Case Type:	Cleanup Program Site
Case Worker:	LG
Local Agency:	Not reported
RB Case Number:	43s1038
File Location:	Not reported
Potential Media Affected:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	* Solvents
Site History:	No Water Board oversight of cleanup at this site. This case is included in Geotracker because the site is covered by the Water Boards NPDES general permits for discharges from pump and treat systems to surface waters (one each for fuels- and VOC-impacted sites). This can happen for two reasons: (i) the site is overseen by another agency (e.g., USEPA or DTSC) and needs coverage under one of the NPDES general permits or (ii) construction dewatering in an area of groundwater contamination necessitates NPDES general permit coverage. Including this case in Geotracker helps staff to receive and review required NPDES reports.

Background Info:	to drinking water aquifers. Raytheon entered into a consent agreement with EPA in August, 1985. Raytheon removed a leaking tank in December of 1987, installed surface drainage controls, and is operating a ground-water extraction system. The groundwater extraction system was installed in 1982, and involves treating the extracted water with either air or steam stripping. DHS reviews Raytheon's monthly reports on this system. Raytheon is also currently participating in an area-wide remedial investigation and feasibility study.

FAIRCHILD SEMICONDUCTOR CORPOR (Continued) **S100833418**

The Raytheon Corporation operates a semiconductor manufacturing plant at this 30-acre site. Chemicals used in the manufacturing process and wastes generated by this process are handled and stored onsite. The site is located adjacent to industrial, commercial and residential development. This site is part of the Middlefield, Ellis, Whisman (MEW) area.
Soil and groundwater beneath the site are contaminated with trichloroethylene (TCE), trichloroethane (TCA), dichloroethylene (DCE), and chloroform. Contamination is believed to have resulted from leaking underground chemical storage tanks and/or concrete acid neutralization sumps.
About 270,000 people live within a 3-mile radius of the site and depend on groundwater as a source of drinking water. Groundwater contamination at the site represents a significant threat

Summary Details:

Conditions at proposal October 15, 1984): Raytheon Corp. manufactures semiconductor products at a plant in Mountain View, Santa Clara County, California. The facility occupies about 30 acres and is surrounded by industrial, business, and residential areas. Soil and ground water beneath the site are contaminated with trichloroethylene, 1,1,1-trichloroethane, and 1,1- and trans-1,2- dichloroethylene, according to

RAYTHEON COMPANY (Continued) **1000407768**

analyses conducted by a consultant to Raytheon. Contaminationis believed to have resulted from a leaking underground chemical storage tank and/or concrete acid neutrali ation sumps. About 270,000 people depend on wells within 3 miles of the site as a source of drinking water. In late 1982, Raytheon conducted an investigation to determine if downgradient ground water contamination near the north property boundary resulted from a source on its property. Raytheon concluded that it was not possible to establish a specific source of contamination based on data obtained from its investigation. At present, Raytheon is working with the California Regional Water Quality Control Board CRWQCB) to determine the full extent of the problem.
This is one of 19 sites in the South BayArea of San Francisco. Facilities at these sites have used a variety of toxic chemicals, primarily chlorinated organic solvents, which contaminate a common ground water basin. Although these sites are listed separately, EPA intends to apply an area-wide approach to the problem as well as take specific action as necessary. Status
June 10, 1986): In an attempt to determine the full extent of ground water contamination, Raytheon has installed three wells to pump and treat ground water to contain the contaminated plume. CRWQCB has issued Waste Discharge Requirements to the company. The requirements are the board s legal mechanism for regulating activities at facilities under its jurisdiction.
On August 15, 1985,EPA issued a CERCLA Administrative Order on Consent to Raytheon Corp. s Mountain View Plant, as well as to Fairchild Camera s and Intel Corp. s Mountain View Plants. The order calls for the three companies to conduct a joint remedial investigation/feasibility study of the area to determine the type and extent of contamination and identify alternatives for remedial action.

Site Description: The Middlefield/Ellis/Whisman (MEW) Study Area is located in Santa Clara County in the city of Mountain View, California. The site is divided into a Local Study Area (LSA) and a Regional Study Area (RSA). The LSA consists of three National Priority List (NPL) sites (Fairchild, Intel and Raytheon), as well as several non-Superfund sites. The LSA encompasses about 1/2 square mile of the RSA and contains primarily light industrial and commercial areas, with some residential areas west of Whisman Road. The RSA encompasses approximately 8 square miles and includes Moffett Naval Air Station (an NPL site) and National Aeronautics and Space Administration (NASA) Ames Research Center, along with light industrial, commercial, agricultural, park, golf course, undeveloped land, residential, motel and school land uses. Various owners or occupants in the area around the intersections of Middlefield Road, Ellis Street, Whisman Road, and the Bayshore Freeway (U.S. Highway 101), are or were involved in the manufacture of semiconductors, metal finishing operations, parts cleaning, aircraft maintenance, and other activities requiring the use of a variety of chemicals. Site investigations at several of these facilities have revealed the presence of toxic chemicals in the subsurface soils and groundwater. To investigate the extent of groundwater contamination emanating from the LSA, and soil contamination at their respective facilities, Fairchild, Intel, and Raytheon performed a Remedial Investigation and a Feasibility Study of potential remedial alternatives under the direction of EPA. There are no natural surface drainage features within the Local Study Area. The nearest significant natural surface drainage features of the Regional Study Area are Stevens Creek to the west and Calabazas Creek to the east. Calabazas Creek is located approximately four miles east of the MEW Study Area. Stevens Creek forms the western boundary of the Regional Study Area. Both discharge into the San Francisco Bay. Surface water runoff from most of the RSA and all of the LSA south of the Bayshore Freeway is intercepted by a storm drain system and is discharged into Stevens Creek. To the north of the Bayshore Freeway, most of the runoff from Moffett Field Naval Air Station is collected by a storm drain system that ultimately discharges to Guadalupe Slough of San Francisco Bay. Runoff from the northwestern portion of Moffett Field discharges into Stevens Creek. The Local and Regional Study Areas are underlain by a thick sequence of unconsolidated sediments deposited into a structural depression. The sediments are comprised of alluvial fan, estuarine, and bay mud deposits. Repeated variations in sea levels resulted in a complex sedimentary sequence characterized by irregular interbedding and interfingering of coarse and fine grained deposits. Groundwater aquifers at the site are subdivided into shallow and deep aquifer systems, separated by a laterally extensive regional aquitard. The shallow aquifer system comprises aquifers and aquitards to a depth of approximately 160 feet below the surface. Within the shallow system four primary hydrogeologic aquiferzones have been identified based upon the occurrence of aquifer material and a similar depth below the surface. The shallow aquifer system is comprised of the A-aquifer and the underlying B1-, B2- and B3- aquifers. The regional B-C aquitard separates the B3-aquifers from the C-aquifer and the deep aquifer system. Current groundwater flow in aquifer zones above the B-C aquitard is generally to the north, toward San Francisco

RAYTHEON COMPANY (Continued) **1000407768**

Bay. During 1981 and 1982, preliminary investigations of facilities within the LSA indicated significant concentrations of contaminants in soil and groundwater. By 1984, the Fairchild, Intel and Raytheon sites, located within the LSA, were proposed for the NPL. By 1985, five companies within the LSA (Fairchild, Intel, Raytheon, NEC, and Siltec) initiated a joint investigation to document and characterize the distribution of chemicals emanating from their facilities. In April 1985, the California Regional Water Quality Control Board - San Francisco Bay Region (RWQCB) adopted Waste Discharge Requirements (WDRs) for each of the five companies. The primary cause of the subsurface contamination was from leaking storage tanks and lines, and poor waste management practices. On August 15, 1985, Fairchild, Intel, and Raytheon entered into a Consent Order with the EPA, the RWQCB, and the California Department of Health Services (DHS). Since signing of the Consent Order, the three companies have carried out an extensive Remedial Investigation and Feasibility Study (RI/FS) of chemicals emanating from the LSA and soil contamination at their respective facilities. Work has been performed under the supervision of EPA, the RWQCB, DHS, and the Santa Clara Valley Water District (SCVWD). Prior to and during the site investigation, the companies have been conducting interim cleanup activities at the site. These interim remedial actions include tank removals, soil removal and treatment, well sealing, construction of slurry walls, and hydraulic control and treatment of local groundwater. NEC and Siltec declined to enter into the Consent Order and were placed under RWQCB enforcement authority. The three companies followed an approved Quality Assurance and Quality Control (QA/QC) Plan and approved Sampling Plans. In addition, split samples were collected by EPA from selected wells and these results were compared with the companies' sampling results. EPA determined that the companies' data quality was adequate for the purpose of the RI/FS. The MEW Remedial Investigation Report was concluded in July, 1988. The draft Feasibility Study and EPA's Proposed Plan were presented to the community for review and public comment in November, 1988. In May 1989, Special Notice letters for the Remedial Design/Remedial Action (RD/RA) Consent Decree were sent out to the five (5) original companies and twelve (12) other Potentially Responsible Parties (PRPs). The Regional Water Quality Control Board - San Francisco Bay Region (RWQCB) was the lead agency until April 1985, when the Board referred the five companies to EPA for cleanup under Superfund. In May, 1985, EPA sent general notice letters, pursuant to Section 106 of CERCLA, to the five companies. NEC and Siltec chose not to participate in the RI/FS negotiations and were referred back to the RWQCB. In August 1985, Fairchild, Intel, and Raytheon signed an Administrative Order on Consent with EPA, to conduct an RI/FS of the MEW area. The RWQCB and California Department of Health Services were cosignees of the Consent Order. The Consent Order and Work Plan called for a comprehensive groundwater investigation of the MEW area and site specific (source) investigation at Fairchild, Intel, and Raytheon. The RWQCB issued Waste Discharge Requirements (WDRs) for NEC and Siltec which paralleled the Consent Order schedule and requirements. During the course of the RI/FS, EPA gathered new information and evaluated existing information concerning other Potentially Responsible Parties (PRPs). During December 1987 and January 1988, EPA issued twenty-four (24) RCRA 3007/CERCLA 104 information request letters to various other parties in the MEW area. In July 1988, EPA issued a RCRA 3013 Unilateral Order to GTE to begin an investigation of its property, to determine if the company had contributed to the MEW groundwater plume. After evaluating the 3007/104 response letters, EPA sent General Notice Letters to seventeen (17) PRPs in September 1988. An initial PRP meeting was sponsored by EPA in October 1988, to explain the Superfund process to the noticed PRPs. EPA issued seven (7) additional General Notice and/or information request letters in March 1989. EPA subsequently issued Special Notice Letters for conducting the selected remedies in May

RAYTHEON COMPANY (Continued) **1000407768**

1989. A Record of Decision addressing OU01 of the Raytheon Corp. Site was completed in June 1989. An Explanation of Significant Differences addressing Operable Unit 01 of the Raytheon Corporation Site was completed in September, 1990. An Explanation of Significant Differences addressing Operable Unit 1 at the Raytheon Corp. (Mountain View Plant) site was completed in April 1996. OU01 ROD Amendment (2010): The Raytheon Company site is one of the sites comprising the Middlefield-Ellis-Whisman (MEW) study area. The MEW Area is a heavily populated, light-industrial, commercial, and residential area that currently hosts semiconductor, computer software, electronics businesses, and other commercial offices and light manufacturing facilities. The western boundary of the Vapor Intrusion Study Area is primarily residential. The Moffett Field Area is primarily used for military housing, air operations, storage, educational facilities, research and development, office, and retail space. NASA's redevelopment plans in the Moffett Field Area include demolition of all non-historic structures. Plans are underway to redevelop unimproved land at Moffett Field into sustainable research facilities including office, educational, recreational, and residential uses. Cleanup actions are being taken at the Site under the 1989 Record of Decision (ROD) to restore groundwater to its potential beneficial use, which is designated as drinking water. Note that the groundwater at the Site is not currently being used for drinking water or other domestic purposes. The MEW Site is not located in an environmentally sensitive area. Based on EPA's updated understanding of the way chemicals can potentially migrate from the subsurface soil and groundwater to the indoor air, EPA requested the Potentially Responsible Parties (PRPs) for the Middlefield-Ellis-Whisman (MEW) groundwater contamination - the MEW Companies, U.S. Navy, and National Aeronautics and Space Administration (NASA) - to evaluate the potential vapor intrusion pathway into buildings overlying shallow trichloroethylene (TCE) groundwater contamination at the MEW Site. During 2003 through 2008, the MEW Companies, NASA, U.S. Navy, and EPA collected over 3,000 air samples from 47 commercial buildings and 20 residences within the Vapor Intrusion Study Area. The indoor air vapor intrusion investigation included the following types of samples: indoor air, outdoor ambient air, pathway air, crawlspace air, and sub-slab soil gas. Indoor air samples were collected in the breathing zone (approximately 3 to 5 feet above floor level) in occupied or potentially occupied areas. Pathway samples were collected in areas where potential conduits (such as penetrations through slab, drains, utility lines or vaults) into the building were observed that might provide a direct route for volatile organic compound (VOC) vapor migration into the building. Outdoor ambient air samples were collected immediately outside the building, including near the air ventilation system air intake, for comparison to indoor air to evaluate the potential contribution of VOCs from outdoor air to indoor air. Additionally, EPA outdoor reference and MEW/NASA background outdoor air samples were collected at distances of 0.25 to 1.5 miles away from the MEW Site to assess background levels of VOCs in the general area. The indoor air results were compared to (1) short-term health-based screening levels; (2) long-term health-based screening levels, and (3) outdoor ambient air. During the Supplemental Remedial Investigation, EPA used an interim long-term TCE indoor air screening level of 2.7 micrograms per cubic meter (ug/m3) for commercial buildings and 1 ug/m3 for residential buildings. Subsequent to the Supplemental Remedial Investigation, EPA established interim TCE indoor air action levels (now TCE indoor air cleanup levels) of 5 ug/m3 for commercial buildings and 1 ug/m3 for residential buildings. EPA also assessed the vapor intrusion pathway using multiple lines of evidence. The types of information used include building surveys, chemical use, operations, historical facility and property information, site geology and hydrogeology, and subsurface and air sampling information and conditions (groundwater, soil gas, sub-slab soil gas, crawlspace, pathway samples), chemical ratios, and

RAYTHEON COMPANY (Continued) **1000407768**

tracer compounds, to determine whether the indoor air concentrations were attributable to subsurface Site contamination and not other sources, such as consumer products or outdoor background air sources. The Supplemental Remedial Investigation results also support the following conclusions: Indoor air results indicate there are no immediate or short-term health concerns. All indoor air concentrations are below the screening criteria for acute and short-term health-based screening criteria (Agency for Toxic Substances Disease Registry [ATSDR] Minimal Risk Levels). Therefore, EPA's focus is whether trichloroethylene (TCE) and other Site chemicals of potential concern in indoor air pose an unacceptable risk of chronic health effects from long-term exposure (30 years for residential exposure and 25 years for non-residential exposure). TCE in indoor air was detected above EPA's interim long-term TCE indoor air screening level in 17 commercial buildings and three residences within the Vapor Intrusion Study Area. Where discrete mitigation measures (e.g., sealing conduits, enhanced mechanical ventilation, air purifiers, sub-slab vapor control systems) were implemented, indoor TCE concentrations were reduced to below the interim screening level. Increasing air exchange rates generally resulted in decreasing indoor air TCE concentrations. Vapor intrusion resulting in concentrations above interim long-term indoor air screening levels appears more likely in commercial buildings when ventilation systems are not providing sufficient air exchanges with outside air in all or part of a building. Buildings overlying elevated groundwater concentrations appear to have a greater likelihood of indoor air TCE concentrations exceeding the TCE screening level, but actual indoor air concentrations are also dependent on other building factors such as air ventilation system operations, building configuration, and preferential pathways into the building. The highest TCE indoor air concentrations were found in a building with a basement, where there was direct contact with groundwater (644 National Avenue in the MEW Area). Elevated concentrations were also found in a NASA building, where the ventilation system introduced air from beneath the raised floor into the building (N210 in the Moffett Field Area). A Record of Decision Amendment addressing vapor intrusion at Operable Unit 01 of the Raytheon Company Superfund Site was completed in August 2010.

CA BOND EXP. PLAN:

Reponsible Party:	NPL SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	The RP will fund the characterization and remedial action at the site. State Bond funds will be used for oversight of the RP's activities. The Department has budgeted $50,000 for direct costs related to the project and will seek to recover all actual costs from the responsible party.
Site Description:	The Raytheon Corporation operates a semiconductor manufacturing plant at this 30-acre site. Chemicals used in the manufacturing process and wastes generated by this process are handled and stored onsite. The site is located adjacent to industrial, commercial and residential development.
Hazardous Waste Desc:	Soil and ground water beneath the site are contaminated with trichloroethylene (TCE), trichloroethane (TCA), dichloroethylene (DCE), and chloroform. Contamination is believed to have resulted from leaking underground chemical storage tanks and/or concrete acid neutralization sumps.
Threat To Public Health & Env:	About 270,000 people live within a 3-mile radius of the site and depend on ground water as a source of drinking water. Ground water contamination at the site represents a significant threat to drinking water aquifers.
Site Activity Status:	Raytheon entered into a consent agreement with the EPA in August, 1985. Raytheon has removed the leaking tank, installed surface drainage controls and is operating a ground water extraction system. Raytheon is also currently participating in an area-wide remedial investigation and feasibility study.

Status Date:	01/01/1990
Global Id:	SL0608526755
Lead Agency:	SAN FRANCISCO BAY RWQCB (REGION 2)
Lead Agency Case Number:	Not reported
Latitude:	37.395939
Longitude:	-122.054269
Case Type:	Cleanup Program Site
Case Worker:	LG
Local Agency:	Not reported
RB Case Number:	43s1042
File Location:	Not reported
Potential Media Affected:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	* Solvents
Site History:	No Water Board oversight of cleanup at this site. This case is included in Geotracker because the site is covered by the Water Boards NPDES general permits for discharges from pump and treat systems to surface waters (one each for fuels- and VOC-impacted sites). This can happen for two reasons: (i) the site is overseen by another agency (e.g., USEPA or DTSC) and needs coverage under one of the NPDES general permits or (ii) construction dewatering in an area of groundwater contamination necessitates NPDES general permit coverage. Including this case in Geotracker helps staff to receive and review required NPDES reports.

