The semiannual Site-wide groundwater monitoring event was conducted in May 2020 and is documented in this report. The monitoring event follows the previously active M&RP No. CI-7483 issued by the LARWQCB, File Number 94-45. This M&RP was directed under WDR Order No. 95-012, which was rescinded in 2010 due to high sulfate levels in effluent as well as asymptotic VOC concentrations. Raytheon voluntarily performs Site-wide semiannual and annual groundwater monitoring in general accordance with this rescinded M&RP. Raytheon will continue monitoring under the current sampling plan until a new program is in place.

The following summarizes the remedial activities and groundwater monitoring events conducted through Second Quarter 2020.

MAY 2020 SITE-WIDE SEMIANNUAL SAMPLING

- Site-wide gauging was performed May 18, 2020 for 44 monitoring and recovery wells. Depths to water ranged from 9.89 feet (well MW-19D) to 58.94 feet below top of casing (well CM-19). Groundwater elevations ranged from 836.98 feet (well MW-44) to 856.33 feet above mean sea level (well VW-122). The average groundwater elevation was 2.24 feet

higher in May 2020 than during the previous Site-wide gauging event in November 2019. The apparent groundwater gradient in the northwest portion of the Site was approximately 0.030 feet per foot (ft/ft) west. The apparent groundwater gradient over the north-central and northeast portions of the Site ranged from 0.024 ft/ft southeast to 0.025 ft/ft southwest. Depth to water measurements and average groundwater gradients for this event are consistent with historical trends;

- Monitoring wells CM-4D, CM-7D, CM-8D, CM-16, MW-15, MW-16, MW-19S, MW-19D, MW-20S, MW-37, and MW-39 were purged and sampled for VOC analysis between May 19 and 21, 2019. Well CM-2D was not sampled due to the presence of substrate from the April 2020 injections;
- VOCs were detected in 6 of the 11 monitoring wells sampled. VOCs were not detected in monitoring wells CM-7D, MW-15, MW-19S, MW-19D, and MW-20S. Concentrations of VOCs did not exceed CAP goals in any monitoring well sampled.
- The maximum concentrations of VOCs detected in monitoring wells include: chloroform at 4.6 micrograms per liter (µg/L) (MW-37); 1,1-dichloroethane (1,1-DCA) at 3.1 µg/L (CM-4D); 1,2-dichloroethane (1,2-DCA) at 2.8 µg/L (CM-4D); *cis*-1,2-dichloroethene (*cis*-1,2-DCE) at 3.2 µg/L (CM-4D); trichloroethene (TCE) at 5.4 µg/L (MW-37); trichlorofluoromethane at 1.8 µg/L (MW-37); vinyl chloride (VC) at 32 µg/L (MW-39); and chloroethane at 3.2 µg/L (CM-4D);
- Recovery wells sampled in May 2020 include RW-01, RW-04 through RW-11, RW-13, RW-15, and RW-16. Recovery well RW-02 was unable to be sampled due to obstruction and well RW-14 was not sampled due to the presence of injection substrate. VOCs were detected in 8 of the 12 recovery wells sampled. VOCs were not detected in recovery wells RW-05 and RW-07 through RW-09. VOC concentrations exceeded CAP goals only in well RW-11, with 1,1-DCE exceeding the CAP goal of 60 µg/L at 66 µg/L.
- The maximum concentrations of other VOCs detected in recovery wells below CAP goals include: benzene at 0.75 µg/L (RW-06); 1,1-DCA at 1.5 µg/L (RW-10); *cis*-1,2-DCE at 12 µg/L (RW-16); tetrachloroethene at 1.3 µg/L (RW-15); TCE at 3.6 µg/L (RW-15); and VC at 20 µg/L (RW-10).

SECOND QUARTER 2020 REMEDIAL PROGRESS MONITORING

EISB injections were implemented in the North-Central Barriers and Former Tank T3 Area in April 2020 to address residual contamination in the areas around wells RW-06, RW-14, CM-2D, and MW-23, and in the Former Tank T3 area. Activities were performed in accordance with the approved CAP Addendum No. 5 and are summarized below.

- Subsurface injections were performed between April 13 and 24, 2020 at nine injection points in the North-Central Barriers Area (IP-21, S-10-M, S-11-D, SW/VW-3, IP-22, IP-23, S-15-M, S-16-M, and SW/VW-16) and one injection point (IP-03) in the Former Tank T3 Area. Planned injection points SW/VW-2 and SW/VW-5 were discovered to have damaged casings and were unable to receive injection substrate.
- Approximately 465 gallons of sodium lactate; 1,583 gallons of EOS® PRO; and 48 liters of BAC-9™ were mixed with 19,955 gallons of anaerobic water and injected into the 10 injection points between approximately 39 and 55 feet bgs.

As there are no post-injection data to compare with Baseline results, a more thorough discussion of results will be included in the next remedial progress monitoring report. The Month #3 post-injection sampling event will be conducted in August 2020, per the revised M&RP. The EISB RPM results will be reported in the third quarter 2020 remedial progress report to be submitted by October 30, 2020.

1.0 INTRODUCTION

On behalf of Raytheon Company (Raytheon), Oneida Total Integrated Enterprises, LLC (OTIE) prepared this report to document remedial progress and waste discharge activities for the Second Quarter 2020. Remedial efforts have been implemented to treat groundwater and saturated soil containing residual concentrations of volatile organic compounds (VOCs) at the Former Canoga Park Facility (the Site) located at 8433 Fallbrook Avenue in Canoga Park, California (Figure 1).

This report was prepared in accordance with the revised Monitoring and Reporting Program (M&RP) No. CI-8947 issued by the Los Angeles Regional Water Quality Control Board (LARWQCB) on December 7, 2018 (LARWQCB, 2018) and the Waste Discharge Requirements (WDR) Order No. R4-2014-0187 (Series No. 076). The revised M&RP included the discontinuation of post-injection enhanced *in-situ* bioremediation (EISB) monitoring at CM-4D and CM-8D Areas and of post-injection *in-situ* chemical oxidation (ISCO) monitoring at the Northwest Area; and the addition of monitoring requirements for EISB injections at the North-Central Barriers and Former Tank T3 Area. Pre-injection Baseline sampling was performed in March 2020 and was reported on in the First Quarter Remedial Progress Monitoring Report (OTIE, 2020). The EISB injections were performed between April 13 and 24, 2020 and are summarized herein.

The monitoring program and remediation at the former Canoga Park facility are conducted under the coordination of:

Ms. Kim Sawyer, P.G
OTIE
317 East Main Street
Ventura, California 93001
(805) 585-2110
ksawyer@otie.com

All consultant work was performed under the review of:

Mr. Daniel S. Samorano, P.E.
Raytheon
1151 E. Hermans Road, TU/B845
Tucson, Arizona 85706
(520) 794-9026
daniel_s_samorano@raytheon.com

Ms. Aleisa Krug, P.E.
Raytheon
1151 E. Hermans Road, TU/B815
Tucson, Arizona 85706
(520) 794-1747
aleisa.m.krug@raytheon.com

The lead agency for the monitoring and remediation is the LARWQCB. The current LARWQCB project manager for the remediation is Ms. Emily Wong, and Dr. Ann Chang oversees the WDR permit and associated monitoring program:

Regional Water Quality Control Board, Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

1.1. SITE OWNERSHIP AND REDEVELOPMENT HISTORY

In 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker-Ramo, an electrical component design and testing company. Bunker-Ramo was the sole

occupant of the facility from 1959 until 1966. From 1966 to 1976, Hughes Missile Systems Company (Hughes) was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes purchased the entire Site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. The former Raytheon Facility was purchased from Hughes by Coast Federal Bank in May 1995. Parcels were subsequently purchased by DeVry and the Los Angeles Metropolitan Police Department. The northern portion of the Site was sold to Regent Properties, Inc. in 1997. Regent Properties, Inc. sold its portion of the property to Shamrock Holdings, Inc. in 2001, who subsequently, sold the property to MEPT West Hills, LLC in June 2002. In 2015, MEPT West Hills, LLC sold the property to BSREP West Hills Office Campus, LLC who is the current property owner. CB Richard Ellis is the current property manager and is the primary contact for Site logistical issues. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Site.

1.2. HISTORICAL REMEDIATION OVERVIEW

Investigation activities at the Site have been ongoing since 1988. Groundwater remediation began in 1995 to achieve cleanup criteria established in the original Corrective Action Plan (CAP) (Hughes, 1992) for the site-specific chemicals of concern (COCs) which include chlorinated ethenes. Clean up goals for COCs are summarized below:

Chemical of Concern	CAP Goal [micrograms per liter (µg/L)]
Tetrachloroethene (PCE)	50
Trichloroethene (TCE)	50
cis-1,2-Dichloroethene (*cis*-1,2-DCE)	60
1,1- Dichloroethene (1,1-DCE)	60
1,1-Dichloroethane (1,1-DCA)	50
1,2-Dichloroethane (1,2-DCA)	5

Remediation techniques used at the Site have included a groundwater recovery and treatment system (GRTS), soil vapor extraction (SVE), an air sparge (AS) system, and *in-situ* remedial actions. In May 2002, the LARWQCB approved an EISB pilot test to evaluate the ability of EISB to reduce chlorinated ethenes in saturated soil and groundwater below CAP goals. Based on the successful results of the pilot test, a full-scale EISB application was approved by the LARWQCB and three separate phases (Phase I through Phase III) were implemented between October 2005 and November 2008 to remediate COCs in treatment areas along the northern perimeter of the Site and the “CM-8D” Area. As a result, the AS/SVE systems and GRTS were phased out and currently serve as contingency options if *in-situ* remedial actions are ineffective.

After the effects of EISB Phases I through III were evaluated, *Corrective Action Plan Addendum No. 3* (TN & Associates [TN&A], 2008) was prepared. The *CAP Addendum No. 3* proposed additional EISB activities and actions to voluntarily address the hexavalent chromium (Cr[VI]) concentrations in residual soil and groundwater at the Former Hazardous Waste Storage Area (HWSA). *In-situ* chemical reduction (ISCR) technology was proposed for the treatment of hexavalent chromium, which involved the injection of an approved reducing agent (calcium polysulfide) into groundwater. The approval and permitting process for *CAP Addendum No. 3* was completed in September 2009.

The *CAP Addendum No. 3* activities were completed in phases, referenced as Phase IV (Northwest Area EISB), Phase V (ISCR at HWSA), Phase VI (EISB at Former Building [Bldg] 269 Area), and Phase VII (EISB at Former Tank T3 Area), with injections performed in separate areas followed by a comprehensive groundwater monitoring program for each phase. Injections in the four areas were conducted in October-November 2009, June 2010, May 2011, and September 2012, respectively.

An additional groundwater investigation was conducted in the Northwest Perimeter area in October-November 2012 to determine the extent of residual VOC concentrations and to improve the understanding of groundwater flow in this area. Based on the VOC concentrations found in the newly installed wells and the continued presence of VOCs in well RW-01, OTIE prepared the *Corrective Action Plan Addendum No. 4: Work Plan for In Situ Chemical Oxidation* (OTIE, 2013). *CAP Addendum No. 4* was submitted to the LARWQCB in May 2013 and M&RP No. CI-8947 was revised on January 22, 2014 (LARWQCB, 2014). Phase VIII ISCO injections were implemented at the Northwest Perimeter area in July 2014 per the revised M&RP. The 2014-revised M&RP also discontinued the remedial progress monitoring for the Northwest Area (Phase IV) and the HWSA (Phase V).

After evaluating the extent of remaining VOCs in groundwater at the Site, the *Corrective Action Plan Addendum No. 5: Work Plan for In Situ* Ch*emical Oxidation and Enhanced In Situ Bioremediation* (OTIE, 2015) was submitted to LARWQCB on December 15, 2015. Additional remedial injections were proposed in four areas: ISCO in Northwest Area, and EISB in the CM-4D Area, the CM-8D Area, and the North-Central Area, near Former Tank T3.

LARWQCB approved *CAP Addendum No. 5* (LARWQCB, 2016a) and enrolled Raytheon under WDR Order No. R4-2014-0187 (Series No. 076) for the injection activities proposed in the CAP Addendum in a letter dated September 19, 2016 (LARWQCB, 2016b). The LARWQCB modified the M&RP for three of the four injection programs described in the CAP: EISB injections in two areas and ISCO in one area. Per the 2016-revised M&RP No. CI-8947, periodic monitoring for EISB in the Former Bldg 269 Area (Phase VI) and the Former Tank T3 Area (Phase VII) were discontinued, with the last remedial progress monitoring (RPM) event completed in May 2016. The revised M&RP also terminated additional monitoring requirements for Phase VIII ISCO in the Northwest Perimeter Area.

Baseline sampling for the CM-8D (previously Phase III) and CM-4D (previously “Phase VI - Former Bldg 269 Area”) EISB areas was conducted in October 2016, and EISB injections were completed in November-December 2016. Baseline sampling for ISCO in the Northwest Area was conducted in February 2017 and injections were performed in March 2017. LARWQCB modified the M&RP in a letter dated December 7, 2018 to discontinue post-injection monitoring requirements following the November 2018 Month #24 RPM events at CM-4D and CM-8D Areas and the Month #21 RPM event in the Northwest Area. The revised M&RP also incorporated RPM requirements for proposed EISB injections in the North-Central Barriers and Former Tank T3 Area.

Raytheon requested access from the Los Angeles Department of Water and Power (LADWP) to install proposed injection wells along the southern boundary of their Chatsworth Reservoir property, adjacent and to the north of the Site. As LADWP had not issued an access agreement as preparations were being made for the injection activities, a modification to the proposed program for the North-Central Barriers and Former Tank T3 Area injections was approved by LARWQCB in an email dated March 13, 2020. The revised injection program incorporated two existing onsite wells to replace the two proposed off-site “LADWP” wells. Pre-injection Baseline sampling was performed on March 9, 2020 for the six RPM wells (wells M-1, CM-2D, MW-23,

RW-11, RW-14, and RW-15). EISB injections were performed between April 13 and 24, 2020 and are summarized herein.

A summary of all phases of *in-situ* remedial efforts is provided in Table 1 and the remedial treatment areas are shown on Figure 2.

Additional site setting information on site geology, hydrogeology, and conceptual site model are included in the *CAP Addendum No. 3*, (TN&A, 2008).

2.0 MAY 2020 SITE-WIDE GROUNDWATER SAMPLING

2.1. FIELD ACTIVITIES AND ANALYSES

2.1.1. Groundwater Gauging and Sampling

Semiannual gauging was performed on May 18, 2020 at 44 monitoring and recovery wells. An electronic water level meter with an accuracy of ± 0.01 ft was used to measure depth to groundwater in each well. The wells were gauged in order from the lowest to highest expected VOC concentrations to minimize the potential for cross-contamination. The water level meter was cleaned prior to gauging each well.

Depths to water ranged from 9.89 feet below top of casing (btoc) at well MW-19D to 58.94 feet btoc at well CM-19. Groundwater elevations ranged from 836.98 feet above mean sea level (amsl) at well MW-44 to 856.33 feet amsl at well VW-122. The average groundwater elevation was 2.24 feet higher in May 2020 than during the previous Site-wide gauging event conducted November 2019. Groundwater elevation contours were plotted using shallow groundwater elevation data from monitoring wells located both on- and off-Site (Figure 3). Apparent groundwater gradient in the northwest corner of the Site was approximately 0.030 feet per foot (ft/ft) west. The apparent groundwater gradient in the north-central and northeast portions of the Site ranged from 0.024 ft/ft southeast to 0.025 ft/ft southwest. Groundwater elevation measurements collected on May 18, 2020 are summarized in Table 2.

Historical hydrographs for 26 monitoring wells are provided in Graphs 1 through 3. Field gauging documentation for May 2020 is included in Appendix A, and a summary of historical water level data for January 1996 through present is provided in Appendix B. Well completion information for Site monitoring and recovery wells is presented in Table 3.

Following gauging activities, and prior to sample collection, all but two wells were purged using the low flow purging method to minimize stress to the groundwater system by minimizing drawdown caused by pumping. The overall goal of low flow purging is to produce a drawdown of less than 10% of the saturated screened interval during purging. “Grab” samples were collected from wells MW-39 (due to an obstruction) and RW-06 (due to the presence of substrate). Specific sampling equipment used is included on the purge sheets for each well in Appendix A.

During groundwater purging, water quality parameters, including temperature, pH, electrical conductivity, dissolved oxygen, oxidation-reduction potential (ORP), and turbidity, were monitored continuously in a flow-through cell with a calibrated water quality meter. Water levels and water quality parameter measurements were recorded every three to five minutes until parameters stabilized to within 10% following three consecutive measurements.

Upon stabilization of water quality parameters, groundwater samples were collected following project-specific requirements and in accordance with the OTIE Standard Operating Practice Number OTIE008F in pre-labeled sample vials or containers. Immediately following collection, the samples were placed on ice, and maintained at 4°C ± 2°C until transported by courier under appropriate chain-of-custody protocol to Calscience Laboratories, Inc. (Calscience) for VOC analysis by EPA Method 8260B. Quality assurance/quality control (QA/QC) samples collected included field duplicates and trip blanks. Field sampling data sheets for this sampling event are provided in Appendix A.

Water generated from well purging was collected and placed into labeled drums pending off-site disposal.

2.1.2. Site-Wide Monitoring Well Sampling

Groundwater samples were collected from 11 Site monitoring wells between May 19 and 21, 2020. The 11 wells sampled include CM-4D, CM-7D, CM-8D, CM-16, MW-15, MW-16, MW-19S, MW-19D, MW-20S, MW-37, and MW-39. Well CM-2D was not sampled due to the presence of substrate from the April 2020 injections. Well CM-2D is an RPM well and was sampled in March 2020 for the Baseline event.

2.1.3. Recovery Well Sampling

Groundwater samples were collected from 12 Site recovery wells between May 19 and 20, 2020. The 12 wells sampled include RW-01, RW-04, RW-05, RW-06, RW-07, RW-08, RW-09, RW-10, RW-11, RW-13, RW-15, and RW-16. Well RW-02 was unable to be sampled due to limited groundwater recharge and a blockage within the well, and well RW-14 was not sampled due to the presence of injection substrate. Well RW-14 is an RPM well and was sampled in March 2020 for the Baseline event.

2.2. LABORATORY RESULTS

2.2.1. Monitoring Well Results

VOCs were detected in 6 of the 11 monitoring wells sampled. VOCs were not detected in monitoring wells CM-7D, MW-15, MW-19S, MW-19D, and MW-20S. VOC concentrations did not exceed CAP goals in any well.

VOCs detected at concentrations below their respective CAP goals are summarized below.

- 1,1-DCA was detected in two wells below the CAP goal of 50 µg/L at 2.7 µg/L (CM-8D) and 3.1 µg/L (CM-4D);
- 1,2-DCA was detected in two wells below the CAP goal of 5 µg/L at 0.96 µg/L (CM-8D) and 2.8 µg/L (CM-4D);
- 1,1-DCE was detected in five wells below the CAP goal of 60 µg/L and ranged from 0.94 µg/L (MW-16) to 47 µg/L (MW-37);
- *cis*-1,2-DCE was detected in three wells below the CAP goal of 60 µg/L at 0.73 µg/L (CM-16), 1.8 µg/L (CM-8D), and 3.2 µg/L (CM-4D);
- TCE was detected in three wells below the CAP goal of 50 µg/L at 0.65 µg/L (CM-16), 2.6 µg/L (CM-8D), and 5.4 µg/L (MW-37);
- Trichlorofluoromethane (TCFM) was detected in well MW-37 at 1.8 µg/L, below the CAP goal of 150 µg/L; and
- Vinyl chloride (VC) was detected in four wells and ranged from 0.88 µg/L (MW-16) to 32 µg/L (MW-39). There is no CAP goal established for VC since it was not detected prior to the initiation of EISB at the Site. VC concentrations at the Site are an intermediate daughter product resulting from the EISB dechlorination process.

Additional analyte detections included chloroform in well MW-37 at 4.6 µg/L and chloroethane in well CM-4D at 3.2 µg/L. There are no established CAP goals for chloroform or chloroethane. The concentration of chloroform in well MW-37 was below the California maximum contaminant level (MCL) of 80 µg/L for trihalomethanes. There is no MCL for chloroethane.

VOC concentrations in Site monitoring wells are generally stable or decreasing. In well MW-39, 1,1-DCE and VC concentrations have decreased significantly between November 2018 and May 2020, from 86 µg/L to 7.6 µg/L and from 62 µg/L to 32 µg/L, respectively. In well MW-37, 1,1-DCE concentrations decreased from a high of 140 µg/L in February 2017 to 18 µg/L in November 2019, below the CAP goal of 60 µg/L. Although 1,1-DCE increased to 47 µg/L in May 2020, it remains below the CAP goal.

Results of the May 2020 sampling event are summarized in Table 4. Historical concentrations from 1995 to present for 10 selected compounds in groundwater are summarized in Table C1 in Appendix C. Concentration trends of select VOCs versus time in monitoring wells are illustrated on Figure 4. Select historical VOC concentrations and groundwater elevations are illustrated on Graphs CM-2D through MW-39. Laboratory reports and chain-of-custody documentation are included in Appendix D.

2.2.2. Recovery Well Results

VOCs were detected in 8 of the 12 recovery wells sampled. VOCs were not detected in recovery wells RW-05, RW-07, RW-08, and RW-09. VOC concentrations exceeded CAP goals only in well RW-11, with 1,1-DCE exceeding the CAP goal of 60 µg/L at 66 µg/L.

VOCs detected in recovery wells at concentrations below their respective CAP goals are summarized below.

- Benzene was detected below the CAP goal of 1 µg/L in well RW-06 at 0.75 µg/L;
- 1,1-DCA was detected in three wells below the CAP goal of 50 µg/L at 0.54 µg/L (RW-01), 0.58 µg/L (RW-04), and 1.5 µg/L (RW-10);
- 1,1-DCE was detected in six wells below the CAP goal of 60 µg/L and ranged from 0.52 µg/L (RW-13) to 45 µg/L (RW-10);
- *cis*-1,2-DCE was detected in three wells below the CAP goal of 60 µg/L at 1.0 µg/L (RW-06), 3.5 µg/L (RW-15), and 12 µg/L (RW-16);
- PCE was detected below the CAP goal of 50 µg/L in well RW-15 at 1.3 µg/L;
- TCE was detected in three wells below the CAP goal of 50 µg/L at 0.52 µg/L (RW-06), 0.71 µg/L (RW-13), and 3.6 µg/L (RW-15); and
- VC was detected in three recovery wells at 2.0 µg/L (RW-04), 9.3 µg/L (RW-16), and 20 µg/L (RW-10). VC was not detected at the Site until EISB activities began in 2004. The VC concentrations are an intermediate daughter product resulting from EISB dechlorination and are anticipated to eventually dissipate.

Additional analyte detections included 2-butanone (MEK) in well RW-06 at 75 µg/L. There is no established CAP goal or MCL for MEK.

VOC concentrations in recovery wells are generally stable or decreasing. However, 1,1-DCE concentrations in well RW-10 have increased from below 2.0 µg/L in April 2017 to 45 µg/L in May 2020, but remain below CAP goals. In well RW-16, VOC concentrations increased between May 2018 and May 2020, including 1,1-DCE from less than 1.0 µg/L to 4.7 µg/L, *cis*-1,2-DCE from 1.4 µg/L to 12 µg/L, and VC from 0.98 µg/L to 9.3 µg/L. 1,1-DCE in well RW-11 remains above CAP goal of 60 µg/L at 66 µg/L, but has decreased from the Baseline concentration of 160 µg/L in March 2020. Well RW-11 is located downgradient of the EISB injection area and

injected substrates are anticipated to stimulate reductive dechlorination processes in the vicinity for further reduction of concentrations.

Results of May 2020 recovery well sampling are summarized in Table 4. Historical recovery well concentrations from 1995 to present for 11 constituents of concern are summarized in Table C2 in Appendix C. Select historical VOC concentration trends in the recovery wells are illustrated in Graphs RW-01 through RW-16. The laboratory reports are provided in Appendix D.

3.0 EISB INJECTION ACTIVITIES

LARWQCB approved CAP Addendum No. 5 (OTIE, 2015) in April 2016 for the implementation of the proposed EISB and ISCO programs in four treatment areas. In December 2018, the LARWQCB revised the M&RP to include the monitoring requirements for EISB injections planned at the North-Central Barriers and Former Tank T3 Area. The RPM program detailed in the M&RP includes collecting samples for water indicator parameters at the Site and off-site laboratory analyses prior to injections (Baseline) and quarterly following injection activities.

Baseline sampling was performed on March 9, 2020 and documented in the *First Quarter 2020 Remedial Progress Monitoring Report* (OTIE, 2020). Baseline results are presented in Table 5 and on Figure 5.

EISB injection activities were performed in April 2020 and are summarized in the following sections.

3.1. PROJECT TREATMENT AREAS AND DEVIATIONS FROM CAP

The EISB remedial injections were conducted per the CAP Addendum No. 5 (OTIE, 2015) in the following treatment areas (Figures 2 and 5):

- North-Central Barriers
- Former Tank T3 Area

The North-Central Barriers include east and southwest treatment areas focused on residual DCE and/or VC concentrations around wells RW-6, RW-14, CM-2D, and MW-23. Injection points were designed to form a barrier-like treatment zone for groundwater migrating northwest and westerly toward and away from these wells. Injection points proposed in CAP Addendum No. 5 for the eastern treatment area included sparge well S-15, the sparge well at SW/VW-16, onsite injection wells IP-22 and IP-23, and offsite injection wells IP-26 and IP-27. Injection points proposed for the southwest treatment area included sparge well S-11; sparge wells at SW/VW-2, SW/VW-3 and SW/VW-5; and injection well IP-21.

Once the CAP addendum was approved, Raytheon requested access from LADWP to install proposed injection wells IP-26 and IP-27 along the southern boundary of their Chatsworth Reservoir property, adjacent and to the north of the Site. LADWP had not issued an access agreement as preparations were being made for the injection event and therefore a modification to the injection program was required. OTIE submitted a request to replace injection points IP-26 and IP-27 with existing on-site sparge wells S-10 and S-16 and LARWQCB approved the modification in an email dated March 13, 2020, prior to mobilization. During the injection activities, wells SW/VW-2 and SW/VW-5 were discovered to have broken well casings. Volumes of substrate intended for these wells were injected into wells IP-21 and SW/VW-3 within the same treatment area.

The Former Tank T3 Area is located along the northern edge of the Site and addresses remaining VOC concentrations in the area. Sparge/vapor extraction well SW/VW-27 was the proposed injection point for this area, however, the well casing was found to be broken and unable to receive substrate injections. Replacement injection well IP-03 was approved by LARWQCB in an email on April 23, 2020.

A well construction summary is included in Table 3.

3.2. SUBSTRATE SELECTION AND DOSAGE

A variety of amendments are available to be added to EISB systems, as described in the CAP Addendum No. 5 (OTIE, 2015). Based on a site-specific evaluation and historical usage, the substrates selected for this EISB project were food-grade sodium lactate, emulsified vegetable oil (EVO), and bioaugmentation culture. EVO was selected because it degrades less quickly than other products and, therefore, the performance period of the substrate is extended. The EOS® PRO formulation of EVO selected for use contains a fast-release soluble substrate to help kick-start the biodegradation of VOCs, and a longer-lasting emulsified soybean oil. Sodium lactate, a soluble substrate, generally degrades and disperses rapidly resulting in effective delivery and kick-off of a rapid biodegradation process. However, the use of sodium lactate as the sole substrate generally requires replenishment every several months as the organic acids can fully degrade before the dechlorination process is complete.

The commercially available bioaugmentation culture, BAC-9™, was selected to ensure that maximum biodegradation rates and furthest extent of dechlorination are achieved during the EISB process. The bioaugmentation culture provides a microbial consortium consisting of various *Dehalococcoides mccartyi* (DHC) strains that can fully dechlorinate PCE, TCE, *cis*-1,2-DCE and VC to ethane and ethene.

The calculations for determining the volumes of EOS® PRO required for each of the treatment areas were included in the CAP Addendum No. 5 (OTIE, 2015). The revised M&RP (LARWQCB, 2018) approved the injection of an estimated 22,990 gallons of substrate containing 1,595 gallons of EOS® PRO, 495 gallons of sodium lactate, and 13 gallons (48 liters) of BAC-9™ into 12 injection points between approximately 39 and 55 feet bgs.

The April 2020 EISB injections included approximately 22,016 gallons of substrate containing 1,583 gallons of EOS® PRO, 465 gallons of sodium lactate, and 48 liters of BAC-9™ injected into 10 injection points.

3.3. SUBSTRATE DELIVERY PROGRAM

Prior to the injection of the substrate solution (water, sodium lactate, EOS® PRO, and BAC-9™), wells were primed from the surface with approximately 4 gallons of sodium lactate and 1.5 grams of vitamin B12 powder (per manufacturer recommendations) into each of the injection points under their natural anaerobic conditions.

Municipal water was transferred into two 6,500-gallon polyethylene aboveground storage tanks (ASTs) near the injection areas prior to the start of injections. The municipal water was treated with sodium lactate to achieve anaerobic conditions (low DO and ORP) prior to mixing with substrate and injection into the wells. Suction hose was connected to the outlet of the tank to a transfer pump (Grundfos® Model CRN 1-9). Anaerobic water was transferred from the ASTs through flexible hose using the transfer pump to a portable injection system equipped with a metering chemical injector (Dosatron® D14MZ10-14 gpm) to control dosing of substrate and amended water. A wellhead assembly was constructed with flexible hose to connect the outlet of the chemical injector to the injection well. An instantaneous flow meter and flow totalizer were utilized to determine the injected flow rate and volumes, respectively, at each well. Pressures and flow rates were monitored and recorded during injections at each well.

Mixing and injection equipment and reagent were stored within a chemical-resistant secondary containment area during injections. A schematic of the mixing and injection system was provided as Figure 7 in CAP.

3.3.1. North-Central Barriers Injections

EISB injections were performed in the North-Central Barriers at the east and southwest barriers between April 13 and 24, 2020.

- East area injection wells were divided into East Area A (IP-22, S-15-M, and S-16-M) and East Area B (IP-23, SW/VW-16).
- Southwest barrier wells were divided into West Area A (IP-21) and West Area B (S-10-M, S-11-D, and SW/VW-3) used for injections. Wells SW/VW-2 and SW/VW-5 were found to have broken casing and were unable to receive substrate.

The injection wells are screened between approximately 39 and 55 feet bgs (Table 6).

Approximately 4 gallons of sodium lactate and 1.5 grams of Vitamin B12 were added to each injection well prior to substrate injection, according to manufacturer recommendations. Each injection well received approximately 4.89 liters of BAC-9™. BAC-9™ was injected in doses during the injection program with half the total volume (2.44 liters) injected with the first 10 gallons of substrate; a quarter of the volume (1.22 liter) injected at 1/3 of total substrate volume; and the final quarter volume (1.22 liter) injected at 2/3 of total substrate volume. Each injection well was designed to receive a total of approximately 40 gallons of sodium lactate and 140 gallons of EOS® PRO mixed with 1,600 gallons of anaerobic water. Between 1,369 and 3,323 gallons of substrate solution were injected at each injection point at rates ranging from 0.7 to 6.1 gallons per minute (gpm), with corresponding injection pressures ranging from 10 to 35 pounds per square inch gauge (psig). Approximately 100 gallons of anaerobic water was injected into each well at the end of the injection process to flush and rinse the well casing and injection equipment. Table 6 summarizes the injection details.

Nearby wells were monitored for influence during injections. Wells RW-14, S-15(S,M,D), S-16(S,M,D), SW/VW-16, SW/VW-19, SW/VW-20, MW-36, and IP-23 were monitored for influence during East Area A injections. Mounding and visual evidence of substrate were noted in well RW-14. Wells CM-2D, RW-06, and VE-1 were monitored during East Area B injections. Mounding and visual evidence of substrate were noted in wells CM-2D and RW-06. A maximum distance of influence of approximately 15 feet was observed in well RW-14 during injections at well IP-22.

Wells MW-23 and SW/VW-5 were monitored for influence during injections at southwest barrier West Area A, and wells RW-11, S-9(S,M,D), S-10(S,M,D), S-11(S,M,D) were monitored for influence during injections at West Area B. Mounding and evidence of substrate were noted in wells RW-11, SW/VW-3, and SW/VW-5. A maximum distance of influence of approximately 28 feet was observed in well RW-11 during injections at well S-10-M.

3.3.2. Former Tank T3 Area Injections

Former Tank T3 Area injections were conducted on April 23, 2020. Injection well IP-03 replaced proposed injection point SW/VW-27 due to a broken casing. Approximately 4 gallons of sodium lactate and 1.5 grams of Vitamin B12 were added to well IP-03 prior to substrate injections. Well IP-03 (screened 40 to 60 ft bgs) received approximately 4.0 liters of BAC-9™ injected in doses, with half the total volume (2.0 liters) injected with the first 10 gallons of substrate; a quarter volume (1.0 liter) injected at 1/3 of the total substrate volume; and the final quarter volume (1.0 liter) injected at 2/3 of total injection volume. Well IP-03 received approximately 55 gallons of sodium lactate and 55 gallons of EOS® PRO mixed with 1,028 gallons of anaerobic water.

Approximately 100 gallons of anaerobic water was injected into the well at the end of the injection process to flush and rinse the well casing and injection equipment. Approximately 1,238 gallons of the substrate solution and rinse water was injected at IP-03 at rates ranging from 4 to 6 gpm with corresponding injection pressures of 4 psig. Table 6 summarizes the injection details.

4.0 QA/QC SAMPLE RESULTS

Calscience analyzed all groundwater samples and data were validated by an OTIE Chemist. The complete laboratory reports are provided in Appendix D. Sections below summarize data validation of field and laboratory QA/QC samples (Table 7).

4.1. FIELD QA/QC SAMPLES

Field QA/QC measures included the collection and analysis of a field duplicate sample at a 10% frequency, and one trip blank per sample shipment. A total of 23 normal samples, 3 field duplicate samples, and 2 trip blank samples were collected and analyzed.

Field duplicate samples are collected and analyzed as an indication of overall precision. The following field duplicate sample pairs were collected:

- Well CM-4D (sample DUP1-202105 duplicate of sample CM-4D-202105);
- Well MW-37 (sample DUP3-202105 duplicate of sample MW-37-202105); and
- Well RW-16 (sample DUP2-201905 duplicate of sample RW-16-201905).

Evaluation of the precision was accomplished by calculating the relative percent difference (RPD) of detected compounds in the field samples and field sample duplicates. The RPD calculated for each field duplicate pairs listed above were below the established control limit of 40%. Initial duplicate pair results for well RW-16 exceeded control limits and OTIE requested that Calscience re-run the associated samples due to suspect RPD values. Results for the confirmation run analysis were below the RPD control limit of 40% and are included herein and provided in Appendix D.

Trip blanks are used to determine whether the samples may have been contaminated by VOCs during shipment, handling, or storage on Site and at the laboratory. Two trip blank samples were submitted and no VOCs were detected.

4.2. LABORATORY QA/QC SAMPLES

Laboratory QA/QC procedures were carried out in accordance with EPA method specifications and the data was accepted based on the QA/QC criteria established by the EPA. All groundwater samples were shipped under appropriate chain of custody protocol at the method-specified temperature limit (4°C ± 2°C) and all sample analyses were completed within the prescribed holding time.

Laboratory blanks were analyzed as required by the analytical methods. No contaminants were found in the laboratory blanks. All surrogate percent recoveries were within QC limits.

Laboratory control samples and laboratory control sample duplicates were analyzed as required by the analytical methods. All percent recoveries and RPDs were within QC limits.

Matrix spike/ matrix spike duplicates were analyzed as required by the analytical methods. All percent recoveries and RPDs were within QC limits.

5.0 SUMMARY AND CONCLUSIONS

The semiannual Site-wide groundwater monitoring event was conducted between May 18 and 21, 2020, per rescinded M&RP No. CI-8947. Field activities and data results from the May 2020 sampling event are summarized below. In addition, EISB injections were implemented in the North-Central Barriers and Former Tank T3 Area in April 2020. Activities were performed in accordance with the approved CAP Addendum No. 5 and WDR Order No. R4-2014-0187 (Series No. 076) and are summarized below.

5.1. MAY 2020 SITE-WIDE SEMIANNUAL SAMPLING

- Site-wide gauging was performed May 18, 2020 for 44 monitoring and recovery wells. Depths to water ranged from 9.89 feet (well MW-19D) to 58.94 feet btoc (well CM-19). Groundwater elevations ranged from 836.98 feet (well MW-44) to 856.33 feet amsl level (well VW-122). The average groundwater elevation was 2.24 feet higher in May 2020 than during the previous Site-wide gauging event in November 2019. The apparent groundwater gradient in the northwest portion of the Site was approximately 0.030 ft/ft west. The apparent groundwater gradient over the north-central and northeast portions of the Site ranged from 0.024 ft/ft southeast to 0.025 ft/ft southwest. Depth to water measurements and average groundwater gradients for this event are consistent with historical trends.

- Monitoring wells CM-4D, CM-7D, CM-8D, CM-16, MW-15, MW-16, MW-19S, MW-19D, MW-20S, MW-37, and MW-39 were purged and sampled for VOC analysis between May 19 and 21, 2019. Well CM-2D was not sampled due to the presence of substrate from the April 2020 injections.

- VOCs were detected in 6 of the 11 monitoring wells sampled. VOCs were not detected in monitoring wells CM-7D, MW-15, MW-19S, MW-19D, and MW-20S. Concentrations of VOCs did not exceed CAP goals in any monitoring well sampled.

- The maximum concentrations of VOCs detected in monitoring wells include: chloroform at 4.6 µg/L (MW-37); 1,1-DCA at 3.1 µg/L (CM-4D); 1,2-DCA at 2.8 µg/L (CM-4D); *cis*-1,2-DCE at 3.2 µg/L (CM-4D); TCE at 5.4 µg/L (MW-37); TCFM at 1.8 µg/L (MW-37); VC at 32 µg/L (MW 39); and chloroethane at 3.2 µg/L (CM-4D).

- Recovery wells sampled in May 2020 include RW-01, RW-04 through RW-11, RW-13, RW-15, and RW-16. Recovery well RW-02 was unable to be sampled due to obstruction and well RW-14 was not sampled due to the presence of injection substrate in the well. VOCs were detected in 8 of the 12 recovery wells sampled. VOCs were not detected in recovery wells RW-05, RW-07, RW-08, and RW-09. VOC concentrations exceeded CAP goals only in well RW-11, with 1,1-DCE exceeding the CAP goal of 60 µg/L at 66 µg/L.

- The maximum concentrations of other VOCs detected in recovery wells below CAP goals include: benzene at 0.75 µg/L (RW-06); 1,1-DCA at 1.5 µg/L (RW-10); *cis*-1,2-DCE at 12 µg/L (RW-16); PCE at 1.3 µg/L (RW-15); TCE at 3.6 µg/L (RW-15); and VC at 20 µg/L (RW-10).

5.2. SECOND QUARTER 2020 REMEDIAL PROGRESS MONITORING

EISB injections were implemented in the North-Central Barriers and Former Tank T3 Area in April 2020 to address residual contamination in the area around wells RW-06, RW-14, CM-2D, and MW-23, and in the Former Tank T3 area. Activities were performed in accordance with the approved CAP Addendum No. 5 and are summarized below:

- Subsurface injections were performed between April 13 and 24, 2020 at nine injection points in the North-Central Barriers Area (IP-21, S-10-M, S-11-D, SW/VW-3, IP-22, IP-23, S-15-M, S-16-M, and SW/VW-16) and at one injection point (IP-03) in the Former Tank T3 Area. Panned injection points SW/VW-2 and SW/VW-5 were discovered to have damaged casings and were unable to receive injection substrate.
- Approximately 465 gallons of sodium lactate; 1,583 gallons of EOS® PRO; and 48 liters of BAC-9™ were mixed with 19,955 gallons of anaerobic water and injected into the 10 injection points between approximately 39 and 60 feet bgs.

As there are no post-injection data to compare with Baseline results, a more thorough discussion of results will be included in the next remedial progress monitoring report. The Month #3 post-injection sampling event will be conducted in August 2020, per the revised M&RP. The EISB RPM results will be reported in the third quarter 2020 remedial progress report to be submitted by October 30, 2020.

- SW/VW-# — Air Sparge/Vapor Extraction Well
- IP-# / S-# / SW/VW-# — North-Central Barriers and Former Tank T3 EISB Injection Well

Graph Legend

- Trichloroethene (TCE)
- 1,1-Dichloroethene (1,1-DCE)
- Vinyl Chloride (VC)
- Phase VII EISB Injections - Sept 2012
- EISB Injections - Apr 2020

Notes

1) All results are in micrograms per liter (µg/L).
2) For wells with duplicate pairs, the highest concentrations are shown.

Notes:

1) feet bgs = feet below ground surface
2) EISB = enhanced *in situ* bioremediation; ISCR = *in situ* chemical reduction; ISCO = *in situ* chemical oxidation
3) RPM = remedial progress monitoring
4) Blue indicates a future monitoring event
5) "Summary Reference" refers to the document which presents the details for each of the injection events.
6) "NA" = Not applicable, M&RP requirement ended

Table 2
Depths to Water and Groundwater Elevation Data - May 18, 2020
Former Canoga Park Facility
8433 Fallbrook Avenue, Canoga Park, CA

Well I.D.	Depth to Water (ft, TOC)	Top of Casing Elevation (ft, MSL)	Screen Interval (ft, bgs)	Groundwater Elevation (ft, MSL)	Comments

Notes:

1) All concentrations in micrograms per liter (µg/L).

2) Only detectable concentrations of chemicals of concern are shown; detections above reporting limit are **bolded**.

3) 1,1-DCA = 1,1-Dichloroethane; 1,2-DCA = 1,2-Dichloroethane; 1,1-DCE = 1,1-Dichloroethene; *cis* -1,2-DCE = *cis* -1,2-Dichloroethene; PCE =Tetrachloroethene; TCE = Trichloroethene; TCFM = trichlorofluoromethane; VC = Vinyl Chloride; MEK = 2-Butanone.

4) CAP Goals = Corrective Action Plan Groundwater Cleanup Goals (Hughes Environmental Systems, 1992); N = Normal Sample; FD = Field Duplicate Sample; "<" = not detected above the stated reporting limit.

5) Concentrations exceeding CAP Goals are shaded in gray. Not all analytes have CAP goals.

6) "J" - result qualified as estimated due to quality control issues. See text for details.

7) * = Sample from MW-20S had elevated detection limits due to matrix interference.

SW/VW-27	50-55	4/23	Well is damaged - unable to perform injections. Replaced with well IP-03.					
		Area Totals:	*55*	*55*	*1,128*	*4*	--	--
		Total Volume:	465	1,583	19,955	48	--	--
		Total Substrate Volume Injected (gallons):	**22,016**					

Notes:

1) Total volume includes amount used for priming wells.
2) Total volume includes flush water.
3) Injections pressures were measured at the well head.
4) Injections at wells SW/VW-2 and SW/VW-5 were discontinued after discovering damaged well casings that caused surfacing of injection substrate in the well vault.
5) EISB = enhanced *in situ* bioremediation; EVO = emulsified vegetable oil; feet bgs = feet below ground surface; gpm = gallons per minute; psi = pounds per square inch

RW-11	05/18/20	21.74	869.17	847.43

Notes:
1) ft = feet
2) TOC = top of well casing
3) MSL = Mean Sea Level, National Geodetic Vertical Datum of 1929 (NGVD29)
4) NM = not measured
5) -- = data not available.

Notes:

1) All concentrations in µg/L.

2) All analyses performed by EPA Method 8260, 8260B or 8021B.

3) "--" = not analyzed for parameter; CAP goals = Cleanup goals established in Corrective Action Plan

4) Only detectable concentrations of constituents of concern are shown. For wells with duplicate samples, the highest of the pair are shown here.

5) 1,1-DCA = 1,1-Dichloroethane; 1,2-DCA = 1,2-Dichloroethane; 1,1-DCE = 1,1-Dichloroethene; cis-1,2-DCE = cis-1,2-Dichloroethene; PCE = Tetrachloroethene; 1,1,1-TCA = 1,1,1-Trichloroethane; TCE = Trichloroethene; TCFM = Trichlorofluoromethane; VC = Vinyl Chloride.

6) "J" - result qualified as estimated due to quality control issues.

Notes:

1) All concentrations in µg/L.

2) All analyses performed by EPA Method 8260, 8260B or 8021B.

3) '-- = not analyzed for this analyte.

4) Only detectable concentrations of constituents of concern are shown. For wells with duplicate samples, the highest of the pair are shown here.

5) 1,1-DCA = 1,1-Dichloroethane; 1,2-DCA = 1,2-Dichloroethane; 1,1-DCE = 1,1-Dichloroethene; cis-1,2-DCE = cis-1,2-Dichloroethene; PCE = Tetrachloroethene; 1,1,1-TCA = 1,1,1-Trichloroethane; 1,1,2-TCA = 1,1,2-Trichloroethane; TCE = Trichloroethene; VC = vinyl chloride

6) "J" - result qualified as estimated due to quality control issues.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Oneida Total Integrated Enterprises LLC
Project/Site: CANOGA PARK 1SA20

Job ID: 570-28918-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Revision
The report being provided is a revision of the original report sent on 5/21/2020. The report (revision 1) is being revised due to: The client requested confirmation runs to be screened and included for sample #4 (RW-16) and #5 (DUP2)..

Receipt
The samples were received on 5/21/2020 5:55 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.0º C.

Receipt Exceptions

The client requested confirmation runs to be screened and included for sample #4 (RW-16) and #5 (DUP2) in the supplemental report package and EDD files.

GC/MS VOA
Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following sample associated with analytical batch 570-71138 were outside control limits: CM-4D-202105 (570-28918-17[MS]). The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for analytical batch 570-71137 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

Method 8260B: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: MW-20S-202005 (570-28918-10). Elevated reporting limits (RLs) are provided.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following sample associated with analytical batch 570-71247 were outside control limits: (570-28893-A-9 MS) and (570-28893-A-9 MSD). The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-72089.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

EXTERNAL EMAIL*

Hi Virendra,

We are okay with either a separate report for the two confirmation runs, or with a new report for the entire SDG, whichever is convenient.

Thank you!

Subject: RE: Eurofins Calscience report and EDD files from 570-28918-1 CANOGA PARK 1SA20

Lindsey,

Good Morning. The lab has completed the confirmation runs on the two subject samples from this batch.

Sample #4 (RW-16) came out higher for the positive hits. Sample #5 (Dup2) confirmed the original run.

How would you like to proceed with data reporting? Please advise. Thank you.

Best Regards,

Virendra Patel

EXTERNAL EMAIL*

Hi Virendra,

We are looking at some unexpected RPDs on two samples in this SDG. Can we possibly re-run the samples/confirm the results for sample DUP2-201905 and RW-16-201905?

Thank you kindly

Lindsey Larsen

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

Job Narrative
570-28689-1

Comments
No additional comments.

Receipt
The samples were received on 5/19/2020 6:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.2º C.

GC/MS VOA
Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) precision for analytical batch 570-70753 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory control sample duplicate (LCS/LCSD) precision was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

RE: Second Quarter 2020 Remedial Progress and Site-Wide Groundwater Monitoring Report, Raytheon Company, Former Canoga Park Facility, 8433 Fallbrook Avenue Compliance File No. CI-8947

Dear Dr. Chang:

This letter provides the certification statement for the referenced report, as required by the Waste Discharge Requirements.

I declare under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of a fine and imprisonment for knowing violations.

Sincerely,

RAYTHEON COMPANY

Daniel S. Samorano
Authorized Representative

The Department of Toxics Substances Control (DTSC) takes every precaution to ensure the accuracy of data in the Hazardous Waste Tracking System (HWTS). However, because of the large number of manifests handled, inaccuracies in the submitted data, limitations of the manifest system and the technical limitations of the database, DTSC cannot guarantee that the data accurately reflect what was actually transported or produced.

1.0 SUMMARY OF CONCLUSIONS

Subject to the qualifications and limitations stated in Chapter 2.0, Introduction, on behalf of Multi Employer Pension Trust (MEPT) West Hills, LLC, and its legal counsel Allen Matkins Leck Gamble & Mallory, LLP (AMLGM), ENVIRON International Corporation (ENVIRON) performed a Phase I/II Environmental Site Assessment of the West Hills Corporate Village facility located at 8501-8531 Fallbrook Avenue in Canoga Park, California (Property, see Figure 1). The Property was part of the Hughes Aircraft Company Missile Systems Group Facility (Site or Facility), that covered approximately 80 acres. ENVIRON understands that the Phase I/II Environmental Site Assessment was requested as part of MEPT's potential purchase of the Property. The Phase I Environmental Site Assessment was performed in conformance with the scope and limitations of the American Society of Testing and Materials (ASTM) Practice E 1527-00, and according to ENVIRON's proposal to Mr. John Allen of AMLGM dated November 8, 2001. Any exceptions to, or deletions from, this practice are described in Section 2.4 of this report. The Phase II work, consisted of indoor air quality sampling, and was performed according to ENVIRON's proposal to Mr. John Allen of AMLGM dated February 22, 2002.

Based on our visual observation of the Property, review of sources of historical information, a review of regulatory agency databases, the results of the indoor air quality sampling, and ENVIRON's professional judgment, "recognized environmental conditions," or "historical recognized environmental conditions" as defined by ASTM (see pages 3 and 5), were identified at the Property, as follows:

- The Property was occupied by aerospace research and development companies from 1966 through 1994. During this period, several underground storage tanks, clarifiers, pits, and trenches were installed. Based on the information reviewed by ENVIRON, these structures appear to have been removed or closed in place. To date, regulatory closures have not been issued for all of the underground storage tanks (USTs). Soil and ground water in proximity to certain of the USTs and clarifiers have been impacted by volatile organic compounds (VOCs) and/or petroleum hydrocarbons (TPH). Numerous subsurface investigations have been conducted since chemicals were first detected in soil and ground water in the mid-1980s. A corrective action plan was prepared in 1992 (1992 CAP) and revised in 1994. The California Regional Water Quality Control Board – Los Angeles Region (LARWQCB) has provided oversight for the soil and ground water remediation at the Property. Based on correspondence from the Department of Toxics Substances Control (DTSC), soil and ground

water cleanup standards established for the Property in the 1992 CAP, were based on the lowest numbers produced from a health risk assessment, background measurement, or maximum contaminant levels (MCLs). Based on ENVIRON's review of available documents, the ground water cleanup goals appeared to be 10 times greater than the MCL, and soil cleanup goals were established for total chlorinated VOCs at 100 milligrams per kilogram (mg/kg). ENVIRON understands that in the purchase and sale agreements for the Property, Raytheon retains all responsibility and liability for the investigation and remediation of chemicals in soil and ground water underlying the Property.

Given the known occurrence of chemicals in soil and ground water underlying the Property, the fact that certain areas of the Property have not been investigated, and stated cleanup goals, which indicate that residual chemical concentrations will remain in soil and ground water, ENVIRON recommended conducting indoor air sampling to evaluate the potential health risks from VOCs to workers inside the buildings. This air monitoring was conducted on February 28 and March 14, 2002, and is described in Section 3.2 of this report. Twelve VOCs were detected at concentrations above applicable detection limits, five of which are Proposition 65 listed chemicals. Detected VOC concentrations were well below worker Permissible Exposure Levels (PELs, 8 hr, time-weighted average) specified by the Occupational Safety and Health Administration (OSHA). Furthermore, ENVIRON reviewed the results for the five Proposition 65-listed VOCs to evaluate if the facility would be subject to Proposition 65 requirements. The results of this assessment indicated that Proposition 65 requirements are not applicable inside the buildings. Therefore, the presence of VOCs and petroleum hydrocarbons in soil and/or ground water underlying the Property does not appear to have resulted in a significant health risk to workers inside the buildings.

- In June 1998, hexavalent chromium contaminated soils were encountered during the demolition of the former Hazardous Waste Storage Area (HWSA). Because the hexavalent chromium contaminated soils were encountered at depths of 5 to 13 feet below ground surface (bgs), Raytheon (which purchased Hughes) believed that the soils would not pose a health threat; therefore, no removal was planned. In 1999, hexavalent chromium was detected in ground water samples collected from wells adjacent to the former HWSA. Seven ground water monitoring wells were installed in proximity to the HWSA in June of 2000, and monitoring for the presence of hexavalent chromium. Sampling results indicated that the state MCL for hexavalent chromium in drinking water, currently 50 micrograms per liter (µg/l), was exceeded at two monitoring wells (MW-32S and MW-32D), both located within the footprint of the former HWSA. It should be noted that the California Environmental

Protection Agency Office of Environmental Health Hazard Assessment (OEHHA) is reviewing the public health goal (PHG) and drinking water standard for hexavalent chromium, and the standards may be decreased in 2003. However, because the former HWSA is paved and located outside the footprint of currently constructed buildings, and due to the absence of a complete exposure pathway, the localized occurrence of hexavalent chromium in ground water at the former HWSA does not appear to represent a significant health risk to workers at the Property.

The following are other pertinent findings, which are not representative of recognized environmental conditions:

- Two Resource Conservation and Recovery Act (RCRA) permitted waste storage facilities were located at the Property: Tank T-3 and the hazardous waste storage area (HWSA). DTSC is the lead agency for RCRA closure of these two waste storage facilities. In a 1995 memorandum, DTSC outlined seven areas of concern (AOCs) and several solid waste management units (SWMUs) at the Property. Correspondence from DTSC indicates that the agency has not been fully satisfied with the investigations of the AOCs, the closure of the SWMUs, or post closure of the hazardous waste management unit (Tank T-3).

- Based on historical documents reviewed, the Property was used for agricultural purposes from at least 1928 until the mid- to late 1950s, when commercial structures were built. From 1966 to 1994, the Property was occupied by aerospace research and development companies. In the late 1990s, several buildings were demolished and the remaining buildings were completely remodeled. One additional building was constructed on the Property in 2000. The Property buildings are currently used for office space.

  Prior asbestos documents reviewed indicated that several types of asbestos-containing materials (ACMs) were present within the Property buildings (except for the recently constructed building). Based on a review of prior documents, interviews conducted, and the site visit, it appears that the previously identified ACMs were removed from the Property prior to remodeling activities. Therefore, it is unlikely that ACMs are present in the Property buildings.

- Based on interviews and the site visit conducted, it appears that painted materials previously located within the Property buildings were removed prior to remodeling activities. Therefore, it is unlikely that lead-based paint is present in the Property buildings.

- Based on a review of prior documents, interviews conducted, and visual observations of readily accessible areas during site visit, it does not appear that areas of water leaks or stains, or areas of mold are located in the Property buildings.

- The Property is listed in the Environmental Data Resources (EDR) report on the Historical Underground Storage Tanks (HIST UST), Resource Conservation and Recovery Information Systems (RCRIS), Facility Index System (FINDS), RCRIS – Transport, Storage and Disposal (RCRIS-TSD), RCRIS- - Corrective Action Sites (CORRACTS), Comprehensive Environmental Response, Compensation and Liability Information System - No Further Action Planned (CERCLIS-NFRAP), California Hazardous Substances Release Sites (Cal-Sites), Hazardous Waste and Substances Sites List (Cortese), and Leaking Underground Storage Tank (LUST) databases. These listings appear to include the former Hughes facility at the Property and southern adjacent area. As described above, remediation activities are currently being conducted by Raytheon at the Property.

- Several off-site facilities were identified in the database report, within the specified search radii. Based on the regulatory status and/or direction from the Property, it is unlikely that these listed facilities have adversely affected the Property.

2.0 INTRODUCTION

ENVIRON was retained by AMLGM on behalf of MEPT to conduct a Phase I/II Environmental Site Assessment of the West Hills Corporate Village located at 8501-8531 Fallbrook Avenue in Canoga Park, California ("Property"). ENVIRON understands that the Phase I Environmental Site Assessment was requested as part of MEPT's potential purchase of the Property. The Phase I Environmental Site Assessment described in this report was performed in conformance with the scope and limitations of the ASTM Practice E 1527-00, and ENVIRON's proposal to Mr. John Allen of AMLGM, dated November 8, 2001. The purpose of the assessment was to identify recognized environmental conditions. The term "recognized environmental conditions" is defined by ASTM as:

> "The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products in structures on the property or into the ground, ground water, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimus* conditions that generally do not represent a material risk of harm to public health and environment and that generally would not be the subject of enforcement action if brought to the attention of appropriate governmental agencies."

ENVIRON undertook tasks, as necessary, to provide information required under ASTM Practice E1527-00. In addition, ENVIRON performed Phase II work, consisting of indoor air quality sampling, which was performed according to ENVIRON's proposal to Mr. John Allen of AMLGM dated February 22, 2002.

2.1 Scope of Phase I/II Environmental Site Assessment

The assessment included the following activities:

- A visit to the Property to observe and evaluate visible site conditions (see Appendix A for site photographs), ENVIRON was escorted by Ms. Rosa Amelia Samaniego, Property Manager with Insignia/ESG, Inc. (Insignia).

- A review of historical aerial photographs (dated 1928, 1952, 1965, 1976, 1989, and 1994) provided by Environmental Data Resources (EDR).

- A review of a city directory abstract dated November 19, 2001 (for the years from 1920 to 2000), provided by EDR.

- A review of historical topographic maps (dated 1903, 1947, and 1967) provided by EDR.

- A request for Sanborn maps of the Property and vicinity from EDR. EDR indicated that Sanborn maps are not available for the area of the Property.

- A review of publicly available reports pertaining to geology and hydrogeology in the vicinity of the Property.

- A request, through Environmental Support Services of Santa Ana, California (ESS) for available documents pertaining to the Property from the following agencies: The Los Angeles County Environmental Health Department (Health Department), and City of Los Angeles Building and Fire Departments (Building and Fire Departments).

- A review of available documents pertaining to the Property at the LARWQCB.

- A review of the results of an environmental regulatory database search of environmentally impaired sites located in the vicinity of the Property, conducted by EDR, dated November 19, 2001 (see Appendix B). EDR conducted searches of the following federal databases: the United States Environmental Protection Agency (USEPA) Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS); the USEPA National Priority List (NPL); the USEPA Emergency Response Notification System (ERNS); the USEPA Resource Conservation and Recovery Information System (RCRIS); and, the USEPA Corrective Action Reports (CORRACTS). State databases searched were: State Hazardous Waste Sites (SHWS), Solid Waste Sites & Facilities (LF), Leaking Underground Storage Tank List (LUST), Underground Storage Tank Database (UST), Historic UST Database (HIST UST), Known Hazardous Waste Sites (Cal-Sites), California hazardous Material Incident Report System (CHMIRS), and Hazardous Waste Information System (HAZNET).

Because the environmental databases themselves are sometimes not updated by the specific regulatory agencies for periods of up to one year (depending on the database and the agency), the database search conducted herein will not necessarily list all facilities or sites recently identified as having, or suspected of having, environmental problems and for which an environmental investigation/listing has been initiated, or reflect the current status of activities at a particular site, subsequent to the last update of a given list. The dates of the most recent updates for the searched environmental databases are listed in Appendix B.

- A review of the 2001 Munger Map Book, California-Alaska Oil and Gas Fields, to identify oil and gas wells located on or adjacent to the Property.

- A review of previous reports relating to soil and ground water sampling, remediation, and asbestos surveys and abatement at the Property, a complete list of all reports reviewed by ENVIRON is included in Section 5.0 of this report.

- An assessment of indoor air quality at the Property, performed in the existing buildings, to evaluate the potential health risks from VOCs detected in soil and ground water to workers inside the buildings. This air monitoring was conducted on February 28 and March 14, 2002, and is described in Section 3.2 of this report.

2.2 Definitions

The following terms are used in this report:

- The word "Property" refers to the property within the approximate boundaries depicted on Figure 2,

- "Immediate vicinity" refers to properties immediately adjacent to the Property that share a common boundary with the Property, and

- "Vicinity" refers to the area within an approximate 1/4-mile radius of the Property.

- "Historical Recognized Environmental Condition" is based on the definition in ASTM E 1527-00 and refers to an environmental condition which in the past would have been considered to be Recognized Environmental Condition, but has been satisfactorily remediated or addressed in such a manner that it is no longer considered to be a Recognized Environmental Condition.

The term "hazardous" is used herein in general accordance with 40 CFR Part 261, Federal Code of Regulations. No legal distinction is implied between the three terms "material," "waste," and "substance" as used herein. The word "impact" or "impacted" is used herein to indicate the result of a release of a hazardous substance.

2.3 Data Evaluation and Report Compilation

This report presents the results of ENVIRON's evaluation. It is based primarily upon a site visit, a review of available historical documents, and a review of lists of environmentally impaired sites. No environmental samples, other than indoor air quality samples, were collected as part of this review. Chain-of-title documents were not provided for ENVIRON's review. Although, where possible, reasonable attempts were made to verify information provided to ENVIRON, this report is accurate and complete only to the extent that information provided to ENVIRON was itself accurate and complete. However, we have found no reason to question the information received.

Antecedent to this Introduction (Chapter 2.0), ENVIRON's conclusions are presented in Chapter 1.0. The findings for the Phase I/II environmental assessment for the Property are presented in Chapter 3.0. Limitations are presented in Chapter 4.0, and references are presented in Chapter 5.0.

2.4 Exceptions to/Deletions from ASTM Practice E 1527-00

Resumes for ENVIRON personnel conducting the assessment are not included in this report, but will be provided upon request. Due to security clearance restrictions, ENVIRON was able to access only a portion of Building C, located on the Property. No other exceptions to, or deletions from, ASTM Practice E 1527-00 were made during this assessment.

3.1.1.3 Utilities

Electricity, domestic water, and sewer services are provided to the Property by the Los Angeles Department of Water and Power (LADWP). Natural gas is supplied by the Southern California Gas Company.

3.1.2 Site Reconnaissance

As described previously, the Property consists of approximately 30 acres of land, improved with four office buildings and associated parking and landscaped areas. ENVIRON's site visit to the Property was conducted on December 18, 2001. ENVIRON was escorted during the visit by Ms. Samaniego of Insignia. Ms. Samaniego indicated that three of the Property buildings (A through C) were completely remodeled in the year 2000. According to Ms. Samaniego, all interior building materials, with the exception of the steel framing and concrete flooring were removed and the building interiors were re-built. The roofing materials also were reportedly removed and replaced during this remodeling. Light and other electrical fixtures, as well as plumbing also were replaced.

Ms. Samaniego indicated that ground water remediation has been ongoing during the year that she has managed the Property. She stated that approximately ten soil borings were drilled in the northwestern portion of the Property during the past month. Remedial activities and subsurface investigations at the Property are further discussed in Section 3.3.3 and Appendix D of this report.

Ms. Samaniego indicated that the buildings are comprised of office space and no manufacturing is conducted at the Property. She also indicated that no chemicals are stored or used on-site, other than janitorial supplies and a small amount of paint.

The four buildings at the Property are referred to as Buildings A through D. Building A has the address of 8501 Fallbrook Avenue and is located in the northeastern portion of the Property. Building A was previously known as Building 262, when occupied by Hughes Missile Systems Company (Hughes). This building has 157,674 square feet of rentable space covering 2½ floors. The ground floor is the ½ floor and is partially below grade. Building A has two hydraulic passenger elevators and one hydraulic freight elevator. Electrical rooms, janitorial rooms, and restrooms are located on each floor of the building. Building A is occupied by Xerox, Software Dynamics, and Countrywide, all of which use the space for offices. Asphalt paved parking areas are located to the east and north of the building.

Building B has the address of 8521 Fallbrook Avenue and is located in the southwestern portion of the Property. This building was previously known as Building 268, when occupied by Hughes. Building B has 153,892 rentable square feet covering 2½ floors. Again the ground floor is the ½ floor and is partially below grade. This building has two hydraulic passenger elevators and one hydraulic freight elevator. Electrical rooms, janitorial rooms, and restrooms are located on each floor of the building. This building is occupied by Pitney Bowes, IBM, Boeing, and Countrywide, all of which use the space for offices. One tenant suite in Building B is currently vacant, and was previously occupied by Vast Solutions, a paging company. Asphalt parking areas are located to the north and south of this building.

Building C has the address of 8531 Fallbrook Avenue and is located in the northwestern corner of the Property. This building was previously known as Building 270, when occupied by Hughes. Building C has 2 floors, with a portion of the ground floor located partially below grade. This building has 100,000 square feet of rentable space, all of which is occupied by Boeing. Only the entrance and front hallway of this building were accessible to ENVIRON during the site visit due to security clearance requirements. The portion accessed was observed to consist of office space and the remainder of the building is reportedly also used for offices. This building has two hydraulic passenger elevators and one hydraulic freight elevator. A diesel-operated emergency generator is located within a fenced enclosure at the southeastern exterior of the building. Asphalt parking areas are located to each side of this building. Numerous monitoring wells were observed in these parking areas.

Building D has the address of 8511 Fallbrook Avenue and is located in the north-central portion of the Property. This building was constructed during the year 2000, and was not a part of the former Hughes facility. Building D has 141,386 square feet of rentable space in four floors. An unfinished portion of the first floor (located in the south-central part of the building) is partially below grade, and was designed to be used as an auditorium. The interior spaces on the first floor, with the exception of the lobby, and the fourth floor have not been finished. The building is currently leased by Sterling Software/Computer Associates, which occupies the second floor. The first and fourth floors were also to be occupied by this tenant, however, construction has been halted. The third floor is subleased to Countrywide. The occupied areas of this building are used for office space. Two hydraulic passenger elevators and one hydraulic freight elevator are located in the building. Restrooms, electrical rooms, and janitorial rooms are located on each floor. A diesel-operated emergency generator and large electrical transformer are located in a fenced enclosure on the eastern exterior of this building. Asphalt parking areas are located to the north and west of the building.

As described above, asphalt parking areas are located adjacent to each of the buildings. Numerous ground water wells and former soil boring locations were observed in the northern and northwestern portions of the parking areas. These wells and borings are associated with past and current remediation activities at the Property (Figures 3 and 4). These activities are discussed further in Section 3.3.3 and Appendix D of this report.

A large landscaped area, consisting of grass, planters, a pond, and two streams, is located in the center of the Property, to the south of Building D, between Buildings A and B. According to Ms. Samaniego, the water in the pond and connected streams is recirculated through a biofilter, and no chlorine or other chemicals are used in the water. Landscaping services are provided by an on-site contractor which uses the West Hills Corporate Park site adjacent to the south of the Property to store equipment.

A water reclaim system, used for watering landscaped areas on the Property, is located along the northern Property boundary, to the north of Building D. The reclaim system is located within a fenced enclosure and consists of large water holding tanks and PVC piping. According to Ms. Samaniego, ground water extracted at the Property is processed through the system and delivered by PVC piping to planter areas throughout the Property. Based on information provided in the ground water monitoring and remediation reports reviewed for the Property, treated ground water is used for the irrigation of landscaping. Several steel drums, labeled "purge water" were observed within the fenced enclosure. Based on ENVIRON's observations at the time of the site visit, it appears that these drums are used during monitoring well sampling.

A fenced trash enclosure is also located along the northern Property boundary. Several trash dumpsters, placed in the enclosure area, are used by the Property tenants. Minor staining was observed on the asphalt beneath the dumpsters.

A remediation system is located in a locked, fenced enclosure along the northern Property boundary. This enclosure was not accessible at the time of the site visit, however portions were observed through the fencing. The systems appear to include several units labeled as "aqua scrub" and "carbon." According to Ms. Samaniego, ground water sampling and remediation activities currently are being conducted at the Property. These remediation activities are discussed further in Section 3.3.3.

