The subject site and immediate surrounding properties appear essentially as shown in the previous digital aerial photograph image, except the containers and materials piles have been removed from the property to the north of the west portion of the subject site across the Zanja Creek.

Assessor's Parcel Information

The subject site is comprised of APN 0292-192-11, approximately 8.17 acres of land under industrial use, and has an associated address at 301 Tennessee Street. A year built is shown as 1965, presumably for the original onsite industrial buildings (Parcel Quest Lite, 2019).

According to the County of San Bernardino Assessor's online Property Information Management System (PIMS), APN 0292-192-11 is currently owned by La Z Boy Chair Co., who has owned the parcel since at least February 1973. No other property owners are shown. The parcel is shown as industrial land with a light industrial use code shown (County of San Bernardino Assessor's Office, 2019).

During a recent Phase I ESA for the adjoining, offsite property at the northeast corner of the intersection at Tennessee and West State Streets, copies of old Assessor's parcel maps, last revised as late as May 1958, were obtained at the Heritage Room in the A. K. Smiley Public Library in Redlands. These parcel maps had hand written information about usage or parcel occupants and addresses. At the subject site, an address at 301 Tennessee Street and "Lazy-Boy" are shown. Across Tennessee Street to the east of the subject site, the parcel at the northeast corner of Tennessee and West State Streets (shown as Citrus Avenue on the parcel maps) is shown under use by "Wesley Ray Storage

Yard", located at 300 Tennessee Street. To the east beyond this offsite parcel to the east is shown with "Calif. Water & Telephone Co.", located at 1430 Citrus Avenue, and to the north is a parcel shown with address at 340 Tennessee Street. Citrus grove and apparent structures with associated addresses at 1439, 1445, and 1449 Citrus Avenue are shown at the southeast corner of Tennessee Street and Citrus Avenue (present day West State Street).

A copy of the Assessor's Parcel Map is presented on Figure 2 with the approximate boundaries of the subject site.

City Directory Information

Historical EDR city directory information (image report) for listings along Tennessee Street and Kansas Street were reviewed, as the subject site and offsite commercial or industrial properties of concern border these streets. The available listings were from 1965 to 2014. The EDR-City Directory Image Report is provided in Appendix E.

Listings for the subject site address at 301 Tennessee Street were available under La-Z-Boy West, LAZBOY West, La-Z-Boy Chair Company, La-Z-Boy Incorporated, or LZB Manufacturing, Inc. in 1972, 1975, 1981, 1985, 1992, 1995, 2000, 2005, 2010, and 2014.

Commercial or industrial listings from 1965 to 2014 for adjacent or nearby properties include a plastics company, storage facility (boat and recreational vehicles), machine shop, alarm company, electric contractors, solar company, engineering company, pipeline contractor, pet resort, automotive-related businesses (including vehicle smog shop, transmission shop, auto upholstery, and auto dismantler) concrete paving contractor, schools and colleges, Southern California Edison service center, dental office, pool service, insurance, analytical lab, antiques, restaurant, plumbing supply, bike shop, and drilling and consulting company.

City Building Records Review

On October 24, 2019, the City of Redlands Building and Safety Division was visited to review available building permits for the subject site address at 301 Tennessee Street. Building permits were available for the subject site dating from 1965 to 2017. These permits are all related to the onsite industrial facility recently vacated by La-Z-Boy. The original portion of Building 1 (main manufacturing building) and Building 3 (smallest building), a total of 72,000 square feet, were permitted in 1965 to 1966. In 1969, Building 2,

12,000 square feet, was permitted, along with an addition of 28,000 square feet to Building 1. Another addition to Building 1 of 43,600 square feet was permitted in 1972. An addition of unspecified size, likely the approximate 21,000 square foot south end of Building 1, was permitted in 1986. The last addition to Building 1, 9,225 square feet, was permitted in 1991. The permit records include typical building features involving structural, mechanical, electrical, and plumbing features. Some floor drains and a seepage pit are documented in some of the permit records. No other features of potential environmental concern were noted.

Interview

On October 21, 2019, during our site reconnaissance, Mr. Chris Davis, Director of Facilities and Automation for La-Z-Boy Incorporated, provided a partial tour of the subject site, and was interviewed. Mr. Davis has worked for La-Z-Boy for 26 years, was knowledgeable about onsite facilities and operations, and is involved with the move-out of the La-Z-Boy operation to Mexico. Mr. Davis stated that the onsite manufacturing facility is designated “Plant 3" for La-Z-Boy. He indicated the large onsite industrial building is designated as “Building 1" and the smaller building in the northwest corner is “Building 2". It was not clear if the smallest and third onsite building was designated by La-Z-Boy, but for the purposes of this Phase I ESA, the smallest building has been designated “Building 3".

The last onsite spray booths, recently removed, were used for a water-based, latex glue which involved no chemical solvent usage. These spray booths were located in the northwest portion of Building 1, approximately 80 to 95 feet east-southeast of the northwest building corner. Other past spray booths that Mr. Davis is aware of, including for lacquer, were located in the old “Finishing Room”, which is located within the northwest portion of Building 1, adjacent to the west of the former central storage. The old “Finishing Room” was used in recent years for Dacron® cutting and storage and a fenced area with stored electrical components. The former maintenance shop in Building 1, adjacent to the east of the former central storage, was used to work on pneumatic/air tools, sewing machines, battery lift, and the “tuggers”, like airport tugs for luggage. The former maintenance shop included welding equipment and a lathe. Other areas of Building 1 were indicated to have been used for storage, offices, cafeteria, assembly, cutting, material receiving, and shipping.

Building 2, located in the northwest corner of the subject site, was used for wood cutting and metal and wood parts storage.

The designated “Hazardous Materials Area” along the west side of the south portion of Building 3 was indicated to be used primarily for storage of empty containers of hazardous materials. Due to their move-out activities, metal and plastic containers with hazardous materials and wastes, including 5-gallon buckets, 55-gallon drums, and approximate 300-gallon totes, were being stored in this area.

The former “Lacquer Room” in the south portion of Building 3 was used to store filters, electrical items, sewing machines, paint supplies, and red-dyed diesel fuel. The red-dyed diesel fuel was utilized for the “switch tractor” trucks used to move truck trailers onsite.

On October 28, 2019, Mr. Tim McCurry, Director of Environmental Health & Safety for La-Z-Boy Incorporated, was briefly interviewed. Mr. McCurry indicated the former operation at the subject site involved relatively minor hazardous materials and wastes, including oils for equipment, paints, and glues. Typical wastes included liquid non-hazardous wastes, light bulbs, batteries, aerosol cans (used for touch-up paint finishing), paint (small quantities), and glues. The smallest onsite building (Building 3) was referred to or called “shed” or “outbuilding” by La-Z-Boy personnel. Mr. McCurry suggested we send him an email to request additional information.

On October 30, 2019, Mr. McCurry was emailed a request for records/information, including the numbered items below. On November 14, 2019, Mr. Cody Buell, Environmental Health and Safety & Sustainability Manager for La-Z-Boy, provided the responses to the number items shown below.

1) A list of all known hazardous materials that have been stored/used onsite.

La-Z-Boy response: Hazardous materials generated were typically thinners, paints, and stains. No major quantities of any material were used at the site.

2) A list of all known hazardous wastes that have been generated onsite.

La-Z-Boy response: Limited to “typical” wastes such as diesel, thinners, stains, and paints. Nothing in large quantities.

3) Does La-Z-Boy know of any underground tanks that have been present onsite?

La-Z-Boy response: No.

4) Is La-Z-Boy aware of any onsite environmental issues affecting the property?

La-Z-Boy response: No.

5) Is La-Z-Boy aware of any offsite environmental issues at neighboring properties?

La-Z-Boy response: No.

6) Does La-Z-Boy have any maps, recent and historical, which show storage/use of hazardous materials and wastes (including spray booths and degreaser)?

La-Z-Boy response: I (we) have not been able to track one down as of this moment.

On November 13, 2019, Mr. McCurry called in response to our request for information regarding the former collection trap for fire suppression water overflow. Mr. McCurry was unaware of any specific details regarding the former collection trap, but indicated that current procedures at La-Z-Boy facilities involve an annual water flow flush test of the fire sprinkler system to ensure adequate pressure is available for the fire sprinklers to work properly. This test involves water flowing through pipes and being fed directly into drains that lead to the sanitary sewer.

In a followup to the above telephone conversation with Mr. McCurry regarding the former collection trap for fire suppression water overflow, Mr. Chris Davis, Director of Facilities and Automation for La-Z-Boy Incorporated, responding to an internal La-Z-Boy email, indicated he believed the former trap was supposed to collect any oils or debris before going over to the storm canal north of the property line.

On November 14, 2019, Mr. Buell emailed Mr. Chris Davis about our question regarding the nature and purpose of the former collection trap for fire suppression water overflow. Mr. Davis responded that he thought it was supposed to collect any oils or debris before going over to the storm canal north of the property line.

SITE RECONNAISSANCE

Site reconnaissance across the subject site was initially conducted on October 21, 2019, and later observations during Phase II ESA related activities were made on October 29 and November 6, 7, and 8, 2019. To orient our site reconnaissance, a copy of a recent color aerial photograph was obtained for our use. This recent color aerial photograph with approximate site boundaries is presented on Figure 3.

The subject site is comprised of an approximate 8.2-acre, rectangular parcel (APN 0292-192-11) of land at the northwest corner of Tennessee Street and West State Street, addressed 301 Tennessee Street. Just over half the area of the subject site is occupied by buildings, including the main manufacturing building, Building 1, approximately 181,500 square feet of primarily concrete tilt up construction with concrete block wall and metal siding on the north side addition from 1991. Buildings 2 and 3 are approximately 12,000 and 1,355 square feet, respectively, of concrete tilt up construction. All three buildings have flat roofs. The remainder of the subject site includes asphalt-paved drives, parking areas, loading dock areas, and planter areas. Onsite vegetation includes landscaped trees (including orange trees along most of the north boundary), bushes, ornamental plants, and grass. Approximate 6-foot high metal chain-link fencing is present along most of the north site boundary and along the south portion of the west site boundary. Wrought iron fencing and/or security gates are present along/near the north portion of the east site boundary, along the south side just east of the southwest corner at a concrete entrance drive off of West State Street, and near the middle of the west side of Building 1, running east to west, extending from Building 1 to the west site boundary. Extending west from the southwest corner of Building 1 to the southwest site corner is approximate is approximate 8-foot high concrete block wall, atop of which is up to several feet high of wrought iron fencing with spiked tips.

The outside areas of the subject site included parked vehicles, up to around half a dozen truck trailers, two “switch tractor” trucks, a forklift (propane-powered), various roll-off bins that included trash and debris or scrap metal, pallets, baled cardboard, partially disassembled baling equipment, lift equipment, a trash compactor, and metal items.

Inside Building 1 were remnant items, but was largely vacated as a result of the move-out by La-Z-Boy. Office furniture, finished goods, and materials, including wood, poly foam insulation, and metal, were among the items still in the process of being moved out. In the north central portion of the building, primarily at the former manufacturing/assembly Cell 16, were accumulated containers of hazardous materials up to 5 gallons in capacity which included paint, mineral spirits, epoxy, wood stain, floor tile adhesive, asphalt crack filler, chemical cleaner, and urethane. Racks in former storage areas are present. Office furniture and other items remained in the office area and tables, chairs, and outdoor tables with benches and some umbrellas remained in the cafeteria location within the far east end of Building 1. In the central storage adjacent to the west of the former maintenance shop some items were left that are related to building maintenance, including cleaners, light bulbs, air hoses, and roof drain parts.

Inside Building 2 were boxes of materials, including wood and metal items. Two approximate 300-gallon totes of green-dyed glue were present.

Inside Building 3, in the south half, the last remaining storage items included four 55-gallon drums of red-dyed diesel fuel, plastic 5- to 55-gallon containers that included latex rubber wax, neutralizing acid absorber, degreasers (non-chlorinated), and polyurethane additive (release agent), fluorescent light bulbs, and three plastic buckets with light bulbs, batteries, and light fixture ballasts marked to be recycled. Minor diesel-stained concrete was noted on the floor. In the north half of Building 3 is compressor equipment, including two compressor units and associated drying tanks, and electrical equipment, including a 575 volt, step-up, dry type, electrical transformer.

Along the west side of the southwest corner of Building 3, is a canopied fenced “Hazardous Materials Area”. A concrete bermed area is present beneath the canopy, with some apparent paint and glue staining. This location was observed with two approximate 300-gallon totes of glue/adhesive, plastic 5-gallon buckets with lithium grease, paint, and glue, and plastic and metal 55-gallon drums with glue, concrete sealer, waste oil, wax emulsion, and diesel fuel. Immediately adjacent to or near the northwest corner of the concrete berm is what appeared to be smaller areas of dark stained asphalt.

During site visits following the initial visit on October 21, 2019, the amount of truck trailers, vehicles, roll-off bins, etc. outside the onsite buildings were observed to be significantly reduced in number or absent completely. Most of the items observed within all three onsite buildings, including containers of hazardous materials and wastes, were moved offsite following our initial site visit. Safety Kleen transported the containers of hazardous materials and wastes offsite on November 7 and 8, 2019.

Onsite utilities include natural gas, electric, water, sewer, and telecommunications. Two onsite power poles are present with associated lines along the west side of the south portion of the subject site. Near the northernmost of these power poles is an old, pad-mounted electrical transformer with no evidence of leakage. This transformer is likely from the mid 1960s when the industrial development of the subject site began. At least a handful of dry type, private electrical transformers were observed onsite. An electrical panel in Building 2 indicates spray booth fans were present at some point in the past. At the northwest corner of Building 1 is an area bordered by crash posts that formerly had an aboveground propane storage tank. Storm drain swales, asphalt or concrete, are present in the northwest portion of the subject site, draining in a northerly direction to concrete head walls which are associated with drain pipes that terminate into the Mission Zanja Creek flood control channel. At the southernmost loading dock on the east side of

Building 1, just north of the southeast corner, is an apparent storm drain sump with a pump connected to a plastic pipe that discharges to the planter area along the west side of Building 1. An underground tunnel with water and air lines connect Building 3 to the north with the former maintenance shop (old “Spray Room”) in Building 1 to the south. Two fire hydrants are present onsite, one in the north central portion at the other along/near the middle of the west subject site boundary. Two light posts are present along the west boundary of the subject site.

Adjoining Properties

The subject site is located in a mixed commercial, industrial, and residential area that was historically dominated by agricultural groves. The subject site is bordered to the east by Tennessee Street, a 4-lane, asphalt-paved, improved roadway. Bordering to the south is West State Street, a 2-lane, asphalt-paved, improved roadway. To the east beyond Tennessee Street is a yard at 300 Tennessee Street for a former pipeline contractor that is under removal for various items stored on the property, adjacent to which is part of the ESRI campus at 1070 West State Street. To the southeast beyond the intersection at Tennessee and West State Streets are commercial office buildings, including the site of the former Centrum Analytical Laboratories at 290 Tennessee Street, and Redlands Adventist Kindergarten and Kids Care. To the south, across West State Street, is a Southern California Edison facility, addressed 287 Tennessee Street. Adjacent to the west of the central and south portions of the subject site is the Toy Locker, a boat and recreational vehicle storage facility, addressed 300 Kansas Street. Adjacent to the west of the north portion of the subject site is a vacant yard area used for truck trailer parking, associated with the subject site. Bordering to the north of the subject site is the Mission Zanja Creek flood control channel. This channel is earthen where is borders the subject site, but is a concrete-lined channel to the northeast across Tennessee Street where it borders a portion of the ESRI campus to the north. This channel is at least 100 feet wide north of the subject site. Properties beyond the channel to the northwest, north, and northeast include a tow yard, a property under construction for a new United States Post Office, an animal kennel, and numerous commercial businesses in multi-unit buildings.

Observations of the properties adjoining the site did not reveal any potential source(s) of aboveground contamination which is anticipated to significantly impact the subject site.

Color photographs of the subject site and adjoining properties are provided within Appendix F.

REGULATORY AGENCY RECORDS REVIEW

For records relating to environmental compliance and hazardous materials/waste within the County of San Bernardino, the CSBFD-HMD generally is the lead agency. The California Regional Water Quality Control Board, Santa Ana Region (CRWQCB-SAR) or CSBFD-HMD may be the lead agency for soil and/or groundwater investigations and remediation. These agencies were contacted, either directly and/or online, for records they may have for the subject site. Online South Coast Air Quality Management District (SCAQMD) and California DTSC records were also searched.

County of San Bernardino Fire Department-Hazardous Materials Division

A Request to review records for the subject site was emailed to the CSBFD-HMD on October 2, 2019. In a letter dated October 15, 2019, the CSBFD-HMD indicated that records were found. A copy of the CSBFD-HMD records response letter and select records are provided in Appendix G.

The records for the subject site, under La-Z-Boy West at 301 Tennessee Street, pertain to hazardous materials handling and hazardous waste generation. From 1984 to August 2015, permitting records indicated the subject site was permitted for handling hazardous materials, hazardous waste generation, limited hazardous waste generation, conditionally exempt small quantity hazardous waste generation, and/or as an EPCRA (Emergency Planning and Community Right-to-Know Act) facility. More recent permit records were not available.

Documentation was available indicated Business Plans were filed from 1987 to 2012, with electronic submittal in 2014. These Business Plans included inventories of hazardous materials and wastes, including hydraulic fluid (and waste), CalFoam-Bond 100 (natural latex compound), AW-60 wax (wax emulsion), adhesives, synthetic resin, lead-acid batteries, sulfuric acid, heavy duty degreaser (butoxyethanol, sodium hydroxide, and sodium metasilicate), diesel, aerosols (universal waste), waste empty containers, waste non-hazardous liquid, and propane. County permit application documentation from 1993 lists 1,1,1-trichloroethane (1,1,1-TCA) and oil wastes, and hazardous materials, including 1,1,1-TCA, oil, and finish material. County permit application documentation from 1986 lists boiler cleaner waste, cleaning solvents, degreasing waste, latex waste, and alkaline cleaner. The boiler cleaner waste was indicated to be disposed by septic tank, latex waste was placed in the trash, and the remaining wastes were transported by licensed haulers or recycler.

Documentation of periodic county inspections is available from November 1984 to November 2017. Hazardous materials noted include solvents, adhesives (including solvent- and water-based glues), stains (solvent- and water-based), thinner (including methyl ethyl ketone and 1,1,1-TCA), lacquer (solvent- and water-based), 1,1,1-TCA, motor oil, lube oil, hydraulic oil, turbine oil, gear oil, grease, coating materials, propane, oxygen, acetylene, diesel, and paint. Hazardous wastes noted include degreasing solution, waste oil, boiler cleaning waste (alkaline), and 1,1,1-TCA waste.

Violations noted during the onsite inspections include container labeling, removing hazardous wastes every 90 days, berm for the hazardous waste storage area, sign posted for hazardous waste storage area, keeping hazardous waste manifests and receipts available, removal of all used empty drums by licensed hauler, annual update for Business Plan, and failure to obtain California Environmental Protection Agency (EPA) identification (ID) number.

The September 14, 1994 inspection report indicates many materials used onsite were changed from solvent-based (including 1,1,1-TCA) to water-based. The April 23, 1996 inspection report indicates onsite hazardous waste streams had been reduced to waste oil only. The April 21, 2008 inspection report indicates the onsite manufacturing process had changed, some of the manufacturing processes had been outsourced, and the only hazardous waste generated was waste oil from sewing machines. The January 5, 2012 inspection report for the November 28, 2011 inspection indicates hazardous waste was no longer being generated onsite.

California Regional Water Quality Control Board - Santa Ana Region

On October 30, 2019, a request to review records for the subject site address at 301 Tennessee Street was emailed to the CRWQCB-SAR. In a reply email on November 4, 2019, the CRWQCB-SAR indicated that only storm water records are available, and provided an online link to these records at the Water Boards Storm Water Multiple Application & Report Tracking System (SMARTS) website. This website has three listings under Lazboy/La Z-Boy, all of which are industrial, with statuses that include terminated, no action required, and undetermined. Nothing of an environmental concern was noted in a review of the online storm water records for the subject site.

The California State Water Resources Control Board (SWRCB) maintains the online GeoTracker database, which includes CRWQCB-SAR records for: 1) cleanup sites, including leaking underground storage tank (LUST) sites, cleanup program sites, military cleanup sites, and California DTSC cleanup sites; 2) permitted facilities, including waste

discharge requirements sites, permitted USTs, DTSC hazardous waste sites, land disposal sites, irrigated lands regulatory program sites, and oil/gas sites; and 3) other sites, including project sites, non-case information sites, sampling points - public, and field points.

The GeoTracker database was searched for records that may pertain to the subject site or nearby properties (California State Water Resources Control Board, 2019). No records were found to be associated with the subject site. The closest site to the subject site with records is the City of Redlands Corporation Yard at 1270 West Park Avenue, located approximately 760 feet north of the subject site. This site is a UST and LUST site with a regulatory case for diesel in soil that was closed in 2000.

California Department of Toxic Substances Control

The online California DTSC Hazardous Waste Tracking System (HWTS) was searched for hazardous waste manifest records available for sites at or adjacent to the subject site (California DTSC, 2019b). Hazardous waste manifest records for the subject site were found under 301 Tennessee Street and adjacent property to the west under 300 Kansas Street.

Under 301 Tennessee Street, the subject site is listed with two California EPA ID profiles, one for La-Z-Boy and the other for Hahan Contractors. The California hazardous waste manifest data is from 1994 to 2015, and documents asbestos-containing waste, other inorganic solid waste, off-specification, aged or surplus organics, other organic solids, and liquids with halogenated organic compounds $\geq$1,000 milligrams per liter (mg/L). The manifest data for the subject site is similar to and inclusive within that shown in the HAZNET database, discussed in the HAZNET subsection of the **ENVIRONMENTAL DATABASE REVIEW** section of this Phase I ESA report.

Under 300 Kansas Street, Spartech Plastics, Inc. is listed with one California EPA ID profile. Numerous California hazardous waste manifest data is listed from 1993 to 2005, and documents 0.3 ton of an unspecified waste indicated to have an invalid waste code, approximately 10.3 tons of alkaline solution (pH $\geq$12.5) without metals, approximately 0.9 ton of aqueous solution (2< pH <12.5) with organic residues less than 10 percent, approximately 3.4 tons of asbestos-containing waste, approximately 0.02 ton of other inorganic solid waste, approximately 12.2 tons of unspecified solvent mixture, approximately 1.4 tons of waste oil and mixed oil, approximately 3.4 tons of unspecified oil-containing waste, approximately 17.6 tons of other organic solids, and approximately 0.01 ton of liquids with pH $\leq$2.

South Coast Air Quality Management District

The online SCAQMD records (Facility Information Detail [FIND] database) were searched for sites at or adjacent to the subject site. Records were found for the subject site under 301 Tennessee Street and adjacent property to the west under 300 Kansas Street (SCAQMD, 2019). SCAQMD records for the subject site were also directly requested from the SCAQMD on October 2, 2019.

Online FIND records for the subject site are listed under La-Z-Boy West at 301 Tennessee Street. The facility is listed as active. The equipment list includes multiple permits for spray equipment ("spray equipment open" and "spray booth paint and solvent"). Also included are a drying oven, dip tank coating paint, paints drying, and degreaser methylene chloride. Permits for the listed equipment was issued from 1978 to 1991. There have been no reported Notice of Violation (NOV), but a handful of Notices to Comply (NTC) have been reported. The NTC occurred from April 2008 to May 2019, and are all shown as being in compliance. The reported NTC involved posting permits, providing material safety data sheets (MSDS) and VOC content of glue sprayed and wax MSDS, maintaining records, submitting compliance forms and fees, and operating equipment according to the conditions specified in the permit to operate.

On October 9, 2019, the SCAQMD provided digital records for the subject site. These records include permits for similar equipment as indicated above, dated in the time period from 1978 to 1991. Some of the spray equipment permits made reference to stain, glue, and lacquer. One of the two permits for degreasers from 1984 specified only 1,1,1-TCA, trichlorotrifluoroethane, methylene chloride, or a combination of these solvents was to be used as a cleaning solvent in the degreasing equipment. One of the permitted pieces of equipment, permitted in 1989, was an electrodeposition line that included a dip tank. The 1988 permit application for this equipment listed "Ransplate - Electro Deposition Plating", with the word "plating" crossed out and "painting" written next to it.

Under 300 Kansas Street, located adjacent to the west of the subject site, Uniroyal Tech Corp, Royalite Thermoplastics (UTCRT), Alchem Plastics Inc., Spartech Plastics (APISP), and Spartech Plastics Corp. are listed.

UTCRT is listed with a status that indicates the business was sold. The equipment list includes four extrusion systems (foam, plastic, and rubber) and six plastics and resins extruders, with permits from 1981 to 1997. A cancelled permit application from 1989 for cooling towers-hex chrome compliance is documented. There have been no NOV or NTC reported.

APISP is listed with an inactive status. The equipment list includes four extrusion systems (foam, plastic, and rubber), with permits from 2000. A cancelled permit application from 2004 for a foams plastics and rubber extruder is documented. There have been no NOV or NTC reported.

Spartech Plastics Corp. is listed with an active status and no equipment. There have been no NOV or NTC reported.

ENVIRONMENTAL DATABASE REVIEW

EDR was contacted to provide an environmental database search for the subject site. The database search provides information regarding landfills, USTs, hazardous waste generators, etc., at the subject site and surrounding properties in accordance with ASTM Standards and AAI. Numerous sites, including the subject site, were found in EDR's search of available government records within the respective search radii. A copy of the EDR database report, which provides a complete list of the federal, state, tribal, and proprietary records searched is provided in Appendix H.

CORRACTS

The United States Environmental Protection Agency (USEPA) maintains this database, which identifies hazardous waste handlers with RCRA corrective action activity. Teledyne Inc. Teledyne Battery, at 840 West Brockton Avenue, is listed in this database approximately 0.7 mile north-northeast of the subject site. This CORRACTS site is listed with numerous activities, dating from 1987 to 2012, including remedial feasibility investigation and assessment, control of the migration of contaminated groundwater, and control of human exposures. The facility at this site included storage battery manufacturing. No adverse environmental impact to the subject site is anticipated from this CORRACTS site, based on regulatory oversight and distance from the subject site.

RCRA-LQG

The RCRA-LQG (Large Quantity Generators) database includes selective information on sites which generate, transport, store, treat, and/or dispose of hazardous waste as defined by RCRA. LQGs generate over 1,000 kilograms of hazardous waste or over 1 kilogram of acutely hazardous waste per month. One site, SCE Redlands Service Center at 287 Tennessee Street, located south of the subject site across West State Street, is listed twice in this database with no reported violations. Based on the lack of reported violations

and distance away, this RCRA-LQG site should have no adverse environmental impact to the subject site.

RCRA-SQG

RCRA-SQG (Small Quantity Generators) include sites that generate between 100 and 1,000 kg of hazardous waste per month. Eight sites are listed in the RCRA-SQG database within approximately 0.25 mile of the subject site. The only sites within approximately 0.1 mile are Spartech Plastics, Inc. adjacent to the west, Centrum Analytical Laboratories, located to the southeast beyond the intersection at Tennessee Street and West State Street, and Pioneer Consultants, located several hundred feet south of the subject site. All eight RCRA-SQG sites had no reported violations. The listed RCRA-SQG sites should have no adverse environmental impact to the subject site based on the lack of reported violations and/or distance away.

ENVIROSTOR

The California DTSC Site Mitigation and Brownfields Reuse Program's ENVIROSTOR database identifies sites that have known contamination or sites for which there may be reasons to investigate further. There are five sites listed in this database that are located greater than 0.4 mile from the subject site. Based on distance from the subject site and regulatory oversight, no adverse environmental impact to the subject site from these ENVIROSTOR sites is anticipated.

LUST

The SWRCB maintains a list of all leaking underground storage tanks (LUST) within the state. According to the SWRCB LUST database, there are two sites (one listed twice) over 0.1 mile from the subject site. Both of these LUST sites are listed with closed regulatory cases. None of these LUST sites should have an adverse environmental impact to the subject site, based on their closed regulatory case and distance from the subject site.

CPS-SLIC

The Cleanup Program Sites (CPS; also known as Site Cleanups and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) database is derived from the SWRCB online GeoTracker website, which is a data management system for sites that impact, or have the potential to impact with quality in California, with emphasis on groundwater. One site, Argon Fuel, is listed in this database, over 0.2 mile north of the

subject site. Argon Fuel is shown with site assessment under an open regulatory case. Based on the distance away and regulatory oversight, this CPS-SLIC site should have no adverse environmental impact to the subject site.

UST

The UST database is maintained by the SWRCB and lists all registered USTs. This database lists four sites, with only one, SCE-Redlands at 287 Tennessee Street, within 0.1 mile of the subject site. The SCE-Redlands site is located to the south of the subject site across West State Street. Only one of these sites, Redlands Corp. Yard at 1270 West Park Avenue, over 0.1 mile north-northwest of the subject site, has a reported release (LUST). These UST sites should generally have no adverse environmental impact to the subject site due to the distance away and/or closed regulatory case. However, the SCE-Redlands site is located within 100 feet of the subject site, and an unreported UST release could potentially impact the subject site, which is discussed under the **VAPOR ENCROACHMENT EVALUATION** section of this Phase I ESA report.

AST

The SWRCB maintains a list of aboveground storage tanks (ASTs). The data comes from their hazardous substance storage container database. One AST site, SCE-Redlands Service Center at 287 Tennessee Street, is listed twice. This AST site is listed with a total of 14,700 gallons of unspecified hazardous substance storage, but may include diesel fuel, transformer oil, and/or automotive-related hazardous materials and wastes, such as waste oil, motor oil, and automatic transmission fluid. Based on a lack of reported AST release and likely nature of hazardous substances stored, this AST site is not anticipated to have an adverse environmental impact to the subject site.

CERS HAZ WASTE

The CERS HAZ WASTE (California Environmental Protection Agency (Cal EPA) Regulated Site Hazardous Waste) database is a listing of sites in the Cal EPA Regulated Site Portal which fall under the Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, and RCRA Large Quantity Hazardous Waste Generator programs. Thirteen sites are listed in the CERS HAZ WASTE database within 0.25 mile of the subject site. The only sites within approximately 0.1 mile of the subject site are Southern California Edison Redlands Service Center at 287 Tennessee Street, Broncs Towing Inc. at 380 Kansas Street, and Dutch Girl Cleaners at 414 Tennessee Street, Suite K. The SCE Redlands Service Center site,

located south of the subject site across West State Street, has no reported violations. The Broncs Towing, Inc. site, located approximately 120 feet north of the subject site across the Mission Zanja Creek flood control channel, is listed with multiple hazardous waste generator violations, including hazardous materials inventory and site map submittal insufficiencies. The Dutch Girl Cleaners site, located approximately 350 northeast of the subject site, is listed with multiple hazardous waste generator violations. Based on the distance away and/or lack of reported violations, the CERS HAZ WASTE sites should have no adverse environmental impact to the subject site.

SWEEPS UST

The Statewide Environmental Evaluation and Planning System (SWEEPS) database is an UST listing that was updated and maintained by a company contracted by the SWRCB. This database lists five sites within approximately 0.25 mile of the subject site. One of the six sites has a closed LUST regulatory case. The closest site is SCE at 287 Tennessee Street, south of the subject site across West State Street. This site is listed with one 10,000-gallon UST used for regular unleaded gasoline motor vehicle fuel. Based on the distance away, closed LUST regulatory case, and/or lack of reported release, the listed SWEEPS UST sites are generally not anticipated to have an adverse environmental impact to the subject site. However, the SCE site is located within 100 feet of the subject site, and an unreported UST release could potentially impact the subject site, which is discussed under the **VAPOR ENCROACHMENT EVALUATION** section of this Phase I ESA report.

HIST UST

The SWRCB maintains the Historical UST (HIST UST) list which contains active and inactive underground storage tank locations. This database lists six sites (two sites are listed twice) within approximately 0.25 mile of the subject site. The nearest HIST UST site to the subject site is SCE Redlands Service Center at 287 Tennessee Street, located to the south of the subject site across West State Street. This facility is listed with at least two USTs, one a 10,000-gallon unleaded gasoline tank, and the other an apparent waste tank of unreported capacity. The second closest site, Wesley Ray and Son, Inc. at 300 Tennessee Street, is located to the east of the subject site across Tennessee Street. This site is listed with a 500-gallon diesel tank and 1,000-gallon regular gasoline tank. Based on the distance away, regulatory oversight, and/or past offsite Phase II ESA by this firm, the listed HIST UST sites are generally not anticipated to have an adverse environmental impact to the subject site. However, the SCE Redlands Service Center site is located within 100 feet of the subject site, and an unreported UST release could potentially impact the subject site, which is discussed under the **VAPOR**

ENCROACHMENT EVALUATION section of this Phase I ESA report.

CA FID UST

The California Facility Inventory Database (FID) contains a historical listing of active and inactive UST locations from the SWRCB. The same five sites listed under the SWEEPS UST are listed in this database. This database does not provide specific information regarding USTs. Based on the distance away, closed LUST regulatory case, and/or lack of reported release, the listed CA FID UST sites are generally not anticipated to have an adverse environmental impact to the subject site. However, the SCE site is located within 100 feet of the subject site, and an unreported UST release could potentially impact the subject site, which is discussed under the **VAPOR ENCROACHMENT EVALUATION** section of this Phase I ESA report.

CERS TANKS

This database is a list of sites in the California Environmental Protection Agency Regulated Site Portal which fall under the Aboveground Petroleum Storage and UST regulatory programs. Three CERS TANKS sites are listed within 0.25 mile of the subject site. The only one of these three sites located within 0.1 mile is SCE Redlands Service Center at 287 Tennessee Street. This site is listed for aboveground petroleum storage with no reported violations. Based on the distance away, regulatory oversight, lack of reported release, and/or likely nature of hazardous substances stored aboveground, the listed CERS TANKS sites should have no adverse environmental impact to the subject site.

HMIRS

The Hazardous Materials Incident Report System (HMIRS) database contains hazardous material spill incidents reported to the United States Department of Transportation. The subject site, under 301 Tennessee Street, is listed in this database for an incident on February 14, 2018 involving a truck carrying diesel fuel that was involved in a vehicle accident, apparently on a freeway. The release of 133 gallons of diesel fuel was cleaned up. Based on the listed incident occurring offsite, nature of the release, and cleanup, there should be no adverse environmental impact to the subject site.

RCRA-NonGen

RCRAInfo is USEPA's comprehensive information system that includes selective information on sites which generate, transport, store, treat, and/or dispose of hazardous

waste as defined by RCRA. Non-Generators do not presently generate hazardous waste. Seventeen sites (two listed twice), including the subject site, are listed in this database, most of which are located over 0.1 mile from the subject site. The subject site, under La-Z-Boy at 301 Tennessee Street, is listed in this database as a transporter of hazardous waste with no reported violations. No information is provided regarding what types of past hazardous wastes were generated. The closest nearby site is SCE Redlands Service Center to the south across West State Street and Broncs Towing, Inc. approximately 120 feet to the north across the Mission Zanja Creek flood control channel. Neither of these two sites has reported violations. Based on the distance away and/or lack of reported violations, none of the listed RCRA-NonGen sites should have an adverse environmental impact to the subject site.

FINDS

The Facility Index System (FINDS), maintained by the USEPA, contains both facility information and 'pointers' to other sources that contain more detail. Two sites, including the subject site and SCE Redlands Service Center (listed three times), are listed in this database. The subject site, under La-Z-Boy West at 301 Tennessee Street, is listed in this database. The online link provided for this subject site listing in the EDR database report refers to seven information systems, including Emission Inventory System, National Pollutant Discharge Elimination System (NPDES), Occupational Safety and Health Administration (OSHA), Compliance and Emissions Data Reporting Interface, Toxics Release Inventory System, RCRA Information System, and California Enviroview. Most of these listed information systems have no additional links to information. The RCRA information provides no new information beyond that discussed above in the RCRA-NonGen subsection of this report. The NPDES information indicates the industrial storm water permitting has been terminated, the last inspection was conducted on March 21, 2018, and no violations were reported. The nearby SCE Redlands Service Center at 287 Tennessee Street is listed with associated RCRA and OSHA references. The RCRA reference is likely related to past hazardous waste generation. The FINDS sites listings do not appear to indicate any adverse environmental impact to the subject site.

The EDR Site Report™ with a link to the FINDS online database information for the subject site is provided within Appendix H.

ECHO

This USEPA database, Enforcement & Compliance History Information (ECHO), provides integrated compliance and enforcement information for about 800,000 regulated facilities

nationwide. Two sites, including the subject site and SCE Redlands Service Center (listed twice), are listed in this database. The subject site, under La-Z-Boy West at 301 Tennessee Street, is listed in this database. The online link provided for this subject site listing in the EDR database report leads to a "Detailed Facility Report", which includes various information, including some provided in the FINDS online database. Of note is "Toxics Release Inventory Total Releases and Transfers in Pounds by Chemical and Year" information which lists the compounds toluene and 1,1,1-trichloroethane, with no amounts of release shown for the years 2009 to 2018. No other information regarding these compounds is provided. No violations going back at least 3 years are shown for the subject site. The nearby SCE Redlands Service Center at 287 Tennessee Street has no reported violations and nothing else of particular note. The FINDS sites listings do not appear to indicate any adverse environmental impact to the subject site. However, the presence of toluene and 1,1,1-trichloroethane compounds may have caused onsite impacts. These potential impacts are discussed in other sections of this Phase I ESA report, including the **VAPOR ENCROACHMENT EVALUATION** section.

The EDR Site Report™ with a link to the ECHO online database information for the subject site is provided within Appendix H.

DRYCLEANERS

This database is a list of drycleaner-related facilities that have EPA identification numbers. These are facilities with certain Standard Industrial Classification (SIC) codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; drycleaning plants except rugs; carpet and upholster cleaning; industrial launderers; and laundry and garment services. One site, Dutch Girl Dry Cleaners & Laundry at 414 Tennessee Street, Suite K, is listed in this database twice. This drycleaner is located within a multi-tenant, light commercial complex, and is located approximately 350 feet northeast of the subject site. Based on the distance away and lack of reported release(s), this DRYCLEANERS site is not anticipated to have an adverse environmental impact to the subject site.

EMI

The Emissions Inventory Data (EMI) database includes toxics and criteria pollutant emissions data collected by the California Air Resources Board and local air pollution agencies. The subject site, under LaZBoy West at 301 Tennessee Street, is listed in the EMI database for the years 1987, 1990, and 1995 through 2001. The emissions listed include total organic hydrocarbon gases up to 56 tons per year and reactive organic gases

up to 41 tons per year. The amount of listed emissions decreased significantly after 1990. The relative high quantity of organic emissions suggest that significant quantities of organic compounds were present onsite, and may have had potential impacts. These potential impacts are discussed in other sections of this Phase I ESA report, including the **VAPOR ENCROACHMENT EVALUATION** section.

ENF

The ENF database is a listing of SWRCB Enforcement Actions, including formal, which is everything except oral/verbal communication, Notice of Violation, expedited payment letter, and staff enforcement letter. The (SCE) Redlands Service Center at 287 Tennessee Street, located across West State Street to the south of the subject site, is listed in this database. This site is listed with an unspecified, illegal discharge that apparently took place or was discovered in April 2000. The listed unspecified, illegal discharge is not anticipated to have an adverse environmental impact to the subject site, as it likely occurred across the street at the SCE facility. Any potential soil vapor impacts to the subject site from the listed ENF site are discussed in other sections of this Phase I ESA report, including the **VAPOR ENCROACHMENT EVALUATION** section.