Case Type: Cleanup Program Site
Case Worker: MBR
Local Agency: Not reported
RB Case Number: 43S1158
File Location: Not reported
Potential Media Affected: Indoor Air, Other Groundwater (uses other than drinking water), Soil Vapor
Potential Contaminants of Concern: Dichloroethane (DCA), Dichloroethene (DCE), Other Chlorinated Hydrocarbons, Tetrachloroethylene (PCE), Trichloroethylene (TCE), Vinyl chloride
Site History: Background On March 2, 1998, the Regional Water Board issued a letter concurring that the volatile organic compounds (VOCs) concentrations in groundwater detected at the Site were associated with the VOC plume originating from the upgradient Hewlett-Packard E/M Lubricants facilities. However, the letter requested a deed restriction be placed on the Site for the notification of the presence of onsite impacted soil and groundwater and for the prohibition the drilling of water production wells and use of the shallow groundwater without prior notification to the Regional Water Board. On July 8, 2013, the Regional Water Board issued a cost recovery agreement letter in response to the June 19, 2013, Request for Agency Oversight of a Brownfield Site, regarding the redevelopment at the Site and Water Board review the Site Management Plan (SMP). Site Management Plan Summary Regional Water Board approval of the SMP was required by the City of Mountain View as a condition for obtaining the demolition/building permit. The SMP describes appropriate safe construction practices and soil/groundwater management procedures for redevelopment construction, including contingency procedures The proposed redevelopment covered under the SMP entails construction of a two-building office campus, including two above-grade open-air parking structures. There will be minimal site grading, and the buildings will be at-grade (i.e., no subsurface occupied spaces or parking areas). Despite the expected low and declining VOC concentrations in groundwater, as a precaution the office buildings have vapor intrusion mitigation system to mitigate any potential vapor intrusion concerns from the underlying VOC groundwater plume. Specifically, the SMP proposes a vapor intrusion mitigation system using a sprayed-in-place vapor barrier, such as Liquid Boot, and a sub-slab passive venting installed beneath the vapor barrier. Proper installation of the vapor barrier and the venting system will be verified by PES Environmental, Inc. Additionally, the SMP proposes environmental monitoring and/or field screening of the following. Worker health and safety Installation of the geotechnical test piles

CYPRESS BUSINESS PARK (Continued) **S113804588**

Removal of the building foundation slab and parking lot Demolition of the existing subsurface utilities Installation of the subsurface utilities Grading activities Construction of the building and parking structure foundation Discovery of unexpected below grade features Reuse of graded soil Disposal of excess soil

File Location: Not reported
Potential Media Affected: Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern: * Solvents
Site History: No Water Board oversight of cleanup at this site. This case is included in Geotracker because the site is covered by the Water Boards NPDES general permits for discharges from pump and treat systems to surface waters (one each for fuels- and VOC-impacted sites). This can happen for two reasons: (i) the site is overseen by another agency (e.g., USEPA or DTSC) and needs coverage under one of the NPDES general permits or (ii) construction dewatering in an area of groundwater contamination necessitates NPDES general permit coverage. Including this case in Geotracker helps staff to receive and review required NPDES reports.

Background Info:

Fairchild operates a semiconductor manufacturing plant at this 56-acre site. Chemicals used in the manufacturing processa and wastes generated as a result of this process have been handled & stored onsite. The site is adjacent to residential & industrial development. This site is part of the Middlefield-Ellis-Whisman (MEW) area.

In 1982, soil and groundwater contamination were discovered. The sources of contamination were leaking underground storage tanks containing solvents. At that time, there were a total of 71 tanks & sumps used for the onsite storage of hazardous materials and wastes. The contaminants which have been detected in soil and groundwater include trichloroethylene (TCE), trichloro-

FAIRCHILD SEMICONDUCTOR/MT. VIEW (Continued) **U001594292**

ethane (TCA), dichloroethylene (DCE) and chloroform.
Groundwater contamination represents a significant threat to aquifers used as a source of drinking water. About 270,000 people reside within a 3-mile radius of the site. One private well has been closed due to the encroachment of contaminants. To date, three contaminated private wells have been identified. The City of Mountain View operates a municipal well (No. 18) 1.2 miles from the site.
Fairchild entered into a consent agreement with EPA to conduct RI/FS in August, 1985.
As an initial stabilization action, six of the 71 tanks and sumps used to store hazardous materials and wastes were excavated and removed. A groundwater extraction system consisting of 25 extraction wells has been installed and is operating.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CA BOND EXP. PLAN:
Reponsible Party: NPL SITE CLEANUP WORKPLAN
Project Revenue Source Company: Not reported
Project Revenue Source Addr: Not reported
Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: The RP will fund the characterization and remedial action at the site. State Bond funds will be used for oversight of the RPs activities. DHS has budgeted $50,000 for direct costs related to the project and will seek to recover all actual costs fromthe responsible party.
Site Description: Between 1968 and 1981, Intel Corporation operated a semiconductor manufacturing plant at the site. Chemicals used in the manufacturing process and wastes generated by this process were handled and stored onsite. The site is located adjacent to residential and commercial development.
Hazardous Waste Desc: In 1981, soil and ground water contamination was discovered at the site. An investigation determined that the sources of contamination were leaking underground storage tanks containing solvents. The types of contaminants identified include trichloroethylene (TCE), xylene, Freon-113, trichloroethane (TCA), dichloroethylene (DCE) and vinyl chloride.
Threat To Public Health & Env: Approximately 270,000 people living within a 3-mile radius of the facility

INTEL CORPORATION - MOUNTAIN VIEW (Continued) **S100833411**

depend on ground water as a principal sources of drinking water. Three private wells have been contaminated. Five municipal wells belonging to the City of Mountain View and five City of Sunnyvale wells are located within a three-mile radius of the site. The City of Mountain View's well No. 18 is located 1.1 miles from the facility and is 2,600 feet away from a contaminated monitoring well.

Site Activity Status: Intel entered into a consent agreement with EPA in August, 1985. All five underground tanks and sumps at the site have been excavated along with 4,600 cubic yards of contaminated soil. Ground water monitoring and extraction wells have been installedfor plume characterization, monitoring and extraction. About 72,000 gallons of contaminated ground water is pumped daily and treated by carbon adsorption prior to discharge to Stevens Creek, Whisman Slough and the San Francisco Bay.

Background Info:	Between 1968, and 1981, Intel Corporation operated a semiconductor manufacturing plant at the site. Chemicals used in the manufacturing process and wastes generated by this process were handled and stored onsite. The site is located adjacent to residential and commercial development. This site is part of the Middlefield-Ellis-Whisman (MEW) study area. In 1981, soil and groundwater contamination was discovered at the site. An investigation determined that the sources of contamination were leaking underground storage tanks containing solvents. The types of contaminants identified include trichloroethylene (TCE), xylene, Freon-113, trichloroethane (TCA), dichloroethylene (DCE), and vinyl chloride. Approximately 270,000 people living within a 3-mile radius of the facility depend on groundwater as a principal source of drinking water. Three private wells have been contaminated. Five municipal wells belonging to the City of Mountain View and five City of Sunnyvale wells are located within a three-mile radius of the site. The City of Mountain View's well No. 18 is located 1.1 miles from the facility & is 2,600 feet away from a contaminated monitoring well. In August, 1985, Intel entered into a consent agreement with

INTEL CORPORATION (MOUNTAIN VIEW PLANT) (Continued) **S105628343**

EPA to conduct a RI/FS.
All five underground tanks and sumps at the site have been excavated along with 4,600 cubic yards of contaminated soil. Groundwater monitoring and extraction wells have been installed for plume characterization, monitoring and extraction. About 72,000 gallons of contaminated groundwater is pumped daily and treated by carbon adsorption prior to discharge to Stevens Creek, Whisman Slough and the San Francisco Bay.

SYLVANIA SYSTEMS GROUP GTE PRODUCTS (Continued) **1000429429**

Event: Igration of Contaminated Groundwater under Control, More information is needed to make a determination.

Event date: 08/30/2006
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Case Type:	Cleanup Program Site
Case Worker:	LG
Local Agency:	Not reported
RB Case Number:	43s1029
File Location:	Not reported
Potential Media Affected:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	* Solvents
Site History:	No Water Board oversight of cleanup at this site. This case is included in Geotracker because the site is covered by the Water Boards NPDES general permits for discharges from pump and treat systems to surface waters (one each for fuels- and VOC-impacted

SYLVANIA SYSTEMS GROUP GTE PRODUCTS (Continued) **1000880930**

sites). This can happen for two reasons: (i) the site is overseen by another agency (e.g., USEPA or DTSC) and needs coverage under one of the NPDES general permits or (ii) construction dewatering in an area of groundwater contamination necessitates NPDES general permit coverage. Including this case in Geotracker helps staff to receive and review required NPDES reports.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Document Type:	Site Screening
Completed Date:	11/19/1990
Comments:	Completed Site Screening. 19 soil samples have been randomly taken at a depth of approximately 1 foot. Samples were analyzed for organochlorine pesticides. 2 samples had slightly elevated DDD, DDE, and DDT (1.62 and 1.32 ppm). 1 sample had slightly elevated chlordane. Site Screening done recommends a Preliminary Endangerment Assessment (PEA). More samples are needed to characterize the vertical extent of contamination. Depending upon the pesticide-use

FERGUSON BUSINESS PARK (Continued) **S100183040**

history, soil samples need to be analyzed not only for chlorinated pesticides but also metals, organophospates, and carbamates.

Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 10/22/2013
Comments: Based on the Preliminary Endangerment Assessment Report, DTSC determined that no significant releases have occurred from the Site and issued a letter to the Site owner conveying that DTSC requires no further action at the Site. The Report identifies possible indoor air impacts from volatile organic compounds in groundwater that originated from off-Site sources as the only environmental concern. The Site is located within the the Middlefield-Ellis-Whisman Study Area, which encompasses an existing regional groundwater contamination plume. DTSC's letter noted that although DTSC requires no further action, actions may be required by the U.S. Environmental Protection, pursuant to its Record of Decision Amendment for the Vapor Intrusion Pathway, dated August 16, 2010, to address the potential vapor intrusion risk.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Sub Area Name: Not reported
Completed Document Type: No Further Action Letter
Completed Date: 12/07/2011
Comments: DTSC issued a letter concluding no further action is required at the site. DTSC's determination was based on its review of a U.S. December 7, 2005 EPA letter and four site-specific technical documents that are identified in the no further action letter and are available on EnviroStor.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Assessment Report
Completed Date: 12/02/2011
Comments: The documents reviewed by DTSC in making a no further action determination included an environmental sampling results report, Phase I environmental site assessment report, soil management plan, and sub-slab pressurization startup testing and air sampling report.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Potential Contaminants of Concern:	Not reported
Site History:	California Microwave (CMI) operated a production facility at 985 Almanor until 1996. The company's headquarters were located at 990 Almanor. The production facility manufactured proprietary electronic equipment for telecommunication transmission and distribution, as well as defense applications. Chemical wastes included 1,1,1-trichloroethane (TCA), freon, methyl ethyl ketone, deoxidizer, waste oil and mixed oil, sodium hydroxide, allodyning solution, waste water, and solid wastes. Inspections conducted in the 1980's by the Department of Health Services, Toxic Substances Control Division (DHS, currently the Department of Toxic Substances Control, DTSC) found leaking drums, ponded water, stains on blacktop, and unlabelled drums were observed. Enforcement actions were taken by DHS, including requiring the construction of a bermed hazardous waste storage area. Soil and groundwater investigations were performed under the oversight of the San Francisco Bay Regional Water Quality Control Board (RWQCB). Soils containing VOCs greater than 0.5 parts per million (ppm) were excavated in June of 1995. Groundwater analyses indicated that TCE was migrating onto the former CMI facility from neighboring companies upgradient of the Site. RWQCB noted that the PCE in groundwater appeared to originate from an on-site source. Following this report, RWQCB did not pursue further investigation at the Site for several reasons. Soil removal effectively removed the source of PCE to grounwater, and the Site is currently capped with buildings and asphalt. The concentrations of VOCs in the groundwater beneath the Site were also not high enough compared to levels of VOCs in the local groundwater plume to warrant further work at this time, and the PCE contamination was limited to shallow groundwater.

Summary Details:

Conditions at proposal October 15, 1984): Fairchild Semiconductor Corp. manufactures semiconductors in Mountain View, Santa Clara County, California. The facility occupies approximately 56 acres and is surrounded by residential and industrial areas. This site was originally proposed under the name Fairchild Camera Instrument Corp. Mountain View Plant). The company took the new name in 1986. Monitoring wells on the site are contaminated with trichloroethylene,1,1,1-trichloroethane, 1,1- and trans-1,2-dichloroethylene, according to analyses conducted by a consultant to Fairchild. Contamination is believed to have resulted from leaking underground tanks. About 270,000 people depend on wells within 3miles of the site for drinking water. Since early 1982, Fairchild has been investigating the site geology and hydrogeology and attempting to define the lateral and vertical extent of solvents underlying the site. Fairchild has installedtwo wells to pump and treat the contaminated ground water plume.

FAIRCHILD SEMICONDUCTOR CORP. (MOUNTAIN VIEW PLANT) (Continued) **1000260555**

The company is working with the California Regional Water Quality Control Board to further define the extent of contamination and outline various cleanup strategies. The plant received Interim Status under Subtitle C of the Resource Conservation and Recovery Act RCRA) when the company filed Part A of a permit application. This is one of 19 sites in the South Bay Area of San Francisco. Facilities at these sites have used a variety of toxic chemicals, primarily chlorinated organic solvents, which contaminate a common ground water basin. Although these sites are listed separately, EPA intends to apply an area-wide approach to the problem as well astake specific action as necessary. Status February 1986): Continuing to determine the extent of ground water contamination, Fairchild has installed more than 100 monitoring wells. On August 15, 1985, EPA issued an AdministrativeOrder on Consent under CERCLA Section 106 a) to Fairchild s Mountain View Plant, as well as to Intel Corp. s and Raytheon Corp. s Mountain View Plants. The order calls for the companies to conduct a joint remedial investigation/feasibility study of the area to determine the type and extent of contamination and identify alternatives for remedial action. Status June 1988): EPA is proposing to drop Fairchild Semiconductor Corp. s Mountain View Plant from the proposed NPL. Because the site is a treatment and storage facility, it is subject to the corrective action authorities of Subtitle C RCRA. Fairchild now has 25 wells in operation that pump and treat contaminated ground water; has installed three undergroundslurry walls to control migration of contaminated ground water. EPA has sealed two abandoned agricultural wells that were carrying contamination to the deeper aquifers. EPA may also pursue cleanup under RCRA authorities and will ensure that the cleanup protects public health and the environment. EPA can later repropose the site for the NPL if it determines that the owner or operator is unable or unwilling to clean up the site effectively. Status February 11, 1991): EPAis adding this site to the NPL because, although it is subject to RCRA Subtitle C, the transfer of primary responsibility from CERCLA to RCRA would delay and complicate the overall cleanup of the site. The RI was concluded in July 1988. Adraft FS and EPA s Proposed Plan were presented to the community for a 60-day public comment period in November 1988. EPA signed the Record of Decision ROD) identifying the selected remedy on June 9, 1989. On September 21, 1990, EPA issued an Explanation of Significant Differences clarifying the ROD. In May 1989, EPA sent Special Notice Letters calling for a remedial design/remedial action RD/RA) Consent Decree to Fairchild and 16 other parties potentially responsible for wastes associated with the site. Fairchild failed to conclude a settlement Consent Decree) with EPA. On November 29, 1990, EPA issued Fairchild and eight other parties a Unilateral Administrative Order for RD/RA.

