. One trip blank was included in the cooler for transportation with the samples during the monitoring event. Method blank, matrix spike, blank spike, and surrogate spike samples were prepared and analyzed by the laboratory.

Analytical data generated from this groundwater monitoring event were validated per the USEPA's data validation Level II methodology by GHD, a third-party UPRR contractor. The data quality evaluation was performed to determine the reliability of the laboratory analyses and the accuracy and precision of information acquired from the laboratory. Data quality was assessed through the review and evaluation of field sampling activities, quality control samples, and data associated with the analytical results.

Overall, the analytical data for the Site are acceptable and defensible and can be used for their intended purposes. Any changes to the data resulting from the validation process, such as the addition of qualifiers, are included in the tables and on the figures. A copy of the data validation report is included in Appendix C.

Waste Management

Purge and decontamination water generated during this sampling event were stored on site in a 55-gallon drum properly labeled with the UPRR Waste Request Number (16211). Waste was transported to Crosby and Overton in Long Beach, California for disposal on November 6, 2023. The waste manifest can be found in Appendix D. .

RESULTS

Depth to groundwater was measured during the October 2023 monitoring event. Measurements are summarized in Table 1; groundwater elevation contours are shown on Figure 3. Current and historical groundwater analytical data for the Site is summarized in Tables 2, 3, and 4, and select data are shown on Figure 4. Chemical-specific isoconcentration contour maps are presented on Figures 5 through 9.

Depth to Groundwater

Depth to groundwater ranged at the lower flat portion of the site from 24.68 feet below ground surface (bgs) in well MW-19 to 44.14 feet bgs in well BMW-6. The groundwater depth was 56.88 feet bgs in well MW-18, which is located above the escarpment north of the MTA easement. The current estimated horizontal groundwater flow direction during this annual monitoring period was toward the southwest, which is generally consistent with the historical groundwater flow directions.

Analytical Results – Volatile Organic Compounds

The highest concentrations of VOCs during the annual groundwater monitoring event were detected in well BMW-4, consistent with prior monitoring events. Concentrations of the gasoline-related petroleum hydrocarbons, benzene, ethylbenzene, toluene, and total xylenes decreased since the 2022 monitoring event and have significantly decreased since 2017. Other VOCs such as naphthalene (66.2 micrograms per liter [µg/L]), n-butylbenzene (6.17 µg/L), n-propyl-benzene (36 µg/L), sec-butyl-benzene (5.13 µg/L), 1,2,4-trimethylbenzene (45.8 µg/L), and 1,3,5-trimethylbenzene (9.81µg/L) have also decreased since 2022.

The maximum concentration of benzene (243 µg/L) in BMW-4 was greater than the California maximum contaminant level (MCL) during the October 2023 monitoring event but has significantly decreased from 1,640 µg/L in 2022. No other VOCs were detected at concentrations greater than their respective MCLs.

No VOCs were detected above the reporting limit at BMW-6 during the 2023 event.

Analytical Results – Total Petroleum Hydrocarbons

The following maximum concentrations were detected:

- TVPH (2.99 J milligrams per liter [mg/L]), TEPH-d (2.40 mg/L), and TEPH-mo (0.235 mg/L) in well BMW-4.

- TEPH-d (1.20 mg/L), and TEPH-mo (0.187 mg/L) in well BMW-6. TVPH was not detected above the reporting limit..

Analytical Results – Biogeochemical

Biogeochemical testing was conducted to evaluate the potential biodegradation processes that may be occurring and to provide an additional line of evidence for natural attenuation of hydrocarbons in groundwater. The biogeochemical data collected during October 2023 are summarized in Table 4.

Concentrations of several biogeochemical parameters continue to be consistent in wells BMW-4 and BMW-6 and indicate ongoing biodegradation. In wells BMW-4 and BMW-6, DO concentrations were 0.44 and 6.737 mg/L, respectively, but ranged between 0.2 and 2.07 mg/L during historical monitoring at these locations, indicating reducing to mildly aerobic conditions in the source area (BMW-4). Methane was also detected in wells BMW-4 and BMW-6, indicating more strongly reducing conditions near the source area. Levels of pH were within a range conducive to biological activity (between 6 and 7). Additionally, sulfate concentrations were suppressed in wells BMW-4 and BMW-6 compared to historical results from other wells outside of the source area, suggesting that sulfate reduction may be occurring as it is used as an electron acceptor to oxidize organic carbon in the source area. Sulfate concentrations in well BMW-6 have increased and approached background level since the 2017 monitoring event, suggesting the area of active sulfate reduction (i.e., area of impacts) is shrinking and limited to the vicinity of well BMW-4.

SUMMARY AND CONCLUSIONS

The groundwater data collected to date show the following:

- Groundwater elevations are at or near historical high levels; however, since monitoring began in August 2000, levels have fluctuated less than approximately 3 feet in elevation. Groundwater elevations measured in the wells during 2023 decreased an average of 2.07 feet compared to 2022.
- Current monitoring of wells BMW-4 and BMW-6 confirmed that the detected benzene, toluene, ethylbenzene, and total xylenes (BTEX) in well BMW-4 is limited in extent. The 2023 result of 243 µg/L for benzene in well BMW-4 represents a significant decrease from the 2002 high of 16,000 µg/L and the 2022 concentration of 1,640 µg/L. The measurements in this event represents the lowest BTEX concentrations detected in well BMW-4 since sampling began in 2000, supporting evidence of a continued reducing trend in BMW-4.
- BTEX concentrations in samples collected from well BMW-6, immediately downgradient from well BMW-4, have shown a generally decreasing trend since January 2004. Benzene was detected in well BMW-6 at a concentration of 2.31 µg/L during the 2021 sampling event. The overall historical results from wells downgradient from wells BMW-4 and BMW-6 suggest that the area of remaining dissolved-phase gasoline-range impacts to groundwater is stable given the long-term monitoring concentration trends observed at the Site.
- 1,2-Dichloroethane (1,2-DCA) was not detected in well BMW-6 during the October 2023 monitoring event. 1,2-DCA was previously detected at concentrations up to 140 µg/L in well BMW-4 (2001) but

has shown a decreasing trend since then, which is likely due to natural attenuation with BTEX in well BMW-4 serving as carbon donor.

- Sulfate concentrations are significantly depleted in well BMW-4, compared to downgradient well BMW-6 and other site wells, suggesting that there is ongoing consumption of petroleum hydrocarbons by sulfate-reducing microorganisms within the source area.
- Methane was detected in well BMW-4 at a higher concentration (8.60 mg/L) than in downgradient well BMW-6 (0.0472 mg/L) and other site wells, indicating highly reducing conditions at well BMW-4, which is consistent with historical and ongoing degradation of petroleum compounds.

Based on overall decreasing BTEX concentrations observed in wells BMW-4 and BMW-6, it is apparent that remaining dissolved-phase BTEX has continued to attenuate. Furthermore, the biogeochemical data and non-detections of BTEX in well BMW-6, downgradient from well BMW-4, are evidence that microbial biodegradation of petroleum hydrocarbons is ongoing and are indicative of a shrinking plume.