As described above, Ms. Samaniego indicated that several soil borings were recently drilled along the northern portion of the parking area. Four roll-off bins and approximately 20 steel drums were observed in the area of the recent borings. The bins appear to contain soil, and the drums are labeled as containing "non-classified waste decon water." The drums and bins were placed on the asphalt surface without secondary containment; however, no sign of leaks or spills were observed around these containers at the time of ENVIRON's site visit.

3.1.2.1 Chemical Use and Chemical Waste Storage

Ms. Samaniego indicated that significant quantities of chemicals are not used at the Property. No chemical waste reportedly is generated at the Property, and no waste storage areas (other than municipal waste dumpsters) were observed during the site visit. Chemicals observed, or reported to be used on-site, consist of janitorial cleaners, small amounts of paint, hydraulic fluid for the elevators, and diesel in the emergency generators. Paint cans are stored in a small flammable cabinet in the maintenance room located in Building B. The paint reportedly is used for touch-up jobs only.

One 55-gallon drum of hydraulic fluid, without secondary containment, was observed in the elevator machine room in Building B. No containers of hydraulic fluid were observed in the elevator equipment rooms of the remaining buildings. ENVIRON did not observe staining on the concrete floor beneath or adjacent to the elevator equipment in the machine rooms during the site visit.

Diesel is stored in tanks that are an integral part of the emergency generators. Ms. Samaniego was not aware of the capacity of these tanks. No staining was observed on the raised concrete pads beneath the generators.

3.1.2.2 Non-Hazardous and Hazardous Solid Waste

No hazardous solid waste was observed or reported to be stored (with the exception of the possible hazardous drill cuttings generated from recent investigations at the Property). Non-hazardous waste observed at the Property consists of general office trash. This waste is collected in dumpsters located in the enclosure at the northern side of the Property, as described above. Minor staining was observed on the asphalt beneath the dumpsters.

3.1.2.3 Asbestos

Based on the construction date of Building D (built in 2000), it is unlikely that asbestos-containing materials (ACMs) were used in this building. As previously mentioned, Ms. Samaniego indicated that Buildings A through C were completely remodeled during 1999-2000. Several previous reports relating to asbestos surveys and abatement activities conducted in these buildings were provided for ENVIRON's review and are summarized in Appendix C of this report.

Based on a review of available reports, it appears that the majority of floor tiles and associated mastics and pipe, elbow, and tee insulation in the Property buildings were found to contain asbestos. Portions of the wall materials, exterior stucco (paint) materials, and roofing materials also were found to contain asbestos. As reported by Ms. Samaniego, all building materials, other than metal, wood, and concrete, reportedly were removed during recent remodeling activities. Ms. Samaniego also indicated the roofing materials were removed and replaced during the remodeling. Reports describing the abatement of various ACMs were reviewed (see Appendix C), however reports documenting the removal of all ACMs from the buildings were not provided to ENVIRON. A June 2000 Environmental Impact Report prepared by AllWest stated that a review of a November 1999 report by J&H indicated that *"all asbestos containing material identified in the interiors of the buildings"* (Buildings A and B at 8521 and 8531 Fallbrook Avenue) had been abated. During the site visit, the building materials observed appeared to have been installed recently, and ENVIRON believes it is unlikely that the current building materials contain ACMs.

3.1.2.4 Lead-Based Paint

Based on the construction date of Building D (built in 2000), it is unlikely that lead-based paint was used. As described above, Ms. Samaniego indicated that Buildings A through C were completely remodeled during 1999-2000. The only materials reportedly left in-place were metal, wood, and concrete, which were not painted. Property areas accessed during the site visit appeared to have been recently painted, and no areas of peeling or chipping paint were observed. Black paint was not observed during the site visit.

One report relating to paint sampling was provided to ENVIRON during the site visit. The report entitled "*Lead Inspection, Westhills Corporate Village, Building 8521,*" prepared by J&H, and dated November 15, 1999, was reviewed. Based on this

report, the paint sampled during this inspection was collected from the ceiling area on the first floor of Building B. Four bulk samples of the black paint were collected and found to contain between 0.050% and 0.056% lead. These results are below the Los Angeles County Department of Health Services and U.S. Department of Housing and Urban Development's standards for lead-based paint. No recommendations were included in the report.

3.1.2.5 Polychlorinated Biphenyls ("PCBs")

Small, dry-type transformers are located in various areas throughout the Property. Because the transformers are dry-type units, PCB-containing fluid is not expected to be present in the transformers.

Pad-mounted transformers are located within fenced enclosures adjacent to Buildings C and D. These transformers are not labeled, but are assumed to be owned by the electric utility company, LADWP. Ms. Samaniego indicated that the transformers were installed during the buildings' remodeling activities in 1999 or 2000. Based on this installation date, it is unlikely that the transformers are PCB-containing. No staining was observed on the concrete pads beneath and adjacent to the transformers.

Fluorescent light fixtures are present throughout the buildings at the Property. Ms. Samaniego indicated that the fixtures were installed during the remodeling conducted in 1999-2000. Based on this installation date, it is unlikely that these fixtures and ballasts contain PCBs.

3.1.2.6 Air Emissions

Air emissions sources observed at the Property appear to be limited to the two diesel emergency generators, which are only operated during routine testing and power outages. Emissions from the generators are expected to be limited in duration and quantity and are not expected to adversely affect soil and/or ground water underlying the Property. Permits for the generators, issued by the South Coast Air Quality Management District (SCAQMD), were observed at the Property.

In addition, the remediation system located at the Property likely generates air emissions and would, therefore, require a permit from the SCAQMD. ENVIRON was not provided with access to this system to check whether such a permit is posted near the equipment.

3.1.2.7 Wastewater Discharges

According to Ms. Samaniego, sources of wastewater generated at the Property consist of sanitary effluent from the sinks and toilets. Rainwater runoff on the western side of the Property is directed into concrete gutters that flow to an unlined creek located between the Property and adjacent residences. This creek was dry at the time of the site visit. Rainwater runoff on the remainder of the Property appears to flow toward the south and southeast, to street gutters.

Treated ground water arising from the remediation system is collected in the water reclaim system and used in the landscaped areas of the Property.

3.1.2.8 Soil and Ground Water Contamination

As previously mentioned, numerous monitoring wells are located at the Property. Moreover, evidence of previous soil borings was observed during the site visit. Ground water remediation activities currently are being conducted at the Property. Soil and ground water contamination at the Property is a result of past Property use by Hughes. The contamination and remediation activities are discussed in Section 3.3.3 and Appendix D of this report. No current Property uses that would contribute to soil or ground water contamination were observed by ENVIRON during the site visit.

3.1.2.9 Mold

During the site visit, ENVIRON observed the readily accessible areas of the Property buildings for indications of water stains and/or mold. No signs of such stains or mold were observed within the Property buildings at the time of the site visit. Additionally, Ms. Samaniego indicated that she is not aware of any such areas within the buildings, or of any current roof or pipe leaks.

Ms. Samaniego indicated that there had a been an area of mold previously identified in Building A, and provided ENVIRON with a report pertaining to the sampling of the mold. This area was identified due to visual observation from an employee. According to an April 9, 2001 letter report prepared by J&H regarding "mold inspection, sampling and report," an inspection for mold was conducted in Building A on March 30, 2001. The inspection included Cubicle 109A, the adjacent area, and Cubicle 112A. At the time of the inspection, no visible signs of mold reportedly were observed; however, three tape lift samples were collected from the carpet of the

above referenced areas. The sample collected from the carpet adjacent to cubicle 109A was found to have a minor, abundant, and major density of acremonium, aspergillus/penicillium, and hyphae, respectively. Penicilium phialides reportedly was also observed. The sample collected from the carpet beneath the desk in cubicle 109A was found to have a trace density of cladosporium, aspergillus/penicillium, and hyphae, and the sample collected from the carpet in cubicle 112A was found to have a trace density of cladosporium and hyphae. J&H concluded that "no toxic molds" were found. However, Ms. Samaniego stated that the materials in the area of concern were removed and the area was cleaned with a biocide substance.

3.1.3 Immediate Vicinity Reconnaissance

A reconnaissance of the immediate vicinity of the Property was conducted by ENVIRON on December 18, 2001. ENVIRON's reconnaissance of the immediate vicinity consisted of walk- and drive-by observations from the public streets. ENVIRON did not enter any sites near or adjacent to the Property. The immediate vicinity of the Property was observed to consist of residences, a park/recreation area, a reservoir, and office buildings. During ENVIRON's reconnaissance of the immediate vicinity, ENVIRON did not identify facilities that are listed in the EDR database report.

3.2 Indoor Air Sampling

ENVIRON conducted indoor air sampling in the four buildings at the Property to evaluate the potential health risks from VOCs to workers inside the buildings. This air monitoring was conducted on February 28 and March 14, 2002. On February 28, 2002, ENVIRON placed nine Summa canisters, with flow controllers, at the Property (see Figure 5). The sample locations included three on the ground floor of Building A, three on the ground floor of Building B, one on the ground floor of Building C, one at the exterior of Building C, and one on the ground floor of Building D. The sample located exterior to Building C malfunctioned, and the canister was not full after 8 hours, therefore, VOC detection limits for this sample were elevated. This sample was recollected on March 14, 2002. In all cases, the canisters were retrieved after approximately eight hours , and submitted to Performance Analytical Inc. Air Quality Laboratory (Performance) under chain-of-custody protocol for VOC analysis using EPA Method TO-15. Air samples were analyzed on an expedited turnaround.

Based on the analytical results, the following 12 compounds were detected at various concentrations in Buildings A, B, C, and/or D: acetone, benzene, chloromethane, methylene chloride, 2-butanone, o-xylene, ethylbenzene, 4-methyl-2-pentanone, toluene, tetrachloroethene, methyl-t-butyl ether (MTBE), and p/m-xylene. Tables summarizing sampling results, and the laboratory data report are

included in Appendix E. Using these data, ENVIRON calculated the average indoor concentration for each detected analyte, according to the building in which the samples were retrieved. The three samples obtained in Building A were retrieved in office working areas where employees could be expected to work an entire 8-hour day. The average compound concentration of each detected analyte in the three samples was calculated and assumed to be representative of the compounds' concentrations in Building A. Similarly, the average compound concentration of each detected analyte in the three samples obtained in Building B (office working areas) were assumed to be representative of the compound concentrations in Building B. In Building C, the representative compound concentrations were assumed to be the values obtained from the one indoor sample (C1) located in the building's front lobby. For the sole sample obtained from Building D, the concentrations observed from the sampling result were considered to be representative of average concentrations inside the building. Building D was under construction at the time of the sampling.

The average concentration of each detected VOC was compared to the 8-hr time-weighted-average (TWA) Permissible Exposure Level (PEL) specified by OSHA and/or the OSHA Limit for Air Concentrations specified in 29 CFR 1910.1000 Tables Z-1 and Z-2. For all 12 compounds in all four buildings, the representative concentrations were well below the OSHA thresholds.

To evaluate compliance with California Proposition 65 requirements, the 12 chemicals detected inside the buildings were compared with the Proposition 65 list of applicable chemicals for either developmental or carcinogenic effects listing. Two compounds were identified on the developmental effects listing: chloromethane and toluene. Three compounds were identified on the carcinogenic effects listing: benzene, methylene chloride, and tetrachloroethene.

Certain interpretations of Proposition 65 exposure thresholds employ a daily intake limitation, therefore as a conservative measure, daily human intake values were calculated as exposure through the inhalation pathway using the average concentration for each Proposition 65 listed VOC. The daily intake amount was calculated by multiplying the compound concentration by the amount of air an exposed human would breathe during the 8-hour exposure period (i.e., 10 cubic meters). The California Office of Environmental Health Hazard Assessment (OEHHA) has established the maximum allowable daily limit (MADL) for each compound with developmental effects and the no significant risk level (NSRL) for each listed carcinogenic compound. The MADL and NSRL are specified in the Proposition 65 Status Report, dated February 2001. The results of ENVIRON's evaluation are presented in Appendix E. The representative toluene concentrations were found to be less than the established MADL. As such, no further evaluation for toluene was necessary. The MADL for chloromethane has not yet been established and, therefore, the compound could not be evaluated. The representative methylene chloride concentrations were less than the established

NSRL. As such, no further evaluation for methylene chloride was necessary. The representative concentrations for benzene and tetrachloroethene were greater than the NSRLs in all four buildings. Therefore, the incremental lifetime cancer risks for benzene and tetrachloroethene were calculated for each building.

To conduct these calculations, ENVIRON used guidance provided by OEHHA, which calculates risk as the average chronic daily dose multiplied by the established cancer slope factor. A few conservative assumptions are utilized in the equation for calculating the average chronic daily dose, such as exposure duration, average body weight, and inhalation rate. For this evaluation, the average exposure duration was assumed to be 20.9 years of exposure in Buildings A, B, and C, using US EPA exposure factors. Since Building D was under construction, exposure duration of 2 years was assumed for a construction worker. As shown in data tables included in Appendix E, an exposure scenario was generated for each building, assuming an 8-hour day for 250 days per year for the exposure period, a daily exposure breathing volume of 10 cubic meters, and the average compound concentration for each building. In all scenarios, the calculated incremental cancer risks were below 1 in 100,000 (i.e., 1.0 E-05). Given these exposure scenarios, Proposition 65 requirements are not applicable for benzene and tetrachlorothene inside the buildings.

3.3 Historical Review

To evaluate the historical uses of the Property, ENVIRON reviewed topographic maps (dated 1903, 1947, and 1967), historic aerial photographs (dated 1928, 1952, 1965, 1976, 1989, and 1994), and city directories (dated 1920 to 2000). Sanborn maps were also requested from EDR. EDR indicated that Sanborn maps were not available for the Property. ENVIRON also conducted an interview with Ms. Samaniego, the current Property manager, and reviewed numerous reports pertaining to the Property. The results of ENVIRON's historical review are presented below.

3.3.1 Historical Operations Interview

During the site visit, ENVIRON interviewed Ms. Samaniego regarding the history of the Property. Ms. Samaniego indicated that the Property was previously owned and occupied by Hughes, then later owned by Coast Federal Savings. The Property is currently owned by West Hills Corporate Village/Shamrock. As discussed previously, Ms. Samaniego indicated that Buildings A through C had been completely remodeled during 1999-2000 and all interior building materials, with the exception of concrete floors and framing, had been removed. Ms. Samaniego also indicated that Building D was constructed in 2000. According to Ms. Samaniego, tenants occupying the Property buildings since the time of the remodeling have

used the spaces for offices, and no manufacturing or chemical use are conducted at the Property.

Ms. Samaniego indicated that additional soil borings had been drilled in the northern portion of the Property during the past month, and that she has been told that the current remediation activities will be completed within approximately the next two years.

3.3.2 Chronological Summary of Historical Topographic Maps, Aerial Photographs, and City Directories

- The 1903 topographic map depicts the Property and surrounding areas as vacant, undeveloped land. The roads currently adjacent to the Property and the reservoir are not shown on this map. The vicinity is depicted as primarily undeveloped land.

- The Property address of 8501 Fallbrook Avenue was not listed in the city directories dated from 1920 to 2000. The surrounding site addresses were not listed in the city directories dated from 1920 to 1961.

- In the 1928 aerial photographs, the Property and adjacent area appear to be agricultural land. Unpaved roads are visible to the east and south of the Property. The vicinity is primarily agricultural land.

- The 1947 topographic map shows the Property as vacant, undeveloped land. Fallbrook Avenue is depicted as an unpaved road adjacent to the east of the Property. Several residential-type structures are shown beyond this road to the east. The Chatsworth Reservoir is depicted to the north of the Property, and vacant, undeveloped land is shown to the west and south. Roscoe Boulevard is depicted further south. The Property vicinity land use is shown as a mixture of agriculture, undeveloped land, and scattered residences.

- In the 1952 aerial photograph, the Property appears to be agricultural land. An unpaved road is located adjacent to the north and west of the Property, and Fallbrook Avenue is visible to the east. Undeveloped land and a small lake are visible to the west of the Property. The Chatsworth Reservoir is located to the north of the Property, north of the unpaved road. Several small structures, which are likely related to the apparent agricultural activities, are located to the south and southeast of

the Property. The remainder of the land to the south of the Property and the vicinity also appears to be used for agricultural purposes.

- Residences are listed in the 1962 city directory for surrounding sites. Surrounding site addresses were not listed in the city directories dated from 1963 to 1969.

- Three of the current Property buildings are visible in the 1965 aerial photograph. Associated paved parking areas are discernable to the east and west of the buildings. Additional commercial structures and parking areas (which appear to be part of the same complex as the Property) are located to the south. A small commercial structure and an apparent residential development are visible to the east of the Property, beyond Fallbrook Avenue. Undeveloped land and a small lake are visible to the west of the Property. Other than the large structures observed south of the Property, the vicinity appears to have been primarily developed for residential uses.

- Three structures are depicted on the 1967 topographic map at the Property. The structures correspond to the current buildings (Buildings A and C). An unnamed road, then the Chatsworth Reservoir, is shown to the north of the Property. Fallbrook Avenue is depicted to the east of the Property, with several small structures, one larger commercial structure and a residential development shown further east. Undeveloped land and Lees Lake are to the west of the Property, with a residential development further west. The vicinity is primarily residential, with scattered areas of agricultural use.

- In the 1970 city directory, the neighboring site address of 8500 Fallbrook Avenue was listed as North American Rockwell and "Rocketdyne/A Division of North America."

- The surrounding site addresses are not listed in the 1971 to 1990 city directories.

- No major changes were noted in the 1976 aerial photograph from the 1965 photograph, with the exception of a residential development to the west of the Property, surrounding the small lake. The Property and vicinity appear to have changed from the 1976 to the 1989 aerial photograph..

- Residences were listed in the 1991 and 1995 city directories for neighboring sites. Surrounding site addresses were not listed in the 2000 city directory.

- The 1994 aerial photograph shows the Property as it is currently developed. The adjacent areas and vicinity appear similar to the 1989 photograph.

3.3.3 Previous Reports Review

ENVIRON reviewed numerous prior reports that included information regarding historical uses of, and activities conducted at, the Property. A detailed summary of each report/letter reviewed by ENVIRON is presented in Appendix D.

3.3.4 Summary of Historical Reviews

Based on available historical aerial photographs and topographic maps, the Property and vicinity appear to have been used for agricultural purposes from the early 1900s to the late 1950s. The first structures were built at the Property in 1959 and were used by several occupants. The historical documents reviewed did not provide details of the operations conducted at the Property from 1959 to 1966. Hughes first occupied the Property in 1966 and was the sole occupant of the Site from 1976 to 1994.

Hughes operations were mainly related to aerospace research and development programs. Six buildings were located at the Property (Buildings 262, 268, 269, 270, 272, and 282); activities conducted in these buildings included solvent cleaning, painting, coating, lubricating, etching, degreasing, soldering, as well as laboratory and garage/repair shop operations. The Property buildings were damaged during the 1994 Northridge earthquake, and it appears from review of various documents, that the buildings were then vacated due to this damage. In November 1995, the Hughes facility, including the Property and adjacent areas to the south, were purchased by Coast Federal Bank. The Property was then sold to Regent Properties, Inc. (Regent) in 1997. During 1997 and/or 1998, Buildings 269, 272, and 282 were demolished. Shamrock later purchased Regent, and the Property is currently owned by West Hills Corporate Village/Shamrock. Only Buildings 262, 268, and 270 remain from the original buildings.

A hazardous waste storage shed also was located at the northern boundary of the Property. Eight USTs were located at the Property (Tanks T-1 to T-4, T-12 to T-14, and T-17). Most of these tanks have been removed; tank T-4 was abandoned in-place; and, according to McLaren/Hart tank T-14 actually was an aboveground storage tank. Soils in the vicinity of these tanks reportedly were impacted by VOCs. The local regulatory agency has not issued closure letters for the USTs.

Two clarifiers were present immediately east of Building 269 (which has been demolished). Soil and ground water investigations have been conducted in the areas surrounding the clarifiers; however, it appears that the clarifiers were backfilled and capped in-place (it is not clear whether they were subsequently removed). A clarifier reportedly also was located in or immediately north of Building 268; according to McLaren/Hart, this clarifier was located on the second floor of the building and received only photographic laboratory effluent. A system of pits and trenches were also located in Building 268. Soil samples in this area showed no detectable contamination; therefore, the pits and trenches were backfilled with sand or slurry and covered with a concrete cap. A large cooling pond reportedly was located between Buildings 268 and 269.

Based on information contained in the Order issued by the LARWQCB in December 1994, in 1985 Hughes discovered that soil and ground water at the Site were impacted with VOCs. Since then, numerous investigations have been conducted to delineate the nature and extent of these impacts. Three areas of the Site are known to be contaminated: (1) Northwestern corner from Building 269 to western edge of the Site (northwestern part of the Property); (2) area of monitoring well CM-8D (outside the Property to the south); and (3) area of monitoring well CM-10 (outside the Property to the south).

In 1990, Hughes and the DTSC entered into a consent agreement whereby Hughes would comply with LARWQCB requirements for the ground water remediation and monitoring at the Site. A CAP was prepared in 1992, and amended in 1994. In 1995, DTSC and the LARWQCB agreed to include the Site on the SB1082 list. It appears that the LARWQCB has provided oversight for the soil and ground water remediation at the Site, while DTSC is the lead agency for RCRA closure at the Site. Two RCRA permitted facilities were located at the Property: Tank T-3 and the HWSA. In a 1995 memorandum, DTSC outlined seven AOCs at the Property: Buildings 272/282, portions of Building 262, Building 268, Building 269, Building 270, Tank T-12, and Tanks T-14/T-16. In addition, several SWMUs were identified at the Property. ENVIRON has not been able to find one document that details all the SWMUs, but based on available records, the following were identified: SWMU#1 at Building 272, SWMU#2 at Building 282, SWMU#3 at Building 269 P-1 and P-2, and SWMU#6 at Tanks T-1/T-2 and associated pump area.

Correspondence from DTSC indicates that the agency has not been fully satisfied with the investigations of the AOCs, the closure of the SWMUs, or post closure of the HWMU. In a letter dated March 12, 1999, DTSC indicated that Raytheon's (Raytheon purchased Hughes

in 1997) approach thus far of investigating small portions of the Facility and submitting such data to DTSC for closure of SWMUs or AOCs was not adequate. DTSC was requiring a RCRA Facility Investigation Workplan, which summarized all SWMUs, AOCs, and HWMUs identified at the Facility and investigations and corrective actions conducted to date. DTSC would then work with Raytheon to prioritize these areas. However, since Raytheon had elected to stop its fee-for-service agreement with DTSC, DTSC staff could not perform significant work on the corrective action activities. DTSC further indicated that Raytheon was in violation of requirements to submit post-closure permit application for Tank T-3.

As previously mentioned, the Property is undergoing remediation. The remediation system includes a ground water recovery system consisting of 17 recovery wells (first started in February 1995 and fully operational since March 1995); the treated effluent is reused for on-site irrigation purposes. An SVE system, which has operated since August 1995, included 54 manifolded extraction wells. The air sparging system operated since March 1996 and consisted of 30 manifolded wells, which are connected to an air compressor. A dual-phase treatment system was tested at the Property in 1999, but has not been fully implemented. Since late 1999, the SVE and air sparging wells have not been in operation. Moreover, as of December 2000, only ten recovery wells have been connected to the treatment system at the Property.

In a letter dated October 12, 1995, the DTSC indicated that initially soil and ground water cleanup standards were established for the Site (1992 CAP) based on the lowest numbers produced from a health risk assessment, background measurement, or MCLs. Based on ENVIRON's review of available documents, the ground water cleanup goals appeared to be 10 times greater than the MCL, and soil cleanup goals were established for total chlorinated VOCs at 100 milligrams per kilogram (mg/kg).

The main chlorinated VOCs detected in soils and ground water at the Property are dichloroethene (DCE), 1,1-dichloroethane (1,1-DCA), 1,2-dichloroethane (1,2-DCA), Tetrachloroethene (PCE), trichloroethane (TCA), and trichloroethene (TCE). In addition, benzene is detected in several wells, and is known to be present in soils near former tanks. Based on the latest available ground water monitoring report (June 2001), DCE, 1,1-DCA, and benzene are still detected in several wells at concentrations exceeding the CAP cleanup goals; however, in general VOCs concentrations have been declining in the monitored wells, which shows progress towards Site cleanup.

During the demolition of the HWSA in June 1998, hexavalent chromium contamination was encountered in soils in this area. At that time, Fluor Daniel/Groundwater Technology, Inc. (FD/GTI) did not recommend any additional subsurface investigation or soil removal because the hexavalent chromium contaminated soils were encountered at minimal depths of 5 to 13 feet bgs. Furthermore, FD/GTI indicated that future grading in this area would raise the ground surface by approximately 5 feet. Therefore, FD/GTI did not believe that the hexavalent chromium encountered in the soils would pose a health threat. FD/GTI recommended sampling monitoring wells located up- and down-gradient of the former HWSA for hexavalent chromium on a quarterly basis for a period of one year to evaluate whether the impacted soils would result in impact to ground water. In its March 1999 letter, the DTSC indicated that Raytheon's plan to keep hexavalent chromium contaminated soils in-place and monitor the ground water in this area was not acceptable.

In 1999, hexavalent chromium was detected in three ground water samples collected from Well RW-15, with concentrations ranging from 0.083 to 0.1 milligrams per liter (mg/L). RW-15 is located adjacent to the former HWSA. RW-15 was disconnected from the remediation system and the LARWQCB and DTSC were notified. Seven ground water monitoring wells were installed in proximity to the HWSA in June of 2000, and monitoring for the presence of hexavalent chromium. Sampling results indicated that the MCL for hexavalent chromium, currently 50 micrograms per liter (µg/l), was exceeded at two monitoring wells (MW-32S and MW-32D), both located within the footprint of the former HWSA. It should be noted that the California Environmental Protection Agency Office of Environmental Health Hazard Assessment (OEHHA) is reviewing the public health goal (PHG) and drinking water standard for hexavalent chromium, and the standards may be decreased in 2003.

3.4 Regulatory Review

To assess the potential for soil and/or ground water contamination at the Property due to on- and off-site sources, ENVIRON conducted a review of federal and state regulatory agency database lists of environmentally impacted sites. Sites from the searched databases are summarized in Table 1 in Section 3.4.3.

3.4.1 Geologic and Hydrogeologic Setting

In the evaluation of the potential for environmental problems from other sites to impact the Property, one must consider the possibility that ground water could transport contamination from sites in the vicinity to the Property. Therefore, the depth and flow direction of ground

water are important. To evaluate the possibility of migration of contaminants from other sites onto the Property, this section presents a discussion regarding the geologic and hydrogeologic setting of the Property.

The geologic and hydrogeologic setting at the Property presented below is generated from a review of numerous previous reports. The Property overlies consolidated bedrock of the Miocene Modelo Formation, over the Lower Miocene-aged Topanga Formations. The Modelo Formation consists of siltstone, clayey siltstone and shale with minor interbedded diatomaceous shale. Soils at the Property and vicinity are comprised of Cenozoic-aged Basin fill, which consists of flat-lying, poorly sorted unconsolidated sands, silts, and clays, with some gravels. A layer of construction fill lies above the native soils.

Shallow ground water is encountered at the Property at depth of 15 to 50 feet bgs. Ground water flow direction across the Property is generally to the south and southeast, however the flow is to the southwest in the northwestern portion of the Property (influenced by the remediation system).

3.4.2 Regulatory Agency File Review

ENVIRON requested, through Environmental Support Services of Santa Ana, California (ESS), information regarding the Property address of 8501 Fallbrook Avenue from the Los Angeles County Environmental Health Department, City of Canoga Park Fire Department, and the City of Canoga Park Building Department. According to ESS, the Health Department and Fire Department did not have files for this address. The Building Department files included a demolition permit for Building 269 (previously located on the Property, adjacent to Building 270, currently Building C). The permit was issued in October 1997 to Coast Federal Bank.

ESS also requested information from the above agencies for the former Property address of 8433 Fallbrook Avenue. ESS has not provided ENVIRON with this information as of the date of this report.

ENVIRON also reviewed available files pertaining to the Property, at the LARWQCB. ENVIRON reviewed available reports for the Property provided by Trammel Crow and Insignia. These documents are summarized in Appendix D.

3.4.3 Regulatory Agency Databases

EDR conducted an environmental regulatory agency database search of sites located within the ASTM radii from the Property. The EDR report is presented in Appendix B. Findings of the database search for sites within the search radii required by ASTM are presented in this section.

The EDR report indicated there was poor or inadequate address information for several sites located in the vicinity of the Property; therefore, these sites could not be mapped by EDR. Because the location of these sites with respect to the Property could not be evaluated, ENVIRON is limited in its ability to express an opinion regarding the potential for impact to the Property from these sites. However, ENVIRON reviewed the list of unmappable sites and could not identify sites located adjacent to the Property that were listed as environmentally impaired.

In this section, only facilities that were listed on databases of environmentally impaired sites, and that are located in the immediate vicinity of the Property or are located upgradient (but are not necessarily located near the Property) are discussed. These facilities were selected based on the assumption that a hazardous material released to the subsurface generally does not migrate laterally within the unsaturated soil for a significant distance, but a hazardous material can migrate in the ground water in a generally downgradient direction; however, there are limitations to this interpretation. A list of these facilities is presented in Table 1.

TABLE 1

Regulatory Data Base Search Results

Site	Location Relative to Property	Data Base(s) Listings	Regulatory Status/ Comments
LA City Fire Station #106 23004 Roscoe Boulevard	Approximately 1/6 mile southwest	LUST RCRIS FINDS HAZNET	This facility is listed as having had a tank release, which occurred during repair and impacted soils. No action reportedly has been taken by the responsible party. This facility is also reported to be a small quantity generator of hazardous waste, with wastes listed as unspecified aqueous solution, unspecified oil-containing waste, asbestos-containing waste, and tank bottom waste.
Missile Systems Group/Hughes	Former Property and	HIST UST FINDS	Facility is listed as having had 14 USTs, which stored gasoline, waste, and other

TABLE 1

Regulatory Data Base Search Results

Site	Location Relative to Property	Data Base(s) Listings	Regulatory Status/ Comments
Aircraft Company 8433 Fallbrook Avenue	southern adjacent area	RCRIS RCRIS-TSD CORRACTS CERC-NFRAP Cal-Sites Cortese LUST	substances. A solvents tank release reportedly impacted the ground water. The abatement method for the site is described as excavation and disposal of contaminated soil, and the status is listed as remedial action in progress. The Facility was assigned a low corrective action priority on the CORRACTS database, and has a status of "no further remedial action planned on the CERCLIS database." The Cal-Sites listing indicates that DTSC action is not required, and the case has been referred to a RCRA lead. The Facility is a large quantity generator of hazardous waste and a TSD facility. Violations are reported as "TSD-other requirements," "TSD-closure/post closure requirements," and "TSD-financial responsibility requirements."
Hughes Aircraft Company/Missile Systems group 8433 Fallbrook Avenue	Former Property and southern adjacent area	CA FID UST HIST UST	This facility is listed as an inactive UST location, that had three waste USTs installed in 1981.

The former occupant of the Property, Hughes, is identified on several databases. These listings appear to include the former Hughes facility at the Property and southern adjacent area. As discussed in Section 3.3.3 and 3.3.4, remediation activities currently are being conducted at the Property.

Listings on the UST, RCRIS, HAZNET, ERNS, or FINDS databases are not necessarily indicative of environmental impairment at a facility, therefore facilities listed on those databases are not included in the table above. As indicated above, there is one LUST listing identified as being located in proximity of the Property. However, this facility is located downgradient of the Property, and therefore, is not expected to have adversely impacted the Property.

3.4.4 Munger Map Book

According to the 2001 Munger Map Book of California and Alaska Oil and Gas Fields, oil or gas wells are not located, and were not previously located, on or within ½ mile of the Property.

3.4.5 Radon

Based on radon information included in the EDR database report, the Property is located in an area noted as Zone 2. Zone 2 has average indoor radon levels of greater than 2 pico Curies per liter (pCi/L) and less than 4 pCi/L. The continuous exposure limit established by the EPA is 4.0 pCi/L, which is the limit at which further testing or remedial action is indicated.

The radon survey results listed in the EDR report cannot predict the radon exposure level measurement in any existing or future buildings at the Property. The only way to determine the amount of radon present in a particular structure is to conduct a radon survey in that structure. However, the results detected in the survey are indicative of similar results that could be expected from a survey conducted at other locations and at other times within this same region, which includes the Property.

4.0 LIMITATIONS

This Assessment has been prepared exclusively for use by AMLGM and MEPT and may not be relied upon by any other person or entity without ENVIRON's express written permission. The conclusions presented in this report represent ENVIRON's professional judgment based upon the information available to us and conditions existing as of the date of the Assessment, and are true and correct to the best of ENVIRON's knowledge as of the date of the Assessment. Future conditions may differ from those described herein and this report is not intended for use in future evaluations of the Property. In performing its assignment, ENVIRON must rely upon publicly available information, information provided by the client, and information provided by third parties. Accordingly, the conclusions in the report are valid only to the extent that the information provided to ENVIRON was accurate and complete. ENVIRON does not make any warranties or representations, whether expressed or implied, regarding the accuracy of such information, and shall not be held accountable or responsible in the event that any such inaccuracies are present.

This report is not intended as a substitute for legal advice. Nor is it an exhaustive review of site conditions. ENVIRON makes no representations or warranties about the condition of the Property.

ENVIRON performed the activities cited herein in conformance with the ASTM Practice E 1527-00 for Phase I environmental site assessments. The work was conducted objectively in accordance with generally accepted professional practice standards for this type of work. ENVIRON's scope of work for this assignment did not include collecting samples of any environmental media. As such, this Assessment cannot rule out the existence of latent conditions, and is intended, consistent with normal standards of practice and care, to assist the client in identifying the risks of such conditions.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

TARGET PROPERTY INFORMATION

ADDRESS

8501 FALLBROOK AVENUE
CANOGA PARK, CA 91304

COORDINATES

Latitude (North):	34.220100 - 34° 13' 12.4"
Longitude (West):	118.624000 - 118° 37' 26.4"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	350404.2
UTM Y (Meters):	3787558.0

USGS TOPOGRAPHIC MAP ASSOCIATED WITH TARGET PROPERTY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the ASTM E 1527-00 search radius around the target property for the following databases:

FEDERAL ASTM STANDARD

NPL..... National Priority List
Proposed NPL..... Proposed National Priority List Sites
CERCLIS..... Comprehensive Environmental Response, Compensation, and Liability Information System
ERNS..... Emergency Response Notification System

STATE ASTM STANDARD

AWP..... Annual Workplan Sites
CHMIRS..... California Hazardous Material Incident Report System
Notify 65..... Proposition 65 Records
Toxic Pits..... Toxic Pits Cleanup Act Sites
SWF/LF..... Solid Waste Information System
WMUDS/SWAT..... Waste Management Unit Database
CA BOND EXP. PLAN..... Bond Expenditure Plan
UST..... List of Underground Storage Tank Facilities

FEDERAL ASTM SUPPLEMENTAL

CONSENT..... Superfund (CERCLA) Consent Decrees

EXECUTIVE SUMMARY

ROD..... Records Of Decision
Delisted NPL..... National Priority List Deletions
FINDS..... Facility Index System/Facility Identification Initiative Program Summary Report
HMIRS..... Hazardous Materials Information Reporting System
MLTS..... Material Licensing Tracking System
MINES..... Mines Master Index File
NPL Liens..... Federal Superfund Liens
PADS..... PCB Activity Database System
RAATS..... RCRA Administrative Action Tracking System
TRIS..... Toxic Chemical Release Inventory System
TSCA..... Toxic Substances Control Act
FTTS..... FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)

STATE OR LOCAL ASTM SUPPLEMENTAL

AST..... Aboveground Petroleum Storage Tank Facilities
CLEANERS..... Drycleaner Facilities
CA WDS..... Waste Discharge System
CA SLIC..... Spills, Leaks, Investigation & Cleanup Cost Recovery Listing
LOS ANGELES CO. HMS.... HMS: Street Number List
LA Co. Site Mitigation..... Site Mitigation List
AOCONCERN..... San Gabriel Valley Areas of Concern

EDR PROPRIETARY DATABASES

Coal Gas..... Former Manufactured Gas (Coal Gas) Sites

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS 1 degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. EDR's definition of a site with an elevation equal to the target property includes a tolerance of +/- 10 feet. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property (by more than 10 feet). Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

CERCLIS-NFRAP: As of February 1995. CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund Action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to

promote economic redevelopment of unproductive urban sites.

A review of the CERC-NFRAP list, as provided by EDR, and dated 07/12/2001 has revealed that there is 1 CERC-NFRAP site within approximately 0.375 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2N*	*B6*	*13*

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 09/20/2001 has revealed that there is 1 CORRACTS site within approximately 1.125 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2N*	*B6*	*13*

RCRIS: The Resource Conservation and Recovery Act database includes selected information on sites that generate, store, treat, or dispose of hazardous waste as defined by the Act. The source of this database is the U.S. EPA.

A review of the RCRIS-TSD list, as provided by EDR, and dated 06/21/2000 has revealed that there is 1 RCRIS-TSD site within approximately 0.625 miles of the target property.

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, has revealed that there are 3 Cortese sites within approximately 1.125 miles of the target property.

STATE OR LOCAL ASTM SUPPLEMENTAL

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, has revealed that there are 2 HAZNET sites within approximately 0.25 miles of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List
Source: EPA
Telephone: N/A
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/26/01
Date Made Active at EDR: 08/28/01
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 08/06/01
Elapsed ASTM days: 22
Date of Last EDR Contact: 11/05/01

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 07/12/01
Date Made Active at EDR: 10/16/01
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 09/24/01
Elapsed ASTM days: 22
Date of Last EDR Contact: 09/24/01

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 07/12/01
Date Made Active at EDR: 10/16/01
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 09/24/01
Elapsed ASTM days: 22
Date of Last EDR Contact: 09/24/01

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 09/20/01
Date Made Active at EDR: 10/30/01
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 09/24/01

Date of Last EDR Contact: 09/11/01

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-424-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 06/21/00
Date Made Active at EDR: 07/31/00
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 07/10/00
Elapsed ASTM days: 21
Date of Last EDR Contact: 11/07/01

ERNS: Emergency Response Notification System
Source: EPA/NTIS
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 08/08/00
Date Made Active at EDR: 09/06/00
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 08/11/00
Elapsed ASTM days: 26
Date of Last EDR Contact: 10/25/01

FEDERAL ASTM SUPPLEMENTAL RECORDS

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/99
Database Release Frequency: Biennially
Date of Last EDR Contact: 09/18/01
Date of Next Scheduled EDR Contact: 12/17/01

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: N/A
Database Release Frequency: Varies
Date of Last EDR Contact: N/A
Date of Next Scheduled EDR Contact: N/A

ROD: Records Of Decision
Source: NTIS
Telephone: 703-416-0223
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 09/30/00
Database Release Frequency: Annually

Date of Last EDR Contact: 10/09/01
Date of Next Scheduled EDR Contact: 01/07/02

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: N/A
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/26/01
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 11/05/01
Date of Next Scheduled EDR Contact: 02/04/02

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report
Source: EPA
Telephone: N/A
Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 07/13/01
Database Release Frequency: Quarterly

Date of Last EDR Contact: 10/08/01
Date of Next Scheduled EDR Contact: 01/07/02

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4526
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 05/31/01
Database Release Frequency: Annually

Date of Last EDR Contact: 10/22/01
Date of Next Scheduled EDR Contact: 01/21/02

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 05/29/01
Database Release Frequency: Quarterly

Date of Last EDR Contact: 10/08/01
Date of Next Scheduled EDR Contact: 01/07/02

Telephone: 205-564-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Last EDR Contact: 08/21/01
Date of Next Scheduled EDR Contact: 11/19/01

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-260-3936
PCB Activity Database. PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 03/30/01
Database Release Frequency: Annually
Date of Last EDR Contact: 10/25/01
Date of Next Scheduled EDR Contact: 11/12/01

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95
Database Release Frequency: No Update Planned
Date of Last EDR Contact: 09/13/01
Date of Next Scheduled EDR Contact: 12/10/01

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-260-1531
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/99
Database Release Frequency: Annually
Date of Last EDR Contact: 09/24/01
Date of Next Scheduled EDR Contact: 12/24/01

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-1444
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/98
Database Release Frequency: Every 4 Years

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

STATE OF CALIFORNIA ASTM STANDARD RECORDS

AWP: Annual Workplan Sites
Source: California Environmental Protection Agency
Telephone: 916-323-3400
Known Hazardous Waste Sites. California DTSC's Annual Workplan (AWP), formerly BEP, identifies known hazardous substance sites targeted for cleanup.

Date of Government Version: 11/08/00
Date Made Active at EDR: 03/02/01
Database Release Frequency: Annually
Date of Data Arrival at EDR: 01/31/01
Elapsed ASTM days: 30
Date of Last EDR Contact: 10/30/01

CAL-SITES: Calsites Database
Source: Department of Toxic Substance Control
Telephone: 916-323-3400
The Calsites database contains potential or confirmed hazardous substance release properties. In 1996, California EPA reevaluated and significantly reduced the number of sites in the Calsites database.

Date of Government Version: 10/01/00
Date Made Active at EDR: 11/22/00
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 10/30/00
Elapsed ASTM days: 23
Date of Last EDR Contact: 10/16/01

CHMIRS: California Hazardous Material Incident Report System
Source: Office of Emergency Services
Telephone: 916-464-3283
California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

Date of Government Version: 12/31/94
Date Made Active at EDR: 04/24/95
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 03/13/95
Elapsed ASTM days: 42
Date of Last EDR Contact: 08/29/01

CORTESE: "Cortese" Hazardous Waste & Substances Sites List
Source: CAL EPA/Office of Emergency Information
Telephone: 916-327-1848
The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

Date of Government Version: 04/01/01
Date Made Active at EDR: 07/26/01
Database Release Frequency: Varies
Date of Data Arrival at EDR: 05/29/01
Elapsed ASTM days: 58
Date of Last EDR Contact: 10/30/01

NOTIFY 65: Proposition 65 Records
Source: State Water Resources Control Board
Telephone: 916-657-0696
Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

Date of Government Version: 10/21/93
Date Made Active at EDR: 11/19/93
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 11/01/93
Elapsed ASTM days: 18
Date of Last EDR Contact: 10/22/01

TOXIC PITS: Toxic Pits Cleanup Act Sites
Source: State Water Resources Control Board
Telephone: 916-227-4364
Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

Date of Government Version: 07/01/95
Date Made Active at EDR: 09/26/95
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 08/30/95
Elapsed ASTM days: 27
Date of Last EDR Contact: 11/05/01

SWF/LF (SWIS): Solid Waste Information System
Source: Integrated Waste Management Board
Telephone: 916-341-6320
Active, Closed and Inactive Landfills. SWF/LF records typically contain an inve ntory of solid waste disposal facilities or landfills. These may be active or i nactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 09/20/01
Date Made Active at EDR: 10/19/01
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 09/21/01
Elapsed ASTM days: 28
Date of Last EDR Contact: 09/21/01

WMUDS/SWAT: Waste Management Unit Database
Source: State Water Resources Control Board
Telephone: 916-227-4448
Waste Management Unit Database System. WMUDS is used by the State Water Resources Control Board staff and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. WMUDS is composed of the following databases: Facility Information, Scheduled Inspections Information, Waste Management Unit Information, SWAT Program Information, SWAT Report Summary Information, SWAT Report Summary Data, Chapter 15 (formerly Subchapter 15) Information, Chapter 15 Monitoring Parameters, TPCA Program Information, RCRA Program Information, Closure Information, and Interested Parties Information.

Date of Government Version: 04/01/00
Date Made Active at EDR: 05/10/00
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 04/10/00
Elapsed ASTM days: 30
Date of Last EDR Contact: 09/13/01

LUST: Leaking Underground Storage Tank Information System
Source: State Water Resources Control Board
Telephone: 916-445-6532
Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

Date of Government Version: 08/07/01
Date Made Active at EDR: 09/07/01
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 08/09/01
Elapsed ASTM days: 29
Date of Last EDR Contact: 11/08/01

CA BOND EXP. PLAN: Bond Expenditure Plan
Source: Department of Health Services
Telephone: 916-255-2118
Department of Health Services developed a site-specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds. It is not updated.

Date of Government Version: 01/01/89
Date Made Active at EDR: 08/02/94
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 07/27/94
Elapsed ASTM days: 6
Date of Last EDR Contact: 05/31/94

CA UST:

UST: Active UST Facilities
Source: SWRCB
Telephone: 916-341-5700
Active UST facilities gathered from the local regulatory agencies

Date of Government Version: 10/30/01
Date Made Active at EDR: 11/14/01
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 11/05/01
Elapsed ASTM days: 9
Date of Last EDR Contact: 10/15/01

CA FID UST: Facility Inventory Database
Source: California Environmental Protection Agency
Telephone: 916-445-6532
The Facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resource Control Board. Refer to local/county source for current data.

Date of Government Version: 10/31/94
Date Made Active at EDR: 09/29/95
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 09/05/95
Elapsed ASTM days: 24
Date of Last EDR Contact: 12/28/98

HIST UST: Hazardous Substance Storage Container Database
Source: State Water Resources Control Board
Telephone: 916-227-4408
The Hazardous Substance Storage Container Database is a historical listing of UST sites. Refer to local/county source for current data.

Date of Government Version: 10/15/90
Date Made Active at EDR: 02/12/91
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 01/25/91
Elapsed ASTM days: 18
Date of Last EDR Contact: 07/26/01

STATE OF CALIFORNIA ASTM SUPPLEMENTAL RECORDS

AST: Aboveground Petroleum Storage Tank Facilities
Source: State Water Resources Control Board
Telephone: 916-227-4382
Registered Aboveground Storage Tanks.

Date of Government Version: 08/21/01
Database Release Frequency: Quarterly
Date of Last EDR Contact: 11/05/01
Date of Next Scheduled EDR Contact: 02/04/02

CLEANERS: Drycleaner Facilities
Source: Department of Toxic Substance Control
Telephone: 916-225-0873
A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaner's agents; linen supply; coin-operated laundries and cleaning; drycleaning plants, except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

Date of Government Version: 07/27/01
Database Release Frequency: Annually
Date of Last EDR Contact: 10/08/01
Date of Next Scheduled EDR Contact: 01/07/02

CA WDS: Waste Discharge System
Source: State Water Resources Control Board
Telephone: 916-657-1571
Sites which have been issued waste discharge requirements.

Date of Government Version: 07/19/01
Database Release Frequency: Quarterly
Date of Last EDR Contact: 09/25/01
Date of Next Scheduled EDR Contact: 12/24/01

HAZNET: Hazardous Waste Information System
Source: California Environmental Protection Agency
Telephone: 916-255-1136
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

Date of Government Version: 12/31/00
Database Release Frequency: Annually
Date of Last EDR Contact: 08/17/01
Date of Next Scheduled EDR Contact: 11/12/01

EDR PROPRIETARY DATABASES

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

HISTORICAL AND OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 1999 from the U.S. Fish and Wildlife Service.

GEOCHECK®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

PARCEL C
8501 FALLBROOK AVENUE
CANOGA PARK, CA 91304

TARGET PROPERTY COORDINATES

Latitude (North):	34.220100 - 34° 13' 12.4"
Longitude (West):	118.624001 - 118° 37' 26.4"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	350404.2
UTM Y (Meters):	3787558.0

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

USGS TOPOGRAPHIC MAP ASSOCIATED WITH THIS SITE

Target Property: 2434118-B5 CANOGA PARK, CA
Source: USGS 7.5 min quad index

GENERAL TOPOGRAPHIC GRADIENT AT TARGET PROPERTY

Target Property: General SE

Source: General Topographic Gradient has been determined from the USGS 1 Degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
LOS ANGELES, CA	YES - refer to the Overview Map and Detail Map

0601370035C / CBPP

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CANOGA PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Site-Specific Hydrogeological Data*:

Search Radius:	2.0 miles
Status:	Not found

AQUIFLOW®

Search Radius: 2.000 Miles.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
A2	1 - 2 Miles East	SW
A3	1 - 2 Miles East	NW
4	1 - 2 Miles East	SSW
B5	1 - 2 Miles SE	S
B6	1 - 2 Miles SE	SSE

For additional site information, refer to Physical Setting Source Map Findings.

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Mesozoic
System:	Cretaceous

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

Soil Layer Information

	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Surficial Soil Types:
loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Shallow Soil Types:
fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types:
stratified

clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 1999 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the national Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-260-2805
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-260-2805
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

STATE RECORDS

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations for District 2 and 6
Source: Department of Conservation
Telephone: 916-323-1779

RADON

Area Radon Information: The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones: Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

APPENDIX C

Summary of Asbestos Reports

Appendix C
Summary of Asbestos Reports

Asbestos Survey Results, Hughes Aircraft Missile Systems Group, Building 269
This document consists of only a table with sample numbers, sample locations, descriptions, analytical results, and friability. No text report or cover page was included with this document.

Based on a review of this document, materials that were sampled from Building 269 (no longer located at the Property) included: several types of ceiling tiles, ceiling tile mastic, door gasket, drywall, pipe elbow insulation, valve packing, pipe valve insulation, and duct tape. The materials found to contain asbestos included: door gasket in oven #1 in room 1570, pipe elbow insulation, valve packing, and pipe valve insulation in mezzanine 03.

Interdepartmental Correspondence, Hughes Aircraft Company, regarding an asbestos survey conducted by International Technology, Inc. (IT), dated June 27, 1989
This survey included portions of Buildings 262 (Building A) and 270 (Building C). Suspect ACMs sampled in Building 262 included pipe and elbow insulation, pipe insulation debris, drywall, ceiling tile, fireproofing, ceiling tile mastic, plaster, and duct tape. Materials that were found to contain asbestos included pipe and elbow insulation and associated debris, plaster, and drywall. One sample of the drywall material and two samples of the plaster material were found to contain a trace amount of asbestos. The remaining samples of these materials were found to be non-detect for asbestos. Suspect ACMs sampled and found to contain asbestos in Building 270 included valve and gauge insulation pipe and elbow insulation and related debris. It is not known if other materials were sampled in this building. The pipe, elbow, valve, and gauge insulation materials reportedly were rated in a condition of 2 to 6. The rating system appears to be qualitative with 1 (worst condition) to 7 (best condition).

Interdepartmental Correspondence, Hughes Aircraft Company, dated June 20, 1989
This document refers to Buildings 272, 274, and 279, however only information relating to Building 272 (no longer at the Property) was reviewed as part of this scope of work. The remaining buildings were not located at the Property. Suspect ACMs sampled in this building included: drywall and drywall mud material. No asbestos was detected in the samples analyzed. Vinyl floor materials were reportedly assumed to contain asbestos.

Asbestos Survey Buildings 261, 264, and 268, September 13, 1989

Only information for Building 268 (Building B) was reviewed from this report. The remaining buildings were not part of the Property. Suspect ACMs sampled as part of this survey included: pipe elbow insulation, pipe trap insulation, transite vent pipe, "clean out" insulation at the roof drain, plaster, drywall, ceiling tiles, and duct tape. It is not known if the joint compound associated with the drywall was sampled. Sampled materials that were found to contain asbestos included: pipe elbow insulation, "clean out" insulation, and transite vent pipe. The ACMs were reportedly observed in conditions from 2 to 6.

Hughes Interdepartmental Correspondence, dated November 7, 1989

This memorandum indicates that ACM was identified on "some water pipes above the ceilings, drain lines, and in duct chaseways" in Building 262 (Building A). These materials were reportedly planned for removal between November and December 1989. No abatement reports or closeout documents were available to confirm the removal activities.

Asbestos Sampling and Laboratory Testing of Wall & Ceiling Construction Materials in Building 262 and 265 at the Hughes Missile Systems Group Facility, by E&A Environmental Services, Inc. (E&A), dated February 18, 1994

Only information pertaining to Building 262 is included in this review. Building 265 is not a part of the Property. According to this report, plaster and button board materials were sampled due to damage that occurred during the 1994 earthquake. The table of laboratory results included in this report was not legible, however, the text portion indicates that asbestos was detected in the plaster material on the first floor east end stairwell of the building. The material was reported to be damaged, and repair was recommended.

Asbestos Bulk Sampling at The Hughes Missile Systems Group, Building 262 & 268, by E&A, dated April 29, 1994

According to this report, suspect ACMs that were sampled in each of the buildings included: ceiling tiles, floor tiles and associated mastic, vapor barrier, drywall and joint compound, pipe insulation, roofing materials, vibration damper, and exterior paint. Materials that were found to contain asbestos in each of the buildings included: various floor tiles and mastic, drywall joint compound, mastic on an exterior wall base, exterior wall paint, pipe insulation, and roof mastic. The majority of these materials were reported as being in good condition, with damage reported on some pipe insulation and drywall.

Asbestos Bulk Sampling at The Hughes Missile Systems Group, Building 270, by E&A, dated April 20, 1994

According to this report, the suspect ACMs sampled were roofing materials. Asbestos was detected in roof flashing and black mastic patches. These materials were reported as being in good condition.

Visual Asbestos Survey of the Facility Located at 8433 Fallbrook, Canoga Park, California, by Earth Tech, November 30, 1994

This survey includes Buildings 261, 263, 264, 265, 268, 274, 276, 277, and 281. Only those portions of the report related to Building 268 were reviewed. The remaining buildings were not located at the Property. The purpose of the survey reportedly was to inspect the known ACMs and note any change in condition. The building was previously surveyed by IT in 1989.

The report indicates that damaged materials were observed in Building 268. Some areas of this building were not inspected because they were unsafe (presumably from earthquake damage). No information on the types of ACMs or locations was included in the report. According to this report, the majority of the damaged and/or friable pipe insulation identified in various buildings (assumed to include Building 268) in the 1989 IT survey, had been removed. Floor tiles and associated mastic were assumed to contain asbestos during the 1989 survey and reportedly were still in place during this survey.

Asbestos Inspection Report #R970732-2, Coast Federal Bank Facility, Buildings 262, 268, 269, 270, 272 & 282, by J&H Environmental, Inc. (J&H), dated July 21, 1997

This inspection reportedly was conducted to verify the extent of abatement work that had been performed and to collect samples to confirm the existence of non-friable ACMs. As part of the inspection, J&H reviewed prior asbestos documents, dated from 1989 to 1994. The buildings were not occupied at the time of the inspection, due to earthquake damage.

According to the J&H report, flooring materials, drywall joint compound, pipe insulation, exterior stucco (paint), and roofing materials in Buildings 262, 268, 269, and 270 had been found to contain asbestos. Drywall joint compound and roofing materials in Building 272 had been found to contain asbestos, and none of the suspect materials sampled in Building 282 were found to contain asbestos.

Asbestos Inspection Report, Coast Federal Bank Facility, Buildings 262, 268, 269, 270, 272, & 282, by J&H, dated August 6, 1997

The findings of this report are similar to the July 21, 1997 J&H report, moreover, confirmation of the removal of pipe insulation was included in this report. Based on this report, the majority of accessible asbestos-containing pipe insulation had been removed and replaced with fiberglass.

Asbestos Abatement Observation Report, Bldg #268, Coast Federal Bank Facility, by J&H, dated April, 1998

According to this report, floor tiles and mastic were removed from Building 268 during March and April 1998. Clearance air sample results were within the allowable limits. The quantity of material removed is not included in the report.

Emergency Asbestos Clean Up, Patch and Repair Report, Westhills Corporate Village, Building 8521, by J&H, dated November 6, 1999

The cleanup referenced in this report consisted of asbestos pipe insulation and debris located in and near the HVAC system on the roof of Building 8521 (known as Building B). Repairs were also made to damaged pipe, tee, and elbow insulation. Clearance air sampling was conducted and the results were within the allowable limits.

Asbestos Inspection Report, West Hills Corporate Village, Buildings 8501 and 8531, by J&H, dated November 15, 1999

Suspect ACMs sampled as part of this inspection included pipe insulation, silver paint, roof mastic, and several types of insulation. The pipe insulation was found to contain asbestos, and the remainder of the materials were reported as not containing asbestos. J&H recommended abatement of the ACMs, due to the poor condition.

APPENDIX D

Summary of ENVIRON's Review of Previous Reports

Appendix D
Summary of ENVIRON's Review of Previous Reports

Letter, dated July 12, 1988

The earliest dated document available for ENVIRON's review is a letter from Calscience Engineering & Laboratories, Inc. (CEL) dated July 12, 1988, regarding supplemental information on excavation pits T-3 and T-13 (both of which were located at the Property). The letter indicated that two USTs were closed by abandonment at the Hughes Aircraft Company Missile Systems Group Facility, Canoga Park (Site or Facility), that comprised an area much larger than that of the Property. The letter further indicated that pits were excavated in those areas to approximate depths of 23 feet and samples were collected from the bottom and sides of the pits, and were analyzed for total recoverable petroleum hydrocarbons (TRPH). The letter reported that analytical results showed minimal contamination in pit T-13, while elevated concentrations were detected in pit T-3, and therefore, the extent of contamination in that area had not been delineated.

Potential Source Area Investigation Report for the Hughes Missile Systems Group, Canoga Park, California, prepared by McLaren Hart (Mclaren), dated November 30, 1989

Mclaren indicated that the Site covers approximately 80 acres; the report indicated that a plan view of the Facility showing all areas of chemical use and concern was included (this figure was not included in the report, but was provide to ENVIRON by AMLGM). McLaren further indicted that operations at the Site began in 1959 under ownership and occupants other than Hughes. Hughes first occupied the Site in 1966, and was still operating at the Facility in 1989 (mainly research and development activities in fifteen buildings). Mclaren reported that the main chemicals of concern at the Site included paints, solvents, and petroleum products including oils, diesel and gasoline; corrosives were also used in printed wire board plating. Since 1959, storage tanks have been used at the Site, including twenty-nine ASTs used primarily for processed water storage, six active USTs used for diesel and gasoline storage, seven abandoned USTs previously used for storage of oils and solvents, two polypropylene lined concrete pits, and several areas for drum storage. The USTs reportedly had resulted in releases and have impacted the Site with benzene, trichloroethene (TCE), 1,1-dichloroethene (DCE), and 1,1-dichloroethane (1,1-DCA). Eight of the aforementioned USTs were located at the Property.

Mclaren indicated that the Facility had been investigated for potential sources of contamination and that 53 areas of concern were identified and detailed on a figure, which was later provided to ENVIRON by AMLGM.

The McLaren report included a brief summary of activities in each of the buildings at the Site; only those buildings currently or previously located at the Property are summarized below:

- Building 262: areas used for solvent cleaning, paint storage, coating and lubrication operations.

- Building 268: areas where solvents, lubricants, spray paint and ferric chloride are used, copper etching was also conducted. A clarifier has been active since 1982 and receives photographic lab waste.

- Building 269: areas used for cleaning, vapor degreasing, bonding, metal machining, plating, painting, etching, soldering, photographic developing and laboratory operations.

- Building 270: areas used for degreasing, soldering, solvent cleaning, bonding, laboratory operations.

- Building 272: solvents, acids, bases, caustic materials, flammable and nonflammable liquid storage.

- Building 282: garage with gasoline, motor oil, antifreeze, and kerosene use.

- Hazardous Waste Storage Shed or Area (HWSA): solvent storage.

In addition to tank T-3 area, Mclaren recommended investigations at five areas, all of which are located at the Property:

1) Waste neutralization sump P-2 (clarifier near former building 269)
2) Buildings 269/270 plating areas
3) Building 270 UST T-12
4) Building 272 chemical storage area
5) Former drum storage area east of building 272.

Radioisotope Review and Comparison for the Hughes Missile Systems Group Facility, Canoga Park, California, by Mclaren, dated July 30, 1991

It is not clear what prompted this study. Mclaren reported that the objective was to evaluate whether radioactivity levels observed in ground water beneath the Facility were consistent with background levels within the region.

Uranium was identified as a naturally occurring radioisotope in rock and soil in nearby formations. Mclaren also reviewed a summary of the reported radioisotopes concentrations in ground water in the San Fernando Valley Area. On a regional basis, gross alpha, gross beta, total uranium, and radium-226 were detected at mean concentrations ranging from 2 to 41, 3.7 to 11.9, 18.3, and 0.1 to 0.8 picoCuries per liter (pCi/L), respectively. These radioisotopes were detected in ground water at the Site in the following ranges: Gross alpha 2.5 to 43.4 pCi/L, gross beta 5.5 to 20.4 pCi/L, total uranium 1.0 to 49.7 pCi/L, and radium-226 from 0.1 to 1.9 pCi/L. The drinking water standards (maximum contaminant levels or MCLs) for these radioisotopes are: Gross alpha 15 pCi/L, gross beta 50 pCi/L, total uranium 20 pCi/L, and radium-226 5 pCi/L.

Mclaren indicated that, although rock deposits at the Site have not been tested for radioisotopes, research suggests that uranium and radium are naturally occurring in this area. Mclaren concluded that, although radioisotopes are slightly elevated at the Site in comparison to other parts of San Fernando Valley, the occurrence could be attributed to uranium in geologic deposits. Mclaren recommended continuing to monitor the on-site ground water for uranium and radium-226 on a quarterly basis.

Feasibility Study for Ground Water Remediation at Hughes Aircraft Company Missile System Group Facility, by Groundwater Technology Inc. (GTI), February 14, 1992

ENVIRON was only provided with the executive summary and some of the figures from this report; the reviewed portions did not detail the contaminants present at the Property. The purpose of GTI's feasibility study was to evaluate the remedial activities for ground water containing dissolved-phase volatile organic compounds (VOCs) at the Site (which included the Property).

Based on its calculations of the volume of dissolved VOCs present in the ground water at the northeast portion of the Site, the estimated transmissivity of the underlying aquifer, and using a numerical ground water modeling program, GTI indicated that the capture zones produced by pumping would be sufficiently large to capture and remediate the existing plume within 20 years. GTI further indicated that the ground water pump-and-treat system using liquid-phase carbon would

be the most appropriate remedial technology for this Site. GTI recommended installing a minimum of nine ground water recovery wells to fully contain of the dissolved-phase plume.

Investigation of Radioactivity in Groundwater at the Hughes Aircraft Company, Canoga Park Facility, Canoga Park, California, prepared by Groundwater Resources Consultants, Inc. (GRCI), dated January 23, 1992

GRCI indicated that it collected ground water samples from twenty-seven monitoring wells at the Site. Only the summary and recommendations section of this report was available for ENVIRON's review. GRCI indicated that based on the analytical results from monitoring wells at the Site, all adjusted gross alpha results were below the drinking water standards. Several samples had uranium concentrations that exceeded the proposed MCL; these were attributed to naturally occurring uranium in the region's soils.

Phase I Environmental Report: Areas of Potential Chemical Release to Soil and Ground Water, Hughes Missile Systems Company, prepared by GTI, dated December 28, 1993

This report indicated that thirteen USTs exist or existed at the Site. Based on available figures from other reports, eight USTs were present at the Property (Tanks T-1 to T-4, T-12 to T-14, and T-17). GTI indicated that there are reports documenting the removal of ten tanks (T-1 to T-3, T-5 to T-10, and T-13). T-4 reportedly was abandoned in-place. Soils in the vicinity of these tanks reportedly have been impacted by VOCs.

Two storage pits (likely referring to the clarifiers) are reported to be present immediately east of Building 269, Mclaren identified one of them as a source of contamination. Two large cooling ponds reportedly were present between Buildings 262/263 (outside the Property) and 268/269 (at the Property). Two main chemical storage areas were identified at the Site as Building 272 and the HWSA, both located at the Property.

Report on Facility-Wide Site Assessment, Hughes Missile Systems Company, prepared by GTI, dated January 4, 1994

GTI indicated that investigations have been conducted at the Site since early 1980s but have not been thorough. GTI reported that three areas of the Site are known to be contaminated: (1) Northwestern corner from Building 269 to western edge of the Site (northwestern part of the Property); (2) area of monitoring well CM-8D (outside the Property); and (3) area of monitoring well CM-10 (outside the Property). As part of this investigation, GTI installed seven additional monitoring wells (central and eastern portions of the Facility) and advanced twenty soil borings (near

former plating areas by Building 269, along main sewer line from pit P-2, on periphery of Building 270, and at four random locations). Ground water samples were collected from these seven wells and from three existing wells. Soil samples were analyzed for metals and VOCs.

GTI reported that based on soil sampling analytical results, there was no evidence of releases in the areas sampled. VOCs were detected, however, in the ground water. Freon 11 was detected in samples collected from well CM-10.

Corrective Action Plan Addendum, Hughes Missile Systems Company, prepared by GTI, dated March 29, 1994

The GTI report indicated that VOCs are present in ground water at concentrations exceeding 100 micrograms per liter (µg/L) at three main areas of the Site:

- Northwestern corner of the Facility from north of Building 269 to the extreme northwestern edge of the Site (total petroleum hydrocarbons in the gasoline range [TPH-g] has also been detected in ground water in this area; furthermore, soils in this area are impacted with VOCs and TPH-g). The area includes former Tanks T-1 and T-2 (vicinity of Building 282), and T-3 (near monitoring well M-1).

- Area around monitoring well CM-8D, where tanks T-5, T-6, and T-10 were previously located (outside the Property).

- Area around monitoring well CM-10, ground water impacted with Freon 11 (outside the Property).

The report indicated that an interim ground water remediation system is operating at the Site, and consists of recovery wells RW-1 to RW-5 (operating since early 1993). GTI indicated that this report offers an addendum to the corrective action plan (CAP) previously prepared in 1992. ENVIRON does not have a copy of the 1992 CAP, which reportedly outlined a phased approach to Site remediation, as follows:

- Phase I: Containing the ground water contamination to prevent off-site migration (installing and operating 5 recovery wells).

- Phase II: Continuing Site Assessment and conducting pilot testing of alternative remedial technologies.

- Phase III: Designing and implementing an expanded Facility-wide remediation system.

- Phase IV: Verifying that remediation objectives have been met and requesting Site closure.

GTI indicated that Phase I was partially completed because a system has been installed; however, the system had not been operated because extracted ground water was found to be high in total dissolved solids (TDS) and could not be discharged to the storm drain. Hughes was obtaining a permit from the Regional Water Quality Control Board – Los Angeles Region (LARWQCB) to reuse the extracted ground water for on-site irrigation.

GTI also indicated that a pilot test of vapor extraction, air sparging and ground water pumping was conducted in May 1993. Moreover, in August and October 1993, additional assessments reportedly were conducted at the Facility, and no additional source areas were identified. The main contaminants at the Site are TPH-g, 1,1-DCE, and TCE with maximum concentrations detected in ground water at 24,000, 5,100, and 310 µg/L, respectively. 1,1,1-trichloroethane (TCA), 1,1-DCA, and tetrachloroethene (PCE) were also detected at lower concentrations. The chlorinated VOCs reportedly were detected down to 25 to 30 feet below the ground water table. GTI proposed the following: Seventeen ground water recovery wells (some of which had already been installed as part of Phase I), twenty five vapor extraction wells, and twenty nine air sparging/vapor extraction combination wells. The recovery wells were proposed to be screened from 5 feet above to 35 feet below the ground water table. GTI proposed no remediation but only monitoring of ground water in the area of CM-8D.

The addendum to the CAP did not re-list the cleanup goals, reportedly established in the CAP.