Site Description: The Middlefield/Ellis/Whisman (MEW) Study Area is located in Santa Clara County in the city of Mountain View, California. The site is divided into a Local Study Area (LSA) and a Regional Study Area (RSA). The LSA consists of three National Priority List (NPL) sites (Fairchild, Intel and Raytheon), as well as several non-Superfund sites. The LSA encompasses about 1/2 square mile of the RSA and contains primarily light industrial and commercial areas, with some residential areas west of Whisman Road. The RSA encompasses approximately 8 square miles and includes Moffett Naval Air Station (an NPL site) and National Aeronautics and Space Administration (NASA) Ames Research Center, along with light industrial, commercial, agricultural, park, golf course, undeveloped land, residential, motel and school land uses. Various owners or occupants in the area around the intersections of Middlefield Road, Ellis Street, Whisman Road, and the Bayshore Freeway (U.S. Highway 101), are or were involved in the manufacture of semiconductors, metal finishing operations, parts cleaning, aircraft maintenance, and other activities requiring the use of a variety of chemicals. Site investigations at several of these facilities have revealed the presence of toxic chemicals in the subsurface soils and groundwater. To investigate the extent of groundwater contamination emanating from the LSA, and soil contamination at their respective facilities, Fairchild, Intel, and Raytheon performed a Remedial Investigation and a Feasibility Study of potential remedial alternatives under the direction of EPA. There are no natural surface drainage features within the Local Study Area. The nearest significant natural surface drainage features of the Regional Study Area are Stevens Creek to the west and Calabazas Creek to the east. Calabazas Creek is located approximately four miles east of the MEW Study Area. Stevens Creek forms the western boundary of the Regional Study Area. Both discharge into the

FAIRCHILD SEMICONDUCTOR CORP. (MOUNTAIN VIEW PLANT) (Continued) **1000260555**

San Francisco Bay. Surface water runoff from most of the RSA and all of the LSA south of the Bayshore Freeway is intercepted by a storm drain system and is discharged into Stevens Creek. To the north of the Bayshore Freeway, most of the runoff from Moffett Field Naval Air Station is collected by a storm drain system that ultimately discharges to Guadalupe Slough of San Francisco Bay. Runoff from the northwestern portion of Moffett Field discharges into Stevens Creek. The Local and Regional Study Areas are underlain by a thick sequence of unconsolidated sediments deposited into a structural depression. The sediments are comprised of alluvial fan, estuarine, and bay mud deposits. Repeated variations in sea levels resulted in a complex sedimentary sequence characterized by irregular interbedding and interfingering of coarse and fine grained deposits. Groundwater aquifers at the site are subdivided into shallow and deep aquifer systems, separated by a laterally extensive regional aquitard. The shallow aquifer system comprises aquifers and aquitards to a depth of approximately 160 feet below the surface. Within the shallow system four primary hydrogeologic aquiferzones have been identified based upon the occurrence of aquifer material and a similar depth below the surface. The shallow aquifer system is comprised of the A-aquifer and the underlying B1-, B2- and B3- aquifers. The regional B-C aquitard separates the B3-aquifers from the C-aquifer and the deep aquifer system. Current groundwater flow in aquifer zones above the B-C aquitard is generally to the north, toward San Francisco Bay. During 1981 and 1982, preliminary investigations of facilities within the LSA indicated significant concentrations of contaminants in soil and groundwater. By 1984, the Fairchild, Intel and Raytheon sites, located within the LSA, were proposed for the NPL. By 1985, five companies within the LSA (Fairchild, Intel, Raytheon, NEC, and Siltec) initiated a joint investigation to document and characterize the distribution of chemicals emanating from their facilities. In April 1985, the California Regional Water Quality Control Board - San Francisco Bay Region (RWQCB) adopted Waste Discharge Requirements (WDRs) for each of the five companies. The primary cause of the subsurface contamination was from leaking storage tanks and lines, and poor waste management practices. On August 15, 1985, Fairchild, Intel, and Raytheon entered into a Consent Order with the EPA, the RWQCB, and the California Department of Health Services (DHS). Since signing of the Consent Order, the three companies have carried out an extensive Remedial Investigation and Feasibility Study (RI/FS) of chemicals emanating from the LSA and soil contamination at their respective facilities. Work has been performed under the supervision of EPA, the RWQCB, DHS, and the Santa Clara Valley Water District (SCVWD). Prior to and during the site investigation, the companies have been conducting interim cleanup activities at the site. These interim remedial actions include tank removals, soil removal and treatment, well sealing, construction of slurry walls, and hydraulic control and treatment of local groundwater. NEC and Siltec declined to enter into the Consent Order and were placed under RWQCB enforcement authority. The three companies followed an approved Quality Assurance and Quality Control (QA/QC) Plan and approved Sampling Plans. In addition, split samples were collected by EPA from selected wells and these results were compared with the companies' sampling results. EPA determined that the companies' data quality was adequate for the purpose of the RI/FS. The MEW Remedial Investigation Report was concluded in July, 1988. The draft Feasibility Study and EPA's Proposed Plan were presented to the community for review and public comment in November, 1988. In May 1989, Special Notice letters for the Remedial Design/Remedial Action (RD/RA) Consent Decree were sent out to the five (5) original companies and twelve (12) other Potentially Responsible Parties (PRPs). The Regional Water Quality Control Board - San Francisco Bay Region (RWQCB) was the lead agency until April 1985, when the Board referred the five companies to EPA for cleanup under Superfund. In May, 1985, EPA sent general notice letters, pursuant to Section 106 of

FAIRCHILD SEMICONDUCTOR CORP. (MOUNTAIN VIEW PLANT) (Continued) **1000260555**

CERCLA, to the five companies. NEC and Siltec chose not to participate in the RI/FS negotiations and were referred back to the RWQCB. In August 1985, Fairchild, Intel, and Raytheon signed an Administrative Order on Consent with EPA, to conduct an RI/FS of the MEW area. The RWQCB and California Department of Health Services were cosignees of the Consent Order. The Consent Order and Work Plan called for a comprehensive groundwater investigation of the MEW area and site specific (source) investigation at Fairchild, Intel, and Raytheon. The RWQCB issued Waste Discharge Requirements (WDRs) for NEC and Siltec which paralleled the Consent Order schedule and requirements. During the course of the RI/FS, EPA gathered new information and evaluated existing information concerning other Potentially Responsible Parties (PRPs). During December 1987 and January 1988, EPA issued twenty-four (24) RCRA 3007/CERCLA 104 information request letters to various other parties in the MEW area. In July 1988, EPA issued a RCRA 3013 Unilateral Order to GTE to begin an investigation of its property, to determine if the company had contributed to the MEW groundwater plume. After evaluating the 3007/104 response letters, EPA sent General Notice Letters to seventeen (17) PRPs in September 1988. An initial PRP meeting was sponsored by EPA in October 1988, to explain the Superfund process to the noticed PRPs. EPA issued seven (7) additional General Notice and/or information request letters in March 1989. EPA subsequently issued Special Notice Letters for conducting the selected remedies in May 1989. A Record of Decision addressing OU01 of the Fairchild Semiconductor Corp. Site was completed in June 1989. EPA is now changing the June 9, 1989 ROD by specifying final cleanup standards rather than just goals. EPA is making this change because it has determined that there is insufficient information at this time to invoke a waiver to ARARs. However, EPA continues to recognize that it is always possible that the chosen remedy will be demonstrated to be unattainable. Therefore, EPA recognizes that if data are generated that demonstrate that the selected remedy cannot be achieved, EPA may need to reconsider its decision embodied in the ROD. An Explanation of Significant Differences addressing Operable Unit 01 of the Fairchild Semiconductor Corporation Site was completed in September, 1990. An Explanation of Significant Differences addressing Operable Unit 1 at the Fairchild Semiconductor Corp. (Mountain View Plant) site was completed in April 1996. OU 01 ROD Amendment (2010): The Fairchild Semiconductor (Mountain View) Site is one of the sites comprising the Middlefield-Ellis-Whisman (MEW) study area. The MEW Area is a heavily populated, light-industrial, commercial, and residential area that currently hosts semiconductor, computer software, electronics businesses, and other commercial offices and light manufacturing facilities. The western boundary of the Vapor Intrusion Study Area is primarily residential. The Moffett Field Area is primarily used for military housing, air operations, storage, educational facilities, research and development, office, and retail space. NASA's redevelopment plans in the Moffett Field Area include demolition of all non-historic structures. Plans are underway to redevelop unimproved land at Moffett Field into sustainable research facilities including office, educational, recreational, and residential uses. Cleanup actions are being taken at the Site under the 1989 Record of Decision (ROD) to restore groundwater to its potential beneficial use, which is designated as drinking water. Note that the groundwater at the Site is not currently being used for drinking water or other domestic purposes. The MEW Site is not located in an environmentally sensitive area. Based on EPA's updated understanding of the way chemicals can potentially migrate from the subsurface soil and groundwater to the indoor air, EPA requested the Potentially Responsible Parties (PRPs) for the Middlefield-Ellis-Whisman (MEW) groundwater contamination - the MEW Companies, U.S. Navy, and National Aeronautics and Space Administration (NASA) - to evaluate the potential vapor intrusion pathway into buildings overlying shallow trichloroethylene (TCE) groundwater

FAIRCHILD SEMICONDUCTOR CORP. (MOUNTAIN VIEW PLANT) (Continued) **1000260555**

contamination at the MEW Site. During 2003 through 2008, the MEW Companies, NASA, U.S. Navy, and EPA collected over 3,000 air samples from 47 commercial buildings and 20 residences within the Vapor Intrusion Study Area. The indoor air vapor intrusion investigation included the following types of samples: indoor air, outdoor ambient air, pathway air, crawlspace air, and sub-slab soil gas. Indoor air samples were collected in the breathing zone (approximately 3 to 5 feet above floor level) in occupied or potentially occupied areas. Pathway samples were collected in areas where potential conduits (such as penetrations through slab, drains, utility lines or vaults) into the building were observed that might provide a direct route for volatile organic compound (VOC) vapor migration into the building. Outdoor ambient air samples were collected immediately outside the building, including near the air ventilation system air intake, for comparison to indoor air to evaluate the potential contribution of VOCs from outdoor air to indoor air. Additionally, EPA outdoor reference and MEW/NASA background outdoor air samples were collected at distances of 0.25 to 1.5 miles away from the MEW Site to assess background levels of VOCs in the general area. The indoor air results were compared to (1) short-term health-based screening levels; (2) long-term health-based screening levels, and (3) outdoor ambient air. During the Supplemental Remedial Investigation, EPA used an interim long-term TCE indoor air screening level of 2.7 micrograms per cubic meter (ug/m3) for commercial buildings and 1 ug/m3 for residential buildings. Subsequent to the Supplemental Remedial Investigation, EPA established interim TCE indoor air action levels (now TCE indoor air cleanup levels) of 5 ug/m3 for commercial buildings and 1 ug/m3 for residential buildings. EPA also assessed the vapor intrusion pathway using multiple lines of evidence. The types of information used include building surveys, chemical use, operations, historical facility and property information, site geology and hydrogeology, and subsurface and air sampling information and conditions (groundwater, soil gas, sub-slab soil gas, crawlspace, pathway samples), chemical ratios, and tracer compounds, to determine whether the indoor air concentrations were attributable to subsurface Site contamination and not other sources, such as consumer products or outdoor background air sources. The Supplemental Remedial Investigation results also support the following conclusions: Indoor air results indicate there are no immediate or short-term health concerns. All indoor air concentrations are below the screening criteria for acute and short-term health-based screening criteria (Agency for Toxic Substances Disease Registry [ATSDR] Minimal Risk Levels). Therefore, EPA's focus is whether trichloroethylene (TCE) and other Site chemicals of potential concern in indoor air pose an unacceptable risk of chronic health effects from long-term exposure (30 years for residential exposure and 25 years for non-residential exposure). TCE in indoor air was detected above EPA's interim long-term TCE indoor air screening level in 17 commercial buildings and three residences within the Vapor Intrusion Study Area. Where discrete mitigation measures (e.g., sealing conduits, enhanced mechanical ventilation, air purifiers, sub-slab vapor control systems) were implemented, indoor TCE concentrations were reduced to below the interim screening level. Increasing air exchange rates generally resulted in decreasing indoor air TCE concentrations. Vapor intrusion resulting in concentrations above interim long-term indoor air screening levels appears more likely in commercial buildings when ventilation systems are not providing sufficient air exchanges with outside air in all or part of a building. Buildings overlying elevated groundwater concentrations appear to have a greater likelihood of indoor air TCE concentrations exceeding the TCE screening level, but actual indoor air concentrations are also dependent on other building factors such as air ventilation system operations, building configuration, and preferential pathways into the building. The highest TCE indoor air concentrations were found in a building with a basement, where there

FAIRCHILD SEMICONDUCTOR CORP. (MOUNTAIN VIEW PLANT) (Continued) **1000260555**

was direct contact with groundwater (644 National Avenue in the MEW Area). Elevated concentrations were also found in a NASA building, where the ventilation system introduced air from beneath the raised floor into the building (N210 in the Moffett Field Area). A Record of Decision Amendment addressing vapor intrusion at Operable Unit 01 of the Fairchild Semiconductor (Mountain View) Site was completed in August 2010.

Hazardous Waste Summary:
Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D004
Waste name: ARSENIC

Waste code: D007
Waste name: CHROMIUM

Waste code: D008
Waste name: LEAD

Waste code: D011
Waste name: SILVER

Waste code: F006

SIERRA CIRCUITS, INC. (Continued) **1000368651**

Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: F007
Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS

Biennial Reports:

Last Biennial Reporting Year: 2013

Annual Waste Handled:

SIC Code 2:	Not reported
Primary Waste Type:	Hazardous/Influent or Solid Wastes that contain toxic, corrosive, ignitable or reactive substances and must be managed according to applicable DOHS standards.
Primary Waste:	CNWTRS
Waste Type2:	Not reported
Waste2:	Contaminated Ground Water
Primary Waste Type:	Hazardous/Influent or Solid Wastes that contain toxic, corrosive, ignitable or reactive substances and must be managed according to applicable DOHS standards.
Secondary Waste:	Not reported
Secondary Waste Type:	Not reported
Design Flow:	0
Baseline Flow:	0
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The POTW Does not have an approved pretreatment program. Some POTWs may have local pretreatment programs that have not been approved by the regional board and/or EPA.
Treat To Water:	Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.
Complexity:	Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Corrective Action Summary:
Event date: 08/01/1985
Event: CA049SI

Event date: 04/15/1987
Event: RFI Imposition

Event date: 04/15/1987
Event: Stabilization Measures Implemented, Primary measure is source removal and/or treatment (e.g., soil or waste excavation, in-situ soil treatment, off-site treatment).

ANACOMP INC (Continued) **1015732743**

Event date: 04/15/1987
Event: CMS Imposition

Event date: 08/31/1987
Event: Stabilization Construction Completed

Event date: 05/01/1988
Event: CA049RE

Event date: 05/01/1988
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 05/01/1988
Event: CA029WQ

Event date: 10/17/1990
Event: CA049PA

Event date: 10/17/1990
Event: RFA Completed

Event date: 04/20/1991
Event: CA Prioritization, Facility or area was assigned a medium corrective action priority.

Event date: 07/29/1994
Event: Stabilization Measures Evaluation,This facility is amenable to stabilization activity based on the status of corrective action work at the facility, technical factors, the degree of risk, timing considerations and administrative considerations.

Event date: 07/29/1994
Event: Stabilization Measures Evaluation,This facility is amenable to stabilization activity based on the status of corrective action work at the facility, technical factors, the degree of risk, timing considerations and administrative considerations.

Event date: 07/29/1994
Event: CA Prioritization, Facility or area was assigned a medium corrective action priority.

Event date: 02/01/1995
Event: RFI Approved

Event date: 09/24/1997
Event: Stabilization Measures Evaluation,This facility is not amenable to stabilization activity at the present time for reasons other than 1- it appears to be technically infeasible or inappropriate (NF) or 2- there is a lack of technical information (IN). Reasons for this conclusion may be the status of closure at the facility, the degree of risk, timing considerations, the status of corrective action work at the facility, or other administrative considerations.

Event date: 09/24/1997
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information

ANACOMP INC (Continued) **1015732743**

contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 09/24/1997
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Event date: 09/24/1997
Event: CA Responsibility Referred To A Non-RCRA Federal Authority

Event date: 10/18/2000
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Event date: 10/18/2000
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 12/28/2000

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/25/2013

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/25/2013

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/25/2013

Data Release Frequency: Varies

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/10/2013

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 09/10/2013
Date Data Arrived at EDR: 10/02/2013

Last EDR Contact: 03/13/2014
Next Scheduled EDR Contact: 05/19/2014
Data Release Frequency: Quarterly

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 12/04/2013

Local Land Records

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

Date of Government Version: 02/06/2013

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

2020 COR ACTION: 2020 Corrective Action Program List
The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

UTM Y (Meters):	4138924.8

USGS TOPOGRAPHIC MAP

Target Property Map:	37122-D1 MOUNTAIN VIEW, CA
Most Recent Revision:	1999

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNE

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
SANTA CLARA, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06085C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MOUNTAIN VIEW	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/4 - 1/2 Mile WNW
Site Name:	Raytheon Corp
Site EPA ID Number:	CAD009205097
Surficial Aquifer Flow Dir.:	N. THIS FLOW APPLIES TO AQUIFERS ABOVE 160 FEET DEEP.
Measured Depth to Water:	less than 45 feet.
Hydraulic Connection:	Vertical leakage between aquifers underlying the site occurs.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information based on site-specific subsurface investigations is documented in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site--specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	BOTELLA
Soil Surface Texture:	clay loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	MODERATE
Depth to Bedrock Min:	> 60 inches
Depth to Bedrock Max:	> 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	9 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.30 Min: 5.60
2	9 inches	41 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60
3	41 inches	76 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: No Other Soil Types

Surficial Soil Types: No Other Soil Types

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: No Other Soil Types

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

EDR Inquiry # 3900146.3

Contact: Daniela D Hamann-

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Iris Environmental were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EDR Environmental Lien and AUL Search

The EDR Environmental Lien and AUL Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

FORM #4280 (Rev. 3/85)

Exhibit "A"

Real property situated in the City of Mountain View, County of Santa Clara, State of California, described as follows:

PARCEL 1

Beginning at an iron bar in the center line of the Mountain View-Alviso Road from which a granite monument, with a brass plug, in the center of said road bears North 49° 12' East a distance of 201.47 feet, said granite monument lying South 56° 48' 30" West a distance of 50.55 feet from the intersection of said center line with the center line of Maude Avenue, and running North 50° 26' 10" West along the Southwesterly line of the property of James Logue, hereinafter referred to, a distance of 63.63 feet to a Southerly corner in that certain parcel of land conveyed to Kathleen M. Taylor by that certain deed recorded March 2, 1955 in Book 3099, page 289, Santa Clara County Records,

thence North 39° 33' 50" East along a Southeasterly line of said parcel of land a distance of 60.03 feet to an angle in said parcel of land,

thence South 50° 29' East 43.40 feet to a point in the Northwesterly line of Mountain View-Alviso Road; 60 feet wide;

thence North 49° 12' East along said Northwesterly line a distance of 66.07 feet; to a point in the Southwesterly line of Maude Avenue as shown upon that certain map of Tract Number 2917, recorded August 26, 1961 in Book 138 of maps, pages 24 and 25, Santa Clara County Records;

thence South 40° 19' 30" East, 30 feet more or less to the center line of the Mountain View-Alviso Road;

thence South 49° 06' 50" West along said centerline to the point of beginning.

