RE: Paleontological Resource Assessment for the Speedway Commerce Center II Project, San Bernardino County, California

Dear Ms. Burnett,

At the request of Kimley-Horn, PaleoWest LLC (PaleoWest) conducted a paleontological resource assessment for the Speedway Commerce Center II Specific Plan Project (Project) in unincorporated San Bernardino County, California. The goal of the assessment is to identify the geologic units that may be impacted by development of the Project, determine the paleontological sensitivity of geologic units within the Project area, assess potential for impacts to paleontological resources from development of the Project, and recommend mitigation measures to avoid or mitigate impacts to scientifically significant paleontological resources, as necessary.

This paleontological resource assessment included fossil locality records searches conducted by the Natural History Museum of Los Angeles County (NHMLAC) and the San Bernardino County Museum (SBCM), as well as a search of the University of California Museum of Paleontology's (UCMP) online database. The records searches were supplemented by a review of existing geologic maps and primary literature regarding fossiliferous geologic units within the proposed Project vicinity and region. This technical memorandum, which was written in accordance with the guidelines set forth by the Society of Vertebrate Paleontology (SVP) (2010), has been prepared to support environmental review under the California Environmental Quality Act (CEQA).

PROJECT LOCATION AND DESCRIPTION

The proposed Project lies between the cities of Fontana and Rancho Cucamonga in southwestern San Bernardino County (Figures 1 and 2). The Project encompasses approximately 432 acres of land within the 522-acre Auto Club Speedway (ACS) property. The ACS consists of eight contiguous parcels (Assessor Parcel Numbers 0231-011-09, -10, -11, -12, 17, -18, -19-, and -20) bounded by Cherry Avenue to the east, the Burlington Northern and Santa Fe Railroad to the north, the West Valley Materials Recycling Facility to the west, and California Steel Industries to the south (Figure 2). The Project area lies in Sections 9, 10, 15, and 16, Township 1 South, Range 6 West, San Bernardino Baseline and Meridian (SBBM), as depicted on the *Guasti, CA* and *Fontana, CA* 7.5' U.S. Geological Survey (USGS) topographic quadrangles (Figure 2).

Project Area

The Project proposes conceptual land uses that include, but not limited to, the construction of approximately 6.6 million square feet of industrial warehouse/distribution and e-commerce development with approximately 12 acres of retail commercial and medical/health care. The Project site would also be developed with greenbelts, public roads, and other support amenity features, and water detention areas. The proposed Project would surround the Next Gen in California Project, which was approved by San Bernardino County in June 7, 2021. Construction of the proposed Project, including recordation of final subdivision map(s), and design review may be progressively implemented in stages, provided that vehicular access, public facilities, and infrastructure are constructed to adequately service the development, or as needed for public health and safety.

REGULATORY CONTEXT

CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA requires that public agencies and private interests identify the potential environmental consequences of their Projects on any object or site of significance to the scientific annals of California (Division I, California Public Resources Code [PRC] Section 5020.1 [b]). Appendix G in Section 15023 provides an Environmental Checklist of questions (PRC 15023, Appendix G, Section VII, Part f) that includes the following: "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geological feature?"

CEQA does not define "a unique paleontological resource or site." However, the Society of Vertebrate Paleontology (SVP) has provided guidance specifically designed to support state and Federal environmental review. The SVP broadly defines significant paleontological resources as follows (SVP 2010, page 11):

"Fossils and fossiliferous deposits consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years)."

Significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, diagnostically important, or are common but have the potential to provide valuable scientific information for evaluating evolutionary patterns and processes, or which could improve our understanding of paleochronology, paleoecology, paleophylogeography, or depositional histories. New or unique specimens can provide new insights into evolutionary history; however, additional specimens of even well represented lineages can be equally important for studying evolutionary pattern and process, evolutionary rates, and paleophylogeography. Even unidentifiable material can provide useful data for dating geologic units if radiometric dating is possible. As such, common fossils (especially vertebrates) may be scientifically important, and therefore considered significant.

CALIFORNIA PUBLIC RESOURCES CODE

Section 5097.5 of the Public Resources Code (PRC) states:

"No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site,

including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor."

As used in this PRC section, "public lands" means lands owned by, or under the jurisdiction of, the state or any city, county, district, authority, or public corporation, or any agency thereof. Consequently, public agencies are required to comply with PRC 5097.5 for their own activities, including construction and maintenance, as well as for permit actions (e.g., encroachment permits) undertaken by others.

LOCAL

The County of San Bernardino has goals and policies related to paleontological resource issues in their General Plan (County of San Bernardino 2020). The following presents the countywide goal for paleontological resources and their associated policies and programs.

GOAL CR-2 Historic resources (buildings, structures, or archaeological resources) and paleontological resources that are protected and preserved for their cultural importance to local communities as well as their research and educational potential.

CR-2.1 National and state historic resources. We encourage the preservation of archaeological sites and structures of state or national significance in accordance with the Secretary of Interior's standards.

CR-2.2 Local historic resources. We encourage property owners to maintain the historic integrity of resources on their property by (listed in order of preference): preservation, adaptive reuse, or memorialization.

CR-2.3 Paleontological and archaeological resources. We strive to protect paleontological and archaeological resources from loss or destruction by requiring that new development include appropriate mitigation to preserve the quality and integrity of these resources. We require new development to avoid paleontological and archeological resources whenever possible. If avoidance is not possible, we require the salvage and preservation of paleontological and archeological resources.

CR-2.4 Partnerships. We encourage partnerships to champion and financially support the preservation and restoration of historic sites, structures, and districts.

CR-2.5 Public awareness and education. We increase public awareness and conduct education efforts about the unique historic, natural, tribal, and cultural resources in San Bernardino County through the County Museum and in collaboration with other entities and organizations.

PALEONTOLOGICAL RESOURCE POTENTIAL

Absent specific agency guidelines, most professional paleontologists in California adhere to the guidelines set forth by SVP (2010) to determine the course of paleontological mitigation for a given project. These guidelines establish protocols for the assessment of the paleontological resource potential of underlying geologic units and outline measures to mitigate adverse impacts that could result from project development. Using baseline information gathered during a paleontological resource assessment, the paleontological resource potential of the geologic unit(s) (or members thereof) underlying a project area can be assigned to one of four categories defined by SVP (2010). These categories include high, undetermined, low and no paleontological resource potential.

- High Sensitivity: Vertebrate fossils, as well as the respective stratigraphic units in which these vertebrate fossils were discovered, are likely present, and likely have significant scientific value. In areas of high sensitivity, full-time monitoring is recommended during project-related ground disturbance.

- Low Sensitivity: Stratigraphic units that have yielded few fossils in the past, based upon review of available literature and museum collections records, are considered to possess low paleontological sensitivity. Monitoring is usually not recommended during excavation within a stratigraphic unit of low sensitivity, although spot monitoring may be recommended to confirm that disturbance remains restricted to low-sensitivity units.

- Undetermined Sensitivity: In certain instances, the lack of available literature on a particular geologic unit, or absence of exposures of that unit, make it difficult to determine a unit's likelihood of yielding fossiliferous remains. Under these circumstances, further studies may be recommended to assess the unit's paleontological resource potential (i.e., field survey). If a unit remains of "undetermined" paleontological sensitivity, then it is treated as possessing "high" sensitivity for purposes of initial monitoring and mitigation.

- No Sensitivity: This category includes geological strata that are either too young (<10,000 years old), too weathered, metamorphosed, or too coarse-grained to preserve significant fossilized remains. Metamorphic and plutonic igneous rocks normally do not contain fossils due to the high heat and pressure during their formation, and commonly possess no paleontological sensitivity.

METHODS

In order to assess whether or not a particular area has the potential to contain significant fossil resources at the subsurface, it is necessary to review published geologic mapping to determine the geology and stratigraphy of the area. Geologic units are considered to be "sensitive" for paleontological resources if they are known to contain significant fossils anywhere in their extent. Therefore, a search of pertinent local and regional museum repositories for paleontological localities within and nearby the Project area is necessary to determine whether

or not fossil localities have been previously discovered within a particular rock unit. For this Project, data obtained from recent museum records searches conducted at the NHMLAC and the SBCM were used to assess paleontological resource sensitivity. The museum records search was supplemented by a review of the online collections of the UCMP and the San Diego Natural History Museum, the online Paleobiology Database and FAUNMAP, and other published paleontological and geological literature which contains records for the surrounding area.

RESOURCE CONTEXT

GEOLOGIC SETTING

The Project area is located in the northwestern portion of the Peninsular Ranges geomorphic province. Northwest trending mountain ranges and valleys following faults branching from the San Andreas Fault distinguish the Peninsular Ranges province. The Peninsular Ranges are bound to the east by the Colorado Desert and extend north to the San Bernardino – Riverside County line, west into the submarine continental shelf, and south to the California state line (Norris and Webb 1976). Locally, the Project is located in the Fontana plain, an alluvial fan originating in Lytle Creek canyon in the foothills of the San Bernardino Mountains to the north and extending south to the Jurupa Mountains (Dutcher and Garrett 1963). The Fontana plain is divided by Lytle Creek into an eastern section that is dominated by deposits of the late Holocene Epoch (11,700 years ago to today), and a western portion that contains deposits of the Pleistocene (2.6 million years ago to 11,700 years ago) and Holocene Epochs (Dutcher and Garrett 1963).

SITE SPECIFIC GEOLOGY AND PALEONTOLOGY

According to published geologic maps (Morton and Miller 2006), the Project area is predominantly underlain by Artificial fill (Qaf), with lesser amounts of Very young alluvial-fan deposits (Qf) and Young alluvial-fan deposits, Unit 5 (Qyf_5), all of late Holocene age (Figure 3). Artificial fill is composed of imported sand, gravel, and bedrock associated with construction activities (Morton and Miller 2006). Due to its artificial nature and *ex situ* context, Artificial fill has no paleontological sensitivity.

Very young alluvial-fan deposits are composed of unconsolidated to slightly coherent undissected deposits of angular to subrounded sand, gravel, and boulders. Young alluvial-fan deposits, Unit 5, are composed of unconsolidated to slightly consolidated coarse-grained sand to bouldery alluvial fan deposits having slightly dissected to essentially undissected surfaces. Due to their young age, late Holocene deposits have not been able to accumulate or preserve significant biological material and are considered to have low paleontological sensitivity.

However, late Holocene deposits can transition with depth into older Pleistocene deposits which have a high paleontological sensitivity. Elsewhere in San Bernardino County, Pleistocene deposits have produced remains of a diverse terrestrial fauna, including deer, mammoth, camel, horse, bison, badger, mole, rabbit, gray fox, and coyote (Jefferson 1991a, 1991b; Miller 1971; McLeod 2020).

RECORDS SEARCH RESULTS

The NHMLAC and SBCM do not have on record any previously recorded vertebrate fossil localities directly within the proposed Project boundaries; however, several fossil localities from sedimentary deposits similar to those found at depth within the Project site have been recorded somewhat nearby. South-southwest of the proposed Project area west of Mira Loma, LACM 8062 yielded fossil specimens of Proboscidea (elephant), *Ursus* (bear), *Canis dirus* (dog), *Equus* (horse), *Camelops* (camel) and *Bison* (bison) at shallow depths. Slightly farther south-southwest, LACM 7811 yielded a fossil specimen of *Masticophis flagellum* (coachwhip) from older Quaternary deposits at depths of 9 to 11 feet below the ground surface (McLeod 2020). The SBCM contains records of eight fossil sites within three miles of the Project, to the southeast. SBCM 5.1.11 preserved a partial *Smilodon* skull (sabre-toothed cat) at five feet below ground surface; SBCM 5.1.14 produced the invertebrates *Gyraulus* sp., *Stagnicola* sp., Gastropoda, and Bivalvia, in addition to the vertebrates, *Sylvilagus* sp. (rabbit), *Thomomys* sp. (pocket gopher), *Neotoma* sp. (packrat), *Microtus californicus* (California vole), *Mammut pacificus* (Pacific mastodon) (Cortez 2021). SBCM 5.1.15 resulted in a partial *Bison* tooth; SBCM 5.1.16 preserved bone fragments of *Camelops hesternus* (camel); SBCM 5.1.17 & 5.1.19 produced large mammal bones and fragmentary remains of *Mammut pacificus* (Cortez 2021). SBCM 5.1.20 preserved fragments of *Camelops hesternus*; SBCM 5.1.21 resulted in fragmentary remains of *Equus* sp. (horse) at 21 feet below ground surface (Cortez 2021).

A supplemental review of online museum collections records maintained by the UCMP returned no previously recorded vertebrate localities in the vicinity of the Project (UCMP 2021). However, the UCMP database maintains records for at least five vertebrate fossil locality records identified within unnamed Pleistocene deposits elsewhere in San Bernardino County. Recovered specimens include *Equus* (horse), *Lepus* (hare), *Hesperotestudo* (Western turtle), *Ovis canadensis* (bighorn sheep), *Camelops* and *Camelus* (camels), *Tanupolama stevensi* (llama), and *Canis dirus* (dog) (UCMP 2021). Table 1 below summarizes the compiled information on known vertebrate localities from Pleistocene alluvial deposits in San Bernardino County.

FINDINGS

Information provided by ACS representative Brian Geye indicated that the construction of the racetrack facility involved a high level of ground disturbance. Specifically, the interior portion of the track structure and stand areas required extensive overexcavation and subsequent compaction. Large quantities of fill were also placed around the perimeter of the track to create the raised outer bank of the track. Therefore, ground disturbance into this artificial fill (Qaf) will not require monitoring, unless disturbance extends to a depth below the fill and native sediment (Qyf_5 or Qf) is encountered.

Shallow excavations (approximately five feet in depth or less) into Young alluvial-fan deposits (Qyf_5) and Very young alluvial fan deposits (Qf) are unlikely to yield any significant paleontological resources, as late Holocene deposits are too young to contain fossils, and therefore possess low sensitivity. As a result, no impacts to paleontological resources would occur from earth-moving activities at shallow depths at the Project site. However, deeper excavations into Qyf_5 and Qf may extend down into older, high sensitivity Pleistocene

sediments. Pleistocene deposits underlying the Project area at depth are considered to have a high paleontological sensitivity because they have proven to yield significant paleontological resources (i.e., identifiable vertebrate fossils). Ground disturbing activities exceeding depths of five feet into Qyf_5 and Qf could potentially impact paleontological resources and should be monitored by a qualified paleontological monitor to identify and effectively salvage any recovered resources while minimizing discovery-related delays.

RECOMMENDATIONS

In general, the potential for a given project to result in negative impacts to paleontological resources is directly proportional to the amount of ground disturbance associated with the project; thus, the higher the amount of ground disturbances within geological deposits with a known paleontological sensitivity, the greater the potential for negative impacts to paleontological resources. Since this Project entails grading and excavations for multiple buildings, new ground disturbances are anticipated. Sediments in the Project area have a no to high paleontological sensitivity, being disturbed or too young at the surface to preserve fossil resources but increasing in age and sensitivity with depth. Ground disturbing activities in previously undisturbed portions of the Project that exceed five feet in depth into Qyf_5 and Qf may result in significant impacts under CEQA to paleontological resources, such as destruction, damage, or loss of scientifically important paleontological resources. Therefore, if the Project plans include excavations that extend five or more feet in depth into Qyf_5 and Qf, then a qualified paleontologist should be retained to develop and implement the measures recommended below. A review of the grading and excavation plans, when available, should help inform the need for the measures below. These measures have been developed in accordance with SVP guidelines; if implemented, these measures will satisfy the requirements of CEQA.

WORKER'S ENVIRONMENTAL AWARENESS PROGRAM (WEAP)

Prior to the start of the proposed Project activities, all field personnel will receive a worker's environmental awareness training on paleontological resources. The training will provide a description of the laws and ordinances protecting fossil resources, the types of fossil resources that may be encountered in the Project area, the role of the paleontological monitor, outline steps to follow in the event that a fossil discovery is made, and provide contact information for the Project Paleontologist. The training will be developed by the Project Paleontologist and can be delivered concurrent with other training including cultural, biological, safety, etc.

PALEONTOLOGICAL MITIGATION MONITORING

Prior to the commencement of ground-disturbing activities, a professional paleontologist will be retained to prepare and implement a Paleontological Resources Mitigation and Monitoring Plan (PRMMP) for the proposed Project. The PRMMP will describe the monitoring required during excavations that extend into Pleistocene sediment (i.e., excavations greater than five feet in depth in Qyf_5 and Qf sediments), and the location of areas deemed to have a high paleontological resource potential. Monitoring will entail the visual inspection of excavated or graded areas and trench sidewalls. If the Project Paleontologist determines full-time monitoring is no longer warranted, based on the geologic conditions at depth, he or she may recommend that monitoring be reduced or cease entirely.

FOSSIL DISCOVERIES

In the event that a paleontological resource is discovered, the monitor will have the authority to temporarily divert the construction equipment around the find until it is assessed for scientific significance and, if appropriate, collected. If the resource is determined to be of scientific significance, the Project Paleontologist shall complete the following:

1. Salvage of Fossils. If fossils are discovered, all work in the immediate vicinity should be halted to allow the paleontological monitor, and/or Project Paleontologist to evaluate the discovery and determine if the fossil may be considered significant. If the fossils are determined to be potentially significant, the Project Paleontologist (or paleontological monitor) should recover them following standard field procedures for collecting paleontological as outlined in the PRMMP prepared for the project. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive excavation and longer salvage periods. In this case the paleontologist should have the authority to temporarily direct, divert or halt construction activity to ensure that the fossil(s) can be removed in a safe and timely manner.

2. Fossil Preparation and Curation. The PRMMP will identify the museum that has agreed to accept fossils that may be discovered during project-related excavations. Upon completion of fieldwork, all significant fossils collected will be prepared in a properly equipped laboratory to a point ready for curation. Preparation may include the removal of excess matrix from fossil materials and stabilizing or repairing specimens. During preparation and inventory, the fossils specimens will be identified to the lowest taxonomic level practical prior to curation at an accredited museum. The fossil specimens must be delivered to the accredited museum or repository no later than 90 days after all fieldwork is completed. The cost of curation will be assessed by the repository and will be the responsibility of the client.

FINAL PALEONTOLOGICAL MITIGATION REPORT

Upon completion of ground disturbing activity (and curation of fossils if necessary) the Project Paleontologist should prepare a final mitigation and monitoring report outlining the results of the mitigation and monitoring program. The report should include discussion of the location, duration and methods of the monitoring, stratigraphic sections, any recovered fossils, and the scientific significance of those fossils, and where fossils were curated.

It has been a pleasure working with you on this Project. If you have any questions, please do not hesitate to contact us.

Sincerely,

PALEOWEST

Benjamin Scherzer, M.S. |
Senior Paleontologist

SUBJECT: Report of Preliminary Infiltration Study
Proposed Speedway Commerce Center II
County of San Bernardino, California 92335

Dear Mr. Cox:

Kleinfelder is pleased to present this report summarizing our infiltration study performed for the proposed Speedway Commerce Center located at the surrounding areas of the Auto Club Speedway at 9300 Cherry Avenue in Fontana, California. Our scope of work was presented in our August 31, 2021 proposal. The purpose of this study is to provide preliminary conclusions and recommendations pertaining to infiltration characteristics of the existing subsurface soil at the subject site.

SITE AND PROJECT DESCRIPTION

The project site is located at the surrounding areas of the existing California Speedway site located at 9300 Cherry Avenue in Fontana, California. Hillwood wishes to construct approximately seven new logistics buildings within the project area. Other site improvements include new public streets, auto and truck trailer parking, and associated Best Management Practice (BMP) infiltration facilities.

We understand the new buildings will generally consist of large, warehouse-sized buildings equipped with loading docks and automotive and truck trailer parking areas and heavy-duty pavement. The approximate site area, building size, and number of truck trailer parking of the proposed buildings is shown in the table below.

Building	Site Area (acres)	Building Area (sf)	Truck Trailer Parking
1	53.99	1,286,600	271
2	22.99	540,500	107
3	53.99	1,316,800	292
4	39.60	960,500	210
5	40.36	939,800	274
6	41.76	926,000	187
7	26.92	629,800	136

We anticipate the proposed warehouse buildings will be single-story, concrete-tilt-up structures, supported on conventional shallow spread foundations with a dock high slab-on-grade floor.

Copyright 2021 Kleinfelder

2280 Market Street, Suite 300, Riverside, CA 92501 p|951.801.3681 f|951.682.0192

We were informed by Webb Associates (Webb), the project Civil Engineer, that numerous areas of underground infiltration chambers are planned. Kleinfelder performed infiltration testing at each of the 20 locations shown on Figure 1, Infiltration Test Location Map. The depth of our testing is approximately 10 feet below the existing ground surface (bgs) at each location.

FIELDWORK

Kleinfelder's subcontractor, BC2 Environmental, used a CME-95 drill rig to drill 20 borings that were converted to infiltration tests between September 6 and September 28, 2021. The infiltration tests were drilled to approximately 10 feet bgs and the approximate locations are shown on Figure 1. The infiltration tests were setup and tested in general accordance with the San Bernardino County Technical Guidance Document for Water Quality Management Plans, 2011 (SBCTGD) Percolation Test procedure. Based on the SBCTGD, the bottom elevation of the tests corresponded to the proposed inverts for the proposed infiltration systems.

SUBSURFACE CONDITIONS

In general, the subsurface conditions at the proposed infiltration facilities onsite consist of artificial fill soil overlying native alluvial soil. Artificial fill was encountered to depths ranging from approximately 2 feet bgs to the maximum depth explored of approximately 10 feet bgs. Native alluvial soil was encountered to the maximum depth explored of approximately 10 feet bgs.

Artificial fill generally consisted of silty sand to sand with varying amounts of silt and gravel, slag from previous site use, and debris. Similar to the artificial fill, native alluvial soils generally consisted of silty sand to poorly graded sand with varying amounts of gravel and sandy silt.

Groundwater was not encountered in any of the infiltration test borings. Groundwater is anticipated to be at a depth significantly greater than 50 feet below ground surface.

A detailed summary of the subsurface conditions encountered at the infiltration test locations are shown in Appendix A, Infiltration Test Logs. The borings were logged by a Kleinfelder engineer using the Unified Soil Classification System (USCS).

LABORATORY TESTING

Laboratory testing was performed on representative samples of soil collected from the bottom of our infiltration test borings to substantiate field classifications. Laboratory testing included sieve analysis (ASTM D422). The results of the testing performed are presented in Appendix B, Laboratory Testing.

BOREHOLE PERCOLATION TEST

Falling head percolation tests were performed per the SBCTGD. Test setup included placing 2 inches of gravel at the bottom of the borings 8 inches in diameter. At each location, a 3-inch perforated PVC pipe was placed, and the infiltration tests were pre-soaked. During testing, test holes were carefully filled with water to a depth equal to at least 5 times the hole's radius above the gravel at the bottom of the holes. Testing began by performing two trial readings to show if 6 inches of water seeps away in less than 25 minutes in order to verify if testing would be performed using "sandy soils" or "non-sandy soils" criteria. Nineteen tests were performed using "sandy soils" criteria, where testing was generally performed for one hour with readings taken

Copyright 2021 Kleinfelder

every 10 minutes. P-15 was tested using “non-sandy soils” criteria and was performed for six hours with readings taken every 30 minutes. The tested percolation rates were converted to tested infiltration rates using the “Porchet Method”. Test reading data and calculations are provided in Appendix C, Infiltration Test Results. Results of the tests performed are summarized below.

INFILTRATION TEST LOCATION	*TESTED INFILTRATION RATE (INCH/ HOUR)
P-1	2.0
P-2	7.2
P-3	5.6

DATA EVALUATION

The field results of this testing provide unfactored infiltration rates. To evaluate design infiltration rates, correction factors are applied. Correction factors used for this study are based on the 2011 SBCTGD, summarized below:

Copyright 2021 Kleinfelder

Site Suitability Related Considerations for Infiltration Facility Safety Factors*

CONSIDERATION	HIGH CONCERN (3)	MEDIUM CONCERN (2)	LOW CONCERN (1)
Assessment methods (see explanation below)	Use of soil survey maps or simple texture analysis to estimate short-term infiltration rates	Direct measurement of ≥ 20 percent of infiltration area with localized infiltration measurement methods (e.g., infiltrometer)	Direct measurement of ≥ 50 percent of infiltration area with localized infiltration measurement methods or Use of extensive test pit infiltration measurement methods
Texture Class	Silty and clayey soils with significant fines	Loamy soils	Granular to slightly loamy soils
Site soil variability	Highly variable soils indicated from site assessment or limited soil borings collected during site assessment	Soil borings/test pits indicate moderately homogeneous soils	Multiple soil borings/test pits indicate relatively homogeneous soils
Depth to groundwater/ impervious layer	<5 ft below facility bottom	5-10 ft below facility bottom	>10 below facility bottom

*As presented in Table VII.3 on page VII-31 of SBC Guidance Document (2011)

Design Related Considerations for Infiltration Facility Safety Factors*

Consideration	High Concern (3)	Medium Concern (2)	Low Concern (1)
Tributary area size	Greater than 10 acres.	Greater than 2 acres but less than 10 acres.	2 acres or less.
Level of pretreatment/ expected influent sediment loads	Pretreatment from gross solids removal devices only, such as hydrodynamic separators, racks and screens AND tributary area includes landscaped areas, steep slopes, high traffic areas, or any other areas expected to produce high sediment, trash, or debris loads.	Good pretreatment with BMPs that mitigate coarse sediments such as vegetated swales AND influent sediment loads from the tributary area are expected to be relatively low (e.g., low traffic, mild slopes, disconnected impervious areas, etc.).	Excellent pretreatment with BMPs that mitigate fine sediments such as bioretention or media filtration OR sedimentation or facility only treats runoff from relatively clean surfaces, such as rooftops.
Redundancy of treatment	No redundancy in BMP treatment train.	Medium redundancy, other BMPs available in treatment train to maintain at least 50% of function of facility in event of failure.	High redundancy, multiple components capable of operating independently and in parallel, maintaining at least 90% of facility functionality in event of failure.
Compaction during construction	Construction of facility on a compacted site or elevated probability of unintended/ indirect compaction.	Medium probability of unintended/ indirect compaction.	Heavy equipment actively prohibited from infiltration areas during construction and low probability of unintended/ indirect compaction.

*As presented in Table VII.4 on page VII-33 of the SBC Guidance Document (2011)

Copyright 2021 Kleinfelder

CONCLUSIONS AND RECOMMENDATIONS

Based on our evaluation of the borehole percolation test procedure test data, the soils encountered at a depth of approximately 10 feet bgs in the borings tested generally exhibit a short-term, non-factored infiltration rate of 0.6 to 30.0 inches per hour.

The site suitability factors presented above were selected by Kleinfelder based on the materials observed during drilling services. The design related considerations were selected by Webb Engineers based on the proposed type of infiltration system. For the design infiltration rate, Kleinfelder recommends using the Combined Safety Factor presented below.

Factor of Safety and Design Infiltration Rate and Worksheet*

FACTOR CATEGORY		FACTOR DESCRIPTION	ASSIGNED WEIGHT (w)	FACTOR VALUE (v)	PRODUCT (p) p = w * v
A	Suitability Assessment	Soil assessment methods	0.25	2	0.50
		Predominant soil texture	0.25	1	0.25
		Site soil variability	0.25	2	0.50
		Depth to groundwater / impervious layer	0.25	1	0.25
		Suitability Assessment Safety Factor, $S_A = \sum p$			1.5
B	Design	Tributary area size	0.25	3	0.75
		Level of pretreatment/ expected sediment loads	0.25	3	0.75
		Redundancy	0.25	3	0.75
		Compaction during construction	0.25	3	0.75
		Design Safety Factor, $S_B = \sum p$			3.0
Combined Safety Factor, $S_{TOT} = S_A \times S_B$					$1.5 \times 3.0 = 4.5$

*As presented in Worksheet H of the SBC Guidance Document (2011)

Based on the testing performed and the correction factors presented above from the SBCTGD, we recommend a Combined Safety Factor of 4.5. The resulting design infiltration rates are summarized in the table below.

Summary of Design Infiltration Rates

Infiltration Test Location	Tested Depth from Ground Surface (ft)	Tested Infiltration Rate (in/hr)	Long-Term Design Infiltration Rate (in/hr)	Soil Description
P-1	5 – 10	2.0	0.4	Silty Sand with Gravel (SM)
P-2	4.5 – 10	7.2	1.6	Well Graded Sand with Silt and Gravel (SW-SM)

Copyright 2021 Kleinfelder

Summary of Design Infiltration Rates (Continued)

Infiltration Test Location	Tested Depth from Ground Surface (ft)	Tested Infiltration Rate (in/hr)	Long-Term Design Infiltration Rate (in/hr)	Soil Description
P-3	7 – 10	5.6	1.2	Well Graded Sand with Silt and Gravel (SW-SM)
P-4	6.5 – 10	1.8	0.4	Sandy Silt (ML)
P-5	6.5 – 10	30.0	6.7	Well Graded Sand with Silt and Gravel (SW-SM)
P-6	7 – 10	15.0	3.7	Poorly Graded Sand with Silt and Gravel (SP-SM)
P-7	4.5 – 10	2.5	0.6	Silty Sand with Gravel (SM)
P-8	7 – 10	14.1	3.1	Well Graded Sand with Silt and Gravel (SW-SM)
P-9	5 – 10	6.9	1.5	Well Graded Sand with Silt and Gravel (SW-SM)
P-10	7 – 10	16.8	3.7	Well Graded Sand with Silt and Gravel (SW-SM)
P-11	5 – 10	0.9	0.2	Silty Sand with Gravel (SM)
P-12	7 – 10	4.7	1.0	Well Graded Sand with Silt and Gravel (SW-SM)
P-13	7 – 10	6.2	1.4	Well Graded Sand with Silt and Gravel (SW-SM)
P-14	5.5 – 10	11.0	2.4	Well Graded Sand with Silt and Gravel (SW-SM)
P-15	6.5 – 10	0.6	0.1	Silty Sand with Gravel (SM)
P-16	6 – 10	9.6	2.1	Well Graded Sand with Gravel (SW)
P-17	7 – 10	16.1	3.6	Well Graded Sand with Silt and Gravel (SW-SM)
P-18	7.5 – 10	22.2	4.9	Well Graded Sand with Silt and Gravel (SW-SM)
P-19	6.5 – 10	12.0	2.7	Well Graded Sand with Silt and Gravel (SW-SM)
P-20	6.5 – 10	11.2	2.5	Well Graded Sand with Silt and Gravel (SW-SM)

Based on the results of the infiltration testing, it is our opinion that the site is generally suitable for infiltration BMPs, provided the following recommendations are incorporated into the design and construction. Due to the relatively large size of the site, we recommend that a design infiltration

Copyright 2021 Kleinfelder

rate for any individual infiltration facility be selected and properly sized based on the long-term rates provided above and the location of the testing (see Figure 1).

Groundwater was not encountered in any of the boreholes performed for the project. Groundwater is anticipated to be at a depth significantly greater than 50 feet below ground surface. Based on this information, we do not anticipate that the depth to groundwater will affect the long-term performance of an infiltration system.

The degree of influent water pre-treatment and system maintenance are critical factors that will affect long-term performance. Pre-treatment may consist of combinations of debris screens, sediment settling chambers, filters and/or other mechanisms. Maintenance may include clearing debris, cleaning pre-treatment filters and sediment chambers, and reconditioning the bottom of the infiltration system after storm events and at regular intervals.

If infiltration BMPs are impractical due to existing site constraints, we recommend alternatives, such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the project site. If bio-filtration/bio-retention systems are employed, we recommend that the BMPs be built such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement. If planters are located within 10 feet of any building or building foundations, or adjacent to slabs and pavements, then some means of diverting water away from the building, building foundation soils, or soils that support slabs and pavements would be required, such as lining the planters.

Additional Design/Maintenance Recommendations

Based on the results from our testing, our knowledge of the project, and our professional judgment, the following is a list of recommendations for development of the proposed project.

- The design should incorporate pre-treatment of influent water.
- The infiltration facilities should be located at least 10 feet away from the bottom of any proposed structure foundation. Structure foundations include buildings, retaining walls, or screen walls supported on a foundation.
- Maintenance of the facility should be performed annually or at more frequent intervals depending on frequency of storm events and the system maintenance schedule. The schedule should also be selected based on volume and turbidity of influent water, and final design of the facility.
- The facility should be designed with an outlet system to allow excess flow to either bypass the system or flow through the system and discharge into the offsite storm drain system.
- An operations and maintenance manual should be developed for the facility. The manual should include requirements for monitoring the infiltration rate and sediment build up. The operations and maintenance manual should also include procedures on how the system should be cleaned out and restored at each maintenance interval.

Additional Considerations

This study was performed and this report was prepared to support the design of an infiltration system at the subject site. Heavy equipment and soil compaction should be limited within the

Copyright 2021 Kleinfelder

excavation bottoms and areas designed to infiltrate water. Altering the natural density of the proposed infiltration bottom by compaction will decrease the design infiltration rate.

The environmental constituents at the site were not evaluated as part of this infiltration study.

LIMITATIONS

This report summarizes our evaluation only of the capacity of soils to infiltrate water. The findings, conclusions and recommendations presented in this report were prepared in a manner consistent with the standards of care and skill ordinarily exercised by members of our profession practicing under similar conditions in the geographic vicinity and at the time the services will be performed. No warranty or guarantee, express or implied, is made.

This report may be used only by the client and only for the purposes stated, within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land use, site conditions (both on site and off site) or other factors may change over time, and additional work may be required with the passage of time. Any party, other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of this report and the nature of the new project, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party and the client agrees to defend, indemnify, and hold harmless Kleinfelder from any claims or liability associated with such unauthorized use or non-compliance.

Because of the limited nature of any subsurface study, the contractor may encounter conditions during construction which differ from those presented in this report. In such event, the contractor should promptly notify the owner so that Kleinfelder's geotechnical engineer can be contacted to confirm those conditions.

CLOSING

We appreciate the opportunity to be of professional service to you on this project. If you have any questions or require additional information, please do not hesitate to contact the undersigned at 951.801.3681.

Sincerely,

KLEINFELDER

Charles Chen, PE, GE
Project Geotechnical Engineer

Jeffery D. Waller, PE, GE
Senior Geotechnical Engineer

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

PLASTICITY

DESCRIPTION	LL	Either the LL or the PI (or both) may be used to describe the soil plasticity. The ranges of numbers shown here do not imply that the LL ranges correlate with the PI ranges for all soils.	PI
Non-Plastic	NP		NP
Low	< 30		< 15
Medium	30 - 50		15 - 25
High	> 50		> 25

LL is from Casagrande, 1948. PI is from Holtz , 1959.

STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. thick, note thickness.
Laminated	Alternating layers of varying material or color with the layer less than 1/4-in. thick, note thickness.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensided	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness.

ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

The boring was terminated at approximately 10 ft. below ground surface. The boring was backfilled with auger cuttings and patched at surface with quickset concrete dyed black on September 13, 2021.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration location and elevation are approximate and were estimated by Google Earth.

The boring was terminated at approximately 10 ft. below ground surface. The boring was backfilled with auger cuttings and patched at surface with quickset concrete dyed black on September 27, 2021.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration location and elevation are approximate and were estimated by Google Earth.

APPENDIX C
INFILTRATION TEST RESULTS

Copyright 2021 Kleinfelder

Project: Proposed Speedway Commerce Center
Tester CC
Date: September 13, 2021
Location: P-1

Method: Borehole Percolation Test Procedure

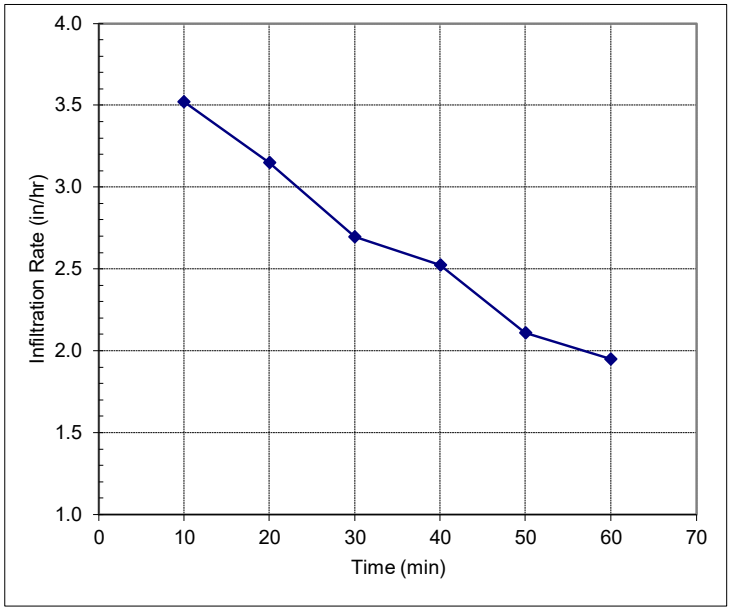
INCREMENTAL INFILTRATION RATE

Time Between Readings (minutes)	Total Elapsed Time (minutes)	Initial Depth (feet, bgs)	Final Depth (feet, bgs)	Drop in Head (feet)	Percolation Rate (min/in)	Tested Infiltration Rate (in/hour)
5	5.00	5.40	6.24	0.84	--	--
5	10.00	6.24	7.10	0.86	--	--
10	10.00	5.21	6.53	1.32	0.63	3.5
10	20.00	5.11	6.33	1.22	0.68	3.2
10	30.00	5.12	6.18	1.06	0.79	2.7
10	40.00	5.22	6.20	0.98	0.85	2.5
10	50.00	5.11	5.96	0.85	0.98	2.1
10	60.00	5.18	5.96	0.78	1.07	2.0

$$I_t = \frac{\Delta H\, \pi r^2\, 60}{\Delta t(\pi r^2 + 2\pi r H_{avg})} = \frac{\Delta H\, 60\, r}{\Delta t(r + 2H_{avg})}$$

Where:

I_t = tested infiltration rate, inches/hour
ΔH = change in head over the time interval, inches
Δt = time interval, minutes
$^*r$ = effective radius of test hole
H_{avg} = average head over the time interval, inches



Presoak Level (ft, bgs):	5.0
Well bottom depth (ft, bgs)	10.2
Final period drop delta d (in):	9.4
Diameter of well casing (in)	3
Diameter of boring (in):	8

Subject: **Preliminary Report of Geotechnical Study**
Proposed Speedway Commerce Center II
County of San Bernardino, California

Dear Mr. Cox:

Kleinfelder is pleased to present this report summarizing the preliminary geotechnical study performed for the subject site, located at the surrounding areas of the existing Auto Club Speedway located at 9300 Cherry Avenue in Fontana, California. Our conclusions and recommendations for geotechnical design and construction are presented in the attached report. An Executive Summary has been included for your convenience.

We appreciate the opportunity to provide geotechnical engineering services to you on this project. If you have any questions regarding this report or if we can be of further service, please do not hesitate to contact the undersigned.

Sincerely,
KLEINFELDER, INC.

EXECUTIVE SUMMARY

This report presents the results of our preliminary geotechnical study for the proposed Speedway Commerce Center II at the surrounding areas of the existing Auto Club Speedway located at 9300 Cherry Avenue in Fontana, California. The location of the proposed site is shown on Figure 1, Site Vicinity Map. The improvements at the site are generally located in the surrounding areas of the existing speedway track as shown on Figure 2, Boring Location Map.

We understand HIP VI Enterprises, LLC wishes to construct approximately seven new logistics buildings within the project area. Other site improvements include new public streets, auto and truck trailer parking, and associated Best Management Practices (BMPs) infiltration facilities. The proposed project includes demolition of the existing asphalt parking lot, portions of the existing grandstand and speedway, and an existing maintenance building located at the northeast corner of the existing speedway track.

The purpose of this preliminary study was to evaluate the general subsurface soil conditions, the nature and engineering properties of the subsurface soils, and to provide preliminary recommendations for the design and construction of the proposed project. Our scope of work included field exploration (borings), laboratory testing, analysis, and report preparation. The boring locations are shown on Figure 2 and the boring logs are presented in Appendix A, Field Exploration. Laboratory testing performed by EGLab Inc. is presented in Appendix B, Laboratory Testing.

As encountered in our borings, the site is underlain by artificial fill containing steel slag, concrete, brick, and other inert debris created during demolition of the former Kaiser Steel Factory. The artificial fill was encountered to a depth up to approximately 13 feet and is underlain by loose to very dense alluvium to the total depth explored of approximately 50 feet below ground surface (bgs). Thicker artificial fill soils are potentially anticipated between our borings based on observations by others during demolition and remediation of the Kaiser Steel facility and construction of the Auto Club Speedway.

Groundwater was not encountered during our investigation. However, perched groundwater was encountered in boring KLF-4 at approximately 5½ feet bgs, KLF-12 at approximately 43 feet bgs, and KLF-13 at approximately 48 feet bgs. Based on research of the general area, groundwater is anticipated to be greater than 400 feet bgs and is not expected to impact project development.

Copyright 2021 Kleinfelder

Fluctuations of localized zones of perched water and rise in soil moisture content should be anticipated during the rainy season. Irrigation of landscaped areas may also lead to an increase in soil moisture content and fluctuations of intermittent shallow perched groundwater levels.

It is our professional opinion that the site can be developed as planned from a geotechnical standpoint, provided the recommendations presented in this report are incorporated into design and construction. The following conclusions and recommendations are based on our understanding of the proposed project and results of our field exploration, laboratory testing, and engineering analysis.

- Undocumented artificial fill extended down to 13 feet below existing grades. Deeper undocumented artificial fill soils may be present between borings. Based on current blow counts and our observations during initial grading, we anticipate the current engineered fill may be acceptable for support of the proposed improvements. However, documentation of the placement of the engineered fill would need to be reviewed by Kleinfelder to conclude the existing artificial fill is acceptable. If documentation is unavailable or the quality of artificial fill is determined to be unacceptable, then the undocumented artificial fill will need to be removed and replaced as engineered fill. A Kleinfelder professional (geologist or engineer) should also observe the fill during excavation and evaluate the condition of the fill at the elevation of the proposed foundations for relative conformance with the recommendations in this report.

- For areas with the higher axial column structural loads, ground improvement or deep foundations may be required.

- The proposed buildings may be constructed using a shallow foundation system with a slab-on-grade floor.

- Foundations, floor slabs, concrete flat work, and pavements should be supported on engineered fill. The existing engineered fill should be observed and evaluated once excavations are performed, however, we believe it is suitable for the proposed loading conditions.

- Spread foundations and building slab-on-grade underlain by engineered fill may be designed for a net allowable bearing pressure of 3,000 pounds per square foot (psf) for dead plus sustained live loads. All footings should be established at a depth of at least 24 inches below the lowest adjacent grade or finished slab grade, whichever is deeper.

Copyright 2021 Kleinfelder

- On portions of the project site, overexcavation performed for the proposed building foundations may extend into very dense oversize materials. The overexcavation and bottom of each foundation should be observed during grading.
- The characteristics of the soils and the anticipated groundwater depth indicate that the site soils have a remote potential for liquefaction during a design-level earthquake. Dry seismically-induced settlement is estimated to be less than 1 inch or less.
- Prior to general site grading, existing vegetation, organic topsoil, debris, and oversized materials (greater than 6 inches in maximum dimension) should be stripped and disposed outside the construction limits. Large particles in the artificial fill may be encountered.
- We recommend that non-structural areas of the site be prepared by proof rolling and recompacting as needed. These areas should be evaluated by the onsite field technician and be processed as new engineered fill where needed.
- In areas of cut, over-excavation and re-compaction should be extended where necessary so that pavements and truck aprons are underlain by at least 18 inches of engineered fill.
- 2019 CBC Seismic Design Parameters for the project site are summarized in Table ES-1 below.

Table ES-1
2019 CBC Seismic Design Parameters

Design Parameter	Building 1	Building 2	Building 3	Building 4	Building 5	Building 6	Building 7
Site Class	C	C	C	C	C	C	C
S_s (g)	1.829	1.836	1.848	1.831	1.819	1.796	1.786
S_1 (g)	0.686	0.689	0.694	0.687	0.681	0.672	0.668

S_{M1} (g)	0.960	0.964	0.972	0.961	0.954	0.940	0.935
S_{DS} (g)	1.463	1.468	1.479	1.465	1.455	1.437	1.429
S_{D1} (g)	0.640	0.643	0.648	0.641	0.636	0.627	0.623
PGA_M (g)	0.938	0.942	0.949	0.940	0.932	0.919	0.914

- The R-Value test results from our investigations for the development ranged from 73 to 83. The result of the R-Value testing was evaluated and a design R-Value of 50 was selected for pavement design. The pavement sections presented in Tables ES-2 and ES-3 below were established using assumed Traffic Indices of 5, 7, 8, and 9.

Copyright 2021 Kleinfelder

Table ES-2
Preliminary Asphalt Concrete Pavement Sections

Traffic Use	Assumed Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
General Parking Traffic	5	3.0	4.0
Local Street	6	3.0	5.0
Heavy Truck Access Ways	7	3.0	6.0
Public Streets	8	3.5	8.0
High Volume Heavy Truck Access Ways	9	4.0	9.0

Table ES-3
Preliminary Recommended PCC Pavement Sections

Traffic Use	Assumed Traffic Index (TI)	Concrete Thickness (inches; using a 28-day compressive strength of 4,000 psi)	Concrete Thickness (inches; using a 28-day compressive strength of 3,500 psi)	Concrete Thickness (inches; using a 28-day compressive strength of 3,000 psi)
General Parking Traffic	5	6.0	6.5	7.0
Local Street	6	6.5	6.5	7.0
Heavy Truck Access Ways	7	6.5	7.0	7.5
Public Streets	8	7.0	7.5	8.0
High Volume Heavy Truck Access Ways	9	7.5	8.0	8.5

- Most of the onsite soils may be reusable as engineered fill once any debris, oversized material, organic debris, and vegetation is cleared and disposed of outside the construction limits. Excavations extending into the existing artificial fill may generate oversize material of cobble or boulder size, which may need additional processing or handling to be placed within the engineered fill. Engineered fill should contain less than 2 percent organic content and maximum material size should be less than 6 inches in maximum dimension in the upper 3 feet. Particles of approximately 6 inches in maximum dimension were observed during our explorations. Placement of oversize material within

Copyright 2021 Kleinfelder

the engineered fill in specific areas may be acceptable with approval by the geotechnical engineer.

- During dry months, moisture conditioning of the subgrade soils may be required if left exposed for greater than a few days. A sufficient water source should be available to provide adequate water during compaction. Conversely, during the wet months, soils may become saturated and may require provisions for drying of soils prior to compaction.

The executive summary briefly summarizes results of our geotechnical study for the subject project and should be used only in conjunction with recommendations presented in the attached report. This summary is also subject to the limitations included in Section 6 of this report.

Copyright 2021 Kleinfelder

1 INTRODUCTION

This report presents the results of our preliminary geotechnical study for the proposed Speedway Commerce Center at the existing Auto Club Speedway site. The project site is located at the surrounding areas of the existing Auto Club Speedway site located at 9300 Cherry Avenue in Fontana, California. The general location of the site is shown on Figure 1, Site Vicinity Map.

The purpose of this preliminary geotechnical study was to evaluate the subsurface soil conditions at the site in order to provide geotechnical recommendations for the design and construction of the proposed development. The scope of our services was presented in our proposal dated August 31, 2021. This report only provides recommendations for the proposed improvements discussed below.

1.1 PROJECT DESCRIPTION

Based on our review of the referenced conceptual plans, we understand HIP VI Enterprises, LLC) wishes to construct approximately seven new logistics buildings within the project area. Other site improvements include new public streets, auto and truck trailer parking, and associated Best Management Practices (BMPs) infiltration facilities.

We understand the new buildings will generally consist of large, warehouse-sized buildings equipped with loading docks and automotive and truck trailer parking areas and heavy-duty pavement. The approximate site area, building size, and number of truck trailer parking of the proposed buildings is shown in Table 1, Proposed Buildings Summary Table.

Table 1
Proposed Buildings Summary Table

Building	Site Area (acres)	Building Area (sf)	Truck Trailer Parking
1	53.99	1,286,600	271
2	22.99	540,500	107
3	53.99	1,316,800	292
4	39.60	960,500	210
5	40.36	939,800	274
6	41.76	926,000	187
7	26.92	629,800	136

We anticipate the proposed warehouse buildings will be single-story, concrete-tilt-up structures, supported on conventional shallow spread foundations with a dock high slab-on-grade floor. We have assumed that foundations for proposed structures are proposed to be shallow (less than approximately 5 feet bgs) We have been provided the following loading conditions:

Copyright 2021 Kleinfelder

- Typical Column Loads: Building 1 to 7 Column Pads – 110 kips, Building 3 Canopy – 45 kips, Building 3 Mezzanine/Office – 230 kips
- Slab on Grade – 60 to 100 psf dead load, 550 psf live load
- G+4.5 Building Column Pads: Column Pads – 90 to 1090 kips dead load, 34 to 1,242 kips live load
- Perimeter Concrete Wall: 8 to 10 kips per linear foot (klf)

Conceptual grading plans were not available at this time. Based on the existing topography, we anticipate the site will be balanced with cuts and fills to achieve desired grades in building areas. Deeper excavations to remove existing undocumented artificial fills, subterranean structures, and rubble fill are also recommended.

We have been informed by Webb Associates (Webb), the project Civil Engineer, that numerous areas of underground infiltration chambers are planned. At the time of preparation of this proposal, the location of the chambers has not been selected by Webb, but they have provided the 20 locations for Kleinfelder to investigate for additional information. We have provided our recommendations for long term infiltration in the referenced Kleinfelder 2021 infiltration report.

We anticipate parking lot and drive aisles will consist of asphaltic concrete (AC) pavement and Portland cement concrete pavement (PCCP). Ancillary construction is anticipated to include concrete flat work, landscaping, and installation of buried utilities.

1.2 SCOPE OF SERVICES

The scope of our preliminary geotechnical study consisted of a literature review, historical aerial photo review, subsurface exploration, infiltration testing, geotechnical laboratory testing, engineering evaluation and analysis, and preparation of this report. Our report includes a description of the work performed, a discussion of the geotechnical conditions observed at the site, and preliminary recommendations developed from our engineering analysis of field and laboratory data. A description of our scope of services performed for this project is presented below.

Our scope also included evaluation of site infiltration. We provided our geotechnical recommendations for site infiltration in our referenced Kleinfelder 2021 infiltration report.

Task 1 – Background Data Review. We reviewed published and unpublished geologic literature in our files and the files of public agencies, including selected publications prepared by

Copyright 2021 Kleinfelder

the California Geological Survey and the U.S. Geological Survey. We also reviewed readily available seismic and faulting information, including data for designated earthquake fault zones and our in-house database of faulting in the general site vicinity. Additionally, we reviewed the referenced 1994 and 2020 Kleinfelder reports prepared for the original development and planned redevelopment of the California Speedway site.

Task 2 – Field Exploration. The subsurface conditions at the site were explored by drilling and logging twenty three (23) hollow-stem auger geotechnical borings (KLF-1 to KLF-23) and twenty (20) hollow-stem auger infiltration borings (P-1 to P-20). The geotechnical borings were drilled to depths of approximately 50 feet bgs and the infiltration borings were drilled to a depth of approximately 10 feet bgs. The locations of our borings are shown on the attached Figure 2, Exploration Location Map. The results of the infiltration testing are presented in a separate Kleinfelder report.

Prior to commencement of the fieldwork, our proposed exploration locations were cleared for known existing utility lines and with the participating utility companies through Underground Service Alert (USA). In addition, we retained a geophysical subconsultant to further confirm the absence of underground utilities at the boring locations. A Kleinfelder representative supervised the field operations and logged the borings. Selected bulk and drive samples were retrieved, sealed and transported to EGLab, Inc. of Arcadia, California for laboratory testing. Our typical sampling interval for the hollow stem auger borings was every 5 feet to full depths explored. The number of blows necessary to drive both Standard Penetration Test (SPT) and modified California-type samplers were recorded. A description of the field exploration and the logs of the borings, including a Legend to the Log of Borings, are presented in Appendix A.

Seven (7) seismic refraction surveys (SW-1 to SW-7) were conducted at each of the proposed seven building locations within the project site. The purpose of this investigation was to assess the general seismic velocity characteristics of the underlying earth materials and to evaluate site specific ground motions. The approximate seismic refraction survey locations are shown on Figure 2. Results of the seismic refraction surveys are presented in Appendix C, Seismic Refraction Survey Results.

Task 3 – Laboratory Testing. Laboratory testing was performed on representative samples of soil collected from our excavations to substantiate field classifications and to provide engineering parameters for geotechnical design. Laboratory testing included moisture determination and unit weight, grain size distribution, wash sieve, direct shear, consolidation, maximum dry density and optimum moisture, R-Value, and preliminary corrosion potential. A

Copyright 2021 Kleinfelder

summary of the testing performed and the results for this subject site are presented in Appendix B.

Task 4 – Geotechnical Analyses. Field and laboratory data were analyzed in conjunction with the proposed site plan presented on Figure 2 and the provided structural loads to develop geotechnical recommendations for the design and construction of the proposed development. We evaluated potential foundation systems, lateral earth pressures, settlement, and earthwork considerations. Potential geologic hazards, such as ground shaking, seismic settlement potential, flood hazard, and fault rupture hazard were also evaluated.

Task 5 – Report Preparation. This report summarizes the work performed, data acquired, and our findings, conclusions, and geotechnical recommendations for the design and construction of the proposed development. Recommendations for the following are presented in this report:

- Earthwork, including site preparation, excavation, site drainage, and the placement of engineered fill;
- Design of suitable foundation systems including allowable capacities, lateral resistance, and settlement estimates;
- Seismic design parameters;
- Floor slab and slab-on-grade support, including subgrade preparation;
- Lateral earth pressures for design of retaining walls; and
- Design and construction of asphalt and Portland cement concrete pavements, including driveways, fire lanes, and concrete walks.

This report also contains reference maps and graphics, as well as the logs of the borings and laboratory test results.