Contingent Closure and Post Closure Plans, Hughes Aircraft Company, Missile Systems Group, Canoga Park Facility, prepared by CH2M Hill, dated November 21, 1994

The Department of Toxics Substances Control (DTSC) had requested a contingent closure plan for Tank T-3, which was permitted under the Resource Conservation and Recovery Act (RCRA) when it was removed in 1988. Two RCRA permitted facilities reportedly were present at the Site: the HWSA, and the Tank T-3 (both are located at the Property). CH2M Hill reported that all remedial activities at T-3 area will be completed during closure, therefore, post closure care is not anticipated.

The contingent closure plan indicated that soil remediation in the tank vicinity was conducted in accordance with the CAP and was detailed in the Final Report for Remediation of Former Tank T-3 Site (November 1991, ENVIRON has no copies). CH2M Hill further reported that soils were excavated in the area of this tank and confirmation soil samples were compared to RCRA Universal Treatment Standards (UTS) and found to be below these standards. Ground water, however, was found to contain 1,1-DCE, TCA, TCE and PCE above UTS. The ground water was being remediated under oversight from the LARWQCB.

Technical Memorandum Records Review and Limited Site Investigation, Hughes Missile Systems Company, prepared by Earth Tech, dated November 28, 1994

Earth Tech conducted the work for a potential buyer with the purpose of: (1) evaluating whether current or past environmental investigations and remedial actions carried out by Hughes sufficiently identified past environmental conditions; (2) evaluating whether Hughes adequately mitigated areas of environmental impacts; and (3) documenting the current regulatory status of the Site. The portion of the Site considered for purchase lies outside the Property (to the south) and includes Buildings 261, 263, 264, 265, 271, 274, 276, 277, and 281. The report reiterates the three main areas of contamination at the Site (same as those described in the GTI 1994 report).

Earth Tech also indicated that based on its reviews, the following additional concerns were identified at the Site: (1) Hughes was still in the process of obtaining regulatory closure for its hazardous waste storage building from DTSC. (2) Chemical staining and powder residues were noted in Building 272 at the Property. (3) No sampling has been conducted for drain lines inside buildings; however, based on sampling in outside areas, contamination would be expected to be minor. (4) Earth Tech recommended that Clarifiers P-1 and P-2 be removed. (5) Although all tanks have been removed, no closure letters were available. Earth Tech conducted supplemental soil sampling in areas of several former USTs (figure shows locations), which did not reveal additional sources of VOCs or TPH-g.

LARWQCB, Order Number 95-012, Waste Discharge Requirements for Hughes Missile Systems (File No. 94-45), dated December 14, 1994

The Order indicated that in 1985 Hughes discovered that soils and ground water at the Facility were contaminated with VOCs, and that the lateral and vertical extent of contamination is believed to have been defined. The Order also indicated that Hughes has prepared a CAP, which has been approved by the LARWQCB. The CAP indicates that shallow ground water will be pumped and treated on-site using activated carbon; the treated water would be reused on-site for irrigation purposes. The

Order lists maximum discharge limitations for treated water for benzene, toluene, ethylbenzene, and xylenes (BTEX), chlorinated VOCs, oil and grease, TDS, sulfate, chloride, and boron. The Order requires quarterly monitoring of ground water and treatment systems at the Site; in addition, an annual summary is required to be submitted to the LARWQCB in March of each year.

Proposed Negative Declaration for Hughes Missile Systems, Canoga Park Facility Closure Plan, prepared by DTSC and dated January 1995

The document was prepared by DTSC for the closure units: HWSA and Tank T-3 (both located at the Property). The negative declaration describes the closure requirements and indicates that Hughes will prepare a final closure certification report upon completion of the closure activities; and if acceptable, the DTSC will issue a letter approving the certification to release DTSC of its financial assurance responsibility; the DTSC, however, indicated that it could still impose additional corrective action to be addressed during post closure if any credible evidence is obtained indicating there are new solid waste management units at the Site.

Memorandum regarding Areas of Concern for Hughes Missile Systems Group, prepared by DTSC and dated February 1995

The memorandum outlines tentative solid waste management units (SWMUs) and areas of concern (AOCs), based on existing data to date. Only areas located at the Property are listed below:

- Buildings 272 and 282, which are located at the Property north of Building 270, were previously used for hazardous waste storage and identified as sources of chlorinated solvents contamination. These buildings are SWMUs that require remediation.

- Portions of Building 262 at the Property are considered AOCs because of the long history of chemical usage and because wells located semi-downgradient (CM-8d, CM-9d, and CM-18) have 1,1-DCE. Further evaluation is required.

- Building 268, located at the Property, had several areas of active chemical use. Well CM-12 is located approximately 100 feet downgradient of this building and has high concentrations of 1,1-DCE. According to DTSC, this building is considered an AOC and a soil gas survey should be conducted in this area.

- Building 269, located at the Property, has been identified as a source of soil and ground water contamination; however, according to DTSC, not all potential sources in this building

have been investigated; therefore, the building remained an AOC requiring additional investigations. DTSC requested that a soil gas survey be conducted in this area.

- Building 270, located at the Property, had several source areas. The DTSC indicated that investigations have been conducted outside the building; however, the building would still need to be considered an AOC requiring further evaluation with respect to the previous interior uses and waste disposal. The DTSC further indicated that a soil gas survey is required as an initial step to evaluate this AOC.

- Tanks T-1, T-2 and associated pump island are located near Building 272 at the Property, are considered SWMUs. Also tanks T-5, T-6, T-7, T-8, T-9, and T-10, which appear to be south of the Property (near Buildings 281 and 263) are considered SWMUs.

- Tank T-12, located at the Property south of Building 270, was used for storage of waste solvent. T-13 was also a short distance away from T-12; both are AOCs requiring further evaluation.

- Tank T-14 reportedly was located south of Building 269, and another tank T-16 is shown on a map south of Building 269; neither tanks are discussed and would be considered AOCs until further evaluation was completed by Hughes.

Report on Soil Gas Surveying at Former Hughes Missile Systems Company, Canoga Park, prepared by GTI, dated August 1, 1995

Only the results and discussions portion of this report was available for ENVIRON's review. VOCs were detected in most soil gas samples. It appears that GTI divided the Site into 5 areas, as follows:

Area 1: East of Building 269, no evidence that there is additional sources other than T-3, T-1 and T-2.

Area 2: South of Building 270, no evidence of sources in this area.

Area 3: Southwest of Building 263 (outside the Property), no evidence of sources in this area.

Area 4: Southeast of Building 263 (outside the Property), no clear source area was identified; therefore GTI was not able to point to the origin of contamination detected in well CM-8D.

Area 5: Southeast of Building 265 (outside the Property), a Freon anomaly was detected in this area and could be attribute to releases from the sewer lines.

Letter, dated October 12, 1995

In a letter dated October 12, 1995, the DTSC indicated that initially soil and ground water cleanup standards were established for the Site based on the lowest numbers produced from a health risk assessment, background measurement, or MCLs. However, since those cleanup levels were established, the LARWQCB has issued a Waste Discharge Requirement (WDR) permit with limitations that are lower than MCLs. The DTSC was requesting from the LARWQCB a determination regarding which cleanup goals to use for the Site.

Letter, dated January 26, 1996

In a letter dated January 26, 1996 to the LARWQCB, the DTSC was requesting confirmation of the lead agency for the corrective action conducted at the Site. The letter indicated that on November 28, 1995, DTSC and LARWQCB agreed to include the Site on the SB1082 list. However, back in August 1990, Hughes and DTSC had entered into a consent agreement and order wherein Hughes would comply with LARWQCB requirements for the ground water remediation and monitoring. The LARWQCB responded in a letter dated January 30, 1996 that it has no objections to the DTSC's request to be the lead agency. The LARWQCB, however, requested to be copied on all future correspondence/reports regarding this case.

Quarterly Ground Water Monitoring Report, Fourth Quarter 1995, by Groundwater Resources Consultants Inc. (GRCI), January 10, 1996

ENVIRON reviewed only a text summary of this report, which did not include figures and tables. GRCI reported that in December 1995, the depth to ground water measured at the Site ranged from approximately 10 feet to 63 feet below ground surface (bgs). During the period from September 1995 to December 1995, water levels generally declined in peripheral wells and rose in wells located in or near the reclamation well field.

GRCI reported that the direction of ground water flow in the shallow portion of the saturated zone was generally to the south and southwest, which was consistent with previously reported ground

water flow. Ground water extraction from reclamation wells in the northwest portion of the Facility was reported to have resulted in a cone of depression. The portions of the report reviewed by ENVIRON did not include analytical results from the sampling activities.

Groundwater Monitoring, Quarterly Report, January-March 1996, Hughes Missile Systems Company, by Groundwater Technology, dated March 27, 1996

Based on this report, a ground water recovery system was in operation at the Site. Seventeen recovery wells reportedly were pumping on a cyclic basis, thirty-four monitoring wells (located on and off the Property) were gauged monthly for depth to ground water, while sixteen monitoring wells were sampled on a quarterly basis. GTI reported that the recovery system was permitted for treatment of up to 22,000-gallons per day (gpd) of extracted ground water. On average 4,000 and 11,000 gpd were treated and reused on-site for irrigation purposes. GTI estimated that remediation of the ground water would be completed sometime between 2001 and 2003.

Based on the first quarter 1996 monitoring, the depth to ground water in shallow wells ranged from 12.78 to 46.40 feet bgs, and the gradient was to the southwest in the northwest portion of the Site and to the south-southeast in the remainder of the Site. Treated ground water effluent reportedly met the discharge requirements specified in the WDR permit. Quarterly ground water sampling results had detectable VOCs in two of the monitoring wells and in twelve of the recovery wells.

Letter, dated August 6, 1996

In a letter dated August 6, 1996, the DTSC approved the Negative Declaration for Hughes' closure plan.

Limited Review of Potential Environmental Impacts to Former Hughes Missile System Company, by AllWest Geoscience, Inc. (Allwest), dated October 11, 1996

This review, conducted by Allwest, included Buildings 262, 268, 270, 272, and 282, all of which are currently, or were previously, located on the Property. The review included a site visit, file reviews at local regulatory agencies, and review of previous documents pertaining to the Property.

Based on its review of previous reports and site visit, Allwest reported the following findings:

- The area of the Property beneath Building 269, and northward to the Property boundary has soil and ground water contaminated with chlorinated VOCs and TPH-g. At the time of Allwest's site visit, this area was undergoing remediation, which included ground water

pumping/treatment, air sparging, and soil vapor extraction (SVE)/treatment. Allwest indicated that GTI was conducting quarterly ground water monitoring at the Site.

- Six USTs were previously located at the Property, and were used for storage of gasoline, waste oil, hydraulic fluid, solvent waste, fuel oil, and water. The tanks reportedly had been removed, however at the time of Allwest's report, no formal closure documents were available from regulatory agencies (most likely would have to be obtained from the Fire Department).

- Two clarifiers, located to the east of Building 269, reportedly were closed in-place. Allwest recommended excavating and removing the clarifiers, as well as sampling the soils beneath these structures.

- A clarifier and a system of pits and trenches were located in Building 268 (current Building B). Allwest recommended removing the pits and trenches and sampling the soils beneath this area.

- Stained floor areas were observed by Allwest in Buildings 268 and 269. Allwest recommended that these areas be sampled for solvents and heavy metals.

- Based on the age of the buildings at the Site, Allwest recommended that asbestos surveys and a structural inspection be conducted in the buildings.

Operation & Maintenance Program, Former Hughes Site, Canoga Park, prepared by GTI, dated February 25, 1997

In a letter submitted to the LARWQCB, GTI described its remediation system and detailed the proposed monitoring and maintenance activities that would be conducted at the Site. The remediation is described to include a ground water recovery system consisting of 17 recovery wells (first started in February 1995 and fully operational since March 1995); the recovery wells are connected to a holding tank, followed by two liquid-phase granular activated carbon (GAC) vessels. The treated effluent is reused for on-site irrigation purposes. An SVE system, which has operated since August 1995, included 54 manifolded extraction wells, which were originally connected to a thermal oxidizer (permitted by the South Coast Air Quality Management District-SCAQMD). The thermal oxidizer was removed in October 1995 and replaced by four vapor-phase GAC vessels

(SCAQMD permitted). The air sparging system operated since March 1996 and consisted of 30 manifolded wells, which are connected to an air compressor.

Environmental Sampling and Testing under Floor Slabs and Clarifiers, Former Hughes Missile Systems Company, by Allwest, dated June 27, 1997

Following its review in 1996, Allwest conducted additional sampling at the Property. Allwest advanced four borings in the pit and trench areas of Building 268, two borings near the former solvent tank in Building 269, and four borings near the clarifiers at Building 269 (all at the Property). Soil samples were collected at a depth of 2 feet bgs in all areas except near the clarifiers where samples were collected at 8 feet bgs. The samples were analyzed for VOCs by EPA Method 8260 and CAM metals by EPA 7000 Series methods.

No VOCs were detected in the soil samples collected during this investigation. Moreover, metals were reported to be within naturally occurring background levels.

Summary Review of Environmental Documents, Former Hughes Missile Systems Company, by Allwest, dated July 10, 1997

The purpose of Allwest's review of environmental documents was (a) to evaluate whether current and past investigations and remedial actions were sufficient to identify environmental conditions at the Property, (b) to evaluate whether areas with environmental impacts have been adequately mitigated, and (c) to document the current regulatory status of the Property.

Allwest summarized the following findings:

- Soil and ground water remediation conducted in the northwestern area of the former Hughes site appeared to be several years from completion.

- All USTs had reportedly been removed, however tank closures had not been granted by regulatory agencies (in this case, the Fire Department) and would reportedly not be granted until "all soil and ground water remediation at the Site is completed."

- Although no detectable contamination was found from soil samples collected from the sides of the clarifiers located near Building 269, additional soil sampling was recommended if the clarifiers were to be removed during demolition of this building.

- Allwest recommended that the pits and trenches in Building 268 be backfilled with sand or slurry and covered with a concrete cap. Soil sampling in this area reportedly showed no detectable contamination.

- Soil sampling in areas below the former solvent tanks at Building 269 reportedly showed no detectable contamination due to solvents or heavy metals.

Allwest concluded that the "existing contamination poses no health threat and will not interfere with the occupancy of the exiting or proposed buildings, provided that requirements of the Remedial Action Plans" were followed.

Letter, dated November 14, 1997

In a letter dated November 14, 1997, DTSC discusses the RCRA closure issues at the Site, which included Hazardous Waste Management Units (HWMUs), Corrective Action SWMUs, and AOCs. The letter does not detail all the RCRA closures required at the Site. The letter, however, indicated that one of the HWMUs is the former HWSA, where much of the closure plan requirements had been implemented. DTSC also indicated that the ground water remediation conducted at the Site also was cleaning up contamination from the other HWMU at the Site (the former underground hazardous waste storage tank T-3). The remediation also was believed to be removing contamination from beneath SWMU #1 (Building 272) and SWMU#2 (Building 282). However, DTSC indicated that additional investigations still were required near many of the SWMUs and AOCs, and would be clarified in a future Corrective Action Order to be issued for the Site (anticipated to be issued in January 1998). Finally, the DTSC letter indicated that Tank T-3 will be subject to post-closure monitoring requirements under Title 22, Article 6.

Letter, dated January 9, 1998

In a letter dated January 9, 1998, DTSC approved the Corrective Action (Solid Waste Management Units and Areas of Concern) Plan (SWMU CAP) proposed by Hughes (ENVIRON has not copies of the SWMU CAP). The DTSC letter indicated that Hughes could proceed with the demolition and disposal of the HWSA. Again, DTSC required that Hughes submit a Post-Closure Operation Plan for the Tank T-3 HWMU.

Ground Water and Remediation System Monitoring, October-December 1997 Quarterly Report and 1997 Annual Report for Raytheon Missile Systems Company by Fluor Daniel GTI, February 20, 1998

This report summarizes the remediation and monitoring activities conducted at the Site in 1997. Fluor Daniel GTI (FD/GTI) monitored ground water conditions and maintained the remediation systems for Raytheon Missile Systems Company. As previously mentioned, the remediation system included ground water recovery/treatment, SVE/treatment, and air sparging.

FD/GTI indicated that approximately 6,800 pounds of VOCs including 500 pounds of chlorinated solvents had been removed since start-up. VOCs were detected in three of the ten ground water monitoring wells sampled on a semiannual basis (none located at the Property); VOCs were also detected in eleven of the seventeen recovery wells sampled on a semiannual basis (RW-1, RW-6 through RW-8, RW-10 through RW-12 and RW-14 through RW-17). Additional samples were collected semiannually from Wells RW-6 and RW-12 and analyzed for TPH-g and BTEX, which reportedly were not detected. VOCs were also detected in two of the twenty-four monitoring wells (CM-13 and CM-18, both located at the Property) sampled annually. Boron, sulfate, chloride and total dissolved solids were detected in the treated ground water effluent samples collected annually.

Letter, dated May 15, 1998

In a letter to Raytheon Missile Systems Company dated May 15, 1998, FD/GTI provided a summary of the status of on-going ground water and soil vapor treatments at the Site. Influent VOCs concentrations measured in the vapor stream were reported to reaching an asymptotic limit of 3 to 4 part per million by volume (ppmv).

FD/GTI reported that demolition and construction activities at the Site had damaged several components of the SVE and air sparging systems.

Letters, dated May 19, 1998 and June 18, 1998

In a letter dated May 19, 1998, the DTSC indicated that Raytheon was in violation of Title 22, because it had failed to provide DTSC with the required post closure plan for T-3. In a letter dated June 18, 1998, DTSC indicated to the LARWQCB that Hughes has not complied with its RCRA closure requests.

Letter, dated June 30, 1998

In a letter dated June 30, 1998, DTSC acknowledged the request for change of ownership at the Facility from Hughes to Raytheon.

Plan for Modification of Remediation the Systems at the Former Hughes Missile Systems Company, prepared by Errol L. Montgomery & Associates, September 16, 1998

Errol L. Montgomery & Associates (EM&A), reported that recent sampling had showed that VOCs concentrations were below the established ground water cleanup criteria in eight of the forty-three ground water monitoring wells sampled. The EM&A report included a table listing the established cleanup goals for soils and ground water at the Site. The ground water cleanup goals appeared to be 10 times greater than the MCL. Furthermore, based on the EM&A table, soil cleanup goals were not established for individual chlorinated VOCs at the Site; the table lists a total chlorinated VOCs cleanup goal of 100 milligrams per kilogram (mg/kg). Finally, the EM&A table did not list any established goals for hexavalent chromium.

EM&A proposed some modifications to the remediation system to expedite cleanup. Based on EM&A's recommendations, Raytheon planned to install additional wells in areas of the Site where concentrations of VOCs in ground water remained above the cleanup criteria. Raytheon also planned to deactivate sixteen air sparging wells, twenty-seven SVE wells and four ground water reclamation wells located at portions of the Site where concentrations of VOCs in ground water were consistently measured to be below the cleanup criteria. In addition, EM&A reported that Raytheon planned to continue pilot testing high-vacuum dual-phase treatment at selected ground water recovery wells.

Summary Report of Supplemental Sampling and Analysis Performed at the Locations of Former Buildings 269, 272, 282; Raytheon Former Canoga Park Facility, Canoga Park, California, by Raytheon Systems Company, dated October 5, 1998

Raytheon prepared and submitted this letter report summarizing recent sampling events conducted by FD/GTI to DTSC. The letter indicated that no metals were detected in these areas above background levels. VOCs impacted soils and ground water were encountered in an area where metal working, finishing, and cleaning operations were known to have occurred within the former Building 269. FD/GTI recommended additional sampling along the western boundary of this area to further delineate the contamination plume. FD/GTI also recommended increasing the number of recovery wells to expedite cleanup, as outlined in the Plan for Modification of Remediation Systems dated September 16, 1998.

Previous sampling conducted by Allwest Geosciences in 1998 concluded that "there have been no environmental impacts from VOCs or metals to subsurface soil directly under the concrete floor slabs or adjacent to the clarifiers due to leaks or migration of contaminants through the concrete slabs." This sampling addressed the following SWMUs and AOCs:

- SWMU#1: Building 272
- SWMU#2: Building 282
- SWMU#3: Building 269, Pits 1 and 2
- AOC#13: Tank T-14

Therefore, Raytheon requested that DTSC remove these SWMUs and AOC from its RCRA Closure requirements (no indication whether DTSC approved this request).

Results of Follow-up Sampling and Analysis, Conducted September 21, 1998, in the HWSA, by FD/GTI, dated October 30, 1998

The FD/GTI sampling was conducted in accordance with a workplan submitted to the DTSC in August 1998 and revised in September 1998.

FD/GTI indicated that the demolition of the former HWSA started in June 1998, and included soil excavation and backfilling. Soil samples reportedly were collected from the walls and floor of the excavation in this area prior to its backfilling. Hexavalent chromium was previously detected at concentrations exceeding the DTSC approved closure plan level of 0.19 mg/kg in the acid and alkaline storage bays of the former HWSA. The purpose of the follow-up sampling conducted by FD/GT was to assess the lateral and vertical extent of hexavalent chromium in subsurface soils beneath the former HWSA. FD/GTI drilled five soil borings: three within the former HWSA, one to the south of the area and one to the east of the area. Samples were collected at depths of 13, 19, and 27 feet bgs within the former HWSA and at depths of 2, 5, 13, 19, and 27 feet bgs at the adjacent areas.

Samples from the former HWSA were analyzed for hexavalent chromium using EPA Method 7196, total organic carbon (TOC) using Test Method SM 5310B, total iron (Fe) using EPA Method 601D, ferrous iron using Test Method SM3500-Fe D, and manganese using EPA Method 6010. The samples collected south and east of the former HWSA were analyzed for hexavalent chromium only. Hexavalent chromium was detected at concentrations ranging from non-detect to 78 mg/kg. The highest detections were encountered at a depth of 19 feet bgs. The TOC concentrations ranged from

1,420 mg/kg to 16,400 mg/kg, the total Fe ranged from 8,800 mg/kg to 26,000 mg/kg, the ferrous Fe was non-detect for all samples analyzed, and the manganese concentrations ranged from 47 mg/kg to 480 mg/kg.

FD/GTI did not recommend any additional subsurface investigation or soil removal because the hexavalent chromium contaminated soils were encountered at minimal depths of 5 to 13 feet bgs. Furthermore, FD/GTI indicated that future grading in this area would raise the ground surface by approximately 5 feet. Therefore, FD/GTI did not believe that the hexavalent chromium encountered in the soils would pose a health threat. FD/GTI recommended sampling monitoring wells located up- and down-gradient of the former HWSA for hexavalent chromium on a quarterly basis for a period of one year to evaluate whether the impacted soils would result in impact to ground water.

Summary Review of Environmental Documents and Potential Environmental Impacts, Building A (Former Building 262), West Hills Corporate Village; prepared by Allwest, dated January 15, 1999
Allwest indicated that based on a 1995 Facility inspection and subsequent document review, the DTSC had concerns that the past usage of solvents may have impacted the soils at the sewer lines connecting to the main sewer from Building 262 (now Building A). Allwest indicated that Hughes was responding to DTSC's recommendations for additional investigations in this area. Allwest further reported that Hughes cleaned and washed down Building A prior to its remodeling. Building A is not captured by the current remediation system at the Property, but no source areas have been identified in this building, to date. Tank T-4 was located at the southeast corner of this building. Although all tanks have been removed, as previously mentioned, closure would not be issued until ground water remediation is completed at the Site. Allwest concluded that environmental conditions at Building A have been adequately characterized and would not interfere with future occupancy of Building A.

Letter, dated January 20, 1999
In a letter dated January 20, 1999, the LARWQCB approved Hughes' request to deactivate select air sparging, SVE, and ground water reclamation wells in areas of the Site where VOCs have been consistently detected at concentration below the established cleanup criteria. The LARWQCB also approved the installation of five additional recovery wells to prevent off-site migration of contaminants in the northwestern part of the Site.

Letter, dated January 21, 1999

In a letter dated January 21, 1999 and marked as URGENT, the DTSC expressed concerns over planned demolition and development activities at the Facility, which may affect areas considered to be SWMUs, AOCs or HWMUs; DTSC considered activities such as grading, demolition or development as unauthorized and would proceed with legal action against Raytheon and Regent Properties, Inc. DTSC requested that the Site owners/developers contact the Attorney General's office for further information.

Letter, dated January 26, 1999

In a letter dated January 26, 1999, Raytheon responded to DTSC and indicated that it does not plan to conduct redevelopment activities in areas of the Site considered to be SWMUs, HWMUs or AOCs. However, Raytheon indicated that it has requested closure of some of these areas from DTSC and has not received a response to date.

Ground Water and Remediation System Monitoring October-December 1998 Fourth Quarter and 1998 Annual Summary, prepared by IT Corporation (IT), dated February 20, 1999

During 1998, IT monitored remediation activities at the Site. The ground water recovery system generally remained at full operating capacity during 1998. The treated effluent was monitored weekly to ensure compliance with limits set by the LARWQCB. Sixty-nine monitoring and vapor extraction wells were gauged quarterly. Ten perimeter monitoring wells and seventeen recovery wells were sampled on a semiannual basis and analyzed for VOCs. During 1998, VOCs were detected in ten of the seventeen recovery wells (RW-1, RW-3, RW-7 RW-10 through RW-12, and RW-14 through RW-17). Additional samples were collected semiannually from wells RW-6 and RW-12 and analyzed for TPH-g and BTEX, which were not detected.

The high-vacuum, dual-phase extraction system were applied to targeted ground water recovery wells RW-1, RW-10, RW-11, RW-14 and RW-15. The evaluation period demonstrated that ground water recovery and vapor-phase volatile organics transport temporarily increased following application of the vacuum.

Letter, dated March 12, 1999

In a letter dated March 12, 1999, DTSC indicated that Raytheon's approach thus far of investigating small portions of the Facility and submitting such data to DTSC for closure of SWMUs or AOCs was not adequate. DTSC was requiring a RCRA Facility Investigation Workplan, which summarized all SWMUs, AOCs, and HWMUs identified at the Facility and investigations and corrective actions

conducted to date. DTSC would then work with Raytheon to prioritize these areas. However, since Raytheon had elected to stop its fee-for-service agreement with DTSC, DTSC staff could not perform significant work on the corrective action activities. DTSC further indicated that Raytheon was in violation of requirements to submit post-closure permit application for Tank T-3. Finally, DTSC indicated that Raytheon's plan to keep hexavalent chromium contaminated soils in-place and monitor the ground water in this area was not acceptable.

Letter, dated March 25, 1999

Raytheon responded to DTSC's comments in a letter dated March 25, 1999 and indicated that much of the data gaps referred to by DTSC had been filled in reports recently submitted to DTSC.

Additional Site Assessment Report, Sampling and Analysis at Former Building 269, Former Raytheon Systems Company, prepared by IT, dated April 1999

According to the IT report, this work included sampling soil and ground water in five temporary ground water wells in the location of former Building 269. The samples were analyzed for VOCs, and none were detected in the soil samples and ground water samples from four of the wells. PCE and TCE were detected in ground water samples collected from one of the wells at the respective concentrations of 5.1 and 13 µg/L.

IT concluded that the contamination was confined to an area of former metal working, finishing, and cleaning operations, and was being addressed by the on-going ground water and soil remediation. Therefore, no additional sampling was recommended in this area.

Letter, dated June 11, 1999

In a letter dated June 11, 1999, the LARWQCB approved Raytheon's request to modify the ground water remediation system at the Facility. The LARWQCB also permitted Raytheon to deactivate some of the air sparging/vapor extraction wells and the ground water extraction wells at the Facility. The pilot testing of the dual-phase treatment system at selected ground water recovery wells was to be continued. The letter also indicated approval of the modification plan to install additional wells in the areas of the Site where VOC concentrations in the ground water remain above the cleanup criteria.

Letter, dated July 22, 1999

In a letter dated July 22, 1999, DTSC reiterated that Raytheon has failed to provide the required closure and post-closure permit application for HWMUs at its Facility.

Letter, dated August 17, 1999

In a letter dated August 17, 1999, Raytheon indicated that it has agreed to include hexavalent chromium in its semiannual sampling events. Hexavalent chromium had been detected in ground water samples collected from Well RW-15 (located at the Property).

Letter, dated August 19, 1999

In a letter dated August 19, 1999, Raytheon responded to DTSC's July letter and indicated that it was making a diligent effort to meet the approved closure requirements for the HWSA.

Environmental Health Concerns, Planned Building D, West Hills Corporate Center, prepared by Allwest, dated September 13, 1999

This report concluded that with the continued operation of the ground water remediation system, there were no environmental impacts on the health or safety of the occupants of planned Building D. Allwest did not conduct a health risk assessment, rather it based its conclusion on the low concentrations of VOCs detected in near surface soils in this area.

Quarterly Remediation System and Ground Water Monitoring Report, July-September 1999, Third Quarter, Raytheon Company, Canoga Park, California, prepared by IT, dated October 1999

The remediation system continued to operate as described in previous monitoring reports. Samples were collected as part of a rebound sampling effort approved by the LARWQCB. VOCs were detected in both ground water and soil gas samples collected during this sampling event.

Hexavalent chromium was detected in three ground water samples collected from Well RW-15, with concentrations ranging from 0.083 to 0.1 milligrams per liter (mg/L). Hexavalent chromium was not detected in the remaining five ground water wells that were sampled during this event (CM-16, M-1, MW-17, RW-13 and RW-16). Upon detection of hexavalent chromium, RW-15 was disconnected from the remediation system and the LARWQCB and DTSC were notified. RW-15 is located adjacent to the former HWSA.

Letter, dated October 27, 1999

In a letter dated October 27, 1999, DTSC indicated that based on available records it does not appear that releases have occurred in the area of the proposed Building D at the Facility and therefore, DTSC did not believe that further investigations or remediation were required in this area prior to the construction of the new building.

Letters, dated December 16, 1999 and January 7, 2000

In a letter dated December 16, 1999, the LARWQCB approved Raytheon's request to install additional ground water monitoring wells as proposed in a letter dated December 10, 1999. Three wells were proposed in areas close to the former HWSA. However, in a letter dated January 7, 2000, DTSC indicated that the proposed workplan was inadequate for accurately determining the nature and extent of releases from the HWSA. The DTSC requested that a rationale be provided for the number, design and placement of ground water monitoring wells, as well as boring logs for nearby wells to justify design protocols.

Letters, dated April 13, 14, and 20, 2000

In letters dated April 13 and 20, 2000, the LARWQCB approved a proposed pilot test plan to evaluate a treatment system for the hexavalent chromium, detected in the ground water at Well RW-15. However, in a letter dated April 14, 2000, DTSC indicated that a workplan that was submitted for the delineation of contamination in the former HWSA was inadequate.

Environmental Impacts, West Hills Corporate Village, prepared by Allwest, dated June 14, 2000

Allwest indicated that its report conclusions are based on several conversations with DTSC and the LARWQCB staff regarding potential environmental health concerns at the Property (Buildings A to D). Moreover, Allwest reviewed select documents pertaining to previous investigations and monitoring conducted at the Property.

1,1-DCE, 1,1-DCA, PCE and TCE were noted as the primary VOCs of concern in the ground water at the Property. The ground water undergoing remediation is at depths of 30 to 40 feet bgs; the lead agency for the remediation is the LARWQCB; while the DTSC is the lead agency for RCRA closure at the Site. Allwest reported that the ground water remediation was progressing to the satisfaction of the LARWQCB. DTSC, however, had remaining concerns regarding identification of all sources of soil and ground water contamination and closure of SWMUs and other AOCs. According to Allwest, Raytheon was actively working with DTSC to address these concerns.

Allwest reported that, with the exception of delineating the hexavalent chromium contamination near the HWSA, adequate soil and ground water investigations had been conducted near the buildings.

Allwest concluded that based on available information, there were no anticipated health or safety impacts on occupants of the buildings.

Ground Water and Remediation System Monitoring October-December1999, Fourth Quarter, and 1999 Annual Report, prepared by IT, and dated August 2000

IT reported that treated ground water effluent continued to meet all discharge requirements specified in the WDR permit with the exception of naturally occurring boron. The treated ground water was reused on-site for irrigation purposes. Influent concentrations of petroleum fuel hydrocarbons had decreased over time to below laboratory detectable levels. Influent concentrations of halogenated VOCs (mainly TCA, 1,1-DCA and TCE) had also decreased over time.

The ground water flow gradient had remained relatively constant, with some anomalies in the northwestern portion of the Site due to fluctuations in the operation of the pumping wells.

Due to redevelopment activities, the SVE and air sparging systems were shut down since December 1998. As of December 1999, the SVE system, which had been operating since August 1995, was estimated to have removed 7,400 pounds of VOCs from the vadose zone. Influent concentrations of TPH-g and chlorinated VOCs had decreased over time.

During the second quarter of 1999, IT initiated a rebound sampling effort as described in the LARWQCB-approved Plan for Modification of Remediation Systems dated September 16, 1998. The main wells where VOC concentrations exceeded cleanup criteria were located along the northern boundary of the Site or in the vicinity of the eastern portion of the former Building 269. 1,1-DCE and 1,2-dichloroethane (1,2-DCA) were the main contaminants detected above their respective cleanup criteria. Soil gas samples were also collected during the third and fourth quarters of 1999. The main contaminants detected in the soil gas samples were 1,1-DCE and TCE.

Hexavalent chromium was detected in ground water samples collected from RW-15 with concentrations ranging from 0.083 to 0.1 mg/L. Hexavalent chromium was also detected in one of the ground water samples collected from Well M-1, at a concentration of 0.02 mg/L. This was the first occurrence of hexavalent chromium in this well, which is not connected to the ground water recovery system. Hexavalent chromium was not detected above the laboratory detection limit of

0.01 mg/L in the remaining four wells sampled in 1999. The six wells selected for hexavalent chromium sampling surround the former HWSA. A workplan to delineate the boundaries of hexavalent chromium in ground water and soil in the vicinity of the former storage area was developed and submitted to the DTSC.

Annual Ground Water Monitoring and Ground Water Remediation System Report January-December 2000, prepared by TN & Associates, Inc., dated January 29, 2001

TN & Associates, Inc. (TN&A) conducted annual ground water sampling and remediation system monitoring for 2000. As of December 2000, ten recovery wells were still pumping; four recovery wells were shut down during the first quarter of 2000 due to continuously low VOCs concentrations. Recovery well RW-15 was shut down during the second quarter of 2000 due to the presence of hexavalent chromium.

The SVE and air sparging systems were not in operation in 2000 because of Site demolition and construction activities.

The main contaminant detected in the influent samples to the ground water treatment system was DCE. Other VOCs detected in the influent ground water samples included: benzene, 1,1-DCA, 1,2-DCA, PCE, TCA and TCE. No VOCs were detected in the effluent samples. DCE was also detected in nine of the monitoring wells and four of the recovery wells at concentrations ranging from 110 to 1,900 µg/L (exceeding the CAP cleanup criteria of 60 µg/L). Other VOCs detected above their respective cleanup criteria were benzene, 1,2-DCA, and TCE.

A pilot test was completed at recovery well RW-15 in May of 2000 to test the effectiveness of the existing system in treating hexavalent chromium. It is not clear how the existing system of carbon vessels would be adequate in treating hexavalent chromium. The pilot test results reportedly showed that the existing remediation system was adequate for treating the hexavalent chromium plume. Nonetheless, RW-15 remained shut off until all the data and options for addressing the hexavalent chromium concentrations were evaluated.

In order to evaluate the extent of hexavalent chromium contamination, TN&A advanced four borings in the vicinity of the former HWSA area to total depths of 55 to 60 feet bgs. One of the borings was drilled through the footprint of the former HWSA and the other three were drilled adjacent to the former HWSA area in up-, cross-, and down-gradient locations. Nested monitoring wells were installed at each of the four locations, and were screened from 35 to 45 feet and 50 to 55 bgs.

Hexavalent chromium was detected in all ground water samples at concentrations ranging from 0.03 µg/L in the deep ground water zone to 120 µg/L in the shallow ground water zone.

Semiannual Ground Water Monitoring and Ground Water Remediation System Report, prepared by TN&A, dated September 12, 2001

TN&A summarized the semiannual ground water monitoring and remediation for January to June 2001. Concentrations of DCE for the first and second quarter 2001 influent samples were 290 µg/L and 220 µg/L, respectively. Other VOCs detected in the influent samples included: benzene, 1,1-DCA, 1,2-DCA, PCE, TCA and TCE. No VOC concentrations were detected in any of the effluent samples.

Weekly influent organic vapor readings from the SVE system ranged from 1 to 3 ppmv. Trace concentrations of DCE (0.19 ppmv), and TCA (0.75 ppmv), were the only contaminants detected in the monthly Tedlar bag samples collected from the influent vapor to the SVE system.

In June 2001, seven of the fourteen recovery wells sampled had DCE concentrations ranging from 100 to 800 µg/L, exceeding the CAP ground water cleanup goal of 60 µg/L. The sample from RW-6 had a benzene concentration at 2.5 µg/L, exceeding the CAP cleanup goal of 1 µg/L and the sample from well RW-14 had a 1,1-DCA concentration at 5.2 µg/L, exceeding the CAP cleanup goal of 5 µg/L.

TN&A was planning to implement a ground water sampling and analysis plan for the HWSA to monitor hexavalent chromium in the ground water. As of September 2001, the plan was still under review by DTSC.

Results of Quarterly Groundwater Monitoring, Former Hazardous Waste Storage Area; Former Raytheon Facility, 8433 Fallbrook Avenue, Canoga Park, California, prepared by TN&A, dated January 23, 2002

TN&A reported the results of ground water monitoring for hexavalent chromium near the former HWSA. Eight wells, seven of which were installed in June of 2000, were monitored. Ground water levels were measured on October 29, 2001 and ground water samples were collected from the eight wells on October 29 and November 1, 2001. Hexavalent chromium concentrations ranged from less than 0.1 µg/l to 370 µg/l. The highest concentrations were found in the samples collected from wells MW-32S and MW-32D, both located within the footprint of the former HWSA.

Indoor Air Monitoring Results, Calculations and Laboratory Data Reports

Table 1
Exposure Calculations

SUMMARY OF DETECTED VOCS, OSHA PELS, AND PROPOSITION 65 NSRLS AND MADLS

Compounds Name	CAS Number	Molecular Weight (g/gmol)	OSHA PELs 8-hr Permissible Exposure Levels (ug/m^3)	Prop 65 Listed?	Prop 65 NSRL[4] (ug/day)	Prop 65 MADL[4] (ug/day)
Acetone	67641	58.1	2,400,000[3]	no	NA	NA
Benzene	71432	78.1	3,190 (1 ppm [2]) 31,900 (10 ppm [3])	yes, cancer	7.0	NA
Chloromethane	74873	50.5	207,000 (100 ppm [2])	yes, developmental	NA	not established[5]
Methylene Chloride	75092	84.9	86,750 (25 ppm [2])	yes, cancer	200.0	NA
2-Butanone	78933	72.1	590,000[3]	no	NA	NA
o-Xylene	95476	106.2	435,000[3]	no	NA	NA
Ethylbenzene	100414	106.2	435,000[3]	no	NA	NA
4-Methyl-2-Pentanone	108101	100.2	410,000[3]	no	NA	NA
Toluene	108883	92.1	754,000 (200 ppm[2],[3])	yes, developmental	NA	7000.0
Tetrachloroethene	127184	165.8	687,000 (100 ppm [2],[3])	yes, cancer	14.0	NA
Methyl-t-Butyl Ether (MTBE)	1634044	88.1	(not established)	no	NA	NA
p/m-Xylene	13302071/ 136777612	106.2	435,000[3]	no	NA	NA

Building A Compounds Name	Measured Concentrations A1 (ug/m^3)	A2 (ug/m^3)	A3 (ug/m^3)	Average Concentration (ug/m^3)	Is conc. above PEL ?	Daily Intake[1] ug/day	Is intake above Prop65 NSRL or MADL?
Acetone	38.0	45.0	40.0	41.0	no	410	NA
Benzene	3.2	3.7	3.3	3.4	no	34	yes, NSRL
Chloromethane	1.9	1.6	1.7	1.7	no	17	unable to compare[6]
Methylene Chloride	2.2	2.4	2.1	2.2	no	22	no
2-Butanone	5.4	6.1	5.2	5.6	no	56	NA
o-Xylene	2.2	2.8	2.5	2.5	no	25	NA
Ethylbenzene	1.9	2.3	2.2	2.1	no	21	NA
4-Methyl-2-Pentanone	ND	3.2	1.8	2.5	no	25	NA
Toluene	14.0	14.0	18.0	15.3	no	153	no
Tetrachloroethene	2.6	2.3	2.3	2.4	no	24	yes, NSRL
Methyl-t-Butyl Ether (MTBE)	8.9	10.0	9.3	9.4	NA	94	NA
p/m-Xylene	ND	7.3	6.8	7.1	no	71	NA

Sample ID Nos.: A1 (#01109); A2 (#01500); A3 (#01187)

Building B Compounds Name	Measured Concentrations B1 (ug/m^3)	B2 (ug/m^3)	B3 (ug/m^3)	Average Concentration (ug/m^3)	Is conc. above PEL ?	Daily Intake[1] ug/day	Is intake above Prop65 NSRL or MADL?
Acetone	34.0	37.0	34.0	35.0	no	350	NA
Benzene	3.3	3.4	3.3	3.3	no	33	yes, NSRL
Chloromethane	ND	1.7	1.5	1.6	no	16	unable to compare[6]
Methylene Chloride	2.1	2.3	2.0	2.1	no	21	no
2-Butanone	5.3	9.7	4.8	6.6	no	66	NA
o-Xylene	2.2	2.2	2.1	2.2	no	22	NA
Ethylbenzene	1.7	1.9	1.8	1.8	no	18	NA
4-Methyl-2-Pentanone	4.3	12.0	2.3	6.2	no	62	NA
Toluene	12.0	14.0	12.0	12.7	no	127	no
Tetrachloroethene	1.6	1.9	1.7	1.7	no	17	yes, NSRL
Methyl-t-Butyl Ether (MTBE)	8.8	9.0	8.8	8.9	NA	89	NA
p/m-Xylene	5.6	5.9	5.5	5.7	no	57	NA

Sample ID Nos.: B1 (#00357); B2 (#01162); B3 (#01605

Table 1
Exposure Calculations

Building C	Measured Concentrations		Representative	Is conc.	Daily	Is intake
	C1	C2[7]	Concentration	above	Intake[1]	above Prop65
Compounds Name	(ug/m^3)	(ug/m^3)	(ug/m^3)	PEL ?	ug/day	NSRL or MADL?
Acetone	30.0	27.0	30.0	no	300	NA
Benzene	3.5	ND	3.5	no	35	yes, NSRL
Chloromethane	ND	ND	NA	no	NA	NA
Methylene Chloride	2.1	ND	2.1	no	21	no
2-Butanone	4.2	ND	4.2	no	42	NA
o-Xylene	3.6	ND	3.6	no	36	NA
Ethylbenzene	2.4	ND	2.4	no	24	NA
4-Methyl-2-Pentanone	6.7	ND	6.7	no	67	NA
Toluene	13.0	14.0	13.0	no	130	no
Tetrachloroethene	1.8	ND	1.8	no	18	yes, NSRL
Methyl-t-Butyl Ether (MTBE)	9.7	8.7	9.7	NA	97	NA
p/m-Xylene	8.5	ND	8.5	no	85	NA

Sample ID Nos.: C1 (#01326); C2 (#01132)

Building D	Measured Concentration	Representative	Is conc.	Daily	Is intake
	D1	Concentration	above	Intake[1]	above Prop65
Compounds Name	(ug/m^3)	(ug/m^3)	PEL ?	ug/day	NSRL or MADL?
Acetone	32.0	32.0	no	320	NA
Benzene	3.6	3.6	no	36	yes, NSRL
Chloromethane	ND	NA	no	NA	NA
Methylene Chloride	2.1	2.1	no	21	no
2-Butanone	4.2	4.2	no	42	NA
o-Xylene	2.4	2.4	no	24	NA
Ethylbenzene	1.9	1.9	no	19	NA
4-Methyl-2-Pentanone	ND	NA	no	NA	NA
Toluene	13.0	13.0	no	130	no
Tetrachloroethene	1.9	1.9	no	19	yes, NSRL
Methyl-t-Butyl Ether (MTBE)	10.0	10.0	NA	100	NA
p/m-Xylene	6.2	6.2	no	62	NA

Sample ID No.: D1 (#01277)

Notes:

[0] Each sample was obtained using SUMMA canister and 8-hour flow controller; samples were analyzed by EPA Method TO-15.

[1] Intake = Maximum Concentration * Occupational Breathing Rate

10 m^3/day; 8-hr Occupational Breathing Rate,

[2] NIOSH Pocket Guide to Chemical Hazards; June 1997; OSHA Permissible Exposure Level (PEL) 8-hr time weighted average (TWA).

[3] Limits for Air Contaminants. - 29 CFR 1910.1000 TABLE Z-1 and Table Z-2; August 4, 1997.

[4] Proposition 65 Status Report, No Significant Risk Levels (NSRL) for Carcinogens and Maximum Allowable Daily Levels (MADL) for Chemicals Causing Reproductive Toxicity; February 2001.

[5] The MADL has not been established for Chloromethane. It is on the 3rd priority list, which is not likely to be developed for at least 3 years from February 2001.

[6] The California Office of Environmental Health and Hazard Assessment (OEHHA) has not established a chronic Reference Exposure Level (REL) for Chloromethane.

[7] This sample did not obtain a reasonable amount of sample air; hence, the detection limits were roughly 5 times higher.

C:\windows\TEMP\[MEPT_measurements.xls]VOCs

Table 2
Cancer Risk Calculations under Proposition 65

Carcinogenic Risk Calculations for Inhalation Pathway:

Risk = CPS x Dose

where,

Risk - Cancer Risk, 1×10^{-5} (Proposition 65 No Significant Risk Level)

CPS - Cancer Potency Slope, $(mg/kg\text{-}day)^{-1}$, OEHHA, December 2001

Dose, mg/kg-day = (C x IR x EF x ED x CF) / (BW x AT)

C - Concentration in air, ug/m^3 (maximum measured level indoor)

IR - Inhalation Rate - 20 m^3/day for adults and adolescents (24 hrs/day),

Note: half the daily-IR will be used to represent 8 hrs/day due to activity.

EF - Exposure Frequency - 250 days/year for workers (5 days/wk and 50 wks/yr)

ED - Exposure Duration - 20.1 years for workers

CF - Conversion Factor (0.001 mg/ug)

BW - Body Weight - 70 kg for adults

AT - Averaging Time, 25550 days for lifetime

SUMMARY OF OCCUPATIONAL EXPOSURE SCENARIOS

Building A - Adult Workers (8 hours/day, National Median: 20.1 years*):

	Risk	CPS	Dose	C	IR	EF	ED*	CF	BW	AT
Benzene	**9.55E-06**	1.0E-01	9.6E-05	3.4	10	250	20.1	0.001	70	25550
Tetrachloroethene	**1.42E-06**	2.1E-02	6.7E-05	2.4	10	250	20.1	0.001	70	25550

Building B - Adult Workers (8 hours/day, National Median: 20.1 years*):

	Risk	CPS	Dose	C	IR	EF	ED*	CF	BW	AT
Benzene	**9.37E-06**	1.0E-01	9.4E-05	3.3	10	250	20.1	0.001	70	25550
Tetrachloroethene	**1.02E-06**	2.1E-02	4.9E-05	1.7	10	250	20.1	0.001	70	25550

Building C - Adult Workers (8 hours/day, National Median: 20.1 years*):

	Risk	CPS	Dose	C	IR	EF	ED*	CF	BW	AT
Benzene	**9.83E-06**	1.0E-01	9.8E-05	3.5	10	250	20.1	0.001	70	25550
Tetrachloroethene	**1.06E-06**	2.1E-02	5.1E-05	1.8	10	250	20.1	0.001	70	25550

Building D - Adult Workers (8 hours/day, Construction Worker: 2 years):

	Risk	CPS	Dose	C	IR	EF	ED**	CF	BW	AT
Benzene	**1.01E-06**	1.0E-01	1.0E-05	3.6	10	250	2	0.001	70	25550
Tetrachloroethene	**1.12E-07**	2.1E-02	5.3E-06	1.9	10	250	2	0.001	70	25550

LABORATORY REPORT

Client:	Environ International Corporation	Date of Report:	03/07/02
Address:	707 Wilshire Blvd., Suite 4950	Date Received:	02/28/02
	Los Angeles, CA 90017	PAI Project No:	P2200394
Contact:	Ms. Debbie Scanlon	Purchase Order:	Verbal

Client Project ID: MEPT / Canoga Park

Nine (9) Stainless Steel Summa Canisters labeled:

"C1" "C2" "D1" "A1" "A2" "A3" "B1" "B2" "B3"

The samples were received at the laboratory under chain of custody on February 28, 2002. The samples were received intact. The client requested and received 3 day rush results. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the samples at the time that they were received at the laboratory.

Volatile Organic Compound Analysis

The samples were analyzed by combined gas chromatography/mass spectrometry (GC/MS) for volatile organic compounds. The analyses were performed according to the methodology outlined in EPA Method TO-15. The analyses were performed by gas chromatography/mass spectrometry, utilizing a direct cryogenic trapping technique. The analytical system used was comprised of a Hewlett Packard Model 5972 GC/MS/DS interfaced to a Tekmar AutoCan Elite whole air inlet system/cryogenic concentrator. A 100% Dimethylpolysiloxane capillary column (RT_x-1, Restek Corporation, Bellefonte, PA) was used to achieve chromatographic separation

The results of analyses are given on the attached data sheets.

Attention: Mr. Neal Holdridge, Environmental Manager

Subject: COAST WESTHILLS PROPERTY
8433 FALLBROOK AVENUE
CANOGA PARK, CALIFORNIA
"ENHANCED" PHASE I ENVIRONMENTAL SITE ASSESSMENT

Dear Mr. Holdridge:

In accordance with your request on behalf of MEPT West Hills LLC (MEPT) or its nominated assignee, Environmental Asset Services, Inc. (EASI) and Trammell Crow So. Cal. Properties, Inc. (TCSCPI), Geocon Environmental Consultants, Inc. (Geocon) has conducted an "Enhanced" Phase I Environmental Site Assessment (ESA) of the subject property. The approximately 30-acre property is located to the northwest of the intersection of Fallbrook Avenue and Roscoe Boulevard, in the Canoga Park area of the City of Los Angeles, Los Angeles County, California. The property is further identified by Los Angeles County Assessor's Parcel Numbers 2005-002-001 and 2005-002-002.

We trust the accompanying report provides MEPT, TCSCPI, and EASI and with the information you require at this time. If you have any questions regarding the information presented in the report, or if Geocon may be of further service, please contact us at (213) 538-1282.

Very truly yours,

GEOCON ENVIRONMENTAL CONSULTANTS, INC.

Robin J. Ferber, R.G., R.E.A.
Senior Managing Geologist

Robin M. Blanchard
Project Environmental Scientist

(1) John J. Allen, Esq., Sonnenschein Nath & Rosenthal

EXECUTIVE SUMMARY

This report presents the results of an *"Enhanced" Phase I Environmental Site Assessment,* performed in general conformance with the scope and limitations of ASTM Designation E 1527-97 of Subdivision B of the property located at 8433 Fallbrook Avenue in the Canoga Park area of the City of Los Angeles, Los Angeles County, (the "subject property") further identified by Los Angeles County Assessor's Parcel Numbers 2005-002-001 and 2005-002-002. Any exceptions to, or deletions from this practice are described in Section 1.3 of this report. The term "Enhanced", as referenced in this report, refers to the extensive review of pertinent environmental documents provided by Environmental Asset Services, Inc. (EASI) and present in files at the offices of the California Regional Water Quality Control Board, Los Angeles Region (CRWQCB) and the California - Environmental Protection Agency, Department of Toxic Substances Control (DTSC) that was specifically requested by Mr. Neal H. Holdridge, Environmental Manager of EASI.

The subject property occupies approximately 30 acres and includes nine buildings and landscaped and paved parking areas. It was formerly a part of an approximately 86-acre property used by Hughes Aircraft Company and Hughes Missiles Systems Company (hereinafter Hughes) as an aerospace research and development facility. The former Hughes property was subsequently divided into subdivisions A, B, C, and D (hereinafter referred to as Lots A, B, C, D). The subject property occupies Lot B, and is currently owned by Home Savings of America (Home) as successor to Coast Federal Bank (Coast). The nine buildings at the subject property were not occupied at the time of the reconnaissance. With the exception of onsite features associated with the ongoing groundwater monitoring program and potential impacts associated with the Raytheon soil vapor and groundwater extraction and treatment systems, evidence of "recognized environmental conditions" was not observed during our site reconnaissance of the subject property.

Hughes sold the site to Coast in 1995; however, it remained responsible for responding to certain environmental impacts discovered on the site during the late 1980's. Raytheon Missiles Systems Group (Raytheon) acquired Hughes in December 1997 and has assumed financial responsibility for certain ongoing and future environmental investigations and remediation activities at the former Hughes facility, including the subject property.

Obvious evidence of hazardous materials use, storage or disposal was not observed onsite in the aerial photographs reviewed. The subject property appears to have been used for agricultural purposes prior to development as an aerospace research and development facility in 1959. Construction of onsite buildings and features occurred roughly from 1959 to 1986.

The USGS topographic map dated 1967 (photorevised 1979) for the Calabasas, California quadrangle depicts onsite elevations ranging from approximately 840 to 900 feet above mean sea level (MSL). Onsite topography slopes to the south, east, and west from a high point located roughly at the center of the northern subject property boundary. Groundwater beneath the subject property flows to the south-southeast with the exception of the Lot C area northwest of the subject property where groundwater flows to the west towards Chatsworth Creek.

A 50-year Chain-of-Title Report was not provided for review. The current owner of the subject property is reported to be Home as successor to Coast.

The subject property was identified in the information sources reviewed by VISTA Information Solutions, Inc. (VISTA). All of the subject property listings appear to relate to the ongoing soil and groundwater investigations at the subject property. Several businesses listed by VISTA in their report were within the appropriate search radii used for this ESA. The properties listed by VISTA are not considered likely to impact soil and groundwater beneath the subject property with hazardous materials based on their distance from the subject property, their location relative to the local hydraulic gradient (interpreted to flow generally to the south-southeast), and/or the absence of information indicating releases of hazardous materials originating from the listed properties.

Releases of diesel fuel, chlorinated and non-chlorinated volatile organic compounds (VOCs), aromatic VOCs, and semi-volatile organic compounds (SVOCs) to soil and/or groundwater have been documented at the former Hughes facility, including the subject property. Investigation of impacts to soil and groundwater from these substances has been ongoing since 1989 under the direction of various regulatory agencies including the City of Los Angeles Fire Department, CRWQCB, California Department of Health Services, and the DTSC. The DTSC and the CRWQCB are currently the key environmental agencies involved at the subject property and neighboring Lots A, C and D comprising the former Hughes properties.

Four underground storage tanks (USTs) containing fuel oil and two USTs containing waste oil and sulfuric acid were formerly operated on Lot B. Five of the six USTs exhibited evidence of leakage.

Historical remedial activity on Lot B consisted of excavation and offsite disposal of soils impacted by the five USTs.

The review of environmental documents indicates that soil and groundwater beneath the subject property have been impacted by chlorinated and non-chlorinated VOCs in two areas. One is located to the south of Building No. 281. Groundwater samples collected from groundwater monitoring well CM-8D have shown the presence of VOCs from an unknown source. Hughes' environmental consultant estimated that the release of approximately 0.2 gallons of VOCs caused the impact to groundwater discovered in that area. Identifying the source of the VOCs detected in the well CM-8D area has been and remains a primary DTSC concern. Soil vapor samples collected in the area of well CM-8D have not been conclusive in identifying a source of the VOCs detected in the groundwater. DTSC could require Raytheon to conduct further environmental investigations in this area. In addition, it may be prudent to conduct indoor air monitoring for VOCs in Building Nos. 263, 264, and 281 to evaluate potential exposure concerns to future building tenants.

Groundwater impacts by VOCs were also detected near monitoring well CM-10 located offsite (on Lot A) to the south-southeast of Building No. 274. Freon 11 was the primary constituent of concern detected here. A soil vapor plume comprised primarily of Freon 11 and other VOCs was identified onsite and to the south of this building in an area hydraulically upgradient of well CM-10. In addition, groundwater well MW-31, located onsite in the central portion of the area where Freon 11 was found in soil vapor, contained Freon at concentrations equal to the US EPA Maximum Contaminant Level (MCL) established for groundwater. Raytheon believes the Freon 11 soil vapor plume is from air conditioning equipment repairs that were conducted in the unpaved portions of the parking lot during the 1960s.

The DTSC identified eight Areas of Concern (AOCs) and three Solid Waste Management Units (SWMUs) on the subject property which may require further investigation. Based on the findings of a soil and groundwater investigation documented in a September 1998 report prepared by GTI, Raytheon requested that DTSC de-list two of the SWMUs and three of the AOCs, all of which are located in the southern portion of the subject property. DTSC has declined to "de-list" SWMUs or AOCs until it is satisfied that its concerns have been adequately addressed.

DTSC has identified additional SWMUs and AOCs for Lot C, which is adjacent to and to the north of the subject property. Lot C also has a former Hazardous Waste Storage Area (for which Raytheon has not yet completed its DTSC approved Closure Plan), and a UST designated as T-3, which is a

regulated hazardous waste unit subject to post-closure care requirements as specified in the California Code of Regulations, Title 22. These two units were and still are under RCRA Permit. Soil vapor and water extraction and treatment systems are active in the northern portion of Lot C. Treated water from the extraction system is used only on Lot C for irrigation of landscaped areas, under NPDES permit from the CRWQCB; however, the treatment system is currently shut down due to construction activities ongoing in the northern portion of Lot C.

According to a November 21, 1994 interview with Hughes employees, mercury may have been present in a soundproofing coating on foam "cones" formerly present on the walls and ceilings of the anechoic chamber present in Building No. 274. This soundproofing material was reportedly removed under appropriate manifest to a disposal site in Arizona. During our site reconnaissance, a minor amount of residual soundproofing material was noted on the floor of the anechoic chamber. A Certified Industrial Hygienist should be retained to evaluate for the presence of mercury in the residual soundproofing material observed in the anechoic chamber.

Personal interviews with DTSC staff suggest that the City of Los Angeles may require DTSC concurrence prior to issuance of future building permits at the subject property if concerns regarding the SWMUs and AOCs are not resolved. DTSC communications with DeVry Inc. who is developing Lot A to the south of the subject property, indicated that the DTSC may require access to that property for soil and groundwater investigations/remediation should future evidence of environmental impacts be discovered on Lot A. Appropriate personnel at the City of Los Angeles should be contacted to evaluate the potential involvement of the DTSC in the acquisition of Building Permits for the subject property. In addition, DTSC input should be obtained regarding new structures to be built in designated areas of the subject property.

Groundwater beneath the subject property and adjoining lots contains levels of uranium and radium above drinking water standards. Groundwater monitoring wells CM-8D and CM-10 generally contain higher levels of uranium and radium in the groundwater, when compared to the other wells throughout the former Hughes facility that were sampled. Previous investigations concerning the presence of these radioactive materials concluded they were naturally occurring and due to local variations in geological deposits. The prior investigations concluded that no man-made radionuclides were indicated. No surface soil investigations regarding the presence of radioactive materials have been conducted at the site. Documents listing the radioactive materials formerly used by Hughes indicate that Hughes' operations have not served as the source for the radioactivity discovered in

groundwater. It may be prudent to conduct a radon gas investigation in the buildings onsite to investigate potential radioactive exposure concerns to Lot B building tenants.

The northern portion of Lot C is undergoing remediation under the guidance of the DTSC and CRWQCB. According to the DTSC, Raytheon is in violation of Title 22, California Code of Regulations for not having submitted an application for post-closure of UST T-3. In addition, the DTSC has asked Raytheon to investigate the lateral and vertical extent of hexavalent chromium detected in soil beneath the former hazardous waste storage area. Raytheon has issued written complaints to the DTSC regarding the DTSC's lack of administrative response concerning environmental issues at the site. The effect of these outstanding issues between the DTSC and Raytheon on the proposed acquisition of Lot B is considered of minimal impact because they appear to only impact Lot C.

PHASE I ENVIRONMENTAL SITE ASSESSMENT

1. INTRODUCTION

This report has been prepared by Geocon Environmental Consultants, Inc. (Geocon) in accordance with the request of Mr. Neal H. Holdridge on behalf of the MEPT West Hills LLC (MEPT) or its nominated assignee, Environmental Assets Services, Inc. (EASI), and Trammell Crow So. Cal. Properties, Inc. (TCSCPI). The report presents the results of a "Enhanced" Phase I Environmental Site Assessment (Enhanced-ESA) and document review of the Coast Westhills Property, an approximately 30-acre property located to the northwest of the intersection of Fallbrook Avenue and Roscoe Boulevard (Lot B of 8433 Fallbrook Avenue), in the Canoga Park area of the City of Los Angeles, Los Angeles County, California (the "subject property"). The term "Enhanced", as referenced in this report, refers to the review of pertinent environmental documents provided by EASI and present in the available files at the offices of the California Regional Water Quality Control Board, Los Angeles Region (CRWQCB) and the California - Environmental Protection Agency, Department of Toxic Substances Control (DTSC) that was specifically requested by EASI.

1.1. Purpose

The purpose of this ESA is to review past and present land use practices and site operations to evaluate the potential presence of recognized environmental conditions at the subject property. This assessment was accomplished by, and limited to, a site reconnaissance, a drive-by survey of the subject property vicinity, interviews, review of information provided by TCSCPI and EASI, review of records available at the CRWQCB, DTSC, and other agencies, and a review of presently and readily available pertinent documentation through Geocon's standard resources. Representatives of the CRWQCB and DTSC were also contacted by telephone or in person regarding environmental issues and/or the status of the site investigations. These tasks were performed to evaluate past and current land use for indications of the manufacture, generation, use, storage, and/or disposal of hazardous materials at the subject property. This ESA includes a preliminary evaluation of the potential for soil and/or groundwater impacts resulting from past and present subject property land use activities and nearby offsite operations, based upon the scope of services described. The ESA was conducted in general conformance with ASTM Designation: E1527-97. The collection of soil, groundwater, asbestos, and radon samples or performance of analytical laboratory testing was not included as a part of our scope of services, nor is the sampling and testing of these materials within the normal scope of a Phase I ESA. The guidelines 'used for the definition of hazardous materials/hazardous wastes, as used in this report, are referenced in the *California Code of Regulations (CCR)* "Title 22, Division 4.5".

1.2. Credential

This report has been prepared by Geocon Environmental Consultants, Inc. (Geocon) under the professional supervision of the principal whose seal and signature appears herein. The information contained in this report has received appropriate technical review and approval. The conclusions represent professional judgments and are founded upon the findings of the investigations identified in the report and the interpretation of such data based on our experience and expertise according to the existing standard of care.

1.3. Scope of Services

EASI's Consulting Service Agreement with Geocon, dated December 8, 1998, outlines the scope of services proposed for the ESA. Geocon performed the services outlined in the referenced Consulting Service Agreement with the following exceptions:

- Historical Sanborn Fire Insurance Maps were sought from the Los Angeles County Public Library collection of maps for the west coast of the United States. No historical Sanborn, Inc. Fire Insurance Maps were available for the subject property from this source.
- Some documents provided by EASI and reviewed at the DTSC and CRWQCB were not summarized in the attached Tables 1, 2, and 3 because they were evaluated as not providing relevant information regarding the environmental status of the subject property. In addition, because Geocon's primary focus was on the environmental condition of Lot B, only generalized environmental information affecting the other subdivided former Hughes lots (i.e., Lots A, C, and D) was provided.

1.4. Site Location

The subject property is located to the northwest of the intersection of Fallbrook Avenue and Roscoe Boulevard and is identified as the Coast Federal Bank – West Hills Property, or as Lot "B". It was formerly one of 4 lots forming the approximately 85.7-acre property occupied by Hughes Aircraft Company and Hughes Missile System Group (hereinafter Hughes) until 1994. The entire former Hughes property is bounded by the Chatsworth Reservoir and residential neighborhoods. The approximate location of the subject property is depicted on the reproduction of a portion of the USGS topographic map for the Calabasas, California quadrangle, dated 1967 (photorevised 1979) and presented as Figure 1. A Site Plan is included as Figure 2. The subject property is further identified by Los Angeles County Assessor's Parcel Numbers 2005-002-001 and 2005-002-002.

2. GEOLOGIC AND GROUNDWATER CONDITIONS

2.1. Geologic Conditions

Geologic information was obtained from the September 3, 1998 Fluor Daniel GTI (GTI) *Additional Site Assessment Report – Vicinity of CM-10 and Buildings 265, 274, and 276* and compared with the State of California Department of Conservation Geologic Map of California Los Angeles Sheet. The GTI Report and review of the USGS "Calabasas, California" topographic quadrangle indicated that the subject property is located at an elevation of approximately 840 to 900 feet above mean sea level (MSL). Surface topography generally slopes to the south, east, and west from a high point located at the center of the northern boundary of the subject property. Surface water is directed to storm drains that flow west to the adjacent Chatsworth Creek. The nearest surface water indicated on the topographic map is the Chatsworth Reservoir and Spillways located within 1/8-mile to the north of the subject property and Chatsworth Creek and Lees Lake located adjacent to the west of the subject property.

According to the GTI Report, the geologic materials found near the surface in the vicinity of the subject property are generally composed of flat-lying, poorly sorted, unconsolidated sands, silts, and clays with occasional gravels. These materials are collectively termed the Cenozoic-age Basin fill and overlie more consolidated geologic units. The thickness of these deposits range from approximately 20 feet along the northern portion of the facility, to nearly 75 feet along the southern portion of the facility. A thin layer (up to 10 feet) of construction fill is present across the subject property.

The subject property is situated on the consolidated bedrock of the Miocene-age Modelo Formation, which locally overlies the Lower Miocene-age Topanga Formation. Older Formations include the Cretaceous Chatsworth Formation, which crops out in the nearby Simi hills. The Modelo Formation is comprised of grayish siltstone and shale, brownish siltstone, clayey siltstone, and clayey shale, with some interbedded grayish diatomaceous shale. Beds of the Modelo Formation appear to dip 45 degrees to the south, as seen from exposures in nearby roadcuts and from lithologic samples taken from onsite soil borings. Near the surface and near the contact with the younger Basin fill, the Modelo Formation is highly weathered.

2.2. Groundwater Quality and Occurrence

Based on a review of a April 15, 1998 GTI Report, groundwater throughout the former Hughes facility (Lots A, B, C, D) was encountered at depths ranging from 9.5 feet to 62 feet below grade. Groundwater in two borings drilled to the south of Building No. 274 on the subject property was

encountered by GTI in September 1998 at depths ranging between 36 feet to 48 feet below grade. The Los Angeles County Department of Public Works Hydrologic Records Section records indicate that depth to water in Well #4699, located approximately 1½ miles to the southeast of the subject property, was measured at 21.9 feet bgs on November 12, 1997. The groundwater gradient across the subject property is generally to the south/southeast, with the exception of the western portion of the subject property where groundwater apparently flows to the west towards Chatsworth Creek. Local water quality tends to be unusable for drinking due to concentrations of total dissolved solids (TDS) exceeding 1,000 mg/L. Because of the high TDS groundwater and because of relatively low yields, no drinking water is reportedly pumped locally from the Cenozoic valley fill sediments or the Modelo Formation.