PARCEL 2

Beginning st an iron bar in the center line of the Mountain View-Alviso Road from which a granite monument, with a brass plug, in the center of said road bears North 49° 12' East a distance of 201.47 feet, said granite monument lying South 56° 48' 30" West a distance of 50.55 feet from the intersection of said center line with the center line of Maude Avenue, and running North 50° 26' 10" West along the Southwesterly line of the property of James Logue, hereinafter referred to, a distance of 63.63 feet to a 3/4" iron pipe at the true point of beginning;

thence leaving said Southwesterly line and running North 39° 33' 50" East a distance of 60.03 feet to a 3/4" iron pipe;

thence South 50° 29' East a distance of 43.40 feet to a 3/4" iron pipe set in the Northwesterly line of the Moutnain View-Alviso Road, 60 feet wide;

thence North 49° 12' East along said Northwesterly line, a distance of 66.07 feet to a 3/4" iron pipe;

thence leaving said Northwesterly line and running North 40° 13' West a distance of 174.48 feet to a 3/4" iron pipe;

thence South 61° 47' West a distance of 168.66 feet to a 3/4" pipe set in said Southwesterly line of the property of James Logue;

thence running South 50° 26' 10" East along said Southwesterly line, a distance of 181.03 feet to the True Point of Beginning. Being a portion of that certain 0.63828 acre parcel of land shown on that certain record of survey map filed in the office of the County Recorder in Book 43 of Maps, at page 44 on the 24th day of June, 1953.

Being also a portion of that certain 101.56 acre tract of land conveyed by deed dated April 21, 1919 by James Logue to Catherine Logue, his wife, and recorded April 3, 1935 in Vol. 725, page 249 of Official Records of Santa Clara County, California.

Appendix F

Client/User Questionnaire

USER / CLIENT QUESTIONNAIRE
FOR A PHASE I ENVIRONMENTAL SITE ASSESSMENT (ESA) COMPLIANT WITH ASTM E 1527-13

INTRODUCTION: In order to qualify for one of the Landowner Liability Protections (LLP) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001, the user (in this case, Google Inc.), must provide the following information (if available) to Iris Environmental. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete, and liability protection may be forfeited.

REQUIRED INFORMATION AND USER/CLIENT QUESTIONS

1. **Environmental liens that are filed or recorded against the site.**
   Did a search of recorded land title records (or judicial records where appropriate) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law? No

2. **Activity and use limitations (AULs) that are in place at the site or that have been filed or recorded against the property.**
   Did a search of recorded land title records (or judicial records where appropriate) identify any AULs, such as engineering controls, land use restrictions, or institutional controls that are in place at the property and /or have been filed or recorded against the property under federal, tribal, state or local law? Not aware of any.

3. **Specialized knowledge or experience of the person seeking to qualify for the LLP.**
   Do you have any specialized knowledge or experience related to the property or nearby properties? For example are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business? No

4. **Relationship of the purchase price to the fair market value of the property if it were not contaminated.**
   Does the purchase price being paid for this property reasonable reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether this lower purchase price is because contamination is known or believed to be present at the property? Don't know

5. **Commonly known or reasonably ascertainable information about the property.**
   Are you aware of commonly known or reasonable ascertainable information about the property that would help Iris Environmental to identify conditions indicative of releases or threatened releases? For example:
   a. Do you know the past uses of the property? No
   b. Do you know of specific chemicals that are present or once were present at the property? No
   c. Do you know if spills or other chemical releases that have taken place at the property? No
   d. Do you know of any environmental cleanups that have taken place at the property? No

6. **The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation.**
   Based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of releases at the property? Unknown

I. Executive Summary

On behalf of Google LLC (Google), Elevate Environmental Consultants Inc. (Elevate) conducted a limited Phase II subsurface investigation at the properties comprised of 420, 433, 440, 450, 485, 489, 500, 506, 510, 516, 520, and 526 Clyde Avenue; 440, 441, 500, 510, 520, and 530 Logue Avenue; and 800, 830, 840, 850, 880, 885, 889, and 891 Maude Avenue in Mountain View, California, collectively referred to herein as the eastern portion of the Middlefield Park Site or the East Middlefield Park properties, and at the properties comprised of 500 East Middlefield Road and 401 Ellis Street, collectively referred to herein as the western portion of the Middlefield Park Site or the West Middlefield Park properties. Together, the East Middlefield Park and West Middlefield Park properties are known as Middlefield Park (the Site). The Site is located in a light industrial area, where historical activities at some nearby properties have been documented to impact groundwater in the region. Based on the proximity of the Site to the Middlefield-Ellis-Whisman (MEW) Superfund groundwater plume (MEW plume), which is contaminated primarily with chlorinated solvents including trichloroethene (TCE), and to the commingled Hewlett Packard (HP) and E/M Lubricant groundwater plume (the HP and E/M Lubricant plume), which is impacted by chlorinated solvents including TCE and tetrachloroethene (PCE), soil, groundwater, and soil vapor samples were collected and analyzed for volatile organic compounds (VOCs) to evaluate subsurface conditions at the Site. Soil samples were also analyzed for additional analytes to characterize the soil in the context of typical off-haul and disposal requirements.

The results of this investigation support that concentrations of TCE and PCE present in on-Site groundwater and soil vapor at the East Middlefield Park properties are primarily associated with the HP and E/M Lubricant plume, which extends through the central portion of the Site from south to north. The results of this investigation also support that concentrations of TCE are present in on-Site groundwater and soil vapor near the western boundary of the Site and are associated with the off-Site cross-gradient MEW plume. Other VOC impacts may be associated with the MEW plume on the western side of the Site. Additionally, on-Site soils can be characterized as non-hazardous for potential future off-haul purposes and may be acceptable for on-Site re-use or receipt by a site with acceptance criteria based on unrestricted residential land use screening criteria.

Based on detected concentrations of TCE, PCE, and other VOCs in soil vapor at the Site, vapor intrusion controls, such as those commonly used to address potential vapor intrusion from regional groundwater contamination of VOCs, could be installed on future buildings, as needed, to manage the concentrations of TCE and PCE documented herein and to account for the potential for off-Site VOC impacts to further migrate onto the Site in the future. The results of this investigation support that with the implementation of vapor intrusion controls, as needed on a property-by-property basis, the Site is suitable for residential use.

II. INTRODUCTION

Elevate has prepared this *Sampling and Analysis Report (SAR)* to document the limited Phase II subsurface investigation performed at the Site on behalf of Google. The purpose of this investigation was to evaluate subsurface conditions at the Site. The limited Phase II subsurface investigation was implemented in two phases, first at the West Middlefield Park properties and second at the East Middlefield Park properties, in general accordance with the Sampling and Analysis Plans (SAPs) prepared by Elevate, included as Appendix A.

The location of the West Middlefield Park properties is shown on Figure 1a. The West Middlefield Park properties currently consist of two buildings (500 East Middlefield Road and 401 Ellis Street) of approximately 101,725 and 136,694 square feet, respectively, surrounding parking, and landscaping. Groundwater samples were collected from ten locations at these properties, and soil and soil vapor samples were collected from 12 sampling locations across the West Middlefield Park properties, as shown on Figure 2a. Grab groundwater samples were collected from first-encountered water at all ten sampling locations. Soil samples were collected from the vadose zone at each of the 12 sampling locations at the West Middlefield Park properties. Additionally, one deeper soil sample was collected at each planned future basement at the West Middlefield Park properties, from approximately 20 feet below ground surface (ft bgs). Dual-depth soil vapor samples were collected from the vadose zone at each of the 12 sampling locations at the West Middlefield Park properties unless soil vapor was not sufficient to collect a sample due to tight clay formations in the subsurface.

The location of the East Middlefield Park properties is shown on Figure 1b and consists of 21 buildings surrounded by parking and landscaping. Groundwater samples were collected from 28 locations at these properties, soil samples were collected from 38 locations, and soil vapor samples were collected from 30 sampling locations across the East Middlefield Park properties, as shown on Figure 2b. All samples were collected exterior to existing buildings, in parking or light landscaping areas. Grab groundwater samples were collected from first-encountered water at all 28 sampling locations. Soil samples were collected from the vadose zone at each of the 38 locations. Additionally, one deeper soil sample was collected at each planned future basement at the East Middlefield Park properties, from approximately 10 ft bgs. Dual-depth soil vapor samples were collected from the vadose zone at each of the 30 sampling locations at the East Middlefield Park properties, unless soil vapor was not sufficient to collect a sample due to tight clay formations in the subsurface.

The following sections describe the findings of the subsurface characterization.

III. BACKGROUND

A. Site Description

The Site is located at 420, 433, 440, 450, 485, 489, 500, 506, 510, 516, 520, and 526 Clyde Avenue; 500 East Middlefield Road; 401 Ellis Street; 440, 441, 500, 510, 520, and 530 Logue Avenue; and 800, 830, 840, 850, 880, 885, 889, and 891 Maude Avenue in Mountain View, California, as shown on Figures 1a and 1b. The Site covers an area of approximately 40.85 acres, and is identified as Assessor's Parcel Numbers (APN) 160-57-004, -006, -007, -008, -009, -010, -011, -012, -013, and -016; 160-58-001, -017, and -017; and 16-59-005 and-006. Features of the Site are as follows:

- The Site is located in an urban setting and surrounded by light industrial and commercial office development, dominated by corporate office parks. Historical information suggests that the on-Site buildings were built from the 1960s through the 1990s, and prior to the construction of the existing commercial office buildings, previous light industrial and commercial office buildings had occupied some parcels since the 1940s. Prior to the construction of buildings and Site development, the Site's parcels were used for agricultural purposes.

- Portions of the Site are located directly within the extent of the HP and E/M Lubricant plume as estimated by the potential responsible parties (PRPs), which is impacted by VOCs, primarily TCE and PCE. Sources to the HP and E/M Lubricant plume are located to the south and upgradient of the Site. The plume has been delineated by the PRPs as primarily extending through the center of the Site, south to north, just to the west of Clyde Avenue. The extent of this plume, as delineated by the PRPs, is depicted on Figures 3 and 4.

- The Site is also located directly adjacent and cross-gradient (east) of the MEW plume, which is impacted by VOCs, primarily TCE. Several National Priority List (NPL) sites located within one mile of the Site have contributed to the MEW plume. The MEW plume has been delineated by the PRPs to the MEW plume as extending just to the west of the Site, near Ellis Street.

- There are several groundwater monitoring wells on-Site associated with historical investigations. Several groundwater monitoring wells associated with ongoing monitoring of the MEW plume exist on the West Middlefield Park properties, and two monitoring wells associated with the MEW plume are located near the Site boundary, just east of 440 Logue Avenue. Monitoring wells on-Site associated with the HP and E/M Lubricant plume have been decommissioned. Records provided by Valley Water indicate that additional wells may be present on-Site, which may be associated with regional plume monitoring or other purposes.

- No existing underground storage tanks (USTs) have been identified at the Site as of the date of this report. Historic records indicate that leaking USTs were identified at 440 Logue Avenue in 1988 and at 441 Logue Avenue in 1987. However, cleanup was performed at both sites and both cases have since been closed (Iris Environmental, 2014; Lowney Associates, 1999).

- Based on the historical documents, we are not aware of any active on-Site environmental oversight from regulatory agencies (e.g. RWQCB or United States Environmental Protection Agency [USEPA]) associated with the on-Site environmental history as of the date of this report. As mentioned above, monitoring wells associated with the MEW plume are present at the West Middlefield Park properties and are regularly monitored. Removal or relocation of these wells would require involvement from the PRPs of the MEW plume and the USEPA. As the West Middlefield Park properties are located adjacent to the MEW plume, regulatory involvement from this Site condition could occur in the future, for example if the properties were redeveloped. Also as noted above, 440 Logue Avenue and 441 Logue Avenue were previously under regulatory oversight due to leaking USTs but have been closed. Additionally, 485 Clyde Avenue was previously under RWQCB oversight due to historical site uses of solvents and detections of VOCs in groundwater, but the RWQCB issued a No Further Action letter in 1998 for 485 Clyde Avenue, attributing the groundwater impact to likely off-site contamination (IVI Assessment Services, Inc. 2013). As noted above, monitoring wells associated with the HP and E/M Lubricant plume were historically present on-Site, and were sampled under oversight from the RWQCB. However, routine monitoring of the HP and E/M Lubricant plume ceased in 2013 and the on-Site wells were decommissioned in 2015.

- Removal or relocation of wells on-Site may require involvement from the PRPs of the MEW plume and the USEPA. Based on the presence of the HP and E/M Lubricant plume on-Site, the proximity of the MEW plume to the west of the Site, and other historical regulatory requirements as discussed above, additional regulatory involvement due to existing Site conditions could be necessary in the future, for example, if the properties were redeveloped.

- There are no documented deed restrictions on the Site related to environmental conditions at the time of this report. There therefore does not appear to be any current restrictions on land use (e.g. residential or commercial).

- Groundwater flow direction at the Site is generally to the north.

B. Objectives

The purpose of this limited subsurface investigation was to evaluate whether the Site is impacted by subsurface VOC or total petroleum hydrocarbon (TPH) contamination, and to further characterize Site soils for future Site use and potential future off-haul and disposal. This

investigation included a combination of vadose zone and saturated zone subsurface characterization. Objectives of this investigation included 1) evaluating the potential for upgradient or off-Site sources to be contributing to VOC and/or TPH contamination on-Site, 2) evaluating on-Site VOC concentrations in consideration of planned redevelopment and potential residential Site use, and 3) characterizing Site soil in the context of typical off-haul and disposal requirements.

C. Scope of Investigation

Soil, groundwater, and soil vapor sampling was conducted by Elevate in two phases: at the West Middlefield Park properties between September 21 and September 25, 2020, and at the East Middlefield Park properties between October 12 and October 22, 2020. The investigation was conducted in general accordance with the SAPs developed by Elevate, included in Appendix A. These SAPs described the objectives of the investigation, identified proposed sampling locations and the rationale for their selection, and detailed the types of samples that would be collected, the methodology for collecting each media-specific sample, and the laboratory analyses that would be requested to be performed on each sample.

A drilling subcontractor and direct-push drill rig were used to collect subsurface groundwater samples from 38 borings, soil samples from 50 borings, and soil vapor samples from 42 borings. As stated in the SAPs, dual-depth soil vapor probes were constructed at each soil vapor sampling location. However, due to persistent back pressure during sampling at three sampling locations (WMP-6, EMP-1, and EMP-35), shallow soil vapor samples at those locations could not be collected. Experiencing back pressure is common when soil formations are tight (e.g., clayey soils) and/or the groundwater table is shallow. Additionally, due to shallow groundwater encountered at three locations (EMP-31, EMP-42, and EMP-43), soil vapor probes at the capillary fringe could not be installed, and accordingly soil vapor samples could not be collected at the capillary fringe. Back pressure was also experienced during sample collection at eight other locations, however re-drilling resulted in samples being successfully collected from those eight locations.

1. Soil Sampling

One soil sample was collected at each of the 50 soil sampling locations, from depths between 2.0 and 5.0 feet ft bgs. Additionally, at ten of the sampling locations an additional soil sample was collected from 10 ft bgs, and at three of the sampling locations an additional soil sample was collected from 20 ft bgs. All soil samples were analyzed for a typical analytical scope necessary to evaluate Site soils for future offhaul from an environmental perspective. Once sampling was completed the borings were sealed to grade using neat cement grout tremied from the bottom of the boring. Boring logs are included as Appendix B.

2. Groundwater Sampling

Shallow-zone grab groundwater samples were collected from 38 sampling locations throughout the Site, as shown on Figures 2a and 2b. At each sampling location, a boring was first advanced until groundwater was first encountered, which ranged from approximately 7.0 to 19.0 ft bgs. The boring was then advanced to a depth of approximately 5.0 feet below first encountered groundwater, and a grab groundwater sample was collected from the boring. Groundwater samples were submitted to the laboratory for analysis of VOCs by EPA Method 8260B and TPHs by EPA Method 8015. Once sampling was completed the borings were sealed to grade using neat cement grout tremied from the bottom of the boring.

3. Soil Vapor Sampling

A total of 78 soil vapor samples were collected. At each of 42 soil vapor sampling locations, a boring was advanced using direct push drilling methods at the specified depths for construction of a temporary soil gas probe. Unless otherwise noted in this report, at each boring location two nested temporary soil gas probes were designed, installed, purged, and sampled in accordance with the *Advisory - Active Soil Gas Investigations* (Soil Gas Advisory; Cal/EPA, 2015), and soil vapor samples were collected from two depths: 4.5-8.0 ft bgs and at the capillary fringe (approximately 7.5 to 12.0 ft bgs). Soil vapor samples were submitted to the laboratory for analysis of VOCs by EPA Method TO-15 and helium by ASTM Method 1946. Once sampling was completed, the borings were decommissioned in accordance with local regulations. Soil vapor sampling forms are included as Appendix C.

Shallow soil vapor samples could not be collected from locations WMP-1, WMP-5, WMP-6, WMP-7, EMP-1, EMP-6, EMP-9, EMP-18, or EMP-35 and soil vapor samples at the capillary fringe could not be collected from locations EMP-38 or EMP-40 due to persistent back pressure encountered during purging/sampling. This condition is anticipated to be due to the fine-grained formation in the subsurface at these locations. Boring logs documenting these conditions are presented in Appendix B. Redrilling at an adjacent location and constructing the probes improved conditions at locations WMP-1, WMP-5, WMP-7, EMP-6, EMP-9, EMP-18, EMP-38, and EMP-40. These locations were successfully resampled. Redrilling at locations WMP-6, EMP-1, and EMP-35 did not improve conditions, and a shallow soil vapor sample at these locations could not be collected. Additionally, due to shallow groundwater at locations EMP-31, EMP-42, and EMP-43, soil vapor probes could not be installed at the capillary fringe and therefore a soil vapor sample at the capillary fringe could not be collected.