Copyright 2021 Kleinfelder

2 SITE AND SUBSURFACE CONDITIONS

2.1 SITE DESCRIPTION

The site is comprised of 8 contiguous parcels totaling approximately 520 acres. The site is located west of Cherry Avenue and is generally bounded by existing industrial facilities to the south and west, Cherry Avenue to the east, and railroad tracks to the north. While the site is relatively flat, except for slopes and fills for the racetrack and grandstand, the overall site generally drains to the south and west with approximate surface elevations of 1090 feet at the southwest corner of the site to 1170 feet at the northeast corner of the site. There is approximately 80 feet of relief across the site. The site is currently occupied by asphalt parking lot, portions of the existing grandstand and speedway, and an existing maintenance building located at the northeast corner of the existing speedway track (Building 2).

The overall site generally drains to the south and west or to onsite drainage facilities. A large diameter Metropolitan Water District (MWD) line is also located in the current racetrack infield.

2.2 SUBSURFACE CONDITIONS

The subject site is located at the northern end the Perris block along the northern boundary of the Peninsular Ranges geomorphic province of California (Norris and Webb, 1990). The area is underlain by Holocene age alluvial-fan and aeolian (wind blown) deposits overlying Quaternary age alluvial-fan deposits and Cretaceous age plutonic rock bedrock at depth. Detailed descriptions of the near surface deposits are provided in our boring logs and are presented in Appendix A.

Soils encountered during our field investigation consisted of:

- Artificial fill extending up to approximately 13 feet
- Alluvium was encountered from the contact with the artificial fill to at least approximately 50 feet bgs;
- The soils encountered during our field work consisted primarily of interbedded sands with varying silt content, gravel and cobbles to the total depths explored.

Boring KLF-9 encountered refusal at a depth of approximately 3 feet bgs due to an unknown large object. The boring was moved a distance of approximately 5 feet to the north.

Copyright 2021 Kleinfelder

Artificial Fill:

Artificial fill soils generally consisted of sandy silt, silty sand and sands with varying amounts of gravel, and cobbles. During grading for the existing improvements at the site, artificial fill containing limited construction debris from the previous site grading operations was used. The construction debris placed in the artificial fill generally consisted of concrete, brick, and steel slag and is considered inert materials. It was documented by Kleinfelder that previously existing concrete structures and steel slag remnants were crushed and placed within the fill. At the locations we investigated, the artificial fill extended up to 13 feet below the ground surface. Thicker artificial fill soils are anticipated between our borings based on observations by others during demolition and remediation of the Kaiser Steel facility and construction of the Auto Club Speedway. A summary of artificial fill depth encountered during our current investigation is summarized in Table 2, Artificial Fill Summary Table.

Maximum density-optimum moisture tests were performed on seven artificial fill samples. The optimum moisture content for the soil samples tested ranged from 5.6 to 9.4 percent and the maximum density of the samples tested ranged from 130.0 to 143.0 pounds per cubic foot (pcf).

Copyright 2021 Kleinfelder

Alluvium/Native Soils:

The alluvium/native soils generally consisted of sandy silt, sandy clay, silty sand and sands with varying amounts of gravel and cobble to the total depth explored of approximately 51½ feet bgs. Generally, the apparent density of the subsurface soils was medium stiff to hard and loose to very dense.

2.3 GROUNDWATER CONDITIONS

Groundwater was not encountered during our investigation which was drilled up to an approximate depth of 51½ feet bgs. However, perched groundwater was encountered in boring KLF-4 at approximately 5½ feet bgs, KLF-12 at approximately 43 feet bgs, and KLF-13 at approximately 48 feet bgs. It appeared groundwater was likely perched on finer grained soil layers. Groundwater was not encountered during our 2020 investigation which was drilled up to an approximate depth of 81½ feet bgs. Depth to groundwater within onsite groundwater monitoring wells (SW-1S, SW-1M, SW-1D, SW-2, and SW-3, with approximate ground surface elevations of 1120 to 1160 feet) was approximately 425 to 450 feet bgs (approximate elevation 690 to 705 MSL) last measured on February 13, 2019 (RPS, 2019). Another well in the vicinity of the site is approximately 1.0 mile north of the site (01S/06W-10H003S) with a ground surface elevation of 1,212 above mean sea level (MSL). Depth to groundwater was approximately 500 feet bgs (approximate elevation 711 MSL) last measured on November 19, 2019 (WMWD, 2020).

3 GEOLOGIC CONDITIONS

3.1 REGIONAL GEOLOGY

The subject site is situated within the Chino Valley at the northern end of the Perris block along the northern boundary of the Peninsular Ranges geomorphic province of California (Norris and Webb, 1990). The geology of the region is presented on a referenced map by Morton and Miller (2006). The Peninsular Ranges are the southernmost segment of a chain of North American Mesozoic batholiths that extend from Alaska to the southern tip of Baja California, and are a series of northwest-southeast trending mountain ranges separated by similarly trending valleys. These geomorphic structures in the area are sub-parallel to the major fault systems, such as the Elsinore Fault zone, which includes the Whittier, Chino-Central Avenue, and the San Jacinto Fault zone. The Perris Block is composed chiefly of crystalline rocks of Cretaceous and earlier ages with thin mantles of sedimentary and volcanic rocks (Woodford et al, 1971). The Perris Block is bounded on the northeast by the San Jacinto fault zone, on the north by the Sierra Madre-Cucamonga fault zone, on the west by the Elsinore Fault zone. The southern boundary is undefined.

3.2 SITE GEOLOGY

According to a review of available reports and maps which include the project site, the site is underlain by Holocene age alluvial-fan deposits (Qyf5) (Morton and Miller, 2006). Surficial deposits observed during drilling consist of fill soils ranging in thickness from approximately 2 to 13 feet bgs. Some of the fill soils contained fragments of steel slag debris likely from the former Kaiser Steel plant that previously occupied the site.

3.3 GEOLOGIC HAZARDS

We have addressed below the potential geologic hazards for the site.

3.3.1 Active and Potentially Active Fault Search

Earthquakes and faulting occur as the tectonic plates, which comprise the Earth’s crust, or lithosphere, move relative to one-another. Faults identified by the State of California and the County of San Bernardino as being active are not known to be present at the surface within the project limits. No portion of the site is located within a State of California-Special Studies Zone, formerly Alquist-Priolo Earthquake Fault Zone (CGS, 2021). The site is underlain by Holocene

Copyright 2021 Kleinfelder

age alluvial sands and gravels several hundreds of feet thick, which overly Cretaceous age plutonic rock of the Perris Block. A review of stereo and oblique air photos, which encompass the project site, did not reveal lineaments or geomorphic features indicative of surface faulting. The site situated on the northern end of the Perris Block, which is bounded by the active Sierra Madre fault zone approximately 5 miles north and San Jacinto fault zone approximately 8.0 miles east.

Based on the lack of geomorphic evidence such as lineaments, off-set drainages or concentration of vegetation, and the distance to known active faults in the region, the risk of surface rupture at the site resulting from faulting is considered low.

3.3.2 Flooding

Surface water flow at the site is generally via sheet flow in a southwesterly direction.

The site is within a flood hazard zone “X” FP2, where the flood hazard is inside a 500 Year Flood Plain (SBC, 2010a,b). The site is not listed by the County of San Bernardino (SBC, 2010a,b), as being in any mapped dam inundation hazard zone.

A seiche is a wave or sloshing of a body of water that is at least partially impounded caused by strong wind or seismic shaking. The site is not downstream of large bodies of water or tanks which potentially could causes flooding and inundate the project site. The risk of seiche damage following a seismic event at the site is considered low.

3.3.3 Landslides

Landslides and other forms of mass wasting, including mud flows, debris flows, soil slips, and rock falls occur as soil or rock moves down slope under the influence of gravity. Landslides are frequently triggered by intense rainfall or seismic shaking. The site is not located within a State or County of San Bernardino (SBC, 2010a,b) designated landslide hazard zone. The site is relatively flat and the risk at the site from landslides and other forms of mass wasting is considered very low.

3.3.4 Subsidence

Land subsidence can occur as a result of sediment consolidation subsequent to groundwater or petroleum withdrawal or from liquefaction of subsurface soils due to seismic shaking. The project site is not situated within a City, County, or State designated area which is zoned or listed as susceptible to land subsidence. The risk of subsidence and/or earth fissures as a result

Copyright 2021 Kleinfelder

of groundwater or petroleum withdrawal at the site is considered low. Depth to groundwater is reported to be greater than 400 feet below the ground surface (WMWD, 2021) and as such subsidence due to liquefaction is considered low.

3.3.5 Liquefaction

Liquefaction occurs when saturated, loose, coarse-grained or silty soils are subjected to strong shaking resulting from earthquake motions. The coarse-grained or silty soils typically lose a portion or all of their shear strength and regain strength sometime after the shaking stops. Soil movements (both vertical and lateral) have been observed under these conditions due to consolidation of the liquefied soils.

Based on the properties of the soils underlying the site and depth to groundwater, there is a low potential for impact due to liquefaction from a seismic event. Liquefaction potential is further discussed in Section 4.2.3.

Copyright 2021 Kleinfelder

4 CONCLUSIONS AND RECOMMENDATIONS

4.1 GENERAL

Based on the results of our field exploration, laboratory testing and geotechnical analyses conducted during this study, it is our professional opinion that the proposed project is geotechnically feasible, provided the recommendations presented in this report are incorporated into the project design and construction. The primary geotechnical considerations for site development are as follows:

1. Undocumented artificial fill soils (as deep as 13 feet bgs) located on site. Deeper undocumented artificial fill soils may be present between borings.
2. Settlement due to high structural loading.
3. Excavations extending into the existing artificial fill may be difficult to perform and heavy ripping and large grading equipment should be anticipated. Large artificial fill particles/debris up to and including boulder sizes should be anticipated and may need to be disposed outside of the engineered fill.
4. The soil placed within the building and pavement areas should consist of materials less than 6 inches in maximum dimension in the upper 3 feet of fill.
5. Based on the soils encountered during our investigation we do not anticipate expansive soils to adversely impact the design and construction of the proposed project.
6. The characteristics of the soils and the anticipated groundwater level indicate that the site soils have a remote potential for liquefaction during a design-level earthquake. Dry seismically-induced settlement is calculated to be less than 1 inch.

The following preliminary opinions, conclusions, and recommendations are based on the properties of the materials encountered in the prior and current explorations, the results of our literature review, the results of the laboratory testing program, and our engineering analyses performed. Our recommendations regarding the geotechnical aspects of the design and construction of the project are presented in the following sections. We do not anticipate any cut or fill slopes to have a maximum height greater than 25 feet or to have inclinations steeper that 2:1 (horizontal:vertical). We recommend that the final grading plans be reviewed by Kleinfelder prior to the start of construction.

Copyright 2021 Kleinfelder

4.2 SEISMIC DESIGN CONSIDERATIONS

4.2.1 General

The site is located in a seismically active region of southern California. The proposed site can be expected to be subject to strong seismic shaking during its design life. Potential seismic hazards include ground shaking, localized liquefaction, ground rupture due to faulting, and seismic settlement. The following sections discuss these potential seismic hazards where relevant with respect to this site.

4.2.2 Seismic Design Parameters

According to the 2019 California Building Code, every structure, and portion thereof, including non-structural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with ASCE/SEI 7-16. The Seismic Design Category for a structure may be determined in accordance with Section 1613 of the 2019 CBC.

Based on information obtained from the investigation, published geologic literature and maps, and on our interpretation of the ASCE/SEI 7-16 criteria, it is our opinion that the project site may be classified as Site Class C, Very Dense Soil and Soft Rock, according to Section 1613 of 2019 CBC and Table 20.3-1 of ASCE/SEI 7-16 (2016). Approximate coordinates for the building sites are summarized in Table 3, Proposed Building Site Coordinates.

Table 3
Proposed Building Site Coordinates

Building	Latitude (°N)	Longitude (°W)
1	34.086365	117.492756
2	34.088873	117.494048
3	34.091588	117.492744
4	34.091268	117.499184
5	34.091412	117.504360
6	34.086329	117.507223
7	34.086237	117.511511

The Risk-Targeted Maximum Considered Earthquake (MCER) mapped spectral accelerations for 0.2 seconds and 1 second periods (S_s and S_1) were estimated using Section 1613 of the 2019 CBC and the OSHPD seismic design maps web-based application (available at https://seismicmaps.org/). The mapped acceleration values and associated soil amplification factors (F_a and F_v) based on the 2019 CBC and corresponding site modified spectral

Copyright 2021 Kleinfelder

accelerations (S_{MS} and S_{M1}) and design spectral accelerations (S_{DS} and S_{D1}) are presented in Table 4, 2019 CBC Seismic Design Parameters.

4.2.3 Ground Motion Hazard Analysis

The governing building code for the project is the 2019 CBC. As requested, a ground motion hazard analysis for Building 1 was developed in accordance with the requirements of ASCE 7-16, which is the basis for the 2019 CBC. Ground motion criteria were developed in terms of peak ground accelerations and response spectral accelerations for the subject site by using the current seismic source model for California (proximity to active faults, major historical earthquakes, and regional seismicity) and subsurface soil conditions at the site. The results of the site-specific ground motion hazard analysis for Building 1 are presented in Appendix D.

4.2.4 Liquefaction and Seismic Settlement

The term liquefaction describes a phenomenon in which saturated, cohesionless soils temporarily lose shear strength (liquefy) due to increased pore water pressures induced by strong, cyclic ground motions during an earthquake. Structures founded on or above potentially liquefiable soils may experience bearing capacity failures due to the temporary loss of foundation support, vertical settlements (both total and differential), and undergo lateral spreading. The factors known to influence liquefaction potential include soil type, relative density, grain size, confining pressure, depth to groundwater, and the intensity and duration of the seismic ground shaking. The cohesionless soils most susceptible to liquefaction are loose, saturated sands and some silt.

Copyright 2021 Kleinfelder

Based on the properties of the soils encountered during our investigation and our knowledge of the geologic conditions in the area of the site from our previous investigations, a site class of 'C' is considered appropriate as determined from the 2019 California Building Code. The characteristics of the soils and depth to groundwater indicate that the site soils have a remote potential for liquefaction during a design-level earthquake. However, medium dense granular soils are prone to settlement due to seismic shaking. Seismically-induced settlement is estimated to be less than 1-inch total and ½ inch differential settlement over a distance of over 40 to 70 feet.

4.3 FOUNDATIONS

4.3.1 General

Based on our analysis, the structural loads for the proposed improvements may generally be supported on conventional shallow foundations underlain by engineered fill, provided that the subgrade preparation recommendations included in this report are implemented.

For areas with the higher axial column structural loads, our analysis of the static settlement exceeds the typical allowable settlement for buildings of similar construction. To mitigate the static settlement potential, several options of ground improvement or deep foundations should be evaluated. The decision as to which option to select will likely be dictated at least partially by economics and should be made by HIP VI Enterprises, LLC in consultation with the project team based on the overall project findings. Ground improvement options could consist of Deep Soil Mixing, stone columns, or rammed aggregate piers. Deep foundations generally consisting of cast-in-drilled-hole (CIDH) piles are a preliminary option for this site. Driven piles are not recommended as there are very dense subsurface layers that may include cobbles. Preliminary design and construction recommendations for ground improvement and CIDH piles are beyond the scope of this preliminary report. Further evaluation of ground improvement and deep foundations options should be considered as the project design progresses.

4.3.2 Allowable Bearing Capacity

Spread foundations (including retaining wall foundations) underlain by new engineered fill may be designed for a net allowable bearing pressure of 3,000 pounds per square foot (psf) for dead plus sustained live loads. All footings should be established at a depth of at least 24 inches below the lowest adjacent grade or finished slab grade, whichever is deeper. Thus, for interior column footings, embedment may be considered from the top of slab based on our understanding that the floor slabs will be a minimum of 6 inches thick directly over the finished

Copyright 2021 Kleinfelder

subgrade pad (no gravel or sand between the engineered fill and floor slab). Where the slab is loaded in proximity to the columns, or above the underlying spread foundation, the allowable bearing pressure of the footing remains 3,000 psf and should include the slab load.

For footings that are directly adjacent to the property line, it is anticipated that the zone of influence below the footing will be outside of the new engineered fill placed for this project. In this case, the depth of building footings shall be increased by two feet. The deepened portion of the footing may be constructed using three-sack sand slurry mix, with vertical reinforcement designed by the structural engineer to tie in to the typical concrete footing. Footings at the property line may be designed for a net allowable bearing pressure of 3,000 pounds per square foot (psf) for dead plus sustained live loads.

The perimeter footings of any proposed buildings should be embedded at least 24 inches into the engineered fill soils. Embedment for perimeter footings should not be considered from top of pavements, flatwork, or aggregate base grades. The footing dimensions and reinforcement should be designed by the structural engineer. Footings should be deepened as needed based on the recommendations in Section 4.3.5 to avoid surcharging existing buried utilities and/or walls. The engineered fill should be prepared as recommended in Section 4.4.

The allowable bearing pressure provided above is a net value; therefore, the weight of the foundation (which extends below grade) may be neglected when computing dead loads. The allowable bearing pressure applies to dead plus live loads. This value may be increased by one-third for short-term loading due to wind or seismic forces.

4.3.3 Estimated Settlements

Total static settlement for foundations designed in accordance with the recommendations presented herein is estimated to be less than 1 inch. Differential static settlement between similarly loaded columns is estimated to be less than ½ inch over 40 to 70 feet. Note that this settlement is in addition to the estimated settlement due to seismic shaking. Seismically-induced settlement is estimated to be less than 1-inch total and ½ inch differential.

4.3.4 Lateral Resistance

Resistance to lateral loads (including those due to wind or seismic forces) may be provided by frictional resistance between the bottom of concrete foundations and the underlying soils and by passive soil pressure against the sides of the foundations. A coefficient of friction of 0.35 may be used between cast-in-place concrete foundations and the underlying soil. The passive

Copyright 2021 Kleinfelder

pressure available for engineered fill may be taken as equivalent to the pressure developed by a fluid with a unit weight of 300 pounds per cubic foot (pcf). A one-third increase in the passive resistance may be used for resistance to transient loads such as wind and seismic. The upper one foot of soil should be neglected when calculating passive resistance.

The lateral resistance parameters provided above are ultimate values. Therefore, a suitable factor of safety should be applied to these values for design purposes. The appropriate factor of safety will depend on the design condition and should be determined by the project Structural Engineer. Depending on the application, typical factors of safety could range from 1.5 to 2.0.

4.3.5 Foundations Adjacent to Buried Utilities

To avoid surcharging existing utilities and walls below grade, foundations should be deepened below a 1:1 (H:V) plane projected from the bottom of the utility or wall. Alternatively, the utilities or wall could be evaluated for potential surcharge pressures due to the foundation loads.

4.4 EARTHWORK

4.4.1 General

Recommendations for site preparation are presented below. All site preparation and earthwork operations should be performed in accordance with applicable codes, safety regulations and other local, state or federal specifications. All references to maximum unit weights are established in accordance with the latest version of ASTM Standard Test Method D1557.

Engineered fill was placed during the original Auto Club Speedway development in the late 1990s. As encountered during our investigation, the fill extended down to 13 feet below existing grades. Based on current blow counts and our observations during initial grading, we anticipate the current engineered fill may be acceptable for support of the proposed improvements. However, documentation of the placement of the engineered fill would need to be reviewed by Kleinfelder to conclude the existing artificial fill is acceptable. If documentation is unavailable or the quality of artificial fill is determined to be unacceptable, then the undocumented artificial fill will need to be removed and replaced as engineered fill. A Kleinfelder professional (geologist or engineer) should also observe the fill during excavation and evaluate the condition of the fill at the elevation of the proposed foundations for relative conformance with the recommendations in this report.

Copyright 2021 Kleinfelder

Grading operations during the wet season or in areas where the soils are saturated may require provisions for drying of soils prior to compaction. If the project necessitates fill placement and compaction in wet conditions, we can provide suggested alternative recommendations for drying the soil. Conversely, additional moisture may be required during the dry months. A sufficient water source should be available to provide adequate water during compaction. During dry months, moisture conditioning of the subgrade soils may be required if left exposed for greater than a few days.

4.4.2 Site Preparation

Prior to general site grading, existing vegetation, debris, and oversized materials (greater than 6 inches in maximum dimension) should be stripped and disposed outside the construction limits. We estimate the depth of stripping to be approximately 6 inches over most portions of the site. Deeper stripping or grubbing may be required where higher concentrations of vegetation are encountered during site grading. Stripped topsoil (less any debris) may be stockpiled and reused for landscaping purposes; however, this material should be evaluated for suitability if it is desired to use this material for engineered fill below structures.

All oversize and organic debris, including any produced by demolition operations, (wood, steel, piping, plastics, etc.), should be separated and disposed offsite. The material generated during demolition of the existing roadways and concrete structures may be reused onsite. If reused, the particles should be crushed to a maximum particle size of 6 inches and spread across the site to prevent nesting.

Existing utility pipelines (if encountered) which extend beyond the limits of the proposed construction and are to be abandoned in place should be plugged with cement grout to prevent migration of soil and/or water. Demolition, disposal, and grading operations should be observed and tested by a representative from our office.

Depending on the condition of the soils immediately adjacent to the property line, shoring and/or underpinning may be required to perform demolition and overexcavation adjacent to existing properties. Excavations within a 1:1 (horizontal: vertical) plane extending downward from a horizontal distance of 2 feet beyond the bottom outer edge of existing improvements should not be attempted without bracing and/or underpinning. All applicable excavation safety requirements and regulations, including OSHA requirements, should be met. As an alternative, slot cutting using an “ABC” technique may be used. Temporary shoring and slot cutting recommendations are presented in Sections 4.4.9, respectively.

Copyright 2021 Kleinfelder

4.4.3 Overexcavation

Recommendations for overexcavation of the proposed building pads (building foundations and floor slabs), embankments, and parking lots (pavements) are presented below. All site preparation and earthwork operations should be performed in accordance with applicable codes, safety regulations and other local, state, or federal specifications. All references to maximum unit weights are established in accordance with the latest version of ASTM Standard Test Method D1557.

Excavations within a 1:1 (horizontal: vertical) plane extending downward from a horizontal distance of 2 feet beyond the bottom outer edge of existing improvements (e.g. building foundations) or property lines should not be attempted without bracing and/or underpinning. All applicable excavation safety requirement and regulations, including OSHA requirements should be met. As an alternative, slot cutting using an “ABC” technique may be used. Slots should not expose more than 6 feet of continuous feet of existing continuous foundations and should be separated by at least 12 feet of native or structural fill. We recommend the existing structures be monitored for signs of settlement or distress during slot cutting and backfilling.

4.4.3.1 Structural Areas Supporting Spread Footings

In order to provide uniform support for the proposed spread foundations and slab-on-grade floors, we recommend the site soils be overexcavated and replaced as engineered fill to a minimum depth of 3 feet from existing grade and at least 3 feet below the bottom of footings, whichever is greater. Existing undocumented artificial fill soils should be removed until native alluvium is exposed. The overexcavation should extend horizontally at least 5 feet beyond the edges of foundations and a distance equivalent to the thickness of anticipated fill below the footing, whichever is greater. Depending on the observed condition of the existing soil and engineered fill, deeper overexcavation may be required in some areas. The Geotechnical Engineer of Record should be notified for supplemental recommendations if the minimum relative compaction of the soil is not achieved.

4.4.3.2 Non-structural Areas

Within the non-structural areas, such as truck aprons, pavements, sidewalks, other flatwork, etc., we anticipate the presence of artificial fill soils. Based on the presence of artificial fill soils and the understanding that minor pavement maintenance may be needed, we recommend that these items be underlain by at least 24 inches of newly placed engineered fill. In these areas, a

Copyright 2021 Kleinfelder

few locations should be potholed to observe the presence and condition of the existing fill soils and evaluate their suitability.

Depending on the depth of existing artificial fill and the observed condition of the existing soils and the observation of soil porosity during our investigation, deeper overexcavation may be required in some areas. The overexcavation should extend beyond the proposed improvements a horizontal distance of at least two feet.

After site preparation and overexcavation, and prior to scarification or placement of compacted fills, the excavation bottom should be observed, evaluated, and approved by a Kleinfelder professional (geologist or engineer). Additional removals may be needed if significant porosity or other adverse conditions are observed. The subgrade should then be scarified to a depth of approximately 12 inches, moisture conditioned to at least optimum moisture content; and recompacted. After compaction, the subgrade should be proof rolled using equipment with sufficient weight to evaluate surface deflection. Proof rolling should be performed to verify that the subgrade soils are firm and unyielding at the depth of the recommended overexcavation presented above.

During excavations within the artificial fill, oversize material of cobble to boulder size may be generated. These oversized materials, if encountered, would require additional processing prior to placement within the fill. Placement of oversize material (larger than 6 inches in maximum diameter) within the engineered fill may be acceptable with approval by the geotechnical engineer, but may require special handling and placement within the fill. Specific recommendations can be provided during grading based on the material encountered and available placement areas within the fill.

4.4.4 Permanent slopes

We anticipate fill slopes with inclinations of up to 2:1 (horizontal:vertical) will be proposed. Based on our knowledge of the subsurface information, cut and fill slopes inclined at a 2:1 (H:V) or flatter will be globally stable. The following sections present recommendations for design and construction of slopes.

Where the toe of a fill slope terminates, we recommend constructing a keyway at the toe of the fill slope as shown on Figure 3, Typical Engineered Fill Slope Detail. In general, fill slope keyways should have a minimum width of 15 feet, with a minimum depth of three feet into competent natural material or existing artificial fill, and should extend a distance equal to the

Copyright 2021 Kleinfelder

depth of the keyway beyond the toe of the fill. The keyway depth and width should be constructed as presented in Table 5, Minimum Keyway Recommendations.

Table 5
Minimum Keyway Recommendations

Keyway Recommendations for Fill Slopes up to 30 feet High			
Slope Height	5 feet or less	> 5 feet to 10 feet	> 10 feet to 30 feet
Minimum Keyway Depth	1 foot into competent material	2 feet into competent material	2 feet into competent material
Minimum Keyway Width	8 feet	10 feet	10 feet

Proposed embankment slopes that will terminate into the existing embankment slope should be benched into the existing slope as shown on Figure 3.

When constructing fill slopes, the contractor should avoid spillage of loose material down the face of the slope during dumping and rolling conditions. We recommend that the incoming load be dumped behind the face of the slope and bladed into place. In order to obtain slope face compaction, the slope may be over-built and then trimmed back to expose a compacted core. As an alternative method, after each 4 feet of vertical height has been obtained, the contractor may compact the outer face of the slope by backing the tamping roller over the top of the slope and thoroughly covering the entire slope surface with overlapping passes of the roller. The foregoing should be repeated after the placement of each 4-foot thickness of fill. As discussed previously, fill slopes should conform to the requirements of the engineered fill section of this report and should contain no particles greater than 6 inches in maximum dimension. The fill slope surface should be compacted to a minimum of 90 percent relative compaction per ASTM D1557, or as specified in the project plans and specifications. Surface drainage control, such as berms at the tops of slopes, should be included in the design of fill slopes to direct sheet flow away from the tops of slopes and reduce the potential for slope erosion.

4.4.5 Excavations Within Artificial Fill

Grading plans were not provided to use at the time this report was written, however based on experience from similar projects, overexcavation for foundations and excavation for utilities may encounter large particles in the underlying fill. The contractor should expect to encounter large particles as presented in the table in Section 4.4.7 below.

Copyright 2021 Kleinfelder

4.4.6 Engineered Fill

We anticipate that most of the on-site soils may be reusable as engineered fill once any debris and oversized materials greater than 6 inches in diameter have been removed, and after any vegetation and organic debris is cleared. Engineered fill should contain less than 2 percent organic content and maximum material size should be less than 6 inches in maximum dimension. Disturbed/tilled soil, less vegetation, may be used in landscape areas, exported, or placed in a controlled manner and blended with the onsite soils, provided that the resulting engineered fill contains less than 2 percent organic content.

Fill should be placed in lifts no greater than 8 inches thick, loose measurement, and should be compacted to at least 90 percent of the maximum dry density. The moisture content of the on-site soils should be within 2 percent of the optimum moisture at the time of compaction.

Engineered fill placed below pavement should be compacted to at least 90 percent of the maximum dry density obtained by the ASTM D1557 method of compaction, with the upper 12 inches below pavements compacted to at least 95 percent relative compaction.

Although not anticipated, any imported fill materials to be used for engineered fill should be sampled and tested for approval by the geotechnical engineer prior to being transported to the site. The expansion index of an imported soil should be less than 20. In general, well-graded mixtures of gravel, sand and non-plastic silt are acceptable for use as import fill. A minimum notice of 3 working days will be required to allow for qualification testing prior to compaction of imported materials.

4.4.7 Demolition Debris

Based on review of project documents and our boring logs, we anticipate encountering steel slag and other demolition debris from the previous site uses and grading operations. Table 6, Buried Demolition Debris In Engineered Fill Recommendations, was presented in Kleinfelder's referenced 1994 report. In the existing artificial fill, grading operations at the depths presented below are likely to encounter particles up to the maximum particle size. Additionally, we recommend that any newly placed engineered fill conform to the same recommendations. In fill soils where oversized material, if any, will be placed, the oversized material should be mixed with native soils or pulverized such that a soil/rock fill is created. A soil/rock fill is defined as a fill containing oversized fragments with a sufficient matrix of soil to allow for proper compaction of the soil fill. Oversized material should be buried within compacted soil such that voids surrounding the oversized material are filled with compacted fill and "point to point" contact

Copyright 2021 Kleinfelder

between oversized fragments is minimized. Nesting of oversized fragments should not be permitted.

Table 6
Buried Demolition Debris In Engineered Fill Recommendations

Depth Below Final Grade	Maximum Particle Size
0 – 3 Feet	6 inches
3 – 6 feet	9 inches
6 – 10 feet	12 inches
Greater than 10 feet	36 inches

If during removal of existing artificial fill, excess amounts of oversize material is encountered and requires removal/disposal, it is an option to place such material in windrows outside of the current project area. Details regarding the placement of windrows are shown on Figure 4, Typical Oversize Rock Disposal.

4.4.8 Post Construction Settlement of Fills

The post-construction settlement of fills following site preparation and fill construction, as described in previous sections of this report, is estimated to be approximately 0.1 percent of the fill thickness for fills compacted to 90 percent of the maximum dry density at moisture contents near optimum moisture content. Most of the static settlement are expected to occur as the loads are applied or shortly thereafter.

4.4.9 Temporary Excavations

All excavations must comply with applicable local, state, and federal safety regulations including the current OSHA Excavation and Trench Safety Standards. Construction site safety generally is the sole responsibility of the Contractor, who shall also be solely responsible for the means, methods, and sequencing of construction operations. We are providing the information below solely as a service to our client. Under no circumstances should the information provided be interpreted to mean that Kleinfelder is assuming responsibility for construction site safety or the Contractor's activities; such responsibility is not being implied and should not be inferred.

Excavations within a 1:1 plane extending downward from a horizontal distance of 2 feet beyond the bottom outer edge of existing improvements (e.g. building foundations) should not be attempted without bracing and/or underpinning the improvements. The geotechnical engineer or their field representative should observe the excavations so that modifications can be made to

Copyright 2021 Kleinfelder

the excavations, as necessary, based on variations in the encountered soil conditions. All applicable excavation safety requirements and regulations, including OSHA requirements, should be met.

Near-surface soils encountered during our field investigation consisted predominantly of sandy silt, silty sand and sands with varying amounts of gravel and cobble. In our opinion, these soils would be considered a Type 'C' soil with regard to the OSHA regulations. For this soil type, OSHA requires a maximum slope inclination of 1.5:1 (horizontal to vertical) or flatter for excavations 20 feet or less in depth. Temporary, shallow excavations with vertical side slopes less than 4 feet high should generally be stable, although sloughing may be encountered. Vertical excavations greater than 4 feet high should not be attempted without appropriate shoring to prevent local instability. All trench excavations should be braced and shored in accordance with good construction practice and all applicable safety ordinances and codes. The contractor should be responsible for the structural design and safety of the temporary shoring system, and we recommend that this design be submitted to Kleinfelder for review to check that our recommendations have been incorporated.

Stockpiled (excavated) materials should be placed no closer to the edge of an excavation than a distance equal to the depth of the excavation, but no closer than 4 feet. All trench excavations should be made in accordance with OSHA requirements.

4.4.10 Excavation Conditions

The borings were advanced using a truck-mounted hollow-stem auger drill rig. Drilling excavations were completed with moderate to difficult effort through the existing artificial fill, engineered fill and site soils. Boring KLF-9 encountered auger refusal at approximately 3 feet bgs and was relocated approximately 5 feet away. KLF-9 reached the design depth of approximately 51½ feet after relocation.

Conventional earth moving equipment should be capable of performing the soil excavations, although large and dense materials are known to have been placed in the artificial fill. The artificial fill was also encountered within the proposed development areas investigated. Based on review of project documents and discussions with the project team, there are areas of buried foundations, slag, and large concrete pieces within the existing developed areas onsite.

Copyright 2021 Kleinfelder

4.4.11 Shrinkage/Bulking

Due to the inherent inaccuracies and the many variables associated with the soil materials onsite and the additional aspects of construction, it is our opinion that shrinkage estimates may be unreliable. We have provided our estimate based on the limited information available and should only be used by the designers and not for grading bidding purposes.

Estimates for shrinkage of the onsite soils have been approximated by evaluating the results of in situ moisture and dry density tests and laboratory maximum dry density tests taken from soils within the upper 5 to 20 feet in selected borings. Although a great deal of care has been exercised in sampling and testing of the soils, a significant variability of actual shrinkage values is likely. These variations are heavily influenced by changes in soil types and densities between borings, the distance between the borings, the earthwork methods employed by the contractor, and variations in the actual compaction effort used. We estimate that overexcavation and recompaction of the onsite soils will result in an average shrinkage of approximately 5 to 15%.

4.4.12 Slope Stability

Based on our current understanding of the proposed project, we do not anticipate any cut or fill slopes to have a maximum height greater than 20 feet and to have inclination steeper that 2:1 (horizontal:vertical), and therefore do not require additional slope stability analysis. Once final grading plans and slope configuration and retaining wall designs are complete we should be provided the opportunity to review and perform further slope stability analysis, if needed.

4.4.13 Pipe Bedding and Trench Backfill

Pipe bedding and pipe zone material should consist of sand or similar granular material having a minimum sand equivalent value of 30. Onsite soils may be suitable, but should be tested and approved by the engineer of record prior to use. The sand should be placed in a zone that extends a minimum of 6 inches below and 6 inches above the pipe for the full trench width. The bedding material should be compacted to a minimum of 90 percent of the maximum dry density or to the satisfaction of the geotechnical engineer's representative observing the compaction of the bedding material. Bedding material should consist of sand, gravel, crushed aggregate, or native free-draining granular material with a maximum particle size of ¾ inch. Bedding materials should also conform to the pipe manufacturer's specifications, if available. Trench backfill above bedding and pipe zone materials may consist of approved, on-site or import soils placed in lifts no greater than 8 inches loose thickness and compacted to 90 percent of the maximum dry density based on ASTM Test Method D1557. Jetting of backfill is not recommended. The on-site

Copyright 2021 Kleinfelder

soils are suitable for backfill of utility trenches from one foot above the top of the pipe to the surface provided the material is free of organic and deleterious substances.

4.4.14 Stockpiling Excess Material

All stockpiles of excess soil materials should be kept away from the top of the excavations a minimum distance equal to the depth of the excavation. We recommend that stockpiles be constructed with a slope ratio of at least 2:1 (horizontal to vertical) and compacted to at least 85 percent relative compaction. Compaction requirements and slope ratios are provided only for temporary stockpiling considerations, such as erosion control and temporary influences on excavations. We have not considered any long-term or structural support usage of stockpiles.

4.5 CONCRETE SLABS SUPPORTED ON GRADE

4.5.1 General

Slab-on-grade floors should be underlain by engineered fill as discussed in the Earthwork Section of this report. We anticipate that the planned floor slabs will have a minimum thickness of 6 inches, will be unreinforced and dowelled at panel edges. Minimum reinforcement for floor slabs, if required, should be determined by the structural engineer. The structural engineer should design the slabs for any specific loading conditions. A modulus of subgrade reaction of 150 pounds per cubic inch may be used for design. The moisture content of the upper 18 inches of engineered fill should be at the recommended range for fill compaction at the time the floor slab is constructed. Precautions should be taken so as not to allow the upper engineered fill below the slab to dry out below the recommended moisture range between completion of the building pad and construction of the floor slab. Total static settlement for foundations designed in accordance with the recommendations presented herein, with an anticipated maximum load of 500 psf, is estimated to be less than a 1 inch.

Construction activities and exposure to the environment can cause deterioration of the prepared subgrade. We recommend that a Kleinfelder representative inspect the final subgrade conditions prior to placement of the concrete, and if necessary, perform additional moisture and density testing to determine the subgrade suitability. A low slump concrete should be used to reduce possible curling of the slab.

Copyright 2021 Kleinfelder

4.5.2 Exterior Flatwork

Where exterior flatwork, such as sidewalks, are to be constructed, the subgrade should be prepared by being scarified to a depth of 8 inches and moisture conditioned to a moisture content within 2 percent of the optimum moisture content, and recompacted as recommended in the Earthwork Section of this report. Exterior, structurally loaded flatwork, such as truck docks or trash enclosures should adhere to the recommendations for rigid pavement presented in this report.

4.5.3 Vapor Retarder

Subsurface moisture and moisture vapor naturally migrate upward through the soil and, where the soil is covered by a building or pavement, this subsurface moisture will collect. To reduce the impact of this subsurface moisture and the potential impact of future introduced moisture (such as landscape irrigation or precipitation) on moisture sensitive flooring, the current industry standard is to place a vapor retarder on a compacted crushed rock layer and/or sand layers, 1 to 2 inches in thickness, placed above and below the vapor retarder. The crushed rock layer and/or sand layer may be omitted in accordance with the vapor barrier manufacturer's installation recommendations.

The necessity and placement of a vapor retarder should be evaluated by the structural engineer and/or flooring consultant. It should be noted that although vapor barrier systems are currently the industry standard, this system might not be completely effective in preventing floor slab moisture problems. These systems typically will not necessarily assure that floor slab moisture transmission rates will meet floor covering manufacturer standards and that indoor humidity levels be appropriate to inhibit mold growth. The design and construction of such systems are totally dependent on the proposed use and design of the proposed building and all elements of building design and function should be considered in the slab-on-grade floor design. Building design and construction may have a greater role in perceived moisture problems since sealed buildings/rooms or inadequate ventilation may produce excessive moisture in a building and affect indoor air quality.

4.5.4 Concrete Curing and Flooring

Various factors such as surface grades, adjacent planters, the quality of slab concrete and the permeability of the on-site soils affect slab moisture and can control future performance. In many cases, floor moisture problems are the result of either improper curing of floor slabs or improper application of flooring adhesives. We recommend contacting a flooring consultant

Copyright 2021 Kleinfelder

experienced in the area of concrete slab-on-grade floors for specific recommendations regarding your proposed flooring applications. Special precautions must be taken during the placement and curing of all concrete slabs. Excessive slump (high water-cement ratio) of the concrete and/or improper curing procedures used during either hot or cold weather conditions could lead to excessive shrinkage, cracking or curling of the slabs. High water-cement ratio and/or improper curing also greatly increase the water vapor permeability of concrete. We recommend that all concrete placement and curing operations be performed in accordance with the American Concrete Institute (ACI) Manual.

It is emphasized that we are not floor moisture-proofing experts. We make no guarantee, nor provide any assurance that use of the capillary break/vapor retarder system will reduce concrete slab-on-grade floor moisture penetration to any specific rate or level, particularly those required by floor covering manufacturers. The builder and designers should consider all available measures for slab moisture protection.

4.6 RETAINING WALLS

We have provided preliminary cantilever retaining wall recommendations below. Further evaluation will be needed once wall types, locations and heights are selected.

4.6.1 General

Design earth pressures for retaining walls depend primarily on the allowable wall movement, wall inclination, type of backfill materials, backfill slopes, surcharges, and drainage. The earth pressures provided assume that that a non-expansive backfill will be used and a drainage system will be installed behind the walls, so that external water pressure will not develop. If a drainage system will not be installed, the wall should be designed to resist hydrostatic pressure in addition to the earth pressure as well as reinforcement that should be protected from rust or other corrosion-inducing effects of moisture. Determination of whether the active or at-rest condition is appropriate for design will depend on the flexibility of the walls. Walls that are free to rotate at least 0.002 radians (deflection at the top of the wall of at least 0.002 x H, where H is the unbalanced wall height) may be designed for the active condition. Walls that are not capable of this movement should be assumed rigid and designed for the at-rest condition. The recommended active and at-rest earth pressure values are provided in Table 7, Earth Pressures for Retaining Walls.

Copyright 2021 Kleinfelder

Table 7
Earth Pressures for Retaining Walls
(Non-Expansive Backfill)

Wall movement	Equivalent Fluid Pressure Level Backfill (pcf)	Equivalent Fluid Pressure Backfill at 2:1 (H:V) (pcf)
Free to Deflect (active condition)	40	60
Restrained (at-rest condition)	60	85
Seismic Increment Increase[1, 2]	30	85

[1] Walls supporting more than 6 feet of backfill should be designed to support an incremental seismic lateral pressure for the active condition, which is applied as a triangular pressure distribution with a maximum pressure at the bottom of the wall, not inverted. Analysis of seismic 2:1 slope backfill has been limited to 10-foot wall height and 10 foot slope height. Additional information specific to each wall should be provided for walls greater than these limits.

[2] For restrained wall, use the static active earth pressure and seismic increment to check the seismic condition; use at-rest earth pressure only to check the static condition; the larger loading of both cases should be used for the design of restrained wall.

In addition to the above lateral pressure, undrained walls will have to be designed for full hydrostatic pressure. The above lateral earth pressures do not include the effects of surcharges (e.g., traffic, footings), compaction, or truck-induced wall pressures. Any surcharge (live, including traffic, or dead load) located within a 1:1 plane drawn upward from the base of the excavation should be added to the lateral earth pressures. The lateral contribution of a uniform surcharge load located immediately behind walls may be calculated by multiplying the surcharge by 0.3 for cantilevered walls and 0.45 for restrained walls. Walls adjacent to areas subject to vehicular traffic should be designed for a 2-foot equivalent soil surcharge (240 psf). Lateral load contributions from other surcharges located behind walls may be provided once the load configurations and layouts are known.

4.6.2 Backfill Compaction

Care must be taken during the compaction operation not to overstress the wall. Wall backfill should be compacted to a least 90 percent relative compaction; however, heavy construction equipment should be maintained a distance of at least 3 feet away from the walls while the

Copyright 2021 Kleinfelder

backfill soils are being placed. Kleinfelder should be contacted when development plans are finalized for review of wall and backfill conditions on a case-by-case basis.

4.6.3 Drainage

Walls should be properly drained or designed to resist hydrostatic pressures. Adequate drainage is essential to provide a free-drained backfill condition and to limit hydrostatic buildup behind the wall. Walls should also be appropriately waterproofed and include weep holes for drainage. In lieu of weep holes, a 4-inch diameter perforated PVC pipe, placed perforations down leading to a suitable gravity outlet, should be installed at the base of the walls.

4.7 DRAINAGE AND LANDSCAPING

It is important that positive surface drainage be provided to prevent ponding and/or saturation of the soils in the vicinity of foundations, concrete slabs-on-grade, or pavements. We recommend that the site be graded to carry surface water away from the improvements and that positive measures be implemented to carry away roof runoff. Poor perimeter or surface drainage could allow migration of water beneath the building or pavement areas, which may result in distress to project improvements. If planted areas adjacent to structures are desired, we suggest that care be taken not to over irrigate and to maintain a leak-free sprinkler piping system. In addition, it is recommended that planter areas next to buildings have a minimum of 5 percent positive fall away from building perimeters to a distance of at least 5 feet. Drain spouts should be extended to discharge a minimum of 5 feet from the building, or some other method should be utilized to prevent water from accumulating in planters. Landscaping after construction should not promote ponding of water adjacent to structures.

4.8 EXPANSION POTENTIAL

Based on the granular nature of the soils encountered during our investigation, expansion potential of the existing soils is considered very low.

4.9 PRELIMINARY SOIL CORROSIVITY

The soil corrosivity potential of the on-site materials to steel and buried concrete was preliminarily evaluated using a sample collected during our investigation. Testing was performed in general accordance with California Test Methods 643, 417, and 422 for pH and resistivity, soluble chlorides, and soluble sulfates, respectively. The test results are presented in Table 8, Preliminary Corrosivity Test Results.

Copyright 2021 Kleinfelder

Table 8
Preliminary Corrosivity Test Results

Boring	Depth (ft)	pH	Sulfate (% per weight)	Chloride (ppm)	Resistivity (ohm-cm)
KLF-1	1 – 5	9.16	0.037	135	3,100
KLF-3	1 – 5	8.15	0.001	115	14,000
KLF-4	10	8.05	0.001	130	21,000
KLF-5	3 – 5	10.66	0.013	135	3,800
KLF-6	5	8.23	0.001	125	16,000
KLF-7	5	7.63	0.001	195	13,000
KLF-10	1 – 5	9.68	0.122	135	1,500
KLF-12	10.0	8.87	0.216	155	1,400
KLF-13	1 – 5	10.11	0.222	245	720
KLF-16	1 – 5	7.66	0.001	125	19,000
KLF-17	10	7.63	0.001	215	8,500
KLF-18	5	8.3	0.017	305	3,600
KLF-19	5	4.48	0.001	275	14,000
KLF-20	1 – 5	7.62	0.001	205	11,000

These tests are only an indicator of soil corrosivity for the samples tested. Other soils found on site may be more, less, or of a similar corrosive nature. Imported fill materials should be tested to confirm that their corrosion potential is not more severe than those noted.

Resistivity values below 1,000 ohm-cm are considered extremely corrosive and values between 1,000 and 3,000 ohm-cm are considered highly corrosive to buried ferrous metals (Roberge, 2006). Corrosion potential generally decreases as resistivity values increase.

A water-soluble chloride content of less than 500 ppm is generally considered non-corrosive to reinforced concrete.

The concentrations of soluble sulfates indicate that the subsurface soils in the vicinity of Building 3 and 4 represent a Class S2 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-14 Table 19.3.1.1 (ACI, 2014). Therefore, in accordance with ACI Building Code 318-14, a concrete mix of Type V cement with a minimum compressive strength of 4,500 psi and maximum water-cement ratio of 0.45 are specified for these sulfate concentrations in the vicinity of Building 3 and 4. We recommend further corrosion testing in the vicinity of Building 3 and 4 to confirm higher sulfate concentrations in this area as the concentrations in these areas appear significantly higher than the project site. An option to decrease the sulfate content in this area is by using the, grading operation to blend soils in this area with onsite soil containing lower sulfate concentrations. Subsequent verification corrosion testing in these areas presenting results with lower sulfate content should be performed.

Copyright 2021 Kleinfelder

The concentrations of soluble sulfates elsewhere on the project site indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-14 Table 19.3.1.1 (ACI, 2014). Therefore, in accordance with ACI Building Code 318-14, no special provisions for selection of cement type are required in these areas.

We provided the results of the corrosion testing to a competent corrosion engineer to evaluate the corrosion potential of the on-site soils to the proposed improvements. A Soil Corrosion Evaluation report is presented in Appendix E, Soil Corrosivity Evaluation. We recommend further consultation with a corrosion engineer and testing as required to provide specific corrosion mitigation methods appropriate for the project, if desired.

4.10 PAVEMENT SECTIONS

4.10.1 Asphalt-Concrete Pavement Sections

The required pavement structural sections will depend on the expected wheel loads, volume of traffic, and subgrade soils. The Traffic Indexes (TI's) assumed should be reviewed by the project Owner, Architect, and/or Civil Engineer to evaluate their suitability for this project. Changes in the TI's will affect the corresponding pavement section. The pavement subgrade should be prepared just prior to placement of the base course. Positive drainage of the paved areas should be provided since moisture infiltration into the subgrade may decrease the life of pavements. Table 9, Preliminary Asphalt Concrete Pavement Sections, presents our recommendations of asphalt concrete pavement sections.

Table 9
Preliminary Asphalt Concrete Pavement Sections
(Design R-value = 50)

Traffic Use	Assumed Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
General Parking Traffic	5	3.0	4.0
Local Streets	6	3.0	5.0
Heavy Truck Access Ways	7	3.5	6.0
Public Streets	8	3.5	8.0
Heavy Truck Access Ways	9	4.0	9.0

Copyright 2021 Kleinfelder

The R-Values from our investigation were evaluated and a design R-Value of 50 was selected for pavement design. Since the characteristics of the near-surface soils can change as a result of grading, we recommend that the subgrade/artificial fill soils be retested for pavement support characteristics, to confirm the parameters used in design and allow for a possible reduction in structural section thickness. Pavement sections provided above are contingent on the following recommendations being implemented during construction.

- The pavement sections recommended above should be placed on at least 18 inches of engineered fill compacted to at least 90 percent of maximum dry density with the upper 12 inches below pavements compacted to at least 95 percent relative compaction. The overexcavation of the pavement areas should be conducted as recommended in the earthwork section of this report. Prior to fill placement, the exposed subgrade should be scarified to a depth of 8 inches, uniformly moisture conditioned to the moisture content of granular soils (sands, silty sands and gravels) should be within 2 percent of the optimum moisture content at the time of compaction.
- Subgrade soils should be in a stable, non-pumping condition at the time aggregate base materials are placed and compacted.
- Aggregate base materials should be compacted to at least 95 percent relative compaction.
- Adequate drainage (both surface and subsurface) should be provided such that the subgrade soils and aggregate base materials are not allowed to become wet.
- Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base rock, or crushed miscellaneous base as specified in the "Standard Specifications for Public Work Construction" ("Greenbook").
- The asphalt pavement should be placed in accordance with “Green Book” specifications or the County of San Bernardino requirements, as appropriate. We recommend that the asphalt pavement be placed in a single layer of ½-inch aggregate mix for pavements 4 inches thick or less. If the pavement section is over 4 inches thick, then the asphalt should be placed in at least two layers of mix. The first layer should consist of a base or coarse layer (3/4-inch mix). The second layer (i.e., top layer) should consist of a medium or fine layer of ½-inch mix.
- Based on our analyses and our experience with similar projects, it is our professional opinion that the as-built asphalt pavement sections should have a tolerance of +/- ¼-inch in order to remain valid for satisfying the intent of the recommendations presented

Copyright 2021 Kleinfelder

herein. Typically, the loose thickness should be ¼ inch per inch greater than the required compacted thickness. In addition to loose measurements prior to compaction, this is typically evaluated by averaging the thickness of several cores in a specific area. Individual measurements (loose thickness or core dimension) should be within at least ¾-inch of the design thickness.

- All concrete curbs separating pavement and landscaped areas should extend into the subgrade and below the bottom of adjacent, aggregate base materials.

Pavement sections provided above are based on the soil conditions encountered during our field investigation, our assumptions regarding final site grades, and limited laboratory testing. Since the actual pavement subgrade materials exposed during grading may be significantly different than those tested for this study, we recommend that representative subgrade samples be obtained and additional R-value tests performed. Should the results of these tests indicate a significant difference, the design pavement section(s) provided above may need to be revised.

4.10.2 Portland Cement Concrete Pavement

Concrete pavements may be desirable in loading dock and trash collection areas. The concrete pavement should have a minimum 28-day compressive strength of 3,000 psi. Control joints should be spaced approximately every 10 feet. The concrete pavement section should be placed on at least 18 inches of engineered fill compacted to at least 90 percent of the maximum dry density. Prior to fill placement, the exposed subgrade should be scarified to a depth of 8 inches, uniformly moisture conditioned to the moisture content range recommended in Section 4.4 of this report. Table 10, Preliminary Recommended PCC Pavement Sections, presents our recommendations of Portland Cement Concrete pavement sections.

Table 10
Preliminary Recommended PCC Pavement Sections

Assumed Traffic Index (TI)	Concrete Thickness (inches; using a 28-day compressive strength of 4,000 psi)	Concrete Thickness (inches; using a 28-day compressive strength of 3,500 psi)	Concrete Thickness (inches; using a 28-day compressive strength of 3,000 psi)
5	6.0	6.5	7.0
6	6.5	6.5	7.0
7	6.5	7.0	7.5
8	7.0	7.5	8.0
9	7.5	8.0	8.5

Copyright 2021 Kleinfelder

As an alternative to placing PCC pavements directly over 18 inches of engineered fill, 6 inches of aggregate base material may be added between the PCC and engineered fill to provide additional load distribution, drainage, and an option to reduce the thickness of the recommended PCC. If 6 inches of aggregate base material (compacted to 95% relative compaction) is used between the recommended 18 inches of engineered fill and PCC pavement, the recommended PCC thickness may be reduced by ½ inch. Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base, or crushed miscellaneous base as specified in the "Standard Specifications for Public Work Construction" ("Greenbook").

Copyright 2021 Kleinfelder

5 ADDITIONAL SERVICES

5.1 DESIGN LEVEL INVESTIGATION

This report presents preliminary geotechnical recommendations to develop a conceptual design and provide planning-level cost estimating. This study is not intended to be a design-level geotechnical study, and additional field and laboratory testing will be required in order to provide detailed geotechnical recommendations.

The recommendations provided in this report are based on our understanding of the described project information and on our interpretation of the data. We have made our recommendations based on experience with similar subsurface conditions under similar loading conditions. The recommendations apply to the specific project discussed in this report; therefore, any change in the structure configuration, loads, location, or the site grades should be provided to us so that we can review our conclusions and recommendations and make any necessary modifications.

5.2 PLANS AND SPECIFICATIONS REVIEW

We recommend that a general review of the project plans and specifications be conducted before they are finalized to verify that our geotechnical recommendations have been properly interpreted and implemented during design. We also recommend that evaluations be performed on any slopes and retaining wall designs that are proposed. If we are not accorded the privilege of performing this review, we can assume no responsibility for misinterpretation of our recommendations. The review can be completed on a time-and-expense basis.