3. SITE RECONNAISSANCE

Representatives of Geocon conducted a reconnaissance of the subject property on December 28, 1998. Geocon representatives were accompanied during portions of the site visit by Mr. Neal Holdridge of EASI and by Mr. Grant Baker of Home Savings of America. The purpose of the site reconnaissance was to observe existing subject property conditions and to evaluate for evidence of recognized environmental conditions, including hazardous materials and/or wastes. Observations noted during the site reconnaissance are summarized below. Selected photographs of the subject property are presented as Appendix A of this report.

3.1. Onsite Reconnaissance

The subject property was occupied by nine recently vacated buildings, a helipad, and landscaped and paved parking areas at the time of the site reconnaissance. Coast Federal Bank (Coast), as predecessor to Home Savings and Loan (Home), occupied the subject property from 1994 to 1998, using it as professional office space. Most of the office furnishings installed by Coast remained at the time of Geocon's reconnaissance on December 28, 1998. According to Mr. Baker, Coast's use of hazardous materials at the subject property was limited to chemicals used in the Central Engineering Plant (Building No. 263), such as corrosive inhibitors, Freon, petroleum based oils and lubricants, ammonia used in onsite duplicating machinery, and general maintenance and cleaning supplies. Observations made for each of the onsite buildings are provided below.

Building No. 264

Building No. 264 was constructed in 1959 as a kitchen and cafeteria and has retained that use to the time of Geocon's onsite reconnaissance. Evidence of use or storage of hazardous materials or wastes in the building, such as storage drums or containers or staining of the floors and walls, was not

observed during the site visit, nor was it reported historically. A grease trap was verbally reported at Building No. 264 by Mr. Grant, but was not available for observation during the site reconnaissance. One grease dumpster was observed in a car washdown room located adjacent to the west of the Building No. 264. The dumpster was labeled as belonging to Baker Commodities and was observed to be approximately half full of grease. Mr. Baker reported that the grease would be transported offsite for recycling or disposal. We did not observe evidence of environmental concerns inside Building No. 264.

Adjacent to the east of Building No. 264 was an air refrigeration unit associated with the walk-in coolers located in the building. No chemicals or evidence of staining were observed in the area of the refrigeration unit. A patched asphalt area and two apparent monitoring wells were observed in this area. This area is reported as the site of former 10,000-gallon UST (T-10), which contained diesel fuel, and was removed from the subject property in 1991. This UST was connected by piping to three other former diesel USTs (T-7, T-8, and T- 9) located further to the east (discussed under Building No. 281 section). The areas near these former USTs and associated piping is included in the ongoing investigation for the entire former Hughes property, as directed by the CRWQCB and DTSC.

Building No. 281

Building No. 281 was constructed in 1986 and contains office space, a large auditorium, a conference room and a main lobby entrance area. Evidence of use or storage of hazardous materials or wastes in the building, such as storage drums or containers or staining of the floors and walls, was not observed during the site visit. Two hydraulic elevators are present in the building and are serviced monthly by an outside contractor. The elevator equipment rooms were observed to contain elevator machinery consisting of self-contained units with built-in oil reservoirs. A minor amount of oil was observed in the pan of one of the units, however, no evidence of spillage or leakage was observed on the floor of the room.

According to Mr. Baker and the November 30, 1989 McLaren Historical Chemical Use Inventory for the Hughes Missile Systems Group Facility, Building No. 281 contained two maintenance shops and a "control material storage" area, on the basement and first floors. Hazardous materials reported in these areas were limited to insecticide storage and use of dichloromethane (methylene chloride) in the maintenance shops. The extent of use of these materials was described as "quantifiably insignificant" and no further investigation was required. No concerns were identified with regard to chemical, use, storage or disposal at Building No. 281.

Three 12,000-gallon USTs (T-7, T-8, and T-9), containing diesel fuel were removed from the parking area located to the southeast of Building No. 281 in 1991. Soil and groundwater impact from releases from these USTs and associated piping was identified and the area is included in the ongoing onsite soil and groundwater investigation and remediation activities, under guidance of the CRWQCB and DTSC. One monitoring well, CM-8D, was observed in this area. Sampling performed by Fluor Daniel/GTI indicates that groundwater in the vicinity of well CM-8D contains chlorinated volatile organic compounds (VOCs) from an unknown source.

Building No. 271

Building No. 271 was constructed in approximately 1959 and has been used as a paint and maintenance shop. An approximately 135,000-gallon concrete or masonry water test tank is present beneath the building. The water test tank was empty at the time of Geocon's site reconnaissance and was observed from the access point in the floor of the building. According to Mr. Baker, this water test tank was formerly filled with water and used for specialized sonar testing, not for storage of regulated material. Spray painting was reportedly conducted in the building in the late 1980's; however; no evidence of environmental impact was observed or reported from these operations.

Building No. 263

Building No. 263 was constructed in 1959 as the Central Engineering Plant for the entire site. All of the major building systems equipment; i.e. boilers, chillers, air handlers, cooling towers, are located within this building. Hazardous materials observed in the Central Plant included: Freon 11 and 12, corrosion control water treatment chemicals, and small quantities of miscellaneous oils and lubricants stored in flammable materials cabinets. No concerns were noted with regard to handling or storage of these materials and no evidence of significant spillage or leakage was noted on the floors or walls. One hydraulic elevator is present in the building. Observation of the elevator equipment did not reveal evidence of leakage or spillage of hydraulic fluid to the surrounding concrete slab.

A series of concrete filled trenches was observed in the ground floor of the boiler room of Building No. 263. According to Mr. Grant, these trenches formerly contained diesel fuel lines connecting the former USTs located to the east of Building Nos. 264 and 281 with the former diesel boilers located within the building. The current boilers are fueled by natural gas, and the chillers by electricity. These areas were investigated as part of the soil and groundwater investigative and remedial activities conducted at the subject property under the direction of the CRWQCB and DTSC and no evidence of impact to subsurface soils has reportedly been encountered beneath the buildings.

A Los Angeles Department of Water and Power (LADWP) transformer yard was observed adjacent to the east of Building No. 263, containing six large liquid-cooled distribution transformers. The northwesternmost transformer appeared to have staining around its base. According to Mr. Donald Giddings of the LADWP, these transformers are owned and maintained by the LADWP and they are not considered to contain polychlorinated biphenyls (PCBs) as a component of their cooling oil. One monitoring well was observed in the parking area to the east of the transformer yard.

Two former 500 gallon USTs (T-4 and T-5) containing waste oil and sulfuric acid were removed from outside the western area of Building No. 263 in 1984. Two large cooling towers are now present in the former locations of these USTs. Impacts to soil and groundwater from releases of chlorinated and non-chlorinated volatile organic compounds and semi-volatile organic compounds from these tanks have been investigated under the ongoing sitewide investigation and remediation program directed by the CRWQCB and DTSC. One monitoring well and two apparent grout-filled borings were observed near the location of the former USTs.

Building No. 265

Building No. 265 was constructed in 1959 and contained offices, maintenance shops, and two anechoic chambers for the testing of radar impacts to missile guidance systems. At the time of the site visit, only office and document storage areas were observed in the building. Previous investigations did not identify this building as a potential source for soil and groundwater impacts. One hydraulic elevator is present in the building. Observation of the elevator equipment did not reveal evidence of leakage or spillage of hydraulic fluid to the surrounding concrete slab.

A diazo blueprint reproducing unit was observed in a small room on the basement level of the building. No ammonia or other chemicals were observed in the room, however a binder containing Material Safety Data Sheets (MSDS) was observed and containing MSDS' for citric metal cleaner and ammonia. No evidence of chemical mishandling or spillage was observed in this area. The east end of the basement of the building was observed to have numerous cuts in the concrete slab. According to Mr. Baker, these areas were formerly occupied by a loading dock and maintenance shops. Mr. Baker further reported that no significant chemical use occurred in these areas and that the concrete cuts marked the locations of former trenches containing electrical and plumbing conduits for the machinery formerly present. Evidence of water staining was noted in the northern basement areas on walls and floors, however, this is not anticipated to represent an environmental concern.

An enclosed fenced area was observed adjacent to the outside of the northeast corner of the building and was labeled as containing corrosive materials. No storage containers or evidence of hazardous

materials or waste storage, including staining, was observed in this area at the time of the site reconnaissance. Mr. Baker reported that this enclosure originally housed a self-contained emergency generator and later was used for storage of waste ammonia and other photo-processing chemicals pending offsite disposal. Mr. Baker further reported that Safety Kleen was contracted to remove these materials from the subject property; however, manifests of pickup and disposal were not available for review onsite. This area has been investigated by the CRWQCB and DTSC as part of the ongoing sitewide soil and groundwater investigation and remediation program and no concerns have been identified with regard to Building No. 265.

Building No. 274

Building No. 274 was constructed in 1981 and houses a large anechoic chamber for testing of radar impacts to missile guidance systems. At the time of the site visit, the chamber soundproofing had been removed from the exposed steel walls and portion of the building had been used by Coast Federal Bank to house the onsite telephone system equipment. According to a transcript of a November 21, 1994 interview with Hughes employees, mercury may have been present in a soundproofing coating on foam "cones" of the anechoic chamber and, according to Mr. Baker, this material was removed under appropriate manifest to a disposal site in Arizona. No documentation of this removal was available for review onsite. During our site visit, a minor amount of soundproofing material was noted on the floor of the anechoic chamber.

A battery bank associated with an uninterrupted power supply system was observed within the building. An emergency electrical generator with an associated 1,500-gallon aboveground storage tank (AST) containing diesel fuel was observed adjacent to the southwest of the outside of the building. No concerns were noted with regard to these features and no evidence of spillage or leakage from the batteries or the outdoor generator system was observed during the site visit.

The area to the south/southeast of Building No. 274 has been investigated during the course of the sitewide soil and groundwater investigation and remediation activities directed by the CRWQCB and DTSC, most recently in September of 1998.

Building No. 277

Building No. 277 was constructed in 1986 as office space. With the exception of less than 5 gallons of photo-processing chemicals observed in a room in this building, no evidence of hazardous materials or hazardous waste use, storage or disposal was observed. The drain in the photo-processing room did not exhibit staining, nor did the floor. According to Mr. Baker, all used photo-

processing and diazo blueprint chemicals were collected for offsite disposal by Safety Kleen and no such materials were discharged to onsite drains. According to a 1989 Phase I ESA report by McLaren, waste photo-processing chemicals were stored in fifty-gallon drums in Building No. 277 (location not identified) and transported offsite for disposal. The McLaren report also identified the use of "quantifiably insignificant" amounts of mineral oil on the first floor of this building; however, no environmental concerns were noted with regard to the use, storage or disposal of the mineral oil.

One hydraulic elevator is present in the building. Observation of the elevator equipment did not reveal evidence of leakage or spillage of hydraulic fluid to the surrounding concrete slab. A self-contained emergency electrical generator was observed outside the southwest end of the building. This generator was equipped with a built-in diesel fuel reservoir. No evidence of leakage or spillage of fuel or oil was observed on the ground surrounding the generator.

Two fenced enclosures were observed to the southwest of the building. These areas were not accessed but appeared to contain electrical supplies for parking area lights. No evidence of chemical use or storage was observed in these areas.

A helicopter landing pad was observed further to the southwest of Building No. 277. No evidence of onsite fueling or servicing of helicopters or other vehicles was observed or reported.

Building No. 276

Building No. 276 was constructed in 1984 as office space. No evidence of hazardous materials or waste use, storage or disposal was observed, with the exception of one former photo-processing room. No hazardous materials or wastes remained in this room and the drain in the photo-processing room did not exhibit staining, nor did the floor. According to Mr. Baker, all used photo-processing and diazo blueprint chemicals were collected for offsite disposal by Safety Kleen and no such materials were discharged to onsite drains. According to a 1989 Phase I ESA report by McLaren, waste photo-processing chemicals were stored in fifty-gallon drums in Building No. 277 (location not identified) and transported offsite for disposal.

A self-contained emergency electrical generator was observed outside the north end of the building. This generator was equipped with a built-in diesel fuel reservoir. No evidence of leakage or spillage of fuel or oil was observed on the ground surrounding the generator.

Building No. 261

Building No. 261 was constructed in 1959 as office space. This building sustained structural damage from the Northridge earthquake in 1994 and reportedly has been vacant since that time. No evidence of the use, storage, or disposal of hazardous materials or wastes at this building was observed or reported. One room in the basement was identified as a print-shop, however, Mr. Baker indicated that only computer generated forms were printed in this location and no wet or dry inks, paints, solvents, or thinners were used at this location. No evidence of such activities, such as staining of walls or floors or evidence of chemical storage was observed in this room. Two cable-type elevators were observed at this building. No hydraulic oils are used in these systems, and as the elevator machinery is located on the roof of the building, the potential for environmental impact from releases of any hazardous materials is considered remote.

A self-contained emergency electrical generator was observed outside the east end of the building. This generator was equipped with a built-in diesel fuel reservoir. Minor staining was noted around the base of the generator, apparently from leakage or spillage of motor oil or diesel fuel. The extent of the staining does not indicate a significant potential for environmental impact to subsurface soils from hazardous materials and this area has been investigated during the course of removal and remediation of the soils surrounding former USTs T-5 and T-6 which were located at the western end of the building in the current location of the cooling towers.

Other Site Features

With the exception of the LADWP electrical transformer station described above, only type "AA" or "dry-type" electrical transformers were observed within the onsite buildings. These types of electrical transformers do not use oil as a coolant and are not considered to pose an environmental concern at the subject property.

Other than the empty former water test tank present beneath Building No. 271, evidence of USTs remaining onsite was not observed. Six USTs have been removed from the subject property since 1984 and releases from five of these UST systems are currently monitored under the sitewide soil and groundwater investigation and remediation program, as directed by the CRWQCB and DTSC. One , approximately 1,500-gallon "Con-Vault" AST containing diesel fuel for an associated emergency electrical generator is present adjacent to Building No. 274.

Eleven monitoring wells are currently present onsite, associated with the ongoing sitewide soil and groundwater investigation and remediation. Treated groundwater discharged from the treatment

units located offsite on Lot C, to the north of the subject property, is used for irrigation on Lot C, under appropriate permits from Los Angeles County and the CRWQCB.

Dumpsters for solid waste were observed at each building location. The dumpsters are owned and maintained by Foothill Waste Disposal Company and evidence of improper dumping or disposal of hazardous materials or wastes was not observed in the dumpster areas.

Utilities reported as providing service to the site were identified as follows:

Electricity:	Los Angeles County Department of Water and Power
Natural Gas:	Southern California Gas Company
Water:	Los Angeles County Department of Water and Power
Sewer:	Los Angeles County Sanitation District
Refuse:	Foothill Waste Disposal Company

With the exception of areas and features noted above and the ongoing soil and groundwater investigation and remediation program, evidence of recognized environmental conditions were not observed at the site. Evidence of dumping of hazardous materials, distressed vegetation, significant soil disturbance or discoloration, ponded or pooled water, septic systems, pits, ponds, or sumps, or indications of hazardous materials use, storage or disposal, was not observed on the subject property.

3.2. Off-Site Observations

Representatives of Geocon observed the adjacent properties from the subject property and from public thoroughfares on December 28, 1998, to assess if facilities and/or structures located on these properties are operated by entities that potentially use, store, generate, or dispose of hazardous materials/wastes.

The subject property is bounded by Lot C (Regent's Property) to the north. At the time of Geocon's site reconnaissance, substantial construction work was underway at the buildings on this property. Reportedly, Lot C is being redeveloped as a business park. Lot C has been impacted by releases of hazardous materials dating from the Hughes occupancy of the entire site and is part of the ongoing soil and groundwater investigation and remediation activities directed by the CRWQCB and DTSC. The subject property has been environmentally impacted by hazardous materials and wastes originating from Lot C. Beyond Lot C is open space containing spillways for the adjacent north Chatsworth Reservoir.

To the east is Fallbrook Avenue followed by residential neighborhoods and a playground for Rockwell Employees. Further east from the playground is Rockwell AID/C at 8500 Fallbrook

Avenue. The Rockwell facility was not visible from Fallbrook Avenue and was not observed during the site visit.

To the south of the subject property are Lots A and D. A large building, reportedly a private school owned by DeVry Inc., is under construction at Lot A. Lot D remains as paved parking areas but is projected to be developed as a Los Angeles Police Department (LAPD) 911 Emergency Center. Roscoe Boulevard, lined by commercial properties follows to the south.

To the west is open space and Lees Lake and the Chatsworth Creek followed by residential areas.

4. SITE HISTORY

4.1. Review of Historical Aerial Photographs

Historical aerial photographs available from Continental Aerial Photography, Inc. (Continental) for the years 1952, 1970, 1972, 1979, 1986, 1988, 1990, 1993, and 1995 were reviewed. Historical Sanborn Fire Insurance maps and City Directories were sought from the Los Angeles County Public Library but were not available for the subject property and vicinity. Observations noted during the historical photograph review are discussed below. In addition, copies of three undated, low-altitude, oblique aerial photographs of the subject property were provided by EASI and are presented in the rear portion of Appendix A.

1952 Aerial Photograph – The subject property appeared as agricultural land with one cluster of rural residential buildings located roughly at the center of the property. Surrounding properties were also agricultural with an area of construction or grading in the location of the residential neighborhood present today to the east of Fallbrook Avenue. A cluster of rural residential type structures was also present to the northeast of the subject property and the Chatsworth Reservoir was present in its current location.

1970 Aerial Photograph - The subject property was developed with Building Nos. 261, 263, 264, 265 and 271, the helipad, and paved parking areas. A few small unidentifiable features appeared in the parking lot to the east of Building No. 264, the current location of the well CM-8D plume. To the north of the subject property was the remainder of the Hughes facility (currently Lot C), including cooling ponds in the center of that property. Areas to the west and south remained undeveloped and residential neighborhoods were present to the east, across Fallbrook Avenue.

1972 Aerial Photograph – The subject property and vicinity appeared similar to the configuration observed on the 1970 photograph.

1979 Aerial Photograph - The subject property appeared to be developed with the five buildings observed on the 1970 photograph and with eight additional structures which were not present during

the December 28, 1998 site visit. These buildings appeared in the center of subject property, to the west of Building No. 265. Offsite areas appeared developed similar to areas observed during the December 28, 1998 site visit.

1986 Aerial Photograph - The subject property was developed with the five buildings observed since 1970 and Building No. 276. Three of the eight structures observed in the 1979 photograph remained as well. An excavated or otherwise disturbed area appeared roughly in the area of the former location of USTs T-7, 8, and 9, to the west of the current location of Building No. 281. Other areas appeared similar to their depiction in the 1972 photograph.

1988 Aerial Photograph - The subject property was depicted essentially the same as during the December 28, 1998 site visit with all nine buildings present. North of the subject property was Lot C, to the east was Fallbrook Avenue followed by residential areas, to the south were Lots A and D. Lot A remained paved parking and Lot D was occupied by a recreation area with fields and a baseball diamond. To the west was paved parking and vacant land.

1990 – 1993 Aerial Photographs - The subject property and vicinity appeared similar to the 1988 photographs.

1995 Aerial Photograph - The subject property and surrounding properties appeared relatively unchanged from the 1993 photograph; however, large piles of assumed construction debris were present in several of the parking lots onsite.

4.2. Historical Ownership

A Chain-of-Title report was not provided for review. Based on a review of historical documentation Geocon has compiled the following chronology of subject property ownership. The subject property was originally developed as an aerospace research and development facility in 1959 by Bunker Ramo. Prior to this time the subject property was used as agricultural land, and may have also been used as a filming site. Hughes Aircraft Company and Bunker Ramo jointly operated onsite through the 1960's when Hughes assumed sole ownership of the site. Rocketdyne was a tenant of the property at one time, according to the DTSC. Hughes vacated the site in approximately 1994 and Coast Federal Bank acquired the property and divided it into four lots which exist today. Coast Federal Bank and its successer Home Savings and Loan maintained administrative offices and a training center onsite until they vacated the subject property in 1998. Raytheon Missiles Systems Group (Raytheon) acquired Hughes in December 1997 and since that time has assumed financial responsibility for ongoing and future environmental investigations and remediation activities at the former Hughes facility, including the subject property.

4.3. Interview - Property Owner Representative

Mr. Grant Baker, of Home Savings of America was interviewed regarding historical use of the subject property. Mr. Baker was an employee of Hughes Aircraft Company for nineteen years and has extensive knowledge of subject property conditions and operations. Information obtained from Mr. Baker regarding historical subject property operations is presented in Section 3.0.

5. GOVERNMENTAL AGENCIES - RECORDS REVIEW

VISTA Environmental Solutions, Inc., retained by Geocon, performed a search of federal and state governmental information sources according to prescribed search distances referenced in American Society for Testing and Materials (ASTM) Designation E 1527-97. A reproduction of the report prepared by VISTA is presented in Appendix B.

5.1. VISTA Report

The report prepared by VISTA entitled *Site Assessment Plus Report* dated January 5, 1998, includes a Site Distribution Summary, a Map of Sites Within 1¼-Miles, a Map of Sites Within 3/8-Mile, a Street Map, a Site Inventory, a Description of the Databases Searched, and Details of the Property, Adjacent Area, and Unmapped Sites. The Unmapped Sites included in the report identified sites that have incomplete address information and could not be plotted. Based on a review of the Unmapped Sites list and comparison with local street maps, none of the Orphan sites appear to be within one mile of the subject property.

A description of each database referenced by VISTA is provided in the report presented as Appendix B. The acronyms used in the VISTA report are defined in the rear portion of the VISTA report. The findings of the VISTA report are discussed as follows. The identification number as plotted in the VISTA report for each listed property is reported in parenthesis to the right of each facility name.

5.1.1 Subject Property

The subject property was identified in the VISTA Report on the ERNS, LA County Site Mitigation, UST, CORTESE, RCRA-Large Generator, CORRACTS, RCRA-Violations, RCRA-TSD CORRACTS, State Equivalent CERCLIS, State LUST, and NFRAP lists. It is referenced variously as part of the Hughes Aircraft, Hughes Aircraft Company, Hughes Missile Systems, Hughes Missile Systems Company, and Hughes T-3 Site. The site description and address refers to the entire former Hughes facility which includes not only the subject property (Lot B) but also Lots A, C, and D. According to the VISTA report, the Hughes facility has had releases of gasoline (not described), volatile organic compounds (VOCs) (not described), solvents (not described) and formaldehyde (20-

gallons). The current site status is reported as "remediation underway". Fourteen various sized USTs used for storing unleaded gasoline and miscellaneous chemicals are reported as closed and removed from the entire former Hughes facility. According to the State LUST list information contained in the VISTA report, solvents and VOCs were released from the onsite USTs and investigation of the releases is currently underway. Nine undefined RCRA violations are reported from 1989 to 1994. The site is not identified on the EPA NPL (Superfund) list.

5.1.2. Offsite Properties

- Rockwell AID/C (2), at 8500 Fallbrook, is located across Fallbrook Avenue to the northeast of the subject property and is likely hydraulically cross-gradient of the subject property. The Rockwell AID property is reported as a registered UST site and as an RCRA Small Quantity Generator of hazardous waste (SmGen). SmGen's are defined as facilities which generate at least 100 kilograms but less than 1,000 kilograms per month of non-acutely hazardous waste. One registered UST is reported at the property but no other information regarding the UST was reported. According to the VISTA report, no indications of violations or release of hazardous materials are identified for this property and based on this information, it is not considered to have significant potential to have affected environmental conditions at the subject property.

- Chatsworth Reservoir (2), at 8600 Fallbrook, is located approximately 1/8-mile to the north of the subject property and is potentially hydraulically upgradient of the subject property. The Chatsworth Reservoir property is reported as having one registered UST. Information regarding the status of this UST is not documented in the VISTA report. According to the VISTA report, no indications of violations or release of hazardous materials are identified for this property and based on this information, it is not considered to have significant potential to have affected environmental conditions at the subject property.

- Fire Station 106 (3), at 23004 Roscoe Boulevard, is located slightly less than ¼-mile to the south of the subject property and is likely to be hydraulically downgradient of the subject property. This site is identified as a registered UST site with one UST of unreported status, and as an RCRA SmGen. According to the VISTA report, no indications of violations or release of hazardous materials are identified for this property and based on this information, it is not considered to have significant potential to have affected environmental conditions at the subject property.

- Lakeview Cleaners (4), at 22736 Roscoe Boulevard, is located slightly over ¼-mile to the southeast of the subject property and is likely to be hydraulically downgradient of the subject property. This site is identified as an RCRA Large Quantity Generator of Hazardous Wastes (LgGen). LgGen's are defined as facilities which generate at least 1,000 kilograms per month of non-acutely hazardous waste or 1 kilogram per month of acutely hazardous waste. According to the VISTA report, no indications of violations or release of hazardous materials are identified for this property and based on this information, it is not considered to have significant potential to have affected environmental conditions at the subject property.

5.2. Agency Communications and Review of Records at Public Agencies

5.2.1. California Department of Conservation Division of Oil, Gas and Geothermal Resources (DOGGR)

The California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR) Field Map (W 1-2) (June 19, 1986) was reviewed by a representative of Geocon to obtain information concerning the subject property and properties situated within approximately ¼-mile of the subject property. The map depicts the location of oil and gas wells. The map did not indicate the existence of oil or gas wells within ¼-mile of the subject property.

5.2.2. City of Los Angeles Building and Safety Department

The City of Los Angeles Building and Safety Department was visited in person on December 29, 1998. Building permits for the original buildings constructed by Bunker Ramo in 1959-1961 on the entire former Hughes Aircraft Company were identified, as well as various tenant improvements, plumbing and electrical permits. No indications of the use or storage or hazardous materials at the subject property was identified from this review. Mr. Baker of Home Savings of America stated that Hughes Aircraft Company had requested many of the original building permits to be destroyed for security reasons.

5.2.3. Los Angeles City Fire Department – Underground Storage Tank Division

The Los Angeles City Fire Department (LAFD) was visited by Geocon on December 29, 1998. Files reviewed at this agency documented the removal of onsite USTs T-10, T-7, T-8, and T-9, as well as removal of soil impacted by diesel fuel and VOCs. The file also contained information regarding removal and investigation of USTs and clarifiers located on Lot C, located adjacent to the north of the subject property. Oversight for the site investigation was referred to the CRWQCB on December 23, 1991 and no closure letters for removal of the USTs was found in the files.

5.2.4. Health Department, Los Angeles County

The Los Angeles County Health Department was contacted in writing on December 23, 1998. At the time of this report writing, Geocon has not received a response from this agency. Geocon will report any pertinent information received from this agency in a letter addendum to this report.

5.2.5. Department of Public Works, Los Angeles County

The Los Angeles County Department of Public Works (LACDPW) was visited in person on January 13, 1999 and reported that no environmental files were found for the subject property. The LACDPW is not an oversight agency for areas which are contained within City of Los Angeles boundaries.

5.2.6. California Regional Water Quality Control Board (CRWQCB)

Ms. Regina Simms of the CRWQCB reported by telephone on December 23, 1998 that files were found for the subject property in the Site Cleanup Section of the CRWQCB. No files were reported by the WIP, SLIC, NPDES or UST Sections. CRWQCB staff reported that all files previously held by these sections had been transferred to the Site Cleanup Section. The Site Cleanup Section files were reviewed on January 11, 1999 by Mr. Robin Ferber, Senior Managing Geologist, of Geocon. The subject property is included in an ongoing investigation of soil and groundwater impacts from onsite USTs T-5, T-6, T-7, T-8, T-9, and T-10, in addition to environmental impacts from USTs and other features formerly located on Lot C, located adjacent to the north of the subject property. The review of these files is described in detail in Table 2.

5.2.7. South Coast Air Quality Control Board (SCAQMD)

Ms. Flor Tumambing of the SCAQMD reported in writing on January 6, 1999 that numerous files were found for the subject property. A list of permitted equipment was provided comprising equipment permitted between 1967 and 1994. It is not possible to discern which permits apply to the subject property rather than those applicable to Lots A, C, and D. Permitted equipment included: soldering equipment, storage tanks, plating equipment, ovens, degreasers, spray booths, solvents, scrubbers, chemical mills, film cleaning, cooling towers, boilers, flues, circuit board etchers and cleaners, internal combustion engines (emergency generators), and soil vapor extraction treatment systems. A complete list of the equipment provided by SCAQMD is provided in Appendix C.

5.2.8. California – EPA, Department of Toxic Substance Control (DTSC)

Mr. Glen Castillo of the DTSC reported by telephone on January 5, 1999 that files were found for the subject property. The files were reviewed on January 14, 1999 by Mr. Robin Ferber of Geocon. The subject property is included in an ongoing investigation of soil and groundwater impacts from onsite USTs T-5, T-6, T-7, T-8, T-9, and T-10, VOCs detected monitoring wells CM-8D and CM-10, eight Areas of Concern and three Solid Waste Management Units identified by the DTSC, in addition to environmental impacts from USTs and other features formerly located on Lot C, located

adjacent to the north of the subject property. The review of these files is described in detail in Table 3.

5.3. Interviews with Representatives of the CRWQCB and DTSC

5.3.1. Interview with Ms. Manjulika Chakrabarti of the CRWQCB

An interview was conducted with Ms. Manjulika Chakrabarti, Technical Support Unit, CRWQCB Los Angeles Region by Mr. Robin Ferber, Senior Managing Geologist with Geocon on January 5, 1999. Ms. Chakrabarti is currently the project manager for the Raytheon (formerly Hughes) Canoga Park project. Ms. Chakrabarti indicated some existing monitoring wells will be closed and some new wells may be added in Lot C. Ms. Chakrabarti indicated to the best of her knowledge, Raytheon (formerly Hughes) has complied with the requests of the CRWQCB.

5.3.2. Interviews with Mr. Phil Blum and Mr. Phil Chandler of the DTSC

Mr. Phil Blum, Project Manager, Southern California Permitting Branch, DTSC and Mr. Philip Chandler, Supervising Hazardous Substances Engineering Geologist, Southern California Permitting Branch, DTSC were interviewed together on January 14, 1999 by Mr. Robin Ferber of Geocon and Mr. Neal H. Holdridge, Environmental Manager of EASI. Mr. Blum was also interviewed by telephone by Mr. Ferber on January 8, 1999.

During the January 8, 1999 telephone conversation with Mr. Ferber, Mr. Blum indicated that he has been managing the project actively since April 1998. Mr. Blum indicated that the DTSC has notified Raytheon to conduct activities at the site and that Raytheon has not performed these activities. The activities include providing a post-closure permit application for UST T-3 and sampling for hexavalent chromium in the area beneath the former Hazardous Waste Storage Area. Mr. Blum indicated that Raytheon has also been asked to do Corrective Action activities for environmental concerns associated with Building No. 269 (Lot C). Mr. Blum indicated that the DTSC has been shorthanded in response to information and clarifications requested by Raytheon. Mr. Blum indicated the most significant groundwater problem is where the VOCs are present beneath UST T-3. In Mr. Blum's opinion, Raytheon has not defined the lateral and vertical extent of contamination beneath UST T-3. Mr. Blum indicated that Raytheon has contested the necessity of providing a post-closure permit application for UST T-3. Mr. Blum indicated that a DTSC compliance enforcement action may be needed if Raytheon continues to contest the post-closure permit application required for UST T-3.

Mr. Blum indicated that Mr. Chandler is a more senior level DTSC representative and recommended discussing the project with both of them during Mr. Ferber's file review on January 14, 1999. During the joint interview with Mr. Blum and Mr. Chandler on January 14, 1999, Mr. Chandler indicated that Raytheon's position is that the post-closure permit application for UST T-3 is unnecessary. Mr. Chandler indicated that the DTSC has sent three letters to Raytheon to indicate they are not in compliance with the post-closure requirements. The DTSC indicated that they are in the process of preparing a letter providing Raytheon with 90-days to respond and comply to the post-closure application requirements for UST T-3.

Both Mr. Chandler and Mr. Blum indicated that the DTSC still needs to sign off on the AOCs and SWMUs previously identified and that further investigations associated with AOCs and SWMUs are possible for the subject property (i.e., Lot B). Mr. Chandler and Mr. Blum both indicated that they have been short staffed and have not responded to Raytheon's requests in a timely manner. They indicated the DTSC is the lead agency for Corrective Action and closure and post-closure of the permitted units under RCRA. The CRWQCB was described by Mr. Chandler as the lead agency for groundwater protection for the whole former Hughes facility.

Mr. Chandler indicated that the City of Los Angeles may request an environmental clearance by the DTSC prior to authorizing the construction of any building on the former Hughes property. Mr. Chandler also stated that the DeVry Inc. property (Lot A) located south of the subject property had to acquire an environmental clearance letter for the City of Los Angeles from the DTSC prior to the construction of their building.

Mr. Chandler was aware of the elevated uranium and radium levels detected previously in groundwater beneath the site, but did not have an explanation as to the source of the detections. Mr. Chandler did not rule out the possibility that the DTSC may further investigate the radioactivity issue at a later time. Mr. Chandler indicated that Rocketdyne was reportedly a tenant at the site in the past.

6. CONCLUSIONS AND RECOMMENDATIONS

The conclusions and recommendations resulting from the performance of this Enhanced ESA are summarized below:

- During a site reconnaissance of the subject property, the approximately 30-acre subject property was occupied by nine buildings and landscaped and paved parking areas. With the exception of onsite features associated with the ongoing groundwater monitoring program and potential impacts associated with the Raytheon soil vapor and groundwater extraction and treatment

systems, evidence of "recognized environmental conditions" was not observed during our site reconnaissance of the subject property.

- Raytheon acquired Hughes in December 1997 and since that time has assumed financial responsibility for ongoing and future environmental investigations and remediation activities at the former Hughes facility, including the subject property.

- Obvious evidence of hazardous materials use, storage or disposal was not observed onsite in the aerial photographs reviewed. The subject property appears to have been used for agricultural purposes prior to development as an aerospace research and development facility in 1959. Construction of onsite buildings and features occurred roughly from 1959 to 1986.

- Onsite topography slopes to the south, east, and west from a high point located roughly at the center of the northern boundary of the subject property. Groundwater beneath the subject property flows to the south-southeast with the exception of the Lot C area northwest of the subject property where groundwater flows to the west towards Chatsworth Creek.

- The subject property was identified in the information sources reviewed by VISTA. All of the subject property listings appear to relate to the ongoing soil and groundwater investigations at the subject property. Several businesses listed by VISTA in their report were within the appropriate search radii used for this ESA. The properties listed by VISTA are not considered likely to impact soil and groundwater beneath the subject property with hazardous materials based on their distance from the subject property, their location relative to the local hydraulic gradient, and/or the absence of information indicating releases of hazardous materials originating from the listed properties.

- Releases of diesel fuel, chlorinated and non-chlorinated volatile organic compounds (VOCs), aromatic VOCs, and semi-volatile organic compounds (SVOCs) to soil and/or groundwater have been documented onsite. Investigation of impacts to soil and groundwater from these substances has been ongoing since 1989 under the direction of various regulatory agencies including the City of Los Angeles Fire Department, CRWQCB, California Department of Health Services, and the DTSC. The DTSC and the CRWQCB are currently the key environmental agencies involved at the subject property and neighboring former Hughes properties.

- Four USTs containing fuel oil (T-7, T-8, T-9, and T-10) and two USTs containing waste oil and sulfuric acid (T-5 and T-6) were identified at the subject property. Five of these USTs exhibited evidence of leakage; one of the USTs containing fuel oil did not apparently leak. Historical

remedial activity on Lot B consisted of excavation and offsite disposal of soils impacted by the five USTs, which has been documented in previously generated environmental reports.

- The review of environmental documents indicate that soil and groundwater beneath the subject property have been impacted by VOCs in two areas. One of the areas where groundwater has been impacted by VOCs is located to the south of Building No. 281 and east of Building No. 264. Groundwater samples collected from groundwater monitoring well CM-8D have shown the presence of VOCs from an unknown source. Hughes' environmental consultant estimated that approximately 0.2 gallons VOCs caused the impact to groundwater discovered in that area. Identifying the source of the VOCs detected in the well CM-8D area has been and remains one of the major concerns of the DTSC. Soil vapor samples collected in the area of well CM-8D have not been conclusive in identifying a source of the VOCs detected in the groundwater. The possibility exists that the DTSC may require Raytheon to conduct further environmental investigations in this area. It may be prudent to conduct indoor air monitoring for VOCs in Building Nos. 263, 264, and 281 to evaluate potential exposure concerns to future building tenants.

- The second area where groundwater impacts by VOCs were detected is in the area of monitoring well CM-10 located offsite to the south-southeast of Building No. 274. Freon 11 was the primary constituent of concern detected in groundwater from this well. A soil vapor plume comprised primarily of Freon 11 and other VOCs was identified onsite and to the south of Building No. 274 in area hydraulically upgradient of monitoring well CM-10. In addition, groundwater well MW-31, located onsite in the central portion of the Freon 11 soil vapor plume contained Freon at concentrations equal to the US EPA Maximum Contaminant Level (MCL) established for groundwater. The source of the Freon 11 soil vapor plume is speculated by Raytheon to be from air conditioning equipment repairs that were conducted in the unpaved portions of the parking lot during the 1960s. Aside from groundwater monitoring, Raytheon has recommended that further investigation of the Freon 11 soil vapor and groundwater plume be discontinued. The DTSC has not accepted Raytheon's recommendation for this area and therefore, the potential exists that the DTSC will require future soil and/or groundwater investigations in this area.

- The DTSC identified eight Areas of Concern (AOCs) and three Solid Waste Management Units (SWMUs) on the subject property that may require further investigation. Based on the findings of a soil and groundwater investigation documented in a September 1998 report prepared by GTI, Raytheon requested that the DTSC de-list two of the SWMUs and three of the AOCs located in southern portion of the subject property. Geocon did not find a written response from

the DTSC regarding Raytheon's request for de-listing. The DTSC should be contacted to evaluate the status of the AOCs and SWMUs and whether any of them have been de-listed.

- Other SWMUs and AOCs were identified by the DTSC for Lot C, located adjacent to and to the north of the subject property. Lot C also has a former Hazardous Waste Storage Area for which Raytheon has not yet completed its DTSC approved Closure Plan, and a UST designated as T-3, which is a regulated unit and subject to post-closure care requirements as specified in the California Code of Regulations, Title 22. Soil vapor and water extraction and treatment systems are active in the northern portion of Lot C. Treated water from the extraction system is solely on Lot C, for irrigation of landscaped areas, under permit from the CRWQCB; however, the treatment system is currently shut down due to construction activities ongoing in the northern portion of Lot C.

- According to a November 21, 1994 interview with Hughes employees, mercury may have been present in a soundproofing coating on foam "cones" of the anechoic chamber present in Building No. 274. This soundproofing material was reportedly removed under appropriate manifest to a disposal site in Arizona. During our site reconnaissance, a minor amount of residual soundproofing material was noted on the floor of the anechoic chamber. A Certified Industrial Hygienist should be retained to evaluate for the presence of mercury in the residual soundproofing material observed in the anechoic chamber.

- Personal interviews conducted with the DTSC indicate that the City of Los Angeles may request DTSC approval prior to issuance of future building permits at the subject property. DTSC communications with DeVry Inc. who is developing Lot A to the south of the subject property indicated that the DTSC may require access to their property for soil and groundwater investigations/remediation should future evidence of environmental impacts be discovered on Lot A. Appropriate personnel at the City of Los Angeles should be contacted to evaluate the potential involvement of the DTSC in the acquisition of Building Permits for the subject property. In addition, DTSC input should be obtained regarding their concerns if new structures are built in designated areas of the subject property.

- Groundwater beneath the subject property and adjoining lots contains levels of uranium and radium above drinking water standards. Groundwater monitoring wells CM-8D and CM-10 generally contain higher levels of uranium and radium in the groundwater, when compared to the other wells throughout the former Hughes facility that were sampled. Previous investigations concerning the presence of these radioactive materials concluded they were naturally occurring and due to local variations in geological deposits. The prior investigations concluded that no man-made radionuclides were indicated. No surface soil investigations regarding the presence

of radioactive materials have been conducted at the site. Documents listing the radioactive materials formerly used by Hughes indicate that Hughes' operations have not served as the source for the radioactivity discovered in groundwater. It may be prudent to conduct a radon gas investigation in the buildings onsite to investigate potential radioactive exposure concerns to Lot B building tenants.

- The northern portion of Lot C is undergoing remediation under the guidance of the DTSC and CRWQCB. According to the DTSC, Raytheon is in violation of Title 22, California Code of Regulations for not having submitted an application for post-closure of UST T-3. In addition, the DTSC has asked Raytheon to investigate the lateral and vertical extent of hexavalent chromium detected in soil beneath the former hazardous waste storage area. Raytheon has issued written complaints to the DTSC regarding the DTSC's lack of administrative response concerning environmental issues at the site. The effect of these outstanding issues between the DTSC and Raytheon on the proposed acquisition of Lot B is considered of minimal impact in compliance with all directives issued by the oversight agencies. No additional environmental concerns were identified based on the scope of work performed for this Phase I ESA.

As of the date of this report, one regulatory agency referenced in Section 1.3 has not responded to Geocon's request for environmental information. If a response is received from the referenced agency which affects the conclusions of this report, an addendum letter will be provided to TCSCPR, EASI and MEPT.

7. LIMITATIONS

This Phase I environmental site assessment report has been prepared solely for TCSCPI, EASI, and MEPT in consideration of TCSCPI's, EASI's, and MEPT's requirements. Other parties may rely on the findings and conclusions of the report for informational purposes only. However, TCSCPI, and EASI and other parties who may rely on the findings and conclusions of the report should recognize that this report is not a comprehensive site characterization and should not be construed as such. The findings and conclusions in this report are predicated on a site reconnaissance, a review of specified regulatory records, and a review of the historical usage of the property as presented in this report.

The information obtained is only relevant for the dates of the records reviewed or as of the date of the latest site visit. Thus, the information contained herein is only valid as of the date of the report, and will require an update to reflect recent records review/site visits. Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee of the results of the study is implied within the intent of this report or any subsequent report, correspondence or consultation, either expressed or implied. The services performed were conducted in accordance with the local standard of care in the geographic region at the time the services were rendered. TCSCPI, EASI and MEPT should also understand that asbestos, lead-based paint, radon, lead in drinking water, wetlands, and methane gas were not addressed in the scope of services of this report.

-o0o-

We trust this report provides TCSCPI, EASI, and MEPT with the information you require at this time. Should you have any questions regarding the information presented in this report, please call us at (213) 538-1282.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
11/30/89	McLaren	Hughes Missile Systems Company (HMSC)	Potential Source Area Investigation Report	This report presents the results of the historical chemical use inventory performed at the Hughes Missile System Group Facility in Canoga Park, California. This report was requested by California Regional Water Quality Control Board. The reports summarized the chemical use inventories for all the buildings at the Hughes facility. This includes Building Nos. 261, 263, 264, 265, 271, 274, 276, 277, and 281. The purpose of the report was to document all relevant chemical use areas at the facility and identify those potential source areas which may have released chemicals to the ground. No chemical use was indicated for Building No. 261. Prior to 1987, a paint spray room existed in Building No. 263, Room 1300. The paint spray room was relocated to Building No. 271 in 1987. The report indicated that there do not appear to be any significant contaminant source areas within Building No. 263. No chemical use was indicated for Building No. 264. Building No. 265 contained two active chemical use areas that involved cleaning, soldering and solvent cleaning operations. General housekeeping practices were determined to be of good quality. There did not appear to be any significant chemical source areas that could impact subsurface soil beneath Building No. 265. Building No. 271 contained one active chemical use area which included a spray paint booth that utilized chemical solvents. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 271. Building No. 274 had one active chemical use area. Solvent cleaning had reportedly been conducted in Room 305 since after the construction of the building in 1980/1981. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 274. Building No. 276 had two active chemical use areas. Cleaning operations in Room 1252 and photographic processing operations in Room 1282 had been conducted since sometime after

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				construction of the building in 1986. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 276. Building No. 277 had one active chemical use area. Mineral oil had been used for lubrication in Room 1528. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 277. Building No. 281 had two active chemical use areas. Insecticide had been stored in the controlled materials storage area of Room 211 since approximately 1986, when construction of the building was completed. In addition, anti-freeze and mineral oil had been used in the maintenance shop of Room 1261. There did not appear to be any significant contaminant source areas that could impact subsurface soil in Building No. 281.
07/29/91	Ecology and Environment, Inc.	Environmental Protection Agency, Region 9	RCRA Preliminary Assessment	Preliminary Assessment (PA) for the Hughes Aircraft facility located in Canoga Park, California. In 1959, the site was developed by an electrical component design and testing company called Bunker Ramo and it was operated as an industrial park. From 1966 to 1976, Hughes was a co-occupant of the site with Rocketdyne, a division of Rockwell International, and Bunker Ramo. Hughes purchased the entire site in the mid-1970s and became the sole occupant. The report listed and described underground storage tanks (USTs) that were used at the facility. There were three areas of concern identified at the Hughes facility. The first area is the northwest portion of the site (i.e., Lot C) which has historically handled and stored chemicals. Soil and groundwater in this area is contaminated with petroleum hydrocarbons and VOCs that include halogenated compounds. The second area is the southwest corner of Building No. 281. A fuel oil UST was located in this area. Soil and groundwater in this area is contaminated with VOCs that include halogenated compounds. The third area is the recreation center in the southeast corner of the site (i.e., Lot A). Soil and groundwater in this area are contaminated with Freon 11. Elevated levels of radioactivity, above drinking water standards, also appeared in groundwater in this area; however Hughes believes this

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				radioactivity is due to high background levels in the area. The types of radioactive isotopes were not identified. The report indicated that no groundwater wells are used for drinking water within four miles of the Hughes facility. The report summarized the following Hazard Ranking System factors associated with the Hughes facility: (1) low potential for release to air and surface water; (2) low potential for exposure to contaminated soils; and (3) no drinking water wells are located within four miles of the site. The EPA's recommendation was to defer to another authority: RCRA.
11/25/91	American Environmental Management Corp.	Los Angeles City Fire Department	Letter regarding Soil and Groundwater Contamination	This letter requested that the California Regional Water Quality Control Board be allowed to serve as the lead agency for environmental investigations and remediation activities ongoing at the site.
12/02/91	HMSG	Los Angeles City Fire Department	Letter regarding Soil and Groundwater Contamination	This letter confirmed that the California Regional Water Quality Control Board would serve as the lead agency for investigative and remedial activities ongoing at the site.
12/23/91	Los Angeles City Fire Department	HMSC	Letter regarding Groundwater Contamination	This letter indicated that because groundwater contamination was discovered at the site, the California Regional Water Quality Control Board would serve as the lead agency for ongoing investigative and remedial activities at the site.
12/28/93	Groundwater Technology	HMSC	Phase I Environmental Report: Areas of Potential Chemical Release to Soil and Groundwater	GTI was contracted by Hughes to conduct a Phase I ESA of its research and development facility in Canoga Park, California. The review was conducted to identify potential sources of chemical release to area soil and groundwater. This Phase 1 ESA identified soil and groundwater contamination at the site originating from leaking USTs located both on the subject property and in the current Lot C area. USTs located on the site included UST #s T-5, T-6, T-7, T-8, T-9 and T-10. UST #s T-5 and T-6 reportedly contained chlorinated and non-chlorinated VOCs and one semi-volatile compound. UST #s T-7, T-8, and T-9 reportedly contained diesel fuel. The report indicated areas of potential release to be the east end of Building No. 269 and the Building No. 272 hazardous materials and waste storage area. The report also indicated that an additional area of low level environmental concern for metals was the main sewer line route.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
01/04/94	Groundwater Technology	HMSG	Report on Facility-Wide Site Assessment	This report provide details on a site investigation to evaluate the VOCs previously detected in the CM-8D (Lot B) and CM-10 (Lot A) monitoring well areas. GTI indicated that chlorinated VOCs at a combined concentration of just over 1,000 ug/L have been detected in groundwater from well CM-8D. The source of the VOCs is not definitely known; however, three monitoring wells located south of well CM-8D contained detectable concentrations of VOCs. Building No. 264 is located central between the VOC detected in the associated with well CM-8D. GTI estimated the volume of released chlorinated VOCs in groundwater in the well CM-8 D area as 0.2 gallons. The total estimated volume of VOCs near well CM-8D is thought to be sufficiently small that no threat to human health or the environment exists. Freon 11 at a concentration up to 190 ug/L was detected in groundwater from monitoring well CM-10. No Freon 11 has been detected in nearby wells, MW-29, MW-30, or CM-17. A volumetric estimation was not made for Freon 11 in the well CM-10 area. It was thought that the Freon 11 in the well CM-10 area poses no environmental threat. A "Leave in Place" with groundwater monitoring was proposed for the well CM-8D area. Computer modeling suggested that the VOCs will not migrate off the property and that with time the VOCs will degrade to lower concentrations than are now present.
8/30/94	Earth Tech	Coast Federal Bank	Consultation Letter Regarding Property Transfer and Summary of Preliminary Records Review	This report summarized a review of California Regional Water Quality Control Board (CRWQCB) for files from the years 1986 through March 1993 *(these files were not available for review by Geocon on January 11, 1999 at the CRWQCB)*. As related to the subject property, the report indicated that groundwater in the area of Building No. 264 requires continued monitoring for VOCs in Wells MW-25, MW-26 and MW-27, at a minimum. The report indicated that a detailed review of hazardous chemicals used at each building at the site would need to be reviewed. For off-site concerns that could impact the subject property, the report indicated the gasoline plume in northwestern area of the site had not been adequately delineated. Documents reviewed by Earth Tech relating to concerns about radioactivity in groundwater, include reports entitled *Groundwater Quality Analytical Results for Radioisotopes, Off-site Wells*, McLaren

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				Hart Environmental December 1990 and January 1991; *Investigation of Radioactivity in Groundwater at Hughes,* Groundwater Resources Consultants, Inc., January 23, 1992; and *Results of Radiological Sampling of Wells,* Groundwater Resources Consultants, Inc., July 1, 1992.
11/14/94	Groundwater Technology	HMSC	Letter- Analytical Results for Soil Samples	This document contained a December 7, 1994 facsimile cover sheet for a Nov. 14, 1994 report entitled *Analytical Results for Soil Samples, Remediation System Wells, Hughes Missile Systems Co., Canoga Park, California,* prepared by Groundwater Technology and submitted to Hughes. The report indicated that a vadose and groundwater remediation system was under construction at Hughes and include two groundwater recovery, air sparging, and vapor extraction wells. 71 wells are involved including 17 groundwater recovery wells, 30 combination air sparge/vapor extraction wells, and 24 vapor extraction wells. A plume map prepared for VOCs in soil in the report was unreadable because of poor resolution.
11/18/94	Earth Tech	Coast Federal Bank	Potential Source Area Investigation	This is simply a transmittal of the November 30, 1989 *Potential Source Area* report prepared by McLaren and referenced above.
11/21/94	N/A	N/A	Interview conducted by Coast Federal Bank of Hughes Employees	This is the transcript of a verbal interview conducted by Coast Federal Bank of various Hughes employees. One of the questions asked was *Do you know of any radioactive materials used on the property?* The Hughes employees indicated that *"minor"* amounts were used in the form of *"flat-packs". Geocon's discussions with Grant Baker, formerly of Hughes, currently with Coast Federal Bank, indicated that the referenced flat-packs were used to monitor the quality of electric circuits in printed circuit boards.* The employees were also asked *Do you know of any radioactive materials released or disposed at the property?* The Hughes employees responded that there were *"none".* One of the employees mentioned that mercury may have been present in the "cones" (i.e., soundproofing material) of the "chamber" (i.e., anechoic chamber) present in Building No. 274.
11/21/94	CH2M Hill	HMSC	Contingent Closure and Post Closure Plans	This document, stamped draft, was requested by the California EPA and presents a Contingent Closure Plan for UST T-3 prepared by CH2M Hill for Hughes. The UST was removed in 1991 and was reportedly a 4,000-gallon fiberglass tank that was used to store waste oils and waste oils mixed with solvents. Associated contaminated soils were removed in September 1991 under a Corrective Action Plan (CAP). The Contingent Closure Plan was reportedly prepared in accordance with EPA guidance. The report documents remediation of soil associated with UST T-3. The remediation consisted of excavation and off-site disposal of 1,321 cubic yards of soil contaminated with

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				petroleum hydrocarbons, DCE, and VOCs. Soils were excavated by using three-foot diameter boreholes to an average depth of 40 feet below the ground surface. A cement/sand slurry was backfilled into the excavated boreholes. A final cover, using asphalt concrete, was placed over the backfilled boreholes. Groundwater remediation will consist of groundwater pumping and treatment, air sparging, and vapor extraction. The report indicated that groundwater remediation was expected to take approximately 4-8 years. The report indicated groundwater monitoring wells would be used to monitor groundwater conditions associated with contamination originating from UST T-3. The site would be considered successfully remediated when concentrations of VOCs averaged per well over the most recent four sampling periods are below the target cleanup levels at all recovery wells. In addition, the report indicated soil vapor constituents would be monitored as part of the groundwater remediation system.
11/28/94	Earth Tech	Coast Federal Bank	Technical Memorandum Records Review Limited Site Investigation	This report documents the Earth Tech's review of reports and documents made available for public review and selected reports and documentation made available by Hughes. The purpose of the review was to evaluate (1) whether current and past environmental investigations in remedial actions carried out by Hughes sufficiently identified past environmental conditions, (2) whether Hughes adequately mitigated areas identified as having environmental impacts, and (3) document the current regulatory status of the site. The report identified areas subject to remediation/corrective action. The three areas that were identified as having resulted in soil and groundwater contamination included: the northwestern area of Lot C with chlorinated VOCs and gasoline contamination reported in both soil and shallow groundwater; the Lot B area of monitoring well CM-8 D containing chlorinated VOCs and groundwater; and the Lot A area of monitoring well CM-10 with Freon 11 contamination in groundwater. The report indicated that USTs T-5 and T-6, formerly located beneath the existing water cooling towers, were investigated by the placement of two vertical, continually sampled boreholes to a depth of approximately 25 feet below ground surface. The chemical test results did not indicate the presence of VOCs or semi-VOCs at concentrations above laboratory instrument detection limits in a soil sample collected at 24 feet below ground surface. It is not known why shallower soil samples

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				were not analyzed for the VOCs and SVOCs. Although selected soils were chemically tested for CCR metals, it is not known why these results were not reported. Relatively low levels of BTEX were encountered in some of the soil samples. Soils that were encountered included siltstone and interbedded claystone.
12/21/94	Department of Toxic Substances Control	Hughes Missile Systems Group	Letter regarding Notice of Deficiency of Closure Plan	DTSC provided their comments in a Notice of Deficiency to the Draft Closure Plan dated April 1994 provided by Hughes for the facility hazardous waste storage area and UST T-3. The DTSC letter indicated that the Hughes Closure Plan did not meet the closure performance standards of Title 22, California Code of Regulations, Chapter 15, Article 8. Additional information will be required from Hughes to revise the Draft Closure Plan as well as corresponding information to develop a response to the requirements of the California Departmental Quality Act. The DTSC letter focused on written comments to the April 1994 Closure Plan associated with off-site (i.e., Lot C facilities).
02/07/95	Hughes Missile Systems Company	Department of Toxic Substances Control	Submittal of Response to Notice of Deficiency and Revised Closure Plan	Hughes issued a written response to the DTSC Notice of Deficiency on Feb. 7, 1995. The revised Hughes Closure Plan replaced and superseded the Closure Plan for the Hughes facility dated April 1994. Hughes also provided an itemized response to the comments enclosed in the DTSC's Notice of Deficiency. All the comments primarily addressed the T-3 UST area and the hazardous waste storage area which are located in Lot C, upgradient of the site.
02/27/95	Department of Toxic Substances Control	HMSC	Letter regarding areas of concern for Hughes Missile System Group	This DTSC letter notified Hughes that an attached DTSC memorandum (dated February 28, 1995 and discussed below) identifies the solid waste management units (SWMUs) and areas of concern (AOCs) that were identified by the DTSC from the various environmental data developed with reference to the subject site. The DTSC letter also indicated that a revised Closure Plan had been received from Hughes and was undergoing review.
02/28/95	Department of Toxic Substances Control	Department of Toxic Substances Control	Internal Memo regarding areas of concern	The DTSC memornadum primarily discussed Area of Concerns at buildings located in the current Lot C. In regards to specific concerns identified on Lot B, DTSC indicated that Building No. 263, which contained spray paint operations prior to 1987 and used a degreaser and solvents apparently utilized in boiler room cleaning until operations ceased, is located relatively nearby and upgradient of monitoring well CM-8D. DTSC indicated the monitoring well had exhibited concentrations of DCE as high as 760 ug/L. DTSC indicated that Building No. 263 should be considered an Area of Concern and further investigation, such as a soil gas survey, needed to be performed.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				DTSC also indicated that Building No. 265 should be considered an Area of Concern until Hughes demonstrates that soils underlying or adjacent to the basement are not responsible for Freon 11 impacts discovered in monitoring well CM-10. DTSC indicated a necessity to evaluate operations formerly conducted in Building No. 265 (in greater detail) and probably a soil vapor investigation of those potential pathways. DTSC indicated Building No. 271 contained a spray paint booth and considers this building an Area of Concern. DTSC recommended a limited soil vapor investigation. DTSC indicated Building No. 274 was an Area of Concern because it was used for solvent cleaning and is located upgradient of the Freon 11 impacted groundwater well CM-10. A soil vapor survey was recommended by DTSC for this building. DTSC identified Building No. 276 as an Area of Concern because of the minor amounts of TCA used in the building. DTSC recommended a soil gas investigation as the first logical step. DTSC identified Building No. 281 as an Area of Concern because of the use of methylene chloride in this building. DTSC recommended that a limited soil gas investigation be performed as *"an initial element"*. DTSC recommended a soil gas investigation in the area of the former T-5 and T-6 USTs. DTSC noted that halogenated and aromatic VOCs were reported in the soil from USTs T-5 and T-6 and the cleanups of the T-7, T-8, and T-9 UST cluster had left some soil hydrocarbon contamination in place. DTSC identified all five of these USTs as Solid Waste Management Units; however, DTSC indicated that designation did not necessarily mean that DTSC will necessarily require any further activity at either location. DTSC indicated that diesel UST T-10, located south of Building No. 281, should not be considered an Area of Concern or Solid Waste Management Unit. DTSC implied that the T-7, T-8, and T-9 UST cluster may be a potential release point to groundwater. DTSC indicated their concern that the main sewer line onsite may be a conduit for the Freon 11 detected in monitoring well CM-10. Wherever the source area or areas for the Freon 11 contamination in monitoring well CM-10 is or are, DTSC indicated it or they should be considered

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				Areas of Concern. DTSC indicated that Hughes needs to fully extend its soil gas survey to include such source types upgradient from well CM-10 to evaluate the Area of Concerns.
05/08/95	Groundwater Technology	Department of Toxic Substances Control	Letter regarding areas of concern	The resolution and quality of this letter was very poor and it was difficult to discern the referenced building numbers. This letter was written by Groundwater Technology, Inc. (GTI) in response to the DTSC's Feb. 28, 1995 letter listing environmental Areas of Concern for the site. GTI indicated that the soil gas survey would be conducted south and east (near well CM-8D) of Building No. 263. GTI indicated that no further investigation of Building No. 265 or 271 was required, and that Building No. 274 should no longer be considered an Area of Concern. GTI indicated that the soil gas survey associated with the CM-8D investigation would include the area south of Building No. 281 and no further investigation of Building No. 281 was required. GTI indicated that the former UST T-5 and T-6 areas would be included in a soil gas survey but no further investigation was required in the UST T-7, T-8, and T-9 area. GTI indicated that the source of the Freon 11 detected in well CM-10 was not known. The soil gas survey near CM-10, and near the main sewer line junction and the sewer line terminus may help to determine the source if a surface or near surface Freon 11 anomaly can be located. Other information on this letter was difficult to discern because of the poor quality of the copy.
05/11/95	Department of Toxic Substances Control	HMSC	Comments to February 1995 Modified Closure Plan submitted by Hughes	This letter provided comments to the Feb. 1995 modified Closure Plan provided by Hughes to the DTSC. All the comments primarily addressed the T-3 UST area and the hazardous waste storage area which are located in Lot C, upgradient of the site.
05/11/95	Groundwater Technology	Department of Toxic Substances Control	Letter regarding DTSC Areas of Concern	This letter appears to be an identical copy of the May 8, 1995 letter prepared by GTI. This letter was finalized and put on letterhead.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
10/11/95	Groundwater Resources Consultants, Inc.	HMSC	Quarterly Groundwater Monitoring Report 3rd Quarter 1995	This report summarized the results of the second quarter 1995 groundwater monitoring at the Hughes facility. The depth to groundwater throughout the whole facility, as measured in monitoring wells, ranged from approximately 9 feet to 62 feet below ground surface. Groundwater appears to move towards the southwest, south, and southeast in various areas of the site. Groundwater extraction from reclamation wells in the northwest portion of the facility appears to be causing a cone of depression which can be observed on the site-wide map. The analytical results for VOCs in samples from the monitoring wells were summarized in a figure.
11/29/95	Camp Dresser and McKee, Inc.	Los Angeles Department of Public Works	Environmental Analytical Results of Soil and Groundwater Samples – Valley Communications Dispatch Center	This report described the results of sampling of soil and groundwater to assess whether VOCs, TPH, or metals contamination had impacted the proposed Valley Communications Dispatch Center (formerly Hughes Aircraft Missile System facility) located 8433 Fallbrook Avenue. The proposed Valley Communications Dispatch Center is located in Lot D and offsite to the west of Building No. 276. Four soil borings were drilled to 20 feet below ground surface to collect soil samples. One soil boring was drilled to about 50 feet below ground surface to collect soil and groundwater samples. The work was performed on Nov. 3, 1995. Non-detect to low levels of TRPH were detected (<52 ppm TRPH). No soil samples contained CCR metals exceeding California TTLCs. VOCs, SVOCs, and organochlorine pesticides and PCBs were not detected in the soil samples above laboratory instrument detection limits. VOCs (excluding 51 ug/l Freon 11), SVOCs, organochlorine pesticides, and PCBs, and fuel range hydrocarbons were not detected in the groundwater samples collected. The groundwater exceeded the MCL for chloride, manganese, nitrate, sulfate, and total dissolved solids.
12/11/95	City of Los Angeles City Engineer	Los Angeles Police Chief Department	Letter regarding Soil and Groundwater Contamination	This letter was from the Los Angeles City Engineer to the Los Angeles Police Department regarding the proposed Valley Communications Dispatch Center (Lot D). The letter summarized the results of the November 29, 1995 investigation described above. The letter stated that the report revealed no significant soil or groundwater contamination at the site. It was recommended that the City ensure the previous occupants (i.e., Hughes) assume all responsibility for the minor groundwater contamination that exists under the southern parcel and for any contamination which may migrate into the groundwater in the future.

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
12/18/95	Department of Toxic Substances	General Public	Public Notice – Draft Closure Plan	The DTSC issued a *Notice of Public Comment On a Draft Closure Plan and Proposed Negative Declaration for a Hazardous Waste Storage Area and Underground Storage Tank T-3 Hughes Missile Systems.* The letter indicated that written comments on the draft Closure Plan and proposed Negative Declaration would be accepted the for 60-day period commencing on December 20, 1995.
01/10/96	Groundwater Resources Consultants Inc.	HMSC	Quarterly Groundwater Monitoring Report-Fourth Quarter, 1995	This report summarized the results of the fourth quarter 1995 groundwater monitoring at the Hughes facility. The depth to groundwater throughout the whole facility, as measured in monitoring wells, ranged from approximately 9 feet to 62 feet below ground surface. Groundwater appeared to move towards the Southwest, South, and Southeast in various areas of the site. Groundwater extraction from reclamation wells in the northwest portion of the facility appeared to be causing a cone of depression which can be observed at the scale of the site-wide map. The analytical results for VOCs in samples from the monitoring wells were summarized in a figure.
03/27/96	Groundwater Technology	HMSC	Groundwater Monitoring Report	This report indicated that static groundwater depths measured approximately 13 to 46 feet below grade for the wells measured on Feb. 12, 1996. Some of the metal cables in the recovery wells had to be replaced with polypropylene rope. Some flow rates were increased for recovery wells. VOCs were detected in two monitoring wells, CM-8D (located onsite and south of Building No. 281) and monitoring well CM-10 (located off-site and south of Building No. 274).
07/09/97	Fluor Daniel GTI	HMSC	Groundwater and Remediation System Monitoring Report	This reports summarized the results and observations for the second quarter 1997 groundwater monitoring at the former Hughes facility. Groundwater depths ranged from approximately 12 feet to 63 feet below grade for the monitoring wells measured on May 12, 1997. Groundwater flowed to the west on the northwest portion of the Lot C and to the south-southeast over the remainder of the site (i.e., Lot B). Detectable VOCs were detected in four monitoring wells and in ten recovery wells (including onsite wells CM-8D and CM-10).
01/07/98	Harding Lawson Associates	Home Savings of America	Environmental Site Assessment	**Historical Land-Use**: Vacant agricultural land from 1903-1958; ranch house observed onsite in 1952; Bunker-Ramo developed site into aerospace research and development facility in 1959. In 1965, Rockwell, Westinghouse, and General Electric acquired short term leases for use of the office space until the site was purchased by Hughes Aircraft Company in 1966. Hughes Aircraft Company Missile Systems Group shared the property with Bunker-Ramo until 1976, when Hughes became the only occupant; Coast federal Bank purchased the property in 1994 and in 1997 divided the property into four subdivisions (A-D).

TABLE 1: SUMMARY OF ENVIRONMENTAL DOCUMENTS PROVIDED BY EASI, INC.*

Date	From	To	Subject/Title	Comments:
				Recognized Environmental Conditions: Evidence of six historical USTs at the site. Two 500-gallon waste oil/sulfuric acid USTs; three 12,000-gallon diesel USTs; and one 10,000-gallon diesel UST. Other USTs, one waste pit, and two clarifiers were found on the property located adjacent to and north of the site. Paints, solvents, petroleum products including oils, diesel, and gasoline, and corrosive materials used in printed wiring board plating were used at the site. Contaminated soil and groundwater have been documented onsite and on the property to the north. The are ~35 groundwater monitoring wells located onsite and on immediate surrounding properties. Groundwater flows southeast and is ~30.11 to 47.56 bgs at the site. Two areas of known releases are documented at the site. 15 yards of VOC and SVOC-impacted soil removed from the waste oil/sulfuric acid UST area and more than 1,000 cubic yards of hydrocarbon impacted soil removed from diesel UST area. One groundwater monitoring well onsite, well CM-8D, has documented chlorinated VOCs in groundwater. It is the prior location of a diesel UST (Tank # 10) and associated underground pipelines. DCE and TCE were detected in the well above MCLs. Well CM-8D is the only well onsite being monitored for contamination and no remedial activities were conducted on the site. City of Los Angeles Fire Department letters dated December 23, 1991 and September 20, 1989 noted the presence of groundwater contamination and referred the matter to the RWQCB. **Offsite:** Contaminated soil and groundwater have been documented on the Hughes property located adjacent to and north of the site. As of February 25, 1997, the SVE system operated by Fluor Daniel GTI has been online since August 1995 and has removed 7,188 pounds of volatile and chlorinated hydrocarbons from the vadose zone. The main sewer line that crosses the site can be considered a combined sanitary sewer and process waste water disposal line. Chlorinated VOCs have impacted groundwater monitoring wells located to the north and potentially upgradient of the site. The RWQCB has approved a reduction in groundwater monitoring from quarterly to semi-annually.
1/23/98	N/A	N/A	Figure- Chemical Use and Associated Activities by Area	This figure highlighted areas of historical chemical use, USTs, chemical storage, and the location of groundwater monitoring wells at the site.