HAZNET

This database includes facility and manifest data, which is extracted from the copies of hazardous waste manifests received each year by the DTSC. Two sites, both listed twice and including the subject site, are listed in the HAZNET database. The subject site is listed under La-Z-Boy and Hahan Contractors at 301 Tennessee Street. Hazardous waste manifest listings from 1984 to 2015 under La-Z-Boy include approximately 5 tons of halogenated solvents, approximately 5.09 tons of unspecified solvent mixture, approximately 2.96 tons of other organic solids, approximately 17.5 tons of liquids with halogenated organic compounds $\geq$1,000 mg/L, approximately 0.92 ton of oxygenated solvents, approximately 2.61 tons of other inorganic solid waste, approximately 2.93 tons of asbestos-containing waste, and 1.82 tons of off-specification, aged or surplus organics. A hazardous waste listing under Hahan Contractors from 2014 is for 0.4 ton of asbestos-containing waste. The other site listed in this database is SCE Redlands Service Center/Sunwest Engineering at 287 Tennessee Street, across West State Street to the south of the subject site. These sites have generated various hazardous wastes under numerous (greater than 100) manifests from 2003 to 2017, including paint sludge, waste oil and mixed oil, other organic solids, halogenated solvents, liquids with polychlorinated biphenyls (PCBs) $\geq$50 mg/L, unspecified oil-containing waste, unspecified solvent mixture, asbestos-containing waste, PCBs and material containing PCBs, other empty containers

30 gallons or more, biological waste other than sewage sludge, organic liquids with metals (alkaline solution (pH ≥12.5) with metals), off-specification, aged or surplus organics, aqueous solution with total organic residues 10 percent or more, sewage sludge, and tank bottom waste. Based on the nature and amounts of the reported hazardous wastes generated onsite and offsite at the nearby SCE facility, there may be potential impacts to the subject site. Potential impacts to the subject site from the listed HAZNET sites are discussed in other sections of this Phase I ESA report, including the **VAPOR ENCROACHMENT EVALUATION** section.

The EDR Site Report™ with additional listed hazardous waste manifests for the subject site is provided within Appendix H.

HIST CORTESE

The historical Cortese (HIST CORTESE) list is a historical listing from the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (CALSITES). There are two sites listed in the HIST CORTESE database over 0.1 mile from the subject site, both with closed regulatory cases. Based on the distance away and closed LUST regulatory case, the listed HIST CORTESE sites should have no adverse environmental impact to the subject site.

HWP

This database is an ENVIROSTOR permitted facilities listing, which includes detailed information on permitted hazardous waste facilities and corrective action tracked in ENVIROSTOR. Two sites are listed in this database over 0.3 mile from the subject site. One of the two sites, Teledyne Battery Products at 840 West Brockton Avenue, was previously discussed under the CORRACTS subsection of this report. The second site, QA Processor Service at 302 Alabama Street, Suite 8, is listed as a non-operating hazardous waste facility. Based on regulatory oversight and/or distance from the subject site, the listed HWP sites should have no adverse environmental impact to the subject site.

NPDES

The NPDES database is maintained by the SWRCB, and is a listing of NPDES permits, including storm water. The subject site, under LaZBoy West at 301 Tennessee Street, is listed in this database under an industrial program, and is indicated to be an active facility with effective date of regulatory measure listed as July 27, 2018.

Based on the nature of the permitted storm water runoff for the subject site, no adverse environmental impact is anticipated.

San Bernardino County Permit

This database, maintained by the San Bernardino County Fire Department, Hazardous Materials Division, includes underground storage tanks, medical waste handlers/generators, hazardous materials handlers, hazardous waste generators, and waste oil generators/handlers. The subject site and twenty-nine sites (one listed twice) within approximately 0.25 mile of the subject site are listed in this database. The subject site, under La-Z-Boy West at 301 Tennessee Street, is shown with three permits, for handling hazardous materials (4-10 chemicals, expired in August 2019), for a conditionally exempt small quantity hazardous waste generator (expired in August 2015), and for an EPCRA facility (expired in August 2013). The adjacent property to the west of the subject site, located at 300 Kansas Street, is listed under SMI Modular Industries of CA with permits for handling hazardous materials (11-25, 26-50 employees) that expired in 2006 and 2010 and generating hazardous wastes (special generator) that expired in 2006. The SCE Redlands Service Center at 287 Tennessee Street, to the south of the subject site across West State Street, is listed with the following permits: handling hazardous materials (11-30 chemicals, expired in September 2019), APSA (Aboveground Petroleum Storage Act) 10,001-100,000 gallon facility capacity (expired in September 2019), super large quantity generator of hazardous materials (expired in September 2019), hazardous waste consolidation (expired in September 2017), EPCRA facility (expired in September 2013), universal waste handler with another CUPA (Certified Unified Program Agency) which expired in September 2013, and two regular UST annual inspection permits that expired in September 2009. Across Tennessee Street to the east of the subject site, Wesley Ray and Son, Inc. at 300 Tennessee Street is listed with a permit for handling hazardous materials (0-10 employees) which expired in May 2011. The remainder of the sites are listed primarily for generating hazardous waste and/or handling hazardous materials, and are mostly 0.1 mile away from the subject site. The onsite and nearby offsite handling of hazardous materials and generation of hazardous wastes may have impacted the subject site. Potential impacts to the subject site from the listed county permit sites are discussed in other sections of this Phase I ESA report, including the **VAPOR ENCROACHMENT EVALUATION** section.

CIWQS

The California Integrated Water Quality System (CIWQS) is a computer system used by the State and Regional Water Quality Control Boards to track information about places of

environmental interest, manage permits and other orders, track inspections, and manage violations and enforcement activities. The subject site, under LaZBoy West at 301 Tennessee Street, is listed in this database. This CIWQS listing for the subject site provides similar information as that discussed above in the NPDES subsection of this Phase I ESA report. Based on the nature of the permitted storm water runoff for the subject site, no adverse environmental impact is anticipated.

CERS

The CalEPA Regulated Site Portal (CERS) database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials. The subject site, under LaZBoy West at 301 Tennessee Street, and SCE Redlands Service Center at 287 Tennessee Street are listed in this database. The subject site is listed in this database for air emissions, chemical storage facility, and an industrial facility with storm water. Compliance evaluation inspections in 2014 and 2017 found no violations. The SCE Redlands Service Center is listed in this database for a chemical storage facility. Compliance evaluation inspections in 2015 and 2018 found no violations. Based on the lack of reported violations, the CERS sites listings do not indicate an adverse environmental impact to the subject site. However, the onsite and nearby offsite handling of hazardous materials and generation of hazardous wastes may have impacted the subject site. Potential impacts to the subject site from the listed county permit sites are discussed in other sections of this Phase I ESA report, including the **VAPOR ENCROACHMENT EVALUATION** section.

EDR MGP

This EDR proprietary Manufactured Gas Plant (MGP) database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800s to 1950s to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils, and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination. One site, So Cal Gas/Redlands

MGP, is listed in this database over 0.5 mile from the subject site. Based on the distance to this EDR MGP site from the subject site and regulatory oversight, there should be no adverse environmental impact to the subject site.

EDR Hist Auto

This EDR proprietary Historical Auto (Hist Auto) database includes records based on EDR's search of selected national collections of business directories, and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches. There is one site listed in this proprietary EDR database, located at 446 Tennessee Street, approximately 0.1 mile north-northeast of the subject site. This site is listed with Auto Analysts in 1992 through 2001 and MG Transmission PHX in 2011 through 2014. Based on the distance away and lack of reported release and/or open regulatory case, the EDR Hist Auto site should pose no adverse environmental impact to the subject site.

EDR US Hist Cleaner

This EDR proprietary United States Historical Cleaners (US Hist Cleaners) database includes records based on EDR's search of selected national collections of business directories, and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches. One site is listed at 414 Tennessee Street, approximately 350 feet northeast of the subject site. This site is listed with Dutch Girl Laundry & Cleaners in 2003 through 2014. Based on the distance away and lack of reported release(s), this EDR US Hist Cleaner site is not anticipated to have an adverse environmental impact to the subject site.

Orphan Summary

The Orphan Summary within the EDR database report, which is a list of all sites whose location is not readily identified (mapped), and may be near the subject site, was reviewed. The subject site and adjoining properties are not listed in the Orphan Summary.

Other Databases

California Division of Oil, Gas, and Geothermal Resources

The California Division of Oil, Gas, and Geothermal Resources (DOGGR) maintains a list of all producing and abandoned oil and gas wells within the State of California. We reviewed the online DOGGR Well Finder, which indicates no abandoned or producing gas and/or oil wells have been located within one mile of the subject site (California Division of Oil, Gas, and Geothermal Resources, 2019).

VAPOR ENCROACHMENT EVALUATION

As part of this Phase I ESA, a Vapor Encroachment Screen (VES) was conducted to determine if a vapor encroachment condition (VEC) exists, based on the information obtained during the Phase I ESA. A VEC is the presence or likely presence of chemicals of concern (COC) vapors in the subsurface of the target property caused by the release of vapors from contaminated soil or groundwater either on or near the target property (i.e., subject site).

Vapor Encroachment Screen

A VES, comprised of Tier 1 and Tier 2 (non-invasive and invasive) screening, was conducted by this firm for the subject site. The VES was conducted in general accordance with the Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions, ASTM E2600-15. Although not required to satisfy the requirements of the Phase I ESA under ASTM E1527-13, ASTM E2600-15 was chosen as a methodology to evaluate potential contaminant vapor concerns at or adjoining the subject site.

The subject site is currently a recently vacated La-Z-Boy manufacturing facility, the original portion of which was constructed in the mid 1960s. The subject site historical usage prior to the mid 1960s included an agricultural grove and associated structures, including a residence and garage. The site is located in a mixed commercial, industrial, and residential

area. The subject site and surrounding area are anticipated to be underlain primarily by interbedded sands, silty sands, and silts with varying amounts of clays, gravels, and cobbles. Based on the local geology and hydrogeology, groundwater beneath the subject site, anticipated to be over 150 feet bgs, is not considered to be a likely source of vapor intrusion into the subject site.

Based on the results of Tier 1 screening, utilizing the EDR Radius Map™ Report with GeoCheck® and research of the history of the subject site and adjoining properties, there are two sites within 0.33 mile of the subject site with current and/or former potential sources of soil vapor intrusion or encroachment, such as leaking (current or former) USTs, dry cleaners, etc. Based on ASTM E2600-15 methodology, utilizing regulatory database listings, these sites include the subject site (RCRA-NonGen site) and Argon Fuel (CPS-SLIC site) at 1205/1255 (West) Redlands Boulevard. The subject site, which had past use as a furniture manufacturer, included the generation of solvent wastes, including halogenated solvent wastes. Adjoining properties, including the Southern California Edison site to the south across West State Street and former plastics manufacturer adjacent to the west of the subject site have either historical USTs and/or solvent hazardous waste generation. Based on the results of the VES, Tier 1 screening, a VEC at the subject site could not be ruled out.

Under VES, Tier 2 screening (non-invasive), using the critical distance determination, the Argon Fuel site, located over 100 feet from the subject site, can be ruled out. Based on the results of the Tier 2 screening (non-invasive), a VEC at the subject site could not be ruled out.

Under VES, Tier 2 screening (invasive), a recent Phase II ESA was conducted onsite, including the installation and sampling of thirty-four (34) shallow (3 to 5 feet bgs) soil vapor probes. These soil vapor probe locations were placed at select locations, including along the south and west subject site boundaries, within all three onsite buildings, and near onsite Building 3. The soil vapor probe locations in the south portion of onsite Building 1 and along the south subject site boundary had no reportable concentrations of TPH-G and VOCs, as did most of the soil vapor probes along the west subject site boundary, except for the one (SVP-13) closest to Building 2. The remaining probes had concentrations of chlorinated VOCs, including chloroform, cis-1,2-dichloroethene, 1,1-dichloroethane, 1,1-dichloroethene, tetrachloroethene (PCE), 1,1,1-trichloroethane, and trichloroethene (TCE). Due to the reported concentrations of these compounds in soil vapor samples, the client had indoor air sampling performed onsite. The results of the laboratory analysis of this indoor air sampling included concentrations of PCE and TCE that exceeded DTSC screening levels for commercial/industrial indoor air (DTSC, 2019a). The soil vapor

analytical results associated with the recent Phase II ESA are discussed in more detail in the **PHASE II ESA** section of this report. The indoor air analytical results associated with the indoor air sampling are discussed in more detail in the **USER PROVIDED INFORMATION** section of this report. Based on the results of the Tier 2 screening (invasive), a VEC exists at the subject site.

DATA GAPS

Under AAI and ASTM E1527-13, data gaps that remain after the conduct of all required activities must be identified. The source of information consulted to address the data gaps should be identified, and the significance of the data gaps with respect to our ability to identify conditions indicative of releases or threatened release of hazardous substances on, at, in, or to the property should be addressed.

There are no significant data gaps remaining after our conduct of AAI and ASTM E1527-13.

PHASE II ESA

Based on the past historical onsite uses, including agricultural from at least the 1930s to mid 1960s and industrial use (La-Z-Boy manufacturing facility) from the mid 1960s to 2019, a Phase II ESA was performed in conformance with ASTM E1903-11. Locations of current and past onsite features were used to guide the locations of soil borings and soil vapor probes to assess potentially impacted subsurface soil and soil vapor.

Color photographs taken during soil boring advancement and soil sampling, soil vapor probe installation, and soil vapor sampling and analysis activities are provided within Appendix I.

Soil Boring Advancement and Soil Vapor Probe Installation

Over three working days prior to field sampling activities, a visit was made to mark the subject site for Underground Service Alert of Southern California (USA), who was notified of planned boring activity to identify public subsurface utilities. In addition, the client and property owner were also notified in advance of planned onsite activities.

On October 29, 2019, geophysical survey activities were conducted onsite to clear planned boring/soil vapor probe locations which were to be advanced with power tools or heavy equipment. The survey was conducted by Mr. Donn Schwartzkopf, a licensed geophysicist.

Devices used during the during included a ground-penetrating radar and utility locator. All of the cleared boring locations were marked by Mr. Schwartzkopf with marking paint.

On October 28 and 29, 2019, shallow soil sampling was conducted by hand. A hand auger was used to excavate up to approximately 1 to 1.5 feet bgs to collect soil samples at SS-5 through S-11. Soil sample locations SS-5 through SS-7 were placed to evaluate potential impacts from the offsite, former main railway line within West State Street. Soil sample locations SS-8 through SS-11 were to evaluate potential impacts from the former onsite agricultural grove. The soil sample locations SS-5 through S-11 are shown on a recent color aerial photograph, Figure 4.

On November 6, 7, and 8, 2019, Optimal Technology was contracted to advance thirty-four 3- to 5-foot soil vapor probes, SVP-1 through SVP-34. These probes were installed to collect soil vapor samples to evaluate potential impacts from past or recent onsite and offsite activities. Most of the probes were advanced to approximately 5 feet bgs, with a handful advanced to depths ranging from approximately 3 to 4 feet bgs, due to difficulties encountered with advancement and/or soil vapor flow extraction with a vacuum pump. Optimal Technology utilizes a van with mobile laboratory inside and hydraulic push rig at the front. All probe borings were initially advanced with a rotary hammer drill to roughly 2 feet bgs, as a pilot hole. A stainless steel, 7/8-inch outer-diameter soil vapor probe was then advanced to approximately 4 to 5 feet bgs, either with the van-mounted hydraulic push or by hand with a rotary hammer. The probe boreholes were sealed around the soil vapor probe with hydrated bentonite granules. Soil samples SS-2 through SS-4 were collected at soil vapor probe locations SVP-2 through SVP-4, respectively. These soil samples were collected to evaluate potential impacts from the former railroad spur track and/or fill materials along the south side of the original portion of Building 1, near the north side of the 1986 addition to Building 1. Soil samples were collected at each location at approximately 1, 1.5, 3.5, and 4 feet bgs. No evidence of soil contamination, such as odor or staining, was noted. The soil boring/vapor probe locations are shown on a recent color aerial photograph, Figure 5.

Soil Sampling and Analytical Procedures

The soil samples collected by hand were obtained directly into clean, laboratory-supplied 4-ounce glass jars with Teflon®-lined screw lids. Following sample collection, the jars were labeled with the sample identification (number/location/depth) and time and date of sampling.

Soil samples collected during soil vapor probe advancement were obtained in driven approximate 8-inch long, 5/8-inch diameter stainless steel sleeves, which were sealed with Teflon® sheets and plastics caps immediately following sample collection. The sample sleeves were labeled with sample identification (number/location/depth) and date and time of sampling.

All soil samples were placed on ice for transport to the laboratory for analysis. The samples were transported under Chain-of-Custody (CoC) to A & R Laboratories, Inc. (A & R), a state-certified hazardous waste testing laboratory in Ontario, California. Upon delivery of the samples to the laboratory for analysis, the CoC form was signed by authorized personnel, and a copy was retained by LOR personnel.

The quality assurance/quality control (QA/QC) program in effect during the performance of all field activities included the following items:

- Complete documentation of all field activities.
- Use of appropriate CoC forms.
- Use of clean sampling equipment.
- Sampling according to generally accepted protocols.

The 1- and 3.5-foot soil samples collected at SS-2 through SS-4 were analyzed for extractable oil- and diesel-range (fuel screen) hydrocarbons (TPH-FS) using USEPA Method 8015B, semi-volatile organic compounds (SVOCs) using USEPA Method 8270C, and organochlorine pesticides (OCPs) using USEPA Method 8081A.

The 1.5- and 4-foot soil samples collected at SS-2 through SS-4 were analyzed for California Title 22 metals (total) using USEPA Methods 6020 and 7471A.

Soil samples SS-5 through SS-7 were analyzed for TPH-FS using USEPA Method 8015B, SVOCs using USEPA Method 8270C, and California Title 22 heavy metals (total) using USEPA Methods 6020 and 7471A.

Soil samples SS-8 through SS-11 were analyzed for OCPs using USEPA Method 8081A and total arsenic using USEPA Method 6020.

Soil Vapor Sampling and Analytical Procedures

The soil vapor samples plus three duplicate samples were collected from the thirty-four soil vapor probes following advancement/installation. Optimal Technology personnel collected

the soil vapor samples and analyzed them in general accordance with the Advisory - Active Soil Gas Investigations (California Environmental Protection Agency et al., 2015). At each sampling location, an electric vacuum pump, set to draw 0.2 liters per minute of soil vapor, was attached to the probe, and purged 3 volumes prior to sample collection. Soil vapor samples were obtained in gas-tight syringes. Samples were immediately injected into the gas chromatograph after collection. New tubing was used at each sampling point to prevent cross contamination. All nine of the soil vapor samples collected were analyzed for TPH-G and VOCs using USEPA Method 8260B.

Laboratory Analytical Results

The 1- and 3.5-foot soil samples collected at SS-2 through SS-4 had no reportable concentrations of TPH-FS and SVOCs. Concentrations of the OCPs dieldrin and DDT (4,4'-dichlorodiphenyltrichloroethane) were reported up to 0.0050 mg/kg and 0.0061 mg/kg, respectively.

The 1.5- and 4-foot soil samples collected at SS-2 through SS-4 had reportable concentrations of heavy metals (total), including arsenic up to 8.87 mg/kg, barium up to 54.6 mg/kg, chromium up to 70.7 mg/kg, cobalt up to 7.98 mg/kg, copper up to 21.3 mg/kg, lead up to 12.6 mg/kg, nickel up to 29.9 mg/kg, vanadium up to 34.6 mg/kg, and zinc up to 937 mg/kg.

The 1- to 1.5-foot soil samples collected at SS-5 through SS-7 had no reportable concentrations of TPH-FS and SVOCs. Reportable concentrations of heavy metals (total) include arsenic up to 2.26 mg/kg, barium up to 51.9 mg/kg, chromium up to 15.0 mg/kg, cobalt up to 6.69 mg/kg, copper up to 14.6 mg/kg, lead up to 7.30 mg/kg, nickel up to 9.64 mg/kg, vanadium up to 31.1 mg/kg, and zinc up to 52.7 mg/kg.

The 1-foot soil samples collected at SS-8 through SS-11 had reportable concentrations of the OCPs chlordane up to 0.022 mg/kg, DDE (4,4'-dichlorodiphenyldichloroethene) up to 0.0098 mg/kg, dieldrin up to 0.0043 mg/kg, and heptachlor epoxide up to 0.0050 mg/kg. Concentrations of total arsenic were reported up to 1.87 mg/kg. However, soil samples SS-10 and SS-11 were reported as non-detect for arsenic at laboratory reporting limits ranging from 4.98 to 5.03 mg/kg. The laboratory analytical report prepared by Eurofins Calscience, LLC, the analytical laboratory that A & R subcontracted to perform the arsenic analysis by USEPA Method 6020, indicates there were sample matrix effects on the internal standard requiring sample dilution. As arsenic often exceeds the regulatory soil screening levels, local background concentrations are used to evaluate potential soil impacts.

The elevated laboratory reporting limits for arsenic, around 5 mg/kg, are higher than the expected local background range under 4 mg/kg.

The analytical laboratory reports for the soil samples are provided in Appendix J. Soil sample summary analytical results for California Title 22 heavy metals (total) and OCPs are presented in Tables 1 and 2, respectively.

Most of the thirty-seven (37) soil vapor samples collected and analyzed, including three duplicates, had reportable concentrations of VOCs, with no reportable concentrations of TPH-G. The locations with reportable VOCs were generally located in the north portion of Building 1, within Buildings 2 and 3, and near Building 3. The reportable concentrations of VOCs include chloroform up to 0.22 µg/L, cis-1,2-dichloroethene up to 1.65 µg/L, 1,1-dichloroethane up to 58.71 µg/L, 1,1-dichloroethene up to 22.54 µg/L, tetrachloroethene up to 1.51 µg/L, 1,1,1-trichloroethane up to 1,054.42 µg/L, and trichloroethene up to 37.33 µg/L.

The analytical laboratory reports for the soil vapor samples are provided in Appendix K. Soil vapor sample summary analytical results for TPH-G and VOCs are presented in Table 3.

CONCLUSIONS AND RECOMMENDATIONS

Based on the age of the onsite buildings, lead-based paint (LBP) and/or asbestos-containing materials (ACM) may be present. As the onsite buildings will remain, no demolition is planned. However, modification of or addition to the onsite buildings will likely require a LBP and ACM survey to identify any affected building materials. The LBP and ACM survey should be conducted in accordance with the regulatory agencies having jurisdiction.

Based on the past historical onsite uses dating back to at least 1930, including agricultural grove and industrial use (furniture manufacturing), a Phase II ESA was performed. Thirty-four (34) soil vapor probe locations (SVP-1 through SVP-34), with 3- to 5-foot probes, were placed at current and past onsite features to assess potentially impacted subsurface soil vapor. Coincident with three of these locations (SVP-2 through SVP-4), soil samples (SS-2 through SS-4) were collected at multiple depths to assess potentially impacted subsurface soils along a former railroad spur track and/or fill materials along the south side of the original portion of Building 1 to a maximum depth of approximately 4 feet below ground surface (bgs). Three soil samples (SS-5 through SS-7) were collected at 1- to 1.5-foot depths to evaluate potential impacts from the offsite main railroad line within

West State Street. Four soil samples (SS-8 through S-11) were collected at approximate 1-foot depths to evaluate potential pesticide impacts from past agricultural activities.

The 1- and 3.5-foot soil samples collected at SS-2 through SS-4 had no reportable concentrations of extractable oil- and diesel-range (fuel screen) hydrocarbons (TPH-FS) and semi-volatile organic compounds (SVOCs). Concentrations of the organochlorine pesticides (OCPs) dieldrin and DDT (4,4'-dichlorodiphenyltrichloroethane) were reported up to 0.0050 milligrams per kilogram (mg/kg) and 0.0061 mg/kg, respectively. The 1.5- and 4-foot soil samples collected at SS-2 through SS-4 had reportable concentrations of heavy metals (total), including arsenic up to 8.87 mg/kg, barium up to 54.6 mg/kg, chromium up to 70.7 mg/kg, cobalt up to 7.98 mg/kg, copper up to 21.3 mg/kg, lead up to 12.6 mg/kg, nickel up to 29.9 mg/kg, vanadium up to 34.6 mg/kg, and zinc up to 937 mg/kg. The 1- to 1.5-foot soil samples collected at SS-5 through SS-7 had no reportable concentrations of TPH-FS and SVOCs. Reportable concentrations of heavy metals (total) include arsenic up to 2.26 mg/kg, barium up to 51.9 mg/kg, chromium up to 15.0 mg/kg, cobalt up to 6.69 mg/kg, copper up to 14.6 mg/kg, lead up to 7.30 mg/kg, nickel up to 9.64 mg/kg, vanadium up to 31.1 mg/kg, and zinc up to 52.7 mg/kg. The 1-foot soil samples collected at SS-8 through SS-11 had reportable concentrations of the OCPs chlordane up to 0.022 mg/kg, DDE (4,4'-dichlorodiphenyldichloroethene) up to 0.0098 mg/kg, dieldrin up to 0.0043 mg/kg, and heptachlor epoxide up to 0.0050 mg/kg. Concentrations of total arsenic were reported up to 1.87 mg/kg. However, soil samples SS-10 and SS-11 were reported as non-detect for arsenic at laboratory reporting limits ranging from 4.98 to 5.03 mg/kg. These elevated reporting limits were due to sample matrix effects on the laboratory internal standard requiring sample dilution. As arsenic often exceeds the regulatory soil screening levels, local background concentrations are used to evaluate potential soil impacts. The elevated laboratory reporting limits for arsenic, around 5 mg/kg, are higher than the expected local background range under 4 mg/kg. All of the reported concentrations of OCPs are less than the California DTSC soil screening levels for residential and commercial/industrial soils (DTSC, 2019a). The reported concentrations of California Title 22 heavy metals (total) are generally less than the California DTSC soil screening levels for residential and commercial/industrial soils or within the expected background ranges, with the exception being a reported concentration of arsenic at 8.87 mg/kg in the 1.5-foot sample at SS-3.

Twelve (SVP-1 through SVP-12) of the thirty-four (34) soil vapor probe locations were non-detect for total petroleum hydrocarbons as gasoline (TPH-G) and VOCs. The remaining twenty-two (SVP-13 through SVP-34) soil vapor probe locations had concentrations of multiple chlorinated VOCs reported, including chloroform up to 0.22 micrograms per liter (µg/L), cis-1,2-dichloroethene (cis-1,2-DCE) up to 1.65 µg/L,

1,1-dichloroethane (1,1-DCA) up to 58.71 µg/L, 1,1-dichloroethene (1,1-DCE) up to 22.54 µg/L, tetrachloroethene (PCE) up to 1.51 µg/L, 1,1,1-trichloroethane (1,1,1-TCA) up to 1,054.42 µg/L, and trichloroethene (TCE) up to 37.33 µg/L. The soil vapor probe locations in Buildings 1 and 2 generally were reported with only PCE and TCE, with multiple VOCs reported at the soil vapor probe locations at and near Building 3. The highest reported concentrations of VOCs were at soil vapor probe SVP-20, located at the estimated location of the former subsurface collection trap for fire suppression water.

Due to the onsite soil vapor concentrations reported above, the client had air sampling performed. CEHSC collected eleven onsite air samples, including one outdoor air sample (SC1) and ten indoor air samples (SC2 through SC11). Two of the indoor air samples (SC2 and SC3) were collected in onsite Building 2 and the remaining eight indoor air samples (SC4 through SC11) were collected in onsite Building 1. The outdoor air sample had reportable concentrations of ethanol at 7.6 micrograms per cubic meter (µg/m^3), benzene at 0.47 µg/m^3, carbon tetrachloride at 0.63 µg/m^3, and naphthalene at 0.39 µg/m^3. The reported outdoor air concentrations of benzene and naphthalene exceed the DTSC screening levels for residential and commercial/industrial air (DTSC, 2019a). The reported outdoor air concentration of carbon tetrachloride falls between the DTSC screening levels for residential and commercial/industrial air. The two indoor air samples from Building 2 had reported concentrations of ethanol up to 6.7 µg/m^3, benzene up to 0.51 µg/m^3, carbon tetrachloride up to 0.65 µg/m^3, chloroform at 0.14 µg/m^3, naphthalene up to 0.37 µg/m^3, and TCE up to 0.17 µg/m^3. The reported concentrations of benzene and naphthalene in Building 2 air samples exceed the DTSC screening levels for residential and commercial/industrial air. The reported concentrations of carbon tetrachloride and chloroform in Building 2 air fall between the DTSC screening levels for residential and commercial/industrial air. The eight indoor air samples from Building 1 had reported concentrations of ethanol up to 13 µg/m^3, trichlorofluoromethane (Freon 11) up to 24 µg/m^3, acetone up to 10 µg/m^3, 1,1,1-TCA up to 22 µg/m^3, benzene up to 0.65 µg/m^3, carbon tetrachloride up to 0.81 µg/m^3, chloroform up to 0.23 µg/m^3, 1,4-dichlorobenzene up to 0.17 µg/m^3, 1,2-DCA up to 0.14 µg/m^3, 1,2-dichloropropane up to 0.12 µg/m^3, naphthalene up to 0.42 µg/m^3, PCE up to 32 µg/m^3, TCE up to 4.0 µg/m^3, and 1,1-DCA up to 2.8 µg/m^3 (estimated value exceeding the laboratory calibration range). The reported concentrations of benzene, carbon tetrachloride, chloroform, 1,2,-DCA, naphthalene, PCE, TCE, and 1,1-DCA in Building 1 air samples exceed the DTSC screening levels for residential and/or commercial/industrial air.

There are numerous sites listed in environmental regulatory and proprietary databases within 1 mile of the subject site, including the subject site. Based on our research, Vapor Encroachment Screen (utilizing ASTM E2600-15), Phase II ESA findings, and indoor air

sampling performed by Citadel Environmental Health and Safety Consultants, a vapor encroachment condition exists at the subject site.

We have performed a Phase I ESA in conformance with ASTM E1527-13 and AAI set forth in 40 CFR Part 312, along with a concurrent Phase II ESA in conformance with ASTM E1903-11, for the former La-Z-Boy West Facility located at 301 Tennessee Street in Redlands, California. This Phase I and II ESA has revealed no evidence of recognized environmental conditions (RECs), historical recognized environmental conditions (HRECs), or controlled recognized environmental conditions (CRECs) indicative of releases or threatened releases of hazardous substances on, at, in, or to the subject site, except for the following:

- Past subsurface soil investigation by RMT in 1994 revealed concentrations of trace chlorinated VOCs within the upper 30 feet in the north central portion of the subject site near or in the general vicinity of a former collection trap (seepage pit) for fire suppression water. Based on the concentrations reported, the chlorinated VOCs are an HREC. However, the lateral and vertical extent of chlorinated VOCs was not assessed.

- Past manufacturing use of the subject site has involved the use of chlorinated solvents, including 1,1,1-TCA is a REC. The recently conducted Phase II ESA has identified the presence of impacted, shallow subsurface soil vapor within the central and north portions of the subject site. Recently conducted indoor air sampling indicated concentrations of VOCs exceeding DTSC screening levels for residential and/or commercial/industrial air.

- Soil sampling was conducted during the recent Phase II ESA to evaluate past agricultural grove and railroad track usage, including an onsite spur track. Elevated concentrations of some California Title 22 heavy metals (total) were reported, including arsenic, chromium, nickel, and zinc, is a REC. However, these concentrations are generally less than the California DTSC soil screening levels for residential and commercial/industrial soils or within expected background ranges, with the exception being a reported concentration of arsenic at 8.87 mg/kg in the 1.5-foot sample at SS-3. This isolated concentration of arsenic is not anticipated to have a significant impact to the subject site.

The onsite, impacted subsurface soil and soil vapor by VOCs represents both responsible party liability for cleanup and health risk concerns. To determine the lateral and vertical extent of impacted soil and soil vapor, additional Phase II ESA would be needed.

Depending on the extent of impacted soil and soil vapor and/or other impacted media, potentially including groundwater, regulatory agency oversight may be warranted. Based on the recent indoor air sampling analytical results, CEHSC, who performed the indoor air sampling, recommended that interim engineering controls for indoor air be implemented, including increasing ventilation rates and installing air scrubbers, while a more comprehensive remediation plan is developed. As a result of these recommendations to address the onsite impacts to subsurface soil vapor and indoor air, it is our understanding that the client has solicited proposals from CEHSC and other consultants to implement subsurface slab depressurization and/or soil vapor extraction through vertical wells to prevent vapor intrusion into the onsite buildings and possibly affect sufficient remediation to negate the future need to operate and maintain a vapor extraction system for subsurface slab depressurization. We recommend no occupation of the onsite buildings until sufficient control of indoor air has been established, including concentrations of VOCs less than DTSC screening levels for commercial/industrial (indoor) air.

STATEMENT OF QUALIFICATIONS

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquires in conformance with the standards and practices set forth in 40 CFR Part 312.

Mr. John Leuer is the President of LOR Geotechnical Group, Inc., founded in 1988. As a cofounder and President of the company, Mr. Leuer has managed LOR through hundreds of Phase I Environmental Site Assessments, as well as numerous Phase II Environmental Site Assessments and remediation projects, primarily remedial excavation. Mr. Leuer has over 36 years experience in the geotechnical and environmental fields. Mr. Leuer has substantial experience coordinating projects for many city, county and state agencies, as well as in the public sector, gaining a reputation for being responsive to clients needs while providing strong technical expertise. LOR Geotechnical Group, Inc. is one of three firms that previously provided report review for underground storage tank closure for the County of San Bernardino, Fire Department Hazardous Materials Division.

Mr. Leuer holds a B.S. in Civil Engineering from Cal State University at Northridge. He is a registered Geotechnical and Civil Engineer in the State of California. Mr. Leuer is a member of the American Society of Civil Engineers.

Mr. Mathew L. Hunt has over 20 years experience in the environmental field. Mr. Hunt works under LOR Geotechnical Group's environmental operations and has conducted over

350 Phase I Environmental Site Assessments for the private and public sectors. The properties have ranged from agricultural to residential to commercial/industrial. In addition to his experience with environmental assessments for property transfers, he has worked on projects that require mitigation prior to development. Mr. Hunt is well versed in hazardous waste sampling and characterization methodologies in soil and groundwater regimes for groundwater monitoring, site assessment, and site remediation. Projects have ranged from leaking USTs at gasoline stations to commercial and government (including Superfund/CERCLA sites) projects involving metals, perchlorate, and solvents.

Mr. Hunt has a B.S. in soil science from California Polytechnic State University, San Luis Obispo and a M.S. in soil and water science from the University of California, Riverside.

LIMITATIONS

This report was prepared solely for the use and benefit of LOR's client, NYS New, LLC, and their designates, including NYS, LLC. They may release this information to third parties, who may use and rely upon this information at their discretion. However, any use of or reliance upon this information by a party other than NYS New, LLC and their designates, shall be solely at the risk of such third party and without legal recourse against LOR Geotechnical Group, Inc.; its subsidiaries and affiliates; or their respective employees, officers, or directors; regardless of whether the action in which recovery of damages is sought is based upon contract, statute, or otherwise.

The content and conclusions provided by LOR in this assessment are based on information collected during our investigation, which may include, but is not limited to, visual site inspections, interviews with the site owner, regulatory agencies and other pertinent individuals, a review of available public documents, and our professional judgement based on said information at the time of preparation of this document. Any subsurface samples results and observations presented herein are considered to be representative of the area of investigation; however, soil conditions may vary between sample locations and may not necessarily apply to the general site as a whole. If future subsurface or other conditions are revealed which may vary from these findings, the newly-revealed conditions must be evaluated and may invalidate the conclusions of this report.

This report has been prepared in accordance with generally accepted practices using standards of care and diligence normally practiced by recognized consulting firms performing services of a similar nature. LOR Geotechnical Group, Inc. (LOR) is not responsible for the accuracy of information provided by other individuals or entities which is used in this report. This report presents our professional judgement based upon data

and findings identified in this report, and the interpretation of such data based upon our experience and background, and no warranty, either expressed or implied, is made. The conclusions presented are based upon the current regulatory climate and may require revision if future regulatory changes occur.

TIME LIMITATIONS

The findings of this report are valid as of this date. Changes in the condition of a property can, however, occur with the passage of time, whether they be due to natural processes or the work of man on this or adjacent properties. In addition, changes in the Standards-of-Practice and/or Governmental Codes may occur. Due to such changes, the findings of this report may be invalidated wholly or in part by changes beyond our control. Therefore, this report should not be relied upon after a significant amount of time without a review by LOR, verifying the suitability of the conclusions and recommendations. Based on ASTM E1527-13 and AAI, certain components of this report are no longer valid after 180 days of their being performed, including interviews, visual inspection of the subject property and adjoining properties, and review of federal, tribal, state, and local government records. Once this 180-day period has expired, this report should be updated or revised to meet the requirements for continued viability under the ASTM and AAI standards.

CLOSURE

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in § 312.10 of 40 CFR part 312.

We appreciate this opportunity to be of service and trust this report provides the information desired at this time. Should questions arise, please do not hesitate to contact this office.

Respectfully submitted,
LOR Geotechnical Group, Inc.

Mathew L. Hunt

Subject: **Sub-Slab Depressurization Results, Permit No. G61173, A/N 61982**
301 Tennessee Street, Redlands, California 92373-8125

Dear South Coast AQMD:

On behalf of Esri Real Estate Transaction and Management (Esri), enclosed is the operations information as required in Condition 9 of South Coast Air Quality Management District permit number G61173. The permitted sub-slab depressurization (SSD) system comprises 26 subsystems, each with an individual extraction blower. The SSD system is installed at Esri's facility located at 301 Tennessee Street in Redlands, California.

Please contact us with any questions regarding the information submitted here.

Sincerely,
Rincon Consultants, Inc.

Table 1 Total VOC Concentrations and Flow Rate
Table 2 VOC Concentrations in Air Samples

Sub-Slab Depressurization

A total of 26 sub-slab depressurization (SSD) units have been installed at the subject property as described in South Coast Air Quality Management District (SCAQMD) permit number G61173 (Permit). Per the Permit, the SSD units were monitored daily during the first week of operation. Total volatile organic compound (VOC) concentrations were measured using a photoionization detector (PID), calibrated in parts per million by volume (ppmv) as hexane. The flow rate was also measured at each SSD unit. Following the daily monitoring of flow rates and total VOC concentrations with the PID, weekly air samples were collected from the SSD units and analyzed for VOCs by Environmental Protection Agency (EPA) Method 8260BM.

Per the Permit, the monitoring activities were conducted at the subject property to ensure that site conditions did not exceed the following parameters:

- The total VOC concentrations measured at each unit shall not exceed 10 ppmv as hexane (Condition 8)
- The maximum flow rate at each unit shall not exceed 40 standard cubic feet per minute (scfm), and the total flow rate of all SSD units shall not exceed 1,000 scfm (Condition 3).
- The VOC concentrations in air samples shall not exceed 0.10 ppmv for 1,1-dichloroethene, 1,2-dichloroethene, benzene, carbon tetrachloride, chloroform, 1,4-dichlorobenzene, naphthalene, trichloroethene (TCE) and 0.40 ppmv for tetrachloroethene (PCE) (Condition 5)

Total VOC Concentrations and Flow Rate

The system was started on July 6, 2020 and measurements were recorded on July 6 through 12, 2020 with the PID (Table 1). SSD-7 through SSD-10 were not operated initially, and SSD-7, SSD-8, and SSD-9 have remained off for the entire monitoring period. SSD-10 was activated on July 9, 2020. SSD-17 and SSD-22 were shut down due to the inability to operate below the required flow rate of 40 scfm.