IV. RESULTS

Samples were submitted to the laboratory for analysis of groundwater, soil, and soil vapor. Soil and groundwater samples were submitted for analysis to McCampbell Analytical, Inc., a California-certified analytical laboratory located in Pittsburg, California. Soil vapor samples collected at the West Middlefield Park properties were submitted for analysis to Pace National, a California-certified analytical laboratory located in Mount Juliet, Tennessee, and soil vapor

samples collected at the East Middlefield Park properties were submitted for analysis to Eurofins Air Toxics, Inc., a California-certified analytical laboratory located in Folsom, California.

Sampling results are presented in Tables 1a through 3a and Tables 1b through 3b. Sampling locations are presented on Figures 2a and 2b, TCE results are presented on Figures 3a and 3b, and PCE results from the East Middlefield Park properties are presented on Figure 4. .

A. Soil Sampling Results

All soil samples were analyzed for a typical suite of analytes to support off-haul characterization: VOCs, TPHs, semivolatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), metals, and asbestos. Soil results were compared to both hazardous waste screening criteria and San Francisco Bay Regional Water Quality Control Board (RWQCB) Soil Environmental Screening Levels (ESLs). All analytes were compared to Tier 1 Soil ESLs in Tables 1a and 1b, with the exception of pesticides, which were compared to Residential Direct Contact Soil ESLs (residential ESLs).

1. Soil Sampling Results Compared to Hazardous Waste Screening Criteria

As shown in Tables 1a and 1b, all soil results were below hazardous waste screening criteria, with the exception of chromium and nickel. Chromium was detected above the Soluble Threshold Limit Concentration (STLC)-based screening criteria in 63 soil samples, and above the Toxicity Characteristic Leaching Procedure (TCLP)-based screening criteria in three soil samples. Nickel was detected above the STLC-based screening criteria in one soil sample. Accordingly, the laboratory analyzed the corresponding STLC and TCLP leachates for chromium and nickel. As shown in Tables 1a and 1b, all leachate results were below the hazardous waste thresholds. Accordingly, the sampling conducted supports that Site soil may be characterized as non-hazardous waste. Further, these chromium and nickel concentrations are consistent with background concentrations.

2. Soil Sampling Results Compared to ESLs

All analytes in soil were below their Soil ESLs, with the exception of five metals and two SVOCs. Specifically, arsenic, barium cobalt, nickel, vanadium, pentachlorophenol, and phenol were detected above their Tier 1 ESLs, however average concentrations were either below Tier 1 ESLs or within the range of regional background concentrations, as further discussed below.

- Arsenic was detected in each of the 60 soil samples at concentrations between 1.5 and 12 mg/kg, each above the Tier 1 ESL of 0.067 mg/kg. However, these concentrations are within the range of regional background concentrations for arsenic (Duvergé, 2011).

- Barium was detected in each of the 60 soil samples at concentrations between 120 mg/kg and 710 mg/kg, and above the Tier 1 ESL of 390 mg/kg in four of those samples. Accordingly, a 95 percent upper confidence limit (UCL) of the mean concentration of barium in Site soils was calculated using the sampling results to determine an upper-bound estimate of the actual average barium concentration in Site soils. The 95 percent UCL was calculated to be 268 mg/kg, below the Tier 1 ESL of 390 mg/kg.

- Cobalt was detected in all 60 soil samples at concentrations between 10 and 31 mg/kg, and above the Tier 1 ESL of 23 mg/kg in four of these samples. The 95 percent UCL of the mean concentration of cobalt in Site soils was calculated to be 16.2 mg/kg, below the Tier 1 ESL of 23 mg/kg.

- Nickel was detected in each of the 60 soil samples at concentrations between 52 and 240 mg/kg, and above the Tier 1 ESL of 86 mg/kg in 29 of these samples. However, these concentrations are within the range of regional background concentrations for Nickel (Kearney, 1996).

- Vanadium was detected in each of the 60 soil samples at concentrations between 50 and 160 mg/kg, each above the Tier 1 ESL of 18 mg/kg. However, these concentrations are within the range of regional background concentrations for vanadium (Kearney, 1996).

- Pentachlorophenol was detected in one of the 60 soil samples at a concentration of 0.017 J (indicating an estimated concentration below the laboratory practical quantification limit but above the laboratory method detection limit) mg/kg, above the Tier 1 ESL of 0.013 mg/kg. Because there was only one detection, the 95 UCL of the mean concentration could not be calculated. Instead, the arithmetic mean of pentachlorophenol sampling results in soil was calculated, using half the MDL for non-detect results. The mean pentachlorophenol concentration was calculated to be 0.0096 mg/kg, below the Tier 1 ESL of 0.013 mg/kg.

- Phenol was detected in 11 soil samples at concentrations between 0.031 J and 0.38 mg/kg, and above the Tier 1 ESL of 0.16 mg/kg in one of these samples. The 95 percent UCL of the mean concentration of phenol in Site soils was calculated to be 0.0416 mg/kg, below the Tier 1 ESL of 0.16 mg/kg.

The 95 percent UCLs referenced herein were calculated using the United States Environmental Protection Agency (USEPA) statistical tool ProUCL version 5.1. The proUCL output is included as Appendix D.

Additional analytes were detected, but did not exceed their respective screening levels. It is noted that while all pesticide concentrations were below their residential ESLs, there were sporadic soil sample exceedances of Tier 1 Soil ESLs for chlordane, DDD, and DDT, for which the Tier 1 Soil ESLs are based on a terrestrial habitat endpoint, and of dieldrin, for which the Tier 1 Soil ESL is based on a leaching to groundwater endpoint.

B. Groundwater Sampling Results

Groundwater sampling results were compared to the RWQCB Tier 1 Groundwater ESLs and the Groundwater Vapor Intrusion Human Health Risk Screening Levels for Residential and Commercial/Industrial exposure scenarios (Groundwater VI ESLs).

As shown in Tables 2a and 2b, chloroform, 1,2-dichloroethane (1,2-DCA), PCE, TCE, and TPH-diesel (TPH-d) were detected above ESLs. Chloroform was detected above the Groundwater VI ESL in three samples, at concentrations of 0.91, 1.2, and 2.4 µg/L. 1,2-DCA was detected above the Groundwater VI ESL in one sample at a concentration of 2.9 µg/L. PCE was detected above the Groundwater VI ESL in ten samples at concentrations between 0.85 and 5.7 µg/L. TCE was detected above the Groundwater VI ESLs in 23 samples, at concentrations between 1.4 and 39 µg/L. TPH-d was detected above its Tier 1 Groundwater ESL, which is based on an odor nuisance endpoint. There is no Groundwater VI ESL for TPH-d.

Groundwater sampling results are presented in Tables 2a and 2b.

C. Soil Vapor Sampling Results

Soil vapor sampling results were compared to the RWQCB Tier 1 Subslab/Soil Gas ESLs and the Subslab/Soil Gas Vapor Intrusion Human Health Risk Screening Levels for Residential and Commercial/Industrial exposure scenarios (Subslab/Soil Gas VI ESLs). As shown in Tables 3a and 3b, VOCs were detected above one or more of these screening levels at all locations. In particular, PCE was detected above Subslab/Soil Gas VI ESLs in 36 samples at concentrations between 19 and 13,000 µg/m^3, and TCE was detected above Subslab/Soil Gas VI ESLs in 37 samples at concentrations between 16 and 5,100 µg/m^3. Other chlorinated VOCs including chloroform, 1,1-dichloroethane (1,1-DCA), 1,2-dichloroethane (1,2-DCA) and vinyl chloride were also detected above their respective screening levels, though at relatively low concentrations compared to the detected concentrations of PCE and TCE at the Site.

Soil vapor sampling results are presented in Tables 3a and 3b.

V. Discussion of Results

As previously summarized, the Site is located to the north and downgradient of the HP and E/M Lubricant plume, of which the primary contaminants are chlorinated hydrocarbons, including TCE and PCE, and to the east and cross-gradient of the MEW plume, of which the primary

contaminants are chlorinated hydrocarbons, including TCE. The objectives of this investigation were to 1) evaluate the potential for upgradient or off-Site sources to be contributing to VOC and/or TPH contamination on-Site, 2) evaluate on-Site VOC concentrations in consideration of planned redevelopment and residential Site use, and 3) characterize Site soil in the context of off-haul and disposal requirements. The results from this investigation were evaluated in the context of these objectives, as well as in the context of the HP and E/M Lubricant plume and the MEW plume.

A. Evaluation of Upgradient or Off-Site Sources

The results of this subsurface investigation indicate that the HP and E/M Lubricant plume is present on the Site, based on the detections of TCE and PCE in groundwater at sampling locations within and near the extent of this plume as previously delineated by the PRPs, as shown on Figures 3b, and 4. Additionally, results indicate that the MEW plume is likely encroaching onto the western edge of the Site. In particular, the highest concentrations of TCE in both groundwater and soil vapor detected at the West Middlefield Park properties were detected at the sampling locations along the western edge of the Site, as shown on Figure 3a. These detections appear to be a result of the MEW plume.

B. Evaluation of VOC Concentrations in Consideration of Redevelopment

Based on the results of this investigation, the Site appears suitable for future residential use. As discussed in Section IV.A, concentrations in soil were either below Residential Direct Contact ESLs or within the range of regional background concentrations. Based on the detections of VOCs in on-Site soil vapor above Residential Subslab/Soil Vapor VI ESLs, the presence of the HP and E/M Lubricant plume in groundwater at the Site, and the presence of the off-Site MEW plume encroaching onto the western edge of the Site, future buildings at the Site could be designed and constructed with appropriate vapor intrusion controls, as needed, in consideration of the planned future Site use.

C. Characterization of Soil for Off-Haul and Disposal

A total of 60 soil samples were collected and analyzed for an analytical suite typically used to evaluate offhaul and disposal considerations. Fifty of these samples were collected from shallow soils, while seven were collected from approximately 10 ft bgs and three were collected from approximately 20 ft bgs, to characterize deeper soils which may be excavated in order to construct future on-Site buildings. As noted in Section IV.A, all samples were below hazardous waste screening criteria, supporting that on-Site soils may be characterized as non-hazardous waste for disposal purposes, and would likely be acceptable for disposal at most landfills accepting non-hazardous waste (e.g., Class II or Class III landfills).

Soils were also evaluated against Soil ESLs to evaluate whether they may be acceptable for disposal and reuse at receiving facilities utilizing similar acceptance criteria (e.g., other

redevelopment projects). Five metals and one SVOC were detected above their Tier 1 Soil ESLs. However, as discussed above, average concentrations were either below Tier 1 ESLs or within the range of background concentrations reported for the region. Pesticides were below their residential ESLs, however chlordane, DDD, DDT, and dieldrin were each detected in one or more shallow soil samples at concentrations above their respective Tier 1 Soil ESLs. Of note, pesticides in the deeper samples, collected at approximately 10 and 20 ft bgs, were all below Tier 1 Soil ESLs. Accordingly, these results support that shallow on-Site soil may be acceptable from an environmental standpoint for on-Site re-use or disposal at a site with acceptance requirements based on unrestricted residential land use criteria, however it may not be acceptable at sites that use stricter acceptance criteria standards for pesticide concentrations such as criteria commonly applied to wetlands projects. Deeper soils at the Site may potentially be acceptable at sites that use stricter acceptance criteria standards for pesticide concentrations, however it may be possible that such sites would require additional characterization of Site soils at depth.

VI. CONCLUSIONS

The results of this investigation suggest that the HP and E/M Lubricant plume is present in groundwater at the Site and is impacting soil vapor at the Site, and the MEW plume is impacting the groundwater and soil vapor on the western edge of the Site. Accordingly, vapor intrusion controls could be installed on future buildings, as needed, to manage the concentrations of VOCs currently present on-Site and any potential future VOC impacts that may further migrate onto the Site. The results of this investigation support that, with the implementation of vapor intrusion controls, as needed on a property-by-property basis, the Site is suitable for residential use.

Soil sampling results also support that on-Site soils would likely be acceptable for off-haul and disposal as non-hazardous waste at most landfills accepting non-hazardous waste (e.g., Class II or Class III landfills), and may be acceptable from an environmental standpoint for on-Site re-use or disposal at a site with acceptance requirements based on unrestricted residential land use criteria.

VII. LIMITATIONS

This report has been prepared exclusively for use by Google, its successors and assignees, and may not be relied upon by any other person or entity without the express written permission of Elevate. The subsurface investigation documented herein was performed in general accordance with standard industry practices at the time of this evaluation. The conclusions presented in this report represent Elevate's professional judgment based on existing conditions and information made available during the course of this assessment. Elevate has no reason to doubt the accuracy of any of the information provided for report content.

Table 1a. Soil Sampling Results – West Middlefield Park Properties

Notes:

1. The Hazardous Waste Screening Criteria used are the TCLP- and STLC-based screening criteria and the TTLC.
2. The Soil Screening Levels are the Tier 1 Environmental Screening Levels (ESLs) for soil for all analytes except for pesticides, which use the lower of the residential direct contact ESLs for cancer risk and noncancer hazard (SFBRWQCB, July 2019).
3. A result in **bold font** indicates the analyte was detected above the laboratory reporting limit (total xylenes and total PCBs) or method detection limit (all other analyses).
4. A boxed result indicates the analytes was detected above the Soil Screening Level.
5. A yellow highlighted result indicates the analyte was detected at or above the STLC-based screening criterion.
6. A blue highlighted result indicates the analyte was detected at or above the STLC-based and TCLP-based screening criterion.
7. All results are expressed in units of milligrams per kilogram (mg/kg) except leachate metals, which are in milligrams per liter (mg/L), and asbestos, which is in percent asbestos fibers (%).

Definitions:

A: The reported value is determined using a "single point" calibration by GC-ECD as allowed by the method.
B: Contamination found in associated Method Blank.
J: Analyte was detected above laboratory method detection limit (MDL) but below laboratory reporting limit (RL). The reported value is an estimated concentration.
P: Agreement between quantitative confirmation results exceed method recommended limits.
--: No screening level
<X: Not detected above the laboratory reporting limit (total xylenes and total PCBs) or laboratory method detection limit (all other analyses) of X.
NA: Not analyzed for
ND: None detected
mg/kg: milligrams per kilogram
mg/L: milligrams per liter
TCLP: Toxicity characteristic leaching procedure
STLC: Soluble threshold limit concentration
TTLC: Total threshold limit concentration

Table 1b. Soil Sampling Results – East Middlefield Park Properties

Notes:

1. The Hazardous Waste Screening Criteria used are the TCLP- and STLC-based screening criteria and the TTLC.
2. The Soil Screening Levels are the Tier 1 Environmental Screening Levels (ESLs) for soil for all analytes except for pesticides, which use the lower of the residential direct contact ESLs for cancer risk and noncancer hazard (SFBRWQCB, July 2019).
3. A result in **bold font** indicates the analyte was detected above the laboratory reporting limit (total xyles and total PCBs) or method detection limit (all other analyses).
4. A boxed result indicates the analytes was detected above the Soil Screening Level.
5. A yellow highlighted result indicates the analyte was detected at or above the STLC-based screening criterion.
6. A blue highlighted result indicates the analyte was detected at or above the STLC-based and TCLP-based screening criterion.
7. All results are expressed in units of milligrams per kilogram (mg/kg) except leachate metals, which are in milligrams per liter (mg/L), and asbestos, which is in percent asbestos fibers (%).

Definitions:

B: Contamination found in associated Method Blank.
J: Analyte was detected above laboratory method detection limit (MDL) but below laboratory reporting limit (RL). The reported value is an estimated concentration.
P: Agreement between quantitative confirmation results exceed method recommended limits.
--: No screening level
<X: Not detected above the laboratory reporting limit (total xylenes and total PCBs) or laboratory method detection limit (all other analyses) of X.
NA: Not analyzed for
ND: None detected
mg/kg: milligrams per kilogram
mg/L: milligrams per liter
TCLP: Toxicity characteristic leaching procedure
STLC: Soluble threshold limit concentration
TTLC: Total threshold limit concentration

Table 21. Groundwater Sampling Results – West Middlefield Park Properties

Notes:

1. The Tier 1 Environmental Screening Levels (ESLs) for groundwater are from the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB), published July 25, 2019.
2. The Residential Groundwater Vapor Intrusion (VI) ESLs are the minimum of the cancer risk and non-cancer hazard residential VI human health risk ESLs from the SFBRWQCB, published July 25, 2019.
3. The Commercial/Industrial Groundwater VI ESLs are the minimum of the cancer risk and non-cancer hazard commercial/industrial VI human health risk ESLs from the SFBRWQCB, published July 25, 2019.
4. A result in **bold font** indicates the analyte was detected above the reporting limit (total xylenes) or laboratory method detection limit (all other analytes).
5. A boxed result indicates the analyte was detected at or above its Tier 1 ESL.
6. A yellow highlighted result indicates the analyte was detected at or above its Residential VI ESL.
7. A blue highlighted result indicates the analyte was detected at or above both its Residential VI ESL and its Commercial/Industrial VI ESL.
8. All results are expressed in units of micrograms per liter (µg/L).
9. No groundwater ESL is published for TPH-mo in the 2019 ESLs. TPH-mo is composed of large carbon chain compounds having negligible solubility. Organic material may contribute to TPH-mo detections.
10. Depth to groundwater recorded is the depth to first encountered groundwater at that sampling location in feet below ground surface.