In summary, the data show a progressive reduction of BTEX concentrations since 2019. At well BMW-4, the 2023 benzene concentrations are the lowest concentrations recorded since sampling began in 2000, and the biogeochemical data continue to show that natural attenuation is sustainable and ongoing. The 2023 groundwater data continue to support the closure request based on multiple lines of evidence set forth in the five annual GWM Reports submitted since 2018 GWM Reports (Arcadis 2022).

REQUEST FOR CLOSURE

As stated in the Request Addendum (Arcadis 2010), the following conclusions with respect to groundwater at the Site can be demonstrated:

- *Source remediation conducted.* Remediation activities conducted at the Site include soil excavation and soil vapor extraction (SVE). Excavation of petroleum-affected soil was conducted during the MTA rail construction. Between March 2001 and June 2002, an SVE system was operated at the well BMW-4 area. During this period, a total of 7,658 pounds of petroleum hydrocarbons were removed. Between October 2003 and June 2005, a second SVE system was operated at the former Texaco Station on the 8-acre parcel. During this second period of SVE operation, a total of 357 pounds of petroleum hydrocarbons were removed. In 2006, a soil NFA letter was issued by the RWQCB for the 8-acre parcel.
- *Site use and acceptable human health risk*. Current and future site use is acceptable for its intended use (on-site soil does not pose unacceptable risk to site users and the Site's intended use is limited to commercial and/or industrial use), and the Site will remain a recreational park. The dissolved petroleum hydrocarbons in groundwater at the Site do not pose a threat to on- or off-site receptors.
- *Plume stability.* The concentrations remain low, and the groundwater plume has remained stable (i.e., has not enlarged). The BTEX concentrations at downgradient well BMW-6 have not exceeded the respective MCLs since the November 2017 groundwater monitoring and sampling event. Furthermore, there are no groundwater receptor wells located within 1 mile downgradient from the Site.

- *Decreasing BTEX concentrations*. Dissolved BTEX concentrations continue to show an overall decreasing trend since 2000. TVPH concentrations have also shown a decreasing trend through time.
- *Natural attenuation*. Continued groundwater sampling has shown that natural attenuation is occurring. Biogeochemical data have been consistent since 2009.
- *Impracticability of additional remediation*. Due to the location of the MTA rail line and multiple subsurface utilities adjacent to or within the MTA easement, further remediation activities to remove the residual BTEX are not practicable. For remediation to be effective, the area directly upgradient from the well BMW-4 area would need to be accessible for placement of remediation infrastructure (e.g., injection wells). This area is occupied by the active MTA rail line, and access is not feasible at present or in the foreseeable future.

Based on the above considerations, Arcadis requests an NFA determination for the Site.

If you have any questions or concerns regarding the contents of this 2023 Report, please contact Phil Skorge at 714.508.2676 or Gianne Schull at 303.834.5216.

Sincerely,

Arcadis U.S., Inc.

	3/19/03		35.18	--	--	304.13	0.43

Notes:
[a] Positive change indicates an increase in groundwater elevation whereas a negative change indicates a decrease in groundwater elevation.
1. Data prior to January 2007 provided by ERM.
2. Wells originally surveyed on May 18, 2000 by Don Thomas Associates.
3. Wells BMW-4 and MW-20 surveyed on August 24, 2006 by Dulin and Boynton.
4. All actively monitored wells resurveyed on July 2, 2002 and January 1, 2007 by Cal Vada Surveying, relative to the National Geodetic Vertical Datum of 1929 (NGVD29).

*Groundwater elevation not reported due to wellhead damage or modification to surface elevation caused during construction activities.
**Groundwater elevation corrected for the presence of LNAPL, when detected, using the formula (Corrected depth to water = Depth to water - [LNAPL Thickness * LNAPL Density]). An estimated density of 0.78 was used for the LNAPL.
***Well was raised during regrading of the site; therefore data is inaccurate and groundwater elevation not reported until well is resurveyed.

Acronyms and Abbreviations:
amsl = above mean sea level
FPH = free product hydrocarbon
LNAPL = light non-aqueous phase liquid
NM = not measured
TOC = top of casing
-- = data not available

Table 2
Volatile Organic Compounds in Groundwater
Union Pacific Railroad Former Cornfield Yard
1245 North Spring Street
Los Angeles, California

Notes:
[1] BMW-9: 1,1,2,2-tetrachloroethane also detected at 0.7 mg/L.
[2] BMW-15: Dichlorodifluoromethane also detected at 4.7 mg/L.
[3] BMW-15: Freon-12 also detected at 8.3 mg/L.
[4] BMW-15: Freon-12 also detected at 3.3 mg/L; trichlorofluoromethane also detected at 1.1 mg/L.
[5] Chloroform detected at 1.1 µg/L in this QCTB sample.
[6] Tert-Butanol (TBA) was also detected with a J lab qualifier.
[7] 2-Butanone was also detected in the equipment blank collected in January 2008. 2-Butanone was not detected in any of the samples collected from the wells.
[8] January 18, 2008 - BMW-5, BMW-6, and BMW-20 sample collection order after BMW-4 may have influenced analytical results. Wells were resampled on March 7, 2008 and reflect normal well sampling order.

1. Data reported prior to January 2007 were provided by ERM.
2. Only volatile organic compounds detected in one or more samples are listed.

Acronyms and Abbreviations:
1,1-DCA = 1,1-dichloroethane
1,2-DCA = 1,2-dichloroethane
1,2,4-TMB = 1,2,4-trimethylbenzene
1,3,5-TMB = 1,3,5-trimethylbenzene
A-01 = sample reanalyzed to confirm the hit
Bold = Results in excess of MCL.
cis-1,2-DCE = cis-1, 2-dichloroethene
DIPE = diisopropyl ether
dup = duplicate sample
EB = equipment blank
ID = identification
low-flow = Field duplicate sample collected using low-flow purging and sampling techniques/equipment. After July 2002, all samples collected using low-flow techniques/equipment.
MCL = California Maximum Contaminant Level (California Department of Public Health; RWQCB 2008)
mg/L = milligram per liter
MTBE = methyl tertiary-butyl ether
NA = not analyzed
NS = not sampled
p-IPT = p-isopropyl toluene
PCE = tetrachloroethene
QA/QC = quality assurance/quality control
RWQCB = California Regional Water Quality Control Board, Los Angeles Region
TCE = trichloroethene
trans-1,2-DCE = trans-1, 2-dichloroethene
µg/L = microgram per liter
'--- = no MCL
< = Not present at or above listed reporting limit.

Qualifiers:
H3 = Sample was received and analyzed past the holding time.
J = Estimated result between method detection limit and reporting limit.
B = The same analyte is found in the associated blank.
L = Laboratory Control Sample and/or Laboratory Control Sample Duplicate recovery was above the acceptance limits. Analyte not detected, data not impacted.
U = Reported concentration should be considered not detected above the reported sample value.
UJ = Estimated result not reported above the method detection limit and reporting limit.
J4 = The associated batch QC was outside the established quality control range for accuracy.