The only exceedance of total VOC concentration and flow rate was observed at SSD-4 on July 10, 2020, where the total VOC concentration was measured to be 23.6 ppmv and the flow rate was measured to be 270.5 cfm. SSD-4 was subsequently shut down that day. On July 11, 2020, the flow was manually adjusted and PID readings were collected; both measurements confirmed SSD-4 was back within the permit requirements.

VOC Concentrations in Air Samples

Beginning on July 8, 2020, weekly air samples were collected from the SSD units. In the first two sampling events, concentrations of TCE exceeded the threshold of 0.1 ppmv in SSD-1, SSD-2, SSD-14, SSD-16, SSD-18, SSD-19, and SSD-23. Concentrations of 1,1-dichloroethane also exceeded the threshold of 0.1 ppmv in SSD-23. Following the receipt of the analytical data from these events, each unit in exceedance was shut down.

During the third sampling event on July 21, 2020, concentrations of VOCs in the remaining units were below the permit thresholds, with the exception of TCE at SSD-13 (0.13 ppmv). During the fourth sampling event on July 28, 2020, SSD-18 was turned back on and was sampled due to the low-level prior exceedance and has remained within the permit thresholds. SSD-13 also exceeded the TCE threshold

during this event (0.14 ppmv) and is not currently operational. No VOC exceedances were reported during the fifth sampling event.

To date, seven SSD units remain off due to VOC exceedances (SSD-1, SSD-2, SSD-13, SSD-14, SSD-16, SSD-19, and SSD-23), and two SSD units (SSD-17 and SSD-22) remain off due to flow exceedances. In addition, two SSD units (SSD-10 and SSD-18) were a week behind the weekly sampling cycle and, therefore, were sampled on August 13, 2020 (Week 5.1 of Table 2). No VOC exceedances were reported.

Conclusion

Rincon has been working in close coordination with SCAQMD since SSD system start-up seeking guidance on issues related to SSD unit flow rates, VOC concentrations, and SSD unit modifications to facilitate greater cooling (many SSD units were shutting down automatically due to heat build-up). It is Rincon's understanding that Permit revisions are underway which will be reflected in the six-month report. The six-month report will be submitted prior to January 6, 2021.

Notes:

[1] : Per Condition 8 of South Coast Air Quality Management District (SCAQMD) permit number G61173 (Permit), the total VOC concentrations in the exhaust stack shall not exceed 10 ppmv as hexane

[2] : Per Condition 3 of the Permit, the total flow rate shall not exceed 1,000 SCFM. The maximum flow rate of individual SSD units will not exceed 40 SCFM.

Definitions:

-- : Did not operate due to non-detect soil vapor VOC data previously reported

^^ : Did not operate due to previously exceeded permit requirements for VOC concentrations

** : Did not operate due to exceedance of permitted flow

cfm : Cubic feet per minute

fpm : Feet per minute

hexane : Per Condition 4B of the Permit, concentrations were measured using a Photoionization Detector (PID) calibrated in ppmv as hexane

ppmv : Parts per million per volume

SSD : Sub-slab depressurization

VOC : Volatile organic compound

: The total VOC concentration in the exhaust stack exceeds 10 ppmv as hexane

1.0 INTRODUCTION

Partner Engineering and Science, Inc. (Partner), on behalf of Acc Bld, LLC (the "Client"), has prepared the following report summarizing the field activities, methods, and findings of the Additional Site Characterization performed at 301 Tennessee Street in Redlands, California (the "Site").

1.1 Objective

The objective of the project was to further delineate the extent of volatile organic compounds (VOCs) in the subsurface.

1.2 Scope

The scope of the project included installation and sampling of 16 nested soil gas probes and a groundwater monitoring well.

1.3 Quality Assurance / Quality Control

The project was performed in accordance with applicable methodology approved by the United States Environmental Protection Agency (EPA), the Department of Toxic Substances Control (DTSC), and the State Water Resources Control Board (SWRCB). The registered professional in charge, Mr. Robert Traylor, PG, CHg, has at least 5 years of hydrogeologic experience and supervised the work associated with the project.

2.0 SITE HISTORY AND BACKGROUND

2.1 Site Description

The Site consists of an approximately 8.2-acre rectangular parcel of land (Assessor's Parcel Number [APN] 0292-192-11) located on the northwest corner of the Tennessee Street and West State Street intersection in a mixed industrial and commercial area of the City of Redlands, California. The Site is developed with three buildings. The main building (Building 1) encompasses much of the parcel and was constructed in phases from the mid-1960s to 1991. The second building (Building 2) is in the northwest corner of the parcel and was constructed in 1969. The third building (Building 3) is located to the north of Building 1 and was constructed in the mid-1960s. Please see Figures 2.1-1 and 2.1-2 for a topographic map of the site vicinity and a site plan, respectively.

2.2 Site History

According to a Phase I and II Environmental Site Assessment (Phase I and II) Report prepared by LOR Geotechnical Group, Inc. (LOR), dated January 21, 2020, La-Z-Boy previously operated at the Site from approximately the 1960s to 2019 for furniture manufacturing. Available regulatory agency records documented historical on-site use of hazardous materials.

In 1994, RMT, Inc. (RMT) performed two subsurface investigations at the Site as summarized in two reports (Limited Subsurface Investigation Report, dated November 29, 1994, and Results of the Subsurface Investigation Report, dated March 1995) to evaluate potential subsurface impacts associated with a former fire suppression water overflow collection trap, which was located in the parking lot to the north of Building 1 and to the southeast of Building 3. The cumulative scope of the investigations included seven borings (SB-1 through SB-7) advanced to a maximum terminal depth of 50 feet below ground surface (bgs) and laboratory analysis of multiple soil samples. The RMT investigations identified various chlorinated VOCs in soil to at least 30 feet bgs.

Subsequently, LOR performed an investigation at the Site in 2019 as summarized in the aforementioned Phase I and II Report to evaluate whether the historical industrial operations impacted the subsurface. The investigation scope included, in part, a 34-point soil gas survey across the Site. Soil gas samples were collected at 5 feet bgs or shallower. The LOR investigation identified elevated concentrations of various chlorinated VOCs in soil gas. Peak concentrations were generally detected in the vicinity of the former fire suppression water overflow collection trap.

Please see Figure 2.2-1 for a map of the prior boring locations and Tables 2.2-1 and 2.2-2 for cumulative summaries of the VOCs laboratory results for soil and soil gas, respectively.

3.0 GEOLOGY AND HYDROGEOLOGY

3.1 Regional Geology and Hydrogeology

According to Department of Water Resources (DWR) Bulletin 118, the Site is located in the Bunker Hill Subbasin of the Upper Santa Ana Valley Groundwater Basin. The subbasin consists of alluvial materials underlying the San Bernardino Valley and is bounded by consolidated rocks of the San Gabriel Mountains, San Bernardino Mountains, and Crafton Hills, and by several faults.

According to Bulletin 118, water-bearing material in the subbasin consists of Holocene and Pleistocene Age alluvial deposits of sand, gravel, and boulders interspersed with silt and clay deposits. Groundwater generally converges toward the Santa Ana River in the southwestern part of the subbasin and discharges over the San Jacinto Fault at Colton Narrows.

3.2 Local Geology and Hydrogeology

Based on a review of the United States Geological Survey (USGS) Redlands, California, Quadrangle topographic map, the Site is situated at an elevation of approximately 1,265 feet above mean sea level (amsl) and the local topography generally slopes to the west. USGS geologic mapping of the Redlands, California, Quadrangle indicates that the Site is largely underlain by young axial-valley deposits of Middle Holocene Age. These deposits consist of slightly to moderately consolidated silt, sand, and gravel.

Based on borings advanced during this investigation, the Site is primarily underlain by poorly graded sand with varying amounts of silt to at least 130 feet bgs. Layers of silt with varying amounts of clay were encountered at approximately 35, 75, and 105 to 110 feet bgs. Please see Appendix A for boring logs from this investigation.

Groundwater was first encountered beneath the Site at approximately 113 feet bgs. The water-bearing unit extended to at least 130 feet bgs, the maximum terminal depth of this investigation.

According to records from the SWRCB GeoTracker website, Lockheed Martin Corporation is under several Cleanup and Abatement Orders (CAOs) due to a release or releases associated with the former Lockheed Propulsion Company (LPC) Site at 1500 Crafton Avenue in Redlands. Associated groundwater impacts are referred to as the Crafton-Redlands plume, which is located in the eastern and central portions of the Bunker Hill Subbasin and consists of a perchlorate plume and a trichloroethene (TCE) plume that fully resides within the footprint of the perchlorate plume.

According to the 2020 Comprehensive Groundwater Sampling Event Report prepared by Tetra Tech, Inc. (Tetra Tech), dated November 24, 2020, for the LPC Site, groundwater in the eastern portion of the Bunker Hill Subbasin, east of California Street (inclusive of the Site), occurs under water table conditions. Groundwater flow in the eastern portion of the subbasin is generally from east to west toward the central portion of the subbasin.

According to the Tetra Tech report, production wells are located both up- and down-gradient of the Site. The Site is located within the lateral limits of the Crafton-Redlands perchlorate plume, but not the TCE plume.

4.0 FIELD ACTIVITIES

4.1 Permitting

Partner filed a well permit with the San Bernardino County Department of Public Health (DPH) Environmental Health Services (EHS) for each boring drilled to 20 feet bgs or deeper. EHS issued well permit numbers 2021010040 and 2021040238 for borings B1 and MW1, respectively. Please see Appendix B for copies of the permits filed for the project.

4.2 Health and Safety Plan

Partner implemented a site-specific Health and Safety Plan with on-site personnel involved in the project prior to the commencement of field activities.

4.3 Utility Clearance

Partner delineated the work area(s) with white spray chalk and notified Underground Service Alert (USA) to clear public utility lines as required by law at least 3 business days prior to drilling and/or excavation activities.

On January 20, 2021, Partner subcontracted with Subsurface Surveys & Associates, Inc. (SSS) to further clear boring locations of utility lines using electromagnetic induction (EM) equipment, magnetometers, ground-penetrating radar (GPR), and/or utility tracers. Please see Appendix C for the private utility locator report.

In addition, the upper 5 feet of boring locations was manually excavated with a hand-auger for further utility clearance.

4.4 Decontamination

Drilling and sampling equipment arrived pre-cleaned. Downhole equipment and materials were decontaminated in a detergent / tap water wash and double-rinsed with tap water or with a pressure washer between samples and/or borings to reduce the potential for cross-contamination.

4.5 Soil Gas Probes Installation

Sixteen nested soil gas probes (B1 through B12 and B15 through B18) were installed across the Site.

4.5.1 Drilling Equipment

Partner subcontracted with MR Drilling Co. (MR) (formerly J&H Drilling Co., Inc. [J&H]), a State-licensed water well drilling contractor (C57 license number 740854) to provide and operate drilling equipment. On January 20 and 21, 2021, MR installed soil gas probes B2 through B12 and B15 through B18 with track-mounted direct-push drill rigs. On January 22, 2021, MR installed soil gas probe B1 with a truck-mounted auger drill rig.

4.5.2 Soil Gas Probe Locations

Soil gas probe B1 was installed in the parking lot to the north of Building 1, in the vicinity where LOR previously detected peak VOC concentrations in soil gas. Soil gas probes B2 through B9 were installed throughout the Site's parking lot. Soil gas probe B10 was installed in Building 2. Soil gas probes B11, B12, and B15 through B18 were installed throughout Building 1.

Boring B13 was originally advanced in the west-central area of Building 1. However, an electrical line was encountered in the boring. Accordingly, the boring was abandoned, relocated several feet, and renamed B17.

Boring B14 was originally planned in the east-central area of Building 1. However, due to potential conflicts with an underground electrical line, the boring was relocated several feet and renamed B18.

In general, soil gas probe B1 was constructed to delineate the vertical extent of VOCs in the subsurface and the remaining soil gas probes were constructed to delineate the horizontal extent of VOCs at shallow depths across the Site. Please see Figure 2.2-1 for a map of the soil gas probes.

4.5.3 Sampling Depths

Boring B1 was advanced to a terminal depth of 75.75 feet bgs and boring B17 was advanced to drilling refusal, which was encountered at 6.5 feet bgs. The remaining borings were advanced to a terminal depth of 15.5 feet bgs.

Soil was collected from boring B1 in 5-foot intervals to the terminal depth and from the remaining borings continuously to the terminal depth.

Nested soil gas probes were constructed in boring B1 screened at 5, 15, 30, 50, and 75 feet bgs, and a soil gas probe was constructed in boring B17 screened at 5 feet bgs. In the remaining borings, nested soil gas probes were constructed screened at 5 and 15 feet bgs (at B15, the shallow soil gas probe was screened at 4 feet bgs since an asphalt layer was encountered in the boring at 5 feet bgs).

4.5.4 Soil Sampling Methodology

At B1, the drill rig advanced 8.25-inch outer diameter (OD) continuous flight hollow-stem augers into the subsurface after the initial hand-augering for utility clearance. Soil cuttings generated during drilling were carried upward by the auger flights to the ground surface and containerized by the drill rig crew. Discrete soil samples were collected at desired sampling depths using a 2-inch diameter California-modified split-spoon sampler advanced ahead of the lead auger. At a desired sampling depth, the split-spoon sampler was attached to the center drill string and driven within the auger column into the subsurface using the drill rig hammer system to allow undisturbed soil to enter the sampler a maximum of 18 inches or until refusal (i.e., hammer blow count of at least 50). The augers were advanced to the next sampling depth, the soil-filled sampler was retrieved from the subsurface, the soil core was recovered from the sampler, and sampling continued as described to the terminal depth.

Soil was collected from the remaining borings using a dual-tube sampler. After the initial hand-augering for utility clearance, the direct-push drill rig advanced 4-foot long by 2.25-inch diameter outer casing into

the subsurface. An inner drill string consisting of a 4-foot long by 1.125-inch diameter acetate liner connected to 1.25-inch diameter center rods was driven into the subsurface flush with the lead outer casing to allow undisturbed soil to enter the open liner. The inner drill string was retrieved from the cased boring to recover the soil-filled liner, a lengthwise section of each acetate liner was removed with a splitting tool to expose the soil core, and soil sampling continued as described to the terminal depth.

The soil cores were visually inspected for discoloration, monitored for odors, and classified in general accordance with the Unified Soil Classification System (USCS). Soil from select intervals was placed in a sealable plastic bag and field-screened for volatile organics with a calibrated photoionization detector (PID).

Discrete soil samples were prepared for laboratory analysis from each boring in 5-foot intervals to the terminal depth. At a desired sampling depth, subcores were collected directly from the soil core using a dedicated disposable plastic syringe, which were retained in two pre-weighed, laboratory-supplied, 40-milliliter, sodium bisulfate-preserved volatile organics analysis vials (VOAs) in accordance with EPA Method 5035 sampling protocol and sealed with Teflon-lined septum caps. Additional soil for each sample was retained in the original sample liner, which was cut and sealed on either end with Teflon tape and plastic caps, or transferred to a glass jar, which was filled with no observable headspace and sealed with Teflon tape and a threaded cap. Each sample container was labeled for identification and stored in iced coolers.

4.5.5 Soil Gas Probe Construction

Nested soil gas probes were constructed in boring B1 upon advancement to the terminal depth. New ¼-inch diameter Nylaflow tubing with a 6-inch long stainless steel vapor implant at the terminal end was suspended within the auger flights with the aid of blank polyvinyl chloride (PVC) casing to the deepest desired sampling depth and #3 sand was poured into the annulus to form an approximately 1.5-foot long sand pack around the vapor implant. Approximately 6 inches of dry transitional granular bentonite was placed atop the sand pack and the annulus was backfilled with hydrated bentonite to approximately 1.25 feet below the next desired sampling depth. Approximately 6 inches of dry transitional granular bentonite was placed atop the hydrated bentonite and the next soil gas probe was constructed as previously described. Additional shallower soil gas probes within the boring were similarly constructed. Upon installation of the shallowest probe, the remainder of the annulus was backfilled with hydrated bentonite to approximately 1 foot bgs to form a seal. The augers were retrieved from the subsurface as the nested soil gas probes were constructed and the depth to the annular materials was periodically measured to verify that bridging was not occurring. Each probe was fitted with a valve on the sampling end of the tubing and labeled for identification. An 8-inch diameter, flush-mounted, traffic-rated vault was installed at the ground surface within a concrete pad to house the nested soil gas probes.

Nested soil gas probes were constructed within each direct-push boring upon advancement to the terminal depth and withdrawal of downhole casing. Where necessary, the boring was first backfilled with hydrated bentonite chips to raise the terminal depth to approximately 6 inches below the deepest soil gas probe screening depth. New ¼-inch diameter Nylaflow tubing with a 1-inch long by 0.5-inch diameter

stainless steel vapor implant at the terminal end was inserted into the boring with the aid of blank PVC casing to the deepest desired sampling depth and #3 sand was poured into the boring annulus to form an approximately 1-foot long sand pack around the vapor implant. The PVC casing was withdrawn from the boring; approximately 6 inches of dry, granular bentonite was placed atop the sand pack; and the boring annulus was backfilled with hydrated bentonite to approximately 1 foot below the next desired sampling depth. Approximately 6 inches of dry transitional granular bentonite was placed atop the hydrated bentonite and the next soil gas probe was constructed as previously described. Upon installation of the shallowest probe, the remainder of the boring annulus was backfilled with hydrated bentonite to approximately 1 foot bgs to form a seal. The depth to the annular materials was periodically measured to verify that bridging was not occurring. Each probe was fitted with a valve on the sampling end of the tubing and labeled for identification. An 8-inch diameter, flush-mounted, traffic-rated vault was installed at the ground surface within a concrete pad to house the nested soil gas probes.

Please see Appendix A for the nested soil gas probe construction diagrams integrated into the respective boring logs.

4.6 Monitoring Well Installation

4.6.1 Drilling Equipment

Partner subcontracted with MR to provide and operate drilling equipment. On April 13 and 14, 2021, MR installed groundwater monitoring well MW1 with a truck-mounted auger drill rig.

4.6.2 Monitoring Well Location

Groundwater monitoring well MW1 was installed adjacent to soil gas probe B1 where LOR previously detected peak VOC concentrations in soil gas. Please see Figure 2.2-1 for a map of the groundwater monitoring well.

4.6.3 Sampling Depths

Boring MW1 was advanced to a terminal depth of 130.5 feet bgs. Soil was collected from the boring in 5-foot intervals from 80 feet bgs to the terminal depth. A grab groundwater sample was collected from the boring during monitoring well construction and a groundwater sample was collected from the monitoring well after construction and development. In addition, a soil gas probe was integrated into the well annulus screened at 95 feet bgs. The integrated soil gas probe was considered a continuation of adjacent nested soil gas probe B1.

4.6.4 Soil Sampling Methodology

Soil samples were collected from auger boring MW1 and prepared for laboratory analysis as described in Section 4.5.4.

4.6.5 Grab Groundwater Sampling Methodology

A grab groundwater sample was collected from the boring during monitoring well construction (described in the following Section). The grab groundwater sample was collected using a bailer with the well screen and riser in place. After purging one or more bailers of groundwater from the casing, groundwater was retrieved downhole with the bailer and decanted into laboratory-supplied, 40-milliliter, hydrochloric acid-preserved VOAs, which were filled and sealed with Teflon-lined septum caps with no observable headspace or air bubbles to reduce the potential for volatilization, labeled for identification, and stored in an iced cooler. Monitoring well construction continued after grab groundwater sample collection.

4.6.6 Monitoring Well Construction

The monitoring well was constructed of 2-inch diameter, 0.010-inch slotted schedule 80 PVC screen spanning from approximately 110 to 130 feet bgs (20 feet of screen) and sufficient 2-inch diameter schedule 80 PVC riser to extend to the ground surface. The terminal end of the monitoring well was fitted with a PVC end cap, the well segments were attached with threaded connections, and the wellhead was fitted with a locking cap. The integrated soil gas probe was constructed of new ¼-inch diameter Nylaflow tubing with a 6-inch long stainless steel vapor implant, mirroring the construction of adjacent nested soil gas probe B1.

The monitoring well was constructed within the auger flights upon drilling and sampling to the terminal depth. The well casing was suspended in the center of the auger flights approximately 6 inches above the boring terminal depth and the well annulus was backfilled from the bottom upwards with #2/16 sand to approximately 2 feet above the well screen. The annulus above the sand pack was backfilled with hydrated bentonite to approximately 1.25 feet below the desired soil gas sampling depth. Approximately 6 inches of dry transitional granular bentonite was placed atop the hydrated bentonite and the soil gas probe tubing with vapor implant was suspended in the annulus with the aid of blank PVC casing to the desired sampling depth. #3 sand was poured into the annulus to form an approximately 1.5-foot long sand pack around the vapor implant. Approximately 6 inches of dry transitional granular bentonite was placed atop the sand pack and the remainder of the annulus was backfilled with cement-bentonite grout to approximately 1 foot bgs to form a seal. The augers were retrieved from the subsurface as the well was constructed and the depth to the annular materials was periodically measured to verify that bridging was not occurring. The probe was fitted with a valve on the sampling end of the tubing and labeled for identification. A 12-inch diameter, flush-mounted, traffic-rated vault was installed at the ground surface within a concrete pad to house the groundwater monitoring well and nested soil gas probe. Please see Appendix A for the well construction diagram integrated into the respective boring log.

4.6.7 Monitoring Well Development

Partner subcontracted with MR to develop the newly installed monitoring well on April 21, 2021. MR developed the well by block-surging, bailing sediment, and over-pumping a minimum of 10 water-filled casing volumes. During development, purge water was periodically monitored for turbidity, pH, electrical conductivity, and/or temperature. Well development ceased after over-pumping the minimum purge

volume and stabilization of the water parameters. Please see Appendix D for the well development field sheets.

4.6.8 Monitoring Well Sampling Methodology

On May 3, 2021, Partner subcontracted with Blaine Tech Services, Inc. (Blaine Tech) to provide and operate well sampling equipment. Please see Appendix E for a discussion of general field procedures for the groundwater elevation measurements, well purging, and sampling and Appendix F for the groundwater monitoring field sheets.

Blaine Tech performed low-flow purging and sampling with a bladder pump for this Site. Purge water parameters were measured in the field with a HACH turbidimeter for turbidity and a YSI Model Professional Plus multi-parameter meter with flow cell for temperature, pH, specific conductivity, dissolved oxygen (DO), and oxidation-reduction potential (ORP). Blaine Tech calibrated the field instruments prior to use.

Once parameters stabilized, groundwater was conveyed from the bladder pump outlet into laboratory-supplied, 40-milliliter, hydrochloric acid-preserved VOAs, which were filled and sealed with Teflon-lined septum caps with no observable headspace or air bubbles to reduce the potential for volatilization, labeled for identification, and stored in an iced cooler.

Please note that the MW1 wellhead elevation was not surveyed as part of this investigation. As such, the groundwater elevation in the monitoring well was unable to be calculated.

4.7 Soil and Groundwater Laboratory Analysis

Soil and groundwater samples were transferred in iced coolers under chain-of-custody protocol to Alpha Scientific Corporation (ASC), a State-accredited laboratory (SWRCB Division of Drinking Water [DDW] Environmental Laboratory Accreditation Program [ELAP] certificate number 3007) in Cerritos, California, for analysis. Soil samples from boring MW1 in 10-foot intervals from 80 feet bgs to the terminal depth, each of the soil samples from the remaining borings, and the groundwater samples were analyzed for VOCs in accordance with EPA Method 8260B.

4.8 Soil Gas Sampling Methodology and Laboratory Analysis

Partner subcontracted with H&P Mobile Geochemistry, Inc. (H&P), a U.S. Department of Defense (DoD) accredited mobile laboratory (DoD-ELAP certificate number L19-589-R1) based in Carlsbad, California, to provide soil gas sampling and mobile laboratory field services on February 23 and 25 and April 19, 2021. H&P collected and analyzed soil gas samples from the newly installed soil gas probes in general accordance with the July 2015 DTSC and Los Angeles Regional Water Quality Control Board (LARWQCB) "Advisory – Active Soil Gas Investigations." The mobile laboratory was calibrated at the beginning of each field day prior to the first sample analysis. Soil gas probes equilibrated for a minimum of 48 hours after installation prior to sampling.

A shut-in test was performed at each soil gas probe prior to purging and sampling to identify potential leaks by evacuating the aboveground sampling train to approximately 100 inches of water column (" WC).

The shut-in test was considered acceptable if the vacuum level did not dissipate over a nominal period of 60 seconds. Conversely, a loss of vacuum would indicate a potential leak in the sampling train, which would require shut-in retesting after adjustments to the aboveground sampling train fittings and connections.

H&P purged approximately three purge volumes from each probe after shut-in testing at a flow rate of approximately 200 milliliters per minute (mL/min) (up to 2 liters per minute [L/min] for probes with large purge volumes) while maintaining a vacuum of less than 100" WC. One purge volume included the internal volume of the tubing and vapor implant, the void space of the soil gas probe sand pack, and the void space of the dry, granular bentonite above and below the sand pack.

A sample was collected from each soil gas probe within the closed system of the aboveground sampling train with gas-tight glass syringes after purging. A vacuum of less than 100" WC was maintained during sample collection. Each sample was injected into the mobile laboratory gas chromatograph / mass spectrometer (GC/MS) for VOCs analysis in accordance with EPA Method 8260B within 30 minutes of sample collection.

If the vacuum approached 100" WC during purging and/or sampling, the sampling train was left under vacuum and monitored. Sampling activities ceased and the probe was considered to be under "no flow" conditions if the vacuum did not dissipate after a nominal period of 3 minutes. "No flow" conditions were not encountered during this investigation.

4.9 Investigation-Derived Waste

Investigation-derived waste (IDW) (e.g., soil cuttings, decontamination and purge water) was containerized in sealed and labeled 55-gallon steel drums approved by the Department of Transportation (DOT) and stored on-site. A total of 26 drums of soil and 5 drums of water were generated during this investigation.

The IDW was profiled based on laboratory analysis results and transported to permitted receiving facilities for recycling, treatment, and/or disposal. Partner will issue an addendum to this report once disposal documentation is available from the receiving facilities.

5.0 DISCUSSION

5.1 Laboratory Results and Quality Assurance / Quality Control

Please see Tables 5.1-1 and 5.1-2 for the current soil and soil gas VOCs laboratory analysis results, respectively; Tables 2.1-2 and 2.1-2 for cumulative soil and soil gas VOCs laboratory analysis results, respectively; Table 5.1-3 for the groundwater VOCs laboratory analysis results; and Appendix G for the laboratory analysis reports, which include chain-of-custody and laboratory Quality Assurance / Quality Control (QA/QC) documentation.

The soil, soil gas, and groundwater samples were analyzed within the respective analysis hold times.

The laboratories ran surrogate samples, method blanks (MB), matrix spikes (MS), matrix spike duplicates (MSD), laboratory control spikes (LCS), laboratory control spike duplicates (LCSD), and/or continuing calibration verifications (CCV) as part of its QA/QC program. Partner noted the following for H&P laboratory report number PAR022321-SB1:

- Surrogate dibromofluoromethane recovery was above the acceptability range for sample B1 at 50 feet bgs. The results were considered acceptable since recovery of the remaining surrogates was within established control limits;
- Chloroethane and trichlorofluoromethane (Freon 11) LCS recoveries for batch EB12508 were above the respective acceptability ranges. Accordingly, results of these analytes for samples analyzed under this batch QC may be biased high;
- Isopropylbenzene, naphthalene, and bromomethane CCV recoveries for batch EB12309 were below the respective acceptability ranges. Accordingly, results for these analytes for samples analyzed under this batch QC may be biased low;
- Naphthalene CCV recovery for batch EB12507 was below the acceptability range. Accordingly, results for this analyte for samples analyzed under this batch QC may be biased low; and
- 1,1-Difluoroethane CCV recovery for batch EB12508 was below the acceptability range. Accordingly, results for this analyte for samples analyzed under this batch QC may be biased low.

Partner noted in H&P laboratory report number PAR041921-ML that chloroethane; methylene chloride; 1,1,2-trichoroethane (TCA); and 1,1,2,2-tetrachloroethane (R-130) LCS recoveries for batch ED11909 were above the respective acceptability ranges. Accordingly, results for these analytes for samples analyzed under this batch QC may be biased high.

The remaining laboratory QA/QC data were within acceptable limits and/or did not affect data interpretation.

A field replicate was collected and analyzed each field day for each mobile laboratory to evaluate the precision of the laboratory analysis. Soil gas probes B1 at 30 and 95 feet bgs, B6 at 15 feet bgs, and B7 at 5 feet bgs were selected for replicate sampling and analysis.

Identical analytes were identified between each pair of original and replicate samples except B1 at 95 feet bgs where 1,1-difluoroethane (leak check compound [LCC]) was detected in the replicate sample, but not

the original sample. The results were considered acceptable since the detected LCC concentration was less than five times the laboratory Reporting Limit (RL). The relative percent difference (RPD) in concentrations of the remaining detected analytes between the original and replicate sample pairs ranged from 4.9% to 21%, 7.7% to 29%, 2.0% to 12%, and 8.0% to 12%, respectively. The results were considered acceptable since the RPDs did not exceed 50%.

Tracer gas (LCC) 1,1-difluoroethane was placed at the ground surface near the soil gas probe and aboveground sampling train while sampling to evaluate the potential for ambient air intrusion. The LCC, detection of which would indicate that atmospheric leakage had occurred during sampling, was included on the list of target analytes. The LCC was detected in five samples: B1 at 95 feet bgs (replicate); B11 at 5 feet bgs, B12 at 15 feet bgs, B15 at 4 feet bgs, and B17 at 5 feet bgs. The results were considered acceptable since the detected LCC concentrations were less than 10 times the respective laboratory RLs.

5.2 VOCs in Soil

TCE was detected in 5 of the 66 analyzed soil samples at concentrations ranging from 2.3 to 4.1 micrograms per kilogram (μg/kg). Other VOCs detected in soil included benzene in two samples and naphthalene in one sample.

To evaluate the laboratory analysis results, Partner compared the VOC detections in soil to Regional Screening Levels (RSLs) and Note 3 Screening Levels (DTSC-SLs).

RSLs are generic, risk-based chemical concentrations developed by EPA for use in initial screening-level evaluations. RSLs combine human health toxicity values with standard exposure factors to estimate chemical concentrations for soil, tap water, and ambient air that are considered to be protective of human health over a lifetime through direct-contact exposure pathways (e.g., via inhalation and/or ingestion of and/or dermal contact with impacted soil). RSLs are not legally enforceable standards, but rather are considered guidelines to evaluate if potential risks associated with impacted media may warrant further evaluation.

The DTSC Human and Ecological Risk Office (HERO) has developed modified DTSC-SLs based on the RSLs for use in screening-level risk assessments for California sites and facilities. The DTSC-SLs for soil, tap water, and ambient air are compiled under HERO Human Health Risk Assessment Note 3.

Please see Table 5.1-1 for a comparison of the soil analysis results and the respective residential and commercial/industrial soil SLs. The presented SLs were the most conservative values between RSLs and DTSC-SLs. No VOCs were detected in soil above residential or commercial/industrial soil SLs.

5.3 VOCs in Soil Gas

TCE was detected in 31 of the 35 analyzed soil gas samples at concentrations ranging from 0.026 to 23 micrograms per liter (μg/L). Other VOCs frequently detected in soil gas included various other chlorinated ethenes (e.g., tetrachloroethene [PCE] and 1,1-dichloroethene [DCE]) as well as chlorinated ethanes (e.g., 1,1-dichloroethane [DCA] and 1,1,1-TCA) and chloroform (a chlorinated methane).

Volatile chemicals in the subsurface can migrate upward through the soil and enter buildings, causing unacceptable chemical exposure for building occupants (i.e., vapor intrusion). DTSC has developed "Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air" (Vapor Intrusion Guidance; release date October 2011), which provides a recommended approach for evaluating vapor intrusion into buildings and its subsequent impact on indoor air quality. According to the Vapor Intrusion Guidance, a preliminary screening evaluation for potential vapor intrusion concerns can be performed by applying an Attenuation Factor (AF) to detected soil gas concentrations to calculate corresponding theoretical indoor air concentrations. The relationship between the AF, the indoor air concentration of a VOC, and the soil gas concentration of a VOC is described below:

$$\alpha = \frac{C_{indoor}}{C_{soil\ gas}}$$

where: α = AF

C_{indoor} = Indoor Air Concentration of a VOC

$C_{soil\ gas}$ = Soil Gas Concentration of a VOC

To evaluate potential vapor intrusion concerns associated with VOCs in soil gas, Partner calculated soil gas SLs based on the above equation using the default AF from EPA's OSWER [Office of Solid Waste and Emergency Response] Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Vapor Sources to Indoor Air, dated June 2015, for the residential and commercial/industrial land use scenarios (AF of 0.03 for both) along with the most conservative residential and commercial/industrial ambient air SLs between RSLs and DTSC-SLs. A summary of the soil gas SL calculations is presented in Table 5.3-1 and a comparison of the soil gas VOC concentrations during this investigation and the respective SLs is presented in Table 5.1-2.

Of the 31 soil gas samples with TCE detections, each exceeded the residential SL and 23 of the samples exceeded the commercial/industrial SL. Among the other VOCs detected in soil gas, the following were detected in at least one sample at a concentration exceeding the respective commercial/industrial SL: PCE (4 samples); 1,1-DCE (2 samples); 1,1-DCA (9 samples); 1,1,1-TCA (1 sample); 1,1,2-TCA (1 sample); and chloroform (13 samples).

The cumulative investigation results indicate that TCE is the primary chemical of concern at the Site based on the frequency and magnitude of detections and chemical toxicity. Notably, in each soil gas sample where one or more of the other chlorinated VOCs were detected, TCE was also detected in the sample, typically at the highest concentration among the VOCs.

Please see Figures 5.3-1 and 5.3-2 for soil gas TCE isoconcentrations at 5 and 15 feet bgs, respectively. The former illustrates that TCE impacts are generally centered on the exterior area to the north of Building 1, in the vicinity of the former fire suppression water overflow collection trap. The lateral extent of TCE in soil gas at 5 feet bgs has been delineated in the easterly, southerly, and westerly directions. Some uncertainty remains regarding the lateral extent in the northly and northwesterly directions, though concentrations are trending downward in those directions. In addition, the lateral extent of TCE in soil gas

exceeding the commercial/industrial SL appears to be largely within the Site's property boundaries. The lateral distribution of TCE in soil gas at 15 feet bgs generally mirrored the lateral distribution at 5 feet bgs.

TCE was detected in soil gas at B1 from 5 to 95 feet bgs, indicating that the release has impacted the vertical soil column above groundwater at that location. The highest TCE concentration at B1 was detected at 30 feet bgs, located just above a silt layer that was encountered at approximately 35 feet bgs.

5.4 VOCs in Groundwater

The following VOCs were detected in groundwater from monitoring well MW1: TCE; cis-1,2-DCE; 1,1-DCE; 1,1-DCA; and 1,1,1-TCA.

To evaluate the laboratory analysis results, Partner compared the VOC detections in groundwater to Maximum Contaminant Levels (MCLs), which are primary standards of drinking water established by SWRCB. MCLs are available for various chemicals and are considered concentrations that are health-protective of human exposures over a lifetime through direct-contact exposure pathways (e.g., ingestion).

Please see Table 5.1-3 for a comparison of the groundwater analysis results and the MCLs. TCE and 1,1-DCE were detected in groundwater above the respective MCLs.

6.0 SUMMARY AND CONCLUSIONS

Partner performed Additional Site Characterization to further delineate the extent of VOCs in the subsurface. The scope of the project included installation and sampling of 16 nested soil gas probes and a groundwater monitoring well with a nested soil gas probe.

TCE was detected in 5 of the 66 analyzed soil samples at concentrations ranging from 2.3 to 4.1 µg/kg. Other VOCs detected in soil included benzene in two samples and naphthalene in one sample. No VOCs were detected in soil above residential or commercial/industrial soil SLs.

TCE was detected in 31 of the 35 analyzed soil gas samples at concentrations ranging from 0.026 to 23 µg/L. Other VOCs frequently detected in soil gas included various other chlorinated ethenes (e.g., PCE and 1,1-DCE) as well as chlorinated ethanes (e.g., 1,1-DCA and 1,1,1-TCA) and chloroform (a chlorinated methane). Of the 31 soil gas samples with TCE detections, each exceeded the residential SL and 23 of the samples exceeded the commercial/industrial SL. Among the other VOCs detected in soil gas, the following were detected in at least one sample at a concentration exceeding the respective commercial/industrial SL: PCE (4 samples); 1,1-DCE (2 samples); 1,1-DCA (9 samples); 1,1,1-TCA (1 sample); 1,1,2-TCA (1 sample); and chloroform (13 samples).

TCE in the subsurface is primarily in the soil gas phase and generally centered on the exterior area to the north of Building 1, in the vicinity of the former fire suppression water overflow collection trap. The lateral extent of TCE in soil gas at 5 feet bgs has been delineated in the easterly, southerly, and westerly directions. Some uncertainty remains regarding the lateral extent in the northly and northwesterly directions, though concentrations are trending downward in those directions. In addition, the lateral extent of TCE in soil gas exceeding the commercial/industrial SL appears to be largely within the Site's property boundaries. The lateral distribution of TCE in soil gas at 15 feet bgs generally mirrored the lateral distribution at 5 feet bgs.

TCE was detected in soil gas at B1 from 5 to 95 feet bgs, indicating that the release has impacted the vertical soil column above groundwater at that location. The highest TCE concentration at B1 was detected at 30 feet bgs, located just above a silt layer that was encountered at approximately 35 feet bgs.

The following VOCs were detected in groundwater from monitoring well MW1: TCE; cis-1,2-DCE; 1,1-DCE; 1,1-DCA; and 1,1,1-TCA. TCE and 1,1-DCE were detected in groundwater above the respective MCLs.

The cumulative investigation results indicate that a release of chlorinated VOCs, primarily TCE, occurred in the general vicinity of the former fire suppression water overflow collection trap. The release has migrated horizontally impacting the majority of the Site's footprint and migrated vertically to groundwater.

7.0 SIGNATURES OF PARTICIPATING PROFESSIONALS

Thank you for the opportunity to be of service. If you have questions regarding this report, please contact the undersigned at (310) 615-4500.

Sincerely,

Rodolfo Nadres, EIT
Project Manager

8.0 LIMITATIONS

This report presents a summary of work performed by Partner under the professional direction and review of the registered professional(s) listed. The work includes observations of site conditions encountered and the analytical results provided by independent third-party laboratories of samples collected during the course of the project. The number and location of samples were selected to provide the required information. However, it cannot be assumed that the limited available data are representative of subsurface conditions in areas not sampled.

The recommendations and/or conclusions provided in this report are based on observations, governing regulations, and/or available information from regulatory agencies; previous field investigations; and/or the results of laboratory analysis of soil, soil gas, and/or groundwater samples. Recommendations and/or conclusions beyond those stated and reported herein should not be inferred from this document.

Partner warrants that the environmental consulting services contained herein were performed in accordance with generally accepted practices in the environmental engineering and science, engineering geology, and hydrogeology fields that existed at the time and location of work. No other warranties are implied or expressed.

Reports, both verbal and written, as they pertain to the Site are for the sole use and benefit of the Client. This report has no other purpose and may not be relied upon by another person or entity without the written consent of Partner. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with Partner granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against Partner, its officers, employees, vendors, successors, or assigns. Any such unauthorized user shall be responsible to protect, indemnify and hold Partner, Client, and their respective officers, employees, vendors, successors, and assigns harmless from any and all claims, damages, losses, liabilities, expenses (including reasonable attorneys' fees), and costs attributable to such Use. Unauthorized use of this report shall constitute acceptance of and commitment to these responsibilities, which shall be irrevocable and shall apply regardless of the cause of action or legal theory pled or asserted. Additional legal penalties may apply.