* Some documents provided by EASI were not summarized because they were evaluated as not providing relevant information regarding the environmental status of the site. In addition, because Geocon's primary focus was on the environmental condition of Lot B, only generalized environmental information affecting the other subdivided former Hughes lots (i.e., Lots C, A, and D) was provided.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
09/15/95	Environmental Support Technologies, Inc.	Groundwater Technology, Inc. (GTI)	Phase 2 Soil and Gas Survey Report	This report provides the results of a soil gas survey performed in the area of the CM-10 groundwater monitoring well where Freon 11 was previously detected. A map produced in the report displayed isoconcentration contours for Freon 11 in ug/l units. Soil vapor probes were installed to a depth of five feet below ground surface. The soil gas samples collected during the survey contained concentrations of Freon 12, Freon 11, Freon 113, 1,1-DCE, PCE, ethylbenzene, and total xylenes. Freon 12, at a concentration of 16 ug/l, was detected in the probe placed adjacent to Building No. 274. PCE was detected at a concentration of 1 ug/l in a probe placed approximately 50 feet southeast of Building No. 274. The highest isoconcentration contour (1,000 ug/l) for Freon 11 was detected approximately 50 feet to the southwest of Building No. 274 and extended approximately another 150 feet to the southwest. The soil vapor plume as measured was approximately 450 feet to the northwest (and hydraulically upgradient) of monitoring well CM-10.
09/21/95	Groundwater Technology, Inc.	California Department of Toxic Substances Control (DTSC)	Letter regarding Additional Soil and Gas Surveying, Area 5	This report provides the results of a soil gas survey documented in the Environmental Support Technologies report dated September 15, 1995 (see above description). The study was performed in the area of the CM-10 groundwater monitoring well where Freon 11 was previously detected. A map produced in the report displayed isoconcentration contours for Freon 11 in ug/l units. GTI indicated that a Freon 11 soil gas high, not associated with any surface or underground feature, is puzzling. Although there is some linearity to the plume outline that might suggest Building No. 274 is a source, the center of the Freon 11 high is located over 100 feet from the nearest corner of the building. Probes placed around building's cooling unit encountered only low concentrations of Freon 11. GTI speculated that drums or other containers may have been placed in the area proximal to the high and that from 1960 to 1963 this area consisted of exposed soil. GTI indicated the Freon 11 high is positioned "*...precisely upgradient of monitoring well CM-10*". Monitoring well CM-10 is the only Hughes' facility well which has consistently contained concentrations of dissolved Freon 11.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
10/11/96	Allwest Geoscience	Regent Properties, Inc.	Limited Review of Potential Environmental Impacts to Subject Property Due to Past Onsite Activities	This report presented a limited review of potential environmental impacts on the adjoining Lot C (located to the north of the site, i.e., Lot B) due to previous environmental activities occurring at Lot C. The documents reviewed related to Building Nos. 262, 268, 269, 270, 272, and 282 which are located on Lot C. The summary of environmental concerns indicated that soil and groundwater remediation is currently being performed in the northwestern area of the property and will likely continue for several years. The report indicated Hughes should remain the responsible party for the remedial activities and that Regent Properties should be included on the distribution list for all environmental related reports. The report indicated that Hughes should remain responsible for any environmental problems found during the removal of clarifiers, concrete floor areas, and asbestos abatement.
07/10/97	Allwest Geoscience	Regent Properties, Inc.	Portion of a Report:- UST Summary, Clarifiers, Summary of Environmental Concerns, and Conclusions	This report, relating to be proposed development of Lot C by Regent/Shamrock, provided the same general conclusions as Allwest Geosciences' report dated October 11, 1996. In addition, the report concluded that *" The existing contamination poses no health threat and will not interfere with the occupancy of the existing or proposed buildings, provided the requirements of the Remedial Action Plan continue to be followed."* The report further indicated that *" The property's environmental condition has been adequately characterized, and the soil and groundwater condition will not interfere with Regent/Shamrock's proposed ownership, use, construction or occupancy of the property."* Finally, the documents reviewed by Allwest Geoscience were considered acceptable to assure that Hughes will remain the responsible party for all environmental impacts from Hughes releases to the property, both previously discovered and potentially found during redevelopment of the site.
06/27/97	Allwest Geoscience	Regent Properties, Inc.	Portion of Report:- Findings, Conclusions and Figures	This report presented information regarding Building Nos. 268 and 269 located in Lot C to the north of the site. The report indicated that for Building No. 268, the bottom of the westernmost pits were stained a dark brown to black color. The eastern pit reportedly had a line of *"efflorescence"* along the sidewall of the pit. In Building No. 269, the chemical analysis of three soil samples collected from beneath a former solvent tank showed no detectable concentrations of VOCs. The 17 CAM metals analyzed showed that the metals were generally within acceptable concentrations and probably indicative of naturally occurring background levels. Four soil samples collected from the bottom of four

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
				borings drilled in the area of clarifiers adjacent to and east of Building No. 269, showed no detectable concentrations of VOCs or elevated metals concentrations.
2/20/98	Flour Daniel GTI	Los Angeles Regional Water Quality Control Board (CRWQCB)	Groundwater and Remediation System Monitoring October-December 1997 Quarterly Report and 1997 Annual Report	This report summarized the remediation systems in operation at the Raytheon (former Hughes) facility. The remediation system has been operational since August 1995. The report primarily dealt with VOC recovery data and the condition of the remediation system. The groundwater gradient in the northwestern portion of the site has consistently shown it is being influenced by groundwater extraction so that capture zones, sufficiently large to completely contain and capture contaminated groundwater, are created. GTI indicated that the groundwater recovery system generally remained at full operating capacity during the year 1997. Approximately 6,800 pounds of VOCs and 500 pounds of total chlorinated compounds comprise the total mass removed by the system since start-up. Of 10 perimeter monitoring well sampled on a semi-annual basis, VOCs were identified in groundwater samples collected from three of the wells (CM-8D, CM-10, and MW-19S). Of the three wells where VOCs were detected, only well CM-8D is located onsite, to the south of Building No. 281.
3/31/98	Raytheon Missile Systems Company (RMSC)	CRWQCB	Letter regarding cost reimbursement account for Former RMSC	Raytheon submitted this letter to the CRWQCB and has not initially agreed to establish a Cost Reimbursement Account with the CRWQCB because they already have a reimbursement account established with the DTSC and have concerns about paying two agencies both under the auspices of the California EPA. Raytheon suggested that a meeting be conducted between the DTSC and the CRWQCB to discuss the cost reimbursement account. In addition, Raytheon described their facility as a former "research and development facility", rather than an "aerospace parts manufacturer". They indicated that the chemical use at their facility was in smaller quantities and under much more controlled conditions than would be found in an aerospace parts manufacturing business. Raytheon further indicated that while groundwater beneath the Canoga Park site may technically be considered a "Water of the State" with "potential beneficial uses", the naturally high Total Dissolved Solids severely limits the realistic beneficial uses of the water.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
04/15/98	Fluor Daniel GTI	CRWQCB	Portion of Report:- Summary and Figures of the First Quarter 1998 Groundwater Monitoring Report.	The results of the first quarter 1998 groundwater monitoring activities at the former Hughes facility were summarized in this report. The general depth of groundwater range from approximately 9.5 feet to 62 feet below grade. The groundwater gradient in the northwestern portion of the site was 0.022 ft/ft and apparent flow was to the west. Over the remainder of the site, the groundwater gradient ranged from 0.027 to 0.043 ft/ft, and apparent flow was to the south-southeast. Treated groundwater effluent met discharge requirements specified in the Waste Discharge Requirements (WDR).
05/08/98	RMSC	CRWQCB	Letter regarding Request for Modification of the Waste Discharge Requirements Permit for the Groundwater Remediation System	The purpose of this letter was to request a modification of the WDR Permit for management of water treated by the groundwater remediation system at the site. The letter indicated that due to issues associated with redevelopment of the property by the new owners, discharge of treated groundwater in this matter has become problematic. Therefore, Raytheon was seeking modification of the WDR permit in order to allow discharge of treated groundwater to a storm drain, as well as continued use for irrigation. The storm drains at the site discharge to Chatsworth Creek, which in turn drains to the Los Angeles River approximately 2.5 miles from the site.
06/12/98	RMSC	DTSC	Letter regarding Response to DTSC Letter of 19 May Requiring Post-Closure Permit Application for RMSC	Raytheon indicated to the DTSC that they were surprised and troubled to receive DTSC's May 19, 1998 letter requiring a " post-closure permit application" and finding Raytheon in violation for failure to submit the application. In a reported Feb. 10, 1998 meeting, Raytheon understood that the post-closure permit issue had been postponed. That understanding was reportedly reiterated in the Raytheon March 11 1998 letter. According to Raytheon, they are not in violation of the California Code of Regulations. Raytheon believed that the post-closure is not applicable for the former tank T-3, and that remedial activities on-going at the site are effectively addressing the contamination and should be allowed to continue without unnecessary hindrance. Raytheon requested a 90-day extension to the June 22, 1998 date for submitting the post-closure permit application. Raytheon indicated they would like to meet with DTSC to continue discussions towards resolution of this issue. Raytheon also criticized DTSC for not realizing that they had been properly notified regarding fieldwork in the Building No. 269 and monitoring well CM-10 area. Raytheon indicated that they have aggressively pursued remedial activities at the site and have made tremendous progress. Raytheon criticized DTSC for unacceptable and serious administrative delays.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
06/18/98	California Environmental Protection Agency (Cal EPA)	CRWQCB	Letter regarding RCRA Closure/Post-Closure and Corrective Action at the RMSC Company	DTSC wrote the CRWQCB to notify them that there are still two permitted hazardous waste management units at the site. DTSC indicated that Raytheon has not yet completed its approved Closure Plan for one unit, a small hazardous waste area. The second unit was a UST which did not have secondary containment and from which RCRA wastes were released into the adjacent soils and groundwater. Under Title 22, California Code of Regulations, the UST is a regulated unit and subject to post-closure care requirements as specified in Title 22. DTSC indicated that the application for post-closure has not been received from Raytheon. DTSC reportedly notified Raytheon in a Nov. 14 1997 letter about the post-closure application requirement. A second letter was forwarded to Raytheon from DTSC on May 19, 1998, which indicated that the Raytheon facility is in violation of Title 22. The DTSC letter indicated that Raytheon believed that it had met the cleanup goals for the CRWQCB and would be shutting down its remediation system. However, upon review by DTSC, it became clear that significant amounts of RCRA waste from UST T-3 would be left in-place in the uppermost aquifer unit. DTSC indicated that Hughes and Raytheon have disputed the evaluation of the Solid Waste Management Units and Areas of Concerns identified by the DTSC. DTSC indicated it is currently revising a draft Correction Action Order that it will share with Raytheon within the next two months.
06/30/98	Cal EPA	RMSC	Letter regarding Conditional Approval of a Class I Permit Modification Ownership and Facility Name Change	The DTSC received Raytheon's notification, dated December 19, 1997, that Raytheon plans to have a Class I Permit Modification application for the ownership and facility name change at the former Hughes facility. Raytheon indicated that the new facility owner would be Raytheon Company and that the facility would be operated under the new name of Raytheon Systems Company, Sensor and Electronics Systems. DTSC also determined that Raytheon's facility's financial assurance document, as required in Raytheon's Permit was not satisfactory. DTSC noted that Raytheon indicated they would submit a revised financial document. DTSC approved the Class I Permit Modification with the condition that Raytheon must submit the revised approval financial assurance document within 90 calendar days.
08/11/98	Flour Daniel GTI	RMSC	Groundwater Contour Map	A groundwater contour map prepared by GTI indicated that the groundwater flow direction in the area of Lot B was to the south-southeast. Groundwater flow in the northwestern portion of the site appeared to flow to the west-southwest, apparently due to the groundwater remediation activities conducted in this portion of the site.

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
09/02/98	Flour Daniel GTI	RMSC	Letter regarding Additional Site Assessment Report	This is a cover letter that summarizes the findings of the GTI report dated September 3, 1998 (summarized by Geocon below).
09/03/98	Flour Daniel GTI	RMSC	Additional Site Assessment Report	This report summarized the field observations and laboratory analytical results at the former Raytheon facility in Canoga Park, California. The report was based on the results of drilling three temporary monitoring wells and one fixed monitoring well (MW-31) in the vicinity of CM-10 and Building Nos. 265, 274, and 276 at the site. GTI indicated that Freon 11 was not detected in the groundwater samples collected from two temporary wells in the area of Building Nos. 265 and 276. Freon 11 was detected in groundwater samples collected from the remaining temporary well (WP-DEV-1) and fixed groundwater monitoring well MW-31 (23 ug/l and 150 ug/l, respectively). The primary MCL for Freon 11 is 150 ug/l. No other VOCs were detected. GTI recommended a course of action that consists of "Monitor Only", indicating that it continues to be appropriate for the CM-10 area of concern. No additional subsurface soil or groundwater assessment activities were recommended for the CM-10 area by GTI. GTI indicated that quarterly sampling and analysis of groundwater collected from MW-31 and CM-10 were recommended to confirm Freon 11 levels remained at or below State MCLs established for this compound. GTI recommended that quarterly monitoring of these wells should continue until samples from four consecutive quarters contained concentrations of Freon 11 less than the State MCL and cleanup criteria of 150 ug/l.
09/08/98	RMSC	Cal DTSC	Letter regarding report of Additional Site Assessment	Raytheon prepared this cover letter that summarizes the findings of a GTI report, entitled *"Additional Site Assessment Report, Sampling and Analysis for Vicinity of CM-10 and Parking Area Adjacent to Building Nos. 265, 264 and 276"*, dated September 23, 1998 (not noted in GTI records by Geocon). Raytheon believes that the results of this assessment support that the Building Nos. 274/276 parking area is the source of the Freon 11 observed in monitoring well CM-10. Further, Raytheon believes that the Freon 11 contamination is derived from air conditioning repairs that were performed on the cooling units at Building No. 263 in 1966, as discussed in the GTI report. Raytheon believes the GTI report addressed the DTSC's concerns expressed in their June 5, 1997 letter regarding the following SWMUs and AOCs:

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
				SWMU No. 4 Parking area between Building Nos. 274 and 276 SWMU No. 4 Cooling unit at the northeast corner outside Building No. 274 AOC No. 3 Building No. 265 AOC No. 8 Building No. 274 AOC No. 9 Building No. 276 Raytheon requested the DTSC remove the above SWMUs and AOCs from their list as presented in their June 5, 1997 letter. Raytheon indicated that they provided additional data regarding other SWMUs and AOCs that would support Raytheon's request remove those from the DTSC list as well. Raytheon indicated DTSC revised list was promised by DTSC at the February 1998 meeting, but has not been received to date.
09/23/98	Flour Daniel GTI	RMSC	Summary Report, Supplementary Sampling and Analysis	This report summarizes the results of sampling and analysis activities for the Building Nos. 269, 272, and 282 SWMUs and AOCs, in accordance with a GTI work plan submitted to the DTSC on April 16, 1998. GTI indicated no evidence of residual soil contamination beneath former Building Nos. 272 and 282, or in the area of former Pits 1 and 2 at Building No. 269. There was no evidence of residual soil contamination from VOCs beneath the former UST T-14. There was no evidence of residual soil contamination by metals from plating, stripline, or degreasing operations conducted in Building No. 269. Finally, soil and groundwater samples from two new wells indicated soil and groundwater contamination by VOCs. GTI indicated the western extent of this residual contamination had not been determined. However, GTI believed the residual contamination is contained within the limits of the area influenced by the soil in groundwater treatment system that is operating currently.
11/03/98	RMSC	DTSC	Letter regarding Results of Follow-on Sampling and Analysis	This letter relates to Lot C which is located north of the subject site (i.e., Lot B.). Raytheon indicated that GTI detected hexavalent chromium in soil underlying the former acid and alkaline storage base of the former Hazardous Waste Storage Area. Raytheon indicated that GTI indicated that the impacted area has been delineated, and is localized directly beneath the former storage bays. The affected soil is, at a minimum, 5 to 13 feet below grade. Raytheon indicated that the existing groundwater data does not suggest that the hexavalent chromium has impacted the groundwater. As part of ongoing redevelopment plans for this portion of the Lot C parcel, Raytheon requested approval from the DTSC to leave this soil in place and allow for the addition of approximately five feet of overlying soil to accommodate a proposed multi-story parking area

TABLE 2: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE CRWQCB ON JANUARY 11, 1999

Date	From	To	Subject/Title	Comments:
				and other site-wide grade modifications. Raytheon requested the DTSC respond to this request before the end of the 1998 calendar year.
11/23/98	RMSC	DTSC	Letter regarding DTSC Review of Hazardous Waste Storage Area Closure Workplan	Raytheon submitted this letter to the DTSC complaining about the DTSC's lack of attention to work plan modifications and fieldwork (that was conducted on June 4, 1998). Raytheon indicated they provided DTSC with prior notification regarding the proposed modifications to the workplan and implementation, but that the DTSC was late in responding to their notifications and only issued a voice mail outlining the DTSC's concerns the day before the field activities were to be performed. Raytheon indicated that notwithstanding the DTSC's lack of attention to the site, Raytheon has made a tremendous amount of progress remediating the site in moving towards final close out. They indicated that again, DTSC administrative progress on this project continues to be seriously lagging. Raytheon indicated the delays are unacceptable, particularly in light of ongoing site development by the new property owners.
11/23/98	RMSC	DTSC	Letter regarding Administrative Progress in Close-out	Raytheon submitted this letter to the chief of the DTSC complaining about the lack of DTSC administrative progress on this project. Raytheon provided a list of five documents that have not been acted upon by DTSC. Of the five documents, only one related to the subject site, Lot B: *Comments on Report of Additional Assessment in the Vicinity of CM-10,* dated September 8, 1998. The September 8 1998 Raytheon letter requested revision of the DTSC's list of proposed SWMUs and AOCs, and again requested the list of priority areas where the DTSC feels additional work, if any, is needed at the site. Raytheon indicated their desire to complete the remediation and exit the Canoga Park facility as soon as possible. Raytheon indicated they no longer own the facility, nor do they have any control over site redevelopment activities. Raytheon indicated that they would appreciate comments on the five listed documents before the years end and that a meeting should be scheduled in January 1999, almost one year since their last meeting.

* Some documents reviewed at the CRWQCB were not summarized because they were evaluated as not providing relevant information regarding the environmental status of the site. In addition, because Geocon's primary focus was on the environmental condition of Lot B, only generalized environmental information affecting the other subdivided former Hughes lots (i.e., Lots C, A, and D) was provided.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
01/24/85	Latham & Watkins	Regional Water Quality Control Board (CRWQCB)	Letter regarding proposed monitoring wells near tank clusters	This letter documents location of a proposed single groundwater monitoring well at a hydraulically downgradient location from USTs T-7, T-8, and T-9 that were formerly located in the area of Building No.281. It appears this plan was submitted before actual removal of the USTs.
06/12/88	Calscience Engineering & Laboratories, Inc. (CEL)	Don Stevens Hughes Aircraft Company (HAC)	Letter regarding supplemental information for IRT excavation pits	This letter documents that the UST T-3 area on Lot C was backfilled with contaminated soil from pits T-13 and T-3 followed by clean dry backfill material. The consultant indicated that additional site assessment work is required. The letter also indicated that if remediation of UST T-3 was attempted, there would be no guarantee that the vertical or lateral extent of contamination could be reached. Further, the letter stated that if the limits of contamination were reached, the cost to load, transport, and dispose the contaminated soil off-site would be cost prohibitive.
08/20/90	CA, DOHS, TSC Program	Hughes/Public Notice	Consent Agreement and Order	This document was Enclosure B to the DTSC letter dated January 26, 1996 (summarized below). This document is a CA, Department of Health Services, Toxic Substances Control Program (DOH) "Consent Agreement and Order" entered between Hughes and the DOH, wherein Hughes agreed to comply with the orders of the DOH regarding groundwater monitoring and site remediation as a result of environmental violations observed during past site inspections. The Consent Agreement and Order alleges that Hughes violated provisions of the Hazardous Waste Control Act (HWCA) and the regulations with respect to its hazardous waste operations at the Fallbrook facility and orders certain corrective action. Both Hughes and the DOH entered into the Consent Agreement and Order pursuant to a compromise and settlement of disputed claims. Hughes agreed to pay $5,500 in settlement of the DOH's claims. As part of the agreement, Hughes agreed to work with the CRWQCB to develop and implement a site characterization plan to determine the extent of the soil and groundwater contamination associated with a leaking UST. The document did

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				not identify the UST; however, Geocon believes the UST to be T-3. After the characterization was completed, a revised closure plan and post-closure plan, if necessary, was to be submitted to the DOH within sixty days. Hughes was required to comply with the orders of the CRWQCB including the orders regarding groundwater monitoring and site mitigation. Hughes was required to permit the DOH to inspect and copy all sampling, testing, monitoring, and other data generated by Hughes or on their behalf.
07/30/91	McLaren/Hart Environmental Engineering Corporation	Hughes Missile Systems Group (HMSG)	Radioisotope Review and Comparison for the Hughes Missile Systems Group Facility	This report presented research concerning radioisotope levels in geological deposits in Southern California and within groundwater in the San Fernando Valley. These levels were compared to levels reported at the Hughes Missiles Systems Group facility in Canoga Park. The results indicated that, although geological deposits at Hughes have not been tested for radioisotopes, research strongly suggests that uranium and radium are naturally occurring in rock and soil at the site. The report also indicated that the maximum values of uranium in groundwater at the Hughes site are slightly elevated when compared to seven other sampling locations in the region. The maximum value for radium at the site exceeds the upper limit of the combined range of the other sampling locations by a factor of five. The report indicated these elevated levels are likely due to local variations in geological deposits. The report recommended a one-time sampling and analysis of groundwater from wells CM-8D, CM-10, and CM-9D for isotopic uranium to evaluate if the observed levels are of natural or man-made origin. In addition, the report recommended quarterly monitoring for uranium and radium at the site.
01/23/92	Groundwater Resources Consultants, Inc.	HMSG	Investigation of Radioactivity in Groundwater at the Hughes Aircraft Company, 3rd Quarter 1991.	This report indicated that groundwater sampled from monitoring wells at the site contained uranium at concentrations that exceeded the proposed MCL established for uranium. The is attributed to the fact that groundwater at the site commonly has natural background TDS concentrations from 3 to 5 times the

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				Secondary Drinking Water Standard of 500 mg/l, resulting in a proportional increase in uranium salts concentrations. All radium results were below the proposed EPA MCL of 20 picoCuries per liter (pCi/l). The Gross Beta results indicated that there were no man-made radioisotopes present. The letter concluded stating that *"Because no man-made radionuclides are indicated by the data from this investigation, no additional radionuclide sampling is warranted."*
02/14/92	Groundwater Technology	HMSG	Feasibility Study for Groundwater Remediation	This feasibility study was performed to evaluate remedial alternatives for groundwater containing dissolved-phase VOCs. It was determined that a groundwater pump-and-treat system using liquid-phase carbon would be the most appropriate remedial technology. The report recommended at least nine groundwater recovery wells be employed for full containment of the dissolved-phase plume. The remediation project was estimated to continue for least 20 years.
03/27/92	Groundwater Resources Consultants, Inc	HMSG	Results of Radiological Sampling of Monitor Wells, December 1991	This report conveyed the same conclusions and recommendations as their report dated January 23, 1992 (described above). The levels of uranium and radium detected in groundwater monitoring wells CM-10 and CM-8D, when compared to similar levels and other wells, were on the average more than five times higher in concentration. No explanation is provided for these variations. Monitoring well CM-18 also had elevated levels of uranium and radium when compared to the other wells. A groundwater gradient map (prior to the influence of pump-and-treat) as well as several cross sections interpreting the local geologic strata are presented in this report.
05/92	Hughes	CRWQCB	Support Documentation for the Radioactive Materials Investigation the Hughes Aircraft Company	This document identifies the equipment used by Hughes that contains radioactive materials. Most of the radioactive source materials listed appeared to be of a small quantity and used for thickness measuring, static illumination, leak detection, and scanning electron microscopy (x-rays). Some irradiated equipment parts were also indicated.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
06/18/92	HMSG	CRWQCB	Letter Regarding Radiological Results from Groundwater Monitoring	This report provided tabulated radiological results from the groundwater monitoring project at Hughes. Groundwater monitoring wells CM-8D and CM-10 exhibited elevated levels of radium and uranium when compared to most of the other wells outside.
01/04/94	Groundwater Technology	HMSG	Report on Facility-Wide Site Assessment	This report is identical to the summary provided in Table 1 (i.e., documents provided by EASI).
03/29/94	Groundwater Technology	HMSG	Corrective Action Plan Addendum	This report provides a four-phased approach for contaminant cleanup of the VOCs-contaminated groundwater at the Hughes site. Phase 1 consists of groundwater containment. Phase 2 consists of continued site assessment/characterization and field pilot testing of alternative remedial technologies. Phase 3 consists of site remediation. Phase 4 consists of closure. The report indicated that Phases 1 and 2 are complete. The report indicated that five groundwater recovery wells were drilled during December 1992 and January 1993. Manifolding of wells, pump installation, and activated carbon installation followed. The report indicated full-time operation of the system had not commenced, due to the difficulty of disposing of treated water (high TDS). The report indicated Hughes has proposed using the treated water for irrigation and the Waste Discharge Permit application has been submitted to the California Regional Water Quality Control Board for review.
11/28/94	Earth Tech	Coast Federal Bank	Technical Memorandum Records Review and Limited Site Investigation	This is the same document provided by EASI for review and is summarized in Table 1.
02/27/95	HMSC	Department of Toxic Substances Control (DTSC)	Waste Discharge Requirements (WDRs)	This transmittal letter provides the DTSC with a copy of the WDRs (dated December 14, 1994) applicable to the use of treated groundwater for landscape irrigation at their Canoga Park facility. The letter also indicated that the CRWQCB is designated as the lead agency for this remediation program.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				The attached letter describing WDRs from the CRWQCB also included a table of constituents providing the discharge limitations maximum in mg/l and ug/l for the treated water.
09/18/95	GTI	DTSC	Closure Plan Cleanup Criteria	This letter references DTSC letter dated August 16, 1995 pertaining to establishing cleanup criteria and performance standards for the Closure Plan. GTI indicated the DTSC letter suggests that cleanup criteria for certain compounds should be based on WDRs implemented by the CRWQCB for managing the discharge of treated water at the site. GTI indicated the CRWQCB offered the following comments: (1) WDR discharge limits are not cleanup levels for groundwater but are surface discharge limits; (2) To establish target cleanup levels for soil, the CRWQCB recommends using MCLs along with CRWQCB-specified attenuation factors, as described in the *Interim Guidance for Remediation of VOC Impacted Sites*, January 1995. DTSC's response to this letter is provided below.
10/12/95	DTSC	CRWQCB	Letter regarding waste discharge levels	This letter documents that Hughes submitted a revised Closure Plan on Sept. 18, 1995 to the DTSC for the two permitted RCRA units at the facility, which DTSC proposed to approve following notification to the public for review and comments. The RCRA units were identified as the Hazardous Waste Storage Area ("HWSA") and the former UST T-3. Simultaneously, the DTSC noted, Hughes is engaged in a groundwater cleanup under the supervision of the CRWQCB, for waste discharged into the groundwater from at least three USTs, one of which is T-3. The revised Closure Plan established soil cleanup standards based on (for particular compounds) lowest numbers produced by health risk assessment calculations, background measurement, or the MCLs with the attenuation factors

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				described in the CRWQCB's *Interim Guidance for Remediation of the VOC Impacted Sites,* January 1995. On Feb. 9, 1995, the CRWQCB issued to Hughes the WDRs, which are lower, in several instances, than their respective MCLs. DTSC indicated that CRWQCB's WDRs must be incorporated within DTSC permitting process which includes closure, post-closure, and corrective action. DTSC indicated that the conflicting closure standards with respect to VOCs (the WDRs levels vs. MCLs) are critical issues that need resolution due to Hughes concern of setting a precedent for the post closure process of T-3.
11/28/95	DTSC	CRWQCB	Lead Agency Designation	DTSC indicated to the CRWQCB that the DTSC will be the lead agency for corrective action at the former Hughes facility.
11/29/95	DTSC	Groundwater Technology, Inc.	Letter regarding clean-up levels	DTSC requested that Hughes use WDRs in its calculations to derive closure standards. The DTSC said *"Note that we use the term closure standard, <u>not</u> cleanup criteria."* DTSC indicated that the WDRs are discharge limits for treated water. DTSC indicated that the WDRs are not cleanup levels; however, they represent the level of protection which the CRWQCB requires to protect the San Fernando Basin as per the CRWQCB's Basin Plan. It is the DTSC's position, until DTSC receives a formal response from CRWQCB, that no more waste should be discharged into the groundwater and Hughes former facility from residual soil contamination than would be allowed to be discharged as treated water under the existing WDRs. In summary, this letter did not specify what the actual groundwater cleanup criteria are for the former Hughes site.
01/26/96	DTSC	CRWQCB	Lead Agency Confirmation	This interagency letter from the DTSC to the RWQCB requested clarification and preference of the CRWQCB regarding the Lead Agency status for Corrective Action at the Hughes facility. Since one of the UST's was permitted under RCRA, provisions regarding long-term care and monitoring under a Post Closure process needs to be implemented. This letter suggests that DTSC should

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				acquire lead agency status for the remediating groundwater contamination underlying the Hughes site.
01/30/96	CRWQCB	DTSC	Lead Agency Confirmation	This interagency letter from the CRWQCB indicated that they have no objections to the DTSC serving as the lead agency for the underground storage tank investigation and cleanup at the former Hughes site under the RCRA corrective action process. The CRWQCB requested to be copied on all future correspondence from the DTSC for this case, especially when closure is pending.
Unknown Date in 1996	DTSC	Unknown, General Public?	Proposed Negative Declaration	This Proposed Negative Declaration for the Hughes facility indicated that Hughes, as part of its RCRA Hazardous Waste Permit, is seeking approval of a revised Closure Plan from the DTSC for its Hazardous Waste Storage Area HWSA and UST T-3. The letter indicated that as a result of Notices of Deficiencies issued to Hughes by the DTSC dated December.1, 1994 and June 6, 1995, the Closure Plan dated February 1995 was revised in August 1995 and modified by the DTSC in December 1995. The letter described the fieldwork, confirmation sampling, and chemical testing remaining for closure of the HWSA. DTSC proposed and described a Contingent Closure and Contingent Post Closure for UST T-3 to comply with DTSC regulations. DTSC indicated that a records review led to the conclusion that hazardous waste residues in soil and groundwater underlying UST T-3 still exists despite tank\soil removal under CRWQCB oversight. DTSC indicated a final Closure Certification Report will be prepared by Hughes (i.e., currently Raytheon) documenting the completion of closure activities. DTSC indicated that the *"DTSC can still impose corrective action to be addressed during the post closure process if any credible evidence(s) is obtained indicating that they are new solid waste management units."*

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				DTSC indicated that the current groundwater remediation and monitoring activities underlying the UST T-3 are performed under the CRWQCB's oversight. DTSC determined that this project will not have a significant effect on the environment. DTSC indicated that the HWSA closure or the contingent post closure will not result in the creation of any health hazard or adverse environmental effect.
08/06/96	DTSC	N/A	Negative Declaration Approval	This letter provides approval of the Negative Declaration. The DTSC found that on the basis of the Initial Study and comments received on the Negative Declaration that there is no substantial evidence that this project will have a significant effect on the environment.
08/06/96	California Environmental Protection Agency (EPA)	??	Response to Comments on the Modified Closure Plan and the Proposed Negative Declaration	This document was an attachment to the DTSC Negative Declaration Approval dated August 6, 1996. The letter includes comments by Hughes and responses by the DTSC. Of note, the DTSC indicated that the soil remediation (i.e., closure) of UST T-3, which was performed under the supervision of the CRWQCB, does not constitute closure under RCRA and that the DTSC finds that hazardous waste residuals is soil still remain and are continuously contributing to groundwater contamination. DTSC noted *"Furthermore, the hazardous waste constituents contained in T-3 cause contamination of groundwater underlying T-3, hence, T-3 is subject to post closure. Since T-3 did not have a secondary containment, it must be closed under landfill requirements which automatically require a post closure permit. These requirements included, at a minimum, groundwater remediation and monitoring that are both subject to RCRA standards".*
02/06/97	DeVry Inc.	??	Portion of Report	This report indicated that Lot A, south of the site (i.e., Lot B) is in an area of minimal flooding potential (Zone C) as defined by the Federal Insurance Administration.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
02/05/98	Raytheon Missile Systems Group (RMSG)	DTSC	Letter regarding the Upcoming Meeting Regarding Designation of Solid Waste Management Unit s and Areas of Concern	Raytheon summarized their position regarding corrective action at the proposed Areas of Concern (AOCs) and Solid Waste Management Units (SWMUs) identified by the DTSC at the former Hughes facility. This letter was prepared prior to a proposed face-to-face February 10, 1998 meeting between Raytheon and the DTSC. Raytheon conclusions and recommendations based on DTSC input are summarized into four categories or groups (summarized herein only for the AOCs and SWMUs on Lot B): **Group 1: Designated as Areas for Consideration of Further Action:** The DTSC-proposed AOCs/SWMUs in this category for Lot B (i.e., the site) are: SWMU No. 4 – The parking area between Building Nos. 274/276 SWMU No. 5 – Building No.274 cooler unit AOC No. 8 – Building No.274 AOC No. 9 – Building No.276 **Group 2: Designated as Areas Being Adequately Addressed Through the Ongoing Groundwater/Soil Remediation Currently Being Conducted Under the CRWQCB August 1990 Consent Order:** The DTSC-proposed AOC/SWMU in this category for Lot B (i.e., the site) is: AOC No. 11 – Former USTs T- and T-6 **Group 3: Areas Being Adequately Addressed Through Natural Attenuation:** The DTSC-proposed AOCs/SWMUs in this category for Lot B (i.e., the site) are: SWMU No. 7 – Sewer line near B-SL-4 AOC No. 1 – Building No.263 AOC No. 3 – Building No.265

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				Group 4: Areas with Inadequate Evidence of a Release: The DTSC-proposed AOCs/SWMUs in this category for Lot B (i.e., the site) are: AOC No. 7 – Building No.271 AOC No. 10 – Building No.281 AOC No. 12 – USTs T-7 and T-9 Raytheon stated that post-closure care for former UST T-3 was not applicable because the unit was "clean-closed" through ongoing corrective action. Raytheon stated that the 1990 Consent Agreement also prevents DTSC from requiring post-closure care for UST T-3. Raytheon further stated that the substantive requirements associated with post-closure make little sense for this site. Raytheon believes that contaminated soils have already been removed from beneath the UST T-3 former location. Raytheon stated that *"Because we continue to firmly believe that post closure is not applicable to Tank T-3, RMSC has no plans to prepare a post-closure operation plan, as requested by DTSC and its letter dated 14 November 1997."* Raytheon concluded that *"...the site poses no threat to human health and the environment, based on all data and reports that have been generated to date."* (Review below, the DTSC's May 19, 1998 Response to this Raytheon Letter) (Also review Raytheon's September 8, 1998 request to DTSC to de-list several of the above-mentioned AOCs and SWMUs)
02/06/98	N/A	N/A	Summary Data Obtained from DTSC that summarizes Radionuclide Data	This is compilation of radiological data obtained from the DTSC that represents groundwater sampling events conducted from December 1990 to March 1992. The radionuclide data has been described previously; however, this is the first table that summarizes the documented sampling events. None of these data appear to test for man-made radionuclides aside from uranium and radium.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
03/21/98	RMSG	CRWQCB	Letter regarding Cost Reimbursement Account	This letter is identical to the letter reviewed at the CRWQCB (see Table 2) that questions Raytheon' s payment to both the CRWQCB and DTSC as part of Cal-EPA's Cost Reimbursement Program.
05/19/98	EPA	RMSG	Letter regarding Post-Closure Permit Application Requirement	DTSC indicates to Raytheon that they have failed to provide the Post-Closure Application for the former UST T-3. Raytheon is in violation of Title 22 California Code of Regulations. DTSC contends T-3 is subject to post closure requirements per Title 22. DTSC again requires Raytheon to submit a post-closure application for T-3 within 30 days of receipt of their letter.
05/29/98	Langdon Wilson	DTSC	Letter regarding DeVry Institute of Technology	DeVry Institute has prepared a Conditional Use Permit for the private school they are planning to build in Lot A. DeVry requested that the DTSC help them with a Hazardous Material Treatment and Disposal Plan that needs to be submitted to LA City Planning and Dept. of Public Works that certifies that remediation has been completed prior to issuance of a building permit. The attached City of LA, Department of Building and Safety letter to DeVry indicated the following: *Hazardous material treatment and disposal plans shall be submitted to the Department of City Planning and the Department of Public Works for approval and by providing a certification by the DTSC that remediation has been completed in compliance with all applicable federal, state and local regulations and in accordance with approved work plans will be required prior to initiation of construction of the proposed project.* **EASI/TCSCRI should evaluate if the City of LA will require the same for any proposed construction project on Lot B.**
07/02/98	RMSG	DTSC	Letter regarding Response to DTSC Comments on Hazardous Waste Storage Area Closure Workplan	Raytheon provided comments to DTSC's comments to their March 11, 1998 workplan for demolition and disposal of their former HWSA in Lot C. Most of the comments to DTSC comments which apply to Lot C do not appear to impact Lot B use and are therefore not described in detail here. Raytheon indicated that a Clean Closure Certification Report will be submitted to DTSC within 8 weeks

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
				of completion of all closure activities and upon receipt of signed disposal manifests.
07/27/98	DTSC	DeVry Inc.	Letter Informing DeVry of No Contamination on Lot A	DTSC notified DeVry that they did not believe that a release has occurred on the DeVry Parcel (i.e., Lot A) of the former Hughes facility and that DTSC does not believe any investigation or remediation is necessary subject to certain conditions: It is possible that the sewer line, which crosses the DeVry parcel, may need to be investigated in the future even though it is not being required at this time. DTSC desires notification 7 calendar days before initiation of excavation activities so that DTSC can observe the sidewalls or bottom of the excavation. DeVry must provide for access should future borings or wells be needed. DeVry or any subsequent owner may be required to provide site access to areas on their parcel requiring corrective action if identified in the future. Such activities may include, but are not limited to, soil excavation and/or groundwater extraction and treatment. Providing such access may require the owner to vacate and/or demolish existing and/or future facilities at the site.
09/08/98	RMSG	DTSC	Letter regarding Report of Additional Site Assessment in Vicinity of CM-10 and Parking Area Adjacent to Building Nos. 265, 274, and 276	This letter is identical to the letter of the same date reviewed at the CRWQCB (see Table 2 summary).
09/16/98	Errol L. Montgomery & Associates, Inc.	Unknown, Raytheon possibly	Plan for Modification of Remediation Systems	Report indicates that VOCs in groundwater in the vicinity of well CM-8D continue to show a decreasing trend and are presently below groundwater cleanup criteria. In addition, notes no indication that VOCs are migrating down-gradient away from the CM-8D area and is no indication that this area of VOCs will require active remediation in order to meet groundwater cleanup criteria established for the site. No further investigations or remedial actions were recommended for the CM-10 area.

TABLE 3: SUMMARY OF ENVIRONMENTAL DOCUMENTS REVIEWED AT THE DTSC ON JANUARY 14, 1999*

Date	From	To	Subject/Title	Comments:
09/18/98	RMSG	CRWQCB	Letter regarding Modification of Remedial System	Raytheon described modifications (deactivation of some wells and addition of new wells) in order to enhance and expedite the ongoing remediation effort at the former Hughes facility (Lot C). Indicated remediation has been in progress since early 1995. Even though Raytheon has concerns about paying for two agencies involvement, Raytheon requested that a Cost Recovery Account be established to pay for both DTSC and CRWQCB regulatory oversight.
10/05/98	RMSG	DTSC	Letter regarding Summary Report of Supplemental Sampling and Analysis Performed at the Locations of Former Building Nos. 269, and 272, 282.	The letter summarized the findings of site investigations performed on the northern portion of Lot C in the Building Nos.269, 272, and 282 building areas. Raytheon requested that DTSC remove several of the SWMUs and AOCs from their list. Raytheon indicated they need DTSC's response on two key issues: (1) A revised list from DTSC of SWMUs and AOCs. They indicated additional data to remove other SWMUs and AOCs was submitted to the DTSC on February 17, 1998 and September 8, 1998. (2) DTSC's final decision regarding post-closure for former UST T-3. They indicated Raytheon will not proceed with plans for site close-out until the post-closure issue is resolved.
12/11/98	DeVry Institute	DTSC	Letter Describing Exposed Sewer Line on Lot A	DeVry wrote the letter to the DTSC to inform them that they observed an existing sewer line crossing a portion of Lot A. The sewer line was observed to be metal and did not exhibit evidence of leakage.

* Some documents reviewed at the DTSC were not summarized because they were evaluated as not providing relevant information regarding the environmental status of the site. In addition, because Geocon's primary focus was on the environmental condition of Lot B, only generalized environmental information affecting the other subdivided former Hughes lots (i.e., Lots C, A, and D) was provided.

RE: Upcoming Meeting Regarding Designation of Solid Waste Management Units(SWMUs) and Areas of Concern (AOCs) at former Hughes Missile Systems Company facility at Canoga Park, EPA ID CAD 041162124

Dear Mr. Chandler:

Raytheon Missile Systems Company (RMSC, formerly known as Hughes Missile Systems Company) appreciates the opportunity to meet with DTSC on 10 February 1998 to review RMSC's conclusions regarding DTSC's designation of Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) at the Canoga Park facility. A proposed agenda for the meeting will be sent to your attention via telefax on Monday. RMSC will be prepared to provide status of the Hazardous Waste Storage Area closure, the ongoing Groundwater and Soil Remediation system, and redevelopment activities at the site, and to discuss the DTSC-proposed AOCs/SWMUs and post-closure of former Tank T-3.

In preparation for the upcoming meeting, RMSC would like to summarize our position regarding corrective action at proposed AOCs/SWMUs at the site, and post-closure at former Tank T3, as follows:

- **Corrective Action:** Many of the AOCs/SWMUs proposed by DTSC in its 5 June 1997 letter are being addressed through the Corrective Action Plan (CAP) and Addendum. For many of those that remain, DTSC has not demonstrated that actual releases have occurred. The California Health & Safety Code 25187(a) gives DTSC the authority to issue corrective action orders "whenever...the department... determines that there is or has been a release of hazardous waste or constituents into the environment from a hazardous waste facility". DTSC has proposed AOCs/SWMUs at the Canoga Park facility based on the *possibility* that hazardous materials could have been handled or disposed of inappropriately, and a suspicion that a release may have occurred. However, under this provision, "suspected" releases, are not enough. Corrective action cannot be required until actual releases of

hazardous waste or constituents from the unit at issue have been proven. It is not sufficient merely to suggest, as DTSC has, that the record does not yet prove that a particular proposed AOC/SWMU could not be a potential source for contamination observed elsewhere. In addition, there is no evidence that suggests mismanagement of hazardous materials.

Based on the foregoing, RMSC and its consultants have reviewed DTSC's 5 June 1997 letter, and the existing relevant data for each of the AOCs and SWMUs proposed by DTSC. RMSC's conclusions and recommendations based on that review are summarized in four categories or groups below. At our meeting next week, we will be prepared to review in detail the available analytical data (through January 1998) for any and all of the DTSC-proposed AOCs/SWMUs.

Group 1- Areas for consideration of further action. RMSC and its consultants have concluded that additional data might be useful to further characterize certain areas. For example, because Building 269 has been demolished by the new owner's subcontractors and further redevelopment plans are uncertain, RMSC will voluntarily collect additional samples in the area in the near future.

The DTSC-proposed AOCs/SWMUs in this category are:

SWMU No. 3 - Pits at Bldg. 269
SWMU No. 4 - Parking area between Bldgs. 274/276
SWMU No. 5 - Bldg. 274 Cooler Unit
AOC No. 5 - Bldg. 269
AOC No. 8 - Bldg. 274
AOC No. 9 - Bldg. 276

Group 2 - Areas being adequately addressed through the ongoing Groundwater/Soil Remediation currently being conducted under the Los Angeles Regional Water Quality Control Board (LARWQCB), in accordance with the August 1990 Consent Order. These areas are located primarily in the northwestern corner of the site. This group also includes areas that have been adequately addressed through activities such as soil excavation, such as former Tank T-3.

The DTSC-proposed AOCs/SWMUs in this category are:

SWMU Nos. 1 and 2 - Bldgs. 272/282
SWMU No. 6 - Bldg. 272/282 Pump Island (Tanks T-1 and T-2)

Group 2 (cont'd) -
AOC No. 6 - Bldg. 270
AOC No.11 - former Tanks T-5 and T-6
Former Tank T-3

Group 3 - Areas being adequately addressed through natural attenuation, as approved in the 1992/4 Corrective Action Plan & Addendum. This category pertains primarily to CM-10, which contains FREON in concentrations below the maximum contaminant level for drinking water, and CM-8D, which contains DCE at concentrations that have been declining significantly. This category also includes areas in which constituent levels are considered to be naturally-occurring, such as the sewerline near soil boring B-SL-4.

The DTSC-proposed AOCs/SWMUs in this category are:

SWMU No. 7 - Sewerline near B-SL-4
AOC No. 1 - Bldg. 262
AOC No. 2 - Bldg. 263
AOC No. 3 - Bldg. 265

Group 4 - Areas with inadequate evidence of a release.
Most of these are buildings that are suspected by DTSC as possible sources for the contamination observed at CM-10 and CM-8D. However, as discussed above, it is RMSC's position that there is no evidence that these areas are associated with any release.

The DTSC-proposed AOCs/SWMUs in this category are:

AOC No. 4 - Bldg. 268
AOC No. 7 - Bldg. 271
AOC No.10 - Bldg. 281
AOC No.12 - former Tanks T-7 and T-8
AOC No. 13 - former Tank T-14

- **Post-closure care for former Tank T-3:** Post-closure is not applicable to the former Tank T3 because the regulations do not authorize post-closure for tanks that can be clean closed through ongoing corrective action. Post-closure care applies only to those facilities at which "all hazardous wastes, waste residues, contaminated materials and contaminated soils *will not* be removed during closure." In fact, owners/operators of tank systems may only

be required to satisfy post-closure standards where "the owner or operator demonstrates that not all contaminated soils *can be* practicably removed or decontaminated....". The regulations do not specify any time limit for achieving the removal of contaminated soils. RMSC has already removed all contaminated soils associated with releases from Tank T3. While there is no evidence to suggest that any residual contaminants remain in deeper soils or groundwater, if that were the case, those contaminants are being properly addressed through the ongoing corrective action process. Therefore, DTSC is without legal authority to require post-closure care for this tank. [22 C.C.R. § 66264.110(b)(3)]. Neither does section 66264.197(c) of the regulations authorize post-closure for Tank T-3. That section requires only that an owner/operator of a tank without secondary containment include in its closure plan a contingent plan which discusses post-closure care. RMSC met that requirement in its Closure Plan approved August 1996.

The 1990 Consent Agreement also prevents DTSC from requiring post-closure care for Tank T3. The agreement resolved RMSC's liability concerning the closure of Tank T3. In accordance with the agreement, RMSC worked with the LARWQCB, developed the various plans required, obtained LARWQCB approval of the plans, and provided DTSC for opportunities for review and comment. An effective groundwater and soil remediation system has been in place since 1995. All contaminated soils have been excavated and removed, as demonstrated by confirmation sampling. DTSC's attempt to effectively revise the clean closure standards, and thereby require post-closure care, is precluded by RMSC'S satisfactory implementation of the approved Remedial Action Plan and Corrective Action Plan (CAP), in accordance with the Consent Agreement.

Post-closure care is not necessary for Tank T3 in light of ongoing remedial activities at the site. The substantive requirements associated with post-closure care make little sense for this site. For example, installation of a cap to prevent downward migration of percolation waters for a period of 100 years would provide no benefit because contaminated soils have already been removed. Requiring RMSC to obtain a post-closure permit under these circumstances would significantly increase RMSC's costs without advancing the goals of protecting human health and the environment and quickly completing corrective action at this site. Such an order would also run counter to an emerging national trend in favor of the use of corrective action in lieu of post-closure permits. EPA and other states in Region IX have recognized the benefits of corrective action's emphasis on achieving clean closure and are moving away from requiring post-closure permits. In early

1998, EPA will finalize a proposed rule removing the current requirement for a post-closure permit and allowing EPA to use alternative authorities to address facilities with units requiring long-term corrective action. DTSC should follow EPA's lead and continue to rely on its corrective action authority to allow RMSC to continue its efforts to achieve clean closure of Tank T3 through corrective action as an alternative to a post-closure permit

Because we continue to firmly believe that post closure is not applicable to Tank T3, RMSC has no plans to prepare a post-closure operation plan, as requested by DTSC in its letter dated 14 November 1997.

In closing, RMSC would like to emphasize that we vacated the Canoga Park site more than three years ago. We have worked with the agencies to develop an appropriate exit strategy, and have performed more than enough work to adequately investigate and remediate this site. As a result, the site poses no threat to human health and the environment, based on all data and reports that have been generated to date. Because we no longer own the facility, and have no control over current owners and their redevelopment contractors, we must be completely out of this site by the end of this year. However, we continue to be ready and willing to address any legitimate concerns that DTSC may have, if we can successfully agree on a clear path to overall site closure that is prudent, rational, and expeditious.

We look forward to our upcoming meeting, and are hopeful that together we can come to agreement regarding actions that will lead to a prompt and final closure of this site.

Sincerely,

RAYTHEON MISSILE SYSTEMS COMPANY

CERTIFIED MAIL

Mr. Ken Rutkowski
Vice President
DeVry, Inc.
One Tower Lane, Suite 1000
Oakbrook Terrace, Illinois 60181-4624

Dear Mr. Rutkowski:

DEVRY INSTITUTE OF TECHNICAL, WEST HILL SITE, 22801 ROSCOE BOULEVARD, WEST HILLS, CALIFORNIA (PARCEL CREATED FROM FORMER HUGHES MISSILE SYSTEMS CANOGA PARK FACILITY, 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (EPA ID NO. CAD041162124

Mr. Bill Woodson of Langdon and Wilson contacted the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) in DeVry Inc.'s behalf regarding a parcel that was created out of the former Hughes Missile Systems Company (HMSC) Canoga Park facility in Canoga Park. A condition has been required by the City of Los Angeles with respect to construction on any of the parcels created out of the former HMSC facility due to releases of hazardous waste that had occurred previously at various parts of the facility. This condition is that DTSC indicate that there is either no problem or that it has been satisfactorily cleaned up.

The HMSC site, as a whole, remains subject to Resource Conservation and Recovery Act (RCRA) corrective action requirements because HMSC had received a permit to store hazardous wastes under RCRA and because there have been documented releases of hazardous wastes at various parts of the facility.

As a result of the request by Mr. Woodson, DTSC has reviewed its files concerning the former Hughes Missile Systems Canoga Park facility as well as the following materials submitted by Mr. Woodson, on July 9, 1998 and July 15, 1998:

"Technical Memorandum, Records Review, and Limited Site Investigation, Hughes Missile System Company, 8433 Fallbrook Avenue, Canoga Park", prepared by Earth Tech, dated November 28, 1994

"Corrective Action Plan Addendum, Hughes Missile System Company, 8433 Fallbrook Avenue, Canoga Park", prepared by Groundwater Technology, Inc., dated March 29, 1994

"Phase I Environmental Report: Areas of Potential Chemical Release to Soil and Groundwater, Hughes Missile System Company, Canoga Park, California", prepared by Groundwater Technology, Inc., dated December 28, 1993

"Report of Geotechnical Investigation Proposed DeVry Institute of Technology Facility", prepared by Law/Crandall, dated February 6, 1997

One set of seven aerial photograph enlargements, dated from 1952 to 1979

Based upon our review, we have not determined that any release has occurred on the DeVry parcel of the former HMSC property and DTSC does not at this time believe any investigation or remediation is necessary subject to the following conditions:

1. It must be noted that the main sewer line, into which HMSC discharged various materials — perhaps including some of the compounds found in ground water elsewhere on the site — crosses the DeVry parcel. It is possible that this segment of the sewer line may need to be investigated although that is not being required at this time.

2. DTSC wishes to be notified at least seven (7) calendar days in advance of the initiation of excavation in order to observe and possibly sample the sidewalls and/or bottom of the excavations for the proposed driveway and any other structures.

3. Since corrective action is not complete with regards to remaining parcels, there may be a need for further installation of borings and groundwater monitoring wells. DeVry must provide access for such installation and allow maintenance of existing and future wells.

4. If DTSC determines the need for further investigation on the DeVry parcel, DTSC reserves the right to do so under its statutory authority. If such investigations identify contaminated areas requiring corrective action, DeVry or any subsequent owner may be required to provide access to such areas to facilitate all necessary remediation activities. Such activities may include, but are not limited to soil excavation and/or groundwater

extraction and treatment. Providing such access may require the owner to vacate and/or demolish existing and/or future facilities on the site.

If you have questions regarding the foregoing, please call Mr. Phil Blum at (818) 551-2961.

Sincerely,

RE: Report of Additional Site Assessment in Vicinity of CM-10 and Parking Area Adjacent to Buildings 265, 274, and 276 at Raytheon Former Canoga Park Facility, 8433 Fallbrook Avenue, Canoga Park, California;
EPA ID CAD 041-162-124

Dear Mr. Blum:

Enclosed please find a copy of the report titled "Additional Site Assessment Report, Sampling and Analysis for Vicinity of CM-10 and Parking Area Adjacent to Buildings 265, 274, and 276". The conclusions and recommendations of Fluor Daniel GTI (FD/GTI), who performed the assessment and prepared the report, are summarized in their attached letter of transmittal to Raytheon.

FD/GTI concludes that the areal extent of the FREON-11 impacts to groundwater beneath the monitor well CM-10 area have been defined. Concentrations in CM-10 remain at or below the State maximum contaminant level (MCL) for drinking water, and have been at that level since June 1995. Sampling in the area of what DTSC believes to be the source of the FREON-11 in CM-10, specifically the parking area adjacent to Buildings 265, 274, and 276, indicates the presence of this constituent also at the MCL. FREON-11 was not detected at significant levels in soil or groundwater at any of the other areas sampled during this assessment.

Raytheon believes that the results of this assessment support the Bldg. 274/276 area as the source of the FREON-11 observed in CM-10. Further, we believe that the FREON-11 contamination is derived from air conditioning repairs that were performed on the cooling units at Building 263 in 1966, as discussed further in Section 2.0 of the enclosed report. The report also concludes that the current "monitor only" strategy continues to be the appropriate course of action for the CM-10 area.

As FD/GTI indicates in their transmittal letter, the assessment in the CM-10 area addresses DTSC's concerns expressed in their 5 June 1997 letter regarding the following SWMUs and AOCs:

SWMU No. 4	Parking Area between Buildings 274 and 276
SWMU No. 4	Cooling unit at the northeast corner outside Building 274
AOC No. 3	Building 265
AOC No. 8	Building 274
AOC No. 9	Building 276

Therefore, Raytheon is requesting that DTSC remove the above SWMUs and AOCs from their list as presented in the 5 June 1997 letter. Also, on 17 February 1998, RMSC provided additional data relating to other SWMUs and AOCs which support our request to remove those from the list as well. DTSC's revised list was promised by Phil Chandler at our February meeting, but has not been received to date.

Please contact me at (520)794-9320 should you have any questions about the enclosed document.

Sincerely,

RAYTHEON MISSILE SYSTEMS COMPANY

Re: **Additional Site Assessment Report, Vicinity of CM-10 and Buildings 265, 274, and 276, Former Raytheon Missile Systems Company Facility, 8433 Fallbrook, Canoga Park, California**

Dear Ms. Roberts:

The attached report summarizes the field observations and laboratory analytical results at the former Raytheon Missile Systems Company Facility, 8433 Fallbrook, Canoga Park, California. The data for this report was based on results from drilling three temporary monitoring wells and one fixed monitoring well in the vicinity of CM-10 and Buildings 265, 274, and 276.

The objectives of this additional site assessment were to determine areal extent of Freon 11 contamination in groundwater in the vicinity of Buildings 265, 274, and 276. These objectives were accomplished by collecting and analyzing groundwater samples from specific sampling locations, and collecting and analyzing soil samples from borings used to construct temporary and fixed wells.

This assessment should address issues raised by the California Environmental Protection Agency (CalEPA) and Department of Toxic Substances Control (DTSC) in their June 5, 1997 letter, with respect to the following SWMUs and AOCs:

SWMU #4	Parking Area between Buildings 274 and 276
SWMU #5	Cooling Unit at the northeast corner outside Building 274
AOC #3	Building 265
AOC #8	Building 274
AOC #9	Building 276

In the Corrective Action Plan Addendum (Groundwater Technology, Inc., 1994) issued for the former Hughes Missile Systems Company Facility, no remedial action was proposed for the CM-10 are of concern because Freon 11 concentrations were below the State Drinking Water Standard or Maximum Contaminant Level (MCL) for this constituent. Based on the findings of the current assessment and the observed continuing decline in Freon 11 concentrations over time, a course of action that consists of "Monitor Only" continues to be appropriate for the CM-10 area of concern. No additional subsurface soil or groundwater assessment activities are recommended at this time. Continued quarterly sampling and analysis of groundwater collected from MW-31 and CM-10 are recommended to confirm Freon 11 levels remain at or below State MCLs established for this compound. It is recommended that quarterly monitoring of these wells continue until samples from four consecutive quarters contain concentrations of Freon 11 less than State MCL and cleanup criteria of 150 μg/L.

If you should have any questions or comments on this Information, please feel free to contact either Dan Grasmick or Bob Davis at (805) 644-9811. Thank you.

Sincerely,

Attachment

- Surrogate spike recoveries in EPA Method 8240/8260 analyses were within acceptable ranges in all soil and groundwater samples.

- Matrix spike and matrix spike duplicate recoveries in EPA Method 8260 were within acceptable ranges.

4.0 SUMMARY

Sampling and analysis activities for the CM-10 area of concern have been implemented in accordance with the April 1998 work plan prepared for this assessment activity. Activities described in the work plan have been completed. Introductory, historical, and background information are provided in Section 1.0 of this report. Field observations and laboratory analytical results are summarized in Section 2.0 of this report. QA/QC procedures implemented during this site assessment are reviewed in Section 3.0 of this report. A summary of findings of these assessment activities is presented below.

- Geologic materials encountered during subsurface drilling consisted of unconsolidated fill, interbedded siltstone, shale, clayey siltstone, and clayey shale, with some interbedded diatomaceous shale.

- The depths to water in temporary groundwater wells WP-265-1, WP-276-1, and WP-DEV-1 were 44, 44.5, and 35.8 feet, respectively. The depth to water in fixed groundwater monitoring well MW-31 was 48.3 feet. Depths to groundwater are generally consistent with data of previous site assessments and ongoing groundwater monitoring and compliance sampling and analyses.

- A trace concentration of trichlorofluoromethane (Freon 11) was encountered in one soil sample collected from soil boring location WP-276-1, at 50 feet below grade surface. However, Freon 11 was not detected in a duplicate soil sample collected at the same location and depth. No other VOCs were detected in any of the soil samples submitted for chemical analyses using EPA Method 8260.

- Freon 11 was not detected above method detection limits in groundwater samples collected from temporary wells WP-265-1 and WP-276-1. These wells were positioned near Buildings 265 and 276, respectively, and near subsurface utilities (subsurface electrical conduit lines and a sewer main, respectively).

- Freon 11 was detected in groundwater samples collected from the temporary well WP-DEV-1, and fixed groundwater monitoring well MW-31 (23 μg/L and 150 μg/L, respectively). No other VOC constituents were detected. The primary maximum contaminant level (MCL) for Freon 11 is 150 μg/L (as promulgated in California's Safe Drinking Water Standard, Title 22 of California Code of Regulations [CCR], Division 4, Chapter 15). Based on concentrations of Freon 11 in WP-DEV-1 and

MW-31, and ongoing analytical data collected from groundwater monitoring well CM-10, Freon 11 concentrations in groundwater underlying the CM-10 area of concern are at, or below, the State MCL.

Based upon the findings of this and previous site assessment activities (ENSR, 1991; Groundwater Technology Inc., 1995 and 1995a; McLaren Hart 1989), the lateral extent of potential impacts to groundwater underlying the CM-10 area of concern has been defined. Installation of a groundwater monitoring well at what is believed to be the sole source area of Freon 11 impacts to groundwater shows groundwater concentrations at the State MCL for this constituent. Further, groundwater quality data collected from temporary wells indicate that Buildings 265 and 276 are not source areas contributing to Freon 11 impacts to groundwater. Finally, downgradient concentrations of Freon 11 in CM-10 and temporary well WP-DEV-1 are below the State MCL for Freon 11.

5.0 RECOMMENDATIONS

In the Corrective Action Plan Addendum (Groundwater Technology, Inc., 1994) issued for the former Hughes Missile Systems Company Facility, no remedial action was proposed for the CM-10 are of concern because Freon 11 concentrations were below the State Drinking Water Standard or Maximum Contaminant Level (MCL) for this constituent. Based on the findings of the current assessment and the observed continuing decline in Freon 11 concentrations over time, a course of action that consists of "Monitor Only" continues to be appropriate for the CM-10 area of concern. No additional subsurface soil or groundwater assessment activities are recommended at this time. Continued quarterly sampling and analysis of groundwater collected from MW-31 and CM-10 are recommended to confirm Freon 11 levels remain at or below State MCLs established for this compound. It is recommended that quarterly monitoring of these wells continue until samples from four consecutive quarters contain concentrations of Freon 11 less than State MCL and cleanup criteria of 150 μg/L.

Glendale, California 91201

RE: Summary Report of Supplemental Sampling and Analysis Performed at the Locations of Former Buildings 269, and 272, 282; Raytheon Former Canoga Park Facility, 8433 Fallbrook Avenue, Canoga Park, California; EPA ID CAD 041-162-124

Dear Mr. Blum:

Enclosed please find a copy of the referenced report, summarizing recent sampling efforts conducted at Raytheon's former Canoga Park facility. RMSC's consultant, Fluor Daniel GTI (FD/GTI), performed the assessment and prepared the enclosed report. The report bears the stamp of a California registered professional engineer.

FD/GTI concludes that concentrations of metals were not detected in soil samples at levels that indicate the need for further action. Further, VOC-impacted soil and groundwater occurs in an area where metal working, finishing, and cleaning operations were known to have occurred within the former Building 269. The lateral extent of the contamination to the east and south has been defined, and the ongoing remediation is adequately addressing the impacted groundwater in those areas. FD/GTI recommends additional sampling to establish the western extent, and a workplan for that effort will be submitted to DTSC in the near future. The contamination in the western area of the former building is being adequately contained by the ongoing remediation. FD/GTI also recommends augmentation of the existing treatment system in order to expedite cleanup. RMSC submitted a plan ("Plan for Modification of Remediation Systems, former Hughes Missile Systems Company Facility", 16 September 1998; copy to DTSC) to the LARWQCB describing proposed system modifications.

In addition to the sampling performed by Raytheon, sampling in the area of the former Building 269 was previously performed by Regent Properties, current owner of the property where the building was formerly located. A copy of their report, titled "Environmental Sampling and Testing Under Floor Slabs and Clarifiers, former Hughes Missile Systems Company", 27 June 1997, was submitted to DTSC on 11 March 1998. The sampling was conducted by Allwest Geosciences in the area beneath the former solvent tank, and in the area of the clarifiers (Pits 1 & 2) at the southeastern corner of the

former building. The Allwest report concluded that "there have been no environmental impacts from VOCs or metals to subsurface soil directly under the concrete floor slabs or adjacent to the clarifiers due to leaks or migration of contaminants through the concrete slabs". Another copy of the Allwest report is enclosed for your convenience.

The assessment in the Building 269/272/282 area, along with the Allwest report, addresses DTSC's concerns expressed in their 5 June 1997 letter regarding the SWMUs and AOCs listed below. Therefore, Raytheon is requesting that DTSC remove the following SWMUs and AOCs from their list:

SWMU No. 1	Building 272
SWMU No. 2	Building 282
SWMU No. 3	Building 269, Pits 1 & 2
AOC No. 13	Tank T-14

With the submittal of the enclosed report, Raytheon has completed several significant investigations at the site. We are anxious to proceed with remaining activities, if any, to satisfy DTSC's concerns and complete site closeout. However, before further plans can be made, we need DTSC's response on two key issues:

1) a revised list of SWMUs and AOCs, which was promised by Phil Chandler at our 17 February meeting. Additional data supporting our request to remove other SWMUs and AOCs from DTSC's list was submitted on 17 February and 8 September.

2) DTSC's final decision regarding post-closure for former Tank T-3. This issue is extremely critical to completion of site close-out. We have thoroughly presented our position regarding the issue on several occasions, and cannot proceed with plans for site close-out until it is resolved.

We would be glad to meet with you to review the recent sampling and assessment activities and our plans for augmenting the remediation system. I will be out of the office until 19 October 1998, but will contact you upon my return to discuss a potential meeting.

Sincerely,

RAYTHEON MISSILE SYSTEMS COMPANY

I. Jean Roberts

I. Jean Roberts, Project Manager
Environmental, Health, & Safety

EXECUTIVE SUMMARY

The former Raytheon Missile Systems Company facility at 8433 Fallbrook Avenue in Canoga Park, California has been the site of environmental assessment work since 1984. A soil and groundwater remediation system has been operating since 1995 to address soil and groundwater containing volatile organic compounds (VOCs) in the northwest part of the property.

The site is currently being redeveloped. Redevelopment activities, specifically building demolition, have created access to obtain soil and groundwater samples from areas which were not completely accessible previously.

This report describes assessment activities and analytical results for an area previously occupied by Building Nos. 269, 272 and 282. These were described as SWMU Nos. 1, 2, 3, and AOC Nos. 5 and 13 in the June, 1997 letter from DTSC. Although this area lies within the area influenced by the currently-operating remediation system, it had been identified as an area of concern by the California Environmental Protection Agency, Department of Toxic Substances Control.

The work performed as part of this assessment included collection and chemical analysis of soil, soil gas, and groundwater samples. The sampling program was designed to determine whether former operations conducted in the subject buildings may have impacted soil and groundwater from releases of metal or VOC constituents.

With respect to concentrations of metals in soil, a total of 36 samples were collected from nine soil borings and analyzed for 14 metals. No samples contained concentrations greater than the Soluble Threshold Limit Concentration for any of the 14 metals. Two metals, silver and hexavalent chromium, were not detected in any of the 36 samples analyzed. Concentrations of other metals detected in certain samples were within ranges considered typical for natural soils in California.

Because significant concentrations of metals were not detected in soil samples, groundwater samples were not analyzed for concentrations of metals.

With respect to VOCs, concentrations of chlorinated hydrocarbons were detected in about half of the soil and soil vapor samples, and four of the five groundwater samples. Although concentrations of VOCs detected in groundwater samples were consistent with adjacent areas (and under influence of the currently-operating remediation system), certain soil samples contained concentrations of VOCs which may warrant further investigation and remedial efforts.