Definitions:

B: Contamination found in associated Method Blank
J: Analyte was detected above laboratory method detection limit (MDL) but below laboratory reporting limit (RL). The reported value is an estimated concentration.
--: No screening level
<X: Not detected above the laboratory method detection limit of X
µg/L: micrograms per liter

Table 2b. Groundwater Sampling Results – East Middlefield Park Properties

Notes:

1. The Tier 1 Environmental Screening Levels (ESLs) for groundwater are from the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB), published July 25, 2019.
2. The Residential Groundwater Vapor Intrusion (VI) ESLs are the minimum of the cancer risk and non-cancer hazard residential VI human health risk ESLs from the SFBRWQCB, published July 25, 2019.
3. The Commercial/Industrial Groundwater VI ESLs are the minimum of the cancer risk and non-cancer hazard commercial/industrial VI human health risk ESLs from the SFBRWQCB, published July 25, 2019.
4. A result in **bold font** indicates the analyte was detected above the reporting limit (total xylenes) or laboratory method detection limit (all other analytes).
5. A boxed result indicates the analyte was detected at or above its Tier 1 ESL.
6. A yellow highlighted result indicates the analyte was detected at or above its Residential VI ESL.
7. A blue highlighted result indicates the analyte was detected at or above both its Residential VI ESL and its Commercial/Industrial VI ESL.
8. All results are expressed in units of micrograms per liter (µg/L).
9. No groundwater ESL is published for TPH-mo in the 2019 ESLs. TPH-mo is composed of large carbon chain compounds having negligible solubility. Organic material may contribute to TPH-mo detections.
10. Depth to groundwater recorded is the depth to first encountered groundwater at that sampling location in feet below ground surface.

Definitions:

B: Contamination found in associated Method Blank
J: Analyte was detected above laboratory method detection limit (MDL) but below laboratory reporting limit (RL). The reported value is an estimated concentration.
--: No screening level
<X: Not detected above the laboratory reporting limit (total xylenes) or laboratory method detection limit (all other analytes).
µg/L: micrograms per liter

Table 3a. Soil Vapor Sampling Results – West Middlefield Park Properties

Notes:

1. Samples were collected in 1 liter canisters with flow controllers calibrated with a flow rate of ≤200 milliliters per minute.
2. The Tier 1 Environmental Screening Levels (ESLs) for soil vapor are from the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB), published July 25, 2019.
3. The Residential Vapor Intrusion (VI) ESLs are the minimum of the cancer risk and non-cancer hazard residential vapor intrusion human health risk ESLs from the SFBRWQCB, published July 25, 2019.
4. The Commercial/Industrial VI ESLs are the minimum of the cancer risk and non-cancer hazard commercial/industrial VI human health risk ESLs from the SFBRWQCB, published July 25, 2019.
5. A result in **bold font** indicates the analyte was detected above the laboratory reporting limit.
6. A boxed result indicates the analyte was detected at or above the Tier 1 ESL.
7. A result highlighted yellow indicates the analyte was detected at or above the Residential VI ESL.
8. A result highlighted blue indicates the analyte was detected at or above the Commercial/Industrial VI ESL and the Residential VI ESL.
9. All results are in units of ($\mu g/m^3$), expect for helium, which is expressed in %.
10. All VOC results shown are for method TO-15 except for 1,2-dibromoethane (EDB) and vinyl chloride, which show results for method TO-15 SIM.
11. VOC results shown are those VOCs that were analyzed in all samples. Additional TO-15 and TO-15 SIM results for some samples can be found in the full laboratory reports.

Definitions:

--: No screening level
<X: Not detected above the laboratory reporting limit of X
E: The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).□
J3: The associated batch QC was outside the established quality control range for precision
J4: The associated batch QC was outside the established quality control range for accuracy
$\mu g/m^3$: Micrograms per cubic meter
ft bgs: feet below ground surface

Table 3b. Soil Vapor Sampling Results – East Middlefield Park Properties

Notes:
1. Samples were collected in 6 liter canisters with flow controllers calibrated with a flow rate of ≤200 milliliters per minute.
2. The Tier 1 Environmental Screening Levels (ESLs) for soil vapor are from the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB), published July 25, 2019.
3. The Residential Vapor Intrusion (VI) ESLs are the minimum of the cancer risk and non-cancer hazard residential vapor intrusion human health risk ESLs from the SFBRWQCB, published July 25, 2019.
4. The Commercial/Industrial VI ESLs are the minimum of the cancer risk and non-cancer hazard commercial/industrial VI human health risk ESLs from the SFBRWQCB, published July 25, 2019.
5. Chemicals with results in **bold** font were detected above their respective laboratory method detection limits.
6. A boxed result indicates the analyte was detected above the Tier 1 ESL.
7. A result highlighted yellow indicates the analyte was detected at or above the Residential VI ESL.
8. A result highlighted blue indicates the analyte was detected at or above the Residential and Commercial/Industrial VI ESLs.
9. All results are in units of (µg/m3), expect for helium, which is expressed in %.

Definitions:
--: No screening level
J: Estimated value.
E: Exceeds instrument calibration range.
ND, UJ: Non-detected compound associated with low bias in the CCV
J0: Estimated value due to bias in the CCV.
<X: Analyte was not detected at or above the laboratory method detection limit. X is the laboratory reporting limit. Method detection limits for non-detect results are available in the full laboratory report.
$\mu g/m^3$: Micrograms per cubic meter
ft bgs: Feet below ground surface

Re: Sampling and Analysis Plan for Limited Phase II Subsurface Investigation, 500 East Middlefield Road and 401 Ellis Street, Mountain View, California 94043

Dear Hannah:

This sampling and analysis plan (SAP) has been prepared by Elevate Environmental Consultants Inc. (Elevate) on behalf of Google LLC (Google) for a proposed Limited Phase II Subsurface Investigation at the 500 East Middlefield Road and 401 Ellis Street property in Mountain View, California (the Site). This Limited Phase II is proposed to conduct further characterization of the subsurface. This letter presents an overview of investigation scope. In addition, Appendix A presents details regarding the field procedures that will be implemented.

Site Setting

The Site covers an area of approximately 10.85 acres, and is identified as Assessor's Parcel Numbers (APN) 160-58-016 and 160-58-017. The Site consists of two buildings (500 East Middlefield Road and 401 Ellis Street) of 101,725 and 136,694 square feet respectively, surrounding parking, and landscaping.

The Site is located in an urban setting and surrounded by light industrial and commercial office development, dominated by corporate office parks. Historical information suggests that the on-Site buildings were built in 1997, and prior to the construction of the existing buildings, two commercial office buildings occupied the Site from the 1960s to 1990s. Prior to the 1960's, the majority of the Site was used for agricultural purposes, with the southern fourth of the Site lying vacant through the 1940s before also becoming cultivated.

The Site is located directly adjacent and cross-gradient (east) of the Middlefield-Ellis-Whisman (MEW) Superfund plume (MEW plume), which is impacted by volatile organic compounds

(VOC), primarily trichloroethene (TCE). Several National Priority List (NPL) sites are located within one-mile of the Site which have contributed to the MEW plume. The plume has been delineated by the potentially responsible parties (PRPs) to the MEW plume as extending just to the west of the Site, near Ellis Street.

The purpose of this investigation is to evaluate whether the Site is impacted by subsurface VOC or total petroleum hydrocarbon (TPH) contamination, and to further characterize subsurface VOC concentrations. This investigation further intends to characterize Site soils for potential future off-haul.

Sampling Locations and Rationale

Groundwater samples will be collected from ten locations, and soil and soil vapor samples will be collected from 12 locations at the Site, as shown on Figure 1. All locations are exterior to existing buildings on-Site. Soil and soil vapor locations have been placed to roughly coincide with future building footprints, with four samples within each footprint of the three future building blocks. Groundwater sample locations have been placed to evaluate upgradient and downgradient conditions at the Site, and to characterize the extent to which VOC and/or TPH impacts might extend onto the Site.

A summary of the sampling locations, sampling depths, analytic methods, and sampling rationale for each location are provided in the attached Table 1. Additional detail pertaining to the purpose of sampling, sample placement, and sample frequency is provided below.

Site Walk and Utility Locating

A Site walk and utility locating with a private utility locator will be conducted prior to sampling. Proposed sample locations will be evaluated for accessibility and screened for the presence of underground utilities within a ten-foot radius. If the proposed location is inaccessible, or a utility conflict is identified, the location will be moved the minimum distance necessary to avoid these conflicts.

Groundwater

At all ten groundwater sample locations, a boring will be drilled to collect one grab groundwater sample from the first encountered groundwater at each drilling location, anticipated to be at approximately ten to 15 feet below ground surface (ft bgs), for a total of ten groundwater samples. The samples along the southern and western perimeter of the Site are intended to assist in evaluating the extent of potential groundwater impacts migrating onto the Site, and the samples from the interior of the Site are intended to assist in evaluating the extent of on-Site contamination.

Soil Vapor

At 12 locations, soil vapor samples will be collected for the purpose of evaluating the nature and extent of any potential VOC impacts from off-Site plume migration. Samples of soil vapor at the 12 sampling locations will be collected from two depths: five ft bgs and at the capillary fringe (anticipated to be approximately eight to ten ft bgs), for a total of 24 soil vapor samples. Results of soil vapor sampling will be evaluated in the context of the potential for subsurface conditions to contribute to vapor intrusion.

Soil

At the same 12 locations where soil vapor samples are collected, soil samples will be collected from one depth per location at a depth between two and five feet bgs. At one location per future building block, one deeper soil sample will be collected at a depth of approximately 20 feet bgs to characterize soils near the full depth of future excavations for redevelopment, for a total of 15 soil samples. Shallow soil samples for VOCs will be used to assess the suitability of the Site for residential or commercial land use in the context of the regional contamination. Other soil samples will be used to support characterization of soils for offhaul.

Sampling Methodologies

The sampling methodologies that will be used to collect the groundwater, soil vapor, and soil samples are summarized below. Additional details are provided in Appendix A.

Grab Groundwater Sampling

A drilling subcontractor and direct-push drill rig will be used to collect subsurface groundwater samples for laboratory analysis. At each groundwater sampling location, one groundwater shallow-zone grab sample will be collected from first encountered groundwater, anticipated to be approximately ten to 15 ft bgs. Once sampling is completed the boring will be sealed to grade using neat cement grout tremied from the bottom of the boring.

Soil Vapor Sampling

At each soil vapor sampling location, a boring will be advanced using direct push drilling methods, such as Geoprobe®, at the specified depths for construction of a temporary soil gas probe. At 12 locations, two nested temporary soil gas probes will be designed, installed, purged, and sampled in accordance with the *Advisory - Active Soil Gas Investigations* (Soil Gas Advisory; Cal/EPA, 2015). Samples will be collected using Summa canisters and standard helium shroud leak-check procedures after an appropriate equilibration period. Once sampling is completed, the borings will be decommissioned in accordance with local regulations.

Soil Sampling

A drilling subcontractor and direct-push drill rig will be used to collect subsurface soil samples for laboratory analysis. At each soil sampling location, soil samples for VOCs will be collected via EPA Method 5035 at the specified depths. Once sampling is completed the borings will be sealed to grade using neat cement grout trimmed from the bottom of the boring.

Laboratory Analysis

Groundwater, soil vapor, and soil samples will be submitted under chain of custody protocol to a State-certified analytical laboratory. The analyses for groundwater, soil vapor, and soil samples that will be requested from the laboratory are summarized in Table 1 and listed in Appendix A.

All samples will be analyzed for VOCs, which include TCE and other chlorinated VOCs. Groundwater samples will additionally be analyzed for TPHs. Soil vapor samples will be analyzed for VOCs and the leak check compound, helium. To support characterization the soil for off-haul considerations, soil samples will be additionally analyzed for semi-volatile organic compounds (SVOCs) including polycyclic aromatic hydrocarbons (PAHs), TPH-g/d/mo, polychlorinated biphenyls (PCBs), pesticides, California Title 22 metals, and asbestos per the DTSC Clean Imported Fill Material guidance for a fill source area, as well as moisture. Based on the results of the sampling, leachability tests (e.g., WET and TCLP) will be run, as necessary, to evaluate whether the soil may be considered non-hazardous.

Reporting

Following implementation of the subsurface investigation as outlined herein, a sampling and analysis report (SAR) will be developed to document the results of sampling, and evaluate the extent of on-Site subsurface contamination compared to applicable risk-based screening levels.

Sincerely,

Elevate Environmental Consultants Inc.

John McLaughlin, P.E.,
President

1.0 Introduction

The purpose of this document is to detail the field sampling procedures which will be employed as part of the Limited Phase II Subsurface Investigation for 500 East Middlefield Road and 401 Ellis Street in Mountain View, California (the Site). This Limited Phase II is proposed to evaluate the nature and extent of subsurface contamination at the Site and the potential for future vapor intrusion. Sample collection will be performed by Elevate Environmental Consultants Inc. (Elevate). This appendix includes the following:

- Pre-Sampling Activities (Section 2.0);
- Soil Vapor Sampling (Section 3.0);
- Soil Sampling (Section 4.0);
- Groundwater Sampling (Section 5.0);
- Decontamination (Section 6.0)
- Investigation Derived Waste (Section 7.0);
- Laboratory Analysis (Section 8.0);
- Recordkeeping (Section 10.0); and
- References (Section 11.0).

Procedures for implementing these activities are detailed herein.

2.0 Pre-sampling Activities

The following pre-fieldwork activities will be conducted by Elevate, prior to mobilizing to the Site to conduct the subsurface investigation:

- Contract and coordinate with subcontractors, as necessary: utility locator, direct push driller, concrete corer, analytical laboratory, shipping for badge and soil vapor samples, and investigation derived waste (IDW) hauler.
- Coordinate with Google to ensure access is authorized prior to on-Site activities.
- Prepare a Site-specific Health and Safety Plan (HASP).
- Conduct a pre-sampling Site visit to select and mark proposed boring locations with consideration to drill rig access issues in selecting exact locations.
- Visit the Site with a utility locating subcontractor to clear proposed boring locations with respect to subsurface utilities, and mark proposed boring locations in white paint for Underground Services Alert (USA). USA will be notified at least 48 hours prior to conducting intrusive fieldwork.

3.0 Soil Vapor Sampling

At the 12 locations shown on Figure 1, temporary soil vapor probes will be installed by Elevate for the purposes of collecting 12 dual-depth soil vapor samples. The following field activities

will be conducted for the installation of these probes and the collection of these samples:

- At each soil vapor sampling location, a temporary nest soil gas probe will be designed, installed, purged, and sampled in accordance with the *Advisory - Active Soil Gas Investigations* (Soil Gas Advisory; Cal/EPA, 2015).
- The borehole will be advanced to the capillary fringe (anticipated to be approximately eight to ten feet below ground surface [bgs]) by a C-57 licensed drilling subcontractor using direct-push drilling technology, under the oversight of Elevate.
- For the deep probe, sand will be emplaced from the bottom of the capillary fringe to six inches above to create a six-inch sand layer at the bottom of the borehole.
- A one-inch diameter PVC pipe will be temporarily lowered to the bottom of the borehole to provide a means of keeping the probe tip and sample line centered in the borehole.
- A new stainless steel probe tip will be connected to a new quarter–inch outer diameter thick-walled 100% Teflon (FEP or PTFE) tubing. The sampling line will be lowered to the bottom of the borehole, inside the temporary pipe, so that the probe tip is sitting on top of the six-inch sand layer and is centered within the borehole. The sampling line will be cut to length leaving approximately two feet of line extending from the ground surface. A protective cap will be placed on the end of the sampling line.
- Another six-inch layer of sand will be emplaced in the borehole while incrementally withdrawing the temporary pipe, to create a 12-inch deep sand pack with the probe tip at the center.
- A 12-inch layer of dry bentonite will be emplaced in the borehole while incrementally withdrawing the temporary pipe.
- Hydrated bentonite will be emplaced in the borehole while incrementally withdrawing the temporary pipe. The bentonite will be hydrated in a container at the surface, and then slowly poured into the borehole.
- For the second, shallow probe, hydrated bentonite will be emplaced in the borehole up to five feet below ground surface (ft bgs). A six-inch layer of sand will be emplaced in the borehole, and a new stainless steel probe tip will be lowered down to the top of the sand, using a PVC pipe as described above. Another six-inch layer of sand will be emplaced on top of the probe tip, creating a 12-inch deep sand pack with the probe tip at the center. A 12-inch layer of dry bentonite will be emplaced in the borehole while incrementally withdrawing the pipe.
- The temporary probe will be completed by emplacing hydrated bentonite to the ground surface.
- Probe construction details will be recorded in field notes, including time of completion. The probe volume will be calculated as the sum of the sand pack pore volume, dry bentonite pore volume, and sample line internal volume.
- The probe will be allowed to equilibrate for a minimum of two hours if the boring is advanced by direct-push method, and a minimum of 48 hours if the boring is advanced by hand auger.
- In accordance with the Soil Gas Advisory, samples should not be collected during a significant rain event or within five days of a significant rain event (defined as 0.5 inches

or more of rainfall in a 24-hour period) (Soil Gas Advisory; Cal/EPA, 2015).

- After the soil gas probe has equilibrated, the sampling train apparatus will be assembled. Valves to the down-hole probe and sample canister will be closed to isolate or "shut-in" the sampling train components and fittings. A minimum vacuum of 100 inches water (7.4 inches mercury) will be applied to the closed system using a purge pump. The system pressure will be monitored for at least one minute with a vacuum gauge sensitive enough to indicate a pressure drop of 0.5 inches water. If there is any observable loss of vacuum, the fittings will be adjusted until the vacuum in the sample train does not noticeably dissipate. After a successful shut-in test, the sampling train will not be altered.
- Following the shut-in test, the soil gas probe will be purged and sampled under leak detection protocol, in accordance with the Soil Gas Advisory (Soil Gas Advisory; Cal/EPA, 2015).
- Each soil gas probe will be purged of a minimum of three probe volumes while under leak detection protocol (see above). The flow rate during purging will be limited to a maximum of 150 to 200 milliliters per minute (mL/min). The probe will be purged manually with a syringe (e.g., three 60-milliliter syringe pulls per minute). The helium concentration in the purge vapor will be observed using a real-time helium detector.
- After the probe is purged, a soil gas sample will be collected into a laboratory cleaned and certified, silicon lined, stainless steel 1-liter Summa canister. The flow rate during sampling will be limited to a maximum of 150 to 200 mL/min by a laboratory-calibrated, cleaned, and certified flow controller.
- Soil gas samples will be labeled and transported under chain-of-custody protocol.