Notes:

[A]Most conservative SL between EPA's RSLs (May 2021) and DTSC's HERO Note 3 DTSC-SLs (June 2020)

Blue highlighted concentrations exceed residential soil SLs

Orange highlighted concentrations exceed commercial/industrial soil SLs

µg/kg = micrograms per kilogram

bgs = below ground surface

SL = Screening Level

NA = not available or applicable

RSL = Regional Screening Level

< = not detected above indicated laboratory Method Detection Limit (MDL) or Reporting Limit (RL)

ND = not detected above laboratory MDLs or RLs

J = trace level (below laboratory Practical Quantitation Limit [PQL])

EPA = U.S. Environmental Protection Agency

DTSC = Department of Toxic Substances Control

HERO = Human and Ecological Risk Office

Table 2.2-2: Cumulative Soil Gas VOCs Laboratory Results (µg/L)

Boring	Sample Depth (feet bgs)	Date Sampled	Tetrachloroethene (PCE)	Trichloroethene (TCE)	cis-1,2-Dichloroethene (cis-1,2-DCE)	1,1-Dichloroethene (1,1-DCE)	1,1-Dichloroethane (1,1-DCA)	1,1,1-Trichloroethane (1,1,1-TCA)	1,1,2-Trichloroethane (1,1,2-TCA)	Chloroethane (Ethyl Chloride)	Chloroform	Toluene	1,1-Difluoroethane (LCC)	Other Volatile Organic Compounds (VOCs)
Residential Soil Gas SL (AF = 0.03)			**0.015**	**0.016**	**0.28**	**2.4**	**0.060**	**33**	**0.0060**	**330**	**0.0040**	**10**	**NA**	**NA**
Commercial/Industrial Soil Gas SL (AF = 0.03)			**0.067**	**0.10**	**1.2**	**10**	**0.26**	**150**	**0.026**	**1,500**	**0.018**	**43**	**NA**	**NA**

Notes:
Blue highlighted concentrations exceed residential soil gas SLs (Attenuation Factor [AF] = 0.03)
Orange highlighted concentrations exceed commercial/industrial soil gas SLs (AF = 0.03)
µg/L = micrograms per liter
bgs = below ground surface
LCC = leak check compound
SL = Screening Level (see Table 5.3-1 for calculations)
AF = attenuation factor
NA = not available or applicable
< = not detected above indicated laboratory Reporting Limit (RL)
ND = not detected above laboratory RLs

Table 5.1-1: Current Soil VOCs Laboratory Results (µg/kg)

Boring	Sample Depth (feet bgs)	Date Sampled	Tetrachloroethene (PCE)	Trichloroethene (TCE)	cis-1,2-Dichloroethene (cis-1,2-DCE)	1,1-Dichloroethene (1,1-DCE)	1,1-Dichloroethane (1,1-DCA)	1,2-Dichloroethane (1,2-DCA)	1,1,1-Trichloroethane (1,1,1-TCA)	1,1,2-Trichloroethane (1,1,2-TCA)	Methylene Chloride	Benzene	Toluene	Xylenes	Naphthalene	Other Volatile Organic Compounds (VOCs)

Notes:

[A]Most conservative SL between EPA's RSLs (May 2021) and DTSC's HERO Note 3 DTSC-SLs (June 2020)

Blue highlighted concentrations exceed residential soil SLs

Orange highlighted concentrations exceed commercial/industrial soil SLs

µg/kg = micrograms per kilogram

bgs = below ground surface

SL = Screening Level

NA = not available or applicable

RSL = Regional Screening Level

< = not detected above indicated laboratory Method Detection Limit (MDL) or Reporting Limit (RL)

ND = not detected above laboratory MDLs or RLs

J = trace level (below laboratory Practical Quantitation Limit [PQL])

EPA = U.S. Environmental Protection Agency

DTSC = Department of Toxic Substances Control

Table 5.1-1: Current Soil VOCs Laboratory Results (µg/kg)

Boring	Sample Depth (feet bgs)	Date Sampled	Tetrachloroethene (PCE)	Trichloroethene (TCE)	cis-1,2-Dichloroethene (cis-1,2-DCE)	1,1-Dichloroethene (1,1-DCE)	1,1-Dichloroethane (1,1-DCA)	1,2-Dichloroethane (1,2-DCA)	1,1,1-Trichloroethane (1,1,1-TCA)	1,1,2-Trichloroethane (1,1,2-TCA)	Methylene Chloride	Benzene	Toluene	Xylenes	Naphthalene	Other Volatile Organic Compounds (VOCs)

Notes:
Blue highlighted concentrations exceed residential soil gas SLs (Attenuation Factor [AF] = 0.03)
Orange highlighted concentrations exceed commercial/industrial soil gas SLs (AF = 0.03)
µg/L = micrograms per liter
bgs = below ground surface
LCC = leak check compound
SL = Screening Level (see Table 5.3-1 for calculations)
AF = attenuation factor
NA = not available or applicable
< = not detected above indicated laboratory Reporting Limit (RL)
ND = not detected above laboratory RLs

Table 5.1-3: Groundwater VOCs Laboratory Results (µg/L)

Boring	Sample Type	Sample Depth (feet bgs)	Date Sampled	Tetrachloroethene (PCE)	Trichloroethene (TCE)	cis-1,2-Dichloroethene (cis-1,2-DCE)	1,1-Dichloroethene (1,1-DCE)	1,1-Dichloroethane (1,1-DCA)	1,1,1-Trichloroethane (1,1,1-TCA)	Toluene	Other Volatile Organic Compounds (VOCs)
			MCL	**5**	**5**	**6**	**6**	**5**	**200**	**150**	**NA**
MW1	**Grab**	**≈113**	**04/13/21**	<1	**4.8**	<1	**1.7 J**	**1.6 J**	<1	**11.8**	ND
MW1	**Well**	**≈113**	**05/03/21**	<1	**18.1**	**1.6 J**	**10.3**	**3.9 J**	**1.2 J**	<0.5	ND

Notes:

Blue highlighted concentrations exceed MCLs

µg/L = micrograms per liter

bgs = below ground surface

MCL = Maximum Contaminant Level (State Water Resources Control Board [SWRCB]; August 2020)

NA = not available or applicable

J = trace level (below laboratory Practical Quantitation Limit [PQL])

< = not detected above indicated laboratory Method Detection Limit (MDL)

ND = not detected above laboratory MDLs

Table 5.3-1: Soil Gas Screening Level Calculations (µg/L)

			Attenuation Factor	0.03	0.03
Chemical of Concern	**Residential Ambient Air SL**	**Commercial/ Industrial Ambient Air SL**	**Basis [A]**	**Calculated Residential Soil Gas SL**	**Calculated Commercial/ Industrial Soil Gas SL**
Tetrachloroethene (PCE)	0.00046	0.0020	Note 3	0.015	0.067
Trichloroethene (TCE)	0.00048	0.0030	RSL	0.016	0.10
cis-1,2-Dichloroethene (cis-1,2-DCE)	0.0083	0.035	Note 3	0.28	1.2
1,1-Dichloroethene (1,1-DCE)	0.073	0.31	Note 3	2.4	10
1,1-Dichloroethane (1,1-DCA)	0.0018	0.0077	Note 3	0.060	0.26
1,1,1-Trichloroethane (1,1,1-TCA)	1.0	4.4	Note 3	33	150
1,1,2-Trichloroethane (1,1,2-TCA)	0.00018	0.00077	RSL	0.0060	0.026
Chloroethane (Ethyl Chloride)	10	44	RSL	330	1,500
Chloroform	0.00012	0.00053	RSL	0.0040	0.018
Toluene	0.31	1.3	Note 3	10	43

Equations

$$\alpha = \frac{C_{indoor}}{C_{soil\ gas}}$$

Where:
α = Attenuation Factor (AF)
C_{indoor} = Indoor Air Concentration of a VOC
$C_{soil\ gas}$ = Soil Gas Concentration of a VOC

Assumptions and Inputs

C_{indoor} = ambient air EPA RSL or ambient air DTSC HERO Note 3 DTSC-SL

α = 0.03 (per June 2015 EPA "OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Vapor Sources to Indoor Air")

Notes:

[A]Most conservative SL between EPA's RSLs (May 2021) and DTSC's HERO Note 3 DTSC-SLs (June 2020)
µg/L = micrograms per liter
SL = Screening Level
RSL = Regional Screening Level
NA = not available or applicable
VOC = volatile organic compound
EPA = U.S. Environmental Protection Agency
DTSC = Department of Toxic Substances Control
HERO = Human and Ecological Risk Office
OSWER = Office of Solid Waste and Emergency Response

Re: Geophysical Investigation Report, 301 Tennessee Street, Redlands, California

This report is to present the results of our geophysical survey carried out at 301 Tennessee Street, Redlands, California (Figure 1). The survey was performed on January 20, 2021, and its purpose was to locate and identify, insofar as possible, pipes, conduits, utilities, and other underground obstructions in the immediate vicinity of sixteen (16) proposed borehole locations.

A combination of electromagnetic induction (EM), magnetometry, and ground penetrating radar (GPR) were brought to the field in anticipation of use. Utility locators with line tracing capabilities were also used where applicable.

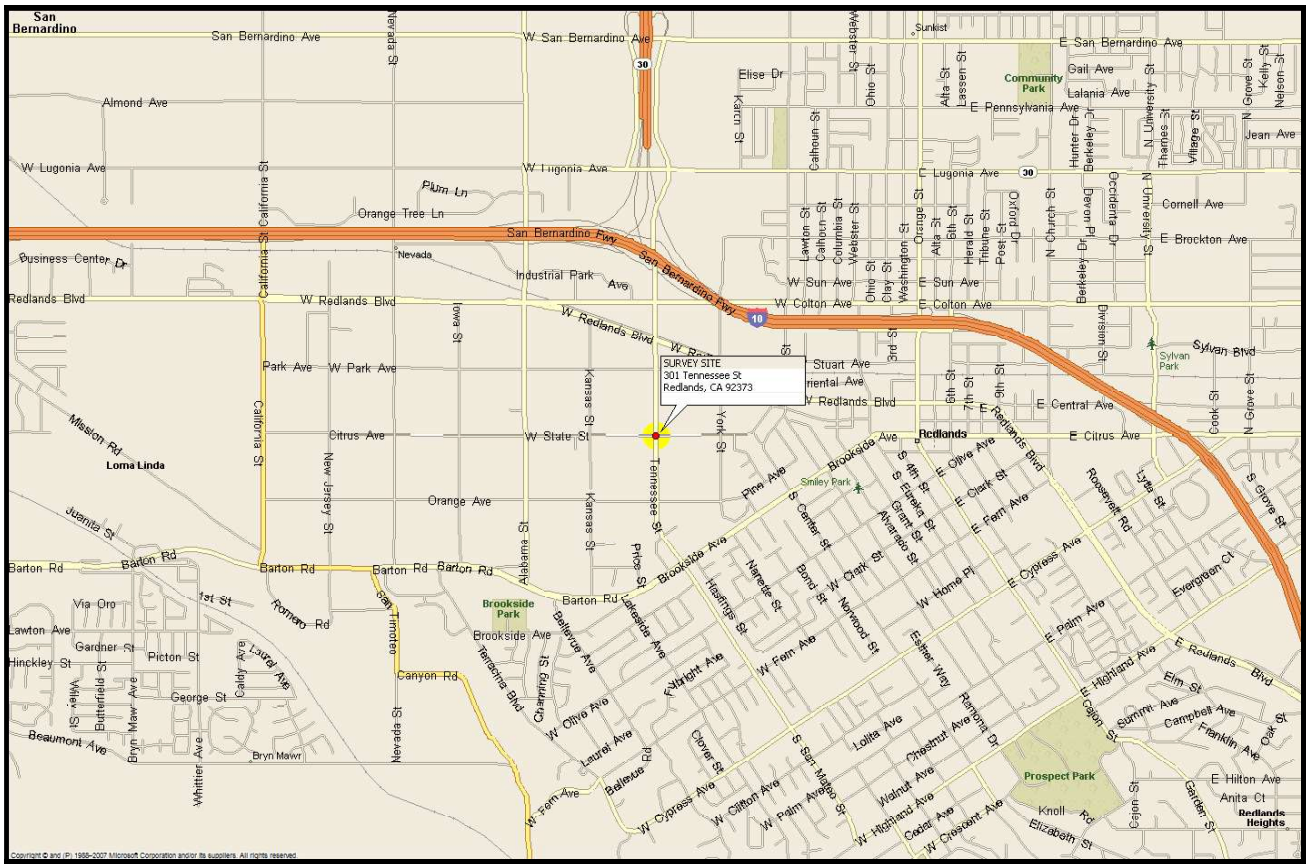

FIGURE 1. Site location map.

Survey Design – The survey site was located at a former La-Z-Boy. Nine (9) boreholes were located throughout the exterior of the facility. Seven (7) boreholes were located inside buildings with their exact location indicated in the field by the client.

Note that the EM and magnetic instruments could not be effectively used inside the buildings due to metallic interferences such as rebar-reinforcing and machinery. Consequently, inside the buildings, the survey could only be conducted with the GPR and utility locators and was, therefore, somewhat limited.

For this particular site and survey objectives, the best use of time was achieved by systematically free-traversing with the instruments while monitoring them manually, continuously, and in real-time to determine which responses were significant and due to true subsurface targets, and which were due to other non-target or above-ground features and must be ignored (an example being nearby buildings concrete). In these situations, the free-traversing method is advantageous in that it allows for immediate detection of anomalous objects and facilitates the opportunity to investigate them further despite any obstructions and without the need to first download data. Where applicable, and depending on location, the EM devices, magnetic gradiometer, and GPR were traversed systematically over the survey areas in multiple, organized directions. Other traverses were taken for detailing and confirmation where anomalous conditions were found.

In addition, the line tracers were used to impress signals onto pipes, generally through accessible risers and tracer wires when present, to delineate the lines' locations and orientations. The instruments were also used in passive mode, configured to detect 60 Hz electrical signals and other common radio-frequency signals found in active electrical and communication lines.

A Geonic's model EM61 and a Fischer TW-6 M-Scope was used for the EM sampling. A Sensors & Software Noggin Ground Penetrating Radar unit with a 500 MHz antenna produced the radar images. The magnetic gradiometer was a Schonstedt GA-52, and a Metrotech 9890 and RIDGID SR-60 SeekTech utility locator rounded out the tools applied.

Brief Description of the Geophysical Methods Applied – The EM61 instrument is a high resolution, time-domain device for detecting buried conductive objects. It consists of a powerful transmitter that generates a pulsed primary magnetic field when its coils are energized, which induces eddy currents in nearby conductive objects. The decay of the eddy currents, following the input pulse, is measured by the coils, which in turn serve as receiver coils. The decay rate is measured for two coils, mounted concentrically, one above the other. By making the measurements at a relatively long time interval (measured in milliseconds) after termination of the primary pulse, the response is nearly independent of the electrical conductivity of the ground. Thus, the instrument is a super-sensitive metal detector. Due to its unique coil arrangement, the response curve is a single well-defined positive peak directly over a buried conductive object. This facilitates quick and accurate location of targets.

The M-Scope device energizes the ground by producing an alternating primary magnetic field with AC current in a transmitting coil. If conducting materials are within the area of influence of the primary field, AC eddy currents are induced to flow in the conductors. A receiving coil senses the secondary magnetic field produced by these eddy currents, and outputs the response as anomalous conditions. The strength of the secondary field is a function of the conductivity of the object, say a pipe, tank or cluster of drums, its size, and its depth and position relative to the instrument's two coils. Conductive objects, to a depth of approximately 7 feet below ground surface (bgs) for the M-Scope are sensed. The device is also somewhat

focused; that is, it is more sensitive to conductors below the instrument than they are to conductors off to the side.

The GPR instrument beams energy into the ground from its transducer/antenna, in the form of electromagnetic waves. A portion of this energy is reflected back to the antenna at a boundary in the subsurface across which there is an electrical contrast. The instrument produces a continuous record of the reflected energy as the antenna is traversed across the ground surface. The greater the electrical contrast, the higher the amplitude of the returned energy. The radar wave travels at a velocity unique to the material properties of the ground being investigated, and when these velocities are known, the two-way travel times can be converted to depth. The depth of penetration and image resolution produced are a function of ground electrical conductivity and dielectric constant.

The magnetic gradiometer has two flux gate magnetic fixed sensors that are passed closely to and over the ground. When not in close proximity to a magnetic object, that is, only in the earth's field, the instrument emits a sound signal at a low frequency. When the instrument passes over a buried iron or steel object, so that locally there is a high magnetic gradient, the frequency of the emitted sound increases. The frequency is a function of the gradient between the two sensors.

The line locator is used to passively detect energized high voltage electric lines and electrical conduit (50-60 Hz), VLF signals (14-22 kHz), as well as to actively trace other utilities. Where risers are present, the utility locator transmitter can be connected directly to the object, and a signal (9.8-82 kHz) is sent traveling along the conductor, pipe, conduit, etc. In the absence of a riser, the transmitter can be used to impress an input signal on the utility by induction. In either case, the receiver unit is tuned to the input signal, and is used to actively trace the signal along the pipe's surface projection.

Interpretation and Conclusions - The interpretation took place in real time as the survey progressed, and accordingly, the findings of our investigation were marked on the ground cover at the site using spray chalk, reported to the client, and are further documented with site photographs of all areas investigated (Figures 2-17).

Items detected in the vicinity of the boreholes were marked in coordinated standard colors including red for electric, yellow for gas, blue for water, green for sewer, and white for lines of unknown utility type. Please review the site photographs for the locations and orientations of all items found within the vicinity of the boreholes.

At the conclusion of the survey, all boreholes were positioned in order to provide adequate clearance from detected obstructions. In their final locations they were marked in in white with a yellow "SSS" to indicate that each had been checked by company personnel.

Limitations and Further Recommendations - It should be understood that limitations inherent in geophysical instruments and/or surveying techniques exist at all sites, and nearly all sites exhibit conditions under which such might not perform optimally. Consequently, the detection of buried objects in all circumstances **cannot be guaranteed**. Such limitations are numerous and include, but are not limited to, rebar-reinforced ground cover, abrupt changes in ground cover type, above-ground obstacles preventing full traverses or traverses in one direction only, above-ground conductive objects interfering with instrument signal, nearby powerlines or EM transmitters, highly conductive background soil conditions, limited GPR penetration, non-metallic targets, shallower or larger objects shielding deeper or smaller targets, tracing

signal jumping from one line to another, and inaccessible risers, cleanouts, valve boxes, and manholes. If one or more geophysical instrument is rendered ineffective and cannot be utilized, the quality of the survey can be somewhat degraded.

For the above reasons, and in the interest of maximum safety, we encourage our clients to take advantage of Underground Service Alert (USA), Dig Alert, or other similar services, when possible. Furthermore, we recommend hand-auguring and the use of a drilling method known as air knifing or vacuum extraction, when feasible or if applicable to this project. These methods may significantly limit damage to underground pipes, conduits, and utilities that might not have been detectable during the course of this survey. Please bear in mind, that geophysical surveying is only one of several levels of protection that is available to our clients.

SubSurface Surveys may include maps in some reports. While they are an accurate general representation of the site and our findings, they are not of engineering quality (i.e., measured and mapped by a licensed land surveyor).

SubSurface Surveys and Associates makes no guarantee either expressed or implied regarding the accuracy of the findings and interpretations present. And, in no event will SubSurface Surveys and Associates be liable for any direct, indirect, special, incidental, or consequential damages resulting from interpretations and opinions presented herewith.

All data generated on this project are in confidential file in this office, and are available for review by authorized persons at any time. The opportunity to participate in this investigation is very much appreciated. Please call, if there are questions.

APPENDIX E: GENERAL FIELD PROCEDURES FOR WELL PURGING AND GROUNDWATER SAMPLING

General Field Procedures
For Well Purging and Groundwater Sampling

These general guidelines will be followed unless additional directives are provided by the Client and/or regulatory agency and/or are warranted based on previous on-site experience. Deviations will be noted in the associated groundwater monitoring report.

The sequence of the monitoring activities will be followed as specified by the project manager. In general, gauging, purging, and sampling activities will be conducted in order from the least to the most impacted wells, whenever feasible, as based on previous on-site experience and/or historical information.

Decontamination

Nitrile gloves will be worn during gauging, purging, and sampling activities. Gloves will be changed at least after each well or more often as required.

Equipment that could come into contact with fluids and/or residue from wells will be dedicated to specific wells, decontaminated between uses, and/or discarded following a single use. Equipment decontamination will consist of a wash in a solution of Liquinox detergent and water followed by a double water rinse, each of which will be performed in a separate container. Care will be taken to decontaminate equipment prior to use on the first well, before use in a subsequent well, and prior to demobilizing from the site.

Groundwater Elevation Measurements

Each well to be monitored will be located based on the provided site map. Well boxes will be opened and debris and/or fluids present in the well box will be removed prior to removal of the well cap. If identified, damages to the well box and/or top of casing (TOC) will be recorded in the field sheets.

Measurements will be recorded to within 0.01 foot using a water level indicator or an interface meter if the presence of light or dense non-aqueous phase liquid (LNAPL or DNAPL, respectively) is known or suspected. A permanent survey mark on the TOC will be used as a constant reference point or the north side of the TOC if a survey mark is not available. NAPL thickness (if encountered), depth to groundwater, and total well length will be recorded for each well in the field sheets.

If LNAPL is not present (<0.02 foot), the well will be purged and sampled as discussed in the proceeding sections. If LNAPL is encountered (>0.02 foot), the total well length will not be measured and the well will not be purged or sampled, though LNAPL will be removed as practical and time permitting with a bailer and placed in a separate, grounded container for disposal.

Conventional Groundwater Purging

The purge volume of each well will be calculated based on the depth to groundwater, well diameter, and total well length. A purge volume equivalent to three well column volumes of groundwater will be removed from the well by vacuum truck, submersible pump, or bailer. The groundwater parameters temperature, pH, conductivity, turbidity, dissolved oxygen, and/or oxidation-reduction potential (ORP) will be periodically recorded at a rate of no less than one reading per well column volume while purging.

Purging may be discontinued prior to removing the calculated purge volume if the well is pumped dry (i.e., dewatered). Sampling may proceed after the water column height has recovered to at least 80% of the pre-purge groundwater level or after 2 hours, whichever is sooner.

Low-Flow Purging

The purpose of low flow sampling is to minimize disturbances to groundwater chemistry during the purging process sample collection and to reduce the amount of investigation-derived waste (IDW) that is generated.

The pump will be set at the desired extraction point within the well prior to purging. This depth will be recorded and the pump will be set at the same depth during future sampling events. Unless otherwise specified, the default depth of the pump in wells will be near the midpoint of the well screened interval.

At least one system volume (i.e., pump tubing volume) will be removed prior to recording groundwater parameters. The groundwater parameters temperature, pH, conductivity, turbidity, dissolved oxygen, and/or ORP will be periodically recorded at a rate of one reading every 3 to 5 minutes. Purging may cease once groundwater parameters stabilize. Groundwater parameter stabilization is considered to be fluctuations of less than 3% in temperature; 10% in conductivity, turbidity, and dissolved oxygen; 0.1 units in pH; and 10 millivolts in ORP over three consecutive readings.

The depth to water (DTW) will be recorded with a water level meter during purging to monitor the water column drawdown. The pump will purge groundwater from the well at a flow rate of no more than 500 milliliters per minute (typically between 200 and 500 milliliters per minute) that results in a stabilized water column drawdown of no greater than 0.33 feet after purging the initial system volume.

Sampling may begin once groundwater parameters and well column drawdown stabilize.

For wells where the water column drawdown is unable to stabilize, the pump will be shut off for 15 minutes after removing one system volume to allow groundwater to recharge before restarting the well purging. This will be performed for up to two iterations. In the event that the well drawdown cannot stabilize after two iterations, the well may be sampled during the third attempt at well purging.

Sample Collection

For wells that have been conventionally purged, a sample will be collected once the water column height has recovered to at least 80% of the pre-purge groundwater level by lowering a new, disposable bailer beneath the groundwater surface to allow water to enter the bailer (bailers used to sample wells for volatile organics analysis will not be fully submerged). The water-filled bailer will be retrieved from the well and groundwater will be conveyed into laboratory-supplied sample containers

For low-flow purged wells, groundwater will be conveyed directly from the pump discharge tubing into laboratory-supplied containers. The pump flow rate will be maintained or reduced slightly during sampling. The pump will be shut off and downhole sampling equipment will be retrieved from the well after sampling.

The type and number of sample containers to be collected will be based on the analyses to be conducted. Care will be taken while conveying the sample into the containers to avoid excessive turbulence and/or aeration. Containers for analysis of volatile compounds will be filled with no observable headspace or air

bubbles to minimize the potential for volatilization. Sample containers will be sealed, labeled for identification, placed into a plastic bag, and stored in an iced cooler. The samples will be transported in an iced cooler (if necessary based on the target analyte[s]) under chain-of-custody protocol to the laboratory for analysis.

Each well cap and well box lid will be securely replaced prior to demobilizing from the site.

Trip Blanks and Duplicate Samples

Trip blanks can be used to identify systematic sources of cross-contamination and will be prepared prior to sample collection, if required for the project. The trip blank containers, which will be filled with deionized water, will be stored in the iced cooler for the duration of the monitoring episode and submitted to the laboratory for analysis along with the collected samples.

Duplicate samples can be used to assess the precision of the laboratory analyses and can be collected, if required for the project. The duplicate samples will be collected consecutively to minimize variations between the samples. Sample collection will be performed as described in the previous sections and the sample will be labeled with a unique identification to disassociate the two samples.

Investigation-Derived Wastes

Generated decontamination and purge water will be containerized in labeled and sealed 55-gallon steel drums. The drums of IDW will remain on-site in a secure location until transportation to an appropriate off-site receiving facility for treatment, recycling, and/or disposal can be arranged.

ALPHA SCIENTIFIC CORPORATION
Environmental Laboratories

01-29-2021

Mr. Rodolfo Nadres
Partner Engineering & Science
2154 Torrance Boulevard
Torrance, CA 90501

Project: SM20-284007
Project Site: Former La-Z-Boy/301 Tennessee St., Redlands, CA
Sample Date: 01-20/21/22-2021
Lab Job No.: PA101045

Dear Mr. Nadres:

Enclosed please find the analytical report for the sample(s) received by Alpha Scientific Corporation on 01-22-2021 and analyzed by the following EPA methods:

LUFT GC/MS Method (TPH-G)
EPA 8015M (TPH-D & TPH-O)
EPA 6010B/7471A for CAM Metals
EPA 8260B (VOCs & Oxygenates by GC/MS)

All analyses have met the QA/QC criteria of this laboratory.

The sample(s) arrived in good conditions (i.e., chilled, intact) and with a chain of custody record attached.

Alpha Scientific Corporation is a CA ELAP certified laboratory (Certificate Number 3007). Thank you for giving us the opportunity to serve you. Please feel free to call me at (562) 809-8880 if our laboratory can be of further service to you.

Sincerely,

Roger Wang, Ph.D.
Laboratory Director

Enclosures

This cover letter is an integral part of this analytical report.

Sample Acceptance Checklist

Section 1

Client: Partner ESI Project: SM20-284007 Lab Job# PA101045

Date Received: 1-22-21

Sample(s) received in cooler(s)? Yes ✓ No____ (skip to Section 2)

Cooler(s) packed with: Ice ✓ Ice Packs____ Packing Material____

Cooler Temperature (°C) : #1: 4°C #2:____ #3:____ #4:____ #5____

(Acceptable range is 0°C to 6°C or arriving on ice for samples received on the same day as collected.)

(Ambient Temperature for vapor or air samples is acceptable).

If sample(s) received outside acceptable range, Project Manager contacted by(Personnel Initial):____

Section 2	YES	NO	N/A
Was a COC received?	✓		
Were client sample IDs present?	✓		
Were sample(s) collection dates present?	✓		
Was the COC signed?	✓		
Were tests clearly indicated?	✓		
Did all samples arrive intact? If no, indicate below.	✓		
Did all container labels agree with COC?	✓		
Were correct containers used for the tests required?	✓		
Was there sufficient sample amount for requested tests?	✓		
Were the samples correctly preserved?	✓		
Was there headspace in VOA vials?			✓
Were Custody seals present?		✓	
If yes-were they intact?			✓

Section 3

Explanations/Comments:____

Section 4

Was the Project Manager notified of anomalies? Yes____ No____ N/A ✓

ALPHA SCIENTIFIC CORPORATION
Environmental Laboratories

04-15-2021

Mr. Rodolfo Nadres
Partner Engineering & Science
2154 Torrance Boulevard
Torrance, CA 90501

Project: SM20-284007
Project Site: Former La-Z-Boy / Redlands, CA
Sample Date: 04-13-2021
Lab Job No.: PA104033

Dear Mr. Nadres:

Enclosed please find the analytical report for the sample(s) received by Alpha Scientific Corporation on 04-14-2021 and analyzed by the following EPA methods:

EPA 8260B (VOCs & Oxygenates by GC/MS)

All analyses have met the QA/QC criteria of this laboratory.

The sample(s) arrived in good conditions (i.e., chilled, intact) and with a chain of custody record attached.

Alpha Scientific Corporation is a CA ELAP certified laboratory (Certificate Number 3007). Thank you for giving us the opportunity to serve you. Please feel free to call me at (562) 809-8880 if our laboratory can be of further service to you.

Sincerely,

Roger Wang, Ph. D.
Laboratory Director

Enclosures

Section 1

Client: PARTNER ESI Project: SM20284007 Lab Job# PA10403 3

Date Received: 4-14-21

Sample(s) received in cooler(s)? Yes ✓ No____ (skip to Section 2)

Cooler(s) packed with: Ice ✓ Ice Packs____ Packing Material____

Cooler Temperature (°C) : #1: 4°C #2:____ #3:____ #4:____ #5____

(Acceptable range is 0°C to 6°C or arriving on ice for samples received on the same day as collected.)

(Ambient Temperature for vapor or air samples is acceptable).

If sample(s) received outside acceptable range, Project Manager contacted by(Personnel Initial):____

Section 2	YES	NO	N/A
Was a COC received?	✓		
Were client sample IDs present?	✓		
Were sample(s) collection dates present?	✓		
Was the COC signed?	✓		
Were tests clearly indicated?	✓		
Did all samples arrive intact? If no, indicate below.	✓		
Did all container labels agree with COC?	✓		
Were correct containers used for the tests required?	✓		
Was there sufficient sample amount for requested tests?	✓		
Were the samples correctly preserved?	✓		
Was there headspace in VOA vials?		✓	
Were Custody seals present?		✓	
If yes-were they intact?			✓

ALPHA SCIENTIFIC CORPORATION
Environmental Laboratories

04-21-2021

Mr. Rodolfo Nadres
Partner Engineering & Science
2154 Torrance Boulevard
Torrance, CA 90501

Project: SM20-284007
Project Site: Former La-Z-Boy/Redlands, CA
Sample Date: 04-13-2021
Lab Job No.: PA104034

Dear Mr. Nadres:

Enclosed please find the analytical report for the sample(s) received by Alpha Scientific Corporation on 04-14-2021 and analyzed by the following EPA methods:

EPA 8260B (VOCs & Oxygenates by GC/MS)

All analyses have met the QA/QC criteria of this laboratory.

The sample(s) arrived in good conditions (i.e., chilled, intact) and with a chain of custody record attached.

Alpha Scientific Corporation is a CA ELAP certified laboratory (Certificate Number 3007). Thank you for giving us the opportunity to serve you. Please feel free to call me at (562) 809-8880 if our laboratory can be of further service to you.

Sincerely,

Roger Wang, Ph.D.
Laboratory Director

ALPHA SCIENTIFIC CORPORATION
Environmental Laboratories

05-07-2021

Mr. Rodolfo Nadres
Partner Engineering & Science
2154 Torrance Boulevard
Torrance, CA 90501

Project: SM20-284007
Project Site: Former La-Z-Boy/300 Tennessee St., Redlands, CA
Sample Date: 05-03-2021
Lab Job No.: PA105003

Dear Mr. Nadres:

Enclosed please find the analytical report for the sample(s) received by Alpha Scientific Corporation on 05-03-2021 and analyzed by the following EPA methods:

EPA 8260B (VOCs & Oxygenates by GC/MS)

All analyses have met the QA/QC criteria of this laboratory.

The sample(s) arrived in good conditions (i.e., chilled, intact) and with a chain of custody record attached.

Alpha Scientific Corporation is a CA ELAP certified laboratory (Certificate Number 3007). Thank you for giving us the opportunity to serve you. Please feel free to call me at (562) 809-8880 if our laboratory can be of further service to you.

Sincerely,

Roger Wang, Ph. D.
Laboratory Director

Enclosures

Mobile Laboratory VIN# 1FDKE30GXSHB60220 (A2)

(Hereinafter called the Organization) and hereby declares that Organization has met the requirements of ISO/IEC 17025:2017 "General Requirements for the competence of Testing and Calibration Laboratories" and the DoD Quality Systems Manual for Environmental Laboratories Version 5.3 February 2018 and is accredited is accordance with the:

United States Department of Defense
Environmental Laboratory Accreditation Program
(DoD-ELAP)

This accreditation demonstrates technical competence for the defined scope:

Environmental Testing
(As detailed in the supplement)

Accreditation claims for such testing and/or calibration services shall only be made from addresses referenced within this certificate. This Accreditation is granted subject to the system rules governing the Accreditation referred to above, and the Organization hereby covenants with the Accreditation body's duty to observe and comply with the said rules.

For PJLA:

Tracy Szerszen
President/Operations Manager

Rodolfo Nadres
Partner Engineering and Science
2154 Torrance Boulevard, Suite 200
Torrance, CA 90501

H&P Project: PAR022321-SB1
Client Project: 20-284007 / Tennessee St

Dear Rodolfo Nadres:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 2/23/2021 -2/25/2021 which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody
- Sampling Logs (if applicable)

Unless otherwise noted, I certify that all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Lisa Eminhizer
Laboratory Director

H&P Mobile Geochemistry, Inc. is certified under the California ELAP and the National Environmental Laboratory Accreditation Conference (NELAC) for the fields of proficiency and analytes listed on those certificates. H& P is approved as an Environmental Testing Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs for the fields of proficiency and analytes included in the certification process and to the extent offered by the accreditation agency . Unless otherwise noted, accreditation certificate numbers, expiration of certificates, and scope of accreditation can be found at: www.handpmg.com/about/certifications. Fields of services and analytes contained in this report that are not listed on the certificates should be considered uncertified or unavailable for certification.

B18-15	E102078-11	Vapor	25-Feb-21	25-Feb-21
B16-15	E102078-12	Vapor	25-Feb-21	25-Feb-21

February 23, 2021 - Batch EB12309
The percent recoveries for Isopropylbenzene, Naphthalene and Bromomethane fell below the method criteria in the continuing calibration verification (CCV). Any results for these analytes, for samples included in this batch, may be biased low.

February 25, 2021 - Batch EB12507
The percent recovery for Naphthalene fell below the method criteria in the CCV. Any result for this analyte, for samples included in this batch, may be biased low.

February 25, 2021 - Batch EB12508
The percent recovery for 1,1-Difluoroethane fell below the method criteria in the CCV. Any result for this analyte, for samples included in this batch, may be biased low.

Partner Engineering and Science	Project: PAR022321-SB1	
2154 Torrance Boulevard, Suite 200	Project Number: 20-284007 / Tennessee St	Reported:
Torrance, CA 90501	Project Manager: Rodolfo Nadres	04-Mar-21 12:30

Notes and Definitions

S-09	Surrogate recovery is outside of established control limits. Corrective action was taken.
QL-1H	The LCS and/or LCSD recoveries fell above the established control specifications for this analyte. Any result for this compound is qualified and should be considered biased high.
LCC	Leak Check Compound
ND	Analyte NOT DETECTED at or above the reporting limit
MDL	Method Detection Limit
%REC	Percent Recovery
RPD	Relative Percent Difference

All soil results are reported in wet weight.

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Testing Laboratory and Mobile Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs through PJLA, accreditation number 69070 for EPA Method TO-15, EPA Method 8260B and H&P 8260SV.

H&P is approved by the State of California as an Environmental Laboratory and Mobile Laboratory in conformance with the Environmental Laboratory Accreditation Program (ELAP) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste, certification numbers 2740, 2741, 2743 & 2745.

H&P is approved by the State of Louisiana Department of Environmental Quality under the National Environmental Laboratory Accreditation Conference (NELAC) certification number 04138

The complete list of stationary and mobile laboratory certifications along with the fields of testing (FOTs) and analyte lists are available at www.handpmg.com/about/certifications.

H&P Project: PAR041921-ML
Client Project: 20-284007 / 301 Tennessee St

Dear Rodolfo Nadres:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 19-Apr-21 which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody
- Sampling Logs (if applicable)

Unless otherwise noted, I certify that all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Lisa Eminhizer
Laboratory Director

H&P Mobile Geochemistry, Inc. is certified under the California ELAP and the National Environmental Laboratory Accreditation Conference (NELAC) for the fields of proficiency and analytes listed on those certificates. H& P is approved as an Environmental Testing Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs for the fields of proficiency and analytes included in the certification process and to the extent offered by the accreditation agency . Unless otherwise noted, accreditation certificate numbers, expiration of certificates, and scope of accreditation can be found at: www.handpmg.com/about/certifications. Fields of services and analytes contained in this report that are not listed on the certificates should be considered uncertified or unavailable for certification.

Notes and Definitions

QL-1H	The LCS and/or LCSD recoveries fell above the established control specifications for this analyte. Any result for this compound is qualified and should be considered biased high.
LCC	Leak Check Compound
ND	Analyte NOT DETECTED at or above the reporting limit
MDL	Method Detection Limit
%REC	Percent Recovery
RPD	Relative Percent Difference

All soil results are reported in wet weight.

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Testing Laboratory and Mobile Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs through PJLA, accreditation number 69070 for EPA Method TO-15, EPA Method 8260B and H&P 8260SV.

H&P is approved by the State of California as an Environmental Laboratory and Mobile Laboratory in conformance with the Environmental Laboratory Accreditation Program (ELAP) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste, certification numbers 2740, 2741, 2743 & 2745.

H&P is approved by the State of Louisiana Department of Environmental Quality under the National Environmental Laboratory Accreditation Conference (NELAC) certification number 04138

The complete list of stationary and mobile laboratory certifications along with the fields of testing (FOTs) and analyte lists are available at www.handpmg.com/about/certifications.

Engineers who understand your business

October 22, 2021

Ms. Veronica Burgess
Acc Bld, LLC
P.O. Box 7538
Redlands, California 92375

Subject: **Additional Indoor Air Quality Screening**
Former La-Z-Boy West Facility
301 Tennessee Street
Redlands, California 92373
Partner Project Number: SM20-284007

Dear Ms. Burgess:

The following letter report summarizes the field activities, methods, and findings of the Additional Indoor Air Quality Screening performed by Partner Engineering and Science, Inc. (Partner) at the above-referenced site (the "Site") on behalf of Acc Bld, LLC (the "Client"). The objective of the project was to further evaluate residual tetrachloroethene (PCE) impacts to indoor air at the Site.

Site Description

The Site consists of an approximately 8.2-acre rectangular parcel of land (Assessor's Parcel Number [APN] 0292-192-11) located on the northwest corner of the Tennessee Street and West State Street intersection in a mixed industrial and commercial area of the City of Redlands, California. The Site is developed with three buildings. The main building (Building 1) encompasses much of the parcel and was constructed in phases from the mid-1960s to 1991. The second building (Building 2) is in the northwest corner of the parcel and was constructed in 1969. The third building (Building 3) is located to the north of Building 1 and was constructed in the mid-1960s. Please see Figure 1 for a site plan.