5.3 CONSTRUCTION OBSERVATION AND TESTING

The construction process is an integral design component with respect to the geotechnical aspects of a project. Because geotechnical engineering is an inexact science due to the variability of natural processes and materials, and because we sample only a small portion of the soils affecting the performance of the proposed project, unanticipated or changed conditions can be disclosed during grading. Proper geotechnical observation and testing during construction is imperative to allow the geotechnical engineer the opportunity to verify assumptions made during the design process. Therefore, we recommend that Kleinfelder be retained during the construction of the proposed development to observe compliance with the design concepts and geotechnical recommendations, and to allow design changes in the event

Copyright 2021 Kleinfelder

that subsurface conditions or methods of construction differ from those assumed while completing this study.

Copyright 2021 Kleinfelder

6 LIMITATIONS

This report has been prepared for the exclusive use of HIP VI Enterprises, LLC, a Delaware Limited Liability Corporation, and its consultants and contractors for specific application to the proposed improvements for the proposed Speedway Commerce Center. The findings, conclusions and recommendations presented in this report were prepared in a manner consistent with the standards of care and skill ordinarily exercised by members of our profession practicing under similar conditions in the geographic vicinity and at the time the services will be performed. No warranty or guarantee, express or implied, is made. Our field exploration program for the geotechnical study of this project was based on the approximate building locations provided to us by the client.

The client has the responsibility to see that all parties to the project, including the designer, contractor, subcontractors, etc., are made aware of this report in its entirety. This report contains information that may be useful in the preparation of contract specifications. However, this report is not designed as a specification document and may not contain sufficient information for this use without proper modification.

This report may be used only by the client and only for the purposes stated, within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land use, site conditions (both on site and off site) or other factors may change over time, and additional work may be required with the passage of time. Any party, other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of this report and the nature of the new project, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party and the client agrees to defend, indemnify, and hold harmless Kleinfelder from any claims or liability associated with such unauthorized use or non-compliance.

The scope of our geotechnical services did not include any environmental site assessment for the presence or absence of hazardous/toxic materials, including methane or other landfill related gases. Kleinfelder will assume no responsibility or liability whatsoever for any claim, damage, or injury which results from pre-existing hazardous materials being encountered or present on the project site, or from the discovery of such hazardous materials.

APPENDIX A
FIELD EXPLORATIONS

Copyright 2021 Kleinfelder

APPENDIX A
FIELD EXPLORATIONS

The subsurface conditions at the site were explored by drilling and logging twenty three (23) hollow-stem auger geotechnical borings and twenty (20) hollow-stem auger infiltration borings. The hollow stem auger borings were drilled using a CME-95 drill rig. The hollow stem auger drill rigs were provided by BC2 Environmental of Orange, California. The hollow stem auger drill rigs mentioned above was equipped with an automatic hammer system to drive the samplers. The locations of our borings are shown on Figure 2. The infiltration borings and infiltration recommendations are presented in the referenced Kleinfelder 2021 report.

The logs of borings are presented as Figures A-3 through A-25. An explanation to the logs is presented on Figures A-1 and A-2. The Logs of Borings describe the earth materials encountered, samples obtained, and show field and laboratory tests performed. The logs also show the boring number, excavation date and the name of the logger and excavation subcontractor. A HAZWOPER trained Kleinfelder engineer logged the borings utilizing the Unified Soil Classification System (USCS). The boundaries between soil types shown on the logs are approximate because the transition between different soil layers may be gradual. Bulk and drive samples of representative earth materials were obtained from the borings at maximum intervals of about 5 feet.

A California-type sampler was used to obtain relatively undisturbed drive samples of the soil encountered. This sampler consists of a 3-inch O.D., 2.4 inch I.D. split barrel shaft that is driven a total of 18 inches into the soil at the bottom of the boring. The soil was retained in six 1-inch brass rings for laboratory testing. The sampler was driven using a 140-pound hammer falling 30 inches. The total number of hammer blows required to drive the sampler the final 12 inches is termed the blow count and is recorded on the Logs of Borings. Where the sample was driven less than 12 inches, the number of blows to drive the sample for each 6-inch segment, or portion thereof, is shown on the logs. For example, 50/4" indicates 50 blows to drive the sampler 4 inches to refusal.

Samples were also obtained using a Standard Penetration Sampler (SPT). This sampler consists of a 2-inch O.D., 1.4-inch I.D. split barrel shaft that is advanced into the soils at the bottom of the drill hole a total of 18 inches. The sampler was driven using a 140 pounds hammer falling 30 inches. The total number of hammer blows required to drive the sampler the final 12 inches is termed the blow count (N-value) and is recorded on the Logs of Borings. Where the sample was driven less than 12 inches, the number of blows to drive the sample for

Copyright 2021 Kleinfelder

each 6-inch segment, or portion thereof, is shown on the logs. The procedures we employed in the field are generally consistent with those described in ASTM Standard Test Method D-1586.

Soil samples obtained from the SPT sampler were stored in plastic bags. Bulk samples of the sub-surface soils were retrieved directly from the soil cuttings and placed in large plastic bags.

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

Modifier	≥15%	≥30%

MOISTURE CONTENT

DESCRIPTION	FIELD TEST
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

CEMENTATION

DESCRIPTION	FIELD TEST
Weakly	Crumbles or breaks with handling or slight finger pressure
Moderately	Crumbles or breaks with considerable finger pressure
Strongly	Will not crumble or break with finger pressure

CONSISTENCY - FINE-GRAINED SOIL

CONSISTENCY	SPT - N_{60} (# blows / ft)	Pocket Pen (tsf)	UNCONFINED COMPRESSIVE STRENGTH (Q_u)(psf)	VISUAL / MANUAL CRITERIA
Very Soft	<2	PP < 0.25	<500	Thumb will penetrate more than 1 inch (25 mm). Extrudes between fingers when squeezed.
Soft	2 - 4	0.25 ≤ PP <0.5	500 - 1000	Thumb will penetrate soil about 1 inch (25 mm). Remolded by light finger pressure.
Medium Stiff	4 - 8	0.5 ≤ PP <1	1000 - 2000	Thumb will penetrate soil about 1/4 inch (6 mm). Remolded by strong finger pressure.
Stiff	8 - 15	1 ≤ PP <2	2000 - 4000	Can be imprinted with considerable pressure from thumb.
Very Stiff	15 - 30	2 ≤ PP <4	4000 - 8000	Thumb will not indent soil but readily indented with thumbnail.
Hard	>30	4 ≤ PP	>8000	Thumbnail will not indent soil.

REACTION WITH HYDROCHLORIC ACID

DESCRIPTION	FIELD TEST
None	No visible reaction
Weak	Some reaction, with bubbles forming slowly
Strong	Violent reaction, with bubbles forming immediately

APPARENT / RELATIVE DENSITY - COARSE-GRAINED SOIL

APPARENT DENSITY	SPT-N_{60} (# blows/ft)	MODIFIED CA SAMPLER (# blows/ft)	CALIFORNIA SAMPLER (# blows/ft)	RELATIVE DENSITY (%)
Very Loose	<4	<4	<5	0 - 15
Loose	4 - 10	5 - 12	5 - 15	15 - 35

Very Dense	>50	>60	>70	85 - 100

FROM TERZAGHI AND PECK, 1948

PLASTICITY

DESCRIPTION	LL		PI
Non-Plastic	NP	Either the LL or the PI (or both) may be used to describe the soil plasticity. The ranges of numbers shown here do not imply that the LL ranges correlate with the PI ranges for all soils.	NP
Low	< 30		< 15
Medium	30 - 50		15 - 25
High	> 50		> 25

LL is from Casagrande, 1948. PI is from Holtz , 1959.

STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. thick, note thickness.
Laminated	Alternating layers of varying material or color with the layer less than 1/4-in. thick, note thickness.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensided	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness.

ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

The boring was terminated at approximately 50 ft. below ground surface. The boring was backfilled with auger cuttings and patched at surface with quickset concrete dyed black on September 14, 2021.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration location and elevation are approximate and were estimated by Google Earth.

The boring was terminated at approximately 51.5 ft. below ground surface. The boring was backfilled with auger cuttings and patched at surface with quickset concrete dyed black on September 17, 2021.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration location and elevation are approximate and were estimated by Google Earth.

The boring was terminated at approximately 51.5 ft. below ground surface. The boring was backfilled with auger cuttings and patched at surface with quickset concrete dyed black on September 27, 2021.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration location and elevation are approximate and were estimated by Google Earth.

The boring was terminated at approximately 51.5 ft. below ground surface. The boring was backfilled with auger cuttings and patched at surface with quickset concrete dyed black on September 22, 2021.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration location and elevation are approximate and were estimated by Google Earth.

The boring was terminated at approximately 51.5 ft. below ground surface. The boring was backfilled with auger cuttings and patched at surface with quickset concrete dyed black on September 23, 2021.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration location and elevation are approximate and were estimated by Google Earth.

APPENDIX B
LABORATORY TESTING

Copyright 2021 Kleinfelder

APPENDIX B
LABORATORY TESTING

Laboratory tests were performed on representative intact and bulk soil samples to estimate engineering characteristics of the various earth materials encountered. The laboratory testing was performed by EGLab Inc. of Arcadia, California. Testing was performed in accordance with one of the following references:

1. Lambe, T. William, Soil Testing for Engineers, Wiley, New York, 1951
2. Laboratory Soils Testing, U.S. Army, Office of the Chief of Engineers, Engineering Manual No. 1110-2-1906, November 30, 1970
3. ASTM Standards for Soil Testing, latest revisions
4. State of California Department of Transportation, Standard Test Methods, latest revisions.

LABORATORY MOISTURE DETERMINATIONS AND UNIT WEIGHTS

Natural moisture content and unit weight tests were performed on selected samples. The moisture content tests were performed in general accordance with ASTM Test Method D 2216 and the unit weight tests were performed in general accordance with ASTM Test Method D 2937. The results are presented on the Logs of Borings in Appendix A.

WASH SIEVE

The percent passing the #200 sieve analysis of ten soil samples was performed by wash sieving in accordance with ASTM Standard Test Method D1140. The test results are summarized in Table B-1, Wash Sieve Test Results and presented on the Logs of Borings in Appendix A.

SIEVE ANALYSES

Sieve analyses were performed on selected samples of the materials encountered at the site to evaluate the grain size distribution characteristics of the soils and to aid in their classification. Tests were performed in general accordance with ASTM Test Method D 422. Results of these tests are presented as Figures B-1 through B-20, Grain Size Distribution Curve.

Copyright 2021 Kleinfelder

DIRECT SHEAR

Direct shear testing was performed on relatively undisturbed and remolded samples for shear strength and cohesion values of the in-situ soils in accordance with ASTM Standard Test Method D 3080. The results are presented as Figure B-21 through B-28, Direct Shear Test.

CONSOLIDATION TESTS

Consolidation testing was performed on selected relatively undisturbed and remolded samples in accordance with ASTM D 2435. The tests were performed on 1.0-inch-high, 2.41-inch diameter samples. After trimming the ends, the sample was placed in a consolidometer and an initial reading was recorded. The sample was saturated during loading, and thereafter, the sample was incrementally loaded. The test results are presented on Figure B-29 through Figure B-35, Consolidation Test in Appendix B.

PRELIMINARY CORROSIVITY TESTS

A series of chemical tests were performed on select near-surface soil samples to evaluate pH, resistivity, sulfate and chloride contents. The results of these tests are presented in Table B-2, Preliminary Corrosion Test Results.

R-VALUE TEST

Resistance value (R-value) tests were performed on select bulk soil samples to evaluate pavement support characteristics of the near-surface onsite soils. R-value testing was performed in accordance with Caltrans Standard Test Method 301. The test results are presented in Table B-3, R-Value Test Results.

MAXIMUM DENSITY

Maximum density tests were performed on a select bulk sample of the on-site soils to determine compaction characteristics. The test was performed in accordance with ASTM Standard Test Method D 1557. The test results are presented in Table B-4, Maximum Dry Density and Optimum Moisture.

APPENDIX D
SITE-SPECIFIC GROUND MOTION HAZARD ANALYSIS

SUBJECT: Proposed Speedway Commerce Center
Fontana, California 92335

PRJ. NO.: 20221328.002A

FROM: Minxing Zhao, PhD, PE, GE; Zia Zafir, PhD, PE, GE

INTRODUCTION

This document presents the results of Kleinfelder's site-specific ground motion hazard analysis (GMHA) for the proposed Speedway Commerce Center, Building 1, located in Fontana, California. The purpose of this GMHA is to develop site-specific ground motion parameters in terms of peak ground accelerations and response spectral accelerations for the subject site, and in accordance with our proposal dated August 31, 2021. This document has been prepared consistent with the requirements of the 2019 California Building Code (CBC) which adopts the procedures outlined in ASCE 7-16 for site-specific analyses. The scope of this analysis includes:

- Development of a site-specific earthquake source model for conformance with the current code requirements and current state of the practice.
- Performing site-specific ground motion hazard analyses per Section 21.2 of ASCE 7-16 consisting of probabilistic and deterministic seismic hazard analyses (PSHA and DSHA).
- Developing site-specific response spectra for the Risk-Targeted Maximum Considered Earthquake (MCE_R) and the Design Earthquake (DE) and obtaining seismic design parameters per Sections 21.4 and 21.5 of ASCE 7-16.
- Preparation of this document presenting the results of the site-specific seismic hazard analyses.

This document is intended to support our current geotechnical study for the subject site and is subject to the same limitations as contained in the main report.

PROJECT LOCATION

The project site is located in Fontana, California. We have used the approximate coordinates of the site as the control point for the ground motion hazard analysis at:

Latitude: 34.0863° N
Longitude: 117.4929° W

SEISMOTECTONIC SETTING AND SEISMICITY

A brief discussion of the seismotectonic setting and historic seismicity is provided below. The regional seismotectonic setting and historic seismicity inform the selection of an appropriate seismic source model and provide context for the likely potential for future earthquakes to impact the site.

Seismotectonic Setting

The site is located within the northern portion of the Perris Block in the Peninsular Ranges geomorphic province in the Western United States (WUS) along the predominantly right lateral transform margin between the Pacific and North American Plates. The Perris Block is bounded on the east by the San Jacinto fault zone, on the west by the Elsinore fault zone, and on the north by the Sierra Madre-Cucamonga fault zone. According to Meigs and Oskin (2002), to the south of ~34°N latitude, the Peninsular Ranges structural province is characterized by northwest-trending strike-slip faulting, northwest motion of crustal blocks relative to stable North America, and negligible vertical-axis block rotation. In contrast, the Transverse Ranges province to the north of ~34°N latitude is characterized by west-trending oblique-slip faulting and a significant component of north-south crustal shortening contemporaneous with northwestward motion and vertical-axis block rotation relative to stable North America. A structurally complex transition zone between 33.75°N and 34.25°N latitude defines the boundary separating these two provinces.

Regional Faulting and Historic Seismicity

Based on the information provided in CGS (2018), the site is not located within a State-designated Alquist-Priolo Earthquake Fault Zone where site-specific studies addressing the potential for surface fault rupture are required and no known active faults are mapped traversing the site. However, the site is located close to several active faults where historic seismic activities have been observed in the past.

The nearest fault to the site is the Fontana (Seismicity) fault located approximately 1.0 km to the southeast of the site. Other nearby major fault sources include the Cucamonga fault (10.4 km to the north), the San Jacinto (Lytle Creek connector) fault (11.2 km to the northeast), the San Jacinto fault zone (14.4 km to the northeast), and the S. San Andreas fault zone (19.2 km to the northeast). The above distances are measured from the site to the surface or projected surface trace using the USGS Earthquake Scenario Map (BSSC 2014). Any seismic activity on these faults could cause significant ground shaking at the site. These and other potential seismogenic sources are identified on Figure D1.

Patterns of historic seismicity are used to identify potentially active sources, develop on- and off-fault recurrence rates, and understand the historic impacts from seismicity at a site. A catalog of events is typically used, such as those developed and used by the Uniform Earthquake Rupture Forecast version 3 (UCERF3, Field et al., 2013). For this study, we compiled and reviewed data from the USGS ANSS Comprehensive Earthquake Catalog which contains data from multiple sources from 1800 to 2021 within 300 km of the site. We also reviewed the catalog of historic events developed and used by the UCERF3 project. Comparison of these two catalogs indicates generally good agreement. In addition, we obtained information about California earthquakes having M≥5 from CGS Map Sheet 49 (Toppozada et al., 2000).

The closest recorded significant event (M_w>5) in the above referenced catalogs is the 1892 Rancho Cucamonga (M_w 5.5) earthquake, located approximately 12.6 km north to the site. The historic seismicity along the San Jacinto fault zone may also be significant due to proximity of this fault zone to the site, such as the 1858 San Bernardino (M_w 6.0) earthquake, the 1923 Loma Linda (M_w 6.0) earthquake, and the 1899 San Jacinto (M_w 6.7) earthquake. Other significant regional seismicity has included the 1812 San Bernardino (M_w 7.5) earthquake, the 1952 Grapevine (M_w 7.5) earthquake, the 1992 Landers (M_w 7.3) earthquake, the 1999 Hector Mine (M_w 7.1) earthquake, and the 1994 Northridge (M_w 6.7) earthquake. Historic seismicity within 100 km of the site is depicted on Figure D1.

A publication prepared by the U.S. Geological Survey regarding earthquake probabilities in the Los Angeles Area (Working Group on California Earthquake Probabilities, 2014) concludes that there is a 60 percent chance that one of the major faults within the Los Angeles Area will experience a major (M 6.7+) earthquake during the period of 2014 to 2043. This publication also shows that there is a 46 percent chance of M 7+ earthquake and 31 percent chance of M 7.5+ happening before 2043. These probabilities are significant and require mitigation. As has been seen in the past earthquakes such as the 1994 (M 6.7) Northridge earthquake, that this level of shaking could cause significant damage to the built environment.

SUBSURFACE SITE CONDITIONS FOR SEISMIC STUDY

Site effects are typically modeled in GMHA based on the average shear wave velocity in the upper 100 feet (V_{S30}). From the geotechnical investigations completed by Kleinfelder in 2021, the interpreted soil profile at the proposed Building 1 generally consists of sands, silty sands and sandy silts with varying amounts of gravels and cobbles. Based on the shear wave velocities measured from the seismic line, SW-1, completed by Kleinfelder in 2021, the V_{S30} value is estimated to be approximately 419 meters per second (m/s). Therefore, for our analysis we have selected V_{S30} of 419 m/s (1374 feet per second) consistent with a Site Class C profile per Table 20.3-1 of ASCE 7-16.

SITE-SPECIFIC GROUND MOTION HAZARD ANALYSIS

A site-specific ground motion hazard analysis (GMHA) is a useful tool in evaluation of potential ground motion hazard at a site. The analysis generally includes a representative seismic source model (geometry, style of faulting, magnitude, etc.), appropriate recurrence relationships, and appropriate ground motion models (aka. attenuation relationships). The analysis can be used to quantify the potential for strong ground shaking at a site including the site-modified peak ground acceleration (PGA) and spectral accelerations (S_a). For this work, the analysis was performed consistent with the requirements of Section 21.2 of ASCE 7-16 and the 2019 CBC. Details of the analysis used in this study are described below.

Seismic Source Model

Based on our review of the seismotectonic setting and nearby active sources we have selected the Petersen et al. (2014) source model, which has been used in USGS 2014 National Seismic Hazard Mapping program, as the base model for our evaluations. The Petersen et al. (2014) source model generally uses the sources developed by the UCERF3 project within California (which utilizes two alternative fault models, FM 3.1 and 3.2) to model on-fault seismicity. Off-fault seismicity (e.g. background seismicity) is modeled using gridded seismic sources from UCERF3. The UCERF3 source model has been used in developing the 2014 USGS National Seismic Hazard Maps and is appropriate for use in modeling seismicity based on the 2019 CBC.

Shallow crustal fault sources from the regional model within 300 km of the site have been included in the model, with subduction earthquake sources included out to 1000 km as recommended by the USGS (Petersen et al., 2014). Based on review of the nearby and significant sources it was felt that the existing UCERF3 model generally adequately captured the seismicity in the region. The source model used for this work is shown on Figure D2 with significant fault sources within 30 km listed in Table D-1.

TABLE D-1: SIGNIFICANT INDEPENDENT SEISMOGENIC FAULT SOURCES WITHIN 30 KM

Segment Name	Closest Distance (km)	Length (km)	Avg Dip (deg.)	FM 3.1	FM 3.2	M_{max}
Fontana (Seismicity)	1.0	24	80	TRUE	TRUE	6.8
Cucamonga	9.0	29	45	TRUE	TRUE	6.9

Notes:

1. Values shown are representative values presented in UCERF3 “fault section data” table.
2. Distances shown are to the modeled fault surface or projected surface trace in UCERF3.
3. Magnitudes are approximate maximum magnitudes based on the relationships of Ellsworth B, Hanks and Bakun, and Shaw (see Field et al., 2013, Appendix E) using values presented in UCERF3 documentation. Actual PSHA run with range of values representing uncertainty in hazard, relaxation of segmentation, and multi-fault ruptures. Multi-fault and multi-segment ruptures result in larger (but typically less probable) events. For example:
    a. Whittier-Elsinore – CM+J+T+s+GI+W Magnitude 7.8 (BSSC, 2014)
    b. San Jacinto – SBV+SJV+s+A+CC+B+SM Magnitude 7.8 (BSSC, 2014)
    c. S. San Andreas – PK+CH+CC+BB+NM+SM+NSB+SSB+BG+CO Magnitude 8.2 (BSSC, 2014)
4. Less significant and/or distant faults are not shown for clarity. See Figure D2 for full fault model to 300 km.

‘Grand Inversion’ and Recurrence Rates

The earthquake recurrence rates used within the source model used for this project were derived from work completed for UCERF3 as implemented by Petersen et al. (2014) using the branch averaged solutions of the ‘grand inversion’. The ‘grand inversion’ scheme used by the UCERF3 project team ‘solved’ the on-fault and off-fault recurrence rates at a system level using a set of defined constraints including the spatial probability density of off-fault seismicity, slip rate balancing, paleoseismic event rate matching, fault smoothness constraint, regional magnitude frequency distribution constraints, and fault section specific magnitude frequency distribution constraints. In simple terms the ‘grand inversion’ solves for three things: large on-fault (supra-seismogenic) event rates; small, near-fault (subseismogenic) event rates; and truly off-fault (unassociated) event rates. The supra-seismogenic ‘on-fault’ events are ultimately

modeled using linear fault sources; while the latter two categories (subseismogenic and off-fault) are considered 'background seismicity' and are modeled using spatially smoothed 'grid' of evenly spaced cells (aka. gridded seismicity). The combined on-fault and off-fault solution set (fault system solution) used the logic tree solution framework shown in a generalized form on Figure D3; and our model implemented the branch averaged solutions.

In the source model used for this work, the on-fault seismicity considers two potential alternative fault models, equally weighted, identified as fault model 3.1 (FM 3.1) and fault model 3.2 (FM 3.2). These fault models each contain a slightly different collection of fault traces that are broken into 'segments' for modeling purposes, with individual 'segments' strung together to create hundreds of thousands of potential fault-based ruptures or multi-rupture events. In our model, fault segments are modeled using a 'characteristic' magnitude frequency distribution (originally described by Schwartz and Coppersmith, 1984) with the recurrence rates constrained during the 'grand inversion' by the UCERF2 'characteristic' inversion branch. Fault slip rates (deformations) are constrained by a combination of a 'pure' geologic deformation model and three other models that consider geologic and geodetic data including the average fault block model, NeoKinema model, and Zeng-Shen model. The magnitude-area relationships used along with the associated slip-length models as well as other solution constraints applied are shown with weights on Figure D3 and discussed in detail in Field et al. (2013).

Off-fault seismicity (e.g. background seismicity) recurrence rates are solved for simultaneously by the 'grand inversion'. This off-fault background seismicity is intended to include all smaller earthquakes (M_w<~6.5) on major faults and earthquakes of all sizes that are not associated with known faults. The off-fault background seismicity considers spatial smoothing of a 'grid' of evenly spaced cells using the spatial probability density function (PDF) grids of off-fault seismicity from UCERF2 and UCERF3 (equally weighted), considering the regional constraints on the model including the total regional magnitude-frequency distribution (e.g. Gutenberg-Richter distribution), maximum off-fault magnitude (7.3, 7.6, or 7.9 weighted as 0.1, 0.8 and 0.1 respectively), number of regional events per year greater than a magnitude 5 (considered between 6.5 and 9.6) and other constraints as shown on the logic tree (see Figure D3). The branch averaged gridded seismicity solution for each fault model, as implemented by Petersen et al. (2014), is used in the source model for this work.

Ground Motion Models

Site-specific ground motions can be influenced by the styles of faulting, magnitudes of the earthquakes, and local soil conditions. Other effects such as near source or basin effects can also influence the ground motions. The ground motion models (GMMs) used to estimate ground motion from an earthquake source need to directly or indirectly consider these effects. Many GMMs have been developed to estimate the variation of spectral acceleration with earthquake magnitude and distance from the site to the source of an earthquake.

We have used four of the Next Generation Attenuation (NGA) West 2 relationships including Abrahamson et al. (2014), Boore et al. (2014), Chiou and Youngs (2014), and Campbell and Bozorgnia (2014) with equal weights applied for all crustal faults (e.g. reverse, strike-slip, normal) included in the fault model. Idriss (2014) GMM has not been used as the seismic source distances used in our analyses are outside the limits of Idriss (2014) GMM and the V_{S30} for our site is outside the range of this relationship. These GMMs also need values of $Z_{1.0}$ (depth to the layer in km where Vs is 1 km/s) and $Z_{2.5}$ (depth to the layer in km where Vs is 2.5 km/s) in addition to the V_{S30} value. We used NGA West 2 relationships based on V_{S30} to estimate $Z_{1.0}$ and $Z_{2.5}$ as 0.34 km and 1.20 km, respectively.

Spectral acceleration values were obtained by averaging the individual hazard results. These GMMs provide 'mean' (RotD50) values of ground motions associated with magnitude, distance, site soil conditions, and mechanism of faulting.

GROUND MOTION HAZARD ANALYSIS

Preceding sections described the development of the source model used in this work. This section describes the use of the source models for the current study and the resulting application to development of design ground motion parameters.

According to ASCE 7-16, the Risk-Targeted Maximum Considered Earthquake (MCE_R) is the most severe earthquake load considered by that standard and is considered at the orientation that results in the maximum response to horizontal ground motions with adjustment for targeted risk as defined by that standard. The site-specific MCE_R is developed in accordance with Section 21.2 of ASCE 7-16 using a site-specific ground motion hazard analysis procedure and is the lesser of: (1) the probabilistic MCE_R ground motion taken as the five percent damped uniform hazard spectrum for a 2 percent probability of exceedance in 50 years (i.e., return period of about 2,475 years) adjusted for risk factors and for the maximum direction; and (2) the deterministic MCE_R ground motion taken as the 84th percentile (median + 1 standard deviation) deterministic values (adjusted for the maximum direction) from the controlling fault(s) factored as required by Section 21.2.2 of ASCE 7-16. The Design Earthquake (DE) spectrum is defined as two-thirds of the MCE_R spectrum. The resulting site-specific DE spectrum may not be less than the 80 percent of the code spectrum developed in accordance with Chapter 11 of ASCE 7-16.

Both probabilistic and deterministic seismic hazard analyses should be used to estimate the spectral accelerations used to develop the site-specific MCE_R unless the deterministic spectrum need not be calculated per Section 21.2.2 of ASCE 7-16 Supplement 1. Details of our evaluation are provided below.

Probabilistic Seismic Hazard Analysis

For this work, a probabilistic seismic hazard analysis (PSHA) procedure was used to estimate the ground motion parameters (e.g. peak and spectral ground accelerations). The PSHA approach uses a logic tree approach to appropriately account for epistemic and aleatoric uncertainty in the model. The logic tree includes information about uncertainties in the source models, ground motion models, and other items impacting the results. Important source characteristics include such items as magnitude and recurrence interval of potential seismic events, distance from the site to the causative source, and other parameters. The effects of site soil conditions and other considerations such as basin effects can be accounted for using ground motion models (GMMs).

The theory behind the empirical probabilistic approach to seismic risk analysis has been developed over many years (Cornell, 1968, 1971; Merz and Cornell, 1973; SSHAC, 1997), and is based on the "total probability theorem". Generally, this work uses an assumption that earthquake events are independent of time and space from one another (e.g. time-independent models). According to this approach, the probability of exceedance $P_E(z)$ at a given level of ground motion, z, at the site within a specified time period, t, is related to the annual frequency of exceedance v(z) by:

$$P_E(z) = 1 - \exp(-v(z) * t)$$

Different probabilities of exceedance may be selected, depending on the level of performance required. The return period is essentially equivalent to the reciprocal of v(z).

The PSHA is conducted using three generalized steps: 1) development of an appropriate seismic source model including source characterization, development of recurrence relationships, and appropriately capturing uncertainty, 2) selection of appropriate ground motion models (and site amplification models if appropriate), and 3) conducting the calculation and processing the results. The annual frequency of exceedance of a certain ground motion level can be found by summing the rates for all sources, N, with the rate for each source determined by summing over all magnitudes and source to site distances, and so forth. The annual frequency of occurrence of earthquakes of magnitude, m_i, on seismic source, n, is $\lambda(m_i)$. The probability of an earthquake of magnitude m_i on source n occurring at a certain distance, r_j, from the site is $P(R = r_j \mid m_i)$ while the probability that the ground motion level, z, will be exceeded is given as $P(Z>z \mid m_i, r_j)$. Thus, mathematically the basic formulation for the annual frequency of exceedance, v(z), is given by:

$$v(z) = \sum_N \left[\sum_M \lambda(m_i) * \sum_R P\left(R = r_j \middle| m_i\right) * P\left(Z > z \middle| m_i, r_j\right) \right]$$

Modern computers make the above calculation, while computationally expensive, easily implementable. We have used the computer program HAZ (Powers, 2017) for our probabilistic analysis which implements the above general equation and evaluations of the probability of exceedance. Uncertainties are accounted for within the source model using the logic tree approach and source model discussed previously.

Deterministic Seismic Hazard Analysis

The deterministic seismic hazard analysis (DSHA) approach is also based on the characteristics of the earthquake and the causative fault associated with the earthquake. These characteristics include such items as magnitude of the earthquake and distance from the site to the causative fault. The effects of site soil conditions and mechanism of faulting are also accounted for in the GMMs. Per ASCE 7-16, the 84th percentile deterministic site-specific spectral acceleration values should be used for DSHA with the exception that the deterministic spectrum need not be calculated when the largest spectral acceleration from the probabilistic spectrum is less than $1.2*F_a$. If the largest spectral acceleration from the resulting deterministic 84th percentile maximum horizontal spectrum is less than $1.5*F_a$ then the spectrum is scaled by a single factor such that the maximum spectral value equals $1.5*F_a$. The value of F_a is taken from either Table 11.4.1 (Site Classes A to D) with a value of S_s equal to 1.5, or set equal to 1.0 (Site Class E) for purposes of these comparisons.

Since the site is located close to several significant faults in the region, for the deterministic evaluations, we used the NGA West 2 spreadsheet (PEER, 2015) to calculate deterministic values for some of the nearby faults, and used the USGS Earthquake Scenario Map (BSSC 2014) (from https://earthquake.usgs.gov/scenarios/catalog/) in determining the contributing faults and their parameters for deterministic analysis. The faults include the Fontana (Seismicity), Cucamonga, and San Jacinto (Lytle Creek connector) faults, and the San Jacinto and S. San Andreas fault zones. The three faulting mechanisms, reverse, normal and strike-slip, were considered for the Fontana (Seismicity) fault, as the faulting mechanism is unassigned for this fault. The computed deterministic spectra from the above-mentioned nearby faults are shown in Figure D4. Figure D4 shows that the Fontana (Seismicity) reverse fault at a distance to the surface trace of about 1.0 km (R_{RUP}, R_{JB} and R_X of about 1.0 km, 0.0 km and 1.0 km, respectively) and with a moment magnitude of about 6.8 controlled the deterministic values for all periods except

for periods greater than about 3.6 seconds, where the S. San Andreas fault zone at a distance to the surface trace of about 19.2 km (R_{RUP}, R_{JB} and R_X all of about 19.2 km) and with a moment magnitude of about 8.2 controlled the deterministic values.

Site-Specific MCE_R and Design Response Spectra

To develop the site-specific spectral response accelerations, we first obtained the general seismic design parameters, as presented in Table D-2, based on the site class, site coordinates, and the risk category based on Chapter 11 of ASCE 7-16 using the OSHPD online tool (https:/seismicmaps.org) which accesses the USGS database.

TABLE D-2: GENERAL GROUND MOTION PARAMETERS BASED ON ASCE 7-16

Parameter	Value	ASCE 7-16 Reference
S_S	1.829g	Fig 22-1
S_1	0.686g	Fig 22-2
Site Class	C	Table 20.3-1
F_a	1.2	Table 11.4-1
F_v	1.4	Table 11.4-2
S_{MS}	2.195g	Eq. 11 4-1
S_{M1}	0.96g	Eq. 11 4-2
S_{DS}	1.463g	Eq. 11.4-3
S_{D1}	0.64g	Eq. 11.4-4
C_{RS}	0.932	Fig 22-18A
C_{R1}	0.909	Fig 22-19A
PGA	0.782g	Fig 22-9
F_{pga}	1.2	Table 11.8-1
PGA_M	0.938g	Eq. 11.8-1
T_L	12 seconds	Fig 22-14

The MCE_R response spectrum is generally developed by comparing probabilistic, deterministic, and 80% of the general procedure code spectrum. The NGA West 2 GMMs present the spectral accelerations in terms of 'mean' (RotD50) values of the rotated two horizontal components of ground motion. To estimate spectral accelerations in the direction of the maximum horizontal response (e.g. RotD100) at each period from geometric mean values, we have used the scaling factors of Shahi and Baker (2014). These values were used as they more accurately represent the appropriate factors to apply using the NGA West 2 relationships. These factors are shown in Table D-3. In addition, the probabilistic spectrum was adjusted for targeted risk using risk coefficients C_{RS} and C_{R1} (e.g. Method 1 of Section 21.2.1 of ASCE 7-16). C_{RS} and C_{R1} were estimated from Figures 22-18A and 22-19A of ASCE 7-16 and are listed in Table D-2. C_{RS} is applied on periods of 0.2s or less and C_{R1} is applied on periods of 1.0s or greater and linear interpolation in between as shown in Table D-3.

TABLE D-3: RISK COEFFICIENTS AND ROTATION FACTORS

Period (second)	Risk Coefficient (ASCE 7-16)	Shahi and Baker (2014) Max Rotation Factor
0.010	0.932	1.190
0.200	0.932	1.210
0.300	0.929	1.220
0.500	0.923	1.230
1.000	0.909	1.240
2.000	0.909	1.240
5.000	0.909	1.260

As mentioned earlier, the geometric mean 84th percentile deterministic values were estimated for the nearby faults and the largest values were then adjusted for the maximum direction. Since the maximum deterministic spectral acceleration is greater than 1.5*F_a, as shown in Figure D5, there is no need to scale it up to estimate the deterministic lower limit and this spectrum is the governing deterministic spectrum.

Probabilistic and deterministic spectral values are compared in Table D-4 for some specific periods and the two spectra are compared in Figure D6. Figure D6 and Table D-4 show that the probabilistic spectrum is lower than the deterministic spectrum for the periods less than about 2.6 seconds, and the deterministic spectrum is lower than the probabilistic spectrum for the periods beyond 2.6 seconds. Therefore, the site-specific MCE_R spectrum is governed by both the probabilistic and deterministic spectra. The DE spectrum was developed by taking two-thirds of the MCE_R spectrum. Spectral values for the site-specific MCE_R and DE spectra are listed in Table D-5 for some periods, which also compares the DE spectrum with the 80% of the code DE spectrum at those periods. Figure D7 shows the comparison of the DE spectrum with the 80% of the code DE spectrum. Figure D7 and Table D-5 show that the DE spectrum is higher than the 80% of the code DE spectrum for all periods, except for the period of 0.05 second. Therefore, the site-specific DE spectrum is the enveloping spectrum of both the site-specific and 80% code DE spectra. The site-specific MCE_R spectrum is taken as 1.5 times the site-specific DE spectrum. The recommended site-specific DE and MCE_R spectra are shown on Figure D8. Spectral acceleration values for the recommended DE and MCE_R spectra are listed in Table D-6.

SITE-SPECIFIC GROUND MOTION PARAMETERS

Site-specific ground motion parameters were estimated using the site-specific design response spectrum presented above. According to Section 21.4 of ASCE 7-16, the S_{DS} value should be taken as 90 percent of the maximum spectral acceleration at any period between 0.2 and 5 seconds. For this site, S_{DS} value is controlled by the spectral acceleration value at 0.25 second. Since the site's V_{S30} value is greater than 1,200 ft/s (366 m/s), the S_{D1} value is taken as the maximum value of T^*S_a between periods of 1 and 2 seconds, where T is the period and S_a is the corresponding spectral acceleration. For this site, S_{D1} value is controlled by the spectral acceleration value at 1.5 seconds. The parameters S_{MS} and S_{M1} are taken as 1.5 times S_{DS} and S_{D1}. These spectral accelerations shall not be taken as less than 80 percent of the code-based values as determined by Sections 11.4.4 and 11.4.5 of ASCE 7-16. Site-specific values of S_{DS}, S_{D1}, S_{MS}, and S_{M1} are presented below in Table D-7.

TABLE D-7: SITE-SPECIFIC DESIGN ACCELERATION PARAMETERS

Parameter	Value (5% Damping)
S_{DS}	1.475g
S_{D1}	0.794g
S_{MS}	2.213g
S_{M1}	1.191g

Site-Specific PGA_M and Earthquake Magnitude

According to Section 21.5 of ASCE 7-16, the probabilistic Maximum Considered Earthquake Geometric Mean (MCE_G) peak ground acceleration is taken as the geometric mean peak ground acceleration with a 2% probability of exceedance in 50 years. The deterministic MCE_G peak ground acceleration is the largest 84th percentile geometric mean peak ground acceleration for the characteristic earthquakes on all known active faults in the region, but not less than $0.5*F_{PGA}$, where the value of F_{PGA} is taken as 1.2. The site-specific MCE_G peak ground acceleration, PGA_M, is the lesser of the probabilistic and deterministic values, but not less than 80 percent of the value obtained from equation 11.8-1 of ASCE 7-16.

The site-specific PGA_M was developed as described above and is 0.890g and controlled by the probabilistic value. According to the United States Geological Survey (USGS) Unified Hazard Tool deaggregation results, there are several faults significantly and almost equally contributing to the hazard associated with PGA including Fontana (Seismicity) fault, San Jacinto fault zone and S. San Andreas fault zone. The earthquake magnitudes associated with these faults are 6.8, 7.8, and 8.2, respectively. Based on this we recommend a magnitude of 8.0 associated with the PGA for this site, and this magnitude may be used in any geotechnical evaluations at the site.

SEISMIC DESIGN CATEGORY

The Seismic Design Category is determined as specified in the 2019 California Building Code Section 1613.2.5. We understand that the structure is classified as a Risk Category II structure. Based on this and the site-specific seismic design parameters developed above the structure is classified as a Seismic Design Category D.

1 Executive Summary

A corrosion evaluation of the soils at Fontana Speedway Commerce Center was performed to provide corrosion control recommendations for general construction materials. The site is located at **9300 Cherry Avenue, Fontana, CA**. Sixteen (16) samples were tested to a depth of 50.0 ft. Site ground water and topography information was provided by Kleinfelder Inc. Groundwater depth was determined to be 300 feet below finished grade.

Every material has its weakness. Aluminum alloys, galvanized/zinc coatings, and copper alloys do not survive well in very alkaline or very acidic pH environments. Copper and brasses do not survive well in high nitrate or ammonia environments. Steels and irons do not survive well in low soil resistivity and high chloride environments. High chloride environments can even overcome and attack steel encased in normally protective concrete. Concrete does not survive well in high sulfate environments. And nothing survives well in high sulfide and low redox potential environments with corrosive bacteria. This is why Project X tests for these 8 factors to determine a soil's corrosivity towards various construction materials. **Depending solely on soil resistivity or Caltrans corrosion guidelines (which concentrate on concrete/steel highways), will over-simplify descriptions as corrosive or non-corrosive. This approach will not detect these other factors attacking other metals because it is possible to have bad levels of corrosive ions and still have greater than 1,100 ohm-cm soil resistivity. We have observed this fact on thousands of soil samples tested in our laboratory.**

It should not be forgotten that import soil should also be tested for all factors to avoid making your site more corrosive than it was to begin with.

The recommendations outlined herein are not a substitute for any design documents previously prepared for the purpose of construction and apply only to the depth of samples collected.

Soil samples were tested for minimum resistivity, pH, chlorides, sulfates, ammonia, nitrates, sulfides and redox.

As-Received soil resistivities ranged between - ohm-cm and - ohm-cm. This data would be similar to a Wenner 4 pin test in the field and used in the design of a cathodic protection or grounding bed system. This resistivity can change seasonally depending on the weather and moisture in the ground. This reading alone can be misleading because condensation or minor water leaks will occur underground along pipe surfaces creating a saturated soil environment in the trench on infrastructure surfaces. This is why minimum or saturated soil resistivity measurements are more important than as-received resistivities.

Saturated soil resistivities ranged between 720 ohm-cm to 37,000 ohm-cm. The worst of these values is considered to be severely corrosive to general metals but only found in one sample at building 3.The remaining samples are considered to be corrosive to general metals.

PH levels ranged between 4.5 to 10.7 pH. The average pH of these samples is alkaline and can cause accelerated corrosion of copper and aluminum alloys.

Chlorides ranged between 110 mg/kg to 305 mg/kg. Chloride levels in these samples are low and may cause insignificant corrosion of metals.

Sulfates ranged between 10 mg/kg to 2,220 mg/kg. Two buildings (3 & 4) would require Type V concrete due to the high sulfide concentrations while the rest of the buildings can use any type concrete.

Ammonia and Nitrate levels were not tested thus the corrosion probability for copper and brass due to these elements is unknown.

Sulfides presence was determined was not tested thus probability of corrosive bacteria presence is unknown.

2 Corrosion Control Recommendations

The following recommendations are based upon the results of soil testing.

2.1 Cement

The highest reading for sulfates was 2,220 mg/kg or 0.2220 percent by weight.

Per ACI 318-14, Table 19.3.1.1, sulfate levels in these samples categorized as S0 and are negligible for corrosion of metals and cement. Per ACI 318-14 Table 19.3.2.1 any type of cement not containing steel or other metal can be used.

For buildings 3 & 4: Per ACI 318-14, Table 19.3.1.1, sulfate levels in these samples categorized as S2 and are severe for corrosion of metals and cement. Type V, IP(HS), IS(HS), or IT(HS) cement should be used, with a maximum water/cement ratio of 0.45, and minimum strength of 4,500 psi per applicable code.

2.2 Steel Reinforced Cement/ Cement Mortar Lined & Coated (CML&C)

Chlorides in soil can overcome the corrosion inhibiting property of cement for steel, as it can also break through passivated surfaces of aluminum and stainless steels.[1,2] The highest concentration of chlorides was 305 mg/kg.

Chloride levels in these samples are not significantly corrosive to metals not in tension. Standard cement cover may be used in these soils.

Though soils at some locations are significantly corrosive to various metals, per ACI 318-14 Chapter 19 Table 19.3.1.1, all slabs on this site exposure categories and class for **Corrosion Protection of Reinforcement (C) would be considered C1** as Concrete exposed to moisture [mud/rain] (slab sides and bottom) but not to an external source of chlorides. Though there are chlorides in the soil, ACI 318's definition of "external source of chlorides" consists of deicing chemicals, salt, brackish water, seawater, or spray from these sources. The chloride levels in seawater are typically over 19,000 mg/L or 19,000 ppm.

When concrete is tested for water-soluble chloride ion content, the tests should be made at an age of 28 to 42 days. The limits in Per ACI 318-14 Table 5.3.2.1 are to be applied to chlorides contributed from the concrete ingredients, not those from the environment surrounding the concrete.[3]

[3] ACI 381-14., BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE (ACI 318-14) AND COMMENTARY (ACI 318R-14)

2.3 Stainless Steel Pipe/Conduit/Fittings

Stainless steels derive their corrosion resistance from their chromium content and oxide layer which needs oxygen to regenerate if damaged. Thus stainless steel is not good for deep soil applications where oxygen levels are extremely low. Stainless steels should not be installed deeper than a plant root zone. Stainless steels typically have the same nobility as copper on the galvanic series and can be connected to copper. If stainless steel must be used, it must be backfilled with soil having greater than 10,000 ohm-cm resistivity and excellent drainage. 304 Stainless steel will also corrode if in contact with carbon materials such as activated carbon. Stainless steel welds should be pickled.

The soil at this site has low probability for anaerobic corrosive bacteria and low chloride levels. Per Nickel Institute guidelines, 304 or 316 Stainless steels can be used in these soils.

2.4 Steel Post Tensioning Systems

The proper sealing of stressing holes is of utmost importance in PT Systems. Cut off excess strand 1/2" to 3/4" back in the hole. Coat or paint exposed anchorage, grippers, and stub of strands with "Rust-o-leum" or equal. After tendons have been coated, the cement contractor shall dry pack blockouts within ten (10) days. A non-shrink, non-metallic, non-porous moisture-insensitive grout (Master EMACO S 488 or equivalent), or epoxy grout shall be used for this purpose. If an encapsulated post-tension system is used, regular non-shrink grout can be used.

Due to the low chloride concentrations measured on samples obtained from this site, post-tensioned slabs should be protected in accordance with soil considered normal (non-corrosive).[4,5] Addition of grease caps to the cut strand at live end anchors can deter construction defect accusations but are not needed.

2.5 Steel Piles

Steel piles are most susceptible to corrosion in disturbed soil where oxygen is available. Further, a dissimilar environment corrosion cell would exist between the steel embedded in cement, such as pile caps and the steel in the soil. In the cell, the steel in the soil is the anode (corroding metal), and the steel in cement is the cathode (protected metal). This cell can be minimized by coating the part of the steel piles that will be embedded in cement to prevent contact with cement and reinforcing steel.

Piles driven into soils without disturbing soils will avoid oxygen introduction and low corrosion rates unless there is a probability for corrosive anaerobic bacteria. Galvanized steel's zinc coating can provide significant protection for driven piles. In corrosive soils in which normal zinc coatings are not enough, the life of piles can be extended by increasing zinc coating thickness, using sacrificial metal, or providing a combination of epoxy coatings and cathodic protection. Corrosion has been observed to be extremely localized even at and below underground water tables. Pit depths of this magnitude do not have an appreciable effect on the strength or useful life of piling structures because the reduction in pile cross section is not

[4] *Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundations on Expansive Soils, PTI DC10.5-12,Table 4.1, pg 16*
[5] *Specification for Unbonded Single Strand Tendons. Post-tensioning Institute (PTI), Phoenix, AZ, 2000.*

significant.[6] Pitting is of more importance to pipes transporting liquids or gases which should not be leaked into the ground.

The following recommendations are recommended to achieve desired life. We defer to structural engineers to use our estimated corrosion rates and to choose from the corrosion control options listed below.

1) Sacrificial metal by use of thicker piles per non-disturbed soil corrosion rates, or
2) Galvanized steel piles per non-disturbed soil corrosion rates, or
3) Combination of galvanized and sacrificial metal per non-disturbed soil corrosion rates, or
4) For no loss of metal, coat entire pile with abrasion resistant epoxy coating such as 3M Scotchkote 323, or PowercreteDD, or equivalent, or
5) Use high yield steel which will corrode at the same rate as mild steel but have greater yield strength and thus be able to suffer more material loss than mild steel.

2.5.1 Expected Corrosion Rate of Steel and Zinc in disturbed soil

In general, the corrosion rate of metals in soil depends on the electrical resistivity, the elemental composition, and the oxygen content of the soil. Soils can vary greatly from one acre to the next, especially at earthquake faults. The better a soil is for farming; the easier it will be for corrosion to take place. Expansive soils will also be considered disturbed simply because of their nature from dry to wet seasons.

In Melvin Romanoff's NBS Circular 579, the corrosion rates of carbon steels and various metals was studied over long term periods. Various metals were placed in various soil types to gather corrosion rate data of all metals in all soil types. Samples were collected and material loss measured over the course of 20 years in some sites. The following corrosion rates were estimated by comparing the worst results of soils tested with similar soils in Romanoff's studies and Highway Research Board's publications.[7] The corrosion rate of zinc in disturbed soils is determined per Romanoff studies and King Nomograph.[8]

Expected Corrosion Rate for Steel = 0.79 mils/year for one sided attack

Expected Corrosion Rate for Zinc = 0.17 mils/year for one sided attack.

Note: 1 mil = 0.001 inch

In undisturbed soils, a corrosion rate of 1 mil/year for steel is expected with little change in the corrosion rate of zinc due to it's low nobility in the galvanic series.

Per CTM 643: Years to perforation of corrugated galvanized steel culverts

- 65.8 Years to Perforation for a 18 gage metal culvert
- 85.5 Years to Perforation for a 16 gage metal culvert

[6] Melvin Romanoff, Corrosion of Steel Pilings in Soils, National Bureau of Standards Monograph 58, pg 20.

[7] Field test for Estimating Service Life of Corrugated Metal Culverts, J.L. Beaton, Proc. Highway Research Board, Vol 41, P. 255, 1962

[8] King, R.A. 1977, Corrosion Nomograph, TRRC Supplementary Report, British Corrosion Journal

- 105.2 Years to Perforation for a 14 gage metal culvert
- 144.7 Years to Perforation for a 12 gage metal culvert
- 184.1 Years to Perforation for a 10 gage metal culvert
- 223.6 Years to Perforation for a 8 gage metal culvert

2.5.2 Expected Corrosion Rate of Steel and Zinc in Undisturbed soil

Expected Corrosion Rate for Steel = 0.79 mils/year for one sided attack

Expected Corrosion Rate for Zinc = 0.17 mils/year for one sided attack.

Note: 1 mil = 0.001 inch

2.6 Steel Storage tanks

Underground fuel tanks must be constructed and protected in accordance with California Underground Storage Tank Regulations, CCR, Title 23, Division 3, Chapter 16. Metals should be protected with cathodic protection or isolated from backfill material with an epoxy coating.

2.7 Steel Pipelines

Though a site may not be corrosive in nature at the time of construction, **installation of corrosion test stations and electrical continuity joint bonding should be performed during construction** so that future corrosion inspections can be performed. If steel pipes with gasket joints or other possibly non-conductive type joints are installed, their joints should be bonded across by welding or pin brazing a #8 AWG copper strand bond cable. Electrical continuity is necessary for corrosion inspections and for cathodic protection.

Corrosion test stations should be installed every 1,000 feet of pipeline.

Test stations shall have two #8 HMWPE copper strand wire test leads welded or pin brazed to the underground pipe, brought up into the test station hand hole and marked CTS. Wires should be brought into test station hand hole at finished grade with 12 inches of wire coiled within test station.

At isolation joints and pipe casings, 4 wire test stations shall be installed using #8 HMWPE copper strand wire test leads. Use different color wires to distinguish which wires are bonded to one side of isolation joint or to casing. Wires should be brought into test station hand hole at finished grade with 12 inches of wire coiled within test station.

Prevent dissimilar metal corrosion cells per NACE SP0286:

1) Electrically isolate dissimilar metal connections
2) Electrically isolate dissimilar coatings (Epoxy vs CML&C) segments connections
3) Electrically isolate river crossing segments
4) Electrically isolate freeway crossing segments
5) Electrically isolate old existing pipelines from new pipelines

6) Electrically isolate aboveground and underground pipe segments with flange isolation joint kits per NACE SP0286 to avoid galvanic corrosion cells. **These are especially important for fire risers.**

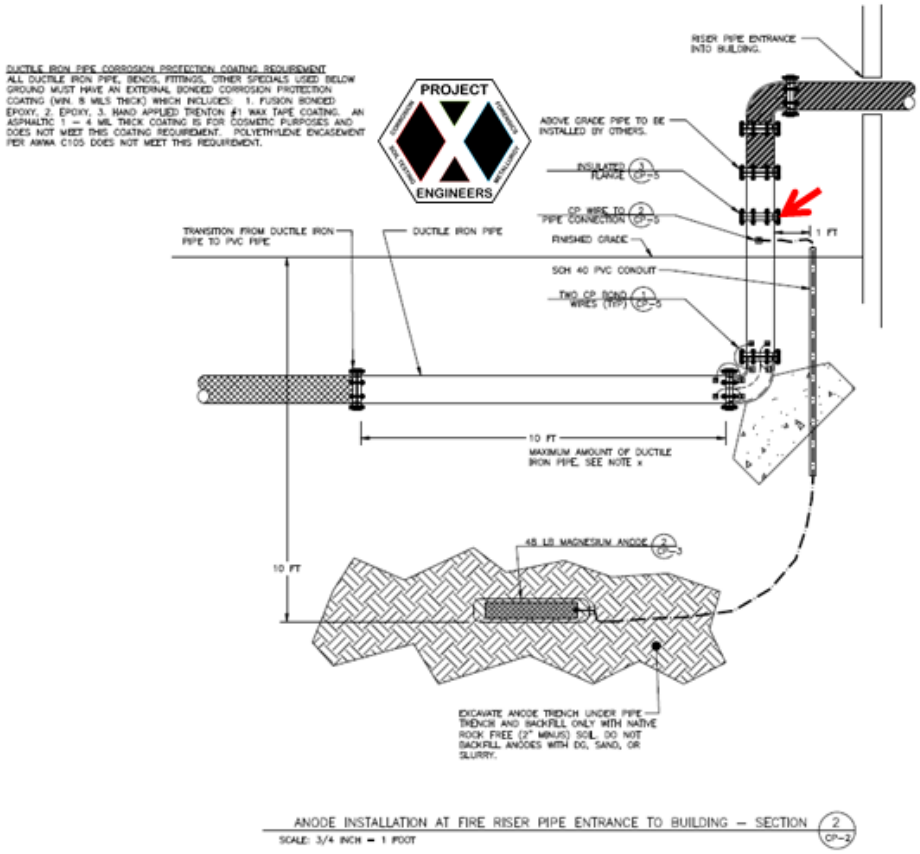

Figure 1- Fire Riser Detail: Install Isolation joint at red arrow

The corrosivity at this site is corrosive to steel. Any piping that must be jack-bored should use abrasion resistant epoxy coating such as 3M Scotchkote 323, or PowercreteDD, or equivalent. The corrosion control options for this site are as follows:

1) Apply impermeable dielectric coating such as minimum 10 mil thick polyethylene, and install cathodic protection system per NACE SP0169, or
2) Wax tape per AWWA C217, or
3) Coal tar enamel per AWWA C203, or
4) Fusion bonded epoxy per AWWA C213, or
5) For bare steel surfaces, such as welded pipe joints, apply 3 inch thick field coating of Type II cement or high pH slurry that will maintain pH higher than 12. Cement is both a corrosion inhibitor and a coating for ferrous metals. Cement naturally holds a pH of 12 or higher for many years if not exposed to high levels of carbon dioxide. (For CML&C pipes, CML&C factory applied 3/4 inch thick coating is equivalent and needs no extra thickness added.)