Notes:

[1] TVPH carbon chain C6 through C12.

1. Data prior to January 2007 provided by ERM.

Acronyms and Abbreviations:
dup = duplicate sample
EB = equipment blank
ID = identification
low-flow = Field duplicate sample collected using low-flow purging and sampling techniques/equipment. After July 2002, all samples collected using low-flow techniques/equipment.
NS = not sampled
QA/QC = quality assurance/quality control
TVPH = total volatile petroleum hydrocarbons in gasoline range, C4-C12; C5-C12 effective 11/18/19
TEPH-d = total extractable petroleum hydrocarbons in diesel range, C13-C22; C12-C22 effective 11/18/19; C10-C28 effective 11/16/20
TEPH-mo = total extractable petroleum hydrocarbons in motor oil range, C23-C32; C22-C32 effective 11/18/19; C28-C40 effective 11/16/20
TPH-cc = total petroleum hydrocarbons measured via carbon chain analysis (C8-C40)
* Chromatogram pattern does not show the peaks characteristic of gasoline, even if the carbon range is typical for gasoline.
**Chromatogram pattern does not show the peaks characteristic of diesel, even if the carbon range is typical for diesel.
*** Chromatogram pattern does not show the peaks characteristic of diesel/motor oil, even if the carbon range is typical for diesel/motor oil.
< = not present at or above listed reporting limit.
-- = not analyzed

Qualifiers:
H-1 = Sample analysis performed past the method-specified holding time per the client's approval.
J = Estimated result between method detection limit and reporting limit.
Nj = Estimated value - chromatogram did not resemble the standard hydrocarbon pattern.
QP1 = Hydrocarbon result partly due to individual peak(s) in quantitation range.
UJ = Estimated result not reported above the method detection limit and reporting limit.

Acronyms and Abbreviations:

DO = dissolved oxygen
dup = duplicate sample
ID = identification
mg/L = milligram per liter
MHA = Matrix spike/matrix spike duplicate does not provide useful spike recovery information due to high levels of analyte. See laboratory control sample.
mV = millivolt
ORP = oxidation-reduction potential
µS = microSiemens
USEPA = United States Environmental Protection Agency
< = not present at or above listed reporting limit
-- = not analyzed

Qualifiers:

C = Calibration verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.
HF = Field parameter with a holding time of 15 minutes.
O1 = The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.
J = Estimated result between method detection limit and reporting limit.

APPENDIX A

Sampling and Decontamination Procedures

Blaine Tech Services, Inc.
Standard Procedure

DECONTAMINATION OF EQUIPMENT

Decontamination of the equipment that is re-used in the process of sample collection is necessary to ensure the validity of the samples collected. Equipment decontamination occurs before, during and after each sampling event.

The nature and extent of decontamination efforts is proportional to the suspected level and volatility of the contamination. That is, it varies. When equipment and cross contamination risk is minimal, so should decontamination efforts. When equipment and cross contamination risk is severe, so should decontamination efforts. When in doubt, err on the side of caution.

All attempts should be made to understand the risk level so that the appropriate effort is applied. Performing superfluous cleaning may raise the confidence level of the Sampling Technician, but does nothing to increase the validity of the sample. Accordingly, superfluous cleaning should be avoided.

Outlined below are equipment decontamination descriptions and guidelines. They should be viewed as minimum standards. Conditions in the field may require greater decontamination efforts. Lesser efforts should not be applied unless first approved by the Project Coordinator.

Decontamination Effort Levels

1. Light. De-ionized or clean water spray rinse with hand held sprayer.
2. Moderate. De-ionized or clean water spray rinse with Pressure Washer.
3. Heavy. De-ionized or clean water spray rinse with Pressure Washer plus non-phosphate soap wash.

The BTS on-board pressure washer system consists of three main components. These are the stainless steel supply tank, Hotsy pressure washer and integrated decontamination sink.

Note: This system uses new water for each decontamination procedure. No rinsate water is ever reused or recycled.

Stainless Steel Supply Tank. All BTS Sampling Vehicles are equipped with custom-built stainless steel supply tanks. These tanks vary in capacity from 80 to 130 gallons and serve as the source for all decontamination activities on the vehicles. The water contained in the tank is routed to both the pressure washer and the integrated decontamination sink.

Hotsy Pressure Washer. An industrial grade Hotsy brand pressure washer/steam cleaner is mounted on all BTS Sampling Vehicles. The wand is located at the rear of the vehicle so that the washer may be used in conjunction with the decontamination sink.

Integrated Decontamination Sink. A custom-built stainless steel decontamination sink is mounted to the rear of all BTS Sampling Vehicles. This deep sink provides an ideal workstation to perform equipment decontamination. All rinsate water is automatically collected in the sink and pumped into the on-board effluent tank(s) thus eliminating potentially hazardous water handling activities.

Blaine Tech Services, Inc.
Standard Operating Procedure

WATER LEVEL, SEPARATE PHASE LEVEL AND TOTAL WELL DEPTH MEASUREMENTS (GAUGING)

Routine Water Level Measurements

1. Establish that water or debris will not enter the well box upon removal of the cover.
2. Remove the cover using the appropriate tools.
3. Inspect the wellhead (see Wellhead Inspections).
4. Establish that water or debris will not enter the well upon removal of the well cap.
5. Unlock and remove the well cap lock (if applicable). If lock is not functional cut it off.
6. Loosen and remove the well cap. CAUTION: DO NOT PLACE YOUR FACE OR HEAD DIRECTLY OVER WELLHEAD WHEN REMOVING THE WELL CAP. WELL CAP MAY BE UNDER PRESSURE AND/OR MAY RELEASE ACCUMULATED AND POTENTIALLY HARMFULL VAPORS.
7. Verify and identify survey point as written on S.O.W.
   TOC: If survey point is listed as Top of Casing (TOC), look for the exact survey point in the form of a notch or mark on the top of the casing. If no mark is present, use the north side of the casing as the measuring point.
   TOB: If survey point is listed as Top of Box (TOB), the measuring point will be established manually. Place the inverted wellbox lid halfway across the wellbox opening and directly over the casing. The lower edge of the inverted cover directly over the casing will be the measuring point.
8. Put new Latex or Nitrile gloves on your hands.
9. Slowly lower the Water Level Meter probe into the well until it signals contact with water with a tone and/or flashing a light.
10. Gently raise the probe tip slightly above the water and hold it there. Wait momentarily to see if the meter emits a tone, signaling rising water in the casing. Gently lower the probe tip slightly below the water. Wait momentarily to see if the meter stops emitting a tone, signaling dropping water in the casing. Continue process until water level stabilizes indicating that the well has equilibrated.
11. While holding the probe at first contact with water and the tape against the measuring point, note depth. Repeat twice to verify accuracy. Write down measurement on Well Gauging Sheet under Depth to Water column.
12. Recover probe, replace and tighten well cap, replace lock (if applicable), replace well box cover and tighten hardware (if applicable)

Water Level and Separate Phase Thickness Measurements in Wells Suspected of Containing Separate Phase

1. Establish that water or debris will not enter the well box upon removal of the cover.
2. Remove the cover using the appropriate tools.
3. Inspect the wellhead (see Wellhead Inspections).
4. Establish that water or debris will not enter the well upon removal of the well cap.

5. Unlock and remove the well cap lock (if applicable). If lock is not functional cut it off.
6. Loosen and remove the well cap. CAUTION: DO NOT PLACE YOUR FACE OR HEAD DIRECTLY OVER WELLHEAD WHEN REMOVING THE WELL CAP. WELL CAP MAY BE UNDER PRESSURE AND/OR MAY RELEASE ACCUMULATED AND POTENTIALLY HARMFULL VAPORS.
7. Verify and identify survey point as written on S.O.W.
   TOC: If survey point is listed as Top of Casing (TOC), look for the exact survey point in the form of a notch or mark on the top of the casing. If no mark is present, use the north side of the casing as the measuring point.
   TOB: If survey point is listed as Top of Box (TOB), the measuring point will be established manually. Place the inverted well box lid halfway across the well box opening and directly over the casing. The lower edge of the inverted cover directly over the casing will be the measuring point.
8. Put new Nitrile gloves on your hands.
9. Slowly lower the tip of the Interface Probe into the well until it emits either a solid or broken tone.
   BROKEN TONE: Separate phase layer is not present. Go to Step 8 of Routine Water Level Measurements shown above to complete gauging process using the Interface probe as you would a Water Level Meter.
   SOLID TONE: Separate phase layer is present. Go to the next step.
10. Gently raise the probe tip slightly above the separate phase layer and hold it there. Wait momentarily to see if the meter emits a tone, signaling rising water in the casing. Gently lower the probe tip slightly below the separate phase layer. Wait momentarily to see if the meter stops emitting a tone, signaling dropping water in the casing. Continue process until water level stabilizes indicating that the well has equilibrated.
11. While holding the probe at first contact with the separate phase layer and the tape against the measuring point, note depth. Repeat twice to verify accuracy. Write down measurement on Well Gauging Sheet under Depth to Product column.
12. Gently lower the probe tip until it emits a broken tone signifying contact with water. While holding the probe at first contact with water and the tape against the measuring point, note depth. Repeat twice to verify accuracy. Write down measurement on Well Gauging Sheet under Depth to Water column.
13. Recover probe, replace and tighten well cap, replace lock (if applicable), replace well box cover and tighten hardware (if applicable).

Routine Total Well Depth Measurements

1. Lower the Water Level Meter probe into the well until it lightens in your hands, indicating that the probe is resting at the bottom of well.
2. Gently raise the tape until the weight of the probe increases, indicating that the probe has lifted off the well bottom.
3. While holding the probe at first contact with the well bottom and the tape against the well measuring point, note depth. Repeat twice to verify accuracy. Write down measurement on Well Gauging Sheet under Total Well Depth column.

4. Recover probe, replace and tighten well cap, replace lock (if applicable), replace well box cover and tighten hardware (if applicable).

Blaine Tech Services, Inc.
Standard Operating Procedure

LOW FLOW PURGING AND SAMPLING

The Low-Flow purging and sampling process requires the use of a variable speed pump and a Flow Cell. The Flow Cell (typically YSI 556) consists a flow cell, a sonde, a display unit and various hose lines. The pump must be used to supply the flow of water to the Flow Cell. The most common purge pump used is the Grundfos Redi-Flo II variable speed electric submersible pump. Both peristaltic and pneumatic bladder pumps are common alternatives.

Flow Cell purging provides the user with a constant stream of real time, highly accurate water quality information during the purge process.

As the Low-Flow methodology stipulates sampling through the purge tube (as opposed to a bailer) to minimize disturbance to the water column, dedicated, small-diameter tubing is typically used.

Low-Flow purging and sampling using Flow Cell

1. Plug the display unit into the sonde.
2. Calibrate the sonde for all parameters using the supplied calibration fluids.
3. Connect the flow cell to the sonde.
4. Without disturbing the water column in the well, lower the purge pump carefully into the well until it rests at the middle of the screened interval. Connect the water line from the pump to the lower end of the flow cell. Alternatively, connect the water line from the in-place pump to the lower end of the flow cell.
5. Connect a water discharge line to the upper end of the flow cell.
6. Without disturbing the water column, connect the power source (electricity, compressed air, etc.) to the in-place pump, if required.
7. Lower an electronic water level indicator (sounder) slowly into the well until it hits the water surface.
8. While monitoring the sounder, commence pumping at a rate that does not induce draw-down in the well.
9. Collect parameter measurements from the display unit as per job specifications (ie. every 1 minute, every 3 minutes, etc.).
10. Monitor flow cell to make sure it remains free of air bubbles.
11. Once parameters have stabilized, adjust the pump rate to the lowest technically feasible setting.
12. Disconnect the water line from the lower end of the flow cell.
13. Fill the appropriate sample containers.
14. Remove sounder and power supply or pump from well.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Brittnie L Boyd

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
T8	Sample(s) received past/too close to holding time expiration.
V	The sample concentration is too high to evaluate accurate spike recoveries.

Subject	Analytical Results and Data Verification of Report L1662484 Annual Groundwater Monitoring Lease Site-Cornfield II Los Angeles, California October 2023		

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

1. Introduction

This document details a data verification of analytical results for groundwater samples collected in support of the Annual Groundwater Monitoring at the Lease Site-Cornfield II site in Los Angeles, California during October 2023. Samples were submitted to Pace National Center for Testing and Innovation, located in Mt. Juliet, Tennessee. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard GHD report deliverables were submitted by the laboratory. The analytical results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody form, finished report forms, method blank data, recovery data from surrogate spikes, laboratory control data, matrix spikes and field QC data.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 2 and applicable guidance from the documents entitled:

1. "National Functional Guidelines for Organic Superfund Methods Data Review", United States Environmental Protection Agency (USEPA) 540-R-20-005, November 2020
2. "National Functional Guidelines for Inorganic Superfund Methods Data Review", United States Environmental Protection Agency (USEPA) 542-R-20-006, November 2020

These items will subsequently be referred to as the "Guidelines" in this report.

2. Sample Holding Time and Preservation

The sample holding time criteria and sample preservation requirements for the requested parameters are summarized in the methods. The sample chain of custody document and analytical report were used to determine sample holding times. All samples were prepared and analyzed within the required holding times with the exception of samples for nitrate analysis. The associated sample results were qualified as estimated (see Table 4).

All sample containers were properly preserved, delivered on ice and stored by the laboratory at the required temperature (0-6°C) with the exception of one sample container received by the laboratory with a pH outside of the acceptable limit resulting in a reduced holding time. The sample was analyzed within the reduced holding time and no qualification of the data was deemed necessary.

3. Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of one per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation with the exception of hexachlorobutadiene present at a low concentration. The associated sample result was non-detect and was not impacted. No qualification of the data was deemed necessary.

4. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for volatile organic compound (VOC), gasoline range organics (GRO) and diesel range organics (DRO)/motor oil range organics (ORO) analysis were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Surrogate recoveries were assessed against the control limits. All surrogate recoveries met the associated criteria.

5. Laboratory Control Sample Analyses

Laboratory control samples (LCS)/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of one per analytical batch.

5.1 Organic Analyses

The LCS and LCS/LCSD contained all analytes of interest. All LCS and LCS/LCSD recoveries and RPDs were within associated control limits, demonstrating acceptable analytical accuracy and precision (where applicable) with a few exceptions. Where high recoveries or a high RPD were found the associated sample results were non-detect and were not impacted. Where low recoveries were found the associated sample results were qualified as estimated due to the implied low bias (see Table 5).

5.2 Inorganic Analyses

The LCS contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries were within the control limits, demonstrating acceptable analytical accuracy.

6. Matrix Spike Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as matrix spike (MS)/matrix spike duplicate (MSD) samples. The RPD between the MS and MSD is used to assess analytical precision. MS/MSD analyses were performed as specified in Table 1. If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

6.1 Organic Analyses

The MS/MSD samples were spiked with the analytes of interest. All percent recoveries and RPD values were within the associated control limits, demonstrating acceptable analytical accuracy and precision.

6.2 Inorganic Analyses

The MS/MSD samples were spiked with the analytes of interest and the results were evaluated using the "Guidelines". All percent recoveries and RPD values were within the control limits, demonstrating acceptable analytical accuracy and precision.

7. Field QA/QC Samples

The field QA/QC consisted of one trip blank sample, one field blank sample, three equipment blank samples and one field duplicate sample set.

7.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, one trip blank was submitted to the laboratory for analysis. All results were non-detect for the analytes of interest.

7.2 Field Blank Sample Analysis

To assess ambient conditions at the site and cleanliness of sample containers, one field blank was submitted to the laboratory for analysis. All results were non-detect for the analytes of interest with the exception of DRO present at a low concentration. The associated sample results were all significantly greater than the blank and were not impacted. No qualification of the data was deemed necessary.

7.3 Equipment Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, three equipment blanks were submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest.

7.4 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPD associated with the duplicate sample must be less than

50 percent. If the reported concentration in both the investigative sample and its duplicate are less than five times the reporting limit (RL), the evaluation criterion is one times the RL value.

All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision.

8. Analyte Reporting

Data were reported down to the laboratory's quantitation limit (QL), which is defined as the method detection limit (MDL) with sample-specific adjustments for dilutions, aliquot size, volumes, etc. Positive analyte detections less than the RL but greater than the QL were reported as estimated (J) in Table 3. Non-detect results were presented as non-detect at the RL in Table 3.

If multiple QC results exhibit variability and/or high/low directional biases as related to a sample result, then any directional bias indicators are removed from the final sample result qualification.

9. Conclusion

Based on the assessment detailed in the foregoing, the summarized data are acceptable with the specific qualifications noted herein.

Regards

Jeffrey Cloud

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 09/19/2023 has revealed that there are 7 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Site ID: 0900012
EPA Id: CAD983566563

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 07/24/2023 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
MAIN STREET CENTER EPA ID:: CAD000633305	***1630 N. MAIN STREET***	***ESE 1/4 - 1/2 (0.289 mi.)***	***BA330***	***924***

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 07/24/2023 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
MAIN STREET CENTER EPA ID:: CAD000633305	***1630 N. MAIN STREET***	***ESE 1/4 - 1/2 (0.289 mi.)***	***BA330***	***924***

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 07/24/2023 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 07/24/2023 has revealed that there are 20 RCRA-SQG sites within approximately 0.25 miles of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal

EXECUTIVE SUMMARY

Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/24/2023 has revealed that there are 46 ENVIROSTOR sites within approximately 1 mile of the target property.

Lists of state and tribal registered storage tanks

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 63 UST sites within approximately 0.25 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 27 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 07/24/2023 has revealed that there are 52 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

PFAS ECHO: Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. EPA has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

A review of the PFAS ECHO list, as provided by EDR, and dated 07/05/2023 has revealed that there is 1 PFAS ECHO site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 6 EDR MGP sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 24 EDR Hist Auto sites within approximately 0.25 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 13 EDR Hist Cleaner sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Eval General Type: Compliance Evaluation Inspection
Eval Date: 02-08-2023
Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: Consent to enter, inspect and take photographs was given by: Stefan Sadeli The Business Activities, Owner/Operator Identification, Hazardous Materials Inventory, Site Map, Emergency Response/Contingency Plan and Employee Training Plan sections were reviewed in CERS and field verified. Review and correct any violations indicated previously in this report, on or before the COMPLY BY date associated with each violation. NOTE: The LAMC, Sections (L.A.M.C. SECTION 57.105.1.4; 57.120.3; 57.121.2 and 57.121.2.1.) requires businesses that store, use or handle hazardous materials in the City of Los Angeles to obtain a Consolidated Permit from the Los Angeles Fire Department CUPA **** Annual submission of a Hazardous Materials Business Plan into California Environmental Reporting System (CERS) is required between January 1 and March 1 of every year. Per L.A.M.C. 57.121.3.5, failure to submit the required hazardous material business plan (HMBP) information annually into [Truncated]

Name:	ARTYPE PRINTING CO
Address:	985 N BROADWAY
City,State,Zip:	LOS ANGELES, CA 90012
Site ID:	7046
CERS ID:	10251844
CERS Description:	Hazardous Waste Generator

Violations:

Site ID:	7046
Site Name:	ARTYPE PRINTING CO
Violation Date:	06-16-2016
Citation:	22 CCR 12 66262.12 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.12
Violation Description:	Failure to obtain an Identification Number prior to treating, storing, disposing of, transporting or offering for transportation any hazardous waste.
Violation Notes:	Returned to compliance on 09/23/2016. OBSERVATION: This facility does not have a valid EPA ID number to manage hazardous waste. A hazardous waste generator shall not treat, store, dispose of, transport or offer for transportation, hazardous waste without an EPA ID number. CORRECTIVE ACTION: Immediately obtain an EPA ID number through DTSC to manage hazardous waste and submit evidence to the CUPA.
Violation Division:	Los Angeles County Fire Department
Violation Program:	HW
Violation Source:	CERS,

Site ID:	7046
Site Name:	ARTYPE PRINTING CO
Violation Date:	06-16-2016
Citation:	22 CCR 12 66262.40(a) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.40(a)
Violation Description:	Failure to keep a copy of each properly signed manifest for at least three years from the date the waste was accepted by the initial transporter. The manifest signed at the time the waste was accepted for transport shall be kept until receiving a signed copy from the designated facility which received the waste.
Violation Notes:	Returned to compliance on 09/23/2016. OBSERVATION: Copies of hazardous waste disposal records for INK CONTAMINATED RAGS were not available. INK CONTAMINATED SOLIDS CONTAINER WITH PROPER LABELING WAS SET UP BY THE END OF INSPECTION. Hazardous waste generators shall retain copies of all manifests signed off by the disposal facility and all receipts used in a consolidated manifesting procedure on site for three years and have them readily available for review. CORRECTIVE ACTION: Immediately locate a copy of all manifests and receipts for the last three years.