RESULTS OF RADIOLOGICAL SAMPLING OF MONITOR WELLS

DECEMBER 1991

HUGHES MISSILE SYSTEMS GROUP

CANOGA PARK FACILITY

CANOGA PARK, CALIFORNIA

INTRODUCTION

This report presents the results of radiological analyses of groundwater samples collected from monitor wells at the Hughes Missile Systems Group Facility at 8433 Fallbrook Avenue in Canoga Park, California. The groundwater samples were collected from 27 monitor wells on December 10 through 13, 1991. The samples were collected according to the sampling protocol described in the December 1991 workplan (Groundwater Resources Consultants, Inc., 1991a). According to contractual arrangements, the samples were analyzed for Gross Alpha, Gross Beta, isotopic uranium, and radium- 226/radium 228 if Gross Alpha for the sample exceeded five (5) pico curies per liter (pCi/l). Final analytical results were received by this office on March 11, 1992.

The samples were analyzed by IT Analytical Services of Richland Washington, an EPA certified laboratory. The detection limits for the radiological constituents are listed in Table 1. The laboratory results are included as Appendix A.

The proposed EPA Maximum Contaminant Levels (MCLs) for radiological constituents in community and all non-transient, non-community public water systems are summarized in Table 2 (Federal Register, Vol. 56, No. 138, pp. 33050 - 33127, July 18, 1991).

ANALYTICAL RESULTS

GROSS ALPHA RESULTS

Gross Alpha screening is considered to be an indicator of naturally occurring radiological constituents (Federal Register, Vol. 56, No. 138, pp. 33050 - 33127, July 18, 1991). The primary constituents that make up the naturally occurring Alpha emitters are uranium, radium-226, and radon-222. The groundwater samples from the monitor wells were analyzed for both uranium isotopes and radium-226. No samples were analyzed for the volatile gas radon-222 because of the impracticality of sample collection and analysis and because radon is a naturally occurring constituent that could be of interest from a regional standpoint but would not be specific to the Facility and would not have resulted from industrial activities at the Facility.

The proposed EPA Adjusted Gross Alpha MCL of 15 pico-Curies per liter (pCi/l) involves the subtraction of the activity of uranium isotopes, radium-226, and radon-222. The EPA has developed separate MCLs for the common alpha-contributing isotopes (Table 2). Even without the subtraction of radon-222, none of the samples exceeded the Adjusted Gross Alpha MCL of 15 pCi/l (Table 3). The most elevated observed value for adjusted Gross Alpha was 3.8 pCi/l, in the sample from CM-6D.

URANIUM ISOTOPES

The groundwater samples were analyzed for individual uranium isotopes, uranium-234, uranium-235, and uranium-238. The results of the uranium isotope analyses are summarized in **Table 4** in both mass and activity units. Laboratory results were given in terms of activity units. The equation used for the conversion to mass units is illustrated in **Table 5.**

Samples from three wells, CM-8D, CM-10, and CM-18, exceeded the EPA activity level MCL for uranium (30 pCi/l). The EPA MCLs were developed for community water supplies. Community water supplies would commonly have total dissolved solids concentrations (TDS) concentrations of 500 milligrams per liter (mg/l) or less. Elevated uranium levels are attributed to the fact that groundwater at the Facility has elevated natural background TDS ranging up to 2,600 mg/l resulting in proportional elevation in uranium salts concentration.

The EPA defines naturally occurring uranium as (Federal Register, Vol. 56, No. 138, pp. 33050 - 33127, July 18, 1991):

> ...uranium with combined uranium-234 plus uranium-235 plus uranium-238 which has a varying isotopic composition but typically is 0.006% uranium-234, 0.7% uranium-235, and 99.27% uranium-238.

For the groundwater samples in which all three isotopes of uranium were detected above the laboratory detection limit, the associated isotopic mass

percentages fall within the range expected for naturally occurring uranium (Table 4).

This data does not indicate any enrichment of uranium-235 which could be associated with man-made fuels and there would be no reason on the basis of these data to suspect any non-natural alpha emitters.

RADIUM 226

Radium-226 is a naturally occurring alpha emitter. The proposed EPA MCL for radium-226 is 20 pCi/l. The results of the radium-226 analyses are summarized in Table 3. Samples were analyzed for Radium-226 if Gross Alpha exceeded 5 pCi/l. All results were reported to be less than the MCL. The results ranged from less than the detection limit for most samples to 11.3 pCi/l for the sample from MW-21D.

GROSS BETA AND RADIUM-228

The Gross Beta emitter analysis is generally considered to be an indicator of the presence of man-made radionuclides, although there is at least one common naturally-occurring beta emitter, radium-228. Samples were analyzed for radium-228 if Gross Alpha exceeded 5 pCi/l. The Gross Beta and radium-228 analyses are summarized in Table 6. The EPA compliance screening level for Gross Beta is 50 pCi/l and the proposed MCL for radium-228 is 20 pCi/l. All Beta results were below the compliance screening level and ranged from less than the detection limit to 33.7 pCi/l in a sample from CM-

18. All radium-228 results were below the MCL and ranged from below the detection limit to 1.84 pCi/l in a sample from MW-16.

These results do not give any indication of the presence of man-made radionuclides.

SUMMARY AND RECOMMENDATIONS

These analytical results of groundwater samples from monitor wells at the Facility indicate the following:

1. All Adjusted Gross Alpha results were below the proposed EPA MCL of 15 pCi/l.

2. Several samples had uranium concentrations that exceeded the proposed MCLs for uranium. This is attributed to the fact that the groundwater at the Facility commonly has natural background TDS concentrations of from three to five times the Secondary Drinking water standard of 500 mg/l resulting in proportional increase in uranium salts concentrations. An analysis of the isotopic mass percentages of the samples with elevated uranium levels indicates that the percentages conform to the EPA definition of naturally occurring uranium.

3. All radium-226 results were below the proposed EPA MCl of 20 pCi/l.

4. All Gross Beta results were below the compliance screening level of 50 pCi/l. This would indicate that there are no man-made radionuclides present.

5. All radium-228 results were below the proposed EPA MCL of 20 pCi/l.

Because no man-made radionuclides are indicated by the data from this investigation, no additional radionuclide sampling is warranted.

TABLE 2

EPA PROPOSED MAXIMUM CONTAMINANT LEVELS[1/]

	MCL	REMARKS
1. Adjusted gross alpha emiters	15 pCi/l	Gross alpha minus emission of uranium, radium-226, and radon-222
2. Beta and photon emitters[2/]	4 mrem ede/yr	Beta and photon emitters minus radium-228. Mrem ede/yr refers to the dose committed over a period of 50 years to reference man with an annual intake of two liters of drinking water per day.
3. Uranium	20 µg/l (30 pCi/l)	Mass concentration (activity level); Includes uranium-234, uranium-235, uranium-238.
4. Radium-226	20 pCi/l	
5. Radium-228	20 pCi/l	
6. Radon-222	300 pCi/l	

(µg/l) = micrograms per liter
(pCi/l) = picocuries per liter

1/ Proposed regulations published in Federal Register, Vol. 56, No. 138, July 18, 1991. The proposed regulations would apply to all community and non-transient, non-community public water systems.

2/ The screening level for compliance with the MCL for Gross Beta level is 50 pCi/l.

July 28, 2006

Unmack Corporation Project # 06.109.03

1. EXECUTIVE SUMMARY

Unmack Corporation (UC) was retained by Trammell Crow Company to perform a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-00 at the DeVry University located at 22801 Roscoe Boulevard in West Hills, California 91304 herein referred to as the SITE. Any exceptions to, or deletions from, this practice is described in Section 1 of this report.

The purpose of a Phase I is not only to assist a purchaser or lender to qualify for the innocent landowner defense under the federal Superfund statute, it is also intended to provide reliable, early information on the environmental condition of the property and on the possible need for additional, more extensive and costly investigation.

In short, the Phase I assessment is designed to recognize and catalog those concerns or problems that the environmental professional believes deserve further investigation. A major purpose of the Phase I assessment is to evaluate the need for more intrusive research. The recommendations provided in a Phase I report reflect professional judgments made by the assessment team based on observations of the SITE and a thorough review of available agency and other historical records, including information provided by the SITE's owner or representative, within the time constraints of the reporting period. Precise information about actual SITE contamination can only be obtained through a different and subsequent level of investigation, as would occur in a Phase II study, which might involve sampling of soil and/or groundwater to determine actual levels of contamination, or of building materials to determine the presence of asbestos or lead containing materials.

In performing this Phase I investigation, Unmack Corporation's team completed the following steps: review of government records and databases for evidence of possible environmental contamination; site reconnaissance through a site walk of the property; interviews with current owners and occupants of the property or their representative(s), as well as with appropriate government agency staff; and an evaluation of the evidence developed during the site assessment presented in a written report to the individual ordering the performance of the Phase I.

This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the SITE.

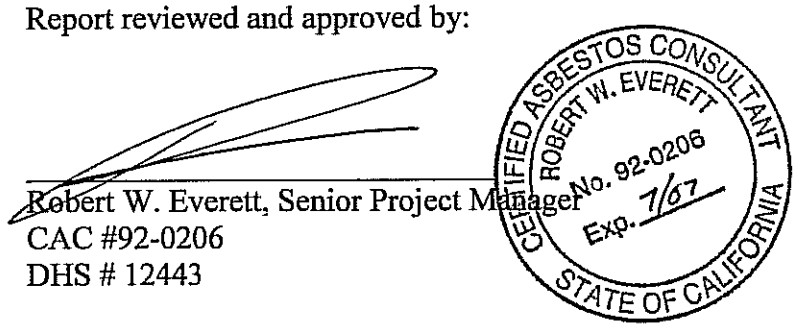
In conclusion, the SITE presents evidence of low environmental risk, stemming from any undocumented underground storage tanks (USTs), underground piping and the former adjoining northern property previously owned and occupied by Hughes Missile System Company.

Based on the results of the Phase I Environmental Site Assessment, Unmack Corporation recommends the following:

- A closure letter should be obtained from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding the four groundwater monitoring wells located on the SITE if these wells are considered to be a no further action activity.

- Prior to any renovation or demolition of the current building, a Hazardous Materials Survey should be performed to determine if any hazardous materials such as asbestos containing materials or lead-containing materials are present in the building.

Report reviewed and approved by:



Robert W. Everett, Senior Project Manager
CAC #92-0206
DHS # 12443

I. INTRODUCTION

Purpose

Property and Client

The property subject to this Phase I Environmental Site Assessment is the DeVry University located at 22801 Roscoe Boulevard in West Hills, California 91304. The Unmack Corporation retained W&K to prepare this assessment.

Purpose of a Phase I Environmental Site Assessment

Under the federal Comprehensive Environmental Response, Compensation and Liability Act (CERCLA, or "Superfund"), owners of property where hazardous substances have been released (including deposited or disposed of) are strictly liable for the costs of response and cleanup. This liability, which can amount to millions of dollars, generally extends to landowners who receive title after the release has occurred, unless the landowner can demonstrate that at the time of acquisition, he had no knowledge or reason to know of the release or disposal. Such an "innocent landowner" must meet certain statutory requirements and bears the burden of proof in establishing this defense. Generally, the landowner must demonstrate that prior to acquisition, he undertook "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice in an effort to minimize liability."[1] Potential environmental liability may also result under other federal and state laws, and under common law tort suits based on contamination. In addition, the Federal Deposit Insurance Corporation since 1993 has required that all insured lending institutions have in place "appropriate safeguards and controls to limit exposure to potential environmental liability associated with real property held as collateral or as an investment... Examiners will review the institution's compliance with its own environmental risk program as part of the examination of lending and investment activities."[2] As a result, essentially all nonresidential real estate transactions now include an environmental site assessment.

The legal standard exists defining what a site assessment must include, both the Environmental Protection Agency (EPA) and the American Society for Testing and Materials (ASTM) has published a standard defining recommended elements to be included. However, the standard does not take effect until December 2006. According to this standard[3], the goal of the Phase I Environmental Site Assessment process is to identify *recognized environmental conditions*, which means:

> the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimus

---

[1] 42 USC 9601(35)(B)

[2] Poling, Stanley J., Director, Federal Deposit Insurance Corporation, *Guidelines for an Environmental Risk Program*, FIL-14-93, February 25, 1993.

[3] ASTM E 1527-05, page 1

conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies.[4]

The purpose of a Phase I is not only to assist a purchaser or lender qualify for the innocent landowner defense; it is also intended to provide reliable, early information on the environmental condition of the property and on the possible need for additional, more extensive and costly investigation. In the terminology currently used in the industry, site investigation and cleanup entails up to three discrete steps: Phase I, which involves nonintrusive investigation designed to spot the most common contamination problems and sources; Phase II, which involves sampling and analysis to characterize the nature and extent of contamination, considering the Phase I findings; and Phase III, which covers the actual site cleanup, based on information from the Phase II study.

More specifically, a Phase I Environmental Site Assessment entails nonintrusive research to identify areas of potentially significant liability for the current or prospective owner. Conditions suggesting possible onsite contamination are described, and the client notified that further investigation may be warranted to confirm the existence and/or extent of contamination; cleanup remedies and costs can then be more confidently evaluated. Such a subsequent investigation involves intrusive measures such as soil and/or groundwater testing; this level of investigation is termed a "Phase II" study. In short, the Phase I assessment is designed to recognize and catalog those concerns or problems that the environmental professional believes deserve further investigation. A major purpose of the Phase I assessment is to evaluate the need for more intrusive research. The recommendations provided in a Phase I report reflect professional judgments made by the assessment team based on observations of the site and a thorough review of available agency and other historical records; precise information about actual site contamination can only be obtained through a different and subsequent level of investigation, as would occur in a Phase II study.

This Environmental Site Assessment has been performed to meet the ASTM standard and to assist in fulfilling both purposes described above.

Detailed Scope-of-Services

A Phase I Environmental Site Assessment generally has four elements: Review of government records and databases for evidence of possible environmental contamination; site reconnaissance through a site walk of the property; interviews with current owners and occupants of the property, as well as with appropriate government agency representatives; and an evaluation of the evidence developed during the site assessment presented in a written report to the individual ordering the performance of the Phase I.

Significant Assumptions

None

---

[4] *op cit.*, p. 6

Limitations and Exceptions of Assessment

Consistent with customary practice and the ASTM standard, this Phase I did not include a specific evaluation of the potential presence of asbestos, radon, lead-based paint, lead in drinking water, or fungus/mold.

Any sketch appearing in or attached to this report, or any statement of dimensions, capacities, quantities or distances, are approximate and are included to assist the reader in visualizing the property. No survey of the property has been made as part of this Phase I assessment. W&K assumes that there are no hidden, unapparent or latent conditions or defects in or of the property, subsoil, or structures, other than those noted in this report. No responsibility for such conditions or for their repair is assumed. Information, estimates and opinions furnished to W&K and contained in this report were furnished from sources considered reliable and believed to be true and correct. However, no independent investigation as to such matters has been made, and W&K assumes no further responsibility for their accuracy.

A Phase I Environmental Site Assessment is not an audit of a facility's compliance with applicable environmental, health and safety standards. Although such a compliance audit may sometimes be useful in connection with the acquisition of a commercial or industrial enterprise, it involves a different approach as well as higher levels of scrutiny and effort than those involved in a Phase I scope of work.

Special Terms and Conditions

None

User Reliance

An environmental professional is not required to verify independently the information provided but may rely on information provided unless he or she has *actual knowledge* that certain information is incorrect or unless it is *obvious* that certain information is incorrect based on other information obtained in the Phase I Environmental site assessment or otherwise actually known to the *environmental professional.*

II. SITE DESCRIPTION

Location and Legal Description

The SITE consists of the DrVry University located at 22801 Roscoe Boulevard in community of West Hills in the City of Los Angeles, California 91739. The SITE is located on approximately 15.25 acres of land and 106,190 square feet of building and consists of Parcel A with APN number of: 2005-002-001 in the City of Los Angeles, County of Los Angeles, California.

A topographic map is provided in Exhibit A.

Site and Vicinity General Characteristics

Fallbrook Avenue is to the east and adjoining to the SITE, Roscoe Boulevard is to the south and adjoining to the SITE, residential development is to the west and adjoining to the SITE and West Hills Corp Pointe commercial center is to the north and adjoining to the SITE. Residential developments are located along the east side of Fallbrook Avenue and the south side of Roscoe Boulevard.

Current Use of Property

The SITE is currently occupied by DeVry University a computer training school and the adjoining parking lots.

Site Structures, Roads and Other Improvements

The SITE is currently occupied by DeVry University, a two-story 106,000 square foot building on approximately 15.25 acres of land with several parking lots. West Hills Corp Pointe commercial center is to the north, Fallbrook Avenue is to the east, Roscoe Boulevard is to the south and residential development is to the west.

Current Uses of Adjoining Properties

At present, West Hills Corp Pointe commercial center is to the north with the remainder of the surrounding area predominately residential development. West Hills Corp. Pointe used to be the Hughes Missile System Company complex.

Site Plan

A site plan sketch is included in Exhibit B showing the general layout of the properties.

III. USER PROVIDED INFORMATION

Title Records

No current title records were requested nor provided to Winzler & Kelly Consulting Engineers.

Environmental Liens or Activity and Use Limitations

Mr. Kenneth Katich of Trammell Crow Company the representative of MEPT West Hills, LLC, the potential buyer reported that to the best of their knowledge, there are no pending, threatened or past litigation, administrative proceedings, liens, or notices from any governmental entity regarding possible violation of environmental laws or possible liability regarding hazardous substances or petroleum products.

Specialized Knowledge

If the *user* is aware of any specialized knowledge or experience that is material to *recognized environmental conditions* in connection with the property, it is the user's responsibility to communicate any information based on such specialized knowledge or experience to the *environmental professional.* No specialized knowledge was reported to Winzler & Kelly.

Valuation Reduction for Environmental Issues

No reduction in value to compensate for environmental issues is known to the Unmack Corporation.

Owner, Property Manager, and Occupant Information

DeVry University is the current owner.

Reason for Performing Phase I

The Phase I Environmental Site Assessment was performed to investigate the site for potential purchase.

Previous Environmental Investigations

There have been numerous environmental investigations of the SITE which was included in the Hughes Missile Systems Company site. Unmack Corp provided Winzler and Kelly with a copy of several reports including the following:

1. *Technical Memorandum Records Review and Limited Site Investigation* performed by Earth Tech, November 28, 1994
2. *Environmental Assessment* performed by Environmental Planning Associates, Inc. August 15, 1996

3. *Traffic Impact Study* performed by Environmental Planning Associates, Inc. August 15, 1996
4. *Report of Geotechnical Investigation* performed by Law Crandall February 6, 1997.
5. *Site Assessment* performed by Fluor Daniel GTI September 2, 1998.

The conclusions and recommendations of these reports are as follows:

1. *Technical Memorandum Records Review and Limited Site Investigation* performed by Earth Tech, November 28, 1994

This report reviewed various records that dealt with the buildings associated with the Hughes Missile Systems Company since the DeVry building was not built until 1999. The impact of the Hughes facility on the subject SITE is the possible groundwater contamination from the previous activities at the Hughes facility. According to records reviewed by Earth Tech at the Los Angeles Regional Water Quality Control Board (LARWQCB) groundwater monitoring wells were installed throughout the Hughes property and the Subject SITE and Quarterly groundwater monitoring was ongoing since 1990.

2. *Environmental Assessment* performed by Environmental Planning Associates, Inc. August 15, 1996.

This report appears to be a documentation of the impact on the surrounding area if the DeVry University site is built.

3. *Traffic Impact Study* performed by Environmental Planning Associates, Inc. August 15, 1996

This report appears to be a documentation of the impact on the surrounding streets and traffic flow if the DeVry University site is built.

4. *Report of Geotechnical Investigation* performed by Law Crandall February 6, 1997.

This report is of the geotechnical investigation for the proposed DeVry facility building. This report dealt with geotechnical aspects of construction of the subject SITE.

5. *Site Assessment* performed by Fluor Daniel GTI September 2, 1998.

This report dealt with additional sampling and analysis of the groundwater monitoring, CM-10 which is the nearest groundwater monitoring well. In previous groundwater monitoring events Freon 11 was found in this groundwater monitoring well. Fluor Daniel GTI's recommendation was to continue quarterly groundwater monitoring until the concentrations of Freon 11 become less than the State Maximum Contaminant Level (MCL) for Freon 11 which is 150 µg/L. Part of this report is included in Exhibit I.

IV. RECORDS REVIEW

Standard Environmental Record Sources

W&K contracted with Environmental Data Resources, Inc. (EDR) to review databases constructed by federal, state, and local regulatory agencies. This review was designed to identify facilities and properties recently or currently under investigation for environmental contamination within a specific radius of the site. Additionally, this search noted any reported hazardous waste sites, landfills, Superfund sites, or businesses generating or treating hazardous wastes within the radius area. Finally, records of spills and other types of releases of hazardous materials were reviewed for properties within a smaller radius.

W&K does not assert to the completeness or accuracy of the database report. Our review is therefore only as current and accurate as that given in the database report, and this may not represent all known or potential hazardous waste or contaminated sites. Further, there may be errors in the database information reported for a site resulting from a number of different operations involved in processing the search. These errors could result in a site being included in the database due to a similar street name as a street within the search radius, when in fact the site is outside the search distance for the report. Additionally, a site within the search radius may be omitted resulting from errors in the data entry phase of the search process. While W&K periodically reviews the EDR Information database report against another leading vendor's database report for the same site to ensure quality assurance and control, the accuracy and completeness of each report cannot be guaranteed by W&K. *What follows is an interpretation of this information, based on a careful evaluation of the database report, a USGS topographical map, an area street map, knowledge of the region, and professional judgment about potential environmental conditions.* A complete copy of the regulatory agency database search report is included with this report as Exhibit E in the Appendices. The Site Information Map, contained in the database report, illustrate the locations of the site relative to the listed properties that are discussed and reviewed in the following section.

In each case, the radius distance was chosen on the basis of the potential hazards that identified neighboring properties could pose to the SITE, the type of information provided, and the extent of overlap with other, more extensive databases. The resulting database search provided information that meets or exceeds the ASTM requirements. The date of the most recent update for each database is noted parenthetically below, following a description of the database. The name, address, status, and distance from subject site for each site identified by the database are also given.

The results are organized by listing sites, which were identified on a particular database. Since some of the sites appear on more than one database, these sites may be listed more than once.

These sites are listed according to closest proximity relative to the subject site. Further, information on the topographic gradient relative to the subject site is given to aid in the assessment of potential impact to the subject site from groundwater contamination. This information is based on the assumption, as explained in the section on hydrogeology, that the

direction of groundwater flow in the shallow groundwater aquifer generally follows topography. Also, the database report site number is noted parenthetically.

Subject Property

The database review indicates that at this time, the SITE is not known to have released hazardous substances, or to currently be under investigation by a state or federal environmental regulatory agency, or to have been a facility involved in generating, treating, or disposing of hazardous waste onsite, or to have stored or used hazardous materials.

Adjoining Properties

The database review indicates that, at this time, there are two properties immediately adjoining the site that are listed as being identified or under investigation by a state or federal environmental regulatory agency, or to have been a facility involved in generating, treating, or disposing of hazardous wastes onsite. In addition to these two sites there are two other sites listed.

Table: AREA WIDE REGULATORY CASES

Site name, address & ID number	*Database(s) & Status*	*Distance & Direct from Subject Site*	*Risk*
Hughes Aircraft Company (Map ID #C9) 8433 Fallbrook Avenue	CERCLIS-NFRAP: No Further Action CORRACTS: RCRA corrective action–low priority RCRA Info: RCRA TSDF closed CORTESE: Cal-EPA listing of leaking UST LUST: solvents –Remedial Action Underway	<0.125 mile north; up gradient Adjoining northern site	Low

Table: AREA WIDE REGULATORY CASES			
Site name, address & ID number	***Database(s) & Status***	***Distance & Direct from Subject Site***	***Risk***
Quest Diagnostics (Map ID B6) 8401 & 8403 Fallbrook Avenue	RCRA Info: Large Quantity Generator; no violations found	<0.125 mile northeast; up gradient	Low
Lakeview Cleaners (Map ID 1) 22736 Roscoe Blvd.	RCRA Info: Small Quantity Generator-No violations found	0.125-0.25 mile southeast; down gradient	Low
LA Fire Station 106 (Map ID A3) 23004 Roscoe Blvd.	RCRA Info: Small Quantity Generator-No violations found HAZNET: Asbestos-containing waste LUST: Diesel- soil only affected	0.125-0.25 mile west; down gradient	Low

Orphan Sites

Two sites were listed as "orphan sites," in other words, there was a lack of available information in the agency databases to precisely identify the site or its location relative to the subject site, other than its shared zip code or city name. However, upon closer review, all sites with open agency files were located beyond the radius search distance from the subject site.

Summary of Database Review

The review of regulatory agency database lists indicates that at this time, the SITE is not known to have released hazardous substances, or to currently be under investigation by a state or federal environmental regulatory agency, or to have been a facility involved in generating, treating, or disposing of hazardous waste onsite, or to have stored or used hazardous materials.

There are two adjoining property: Hughes Aircraft Company located at 8433 Fallbrook Avenue is listed on the CERCLIS-NFRAP list as a site that has been removed and archived from the inventory of CERCLIS sites and the EPA has determined no further action for this site. It is also listed on several other lists including: CORRACTS as a RCRA site with a low corrective action priority; as a RCRA Large Quantity Generator and as a Treatment, Storage, Disposal Facility (TSDF) both of which are now closed; as a LUST site from the numerous underground storage tanks that had leaked but now have been removed with groundwater monitoring wells in place. The second adjoining site is Quest Diagnostics located at 8401 and 8403 Fallbrook Avenue and is listed as a large quantity generator with no violations.

Two other properties were listed: Los Angeles Fire Station #106 located at 23004 Roscoe Boulevard. is listed as a Small Quantity Generator of hazardous waste with the waste being asbestos-containing materials that had been removed and it is listed on the LUST list as a site with a leaking underground storage tank that leaked diesel fuel but only affected the soil. The second site listed is the Lakeview cleaners located at 22736 Roscoe Boulevard is listed as a RCRA Small Quantity Generator of hazardous waste from dry cleaning

Physical Setting

General property information and property use are summarized in Table 2. Refer to the Vicinity Map (included in Exhibit A).

TABLE 2	
Summary of Property Information	
Topographic Map:	Canoga Park/Calabasas
Topography:	Slopes to the southeast at approximately 25 feet per mile.
General Location:	The northwest corner of Roscoe Boulevard and Fallbrook Avenue in West Hills, California
Assessor's Parcel Numbers:	2005-002-001
Regional Groundwater Flow Direction:	South / southeast
Existing use:	DeVry University computer training school

An Assessor's Parcel Map is included in Exhibit H.

Site Geology

Regionally, the SITE is mapped as being underlain by primarily consolidated bedrock of the Miocene Modelo Formation (Geological Map of California). This formation consists of tan to grayish siltstone, clayey siltstone and shale with minor interbedded diatomaceous shale. The SITE is located upon recent alluvium and stream bed deposits that make up the valley fill and outwash from the nearby surrounding hills and mountains. The Modelo Formation is believed to be present below the valley fill. Ground water has historically been used for private and agricultural purposes.

Site Geohydrology

The SITE is located within the Central Basin of the Los Angeles County Groundwater Basin as shown in the Hydrologic Report of the Los Angeles County Department of Public Works (1989). The SITE is located within the San Fernando Ground Water Basin of the South Coast Hydrologic Region as shown in the Hydrologic Report of the State of California Bulletin No. 118 (2003). The Chatsworth Creek Channel is located approximately one-quarter mile to the west of the SITE.

Groundwater Well Information

According to the most recent available well data records that were obtained on July 25, 2006 from Carnie with the Los Angeles County Department of Public Works (LACDPW), Hydraulic/Water Conservation Division, the closest active groundwater well to the SITE, Well # 4699, is located southeast at Valerio Street and Glade Avenue, which is approximately one and one-half miles southeast of the SITE. The depth to groundwater at this well was last recorded on May 8, 2006 as being 21.3 feet below ground surface. The ground surface elevation at that location is 807.7. Therefore, the water surface level is at 786.4 feet above Mean Sea Level. The shallow groundwater gradient would be expected to follow the local topographical gradient, which is to the southeast.

The depth to groundwater recorded in the well data is *generally not* the first encountered groundwater. It is the depth to the main potable, or deep, aquifer. As a general rule, topography is often indicative of the groundwater flow direction for the perched aquifer, or the first encountered groundwater. Local groundwater contamination usually affects this shallow-level aquifer.

In the evaluation of the regulatory records, the hydrogeologic conditions of a listed property relative to the subject site is given to aid in the evaluation of the potential hazard or

threat to the subject site of groundwater contamination from the listed site. In this evaluation, it is assumed that the shallow-level aquifer follows topography. Reference to the hydrogeologic conditions is given by stating the relationship of the listed site, either up-, down-, or cross-gradient relative to the site. There is a greater threat of migration of contaminated groundwater when the listed site is up-gradient versus down or cross-gradient from the site. Further, the threat decreases with distance from the listed site.

Historical Use Information on the Property

Building Records

A request for information with regards to the building records was made at the City of Los Angeles Building and Safety. These records showed the following highlights:

Date	Type of Permit	Activity	Owner
01/10/1952	Building	Erect a new single family house	Mr. & Mrs. Thomas R. Dempsey
07/16/1998	Building	Demo dwelling and garage	DeVry Inc.
08/06/1998	Building	Erect a school building	DeVry Inc.

Copies of some of these permits are included as Exhibit D.

Aerial Photo Review

Aerial photos of the site were reviewed for the period from 1928 through 2002 at the collection of Environmental Date Resources (EDR). Highlights include:

Date	Site Description
1928	The SITE consists of agricultural land. The main street of Roscoe Boulevard is in place A creek appears to in place west of the SITE.
1938	The SITE is unchanged; Fallbrook Avenue is in place to the east.
1947	Same as previous.
1956	Same as previous
1965	The SITE is now graded vacant land.
1976	Same as previous
1989	The eastern side of the SITE is now a baseball field. The remainder of the SITE is still vacant.
1994	Same as previous
2002	The SITE has the current building and parking lots on it.

Sanborn Insurance Maps

Historical Sanborn fire insurance maps were not available for the SITE or the surrounding area in the EDR collection for the period covering the years 1894 – 1970.

Division of Oil, Gas and Geothermal Resources Records

A review of California Department of Conservation, Division of Oil, Gas and Geothermal Resources Map Website indicates that there were no oil wells located within one

mile of the SITE. However, it is possible that wildcat drilling may have occurred in the area in the past.

Historical Use Information on Adjoining Properties

Aerial photos of the site were reviewed for the period from 1938 through 2002 at the collection of Environmental Date Resources (EDR). Highlights include:

Date	Surrounding Site Description
1928	The surrounding area consists of agricultural land. The main street of Roscoe Boulevard is in place A creek appears to in place west of the SITE. The Chatsworth Reservoir is visible to the far north.
1938	Same as previous. Fallbrook Avenue is now in place to the east.
1947	Same as previous. There is a road in place that surrounds the northern property.
1956	The northern property now has a small building in the center of it and another building to the east of the center building. The surrounding area is still agricultural land.
1965	The northern adjoining property (Hughes Missile Systems Company) is now built. There is residential development to the south and east of the SITE.
1976	Same as previous
1989	Same as previous with heavy residential development in all directions.
1994	Same as previous
2002	Same as previous

Sanborn Insurance Maps

Historical Sanborn fire insurance maps were not available for the SITE or the surrounding area in the EDR collection for the period covering the years 1894 – 1970.

Summary of Historical Use Information

Site history information was obtained from aerial photographs and City of Los Angeles Building and Safety permits. The aerial photographs indicate the SITE had been agricultural land from at least 1928 until 1989 when the eastern portion was a baseball field. In 1999 the current building and parking lots were constructed.

V. SITE RECONNAISSANCE

Methodology and Limiting Conditions

The methodology used to observe the site was to walk the entire site, both interior and exterior areas, and to observe the adjoining properties from public areas, i.e., sidewalks and streets.

General Site Setting

Current Use of the Property

Ms. Candice M. Cassato of Winzler and Kelly performed a site walk investigation of the site on the morning of July 24, 2006. The weather was sunny and hot. The temperature was in the low 90s (F). Access to the site was unimpeded.

The site is currently occupied by a 106,190 square feet two-story steel and glass building on 15.25 acres of land which is primarily asphalt-paved parking lots. The building is currently occupied by DeVry University a computer training school. The SITE is bounded by Fallbrook Avenue on the east, Roscoe Boulevard on the south, residential development to the west and West Hills Corp Pointe commercial development (formerly Hughes Missile Systems Company) on the north. Photographs taken during the site walk are included as Exhibit C.

Past Use of the Property

The aerial photographs indicate the SITE had been agricultural land from at least 1928 until 1989 when the eastern portion was a baseball field. In 1999 the current building and parking lots were constructed.

Current Uses of Adjoining Properties

Table 3 summarizes the current roads and site uses observed during the site reconnaissance.

TABLE 3
Adjacent Streets and Property Use

Direction	Adjacent Street	Adjacent Property Use
North	None	West Hills Corp Pointe
East	Fallbrook Avenue	Residential
South	Roscoe Boulevard	Residential
West	None	Residential

Past Use of Adjoining Properties

Based on the aerial photos and other information, the adjoining properties had been agricultural land from 1928 to 1965.

Current or Past Uses in the Surrounding Area

Generally the area has been agricultural land from at least 1928 to 1965.

TABLE 4 Summary of Site Reconnaissance		
Feature	**Observed**	**Not Observed**
Structures (existing)	X	
Evidence of past uses		X
Hazardous Substances and/or petroleum products (including containers)	X	
Aboveground storage tanks (ASTs)		X
Underground storage tanks (USTs) or evidence of USTs		X
Strong, pungent, or noxious odors		X
Pools of liquid likely to be hazardous materials or petroleum products		X
Drums / Areas of Storage containers	X	
Unidentified substance containers		X
Pad-mounted transformer/Pole-mounted transformer	X	
Subsurface hydraulic equipment		X
Heating/ventilation/air-conditioning (HVAC)	X	
Stains or corrosion on floors, walls, or ceilings		X
Floor drains and sumps		X
Pits, ponds, or lagoons		X
Stained soil and or/pavement		X
Stressed vegetation		X
Waste or wastewater discharges to surface or surface waters on subject site (including stormwater)		X
Wells (irrigation, domestic, dry, injection, abandoned, monitoring wells)	X	
Utilities	X	
Petroleum and/or natural gas pipelines		X
Suspect asbestos containing building materials	X	
Suspect lead-based painted surfaces and/or lead-containing substances	X	
Septic systems		X

General Description of Structures

The site is currently occupied by a 106,190 square feet two-story steel and glass building on 15.25 acres of land which is primarily asphalt-paved parking lots. The building is currently occupied by DeVry University a computer training school. The 1st floor consists primarily of classrooms with a cafeteria and the 2nd floor is offices.

Roads

Fallbrook Avenue is directly east and adjoining to the SITE. Roscoe Boulevard is directly south and adjoining to the SITE. Valley Circle Boulevard is approximately two miles to the west. The Chatsworth Reservoir is to the north. All streets are within the community of West hills in the City of Los Angeles, California.

Potable Water Supply

The City of Los Angeles Department of Water and Power (LACDWP) is the provider of potable water for the site and surrounding area.

Interior and Exterior Observations

Hazardous Substances and Petroleum Products in Connection with Identified Uses

There is one diesel powered emergency generator observed in the pump room on the 1st floor. No stains or spills were observed. There are two other battery operated emergency

backup lighting systems. No stains or spills were observed. The maintenance room had several five gallon paint containers and other small quantities of lubricating oils and maintenance supplies. The room is kept locked. There is a locked cleaning supply room; the cleaning itself is performed by an outside contractor. The HVAC equipment is located on the roof; all areas were observed to be clean and free of stains or spills at the time of the SITE visit.

PCBs

Transformers, elevators, hydraulic lifts, and fluorescent lighting ballasts are potential sources of PCB-containing insulating fluids. One elevator was observed inside the building. It is a hydraulic elevator, however, no stains or spills were observed in the elevator room. One LACDWP pad-mounted transformer was observed on the eastern side of the building. No stains or spills were observed during the SITE visit.

Interior Observations

Hazardous Materials, Hazardous Waste and Petroleum Products

There is one diesel powered emergency generator observed in the pump room on the 1st floor. No stains or spills were observed. There are two other battery operated emergency backup lighting systems. No stains or spills were observed. The maintenance room had several five gallon paint containers and other small quantities of lubricating oils and maintenance supplies. The room is kept locked. There is a locked cleaning supply room; the cleaning itself is performed by an outside contractor.

Asbestos-Containing Materials

Suspect asbestos-containing building materials were observed throughout the building. Materials included wallboard systems, various colored 12" x 12" resilient vinyl floor tiles, vinyl baseboard, 2' x 4' drop-in ceiling panels, carpet mastic and roofing materials. Based on the age of construction, 1999, the potential for asbestos-containing building materials is low.

Lead-Based Paints

No peeling paint was observed either inside or outside the building. Based on the age of construction, 1999, the potential for lead-based paints is low.

PCBs

Transformers, elevators, hydraulic lifts, and fluorescent lighting ballasts are potential sources of PCB-containing insulating fluids. One elevator was observed inside the building. It is a hydraulic elevator, however, no stains or spills were observed in the elevator room. One LACDWP pad-mounted transformer was observed on the eastern side of the building. No stains or spills were observed during the SITE visit.

Exterior Observations

Wells

There were three groundwater monitoring wells observed in the parking lots. According to the last site assessment report performed in 1998, these wells were to be monitored on a quarterly basis.

VI. INTERVIEWS

Interview With Owner

Mr. Kenneth Katich, the Project Manager for Trammell Crow Company, was interviewed on July 24, 2006. Mr. Katich has been associated with the SITE for more than five years with the SITE. Mr. Katich answered the Transaction questionnaire which is included in Exhibit G.

Proceedings Involving the Property

Mr. Katich reported that to the best of his knowledge, there are no pending, threatened or past litigation, administrative proceedings, liens, or notices from any governmental entity regarding possible violation of environmental laws or possible liability regarding hazardous substances or petroleum products.

Previous Environmental Investigations

There were five previous Environmental Reports given to W&K and are detailed in Section III.

Interview with Site Manager

Mr. Katich is the on-site manger of the SITE.

Interviews with Local Government Officials

Los Angeles Regional Water Quality Control Board (LARWQCB)

A written request for information was faxed to the Los Angeles Regional Water Quality Control Board with regards to the groundwater monitoring wells observed on the SITE. To date, there has been no response from LARWQCB. Should any negative environmental information be obtained from any files the LARWQCB might have, an addendum letter will be issued to the client from W&K.

City of Los Angeles Fire Department Hazardous Materials Division

A written request for information was faxed to the City of Los Angeles Fire Department, Hazardous Materials Division with regards to the SITE address. There are no records for the SITE address. The request and response documentation is included in Exhibit G.

City of Los Angeles Fire Department Underground Storage Tank Division

A written request for information was faxed to the City of Los Angeles Fire Department, Underground Storage Tank Division with regards to the SITE address. There are no records for the SITE address. To date, there has been no response from Fire Department. Should any negative environmental information be obtained from any files the Fire Department might have, an addendum letter will be issued to the client from W&K. The request documentation is included in Exhibit G.

VII. CONCLUSIONS AND RECOMMENDATIONS

Conclusions

Winzler & Kelly Consulting Engineers (W&K) was retained by Unmack Corporation to perform a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-00 at the DeVry University located at 22801 Roscoe Boulevard in West Hills, California 91304 herein referred to as the SITE. Any exceptions to, or deletions from, this practice is described in Section I of this report.

This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the SITE.

In conclusion, the SITE presents evidence of low environmental risk, stemming from any undocumented underground storage tanks (USTs), underground piping and the former adjoining northern property previously owned and occupied by Hughes Missile System company.

Based on the results of the Phase I Environmental Site Assessment, W&K recommends the following:

- A closure letter should be obtained from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding the four groundwater monitoring wells located on the SITE if these wells are considered to be a no further action activity.

- Prior to any renovation or demolition of the current building, a Hazardous Materials Survey should be performed to determine, if any, hazardous substances such as asbestos-containing substances or lead-based substances are present in the building.

VIII. SIGNATURE AND QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONAL

Qualifications

Ms. Candice M. Cassato, an Environmental Analyst of W&K, directed the performance and reporting of this Phase I Environmental Site Assessment. Ms. Cassato has performed environmental site assessments and project management since 1989. Ms. Cassato is an experienced auditor, performing evaluations of facilities ranging from office buildings to industrial factories to assess their compliance with all applicable health, safety, and environmental standards. She has conducted audits throughout the western United States. She has performed Phase I Environmental Site Assessments for property transfers and financing, prepared independent reviews of Phase I reports, and managed asbestos surveys. Ms. Cassato is a California Certified Asbestos Consultant and a California Certified Lead-Related Construction Inspector/Assessor.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT. Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

22801 ROSCOE BOULEVARD
WEST HILLS, CA 91304

COORDINATES

Latitude (North):	34.219900 - 34° 13' 11.6"
Longitude (West):	118.624400 - 118° 37' 27.8"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	350367.0
UTM Y (Meters):	3787536.5
Elevation:	845 ft. above sea level

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

FEDERAL RECORDS

NPL	National Priority List
Proposed NPL	Proposed National Priority List Sites
Delisted NPL	National Priority List Deletions
NPL RECOVERY	Federal Superfund Liens
CERCLIS	Comprehensive Environmental Response, Compensation, and Liability Information System
ERNS	Emergency Response Notification System

HMIRS	Hazardous Materials Information Reporting System

EDR Historical Cleaners.... EDR Proprietary Historic Dry Cleaners

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

CERCLIS-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 02/01/2006 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2N*	*C9*	*15*

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/15/2006 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/09/2006 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2 N*	*C9*	*15*

STATE AND LOCAL RECORDS

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, and dated 04/01/2001 has revealed that there is 1 Cortese site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir	Map ID	Page
HUGHES AIRCRAFT COMPANY	*8433 FALLBROOK AVENUE*	*1/4 - 1/2N*	*C9*	*15*

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 04/10/2006 has revealed that there are 2 LUST sites within approximately 0.5 miles of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/19/2006
Date Data Arrived at EDR: 05/05/2006
Date Made Active in Reports: 05/22/2006
Number of Days to Update: 17

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL RECOVERY: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/01/2006

Next Scheduled EDR Contact: 09/18/2006
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Data Release Frequency: Quarterly

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Data Release Frequency: Quarterly

NFE: Properties Needing Further Evaluation

This category contains properties that are suspected of being contaminated. These are unconfirmed contaminated properties that need to be assessed using the PEA process. PEA in Progress indicates properties where DTSC is currently conducting a PEA. PEA Required indicates properties where DTSC has determined a PEA is required, but not currently underway.

Date of Government Version: 08/08/2005

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Historical Auto Stations: EDR Proprietary Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

GEOCHECK®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

DEVRY UNIVERSITY
22801 ROSCOE BOULEVARD
WEST HILLS, CA 91304

TARGET PROPERTY COORDINATES

Latitude (North):	34.21990 - 34° 13' 11.6"
Longitude (West):	118.6244 - 118° 37' 27.8"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	350367.0
UTM Y (Meters):	3787536.5
Elevation:	845 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	34118-B6 CALABASAS, CA
Most Recent Revision:	1967
East Map:	34118-B5 CANOGA PARK, CA
Most Recent Revision:	1967

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

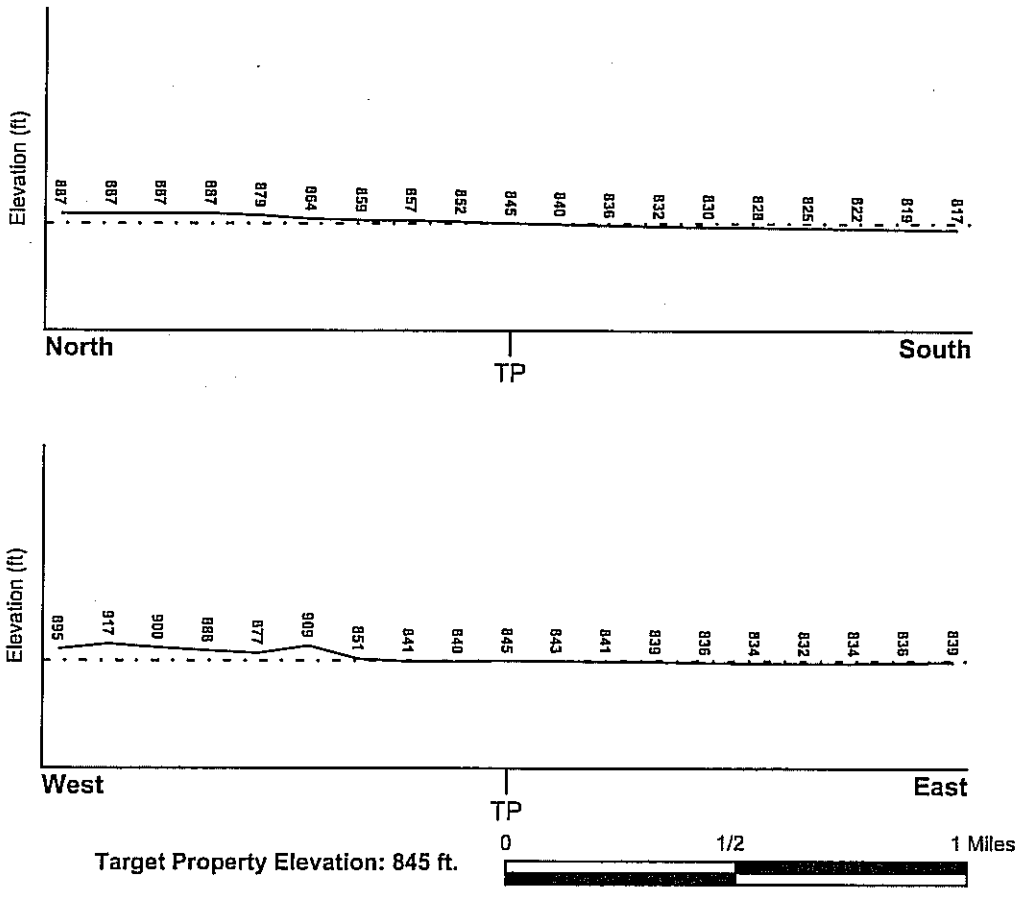
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
LOS ANGELES, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 0601370026C

Additional Panels in search area: 0601370017C

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CANOGA PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Mesozoic
System:	Cretaceous
Series:	Upper Cretaceous
Code:	uK *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	URBAN LAND
Soil Surface Texture:	variable
Hydrologic Group:	Not reported
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	Not Reported
Depth to Bedrock Min:	> 10 Inches
Depth to Bedrock Max:	> 10 Inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Surficial Soil Types:
loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Shallow Soil Types:
fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types:
stratified
clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

CONSULTING ENGINEERS

8. Are there currently, or to the best of your knowledge have there been previously, any *pits, ponds, or lagoons* located on the *property* in connection with waste treatment or waste disposal.

☐ Yes ☒ No ☐ Unknown on adjoining northerly property

9. Is there currently, or to the best of your knowledge has there been previously, any stained soil on the *property*? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

10. Are there currently, or to the best of your knowledge have there been previously, any registered or unregistered storage tanks (above or underground) located on the *property*?

☐ Yes ☒ No ☐ Unknown ~~on adjoining~~ northerly property

11. Are there currently, or to the best of your knowledge have there been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property* or adjacent to any structure located on the *property*? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

12. Are there currently, or to the best of your knowledge have there been previously, any flooring, drains, or walls located within the facility that are stained by substances other than water or are emitting foul odors? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

13. Is the property served by a private well or non-public water system, or is all water service provided by the city or other water agency?

☐ Private well or non-public water system (Go to 13a) ☒ City or other water agency

13a. *If the property is served by a private well or non-public water system:* Have contaminants been identified in the well or system that exceed guidelines applicable to the water system or has the well been designated as contaminated by any government/health agency?

☐ Yes ☒ No ☐ Unknown _____

14. Do you have any knowledge of environmental liens or governmental notification relating to past or recurrent violations of environmental laws with respect to the *property* or any facility located on the *property*? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

15. Have you been informed of the past or current existence of *hazardous substances or petroleum products* or environmental violations with respect to the *property* or any facility located on the *property*? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

16. Do you have any knowledge of any environmental site assessment of the *property* that indicated the presence of *hazardous substances or petroleum products* on, or contamination of, the *property* or recommended further assessment of the *property*? If yes, describe.

26. Has the facility ever had electric transformers, capacitors, or hydraulic equipment such as elevators or car repair lifts? If yes, describe.

☐ Yes ☑ No ☐ Unknown _____

27. Are you aware of the presence of any asbestos-containing or presumed asbestos-containing building materials at the property? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

28. Are you aware of the presence of any lead-based paint in the building? If yes, describe.

☐ Yes ☒ No ☐ Unknown _____

1.0 INTRODUCTION

The former Raytheon Missile Systems Company (RMSC) facility at 8433 Fallbrook Avenue in Canoga Park, California (Figure 1-1), has been the subject of environmental assessment work since 1984. The facility, which was used to conduct research and development of advanced military missile systems, made use of a variety of solvents and other chemicals in moderate quantities. Thirteen underground storage tanks (USTs) were maintained for holding fuel, hydraulic oil, waste oil, and spent solvents. All USTs which contained fuel hydrocarbons, oil, or solvents were removed between 1984 and 1991.

Soil and groundwater assessment began in 1984 and has continued to date. Groundwater monitoring involving approximately 30 wells has been conducted regularly since 1991. An extensive facility-wide soil assessment was performed in 1993. Remediation methods, including excavation and in-situ techniques, have been employed to address several petroleum hydrocarbon or solvent releases to soil and/or groundwater at various locations within the facility.

The California Environmental Protection Agency (CalEPA), Department of Toxic Substances Control (DTSC) has been provided extensive information on investigation and remediation activities at the site. In a letter from Yolanda Garza of DTSC to Pamela Beilke of RMSC, dated June 5, 1997, several solid waste management units (SWMUs) and areas of concern (AOCs) at the former RMSC, Canoga Park facility were identified by the DTSC. Based on the DTSC's review of past site investigation and cleanup summary documentation, the SWMUs and AOCs were identified as needing additional investigation. The criteria for including each SWMU and AOC in the list were also described in the June 1997 letter and attachment.

In the June 5, 1997 letter, the DTSC expressed concern that the area within, at, or nearby Building 274 may be a source of trichlorofluoromethane (Freon 11). The DTSC noted that "Building 274 was reported in the Potential Source Area Investigation Report (PSAIR) as having been used for solvent cleaning...specific solvents listed... included 1,1,1-TCA and Freon 11..." The DTSC's letter also indicated that groundwater samples taken from quasi-downgradient monitoring well CM-10 exhibited significant amounts of Freon 11.

The primary objective of the Additional Site Assessment was to, in response to the DTSC's concerns, assess the lateral extent of Freon 11 in groundwater near the area of monitoring well CM-10 and near buildings 265 and 274. This report describes the scope of work, methods, and procedures that were carried out to delineate potentially impacted groundwater and soil in this area.

Included in the CAP are brief descriptions of work by Hargis & Associates, Cal Science Engineering, McLaren/Hart Environmental, ENSR Consulting and Engineering, American Environmental Management Corporation, Ground Water Resources Consultants, Inc., and Groundwater Technology, Inc. The work included UST removals, excavation of petroleum hydrocarbon-containing soil from areas adjoining USTs, UST-related soil assessment activities, installation and sampling of groundwater monitoring wells, and remediation pilot testing. Post-1992 work at the site included facility-wide assessment (*Report on Facility-Wide Assessment*, Groundwater Technology, Inc., January 4, 1994), additional pilot testing (*Report on Pilot Testing of Remedial Technologies*, Groundwater Technology. Inc., July 20, 1993), and soil sampling and analyses completed during construction of the soil and groundwater remediation system (*Analytical Results for Soil Samples, Remediation System Wells*, Groundwater Technology, Inc., December 12, 1994).

In 1995, a series of soil gas investigations were conducted to delineate the areal extent of Freon 11 contaminated soil. These investigations have shown a limited area of Freon 11 soil gas concentrations in excess of 100 μg/l to the southeast of buildings 265 and 274 (Figure 2-1). This area is believed to be the sole source of Freon 11 contamination to groundwater.

Aerial photographs of the facility show that the area to the southeast of Building 265 was not paved until at least 1960. Between 1963 and 1965, the pavement was extended to the west, to the present location of Building 276. Referring to Figure 2-2, the center of mass of the Freon 11 plume (as delineated through soil vapor sampling) lies on the edge of the original pavement to the southeast of Building 265. Moreover, conversations with former facility maintenance personnel revealed that in 1966, the cooling units in Building 263 were overhauled. The method by which spent Freon 11 was disposed is unknown.

Table 1-1 shows an inventory of coolant used at the former RMSC. As can be seen from Table 1-1, the only location where Freon 11 was used was Building 263. Therefore, the source of Freon 11 could not be from the cooling unit adjacent to Building 274, because Freon 11 was not used in that building.

If the Freon 11 were introduced solely through the asphalt parking lot near the cooling unit adjacent to Building 274, one would expect a more diffuse soil plume closer to the cooling unit. However, as Figure 2-1 shows, the center of mass appears to be localized around the former edge of the original parking lot on the southeastern side of Building 265.

2.0 FIELD SAMPLING PLAN

The installation of three temporary wells and one fixed groundwater monitoring well and subsequent groundwater sampling in the area near buildings 265, 274, and 276 were used to assess the areal extent of Freon 11 encountered in groundwater in this localized area of the facility.

2.1 Basis for Temporary and Fixed Groundwater Monitoring Well Sample Locations

As discussed above, the likely area for the source of contamination would be close to the center of mass of the Freon 11 plume as delineated by the soil vapor surveys. To further delineate the areal extent of groundwater contamination associated with the Freon 11, three temporary groundwater wells and one fixed groundwater monitoring well were constructed around the area of elevated soil gas concentrations.

Figure 2-3 shows the locations for the three temporary groundwater wells and one fixed groundwater monitoring well. The basis for selection of the locations was as follows:

Temporary Groundwater Wells

One temporary groundwater well was installed near the southeast corner of Building 276 to define the southwestern edge of the groundwater plume. Another temporary well was installed between the southwest corner of Building 265 and the northeastern corner of Building 276 to delineate the northwestern edge of the groundwater plume. The third temporary groundwater well was positioned at a location approximately midway between the Freon 11 soil gas plume and the existing groundwater monitoring well, CM-10.

Fixed Groundwater Monitoring Well

One groundwater monitoring well (MW-31) was installed within the center of mass of the soil gas plume located in the parking area between Buildings 274 and 276.

Previous groundwater investigations and groundwater monitoring events have shown "none detected" for Freon 11 in monitoring wells MW-29 and MW-30. Furthermore, hydropunch samples taken from the parking area near the northeastern edge of Building 265 have also shown "none detected" for Freon 11 (ENSR Consulting and Engineering, 1991). In light of this data, no fixed groundwater monitoring wells or temporary wells were proposed for the northeastern or east edge of the groundwater plume.

2.2 Soil Sample Collection Procedures

A truck-mounted hollow stem auger rig equipped with 8-inch diameter augers was used to drill the boreholes for the wells. During drilling activities, soil samples were collected in the vadose zone at 10-foot intervals beginning at 10 feet bgs and continuing to down until shallow groundwater was encountered.

Soil samples were collected within the vadose zone at depth intervals of 10 feet beginning at 10 feet bgs. Each soil sample was collected using a California Modified Split Spoon Sampler fitted with three pre-cleaned stainless steel sleeves. Each sampler and stainless steel sleeve was decontaminated prior to and between each sampling interval. After each sampling event, the sampler was washed in a detergent solution, rinsed in tap water, and then rinsed in distilled water. This method decontaminates the sampler and prevents cross contamination between sampling events. The augers were also decontaminated (steam cleaned) between each boring.

Soil samples were field screened using a hand held organic vapor analyzer equipped with a photoionization detector (PID). Four soil samples from each boring (a total of 36 samples) were submitted to NEL Laboratories, a California-certified analytical laboratory, for analysis.

Soil samples were collected by a Fluor Daniel GTI site geologist under the supervision of a California Registered Geologist. Each sample was logged using the Unified Soil Classification System. In addition, field observations including color, moisture content, the presence or absence of hydrocarbon staining as well as odors were documented on a field log sheet.

Depending upon sample recovery, three soil-filled stainless steel sleeves were collected at 10-foot intervals. Of these three sleeves collected at each sampling point, the bottom sleeve was covered at each end with Teflon™ sheets and covered with plastic end caps. The selected samples were labeled with site name, date, time, and sample number. The samples were stored in plastic bags on ice in an ice chest until picked up by a NEL Laboratories courier who transported the samples, under chain-of-custody protocol, to NEL Laboratories, a California-certified laboratory, for analyses. The middle sleeve was screened for the presence of volatile organic vapors using a hand held PID in the following fashion:

> The soil sample was transferred into a ziplock baggie and sealed. The sealed baggie was then placed in the sun for a minimum of 5 minutes at which time the PID probe was inserted through a small opening made by separating the top seal. The highest PID reading was then written on the field log sheet.

The third and middle samples were used for field logging.

2.3 Groundwater Monitoring Well Installation and Sampling

2.3.1 Temporary Groundwater Well Completion

Upon completion of the soil boring, the borings were converted to temporary wells with 2-inch diameter, Schedule 40 PVC casing with threaded joints. The well screens consisted of 2-inch diameter, Schedule 40 PVC with 0.020-inch slots. Wells were screened based on field observations and conditions. Screened intervals were from 35 to 60 feet (WP-DEV-1), 45 to 70 feet (WP-265-1), and 75 to 100 feet (WP-276-1). Because the wells were temporary, a polyester filter sock was wrapped around the well screen in lieu of a sandpack. Upon completion, the temporary wells were allowed to stand a minimum of 24 hours prior to groundwater sample collection. The open boreholes were covered with plastic, then with plywood, and demarcated with traffic cones to avoid the possibility of surface contamination.

After groundwater sampling, the temporary wells were withdrawn, leaving no materials within the borings. The borings were then abandoned in accordance with state and local requirements. The borings were backfilled with bentonite grout upon removal of well materials. Soil cuttings generated during drilling were contained in 55-gallon drums on site pending chemical analytical results.

2.3.2 Groundwater Monitoring Well Completion

The fixed groundwater monitoring well (MW-31) was constructed in accordance with California State Monitoring Well guidelines. Monitoring well MW-31 was constructed to a depth of 70 feet bgs using an HSA drill rig, and completed with 2-inch diameter, Schedule 40 PVC casing with threaded joints, and 0.02-inch machine slotted screens. The screened interval extended from 45 feet to 70 feet below grade. Blank casing was installed from 45 feet bgs to the ground surface. Static groundwater was measured at 48.3 feet below grade using an interface probe.

The annular space extending from the bottom of the wells to 2 feet above the top of the screened interval (43 feet) was filled with Monterey Number 3 sand. The well was then surged to allow the sand pack to properly settle within the annular space. Sand was added as needed. A 2-foot thick seal of bentonite was then placed above the sand pack. The remaining annular space above the seal (41 feet to surface grade) was backfilled with neat cement/bentonite grout. A locking steel traffic box was placed around the PVC casing at the ground surface.

2.3.3 Groundwater Sample Collection Procedures

The following describes groundwater sampling procedures employed at the temporary and fixed groundwater monitoring wells.

Temporary Groundwater Monitoring Wells

Prior to sampling, the groundwater level was measured in each of the wells. Groundwater purging sampling was accomplished using a pre-cleaned peristaltic pump. During purging, key parameters including temperature, conductivity, and pH were measured with a portable electronic meter and recorded. Purging continued until the monitored parameters stabilized. Following purging, groundwater samples were collected with a Teflon™ bailer and discharged with a non-aerating, bottom-emptying device into sterilized glass VOC vials, capped with Teflon™ septa lids, and placed on ice in an ice chest for transport. Groundwater samples were transported to a State-certified analytical laboratory within 24 hours of collection. Groundwater samples were analyzed for VOCs using EPA Method 8260.

Fixed Groundwater Monitoring Wells

Prior to obtaining water samples, the fixed groundwater monitoring well was developed and purged of water. Approximately four well volumes of water were purged from the well and placed in DOT-approved steel 55-gallon drums. During purging, groundwater pH, temperature, specific conductivity and color were monitored and recorded. Purging continued until the monitored parameters stabilized. Following purging, groundwater samples were collected with a Teflon™ bailer and discharged with a non-aerating, bottom-emptying device into sterilized glass VOC vials, capped with Teflon™ septa lids, and placed on ice in an ice chest for transport. Groundwater samples were transported to a State-certified analytical laboratory within 24 hours of collection according to the April 1998 sampling and analysis work plan. Groundwater samples were analyzed for VOCs using EPA Method 8260.

2.4 Analytical Results for Soil Samples

On May 19 and 20, 1998, 30 soil samples were collected from the four soil borings used to construct the three temporary and one fixed groundwater monitoring wells. Soil samples were collected at 10-foot intervals in each soil boring. All soil samples were submitted to a California-certified analytical laboratory. However, as described in Section 2.2, a field OVA (PID) was used to screen soil samples for the potential presence of VOCs. Of the 30 soil samples collected, 16 were selected for laboratory chemical analyses, including soil samples collected at the maximum depth of each

boring, and samples with the highest OVA field measurements. The following soil samples were analyzed:

WP-265-1	WP-276-1	WP-DEV-1	MW-31
@10'	@10'	@10'	@10'
@40'	@20'	@40'	@20'
@50'	@40'	@50'	@40'
@70'	@50'	@60'	@70'

Summary tables of soil sample analytical results for temporary wells WP-265-1, WP-276-1, WP-DEV-1, and fixed well MW-31 are provided in Tables 2-1 through 2-4, respectively. Photocopies of laboratory summary reports are provided in Appendix B. Photocopies of field log notes, including OVA field measurements collected at each sample depth, are provided in Appendix C. With one exception, concentrations of VOCs in soil were below the reported analytical detection limits in samples collected from all four boring locations. The exception was the detection of trichlorofluoromethane (Freon 11) at a concentration of 7.2 μg/kg in soil sample WP-276-1@50' (Table 2-2).

2.5 Analytical Results for Groundwater Samples

On May 21 and 22, 1998, groundwater samples were collected from temporary groundwater monitoring wells WP-265-1, WP-276-1, and WP-DEV-1, and the fixed monitoring well MW-31. A summary of groundwater sample analytical results is provided in Table 2-5. Photocopies of laboratory summary reports are provided in Appendix B. For comparison, analytical results for a groundwater sample collected from groundwater monitoring well CM-10 is also summarized in Table 2-5. Groundwater monitoring well CM-10 was sampled May 12, 1998 as part of ongoing groundwater and remediation system monitoring performed at the former RMSC facility. Trichlorofluoromethane (Freon 11) was detected in groundwater samples collected from the temporary monitoring well WP-DEV-1 (23 μg/L) and the new fixed groundwater monitoring well MW-31 (150 μg/L).

The groundwater sample collected from groundwater monitoring well CM-10 on May 12, 1998 had a trichlorofluoromethane (Freon 11) concentration of 120 μg/L. No other VOC constituents targeted by EPA Method 8260 were encountered above reported analytical detection limits.

2.6 Analytical Results for Trip and Equipment Blanks (Water)

One trip blank was submitted for chemical analysis each day of soil and groundwater sampling. Laboratory prepared trip blank samples (TB-1, TB-2, and TB-4) were analyzed for VOCs using EPA Method 8260. VOC concentrations were below reported method detection limits in all of the trip blank samples referenced above. Photocopies of trip blank sample laboratory summary reports are provided in Appendix B.

Equipment blank samples were also collected during soil and groundwater sampling activities. Equipment blank samples EB-1, EB-2, and EB-4 were analyzed for VOCs using EPA Method 8260. VOC concentrations were below reported method detection limits in all of the equipment blank samples. Photocopies of equipment blank sample laboratory summary reports are provided in Appendix B.

3.0 QUALITY ASSURANCE/QUALITY CONTROL REVIEW

This section presents the quality assurance/quality control (QA/QC) procedures employed in both the field and the laboratory, and includes their respective results. These procedures were performed in accordance with the April 1998 sampling and analysis work plan.

3.1 Field QA/QC Procedures and Review

Field QA/QC samples were collected to document the accuracy and representativeness of the confirmation samples. They are discussed below.

3.1.1 Field Duplicate Samples

Field duplicate soil samples were collected at a frequency of 10 percent. Each field duplicate was obtained by collecting an additional sample from the same location and time as the original sample, with the same sampling procedures.

Duplicate soil samples were collected from temporary well location WP-276-1 at 50 feet below grade, and from temporary well location WP-DEV-1 at 40 feet below grade surface. The only VOC constituent detected in any of the paired original and duplicate soil samples was trichlorofluoromethane (Freon 11) in WP-276-1@50' (7.2 µg/kg and <5 µg/kg, respectively). The

relative percent difference (RPD) calculated for this sample pairing and constituent was 36 percent. The RPD for the remaining VOC constituents below detectable limits were not calculated.

3.1.2 Equipment Blank Samples

Equipment blank samples are organics-free water aliquots that are placed in contact with nondedicated sampling equipment (e.g., concrete chisel) after the equipment has been decontaminated. Analytical results from these samples are used to evaluate the integrity of the decontamination process and to identify possible cross-contamination of samples. A minimum of one equipment blank sample per day was collected where nondedicated sampling equipment was used. As indicated in Section 2.6, targeted constituents of concern were not detected in equipment blanks collected during sampling activities.

3.1.3 Trip Blank Samples

Trip blank samples are organics-free water aliquots used to evaluate the potential cross-contamination of samples that may occur during sample handling. The trip blank usually originates at the contract laboratory and accompanies the sample bottles to the site. Trip blank bottles and sample analyses are usually limited to 40-ml volatile organic analytes (VOAs). A minimum of one trip blank accompanied each cooler containing VOA samples. As indicated in Section 2.6, VOCs were not detected in trip blanks collected during sampling activities.

3.2 Laboratory QA/QC Procedures and Review

Laboratory QA/QC procedures included the following:

- Laboratory analyses were performed within the required holding times for all samples.
- Appropriate minimum detection limits were achieved for the selected analytical method.
- A state-certified analytical laboratory conducted the required analyses.
- The laboratory provided for each sample a signed laboratory report which included the sample designation, date of sample collection, date of sample analysis, laboratory analytical method employed, sample volume, and the minimum detection level.

- Surrogate spike recoveries in EPA Method 8240/8260 analyses were within acceptable ranges in all soil and groundwater samples.
- Matrix spike and matrix spike duplicate recoveries in EPA Method 8260 were within acceptable ranges.

4.0 SUMMARY

Sampling and analysis activities for the CM-10 area of concern have been implemented in accordance with the April 1998 work plan prepared for this assessment activity. Activities described in the work plan have been completed. Introductory, historical, and background information are provided in Section 1.0 of this report. Field observations and laboratory analytical results are summarized in Section 2.0 of this report. QA/QC procedures implemented during this site assessment are reviewed in Section 3.0 of this report. A summary of findings of these assessment activities is presented below.

- Geologic materials encountered during subsurface drilling consisted of unconsolidated fill, interbedded siltstone, shale, clayey siltstone, and clayey shale, with some interbedded diatomaceous shale.
- The depths to water in temporary groundwater wells WP-265-1, WP-276-1, and WP-DEV-1 were 44, 44.5, and 35.8 feet, respectively. The depth to water in fixed groundwater monitoring well MW-31 was 48.3 feet. Depths to groundwater are generally consistent with data of previous site assessments and ongoing groundwater monitoring and compliance sampling and analyses.
- A trace concentration of trichlorofluoromethane (Freon 11) was encountered in one soil sample collected from soil boring location WP-276-1, at 50 feet below grade surface. However, Freon 11 was not detected in a duplicate soil sample collected at the same location and depth. No other VOCs were detected in any of the soil samples submitted for chemical analyses using EPA Method 8260.
- Freon 11 was not detected above method detection limits in groundwater samples collected from temporary wells WP-265-1 and WP-276-1. These wells were positioned near Buildings 265 and 276, respectively, and near subsurface utilities (subsurface electrical conduit lines and a sewer main, respectively).
- Freon 11 was detected in groundwater samples collected from the temporary well WP-DEV-1, and fixed groundwater monitoring well MW-31 (23 μg/L and 150 μg/L, respectively). No other VOC constituents were detected. The primary maximum contaminant level (MCL) for Freon 11 is 150 μg/L (as promulgated in California's Safe Drinking Water Standard, Title 22 of California Code of Regulations [CCR], Division 4, Chapter 15). Based on concentrations of Freon 11 in WP-DEV-1 and

MW-31, and ongoing analytical data collected from groundwater monitoring well CM-10, Freon 11 concentrations in groundwater underlying the CM-10 area of concern are at, or below, the State MCL.

Based upon the findings of this and previous site assessment activities (ENSR, 1991; Groundwater Technology Inc., 1995 and 1995a; McLaren Hart 1989), the lateral extent of potential impacts to groundwater underlying the CM-10 area of concern has been defined. Installation of a groundwater monitoring well at what is believed to be the sole source area of Freon 11 impacts to groundwater shows groundwater concentrations at the State MCL for this constituent. Further, groundwater quality data collected from temporary wells indicate that Buildings 265 and 276 are not source areas contributing to Freon 11 impacts to groundwater. Finally, downgradient concentrations of Freon 11 in CM-10 and temporary well WP-DEV-1 are below the State MCL for Freon 11.

5.0 RECOMMENDATIONS

In the Corrective Action Plan Addendum (Groundwater Technology, Inc., 1994) issued for the former Hughes Missile Systems Company Facility, no remedial action was proposed for the CM-10 are of concern because Freon 11 concentrations were below the State Drinking Water Standard or Maximum Contaminant Level (MCL) for this constituent. Based on the findings of the current assessment and the observed continuing decline in Freon 11 concentrations over time, a course of action that consists of "Monitor Only" continues to be appropriate for the CM-10 area of concern. No additional subsurface soil or groundwater assessment activities are recommended at this time. Continued quarterly sampling and analysis of groundwater collected from MW-31 and CM-10 are recommended to confirm Freon 11 levels remain at or below State MCLs established for this compound. It is recommended that quarterly monitoring of these wells continue until samples from four consecutive quarters contain concentrations of Freon 11 less than State MCL and cleanup criteria of 150 μg/L.

Hillmann Project Number: C3-5451

Hillmann Consulting, LLC, is pleased to provide the results of our Phase I Environmental Site Assessment of the above referenced property. This assessment was performed in accordance with the scope and limitations of ASTM Practice E 1527-05.

This report is for the exclusive use of the law firm named on the front cover, its client; Brookfield Property Group, its prospective lenders, prospective bond holders and bond holders, and prospective future purchasers and purchasers of the property involved, as well as their attorneys and consultants, and no other party shall have any right to rely on any service provided by Hillmann Consulting, LLC, without prior written consent.

We appreciate the opportunity to provide environmental due diligence services. If you have any questions concerning this report, or if we can assist you in any other matter, please contact the Project Manager at 714-634-9500.

Very Truly Yours,
Hillmann Consulting, LLC

Kenneth A. Thornburgh, Ph.D.
Project Manager

David Rutherford
Director of Due Diligence

1.0 EXECUTIVE SUMMARY

At the request of Glaser, Weil, Flink, Jacobs, Howard, Avchen & Shapiro, LLP, Hillmann Consulting, LLC (Hillmann) performed a Phase I Environmental Site Assessment (ESA) of the Property located at 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue in Los Angeles, California (the Property). This assessment has been conducted utilizing generally accepted Phase I ESA industry standards in accordance with the ASTM Standard Practice E 1527-05 for Phase I Environmental Site Assessments.

1.1 Property Summary Table

A summary of the pertinent details of the project is provided below:

PROJECT SUMMARY TABLE					
Name of Client			Glaser, Weil, Flink, Jacobs, Howard, Avchen & Shapiro, LLP		
Client Project No.:			N/A		
Client Contact:			Mr. Gregory McClintock		
Description of Project			Phase I Environmental Site Assessment		
Property Name:			Corporate Point at West Hills		
Property Address:			8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue		
City:	Los Angeles	**County:**	Los Angeles		CA
Tax Map designation:		**APN**:	2005-002-009, 2005-022-001, 2005-022-002, 2005-022-003, 2005-022-004, 2005-022-005, 2005-022-006, 2005-002-011		
Property Area:			85.7 acres		
Building Area:			8401 – 160,741; 8403 – 38,795; 8407 – 82,815; 8411 – 11,021; 8413 – 30,271; 8501 – 160,681; 8511 – 133,720; 8521 – 160,498; 8531 – 98,397; 8415 – 17,100; 22801 – 106,190		
Assessor Designated Site Use:			Commercial		
Year Built:			8401 – 1959; 8403 – 1984; 8407 – 1984; 8411 – 2008; 8413 – 1984; 8501 – 1959; 8511 – 1999; 8521 – 1959; 8531 – 1974; 8415 – 1959; 22801 – 1999		
Property Owner:			MEPT West Hills, LLC		
Assessment Personnel:			Mr. Ryan Terwilliger		
Accompanied/Escorted By:			Patrick Teal – Lead Engineer		
Property Contact:			Ms. Erin Sullivan		
Inspection Date:			December 5 & 6, 2012		
Weather Conditions:			Clear, 64 degrees F		

1.2 Summary of Findings

The following table summarizes the individual sections of this assessment. This table, alone, does not constitute the complete assessment. The report must be reviewed in its entirety.

FINDINGS SUMMARY					
ASSESSMENT SECTION	ACCEPTABLE	O&M RECOM'D	REC	FURTHER ACTION/ PHASE II RECOM'D	REF. SECTION
Historical Review			X		5.0
Regulatory Review			X		8.0
Site Use	X				3.3/6.2
Hazardous Materials			X		6.3

Lead Paint		X		Compliance w/Applicable Regulations	7.2
Drinking Water	X				6.11
Radon	X				7.3
Mold	X				7.4
Adjoining/Surrounding Area	X				3.6/3.7/8.2

1.3 Conclusions

Hillmann has performed a Phase I Environmental Site Assessment in accordance with the scope and limitations of ASTM Practice E 1527-05 of the Property as described in Section 2 of this report. Any additions to, exceptions to, or deletions from this practice are also described in Section 2 of this report. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the Property, except for the following:

- The Property was developed in the late 1950's by Hughes Aircraft Company or an affiliated entity ("Hughes") to test missile defense systems and remained in operation until the mid-1990s. Hazardous substances and petroleum products were utilized on-site in association with the former missile defense system testing operations and resulted in the generation of USEPA RCRA regulated hazardous wastes. These activities resulted in

release(s) to the environmental that caused a subsurface impact to the Property. The releases at the site were discovered by investigations triggered by RCRA permitting at the Site in the late 1980's with the lead regulatory agency reported as the California Department of Toxic Substances Control (DTSC).

- Site investigation began in the early 1990's and all subsequent remediation procedures that have taken place on the Property have been well documented. Hughes and now Raytheon Company ("Raytheon"), its successor, have been responsible for all remediation on the property pursuant to a set of recorded remediation covenants that run with the land. Site investigations at the Property have identified thirteen Areas of Concern (AOCs) and seven Solid Waste Management Units (SWMUs) throughout the site.

- The most significant concern at the site is a plume of chlorinated solvent groundwater contamination located on the northwest corner of the site and which may extend slightly off-site to the north (the "northwest plume"). Groundwater remediation has been ongoing on the Property since 1995 when a Pump and Treat system was installed in the northwest area. The system was shut down in 2005 in favor of "in-situ" bio remediation groundwater treatments.

- Hillmann was informed by a property representative that Raytheon submitted a 2008 report package to the DTSC detailing remedial progress at the site and requesting closure for all AOCs and SWMUs except for groundwater. The request for closure by Raytheon was based on a summation of investigations and remedial actions as documented by the 2008 report. Hillmann was further informed by a property representative that the DTSC review of the submittal has been delayed within the agency; but that the DTSC has recently resumed its review of the package with a response expected within a few months. In the meantime, a Soil Management Plan ("SMP") had been established in 2008 voluntarily by Property management to facilitate site construction activities at the site as the need arose. The SMP has been approved by DTSC.

- Hillmann reviewed the most recently issued groundwater remediation and monitoring progress report dated November 15, 2012. That report has indicated that at least four "enhanced in-site bioremediation" (EISB) treatments have occurred since 2009, the latest having occurred in September 2012. Contaminant levels at the northwest plume have been trending downwards but remain above the site specific cleanup criteria (SPCC) of 60 ug/L VOCs set by the Regional Water Quality Control Board (RWQCB). Hillmann was informed by a property representative that, in his opinion, that the continuation of groundwater treatments and monitoring would be required for an additional few years before closure can be achieved; and that partial closure of other AOCs and SWMUs is expected sooner but also that some additional investigations and/or submittals may be requested by the DTSC.

Hillmann has also performed cursory evaluations for ASTM "Non-Scope" items, such as asbestos-containing materials (ACM), lead-based paint, radon and mold. Our observations and research did not identify any potential concerns, except for the following:

- Considering the original date of construction for some of the buildings (circa 1959), there is the potential for asbestos-containing materials in non-renovated areas at the Property. According to surveys performed on the Property the remaining ACM includes the Pipe TSI on the roofs of the older buildings. Additional quantities of ACM or suspect ACM may exist in enclosed areas, or areas not accessed during the assessment. It is emphasized that this limited screening does not constitute a comprehensive asbestos survey of the premises and is meant only to provide a cursory evaluation regarding the overall prevalence of ACM at the Property. Additional investigation and comprehensive testing of suspected ACM would be required to determine the presence or absence of ACM at the Property.

- Based on the date of building construction, lead based paint may be present at the Property. However, considering the non-residential occupancy, the potential presence of lead based paint is not considered to be a significant environmental concern at the Property at this time.

1.4 Recommendations

Based on information collected from the site investigation, record review, interviews and site reconnaissance, Hillmann makes the following recommendations:

- In general, it appears that Raytheon appears to be meeting its obligations as responsible party for the remediation. The progress of Raytheon should be monitored with regard to the completion of remedial actions in order to achieve regulatory closure for all AOCs and SWMUs. The Property owner should continue to cooperate with Raytheon in accordance with the reported access agreement to allow the necessary site access to conduct remedial actions. The property owner should request from Raytheon to be copied on all pertinent regulatory data and correspondences generated by the remedial activities at the site, as has been the case to date.

- The existing Soil Management Plan should continue to be adhered to by property management. In the event of transfer of ownership, the new owner should confirm to DTSC that it agrees to the terms and will comply with the Plan.

- Hillmann recommends suspect ACM at the Property should be managed in compliance with all applicable rules and regulations.

2.0 PURPOSE AND LIMITATIONS

2.1 Purpose and Scope

This assessment was conducted utilizing generally accepted Phase I ESA industry standards in accordance with the ASTM Standard Practice E 1527-05. The ASTM describes these methodologies as representing good commercial and customary practice for conducting an Environmental Site Assessment of a property for the purpose of identifying recognized environmental conditions.

The term *recognized environmental conditions (RECs)* is defined by the ASTM as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not *REC*s.

The chief components of this assessment are described as follows:

- Review and discussion of current Property conditions regarding the presence or absence of hazardous chemicals/petroleum products; generation, treatment, storage or disposal of hazardous, regulated or medical wastes; electrical equipment that utilizes oils which potentially contain PCBs; and bulk storage tanks (above or below ground).

- Review and discussion of the usage of adjacent and nearby properties to identify the potential for contamination (if present and/or suspected) to migrate onto the Property.

- Summary of physical characteristics of the Property through a review of available topographic, geologic and groundwater data.

- Research of the historic uses of the Property through a review of reasonably ascertainable standard sources, such as fire insurance maps, city directories, aerial photographs, prior reports and interviews.

- A regulatory review of federal and state environmental databases, and other local environmental records, within specific search distances defined by the ASTM.

These methodologies are described as representing good commercial and customary practice for conducting an Environmental Site Assessment of a property for the purpose of identifying recognized environmental conditions.

A cursory evaluation for the following "Non-ASTM" concerns, such as the following:

- ♦ Suspect Asbestos-containing Materials

- Lead-based Paint
- USEPA Designated Radon Potential
- Mold

2.2 Inaccessible Locations

Hillmann is unaware of any notable areas of the Property that were excluded from our visual inspection.

2.3 Limitations and Exceptions

Historic research data gaps are detailed in Section 5, if applicable. No other exceptions or deletions from the ASTM Standard E 1527-05 are reported.

2.4 Abbreviations/Acronyms

Hillmann may use the following abbreviations and acronyms for common terminology described in our report. Not all abbreviations or acronyms may be applicable to this report:

ACM – Asbestos-containing Material
AST – Aboveground Storage Tank
ASTM – American Standard for Testing Materials
FOIA – Freedom of Information Act
HVAC – Heating Ventilation & Air Conditioning
HREC – Historic Recognized Environmental Condition
IAQ – Indoor Air Quality
LBP – Lead-based Paint
LUST – Leaking Underground Storage Tank
MSDS – Material Safety Data Sheet
REC – Recognized Environmental Condition
UST – Underground Storage Tank

2.5 Special Terms and Conditions

Hillmann has prepared this Phase I Environmental Site Assessment using reasonable efforts in each phase of its work to identify recognized environmental conditions associated with hazardous substances, wastes and petroleum products at the Property. The methodology of this Phase I Environmental Site Assessment was consistent with the ASTM Standard Practice for E 1527-05. Findings within this report are based on information collected from observations made on the day of the site investigation and from reasonably ascertainable information obtained from governing public agencies and private sources.

This report is not definitive and should not be assumed to be a complete or specific definition of the conditions above or below grade. Information in this report is not intended to be used as a construction document and should not be used for demolition, renovation or other construction purposes. Hillmann makes no representation or warranty that the past or current

operations at the Property are, or have been, in compliance with all applicable federal, state and local laws, regulations and codes.
Findings, conclusions and recommendations presented in this report are based on our visual observations of the Property, the municipal research findings reasonably obtained, information provided by the Client, and/or a review of readily available and supplied drawings and documents. Hillmann relies completely on the information, whether written, graphic or verbal, provided by the subject Property contact(s) or as shown on any documents reviewed or received from the subject Property contact, owner or agent, or municipal source, and assumes that information to be true and correct. Although there may have been some degree of overlap in the information provided by these various sources, Hillmann did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this assessment.

Regardless of the findings stated in this report, Hillmann is not responsible for consequences or conditions arising from facts that were concealed, withheld or not fully disclosed at the time the assessment was conducted.

This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

The regulatory database report provided is based on an evaluation of the data collected and compiled by a contracted data research company. The report focuses on the Property and neighboring properties that could impact the Property. Neighboring properties listed in governmental environmental records are identified within specific search distances. The search distance varies depending upon the particular government record being checked. The regulatory research is designed to meet the requirements of ASTM Standard E 1527-05. The information provided in the regulatory database report is assumed to be correct and complete.

Subsurface conditions may differ from the conditions implied by the surface observations and can only be reliably evaluated through intrusive techniques.

Reasonable efforts have been made during this assessment to identify aboveground and underground storage tanks and ancillary equipment. “Reasonable efforts” are limited to information gained from visual observation of largely unobstructed areas, recorded database information held in public record and available information gathered from interviews. Such methods may not identify subsurface equipment that may have been hidden from view due to parked automobiles and other vehicles, snow cover, vegetative growth, pavement, construction or debris pile storage or incorrect information from sources.

Hillmann is not a professional title insurance firm and makes no guarantee, explicit or implied, that the records which were reviewed represent a comprehensive or precise delineation of past Property ownership or tenancy for legal purposes.

3.0 PROPERTY DESCRIPTION

3.1 Property Location

The Property is located at 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue and 22801 Roscoe Boulevard in Los Angeles, California. The legal designation of the Property is APN #2005-002-009, 2005-002-011, 2005-022-001, 2005-022-002, 2005-022-003, 2005-022-004, 2005-022-005, and 2005-022-006. The latitude and longitude of the Property is approximately north 34.2216 degrees, and west 118.6235 degrees.

3.2 Site and Vicinity Characteristics

The Property consists of eleven commercial buildings with the following addresses and square footages: 8401 Fallbrook – 160,741 ft^2; 8403 Fallbrook – 38,795 ft^2; 8407 Fallbrook – 82,815 ft^2; 8411 Fallbrook – 11,021 ft^2; 8413 Fallbrook – 30,271 ft^2; 8501 Fallbrook – 160,681 ft^2; 8511 Fallbrook – 133,720 ft^2; 8521 Fallbrook – 160,498 ft^2; 8531 Fallbrook – 98,397 ft^2; 8415 Fallbrook – 17,100 ft^2; 22801 Roscoe – 106,190 ft^2; and located on the northwest corner of Roscoe Boulevard and Fallbrook Avenue. The Property covers an approximate land area of approximately 85.7-acres. The main entry drives onto the Property are from Roscoe Blvd. at the south end and Fallbrook Ave on the east side of the Property. The Property is located in an area characterized by residential and commercial uses. An empty reservoir owned by the county of Los Angeles is located to the north of the Property.

3.3 Current Use of the Property

The Property consists of eleven (11) commercial buildings occupied by various tenants for primarily office purposes with the exception of Quest diagnostics which runs a medical laboratory in 8401 and 8403. A full rent roll is included in Appendix D.

3.4 Description of Property Improvements

The Property development includes eleven (11) commercial structures that provide a combined space of approximately 1,000,229-ft^2. The buildings on-site include:

8401 - is a concrete reinforced structure (type 1 construction), has a built-up roof, and was built in 1959. The building was renovated in 2005. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

8403 - is a butler building with steel frame and concrete deck. (type 4 construction). It has a butler roof, and was built in 1984. The building was renovated in 1999 & 2008. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

8407 - is a butler building with steel frame and concrete deck. It has a butler roof, and was built in 1984. The building was renovated in 1999 & 2008. Interior finishes include painted drywall,

vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.
8411 - is a butler building with steel frame and concrete deck. It has a butler roof, and was built in 2008. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

8413 - is a butler building with steel frame and concrete deck. It has a butler roof, and was built in 1984. The building was renovated in 2009 & 2012. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

8501 - is a concrete reinforced structure, has a built-up roof, and was built in 1959. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

8511 - is a concrete reinforced structure, has a built-up roof, and was built in 1999. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

8521 - is a concrete reinforced structure, has a built-up roof, and was built in 1959. The building was renovated in 1998. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

8531 - is a concrete reinforced structure, has a built-up roof, and was built in 1974. The building was renovated in 1998. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

8415 (plant) - is a concrete poured in place structure, has a built-up roof, and was built in 1959. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

22801 - is a steel structure with pre-cast concrete metal façade, has a built-up roof, and was built in 1999. Interior finishes include painted drywall, vinyl flooring, and drop-in ceiling tile. Windows and entry doors are double-pane aluminum systems.

3.5 Utilities/Source of Heating

The various buildings are reported to be heated/cooled by electric powered package units located on the roof of the building.

According to information provided by property management, utility providers that service the subject Property are summarized as follows:

Utility	Provider
Electric	Los Angeles County Department of Water and Power
Natural Gas	Southern California Gas Company
Water	Los Angeles County Department of Water and Power

Sewer	Los Angeles County Sanitation District

3.6 Current Uses of the Adjoining Properties

The following describes adjacent and abutting properties to the Property at issue:

DIRECTION	DESCRIPTION
North	County of Los Angeles Reservoir
East	(Fallbrook Ave.) Recreational area owned by Boeing and residential properties
South	(Roscoe Blvd.) Residential properties
West	Residential Properties and an office building housing a Los Angeles police call center

No visual evidence of any impacts from the adjoining properties was observed.

3.7 Surrounding Area

The vicinity of the Property, which is located in in Los Angeles, California is characterized by a mix of commercial and residential properties with a dry reservoir to the north.

3.8 Physical Setting

3.8.1 Topography

According to the United States Geological Survey (USGS) 7.5-Minute Series Topographic Map, Canoga Park, CA Quadrangle (1967), the Property is located at approximately 848 feet above mean sea level. The topographic gradient at the Property is slopes in a general southeast direction. Copies of the topographic maps are included in Appendix C.

3.8.2 Soils

Based on the United States Department of Agriculture - Soil Conservation Service data, soils at the Property are classified as "Anacapa". This soil has a texture of sandy loam and is well drained with moderate infiltration rates.

3.8.3 Geology

According to the EDR Geo-Check report, the bedrock geologic formation in the area within the vicinity of the Property is identified to be Stratified Sequence of the Mesozoic Era.

3.8.4 Hydrology

Based on the drainage/topography, groundwater is believed to flow to the southeast.

Groundwater levels and/or flow direction(s) may vary due to seasonal fluctuations in precipitation, local usage demands, geology, underground structures or dewatering operations.

Based on the U.S. Fish & Wildlife Service's National Wetlands Inventory, wetlands are not suspected to be present on the Property.

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) covering the area of the Property, the Property is located outside of the 100 and 500 year flood zones.

4.0 USER PROVIDED INFORMATION

4.1 Title Records/Environmental Liens/Activity and Use Limitations

Review of title records is not included in the scope of work for this assessment project. No information regarding environmental liens or activity and use limitations was provided to Hillmann by the Client.

4.2 Specialized Knowledge or Experience

Hillmann was provided with reports and other documentation regarding an on-going site remediation case being overseen by the DTSC and LAWQCB, as detailed throughout this report. No other indication of any specialized knowledge or experience regarding the Property was reported to Hillmann by the Client.

4.3 Commonly Known or Reasonably Ascertainable Information

No commonly known or reasonably ascertainable knowledge of the Property was reported to Hillmann by the Client.

4.4 Property Value Reduction due to Environmental Conditions

No information was provided by the Client to Hillmann regarding a reduction of the Property value due to environmental problems or conditions.

4.5 Reason for Performing Phase I ESA

It is Hillmann's understanding that the Phase I ESA was being performed in conjunction with a pending real estate or bank financing transaction involving the Property.

5.0 HISTORICAL USE RESEARCH

5.1 Sanborn Fire Insurance Maps

Fire insurance maps were created for insurance underwriters and often contain information regarding the uses of individual structures, and the locations of fuel and/or chemical storage tanks that may have been on a particular property. These maps were generally prepared for urban areas beginning in the middle to late 1880s and continuing generally into the 2000s.

A search of Sanborn Fire Insurance Maps for the Property and surrounding area was conducted by Environmental Data Resources, Inc. (EDR) of Milford, Connecticut. EDR provided a Sanborn report that stated fire insurance maps covering the Property were not found.

5.2 Historic City Directories

A search of City Directories for the Property and surrounding area was conducted by EDR. The City Directory Abstract report provided data from directories dated 1920 through 2012 in approximately one to five year intervals. The following pertinent details were obtained from review of the city directories listings:

8401 FALLBROOK AVE:

Year	Uses	Source
2012	QUEST DIAGNOSTICS	Cole Information Services
2007	QUEST DIAGNOSTICS	Cole Information Services

8407 FALLBROOK AVE:

5.3 Historical Topographic Map Review

A search of historical topographic maps for the Property was conducted by EDR. Topographic maps of the Property and vicinity for the years 1903, 1910, 1927, 1940, 1947, 1952 and 1967 were provided for review. The following pertinent details were obtained from review of the topographic maps:

YEAR(S)	DESCRIPTION	
1903-1910	**Property**	The scale of the map is too large to discern specific details about the Property
	Adjacent Properties	The scale of the map is too large to discern specific details about the adjacent properties.
1927-1947	**Property**	The Property appears to be undeveloped.

	Adjacent Properties	The majority of the adjacent properties appear to be undeveloped. Structures are depicted to the northeast of the Property across Fallbrook Avenue, which is depicted as an unpaved road. The Chatsworth Reservoir is visible north of the Property and Roscoe Boulevard is visible to the south.
1952	**Property**	The Property appears to be developed with a single structure. An access road for the structure appears to be present on the Property running in an east-west direction from Fallbrook Avenue.
	Adjacent Properties	The visible portions of the adjacent properties to the south and east appear to be undeveloped. Three structures are depicted to the northeast of the Property across Fallbrook Avenue, which is now depicted as a paved road.
1967	**Property**	The map only shows the eastern portion of the Property. The visible areas appear to be developed with large structures and access roads
	Adjacent Properties	The visible portion of the adjacent property to the south appears to be developed with access roads; however no structures are depicted on the visible area of the property. Several structures are depicted to the northeast of the Property across Fallbrook Avenue, and the area to the east across Fallbrook Avenue is shaded to denote general urban development.

5.4 Aerial Photograph Review

A search of Aerial Photographs for the Property and surrounding area was conducted by EDR. EDR provided an Aerial Photography report of several historic photographs of the Property area from the years 1928, 1938, 1947, 1956, 1965, 1976, 1989, 1994 and 2005. The following pertinent details were obtained from review of the report:

YEAR(S)	DESCRIPTION	
1928	**Property**	The Property appears to be cleared vacant land.
	Adjacent Properties	The adjacent property to the north is the Chatsworth Reservoir and Nature Preserve. The property to the northeast appears to be developed with a few scattered structures. The adjacent properties to the south and east appear to be agricultural land. The adjacent property to the west is not visible.
1938	**Property**	The Property appears to be cleared land. Hidden Lake road is visible around the perimeter of the Property. Two other roads appear on the Property.
	Adjacent Properties	The adjacent property to the north is the Chatsworth Reservoir and Nature Preserve. The property to the northeast appears to have undergone further development, but appears to still be used for primarily agricultural purposes. The adjacent properties to the south and east appear to remain agricultural land. Fallbrook Avenue is visible to the east of the Property. The adjacent property to the west is not visible.
1947	**Property**	The Property appears to be developed for agricultural use. Several structures are present starting in the 1956 photo. Hidden Lake road is visible around the perimeter of the Property.
	Adjacent Properties	The adjacent property to the north is the Chatsworth Reservoir and Nature Preserve. The properties to the northeast, south, and east are developed for agricultural use with some structures present. The adjacent property to the west is not visible in the 1947 photo, but appears to be undeveloped wooded land in 1956.
1965-1994	**Property**	The Property is developed with several large structures.

	Adjacent Properties	The adjacent property to the north is the Chatsworth Reservoir and Nature Preserve. The properties to the northeast appear developed for agricultural use with some structures present. The properties to the east are developed into a residential subdivision. The properties to the south appear to be developed with residential structures. The adjacent property to the west appears to be undeveloped wooded land in the 1965 photo, but appears to be a residential subdivision in the 1976, 1989, and 1995 images.
2005	**Property**	The Property is developed with several large structures, however some of the structures in the north have been demolished and one structure in the south portion of the Property has been constructed.
	Adjacent Properties	The adjacent property to the north is the Chatsworth Reservoir and Nature Preserve. The properties to the northeast appear developed for recreational use with some structures present. The properties to the east are developed into a residential subdivision. The property to the south appears undeveloped. The adjacent property to the west appears to be developed with a residential subdivision.

5.5 Prior Investigation Reports

Several previous investigation reports for the Property were provided to Hillmann for review. The most relevant reports are discussed below:

Enhanced In Situ Bioremediation and In Situ Chemical Reduction Progress Report Third Quarter 2012, Former Canoga Park Facility 8433 Fallbrook Avenue, Canoga Park, California prepared by OTIE dated November 15, 2012. The following is a summary of the Report:

- "A groundwater remediation program has been underway at the Site since 1995 to progress towards achieving cleanup criteria established in the Corrective Action Plan (CAP) for the Site (60 micrograms per liter [µg/L] for 1,1-DCE). The LARWQCB is the lead oversight agency for the remediation activities at the Site (LARWQCB File No. 94-45)."
- PHASE IV EISB SUMMARY – NORTHWEST AREA
  In October 2009, the Phase IV EISB injections were implemented in the "Northwest Area" of the Site. A total of four RPM wells were included in the M&RP for CI-8947, and eight post-injection monitoring events have been completed since the injections. No EISB-related activities were performed in the Northwest Area during the third quarter of 2012.
- PHASE V ISCR SUMMARY – FORMER HWSA
  In June 2010, the Phase V ISCR injections were implemented in the former HWSA. A total of six RPM wells were included in the M&RP for CI-8947 and seven post-injection monitoring events have been completed. No ISCR-related activities were performed at the Former HWSA during the third quarter of 2012.
- PHASE VI EISB SUMMARY – FORMER BLDG 269 AREA
  In May 2011, the Phase VI EISB injections were implemented in the Former Bldg 269 Area of the Site. A total of three RPM wells were included in the M&RP for CI-8947 and five post injection monitoring events have been completed since the injections. No EISB-related activities were performed in the Former Bldg 269 Area during the third quarter of 2012.
- PHASE VII EISB – FORMER TANK T3 AREA
  In September 2012, the Phase VII EISB injections were implemented in the Former Tank T3 Area of the Site. A total of three RPM wells were included in the M&RP for CI-8947

and one monitoring event was completed prior to the injections. EISB-related activities performed at the
Former Tank T3 Area during the third quarter of 2012 are summarized below:

- Injection wells (IP-02 through IP-06) were installed and developed in September 2012.
- The baseline groundwater sampling event was conducted prior to the start of the injections in accordance with the M&RP. Groundwater levels were gauged and samples collected on September 18, 2012.
- Static depth to water measurements were 25.62 feet btoc (RW-11) and 27.82 feet btoc (RW-14) on September 18, 2012.
- TCE was detected in upgradient well RW-15 at a concentration of 7.7 µg/L and in treatment well RW-14 at 2.8 µg/L.
- 1,1-DCE concentrations ranged from 41 µg/L (upgradient RW-15) to 190 µg/L at well RW-14 in the treatment area.
- VC was detected in injection area well RW-14 at a concentration of 54 µg/L. The VC concentrations are an intermediate daughter product, resulting from the EISB dechlorination process and are anticipated to eventually dissipate as further treatment is completed.
- VFAs were not detected in any well during the baseline event.
- Methane was detected in all three RPM wells at concentrations ranging from 17 µg/L in well RW-11 to 465 µg/L in well RW-14.
- CO2 concentrations ranged from 35.3 mg/L (well RW-15) to 59.3 mg/L (well RW-14).
- No ethane or ethene were detected in RPM wells above the reporting limit of 1.0 µg/L during the baseline.
- Subsurface injections of EVO were performed using a portable injection system between September 24 and 27, 2012.
- A combined total of 550 gallons of EVO substrate and 10,840 gallons of treated groundwater were injected in the Former Tank T3 area via the five new injection wells and two sparge wells in September 2012.

1,1 DCE concentrations are still present in excess of the 60 µg/L limit set by the RWQCB. Based on these results remediation will need to continue until levels reach the designated limits.

<u>RCRA Facility Assessment Hughes Missile Systems Company Canoga Park Facility (Raytheon) Epa Id – CAD041162124</u> Prepared by DTSC on January 30th, 2008. The following is a summary of the report:

The DTSC outlined the past work completed on the Property and identified the solid waste management units and areas of concern within the Property. It then went on to further summarize the actions that have been completed in each SWMU and AOC. The recommendations for further action outlined in the report are provided below:

• Continue Groundwater Remediation

• Determine data gaps to developing a site wide heath risk assessment using the current DTSC-modified model. A site conceptual model needs to be developed to address all exposure routes.

• Collect samples needed to fill in the data gaps.

• Complete a soil vapor survey using old and new data as appropriate to model vapor intrusion. This work is to be in accordance with the Department's publications: GUIDANCE FOR THE EVALUATION AND MITIGATION OF SUBSURFACE VAPOR INTRUSION TO INDOOR AIR and ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS. As these documents are undergoing revision it is important that this investigation be done with close coordination with the project manager.

• Prepare site wide HRA for all modes of exposure to define remediation goals acceptable to DTSC.

• Modify remediation effort as required to meet the DTSC remediation goals or existing CAP goals whichever is the more stringent.

Phase I Environmental Site Assessment, Coast Westhills Property 8433 Fallbrook Avenue, Lot B, Canoga Park, California Prepared by Geocon dated February 1999.

The report found that a long history of environmental impacts and subsequent remediation was present at the site. It found that Raytheon had complied with all of DTSC's and RWQCB's recommendations while conducting the remediation onsite. The report recommended that indoor air monitoring for VOC's be conducted in the interior of buildings, the current groundwater remediation on the Property be continued, and communication with the DTSC and Raytheon regarding the current status of the remediation efforts remain open.

Soil Management Plan Corporate Point at West Hills, 8413 Fallbrook Avenue, West Hills California. Prepared by Environ International Corporation dated March 2008.

The SMP was prepared to describe, in general, what procedures will be employed to monitor and mitigate dust and to address areas of previously unidentified impacted soils that may be discovered during redevelopment of the site. Principle requirements of the SMP include the following. Site monitoring for VOC vapors will be conducted during those activities which directly uncover or disturb ground surfaces for the first time and in the event the contractor discovers soil that is visibly stained, discolored, oily, or has a noticeable solvent-like or hydrocarbon odor. A health and safety plan will be prepared for the entire site which must be followed when working with or disturbing subgrade soils. Perimeter dust monitoring will take place during work activities and should visibly stained soil be found it will be collected and analyzed for VOC's and TPH and if necessary SVOCs and Metals. A completion report will be prepared at the end of each project. Neal Holdridge of Trammel Crow indicated that he was not aware of any finding of elevated contaminant levels in soils by SMP required monitoring during redevelopment related activities at the Property.

5.6 Interviews

Hillmann interviewed Mr. Neal Holdridge, Environmental Consultant from Trammell Crow, the property owner's agent over the phone. Mr. Holdridge stated he has been involved with the environmental issues associated with the site for over 10 years. He stated that the Property was developed in the 1960's by Hughes to test missile guidance systems and remained active until

the mid-1990's when Raytheon bought them out. In the late 1980's releases were reported from two RCRA units (A waste UST and Hazardous Waste Storage Area) in the northwest portion of the Property. The primary pollutant of concern was discovered to be 1,1 DCE. This lead to several areas of concern that were detailed by the DTSC. In the 1990s a pump and treat system was installed in the northwest portion of the property, where contamination had impacted groundwater. In 2005 the pump and treat system was shut down due to low levels of contamination found in monitoring wells installed throughout the Property. Currently "enhanced in-situ bioremediation (EISB) is being used to treat the remainder of the contamination. According to Mr. Holdridge a site specific cleanup goal level of 60 ug/L VOCs was agreed upon with the RWQCB and the DTSC with regards to the remediation of the groundwater. A soil management plan (SMP) was also designed once the DTSC designated the Areas of Concern (AOC) on the Property. The SMP applies to any subsurface work that is conducted in the area of an AOC or a Solid Waste Management Unit (SWMU). According to Mr. Holdridge, there have never been any contaminates found in the soil when tested in accordance with the SMP. Mr. Holdridge also stated that in 2008 Raytheon submitted a document in response to a "RCRA Facility Assessment (RFA) Questionnaire Request" from the DTSC that requested closure of all AOC's and SWMUs other than the NW groundwater plume. He stated that delays in acting on the request by DTSC were due to the changing of case managers but the agency is now reviewing the file. An environmental questionnaire was provided to the seller through Mr. Holdridge. To date there has been no response to the questionnaire.

5.7 Summary and Conclusion of Historic Use Research

The Property was originally developed in the 1960's with several large buildings with the purpose of testing missile defense systems, testing which remained active until the mid-1990s. In the late 1980's it was discovered that contamination was present in the subsurface soil and water at the Property. This contamination has been actively undergoing remediation by Raytheon with regulatory oversight by the DTSC and the RWQCB since the mid-1990s. In 1999 the property was subdivided into four different parcels and redeveloped as an office park. During that redevelopment some of the buildings were demolished or renovated and some new buildings were constructed Between 2000 and 2008 more of the original buildings were demolished or renovated and one new building was constructed, resulting in the Property's current configuration.

5.8 Data Gaps

It is Hillmann's opinion that no significant data gaps were encountered with regard to the review of historical records for the Property.

6.0 SITE RECONNAISSANCE/INTERVIEWS

6.1 Interviews

Hillmann was accompanied onsite by Mr. Patrick Teal, lead engineer, during the site reconnaissance. Any pertinent information obtained is referenced in the appropriate sections of this report.

6.2 Property Use

The Property development includes eleven (11) commercial structures that provide a combined space of approximately 1,000,229 ft2. Currently the Property is used by several tenants as office buildings with the exception of Quest Diagnostics in 8401 and 8403. Quest diagnostics operates a medical laboratory which tests and analyzes human tissue and fluid specimens.

6.3 Hazardous Substance/Petroleum Products Storage/Handling

Storage of hazardous substances was identified on the Property in building 8401 operated by Quest diagnostics. Such storage included various laboratory chemicals and medical wastes in special sealed secondary containment chambers. No evidence of any spills or releases was observed during the site reconnaissance.

6.4 Waste Generation, Storage and Disposal

No evidence of improper or illegal waste disposal was observed visually during the site reconnaissance. Quest diagnostics in 8401 participates in hazardous waste generation and disposal of laboratory chemical waste and medical waste which is reported to be disposed of by Stericycle on a regular basis.

6.5 Waste Discharges

Sanitary sewage generated on-site is discharged into the Los Angeles County Sanitation District sewer system. Storm water is discharged into the Los Angeles County Sanitation District storm water system. No industrial or process waste discharges were identified at the Property.

6.6 Underground/Above Ground Storage Tanks

There is a 2,500 gallon Grease Trap located adjacent to the south side of building 8411 (The Café) on the Property. It is emptied by Alpha Pumping with the latest service call in July of 2012. Considering the content, kitchen grease traps are not considered to be significant environmental concerns.

There are two diesel AST's (500-gallons at 8521 and 250-gallons at 8511) associated with the two emergency generators operated by the Property owner's leasing and management agent on the Property and there are two additional AST's (1,200-gallons and 4,200-gallons) owned and operated by Quest Diagnostics associated with their emergency generators. No spills or

staining were observed with regards to the AST's. No evidence of any reported spills or releases associated with the active ASTs was found during the assessment.

Database listings reflecting historical USTs at the Property associated with the prior Hughes Missile Testing facility are discussed further in Section 8.1.

6.7 Polychlorinated Biphenyls (PCBs)

Several dry style power transformers were located on the Property and a large power transfer station with multiple transformers was located adjacent to the plant in the center of the Property. The transformers were not labeled as to PCB content and are owned and operated by the Los Angeles County Department of Water and Power. No staining or evidence of a release was observed around transformers at the Property at the time of the assessment.

6.8 Drains/Sumps

No interior floor drains or sumps were noted at the Property. However there are two below grade pumping rooms associated with the water features on the Property.

6.9 Exterior Pits/Ponds/Lagoons

No evidence of exterior pits, ponds or lagoons was identified on the Property in connection with waste treatment or disposal. There are two water features located on the Property. A central pond and a manmade waterfall by the café area are located on the Property.

6.10 Stained Soil, Pavement/Stressed Vegetation

No evidence of stained soils or stressed vegetation was identified on the Property.

6.11 Drinking Water/Wells/Septic Systems

Potable water is provided to the Property by the Los Angeles County Department of Water and Power. No evidence of water wells or septic systems was identified at the Property. There are several groundwater monitoring wells on the Property associated with the ongoing remediation operations.

7.0 NON-ASTM SCOPE CONCERNS

7.1 Asbestos-Containing Material (ACM)

Considering the original date of construction for some of the buildings (circa 1959), there is the potential for asbestos-containing materials in non-renovated areas at the Property. According to surveys performed on the Property the buildings were substantially refurbished in 1999 and the remaining ACM includes the Pipe TSI on the roofs of the older buildings. Additional quantities of ACM or suspect ACM may exist in enclosed areas, or areas not accessed during the assessment. It is emphasized that this limited screening does not constitute a comprehensive asbestos survey of the premises and is meant only to provide a cursory evaluation regarding the overall prevalence of ACM at the Property. Additional investigation and comprehensive testing of suspected ACM would be required to determine the presence or absence of ACM at the Property.

7.2 Lead-Based Paint

Considering the date of construction, lead-based paint may be present at the Property. However, due to the non-residential usage of the Property, lead-based paint is not considered to be a significant environmental concern. In addition, the site was substantially refurbished in 1999 which lessens the potential for lead based paint at the Property. No further investigation is recommended at this time.

7.3 Radon

Radon is a naturally occurring, colorless, odorless gas that is a byproduct of the decay of radioactive materials potentially present in bedrock and soil. Radon gas may enter the lowest level of a building through floor cracks, structural joints or plumbing conduits. The United States Environmental Protection Agency (USEPA) guidance level for annual residential exposure to radon is 4.0 picocuries per liter of air (pCi/L). The guidance level is not a regulatory requirement for private owners of commercial real estate, but is commonly used for comparison purposes to suggest whether further action at a building may be prudent.

Based on information obtained from data possessed by the USEPA, the Property is located in an area with a moderate potential for radon concentrations that exceed current USEPA action guidelines. The County of Los Angeles is classified as Zone 2, or 'moderate risk' area for radon.

According to the Regional Water Quality Control Board (RWQCB), groundwater testing for radioactivity with regards to historical operations at the Property was performed in 1991 and 2009. According to a "No Further Action" Letter from the RWQCB, it was determined that any radioactivity found in the groundwater was from naturally occurring sources and not past site usage. They determined that no further analyses were required.

7.4 Mold

While a comprehensive inspection for the presence of mold and/or microbial growth is beyond the scope of this assessment, Hillmann conducted a cursory screening for evidence of excessive or amplified mold growth, or for conditions favorable for mold growth. No evidence of significant mold growth was identified at the Property in the accessed areas during the cursory screening.

8.0 REGULATORY RECORD REVIEWS

A search of environmental regulatory databases, by Environmental Data Resources of Milford, CT, was conducted in accordance with the requirements of the ASTM. Hillmann also reviewed the "unmappable" listings within the database report, cross-referencing available address information and facility names. Unmappable sites are listings that cannot be plotted with confidence, but are identified as being located within the general area of the Property based on the partial street address, city name or zip code. In general, such a listing cannot be mapped due to inaccurate or incomplete address information in the database that was supplied by the corresponding regulatory agency. Any listings from the unmappable summary that were identified by Hillmann as a result of the area reconnaissance and/or cross-referencing to mapped listings are included in the corresponding database discussion within this section.

REGULATORY DATABASE	SEARCH DISTANCE	ON-SITE LISTINGS	ADJ. PROPERTY LISTINGS	TOTAL WITHIN SEARCH DISTANCE
Fed. NPL	1-mile	0	0	0
Fed. Delisted NPL	½-mile	0	0	0

- *The results of the review for each database are discussed below. The locations for the facilities discussed in this section are shown on the figures in the EDR report, included as Appendix E.*

- *According to the EPA Policy Toward Owners of Property Containing Contaminated Aquifers, dated July 3, 1995, the EPA will not take enforcement action against a property owner who owns property under which is an aquifer contaminated by subsurface migration from an off-site source or sources.*

8.1 On-Site Database Listings

The Property is listed on the CERCLIS-NFRAP database (The EPA database of archived sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that the EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time) as Hughes Missile Systems Co located at 8433 Fallbrook Avenue. The description for the site is listed as "RCRA Deferral – Lead Confirmed". The records show the site was deferred to the RCRA under Subtitle C in 1991 and then archived in 1996.

The Property is listed on the RCRA CORRACTS database(A list of hazardous waste treatment, storage or disposal facilities and other RCRIS facilities (due to past interim status or storage of hazardous waste beyond 90 days) that have been notified by the US EPA to undertake corrective action under RCRA) as Hughes Missile Systems Co located at 8433 Fallbrook Avenue in relation to its use in the manufacturing of guided missile and space vehicle parts and equipment.

The Property is listed on the RCRA TSDF (Facilities listed under TSD are sites that treat, store, and/or dispose of EPA regulated hazardous waste) and Small Quantity Generators (SQG) database as Hughes Missile Systems Co located at 8433 Fallbrook Avenue. Several violations were listed on the database; however, the site is shown as having achieved compliance for all violations listed.

The Property is listed on the RCRA Large Quantity Generators (LQG) database as Quest Diagnostics located at 8401 and 8403 Fallbrook Avenue. Multiple substances were included on the listing; however, no violations were found for the site.

The Property is listed on the RCRA SQG database as The Boeing Co - Canoga Park located at 8521 and 8531 Fallbrook Avenue. Multiple substances were included on the listing; however, no violations were listed for the site.

The Property is listed on the ENVIROSTOR database (The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further) as Hughes Missile Systems Co located at 8433 Fallbrook Avenue. The ENVIROSTOR database lists the site as a Corrective Action site, and lists the site's status as "Active" as of 2009.

The Property is listed on the LUST database as Hughes Missile Systems Co located at 8433 Fallbrook Avenue. The LUST status is shown as "Remedial action (cleanup) Underway" and indicates the site is undergoing quarterly monitoring of the groundwater.

The Property is listed on the SLIC database (The SLIC (Spills, Leaks, Investigations and Cleanup) program is designed to protect and restore water quality from spills, leaks, and similar discharges) as Hughes Missile Systems Co located at 8433 Fallbrook Avenue. The SLIC database lists the site's status as "Open - Remediation" as of 1992 and 2002.

The Property is listed on the HAZNET database (Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC) Quest Diagnostics Inc. located at 8401 Fallbrook Avenue for the years 2007-2011, and as The Boeing Co - Canoga Park located at 8521 and 8531 Fallbrook Avenue for the years 1999, 2004, 2007, and 2010.

The Property is listed on the FINDS database (Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail) as Quest Diagnostics located at 8401 Fallbrook Avenue and Hughes Missile Systems Co located at 8433 Fallbrook Avenue.

The Property is listed on the NEPDES (National Pollutant Discharge Elimination System) database as Hughes Missile Systems Co located at 8433 Fallbrook Avenue. The NPDES database lists the site's status as "Terminated" as of 2010.

The Property is listed on the CORTESE database (Hazardous Waste & Substances Sites List
The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites) as Hughes Missile Systems Co located at 8433 Fallbrook Avenue.

The Property is listed on the HWP (EnviroStor Permitted Facilities Listing), Activities, Closure, and Alias databases as Hughes Missile Systems Co located at 8433 Fallbrook Avenue. The facility type on these databases is listed as "Historical – Non-Operating".

The Property is listed on the CA Financial Assurance 1 and US FIN ASSUR databases as Hughes Missile Systems Co located at 8433 Fallbrook Avenue.

The Property is listed on the HIST UST database as Missile Systems Group located at 8433 Fallbrook Avenue. The HIST UST database lists 14 tanks of various sizes that were installed between 1959 and 1980.

The Property is listed on the EMI database (Emissions Inventory Data - Toxics and criteria pollutant emissions data collected by the ARB and local air pollution agencies) as Missile Systems Group located at 8433 Fallbrook Avenue for the years 1987, 1990, 1993, and 1995-2001.

Additional discussion of the active regulatory cases involving the Property was included in Section 5 of this report.

8.2 Adjoining Property Database Listings

Chatsworth Reservoir at 8600 Fallbrook Avenue, adjacent to the north of the Property, was identified on the CA FID UST and SWEEPS UST databases.

Rockwell AID/C at 8500 Fallbrook Avenue, adjacent to the northwest of the Property, was identified on the CA FID UST (The Facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resource

Control Board), SWEEPS UST (Statewide Environmental Evaluation and Planning System), and HAZNET databases. This site was also listed as Rockwell AID on the RCRA SQG and FINDS databases. The RCRA SQG database states that no violations were found for this site and is not considered to be recognized environmental conditions.

8.3 Federal Agency Record Review

EPA - The National Priorities List (NPL), also known as the Superfund list, is the United States Environmental Protection Agency (EPA) listing of uncontrolled or abandoned hazardous waste sites. These sites are targeted for possible long-term remedial action under the Superfund Act of 1980. The list is primarily based on the EPA's Hazardous Ranking System.

- No NPL listings were identified within a one-mile radius of the subject property.

EPA – Delisted NPL Site List (DNPL) provides a list of sites formerly listed on the NPL that have since been "de-listed" after the EPA has determined that no further response is appropriate.

- No DNPL listings were identified within a ½-mile radius of the Property.

EPA - The Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) is the EPA database of known or suspected uncontrolled or abandoned hazardous waste sites. These sites have either been investigated, or are currently under investigation by the EPA for the release or threatened release of hazardous substances.

- No CERCLIS listings were identified within a ½-mile radius of the Property.

EPA – CERCLIS-NFRAP (No Further Remedial Action Planned) is the EPA database of archived sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that the EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time.

- No CERCLIS-NFRAP listings were identified within a ½-mile radius of the Property.

EPA - The Resource Conservation and Recovery Information System (RCRIS) is a database of facilities, which generate or treat, store or dispose of EPA regulated hazardous waste, or meet other applicable requirements of the Resource Conservation and Recovery Act (RCRA). Inclusion on this database does not imply that mishandling or a release of hazardous waste has occurred at the facility. RCRIS categories are as follows:

Corrective Action (CORRACTS) list is a list of hazardous waste treatment, storage or disposal facilities and other RCRIS facilities (due to past interim status or storage of hazardous waste beyond 90 days) that have been notified by the US EPA to undertake corrective action under RCRA.

- No CORRACTS listings were identified within a one-mile radius of the subject Property.

Treatment, Storage, and Disposal Facilities (TSD). Facilities listed under TSD are sites that treat, store, and/or dispose of EPA regulated hazardous waste.

- No TSD listings were identified within a ½-mile radius of the Property.

Large Quantity Generators (LQG). Facilities listed under LQG either generate more than 1000 Kilograms (kg) of EPA regulated hazardous waste per month, or meet other applicable requirements of RCRA.

- No adjoining properties were identified on the LQG database.

Small Quantity Generators (SQG). Facilities listed under SQG either generate from 100 kilograms (kg) to 1000 kg of EPA regulated hazardous waste per month, or meet other applicable requirements of RCRA.

- No adjoining properties were identified on the SQG database.

EPA - The Emergency Response Notification System (ERNS) is a national database used to store information concerning the sudden and/or accidental release of hazardous substances, including petroleum in quantities greater than the reportable quantity, as maintained at the National Response Center. The database contains preliminary information from spill reports made to various federal departments including the EPA.

- No listings were identified for the Property.

8.4 State Agency Record Review

State Hazardous Waste Sites (SHWS) database contains potential or confirmed hazardous substance release properties.

- No SHWS listings were identified within a one-mile radius of the Property.

Solid Waste Facility/Landfill (SWF/LF) list provides information on the location of registered state landfills and associated transfer facilities.

- No SWF/LF listings were identified within a ½-mile radius of the subject Property.

Leaking Underground Storage Tank's (LUST) is a comprehensive listing of all reported active and inactive leaking storage tank sites.

- Two (2) LUST listings were identified within a ½-mile radius of the Property. They were identified as City of LA General Services and LA City Fire Station #106 located at 23004 Roscoe Boulevard. This site is approximately 1,082 feet west-southwest and cross-gradient of the subject Property. This site was assigned a"Completed - Case Closed" status in 2000, but was reopened and assigned an "Open – Site Assessment" status in 2002.

Considering the distance and topographical relation to the Property, this site is not considered to be a recognized environmental condition in connection with the Property.

Registered Storage Tank Database is the listing of registered storage tank sites. This includes the UST database.

- No adjoining properties were identified on the UST database.

Engineering Controls Site Listing (ENG Controls) list provides information on the location of remediation sites using engineering controls as part of the response action. Engineering controls include various forms of caps, building foundations, liners and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

- No ENG Controls listings were identified within a ½-mile radius of the subject Property.

Institutional Controls Site Listing (INST Controls) list provides information on the location of remediation sites using institutional controls as part of the response action. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions and post remediation care requirements intended to prevent exposure to contaminants remaining on-site. Deed restrictions are generally required as part of the institutional controls.

- No INST Controls listings were identified within a ½-mile radius of the Property.

Voluntary Cleanup Program (VCP) and **Independent Cleanup Report (ICR)** lists provide information on the location of sites involved in a Voluntary Cleanup or similar program. Under a Voluntary Cleanup Program, a property owner will voluntarily enter into an agreement with a state or local environmental regulatory agency to conduct an investigation and remediation for specific area(s) of concern.

- No VCP or ICR sites were identified within a ½-mile radius of the Property.

Brownfields (BF) list provides information on the location of sites involved in a state or local Brownfields program.

- No Brownfield listings were identified within a ½-mile radius of the Property.

Review of the remaining sites identified within the ASTM search parameters did not identify any site that is considered to be a REC in connection with the Property.

8.5 Local Government Agencies

City of Los Angeles

Building Department

Hillmann contacted the City of Lo Angeles Building Department to review building permits on file for the Property's addresses. Building permits for the original buildings constructed in 1959 were reviewed, along with various tenant improvements, demolition permits, and building permits for the new builds that were constructed on the Property in the late 1990's and mid 2000's.

Los Angeles County

Tax Assessor's Office

Property information was researched at the Los Angeles County Tax Assessor's Office during the site assessment. The current Assessor's Parcel Numbers (APN) for the Property are 2005-002-009, 2005-022-001, 2005-022-002, 2005-022-003, 2005-022-004, 2005-022-005, 2005-022-006, and 2005-002-011. According to Tax Assessor's records, the current Property building owner is MEPT West Hills, LLC.

Los Angeles County Fire Department

Hillmann contacted the Los Angeles County Fire Department in order to determine if any records of underground storage tanks (USTs) or hazardous wastes/materials were on file for the property's address. Hillmann reviewed records of routine inspections at the property. No records indicating any spills or releases were identified. As of the date of this report, no response has been received by the Los Angeles County Fire Department.

County of Los Angeles Department of Public Works

Hillmann contacted the County of Los Angeles Department of Public Works (LADPW) in order to determine if any UST or hazardous materials records were on file for the Property's addresses. To date no response has been received from the agency.

State of California

South Coast Air Quality Management District

Hillmann contacted the South Coast Air Quality Management District (SCAQMD) in order to determine if there are any records of applications, permits to operate, equipment list reports, notices of violations, notices to comply, complaints, site inspection reports, emissions summaries, source test reports, air monitoring data, asbestos notifications, facility potential to emit, facility positive balance or toxic health risk assessments on file for the Property's address. To date no response has been received from the agency.

Department of Toxic Substances Control – Cypress Regional Office

Hillmann contacted the State of California Department of Toxic Substances Control (DTSC) in order to determine if any records were on file for the property's address. To date no response has been received from the agency, however several files were reviewed online via the DTSC's Envirostor database.

Regional Water Quality Control Board – Santa Ana Region

Hillmann contacted the State of California Regional Water Quality Control Board (RWQCB) in order to determine if any records of underground storage tanks (USTs) or groundwater contamination were on file for the Property's address. To date no response has been received from the agency; however several files were available for review through the online Geotracker database including the most recent

9.0 ENVIRONMENTAL PROFESSIONAL STATEMENT

I declare that, to the best of my professional knowledge and belief, I meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR 312. I have the specific qualifications based on education, training and experience to assess a *property* of the nature, history and setting of the subject Property. Hillmann has developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

The Sanborn Library includes more than 1.2 million Sanborn fire insurance maps, which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Hillmann Environmental Co. (the client) is permitted to make up to THREE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2012. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

NO FURTHER ACTION FOR RADIOACTIVITY ANALYSES IN GROUNDWATER PURSUANT TO CALIFORNIA WATER CODE SECTION 13267 ORDER – RAYTHEON COMPANY (FORMER HUGHES MISSILE SYSTEMS COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA 91304
(SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) is the State regulatory agency responsible for protecting water quality in Los Angeles and Ventura Counties. To accomplish this, the Regional Board issues investigative orders authorized by the Porter-Cologne Water Quality Control Act (California Water Code [CWC], Division 7).

At the request of the Regional Board, Raytheon's predecessor, Hughes Missile Systems, Inc., conducted eight groundwater sampling events between March 1990 and December 1991 to determine radioactivity levels in groundwater at the site. The results were submitted to the Regional Board in 1992 and indicated that a subset of the well samples had radiological parameters exceeding California Maximum Contaminant Levels (MCLs), but that the concentrations were naturally occurring based on the relative abundances of the individual uranium isotopes.

In response to public concerns regarding radioactivity sampling results from the on-site groundwater monitoring wells, the Regional Board issued a CWC section 13267 Order on March 5, 2008, requiring submittal of a work plan for a site-wide groundwater investigation to verify current radioactivity conditions. The revised work plan was reviewed and conditionally approved by the Regional Board on January 29, 2009. Subsequently, Regional Board staff have received and reviewed the *Groundwater Investigation Report to Verify Current Radioactivity Conditions* (Report), dated August 2009, prepared by Oneida Total Integrated Enterprises (OTIE) on behalf of Raytheon Company for the referenced site.

The Report presents the results of the groundwater sampling from 11 site wells for radioactivity analyses in May 2009. Gross alpha particle activity, uranium, combined radium - 226+228, and gross beta particle activity were detected up to 61.12 pCi/L, 126.5 pCi/L, 18.62 pCi/L, and 54.77 pCi/L, respectively, which exceeded their California MCLs of 15 pCi/L, 20 pCi/L, 5 pCi/L, and 50pCi/L, respectively.

The data produced during 2009 groundwater investigation are consistent with previous results collected in 1990 and 1991. This current investigation and the 1990/1991 investigation work have demonstrated that the levels of radiological isotopes detected in groundwater at the former Raytheon facility are attributable to naturally occurring sources in the underlying aquifer matrix and geochemical system. OTIE recommends no further action for radioactivity analyses in groundwater at the site.

Based on review of the submitted information and radionuclides related documentation, Regional Board staff have the following findings:

1. **No Suspected Releases of Radioisotopes from Historical Operations at the Site**

   The Regional Board has jurisdiction for the investigation and remediation of groundwater contamination at the former Raytheon site, while the Department of Toxic Substances Control (DTSC) has jurisdiction to address environmental contamination in soil as a result of historic operations. On March 4, 2009, DTSC issued the following responses to public comments:

   > "DTSC has obtained records submitted by Raytheon which includes information on the types radioisotopes used at the site, and the buildings in which the radioisotopes were used. The records indicate that only small amounts of radioactive materials were present, primarily in measurement devices, and that licenses were properly terminated and materials were properly disposed of more than twenty (20) years ago."

   Regional Board staff has also reviewed the *Supporting Documentation for the Radioactive Materials Investigation at Hughes Aircraft Company-MSG-CP*, dated May 1992, documenting the information on radioactive materials being used at the site approximately from 1964 to 1992. Based on review of the information provided, Regional Board staff concurs with DTSC's statement. Following further consultation with DTSC, Regional Board staff concludes that there is no evidence suggesting that releases of radionuclides resulted from the historical operations at the former Raytheon facility.

2. **Naturally Occurring Uranium and Radium**

   During the 2009 groundwater investigation, isotopic uranium analyses were conducted to calculate the relative mass ratios in order to determine if the origin of the uranium was man-made (enriched or depleted) or was consistent with naturally occurring sources. The results of the 2009 groundwater investigation were compared to the published values of typical isotopic abundances. These values were obtained from both the United States Department of Energy's *Guide of Good Practices for Occupational Radiological Protection in Uranium Facilities* (USDOE, 2004) and the United States Environmental Protection Agency's *Depleted Uranium Technical Brief* (USEPA, 2006).

The isotopic analysis of uranium demonstrates that the isotopic mass percentages for the 2009 groundwater samples with elevated uranium levels fall within the range expected for naturally occurring uranium as shown in the table below. The same calculations were previously performed for the October 1991 and December 1991 analytical results and yielded similar ratios. The 2009 groundwater data strongly support the statement that naturally occurring uranium is encountered in groundwater at the site.

Relative Abundance of Uranium Isotopes

Isotope	**U-238**	**U-235**	**U-234**
Natural Abundance (%)	99.27	0.72	0.0055
October 1991 Sampling Results	99.10 to 99.42	0.57 to 0.88	0.0053 to 0.0067
December 1991 Sampling Results	99.14 to 99.55	0.44 to 0.84	0.0051 to 0.0064
May 2009 Sampling Results	99.13 to 99.50	0.48 to 0.85	0.0050 to 0.0062

Based on the information obtained from the USEPA website at: http://www.epa.gov/radiation/radionuclides/index.html, uranium and radium occur naturally in the environment. They are present in virtually all rock, soil, and water. Uranium, radium and their compounds are soluble in water. As a result, groundwater in areas where concentrations of uranium and radium are high in aquifer materials and in surrounding bedrock typically has relatively high uranium and radium content.

Based upon the information provided to the Regional Board, and with the provision that the information was accurate and representative of site conditions, the Regional Board finds that the May 2009 groundwater investigation for radioactivity analyses carried out at the site is in compliance with the requirements of the CWC section 13267 Order issued to Raytheon Company on March 5, 2008 and that no further action for radioactivity analyses in groundwater is required at the site at this time. However, if new information indicates potential releases of radionuclides from the former Raytheon facility, the Regional Board may require groundwater monitoring for radioactivity analyses at the site.

If you have any questions, please contact Dr. Ann Chang at (213) 620-6070 or nchang@waterboards.ca.gov.

Dear Sir/Madam:

I would like to know if you have any environmental records for the above referenced property. Please call/fax me and let me know whether or not you locate any records. If you locate any records for the properties, I would like to either obtain copies or schedule a file review. My office number is 714-634-9500.

Dear Mr. Samorano:

FINAL ORDER - TERMINATION OF WASTE DISCHARGE REQUIREMENTS FOR FORMER HUGHES MISSILE SYSTEMS COMPANY, 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (ORDER NO. R4-2010-0162, CI-7483)

Our letter of July 14, 2010, transmitted a revised tentative order to terminate Waste Discharge Requirements (WDR), Order No. 95-012 for discharge of treated groundwater at former Hughes Missile Systems Company located at 8433 Fallbrook Avenue, Canoga Park.

Pursuant to Division 7 of the California Water Code, this Regional Board at a public meeting held on September 2, 2010 reviewed the tentative order, considered all factors in the case, and adopted Order No. R4-2010-0162 (a copy is enclosed) relative to the termination of the WDR. No written comments were received related to the termination of the WDR.

If you have any questions or need additional information, please call Project Manager, Ms. Dionisia Rodriguez at (213) 620-6122 or me at (213) 576-6618.

Sincerely,

Rebecca Chou, Ph.D., P.E.
Chief of Groundwater Permitting and Land Disposal Section

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. R4-2010-0162

TERMINATION OF WASTE DISCHARGE REQUIREMENTS
FOR DISCHARGES TO LAND/GROUNDWATER

The California Regional Water Quality Control Board, Los Angeles Region,(Regional Board) finds:

1. This Regional Board adopted Waste Discharge Requirements (WDR) Order No. 95-012 for Raytheon Company (Discharger) on January 23, 1995 for discharge of treated groundwater to groundwater basins in the Los Angeles Region at former Hughes Missile Systems Company located at 8433 Fallbrook Avenue, Canoga Park.,

2. On June 30, 2010, Discharger notified this Regional Board that the Discharger has ceased its discharge to groundwater basins.

3. The Board finds that the WDR Order No. 95-012 is no longer applicable and shall be terminated.

4. The Regional Board has notified the Discharger and interested agencies and persons of its intent to consider termination of Order No. 95-012 and has provided them with an opportunity to submit their written views and recommendations. The Regional Board, in a public hearing, heard and considered all comments and testimony pertinent to this matter.

IT IS HEREBY ORDERED that Waste Discharge Requirements Order No. 95-012 be terminated, except for enforcement purposes.

The Executive Officer of this Regional Board is authorized, and he is hereby directed, to certify and submit copies of this Order to the Discharger, and to such individuals and governmental agencies that request it.

I, Samuel Unger, Executive Officer, do certify that the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Los Angeles Region on September 2, 2010.

RESPONSE TO REQUEST FOR CONFIRMATION ON GROUNDWATER CLEANUP POLICY AT CORPORATE POINTE AT WEST HILLS – 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Ehrlich:

Los Angeles Regional Water Quality Control Board (Regional Board) staff have received and reviewed your November 26, 2008 letter (attached) for the referenced site. Based on our review of the information included in your letter, we confirm that the Regional Board will apply site-specific methodologies for the protection of groundwater resources for remediation at the site.

Should you have any questions, please contact Dr. Ann Chang at (213) 620-6070, or Ms. Su Han at (213) 576-6735.

Sincerely,

Tracy J. Egoscue
Executive Officer

Re: Corporate Pointe at West Hills; West Hills, CA (the "Property")

Dear Ms. Chang and Mr. Collins:

This letter follows our November 5, 2008 meeting at which we discussed issues relating to MEPT West Hills, LLC's entitlement and permitting for the redevelopment of the southern portion of the Property. This letter confirms our understanding of the DTSC and RWQCB's policies in connection with establishing remediation and/or water quality standards for the Property, and requests written confirmation of same from the agencies.

During the meeting, MEPT described certain neighbors' inaccurate claims that the proposed rezoning (from agricultural to commercial/industrial) would allow greater amounts of alleged contaminants to remain in place. As confirmed at the meeting by Department of Toxic Substance Control ("DTSC") and Los Angeles Regional Water Quality Control Board ("RWQCB") representatives, neither agency considers zoning when formulating and applying remediation or water quality standards. The neighbors' concerns in this regard have no merit whatsoever.

The DTSC considers the current and future use of a property when establishing site specific remediation levels and does not rely on zoning when determining remediation standards. The RWQCB utilizes published maximum contaminant levels (MCLs), based on the agency's Basin Plan, to measure remediation levels-- which are also independent of zoning.

Although the southern portion of the campus is zoned for agricultural uses, it has been used for commercial industrial purposes for more than 50 years. The current and future use of the site will remain commercial industrial. Remediation levels will be established by DTSC based

upon health risk analysis that reflects commercial industrial uses, while RWQCB utilizes published MCLs. This process is standard practice throughout California. Thus, any zone change for the Property will have no effect on the remediation standards that are utilized by the DTSC and RWQCB for the Corporate Pointe at West Hills campus.

At your earliest convenience, please confirm that your agency will apply the site-specific methodology specified above in connection with the Property.

Please contact us with any questions or comments.

Very truly yours,

KENNETH A. EHRLICH,
a Professional Corporation of
Jeffer, Mangels, Butler & Marmaro LLP

Van Nuys, CA 91401

CORPORATE POINTE AT WEST HILLS, WEST HILLS, CA ("PROPERTY"), CAD0411692124; STATUS OF DTSC INVESTIGATION AND REMEDIATION

Dear Mr. Glick:

DTSC understands that the City of Los Angeles ("City") is in the process of completing its environmental review and other permitting associated with the application of the owner, MEPT West Hills LLC ("MEPT"), for a general plan amendment, zone change, conditional use for commercial corner development, and site plan review. This letter updates the City on DTSC's continuing oversight of assessment and, as needed, remediation and monitoring at the Property.

A. Site History and Location

The subject property ("Property") encompasses approximately fifty (50) acres of the approximately eighty-five (85) acre former Hughes Missile Systems site ("Site"), now known as Corporate Pointe at West Hills. The Site, including the Property, has been under DTSC's jurisdiction to address environmental contamination in soil as a result of historic operations. The Regional Water Quality Control Board ("RWQCB") also has jurisdiction for contamination associated with groundwater at the site. MEPT proposes to build an additional 360,000 square feet of office space and a new parking structure at the Property. Trammell Crow Company will develop the structures.

The entire Site is located at the northwest corner of Fallbrook Avenue and Roscoe Boulevard in West Hills, California. From 1959 until 1966, Bunker-Ramo, an electrical component design and testing company, developed and used the Site as an industrial park. From approximately 1966 to 1976, Hughes Missiles Systems shared occupancy of the Site with Rocketdyne and Bunker-Ramo. Hughes later purchased the Site and occupied the entire facility as an aerospace research and development facility. Following a merger with Hughes in 1997, Raytheon assumed management of all environmental investigation and remediation activities at

the 85-acre facility, including the Property.

In May 1995, Hughes sold the Site and the land use changed to commercial office space. In 1997, the northern portion of the Site was sold to Regent Properties. Certain parcels within the southern portion of the site were subsequently purchased by DeVry Incorporated, the City of Los Angeles (Police Department), and MEPT. MEPT acquired the remaining portions of the Site, excluding the 5-acre City portion, in 2002.

While the Site was used as a design and testing facility prior to 1995, the DTSC permitted the use of two hazardous waste units on site: a hazardous waste storage area and an underground waste oil/solvent tank. Both of these units were located along the northern Site boundary and are not located within the Property. In or about 1997, Raytheon removed all on-site hazardous waste units and certain affected soil with DTSC oversight. Since then, Raytheon, DTSC and the RWQCB have been working to finalize Site closure.

B. DTSC's Continuing Role and Site Specific Remediation Goals

1. DTSC Role

For sites where a historic release or threatened release of hazardous substances into the environment has occurred, California law requires DTSC approval of a "remedial action plan" or similar decision document to certify that the remedy selection process was completed in accordance with all applicable laws and regulations. This process also provides a public source of information about the history, characteristics, and risks posed by a particular site, as well as a summary of the cleanup alternatives considered, their evaluation, and the rationale supporting the selected remedy. DTSC must determine whether the selected cleanup levels and remedies meet all legal requirements and protect public health and the environment. Upon the completion of the environmental cleanup process, DTSC has the statutory responsibility for certifying that the necessary remediation has been completed and that no further remedial action is necessary. See, Cal. Health & Safety Code, Chapter 6.5, 6.8 and DTSC's Land Use Covenant Agreements Fact Sheet, Oct. 2000.

2. Development and Implementation of Site Specific Remediation Goals

DTSC's remedy selection requirements mandate the evaluation of reasonably anticipated future land uses which affect exposure pathways. For the Property, the City serves as the source of information and permitting authority for land uses. Selection of cleanup levels must be based on consideration of public health and environmental risks, technical and costs limitations, and the performance and risk uncertainties inherent in all waste remediation efforts. Cleanup levels at industrial or recreational sites are generally less stringent than more intensive uses because of shorter human exposure duration and limited exposure pathways.

When selecting a remedy for a site, California law requires, and DTSC insists that:

a. The chosen remedy must protect public health and the environment for the reasonably anticipated future land use;

b. Engineering controls must be used for low-level threats;

c. Institutional controls must be used to supplement engineering controls;

d. The use of innovative technology must be considered with preference given to permanent remedies;

e. Usable groundwater must be returned to beneficial use; and

f. The selected remedy must comply with the California Environmental Quality Act ("CEQA").

Here, the City has assumed the role of lead agency for CEQA purposes for MEPT's proposed project. To the extent that any future unanticipated environmental contamination at the site triggers CEQA, a separate CEQA process will be initiated.

DTSC considers the current and future use of a site when establishing site-specific remediation levels and does not reply upon zoning when determining remediation standards. RWQCB utilizes published maximum contaminant levels ("MCLs") to measure remediation levels in groundwater, which are also independent of zoning.

Here, the Property is currently zoned for agricultural uses, but has been used for commercial industrial purposes for more than 50 years. The current and future use of the site will remain commercial industrial. Therefore, DTSC will establish remediation levels based upon health risk analysis that reflects commercial industrial uses, while the RWQCB will utilize published MCLs. This process follows standard practice throughout California.

Any zone change for the Property will have no effect on the remediation standards utilized by either DTSC or RWQCB for the Property.

C. Environmental Investigation and Remediation

From 1988 through 2000, Hughes and Raytheon conducted numerous environmental investigations aimed at identifying the extent of soil and groundwater impact associated with the permitted units and identified Areas of Concern ("AOC") and Solid Waste Management Units ("SWMU's"). Environmental remediation has continued at the Site since approximately 1995. The DTSC and RWQCB's primary common objective remains remediation of soil and groundwater to facilitate Site closure.

In May 2008, Raytheon submitted to DTSC a Resource Conservation & Recovery Act Facility Assessment ("RFA") questionnaire response. The document outlines all historical data and completed remediation efforts to date. The DTSC is presently finalizing the RFA, which will evaluate if additional investigation and/or remediation is necessary.

D. Next Steps

The RFA will determine the future site assessment and remediation that will be necessary. There are no restrictions on development in those areas of the Property not identified as AOCs or SWMUs as previously noted in DTSC's August 5, 2008 letter to Mr. Hadar Plafkin of the City Planning Department. The January 30, 2008 Draft RCRA Facility Assessment, Hughes Missiles Systems Company, Canoga Park facility (Raytheon) EPA ID-CAD041162124 identifies all AOCs and SWMUs for the entire site, including the Property.

Pending closure of an AOC or a SWMU area where development is to occur, DTSC requires the use of a Soil Management Plan ("SMP") detailing the required sampling and monitoring to be implemented. DTSC has approved an SMP for the Property and MEPT has implemented same. Specific appendices to the SMP are required to be created for any AOC or SMU where ground disturbance activities are to occur, until such time as those AOCs/SWMUs receive final closure.

E. Specific Documentation for the Site

Additional documentation relating to the entire site, including the Property is available at www.envirostor.dtsc.ca.gov\public.

Please contact the undersigned or Susan Callery, DTSC's Public Participation Specialist for this project (818/ 717-6567) with questions or comments.

Sincerely,

Rodney Collins

Re: **Limited Asbestos Inspection**
8521 Fallbrook Ave Property
8521 Fallbrook Ave.
West Hills, CA 91304

Claim No: N/A

Project No: 40380

Dear Ms. Singletary,

On November 16, 29 & 30, 2011, California DOSH Certified Site Surveillance Technician, Mr. Gary Brockway (CSST 06-4120) of Patriot Environmental Laboratory Services, Inc. (Patriot) performed a limited asbestos inspection at the above subject property located in West Hills, California. **The purpose of the inspection was to determine if asbestos is present in any of the building materials as specified for a renovation at the subject property.**

Summary of Findings
The following asbestos containing materials were identified:

Note: The Quantities Provided Below Are Estimates. Actual Quantities Must Be Field Verified By Contractors Prior To Submitting Bids For Abatement.

Samples Collected November 16, 2011:

Material Description	Sample Number	Material Location	Material Condition	Estimated Percent Damaged	Approximate Quantity	Percent & Type of Asbestos

Property Description

The subject property is commercial structure. The subject buildings are three-story wood frame set on concrete slab foundations. At the time of this inspection, the identified asbestos-containing materials were in weathered/damaged condition.

Scope of Work

On November 16, 2011, Mr. Gary Brockway (CSST 06-4120) of Patriot conducted a limited asbestos inspection at the subject property. The interior and exterior of the building was visually inspected for the purpose of inventorying any suspect asbestos containing materials for a renovation project at the subject property. Once the inventory of suspect materials was created, physical bulk samples were collected of the materials from representative locations. Samples were collected in airtight containers. Upon collection, sample numbers, descriptions, and collection locations were entered on to a chain of custody for transportation to Patriot's NVLAP accredited laboratory.

Sampled Suspect Materials

Samples of the following suspect materials were collected:

Pipe Covering & Insulation	Elbow Insulation	Duct Seam Mastic
Roof Penetration Mastic	--	--

Sample Protocol/Analysis

Samples were collected in accordance with the Asbestos School Hazard Emergency Response Act (40 CFR 763 Subpart E) as mandated by Cal/OSHA (Title 8 Section 1529) and South Coast Air Quality Management District (Rule 1403).

Physical bulk samples were analyzed by Patriot. Patriot is accredited by the National Voluntary Laboratory Accreditation Program (200358-0). The method of analysis was Polarized Light Microscopy (EPA 600/M4-82-020).

Recommendations

If any of the asbestos containing materials identified in this report is scheduled to be impacted by renovation or demolition activities, an asbestos abatement contractor must remove them prior to disturbance. Asbestos abatement contractors must be registered with the Division of Occupational Safety and Health.

Disclaimer

Limited destructive sampling was conducted at the subject property. If additional suspect materials are discovered during renovation, all work should cease until a Certified Asbestos Consultant is contracted to ascertain the possibility of asbestos content. This inspection was performed in accordance with current regulations and state of the art practices. The inventory of asbestos containing materials and determination of their condition are based upon conditions observed at the time of inspection. Patriot does not assume responsibility for future regulatory changes or changes in the condition of the building.

Enclosed is the laboratory analysis report. Please contact our office if there are any questions regarding this inspection.

Sincerely,

Chris Blake
Certified Asbestos Consultant No. 01-3027

Bulk sample(s) submitted was (were) analyzed in accordance with the procedure outlined in the US Federal Register 40 CFR 763, Subpart F, Appendix A; EPA-600/R-93/116 (Method for Determination of Asbestos in Building Materials), and EPA-600/M4-82-020 (US EPA Interim Method for the Determination of Asbestos in Bulk Insulation Samples).Samples were analyzed using Calibrated Visual Estimations (CVES); therefore, results may not be reliable for samples of low asbestos concentration levels. Samples of wall systems containing discrete and separable layers are analyzed separately and reported as composite unless specifically requested by the customer to report analytical results for individual layers. This report applies only to the items tested. Results are representative of the samples submitted and may not represent the entire material from which the samples were collected. "None Detected" means that no asbestos was observed in the sample. "<1%" (less than one percent) means that asbestos was observed in the sample but the concentration is below the quantifiable level of 1%.

Lab/Client ID/Layer	Location	Material Description	Color	Composition (%)

Bulk sample(s) submitted was (were) analyzed in accordance with the procedure outlined in the US Federal Register 40 CFR 763, Subpart F, Appendix A; EPA-600/R-93/116 (Method for Determination of Asbestos in Building Materials), and EPA-600/M4-82-020 (US EPA Interim Method for the Determination of Asbestos in Bulk Insulation Samples).Samples were analyzed using Calibrated Visual Estimations (CVES); therefore, results may not be reliable for samples of low asbestos concentration levels. Samples of wall systems containing discrete and separable layers are analyzed separately and reported as composite unless specifically requested by the customer to report analytical results for individual layers. This report applies only to the items tested. Results are representative of the samples submitted and may not represent the entire material from which the samples were collected. "None Detected" means that no asbestos was observed in the sample. "<1%" (less than one percent) means that asbestos was observed in the sample but the concentration is below the quantifiable level of 1%.

Equipment Location: 8531 FALLBROOK AVE, WEST HILLS, CA 91304

Equipment Description :

INTERNAL COMBUSTION ENGINE, JOHN DEERE, MODEL NO. 6068T (123 KW), SERIAL NO. TD6068T820014, 165 BHP, DIESEL-FUELED, NON-ROAD, 6 CYLINDERS, FOUR CYCLES, TURBOCHARGED, DRIVING AN EMERGENCY ELECTRICAL GENERATOR.

Conditions :

1. OPERATION OF THIS EQUIPMENT SHALL BE CONDUCTED IN ACCORDANCE WITH ALL DATA AND SPECIFICATIONS SUBMITTED WITH THE APPLICATION UNDER WHICH THIS PERMIT IS ISSUED UNLESS OTHERWISE NOTED BELOW.

2. THIS EQUIPMENT SHALL BE PROPERLY MAINTAINED AND KEPT IN GOOD OPERATING CONDITION AT ALL TIMES.

3. THIS ENGINE SHALL NOT OPERATE MORE THAN 200 HOURS IN ANY ONE YEAR, WHICH INCLUDES NO MORE THAN 50 HOURS IN ANY ONE YEAR FOR MAINTENANCE AND TESTING PURPOSES.

4. THE OPERATION OF THE ENGINE BEYOND THE 50 HOURS PER YEAR ALLOTTED FOR ENGINE MAINTENANCE AND TESTING SHALL BE ALLOWED ONLY IN THE EVENT OF A LOSS OF GRID POWER OR UP TO 30 MINUTES PRIOR TO A ROTATING OUTAGE, PROVIDED THAT THE ELECTRICAL GRID OPERATOR OR ELECTRIC UTILITY HAS ORDERED ROTATING OUTAGES IN THE CONTROL AREA WHERE THE ENGINE IS LOCATED OR HAS INDICATED THAT IT EXPECTS TO ISSUE SUCH AN ORDER AT A CERTAIN TIME, AND THE ENGINE IS LOCATED IN A UTILITY SERVICE BLOCK THAT IS SUBJECT TO THE ROTATING OUTAGE. ENGINE OPERATION SHALL BE TERMINATED IMMEDIATELY AFTER THE UTILITY DISTRIBUTION COMPANY ADVISES THAT A ROTATING OUTAGE IS NO LONGER IMMINENT OR IN EFFECT.

5. AN OPERATIONAL NON-RESETTABLE TOTALIZING TIME METER SHALL BE INSTALLED AND MAINTAINED TO INDICATE THE ENGINE ELAPSED OPERATING TIME.

6. THIS ENGINE SHALL NOT BE USED AS PART OF A DEMAND RESPONSE PROGRAM USING INTERRUPTIBLE SERVICE CONTRACT IN WHICH A FACILITY RECEIVES A PAYMENT OR REDUCED RATES IN RETURN FOR REDUCING ITS ELECTRIC LOAD ON THE GRID WHEN REQUESTED TO SO BY THE UTILITY OR THE GRID OPERATOR.

EXECUTIVE SUMMARY

On behalf of Raytheon Company (Raytheon), Oneida Total Integrated Enterprises, LLC (OTIE) has prepared this Enhanced *In Situ* Bioremediation (EISB) and *In Situ* Chemical Reduction (ISCR) Progress Report for the Third Quarter of 2012 to document the progress of the EISB and ISCR programs implemented to treat groundwater and saturated soil that contain chlorinated ethenes and hexavalent chromium [Cr(VI)], at the Former Canoga Park Facility (the Site) located at 8433 Fallbrook Avenue in Canoga Park, California (Figure 1). This report was prepared in accordance with the Waste Discharge Requirements (WDR) Order No. R4-2007-0019 (Series No. 092) and the Monitoring and Reporting Program (M&RP) No. CI-8947 issued by the Los Angeles Regional Water Quality Control Board (LARWQCB).

The Site operated as an industrial park from 1959 through 1994, and chemical use and storage activities on site likely caused impacts to soil and groundwater. The chemical of concern (COC) in groundwater at the Site is 1,1-dichloroethene (1,1-DCE) as defined in the Corrective Action Plan (CAP) (Hughes Missile Systems Company [Hughes], 1992). The groundwater impacts are generally limited to the upper 25 feet of shallow groundwater in the northwest portion of the Site, which occurs from 25 to 50 feet below ground surface. One additional area of impacted shallow groundwater at the Site is a small isolated area with hexavalent chromium [Cr(VI)] in groundwater underlying a Former Hazardous Waste Storage Area (HWSA), which was also located in the northern portion of the site.

A groundwater remediation program has been underway at the Site since 1995 to progress towards achieving cleanup criteria established in the CAP for the Site (60 micrograms per liter [µg/L] for 1,1-DCE). The LARWQCB is the lead oversight agency for the remediation activities at the Site (LARWQCB File No. 94-45). Remediation techniques used at the Site have included remedial excavation, a groundwater recovery and treatment system, a soil vapor extraction system, and an air sparge system. In May 2002, the LARWQCB approved an EISB pilot test as proposed in CAP Addendum #1 (T N & Associates, Inc.[TN&A], 2002) to evaluate the ability of EISB to reduce chlorinated ethenes in saturated soil and groundwater to below CAP goals. Based on the successful results of the pilot test, the full application of EISB was implemented in 2005 by injecting an emulsified soybean oil mixture into the groundwater per CAP Addendum #2 (TN&A, 2005). The full-scale EISB activities at the Site were divided into three phases. Phases I and II refer to October 2005 and May 2006 injection activities in the vicinity of Former Tank T3 area and a downgradient area west of Former Tank T3, respectively. Phase III, refers to a separate treatment area in the eastern portion of the Site where injections were completed in December 2006.

Once the effects of Phases I through III were properly evaluated, CAP Addendum #3 (TN&A, 2008b) was prepared, which proposed additional EISB activities as well as voluntarily addressing the Cr(VI) concentrations in residual soil and groundwater at the Former HWSA. ISCR technology was proposed for the treatment of Cr(VI), which involved the injection of calcium polysulfide into the groundwater. The approval and permitting process for CAP Addendum #3 was completed in September 2009.

The CAP Addendum #3 activities are also being completed in phases, referenced as Phases IV, V, VI and VII, with injections in separate areas followed by a comprehensive groundwater

monitoring program for each phase. The objective of the CAP Addendum #3 EISB program is to accelerate the degradation of 1,1-DCE to concentrations below the cleanup goal of 60 µg/L. The objective of the ISCR activities is to reduce the Cr(VI) in groundwater to the less mobile and much less toxic form, trivalent chromium [Cr(III)]. As there is no promulgated maximum contaminant level (MCL) specific to Cr(VI) in groundwater, the cleanup target level is 50 µg/L, which is the MCL for total chromium [the total of Cr(III) and Cr(VI)]. The following summarizes the CAP Addendum #3 activities through the Third Quarter of 2012.

PHASE IV EISB SUMMARY – NORTHWEST AREA

In October 2009, the Phase IV EISB injections were implemented in the "Northwest Area" of the Site. A total of four remedial progress monitoring (RPM) wells were included in the M&RP for CI-8947, and eight post-injection monitoring events have been completed since the injections. No EISB-related activities were performed in the Northwest Area during the third quarter of 2012.

The next scheduled EISB monitoring event (month #36) for the Northwest Area will be in December 2012, concurrent with the second semiannual 2012 event per the M&RP.

PHASE V ISCR SUMMARY – FORMER HWSA

In June 2010, the Phase V ISCR injections were implemented in the former HWSA. A total of six RPM wells were included in the M&RP for CI-8947 and seven post-injection monitoring events have been completed. No ISCR-related activities were performed at the Former HWSA during the third quarter of 2012.

The next sampling event, month #30 for Phase V, will be in December 2012, concurrent with the second semiannual 2012 event per the M&RP.

PHASE VI EISB SUMMARY – FORMER BLDG 269 AREA

In May 2011, the Phase VI EISB injections were implemented in the Former Bldg 269 Area of the Site. A total of three RPM wells were included in the M&RP for CI-8947 and five post-injection monitoring events have been completed since the injections. No EISB-related activities were performed in the Former Bldg 269 Area during the third quarter of 2012.

The next sampling event, month #30 for Phase V, will be in December 2012, concurrent with the second semiannual 2012 event per the M&RP.

PHASE VII EISB SUMMARY – FORMER TANK T3 AREA

In September 2012, the Phase VII EISB injections were implemented in the Former Tank T3 Area of the Site. A total of three RPM wells were included in the M&RP for CI-8947 and one monitoring event was completed prior to the injections. EISB-related activities performed at the Former Tank T3 Area during the third quarter of 2012 are summarized below:

- Injection wells (IP-02 through IP-06) were installed and developed in September 2012.

- The baseline groundwater sampling event was conducted prior to the start of the injections in accordance with the M&RP. Groundwater levels were gauged and samples collected on September 18, 2012.
- Static depth to water measurements were 25.62 feet btoc (RW-11) and 27.82 feet btoc (RW-14) on September 18, 2012.
- TCE was detected in upgradient well RW-15 at a concentration of 7.7 µg/L and in treatment are well RW-14 at 2.8 µg/L.
- 1,1-DCE concentrations were ranged from 41 µg/L (upgradient RW-15) to 190 µg/L at well RW-14 in the treatment area.
- VC was detected in injection area well RW-14 at a concentration of 54 µg/L. The VC concentrations are an intermediate daughter product, resulting from the EISB dechlorination process and are anticipated to eventually dissipate as further treatment is completed.
- VFAs were not detected in any well during the baseline event.
- Methane was detected in all three RPM wells at concentrations ranging from 17 µg/L in well RW-11 to 465 µg/L in well RW-14.
- CO_2 concentrations ranged from 35.3 mg/L (well RW-15) to 59.3 mg/L (well RW-14).
- No ethane or ethene was detected in RPM wells above the reporting limit of 1.0 µg/L during the baseline.
- Subsurface injections of emulsified vegetable oil (EVO) were performed using a portable injection system between September 24 and 27, 2012.
- A combined total of 550 gallons of EVO substrate and 10,840 gallons of treated groundwater were injected in the Former Tank T3 area via the five new injection wells and two sparge wells in September 2012.

The month #1 and month #3 RPM sampling events for Phase VII are scheduled for October and December 2012, respectively. The December event will be conducted concurrent with the second semiannual 2012 groundwater monitoring event per the M&RP.

Results for the December 2012 remedial progress sampling events for all four phases (IV, V, VI, and VII) will be reported in the Fourth Quarter 2012 and 2012 Annual EISB/ISCR summary report to be submitted by February 15, 2013.

1.0 INTRODUCTION

On behalf of Raytheon Company (Raytheon), Oneida Total Integrated Enterprises, LLC (OTIE) has prepared this Enhanced *In Situ* Bioremediation (EISB) and *In Situ* Chemical Reduction (ISCR) Progress Report for the Third Quarter of 2012 to document the progress of the EISB and ISCR programs implemented to treat groundwater and saturated soil that contain chlorinated ethenes and hexavalent chromium [Cr(VI)], at the Former Canoga Park Facility (the Site) located at 8433 Fallbrook Avenue in Canoga Park, California (Figure 1). This report was prepared in accordance with the Waste Discharge Requirements (WDR) Order No. R4-2007-0019 (Series No. 092) and the Monitoring and Reporting Program (M&RP) No. CI-8947 issued by the Los Angeles Regional Water Quality Control Board (LARWQCB). The Site Cleanup Program number is 0693, the Site ID number is 2043T00, and the file number is 94-45.

The remedial activities at the former Raytheon Facility are under the coordination of:

Mr. Jacques Marcillac, CHG
OTIE
317 East Main Street
Ventura, California 93001
(805) 585-2110

All consultant work was performed under the review of:

Mr. Daniel Samorano, P.E.
Raytheon
PO Box 11337, Building 845
Tucson, Arizona 85734-1337
(520) 794-9026

The lead agency for the remediation is the LARWQCB:

Dr. Ann Chang
Regional Water Quality Control Board, Los Angeles Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013
(213) 576-6723

1.1 SITE OWNERSHIP AND REDEVELOPMENT HISTORY

In 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker-Ramo, an electrical component design and testing company. Bunker-Ramo was the sole occupant of the facility from 1959 until 1966. From 1966 to 1976, Hughes Missile Systems Company (Hughes) was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes purchased the entire Site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. The former Raytheon Facility was purchased from Hughes by Coast Federal Bank in May 1995. Parcels were subsequently purchased by DeVry and the Los Angeles Metropolitan Police Department. The northern portion of the Site was sold to Regent Properties, Inc. in 1997. Regent Properties, Inc.

sold its portion of the property to Shamrock Holdings, Inc. in 2001, who subsequently, sold the property to MEPT West Hills, LLC in June 2002. MEPT West Hills, LLC is the current property owner; however, CB Richard Ellis is the current property manager and is the primary contact for Site logistical issues. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Site.

1.2 REMEDIATION OVERVIEW

Investigation activities at the Site have been ongoing since 1988 and a groundwater remediation program has been underway at the Site since 1995 to achieve cleanup criteria established in the original Corrective Action Plan (CAP) (Hughes, 1992) for the site-specific chemicals of concern (COCs) which include chlorinated ethenes. Clean up goals for the volatile organic compounds (VOCs) are summarized below:

Chemical of Concern	CAP Goal (micrograms per liter [µg/L])
Tetrachloroethene (PCE)	50
Trichloroethene (TCE)	50
cis-1,2-Dichloroethene (*cis*-1,2-DCE)	60
1,1- Dichloroethene (1,1-DCE)	60
1,1-Dichloroethane (1,1-DCA)	50
1,2-Dichloroethane (1,2-DCA)	5

The LARWQCB is the lead oversight agency for the remediation activities at the Site. Remediation techniques used at the Site have included a groundwater recovery and treatment system (GRTS), soil vapor extraction (SVE), and an air sparge (AS) system. In May 2002, the LARWQCB approved an EISB pilot test to evaluate the ability of EISB to reduce chlorinated ethenes in saturated soil and groundwater below CAP goals. Based on the successful results of the pilot test, a full-scale EISB application was approved by the LARWQCB and three separate phases (Phase I through Phase III) were implemented between October 2005 and November 2008 to remediate COCs in treatment areas “A” through “D”. As a result, the AS/SVE systems and GRTS were phased out and currently serve as contingency options if EISB is not a successful remedial action.

In addition to the remediation progress monitoring related to the injection activities, routine Site-wide groundwater monitoring has been conducted since 1991. The current site-wide groundwater monitoring and sampling program is performed in accordance with M&RP No. CI-7483 issued by the California LARWQCB, File No. 94-45 as modified by August 26, 1997, and January 22, 2007, LARWQCB letters.

One other remedial effort at the Site involved a small isolated area of Cr(VI) concentrations underlying the Former Hazardous Waste Storage Area (HWSA). A remedial excavation was performed at the Former HWSA in 1998. As a follow-up to the remedial excavation, eight wells (wells MW-32S, MW-32D, VW-122, MW-33, MW-34S, MW-34D, MW-35S and MW-35D) were installed and monitored to delineate residual concentrations of Cr(VI) in groundwater. This work was performed under the direction of the Department of Toxic Substances Control (DTSC).

Currently, there is no promulgated maximum contaminant level (MCL) specific to Cr(VI) in groundwater; however, the current MCL for total chromium, which is the total of trivalent chromium [Cr(III)] and Cr(VI), is 50 µg/L, which is the target cleanup level for the HWSA groundwater. Ten groundwater monitoring events of wells within and surrounding the Former HWSA were performed between 2000 and 2008 on a voluntary basis by Raytheon, as there was no regulatory directive for chromium monitoring by the DTSC. In 2008, Raytheon proposed *in situ* remedial actions for chromium in groundwater in the CAP Addendum #3, (TN&A, 2008b) which was approved by the LARWQCB in September 2009. Current monitoring of the wells in the HWSA is conducted in accordance with the WDR Order No. R4-2007-0019 (Series No. 092) and the M&RP No. CI-8947 related to the proposed remedial actions.

2.0 *IN SITU* REMEDIATION ACTIVITIES

In September 2003, a pilot test was performed to assess the potential for EISB to further remediate the VOC concentrations in groundwater. This pilot test included the injection of lactic acid and a subsequent remedial progress monitoring program that was completed in June 2004. Final results and data summaries were presented to the LARWQCB in April 2005. Based on the EISB pilot test results, Raytheon implemented a full-scale EISB program to accelerate degradation of chlorinated ethenes in shallow groundwater to concentrations below clean-up goals established in the CAP (Hughes, 1992). The injection events occurred in October 2005 (treatment areas "A" and "B-I"), May 2006 (treatment areas "A", "B-II", and "C"), and December 2006 (treatment area "D") under WDR Permit No. R4-2005-0030 (Table 1). The June/July 2008 monitoring event fulfilled the last of the EISB monitoring requirements for M&RP No. CI-8947.

An evaluation of the July 2008 groundwater results (TN&A, 2008a) indicated that COC concentrations were generally stable or decreasing with significant sustained decreases in the injection areas after the full-scale EISB program was implemented. The results also indicated that some areas would benefit from additional treatment and Raytheon proposed to further treat 1,1-DCE using EISB technology in the Northwest Area, the Former Building (Bldg) 269 Area, and the Former Tank T3 Area. In addition, based on the June 2008 Cr(VI) results, remedial measures using ISCR technology were also proposed to address the Cr(VI) in groundwater underlying the Former HWSA. On September 9, 2009, the LARWQCB approved T N & Associates, Inc.'s (TN&A's) *Corrective Action Plan Addendum #3: Work Plan for Additional Enhanced In Situ Bioremediation and In Situ Chemical Reduction Activities* (TN&A, 2008b) to implement additional EISB efforts in the three treatment areas and ISCR technology in the HWSA.

After the LARWQCB approved the *Corrective Action Plan Addendum #3* (TN&A, 2008b), the Phase IV injection was performed in October/November 2009 in the Northwest Area (treatment area "E"). ISCR technology was implemented at the Former HWSA (Phase V in treatment area "H") in June 2010, and Phase VI EISB was conducted at Former Bldg 269 area in May 2011 (treatment area "G"). EISB injections were implemented in Former Tank T3 area (Phase VII in Treatment Area "F") in September 2012. Figure 2 shows the remedial areas located in the northern portion of the Site.

Details for each of the phases of EISB and ISCR implementation are provided in Table 1.

2.1 PROJECT TREATMENT AREAS

Per the 2009 CAP Addendum, the additional EISB/ISCR project area is divided into the following four primary treatment areas:

- Area "E": Northwest Area (Phase IV);
- Area "F": Former Tank T3 Area (Phase VII);
- Area "G": Former Bldg 269 Area (Phase VI); and
- Area "H": Former HWSA (Phase V).

Areas "E", "F", and "G" involve EISB whereas area "H" involves ISCR.

The Northwest Area, which is approximately 200 feet by 60 feet in area, is located along the north property boundary. The injection/sparge wells (S-1 through S-5) were used as injection points (Figure 2). The injection depths, determined by screen intervals of sparge wells, were from 29 to 30 feet below ground surface (bgs), from 39 feet bgs to 40 feet bgs, and from 49 feet bgs to 50 feet bgs. A well construction summary is included as Table 2 for all site wells.

Former Tank T3 treatment area, approximately 155 ft by 60 ft, is believed to be the source zone of the DCE plume. It is located near the former Tank T3 and the Recovery Well RW-14. Five injection wells (IP-02 through IP-06) were installed and they, as well as sparge wells S-16 and S-17, were used as injection points for the September 2012 implementation of the Phase VII EISB (Figure 2). Complete well installation details are included in the separate technical memorandum included in Appendix A.

The Former Bldg 269 Area is located in the northern portion of the property. Four injection wells (IP-07 through IP-10) and a downgradient monitoring well (MW-38) were installed between April 25 and April 28, 2011 (Figure 2). The new injection wells were used as injection points for the May 2011 implementation of the Phase VI EISB. The injection depths were determined by the screened intervals of injection wells which are from approximately 40 to 60 feet bgs, as shown in Table 2. Details on the well installation and substrate injection were presented in the *Second Quarter 2011 EISB and ISCR Progress Report* (OTIE, 2011b).

The Former HWSA treatment area, approximately 1,515 square feet, is located within the immediate vicinity of the wells MW-32S and MW-32D (Figure 2), which consistently had concentrations of Cr(VI). Four 2-inch injection wells (IP-HWSA-01 through IP-HWSA-04) were installed within the footprint of the former HWSA in June 2012 to facilitate the injection of the calcium polysulfide within the immediate area of the Former HWSA. Details on the well installation and substrate injection were presented in the *Second Quarter 2010 EISB and ISCR Progress Report* (OTIE, 2010b).

2.2 EISB - PHASE IV – NORTHWEST AREA

The Phase IV EISB injections were performed in October-November 2009. Details on the substrate selection and dosage as well as the substrate delivery program for the injections are discussed in the *Enhanced In Situ Bioremediation Progress Report, Fourth Quarter 2009 and Annual 2009 Summary 2009* (OTIE, 2010a) and injection details are provided in Table 1.

2.3 ISCR - PHASE V – FORMER HWSA

The ISCR Phase V remedial actions were conducted in June 2010. Details on the substrate selection and dosage as well as the substrate delivery program for ISCR injections in the HWSA are discussed in the *Enhanced In Situ Bioremediation and In Situ Chemical Reduction Progress Report, Second Quarter 2010* (OTIE, 2010b) and injection details are provided in Table 1.

2.4 EISB - PHASE VI – FORMER BLDG 269 AREA

The Phase VI EISB injections were performed in May 2011. Details on the substrate selection and dosage as well as the substrate delivery program for the injections are discussed in the *Enhanced In Situ Bioremediation Progress Report, Second Quarter 2011* (OTIE, 2011b) and injection details are provided in Table 1.

2.5 EISB - PHASE VII – FORMER TANK T3 AREA

The Former Tank T3 Area is located just south of the northern property boundary and northwest of an existing commercial building (8511 Fallbrook Avenue). Injection wells (IP-02 through IP-06) were installed along the northern property boundary, flanking the Former Tank T3 tank pit between September 10 and 14, 2012 (Figure 2). The five injection wells, as well as sparge wells S-16 and S-17, were used as injection points for the September 2012 implementation of the Phase VII EISB (Figure 2). The injection depths were determined by the screened intervals of injection wells which are generally approximately 45 to 60 feet bgs, as shown in Table 2. Complete details of the well installation work are included in Appendix A.

2.5.1 Substrate Selection and Dosage

A variety of amendments are available to be added to EISB systems as described in CAP Addendum #3 (TN&A, 2008b). Based on a site-specific evaluation, emulsified vegetable oil (EVO) was selected for additional EISB application at the Site because it degrades less quickly than other products and, therefore, the performance period of the substrate is extended.

The calculation for determining the volumes of EVO required for the former Tank T3 area was described worksheet was provided in the *Corrective Action Plan Addendum #3 Work Plan for Additional Enhanced In Situ Bioremediation and In Situ Chemical* Reduction *Activities* (TN&A, 2008b).

2.5.2 Substrate Delivery Program

Groundwater was extracted, treated, and stored in the 21,000-gallon Baker tank located onsite prior to the start of the injections. Suction hose was connected to the outlet of the tank to a Grundfos® CRN 1-9 pump (1 phase, 1 horsepower). The pump was powered by a receptacle in the nearby 21,000-gallon tank compound.

Injections were performed using a portable injection system shown in Figure 4 of the *Second Quarter 2010 EISB and ISCR Progress Report* (OTIE, 2010b). Eleven 50-gallon drums (550 gallons) of substrate mixed with 10,840 gallons of groundwater were injected into the seven injection points (Table 3).

Substrate was injected into five newly installed injection wells (IP-02 through IP-06) with screen intervals for each well from 45 to 60 feet bgs and the sparge wells (S-16 and S-17) screened 49 to 50 feet bgs. A total of 550 gallons of EVO and approximately 10,840 gallons of treated groundwater were injected at a ratio of approximately 1:20 between September 24 and 27, 2012.

3.0 REMEDIAL PROGRESS MONITORING PROGRAM

3.1 EISB PHASE IV MONITORING PROGRAM - NORTHWEST AREA

The baseline, month #1, month #3, month #6, month #9, month #12, month #18, month #24 and month #30 sampling events for the Phase IV EISB activities were performed in accordance with the LARWQCB's second revision to M&RP No. CI-8947 dated September 9, 2009. The remedial progress monitoring (RPM) program for Phases I through III was implemented in accordance with the M&RP No. CI-8947 as modified per the LARWQCB's approval in a letter dated April 24, 2006. Due to the phased injection implementation, the RPM wells are divided into groups as described in Table 1. To evaluate geochemical changes associated with the EISB injection activity during Phase IV, the following monitoring wells were selected as RPM wells within treatment area "E":

- RW-11 – upgradient location;
- RW-01 – within treatment area location;
- RW-10 – within treatment area location; and
- RW-02 – downgradient location.

In addition to the selected RPM wells listed above, additional wells within and adjacent to the treatment areas are sampled as part of the semiannual and annual groundwater monitoring programs. To better ascertain the distribution of the injected substrate, groundwater samples were also collected from wells VW-109, VW-126, and VW-127 and analyzed for volatile fatty acids (VFAs) during the baseline and subsequent sampling events through the month #24 event in November 2011. Sampling of these three wells were has been discontinued.

The groundwater monitoring program includes collecting samples for water quality parameter measurements at the Site and off-site laboratory analyses at frequencies listed in Table 3 of the Fourth Quarter 2009 EISB Progress Report (OTIE, 2010a) and per M&RP No. CI-8947. Groundwater samples were sent to an off-site laboratory for the following analytes: VOCs, VFAs, dissolved gases, anions, ferrous iron, total dissolved solids (TDS), total organic carbon (TOC), dissolved cations, mercury, and Cr(VI) by the methods listed in M&RP No. CI-8947. Field measurements include dissolved oxygen (DO), oxygen-reduction potential (ORP), pH, specific conductivity, and temperature.

In September 2011, OTIE requested on Raytheon's behalf in their *Request for Reduction in Required Analyses Request for Waste Discharge Requirement Order No. R4-2007-0019 (Series No. 092)* (OTIE, 2011a), to remove analytes that had shown no significant concentration changes since the baseline (Oct09 to Jun11). In their letter dated November 4, 2011, LARWQCB agreed to remove the following analytes from the program: bromide, orthophosphate, arsenic, barium, cadmium, copper, lead, magnesium, manganese, mercury, potassium, selenium, sodium, and zinc (LARWQCB, 2011).

3.2 ISCR PHASE V MONITORING PROGRAM – FORMER HWSA

The baseline, month #1, month #3, month #6, month #9, month #12, month #18 and month #24 sampling events for the ISCR activities were performed in accordance with the LARWQCB's second revision to M&RP No. CI-8947 dated September 9, 2009. The following six RPM wells

were selected to monitor remediation progress at the Former HWSA during Phase V within treatment area "H" (Table 1):

- MW-35S/D – upgradient and cross-gradient locations;
- MW-32S/D – within treatment area locations;
- MW-33 – downgradient location, deep zone; and
- VW-122 – downgradient location, shallow zone.

The ISCR groundwater monitoring program includes collecting samples for water quality measurements at the Site and off-site laboratory analyses for the frequencies listed in Table 6 of the Second Quarter 2010 EISB and ISCR Progress Report (OTIE, 2010b) and per M&RP No. CI-8947. Groundwater samples are sent to an off-site laboratory for the following analyses: Cr(VI), total sulfide, anions, TDS, dissolved cations, ferrous iron, and mercury by the methods listed in M&RP No. CI-8947. Field measurements include DO, ORP, pH, specific conductivity, and temperature.

3.3 EISB PHASE VI MONITORING PROGRAM – FORMER BLDG 269 AREA

The baseline, month #1, month #3, month #6 and month #12 sampling events for the Phase VI EISB activities were performed in accordance with the LARWQCB's second revision to M&RP No. CI-8947 dated September 9, 2009. To evaluate geochemical changes associated with the EISB injection activity during Phase VI, the following monitoring wells were selected as RPM wells within treatment area "G":

- CM-16 – upgradient location;
- CM-4D – within treatment area location; and
- MW-38 – downgradient location.

The groundwater monitoring program includes collecting samples for water quality parameter measurements at the Site and off-site laboratory analyses at frequencies listed in Table 3 of the Fourth Quarter 2009 EISB Progress Report (OTIE, 2010a) and per M&RP No. CI-8947. Groundwater samples are sent to an off-site laboratory for the following analytes: VOCs, VFAs, dissolved gases, anions, ferrous iron, TDS, TOC, dissolved cations, mercury, and Cr(VI) by the methods listed in M&RP No. CI-8947. Field measurements include DO, ORP, pH, specific conductivity, and temperature.

3.4 EISB PHASE VII MONITORING PROGRAM – FORMER TANK T3 AREA

The baseline event for the Phase VII EISB activities was performed in accordance with the LARWQCB's second revision to M&RP No. CI-8947 dated September 9, 2009. To evaluate geochemical changes associated with the EISB injection activity during Phase VII, the following monitoring wells were selected as RPM wells within treatment area "F":

- RW-15 – upgradient location;
- RW-14 – within treatment area location; and
- RW-11 – downgradient location.

The groundwater monitoring program includes collecting samples for water quality parameter measurements at the Site and off-site laboratory analyses at frequencies listed in Table 3 of the Fourth Quarter 2009 EISB Progress Report (OTIE, 2010a) and per M&RP No. CI-8947. Groundwater samples are sent to an off-site laboratory for the following analytes: VOCs, VFAs, dissolved gases, anions, ferrous iron, TDS, TOC, dissolved cations, mercury, and Cr(VI) by the methods listed in M&RP No. CI-8947. Field measurements include DO, ORP, pH, specific conductivity, and temperature. Well RW-11 is a RPM point for the Northwest Area (Phase IV) and Former Tank T3 area (Phase VII). Because the parameter list for the Phase IV wells has been abbreviated per LARWQCB 2011 letter, analysis of RW-11 samples for the Phase VII monitoring events will include the full analyte list.

3.5 GROUNDWATER GAUGING ACTIVITIES

Select wells were gauged for depth to groundwater prior to groundwater purging and sampling activities in each area. An electronic interface probe, accurate to the nearest ± 0.01 feet, was used to measure the water levels in each well and for the determining presence or absence of substrate. Total well depths in selected wells were measured by lowering the weighted probe to the bottom of the well and recording the depth to the nearest 0.01 feet. Well construction details are summarized in Table 2.

3.6 GROUNDWATER PURGING AND SAMPLING ACTIVITIES

Following gauging activities, and prior to sample collection, each well was purged using the low flow purging method to minimize stress to the groundwater system by minimizing drawdown caused by pumping. The overall goal of low flow purging is to produce a drawdown of less than 10% of the saturated screened interval during purging.

During groundwater purging, water quality parameters, such as temperature, pH, electrical conductivity, DO, ORP, and turbidity, were monitored continuously in a flow-through cell with a calibrated water quality meter. Water levels and measurements of water quality parameters were recorded every three to five minutes until water quality parameters stabilized to within 10% following three consecutive measurements.

Upon stabilization of water quality parameters, groundwater samples were collected following project-specific requirements and in accordance with the OTIE Standard Operating Practice Number OTIE008F in pre-labeled sample vials or containers. Immediately following collection, the samples were placed on ice, maintained at 4°C ± 2°C and transported under appropriate chain-of-custody protocol to a California State-certified analytical laboratory, Calscience Environmental Laboratories, Inc. located in Garden Grove, California. Quality assurance/quality control (QA/QC) samples were collected during each event.

All analyses were conducted at a laboratory certified for such analyses by the State of California and NELAC and in accordance with current U.S. EPA procedures or as specified in the M&RP.

4.0 REMEDIAL PROGRESS RESULTS

4.1 PHASE IV – NORTHWEST AREA

The wells in the Northwest Area were not sampled during the Third Quarter 2012. The next sampling event, Month #36, will occur in December 2012 with results reported in the Fourth Quarter- 2012 Annual report to be submitted in February 2013.

Historical COC concentrations for monitoring wells and recovery wells are provided in Tables B1 and B2 in Appendix B.

4.2 PHASE V – FORMER HWSA

The wells in the HWSA Area were not sampled during the Third Quarter 2012. The next sampling event, Month #30, will occur in December 2012 with results reported in the Fourth Quarter- 2012 Annual report to be submitted in February 2013.

Historical COC concentrations for monitoring wells and recovery wells are provided in Tables B1 and B2 in Appendix B.

4.3 PHASE VI – FORMER BLDG 269 AREA

The wells in the Former Bldg 269 Area were not sampled during the Third Quarter 2012. The next sampling event, Month #18, will occur in December 2012 with results reported in the Fourth Quarter- 2012 Annual report to be submitted in February 2013.

Historical COC concentrations for monitoring wells and recovery wells are provided in Tables B1 and B2 in Appendix B.

4.4 PHASE VII – FORMER TANK T3 AREA

4.4.1 Baseline Sampling Event

The baseline groundwater sampling event for Phase VII was performed on September 18, 2012. The field parameters and analytical results are presented in Table 4. The baseline data are summarized in the following subsections and will be used to evaluate all future data collected as part of this M&RP.

Well purge records are provided in Appendix C. Chain of custody forms and analytical laboratory reports are provided in Appendix D.

4.4.2 Groundwater Gauging Results

Depths to water measured at wells RW-11 and RW-14 and recorded on the purge sheets. Well RW-15 is not gauged because it is obstructed with groundwater extraction conveyance hose. Static depth to water measurements were 25.62 feet below top of casing (btoc) (RW-11) and 27.82 feet btoc (RW-14) on September 18, 2012. The well casing elevations have not yet been surveyed and groundwater elevations could not be calculated for the wells.

The most recent gauging at the site was in May 2012. The groundwater elevation contours and flow directions for the northern portion of the Site are shown in Figure 3. As shown, the gradient slopes to the west and southwest in the Former Tank T3 area.

4.4.3 Groundwater Monitoring Results

Groundwater samples were collected from three RPM wells on September 18, 2012 for all analytes listed in Table 4 to establish baseline values. An exception was the TOC sample from well RW-11. The TOC sample container was broken before reaching the laboratory and was collected again on September 19, 2012. The baseline results are presented below.

Selected groundwater monitoring results for COC and dissolved gases are shown in Figure 4 and substrate distribution results and selected field parameters are shown in Figure 5.

4.4.4 Groundwater Monitoring Results, Baseline

Groundwater samples for the Phase VII baseline event were collected in accordance with M&RP No. CI-8947. The following presents the results for the baseline samples collected from the RPM wells on September 18, 2012:

- The only CVOC result that exceeded a CAP goal was for 1,1-DCE in well RW-14 at a concentration of 190 µg/L.
- Vinyl chloride (VC) was detected in injection area well RW-14 at a concentration of 54 µg/L. VC is an intermediate daughter product, resulting from the EISB dechlorination process and concentrations are anticipated to eventually dissipate as further treatment is completed.
- VFAs were not detected in any RPM well.
- Methane was detected in all three RPM wells at concentrations ranging from 17 µg/L in well RW-11 to 465 µg/L in well RW-14.
- Carbon dioxide (CO_2) concentrations ranged from 35.3 milligrams per liter (mg/L) (well RW-15) to 59.3 mg/L (well RW-14).
- No ethane or ethene was detected in RPM wells above the reporting limit of 1.0 µg/L during the baseline.
- TDS concentrations ranged from 1,200 mg/L in RW-15 to 2,100 mg/L in well RW-11.
- TOC concentrations ranged from 34 mg/L (well RW-11) to 40 mg/L (well RW-14).
- Nitrate concentrations were detected in RW-14 at 0.7 mg/L and in RW-11 at 84 mg/L. Sulfate concentrations ranged from 210 mg/L (RW-14) to 560 mg/L in well RW-11. Ferrous iron was detected only in well RW-14 at a concentration of 2.82 mg/L.
- pH levels in the three RPM wells ranged from 7.14 to 7.26 in September 2012. DO concentrations ranged from 0.21 mg/L to 1.54 mg/L and ORP levels ranged from (-)80 millivolts (mV) to (+)132 mV.

5.0 QA/QC SAMPLE RESULTS

For the Phase VII Baseline sampling event, one field duplicate and one trip blank were collected. The duplicate groundwater sample labeled DUP5-9-18-12 was collected from well RW-14. The trip blank was labeled as TB1-9-18-12. Both QA/QC samples were analyzed only for VOCs. The purpose of a duplicate sample is to assess the accuracy and consistency of the sampling program. The relative percent differences (RPDs) between positive detections for the primary and duplicate samples were within the specified range for the sampling program (<30%) for all detected analytes except for 1,2-DCA: both the primary and duplicate 1,2-DCA results were flagged with a "J."

Trip blanks are used to evaluate representativeness by identifying any VOCs that may have been introduced to the samples' environment during shipment, handling, or storage on site and at the laboratory. The laboratory-supplied trip blank was placed in the cooler with other groundwater samples for shipment to the laboratory by courier. All VOCs were non-detect for the trip blank.

All groundwater samples were shipped under appropriate chain of custody protocol at the method-specified temperature limit (4°C ± 2°C). All sample analyses were completed within the prescribed holding time.

Laboratory QA/QC procedures were carried out in accordance with U.S. EPA method specifications and the data was accepted based on the QA/QC criteria established by the U.S. EPA. Laboratory QA/QC samples included method blanks, laboratory control samples (LCS), LCS duplicates (LCSD), matrix spike samples (MS), MS duplicate (MSD) samples, post-digestion spike (PDS), and post-digestion spike duplicate (PDSD).

All laboratory quality control samples (method blanks, spike/spike duplicate, PDS/PDSD, and LCS/LCSD) were within their respective control limits with the following exceptions:

- Zinc and boron in spike/spike duplicate sample RW-14 were outside of their control limits due to matrix interference. As a result, zinc and boron detects in sample RW-14 were "J" flagged.

6.0 WASTE MANAGEMENT

Purge water generated during groundwater monitoring activities from the Former Tank T3 Area wells was treated by the GRTS and stored for use as mixing water for the EISB injections.

7.0 SUMMARY

7.1 PHASE IV EISB SUMMARY – NORTHWEST AREA

In October 2009, the Phase IV EISB injections were implemented in the "Northwest Area" of the Site. A total of four RPM wells were included in the M&RP for CI-8947, and eight post-injection monitoring events have been completed since the injections. No EISB-related activities were performed in the Northwest Area during the third quarter of 2012.

The next scheduled EISB monitoring event (month #36) for the Northwest Area will be in December 2012, concurrent with the second semiannual 2012 event per the M&RP.

7.2 PHASE V ISCR SUMMARY – FORMER HWSA

In June 2010, the Phase V ISCR injections were implemented in the former HWSA. A total of six RPM wells were included in the M&RP for CI-8947 and seven post-injection monitoring events have been completed. No ISCR-related activities were performed at the Former HWSA during the third quarter of 2012.

The next sampling event, month #30 for Phase V, will be in December 2012, concurrent with the second semiannual 2012 event per the M&RP.

7.3 PHASE VI EISB SUMMARY – FORMER BLDG 269 AREA

In May 2011, the Phase VI EISB injections were implemented in the Former Bldg 269 Area of the Site. A total of three RPM wells were included in the M&RP for CI-8947 and five post-injection monitoring events have been completed since the injections. No EISB-related activities were performed in the Former Bldg 269 Area during the third quarter of 2012.

The next sampling event, month #30 for Phase V, will be in December 2012, concurrent with the second semiannual 2012 event per the M&RP.

7.4 PHASE VII EISB – FORMER TANK T3 AREA

In September 2012, the Phase VII EISB injections were implemented in the Former Tank T3 Area of the Site. A total of three RPM wells were included in the M&RP for CI-8947 and one monitoring event was completed prior to the injections. EISB-related activities performed at the Former Tank T3 Area during the third quarter of 2012 are summarized below:

- Injection wells (IP-02 through IP-06) were installed and developed in September 2012.
- The baseline groundwater sampling event was conducted prior to the start of the injections in accordance with the M&RP. Groundwater levels were gauged and samples collected on September 18, 2012.
- Static depth to water measurements were 25.62 feet btoc (RW-11) and 27.82 feet btoc (RW-14) on September 18, 2012.
- TCE was detected in upgradient well RW-15 at a concentration of 7.7 µg/L and in treatment are well RW-14 at 2.8 µg/L.
- 1,1-DCE concentrations were ranged from 41 µg/L (upgradient RW-15) to 190 µg/L at well RW-14 in the treatment area.
- VC was detected in injection area well RW-14 at a concentration of 54 µg/L. The VC concentrations are an intermediate daughter product, resulting from the EISB

dechlorination process and are anticipated to eventually dissipate as further treatment is completed.

- VFAs were not detected in any well during the baseline event.
- Methane was detected in all three RPM wells at concentrations ranging from 17 µg/L in well RW-11 to 465 µg/L in well RW-14.
- CO_2 concentrations ranged from 35.3 mg/L (well RW-15) to 59.3 mg/L (well RW-14).
- No ethane or ethene was detected in RPM wells above the reporting limit of 1.0 µg/L during the baseline.
- Subsurface injections of EVO were performed using a portable injection system between September 24 and 27, 2012.
- A combined total of 550 gallons of EVO substrate and 10,840 gallons of treated groundwater were injected in the Former Tank T3 area via the five new injection wells and two sparge wells in September 2012.

The next scheduled EISB monitoring events (Month #01 and Month #03) for the Former Tank T3 Area are scheduled for October 2012 and December 2012, respectively. The December sampling will be concurrent with the second semiannual 2012 sampling event conducted per the M&RP.

Results for the December 2012 remedial progress sampling events for all four phases (IV, V, VI, and VII) will be reported in the Fourth Quarter 2012 and 2012 Annual EISB/ISCR summary report to be submitted by February 15, 2013.

Month #30	NA		NA			NA	5/30/12	December 2012	December 2013	December 2014
Month #36	NA		NA			NA	December 2012	June 2013	June 2014	June 2015

Notes:
1) feet bgs = feet below ground surface
2) EISB = enhanced *in situ* bioremediation
3) ISCR = *in situ* chemical reduction
4) RPM = remedial progress monitoring
5) Blue indicates a future monitoring event
6) "Summary Reference" refers to the document which presents the details for each of the injection events.

Table 2

Re: Well Installation Report
Former Tank T3 Area, Former Canoga Park Facility
8433 Fallbrook Avenue, Canoga Park, California
WDR #R4-2007-0019 Series 092
Compliance File No. CI-8947

Dear Dr. Chang:

Oneida Total Integrated Enterprises, LLC (OTIE) has prepared this technical memorandum on behalf of Raytheon Company documenting the installation of five injection wells within the immediate vicinity of the Former Tank T3 Area. Wells were installed for remedial purposes at Raytheon's Former Canoga Park Facility located at 8433 Fallbrook Avenue, Canoga Park, California (Figure 1). The Former Tank T3 Area remedial action is Phase VII of continuing groundwater remediation at the site.

In the *Corrective Action Plan Addendum #3, Work Plan for Additional Enhanced In Situ Bioremediation (EISB) and In Situ Chemical Reduction Activities*, dated September 2008, OTIE proposed installing five groundwater injection wells in the Former Tank T3 Area. The request was approved by the Los Angeles Regional Water Quality Control Board in a letter dated February 23, 2009 (provided in Attachment A).

Injection wells IP-02, IP-03, IP-04, IP-05, and IP-06 were installed in the vicinity of the Former Tank T3 Area between September 10 and 14, 2012. Well development of the recently installed injection wells occurred between September 17 and 18, 2012. The injection wells were installed to implement an EISB program to accelerate the degradation of 1,1-dichloroethene (1,1-DCE) within in the vicinity of the Former Tank T3 Area.

Activities described herein include:

- Pre-field activities, including obtaining required permits and notifying Underground Service Alert of Southern California;
- Performing a geophysical survey to identify and locate utilities and other subsurface anomalies;
- Installation of the new remedial wells;
- Well development;

- Surveying of the well locations; and
- Disposal of investigation-derived waste.

Pre-Field Activities

Following approval to execute work in the Former Tank T3 Area, a well installation permit number 890438-13-17 was obtained from the County of Environmental Health Division of Los Angeles County (provided in Attachment A). A site-specific safety and health plan was prepared in advance and implemented during well installation and development activities.

Underground Service Alert of Southern California was notified of the intent to drill and issued the following ticket number: A22491348-00A. A geophysical line locator (Spectrum Geophysics of Los Angeles, California) was contracted to clear the drilling locations of subsurface utilities under the direction of an OTIE representative on September 6, 2012.

Installation of Wells

Injection wells IP-02, IP-03, IP-04, IP-05, and IP-06 were installed using a CME 95 hollow stem auger rig operated by Gregg Drilling and Testing, Inc. (Gregg) of Signal Hill, California, between September 10 and 14, 2012. All site activities were conducted under the direction of an experienced OTIE geologist. The locations of the new wells are presented on Figure 2. Prior to drilling, boreholes were cleared to depths between 6.5 and 10.5 feet below ground surface (bgs) using a hand auger because of known utilities within the immediate area of the proposed boring locations.

Borings were advanced with 8.5-inch diameter augers. Two well locations (IP-02 and IP-04) were continuously sampled to total depth with successive discrete sample using either a 1.5-inch by 18-inch or 1.5-inch by 24-inch standard penetration test sampler for soil logging purposes. All borehole geology was logged from soil samples by an experienced OTIE field geologist using the Unified Soil Classification System (USCS) and knowledge of the site geology. Each sample interval was field-screened for volatile organic compounds (VOCs) using a calibrated photoionization detector (PID). The soil cuttings from the non-cored borings were also field-screened for VOCs using a PID. All USCS descriptions, PID readings, and well construction details are included on the boring logs provided in Attachment B.

No significant VOC concentrations, odors, or staining were observed during drilling activities at any of the borings. Lithologies observed in borings IP-02 and IP-04 were generally consistent with other borings within the vicinity of Former Tank T3 Area as described below:

- 0.0 feet bgs to 0.8 feet bgs: Pavement;
- 0.8 feet bgs to 5.5 feet bgs: Fill; and
- 5.5 feet bgs to total depths (60 to 65 feet bgs): Weathered siltstone.

Boring logs for wells IP-02, IP-04, and as-built diagrams of wells IP-03, IP-05, and IP-06 Attachment B.

Borings for the wells were advanced to depths between approximately 60.3 and 65.0 feet bgs. Note that the boring for well IP-02 was advanced to approximately 65 feet bgs, but was backfilled with bentonite pellets, hydrated in discrete lifts to approximately 62 feet bgs before setting the well. Injection wells were constructed of 2-inch diameter schedule 40 polyvinyl chloride (PVC) with 0.020-inch-slotted PVC well screens. Wells were each constructed with a 15-foot screened interval between approximately 45 feet and 60 feet bgs. Total depth of wells ranged from 60.3 to 61.0 feet bgs. A coarse-sand filter pack (Monterey #2/12) was placed within the annular space between the well screen and formation to a minimum of three feet above the top of the well screen. Above the filter pack, approximately one foot of fine silica transition sand (#0/30) was followed by approximately three feet of 3/8-inch bentonite chips or pellets, hydrated in 6-inch lifts. Portland cement bentonite grout consisting of 5% solids was pumped into the annular space using a tremie pipe from the top of the bentonite chips to near ground surface. Wells were completed with flush-mounted, traffic-rated, 12-inch diameter well vaults. Complete well construction details are provided in Table 1 and on the drilling logs. All generated soil cuttings were placed in a roll-off bin, which was labeled and stored on site pending characterization and disposal.

Development of Wells

The recently installed wells were developed between September 17 and 18, 2012, by Gregg using a Smeal development rig under the direct supervision of experienced OTIE field personnel. A total of approximately 540 gallons of water was removed using a bailer and a submersible pump from all five wells during well development. All downhole equipment was cleaned using a steam cleaner prior to beginning development activities and between each well. A surge block, bailer, and submersible pump were used to surge, bail, and pump the well, respectively. Well development continued in each well until it was either bailed dry twice or extracted water was relatively clear by visual inspection. Well development records are provided in Attachment B.

Well Surveying

All wells will be surveyed by a California-licensed survey during the fourth quarter 2012, and data provided in the subsequent report.

Investigation-Derived Waste

All soil cuttings, development water, and water used for equipment cleaning were considered investigation-derived waste (IDW).

- Well development and equipment cleaning water generated during field work were temporarily stored in 10 labeled 55-gallon drums. These drums containing IDW water were treated through the on-site groundwater treatment system and stored on site for use in the EISB injections.
- Soil cuttings were temporarily stored in a label, secured, roll-off bin. IDW will be profiled, transported off site, and properly disposed of during the fourth quarter 2012. Laboratory reports, waste profile, and waste disposal manifests will be provided in the subsequent report.

Please feel free to contact the undersigned at (805) 585-2110 with any questions.

Sincerely,

FOR:

CONDITIONAL APPROVAL OF CORRECTIVE ACTION PLAN ADDENDUM #3 WORK PLAN FOR ADDITIONAL ENHANCED IN SITU BIOREMEDIATION AND IN SITU CHEMICAL REDUCTION ACTIVITIES – FORMER RAYTHEON FACILITY (HUGHES MISSILE SYSTEM COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

Los Angeles Regional Water Quality Control Board (Regional Board) staff received and reviewed the *Corrective Action Plan Addendum #3 Work Plan for Additional Enhanced In Situ Bioremediation and In Situ Chemical Reduction Activities* (Work Plan), dated September 2008, prepared by TN & Associates, Inc. for the referenced site. The Work Plan proposes to implement an additional Enhanced In Situ Bioremediation (EISB) program to reduce volatile organic compounds (VOCs) concentrations and to implement In Situ Chemical Reduction (ISCR) technology for the reduction of hexavalent chromium (Cr^{+6}) concentrations.

A pilot test was performed to evaluate the ability of EISB to reduce chlorinated ethenes in groundwater between September 2003 and June 2004. Based on the successful results of the pilot test, a full-scale EISB program was implemented to accelerate degradation of chlorinated ethenes, particularly 1,1-dichloroethene (DCE), in shallow groundwater between October 2005 and July 2008.

To further treat DCE and trichloroethene (TCE) in shallow groundwater, the additional EISB program is proposed for three separate treatment areas referred to herein as: 1) Northwest Area, 2) Former Tank T3 Area, and 3) Former Bldg 269 Area. The target remediation depths for each area vary, but are generally between depths of 30 to 60 feet (ft) below ground surface (bgs). The EISB program will involve the injection of a carbon source/electron donor in these areas, which should induce sulfate reduction, reduce the dissolved oxygen (DO), and oxidation-reduction potential (ORP), and enhance the rate of anaerobic dechlorination of DCE and TCE in groundwater.

In addition to the VOC concentrations in groundwater at the site, there is a small area with elevated concentrations of Cr^{+6} in the immediate vicinity of the former hazardous waste storage area (Former HWSA), located in the northwest portion of the site. The ISCR technology is proposed to reduce Cr^{+6} concentrations in groundwater by injecting a reducing agent, calcium polysulfide, into the saturated zone between 35 and 55 ft bgs in the Former HWSA footprint. The reducing agent should transform the Cr^{+6} to the less toxic and less mobile trivalent chromium (Cr^{+3}).

The Work Plan is approved with the following conditions:

1. A site-specific Health and Safety Plan shall be available at the site and implemented during all field activities.

2. Prior to start of work, all necessary permits shall be obtained from appropriate agencies. Copies of the agency-approved permits must be included in the final report submitted to the Regional Board.

3. Contaminated soil and water generated, if any, during drilling and sampling shall be managed in accordance with appropriate regulations.

4. Properly manifest and dispose of all wastes generated during field activities in conformation with the State and Federal regulations. Copies of the manifest for waste disposal shall be included in the final report submitted to the Regional Board.

5. Notify Regional Board staff at least 1 week before you start the proposed fieldwork.

6. The well installation report shall be submitted to the Regional Board within 60 days following the completion of the construction and development of the injection wells and groundwater monitoring wells.

7. A final report, providing the results of the proposed Work Plan, shall be submitted to the Regional Board within 90 days after completion of the Work Plan implementation. The report shall contain both tabular and graphical summaries of the monitoring data obtained during the technology application, conclusions regarding the effectiveness of the technology, and groundwater remediation activities.

Please note that existing General Waste Discharge Requirements (WDR) Order No. R4-2005-0030 and Monitoring and Reporting Program (MRP) No. CI-8947, that was issued to you on September 20, 2005, was for implementation of a previous full-scale EISB application on site. Therefore, the implementation of this additional EISB and ISCR at the site requires a revision of general WDR Order No. R4-2005-0030 and MRP No. CI-8947 from this Regional Board. Please submit a complete Application/Report of Waste Discharge (Form 200) for Regional Board review and approval. An electronic copy of Form 200 can be found on the Internet at: http://www.waterboards.ca.gov/sbforms/docs/form200.pdf.

On March 1, 2007, the Regional Board adopted the general WDR Order No. R4-2007-0019 for groundwater remediation at petroleum hydrocarbon fuel, volatile organic compound and/or hexavalent chromium impacted sites which supersedes WDR Order No. R4-2005-0030. The coverage under general WDR Order No. R4-2007-0019 will be issued to you in a separate letter. Requirements for the monitoring and sampling parameters, frequency, and reporting periods will be stated in the revised MRP No. CI-8947 when the revised general WDR is issued. Please note that the revised MRP No. CI-8947 may be different from your proposed sampling and reporting plan. In addition, the EISB and ISCR injection activities shall not occur at the site prior to the approval date of the revised general WDR coverage by this Regional Board.

Should you have any questions, please contact me at (213) 620-6070.

Sincerely,

Ann Chang

Ann Chang, Ph.D.
Water Resource Control Engineer

ATTENTION: WORK PLAN MODIFICATIONS MAY BE REQUIRED IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED AT THE SITE INSPECTION ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THIS DEPARTMENT.

I hereby agree to comply in every respect with all the regulations of the County Environmental Health Division and with all ordinances and laws of the County of Los Angeles and the State of California pertaining to well construction, reconstruction, and decommissioning data deemed necessary by the County Environmental Health Division Of Los Angeles County.

Signature of Applicant: _____ Printed Name: Lucas Buda

THIS PERMIT IS NOT COMPLETE UNTIL ALL OF THE FOLLOWING REQUIREMENTS ARE SIGNED BY THE DEPUTY HEALTH OFFICER. WELL CONSTRUCTION OR DECOMMISSIONING CANNOT BE STARTED WITHOUT A WORK PLAN APPROVAL FROM THIS DEPARTMENT.

**********(DEPARTMENT USE ONLY)**********

WORK PLAN APPROVAL (Date approved is valid for 180 Days)	REHS Arnaldo Juarez REHS NO. DATE 09/05/12
Conditions: Permit # 890438 13~17 Observe work plan submitted. All field work must be conducted by a lic professional geologist in the state of Calif. Please notify 48hrs. prior to start field work	ajuarez@ph.lacounty.gov
FINAL INSPECTION (Upon completion of the project, it must be inspected by a Deputy Health Officer or the Well Unit Staff. Contact the Department to schedule an appointment.)	REHS DATE

NOTICE

This well permit approval is limited to compliance with the California Well Standards and the Los Angeles County Code and does not grant any rights to construct, reconstruct, or decommission any well. The applicant is responsible for securing all other necessary permits.

Notes:

1) All concentrations in µg/L.

2) All analyses done by EPA Method 8260, 8260B or 8021B.

3) '-- = not analyzed for parameter

4) Only wells with detectable concentrations of constituents of concern since March 1995 are shown.

5) 1,1-DCA = 1,1-Dichloroethane; 1,2-DCA = 1,2-Dichloroethane; 1,1-DCE = 1,1-Dichloroethene; cis-1,2-DCE = cis-1,2-Dichloroethene; PCE = Tetrachloroethene; 1,1,1-TCA = 1,1,1-Trichloroethane; TCE = Trichloroethene; TCFM = Trichlorofluoromethane; VC = Vinyl C

6) "J" - result qualified as estimated due to quality control issues.