4.0 Soil Sampling

At each of the sampling locations, a discrete soil sample will be collected by Elevate from depths between approximately two to five ft bgs. Elevate will oversee the advancement of these soil borings by the driller using direct-push technology. Each sample will be collected in a six-inch sleeve cut from the acetate-lined soil core, capped with Teflon tape, and fitted with plastic end caps (direct push). Alternatively, soil may be transferred from the sampler into a laboratory-provided 16-ounce glass jar. The soil samples collected from these locations will be labeled and stored in an iced cooler for transport under chain-of-custody protocol to the laboratory. Additionally at one location per each of the three proposed building blocks, one boring will be advanced to approximately 20 feet bgs to characterize soils near the full depth of future excavations for redevelopment. Samples will be analyzed for a complete analytical scope anticipated to be necessary to evaluate Site soils for future offhaul.

Each of the soil samples will be collected into two separate containers:

- Soil collected for non-volatiles analyses will be collected in a 6-inch sleeve cut from the acetate-lined soil core, capped with Teflon tape, and fitted with plastic end caps (direct push). Alternatively, soil may be transferred from the sampler into a laboratory-provided

16-ounce glass jar.
- Soil collected for volatiles analyses will be collected using an Encore or Terracore sampler in accordance with US EPA Method 5035 to minimize loss of volatiles during sample collection and handling.

These soil samples will be labeled and stored in an iced cooler for transport under chain-of-custody protocol.

5.0 Groundwater Sampling

Ten shallow-zone grab groundwater samples will be collected by Elevate from the Site at the locations shown on Figure 1. The following field activities will be conducted for the collection of these samples:

- Each groundwater boring will be advanced using direct-push drilling technology by a C-57 licensed drilling subcontractor, under the oversight of Elevate. A boring will be drilled to collect a groundwater shallow-zone grab sample from first encountered groundwater (anticipated to be approximately 10 to 15 ft bgs).
- The first encountered groundwater depth will be recorded, and the water level will be observed for any rapid changes associated with confining conditions.
- The boring will then be advanced to a depth of approximately five feet below the water table for collection of the shallow zone sample.
- A grab groundwater sample from the shallow zone will be collected from the open borehole using an inertial pump, peristaltic pump, or bailer as follows:
    - The inner core barrel will be retracted, and a 1-inch diameter temporary PVC casing with a 5-foot or 10-foot interval of 0.010-inch slots will be lowered through the outer drill pipe to the bottom of the borehole.
    - The borehole will be permitted to stabilize for approximately 15 minutes prior to sampling; the boring will not be purged and no field parameters will be measured.
    - An oil/water interface probe will be used to measure the depth to groundwater and evaluate for the presence of free product.
    - A grab groundwater sample will be collected using an inertial pump, peristaltic pump, or bailer. New polyethylene tubing will be lowered down the temporary PVC casing to within the screened interval for sampling by inertial pump, or a new disposable bailer for sampling by bailer. Sample containers will be filled directly from the polyethylene tubing or bailer.
- The depths and length of the temporary PVC casing and/or screen can be adjusted to reflect the encountered depth to groundwater. In general, the objective is to have the perforated well screen straddle the groundwater interface.
- Following sample collection, the boring will be grouted to the surface with neat cement grout.
- Groundwater samples will be labeled and stored in an iced cooler for transport under chain-of-custody protocol.

6.0 Decontamination

All downhole sampling equipment will be decontaminated between borings drilled for all soil vapor, soil, and groundwater, and sampling. Decontamination procedures at a minimum should consist of a wash with Alconox® or equivalent detergent, followed by a double rinse with clean water or steam-cleaning.

For groundwater sampling, new disposable bailers or polyethylene tubing should be used for each sample, or if a stainless steel bailer is to be used, it should be decontaminated as described above.

For soil vapor sampling, a new vapor probe and new 100% Teflon tubing should be used for each soil vapor well.

7.0 Investigation Derived Waste

Waste derived from sampling activities (soil cuttings, decon and purge water, piping from grab groundwater sampling, etc.) will be contained within 55-gallon drums and sampled by Elevate for waste characterization prior to disposal. One soil sample and one water sample will be collected. Following review of the sample results, the drums will be disposed of off-Site by Elevate at an appropriate waste disposal facility. It is the understanding of Elevate that the landowner (e.g. Google) will be listed as the generator of these investigation derived wastes (IDW) for the purposes of proper off-Site disposal.

8.0 Laboratory Analysis

Soil vapor, soil, groundwater, and IDW samples will be submitted by Elevate to the laboratory under chain of custody protocol on a standard turnaround time. The following analyses for each sample media will be requested of the laboratory, and a target analyte list is provided in the following section.

Soil Vapor

All soil vapor samples will be analyzed for VOCs by EPA Method TO-15 hi/lo and helium.

Soil

All soil samples will be analyzed for the following (and based on the results of the sampling, leachability tests (e.g., WET and TCLP) will be run, as necessary, to evaluate whether the soil may be considered non-hazardous):

- VOCs by 8260B
- SVOCs by 8270C

- TPH-gasoline/diesel/motor oil by 8015M
- PAHs by 8270C-SIM
- PCBs by 8082
- Pesticides by 8081
- Title 22 metals by 6010B/7470
- Moisture
- Asbestos by CARB 435
- WET extraction
- STLC metals

Groundwater

All groundwater samples will be analyzed for the following:

- VOCs by EPA Method 8260B.
- TPH-gasoline/diesel/motor oil by 8015M

Investigation Derived Waste

One IDW soil sample will be analyzed for the following: TPH-gasoline by 8015B, TPH-diesel/motor oil by 8015M, VOCs by 8260B, SVOCs by 8270C, PAHs by 8270C-SIM, PCBs by 8082, Pesticides by 8081, Title 22 metals by 6010B/7470A, Asbestos by CARB 435, Moisture by CLP, WET extraction, and STLC metals.

Additionally, one IDW water sample will be analyzed for all of the following: TPH-gasoline by 8015B, TPH-diesel/motor oil by 8015M, VOCs by 8260B, SVOCs by 8270C, PAHs by 8270C-SIM, PCBs by 8082, Pesticides by 8081, and Title 22 metals by 6010B/7470A.

9.0 Recordkeeping

Field notes will be taken by Elevate to document all events, equipment used, and samples collected during the field activities. The notes should include on-Site conditions, including:

- Figures marked with sampling locations;
- Problems encountered and any deviations made from the established monitoring/sampling protocol.

Additional information which may be included in field notes, as necessary and applicable, includes:

- Names, addresses and phone numbers of the field contact (inside logbook cover) including the Site Safety Manager and the Elevate Project Manager and/or Project Engineer;

- Time of site arrival and departure;
- Names, affiliations, and responsibilities of personnel on the Site;
- Summary of important meetings or discussions with federal, state, or local regulatory agencies;
- General description of each day's field activities;
- Sample location descriptions;
- Site sketch showing sample;
- Photograph information;
- Observations of sample collection environment (e.g., ambient odor);
- Identification of monitoring/sampling device, including equipment model and serial number;
- Equipment calibration data;
- Field sample identification number;
- Type of sample matrix (e.g., soil);
- Date and time of sample collection;
- Sampler's name;
- Sample type (e.g., grab, duplicate);
- All associations between and identification numbers of environmental samples, duplicates, and equipment blanks;
- Preliminary sample descriptions (e.g., non-native source material such as petroleum-based product observed in soil);
- Shipping arrangements (e.g., tracking number for overnight courier service);
- Recipient laboratories;
- Levels of safety protection worn by field personnel;
- Deviations from these procedures; and
- Changes in personnel and responsibilities, along with reasons for the changes.

Table 1. Summary of Proposed Sampling and Analysis Program

Location	Sample ID	Depth (ft bgs)	Matrix	Laboratory Analyses										Sampling Rationale
				VOCs	TPH	SVOCs	PAHs	PCBs	Pesticides	Asbestos	Metals	Helium	Moisture	

Notes:
(1) "X" indicates sample to be run for indicate chemical analysis.
(2) "VOCs" indicates volatile organic compounds by USEPA Method 8260B for soil, and groundwater, and USEPA TO-15 Full-scan for soil vapor samples.
(3) "TPH" indicates total petroleum hydrocarbons including:
TPH-g – gasoline range organics (GRO) by USEPA method 8015M;
TPH-d – diesel range organics (DRO) by USEPA method 8015M; and
TPH-mo – motor oil range organics (ORO) by USEPA method 8015M.
(4) "SVOCs" indicates semi-volatile organic compounds by USEPA method 8270C.
(5) "PCBs" indicates polychlorinated biphenyls by USEPA method 8082.
(6) "PAH's" indicates polycyclic aromatic hydrocarbons by USEPA method 8270C-SIM
(7) "Pesticides" indicates organochlorine pesticides by USEPA method 8081.
(8) "Asbestos" indicates asbestos by CARB 435.
(9) "Metals" indicates Title 22 Metals by USEPA method 6010B/7470.
(10) "Helium" indicates helium by USEPA method 3C.
(11) "Moisture" will be analyzed by CLP
(12) Grab groundwater samples to be collected from first encountered groundwater, anticipated at a depth of approximately 10-15 ft bgs.
(13) Soil vapor sample to be collected at the capillary fringe (CF), anticipated at a depth of approximately 8-10 ft bgs.
(14) Soil vapor sample to be collected at 5 ft bgs.
(15) Soil sample to be collected between 2 and 5 ft bgs.
(16) Soil samples at three locations, one deeper soil sample per building block will be collected to characterize soils near the full depth of future excavations for redevelopment.
□

Re: Sampling and Analysis Plan for Limited Phase II Subsurface Investigation, East Middlefield Park, Mountain View, California 94043

Dear Hannah:

This sampling and analysis plan (SAP) has been prepared by Elevate Environmental Consultants Inc. (Elevate) on behalf of Google LLC (Google) for a proposed Limited Phase II Subsurface Investigation at the property comprised of 405, 420, 433, 440, 450, 485, 489, 500, 506, 510, 516, 520, and 526 Clyde Avenue; 440, 441, 500, 510, 520, and 530 Logue Avenue; and 800, 830, 840, 850, 880, 885, 889, and 891 Maude Avenue in Mountain View, California, collectively referred to herein as the Eastern portion of the Middlefield Park Site or East Middlefield Park (the Site). This Limited Phase II is proposed to conduct further characterization of the subsurface. This letter presents an overview of investigation scope. In addition, Appendix A presents details regarding the field procedures that will be implemented.

Site Setting

The Site covers an area of approximately 30 acres and is identified as Assessor's Parcel Numbers (APN) 160-57-004, -006, -007, -008, -009, -010, -011, -012, -013, -016; 160-58-001; and 16-59-005, -006. The Site consists of 27 addresses, across 22 buildings, within 13 APNs. All of the buildings are surrounded by parking and landscaping.

The Site is located in an urban setting and surrounded by light industrial and commercial office development, dominated by corporate office parks. Historical information suggests that the on-Site buildings were built from the 1960s through the 1990s, and prior to the construction of the existing commercial office buildings, previous light industrial and commercial office buildings had occupied some parcels since the 1940s. Prior to the construction of buildings and Site development, the Site's parcels were used for agricultural purposes.

Portions of the Site are located directly within the estimated extent of the commingled Hewlett Packard (HP) and E/M Lubricant groundwater plume (the HP and E/M Lubricant plume), which is impacted by volatile organic compounds (VOC), primarily trichloroethene (TCE) and tetrachloroethene (PCE). Sources to the HP and E/M Lubricant plume are located to the south and upgradient of the Site. The plume has been delineated by the potentially responsible parties (PRPs) as primarily extending through the center of the Site, south to north, just to the west of Clyde Avenue.

The Site is also located just east and cross-gradient of the Middlefield-Ellis-Whisman (MEW) Superfund plume (MEW), which is impacted by VOCs, primarily TCE. Several National Priority List (NPL) sites are located within one-mile of the Site which have contributed to the MEW plume. The plume has been delineated by the potentially responsible parties (PRPs) to the MEW plume as extending to the west of the Site, near Ellis Street.

The purpose of this investigation is to evaluate whether the Site is impacted by subsurface VOC or total petroleum hydrocarbons (TPH) contamination, and to further characterize subsurface VOC concentrations. This investigation further intends to characterize Site soils for potential future off-haul.

Sampling Locations and Rationale

Groundwater samples will be collected from 30 locations, soil samples from 42 locations, and soil vapor samples from 32 locations at the Site, as shown on Figure 1. All locations are exterior to existing buildings on-Site. Soil and soil vapor sampling locations have been placed to roughly coincide with future building footprints, with approximately four samples within each footprint of the eight future building blocks. Groundwater sampling locations have been placed to evaluate conditions throughout the Site, and to characterize the extent to which VOC and/or TPH impacts might extend beyond the previously delineated plumes.

A summary of the sampling locations, sampling depths, analytic methods, and sampling rationale for each location are provided in the attached Table 1. Additional detail pertaining to the purpose of sampling, sample placement, and sample frequency is provided below.

Site Walk and Utility Locating

A Site walk and utility locating with a private utility locator will be conducted prior to sampling. Proposed sample locations will be evaluated for accessibility and screened for the presence of underground utilities within a ten-foot radius. If the proposed location is inaccessible, or a utility conflict is identified, the location will be moved the minimum distance necessary to avoid these conflicts.

Groundwater

At all 30 groundwater sample locations, a boring will be drilled to collect one grab groundwater sample from the first encountered groundwater at each drilling location, anticipated to be at approximately ten to 15 feet below ground surface (ft bgs), for a total of 30 groundwater samples. The samples located throughout the Site are intended to assist in evaluating the extent of potential groundwater impacts migrating beyond the delineated plumes' boundaries, as well as the extent of on-Site contamination.

Soil Vapor

At 32 locations, soil vapor samples will be collected for the purpose of evaluating the nature and extent of any potential VOC impacts from the plumes. Samples of soil vapor at the 32 sampling locations will be collected from two depths: five ft bgs and at the capillary fringe (anticipated to be approximately eight to ten ft bgs), for a total of 64 soil vapor samples. Results of soil vapor sampling will be evaluated in the context of the potential for subsurface conditions to contribute to vapor intrusion.

Soil

At 42 locations, soil samples will be collected from one depth per location at a depth between two and five feet bgs. At one location within the seven future building blocks with planned basements, one deeper soil sample will be collected at a depth of the planned basement (approximately 10 feet bgs) to characterize soils near the full depth of future excavations for redevelopment, for a total of 49 soil samples. Shallow soil samples will be used to assess the suitability of the Site for residential or commercial land use in the context of the regional contamination. Other soil samples will be used to support characterization of soils for offhaul.

Sampling Methodologies

The sampling methodologies that will be used to collect the groundwater, soil vapor, and soil samples are summarized below. Additional details are provided in Appendix A.

Grab Groundwater Sampling

A drilling subcontractor and direct-push drill rig will be used to collect subsurface groundwater samples for laboratory analysis. At each groundwater sampling location, one groundwater shallow-zone grab sample will be collected from first encountered groundwater, anticipated to be approximately ten to 15 ft bgs. Once sampling is completed the boring will be sealed to grade using neat cement grout tremied from the bottom of the boring.

Soil Vapor Sampling

At each soil vapor sampling location, a boring will be advanced using direct push drilling methods, such as Geoprobe®, at the specified depths for construction of a temporary soil gas probe. At all locations, two nested temporary soil gas probes will be designed, installed, purged, and sampled in accordance with the *Advisory - Active Soil Gas Investigations* (Soil Gas Advisory; Cal/EPA, 2015). Samples will be collected using Summa canisters and standard helium shroud leak-check procedures after an appropriate equilibration period. Depending on the soil conditions encountered, some locations may not produce sufficient soil vapor to collect a sample. If sufficient soil vapor volume can not be collected from a soil vapor probe, a replacement probe may be installed at a different depth and sampling attempted again, if access and subcontractor availability allow. Once sampling is completed, the borings will be decommissioned in accordance with local regulations.

Soil Sampling

A drilling subcontractor and direct-push drill rig will be used to collect subsurface soil samples for laboratory analysis. At each soil sampling location, soil samples for VOCs will be collected via EPA Method 5035 at the specified depths. Once sampling is completed the borings will be sealed to grade using neat cement grout tremied from the bottom of the boring.

Laboratory Analysis

Groundwater, soil vapor, and soil samples will be submitted under chain of custody protocol to a State-certified analytical laboratory. The analyses for groundwater, soil vapor, and soil samples that will be requested from the laboratory are summarized in Table 1 and listed in Appendix A.

All samples will be analyzed for VOCs, which include TCE, PCE, and other chlorinated VOCs. Groundwater samples will additionally be analyzed for TPH. Soil vapor samples will be analyzed for VOCs and the leak check compound, helium. To support characterization of the soil for off-haul considerations, soil samples will be additionally analyzed for semi-volatile organic compounds (SVOCs) including polycyclic aromatic hydrocarbons (PAHs), TPH in the gasoline, diesel, and motor oil ranges (TPH-g/d/mo respectively), polychlorinated biphenyls (PCBs), pesticides, California Title 22 metals, and asbestos in accordance with the Department of Toxic Substances Control (DTSC) *Information Advisory Clean Imported Fill Material* (Cal/EPA, 2001), as well as moisture. Based on the results of the sampling, leachability tests (e.g., WET and TCLP) will be run, as necessary, to evaluate whether the soil may be considered non-hazardous.

Reporting

Following implementation of the subsurface investigation as outlined herein, a sampling and analysis report (SAR) will be developed to document the results of sampling, and evaluate the extent of on-Site subsurface contamination compared to applicable risk-based screening levels.

Sincerely,

Elevate Environmental Consultants Inc.