It is critical for the life of the pipe that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.8 Steel Fittings

The corrosivity at this site is corrosive to steel. The corrosion control options for this site are as follows:

1) Apply impermeable dielectric coating such as minimum 10 mil thick polyethylene, and install cathodic protection system per NACE SP0169, or
2) Tape coating system per AWWA C214, or
3) Wax tape per AWWA C217, or
4) Coal tar enamel per AWWA C203, or
5) Fusion bonded epoxy per AWWA C213
6) Apply 3 inch coating of Type II cement or high pH slurry that will maintain pH higher than 12. Cement is both a corrosion inhibitor and a coating for ferrous metals. Cement naturally holds a pH of 12 or higher for many years if not exposed to high levels of carbon dioxide.

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.9 Ductile Iron (DI) & Cast Iron Fittings

AWWA C105 developed a 10 point system to classify sites as aggressive or non-aggressive to ductile iron materials. The 10-point system does not, and was never intended to, quantify the corrosivity of a soil. It is a tool used to distinguish nonaggressive from aggressive soils relative to iron pipe. Soils <10 points are considered nonaggressive to iron pipe, whereas soils ≥10 points are considered aggressive. A 15 and a 20 point soil are both considered aggressive to iron pipe, however, because of the nature of the soil parameters measured, the 20 point soil may not necessarily be more aggressive than the 15 point soil. The criterion is based upon soil resistivities, soil drainage, pH, sulfide presence, and reduction-oxidation (REDOX) potential. The soil samples tested for this site resulted in a score of 16 out of 25.5. A score greater or equal

to 10 points classifies soils as aggressive to iron materials. The black coating on iron pipes is purely for aesthetic purposes and should not be relied upon for corrosion protection.[9]

The corrosivity at this site is corrosive to iron. The corrosion control options for this site are as follows:

1) Apply impermeable dielectric coating such as minimum 10 mil thick polyethylene, and install cathodic protection system per NACE SP0169, or
2) Wax tape per AWWA C217, or
3) Coal tar enamel per AWWA C203, or
4) Fusion bonded epoxy per AWWA C213
5) Apply standard concrete cover of Type II cement or high pH slurry that will maintain pH higher than 12. Cement is both a corrosion inhibitor and a coating for ferrous metals. Cement naturally holds a pH of 12 or higher for many years if not exposed to high levels of carbon dioxide.

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.10 Ductile Iron & Cast Iron Pipe

AWWA C105 developed a 10 point system to classify sites as aggressive or non-aggressive to ductile iron materials. The 10-point system does not, and was never intended to, quantify the corrosivity of a soil. It is a tool used to distinguish nonaggressive from aggressive soils relative to iron pipe. Soils <10 points are considered nonaggressive to iron pipe, whereas soils ≥10 points are considered aggressive. A 15 and a 20 point soil are both considered aggressive to iron pipe, however, because of the nature of the soil parameters measured, the 20 point soil may not necessarily be more aggressive than the 15 point soil. The criterion is based upon soil resistivities, soil drainage, pH, sulfide presence, and reduction-oxidation (REDOX) potential. The soil samples tested for this site resulted in a score of 16 out of 25.5. A score greater or equal to 10 points classifies soils as aggressive to iron materials. The black coating on iron pipes is purely for aesthetic purposes and should not be relied upon for corrosion protection.[10]

Though a site may not be corrosive in nature at the time of construction, **installation of corrosion test stations and electrical continuity joint bonding should be performed during construction** so that future corrosion inspections can be performed. If steel pipes with gasket joints or other possibly non-conductive type joints are installed, their joints should be bonded across by welding or pin brazing a #8 AWG copper strand bond cable. Electrical continuity is necessary for corrosion inspections and for cathodic protection. **If using thermite, perform one**

[9] https://www.dipra.org/ductile-iron-pipe-resources/frequently-asked-questions/corrosion-control

[10] https://www.dipra.org/ductile-iron-pipe-resources/frequently-asked-questions/corrosion-control

test bond using a half-charge then pressure test to confirm excess heat and pinholes were not created.

Pea gravel is used by plumbers to lay pipes and establish slopes. If the gravel has more than 200 ppm chlorides or is not tested, a 25 mil plastic should be placed between the gravel and pipe to avoid corrosion.

Corrosion test stations should be installed every 1,000 feet of pipeline.

Test stations shall have two #8 HMWPE copper strand wire test leads welded or pin brazed to the underground pipe, brought up into the test station hand hole and marked CTS. Wires should be brought into test station hand hole at finished grade with 12 inches of wire coiled within test station.

At isolation joints and pipe casings, 4 wire test stations shall be installed using #8 HMWPE copper strand wire test leads. Use different color wires to distinguish which wires are bonded to one side of isolation joint or to casing. Wires should be brought into test station hand hole at finished grade with 12 inches of wire coiled within test station.

Prevent dissimilar metal corrosion cells per NACE SP0286:

1) Electrically isolate dissimilar metal connections
2) Electrically isolate dissimilar coatings (Epoxy vs CML&C) segments connections
3) Electrically isolate river crossing segments
4) Electrically isolate freeway crossing segments
5) Electrically isolate old existing pipelines from new pipelines
6) Electrically isolate aboveground and underground pipe segments with flange isolation joint kits per NACE SP0286**. These are especially important for fire risers.**

The corrosivity at this site is corrosive to iron. Any piping that must be jack-bored should use abrasion resistant epoxy coating such as 3M Scotchkote 323, or PowercreteDD, or equivalent. The corrosion control options for this site are as follows:

1) Apply impermeable dielectric coating such as minimum 10 mil thick polyethylene, and install cathodic protection system per NACE SP0169, or
2) Wax tape per AWWA C217, or
3) Coal tar enamel per AWWA C203, or
4) Fusion bonded epoxy per AWWA C213
5) Apply 3 inch coating of Type II cement or high pH slurry that will maintain pH higher than 12. Cement is both a corrosion inhibitor and a coating for ferrous metals. Cement naturally holds a pH of 12 or higher for many years if not exposed to high levels of carbon dioxide.

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less

expensive a cathodic protection system will be in anode material and power requirement if needed.

2.11 Copper Materials

Copper is an amphoteric material which is susceptible to corrosion at very high and very low pH. It is one of the most noble metals used in construction thus typically making it a cathode when connected to dissimilar metals. Copper's nobility can change with temperature, similar to the phenomenon in zinc. When zinc is at room temperature, it is less noble than steel and can provide cathodic protection to steel. But when zinc is at a temperature above 140F such as in a water heater, it becomes more noble than the steel and the steel becomes the sacrificial anode. This is why zinc is not used in steel water heaters or boilers. Cold copper has one native potential, but when heated it develops a more electronegative electro-potential aka open circuit potential. Thus hot and cold copper pipes should be electrically isolated from each other to avoid creation of a thermo-galvanic corrosion cell. Unfortunately ammonia and nitrates were not tested and recommendations cannot be provided.

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.11.1 Brass Fittings

Brass fittings should be electrically isolated from dissimilar metals by use of dielectric unions or isolation joint kits per NACE SP0286.

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.12 Aluminum Pipe/Conduit/Fittings

Aluminum is an amphoteric material prone to pitting corrosion in environments that are very acidic or very alkaline or high in chlorides.

Conditions at this site are unsafe for aluminum. Soils at this site were determined to be too alkaline for aluminum. Soil contact with aluminum alloys should be avoided at this site. This can be achieved with:

1) Impermeable minimum 20 mil polyethylene coatings, or
2) Epoxy coatings with minimum 20 mil thickness free of scratches and defects, or

3) Wax tape

Aluminum derives its corrosion resistance from its oxide layer which needs oxygen to regenerate if damaged, similar to stainless steels. Thus aluminum is not good for deep soil applications. Since aluminum corrodes at very alkaline environments, it cannot be encased or placed against cement or mortar such as brick wall mortar up against an aluminum window frame.

Aluminum is also very low on the galvanic series scale making it most likely to become a sacrificial anode when in contact with dissimilar metals in moist environments. Avoid electrical continuity with dissimilar metals by use of insulators, dielectric unions, or isolation joints per NACE SP0286. Pooling of water at post bottoms or surfaces should be avoided by integrating good drainage.

2.13 Carbon Fiber or Graphite Materials

Carbon fiber or other graphite materials are extremely noble on the galvanic series and should always be electrically isolated from dissimilar metals. They can conduct electricity and will create corrosion cells if placed in contact within a moist environment with any metal.

2.14 Plastic and Vitrified Clay Pipe

No special precautions are required for plastic and vitrified clay piping from a corrosion viewpoint.

Protect all metallic fittings and pipe restraining joints with wax tape per AWWA C217, cement if previously recommended, or epoxy.

3 CLOSURE

In addition to soils chemistry and resistivity, another contributing influence to the corrosion of buried metallic structures is stray electrical currents. These electrical currents flowing through the earth originate from buried electrical systems, grounding of electrical systems in residences, commercial buildings, and from high voltage overhead power grids. Therefore, it is imperative that the application of protective wraps and/or coatings and electrical isolation joints be properly applied and inspected.

It is the responsibility of the builder and/or contractor to closely monitor the installation of such materials requiring protection in order to assure that the protective wraps or coatings are not damaged.

The recommendations outlined herein are in conformance with current accepted standards of practice that meet or exceed the provisions of the Uniform Building Code (UBC), the International Building Code (IBC), California Building Code (CBC), the American Cement Institute (ACI), Nickel Institute, National Association of Corrosion Engineers (NACE International), Post-Tensioning Institute Guide Specifications and State of California Department of Transportation, Standard Specifications, American Water Works Association (AWWA) and the Ductile Iron Pipe Research Association (DIPRA).

Our services have been performed with the usual thoroughness and competence of the engineering profession. No other warranty or representation, either expressed or implied, is included or intended.

Please call if you have any questions.

5 Corrosion Basics

In general, the corrosion rate of metals in soil depends on the electrical resistivity, the elemental composition, and the oxygen content of the soil. Soils can vary greatly from one acre to the next, especially at earthquake faults. The better a soil is for farming; the easier it will be for corrosion to take place. Expansive soils should be considered disturbed simply because of their nature from dry to wet seasons.

5.1 Pourbaix Diagram – In regards to a material's environment

All metals are unique and have a weakness. Some metals do not like acidic (low pH) environments. Some metals do not like alkaline (high pH) environments. Some metals don't like either high or low pH environments such as aluminum. These are called amphoteric materials. Some metals become passivated and do not corrode at high pH environments such as steel. These characteristics are documented in Marcel Pourbaix's book "Atlas of electrochemical equilibria in aqueous solutions"

In the mid 1900's, Marcel Pourbaix developed the Pourbaix diagram which describes a metal's reaction to an environment dependent on pH and voltage conditions. It describes when a metal remains passive (non-corroding) and in which conditions metals become soluble (corrode). Steels are passive in pH over 12 such as the condition when it is encased in cement. If the cement were to carbonate and its pH reduce to below 12, the cement would no longer be able to act as a corrosion inhibitor and the steel will begin to corrode when moist.

Some metals such as aluminum are amphoteric, meaning that they react with acids and bases. They can corrode in low pH and in high pH conditions. Aluminum alloys are generally passive within a pH of 4 and 8.5 but will corrode outside of those ranges. This is why aluminum cannot be embedded in cement and why brick mortar should not be laid against an aluminum window frame without a protective barrier between them.

5.2 Galvanic Series – In regards to dissimilar metal connections

All metals have a natural electrical potential. This electrical potential is measured using a high impedance voltmeter connected to the metal being tested and with the common lead connected to a copper copper-sulfate reference electrode (CSE) in water or soil. There are many types of reference electrodes. In laboratory measurements, a Standard Hydrogen Electrode (SHE) is commonly used. When different metal alloys are tested they can be ranked into an order from most noble (less corrosion), to least noble (more active corrosion). When a more noble metal is connected to a less noble metal, the less noble metal will become an anode and sacrifice itself through corrosion providing corrosion protection to the more noble metal. This hierarchy is known as the galvanic series named after Luigi Galvani whose experiments with electricity and muscles led Alessandro Volta to discover the reactions between dissimilar metals leading to the early battery. The greater the voltage difference between two metals, the faster the corrosion rate will be.

Table 1- Dissimilar Metal Corrosion Risk

	Zinc	Galvanized Steel	Aluminum	Cast Iron	Lead	Mild Steel	Tin	Copper	Stainless Steel
Zinc	None	Low	Medium	High	High	High	High	High	High
Galvanized Steel	Low	None	Medium	Medium	Medium	High	High	High	High
Aluminum	Medium	Medium	None	Medium	Medium	Medium	Medium	High	High
Cast Iron	High	Medium	Medium	None	Low	Low	Low	Medium	Medium
Lead	High	Medium	Medium	Low	None	Low	Low	Medium	Medium
Mild Steel	High	High	Medium	Low	Low	None	Low	Medium	Medium
Tin	High	High	Medium	Low	Low	Low	None	Medium	Medium
Copper	High	High	High	Medium	Medium	Medium	Medium	None	Low
Stainless Steel	High	High	High	Medium	Medium	Medium	Medium	Low	None

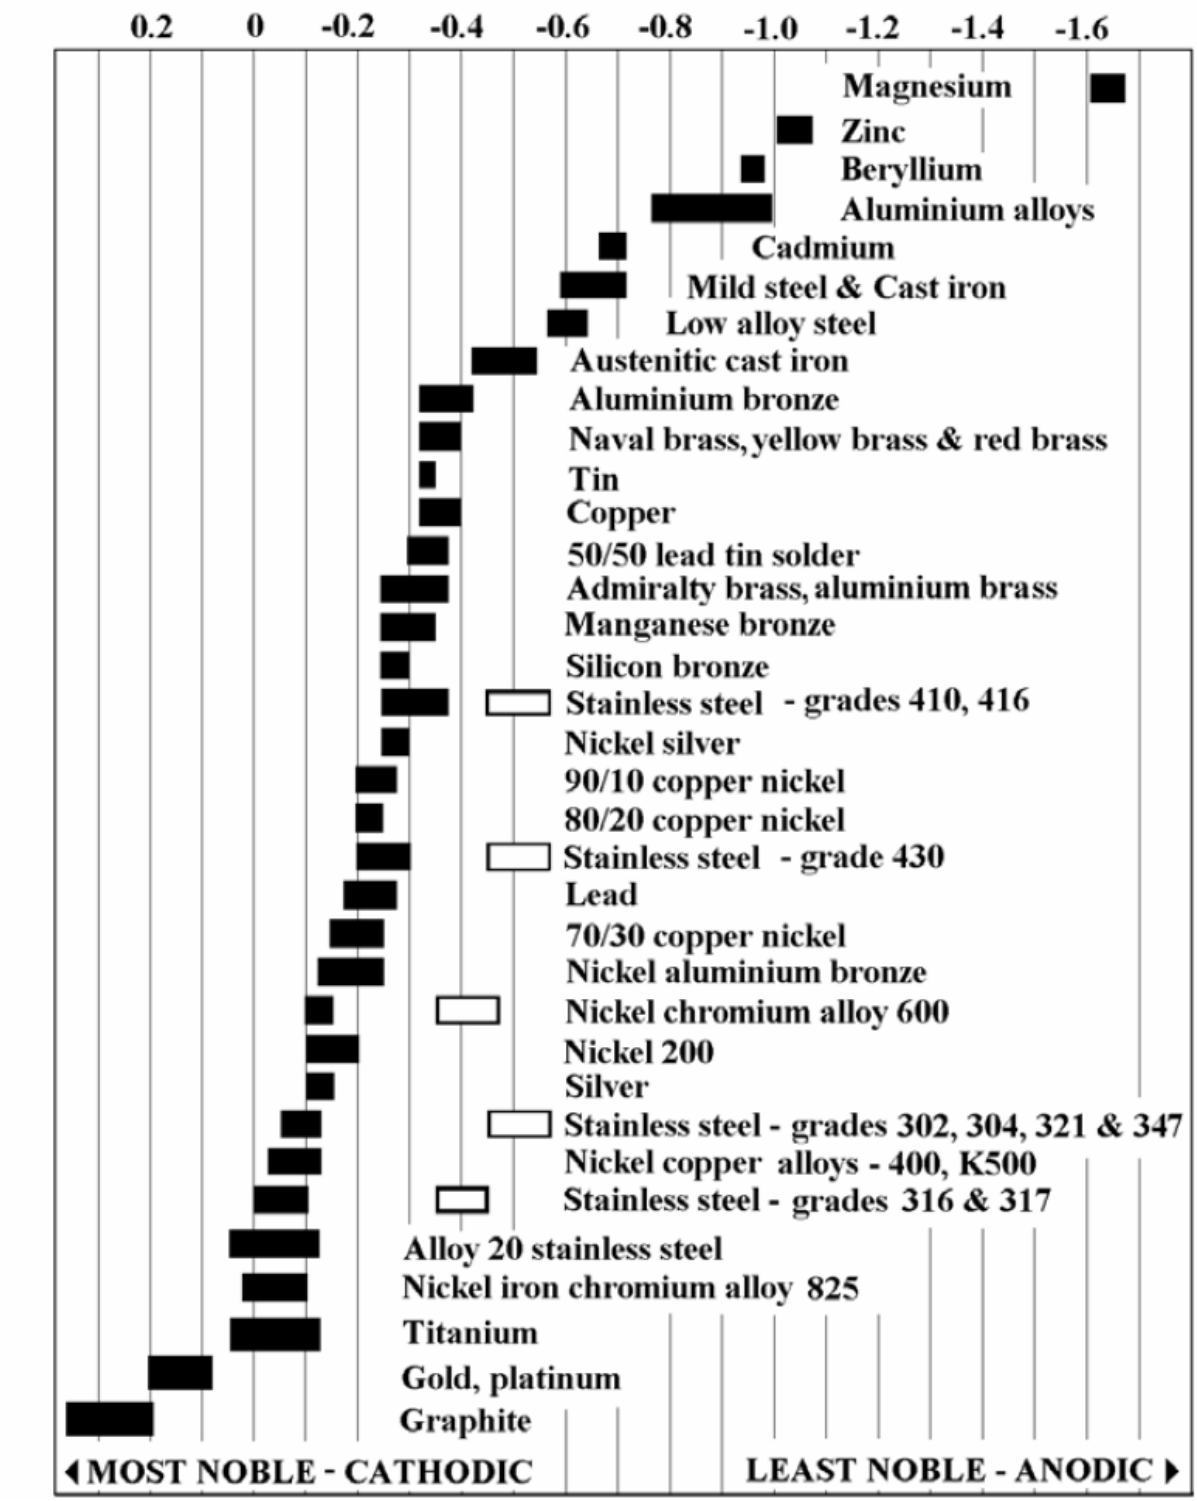

Figure 4 - Galvanic series of metals relative to CSE half cell.

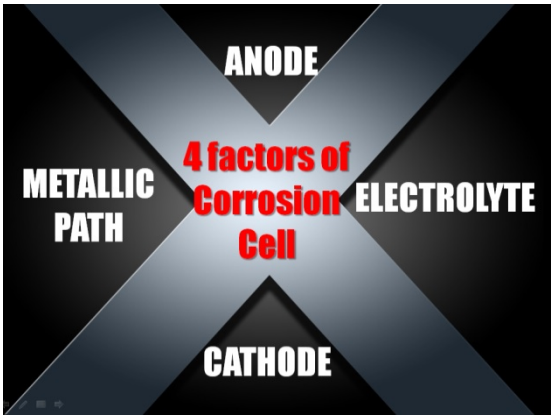
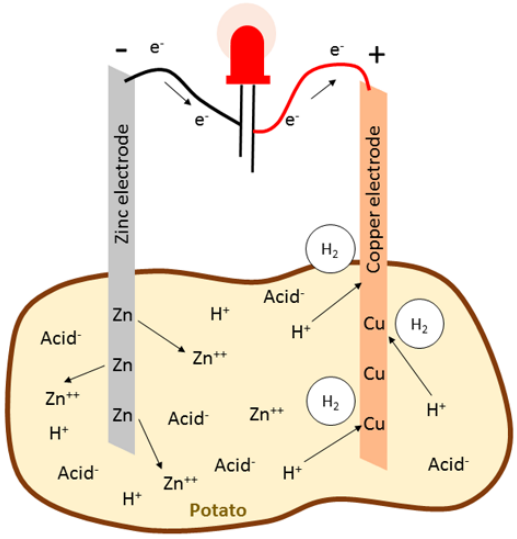
5.3 Corrosion Cell

In order for corrosion to occur, four factors must be present. (1) The anode (2) the cathode (3) the electrolyte and (4) the metallic or conductive path joining the anode and the cathode. If any one of these is removed, corrosion activity will stop. This is how a simple battery produces electricity. An example of a non-metallic yet conductive material is graphite. Graphite is similar in nobility to gold. Do not connect graphite to anything in moist environments.



The anode is where the corrosion occurs, and the cathode is the corrosion free material. Sometimes the anode and cathode are different materials connected by a wire or union. Sometimes the anode and cathode are on the same pipe with one area of the pipe in a low oxygen zone while the other part of the pipe is in a high oxygen zone. A good example of this is a post in the ocean that is repeatedly splashed. Deep underwater, corrosion is minimal, but at the splash zone, the corrosion rate is greatest.



Low oxygen zones and crevices can also harbor corrosive bacteria which in moist environments will lead to corrosion. This is why pipes are laid on backfill instead of directly on native cut soil in a trench. Filling a trench slightly with backfill before installing pipe then finishing the backfill creates a uniform environment around the entire surface of the pipe.

The electrolyte is generally water, seawater, or moist soil which allows for the transfer of ions and electrical current. Pure water itself is not very conductive. It is when salts and minerals dissolve into pure water that it becomes a good conductor of electricity and chemical reactions. Metal ores are turned into metal alloys which we use in construction. They naturally want to return to their natural metal ore state but it requires energy to return to it. The corrosion cell, creates the energy needed to return a metal to its natural ore state.

The metallic or conductive path can be a wire or coupling. Examples are steel threaded into a copper joint, or an electrician grounding equipment to steel pipes inadvertently connecting electrical grid copper grounding systems to steel or iron underground pipes.

The ratio of surface area between the anode and the cathode is very important. If the anode is very large, and the cathode is very small, then the corrosion rate will be very small and the anode may live a long life. An example of this is when short copper laterals were connected to a large and long steel pipeline. The steel had plenty of surface area to spread the copper's attack, thus corrosion was not

noticeable. But if the copper was the large pipe and the steel the short laterals, the steel would corrode at an amazing rate.

5.4 Design Considerations to Avoid Corrosion

The following recommendations are based upon typical observations and conclusions made by forensic engineers in construction defect lawsuits and NACE International (Corrosion Society) recommendations.

5.4.1 Testing Soil Factors (Resistivity, pH, REDOX, SO, CL, NO3, NH3)

As previously mentioned, different factors can cause corrosion. The most useful and common test for categorizing a soil's corrosivity has been the measure of soil resistivity which is typically measured in units of (ohm-cm) by corrosion engineers and geologists. Soil resistivity is the ability of soil to conduct or resist electrical currents and ion transfer. The lower the soil resistivity, the more conductive and corrosive it is. The following are "generally" accepted categories but keep in mind, the question is not "Is my soil corrosive?", the question should be, "What is my soil corrosive to?" and to answer that question, soil resistivity and chemistry must be tested. Though **soil resistivity is a good corrosivity indicator for steel materials, high chlorides or other corrosive elements do not always lower soil resistivity, thus if you don't test for chlorides and other water soluble salts, you can get an unpleasant surprise.** The largest contributing factor to a soil's electrical resistivity is its clay, mineral, metal, or sand make-up.

Table 2 - Corrosion Basics- An Introduction, NACE, 1984, pg 191

(Ohm-cm)	Corrosivity Description
0-500	Very Corrosive
500-1,000	Corrosive
1,000-2,000	Moderately Corrosive
2,000-10,000	Mildly Corrosive
Above 10,000	Progressively less corrosive

Testing a soil's pH provides information to reference the Pourbaix diagram of specific metals. Some elements such as ammonia and nitrates can create localized alkaline conditions which will greatly affect amphoteric materials such as aluminum and copper alloys.

Excess sulfates can break-down the structural integrity of cement and high concentrations of chlorides can overcome cement's corrosion inhibiting effect on encased ferrous metals and break down protective passivated surface layers on stainless steels and aluminum.

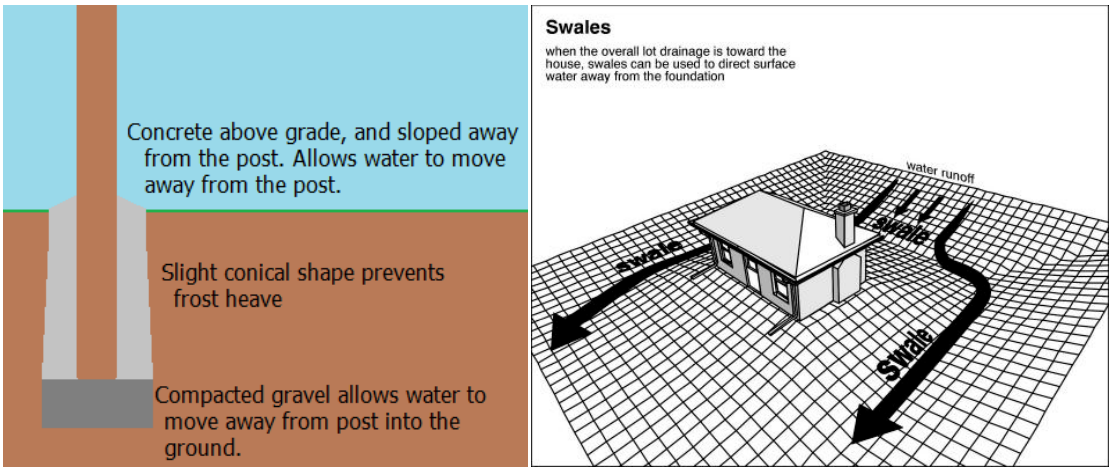
Corrosive bacteria are everywhere but can multiply significantly in anaerobic conditions with plentiful sulfates. The bacteria themselves do not eat the metal but their by-products can form corrosive sulfuric acids. The probability of corrosive bacteria is tested by measuring a soil's oxidation-reduction (REDOX) electro-potential and by testing for the presence of sulfides.

Only by testing a soil's chemistry for minimum resistivity, pH, chlorides, sulfates, sulfides, ammonia, nitrate, and redox potential can one have the information to evaluate the corrosion risk to construction materials such as steel, stainless steel, galvanized steel, iron, copper, brass, aluminum, and concrete.

5.4.2 Proper Drainage

It cannot be emphasized enough that pooled stagnant water on metals will eventually lead to corrosion. This stands for internal corrosion and external corrosion situations. In soils, providing good drainage will lower soil moisture content reducing corrosion rates. Attention to properly sealing polyethylene wraps around valves and piping will avoid water intrusion which would allow water to pool against metals. Above ground structures should not have cupped or flat surfaces that will pond water after rain or irrigation events.

Buildings typically are built on pads and have swales when constructed to drain water away from buildings directing it towards an acceptable exit point such as a driveway where it continues draining to a local storm drain. Many homeowners, landscapers and flatwork contractors appear to not be aware of this and destroy swales during remodeling. The majority of garage floor and finished grade elevations are governed by drainage during design.[11,12]



5.4.3 Avoiding Crevices

Crevices are excellent locations for oxygen differential induced corrosion cells to begin. Crevices can also harbor corrosive bacteria even in the most chemically treated waters. Crevices will also gather salts. If water's total alkalinity is low, its ability to maintain a stable pH can also become more difficult within a crevice allowing the pH to drop to acidic levels continuing a pitting process. Welds in extremely corrosive environments should be complete and well filleted without sharp edges to avoid crevices. Sharp edges should be avoided to allow uniform coating of protective epoxy. Detection of crevices in welds should be treated immediately. If pressures and loads are low, sanding and rewelding or epoxy patching can be suitable repairs. Damaged coatings can usually be repaired with Direct to Metal paints. **Scratches and crevice corrosion are like infections, they should not be left to fester or the infection will spread making things worse.**

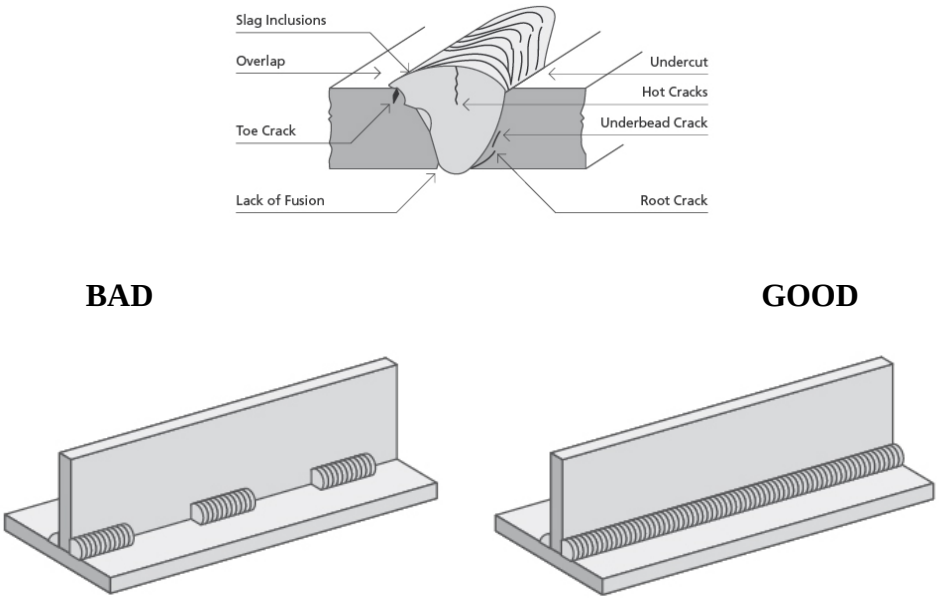

Figure 5 Defects which form weld crevices[13]

5.4.4 Coatings and Cathodic Protection

When faced with a corrosive environment, the best defense against corrosion is removing the electrolyte from the corrosion cell by applying coatings to separate the metal from the soil. During construction and installation, there is always some scratch or damage made to a coating. NACE training recommends that coatings be used as a first line of defense and that sacrificial or impressed current cathodic protection is used as a 2nd line of defense to protect the scratched areas. Use of a good coating dramatically reduces the amount of anodes a CP system would need. If CP is not installed as a 2nd line of defense in an extremely corrosive environment, the small scratched zones will suffer accelerated corrosion. CP details such as anode installation instructions must be designed by corrosion engineers or vessel manufacturers on a per project basis because it depends on electrolyte resistivity, surface area of infrastructure to be protected, and system geometry.

There are two types of cathodic protection systems, a Galvanic Anode Cathodic Protection (GACP) system and an Impressed Current Cathodic Protection (ICCP) system. A Galvanic Anode Cathodic Protection (GACP) system is simpler to install and maintain than an Impressed Current Cathodic Protection (ICCP) system. To protect the metals, they must all be electrically continuous to each other. In a GACP system, sacrificial zinc or magnesium anodes are then buried at locations per the CP design and connected by wire to a structure at various points in system. At the connection points, a wire connecting to the structure and the wire from the anode are joined in a Cathodic Protection Test Station hand hole which looks similar in size and shape to an irrigation valve pull box. By coating the underground structures, one can reduce the number of anodes needed to provide cathodic protection by 80% in many instances.

An ICCP system requires a power source, a rectifier, significantly more trenching, and more expensive type anodes. These systems are typically specified when bare metal is requiring protection

[13] http://www.daroproducts.co.uk/makes-good-weld/

in severely corrosive environments in which galvanic anodes do not provide enough power to polarize infrastructure to -850 mV structure-to-soil potential or be able to create a 100 mV potential shift as required by NACE SP169 to control corrosion. In severely corrosive environments, a GACP system simply may not last a required lifetime due to the high rate of consumption of the sacrificial anodes. ICCP system rectifiers must be inspected and adjusted quarterly or at a minimum bi-annually per NACE recommendations. Different anode installations may be possible but for large sites, anodes are placed evenly throughout the site and all anode wires must be trenched to the rectifier. For a large site, it may be beneficial to use two or more rectifiers to reduce wire lengths or trenching.

To simplify, a GACP system can be installed and practically forgotten with minor trenching because the anodes can be installed very close to the structures. An ICCP system must be inspected annually and anode wires run back to the rectifier which itself connects to the pile system. If any type of trenching or development is expected to occur at the site during the life of the site, it is a good idea to inspect the anode connections once a year to make sure wires are not cut and that the infrastructure is still being provided adequate protection. A common situation that occurs with ICCP systems is that a contractor accidently cuts the wires during construction then reconnects them incorrectly, turning the once cathode, into a sacrificing anode.

Design of a cathodic protection system protecting against soil side corrosion requires that Wenner Four Pin ground resistance measurements per ASTM G57 be performed by corrosion engineers at various locations of the site to determine the best depths and locations for anode installations. Ideally, a sample pile is installed and experiments determining current requirement are conducted. Using this data, the decision is made whether a GACP system is feasible or if an ICCP must be used.

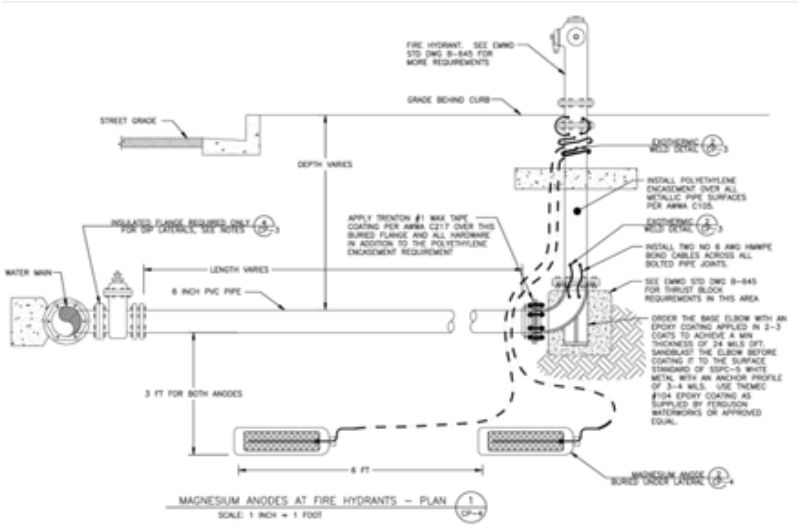

Figure 6 Sample anode design for fire hydrant underground piping

Vessels such as water tanks will have protective interior coatings and anodes to protect the interior surfaces. Anodes can also be buried on site and connected to system skid supports to protect the metal in contact with soil. A good example of a vessel cathodic protection system exists in all home water heaters which contain sacrificial aluminum or magnesium anodes. In environments that exceed 140F, zinc anodes cannot be used with carbon steel because they become the aggressor (Cathodic) to

the steel instead of sacrificial (anodic). Anodes in vessels containing extremely brackish water with chloride levels over 2,000 ppm should inspect or change out their anodes every 6 months.

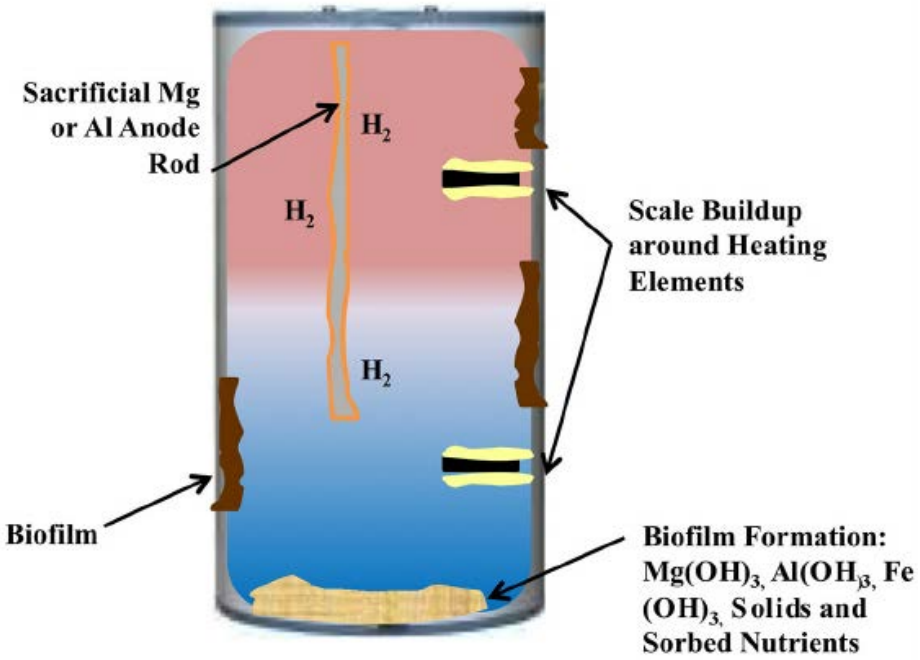

Figure 7 Cross section of boiler with anode

Cathodic protection can only protect a few diameters within a pipeline thus it is not recommended for small diameter pipelines and tubing internal corrosion protection. Anodes are like a lamp shining light in a room. They can only protect along their line of sight.

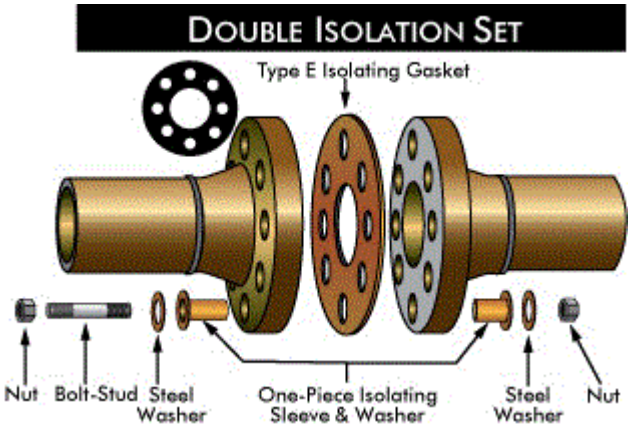
5.4.5 Good Electrical Continuity

In order for cathodic protection to protect a long pipeline or system of pipes from external soil side corrosion, they must all be electrically continuous to each other so that the electric current from the anode can travel along the pipes, then return through the earth to the anode. Electrical continuity is achieved by welding or pin brazing #8 AWG copper strand bond cable to the end of pipe sticks which have rubber gaskets at bell and spigots. If steel pipes are joined by full weld, bonding wires are not needed.

Electrical continuity between dissimilar metals is not desirable. Isolation joints or di-electric unions should be installed between dissimilar metals, such as steel pipes connecting to a brass valve per NACE SP0286. Bonding wires should then be welded onto the steel pipes by-passing the brass valve so that the cathodic protection system's current can continue to travel along the steel piping but isolate the brass valve from the steel pipeline. Another option would be to provide a separate cathodic protection system for steel pipes on both sides of the brass valve.

Typically, water heater inlets and outlets, gas meters and water meters have dielectric unions installed in them to separate utility property from homeowner property. This also protects them in the case that a home owner somehow electrically connects water pipes or gas pipes to a neighborhood electrical grounding system which can potentially have less noble steel in soil now connected to much

more noble copper in soil which will then create a corrosion cell. This is exactly how a lemon powered clock works when a galvanized zinc nail and a steel nail are inserted into a lemon then connected to a clock. The clock is powered by the corrosion cell created.



5.4.6 Bad Electrical Continuity

Bad electrical continuity is when two different materials or systems are made electrically continuous (aka shorted) when they were not designed to be electrically continuous. Examples of this would be when gas lines are shorted to water lines or to electrical grounding beds. Very often, fire risers are shorted to electrical grounding systems, and water pipes at business parks. Since fire risers usually have a very short ductile iron pipe in the ground which connects to PVC pipe systems, they tend to experience leaks after 7 to 10 years of being attacked by underground copper systems.

It is absolutely imperative that any copper water piping or other metal conduits penetrating cement slab or footings, not come in contact with the reinforcing steel or post-tensioning tendons to avoid creation of galvanic corrosion cells.

5.4.7 Corrosion Test Stations

Corrosion test stations should be installed every 1,000 feet along pipelines in order to measure corrosion activity in the future. For a simple pipeline, two #8 AWG copper strand bond cable welded or pin brazed onto the pipeline are run up to finished grade and left in a hand hole. Corrosion test stations are used to measure pipe-to-soil electro potential relative to a copper copper-sulfate reference electrode to determine if the pipe is experiencing significant corrosion activity. By measuring test stations along a pipeline, hot spots can be determined, if any. The wires also allow for electrical continuity testing, condition assessment, and a multitude of other types of tests.

At isolation joints and pipe casings, two wires should be welded to either side of the isolation joint for a total of 4 wires to be brought up to the hand hole. This allows for future tests of the isolation joint, casing separation confirmation, and pipe-to-soil potential readings during corrosion surveys.

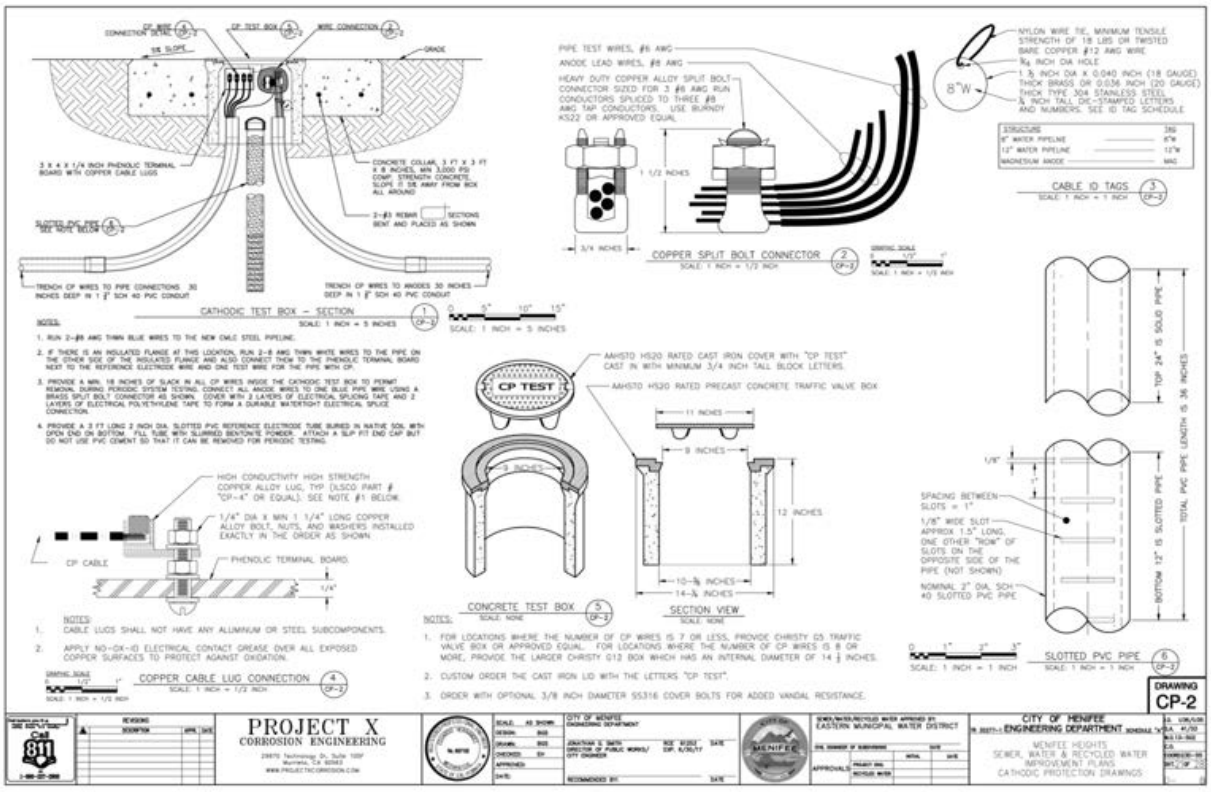


Figure 8 Sample of corrosion test station specification drawing

5.4.8 Excess Flux in Plumbing

Investigations of internal corrosion of domestic water plumbing systems almost always finds excess flux to be the cause of internal pitting of copper pipes. Some people believe that there is no such thing as too much flux. Flux runs have been observed to travel up to 20 feet with pitting occurring along the flux run. Flushing a soldered plumbing system with hot water for 15 minutes can remove significant amounts of excess flux left in the pipes. If a plumbing system is expected to be stagnant for some time, it should be drained to avoid stagnant water conditions that can lead to pitting and dezincification of yellow brasses.

5.4.9 Landscapers and Irrigation Sprinkler Systems

A significant amount of corrosion of fences is due to landscaper tools scratching fence coatings and irrigation sprinklers spraying these damaged fences. Recycled water typically has a higher salt content than potable drinking water, meaning that it is more corrosive than regular tap water. The same risk from damage and water spray exists for above ground pipe valves and backflow preventers. Fiber glass covers, cages, and cement footings have worked well to keep tools at an arm's length.

5.4.10 Roof Drainage splash zones

Unbelievably, even the location where your roof drain splashes down can matter. We have seen drainage from a home's roof valley fall directly down onto a gas meter causing it's piping to corrode at an accelerated rate reaching 50% wall thickness within 4 years. It is the same effect as a splash

zone in the ocean or in a pool which has a lot of oxygen and agitation that can remove material as it corrodes.

5.4.11 Stray Current Sources

Stray currents which cause material loss when jumping off of metals may originate from direct-current distribution lines, substations, or street railway systems, etc., and flow into a pipe system or other steel structure. Alternating currents may occasionally cause corrosion. The corrosion resulting from stray currents (external sources) is similar to that from galvanic cells (which generate their own current) but different remedial measures may be indicated. In the electrolyte and at the metal-electrolyte interfaces, chemical and electrical reactions occur and are the same as those in the galvanic cell; specifically, the corroding metal is again considered to be the anode from which current leaves to flow to the cathode. Soil and water characteristics affect the corrosion rate in the same manner as with galvanic-type corrosion.

However, stray current strengths may be much higher than those produced by galvanic cells and, as a consequence, corrosion may be much more rapid. Another difference between galvanic-type currents and stray currents is that the latter are more likely to operate over long distances since the anode and cathode are more likely to be remotely separated from one another. Seeking the path of least resistance, the stray current from a foreign installation may travel along a pipeline causing severe corrosion where it leaves the line. Knowing when stray currents are present becomes highly important when remedial measures are undertaken since a simple sacrificial anode system is likely to be ineffectual in preventing corrosion under such circumstances.[14] Stray currents can be avoided by installing proper electrical shielding, installation of isolation joints, or installation of sacrificial jump off anodes at crossings near protected structures such as metal gas pipelines or electrical feeders.

1 INTRODUCTION

This report documents the results of a Greenhouse Gas (GHG) Emissions Assessment completed for the Speedway Commerce Center II Specific Plan Project (Project). The purpose of this GHG Emissions Assessment is to evaluate the potential construction and operational emissions associated with the Project and determine the level of impact the Project would have on the environment.

1.1 Project Location

The Project site is in an unincorporated area of southwestern San Bernardino County and within the City of Fontana Sphere of Influence (SOI). The Project site is approximately 40 miles east of downtown Los Angeles, 20 miles west of downtown San Bernardino, and 30 miles northeast of central Orange County. The approximately 522.30-acre site is located north of the San Bernardino Freeway (I-10) and San Bernardino Avenue and is bounded by Cherry Avenue to the east, the Burlington Northern and Santa Fe (BNSF) Railroad to the north, the West Valley Materials Recycling Facility to the west, and California Steel Industries to the south.

The City of Fontana is located to the north, east, and south of the site. The City of Rancho Cucamonga is located to the west and northwest and the City of Ontario is located to the southwest, as shown in Exhibit 1: Regional Vicinity and Exhibit 2: Site Vicinity.

1.2 Project Description

The Project encompasses approximately 433 acres of the approximately 522-acre site that is currently developed with the Auto Club Speedway (ACS), formerly known as the California Speedway, in the County. The Project proposes conceptual land uses that include, but are not limited to, up to 6.6 million square feet of high cube warehouse and e-commerce uses with approximately 12 acres (261,360 sf) of accessory commercial uses. The Project site would also be developed with greenbelts, public roads, other support amenity features, and water detention areas. The Project would surround the separate Next Gen in California Project, which was approved by the County on June 7, 2021; see Exhibit 3: Conceptual Site Plan. Construction of the Project, including recordation of final subdivision map(s) and design review may be progressively implemented in stages, provided that vehicular access, public facilities, and infrastructure are constructed to adequately service the development, or as needed for public health and safety. However, the actual phasing sequence and time-frame may vary depending on market conditions.

The current county land use category is C-Commercial and the zoning for the Project site is SD-COM-Special Development-Commercial. Table 1 shows the summary of the proposed land uses and attributed areas. Parking would be scattered throughout the site and located on the north, west, east, south, and center portions of the Project site. The proposed Project would dedicate 78.5 acres to Parking Fields/Drop Lots.

Table 1: Proposed Land Uses

Land Use	Speedway Commerce SP	Planning Area(s)
Warehouse	280.2 acres/approximately 6.6 million sq. ft.	PA 1a, PA 2a, PA 3a and PA 4a
Accessory Commercial (with Drop Lot)	27.1[1] acres/261,360 sq. ft.	PA 5a, PA 1c, PA 2c
Parking Field/Drop Out	82.5 acres	PA 1b, PA 2b, PA 3b, PA 4c, PA 5b, PA 6a, PA 6b, PA 6c
Open Space/Basin	9.4 acres	PA 4b and PA 5c
Public Right-of-Way	33.7 acres	NA
Total	432.9 acres	NA

Source: Kimley-Horn, *Speedway Commerce Center II Specific Plan,* Table 3-1: Land Use, 2021.
1. Includes approximately 23.5 acres of parking field/drop lot. Total potential parking/drop lot areas is 101 acres.

2 ENVIRONMENTAL SETTING

2.1 Greenhouse Gases and Climate Change

Certain gases in the earth's atmosphere classified as GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space. A portion of the radiation is absorbed by the earth's surface and a smaller portion of this radiation is reflected back toward space. This absorbed radiation is then emitted from the earth as low-frequency infrared radiation. The frequencies at which bodies emit radiation are proportional to temperature. Because the earth has a much lower temperature than the sun, it emits lower-frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on earth.

The primary GHGs contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). Fluorinated gases also make up a small fraction of the GHGs that contribute to climate change. Examples of fluorinated gases include chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3); however, it is noted that these gases are not associated with typical land use development. Human-caused emissions of GHGs exceeding natural ambient concentrations are believed to be responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the Earth's climate, known as global climate change or global warming.

GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants (TACs), which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about one day), GHGs have long atmospheric lifetimes (one to several thousand years). GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Although the exact lifetime of a GHG molecule is dependent on multiple variables and cannot be pinpointed, more CO_2 is emitted into the atmosphere than is sequestered by ocean uptake, vegetation, or other forms of carbon sequestration. Of the total annual human-caused CO_2 emissions, approximately 55 percent is sequestered through ocean and land uptakes every year, averaged over the last 50 years, whereas the remaining 45 percent of human-caused CO_2 emissions remains stored in the atmosphere[1]. Table 2: Description of Greenhouse Gases describes the primary GHGs attributed to global climate change, including their physical properties.

In: Climate Change 2013: The Physical Science Basis*, *Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2013. http://www.climatechange2013.org/ images/report/WG1AR5_ALL_FINAL.pdf.

Table 2: Description of Greenhouse Gases

Greenhouse Gas	Description
Carbon Dioxide (CO_2)	CO_2 is a colorless, odorless gas that is emitted naturally and through human activities. Natural sources include decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources are from burning coal, oil, natural gas, and wood. The largest source of CO_2 emissions globally is the combustion of fossil fuels such as coal, oil, and gas in power plants, automobiles, and industrial facilities. The atmospheric lifetime of CO_2 is variable because it is readily exchanged in the atmosphere. CO_2 is the most widely emitted GHG and is the reference gas (Global Warming Potential of 1) for determining Global Warming Potentials for other GHGs.
Nitrous Oxide (N_2O)	N_2O is largely attributable to agricultural practices and soil management. Primary human-related sources of N_2O include agricultural soil management, sewage treatment, combustion of fossil fuels, and adipic and nitric acid production. N_2O is produced from biological sources in soil and water, particularly microbial action in wet tropical forests. The atmospheric lifetime of N_2O is approximately 120 years. The Global Warming Potential of N_2O is 298.
Methane (CH_4)	CH_4, a highly potent GHG, primarily results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) and is largely associated with agricultural practices and landfills. Methane is the major component of natural gas, about 87 percent by volume. Human-related sources include fossil fuel production, animal husbandry, rice cultivation, biomass burning, and waste management. Natural sources of CH_4 include wetlands, gas hydrates, termites, oceans, freshwater bodies, non-wetland soils, and wildfires. The atmospheric lifetime of CH_4 is about 12 years and the Global Warming Potential is 25.
Hydrofluorocarbons (HFCs)	HFCs are typically used as refrigerants for both stationary refrigeration and mobile air conditioning. The use of HFCs for cooling and foam blowing is increasing, as the continued phase out of CFCs and HCFCs gains momentum. The 100-year Global Warming Potential of HFCs range from 124 for HFC-152 to 14,800 for HFC-23.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and only break down by ultraviolet rays about 60 kilometers above Earth's surface. Because of this, they have long lifetimes, between 10,000 and 50,000 years. Two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Global Warming Potentials range from 6,500 to 9,200.
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. They are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). CFCs were synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. The Montreal Protocol on Substances that Deplete the Ozone Layer prohibited their production in 1987. Global Warming Potentials for CFCs range from 3,800 to 14,400.
Sulfur Hexafluoride (SF_6)	SF_6 is an inorganic, odorless, colorless, and nontoxic, nonflammable gas. It has a lifetime of 3,200 years. This gas is manmade and used for insulation in electric power transmission equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas. The Global Warming Potential of SF_6 is 23,900.
Hydrochlorofluoro-carbons (HCFCs)	HCFCs are solvents, similar in use and chemical composition to CFCs. The main uses of HCFCs are for refrigerant products and air conditioning systems. As part of the Montreal Protocol, HCFCs are subject to a consumption cap and gradual phase out. The United States is scheduled to achieve a 100 percent reduction to the cap by 2030. The 100-year Global Warming Potentials of HCFCs range from 90 for HCFC-123 to 1,800 for HCFC-142b.
Nitrogen Trifluoride (NF_3)	NF_3 was added to Health and Safety Code section 38505(g)(7) as a GHG of concern. This gas is used in electronics manufacture for semiconductors and liquid crystal displays. It has a high global warming potential of 17,200.

3 REGULATORY SETTING

3.1 Federal

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

U.S. Environmental Protection Agency Endangerment Finding

The U.S. Environmental Protection Agency (EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in *Massachusetts v. EPA* (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the EPA finalized an endangerment finding in December 2009. Based on scientific evidence it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the EPA's assessment of the scientific evidence that form the basis for the EPA's regulatory actions.

Federal Vehicle Standards

In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency.

In 2018, the President and the EPA stated their intent to halt various federal regulatory activities to reduce GHG emission, including the phase two program. California and other states have stated their intent to challenge federal actions that would delay or eliminate GHG reduction measures and have committed to cooperating with other countries to implement global climate change initiatives. On September 27, 2019, the EPA and the NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program." (84 Fed. Reg. 51,310 (Sept. 27, 2019.) The Part One Rule revokes California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. On March 31, 2020, the EPA and NHTSA finalized rulemaking for SAFE Part Two sets CO_2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021-2026. The current U.S. EPA administration has repealed SAFE Rule Part One, effective January 28, 2022 and is reconsidering Part Two pursuant to Presidential Executive Order 13390 issued on January 20, 2021 as discussed below.

Presidential Executive Orders 13990 and 14008

On January 20, 2021, President Biden issued Executive Order 13990, "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis". Executive Order 13990 directs Federal agencies to immediately review and take action to address the promulgation of Federal regulations and other actions that conflict with these important national objectives and to immediately commence work to confront the climate crisis. Executive Order 13990 directs the Council on Environmental Quality (CEQ) to review CEQ's 2020 regulations implementing the procedural requirements of the National Environmental Policy Act (NEPA) and identify necessary changes or actions to meet the objectives of Executive Order 13990.

Executive Order 13390 also directs the EPA to consider whether to propose suspending, revising, or rescinding the standards previously revised under the "The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks," promulgated in April 2020.

On January 27, 2021, President Biden signed Executive Order 14008, "Tackling the Climate Crisis at Home and Abroad," to declare the Administration's policy to move quickly to build resilience, both at home and abroad, against the impacts of climate change that are already manifest and will continue to intensify according to current trajectories. In line with these Executive Order directives, CEQ is reviewing the 2020 NEPA regulations and plans to publish a notice of proposed rulemaking (NPRM) to identify necessary revisions in order to comply with the law; meet the environmental, climate change, and environmental justice objectives of Executive Orders 13990 and 14008; ensure full and fair public involvement in the NEPA process; provide regulatory certainty to stakeholders; and promote better decision making consistent with NEPA's statutory requirements. This phase 1 rulemaking will propose a narrow set of changes to the 2020 NEPA regulations to address these goals.

3.2 State of California

California Air Resources Board

The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of CO_2 equivalents (CO_2e) in the world and produced 459 million gross metric tons of CO_2e in 2013. In the State, the transportation sector is the largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark Assembly Bill (AB) 32, *California Global Warming Solutions Act of 2006*, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major provisions of the legislation.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

California Air Resource Board Scoping Plan

CARB adopted the Scoping Plan to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that would be adopted to reduce California's GHG emissions. CARB determined that achieving the 1990 emissions level would require a reduction of GHG emissions of approximately 29 percent below what would otherwise occur in 2020 in the absence of new laws and regulations (referred to as "business-as-usual")[2]. The Scoping Plan evaluates opportunities for sector-specific reductions, integrates early actions and additional GHG reduction measures by both CARB and the State's Climate Action Team, identifies additional measures to be pursued as regulations, and outlines the adopted role of a cap-and-trade program[3]. Additional development of these measures and adoption of the appropriate regulations occurred through the end of 2013. Key elements of the Scoping Plan include:

[2] CARB defines business-as-usual (BAU) in its Scoping Plan as emissions levels that would occur if California continued to grow and add new GHG emissions but did not adopt any measures to reduce emissions. Projections for each emission-generating sector were compiled and used to estimate emissions for 2020 based on 2002–2004 emissions intensities. Under CARB's definition of BAU, new growth is assumed to have the same carbon intensities as was typical from 2002 through 2004.

[3] The Climate Action Team, led by the secretary of the California Environmental Protection Agency, is a group of State agency secretaries and heads of agencies, boards, and departments. Team members work to coordinate statewide efforts to implement global warming emissions reduction programs and the State's Climate Adaptation Strategy.

- Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
- Achieving a statewide renewables energy mix of 33 percent by 2020.
- Developing a California cap-and-trade program that links with other programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions (adopted in 2011).
- Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets (several sustainable community strategies have been adopted).
- Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, heavy-duty truck measures, the Low Carbon Fuel Standard (amendments to the Pavley Standard adopted 2009; Advanced Clean Car standard adopted 2012), goods movement measures, and the Low Carbon Fuel Standard (adopted 2009).
- Creating targeted fees, including a public goods charge on water use, fees on gasses with high global warming potential, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.
- The California Sustainable Freight Action Plan was developed in 2016 and provides a vision for California's transition to a more efficient, more economically competitive, and less polluting freight transport system. This transition of California's freight transport system is essential to supporting the State's economic development in coming decades while reducing pollution.
- CARB's Mobile Source Strategy demonstrates how the State can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years. The mobile Source Strategy includes increasing ZEV buses and trucks.

In 2012, CARB released revised estimates of the expected 2020 emissions reductions. The revised analysis relied on emissions projections updated in light of current economic forecasts that accounted for the economic downturn since 2008, reduction measures already approved and put in place relating to future fuel and energy demand, and other factors. This update reduced the projected 2020 emissions from 596 million metric tons of CO_2e ($MMTCO_2e$) to 545 $MMTCO_2e$. The reduction in forecasted 2020 emissions means that the revised business-as-usual reduction necessary to achieve AB 32's goal of reaching 1990 levels by 2020 is now 21.7 percent, down from 29 percent. CARB also provided a lower 2020 inventory forecast that incorporated State-led GHG emissions reduction measures already in place. When this lower forecast is considered, the necessary reduction from business-as-usual needed to achieve the goals of AB 32 is approximately 16 percent.

CARB adopted the first major update to the Scoping Plan on May 22, 2014. The updated Scoping Plan summarizes the most recent science related to climate change, including anticipated impacts to California and the levels of GHG emissions reductions necessary to likely avoid risking irreparable damage. It identifies the actions California has already taken to reduce GHG emissions and focuses on areas where further reductions could be achieved to help meet the 2020 target established by AB 32. By 2016, California had reduced GHG emissions below 1990 levels, achieving AB 32's 2020 goal four years ahead of schedule.

In 2016, the Legislature passed Senate Bill (SB) 32, which codifies a 2030 GHG emissions reduction target of 40 percent below 1990 levels. With SB 32, the Legislature passed companion legislation, AB 197, which provides additional direction for developing the Scoping Plan. On December 14, 2017 CARB adopted a second update to the Scoping Plan[4]. The 2017 Scoping Plan details how the State will reduce GHG emissions to meet the 2030 target set by Executive Order B-30-15 and codified by SB 32. Other objectives listed in the 2017 Scoping plan are to provide direct GHG emissions reductions; support climate investment in disadvantaged communities; and support the Clean Power Plan and other Federal actions.

Senate Bill 32 (California Global Warming Solutions Act of 2006: Emissions Limit)

Signed into law in September 2016, SB 32 codifies the 2030 GHG reduction target in Executive Order B-30-15 (40 percent below 1990 levels by 2030). The bill authorizes CARB to adopt an interim GHG emissions level target to be achieved by 2030. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions.

SB 375 (The Sustainable Communities and Climate Protection Act of 2008)

Signed into law on September 30, 2008, SB 375 provides a process to coordinate land use planning, regional transportation plans, and funding priorities to help California meet the GHG reduction goals established by AB 32. SB 375 requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, aligns planning for transportation and housing, and creates specified incentives for the implementation of the strategies.

AB 1493 (Pavley Regulations and Fuel Efficiency Standards)

AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the EPA's denial of an implementation waiver. The EPA subsequently granted the requested waiver in 2009, which was upheld by the by the U.S. District Court for the District of Columbia in 2011. The regulations establish one set of emission standards for model years 2009–2016 and a second set of emissions standards for model years 2017 to 2025. By 2025, when all rules will be fully implemented, new automobiles will emit 34 percent fewer CO_2e emissions and 75 percent fewer smog-forming emissions. In 2019 the EPA published the SAFE Rule that revoked California's waiver. However, the EPA is currently reconsidering the SAFE rule pursuant to Presidential Executive Order 13390.

SB 1368 (Emission Performance Standards)

SB 1368 is the companion bill of AB 32, which directs the California Public Utilities Commission (CPUC) to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 limits carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. The new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the State. The CPUC adopted the regulations required by SB 1368 on August 29, 2007.

[4] California Air Resources Board, *California's 2017 Climate Change Scoping Plan,* https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed May 9, 2018.

The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, for 1,100 pounds of CO_2 per megawatt-hour.

SB 1078 and SBX1-2 (Renewable Electricity Standards)

SB 1078 requires California to generate 20 percent of its electricity from renewable energy by 2017. SB 107 changed the due date to 2010 instead of 2017. On November 17, 2008, Governor Arnold Schwarzenegger signed Executive Order S-14-08, which established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Executive Order S-21-09 also directed CARB to adopt a regulation by July 31, 2010, requiring the State's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010 by Resolution 10-23. SBX1-2, which codified the 33 percent by 2020 goal.

SB 350 (Clean Energy and Pollution Reduction Act of 2015)

Signed into law on October 7, 2015, SB 350 implements the goals of Executive Order B-30-15. The objectives of SB 350 are to increase the procurement of electricity from renewable sources from 33 percent to 50 percent (with interim targets of 40 percent by 2024, and 25 percent by 2027) and to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation. SB 350 also reorganizes the Independent System Operator to develop more regional electricity transmission markets and improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

AB 398 (Market-Based Compliance Mechanisms)

Signed on July 25, 2017, AB 398 extended the duration of the Cap-and-Trade program from 2020 to 2030. AB 398 required CARB to update the Scoping Plan and for all GHG rules and regulations adopted by the State. It also designated CARB as the statewide regulatory body responsible for ensuring that California meets its statewide carbon pollution reduction targets, while retaining local air districts' responsibility and authority to curb toxic air contaminants and criteria pollutants from local sources that severely impact public health. AB 398 also decreased free carbon allowances over 40 percent by 2030 and prioritized Cap-and-Trade spending to various programs including reducing diesel emissions in impacted communities.

SB 150 (Regional Transportation Plans)

Signed on October 10, 2017, SB 150 aligns local and regional GHG reduction targets with State targets (i.e., 40 percent below their 1990 levels by 2030). SB 150 creates a process to include communities in discussions on how to monitor their regions' progress on meeting these goals. The bill also requires the CARB to regularly report on that progress, as well as on the successes and the challenges regions experience associated with achieving their targets. SB 150 provides for accounting of climate change efforts and GHG reductions and identify effective reduction strategies.

SB 100 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases)

Signed into Law in September 2018, SB 100 increased California's renewable electricity portfolio from 50 to 60 percent by 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045.

AB 1346 (Air Pollution: Small Off-Road Engines)

Signed into Law in October 2021, AB 1346 requires CARB, to adopt cost-effective and technologically feasible regulations to prohibit engine exhaust and evaporative emissions from new small off-road engines, consistent with federal law, by July 1, 2022. The bill requires CARB to identify and, to the extent feasible, make available funding for commercial rebates or similar incentive funding as part of any updates to existing applicable funding program guidelines to local air pollution control districts and air quality management districts to implement to support the transition to zero-emission small off-road equipment operations.

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs using executive orders. Although not regulatory, they set the tone for the State and guide the actions of state agencies.

Executive Order S-3-05. Executive Order S-3-05 was issued on June 1, 2005, which established the following GHG emissions reduction targets:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Executive Order S-01-07. Issued on January 18, 2007, Executive Order S 01-07 mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The executive order established a Low Carbon Fuel Standard (LCFS) and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission, CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. CARB adopted the LCFS on April 23, 2009.

Executive Order S-13-08. Issued on November 14, 2008, Executive Order S-13-08 facilitated the California Natural Resources Agency development of the 2009 California Climate Adaptation Strategy. Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order S-14-08. Issued on November 17, 2008, Executive Order S-14-08 expands the State's Renewable Energy Standard to 33 percent renewable power by 2020. Additionally, Executive Order S-21-09 (signed on September 15, 2009) directs CARB to adopt regulations requiring 33 percent of electricity sold in the State come from renewable energy by 2020. CARB adopted the Renewable Electricity Standard on September 23, 2010, which requires 33 percent renewable energy by 2020 for most publicly owned electricity retailers.

Executive Order S-21-09. Issued on July 17, 2009, Executive Order S-21-09 directs CARB to adopt regulations to increase California's RPS to 33 percent by 2020. This builds upon SB 1078 (2002), which

established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II.

Executive Order B-30-15. Issued on April 29, 2015, Executive Order B-30-15 established a California GHG reduction target of 40 percent below 1990 levels by 2030 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO_2e (MMTCO2e). The 2030 target acts as an interim goal on the way to achieving reductions of 80 percent below 1990 levels by 2050, a goal set by Executive Order S-3-05. The executive order also requires the State's climate adaptation plan to be updated every three years and for the State to continue its climate change research program, among other provisions. With the enactment of SB 32 in 2016, the Legislature codified the goal of reducing GHG emissions by 2030 to 40 percent below 1990 levels.

Executive Order B-55-18. Issued on September 10, 2018, Executive Order B-55-18 establishes a goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing GHG emissions. The executive order requires CARB to work with relevant state agencies to develop a framework for implementing this goal. It also requires CARB to update the Scoping Plan to identify and recommend measures to achieve carbon neutrality. The executive order also requires state agencies to develop sequestration targets in the Natural and Working Lands Climate Change Implementation Plan.

Executive Order N-79-20. Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

Title 20 Appliance Efficiency Regulations. The appliance efficiency regulations (California Code of Regulations [CCR] Title 20, Sections 1601-1608) include standards for new appliances. Twenty-three categories of appliances are included in the scope of these regulations. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

Title 24 Building Energy Efficiency Standards. California's Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow

consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The 2016 Building Energy Efficiency Standards approved on January 19, 2016 went into effect on January 1, 2017. The 2019 Building Energy Efficiency Standards were adopted on May 9, 2018 and took effect on January 1, 2020. Under the 2019 standards, homes will use about 53 percent less energy and nonresidential buildings will use about 30 percent less energy than buildings under the 2016 standards.

Title 24 California Green Building Standards Code. The California Green Building Standards Code (CCR Title 24, Part 11 code) commonly referred to as the CALGreen Code, is a statewide mandatory construction code developed and adopted by the California Building Standards Commission and the Department of Housing and Community Development. The CALGreen standards require new residential and commercial buildings to comply with mandatory measures under the topics of planning and design, energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt that encourage or require additional measures in the five green building topics.

On August 11, 2021, the CEC adopted the 2022 Energy Code. In December, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. Among other updates like strengthened ventilation standards for gas cooking appliances, the 2022 Energy Code includes updated standards in three major areas:

- New electric heat pump requirements for residential uses, schools, offices, banks, libraries, retail, and grocery stores.
- The promotion of electric-ready requirements for new homes including the addition of circuitry for electric appliances, battery storage panels, and dedicated infrastructure to allow for the conversion from natural gas to electricity.
- The expansion of solar photovoltaic and battery storage standards to additional land uses including high-rise multifamily residences, hotels and motels, tenant spaces, offices, (including medical offices and clinics), retail and grocery stores, restaurants, schools, and civic uses (including theaters auditoriums, and convention centers)

Projects whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.[5]

CARB Advanced Clean Truck Regulation. CARB adopted the Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

[5] California Energy Commission. 2022. *2022 Building Energy Efficiency Standards*, https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency (accessed April 2022).

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.

- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

3.3 Regional

South Coast Air Quality Management District Rule 2305 (Warehouse Indirect Source Rule)

Rule 2305 was adopted by the SCAQMD Governing Board on May 7, 2021 to reduce NOX and particulate matter emissions associated with warehouses and mobile sources attracted to warehouses. However, Rule 2305 would also reduce GHG emissions. This rule applies to all existing and proposed warehouses over 100,000 square feet located in the SCAQMD. Rule 2305 requires warehouse operators to track annual vehicle miles traveled associated with truck trips to and from the warehouse. These trip miles are used to calculate the warehouses WAIRE (Warehouse Actions and Investments to Reduce Emissions) Points Compliance Obligation. WAIRE Points are earned based on emission reduction measures and warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. Reduction strategies listed in the WAIRE menu include acquire zero emission (ZE) or near zero emission (NZE) trucks; require ZE/NZE truck visits; require ZE yard trucks; install on-site ZE charging/fueling infrastructure; install onsite energy systems; and install filtration systems in residences, schools, and other buildings in the adjacent community. Warehouse operators that do not earn a sufficient number of WAIRE points to satisfy the WAIRE Points Compliance Obligation would be required to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby.

South Coast Air Quality Management District Thresholds

The South Coast Air Quality Management District (SCAQMD) formed a GHG California Environmental Quality Act (CEQA) Significance Threshold Working Group to provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents. This working group was formed to assist SCAQMD's efforts to develop a GHG significance threshold and is composed of a wide variety of stakeholders including the State Office of Planning and Research, CARB, the Attorney General's Office, a variety of city and county planning departments in the South Coast Air Basin (SCAB), various utilities such as sanitation and power companies throughout the SCAB, industry groups, and environmental and professional organizations. The Working Group has proposed a tiered approach to evaluating GHG emissions for development projects where SCAQMD is not the lead agency, wherein projects are evaluated sequentially through a series of "tiers" to determine whether the project is likely to result in a potentially significant impact due to GHG emissions.

With the tiered approach, a project is compared against the requirements of each tier sequentially and would not result in a significant impact if it complies with any tier. Tier 1 excludes projects that are specifically exempt from SB 97 from resulting in a significant impact. Tier 2 excludes projects that are consistent with a GHG reduction plan that has a certified final CEQA document and complies with AB 32 GHG reduction goals. Tier 3 excludes projects with annual emissions lower than a screening threshold. The SCAQMD has adopted a threshold of 10,000 metric tons of CO_2e ($MTCO_2e$) per year for industrial projects and a 3,000 $MTCO_2e$ threshold was proposed for non-industrial projects but has not been adopted. During Working Group Meeting #7 it was explained that this threshold was derived using a 90 percent capture rate of a large sampling of industrial facilities. During Meeting #8, the Working Group defined industrial uses as production, manufacturing, and fabrication activities or storage and distribution (e.g., warehouse, transfer facility, etc.). The Working Group indicated that the 10,000 $MTCO_2e$ per year threshold applies to both emissions from construction and operational phases plus indirect emissions (electricity, water use, etc.). The SCAQMD concluded that projects with emissions less than the screening threshold would not result in a significant cumulative impact.

Tier 4 consists of three decision tree options. Under the Tier 4 first option, SCAQMD initially outlined that a project would be excluded if design features and/or mitigation measures resulted in emissions 30 percent lower than business as usual emissions. However, the Working Group did not provide a recommendation for this approach. The Working Group folded the Tier 4 second option into the third option. Under the Tier 4 third option, a project would be excluded if it was below an efficiency-based threshold of 4.8 $MTCO_2e$ per service population per year. Tier 5 would exclude projects that implement offsite mitigation (GHG reduction projects) or purchase offsets to reduce GHG emission impacts to less than the proposed screening level.

Tier 3 Screening Thresholds

When the tiered approach is applied to a proposed project, and the project is found not to comply with Tier 1 or Tier 2, the project's emissions are compared against a screening threshold, as described above, for Tier 3. The screening threshold formally adopted by SCAQMD is an "interim" screening threshold for stationary source industrial projects where the SCAQMD is the lead agency under CEQA. The threshold was termed "interim" because, at the time, SCAQMD anticipated that CARB would be adopting a statewide significance threshold that would inform and provide guidance to SCAQMD in its adoption of a final threshold. However, no statewide threshold was ever adopted, and the interim threshold remains in effect.

For projects for which SCAQMD is not a lead agency, no screening thresholds have been formally adopted. However, the SCAQMD Working Group has recommended a threshold of 10,000 $MTCO_2e$/year for industrial projects and 3,000 $MTCO_2e$/year for residential and commercial projects. SCAQMD determined that these thresholds would "capture" 90 percent of GHG emissions from these sectors, "capture" meaning that 90 percent of total emissions from all new projects would be subject to some type of CEQA analysis (i.e., found potentially significant).[6]

[6] SCAQMD, "Staff Report: Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans," December 5, 2008, Attachment E: "Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold," October 2008, p. 3-2.

Southern California Association of Governments

On September 3, 2020, SCAG's Regional Council adopted Connect SoCal (2020 - 2045 Regional Transportation Plan/Sustainable Communities Strategy [2020 RTP/SCS]). The RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The strategy was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The RTP/SCS is a long-range vision plan that balances future mobility and housing needs with economic, environmental, and public health goals. The SCAG region strives toward sustainability through integrated land use and transportation planning. The SCAG region must achieve specific federal air quality standards and is required by state law to lower regional GHG emissions.

3.4 Local

County of San Bernardino Countywide Plan

The project site is within an unincorporated area of the non-desert portion of southwestern San Bernardino County, which is part of the South Coast Air Basin (SCAB) and is under the jurisdiction of the SCAQMD. The San Bernardino Countywide General Plan includes the following goals and policies to reduce GHG emissions within the county boundaries:

Goal NR-1 **Air Quality. Air quality that promotes health and wellness of residents in San Bernardino County through improvements in locally-generated emissions.**

Policy NR-1.1 **Land use.** Promote compact and transit-oriented development countywide and regulate the types and locations of development in unincorporated areas to minimize vehicle miles traveled and greenhouse gas emissions.

Policy NR-1.7 **Greenhouse gas reduction targets**. Strive to meet the 2040 and 2050 greenhouse gas emission reduction targets in accordance with state law.

Policy NR-1.9 **Building design and upgrades**. Use the CALGreen Code to meet energy efficiency standards for new buildings and encourage the upgrading of existing buildings to incorporate design elements, building materials, and fixtures that improve environmental sustainability and reduce emissions.

Goal RE-1 **Energy Conservation and Efficiency. The County will pursue energy efficiency tools and conservation practices that optimize the benefits of renewable energy.**

Policy RE-1.1 **GHG Reduction Plan.** Continue implementing the energy conservation and efficiency measures identified in the County of San Bernardino Greenhouse Gas Emissions Reduction Plan.

Policy RE-1.2 **Optimized efficiency.** Optimize energy efficiency in the built environment

Policy RE-1.4 **Energy conservation.** Encourage residents and businesses to conserve energy.

Goal RE-2 **Renewable Energy Systems. The County will be home to diverse and innovative renewable energy systems that provide reliable and affordable energy to our unique Valley, Mountain, and Desert regions.**

Policy RE-2.1 **Types of renewable energy systems**. Support solar energy generation, solar water heating, wind energy and bioenergy systems that are consistent with the orientation, siting and environmental compatibility policies of the General Plan.

San Bernardino County Greenhouse Gas Reduction Plan

The County adopted a GHG Reduction Plan in September 2011 and updated their GHG Development Review Process in March 2015, and most recently in September 2021 (GHG Reduction Plan). The GHG Reduction Plan provides a means of implementing state regulations, including AB 32, AB 1493, Executive Order S-3-05, SB 375, Executive Order B-30-15, SB 32, AB 398, and SB 97, at the County level. The 2021 GHG Reduction Plan Update provides a target and comprehensive set of actions for GHG emission reductions for the year 2030 (i.e., an emissions reduction 40 percent below 2007 levels). This reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045.

GHG emissions impacts are assessed through the GHG Development Review Process by applying appropriate reduction requirements as part of the discretionary approval of new development projects. Through its development review process, the County will implement CEQA requiring new development projects to quantify project GHG emissions and adopt feasible mitigation to reduce project emissions below a level of significance.

A review standard of 3,000 $MTCO_2e$ per year is used to identify projects that require the use of Screening Tables or a project-specific technical analysis to quantify and mitigate project emissions. The purpose of the Screening Tables is to provide guidance in measuring the reduction of GHG emissions attributable to certain design and construction measures incorporated into development projects.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 CEQA Thresholds and Significance Criteria

Based upon the criteria derived from Appendix G of the CEQA Guidelines, a project normally would have a significant effect on the environment if it would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, based on any applicable threshold of significance; or
- Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

Addressing GHG emissions generation impacts requires an agency to determine what constitutes a significant impact. The amendments to the CEQA Guidelines specifically allow lead agencies to determine thresholds of significance that illustrate the extent of an impact and are a basis from which to apply mitigation measures. This means that each agency is left to determine whether a project's GHG emissions will have a "significant" impact on the environment. The guidelines direct that agencies are to use "careful judgment" and "make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" the project's GHG emissions[7].

GHG Thresholds

On December 5, 2008, the SCAQMD Governing Board adopted a 10,000 $MTCO_2e$ industrial threshold for projects where SCAQMD is the lead agency. The SCAQMD GHG CEQA Significance Threshold Working Group defined industrial uses as production, manufacturing, and fabrication activities or storage and distribution (e.g., warehouse, transfer facility, etc.) during Meeting #8. Additionally, the SCAQMD GHG Significance Threshold Stakeholder Working Group has specified that a warehouse is considered to be an industrial project.[8] During the GHG CEQA Significance Threshold Working Group Meeting #15, the SCAQMD noted that it was considering extending the industrial GHG significance threshold for use by all lead agencies. Furthermore, the Working Group indicated that the 10,000 $MTCO_2e$ per year threshold applies to both emissions from construction and operational phases plus indirect emissions (electricity, water use, etc.). The SCAQMD has not announced when staff is expecting to present GHG thresholds for land use projects where the SCAQMD is not the lead agency to the governing board.

As noted above, the County's GHG Reduction Plan includes review standard of 3,000 $MTCO_2e$ per year to identify projects that require the use of Screening Tables or a project-specific technical analysis to quantify and mitigate project emissions. The purpose of the Screening Tables is to provide guidance in measuring the reduction of GHG emissions attributable to certain design and construction measures incorporated into development projects. Projects that exceed the 3,000 $MTCO_2e$/year are required to either achieve a minimum 100 points per the Screening Tables or a 31 percent reduction over 2007 emissions levels.

According to the County's 2021 GHG Emissions Reduction Plan Update, any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be

[7] 14 California Code of Regulations, Section 15064.4a

[8] South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #8*, 2009.

consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions.

4.2 Methodology

Global climate change is, by definition, a cumulative impact of GHG emissions. Therefore, there is no project-level analysis. The baseline against which to compare potential impacts of the project includes the natural and anthropogenic drivers of global climate change, including world-wide GHG emissions from human activities which almost doubled between 1970 and 2010 from approximately 27 gigatonnes (Gt) of CO_2/year to nearly 49 $GtCO_2$/year.[9] As such, the geographic extent of climate change and GHG emissions cumulative impact discussion is worldwide.

The Project's construction and operational emissions were calculated using the California Emissions Estimator Model version 2020.4.0 (CalEEMod). Details of the modeling assumptions and emission factors are provided in Appendix A: Greenhouse Gas Emissions Data. For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. GHG emissions during construction were forecasted based on the proposed construction schedule and applying the mobile-source and fugitive dust emissions factors derived from CalEEMod. The Project's construction-related GHG emissions would be generated from off-road construction equipment, on-road hauling, vendor (material delivery) trucks, and worker vehicles. Construction was modeled generally according to the following timeline[10]:

- Phase 1a: Commence in 2023 with a 12-month duration.
- Phase 1b: Commence in 2024 with a 12-month duration.
- Phase 2: Commence in 2025 with a 12-month duration.
- Commercial Parcel: Commence in 2026 with an 11-month duration.

The Project's operational GHG emissions would be generated by vehicular traffic, off-road equipment, area sources (e.g., landscaping maintenance, consumer products), electrical generation, natural gas consumption, water supply and wastewater treatment, and solid waste. These emissions categories are discussed below.

- **Area Sources**. Area source emissions occur from hearths, architectural coatings, landscaping equipment, and consumer products. The Project involves warehouse uses and would not include hearths. Landscaping and consumer products would be limited. Negligible quantities of consumer

[9] Intergovernmental Panel on Climate Change, *Climate Change 2014 Mitigation of Climate Change Working Group III Contribution to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2014.

[10] As the Project development is speculative, a conservative worst-case construction timeline has been modeled for analysis purposes. This involves modeling emissions at the earliest feasible date. Emissions in future years (i.e., due to a later construction start date or operational opening year) would be lower due to phased-in emissions standards, inspection and maintenance requirements, and fleet turnover). Project construction that occurs at a later date than what was modeled impacts would result in lower emissions than those analyzed due to the use of more energy-efficient and cleaner burning construction vehicle fleet mix, pursuant to state regulations that require vehicle fleet operators to phase-in less polluting heavy-duty equipment. As a result, Project-related construction emissions would be lower than the impacts disclosed herein. For emissions modeling purposes, conservatively analyzing the emissions using an earlier construction start date provides for a worst-case analysis and full disclosure of potential air quality impacts, as required by CEQA.

products (i.e., personal care products, home, lawn, and garden products, disinfectants, sanitizers, polishes, cosmetics, and floor finishes) would be used.

- **Energy Consumption**. Energy consumption consists of emissions from project consumption of electricity and natural gas. Primary uses of electricity and natural gas by the Project would be for miscellaneous warehouse equipment, space heating and cooling, water heating, ventilation, lighting, appliances, and electronics. Energy emissions are calculated based on consumption rates and emissions factors in CalEEMod.
- **Solid Waste**. Solid waste releases GHG emissions in the form of methane when these materials decompose. Solid waste emissions are calculated based on generation rates and emissions factors in CalEEMod.
- **Water and Wastewater**. Project GHG emissions would be generated from energy consumption associated with water and wastewater conveyance and treatment. Water and wastewater emissions are calculated based on consumption rates and emissions factors in CalEEMod.
- **Off-Road Equipment**. Operational off-road emissions would be generated by off-road cargo handling equipment used during operational activities at the warehouses (off-road equipment would not be needed for the operational activities at the commercial development). Off-road emissions were calculated with emissions rates derived from CARB's OFFROAD database. For this project it was assumed that the warehouses would including the following off-road equipment per SCAQMD data[11]:
    - Phase 1a: 63 forklifts and 11 yard trucks
    - Phase 1b: 38 forklifts and 7 yard trucks
    - Phase 2: 31 forklifts and 6 yard trucks
- **Transport Refrigeration Units**. Transport Refrigeration Units (TRUs) are refrigeration systems powered by diesel internal combustion engines designed to refrigerate or heat perishable products that are transported in various containers, including semi-trailers and truck vans. TRU emissions were quantified with CARB's OFFROAD database. All trucks associated with the refrigerated building space were assumed to have TRUs for modeling purposes to provide a worst-case scenario.
- **Emergency Backup Generators**. As the Project warehouses are speculative, it is unknown whether emergency backup generators would be used. Backup generators would only be used in the event of a power failure and would not be part of the Project's normal daily operations. Nonetheless, emissions associated with this equipment were included to be conservative. Emissions from an emergency backup generator for each warehouse building were calculated separately from CalEEMod; refer to Appendix A. However, CalEEMod default emissions rates were used. If backup generators are required, the end user would be required to obtain a permit from the SCAQMD prior to installation. Emergency backup generators must meet SCAQMD's Best Available Control Technology (BACT) requirements and comply with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines), which would minimize emissions.

Mobile Sources. Mobiles source emissions were calculated with CalEEMod based on the trip generation from the Project Traffic Study prepared by Kimley-horn and Associates (January 2022).

[11] SCAQMD, *High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results*, June 2014.

The Project land use assumptions and trip generation from the Traffic Study is summarized in Table 3: CalEEMod Land Use and Trip Generation. Project trip generation is based on Institute of Transportation Engineers (ITE) land use categories or specific counts where ITE categories were not available. Truck mix percentages are based on the SCAQMD Truck Trip Generation Study applied to ITE truck percentages and data from other similar facilities. Other operational emissions from area, energy, and stationary sources were quantified in CalEEMod based on land use activity data.

Table 3: CalEEMod Land Use and Trip Generation

Land Use Type	Building Area Modeled (Thousand Square Feet)[7]	Modeled Acreage[8]	Total Daily Trips[9]	Truck %	Trucks[10]
Phase 1a					
E-Commerce Warehouse with Office[1, 2]	2,773.050	63.7	13,595	13.4%	1,828

1. Trip generation based on trip counts for similar uses; refer to the Traffic Study.
2. Includes 50 thousand square feet (KSF) of office and 2,723.050 KSF unrefrigerated warehouse.
3. Additional warehouse building area is modeled to be conservative and provide flexibility between phases. The overall building area is conservative and additional building area (refrigerated and non-refrigerated) has also been included in the initial phases.
4. As indicated in the Traffic Study, truck storage trips rates provided by the City of San Bernardino based on data from similar facilities; refer to the Traffic Study.
5. Includes 40 KSF office and 1,735.3 KSF unrefrigerated warehouse.
6. Includes 30 KSF office and 1,273.84 KSF unrefrigerated warehouse.
7. Total square footage includes high cube/e-commerce warehouse and commercial building sizes used in the CalEEMod modeling.
8. The total acreage for the Project site is 432.9 acres. However, for modeling purposes an additional 12 acres was included to conservatively capture the commercial uses.
9. Per the TIA, the project would generate are 34,489 total daily trips (34,150 net trips). For emissions modeling purposes, this analysis evaluates the daily trip generation based on the maximum building area of 6.6 million square feet to conservatively capture the maximum potential passenger car and truck trips even though this trip scenario may not be feasible due to site constraints.
10. The TIA trip generation includes 8,468 non-passenger car equivalent daily truck trips and 25,681 net passenger car trips for a total of 34,150 net trips. As noted above, a greater number of daily trips was analyzed for emissions modeling purposes.
11. Of the total acreage noted for proposed parking lots, 12 acres are identified with a commercial overlay that could support up to 261,300 sf of commercial uses. Due to the speculative nature of the commercial development and in order to represent a worst case scenario, the analysis assumes that all 130.3 acres of parking (including the 12 acres with commercial overlay) would be developed in Phases 1a, 1b, and 2 as parking lots. Furthermore, the analysis assumes that the commercial uses would be developed after the parking lots were constructed and would require re-purposing of the parking lots into a commercial use. Therefore, the model includes an additional 12 acres of re-development of the parking lots to support the 261,300 sf of commercial. The total modeled acreage is 432.9 acres plus the additional 12 acres, for a total of 444.9 acres modeled. The total site does not exceed 432.9 acres.

The Project site would consist of up to approximately 6.6 million square feet of high-cube logistics and e-commerce uses with 261,360 square feet of ancillary commercial uses, and approximately 98 acres of parking fields/drop lot areas as well as ancillary open space. However, for purposes of trip generation and associated air quality analysis, a conservative approach was used in the trip generation which assumes 2,641,000 million square feet of high-cube logistics and 2,773,050 million square feet of e-commerce uses, for a total of 5,414,050 million sf of combined high-cube logistics and e-commerce uses. This scenario provides for the maximum number of trips and related air quality impacts that could be associated with the Project. For instance, if the Project were to develop with 6.6 million square feet of high-cube logistics uses only, the number of trips associated with the project would be less than if the project were to develop with the assumed 2,641,000 million square feet of high-cube logistics and 2,773,050 million square feet of e-commerce uses due to the higher intensity of trips generated with e-commerce uses. Potential tenants and end users are unknown at this time; therefore, the exact square footage allocation between high-cube logistics and e-commerce uses cannot be determined at the time this EIR was prepared. Therefore, future development of high-cube logistics and e-commerce uses within the Project site would occur in a combination that would not exceed the maximum number of vehicle trips analyzed within this EIR, which represents a conservative, worst-case scenario. For purposes of construction emissions modeling, the maximum potential development of approximately 6.6 million square feet building area was modeled to reflect the maximum square footage of building construction potential.

Emissions reductions from mitigation measures were applied in CalEEMod are derived from methodologies compiled in the CAPCOA report Quantifying GHG Measures[12]. Each measure was assessed to determine its consistency with CAPCOA criteria for the use of the measure. The following mitigation measure were applied in CalEEMod include:

- Transportation Demand Management Measures: TRT-1 (Implement Trip Reduction Program), TRT-7 (Market Commute Trip Reduction Option), and TRT-11 (Employee Vanpool/Shuttle).
- A-1 – Electric Handheld Landscape Equipment.
- BE-1 – Exceed Title 24. The project would be required to comply with CALGreen Tier 2, which requires a 30 percent improvement.
- SW-1 – 75 Percent Reduction in Solid Waste Disposal.

Additionally, the following design feature was quantified outside of CalEEMod:

- **Zero Emission Cargo Handling Equipment**. Zero emission/electric cargo handling equipment (see Mitigation Measure (MM) AQ-9, below) emissions from energy consumption were calculated based on 132 forklifts and 24 yard trucks operating for 12 hours per day and the Southern California Edison (SCE) electricity CO_2e emissions factor from CalEEMod. As noted above, the assumptions for the equipment are based on the SCAQMD *High Cube Warehouse Truck Trip Study White Paper* (2014).

4.3 Project Design Features

The Master Developer proposes the following Project Design Features (PDFs) that would be incorporated into the Project design and constructed or implemented as part of the Project. PDFs are specific design and/or operational characteristics proposed by the Master Developer that are incorporated into the Project and part of the Project description and Specific Plan. Because PDFs are incorporated into the Project, they do not constitute mitigation measures. PDFs relevant to GHG emissions are provided in the Project Air Quality Assessment.

For example, PDF AQ-8 requires all heavy-duty vehicles registered in California entering or operated on the Project site shall be model year 2010 or later. To promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment, PDF AQ-9 requires that all heavy-duty trucks to be zero emissions beginning in 2030 if such trucks are widely available and economically feasible and PDF AQ-10 requires tenants/facility operators to use zero-emission light- and medium-duty trucks as part of business operations, if such trucks are widely available and economically feasible. PDF AQ-11 requires tenants/facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks. PDF AQ-12 and PDF AQ-13 requires future tenants/facility operators to attend CARB training for record keeping and ensuring vehicles comply with CARB regulations and are in good condition. PDF AQ-14 requires site enforcement staff to be certified in diesel health effects and technologies by attending CARB training and PDF AQ-15 requires compliance with all current air quality regulations for on-road trucks. PDF AQ-16 and PDF AQ-17 requires charging infrastructure and conduit, and PDF AQ-18 requires necessary infrastructure to allow solar photovoltaic systems to be installed in the future. PDF AQ-19 enroll in the EPA's SmartWay program and PDF AQ-20 provide information on CARB's Carl Moyer Voucher Incentive Program to upgrade fleets. PDF AQ-21 requires signage for truck routes and PDF AQ-22 requires check-in points to be located inside the

[12] California Air Pollution Control Officers Association, *Quantifying Greenhouse Gas Mitigation Measures*, August 2010.

facility to ensure truck queues do not occur outside of the facility. It should be noted that these PDFs facilitate compliance with regulations and latest best practices. Emissions benefits from implementation of PDF AQ-1 through PDF AQ-23 are not directly quantifiable and conservatively not quantified; no credit is taken for these measures. Quantifiable reduction measures are incorporated below as mitigation measures, which would be supported by these PDFs.

5 POTENTIAL IMPACTS AND MITIGATION

5.1 Greenhouse Gas Emissions

Threshold 5.1 Would the Project generate GHG emissions, either directly or indirectly, that could have a significant impact on the environment?

Construction Emissions

Project construction would result in direct emissions of CO_2, N_2O, and CH_4 from construction equipment and the transport of materials and construction workers to and from the Project site. The GHG emissions only occur during temporary construction activities and would cease once construction is complete. The total GHG emissions generated during all phases of construction were combined as CO_2e and are shown in Table 4: Construction-Related Greenhouse Gas Emissions.

Table 4: Construction-Related Greenhouse Gas Emissions

Construction Phase	$MTCO_2e$
Phase 1a (2023)	14,828
Phase 1b (2024)	10,765
Phase 2 (2025)	11,453
Commercial Phase (2026)	578
Total Construction Emissions	*37,624*
30-Year Amortized Construction	1,254

Source: CalEEMod version 2020.4.0. Refer to Appendix A for model outputs.

As shown, the Project would result in the generation of approximately 37,624 $MTCO_2e$ over the course of construction. Construction GHG emissions are typically summed and amortized over a 30-year period, then added to the operational emissions[13]. The amortized Project construction emissions would be 1,254 $MTCO_2e$ per year. Once construction is complete, the generation of these GHG emissions would cease.

Operational Greenhouse Gas Emissions

Operational or long-term emissions occur over the life of the Project. GHG emissions would result from direct emissions such as Project generated vehicular traffic, on-site combustion of natural gas, and operation of any landscaping equipment. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power, the energy required to convey water to, and wastewater from the Project, the emissions associated with solid waste generated from the Project, and any fugitive refrigerants from air conditioning or refrigerators.

As noted above in Section 4.3, several PDFs and standard conditions of approval applicable to the Project would help to reduce GHG emissions. In addition, prior to issuance of a building permit, San Bernardino

[13] The project lifetime is based on the standard 30-year assumption of the South Coast Air Quality Management District (South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13,* August 26, 2009).

County would review and verify that the Project plans demonstrate compliance with the current version of the Building and Energy Efficiency Standards. The Project would also be required to adhere to the provisions of CALGreen, which establishes planning and design standards for sustainable site development, and energy efficiency. Construction activities would be required to monitor air quality emissions using applicable regulatory guidance such as the SCAQMD Rules. GHG emissions associated with the Project are summarized in Table 5: Project Greenhouse Gas Emissions.

Table 5: Project Greenhouse Gas Emissions

Emissions Source	$MTCO_2e$ per Year				
	Phase 1a	Phase 1b	Phase 2	Commercial	Total
Unmitigated					
Construction Amortized Over 30 Years	494	359	382	19	1,254

1. Mitigation Measure GHG-2 requires the installation of photovoltaic solar panels to offset energy emissions. Mitigation Measure GHG-3 requires the buildings to meet or exceed CalGreen Tier 2 standards.
2. Mitigation Measure AQ-3 (refer to the Projects Air Quality Assessment) requires implementation of a TDM program.
3. Energy savings from water conservation resulting from the Green Building Code Standards for indoor water use and the County's Water Efficient Landscape Ordinance for outdoor water use are not included in CalEEMod. These are regulatory measures have been incorporated into the CalEEMod mitigation module.

Source: CalEEMod version 2020.4.0. Refer to Appendix A for model outputs.

Table 5 shows that the Project's unmitigated emissions would be approximately 219,696 $MTCO_2e$ annually from operations with amortized construction. Project-related GHG emissions would exceed the County's 3,000 $MTCO_2e$ per year review standard. It should be noted that the majority of the unmitigated GHG emissions (86 percent) are associated with non-construction related mobile sources. Emissions of motor vehicles are controlled by State and Federal standards, and the Project has no control over these standards.

The Project includes numerous PDFs that would minimize emissions as described above. Additionally, Standard Conditions (SC) GHG-1 through SC GHG-9 would provide designated parking to promote the use of alternative fuels and clean fleets, facilitate future installation of electric vehicle supply equipment, and limit idling times.

Furthermore, the Project's Air Quality Assessment includes numerous mitigation measures that would also reduce GHG emissions. For example, Mitigation Measure (**MM) AQ-3** through **MM AQ-10** have been identified to reduce operational emissions. **MM AQ-3** requires the implementation of a Transportation Demand Management (TDM) program to reduce single occupant vehicle trips and encourage transit. **MM AQ-4** requires the buildings to be designed to accommodate electric vehicle (EV) infrastructure, **MM AQ-5** requires tenant installation of conduit at select loading bays, and **MM AQ-6** prohibits idling when engines are not in use. Given the state's clean truck rules and regulations aiming to accelerate the utilization and market penetration of ZE and NZE trucks, **MM AQ-7** requires energy efficient vendor trucks, **MM AQ-8** requires EV charging stations and carpool parking, and **MM AQ-9** requires electric outdoor cargo handling equipment (i.e., forklifts and yard trucks). **MM AQ-10** requires compliance with SCAQMD's Warehouse Indirect Source Rule (Rule 2305). It should be noted that as the nature, timing, and extent of the incorporation of ZE and NZE vehicles cannot be determined at this time, conservatively no emissions reduction credits from **MM AQ-7** through **MM AQ-10** are applied.

In addition, the Project would be required to comply with SCAQMD Rule 2305 which would directly reduce emissions or to otherwise facilitate emissions reductions. Alternatively, warehouse operators can choose to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby. Although Rule 2305 focuses on air quality pollutant emissions, the rule would facilitate cleaner vehicles and supporting infrastructure that would also result in GHG benefits.

Warehouse owners and operators are required to earn Warehouse Actions and Investments to Reduce Emissions (WAIRE) Points each year. WAIRE points are a menu-based system earned by emission reduction measures. Warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. WAIRE points can be earned by completing actions from a menu that can include acquiring and using natural gas, Near-Zero Emissions and/or Zero-Emissions on-road trucks, zero-emission cargo handling equipment, solar panels or zero-emission charging and fueling infrastructure, or other options.

A preliminary WAIRE calculation has been conducted for the proposed Project. The Project would include rooftop solar (refer to **MM GHG-2**) and 24 zero emission yard trucks that would operate for approximately 12 hours per day, 365 days per year. Based on the SCAQMD WAIRE User Calculator the Project would have

a Warehouse Points Compliance Obligation (WPCO) of 13,510 and would earn 41,999 points. As a result, the Project more than fulfill its WPCO and would bank 28,489 points.[14]

The County uses a review standard of 3,000 $MTCO_2e$ per year to identify projects that require the use of the Screening Tables. The County's GHG Development Review Process specifies a two-step approach in quantifying GHG emissions. First, a screening threshold of 3,000 $MTCO_2e$/year is used to determine if additional analysis is required. Projects that exceed the 3,000 $MTCO_2e$/year are required to either achieve a minimum 100 points per the Screening Tables or a 31 percent reduction over 2007 emissions levels.

According to the County's 2021 GHG Emissions Reduction Plan Update, any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions.

Table 6: San Bernardino County GHG Reduction Measures Screening Table shows that each building would potentially earn 104 points on the County's GHG Screening Tables, which would exceed the minimum 100 points required to be consistent with the County's GHG Emissions Reduction Plan. Mitigation Measure **(MM) GHG-1** has been included to ensure application of the GHG reduction measures. Additionally, as stipulated by **MM GHG-1**, individual projects can utilize different measures than those chosen in Table 6 as longs as the total of the measures utilized meet 100 points.

Additionally, **MM GHG-2** requires the Project to offset energy demand with solar PV infrastructure, **MM GHG-3** requires the Project to meet or exceed CALGreen Tier 2 standards (which exceeds code requirements), **MM GHG-4** requires the project to divert at least 75 percent of solid waste from landfills, and **MM GHG-5** requires handheld landscape equipment to be 100 percent electric. Note that credit for solar PV was conservatively not taken in Table 6 as these renewable energy systems may be installed subsequent to occupancy permit issuance.
The project would achieve more than 100 points from the County's GHG Reduction Plan Screening tables and would not conflict with the County's GHG Reduction Plan. However, due to the size of the Project, the magnitude of the Project's emissions could be considered significant. Additionally, 86 percent of the total emissions are from mobile sources. Mitigation measures would be required to reduce emissions to the maximum extent feasible; however, emissions of motor vehicles are controlled by State and Federal standards and the Project has no control over these standards. CARB is addressing emissions from heavy duty vehicles through various regulatory programs including lower emission standards, restrictions on idling, the use of post-combustion filter and catalyst equipment, and retrofits for diesel truck fleets. Additionally, as described above, the SCAQMD is addressing mobile source emissions through the implementation of the Warehouse Indirect Source Rule (Rule 2305)., which would reduce the Projects emissions. Nonetheless, impacts related to GHG emissions are conservatively considered significant and unavoidable despite the implementation of all feasible mitigation.

[14] Note that this calculation is preliminary and provided for informational purposes. The WAIRE Points Compliance Obligation is determined by the actual number of truck trips to the facility based on logs of truck trips submitted on January 1 after the first year of operation. The trip rates that SCAQMD uses in the WAIRE User Calculator would be slightly different than what is used in the Project's Traffic Study.

Table 6: San Bernardino County GHG Reduction Measures Screening Table			
Feature	**Description**	**Assigned Point Values**	**Project Points**
Reduction Measure Energy: Exceed Energy Efficiency Standards in New Commercial Units			
Building Envelope			
Insulation	• 2019 Title 24 Requirements (walls R-8, roof/attic R-30) • Modestly Enhanced Insulation (walls R-15, roof/attic R-38) • **Enhanced Insulation (rigid wall insulation R-13, roof/attic R-38)** • Greatly Enhanced Insulation (spray foam wall insulated walls R-18 or higher, roof/attic R-38 or higher)	0 points 9 points **11 points** 12 points	**11**
Windows	• 2019 Title 24 Windows (0.57 U-factor, 0.4 SHGC) • **Modestly Enhanced Window Insulation (0.4 U-factor, 0.32 SHGC)** • Enhanced Window Insulation (0.32 U-factor, 0.25 SHGC) • Greatly Enhanced Window Insulation (0.28 or less U-factor, 0.22 or less SHGC)	0 points **4 points** 5 points 7 points	**4**
Cool Roofs	• **Enhanced Cool Roof (CRRC Rated 0.2 aged solar reflectance, 0.75 thermal emittance)** • Greatly Enhanced Cool Roof (CRRC Rated 0.35 aged solar reflectance, 0.75 thermal emittance)	**8 points** 10 points	**8**
Air Filtration	Minimizing leaks in the building envelope is as important as the insulation properties of the building. Insulation does not work effectively if there is excess air leakage. • **Air barrier applied to exterior walls, caulking, and visual inspection such as the HERS Verified Quality Insulation Installation (QII or equivalent)** • Blower Door HERS Verified Envelope Leakage or equivalent	**7 points** 6 points	**7**
Thermal Storage of Building	Thermal storage is a design characteristic that helps keep a constant temperature in the building. Common thermal storage devices include strategically placed water filled columns, water storage tanks, and thick masonry walls. • **Modest Thermal Mass (10% of floor or 10% of walls 12" or more thick exposed concrete or masonry with no permanently installed floor covering such as carpet, linoleum, wood, or other insulating materials)** • Enhanced Thermal Mass (20% of floor or 20% of walls 12" or more thick exposed concrete or masonry with no permanently installed floor covering such as carpet, linoleum, wood, or other insulating materials) • Enhanced Thermal Mass (80% of floor or 80% of walls 12" or more thick exposed concrete or masonry with no permanently installed floor covering such as carpet, linoleum, wood, or other insulating materials)	**2 points** 4 points 14 points	**2**
Indoor Space Efficiencies			
Heating/ Cooling Distribution System	• Modest Duct insulation (R-6 required) • **Enhanced Duct Insulation (R-8)** • Distribution loss reduction with inspection (HERS Verified Duct Leakage or equivalent)	0 points **6 points** 8 points	**6**
Space Heating/ Cooling Equipment	• 2019 Title 24 Minimum HVAC Efficiency (SEER 13/75% AFUE or 7.7 HSPF) • Improved Efficiency HVAC (SEER 14/78% AFUE or 8 HSPF) • **High Efficiency HVAC (SEER 15/80% AFUE or 8.5 HSPF)**	0 points 4 points **5 points**	**5**

Table 6: San Bernardino County GHG Reduction Measures Screening Table

Feature	Description	Assigned Point Values	Project Points
	• Very High Efficiency HVAC (SEER 16/82% AFUE or 9 HSPF)	7 points	
Commercial Heat Recovery Systems	Heat recovery strategies employed with commercial laundry, cooking equipment, and other commercial heat sources for reuse in HVAC air intake or other appropriate heat recovery technology. Point values for these types of systems will be determined based upon design and engineering data documenting the energy savings.	TBD	N/A
Water Heaters	• 2019 Title 24 Minimum Efficiency (0.57 Energy Factor) • Improved Efficiency Water Heater (0.675 Energy Factor) • **High Efficiency Water Heater (0.72 Energy Factor)** • Very High Efficiency Water Heater (0.92 Energy Factor) • Solar Pre-heat System (0.2 Net Solar Fraction) • Enhanced Solar Pre-heat System (0.35 Net Solar Fraction)	0 points 8 points **10 points** 11 points 2 points 5 points	**10**
Daylighting	Daylighting is the ability of each room within the building to provide outside light during the day reducing the need for artificial lighting during daylight hours. • All peripheral rooms within building have at least one window or skylight • **All rooms within building have daylight (through use of windows, solar tubes, skylights, etc.)** • All rooms daylighted	0 points **1 point** 1 point	**1**
Artificial Lighting	• **Efficient Lights (25% of in-unit fixtures considered high efficiency. High efficiency is defined as 40 lumens/watt for 15 watt or less fixtures; 50 lumens/watt for 15-40 watt fixtures, 60 lumens/watt for fixtures >40 watt)** • High Efficiency Lights (50% of in-unit fixtures are high efficiency) • Very High Efficiency Lights (100% of in-unit fixtures are high efficiency	**5 points** 7 points 8 points	**5**
Appliances	• Energy Star Commercial Refrigerator (new) • Energy Star Commercial Dishwasher (new) • Energy Star Commercial Clothes Washer (new)	2 points 2 points 2 points	0
Miscellaneous Commercial Building Efficiencies			
Building Placement	**North/south alignment of building or other building placement such that the orientation of the buildings optimizes conditions for natural heating, cooling, and lighting.**	**4 points**	**4**
Shading	**At least 90% of south-facing glazing will be shaded by vegetation or overhangs at noon on June 21st.**	**6 points**	**6**
Other	This allows innovation by the applicant to provide design features that increase the energy efficiency of the project not provided in the table. Note that engineering data will be required documenting the energy efficiency of innovative designs and point values given based upon the proven efficiency beyond Title 24 Energy Efficiency Standards.	TBD	0
Existing Commercial Buildings Retrofits	The applicant may wish to provide energy efficiency retrofit projects to existing commercial buildings to further the point value of their project. Retrofitting existing commercial buildings within the County is a key reduction measure that is needed to reach the reduction goal. The potential for an applicant to take advantage of this program will be decided on a case-by-case basis and shall have the approval from the County of San Bernardino Planning Department. The decision to allow	TBD	0

Table 6: San Bernardino County GHG Reduction Measures Screening Table

Feature	Description	Assigned Point Values	Project Points
	applicants to participate in this program will be evaluated based upon, but not limited to the following: • Will the energy efficiency retrofit project benefit low income or disadvantaged communities? • Does the energy efficiency retrofit project provide co-benefits important to the County? • Point value will be determined based upon engineering and design criteria of the energy efficiency retrofit project.		
Reduction Measure Energy-3: All Electric Buildings			
All-Electric Buildings	All electric buildings reduce GHG emissions, as the grid electricity they use is generated using less carbon over time. Grid electricity in California will be 60 percent renewable energy by 2030 and 100 percent renewable energy by 2040.	15 points	0
Reduction Measure Energy-7: Clean Energy			
Commercial/Industrial Renewable Energy Generation			
Photovoltaic	Solar Photovoltaic panels installed on commercial buildings or in collective arrangements within a commercial development such that the total power provided augments: • 30 percent of the power needs of the project • 40 percent of the power needs of the project • 50 percent of the power needs of the project • 60 percent of the power needs of the project • 70 percent of the power needs of the project • 80 percent of the power needs of the project • 90 percent of the power needs of the project • 100 percent of the power needs of the project	 8 points 12 points 16 points 19 points 23 points 26 points 30 points 34 points	0
Wind Turbines	Some areas of the County lend themselves to wind turbine applications. Analysis of the areas capability to support wind turbines should be evaluated prior to choosing this feature. Wind turbines as part of the commercial development such that the total power provided augments: • 30 percent of the power needs of the project • 40 percent of the power needs of the project • 50 percent of the power needs of the project • 60 percent of the power needs of the project • 70 percent of the power needs of the project • 80 percent of the power needs of the project • 90 percent of the power needs of the project • 100 percent of the power needs of the project	 8 points 12 points 16 points 19 points 23 points 26 points 30 points 34 points	0
Off-site Renewable Energy Project	The applicant may submit a proposal to supply an off-site renewable energy project such as renewable energy retrofits of existing residential or existing commercial/industrial. These off-site renewable energy retrofit project proposals will be determined on a case-by-case basis accompanied by a detailed plan documenting the quantity of renewable energy the proposal will generate. Point values will be based upon the energy generated by the proposal.	TBD	0
Other Renewable Energy Generation	The applicant may have innovative designs or unique site circumstances (such as geothermal) that allow the project to generate electricity from renewable energy not provided in the table. The ability to supply other	TBD	0

Table 6: San Bernardino County GHG Reduction Measures Screening Table			
Feature	**Description**	**Assigned Point Values**	**Project Points**
	renewable energy and the point values allowed would be decided based upon engineering data documenting the ability to generate electricity.		
Reduction Measure Water 1-3: Exceed Water Efficiency Standards			
Commercial Irrigation and Landscaping			
Water Efficient Landscaping	• Eliminate conventional turf from landscaping • Only moderate water using plants • **Only low water using plants** • Only California Native landscape that requires no or only supplemental irrigation	0 point 2 points **3 points** 5 points	**3**
Water Efficient Irrigation Systems	• Low precipitation spray heads< 0.75”/hr or drip irrigation • **Weather based irrigation control systems combined with drip irrigation (demonstrate 20% reduced water use)**	1 point **3 points**	**3**
Storm Water Reuse Systems	Innovative on-site storm water collection, filtration, and reuse systems are being developed that provide supplemental irrigation water and provide vector control. These systems can greatly reduce the irrigation needs of a project. Point values for these types of systems will be determined based upon design and engineering data documenting the water savings.	TBD	0
Commercial Potable Water			
Showers	Water Efficient Showerheads (2.0 gpm)	2 points	0
Toilets	• **Water Efficient Toilets/Urinals (1.5 gpm)** • Waterless Urinals (note that commercial buildings having both waterless urinals and high efficiency toilets will have a combined point value of 6 points)	**3 points** 3 points	**3**
Faucets	**Water Efficient faucets (1.28 gpm)**	**2 points**	**2**
Commercial Dishwashers	Water Efficient dishwashers (20% water savings)	2 points	0
Commercial Laundry Washers	• Water Efficient laundry (15% water savings) • High Efficiency laundry equipment that captures and reuses rinse water (30% water savings)	2 points 4 points	0
Commercial Water Operations Program	Establish an operational program to reduce water loss from pools, water features, etc., by covering pools, adjusting fountain operational hours, and using water treatment to reduce draw down and replacement of water. Point values for these types of plans will be determined based upon design and engineering data documenting the water savings.	TBD	0
Increase Commercial/Industrial Reclaimed Water Use			
Recycled Water	Graywater (purple pipe) irrigation system on site	5 points	0
Reduction Measure On Road: Alternative Transportation Options			
Mixed-Use Development			
Mixed-Use	Mixes of land uses that complement one another in a way that reduces the need for vehicle trips can greatly reduce GHG emissions. The point value of mixed-use projects will be determined based upon traffic	TBD	0

Table 6: San Bernardino County GHG Reduction Measures Screening Table

Feature	Description	Assigned Point Values	Project Points
	studies that demonstrate trip reductions and/or reductions in vehicle miles traveled.		
Local Retail Near Residential (Commercial only Projects)	Having residential developments within walking and biking distance of local retail helps to reduce vehicle trips and/or vehicle miles traveled. The point value of residential projects in close proximity to local retail will be determined based upon traffic studies that demonstrate trip reductions and/or reductions in vehicle miles traveled.	TBD	0
Preferential Parking			
Parking	• **Provide reserved preferential parking spaces for car-share, carpool, and ultra-low or zero emission vehicles.** • **Provide larger parking spaces that can accommodate vans used for ride-sharing programs and reserve them for vanpools and include adequate passenger waiting/loading areas.**	**1 point** **1 point**	**1** **1**
Signal Synchronization and Intelligent Traffic Systems			
Signal Improvements	Techniques for improving traffic flow include: traffic signal coordination to reduce delay, incident management to increase response time to breakdowns and collisions, Intelligent Transportation Systems (ITS) to provide real-time information regarding road conditions and directions, and speed management to reduce high free-flow speeds. • Synchronize signals along arterials used by project. • Connect signals along arterials to existing ITS.	 1 point/signal 3 points/signal	0
Increase Public Transit			
Public Transit	The point value of a project's ability to increase public transit use will be determined based upon a Transportation Impact Analysis (TIA) demonstrating decreased use of private vehicles and increased use of public transportation. • Increased transit accessibility (1–15 points)	TBD	0
Reduction Measure: Install Electric Vehicle Chargers			
Worker and Customer Based Electric Vehicle Chargers	Installation of Electric Vehicle (EV) Chargers for passenger EVs: • **Level 2 240 volt AC Fast Chargers** • Level 3 480 volt DC Rapid Chargers	**5 points/charger** 8 points/charger	**10**
Electric Commercial Truck Chargers	Installation of electric chargers for medium duty and heavy duty trucks: • Level 1 AC Chargers for EV Medium Duty Trucks • Level 1 AC Chargers for EV Class 8 (Heavy Duty) Trucks • Level 2 AC Chargers for EV Medium Duty Trucks • Level 2 AC Chargers for EV Class 8 (Heavy Duty) Trucks • Level 3 DC Fast Chargers for EV Class 8 (Heavy Duty) Trucks	 3 points/charger 5 points/charger 8 points/charger 12 points/charger 16 points/charger	0
Reduction Measure: Adopt and Implement a Bicycle Master Plan to Expand Bike Routes around the County			
Sidewalks	• Provide sidewalks on both sides of the street (required) • Provide pedestrian linkage between commercial and residential land uses within 1 mile	0 points 3 points	0
Bicycle Paths	• **Provide bicycle paths within project boundaries** • Provide bicycle path linkages between commercial and other land uses • Provide bicycle path linkages between commercial and transit	**1 point** 2 points 5 points	**1**

Table 6: San Bernardino County GHG Reduction Measures Screening Table			
Feature	**Description**	**Assigned Point Values**	**Project Points**
Reduction Measure: Reduce Waste to Landfills			
Recycling	County initiated recycling program diverting 80% of waste requires coordination with commercial development to realize this goal. The following recycling features will help the County fulfill this goal: • **Provide separated recycling bins within each commercial building/floor and provide large external recycling collection bins at central location for collection truck pick-up** • **Provide commercial/industrial recycling programs that fulfills an on- site goal of 80% diversion of solid waste** • **Recycle construction waste**	**2 points** **5 points** **4 points**	**2** **5** **4**
Other GHG Reduction Feature Implementation			
Other GHG Emissions Reduction Features	This allows innovation by the applicant to provide commercial design features that the GHG emissions from construction and/or operation of the project not provided in the table. Note that engineering data will be required documenting the GHG reduction amount and point values given based upon emission reductions calculations using approved models, methods, and protocols.	TBD	0
Total Points Earned by Project:			**104**

Standard Conditions and Requirements:

Standard Conditions are existing requirements and standard conditions that are based on local, state, or federal regulations or laws that are frequently required independently of CEQA review. Typical standard conditions and requirements include compliance with the provisions of the Building Code, SCAQMD Rules, etc. The City may impose additional conditions during the approval process, as appropriate. Because Standard Conditions are neither Project specific nor a result of development of the Project, they are not considered to be either PDFs or Mitigation Measures.

SC GHG-1 Require diesel-powered construction equipment to turn off when not in use per Title 13 of the California Code of Regulations, Section 2449.

SC GHG-2 In accordance with California Title 24 Standards, buildings will be designed to have 15 percent of the roof area "solar ready" that will structurally accommodate later installation of rooftop solar panels. If future building operators pursue providing rooftop solar panels, they will submit plans for solar panels prior to occupancy.

SC GHG-3 Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and sensors for landscaping according to the County's Water Efficient Landscape Requirements (Chapter 22, Section 63.2201 of the County's Code).

SC GHG-4 Design buildings to be water-efficient. Install water-efficient fixtures in accordance with Section 5.303 of the California Green Building Standards Code Part 11.

SC GHG-5 Recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste in accordance with Section 5.408.1 of the California Green Building Standards Code Part 11.

SC GHG-6 Provide storage areas for recyclables and green waste and adequate recycling containers located in readily accessible areas in accordance with Section 5.410.1 of the California Green Building Standards Code Part 11.

SC GHG-7 Provide designated parking for any combination of low-emitting, fuel efficient and carpool/van pool vehicles. At least eight percent of the total parking spaces are required to be designated in accordance with Section 5.106.5.2, Designated Parking for Clean Air Vehicles, of the California Green Building Standards Code Part 11.

SC GHG-8 Provide at least six percent of the total parking spaces to facilitate future installation of electric vehicle supply equipment in accordance with Section 5.106.5.3.2, Multiple Charging Space Requirements, of the California Green Building Standards Code Part 11.

SC GHG-9 Limit idling time for commercial vehicles to no more than five minutes per Title 13 of the California Code of Regulations, Section 2485.

Mitigation Measures: Refer to MM AQ-1 through MM AQ-10 in the Air Quality Assessment. The following additional mitigation is also required.

MM GHG-1 Project development proposals with building permit applications for tenant improvements shall implement Screening Table Measures that demonstrate that each building achieve at least 100 points per the Screening Tables. The County shall verify that Screening Table Measures achieving the 100-point performance standard are incorporated in development plans prior to the issuance of building permit(s) and/or site plans (as applicable). The County shall verify implementation of the selected Screening Table Measures prior to the issuance of Certificate(s) of Occupancy. At the discretion of the County, measures that provide GHG reductions equivalent to GHG emissions reductions achieved via the Screening Table Measures may be implemented. Multiple development proposals may, at the discretion of the County, be allowed to collectively demonstrate achievement of at least 100 points per the Screening Tables. This mitigation measure applies only to tenant permits and not the building shell approvals.

MM GHG-2 As part of the building permit for tenant improvements, the project shall install solar photovoltaic (PV) panels or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable sources, that would provide at least 50 percent of the expected total building load. On-site solar PV or other clean energy systems shall be installed within two years of commencing operations. Each building shall include an electrical system and other infrastructure sufficiently sized to accommodate the PV arrays. The electrical system and infrastructure must be clearly labeled with noticeable and permanent signage. This mitigation measure applies only to tenant permits and not the building shell approvals.

MM GHG-3 Prior to the issuance of a building permit for tenant improvements, the tenant or successor in interest shall provide documentation to the San Bernardino County demonstrating that the Project is designed to achieve Leadership in Energy and Environmental Design (LEED) standards or meet or exceed CALGreen Tier 2 standards in effect at the time of building permit application. This mitigation measure applies only to tenant permits and not the building shell approvals.

MM GHG-4 The development shall divert a minimum of 75 percent of landfill waste. Prior to issuance of certificate of tenant occupancy permits, a recyclables collection and load area shall be constructed in compliance with County standards for Recyclable Collection and Loading Areas. This mitigation measure applies only to tenant permits and not the building shell approvals.

MM GHG-5 Prior to the issuance of tenant occupancy permits, the Planning Department shall confirm that tenant lease agreements include contractual language that all handheld landscaping equipment used onsite shall be 100 percent electrically powered. This mitigation measure applies only to tenant permits and not the building shell approvals.

Level of Significance: Significant and unavoidable impact. No additional feasible mitigation measures are available that can reduce impacts to less than significant. As explained above, the Project incorporates all feasible mitigation measures that could be implemented to further reduce the Project's GHG emissions. There are no additional measures available that would further reduce emissions because the majority of the Project's emissions come from mobile sources which are regulated by the State and not the County of San Bernardino.

5.2 Greenhouse Gas Reduction Plan Compliance

Threshold 5.2 Would the Project conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing GHG emissions?

County of San Bernardino Greenhouse Gas Reduction Plan Update

As discussed above, the County's GHG Reduction Plan includes a review standard of 3,000 $MTCO_2e$ per year to identify projects that require the use of Screening Tables or a project-specific technical analysis to quantify and mitigate project emissions. The purpose of the Screening Tables is to provide guidance in measuring the reduction of GHG emissions attributable to certain design and construction measures incorporated into development projects. As noted above, projects that exceed 3,000 $MTCO_2e$/year of GHG emissions, the applicant may choose to either utilize the Screening Tables. Table 6 shows that each building within the proposed Project would earn 104 points on the County's GHG Screening Tables, which would exceed 100 points. Therefore, the Project would be consistent with the County's GHG emissions reduction plan.

The GHG Reduction Plan Update as discussed in Section 3.7.1 GHG Performance Standards for New Development states "This determination of consistency can be used in a CEQA climate change analysis of the development, with provides a legally defensible and streamlined CEQA process for the project." As such the additional discussion provided for RTP and CARB Scoping Plan is provided optionally and further demonstrates the project consistency with applicable plan, policy, or regulation of an agency adopted for the purpose of reducing GHG emissions.

Regional Transportation Plan/Sustainable Communities Strategy Consistency

On September 3, 2020, SCAG's Regional Council adopted Connect SoCal (*2020 - 2045 Regional Transportation Plan/Sustainable Communities Strategy* [2020 RTP/SCS]). The RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The RTP/SCS embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders in the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. SCAG's RTP/SCS establishes GHG emissions goals for automobiles and light-duty trucks for 2020 and 2035 as well as an overall GHG target for the Project region consistent with both the target date of AB 32 and the post-2020 GHG reduction goals of Executive Orders 5-03-05 and B-30-15.

The RTP/SCS contains over 4,000 transportation projects, ranging from highway improvements, railroad grade separations, bicycle lanes, new transit hubs and replacement bridges. These future investments were included in county plans developed by the six county transportation commissions and seek to reduce traffic bottlenecks, improve the efficiency of the region's network, and expand mobility choices for everyone. The RTP/SCS is an important planning document for the region, allowing project sponsors to qualify for federal funding.

The plan accounts for operations and maintenance costs to ensure reliability, longevity, and cost effectiveness. The RTP/SCS is also supported by a combination of transportation and land use strategies that help the region achieve state GHG emissions reduction goals and Federal Clean Air Act (FCAA) requirements, preserve open space areas, improve public health and roadway safety, support our vital goods movement industry, and utilize resources more efficiently. GHG emissions resulting from development-related mobile sources are the most potent source of emissions, and therefore Project comparison to the RTP/SCS is an appropriate indicator of whether the Project would inhibit the post-2020 GHG reduction goals promulgated by the state. The Project's consistency with the RTP/SCS goals is analyzed in detail in Table 7: Regional Transportation Plan/Sustainable Communities Strategy Consistency.

Table 7: Regional Transportation Plan/Sustainable Communities Strategy Consistency

SCAG Goals		Compliance	
GOAL 1:	Encourage regional economic prosperity and global competitiveness.	N/A:	This is not a project-specific policy and is therefore not applicable. However, the Project is located on a vacant site and development of the site would contribute to regional economic prosperity.
GOAL 2:	Improve mobility, accessibility, reliability, and travel safety for people and goods.	Consistent:	Although this Project is not a transportation improvement project, the Project is located near existing transit routes such as Omnitrans Route 61 along San Bernardino Avenue and Route 66 along Foothill Boulevard.
GOAL 3:	Enhance the preservation, security, and resilience of the regional transportation system.	N/A:	This is not a transportation improvement project and is therefore not applicable.
GOAL 4:	Increase person and goods movement and travel choices within the transportation system.	N/A:	This is not a transportation improvement project and is therefore not applicable. However, the Project includes warehouses and related uses that would support goods movement.

Table 7: Regional Transportation Plan/Sustainable Communities Strategy Consistency

SCAG Goals		Compliance	
GOAL 5:	Reduce greenhouse gas emissions and improve air quality.	Consistent:	The Project is located within an industrial area in proximity to existing truck routes and freeways. The project is surrounded by existing industrial development. Location of the project within a developed area would reduce trip lengths, which would reduce GHG and air quality emissions.
GOAL 6:	Support healthy and equitable communities	Consistent:	The Project is located in an industrial area that is away sensitive receptors. Although the Project exceeds regional thresholds for criteria pollutants, the Project does not exceed localized thresholds. Based on the Friant Ranch decision, projects that do not exceed the SCAQMD's LSTs would not violate any air quality standards or contribute substantially to an existing or projected air quality violation and result in no criteria pollutant health impacts.
GOAL 7:	Adapt to a changing climate and support an integrated regional development pattern and transportation network.	N/A:	This is not a project-specific policy and is therefore not applicable.
GOAL 8:	Leverage new transportation technologies and data-driven solutions that result in more efficient travel.	N/A:	This is not a project-specific policy and is therefore not applicable.
GOAL 9:	Encourage development of diverse housing types in areas that are supported by multiple transportation options.	N/A:	The Project involves development of warehouses and related uses and does not include housing.
GOAL 10:	Promote conservation of natural and agricultural lands and restoration of habitats.	N/A:	This Project is located on previously disturbed/developed land and is not located on agricultural lands.

Source: Southern California Association of Governments, *Connect SoCal (2020 - 2045 Regional Transportation Plan/Sustainable Communities Strategy,* 2020.

The goals stated in the RTP/SCS were used to determine consistency with the planning efforts previously stated. As shown in Table 6, the Project would be consistent with the stated goals of the RTP/SCS. Therefore, the Project would not result in any significant impacts or interfere with SCAG's ability to achieve the region's post-2020 mobile source GHG reduction targets.

California Air Resource Board Scoping Plan Consistency

The California State Legislature adopted Assembly Bill (AB) 32 in 2006. AB 32 focuses on reducing GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) to 1990 levels by the year 2020. Pursuant to the requirements in AB 32, CARB adopted the *Climate Change Scoping Plan* (Scoping Plan) in 2008, which outlines actions recommended to obtain that goal. The Scoping Plan provides a range of GHG reduction actions that include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as the cap-and-trade program, and an AB 32 implementation fee to fund the program.

The 2017 Scoping Plan Update identifies additional GHG reduction measures necessary to achieve the 2030 target. These measures build upon those identified in the first update to the Scoping Plan in 2013.

Although a number of these measures are currently established as policies and measures, some measures have not yet been formally proposed or adopted. It is expected that these actions to reduce GHG emissions will be adopted as required to achieve statewide GHG emissions targets. As shown in Table 8: Project Consistency with Applicable CARB Scoping Plan Measures, the Project is consistent with most of the strategies, while others are not applicable to the Project. As such, impacts related to consistency with the Scoping Plan would be less than significant.

Table 8: Project Consistency with Applicable CARB Scoping Plan Measures

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
Transportation	California Cap-and-Trade Program Linked to Western Climate Initiative	Regulation for the California Cap on GHG Emissions and Market-Based Compliance Mechanism October 20, 2015 (CCR 95800)	**Consistent.** The Cap-and-Trade Program applies to large industrial sources such as power plants, refineries, and cement manufacturers. However, the regulation indirectly affects people who use the products and services produced by these industrial sources when increased cost of products or services (such as electricity and fuel) are transferred to the consumers. The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, generated in-state or imported. Accordingly, GHG emissions associated with CEQA projects' electricity usage are covered by the Cap-and-Trade Program. The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and combustion of other fossil fuels not directly covered at large sources in the Program's first compliance period.
	California Light-Duty Vehicle GHG Standards	Pavley I 2005 Regulations to Control GHG Emissions from Motor Vehicles Pavley I 2005 Regulations to Control GHG Emissions from Motor Vehicles	**Consistent**. This measure applies to all new vehicles starting with model year 2012. The Project would not conflict with its implementation as it would apply to all new passenger vehicles purchased in California. Passenger vehicles, model year 2012 and later, associated with construction and operation of the Project would be required to comply with the Pavley emissions standards.
		2012 LEV III California GHG and Criteria Pollutant Exhaust and Evaporative Emission Standards	**Consistent.** The LEV III amendments provide reductions from new vehicles sold in California between 2017 and 2025. Passenger vehicles associated with the site would comply with LEV III standards.
	Low Carbon Fuel Standard	2009 readopted in 2015. Regulations to Achieve GHG Emission Reductions Subarticle 7. Low Carbon Fuel Standard CCR 95480	**Consistent.** This measure applies to transportation fuels utilized by vehicles in California. The Project would not conflict with implementation of this measure. Motor vehicles associated with construction and operation of the Project would utilize low carbon transportation fuels as required under this measure.
	Regional Transportation-Related GHG Targets.	SB 375. Cal. Public Resources Code §§ 21155, 21155.1, 21155.2, 21159.28	**Consistent**. The Project would provide development in the region that is consistent with the growth projections in the RTP/SCS.
	Goods Movement	Goods Movement Action Plan January 2007	**Not applicable**. The Project does not propose any changes to maritime, rail, or intermodal facilities or forms of transportation.
	Medium/Heavy-Duty Vehicle	2010 Amendments to the Truck and Bus	**Consistent**. This measure applies to medium and heavy-duty vehicles that operate in the state. The

Table 8: Project Consistency with Applicable CARB Scoping Plan Measures

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
		Regulation, the Drayage Truck Regulation and the Tractor-Trailer GHG Regulation	Project would not conflict with implementation of this measure. Medium and heavy-duty vehicles associated with construction and operation of the Project would be required to comply with the requirements of this regulation.
	High Speed Rail	Funded under SB 862	**Not applicable**. This is a statewide measure that cannot be implemented by a project applicant or Lead Agency.
Electricity and Natural Gas	Energy Efficiency	Title 20 Appliance Efficiency Regulation	**Consistent.** The Project would not conflict with implementation of this measure. The Project would comply with the latest energy efficiency standards.
		Title 24 Part 6 Energy Efficiency Standards for Residential and Non-Residential Building	
		Title 24 Part 11 California Green Building Code Standards	
	Renewable Portfolio Standard/Renewable Electricity Standard.	2010 Regulation to Implement the Renewable Electricity Standard (33% 2020)	**Consistent**. The Project would obtain electricity from the electric utility, Southern California Edison (SCE). SCE obtained 36 percent of its power supply from renewable sources in 2019. Therefore, the utility would provide power when needed on site that is composed of a greater percentage of renewable sources.
	Million Solar Roofs Program	SB 350 Clean Energy and Pollution Reduction Act of 2015 (50% 2030)	
	Million Solar Roofs Program	Tax Incentive Program	**Consistent.** This measure is to increase solar throughout California, which is being done by various electricity providers and existing solar programs. The program provides incentives that are in place at the time of construction.
Water	Water	Title 24 Part 11 California Green Building Code Standards	**Consistent.** The Project would comply with the CalGreen standards, which requires a 20 percent reduction in indoor water use. The Project would also comply with the City's Water-Efficient Landscaping Regulations (Chapter 22, Section 63.2201 of the County's Code).
		SBX 7-7—The Water Conservation Act of 2009	
		Model Water Efficient Landscape Ordinance	
Green Buildings	Green Building Strategy	Title 24 Part 11 California Green Building Code Standards	**Consistent.** The State is to increase the use of green building practices. The Project would implement required green building strategies through existing regulation that requires the Project to comply with various CalGreen requirements. The Project includes sustainability design features that support the Green Building Strategy.
Industry	Industrial Emissions	2010 CARB Mandatory Reporting Regulation	**Not applicable.** The Mandatory Reporting Regulation requires facilities and entities with more than 10,000 $MTCO_2e$ of combustion and process emissions, all facilities belonging to certain industries, and all electric power entities to submit an annual GHG emissions data report directly to CARB. As shown above, although total Project GHG emissions would exceed

Table 8: Project Consistency with Applicable CARB Scoping Plan Measures

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
			10,000 $MTCO_2e$, the majority of these emissions are from mobile sources. Therefore, this regulation would not apply.
Recycling and Waste Management	Recycling and Waste	Title 24 Part 11 California Green Building Code Standards	**Consistent.** The Project would not conflict with implementation of these measures. The Project is required to achieve the recycling mandates via compliance with the CALGreen code. The City has consistently achieved its state recycling mandates.
		AB 341 Statewide 75 Percent Diversion Goal	
Forests	Sustainable Forests	Cap and Trade Offset Projects	**Not applicable.** The Project is in an area designated for urban uses. No forested lands exist on-site.
High Global Warming Potential	High Global Warming Potential Gases	CARB Refrigerant Management Program CCR 95380	**Consistent**. The regulations are applicable to refrigerants used by large air conditioning systems and large commercial and industrial refrigerators and cold storage system. The Project would not conflict with the refrigerant management regulations adopted by CARB.
Agriculture	Agriculture	Cap and Trade Offset Projects for Livestock and Rice Cultivation	**Not applicable**. The Project site is designated for urban development. No grazing, feedlot, or other agricultural activities that generate manure occur currently exist on-site or are proposed to be implemented by the Project.

Source: California Air Resources Board, *California's 2017 Climate Change Scoping Plan*, November 2017 and CARB, *Climate Change Scoping Plan*, December 2008.

As seen in Table 7 and Table 8, the Project would be consistent with all applicable plan goals. In addition, the Project would include several sustainable design features that would help reduce GHG emissions. Table 5 shows that with mitigation the Project at buildout with mitigation is estimated to emit approximately 207,327 $MTCO_2e$ per year in the opening year directly from on-site activities and indirectly from off-site motor vehicles.

Regarding goals for 2050 under Executive Order S-3-05, at this time it is not possible to quantify the emissions savings from future regulatory measures, as they have not yet been developed; nevertheless, it can be anticipated that operation of the proposed Project would benefit from the implementation of current and potential future regulations (e.g., improvements in vehicle emissions, SB 100/renewable electricity portfolio improvements, CARB's Mobile Source Strategy, etc.) enacted to meet an 80 percent reduction below 1990 levels by 2050.

The majority of the GHG reductions from the Scoping Plan would result from continuation of the Cap-and-Trade regulation. Assembly Bill 398 (2017) extends the state's Cap-and-Trade program through 2030 and the Scoping Plan provide a comprehensive plan for the state to achieve its GHG targets through a variety of regulations enacted at the state level. Additional reductions are achieved from electricity sector standards (i.e., utility providers to supply 60 percent renewable electricity by 2030 and 100 percent renewable by 2045), doubling the energy efficiency savings at end uses, additional reductions from the LCFS, implementing the short-lived GHG strategy (e.g., hydrofluorocarbons), and implementing the Mobile Source Strategy and Sustainable Freight Action Plan.

As noted above, mobile sources comprise approximately 82 percent of the Project's unmitigated GHG emissions and approximately 92 percent of the mitigated emissions. CARB is directly responsible for regulating mobile and transportation source emissions in the State. Regarding mobile sources, California

addresses emissions control technology through a variety of legislation and regulatory schemes, including the state's Low Carbon Fuel Standard (Executive Order S-01-07) (LCFS), a regulatory program designed to encourage the use of cleaner low-carbon transportation fuels in California, encourage the production of those fuels, and therefore, reduce GHG emissions and decrease petroleum dependence in the transportation sector. The regulatory standards are expressed in terms of the "carbon intensity" of gasoline and diesel fuel and their substitutes. Different types of fuels are evaluated to determine their "life cycle emissions" which include the emissions associated with producing, transporting, and using the fuels. Each fuel is then given a carbon intensity score and compared against a declining carbon intensity benchmark for each year. Providers of transportation fuels must demonstrate that the mix of fuels they supply for use in California meets these declining benchmarks for each annual compliance period. In 2018, CARB approved amendments to the LCFS, which strengthened the carbon intensity benchmarks through 2030 to ensure they are in-line with California's 2030 GHG emission reduction target enacted through SB 32. This ensures that the transportation sector is meeting its obligations to achieve California's GHG reduction targets. The state is also implementing legislation and regulations to address the second parameter affecting transportation related GHG emissions by controlling for VMT. Examples of this include SB 375, which links land use and transportation funding and provides one incentive for regions to achieve reductions in VMT, and SB 743, which discourages VMT increases for passenger car trips above a region-specific benchmark. San Bernardino County has no regulatory control over emissions control technology and therefore limited ability to control or mitigate emissions associated with truck emissions associated with this Project.

In addition to the LCFS, the State includes numerous plans and policies that would contribute to a reduction in mobile source emissions from the Project. These include the following:

- **CARB's Advanced Clean Truck Regulation**: Adopted in June 2020, CARB's Advanced Clean Truck Regulation requires truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8.

- **Executive Order N-79-20**: Executive Order N-79-20 establishes the goal for all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035 and all medium and heavy-duty vehicles will be zero-emission by 2045. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new ZEVs "towards the target of 100 percent."

- **CARB's Mobile Source Strategy**: CARB's Mobile Source Strategy takes an integrated planning approach to identify the level of transition to cleaner mobile source technologies needed to achieve all of California's targets by increasing the adoption of ZEV buses and trucks.

- **CARB's Sustainable Freight Action Plan**: The Sustainable Freight Action Plan which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of ZEV trucks. This Plan applies to all trucks accessing the Project site and may include existing trucks or new trucks that are part of the statewide goods movement sector.

- **CARB's Emissions Reduction Plan for Ports and Goods Movement**: CARB's Emissions Reduction Plan for Ports and Goods Movement identifies measures to improve goods movement efficiencies

such as advanced combustion strategies, friction reduction, waste heat recovery, and electrification of accessories.

While these measures are not directly applicable to the Project, any commercial activity associated with goods movement would be required to comply with these measures as adopted. As such, the Project would not interfere with their implementation.

The Project would not obstruct or interfere with efforts to increase ZEVs or state efforts to improve system efficiency. As described above, the Project would be consistent with all applicable plan goals. Compliance with applicable State standards (e.g., continuation of the Cap-and-Trade regulation; CARB's Mobile Source Strategy, Sustainable Freight Action Plan, and Advanced Clean Truck Regulation; Executive Order N-79-20; SB 100/renewable electricity portfolio improvements that require 60 percent renewable electricity by 2030 and 100 percent renewable by 2045, etc.) would ensure consistency with State and regional GHG reduction planning efforts.

As discussed above, extensive PDFs and **MM AQ-3** through **MM AQ-10** as identified in the Project's Air Quality Assessment, would reduce mobile source emissions and would support the State's transition to ZEVs by requiring electrical hookups at all loading bays, promoting the use of alternative fuels and clean fleets, requiring electric vehicle charging stations and/or infrastructure to support the future installation of truck charging stations. The Project would also benefit from implementation of the State programs for ZEVs and goods movement efficiencies that reduce future GHG emissions from trucks.

SC GHG-1 through SC GHG-9, as required by the California Building Code, address non-mobile source emissions, and would provide designated parking to promote the use of alternative fuels and clean fleets, facilitate future installation of electric vehicle supply equipment, and limit idling times. The Project's PDFs also address non-mobile emissions by designing buildings to provide environmental design features, incorporate energy and water conservation measures, and provide electrical, heating, ventilation, lighting, and power systems that meet CALGreen Standards. Additionally, **MM GHG-3** requires the Project to meet or exceed CALGreen Tier 2 standards, which exceeds code requirements). Further, the Project would offset energy demand with solar PV infrastructure (**MM GHG-2**), divert 75 percent of solid waste from landfills (**MM GHG-4**) and require landscape equipment to be 100 percent electric (**MM GHG-5**). Additionally, **MM AQ-9** in the Project's Air Quality Assessment requires the Project use electric cargo handling equipment.

In conclusion, the Project does not conflict with the applicable plans that are discussed above and therefore with respect to this threshold, impacts are less than significant.

Mitigation Measures: Refer to **MM AQ-3** through **MM AQ-10** in the Air Quality Assessment and **MM GHG-1** through **MM GHG-5**, above.

Level of Significance: Less than significant impact with mitigation.

5.3 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and TACs, which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects

have relatively short atmospheric lifetimes (about 1 day), GHGs have much longer atmospheric lifetimes of 1 year to several thousand years that allow them to be dispersed around the globe.

Cumulative Impacts

It is generally the case that an individual project of this size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory. GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. The additive effect of Project-related GHGs would not result in a reasonably foreseeable cumulatively considerable contribution to global climate change. As discussed above, the Project-related GHG emissions would exceed the County's 3,000 $MTCO_2e$ review standard. As such, the Project is required to achieve a minimum 100 points per the County's GHG Emissions Reduction Plan Screening Tables. According to the County's 2021 GHG Emissions Reduction Plan Update, any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions. As discussed above, and shown in Table 6, each building within the proposed Project would earn 104 points on the County's GHG Screening Tables, which would exceed 100 points. **MM GHG-1** through **MM GHG-5** have been included to ensure application of the GHG reduction measures. As such, the Project would be consistent with the Stat's long-term goal to achieve statewide carbon neutrality by 2045. However, as discussed above, due to the magnitude of Project emissions and the fact that 86 percent of the emissions are from mobile sources, the Project's GHG emissions would be cumulatively considerable. As noted above, mobile sources are regulated at the State and Federal level and the Project has no control over these standards. The reduction of mobile source and warehouse emissions are being addressed by various CARB and SCAQMD regulations. Mitigation measures would be required to reduce Project emissions to the maximum extent feasible. However, despite Project Design Features, Standard Conditions, Mitigation Measures and CARB and SCAQMD efforts to reduce mobile source emissions, the Project would result in a potentially significant cumulative GHG impact.

Mitigation Measures: Refer to **MM AQ-3** through **MM AQ-10** in the Air Quality Assessment and **MM GHG-1** through **MM GHG-5**, above.

Level of Significance: Despite consistency with the County's GHG Reduction Plan and compliance with various CARB and SCAQMD emissions reduction programs, the magnitude of the Project's emissions would be considered cumulatively significant unavoidable.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	50.00	1000sqft	1.15	50,000.00	0
Refrigerated Warehouse-Rail	125.00	1000sqft	2.87	125,000.00	0
Unrefrigerated Warehouse-Rail	2,973.37	1000sqft	68.26	2,973,370.00	0
Other Asphalt Surfaces	71.55	Acre	71.55	3,116,718.00	0
Parking Lot	60.73	Acre	60.73	2,645,398.80	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2024
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	345	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Updated with EMFAC 2021 which already includes SAFE rules adjustments
CO2 factor per RPS

Land Use -

Construction Phase - operations only

Off-road Equipment - Anticipated equipment

Trips and VMT - anticipated concrete truck trips

Demolition -

Grading -

Speedway Commerce Center (Phase 1a Vans) - San Bernardino-South Coast County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Architectural Coating - Mitigation requires low VOC (10 gr/L)

Vehicle Trips - Phase 1a Vans run

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Road Dust - adjusted per CARB guidance for Riverside and SB counties

Consumer Products -

Construction Off-road Equipment Mitigation - SCAQMD rule compliance

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix - Phase 1a vans run

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	40.00	1000sqft	0.92	40,000.00	0
Refrigerated Warehouse-Rail	125.00	1000sqft	2.87	125,000.00	0
Unrefrigerated Warehouse-Rail	1,735.30	1000sqft	39.84	1,735,300.00	0
Other Asphalt Surfaces	61.66	Acre	61.66	2,685,909.60	0
Parking Lot	36.46	Acre	36.46	1,588,197.60	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2025
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	335	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Updated with EMFAC 2021 which already includes SAFE rules adjustments
CO2 Factor adjusted per RPS

Land Use -

Construction Phase - per construction schedule

Off-road Equipment - Anticipated equipment

Off-road Equipment - Per construction equipment list

Off-road Equipment -

Off-road Equipment - Per construction equipment list

Speedway Commerce Center (Phase 1b Passenger Cars) - San Bernardino-South Coast County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Off-road Equipment - Per Construction equipment list

Off-road Equipment - anticipated construction equipment

Trips and VMT - anticipated concrete truck trips

Demolition -

Grading -

Vehicle Trips - Phase 1b passenger cars run

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Road Dust - adjusted per CARB guidance for Riverside and SB counties

Consumer Products - project would not use consumer products as specified in definition, emission factor reduced by 50%

Construction Off-road Equipment Mitigation - SCAQMD rule compliance

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix - Phase 1b passenger cars run

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	40.00	1000sqft	0.92	40,000.00	0
Refrigerated Warehouse-Rail	125.00	1000sqft	2.87	125,000.00	0
Unrefrigerated Warehouse-Rail	1,735.30	1000sqft	39.84	1,735,300.00	0
Other Asphalt Surfaces	61.66	Acre	61.66	2,685,909.60	0
Parking Lot	36.46	Acre	36.46	1,588,197.60	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2025
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	335	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Updated with EMFAC 2021 which already includes SAFE rules adjustments
CO2 Factor adjusted per RPS

Land Use -

Construction Phase - per construction schedule

Off-road Equipment - Anticipated equipment

Off-road Equipment -

Trips and VMT - anticipated concrete truck trips

Demolition -

Speedway Commerce Center (Phase 1b Trucks) - San Bernardino-South Coast County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Grading -

Vehicle Trips - Phase 1b trucks run

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Road Dust - adjusted per CARB guidance for Riverside and SB counties

Consumer Products - project would not use consumer products as specified in definition, emission factor reduced by 50%

Construction Off-road Equipment Mitigation - SCAQMD rule compliance

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix - Phase 1b trucks run

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	40.00	1000sqft	0.92	40,000.00	0
Refrigerated Warehouse-Rail	125.00	1000sqft	2.87	125,000.00	0
Unrefrigerated Warehouse-Rail	1,735.30	1000sqft	39.84	1,735,300.00	0
Other Asphalt Surfaces	61.66	Acre	61.66	2,685,909.60	0
Parking Lot	36.46	Acre	36.46	1,588,197.60	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2025
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	335	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Updated with EMFAC 2021 which already includes SAFE rules adjustments
CO2 Factor adjusted per RPS

Land Use -

Construction Phase - operations only

Off-road Equipment - Anticipated equipment

Off-road Equipment -

Trips and VMT - anticipated concrete truck trips

Demolition -

Speedway Commerce Center (Phase 1b Vans) - San Bernardino-South Coast County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Grading -

Vehicle Trips - Phase 1b vans run

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Road Dust - adjusted per CARB guidance for Riverside and SB counties

Consumer Products - project would not use consumer products as specified in definition, emission factor reduced by 50%

Construction Off-road Equipment Mitigation - SCAQMD rule compliance

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix - Phase 1b vans run

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	30.00	1000sqft	0.69	30,000.00	0
Refrigerated Warehouse-Rail	250.00	1000sqft	5.74	250,000.00	0
Unrefrigerated Warehouse-Rail	1,273.84	1000sqft	29.24	1,273,840.00	0
Other Asphalt Surfaces	17.74	Acre	17.74	772,754.40	0
Parking Lot	33.13	Acre	33.13	1,443,142.80	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2026
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	325	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Updated with EMFAC 2021 which already includes SAFE rules adjustments
CO2 factor adjusted per RPS

Land Use -

Construction Phase - per construction schedule

Off-road Equipment - Anticipated equipment

Off-road Equipment - Per construction equipment list

Off-road Equipment - Per construction equipment list

Off-road Equipment - Per Construction equipment list

Speedway Commerce Center (Phase 2 Passenger Cars) - San Bernardino-South Coast County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Off-road Equipment - anticipated construction equipment

Trips and VMT - anticipated concrete truck trips

Demolition -

Grading -

Vehicle Trips - Phase2 passenger car run

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Road Dust - adjusted per CARB guidance for Riverside and SB counties

Consumer Products - project would not use consumer products as specified in definition, emission factor reduced by 50%

Construction Off-road Equipment Mitigation - SCAQMD rule compliance

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix - Phase2 passenger cars run

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	30.00	1000sqft	0.69	30,000.00	0
Refrigerated Warehouse-Rail	250.00	1000sqft	5.74	250,000.00	0
Unrefrigerated Warehouse-Rail	1,273.84	1000sqft	29.24	1,273,840.00	0
Other Asphalt Surfaces	17.74	Acre	17.74	772,754.40	0
Parking Lot	33.13	Acre	33.13	1,443,142.80	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2026
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	325	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Updated with EMFAC 2021 which already includes SAFE rules adjustments
CO2 factor adjusted per RPS

Land Use -

Construction Phase - per construction schedule

Off-road Equipment - Anticipated equipment

Trips and VMT - anticipated concrete truck trips

Demolition -

Grading -

Speedway Commerce Center (Phase 2 Trucks) - San Bernardino-South Coast County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Vehicle Trips - Phase2 Trucks run

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Road Dust - adjusted per CARB guidance for Riverside and SB counties

Consumer Products -

Construction Off-road Equipment Mitigation - SCAQMD rule compliance

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix - Phase2 trucks run

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Parking Lot	6.00	Acre	6.00	261,360.00	0
Strip Mall	261.36	1000sqft	6.00	261,360.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2027
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	316	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Updated with EMFAC 2021 which already includes SAFE rules adjustments
CO2 factor adjusted per RPS

Land Use -

Construction Phase - per construction schedule

Off-road Equipment - Anticipated equipment

Off-road Equipment - Per construction equipment list

Off-road Equipment - Per Construction equipment list

Trips and VMT - anticipated concrete truck trips

Demolition -

Grading -

Vehicle Trips - Commercial Trip gen

Speedway Commerce Center (General Commercial) - San Bernardino-South Coast County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Vehicle Emission Factors - EMFAC 2021

Road Dust - adjusted per CARB guidance for Riverside and SB counties

Consumer Products -

Construction Off-road Equipment Mitigation - SCAQMD rule compliance

Mobile Commute Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix -

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Replace Ground Cover

Water Exposed Area

Water Unpaved Roads

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

Speedway Commerce Center (General Commercial) - San Bernardino-South Coast County, Annual

Based on aggregated emission rates obtained from CARB OFFROAD Version 1.0.1.
Number of yard trucks/hostlers per SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results, June 2014.

Model Output: OFFROAD2021 (v1.0.1) Emissions Inventory
Region Type: Sub-Area
Region: San Bernardino (SC)
Calendar Year: 2024, 2025, 2026
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Subject: Summary Assessment of Environmental Conditions and Land Use Restrictions at the Auto Club Speedway property, 9300 Cherry Avenue, Fontana, California 92335

Dear Mr. Carlin:

Geosyntec Consultants (Geosyntec) prepared this summary assessment of historical environmental conditions and related land use restrictions at the Auto Club Speedway Property (Site), at 9300 Cherry Avenue, Fontana, California 92335 (Figure 1). The purpose of the summary assessment is to support California Environmental Quality Act (CEQA) compliance for proposed modifications to the Auto Club Speedway to develop a ½ mile track as discussed below (Modified Project). This assessment is prepared on behalf of the applicant, California Speedway, LLC.

The Modified Project generally includes demolition of the existing two-mile race track and certain support structures (i.e., lighting, fencing, etc.), demolition of a portion of the existing grandstands and support facilities (i.e., entrance gates, restrooms, concession stands, etc.), and the development of a new ½ mile short-track and support facilities (i.e., modified entrance gates, restrooms, concession stands, etc.) on approximately 98-acres of the 522.30-acre Site, along with parking, entrance, and stormwater detention basins. The Modified Project would retain a portion of the existing grandstands and certain support facilities. The existing drag strip, Go-Kart track, and parking facilities would not be affected by the proposed modifications.

It is anticipated that after the completion of the Auto Club 400 NASCAR Cup Series race in the spring of 2021, demolition of the existing track and selective facilities will begin the next day. Under this anticipated scenario, between the start of construction and its scheduled completion approximately 11 months later in 2022, no events will be scheduled at the Speedway, although some ancillary activities (Go-Kart racing, drag racing, etc.) which are not located within the 98-acre footprint where construction activities will occur may continue if they are not affected by the cons-

truction. Construction activities could occur later, including commencing in 2022 or later, or over multiple years with phased demolition and construction development.

The conclusions contained in this summary assessment by Geosyntec are based upon our review of publicly available information obtained from the Department of Toxic Substances Control (DTSC) ENVIROSTOR website, State Water Resources Control Board (SWRCB) GeoTracker website, documentation provided by or on behalf of California Speedway, LLC or its affiliates, and on-site reconnaissance.

BACKGROUND SITE HISTORY

The Site is located within the former boundaries of the Kaiser Steel Mill, which was originally located on approximately 1,200 acres in Fontana (Figure 2). The Kaiser Steel Mill was owned and operated by the Kaiser Steel Corporation from approximately 1942 to 1983. The steel mill was an integrated steel production plant producing steel plates for the Pacific Coast shipbuilding industry during World War II. After World War II, Kaiser initiated a series of expansions to supply a wider range of products, including everything from steel plates and pipe to structural shapes, as well as tin plates for cans. By the late 1970s, the steel mill was the biggest integrated steel mill on the West Coast. By 1983 the facility closed, portions of the property were sold or transferred, and Kaiser Steel entered bankruptcy, re-emerging in 1988 as Kaiser Steel Resources, Inc.

Hazardous waste was first identified on the property in 1983 during demolition activities. An environmental assessment at the property was conducted in 1985, with subsequent investigations in 1988 and 1989. Thirty-two areas were investigated, with 12 areas identified as requiring no further action by the regulatory agency (ultimately the DTSC), and 20 recommended for remedial investigation. Two phases of remedial investigation were completed, the first in April 1990 evaluated the 20 potential areas, and concluded that three areas required further investigation and/or remediation. Additional investigations and remediation were conducted for the By-products Plant, additional remediation was conducted for the East Slag Pile Landfill, and limited material removal was also completed for the Cooling Tower Sludge Pit and the Furnace Dust and Mill Scale Piles (Figure 2a).

CCG Ontario, LLC (CCG) acquired 529 acres of the former Kaiser Steel Mill in August 2000 and entered into an Imminent and Substantial Endangerment Determination Consent Order with the DTSC for the environmental liabilities associated with the acquisition. CCG assumed responsibility for implementing final remedies at the former Kaiser Steel Mill, and impacted areas were divided into four separate operable units, two of which (Operable Units Nos. 1 and 2) contain portions of the Site:

- Operable Unit No. 1 – Tar pits; Southwest Corner Parcel, Former Heckett Slag Processing Area, the Tar Pits, and Napa Lots Area. The Southwest Corner Parcel and the Former Heckett Slag Processing Area are within the Site.
- Operable Unit No. 2 – By-Products area; Coke Quench Sumps and Blast Furnace Sumps. The By-Products area and sumps are located within the Site.
- Operable Unit No. 3 – East Slag Pit Landfill area, not included within the Site.
- Operable Unit No. 4 – Chem West Area, not included within the Site.

Constituents of concern at the property included total recoverable petroleum hydrocarbons (TRPH), polyaromatic hydrocarbons (PAHs), various metals and volatile organic compounds (VOCs).

In 2008, Operable Unit No. 5 was established for groundwater at the former Kaiser Steel Mill. 34 groundwater monitoring wells have been installed across the former Kaiser Steel Mill. Two groundwater monitoring wells were installed in Operable Unit No. 2 on the Site, as indicated on the figure below.

Excerpt from *Remedial Investigation Report for Site-Wide Groundwater, Iris Environmental, September 1, 2016 – Figure 6*

On June 7, 2012 DTSC issued a Resource Conservation Recovery Act (RCRA) Corrective

Action Completeness Determination (CACD) for portions of the former Kaiser Steel Mill, with institutional controls in place, operations and maintenance, and land use covenants (LUCs). Groundwater investigation and remediation was excluded from the CACD. In September 2016, the final Remedial Investigation (RI)/Feasibility Study (FS)/Remedial Action Plan (RAP) for Operable Unit No.5 was submitted and approved by the DTSC, with a selected remedy of long-term groundwater monitoring and LUCs on the property.

The southern portion of the former Kaiser Steel Mill is being used by California Steel Corporation for steel production. The Auto Club Speedway, owned and operated by California Speedway, LLC, occupies parcels on the northern portion of the former Kaiser Steel Mill (Figure 3). California Speedway, LLC's predecessor purchased the two portions of the former Kaiser Steel Mill in 1994 and started construction of the race track and associated facilities and stands in 1995. The first NASCAR race took place in June 1997, and in February 2008 the racetrack was renamed the Auto Club Speedway. The Speedway property consists of eight contiguous parcels (Parcels 09, 10, 11, 12, 17, 18, 19 and 20), totaling approximately 520 acres (Figures 5 to 11).

ENVIRONMENTAL CONDITIONS AND RESTRICTIONS

The following section describes the known current environmental conditions for the Auto Club Speedway Property, and summarizes existing LUCs and limitations.

Auto Club Speedway Property

The Auto Club Speedway Property consists of Parcels 09, 10, 11, 12, 17, 19 and 20, totaling 520.38 acres with most of the acreage, 425.43 acres in Parcel 09 (Figure 4). The Auto Club Speedway Property contains portions of Operable Unit No. 1 with the Former Heckett Slag Processing Area, and the Southwest Parcel; and encompasses Operable Unit No. 2 (Figure 12), containing the By-Products Area, the Coke Quench Sumps and the Blast Furnace Sumps (Figure 13).

Operable Unit No.1 Former Heckett Slag Processing Area – Parcel 09

The Former Heckett Slag Processing Area is located within the northeastern portion of Operable Unit No. 1 and northern portion of Operable Unit 2 (Figure 12 and below). The Former Heckett Slag Processing Area covers approximately 35 acres that was formerly used for processing and storing steel mill slag. The slag was crushed, screened and stockpiled, then sold for construction use in road base and railroad ballast. Sampling in the area as part of the site-wide investigation in 1995, demonstrated the presence of metals and PAHs in surficial soils. A health risk assessment based on on-site residential exposure scenario, indicated "concentrations were within an acceptable risk range to protect human

health" (DTSC, 1995). As an additional remedial measure, residual slag was either removed and used to construct the California Speedway, or buried at depths of 20 feet below ground surface (bgs).

No documentation of geotechnical conditions was identified on the ENVIROSTOR website. Given that remedial activities included excavation and burial activities, an assessment of geotechnical conditions may be required.

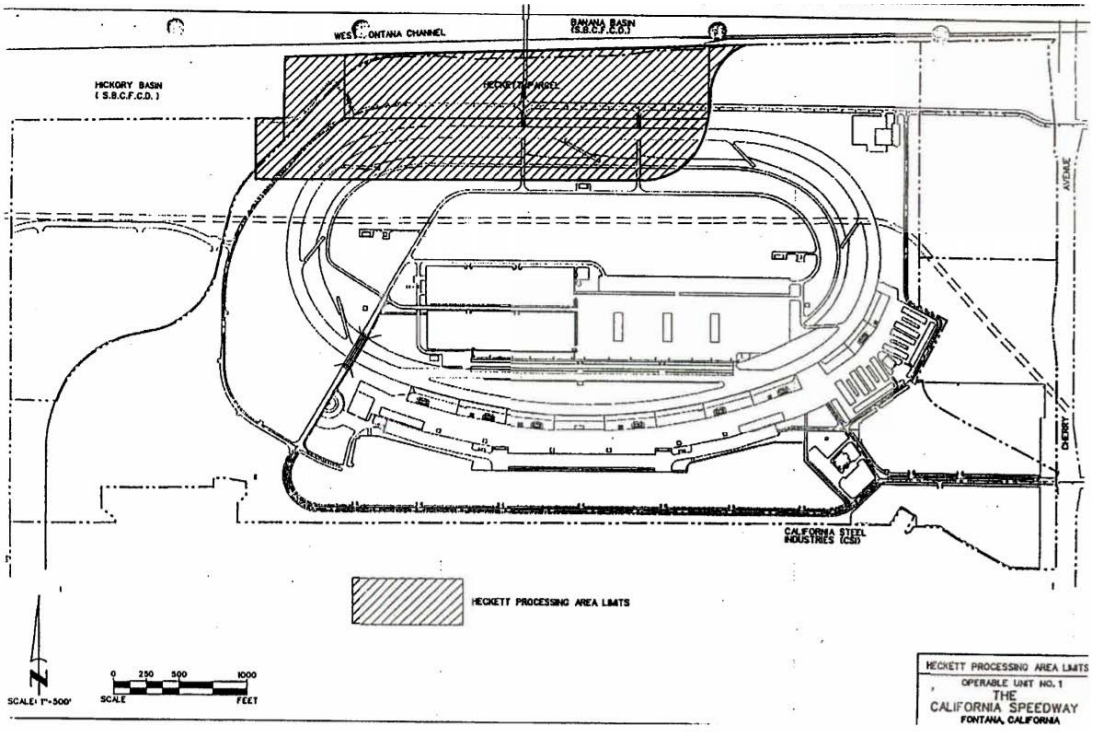
Current use

This area of the Site is currently used as the Back Stretch of the Speedway racetrack, the infield, additional racetrack areas, the westerly portion of the drag racing track and associated garages and a portion of surface parking leased by a local car dealership for storing inventory. The location of the Former Heckett Slag Processing Area is illustrated on the figure below.

Current environmental conditions

Metals and PAHs are present at depths of greater than 20 feet bgs at concentrations that were not considered a human health risk in 1995 using an on-site residential exposure scenario. Slag material was subsequently removed or buried at depths of 20 feet bgs, thereby diminishing the potential health risks further. There is a low likelihood that the continued presence of metals and PAHs at depths of greater than 20 feet bgs would be present at unacceptable risk levels under industrial/commercial land scenarios.

[The remainder of this page is blank.]



Excerpt from *Kaiser Steel - Heckett Slag Processing Area of OU-1 - Remedial Action Completion - approval letter 3-18-96 (1)*

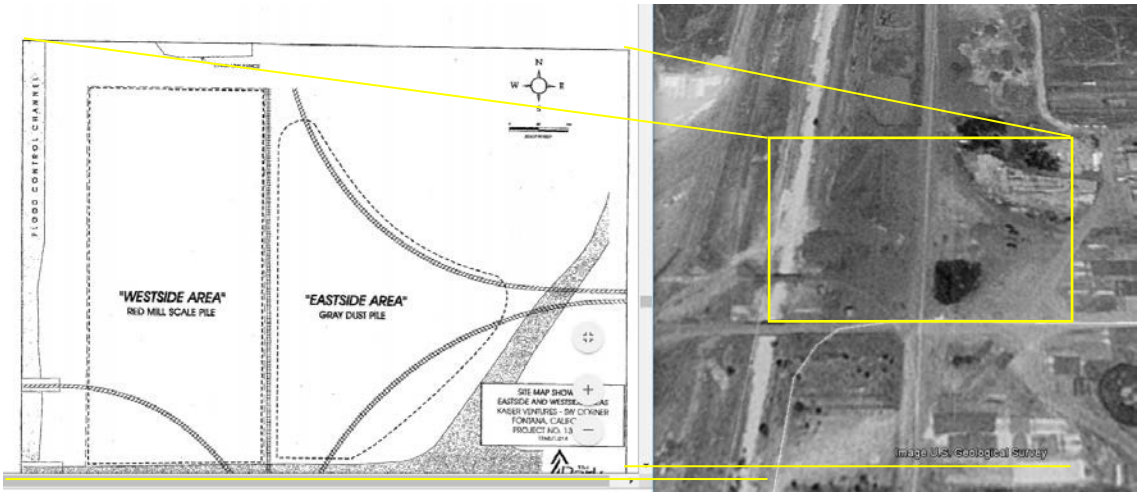
Current deed restrictions

Based on a review of the DTSC ENVIROSTOR Land Use Restrictions webpage (https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60001356), no current deed restrictions or LUCs were found for the Former Heckett Slag Processing Area.

Summary

- Contaminants identified — Metals and PAHs
- Remediation completed — Yes
- DTSC closure — Yes
- Ongoing O&M — No
- LUCs or deed restrictions — None reported
- Geotechnical concerns — Potential

Operable Unit No. 1 - Southwest Corner Parcel – Parcel 09



The Southwest Corner Parcel is approximately 9 acres and located in the southwest corner of the Auto Club Speedway property, within Parcel 09 (Figure 4). The parcel was split into the Westside Area and the Eastside Area by a rail line running north-south (Figure 14).

Site map from the *Report of Remedial Action at the Red Mill Scale/Gray Dust Pile Area of Operable Unit No.1 Southwest Corner of Former Kaiser Steel Facility Fontana, California* (Park Report, 1996) compared to an aerial photograph from 1994 (Google Earth) of the Southwest Corner of the Kaiser Steel Mill.

Three additional rail spurs were also present diverging from or onto, the north-south rail line during investigation and remediation activities in the mid-1990s. The north-south rail line and the rail spur in the Westside Area are currently present, while the other two rail spurs are no longer present.

The Westside Area was used for stockpiling red mill scale, slag and other recyclable products from the steel making process. The Eastside Area was used to stockpile gray dust or filter cake material from Kaiser Steel's emission control equipment. The Southwest Corner Parcel was included within the *Remedial Action Plan, Tar Pits Area, August 1993* and the *Park Remedial Workplan Letter, dated February 14, 1996*. Soil remediation was conducted between January 2 and March 15, 1996.

Eastside Area surface soils impacted by gray dust or filter cake were excavated, screened and disposed of, while recyclable slag and debris that had been stockpiled on the Westside Area were removed. Confirmation soil sampling and additional excavation was

conducted until remedial site goals were achieved.

No documentation of geotechnical conditions was identified on the ENVIROSTOR website, given remedial activities included excavation and burial activities, an assessment of geotechnical conditions may be required.

Current use

The area is currently in use for two railway spurs, two flood detention basins and paved for surface parking.

Current environmental conditions

On April 10, 1996, the DTSC confirmed that no further remedial work was required for the Southwest Corner Parcel, as remediation had been completed in accordance with the *Remedial Action Plan, Tar Pits Area, August 1993* and the *Park Remedial Workplan Letter, dated February 14, 1996*. According to this report, remedial goals for soils affected by polynuclear aromatic hydrocarbons (PAHs) with a future residential scenario are commonly set at 1.0 milligrams per kilogram (mg/kg). Remedial goals for the Westside and Eastside Areas were established at 1.0 mg/kg for PAHs, and statistical sampling indicated that concentrations within both areas were 0.45 mg/kg, below PAH remedial goals. Site background concentrations for metals also were achieved (Park Report, 1996). A risk screening analysis was conducted and a cumulative carcinogenic risk of 1.42E-05 and a cumulative hazard (non-carcinogen) index of 1.46E-08 were identified. The Park Report concluded that these values were within published remedial health goals.

Current deed restrictions

Based on a review of the DTSC ENVIROSTOR Land Use Restrictions webpage (https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60001356), no current deed restrictions or LUCs were found for the Southwest Corner Parcel. This area of the Site appears to be used for flood management and may be subject to permitting requirements with the San Bernardino County Flood Control District (SBCFCD).

Summary

- Contaminants identified — Metals and PAHs
- Remediation completed — Yes
- DTSC closure — Yes
- Ongoing O&M — No
- LUCs or deed restrictions — None reported, potential SBCFCD permitting
- Geotechnical concerns — Potential

Geosyntec consultants

Operable Unit No. 2 – Auto Club Speedway Property

Operable Unit No. 2 consists of approximately 340 acres of the northern portion of the former Kaiser Steel plant and contained the By-products Area (Figure 13). This area included an approximately 16-acre portion in which volatile portions of the coking operations were processed to produce other valuable materials or by-products (Figure 13).

Approximately 18 single-walled, steel, underground storage tanks (USTs) of either 10,000- or 20,000-gallon capacity were located in the By-products Area (Figure 13). These USTs contained light oils, motor fuels, and various aromatic hydrocarbons.

Soils in the area had elevated concentrations of PAHs and VOCs. Remedial activities conducted in the By-products Area in the mid-1990s included:

- Soil excavation;
- Excavation of USTs;
- An in-situ soil vapor extraction system (VES) to remove VOCs associated with the USTs,
- Removal of materials in the Cooling Tower and Blast Furnace Areas with verification sampling; and
- A 12.75-acre cap of low permeability synthetic membrane with soil layers and concrete or asphalt (Cap) paving with a gas collection system (GCS) under the Cap (Figure 15).

Three groundwater monitoring wells were installed to a depth of approximately 385 to 410 feet bgs within Operable Unit No. 2. The Cap, VES, GCS and groundwater monitoring wells were collectively referred to as Response Structures. On completion of remedial activities and installation of the Response Structures, long term monitoring and maintenance of these Response Structures was initiated in agreement with the DTSC in 1995. Operations and maintenance activities include:

- Inspection of the Cap for stability, settlement, cover, unusual conditions and any corrective action;
- Inspection of the gas vent pipes for damage, odor or vapors; and
- Implementation of any corrective actions on the Response Structures as required.

The area where the Cap has been implemented is known as the Capped Property, and the area where the Coke Quench Sumps and Slag Quench Pits used to be located is known as the Restricted Property (Figure 13). A third area, known as the A&C Recycling Center,

and formerly located in the southeast corner of Operable Unit No. 2, reportedly had remedial action to remove metal and PAH affected soil. On December 2, 1996, the DTSC responded to a soil verification sampling and analysis report prepared by the Park Corporation, confirming no additional remedial action was required in relation to the A&C Recycling Center (*No Further Remedial Action at the former A&C Recycling Area, DTSC, December 2, 1996*).

Current use

The land within Operable Unit No. 2 is owned and operated by California Speedway, LLC for the Auto Club Speedway. The area consists of race tracks, drag racing strip, garages, hospitality areas, driving schools, grandstands, and parking lots. Portions of the Auto Club Speedway overlay the Capped or Restricted Property.

Current environmental conditions

The Capped Property land use covenants prevent puncturing or breaching the protective cap or overburden material, both the Capped Property and Restricted Property have been developed with no access to soil, and as such soil conditions have to be inferred from vapor extracted from the VES. Based on the remediation conducted at the Site, it is reasonable to assume that residual elevated concentrations of metals, VOCs and PAHs likely persist beneath the Capped Property and in portions of the Restricted Property.

Current deed restrictions – Capped Property

Based on a review of the DTSC ENVIROSTOR Land Use Restrictions webpage (https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60001356), the *Capped Property* is subject to deed restrictions or LUCs specified in the *Covenant to Restrict Use of Property*, Docket Number 19950393082 and dated November 14, 1995 (Capped Property Covenant). The covenant consists of the following preclusions:

- A residence, including any mobile home or factory-built housing, constructed or installed for use as permanently-occupied residential human habitation.
- A long-term care hospital for humans. Nothing herein shall restrict use of the Capped Property for any infirmary, medical aid station, or emergency medical care facility where there is no intent for any patient to remain in such facility for more than 24 hours (e.g. as may be associated with the motor sport complex).
- A traditional public or private school for persons under 21 years of age. Nothing herein shall restrict use of the Capped Property for any specified training programs related to then-existing facilities on the Capped Property (e.g. a driving "school" related to the motor sport complex).
- A day care center for children.

In addition, the covenant specifies activities that are precluded that could interfere with the Cap or VES and consist of:

- No activities which will disturb the Cap and/or the VES (e.g. excavation, grading, removal, trenching, filing, earth movement, or mining) shall be permitted on the Capped Property without prior review and approval by DTSC.
- All uses, and development of the Capped Property shall preserve the integrity of the Cap and operation of the VES.
- Any proposed alteration of the Cap and/or the VES shall require written approval by the Department, except for the addition of non-invasive surface materials ("Non-invasive Surface Materials" means any materials, including soil, asphalt, concrete, and structures, placed upon or over the Cap which does not disturb the Cap or the VES, or impair the integrity or operation of either.
- Covenantor shall notify DTSC of each of the following: (i) The type, cause, location, and date of any disturbance to the Cap and/or VES which could affect the ability of the Cap to contain subsurface Hazardous Substances in the Capped Property and/or the VES to operate properly, and (ii) the type and date of repair of such disturbance. Notification to DTSC shall be made as provided below within ten (10) working days of both the discovery of any such disturbance(s) and the completion of any repairs.

The surveyed location of the Capped Property is defined on the Capped Property Covenant, included in Appendix A.

Current deed restrictions – Restricted Property

Based on a review of the DTSC ENVIROSTOR Land Use Restrictions webpage (https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60001356), the *Restricted Property* is subject to deed restrictions or LUCs specified in the *Covenant to Restrict Use of Property*, Docket Number 19950393083 and dated November 14, 1995 (Restricted Property Covenant). The covenant consists of the same preclusions as the Capped Property.

In addition, the Restricted Property Covenant specifies that the Covenantor agrees that the Owner to provide to DTSC written notice at least fourteen (14) days prior to any excavations in the Restricted Property which presents a significant likelihood of disturbing the Hazardous Substances in the Restricted Property. The surveyed location of the Restricted Property is defined on the Restricted Property Covenant, included in Appendix A.

Current deed restrictions – Groundwater Monitoring Wells

Based on a review of the DTSC ENVIROSTOR Land Use Restrictions webpage (https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60001356), no specific land use restrictions were listed for groundwater monitoring wells in Operable Unit No. 2. However, the Former Kaiser Steel Facility Groundwater Remedial Action Plan, submitted to the California Office and Planning and Research by the DTSC on

September 13, 2016 proposed groundwater monitoring and recordation of a LUC to restrict the use of groundwater beneath the former Kaiser Steel Mill. The existing groundwater monitoring wells in Operable Unit No. 2 are required to remain intact or be replaced if damaged and remain accessible for groundwater gauging and sampling. Groundwater monitoring was proposed to be performed for a period of up to 30 years and will include annual gauging and sampling of a network of groundwater monitoring wells, as well as an annual reporting of the results of groundwater monitoring to the DTSC. Groundwater beneath the Site cannot be used for municipal or industrial process water or drinking water. DTSC will have entry and access rights to the former Kaiser Steel Mill Site for inspection, monitoring, and other necessary activities. If the Site is transferredto another entity, the land use controls will be included in the appropriate transfer documents to ensure their continuing application. DTSC will conduct a protectiveness review every five years to ensure that the remedy continues to adequately protect human health and the environment.

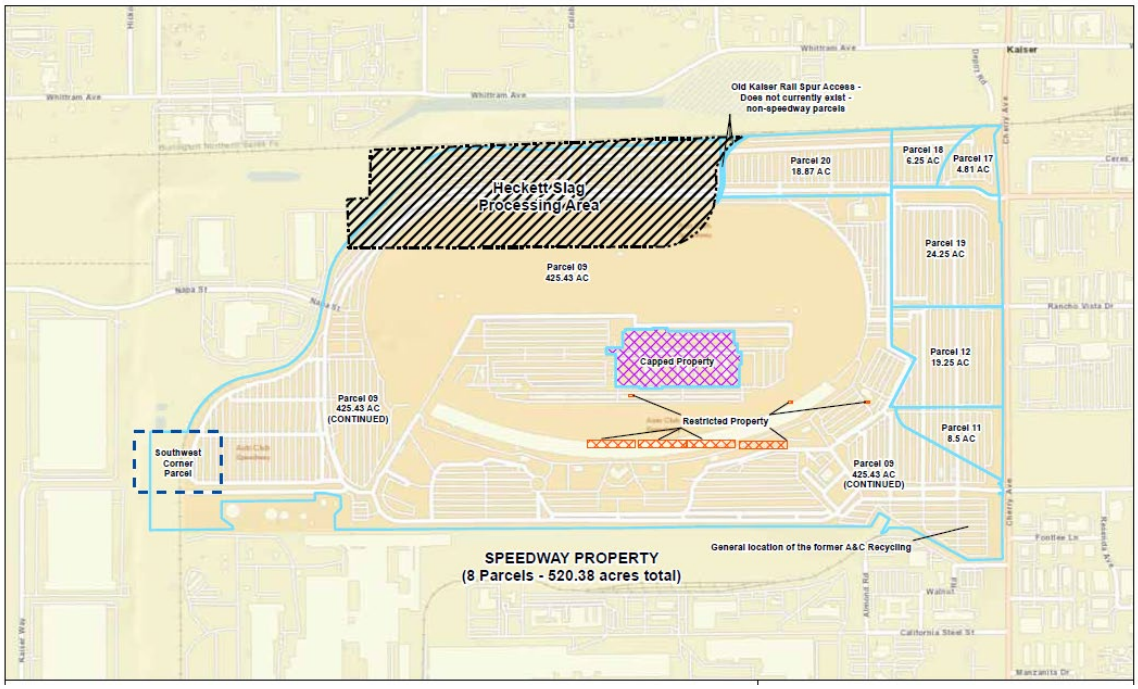
Summary

- Contaminants identified — Metals, PAH and VOCs
- Remediation completed — Yes, excluding groundwater as part of operable unit No. 5
- Ongoing O&M — Yes
- LUCs or deed restrictions — Yes, Capped Property, Restricted Property and Groundwater Monitoring Wells
- Geotechnical concerns — Potential

DISCUSSION OF KEY FINDINGS & OBSERVATIONS

Geosyntec has conducted an initial review of available documents on the DTSC ENVIROSTOR website for the former Kaiser Steel Mill located at 9300 Cherry Avenue, Fontana, California. The purpose of the review was to identify LUCs on portions of the former Kaiser Steel Mill owned by California Speedway, LLC. Based on our review we have identified the following findings (also illustrated on Figure 16 and excerpted below):

- Several areas of the Auto Club Speedway Property were subject to historical remediation activities, and with the exception of ongoing groundwater monitoring, other areas have received no further action designation from the DTSC or "closure", two of these areas received closure with LUCs.
- The Capped Property located in the infield of the racetrack and beneath garages has a LUC.
- The Restricted Property located under the racetrack and grandstands have a LUC.
- The Southwest Corner parcel of the Site appears to be used for flood management and may be subject to permitting requirements with the SBCFCD.



Excerpt from Figure 16, Site Overview Showing Areas of Interest

MODIFED PROJECT LUCS IMPACT

Based on the planned modifications to the Auto Club Speedway, depicted on Figures 17 and 18, the proposed short track would be consistent with the LUCs for the capped or restricted properties and the assessed site conditions. The proposed short track is also compatible with the current property site use.

Geosyntec consultants

CLOSURE

Geosyntec appreciates the opportunity to assist Alston & Bird with this *Summary Assessment of Environmental Conditions at the Auto Club Speedway property, 9300 Cherry Avenue, Fontana, California 92335.* We look forward to continuing to work with you and the Auto Club Speedway on this project.

Sincerely,

Chris Lieder, PG
Principal Geologist

COVENANT TO RESTRICT USE OF PROPERTY

(Re: a Portion of the Kaiser Ventures Inc. (Formerly Known as Kaiser Resources Inc.)
Mill Site, Operable Unit No. 2, Former By-Products Plant Area)

This Covenant and Agreement ("Covenant") has an effective date of September 20, 1995, by and between Kaiser Ventures Inc., formerly known as Kaiser Resources Inc., and its successors and assigns (the "Covenantor"), the current owner of the subject property to be restricted herein, and the California Environmental Protection Agency, Department of Toxic Substances Control (the "Department"), the government agency with statutory oversight responsibility with respect to hazardous substances response actions at the subject property. The Covenantor and Department may be collectively referred to herein as the "Parties." This Covenant is made with reference to the following facts:

A. The Capped Property (as defined below) is a limited portion of the site of the former World War II era Kaiser Steel Mill (13425 San Bernardino Avenue, Fontana), located in the area now generally bounded by Etiwanda Avenue on the west, Whittram Avenue on the north, Cherry Avenue on the east, and Valley Blvd. on the south, County of San Bernardino, State of California (the "Site"). The area to be restricted herein ("Capped Property"), more particularly described and depicted in Exhibit "A" (San Bernardino County, Parcel #6 of Parcel Map No. 14723) attached hereto and incorporated herein by this reference, where operations were located that recovered and temporarily stored various valuable by-products recovered from the coke oven gas stream.

B. On August 22, 1988, the Department's predecessor in interest (California Department of Health Services) issued to Covenantor's predecessor in interest (Kaiser Steel Corporation) a Consent Order pursuant to California Health and Safety Code ("H&S Code") §§ 205, 25355.1(a)(1)(B), and 25355.5(a)(1)(C). The purpose of this Consent Order was "to ensure that any release or threatened release of a hazardous substance or hazardous waste to the air, soil, surface water and ground water at or from the Facility [i.e., the Site] is thoroughly investigated and that appropriate remedial actions are taken." In furtherance of the Consent Order, and pursuant to the Department's applicable statutory authority referenced therein and elsewhere, the Department is requiring this Covenant as part of the remedial actions at the Site.

C. As of 1995, land within a two (2) mile radius of the Capped Property supports a mixture of primarily industrial and low-density residential uses. There is also a considerable amount of vacant, currently unproductive agricultural land for which industrial development is planned. The nearest residences to the Site are located approximately 2,000 feet to the north of the border of the Site and 2,000 feet to the east of the border of the Site. The nearest sensitive population to the Site is an elementary school located 3,400 feet to the southeast of the border of the Site.

D. All or a portion of the Capped Property contains hazardous substances ("Hazardous Substances") which include or may include one or more of the following contaminants of concern (as reported in the March 1995, Remedial Action Plan, Operable Unit No. 2 ("RAP"), which became effective upon the Department's approval on May 1, 1995): acenaphthene, anthracene, antimony, arsenic, barium, benz(a)anthracene, benzene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, beryllium, cadmium, chrysene, chromium (including hexavalent), copper, cyanide, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, lead, maganese, mercury, molybdenum, naphthalene, nickel, phenol, pyrene, selenium, silver, styrene, tetrachloroethylene, thallium, toluene, vanadium, xylene, and zinc. The Department considers the concentrations of certain polynuclear aromatics (e.g., benzo(a)pyrene) and certain trace metals to be above acceptable health risk-based levels.

E. Covenantor, in compliance with applicable law, and under the supervision and authority of the Department, is undertaking a response action ("Response Action") at several areas of the Site pursuant to the RAP, which response action Covenantor asserts is in compliance with applicable requirements of the National Contingency Plan (40 C.F.R. § 300, *et. seq.*). The Response Action includes installing and maintaining, pursuant to the RAP, a synthetic membrane cover ("Cap") over the Capped Property. The Cap consists of a low permeability synthetic membrane and other associated layers over the Hazardous Substances, as more particularly described in the engineering drawing attached as Exhibit "B" hereto. The Response Action also includes the installation and operation of: (1) a passive gas collection system ("GCS") on the Capped Property which removes miscellaneous gas/vapors migrating upward from under the Cap, (2) a vapor extraction system ("VES"), on a limited portion of the Capped Property where there were formerly located underground storage tanks, more particularly described and depicted in Exhibit "C" hereto, which remediates certain volatile organic compound-impacted soils, and (3) groundwater monitoring wells ("Monitoring Wells"), which are not on the Capped Property. The operation and maintenance ("O&M") of the Cap, GCS, VES, and Monitoring Wells is pursuant to an O&M Manual incorporated into the O&M Agreement between Covenantor and the Department dated September 20, 1995.

F. This Covenant does not nullify or otherwise modify any releases from liability granted by the Department pursuant to H&S Code §§ 25364 and 25364.1 (California AB 2589, as amended by AB 3201) or other law of similar import.

G. The Department has approved this Response Action as being sufficiently protective of human health and the environment.

ARTICLE I
PARAMETERS OF COVENANT

1. Restrictions to Run With the Land. This Covenant sets forth protective provisions, covenants, restrictions, and conditions (collectively referred to as "Restrictions"), upon and subject to which the Capped Property and every portion thereof shall be improved, held, used, occupied, leased, sold, hypothecated, encumbered, and/or conveyed. Each and every of the Restrictions: (a) shall run with the land pursuant to H&S Code § 25355.5, (b) shall inure to the benefit of and pass with each and every portion of the Capped Property, (c) shall apply to and bind the respective successors in interest to the Capped Property, (d) are for the benefit of, and shall be enforceable by, the Department, (e) are imposed upon the entire Capped Property unless expressly stated as applicable only to a specific portion thereof, and (f) are imposed pursuant to H&S Code §§ 25355.5 and 25356.1.

2. Concurrence of Owners/Occupants. Each and every owner ("Owner" shall mean the Covenantor or its successors in interest, including heirs and assigns, who hold title to all or any portion of the Capped Property) and occupants ("Occupants" shall mean lessees or other possessors of any portion of the Capped Property whose occupancy has a significant likelihood of disturbing or impairing the Cap and/or any other possessors of any portion of the Capped Property who hold such interest(s) for more than three (3) consecutive months) shall be deemed to be in accord with this Covenant and shall further be deemed to unconditionally agree, for and among themselves, their heirs, successors, and assignees (and for any agents thereof), to the Restrictions as herein established (such that their interest(s) and/or possessory rights in the Capped Property are taken subject to such Restrictions).

ARTICLE II
RESTRICTIONS

3. Incorporation into Deeds and Leases. Covenantor agrees that the Restrictions set forth herein shall be incorporated by reference in each and all deeds, and leases to Occupants, for any portion of the Capped Property.

4. Restrictions on Use. Covenantor agrees to restrict the use of the Capped Property in accordance with the restrictions set forth herein in order to protect the present and future public health and safety from potential harm to persons which may result from hazardous substances which exist on the Capped Property. The Restrictions provided herein shall apply only to the Capped Property. Covenantor agrees not to use the Capped Property for any of the following purposes:

(a) A residence, including any mobile home or factory built housing, constructed or installed for use as permanently-occupied residential human habitation.

(b) A long-term care hospital for humans. Nothing herein shall restrict use of the Capped Property for any infirmary, medical aid station, or emergency medical care facility where there is no intent for any patient to remain in such facility for more than 24 hours (e.g., as may be associated with the motor sport complex).

(c) A traditional public or private school for persons under 21 years of age. Nothing herein shall restrict use of the Capped Property for any specialized training programs related to then-existing facilities on the Capped Property (e.g., a driving "school" related to the motor sport complex).

(d) A day care center for children.

5. Non-Interference with Cap and VES. Covenantor agrees:

(a) No activities which will disturb the Cap and/or the VES (e.g., excavation, grading, removal, trenching, filling, earth movement, or mining) shall be permitted on the Capped Property without prior review and approval by the Department.

(b) All uses and development of the Capped Property shall preserve the integrity of the Cap and operation of the VES.

(c) Any proposed alteration of the Cap and/or the VES shall require written approval by the Department, except for the addition of non-invasive surface materials ("Non-Invasive Surface Materials" means any materials, including soil, asphalt, concrete, and structures, placed upon or over the Cap which does not disturb the Cap or the VES, or impair the integrity or operation of either).

(d) Covenantor shall notify the Department of each of the following: (i) The type, cause, location and date of any disturbance to the Cap and/or VES which could affect the ability of the Cap to contain subsurface Hazardous Substances in the Capped Property and/or the VES to operate properly, and (ii) the type and date of repair of such disturbance. Notification to the Department shall be made as provided below within ten (10) working days of both the discovery of any such disturbance(s) and the completion of any repairs.

6. Notice in Agreements. Covenantor agrees that the Owner shall furnish in writing to Occupants and/or to the Owner's successor in interest to any part of the Capped Property, as either part of another written agreement (e.g., a lease), or as a stand alone instrument, the following statement:

"All or a portion of the land described herein contains hazardous substances. Such condition renders the land and the owner, lessee, or other possessor of the land subject to requirements, restrictions, provisions, and liabilities contained in Chapter 6.5 and 6.8 of Division 20 of the California Health and Safety Code. This statement is not a declaration that a hazard exists and does not address the liability of any party."

7. Conveyance of Capped Property. Covenantor agrees that the Owner shall provide notice to the Department not later than thirty (30) days prior to any conveyance of any ownership interest in the Capped Property (excluding mortgages, liens, and other non-possessory encumbrances). The Department shall not, by reason of this Covenant, have authority to approve, disprove, or otherwise affect such proposed conveyance, except as otherwise provided by law, by administrative order, or by reason of this Covenant.

8. Access for Implementing O&M. Covenantor agrees that all Owners and Occupants shall forever grant reasonable right of entry and access, to the entity or person responsible for implementing the O&M Agreement or any portion thereof, for the purpose of implementing such O&M Agreement.

ARTICLE III
ENFORCEMENT

9. Enforcement. Failure of the Covenantor and/or Owner to comply with any of the Restrictions specifically applicable to it shall be grounds for the Department, by reason of this Covenant, to require that the Covenantor and/or Owner modify or remove any improvements ("Improvements" herein shall mean all buildings, roads, driveways, and paved parking areas, constructed or placed upon any portion of the Capped Property) constructed in violation of the Restrictions. Violation of this Covenant shall be grounds for the Department to file civil and/or criminal actions against the Covenantor and/or Owner as provided by law.

ARTICLE IV
VARIANCE, TERMINATION, AND TERM

10. Variance. Covenantor, any Owner or, with the Owner's written consent, any Occupant of the Capped Property or any portion thereof may apply to the Department for a written variance from the provisions of this Covenant. Such application shall be made in accordance with H&S Code § 25233.

11. Termination. Covenantor, any Owner or, with the Owner's written consent, any Occupant of the Capped Property or any portion thereof may apply to the Department for a termination of the Restrictions or other term of this Covenant as they apply to all or any portion of the Capped Property. Such application shall be made in accordance with H&S Code § 25234.

12. Term. Unless ended in accordance with the "termination" paragraph above, by law, or by other valid method, this Covenant shall continue in effect in perpetuity.

ARTICLE V
MISCELLANEOUS

13. No Dedication Intended. Nothing set forth in this Covenant shall be constructed to be a gift or dedication, or offer of a gift or dedication, of the Site, Capped Property, or any portion thereof to the general public or anyone else for any purpose whatsoever. In addition, nothing in this Covenant shall be deemed to constitute a covenant, encumbrance, or restriction on the use of any property other than the Capped Property.

14. Headings. Headings at the beginning of each numbered article of this Covenant are solely for the convenience of the Parties and are not a part of the Covenant.

15. Code References. All references to Code sections include successor provisions, if any.

16. Department References. All references to the Department include successor agencies/departments or other successor entity.

17. Recordation. The Covenantor shall record this Covenant, with all referenced Exhibits, in the County of San Bernardino within ten (10) days of the Covenantor's receipt of a fully executed original.

18. Notices. Whenever any person gives or serves any notice ("Notice" as used herein includes any demand or other communication with respect to this Covenant), each such Notice shall be in writing and shall be deemed effective: (1) when delivered, if personally delivered to the person being served or to an officer of a corporate party being served, or (2) three (3) business days after deposit in the mail, if mailed by United States mail, postage paid certified, return receipt requested:

To Covenantor: Kaiser Ventures Inc.
3633 E. Inland Empire Boulevard, Suite 850
Ontario, California 91764
Attention: Lee R. Redmond III

To Department: Department of Toxic Substances Control
Region 4, Site Mitigation Cleanup Operations
245 West Broadway, Suite 350
Long Beach, California 90802
Attention: Peter A. Garcia

Any party may change its address or the individual to whose attention a notice is to be sent by giving such written notice in compliance with the provisions of this section.

19. Partial Invalidity. If any portion of the Restrictions or other term set forth herein is determined by a court of competent jurisdiction to be invalid for any reason, the surviving portions of this Covenant shall remain in full force and effect as if such portion found invalid had not been included herein.

IN WITNESS WHEREOF, the Parties execute this Covenant.

COVENANT TO RESTRICT USE OF PROPERTY

(Re: a Portion of the Kaiser Ventures Inc. (Formerly Known as Kaiser Resources Inc.)
Mill Site, Operable Unit No. 2, Former By-Products Plant Area)

This Covenant and Agreement ("Covenant") has an effective date of September 20, 1995, by and between Kaiser Ventures Inc., formerly known as Kaiser Resources Inc., and its successors and assigns (the "Covenantor"), the current owner of the subject property to be restricted herein, and the California Environmental Protection Agency, Department of Toxic Substances Control (the "Department"), the government agency with statutory oversight responsibility with respect to hazardous substances response actions at the subject property. The Covenantor and Department may be collectively referred to herein as the "Parties." This Covenant is made with reference to the following facts:

A. The Restricted Property (as defined below) is a limited portion of the site of the former World War II era Kaiser Steel Mill (13425 San Bernardino Avenue, Fontana), located in the area now generally bounded by Etiwanda Avenue on the west, Whittram Avenue on the north, Cherry Avenue on the east, and Valley Blvd. on the south, County of San Bernardino, State of California (the "Site"). The limited areas of the Site to be restricted herein ("Restricted Property"), totaling approximately 2.3 acres, are more particularly described and depicted in Exhibit "A" (a portion of San Bernardino County Parcel #4 of Parcel Map No. 14723) attached hereto and incorporated herein by this reference.

B. On August 22, 1988, the Department's predecessor in interest (California Department of Health Services) issued to Covenantor's predecessor in interest (Kaiser Steel Corporation) a Consent Order pursuant to California Health and Safety Code ("H&S Code") §§ 205, 25355.1(a)(1)(B), and 25355.5(a)(1)(C). The purpose of this Consent Order was "to ensure that any release or threatened release of a hazardous substance or hazardous waste to the air, soil, surface water and ground water at or from the Facility [i.e., the Site] is thoroughly investigated and that appropriate remedial actions are taken." In furtherance of the Consent Order, and pursuant to the Department's applicable statutory authority referenced therein and elsewhere, the Department is requiring this Covenant as part of the remedial actions at the Site.

C. As of 1995, land within a two (2) mile radius of the Restricted Property supports a mixture of primarily industrial and low-density residential uses. There is also a considerable amount of vacant, currently unproductive agricultural land for which industrial development is planned. The nearest residences to the Site are located approximately 2,000 feet to the north of the border of the Site and 2,000 feet to the east of the border of the Site. The nearest sensitive population to the Site is an elementary school located 3,400 feet to the southeast of the border of the Site.

D. All or a portion of the Restricted Property contains hazardous substances ("Hazardous Substances") which include or may include one or more of the following contaminants of concern (as reported in the March 1995, Remedial Action Plan, Operable Unit No. 2 ("RAP"), which became effective upon the Department's approval on May 1, 1995): acenaphthene, anthracene, antimony, arsenic, barium, benz(a)anthracene, benzene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, beryllium cadmium, chrysene, chromium (including hexavalent), copper, cyanide, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, lead, maganese, mercury, molybdenum, naphthalene, nickel, phenol, pyrene, selenium, silver, styrene, tetrachloroethylene, thallium, toluene, vanadium, xylene, and zinc. The Department considers the concentrations of certain polynuclear aromatics (e.g., benzo(a)pyrene) and certain trace metals to be above acceptable health risk-based levels.

E. Covenantor, in compliance with applicable law, and under the supervision and authority of the Department, is undertaking a response action ("Response Action") at several areas of the Site pursuant to the RAP, which response action Covenantor asserts is in compliance with applicable requirements of the National Contingency Plan (40 C.F.R. § 300, *et. seq.*).

F. This Covenant does not nullify or otherwise modify any releases from liability granted by the Department pursuant to H&S Code §§ 25364 and 25364.1 (California AB 2589, as amended by AB 3201) or other law of similar import.

G. As shown in Exhibit "A," it is anticipated that the Restricted Property will be covered by seven (7) to thirty-five (35) feet of clean fill, asphalt, and/or concrete in connection with construction of a planned motor sports complex. The Department has approved this Response Action as being sufficiently protective of human health and the environment.

ARTICLE I
PARAMETERS OF COVENANT

1. Restrictions to Run With the Land. This Covenant sets forth protective provisions, covenants, restrictions, and conditions (collectively referred to as "Restrictions"), upon and subject to which the Restricted Property and every portion thereof shall be improved, held, used, occupied, leased, sold, hypothecated, encumbered, and/or conveyed. Each and every of the Restrictions: (a) shall run with the land pursuant to H&S Code § 25355.5, (b) shall inure to the benefit of and pass with each and every portion of the Restricted Property, (c) shall apply to and bind the respective successors in interest to the Restricted Property, (d) are for the benefit of, and shall be enforceable by, the Department, (e) are imposed upon the entire Restricted Property unless expressly stated as applicable only to a specific portion thereof, and (f) are imposed pursuant to H&S Code §§ 25355.5 and 25356.1.

2. Concurrence of Owners/Occupants. Each and every owner ("Owner" shall mean the Covenantor or its successors in interest, including heirs and assigns, who hold title to all or any portion of the Restricted Property) and occupants ("Occupants" shall mean lessees or other possessors of any portion of the Restricted Property whose occupancy has a significant likelihood of violating the Restrictions) shall be deemed to be in accord with this Covenant and shall further be deemed to unconditionally agree, for and among themselves, their heirs, successors, and assignees (and for any agents thereof), to the Restrictions as herein established (such that their interest(s) and/or possessory rights in the Restricted Property are taken subject to such Restrictions).

ARTICLE II
RESTRICTIONS

3. Incorporation into Deeds and Leases. Covenantor agrees that the Restrictions set forth herein shall be incorporated by reference in each and all deeds, and leases to Occupants, for any portion of the Restricted Property.

Restrictions on Use. Covenantor agrees to restrict the use of the Restricted Property in accordance with the restrictions set forth herein in order to protect the present and future public health and safety from potential harm to persons which may result from hazardous substances which exist on the Restricted Property. The Restrictions provided herein shall apply only to the Restricted Property. Covenantor agrees not to use the Restricted Property for any of the following purposes:

(a) A residence, including any mobile home or factory built housing, constructed or installed for use as permanently-occupied residential human habitation.

(b) A long-term care hospital for humans. Nothing herein shall restrict use of the Restricted Property for any infirmary, medical aid station, or emergency medical care facility where there is no intent for any patient to remain in such facility for more than 24 hours (e.g., as may be associated with the motor sport complex).

(c) A traditional public or private school for persons under 21 years of age. Nothing herein shall restrict use of the Restricted Property for any specialized training programs related to then-existing facilities on the Restricted Property (e.g., a driving "school" related to the motor sport complex).

(d) A day care center for children.

Additionally, Covenantor agrees that the Owner to provide to the Department written notice at least fourteen (14) days prior to any excavations in the Restricted Property which present a significant likelihood of disturbing the Hazardous Substances in the Restricted Property

5. Notice in Agreements. Covenantor agrees that the Owner shall furnish in writing to Occupants and/or to the Owner's successor in interest to any part of the Restricted Property, as either part of another written agreement (e.g., a lease), or as a stand alone instrument, the following statement:

> "All or a portion of the land described herein contains hazardous substances. Such condition renders the land and the owner, lessee, or other possessor of the land subject to requirements, restrictions, provisions, and liabilities contained in Chapter 6.5 and 6.8 of Division 20 of the California Health and Safety Code. This statement is not a declaration that a hazard exists and does not address the liability of any party."

6. Conveyance of Restricted Property. Covenantor agrees that the Owner shall provide notice to the Department not later than thirty (30) days prior to any conveyance of any ownership interest in the Restricted Property (excluding mortgages, liens, and other non-possessory encumbrances). The Department shall not, by reason of this Covenant, have authority to approve, disprove, or otherwise affect such proposed conveyance, except as otherwise provided by law, by administrative order, or by reason of this Covenant.

ARTICLE III
ENFORCEMENT

7. Enforcement. Failure of the Covenantor and/or Owner to comply with any of the Restrictions specifically applicable to it shall be grounds for the Department, by reason of this Covenant, to require that the Covenantor and/or Owner to modify or remove any improvements ("Improvements" herein shall mean all buildings, roads, driveways, and paved parking areas, constructed or placed upon any portion of the Restricted Property) constructed in violation of the Restrictions. Violation of this Covenant shall be grounds for the Department to file civil and/or criminal actions against the Covenantor and/or Owner as provided by law.

ARTICLE IV
VARIANCE, TERMINATION, AND TERM

10. Variance. Covenantor, any Owner, and/or, with the Owner's written consent, any Occupant of the Restricted Property or any portion thereof may apply to the Department for a written variance from the provisions of this Covenant. Such application shall be made in accordance with H&S Code § 25233.

11. Termination. Covenantor, any Owner, and/or, with the Owner's written consent, any Occupant of the Restricted Property or any portion thereof may apply to the Department for a termination of the Restrictions or other term of this Covenant as they apply to all or any portion of the Restricted Property. Such application shall be made in accordance with H&S Code § 25234.

12. Term. Unless ended in accordance with the "termination" paragraph above, by law, or by other valid method, this Covenant shall continue in effect in perpetuity.

ARTICLE V
MISCELLANEOUS

13. No Dedication Intended. Nothing set forth in this Covenant shall be construed to be a gift or dedication, or offer of a gift or dedication, of the Site, Restricted Property, or any portion thereof to the general public or anyone else for any purpose whatsoever. In addition, nothing in this Covenant shall be deemed to constitute a covenant, encumbrance, or restriction on the use of any property other than the Restricted Property.

14. Headings. Headings at the beginning of each numbered article of this Covenant are solely for the convenience of the Parties and are not a part of the Covenant.

15. Code References. All references to Code sections include successor provisions, if any.

16. Department References. All references to the Department include successor agencies/departments or other successor entity.

17. Recordation. The Covenantor shall record this Covenant, with all referenced Exhibits, in the County of San Bernardino within ten (10) days of the Covenantor's receipt of a fully executed original.

18. Notices. Whenever any person gives or serves any notice ("Notice" as used herein includes any demand or other communication with respect to this Covenant), each such Notice shall be in writing and shall be deemed effective: (1) when delivered, if personally delivered to the person being served or to an officer of a corporate party being served, or (2) three (3) business days after deposit in the mail, if mailed by United States mail, postage paid certified, return receipt requested:

To Covenantor: Kaiser Ventures Inc.
3633 E. Inland Empire Boulevard, Suite 850
Ontario, California 91764
Attention: Lee R. Redmond III

To Department: Department of Toxic Substances Control
Region 4, Site Mitigation Cleanup Operations
245 West Broadway, Suite 350
Long Beach, California 90802
Attention: Peter A. Garcia

Any party may change its address or the individual to whose attention a notice is to be sent by giving such written notice in compliance with the provisions of this section.

19. Partial Invalidity. If any portion of the restrictions or other term set forth herein is determined by a court of competent jurisdiction to be invalid for any reason, the surviving portions of this Covenant shall remain in full force and effect as if such portion found invalid had not been included herein.

IN WITNESS WHEREOF, the Parties execute this Covenant.

SECTION 1 - SUMMARY

PURPOSE

The purpose of this report is to document the hydrologic and hydraulic analyses performed in support of the Speedway Commerce Center II Specific Plan project located in unincorporated San Bernardino County, California. The project site is located at north of the San Bernardino Freeway (I-10) and San Bernardino Avenue and is bounded by Cherry Avenue to the east, the Burlington Northern and Santa Fe (BNSF) Railroad to the north, the West Valley Materials Recycling Facility to the west, and California Steel Industries to the south. The Specific Plan area is comprised of approximately 432.7 acres of the approximately 522 acres site of land presently occupied by the Auto Club Speedway (ACS) and associated uses. This report will summarize the hydrologic and hydraulic analyses that were conducted in order to determine the necessary drainage improvements required to provide flood protection for the proposed building and safely convey the runoff through the site.

The scope of this report will include the following:

- Determine the peak 100-year and 10-year flow rates for the developed condition using the San Bernardino County Hydrology Manual Rational Method.
- Determine the required storm drain facilities, alignment, and sizes required to flood protect the project site.
- Determine the necessary basin area and volume required for water quality treatment and to mitigate for increases in runoff.
- Summarize the hydrology and hydraulic results.

DESCRIPTION OF WATERSHED

As previously described, the Specific Plan area is comprised of approximately 432.7 acres of the approximately 522 acres of land presently occupied by the Auto Club Speedway (ACS) and associated uses. Existing elevations across the site vary from 1,144 feet above mean sea level (msl) at the northeast corner to 1,084 feet msl at the southwestern corner, sloping to the southwest. The existing drainage pattern for the site and the general area is characterized by sheet flow.

Under existing conditions, the project site naturally drains from the northeast to the southwest. An open stormwater channel exists on the south side of the site. This channel intercepts all runoff within the project area, and outlets into existing drainage basin located at the southwest corner of the site. An additional offsite area on the east of site, approximately 23.4 acres, drains south to the existing channel as well. All offsite flows are intercepted by Cherry Ave to the east and existing San Sevaine Channel to the north of the site.

The site is within a flood hazard zone "X" FP2, where the flood hazard is inside a 500 Year Flood Plain (SBC, 2010a, b). The site is not listed by the County of San Bernardino (SBC,2010a, b), as being in any mapped dam inundation hazard zone. A seiche is a wave or sloshing of a body of water that is at least partially impounded caused by strong wind or seismic shaking. The site is not downstream of large bodies of water or tanks which potentially could causes flooding and inundate the project site. The risk of seiche damage following a seismic event at the site is considered low. Furthermore, the probability of said conditions occurring during a 100-Year storm is very miniscule. In our engineering opinion, the proposed project site bears very low risk, if any, from such an event.

PROPOSED CONDITIONS

The existing drainage pattern is maintained in the proposed conditions. All flows onsite drain in a north east - south westerly manner consistent with existing pattern. Flows originate at northeast corner of the site and traverse through the site via storm drain network, picking up flows from remaining onsite areas, and are ultimately conveyed to the existing San Sevaine channel located southwesterly of the site.

A 164 feet long weir outlet structure is proposed to convey the 885 cfs 100-Year flow. The outlet structure is located in the south of the existing basin which is in the southwest corner of the site. The existing basin is used to treat water quality as a natural infiltration basin. Water depth of 1.4 feet and 2.1 feet freeboard is used to design the size of the weir. See Appendix C for details. It is worthy to note that in the 100-year flood conditions, when the existing basin reaches its maximin capacity, the actual captured volume of water quality treatment is the sum of the above-ground storage volume and 3-hour infiltrated volume of basin.

METHODOLOGY

HYDROLOGY

Hydrologic calculations were performed in accordance with the San Bernardino County Hydrology Manual, dated August 1986. The Rational Method was utilized in determining peak 1-Hour flow rates.

The hydrological parameters, including rainfall values and soil types were derived from the San Bernardino County Hydrology Manual. The isohyetal maps and soil map have been included in Section 2.

Rational Method calculations were performed using a computer program developed by CivilDesign Corporation and Joseph E. Bonadiman and Associates Inc. The computer program is commonly referred to as CivilD which incorporates the hydrological parameters outlined in the San Bernardino County Hydrology Manual.

The Rational Method was used to determine the peak flow rates to size and design the drainage facilities need to convey onsite flows through the site to the existing basin to existing San Sevaine channel. The flow rates were computed by generating a hydrologic "link-node" model in which the overall area is divided into separate drainage sub-areas, and then each tributary is linked to a concentration point (node) determined by the proposed layout and grading.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County Southwestern Part, California
Survey Area Data: Version 13, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 10, 2018—Feb 6, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

W	Water		1.4	0.1%
Totals for Area of Interest			**2,548.4**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Tie-break Rule: Higher

SECTION 2 - HYDROLOGY ANALYSIS

HYDROLOGY PARAMETERS

The San Bernardino County Hydrology Manual was used to determine several of the hydrological parameters. The following rainfall depths were utilized in the hydrology analyses, which were obtained from the isohyetal maps provided in the San Bernardino County Hydrology Manual:

Table 1 – Precipitation Values

	Duration
Storm Event	1-Hour (inches)
10-Year	0.95
100-Year	1.35

The value for slope of intensity was determined to be 0.6. The isohyetal maps have been included in Appendix A.

Based on USDA Natural Resources Conservation Service (NRCS) soil data, the project site is classified as soil type A. The soils map is included in Appendix A.

The cover type was determined based on the existing land cover and proposed land use of the site. Hydrological computations for the existing condition were done using 'Commercial' landuse. The commercial cover type was also used to represent the existing and proposed condition. The table below summarizes the runoff index values and the recommended values for percentage of impervious cover for each category:

Table 2 – Cover Type

Cover Type	Soil Group A	Soil Group B	Soil Group C	Soil Group D	Percentage of Impervious Cover
Commercial	32	56	69	75	90%

ON-SITE RATIONAL METHOD HYDROLOGY

The rational method was used to determine peak flow rates in order to adequately size the proposed subsurface storm drains and associated inlets used to convey on-site flows to the existing basin, and eventually to San Sevaine channel. The study commences at node 100 in the northeast corner and ends at node 508 in the southwest corner of the site. Onsite flows are collected by a system of underground chambers and storm drain network. The underground chambers are only provided for Water Quality treatment and provide no mitigation of flood. See Preliminary Water Quality Management Plan (WQMP) report for more details on water quality. Almost all storm drains are directed to the existing channel (stretching from nodes 500 to 506) located along the south boundary of the project. From thereon, flows are conveyed by a combination of existing and proposed box culverts. These flows are then confluenced

with flows from another storm drain system running along the westerly boundary of the project (from nodes 104 to 508). Finally, all flows are conveyed to the existing basin located at the southwest corner of the project and thereon to the existing basin to the existing San Sevaine channel. The project was modeled as commercial land use which assumes a 10% pervious cover.

The following table summarizes the rational method results at key points:

Table 3 – Existing Conditions Rational Method Results

Point of Interest	10-Year Peak Flow Rate (cfs)	100-Year Peak Flow Rate (cfs)
Node 109 – Flow from east regions tributary to channel	234.0	347.2
Node 204 – Flow from north regions tributary to channel	61.0	92.3
Node 305 – Flow from central regions tributary to channel	268.4	403.8
Node 113 – Total flow produced from the project site and tributary to channel	504.5	762.2

Table 4 – Proposed Conditions Rational Method Result

Point of Interest	10-Year Peak Flow Rate (cfs)	100-Year Peak Flow Rate (cfs)
Node 108 – Flow from northeast and northwest corner of site tributary to channel	83.1	127.3
Node 213 – Flow from east regions tributary to channel	186.3	280.9
Node 406 – Flow from north central regions tributary to channel	92.4	138.1
Node 508 – Total flow produced from the project site and tributary to channel	577.9	885.8

The rational method output files and hydrology map have been included in Appendix A.

SECTION 3 - CONCLUSION

The current project site is substantially in paved condition and as such no significant differences are observed in the peak flow rates. Although the proposed condition results in an approximately 16% increase in peak flows, the existing storm drain system is designed for a much higher peak flow. Please see Appendix B referencing plans entitled *California Speedway Storm Drain Improvement Plan*. Existing system has a capacity to convey 1,135 cfs. It must also be noted that the existing channel running along the southern border of the project, together with the portion of existing upstream storm drain and the portion of existing downstream box culvert have enough capacity to convey the proposed flows. Also, note that the project site is exempt from HCOC per the HCOC exempt map (see Appendix D). A review of the aerial imagery shows hardened facilities downstream of the project which substantiate the HCOC exempt status. As such, the proposed project conditions will not cause any downstream impacts. See table below:

	Proposed Flows (cfs)	Designed Flows* (cfs)
Existing Channel	**1,135**	885
Existing Box	**949**	688
Existing Strom Drain	260	45

* See Appendix B referencing plans entitled *California Speedway Storm Drain Improvement Plan*.

Therefore, based on the analysis performed it can be safely concluded that:

- The proposed drainage improvements will adequately convey flows to the existing San Sevaine channel and provide flood protection for the 100-year storm event.
- The existing basin on the south-west corner of site will provide adequate water quality treatment for all onsite streets' tributary areas and central tributary area of site (Refer to DMA 8 in the WQMP Report). Please see more information in WQMP Report.
- The proposed project will not impact flooding condition to upstream or downstream properties.

Runoff from this stream =     46.501(CFS)
Time of concentration =   11.24 min.
Rainfall intensity =     2.595(In/Hr)
Area averaged loss rate (Fm) =    0.0978(In/Hr)
Area averaged Pervious ratio (Ap) = 0.1000
Summary of stream data:

Stream Flow rate    Area    TC     Fm       Rainfall Intensity
 No.    (CFS)   (Ac.)       (min) (In/Hr)     (In/Hr)

1     61.77    34.200     15.94    0.098      2.105
2     46.50    20.000     11.24    0.098      2.595
Qmax(1) =
           1.000 *    1.000 *    61.770) +
           0.804 *    1.000 *    46.501) + =      99.144
```

```
Qmax(2) =
          1.244 *    0.705 *    61.770) +
          1.000 *    1.000 *    46.501) + =     100.719

Total of 2 streams to confluence:
Flow rates before confluence point:
      61.770      46.501
Maximum flow rates at confluence using above data:
       99.144      100.719
Area of streams before confluence:
       34.200       20.000
Effective area values after confluence:
       54.200       44.127
Results of confluence:
Total flow rate =    100.719(CFS)
Time of concentration =    11.243 min.
Effective stream area after confluence =     44.127(Ac.)
Study area average Pervious fraction(Ap) =  0.100
Study area average soil loss rate(Fm) =    0.098(In/Hr)
Study area total (this main stream) =      54.20(Ac.)

100-YEAR ONSITE HYDROLOGY (RATIONAL METHOD)

San Bernardino County Rational Hydrology Program

(Hydrology Manual Date - August 1986)

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1989-2005 Version 7.1
Rational Hydrology Study Date: 04/12/22

Program License Serial Number 4010

********* Hydrology Study Control Information **********

Rational hydrology study storm event year is 100.0
10 Year storm 1 hour rainfall = 0.950(In.)
100 Year storm 1 hour rainfall = 1.350(In.)
Computed rainfall intensity:
Storm year = 100.00 1 hour rainfall = 1.350 (In.)
Slope used for rainfall intensity curve b = 0.6000
Soil antecedent moisture condition (AMC) = 2

********* Hydrology Study Control Information **********

Rational hydrology study storm event year is 100.0
10 Year storm 1 hour rainfall = 0.950(In.)
100 Year storm 1 hour rainfall = 1.350(In.)
Computed rainfall intensity:
Storm year = 100.00 1 hour rainfall = 1.350 (In.)
Slope used for rainfall intensity curve b = 0.6000
Soil antecedent moisture condition (AMC) = 2

```
_____________________________________________________________________________
The following data inside Main Stream is listed:
In Main Stream number: 2
Stream flow area =    424.066(Ac.)
Runoff from this stream =    716.572(CFS)
Time of concentration =   31.99 min.
Rainfall intensity =     1.969(In/Hr)
Area averaged loss rate (Fm) =    0.0978(In/Hr)
Area averaged Pervious ratio (Ap) = 0.1000
Summary of stream data:

Stream Flow rate    Area    TC     Fm       Rainfall Intensity
 No.    (CFS)   (Ac.)       (min) (In/Hr)     (In/Hr)

1    127.27    87.400     40.58    0.098      1.707
2    716.57   424.066     31.99    0.098      1.969
Qmax(1) =
           1.000 *    1.000 *   127.266) +
           0.860 *    1.000 *   716.572) + =     743.508
Qmax(2) =
           1.163 *    0.788 *   127.266) +
           1.000 *    1.000 *   716.572) + =     833.217

Total of 2 main streams to confluence:
Flow rates before confluence point:
     128.266     717.572
Maximum flow rates at confluence using above data:
      743.508      833.217
Area of streams before confluence:
       87.400      424.066
Effective area values after confluence:
      511.466      492.956

Results of confluence:
Total flow rate =    833.217(CFS)
Time of concentration =    31.986 min.
Effective stream area after confluence  =    492.956(Ac.)
Study area average Pervious fraction(Ap) =  0.100

CAPACITY OF EXISTING FACILITIES

THE CALIFORNIA Speedway

STORM DRAIN IMPROVEMENT PLANS

GENERAL NOTES:

1. ELEVATIONS ARE IN FEET ABOVE U.S.C. & G.C. MEAN SEA LEVEL DATUM OF 1929.
2. NO CONCRETE SHALL BE PLACED UNTIL THE FORMS AND REINFORCING STEEL HAVE BEEN SET, INSPECTED AND APPROVED.
3. ALL CONCRETE SHALL BE PORTLAND CEMENT CONCRETE WITH AN ULTIMATE 28-DAY COMPRESSIVE STRENGTH OF 3250 P.S.I. UNLESS DIFFERENTLY SPECIFIED.
4. ALL EXPOSED EDGES SHALL BE FINISHED WITH 3/4" CHAMFER.
5. ALL STEEL ADJACENT TO FACE OF CONCRETE SHALL HAVE A 2-1/2" CLEARANCE UNLESS OTHERWISE SPECIFIED.
6. REINFORCEMENT SHALL BE DEFORMED BARS OF INTERMEDIATE GRADE STEEL AS PER A.S.T.M. A-615 GRADE 60.
7. ALL BAR ENDS AND HOOKS SHALL CONFORM TO THE AMERICAN CONCRETE INSTITUTE "MANUAL OF STANDARD PRACTICE".
8. DIMENSION FROM FACE OF CONCRETE TO STEEL ARE TO CENTER LINE OF STEEL UNLESS OTHERWISE NOTED.
9. ALL BACKFILLS AND FILLS TO BE USED AS SUBGRADES SHALL BE COMPACTED TO A RELATIVE DENSITY OF 90% UNLESS OTHERWISE SPECIFIED. TOP 12" OF SUBGRADE TO BE 95%. ANY A.B. THICKNESS SHALL BE CONSIDERED AS INCLUDED IN THE 12" DIMENSION.
10. ALL STEEL THAT IS TO BE CONTINUOUS SHALL HAVE A MINIMUM LAP OF 30 BAR DIAMETERS OR 18" WHICHEVER IS GREATER.
11. PIPE SHALL BE EMBEDDED 5" INTO ALL STRUCTURES INCLUDING INLET AND HEADWALLS, UNLESS OTHERWISE SPECIFIED.
12. ALL BACKFILL AND FILL AROUND CLOSED CONDUIT IN STREET ROADWAY SHALL BE BROUGHT UP TO SUBGRADE OF THE ROAD OR TO 2' ABOVE THE TOP OF THE CONDUIT, WHICHEVER IS LESS. THE SAN BERNARDINO COUNTY INSPECTOR AND THE SOILS ENGINEER SHALL INSPECT ALL BACKFILL AND FILL ABOVE AFOREMENTIONED LIMITS. APPLICATIONS FOR AN ENGINEER OR INSPECTOR IN CONNECTION WITH THE WORK SHALL BE MADE BY THE CONTRACTOR AT LEAST 1 WORKING DAY BEFORE HIS SERVICE IS REQUIRED.
13. ALL REINFORCED CONCRETE PIPE SHALL BE BEDDED IN ACCORDANCE WITH LACFCD STD 2-D177.
14. THE CONTRACTOR'S ATTENTION IS DIRECTED TO SECTION 7-10.4.1 OF THE STD. SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION IN REGARD TO SAFETY ORDERS.
15. ALL PIPE SHALL BE PLACED IN A TRENCH IN NATURAL GROUND AND/OR COMPACTED FILL.
16. THE CONTRACTOR SHALL PROVIDE FOR CONTRIBUTARY DRAINAGE AT ALL TIMES UNTIL THIS STORM DRAIN SYSTEM IS OPERABLE.
17. ALL STATE AND LOCAL TRENCH SAFETY RULES WILL BE RIGIDLY ENFORCED.
18. CONTRACTOR SHALL FURNISH A LETTER OF CERTIFICATION FROM PIPE MANUFACTURER AS TO TEST RESULTS OF PIPE INSTALLED (D-LOAD PER PLAN).
19. R.C.P. SHALL BE MANUFACTURED AND INSPECTED IN ACCORDANCE WITH SECTION 207-2.7, 2.8 AND 2.9 OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS.
20. ALL PIPES SHALL BE CERTIFIED BY MANUFACTURER AND MARKED WITH D-LOAD, DATE AND TEE'S LOCATIONS, MARKED FOR PUBLIC WORKS INSPECTOR ACCEPTANCE.
21. ALL PIPE WITH VELOCITIES EXCEEDING 20 F.P.S. WILL HAVE 1/2" THICKENED INVERTS (SPECIAL COVER PIPE).
22. THE CONSTRUCTION OF ALL PUBLIC IMPROVEMENTS SHALL CONFORM TO THESE PLANS AND TO THE REQUIREMENTS OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION.
23. CONSTRUCTION PERMITS SHALL BE OBTAINED FROM THE COUNTY OF SAN BERNARDINO PRIOR TO START OF ANY WORK WITHIN THEIR JURISDICTIONAL LIMITS.
24. STATIONING REFERS TO THE CENTERLINES OF STORM DRAINS AND INLETS EXCEPT WHERE OTHERWISE NOTED ON PLANS.
25. ALL EXPOSED CONCRETE SURFACES SHALL CONFORM IN GRADE, COLOR AND FINISH TO ALL ADJOINING CURBS AND SIDEWALKS.
26. "UNDERGROUND SERVICE ALERT" SHALL BE NOTIFIED 2 WORKING DAYS PRIOR TO START OF WORK (1-800-422-4133).
27. ALL UNDERGROUND WORK SHALL BE COMPLETED PRIOR TO PAVING OF STREETS.
28. EXISTING BURIED FOUNDATION WALL(S) MAY BE ENCOUNTERED. REMOVE ANY WALL(S) NECESSARY TO FACILITATE CONSTRUCTION OF STORM DRAIN SYSTEM. WALL(S) SHALL BE REMOVED TO CLEAR STORM DRAIN 12" MINIMUM.

Hydromodification

A.1 Hydrologic Conditions of Concern (HCOC) Analysis

HCOC Exemption:

1. **Sump Condition:** All downstream conveyance channel to an adequate sump (for example, Prado Dam, Santa Ana River, or other Lake, Reservoir or naturally erosion resistant feature) that will receive runoff from the project are engineered and regularly maintained to ensure design flow capacity; no sensitive stream habitat areas will be adversely affected; or are not identified on the Co-Permittees Hydromodification Sensitivity Maps.

2. **Pre = Post**: The runoff flow rate, volume and velocity for the post-development condition of the Priority Development Project do not exceed the pre-development (i.e, naturally occurring condition for the 2-year, 24-hour rainfall event utilizing latest San Bernardino County Hydrology Manual.

    a. Submit a substantiated hydrologic analysis to justify your request.

3. **Diversion to Storage Area**: The drainage areas that divert to water storage areas which are considered as control/release point and utilized for water conservation.

    a. See Appendix F for the HCOC Exemption Map and the on-line Watershed Geodatabase (http://sbcounty.permitrack.com/wap) for reference.

4. **Less than One Acre**: The Priority Development Project disturbs less than one acre. The Co-permittee has the discretion to require a Project Specific WQMP to address HCOCs on projects less than one acre on a case by case basis. The project disturbs less than one acre and is not part of a common plan of development.

5. **Built Out Area**: The contributing watershed area to which the project discharges has a developed area percentage greater than 90 percent.

    a. See Appendix F for the HCOC Exemption Map and the on-line Watershed Geodatabase (http://sbcounty.permitrack.com/wap) for reference.

Project Owner's Certification

This Water Quality Management Plan (WQMP) has been prepared for California Speedway, LLC. by Albert A. Webb Associates. The WQMP is intended to comply with the requirements of the County of San Bernardino and the NPDES Areawide Stormwater Program requiring the preparation of a WQMP. The undersigned, while it owns the subject property, is responsible for the implementation of the provisions of this plan and will ensure that this plan is amended as appropriate to reflect up-to-date conditions on the site consistent with San Bernardino County's Municipal Storm Water Management Program and the intent of the NPDES Permit for San Bernardino County and the incorporated cities of San Bernardino County within the Santa Ana Region. Once the undersigned transfers its interest in the property, its successors in interest and the city/county shall be notified of the transfer. The new owner will be informed of its responsibility under this WQMP. A copy of the approved WQMP shall be available on the subject site in perpetuity.

"I certify under a penalty of law that the provisions (implementation, operation, maintenance, and funding) of the WQMP have been accepted and that the plan will be transferred to future successors."

Section 1 Discretionary Permit(s)

Form 1-1 Project Information					
Project Name	Speedway Commerce Center II				
Project Owner Contact Name:	California Speedway, LLC				
Mailing Address:	9300 Cherry Avenue, Fontana, CA 92335	E-mail Address:		Telephone:	(909) 429-5304
Permit/Application Number(s):		Tract/Parcel Map Number(s):			
Additional Information/ Comments:					
Description of Project:	The Speedway Commerce Center II Specific Plan area is comprised of approximately 432.7 acres of a 522-acre site, located in unincorporated San Bernardino County. The Specific Plan area is within the City of Fontana Sphere of Influence (SOI). Under existing conditions, the project site naturally drains from the northeast to the southwest. An open stormwater channel exists on the south side of the site. This channel intercepts all runoff within the project area, and outlets into an existing drainage basin located at the southwest corner of the site. All offsite flows are intercepted by Cherry Ave to the east and existing San Sevaine Channel to the north of the site. The existing onsite drainage pattern is maintained in the proposed conditions. All flows drain in a northeast to south westerly manner consistent with the existing pattern. Flows originate at northeast corner of the site and traverse through the site via a proposed storm drain network, picking up flows from remaining onsite areas and street flows, and are ultimately conveyed to the existing San Sevaine channel located southwesterly of the site. Sixteen underground infiltration facilities and five biotreatment facilities (modular wetland) are placed to treat design capture volume (DCV) for respective tributary areas. DMA 8 consists of all onsite streets tributary areas and central tributary area of site. The design capture volume (DCV) of DMA8 will be treated by existing infiltration basin located at the southwest corner of the site. Infiltration testing has been conducted and a Factor of safety of 4.5 has been applied in accordance with Worksheet in Appendix D of the Technical Guidance Document. The facilities will intercept and infiltrate entire design capture volume (DCV) within 48 hrs. Events in excess of the DCV volume will overflow to the existing San Sevaine channel through adequately sized outlet structures.				

Provide summary of Conceptual WQMP conditions (if previously submitted and approved). Attach complete copy.	N/A

Section 2 Project Description

2.1 Project Information

This section of the WQMP should provide the information listed below. The information provided for Conceptual/ Preliminary WQMP should give sufficient detail to identify the major proposed site design and LID BMPs and other anticipated water quality features that impact site planning. Final Project WQMP must specifically identify all BMP incorporated into the final site design and provide other detailed information as described herein.

The purpose of this information is to help determine the applicable development category, pollutants of concern, watershed description, and long term maintenance responsibilities for the project, and any applicable water quality credits. This information will be used in conjunction with the information in Section 3, Site Description, to establish the performance criteria and to select the LID BMP or other BMP for the project or other alternative programs that the project will participate in, which are described in Section 4.

Form 2.1-1 Description of Proposed Project

1 Development Category (Select all that apply):

☒ Significant re-development involving the addition or replacement of 5,000 ft² or more of impervious surface on an already developed site	☐ New development involving the creation of 10,000 ft² or more of impervious surface collectively over entire site	☐ Automotive repair shops with standard industrial classification (SIC) codes 5013, 5014, 5541, 7532- 7534, 7536-7539	☐ Restaurants (with SIC code 5812) where the land area of development is 5,000 ft² or more
☐ Hillside developments of 5,000 ft² or more which are located on areas with known erosive soil conditions or where the natural slope is 25 percent or more	☐ Developments of 2,500 ft² of impervious surface or more adjacent to (within 200 ft) or discharging directly into environmentally sensitive areas or waterbodies listed on the CWA Section 303(d) list of impaired waters.	☐ Parking lots of 5,000 ft² or more exposed to storm water	☐ Retail gasoline outlets that are either 5,000 ft² or more, or have a projected average daily traffic of 100 or more vehicles per day

☐ Non-Priority / Non-Category Project *May require source control LID BMPs and other LIP requirements. Please consult with local jurisdiction on specific requirements*.

2 Project Area (ft2):	22,738,320	**3** Number of Dwelling Units:	0	**4** SIC Code:	

5 Is Project going to be phased? Yes ☒ No ☐ *If yes, ensure that the WQMP evaluates each phase as a distinct DA, requiring LID BMPs to address runoff at time of completion.*

6 Does Project include roads? Yes ☒ No ☐ *If yes, ensure that applicable requirements for transportation projects are addressed (see Appendix A of TGD for WQMP)*

2.2 Property Ownership/Management

Describe the ownership/management of all portions of the project and site. State whether any infrastructure will transfer to public agencies (City, County, Caltrans, etc.) after project completion. State if a homeowners or property owners association will be formed and be responsible for the long-term maintenance of project stormwater facilities. Describe any lot-level stormwater features that will be the responsibility of individual property owners.

Form 2.2-1 Property Ownership/Management

Describe property ownership/management responsible for long-term maintenance of WQMP stormwater facilities:

The existing basin located in the southwest corner of the site will be transferred to San Bernardino County – Special Districts for Ownership, Operations, & Maintenance. The onsite BMPs (infiltration & biotreatment facilities) will be maintained by the property owner.

2.3 Potential Stormwater Pollutants

Determine and describe expected stormwater pollutants of concern based on land uses and site activities (refer to Table 3-3 in the TGD for WQMP).

Form 2.3-1 Pollutants of Concern			
Pollutant	Please check: E=Expected, N=Not Expected		Additional Information and Comments
Pathogens (Bacterial / Virus)	E ☒	N ☐	
Nutrients - Phosphorous	E ☒	N ☐	
Nutrients - Nitrogen	E ☒	N ☐	
Noxious Aquatic Plants	E ☒	N ☐	
Sediment	E ☒	N ☐	
Metals	E ☒	N ☐	
Oil and Grease	E ☒	N ☐	
Trash/Debris	E ☒	N ☐	
Pesticides / Herbicides	E ☒	N ☐	
Organic Compounds	E ☒	N ☐	
Other:	E ☐	N ☐	
Other:	E ☐	N ☐	
Other:	E ☐	N ☐	
Other:	E ☐	N ☐	
Other:	E ☐	N ☐	

2.4 Water Quality Credits

A water quality credit program is applicable for certain types of development projects if it is not feasible to meet the requirements for on-site LID. Proponents for eligible projects, as described below, can apply for water quality credits that would reduce project obligations for selecting and sizing other treatment BMP or participating in other alternative compliance programs. Refer to Section 6.2 in the TGD for WQMP to determine if water quality credits are applicable for the project.

Form 2.4-1 Water Quality Credits

1 Project Types that Qualify for Water Quality Credits: *Select all that apply*			
☐ Redevelopment projects that reduce the overall impervious footprint of the project site. [Credit = % impervious reduced]	Higher density development projects ☐ Vertical density [20%] ☐ 7 units/ acre [5%]	☐ Mixed use development, (combination of residential, commercial, industrial, office, institutional, or other land uses which incorporate design principles that demonstrate environmental benefits not realized through single use projects) [20%]	☐ Brownfield redevelopment (redevelop real property complicated by presence or potential of hazardous contaminants) [25%]
☐ Redevelopment projects in established historic district, historic preservation area, or similar significant core city center areas [10%]	☐ Transit-oriented developments (mixed use residential or commercial area designed to maximize access to public transportation) [20%]	☐ In-fill projects (conversion of empty lots & other underused spaces < 5 acres, substantially surrounded by urban land uses, into more beneficially used spaces, such as residential or commercial areas) [10%]	☐ Live-Work developments (variety of developments designed to support residential and vocational needs) [20%]
2 Total Credit % *(Total all credit percentages up to a maximum allowable credit of 50 percent)*			
Description of Water Quality Credit Eligibility (if applicable)	N/A		

Section 3 Site and Watershed Description

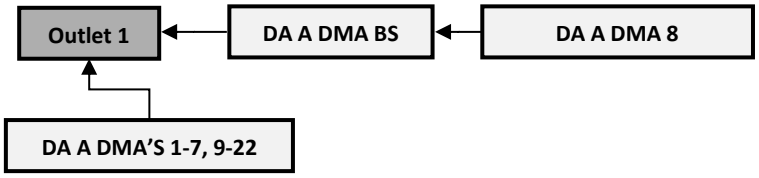
Describe the project site conditions that will facilitate the selection of BMP through an analysis of the physical conditions and limitations of the site and its receiving waters. Identify distinct drainage areas (DA) that collect flow from a portion of the site and describe how runoff from each DA (and sub-watershed DMAs) is conveyed to the site outlet(s). Refer to Section 3.2 in the TGD for WQMP. The form below is provided as an example. Then complete Forms 3.2 and 3.3 for each DA on the project site. ***If the project has more than one drainage area for stormwater management, then complete additional versions of these forms for each DA / outlet.***

Form 3-1 Site Location and Hydrologic Features

Site coordinates *take GPS measurement at approximate center of site*	Latitude 34° 5' 20.09554"N	Longitude - 117° 30' 14.78398"W	Thomas Bros Map page 604

1 San Bernardino County climatic region: ☒ Valley ☐ Mountain

2 Does the site have more than one drainage area (DA): Yes☐ No☒ *If no, proceed to Form 3-2. If yes, then use this form to show a conceptual schematic describing DMAs and hydrologic feature connecting DMAs to the site outlet(s). An example is provided below that can be modified for proposed project or a drawing clearly showing DMA and flow routing may be attached*



Conveyance	Briefly describe on-site drainage features to convey runoff that is not retained within a DMA
DA A DMA 8 to DMA BS Outlet 1	Runoff form streets and central areas (DMA 8) are conveyed by proposed storm drain and the existing channel to the existing infiltration basin (DMA BS) on SE corner of site.

Form 3-2 Existing Hydrologic Characteristics for Drainage Area A

For Drainage Area 1's sub-watershed DMA, provide the following characteristics	DMA 1	DMA 2	DMA 3	DMA 4
1 DMA drainage area (ft^2)	2,352,240.0	1,001,880.0	2,352,240.0	1,724,976.0
2 Existing site impervious area (ft^2)	2,117,016.0	901,692.0	2,117,016.0	1,552,478.4
3 Antecedent moisture condition *For desert areas, use http://www.sbcounty.gov/dpw/floodcontrol/pdf/20100412_map.pdf*	II	II	II	II
4 Hydrologic soil group *Refer to Watershed Mapping Tool – http://permitrack.sbcounty.gov/wap/*	A	A	A	A
5 Longest flowpath length (ft)*				
6 Longest flowpath slope (ft/ft)*				
7 Current land cover type(s) *Select from Fig C-3 of Hydrology Manual*	Commercial	Commercial	Commercial	Commercial
8** Pre-developed pervious area condition: *Based on the extent of wet season vegetated cover good >75%; Fair 50-75%; Poor <50% Attach photos of site to support rating*	Poor	Poor	Poor	Poor

*Will be provided in final WQMP
**See Appendix A1

Form 3-2 Existing Hydrologic Characteristics for Drainage Area A

For Drainage Area 1's sub-watershed DMA, provide the following characteristics	DMA 5	DMA 6	DMA 7	DMA 8
1 DMA drainage area (ft^2)	1,846,944.0	1,838,232.0	1,176,120.0	5375304.0
2 Existing site impervious area (ft^2)	1,662,249.6	1,654,408.8	1,058,508.0	4,837,773.6
3 Antecedent moisture condition *For desert areas, use* *http://www.sbcounty.gov/dpw/floodcontrol/pdf/20100412_map.pdf*	II	II	II	II
4 Hydrologic soil group *Refer to Watershed Mapping Tool – http://permitrack.sbcounty.gov/wap/*	A	A	A	A
5 Longest flowpath length (ft)*				
6 Longest flowpath slope (ft/ft)*				
7 Current land cover type(s) *Select from Fig C-3 of Hydrology Manual*	Commercial	Commercial	Commercial	Commercial

Section 4 Best Management Practices (BMP)

4.1 Source Control BMP

4.1.1 Pollution Prevention

Non-structural and structural source control BMP are required to be incorporated into all new development and significant redevelopment projects. Form 4.1-1 and 4.1-2 are used to describe specific source control BMPs used in the WQMP or to explain why a certain BMP is not applicable. Table 7-3 of the TGD for WQMP provides a list of applicable source control BMP for projects with specific types of potential pollutant sources or activities. The source control BMP in this table must be implemented for projects with these specific types of potential pollutant sources or activities.

The preparers of this WQMP have reviewed the source control BMP requirements for new development and significant redevelopment projects. The preparers have also reviewed the specific BMP required for project as specified in Forms 4.1-1 and 4.1-2. All applicable non-structural and structural source control BMP shall be implemented in the project.

Form 4.1-1 Non-Structural Source Control BMPs

Identifier	Name	Check One		Describe BMP Implementation OR, if not applicable, state reason
		Included	Not Applicable	
N1	Education of Property Owners, Tenants and Occupants on Stormwater BMPs	☒	☐	Owner shall provide, to all employees and persons/entities that will be contracted to perform services for the development, BMP training and educational materials. Materials provided through the San Bernardino County Area-Wide Storm Water Program Public Education Program should be made available (http://www.co.san-bernardino.ca.us/flood/npdes).Training will be required within 6 months of hire dates for new employees, and then annually thereafter
N2	Activity Restrictions	☒	☐	Restrictions will include requiring dumpster lids to be closed at all times and prohibiting the blowing, sweeping, or hosing of debris into streets, storm drain inlets, and other conveyances. In particular, pesticide application in areas must be performed by an applicator certified by the California Department of Pesticide Regulation. No activity shall be allowed for which a specific BMP has not been included
N3	Landscape Management BMPs	☒	☐	Landscape planning shall employ strategies to maximize water storage and conservation and minimize runoff, promote infiltration, and protect slopes from erosion. Such strategies include extensive mulching, low water use shrubs, and grouping of plants with similar water requirements. Maintenance personnel will regularly mow, remove all sediment, inspect and keep any equipment in good repair, i.e. broken sprinkler heads, etc. Any repairs will be done promtly. In addition, fertilizer and pesticide use will be consistent with instructions contained on product labels and with the regulations administered by the State Department of Pesticide Regulation
N4	BMP Maintenance	☒	☐	Create regularly scheduled times for inspection and maintenacne of Infiltration facilities. The frequency shall meet the current minimum City standard but shall be at a minimum once per three months. A time in the late summer or early fall, prior to the storm season (October 1 to May 1), shall also be part of this schedule to reduce the amount of sediment, garden waste, and trash entering the basins.
N5	Title 22 CCR Compliance (How development will comply)	☒	☐	Hazardous waste materials and wastes shall be collected and stored in covered containers in designated areas. In addition, signs shall be placed to ensure all hazardous waste is collected, removed and disposed of only at authorized disposal areas. Inspections shall be conducted regularly to check all containers and other equipment,

Form 4.1-1 Non-Structural Source Control BMPs				
				used in handling hazardous waste, to minimize potential leaks and spills. Regular maintenance of all equipment will be conducted and repairs will be carried out promtly after identification. Owner shall ensure all operations are in conformance with Title 22 Division 4.5 - Environmental Health Standards for the Management of Hazardous Materials.
N6	Local Water Quality Ordinances	☒	☐	This PWQMP meets or exceeds local water quality ordinances.
N7	Spill Contingency Plan	☒	☐	Spill Contingency Plan to be determined by building owner prior to occucpancy. See SC-11"Spill Prevention, Control, and Cleanup", sample Spill Contingency Template, and SC10"Non-Storm water Discharges" in "BMP Fact Sheets") for guidance and recommended procedures.
N8	Underground Storage Tank Compliance	☐	☐	Will be determined at final study
N9	Hazardous Materials Disclosure Compliance	☒	☐	Compliance through the Phase 1 Site Assessments

Form 4.1-1 Non-Structural Source Control BMPs

Identifier	Name	Check One		Describe BMP Implementation OR, if not applicable, state reason
		Included	Not Applicable	
N10	Uniform Fire Code Implementation	☒	☐	Hazardous waste materials and wastes shall be collected and stored in covered containers in designated areas. In addition, signs shall be placed to ensure all hazardous waste is collected, removed and disposed of only at authorized disposal areas. Inspections shall be conducted regularly to check all containers and other equipment, used in handling hazardous waste, to minimize potential leaks and spills. Regular maintenance of all equipment will be conducted and repairs will be carried out promtly after identification. Owner shall ensure all operations are in conformance with the Uniform Fire Code Article 80.
N11	Litter/Debris Control Program	☒	☐	Litter control and trash management will be provided by a contracted maintenance company under the direction of the building owner
N12	Employee Training	☒	☐	Training will be required within 6 months of hire dates for new employees, and then annually thereafter
N13	Housekeeping of Loading Docks	☐	☐	Will be determined at final study
N14	Catch Basin Inspection Program	☒	☐	Drainage outlet proposed at the Infiltration basins shall be inspected semy-annually, in the late summer or early fall, and at the end of the rainy season, and cleaned as needed, or if accumulated sediment/debris. All portions of the drainage facilities will be evaluated annually to determine the adequacy of the inspection and maintenance frequency.
N15	Vacuum Sweeping of Private Streets and Parking Lots	☒	☐	Create regularly scheduled times for the sweeping of drive isles and parking lot areas. The frequency should meet the current minimum City standard but shall be at a minimum once a month. A time in the late summer or early fall, prior to the storm season (October 1 to May 1), shall also be part of this schedule to reduce the amount of sediment, garden waste, and trash entering the storm drain system
N16	Other Non-structural Measures for Public Agency Projects	☐	☒	N/A
N17	Comply with all other applicable NPDES permits	☒	☐	Construction general permit compliance will be accomplished via filing an NOI with SMARTS and preparing a project specific SWPPP document.

Form 4.1-2 Structural Source Control BMPs

Identifier	Name	Check One		Describe BMP Implementation OR, If not applicable, state reason
		Included	Not Applicable	
S1	Provide storm drain system stencilling and signage (CASQA New Development BMP Handbook SD-13)	☒	☐	The runoff will flow on the surface via concrete gutters, grass swale or curb cuts into the proposed Infiltration basins.
S2	Design and construct outdoor material storage areas to reduce pollution introduction (CASQA New Development BMP Handbook SD-34)	☐	☒	There are no outdoor storage areas proposed
S3	Design and construct trash and waste storage areas to reduce pollution introduction (CASQA New Development BMP Handbook SD-32)	☐	☐	Will be determined at final study
S4	Use efficient irrigation systems & landscape design, water conservation, smart controllers, and source control (Statewide Model Landscape Ordinance; CASQA New Development BMP Handbook SD-12)	☒	☐	Landscape planning shall employ strategies to maximize water storage and conservation and minimize runoff, promote infiltration, and protect slopes from erosion. Such strategies include extensive mulching, low water use shrubs, and grouping of plants with similar water requirements. Maintenance personnel will regularly inspect and keep in good repair, i.e. broken sprinkler heads, etc. will be repaired promptly. In addition, fertilizer and pesticide use will be consistent with instructions contained on product labels and with the regulations administered by the State Department of Pesticide Regulation.
S5	Finish grade of landscaped areas at a minimum of 1-2 inches below top of curb, sidewalk, or pavement	☒	☐	Where possible, landscape areas will be depressed
S6	Protect slopes and channels and provide energy dissipation (CASQA New Development BMP Handbook SD-10)	☒	☐	All sloped areas will be protected from erosion with landscaping in accordance with the recommendations CASQA SD-10
S7	Covered dock areas (CASQA New Development BMP Handbook SD-31)	☐	☐	Will be determined at final study
S8	Covered maintenance bays with spill containment plans (CASQA New Development BMP Handbook SD-31)	☐	☐	Will be determined at final study
S9	Vehicle wash areas with spill containment plans (CASQA New Development BMP Handbook SD-33)	☐	☒	Vehicle washing prohibited onsite
S10	Covered outdoor processing areas (CASQA New Development BMP Handbook SD-36)	☐	☒	There are no outdoor processing areas proposed

Form 4.1-2 Structural Source Control BMPs

Identifier	Name	Check One		Describe BMP Implementation OR, If not applicable, state reason
		Included	Not Applicable	
S11	Equipment washeareas with spill containment plans (CASQA New Development BMP Handbook SD-33)	☐	☒	Equipment washing is prohibited onsite
S12	Fueling areas (CASQA New Development BMP Handbook SD-30)	☐	☒	No fueling areas proposed
S13	Hillside landscaping (CASQA New Development BMP Handbook SD-10)	☐	☒	No hillside areas onsite
S14	Wash water control for food preparation areas	☐	☒	Project is not a food establishment
S15	Community car wash racks (CASQA New Development BMP Handbook SD-33)	☐	☒	Vehicle and equipment washing is prohibited onsite

4.1.2 Preventative LID Site Design Practices

Site design practices associated with new LID requirements in the MS4 Permit should be considered in the earliest phases of a project. Preventative site design practices can result in smaller DCV for LID BMP and hydromodification control BMP by reducing runoff generation. Describe site design and drainage plan including:

- A narrative of site design practices utilized or rationale for not using practices
- A narrative of how site plan incorporates preventive site design practices
- Include an attached Site Plan layout which shows how preventative site design practices are included in WQMP

Refer to Section 5.2 of the TGD for WQMP for more details.

Form 4.1-3 Preventative LID Site Design Practices Checklist

Site Design Practices *If yes, explain how preventative site design practice is addressed in project site plan. If no, other LID BMPs must be selected to meet targets*
Minimize impervious areas: Yes ☒ No ☐ Explanation: : This project has maximized the open landscaped areas to the maximum extent allowed by the proposed land use.
Maximize natural infiltration capacity: Yes ☒ No ☐ Explanation: Natural infiltration capacity is preserved wherever possible, given the landuse. Natural infiltration will take place over these areas.
Preserve existing drainage patterns and time of concentration: Yes ☒ No ☐ Explanation: Existing site drains south-west. This is preserved in the proposed conditions.
Disconnect impervious areas: Yes ☒ No ☐ Explanation: To the maximum extent practical and as dictated by the landuse.
Protect existing vegetation and sensitive areas: Yes ☐ No ☒ Explanation: The site has been used as commercial land. No environmentally sensitive nor natural, undisturbed areas exist.
Re-vegetate disturbed areas: Yes ☒ No ☐ Explanation: The site will be completely developed either with buildings, asphalt, or landscaping. There will be no undeveloped disturbed areas.
Minimize unnecessary compaction in stormwater retention/infiltration basin/trench areas: Yes ☒ No ☐ Explanation: Provisions will be in place that will prevent unnecessary heavy equipment from driving over the proposed infiltration facilities.
Utilize vegetated drainage swales in place of underground piping or imperviously lined swales: Yes ☒ No ☐ Explanation: To the maximum extent practicable and as allowed by county flood control regulations to contain 10-year events in curb and 100-year events in right of way
Stake off areas that will be used for landscaping to minimize compaction during construction : Yes ☒ No ☐ Explanation: : All landscaped areas shall be roped off to keep unwanted equipment from driving over these areas.

4.2 Project Performance Criteria

The purpose of this section of the Project WQMP is to establish targets for post-development hydrology based on performance criteria specified in the MS4 Permit. These targets include runoff volume for water quality control (referred to as LID design capture volume), and runoff volume, time of concentration, and peak runoff for protection of any downstream waterbody segments with a HCOC. ***If the project has more than one outlet for stormwater runoff, then complete additional versions of these forms for each DA / outlet.***

Methods applied in the following forms include:

- For LID BMP Design Capture Volume (DCV), the San Bernardino County Stormwater Program requires use of the P_6 method (MS4 Permit Section XI.D.6a.ii) – Form 4.2-1
- For HCOC pre- and post-development hydrologic calculation, the San Bernardino County Stormwater Program requires the use of the Rational Method (San Bernardino County Hydrology Manual Section D). Forms 4.2-2 through Form 4.2-5 calculate hydrologic variables including runoff volume, time of concentration, and peak runoff from the project site pre- and post-development using the Hydrology Manual Rational Method approach. For projects greater than 640 acres (1.0 mi^2), the Rational Method and these forms should not be used. For such projects, the Unit Hydrograph Method (San Bernardino County Hydrology Manual Section E) shall be applied for hydrologic calculations for HCOC performance criteria.

Refer to Section 4 in the TGD for WQMP for detailed guidance and instructions.

Form 4.2-1 LID BMP Performance Criteria for Design Capture Volume (DA A)

1 Project area DA 1 (ft^2): 22,738,320	**2** Imperviousness after applying preventative site design practices (Imp%): 90%	**3** Runoff Coefficient (Rc): _0.73 *$R_c = 0.858(Imp\%)^{\wedge 3} - 0.78(Imp\%)^{\wedge 2} + 0.774(Imp\%) + 0.04$*
4 Determine 1-hour rainfall depth for a 2-year return period $P_{2yr\text{-}1hr}$ (in): 0.528 *http://hdsc.nws.noaa.gov/hdsc/pfds/sa/sca_pfds.html*		
5 Compute P_6, Mean 6-hr Precipitation (inches): 0.782 *P_6 = Item 4 *C_1, where C_1 is a function of site climatic region specified in Form 3-1 Item 1 (Valley = 1.4807; Mountain = 1.909; Desert = 1.2371)*		
6 Drawdown Rate *Use 48 hours as the default condition. Selection and use of the 24 hour drawdown time condition is subject to approval by the local jurisdiction. The necessary BMP footprint is a function of drawdown time. While shorter drawdown times reduce the performance criteria for LID BMP design capture volume, the depth of water that can be stored is also reduced.*		24-hrs ☐ 48-hrs ☒
7 Compute design capture volume, DCV (ft^3): 2,123,376 *DCV = 1/12 * [Item 1* Item 3 *Item 5 * C_2], where C_2 is a function of drawdown rate (24-hr = 1.582; 48-hr = 1.963)* *Compute separate DCV for each outlet from the project site per schematic drawn in Form 3-1 Item 2*		

Form 4.2-2 Summary of HCOC Assessment (DA 1)

Does project have the potential to cause or contribute to an HCOC in a downstream channel: Yes ☐ No ☒

Go to: *http://permitrack.sbcounty.gov/wap/*

If "Yes", then complete HCOC assessment of site hydrology for 2yr storm event using Forms 4.2-3 through 4.2-5 and insert results below

(Forms 4.2-3 through 4.2-5 may be replaced by computer software analysis based on the San Bernardino County Hydrology Manual)

If "No," then proceed to Section 4.3 Project Conformance Analysis

Condition	Runoff Volume (ft^3)	Time of Concentration (min)	Peak Runoff (cfs)
Pre-developed	**1** *Form 4.2-3 Item 12*	**2** *Form 4.2-4 Item 13*	**3** *Form 4.2-5 Item 10*
Post-developed	**4** *Form 4.2-3 Item 13*	**5** *Form 4.2-4 Item 14*	**6** *Form 4.2-5 Item 14*
Difference	**7** *Item 4 – Item 1*	**8** *Item 2 – Item 5*	**9** *Item 6 – Item 3*
Difference (as % of pre-developed)	**10** % *Item 7 / Item 1*	**11** % *Item 8 / Item 2*	**12** % *Item 9 / Item 3*

Form 4.2-3 HCOC Assessment for Runoff Volume (DA 1)

Weighted Curve Number Determination for: Pre-developed DA	DMA A	DMA B	DMA C	DMA D	DMA E	DMA F	DMA G	DMA H
1a Land Cover type								
2a Hydrologic Soil Group (HSG)								
3a DMA Area, ft^2 *sum of areas of DMA should equal area of DA*								
4a Curve Number (CN) *use Items 1 and 2 to select the appropriate CN from Appendix C-2 of the TGD for WQMP*								
Weighted Curve Number Determination for: Post-developed DA	DMA A	DMA B	DMA C	DMA D	DMA E	DMA F	DMA G	DMA H
1b Land Cover type								
2b Hydrologic Soil Group (HSG)								
3b DMA Area, ft^2 *sum of areas of DMA should equal area of DA*								
4b Curve Number (CN) *use Items 5 and 6 to select the appropriate CN from Appendix C-2 of the TGD for WQMP*								

5 Pre-Developed area-weighted CN:	**7** Pre-developed soil storage capacity, S (in): *S = (1000 / Item 5) - 10*	**9** Initial abstraction, I_a (in): *I_a = 0.2 * Item 7*
6 Post-Developed area-weighted CN:	**8** Post-developed soil storage capacity, S (in): *S = (1000 / Item 6) - 10*	**10** Initial abstraction, I_a (in): *I_a = 0.2 * Item 8*

11 Precipitation for 2 yr, 24 hr storm (in):
Go to: http://hdsc.nws.noaa.gov/hdsc/pfds/sa/sca_pfds.html

12 Pre-developed Volume (ft^3):
*V_{pre} =(1 / 12) * (Item sum of Item 3) * [(Item 11 – Item 9)^2 / ((Item 11 – Item 9 + Item 7)*

13 Post-developed Volume (ft^3):
*V_{pre} =(1 / 12) * (Item sum of Item 3) * [(Item 11 – Item 10)^2 / ((Item 11 – Item 10 + Item 8)*

14 Volume Reduction needed to meet HCOC Requirement, (ft^3):
*V_{HCOC} = (Item 13 * 0.95) – Item 12*

Form 4.2-4 HCOC Assessment for Time of Concentration (DA 1)

Compute time of concentration for pre and post developed conditions for each DA *(For projects using the Hydrology Manual complete the form below)*

Variables	Pre-developed DA1 *Use additional forms if there are more than 4 DMA*				Post-developed DA1 *Use additional forms if there are more than 4 DMA*			
	DMA A	DMA B	DMA C	DMA D	DMA A	DMA B	DMA C	DMA D
1 Length of flowpath (ft) *Use Form 3-2 Item 5 for pre-developed condition*								
2 Change in elevation (ft)								
3 Slope (ft/ft), *S_o = Item 2 / Item 1*								
4 Land cover								
5 Initial DMA Time of Concentration (min) *Appendix C-1 of the TGD for WQMP*								
6 Length of conveyance from DMA outlet to project site outlet (ft) *May be zero if DMA outlet is at project site outlet*								
7 Cross-sectional area of channel (ft^2)								
8 Wetted perimeter of channel (ft)								
9 Manning's roughness of channel (n)								
10 Channel flow velocity (ft/sec) *V_{fps} = (1.49 / Item 9) * (Item 7/Item 8)^0.67 * (Item 3)^0.5*								
11 Travel time to outlet (min) *T_t = Item 6 / (Item 10 * 60)*								
12 Total time of concentration (min) *T_c = Item 5 + Item 11*								
13 Pre-developed time of concentration (min): *Minimum of Item 12 pre-developed DMA*								
14 Post-developed time of concentration (min): *Minimum of Item 12 post-developed DMA*								
15 Additional time of concentration needed to meet HCOC requirement (min): *$T_{C\text{-}HCOC}$ = (Item 13 * 0.95) – Item 14*								

Form 4.2-5 HCOC Assessment for Peak Runoff (DA 1)

Compute peak runoff for pre- and post-developed conditions

Variables		Pre-developed DA to Project Outlet (*Use additional forms if more than 3 DMA)*			Post-developed DA to Project Outlet (*Use additional forms if more than 3 DMA)*		
		DMA A	DMA B	DMA C	DMA A	DMA B	DMA C
1 Rainfall Intensity for storm duration equal to time of concentration *I_{peak} = 10^(LOG Form 4.2-1 Item 4 - 0.6 LOG Form 4.2-4 Item 5 /60)*							
2 Drainage Area of each DMA (Acres) *For DMA with outlet at project site outlet, include upstream DMA (Using example schematic in Form 3-1, DMA A will include drainage from DMA C)*							
3 Ratio of pervious area to total area *For DMA with outlet at project site outlet, include upstream DMA (Using example schematic in Form 3-1, DMA A will include drainage from DMA C)*							
4 Pervious area infiltration rate (in/hr) *Use pervious area CN and antecedent moisture condition with Appendix C-3 of the TGD for WQMP*							
5 Maximum loss rate (in/hr) *F_m = Item 3 * Item 4* *Use area-weighted F_m from DMA with outlet at project site outlet, include upstream DMA (Using example schematic in Form 3-1, DMA A will include drainage from DMA C)*							
6 Peak Flow from DMA (cfs) *Q_p =Item 2 * 0.9 * (Item 1 - Item 5)*							
7 Time of concentration adjustment factor for other DMA to site discharge point *Form 4.2-4 Item 12 DMA / Other DMA upstream of site discharge point (If ratio is greater than 1.0, then use maximum value of 1.0)*	DMA A	*n/a*			*n/a*		
	DMA B		*n/a*			*n/a*	
	DMA C			*n/a*			*n/a*

8 Pre-developed Q_p at T_c for DMA A: *Q_p = Item 6_{DMAA} + [Item 6_{DMAB} * (Item 1_{DMAA} - Item 5_{DMAB})/(Item 1_{DMAB} - Item 5_{DMAB})* Item $7_{DMAA/2}$] + [Item 6_{DMAC} * (Item 1_{DMAA} - Item 5_{DMAC})/(Item 1_{DMAC} - Item 5_{DMAC})* Item $7_{DMAA/3}$]*	**9** Pre-developed Q_p at T_c for DMA B: *Q_p = Item 6_{DMAB} + [Item 6_{DMAA} * (Item 1_{DMAB} - Item 5_{DMAA})/(Item 1_{DMAA} - Item 5_{DMAA})* Item $7_{DMAB/1}$] + [Item 6_{DMAC} * (Item 1_{DMAB} - Item 5_{DMAC})/(Item 1_{DMAC} - Item 5_{DMAC})* Item $7_{DMAB/3}$]*	**10** Pre-developed Q_p at T_c for DMA C: *Q_p = Item 6_{DMAC} + [Item 6_{DMAA} * (Item 1_{DMAC} - Item 5_{DMAA})/(Item 1_{DMAA} - Item 5_{DMAA})* Item $7_{DMAC/1}$] + [Item 6_{DMAB} * (Item 1_{DMAC} - Item 5_{DMAB})/(Item 1_{DMAB} - Item 5_{DMAB})* Item $7_{DMAC/2}$]*
10 Peak runoff from pre-developed condition confluence analysis (cfs):		*Maximum of Item 8, 9, and 10 (including additional forms as needed)*
11 Post-developed Q_p at T_c for DMA A: *Same as Item 8 for post-developed values*	**12** Post-developed Q_p at T_c for DMA B: *Same as Item 9 for post-developed values*	**13** Post-developed Q_p at T_c for DMA C: *Same as Item 10 for post-developed values*
14 Peak runoff from post-developed condition confluence analysis (cfs):		*Maximum of Item 11, 12, and 13 (including additional forms as needed)*
15 Peak runoff reduction needed to meet HCOC Requirement (cfs):		$Q_{p\text{-}HCOC}$ *= (Item 14 * 0.95) – Item 10*

4.3 Project Conformance Analysis

Complete the following forms for each project site DA to document that the proposed LID BMPs conform to the project DCV developed to meet performance criteria specified in the MS4 Permit (WQMP Template Section 4.2). For the LID DCV, the forms are ordered according to hierarchy of BMP selection as required by the MS4 Permit (see Section 5.3.1 in the TGD for WQMP). The forms compute the following for on-site LID BMP:

- Site Design and Hydrologic Source Controls (Form 4.3-2)
- Retention and Infiltration (Form 4.3-3)
- Harvested and Use (Form 4.3-4) or
- Biotreatment (Form 4.3-5).

At the end of each form, additional fields facilitate the determination of the extent of mitigation provided by the specific BMP category, allowing for use of the next category of BMP in the hierarchy, if necessary.

The first step in the analysis, using Section 5.3.2.1 of the TGD for WQMP, is to complete Forms 4.3-1 and 4.3-3) to determine if retention and infiltration BMPs are infeasible for the project. For each feasibility criterion in Form 4.3-1, if the answer is "Yes," provide all study findings that includes relevant calculations, maps, data sources, etc. used to make the determination of infeasibility.

Next, complete Forms 4.3-2 and 4.3-4 to determine the feasibility of applicable HSC and harvest and use BMPs, and, if their implementation is feasible, the extent of mitigation of the DCV.

If no site constraints exist that would limit the type of BMP to be implemented in a DA, evaluate the use of combinations of LID BMPs, including all applicable HSC BMPs to maximize on-site retention of the DCV. If no combination of BMP can mitigate the entire DCV, implement the single BMP type, or combination of BMP types, that maximizes on-site retention of the DCV within the minimum effective area.

If the combination of LID HSC, retention and infiltration, and harvest and use BMPs are unable to mitigate the entire DCV, then biotreatment BMPs may be implemented by the project proponent. If biotreatment BMPs are used, then they must be sized to provide sufficient capacity for effective treatment of the remainder of the volume-based performance criteria that cannot be achieved with LID BMPs (TGD for WQMP Section 5.4.4.2). **Under no circumstances shall any portion of the DCV be released from the site without effective mitigation and/or treatment**.

Form 4.3-1 Infiltration BMP Feasibility (DA 1)

Feasibility Criterion – Complete evaluation for each DA on the Project Site

[1] Would infiltration BMP pose significant risk for groundwater related concerns? Yes ☐ No ☒
Refer to Section 5.3.2.1 of the TGD for WQMP

If Yes, Provide basis: (attach)

[2] Would installation of infiltration BMP significantly increase the risk of geotechnical hazards? Yes ☐ No ☒
(Yes, if the answer to any of the following questions is yes, as established by a geotechnical expert):

- The location is less than 50 feet away from slopes steeper than 15 percent
- The location is less than eight feet from building foundations or an alternative setback.
- A study certified by a geotechnical professional or an available watershed study determines that stormwater infiltration would result in significantly increased risks of geotechnical hazards.

If Yes, Provide basis: (attach)

[3] Would infiltration of runoff on a Project site violate downstream water rights? Yes ☐ No ☒

If Yes, Provide basis: (attach)

[4] Is proposed infiltration facility located on hydrologic soil group (HSG) D soils or does the site geotechnical investigation indicate presence of soil characteristics, which support categorization as D soils? Yes ☐ No ☒

If Yes, Provide basis: (attach)

[5] Is the design infiltration rate, after accounting for safety factor of 2.0, below proposed facility less than 0.3 in/hr (accounting for soil amendments)? Yes ☐ No ☒

If Yes, Provide basis: (attach)

[6] Would on-site infiltration or reduction of runoff over pre-developed conditions be partially or fully inconsistent with watershed management strategies as defined in the WAP, or impair beneficial uses? Yes ☐ No ☒
See Section 3.5 of the TGD for WQMP and WAP

If Yes, Provide basis: (attach)

[7] Any answer from Item 1 through Item 3 is "Yes": Yes ☐ No ☒
If yes, infiltration of any volume is not feasible onsite. Proceed to Form 4.3-4, Harvest and Use BMP. If no, then proceed to Item 8 below.

[8] Any answer from Item 4 through Item 6 is "Yes": Yes ☐ No ☒
If yes, infiltration is permissible but is not required to be considered. Proceed to Form 4.3-2, Hydrologic Source Control BMP.
If no, then proceed to Item 9, below.

[9] All answers to Item 1 through Item 6 are "No":
Infiltration of the full DCV is potentially feasible, LID infiltration BMP must be designed to infiltrate the full DCV to the MEP.
Proceed to Form 4.3-2, Hydrologic Source Control BMP.

4.3.1 Site Design Hydrologic Source Control BMP

Section XI.E. of the Permit emphasizes the use of LID preventative measures; and the use of LID HSC BMPs reduces the portion of the DCV that must be addressed in downstream BMPs. Therefore, all applicable HSC shall be provided except where they are mutually exclusive with each other, or with other BMPs. Mutual exclusivity may result from overlapping BMP footprints such that either would be potentially feasible by itself, but both could not be implemented. Please note that while there are no numeric standards regarding the use of HSC, if a project cannot feasibly meet BMP sizing requirements or cannot fully address HCOCs, feasibility of all applicable HSC must be part of demonstrating that the BMP system has been designed to retain the maximum feasible portion of the DCV. Complete Form 4.3-2 to identify and calculate estimated retention volume from implementing site design HSC BMP. Refer to Section 5.4.1 in the TGD for more detailed guidance.

Form 4.3-2 Site Design Hydrologic Source Control BMPs (DA 1)

1 Implementation of Impervious Area Dispersion BMP (i.e. routing runoff from impervious to pervious areas), excluding impervious areas planned for routing to on-lot infiltration BMP: Yes ☐ No ☒ *If yes, complete Items 2-5; If no, proceed to Item 6*	DA DMA BMP Type	DA DMA BMP Type	DA DMA BMP Type *(Use additional forms for more BMPs)*
2 Total impervious area draining to pervious area (ft^2)			
3 Ratio of pervious area receiving runoff to impervious area			
4 Retention volume achieved from impervious area dispersion (ft^3) *V = Item2 * Item 3 * (0.5/12), assuming retention of 0.5 inches of runoff*			
5 Sum of retention volume achieved from impervious area dispersion (ft^3):		$V_{retention}$ *=Sum of Item 4 for all BMPs*	
6 Implementation of Localized On-lot Infiltration BMPs (e.g. on-lot rain gardens): Yes ☐ No ☒ *If yes, complete Items 7-13 for aggregate of all on-lot infiltration BMP in each DA; If no, proceed to Item 14*	DA DMA BMP Type	DA DMA BMP Type	DA DMA BMP Type *(Use additional forms for more BMPs)*
7 Ponding surface area (ft^2)			
8 Ponding depth (ft)			
9 Surface area of amended soil/gravel (ft^2)			
10 Average depth of amended soil/gravel (ft)			
11 Average porosity of amended soil/gravel			
12 Retention volume achieved from on-lot infiltration (ft^3) $V_{retention}$ *= (Item 7 *Item 8) + (Item 9 * Item 10 * Item 11)*			
13 Runoff volume retention from on-lot infiltration (ft^3):		$V_{retention}$ *=Sum of Item 12 for all BMPs*	

Form 4.3-2 Site Design Hydrologic Source Control BMPs (DA 1)

Form 4.3-2 cont. Site Design Hydrologic Source Control BMPs (DA 1)

14 Implementation of evapotranspiration BMP (green, brown, or blue roofs): Yes ☐ No ☒ *If yes, complete Items 15-20. If no, proceed to Item 21*	DA DMA BMP Type	DA DMA BMP Type	DA DMA BMP Type *(Use additional forms for more BMPs)*
15 Rooftop area planned for ET BMP (ft^2)			
16 Average wet season ET demand (in/day) *Use local values, typical ~ 0.1*			
17 Daily ET demand (ft^3/day) *Item 15 * (Item 16 / 12)*			
18 Drawdown time (hrs) *Copy Item 6 in Form 4.2-1*			
19 Retention Volume (ft^3) $V_{retention}$ *= Item 17 * (Item 18 / 24)*			
20 Runoff volume retention from evapotranspiration BMPs (ft^3): $V_{retention}$ *=Sum of Item 19 for all BMPs*			
21 Implementation of Street Trees: Yes ☐ No ☒ *If yes, complete Items 22-25. If no, proceed to Item 26*	DA DMA BMP Type	DA DMA BMP Type	DA DMA BMP Type *(Use additional forms for more BMPs)*
22 Number of Street Trees			
23 Average canopy cover over impervious area (ft^2)			
24 Runoff volume retention from street trees (ft^3) $V_{retention}$ *= Item 22 * Item 23 * (0.05/12) assume runoff retention of 0.05 inches*			
25 Runoff volume retention from street tree BMPs (ft^3): $V_{retention}$ *= Sum of Item 24 for all BMPs*			
26 Implementation of residential rain barrel/cisterns: Yes ☐ No ☒ *If yes, complete Items 27-29; If no, proceed to Item 30*	DA DMA BMP Type	DA DMA BMP Type	DA DMA BMP Type *(Use additional forms for more BMPs)*
27 Number of rain barrels/cisterns			
28 Runoff volume retention from rain barrels/cisterns (ft^3) $V_{retention}$ *= Item 27 * 3*			
29 Runoff volume retention from residential rain barrels/Cisterns (ft3): $V_{retention}$ *=Sum of Item 28 for all BMPs*			
30 Total Retention Volume from Site Design Hydrologic Source Control BMPs: 0 *Sum of Items 5, 13, 20, 25 and 29*			

4.3.2 Infiltration BMPs

Use Form 4.3-3 to compute on-site retention of runoff from proposed retention and infiltration BMPs. Volume retention estimates are sensitive to the percolation rate used, which determines the amount of runoff that can be infiltrated within the specified drawdown time. The infiltration safety factor reduces field measured percolation to account for potential inaccuracy associated with field measurements, declining BMP performance over time, and compaction during construction. Appendix D of the TGD for WQMP provides guidance on estimating an appropriate safety factor to use in Form 4.3-3.