Project History

According to a Phase I and II Environmental Site Assessment (Phase I and II) Report prepared by LOR Geotechnical Group, Inc. (LOR), dated January 21, 2020, La-Z-Boy previously operated at the Site from approximately the 1960s to 2019 for furniture manufacturing. Available regulatory agency records documented historical on-site use of hazardous materials.

To evaluate whether the historical industrial operations impacted the subsurface, LOR collected and analyzed soil and soil gas samples from across the Site in October and November of 2019. The LOR investigation identified elevated concentrations of volatile organic compounds (VOCs) in soil gas including PCE; trichloroethene (TCE); and 1,1,1-trichloroethane (TCA).

To evaluate potential vapor intrusion risks associated with the subsurface impacts, Citadel EHS (Citadel) performed an indoor air quality survey in November of 2019 as summarized in the LOR Phase I and II

Report. The Citadel investigation identified elevated concentrations of VOCs in indoor air, particularly PCE in Building 1.

Subsequently, a sub-slab depressurization system (SSDS) was installed in Building 1 to address potential vapor intrusion concerns. The Building 1 SSDS consisted of 25 subsystems, each consisting of suction pits and risers, an extraction blower or inline fan, and an exhaust stack.

Rincon Consultants, Inc. (Rincon) was tasked with operating the SSDS. Rincon began SSDS operation on July 6, 2020, and performed verification indoor air sampling in July and September of 2020. The verification indoor air sampling results indicated that elevated concentrations of PCE persisted inside Building 1 despite SSDS operation.

Due to the Rincon findings, Partner performed Indoor Air Quality Screening in November of 2020 as summarized in a report dated December 9, 2020, to further evaluate PCE impacts to indoor air at the Site. The scope of the project included discrete air sampling and a 3-day real-time air sampling episode. The investigation results indicated that the PCE impacts to indoor air were most likely unrelated to vapor intrusion from the subsurface and identified the building's insulation as a likely source.

The Client subsequently removed and replaced the building insulation, and Rincon performed verification indoor air sampling in January and February of 2021. The results of the Rincon investigation indicated that PCE concentrations in indoor air decreased by at least 50%, but remained above regulatory screening levels.

Field Activities

Partner performed multiple rounds of sampling at the Site as summarized below to identify the source of the residual PCE impacts to indoor air.

Discrete Air Sampling, Second Episode

On March 1 and 2, 2021, Partner subcontracted with Hartman Environmental Geoscience (HEG) to provide discrete air sampling and analysis field services. HEG implemented the VaporSafe™ automated mobile real-time high-resolution air sampling and analysis system developed by Groundswell Technologies, Inc. (Groundswell) for the project. HEG calibrated the VaporSafe™ system prior to sampling.

HEG collected 68 discrete air samples from throughout Building 1 to evaluate the distribution of residual PCE in indoor air. The SSDS and heating, ventilation, and air conditioning (HVAC) units were off at the time of sampling. Please see Table 1 for a summary of the discrete air sampling locations and Figures 2A and 2B for maps of the discrete air sampling locations.

HEG collected discrete air samples with a gas-tight syringe, which were injected into the VaporSafe™ gas chromatograph (GC) with electron capture detector (ECD) for analysis in accordance with U.S. Environmental Protection Agency (EPA) Modified Method TO-14. The system was configured to analyze for PCE and TCE. Please see Appendix A for the discrete air sample laboratory analysis report and Table 1 for a summary of the discrete air sample laboratory analysis results.

The discrete air sampling results documented that PCE in indoor air exhibited a vertical gradient in Building 1 with peak concentrations detected immediately below the ceiling, similar to the findings of the initial discrete air sampling episode. The highest PCE concentration detected in air during the investigation was 310 micrograms per cubic meter ($\mu g/m^3$), collected from ceiling insulation at 34-CI. Since the newly installed insulation presumably did not contain PCE, Partner identified the building's roof as the likely source of the residual PCE in indoor air.

Core Sampling

On April 13, 2021, Partner, in conjunction with the Client, mechanically collected core samples of the roof at 34-CI. The replacement insulation installed by the Client had been largely removed by this point in the investigation. Please see Figure 2A for a map of the core sample location.

The core samples yielded three distinct layers of the roof deck: (1) the bottom visible plywood, (2) tar paper or similar on top of the plywood, and (3) a foam material above the tar paper. The approximate thickness of the roof deck materials was 0.5 inches, ⅛ inch, and more than 2.5 inches, respectively. Note that the core samples did not penetrate the full thickness of the roof deck.

The different layers of the roof deck were separated and placed in sealable plastic bags, labeled for identification (PW, TP, and FM, respectively), and transported in an iced cooler under chain-of-custody protocol to Alpha Scientific Corporation (ASC), a state-accredited laboratory (State Water Resources Control Board [SWRCB] Division of Drinking Water [DDW] Environmental Laboratory Accreditation Program [ELAP] certificate number 3007) in Cerritos, California for analysis. Each sample was analyzed for PCE in accordance with EPA Method 8260B. Please see Appendix B for the roof materials laboratory analysis report and Table 2 for a summary of the roof materials laboratory analysis results.

Considerably elevated concentrations of PCE were detected in each roof material sample. Furthermore, the PCE concentrations exhibited a vertical gradient, increasing from the plywood to the foam material (concentrations of 15.0 milligrams per kilogram [mg/kg], 61.7 mg/kg, and 933 mg/kg, respectively). Accordingly, the core sampling results indicated that the building's roof deck was the likely source of the residual PCE in indoor air, particularly the foam material layer.

Discrete Air Sampling, Third Episode

On April 19, 2021, Partner subcontracted with H&P Mobile Geochemistry Inc. (H&P) a U.S. Department of Defense (DoD) accredited mobile laboratory (DoD-ELAP certificate number L19-589-R1) based in Carlsbad, California, to provide discrete air sampling and mobile laboratory field services. H&P calibrated the mobile laboratory prior to sampling.

H&P collected two discrete air samples: from (1) from the void space formed in the roof deck after coring at 34-CI and (2) the breathing zone immediately below 34-CI (IA-25). The SSDS and HVAC units were off at the time of sampling. Please see Table 1 for a summary of the discrete air sampling locations and Figures 2A and 2B for maps of the discrete air sampling locations.

H&P collected discrete air samples with a gas-tight syringe, which were injected into the mobile laboratory GC / mass spectrometer (MS) for PCE analysis in accordance with EPA Method 8260B. Please see Appendix A for the discrete air sample laboratory analysis report and Table 1 for a summary of the discrete air sample laboratory analysis results.

PCE was detected in the roof deck core air sample at a concentration of 29,000 $\mu g/m^3$, approximately two orders of magnitude higher than what was detected at the same location in the insulation. For comparison, PCE was detected in the breathing zone immediately below the roof deck core air sample at a concentration of 21 $\mu g/m^3$, a decrease of approximately three orders of magnitude. Accordingly, the air sampling results further reinforced that the building's roof was the likely source of the residual PCE in indoor air.

Core Sampling, Second Episode

On May 3, 2021, Partner, in conjunction with the Client, mechanically collected two additional core samples of the roof: at (1) 30-CI and (2) 16-CI. Please see Figure 2A for a map of the core sample locations.

The core sample from the former was similar to the original core sample from 34-CI in terms of the roof construction. The core sample from the latter differed and only yielded two distinct layers of the roof deck: (1) the bottom visible plywood and (2) an unidentified material, possibly fiberglass.

The different layers of the roof deck were separated and placed in sealable plastic bags, labeled for identification (PW-1, TP-1, and FM-1 for the former and PW-2 and CM-2 for the latter, respectively), and transported in an iced cooler under chain-of-custody protocol to ASC for analysis. Each sample was analyzed for PCE in accordance with EPA Method 8260B. Please see Appendix B for the roof materials laboratory analysis report and Table 2 for a summary of the roof materials laboratory analysis results.

The laboratory results of the 30-CI core sample were similar to that of the prior core sample with PCE concentrations exhibiting a vertical gradient, increasing from the plywood to the foam material (concentrations of 10.4 mg/kg, 25.1 mg/kg, and 761 mg/kg, respectively). Only trace concentrations of PCE were detected in the roof deck materials of the 16-CI core sample.

The additional core sampling results indicated that elevated concentrations of PCE in the roof deck did not extend across the entirety of Building 1. The core sampling results also generally correlated with prior indoor air sampling results since core sample 16-CI, which had only trace concentrations of PCE, was collected from the southern end of Building 1 and the lowest PCE concentrations in indoor air were typically detected in this area of the building.

Discrete Air Sampling, Fourth Episode

The Client pilot tested the ability of two technologies to mitigate off-gassing of PCE from the roof deck: (1) Safe Seal, a water-based sealer developed by AFM Safecoat, and (2) Retro-Coat Vapor Intrusion Coating System, a non-VOC epoxy sealer developed by Land Science. In general, the Client performed the following tasks:

- Prepared the pilot test area. This involved staging containment for one room of Building 1 to isolate the ambient air within the pilot test area from the rest of the building. This included installing barriers with plastic sheeting at the entryways to the room and sealing wall penetrations with plastic sheeting. Please see Figure 2A for a map of the pilot test area;
- Dividing the pilot test area into two subareas by constructing a barrier spanning from the floor to the ceiling with wood framing and plastic sheeting along the center of the room, oriented north-south; and
- Subcontracting with Pacific Coast Contracting Services, Inc. (Pacific) to spray-apply the sealants to the pilot test area ceiling. Safecoat was applied to the western half of the room and Retro-Coat was applied to the eastern half of the room. Prior to sealant application, Pacific installed plastic sheeting along the floors and around exposed piping, utility lines, etc. and brushed loose debris from the ceiling to the extent feasible. Three coats of Safecoat were applied to the western subarea while primer and two coats of Retro-Coat were applied to the eastern subarea.

On June 21, 2021, Partner subcontracted with HEG to provide discrete air sampling and analysis field services. HEG collected 14 discrete air samples primarily in and around the pilot test area to evaluate the effectiveness of the sealants. The SSDS and HVAC units were on at the time of sampling. Please see Table 1 for a summary of the discrete air sampling locations and Figures 2A and 2B for maps of the discrete air sampling locations.

Sampling and analysis protocol were as previously described for the VaporSafe™ system. Please see Appendix A for the discrete air sample laboratory analysis report and Table 1 for a summary of the discrete air sample laboratory analysis results.

The discrete air sampling results documented that neither sealant was effective in mitigating off-gassing of PCE from the roof deck since concentrations of PCE in indoor air in the pilot test area remained above regulatory screening levels, both immediately below the ceiling and in the breathing zone. Notably, there was no evident vertical gradient in PCE in indoor air during this sampling episode. This was likely a result of air circulation within the building due to the HVAC units operation.

In addition, Partner collected a sample of the replacement insulation that had been removed and stockpiled on-site. The insulation sample was placed in a sealable plastic bag, labeled for identification, and transported in an iced cooler under chain-of-custody protocol to ASC for analysis. The sample was analyzed for PCE in accordance with EPA Method 8260B. Please see Appendix B for the roof materials laboratory analysis report and Table 2 for a summary of the roof materials laboratory analysis results.

PCE was not detected in the insulation sample above the laboratory Method Detection Limit (MDL).

Discrete Air Sampling, Fifth Episode

The Client subsequently aired out the pilot test area by operating fans in the space and opening the roof hatch for an unspecified period of time, and on July 28, 2021, Partner subcontracted with HEG to provide discrete air sampling and analysis field services. HEG collected six discrete air samples primarily in and around the pilot test area from the breathing zone to evaluate the current conditions in the pilot test area.

The SSDS and HVAC units were on, the aforementioned fans remained in operation, and the roof hatch remained open at the time of sampling. Please see Table 1 for a summary of the discrete air sampling locations and Figure 2B for a map of the discrete air sampling locations.

Sampling and analysis protocol were as previously described for the VaporSafe™ system. Please see Appendix A for the discrete air sample laboratory analysis report and Table 1 for a summary of the discrete air sample laboratory analysis results.

The discrete air sampling results indicated that PCE concentrations in the pilot test area breathing zone declined, though they remained above regulatory screening levels.

Summary and Conclusions

Partner performed additional indoor air quality screening to further evaluate residual PCE impacts to indoor air at the Site. The results of the investigation indicate that the roof deck of Building 1 is the most likely source of the PCE impacts to indoor air, particularly the foam material layer concentrations as high as 933 mg/kg were detected. The elevated concentrations of PCE in the roof deck do not extend across the entirety of Building 1.

Limitations

This report presents a summary of work performed by Partner under the professional direction and review of the registered professional(s) listed. The work includes observations of site conditions encountered and the analytical results provided by independent third-party laboratories of samples collected during the course of the project. The number and location of samples were selected to provide the required information. However, it cannot be assumed that the limited available data are representative of subsurface conditions in areas not sampled.

The recommendations and/or conclusions provided in this report are based on observations, governing regulations, and/or available information from regulatory agencies; previous field investigations; and/or the results of laboratory analysis of soil, soil gas, and/or groundwater samples. Recommendations and/or conclusions beyond those stated and reported herein should not be inferred from this document.

Partner warrants that the environmental consulting services contained herein were performed in accordance with generally accepted practices in the environmental engineering and science, engineering geology, and hydrogeology fields that existed at the time and location of work. No other warranties are implied or expressed.

Reports, both verbal and written, as they pertain to the Site are for the sole use and benefit of the Client. This report has no other purpose and may not be relied upon by another person or entity without the written consent of Partner. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with Partner granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against Partner, its officers, employees, vendors, successors, or assigns. Any such unauthorized user shall be responsible to protect, indemnify and hold Partner, Client,

and their respective officers, employees, vendors, successors, and assigns harmless from any and all claims, damages, losses, liabilities, expenses (including reasonable attorneys' fees), and costs attributable to such Use. Unauthorized use of this report shall constitute acceptance of and commitment to these responsibilities, which shall be irrevocable and shall apply regardless of the cause of action or legal theory pled or asserted. Additional legal penalties may apply.

Signatures of Participating Professionals

Thank you for the opportunity to be of service. If you have questions regarding this report, please contact the undersigned at (310) 615-4500.

Sincerely,

Rodolfo Nadres, EIT

H&P Project: PAR041921-MLA Rev
Client Project: 20-284007 / 301 Tennessee St

Dear Rodolfo Nadres:

Enclosed is the analytical report for the above referenced project. The data herein applies to samples as received by H&P Mobile Geochemistry, Inc. on 19-Apr-21 which were analyzed in accordance with the attached Chain of Custody record(s).

The results for all sample analyses and required QA/QC analyses are presented in the following sections and summarized in the documents:

- Sample Summary
- Case Narrative (if applicable)
- Sample Results
- Quality Control Summary
- Notes and Definitions / Appendix
- Chain of Custody
- Sampling Logs (if applicable)

Unless otherwise noted, I certify that all analyses were performed and reviewed in compliance with our Quality Systems Manual and Standard Operating Procedures. This report shall not be reproduced, except in full, without the written approval of H&P Mobile Geochemistry, Inc.

We at H&P Mobile Geochemistry, Inc. sincerely appreciate the opportunity to provide analytical services to you on this project. If you have any questions or concerns regarding this analytical report, please contact me at your convenience at 760-804-9678.

Sincerely,

Lisa Eminhizer
Laboratory Director

H&P Mobile Geochemistry, Inc. is certified under the California ELAP and the National Environmental Laboratory Accreditation Conference (NELAC) for the fields of proficiency and analytes listed on those certificates. H& P is approved as an Environmental Testing Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs for the fields of proficiency and analytes included in the certification process and to the extent offered by the accreditation agency . Unless otherwise noted, accreditation certificate numbers, expiration of certificates, and scope of accreditation can be found at: www.handpmg.com/about/certifications. Fields of services and analytes contained in this report that are not listed on the certificates should be considered uncertified or unavailable for certification.

Appendix

H&P Mobile Geochemistry, Inc. is approved as an Environmental Testing Laboratory and Mobile Laboratory in accordance with the DoD-ELAP Program and ISO/IEC 17025:2005 programs through PJLA, accreditation number 69070 for EPA Method TO-15, EPA Method 8260B and H&P 8260SV.

H&P is approved by the State of California as an Environmental Laboratory and Mobile Laboratory in conformance with the Environmental Laboratory Accreditation Program (ELAP) for the category of Volatile and Semi-Volatile Organic Chemistry of Hazardous Waste, certification numbers 2740, 2741, 2743 & 2745.

H&P is approved by the State of Louisiana Department of Environmental Quality under the National Environmental Laboratory Accreditation Conference (NELAC) certification number 04138

The complete list of stationary and mobile laboratory certifications along with the fields of testing (FOTs) and analyte lists are available at www.handpmg.com/about/certifications.

APPENDIX B: ROOF MATERIALS LABORATORY ANALYSIS REPORTS

ALPHA SCIENTIFIC CORPORATION
Environmental Laboratories

04-19-2021

Mr. Rodolfo Nadres
Partner Engineering & Science
2154 Torrance Boulevard
Torrance, CA 90501

Project: SM20-284007
Project Site: Former La-Z-Boy/301 Tennessee St., Redlands, CA
Sample Date: 04-13-2021
Lab Job No.: PA104027

Dear Mr. Nadres:

Enclosed please find the analytical report for the sample(s) received by Alpha Scientific Corporation on 04-13-2021 and analyzed by the following EPA methods:

EPA 8260B (PCE by GC/MS)

All analyses have met the QA/QC criteria of this laboratory.

The sample(s) arrived in good conditions (i.e., chilled, intact) and with a chain of custody record attached.

Alpha Scientific Corporation is a CA ELAP certified laboratory (Certificate Number 3007). Thank you for giving us the opportunity to serve you. Please feel free to call me at (562) 809-8880 if our laboratory can be of further service to you.

Sincerely,

Roger Wang, Ph.D.
Laboratory Director

RE: Results of Limited Phase II Site Investigation
ACC BLD, LLC: Redlands
Former La-Z-Boy West Facility
301 Tennessee Street
Redlands, California 92373

Dear Ms. Burgess,

GSI Environmental Inc. (GSI) is submitting the results of a soil, soil vapor, and groundwater investigation conducted for ACC BLD, LLC (Client) for the property located at 301 Tennessee Street, Redlands, California ("the Site", Figures 1 and 2). The investigation activities were conducted between February 1 and February 7, 2022.

BACKGROUND

The Site is an approximately 8.2-acre property situated on the northwest corner of Tennessee Street and West State Street in the City of Redlands, California (Assessor's Parcel Number [APN]: 0292-192-11). The Site is currently developed with three buildings which formerly operated as the La-Z-Boy West Facility. The surrounding land use is mixed use industrial and commercial.

Previous Phase I Environmental Site Assessments (ESA) and Phase II (soil, groundwater, and soil vapor) investigations were conducted by RMT, Inc. (RMT), LOR Geotechnical Group, Inc. (LOR), and Partner Engineering and Science, Inc. (Partner).

Based on these investigations, historical Site use consisted of agricultural, residential, and/or industrial. The Site was developed as agricultural land (containing one residence) from at least 1930 until the mid-1960s, at which point the Site was developed for industrial/commercial use. The Site has remained vacant since the La-Z-Boy operations ceased reportedly in 2019.

The investigations have shown that the Site has been impacted with volatile organic compounds (VOCs), specifically trichloroethylene (TCE). A sub-slab depressurization (SSD) system has been installed and operated under the main building at the Site since 2020.

SAMPLING ACTIVITIES

To address concerns for groundwater quality and assess groundwater flow direction, GSI installed and surveyed two temporary groundwater monitoring wells (GSI-B1 and GSI-B2) to facilitate the collection of groundwater samples, as well as sampling existing groundwater monitoring well MW-1 (installed by Partner in January 2021). To address concerns of soil vapor impacts at the Site, GSI sampled soil vapor probes installed by Partner in January 2021 (vapor probe borings B1 through B16). The vapor probes were installed at 5 and 15 feet below ground surface (bgs) in borings B2 through B12 and B15 through B18 and at depths of 5, 15, 30, 50,

and 75 in boring B1. Additionally, the temporary groundwater monitoring wells, GSI-B1 and GSI-B2, were converted into semi-permanent soil vapor borings with vapor probes installed at 5, 15, 30, 50, 75, and 95 feet bgs. Boring logs for GSI-B1 and GSI-B2 are included as Attachment A.

Based on the Additional Site Characterization report by Partner dated June 23, 2021, groundwater at the Site was expected to be encountered at approximately 113 feet bgs. GSI measured depth to water at approximately 112.98 and 114.58 bgs at GSI-B1 and GSI-B2, respectively.

Sampling activities were conducted from February 1 to February 7, 2022. Underground Service Alert (USA) was notified prior to drilling activities. Additionally, a private geophysical survey company conducted an on-Site utility survey prior to initiating drilling activities. Drilling, soil sampling, and soil vapor probe installation was conducted by J&H Drilling Co., Inc. (dba MR Drilling) of Santa Fe Springs, California. Soil vapor sampling and analysis was conducted by A&R Laboratories, Inc. of Ontario, California. Groundwater sampling was conducted by GSI and Confluence Environmental Inc. of Sacramento, California.

Temporary Groundwater Monitoring Well Installation, Surveying, and Sampling

On February 1, 2022, soil borings GSI-B1 and GSI-B2 were drilled to assess the potential presence of contaminants in groundwater beneath the Site, as well as assess the direction of groundwater flow. A 2-inch Schedule 40 polyvinyl chloride (PVC) temporary well casing was installed at GSI-B1 to a depth of 130 feet bgs (10 feet below encountered groundwater). The temporary well was screened with a 0.020-inch slotted PVC screen from 120 to 130 feet bgs. A similarly designed temporary well casing was installed with a 10-foot screen, 10 feet below first-encountered groundwater to a depth of approximately 125.5 feet bgs in boring GSI-B2 (Figure 2). Each temporary groundwater monitoring well was backfilled with #2/12 filter pack sand in the annular space surrounding the screen from total depth to approximately 2 feet above the top of screen. The boring logs for GSI-B1 and GSI-B2 are included as Attachment A.

During drilling, recovered soil was screened for the presence of VOCs using a photoionization detector (PID). A total of 23 soil samples were collected from each temporary well using United States Environmental Protection Agency (US EPA) Method 5035 field preservation methods and select samples were analyzed for VOCs by US EPA Method 8260B.

Following the installation and backfilling of each temporary groundwater monitoring well, each well was developed through a process of surging and bailing until solid/fine materials were removed from the well. Approximately 40 gallons of groundwater was removed from each temporary well during development.

On February 2, 2022, the surveying subcontractor, KDM Meridian of Irvine, California, surveyed the two temporary groundwater monitoring wells (GSI-B1 and GSI-B2) and MW-1 (Attachment B) prior to collection of depth to water measurements. Groundwater samples were collected from GSI-B1 and GSI-B2 on February 2, 2022, by GSI and a groundwater sample was collected from previous monitoring well MW-1 on February 7, 2022, by Confluence Environmental. All groundwater samples were analyzed for VOCs by US EPA Method 8260B.

Soil Vapor Probe Installation and Sampling

Following the installation, survey, and groundwater sample collection, the two temporary groundwater monitoring wells (GSI-B1 and GSI-B2) were converted into semi-permanent nested soil vapor probes with 6-inch stainless steel probe inlets at 5, 15, 30, 50, 75, and 95 feet bgs. Temporary groundwater well casing was removed, and annular material was over drilled to 130

feet bgs. Soil vapor probe construction consisted of 6-inch probes attached to a 1-inch PVC centralizer pipe. Probes were centered in 1 foot of #2/12 filter pack sand, followed by 1 foot of dry granular bentonite, 4 feet of hydrated bentonite chips, and cement-bentonite grout to the next sand and probe interval. On February 7, 2022, A&R Laboratories collected soil vapor samples from each probe within the converted borings (Figure 2) following a 48-hour stabilization period and in accordance with the July 2015 California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC) Advisory for Active Soil Gas Investigation (Advisory).

Partner's soil vapor borings B1 through B12 and B15 through B18 were sampled for VOCs by A&R Laboratories on February 1 and 2, 2022. Soil vapor samples were collected in accordance with the Advisory and analyzed for VOCs by US EPA Method 8260B.

INVESTIGATION RESULTS

The lithology and groundwater flow direction are presented in this section. The soil, soil vapor, and groundwater analytical results were compared to risk-based screening levels (RBSLs), including California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC) modified screening levels (SLs)[1], US EPA regional screening levels (RSLs), and California State Water Resources Control Board (SWRCB) maximum contaminant levels (MCLs) for groundwater.

Lithology and Groundwater Flow Direction

Observations of lithology documented during drilling indicates that the Site is generally underlain by poorly graded sands, silty sands, and silty sands with gravel and occasional units containing larger percentages of medium plasticity fines in GSI-B1. While drilling, groundwater was encountered at approximately 119.5 feet bgs in GSI-B1 and 115 feet bgs in GSI-B2. After the installation of the temporary monitoring wells, groundwater was measured at 112.98 bgs in GSI-B1 and 114.58 in GSI-B2 (indicating confining conditions). Perched groundwater was encountered at GSI-B2 between approximately 95 and 101 feet bgs above a fine grade clay unit. The groundwater elevation at GSB-1 is 0.1 feet lower than MW-1 and 4.7 feet lower than GSB-2, indicating that groundwater level at GSB-2 is impacted by the perched water bearing zone and/or confining conditions. Based on these conditions, groundwater flow direction is inferred to be towards west/southwest.

Soil Analytical Results

A total of 23 soil samples were collected from each soil boring (GSI-B1 and GSI-B2) at 5-foot intervals. Select soil samples (5, 15, 25, 35, 45, 55, 65, 75, 85, 95, 105, and 115 feet bgs from each boring) were analyzed for VOCs by US EPA Method 8260B. VOCs were not detected above laboratory reporting limits in the soil samples analyzed from borings GSI-B1 and GSI-B2. The analytical results are summarized in Table 1 and the laboratory analytical reports are included in Attachment B.

Soil Vapor Analytical Results from Existing Vapor Probes

Soil vapor samples were collected from 5 and 15 feet bgs at the seven existing vapor probes inside the two buildings (B10 through B12, and B15 through B18) and from nine existing vapor probes in the parking lots and driveways (B1 through B9). Soil vapor samples were also collected from depths of 30, 50, 75, and 95 feet bgs from soil vapor boring B1 (in the vicinity of

[1] In accordance with recommendations from DTSC HHRA Note 3 (Cal/EPA, 2020)

groundwater monitoring well MW-1). Soil vapor samples were collected and analyzed by A&R's mobile laboratory for VOCs by US EPA Method 8260B. The sampling locations are shown on Figure 2 and TCE concentrations, the primary constituent of concern, are shown on Figure 3. The results of soil vapor analysis are presented in Table 2 and the laboratory analytical reports are included in Attachment D.

VOCs detected above laboratory reporting limits in soil vapor include chloroform, 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), tetrachloroethene (PCE), TCE, 1,1,1-trichloroethane (1,1,1-TCA) and 1,1,2-trichloroethane (1,1,2-TCA). The analytical results of soil vapor samples were compared to their respective DTSC-modified SLs. Samples collected from multiple depths within boring B1 contained concentrations of chloroform, 1,1-DCA, and TCE above their respective commercial/industrial soil vapor SLs and the 15-foot sample from vapor probe B18 contained concentrations of TCE above future residential DTSC SL.

Soil Vapor Analytical Results from Newly Installed Vapor Probes

Soil vapor samples were collected from probes installed in the temporary groundwater monitoring wells (GSI-B1 and GSI-B2) at 5, 15, 30, 50, 75, and 95 feet bgs. The vapor samples were analyzed at the A&R's mobile laboratory at the Site for VOCs by US EPA Method 8260B. The soil vapor analytical results are summarized in Table 2 and shown on Figure 3. No VOCs were reported above laboratory reporting limits in the vapor probes installed in boring GSI-B2. Soil vapor VOCs detected above laboratory reporting limits in GSI-B1 include chloroform, 1,1-DCE, and TCE, all below their respective DTSC commercial/industrial SLs. The laboratory analytical reports are included in Attachment D.

Groundwater Analytical Results from Newly Installed Temporary Wells and MW-1

Groundwater samples were collected from temporary groundwater monitoring wells, GSI-B1 and GSI-B2, as well as groundwater monitoring well MW-1. Groundwater samples were analyzed for VOCs by US EPA Method 8260B. VOCs were below laboratory reporting limits in groundwater samples collected from GSI-B1 and GSI-B2. Five VOCs (1,1-DCA, 1,1-DCE, cis-1,2-DCE, 1,1,1-TCA, and TCE) were reported above laboratory reporting limits in groundwater samples collected from MW-1. The groundwater concentration of 1,1-DCE, 1,1-DCA, and TCE in the sample collected from MW-1 were slightly above their respective Federal and California MCLs for drinking water. The groundwater results are summarized in Table 3 and shown on Figure 4. The laboratory analytical reports are included in Attachment E.

SUMMARY AND RECOMMENDATIONS

Based on the results of the soil and soil vapor sampling presented herein, it is GSI's professional opinion that the Site meets commercial screening criteria for soil and soil vapor.

The results of the soil, soil vapor, and groundwater investigations conducted by GSI, and others indicate the presence of a limited VOC-impacted area in the northern portion of the property, in the vicinity of groundwater monitoring well MW-1. The VOC concentrations in soil and soil vapor have slightly impacted the groundwater.

It is GSI's professional opinion that implementation of a soil vapor extraction (SVE) system to address the VOC impacts to depths of approximately 100 feet should be installed for remediation of soil and soil vapor in the northern portion of the Site. The existing sub-slab depressurization system (which is currently addressing shallow soil vapor impacts under the building) can be connected to the proposed SVE unit to simultaneously operate, remediating soil vapors from the deeper impacted area in the northern portion of the Site. It is also GSI's

professional opinion that the low VOC concentrations observed in the groundwater monitoring well MW-1 does not warrant active groundwater remediation. Additionally, GSI recommends implementing a monitoring program for well MW-1 to demonstrate natural attenuation of the VOCs, in conjunction with the SVE implementation.

Please feel free to contact either of the undersigned if you have any questions.

Sincerely,

Farid Achour, PhD. PG.

Notes:

Soil samples collected by GSI Environmental using U.S. Environmental Protection Agency (USEPA) Method 5035 and analyzed by Positive Lab Service for volatile organic compounds (VOCs) by USEPA Method 8260B.

1. Screening Levels (SLs) published by USEPA (2021) and endorsed or modified by the Department of Toxic Substances Control (DTSC, 2020).

Abbreviations:

< = analyte not detected above the reporting limit shown
bgs = below ground surface
ND = not detected
NP = not published
VOC = volatile organic compound
bold = analyte is detected above a screening level

TABLE 2
SOIL VAPOR ANALYTICAL RESULTS
301 Tennessee Street, Redlands, California

GSI ENVIRONMENTAL

Boring	Sample Name	Date Collected	Probe Depth	Chloro-ethane	Chloroform	1,1-Dichloro-ethane	1,1-Dichloro-ethene	cis-1,2-Dichloro-ethene	Tetrachloro-ethene	Toluene	1,1,1-Trichloro-ethane	1,1,2-Trichloro-ethane	Trichloro-ethene	All other VOCs
			feet bgs	micrograms per liter (µg/L)										

Notes:
Soil vapor samples collected and analyzed by A&R Laboratories for volatile organic compounds using U.S. Environmental Protection Agency (USEPA) Method 8260B.

1. Screening levels (SLs) recommended by the Department of Toxic Substances Control (DTSC) for soil vapor were calculated by applying the DTSC default soil vapor attenuation factors for future residential (0.001) and existing commercial use (0.001; DTSC, 2011) to the residential and commercial air Regional Screening Levels published by USEPA (2020) and endorsed or modified by DTSC (2020).

Abbreviations:
VOC = volatile organic compound
< = analyte not detected above the reporting limit shown
bgs = below ground surface
µg/L = micrograms per liter
NA = not applicable (leak test corr
ND = not detected

Survey Report

KDM MERIDIAN
Surveying, Mapping, and Land Services

Date: March 3, 2022
Project No.: 22-GSI-01
Project Name: 301 Tennessee St - Redlands

Prepared For: Farid Achour, GSI Environmental Inc.

Survey Report

Date of Survey: February 2, 2022

Scope of Survey: 3 Monitoring Wells (2 Temporary)

Methodology

The environmental items were surveyed horizontally using GPS RTK. Monitoring well elevations were surveyed by means of differential leveling.

All survey data was adjusted using least squares statistical methods through the use of MicroSurvey STAR*NET. All accuracies shown are network accuracies to 2σ (95%) confidence levels to the nearest centimeter.

No issues or problems were encountered that impact the survey accuracy and precision.

Equipment Used: Trimble R8 GPS System and Leica DNA 10 Digital Level

Report No.: 2202036
Project Name: Former La-Z-Boy Redlands / 6127

Dear Farid Achour,

This report contains the analytical results for the sample(s) received under chain of custody(s) by Positive Lab Service on February 04, 2022.

The test results in this report are performed in compliance with ELAP accreditation requirements for the certified parameters. The laboratory report may not be produced, except in full, without the written approval of the laboratory.

The issuance of the final Certificate of Analysis takes precedence over any previous Preliminary Report. Preliminary data should not be used for regulatory purposes. Authorized signature(s) is provided on final report only.

If you have any questions in reference to this report, please contact your Positive Lab Service coordinator.

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

The data and information on this, and other accompanying documents, represent only the sample(s) analyzed and is rendered upon condition that it is not to be reproduced, wholly or in part, for advertising or other purposes without approval from the laboratory.

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

Report No.: 2202037
Project Name: Former La-Z-Boy Redlands / 6127

Dear Farid Achour,

This report contains the analytical results for the sample(s) received under chain of custody(s) by Positive Lab Service on February 04, 2022.

The test results in this report are performed in compliance with ELAP accreditation requirements for the certified parameters. The laboratory report may not be produced, except in full, without the written approval of the laboratory.

The issuance of the final Certificate of Analysis takes precedence over any previous Preliminary Report. Preliminary data should not be used for regulatory purposes. Authorized signature(s) is provided on final report only.

If you have any questions in reference to this report, please contact your Positive Lab Service coordinator.

Report No.: 2202049
Project Name: Former La-Z-Boy Redlands / 6127

Dear Farid Achour,

This report contains the analytical results for the sample(s) received under chain of custody(s) by Positive Lab Service on February 07, 2022.

The test results in this report are performed in compliance with ELAP accreditation requirements for the certified parameters. The laboratory report may not be produced, except in full, without the written approval of the laboratory.

The issuance of the final Certificate of Analysis takes precedence over any previous Preliminary Report. Preliminary data should not be used for regulatory purposes. Authorized signature(s) is provided on final report only.

If you have any questions in reference to this report, please contact your Positive Lab Service coordinator.

USGS Quadrangle: Redlands, Calif., 7.5' quadrangle (Rancho San Bernardino land grant; T1S R3W, San Bernardino Baseline and Meridian)

Project Size: Approximately 11 acres

Keywords: Western Redlands area; eastern San Bernardino Valley; Phase I cultural resources survey; Site 3693-1H*: former La-Z-Boy plant at 301 Tennessee Street, ca. 1965; Site 3693-2H*: former Alex and Sadie Kimm residence at 360 Kansas Street, ca. 1950; Architect Leon Armantrout; no "historical resources" under CEQA provisions.

* *Temporary designations, pending assignment of permanent identification numbers*

EXECUTIVE SUMMARY

Between November 2022 and February 2023, at the request of MIG, Inc., CRM TECH performed a cultural resources study on approximately 11 acres of previously developed urban land in the western portion of the City of Redlands, San Bernardino County, California. The subject property of the study consists of Assessor's Parcel Numbers 0292-192-11 and 0292-192-14, located at the northwest corner of Tennessee Street and State Street, in a portion of the Rancho San Bernardino land grant lying within what would be the southeast quarter of Section 28, T1S R3W, San Bernardino Baseline and Meridian.

The study is part of the environmental review process for a proposed warehouse project that will require the demolition of the existing buildings on the property, including a former La-Z-Boy furniture manufacturing plant, a single-family residence, and several ancillary buildings. The City of Redlands, as the lead agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA). The purpose of the study is to provide the City with the necessary information and analysis to determine whether the proposed project would cause substantial adverse changes to any "historical resources," as defined by CEQA, that may exist in or near the project area.

In order to identify such resources, CRM TECH conducted a historical/archaeological resources records search, initiated a Native American Sacred Lands File search, consulted with local historical organizations, pursued historical background research, and carried out an intensive-level field survey and field inspection of the buildings. The results of these research procedures indicate that the former La-Z-Boy furniture manufacturing plant dates to 1965 and operated at this location until 2019, while the residence was built around 1950.

Although both buildings have been expanded and altered, they retain sufficient historical characteristics to relate to their periods of origin and were therefore recorded into the California Historical Resources Inventory with the temporary designations of 3963-1H and -2H, pending assignment of permanent identification numbers. They do not, however, appear to be eligible for listing in the California Register of Historical Resources or for local designation by the City of Redlands. Therefore, they do not constitute "historical resources" for CEQA-compliance purposes.

No other potential "historical resources" were encountered within or adjacent to the project area. However, the State of California Native American Heritage Commission stated that the Sacred Lands File maintained by the commission indicated the presence of unspecified Native American cultural resource(s) in the general vicinity of the project location and referred further inquiry to the local Native American tribes. According to CEQA guidelines, the identification of potential "tribal cultural resources" is beyond the scope of this study and needs to be addressed through government-to-government consultations between the City of Redlands and the pertinent Native American groups pursuant to Assembly Bill (AB) 52.

Based on these findings, CRM TECH recommends to the City of Redlands a tentative conclusion of *No Impact* on cultural resources, pending completion of the AB 52 consultation process. No additional cultural resources investigation is recommended for the project unless development plans undergo such changes as include areas not covered by this study. However, if buried cultural materials are encountered during any earth-moving operations associated with the project, all work within 50 feet of the discovery should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

INTRODUCTION

Between November 2022 and February 2023, at the request of MIG, Inc., CRM TECH performed a cultural resources study on approximately 11 acres of previously developed urban land in the western portion of the City of Redlands, San Bernardino County, California (Fig. 1). The subject property of the study consists of Assessor's Parcel Numbers (APN) 0292-192-11 and 0292-192-14, located at the northwest corner of Tennessee Street and State Street, in a portion of the Rancho San Bernardino land grant lying within what would be the southeast quarter of Section 28, T1S R3W, San Bernardino Baseline and Meridian (Figs. 2, 3).

The study is part of the environmental review process for a proposed warehouse project that will require the demolition of the existing buildings on the property, including a former La-Z-Boy furniture manufacturing plant, a single-family residence, and several ancillary buildings. The City of Redlands, as the lead agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA; PRC §21000, et seq.). The purpose of the study is to provide the City with the necessary information and analysis to determine whether the proposed project would cause substantial adverse changes to any "historical resources," as defined by CEQA, that may exist in or near the project area.

In order to identify such resources, CRM TECH conducted a historical/archaeological resources records search, initiated a Native American Sacred Lands File search, consulted with local historical organizations, pursued historical background research, and carried out an intensive-level field survey and field inspection of the buildings. The following report is a complete account of the methods, results, and conclusion of the study. The qualifications of personnel who participated in the study are presented in Appendix 1.