RWQCB Region:	LOS ANGELES RWQCB (REGION 4)
Site History:	Parcel PA-018 is located at the intersection of North Spring Street and College Street in the City of Los Angeles, and across the street from the Metro Chinatown Station. The Site was previously owned by Union Pacific Railroad Company and at present is owned by the Los Angeles to Pasadena Metro Blue Line Construction Authority (Authority). The Site is about 6 acres and is surrounded by industrial and commercial use land. Historically the Site has been used for a wood and coal yard, an oil warehouse, dwellings, and for small businesses. Since 1905 it was used as a rail freight yard, but it has been vacant since about 1970. Buildings at the Site were demolished in the late 1980s. A gasoline tank was removed in April 1987 with no evidence of leakage. Reports from 1989 indicate that the Site was used for the storage of tanks and shipping containers. Several water-bearing zones underlie the Site, but there are no production wells within one mile of the property. The shallow semi-perched zone is about 30 ft below ground surface, and the groundwater flow direction is in a south-southwest direction. Groundwater in the southwestern portion of the Site has been impacted by heavy-end hydrocarbons (diesel-range and total recoverable petroleum hydrocarbons). Based on regional groundwater flow and documented historic service station operations at neighboring off-site properties, the groundwater contamination appears to be from off-site sources. The Site is planned for development of a four-story

BLUE LINE PARCEL PA-018 (Continued) **S106087297**

building, with commercial, retail business on the lower level, and housing on the other three floors. There are no planned underground structures, green areas, or unpaved areas at the Site.

inventory information for all reportable hazardous materials on site at or above reportable quantities.

Violation Notes: Returned to compliance on 06/17/2019. "NOT ACCEPTED: Effective December 28, 2017, CalEPA has replaced the previously existing five federal hazard categories in CERS with twenty-four new federal hazard categories. The following federal hazard categories are now obsolete fire, reactive, pressure release, acute health, chronic health. A review of your submittal has determined that you still have the previous federal categories selected and/or have NOT selected any of the NEW federal hazard categories for your chemical inventory. Please review your hazardous material inventory and complete the following steps: 1) Deselect all of the five obsolete federal hazard categories for all chemical inventory listed under your facility. 2) Update your hazardous material inventory and select all applicable federal hazard categories from the 24 newly listed categories for all chemical inventory stored at your facility. You may refer to Section 2 of a current Safety Data Sheets (SDS) (previously called an MSDS) to determine [Truncated]

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Violation Date:	06-28-2021
Citation:	HSC 6.95 25508(a)(3) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(3)
Violation Description:	Failure to establish and electronically submit an adequate emergency response plan and procedures for a release or threatened release of a hazardous material.
Violation Notes:	Returned to compliance on 07/08/2021. OBSERVATION: The business failed to establish and electronically submit adequate emergency response procedures for a release or threatened release of a hazardous material. CORRECTIVE ACTION: Review, update and resubmit the Emergency Response Plan in CERS with all the required elements. The CONSOLIDATED EMERGENCY RESPONSE / CONTINGENCY PLAN form can be used to satisfy both the Emergency Response Plan as well as the Employee Training Plan requirements. You can download the most current CONSOLIDATED EMERGENCY RESPONSE / CONTINGENCY PLAN form at https://www.lafd.org/fire-prevention/cupa/hazardous-materials. The phone number for the Local CUPA should be (213) 978-3680 and the phone number for the Region Water Quality Control Board is (213) 576-6600.

Violation Source:	CERS,

Site ID:	32590
Site Name:	China Town Gas America
Violation Date:	09-12-2022
Citation:	HSC 6.7 25292.1(a) - California Health and Safety Code, Chapter 6.7, Section(s) 25292.1(a)
Violation Description:	Failure to operate the UST system to prevent unauthorized releases including leaks, spills, and/or overfills.

CHINA TOWN GAS AMERICA (Continued) **U001560538**

Violation Notes:	Returned to compliance on 09/26/2022. OBSERVATION: Owner/Operator did not operate UST system to prevent spills and/or overfills for T1-2. Facility is using a single audible/visual alarm annunciator for multiple UST's, which per the current LG 150 letter, is not considered acceptable overfill prevention. This is due to the fact the Veeder Root software does not reset the relay in the audible/visual annunciator and therefor would not alert the fuel transfer operator that the next UST is at 90% or greater. CORRECTIVE ACTION: Facility has a few options. Option 1: Install 1 more audible/visual annunciators in order that each UST at the motoring vehicle fueling site has its own audible/visual annunciator and thus compliant with the most current LG 150 letter. Option 2: Determine if T1-2 have flapper valves and if so remove and test them to ensure the valve is functioning and is set at 95% or less. If facility decides option 2 update CERS accordingly. If the flappers are set at 96% or higher, the facility [Truncated]

Violation Date:	08-20-2020
Citation:	23 CCR 16 2716(e) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2716(e)
Violation Description:	For designated operator (DO) monthly inspections conducted before October 1, 2018, failure to comply with one or more of the following requirements: Be performed by an ICC certified DO. Inspect monthly alarm history report, check that alarms are documented and responded to appropriately, and attach a copy. Inspect for the presence of liquid/debris in spill containers. Inspect for the presence of liquid/debris in under dispenser containment (UDC) and ensure that the monitoring equipment is positioned correctly. Inspect for liquid or debris in containment sumps where an alarm occurred with no service visit. Check that all testing and maintenance has been completed and documented. Verify that all facility employees have been trained in accordance with 23 CCR 2715(c). For designated operator (DO) 30 day inspections conducted on and after October 1, 2018, failure to conduct the designated UST operator visual inspection at least once every 30 days.
Violation Notes:	Returned to compliance on 08/31/2020. OBSERVATION: Facility did not comply with one or more of the following DO monthly inspection requirements: Tank owner/operator not the DO fills out Section V in response to compliance issues noted by DO in Section III. CERS ID was

CHINA TOWN GAS AMERICA (Continued) **U001560538**

missing on DO report on 10/2018-2/2019. Section VII was incorrectly marked YES on 11/2018-6/2019. Overfill was noted late but was not corrected from previous DO inspection report. Fuel alarm on 6/6/2019 for L6 91 fill was not noted on DO report in Section III or alarm log/work order was not attached to the DO report showing response to the alarm. Overfill was marked NO in Section X on 5/29/2019 & 2/5/2019, but it was not noted in Section III and tank owner/operator was not able to fill in response in Section V. CORRECTIVE ACTION: Have tank owner/operator fill out Section V on DO reports in response to compliance issues noted by DO in Section III. Add CERS ID of 10249207 to listed DO reports 10/2018-2/2019. Have DO correct Section VII to state NO [Truncated]