John McLaughlin, P.E.,
President

PROPOSED SAMPLING LOCATIONS

- GROUNDWATER
- SOIL VAPOR
- SOIL (SHALLOW)
- SOIL (DEEP)

NOTES

1. ALL LOCATIONS ARE APPROXIMATE.
2. GROUNDWATER SAMPLES WILL BE COLLECTED AT FIRST ENCOUNTERED GROUNDWATER.
3. SOIL VAPOR SAMPLES WILL BE COLLECTED AT TWO DEPTHS PER SAMPLING LOCATION WHERE POSSIBLE BASED ON GROUNDWATER DEPTH.
4. SOIL SAMPLES WILL BE COLLECTED AT A SINGLE DEPTH WHERE INDICATED, EXCEPT AT LOCATIONS WHERE 1-LEVEL OF PARKING IS PLANNED WHERE SOIL SAMPLES AT 10 FT BGS WILL ALSO BE COLLECTED. IF PLANS ARE UPDATED PRIOR TO THE IMPLEMENTATION OF SAMPLING SUCH THAT 2-LEVELS OF PARKING ARE PLANNED ANYWHERE, THEN THE SAMPLE DEPTHS MAY BE UPDATED TO COLLECT 20 FT BGS SAMPLES WHERE TWO LEVELS ARE PLANNED.

"FT BGS" = FEET BELOW GROUND SURFACE

Table 1. Summary of Proposed Sampling and Analysis Program

Location	Sample ID	Depth (ft bgs)	Matrix	Laboratory Analyses										Sampling Rationale
				VOCs	TPH	SVOCs	PAHs	PCBs	Pesticides	Asbestos	Metals	Helium	Moisture	

Notes:
(1) "X" indicates sample to be run for indicate chemical analysis.
(2) "VOCs" indicates volatile organic compounds by USEPA Method 8260B for soil, and groundwater, and USEPA TO-15 Full-scan for soil vapor samples.
(3) "TPH" indicates total petroleum hydrocarbons including:
TPH-g – gasoline range organics (GRO) by USEPA method 8015M;
TPH-d – diesel range organics (DRO) by USEPA method 8015M; and
TPH-mo – motor oil range organics (ORO) by USEPA method 8015M.
(4) "SVOCs" indicates semi-volatile organic compounds by USEPA method 8270C.
(5) "PCBs" indicates polychlorinated biphenyls by USEPA method 8082.
(6) "PAH's" indicates polycyclic aromatic hydrocarbons by USEPA method 8270C-SIM
(7) "Pesticides" indicates organochlorine pesticides by USEPA method 8081.
(8) "Asbestos" indicates asbestos by CARB 435.
(9) "Metals" indicates Title 22 Metals by USEPA method 6010B/7470.
(10) "Helium" indicates helium by USEPA method 3C.
(11) "Moisture" will be analyzed by CLP
(12) Grab groundwater samples to be collected from first encountered groundwater, anticipated at a depth of approximately 10-15 ft bgs.
(13) Soil vapor sample to be collected at the capillary fringe (CF), anticipated at a depth of approximately 8-10 ft bgs.
(14) Soil vapor sample to be collected at 5 ft bgs.
(15) Soil sample to be collected between 2 and 5 ft bgs.
(16) Soil samples at three locations, one deeper soil sample per building block will be collected to characterize soils near the full depth of future excavations for redevelopment.

1.0 Introduction

The purpose of this document is to detail the field sampling procedures which will be employed as part of the Limited Phase II Subsurface Investigation for the collection of properties referred to herein as East Middlefield Park in Mountain View, California (the Site). This Limited Phase II is proposed to evaluate the nature and extent of subsurface contamination at the Site and the potential for future vapor intrusion. Sample collection will be performed by Elevate Environmental Consultants Inc. (Elevate). This appendix includes the following:

- Pre-Sampling Activities (Section 2.0);
- Soil Vapor Sampling (Section 3.0);
- Soil Sampling (Section 4.0);
- Groundwater Sampling (Section 5.0);
- Decontamination (Section 6.0)
- Investigation Derived Waste (Section 7.0);
- Laboratory Analysis (Section 8.0);
- Recordkeeping (Section 10.0); and
- References (Section 11.0).

Procedures for implementing these activities are detailed herein.

2.0 Pre-sampling Activities

The following pre-fieldwork activities will be conducted by Elevate, prior to mobilizing to the Site to conduct the subsurface investigation:

- Contract and coordinate with subcontractors, as necessary: utility locator, direct push driller, concrete corer, analytical laboratory, shipping for badge and soil vapor samples, and investigation derived waste (IDW) hauler.
- Coordinate with Google to ensure access is authorized prior to on-Site activities.
- Prepare a Site-specific Health and Safety Plan (HASP).
- Conduct a pre-sampling Site visit to select and mark proposed boring locations with consideration to drill rig access issues in selecting exact locations.
- Visit the Site with a utility locating subcontractor to clear proposed boring locations with respect to subsurface utilities, and mark proposed boring locations in white paint for Underground Services Alert (USA). USA will be notified at least 48 hours prior to conducting intrusive fieldwork.

3.0 Soil Vapor Sampling

At each of the locations shown on Figure 1, temporary soil vapor probes will be installed by

Elevate for the purposes of collecting dual-depth soil vapor samples. The following field activities will be conducted for the installation of these probes and the collection of these samples:

- At each soil vapor sampling location, a temporary nest soil gas probe will be designed, installed, purged, and sampled in accordance with the *Advisory - Active Soil Gas Investigations* (Soil Gas Advisory; Cal/EPA, 2015).
- The borehole will be advanced to the capillary fringe (anticipated to be approximately eight to ten feet below ground surface [bgs]) by a C-57 licensed drilling subcontractor using direct-push drilling technology, under the oversight of Elevate.
- For the deep probe, sand will be emplaced from the bottom of the capillary fringe to six inches above to create a six-inch sand layer at the bottom of the borehole.
- A one-inch diameter PVC pipe will be temporarily lowered to the bottom of the borehole to provide a means of keeping the probe tip and sample line centered in the borehole.
- A new stainless steel probe tip will be connected to a new quarter–inch outer diameter thick-walled 100% Teflon (FEP or PTFE) tubing. The sampling line will be lowered to the bottom of the borehole, inside the temporary pipe, so that the probe tip is sitting on top of the six-inch sand layer and is centered within the borehole. The sampling line will be cut to length leaving approximately two feet of line extending from the ground surface. A protective cap will be placed on the end of the sampling line.
- Another six-inch layer of sand will be emplaced in the borehole while incrementally withdrawing the temporary pipe, to create a 12-inch deep sand pack with the probe tip at the center.
- A 12-inch layer of dry bentonite will be emplaced in the borehole while incrementally withdrawing the temporary pipe.
- Hydrated bentonite will be emplaced in the borehole while incrementally withdrawing the temporary pipe. The bentonite will be hydrated in a container at the surface, and then slowly poured into the borehole.
- For the second, shallow probe, hydrated bentonite will be emplaced in the borehole up to five feet below ground surface (ft bgs). A six-inch layer of sand will be emplaced in the borehole, and a new stainless steel probe tip will be lowered down to the top of the sand, using a PVC pipe as described above. Another six-inch layer of sand will be emplaced on top of the probe tip, creating a 12-inch deep sand pack with the probe tip at the center. A 12-inch layer of dry bentonite will be emplaced in the borehole while incrementally withdrawing the pipe.
- The temporary probe will be completed by emplacing hydrated bentonite to the ground surface.
- Probe construction details will be recorded in field notes, including time of completion. The probe volume will be calculated as the sum of the sand pack pore volume, dry bentonite pore volume, and sample line internal volume.
- The probe will be allowed to equilibrate for a minimum of two hours if the boring is advanced by direct-push method, and a minimum of 48 hours if the boring is advanced by

hand auger.

- In accordance with the Soil Gas Advisory, samples should not be collected during a significant rain event or within five days of a significant rain event (defined as 0.5 inches or more of rainfall in a 24-hour period) (Soil Gas Advisory; Cal/EPA, 2015).
- After the soil gas probe has equilibrated, the sampling train apparatus will be assembled. Valves to the down-hole probe and sample canister will be closed to isolate or "shut-in" the sampling train components and fittings. A minimum vacuum of 100 inches water (7.4 inches mercury) will be applied to the closed system using a purge pump. The system pressure will be monitored for at least one minute with a vacuum gauge sensitive enough to indicate a pressure drop of 0.5 inches water. If there is any observable loss of vacuum, the fittings will be adjusted until the vacuum in the sample train does not noticeably dissipate. After a successful shut-in test, the sampling train will not be altered.
- Following the shut-in test, the soil gas probe will be purged and sampled under leak detection protocol, in accordance with the Soil Gas Advisory (Soil Gas Advisory; Cal/EPA, 2015).
- Each soil gas probe will be purged of a minimum of three probe volumes while under leak detection protocol (see above). The flow rate during purging will be limited to a maximum of 150 to 200 milliliters per minute (mL/min). The probe will be purged manually with a syringe (e.g., three 60-milliliter syringe pulls per minute). The helium concentration in the purge vapor will be observed using a real-time helium detector.
- After the probe is purged, a soil gas sample will be collected into a laboratory cleaned and certified, silicon lined, stainless steel 1-liter Summa canister. The flow rate during sampling will be limited to a maximum of 150 to 200 mL/min by a laboratory-calibrated, cleaned, and certified flow controller.
- Soil gas samples will be labeled and transported under chain-of-custody protocol.
- Depending on the soil conditions encountered, some locations may not produce sufficient soil vapor to collect a sample. If sufficient soil vapor volume can not be collected from a soil vapor probe, a replacement probe may be installed at a different depth and sampling attempted again, if access and subcontractor availability allow.

4.0 Soil Sampling

At each of the sampling locations shown on Figure 1, a discrete soil sample will be collected by Elevate from depths between approximately two to five ft bgs. Elevate will oversee the advancement of these soil borings by the driller using direct-push technology. Each sample will be collected in a six-inch sleeve cut from the acetate-lined soil core, capped with Teflon tape, and fitted with plastic end caps (direct push). Alternatively, soil may be transferred from the sampler into a laboratory-provided 16-ounce glass jar. The soil samples collected from these locations will be labeled and stored in an iced cooler for transport under chain-of-custody protocol to the laboratory. Additionally at one location per each of the seven proposed building blocks with planned basements, one boring will be advanced to approximately the depth of the

planned basement to characterize soils near the full depth of future excavations for redevelopment. One-story basements will have a sample collected at approximately 10 feet bgs, and two-story basements will have a sample collected at approximately 20 feet bgs. Samples will be analyzed for a complete analytical scope anticipated to be necessary to evaluate Site soils for future offhaul.

Each of the soil samples will be collected into two separate containers:

- Soil collected for non-volatiles analyses will be collected in a 6-inch sleeve cut from the acetate-lined soil core, capped with Teflon tape, and fitted with plastic end caps (direct push). Alternatively, soil may be transferred from the sampler into a laboratory-provided 16-ounce glass jar.
- Soil collected for volatiles analyses will be collected using an Encore or Terracore sampler in accordance with US EPA Method 5035 to minimize loss of volatiles during sample collection and handling.

These soil samples will be labeled and stored in an iced cooler for transport under chain-of-custody protocol.

5.0 Groundwater Sampling

Thirty shallow-zone grab groundwater samples will be collected by Elevate from the Site at the locations shown on Figure 1. The following field activities will be conducted for the collection of these samples:

- Each groundwater boring will be advanced using direct-push drilling technology by a C-57 licensed drilling subcontractor, under the oversight of Elevate. A boring will be drilled to collect a groundwater shallow-zone grab sample from first encountered groundwater (anticipated to be approximately 10 to 15 ft bgs).
- The first encountered groundwater depth will be recorded, and the water level will be observed for any rapid changes associated with confining conditions.
- The boring will then be advanced to a depth of approximately five feet below the water table for collection of the shallow zone sample.
- A grab groundwater sample from the shallow zone will be collected from the open borehole using an inertial pump, peristaltic pump, or bailer as follows:
    - The inner core barrel will be retracted, and a 1-inch diameter temporary PVC casing with a 5-foot or 10-foot interval of 0.010-inch slots will be lowered through the outer drill pipe to the bottom of the borehole.
    - The borehole will be permitted to stabilize for approximately 15 minutes prior to sampling; the boring will not be purged and no field parameters will be measured.
    - An oil/water interface probe will be used to measure the depth to groundwater and evaluate for the presence of free product.

    - A grab groundwater sample will be collected using an inertial pump, peristaltic pump, or bailer. New polyethylene tubing will be lowered down the temporary PVC casing to within the screened interval for sampling by inertial pump, or a new disposable bailer for sampling by bailer. Sample containers will be filled directly from the polyethylene tubing or bailer.
- The depths and length of the temporary PVC casing and/or screen can be adjusted to reflect the encountered depth to groundwater. In general, the objective is to have the perforated well screen straddle the groundwater interface.
- Following sample collection, the boring will be grouted to the surface with neat cement grout.
- Groundwater samples will be labeled and stored in an iced cooler for transport under chain-of-custody protocol.

6.0 Decontamination

All downhole sampling equipment will be decontaminated between borings drilled for all soil vapor, soil, and groundwater, and sampling. Decontamination procedures at a minimum should consist of a wash with Alconox® or equivalent detergent, followed by a double rinse with clean water or steam-cleaning.

For groundwater sampling, new disposable bailers or polyethylene tubing should be used for each sample, or if a stainless steel bailer is to be used, it should be decontaminated as described above.

For soil vapor sampling, a new vapor probe and new 100% Teflon tubing should be used for each soil vapor well.

7.0 Investigation Derived Waste

Waste derived from sampling activities (soil cuttings, decon and purge water, piping from grab groundwater sampling, etc.) will be contained within 55-gallon drums and sampled by Elevate for waste characterization prior to disposal. One soil sample and one water sample will be collected. Following review of the sample results, the drums will be disposed of off-Site by Elevate at an appropriate waste disposal facility. It is the understanding of Elevate that the landowner (e.g. Google) will be listed as the generator of these investigation derived wastes (IDW) for the purposes of proper off-Site disposal.

8.0 Laboratory Analysis

Soil vapor, soil, groundwater, and IDW samples will be submitted by Elevate to the laboratory under chain of custody protocol on a standard turnaround time. The following analyses for each sample media will be requested of the laboratory, and a target analyte list is provided in the following section.

Soil Vapor

All soil vapor samples will be analyzed for VOCs by EPA Method TO-15 Hi/Lo, TO-15 Hi/Lo SIM, and helium.

Soil

All soil samples will be analyzed for the following (and based on the results of the sampling, leachability tests (e.g., WET and TCLP) will be run, as necessary, to evaluate whether the soil may be considered non-hazardous):

- VOCs by 8260B
- SVOCs by 8270C
- TPH-gasoline/diesel/motor oil by 8015M
- PAHs by 8270C-SIM
- PCBs by 8082
- Pesticides by 8081
- Title 22 metals by 6010B/7470
- Moisture
- Asbestos by CARB 435
- WET extraction
- STLC metals

Groundwater

All groundwater samples will be analyzed for the following:

- VOCs by EPA Method 8260B
- TPH-gasoline/diesel/motor oil by 8015M

Investigation Derived Waste

One IDW soil sample will be analyzed for the following: TPH-gasoline by 8015B, TPH-diesel/motor oil by 8015M, VOCs by 8260B, SVOCs by 8270C, PAHs by 8270C-SIM, PCBs by 8082, Pesticides by 8081, Title 22 metals by 6010B/7470A, Asbestos by CARB 435, Moisture by CLP, WET extraction, and STLC metals.

Additionally, one IDW water sample will be analyzed for all of the following: TPH-gasoline by 8015B, TPH-diesel/motor oil by 8015M, VOCs by 8260B, SVOCs by 8270C, PAHs by 8270C-SIM, PCBs by 8082, Pesticides by 8081, and Title 22 metals by 6010B/7470A.

9.0 Recordkeeping

Field notes will be taken by Elevate to document all events, equipment used, and samples collected during the field activities. The notes should include on-Site conditions, including:

- Figures marked with sampling locations;
- Problems encountered and any deviations made from the established monitoring/sampling protocol.

Additional information which may be included in field notes, as necessary and applicable, includes:

- Names, addresses and phone numbers of the field contact (inside logbook cover) including the Site Safety Manager and the Elevate Project Manager and/or Project Engineer;
- Time of site arrival and departure;
- Names, affiliations, and responsibilities of personnel on the Site;
- Summary of important meetings or discussions with federal, state, or local regulatory agencies;
- General description of each day's field activities;
- Sample location descriptions;
- Site sketch showing sample;
- Photograph information;
- Observations of sample collection environment (e.g., ambient odor);
- Identification of monitoring/sampling device, including equipment model and serial number;
- Equipment calibration data;
- Field sample identification number;
- Type of sample matrix (e.g., soil);
- Date and time of sample collection;
- Sampler's name;
- Sample type (e.g., grab, duplicate);
- All associations between and identification numbers of environmental samples, duplicates, and equipment blanks;
- Preliminary sample descriptions (e.g., non-native source material such as petroleum-based product observed in soil);
- Shipping arrangements (e.g., tracking number for overnight courier service);
- Recipient laboratories;
- Levels of safety protection worn by field personnel;
- Deviations from these procedures; and
- Changes in personnel and responsibilities, along with reasons for the changes.

79					95% Student's-t UCL	270			or 95% Modified-t UCL	270.6	
80					or 95% H-UCL	267.7					
81											
82	Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.										
83	Recommendations are based upon data size, data distribution, and skewness.										
84	These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).										
85	However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.										
86											
87	ProUCL computes and outputs H-statistic based UCLs for historical reasons only.										
88	H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.										
89	It is therefore recommended to avoid the use of H-statistic based 95% UCLs.										
90	Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

210	Gamma ROS Statistics using Imputed Non-Detects										
211	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs										
212	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)										

213	For such situations, GROS method may yield incorrect values of UCLs and BTVs										
214	This is especially true when the sample size is small.										
215	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates