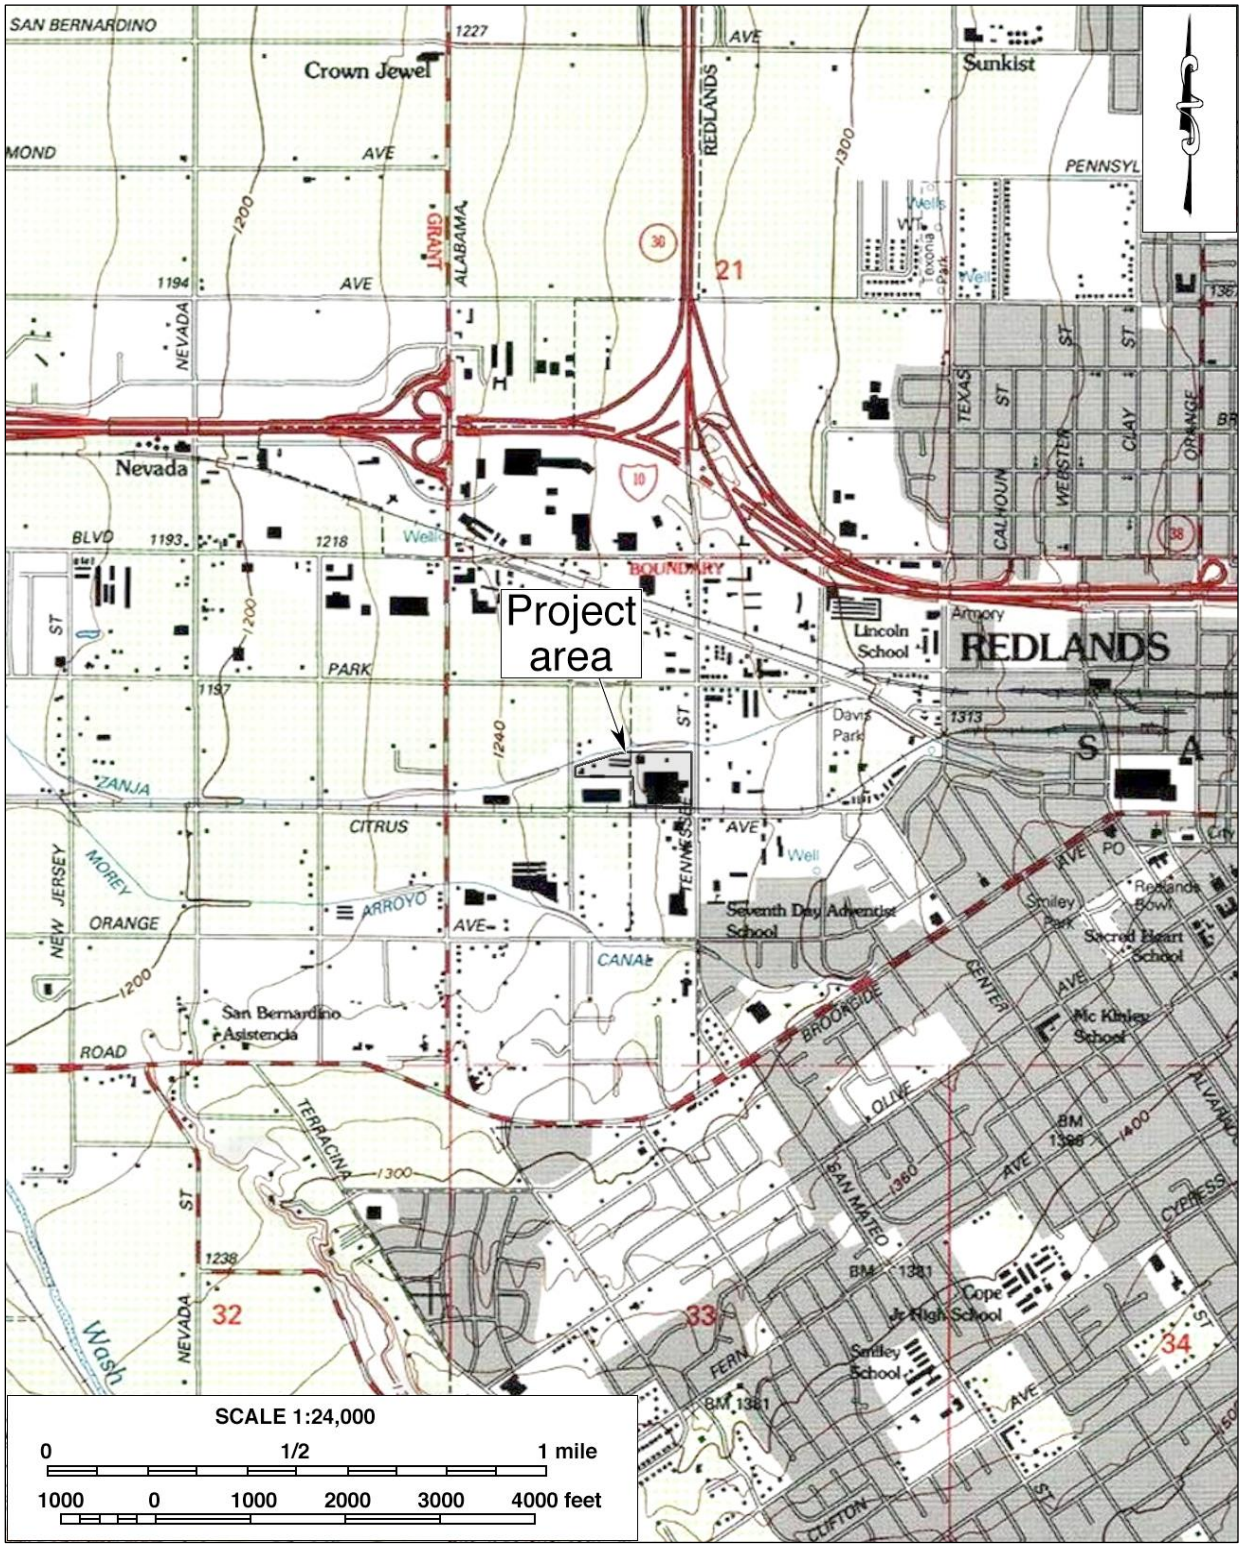

Figure 2. Location and configuration of the project area. (Based on USGS Redlands, Calif., 7.5' quadrangle [USGS 1996])

Figure 3. Recent satellite image of the project area. (Based on Google Earth imagery)

SETTING

CURRENT NATURAL SETTING

The City of Redlands is situated in the eastern San Bernardino Valley, a broad inland valley bound by the San Gabriel and San Bernardino mountain ranges on the north and a series of low rocky hills on the south. Geologically, the San Bernardino Valley lies on the northern rim of the Peninsular Ranges geomorphic province, adjacent to the Transverse Ranges province. The natural environment of the region is characterized by its temperate Mediterranean climate. Precipitation is typically less than 20 inches annually, falling mostly between November and April.

The approximately 11-acre project area is an irregularly shaped tract of commercial property bounded on the east by Tennessee Street, on the south by State Street, on the west by Kansas Street, and on the north by the "Mission Zanja," a drainage channel bearing a name that often causes confusion with the historic Mill Creek Zanja further to the south. The main building of the former La-Z-Boy furniture manufacturing plant and two associated smaller buildings occupy the eastern two-thirds of the property, and the modest single-family residence stands in the western portion along Kansas Street (Figs. 4, 5). The surrounding properties are primarily commercial in character.

Elevations in the project area range approximately from 1,245 feet to 1,260 feet above mean sea level over relatively level terrain. Vegetation consists mostly of introduced species, such as eucalyptus trees and a string of lemon trees along part of the northern border and landscaping plants near the buildings, including pomegranate and gum trees around the residence, along with various small grasses and shrubs. Surface soils over most of the project area consist of medium brown, fine- to medium-grained sands.

CULTURAL SETTING

Prehistoric Context

The earliest evidence of human occupation in inland southern California was discovered below the surface of an alluvial fan in the northern Lakeview Mountains overlooking the San Jacinto Valley, with radiocarbon dates clustering around 9,500 B.P. (Horne and McDougall 2008). Another site found near the shoreline of Lake Elsinore, close to the confluence of Temescal Wash and the San Jacinto River, yielded radiocarbon dates between 8,000 and 9,000 B.P. (Grenda 1997). Additional sites with isolated Archaic dart points, bifaces, and other associated lithic artifacts from the same age range have been found in the nearby Cajon Pass area, typically atop knolls with good viewsheds (Basgall and True 1985; Goodman and McDonald 2001; Goodman 2002; Milburn et al. 2008).

The cultural history of southern California has been summarized into numerous chronologies, including work by Chartkoff and Chartkoff (1984), Warren (1984), and others. The prehistory of Riverside County specifically has been addressed by O'Connell et al. (1974), McDonald, et al. (1987), Keller and McCarthy (1989), Grenda (1993), Goldberg (2001), and Horne and McDougall (2008). Although the beginning and ending dates of different cultural horizons vary regionally, the general prehistory framework for inland southern California can be divided into three periods:

- Paleoindian Period (ca. 18,000-9,000 B.P.): Native people of this period created fluted spearhead bases designed to be hafted to wooden shafts. The distinctive method of thinning bifaces and spearhead preforms by removing long, linear flakes leave diagnostic Paleoindian markers at tool-making sites. Other artifacts associated with the Paleoindian toolkit include choppers, cutting tools, retouched flakes, and perforators. Sites from this period are sparse across the landscape and most are deeply buried.

- Archaic Period (ca. 9,000-1,500 B.P.): Archaic sites are characterized by abundant lithic scatters of considerable size with many biface thinning flakes, bifacial preforms broken during manufacture, and well-made groundstone bowls and basin metates. As a product of making dart points, many biface thinning waste flakes were generated at individual production stations, which is a diagnostic feature of Archaic sites.
- Late Prehistoric Period (ca. 1,500 B.P.-contact): Sites from this period typically contain small lithic scatters from the manufacture of small arrow points, expedient groundstone tools such as tabular metates and unshaped manos, wooden mortars with stone pestles, acorn or mesquite bean granaries, ceramic vessels, shell beads suggestive of extensive trading networks, and steatite implements such as pipes and arrow shaft straighteners.

Ethnohistoric Context

The Redlands area lies in the traditional homeland of the Serrano Indians, although the Native population at the time of European contact are believed to have been Gabrielino from the San Gabriel Valley, who were later succeeded by a Mountain Cahuilla group from the San Jacinto and Santa Rosa Mountains around 1846 (Strong 1929:8). Serrano ancestral territory is centered in the San Bernardino Mountains, but also includes a portion of the San Bernardino Valley and the southern rim of the Mojave Desert, extending from today's Victorville eastward to Twentynine Palms. "Serrano" derives from a Spanish term meaning "mountaineer" or "highlander." The basic written sources on Serrano culture are Kroeber (1925), Strong (1929), and Bean and Smith (1978).

Prior to European contact, Serrano were primarily hunters and gatherers and occasional fishers, who settled near where flowing water emerged from the mountains. They were loosely organized into exogamous clans led by hereditary heads, and the clans in turn were affiliated with one of two exogamous moieties. The exact nature of the clans, their structure, function, and number are not known, except that each clan was the largest autonomous political and landholding unit, the core of which was the patrilineage. There was no pan-tribal political union among the clans. Despite their linguistic differences, Serrano, Gabrielino and Cahuilla societies shared many characteristics in social organization and material culture.

Although contact with Europeans may have occurred as early as 1771 or 1772, Spanish influence on Serrano lifeways was minimal until the 1810s, when a mission *asistencia* was established in the vicinity of present-day Redlands. Between then and the end of the mission era in 1834, most of the Serrano in the western portion of their traditional territory were removed to the nearby missions. In the eastern portion, a series of punitive expeditions in 1866-1870 resulted in the death or displacement of almost all remaining Serrano population in the San Bernardino Mountains. Today, most Serrano descendants are affiliated with the Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians), the Morongo Band of Mission Indians, or the Serrano Nation of Indians.

Historic Context

The San Bernardino Valley, including the Redlands area, received its first European visitors in 1771, when a small force of Spanish soldiers traveled through the area under the command of Pedro Fages, the military *comandante* of Alta California (Beck and Haase 1974:15). After the establishment of Mission San Gabriel that year, the San Bernardino Valley nominally became a part of the vast

landholdings of that mission. The name "San Bernardino" was bestowed on the valley when the San Bernardino *Asistencia*, along with a mission rancho bearing the same name, was officially established in 1819, originally on the north side of present-day Mission Road in nearby Loma Linda (Lerch and Haenszel 1981).

Historically, the project area was located on the periphery of "Old San Bernardino," the site of the earliest non-Native settlement in the eastern San Bernardino Valley. It was centered around the adobe storehouse of Rancho San Bernardino and extended from the easternmost portion of Loma Linda to the westernmost portion of Redlands (Hall 1888). In 1842, after secularization of the mission system, the Mexican authorities in Alta California granted Rancho San Bernardino, along with several other adjacent former mission ranchos, to members of a prominent Los Angeles family, the Lugos (Schuiling 1984:34). After nine years of cattle raising on their 35,000-acre domain, the Lugo family sold the entire rancho in 1851 to Amasa M. Lyman and Charles C. Rich, leaders of a Mormon colony that was to become today's City of San Bernardino (*ibid*.:45).

In the early 1880s, Frank E. Brown and Edward G. Judson purchased a portion of the rancho and combined it with other land acquisitions to form the town of Redlands (Schuiling 1984:86). To ensure a reliable water supply for the new colony, in 1883-1884 Brown and Judson constructed the Bear Valley Reservoir in the San Bernardino Mountains for the exclusive use of Redlands settlers (*ibid.*). Amid the great southern California land boom of the 1880s and the thriving citrus industry, the Redlands colony incorporated in 1888 and soon became the best-known winter retreat in the nation (*ibid.*:87). An influx of winter residents from the eastern United States perpetuated Redlands' image as an affluent city characterized by vast citrus groves surrounding elegant mansions of gentlemen farmers.

In the mid-20th century, and particularly after World War II, the expansive citrus groves increasingly gave way urban expansion and increasing diversification of Redlands' economic interests. After U.S. Highway 99 (Redlands Boulevard) was realigned in 1946, commercial development that was previously concentrated in the historic downtown area began to muster along the new route toward the western city limit, and then to the north after Interstate Highway 10 was completed in 1962 (ARG 2017:145, 148). Over the last few decades of the 20th century, like many other former small rural towns in southern California, Redlands increasingly took on the characteristics of a "bedroom community." Nevertheless, the citrus culture that developed during the late 19th and early 20th centuries continues to be an integral part of the City's identity.

RESEARCH METHODS

RECORDS SEARCH

On December 7, 2022, CRM TECH archaeologist Nina Gallardo conducted the records search at the South Central Coastal Information Center (SCCIC), California State University, Fullerton, which is the State of California's official cultural resource records repository for San Bernardino County. During the records search, Gallardo examined maps, records, and electronic databases at the SCCIC for previously identified cultural resources and existing studies within a one-mile radius of the project area. Previously identified cultural resources include properties designated as California

Historical Landmarks, Points of Historical Interest, or San Bernardino County Historical Landmarks, as well as those listed in the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resources Inventory.

SACRED LANDS FILE SEARCH

On November 4, 2022, CRM TECH submitted a written request to the State of California Native American Heritage Commission (NAHC) for a records search in the commission's Sacred Lands File. The NAHC is the State of California's trustee agency for the protection of tribal cultural resources as defined by California Public Resources Code §21074 and is tasked with identifying and cataloging properties of Native American cultural value throughout the state, including places of special religious, spiritual, or social significance and known graves and cemeteries. The NAHC's reply is summarized below and attached to this report in Appendix 2.

LOCAL COMMUNITY CONSULTATION

As a part of the research procedures, the Redlands Historical Museum Association and the Redlands Area Historical Society were contacted for supplementary information on the history of the subject property and for local community input regarding potential historic interest in any of the buildings on the property. The contact was initiated by e-mail on January 4, 2023, and included a map showing the project location and photographs of the historic-era buildings identified on the property. A follow-up e-mail was sent on January 14. To date, no reply has been received from either group.

HISTORICAL RESEARCH

Historical research for this study was completed in two phases. The preliminary background research was conducted by CRM TECH historian Terri Jacquemain on the basis of published literature in local and regional history, U.S. General Land Office (GLO) land survey plat maps dated 1858, U.S. Geological Survey (USGS) topographic maps dated 1901-1996, and aerial/satellite photographs taken in 1938-2022. The historic maps are available at the websites of the U.S. Bureau of Land Management and the USGS. The aerial and satellite images are available through the Google Earth software, at the Nationwide Environmental Title Research (NETR) Online website, and at the FrameFinder Online website hosted by the University of California, Santa Barbara.

After the identification of historic-era buildings in the project area, Jacquemain pursued more specific and in-depth research on the history of these buildings. Sources consulted during this phase of the research included primarily the archival records of the City of Redlands and the County of San Bernardino, particularly building safety records and real property assessment records, materials on file at the A.K. Smiley Public Library, and various online genealogical and commercial business databases.

FIELD SURVEY

On November 17, 2022, CRM TECH archaeologists Hunter O'Donnell and Cynthia Ayala conducted the intensive-level field survey of the project area by walking parallel north-south transects spaced 15 meters (approximately 50 feet) apart across all open areas on the property. In this way, the ground surface in the entire project area was carefully examined for any evidence of

human activities dating to the prehistoric or historic period (i.e., 50 years or older). While most of the project area is paved or occupied by buildings, ground visibility was good to excellent (85-90%) over the rest of the property except for a few pockets of excessive duff under trees and clusters of vegetation along the peripheries.

In conjunction with the archaeological survey, O'Donnell carried out a field inspection of the buildings and other built-environment features in the project area and field recordation on those that appeared to be more than 45 years old and retained at least a recognizable level of historical characteristics. The field recordation consisted mainly of detailed notations and preliminary photo-documentation of the structural and architectural characteristics and current conditions. The field data and observations were compiled into standard record forms for submittal to the California Historical Resources Inventory (see App. 3).

RESULTS AND FINDINGS

RECORDS SEARCH

According to SCCIC records, the project area had not been surveyed for cultural resources prior to this study, and no cultural resources had been recorded on the property. Within the one-mile scope of the records search, some 75 cultural resources studies completed between 1973 and 2015 have been reported to the SCCIC (Fig. 6). Most of these studies were clustered to the west of Alabama Street, attesting to the increased development activities on former citrus land in the Old San Bernardino area since CEQA mandates were implemented in the 1970s. To the east of the project area, a number of small-scale studies have occurred near the City's downtown core.

As a result of the past survey efforts, some 179 historical/archaeological sites of historical origin were previously recorded within the one-mile radius. Closest to the project area among them, along State Street adjacent to the southern property boundary, was Site 36-027672, the former alignment of the 1888 San Bernardino and Redlands Railroad Company motor line, also known as the Redlands Central Railway or the "Redlands Dinky." The 10-mile-long narrow-gauge rail line linked the two cities, with passenger fares costing 30¢ one-way and 50¢ for a round trip (Landis n.d.). As is the case with many early infrastructure features, Site 36-027672 exists only on paper today.

Other sites recorded within the one-mile radius include well-known local historical landmarks such as the Mill Creek Zanja, the reconstructed San Bernardino *Asistencia*, and the Bryn Mawr Townsite, but the majority of the sites consists of buildings, including many in the City's designated historic districts, along with structural foundations, roads, and refuse scatters. Other than the no-longer-extant 36-027672, none of the sites were recorded in the immediate vicinity of the project area. As such, they require no further consideration during this study. No cultural resources of prehistoric—i.e., Native American—origin have been identified within the scope of the records search.

SACRED LANDS FILE SEARCH

In response to CRM TECH's inquiry, the NAHC reported in a letter dated December 8, 2022, that the Sacred Lands File indicated the presence of Native American cultural resource(s) in the general vicinity of the project location, but the nature and location of the resource(s) were not disclosed.

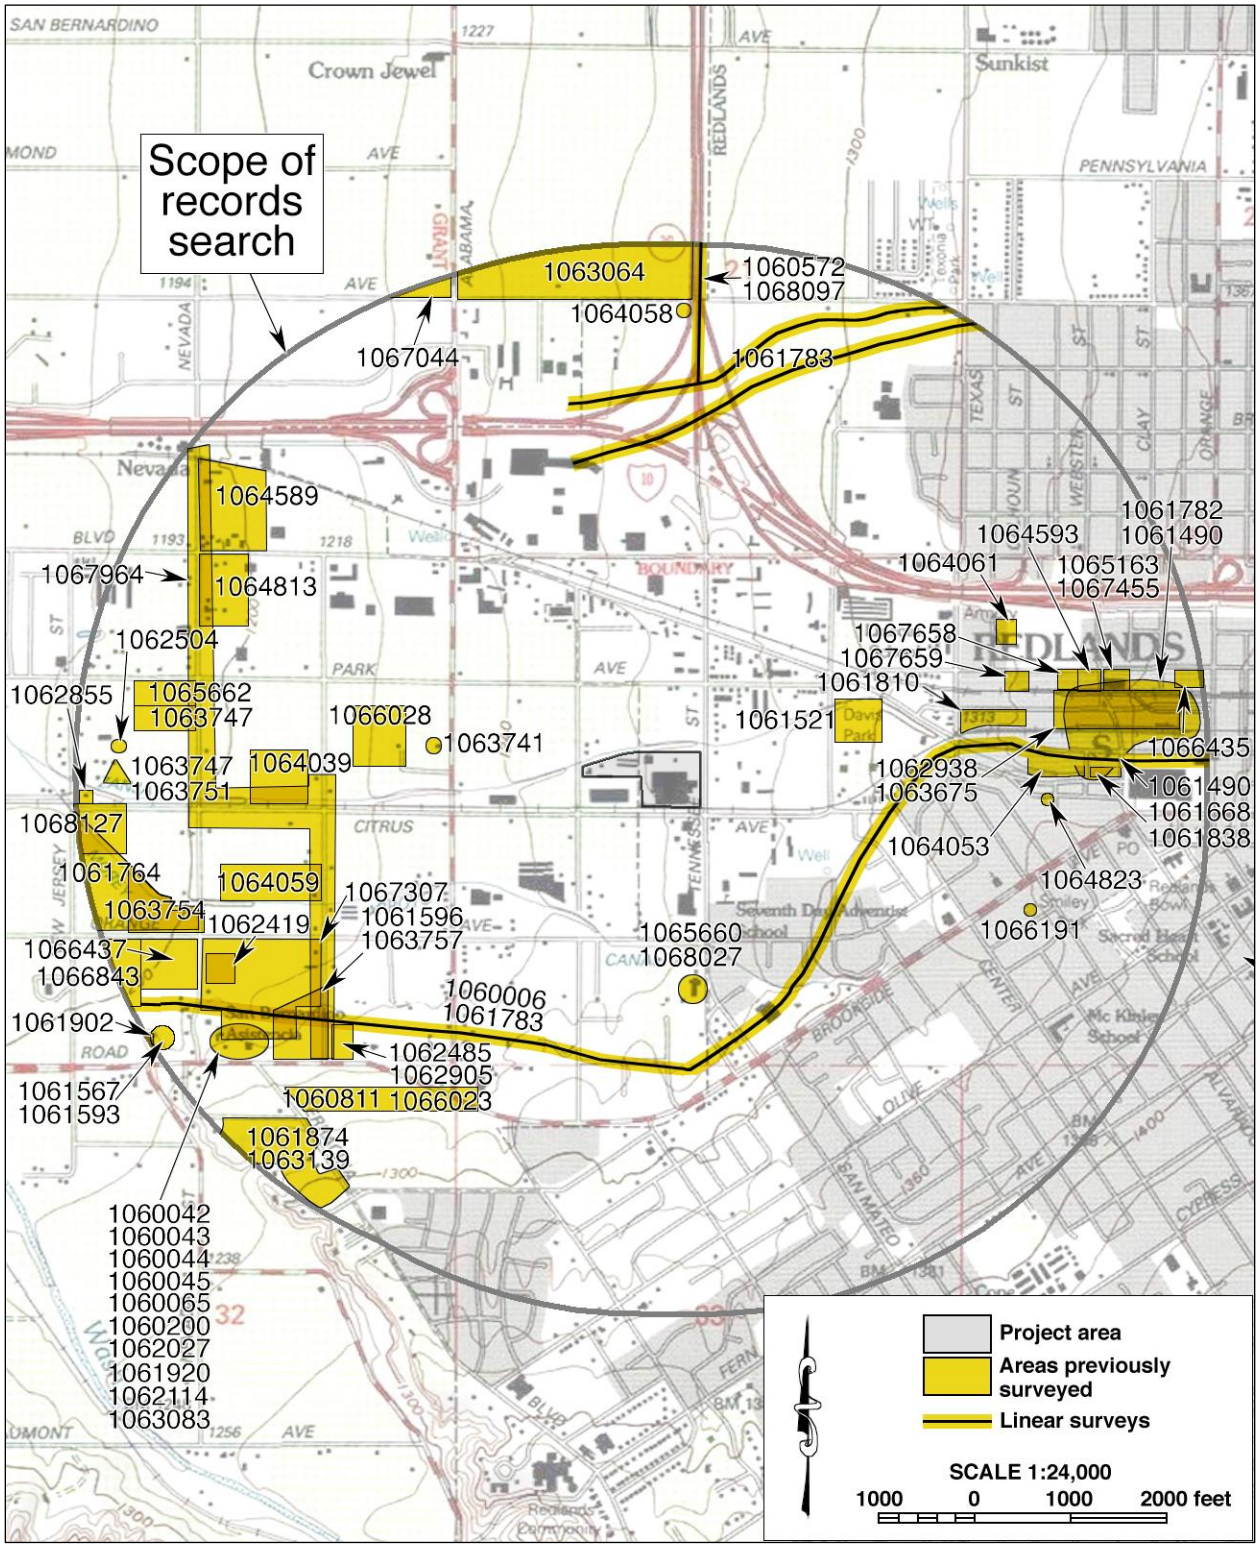

Figure 6. Previous cultural resources studies in the vicinity of the project area. Locations of historical/archaeological resources are not shown as a protective measure.

The NAHC recommended that local Native American groups be consulted for further information and provided a referral list of 11 tribal representatives affiliated with 10 local Native American groups. The NAHC's reply is attached to this report in Appendix 3 for reference by the City of Redlands in future government-to-government consultations with the local Native American groups.

HISTORICAL RESEARCH

The project area is situated about a mile east-northeast of Old San Bernardino, the center of early settlement during the Mission, Rancho, and Mormon periods in the history of San Bernardino Valley, but historical sources consulted for this study yielded no indication that it was involved in any of these early developments, except perhaps as farmland (Figs. 7-10). In the late 19th century, the project area sat in a flood-prone area near the confluence of what are now the Mission Zanja and the Morey Arroyo, amid a regular grid of roads, with the "Dinky" line (Site 36-027672) running along its southern boundary (Fig. 8).

By the late 1930s the project area and nearly all of the surrounding properties were covered by citrus groves, and a building, presumably a farmstead, had appeared near the southeast corner of the project area, as early channelization efforts along the Mission Zanja and the Morey Arroyo facilitated growth in the vicinity (NETR Online 1938; Fig. 9). The Mission Zanja connects to the original Mill Creek Zanja to the east of downtown Redlands near Laramie Park, but it was not a part of the historically significant irrigation canal, which was built in 1819-1820, the first irrigation work completed in San Bernardino County (Beattie 1951:42; Haenszel and Reynolds 1975:10). The 12-mile course of the Mill Creek Zanja ran roughly a half-mile south of the project location at its closest point.

After World War II, land in this area remained predominantly devoted to citrus groves and outside the boundary of the City of Redlands, which in 1959 was at Tennessee Street (UCSB FrameFinder 1952; NETR Online 1959-1968; Fig. 10). In the 1960s, the City's master plan codified land annexation further west, and earmarked it for industrial growth away from the core area (ARG 2017:149). The industrial district was bounded roughly by Redlands Boulevard/Colton Avenue, Tennessee Street, Orange Avenue, and New Jersey Street. Among the earlier industrial enterprises near the project location at the time were a textile knitting factory, a Gill Battery manufacturing plant, and a lumber and wrecking yard (ARG 2017:148, 149). Over the next three decades, industrial development continued to usurp the groves, often replacing them with large industrial buildings of concrete tilt-up construction and designed for truck access and freight distribution. By 1980 most of the citrus land had been laid fallow or replaced by commercial and industrial development, a trend that has continued to the present (NETR Online 1980-2020; Google Earth 1994-2022).

The residence at 360 Kansas Street was built around 1950, accompanied by a long rectangular structure at the rear, or the east (UCSB FrameFinder 1952; NETR Online 1959; County Assessor n.d.). A similar building combination had also appeared on Kansas Street just north of the Mission Zanja (*ibid.*). In 1954, the residence was occupied by Alex and Sadie Kimm, whose address was listed on Kansas Street and "one block north of Citrus" (now State Street; Ancestry.com n.d.). Family members John and Mary Jean Kimm lived on Kansas Street "two blocks north of Citrus" (*ibid.*), possibly in the similar residence across the drainage.

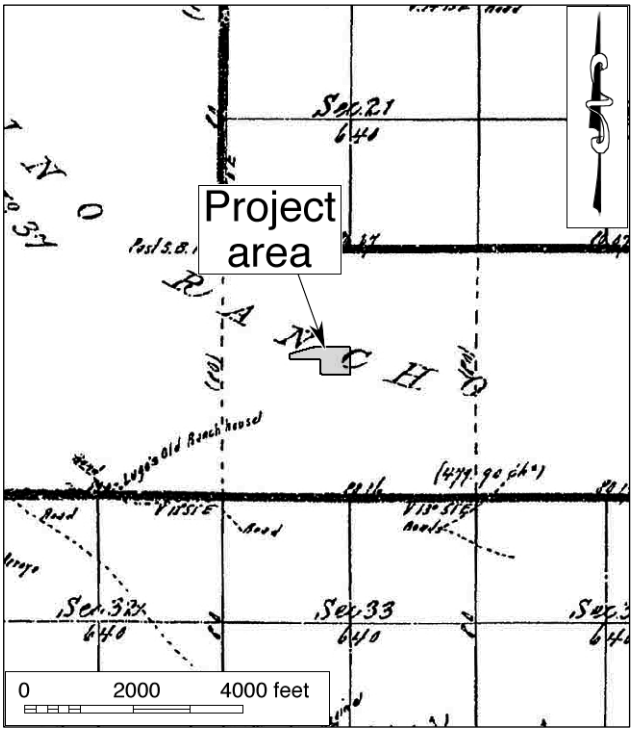

Figure 7. The project area and vicinity in 1853-1857. (Source: GLO 1858)

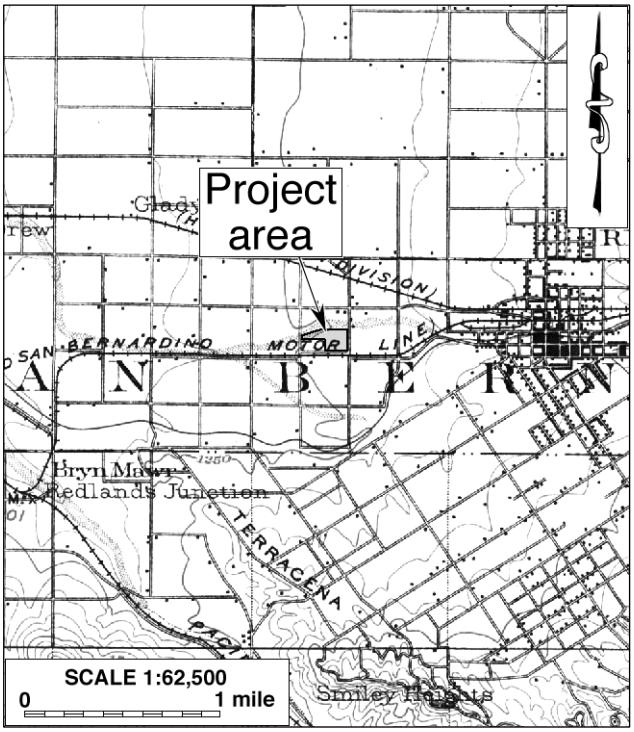

Figure 8. The project area and vicinity in 1898-1899. (Source: USGS 1901)

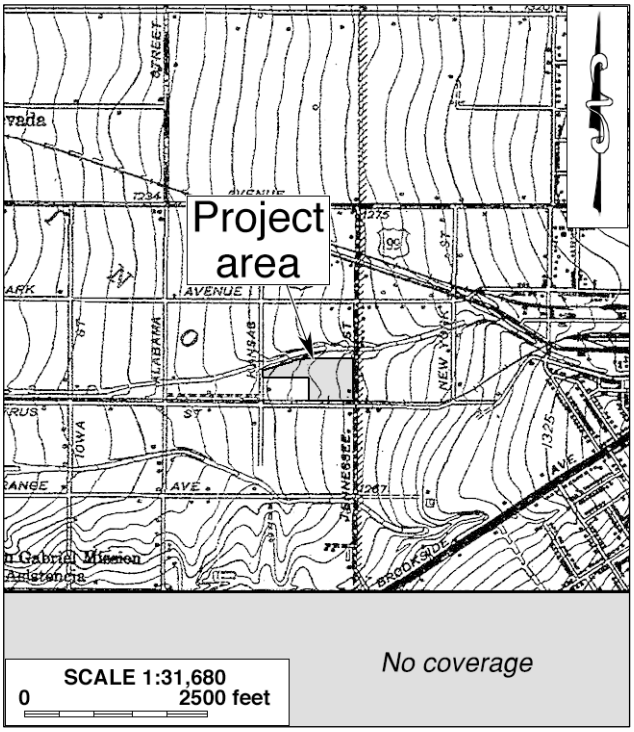

Figure 9. The project area and vicinity in 1939. (Source: USGS 1943)

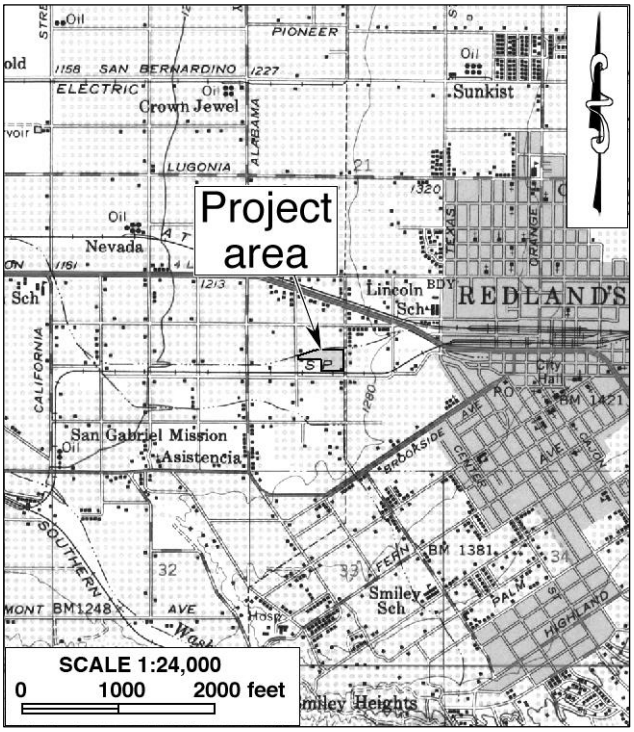

Figure 10. The project area and vicinity in 1952. (Source: USGS 1954)

Lead by patriarch Harkel A. Kimm and his wife Anna, who in 1954 lived on Alabama Street north of Barton Road, the Kimm family were in the business of chicken ranching (Ancestry.com n.d.). Harkel and Anna Kimm were both born in the Netherlands and had journeyed to Montana by 1919 when their youngest son Alex was born (*ibid.*). By 1940, they had settled in Redlands (*ibid.*). The elder Kimms were among some 400,000 Dutch immigrants who came to the U.S. between 1845 and 1930, with enough eventually settling in the Redlands area to form a small but cohesive community based primarily on their Christian Reformed faith and the dairy industry (ARG 2017:208). Alex and Sadie Kimm remained property owners in the project area until 1995, when the land was deeded to Rettig Machine Shop. City building safety records indicate the building suffered fire damage in 1982 (City of Redlands 1982).

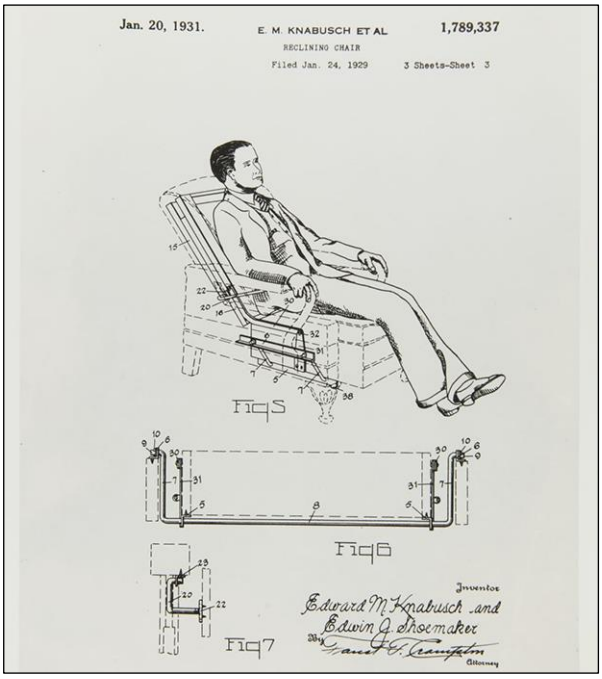

Figure 11. Patent illustration for the original La-Z-Boy Reclining Chair, January 24, 1929. (Source: The Henry Ford n.d.)

The former La-Z-Boy furniture manufacturing plant at 301 Tennessee was built for the company in 1965 and served in that capacity until October 2019, when the plant was closed (City of Redlands 1965; Kibby 1965:1; Iyer 2019). The company was founded in 1927 by cousins Edwin J. Shoemaker and Edward M. Knabusch, who produced their first chair in a garage in Monroe, Michigan (La-Z-Boy n.d.). It was a simple wood-slat chair, but with an innovative mechanism that allowed the occupant to recline (*ibid*.).

As they sought to bring their chair to the market, it was suggested that they upholster it for indoor use (La-Z-Boy n.d.). The duo took the advice and then filed for a patent in 1929 (La-Z-Boy n.d.; Fig. 11). Eventually the furniture line was expanded to encompasses other brands and living room staples such as sofas and loveseats, and the company was incorporated in 1941 (La-Z-Boy.com n.d.). In March 1972, La-Z-Boy went public, having by then established nine manufacturing plants in the United States: two in Michigan, one in Redlands, and six more in several eastern states (Encyclopedia.com n.d.). Today, La-Z-Boy is an internationally recognized brand and is among the leading residential furniture producers worldwide, with its headquarters still in Monroe, Michigan (*ibid*.).

During its 54-year tenure at the Redlands location, La-Z-Boy employed as many as 350 workers, who made and upholstered the company's flagship recliner and other branded products, accounting for about 10% of the company's output (Iyer 2019; Slaughter 2019). The plant was the company's first west of the Mississippi, built after Redlands' civic agencies vied to be the choice among eight contenders. Efforts included hosting La-Z-Boy co-founder Edward Knabusch and his wife at the residence of then-mayor Waldo Burroughs, followed up by city representatives paying a one-day visit to the company headquarters in Michigan (Kibby 1965:1). The company was active in the

Redlands community as a sponsor of the annual Redlands Bowl Summer Music Festival, and in 2011 became the City of Redlands' first recipient of the Mayor's Green Action Award for reducing its landfill waste from manufacturing (Iyer 2019).

The 1960s-1970s industrial buildings constructed in the western Redlands industrial district were commonly plain box-like buildings, but some owners of the era opted to contract stylized primary facades for their buildings, including the Lazy-Z-Boy furniture manufacturing plant, which was designed by Redlands architect Leon H. Armantrout (City of Redlands 1965; ARG 2017:149). Armantrout moved to Redlands in 1960 and opened his office there in 1964 (Johnson 2002). He has built an impressive body of work in Mid-Century Modern and Late Modern styles, including many custom homes and eye-catching institutional, professional, commercial, educational, and religious buildings (*ibid.*). In 2013, Armantrout donated a catalog of his Redlands architectural drawings to the A.K. Smiley Public Library (Schwartz 2013), among them those for the First United Methodist Church, the relocation and expansion of the ESRI campus, Redlands Community Center, Town Square Design for Redlands Mall, Empire Bowl, Redlands Medical Center, and the San Bernardino County Museum.

Constructed by local contractors Forsberg and Gregory, Inc., the La-Z-Boy building was originally a 72,000-square-foot manufacturing plant (City of Redlands 1965). In 1972-1973, 43,600 square feet were added to the factory and 800 square feet to the front office, followed by a 624-square-foot tilt-up panel addition and another 9,225 square feet in 1991 (City of Redlands 1972-1991). The two ancillary buildings to the north of the main plant, measuring 12,000 and 28,000 square feet, are both concrete tilt-up structures erected in 1969, again by Forsberg and Gregory, Inc., but with no architect identified in the building permits (City of Redlands 1969). A 1,300-square-foot conference room was added in 2004, and the monument sign along Tennessee Street was installed in 2014 (City of Redlands 2004-2014).

FIELD SURVEY

Field observations confirm that no vestige of Site 36-027672, the Redlands Dinky line, exists in the vicinity of the project area, and no evidence of any prehistoric cultural resources was encountered within or adjacent to the project boundaries. The ground surface has been extensively disturbed by agricultural operations and construction activities in the past, leaving little potential for any prehistoric or early historic archaeological remains to survive intact.

The three streets adjacent to the project area, Tennessee Street, Kansas Street, and State Street, all date to the historic period, but their current configuration and appearance reflect the results of repeated upgrading and regular maintenance in recent times, and none of them exhibits any distinctively historical characteristics. As working components of the modern transportation infrastructure, these streets are not considered potential "historical resources." Similarly, the Mission Zanja adjacent to the northern project boundary is an unremarkable earthen drainage of common design and construction practices that has been constantly maintained in the modern era. With no anticipated impacts from the project as proposed, it requires no further consideration during this study.

Historical research has revealed that the La-Z-Boy plant and residence on the property are both more than 50 years of age. While both have been significantly altered, field survey observations confirm that they retain a recognizable level of historical characteristics. As such, they were recorded into the California Historical Resources Inventory during this study and designated temporarily as Sites 3963-1H and -2H, pending assignment of permanent identification numbers by the SCCIC. These buildings represent the only potential "historical resources" in the project area.

Site 3963-1H (Former La-Z-Boy Plant)

The former La-Z-Boy manufacturing plant at 301 Tennessee Street consists of a main office/ warehouse building and two smaller auxiliary buildings of concrete tilt-up construction situated to the north, all of them resting on concrete slab foundations with flat roofs (Fig. 12). The main building is a tall one-story steel-frame and concrete structure that covers nearly two acres. Its squarish shape is a product of later additions that effectively doubled the original footprint, while some of the additions resulted in protrusions from the building. The concrete cladding covers nearly all of the exterior, leaving the building relatively blind but punctuated by loading docks with roll-up doors or single entries filled with metal commercial doors.

The rectangular front office portion on the eastern side, facing Tennessee Street, has a flat but lower roof, with its Armantrout-designed Modern-style elements somewhat overshadowed by the sizable unadorned additions at either end. Nevertheless, the Modern style remains apparent in the deeply recessed main entry between slightly over-extended brick partitions sheltering a plateglass wall and a metal-framed glass door with a transom. Varnished pine wood slats cover the entry ceiling, while square cut-outs in the brick sides allow a view of low-growing tropical plant gardens that flank the entry. A steel-framed enclosure reaching the roof level is filled on the top two-thirds by smoke glass, and open at the bottom. The entry is accessed by a brick-edged pebbled concrete walkway, flanked by low planters and paved parking lots and driveway.

Figure 12. Former La-Z-Boy furniture manufacturing plant at 301 Tennessee Street. (Photograph taken on February 14, 2023; view to the northwest)

Figure 13. Single-family residence at 360 Kansas Street. (Photograph taken on November 17, 2022; view to the northwest)

Site 3963-2H (Former Kimm Residence)

Located at 360 Kansas Street, this Ranch-style, one-story single-family residence with an attached garage is a wood-framed structure built on a U-shaped plan. It rests on a concrete foundation and is surmounted by a medium-pitched hip roof sheathed in brown composition shingles (Fig. 13). An addition with a shed roof is attached to the eastern (rear) side at the middle section. Light-colored stucco clads most of the exterior, although there are small half-wall sections of brick-and-mortar and vertical tooth-and-groove wood siding on the rear addition. Fenestration is a mix of vintage and recent windows of various size, as are the sashes adorning the entry doors. A modern metal roll-up door fills the entry to the garage, which is topped by a cupola at the roof ridge. Two corrugated-metal sheds accompany the house in the rear.

DISCUSSION

APPLICABLE REGULATORY FRAMEWORK

The purpose of this study is to identify any cultural resources in the project area and to assist the City of Redlands in determining whether they meet the official definition of "historical resources," as provided in the California Public Resources Code, in particular CEQA. According to PRC §5020.1(j), "'historical resource' includes, but is not limited to, any object, building, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California."

More specifically, CEQA guidelines state that the term "historical resources" applies to any such resources listed in or determined to be eligible for listing in the California Register of Historical Resources, included in a local register of historical resources, or determined to be historically significant by the lead agency (Title 14 CCR §15064.5(a)(1)-(3)). Regarding the proper criteria for

the evaluation of historical significance, CEQA guidelines mandate that "generally a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (Title 14 CCR §15064.5(a)(3)). A resource may be listed in the California Register if it meets any of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history. (PRC §5024.1(c))

A local register of historical resources, as defined by PRC §5020.1(k), "means a list of properties officially designated or recognized as historically significant by a local government pursuant to a local ordinance or resolution." For individual properties and historic districts in the City of Redlands, the City's Historic and Scenic Preservation Ordinance outlines a series of 11 eligibility criteria, any one of which may render a property eligible for designation by the City of Redlands as a "landmark" or a "historic property":

A. It has significant character, interest, or value as part of the development, heritage or cultural characteristics of the city of Redlands, state of California, or the United States;
B. It is the site of a significant historic event;
C. It is strongly identified with a person or persons who significantly contributed to the culture, history or development of the city;
D. It is one of the few remaining examples in the city possessing distinguishing characteristics of an architectural type or specimen;
E. It is a notable work of an architect or master builder whose individual work has significantly influenced the development of the city;
F. It embodies elements of architectural design, detail, materials, or craftsmanship that represents a significant architectural innovation;
G. It has a unique location or singular physical characteristics representing an established and familiar visual feature of a neighborhood, community, or the city;
H. It has unique design or detailing;
I. It is a particularly good example of a period or style;
J. It contributes to the historical or scenic heritage or historical or scenic properties of the city (to include, but not be limited to, landscaping, light standards, trees, curbings, and signs);
K. It is located within a historic and scenic or urban conservation district, being a geographically definable area possessing a concentration of historic or scenic properties which contribute to each other and are unified aesthetically by plan or physical development. (MC §2.62.170)

RESOURCE EVALUATIONS

Site 3963-1H (Former La-Z-Boy Plant)

The former La-Z-Boy furniture manufacturing plant at 301 Tennessee Street was built in 1965 and is among several industrial buildings constructed in the vicinity during the 1960s-1970s period, in the early days of the development of an industrial district in the western portion of the City of Redlands. Its construction reflected the City's increasing efforts to diversify its economic base in the post-

World War II era. At the time, the La-Z-Boy Company was already prominent in the industry and was pursuing a multi-state expansion. The building is arguably associated with a pattern of events or a local historical theme, namely Redlands' transition away from its horticulture roots, and is also notable for its association to an innovative, industry-leading company. In neither case, however, does the building demonstrate a particularly important or close association in comparison to other properties known for similar associations.

To wit, the historical theme of mid-20th century industrial growth is well-represented by industrial and commercial enterprises of similar vintage throughout the Redland area, particularly the western portion of the city, and furniture manufacturing was not a dominant industry in the area or a particularly prominent element of the local economy. In regard to the association to the La-Z-Boy Company, although hailed as being the "first west of the Mississippi" the building was not a flagship building of the La-Z-Boy Company, but rather an outpost far from the company's Michigan headquarters, and one that appeared on the scene decades after the company had garnered wide-spread brand recognition.

Sources consulted during this study have yielded no evidence that the former La-Z-Boy plant is closely associated with any specific events or persons of recognized historic significance. In terms of architectural, structural, engineering, or aesthetic merits, the building was designed by prominent Redland architect Leon Armantrout, who worked primarily in mid-20th century Modern and Late Modern styles. As noted above, Leon Armantrout's body of work is well represented in his catalogue of architectural drawings within the City of Redlands and the larger southern California region. For this building, the Modern-style design elements are largely confined to the central portion of the primary façade, while the rest of the building is functionally utilitarian, an expression sometimes in keeping with the style but overall appearing more vernacular or altered by later additions.

The La-Z-Boy plant is among a handful of industrial buildings to his credit, but despite being fewer in number, it does not stand out as an important or particularly remarkable example of Armantrout's body of work or of any style, property type, period, region, and method of construction. Furthermore, the 1960s era in industrial development is well documented in historical accounts, contemporary literature, as well as archival records, both nationwide and in the City of Redlands. As a result, this building holds little potential for any new or important data for the study of this subject. Based on these considerations, the present study concludes that 3963-1H does not appear eligible for listing in the California Register of Historical Resources or for local designation by the City of Redlands. Therefore, it does not meet the definition of a "historical resource" under CEQA provisions.

Site 3963-2H (Former Kimm Residence)

The Ranch-style residence at 360 Kansas Street was constructed around 1950. While it retains some elements recognizable to the era in scale and materials, such as a few surviving double-hung windows and a single-car garage, it has been significantly altered by additions, exterior wall cladding, and modern window replacements. Nevertheless, as a rural residence built amidst the groves in the waning years of Redlands robust citrus cultivation era, it shares an association with the city's long-held historical heritage and ensuing "citrus culture." Another historical theme that the

residence is associated with is the post-World War II boom in urban/suburban development throughout the U.S. and especially in southern California. While the residence retains sufficient integrity to relate to these patterns of events, once again it does not demonstrate a unique, significant, or particularly close association with the historical themes in comparison to the numerous other residential buildings of similar character and similar vintage that survive in and around Redlands.

The historical background research has not identified any persons or specific events of recognized significance in the history of the residence, nor any prominent architects, designers, or builders in association with its construction. Architecturally, the building is essentially vernacular in appearance, owing partly to the alterations, and does not represent an important example of its style,, type, period, region, or method of construction. With no notable qualities in design or construction, no documented historical association of importance, and little potential to yield any historical information, the residence at 360 Kansas Street does not appear to meet any of the criteria for listing the California Register of Historical Resource or for local designation, and does not qualify as a "historical resource," as defined above.

CONCLUSION AND RECOMMENDATIONS

CEQA establishes that a project that may cause a substantial adverse change in the significance of a "historical resource" is a project that may have a significant effect on the environment (PRC §21084.1). "Substantial adverse change," according to PRC §5020.1(q), "means demolition, destruction, relocation, or alteration such that the significance of a historical resource would be impaired."

In summary, the present study identified and recorded two groups of historic-period buildings within the project area, a La-Z-Boy furniture manufacturing plant at 301 Tennessee Street (Site 3963-1H) and a residence at 360 Kansas Street (Site 3963-2H), but neither of them appears eligible for listing in the California Register of Historical Resources or for local designation by the City of Redlands. Therefore, they do not constitute "historical resources" for CEQA-compliance purposes.

No other potential "historical resources" were encountered within or adjacent to the project area. However, the NAHC's response during this study indicated the presence of unspecified Native American cultural resource(s) in the general vicinity of the project location and referred further inquiry to the local Native American tribes. According to CEQA guidelines, the identification of potential "tribal cultural resources" is beyond the scope of this study and needs to be addressed through government-to-government consultations between the City of Redlands and the pertinent Native American groups pursuant to Assembly Bill (AB) 52.

Based on these findings, CRM TECH presents the following recommendations to the City of Redlands:

- A tentative conclusion of *No Impact* on known cultural resources appears to be appropriate for this project, pending the completion of the AB 52 consultation process to ensure the proper identification of potential "tribal cultural resources."

- No additional cultural resources investigation is necessary for the proposed project unless development plans undergo such changes as to include areas not covered by this study.
- If buried cultural materials are discovered during earth-moving operations associated with the project, all work within 50 feet of the discovery should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

APPENDIX 1:
PERSONNEL QUALIFICATIONS

PRINCIPAL INVESTIGATOR, HISTORY/ARCHITECTURAL HISTORY

Education

1988-1993	Graduate Program in Public History/Historic Preservation, University of California, Riverside.
1987	M.A., American History, Yale University, New Haven, Connecticut.
1982	B.A., History, Northwestern University, Xi'an, China.
2000	"Introduction to Section 106 Review," presented by the Advisory Council on Historic Preservation and the University of Nevada, Reno.
1994	"Assessing the Significance of Historic Archaeological Sites," presented by the Historic Preservation Program, University of Nevada, Reno.

Professional Experience

2002-	Principal Investigator, CRM TECH, Riverside/Colton, California.
1993-2002	Project Historian/Architectural Historian, CRM TECH, Riverside, California.
1993-1997	Project Historian, Greenwood and Associates, Pacific Palisades, California.
1991-1993	Project Historian, Archaeological Research Unit, University of California, Riverside.
1990	Intern Researcher, California State Office of Historic Preservation, Sacramento.
1990-1992	Teaching Assistant, History of Modern World, University of California, Riverside.
1988-1993	Research Assistant, American Social History, University of California, Riverside.
1985-1988	Research Assistant, Modern Chinese History, Yale University.
1985-1986	Teaching Assistant, Modern Chinese History, Yale University.
1982-1985	Lecturer, History, Xi'an Foreign Languages Institute, Xi'an, China.

Cultural Resources Management Reports

Preliminary Analyses and Recommendations Regarding California's Cultural Resources Inventory System (with Special Reference to Condition 14 of NPS 1990 Program Review Report). California State Office of Historic Preservation working paper, Sacramento, September 1990.

Numerous cultural resources management reports with the Archaeological Research Unit, Greenwood and Associates, and CRM TECH, since October 1991.

PRINCIPAL INVESTIGATOR, ARCHAEOLOGY
Michael Hogan, Ph.D., RPA (Registered Professional Archaeologist)

Education

1991	Ph.D., Anthropology, University of California, Riverside.
1981	B.S., Anthropology, University of California, Riverside; with honors.
1980-1981	Education Abroad Program, Lima, Peru.
2002	"Section 106—National Historic Preservation Act: Federal Law at the Local Level," UCLA Extension Course #888.
2002	"Recognizing Historic Artifacts," workshop presented by Richard Norwood, Historical Archaeologist.
2002	"Wending Your Way through the Regulatory Maze," symposium presented by the Association of Environmental Professionals.
1992	"Southern California Ceramics Workshop," presented by Jerry Schaefer.
1992	"Historic Artifact Workshop," presented by Anne Duffield-Stoll.

Professional Experience

2002-	Principal Investigator, CRM TECH, Riverside/Colton, California.
1999-2002	Project Archaeologist/Field Director, CRM TECH, Riverside, California.
1996-1998	Project Director and Ethnographer, Statistical Research, Inc., Redlands, California.
1992-1998	Assistant Research Anthropologist, University of California, Riverside.
1992-1995	Project Director, Archaeological Research Unit, U.C. Riverside.
1993-1994	Adjunct Professor, Riverside Community College, Mt. San Jacinto College, U.C. Riverside, Chapman University, and San Bernardino Valley College.
1991-1992	Crew Chief, Archaeological Research Unit, U.C. Riverside.
1984-1998	Project Director, Field Director, Crew Chief, and Archaeological Technician for various southern California cultural resources management firms.

Research Interests

Cultural Resource Management, Southern Californian Archaeology, Settlement and Exchange Patterns, Specialization and Stratification, Culture Change, Native American Culture, Cultural Diversity.

Cultural Resources Management Reports

Principal investigator for, author or co-author of, and contributor to numerous cultural resources management study reports since 1986.

Memberships

Society for American Archaeology; Society for California Archaeology; Pacific Coast Archaeological Society; Coachella Valley Archaeological Society.

PROJECT HISTORIAN/ARCHITECTURAL HISTORIAN
Terri Jacquemain, M.A.

Education

2004	M.A., Public History and Historic Resource Management, University of California, Riverside.
2002	B.S., Anthropology, University of California, Riverside.
2001	Archaeological Field School, University of California, Riverside.
1991	A.A., Riverside Community College, Norco Campus.

Professional Experience

2003-	Historian/Architectural Historian/Report Writer, CRM TECH, Riverside/ Colton, California.
2002-2003	Teaching Assistant, Religious Studies Department, University of California, Riverside.
2002	Interim Public Information Officer, Cabazon Band of Mission Indians.
2000	Administrative Assistant, Native American Student Programs, University of California, Riverside.
1997-2000	Reporter, *Inland Valley Daily Bulletin*, Ontario, California.
1991-1997	Reporter, *The Press-Enterprise*, Riverside, California.

PROJECT ARCHAEOLOGIST/NATIVE AMERICAN LIAISON
Nina Gallardo, B.A.

Education

2004	B.A., Anthropology/Law and Society, University of California, Riverside.

Professional Experience

2004-	Project Archaeologist, CRM TECH, Riverside/Colton, California.

Honors and Awards

2000-2002	Dean's Honors List, University of California, Riverside.

PROJECT ARCHAEOLOGIST/REPORT WRITER
Nicole A. Raslich, M.A.

Education

2017-	Ph.D. candidate, Michigan State University, East Lansing.
2011	M.A., Anthropology, Michigan State University, East Lansing.
2005	B.A., Natural History of Biology and Anthropology, University of Michigan, Flint.
2022	Adult First Aid/CPR/AED Certification, American Red Cross.
2019	Grant and Research Proposal Writing for Archaeologists; SAA Online Seminar.
2014	Bruker Industries Tracer S1800 pXRF Training; presented by Dr. Bruce Kaiser, Bruker Scientific.
2013	Introduction to ArcGIS, Michigan State University, East Lansing.

Professional Experience

2022-	Project Archaeologist/Report Writer, CRM TECH, Colton, California.
2022	Archaeological Technician, Agua Caliente Band of Cahuilla Indians, Palm Springs, California.
2008-2021	Archaeological Consultant, Saginaw Chippewa Indian Tribe of Michigan.
2019	Archaeologist, Sault Tribe of Chippewa Indians and Little Traverse Bay Band of Odawa Indians
2018	Teaching Assistant, Michigan State University, East Lansing.
2017	Adjunct Professor, University of Michigan, Flint.
2015-2016	Graduate Fellow, Michigan State University Campus Archaeology Program, East Lansing.
2015	Archaeologist, Michigan State University, Illinois State Museum, and Dickson Mounds Museum.
2013-2015	Curation Research Assistant, Michigan State University Museum, East Lansing.
2008-2014	Research Assistant, Intellectual Property Issues in Cultural Heritage, Simon Frasier University, British Columbia, Canada.
2009-2012	Editorial Assistant/Copy Editor, *American Antiquity*.
2009-2011	Archaeologist/Crew Chief, Saginaw Chippewa Indian Tribe of Michigan.

Publications

2017	Preliminary Results of a Handheld X-Ray Fluorescence (pXRF) Analysis on a Marble Head Sarcophagus Sculpture from the Collection of the Kresge Art Center, Michigan State University. Submitted to Jon M. Frey, Department of Art, Art History, and Design. Michigan State University, East Lansing.
2016	Preserving Sacred Sites: Arctic Indigenous Peoples as Cultural Heritage Rights Holders (L. Heinämäki, T.M. Herrmann, and N.A. Raslich). University of Lapland Printing Centre, Rovaniemi, Finland.

PROJECT ARCHAEOLOGIST
Hunter C. O'Donnell, B.A.

Education

2016-	M.A. Program, Applied Archaeology, California State University, San Bernardino.
2015	B.A. (*cum laude*), Anthropology, California State University, San Bernardino.
2012	A.A., Social and Behavioral Sciences, Mt. San Antonio College, Walnut, California.
2011	A.A., Natural Sciences and Mathematics, Mt. San Antonio College, Walnut, California.
2014	Archaeological Field School, Santa Rosa Mountains; supervised by Bill Sapp of the United States Forest Service and Daniel McCarthy of the San Manuel Band of Mission Indians.

Professional Experience

2017-	Project Archaeologist, CRM TECH, Colton, California.
2016-2018	Graduate Research Assistant, Applied Archaeology, California State University, San Bernardino.
2016-2017	Cultural Intern, Cultural Department, Pechanga Band of Luiseño Indians, Temecula, California.
2015	Archaeological Intern, U.S. Bureau of Land Management, Barstow, California.
2015	Peer Research Consultant: African Archaeology, California State University, San Bernardino.

PROJECT ARCHAEOLOGIST
Cynthia Ayala, B.A.

Education

2021	B.A., Anthropology/Law and Society, University of California, Riverside (Dean's List; *cum laude*).
2018	A.A., Anthropology, Pasadena City College (Honors Award for Superior Achievement in Anthropology).
2018	Field School, Milford Archaeological Research Institute, Utah.
2017	Field School, La Suerte Biological Research Station/Maderas Rainforest Conservancy, Costa Rica.

Professional Experience

2022-	Project Archaeologist, CRM TECH, Colton, California.
2020-2021	Field Technician, Mckenna et al., Whittier, California, and Duke CRM, Irvine, California.

Re: Proposed Redlands Warehouse Project at 301 Tennessee Street Assessor's Parcel Numbers 0292-192-11 and -14 (CRM TECH No. 3963) Project, San Bernardino County

Dear Ms. Gallardo:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information submitted for the above referenced project. The results were positive. Please contact the Tribes on the attached list for information. Please note that tribes do not always record their sacred sites in the SLF, nor are they required to do so. A SLF search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with a project's geographic area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites, such as the appropriate regional California Historical Research Information System (CHRIS) archaeological Information Center for the presence of recorded archaeological sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. Please contact all of those listed; if they cannot supply information, they may recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Cameron.vela@nahc.ca.gov.

Sincerely,

Cameron Vela

***P3a Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries) The former La-Z-Boy manufacturing plant at 301 Tennessee Street consists of a main office/warehouse building and two smaller auxiliary buildings of concrete tilt-up construction situated to the north, all of them resting on concrete slab foundations with flat roofs. The main building is a tall one-story steel-frame and concrete structure that covers nearly two acres. Its squarish shape is a product of later additions that effectively doubled the original footprint, while some of the additions resulted in protrusions from the building. The concrete cladding covers nearly all of the exterior, leaving the building relatively blind but punctuated by loading docks with roll-up doors or single entries filled with metal commercial doors. (*Continued on p. 4*)

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.) The former La-Z-Boy furniture manufacturing plant a is among several industrial buildings constructed in the vicinity during the 1960s-1970s period, in the early days of the development of an industrial district in the western portion of the City of Redlands. Its construction reflected the City's increasing efforts to diversify its economic base in the post-World War II era. At the time, the La-Z-Boy Company was already prominent in the industry and was pursuing a multi-state expansion. The building is (*Continued on p. 4*)

Recorded by: Hunter O'Donnell
***Date:** November 17, 2022 √ Continuation Update

***P3a. Description (**continued**):** The rectangular front office portion on the eastern side, facing Tennessee Street, has a flat but lower roof, with its Armantrout-designed Modern-style elements somewhat overshadowed by the sizable unadorned additions at either end. Nevertheless, the Modern style remains apparent in the deeply recessed main entry between slightly over-extended brick partitions sheltering a plateglass wall and a metal-framed glass door with a transom. Varnished pine wood slats cover the entry ceiling, while square cut-outs in the brick sides allow a view of low-growing tropical plant gardens that flank the entry. A steel-framed enclosure reaching the roof level is filled on the top two-thirds by smoke glass, and open at the bottom. The entry is accessed by a brick-edged pebbled concrete walkway, flanked by low planters and paved parking lots and driveway.

***B6. Construction History (continued):** main plant, measuring 12,000 and 28,000 square feet, are both concrete tilt-up structures erected in 1969. A 1,300-square-foot conference room was added in 2004, and the monument sign along Tennessee Street was installed in 2014.

Architect Leon H. Armantrout moved to Redlands in 1960 and opened his office there in 1964. He has built an impressive body of work in Mid-Century Modern and Late Modern styles, including many custom homes and eye-catching institutional, professional, commercial, educational, and religious buildings. In 2013, Armantrout donated a catalog of his Redlands architectural drawings to the A.K. Smiley Public Library, among them those for the First United Methodist Church, the relocation and expansion of the ESRI campus, Redlands Community Center, Town Square Design for Redlands Mall, Empire Bowl, Redlands Medical Center, and the San Bernardino County Museum.

***B10. Significance (continued):** arguably associated with a pattern of events or a local historical theme, namely Redlands' transition away from its horticulture roots, and is also notable for its association to an innovative, industry-leading company. In neither case, however, does the building demonstrate a particularly important or close association in comparison to other properties known for similar associations.

To wit, the historical theme of mid-20th century industrial growth is well-represented by industrial and commercial enterprises of similar vintage throughout the Redland area, particularly the western portion of the city, and furniture manufacturing was not a dominant industry in the area or a particularly prominent element of the local economy. In regard to the association to the La-Z-Boy Company, although hailed as being the "first west of the Mississippi" the building was not a flagship building of the La-Z-Boy Company, but rather an outpost far from the company's Michigan headquarters, and one that appeared on the scene decades after the company had garnered wide-spread brand recognition.

Sources consulted during this study have yielded no evidence that the former La-Z-Boy plant is closely associated with any specific events or persons of recognized historic significance. In terms of architectural, structural, engineering, or aesthetic merits, the building was designed by prominent Redland architect Leon Armantrout, who worked primarily in mid-20th century Modern and Late Modern styles. Armantrout's body of work is well represented in his catalogue of architectural drawings within the City of Redlands and the larger southern California region. For this building, the (*Continued on p. 5*)

Recorded by: Hunter O'Donnell
***Date:** November 17, 2022 √ Continuation Update

***B10. Significance (continued):** Modern-style design elements are largely confined to the central portion of the primary façade, while the rest of the building is functionally utilitarian, an expression sometimes in keeping with the style but overall appearing more vernacular or altered by later additions.

The La-Z-Boy plant is among a handful of industrial buildings to his credit, but despite being fewer in number, it does not stand out as an important or particularly remarkable example of Armantrout's body of work or of any style, property type, period, region, and method of construction. Furthermore, the 1960s era in industrial development is well documented in historical accounts, contemporary literature, as well as archival records, both nationwide and in the City of Redlands. As a result, this building holds little potential for any new or important data for the study of this subject. Based on these considerations, the former La-Z-Boy furniture manufacturing plant does not appear eligible for listing in the National Register of Historic Places or the California Register of Historical Resource.

Recorded by: Hunter O'Donnell
***Date:** November 17, 2022 √ Continuation Update

***B10. Significance (continued):** Another historical theme that the residence is associated with is the post-World War II boom in urban/suburban development throughout the U.S. and especially in southern California. While the residence retains sufficient integrity to relate to these patterns of events, it does not demonstrate a unique, significant, or particularly close association with the historical themes in comparison to the numerous other residential buildings of similar character and similar vintage that survive in and around Redlands.

The historical background research has not identified any persons or specific events of recognized significance in the history of the residence, nor any prominent architects, designers, or builders in association with its construction. Architecturally, the building is essentially vernacular in appearance, owing partly to the alterations, and does not represent an important example of its style, type, period, region, or method of construction. With no notable qualities in design or construction, no documented historical association of importance, and little potential to yield any historical information, the residence at 360 Kansas Street does not appear to meet any of the criteria for listing the National Register of Historic Places or California Register of Historical Resources.

[**NOTICE:** This message originated outside of City of Redlands -- **DO NOT CLICK** on **links** or open **attachments** unless you are sure the content is safe.]

Hello Sean,
Thank you for contacting the Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians) regarding the above referenced project. YSMN appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on September 22nd, 2022, pursuant to CEQA (as amended, 2015) and CA PRC 21080.3.1. The proposed project area exists within Serrano ancestral territory and, therefore, is of interest to the Tribe. However, due to the nature and location of the proposed project, and given the CRM Department's present state of knowledge, YSMN does not have any concerns with the project's implementation, as planned, at this time. As a result, YSMN requests that the following language be made a part of the project/permit/plan conditions:

CUL MMs

1. In the event that cultural resources are discovered during project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease and a qualified archaeologist meeting Secretary of Interior standards shall be hired to assess the find. Work on the other portions of the project outside of the buffered area may continue during this assessment period. Additionally, the Yuhaaviatam of San Manuel Nation Cultural Resources Department (YSMN) shall be contacted, as detailed within TCR-1, regarding any pre-contact and/or historic-era finds and be provided information after the archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regards to significance and treatment.

2. If significant pre-contact and/or historic-era cultural resources, as defined by CEQA (as amended, 2015), are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to YSMN for review and comment, as detailed within TCR-1. The archaeologist shall monitor the remainder of the project and implement the Plan accordingly.

3. If human remains or funerary objects are encountered during any activities associated with the project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5 and that code enforced for the duration of the project.

TCR MMs

1. The Yuhaaviatam of San Manuel Nation Cultural Resources Department (YSMN) shall be contacted, as detailed in CR-1, of any pre-contact and/or historic-era cultural resources discovered during project implementation, and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment. Should the find be deemed significant, as defined by CEQA (as amended, 2015), a cultural resources Monitoring and Treatment Plan shall be created by the archaeologist, in coordination with YSMN, and all subsequent finds shall be subject to this Plan. This Plan shall allow for a monitor to be present that represents YSMN for the remainder of the project, should YSMN elect to place a monitor on-site.

2. Any and all archaeological/cultural documents created as a part of the project (isolate

records, site records, survey reports, testing reports, etc.) shall be supplied to the applicant and Lead Agency for dissemination to YSMN. The Lead Agency and/or applicant shall, in good faith, consult with YSMN throughout the life of the project.

Note: Yuhaaviatam of San Manuel Nation realizes that there may be additional tribes claiming cultural affiliation to the area; however, Yuhaaviatam of San Manuel Nation can only speak for itself. The Tribe has no objection if the agency, developer, and/or archaeologist wishes to consult with other tribes in addition to YSMN and if the Lead Agency wishes to revise the conditions to recognize additional tribes.

Please provide the final copy of the project/permit/plan conditions so that YSMN may review the included language. This communication concludes YSMN's input on this project, at this time, and no additional consultation pursuant to CEQA is required unless there is an unanticipated discovery of cultural resources during project implementation. If you should have any further questions with regard to this matter, please do not hesitate to contact me at your convenience, as I will be your Point of Contact (POC) for YSMN with respect to this project.

Respectfully,
Ryan Nordness

Subject: City of Redlands AB-52 Tribal Consultation Notice - CRA-948, Tennessee Warehouse Project

Good afternoon,
Please see the attached AB-52 Project Notification.

In accordance with Assembly Bill 52, the City of Redlands is sending this notice to inform California Native American tribes that have requested such notice of a project application within a geographic area with which the tribe is traditionally and culturally affiliated. California Public Resources Code §21080.3.1 requires this notice within 14 days of the City determining this application is complete and/or after the City has decided to undertake a project. California Native American tribes have 30 days from the date of this notice to request consultation with the City regarding this project.

Please contact me with any questions.

Thank you,

Sean Reilly

Date:	January 30, 2023
Prepared by:	Meghan Macias, TE
To:	City of Redlands
Site:	301 Tennessee Street
Subject:	VMT Screening Analysis

This technical memorandum evaluates the need to prepare a Vehicle Miles Traveled (VMT) analysis for the proposed 197,397 SF general light industrial building (including up to 10% cold storage) located at 301 Tennessee Street in the City of Redlands. The Assessor's Parcel Numbers are 0292-192-11 and 0292-192-14. The project site is developed with an existing 193,469 square-foot manufacturing warehouse and a single-family house. Regional access to the project site is provided by the Interstate 10 Freeway (I-10) located approximately 0.6 miles north. The proposed project will be accessible via four driveways. There would be two driveways on Tennessee Street: a 40' truck accessible driveway would be located at the northeast corner of the site and a 30' driveway for passenger cars only would be located at the southeast corner of the project. A 40' driveway for truck access would be located on West State Street. Another 40' driveway for both truck and passenger car access would be located on Kansas Street.

The proposed project will consist of a new warehouse building with a total building area of 197,397 SF inclusive of 4,000 SF of office. The project also includes 25 dock doors along the west side of the building. The proposed project includes 267 vehicle parking spaces which are located on the western and eastern parking lots of the warehouse. Truck trailer parking stalls will also be located on the northwest portion of the project site. Internal circulation will be provided via 40' drive aisles for all truck access and 30' drive aisles for passenger car parking areas. The project site plan is shown in Figure 1.

VMT Screening Analysis

Senate Bill (SB) 743 was signed by Governor Brown in 2013 and required the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to provide an alternative to LOS for evaluating Transportation impacts. SB743 specified that the new criteria should promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks and a diversity of land uses. The bill also specified that delay-based level of service could no longer be considered an indicator of a significant impact on the environment. In response, Section 15064.3 was added to the CEQA Guidelines beginning January 1, 2019. Section 15064.3 - Determining the Significance of Transportation Impacts states that Vehicle Miles Traveled (VMT) is the most appropriate measure of transportation impacts and provides lead agencies with the discretion to choose the most appropriate methodology and thresholds for evaluating VMT. Section 15064.3(c) states that the provisions of the section shall apply statewide beginning on July 1, 2020.

The City of Redlands CEQA Assessment VMT Analysis Guidelines provides guidelines for analysis of transportation impacts under CEQA. The guidelines also provide three types of screening that can be applied to determine if a project is exempt from project-level VMT analysis. If a project meets one of the following criteria, then the VMT impact of the project is considered less-than significant and no further analysis of VMT would be required:

- The project is located within a Transit Priority Area.
- The project is located in a low VMT generating area.

- The project is considered a local serving use or would generate less than 3,000 metric tons of CO2 equivalent (3,000 MT CO2e) per year.

The project was screened using the SBCTA VMT Screening Tool (https://sbcta.maps.arcgis.com/apps/webappviewer/index.html?id=779a71bc659041ad995cd48d9ef4052b). The results of the screening analysis are shown in Figures 2A and 2B.

Screening Criteria 1 – The project is located within a Transit Priority Area: The SBCTA tool illustrates that the project is located completely within a Transit Priority Area, however this criterion would not apply as the project has a floor area ratio (FAR) of 0.44. The City of Redlands CEQA Assessment VMT Analysis Guidelines state that this criterion should be applied to projects with an FAR of 0.75 or more.

Screening Criteria 2 – Low VMT Generating Area: The City's guidelines include a screening threshold for projects located in a low VMT generating area. The project's site was evaluated using the SBCTA VMT Screening Tool as discussed previously. The project is located within TAZ 53827301. The criteria applied to this project was 15% below the County baseline using the Origin-Destination VMT per Service Population. As shown in Figures 2A and 2B, the Countywide VMT/Service Population is 33.3 and the threshold would be 28.3 VMT/Service Population. The screening tool indicates that these TAZs have an OD VMT/Service Population of 61.7. This is 85.29% above the threshold and would not be considered to generate a low VMT.

Screening Criteria 3 - The project is considered a local serving use or would generate less than 3,000 metric tons of CO2 equivalent (3,000 MT CO2e) per year. Under the Project Type Screening criteria, projects which generate less than 3,000 MT CO2e per year can be presumed to have a less than significant impact on VMT. Under the criteria, Light Industrial uses less than 74,600 SF would generate less than 3,000 MT CO2e per year. The proposed project would increase the light industrial use on the site by 3,928 square feet. Therefore, the project's VMT impact would be considered less than significant and a VMT analysis would not be required under this criterion.

Summary

The proposed project would increase the light industrial use on the site by 3,928 square feet. Furthermore, when the project is compared against the City of Redlands CEQA Assessment VMT Analysis Guidelines, the project's VMT impact would be considered less than significant and a VMT analysis would not be required under this criterion.

If you have any questions about this information, please contact me at (949) 794-1186.

Date:	February 20, 2023
Prepared by:	Meghan Macias, TE
To:	City of Redlands
Site:	301 Tennessee Street
Subject:	Measure U Focused Traffic Analysis

This technical memorandum provides a Focused Traffic Analysis (FTA) for the proposed 197,397 SF general light industrial building (including up to 10% cold storage) located at 301 Tennessee Street in the City of Redlands. The Assessor's Parcel Numbers are 0292-192-11 and 0292-192-14. The FTA is in compliance with the Measure U Policies identified in the Connected City Element of the City of Redlands 2035 General Plan. The project site is developed with an existing 193,469 square-foot manufacturing warehouse (which is currently operating at its full capacity) and a single-family house. Regional access to the project site is provided by the Interstate 10 Freeway (I-10) located approximately 0.6 miles north. The proposed project will be accessible via four driveways. There would be two driveways on Tennessee Street: a 40' truck accessible driveway would be located at the northeast corner of the site and a 30' driveway for passenger cars only would be located at the southeast corner of the project. A 40' driveway for truck access would be located on West State Street. Another 40' driveway for both truck and passenger car access would be located on Kansas Street.

The proposed project will consist of a new warehouse building with a total building area of 197,397 SF inclusive of 4,000 SF of office. The project also includes 25 dock doors along the west side of the building. The proposed project includes 267 vehicle parking spaces which are located on the western and eastern parking lots of the warehouse. Truck trailer parking stalls will also be located on the northwest portion of the project site. Internal circulation will be provided via 40' drive aisles for all truck access and 30' drive aisles for passenger car parking areas. The project site plan is shown in Figure 1.

The analysis includes an evaluation of the existing and existing plus project levels of service at the following intersections:

1. Kansas Street and Park Avenue
2. Kansas Street and State Street
3. Tennessee Street and Park Avenue
4. Tennessee Street and State Street

The location of the project site and study area intersections are shown in Figure 2. AM and PM peak hour traffic operations were evaluated for the following scenarios:

- Existing Conditions
- Existing Plus Project Conditions

The analysis methodology and significance criteria utilized in this technical study are provided in *Attachment A* for reference.