Citation:	HSC 6.7 25292.1(a) - California Health and Safety Code, Chapter 6.7, Section(s) 25292.1(a)
Violation Description:	Failure to operate the UST system to prevent unauthorized releases including leaks, spills, and/or overfills.
Violation Notes:	Returned to compliance on 06/27/2019. OBSERVATION: Owner/Operator failed to meet one or more of the requirements applicable to overfill prevention equipment. Facility did not test overfill protection before the October 1st 2018 deadline. CORRECTED ON SITE: Overfill protection was tested on 6/27/2019 during monitor cert by Peyman Nasibi with Pacific Nozzle.
Violation Division:	Los Angeles City Fire Department
Violation Program:	UST
Violation Source:	CERS,

Site ID:	32590
Site Name:	China Town Gas America
Violation Date:	09-12-2022
Citation:	23 CCR 16 2712(b)(1)(G) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2712(b)(1)(G)
Violation Description:	Failure to comply with one or more of the following overfill prevention equipment requirements: Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. Install/retrofit overfill prevention equipment that does not use flow restrictors on vent piping to meet overfill prevention equipment requirements when the overfill prevention equipment is installed, repaired, or replaced on and after October 1, 2018. For USTs installed before October 1, 2018, perform an

CHINA TOWN GAS AMERICA (Continued) **U001560538**

inspection by October 13, 2018 and every 36 months thereafter. For USTs installed on and after October 1, 2018, perform an inspection at installation and every 36 months thereafter. Inspected within 30 days after a repair to the overfill prevention equipment. Inspected using an applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Inspected by a certified UST service technician. Maintain records of overfill prevention equipment inspection for 36 months.

Violation Notes: Returned to compliance on 09/26/2022. OBSERVATION: Owner/Operator did not operate UST system to prevent spills and/or overfills for T1-2. Facility is using a single audible/visual alarm annunciator for multiple UST's, which per the current LG 150 letter, is not considered acceptable overfill prevention. This is due to the fact the Veeder Root software does not reset the relay in the audible/visual annunciator and therefor would not alert the fuel transfer operator that the next UST is at 90% or greater. CORRECTIVE ACTION: Facility has a few options. Option 1: Install 1 more audible/visual annunciators in order that each UST at the motoring vehicle fueling site has its own audible/visual annunciator and thus compliant with the most current LG 150 letter. Option 2: Determine if T1-2 have flapper valves and if so remove and test them to ensure the valve is functioning and is set at 95% or less. If facility decides option 2 update CERS accordingly. If the flappers are set at 96% or higher, the facility [Truncated]

Violation Date: 06-27-2019
Citation: 23 CCR 16 2716(e) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2716(e)

Violation Description: For designated operator (DO) monthly inspections conducted before October 1, 2018, failure to comply with one or more of the following requirements: Be performed by an ICC certified DO. Inspect monthly alarm history report, check that alarms are documented and responded to appropriately, and attach a copy. Inspect for the presence of liquid/debris in spill containers. Inspect for the presence of liquid/debris in under dispenser containment (UDC) and ensure that the monitoring equipment is positioned correctly. Inspect for liquid or debris in containment sumps where an alarm occurred with no service visit. Check that all testing and maintenance has been completed and documented. Verify that all facility employees have been trained in accordance with 23 CCR 2715(c). For designated operator (DO) 30 day inspections conducted on and after October 1, 2018, failure to conduct the designated UST operator visual inspection at least once every 30 days.

Violation Notes: Returned to compliance on 07/24/2019. OBSERVATION: Facility did not comply with one or more of the following DO monthly inspection requirements: Tank owner/operator not the DO fills out Section V in response to compliance issues noted by DO in Section III. CERS ID was missing on DO report on 10/2018-2/2019. Section VII was incorrectly marked YES on 11/2018-6/2019. Overfill was noted late but was not corrected from previous DO inspection report. Fuel alarm on 6/6/2019 for L6 91 fill was not noted on DO report in Section III or alarm log/work order was not attached to the DO report showing response to

CHINA TOWN GAS AMERICA (Continued) **U001560538**

the alarm. Overfill was marked NO in Section X on 5/29/2019 & 2/5/2019, but it was not noted in Section III and tank owner/operator was not able to fill in response in Section V. CORRECTIVE ACTION: Have tank owner/operator fill out Section V on DO reports in response to compliance issues noted by DO in Section III. Add CERS ID of 10249207 to listed DO reports 10/2018-2/2019. Have DO correct Section VII to state NO [Truncated]

Citation: HSC 6.5 25123.3(h)(1) - California Health and Safety Code, Chapter 6.5, Section(s) 25123.3(h)(1)
Violation Description: Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.
Violation Notes: Returned to compliance on 06/22/2020. OBSERVATION: Owner/Operator is a small quantity generator and failed to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles), or has failed to comply with the conditions of CCR 66262.34(d) and has stored hazardous waste over 90 days. CORRECTIVE ACTION: Dispose of hazardous waste that has been stored over the applicable time limit and provide documentation that the violation has been corrected.

Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: The responsible parties have been found to be in noncompliance with an order issued by the Department. Therefore, it will be necessary to utilize Bond funds to remediate this site. DHS will undertake appropriate cost recovery actions. This has not been identified as a NPL site, nor does it appear, to be a likely NPL candidate in the future. Therefore, it appears unlikely that federal funds are a viable source of revenue for this site.
Site Description: Bortz Oil was a petroleum products blending and packaging facility. The packaging warehouse was destroyed by fire in 1984. During reconstruction, pervasive subsurface contamination was detected. The site now operates only as a warehouse for storage of chemical products.
Hazardous Waste Desc: Subsurface exploration has revealed that the soil and ground water are contaminated with acetone, toluene, xylene, benzene, methyl ethyl ketone (MEK), methylene chloride and 1,2-dichloroethane (DCE).
Threat To Public Health & Env: Major routes of concern for human and animal exposure are soils, surface water and ground water. The Los Angeles River Channel is 100 feet from the site. Contamination of the soil and ground water was documented in January, 1986. The shallow and deeper aquifers are believed to be hydraulically connected. Soil gas vapors could pose an explosive threat; no threat has been identified to date.
Site Activity Status: A remedial action order was issued April 13, 1987 directing the RPs to mitigate the site. A remedial investigation work plan was submitted and approved with modifications by DHS. Implementation of the remedial investigation commenced August 10, 1987. Routine monitoring of the ground water monitoring wells and vapor collection system is being conducted. The responsible parties were found in non-compliance with the order on April 28, 1988. Completion of the RI/FS is projected for January, 1990.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 01/28/2014
Comments: Removal Action Workplan (RAW) was approved on 1/28/2014. The RAW detailed the groundwater monitoring events that have taken place from 1989 through 2010. In addition, the RAW detailed the decreasing concentrations of site contaminants; volatile organic compounds, methyl tert-buty, TBA, cis-1,2-DCE and vinyl chloride.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Land Use Restriction
Completed Date: 08/19/2002
Comments: A deed restriction to restrict use of the property was recorded on August 19, 2002. The deed restriction prohibits sensitive uses of the property including, but not limited to residential, hospital, public or private school uses for persons under 21 years of age, and daycare uses for children.

Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Notice of Exemption

BORTZ OIL COMPANY (Continued) **S100833375**

Completed Date: 06/30/2000
Comments: DTSC approves the Soil Removal Action Workplan (RAW) for the former Bortz Oil site. Bortz will implement a soil vapor extraction technology to achieve the remedial goals set forth in the RAW. DTSC has determined and filed a CEQA Notice of Exemption for the Site. The Removal Action Workplan (RAW) for the above site was approved on June 30, 2000. As indicated in the RAW, Soil Vapor Extraction will be implemented at the area designated as AOPC-2.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Initial Study/ Neg. Declaration
Completed Date: 08/02/1996
Comments: DTSC approves the Removal Action Workplan and Neg. Dec. for Bortz Oil-Spring Street property. The Removal Action involves removal of above-ground tanks and structures.

Completed Area Name: PROJECT WIDE

Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 01/28/2014
Comments: Removal Action Workplan (RAW) was approved on 1/28/2014. The RAW detailed the groundwater monitoring events that have taken place from 1989 through 2010. In addition, the RAW detailed the decreasing concentrations of site contaminants; volatile organic compounds, methyl tert-buty, TBA, cis-1,2-DCE and vinyl chloride.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Land Use Restriction
Completed Date: 08/19/2002
Comments: A deed restriction to restrict use of the property was recorded on August 19, 2002. The deed restriction prohibits sensitive uses of the property including, but not limited to residential, hospital, public or private school uses for persons under 21 years of age, and daycare uses for children.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Notice of Exemption
Completed Date: 06/30/2000
Comments: DTSC approves the Soil Removal Action Workplan (RAW) for the former Bortz Oil site. Bortz will implement a soil vapor extraction technology to achieve the remedial goals set forth in the RAW. DTSC has determined and filed a CEQA Notice of Exemption for the Site. The Removal Action Workplan (RAW) for the above site was approved on June 30, 2000. As indicated in the RAW, Soil Vapor Extraction will be implemented at the area designated as AOPC-2.

Alternate Address:	1746 NORTH SPRING STREET
Alternate City,St,Zip:	LOS ANGELES, CA 90012
Background Info:	The Bortz Oil Company (BOC) was a petroleum products blending and packaging facility. The site produced various petroleum products (i.e. kerosene, paint, acetone, methyl ethyl ketone (MEK),lacquer thinners, and denatured alcohol). High levels of hydrocarbons and chlorinated solvents have been identified in the soil, while 1,1-dichloroethane (DCE), vinyl chloride, petroleum hydrocarbons, and benzene have been detected in the groundwater. On August 9, 1984, a fire broke out in one of the metal and concrete warehouse facilities on the North Spring Street property. Undetermined amounts of chemicals were consumed by the fire and spilled on the ground, which has since percolated into the soil. The Department's inspection in December 1985, and January 1986, revealed that there were numerous uncontrolled chemical spills, leaking valves and drums, and illegal disposal of chemicals at the site. Since the groundwater is not being used as a drinking water source, the potential impact of the contaminated groundwater is not an immediate concern. The groundwater investigation will be conducted after the Spring Street property is sold. Direct contact with the contaminated soil, inhalation, and dermal absorption are the potential routes of exposure. On April 14, 1987, the Department issued a Remedial Action Order (RAO) to BOC to develop and implement the Remedial Investigation/Feasibility Study (RI/FS), Remedial Action Plan (RAP) and remediation. On July 6, 1988, the RAO was modified to include additional property (1726 N. Naud Street) owned by (BOC). Although remedial activities have been slowed due to the death of the owner in March 1990 the Department approved the Focused Feasibility Study Report for the Naud Street property. The Probate Court has determined that BOC's assets will be used towards the remediation of the Naud Street Property. On October 23, 1992, the Dept. negotiated a Consent Order with the Executor of the BOC estate. In August 1996, DTSC completed a removal action on the North Spring Street property. Bortz removed above-ground tanks and structures and near surface piping.

Environmental Interest/Information System:
The Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on Brownfields properties assessed or cleaned up with grant funding, as well as information on Targeted Brownfields Assessments (TBA) performed by EPA Regions.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters,

Environmental Interest/Information System:

All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database
The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
Registry ID: 110070592328

- Violation Date: 05-17-2016
- Citation: 22 CCR 23 66273.34 - California Code of Regulations, Title 22, Chapter 23, Section(s) 66273.34
- Violation Description: Failure to properly label the following categories of universal waste as: 1) Each batteries or the container in which the batteries are contained as "Universal Waste-Battery(ies)". 2) Each mercury-containing equipment or the container in which the mercury-containing equipment is contained as "Universal Waste -Mercury-Containing Equipment". 3) Each Florescent lamp or the container or package in which the lamps are contained as "Universal Waste-Lamp(s)". 4) Each electronic devices or the container or pallet in or on which the electronic devices are contained as "Universal Waste-Electronic Device(s)". 5) Each CRTs or the container or pallet in or on which the CRTs are contained as "Universal Waste-CRT(s)". 6) A container of CRT glass shall be labeled or marked clearly with the following phrase: "Universal Waste-CRT glass". 7) In lieu of labeling individual electronic devices, CRTs, and/or containers of CRT glass pursuant to subsections d) through f) of this section, a universal waste handler may combine, package, and accumulate those universal wastes in appropriate containers or within a designated area demarcated by boundaries that are clearly labeled with the applicable portion(s) of the following phrase: "Universal Waste-Electronic Device(s)/Universal Waste - CRT(s)/Universal Waste-CRT Glass".
- Violation Notes: Returned to compliance on 09/07/2017. OBSERVATION: MISSING REQUIRED INFORMATION ON CONTAINERS OF BATTERIES, PRINTER CARTRIDGE. A generator shall label or mark universal waste with the words 'Universal Waste',

PACIFIC ALLIANCE MEDICAL CENTER (Continued) **1000308324**

	the type of waste (batteries, mercury containing equipment, lamps/bulbs, electronic devices, CRTs, aerosol cans), name and address of the business and accumulation start date. CORRECTIVE ACTION: Immediately label these wastes and ensure that all universal wastes are labeled with the required information.

Eval Notes: Inspector Young LAFD, on site this date 9/21/2018 to conduct routine inspection of underground storage tank. Consent to enter, inspect and take photographs was given on this date by Bruce Woockman, facility manager. Tank is located on east side of property behind closed medical building. Monitoring system certification was conducted at this time. Monitoring certification was performed by TONY KIANI with Ramtox, Monitoring System components were observed and verified on this date. Tester provided the following certifications: Tony Kiani ICC: 5262139 EXP: 6/17/2019 VR: #A26163 EXP: 2/25/2019 VMI: #1966 EXP: 4/15/2019 The UST monitoring panel showed all functions normal. Current monitoring set up and alarm history are not available for review - ILS 350 does not have tape. The sumps and UDCs WERE available for inspection and the sensors WERE observed positioned to detect a leak at the earliest opportunity on 9/21/2018. The spill buckets were visually The [Truncated]