Figure 1: Project Site Plan

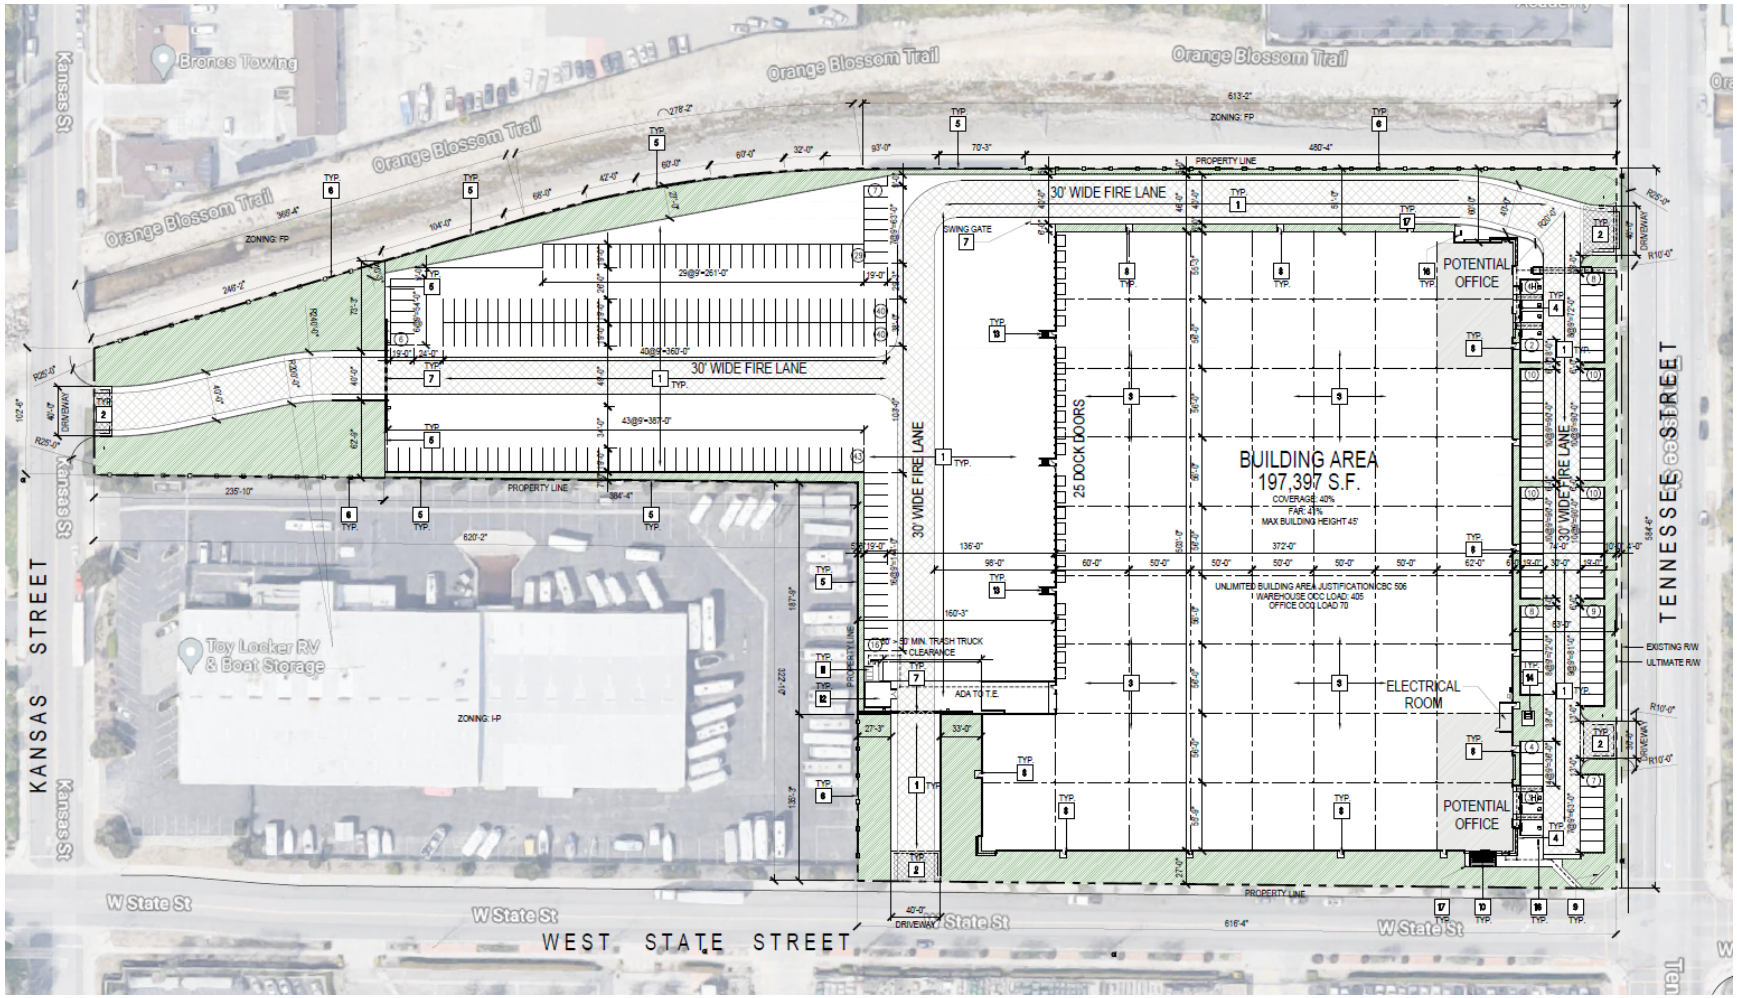

Figure 2: Study Area Intersections

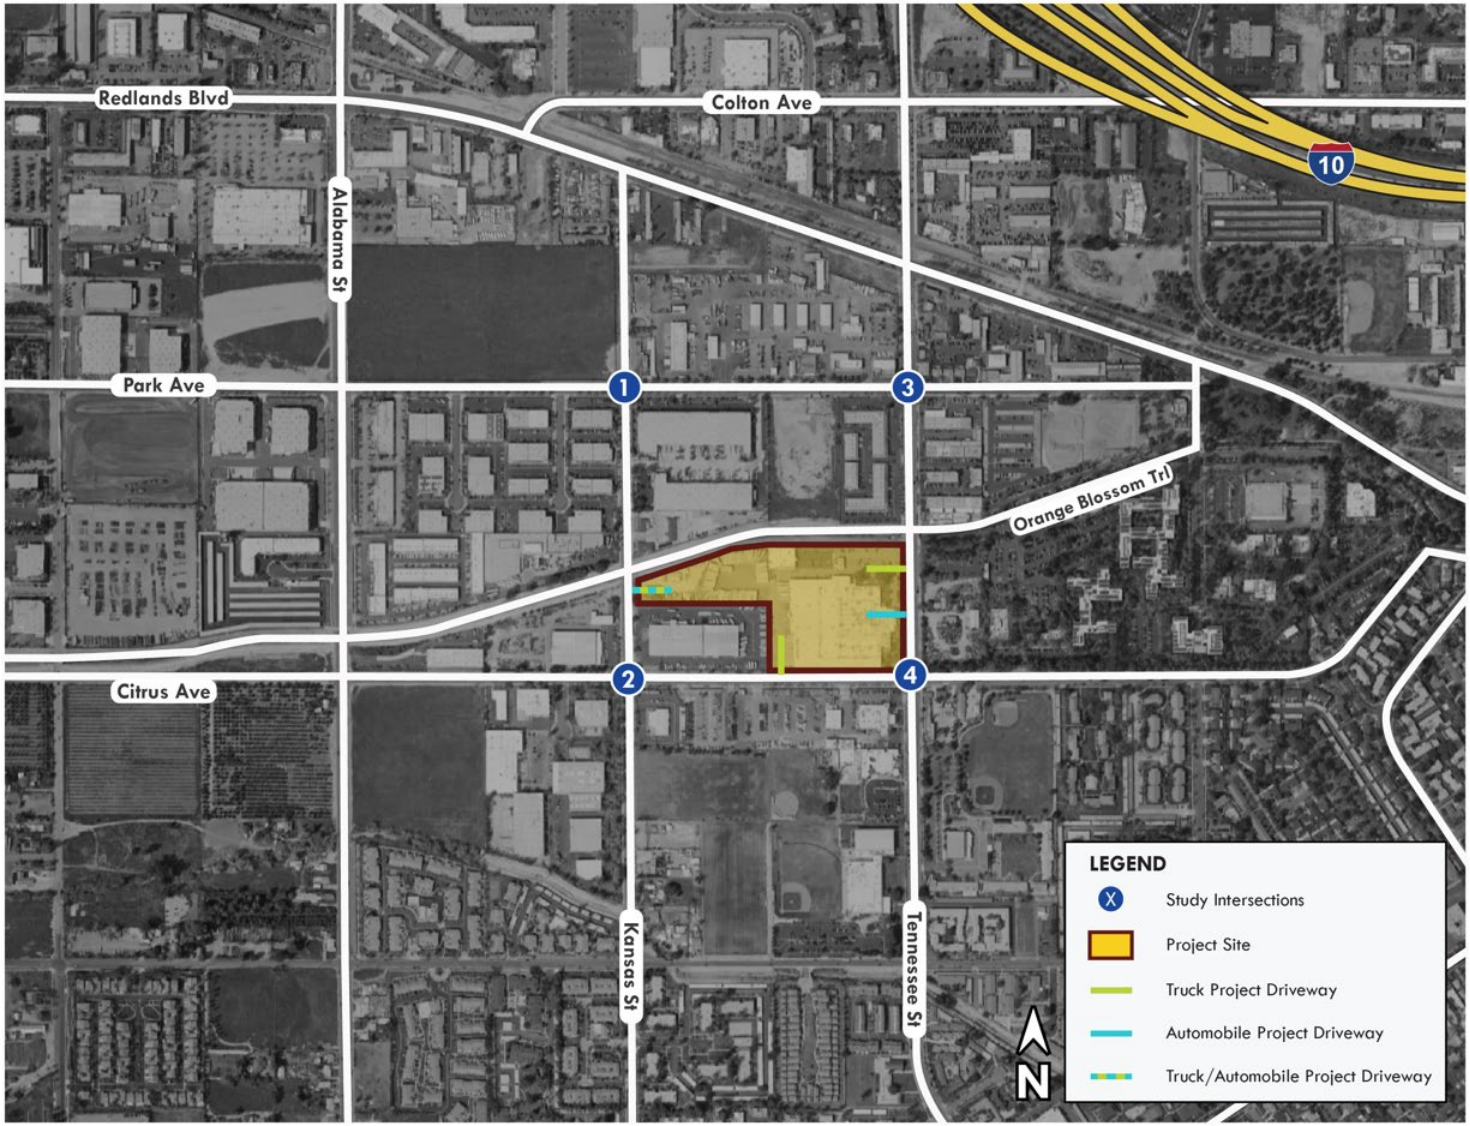
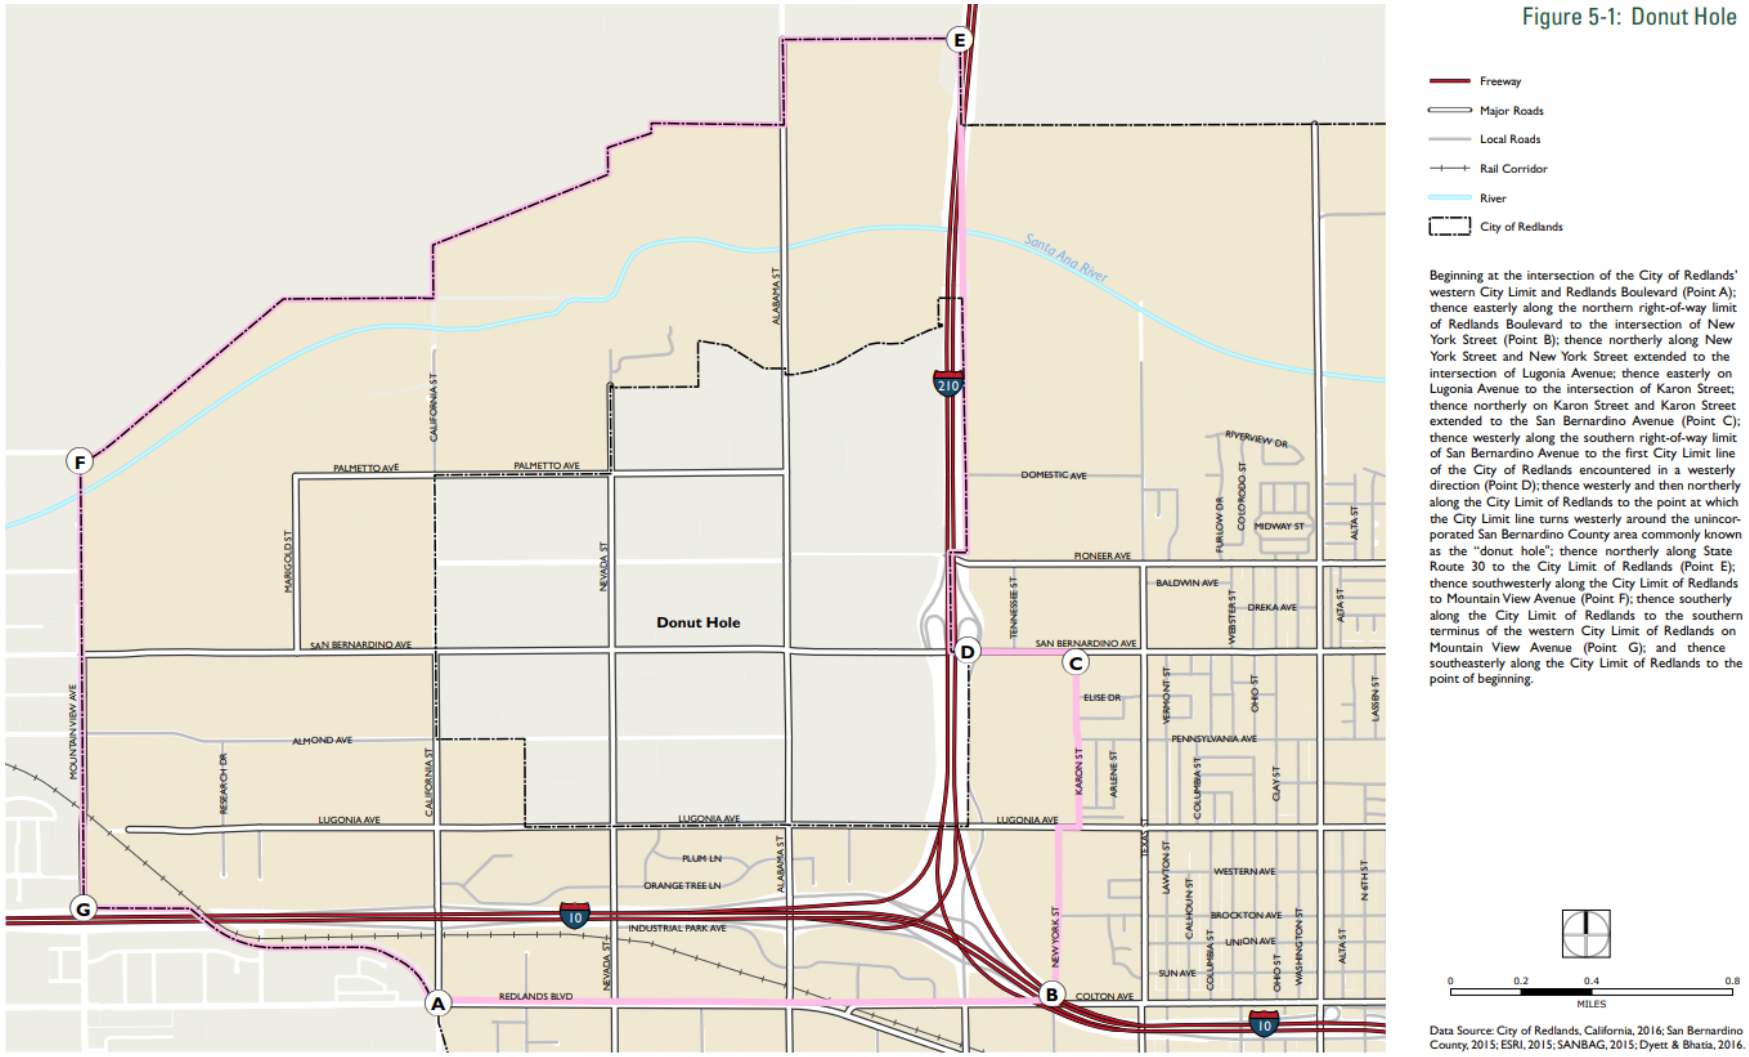


City of Redlands General Plan Figure 5-1



Existing Conditions Intersection Operations

The existing Levels of Service at the study area intersections were determined using the Highway Capacity Manual (HCM), 7th Edition methodology, described in *Attachment A*.

The traffic volumes used in this FTA utilize the traffic volumes that were collected on Tuesday, September 27, 2022 for the following intersections:

1. Kansas Street and Park Avenue
2. Kansas Street and State Street
3. Tennessee Street and Park Avenue
4. Tennessee Street and State Street

The Existing AM and PM peak hour traffic volumes at the aforementioned intersections are provided in *Attachment B*.

Table 1 shows the existing AM and PM peak hour levels of service at study intersections. All Level of Service (LOS) calculations are provided in *Attachment* C. As shown in Table 1, under existing conditions, all intersections operate at a satisfactory LOS during the AM and PM peak hours except for the intersection of Kansas Street and State Street which operates at an unsatisfactory LOS F during the AM peak hour. It is to be noted that the 328.2 seconds AM delay at the Kansas Street/State Street intersection is due to the large existing volume of vehicles that are approaching the Kansas Street/State Street intersection from/to the Arrowhead Christian Academy Upper School. There are 340 vehicles (including 241 vehicles turning right) on the northbound approach during the worst AM peak hour and 453 vehicles (including 263 vehicles turning right and 180 heading through) on the eastbound approach during the worst AM peak hour. The City has a future potential plan to convert the current intersection control (i.e., two-way stop control) to an all-way stop control.

Table 1. Existing AM and PM Peak Hour Level of Service

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay[1]	LOS[2]	Delay[1]	LOS[2]

=Unsatisfactory Level of Service

TWSC = Two-Way Stop Control

[1] Delay in Seconds

[2] Level of Service

Project Trip Generation and Distribution

The project trip generation analysis was prepared using trip rates from the Institute of Transportation Engineers (ITE), Trip Generation Manual, 11th edition. The trip generation takes credit for the existing warehouse and single-family house, as both are fully occupied in the existing condition. As shown in Table 2, the vacant existing manufacturing use is estimated to generate a total of 919 daily trips including 132 AM peak hour trips and 145 PM peak hour trips whereas the single-family house is estimated to generate a total of 9 daily trips including 1 AM peak hour trip and 1 PM peak hour trip. When adjusted for heavy truck trips and applying a passenger car equivalent (PCE) factors the previous manufacturing use would generate 1,308 daily trips including 187 PCE trips during the AM peak hour and 208 PCE trips during the PM peak hour. In total, the existing land use generates 1,317 daily PCE trips, 188 PCE trips during the AM peak hour and 209 PCE trips during the PM peak hour. The proposed general light industrial use including 10% cold storage would generate 1,387 daily PCE trips, 213 PCE trips during the AM peak hour, and 185 PCE trips during the PM peak hour.

The resulting net trip generation on the project site would result in 70 daily PCE trips, 25 PCE trips during the AM peak hour, and -24 PCE trips during the PM peak hour. The project trips were distributed throughout the study area based on logical travel paths and patterns. The project truck and passenger car trip distribution are shown in Figures 3 and 4. The project trip assignment is provided in Attachment D.

Project Site Access Analysis

Regional access to the project site is provided by the Interstate 10 Freeway (I-10) located approximately 0.6 miles north. The proposed project will be accessible via four driveways. There would be two driveways on Tennessee Street: a 40' truck accessible driveway would be located at the northeast corner of the site and a 30' driveway for passenger cars only would be located at the southeast corner of the project. A 40' driveway for truck access would be located on West State Street. Another 40' driveway for both truck and passenger car access would be located on Kansas Street. It is to be noted that all 4 driveways would be perpendicular to City streets as they currently are in the existing condition. Furthermore, the location of the driveways would not change and no new access to City streets is proposed.

Project Truck Routing

As shown in Figure 3 (*Project Truck Trip Distribution*), trucks would utilize the City's designated truck routes including Tennessee Street, Park Avenue, and Citrus Avenue. Trucks would travel to the project site from I-10 freeway via Alabama Street, Park Avenue and Kansas Street. Trucks would also use Tennessee Street and Citrus Avenue to enter the project site. Trucks would exit the project site through Kansas Street, Park Avenue, Alabama Street, and ultimately, the I-10 freeway. Trucks would also use Tennessee Street and Citrus Avenue.

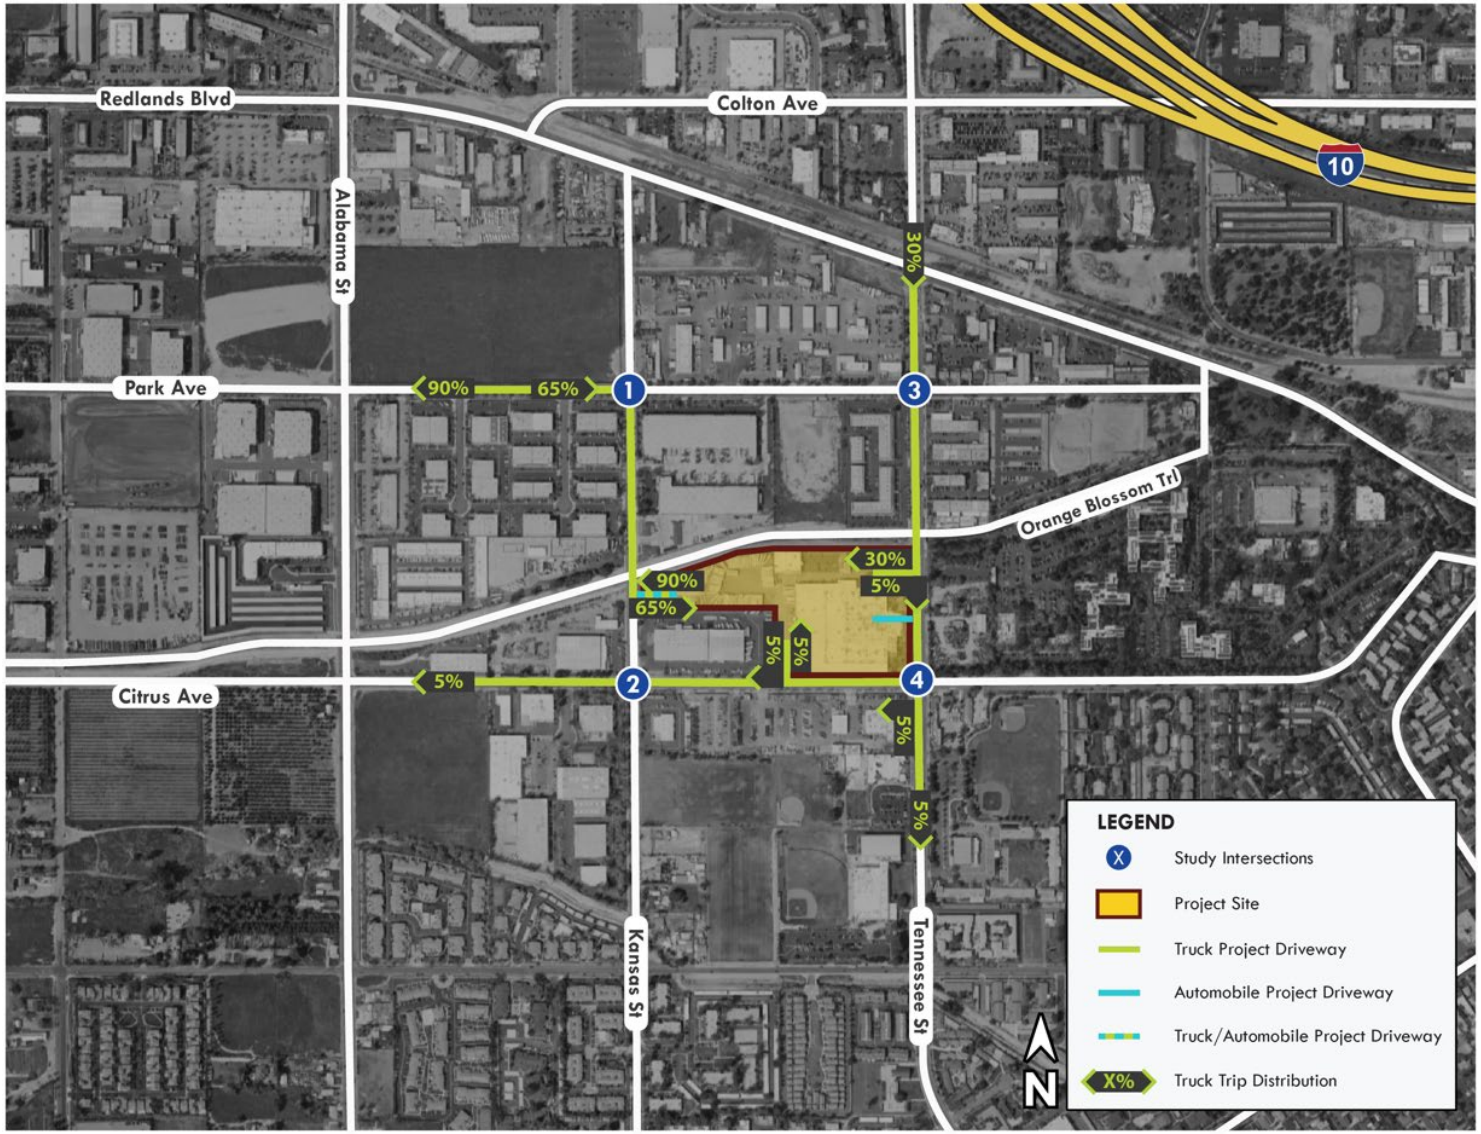

Figure 4: Project Passenger Car Trip Distribution

Existing Plus Project Conditions Intersection Operations

The Existing Plus Project Conditions were analyzed by adding project trips to the existing volumes at the study area intersections. It is to be noted that existing trips for the manufacturing warehouse were removed. Table 3 shows the Existing and Existing Plus Project AM and PM peak hour LOS at study intersections. All LOS calculations are provided in *Attachment* C. As shown in Table 3, under existing plus project conditions, all intersections would operate at a satisfactory LOS during the AM and PM peak hours except for the intersection of Kansas Street and State Street which would continue to operate at an unsatisfactory LOS F during the AM peak hour. However, the project does not impact the intersection since it doesn't increase the control delay at the intersection. It is to be noted that the 328.2 seconds AM delay at the Kansas Street/State Street intersection is due to the large existing volume of vehicles that are approaching the Kansas Street/State Street intersection from/to the Arrowhead Christian Academy Upper School. There are 340 vehicles (including 241 vehicles turning right) on the northbound approach during the worst AM peak hour and 453 vehicles (including 263 vehicles turning right and 180 heading through) on the eastbound approach during the worst AM peak hour. The City has a future potential plan to convert the current intersection control (i.e., two-way stop control) to an all-way stop control.

Table 3. Existing Plus Project AM and PM Peak Hour Level of Service

Intersection	Traffic Control	Existing				Existing Plus Project			
		AM Peak		PM Peak		AM Peak		PM Peak	
		Delay[1]	LOS[2]	Delay[1]	LOS[2]	Delay[1]	LOS[2]	Delay[1]	LOS[2]

=Unsatisfactory Level of Service

TWSC = Two-Way Stop Control

[1] Delay in Seconds

[2] Level of Service

[3] As per the City of Redlands Threshold

The proposed project's study area intersections were evaluated without and with project trips to determine if the project would cause any LOS deficiencies. All study area intersections would operate at satisfactory LOS in the Existing and Existing Plus Project Conditions except for the intersection of Kansas Street and State Street which would continue to operate at an LOS F; however, the project does not impact the intersection since it doesn't increase the time delay. It is to be noted that outbound AM trip generation rates for Manufacturing are higher than General Light Industrial use; therefore, as shown in Table 3, the time delay for the intersection of Kansas Street and Park Avenue in the Existing Plus Project AM scenario decreases when compared to the Existing scenario. Moreover, the project would not result in any unsatisfactory LOS and no improvements would be required.

Measure U Focused Traffic Analysis

This study evaluates the project using the following Measure U Policies identified in the Connected City Element of the City of Redlands 2035 General Plan as well as the County of San Bernardino Transportation Impact Study Guidelines (TIS Guidelines).

Measure U Policies (Standards for Traffic Service):

5.20a Maintain LOS C or better as the standard at all intersections presently at LOS C or better.

As shown in Table 3, all study intersections currently operate at LOS C or better except for the intersection of Kansas Street and State Street during the AM Peak hour. Addition of project traffic would not cause any location to deteriorate from LOS C to worse than LOS C.

5.20b Within the area identified in GP Figure 5-1, including that unincorporated County area identified on GP Figure 5-1 as the "donut hole", maintain LOS C or better; however, accept a reduced LOS on a case-by-case basis upon approval by a four-fifths (4/5ths) vote of the total authorized membership of the City Council. It is to be noted that Measure U Policy 5.20b would not apply since the project is not within the area identified in GP Figure 5-1.

5.20c Where the current level of service at a location within the City of Redlands is below the Level of Service (LOS) C standard, no development project shall be approved that cannot be mitigated so that it does not reduce the existing level of service at that location except as provided in Section 5.20b.

As shown in Table 3, the intersection of Kansas Street and State Street would operate at LOS F during the AM peak hour. Addition of project traffic would not change the delay or LOS at the intersection. Therefore, no mitigation is necessary as the project does not reduce the existing level of service at the intersection.

5.20f If monitoring of conditions at intersections within the East Valley Corridor Specific Plan area and intersections affected by EVC development indicates that peak hour LOS will drop below the standards set by Policies 5.20a, 5.20b, 5.20c revise the EVC Specific Plan. Revisions necessary may include additional roadway improvements, mandated higher TDM (Travel Demand Management, See Section 5.40) reductions in single-occupant vehicle trip share, reduction of intensity of development, or changes in use of undeveloped sites.

As noted previously, the project does not result in a drop in LOS at any intersection and therefore would not cause the LOS to drop below the referenced standards.

Summary

The proposed project's study area intersections were evaluated without and with project trips to comply with the City's Measure U policies by determining if the project would cause any LOS deficiencies. All study area intersections would operate at satisfactory LOS in the Existing and Existing Plus Project Conditions except for the intersection of Kansas Street and State Street which would continue to operate at an LOS F; however, the project does not impact the intersection since it doesn't increase the time delay. Moreover, the project would not result in any unsatisfactory LOS; therefore, the project would be in compliance with Measure U and no improvements would be required.

Attachment A – Analysis Methodology

Methodology

Intersection operations are evaluated using Level of Service (LOS), which is a measure of the delay experienced by drivers on a roadway facility. LOS A indicates free-flow traffic conditions and is generally the best operating conditions. LOS F is an extremely congested condition and is the worst operating condition from the driver's perspective. In this report, LOS at signalized and unsignalized intersections is calculated using the Highway Capacity Manual (HCM), 7th Edition methodology.

LOS at signalized intersections is defined in terms of the weighted average control delay for the intersection as a whole. Control delay is a measure of the increase in travel time that is experienced due to traffic signal control and is expressed in terms of average control delay per vehicle (in seconds). Control delay is determined based on the intersection geometry and volume, signal cycle length, phasing and coordination along the arterial corridor. Table 4 shows the relationship between control delay and LOS.

Table 4: Relationship between Control Delay and LOS at a Signalized Intersection

LOS	Delay (Seconds per Vehicle)
A	≤ 10
B	>10 – 20
C	>20 – 35
D	>35 – 55
E	>55 – 80
F	>80

Unsignalized intersections are categorized as either all-way stop control (AWSC) or two-way stop control (TWSC). LOS at AWSC intersections is determined by the weighted average control delay of the overall intersection. The HCM TWSC intersection methodology calculates LOS based on the delay experienced by drivers on the minor (stop-controlled) approaches to the intersection. For TWSC intersections, LOS is determined for each minor-street movement, as well as the major-street left-turns. The relationship between delay and LOS at Unsignalized intersections is shown in Table 5.

Table 5: Relationship between Delay and LOS an Unsignalized Intersection

LOS	Delay (seconds)
A	0-10
B	>10 – 15
C	>15 – 25
D	>25 – 35
E	>35 – 50
F	>50

Significance Criteria

The city of Redlands has established LOS C as the minimum level of service for its intersections. To determine whether the addition project traffic at an intersection result in a project-related deficiency, the following threshold of significance will be utilized:

- If the addition of project-generated trips reduces the peak hour level of service of the intersection from acceptable operation (e.g., LOS A, B or C) to deficient operation (e.g., LOS D, E or F) or
- If the addition of project-generated trips worsens the pre-project level of service at an intersection at a deficient LOS (e.g., LOS D, E or F) and, if unsignalized, cause an unsignalized intersection to satisfy a CAMUTCD signal warrant.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Kansas/Park	Two-way stop	HCM 7th Edition	NB Left	0.053	14.0	B
2	Kansas/State	Two-way stop	HCM 7th Edition	NB Left	0.813	328.2	F
3	Tennessee/Park	Signalized	HCM 7th Edition	EB Left	0.354	8.7	A
4	Tennessee/State	Signalized	HCM 7th Edition	NB Left	0.505	16.5	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Kansas/Park

Control Type:	Two-way stop	Delay (sec / veh):	14.0
Analysis Method:	HCM 7th Edition	Level Of Service:	B
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.053

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Kansas/Park	Two-way stop	HCM 7th Edition	NB Left	0.025	13.0	B
2	Kansas/State	Two-way stop	HCM 7th Edition	SB Left	0.029	17.1	C
3	Tennessee/Park	Signalized	HCM 7th Edition	WB Left	0.347	10.6	B
4	Tennessee/State	Signalized	HCM 7th Edition	WB Left	0.399	12.1	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Kansas/Park	Two-way stop	HCM 7th Edition	NB Left	0.017	13.9	B
2	Kansas/State	Two-way stop	HCM 7th Edition	NB Left	0.813	328.2	F
3	Tennessee/Park	Signalized	HCM 7th Edition	EB Left	0.359	8.7	A
4	Tennessee/State	Signalized	HCM 7th Edition	NB Left	0.506	16.5	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Kansas/Park

Control Type:	Two-way stop	Delay (sec / veh):	13.9
Analysis Method:	HCM 7th Edition	Level Of Service:	B
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.017

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Kansas/Park	Two-way stop	HCM 7th Edition	NB Left	0.059	13.1	B
2	Kansas/State	Two-way stop	HCM 7th Edition	SB Left	0.029	17.1	C
3	Tennessee/Park	Signalized	HCM 7th Edition	WB Left	0.348	10.7	B
4	Tennessee/State	Signalized	HCM 7th Edition	WB Left	0.400	12.3	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Kansas/Park

Control Type:	Two-way stop	Delay (sec / veh):	13.1
Analysis Method:	HCM 7th Edition	Level Of Service:	B
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.059

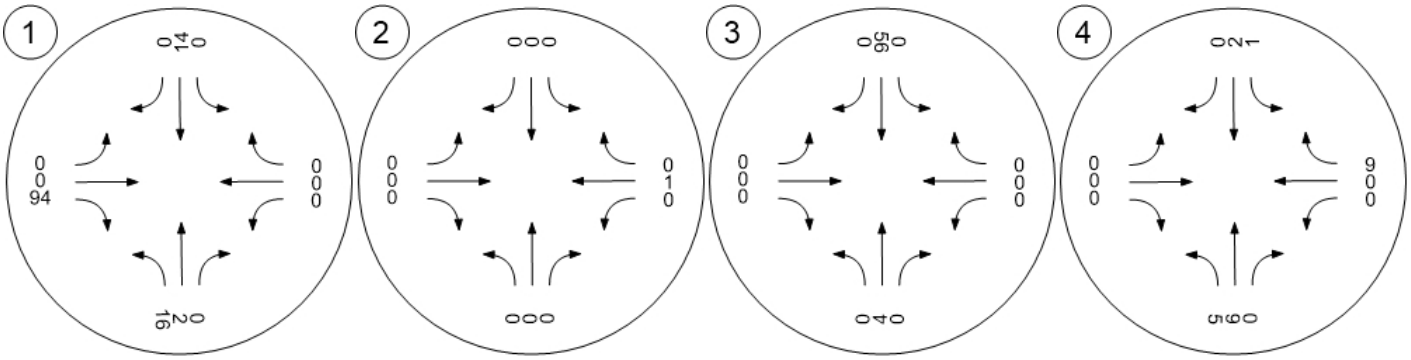
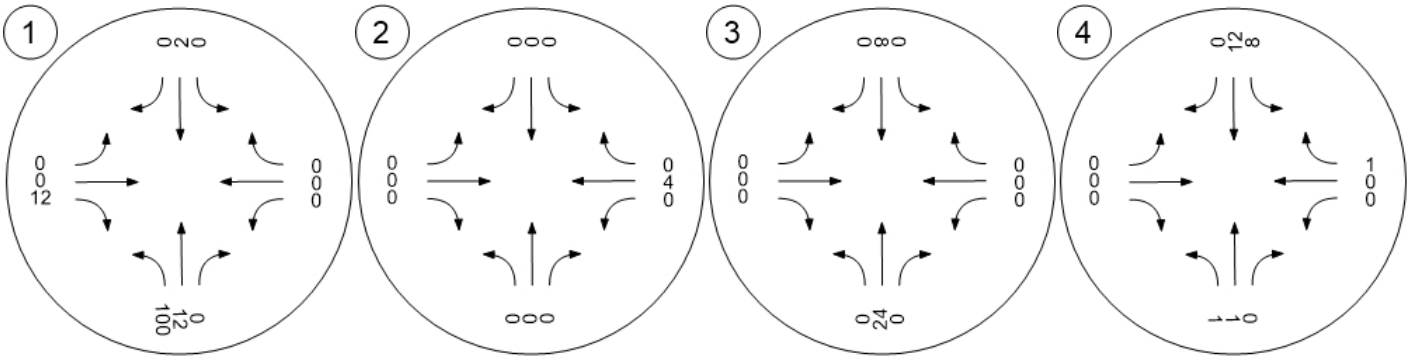
Attachment D – Project Trip Assignment

Traffic Volume - Net New Site Trips



Traffic Volume - Net New Site Trips



Environment | Planning | Development Solutions, Inc.

Date:	January 30, 2023
Prepared by:	Hashem Basrawi
To:	City of Redlands
Site:	301 Tennessee Street, City of Redlands
Subject:	**Response to City Comments**

EPD is in receipt of the City's comments on the traffic documents (i.e., scoping agreement, VMT screening analysis, and Measure U focused traffic analysis) dated December 5, 2022 for the 301 Tennessee Street industrial project. The traffic documents have been updated in response to the City's comments. A response to each comment is provided below.

A. VMT Screening Analysis

Response to Comment: Per CEQA, the baseline conditions to be used for the analysis are the conditions as of the date of the Notice of Preparation (NOP). The existing buildings are currently occupied and therefore credit can be taken for the existing land use. Therefore, the VMT screening analysis is based on the net increase between the prior use and the proposed use.

B. Scoping Agreement

Response to Comment 1: A site access analysis of driveways as well as a discussion that includes the project truck routing to/from the site was included in the updated FTA.

Response to Comment 2: A separate VMT screening analysis has been submitted for CEQA purposes.

C. Measure U Focused Traffic Analysis

Response to Comment 1: The statement on page 11 (i.e., It is to be noted that existing trips for the manufacturing warehouse were removed) clarifies that since the proposed industrial project is replacing the existing manufacturing building, credit for the existing manufacturing warehouse trips was accounted. Furthermore, trips of the existing manufacturing warehouse were deducted from the trips of the proposed industrial project to reflect the net number of trips. Please note that it has been confirmed that the building was in full operations during the time the traffic counts were collected.

Response to Comment 2: The 5-minute delay at the Kansas Street/State Street two-way stop control intersection is due to the large existing volume of vehicles on the northbound and eastbound approaches. There are 340 vehicles (including 241 vehicles turning right) on the northbound approach during the worst AM peak hour. There are 453 vehicles (including 263 vehicles turning right and 180 heading through) on the eastbound approach during the worst AM peak hour. Please note that the Kansas Street/State Street intersection would not be heavily utilized by project trips; as a result, the project would not cause a delay impact at the intersection.

Response to Comment 3: The document has been updated to reflect the correct formatting.

If you have any questions or would like to discuss our responses, please contact me at (909) 525-0528 or at hashem@epdsolutions.com.
